AGENDA

ALISO VIEJO CITY COUNCIL
WEDNESDAY, DECEMBER 3, 2025
7:00 PM REGULAR MEETING

CITY HALL
COUNCIL CHAMBERS
12 JOURNEY
ALISO VIEJO, CA

Mayor Tiffany Ackley
Mayor Pro Tem Max Duncan
Councilmember Garrett Dwyer
Councilmember Mike Munzing
Councilmember Tim Zandbergen

WELCOME to the City of Aliso Viejo City Council meeting. Those persons wishing to address the City Council are requested to complete and submit to the City Clerk a “Request to Address City Council” form available at the entrance to the City Council Chambers. Speakers will be called at the appropriate time as their interested matter is heard. COMMENTS WILL BE LIMITED TO THREE MINUTES PER SPEAKER. Council proceedings are recorded.

It is the City's intention to comply with the Americans with Disabilities Act (ADA) . If you need special assistance to participate in the meeting, the City will make reasonable arrangements to ensure accessibility and/or accommodations. [28 CFR 35.102-35.104 ADA Title II] Please contact the City Clerk's Office at (949) 425-2505 at least 48 hours prior to the meeting.

Regular meetings of the City Council are held on the first and third Wednesday of the month at the City Hall Council Chambers, 12 Journey, Aliso Viejo. Copies of the agenda are available in the lobby at City Hall on the Thursday preceding a regularly scheduled City Council meeting. All communications received by the City regarding an agenda item have been included in the agenda materials. Supplemental documents relating to specific agenda items, including communications received after agenda delivery, are presented at the dais and in the Public Copy agenda binder at the time of the meeting. Supplemental documents are also available for review in the City Clerk's office, 12 Journey, Aliso Viejo. For more information, please contact City Hall at (949) 425-2505.

This meeting will be broadcast live on Cox Communications Channel 851, AT&T U-Verse Channel 99 and the City's website. By attending the City Council Meeting, you are giving your permission to be televised. The Council Meetings are rebroadcast on Wednesday at 7:00 p.m. on Cox Communications Channel 851, AT&T U-Verse Channel 99, and can be viewed on the internet at www.avcity.org.

CITY OF ALISO VIEJO
CITY COUNCIL MINUTES
REGULAR MEETING
NOVEMBER 19, 2025, 7:00 PM
Council Chambers, City Hall, 12 Journey
Aliso Viejo, California

CALL TO ORDER: Mayor Ackley called the Regular Meeting of the City Council of the City of Aliso Viejo to order at 7:00 p.m.

ROLL CALL:

PRESENT: MAYOR TIFFANY ACKLEY
MAYOR PRO TEM MAX DUNCAN
COUNCILMEMBER GARRETT DWYER
COUNCILMEMBER MIKE MUNZING
COUNCILMEMBER TIM A. ZANDBERGEN

STAFF PRESENT: MITZI ORTIZ, CITY MANAGER
HONGDAO NGUYEN, ASSISTANT CITY ATTORNEY
KATHY BAILOR, INTERIM CITY CLERK
SHAUN PELLETIER, PUBLIC WORKS DIRECTOR
SO KIM, COMMUNITY DEVELOPMENT DIRECTOR
LIZZY MENDOZA, RECREATION & COMMUNITY SERVICES MANAGER
ISAAC AZIZ, INFORMATION TECHNOLOGY MANAGER
CAPT. RYAN BUHR, CHIEF OF POLICE SERVICES

PLEDGE OF ALLEGIANCE: Recreation & Community Services Manager Lizzy Mendoza led the pledge of allegiance.

1. SPECIAL PRESENTATIONS:

None.

2. ADDITIONS, DELETIONS, REORDERING TO THE AGENDA:

None.

3. COMMUNITY INPUT:

1. Jenna Minnick-Bull, Director of South Coast Conservatory, invited the City Council, staff, and residents to attend their Winter Festival at Capistrano Valley High School.

4. CONSENT CALENDAR:

Unless otherwise indicated below, the following pertains to all items on the Consent Calendar.

Motion: Councilmember Munzing moved and Mayor Pro Tem Duncan seconded to approve the recommended actions. Motion carried 5-0.

4.1 WAIVE THE READING OF ALL ORDINANCES AND RESOLUTIONS

Recommended Action: Approve the reading by title only of all ordinances and resolutions wherein the titles appear on the public agenda; said titles shall be determined to have been ready by title, and further reading is waived.

4.2 APPROVAL OF MINUTES

Recommended Action: Approve the minutes as submitted for the November 5, 2025, Special and Regular Meetings.

4.3 ACCOUNTS PAYABLE

Recommended Action: Ratify accounts payable checks and electronic funds transfers issued between October 24, 2025, and November 6, 2025, in the amount of $$1,079,640.76.

4.4 APPROVE AGREEMENT WITH UNITED BUILDING AND DEVELOPMENT SERVICES, LLC FOR THE ALISO VIEJO RANCH WOOD SEALING PROJECT

Recommended Action:

1. Approve an agreement in the amount of $64,000 to United Building and Development Services, LLC as the lowest responsible bidder for the Aliso Viejo Ranch wood sealing project.
2. Authorize the City Manager to execute an agreement with United Building Development Services, LLC; and
3. Authorize City staff to make total compensation to United Building Development Services, LLC up to $64,000 plus $6,400 (10% of the agreement amount) to allow for contingencies, totaling $70,400.

5. PUBLIC HEARINGS:

5.1 REQUEST TO APPROVE AN ADMINISTRATIVE USE PERMIT TO ALLOW AN OUTDOOR DINING AREA AND AN EXPANSION OF AN ABC LICENSE INTO THE PARKING LOT AND A CONDITIONAL USE PERMIT TO REDUCE THE PARKING REQUIREMENT BY 17% AT 7 JOURNEY (USE-2025-00018 AND USE-2025-00019)

Mayor Pro Tem Duncan recused himself and left the Council Chambers at 7:05 pm due to his daughter being an employee at the establishment.

City Manager Mitzi Ortiz introduced Senior Planner Rose Rivera, who provided an overview. Staff and Webb's Grainworks owner Jeremy Webb, responded to questions regarding parking restrictions and live performances. Mayor Ackley opened the public hearing, and there were no requests to speak. Mayor Ackley closed the public hearing.

Recommended Action: Adopt Resolution No.2025-19 approving Administrative Use Permit USE-2025-00018 to allow for an outdoor dining area and an expansion of an ABC license into the parking lot and Conditional Use Permit USE-2025-00019 to reduce the parking requirement by 17% at 7 Journey.

Motion: Councilmember Munzing moved and Councilmember Zandbergen seconded to approve the recommended actions. Motion carried 4-0-1, with Mayor Pro Tem Duncan absent.

Mayor Pro Tem Duncan returned to the dais at 7:14 p.m. for the remainder of the meeting.

5.2 GENERAL PLAN AMENDMENT, ZONE CHANGE, VESTING TENTATIVE TRACT MAP, SITE DEVELOPMENT PERMIT, ENVIRONMENTAL ASSESSMENT, AND DEVELOPMENT AGREEMENT FOR 95 ARGONAUT

City Manager Mitzi Ortiz introduced Community Development Director So Kim, who provided an overview. Staff and Danny Hinojosa of Meritage Homes, responded to questions regarding park in-lieu fees, affordable housing, additional impact fees and fee calculations. Mayor Ackley opened the public hearing, and there were no requests to speak. Mayor Ackley closed the public hearing. Direction was provided to use the Orange County Tax Assessor land value for park in-lieu fee calculations, apply State Density Bonus threshold for affordable housing units, not impose additional development impact fees, and use 50-year evaluation years with escalation rate based on last 5 years of CPI for fiscal impact calculation.

Recommended Action:
1. Continue the public hearing to a date uncertain; and
2. Review and provide direction on the preferred impact fee structure for development agreements.

Motion: Councilmember Munzing moved and Councilmember Zandbergen seconded, to continue the public hearing to the Regular City Council Meeting of December 3, 2025. Motion carried 5-0.

6. DISCUSSION:

6.1 INSTALLATION OF FIXED LICENSE PLATE READER CAMERAS

City Manager Mitzi Ortiz introduced Chief of Police Services Captain Ryan Buhr, who provided an overview. Staff responded to questions regarding camera sizes and placements, system compatibility with neighboring jurisdictions, purchase versus leasing costs, anticipated timelines for procurement, data security, and privacy.

Recommended Action: Staff recommends that the City Council discuss the purpose and intended use of License Plate Reader (LPR) cameras within the City of Aliso Viejo, including how this technology can enhance public safety and investigative capabilities. Following this discussion, the Council may direct City staff and OCSD to develop a phased implementation plan, identify LPR camera locations, select a vendor, and provide a detailed proposal for consideration.

No further action was taken.

6.2 ORDINANCE REPEALING SECTION 2.04.150 OF CHAPTER 2.04 RELATING TO LOCAL CAMPAIGN CONTRIBUTION LIMITS TO BE REPLACED BY STATUTORY DEFAULT LIMITS

City Manager Mitzi Ortiz introduced Assistant City Attorney HongDao Nguyen, who provided an overview. Staff responded to questions regarding the history, monitoring and enforcement relating to local campaign contribution limits. Mayor Ackley opened for public comment and the following person spoke:

1. Sarah Chamberlain expressed opposition to the matter.

Recommended Action: Staff recommends the City Council introduce for first reading, an Ordinance of the City Council of the City of Aliso Viejo Repealing Section 2.04.150 of Chapter 2.04 relating to local campaign contribution limits to be replaced by statutory default limits.

Motion: Councilmember Munzing moved and Councilmember Zandbergen seconded to approve the recommended action. Motion carried 4-1, with Mayor Ackley dissenting.

7. CITY MANAGER' S REPORT:

City Manager Mitzi Ortiz announced the 8th Annual All is Bright Holiday Celebration and Tree Lighting Ceremony on December 4, 2025, from 5:00 to 8:00 p.m. at the Town Center Fountain; Boys & Girls Club of Capistrano Valley accepting donations and volunteers for Operation Holiday Homework event on December 12, 2025, from 3:00 to 6:00 p.m. at Aliso Viejo Ranch; and the Nourishing Great Futures Market every Wednesday from 10:00 am to 12:00 pm at the Iglesia Park Community Center.

8. ANNOUNCEMENTS / COUNCIL COMMENTS / COMMITTEE UPDATES:

Councilmember Munzing:

- Attended Veterans Day Observance at El Toro Memorial Park

- Attended Aliso Viejo Chamber of Commerce Networking Lunch
- Attended OCFA Budget & Finance Committee Meeting
- Attended City of Hope Cancer Research Hospital Grand Opening

DRAFT

City of Aliso Viejo
AGENDA ITEM

DATE: December 3, 2025

TO: Mayor and City Council

FROM: Kathy Bailor, Interim City Clerk

SUBJECT: SECOND READING AND ADOPTON OF AN ORDINANCE REPEALING SECTION 2.04.150 OF THE MUNICIPAL CODE REGARDING CAMPAIGN CONTRIBUTION LIMITS

Recommended Action:

Conduct second reading and adopt an Ordinance entitled:

> AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, REPEALING SECTION 2.04.150 OF THE ALISO VIEJO MUNICIPAL CODE RELATING TO LOCAL ELECTION CAMPAIGN CONTRIBUTION LIMITS TO BE REPLACED BY STATUTORY DEFAULT LIMITS.

Fiscal Impact:

None.

Discussion:

On November 19, 2025, the City Council approved the introduction and first reading of the subject Ordinance by 4-1 vote. If adopted, the Ordinance will take effect 30 days after adoption.

Attachment:

1. Ordinance

ORDINANCE NO. 2025-___

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, REPEALING SECTION 2.04.150 OF THE ALISO VIEJO MUNICIPAL CODE RELATING TO LOCAL ELECTION CAMPAIGN CONTRIBUTION LIMITS TO BE REPLACED BY STATUTORY DEFAULT LIMITS

WHEREAS, Assembly Bill No. 571 ("AB 571") imposed default, indexed campaign contribution limit upon cities and counties effective January 1, 2021, together with a regulatory structure to monitor and enforce the limit; and

WHEREAS, pursuant to California Government Code Section 85702.5, the City of Aliso Viejo adopted its own, lower local campaign contribution limit; and

WHEREAS, in adopting this Ordinance, it is the City Council's intention to promote transparency and ensure a fair election process through utilization of the State's default contribution limits and enforcement mechanism, tying them instead the state adjusted limit per Government Code Sections 85301(a) and (d) adjusted by the Commission pursuant to Section 83124; and

WHEREAS, any and all other legal prerequisites relating to the adoption of this Ordinance have occurred.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF ALISO VIEJO DOES ORDAIN AS FOLLOWS:

SECTION 1. Incorporation of Recitals. The recitals above are each incorporated by reference and adopted as findings by the City Council as if fully set forth herein.

SECTION 2. CEQA. The City Council finds that the proposed amendments to the Aliso Viejo Municipal Code are exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Title 14 of the California Code of Regulations, Section 15061(b)(3) because it can be seen with certainty that there is no possibility that the activity in question may have a significant effect on the environment.

SECTION 3. Code Amendment. Section 2.04.150 relating to City Council Campaign Finance Limitations and Regulations is hereby repealed.

SECTION 4. Statutory Compliance. The default campaign contribution limits found in Government Code Sections 85301 and 83124 shall hereafter apply as monitored and enforced by the California Fair Political Practices Commission.

SECTION 5. Publication. The City Clerk shall certify to the adoption of this Ordinance and cause it, or a summary of it, to be published once within 15 days of adoption in a newspaper of general circulation printed and published within the City of

Aliso Viejo, and shall post a certified copy of this Ordinance, including the vote for and against the same, in the Office of the City Clerk in accordance with California Government Code, section 36933.

SECTION 6. Effective Date. This Ordinance shall become effective 30 days after its adoption.

PASSED, APPROVED AND ADOPTED this _____ day of _____, 2025.

City of Aliso Viejo
AGENDA ITEM

DATE: December 3, 2025

TO: Mayor and City Council

FROM: Ann Eifert, Director of Financial Services

SUBJECT: ACCOUNTS PAYABLE

Recommended Action:

Ratify accounts payable checks and electronic funds transfers issued between November 7, 2025, and November 20, 2025, in the amount of $790,067.72.

Fiscal Impact:

Expenditures in the amount of $790,067.72.

Background:

The City issues accounts payable checks on a bi-weekly basis and presents it to City Council for ratification at its next regularly scheduled City Council meeting.

Discussion:

The attached registers containing checks and electronic funds transfers issued between November 7, 2025, and November 20, 2025, for $790,067.72, are being presented for ratification. All payments have been made in compliance with the City's purchasing policy and procedures. Payments have been reviewed and approved by the appropriate departmental staff. The issued accounts payable checks and electronic funds transfers have been reviewed and deemed in accordance with the fiscal year budget by the Director of Financial Services.

City of Aliso Viejo
AGENDA ITEM

DATE: December 3, 2025

TO: Mayor and City Council

FROM: Ann Eifert, Director of Financial Services/City Treasurer

SUBJECT: TREASURER'S STATEMENT – OCTOBER 2025

Recommended Action:

Receive and file the October 2025 Treasurer's Statement.

Fiscal Impact:

No Fiscal Impact.

Background:

Per City policy, the Finance Department presents the monthly Treasurer's Statement for the City Council's review. This statement shows the cash balance for all City funds, a breakdown of bank account balances, investment account balances and the effective yield earned from investments.

Discussion:

The City's portfolio consists of investments in Certificates of Deposits, US Treasuries, US Federal Agencies, Corporate Bonds, and Local Agency Investment Fund (LAIF). All funds invested with LAIF are available for withdrawal within 24 hours.

The Treasurer's Statement provides information regarding the City's investment portfolio and activity during the reporting month. The City's investment portfolio is in compliance with all government codes as well as the City's investment policy. Interest is credited to the City's bank account monthly and allocated among the City's funds. The current portfolio provides sufficient cash flow liquidity to meet the upcoming operating expenses and spending requirements for the next 6 months.

Daily rates are now available here. **View PMIA Daily Rates**

Notes: The apportionment rate includes interest earned on the CalPERS Supplemental Pension Payment pursuant to Government Code 20825 (c)(1) .

**The percentage of administrative cost equals the total administrative cost divided by the quarterly interest earnings. The law provides that administrative costs are not to exceed 5% of quarterly EARNINGS of the fund. However, if the 13-week Daily Treasury Bill Rate on the last day of the fiscal year is below 1%, then administrative costs shall not exceed 8% of quarterly EARNINGS of the fund for the subsequent fiscal year.*

City of Aliso Viejo
AGENDA ITEM

DATE: December 3, 2025

TO: Mayor and City Council

FROM: Ann Eifert, Director of Financial Services

SUBJECT: ANNUAL MEASURE M2 EXPENDITURE REPORT

Recommended Action:

Adopt a Resolution approving the City's annual Measure M2 expenditure report for fiscal year ending June 30, 2025.

Fiscal Impact:

There is no financial impact in approving the annual expenditure report. The annual report is required to receive Measure M2 funds.

Background:

Measure M2 provides funding to local agencies through a half cent sales tax measure for street and traffic related maintenance and improvements and other transportation projects such as the Senior Mobility Program. Local jurisdictions are required to submit an annual report to the Orange County Transportation Authority to continue funding. The city has received approximately $10.5 million since 2011.

Discussion:

Requirements for the Measure M2 funding program include an annual report for all Measure M2 revenues and expenditures during the fiscal year, general fund monies expended to satisfy Maintenance of Effort requirements, and fund balances at the beginning and end of the fiscal year. Measure M2 resources totaled $1,089,672 and expenditures totaled $757,795 for fiscal year 2024-25. Projects funded by Measure M2 include the Aliso Creek Road rehabilitation and Senior Mobility Program.

RESOLUTION NO. 2025-___

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, CONCERNING THE MEASURE M2 (M2) EXPENDITURE REPORT FOR THE CITY OF ALISO VIEJO

WHEREAS, local jurisdictions are required to meet eligibility requirements and submit eligibility verification packages to the Orange County Transportation Authority (OCTA) in order to remain eligible to receive M2 funds; and

WHEREAS, local jurisdictions are required to adopt an annual M2 Expenditure Report as part of one of the eligibility requirements; and

WHEREAS, local jurisdictions are required to account for Net Revenues, developer/traffic impact fees, and funds expended by local jurisdiction in the M2 Expenditure Report that satisfy the Maintenance of Effort requirements; and

WHEREAS, the M2 Expenditure Report shall include all Net Revenue fund balances, interest earned and expenditures identified by type and program or project; and

WHEREAS, the M2 Expenditure Report must be adopted and submitted to the OCTA each year within six months of the end of the local jurisdiction's fiscal year to be eligible to receive Net Revenues as part of M2.

NOW, THEREFORE, BE IT RESOLVED THAT THE CITY COUNCIL FOR THE CITY OF ALISO VIEJO DOES HEREBY INFORM OCTA THAT:

a) The M2 Expenditure Report is in conformance with the template provided in the Measure M2 Eligibility Guidelines and accounts for Net Revenues including interest earned, expenditures during the fiscal year, and balances at the end of fiscal year.

b) The M2 Expenditure Report is hereby adopted by the City of Aliso Viejo.

c) The City of Aliso Viejo Director of Financial Services is hereby authorized to sign and submit the M2 Expenditure Report to OCTA for the fiscal year ending June 30, 2025.

PASSED, APPROVED AND ADOPTED this 3rd day of December, 2025.

Finance Director Confirmation	19	Any California State Constitution Article XIX streets and road eligible expenditure may be "counted" in local jurisdictions' calculation of MOE if the activity is supported (funded) by a local jurisdictions' discretionary funds (e.g. general fund). The California State Controller also provides useful information on Article XIX and the Streets and Highways Code eligible expenditures in its "Guidelines Relating to Gas Tax Expenditures for Cities and Counties". I have reviewed and am aware of these guidelines and their applicability in calculating and reporting on Maintenance of Effort expenditures. Finance Director initial: _____

M2 Expenditure Report
Fiscal Year Ended June 30, 2025

I hereby certify that:

☑ All the information attached herein and included in schedules 1 through 4 is true and accurate to the best of my knowledge;

☑ The interest earned on Net Revenues allocated pursuant to the Ordinance shall be expended only for those purposes for which the Net Revenues were allocated;

☑ The City/County of Aliso Viejo is aware of the State Controller's "Guidelines Relating to Gas Tax Expenditures for Cities and Counties", which is a guide for determining MOE Expenditures for M2 Eligibility purposes;

☑ The City/County's Expenditure Report is in compliance with direction provided in the State Controller's "Guidelines Relating to Gas Tax Expenditures for Cities and Counties;" and

☑ The City/County of Aliso Viejo has expended in this fiscal year an amount of local discretionary funds for streets and roads purposes at least equal to or exceeding the FY 2024-25 MOE benchmark dollar amount [11].

[11] Jurisdictions are encouraged to submit MOE eligible expenditures higher than their MOE benchmark, so that should certain expenses be ruled ineligible during an MOE audit, the local jurisdiction still has sufficient MOE expenditures to demonstrate continued achievement of the MOE benchmark.

City of Aliso Viejo
AGENDA ITEM

DATE: December 3, 2025

TO: Mayor and City Council

FROM: Shaun Pelletier, Public Works Director City Engineer

SUBJECT: APPROVAL OF THE SUBMITTAL OF THE OSO PARKWAY/PACIFIC PARK DRIVE/GLENWOOD DRIVE REGIONAL TRAFFIC SIGNAL SYNCHRONIZATION PROJECT TO THE ORANGE COUNTY TRANSPORTATION AUTHORITY

Recommended Action:

Adopt a Resolution approving the submittal of the Oso Parkway/Pacific Park Drive/Glenwood Drive Regional Traffic Signal Synchronization Project to OCTA for funding under the competitive Measure M2 Regional Traffic Signal Synchronization Program (Project P).

Fiscal Impact:

If awarded, the City of Aliso Viejo will be responsible for a local match of 20%, which is estimated at $468,292. This would be funded with Measure M Fair Share Funds and would be included in the FY 2026-27 CIP budget.

Background:

In 1990, Orange County voters approved Measure M, a 20-year half-cent local transportation sales tax. Then in 2006, Orange County voters approved the renewal of the Measure M half-cent transportation sales tax, known as Measure M2, through 2041. OCTA distributes Measure M2 funds on a formula basis or through a competitive process.

Discussion:

The Regional Traffic Signal Synchronization Program (Project P) provides funds to improve traffic flow, reduce congestion, and reduce greenhouse gas emissions along key corridors and across multiple jurisdictions in Orange County. Most recently, the City received Project P funding for traffic signal synchronization along Aliso Creek Road and La Paz Road.

As part of its 2025 Call for Projects under Measure M2, OCTA accepted project applications for Project P. The application process requires that the City adopt a Resolution supporting the proposed project improvements.

The City of Aliso Viejo will serve as the lead agency in preparing and submitting the Project P application for the Oso Parkway/Pacific Park Drive/Glenwood Drive corridor. The City is partnering with the City of Laguna Niguel, City of Laguna Hills, City of Mission Viejo, County of Orange and Caltrans to prepare and submit a project application for signal synchronization along Oso Parkway/Pacific Park Drive/Glenwood Drive between Moulton Parkway the SR-241 NB On-Ramp. The total improvement cost within the City of Aliso Viejo is estimated at $2,341,468. If awarded, the City of Aliso Viejo will be responsible for a local match of 20%, which is estimated at $468,292. The total project cost across all the agencies is estimated at $3.8 Million.

This regional corridor is approximately 10.6 miles long and includes 41 signalized intersections, 24 of which are in the City of Aliso Viejo (18 are located along the main corridor and 6 are offset signals). The project includes implementation of radar vehicle detection, installation of traffic signal fiber optic communication system, cabinet upgrades, and infrastructure improvements to support a traffic management center at City Hall.

1. Resolution

RESOLUTION NO. 2025-___

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, APPROVING THE SUBMITTAL OF ONE IMPROVEMENT PROJECT TO THE ORANGE COUNTY TRANSPORTATION AUTHORITY FOR FUNDING UNDER THE COMPETITIVE MEASURE M2 REGIONAL TRANSPORTATION SIGNAL SYNCHRONIZATION PROGRAM

THE CITY COUNCIL OF THE CITY OF ALISO VIEJO HEREBY RESOLVES, DETERMINES, AND ORDERS AS FOLLOWS THAT:

WHEREAS, the Measure M2 Regional Traffic Signal Synchronization Program targets over 2000 signalized intersections across Orange County to maintain traffic signal synchronization, improve traffic flow, and reduce congestion across jurisdictions; and

WHEREAS, the City of Aliso Viejo has been declared by the Orange County Transportation Authority to meet the eligibility requirements to receive revenues as part of Measure M2; and

WHEREAS, the City of Aliso Viejo must include all projects funded by Net Revenues in the seven-year Capital Improvement Program as part of the Renewed Measure M Ordinance eligibility requirement; and

WHEREAS, the City of Aliso Viejo authorizes a formal amendment to the seven-year Capital Improvement Program to add projects approved for funding upon approval from the Orange County Transportation Authority Board of Directors, if necessary; and

WHEREAS, the City of Aliso Viejo has currently adopted a Local Signal Synchronization Plan consistent with the Regional Traffic Signal Synchronization Master Plan as a key component of local agencies' efforts to synchronizing traffic signals across local agencies' boundaries; and

WHEREAS, the City of Aliso Viejo will provide matching funds for the project as required by the Orange County Comprehensive Transportation Funding Programs Procedures Manual; and

WHEREAS, the City of Aliso Viejo will not use Renewed Measure M funds to supplant Developer Fees or other commitments; and

WHEREAS, the City of Aliso Viejo desires to implement multi-jurisdictional signal synchronization listed below.

NOW, THEREFORE, BE IT RESOLVED that the City Council of the City of Aliso Viejo hereby requests the Orange County Transportation Authority allocate funds in the amounts specified in the City's application to said City from the Regional Traffic Signal

Synchronization Program. Said funds, if approved, shall be matched by funds from said City as required and shall be used as supplemental funding to aid the City in signal synchronization along the following street(s):

1) Oso Parkway/Pacific Park Drive/Glenwood Drive between Moulton Parkway to SR-241

AGENDA ITEM

DATE: December 3, 2025

TO: Mayor and City Council

FROM: So Kim, Community Development Director

SUBJECT: GENERAL PLAN AMENDMENT GPA-2025-00002, ZONE CHANGE ZC-2025-00002, VESTING TENTATIVE TRACT MAP 19340, SITE DEVELOPMENT PERMIT SDP-2024-00001, ENVIRONMENTAL ASSESSMENT, AND DEVELOPMENT AGREEMENT AND ADOPTION OF A MITIGATED NEGATIVE DECLARATION FOR THE DEVELOPMENT OF A 61-UNIT RESIDENTIAL TOWNHOME COMMUNITY AT 95 ARGONAUT

Recommended Action:

Conduct a public hearing and:

1. Adopt a Resolution entitled: A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, ADOPTING A MITIGATED NEGATIVE DECLARATION AND A MITIGATION MONITORING AND REPORTING PROGRAM PURSUANT TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT FOR GENERAL PLAN AMENDMENT GPA-2025-00002, ZONE CHANGE ZC-2025-00002, VESTING TENTATIVE TRACT MAP 19340, AND A DEVELOPMENT AGREEMENT TO ALLOW THE DEVELOPMENT OF A 61-UNIT RESIDENTIAL TOWNHOME COMMUNITY LOCATED AT 95 ARGONAUT (APN: 623-091-01);

2. Adopt a Resolution entitled: A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, APPROVING AN AMENDMENT TO THE GENERAL PLAN LAND USE DESIGNATION AND ASSOCIATED LAND USE MAP FROM BUSINESS PARK TO HIGH DENSITY RESIDENTIAL FOR THE DEVELOPMENT OF A 61-UNIT RESIDENTIAL TOWNHOME COMMUNITY LOCATED AT 95 ARGONAUT (APN: 623-091-01);

3. Introduce for first reading an Ordinance entitled: A ORDINANCE OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, APPROVING A ZONE CHANGE FROM BUSINESS PARK 2 TO HIGH DENSITY RESIDENTIAL DISTRICT FOR THE DEVELOPMENT OF A 61-UNIT RESIDENTIAL TOWNHOME COMMUNITY LOCATED AT 95 ARGONAUT (623-091-01);

4. Adopt a Resolution entitled: A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, APPROVING VESTING TENTATIVE TRACT MAP 19340 FOR SUBDIVISION INTO CONDOMINIUM PURPOSES AND SITE DEVELOPMENT PERMIT (SDP-2024-00001) TO ALLOW THE DEVELOPMENT OF A 61-UNIT RESIDENTIAL TOWNHOME COMMUNITY LOCATED AT 95 ARGONAUT (623-091-01); and

5. Introduce for first reading an Ordinance entitled: AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, APPROVING A DEVELOPMENT AGREEMENT BETWEEN THE CITY AND MLC HOLDINGS, INC. FOR THE DEVELOPMENT OF A 61-UNIT RESIDENTIAL TOWNHOME COMMUNITY LOCATED AT 95 ARGONAUT (APN: 623-091-01).

Background:

On October 24, 2024, MLC Holdings, Inc. ("Applicant") submitted a General Plan amendment, zone change, vesting tentative tract map, site development permit, and a Development Agreement application to demolish an existing office building to accommodate the construction of a multi-family residential community at 95 Argonaut ("Project").

On November 6, 2024, the City Council held a duly noticed public review to receive and provide initial feedback on concept plans for the Project. At that meeting the City Council directed Staff to contract with a third-party consultant to negotiate terms of the Development Agreement and provide regular updates to the City Council.

On November 5, 2025, the City Council held a study session to discuss development agreements and impact fees. No action was taken.

On November 19, 2025, the City Council discussed the parameters of the public benefit contributions of the Development Agreement and continued the meeting to December 3, 2025, to allow the Applicant additional time to address easement encroachment issues with the Aliso Viejo Community Association.

Discussion:

Existing Site

The existing site measures 2.83 acres (123,275 square feet) in size, located at the southeast corner of Glenwood Drive and 95 Argonaut ("Site"). The site is developed with a two-story, 48,000 square foot office building with exterior parking areas. The site is accessed by a single entry/exit located at the interior south property line and is located within a larger business park. The General Plan land use and zoning designations for the site are Business Park and Business Park 2, respectively. Surrounding land uses are detailed in Table 1 below.

Table 1	Existing Uses
North	Attached multi-family residences, single-family residences, Glenwood Community Park
West & South	Outpatient medical, storage, light industrial, hotel, fitness studios, restaurant, research laboratories, and other offices
East	Moulton Niguel Water District, single-family residences

Proposed Project

The Applicant is proposing to redevelop the Site by demolishing the existing office building and developing a residential community consisting of 61 townhome units, which includes three units restricted to very low-income households. The Project details are provided in Table 2 below:

Table 2	Project Details
Number of Units	• 61 units spread across 8 separate buildings. Each building will consist of 7 to 8 attached units. • Two- to 4-bedroom units measuring 1,210 to 1,765 square feet in size.
Building	Three-story townhomes, measuring 38' max. height. The exterior of the building will have stucco finish, framed windows-some with faux shutters, recessed entryway, wrought iron balcony railings, hip and gable roofs with tile.
Parking	Each unit will have two enclosed private garages at ground floor level. Each garage will include additional areas for trash bins, water heater, and private storage. Driveways are not proposed. An additional 28 guest parking spaces are provided on site.
Common Space	32% (25% required) consisting of a 5,215 square foot private park (BBQ counter, shade structure, picnic tables, benches, play equipment), and approximately 35,000 square feet spread throughout the site as shared yards, walkways, and perimeter landscaping. Exterior mechanical units will be screened with landscaping.
Miscellaneous	Community will not be gated, however, the perimeter of the site will be secured with fencing and landscaped. Entrance to the site will be enhanced with paving, signage, and accent trees. Streetlights, bollards, and shade structure lighting will be designed with recessed, downward-facing light sources.
Grading	25,400 cubic yards ("CY") of grading is proposed, 14,100 CY cut and 11,300 CY fill, with a net export of 2,800 CY. The maximum depth of cut is 8' with 6' fill to level the property.
Infrastructure	New onsite water lines, sewer lines, storm drains, underground storm water facility, and fire hydrants.

Entitlements

The Project requires approval of a General Plan Amendment, Zone Change, Vesting Tentative Tract Map, Site Development Permit, and Development Agreement. Additionally, the Project qualifies for the State Density Bonus Program, and the Applicant is requesting specific waivers and concessions. Each of these components is discussed in detail below.

General Plan Amendment

The Applicant requests to change the existing office use to residential use to develop the Project. This requires an amendment to the General Plan land use designation from Business Park to High Density Residential. Pursuant to Aliso Viejo Municipal Code ("AVMC") Section 15.78.020 (General Plan Amendments), the City Council must make the following findings prior to approving the general plan amendment:

1. Public Welfare. Approval of the amendment will not create conditions materially detrimental to the public health, safety and general welfare.

   While the Site is located within a larger business park, it is at an entry corner, providing a natural transition between the non-residential uses and the surrounding residential neighborhoods. Directly across from the site to the north are established multi-family and single-family residential communities. Notably, the adjacent multi-family development shares several characteristics with the Project, including large buildings, each composed of six attached units. The architectural style is also complementary, featuring stucco exteriors, tile roofing, wrought iron balconies, recessed entryways, and shared open space without private driveways. The single-family tract homes surrounding that multi-family community are also similar in architectural style in terms of color, exterior finish, design, and materials.

   Additionally, the Site is situated in an area with established infrastructure, including roads, utilities, and public services, that can adequately support residential development. As part of the environmental assessment, the Project required comprehensive studies addressing air quality, energy, greenhouse gas emissions, biological resources, cultural resources, geotechnical conditions, hydrology and water quality, noise, and transportation impacts. As discussed further in the Environmental Assessment section below, these studies concluded that the Project would result in less-than-significant impacts with the implementation of proposed mitigation measures. The Project plans also cleared preliminary review by the Orange County Fire Authority (OCFA).

   Furthermore, the Project aligns with the City's housing goals by facilitating the development of new housing opportunities. Future construction on the Site will be subject to plan check review and inspection process to ensure full compliance with applicable building and safety standards. Therefore, this finding can be made.

2. Internal General Plan Consistency. The amendment is internally consistent with those goals, objectives, and policies of the general plan, which are not being amended.

   The proposed amendment is consistent with the goals and policies of the General Plan listed below in that it incorporates landscaping aligned with the City Council-approved plant palette, emphasizing low-water, drought-tolerant species; features building materials, colors, and architectural design that are compatible with the surrounding residential communities; includes a development impact fee that a portion of which is consistent with the City's parkland ordinance; proposes three affordable housing units restricted to very low-income households, thereby enhancing housing diversity and affordability; and introduces rezoning to facilitate residential development that includes affordable units in support of the City's housing objectives. Therefore, this finding can be made.

   In the General Plan, 'COS' refers to Conservation and Open Space policies, 'H' for Housing policies and goals, and 'LU' for Land Use policies.

   - Policy COS-1.2 Reduce the amount of water used for landscaping and increase use of native and low water plants. Maximize use of native, low-water plants for landscaping of areas adjacent to sidewalks or other impermeable surfaces.
   - Policy COS-4.2 Encourage and maintain high-quality architectural and landscaping designs that enhance or complement the community's visual character.
   - Policy COS-7.5 Ensure that new development provides park land and/or improvements at a fair share ratio, pursuant to the City's Parkland Ordinance.
   - Goal H-1: Encourage a diversity of housing types and provide affordability levels within Aliso Viejo to meet the needs of community residents.
   - Policy H-1.1 Identify sites appropriate for the development of a variety of housing types and price ranges to meet the needs of all socioeconomic segments of the community through the disbursement of affordable units in projects.
   - Policy H-1.2 Encourage through the use of density bonuses and rezoning to allow for residential development, development of affordable housing opportunities throughout the community, as well as development of housing for elderly and low- and moderate-income households near public transportation services.
   - Policy H-1.4 Ensure that a portion of future residential development is affordable to low- and very-low-income households by designating certain sites as having the potential to be used for residential uses.
   - Policy H-3.8 Review existing zoning policies and explore zoning changes to facilitate the development of affordable housing.
   - Policy LU-12.2 As a condition upon new development, require payment of park fees and/or dedication and provision of parkland, recreation facilities and/or multi-use trails that improve the public and private recreation system.

3. Land Use Compatibility. In the case of amendments to the General Plan land use policy map, the new designation is compatible with the designations on nearby properties.

   The Site is located at the edge of a larger business park and directly across from established multi-family and single-family residential neighborhoods. The adjacent multi-family development shares several characteristics with the Project, including large attached-unit buildings, stucco exteriors, tile roofing, wrought iron balconies, recessed entryways, and shared open space without private driveways. These similarities ensure architectural and functional continuity between the Project and existing residential uses. Furthermore, the transition from non-residential uses within the business park to residential neighborhoods is reinforced by the Site's location at a corner entry, creating a natural buffer. The proposed land use designation therefore complements the surrounding residential character. Therefore, this finding can be made.

4. Property Suitability. In the case of amendments to the general plan land use policy map, the new designation is suitable for the location, access, visual character and topography of the subject property.

   The property is located along established roadways with adequate vehicular and pedestrian access and is supported by existing infrastructure, including utilities and public services, sufficient to accommodate residential development. The Site is generally level, with a slight descending slope from east to west, and sits several feet below the street elevations to the north and west. Proposed grading will consist primarily of recompaction and limited export to further level the Site, resulting in finished elevations comparable to current conditions. Architecturally, the Project incorporates building styles, materials, and landscaping consistent with adjacent residential communities, ensuring visual compatibility with the surrounding neighborhood. The Site's position at the entry corner of the business park further enhances its suitability, providing a natural transition between non-residential and residential uses. Therefore, this finding can be made.

<u>Zone Change</u>

In addition to the proposed General Plan amendment, the Project requires a zoning designation change for the Site from Business Park 2 to High Density Residential. Pursuant to AVMC Section 15.78.040 (Zone Change and Prezoning), the City Council must make the following findings prior to approving the zone change. All these findings can be made as evidenced in General Plan Amendment Finding Nos. 1, 2, and 4 above.

1. Public Welfare. Approval of the zone change will not create conditions materially detrimental to the public health, safety and general welfare.

2. General Plan Consistency. The zone change is consistent with the goals, objectives, and policies of the general plan and any applicable specific plan.

3. Land Use Compatibility. The zone change is compatible with the zoning and land use on nearby properties.

4. Property Suitability. The zone change is suitable for the location, access, visual character and topography of the subject property.

Vesting Tentative Tract Map

Pursuant to the requirements of the California Subdivision Map Act (Gov. Code §§ 66410 et seq.) and Title 14 of the Aliso Viejo Municipal Code, no tentative map shall be approved unless the following findings of consistency with the General Plan and compliance with CEQA have been made.

1. The proposed map is consistent with the applicable General and Specific Plans. The Site has a General Plan land use designation of Business Park.

   The Applicant proposes a General Plan Amendment to re-designate the property for High Density Residential, which allows for residential development of 19 to 30 dwelling units per acre. The Vesting Tentative Tract Map proposes 61 multi-family homes on 2.85 acres, resulting in a density of 21.4 dwelling units per acre. As conditioned, the Vesting Tentative Tract Map will not take effect unless the General Plan Amendment, Zone Change, Site Development Permit, and Development Agreement take effect. Accordingly, the proposed map would be consistent with the applicable General Plan Land Use designation. There is no applicable Specific Plan for the Site. Therefore, this finding can be made.

2. The design or improvement of the proposed subdivision is consistent with the General and Specific Plans.

   The Project is consistent with the goals and policies of the Conservation and Open Space, Housing, and Land Use element in that the Project promotes orderly growth, provides a compatible transition between non-residential and residential uses, supports housing objectives by creating new residential opportunities, and utilizes existing infrastructure in a manner consistent with the community's long-term vision and planning framework. The Project is also subject to mitigation measures and conditions of approval that address potential impacts related to traffic, noise, air quality, and emergency access. There is no applicable Specific Plan for the Project site. Therefore, this finding can be made.

3. The site is physically suitable for the type of development.

   The Site is generally level, has adequate access from existing public streets, and is served by established infrastructure systems including water, sewer, storm drainage, and utilities. The Site's size, configuration, and surrounding land use context are appropriate to accommodate the Project consistent with applicable

zoning and General Plan designations. No unusual topographic, geologic, or environmental conditions have been identified that would render the site unsuitable for residential use. Therefore, this finding can be made.

4. The site is physically suitable for the proposed density of development.

   The Project includes a General Plan Amendment to re-designate the property to High Density Residential, which permits residential development at a range of 19 to 30 dwelling units per acre. The Vesting Tentative Tract Map proposes 61 multi-family homes on 2.85 acres, resulting in a density of approximately 21.4 dwelling units per acre. This proposed density falls within the allowable range for the High-Density Residential designation. Therefore, this finding can be made.

5. The design of the subdivision and the proposed improvements are not likely to cause substantial environmental damage or substantial and avoidable injury to fish or wildlife or their habitat.

   The Project site is currently developed with an office building, surface parking lot, and landscaping. There is no fish, wildlife, or any habitat that would be affected by the Project.

6. The design of the subdivision or type of improvements is not likely to cause serious public health problems.

   The Project will be served by existing off-site infrastructure, with new on-site water, sewer, and storm drain facilities designed to connect to and extend those systems. All facilities have adequate capacity to accommodate the proposed residential use. The subdivision design incorporates standard improvements, including paved streets, sidewalks, street lighting, and utility connections that will be constructed in compliance with applicable building codes and City engineering standards. The Initial Study prepared for the Project did not identify any conditions that would result in significant public health impacts, and all potentially significant effects have been mitigated to less-than-significant levels.

7. The design of the subdivision or the type of improvements will not conflict with existing easements, acquired by the public at large, for access through or use of property within the subdivision.

   The Project as conditioned requires the Applicant to obtain easement holders' authorization for any improvements or encroachments prior to building permit issuance.

Site Development Permit

The purpose of a site development permit ("SDP") is to ensure that new development conforms to the development and design provisions of the AVMC, including but not

limited to permitted uses, development standards, and supplemental regulations. Pursuant to AVMC Section 15.74.020 (Site Development Permits), the City Council must make the following findings prior to approving the SDP:

1. Consistency with General Plan. The Project is consistent with the general plan and any applicable specific plan.

   The Project includes a General Plan Amendment ("GPA"). As detailed in the preceding GPA section, all required findings to support the amendment can be made.

2. Consistency with Zoning Code. The land use and associated development conform to the permitted use provisions and development standards of this zoning code and is consistent with this code and any applicable specific plan.

   The proposed zone change to High Density Residential, together with the associated development, is compatible with surrounding land uses, providing a transition that complements the existing neighborhood character. The property is suitable for residential use based on its location, access, visual character, and topography, and existing infrastructure is adequate to support the proposed development. The Project incorporates reduced perimeter setbacks for buildings, landscaping, and mechanical equipment, which are expressly permitted as incentives under California's State Density Bonus Law (Government Code §65915). This law requires cities to grant certain concessions and waivers or relaxed development standards when a project includes a qualifying percentage of affordable housing units. Because the Project meets the threshold of 5% for very low-income households, it is eligible for the setback reductions the building setbacks, landscaping setbacks, and mechanical equipment placement in front yard setbacks.

   In addition, the Project qualifies for a reduced parking ratio under the State Density Bonus Law. Based on this ratio, a total of 112 parking spaces is required for the Project. The law does not prescribe how these spaces must be allocated between private resident parking and guest parking; rather, the distribution is left to the Applicant. In this case, the Applicant is proposing 150 parking spaces, consisting of 122 private residential spaces and 28 guest spaces. Although the City does not permit tandem parking, and tandem stalls must therefore be counted as a single space, the Project would still provide a total of 117 spaces (89 private and 28 guest), which exceeds the required 112 spaces.

   With these provisions, the Project conforms to the permitted use requirements and development standards of the zoning code and remains consistent with all applicable Specific Plan regulations. Therefore, this finding can be made.

3. Compliance with CEQA. Processing and approval of the permit application are in compliance with the requirements of the California Environmental Quality Act. This finding can be made as evidenced in the Environmental Analysis below.

4. Architectural Design. The architectural design of the Project, including but not limited to the architectural style, scale, building mass, materials, colors, architectural details, and roof style, is compatible with surrounding development.

   Directly north of the site are established multi-family and single-family residential communities. The adjacent multi-family development, in particular, shares several defining characteristics with the Project, including similarly scaled buildings composed of six attached units. The architectural style is complementary, featuring stucco exteriors, tile roofing, wrought iron balconies, recessed entryways, and communal open space without private driveways. The surrounding single-family tract homes also reflect a consistent architectural design, with comparable color palettes, exterior finishes, and material selections. The Project further enhances this compatibility through the inclusion of framed windows, some accented with faux shutters, as well as a mix of hip and gable roof forms, which reflects the roof styles found in nearby residences. Collectively, these design elements ensure compatibility with the surrounding development and this finding can be made.

5. Site Design. The site design of the Project, including but not limited to project entries, interior circulation, pedestrian and bicycle access, pedestrian amenities, screening of equipment and trash enclosures, exterior lighting, and other site design elements, is compatible with surrounding development.

   Based on the analysis provided in the Initial Study and supporting documentation, the Project will retain the existing single-entry driveway at the southern end of the site along Argonaut. The internal private roadway system designed to provide two-way access to residential garages and guest parking spaces, emergency access, hydrant placement has been reviewed and conceptually approved by both the Building Division and the OCFA. Each unit will include an enclosed private garage with dedicated space for trash bin storage. Approximately 32% of the site will be dedicated to open space, including a private park, shared yards, pedestrian walkways, and perimeter landscaping. Perimeter fencing and exterior mechanical equipment will be screened with additional landscaping, and the site entrance will be enhanced with decorative paving, signage, and accent trees. Lighting throughout the site, including streetlights, bollards, and shade structures, will be designed with recessed, downward-facing fixtures to minimize light spill. These design elements are compatible with surrounding residential communities, and the required finding can be made.

6. Landscape Design. Project landscaping, including but not limited to the location, type, size, color, texture, and coverage of plant materials, has been designed so as to provide visual relief, complement buildings, visually emphasize prominent design elements and vistas, screen undesirable views, provide a harmonious

transition between adjacent land uses and between development and open space, and provide an overall unifying influence to enhance the visual continuity of the Project.

The Project incorporates a landscape plan that enhances the overall visual continuity of the site and complements the architectural character of the development. Approximately 32% of the site is dedicated to open space, which includes a private park featuring a BBQ counter, shade structure, picnic tables, benches, and play equipment. In addition, approximately 35,000 square feet of shared yards, pedestrian walkways, and perimeter landscaping are distributed throughout the site to provide visual relief and promote connectivity. Landscaping is also proposed around the exterior mechanical equipment and perimeter fencing to screen undesirable views. The site entrance is designed to create a welcoming and visually prominent focal point, enhanced with decorative paving, signage, and accent trees. The plant palette aligns with the City Council-approved plant palette, emphasizing low-water, drought-tolerant species. Therefore, this finding can be made.

Development Agreement

This Project requires a land use and zoning change from office to residential, which requires a Development Agreement ("DA") to ensure the Project is implemented as approved, minimize potential adverse impacts, and secure long-term community benefits. Under the DA (Attachment 5, Exhibit A), the Applicant has agreed to pay a one-time public impact fee of $1,038,652, consisting of $213,850 for fiscal impacts and $824,802 for park in-lieu fees. Full payment must be made to the City prior to the issuance of any building permit, and no permit will be issued until the City has received the payment and confirmed compliance with all applicable fee requirements.

Pursuant to AVMC 15.82.010 (Development Agreements and Other Actions), the City Council must make the following findings prior to approving the DA:

1. Public Welfare. Approval of the development agreement will not create conditions materially detrimental to the public health, safety and general welfare.

   The Project is consistent with the policies and regulations of the proposed High-Density Residential zoning district. The DA includes provisions to ensure compliance with applicable land use regulations, defines the scope of the Project, and identifies the public benefit obligations of the Applicant. The Project is compatible with adjacent multi-family and single-family communities in terms of layout, architectural style, materials, and open space; the site is served by existing infrastructure, including roads, utilities, and public services sufficient to support residential development; that the environmental assessment determined impacts would be less than significant with mitigation; the Project advances the City's housing goals by creating new housing opportunities; and future construction will

be subject to plan check review and inspection to ensure compliance with all applicable building and safety standards. Therefore, this finding can be made.

2. General Plan Consistency. The development agreement is consistent with the goals, objectives, and policies of the general plan and any applicable specific plan.

   The Project is consistent with the goals and policies of the Conservation and Open Space, Housing, and Land Use elements in that the Project promotes orderly growth, provides a compatible transition between non-residential and residential uses, supports housing objectives by creating new residential opportunities, and utilizes existing infrastructure in a manner consistent with the community's long-term vision and planning framework. The Project is also subject to mitigation measures and conditions of approval that address potential impacts related to traffic, noise, air quality, and emergency access. The A incorporates, among other provisions, the scope of the Project, compliance with governing regulations, and the Applicant's public benefit obligations, ensuring that this finding can be made.

Environmental:

Pursuant to the California Environmental Quality Act ("CEQA") and the State CEQA Guidelines, the City prepared an Initial Study/Mitigated Negative Declaration ("IS/MND") to evaluate the potential environmental impacts of the proposed Project. The analysis concluded that the Project could result in potentially significant environmental impacts; however, all such impacts can be reduced to less-than-significant levels through the implementation of mitigation measures. As a result, the City also prepared a Mitigation Monitoring and Reporting Program ("MMRP") in compliance with CEQA.

The IS/MND was circulated for a 20-day public review period, from October 2 to October 22, 2025. Distribution included the State Clearinghouse, required public agencies, property owners within a 300-foot radius of the Project site, and interested parties. One comment was received from the California Department of Toxic Substances Control (DTSC) (Attachment 1, Exhibit C), recommending that all imported soil and fill material be tested for contaminants, that any identified contaminants be addressed, and that the DTSC fact sheet on imported fill be referenced. Although the Applicant's geotechnical report concludes that the existing fill materials are suitable for reuse, DTSC's recommendations have been incorporated as conditions of project approval (Attachment 4, Exhibit A).

The IS/MND determined that the Project would not result in significant impacts to aesthetics, agricultural and forestry resources, air quality, energy, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, transportation, utilities and service systems, or wildfire. However, it identified potentially significant impacts to biological resources, cultural resources, tribal cultural resources, and geology and soils. With the implementation of mitigation measures, these impacts would be reduced to less than significant levels. The mitigation measures are detailed in

the Mitigation Monitoring and Reporting Program (MMRP) (Attachment 1, Exhibit B) and have been incorporated into the Conditions of Approval (Attachment 4, Exhibit A) for the Project.

City Staff recommends that the City Council adopt the IS/MND and MMRP based on the findings set forth in the accompanying resolution. If the Project is approved, a Notice of Determination must be filed with the County Clerk and the State Clearinghouse within five working days of approval.

RESOLUTION NO. 2025-___

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF ALISO VIEJO, CALIFORNIA, ADOPTING A MITIGATED NEGATIVE DECLARATION AND A MITIGATION MONITORING AND REPORTING PROGRAM PURSUANT TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT FOR GENERAL PLAN AMENDMENT GPA-2025-00002, ZONE CHANGE ZC-2025-00002, VESTING TENTATIVE TRACT MAP 19340, AND A DEVELOPMENT AGREEMENT TO ALLOW THE DEVELOPMENT OF A 61-UNIT RESIDENTIAL TOWNHOME COMMUNITY LOCATED AT 95 ARGONAUT (APN: 623-091-01).

WHEREAS, on October 24, 2024, MLC Holdings, Inc. ("Applicant") submitted a general plan amendment, zone change, vesting tentative tract map, site development permit, and a development agreement application to demolish an existing office building to accommodate the construction of a multi-family residential community at 95 Argonaut ("Project");

WHEREAS, pursuant to the California Environmental Quality Act (Public Resources Code, § 21000 et seq.) and the State CEQA Guidelines (California Code of Regulations, title 14, § 15000 et seq.) (Collectively, "CEQA"), the City is the lead agency for the proposed of the Project;

WHEREAS, in accordance with State CEQA Guidelines section 15063, the City prepared an Initial Study to analyze whether the proposed Project may cause a potentially significant effect on the environment;

WHEREAS, based on the information contained in the Initial Study, which concluded that the proposed Project could have potentially significant impacts but that those impacts could be reduced to less than significant levels with implementation of proposed mitigation measures, the City determined that a Mitigated Negative Declaration ("MND") should be prepared for the proposed Project;

WHEREAS, the Initial Study/Mitigated Negative Declaration (IS/MND) (State Clearinghouse Number [SCH] 2025100301) was prepared pursuant to CEQA and the State CEQA Guidelines;

WHEREAS, pursuant to CEQA, the City prepared a program for reporting on or monitoring the changes which it has either required in the proposed Project or made a condition of approval to mitigate or avoid potential significant environmental effects (the "Mitigation Monitoring and Reporting Program" or "MMRP");

WHEREAS, in accordance with State CEQA Guidelines sections 15072 and 17073, the IS/MND was circulated for public review from October 2 to October 22, 2025;

WHEREAS, the City received one comment from the California Department of Toxic Substances Control, which the City has reviewed and responded to;

WHEREAS, the City has reviewed the final IS/MND, and relevant information contained in the record regarding the Project, and determined that all legal prerequisites to the adoption of the resolution have been met;

WHEREAS, on October 30, 2025, the City gave public notice of the City Council public hearing for consideration of a Mitigated Negative Declaration, General Plan Amendment GPA-2025-00002, Zone Change ZC-2025-00002, Vesting Tentative Tract Map 19340 and Site Development Permit SDP-2024-00001, for the Project by advertising in a newspaper of general circulation; by posting notices at City Hall and the Project site; and by mailing notices to owners of property within 300 feet, to the project applicant, and to local agencies that provide water, sewage, electricity and schools;

WHEREAS, on December 3, 2025, the City Council held a public hearing as prescribed by law and considered written and verbal public testimony that was submitted prior to the hearing and during the hearing, and evidence and recommendations presented by staff in the agenda report and oral presentation.

WHEREAS, no comments made in the public hearing conducted by the City, and no additional information submitted to the City, have resulted in substantial new information requiring substantial revisions that would trigger recirculation of the IS/MND or additional environmental review of the proposed Project under State CEQA Guidelines section 15073.5; and

WHEREAS, all other legal prerequisites to the adoption of this Resolution have occurred.

NOW, THEREFORE, BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF ALISO VIEJO AS FOLLOWS:

Section 1. **Incorporation of Recitals.** The City Council hereby finds and determines that all of the recitals set forth above are true and correct. The above recitals are hereby incorporated as substantive findings of this Resolution.

Section 2: **Compliance with CEQA.** The City Council has reviewed and considered the information contained in the IS/MND, comments received, and other documents contained in the administrative record for the Project. The City Council finds that the IS/MND has been completed in compliance with CEQA, the State CEQA Guidelines, and the City's Local CEQA Guidelines.

Section 3. **Findings.** Based on the whole record before it, including the IS/MND, the administrative record and all other written and oral evidence presented to the City Council, the City Council finds that all environmental impacts of the Project are either less than significant or can be mitigated to less than significant levels with the mitigation measures outlined in the IS/MND, and the Mitigation Monitoring and Reporting

Program. The City Council finds that there is no substantial evidence in the administrative record supporting a fair argument that the Project may result in any significant environmental impact. The City Council finds that the IS/MND contains complete, objective, and accurate reporting of the environmental impacts associated with the Project and reflects the independent judgment and analysis of the City.

Section 4. **Adoption of The Mitigated Negative Declaration**. The City hereby approves and adopts the IS/MND, which is hereby attached to this Resolution as Exhibit "A".

Section 5. **Adoption of The Mitigation Monitoring And Reporting Program.** The City hereby adopts the MMRP, which is hereby attached to this Resolution as Exhibit "B". In the event of any inconsistencies between the mitigation measures as set forth in the IS/MND and the MMRP, the MMRP shall control.

Section 6. **Notice of Determination**. The City directs Staff to prepare, execute, and file a Notice of Determination with the County Clerk and the State Clearinghouse within five (5) working days of the passage and adoption of this Resolution.

Section 7: **Location of Documents.** The administrative record for the Project is maintained at City Hall located at 12 Journey, Suite 100, Aliso Viejo, CA 92656. The custodian of records is the City Clerk.

Section 8. **Execution of Resolution**. The Mayor shall sign this Resolution and the City Clerk shall attest and certify to the passage and adoption thereof.

PASSED, APPROVED AND ADOPTED this 3rd day of December 2025.

1 - PROJECT DESCRIPTION

1.1 - Purpose

The purpose of this Draft Initial Study/Mitigated Negative Declaration (Draft IS/MND) is to identify any potential environmental impacts that would result from implementation of the 95 Argonaut Residential Project (proposed project) in the City of Aliso Viejo (City), in Orange County (County), California. Pursuant to California Environmental Quality Act (CEQA) Guidelines Section 15367, the City has discretionary authority over the proposed project and is the Lead Agency in the preparation of this Draft IS/MND and any additional environmental documentation required for the proposed project.

The remainder of this section provides a brief description of the project location and the primary project characteristics. Section 2 includes an environmental checklist that provides an overview of the potential impacts that may result from project implementation, elaborates on the information contained in the environmental checklist, and provides justification for each checklist response. Feasible mitigation measures are analyzed to reduce all impacts to below a level of significance. Section 3 contains the List of Preparers.

1.2 - Project Location

The project site is located at 95 Argonaut, in the City of Aliso Viejo, in Orange County, California (Exhibit 1). The approximately 2.83-acre project site consists of one parcel (Assessor's Parcel Number [APN] 623-091-01). As shown in Exhibit 1, the project site is in the northern portion of the City. Regional access to the project site is from Interstate 5 (I-5) via the El Toro Road exit and from State Route (SR) 73 via the Glenwood Drive exit.

1.3 - Environmental Setting

1.3.1 - Land Use Designation and Zoning

The project site is currently developed with an office building and a paved surface parking lot surrounding the building (Exhibit 2). The office building is approximately 24,879 square feet and 37 feet tall and is currently occupied by one tenant for general office uses. The project site is flat, and vehicular access is currently provided from a driveway along the southern boundary of the site.

The City of Aliso Viejo General Plan (General Plan) designates the project site as Business Park (Exhibit 3).[1] The proposed project applicant requests a General Plan Amendment (GPA) to change the General Plan land use designation from Business Park to High Density Residential (HDR). The

[1] City of Aliso Viejo. 2004. City of Aliso Viejo General Plan, Land Use Element, Land Use Policy Map, Figure LU-1. Website: http://avcity.org/DocumentCenter/View/397/Land-Use-Policy-Map-PDF. Accessed December 6, 2024.

HDR land use designation is intended to provide residential development with a density between 18 and 30 dwelling units per gross acre, with an average density of 20 units per gross acre.[2]

The project site is currently zoned Business Park-2 (Exhibit 4). The proposed project applicant requests a rezone to change the zoning designation from Business Park-2 to RH Residential–High Density District. The RH Residential–High Density zoning district is intended to provide for the development and preservation of high-density neighborhoods consisting of attached and multiple dwelling units such as townhomes, apartments, condominiums, and senior housing. The required minimum lot size is 5,000 square feet and the maximum density allowed is 30 dwelling units per gross acre.[3]

1.3.2 - Surrounding Land Uses

North Land designated Very High Density Residential, Glenwood Drive, single-family homes and townhomes

South Land designated Business Park, Argonaut, office buildings

East Land designated Community Facilities, Moulton Niguel Water District (MNWD) water storage facility

West Land designated Business Park, Argonaut, office buildings

1.4 - Proposed Project

MLC Holdings, LLC (applicant) proposes to demolish the existing approximately 48,000-square-foot 2-story office building, the existing parking lot, and landscaping and develop a new residential infill community consisting of a total of up to 61 3-story townhomes between eight buildings. The townhomes would range in size from approximately 1,210 to 1,765 square feet and would offer an array of two-, three-, and four-bedroom units (Exhibit 5). The townhomes would be a maximum height of 38 feet and would have a total building site area of 123,275 square feet.

The proposed project would include private roadways and parking, pedestrian walkways, landscaping, and a recreational amenity area. The proposed project's density would be 21.6 dwelling units per acre (du/acre), which would comply with the maximum density allowed by the HDR land use designation (30 du/acre). The proposed project would also include 5 percent deed restricted affordable homes (three very-low-income homes), and the applicant seeks certain concessions and waivers pursuant the State's Density Bonus Law, including reduced parking, reduced setbacks, and increased retaining wall heights.

[2] City of Aliso Viejo. 2004. City of Aliso Viejo General Plan, Land Use Element. Website: https://avcity.org/DocumentCenter/View/391/Land-Use-Element-PDF. Accessed December 6, 2024.

[3] City of Aliso Viejo. 2024. City of Aliso Viejo Municipal Code. Website: https://www.codepublishing.com/CA/AlisoViejo/#!/AlisoViejo15/AlisoViejo1510.html#15.10. Accessed December 6, 2024.

Townhomes would have a Spanish Eclectic architectural style which includes Spanish characteristics such as covered arched entry ways, window shutters, covered balconies and gable roof accents. These architectural details emulate the adjacent residential community to the north. Three different building types, a 6-plex, a 7-plex, and an 8-plex building, each include their own color scheme to create variety within the community. The color schemes include terracotta colored roof tiles, with trim accents of an earth tone palette such as browns, reds, and blues.

Parking and Circulation

Vehicles would access the project site via a proposed driveway at the south of the project site along Argonaut. An internal private roadway system would provide two-way access to each unit's parking garage as well as to guest parking spaces that would be distributed throughout the site. The proposed project has been designed such that emergency service providers would be able to access the site from any of the public streets or the drive aisles, with a minimum of 150 feet of hose pull to cover the entirety of each building. Pedestrians would circulate within the site via proposed internal pedestrian walkways and sidewalks.

Pursuant to the concessions being sought through the State Density Bonus Law, the proposed project has been designed to meet the Reduced Parking Ratios set forth in Municipal Code Section 15.38.120. The proposed project would have 155 on-site parking spaces, consisting of 122 spaces within garages (2 per unit) and 26 guest spaces. The proposed parking spaces would exceed the parking ratio requirement of 115.5 total parking spaces in accordance with the State Density Bonus Law.

Open Space and Landscaping

The Municipal Code requires open space equal to 25 percent of the total site area (30,819 square feet).[4] The proposed project would provide 40,259.9 square feet of open space area. The proposed project would be required to include a minimum 25 percent of the total site area of open space (30,819 square feet). The proposed project would exceed the required minimum amount of open space. The proposed project would include 5,587.4 square feet of usable open space and 34,672.5 square feet of other type of open space. Additionally, the proposed project design includes amenities such as decorative walkways, gathering spaces with electric barbeques, open lawn area for free-play, and a tot lot (Exhibit 6). The proposed project would include landscaping derived from the City's Landscape Plant Palette for low water plants.

Infrastructure and Utilities

Water service is currently provided by MNWD. The proposed project would connect to an existing 10-inch domestic water line within Argonaut and would extend one existing 8-inch line into the site through the internal drive aisles. An existing 6-inch domestic water line would be capped.

[4] The project site is 2.83 acres in size (123,274 square feet). Twenty-five percent of the total site is therefore 30,819 square feet.

Wastewater is collected via the MNWD's wastewater collection system and is sent to the Regional Treatment Plant operated by the South Orange County Wastewater Authority (SOCWA). The proposed project would include the installation of an 8-inch system within the project site that would connect to an existing 8-inch sewer line in Argonaut.

The proposed project would passively treat stormwater via an on-site underground modular wetland system (MWS). Stormwater would flow from the underground MWS through a proposed 18-inch private storm drain pipe to a proposed 18-inch public storm drain pipe before it enters the municipal storm drain within Argonaut.

Additionally, the proposed project would include a total of three new fire hydrants on the eastern, western, and southern portions of the project site and would connect to existing water lines.

Construction

The applicant anticipates that construction of the proposed project would begin in Quarter 1 of 2026, with the community opening for sales in Quarter 3 of 2027; construction is estimated to be completed at the end of Quarter 4 of 2027. It is anticipated that project construction would require 16,500 cubic yards (cy) of cut and 14,100 cy of fill, with 2,400 cy of export soil.

1.5 - Required Discretionary Approvals

As mentioned previously, the City of Aliso Viejo has discretionary authority over the proposed project and is the CEQA Lead Agency for the preparation of this Draft IS/MND. In order to implement the proposed project, the applicant would need to secure the following permits/approvals:

- **General Plan Amendment** to change the land use designation from Business Park to HDR (density of up to 30 du/acre).
- **Rezone** to change the zoning from Business Park-2 to RH Residential–High Density zone (density of up to 30 du/acre).
- **Waiver of local standards pursuant to State Density Bonus Law** to allow for reduced parking and concessions and waivers for setbacks and retaining wall height.
- **Tentative Tract Map (TTM)** for construction of up to 61 for-sale residential townhomes.
- **Site Development Permit** for building construction.

1.6 - Intended Uses of This Document

This Draft IS/MND has been prepared to determine the appropriate scope and level of detail required in completing the environmental analysis for the proposed project. This document will also serve as a basis for soliciting comments and input from members of the public and public agencies regarding the proposed project.

The Draft IS/MND will be circulated for a minimum of 20 days, during which comments concerning the analysis contained in the Draft IS/MND should be sent to:

2 - ENVIRONMENTAL CHECKLIST AND ENVIRONMENTAL EVALUATION

Environmental Factors Potentially Affected					
The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.					
☐	Aesthetics	☐	Agriculture and Forestry Resources	☐	Air Quality
☒	Biological Resources	☒	Cultural Resources and Tribal Cultural Resources	☐	Energy
☒	Geology and Soils	☐	Greenhouse Gas Emissions	☐	Hazards and Hazardous Materials
☐	Hydrology and Water Quality	☐	Land Use and Planning	☐	Mineral Resources
☐	Noise	☐	Population and Housing	☐	Public Services
☐	Recreation	☐	Transportation	☒	Mandatory Findings of Significance
☐	Utilities and Services Systems	☐	Wildfire		

Environmental Determination

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measure based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Date: _____ Signed: _____

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.1 Aesthetics *Except as provided in Public Resources Code Section 21099, would the project:*				
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☒
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic building within a State Scenic Highway?	☐	☐	☐	☒
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☐	☒
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐

Environmental Evaluation

Setting

The General Plan Conservation/Open Space Element identifies the hillsides, ridgelines, canyons, and view corridors as the primary aesthetic resources in the City. Canyon views and scenic highways are examples of scenic qualities, as defined by the General Plan, benefiting the community. Architectural and landscaping design guidelines complement the natural setting, enhancing the City's unique visual character.[5] Public and private portions of the City bordering the Aliso and Woods Canyons are situated with highly valued viewsheds or scenic overlooks of the canyons. In addition, several City roadways have been designated by the County of Orange Master Plan of Scenic Highways as having scenic qualities worth preserving. These roadways are classified as Viewscape Corridors or

[5] City of Aliso Viejo. 2004. Alisa Viejo General Plan, Conservation/Open Space Element. Website: https://avcity.org/DocumentCenter/View/394/Conservation--Open-Space-Element-PDF. Accessed December 2, 2024.

Landscape Corridors.[6] Additional scenic amenities such as golf courses also provide visual relief from the built environment and are important visual amenities and landmarks.

The project site is relatively flat and is currently developed with a 2-story office building. Surrounding uses include other commercial uses and residential uses, as well as Glenwood Community Park to the north across Glenwood Drive. As such, the project site's existing visual character is a combination of urban and suburban uses. Views from the project site are primarily of surrounding infrastructure and landscaping, as well as surrounding roadways and parking lots. Distant views of hillsides to the east are visible from Glenwood Community Park and from Glenwood Drive but are not visible from the project site.

Existing sources of light and glare include streetlights and lighting on the interiors and exteriors of existing and surrounding buildings, limited amounts of lighting from the gazebo and pathway lights from Glenwood Community Park, as well as vehicle headlights and traffic signals. Landscaping along both sides of Glenwood Drive and Argonaut Drive, as well as the Glenwood Community Park and residential landscaping north of the project site, provide shielding from light and glare.

Would the project:

a) Have a substantial adverse effect on a scenic vista?

No impact. The City does not designate any specific scenic vistas; however, it identifies hillsides, ridgelines, canyons, canyon views, and view corridors as the primary aesthetic resources in the City and states that the Aliso and Woods Canyons have viewsheds or scenic overlooks of the canyons. The project site is in northern portion of the City, 1.56 miles east of the hillside and canyon area. Because of the distance and intervening development and topography, the project site cannot be seen from the hillsides and canyon areas or from the Aliso Viejo Country Club.

General Plan Policy COS-4.1 aims to protect scenic landform features such as hillsides, ridgelines, canyons, and view corridors through designation of key areas as open space and use of other land use planning tools. Because of intervening development, there are no scenic views of the natural slopes from the project site or the surrounding area. Therefore, the proposed project would not impede or obscure any views and would not affect public views of any scenic vistas. Furthermore, no hillsides or ridgelines are visible from the project site and the proposed project does not have the potential to obstruct views of hillsides from Glenwood Community Park or Glenwood Drive. As such, the proposed project would not obstruct any publicly available views and no impact would occur.

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic building within a State Scenic Highway?

No impact. The nearest designated State Scenic Highway is SR-91, approximately 18.40 miles north of the project site. A portion of SR-1, approximately 5.15 miles southwest of the project site, is

[6] City of Aliso Viejo. 2004. Alisa Viejo General Plan, Conservation/Open Space Element. Website: https://avcity.org/DocumentCenter/View/394/Conservation--Open-Space-Element-PDF. Accessed December 2, 2024.

identified as being eligible for listing.[7] Because of the project site's distance from this section of SR-1 and from SR-91, as well as intervening development, the project site is not visible from SR-1 or SR-91.

General Plan Figure COS-1–Conservation/Open Space Policy Map shows the locations of viewscape corridors and landscape corridors. As shown on the map, no viewscape corridors or landscape corridors exist on or adjacent to the project site. The nearest landscape corridor is Aliso Creek Road, located 1,055 feet (0.2 mile) west of the project site. Because of intervening development, Aliso Creek Road is not visible from the project site.

The project site is developed with commercial business uses, and there are no scenic resources such as trees, rock outcroppings, or historic buildings on-site or near the project site. The nearest golf course is Aliso Viejo Country Club, located 0.15 mile north of the project site. The golf course is not visible from the project site due to intervening development. Additionally, no unique visual resources or historic structures are located on or near the project site. Therefore, no impact would occur to scenic or historic resources or a State Scenic Highway.

c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

No impact. The project site is located in an urbanized area and is currently developed with an existing office building and parking lot. As such, this discussion focuses on zoning and other regulations governing scenic quality. The General Plan and Zoning Ordinance define the permitted land uses and the corresponding development standards within the City. The project site currently has a General Plan Land Use Designation of Business Park. The proposed project would require a GPA to amend the land use designation from Business Park to HDR. The proposed project would be consistent with the HDR land use designation's maximum density of 30 du/acre.

The project site is currently zoned as Business Park-2. The proposed project would require a rezone to amend the zoning of Business Park-2 to RH Residential–High Density. The RH Residential–High Density Zone is intended to provide for the development and preservation of high-density neighborhoods consisting primarily of attached and multiple dwelling units such as townhomes, apartments, condominiums, and senior housing. Additionally, the RH Residential–High Density Zone allows for a maximum density of 30 units per gross acre.[8] In conjunction with the proposed General

[7] California Department of Transportation (Caltrans). 2024. State System Highway Map. Website: https://caltrans.maps.arcgis.com/apps/webappviewer/index.html?id=465dfd3d807c46cc8e8057116f1aacaa. Accessed December 2, 2024.

[8] City of Aliso Viejo. 2024. City of Aliso Viejo Municipal Code. Website: https://www.codepublishing.com/CA/AlisoViejo/#!/AlisoViejo15/AlisoViejo1510.html#15.10. Accessed January 15, 2025.

Plan Amendment to HDR, pursuant to the RH Residential–High Density Zoning District the proposed project would be subject to the RH Residential–High Density Zoning development standards.

The proposed project would comply with all Aliso Viejo Municipal Code requirements related to scenic quality, such as Chapter 15.62, which sets out design standards for development within the City and subjects the proposed project to a development review process to ensure the project design is consistent with adopted design guidelines. Additionally, the proposed project would not conflict with any General Plan policies related to scenic quality, including General Plan Policy COS-4.1 and Policy COS-4.2, which protect scenic landforms such as hillsides, ridgelines, and canyons and encourage high-quality architectural and landscaping design. The proposed project would be located on a previously developed site and would not impact any scenic landforms. Additionally, the proposed project would include townhomes with a Spanish Eclectic architectural style, which would be subject to design review as required by Chapter 15.62 of the City's Municipal Code. As such, the proposed project would not conflict with applicable zoning and other regulations pertaining to scenic quality, and no impacts would occur.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less than significant impact. The project site is currently developed and located in an urbanized area with existing light sources, which include streetlights and lighting on the interiors and exteriors of existing and surrounding buildings, as well as vehicle headlights and traffic signals. The existing building on-site contains sources of light and glare, including indoor and outdoor lighting, reflective surfaces, and headlights from vehicles in the parking lot.

The proposed project would generate lighting from two primary sources: lighting from the building interiors that would pass through windows and lighting from exterior sources (e.g., street lighting, parking area lighting, building illumination, security lighting, and landscape lighting). The proposed lighting would be typical of residential developments. The proposed development would replace current existing sources of light and glare with new high-quality development and lighting. The proposed project would include four types of lighting fixtures: streetlights, pedestrian lights, bollard lights, and downlights. The proposed project's lighting would be similar to existing residential development in the area and would not substantially increase sources of light as compared to the existing uses on the project site.

No nighttime construction is proposed, and construction activities would be subject to regulations set forth by the City's Building and Safety Department, which restricts construction activities to between the hours of 7:00 a.m. and 8:00 p.m.[9] Therefore, the proposed project would not require construction lighting, except security and safety lighting.

The City's Building and Safety Department would review any proposed lighting to ensure conformance with the California Building Standards Code (CBC), Title 24, as well as the California

[9] City of Aliso Viejo. 2024. Building & Safety. Website: https://avcity.org/154/Building-Safety. Accessed December 2, 2024.

Green Building Standards Code (CALGreen) (California Code of Regulations [CCR] Title 24, Part 11).. The photometric plan prepared for the proposed project demonstrates that project lighting would not result in light spillage outside of the project boundaries or impact sensitive uses. Although the proposed project would replace existing structures with new buildings that would introduce new light sources, the surrounding area is urban and already illuminated and the proposed lighting conditions would be similar to those currently used on the project site and surrounding the project site. The proposed project would also incorporate the Aliso Viejo Municipal Code, CBC, and CALGreen.

Sunlight or artificial light reflecting from finished surfaces such as window glass or other reflective materials can cause reflected light (glare). Buildings constructed of highly reflective materials from which the sun reflects at a low angle commonly cause adverse glare. The proposed project does not propose use of materials known to cause glare, such as mirrored/reflective glass. Furthermore, the proposed project's lighting would be similar to the existing residential uses in the area and would not substantially increase sources of light as compared to the existing uses on the site. Additionally, the proposed retaining wall and landscaping around the perimeter of the project site, combined with existing landscaping in the area, would help shield adjacent residential areas from sources of light and glare. Therefore, impacts would be less than significant.

Mitigation Measures

None required.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.2 Agriculture and Forestry Resources *In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the State's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.* *Would the project:*				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act Contract?	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to nonagricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

Environmental Evaluation

Setting

The General Plan currently designates the project site Business Park (Exhibit 3). The proposed project requests a GPA to change the General Plan land use designation from Business Park to HDR. The HDR land use designation is intended for residential uses and does not include agricultural or forestry uses.

The project site is currently zoned Business Park-2 (Exhibit 4). The proposed project requests a rezone to change the zoning designation from Business Park-2 to RH Residential–High Density District. The RH Residential–High Density zoning district is intended to provide for residential uses and does not include agriculture or forestry uses.

The project site is mapped as Urban and Built-up Land by the California Department of Conservation Farmland Mapping and Monitoring Program (FMMP). Urban and Built-up Land is a nonagricultural land use designation.[10] The project site was historically used as agricultural land from at least 1938 until 1981. By 1989, a commercial office building was developed on the project site.[11]

Would the project:

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?

No impact. The project site is mapped as "Urban and Built-Up Land" by the California Department of Conservation FMMP, which is a nonagricultural land use designation. There is no Prime Farmland, Unique Farmland, or Farmland of Statewide Importance on or near the project site. The nearest designated farmland is Prime Farmland and Unique Farmland located 2.64 miles north of the project site.[12] Additionally, the General Plan does not designate the site as agricultural or forest land, and the project site is not in active agricultural use. These conditions preclude the possibility of the conversion of farmland to nonagricultural use. No impacts would occur.

b) Conflict with existing zoning for agricultural use, or a Williamson Act Contract?

No impact. The proposed project requests a rezone to change the zoning designation from Business Park-2 to RH Residential–High Density District and is therefore not zoned for agricultural uses. The project site is currently developed with an office building and parking lot and does not support agricultural land use activities and, therefore, is not eligible for a Williamson Act Contract. This

[10] California Department of Conservation. 2025. California Important Farmland Finder. Website: https://maps.conservation.ca.gov/dlrp/ciff/. Accessed January 15, 2025.

[11] Hillman Consulting LLC. 2024. Phase I Environmental Site Assessment (Phase I ESA). April.

[12] California Department of Conservation. 2025. California Important Farmland Finder. Website: https://maps.conservation.ca.gov/dlrp/ciff/. Accessed January 15, 2025.

condition precludes the possibility of conflicts with agricultural zoning or Williamson Act Contracts. No impacts would occur.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?

No impact. The proposed project requests a rezone to change the zoning designation from Business Park-2 to RH Residential–High Density District; both are non-forest zoning districts. This condition precludes the possibility of conflicts with forest zoning. No impacts would occur.

d) Result in the loss of forest land or conversion of forest land to non-forest use?

No impact. The project site is mapped as "Urban and Built-Up Land" by the California Department of Conservation FMMP. The project site is currently developed with an office building and parking lot and does not contain forestland, timberland, or timberland zoned Timberland Production as defined by California Public Resources Code Section 51104(g). This condition precludes the possibility of the conversion of forest land to non-forest use. No impacts would occur.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to nonagricultural use or conversion of forest land to non-forest use?

No impact. The project site and surrounding area are mapped as "Urban and Built-Up Land" by the California Department of Conservation FMMP. The project site is not located on or near land used for farmland or agriculture. This condition precludes the possibility of the proposed project creating pressures to convert farmland to nonagricultural use or forest land to non-forest use. No impacts would occur.

Mitigation Measures

None required.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.3 Air Quality *Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:*				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☒	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard?	☐	☐	☒	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐
d) Result in other emissions (such as those leading to odors or) adversely affecting a substantial number of people?	☐	☐	☒	☐

Environmental Evaluation

Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations.

Setting

The proposed project site is located in the City of Aliso Viejo, in Orange County, which is within the South Coast Air Basin (SoCAB). The SoCAB includes all of Orange County, Los Angeles County (except for the Antelope Valley), the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The San Gabriel, San Bernardino, and San Jacinto Mountains bound the SoCAB on the north and east, while the Pacific Ocean lies to the west of the SoCAB. The southern limit of the SoCAB is the San Diego County line. The SoCAB is under the jurisdiction of South Coast Air Quality Management District (SCAQMD).[13]

[13] South Coast Air Quality Management District (SCAQMD). 2022. Air Quality Management Plan. Website: http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan. Accessed January 10, 2025.

The air pollutants for which national and State standards have been promulgated and that are most relevant to air quality planning and regulation in the SoCAB include ozone, nitrogen oxide (NO_X), carbon monoxide (CO), particulate matter, including dust, 10 micrometers or less in diameter (PM_{10}), and particulate matter, including dust, 2.5 micrometers or less in diameter ($PM_{2.5}$). In addition, toxic air contaminants (TACs) are of concern in the SoCAB. Each of these pollutants is briefly described below. Other pollutants that are regulated but not considered an issue in the project area are sulfur dioxide (SO_2), vinyl chloride, sulfates, hydrogen sulfide, and lead; the proposed project would not emit substantial quantities of those pollutants, so they are not discussed further in this section.

Construction and operation of the proposed project would be subject to applicable SCAQMD rules and requirements. The SCAQMD CEQA Air Quality Handbook was developed to assist local jurisdictions and lead agencies in complying with the requirements of CEQA regarding potentially adverse impacts to air quality.

Would the project:

a) Conflict with or obstruct implementation of the applicable air quality plan?

Less than significant impact. A potentially significant impact would occur if the proposed project would conflict with or obstruct implementation of the applicable air quality plan. The SCAQMD is responsible for preparing air quality attainment plans to be transmitted to the California Air Resources Board (ARB) and the United States Environmental Protection Agency (EPA) for incorporation into the State Implementation Plan. SCAQMD has designated this area as extreme nonattainment for ozone and serious nonattainment for $PM_{2.5}$.[14] To evaluate whether a project conflicts with or obstructs implementation of the applicable air quality plan (2022 Air Quality Management Plan [AQMP] for SoCAB), the SCAQMD CEQA Air Quality Handbook states that there are two key indicators. These indicators are identified by the criteria discussed below.

- **Indicator:** Whether the proposed project will not result in an increase in the frequency or severity of existing air quality violations, or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.
- **Indicator:** According to Chapter 12 of the SCAQMD CEQA Air Quality Handbook, the purpose of the General Plan consistency findings is to determine whether a proposed project is inconsistent with the growth assumptions incorporated into the air quality plan and, thus, whether it would interfere with the region's ability to comply with federal and California air quality standards.

The development of emission burdens used in AQMPs to demonstrate compliance with ambient air quality standards is based, in part, on land use patterns contained within local general plans. Therefore, it is reasonable to conclude that if a project is consistent with the applicable general plan

[14] South Coast Air Quality Management District (SCAQMD). 2022. Air Quality Management Plan. Website: http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan. Accessed January 10, 2025.

land use designation, and the general plan was adopted prior to the applicable AQMP, then the growth of Vehicle Miles Traveled (VMT) and/or population generated by said project would be consistent with growth in VMT and population assumed within the AQMP. The General Plan and Zoning Ordinance defines the permitted land uses and the corresponding development standards within the City.

The proposed project includes a GPA to change the land use designation from Business Park to HDR (density of up to 30 du/acre) and rezone to change the zoning from Business Park-2 to RH Residential–High Density zone (density of up to 30 du/acre). Therefore, the 2022 AQMP would have analyzed a VMT and density different from the proposed project. However, as explained in Section 2.14, Population and Housing, the population growth resulting from the proposed project is consistent with SCAG's growth projections for the City and is considered planned growth. Furthermore, as explained in Section 2.17, Transportation, the City VMT Guidelines consider small projects that generate fewer than 110 net new daily vehicle trips to have a less than significant VMT impact. The proposed project would generate 79 net new daily trips. Therefore, the proposed project would have a less than significant VMT impact. The proposed project would not delay the timely attainment of air quality standards or 2022 AQMP emissions reductions due to an increase of density or VMT beyond what was evaluated in the 2022 AQMP.

Furthermore, considering the recommended criteria in the SCAQMD's 1993 Handbook, this analysis uses the following criteria to address this potential impact:

- **Criterion 1:** Proposed project's contribution to air quality violations; and
- **Criterion 2:** Compliance with applicable emission control measures in the AQMPs.

Criterion 1: Project's Contribution to Air Quality Violations

According to the SCAQMD, the proposed project is consistent with the AQMP if the proposed project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.[15]

If a project's emissions do not exceed the SCAQMD regional thresholds for volatile organic compounds (VOC), NO_X, CO, sulfur oxides (SO_X), PM_{10}, or $PM_{2.5}$, it follows that the project's emissions would not exceed the allowable limit for each project in order for the region to attain and maintain ambient air quality standards, which is the primary goal of air quality plans. As shown in Impact 2.3(b), the proposed project would not exceed the SCAQMD's regional thresholds of significance during either construction or operation. Therefore, the proposed project would be consistent with the AQMP under this criterion.

[15] South Coast Air Quality Management District (SCAQMD). 2022. Air Quality Management Plan. Website: http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan. Accessed January 10, 2025.

Criterion 2: Control Measures

The AQMP contains several control measures which are enforceable requirements through the adoption of rules and regulations. The proposed project would comply with all applicable SCAQMD rules and regulations. Because of the nature of the proposed project, which includes earthmoving activity during construction, SCAQMD Rule 403 applies. Rule 403 requires that fugitive dust be controlled with Best Available Control Measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. In addition, SCAQMD Rule 403 requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off-site. Compliance with this rule is achieved through the application of standard Best Management Practices (BMPs). These BMPs include application of water or chemical stabilizers to disturbed soils; covering haul vehicles; restricting vehicle speeds on unpaved roads to 15 miles per hour (mph); sweeping loose dirt from paved site access roadways; cessation of construction activity when winds exceed 25 mph; and establishing a permanent ground cover on finished sites. The proposed project would also be consistent with SCAQMD Rule 1113, which serves to limit the VOC content of architectural coatings used on projects in the SCAQMD. The proposed project's mandatory compliance with all applicable SCAQMD rules and regulations would result in consistency with the applicable AQMP control measures.

Summary

In summary, the proposed project would not result in a regional exceedance of criteria air pollutants and would comply with all applicable SCAQMD rules and regulations. As such, the proposed project would not result in an increase in the frequency or severity of existing air quality violations, or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP. Furthermore, the proposed project would not interfere with the region's ability to comply with federal and California air quality standards. Therefore, this impact would be less than significant.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard?

Less than significant impact. This impact is related to the cumulative effect of a project's criteria pollutant emissions. By its nature, air pollution is largely a cumulative impact resulting from emissions generated over a large geographic region. The nonattainment status of regional pollutants results from past and present development within the SoCAB, and this regional impact is a cumulative impact. Therefore, new development projects (such as the proposed project) within the SoCAB would contribute to this impact only on a cumulative basis. No single project would be sufficient in size, by itself, to result in nonattainment of regional air quality standards. Instead, a project's emissions may be individually limited but cumulatively considerable when evaluated in combination with past, present, and future development projects.

Potential regional impacts could result in exceedances of State or federal standards for NO_X, $PM_{10,}$ $PM_{2.5}$, or CO. NO_X emissions are of concern because of potential health impacts from exposure to NO_X emissions during both construction and operation and as a precursor in the formation of airborne

ozone. PM_{10} and $PM_{2.5}$ are of concern during construction because of the potential to emit exhaust emissions from the operation of off-road construction equipment and fugitive dust during earth-disturbing activities (construction fugitive dust). CO emissions are of concern during project operation because operational CO hotspots are related to increases in on-road vehicle congestion and resulting health effects.

VOC emissions are also important because of their participation in the formation of ground level ozone. Ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and can cause substantial damage to vegetation and other materials. Elevated ozone concentrations result in reduced lung function, particularly during vigorous physical activity. This health problem is particularly acute in sensitive receptors, such as the sick, elderly, and young children.

The cumulative analysis focuses on whether a specific project would result in cumulatively considerable emissions. According to CEQA Guidelines Section 15064(h)(4), the existence of significant cumulative impacts caused by other projects alone does not constitute substantial evidence that a project's incremental effects would be cumulatively considerable. Rather, the determination of cumulative air quality impacts for construction and operational emissions is based on whether the proposed project would result in regional emissions that exceed the SCAQMD regional thresholds of significance for construction and operations on a project level. Projects that generate emissions below the SCAQMD significance thresholds would be considered consistent with regional air quality planning efforts and would not generate cumulatively considerable emissions. The proposed project's regional construction and operational emissions are evaluated separately below. Construction and operational emissions from the proposed project were estimated using the California Emissions Estimator Model (CalEEMod) Version 2022.1. The complete CalEEMod output files are included as part of Appendix A.

Construction Emissions

Construction emissions are described as "short-term" or temporary in duration; however, they have the potential to represent a significant impact with respect to air quality. Construction of the proposed project would result in the temporary generation of VOC, NO_X, CO, SO_X, PM_{10}, and $PM_{2.5}$ emissions from construction activities such as demolition, site preparation, grading, building construction (home construction), architectural coating, and paving. Fugitive dust emissions are primarily associated with earth disturbance and grading activities and vary as a function of soil silt content, soil moisture, wind speed, acreage of disturbance area, and miles traveled by construction vehicles on-site and off-site. Construction-related NO_X emissions are primarily generated by exhaust emissions from heavy-duty construction equipment, material and haul trucks, and construction worker vehicles. VOC emissions are mainly generated by exhaust emissions from construction vehicles, off-gas emissions associated with architectural coatings, and asphalt paving. For the purpose of this analysis, construction of the proposed project was estimated to begin in April 2026 and conclude in October 2027 and was modeled based on an applicant-provided preliminary schedule; see Appendix A. Note that construction emissions would likely decrease if the construction schedule were deferred to later years because of improvements in technology and more stringent regulatory requirements. The duration of

construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required by the CEQA Guidelines. The calculations of pollutant emissions from the construction equipment account for the type of equipment, horsepower and load factors of the equipment, and the duration of equipment use. Table 1 presents the proposed project's maximum daily construction emissions during the entire construction duration using the worst-case summer or winter daily construction-related criteria pollutant emissions for each phase of construction. The PM_{10} and $PM_{2.5}$ emissions reflect the combined exhaust and fugitive dust emissions after implementation of best available dust control measures outlined in SCAQMD Rule 403. Complete CalEEMod output files are included as part of Appendix A.

Table 1: Unmitigated Construction—Maximum Daily Regional Emissions by Year

Construction Year	Regional Pollutant Emissions (pounds per day)					
	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Maximum Daily from Project Construction (2026)	1.52	19.63	18.22	0.06	6.71	2.20
Maximum Daily from Project Construction (2027)	48.03	6.50	9.26	0.02	0.85	0.35
Maximum Daily Construction Emissions						
Maximum Daily Emissions	**48.03**	**19.63**	**18.22**	**0.06**	**6.71**	**2.20**
SCAQMD Significance Threshold	**75**	**100**	**550**	**150**	**150**	**55**
Exceed Threshold?	**No**	**No**	**No**	**No**	**No**	**No**

Notes:
CO = carbon monoxide
NO_X = nitrogen oxides
PM_{10} = particulate matter less than 10 microns in diameter
$PM_{2.5}$ = particulate matter less than 2.5 microns in diameter
SCAQMD = South Coast Air Quality Management District
SO_X = sulfur oxides
VOC = volatile organic compound
The PM_{10} and $PM_{2.5}$ emissions reflect the combined exhaust and mitigated fugitive dust emissions in accordance with SCAQMD Rule 403.
Source of Emissions: Appendix A.

As shown above in Table 1, the proposed project's construction emissions would not exceed the applicable significance threshold for any of the pollutants. Therefore, the proposed project would have a less than significant impact related to regional air quality during project construction.

Operational Emissions

Long-term operational emissions would be generated, resulting from daily operations at the proposed townhomes. Operational emissions for residential land use development projects are typically

distinguished as mobile-, area-, and energy-source emissions. Mobile source emissions are those associated with automobiles that would travel to and from the project site. Assumptions used to estimate mobile source emissions that would be generated by the proposed project were consistent with those presented in the project-specific Trip Generation Memorandum. The proposed project would replace the existing commercial uses on-site, but for conservative purposes, the analysis does not account for the removal of the existing emissions, such as car trips, that would be replaced by the proposed project. Area-source emissions are those associated with landscape maintenance activities and periodic architectural coatings. The proposed project would be all electric and would not have any natural gas infrastructure. Therefore, there are no direct emissions related to building energy use for space or water heating. Table 2 presents the proposed project's estimated maximum daily operational emissions.

Table 2: Maximum Daily Operational Regional Pollutants

Operational Activity	Regional Pollutant Emissions (pounds per day)[1]					
	VOC	NO_X	CO	SO_X	PM_{10} (Total)	$PM_{2.5}$ (Total)
Area	3.8148	0.0331	3.4631	0.0002	0.0016	0.0012
Energy	0.00	0.00	0.00	0.00	0.00	0.00
Mobile (Automobiles)	1.2362	0.8657	10.1283	0.0267	2.5859	0.6670
Overall Maximum Daily[1]	**5.0510**	**0.8988**	**13.5915**	**0.0268**	**2.5875**	**0.6683**
SCAQMD Significance Threshold	**55**	**55**	**550**	**150**	**150**	**55**
Exceed Threshold?	**No**	**No**	**No**	**No**	**No**	**No**

Notes:
CO = carbon monoxide
NO_X = nitrogen oxides
PM_{10} = particulate matter less than 10 microns in diameter
$PM_{2.5}$ = particulate matter less than 2.5 microns in diameter
SCAQMD = South Coast Air Quality Management District
SO_X = sulfur oxides
VOC = volatile organic compounds
[1] Emissions shown represent the maximum daily emissions for summer and winter seasons for each operational emission source and pollutant. Therefore, total daily operational emissions represent the maximum daily emissions that could occur.
Source of Table: Appendix A.

As shown in Table 2, the proposed project's regional daily operational emissions would not exceed any of the SCAQMD thresholds of significance. Therefore, the proposed project would have a less than significant impact related to regional air quality during project operation.

c) Expose sensitive receptors to substantial pollutant concentrations?

Less than significant impact. This impact evaluates the potential for the proposed project's construction and operational emissions to expose sensitive receptors to substantial pollutant concentration. Sensitive receptors are defined as those individuals who are sensitive to air pollution, including children, the elderly, and persons with pre-existing respiratory or cardiovascular illness. For purposes of CEQA, the SCAQMD considers a sensitive receptor to be a location where a sensitive individual could remain for 24 hours, such as residences, hospitals, or convalescent facilities. Commercial and industrial facilities are not included in the definition because employees do not typically remain on-site for 24 hours. However, when assessing the impact of pollutants with 1-hour or 8-hour standards (such as nitrogen dioxide [NO_2] and CO), commercial and/or industrial facilities would be considered sensitive receptors. To result in a less than significant impact, the following criteria must be true:

- Criterion 1: Localized significance threshold (LST) assessment: emissions and air quality impacts during project construction or operation must be below the applicable LSTs to screen out of needing to provide a more detailed air quality analysis. If the proposed project exceeds any applicable LST when the mass rate lookup tables are used as a screening analysis, then project-specific air quality modeling may be performed to determine significance.
- Criterion 2: A CO hotspot assessment must demonstrate that the proposed project would not result in the development of a CO hotspot that would result in an exceedance of the CO ambient air quality standards.
- Criterion 3: TAC analysis must demonstrate that TAC emissions from construction and operations of the proposed project would not result in significant health risk impacts to nearby sensitive receptors.

Criterion 1: Localized Significance Threshold Analysis—Criteria Pollutants

The localized construction and operational analyses use thresholds (i.e., LSTs) that represent maximum emissions for a project that would not cause or contribute to an exceedance of the most stringent applicable federal or State ambient air quality standard. If the proposed project's construction or operational emissions are under those thresholds, it follows that the proposed project would not cause or contribute to an exceedance of the standard and would not expose sensitive receptors to substantial pollutant concentrations.

Friant Ranch Case and Project Health Impacts

In the 5th District Court of Appeal case *Sierra Club v. County of Fresno (Friant Ranch, L.P.)* (also referred to as *Friant Ranch)* the Court found the project EIR deficient because it did not identify specific health-related effects resulting from the estimated amount of pollutants generated by the project. The ruling stated that the EIR should give a "sense of the nature and magnitude of the 'health and safety problems' caused by a project's air pollution. The EIR should translate the emission numbers into adverse impacts or to understand why such translation is not possible at this time (and what limited translation is, in fact, possible)."

The California Supreme Court held that when an EIR concluded that a project would have significant impacts to air quality, an EIR should "make a reasonable effort to substantively connect a project's air quality impacts to likely health consequences." In order to determine compliance with this case, the Court developed a multi-part test that includes the following:

1. The air quality discussion shall describe the specific health risks created from each criteria pollutant, including diesel particulate matter (DPM).

   This air quality analysis details the specific health risks created from each criteria pollutant above under Section 2.3, Air Quality, Environmental Setting, Air Pollutants. As such, this analysis meets the Part 1 of the *Friant Ranch* case test.

2. The analysis shall identify the magnitude of the health risks created from the project. On page 24 of the Ruling, it is stated that "[t]he Court of Appeal identified several ways in which the EIR could have framed the analysis so as to adequately inform the public and decision-makers of possible adverse health effects."

The *Friant Ranch* case found that an EIR's air quality analysis must meaningfully connect the identified air quality impacts to the human health consequences of those impacts or meaningfully explain why that analysis cannot be provided. As noted in the brief of *Amicus Curiae* by the SCAQMD *Friant Ranch* (Brief), [16] SCAQMD has air quality modeling and health impact evaluation capability among the most sophisticated of any of the air districts in the State, and thus it is uniquely situated to express an opinion on how lead agencies should correlate air quality impacts with specific health outcomes. The SCAQMD discusses that it may be infeasible to quantify health risks caused by projects similar to the proposed project due to various factors. The Brief states that it may not be feasible to perform a health risk assessment for airborne toxics that will be emitted by a generic industrial building that was built on "speculation" (i.e., without knowing the future tenant(s)). Even where a health risk assessment can be prepared, the resulting maximum health risk value is only a calculation of risk; it does not necessarily mean anyone will contract cancer as a result of the project. Similarly, SCAQMD staff does not currently know of a way to accurately quantify ozone-related health impacts caused by NO_X or VOC emissions from relatively small projects due to photochemistry and regional model limitations. The Brief concludes, with respect to the Friant Ranch EIR, that although it may have been technically possible to plug the data into a methodology, the results would not have been reliable or meaningful.

On the other hand, for extremely large regional projects (unlike the proposed project), the SCAQMD states that it has been able to correlate potential health outcomes for very large emissions sources—as part of their rulemaking activity, specifically, 6,620 pounds per day of NO_X and 89,180 pounds per day of VOC were expected to result in approximately 20 premature deaths per year and 89,947 school absences due to ozone. As shown above in Table 1, project-related construction activities

[16] South Coast Air Quality Management District (SCAQMD). 2015. Application of the South Coast Air Quality Management District for Leave to File Brief of *Amicus Curiae* in Support of Neither Party and *[Proposed]* Brief of *Amicus Curiae*. Website: https://www.courts.ca.gov/documents/9-s219783-ac-south-coast-air-quality-mgt-dist-041315.pdf. Accessed March 2, 2025.

would generate a maximum of 48.03 pounds per day of VOC and 19.63 pounds per day of NO_X; and, as shown above in Table 2, operation of the proposed project is estimated to generate 5.05 pounds per day of VOC and 0.98 pounds per day NO_X. The proposed project would not generate emissions anywhere near levels that would reach 6,620 pounds per day of NO_X or 89,190 pounds per day of VOC emissions. Therefore, the proposed project's emissions are not sufficiently high enough to use a regional modeling program to correlate health effects on a basin-wide level.

Notwithstanding, this analysis does evaluate the proposed project's localized impact to air quality for emissions of NO_X, CO, PM_{10}, and $PM_{2.5}$ by comparing the proposed project's on-site emissions to the SCAQMD's applicable LST thresholds. As evaluated in this analysis provided below, the proposed project would not result in emissions that exceeded the SCAQMD's LSTs during either the construction or operational period. Therefore, the proposed project would not be expected to exceed the most stringent applicable federal or State ambient air quality standards for emissions of NO_X, CO, PM_{10}, or $PM_{2.5}$.

Localized Construction Analysis

The LST Methodology only applies to on-site emissions and states that "off-site mobile emissions from the project should not be included in the emissions compared to LSTs." Therefore, for purposes of the construction LST analysis, only on-site emissions were compared with the applicable LSTs.

Utilizing the earthmoving activity acreages and phase durations from CalEEMod (Section 5.6.1), the number of acres disturbed per day were 1.5 for site preparation and 1.0 for grading. As specified in SCAQMD's guidance, Fact Sheet for Applying CalEEMod to Localized Significance Thresholds, the appropriate thresholds were selected based on the maximum number of acres disturbed in a day. To ensure a conservative analysis, the proposed project emissions have been compared to the 1 acre per day LST.

Table 3 presents the proposed project's maximum daily on-site emissions compared with the applicable LSTs. The closest sensitive receptor is within approximately 50 meters. The LSTs for the project site were obtained from the LST Methodology for a 1-acre project site located in Source Receptor Area 20–Central Coastal Orange County, with sensitive receptors at a distance of 50 meters. As noted in Table 3, emission estimates account for implementation of SCAQMD Rule 403 (incorporated into the proposed project through SC AIR-1), and the construction vehicle trip lengths were adjusted to 0.5 mile to represent localized emissions.

Table 3: Construction Localized Significance Screening Analysis

Activity	On-site Emissions (pounds per day)			
	NO_X	**CO**	**PM_{10}**	**$PM_{2.5}$**
Maximum Daily from Project Construction (2026)	14.1883	15.5950	5.0431	1.8778
Maximum Daily from Project Construction (2027)	5.8850	8.4082	0.2398	0.2144
Maximum Daily On-site Construction Emissions1	**14.1883**	**15.5950**	**5.0431**	**1.8778**

Activity	On-site Emissions (pounds per day)			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Construction Localized Significance Threshold (Source Receptor Area 20, 1 acre disturbed, 50 meters)	**93**	**738**	**13**	**5**
Exceed Screening Threshold?	**No**	**No**	**No**	**No**

Notes:
CO = carbon monoxide
NO_X = nitrogen oxides
PM_{10} = particulate matter with an aerodynamic resistance diameter of 10 micrometers or less
$PM_{2.5}$ = particulate matter with an aerodynamic resistance diameter of 2.5 micrometers
SCAQMD = South Coast Air Quality Management District
[1] Assumes overlap of construction activities based on construction schedule shown in Appendix A.
The PM_{10} and $PM_{2.5}$ emissions reflect the combined exhaust and mitigated fugitive dust emissions in accordance with SCAQMD Rule.
Source of emissions: Appendix A.
Source of thresholds: South Coast Air Quality Management District (SCAQMD) Mass Rate Localized Significance Threshold (LST) Lookup Table for Source Receptor Area 20, 1 acre disturbed, within nearest sensitive receptor at a distance of 50 meters from the project site.

As shown in Table 3, the proposed project's maximum daily on-site emissions would not exceed any applicable SCAQMD LSTs. Therefore, localized construction impacts related to these air pollutants would be less than significant.

Localized Operational Analysis

Similar to the construction LST analysis above, the applicable operational LSTs were obtained for a project located in Source Receptor Area 20 with the nearest sensitive receptor being at a distance of 50 meters. SCAQMD provides LST thresholds for projects equal to 1 acre, 2 acres, or 5 acres in size. For the project site of 2.83 acres, the lower, more conservative threshold for a 2-acre site is used.

As described above, the LST Methodology recommends that only on-site emissions are evaluated using LSTs. Because most of the proposed project's mobile source emissions would occur on the local and regional roadway network away from the project site, a trip length of 0.5 mile was used in the modeling input assumptions to account for on-site emissions and from mobile sources. The 0.5-mile on-site trip length is a conservative estimate that takes into account the maximum project site distance a vehicle could travel, not the most likely or fastest route, to ensure all potential impacts are considered. On-site area-, energy-, and mobile source emissions were included in this analysis. Table 4 presents the proposed project's maximum daily on-site emissions compared with the appropriate LSTs.

Table 4: Operational Localized Screening Significance Analysis

Emissions Source	Pounds per Day			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Area	0.0331	3.4631	0.0016	0.0012
Energy	0.0000	0.0000	0.0000	0.0000
Mobile (Automobiles)	0.2891	2.5408	0.1479	0.0392
Maximum Daily On-site Operational Emissions	**0.3221**	**6.3233**	**0.1496**	**0.0404**
Localized Significance Thresholds (Source Receptor Area 20, 2-acre site, 50 meters)	**128**	**1,089**	**6**	**2**
Exceeds Screening Threshold?	**No**	**No**	**No**	**No**

Notes:
CO = carbon monoxide
NO_X = nitrogen oxides
PM_{10} = particulate matter less than 10 microns in diameter
$PM_{2.5}$ = particulate matter less than 2.5 microns in diameter
The highest daily emissions of NO_X, CO, PM_{10}, and $PM_{2.5}$ were in the summer season.
Source of Emissions: Appendix A.
Source of thresholds: SCAQMD Mass Rate Lookup Tables for a 2-acre site in Source Receptor Area 20 for sensitive receptors located within 50 meters of the project site.

As shown in Table 4, the proposed project's maximum daily on-site operational emissions would not exceed any applicable SCAQMD LSTs. Therefore, the proposed project's operational activities would not cause or contribute substantially to an existing or future ambient air quality standard violation. Accordingly, the proposed project's operational criteria air pollutant and ozone precursor concentrations would not expose sensitive receptors to substantial pollutant concentrations. The impact would be less than significant.

Criterion 2: Carbon Monoxide Hotspot Analysis

A CO hotspot represents a condition wherein high concentrations of CO may be produced by motor vehicles accessing a congested traffic intersection under heavy traffic volume conditions. It has long been recognized that CO exceedances are caused by vehicular emissions, primarily when idling at intersections. Accordingly, vehicle emissions standards have become increasingly more stringent to help remedy this impact. The CO hotspot analysis contained in the SCAQMD 1992 CO Plan is used to determine potential CO hotspot impacts from the proposed project, because by using the 1992 CO Plan as a worst-case scenario, the proposed project can measure CO impacts against intersections that experienced significantly more vehicle traffic than those adjacent to the proposed project. The 1992 CO Plan is used as a worst-case scenario because it included a CO hot spot analysis for four busy intersections in Los Angeles at the peak morning and afternoon time periods. The intersections evaluated included Long Beach Boulevard and Imperial Highway (Lynwood); Wilshire Boulevard and

Veteran Avenue (Westwood); Sunset Boulevard and Highland Avenue (Hollywood); and La Cienega Boulevard and Century Boulevard (Inglewood). The busiest intersection evaluated was that at Wilshire Boulevard and Veteran Avenue, which has a daily traffic volume of approximately 100,000 vehicles per day. Subsequently, the CO Plan determined that no CO hotspot would occur even with 100,000 vehicles per day at this one intersection.

According to the transportation analysis prepared by Urban Crossroads, the proposed project would only generate 25 AM peak-hour trips and 32 PM peak-hour trips under the 61-unit scenario. Therefore, the proposed project would not result in traffic volumes exceeding 100,000 vehicles per day at any of the intersections evaluated near the project site. As a result, none of the intersections near the proposed project site would have peak-hour traffic volumes exceeding those at the intersections analyzed in the 1992 CO Plan. Additionally, the adjacent roadways are not located in an area where vertical or horizontal atmospheric mixing is substantially limited, such as a tunnel or overpass. Furthermore, there are no factors unique to the local meteorology to conclude that this intersection would yield higher CO concentrations if modeled in detail. Therefore, the operational CO impact would be less than significant.

Criterion 3: Project-specific Toxic Air Pollutants

An assessment was made of the potential health impacts on surrounding sensitive receptors resulting from TAC emissions during construction. The SCAQMD has defined health risk significance thresholds. These thresholds are represented as a cancer risk to the public and a non-cancer hazard from exposures to TACs. Cancer risk represents the probability (in terms of risk per million individuals) that an individual would contract cancer resulting from exposure to TACs continuously over a period of several years. The principal TAC emission analyzed in this assessment was DPM from operation of off-road equipment and diesel-powered delivery and worker vehicles during construction. DPM has been identified by the ARB as a carcinogenic substance. For purposes of this analysis, DPM is represented as exhaust emissions of PM_{10}. The California Office of Environmental Health Hazard Assessment (OEHHA) has developed guidance for estimating cancer risks that considers the increased sensitivity of infants and adults to TAC emissions, different breathing rates, and time spent at home. This guidance was applied in estimating cancer risks from the construction and operation of the proposed project. To assess impacts to off-site sensitive receptors, the American Meteorological Society/EPA Regulatory Model (AERMOD) air dispersion model was used to estimate the concentrations from PM_{10} and $PM_{2.5}$ exhaust at nearby sensitive receptors within 1,000 feet of the project site. The Hotspots Analysis and Reporting Program (HARP2) software was used to identify the cancer risks associated with DPM generated during construction activities.

Toxic Air Contaminant Construction Analysis

Major sources of DPM during construction include off-road construction equipment and heavy-duty delivery truck activities. The results of the Health Risk Assessment (HRA) prepared for project construction for cancer risk and long-term chronic cancer risk are summarized below. Detailed parameters, a description of methodology, and complete calculations are contained in Appendix A.

The estimated health and hazard impacts at the Maximally Exposed Individual Resident (MEIR) and Maximally Exposed Individual Worker (MEIW) from the proposed project's construction emissions, prior to incorporation of mitigation, are provided in Table 5.

Table 5: Estimated Health Risks and Hazards During Project Construction

Source	Cancer Risk (risk per million)	Chronic Non-cancer HI
Maximally Exposed Individual Resident[1]	8.73	0.0078
Maximally Exposed Individual Worker[2]	1.02	0.0124
Significance Threshold	10	1
Exceeds Individual Source Threshold?	**No**	**No**

Notes:
HI = hazard index
1 The location of the construction MEIR was determined to be an existing single-family residence within approximately 141 feet north of the project boundary, at 33.5956629°N -117.723849"W.
2 The location of the construction MEIW was determined to be an existing office within approximately 100 feet southeast of the project boundary, at 33.594049°N, -117.723602"W.
Source: Appendix A.

As shown in Table 5, the proposed project's construction emissions would not exceed any risk significance threshold. Therefore, the proposed project would have a less than significant impact related to residential health risks and hazards during project construction.

Toxic Air Contaminant Operation Analysis

The proposed project is a residential project and would not have stationary sources or on-site sources of TACs during operation. Traffic generated by the residential project would consist of mostly light-duty gasoline-powered vehicles, which are not a significant source of TAC and air pollutant emissions. Thus, the proposed project would not generate a significant amount of DPM or other TAC emissions during operation and would not result in significant health impacts to nearby sensitive receptors during operation.

Cumulative Toxic Air Contaminant Analysis

As previously discussed, projects that exceed project-specific significance thresholds are considered cumulatively considerable by the SCAQMD. Conversely, projects that do not exceed project-specific thresholds are generally not considered cumulatively significant. As discussed in Criteria 1 through 3 above, the proposed project would not expose sensitive receptors to substantial pollutant concentrations. Since the proposed project would not exceed project-specific thresholds, it would not be considered to result in cumulatively significant impacts.

The Proposed Project as a Receptor

The proposed project would locate new sensitive receptors (residents) that could be subject to existing sources of TACs at the project site. However, as demonstrated above, the proposed project

would comply with all existing regulations and would not exacerbate environmental hazards or conditions that already exist. Accordingly, no further analysis is required. The California Supreme Court concluded in *California Building Industry Association v. BAAQMD* that CEQA generally does not require an analysis of the impact of existing environmental conditions on a project's future users or residents.

In summary, the proposed project would not expose sensitive receptors to substantial pollutant concentrations either during construction or operation. Impacts would be less than significant.

d) Result in other emission (such as those leading to odors) adversely affecting a substantial number of people?

Less than significant impact. Odors can cause a variety of responses. The impact of an odor is dependent on interacting factors such as frequency (how often), intensity (strength), duration (in time), offensiveness (unpleasantness), location, and sensory perception. While offensive odors rarely cause any physical harm, they still can be very unpleasant, leading to considerable distress and often generating citizen complaints to local governments and regulatory agencies.

The SCAQMD does not provide a suggested screening distance for a variety of odor-generating land uses and operations. However, the San Joaquin Valley Air Pollution Control District (Valley Air District) does have a screening distance for odor sources. These screening distances by type of odor generator are listed below in Table 6.

Table 6: Screening Levels for Potential Odor Sources

Odor Generator	Screening Distance
Wastewater Treatment Facilities	2 miles
Sanitary Landfill	1 mile
Transfer Station	1 mile
Composting Facility	1 mile
Petroleum Refinery	2 miles
Asphalt Batch Plant	1 mile
Chemical Manufacturing	1 mile
Fiberglass Manufacturing	1 mile
Painting/Coating Operations (e.g., auto body shop)	1 mile
Food Processing Facility	1 mile
Feed Lot/Dairy	1 mile
Rendering Plant	1 mile

Odor Generator	Screening Distance
Source: San Joaquin Valley Air Pollution Control District (Valley Air District). 2015. Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI). March 19. Website: https://valleyair.org/transportation/GAMAQI.pdf. Accessed February 10, 2025.	

Construction-Related Odors

Potential sources that may emit odors during construction activities include exhaust from diesel construction equipment. However, because of the temporary nature of these emissions, the intermittent nature of construction activities, and the highly diffusive properties of DPM exhaust, nearby receptors would not be affected by diesel exhaust odors associated with project construction. Odors from these sources would be localized and generally confined to the immediate area surrounding the proposed project site. The proposed project would utilize typical construction techniques, and the odors would be typical of most construction sites for a residential subdivision. As such, the proposed project would not cause odors that adversely affect a substantial number of people during the construction period; potential impacts during construction would be less than significant.

Operational-related Odors

The proposed project includes the construction and development of a new residential infill community consisting of a total of up to 61 for-sale townhomes and associated amenities, landscaping, and paving. Operations of the proposed project could lead to odors from associated vehicle exhaust and outdoor cooking. However, such odors generated by project operation would be small in quantity and duration and would not pose an objectionable odor impact to nearby receptors. Land uses that are typically identified as sources of objectionable odors include landfills, transfer stations, sewage treatment plants, composting facilities, feedlots, coffee roasters, asphalt batch plants, and rendering plants. The proposed residential project would not produce any offensive odor emitting end uses such as coffee roasting, composting, feed lots, refining, sewage treatment, or solid waste management and would not be considered an odor generator as identified in Table 6, and potential impacts during operation would be less than significant

Summary

The proposed project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people from construction or operations. Therefore, approval of the proposed project would not result in any significant effects relating to other emissions (such as odors), and impacts would be less than significant.

Applicable Existing Regulations

The proposed project would be required to demonstrate compliance with the following regulations.

SCAQMD 403 SCAQMD Rule 403 requires the implementation of best available dust control measures during activities capable of generating fugitive dust. The proposed project must follow the standard SCAQMD rules and requirements with regard to fugitive dust control, which include, but are not limited to the following:

1. All active construction areas shall be watered two times daily.
2. Speed on unpaved roads shall be reduced to less than 15 miles per hour (mph).
3. Any visible dirt deposition on any public roadway shall be swept or washed at the site access points within 30 minutes.
4. Any on-site stockpiles of debris, dirt, or other dusty material shall be covered or watered twice daily.
5. All operations on any unpaved surface shall be suspended if winds exceed 15 mph.
6. Access points shall be washed or swept daily.
7. Construction sites shall be sandbagged for erosion control.
8. Apply nontoxic chemical soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for 10 days or more).
9. Cover all trucks hauling dirt, sand, soil, or other loose materials, and maintain at least 2 feet of freeboard space in accordance with the requirements of California Vehicle Code (CVC) Section 23114.
10. Pave or gravel construction access roads at least 100 feet onto the site from the main road and use gravel aprons at truck exits.
11. Replace the ground cover of disturbed areas as quickly possible.

SCAQMD 1113 All interior and exterior architectural coatings used on-site during project construction must meet or exceed the VOC content limits established by SCAQMD Rule 1113.The project sponsor shall include in any construction contracts and/or subcontracts a requirement that all interior and exterior architectural coatings used in project construction meet the VOC content limits established by SCAQMD Rule 1113.

Mitigation Measures

None required.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.4 Biological Resources *Would the project:*				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service?	☐	☒	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service?	☐	☐	☐	☒
c) Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of wildlife nursery sites?	☐	☒	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☒
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State Habitat Conservation Plan?	☐	☐	☐	☒

Environmental Evaluation

The analysis in this section is based, in part, on a biological resources evaluation, which consisted of a field survey and desktop survey conducted by FirstCarbon Solutions (FCS). Desktop survey results are included in Appendix B.

Setting

Methods

The biological resources evaluation included a review of existing environmental documentation for the project site and vicinity, including literature pertaining to the habitat requirements of special-status species with the potential to occur in the project vicinity; and federal register listings, protocols, and species data provided by the United States Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW). FCS also reviewed topographic maps, aerial photographs, and published soil surveys and queried special-status species databases, including the USFWS Information for Planning and Consultation (IPaC) database,[17] the California Natural Diversity Database (CNDDB),[18] and the California Native Plant Society Electronic Inventory (CNPSEI) of Rare and Endangered Vascular Plants of California.[19]

The biological resources evaluation included a field survey of the project site on January 2, 2025, to ascertain general site conditions and identify whether existing vegetation communities provide suitable habitat for special-status plant or wildlife species.

Results

An FCS Biologist conducted a general biological survey of the project site on January 2, 2025, between approximately 10:30 a.m. to 11:30 a.m. Weather conditions during the field survey were sunny, with an average temperature around 62–66°F (degrees Fahrenheit) and wind speeds between 0 and 2 mph.

Environmental Setting

The project site is developed and is surrounded by the MNWD water storage facility to the east, Glenwood Drive and residential development to the north, and Argonaut and commercial development to the west and south. The project site is mostly paved or covered by an office building and is flat, with minimal slopes increasing from south to north. Ornamental trees are located along the boundaries or adjacent to the site on all sides, including hedgerows of pine (*Pinus* spp.) trees along the eastern and northern boundaries.

[17] United States Fish and Wildlife Service (USFWS). 2024. Information for Planning and Consultation (IPaC). Website: https://ecos.fws.gov/ipac/. Accessed November 27, 2024.

[18] California Department of Fish and Wildlife (CDFW). 2024. CNDDB RareFind 5 California Natural Diversity Database Query for Special-Status Species. Website: https://wildlife.ca.gov/Data/CNDDB/Maps-and-Data. Accessed November 27, 2024.

[19] California Native Plant Society (CNPS). 2024. California Native Plant Society Rare and Endangered Plant Inventory. Website: http://www.rareplants.cnps.org/. Accessed November 27, 2024.

Would the project:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service?

Less than significant impact with mitigation incorporated. The project site is developed and is mostly paved or covered by an office building and contains ornamental trees located along the site boundaries and near the building. According to the CNDDB and CNPSEI of Rare and Endangered Vascular Plants of California, 83 special-status plant species have been recorded within 10 miles of the project site or within the *San Juan Capistrano, California* United States Geological Survey (USGS) 7.5-minute Topographic Quadrangle Map and the eight surrounding quadrangle search area that encompasses the project site (Appendix B). The potential for occurrence of a species was based on presence of suitable habitats, soil types and recency, proximity, and number of occurrences recorded in the CNPSEI and CNDDB. Based on the surface disturbances occurring throughout the project site, as well as its situation as developed land in an urbanized area, the likelihood for the potential for persistence and occurrence of populations of many special-status plant species is lowered. Because of the urban/developed nature of the project site and lack of suitable habitat, all special-status plants that occur in the region were assessed as having no potential for occurrence (Appendix B, Table 1). Thus, special-status plants are not expected to occur on the project site.

Sixty special-status wildlife species were identified as occurring within 10 miles of the project site as recorded in the CNDDB or as identified in the USFWS IPaC database. Because of the urbanized/developed nature of the project site and vicinity, all special-status wildlife species identified in the database reviews were determined to have no or low potential for occurrence on the project site. However, the project site contains trees that could provide marginally suitable nesting habitat for Cooper's hawk, a California Species of Special Concern. In addition to Cooper's hawk, trees within the project site may provide nesting habitat for various migratory and nesting birds acclimated to anthropogenic environments, which are protected under the Migratory Bird Treaty Act (MBTA). With the implementation of Mitigation Measure (MM) BIO-1a and MM BIO-1b, which require a pre-construction survey and avoidance of direct and indirect impacts on active nests, potential project-related impacts to protected bird nests (including Cooper's hawk) would be reduced to a less than significant level.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service?

No impact. No riparian or other sensitive natural communities were recorded on or adjacent to the project site; therefore, the proposed project would have no impact on any riparian habitat or other sensitive natural community.

c) Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

No impact. There were no waters or wetland features detected on the project site that would be considered potentially jurisdictional by the United States Army Corps of Engineers (USACE), nor any features that would be considered potentially jurisdictional by State regulatory agencies including the San Diego Regional Water Quality Control Board (San Diego RWQCB) and CDFW. Additionally, the project site does not contain vernal pools or features indicative of the historic presence of vernal pools. According to the National Resources Conservation Service (NRCS) Web Soil Survey (WSS),[20] two soil types are mapped on the project site, Calleguas clay loam and Capistrano sandy loam. While Calleguas soils are known to support vernal pools, there would be no potential for vernal pools to occur due to the developed nature of the site. Therefore, implementation of the proposed project would not result in impacts to State or federally protected wetlands, including vernal pools. No impacts would occur.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of wildlife nursery sites?

Less than significant impact with mitigation incorporated. The project site is developed and is surrounded by urbanized areas and roads on all sides that limit wildlife movement through the project site. The project site itself does not serve as a wildlife movement corridor.

The project site contains vegetation, including trees within the site and along the boundaries, that could provide suitable nesting habitat for bird species protected under the MBTA and the Fish and Game Code. These species include Cooper's hawk and other avian species. Only avian species adapted to urbanized areas may use the trees on-site for nesting.

A total of 77 trees would be removed and replaced at a 1:1 ratio. Nearly all trees removed by the project would be replaced with trees that would function in a similar capacity for nesting. The proposed trees would include native species, as well as climate-adaptive and drought-tolerant species. If ground-disturbing or vegetation-removing construction activities are initiated during the nesting season, they could disturb nesting and breeding birds on the ground surface, in trees and shrubs, and on structures on and adjacent to the project site, which would be considered a significant impact. Potential construction-related project impacts on special-status and migratory birds include destruction of eggs or occupied nests, mortality of young, and parental abandonment of nests with eggs or pre-fledged young birds. With the implementation of MM BIO-1a and MM BIO-1b, potential project impacts to nesting Cooper's hawk and other native and migratory birds would be reduced to a less than significant level.

[20] United States Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS). 2025. Web Soil Survey (WSS). Website: https://websoilsurvey.nrcs.usda.gov/app/WebSoilSurvey.aspx. Accessed February 15, 2025.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

No impact. The General Plan for the City of Aliso Viejo contains the following two Ecological and Biological Resources policies for the Conservation/Open Space Element:

Policy COS-3.1 Support regional and sub-regional efforts to conserve ecological and biological resources.

Policy COS-3.2 Protect sensitive habitat areas and vegetation, particularly along Aliso Creek, within Aliso Woods, and within the Aliso and Wood Canyons Wilderness Park, by maintaining these resources as long-term open space.

The proposed project would not conflict with these policies. Therefore, there are no local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, with which the proposed project would conflict. No impact would occur.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan?

No impact. The project site is located within the boundaries of the County of Orange Natural Communities Conservation Plan (County of Orange NCCP) Habitat Conservation Plan (HCP), an HCP and NCCP authorized by the CDFW through the NCCP Act (California Fish and Game Code [FGC] § 2800) and Sections 2081 and 2084 of the California Endangered Species Act (CESA) and by the USFWS through Sections 7 and 10 of the Endangered Species Act.

The project site does not contain Covered Habitats or suitable habitat for Identified Species covered under the County of Orange NCCP HCP. Therefore, the proposed project would not conflict with an HCP, NCCP, or other approved local, regional, or State HCP. No impact would occur.

Mitigation Measures

MM BIO-1a Nesting Bird Pre-construction Surveys

If ground-disturbing or vegetation-removing construction activities or tree removal is proposed during the breeding/nesting season for migratory birds (February 1 through September 15), a qualified Biologist shall conduct pre-construction surveys for special-status birds and other migratory birds within the construction area, including a 300-foot survey buffer (where accessible), no more than 3 days prior to the start of ground-disturbing activities in the construction area.

MM BIO-1b Avoidance of Active Avian Nests

If an active nest (i.e., occupied by eggs or fledglings) is located during pre-construction surveys or at any point during the construction phase of the proposed project, the City of Aliso Viejo shall be notified regarding the status of the nest. Furthermore, construction activities shall be restricted as necessary to avoid disturbance of the nest until the eggs or fledglings no longer are in the nest or a qualified Biologist deems disturbance potential to be minimal. Restrictions may include establishment of exclusion zones (no ingress of personnel or equipment at a minimum radius of 300 feet around an active raptor nest and a 50-foot radius around an active migratory bird nest) or alteration of the construction schedule.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.5 Cultural Resources *Would the project:*				
a) Cause a substantial adverse change in the significance of a historical resource as pursuant to Section 15064.5?	☐	☐	☒	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?	☐	☒	☐	☐
c) Disturb any human remains, including those interred outside of formal cemeteries?	☐	☒	☐	☐

Environmental Evaluation

Setting

This section describes the existing cultural setting and potential effects from project implementation on the project site and its surrounding area. The following discussion is based on a records search at the South Central Coastal Information Center (SCCIC), the Native American Heritage Commission (NAHC), and a cultural resources pedestrian survey conducted by FCS. The non-confidential SCCIC records search, pedestrian survey photographs, and NAHC correspondence are included in Appendix C.

South Central Coastal Information Center

On May 30, 2024, a record search/literature review was conducted at the SCCIC located at California State University, Fullerton. The purpose of this review was to access any existing cultural resources survey reports, archaeological site records, and historic maps to evaluate whether previously documented pre-contact or historic archaeological sites, architectural resources, cultural landscapes, or Tribal Cultural Resources (TCRs) exist within or near the project site. The record search/literature review was also conducted to evaluate whether the project site contains any historic properties listed on or determined eligible for listing on the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), the California Historic Landmarks (CHL) list, the California Points of Historical Interest (CPHI) list, and the Built Environment Resource Directory (BERD) for Orange County. The results of the SCCIC records search indicate that 10 pre-contact cultural resources have been recorded within the 0.5-mile search radius, one of which (P-30-000414) is within the project boundaries. In addition, there are 16 area-specific survey reports on file with the SCCIC, two of which (OR-00255 and OR-00702) partially address the project site and three of which (OR-

00254, OR-00431, and OR-00705) address the project site entirely, indicating that the project site has been previously surveyed for cultural resources and produced positive results for cultural resources.

Native American Heritage Commission

On May 15, 2024, a records search request was sent to the NAHC in an effort to determine whether any sacred sites are listed on its Sacred Lands File (SLF) for the project site. On June 5, 2024, a response from the NAHC was received indicating that their SLF search came back positive for TCRs within the project site. The NAHC included a list of 23 Tribal representatives who may have additional knowledge of the project site. To ensure that all Native American knowledge and concerns over potential TCRs that may be affected by implementation of the proposed project are addressed, FCS sent letters to all 23 Tribal representatives on November 26, 2024. Two responses were received. The first response was received on November 26, 2024; the Gabrieleño Band of Mission Indians–Kizh Nation requested Lead Agency contact information. The second response was received on January 8, 2025, from the Juaneño Band of Mission Indians, Acjachemen Nation, stating that the proposed project is a sensitive area that is located in the Tribe's territory with known burial sites near the project site. The Tribe expressed a request to consult on the proposed project as it moves forward. The Tribe also requested additional information pertaining to the expected extent of ground disturbance, as well as SCCIC record search results. No additional responses have been received to date.

Cultural Resources Pedestrian Survey and Buried Site Potential

On June 6, 2024, an FCS Archaeologist conducted a pedestrian survey for unrecorded cultural resources within the project site. The entirety of the project site is hardscaped. The perimeter of the project site is enclosed by a parking lot dedicated to the business center (constructed between 1988 and 1992) located at the center of the project site. Overview shots of the project site were taken from the northeast, northwest, southeast, and southwest corners that showcase the structure and the surrounding parking lot. Visibility of the exposed soil was non-existent since the entirety of the site is hardscaped; thus, inspection of the soil for cultural resources was not possible. Survey conditions were documented using digital photographs and field notes. No pre-contact or historic resources were found during the pedestrian survey.

In addition to the pedestrian survey, the potential for yet-identified cultural resources in the project vicinity was reviewed against geologic and topographic geographic information system data for the general area and information from other nearby projects. The proposed project was evaluated against a set of criteria originally identified by a geoarchaeological overview that was prepared for the California Department of Transportation (Caltrans) Districts 6 and 9.[21] This study mapped the "archaeological sensitivity," or potential to support the presence of buried pre-contact archaeological deposits, based on geology and environmental parameters including distance to water and landform slope. The methodology used in the study is applicable to other parts of California, such as the Bay Area, and generally concluded that sites consisting of flat, Holocene-era deposits in close proximity to

[21] Meyer, J., D. Craig Young, and Jeffrey S. Rosenthal. 2010. Volume I: A Geoarchaeological Overview and Assessment of Caltrans District 6 and 9, Cultural Resources Inventory of Caltrans District 6/9 Rural Conventional Highways. Submitted to Central California Department of Transportation, District 6.

natural water resources had a moderate to high probability of containing subsurface archaeological deposits when compared to earlier Pleistocene deposits situated on slopes or further away from drainages, lakes, and rivers.

According to the isotopic gravity map with geology of Santa Ana, Southern California,[22] the surface of the project site rests entirely on alluvial valley deposits (Holocene to late Pleistocene; Qya). Applying the criteria set forth in Meyer et al., all Holocene-era deposits have the potential to contain archaeological deposits, which increases with the ease of the slope and proximity to water resources. The terrain of the project site is relatively flat, and the closest water source is Aliso Creek, located approximately 0.7 mile east of the project site. In addition, positive results from the NAHC SLF search for TCRs and the positive SCCIC results for cultural resources indicate a moderate to high potential for unanticipated buried cultural resources to be impacted by project construction.

Cultural Resources

Would the project:

a) Cause a substantial adverse change in the significance of a historical resource as pursuant to Section 15064.5?

No impact. Historical resources in this context refer to the built environment, mainly buildings and structures over 45 years in age that may be eligible for inclusion on the CRHR or NRHP. Records search results conducted at the SCCIC did not identify any historical resources within the 0.5-mile search radius, nor within the proposed project boundaries. Additionally, the results of the pedestrian survey indicated that the project site consists of an enclosed parking lot and a business center building that was constructed between 1988 and 1992. As such, no historical resources were identified during the pedestrian field survey. Thus, the proposed project would not cause a substantial adverse change in the significance of any such known resources. No mitigation measures are required and there would be no impacts to historical resources.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

Less than significant impact with mitigation incorporated. Results from the SCCIC indicate that 10 pre-contact archaeological resources are recorded within a 0.5-mile radius of the project site, of which one pre-contact resource is recorded within the project boundaries. There are no historic era archaeological resources located in or within a 0.5-mile radius of the project site. The results of the pedestrian survey failed to locate or identify any archaeological resources due to the lack of soil visibility across the project site. Given the results of the record searches, the potential to impact unidentified archaeological resources is considered moderate to high. It is possible that earthmoving activities associated with project construction could encounter previously undiscovered

[22] Langenheim, V.E., Tien-Chang Lee, Shawn Biehler, A.C. Jachens, and D.M. Morton. 2006. Isotopic gravity map with geology of the Santa Ana 30' x 60' quadrangle, southern California. United States Geological Survey. Map. Scale 1:100,000.

archaeological resources. Archaeological resources can include but are not limited to stone, bone, wood, or shell artifacts or features, including hearths and structural elements. Damage or destruction of these resources would be a potentially significant impact. MM CUL-1 would require a Worker Environmental Awareness Program (WEAP) training, a site survey conducted by a qualified Archaeologist, and archaeological monitoring. MM CUL-2 would require consultation with a qualified Archaeologist in the event that buried archaeological resources are discovered during construction, as well as inadvertent discovery procedures. Implementation MM CUL-1 and MM CUL-2 would ensure that potential impacts to archaeological resources will be reduced to a level of less than significant.

c) Disturb any human remains, including those interred outside of formal cemeteries?

Less than significant impact with mitigation incorporated. While no formal cemeteries or areas containing human remains are known to be in the project site's vicinity, the possibility always exists that construction-related ground disturbance may uncover previously undiscovered human remains. In the unlikely event such a discovery is made, CEQA Guidelines Section 15064.5, Health and Safety Code Section 7050.5, and Public Resources Code Section 5097.94 and Section 5097.98 must be followed. Additionally, implementation of MM CUL-3, which details inadvertent discovery procedures, would reduce potential impacts of previously undiscovered human remains to a less than significant level.

Mitigation Measures

MM CUL-1 Prior to the initiation of construction activities, all construction personnel conducting ground disturbance at the site shall be provided a Worker Environmental Awareness Program (WEAP) cultural resources "tailgate" training. The training shall include visual aids, a discussion of applicable laws and statutes relating to archaeological resources, types of resources that may be found within the project site, and procedures to be followed in the event such resources are encountered. The training shall be conducted by an Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology.

An Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology shall conduct an updated survey of the site following demolition and exposure of native soils and prior to any project-related trenching or grading to check for the inadvertent exposure of cultural materials.

This shall be followed by archaeological monitoring during the grading and trenching phase of the proposed project. At the completion of these phases, archaeological monitoring shall be reduced to periodic "spot checks." In the event exposed soils indicate cultural materials may be present, this may be followed by regular or full-time archaeological monitoring as determined by the Archaeologist.

MM CUL-2 In the event that buried archaeological resources are discovered during construction, operations shall stop within a 100-foot radius of the find and an Archaeologist who meets the Secretary of Interior's Professional Qualification Standards for archaeology shall be consulted to determine whether the resource requires further study. The qualified Archaeologist shall make recommendations to the Lead Agency on the measures that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with Section15064.5 of the CEQA Guidelines. Potentially significant cultural resources consist of but are not limited to stone, bone, fossils, wood, or shell artifacts or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the project area shall be recorded on appropriate California Department of Parks and Recreation (DPR) forms and evaluated for significance in terms of CEQA criteria. If the resources are determined to be unique historic resources as defined under Section 15064.5 of the CEQA Guidelines, mitigation measures shall be identified by the monitor and recommended to the Lead Agency. Appropriate mitigation measures for significant resources could include avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds. The Lead Agency, along with other relevant or Tribal officials, shall be contacted upon the discovery of cultural resources to begin coordination on the disposition of the find(s). Treatment of any significant cultural resources shall be undertaken with the approval of the Lead Agency. No further grading shall occur in the area of the discovery until the Lead Agency approves the measures to protect these resources. Upon coordination with the Lead Agency, any archaeological artifacts recovered shall be donated to an appropriate Tribal custodian or a qualified scientific institution where they would be afforded applicable cultural resources laws and guidelines.

MM CUL-3 In the event of the accidental discovery or recognition of any human remains, CEQA Guidelines Section 15064.5, Health and Safety Code Section 7050.5, and Public Resources Code Sections 5097.94 and Section 5097.98 shall be followed. If during the course of project construction, there is accidental discovery or recognition of any human remains, the following steps shall be taken:

1. There shall be no further excavation or disturbance of the site where human remains are discovered and/or any nearby area reasonably suspected to overlie adjacent human remains until the County Coroner is contacted to determine whether the remains are Native American and if an investigation of the cause of death is required. If the Coroner determines the remains to be Native American, the Coroner shall contact the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall identify the person or persons it believes to be the Most Likely Descendant (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work within 48 hours, for means of treating or disposing of, with

appropriate dignity, the human remains, and any associated grave goods as provided in Public Resource Code Section 5097.98.

2. Where the following conditions occur, the landowner or his or her authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the MLD or on the project site in a location not subject to further subsurface disturbance:
   - The NAHC is unable to identify an MLD or the MLD failed to make a recommendation within 48 hours after being notified by the commission.
   - The descendant identified fails to make a recommendation.
   - The landowner or his authorized representative rejects the recommendation of the descendant, and mediation by the NAHC fails to provide measures acceptable to the landowner.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.6 Energy *Would the project:*				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a State or local plan for renewable energy or energy efficiency?	☐	☐	☒	☐

Environmental Evaluation

Setting

Energy use, especially through fossil fuel consumption and combustion, relates directly to environmental quality since it can adversely affect air quality and generate greenhouse gas (GHG) emissions that contribute to climate change. Electrical power is generated through a variety of sources, including fossil fuel combustion, hydropower, wind, solar, biofuels, and others. Natural gas is widely used to heat buildings, prepare food in restaurants and residences, and fuel vehicles, among other uses. Fuel use for transportation is related to the fuel efficiency of cars, trucks, and public transportation; choice of different travel modes such as auto, carpool, and public transit; and miles traveled by these modes and is generally based on petroleum-based fuels such as diesel and gasoline. Electric vehicles (EVs) may not have any direct emissions but do have indirect emissions via the source of electricity generated to power the vehicle. Construction and routine operation and maintenance of transportation infrastructure also consume energy. Southern California Edison (SCE) provides electricity and natural gas services within the City of Aliso Viejo. SCE provides electricity and natural gas as customers request their services.

Would the project:

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less than significant impact. A discussion of the proposed project's anticipated energy usage is presented below. Energy use consumed by the proposed project was estimated and includes

electricity and fuel consumption for project construction and operation. Energy calculations are included as part of Appendix A.

Short-term Construction Impacts

For the purpose of this analysis, construction of the proposed project was estimated to begin in April 2026 and conclude in October 2027 and was modeled based on an applicant-provided preliminary schedule (see Appendix A). If the construction schedule moves to later years, construction emissions would likely decrease because of improvements in technology and more stringent regulatory requirements as older, less efficient equipment is replaced by newer and cleaner equipment. The proposed project would require demolition, site preparation, grading, building construction, architectural coating, and paving. The construction phase would require energy for the manufacture and transportation of building materials, preparation of the site (e.g., site clearing, and grading), and the actual construction of the buildings. Petroleum-based fuels such as diesel fuel and gasoline would be the primary sources of energy for these tasks.

The types of on-site equipment used during construction of the proposed project could include gasoline- and diesel-powered construction and transportation equipment, including trucks, front-end loaders, forklifts, and cranes. On-site, off-road construction equipment is estimated to consume a total of approximately 27,788 gallons of fuel over the entire construction duration (Appendix A).

Fuel use associated with construction vehicle trips generated by the proposed project was also estimated; trips include construction worker trips, haul truck trips for material transport, and vendor trips for construction material deliveries. Fuel use from these vehicles traveling to and from the project site was based on (1) the projected number of trips the proposed project would generate during construction, (2) average trip distances by trip type, and (3) fuel efficiencies estimated in the ARB Emissions Factors (EMFAC) model mobile source emission model. In total, the proposed project is estimated to generate approximately 347,132 VMT and a combined 20,449 gallons of gasoline and diesel for vehicle travel during construction.

Other equipment could include construction lighting, field services (office trailers), and electrically driven equipment such as pumps and other tools. Municipal Code Section 8.12.070 restricts noise sources associated with construction, repair, remodeling, or grading of any real property, provided the activities do not take place between the hours of 8:00 p.m. and 7:00 a.m. on weekdays, 8:00 p.m. and 8:00 a.m. on Saturday, or at any time on Sunday or a federal holiday. As on-site construction activities would be restricted during these hours, it is anticipated that the use of construction lighting would be minimal.

The overall construction processes are already designed to be efficient in order to avoid excess monetary costs. For example, equipment and fuel are not typically used wastefully because of the added expense associated with renting the equipment, maintaining it, and fueling it. Therefore, the opportunities for future efficiency gains during construction are limited. Therefore, it is anticipated that the construction phase of the proposed project would not result in wasteful, inefficient, and unnecessary consumption of energy. Construction-related energy impacts would be less than significant.

Long-term Operational Impacts

The proposed project would consume energy as part of building operations and transportation activities. Operation of the proposed project would consume an estimated 478,814 kilowatt hours (kWh) of electricity. The proposed residential buildings would be built all-electric and the proposed project would install solar photovoltaic (PV) systems that would generate renewable energy, consistent with the 2022 Building Energy Efficiency Standards. The proposed project's buildings (including townhomes) would be designed and constructed in accordance with the City's latest adopted energy efficiency standards, which are based on the State's Building Energy Efficiency Standards. These are widely regarded as the most advanced Building Energy Efficiency Standards and compliance would ensure that building energy consumption would not be wasteful, inefficient, or unnecessary. As it relates to energy use from vehicular travel, the proposed project was estimated to generate approximately 412 daily vehicle trips for the 61-unit project. Project-related vehicle trips would consume an estimated 72,634 gallons of gasoline, diesel, natural gas, and electricity annually. Furthermore, the current office building generates energy usage and the proposed project's energy usage would be offset by energy usage under existing conditions. Thus, transportation fuel consumption would not be wasteful, inefficient, or unnecessary. Impacts would be less than significant.

b) Conflict with or obstruct a State or local plan for renewable energy or energy efficiency?

Less than significant impact. The proposed project would be evaluated with existing State energy standards and with energy conservation policies included in the General Plan. The proposed project would be served with electricity provided by SCE. In 2022, the latest year with available data, SCE obtained 33.2 percent of its electricity from renewable energy sources. SCE also offers a Green Rate 50 percent option that sources 66.7 percent of its power mix from eligible renewable energy sources and a Green Rate 100 percent option that sources 100 percent of its power mix from eligible renewable energy sources.[23] SCE would be required to meet the future objective of 60 percent of electricity from renewable energy sources by 2030. Additionally, the proposed project is planned to be an all-electric design and would therefore utilize more renewable energy sources during project operation compared to existing development.

The proposed residential project would be designed in accordance with Title 24, California's Energy Efficiency Standards for residential buildings. These standards include minimum energy efficiency requirements related to building envelope, mechanical systems (e.g., heating, ventilation, and air conditioning [HVAC] and water heating systems), and indoor and outdoor lighting. CALGreen requires all new garages for the proposed homes to install electrical panels of adequate size to support the installation of EV charging systems. Therefore, it is anticipated the proposed project would be designed and built to minimize transportation energy through the promotion of the use of electric-powered vehicles and it is anticipated that existing and planned capacity and supplies of

[23] Southern California Edison (SCE). 2022 Power Content Label. Website: https://www.sce.com/sites/default/files/custom-files/PDF_Files/SCE_2022_Power_Content_Label_B%26W.pdf. Accessed February 10, 2025.

transportation fuels would be sufficient to support the proposed project's demand. The proposed project would install solar PV systems in compliance with Title 24, Part 6, California's Energy Code.

The General Plan Conservation/Open Space Element contains the following policies related to energy conservation.

Energy Supply and Conservation

Policy COS-6.1 Encourage green building designs for new construction and renovation projects within the City.

Policy COS-6.2 Coordinate with regional and local energy suppliers to ensure adequate supplies of energy to meet community needs, implement energy conservation and public education programs, and identify alternative energy sources where appropriate.

Policy COS-6.3 Encourage building orientations and landscaping that enhance natural lighting and sun exposure.

Policy COS-6.3 Encourage expansion of neighborhood-level products and services and public transit opportunities throughout the City to reduce automobile use.

While several of these policies are requirements at City level or voluntary, compliance with Title 24 standards and other applicable regulations would ensure that the proposed project would not conflict with any of the energy conservation policies related to the proposed project's building, mechanical systems, and indoor and outdoor lighting.

The proposed project would comply with existing State energy standards and with energy conservation policies contained in the General Plan. As such, the proposed project would not conflict with State or local renewable or energy efficiency objectives. Potential impacts would be less than significant.

Mitigation Measures

None required.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐

Environmental Evaluation

Setting

Geology and Soils

The analysis in this section is based, in part, on the Geotechnical Due Diligence Review prepared by SA Geotechnical, Inc. (SA GEO) on May 31, 2024, included in Appendix D of this document. The report concluded that the proposed grading and development is considered geotechnically feasible provided the recommendations in the report are implemented during design, grading, and construction.

Paleontological Resources

The analysis in this section is based, in part, on the Cultural Resources Due Diligence Memorandum prepared by FCS on July 3, 2024, which included paleontological records searches of the San Diego Natural History Museum (The Nat) online fossil locality database and the Natural History Museum of Los Angeles County (NHM) collections, which are available online through the Integrated Digitized Biocollections (iDigBio), and the University of California Museum of Paleontology (UCMP) online fossil locality database.

Paleontological resources are the fossilized remains of plants and animals, including vertebrates (animals with backbones; fish, amphibians, reptiles, birds, mammals, etc.), invertebrates (animals without backbones; starfish, clams, coral, cephalopods, etc.), microscopic plants and animals (microfossils), and trace fossils/ichnofossils (i.e., footprints, burrows, etc.). Fossils are valuable, nonrenewable, scientific resources used to document the existence of extinct life forms and to reconstruct the environments in which they lived. Fossils are preserved in sedimentary rocks and, despite the abundance of these rocks and the vast numbers of organisms that have lived through time, preservation of plant or animal remains as fossils is a rare occurrence.

The Society of Vertebrate Paleontology (SVP) defines a significant fossil resource as, “identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic

information." Paleontological resources are considered older than recorded human history and/or older than middle Holocene (i.e., older than about 5,000 radiocarbon years).[24]

The sensitivity of an area with respect to paleontological resources hinges on its geologic setting and whether significant fossils have been discovered in the area or in similar geologic units.

Would the project:

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Less than significant impact. Seismically induced ground rupture is defined as the physical displacement of surface deposits in response to an earthquake's seismic waves. Ground rupture is most likely to occur along active faults and typically occurs during earthquakes of magnitude 5.0 or higher. Ground rupture only affects the area immediately adjacent to a fault.

The project site is located in Southern California, which is a seismically active area. The type and magnitude of seismic hazards affecting the project site are dependent on the distance to the causative fault and the intensity and magnitude of the seismic event. The seismic hazards may be primary, such as surface rupture and/or ground shaking, or secondary, such as liquefaction and/or ground lurching.

Active faults are not known to exist within the project site, as discussed in the Geotechnical Due Diligence Review. According to the Geotechnical Due Diligence Review, the project site is not within a California State-designated earthquake fault zone, and the potential for primary ground rupture is considered very low. Furthermore, according to the most recent Alquist-Priolo Earthquake Fault Zone and Seismic Hazard Zone Map, a known earthquake fault is not located near the project site or known to traverse the project site.[25] Additionally, the General Plan Safety Element states that there are no known fault zones or seismic zones in the City.[26] Therefore, impacts related to rupture of a known earthquake fault would be less than significant.

[24] Society of Vertebrate Paleontology (SVP). 2010. Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources. Society of Vertebrate Paleontology Impact Mitigation Guidelines Revision Committee.

[25] California Geologic Survey. 2024. Earthquake Zones of Required Investigation Map. Website: https://maps.conservation.ca.gov/cgs/informationwarehouse/eqzapp/?print_preview=true. Accessed December 3, 2024.

[26] City of Aliso Viejo. 2004. General Plan Safety Element. Website: https://www.avcity.org/DocumentCenter/View/395/Safety-Element-PDF. Accessed January 22, 2025.

ii) Strong seismic ground shaking?

Less than significant impact. The City, as well as most of Southern California, is located in a region of historic seismic activity. Strong levels of seismic ground shaking can cause damage to buildings. The intensity of ground shaking on the project site would depend upon the earthquake's magnitude, distance to the epicenter, and geology of the area between the project site and epicenter.

According to the Geotechnical Due Diligence Review, the closest active fault to the project site is the Newport-Inglewood Fault located 15.76 miles northwest and the San Joaquin Hills Fault.[27] During seismic events, the project site could experience moderate ground shaking associated with the faults described above. The maximum moment magnitude would be generated from the San Joaquin Hills Fault; however, other regionally active faults could produce ground shaking at the project site during an earthquake.[28]

Pursuant to Municipal Code Chapter 13.02, Building Regulations, the City has adopted the 2022 CBC and related codes. The proposed project would be required to comply with all applicable regulations in the 2022 CBC as amended by the Municipal Code, which includes design requirements to minimize the effects of seismic ground shaking. The proposed project would be subject to the current CBC, as adopted by the City's Planning and Building Department, with respect to seismic design parameters. Conformance with these standard engineering practices and design criteria would reduce the effects of seismic ground shaking.

The Geotechnical Due Diligence Review noted that the project site has the potential for strong seismic shaking during an earthquake event. Section 3 of the Geotechnical Due Diligence Review makes site-specific recommendations concerning earthwork, grading and fill, foundations, seismic design parameters, corrosivity, groundwater, and stormwater infiltration. The Geotechnical Due Diligence Review concluded that the proposed project would be feasible from a geotechnical standpoint provided that the preliminary recommendations are implemented during design, grading, and construction. Municipal Code Chapter 13.08.170, Soil engineering and engineering geology reports, requires implementation of the recommendations provided in the Geotechnical Due Diligence Review, including seismic design parameters. Compliance with Municipal Code Chapter 13.08.170 and the 2022 CBC would reduce potential impacts related to strong seismic ground shaking to a less than significant level.

Following compliance with standard engineering practices, the CBC, the Municipal Code, and the site-specific recommendations provided in the Geotechnical Due Diligence Review, potential impacts concerning exposure of people or structures to potential adverse effects involving strong seismic ground shaking would be less than significant.

[27] SA Geotechnical, Inc. 2024. Geotechnical Subsurface Exploration Due Diligence Study, and Preliminary Geotechnical Recommendations, Proposed Residential Development, 95 Argonaut, City of Aliso Viejo, California. May 31.

[28] Ibid.

iii) Seismic-related ground failure, including liquefaction?

No impact. Liquefaction is a phenomenon where earthquake-induced ground vibrations increase the pore pressure in saturated, granular soils until it is equal to the confining, overburden pressure. When this occurs, the soil can completely lose its shear strength and enter a liquefied state. For liquefaction to occur, a project site must be subject to three factors: underlying loose, course-grained (sandy) soils, a groundwater depth of approximately 25 feet, and a potential for seismic shaking from nearby large-magnitude earthquakes.

The project site is not located in a Liquefaction Hazard Zone.[29] Additionally, the Geotechnical Due Diligence Review indicates that the project site is not located within a potential liquefaction zone as defined by the State's Seismic Hazard Mapping. The Geotechnical Due Diligence Review states that based on the absence of groundwater in the uppermost 50 feet, liquefaction potential is considered very low to nil. Furthermore, the General Plan indicates that the project site is not located within an area with liquefaction potential.[30] Therefore, the proposed project would not cause potential substantial adverse effects involving seismic-related ground failure, including liquefaction. There would be no impact.

iv) Landslides?

Less than significant impact. Landslides can occur if ground shaking and/or heavy rainfall disturb areas of steep slopes consisting of unstable soils. According to the General Plan, earthquake-induced landslides have the potential to occur within the City. Generally, these types of failures consist of rock falls, landslides, and debris flows. Areas having the potential for earthquake-induced landslides generally occur in areas of steep slopes consisting of unstable soils are disturbed by ground shaking and/or heavy rainfall.[31]

The project site is not mapped within an area with landslide potential by the General Plan. As shown in the General Plan Safety Policy Map, the nearest landslide zone is located adjacent to the project site's eastern property boundary.[32] However, as shown in the Geotechnical Due Diligence Review, the project site is not in an area mapped as having previous occurrences of earthquake-induced landslides or in an area where geological conditions indicate a potential for landslides. An approximately 20-foot-high descending slope is present along the eastern property boundary. Accordingly, the Geotechnical Due Diligence Review conducted a slope stability analysis. The Geotechnical Due Diligence Review determined that no significant modifications to the existing fill slope along the eastern property line are planned as part of the proposed project. The existing slope

[31] City of Aliso Viejo. 2004. General Plan, Safety Element. Website: https://avcity.org/DocumentCenter/View/395/Safety-Element-PDF. Accessed December 3, 2024.

[32] City of Aliso Viejo. 2004. General Plan, Figure S-1 Safety Policy Map. Website: https://avcity.org/DocumentCenter/View/384/Safety-Policy-Map-PDF. Accessed December 3, 2024.

is composed of compacted artificial fill materials, and the proposed improvements are not anticipated to adversely impact the slope. Based on the slope stability analysis, the existing slope was found to be grossly stable. However, in general, slopes are considered susceptible to surficial instability in the form of erosion, raveling, and slumping. Municipal Code Chapter 13.08.170 requires implementation of the site-specific recommendations referenced in the Geotechnical Due Diligence Review related to slope stability and slope setbacks. These recommendations would be required as conditions of approval (COA GEO-1) in accordance with Municipal Code Chapter 13.08.170 and would ensure that on-site runoff is controlled and directed off-site in a nonerosive manner and that site drainage and slopes are maintained over the life of the project and would establish minimum setback criteria for descending slopes. Therefore, the proposed project would not result in significant impacts related to landslides. Impacts would be less than significant.

b) Result in substantial soil erosion or the loss of topsoil?

Less than significant impact. The Geotechnical Due Diligence Review indicates that the project site is underlain by sedimentary bedrock of the Monterey and Niguel Formations that is successively overlain by unconsolidated alluvium. The Geotechnical Due Diligence Review noted the presence of compacted artificial fill underlying the site as a result of original mass grading. Approximately 25 to 75 feet of artificial fill was encountered in all borings, which generally consisted of olive gray, olive brown, bluish gray, brown, and black clayey silt, clay, silty/sandy clay, clayey sand, and silty sand that was moist to wet and medium stiff to hard. The proposed project would be required to implement the site-specific recommendations referenced in the Geotechnical Due Diligence Review, which includes remedial grading consisting of removal of weathered/unsuitable artificial fill materials in their entirety.

During construction, the proposed project would be required to comply with erosion and siltation control measures outlined in Municipal Code Chapter 13.08, Grading and Excavation Code, which requires that excavations and fills that may affect drainage and watercourses be performed in accordance with good engineering practice, thereby reducing to a minimum the hazards and damage to public and private property. This would include measures such as using sandbags or straw bales as temporary erosion control.

Additionally, the proposed project would be subject to compliance with the National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order No. 2009-0009DWQ, and all subsequent amendments) (Construction General Permit); see Impact 2.10(a). The Construction General Permit requires development and implementation of a Storm Water Pollution Prevention Plan (SWPPP) and monitoring plan, which must include erosion and sediment control BMPs that would meet or exceed measures required by the Construction General Permit to control potential construction-related pollutants. Following compliance with the established regulatory framework, including Municipal Code Chapter 13.08 and Chapter 13.08.170 and the Construction General Permit, potential impacts concerning soil erosion and loss of topsoil would be less than significant.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Less than significant impact. As discussed in Impact 2.7(a), the project site would not be subject to significant impacts from seismically induced liquefaction or landslides.

Lateral spreading is a type of ground deformation that occurs when surface material extends or spreads on gentle slopes.[33] Ground shaking, especially when inducing liquefaction, may cause lateral spreading toward unsupported slopes.

Subsidence is a gradual settling or sudden sinking of Earth's surface that occurs when the withdrawal of groundwater, oil, or natural gas vertically displaces a large portion of land. Soils that are particularly subject to subsidence include those with high silt or clay content.

Sedimentary bedrock of the Monterey and Niguel Formations that is successively overlain by unconsolidated alluvium underlie the project site. The Geotechnical Due Diligence Review evaluated site conditions and identified the need for removal and recompaction of all weathered/unsuitable fill materials in order to provide competent subgrade and bearing conditions for the proposed structural slabs and foundations. Accordingly, the Geotechnical Due Diligence Study recommends disposal of the upper 3 to 4 feet of any unsuitable/disturbed artificial fill material. The removals for building pads should extend a minimum of 4 feet laterally, beyond the building footprint. Removals within the proposed drive areas may be limited to removal and recompaction of the upper 1 to 2 feet, below existing grades. Where deeper unsuitable material is encountered, the removals should be extended to the bottom of unsuitable materials to competent, unweathered/undisturbed artificial fill. Earthwork would be required to meet compaction standards and import soils must be approved by a Geotechnical Consultant.

Pursuant to Municipal Code Chapter 13.08.170, Soil engineering and engineering geology reports, the proposed project would incorporate all site-specific recommendations of the Geotechnical Due Diligence Study as COA GEO-1, which would address any identified potential soil and geologic hazards. Furthermore, the proposed project would be required to comply with all applicable regulations in the 2022 CBC as amended by the Municipal Code, which includes design requirements to mitigate the effects of potential soil and geologic hazards, including landslide, lateral spreading, subsidence, liquefaction, and seismic settlement. The City would review project design and construction plans for compliance with the CBC and the Municipal Code prior to construction activities. Thus, compliance with the City's established regulatory framework and standard engineering practices and design criteria, which would be verified through the City's plan review process, would ensure potential impacts associated with a geologic unit or soil that is unstable or would become unstable at the project site would be less than significant.

[33] United States Geological Survey (USGS). Lateral Spread. https://www.usgs.gov/media/images/lateral-spread. Accessed January 22, 2025.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Less than significant impact. The Geotechnical Due Diligence Study anticipated on-site soils to have a "High" expansion potential and would be subject to climatic and landscape moisture. As such, the recommendations provided in the Geotechnical Due Diligence Review include foundation design parameters such as remedial grading measures, post-tensioned slabs, and caisson design measures. Municipal Code Chapter 13.08.170 requires implementation of the recommendations provided in the Geotechnical Due Diligence Review. This requirement is incorporated into the proposed project as COA GEO-1. Additionally, the City's Building Division would review construction plans to verify compliance with standard engineering practices, the Aliso Viejo Municipal Code, and the CBC. Compliance with the Municipal Code and the City's established regulatory framework; standard engineering practices, which would be verified through the City's plan review process; and the CBC would ensure potential impacts related to expansive soil are less than significant.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

No impact. Sewers are available for disposal of the proposed project's wastewater. The proposed project would connect to the existing sanitary sewer system for wastewater disposal and would not include the use of septic tanks. Therefore, no impacts would occur, and no mitigation is required.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less than significant impact with mitigation incorporated. Geologic mapping indicates that the project site is underlain by sedimentary bedrock of the Monterey Formation that is successively overlain by fill. According to the Geotechnical Due Diligence Study subsurface exploration, the project site was mass graded in the 1980s, resulting in thick artificial fill materials 25 to 70 feet deep placed over bedrock. Undisturbed sediments of the Monterey and Niguel Formations were encountered at depth of 25 to 75 feet.

According to The Nat online fossil locality database and the NHM collections (which are available online through the iDigBio), there are no recorded fossil localities within the project site.[34,35] There are 23 recorded vertebrate fossil localities (4521, 5547, 5752, 6283, 6284, 6286, 6550, 6551, 7541, 7532, 7543, 7544, 7546, 7547, 7548, 7549, 7550, 7551, 7552, 7553, 7554, 7555 and 7755) approximately 1.09 miles northeast of the project site. Additional localities lie within 1 mile southwest of the site.

[34] Integrated Digitized Biocollections (iDigBio). 2024. Online records search tool. National Science Foundation. Website: https://www.idigbio.org/portal/search. Accessed on December 26, 2024.

[35] San Diego Natural History Museum (The Nat). 2024. Paleontology Collection Database Results, Pleistocene-age vertebrate localities in Aliso Viejo, CA.

To address the potential for an unanticipated discovery during construction, implementation of MM GEO-1 would be required. MM GEO-1 would require a worker training by a qualified Paleontologist, prior to the start of construction, to inform construction personnel of the potential to encounter fossils and procedures to follow in the event fossils are encountered during construction. Implementation of MM GEO-1 would reduce the potentially significant impact to less than significant. The impact would be less than significant with mitigation incorporated.

Condition of Approval

COA GEO-1 In accordance with Municipal Code 13.08.170, Soil Engineering and Engineering Geology Reports, a soil engineering and engineering geology report shall be required for grading projects unless otherwise waived by the building official. The reports shall include information appropriate for the site including any information required by the building official. Recommendations included in the reports and approved by the building official shall be incorporated in the grading plans or specifications.

Accordingly, prior to issuance of grading permit, the project applicant shall provide grading plans or specifications that include all recommendations from the proposed project's May 31, 2024, Geotechnical Subsurface Exploration Due Diligence Study prepared by SA Geotechnical, Inc., or from the latest geotechnical study for the proposed project.

Mitigation Measures

MM GEO-1 The project applicant shall enlist a qualified Paleontologist (meeting the standards of the Society of Vertebrate Paleontology [SVP]) to prepare a Worker Environmental Awareness Program (WEAP) presentation for construction personnel. It will include information on paleontological resources, laws protecting them, types of fossils that could occur at the project site, and protocol for unanticipated discoveries. In the event that fossils are discovered during construction, excavations within 50 feet of the find shall be temporarily halted or diverted. The contractor shall notify the qualified Paleontologist to examine the discovery. The qualified Paleontologist shall document the discovery as needed in accordance with SVP standards, evaluate the potential resource, and assess the significance of the find under the criteria set forth in CEQA Guidelines Section 15064.5. Based on the significance of the find, the qualified Paleontologist shall determine procedures to be followed before construction is allowed to resume at the location of the find. If, in consultation with the qualified Paleontologist, it is determined that avoidance is not feasible, the qualified Paleontologist shall prepare a Paleontological Resources Impact Mitigation Program (PRIMP) to outline salvage and recovery procedures. If deemed necessary by the qualified Paleontologist, the PRIMP shall include construction monitoring requirements as well. The PRIMP shall be submitted to the City for review and approval and the approved plan shall be implemented.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.8 Greenhouse Gas Emissions *Would the project:*				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

Environmental Evaluation

Setting and Threshold of Significance

The project site is within the SoCAB, which is under the jurisdiction of the SCAQMD. In 2008, the SCAQMD formed a working group to identify GHG emissions thresholds for land use projects that could be used by local lead agencies in the SoCAB. The working group developed several different options, which are contained in the SCAQMD Draft Guidance Document-Interim CEQA GHG Significance Threshold (Interim GHG Thresholds). The working group has not provided additional guidance since the release of the interim guidance in 2008. In 2010, the SCAQMD Tier 3 threshold was expanded to include non-industrial projects, as explained in the minutes from the most recent working group meeting.[36] The SCAQMD Board has not approved the thresholds; however, the Guidance Document provides substantial evidence supporting the approaches to significance of GHG emissions that can be considered by the Lead Agency in adopting its own threshold.

In summary, the SCAQMD's draft threshold uses the Executive Order S-3-05 goal as the basis for the Tier 3 screening level. Achieving the Executive Order's objective would contribute to worldwide efforts to cap CO_2 concentrations at 450 parts per million (ppm) and stabilize global climate.

To determine whether the proposed project would have a significant impact with respect to the generation of GHG emissions, the appropriate tier for this project is Tier 3, which states that if GHG emissions are less than 3,000 metric tons (MT) carbon dioxide equivalent (CO_2e) per year, project-level and cumulative GHG emissions would be less than significant. However, this threshold was developed to meet the 2020 GHG emissions goals. To be consistent with State goals detailed in Senate Bill (SB) 32, Executive Order B-30-15, and Executive Order S-3-05 to reduce GHG emissions

[36] South Coast Air Quality Management District (SCAQMD). 2010. Greenhouse Gas CEQA Threshold Stakeholder Working Group Meeting No. 15. September 28.

by 40 percent below 1990 levels by 2030, a scaled screening GHG threshold can be developed for an assumed opening year of 2027. Though the SCAQMD has not published a quantified threshold beyond 2020, a threshold of 2,160 MT CO_2e per year would be appropriate.[37] Therefore, this analysis utilizes 2,160 MT CO_2e per year for a quantitative threshold of significance for GHG emissions and ARB's 2022 Scoping Plan for consistency with an applicable GHG emissions reduction plan.

A project's incremental contribution to a cumulative impact can be found not to be cumulatively considerable if the project would comply with an approved plan or mitigation program that provides specific requirements to avoid or substantially lessen the cumulative problem within the geographic area of the project.

This analysis includes estimates of GHG emissions associated with project construction and operational activities using CalEEMod Version 2022.1. The model is considered by SCAQMD to be an accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects in California. These estimates have been disclosed to comply with CEQA Guidelines Section 15064.4(a) and to provide evidence that the implementation of the plans, policies, and regulations adopted to reduce GHG emissions would result in actual GHG emissions reduction.

Would the project:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less than significant impact. Both construction and operational activities have the potential to generate GHG emissions. The following is a discussion of the proposed project's contribution to GHG emissions during both the construction and operation phases.

Construction Greenhouse Gas Emissions

The proposed project would generate GHG emissions during construction activities, resulting from emission sources such as construction equipment, haul trucks, and construction worker vehicles. Although these emissions would be temporary and short-term in nature, they could represent a substantial contribution of GHG emissions. Construction emissions were modeled using CalEEMod Version 2022.1. Table 7, below, shows the annual construction GHG emissions.

Table 7: Proposed Project Construction GHG Emissions

Construction Year	Total GHG Emissions (MT CO_2e per year)
Project Construction–2026	268
Project Construction–2027	192

[37] The 2,160 MT CO_2e per year threshold for opening year 2027 is calculated by reducing the 3,000 MT CO_2e per year threshold (developed to meet the 2020 GHG emissions goals) by 40 percent, then interpolating to obtain the scaled GHG emissions threshold for 2027. Based on a starting threshold of 3,000 MT CO_2e per year in 2020 a threshold of 1,800 MT CO_2e per year in 2030, the 3,000 MT CO_2e per year threshold would be reduced by 120 MT CO_2e per year through 2030.

Construction Year	Total GHG Emissions (MT CO_2e per year)
Total Construction Emissions	**460**
Emissions Amortized Over 30 Years[1]	**15**

Notes:
GHG = greenhouse gas
MT CO_2e = metric tons carbon dioxide equivalent
[1] Construction GHG emissions are amortized over the 30-year lifetime of the proposed project.
Source: Appendix A.

As shown above, the proposed project would generate approximately 460 MT CO_2e during construction. Over 30 years the construction GHG emissions would be amortized to approximately 15 metric tons carbon dioxide equivalent (MT CO_2e) per year. Since SCAQMD has not established a construction GHG threshold, total construction emissions were amortized over 30 years and included in the emissions inventory to account for the short-term, one-time GHG emissions from the construction phase of the proposed project.

Operational Greenhouse Gas Emissions

Operational, or long-term, emissions are those emissions that occur over the life of the project. Project operations were modeled for the 2027 operational year. To present a conservative estimate of emissions, the baseline for the analysis was assumed to be zero. Because the proposed project would demolish and replace an existing structure, the proposed project's incremental increase in GHG emissions would be lower than what was estimated and presented below. Sources for operational GHG emissions are summarized below.

Motor Vehicles: These emissions refer to GHG emissions contained in the exhaust from the cars and other on-road vehicles that would travel to and from the project site. Based on the project-specific trip generation rates presented in the Trip Generation Memorandum, the proposed project was estimated to generate 412 daily vehicle trips for the 61-unit project.[38] For the purpose of conservative analysis, the emissions in Table 8, below, do not take credit for the vehicle trips and associated emissions that would be replaced by the proposed project.

Natural Gas: These emissions refer to the GHG emissions that occur when natural gas is burned on the project site. The proposed project would be built all-electric and would, therefore, not result in any GHG emissions from natural gas use.

Indirect Electricity: These emissions refer to those generated by off-site power plants to supply electricity required for the proposed project. Although not included in the modeling and Table 8, below, the proposed project would install PV solar panels, consistent with Title 24, Part 6, California's Energy

[38] Urban Crossroads. February 12. Argonaut Residential Trip Generation Assessment. 2025.

Code. The inclusion of solar panels would provide on-site renewable energy that would reduce the proposed project's consumption of electricity generated at off-site power plants.

Area Sources: These emissions refer to those produced during activities such as landscape maintenance.

Water Transport: These emissions refer to those generated by the electricity required to transport and treat the water to be used on the project site.

Waste: These emissions refer to the GHG emissions produced by decomposing waste generated by the proposed project.

Table 8 presents the estimated annual GHG emissions from the proposed project's operational activities. As shown in Table 8, the proposed project would generate approximately 556 MT CO_2e per year after the inclusion of 15 MT CO_2e per year from project construction. In addition, with continued implementation of various Statewide measures, the proposed project's operational energy and mobile source emissions would continue to decline in the future.

Table 8: Operational Greenhouse Gas Emissions—Unmitigated

GHG Emissions Source	GHG Emissions (MT CO_2e per year)
Area	1
Energy	76
Mobile (Automobiles)	444
Waste	14
Water	6
Amortized Construction	15
Total Annual Project Emissions	**556**
Applicable Threshold[1]	**2,160**
Exceed Applicable Threshold	**No**

Notes:
MT CO_2e = metric tons carbon dioxide equivalent
[1] The 2,160 MT CO_2e per year threshold for opening year of 2027 is calculated by reducing the 3,000 MT CO_2e per year threshold (developed to meet the 2020 GHG emissions goals) by 40 percent, then interpolating to obtain the scaled GHG emissions threshold for 2027.
Source: Appendix A.

As shown in Table 8, the proposed project's GHG emissions would not exceed the applicable threshold of significance. In addition, the emissions shown in Table 8 were estimated without taking any reductions for the existing land uses. The proposed project would replace existing structures with new residential buildings. The existing uses are currently generating GHG emissions that would no

longer occur once the existing structures are demolished. Thus, the proposed project's net increase in GHG emissions would be even lower than what is shown in Table 8. In summary, construction and operational GHG emissions would result in a less than significant impact on the environment.

b) Conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?2022 Scoping Plan Consistency

The 2022 Scoping Plan identifies additional GHG reduction actions and strategies necessary to achieve the AB 1279 target of 85 percent below 1990 levels by 2045. These actions and strategies build upon those identified in the first update to the Scoping Plan (2013) and in the second update to the Scoping Plan (2017). Although a number of these measures are currently established as Statewide regulations, some measures have not yet been formally proposed or adopted. It is expected that these measures or similar actions to reduce GHG emissions will be adopted as required to achieve Statewide GHG emissions targets. Many of the measures are implemented at the State level and therefore not applicable to the proposed project. However, as it relates to local climate actions, Appendix D of the ARB 2022 Scoping Plan highlights three priority areas for local jurisdictions to focus on when reducing GHGs: (1) transportation electrification; (2) VMT reduction; and (3) building decarbonization. The proposed project would be consistent with and would further the goals of all three priority areas.

Regarding transportation electrification, the proposed project would provide EV charging infrastructure in accordance with the State CALGreen Code. Accordingly, each dwelling unit would be EV capable by installing a raceway to accommodate a future branch circuit for future electric vehicle supply equipment EVSE installation.[39] Therefore, the proposed project would be consistent with transportation electrification by having the infrastructure to accommodate the future residents' EV charging needs.

Regarding VMT reduction, according to the Argonaut Residential Vehicle Miles Traveled Screening Evaluated, prepared by Urban Crossroads in February 12, 2025, the City Guidelines state that local-serving uses such as day care centers, non-destination hotels, affordable housing, places of worship, municipal services, and other local essential services may be presumed to have a less than significant impact as local-serving in nature and would tend to shorten vehicle trips. The proposed project does not include any local-serving uses. However, the City Guidelines also consider small projects that generate fewer than 110 net new daily vehicle trips to have a less than significant VMT impact. The Argonaut Residential Trip Generation Assessment (Appendix I) estimates the proposed project to generate a net increase of 79 daily vehicle trips, which does not exceed the 110 daily vehicle trip threshold. Therefore, the proposed project would not have a significant VMT impact and would be consistent with VMT reduction goals.

[39] California Energy Codes and Standards. 2022. CALGreen Light-Duty Electric Vehicle Charging Infrastructure Requirements. Website: https://calgreeninfo.com/download/47/resource_file/fieldList/2022+CALGreen+EV+Light+Duty.pdf. Accessed February 10, 2025.

Regarding building decarbonization, the proposed project would have an all-electric design and would therefore comply with this goal. Furthermore, the proposed project complies with all relevant Energy Code and CALGreen requirements, which would ensure energy efficiency. Impact Section 2.6 a) demonstrates that the proposed project will not result in any wasteful, inefficient, or unnecessary energy usage as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the CEQA Guidelines.

The proposed project would be consistent with the appliable measures outlined in the 2022 Scoping Plan. Therefore, the proposed project would be consistent with the 2022 ARB Scoping Plan and potential impacts would be less than significant.

Mitigation Measures

None required.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.9 Hazards and Hazardous Materials *Would the project:*				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐

Environmental Evaluation

Setting

The analysis in this section is based, in part, on the Phase I Environmental Site Assessment (Phase I ESA) prepared by Hillmann Consulting LLC, on April 24, 2024. The Phase I ESA is included in Appendix E of this document.

No Recognized Environmental Conditions (RECs),[40] Historical Recognized Environmental Conditions (HRECs),[41] or Controlled Recognized Environmental Conditions (CRECs)[42] were identified on the project site. There were no significant data gaps identified. *De minimis* conditions are described below.[43]

The project site appears to have been developed as agricultural land from at least 1938 to 1981. Given the 43 years since any agricultural use as well as the grading activities of current development, any remaining pesticide contamination is unlikely and therefore this is not considered to be a REC in connection with the project site.

Would the project:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less than significant impact. Construction of the proposed project would include the routine transport, use, and disposal of limited quantities of hazardous materials necessary for construction, including fuel and solvents. The use of these hazardous materials would be typical of construction

[40] The term Recognized Environmental Condition (REC) is defined by American Society of Testing and Materials (ASTM) E1527-21 as "(1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment."

[41] The term Historical Recognized Environmental Condition (HREC) is defined as a "previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations)." The ASTM E1527-21 standard has clarified that a historical recognized environmental condition is not a recognized environmental condition.

[42] The term Controlled Recognized Environmental Condition (CREC) is a type of recognized environmental condition and defined by ASTM E1527-21 as a "recognized environmental condition affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of required controls (for example, activity and use limitations or other property use limitations)."

[43] The term *de minimis* condition is defined by the ASTM as, "…a condition related to a release that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies." A condition determined to be a *de minimis* condition is not an REC nor a CREC.

projects, would be short-term, and would be handled in accordance with standard construction practices, as well as with applicable federal, State, and local regulations. Standard construction practices would be observed such that hazardous materials are appropriately contained and remediated as needed, as required by local, State, and federal law. Regulatory requirements would include California Code of Regulations Title 22, Division 4.5, for appropriate management of hazardous materials, as well as the requirements of the EPA, Resource Conservation and Recovery Act (RCRA), California Department of Toxic Substance Control (DTSC), Division of Occupational Safety and Health (Cal/OSHA), Caltrans, and SCAQMD.

The proposed project would include residential development, which does not typically use or store large quantities of hazardous materials. During the operational phase of the proposed project, hazardous materials may be handled on the project site. Hazardous materials that would likely be used during operation would likely be limited to fertilizers, herbicides, pesticides, solvents, household cleaning agents, and similar materials used for maintenance and operation of the apartments, apartment building facilities, amenities, and landscaping. These types of materials are common and represent a low risk to people and the environment when used as intended. The proposed project would also be required to adhere to State and federal regulatory requirements as discussed above. Therefore, impacts associated with hazardous materials would be less than significant.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less than significant impact. As discussed above, the Phase I ESA determined that the project site appears to have been developed as agricultural land from at least 1938 to 1981. However, the Phase I ESA determined that the previous agricultural use is not considered a REC. The Phase I ESA determined no RECs, HRECs, or CRECs were identified on the project site.

The Phase I ESA determined there is a potential that asbestos-containing materials (ACMs) are present in acoustical ceiling tiles, adhesives/mastics, and drywall. In the event ACM is detected, proper removal and disposal of the materials in compliance with regulatory requirements such as SCAQMD Rule 1403 (Asbestos Emissions from Demolition/Renovation Activities) would occur prior to any demolition activities.

As previously discussed above under Impact 2.9(a), the proposed project would be required to comply with all applicable local, State, and federal laws and regulations pertaining to the transport, use, disposal, handling, and storage of hazardous waste during the construction phase to reduce the likelihood and severity of accidents during transit. Proper handling of the use and disposal of hazardous materials associated with residential uses would reduce the potential for exposure.

Operation of the proposed project would not involve the transport, use, or disposal of large quantities of hazardous materials. The use of hazardous materials on the project site post-construction would consist of those commonly used in a residential setting for routine maintenance and cleaning and would not be of a significant quantity to create a reasonably foreseeable upset or accident. As such,

the proposed project would not introduce uses to the site that would create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. The proposed project would be required to comply with additional regulatory requirements including, but not limited to, the Code of Federal Regulations, Title 49, Transportation, specific to the transport of hazardous materials; California Code of Regulations Titles 8, 22, and Title 26, and their enabling legislation set forth in California Health and Safety Code Division 20, Chapter 6.95, Hazardous Materials Release Response Plans and Inventory; and the requirements of the Orange County Health Care Agency Environmental Health Division (i.e., the Certified Unified Program Agency), which would ensure safety standards related to the use and storage of hazardous materials are implemented. Consistency with local, State, and federal regulations related to the transport, storage, use, and disposal of hazardous materials would minimize the potential for upset and accident conditions to occur within the site. Therefore, impacts would be less than significant, and no mitigation would be required.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

No impact. There are no schools within 0.25 mile of the project site. The nearest schools are Don Juan Avila Middle and Elementary School (26278 Wood Canyon Drive), 0.99 mile southwest of the project site; Aliso Viejo Middle School (111 Park Avenue), 1.13 miles southeast of the project site; and Laguna Hills High School (25401 Paseo De Valencia), 1.16-mile northeast of the project site. As discussed in Impact 2.9(a), construction of the proposed project would include the limited use of hazardous materials, such as fuel and solvents. The use of these hazardous materials would be in compliance with all applicable local, State, and federal regulations. During operation of the proposed project, limited use of hazardous materials would likely be used for building maintenance. Similarly, these hazardous materials would be stored, handled, and disposed of in accordance with applicable regulations. Thus, the proposed project would not include any uses that could potentially generate hazardous materials in significant quantities that would have an impact to surrounding schools. Therefore, there would be no impact.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

No impact. Government Code Section 65962.5 refers to the Hazardous Waste and Substance Site List, commonly known as the Cortese List. The Cortese List contains hazardous waste and substance sites with known underground storage tanks (USTs) having a reportable release; and solid waste disposal facilities from which there is a known migration. The Cortese List also includes hazardous substance sites selected for remedial action; historic Cortese sites; and sites with known toxic materials identified through the abandoned site assessment program. The proposed project site is not located on a site which is included on a hazardous materials site list compiled pursuant to California Government Code Section 65962.5. The closest site recognized by the Cortese List is approximately 2.04-miles northeast of the project site and is an active Voluntary Cleanup site located at 23804

Mercury Road in Lake Forest.[44] None of the activities occurring at this site would be close enough to the project site to have an impact. Therefore, the proposed project would not create a significant hazard to the public or the environment. No impact would occur, and no mitigation is required.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

No impact. The project site is not within 2 miles of an airport. The nearest airport is John Wayne Airport located 9.65 miles northwest of the project site. The project site is not within the Airport Influence Areas of this airport and is not located within an airport land use plan. Therefore, the proposed project would not result in a safety hazard of excessive noise for people working or living at the project site. No impact would occur.

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less than significant impact. The City has developed an Emergency Operations Plan (EOP) consistent with the Standardized Emergency Management System (SEMS) outlining the City's response to extraordinary emergency situations associated with natural disasters, technological incidents, and national security emergencies. The EOP is designed to incorporate and coordinate all the facilities and personnel of the City into an efficient organization capable of reacting adequately in the face of any disaster and to conduct such operations as the nature of the disaster deems necessary. It serves as an extension of the California Emergency Plan and the Emergency Resource Management Plan. The EOP is not intended to address normal day-to-day emergencies or the well-established and routine procedures used in coping with such emergencies. Instead, the operational concepts reflected in the EOP focus on potential large-scale disasters that can generate unique situations requiring unusual emergency responses. The EOP provides comprehensive policy and guidance for emergency and response operations and details the responsibilities of residents, organizations, and City departments. The EOP also establishes evacuation routes and identifies emergency shelter facilities and water supplies.

The General Plan Safety Element identifies evacuation routes in the City. Within the vicinity of the project site, Aliso Creek Road and Glenwood Drive are identified as primary evacuation routes.[45]

The project site is within Zone 20 of Aliso Viejo's Evacuation Zones. Designated evacuation zones within Zone 20 include Glenwood Drive, Aliso Creek Road, Aliso Viejo Parkway, and Moulton

[44] Department of Toxic Substances Control. 2024. EnviroStor Hazardous Waste and Substances List. Website: https://www.envirostor.dtsc.ca.gov/public/map/?myaddress=Aliso+Viejo. Accessed December 4, 2024.

[45] City of Aliso Viejo. 2004. General Plan, Figure S-1 Safety Policy Map. Website: https://avcity.org/DocumentCenter/View/384/Safety-Policy-Map-PDF. Accessed December 3, 2024.

Parkway.[46] The project site is adjacent to Glenwood Drive, and construction would not require closure or partial closure of Glenwood Drive. The proposed project would be constructed completely within the project site and construction equipment would access the project site via Argonaut, which is the main access point to the project site. If any road closures to Argonaut are required, the project applicant and construction crew would be required to coordinate with the City of Aliso Viejo Public Works Department to ensure that emergency access routes are maintained during construction. Thus, construction of the proposed project would not impede the use of surrounding roadways for emergencies or access for emergency response vehicles.

Operation of the proposed project would not interfere with roadways, and the proposed project would provide internal circulation for emergency vehicle access. The proposed project has been designed to provide emergency service providers access to the site from any of the public streets or the drive aisles. The 24-foot private drive meets Orange County Fire Authority (OCFA) turnaround and access requirements (See Exhibit 5). The design of the proposed project would provide adequate emergency access consistent with City requirements, including the required number and design of access points and safety features. Therefore, the proposed project would not result in significant impacts to emergency access during construction and/or operation. The proposed project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Impacts would be less than significant.

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

No impact. The project site is located in an urbanized, flat area and does not contain slopes that could contribute to wildfire. According to the General Plan, the project site is not located along an urban-wildfire interface and is not located in the portions of the City abutting the Aliso and Woods Canyon Wilderness Park within OCFA's Very High Fire Hazard Severity Zone (VHFHSZ), where wildfires are of the greatest risk.[47] Additionally, the project site and its surrounding areas do not have a history of wildfire.[48] California Department of Forestry and Fire Protection (CAL FIRE) has mapped fire threat potential throughout California and ranks fire threats on a scale of no fire threat, moderate, high, and very high fire severity. According to the CAL FIRE Hazards Severity Zone Mape Viewer, the project site is not located in a Fire Hazard Severity Zone (FHSZ).[49]

[46] City of Aliso Viejo. 2024. Citywide Evacuation Zones. Website: https://avcity.org/DocumentCenter/View/3750. Accessed January 21, 2025.

[47] City of Aliso Viejo. 2004. General Plan, Safety Element. Website: https:// avcity.org/DocumentCenter/View/395/Safety-Element-PDF. Accessed December 4, 2024.

[48] California Department of Forestry and Fire Protection (CAL FIRE). 2024. California Wildfire History Map. Website: https:// projects.capradio.org/california-fire-history/#10.64/33.5901/-117.7005. Accessed December 4, 2024.

[49] California Department of Forestry and Fire Protection (CAL FIRE). 2024. Fire Hazard Severity Zones in State Responsibility Area. Website: https:// calfire-forestry.maps.arcgis.com/apps/webappviewer/index.html?id=988d431a42b242b29d89597ab693d008. Accessed December 4, 2024.

Further, the project site is in a developed, built-up urban area that is not adjacent to any VHFHSZ or areas in the wildland-urban interface. Therefore, the proposed project is not likely to expose people or structures to wildland fire hazards. No impact would occur.

Mitigation Measures

None required.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact

Environmental Evaluation

Setting

The following analysis is based in part on the Preliminary Water Quality Management Plan (PWQMP) and the Preliminary Hydrology Report prepared by X Engineering & Consulting, Inc., both included in Appendix F.

The project site is located within the Aliso Creek Watershed. Site drainage is generally broken up into two main watershed subareas in the existing condition. Drainage originates from overland flow of sloped landscaping and roof runoff that sheet flows east and west into perimeter gutters at the edge of the parking lot. Gutter flow drains into two curb outlets on either side of the driveway aisle located at the present-day driveway access to Argonaut. Stormwater flows into the gutter along Argonaut and to an existing catch basin approximately 250 feet south of the project site. This catch basin collects stormwater into a 39-inch reinforced concrete pipe (RCP) that eventually increases up to a 78-inch RCP downstream. The 78-inch RCP drains along a rip rap energy dissipation structure at Aliso Creek, where stormwater is conveyed to the Pacific Ocean at South Laguna Beach.

The project site is covered by asphalt concrete pavement and is approximately 76 percent impervious. The proposed project would increase the project site to 79 percent impervious.[50] Apart from minor landscape drains that outlet to parking lot curb face, there are no known underground storm drain facilities on-site.

According to the General Plan's Safety Element, the project site is not within a designated 100-year flood zone. The nearest 100-year flood zone is located south of the Aliso Viejo Parkway and Cedarbrook, 0.64 mile southeast of the project site.[51] Additionally, according to the Federal Emergency Management Agency (FEMA) National Flood Hazard Layer, the project site is within an area of minimal flood hazard (Zone X).[52]

Would the project:

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?

Less than significant impact. Project impacts related to water quality could occur over three different periods:

[50] X Engineering & Consulting. 2024. Water Quality Management Plan (WQMP), 95 Argonaut. September.

[51] City of Aliso Viejo. General Plan, Safety Element, Figure S-1 Safety Policy Map. Website: https://avcity.org/DocumentCenter/View/384/Safety-Policy-Map-PDF. Accessed December 16, 2024.

[52] Federal Emergency Management Agency (FEMA). 2024. National Flood Hazard Layer (NFHL) Viewer. Website: https://hazards-fema.maps.arcgis.com/apps/webappviewer/index.html?id=8b0adb51996444d4879338b5529aa9cd. Accessed December 16, 2024.

- During the demolition, earthwork, and construction phase, where the potential for erosion, siltation, and sedimentation would be the greatest;
- Following construction, before the establishment of ground cover, when the erosion potential may remain relatively high; and
- After project completion, when impacts related to sedimentation would decrease markedly but those associated with urban runoff would increase.

Polluted runoff can have harmful effects on drinking water, recreational water, and wildlife. Urban runoff pollution includes a wide array of environmental, stormwater characteristics depending on-site conditions (e.g., land use, impervious cover, and pollution prevention practices), rain events (duration, amount of rainfall, intensity, and time between events), soil type and particle sizes, the amount of vehicular traffic, and atmospheric deposition. Major pollutants typically found in runoff from urban areas include sediments, nutrients, oxygen-demanding substances, heavy metals, petroleum hydrocarbons, pathogens, and bacteria. Most urban stormwater discharges are nonpoint sources.

The City is within the jurisdictional area of the of the San Diego RWQCB. The San Diego RWQCB requirements are further clarified by the Orange County Drainage Area Management Plan (DAMP), which requires the preparation and implementation of Water Quality Management Plans (WQMPs) for development projects. The DAMP reduces the pollution content of stormwater to the Maximum Extent Practicable (MEP). The purpose of the Orange County DAMP is to satisfy NPDES permit conditions for creating and implementing a Storm Water Management Plan (SWMP) to reduce pollutant discharges to the MEP. The DAMP contains guidelines on structural and nonstructural BMPs for meeting the NPDES goals. Consistent with the DAMP, the project applicant would be required to submit a SWPPP prior to project grading and construction for City review along with a Preliminary Project WQMP and a Hydrology Report.

As described in the proposed project's Hydrology Report, drainage originates from overland flow of sloped landscaping and roof runoff that sheet flows east and west into perimeter gutters at the edge of the parking lot. Peak flow originates as overland flow from a highpoint in subarea A-1. Runoff originating as overland flow along the site boundary and from the proposed buildings would be conveyed into area drains placed throughout the development.

As the proposed project would disturb more than 1 acre of land, it would be subject to the NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities Construction General Permit (Construction General Permit). Construction activity subject to the Construction General Permit includes any construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than 1 acre. The Construction General Permit requires development and implementation of a SWPPP and monitoring plan, which must include erosion and sediment control BMPs that would meet or exceed measures required by the Construction General Permit to control potential construction-related pollutants. Erosion-control BMPs prevent erosion, whereas sediment controls trap sediment once it has been mobilized. The types of required BMPs

are relative to the amount of soil disturbed, the types of pollutants used or stored at the project site, and proximity to water bodies.

The WQMP prepared for the proposed project is intended to comply with the requirements of the County of Orange NPDES Stormwater Program. The WQMP outlines the operation and maintenance of all BMPs to be used at the project site, including a catch basin storm filter, hydrologic source controls, and structural and nonstructural source controls.

Additionally, project construction activities would be required to comply with applicable City requirements to control erosion and reduce or eliminate stormwater runoff containing sediment, including Municipal Code Chapter 13.08 Article XIII, Erosion Control, which requires preparation of an Erosion Control Plan, submitted to the building official, and the implementation of erosion and sediment control measures. Project construction activities would also be required to comply with water quality measures included in the City's Water Quality Ordinance (Municipal Code Chapter 7.35, Stormwater Management). The Water Quality Ordinance is designed to effectively prohibit non-stormwater discharges into the storm sewers, reduce the discharge of pollutants, and achieve compliance with the Clean Water Act and the Porter-Cologne Water Quality Control Act. Specifically, in accordance with Section 7.35.080, Control of Urban Runoff–New Development and Redevelopment Projects, prior to the City's issuance of a grading or building permit for the proposed project, the project applicant would be required to submit project plans demonstrating compliance with all applicable local ordinances; California Stormwater Quality Association (CASQA) standards; and the City's water quality manual, which includes the City's jurisdictional urban runoff management plan or local implementation plan, the Orange County DAMP, and the City's NPDES permit. In addition to the requirements of Municipal Code Section 7.35.080, project construction activities would be required to comply with Municipal Code Section 7.35.070, Control of Urban Runoff – Construction Projects, which requires the project applicant to submit a pollution control plan, construction BMP plan, and/or an erosion and sediment control plan meeting the requirements of the water quality manual and to submit evidence of coverage under the Construction General Permit prior to issuance of a permit involving ground-disturbing activities.

Compliance with the above regulations would ensure that impacts related to water quality during construction of the proposed project would be less than significant.

The proposed project would comply with the NPDES requirement through implementation of the WQMP and with the Orange County DAMP; as such, construction of the proposed project would not violate water quality standards or degrade surface or groundwater quality.

During operations, the project site would be subject to compliance with the Regional Municipal Separate Storm Sewer System (MS4) permit. The Regional MS4 Permit (Order No. R9-2013-0001, as amended), requires co-permittees, including the City, to reduce the discharge of pollutants from new development and significant redevelopment to the MEP. All development projects are required to implement source control and site design practices. Per the MS4 Permit requirements for redevelopment, the proposed project will also incorporate Low Impact Development (LID) elements into the site design as well as implementation of BMPs.

The proposed hydromodification management system would be designed to attenuate and manage stormwater flows to mimic pre-development hydrology, per MS4 Permit requirements. The system includes two MWS for water quality treatment, followed by a subsurface concrete detention structure located in the southeasterly portion of the site. The proposed detention system, sized 42 inches by 42 inches by 5.5 inches, is designed for hydromodification management as well as peak flow mitigation.

As described in the Hydrology Report, the impervious surfaces would increase by 3 percent under the proposed project. Under the proposed project conditions, runoff from the project site would be routed to two 8- by 16-foot proposed MWS for water quality treatment prior to entering a proposed subsurface detention basin in the southeasterly portion of the project. The detention system is designed for hydromodification management as well as peak flow mitigation. Peak flows from the site would ultimately discharge through a proposed 18-inch pipe connection into an existing 24-inch RCP storm drain downstream. Drainage under the proposed project would mimic the existing drainage condition to the maximum extent possible. Runoff generally flows from north to south. Drainage under the proposed project condition would generally concentrate sheet flow into drainage inlets and catch basins and route it into subsurface storm drainage pipes. Runoff under proposed project conditions would be conveyed to dual MWS units for water quality treatment. These dual MWS units are designed to handle a typical heavy storm, specifically one that is bigger than 85 percent of all storms in a year and lasts 24 hours. Stormwater flows exceeding this value, including flows from the MWS, would then be routed into a subsurface detention facility with a flow control outlet orifice suitable for mitigating hydromodification and peak stormwater flows. The proposed project would include a proprietary biofiltration as a BMP with no infiltration and BMPs to ensure that the ongoing operation and maintenance of the proposed project is consistent with the DAMP. The proposed condition peak flow drainage would mimic the existing condition to the maximum extent possible.

Under typical storm conditions (e.g., 2- to 10-year events), treated stormwater is detained and slowly released through a low-flow 1.5-inch orifice and a notched riser, reducing flow rates and minimizing downstream erosion. For larger storm events (e.g., 25-year storm event), excess flows bypass the MWS units and pass through the detention system, again slowing release through orifices and a weir before connecting to an existing 24-inch RCP via a new 18-inch pipe located approximately 110 feet south along Argonaut. The proposed system would reduce the post-development peak flow from 9.0 cfs (unmitigated) to 7.5 cfs (mitigated), which is less than the existing condition flow of 7.8 cfs. Therefore, the proposed project would not negatively impact downstream infrastructure.

The proposed project would be subject to federal, State, and local regulations related to water quality, including the City's Water Quality Ordinance. Implementation of the measures outlined above, including water quality operational BMPs, would reduce pollutants of concern associated with the stormwater runoff from the project site in compliance with the Regional MS4 Permit and ensure the proposed project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality. The impact would be less than significant.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less than significant impact. The project site is located within the boundaries of the MNWD. MNWD's potable water supply is entirely imported water purchased from the Municipal Water District of Orange County.[53] As such, project implementation would not substantially decrease groundwater supplies associated with water demand such that the proposed project would impede sustainable groundwater management of the basin.

The proposed project would reduce the pervious surfaces as compared to the existing conditions. Under the existing conditions, the project site is approximately 76 percent impervious. The proposed project would increase the project site to 79 percent impervious.[54] However, according to the Preliminary Hydrology Report, on-site stormwater infiltration is not feasible considering that the site is underlain by relatively thick artificial fill, which is predominantly silty/clayey, overlying bedrock. Since the project site is not considered suitable for infiltration, the proposed project does not propose infiltration BMPs. The project site does not currently allow for infiltration and groundwater recharge; thus, the proposed project would not interfere substantially with groundwater recharge such that the proposed project could impede sustainable groundwater management of the basin. As such, the proposed project would not interfere with groundwater recharge or impede sustainable groundwater management of a basin. Impacts would be less than significant.

c) Substantially alter the existing drainage pattern of area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

(i) result in substantial erosion or siltation on- or off-site;

Less than significant impact. As discussed above, the proposed project would increase impervious surfaces at the project site by 3 percent, which is not considered substantial because the proposed project would be subject to the NPDES permit requirements and would implement BMPs and LID elements to reduce runoff and erosion; the proposed condition peak flow drainage would mimic the existing condition to the maximum extent possible; and the proposed project would include a basin to reduce the proposed 25-year storm flow rate from the project site.[55] As previously discussed, drainage under the proposed project condition would generally concentrate sheet flow into drainage inlets and catch basins and would route it into subsurface storm drainage pipes. Runoff would be conveyed to dual MWS units for water quality treatment; specifically, one that would be sized to be bigger than 85 percent of all storm related flow events in a year and lasts 24 hours. Stormwater flows exceeding this value, including flows from the MWS would then be routed into a subsurface detention

[53] Moulton Niguel Water District (MNWD). 2025. 2020 Urban Water Management Plan, 2021. Website: https://www.mnwd.com/wp-content/uploads/2021/12/2020-Urban-Water-Management-Plan.pdf. Accessed January 23, 2025.

[54] X Engineering & Consulting. 2024. Water Quality Management Plan (WQMP), 95 Argonaut. September.

[55] Ibid.

facility with a flow control outlet orifice suitable for mitigating hydromodification and peak stormwater flows. The proposed basin would reduce the proposed project's peak flow to below the existing conditions. Under the existing conditions, the attenuated peak flow is 7.7 cubic feet per second (cfs). With implementation of the basin, the proposed attenuated peak flow of 7.1 cfs was shown to not have an adverse effect on the existing storm drain.[56]

According to the Geotechnical Due Diligence Review, slopes are considered susceptible to erosion. Implementation of the recommendations provided in the Geotechnical Due Diligence Review in accordance with the Municipal Code, as discussed in Section 2.7, Geology and Soils, would ensure that on-site runoff is controlled and directed off-site in a nonerosive manner and that site drainage and slopes are maintained over the life of the proposed project. Additionally, the proposed project would not alter the course of a river or stream, as the site is developed and located in an urban and developed area. As such, the proposed project would not alter the existing drainage pattern at the project site in a manner which would result in on- or off-site erosion or siltation. Additionally, the proposed project would implement the provisions provided in the WQMP prepared for the proposed project, which includes ongoing operation and management of BMPs at the project site. Further, the proposed project would be required to adhere to Article XIII of Chapter 13.08 of the City's Municipal Code, which contains provisions related to erosion control such as grading specifications and erosion control device requirements. Adherence to the WQMP would also ensure compliance with the County NPDES Stormwater Program. As such, impacts would be less than significant.

(ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;

Less than significant impact. As discussed above, the proposed project would increase impervious surfaces on the project site as compared to the existing conditions. However, the proposed project would implement BMPs designed to manage stormwater runoff. The proposed project would not alter the course of a river or stream. The proposed project would be consistent with the approved drainage plan provided in the Hydrology Report, including the proposed basin discussed above, which would reduce peak flows from the project site and would not result in increased surface runoff in a manner which would result in flooding. The proposed project's peak flow drainage would mimic the existing condition to the maximum extent possible. All project drainage would be routed to two proposed MWSs for water quality treatment prior to entering a proposed subsurface detention basin in the southeasterly portion of the project site. The detention system is designed for hydromodification management as well as peak flow mitigation. Peak flows from the project site would ultimately discharge through a proposed 18-inch pipe connection into an existing 24-inch RCP storm drain downstream. As such, impacts would be less than significant.

[56] X Engineering & Consulting. 2024. Preliminary Hydrology Report, 95 Argonaut. September.

(iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

Less than significant impact. As discussed above, the proposed project would not substantially alter the existing drainage pattern at the project site through the increase of impervious surfaces at the project site or by altering the course of a river or stream. The proposed project would connect to existing water and sanitary sewer lines and would include the installation of stormwater management systems in-site. Stormwater from the proposed project would be routed to two proposed MWS for water quality treatment prior to entering a proposed subsurface detention basin in the southeasterly portion of the project site to meet water quality objectives as required by the MS4 Permit. The proposed project would be designed consistent with the approved drainage plan provided in the Hydrology Report and would not exceed the capacity of the existing stormwater drainage system. Additionally, the proposed project would implement the provisions provided in the WQMP and the Geotechnical Due Diligence Review prepared for the proposed project—which includes ongoing operation and management of BMPs at the project site and measures to ensure that on-site runoff is controlled and directed off-site in a nonerosive manner. Further, adherence to the WQMP would ensure compliance with County NPDES Stormwater Program, which would include biofiltration, and MWS and detention systems to control and reduce the discharge of pollutants in stormwater. Compliance with the WQMP would address potential additional sources of polluted runoff from the project site. The impact would be less than significant.

(iv) impede or redirect flood flows?

Less than significant impact. The project site is within an area of minimal flood hazard (Zone X); and the proposed project would be consistent with the approved drainage plan provided in the Hydrology Report and would not cause flood flows to be impeded or redirected. Any potential flooding on-site would be treated via two MWS prior to entering a proposed subsurface detention basin in the southeasterly portion of the project. Peak flows from the site will ultimately discharge through a proposed public 18-inch pipe connection into an existing 24-inch RCP storm drain downstream approximately 110 feet south along Argonaut. As such, the impact would be less than significant.

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Less than significant impact. The project site is approximately 5.02 miles from the Pacific Ocean and is not near any other large body of water; therefore, the project site is not at risk of inundation from a tsunami or seiche. As discussed above, the project site is within an area of minimal flood risk and would not include the storage of hazardous materials that could be released into the environment due to inundation from a flood other than small quantities of typical household cleaners. As such, the impact would be less than significant.

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less than significant impact. The project site is within the Aliso Creek Watershed and the Water Quality Control Plan for the San Diego Basin (Basin Plan). The Basin Plan includes an implementation plan describing the actions by the RWQCB and others that are necessary to achieve and maintain the water quality standards as well as water quality goals and policies that govern the Santa Ana River Basin.[57] The proposed project would be required to comply with the goals and policies outlined in the Basin Plan, such as nonpoint source pollution control policies, which requires the proposed project to implement LID strategies and site-specific BMPs, and implementation programs, which requires coordination with local stormwater permits. As previously discussed, the proposed project would comply with the WQMP prepared for it to ensure that the proposed project meets water quality standard and would not degrade surface or groundwater quality. Therefore, the proposed project would not conflict with or obstruct implementation of a water quality control plan. Impacts would be less than significant.

Mitigation Measures

None required.

[57] California State Water Resources Control Board (State Water Board). 2024. San Diego Regional Water Quality Control Board (San Diego RWQCB). San Diego Basin Plan. Website: https://www.waterboards.ca.gov/sandiego/water_issues/programs/basin_plan/. Accessed December 16, 2024.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.11 Land Use and Planning *Would the project:*				
a) Physically divide an established community?	☐	☐	☐	☒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐

Environmental Evaluation

Setting

The General Plan currently designates the project site Business Park. The proposed project would require a GPA to change the land use designation from Business Park to HDR. The HDR land use designation is intended to provide residential development with a density between 18 and 30 dwelling units per gross acre, with an average density of 20 units per gross acre.The project site is currently zoned Business Park-2 (Exhibit 4). The proposed project requests a rezone to change the zoning designation from Business Park-2 to RH Residential–High Density District. The RH Residential–High Density zoning district is intended to provide for the development and preservation of high-density neighborhoods consisting of attached and multiple dwelling units such as townhomes, apartments, condominiums, and senior housing.

Would the project:

a) Physically divide an established community?

No impact. The project site is in a highly developed and urbanized area and the project site is currently developed with an office building and parking lot. The surrounding area contains commercial and residential uses, similar to the project site. Land adjacent to the proposed project are designated for Very High Density Residential to the north, for Business Parks to the south and west, and Community Facilities to the east. The project site is not large enough or otherwise configured in such a way that would create a physical barrier within an established community. A typical example of such a barrier would be a project that involved a continuous right-of-way, such as a roadway, which would divide a community and impede access between parts of the community. The proposed project does not include these types of features. Implementation of the proposed project would not disrupt the surrounding land uses or divide the physical arrangement of the established communities to the north

and east of the project site. Therefore, the proposed project would not physically divide an established community. No impact would occur, and no mitigation is required.

b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less than significant impact. The proposed project would include a GPA to amend the General Plan land use designation from Business Park to HDR and a rezone to change the zoning from Business Park-2 to RH Residential–High Density. The land uses to the north, south, east, and west of the project site are designated by the General Plan Very High Density Residential, Business Park, and Community Facilities. The proposed GPA would be consistent with the existing surrounding land uses, and with the approval of these changes, the proposed project would not conflict with any applicable land use plan, policy, or regulation adopted for the purposes of avoiding or mitigating an environmental effect. Table 9 shows an analysis of the proposed project's consistency with relevant policies of the Aliso Viejo General Plan adopted for the purpose of avoiding or mitigating an environmental effect. As shown in Table 9, the proposed project is consistent with all applicable General Plan policies.

Table 9: Project Consistency with Applicable General Plan Policies

Aliso Viejo General Plan Policies and Actions	Project Consistency
Land Use Element	
Policy LU-2.1: Preserve the current pattern of development that encourages more intense and higher density development at the core of the community (near Grand Park and Aliso Viejo Town Center) and less intense uses radiating from the central core.	**Consistent.** The proposed project includes redevelopment of an underutilized office space that is not within the City's central core. The proposed project would include 61 townhome units, which is consistent with the town homes located just northwest of the site at Glenwood Drive. Therefore, the proposed project would provide an appropriate density, consistent with this policy.
Policy LU-2.4: Encourage land uses that complement (in type, size, scale and design) the community's topography, scenic vistas, and natural resources.	**Consistent.** The proposed project includes townhome development in an area that is developed and urbanized. Redevelopment of the site would be generally consistent with existing surrounding uses, including the existing town homes northwest of the site. Further, as discussed in Section 2.1, Aesthetics, the proposed project would not have an adverse effect or damage a scenic vista or natural resources. As such, the proposed project is consistent with this policy.
Policy LU-4.1: Encourage environmentally sensitive development patterns, promote public education, and enforce infrastructure criteria that protect residents and	**Consistent.** The proposed project consists of mixed-use infill redevelopment in an urbanized area and would not degrade environmentally sensitive areas of

Aliso Viejo General Plan Policies and Actions	Project Consistency
property from hazards related to slope stability and flooding.	the City. The proposed project is not located near a flood zone. The proposed project would comply with all recommendations in the project-specific geotechnical review, per COA GEO-1. On-site drainage and water quality improvements would provide protection from localized flooding. Additionally, the proposed project is not located within or near a flood zone. As such, the proposed project is consistent with this policy.
Policy LU-4.2: In areas where residential and business park or office land uses abut each other, use buffering techniques employing water-conserving landscaping, setbacks, screening, and appearance standards to improve compatibility.	**Consistent.** The proposed project would be buffered from adjacent business park uses by setbacks, landscaping, and retaining walls.
Policy LU-4.4: Reduce the discharge of pollutants and runoff flow from urban development to the maximum extent practicable.	**Consistent.** As discussed in Section 2.10, Hydrology and Water Quality, the proposed project includes an on-site stormwater system that would reduce on-site runoff. Specifically, runoff from the project site would be routed to two proposed modular wetland systems (MWS) for water quality treatment prior to entering a proposed subsurface detention basin in the southeasterly portion of the project. The proposed water quality Best Management Practices (BMPs) would adhere to Water Quality Management Plan (WQMP) requirements, including providing operational BMPs that would reduce pollutants of concern associated with the stormwater runoff from the project site in compliance with the Regional Municipal Separate Storm Sewer System (MS4) Permit and ensure the proposed project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality. As such, the proposed project is consistent with this policy.
Policy LU-5.3: Ensure that new development is consistent with City and service provider plans to complete needed improvements and funding capacity for such improvements.	**Consistent.** As discussed in Section 2.15, Public Services and Section 2.19, Utilities and Service Systems, existing public and utility services are generally anticipated to be adequate to serve the proposed project. Any improvements would be constructed in compliance with City and service provider standards and the applicant would pay all applicable fees as required. As such, the proposed project is consistent with this policy.
Policy LU-8.2: Require recycling, composting, source reduction and education efforts throughout the	**Consistent.** As discussed in Section 2.19, Utilities and Service Systems, the proposed project would be

Aliso Viejo General Plan Policies and Actions	Project Consistency
community, including residential, businesses, industries, and institutions, within the construction industry, and in all City-sponsored activities.	required to comply with applicable federal, State, and local regulations regarding the recycling, composting, source reduction, and education efforts. As such, the proposed project is consistent with this policy.
Policy LU-11.1: Ensure that new development contributes its fair share to the timely construction of new school facilities, to the extent permitted by law, and compatible with other City land use objectives.	**Consistent.** As discussed in Section 2.15, Public Services, the project applicant would be required to pay all statutory fees in place at the time in compliance with Senate Bill (SB) 50 and demonstrate proof of payment to the City for approval of a building permit. Payment of developer fees under SB 50 would ensure school related impacts are less than significant. As such, the proposed project is consistent with this policy.
Policy LU-12.2: As a condition upon new development, require payment of park fees and/or dedication and provision of parkland, recreation facilities and/or multiuse trails that improve the public and private recreation system.	**Consistent.** As discussed in Section 2.15, Public Services, the project applicant would be required to pay all public benefits fees in accordance with the Municipal Code Chapter 14.16, which would satisfy the City's parkland requirement. The proposed project would also provide on-site amenities to residents that would partially offset impacts to parks facilities. Additionally, the proposed project would provide 40,259.9 square feet of open space including 5,587 square feet of usable open space to help offset impacts to park facilities. As such, the proposed project is consistent with this policy.
Conservation/Open Space Element	
Policy COS-1.2: Reduce the amount of water used for landscaping and increase use of native and low water plants. Maximize use of native, low water plants for landscaping of areas adjacent to sidewalks or other impermeable surfaces.	**Consistent.** The proposed project would be required to comply with the City's landscaping requirements, including Chapter 7.30, Water Efficient Landscape Regulations, which would increase water efficiency. The project proposes landscaping that includes native and/or low water plants. As such, the proposed project is consistent with this policy.
Policy COS-1.4: Promote water conservation measures, reduce urban runoff, and prevent groundwater pollution within development projects, property maintenance, City operations and all activities requiring City approval.	**Consistent.** As discussed in Section 2.10, Hydrology and Water Quality, the proposed project would implement structural, source control, and site design BMPs to address water quality conditions associated with the proposed project. The proposed project would adhere to WQMP requirements, which would reduce pollutants of concern associated with the stormwater runoff from the project site in compliance with the Regional MS4 Permit and ensure the proposed project would not violate any water quality standards or waste

Aliso Viejo General Plan Policies and Actions	Project Consistency
	discharge requirements or otherwise substantially degrade surface or ground water quality. As such, the proposed project is consistent with this policy.
Policy COS-4.2: Encourage and maintain high-quality architectural and landscaping designs that enhance or complement the community's visual character.	**Consistent.** The proposed project would include townhomes with a Spanish Eclectic architectural style, which would be subject to design review as required by Chapter 15.62 of the City's Municipal Code.
Policy COS-5.1: Integrate air quality planning with City land use, economic development, and transportation planning efforts.	**Consistent.** As discussed in Section 2.3, Air Quality, the proposed project would not generate pollutant emissions in excess of applicable significance thresholds. As such, the proposed project is consistent with this policy.
Policy COS-5.3: Support alternative transportation modes and technologies and develop bike- and pedestrian-friendly neighborhoods to reduce emissions associated with automobile use.	**Consistent.** The proposed project would provide electric vehicle (EV) charging infrastructure consistent with the latest CALGreen requirements, which would allow future residents to charge electric vehicles, in turn reducing air quality emissions from fossil fueled vehicles. As such, the proposed project is consistent with this policy.
Policy COS-6.1: Encourage green building designs for new construction and renovation projects within the City.	**Consistent.** The proposed project would be required to comply with 2022 Title 24 standards and CALGreen. Additionally, the proposed project would be built all-electric and install solar photovoltaic (PV) systems that would generate renewable energy consistent with the 2022 Building Energy Efficiency Standards. As such, the proposed project is consistent with this policy.
Policy COS-7.5: Ensure that new development provides park land and/or improvements at a fair share ratio, pursuant to the City's Parkland Ordinance.	**Consistent.** Refer to response to Land Use Element Policy 12-2.
Policy COS-8.1: Balance the benefits of development with a project's potential impacts to cultural resources.	**Consistent.** As discussed in Section 2.5, Cultural Resources, the project site does not contain known cultural resources; however, there is the potential for unknown or undiscovered resources to be uncovered through ground-disturbing construction activities. The proposed project would be required to implement mitigation measures, which would reduce potential impacts to cultural resources to a level that is less than significant. MM CUL-1 would require a Worker Environmental Awareness Program (WEAP) training, a site survey conducted by a qualified Archaeologist, and archaeological monitoring. MM CUL-2 would require consultation with a qualified Archaeologist in the event that buried archaeological resources are

Aliso Viejo General Plan Policies and Actions	Project Consistency
	discovered during construction, as well as inadvertent discovery procedures. Implementation MM CUL-1 and MM CUL-2 would ensure that potential impacts to archaeological resources will be reduced to a level of less than significant. As such, the proposed project is consistent with this policy.
Safety Element	
Policy S-1.1: Avoid development in areas susceptible to erosion and sediment loss.	**Consistent.** As discussed in Section 2.7, Geology and Soils, grading and earthwork activities associated with project construction would expose soils to potential short-term erosion by wind and water. However, project construction activities would be required to comply with applicable City requirements to control erosion and reduce or eliminate stormwater runoff containing sediment, including Aliso Viejo Municipal Code Chapter 13.08, Article XIII, Erosion Control, which requires the implementation of erosion and sediment control measures. Project construction activities would also be required to comply with applicable water quality measures, including the City's Water Quality Ordinance (Municipal Code Chapter 7.35, Stormwater Management), which include conditions and requirements established by the City related to the reduction or elimination of stormwater runoff pollutants during construction and operational phases of the proposed project. As such, the proposed project is consistent with this policy.
Policy S-1.2: Investigate specific geologic conditions underlying all new development or redevelopment proposals in areas where potential fault rupture, liquefaction, slope instability or other geological hazards are suspected.	**Consistent.** As discussed in Section 2.7, Geology and Soils, the geologic conditions associated with development of the project site have been investigated in the Preliminary Geotechnical Due Diligence Study. The project site is not susceptible to potential fault rupture or liquefaction. The proposed project would be required to comply with site-specific geotechnical recommendations associated with potential earthquake ground shaking, slope instability, or other geological hazards. As such, the proposed project is consistent with this policy.
Policy S-2.3: Ensure adequate fire equipment access and fire suppression resources to all developed and open space areas within the City.	**Consistent.** The proposed project would include a total of three new fire hydrants on the eastern, western, and southern portions of the project site and would connect to existing water lines. The proposed project would be required to comply with all City and Orange County Fire Authority (OCFA) requirements for

Aliso Viejo General Plan Policies and Actions	Project Consistency
	fire prevention and safety measures, including site access and would be subject to approval by the City and OCFA. As such, the proposed project is consistent with this policy.
Policy S-3.1: Require that new development and redevelopment minimize stormwater and urban runoff into drainage facilities by incorporating on-site design features such as detention basins, water features, or other suitable strategies. Where feasible, support the use of common detention facilities serving more than one development.	**Consistent.** Refer to response to Land Use Element Policy LU-4.4 and Conservation/Open Space Element Policy COS-1.4.
Policy S-5.3: Apply design techniques and standards that employ adequate street and property lighting and place an increased emphasis on public areas to reduce potential criminal activity in new development and reuse projects.	**Consistent.** All lighting installed as part of the proposed project would be subject to compliance with the City's lighting requirements. In addition, the proposed project would be required to comply with the City's Crime Prevention Through Environmental Design (CPTED) requirements in accordance with Municipal Code Section 15.50.020, CPTED Safety Requirements. Prior to issuance of a building permit, Orange County Sheriff's Department (OCSD) would review the proposed project plans to ensure the proposed project adheres to all applicable security requirements. As such, the proposed project is consistent with this policy.
Noise Element	
Policy N-3.1: Ensure stationary noise impacts on sensitive receptors and noise emanating from construction activities, private developments/residences, landscaping activities and special events are minimized.	**Consistent.** As discussed in Section 2.13, Noise, the proposed project would result in less than significant impacts related to noise. As such, the proposed project is consistent with this policy.

Impacts are therefore considered less than significant, and no mitigation is required.

Mitigation Measures

None required.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.12 Mineral Resources *Would the project:*				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?	☐	☐	☐	☒
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

Environmental Evaluation

Setting

The information and analysis for Mineral Resources impacts is based on the General Plan. The project site is zoned Business Park-2 and is located in an urbanized area in the City, and no known mineral resources are present on-site.

Would the project:

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?

No impact. The General Plan does not identify any mineral resources in the City. The project site does not support mineral extraction and does not contain any mineral resource zones or other areas designated as containing known mineral resources. The project site is currently developed and is currently zoned Business Park-2 and is currently designated Business Park. The proposed project would redesignate the site HDR and would rezone the project site RH. These land use and zoning classifications do not support mineral resource extraction,[58] which precludes the potential for impacts associated with mineral resources. No impact would occur.

[58] City of Aliso Viejo. 2004. City of Aliso Viejo General Plan, Land Use Element, Land Use Policy Map, Figure LU-1. Website: http://avcity.org/DocumentCenter/View/397/Land-Use-Policy-Map-PDF. Accessed January 21, 2025.

b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

No impact. The Aliso Viejo General Plan does not designate any lands within the City as mineral resources deposit areas. There are no existing mineral resource recovery operations on the project site or surrounding area.[59] Additionally, the project site is not zoned for mineral resources.[60] Therefore, the proposed project would not result in the loss of availability of known mineral resources of value to the region or result in the loss of a locally important mineral resource recovery site described on a local general plan, specific plan, or other land use plan. No impact to mineral resources would occur.

Mitigation Measures

None required.

Environmental Evaluation

Setting

The primary noise sources near the project site include traffic from Glenwood Drive to the north and Argonaut to the south and west. The closest noise-sensitive receptors to the project site are single-family residences located northwest of the project site.

Existing Conditions

Ambient Noise

The dominant noise sources in the project vicinity include traffic on local roadways, primarily from traffic on Glenwood Drive, which runs along the northern boundary of the project site, and on Argonaut located near the southwest corner of the project site.

An ambient noise monitoring effort was conducted to document daytime ambient noise levels on the project site. Short-term noise monitoring was conducted by Vista Environmental on Monday, May 6, 2024, between 12:23 p.m. and 12:56 p.m. The noise measurements were taken during the midday

hours, as the midday hours typically have the highest daytime noise levels in urban environments. It should be noted that peak noise hours often vary slightly from peak traffic hours as peak noise hours more closely align with high volume traffic that is still free-flowing, while peak traffic hours often result in slower vehicle speeds due to the volume of traffic on the roadway. The short-term existing noise measurement results are summarized in Table 10.

Table 10: Existing Ambient Noise Levels on the Project Site

Site ID #	Description	L_{eq}	L_{max}
ST-1	Measurements taken on north side of the project site, approximately 90 feet south of Glenwood Drive centerline. Primary noise sources observed were vehicles on Glenwood Drive.	57.9	72.0
ST-2	Measurements taken on southwest corner of the project site, approximately 70 feet east and 60 feet north of Argonaut centerline. Primary noise sources observed were vehicles on Argonaut and truck delivery on-site.	56.0	73.1

Characteristics of Noise

Noise is defined as unwanted sound. Sound levels are usually measured and expressed in decibels (dB), with 0 dB corresponding roughly to the threshold of hearing. Most of the sounds that we hear in the environment do not consist of a single frequency but rather a broad band of frequencies, with each frequency differing in sound level. The intensities of each frequency add together to generate a sound. Noise is typically generated by transportation, specific land uses, and ongoing human activity.

The standard unit of measurement of the loudness of sound is the dB. The 0 point on the dB scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Changes of 3 dB or less are only perceptible in laboratory environments. A change of 3 dB is the lowest change that can be perceptible to the human ear in outdoor environments. While a change of 5 A-weighted decibel (dBA) is considered to be the minimum readily perceptible change to the human ear in outdoor environments.

Since the human ear is not equally sensitive to sound at all frequencies, the dBA scale was derived to relate noise to the sensitivity of humans, it gives greater weight to the frequencies of sound to which the human ear is most sensitive. The A-weighted sound level is the basis for a number of various sound level metrics, including the day/night sound level (L_{dn}) and the Community Noise Equivalent Level (CNEL), both of which represent how humans are more sensitive to sound at night. In addition, the equivalent continuous sound level (L_{eq}) is the average sound energy of time-varying noise over a sample period and the L_{max} is the maximum instantaneous noise level occurring over a sample period.

Regulatory Framework

The project site is located within the City of Aliso Viejo, in Orange County. The City addresses noise in the Noise Element of the General Plan and the Municipal Code.

City of Aliso Viejo General Plan

The City addresses noise in the City's General Plan. The objectives of the General Plan's Noise Element are to identify noise sources in the City and define strategies for reducing the negative impact of noise on the community. The Noise Element identifies baseline and projected noise levels so that this information can guide future land use decisions in a manner that limit noises and its effect on the community.

The following applicable goals and policies to the proposed project are from the Noise Element of the General Plan.

Goal N-1 Minimize the impact of point source noise and ambient noise levels throughout the community.

Policy N-1.1 Ensure that construction and occupancy of new development are compatible with, and do not exceed thresholds defining the acceptable noise environment in surrounding areas.

Policy N-1.2 Require inclusion of noise-reducing design features in development projects to address the impact of noise on residential development.

Policy N-2.3 Require inclusion of sound-reducing design measures in development projects impacted by transportation-related noise.

Policy N-2.4 Encourage use of alternative transportation technologies that minimize noise impacts.

Goal N-3 Minimize noise impacts from sources other than transportation.

Policy N-3.1 Ensure stationary noise impacts on sensitive receptors and noise emanating from construction activities, private developments/residences, landscaping activities and special events are minimized.

Policy N-3.2 Require that mixed-use structures and areas be designed to prevent transfer of noise and vibration from commercial uses to residential uses.

Table 11 (Table N-1 in the City's General Plan Noise Element) summarizes Orange County's residential noise standards, which have been adopted by the City. The standards represent the maximum acceptable noise levels as measured from any residential property in the City. Accordingly, it is unlawful to cause the noise level on any residential property to exceed the exterior noise standards: (1) for a cumulative period of more than 30 minutes in any hour; (2) by plus 5 dBA for a cumulative period of more than 15 minutes in any hour; (3) by plus 10 dBA for a cumulative period of

more than 5 minutes in any hour; (4) by plus 15 dBA for a cumulative period of more than 1 minute in any hour; or (5) plus 20 dBA for any period of time. In addition, any noise that exceeds the interior noise standards established for residential uses: (1) for a cumulative period of more than 5 minutes in any hour; (2) by plus 5 dBA for a cumulative period of more than 1 minute in any hour; or (3) by plus 10 dBA for any period of time, is unlawful.

Table 11: Orange County Residential Noise Standards

	Daytime Noise Standards (7:00 a.m. through 10:00 p.m.)	Nighttime Noise Standards (10:00 p.m. through 7:00 a.m.)
Interior Noise Standards	55 dBA	45 dBA
Exterior Noise Standards	55 dBA	50 dBA

Note:
dBA = A-weighted decibel
Standards are based on measurements taken from any residential property in the City.
Source: Aliso Viejo General Plan, Noise Element, Table N-1.

City of Aliso Viejo Municipal Code

The City of Aliso Viejo has established noise performance standards and permissible hours for construction activities in the Municipal Code. These provisions are summarized below:

Section 8.12.050 Exterior noise standards

A. The following exterior noise standards (Table 12), unless otherwise specifically indicated, shall apply to all residential property with the City:

Table 12: Exterior Noise Standards

Land Use	Noise Level	Time Period
Residential Exterior Noise Standards		
Density of less than 10 du/acre	50 dBA	7:00 a.m. – 10:00 p.m.
	45 dBA	10:00 p.m. – 7:00 a.m.
Density of more than 10 du/acre	55 dBA	7:00 a.m. – 10:00 p.m.
	50 dBA	10:00 p.m. – 7:00 a.m.
Nonresidential Exterior Noise Standards		
Commercial	65 dBA	7:00 a.m. – 10:00 p.m.
	60 dBA	10:00 p.m. – 7:00 a.m.
Manufacturing/Industrial	70 dBA	24 hours per day

Land Use	Noise Level	Time Period
Notes: dBA = A-weighted decibels du/acre = dwelling units per acre Source: Aliso Viejo Municipal Code Section 8.12.050, Exterior Noise Standards.		

Section 8.12.060, Interior Noise Standards

Section 8.12.060 establishes interior noise standards for residential property within the City. For all residential properties, the interior noise standard is 55 dBA between the hours of 7:00 a.m. to 10:00 p.m. and 45 dBA between the hours of 10:00 p.m. and 7:00 a.m.

Section 8.12.070, Exemptions

Section 8.12.070 establishes a list of activities that the Municipal Code considers exempt from the provisions of the City's noise ordinance. Exempt activities that are relevant to the proposed project include:[61]

E. Noise sources associated with construction, repair, remodeling, or grading of any real property, provided the activities do not take place between the hours of 8:00 p.m. and 7:00 a.m. on weekdays, 8:00 p.m. and 8:00 a.m. on Saturday, or at any time on Sunday or a federal holiday.

F. Noise sources associated with the maintenance of real property, provided the activities take place between the hours of 7:00 a.m. and 8:00 p.m. on any day except Sunday or a federal holiday, or between the hours of 9:00 a.m. and 8:00 p.m. on Sunday or a federal holiday.

G. Any activity to the extent regulation thereof has been preempted by State or federal law.

H. Noise sources associated with solid waste collection and removal, provided such activities take place between 7:00 a.m. and 6:00 p.m. Monday through Friday where audible in residential areas; or between 7:00 a.m. and 6:00 p.m. on Saturdays where audible in residential areas; or between 5:00 a.m. and 9:00 p.m. any day where such activity is not audible in residential areas; or as otherwise provided in an approved franchise agreement between a waste hauler and the City.

Would the project result in:

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

[61] City of Aliso Viejo. 2025. Aliso Viejo Municipal Code 8.12.070 Exemptions. Website: https://www.codepublishing.com/CA/AlisoViejo/html/AlisoViejo08/AlisoViejo0812.html#8.12.070. Accessed February 14, 2025.

Short-term Construction Impacts

Less than significant impact. For purposes of this analysis, a significant impact would occur if construction activities would result in a substantial temporary increase in ambient noise levels in excess of the City's established standards applicable to construction noise.

The Municipal Code Section 8.12.070 establishes allowable hours and noise standards for construction activities and equipment. Construction activities, including the operation of any tools or equipment used in construction, are allowed between the hours of 7:00 a.m. through 8:00 p.m. Monday through Friday and from 8:00 a.m. through 8:00 p.m. Saturday. Construction activities on Sundays and federal holidays are prohibited all hours.

While the City does not establish noise level thresholds for construction activities, this analysis uses the noise limits established by the Federal Transit Administration (FTA) to identify the potential for impacts due to substantial temporary construction noise. The FTA identifies construction noise limits in the Transit Noise and Vibration Impact Assessment Manual.[62] During daytime hours, a significant temporary increase would be an increase in excess of the average daily noise levels of 80 dBA L_{eq} as measured at a receiving residential land use.

Noise impacts from construction activities associated with the proposed project would be a function of the noise generated by construction equipment, equipment location, sensitivity of nearby land uses, and the timing and duration of the construction activities.

Construction is completed in discrete steps, each of which has its own mix of equipment and, consequently, its own noise characteristics. These various sequential phases would change the character of the noise generated on the site and, therefore, the noise levels surrounding the site as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full-power operation followed by 3 or 4 minutes at lower power settings. Impact equipment such as pile drivers would not be used during construction of the proposed project.

The site preparation phase, which includes excavation and grading of the project site, tends to generate the highest noise levels because the noisiest construction equipment is earthmoving equipment. Earthmoving equipment includes excavating machinery and compacting equipment such as bulldozers, draglines, backhoes, front loaders, roller compactors, scrapers, and graders. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full-power operation followed by 3 or 4 minutes at lower power settings.

Construction of the proposed project would require the use of graders, excavators, dozers, front-end loaders, and backhoes. The maximum noise level generated by each bulldozer, excavator, and grader is assumed to be 85 dBA L_{max} at 50 feet from this equipment. A characteristic of sound is that

[62] Federal Transit Administration (FTA). 2018. Transit Noise and Vibration Impact Assessment Manual.

each doubling of sound sources with equal strength increases a sound level by 3 dBA. Assuming that each piece of construction equipment operates at some distance from the other equipment, a reasonable worst-case combined noise level during this phase of construction would be 90 dBA L_{max} at a distance of 50 feet from the acoustic center of a construction area. This would result in a reasonable worst-case hourly average of 86 dBA L_{eq}.

The closest noise-sensitive receptors to the project site are single-family residences located northwest of the project site. The closest residence would be located approximately 200 feet from the acoustic center of construction activity where multiple pieces of heavy construction equipment would potentially operate simultaneously at the project site. At this distance, with minimal shielding from an existing 6-foot masonry walls, worst-case construction noise levels could range up to approximately 70 dBA L_{max} intermittently and could have an hourly average of up to 64 dBA L_{eq}, at the façade of the nearest single-family residential home. The calculation spreadsheet with detailed modeling assumptions is provided in Appendix G.

These reasonable worst-case construction noise levels would only occur periodically throughout the day as construction equipment operates along the nearest project boundaries. Additionally, these noise levels would drop off at a rate of 6 dBA per doubling of distance as the equipment moves over the project site.

Furthermore, the proposed project would be required to comply with the City's permissible hours for construction (7:00 a.m. through 8:00 p.m. Monday through Friday and 8:00 a.m. through 8:00 p.m. Saturday), which would ensure that construction noise would not result in a substantial increase in nighttime noise levels in the project vicinity. In addition, the calculated conservative worst-case construction noise levels would not exceed the FTA's average daily threshold of 80 dBA L_{eq} as measured at the nearest residential receptors. It should also be noted that these temporary, reasonable, worst-case maximum construction noise levels would not exceed existing maximum noise levels on the project site that were documented by the ambient noise monitoring effort. The reasonable worst-case hourly average noise levels would exceed documented existing ambient noise levels of 56 dBA to 57.9 dBA L_{eq} by no more than 8 dBA. This would not be considered a substantial temporary increase in ambient noise levels. Therefore, the analysis demonstrates that the proposed project's construction noise impact from on-site activities would be less than significant.

Operational/Stationary Source Noise Impacts

Less than significant impact. A significant impact would occur if the proposed project would result in an exceedance of the City's noise performance standards for stationary noise sources. A significant impact would occur if operational noise levels generated by stationary noise sources at the proposed project site would result in a substantial permanent increase in ambient noise levels in excess of any of the noise performance thresholds established by the City. As shown in Table 13 above, the City's Residential Noise Standard for exterior daytime noise (7:00 a.m. through 10:00 p.m.) is 55 dBA and exterior nighttime noise (10:00 p.m. through 7:00 a.m.) is 50 dBA.

Implementation of the proposed project would include operation of new mechanical ventilation equipment. Noise levels for residential-grade mechanical ventilation equipment systems range up to

approximately 70 dBA L_{eq} at a distance of 3 feet. The proposed project would have residential-grade mechanical ventilation equipment for each proposed residential units. The proposed mechanical ventilation equipment could be located as close as 200 feet from off-site noise-sensitive receptors. At this distance, with minimal shielding from an existing 6-foot concrete wall, worst-case resulting noise levels could range up to approximately 16 dBA L_{eq}. The noise calculation sheet is provided in Appendix G.

These operational noise levels would not exceed the City's most stringent nighttime noise performance thresholds of 50 dBA as measured at the nearest residential property. In addition, they would not exceed existing ambient noise levels in the project vicinity, which, as noted above, range from 56 dBA to 57.9 dBA L_{eq}. Therefore, rooftop mechanical ventilation system operational noise levels would not result in a substantial permanent increase in noise levels in excess of established standards. The impact of mechanical ventilation equipment operational noise levels on sensitive off-site receptors would be less than significant.

Operational/Mobile Source Noise Impacts

Less than significant impact. A significant impact would occur if project-generated traffic would result in a substantial increase in ambient noise levels compared with those that would exist without the proposed project. Typically, a doubling of the Average Daily Traffic (ADT) hourly volumes on a roadway segment is required in order to result in an increase of 3 dBA in traffic noise levels, which, as discussed in the characteristics of noise discussion above, is the lowest change that can be perceptible to the human ear in outdoor environments. Therefore, for the purposes of this analysis, a doubling of the existing ADT volumes would result in a substantial permanent increase in traffic noise levels.

According to the Trip Generation Assessment prepared by Urban Crossroads (Appendix I),[63] the existing peak-hour trips on Argonaut adjacent to the project site are 38 AM peak-hour trips and 24 PM peak-hour trips. However, the proposed project would only generate 25 AM peak-hour trips and 32 PM peak-hour trips under the 61-unit scenario. Therefore, net new proposed project trips would not double existing traffic trips on any roadway segment in the project vicinity. Furthermore, this increase in trips would result in a less than 1 dBA increase in existing traffic noise levels along any roadway segment in the project vicinity. This increase is below a level that would be a perceptible increase and well below a level that would be considered a substantial increase in traffic noise levels. Therefore, the proposed project would not double average daily trips on Argonaut adjacent to the project site and would not generate 3 dBA increase in traffic noise levels. Thus, the proposed project would not result in a substantial permanent increase in ambient noise levels from project-generated traffic trips, and mobile source operational noise impacts would be less than significant**.**

b) Generation of excessive groundborne vibration or groundborne noise levels?

Less than significant impact. A significant impact would occur if the proposed project would generate groundborne vibration or groundborne noise levels in excess of established standards. The

[63] Urban Crossroads. 2024. Argonaut Residential Trip Generation Assessment. June 1.

City has not established requirements regarding construction vibration impacts; therefore, for the purposes of this analysis, the FTA guidelines for vibration impacts are used to determine potential significant construction and operational-related vibration impacts.[64]

This section analyzes both construction and operational groundborne vibration and noise impacts. Groundborne vibrations consist of rapidly fluctuating motions within the ground that have an average motion of zero. Vibrating objects in contact with the ground radiate vibration waves through various soil and rock strata to the foundations of nearby buildings. Groundborne noise is generated when vibrating building components radiate sound, or noise, generated by groundborne vibration. In general, if groundborne vibration levels do not exceed levels considered to be perceptible, then groundborne noise levels would not be perceptible in most interior environments. Therefore, this analysis focuses on determining exceedances of groundborne vibration levels.

Short-term Construction Vibration Impacts

Of the variety of equipment that would be used during construction, small vibratory rollers would produce the greatest groundborne vibration levels. Impact equipment such as pile drivers would not be used during construction of the proposed project. Small vibratory rollers produce groundborne vibration levels ranging up to 0.101 inch per second (in/sec) peak particle velocity (PPV) at 25 feet from the operating equipment.

The closest structure to the project site is a water tower to the east of the project site, located approximately 80 feet from the nearest construction footprint where small vibratory rollers would potentially operate. At this distance, groundborne vibration levels would range up to 0.01 in/sec PPV from operation of the types of equipment that would produce the highest vibration levels. This is well below the FTA's most stringent threshold for construction vibration damage of 0.12 in/sec PPV for a structure that is extremely susceptible to vibration damage. As a result, construction of the proposed project would not expose the nearby water tower to groundborne vibration levels in excess of their applicable FTA damage criteria, and this impact would be less than significant.

The nearest building structure to the project site is the Azarian US Gymnastics building to the west of the project site and is located approximately 115 feet from the nearest construction footprint where small vibratory rollers would potentially operate. At this distance, groundborne vibration levels would range up to 0.01 in/sec PPV from operation of the types of equipment that would produce the highest vibration levels. This is below the FTA's construction vibration damage criteria of 0.3 in/sec PPV for this type of structure, a building of engineered concrete and masonry construction. As a result, construction of the proposed project would not expose nearby buildings to groundborne vibration levels in excess of their applicable FTA damage criteria, and this impact would be less than significant.

[64] Federal Transit Administration (FTA). 2018. Transit Noise and Vibration Impact Assessment Manual. September.

Operational Vibration Impacts

Implementation of the proposed project would not include any new permanent sources of groundborne vibration that would expose persons in the project vicinity to groundborne vibration levels that could be perceptible without instruments at any existing sensitive land use in the project vicinity. Additionally, there are no active sources of groundborne vibration in the project vicinity that would produce vibration levels that would be perceptible without instruments within the project site. Therefore, there would be no impact related to operational groundborne vibration.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

No impact. The nearest airport to the project site is John Wayne Airport, located approximately 9.65 miles northwest of the project site. While aircraft noise is occasionally audible at the project site, because of the distance from the airport and the orientation of runways and flight patterns, the project site does not lie within the established noise contours of John Wayne Airport and is not close enough to any other airports to be affected by aviation noise. Therefore, implementation of the proposed project would not expose persons residing or working in the project vicinity to noise levels from airport activity that would exceed normally acceptable standards for the proposed land use development, and no impact would occur.

Mitigation Measures

None required.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.14 Population and Housing *Would the project:*				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

Environmental Evaluation

Setting

According to the California Department of Finance, the City had a population of 50,068 persons as of January 1, 2024.[65]

Would the project:

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less than significant impact. As described above, the City had a provisional population estimate of 50,068 persons as of January 1, 2024.[66] The 2004 Aliso Viejo General Plan Final EIR anticipated a population of 48,071 persons at buildout. The buildout population identified in the General Plan Final EIR has already been exceeded.

[65] California Department of Finance. 2024. Table 2: E-5 City/County Population and Housing Estimates, 1/1/2024. Website: https:// view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fdof.ca.gov%2Fwp-content%2Fuploads%2Fsites%2F352%2FForecasting%2FDemographics%2FDocuments%2FE-5_2024_InternetVersion.xlsx&wdOrigin=BROWSELINK. Accessed December 6, 2024.

[66] Ibid.

According to the California Department of Finance, the City has an average of 2.54 persons per household in 2024.[67] The proposed project would include the construction of 61 3-story townhomes, which would increase the City's population by up to 155 persons based on the California Department of Finance's average household size.[68] This is approximately 0.3 percent of the City's existing population, which is a negligible increase of the City's total population.

SCAG is the designated Metropolitan Planning Organization (MPO) for six counties (Los Angeles, Orange, San Bernardino, Riverside, Ventura and Imperial) and 191 cities, including the City of Aliso Viejo. As the federally-designated MPO, SCAG is responsible for developing and adopting regional housing, population, and employment growth forecasts for local Orange County governments, among other counties. The latest SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) is adopted in April 2024.[69]

While the 2024 RTP/SCS does not provide population projections below the county-level, the 2024 RTP/SCS states that a rough estimate of the future jurisdiction-level population based on Connect SoCal's household forecast can be derived using county-level population to housing ratio.[70] Using the 2050 Orange County population to housing ratio of 2.745, Aliso Viejo is projected to have a population of approximately 56,000 for the year 2050. As such, the proposed project would not exceed SCAG's growth projections for the City.

Furthermore, in 2021, SCAG adopted the 6th Cycle Final Regional Housing Needs Assessment (RHNA) Allocation Plan, which assigns a share of the region's future housing need to each jurisdiction in the SCAG region. The City's share of the region's new housing need for the 2021–2029 planning period as established by SCAG in the RHNA is 1,195 units. Of these, the City's housing need includes 390 units for very-low-income households, 214 for low-income households, 205 for moderate-income households, and 386 for above-moderate-income households.[71] The proposed project would provide 61 residential units including three very-low-income units and 58 market rate units. Therefore, the proposed project would help to accommodate the RHNA housing allocation for the City in order to meet housing needs.

Additionally, the proposed project would not indirectly induce substantial unplanned population growth through the extension of roads or other infrastructure, as the project site and surrounding area are currently served by adjacent roadways and utilities infrastructure. Therefore, the proposed project would not induce unplanned population growth either directly or indirectly, and impacts would be less than significant.

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

No impact. There are no existing residences on-site, which precludes the possibility that the proposed project would displace people or housing. As such, no impact would occur.

Mitigation Measures

None required.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.15 Public Services *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:*				
a) Fire protection?	☐	☐	☒	☐
b) Police protection?	☐	☐	☒	☐
c) Schools?	☐	☐	☒	☐
d) Parks?	☐	☐	☒	☐
e) Other public facilities?	☐	☐	☒	☐

Environmental Evaluation

Setting

The information in this section is based, in part, on correspondence with City of Aliso Viejo public service providers, included as Appendix H of this report. Correspondence consisted of responses to an inquiry sent via email to public service providers on December 16, 2024. Responses were provided to FCS between December 17, 2024, and January 14, 2025.

Fire

The City falls under the jurisdiction of OCFA, which provides services to 23 of Orange County's 34 cities and all unincorporated areas of the county. OCFA's services include emergency responses to 911 calls, fire inspections, plan review, public information and education, and arson investigation.

OCFA Fire Station 57 is located at 57 Journey, which is 2 miles south of the project site. It employs five firefighters and two paramedics and operates 24 hours a day, 7 days a week. OCFA Fire Station 57 also serves as a Division Headquarters, housing the local fire chief, administrative staff, and community educator. Division Chief Mike Summers serves as the Fire Chief for the City.[72]

[72] City of Aliso Viejo. 2025. Fire Authority. Website: https://avcity.org/198/Fire-Authority. Accessed January 27, 2025.

Police

The City contracts with the Orange County Sheriff's Department (OCSD) for its law enforcement needs. OCSD–Aliso Viejo Station is located at 11 Journey, which is 2.4 miles south of the project site. The staff dedicated to the City includes one Crime Prevention Specialist, one Emergency Management Coordinator, 17.65 Deputies (Patrol, Traffic Motor, School Resource Officer, Special Enforcement Team and Directed Enforcement Team), two Community Service Officers, 1.5 Investigators, and 2.33 Sergeants. The partial numbers are staff whose duties are split among other cities. There are 15 specialized units that can be contacted to provide service to the City when needed. They include units such as Canine, Gang Enforcement, Homicide Detail, and more.[73]

Schools

The project site falls within the Capistrano Unified School District (CUSD). During the 2023–2024 school year, the CUSD enrolled 48,326 students.[74] CUSD serves the City of San Juan Capistrano, City of Dana Point, City of Laguna Niguel, and the City of San Clemente, as well as a portion of the City of Aliso Viejo, City of Mission Viejo, City of Rancho Santa Margarita, and a very small portion of the Cities of Laguna Beach and Laguna Woods and a portion of unincorporated Orange County.[75] The proposed project is within the service area of Oak Grove Elementary School (584 students), Aliso Viejo Middle School (799 students), and Aliso Niguel High School (2,608 students).[76] During the 2023–2024 school year, Oak Grove Elementary School enrolled 584 students, Aliso Viejo Middle School enrolled 799 students, and Aliso Niguel High School enrolled 2,608 students.[77]

Level 1 Developer Fees are established by the State and are considered a basic mitigation fee that all residential and commercial projects must pay. In January 2024, the State Allocation Board approved the Level 1 Developer Fee of $5.17 per square foot of residential development.[78]

Parks

The City of Aliso Viejo Recreation & Community Services department owns and manages Vista Park and Iglesia Park, which are a total of 7.4 acres. Additionally, Aliso Viejo Community Association

[78] King Consulting. 2024. Developer Fee Justification Study, Capistrano Unified School District. Website: https://www.capousd.org/documents/Developer%20Fees/Residential-and-Commercial-Industrial-Fee-Study-May-2024-Res.-2324-30.pdf. Accessed January 28, 2025.

(AVCA) is responsible for an estimated 179 acres of parkland.[79] The closest park is Glenwood Community Park, located 0.07 mile north of the project site, across Glenwood Drive. Glenwood Community Park is a private park owned and managed by the Glenwood Park neighborhood homeowners' association.[80] Crosswalks and traffic lights are available on Glenwood Drive, allowing for pedestrian access to Glenwood Community Park. The second two closest parks are Pinewood Park and Argonaut Park. Pinewood Park is less than 0.1 mile away in a straight line, but with no accessible pathways through the landscaping and hillsides, residents of the proposed project would need to travel around 0.4 mile on sidewalks along major roadways.

Libraries

Orange County provides a range of public libraries, cultural facilities, and recreation services. The nearest Orange County Public Library branch to the project site is the Laguna Woods Branch, located at 24266 El Toro Road in the City of Laguna Woods, approximately 1.07 miles north of the project site. Additionally, the Aliso Viejo Branch is located at 1 Journey, approximately 1.65 miles south of the project site. Orange County Public Libraries provides library services to the City of Aliso Viejo through its system-wide network of 32 branches across the county. Aliso Viejo residents have access to all services as membership is not specific to individual branches; as such, residents of the City have access to resources and services throughout the entire Orange County Public Library system. The Aliso Vejo branch is currently closed for renovations but is expected to reopen in 2025. The most current tenant projections are from 2023, during which the Aliso Viejo Branch had 140,931 visitors, with an average daily attendance of 470 people.

Upon reopening, the Aliso Viejo Branch is expecting an increase of usage as the redesign will add more amenities, such as quiet study rooms, more electricity, seating available throughout the branch, and a new program room for events.

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

a) Fire protection?

Less than significant impact. According to Deputy Fire Marshal Eric Evans of Planning and Development, OCFA has the ability to provide fire protection services to the project site and the proposed project will require an OCFA Secured Fire Protection Agreement.[81]

[79] Weaver, Chris. Director of Parks & Landscape, Aliso Viejo Community Association. Personal communication: email. December 18, 2024.

[80] Play Parks Creative LLC. 2024. Glenwood Community Park (PRIVATE). Website: https://funorangecountyparks.com/glenwood-community-park-aliso-viejo.html. Accessed January 21, 2025.

[81] Evans, Eric. Deputy Fire Marshal, Orange County Fire Authority. Personal communication: email, January 14, 2025.

Additionally, the proposed project would be required to pay the applicable OCFA planning and development fees.[82] A total of three new fire hydrants would be installed on eastern, western and southern portions of the project site and would connect to existing water lines.

As discussed in Section 4.14, Population and Housing, the proposed project would generate 155 new residents. Fire protection and emergency service by the OCFA are currently provided to the area under existing conditions.

As discussed in Section 4.14, Population and Housing, the population growth resulting from the proposed project is consistent with SCAG's growth projections, and the 155 new residents would be considered planned growth that would be addressed with existing facilities. Therefore, the proposed project would not create a need for new or physically altered fire facilities to maintain acceptable service ratios, response times, or other performance objectives.

Furthermore, the proposed project would be required to comply with the California Fire Code, as amended, in accordance with Municipal Code Chapter 13.04, 2022 Edition of the California Fire Code, and would be subject to approval by OCFA. Adherence with fire code standards and approval by OCFA would reduce the potential demand for fire services by decreasing the likelihood and/or severity of a fire emergency at the project site. Implementation of City requirements, including compliance with the California Fire Code and approval of site plans by OCFA, as well as payment of planning and development fees, would ensure that there would be no substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities for fire protection services. As such, impacts would be less than significant.

b) Police protection?

Less than significant impact. OCSD did not respond to emails sent in December 2024 and January 2025 requesting information on expected impacts to police services as a result of the proposed project.

As described above, the proposed project would include the construction of a residential development that consists of 61 townhomes on the approximately 2.85-acre project site ranging from 1,200 to 1,800 square feet in size. Police protection services to the project site occurs under the existing conditions. While the proposed project would generate an estimated 155 residents, this would be considered planned growth, as discussed in Section 2.14, Population and Housing.

Because the proposed project would not induce substantial unplanned population growth, it is anticipated that the proposed project would be adequately served by OCSD and would not create a need for new or physically altered police facilities to maintain acceptable service ratios, response times, or other performance objectives. The proposed project would also be required to comply with the City's Crime Prevention Through Environmental Design (CPTED) requirements in accordance

[82] Orange County Fire Authority (OCFA) Planning and Development Services. 2024. 2024-25 Community Risk Reduction Fee Study. Website: https://ocfa.org/Uploads/CommunityRiskReduction/OCFA%202024-25%20Fee%20Schedule%20-%20Planning%20and%20Development.pdf. Accessed March 13, 2025.

with Municipal Code Section 15.50.020. OCSD would review the project plans to ensure the proposed project adheres to all applicable security requirements prior to issuing the building permit. Implementation of City requirements and approval of site plans by OCSD would further reduce potential impacts concerning police protection services. As such, impacts would be less than significant.

c) Schools?

Less than significant impact.

The schools that would serve the proposed project would be Oak Grove Elementary (Transitional Kindergarten [TK] through Grade 5), Aliso Viejo Middle School (Grades 6 through 8), and Aliso Niguel High School (Grades 9 through 12). The estimate of the current standard student generation factors for elementary, middle, and high school students used by the CUSD showed that as a result of the proposed project, Oak Grove Elementary would expect an additional 13 students, Aliso Viejo Middle school would expect an additional four students, and Aliso Niguel High School would expect an additional five students, for a total of 23 new students. CUSD shows no concerns about the potential growth associated with the housing development and states that the school district can accommodate the number of projected students.[83]

The 2024 Developer Fee Justification Study conducted by CUSD concluded that while there is capacity for students in grades TK through grade five, student capacity at the CUSD is currently exceeded for grades 6 through 12.[84] The proposed project would be subject to payment of school impact fees in accordance with SB 50. Pursuant to Government Code Section 65995(3)(h), payment of statutory fees is deemed to be "full and complete mitigation of impacts of any legislative or adjudicative act, or both, involving, but not limited to, the planning, use or development of real property . . ." The developer would be required to pay Level 1 Developer Fees in accordance with Government Code Section 65995(3)(h). Developer fees collected by CUSD pursuant to SB 50 are used for the provision of additional and reconstructed or modernized school facilities. The project applicant would be required to pay all statutory fees in place at the time and demonstrate proof of payment to the City for approval of a building permit. With payment of the Level 1 Developer Fees, CUSD would be able to accommodate the additional students generated by the proposed project, and potential impacts to schools would be less than significant.

d) Parks?

Less than significant impact. The proposed project would develop up to 61 dwelling units, which would generate an estimated 155 new residents (See Section 2.14, Population and Housing). The

[83] Hampton, Clark D. Deputy Superintendent, Business and Support Services, Capistrano Unified School District. Personal communication: email, December 17, 2024.

[84] King Consulting. 2024. Developer Fee Justification Study, Capistrano Unified School District. Website: https://www.capousd.org/documents/Developer%20Fees/Residential-and-Commercial-Industrial-Fee-Study-May-2024-Res.-2324-30.pdf. Accessed January 28, 2025.

new residents would increase the demand on existing neighborhood and regional parks. The additional use would further contribute to the need for maintenance and improvements.

The proposed project includes a total of 40,259.9 square feet of open space, which includes 5,587 square feet of on-site recreational amenities to residents that would partially offset impacts to parks facilities. These recreational amenities would include walkways, gathering spaces with electric barbeques, an open lawn area for free-play, and a tot lot (See Exhibit 6). According to Municipal Code Section 14.16.050, the City has a park ratio goal of five acres of parkland for every 1,000 persons. Therefore, the proposed project would need to dedicate 0.755 acre, or 32,888 square feet, of parkland to the City for its 155 new residents. The proposed project would provide approximately 17 percent of the required parkland. However, the applicant would comply with Municipal Code Chapter 14.16, which requires developers to dedicate land for park facilities or pay park and recreation impact fees to offset incremental demand on local parks. By providing on-site recreational amenities that exceed the required minimum open space and paying applicable park development fees, the proposed project would ensure that the incremental increase in recreational demand would not result in substantial physical deterioration of existing neighborhood and regional parks.

Although project residents would likely use public parks, implementation of the proposed project would not require new or physically altered park facilities, the construction of which could cause significant environmental impacts. Therefore, impacts would be less than significant.

e) Other public facilities?

Less than significant impact. A service letter was sent out to the Orange County Public Libraries Administration about expected impacts from the proposed project on December 16, 2024, and they responded on December 20, 2024. The library anticipates that the proposed project's anticipated population generation would utilize library services and that the increase in visitors would not have a significant impact on the library or its services.[85] Additionally, the Aliso Viejo Branch Library is currently undergoing redesign that would allow it to accommodate more visitors that would be added from the proposed project's additional residential population. Although the proposed project would increase demand for library services, the anticipated growth generated by the proposed project would be within the population growth projections anticipated and planned for by local and regional planning documents. The proposed project's impacts to the overall availability per capita of books, media, computers, and library public service space would not result in significant physical or environmental impacts, as the population growth resulting from the proposed project is within current City projections. Therefore, impacts would be less than significant.

Mitigation Measures

None required.

[85] Oakley, Julie. Library Administration, Orange County Public Libraries. Personal communication: email. December 20, 2024.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.16 Recreation				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☒	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?	☐	☐	☒	☐

Environmental Evaluation

Setting

As previously discussed in Section 2.15, Public Services, the closest park is Glenwood Community Park, located 0.07 mile north of the project site, across Glenwood Drive. Glenwood Community Park is a private park owned and managed by the Glenwood Park neighborhood homeowners' association.[86] Crosswalks and traffic lights are available on Glenwood Drive, allowing for pedestrian access to Glenwood Community Park. The second two closest parks are Pinewood Park and Argonaut Park. Pinewood Park is less than 0.1 mile away in a straight line, but with no accessible pathways through the landscaping and hillsides, residents of the proposed project would need to travel around 0.4 mile on sidewalks along major roadways. These parks provide public amenities such as picnic tables, barbecues, playgrounds, and basketball courts.

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Less than significant impact. The proposed project would consist of approximately 61 3-story townhomes. The City has an estimated population of 50,068 persons as of January 1, 2024. As discussed previously in Section 2.14, Population and Housing, given the proposed project would develop up to 61 dwelling units, the proposed project would generate up to 155 new residents, which

[86] Play Parks Creative LLC. 2024. Glenwood Community Park (PRIVATE). Website: https://funorangecountyparks.com/glenwood-community-park-aliso-viejo.html. Accessed January 21, 2025.

would increase the demand on existing neighborhood and regional parks. The additional use would further contribute to the need for maintenance and improvements.

The City's Municipal Code requires open space equal to 25 percent of the total site area (30,819 square feet). The proposed project includes a total of 40,259.9 square feet of open space, exceeding the City's required minimum of 30,819 square feet for a project of this size. The proposed project would exceed the required minimum amount of open space. The proposed project would include 5,587.4 square feet of usable open space and 34,672.5 square feet of other type of open space. This open space includes decorative walkways, gathering spaces with electric barbeques, open lawn area for free-play, and a tot lot (See Exhibit 6). It is expected that these on-site recreational amenities would reduce the demand on neighborhood and regional parks and recreation facilities, reducing the proposed project's contribution to the deterioration of existing parks and recreational facilities.

As previously discussed, the proposed project is expected to add 155 persons to the current City population. As such, the proposed project would need to supply approximately 0.775-acres of parkland to meet the standard of 5 acres per 1,000 residents. To address the incremental increase in demand associated with the proposed project, the applicant would comply with Chapter 14.16 of the Aliso Viejo Municipal Code, which requires developers to dedicate land for park facilities or pay park and recreation impact fees. By providing on-site recreational amenities that exceed the required minimum open space and paying applicable park development fees, the proposed project would ensure that the incremental increase in recreational demand would not result in substantial physical deterioration of existing neighborhood and regional parks. Therefore, impacts would be less than significant.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?

Less than significant impact. The proposed project would include 5,587.4 square feet of usable open space and 34,672.5 square feet of other type of open space. Additionally, the proposed project design includes amenities such as decorative walkways, gathering spaces with electric barbeques, open lawn area for free-play, and a tot lot.

The potential environmental effects associated with construction of the proposed Project, including the proposed amenities have been analyzed throughout this Initial Study, and impacts have been determined to be less than significant with compliance with regulatory requirements and implementation of mitigation measures. It is expected that these on-site recreational amenities would reduce the demand on neighborhood and regional parks and recreation facilities, reducing the proposed project's contribution to the deterioration of existing parks and recreational facilities. In addition, the project applicant would be required to pay all public benefits fees, which would offset impacts to parks and recreation facilities. Impacts would be less than significant in this regard.

Mitigation Measures

None required.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
d) Result in inadequate emergency access?	☐	☐	☒	☐

Environmental Evaluation

Setting

This section is based, in part, on the Argonaut Residential Trip Generation Assessment and the Argonaut Residential Vehicle Miles Traveled (VMT) Screening Evaluation, prepared by Urban Crossroads on June 4, 2025, and included as Appendix I of this report.

Would the project:

a) Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Less than significant impact.

Transit Facilities

Public transportation services within the project site and surrounding area are provided by Orange County Transportation Authority (OCTA). Bus Route 90 provides service from Tustin to Dana Point via Moulton Parkway; a bus stop is located near the intersection of Moulton Parkway and Glenwood Drive. The nearest bus stop is the Moulton-Glenwood bus stop, located along the Moulton Parkway, 0.8 mile east of the project site. There are no existing or planned transit facilities adjacent to the

project site. Project implementation would not conflict with a program plan, ordinance, or policy addressing transit facilities.

Roadway Facilities

Vehicular access to the project site is currently provided from a driveway along the southern boundary of the project site. Vehicles would access the project site via a proposed driveway at the south of the project site along Argonaut. An internal private roadway system would provide two-way access to each unit's parking garage as well as to guest parking spaces that would be distributed throughout the site. Roadway facilities would continue to serve the project site and surrounding development. The proposed project would not involve modifications to any roadways and, thus, would not conflict with a program, plan, ordinance, or policy addressing roadway facilities.

Bicycle Facilities

The Aliso Viejo General Plan Circulation Element (Figure C-2) identifies existing bicycle facilities within the City.[87] According to the General Plan Circulation Element and the OCTA 2009 Commuter Bikeways Strategic Plan, Class II[88] on-road bicycle lanes currently exist along both sides of Glenwood Drive. Additionally, Aliso Creek Road and Moulton Parkway have Class II on-road bicycle lanes.[89] There are no planned bicycle facilities near the project site.[90] The proposed project would not involve modifications to any of these roadways or bicycle lanes and, thus, would not conflict with a program, plan, ordinance, or policy addressing bicycle facilities.

Pedestrian Facilities

Pedestrian facilities, including crosswalks, sidewalks, and traffic lights are currently available along both sides of Glenwood Drive north of the project site and along both sides of Argonaut south and west of the project site. Signalized crosswalks are available at the intersection of Glenwood Drive and Argonaut adjacent to the northwest corner of the project site. Non-signalized crosswalks are available at the intersection of Argonaut located southwest of the project site. Pedestrians would circulate within the site via proposed internal pedestrian walkways and concrete sidewalks. The proposed internal pedestrian walkways and sidewalks would connect to the existing sidewalks along Argonaut via the proposed driveway on the south side of the project site.

The proposed project would not conflict with any program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, or pedestrian facilities. Therefore, impacts would be less than significant.

---

b) Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

Less than significant impact. VMT is a measurement of miles traveled by vehicles within a specified region and for a specified period of time. VMT is a measure of the use and efficiency of the transportation network and is calculated based on individual vehicle trips generated and their associated trip lengths. VMT accounts for two-way (round-trip) travel and is often estimated for a typical weekday for the purposes of measuring transportation impacts.

In September 2013, SB 743 was signed into law, which fundamentally changed transportation impact analysis as part of CEQA compliance. These changes include the elimination of auto delay, Level of Service (LOS), and similar measurements of vehicular roadway capacity and traffic congestion as the basis for determining significant traffic impacts. SB 743 identifies VMT as the most appropriate CEQA transportation metric. The justification for this paradigm shift is that LOS impacts lead to improvements that increase roadway capacity and, thus, induce more traffic and GHG emissions.

In May 2020, the City adopted its Aliso Viejo Transportation Impact Guidelines for CEQA and General Plan Consistency (AVTIG), which serves as the City's transportation analysis guidelines. The AVTIG includes screening criteria that are intended to provide a simplified way to determine whether a project's VMT would be expected to cause a less than significant CEQA transportation impact without having to conduct a detailed VMT analysis. Below is a discussion of the various screening criteria outlined in the AVTIG and an analysis of whether the proposed project would be "screened" from requiring a detailed VMT analysis, either in its entirety or partially based on individual land uses.

City Guidelines outline appropriate screening criteria for identifying when a proposed land use project is expected to have a less than significant impact, thus avoiding the need for a more detailed analysis. The screening criteria are divided into the following:

- Step 1: Transit Priority Areas (TPA) Screening
- Step 2: Low VMT Area Screening
- Step 3: Project Type Screening

A land use project needs only to meet one of the above screening criteria to result in a less than significant impact.

Consistent with guidance identified in the City Guidelines, projects located within a TPA or High-quality Transit Area (HQTA) (i.e., within 0.5 mile of an existing "major transit stop" or an existing stop along a "high-quality transit corridor") may be presumed to have a less than significant impact absent substantial evidence to the contrary. However, consistent with City Guidelines, Aliso Viejo does not have any TPAs within the City. Therefore, the Step 1: TPA screening criteria is not met.

The proposed project is not located within a low VMT-generating area and would not qualify for Step 2: Low VMT Area screening criteria.

The City Guidelines state that local-serving uses such as day care centers, non-destination hotels, affordable housing, places of worship, municipal services, and other local essential services may be presumed to have a less than significant impact as local-serving in nature and would tend to shorten vehicle trips. The proposed project does not include any local-serving uses. However, the City Guidelines also consider small projects that generate fewer than 110 net new daily vehicle trips to have a less than significant VMT impact. The Argonaut Residential Trip Generation Assessment (Appendix I) estimates the proposed project to generate a net increase of 79 daily vehicle trips, which does not exceed the 110 daily vehicle trip threshold. Therefore, Step 3: Project Type screening criteria is met.

Based on the City's VMT screening types, the proposed project meets the Project Type screening criteria and is therefore considered to have a less than significant VMT impact. No additional VMT analysis is required, and impacts would be less than significant.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less than significant impact. The proposed project would not provide any off-site roadway improvements that could substantially increase hazards due to a design feature. No changes are proposed to existing roadways. On-site circulation would be 24 feet wide to allow for emergency access in compliance with OCFA requirements (Exhibit 5).

As part of the City's Site Development Permit process required under Municipal Code Section 15.74.020, Site Development Permits, the proposed project would be reviewed and only approved after finding the proposed development conforms with applicable requirements and standards set forth in the Municipal Code and General Plan, including the Circulation Element. The proposed project is designed to be consistent with existing residential land uses designated Very High Density Residential to the north of the project site. Additionally, the site already supports pedestrian activity associated with the proposed residential uses, including crosswalks and sidewalks available along both sides of Glenwood Drive north of the project site and along both sides of Argonaut south and west of the project site.

It would also be designed such that all driveway and ingress/egress would have sufficient line of sight that would not be impeded by landscaping, signage, or other obstructions. Furthermore, the proposed project is an urban use in an urbanized area, and would not introduce incompatible uses such as farm equipment. The proposed project is subject to the design review requirements set forth in Municipal Code 15.62.050 to further ensure that safe line of sight would be maintained and the proposed project would not create traffic hazards. Therefore, impacts would be less than significant.

d) Result in inadequate emergency access?

Less than significant impact. As discussed in Impact 2.9(f), the City has developed an EOP outlining the City's response to extraordinary emergency situations associated with natural disasters, technological incidents, and national security emergencies. The EOP establishes evacuation routes. Additionally, the General Plan Safety Element identifies evacuation routes in the City. Within the

vicinity of the project site, Aliso Creek Road and Glenwood Drive are identified as primary evacuation routes.[91]

The project site is within Zone 20 of Aliso Viejo's Evacuation Zones. Designated evacuation zones within Zone 20 include Glenwood Drive, Aliso Creek Road, Aliso Viejo Parkway, and Moulton Parkway.[92] The project site is adjacent to Glenwood Drive, and construction would not require closure or partial closure of Glenwood Drive. The proposed project would be constructed completely within the project site and construction equipment would access the project site via Argonaut, which is the main access point to the project site. If any road closures to Argonaut are required, the project applicant and construction crew would be required to coordinate with the City of Aliso Viejo Public Works Department to ensure that emergency access routes are maintained during construction. Thus, construction of the proposed project would not impede the use of surrounding roadways for emergencies or access for emergency response vehicles.

The proposed project would provide internal circulation for emergency vehicle access. The proposed project has been designed to provide emergency service providers access to the site from any of the public streets or the drive aisles. The 24-foot private drive meets OCFA turnaround and access requirements (See Exhibit 5). The design of the proposed project would provide adequate emergency access consistent with City requirements, including the required number and design of access points and safety features. Therefore, the proposed project would not result in significant impacts to emergency access during construction and/or operation. The proposed project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Impacts would be less than significant.

Mitigation Measures

None required.

[91] City of Aliso Viejo. 2004. General Plan, Figure S-1 Safety Policy Map. Website: https://avcity.org/DocumentCenter/View/384/Safety-Policy-Map-PDF. Accessed December 3, 2024.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.18 Tribal Cultural Resources *Would the project cause a substantial adverse change in the significance of a Tribal Cultural Resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:*				
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or	☐	☒	☐	☐
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American Tribe.	☐	☒	☐	☐

Environmental Evaluation

Would the project cause a substantial adverse change in the significance of a Tribal Cultural Resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:

a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or

Less than significant with mitigation incorporated. A review of the CRHR, local registers of historic resources, a records search conducted at the SCCIC, and a pedestrian survey failed to identify any listed TCRs that may be adversely affected by the proposed project. However, the NAHC SLF results were positive for TCRs in the project site, and subsequent outreach to Tribal representatives and a response from the Juaneño Band of Mission Indians, Acjachemen Nation indicated that the proposed project is in a sensitive area that is located in the Tribe's territory with

known burial sites near the project site. As such, no eligible or potentially eligible TCRs will adversely be affected by the proposed project. Should any undiscovered TCRs be encountered during project construction, implementation of MM TCR-1 through MM TCR-3 will ensure that potential impacts to TCRs will be reduced to a level of less than significant.

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American Tribe.

Less than significant with mitigation incorporated. Tribal consultation efforts conducted by the City of Aliso Viejo pursuant to SB 18 and Assembly Bill (AB) 52 to identify additional significant TCRs meeting the criteria set forth in subdivision(c) of Public Resources Code Section 5024.1 were initiated on May 28, 2025, and consultation letters were sent to the Tribes on the NAHC consultation list. The Gabrieleño Band of Mission Indians–Kizh Nation responded on June 2, 2025, and formally requested consultation with the City. The Kizh Nation has ancestral and cultural ties to the project site and seeks to protect and preserve TCRs, sacred sites, and traditional places within the Tribe's traditional territory. A consultation meeting was scheduled for July 17, 2025; however, due to unforeseen circumstances the meeting was cancelled on July 16, 2025, and Kizh Nation offered to provide consultation via email, but no email correspondence was received from the Tribe. On June 30, 2025 the City consulted with the Juaneño Band of Mission Indians Acjachemen Nation. The City emailed draft mitigation measures on August 18, 2025, for review to both consulting Tribes. A response was received on August 18, 2025, from the Kizh Nation providing the City with their standard mitigation measures. The Acjachemen Nation responded on August 21, 2025, indicating that the Tribe agrees with the City's draft mitigation measures. On August 25, 2025, the City emailed the revised mitigation measures with redlines to the Kizh Nation and requested a response by September 1, 2025. The Tribe responded on August 25, 2025, to address the revisions that were made to the mitigation measures, and a consultation meeting was scheduled for August 27, 2025, via a phone call, and a summary of that meeting was provided in a letter via email. The City addressed the concerns the Kizh Nation had with regard to the proposed mitigation measures on September 15, 2025; however, no response was received from the Tribe. On September 25, 2025, the City sent another email to the Kizh Nation expressing appreciation for their participation in the consultation process, thereby concluding the consultation.

Should any undiscovered TCRs be encountered during project construction, implementation of MM TCR-1 through MM TCR-3 will ensure that potential impacts to TCRs will be reduced to a level of less than significant.

Mitigation Measures

MM TCR-1 Retain a Native American Monitor Prior to Commencement of Ground-Disturbing Activities

The project applicant shall retain a Native American Monitor from or approved by both the Gabrieleño Band of Mission Indians – Kizh Nation and the Juaneño Band of Mission Indians, Acjachemen Nation. The Monitor shall be retained prior to the commencement of any "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations included in the project description/definition and/or required in connection with the project, such as public improvement work). "Ground-disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching.

A copy of the executed monitoring agreement shall be submitted to the Director of Community Development prior to the earlier date of either: (1) the commencement of any ground-disturbing activity, or (2) the issuance of any permit required to commence any ground-disturbing activity.

The Monitor shall complete daily monitoring logs that will provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground-disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribes. Monitor logs shall identify and describe any discovered Tribal Cultural Resources (TCRs), including, but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, Tribal Cultural Resources, or TCRs), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of Monitor logs shall be provided to the project applicant and the Director of Community Development upon written request to the Tribe.

On-site Tribal monitoring shall conclude upon the latter of the following: (1) written confirmation to the Monitor and the Lead Agency that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the project are complete; or (2) a determination and written notification by the Monitor to the Director of Community Development that no future planned construction activity and/or development/construction phase at the project site possesses the potential to impact to TCRs.

MM TCR-2 Unanticipated Discovery of Tribal Cultural Resource Objects (Non-funerary/Non-ceremonial)

Upon discovery of any Tribal Cultural Resources (TCRs), all construction activities in the immediate vicinity of the discovery (i.e., not less than the surrounding 50 feet)

shall cease. The City shall consult with the project Archaeologist and initiate Native American consultation procedures with the project's consulting Tribes (Gabrieleño Band of Mission Indians-Kizh Nation and the Juaneño Band of Mission Indians, Acjachemen Nation). The consultation effort is intended to be a meaningful and timely process of seeking, discussing, and considering carefully the views of others in a manner that is cognizant of all parties' cultural values and, where feasible, seeking agreement on the appropriate treatment and disposition of TCRs discovered. A Cultural Resources and Monitoring and Treatment Plan shall be created by the Archaeologist in coordination with the consulting Tribes (Gabrieleño Band of Mission Indians-Kizh Nation and the Juaneño Band of Mission Indians, Acjachemen Nation) and all subsequent finds shall be subject to this plan. Project construction shall not resume within the immediate vicinity of the discovery (i.e., not less than the surrounding 50 feet) until a Cultural Resources and Monitoring Treatment Plan is prepared and implemented. The plan may include, but would not be limited to, reburying, relocating, recording, and/or another culturally appropriate treatment. If it is determined that mutual agreement cannot be reached within 30 days of the initial consultation meeting, the TCR(s) under review shall be reinterred on-site in a location free from future ground-disturbing construction activities. This measure does not apply to the finding of human remains, which must comply with California Health and Safety Code Section 7050.5.

MM TCR-3 Unanticipated Discovery of Human Remains and Associated Funerary or Ceremonial Objects

A. Native American human remains are defined in PRC 5097.98 (d)(1) as an inhumation or cremation, and in any state of decomposition or skeletal completeness. Funerary objects, called associated grave goods in Public Resources Code Section 5097.98, are also to be treated according to this statute.
B. If Native American human remains and/or grave goods are discovered or recognized on the project site, then Public Resource Code 5097.9 as well as Health and Safety Code Section 7050.5 shall be followed.
C. Human remains and grave/burial goods shall be treated alike per California Public Resources Code Section 5097.98(d)(1) and (2).
D. Preservation in place (i.e., avoidance) is the preferred manner of treatment for discovered human remains and/or burial goods.
E. Any discovery of human remains/burial goods shall be kept confidential to prevent further disturbance.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.19 Utilities and Service Systems *Would the project:*				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☐	☐	☒	☐
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e) Comply with federal, State, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

Environmental Evaluation

Setting

According to the City's 2020 Urban Water Management Plan (UWMP), MNWD relies on a combination of imported water and recycled water. The District's potable water demands are supplied from imported sources via the Metropolitan Water District of Southern California (MWD) through the Municipal Water District of Orange County (MWDOC).

Imported water represents approximately 79 percent of MNWD's total water supply. MWD's water supply originates from two principal sources–the Colorado River via the Colorado River Aqueduct and the Feather River Watershed/Lake Oroville in Northern California through the State Water Project (SWP). Recycled water provides 21 percent of the district's water supplies and is produced at one of two local treatment plants.[93]

The MNWD is responsible for maintenance of the City's sewer and storm drain lines. Wastewater is collected via the MNWD's wastewater collection system and sent to the Regional Treatment Plant operated by SOCWA.

Telecommunication services would be provided by AT&T and Cox Communications.

Individual trash service will be provided through CR&R Incorporated, with collection occurring on a weekly basis. Waste from the City is disposed of at a number of solid waste facilities, with the majority of waste disposed at the Prima Deshecha Sanitary Landfill.[94]

Would the project:

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Less than significant impact.

Water

The proposed project would connect to an existing 10-inch domestic water line within Argonaut and would extend an existing 8-inch line into the site through the internal drive aisles. An existing 6-inch domestic water line that serves the existing office building would be capped. The proposed project would be served by the MNWD.

MNWD has completed a preliminary review of the proposed project and indicates there is available water supply to support the proposed project; however, additional information is needed to confirm whether water system upgrades/upsizing is required.[95] As a condition of approval, the project applicant would be required to comply with MNWD review and permitting requirements. Any potential improvements would occur on-site and/or within the project vicinity that has previously been

[93] Moulton Niguel Water District. 2021 (MNWD). 2020 Urban Water Management Plan. Website: https://www.mnwd.com/wp-content/uploads/2021/12/2020-Urban-Water-Management-Plan.pdf. Accessed December 12, 2024.

[94] California Department of Resources Recycling and Recovery (CalRecycle). 2025. RDRS Report 2: Jurisdiction Disposal and Beneficial Reuse by Destination. Website: https://www2.calrecycle.ca.gov/RecyclingDisposalReporting/Reports/JurisdictionDisposalAndBeneficial. Accessed January 28, 2025.

[95] Moulton Niguel Water District, Mark H. Mountford, P.E., Engineering Manager. Personal correspondence: letter. October 16, 2024

disturbed. The potential environmental effects associated with construction and operation of the proposed project, including the proposed water lines to serve the residential units are analyzed within this Initial Study and impacts have been determined to be less than significant with compliance with regulatory requirements and implementation of mitigation measures. Thus, the proposed project would not require or result in relocation or construction of water facilities, the construction or relocation of which could cause significant environmental effects.

Impacts would be less than significant.

Wastewater

Wastewater is collected via the MNWD's wastewater collection system and sent to the Regional Treatment Plant operated by SOCWA. The project site has existing wastewater infrastructure associated with the office building. The proposed project would include the installation of an 8-inch system within the project site that would connect to an existing 8-inch sewer line in Argonaut. MNWD has performed a preliminary review of the proposed project and indicates there is available sewer capacity to support the proposed project. As a condition of approval, the project applicant would be required to comply with MNWD review and permitting requirements. Any potential improvements would occur on-site and/or within the project area that has previously been disturbed. The potential environmental effects associated with construction and operation of the proposed project, including the proposed sewer lines to serve the residential units are analyzed within this Initial Study and impacts have been determined to be less than significant with compliance with regulatory requirements and implementation of mitigation measures. Thus, the proposed project would not require or result in relocation or construction of wastewater facilities, the construction or relocation of which could cause significant environmental effects.

Stormwater

The potential environmental effects associated with construction and operation of the proposed project, including the proposed stormwater facilities to serve the residential units are analyzed within this Initial Study and impacts have been determined to be less than significant with compliance with regulatory requirements and implementation of mitigation measures. As such, impacts would be less than significant.

Electric Power and Natural Gas

The project site is currently served by electrical and gas infrastructure associated with the existing office building. The proposed project would be all electric and would not require natural gas or natural gas infrastructure. The proposed project would connect to existing electrical infrastructure.. The proposed project would be served by two new transformers. Electrical service is currently available in the project area and would be provided by SCE. Electricity would connect to existing lines running within Argonaut through a proposed joint trench within the project site and would be served by SCE. The proposed transformers would connect to the existing underground utility lines and would not cause significant environmental effects. SCE has conducted a preliminary review of the proposed

project and provided a will serve letter.[96] As a condition of approval, the project applicant would be required to comply with SCE review and permitting requirements. Any potential improvements would occur on-site and/or within the project area that has previously been disturbed. The potential environmental effects associated with construction and operation of the proposed project, including the proposed transformers, to serve the residential units are analyzed within this Initial Study and impacts have been determined to be less than significant with compliance with regulatory requirements and implementation of mitigation measures. Thus, the proposed project would not require or result in relocation or construction of electric power facilities, the construction or relocation of which could cause significant environmental effects. Impacts associated with the proposed project's electricity demand are discussed in Section 2.6, Energy.

Telecommunications

The project site is currently fully developed and served by telecommunications infrastructure. The proposed project would connect to the existing telecommunications infrastructure. Therefore, the proposed project would not require the installation or development of new or improved telecommunications facilities such that environmental impacts would occur. Impacts would be less than significant.

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Less than significant impact. The 2020 UWMP includes a supply and demand assessment for projected years between 2025 and 2045 for normal year, single-dry year, and multi-dry year scenarios. Table 13, below, shows the multiple dry year supply and demand comparison through 2045.

Table 13: Multiple Dry Year Supply and Demand Comparison (AFY)

		2025	2030	2035	2040	2045
First year	Supply totals	33,435	33,111	32,934	32,790	32,588
	Demand totals	33,435	33,111	32,934	32,790	32,588
	Difference	0	0	0	0	0
Second year	Supply totals	33,419	33,124	32,953	32,797	32,636
	Demand totals	33,419	33,124	32,953	32,797	32,636

	Demand totals	31,844	31,646	31,501	31,319	31,280
	Difference	0	0	0	0	0

Source: Moulton Niguel Water District (MNWD). 2021 (MNWD). 2020 Urban Water Management Plan. Website: https://www.mnwd.com/wp-content/uploads/2021/12/2020-Urban-Water-Management-Plan.pdf. Accessed December 12, 2024.

The demands are expected to be met through a combination of imported and recycled water. MNWD works together with two primary agencies, MWDOC and MWD, to ensure a safe and reliable water supply that would serve the community in periods of drought and shortage.[97] The UWMP accounts for projected water demand based on water consumption by single- and multi-family residences, commercial, and institutional/government customers.[98] The UWMP also accounts for projected land use, population, economic growth, and future conservation.[99] As noted in the UWMP and as shown in Table 13, the City would have sufficient water supplies for normal year, single dry year, and multiple years.

According to the California Department of Finance, the City has an average of 2.54 persons per household.[100] The proposed project would include the construction of up to 61 3-story townhomes, which would increase the City's population by up to 155 persons based on the average household size.[101] As discussed in Impact 2.14(b), this population growth is considered planned growth. MNWD's 2020 actual consumption was 121 gallons per capita per day (GPCD). For the estimated

Accessed December 6, 2024.

[101] 2.54 persons per household * 61 residential units = 154.94

155 residents under the proposed project, this would result in an estimated 18,747.74 gallons per day (GPD) or 21 AFY. As noted in the UWMP, the projected normal year water use in 2025 is 32,093 AFY for the entire MNWD service area.[102] The proposed project's demand would be approximately 0.07 percent of the total projected normal year 2025 demand. This does not include the existing uses on the project site and is therefore a conservative estimate. As noted in the UWMP, during the fifth year of the multiple dry year scenario, the projected water demand and supply would be 31,844 AFY. The proposed project's demand would be approximately 0.07 percent of the total projected fifth multiple dry year demand. Therefore, the small projected water use of the proposed project would be nominal, and water supplies would be sufficient to serve the proposed project. As such, the proposed project would not significantly impact water supplies. Impacts would be less than significant.

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Less than significant impact. As discussed above, the proposed project would connect to existing sanitary sewer lines. The MNWD is responsible for the City's sewer lines. The MNWD collects and treats more than 10 million gallons of wastewater per day from residential and commercial customers throughout the district's service area. MNWD utilizes three different treatment plants to appropriately treat the wastewater, with two of those treatment plants equipped to produce recycled water. The 3A Treatment Plant in Mission Viejo is owned and operated by MNWD and has a capacity of 6 million GPD. The Regional Treatment Plant in Laguna Niguel is currently operated by a regional operator, SOCWA, but is also home to the largest recycled water facility that is owned and operated by the MNWD. Regional Treatment Plant has a capacity of 9.4 million GPD. Additionally, the J.B. Latham Treatment Plant in Dana Point, which is also operated by SOCWA, provides an additional facility for treatment of wastewater and has a capacity of 13 million GPD.[103] Any treated wastewater that cannot be utilized for irrigation purposes is then discharged to the ocean through one of two ocean outfalls, the Aliso Creek Ocean Outfall and the San Juan Creek Ocean Outfall. The MNWD works closely with SOCWA, as the regional permitting entity, and the appropriate regulatory agencies to ensure that all treated wastewater, whether used for irrigation purposes or discharged to the ocean, is compliant with all regulatory requirements.[104]

A Municipal Service Review was prepared for the Southwest Region of Orange County in 2023, which included a review of the MNWD.[105] The purpose of the review was in part to review and study future growth in the service area and to determine whether Southwest Region of Orange County can

[102] Moulton Niguel Water District (MNWD). 2021. 2020 Urban Water Management Plan. Website: https://www.mnwd.com/wp-content/uploads/2021/12/2020-Urban-Water-Management-Plan.pdf. Accessed December 12, 2024.

[103] Moulton Niguel Water District (MNWD). 2024.Wastewater Collection and Treatment. Website: https:// www.mnwd.com/wastewater-treatment/. Accessed December 12, 2024.

[104] Ibid.

[105] Orange County Local Agency Formation Commission (Orange County LAFCo). 2023. Municipal Service Review and Sphere of Influence Reviews. August 9. Website: https:// oclafco.org/wp-content/uploads/2024/01/OCLAFCO_Southwest_MSR_-_Final_8.28.23.pdf. Accessed December 12, 2024.

efficiently, equitably, and reliably provide services. The review determined that MNWD existing and planned operations and infrastructure can meet current and future service demands.[106] The proposed project would result in approximately 16,873 total gallons of wastewater per day, which is equivalent to 0.017 MGD.[107] This estimate does not consider the existing uses on the project site and is therefore a conservative estimate. Based on a total combined wastewater treatment capacity of 28.4 GPD of the 3a Treatment Plant, the Regional Treatment Plant, and the J.B. Latham Treatment Plant, the proposed project's wastewater generation would be approximately 0.06 percent of the total daily capacity, which is a nominal amount and would not exceed the wastewater treatment capacity. Therefore, MNWD would have adequate capacity to serve the wastewater demands of the proposed project, and impacts would be less than significant.

d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Less than significant impact. The project site currently generates solid waste from the existing office building. Construction and operational activities associated with the proposed project would generate solid waste requiring disposal. CR&R Incorporated is a private recycling and nonhazardous solid waste hauler and provides solid waste services to the City, including the project site.[108] CR&R Incorporated collects solid waste for all residential, commercial, and industrial waste and recycling services. Solid waste is disposed of in Orange County landfills.

Solid waste within the City is primarily disposed of at the Prima Deshecha Sanitary Landfill. Other sanitary landfills, including Chiquita Canyon, El Sobrante, Frank R. Bowerman, Simi Valley, and Olinda Alpha received relatively small amounts of solid waste from the City. The Prima Deshecha Landfill is the closest facility to the City and would likely be the solid waste facility most often receiving waste from the project site.[109] According to the CalRecycle Solid Waste Information System (SWIS), the Prima Deshecha Landfill has a maximum daily capacity of 4,000 tons per day and a remaining capacity of 128,800,000 cubic yards. The facility's maximum permitted capacity is 172,100,000 cubic yards.[110]

CalRecycle provides a solid waste generation factor to estimate the amount of solid waste generated by residential projects. Using the generation rate of 12.23 pounds (lbs) per household per day for residential development, the proposed project would generate approximately 746.03 lbs per day of solid waste, or approximately 0.37 tons per day (based on 61 townhomes)—which represents less

[106] Orange County Local Agency Formation Commission (Orange County LAFCo). 2023. Municipal Service Review and Sphere of Influence Reviews. August 9. Website: https:// oclafco.org/wp-content/uploads/2024/01/OCLAFCO_Southwest_MSR_-_Final_8.28.23.pdf. Accessed December 12, 202.

[107] Based on the assumption that wastewater generated is approximately 90 percent of indoor water use.

[108] City of Aliso Viejo. 2025. Services. Website: https://avcity.org/101/Services. Accessed January 28, 2025.

[109] California Department of Resources Recycling and Recovery (CalRecycle). 2024. SWIS Facility/Site Activity Details. Website: https:// www2.calrecycle.ca.gov/SolidWaste/SiteActivity/Details/2750?siteID=2085. Accessed December 12, 2024.

[110] Ibid.

than 0.01 percent of the maximum daily capacity of the Prima Deshecha Sanitary Landfill. This estimate does not include the existing uses on the project site.

Therefore, the Prima Deshecha Landfill would have sufficient capacity to serve the proposed project and solid waste generated during construction and operations would represent a negligible increase compared to the daily permitted tonnage. The proposed project would also include recycling, reuse, and/or salvage programs to reduce solid waste and comply with all applicable regulations for solid waste. The impact would be less than significant, and no mitigation is required.

e) Comply with federal, State, and local management and reduction statutes and regulations related to solid waste?

Less than significant impact. The City complies with all federal, State, and local statutes and regulations related to solid waste. Regulations specifically applicable to the proposed project include the California Integrated Waste Management Act of 1989 (AB 939), SB 2202, SB 1016, 2019 CALGreen Section 4.408, SB 1383, and AB 341, which requires multiple-family residential development and commercial uses to implement recycling programs.

In accordance with State law and Municipal Code Section 13.02, Building Regulations, which adopts CALGreen, the proposed project would be required to divert at least 65 percent of the nonhazardous construction and demolition debris from the project site by recycling, reuse, and/or salvage. In addition, Municipal Code Chapter 7.05, Solid Waste Disposal, addresses solid waste disposal, including recycling and organic waste. Compliance with the Municipal Code would achieve compliance with State law, including SB 1383.

The City has a per capita population disposal rate target of 3.3 pounds per person per day and a per capita employment disposal rate of 9.4 pounds per person per day. Since 2007, the City has met these targets through its diversion programs. The most recent population disposal rate (2023) was 3.2 pounds per day per capita for population and 7.9 pounds per day per capita for employment. [111] The City would continue to implement its diversion programs and requires compliance with all federal, State, and local statutes and regulations for solid waste, including those identified under the most current CALGreen standards and in compliance with SB 1383.

In 1989, the Legislature adopted AB 939, in order to “reduce, recycle, and reuse solid waste generated in the State to the maximum extent feasible.” AB 939 established a waste management hierarchy and required that each county prepare a new Integrated Waste Management Plan and each City prepare a Source Reduction and Recycling Element (SRRE) by July 1, 1991. The SRRE was required to identify how each jurisdiction would meet the mandatory State waste diversion goal of 50 percent by and after the year 2000.

[111] California Department of Resources Recycling and Recovery (CalRecycle), Jurisdiction Per Capita Disposal Rate Trends. Website: https://www2.calrecycle.ca.gov/LGCentral/AnnualReporting/ReviewReports. Accessed January 28, 2025.

SB 2202 made a number of changes to the municipal solid waste diversion requirements under AB 939. These changes included a revision to the statutory requirement for 50 percent diversion of solid waste to clarify that local governments shall continue to divert 50 percent of all solid waste on and after January 1, 2000.

SB 1016 introduced a per capita disposal measurement system that measures the 50 percent diversion requirement using a disposal measurement equivalent. SB 1016 repealed the California State Water Resources Control Board (State Water Board) 2-year process, requiring instead that the State Water Board make a finding whether each jurisdiction was in compliance with the Act's diversion requirements for calendar year 2006 and determine compliance for the 2007 calendar year and beyond based on the jurisdiction's change in its per capita disposal rate. The State Water Board is required to review a jurisdiction's compliance with those diversion requirements in accordance with a specified schedule, which is conditioned upon the State Water Board finding that the jurisdiction complies with those requirements or has implemented its SRRE and household hazardous waste element. SB 1016 requires the State Water Board to issue an order of compliance if the State Water Board finds that the jurisdiction has failed to make a good faith effort to implement its SRRE or its household hazardous waste element, pursuant to a specified procedure. The per capita disposal rate is a jurisdiction-specific index, which is used as one of several "factors" in determining a jurisdiction's compliance with the intent of AB 939 and allows CalRecycle and jurisdictions to set their primary focus on successful implementation of diversion programs.

SB 1383 requires counties to take the lead in collaborating with jurisdictions located within the county in planning for the necessary organic waste recycling and food recovery capacity needed to divert organic waste from landfills into recycling activities and food recovery organizations.

CALGreen Section 4.408 requires preparation of a Construction Waste Management Plan that provides an overview of ways in which the applicant would recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition debris. As discussed above, during the construction phase, the proposed project would be required to comply with CALGreen through the recycling and reuse of at least 65 percent of the nonhazardous construction and demolition debris from the project site.

Participation in the City's recycling programs during project construction and operation, including CalRecycle's requirements, would ensure that the proposed project would not conflict with federal, State, and local statutes and regulations related to solid waste. Additionally, solid waste would be disposed of at existing Orange County Waste and Recycling landfills. Disposal of solid waste would comply with all federal, State, and local statutes and regulations related to solid waste. During operation, the proposed project would include receptacles for recyclables and garbage. Thus, impacts would be less than significant, and no mitigation is required.

Mitigation Measures

None required.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.20 Wildfire *If located in or near State Responsibility Areas or lands classified as very high fire hazard severity zones, would the project:*				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒

Environmental Evaluation

Setting

The CAL FIRE FHSZ Map indicates that the project site is not within a State Responsibility Area (SRA). The closest SRA is 1.6 miles west of the project site, in the Aliso and Wood Canyons Wilderness Park. No part of the City is listed as an SRA.[112]

[112] California Department of Forestry and Fire Protection (CAL FIRE). 2024. Fire Hazard Severity Zones in State Responsibility Area. Website: https:// calfire-forestry.maps.arcgis.com/apps/webappviewer/index.html?id=988d431a42b242b29d89597ab693d008. Accessed December 4, 2024.

VHFHSZs are located along the southern and western boundaries of the City.[113]

The General Plan indicates that the closest VHFHSZ is located near Aliso Creek Road, 0.85 mile west of the project site.[114] However, according to the most recently updated CAL FIRE maps, which were updated in 2025, the closest VHFHSZ is located near Wingspan Park along Aliso Viejo Road, 0.68 mile west of the project site.[115]

Would the project:

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

No Impact. The project site is developed and located within an urbanized area with existing infrastructure. According to the CAL FIRE FHSZ Map, the project site is not located within a VHFHSZ, nor is it within or near an SRA.[116] Additionally, the proposed project would comply with all City and OCFA requirements for fire prevention and safety measures, including adequate site access.

The City is divided into 22 all-hazard evacuation zones. According to the Citywide Evacuation Zones map, the project site is located in Evacuation Zone 20.[117] Traffic in Evacuation Zone 20 is directed to take either Glenwood Drive or Aliso Viejo Parkway east to Moulton Parkway or west to SR-73 during an emergency evacuation. Aliso Creek Road is an additional evacuation route that provides another north–south evacuation route out of the project site.[118] The proposed project would have access to several different emergency evacuation routes as shown on the evacuation zone maps and would not impair access to any of these emergency evacuation routes. Furthermore, the proposed project would not interfere with the evacuation plan or evacuation routes identified City's EOP and the General Plan Safety Element (see Impact 2.9(f)). Therefore, the proposed project would not conflict with any adopted emergency response or evacuation plans. No impacts related to emergency response or evacuation plans would occur.

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

No Impact. The project site is located in a developed urban area, is currently developed, and is not identified as having significant wildfire risk. The surrounding area is also not designated a VHFHSZ according to the CAL FIRE FHSZ Map.[119] As shown in the General Plan, the project site is not located along an urban-wildfire interface and is not located in the Aliso and Woods Canyon Wilderness Park within a VHFHSZ, where wildfires are of the greatest risk in the City.[120] The topography of the site is relatively flat, and prevailing winds or other factors do not increase the risk of wildfire spread or pollutant concentrations. The proposed project would adhere to applicable fire prevention standards, ensuring no wildfire risks are exacerbated. Thus, no impacts concerning exposure to wildfire pollutant concentrations or wildfire spread would occur.

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

No Impact. The proposed project does not include infrastructure improvements, such as roads, fuel breaks, emergency water sources, or new utility installations, that could exacerbate fire risk. The site is already developed with existing infrastructure in place. Compliance with fire safety standards and coordination with the OCFA ensures no additional infrastructure would create new fire risks or result in temporary or ongoing environmental impacts. Additionally, the proposed project would include a total of three new fire hydrants to be installed on eastern, western and southern portions of the project site, which would be installed in compliance with applicable regulations and approvals and would connect to existing water lines.. The MNWD operates 28 potable water reservoirs across 22 sites, locally storing more than 155 million gallons of water. Additionally, MNWD maintains backup generators at critical facilities and service approximately 7,000 fire hydrants throughout the MNWD service area.[121] The proposed project would be required to submit an OCFA water availability form to the MNWD to ensure compliance with applicable regulations and to verify adequate fire flow and system pressures in the project area.[122] As such, the proposed fire hydrants would not exacerbate any fire risks but would assist the City in preparing for and addressing potential fires.

[119] California Department of Forestry and Fire Protection (CAL FIRE). 2024. Fire Hazard Severity Zones in Local Responsibility Area. Website: https://avcity.org/DocumentCenter/View/4207/FHSZ_City_LRA_11x17_AlisoViejo. Accessed April 17, 2025.

[120] City of Aliso Viejo. 2004. General Plan, Safety Element. Website: https://avcity.org/DocumentCenter/View/395/Safety-Element-PDF. Accessed December 4, 2024.

[121] Moulton Niguel Water District. 2025. Moulton Niguel's Local Fire Preparedness Plan. Website: https;// https://www.mnwd.com/february-2025-newsletter-moulton-niguels-local-fire-preparedness-plan/. Accessed June 17, 2025.

[122] Moulton Niguel Water District. 2019. Development Requirements For Establishing and Moving Potable Water, Recycled Water, and Wastewater Service. Website: https://www.mnwd.com/wp-content/uploads/Complete-Doc-DEVELOPMENT-REQUIREMENTS-SIG-PAGE-PART-I-APENDICES-AND-PART-II-FINAL.pdf. Accessed June 17, 2025.

The proposed internal roadways would allow for emergency access, and fire hydrants would be provided throughout the project site. Therefore, no impacts related to infrastructure installation or maintenance and fire risk would occur.

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact. The project site is currently developed with an office building and is located within a flat, urbanized area that is not susceptible to downslope or downstream flooding, landslides, or post-fire slope instability. The area is not designated a high-risk flood zone or landslide-prone area. The project site and surrounding areas do not have a history of wildfires.[123] Moreover, the proposed project does not include changes to drainage patterns that could increase risks of flooding or slope instability. Compliance with existing stormwater and drainage regulations would further prevent any related risks. Therefore, no impacts concerning significant risks from runoff, slope instability, or drainage changes would occur.

Mitigation Measures

None required.

[123] California Department of Forestry and Fire Protection (CAL FIRE). 2024. California Wildfire History Map. Website: https://projects.capradio.org/california-fire-history/#10.64/33.5901/-117.7005. Accessed December 4, 2024.

Environmental Issues	Potentially Significant Impact	Less than Significant Impact with Mitigation Incorporated	Less than Significant Impact	No Impact
2.21 Mandatory Findings of Significance				
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☐	☒	☐	☐
c) Does the project have environmental effects, which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☒	☐	☐

Environmental Evaluation

a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?

Less than significant impact with mitigation incorporated. As discussed throughout this document, the proposed project does not have the potential to substantially degrade the quality of the

environment or result in significant environmental impacts that cannot be mitigated or reduced to a less than significant level through compliance with the established regulatory framework and implementation of mitigation measures.

As demonstrated in Section 2.4, Biological Resources, the proposed project would not substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, or substantially reduce the number or restrict the range of a rare or endangered plant or animal. The proposed project would be required to comply with the MBTA and other applicable regulations and to implement MM BIO-1a and MM BIO-1b, which require a pre-construction survey and avoidance of direct and indirect impacts on active nests. Implementation of these measures would reduce potential impacts to a less than significant level. Furthermore, the proposed project would not conflict with habitat because it does not contain Covered Habitats or suitable habitat for Identified Species covered under the CONCCP/HCP.

As demonstrated in Section 2.5, Cultural Resources and Tribal Cultural Resources, the proposed project would not eliminate important examples of the major periods of California history or prehistory. As concluded in Section 2.5, the proposed project would not result in significant adverse impacts to archaeological resources, TCRs, or human remains. MM CUL-1 would require a WEAP training, a site survey conducted by a qualified Archaeologist, and archaeological monitoring. MM CUL-2 would require consultation with a qualified Archaeologist in the event that buried archaeological resources are discovered during construction, as well as inadvertent discovery procedures. MM CUL-3 would require specific procedures to be followed related to inadvertent discovery of human remains. Therefore, the proposed project would not degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Less than significant impact with mitigation incorporated. A significant cumulative impact may occur if a project, in conjunction with related projects, would result in impacts that are less than significant when viewed individually but would be cumulatively significant when viewed together. Table 14 lists the development projects that have been proposed within the City. The nearest project is approximately 500 feet from the proposed project. Based on available information, there are no approved projects or projects currently under construction in the project's surrounding area at this time or would have a construction schedule that would overlap with the proposed project.[124] The

[124] City of Aliso Viejo. Major Projects. Website: https://avcity.org/412/Major-Projects. Accessed June 19, 2025.

projects were reviewed to identify whether the proposed project could contribute to cumulatively significant impacts when evaluated in combination with other projects.

Table 14: Current Projects in the Vicinity of the Proposed Project

Project Type	Location	Distance	Description	Status
City of Aliso Viejo[1]				
Residential	27081 Aliso Creek Road	1.63 miles	Demolition of three existing office buildings and construction of a 137-unit, residential community	Under review
Residential	26800-26970 Aliso Viejo Parkway	1.45 miles	Demolition of five, two-story office buildings to accommodate the construction of 215 residential units	Under review
Self Storage	15 Argonaut	2.5 miles	Demolition of an existing office building and construction of a three-story, 149,328 square foot self storage facility	Under review
Residential	400-600 Freedom Lane	500 feet	Construction of a 134-unit residential community	Under review
Mixed Use	26501 Aliso Creek Road	1.03 miles	Construction of a mixed-use building with 17,273 square feet of ground floor commercial space with 343 residential units above	Under review

Notes:
[1] City of Aliso Viejo. Major Projects. Website: https://avcity.org/412/Major-Projects. Accessed June 19, 2025.

When considering the proposed project in combination with other past, present, and reasonably foreseeable future projects in the vicinity of the project site, the proposed project does not result in environmental impacts that would incrementally contribute to a significant cumulatively impact. The proposed project's impacts would be individually limited and not cumulatively considerable. The proposed project could result in potentially significant impacts related to biological resources, cultural resources, and paleontological resources. However, these impacts would primarily be related to construction period activities, would be temporary in nature, and would not substantially contribute to any potential cumulative impacts associated with these topics. As there are no cumulative projects that would be undergoing construction simultaneously with the proposed project, less than significant cumulative impacts are anticipated.

Specifically, since the proposed project would not exceed SCAQMD thresholds of significance related to air quality, the proposed project would not result in a cumulatively considerable net increase of construction emissions, operational emissions, or TACs. As discussed more fully in Section 2.8 of this IS/MND, GHG emissions-related impacts are inherently cumulative in nature. The proposed project

also would not conflict with any applicable GHG plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. As such, the proposed plan, in conjunction with other existing, planned, and probable foreseeable projects, would not results in a significant cumulative impact related to GHG emissions generation. As for transportation and traffic impacts, construction of the proposed project would have the potential for temporary impacts to road hazards and emergency access. Use of local roads for transport of construction equipment and construction personnel would be temporary and short-term. Given the location of the project area in relation to other development projects in the region, the transportation network is sufficient to accommodate construction traffic to avoid significant impacts to any one area. Transportation and Traffic impacts would be temporary and less than significant, and would not contribute to cumulatively considerable impacts.

Furthermore, compliance with the regulatory requirements and implementation of mitigation measures at the project level would reduce the potential for incremental effects that would occur with construction and operation of the proposed project relevant to the environmental topical areas discussed within this document to below a level of significance. The mitigation measures identified in this document, including MM BIO-1a, MM BIO-1b, MM CUL-1, MM CUL-2, MM CUL-3, MM GEO-1, MM TCR-1, MM TCR-2, and MM TCR-3 would reduce the proposed project's incremental contribution to any potential cumulative impacts to below a level of significance. No additional mitigation measures would be required to address cumulative impacts. Therefore, the proposed project would cause less than significant cumulative impacts.

c) Does the project have environmental effects, which will cause substantial adverse effects on human beings, either directly or indirectly?

Less than significant impact with mitigation incorporated. The proposed project would improve the housing stock in the City. Based on the discussion provided in the Project Description and the analysis presented in Sections 2.1 through 2.19 of this document, the proposed project would not cause substantial adverse effects on human beings, either directly or indirectly, because the proposed project's potential impacts would be mitigated to a less than significant level. Therefore, with implementation of MM BIO-1a, MM BIO-1b, MM CUL-1, MM CUL-2, MM CUL-3, MM GEO-1, MM TCR-1, MM TCR-2, and MM TCR-3, the proposed project would not result in substantial adverse effects on human beings. Impacts would be less than significant with mitigation incorporated.

Mitigation Measures

Implement MM BIO-1a, MM BIO-1b, MM CUL-1, MM CUL-2, MM CUL-3, MM GEO-1, MM TCR-1, MM TCR-2, and MM TCR-3.

APPENDIX A:

Air Quality, Greenhouse Gas, and Energy Supporting Information

THIS PAGE INTENTIONALLY LEFT BLANK

Appendix A: Air Quality, Greenhouse Gas, and Energy Supporting Information

Table of Contents

CalEEMod Construction and Operations Emissions Report 1

CalEEMod Construction and Operations Emissions Localized Emissions Report..... 37

Additional Supporting Calculations for CalEEMod Inputs..... 78

AERMOD Source Inputs - DPM..... 81

Construction DPM and Health Risk Calculations..... 82

AERMOD Source Receptor with Legend 83

AERMOD Wind Rose..... 84

AERMOD Max Impact Figure..... 85

AERMOD Report..... 86

Construction HRA HARP Methodology.....109

HARP2 Results 112

CalEEMod Off-Road Construction Equipment Fuel 120

CalEEMod Construction Vehicle Energy Calculations 121

Operational Energy Consumption – Buildings and Parking 122

Energy Consumption Calculations from On-Road Mobile Sources 123

Argonaut Residential Custom Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

3. Construction Emissions Details

3.1. Demolition (2026) - Unmitigated

3.3. Site Preparation (2026) - Unmitigated

3.5. Grading (2026) - Unmitigated

3.7. Building Construction (2026) - Unmitigated

3.9. Building Construction (2027) - Unmitigated

3.11. Paving (2027) - Unmitigated

3.13. Architectural Coating (2027) - Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Argonaut Residential
Construction Start Date	4/7/2025
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	6.00
Location	95 Argonaut, Aliso Viejo, CA 92656, USA
County	Orange
City	Aliso Viejo
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	6039
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.29

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	61.0	Dwelling Unit	1.92	151,628	27,795	0.00	182	—

Parking Lot	0.91	Acre	0.91	0.00	0.00	0.00	—	—

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Un/Mit.	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e
Daily, Summer (Max)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Grading	0.00	2,400	6.00	0.00	—
Paving	0.00	0.00	0.00	0.00	0.91

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Condo/Townhouse	—	0%

Parking Lot	0.91	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2026	370	346	0.03	< 0.005
2027	450	346	0.03	< 0.005

5.9. Operational Mobile Sources

5.9.1. Unmitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Condo/Townhouse	411	411	411	150,066	3,632	3,632	3,632	1,325,753
Parking Lot	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

Hearth Type	Unmitigated (number)
Condo/Townhouse	—
Wood Fireplaces	0
Gas Fireplaces	0
Propane Fireplaces	0
Electric Fireplaces	0
No Fireplaces	61
Conventional Wood Stoves	0

Catalytic Wood Stoves	0
Non-Catalytic Wood Stoves	0
Pellet Wood Stoves	0

5.10.2. Architectural Coatings

Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
307046.7	102,349	0.00	0.00	2,378

5.10.3. Landscape Equipment

Season	Unit	Value
Snow Days	day/yr	0.00
Summer Days	day/yr	250

5.11. Operational Energy Consumption

5.11.1. Unmitigated

Electricity (kWh/yr) and CO2 and CH4 and N2O and Natural Gas (kBTU/yr)

Land Use	Electricity (kWh/yr)	CO2	CH4	N2O	Natural Gas (kBTU/yr)
Condo/Townhouse	444,090	346	0.0330	0.0040	0.00
Parking Lot	34,724	346	0.0330	0.0040	0.00

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

Land Use	Indoor Water (gal/year)	Outdoor Water (gal/year)
Condo/Townhouse	2,289,065	440,285
Parking Lot	0.00	0.00

5.13. Operational Waste Generation

5.13.1. Unmitigated

Land Use	Waste (ton/year)	Cogeneration (kWh/year)
Condo/Townhouse	45.2	—
Parking Lot	0.00	—

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

Land Use Type	Equipment Type	Refrigerant	GWP	Quantity (kg)	Operations Leak Rate	Service Leak Rate	Times Serviced
Condo/Townhouse	Average room A/C & Other residential A/C and heat pumps	R-410A	2,088	< 0.005	2.50	2.50	10.0
Condo/Townhouse	Household refrigerators and/or freezers	R-134a	1,430	0.12	0.60	0.00	1.00

8. User Changes to Default Data

Screen	Justification
Land Use	Bldg Square footage is Gross for construction purposes and conservatively based on 3 story buildings at a site coverage 41 % (this estimate would include unconditioned built space such as garages, porches etc) Landscaping from site plans Parking represents interior roads and parking and calculated by subtracting building footprint/coverage and open space 33,092 sq ft
Construction: Construction Phases	Building construction phases increased based on applicants schedule and density of the construction Assume that on-site electricity is available for uses such as welding - air compressors and temporary power used in lieu of diesel generators
Construction: Off-Road Equipment	Generator Reduced to 4 hours per day to reflect grid/temp power Air Compressors and Welders - Electric

Operations: Energy Use	Calculational Method is from Measure E-15 of the CAPCOA Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health
Construction: Trips and VMT	Vendor Paving Trips for Asphalt
Operations: Vehicle Data	Trip Generation Rate = 6.74 Trips/DU for ITE Code 220 - to match Urban Crossroads Trip Generation (06.01.2024) and VMT Screening Evaluation Report (07.15.24)
Operations: Hearths	No Wood stoves or Fireplaces

Argonaut Residential - Localized Emissions Custom Report

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Argonaut Residential - Localized Emissions
Construction Start Date	4/7/2025
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	6.00
Location	95 Argonaut, Aliso Viejo, CA 92656, USA
County	Orange
City	Aliso Viejo
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	6039
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.29

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	61.0	Dwelling Unit	1.92	151,628	27,795	0.00	182	—

Parking Lot	0.91	Acre	0.91	0.00	0.00	0.00	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

5.13.1. Unmitigated

Land Use	Waste (ton/year)	Cogeneration (kWh/year)
Condo/Townhouse	45.2	—
Parking Lot	0.00	—

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

Land Use Type	Equipment Type	Refrigerant	GWP	Quantity (kg)	Operations Leak Rate	Service Leak Rate	Times Serviced
Condo/Townhouse	Average room A/C & Other residential A/C and heat pumps	R-410A	2,088	< 0.005	2.50	2.50	10.0
Condo/Townhouse	Household refrigerators and/or freezers	R-134a	1,430	0.12	0.60	0.00	1.00

8. User Changes to Default Data

Screen	Justification
Land Use	Bldg Square footage is Gross for construction purposes and conservatively based on 3 story buildings at a site coverage 41 % (this estimate would include unconditioned built space such as garages, porches etc) Landscaping from site plans Parking represents interior roads and parking and calculated by subtracting building footprint/coverage and open space 33,092 sq ft
Construction: Construction Phases	Building construction phases increased based on applicants schedule and density of the construction Assume that on-site electricity is available for uses such as welding - air compressors and temporary power used in lieu of diesel generators
Construction: Off-Road Equipment	Generator Reduced to 4 hours per day to reflect grid/temp power Air Compressors and Welders - Electric

Operations: Energy Use	Calculational Method is from Measure E-15 of the CAPCOA Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health
Construction: Trips and VMT	Vendor Paving trips for asphalt Trip Length 0.5 mile for LST
Operations: Vehicle Data	Trip Length 0.5 mile for LST Trip Generation Rates from Urban Crossroads Reports (June and July 2024) for Trip Generation and VMT Screening
Operations: Hearths	No Woodstoves or Fireplaces

Argonaut Residential
Demolition Debris Calculations

Description	Footprint Area [1] (square feet)	height/depth (ft)	Volume (ft3)	Demolition Waste Fraction	Demolition Volume[1] (ft^3)	Demolition Waste Density (tons/cy)	Demolition Weight (tons)
Building (2-story)	24,000	25	600,000	0.25	150,000	0.50	2,778
Pavement	99,275	0.5	49,637	1	49,637	2.025	3,723
Totals	**123,275**	-	-		-		**6,500**

Notes:

Building demolition estimates are based on methods used in CalEEMod (CAPCOA, 2022), based on 1 story building , assume 10 ft per floor where 1 sf = 10 cf of building volume, and 1 cf of building volume = 0.25 cf of waste. This approach can be used to estimate demolition for multiple story buildings. It also assumes 1 cubic yard building waste = 0.5 ton weight

1 cubic yard of asphalt = 2.025 tons or 4050 lbs.

[1] Source: Site Plans - Pervious Areas removed. Conservatively used as Bldg Square Footage for Demoltion Estimates.

Wind Speed
Direction (blowing from)

COMMENTS:

Wind Rose is generated just for the hours with emissions when construction would occur or from 8 AM – 5 PM. This corresponds to the modeling hours in AERMOD.

DATA PERIOD:

Start Date: 1/1/2017 - 09:00
End Date: 12/31/2021 - 17:00

CALM WINDS:

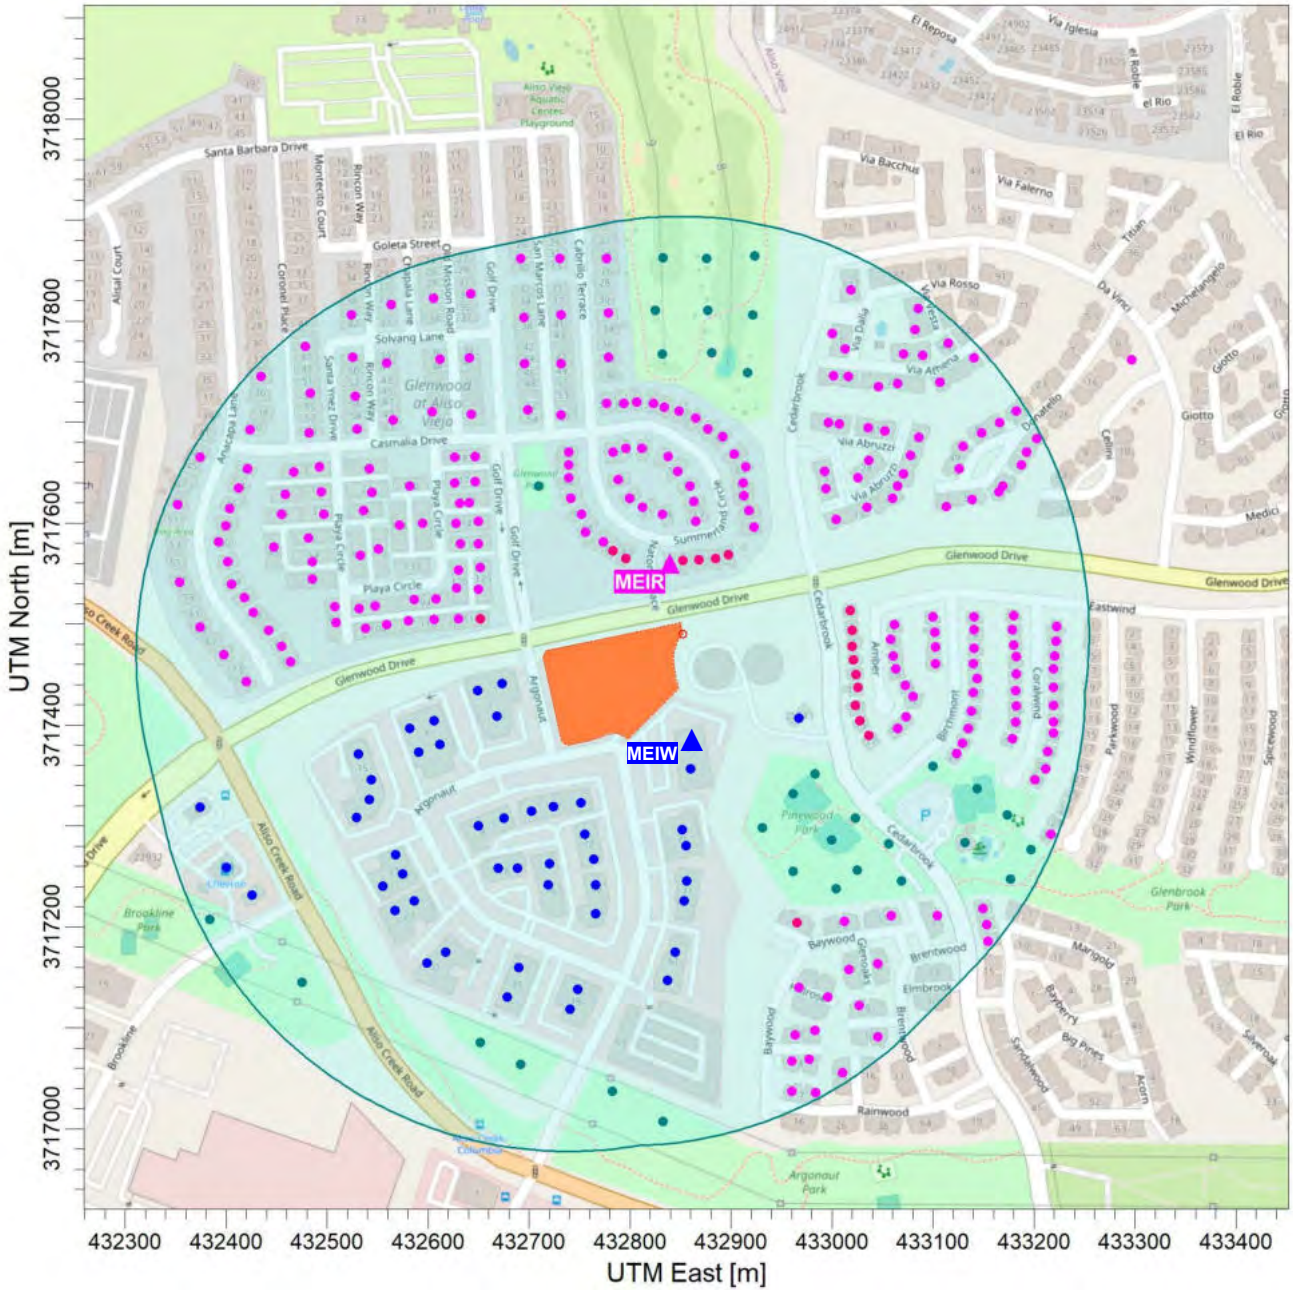
0.56%

AVG. WIND SPEED:

1.96 m/s

How to Read a Wind Rose Diagram

The wind rose above shows the general wind direction and speed for the meteorological data set used in the AERMOD modeling for the project.'



The circular format of the wind rose shows the direction the winds blew from and the length of each "spoke" around the circle shows how often the wind blew from that direction.

HEALTH RISK ASSESSMENT CALCULATIONS

Argonaut Residential Project

The Health Risk Assessment (HRA) follows South Coast Air Quality Management District (SCAQMD) Risk Assessment Guidelines and is based on foundational Office of Environmental Health Hazard Assessment (OEHHA) Guidance[1]. This risk assessment intake methodology addresses children's greater sensitivity and health impacts from early exposure to carcinogenic compounds. The chemical intake or dose describing the frequency and duration of the exposure is estimated using receptor's breathing rates, exposure duration, and exposure frequency. The calculations include the use of age-specific weighting factors, breathing rates, fraction of time at home, and reduced exposure durations.

The HRA was conducted utilizing the California Air Resources Board's (ARB's) Hot Spots Analysis and Reporting Program Version 2 (HARP2) to automatically calculate risks for the projects using OEHHA promulgated cancer potency and reference exposure levels. The approach used in HARP is consistent with SCAQMD's risk assessment guidance methodology under permitting rules 1401 and 212.[2]

These factors are described below, followed by a summary of the HARP2 HRA inputs to determine risk from the maximally exposed individual resident and worker.

AERMOD Inputs — The AMS/EPA Regulatory Model (AERMOD) was utilized to predict the ground level concentrations resulting from the emissions of Diesel Particulate Matter (DPM) (represented as PM_{10} exhaust) associated with construction activities. The modeling included both emissions generated at the project site and those generated along the anticipated haul roads within approximately 1,000 ft of the site boundary. Diesel exhaust from material movement were characterized by an area source with a height of 5 meters to account for the height of the construction exhaust from the off-road equipment. Roadway emissions were modeled as line-volume sources or adjacent volume sources using US EPA Haul Road Guidance. The modeling utilized Urban dispersion coefficients and SCAQMD-provided meteorological data from the Mission Viejo meteorological station (MSVJ). Emissions were modeled only during the hours of 8 AM – 5 PM (with a one-hour break for lunch) Monday to Friday. DPM Emissions were calculated using CalEEMod using emissions from PM_{10} exhaust from diesel vehicles and off-road construction equipment exhaust.

Age Sensitivity Factors — Studies have shown that young animals are more sensitive than adult animals to exposure to many carcinogens.[3] Therefore, OEHHA developed age sensitivity factors (ASFs) to account for the increased sensitivity to carcinogens during early-in-life exposures. Accordingly, the cancer risk methodology applies different ASFs by age groups. The ASFs utilized a 10-fold multiplier in sensitivity for

the third trimester and infants less than age 2, a 3-fold increase in sensitivity for children ages 2 to 16 years old, and a sensitivity factor of 1 for ages 16 and older.

Daily breathing rates (age-specific daily air intake) — Breathing rates are determined for specific age groups (i.e., third trimester, 0-2, 2-16, and 16-30 years). The analysis follows ARB's Risk Management Policy (RMP) that includes recommendations for inhalation exposures. For residential exposures, SCAQMD procedures adopt ARB's RMP policy which recommends using the high-end daily breathing rates (DBR) (e.g., 95th percentile) for children from the third trimester through age 2, and 80th percentile DBR for all other ages.[4]

Time at home – The time at home applies only applies to residential receptors. Residents are assumed to be at home 350 days per year, which assumes individuals are away for approximately 2 weeks of vacation. The fraction of time at home refers to the estimated amount of time residents stay at home during these 350 days. The HRA assumes 100 percent time at home for receptors under age 16. Since the duration of construction is only 1.53 years, all exposure is for infants/children less than 16 years of age.

Exposure Duration — OEHHA 2015 guidelines specify a 30-year residential exposure duration for estimating cancer risk at the maximum exposed individual resident (MEIR). This is based on studies showing that 30 years is a reasonable estimate of the 90th to 95th percentile of residency duration in the population. A 25-year standard exposure duration is the default to estimate cancer risk for off-site workers. However, risk assessors can use other exposure durations with proper justification and documentation. For example, short-term projects (e.g., construction projects) can now be evaluated for as short a duration as 6 months. Because there are no significant sources of TAC emissions during operations, the exposure assessment is limited to the duration of the proposed project construction 399 workdays or 1.53 years.

Residential Cancer Risk — Cancer risk for individual resident receptors exposed to DPM were calculated utilizing HARP2. Consistent with OEHHA guidance, the start of residential exposure was assumed to occur in the third trimester (-0.25 years) to accommodate the increased susceptibility of exposures in early life. Inhalation is the only exposure pathway included in the OEHHA risk assessment guidelines for Diesel Exhaust. The exposure assessment was modeled for Inhalation pathway only, using Risk Management Program.

Exposure Duration Bin Distribution:

3rd Trimester Bin: 0.25
0<2 Years Bin: 1.28
2<9 Years Bin: 0
2<16 Years Bin: 0
16<30 Years Bin: 0

[4] California Air Resources Board (ARB) and California Air Pollution Control Officers Association. 2015. Risk Management Guidance for Stationary Sources of Air Toxics. July 23. Website: https://ww2.arb.ca.gov/sites/default/files/classic/toxics/rma/rmgssat.pdf. Accessed December 24, 2024.

16 to 70 Years Bin: 0

Worker Cancer Risk — Cancer risk for off-site worker receptors exposed to DPM were calculated utilizing HARP2. Consistent with OEHHA guidance, the start of residential exposure was assumed to start at age 16 and occur over the construction period of 1.53 years. Inhalation is the only exposure pathway included in the OEHHA risk assessment guidelines for Diesel Exhaust. The exposure assessment was modeled for Inhalation pathway only, using Risk Management Program assuming the 80th percentile breathing rate for adults. All exposure is in the adult age bin (16 <30 years), with no adjustments for age sensitivity.

The worker adjustment factor (WAF) is used to determine the long-term concentration the worker is breathing during their work shift. Therefore, the long-term concentration is adjusted so it is based only on the hours when the worker is present. For this project, assuming the emitting source and worker's schedules are the same, the adjustment factor is 4.2 = (24 hours per day/8 hours per shift) x (7 days in a week/5 days in a work week).

HARP2 provides for the specification of the WAF for worker cancer risk assessments, and this was entered as 4.2 to make this adjustment.

Noncancer Chronic Health Risks

Chronic RELs are used to assess residential health impacts characterized by the chronic hazard index, affecting the respiratory system for DPM.

Potential chronic noncancer health impacts use the long-term annual average concentration regardless of the emitting facility's schedule.

Biological Resources Supporting Information

THIS PAGE INTENTIONALLY LEFT BLANK

Table 1: Special-status Plant Species Potentially Occurring within the Project Site

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
Dicots						
Aphanisma blitoides aphanisma	—	—	1B.2	Annual herb found in gravelly (sometimes) and sandy (sometimes) soils in coastal bluff scrub, coastal dunes, and coastal scrub. Elevation: 1–305 m Bloom period: February–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are three recent and three historical records between five and ten miles from the project site.	No
Artemisia palmeri San Diego sagewort	—	—	4.2	Perennial deciduous shrub found in mesic and sandy soils in chaparral, coastal scrub, riparian forest, riparian scrub, and riparian woodland. Elevation: 5–915 m Bloom period: May–September	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Astragalus brauntonii Braunton's milk-vetch	FE	—	1B.1	Perennial herb found in carbonate and sandstone soils in chaparral, coastal scrub, and valley and foothill grassland communities. Typically found in burned areas and sometimes in disturbed areas. Elevation: 4–640 m Bloom period: January–August	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record between five and ten miles from the project site.	No
Atriplex coulteri Coulter's saltbush	—	—	1B.2	Perennial herb found in alkaline or clay soils (sometimes) in coastal bluff scrub, coastal dunes, coastal scrub, and valley and foothill grassland communities. Elevation: 3–460 m Bloom period: March–October	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are three historical records within five miles of the project site and there are three recent and eight historical records between five and ten miles from the project site.	No

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
Atriplex pacifica south coast saltscale	—	—	1B.2	Annual herb found in coastal bluff scrub, coastal dunes, coastal scrub, and playas. Elevation: 0–140 m Bloom period: March–October	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are two historical records within five miles of the project site and one recent and two historical records between five and ten miles from the project site.	No
Atriplex parishii Parish's brittlescale	—	—	1B.1	Annual herb found in alkaline soils in chenopod scrub, playas, and vernal pools. Elevation: 25–1900 m Bloom period: June–October	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site. This species may be locally extirpated.	No
Atriplex serenana var. davidsonii Davidson's saltscale	—	—	1B.2	Annual herb found in alkaline soils in coastal bluff scrub and coastal scrub. Elevation: 10–200 m Bloom period: April–October	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one record within five miles of the project site and three historical records between five and ten miles from the project site.	No
Bahiopsis laciniata San Diego County viguiera	—	—	4.3	Perennial shrub found in chaparral and coastal scrub. Elevation: 60–750 m Bloom period: February–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Berberis nevinii Nevin's Barberry	FE	SE	1B.1	Perennial, evergreen shrub found on steep, north-facing slopes or in low-grade sandy washes in coastal scrub, chaparral, cismontane woodland, and riparian scrub communities. Elevation: 290–1,575 m Blooming period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
Camissoniopsis lewisii Lewis' evening-primrose	—	—	3	Annual herb found in clay and sandy soils (sometimes) in coastal bluff scrub, cismontane woodland, coastal dunes, coastal scrub, and valley and foothill grassland communities. Elevation: 0–300 m Bloom period: March–May	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Caulanthus simulans Payson's jewelflower	—	—	4.2	Annual herb found in granitic and sandy soils in chaparral and coastal scrub communities. Elevation: 90–2,200 m Bloom period: March–May	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Centromadia parryi ssp. *australis* southern tarplant	—	—	1B.1	Annual herb found in marshes and swamps (margins), valley and foothill grassland (vernally mesic), and vernal pools. Elevation: 0–480 m Bloom period: May–November	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record within five miles of the project site and six recent and thirteen historical records between five and ten miles from the project site.	No
Chaenactis glabriuscula var. *orcuttiana* Orcutt's pincushion	—	—	1B.1	Annual herb found in coastal bluff scrub (sandy) and coastal dunes. Elevation: 0–100 m Bloom period: January–August	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and one recent and two historical records between five and ten miles from the project site.	No
Chloropyron maritimum salt marsh bird's-beak	FE	SE	1B.2	Annual, hemiparasitic herb found in coastal dunes, marsh and swamp, salt marsh, and wetlands communities. Elevation: 0–30 m Bloom period: May–October	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record between five and ten miles from the project site.	No

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
Chorizanthe leptotheca Peninsular spineflower	—	—	4.2	Annual herb found in granitic soils in chaparral, coastal scrub, and lower montane coniferous forest communities. Elevation: 300–1,900 m Bloom period: May–August	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Chorizanthe polygonoides var. *longispina* long-spined spineflower	—	—	1B.2	Annual herb that occurs in valley and foothill grassland, coastal scrub, chaparral, meadows and seeps, and vernal pools. Elevation: 30–1,530 m Bloom period: April–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Cistanthe maritima seaside cistanthe	—	—	4.2	Annual herb found in sandy soils in coastal bluff scrub, coastal scrub, and valley and foothill grassland. Elevation: 5–300 m Bloom period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Clinopodium chandleri San Miguel savory	—	—	1B.2	Perennial shrub found in chaparral, cismontane woodland, coastal scrub, riparian woodland, and valley and foothill grassland. Sometimes in gabbroic and rocky soils. Elevation: 120–1,075 m Bloom period: March–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one record between five and ten miles from the project site.	No
Comarostaphylis diversifolia ssp. *diversifolia* summer holly	—	—	1B.2	Perennial evergreen shrub found in chaparral and cismontane woodland. Elevation: 30–790 m Bloom period: April–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are one recent and five historical records between five and ten miles from the project site.	No
Convolvulus simulans small-flowered morning-glory	—	—	4.2	Annual herb found in clay soils, seeps, and serpentine soils in openings in chaparral, coastal scrub, and valley and foothill grassland communities. Elevation: 30–740 m	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
				Bloom period: March–July		
Deinandra paniculata paniculate tarplant	—	—	4.2	Annual herb found in sandy soils (sometimes) and in vernally mesic soils (usually) in coastal scrub, valley and foothill grassland, vernal pool communities. Elevation: 25–940 m Bloom period: April–November	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Dichondra occidentalis western dichondra	CONCC P/HCP	CONCC P/HCP	4.2	Perennial rhizomatous herb found in chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland communities. Elevation: 50–500 m Bloom period: March–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Diplacus clevelandii Cleveland's bush monkeyflower	—	—	4.2	Perennial rhizomatous herb found in chaparral, cismontane woodland, and lower montane coniferous forest. In disturbed areas, gabbroic soils, openings, and rocky areas. Elevation: 450–2,000 m Bloom period: April–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Dudleya blochmaniae ssp. *blochmaniae* Blochman's dudleya	CONCC P/HCP	CONCC P/HCP	1B.1	Perennial herb found in clay (often), rocky, and serpentine soils in coastal bluff scrub, chaparral, coastal scrub, and valley and foothill grassland. Elevation: 5–450 m Bloom period: April–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are four historical records between five and ten miles from the project site.	No
Dudleya cymosa ssp. *ovatifolia* Santa Monica dudleya	FT CONCC P/HCP	CONCC P/HCP	1B.1	Perennial herb found in chaparral and coastal scrub, typically in rocky and sometimes volcanic areas. Elevation: 150– 1,675 m Bloom period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
Dudleya multicaulis many-stemmed dudleya	—	—	1B.2	Perennial herb found in clay soils (usually) in chaparral, coastal scrub, and valley and foothill grassland communities. Elevation: 15–790 m Bloom period: April–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are three recent and 22 historical records within five miles of the project site and eight recent and eighteen historical records between five and ten miles from the project site.	No
Dudleya stolonifera Laguna Beach dudleya	FT CONCC P/HCP	CT CONCC P/HCP	1B.1	Perennial stoloniferous herb found in rocky soils in chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland communities. Elevation: 10–260 m Bloom period: May–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record within five miles of the project site.	No
Dudleya viscida sticky dudleya	—	—	1B.2	Perennial herb found in rocky areas in coastal bluff scrub, chaparral, cismontane woodland, and coastal scrub. Elevation: 10–550 m Bloom period: May–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Eryngium pendletonense Pendleton button-celery	—	—	1B.1	Perennial herb found in clay and vernally mesic soils in coastal bluff scrub, valley foothill grassland, and vernal pools. Elevation: 15–110 m Bloom period: April–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Erythranthe diffusa Palomar monkeyflower	—	—	4.3	Annual herb found in gravelly and sandy soils (sometimes) in chaparral and lower montane coniferous forest communities. Elevation: 1,220–1,830 m Bloom period: April – June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
Euphorbia misera Cliff spurge	CONCC P/HCP	CONCC P/HCP	2B.2	Perennial shrub found in rocky soils in coastal bluff scrub, coastal scrub, and Mojavean desert scrub. Elevation: 10–500 m Bloom period: December–August	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are two recent and two historical records between five and ten miles from the project site.	No
Harpagonella palmeri Palmer's grapplinghook	CONCC P/HCP	CONCC P/HCP	4.2	Annual herb found in clay soils and openings in chaparral, coastal scrub, and valley and foothill grassland communities. Elevation: 20–955 m	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Helianthus nuttallii ssp. *parishii* Los Angeles sunflower	—	—	1A	Perennial rhizomatous herb found in marshes and swamps (freshwater, coastal salt). Elevation: 10–1525 m Bloom period: August–October	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Holocarpha virgata ssp. *elongata* graceful tarplant	—	—	4.2	Annual herb found in chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland. Elevation: 60–1,100 m Bloom period: May–November	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Horkelia cuneata var. *puberula* mesa horkelia	—	—	1B.1	Perennial herb found in chaparral, coastal scrub, and cismontane woodland communities. Bloom period: February–July Elevation: 70–810 m Bloom period: March–May	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and one historical record between five and ten miles from the project site.	No

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
Isocoma menziesii var. *decumbens* decumbent goldenbush	—	—	1B.2	Perennial shrub found in chaparral and coastal scrub (often disturbed areas, sandy). Elevation: 10–250 m Bloom period: April–November	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and one historical record between five and ten miles from the project site.	No
Juglans californica southern California black walnut	—	—	4.2	Perennial, deciduous tree found in chaparral, cismontane woodland, coastal scrub, and riparian woodland communities. Elevation: 50–900 m Bloom period: March–August	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Lasthenia glabrata ssp. *coulteri* Coulter's goldfields	—	—	1B.1	Annual herb found in marshes and swamps, playas, and vernal pools. Elevation: 1–1,220 m Bloom period: February–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are three historical records between five and ten miles from the project site.	No
Lepechinia cardiophylla heart-leaved pitcher sage	CONCC P/HCP	CONCC P/HCP	1B.2	Perennial shrub found in closed-cone coniferous forest, chaparral, and cismontane woodland communities. Elevation: 520– 1,370 m Bloom period: April–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Lepidium virginicum var. *robinsonii* Robinson's pepper-grass	—	—	4.3	Annual herb found in dry soils in chaparral and coastal scrub communities. Elevation: 1–855 m Bloom period: January–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are two recent and two historical records between five and ten miles from the project site.	No
Lessingia hololeuca woolly-headed lessingia	—	—	3	Annual herb found in clay and serpentine soils in broadleafed upland forest, coastal scrub, lower montane coniferous forest, and valley and foothill grassland.	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
				Elevation: 15–305 m Bloom period: June–October		
Lycium brevipes var. *hassei* Santa Catalina Island desert-thorn	—	—	3.1	Perennial deciduous shrub found in coastal bluff scrub and coastal scrub communities. Elevation: 65–300 m Bloom period: June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Lycium californicum California box-thorn	—	—	4.2	Perennial shrub found in coastal bluff scrub and coastal scrub communities. Elevation: 5–150 m Bloom period: March–August	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Malacothrix saxatilis var. *saxatilis* cliff malacothrix	—	—	4.2	Perennial rhizomatous herb found in coastal bluff scrub and coastal scrub communities. Elevation: 3–200 m Bloom period: March–September	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Microseris douglasii ssp. *platycarpha* small-flowered microseris	—	—	4.2	Annual herb found in clay soils in cismontane woodland, coastal scrub, valley and foothill grassland, and vernal pool communities. Elevation: 15–1,070 m Bloom period: March–May	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Monardella hypoleuca ssp. *intermedia* intermediate monardella	—	—	1B.3	Perennial rhizomatous herb that occurs in chaparral, cismontane woodland, and lower montane coniferous forest communities. Elevation: 400–1,250 m Bloom period: April–September	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are three recent records between five and ten miles from the project site.	No
Monardella macrantha ssp. *hallii* Hall's monardella	—	—	1B.3	Perennial rhizomatous herb found in broadleafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, and valley and foothill grassland. Elevation: 730–2,195 m	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale[5]	Included in Impact Analysis
	USFWS[1]	CDFW[2]	CNPS[3]			
				Bloom period: June–October		
Myosurus minimus ssp. *apus* little mousetail	—	—	3.1	Annual herb found in alkaline soils in valley and foothill grassland and vernal pools. Elevation: 20– 640 m Bloom period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Nama stenocarpa mud nama	—	—	2B.2	Annual/perennial herb found in marshes and swamps. Elevation: 5–500 m Bloom period: January–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are two historical records within five miles of the project site and three historical records between five and ten miles from the project site.	No
Nasturtium gambelii Gambel's water cress	FE	CT	1B.1	Perennial rhizomatous herb found in marshes and swamps (brackish, freshwater). Elevation: 5–330 m Bloom period: April–October	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Navarretia prostrata prostrate vernal pool navarretia	—	—	1B.2	Annual herb found in mesic, alkaline soils in coastal scrub, meadows and seeps, valley and foothill grassland, and vernal pool communities. Elevation: 3–1,210 m Bloom period: April–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site.	No
Nemacaulis denudata var. *denudata* coast woolly-heads	—	—	1B.2	Annual herb found in coastal dunes. Elevation: 0–100 m Bloom period: April–September	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and one historical record within five miles of the project site and two historical	No

					records between five and ten miles from the project site.	
Pentachaeta aurea ssp. *allenii* Allen's pentachaeta	—	—	1B.1	Annual herb found in openings in coastal scrub and valley and foothill grassland communities. Elevation: 75–520 m Bloom period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are three historical records within five miles of the project site and three historical records between five and ten miles from the project site.	No
Pentachaeta aurea ssp. aurea golden-rayed pentachaeta	—	—	4.2	Annual herb found in chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, riparian woodland, and valley and foothill grassland communities. Elevation: 80–1,850 m Bloom period: March–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Phacelia hubbyi Hubby's phacelia	—	—	4.2	Annual herb found in gravelly, rocky, and talus soils in chaparral, coastal scrub, and valley and foothill grassland. Elevation: 0–1,000 m Bloom period: April–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Phacelia keckii Santiago Peak phacelia	—	—	1B.3	Annual herb found in closed-cone coniferous forest and chaparral communities. Elevation: 545–1,600 m Bloom period: May–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Phacelia ramosissima var. *austrolitoralis* south coast branching phacelia	—	—	3.2	Perennial herb found in rocky (sometimes) and sandy soils in chaparral, coastal dunes, coastal scrub, and marshes and swamps (coastal salt). Elevation: 5–300 m Bloom period: March–August	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No

	USFWS[1]	CDFW[2]	CNPS[3]			
Pseudognaphalium leucocephalum white rabbit-tobacco	—	—	2B.2	Perennial herb found in gravelly and sandy soils in chaparral, cismontane woodland, coastal scrub, and riparian woodland communities. Elevation: 0–2,100 m Bloom period: August–November	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and three recent and two historical records between five and ten miles from the project site.	No
Quercus dumosa Nuttall's scrub oak	CONCC P/HCP	CONCC P/HCP	1B.1	Perennial evergreen shrub found in clay, loam, and sandy soils in closed-cone coniferous forest, chaparral, and coastal scrub. Elevation: 15–400 m Bloom period: February–April	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and three recent and five historical records between five and ten miles from the project site.	No
Rhinotropis cornuta var. *fishiae* Fish's milkwort	—	—	4.3	Perennial deciduous shrub found in chaparral, cismontane woodland, and riparian woodland communities. Elevation: 100–1,000 m Bloom period: May–August	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Romneya coulteri Coulter's matilija poppy	CONCC P/HCP	CONCC P/HCP	4.2	Perennial, rhizomatous herb found in chaparral and coastal scrub, often in burned areas. Elevation: 20–1,200 m Bloom period: March–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Senecio aphanactis chaparral ragwort	—	—	2B.2	Annual herb found in drying alkaline flats (usually) in chaparral, cismontane woodland, and coastal scrub communities. Elevation: 15–800 m Bloom period: January–April	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are three historical records between five and ten miles from the project site.	No

	USFWS[1]	CDFW[2]	CNPS[3]			
Sidalcea neomexicana salt spring checkerbloom	—	—	2B.2	Perennial herb found in playas and in alkaline, mesic soils in chaparral, coastal scrub, lower montane coniferous forest, and Mojavean desert scrub communities. Elevation: 15–1,500 m Bloom period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and one historical record between five and ten miles from the project site.	No
Suaeda esteroa estuary seablite	—	—	1B.2	Perennial herb found in marshes and swamps (coastal salt). Elevation: 0–5 m Bloom period: July–October	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are two recent and one historical record between five and ten miles from the project site.	No
Suaeda taxifolia woolly seablite	—	—	4.2	Perennial evergreen shrub found in coastal bluff scrub, coastal dunes, and marshes and swamps (coastal margins). Elevation: 0–50 m Bloom period: January–December	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Symphyotrichum defoliatum San Bernardino aster	—	—	1B.2	Perennial, rhizomatous herb found in banks of ditches, streams, and springs in cismontane woodlands, coastal scrub, lower montane coniferous forests, meadows and seeps, marshes and swamps, and vernally mesic valley and foothill grassland communities. Elevation: 2–2,040 m Bloom period: July–November	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are two historical records between five and ten miles from the project site.	No
Verbesina dissita big-leaved crownbeard	FT	CT	1B.1	Perennial herb found in chaparral (maritime) and coastal scrub communities. Elevation: 45–205 m Bloom period: April–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record within five miles of the project site and one recent record between five and ten miles from the project site.	No

Ferns						
Asplenium vespertinum western spleenwort	—	—	4.2	Perennial, rhizomatous herb found in rocky areas in chaparral, cismontane woodland, and coastal scrub. Elevation: 180–1,000 m Bloom period: February–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Gymnosperms						
Hesperocyparis forbesii Tecate cypress	CONCC P/HCP	CONCC P/HCP	1B.1	Perennial, evergreen tree found in clay and gabbroic (sometimes) soils in closed-cone coniferous forest and chaparral communities. Elevation: 80–1,500 m	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Lycophytes						
Selaginella cinerascens ashy spike-moss	—	—	4.1	Perennial rhizomatous herb found in chaparral and coastal scrub communities. Elevation: 20–640 m	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Monocots						
Allium marvinii Yucaipa onion	—	—	1B.2	Perennial, bulbiferous herb found in clay soils and openings in chaparral. Elevation: 760–1,065 m Bloom period: April–May	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Brodiaea filifolia thread-leaved brodiaea	FT	CE	1B.1	Perennial, bulbiferous herb found in clay soils in chaparral (openings), cismontane woodland, coastal scrub, playas, valley and foothill grassland, and vernal pools. Elevation: 25–1,120 m Bloom period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and one historical record within five miles of the project site and five recent and four historical records between five and ten miles from the project site.	No

Calochortus catalinae Catalina mariposa lily	CONCC P/HCP	CONCC P/HCP	4.2	Perennial, bulbiferous herb found in chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland communities. Elevation: 15–700 m Bloom period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Calochortus plummerae Plummer's mariposa-lily	—	—	4.2	Perennial, bulbiferous herb found in granitic and rocky soils in chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and valley and foothill grassland communities. Elevation: 100– 1,700 m Bloom period: May–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Calochortus weedii var. *intermedius* intermediate mariposa-lily	CONCC P/HCP	CONCC P/HCP	1B.2	Perennial, bulbiferous herb that occurs in calcareous soils on rocky sites in coastal scrub, chaparral, and valley and foothill grassland communities. Elevation: 105–855 m Bloom period: May–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are twelve recent and nine historical records within five miles of the project site and 36 recent and sixteen historical records between five and ten miles from the project site.	No
Hordeum intercedens vernal barley	—	—	3.2	Annual herb found in vernal pools and depressions and saline flats in coastal dunes, coastal scrub, and valley and foothill grassland communities. Elevation: 5–1,000 m Bloom period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Imperata brevifolia California satintail	—	—	2B.1	Perennial rhizomatous herb found in mesic soils in chaparral, coastal scrub, Mojavean desert scrub, meadows and seeps (often alkali), and riparian scrub. Elevation: 0–1,215 m Bloom period: September–May	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No

	USFWS[1]	CDFW[2]	CNPS[3]			
Juncus acutus ssp. *leopoldii* southwestern spiny rush	—	—	4.2	Perennial, rhizomatous herb found in mesic soils in coastal dunes, meadows and alkaline seeps and coastal salt marshes and swamps. Elevation: 3–900 m Bloom period: May–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Lilium humboldtii ssp. *ocellatum* ocellated Humboldt lily	—	—	4.2	Perennial, bulbiferous herb found in openings in chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and riparian woodland communities. Elevation: 30–1,800 m Bloom period: March–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Nolina cismontana chaparral nolina	—	—	1B.2	Perennial, evergreen shrub occurring in gabbroic soils and sandstone (sometimes) in chaparral and coastal scrub communities. Elevation: 140–1,275 m Bloom period: May–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species. There are six recent and two historical records between five and ten miles from the project site.	No
Orcuttia californica California Orcutt grass	FE	CE	1B.1	Annual herb found in vernal pools. Elevation: 15–660 m Bloom period: April–August	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Piperia cooperi chaparral rein orchid	—	—	4.2	Perennial herb found in chaparral, cismontane woodland, and valley and foothill grassland. Elevation: 15–1,585 m Bloom period: March–June	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No
Piperia leptopetala narrow-petaled rein orchid	—	—	4.3	Perennial herb found in cismontane woodland, lower montane coniferous forest, and upper montane coniferous forest. Elevation: 380–2,225 m Bloom period: May–July	**None:** The project site has been subjected to significant historical surface disturbances and does not contain suitable habitat(s) that would support occurrence of this species.	No

[1] Federal Status: 2025 USFWS Listing

- **FE** = Listed as endangered under Federal Endangered Species Act (FESA)
- **FT** = Listed as threatened under FESA
- **FC** = Candidate for listing (threatened or endangered) under FESA
- **FD** = Delisted in accordance with FESA
- **FPD** = Federally Proposed to be Delisted
- **—** = Not federally listed

[2] State Status: 2025 CDFW Listing

- **SE** = Listed as endangered under California Endangered Species Act (CESA)
- **ST** = Listed as threatened under CESA
- **SC** = Candidate for listing (threatened or endangered) under CESA
- **CR** = Rare in California
- **—** = Not State listed

[3] CNPS: 2025 CNPS Listing

- **Rank 1A** = Plants species that presumed extinct in California.
- **Rank 1B** = Plant species that are rare, threatened, or endangered in California and elsewhere.
- **Rank 2** = Plant species that are rare, threatened, or endangered in California, but more common elsewhere.
- **Rank 3** = Plants about which we need more information—A Review List
- **Rank 4** = Plants of limited distribution—A Watch List
- **CBR** = Considered But Rejected

Blooming period: Months in parentheses are uncommon.

Notes:

[4] **Habitat Description**: Habitat description adapted from CNDDB and CNPS online inventory or other specified source.

[5] **Potential to Occur and Rationale**: Location of recorded species occurrences determined by geospatial information from BIOS 6 or other specified source.

Table 2: Special-status Wildlife Species Potentially Occurring within the Project

Scientific Name Common Name	Status USFWS[1]	Status CDFW[2]	Habitat Description[3]	Potential to Occur and Rationale[4]	Included in Impact Analysis
Insects					
Bombus crotchii Crotch bumble bee	—	SC	This species occurs primarily in California, including coastal habitats, western Mojave Desert, San Joaquin Valley, and adjacent foothills through most of southwestern California. It inhabits arid grasslands and shrublands, and its food sources including milkweeds, pincushions, lupines, clovers, phacelias, sages, clarkias, poppies, and buckwheats.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and one historical record within five miles of the project site and five recent records between five and ten miles from the project site.	No
Bombus pensylvanicus American bumble bee	—	—	Occurs in coastal prairie, Great Basin grassland, and valley & foothill grassland communities. Nests above ground under long grass or underground.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are 14 recent and two historical records within five miles of the project site and 44 recent and six historical records between five and ten miles from the project site.	No
Cicindela hirticollis gravida sandy beach tiger beetle	—	—	Occurs in coastal dunes adjacent to non-brackish water along the coast of California from San Francisco Bay to northern Mexico.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site. This species is believed to be locally extirpated.	No
Cicindela latesignata western beach tiger beetle	—	—	Occurs in mudflats and beaches of coastal estuaries from San Diego County to Los Angeles County. Typically inhabit wet or dry sandy beaches and mud, sand, or salt flats.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are two historical records between five and ten miles from the project site.	No
Coelus globosus globose dune beetle	—	—	Occurs in coastal sand dune habitat. Inhabits foredunes and sand hummocks; burrows beneath the sand surface and is most common beneath dune vegetation.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No

Danaus plexippus monarch butterfly (California overwintering population)	FC	—	Occurs in temperate climates, such as eastern and western North America and undergoes long-distance migration. Lays eggs on obligate milkweed host plant (primarily *Asclepias* spp.). Roosts located in wind protected Eucalyptus, Monterey pine, and Cypress tree groves with nectar and water sources nearby	**None:** The project site does not contain suitable overwintering habitat or the obligate host plant that would support occurrence of this species.	No
Habroscelimorpha gabbii western tidal-flat tiger beetle	—	—	Occurs in estuaries and mudflats along the coast of Southern California. Generally found on dark-colored mud in the lower zone; occasionally found on dry saline flats of estuaries.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site. This species is believed to be locally extirpated.	No
Mollusks					
Tryonia imitator mimic tryonia (=California brackishwater snail)	—	—	Occurs in coastal lagoons, estuaries and salt marshes, from Sonoma County south to San Diego County. Found only in permanently submerged areas in a variety of sediment types; able to withstand a wide range of salinities.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Crustaceans					
Branchinecta sandiegonensis San Diego fairy shrimp	FE CONCC P/HCP	CONCC P/HCP	Small, shallow (5-30 cm deep) vernal pools with cool water (10-20ºC), moderate alkalinity and conductivity, and less than 1 m deep.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and two historical records between five and ten miles from the project site.	No
Streptocephalus woottoni Riverside fairy shrimp	FE CONCC P/HCP	CONCC P/HCP	Vernal pools on the Santa Rosa Plateau on Murrieta stony clay loams, Las Posas series, Wyman clay loam, and Willows soils.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are three recent and six historical records between five and ten miles from the project site.	No
Fish					
Eucyclogobius newberryi tidewater goby	FE	SSC	Occurs in shallow lagoons and lower stream reaches with fairly still but not stagnant water and high oxygen levels.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and one historical record	No

				between five and ten miles from the project site.	
Gila orcuttii arroyo chub	—	SSC	Native to the streams and rivers of the Los Angeles plain in Southern California. Arroyo chub are adapted to survive in streams that fluctuate between large winter storm flows, and low summer flows, and the low dissolved oxygen and wide temperature fluctuations. Feeds on plants such as algae and water fern, as well as insects and mollusks.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are two historical records within five miles of the project site and four historical records between five and ten miles from the project site.	No
Oncorhynchus mykiss irideus pop. 10 steelhead - southern California DPS	FE	SC	Occurs in Pacific coast streams, including the Santa Ana River.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and one recent and one historical record between five and ten miles from the project site.	No
Rhinichthys gabrielino Santa Ana speckled dace	—	SSC	Occurs in small springs, streams, large rivers, and deep lakes, including headwaters of the Santa Ana and San Gabriel Rivers.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are two historical records between five and ten miles from the project site.	No
Amphibians					
Anaxyrus californicus arroyo toad	FE CONCC P/HCP	SSC CONCC P/HCP	Occurs in washes, arroyos, sandy riverbanks, riparian areas with willows, sycamores, oaks, cottonwoods. Requires exposed sandy streamsides with stable terraces for burrowing with scattered vegetation for shelter, and areas of quiet water or pools free of predatory fishes with sandy or gravel bottoms without silt for breeding.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Spea hammondii western spadefoot	CONCC P/HCP	SSC CONCC P/HCP	Occurs in open areas with sandy or gravelly soils in mixed woodlands, grasslands, coastal sage and Riversidean alluvial fan sage scrub, chaparral, sandy washes, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Breeds in ephemeral rain pools that do not contain bullfrogs, fish, or crayfish.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are eight recent and seven historical records within five miles of the project site and seventeen recent and fifteen historical records between five and ten miles from the project site.	No

Reptiles					
Actinemys pallida southwestern pond turtle	—	SSC	Occurs in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches with abundant vegetation, and either rocky or muddy bottoms, in woodland, forest, and grassland. In streams, prefers pools to shallower areas. Logs, rocks, cattail mats, and exposed banks are required for basking. May enter brackish water and even seawater.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are one recent and six historical records within five miles of the project site and one recent and eight historical records between five and ten miles from the project site.	No
Anniella stebbinsi southern California legless lizard	—	SSC	Occurs in moist, loose soil in coastal sand dunes and a variety of interior habitats, including sandy washes and alluvial fans. Tolerant of disturbances.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and one recent and one historical record between five and ten miles from the project site.	No
Arizona elegans occidentalis California glossy snake	—	SSC	Occurs in areas of rocky washes and loose, sandy soils and for burrowing in desert scrub grassland, coastal sage and Riversidean alluvial fan sage scrub, and chaparral habitats. Prefer open sandy areas with scattered brush, but also found in rocky areas.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are two historical records within five miles of the project site and one historical record between five and ten miles from the project site.	No
Aspidoscelis hyperythra orange-throated whiptail	CONCC P/HCP	WL CONCC P/HCP	Occurs primarily on coarse soils in open coastal sage and Riversidean alluvial fan sage scrub habitat.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and six historical records within five miles of the project site and five recent and ten historical records between five and ten miles from the project site.	No
Aspidoscelis tigris stejnegeri San Diegan (coastal) whiptail	CONCC P/HCP	SSC CONCC P/HCP	Occurs in dry, open areas with sparse foliage in coastal sage and Riversidean alluvial fan sage scrub, chaparral, woodland, and riparian habitats.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and one recent and one historical record between five and ten miles from the project site.	No

Crotalus ruber red-diamond rattlesnake	CONCC P/HCP	SSC CONCC P/HCP	Occurs in arid, rocky areas in creosote scrub, coastal sage and Riversidean alluvial fan sage scrub, chaparral, oak and pine woodlands, grasslands, on cultivated areas.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are two historical records within five miles of the project site and four historical records between five and ten miles from the project site.	No
Phrynosoma blainvillii coast horned lizard	CONCC P/HCP	SSC CONCC P/HCP	Occurs in open areas with sandy soil and low vegetation in grasslands, coniferous forests, woodlands, and chaparral.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are six historical records within five miles of the project site and one recent and twelve historical records between five and ten miles from the project site.	No
Salvadora hexalepis virgultea coast patch-nosed snake	—	SSC	Occurs in brushy or shrubby vegetation. Dependent on small mammal burrows.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Thamnophis hammondii two-striped gartersnake	—	SSC	Occurs in or near permanent fresh water in marshes and swamps, riparian scrub, riparian woodlands, and wetlands.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and one historical record within five miles of the project site and two historical records between five and ten miles from the project site.	No
Birds					
Accipiter cooperii Cooper's hawk	MBTA	WL FGC	Occurs and nests in deciduous and mixed forests and open woodland habitats. Year-round resident in southern California, and tolerant of urban areas with an abundance of trees.	**Low:** Marginally suitable foraging and nesting habitat for this species is present in the trees adjacent to the project site. There is one recent and two historical records within five miles of the project site and one recent record between five and ten miles from the project site.	No
Agelaius tricolor tricolored blackbird	MBTA	FT SSC FGC	Occurs and nests in large freshwater marshes with dense stands of hydrophytic vegetation (cattails, bulrushes, etc.). Short-distance migrant.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are four	No

				historical records within five miles of the project site and one recent and five historical records between five and ten miles from the project site.	
Aimophila ruficeps canescens southern California rufous-crowned sparrow	MBTA CONCC P/HCP	WL FGC CONCC P/HCP	Occurs and nests on steep, often rocky hillsides with grass and forb patches in coastal sage and Riversidean alluvial fan sage scrub and sparse mixed chaparral habitats. Year-round resident in southern California.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are fourteen historical records within five miles of the project site and four recent and six historical records between five and ten miles from the project site.	No
Ammodramus savannarum grasshopper sparrow	MBTA	SSC	Occurs and nests in dense grasslands on rolling hills, lowland plains, in valleys and on hillsides on lower mountain slopes.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and one historical record between five and ten miles from the project site.	No
Aquila chrysaetos golden eagle	BGEPA MBTA CONCC P/HCP	FP WL CONCCP /HCP	Forages in areas of rolling foothills, mountainous areas, sage-juniper flats, and desert. Cliff-walled canyons provide nesting habitat in most parts of range; also, large trees in open areas.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one record between five and ten miles from the project site.	No
Asio otus long-eared owl	MBTA	FP FGC	Occurs and nests in conifer, oak, riparian, pinyon-juniper, and desert woodlands that are either open or are adjacent to grasslands, meadows, or shrublands.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are four historical records between five and ten miles from the project site.	No
Athene cunicularia burrowing owl	MBTA	SSC FGC	Occurs and nests in open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. A subterranean nester, dependent upon burrowing mammals, most notably the California ground squirrel. Short-distance migrant.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site and four recent and three historical records between five and ten miles from the project site.	No
Buteo regalis	MBTA	WL	Occurs in grassland and arid shrublands with an abundance of prey species, such as pocket	**None:** The project site does not contain suitable habitat(s) that would support	No

ferruginous hawk			gophers, black-tailed jackrabbits, and desert cottontails. Will winter near cultivated fields that have an abundance of pocket gophers.	occurrence of this species. There are two historical records between five and ten miles from the project site.	
Campylorhynchus brunneicapillus sandiegensis coastal cactus wren	MBTA CONCC P/HCP	SSC FGC CONCC P/HCP	Occurs and nests in coastal sage scrub. Requires tall opuntia cactus or *Yucca* trees for nesting and roosting.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are ten historical records within five miles of the project site and five recent and 32 historical records between five and ten miles from the project site.	No
Charadrius nivosus nivosus western snowy plover	FT MBTA	SSC	Occurs in sandy beaches, salt pond levees and shores of large alkali lakes. Needs sandy, gravelly or friable soils for nesting.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record between five and ten miles from the project site.	No
Circus hudsonius northern harrier	MBTA CONCC P/HCP	SSC BCC CONCC P/HCP	Frequents meadows, grasslands, open rangelands, freshwater emergent wetlands; uncommon in wooded habitats.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Coturnicops noveboracensis yellow rail	MBTA	SSC FGC	Occurs in shallow marshes and wet meadows. In winter, this species inhabits drier fresh-water and brackish marshes, as well as dense, deep grass, and rice fields.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Elanus leucurus white-tailed kite	MBTA	FP FGC	Occurs and nests in grasslands and open coastal scrub in coastal and valley lowlands; rarely found away from agricultural areas. Inhabits herbaceous, open stages of most habitats mostly in cismontane California. Year-round resident in southern California.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are six recent records within five miles of the project site and thirteen recent and one historical records between five and ten miles from the project site.	No
Empidonax traillii extimus southwestern willow flycatcher	FE MBTA CONCC P/HCP	SE CONCC P/HCP	Occurs and nests in dense riparian woodlands. Long-distance migrant.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one	No

				recent and two historical records between five and ten miles from the project site.	
Eremophila alpestris actia California horned lark	MBTA	WL FGC	Occurs and nests in open areas with sparse vegetation. Year-round resident in southern California.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are three historical records within five miles of the project site and two historical records between five and ten miles from the project site.	No
Icteria virens yellow-breasted chat	MBTA	SSC FGC	Occurs and nests in riparian thickets of willow and other bushy tangles near watercourses. Long-distance migrant.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and one historical record within five miles of the project site and three historical records between five and ten miles from the project site.	No
Laterallus jamaicensis coturniculus California black rail	MBTA	ST FP FGC	Occurs and nests in freshwater marshes, wet meadows, and shallow margins of saltwater marshes bordering larger bays. Needs water depths of about 1 inch that do not fluctuate during the year and dense vegetation for nesting habitat.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Pandion haliaetus osprey	MBTA	WL	Occurs in ocean shore, bays, freshwater lakes, and larger streams.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record between five and ten miles from the project site.	No
Passerculus sandwichensis beldingi Belding's savannah sparrow	MBTA	SE	Occurs in coastal wetlands and marshes.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record within five miles of the project site and one historical record between five and ten miles from the project site.	No
Polioptila californica californica	FT MBTA CONCC P/HCP	SSC FGC CONCC P/HCP	Occurs and nests in arid washes, on mesas, and slopes in coastal sage scrub below 2,500 ft. Year-round resident in California.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are 44 recent and twelve historical records within	No

coastal California gnatcatcher				five miles of the project site and 83 recent and 49 historical records between five and ten miles from the project site.	
Rallus obsoletus levipes light-footed Ridgway's rail	FE MBTA	SE FP	Occurs in salt marshes traversed by tidal sloughs, where cordgrass and pickleweed (required for nesting or escape cover) are the dominant vegetation.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are two recent records between five and ten miles from the project site.	No
Setophaga petechia yellow warbler	MBTA	SSC FGC	Occurs and nests in willow shrubs and thickets, cottonwoods, sycamores, ash, and alders, predominantly in riparian habitats. Long-distance migrant.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record within five miles of the project site and one recent record between five and ten miles from the project site.	No
Sternula antillarum browni California least tern	FE MBTA	SE FP	Occurs and nests on bare or sparsely vegetated, flat substrates: sand beaches, alkali flats, land fills, or paved areas.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and one historical record between five and ten miles from the project site.	No
Vireo bellii pusillus least Bell's vireo	FE MBTA CONCC P/HCP	SE CONCC P/HCP	Occurs and nests in low riparian habitat in the vicinity of water or in dry river bottoms. Long-distance migrant.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are ten recent and one historical records within five miles of the project site and 22 recent and five historical records between five and ten miles from the project site.	No
Mammals					
Antrozous pallidus pallid bat	—	SSC	Occurs in deserts, grasslands, shrublands, woodlands, and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Species is very sensitive to disturbance of roosting sites.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are two historical records between five and ten miles from the project site.	No
Chaetodipus californicus femoralis	—	—	Occurs in coastal scrub, chaparral and grassland in San Diego County.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one	No

Dulzura pocket mouse				historical record between five and ten miles from the project site.	
Chaetodipus fallax fallax northwestern San Diego pocket mouse	—	SSC	Occurs in sandy, herbaceous areas, usually in association with rocks or coarse gravel, in coastal sage and Riversidean alluvial fan sage scrub, chaparral, and grasslands.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent record between five and ten miles from the project site.	No
Eumops perotis californicus western mastiff bat	—	SSC	Occurs in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, chaparral. Roosts in crevices in cliff faces, high buildings, trees, and tunnels.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are four historical records within five miles of the project site and five records between five and ten miles from the project site.	No
Lasiurus frantzii western red bat	—	SSC	Occurs in cismontane woodland, lower montane coniferous forest, riparian forest, riparian woodland. Prefers habitat edges and mosaics with trees that are protected from above and open below with open areas for foraging.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Myotis yumanensis Yuma myotis	—	—	Occurs in open forests and woodlands with sources of water over which to feed. Maternity colonies in caves, mines, buildings or crevices.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record within five miles of the project site.	No
Neotoma lepida intermedia San Diego desert woodrat	CONCCP/HCP	SSC CONCCP/HCP	Occurs in rock outcrops, rocky cliffs, and slopes in coastal sage and Riversidean alluvial fan sage scrub with moderate to dense canopies.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one recent and two historical records between five and ten miles from the project site.	No
Nyctinomops macrotis big free-tailed bat	—	SSC	Occurs in rocky habitats in arid landscapes and has been found in a variety of plant associations, including desert shrub, woodlands, and evergreen forests. Roosts by day in crevices on cliff faces. These bats forage mostly for large moths, but may eat other insects as well.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No
Onychomys torridus ramona	—	SSC	Occurs in desert areas, especially scrub habitats with friable soils for digging. Prefers low to moderate shrub cover.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one	No

southern grasshopper mouse				recent record between five and ten miles from the project site.	
Perognathus longimembris pacificus Pacific pocket mouse	FE CONCC P/HCP	SSC CONCC P/HCP	Occurs in coastal strand, coastal dunes, and coastal sage scrub growing on marine terraces. Prefers soils of fine alluvial sands near the ocean.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There are three historical records between five and ten miles from the project site.	No
Sorex ornatus salicornicus southern California saltmarsh shrew	—	SSC	Occurs in coastal marshes in Los Angeles, Orange and Ventura counties. Requires dense vegetation and woody debris for cover.	**None:** The project site does not contain suitable habitat(s) that would support occurrence of this species. There is one historical record between five and ten miles from the project site.	No

Code Designations

[1] Federal Status: 2025 USFWS Listing	[2] State Status: 2025 CDFW Listing
ESU = Evolutionary Significant Unit is a distinctive population.	**SE** = Listed as endangered under the California Endangered Species Act (CESA).
FE = Listed as endangered under the Endangered Species Act.	**ST** = Listed as threatened under the CESA.
FT = Listed as threatened under the Endangered Species Act.	**SSC** = Species of Special Concern as identified by CDFW.
FC = Candidate for listing (threatened or endangered) under the Endangered Species Act.	**FP** = Listed as fully protected under the Fish and Game Code.
FD = Delisted in accordance with the Endangered Species Act.	**FGC** = protected by Fish and Game Code 3503-3513
FPD = Federally Proposed to be Delisted.	**CE** = Candidate endangered under CESA.
BCC = Bird of Conservation Concern	**WL** = CDFW Watch List
MBTA = protected by the Migratory Bird Treaty Act	**—** = Not State listed
— = Not federally listed	

Notes:
3 **Habitat Description**: Habitat description adapted from CNDDB or other specified source
4 **Potential to Occur and Rationale**: Location of recorded species occurrences determined by geospatial information from BIOS 6 or other specified source.

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

Orange County, California

Local office

Carlsbad Fish And Wildlife Office

(760) 431-9440
(760) 431-5901

2177 Salk Avenue - Suite 250
Carlsbad, CA 92008-7385

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

---

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).

NOT FOR CONSULTATION

2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Mammals

NAME	STATUS
Pacific Pocket Mouse Perognathus longimembris pacificus Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/8080	Endangered

Birds

NAME	STATUS
California Least Tern Sternula antillarum browni Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/8104	Endangered
Coastal California Gnatcatcher Polioptila californica californica Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8178	Threatened
Least Bell's Vireo Vireo bellii pusillus Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/5945	Endangered

Reptiles

NAME	STATUS
Southwestern Pond Turtle Actinemys pallida Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/4768	Proposed Threatened

NOT FOR CONSULTATION

Amphibians

NAME	STATUS
Arroyo (=arroyo Southwestern) Toad Anaxyrus californicus Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/3762	Endangered
Western Spadefoot Spea hammondii Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/5425	Proposed Threatened

Fishes

NAME	STATUS
Tidewater Goby Eucyclogobius newberryi Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/57	Endangered

Insects

NAME	STATUS
Monarch Butterfly Danaus plexippus Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/9743	Candidate

Crustaceans

NAME	STATUS
Riverside Fairy Shrimp Streptocephalus woottoni Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8148	Endangered

NOT FOR CONSULTATION

San Diego Fairy Shrimp Branchinecta sandiegonensis Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/6945	Endangered

Flowering Plants

NAME	STATUS
Nevin's Barberry Berberis nevinii Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8025	Endangered
Thread-leaved Brodiaea Brodiaea filifolia Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/6087	Threatened

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

There are no critical habitats at this location.

You are still required to determine if your project(s) may have effects on all above listed species.

Bald & Golden Eagles

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act[1] and the Migratory Bird Treaty Act[2].

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats[3], should follow appropriate regulations and consider implementing appropriate conservation measures, as described in the links below.

NOT FOR CONSULTATION

Specifically, please review the "Supplemental Information on Migratory Birds and Eagles".

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

There are likely bald eagles present in your project area. For additional information on bald eagles, refer to Bald Eagle Nesting and Sensitivity to Human Activity

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the PROBABILITY OF PRESENCE SUMMARY below to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
Bald Eagle *Haliaeetus leucocephalus* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Jan 1 to Aug 31
Golden Eagle *Aquila chrysaetos* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read

"Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (▪)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

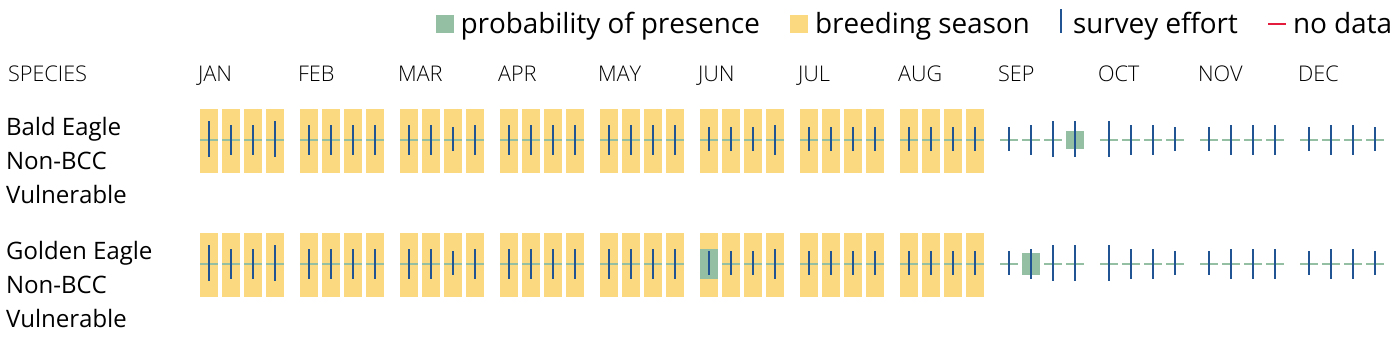
How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.



To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe

NOT FOR CONSULTATION

Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

What does IPaC use to generate the potential presence of bald and golden eagles in my specified location?

The potential for eagle presence is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply). To see a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What does IPaC use to generate the probability of presence graphs of bald and golden eagles in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur. Please contact your local Fish and Wildlife Service Field Office if you have questions.

NOT FOR CONSULTATION

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats[3] should follow appropriate regulations and consider implementing appropriate conservation measures, as described in the links below. Specifically, please review the "Supplemental Information on Migratory Birds and Eagles".

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the PROBABILITY OF PRESENCE SUMMARY below to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON

NOT FOR CONSULTATION

Allen's Hummingbird Selasphorus sasin — Breeds Feb 1 to Jul 15

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9637

Bald Eagle Haliaeetus leucocephalus — Breeds Jan 1 to Aug 31

This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Belding's Savannah Sparrow Passerculus sandwichensis beldingi — Breeds Apr 1 to Aug 15

This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/8

Black Skimmer Rynchops niger — Breeds May 20 to Sep 15

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/5234

Brandt's Cormorant Urile penicillatus — Breeds Apr 15 to Sep 15

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Bullock's Oriole Icterus bullockii — Breeds Mar 21 to Jul 25

This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

California Gull Larus californicus — Breeds Mar 1 to Jul 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

California Thrasher Toxostoma redivivum — Breeds Jan 1 to Jul 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Clark's Grebe Aechmophorus clarkii — Breeds Jun 1 to Aug 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

NOT FOR CONSULTATION

Common Yellowthroat Geothlypis trichas sinuosa — Breeds May 20 to Jul 31

This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/2084

Elegant Tern Thalasseus elegans — Breeds Apr 5 to Aug 5

This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/8561

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31

This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Lawrence's Goldfinch Spinus lawrencei — Breeds Mar 20 to Sep 20

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Marbled Godwit Limosa fedoa — Breeds elsewhere

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9481

Northern Harrier Circus hudsonius — Breeds Apr 1 to Sep 15

This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/8350

Nuttall's Woodpecker Dryobates nuttallii — Breeds Apr 1 to Jul 20

This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9656

NOT FOR CONSULTATION

Olive-sided Flycatcher Contopus cooperi — Breeds May 20 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3914

Santa Barbara Song Sparrow Melospiza melodia graminea — Breeds Mar 1 to Sep 5
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/5513

Tricolored Blackbird Agelaius tricolor — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3910

Western Grebe aechmophorus occidentalis — Breeds Jun 1 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/6743

Western Gull Larus occidentalis — Breeds Apr 21 to Aug 25
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Western Screech-owl Megascops kennicottii cardonensis — Breeds Mar 1 to Jun 30
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

Willet Tringa semipalmata — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Wrentit Chamaea fasciata — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read

"Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (▪)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

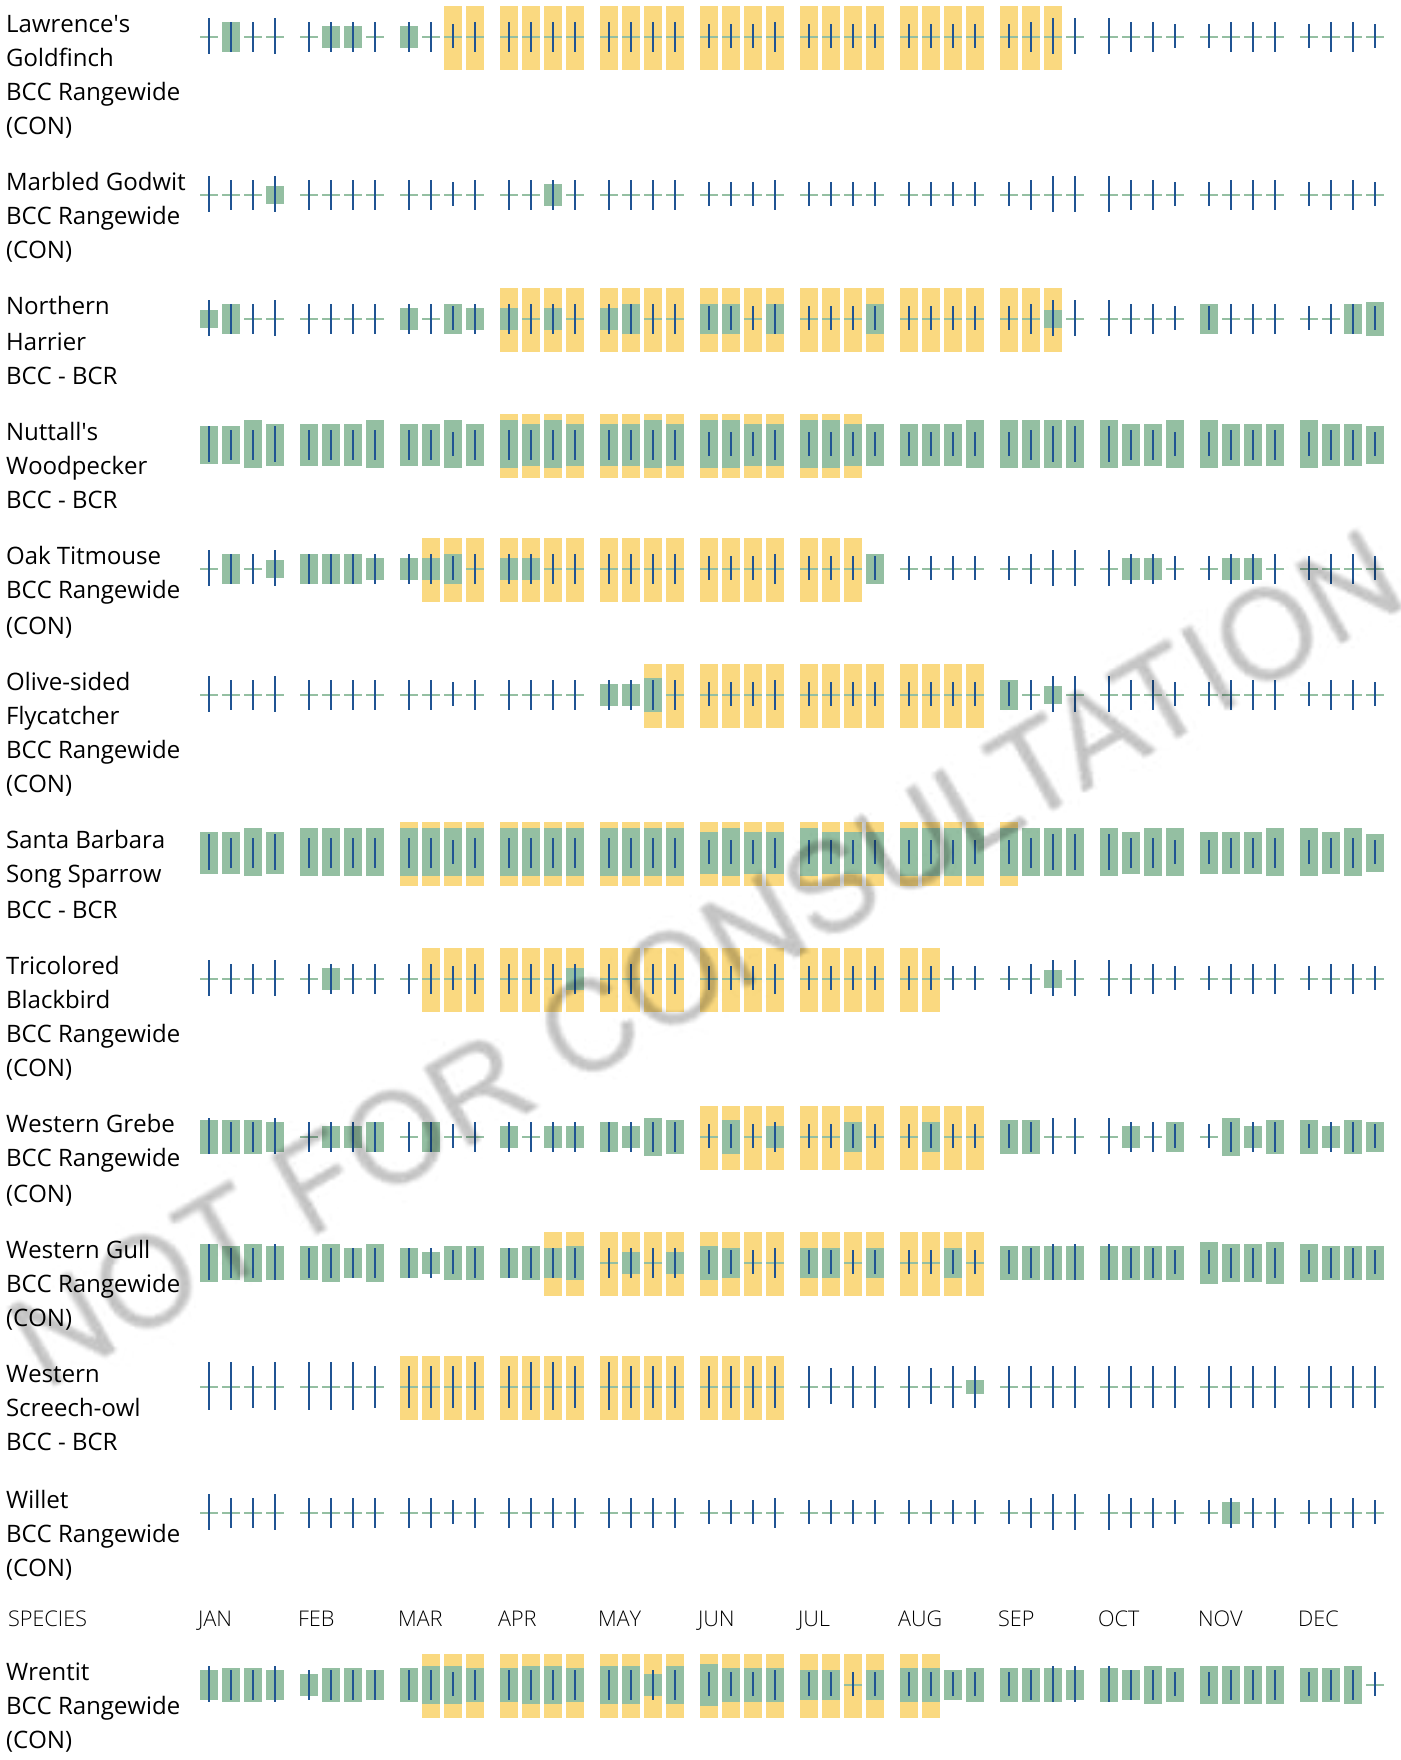
To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.



Survey Timeframe

NOT FOR CONSULTATION

Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

NOT FOR CONSULTATION

NOT FOR CONSULTATION

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets.

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may query your location using the RAIL Tool and look at the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);

NOT FOR CONSULTATION

2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

NOT FOR CONSULTATION

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

There are no refuge lands at this location.

Fish hatcheries

There are no fish hatcheries at this location.

Wetlands in the National Wetlands Inventory (NWI)

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

This location did not intersect any wetlands mapped by NWI.

NOTE: This initial screening does **not** replace an on-site delineation to determine whether wetlands occur. Additional information on the NWI data is provided below.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

NOT FOR CONSULTATION

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Re: Native American Tribal Consultation, Pursuant to the Assembly Bill 52 (AB 52), Amendments to the California Environmental Quality Act (CEQA) (Chapter 532, Statutes of 2014), Public Resources Code Sections 5097.94 (m), 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2 and 21084.3, Argonaut Project, Orange County

To Whom It May Concern:

Pursuant to Public Resources Code section 21080.3.1 (c), attached is a consultation list of tribes that are traditionally and culturally affiliated with the geographic area of the above-listed project. Please note that the intent of the AB 52 amendments to CEQA is to avoid and/or mitigate impacts to tribal cultural resources, (Pub. Resources Code §21084.3 (a)) ("Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource.")

Public Resources Code sections 21080.3.1 and 21084.3(c) require CEQA lead agencies to consult with California Native American tribes that have requested notice from such agencies of proposed projects in the geographic area that are traditionally and culturally affiliated with the tribes on projects for which a Notice of Preparation or Notice of Negative Declaration or Mitigated Negative Declaration has been filed on or after July 1, 2015. Specifically, Public Resources Code section 21080.3.1 (d) provides:

Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section.

The AB 52 amendments to CEQA law does not preclude initiating consultation with the tribes that are culturally and traditionally affiliated within your jurisdiction prior to receiving requests for notification of projects in the tribe's areas of traditional and cultural affiliation. The Native American Heritage Commission (NAHC) recommends, but does not require, early consultation as a best practice to ensure that lead agencies receive sufficient information about cultural resources in a project area to avoid damaging effects to tribal cultural resources.

The NAHC also recommends, but does not require that agencies should also include with their notification letters, information regarding any cultural resources assessment that has been completed on the area of potential effect (APE), such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

- A listing of any and all known cultural resources that have already been recorded on or adjacent to the APE, such as known archaeological sites;
- Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
- Whether the records search indicates a low, moderate, or high probability that unrecorded cultural resources are located in the APE; and
- If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

    - Any report that may contain site forms, site significance, and suggested mitigation measures.

      All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for public disclosure in accordance with Government Code section 6254.10.

3. The result of the Sacred Lands File (SLF) check conducted through the Native American Heritage Commission was positive. Please contact the Juaneno Band of Mission Indians Acjachemen Nation - Belardes on the attached list for more information.

4. Any ethnographic studies conducted for any area including all or part of the APE; and

5. Any geotechnical reports regarding all or part of the APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS are not exhaustive and a negative response to these searches does not preclude the existence of a tribal cultural resource. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the event that they do, having the information beforehand will help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our consultation list remains current.

If you have any questions, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Radiocarbon Assessment of "Modesto" Soil-Age Relationships 39
Radiocarbon Assessment of "Post-Modesto" Soil-Age Relationships 43
Conclusions 44

CHAPTER 4. AGE OF SURFACE LANDFORMS, REFINED SOIL CHRONOSTRATIGRAPHY, AND MODEL OF LANDSCAPE EVOLUTION 51
A Climate-Based Model of Landscape Evolution 51
Refined Soil-Age Relationships, Chronostratigraphy, and the Age of Surface Landforms 53
San Joaquin Valley and Sierra Nevada 54
Older Pleistocene (>25,000 cal BP) 54
Late Pleistocene (~25,000 to 15,000 cal BP) 62
Latest Pleistocene (15,000 to 11,500 cal BP) 65
Early Holocene (11,500 to 7000 cal BP) 69
Middle Holocene (7000 to 4000 cal BP) 75
Late Holocene (4000 to 2000 cal BP) 79
Latest Holocene (2000 to 150 cal BP) 83
Historical to Modern (150 to 0 cal BP) 85
Great Basin and Mojave Desert 89
Late Pleistocene and Older (>15,000 cal BP) 89
Latest Pleistocene (15,000 to 11,500 cal BP) 89
Early Holocene (11,500 to 7000 cal BP) 91
Middle Holocene (7000 to 4000 cal BP) 98
Late Holocene (4000 to 2000 cal BP) 101
Latest Holocene (2000 to 150 cal BP) 102
Historic-Era to Modern (150 to 0 cal BP) 107
Summary and Discussion 110
Latest Pleistocene 110
Early Holocene 110
Middle Holocene 113
Late Holocene 113
Latest Holocene 113
Conclusion 114
CHAPTER 5. ARCHAEOLOGY IN AN ACTIVE VOLCANIC REGION 117
Volcanism in South-Central California 117
Latest Pleistocene (15,000-11,500 BP) 118
Early Holocene (11,500-7000 BP) 118
Middle Holocene (7000-4000 BP) 122
Late Holocene (4000-2000 BP) 124
Latest Holocene (2000-150 BP) 124
Implications for Human Occupation and Preservation of the Archaeological Record 125
The Prehistoric Use of Obsidian in South-Central California: Temporal and Spatial Aspects 125
The Timing of Obsidian Use in South-Central California 127
The Holocene Distribution of Obsidian in South-Central California 130
Conclusions 132

CHAPTER 6. BURIED SITE POTENTIAL IN DISTRICT 6/9 133
Mapping Strategy and Methods 133
Radiocarbon Database 133
Digital Soils Surveys 134
Limitations of the Soils Surveys 135
Map Development 138
Landform Map Limitations 138
Landform Age and Buried Site Potential 139
Caltrans Right-of-Way 139
Environmental Parameters and Buried Site Potential 140
Distance to Water Sources and Degree of Slope 141
An Environmental Model of Buried Site Potential 141
Comparison of Buried Site Potential Using Landform Age and Environmental Parameters 142
Caltrans Right-of-Way 145
Estimating Buried Site Potential: Limitations, Performance, and Use 146
Limitations of Environmental Parameters 146
Testing the Landform Map and Environmental Model 149
CHAPTER 7. APPROACHES FOR IDENTIFYING AND SAMPLING BURIED SITES 153
Survey Strategies and Sampling Methods 153
Phase I Survey 153
Phase I Extended "Subsurface" Survey 154
Phase II Test Evaluation and Phase III Data Recovery 156
Using the Buried Site Potential Model 157

APPENDICES

Included on CD Inside Back Cover

Appendix A. Radiocarbon Dates Documenting Tulare Lake Level History.
Appendix B. Radiocarbon Dating Methods, Results, and Database.
Appendix C. Soil Types, Age Assignments, and Definitions for Soil Horizons and Layers.
Appendix D. Obsidian Hydration Methods, Results, and Database.
Appendix E. Extent of Buried Site Potential along each State Route in District 6/9 Based on Landform Map and Predictive Model.
Appendix F. Known Buried Prehistoric Archaeological Sites in Caltrans District 6/9.
Appendix G. Quaternary Geology Map and Buried Site Potential Map for District 6/9. (Also included as fold-out maps in back pockets.)

CHAPTER 1. INTRODUCTION

The California Department of Transportation (Caltrans) is conducting a cultural resources inventory of rural roads in Districts 6 and 9 (hereafter District 6/9), which includes the counties of Madera, Fresno, Kings, Tulare, Kern, Mono, and Inyo (Figure 1). The inventory combines survey for prehistoric and historic-period archaeological sites, historic-period structures, and architectural properties, along with Native American consultations and ethnographic studies (Davis-King et al. 2009; Leach-Palm et al. 2009a, 2009b; Milliken et al. 2010). In addition, the following geoarchaeological investigation was implemented as part of the inventory to provide Caltrans with baseline information on the potential for buried archaeological resources along rural road segments. This is the third in a series of geoarchaeological investigations conducted for Caltrans designed to address the relationship between late Quaternary landscape evolution and the structure and visibility of the archaeological record. The previous two studies focused on districts 3 and 10 which include the southern Sacramento Valley, northern San Joaquin Valley, and adjacent portions of the eastern Coast Ranges and western Sierra Nevada (Meyer and Rosenthal 2008; Rosenthal and Meyer 2004b). A more geographically restricted study was also completed for the southern Santa Clara Valley (Rosenthal and Meyer 2004a).

The seven counties of Caltrans District 6/9 encompass a diverse landscape, extending eastward from the Diablo and Temblor ranges, across the San Joaquin Valley and Sierra Nevada, to the southwestern Great Basin and northern Mojave Desert (Figure 1). Included within the study area are Mt. Whitney and Death Valley, the highest (4,421 meters [14,505 feet] above sea level) and lowest (86 meters [282 feet] below sea level) points, respectively, in the contiguous United States. Over the span of human occupation in the new world, roughly the past 15,000 years, this landscape has changed dramatically, providing a dynamic backdrop for human colonization, social development, and economic change. In response to world-wide fluctuations in climate, massive glaciers that once occupied the highest peaks of the Sierra Nevada receded, extensive river and lake systems east and west of the Sierra Nevada declined and often dried, 35 genera of mammals including the largest ice-age herbivores became extinct (Grayson 1993), and repeated cycles of erosion and deposition sculpted and transformed the landscape. Such extensive changes not only affected the ways in which humans interacted with the environment, but also how and where evidence of past human occupation is preserved in the modern landscape.

The current study begins with the premise that the archaeological record is inherently biased by processes of landscape evolution. Older archaeological deposits are frequently under-represented at the surface of the modern landscape due to cyclical periods of erosion and deposition during the Holocene (<11,500 cal BP). This is particularly true in the southern San Joaquin Valley and basins east of the Sierra Nevada where substantial alluvial fans and floodplains developed episodically during the span of human occupation. Yet the region also has among the highest concentrations of surface archaeological deposits in California dating to the late Pleistocene and early Holocene. The presence of these ancient surface sites attests to the temporal mosaic that is the modern geomorphic landscape.

With this in mind, a primary goal of the current study was to establish the age and depositional history of late Pleistocene landforms (<25,000 years old) within the seven counties of Caltrans District 6/9. Understanding the age of different landforms is first-order geochronology (Butzer 1980; Renfrew 1976; Waters 1992), a fundamental step in discerning where the archaeological record is likely to be buried, and where cultural remains deposited over the entire span of human occupation may be preserved on or just below the modern ground surface. By mapping the age of surface landforms, we are able to make an initial assessment of the potential for buried archaeological resources throughout a large segment of south-central California, from the eastern foothills of the Coast Ranges to the valleys of the western Great Basin and northern Mojave Desert, providing baseline information on the age of associated archaeological sites. Maps and descriptions of Holocene landscape evolution generated by this study should supplement surface surveys and provide additional contextual information that can be used by resource managers to make decisions about the need for subsurface reconnaissance in particular project areas.

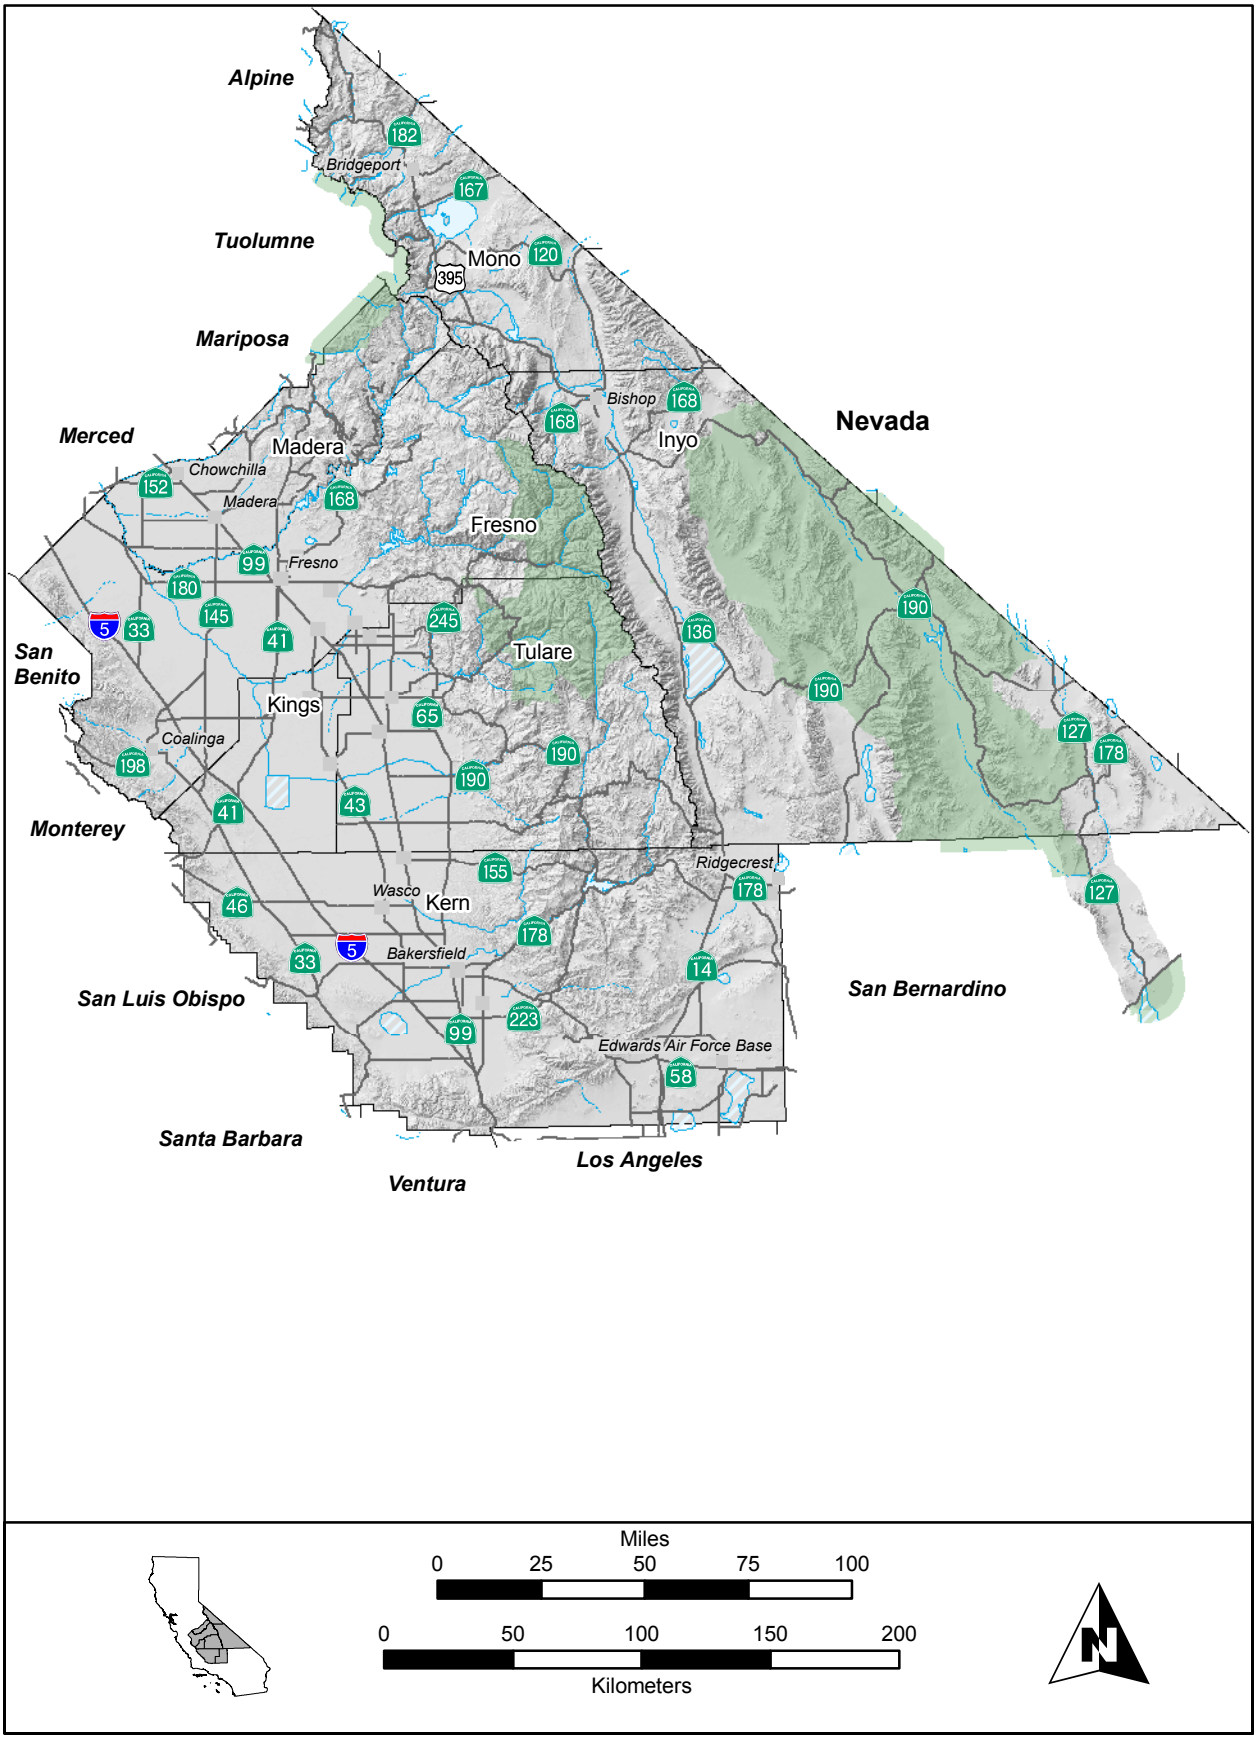

Figure 1. Project Area.

METHODS

Although large portions of the California landscape were emplaced long before humans entered North America, numerous recent studies have shown that repeated cycles of erosion, deposition, and landscape stability have occurred during the latest Pleistocene and Holocene (e.g., Allen et al. 1999; Bacon et al. 2003; Benson et al. 1997; Meyer 1996; Meyer and Rosenthal 1997, 2008; Rosenthal and Meyer 2004a, 2004b; Shlemon and Begg 1975; Wells et al. 2003; White 2003; Young 2009). As a result of these cyclical processes, buried archaeological deposits are not distributed randomly, but are confined to those portions of the landscape that developed during the span of human occupation (i.e., roughly the last 15,000 years; e.g., Goebel et al. 2008; Waters and Stafford 2007). Segments of the surface landscape that developed prior to human colonization of North America obviously cannot contain buried archaeological deposits (Rosenthal and Meyer 2004a, 2004b). With this basic understanding, the search for buried portions of the archaeological record in District 6/9 can be narrowed to recent landform segments, allowing extensive, older portions of the landscape to be confidently excluded from consideration.

To identify the age and extent of different landform segments within the study area, we relied heavily on the recently compiled Soil Survey Geographic Database (SSURGO) and the State Soils Geographic database (STATSGO). Because soil formation is a by-product of sustained or prolonged landscape stability, the degree of soil development is directly related to the amount of time a landform has been subjected to near-surface weathering processes. Landforms with well-developed soils have been stable longer than those with weakly or moderately developed soils. Using these characteristics of soil development we are able to group soil types and landform segments with similar weathering profiles into larger chronostratigraphic units within the SSURGO and STATSGO databases. The age of different soil series and their associated landforms are further refined through the compilation of contextual information for more than 2,400 previously reported radiocarbon dates, analysis of landform superposition, field examination of stratigraphic relationships, and targeted radiocarbon dating for this study. From this work, we produced a detailed map of latest Pleistocene, Holocene, and Historical landforms in District 6/9 (presented in Chapter 5). The age of these landforms serves as a basis for determining their potential to contain buried archaeological deposits and allows for an initial assessment of the relationship between archaeological sites of different ages and the timing of landscape evolution in western California, the southwestern Great Basin, and northwestern Mojave Desert.

Compensating for secular variations in the cosmic output of radiocarbon over time, all radiocarbon dates used in this report (unless otherwise indicated) were calibrated to calendar (solar) years before present (cal BP). Radiocarbon dates less than about 22,000 ^{14}C BP were adjusted using the CALIB version 5.1 program in accordance with Stuiver and Reimer (1993); zero years before present (0 BP) equals 1950 AD by convention. Dates greater than about 22,000 ^{14}C BP were calibrated in accordance with Fairbanks et al. (2005) using an on-line computer program. Regional correction factors were applied to all dates from marine and freshwater shell to compensate for the reservoir effects of old or dead carbon (Berger and Meek 1992; Culleton 2006). The exception is small freshwater gastropods which do not require such corrections (Pigati 2002; Pigati et al. 2004). Unless otherwise indicated, single dates are reported as the calculated median probability, and the error ranges are reported at the 2-sigma (95%) confidence level, and are identified by their original lab number.

RESEARCH AGENDA

According to Waters (1992:7-11), modern geoarchaeological research has three main objectives: (1) place archaeological deposits in their temporal and stratigraphic context; (2) understand the natural processes of site formation; and (3) reconstruct the paleo-landscape. Given the scale of the current study—covering much of south-central California—we apply this geoarchaeological agenda in the broadest sense.

Because we are primarily concerned with the relationship between region-wide patterns of landscape evolution and its affect on the structure and visibility of the archaeological record, discerning the nature, timing, and extent of landscape change is a two-fold problem. It requires not only consideration of the outcome of geomorphic processes (i.e., deposition, stability, erosion), but also the environmental mechanisms responsible for those processes.

Climatically Induced Landscape Change

Long-standing models of late Quaternary landscape evolution, particularly in western California (i.e., west of the Sierra Nevada), assume a direct relationship between climatically driven glacial cycles and episodic development of nested alluvial fans at the base of the Sierra Nevada (Atwater et al. 1986; Dupre et al. 1991; Marchand and Allwardt 1981; Harden and Marchand 1980). Although these models have been regularly invoked to explain and date fan sequences throughout much of central California, they remain largely untested. Less than a handful of radiocarbon dates from widely separated localities has been used to support original suppositions about the timing of fan development and mechanisms responsible for deposition on the western slope of the Sierra Nevada. As a result, the relationships between the timing of glacial advance and recession, and fan aggradation and incision have never been clearly defined or demonstrated.

On the eastern flank of the Sierra Nevada, no well-substantiated fan chronology currently exists, leaving a potentially important record of late Pleistocene and Holocene landscape evolution undefined. Resolution of this record will ultimately be important for understanding the relationship between glacial cycles and the mechanisms and timing of landscape change in the Owens Valley, Mono Basin, and Bridgeport Valley. Away from glaciated watersheds in the Great Basin and Mojave Desert, alluvial deposition has been treated more idiosyncratically, primarily interpreted as a response to local geomorphic thresholds. However, even in isolated basins, it is probable that large-scale environmental fluctuations would have triggered a geomorphic response discernable in the modern landscape.

Pleistocene-Holocene Environmental Change and Human Land Use

Paleoclimatic changes that affected resource distributions would have had a strong influence on native subsistence economies and, in turn, settlement locations, ultimately influencing where archaeological deposits from different time periods are preserved in the modern landscape. The extensive system of interconnected lakes and rivers that unified a large portion of the southwestern Great Basin and northern Mojave Desert during the late Pleistocene was on the decline when humans first entered this region. The value of lakeside and riparian ecosystems to early subsistence economies is attested to by the high density of latest Pleistocene and early Holocene human settlements associated with now-dry lake beds and river channels, both east and west of the Sierra Nevada. However, many of the earliest sites in these lake basins are found well below the elevation of late Pleistocene lake stands, suggesting that human occupation occurred at a time when pluvial lakes were desiccated, or in a recessional phase.

The relationship between early human occupation and now-dry lake basins, particularly in the Mojave Desert, has a long history of archaeological research, yet we continue to know very little about the composition of subsistence economies during this time period and the specific resources that made lake basins attractive to late Pleistocene and early Holocene foragers throughout the Great Basin, Mojave Desert, and San Joaquin Valley. Likewise, how early foraging groups accommodated end-Pleistocene and early Holocene shifts in biotic productivity remains poorly resolved. We cannot begin to fully understand the nature of these early subsistence economies until well-preserved assemblages of associated dietary debris are discovered, and these will only occur in buried stratigraphic contexts, making the search for such deposits paramount.

Archaeology in an Active Volcanic Region

The Inyo-Mono volcanic chain is one of the most active volcanic regions in North America. Numerous volcanic eruptions have occurred in this part of eastern California during the latest Pleistocene and Holocene, with potentially devastating effects to human foraging groups and the primary plant and animal foods from which they made their living (e.g., Hall 1983). These eruptive events spewed tons of volcanic ash and pumice across a significant portion of the study area, obscuring many older archaeological deposits and producing important stratigraphic signatures identified in lake sediments and alluvial landforms east and west of the Sierra Nevada. Furthermore, the distribution of ejected debris has important implications for the efficacy of standard archaeological survey, particularly in Long Valley, Mono Basin, and adjacent lowlands.

The Inyo-Mono region also contains some of the most important prehistoric obsidian quarries in the far west. For at least 13,000 years this material has been quarried and moved by people throughout the Great Basin

and Mojave Desert and across the Sierra Nevada into central California. The distribution of different obsidian sources provides important information useful in reconstructing past foraging territories, changing social relations, and exchange networks across a large portion of south-central California. To the extent that obsidian was an integral part of prehistoric technologies in eastern California, the geographic distribution of obsidian quarries is also thought to have been a factor influencing land use and mobility at different times in the past.

Filling the Middle Holocene Gap

Both east and west of the Sierra Nevada, the record of middle Holocene (ca. 7000 to 4000 cal BP) human occupation remains difficult to find, vastly underrepresented compared to sites from the late Holocene. In both regions, declines in effective precipitation during the middle Holocene are thought to have had structural effects on prehistoric economies and influenced changes in land use, potentially resulting in wholesale abandonment of arid regions (e.g., Elston 1982; Grayson 1993). The extent to which environmental changes actually affected human populations is an on-going problem for archaeologists. The apparent dearth of middle Holocene and earlier sites may in part be related to extensive landscape changes during the late Holocene, obscuring these older deposits, particularly in well-watered settings such as the Owens Valley and San Joaquin Valley.

STRUCTURE OF THE REPORT

We address these research concerns in the following chapters, beginning with an overview of the physiography and climate of the Study Area (Chapter 1), both of which had a strong influence on the nature of landscape evolution in south-central California. Chapter 2 begins with an overview of late Pleistocene and Holocene glacial cycles in the Sierra Nevada and a discussion of pluvial lakes in both eastern and western California, critical background for understanding existing models of landscape change in the Study Area. The second part of Chapter 2 examines the glacial model of landscape evolution, focusing on discrepancies between glacial cycles and alluvial fan and floodplain development in central California. Chapter 3 begins with a new model of landscape evolution based on region-wide changes in climate. A climate change model better accounts for cyclical landscape responses identified in both glaciated and unglaciated drainages and throughout the Holocene, when glacial mechanisms would have been inconsequential.

Next, more than 2,000 radiocarbon dates are used to redefine the depositional history of major landform segments in District 6/9. The Study Area's chronostratigraphy serves as a foundation for regional modeling of landscape change and a basis for the map of buried site potential ultimately presented. Chapter 4 provides an overview of the Holocene eruptive history of the Inyo-Mono volcanic chain, identifies the timing and geographic extent of a series of Holocene ash-falls affecting the eastern and western Sierra Nevada, and tracks the earliest use and geographic distribution of obsidian from several important prehistoric quarries located in the Study Area. Chapter 6 provides an assessment of buried site potential throughout District 6/9 based on the distribution of Holocene-age landforms and a simple model of human settlement. Particular attention is paid to Caltrans highway alignments, documenting the buried site potential of each rural road segment. The final chapter (Chapter 7) outlines methodological approaches for identifying and sampling buried archaeological sites.

CHAPTER 2. ENVIRONMENTAL SETTING

Caltrans District 6/9, also referred to as the Study Area, is located in south-central California and encompass nearly 35,922 square miles, close to one-quarter of the modern state. District 6 falls almost entirely west of the Sierra Nevada crest, and includes the counties of Madera, Fresno, Kings, Tulare, and Kern. Only a portion of eastern Kern County extends across the Sierra Nevada and Tehachapi Range into eastern California. All of District 9, which includes the counties of Inyo and Mono, lies east of the Sierra Nevada crest.

Varied relief and physiography across the districts create significant differences in temperature and precipitation from west to east and from north to south. These environmental differences had a direct bearing on past distributions of economically important plant and animal foods, which in turn influenced prehistoric human settlement-subsistence strategies and land-use patterns. Likewise, these factors contributed to the nature and extent of landscape evolution, as well as the context, preservation, and location of archaeological deposits from different time periods.

With these relationships in mind, the current chapter begins with an overview of the Study Area's physical geography, providing descriptions of major mountain ranges, valley systems, and hydrologic patterns. Then we examine the region's diverse climate, focusing on the ways in which topography and weather patterns interact to affect temperature and precipitation.

PHYSICAL GEOGRAPHY AND HYDROLOGY

The Study Area cross-cuts five major geomorphic provinces, including portions of the Coast Ranges, Central Valley, Sierra Nevada, Basin and Range, and Mojave Desert. Elevations range from 4,421 meters (14,494 feet) above mean sea level[1] at Mt Whitney to 86 meters (282 feet) below sea level at Death Valley, attesting to the marked topographic relief which characterizes the Study Area. With the exception of the Transverse Ranges, all major mountain chains are oriented roughly northwest to southeast, creating a series of parallel valley systems.

The Sierra Nevada is the most prominent mountain range in California and serves as a natural divide between western California and the Great Basin and Mojave Desert to the east. California's Coastal Range lies along the western border of the Study Area, separated from the Sierra Nevada by the San Joaquin Valley. Owens Valley lies between the steep escarpment of the eastern Sierra Nevada and the White and Inyo mountains, while further east, Panamint Valley and Death Valley are flanked by the Panamint and Armagosa ranges, respectively. Several other smaller mountain ranges and internally drained valleys fall within the Great Basin and Mojave Desert portions of the Study Area, adding to their topographic heterogeneity and hydrologic complexity (Figure 2).

Coast Ranges

The foothills of the Diablo Range (a portion of California's Coast Ranges) form the western boundary of the Study Area in Madera, Fresno, and Kings counties, while the Temblor Range forms the western border in Kern County. Rising more than 915 meters (3,000 feet) above the San Joaquin Valley, the eastern margin of the Diablo Range is composed of uplifted Cretaceous-age marine sandstone, siltstone, shale, and conglomerate of the Great Valley sequence (Jennings 1977). Further west, the older Franciscan assemblage forms the core of the Coast Ranges and structurally occurs beneath rocks of the Great Valley sequence. The Franciscan formation consists mainly of bedded deposits of greywacke and shale divided by a discontinuous mélange of greenstone, greywacke, gabbro, serpentinite, and red and green radiolarian chert. Metamorphism of the Franciscan assemblage has also resulted in the development of metagraywacke, metachert, actinolite schist, and glaucophane schist. These rocks outcrop widely throughout the central part of the range, and frequently occur as secondary alluvial deposits and as bed-load in modern stream channels exiting the coastal range into the San Joaquin Valley.

[1] Unless otherwise indicated, all elevations are presented as Above Mean Sea Level.

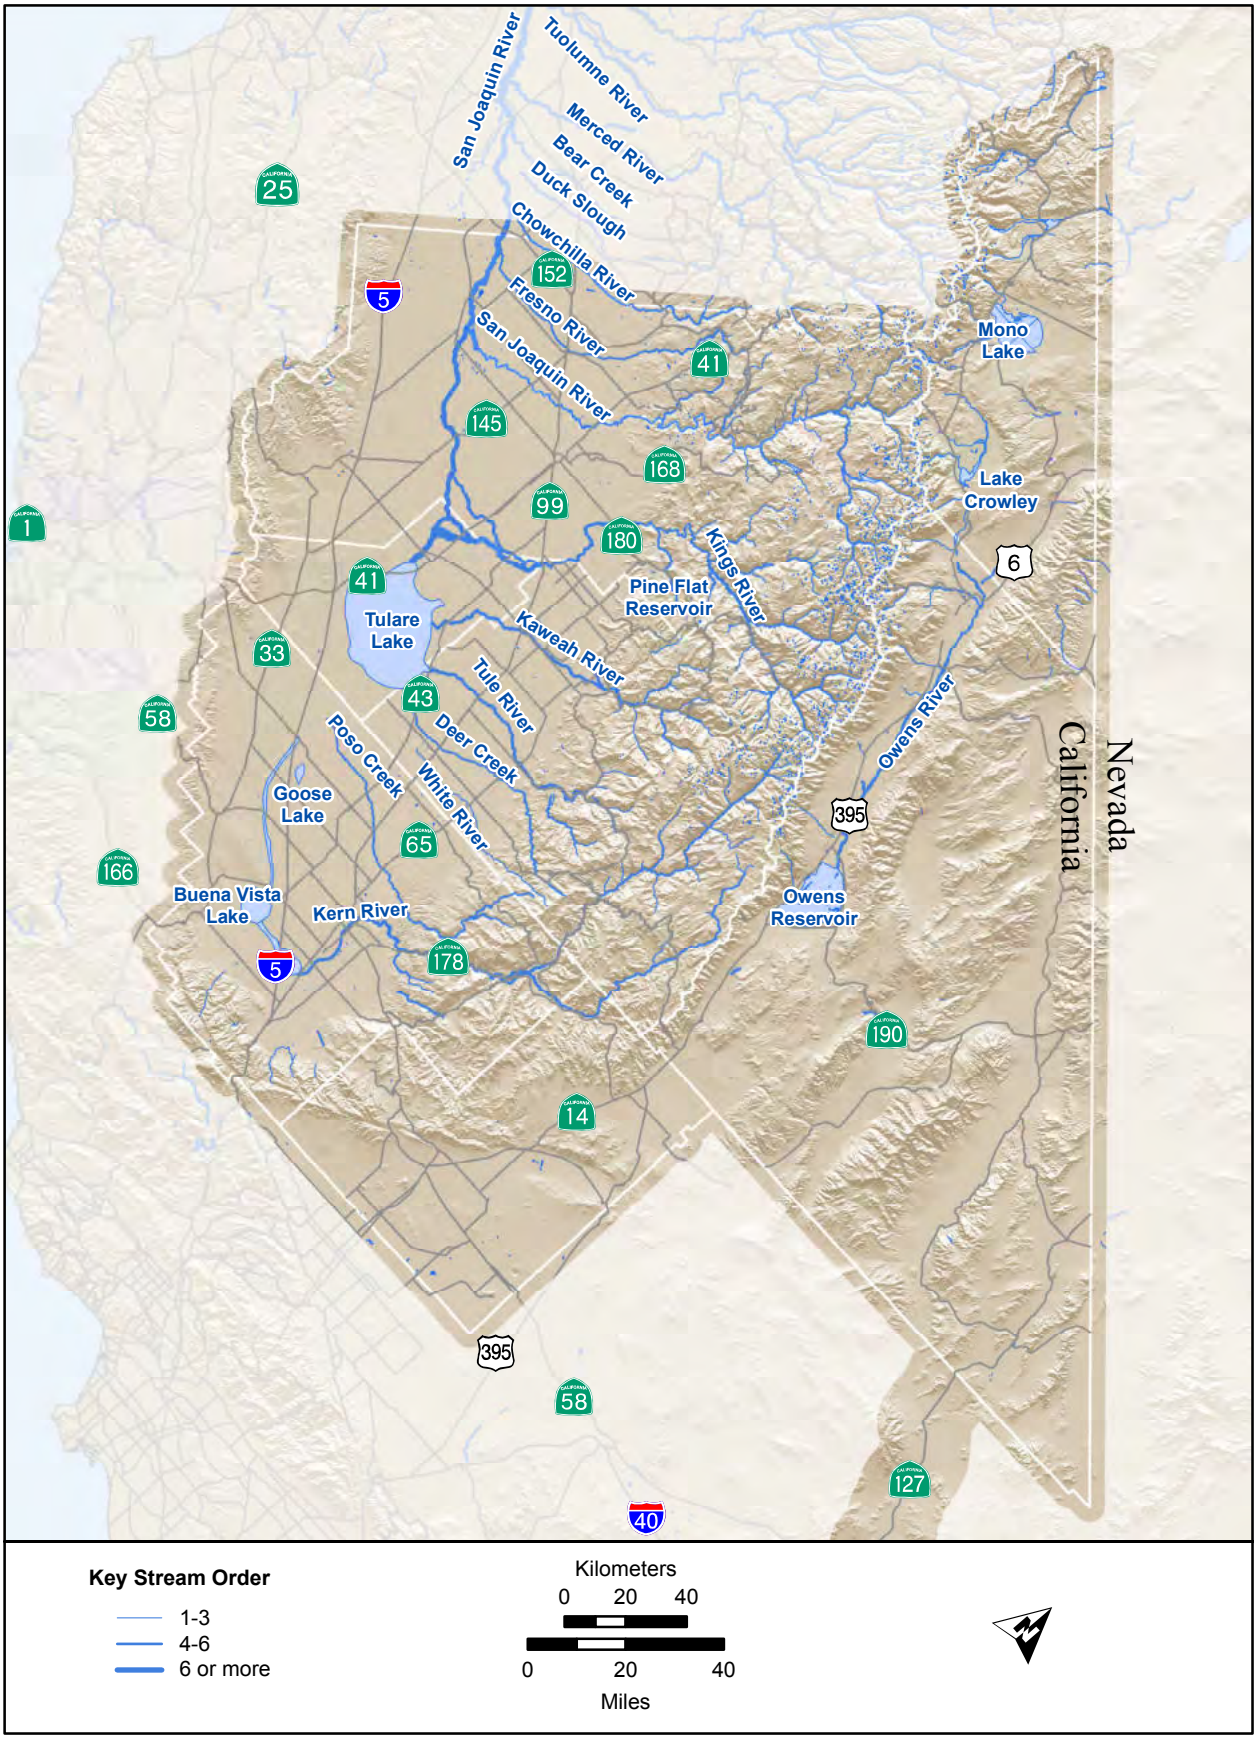

Figure 2. Location and Extent of Major Rivers and Streams in the Study Area.

Numerous streams bisect the foothills of the Diablo Range west to east, carving relatively deep, terraced canyons that connect small interior valleys with the San Joaquin Valley. Among the major drainages are, from north to south, Little Panoche Creek, Panoche Creek, Tumey Gulch, Arroyo Hondo, Cantua Creek, Salt Creek, Los Gatos Creek, Jacalitos Creek, and Zapato Chino Creek. Where these streams exit the Diablo Range, they have built relatively steep alluvial fans that coalesce to form a narrow piedmont along the entire mountain front. The eastern Diablo Range does not typically provide enough water to maintain continuous year-round flows, and most drainage systems are completely dry by mid-summer. Even when sufficient water is present between December and May, few if any of these drainages actually reach the axial San Joaquin River, dissipating instead into porous alluvial deposits along the valley margins (Lettis 1985).

To the south, the Temblor Range is divided from the main body of the Coast Range by the San Andreas Fault which extends in a northwest-southeast direction forming the Chalome Creek drainage. The Temblor Range is also younger than its northern counter-part, consisting of uplifted Miocene marine sandstone, shale, siltstone, conglomerate, and breccia. It is separated from the main San Joaquin Valley by a series of low, northwest-trending ridges and valleys formed by neo-tectonic activity along the San Andreas Fault. These ridges are composed of loosely consolidated continental sedimentary deposits of Pliocene- and Pleistocene-age sandstone, shale, and gravel, including the Kettleman Hills, Lost Hills, and Elk Hills (Jennings 1977). In-between the main body of the Diablo Range and the Temblor Range lie Antelope Valley and the Antelope Plain. Bitterwater Creek, Chico Martinez Creek, Salt Creek, and Buena Vista Creek are the main drainages exiting the Temblor Range en-route to the basins of the southern San Joaquin Valley. Like streams to the north, those exiting the Temblor Range seldom maintain surface flows, remaining dry throughout a large portion of the year.

Tehachapi Mountains and Transverse Ranges

The Tehachapi Mountains form the southern boundary of the San Joaquin Valley and are the northernmost of the transverse ranges, rising to an elevation over 2,410 meters (7,900 feet) at Double Mountain. The main body of the Transverse Ranges, which lie south of the current Study Area, run perpendicular to virtually all other mountain and valley systems in California. They were formed as a result of a bend in the San Andreas Fault, causing compressional uplift where the Pacific Plate moves in a westward direction against the North American Plate. The Tehachapi Mountains link the Coast Ranges with the southern Sierra Nevada and also separate western California from the Mojave Desert and Great Basin to the south and east. They are underlain by granitic rocks of the Sierran batholith and were developed as a result of movement along the Garlock Fault which runs along the southern flanks of the range. The San Emigdio Mountains lie immediately to the northwest of the Tehachapis along the southwestern margin of the San Joaquin Valley. These mountains are a southern extension of the Coast Range as indicated by their similar lithologies, mainly of Tertiary, sandstone, shale, siltstone, conglomerate and breccia (Jennings 1977).

A series of minor streams exit the northern slopes of the Tehachapi and San Emigdio mountains flowing northward into Buena Vista and Kern basins. From west to east these include Bitter Creek, Santiago Creek, Los Lobos Creek, San Emigdio Creek, Pleito Creek, Salt Creek, Tecuy Creek, Pastoria Creek, Tunis Creek, El Paso Creek, Tejon Creek, Comanche Creek, and Caliente Creek. Those drainages on the western side of the San Emigdio Range, such as Quatal Canyon and Alamo Creek, form the headwaters of the Cuyama River which drains westward through the Coast Range to the Pacific Ocean via the Santa Maria River. Like other drainages in this region, surface flows are rare, and most streams draining the Tehachapi and San Emigdio ranges remain dry most of the year.

San Joaquin Valley

The San Joaquin Valley segment of the Study Area begins on the north at the Madera-Merced and Fresno-Merced county lines. The valley is bound by the Diablo Range on the west, Tehachapi and San Emigdio Mountains on the south, and Sierra Nevada Mountains on the east. Included are portions of Madera, Fresno, Kings, Tulare, and Kern counties. The valley itself is an asymmetric structural trough, underlain by thick deposits of Quaternary alluvium eroded from the surrounding mountain fronts (Bartow 1991). Elevations on the valley floor gradually decline northward from about 105 meters (345 feet) at Greenfield near the base of the Tehachapis,

to about 33 meters (108 feet) near the Fresno, Madera, and Merced county lines. Expansive, low-gradient alluvial fans form a broad piedmont on the eastern side of the valley bordering the Sierra Nevada, while on the western side, coalesced fans originating from the Coast Range are comparatively short and steep. This configuration has caused the axial San Joaquin River to be offset towards the west, directed away from the valley center by the massive alluvial deposits fringing the Sierra Nevada.

The northern San Joaquin Valley is separated from Tulare Basin to the south by a subtle hydrological divide formed by the Kings River fan on the east and the Los Gatos Creek fan on the west. Throughout the historic-era, the Kings River spilled southward through a series distributary channels in its broad deltaic fan, providing about 50% of the water input to Tulare Basin and Tulare Lake (Atwater et al. 1986). In the past, Tulare Lake would periodically overtop the Kings River fan at an elevation of approximately 64 meters (211 feet) (Grunsky 1898a:61) and flow northward into the San Joaquin Valley through a forty-mile-long incision known as Fresno Slough. Near the modern town of Mendota, at an elevation of about 50 meters (160 feet), Fresno Slough merges with the San Joaquin River. Here the river is highly sinuous, branching into a mosaic of sloughs and side channels that diverge from both sides of the main channel. It continues in this manner northward to the Merced County line where it exits the Study Area.

South of the Kings River fan, impounded flows of the Kings, Kaweah, and Tule rivers created Tulare Lake, once the largest body of water west of the Great Lakes (Davis 1999a). Due to historic-period diversion of its main water source (the Kings River), Tulare Lake now stands dry. Historically the lake fluctuated in size from a few square miles during extremely dry years to as much as 800 square miles during wet years (Grusky 1898b:16). Tulare Basin itself is divided into sub-basins by a broad alluvial fan emanating from the Kern River. Kern and Buena Vista lakes once occupied the extreme southern end of the valley and occasionally coalesced and spilled northward into Tulare Lake. Historically these southern lakes were fed mainly by outflow from the Kern River, but minor input also came from numerous seasonal drainages originating from the Tehachapis. Like Tulare Lake, Kern and Buena Vista lakes remain dry as a result of water diversion.

Sierra Nevada

The Sierra Nevada segment of the Study Area incorporates eastern portions of Madera, Fresno, Tulare, and Kern counties, as well as western portions of Mono and Inyo counties. This 640-kilometer- (400-mile-) long mountain range separates the San Joaquin Valley on the west from the Owens Valley and Mono Basin on the east. It is the single largest mountain system in the contiguous United States and varies between 50 and 80 miles wide (Hill 2006). Throughout its entire length, the Sierra Nevada is characterized by a long, gradual western slope and a short, abrupt eastern escarpment. In the current Study Area, the crest of the Sierra rises to elevations over 4,250 meters (14,000 feet) at Mt. Whitney, more than 3,050 meters (10,000 feet) above the Owens Valley floor just ten miles to the east. Numerous other peaks reach elevations above 3,650 meters (12,000 feet), making average elevations in the southern Sierra Nevada the highest along the range's length.

Granitic rocks of the Sierran batholith dominate the eastern and western slopes of the mountain range. Unlike the central Sierra to the north, where a heterogeneous mélange of metamorphic rocks occurs in a continuous expanse along the foothill fault zone, few rocks other than granite are widely exposed in the southern Sierra. The most prominent are isolated and discontinuous outcrops of pre-Cenozoic metasedimentary and metavolcanic materials, including mostly slate, quartzite, hornfels, chert, phyllite, mylonite, schist, gneiss, and marble (Jennings 1977).

Several major rivers drain the western slope of the southern Sierra Nevada, many originating from formerly glaciated headwaters, including the San Joaquin, Kings, Kaweah, and Kern rivers. These drainages have carved deep canyons through the Sierran granite, some as much as 2,440 meters (8,000 feet) deep (Hill 2006). Smaller rivers and streams, such as the Fresno, Chowchilla, and Tule rivers, originate lower on the western slope, below the influence of the former glaciers, and their channels are not as deeply entrenched. Although most rivers in the Sierra assume a parallel course, bisecting the range from east to west, the Kern and upper San Joaquin rivers first travel along the axis of the range, south and north respectively, before turning westward to meet the San Joaquin Valley. Where the major rivers emerge from the western slope, they have built a nested series of massive

alluvial fans which decrease in age basin-ward and often coalesce, creating a broad, low-gradient piedmont that fringes the entire western slope.

The only major drainage emerging from the eastern side of the Sierra is the Owens River. It originates above the southern Mono Basin and first flows eastward into Long Valley and then southward into Owens Valley. Due to the abrupt configuration of the eastern slope, numerous small streams emanate from the once glaciated crest of the Sierra, descending steep canyons en-route to Bridgeport Valley, Mono Basin, or Owens Valley below. Typically these drainages run perpendicular to the long axis of the mountain range and occur about every three to five miles, creating an alluvial apron of coalesced fans along the eastern base of the Sierra Nevada.

In Bridgeport Valley, at the northern end of the Study Area, all major streams merge with the East Walker River and flow eastward into western Nevada. To the south, the Mono Basin is internally drained, capturing surface flows from both the Sierra Nevada and Bodie Hills. The numerous drainages entering the Owens Valley from the eastern slope often dissipate in coarse-grained alluvial fans before reaching the axial Owens River. Further south, Sierran drainages become more widely spaced and only rarely contribute surface flows to the valleys of the northern Mojave Desert.

Great Basin

Falling entirely within Mono and Inyo counties, the Great Basin segment of the Study Area is bound by the Sierra Nevada on the west, the California-Nevada border on the east, and the Mono-Alpine county border on the north. For purposes of this discussion, Rose Valley forms the southern boundary of the Great Basin, lying as it does on the northern edge of the Mojave Desert.

North-south trending mountain ranges divide the Great Basin into a series of long, narrow valley systems that run parallel to the eastern escarpment of the Sierra Nevada. Only at the extreme northern end of the Study Area is this pattern broken by relatively recent volcanic ridges that create several small intermontane basins including Bridgeport Valley, Adobe Valley, Long Valley, and Mono Basin. Further south, the Owens Valley borders the eastern escarpment of the Sierra Nevada, extending more than 80 miles until reaching its southern end at Owens Lake. From there, Rose Valley continues southward between the granitic peaks of the high Sierra and the recent volcanic mountains of the Coso Range.

The eastern side of Owens Valley is defined by the White and Inyo mountains which reach more than 4,250 meters (14,000 feet) at White Mountain Peak. The mountain chain declines southward to its terminus at Cerro Gordo Peak, which stands at about 2,800 meters (9,200 feet) elevation, about 1,220 meters (4,000 feet) above the floor of Owens Lake. Broadly spaced drainages emerge from the western side of the White-Inyo range, producing a series of isolated alluvial cones that extend basin-ward from the bedrock slopes. Due to only minor alluvial input from these mountain fronts, Owens River has assumed a course along the eastern side of Owens Valley, influenced in that direction by the comparatively broad alluvial piedmont at the base of the Sierra Nevada (Hollett et al. 1991). Owens River is fed mainly by run-off from the eastern slope of the Sierra beginning with its headwaters west of Long Valley. The Owens River watershed also incorporates runoff from Benton, Hammill, and Chalfont valleys, located east of Long Valley and the volcanic tablelands.

On the eastern side of the White and Inyo mountains lie several internally drained basins including, from north to south, Deep Springs Valley, Eureka Valley, Saline Valley, and Panamint Valley. The Last Chance Range and Panamint Mountains divide these smaller basins from Death Valley which lies to the east. In turn, Death Valley is separated from the Armagosa Desert and Pahrump Valley in western Nevada by the Armagosa Range.

Mountain ranges in the western part of the Great Basin consist of various combinations of plutonic and volcanic rocks, while those to the east are formed from uplifted marine sedimentary and meta-sedimentary rocks. The former include mainly granitoid and basaltic rocks, as well as localized deposits of obsidian, while the latter are composed of various cherts, slate, sandstone, limestone, dolomite, marble, phyllite, schist, hornfels, gneiss, and quartzite. Alluvial bajadas along valley margins incorporate secondary deposits of these rocks, particularly on older pediments where they are often exposed in continuous pavements.

With the exception of the Owens River and numerous smaller streams draining the eastern Sierra Nevada, surface water is rare in the Great Basin segment of the Study Area. Throughout this region, small springs

provide the main sources of fresh water, supplemented occasionally by winter rainstorms which enliven dry washes and quench perennially dry playas. During the late Pleistocene, however, an inter-connected system of lakes and rivers once unified this region, fed by rainfall and snow melt from the Sierra Nevada and coastal Peninsular Ranges to the west. For the most part, however, only a small vestige of this once extensive river and lake system remains, consisting of the East Walker River, Mono Lake, Owens River, and Owens Lake, sustained by surface flows from the eastern slope of the Sierra.

Mojave Desert

The Mojave Desert portion of the Study Area is situated within the southeastern portion of Kern County and extreme southern end of Inyo County, incorporating portions of Indian Wells, Fremont, and Antelope valleys. The Tehachapi Mountains and Sierra Nevada define the northwestern boundary of the Mojave Desert province, while the San Bernardino and Los Angeles county lines demarcate the eastern and southern boundaries of the Study Area, respectively. The El Paso Mountains and Black Hills separate Indian Wells Valley to the north from Fremont Valley to the south, the latter separated from the Antelope Valley further south by the Rand Mountains, Rosamond Hills, and Bissel Hills. Each of the basins in the Mojave Study Area is distinguished by a valley-bottom playa, dry lakebeds that are enduring remnants of the regions more verdant past. These include the playas at China Lake in Indian Wells Valley, Koehn Lake in Fremont Valley, and Rogers, Buckhorn and Rosamond lakes in Antelope Valley.

Bedrock in the Mojave segment of the Study Area consists mainly of granite, quartz monzonite, granodiorite, and quartz diorite. Volcanic, metavolcanic, and metasedimentary rocks underlie the El Paso Mountains and Black Hills along the Garlock Fault, while outcroppings of schist distinguish sections of the Rand Mountains. For the most part, however, Quaternary-age alluvium characterizes much of the Mojave portion of the Study Area, with extensive Pleistocene- and Holocene-age alluvial fans coalescing along mountain fronts and fringing deep, sediment-filled valleys.

Local springs supply the only regular surface water to the Mojave Desert. The Owens River once flowed into Indian Wells, Searles, and Panamint valleys, but those waters stopped flowing by the early Holocene. Storms occasionally result in discharge from the many washes exiting the eastern Sierra Nevada, but these are typically rare, as most precipitation simply evaporates or sinks into coarse-grained alluvial soils.

CONTEMPORARY CLIMATE

The typical climate of south-central California is zonally sub-tropical (33-42 degrees north latitude) or Mediterranean, with hot dry summers and cool humid winters (Major 1977). The interaction between topography and atmospheric circulation provides the primary control for the region's climate. A dominant influence is the cyclical shift in latitude and intensity of the semi-permanent Pacific High pressure cell (Anderson 1990; Hornbeck 1983; Major 1977). In the winter, as the Aleutian Low moves from its North Pacific position towards the equator, the Pacific High is pushed southward, and places California in line with low-pressure systems brought by westerly winds. A reduced ocean-to-land temperature gradient allows storms originating in the Pacific Ocean to move onshore, bringing widespread precipitation to the state. In montane regions, most winter precipitation occurs as snow. Beginning in the late spring, rapid heating of the continent creates a greater temperature gradient between the ocean and land. The Pacific high-pressure cell intensifies and moves northward, obstructing Pacific air masses from moving onshore, which in turn creates dryer conditions in the summer. During these months, precipitation is mainly limited to convective thunderstorms and sporadic rainfall from fronts originating to the south in the Gulf of California, or to the southwest in the Pacific Ocean (Anderson 1990).

Topographic relief also has a strong effect on patterns of temperature and precipitation in south-central California. The Sierra Nevada serves as a barrier to extremely cold winter air from the Great Basin. Cold winds that do make it over the Sierra are compressionally heated and dried, becoming the Santa Anas of southern California and the "northers" of the Central Valley (Hornbeck 1983). The Coast Ranges also serve as a buffer to the thick marine layer that mediates temperatures along the Pacific coast (Major 1977). More significantly however, the coastal and interior mountains have an important effect on precipitation. Due to the north-south orientation of the Coast Ranges and Sierra Nevada, the prevailing westerly winds are cooled as they rise to

overcome the mountain crests, causing them to release heavy moisture. This results in high amounts of rain and snow on the windward, west-facing slopes of the mountains, but creates a rain shadow on the east sides. Consequently, semi-arid to arid conditions prevail on the eastern side of the Coast Ranges, in the western San Joaquin Valley, and in the Great Basin and Mojave Desert east of the Sierra Nevada (Figure 3).

Coast Ranges

The eastern slope of the Diablo and Temblor ranges is hot and dry in the summer. The constraining mountains block cool marine air from the west, causing temperatures in the summer to be considerably warmer on the east side of the Coast Range than those of the interior valleys and ridges just to the west (Lindsey 1974); in the winter the opposite is true. Average annual precipitation in the uplands of the eastern Diablo Range can reach as much as 20 to 30 inches, while valley regions in the rainshadow to the east average between 2.5 and 6.5 inches annually (Figure 4).

San Joaquin Valley

Summer days in the southern San Joaquin Valley often exceed 38 °C (100 °F), with maximum average temperatures in June and July ranging between about 33-37 °C (92-98 °F) at Bakersfield and 36-37 °C (97-99 °F) at Coalinga. In winter (December to January), maximum average temperatures in these same localities range between 13 to 14.5 °C (57 and 58°F). Approximately 90% of annual rainfall occurs during the winter half of the year, between November and April; more than 50% occurs in January, February, and March. The summer months of June, July, and August are the driest of the year, with only about one percent of average annual rainfall originating from periodic thunderstorms during this season.

The orographic effect of the Coast Ranges, combined with latitude, produce clear geographic variation in annual precipitation across the valley, with less than 6.6 inches of rainfall annually on the western and southern sides of the basin, and between 6.6 and 15 inches annually on the eastern and northern sides (Figure 4). As a result of these differences, climate in dryer portions of the southern and western San Joaquin Valley is characterized as mid-latitude desert, while the remainder of the valley is semi-arid steppe (Figure 3; Hornbeck 1983; Major 1977).

Sierra Nevada

The Sierra Nevada Mountains form a boundary between the cool, moist Pacific air masses from the west and the warm, dry continental conditions of the Great Basin to the east. Climate is typical Mediterranean on the western slope, with warm, dry summers followed by wet, cool winters. Extreme annual variation in temperature and precipitation is characteristic of this region. A combination of eastward-moving storm systems and strong west-to-east elevational gradients result in a general pattern of increasing precipitation and decreasing temperature with rising elevation (Figure 4). Moisture-laden winter storms release large amounts of rain and snow as they ascend the western slope, leaving the eastern flanks of the Sierra with little precipitation (Major 1977).

Mean annual rainfall in the western foothills ranges from approximately 15 to 22 inches, while at mid-elevations average rainfall increases to between 22 and 32 inches (Figure 4). Above about 1,070 meters (3,500 feet), most precipitation occurs as winter snow, with annual depths averaging as much as 400 inches (ca. 50 inches of rain equivalent). Above about 2,440 meters (8,000 feet), precipitation decreases to the crest and continues to decline eastward (Major 1977). Snow blankets the highest peaks and alpine zone from November through May, with periodic snowfall recorded annually to elevations as low as 700 meters (2,300 feet). Although most of the yearly precipitation occurs between November and April, convective thunderstorms originating from the south are not uncommon at mid- to high-elevations in the Sierra during summer months, and contribute a measurable amount to yearly rainfall totals.

In the eastern foothills, the warmest months of the year are July and August with average maximum daily temperatures ranging from about 35 to 36 °C (96 to 98 °F; e.g., at Porterville). At higher elevations, temperatures are somewhat cooler, with maximum daily temperatures in the summer averaging about 32 °C (90 °F). Coolest conditions prevail at the highest elevations, where summer high temperatures average in the low 20s °C

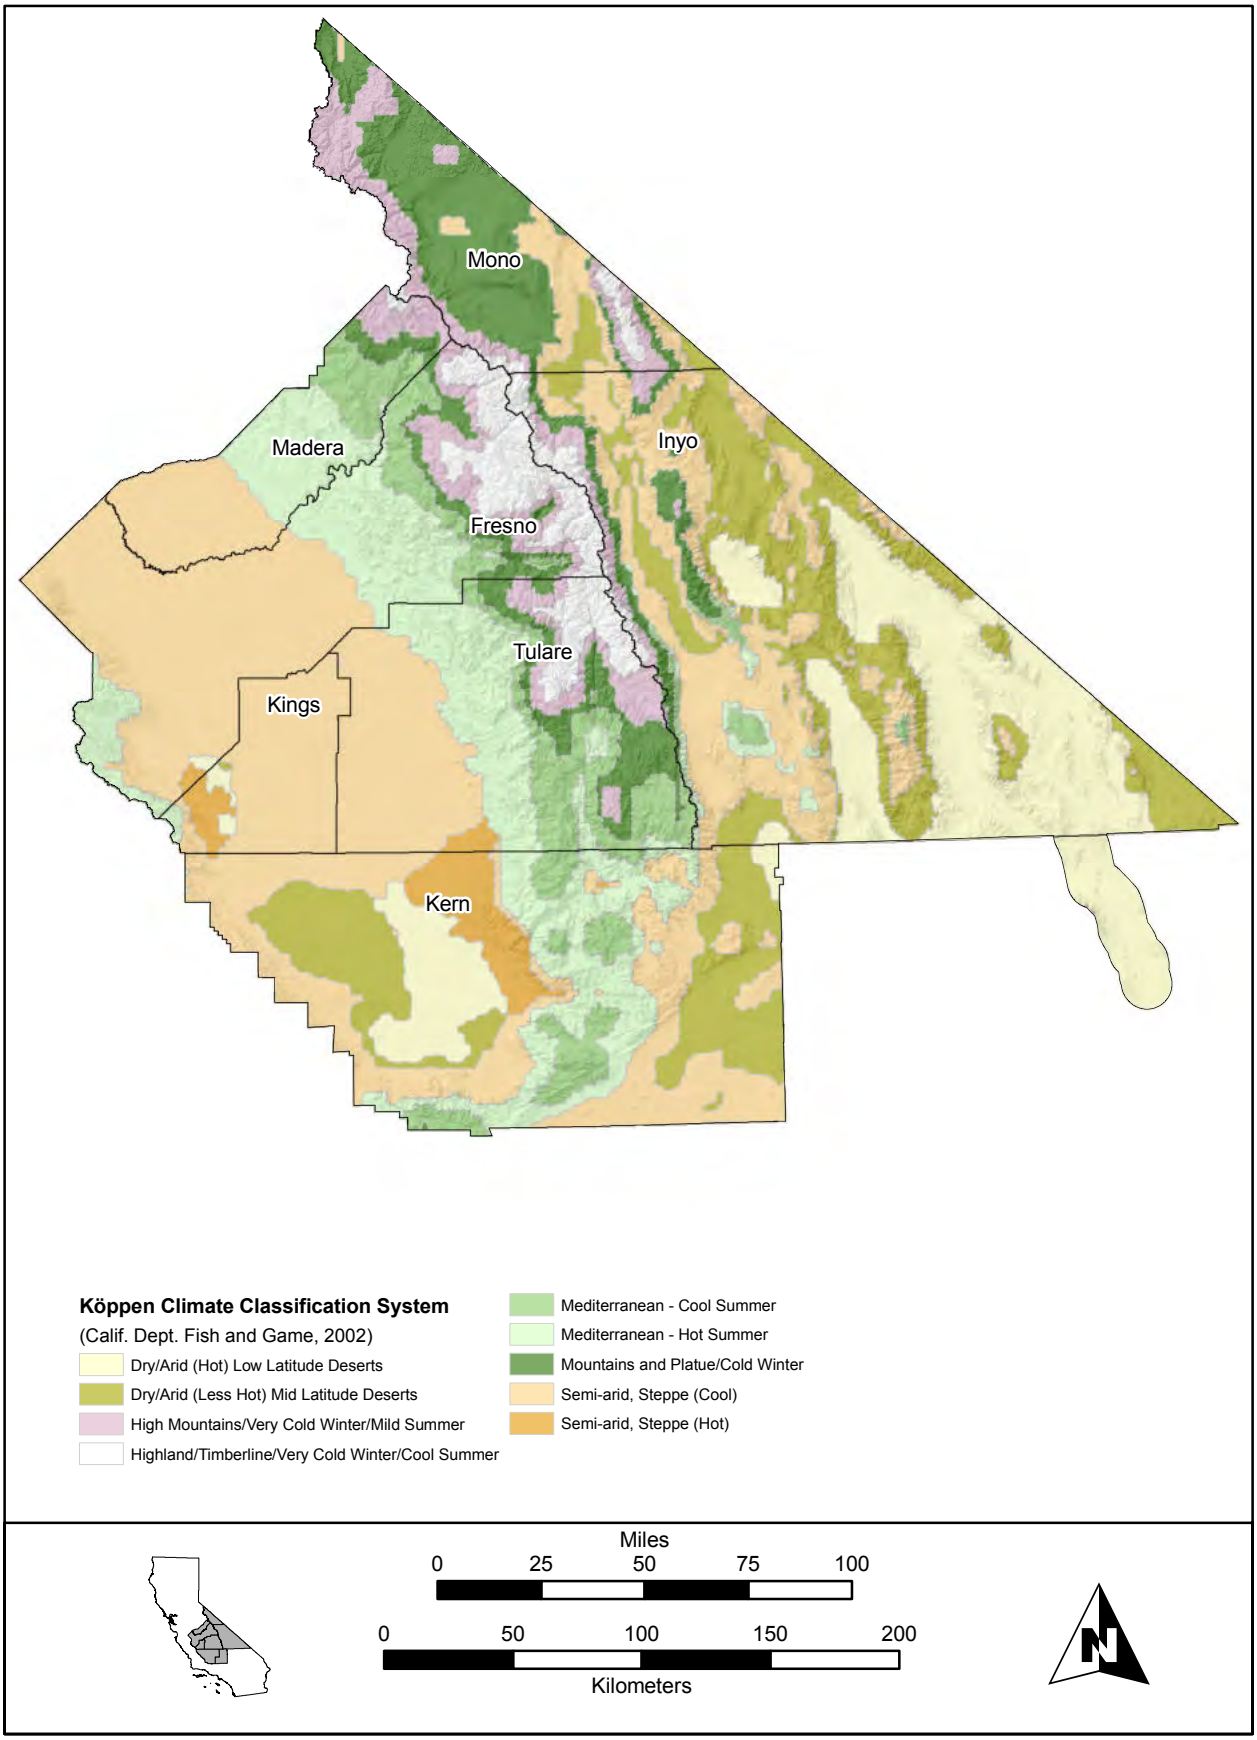

Figure 3. Koppen Climate Zones within District 6/9.

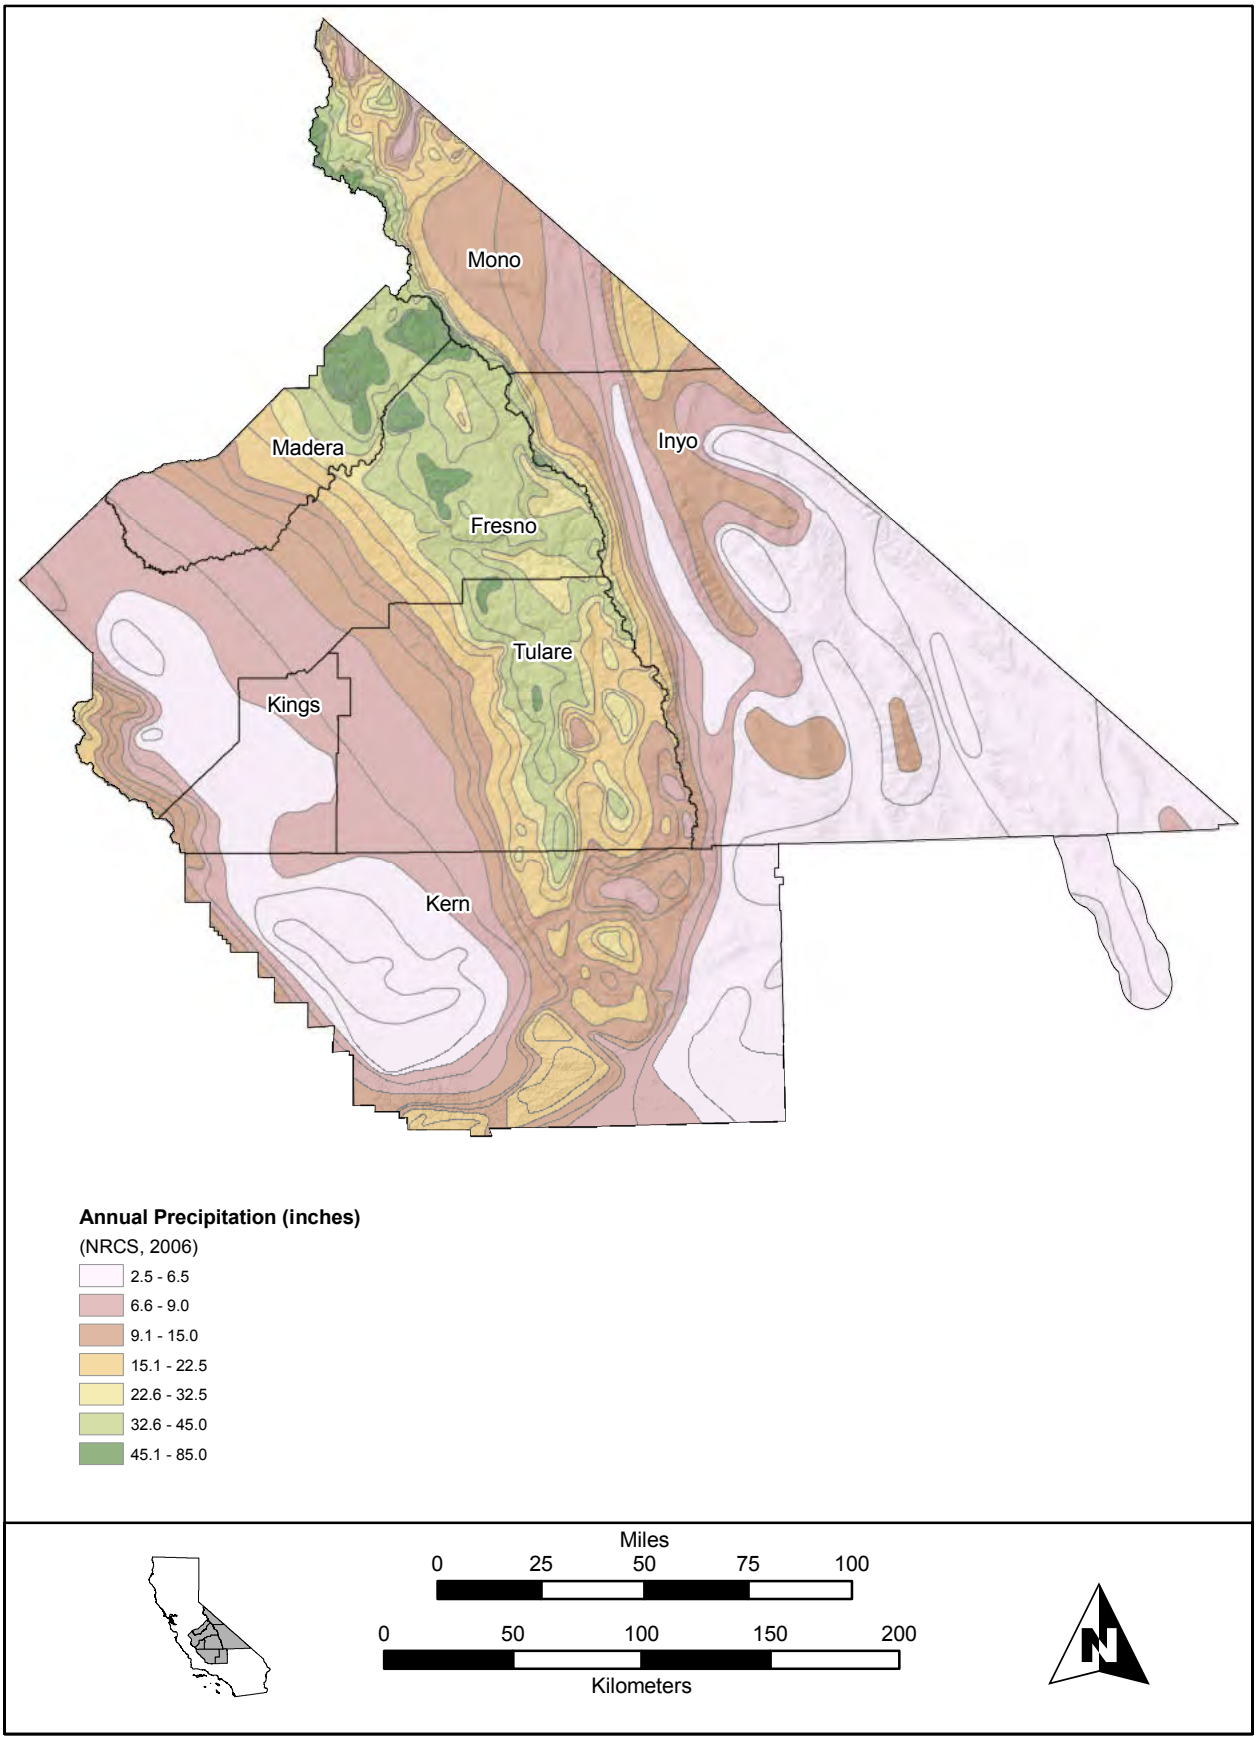

Figure 4. Distribution of Annual Precipitation in District 6/9.

(mid-70s °F; e.g., at Lodgepole). Between December and February, maximum daily temperatures at upper elevations are quite low, averaging just 3 to 4.5 °C (37 to 40 °F). The foothills are mild by comparison, with maximum daily temperatures in December and January averaging between 14 and 18 °C (57 and 64 °F). Most mid-elevation localities have average maximum daily winter temperatures just above 4.5 °C (40 °F).

Great Basin

The Great Basin is a mid-latitude desert, distinguished from the low-latitude Mojave Desert to the south by cooler temperatures in both summer and winter (Grayson 1993:22). In this regard, it is also different from the physiographic Basin and Range province, since cold desert portions of the Study Area are confined mainly to the region between the eastern escarpment of the Sierra Nevada and the White and Inyo mountains; those sections of the Basin and Range geomorphic province to the south and east fall within the bio-geographic Mojave Desert (Grayson 1993).

The rain shadow of the Sierra Nevada assures that little rainfall reaches the western Great Basin, with annual precipitation on the Owens Valley floor averaging less than six inches, about one-third of that obtained at similar elevations on the western slope. Above the Owens Valley in the White Mountains, most precipitation occurs as snow, with as much as 158 inches accumulating annually, about 19 inches of total precipitation. In contrast to the valley floor below, where only a minor amount of rainfall occurs during warm months (April through August), one-third of the annual precipitation in the White and Inyo mountains is derived from summer rain showers.

Maximum winter (December-January) temperatures at Independence on the Owens Valley floor average between 11 and 12 °C (53 and 54 °F), whereas further north at Bridgeport, they range between 5 and 6 °C (42 and 44 °F). Maximum summer (July-August) temperatures in these localities average between about 30 to 36 °C (87 to 97 °F). As would be expected given its higher elevation, both winter and summer temperatures are cooler in the mountains east of Owens Valley, where average daily winter temperatures range between about 0 and 1 °C (32 and 34 °F), while summer temperatures average between about 15 and 18 °C (60 and 65 °F).

Mojave Desert

As the name implies, the Mojave Desert is a very arid region due to its southern latitude and position east of the Sierra Nevada and Peninsular Range. In contrast to the Great Basin further north, this is considered a hot desert, with maximum winter temperatures averaging about 15 °C (60 °F) and summer temperatures averaging between about 35 and 39 °C (96 and 102 °F). Death Valley is considerably warmer, with temperatures in December and January averaging in the mid-60s and summer temperatures averaging between about 45 and 46 °C (113 and 115 °F).

The basins of this region receive less than five inches of rainfall annually, with as little as 2.25 inches on average at Death Valley. Like the rest of the Study Area, the Mojave Desert obtains its yearly rainfall primarily in winter, between December and March. This is unlike the Colorado Desert to the south which receives as much as half of its annual precipitation from summer monsoons. Furthermore, rainfall in the Mojave is sporadic, as particular localities can go many years without measurable precipitation (Major 1977).

CHAPTER 3. EXISTING MODELS AND NOTIONS OF LANDSCAPE CHANGE

> CIVILIZATION EXISTS BY GEOLOGICAL CONSENT,
> SUBJECT TO CHANGE WITHOUT NOTICE.
> ~ WILL DURANT (PHILOSOPHER)

Our current understanding of the mechanisms and timing of late Pleistocene and Holocene landscape evolution in south-central California has been heavily influenced by geological studies of the alluvial fan and floodplain deposits in the San Joaquin Valley (Arkley 1954; 1962; Atwater 1980, 1982; Atwater and Belknap 1980; Harden and Marchand 1980; Marchand 1977a, 1977b; Marchand and Allwardt 1981; Olmstead and Davis 1961), as well as glacial outwash and lacustrine deposits east of the Sierra crest (Bach et al. 1992, 1996; Benson et al. 1998; Blackwelder 1931; Birkeland et al. 1976; Bursik and Gillespie 1993; Clark and Gillespie 1997; Curry 1969, 1971; Davis 1999a; Dorn 1996; Konrad and Clark 1998; Phillips et al. 1996; Smith 1979; Wahrhaftig and Birman 1965). The great majority of these studies assumed that glacial erosion and weathering were the primary mechanisms responsible for generating large amounts of sediment, ultimately transported by melt-water or periodic flood events to adjacent valleys via local rivers and streams. Because similar alluvial fan sequences were recognized along many of the formerly glaciated rivers exiting the Sierra Nevada, it was also assumed that the timing of fan deposition was in phase with glacial cycles and, therefore, development of the alluvial piedmont along the western Sierra and related alluvial deposits in the San Joaquin Valley was mainly a Pleistocene phenomenon. While, it has rarely been specified whether the primary period of sediment deposition occurred during glacial advance or retreat, both Shelmon (1972) and Weismann (Weismann et al. 2002; Weismann et al. 2005) suggest that glacial recession was the primary mechanism of sediment transport, indicating that deposition should have been greatest following the glacial maximum.

In contrast to expansive research focused on the Central Valley of California and adjacent slopes of the western Sierra Nevada, the steep eastern escarpment has been subject to a variety of relatively idiosyncratic studies. This region lacks a synthetic overview correlating regional landforms, especially outside the Owens River system and, as a result, no reliance on an overarching model of landscape change has yet emerged. Nevertheless, if glacial cycles were the primary impetus for alluvial fan development on the western slope, this mechanism too should have had a strong influence on the nature and timing of fan aggradation in the Owens Valley and other basins fronting glaciated mountains east of the Sierra Nevada.

Although the glacial model has served as an organizing framework for numerous geological studies throughout central California, few attempts have been made to actually demonstrate that glacial periods in the Sierra Nevada correlate with the age of alluvial deposits presumed to derive from these cycles. To date, temporal linkages between particular glacial periods and outwash deposits have been based largely on relative dating techniques, such as geomorphic position, cross-cutting relations, and soil development (Bach and Elliot-Fisk 1996; Birkeland et al. 1976; Birkeland et al. 1980; Birkeland and Burke 1988; Swanson et al. 1993, among others). In many cases, one-to-one correlations between glacial intervals and outwash deposits could not be established because the resulting sediments were missing from central parts of glacial drainages, particularly west of the Sierra crest (Janda and Croft 1967; Matthes 1960). While some glacial moraines and outwash deposits have been radiocarbon dated, especially on the eastern slopes of the Sierra (Bach et al. 1996; Bursik and Gillespie 1993; Curry 1971; Clark and Gillespie 1997; Dorn 1996; Konrad and Clark 1998; Phillips et al. 1996), the absolute age of most glacial deposits remains poorly constrained and assumed ages remain highly questionable.

Recent work in the Coast Ranges on the western side of the San Joaquin Valley (e.g., Lettis 1985) and in unglaciated watersheds of the Sierra Nevada (Meyer and Dalldorf 2004; Meyer and Rosenthal 2008) has shown that a similar sequence of alluvial fan and floodplain deposits is present in these regions too, and that extensive deposits of post-glacial, Holocene-age alluvium occurs throughout the valleys of western California (e.g., Lettis 1982, 1985; Meyer 1996; Meyer and Rosenthal 2008; Rosenthal and Meyer 2004a, 2004b). Likewise, geological studies in the western Great Basin and northern Mojave Desert have shown that extensive post-glacial deposition also occurred in regions east of the Sierra Nevada (Harvey and Wells 2003; Mahan et al. 2007; McDonald et al.

2003; Miller and Amoroso 2007; Wells et al. 1987; Young 2007), calling into question glacial cycles as a primary mechanism for sediment transport and deposition in central California.

These studies point to the need for a more inclusive model of landscape evolution which decouples erosion, sediment transport, and deposition from glacial cycles, and provides a mechanism that can accommodate landscape transformations that occurred in glaciated and unglaciated watersheds alike, as well as during more recent times when glacial processes were inconsequential. Before developing such a model, the following chapter provides an overview of prevailing notions of landscape evolution, focusing on inherent inconsistencies and contradictory evidence of landform age that has emerged over the last 30 years. We begin by briefly summarizing glacial cycles in the Sierra Nevada, incorporating new evidence for the timing of glacial advance and retreat, and the relationship between those cycles and high and low lake stands recorded in pluvial basins east and west of the Sierra Nevada. The next section examines prevailing models of landscape evolution in central California in relation to glacial cycles, emphasizing research conducted in the San Joaquin Valley and adjacent uplands where many of the formative geological studies occurred. In that section we introduce stratigraphic nomenclature, and point out how the vagaries of relative-age assignments have resulted in ongoing problems of correlation. Lastly we present recent radiocarbon and stratigraphic evidence which effectively demonstrates inaccuracies in the prevailing glacial model of landscape change.

SIERRA NEVADA GLACIAL SEQUENCE

> IT IS EVIDENT THAT RELATIVE-AGE DATING METHODS
> DO NOT HAVE SUFFICIENT PRECISION AND RESOLUTION
> TO PERMIT DEFINITIVE DISTINCTION OF DEPOSITS
> OF THE TAHOE, TENAYA AND TIOGA AGE CLASSES.
> ~ DAVID FULLERTON - GEOLOGIST (1986:165)

More than twenty thousand years ago, the crest of the Sierra Nevada was covered by a massive sheet of glacial ice that extended from the Feather River to the headwaters of the Kaweah River (north to south). Fed by an upper ice cap roughly 50 kilometers (32 miles) wide, continuous lobes of ice moved down the main valleys on both sides of the Sierra, carving out the bedrock and leaving behind a series of terminal moraines that record multiple advances and retreats.

While glaciation of the Sierra Nevada has long been a subject of intense study (Wahrhaftig and Birman 1965), the exact number and age of particular glacial events are still open to debate (Dupre et al. 1991; Kaufman et al. 2004; Fullerton 1986). Six episodes of Pleistocene glaciation are widely recognized, known from oldest to youngest as the McGee, Sherwin, Tahoe, Tenaya, Tioga, and Recess Peaks (Fullerton 1986; Guyton 1998; Hill 2006). Though the ages of the earliest advances are not well defined, the McGee is estimated to be at least 1.5-million years old, the Sherwin approximately 820,000 years old, and the Tahoe bracketed somewhere between about 150,000 and 40,000 years old (Gillespie and Zehfuss 2004:54; Hill 2006:311).

Of primary importance for the current study, two late Pleistocene glacial cycles include the Tenaya and the last major advance known as the Tioga glaciation (Blackwelder 1931; Curry 1969; Fullerton 1986). A radiocarbon date of about 30,000 cal BP from glacial out-washes in the Kings River fan may provide a beginning date for the Tioga advance (Atwater et al. 1986). The end of the Tioga advance is better constrained by several radiocarbon dates from glaciated basins in the Sierra dating less than 16,000 years cal BP (Table 1), consistent with worldwide evidence that glaciers began to recede about 17,400 cal BP (Schaefer et al. 2006). Terminal moraines of the Tioga advance descend to elevations as low as 2,280 meters (7,480 feet) in the Tuolumne River drainage (Huber 2004), but were higher to the south where they did not extend below about an average of 2,500 meters (8,200 feet; Kaufman et al. 2004). However, apart from concurring that the Tioga advance represents the last glacial maximum, there is little agreement among researchers as to the correlation of Tioga-age alluvial and morainal deposits between different drainages and even within single valleys (Fullerton 1986:165).

Table 1. Radiocarbon Dates from Late Pleistocene Glacial Moraines in the Sierra Nevada.

Locality	Stratigraphic position	Material Dated	14C BP	cal BP	Reference
Pine Creek					
Outermost Tioga moraines	Surface	Rock varnish	19,050 ± 420	22,602	Dorn et al. (1987)
Innermost Tioga moraines	Surface	Rock varnish	13,170 ± 200	15,780	-
Osgood Swamp					
In terminal Tioga moraine of Echo Lakes Glacier	Above glacial flour	Bulk sediment	9,900 ± 800	11,448	Adam (1967)
Swamp Lake					
Near upper limit of Tioga ice, North Fork	In glacial flour	Bulk sediment	15,565 ± 820	18,597	Batchelder (1980)
Stanislaus Valley	Above glacial flour	Bulk sediment	14,035 ± 510	-	-
Lake Moran					
In highest Tioga moraines, North Fork	Above glacial flour	Bulk sediment	12,180 ± 260	16,821	Byrne (1988)
Stanislaus Valley	In glacial flour	Mono Craters Ash	14,700-14,800	-	-
Swamp Lake – Yosemite					
Covered by Tioga glaciation, Tuolumne Valley	Above glacier flour	Bulk sediment	13,690 ±340	16,419	Smith and Anderson (1992)
Siesta Lake					
In Tioga moraine	n/a	Bulk sediment	11,280 ±60	13,274	Brunelle and Anderson (2003)
Tioga Pass Pond					
Covered by Tioga glaciation, Sierra crest	Above Mono Craters ash	Bulk sediment	8760 ± 240	9,838	Anderson (1990)
Starkweather Pond					
In Tioga moraines	In sand and silts	Bulk sediment	10,879 ± 150	12,929	Anderson (1990)
Laurel Creek Canyon					
In Tioga/Recess Peak moraine	n/a	Carbonized leaves	13,600 ± 120	16,329	Pohl et al. (1996); Clark et al. (1995)
Barrett Lake					
Area of Hilgard deposits	Above glacial flour	Bulk sediment	11,730 ± 430	13,817	Anderson (1987)
Upper Baboon Lakes					
In Recess Peak moraines	Above glacial flour	Bulk sediment	11,190 ± 70	13,161	Clark and Gillespie (1997)
Central Baboon Lakes					
In Recess Peak moraines	Above glacial flour	Gyttja	10,880 ± 60	12,940	Clark and Gillespie (1997)
Gabbott Meadow Lake					
Covered by Tioga glaciation	In sandy gravel	Bulk sediment	10,500 ± 140	12,461	Mackey and Sullivan (1991)
Bunker Lake					
Covered by Tioga glaciation	Above glacial flour	Charcoal?	11,180 ± 180	13,090	Edlund (1994a)
Grassy Lake					
Covered by Tioga glaciation	Above glacial flour	Bulk sediment	12.360 ± 100	13,380	Edlund (1994b)

Notes: Table modified and expanded from Edlund 1991.

A separate glaciation, the Hilgard, identified by a number of researchers as a late Pleistocene or early Holocene event, has recently been refuted (Clark and Gillespie 1997). Type-moraines for the Hilgard advance are now thought to be recessional features associated with the Tioga glaciation (Birkeland et al. 1976; Clark and Gillespie 1997). Likewise, a re-evaluation of the smaller Recess Peak glaciation, once thought to be a late Holocene phenomenon (Scuderi 1987), places this advance and retreat between 14,200 and 13,100 cal BP, or latest Pleistocene in age (Clark and Gillespie 1997; Gillespie and Zehfuss 2004). Glacial ice generated by the

Recess Peak advance was substantially smaller than the Tioga ice mass, with the average vertical extent being about 3,375 meters (11,070 feet), or 335 meters (1,100 feet) higher than the maximum Tioga advance (Figure 5).

The Little Ice Age or Matthes glaciation, which began between 650 and 620 years ago, is the only truly Holocene-age glacial advance now recognized in the Sierra, lasting about 500 years (c.f., Curry 1969, 1971; Scuderi 1987; Wahrhaftig and Birman 1965; Wood 1975). In comparison, Little Ice Age glaciers only reached to about 3,520 meters (11,550 feet) at their lowest extent, or about 145 meters (475 feet) higher than during the Recess Peak advance (Figure 5). The Matthes and Recess Peak advances were the only glaciations to occur during the span of human occupation. The Sierra Nevada was essentially unglaciated for the intervening 12,000 years or more, including a cooling interval identified as the Younger Dryas. The overall timing of the glacial sequence is summarized below in Table 2.

Table 2. Generalized Sierra Nevada Glacial Sequence.

Glacial or Non-Glacial Period	Description	Age cal BP [a]	Possible Duration (years)
Little Ice Age/Matthes	Glacial cycle (retreat)	650-150 (400-150)	500 (250)
Holocene	Non-glacial warming	11,500-650	10,850
Younger Dryas	Non-glacial cooling	12,800-11,600	1,200
Recess Peak	Glacial cycle (retreat)	14,200-13,100 (13,600-13,100)	1,100 (500)
Tioga III or IV	Glacial cycle (retreat)	25,000-15,000 (19,000-15,000)	10,000 (4000)
Tenaya or Tioga I	Glacial cycle (retreat)	~42,000-28,000 (~36,000-28,000)	14,000 (8000)
Tahoe II	Glacial cycle	~50,000-42,000	8,000
Mono Basin or Tahoe I	Glacial cycle	~80,000-60,000	20,000

Notes: Adapted from Gillespie and Zehfuss (2004:Table 1), Kaufman et al. (2004:Table 2), and Phillips et al. (1996:Table 1); [a] Age estimates of 40,000 years or more based on radiometric data other than radiocarbon are not necessarily calibrated; Parentheses ( ) denote timing and duration of glacial retreats.

GREAT BASIN LAKE AND RIVER SEQUENCE

> As some writers — especially those who are given to solving the mysteries of nature from their closets — have thought that lakes filling true rock basins are a rarity, and have even doubted whether they exist at all, we shall be interested in examining the result of glacial action...
> **~ Israel Russell** — Geologist (1889:281).

At the height of the most recent glacial maximum, about 22,000 years ago, seasonal melt-water and well-charged groundwater systems maintained stream flow in drainages emanating from the glacier-capped mountains. Tributary streams led to large rivers ending in closed basins where a combination of high stream flow and reduced evaporation formed expansive lakes. This is an "ice-age" snapshot of the eastern Sierra Nevada and western Great Basin traditionally understood to be the landscape of the earliest human inhabitants of the region. Since the time of Russell's nineteenth-century expedition to Mono Lake, geologists, geomorphologists, and archaeologists working on the eastern side of the Sierra have exposed and documented a much more complicated interplay of global climate and local environments, resulting in a diverse record of local landform response. The regional mosaic of uplifted mountains, glacier-cut valleys, alluvial bajadas, and broad, once-lacustrine, valley bottoms is a testament to this landscape dynamic.

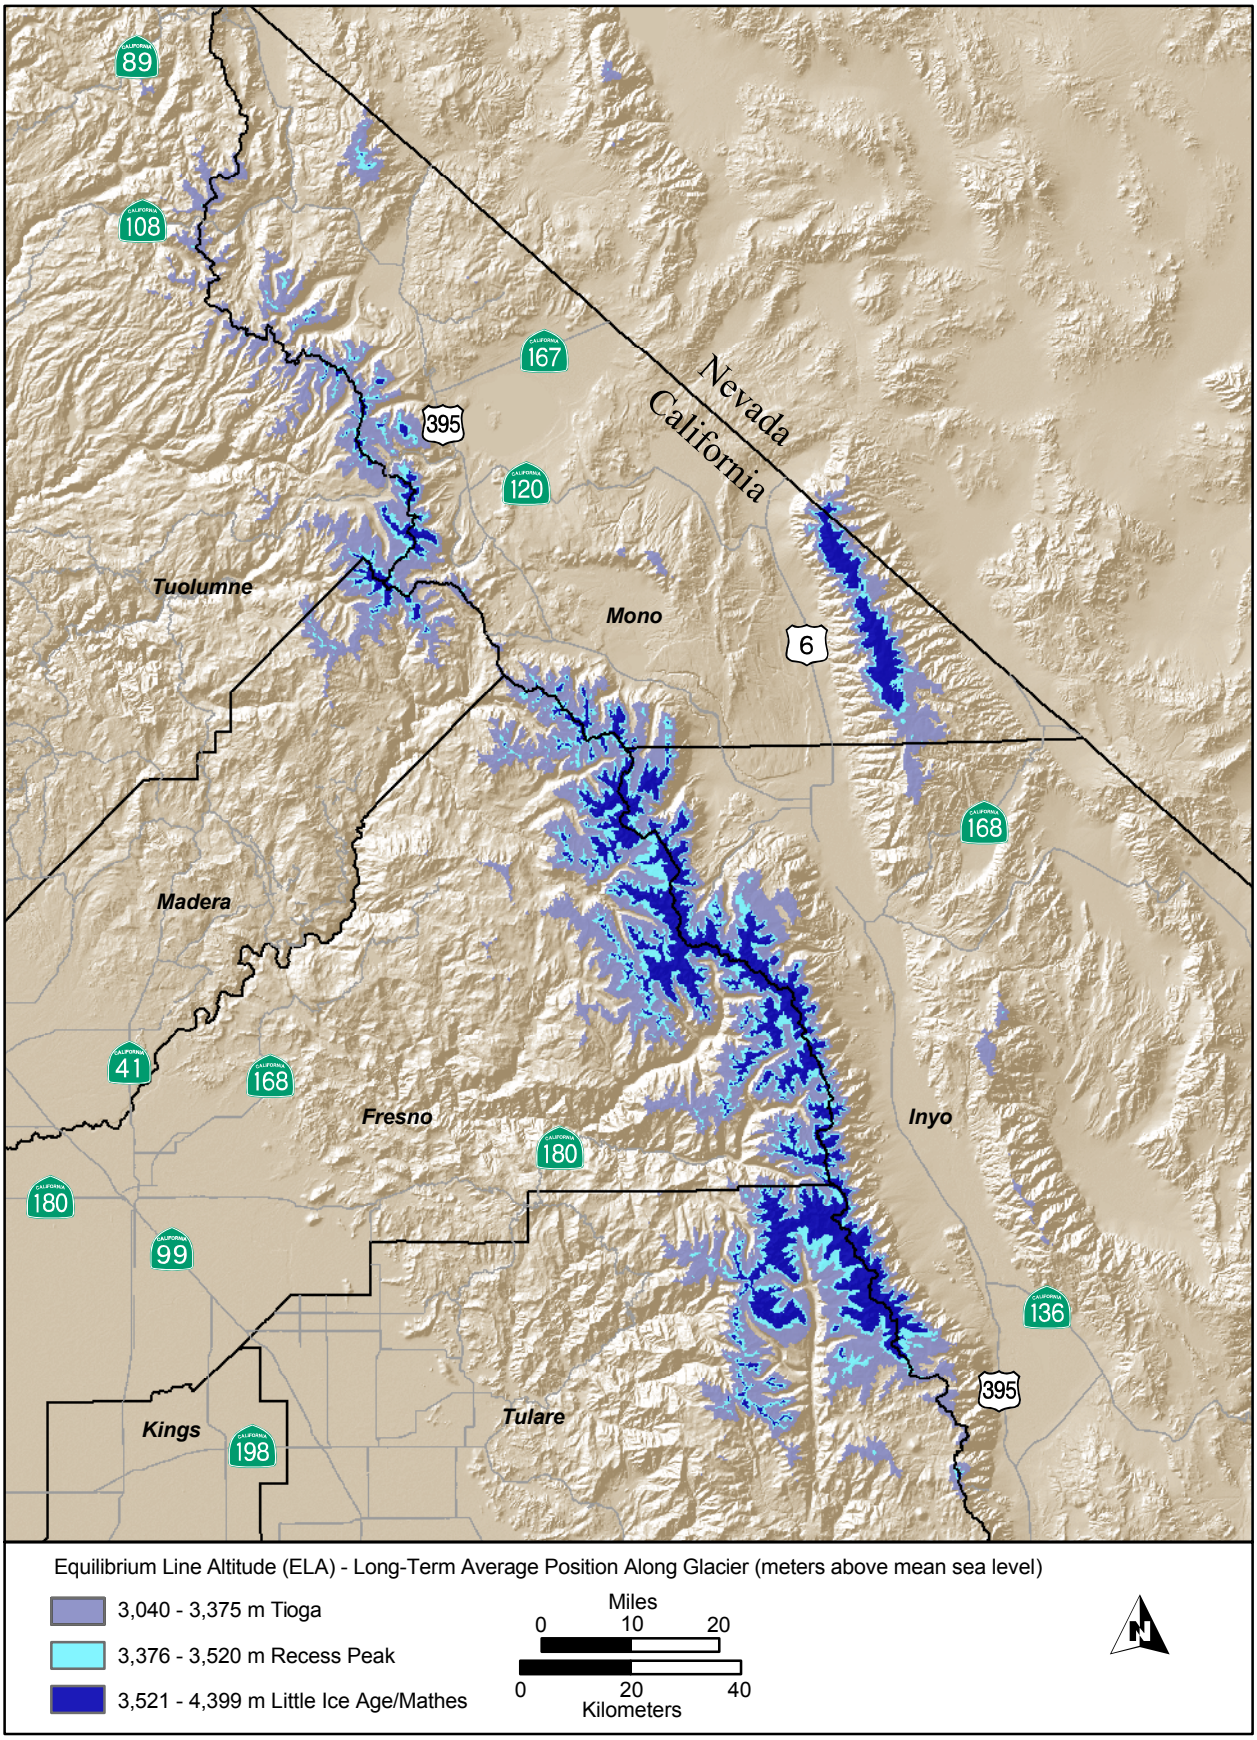

Figure 5. Average Extent of Latest Pleistocene and Holocene Glacial Advances.

Notions of Glaciers and Lakes

The notion of a late Pleistocene, direct "ice age" link between Sierra glaciation and pluvial lake highstands within Mono, Owens, and China Lake (Indian Wells) basins has been decoupled through a greater understanding of post-glacial climate patterns as well as clear documentation of structural relationships between well-dated lake features and generalized glacial landforms (Grayson 1993:111). The steeply uplifted mountain-front of the eastern Sierra preserves a detailed record of the recessional phases of the most recent glacial (Tioga) cycle. Tectonic uplift forces drainages to cut through older mountain-front landforms so that glacial features are preserved; unfortunately, deposition has shifted basinward where recent fans bury lacustrine features on the margins of Owens Valley.

Although numerous creative dating methods have shown promise (Phillips 2008; Phillips et al. 1996), Sierra glacial features tend to be difficult to date with any accuracy beyond some limiting minimum based on exposure of surfaces once beneath the ice mass (for example., see Table 1). Older Tahoe-age features may have been subdued by erosion and soil development and may extend beyond the mountain-front, whereas more recent Tioga-age features are sharp and clearly up-valley from the more expansive Tahoe landforms. Lacustrine records containing stratigraphic isotopic, sedimentologic, or paleontologic (e.g., ostracods) evidence provide robust proxy data for reconstructing glacial and lacustrine sequences (Benson et al. 1996; Benson et al. 1997; Benson et al. 1998; Bradbury and Forester 2002; Phillips 2008; Phillips et al. 1996). While a linkage between glacial and lacustrine processes is assumed by these proxies, the popular notion of a strict synchronicity between glacial or "ice-age" maximum (~22,000 years ago) and pluvial lake highstands (~17,000 years ago) is misguided.

The increased resolution of lacustrine records, along with field observations of multiple recessional landforms, has led researchers to posit multiple Tioga pulses within the broader glacial cycle. The glacial maximum (lowest equilibrium altitude), between about 25,000 and 22,000 years ago, is marked by Tioga II deposits and lake proxies indicating relatively low lake stands, if not complete desiccation (Benson et al. 1997). Glacial systems remained near their maximum extent for several thousand years with only slight recession and expansion fluctuations. Landforms believed to be associated with these post-maximum fluctuations are occasionally labeled as Tioga III features; however, these features are neither geographically extensive nor commonly recognized. Glacial features preserved above the Mono Lake Basin, noted by Russell (1889), reveal that late Tioga glaciers began retreating prior to 16,000 years ago (Bursik and Gillespie 1993:33-34). A significant pause and possible final expansion within the general glacial retreat is marked by well-documented Tioga IV deposits dating to about 16,000 years ago. A general regression in the depth and extent of regional lake systems corresponds to Tioga IV. The final Tioga recession, after the Tioga IV pause, was followed by a rise of Lake Russell (pluvial Mono Lake) to its late Pleistocene highstand (Benson et al. 1998; Bursik and Gillespie 1993). A similar pattern is documented in glacial landforms and lacustrine records elsewhere along the eastern Sierra Nevada.

Tioga fluctuations in the Sierra show equivalents in the White Mountains, the most southerly late Pleistocene glaciated range in the Great Basin (Grayson 1993:108). The early and late Middle Creek glaciations in the eastern cirques of the White Mountains are Tioga-age equivalents; the late Middle Creek ended about 16,000 years ago. Pluvial highstands throughout the Owens River system, from Owens Lake through Lake Searles, clearly post-date Tioga glacial recession.

Notions of the Owens River System

> REALITY IS THE SQUIGGLY STUFF.
> ~ RON KING - ARCHAEOLOGIST

During the Pleistocene, the Owens River system drained almost the entire eastern Sierra Front, from Mono Lake to China Lake, and extended to Panamint Valley and Death Valley of the Mojave Desert (Figure 6). A drainage system of this extent was rare, however. By the late Pleistocene, the paleo-Owens River only connected the intermediate basins of Owens, China, Searles, and Panamint lakes (Smith and Street-Perrott 1983). Today the river terminates at the nearly dry lakebed of Owens Lake.

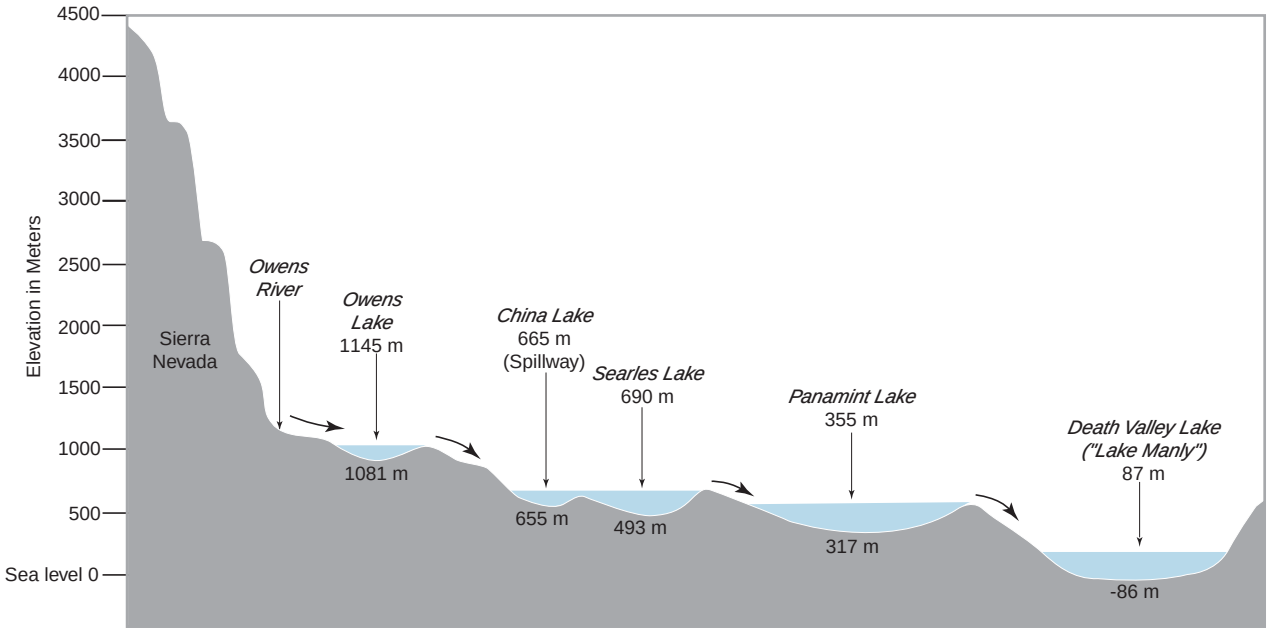

Figure 6. Paleoconnections along the Owens River Drainage System.

Smith and Street-Perrott (1983) and Benson et al. (1990) provide discussions of pluvial lake chronologies along the Owens River system by focusing on the stratigraphy of pluvial Lake Searles. When Owens Lake reached its outlet it overflowed to Rose Valley which, in turn, overflowed to Indian Wells Valley and China Lake. The modern elevation of the Owens Lake sill, beneath the Haiwee reservoirs, is 1,145 meters (3,756 feet). When China Lake reached a depth of approximately ten meters (33 feet), at an elevation of 665 meters (2,182 feet), it overflowed to the deep basin of Searles Valley. Searles Lake filled considerably, to a depth of 172 meters (564 feet), before coalescing with the waters of China Lake to form pluvial Lake Searles. The lake continued to rise until reaching its sill with Panamint Valley where it would have been almost 200 meters deep (656 feet), maintaining a surface elevation of 690 meters (2,264 feet).

This expansive network of rivers and lakes are a key for understanding the structure of late Pleistocene and early Holocene landscape change in the western Great Basin; however, the chronological resolution of post-glacial lake expansions and river connection remains elusive. Early studies focused on Searles Basin as pivotal for understanding the system's history (Smith 1987; Smith and Street-Perrott 1983). The Searles Basin remains important because it retains a deep stratigraphic record and, because it lies in the rain shadow of the Sierra Nevada, local surface runoff and internal input had only a minor influence on lake fluctuations. Thus, the Searles record provides an excellent proxy of the hydrological history of the preceding (up-drainage) basins. Moreover, rising lake levels in Lake Searles provides direct information on the depth of China Lake. In turn, China Lake must have received input from the Owens River to overflow into Searles Basin.

Lake Searles experienced dramatic fluctuations during the late Pleistocene between about 35,000 and 17,500 cal BP (Benson et al. 1990; Smith and Street-Perrott 1983). The pluvial lake, like other regional lakes, experienced a dramatic recession between 17,500 and 15,500 years ago. The lake then fluctuated at moderate levels until about 12,850 years ago, with a distinct increase between 12,850 and 12,200 cal BP. After this final transgression, the lake receded and remained very low or dry with minor oscillation throughout the Holocene (Benson et al. 1990). A radiocarbon date of 15,500 cal BP on rock varnish from an outflow terrace between China and Searles basins indicates the terrace has been exposed and the lakes did not coalesce since at least that time (Benson et al. 1990). Smith reported Holocene lakes in both China (Smith and Davis 1978) and Searles (Smith and Street-Perrott 1983) basins, but these have not been well-documented. While Holocene lake stands, derived from intra-basin drainage, likely occurred in these separate basins, geomorphic features associated with low-level, brief transgressions have not been discovered.

Warren (2008; see also Rosenthal et al. 2001) has shown that Clovis projectile points—the earliest accepted evidence for human occupation in the region—are clustered at elevations below the outflow sill of China Lake Basin. He has interpreted this spatial patterning as indicative of the "Clovis drought" (after Haynes 1991) which immediately predates the brief return to pluvial conditions marking the late Younger-Dryas. During the dry interval of the Clovis drought, the Owens River was confined to Owens Valley. Just prior to 12,200 years ago, fluctuations of the global climatic Younger-Dryas event (12,800-11,500 cal BP) seemingly produced a series of brief increases in Sierra runoff (Benson et al. 1997), probably accompanied by reduced evaporation (Grayson 1993), and forced a return of Lake Owens and extension of the Owens River system through Rose Valley, China Lake, and into Searles Lake. Numerous Clovis points from the Coso Junction site, situated along the former course of the Owens River in Rose Valley (Borden 1971), also support the idea that river flow resumed during Clovis times.

Owens Lake Basin, the "gatekeeper" of the hydrological system, has received copious study via a series of lake cores (Benson 2004; Benson et al. 1996; Benson et al. 1997; Phillips 2008; Phillips et al. 1996) and descriptive and chronological analysis of littoral environments and neotectonics (Bacon et al. 2006; Orme and Orme 2008). Retreating from an extended period of highstands, it is clear that Owens Lake experienced significant desiccation during a pause in Tioga glaciation that formed the Tioga IV terminal moraines. This drying event is evident as prominent desiccation features and frosted quartz grains in the record of core OL84 between 18,300 and 15,800 years ago. Following this early desiccation, isotope data (delta-18O) show four wet intervals (W1-4) when basin outflow via the lower Owens River (to Rose Valley and China Lake) reduced the level of isotope saturation, indicated by lower delta-18O measures. The W2 interval of Benson et al. (1997) shows two sub-peaks and may have lasted almost 1,500 years. Although Benson et al. (1997) do not specifically state that the late wet events (W3 or W4) forced Owens Lake to its sill, the significant reduction in isotope saturation

along with the 500-year duration of each event suggests that outflow was likely (cf. Bacon et al. 2006). The wet periods are bracketed by very dry intervals with relatively high isotope saturation. The first two dry intervals (D1 and D2) resulted in relatively brief lake regressions. The third (D3), at the beginning of the Younger-Dryas, was significant enough to allow formation of a sub-aerial weathering profile on the Owens lakebed. The final dry period (D4) marks a significant transition to generally dry conditions, although the record shows fluctuating delta-18O levels, with a significant decrease at about 10,000 years ago, lasting into the Holocene.

Bacon et al. (2006) present a very different picture of Owens Lake Basin. Their review of dated sub-aerial, littoral, and sub-aqueous features and fauna, either collected by the authors or obtained from previous studies, including the lake core studies, limits the potential for basin outflow. Their interpretation of the Pleistocene-Holocene transition retains significant hydrological fluctuation, but the authors posit that Owens Lake did not have outflow (i.e., it remained a closed basin) after a final highstand between 16,000 and 15,000 years ago. Their record also indicates that the amplitude and duration of early Holocene lakestands was much greater than indicated by the upper sections of well-studied cores.

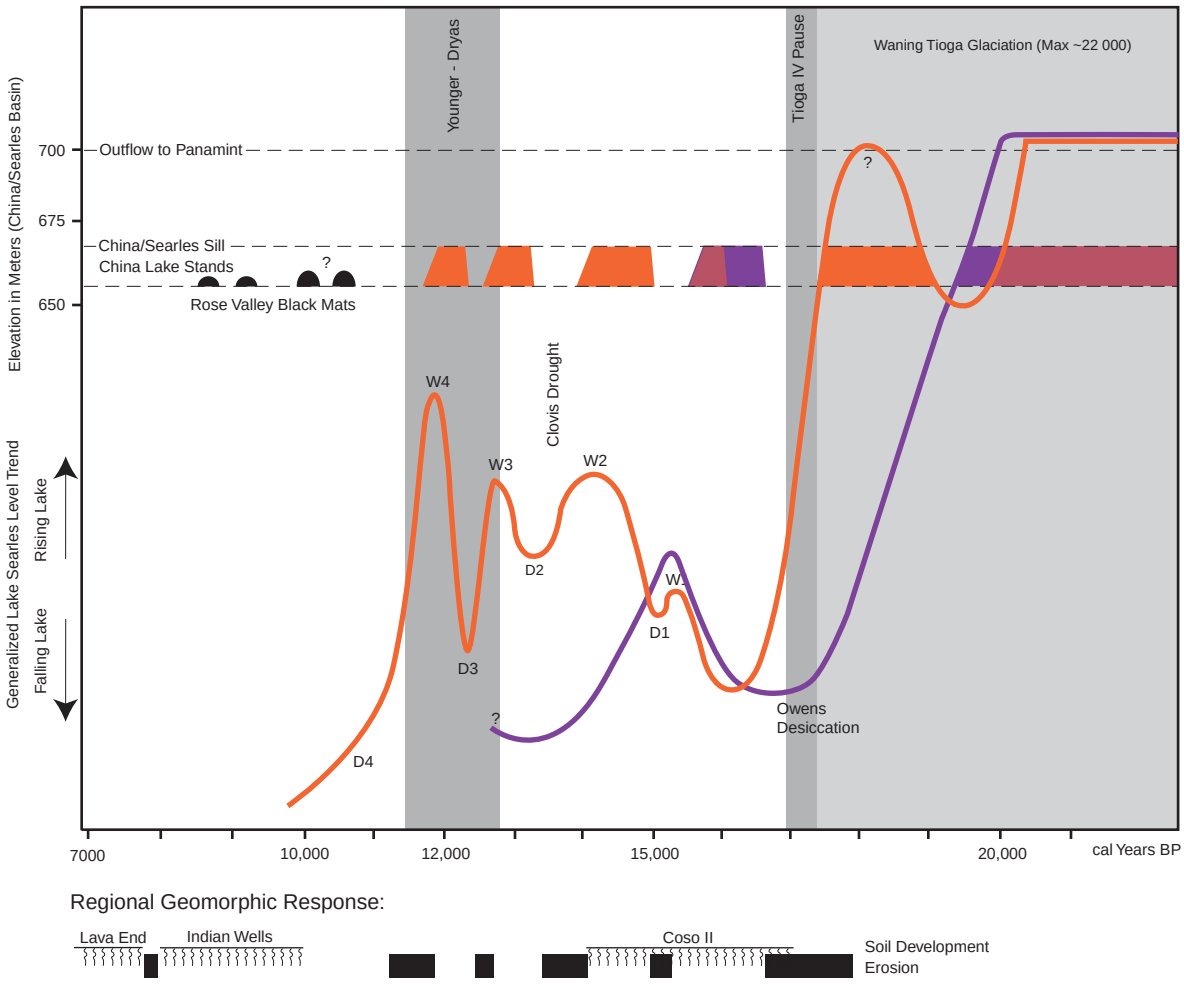

Figure 7 presents an updated lake level curve focusing on the interval between circa 21,500 and 10,000 years ago. The simplified curve is derived from lake level and isotope information from Owens Lake (Bacon et al. 2006; Benson and Bischoff 1993; Benson et al. 1997; Orme and Orme 2008), China Lake (Warren 2000; Young et al. 2001), Searles Lake (Benson et al. 1990), and on-going field studies in Rose Valley. Although significant progress has been made (Bacon et al. 2006; Benson 2004; Orme and Orme 2008; Phillips 2008), the figure illustrates that our understanding of lake levels in Searles Basin, and throughout the system, is incomplete.

As a proxy for the Sierra front landscape conditions, the record provides important information about the Pleistocene/Holocene transition. Water levels in the Searles Basin are dependent on input from China Lake and the Owens River system. Because the overflow sill between China and Searles basin is so low (less than 10 meters [33 feet] above the floor of Indian Wells Valley), and the Searles Basin occupies a much lower-elevation valley, changes in hydrologic inflow and outflow have a greater effect in the basin of China Lake than at Searles. If there is flow in the lower Owens River, via Rose Valley, due to Lake Owens overflow and Sierra input, China Lake fills relatively quickly before overflowing to Searles. Therefore, increasing lake level in the Searles Basin requires outflow from the upstream basin, which in turn produces a relatively stable level in China Lake. If the lake in Searles Basin is receding, we can assume that input from the Owens River system has ceased and China Lake has dropped below its sill. Once the river is cut off, due to the shallowness of China Lake Basin, it is likely that lake desiccation would significantly out-pace that at Searles.

The interpretations of Bacon et al. (2006) do not align with downstream datasets from the Searles Basin (Phillips 2008; Orme and Orme 2008), though they do not necessarily contradict information from Owens Lake cores (Benson et al. 1997). Young (n.d.) has documented early Holocene wet intervals in Rose Valley, where organic black mats on lacustrine deposits near sill levels suggest external water sources. Orme and Orme (2008) have indicated that the elevation of Owens sill has changed since formation of highstand shorelines and find evidence of tectonic uplift along the active margin of the Coso Range. Although something of a "ghost in the machine," this might be a useful explanation for discrepancies in the lacustrine records (Phillips 2008) of the tectonically active trough that forms the course of the Owens River. The structure of the Owens River is not only significant for understanding prehistoric resource distribution along the Sierra front and into the California Great Basin; it is also a useful proxy for reconstructing the character of depositional and erosional regimes within and adjacent to the drainage system.

San Joaquin Valley Lake Records

Tulare Lake and Buena Vista Lake were historically the largest bodies of surface water in the San Joaquin Valley. Before the lakes were drained and reclaimed for agriculture in the early nineteenth-century, the Buena Vista basin captured runoff supplied by the Kern River and all other streams that drain the southern end of the valley. Both lakes were subject to relatively rapid fluctuations in their overall water levels as they regularly responded to annual runoff and periodic floods or droughts (Grunsky 1898a, 1898b; Mendenhall et al. 1916), and both were partially or completely enclosed ("dammed") by large alluvial fans originating near the base of the

Owens to Searles Lake Proxies: Upward trends (right-to-left) show Owens sill overflow and river contribution to Lake China, downward trends show Lake Owens regression and desiccation of lower Owens River; provides general transgression/regression lake level direction for pluvial Lake Searles.

from Benson et al. (1997) with Wet (W)/Dry (D) cycles based on isotopic signatures.

from Bacon et al. (2003) based on synthesis of regional radiocarbon database.

Figure 7. Owens to China to Searles Proxy Lake Indicators.

Sierra foothills to the east. At times of major flooding, water flowed northward from Buena Vista Lake through a convoluted network of shallow channels, known as Buttonwillow Slough, on its way to Tulare Lake. Tulare Lake was the primary hydrologic basin for all runoff from the southern San Joaquin Valley, including all drainages from the Kings River to the Kern River that carried glacial water from the upper Sierra Nevada (see Figure 2). As such, Tulare Lake has been a settling basin for alluvium transported by these drainages, both east and west of the valley's southern axis.

Buena Vista Basin

A basic sketch of Buena Vista Basin's depositional history can be pieced together based on the age and context of several radiocarbon dates obtained by various geologic and archaeological studies from sediments underlying the lakebed (Croft 1968, 1972; Fredrickson and Grossman 1977; Lofgren 1975; Manning 1968; Marchand and Allwardt 1981). These dates indicate that at least 18 meters (59 feet) of sediment were deposited in the basin since the Tenaya glacial advance about 36,370 cal BP (W-2336), and that sand deposits appear to record Tioga-related outwash over the interval from about 20,290 cal BP (W-1504) to 15,820 cal BP (W-1652). Extensive deposition during this time is consistent with a date of 16,845 cal BP (W-1650) obtained on wood buried more than 12 meters (39 feet) below the surface of the Kern River fan near Bakersfield (Marchand and Allwardt 1981).

In parts of Buena Vista Basin, Croft (1968, 1972) identified a thick layer of fine-grained lacustrine or marsh deposits (i.e., "A clay") that appears to mark the Pleistocene to Holocene boundary. Wood from the upper part of the "A clay" yielded a date of 10,175 cal BP (W-1505), indicating that it and the overlying 11.6 meters (38.1 feet) of sediment are Holocene in age. An early Holocene date of 9516 cal BP (Beta-169380) was obtained on a buried soil located along Broad Creek to the west of the basin (Young 2003), and freshwater shells associated with a buried cultural deposit at KER-116 between 2.6 and 4.5 meters (8.5-14.8 feet) below surface on the southwestern edge of Buena Vista Lake produced dates of 8380 and 7740 cal BP (LJ-1356-57, and I-1928, respectively; Fredrickson and Grossman 1977). Charcoal from a buried colluvial deposit along the southern side of the lake generated a middle Holocene date of 4810 cal BP (LJ-314). This suggests that debris flows occasionally made their way to the valley floor from the San Emigdio Mountains and may be inter-fingered with fluvial deposits (Fredrickson and Grossman 1977; Hubbs et al. 1962). Dates of 1300 to 1100 cal BP on archeological materials from surface sites KER-39 and KER-116 located on the western margin of the basin suggest a lake was also present during the latest Holocene (Hartzell 1992). As such, the Buena Vista Basin contains a reasonably complete depositional record from the latest Pleistocene through much of the Holocene. The history of lake fluctuations in Buena Vista Basin, however, has yet to be evaluated.

Tulare Lake

To the north of Buena Vista Basin, lacustrine deposits of Tioga-age (Chatom silt) were identified in the Tulare Lake Basin, but evidence for the two proceeding glacial cycles (Tahoe and Tenaya) has not yet been found (Atwater et al. 1986; Davis 1999a). Atwater et al. (1986) contend that glaciation produced large outwash deposits on the Kings River fan, which created a dam that blocked the usual outlet of the lake to the north. This model suggests the "fan dam" was deposited beginning about 28,000 cal BP during the Tioga glacial advance (i.e., coeval with Chatom silt), and that this lead to an increase in the overall size and depth of the lake basin. Once the fan dam was in place, it would have presumably increased the basin's overall ability to capture and store sediments for long periods. If these changes grant Tulare Lake the unusual potential to record "the timing, magnitude, and climatic context of Sierra Nevada glaciation" as claimed by Atwater et al. (1986:109), then its depositional record should be even more complete than that of Buena Vista Lake. Yet oddly, deposits that might correlate with the Buena Vista "A clay" of Croft (1968, 1972) are not recognized in Tulare Lake.

A subsequent study by Davis (1999a) indicates that the lake's depositional center records a "gap in sedimentation" for the interval from about 21,800 to 11,800 cal BP, a period which fully encompasses the Tioga glacial maximum and retreat, and the entire Recess Peak glacial cycle. Davis interpreted the gap as an erosional contact (not a lake low stand) created when "the alluvial dam impounding the lake was breached by a through-flowing Kern River" (Davis 1999a:255). Though no further explanation is given, this scenario implies a breach

may have occurred even before the fan dam was completely built, and is thus at odds with the Atwater et al. (1986) depositional sequence which suggests continued dam building until about 18,000 cal BP.

Because it is highly unlikely that erosion could have ever been efficient or pervasive enough to remove all depositional evidence of a particular glacial or interglacial period within such a broad and shallow basin, it is puzzling to imagine how Tulare Lake could contain a record of some glaciations and not others, especially when the Kings River, Buena Vista Basin, and all other glaciated and unglaciated western Sierra Nevada drainages contain deposits coeval with the last three or four major glacial cycles (see Table 2). Furthermore, the Tulare Lake record indicates deposition resumed around 11,800 cal BP within the basin, and was relatively continuous through the rest of the Holocene (Atwater et al. 1986; Davis 1999a; Negrini et al. 2006). Thus, not only were these lacustrine deposits laid down during the decidedly non-glacial conditions that typified the Holocene, but they are twice as thick as the Tioga-age Chatom silt (about 6 versus 3 meters [19 versus 10 feet] respectively).

Latest Pleistocene and Holocene lake level histories for Tulare Basin have previously been inferred by both Davis (1999a) and Negrini et al. (2006). Based on the nature of sediment deposition and changing abundances and types of pelagic algae and littoral pollen, Davis (1999a) described periods of high and low lake levels spanning the last 30,000 years. This work was based on core samples retrieved from the lowest portion of Tulare Basin (i.e., the basin's depocenter), and provides information on whether relatively deep or shallow water conditions occurred at the coring site, interpreted as either high or low lake stands (Davis 1999a).

To better understand changes in the size of Tulare Lake during the late Pleistocene and Holocene, Negrini and Wigand (2003 and Negrini et al. 2006) studied sedimentary records from below a prominent wave-cut terrace along the southwestern edge of the basin, which they termed the Rambla shoreline. Negrini's and Weigand's study added important detail on the sedimentary record of the basin margin and areal extent of Tulare Lake at different times in the past. However, they relied heavily on Davis' (1999a) findings to infer the elevation of high lake stands, but provided no constraining dates which demonstrate the actual extent of these transgressions. For example, Negrini's inferred lake level curve provides no direct evidence for high stands above the 64 meter elevation (210 feet), which represents the modern sill level. Nevertheless, he infers high stands well above that level during the early Holocene (i.e., ca. 9000 and 8500 to 7500 cal BP), middle Holocene (ca. 5800 to 5500 cal BP) and during the latest Holocene (after 500 cal BP).

To provide a more complete picture of the latest Pleistocene and Holocene history of Tulare Lake, we plotted the distribution of all radiocarbon dates thus far retrieved from the basin, distinguishing between those that were deposited sub-aqueously, at or near lake level, or in terrestrial contexts above lake level (Figure 8; Figure 9). The latter dates are the most significant as they provide constraints on the maximum elevation of the lake at various times in the past. The terrestrial dates derive from various contexts (Appendix A), the majority of which are buried soils and archaeological deposits. Dates inferred to be at or near the maximum elevation of the lake derive mainly from marsh or beach deposits, whereas those from below lake level originate from lake clays and silts (e.g., the Blakely Canal Silt).

The current data set suggests that Tulare Lake reached its highest elevations only recently, apparently within the last 1,000 years. Early Holocene shorelines appear to have remained around the 63-meter (207-foot) elevation, about one meter (three feet) below the modern sill elevation, while those associated with the middle Holocene and beginning of the late Holocene appear to have been even lower, between about 58 and 56 meters (190 and 184 feet) in elevation about 2000 cal BP, well below the lowest levels recorded historically (Grunsky 1898b). After 2,000 years ago, the lake rose significantly, attaining its highest levels perhaps as recently as the historic period, although the highest transgressions were probably short lived (Grunsky 1898b).

That the lake stood well below the 63-meter (207 feet) level during most of the Holocene is clearly evident from radiocarbon dates obtained from the Los Gatos Creek fan. Along with the Kings River fan, alluvial deposits originating from Los Gatos Creek create the primary impoundment for Tulare Lake basin. Four radiocarbon dates from buried soils at two separate localities on the distal Los Gatos Creek fan range between 13,835 and 13,495 cal BP (OS-72701, OS-72702, Beta-137204, and Beta-255484) and range in elevation between 61.9 and 63.0 meters (203.1 and 206.6 feet). In the Omaha Canal, these late Pleistocene buried soils are immediately capped by lake deposits containing *Anadonta* shell in growth position. A sample of one of these shells

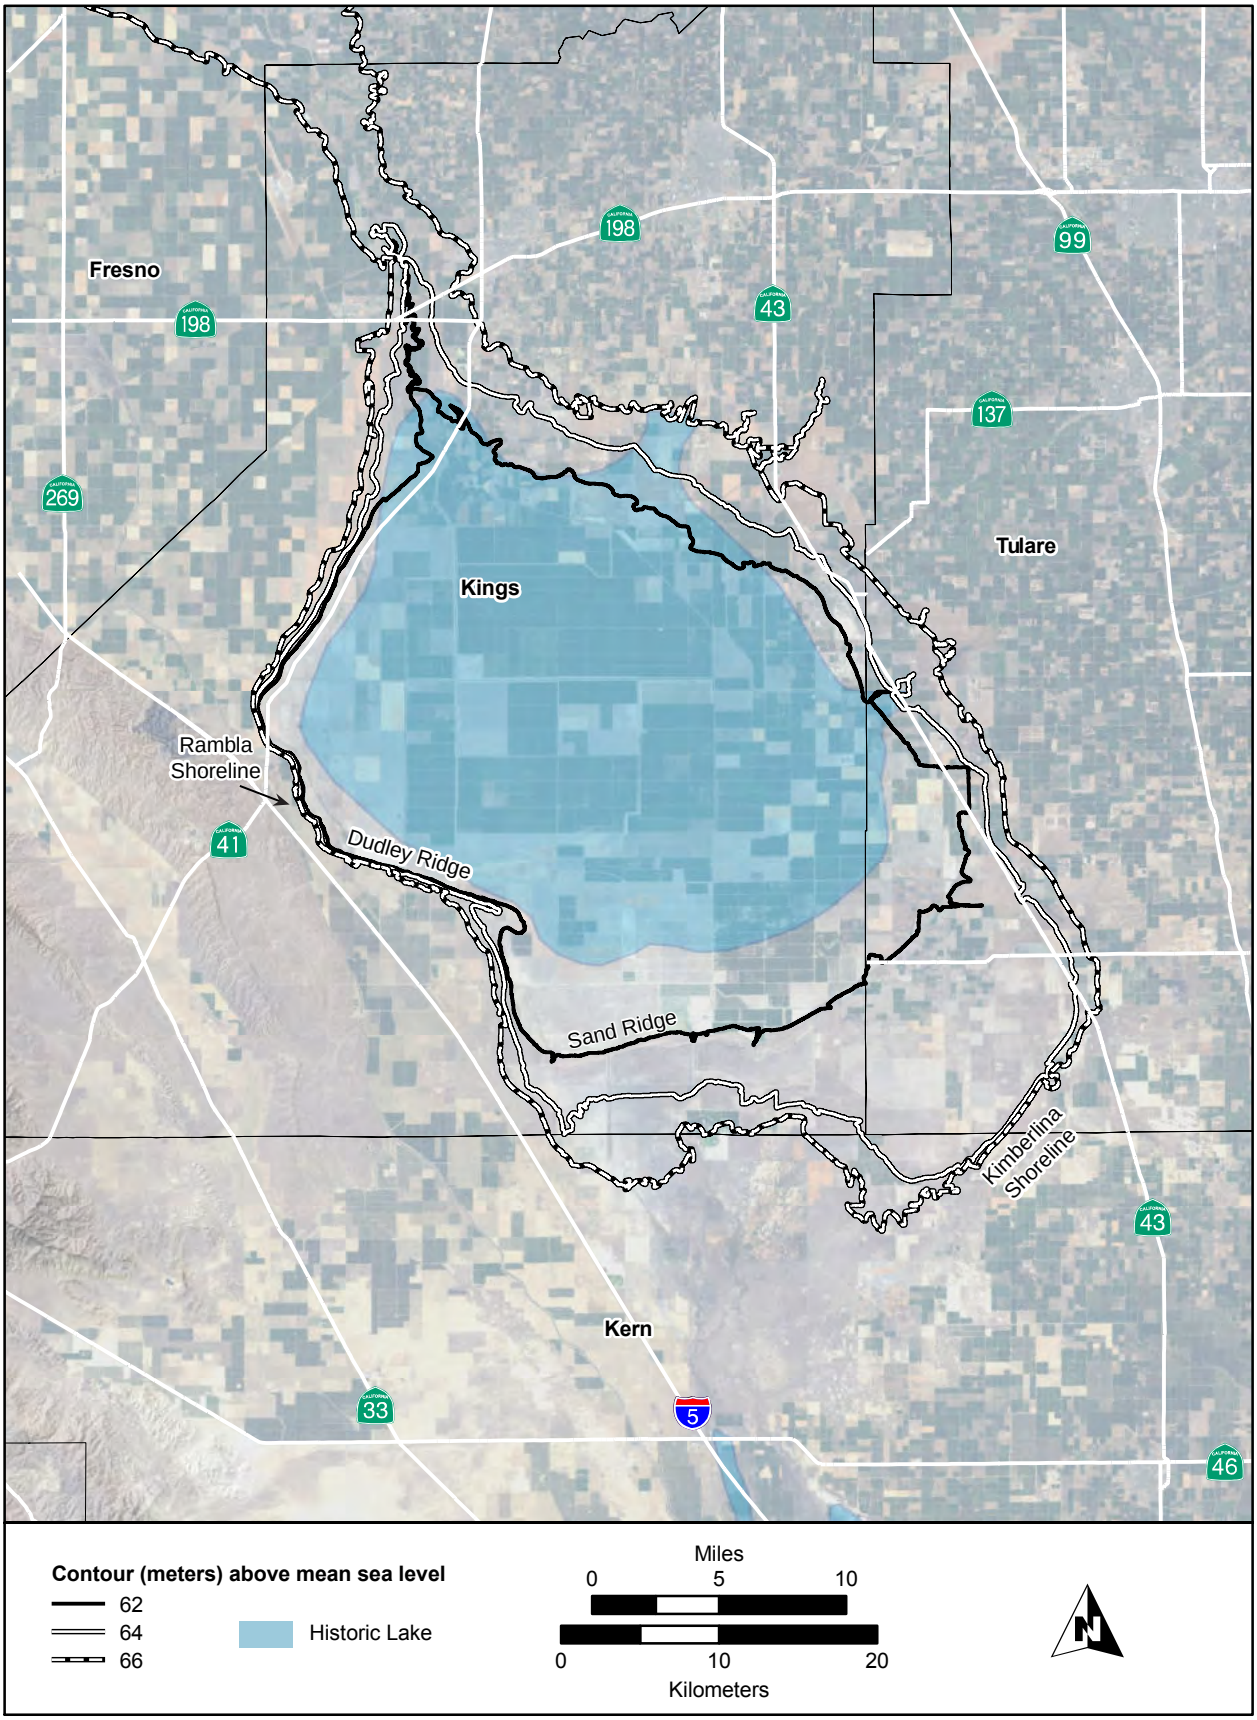

Figure 8. Tulare Lake Highstands and Inferred Shorelines.

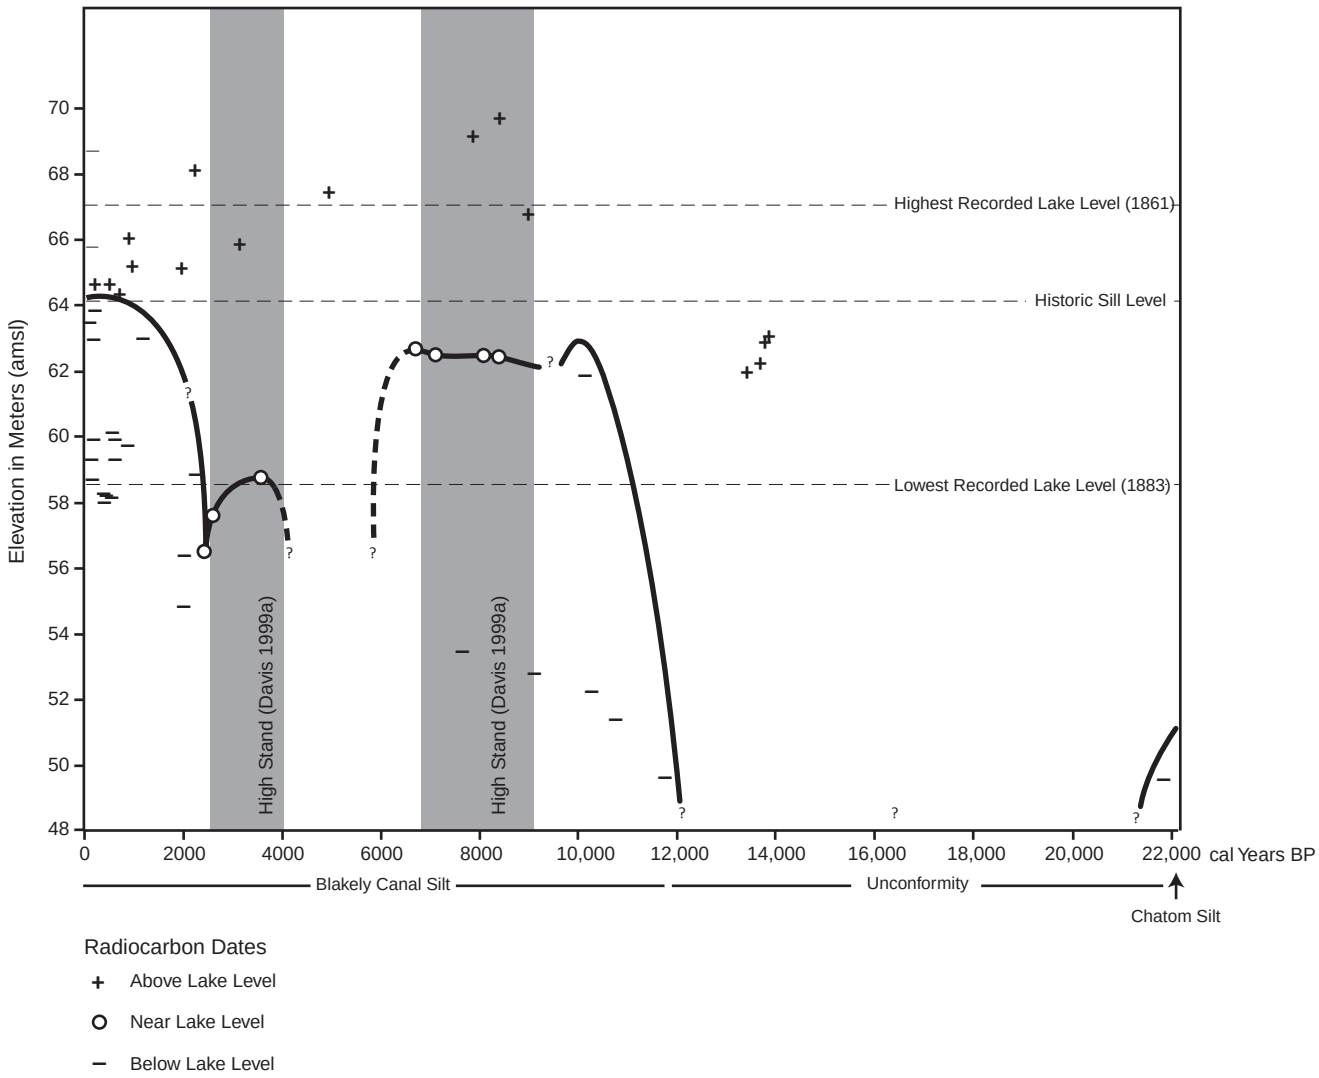

Figure 9. Lake Level History of Tulare Basin.

returned a radiocarbon date of 175 cal BP (OS-73445), indicating lake deposits in this locality are very recent in age. The absence of intervening depositional strata demonstrates that the lake did not attain a significant high stand above 63-meters (207 feet) during the latest Pleistocene and throughout most of the Holocene.

Based on our recent mapping (see Chapter 4), it appears that late Holocene deposition on the Kings River fan likely raised the sill-level of the basin about one meter (three feet) beginning about 2000 cal BP, causing the elevation of the shoreline to rise during recent times. This implies that lake level histories in the basin were controlled as much by changes in the sill level as water in-put related to climatic fluctuations (cf, Davis 1999a). In fact, the absence of a depositional record in the basin from about 21,000 to 11,500 cal BP (Davis 1999a) might suggest that the Kings River was flowing northward at that time, rather than spilling southward into Tulare Basin. A northward-flowing buried channel of the Kings River may be evidence of this hydrological shift (Weissmann et al. 2002; Weissmann et al. 2005).

To better understand the spatial extent of Tulare Lake at different times in the past, we plotted the elevation of the modern sill (64.3 meters [211 feet]) as well as two hypothesized shorelines using maximum (67.05 meters [219.98 feet]) and minimum (58.5 meters [191.9 feet]) elevations of the lake reported historically by Grunsky (1898b). What becomes evident from this exercise is that there are at least two previous shorelines that have geomorphic expressions within the basin. The wave-cut Rambla shoreline, defined by Negrini (Negrini and Wigand 2003; Negrini et al. 2006), was almost certainly the location of the lake margin throughout the latest Pleistocene and Holocene due to the steepness of the alluvial piedmont along the western edge of the basin. The 62-meter (203 feet) shoreline at that location would have also extended along Dudley Ridge, and linked up with the same elevations along Sand Ridge, another prominent shoreline feature which wraps the southern end of the basin (see Figure 8).

Because the maximum elevations of both Dudley Ridge and Sand Ridge lie above the height of the modern sill at 64 meters (210 feet), and late Pleistocene fossils dated more than 17,000 years old (Fenenga 1991; Garber 1989; West et al. 1991) have been found at Dudley Ridge, it seems that these are not recent landscape features and could not have been deposited sub-aqueously during the late Pleistocene or Holocene (c.f., Negrini et al. 2006). Rather these linear features either represent beach berms formed by wave action, or were originally deposited sub-aqueously earlier in the Pleistocene (Chatom silt times?) when depositional records are absent in the central part of the basin. In addition to the shoreline represented by Dudley and Sand ridges, a second probable shoreline is evident further south in the basin, representing an even higher lake stand. This shoreline runs parallel to Sand Ridge, about eight miles to the southeast, at the 64- and 66-meter (210- and 217 feet) contours and is associated with a linear sand deposit mapped in the Kimberlina Series. This landscape feature lies precisely at the level of the highest lake recorded historically (Grunsky 1898b) and further indicates that there is a much greater separation in shoreline features along the low-gradient southeastern edge of the basin than is present along the Rambla shoreline to the west.

Future research on lake-level histories in the basin should focus on those regions beyond Sand Ridge, where the spatial separation of shorelines is the greatest. If our analysis is correct, lake deposits in that part of the basin should date well before 13,000 cal BP or after 2,000 cal BP. Furthermore, unlike pluvial lakes in the Great Basin, the history of Tulare Lake appears to have been strongly controlled by changes in the basins sill elevation, rather than merely recording changes in precipitation and run-off.

Conclusions

Pluvial Lake histories east and west of the Sierra Nevada provide an important record of water run-off and sediment transport from the adjacent slopes of the Sierra Nevada. Contrary to long-held notions, recent studies of basins east of the Sierra Nevada demonstrate that lake levels were generally lowest during the last glacial maximum, now thought to have occurred around 22,000 years ago, reaching their highest stands between about 18,000 and 17,000 years ago. Pluvial lake systems appear to have remained linked up to about 16,000 years ago, after which lake levels fluctuated regularly, but outflow sills appear to have rarely been reached, if at all, during the latest Pleistocene and early Holocene. Differences of opinion remain, however, and estimates of the size and duration of latest Pleistocene lake stands east of the Sierra continue to be elusive. To the extent that the glacial model of landscape evolution is correct, it is likely that sediment transport and deposition was highest when water

run-off was greatest—not at the glacial maximum, but during the recessional phase of the Tioga glaciation. Pluvial lakes west of the Sierra Nevada, have not been studied to the same extent as those to the east, but current information suggests Buena Vista Basin retains a depositional record of end-Pleistocene run-off, while the much larger Tulare Basin is missing a depositional record for this interval. In the latter case, this may be a function of local geomorphology, representing a time when the Kings River flowed northward away from Tulare Basin. If this is true, Tulare Lake was not receiving significant water input at a time when pluvial lakes east of the Sierra were reaching their post-glacial high stands. It is also clear from modern research that no significant glacial cycles occurred after the Recess Peak advance in the terminal Pleistocene (except for the relatively minor Little Ice-Age advance), precluding these processes as a mechanism of landscape evolution during the Holocene.

THE GLACIAL MODEL AND SAN JOAQUIN VALLEY DEPOSITIONAL SEQUENCE

> THE ESSENTIAL FACT AS TO THE PRESENT VALLEY SURFACE IS THAT IT IS A DIRECT RESULT OF STREAM ACTION. IT HAS EVERYWHERE BEEN BUILT UP BY DEPOSITION FROM THE STREAMS OR FROM THE FLUCTUATING LAKES THAT ARE THEMSELVES DEPENDENT UPON THE STREAMS; AND IT IS FORMED OF MATERIALS BROUGHT BY THE STREAMS FROM THE MOUNTAINOUS PORTIONS OF THEIR DRAINAGE BASINS WHERE THEY ARE ERODING INSTEAD OF DEPOSITING.
> ~ MENDENHALL ET AL. (1916:21)

Arkley (1954, 1962) was among the first to study late Quaternary alluvial sequences in the eastern San Joaquin Valley and to relate these to cycles of glaciation. Based on work in Merced and Stanislaus counties, Davis and Hall (1959) identified two main Pleistocene-age geological units, known as the Riverbank (middle Pleistocene) and Modesto (late Pleistocene) formations. While younger Holocene-age deposits were recognized in the valley, these were often grouped and identified simply as "recent alluvium" or "basin deposits" without any further age divisions. In the 1970s, the term "post-Modesto formation" was introduced and applied to Holocene-age deposits by Marchand (1977a) who, along with Allwardt, identified, described, and mapped four sub-Holocene units in the northeastern part of the San Joaquin Valley, including parts of the current Study Area (Marchand and Allwardt 1981). This stratigraphic terminology was quickly adopted by other researchers and applied to similar alluvial sequences elsewhere in Central California (Table 3), including most alluvial landforms in the San Joaquin Valley, Sacramento-San Joaquin Delta region, lower Sacramento Valley, and even parts of the northern Transverse Ranges and western Mojave Desert.

Riverbank Formation

Where exposed at the surface, Riverbank deposits represent alluvial fans and floodplains that have been heavily dissected and truncated by erosion. These landforms have reddish-colored soils with well-developed argillic (Bt) horizons. Fossil mammal remains and radiometric dating of the Rockland Ash, which lies below the Riverbank Formation in the Sacramento Valley, place the age of this formation between about 450,000 and 100,000 years old (Hansen and Begg 1970). Upper and lower sub-units (referred to as "members") of the Riverbank Formation in the San Joaquin Valley (Marchand and Allwardt 1981) are correlated with upper and middle Riverbank units (respectively) in the Sacramento Valley (Blake et al. 1992; Busacca et al. 1989; Helley and Harwood 1985). Deposits of the upper Riverbank Formation are inset and topographically below those of the lower Riverbank formation. The older sub-unit is also distinguished by surfaces that are more rolling and dissected than the younger. In the foothills of the Sierra Nevada, Harden and Marchand (1980) correlate the middle Riverbank with Bowie Flat deposits, and the upper Riverbank with Oroville deposits based on geomorphic position and similar weathering profiles; Bowie Flat deposits are found at only a few locations in the foothills, while the younger Oroville deposits are more extensive (Biggar et al. 1978:87).

Modesto Formation

As defined by previous researchers, the Modesto Formation consists of alluvial fans and floodplains with flat to gently sloping surfaces that are commonly incised by modern stream and river channels near the foothills, but otherwise show little evidence of erosional dissection. These deposits are inset and topographically lie below the Riverbank Formation in positions near the foothills, and are often covered by younger alluvial sediments near the valley floor. The Modesto Formation is generally mapped near existing stream and river channels across much of the Central Valley floor (Busacca 1982; Helley and Harwood 1985), but "Modesto-age" channels are likely buried in some alluvial fans along the valley's eastern side (Atwater 1980; Busacca et al. 1989; Shlemon 1971; Weismann et al. 2002; Weismann et al. 2005). Isolated deposits of wind-blown (aeolian) dune sand, that may be Modesto-age, occur in the Delta (see "Piper sand" of Cosby 1941) and along the eastern edge of the San Joaquin Valley (Atwater 1980, 1982).

Upper Modesto deposits form a sequence of as many as four or more fans (Modesto 1-5) and terraces along each of the major (glaciated) Sierra rivers, which "represent four erosional or depositional phases" (Marchand and Allwardt 1981:59). Within the smaller, unglaciated watersheds of the Sierra foothills, however, upper Modesto deposits create a single terrace (Marchand and Allwardt 1981:59) and were often buried by Holocene-age colluvial fans (Harden and Marchand 1980). The ages of the upper and lower sub-units of the Modesto Formation are only partly constrained by stratigraphic and radiocarbon evidence. The age of the lower sub-unit was initially estimated to be approximately 40,000 to 30,000 years old (late Pleistocene), and the age of the upper sub-unit about 30,000 to 9,000 years old (Harden 1987; Helley and Harwood 1985; Marchand and Allwardt 1981). The age of lower Modesto deposits was later revised to about 33,000 to 26,000 years old, and upper Modesto deposits to about 26,000 to 11,500 years old based on evidence from the Kings River fan (Atwater et al. 1986).

It has been widely assumed that the Modesto formation correlates with late Pleistocene or Wisconsin glaciation (Tahoe, Tenaya, and Tioga stages), and Riverbank deposits with an earlier glacial interval, usually the Mono Basin stage. Because the number, extent, and age of glacial cycles in the Sierra Nevada remain in dispute and age estimates have changed substantially over the last 30 years, previous correlations between glacial intervals and episodes of alluvial deposition are inconsistent and often contradictory (Table 4). While pre-Tioga glaciations are admittedly inconsequential for archaeology, each of these earlier glacial cycles would presumably have produced a corresponding outwash deposit if the link between glaciation and deposition is as strong as often suggested.

In the unglaciated drainages of the western San Joaquin Valley, Lettis (1982) identified a sequence of alluvial deposits that he termed the Los Banos alluvium (middle Pleistocene), San Luis Ranch alluvium (late Pleistocene and early Holocene), Patterson alluvium (middle and late Holocene), and Dos Palos alluvium (latest Holocene), from oldest to youngest respectively (Lettis 1982). The typical geomorphic and stratigraphic relationship between these west-side units is shown in Figure 10, and the overall relationship between the east-side and west-side units within the San Joaquin Valley is shown in Figure 11. Because the western San Joaquin Valley drainages were not glaciated, Lettis (1982) suggests that large-scale climatic changes were responsible for the formation of these landforms. Thus, stratigraphic sequences of the eastern and western San Joaquin Valley are generally presumed to reflect differences between glacially driven (east) and climatically driven (west) landscape evolution.

Furthermore, a distinct middle Holocene-age deposit has not been identified or formally defined as part of previous geological studies of the San Joaquin Valley and Sierra Nevada foothills (see Table 3; e.g., Hall 1984; Harden and Marchand 1980; Marchand and Allwardt 1981); neither buried nor at the surface. The absence of deposits dating to the middle Holocene is both curious and conspicuous given that sedimentation is thought to have been almost continuous in and near the axis of the San Joaquin Valley (Atwater et al. 1986; Busacca et al. 1989; Huntington 1980; Lettis 1982; Olmstead and Davis 1961). The potential lack of a middle Holocene-age unit is problematic because it may indicate a missing time interval ("gap") in the stratigraphic record, and possibly the cultural record as well.

Table 4. Relationship of Glacial Stages with Deposits in the San Joaquin Valley and Adjoining Foothills.

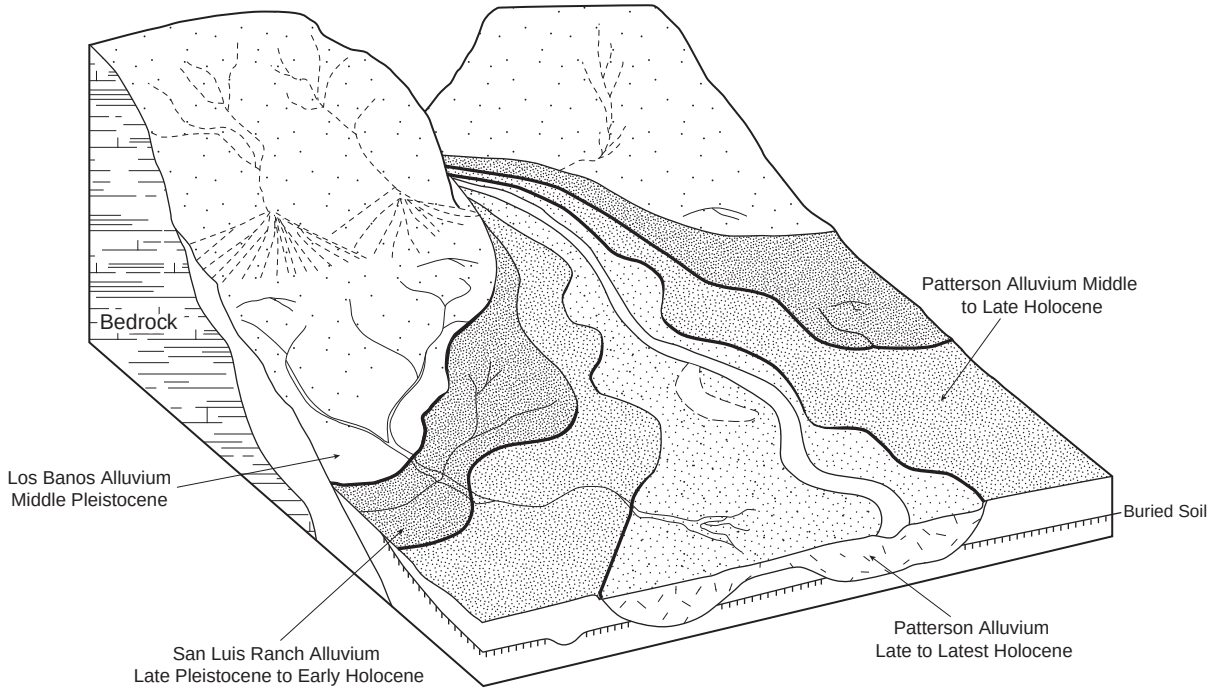
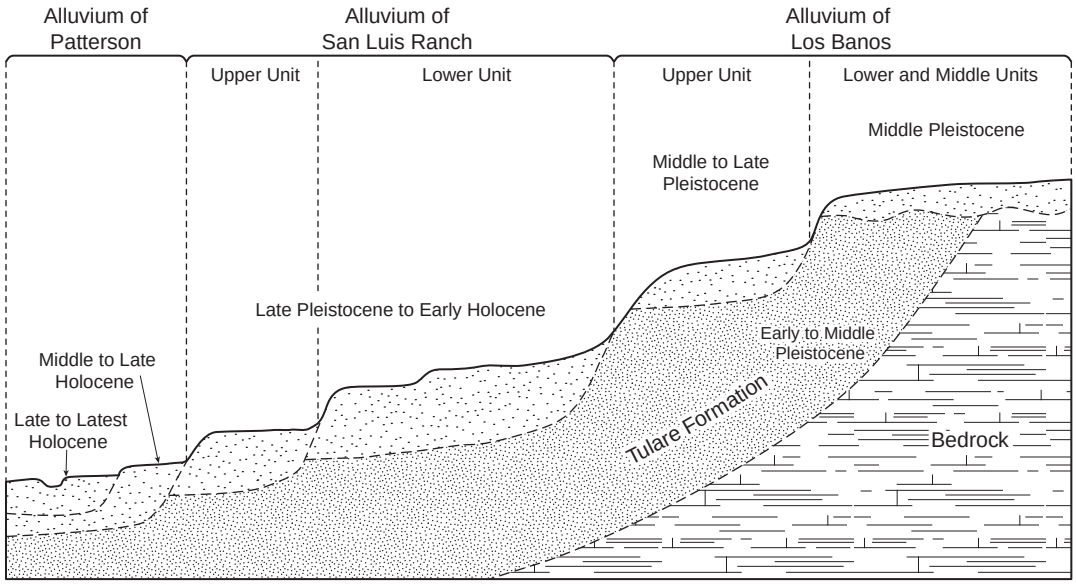
CONSTRAINING THE AGES OF MODESTO AND POST-MODESTO DEPOSITS



> With their four-dimensional minds, and in their interdisciplinary ultra verbal way, geologists can wiggle out of almost anything.
> ~ John McPhee (author)

The chronologic and stratigraphic relationships between Modesto and post-Modesto formations are widely viewed as a temporal and physical boundary that allows latest Pleistocene-age deposits to be distinguished from those that are Holocene in age. While the stratigraphic break between Modesto and Post-Modesto has been widely recognized (i.e., unconformity), the age of the two formations has not been well constrained by previous studies. As shown in Table 5, researchers variously place the age of the upper Modesto formation anywhere between about 28,000 and 7800 cal BP, with a minimum age extending some 3,700 years into the Holocene.

Table 5. Summary of Proposed Age Ranges for Upper Modesto and Post-Modesto Deposits.



Area (Reference)	Upper Modesto	Post-Modesto
Sierra Foothills (Harden and Marchand 1980)	11.5-7.8 ka	7.8-0 ka
Sacramento Valley (Busacca et al. 1989)	16.7-9.2 ka	9.2-0 ka
San Joaquin Valley (Harden 1987)	~28-9.2 ka	9.2-0 ka
San Joaquin Valley (Marchand and Allwardt 1981)	16.7-10.2 ka	10.2-0 ka
San Joaquin Valley (Atwater et al. 1986)	~28-11.5 ka	11.5-0 ka
Maximum Combined Age Range	~28-7.8 ka	7.8-0 ka

Notes: ka – Kiloannum (1,000 years) in calibrated years (cal BP); radiocarbon dates greater than ~22 ka were calibrated according to Fairbanks et al. (2005).

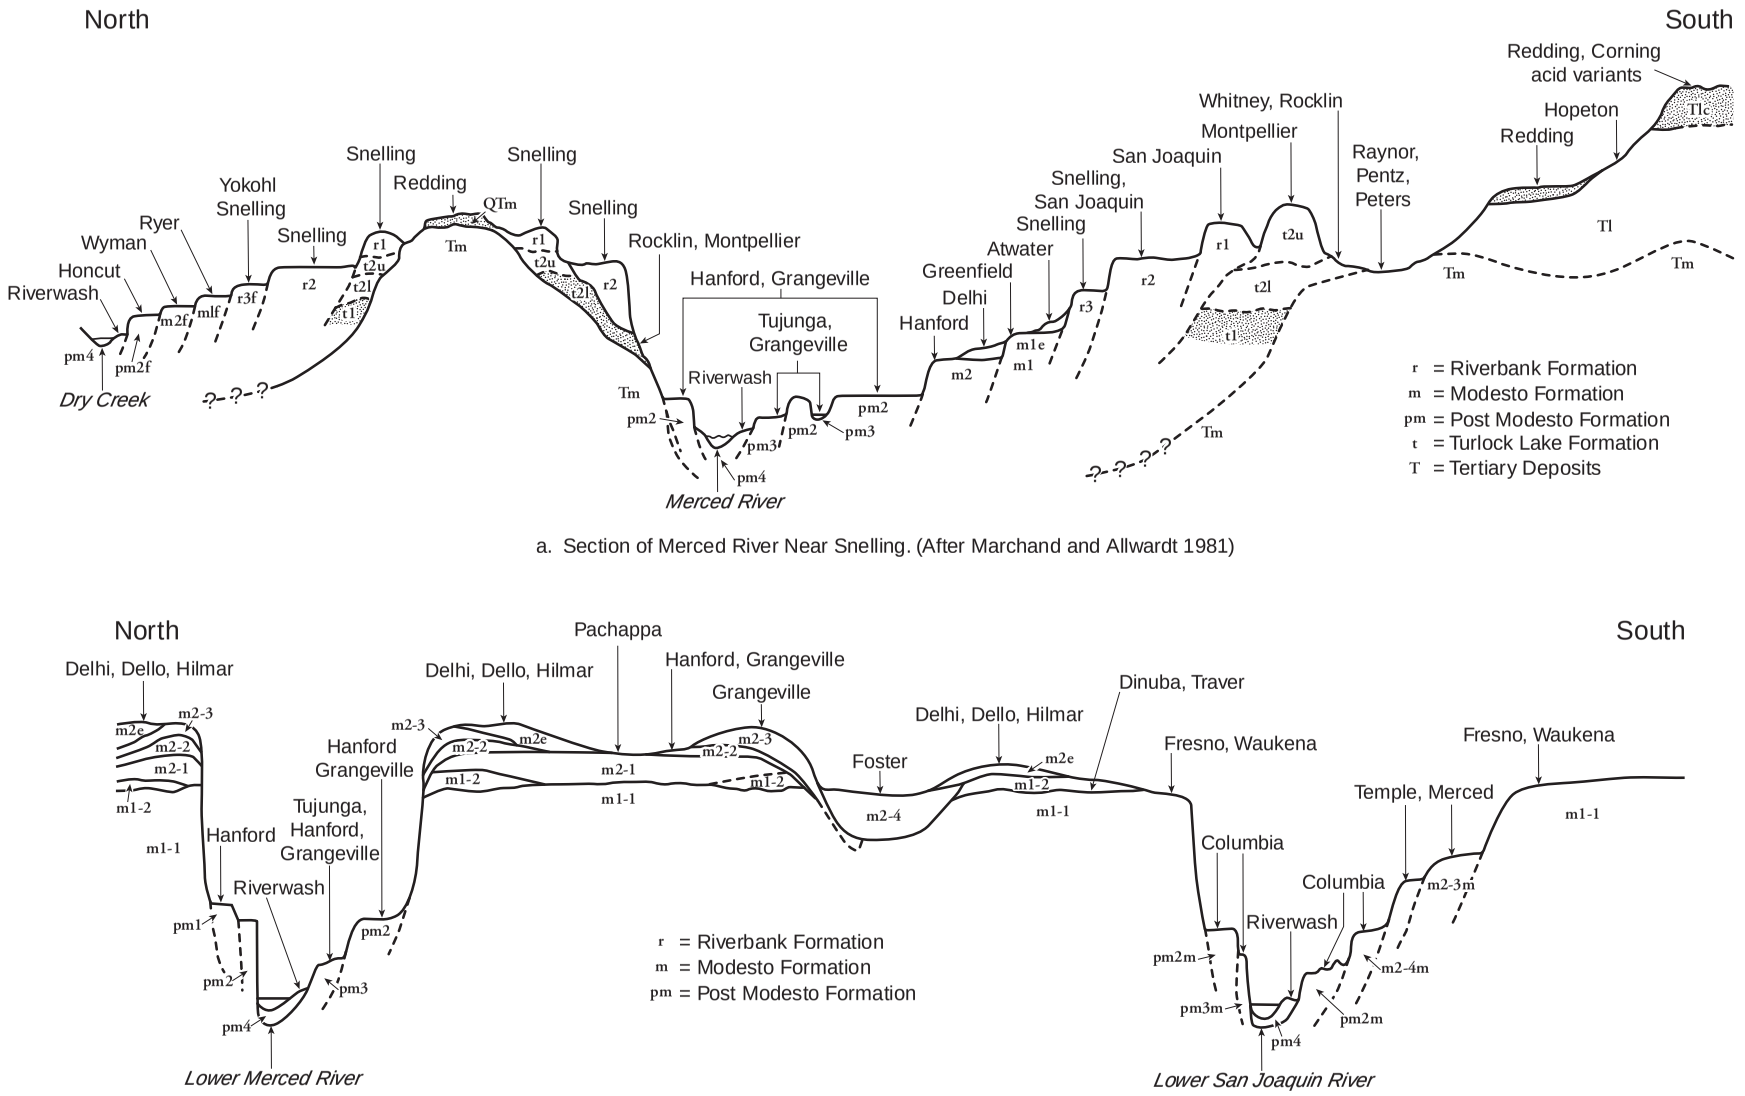
If the general range is correct, the upper Modesto formation may have been deposited thousands of years after the Tioga glaciers had receded, and even after the Recess Peak glacial retreat (<13,500 cal BP). If some portion of the upper Modesto formation is early Holocene in age, then it is technically part of the post-Modesto formation as originally conceived. While uncertainty about the upper Modesto's minimum age is small on a geologic time-scale, it is unacceptably large for archaeological purposes, since the purported age range spans initial human colonization of North America.

Previous Soil-Age Relationships

Quaternary geologists have regularly used soil development to determine the relative ages of alluvial deposits and geomorphic surfaces in central California. Generally speaking, soils with very weakly developed A/C or argillic (Bw or cambic) horizons are often associated with upper Modesto deposits, while soils having strongly developed argillic (Bt) horizons are correlated with lower Modesto or Riverbank deposits (Marchand and Allwardt 1981:59). Temporally significant soil types previously associated with the Modesto and post-Modesto formations are summarized in Table 6. The geomorphic and stratigraphic relationship between these strata and soil types is illustrated in Figure 12.

From the time that Arkley (1954, 1962) first recognized and documented the stratigraphic significance of particular soil types, soil development has been the main criteria for distinguishing and mapping alluvial deposits of different ages throughout the San Joaquin Valley (see Table 3; Atwater 1982, Atwater et al. 1986; Blake et al. 1992; Birkeland 1974; Busacca et al. 1989; Harden 1987; Helley 1966; Helley and Harwood 1985; Huntington 1980; Janda and Croft 1967; Lettis 1982, 1988; Ponti 1985; Shlemon 1967, 1972; Weismann et al. 2002, 2005).



The direct application of this relative dating approach has since been drawn into question because many soils with similar degrees of development have been mapped at the surfaces of different landforms identified as either latest Pleistocene or Holocene in age. This suggests that either the assumed age of these landforms is incorrect or soil development is a poor indicator of landform age (Meyer and Rosenthal 2008). As is evident in Table 6, the estimated age of the same surface soils varies widely among researchers, with several considered to be solely Pleistocene-age by some and solely Holocene-age by others.

One such example was found in the northwestern Sacramento Valley where it was recognized that the development of certain surface soils was inconsistent with a sequence of late Quaternary alluvial terraces identified there. In this case, moderately developed Arbuckle-series soils occur on both the lower Modesto and upper Modesto terraces, while weakly developed Cortina and Yolo soils are mapped on both upper Modesto and post-Modesto terraces (Steele 1979:34-35). It has since been shown, however, that both the Cortina and Yolo soils in this region are only latest Holocene in age (Meyer and Rosenthal 2008).

In the northeastern Sacramento Valley, an upper Modesto deposit dated between about 11,500 and 9200 cal BP bears a relatively undeveloped surface soil with a A/Bw/C profile (Conejo series) thought to be at the "young end of this range" (Busacca et al. 1989:19, 41). Subsequent geoarchaeological evidence from the Best Slough floodplain in Yuba County indicates that Conejo-series soils are actually late Holocene in age (<4000 cal BP), and can contain buried archaeological deposits less than 2,000 years old (Eidsness and Meyer 1999). Other recent geoarchaeological studies have identified Holocene-age deposits with weak (Bw) to moderate (Bt) argillic soil horizons throughout central California—many overlying archaeological sites—that include soils previously considered to be late Pleistocene in age (Meyer 2000; Meyer and Dalldorf 2004; Meyer and Rosenthal 1997, 2008; Rosenthal and Meyer 2004a, 2009).

Radiocarbon Assessment of "Modesto" Soil-Age Relationships

Marchand and Allwardt (1981) have explicitly identified the Fresno soil series as being representative of the lower Modesto formation; however, several recent studies indicate that these soils are instead associated with upper Modesto-age landforms (Table 6). These soils were initially interpreted as being more than 40,000 years old because they exhibit a strongly developed argillic horizon and silica-cemented hardpan (Marchand and Allwardt 1981:56). At the same time, it was noted that the age of the Fresno soil may be overestimated because the fine-grained texture and high sodium content of these soils can increase the rate of development (Atwater 1982; Arkley 1962, 1964; Birkeland 1974:112; Huntington 1980; Jenny 1941:99).

To better constrain the age of the Fresno Series, a radiocarbon sample was obtained as part of the current study from beneath this soil in an exposure along the Chowchilla Canal in Madera County (Figure 13; Location Madera 1). The sample originated from a well-developed buried soil identified more than three meters (10 feet) below the surface (see photos in Chapter 4). The resulting date of 19,080 cal BP (Beta-255480) indicates the Fresno Series formed in alluvium deposited after the last glacial maximum (Tioga), and must correlate with the upper Modesto formation as defined, and not the lower Modesto as originally thought. A late Pleistocene-age for the Fresno soil is significant because it shows that similar strongly developed soils may also date to that time, while more weakly developed soils likely post-date the late Pleistocene.

A similar stratigraphic relationship was observed during a geoarchaeological study conducted in Caltrans District 10 to the north. As part of that study, a radiocarbon date of 20,200 cal BP (Beta-185710) was obtained from a well-developed buried soil exposed in a high terrace south of the Tuolumne River (Rosenthal and Meyer 2004b:66). This location is important because it lies near the original Modesto Formation type section and was mapped as an upper Modesto terrace deposit by Marchand and Allwardt (1981:60). The alluvium that forms the surface of the terrace bears a very weakly developed soil identified as the Tujunga. While previous researchers often associated the Tujunga Series with younger Holocene-age landforms (see Table 6), this soil also occurs on alluvial deposits mapped as late Pleistocene-age (Modesto) on the Chowchilla River fan (Helley 1966), the San Joaquin River fan (Janda and Croft 1967), and the Tuolumne River fan as noted above (Marchand and Allwardt 1981).

The maximum age of Tujunga series soils is constrained by a date of 1200 cal BP (OS-70225) obtained as part of the current study from the first buried soil (2Ab) exposed along the south bank of the Chowchilla River in Madera County (Figure 13:Location Madera 6). This date provides a maximum age for the Tujunga soil and indicates the upper Modesto deposit, as mapped along the Tuolumne River by Marchand and Allwardt (1981), was laid down less than 1,200 years ago, and that the underlying deposit was emplaced before the last glacial maximum (~22,000 cal BP), correlating with the lower Modesto formation as defined. This stratigraphic relationship suggests that late-glacial outwash did not cover this part of the Tuolumne River fan, and that the last major depositional episode did not occur until the latest Holocene, and only then after 20,000 years or more of landform stability (Rosenthal and Meyer 2004b:66).

Pleistocene-age land surfaces buried by middle or late Holocene-age deposits are not unique exceptions found in a few isolated areas, but occur at many other locations throughout the San Joaquin Valley and seem to represent part of a larger pattern of regional landscape evolution (Meyer 1996; Meyer and Rosenthal 1997, 2008; Rosenthal and Meyer 2004a, 2004b, 2009). More than a dozen radiocarbon dates from this and previous geoarchaeological studies confirm that late Pleistocene "Modesto-age" soils are buried at locations throughout the San Joaquin Valley. As shown in Figure 14, a date of 26,350 cal BP (OS-70230) from the glaciated eastern side of the San Joaquin River and one of 31,340 cal BP (OS-70220) from the unglaciated western side, both pre-date the last glacial maximum ("pre-Tioga"). Buried soils on both sides of the river, including below the Fresno Series, correspond closely with the age of the Tioga maximum (20,830 to 19,080 cal BP), suggesting that this time was marked by a period of relative landform stability, and not deposition. Most of the late Pleistocene buried soils, however, post-date the Tioga maximum by about 4,000 to 8,000 years (17,025 to 13,050 cal BP). Further, a revised Modesto soil-age relationship implies that major depositional episodes previously attributed to the Pleistocene are, in fact, Holocene in age (i.e., post-Modesto in age).

Radiocarbon Assessment of "Post-Modesto" Soil-Age Relationships

A variety of surface soils in the San Joaquin Valley are generally associated with Holocene-age landforms, or sub-phases of the post-Modesto Formation as defined by Marchand and Allwardt (1981). But just as many "Modesto-age" soils are found on Holocene-age landforms, many of the most representative "post-Modesto" soils, like the Cajon, Chino, Hanford, Hesperia, Hilmar, Honcut, and Visalia series, also occur at the surface of landforms argued to be Pleistocene-age (see Table 6).

Marchand and Allwardt (1981) identified four main sub-units within the post-Modesto formation, which they designated with Roman numerals I, II, III, and IV from oldest to youngest. In the case of post-Modesto I, they explicitly associated soils of the Pachappa Series with these deposits, and observed that it was poorly represented at the surface and that related landforms were often isolated and/or surrounded by younger

deposits where present. To constrain the age of the Pachappa Series, we obtained two radiocarbon dates from a cutbank exposed along upper Berenda Creek in Madera County (see Figure 13; Location Merced 8), where it is buried by a younger deposit—probably the Hanford series (Figure 15). A sample from the buried (2Ab) surface of the Pachappa soil produced a date of about 3200 cal BP (OS-72823), while a date of about 5230 cal BP (Beta-255479) was obtained from a buried soil (3Btb) underlying the Pachappa (see photos in Chapter 4). Thus, the age of this signature post-Modesto I soil is now bracketed between 5200 and 3200 cal BP, suggesting it is at least late Holocene in age (i.e., <4,000 cal BP).

As for those soils found on both Pleistocene (Modesto) and Holocene (post-Modesto) land surfaces, radiocarbon dating shows that soils of the Cajon, Chino, Hanford, Hesperia, Honcut, and Visalia series are generally no more than 4,000 years old (cal BP), or late Holocene-age, and that soils such as the Hilmar and Tujunga series are less than 2,000 years old (cal BP), or latest Holocene-age (Table 7; Figure 15). Maximum ages were also obtained for soils such as the Cajon, Merced, Rossi, and Wunjey series, indicating that all are at least late or latest Holocene in age.

The only notable exceptions include a maximum early Holocene date of 9680 cal BP (Beta-246542) for the Piper series from Terminous Tract in the San Joaquin Delta (Meyer 2008b), and a minimum middle Holocene date of 5235 cal BP (Beta-255479) for the Greenfield series from Berenda Creek in Madera County. Most importantly, soils most often associated with Holocene (post-Modesto) deposits in the study area (i.e., Arizo, Bear Creek, Foster, Grangeville, and Panoche series), are consistently less than about 4000 cal BP, or late Holocene in age, even at their 2-sigma maximum age ranges (Table 7; Figure 15).

CONCLUSIONS

Recent radiocarbon-dating has shown that alluvial deposits in central California, including those on the skirt of the western Sierra Nevada, are typically out of phase with glacial cycles. At the time of the glacial maximum (about 22,000 cal BP), landscape stability is represented by buried soils of this age in alluvial fans fronting the western Sierra Nevada and floodplains from the San Joaquin Valley proper. At the same time, pluvial lakes east of the Sierra Nevada were desiccated or in a recessional phase. These patterns clearly demonstrate that glacial advance does not correlate with intervals of widespread sediment transport or deposition. However, after the Tioga glaciers had receded, more than 15,000 years ago, depositional pulses are recorded by sequential buried soil profiles in the San Joaquin Valley, which correlates with pluvial lake high-stands east of the Sierra Nevada. This suggests that there is some relationship between non-glacial conditions and sediment transport and deposition in central California. However, soil-age relationships described above offer compelling evidence that many landforms previously mapped as late Pleistocene-age are in fact capped by Holocene-age deposits with weakly to moderately developed soils, clearly demonstrating that widespread deposition was not simply an end-Pleistocene phenomenon. These relationships confirm that the magnitude and extent of Holocene sediment deposition was substantially greater and more pervasive than generally recognized in Central California. They also show that inconsistencies and problems with previous mapping affect our ability to understand the true age of many surface landforms, which has far-reaching implications for deciphering the Holocene landscape evolution and mechanisms driving landscape change.

CHAPTER 4. AGE OF SURFACE LANDFORMS, REFINED SOIL CHRONOSTRATIGRAPHY, AND MODEL OF LANDSCAPE EVOLUTION

> The conflict of theories, leading, as it eventually must,
> to the survival of the fittest, is advantageous.
> ~ Grove Karl Gilbert (USGS Geologist 1879–1918)

Numerous geological studies conducted throughout California indicate that alluvial and colluvial landforms have undergone prolonged periods of stability, interrupted by episodes of widespread erosion and relatively rapid deposition. These cycles of landscape evolution are expressed as stratigraphic series of laterally extensive buried soils. Radiocarbon dates from these buried soils demonstrate that cyclical deposition and stability were on-going processes spanning the late Pleistocene and throughout the Holocene, recorded in glaciated and unglaciated drainages alike. These patterns appear to be best explained by broad changes in regional climate, rather than simply a response to glacial cycles. With this in mind, the following chapter begins by detailing a model of landscape evolution that provides a direct link between changes in precipitation, vegetative cover, and intervals of landscape stability and instability, explaining why roughly synchronous episodes of Pleistocene and Holocene landscape evolution are recorded throughout central California. This is followed by a new synthesis of landscape evolution in the Study Area based on the chronostratigraphic analysis of more than 2,400 radiocarbon dates, resolving many of the inconsistencies in soil-landform relationships inherent to earlier studies.

A CLIMATE-BASED MODEL OF LANDSCAPE EVOLUTION

Geomorphic studies conducted in basins of the western United States have shown that maximum sediment yields are typically produced when vegetation cover is reduced and precipitation is increased (Langbein and Schumm 1958). Such geomorphic thresholds are reached when the prevailing climate changes from dry to wet or wet to dry. Sediment yield drops sharply in either direction of this threshold due to decreased runoff at lower levels of precipitation and increased vegetation cover at higher levels (Bull 1964:37; Langbein and Schumm 1958; Ritter 1986). For example, Figure 16 illustrates the relationship between mean annual temperature, precipitation, and sediment yield using a mean annual temperature of 15 °C (60 °F). Under this temperature regime, maximum sediment yield is predicted at approximately 17-18 inches of annual rainfall because the type of vegetation developed under these conditions is the most conducive to water-related erosion (Langbein and Schumm 1958; Ritter 1986). Although sparse vegetation makes the ground surface highly susceptible to erosion, when annual precipitation falls below 17 inches, sediment yields decrease due to insufficient run-off. Similarly, when effective precipitation reaches above 18 inches, sediment yields are reduced by increased vegetation cover that protects and stabilizes hill slopes and other landforms.

The geologic record of central California suggests that threshold adjustments occurred periodically throughout the late Pleistocene and Holocene, and in many cases were regional in scope. These periods of landscape instability are strongly correlated with transitions reflected in the paleoclimatic record (e.g., Rosenthal and Meyer 2004a). Similarly, periods of both increased and decreased precipitation in central California correspond to intervals of widespread landform stability indicated by extended periods of soil formation during the late Pleistocene, early Holocene, and middle Holocene. The late Holocene geomorphic record is more variable, but also suggests that landscape changes were in large part related to fluctuations in regional precipitation and climate.

Because precipitation, vegetative cover, and topography strongly condition fluvial transport of sediment (e.g., Langbein and Schumm 1958), vastly different potential exists for erosive and depositional forces to have influenced the timing and nature of landscape evolution across the Study Area. Arid regions, such as the Mojave Desert, Great Basin, and eastern Coast Ranges, where vegetative growth has been sparse throughout the Holocene, would have consistently had more sediment available for transport than better-watered and -vegetated

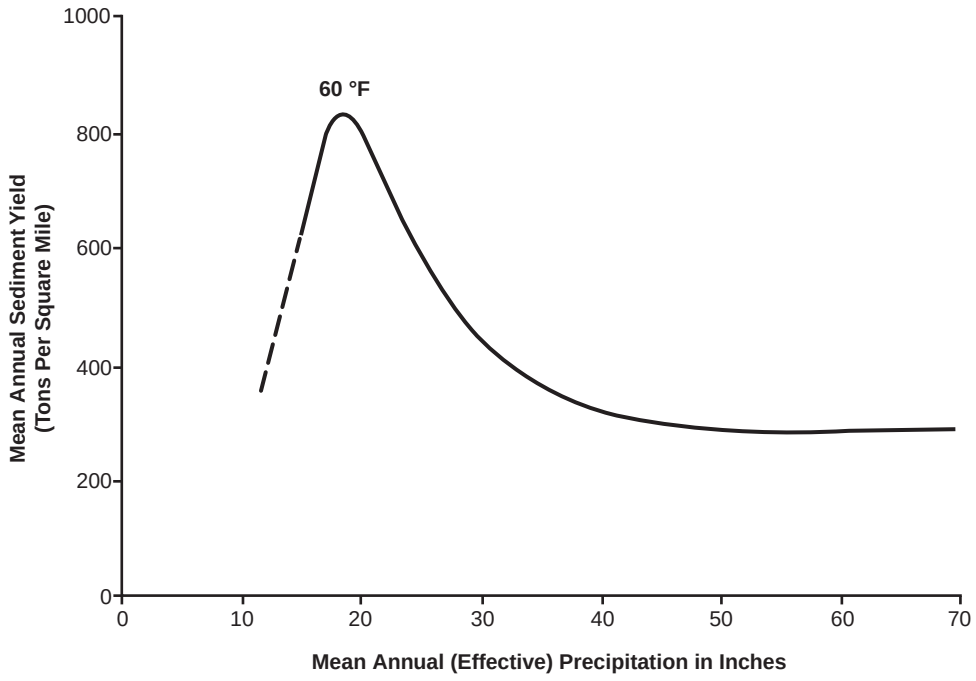

Figure 16. Net Annual Sediment Yield in Relation to Precipitation.

regions, such as the Sierra Nevada. When substantial rainstorms did occur in these arid regions, erosion, fluvial transport, and deposition was probably quite common, resulting in a very idiosyncratic geomorphic record, conditioned by the randomness of local precipitation.

In the Sierra Nevada, precipitation was always higher, resulting in greater vegetation cover which, in turn, served to blanket and bind local landforms, making them less susceptible to erosion and transport of sediment during periods of extreme rainfall. When substantial episodes of erosion and deposition did occur in the Sierra Nevada, it was likely the product of a convergence between changes in vegetative cover and precipitation. As a result, it is expected that sediment deposition in the Sierra Nevada and adjoining San Joaquin Valley would have been greatest during periods of climate change, and therefore would have been regionally synchronous and episodic.

Because arid regions of the Study Area always had reduced vegetative cover, and rainfall was always likely to have been reduced and sporadic due to the rainshadow effect of the Coast Ranges and Sierra Nevada, declines in precipitation due to large-scale climate changes should have had little effect on the geomorphic landscape. However, increases in regional precipitation should have been a significant factor in the evolution of the geomorphic landscape in the arid regions too, resulting in depositional responses similar to those in better-watered portions of the Study Area. As a result, it is likely that major transitions in regional climate are linked to geomorphic responses both east and west of the Sierra Nevada. This, rather than glacial retreat per se, likely explains geomorphic responses recorded on both sides of the Sierra following the last glacial maximum and accompanying the Pleistocene-Holocene transition. It may also explain why cyclical patterns of deposition and landform stability are recorded in both glaciated and unglaciated drainages and continue from the late Pleistocene through the entire Holocene. As discussed in the following section, a climate change model also explains why these episodes of landscape evolution are roughly synchronous across the entire study area.

REFINED SOIL-AGE RELATIONSHIPS, CHRONOSTRATIGRAPHY, AND THE AGE OF SURFACE LANDFORMS

As discussed in the previous chapter, the indiscriminate use of untested (i.e., undated) soil-age assignments has not only blurred and confused a fundamental distinction between Pleistocene and Holocene landforms, it has obscured many other important chrono-stratigraphic relationships as well. This has created serious problems for archaeological studies that must reconstruct former environmental conditions so that patterns of human land use, settlement, and the influence of subsequent landscape changes can be understood. As such, there is a clear need for a new synthesis of landscape evolution in south-central California that attempts to constrain the age of alluvial landforms and the soils formed on them specifically for the purposes of archaeological research and cultural resources management.

It is apparent that the central California landscape has been repeatedly altered and shaped by a complex sequence of large-scale environmental changes. Over the past 20,000 years, this region has experienced the effects of deglaciation, increased aridity, cycles of droughts and floods, as well as human-made changes associated with the historic-era (vegetation replacement, gold mining, and land reclamation). Widespread erosion of the uplands led to the formation of extensive depositional landforms in the lowlands, such as fans, floodplains, and natural levees. The presence of buried soils at the top of multiple alluvial sequences indicates that episodes of sediment deposition were relatively short (annual or decadal scales) compared to long periods of landform stability and soil formation that followed (centennial and millennial scales). Region-wide episodes of alluvial aggradation and stability were accompanied by localized changes in the position and size of stream and river channels, and presumably in the type and distribution of associated plant and animal habitats (e.g., dissected uplands, flood basins, riparian corridors, wetlands), which in turn influenced the location of human settlements. Since many substantial changes occurred during the time that humans first occupied this region, the following section reconstructs the evolution of the landscape by combining previous soil and geologic information with new data generated for this study.

To compensate for the previous lack of temporal control, 65 new radiocarbon dates were obtained from the Study Area (Table 8; Appendix B), and more than 2,400 previously reported radiocarbon dates were compiled into a regional database (provided in Appendix B). All dates and sample locations werelinked to digital soil survey

data (i.e., SSURGO and STATSGO) in a GIS format (see discussion of database and mapping methods in Chapter 6, Buried Site Potential). Through a synthesis and analysis of these radiocarbon dates, this section presents evidence for a refined chrono-stratigraphic framework used to construct a new model of regional landscape change. The discussion is divided into two parts, the first focuses on regions west of the Sierra Nevada, and the second on those parts of the Study Area located to the east. Both discussions are presented in chronological order from oldest to youngest.

SAN JOAQUIN VALLEY AND SIERRA NEVADA

Older Pleistocene (>25,000 cal BP)

Before the last major advance of the Tioga glaciers began about 25,000 years ago, a considerable amount of sediment had already been stripped from the upper slopes of the western Sierra Nevada in response to uplift, channel cutting, and earlier cycles of glacial erosion and outwash (i.e., Tahoe and Tenaya). As a result, large alluvial fans emanating from glaciated and unglaciated drainages were deposited along the eastern side of the San Joaquin Valley and together formed a large pediment-plain (Figure 17 and Figure 18). The size and coarse texture of these older Pleistocene fans reflect the magnitude and geomorphic competence that was achieved during this time period. The nature and extent of older Pleistocene deposits preserved at the modern surface indicate that some large areas have remained relatively stable, while other segments have either been removed by erosion and/or buried by younger deposits, particularly near the axis of the San Joaquin Valley (Lettis 1982; Weissmann et al. 2003).

Many older Pleistocene landforms near the margins of the valley were subsequently incised and dissected by channel and gully erosion, while those near the center of the valley were buried by sediment. Faulting and tectonic uplift of some older Pleistocene deposits increased the pace of surface dissection and channel incision, resulting in the formation of highly eroded landforms like Wheeler Ridge in the southern San Joaquin Valley, and the Elk Hills and Kettleman Hills in the southwestern part of the valley; the latter is composed of uplifted early Pleistocene lakebed sediments (Tulare Formation).

In the glaciated watersheds of the Kaweah, Kern, Kings, Tulare, and San Joaquin rivers, channels in the upper (proximal or fan head) portions of the fans became deeply incised below the surrounding fan surface, effectively "locking" them into the general position they maintain today. A similar pattern of older Pleistocene fan deposition and subsequent fan-head entrenchment is found in virtually every unglaciated watershed along the eastern side of the valley, including Cottonwood, Deer, Dog, Fancher, Poso, Tejon, and Wahtoke creeks, and the Chowchilla, Fresno, Madera, and White rivers. However, no evidence of Tahoe-age or Tenaya-age glacial deposits have been found in the Tulare Lake Basin (Atwater et al. 1986; Davis 1999a), one of the valley's primary depositional centers which, as noted in the previous chapter, may suggest the Kings River flowed northward at this time.

A series of much smaller fans is exposed along the valley's western margin near the base of the hillslopes and mouths of every major stream that drains the Temblor and Coast ranges; the largest is found near Los Gatos, Panoche, and Little Panoche creeks. Because only the upper (proximal) portions of these fans tend to be exposed at the surface, central and lower (medial and distal) portions appear to be buried by younger deposits.

Dates from buried soils in three separate locations indicate that landforms of this age were buried by younger deposits between about 31,340 and 26,352 cal BP, centering on a mean age of about 29,345 cal BP

Table 8. Summary of Radiocarbon Dates Obtained for This Study (Listed by Lab/Sample Number).

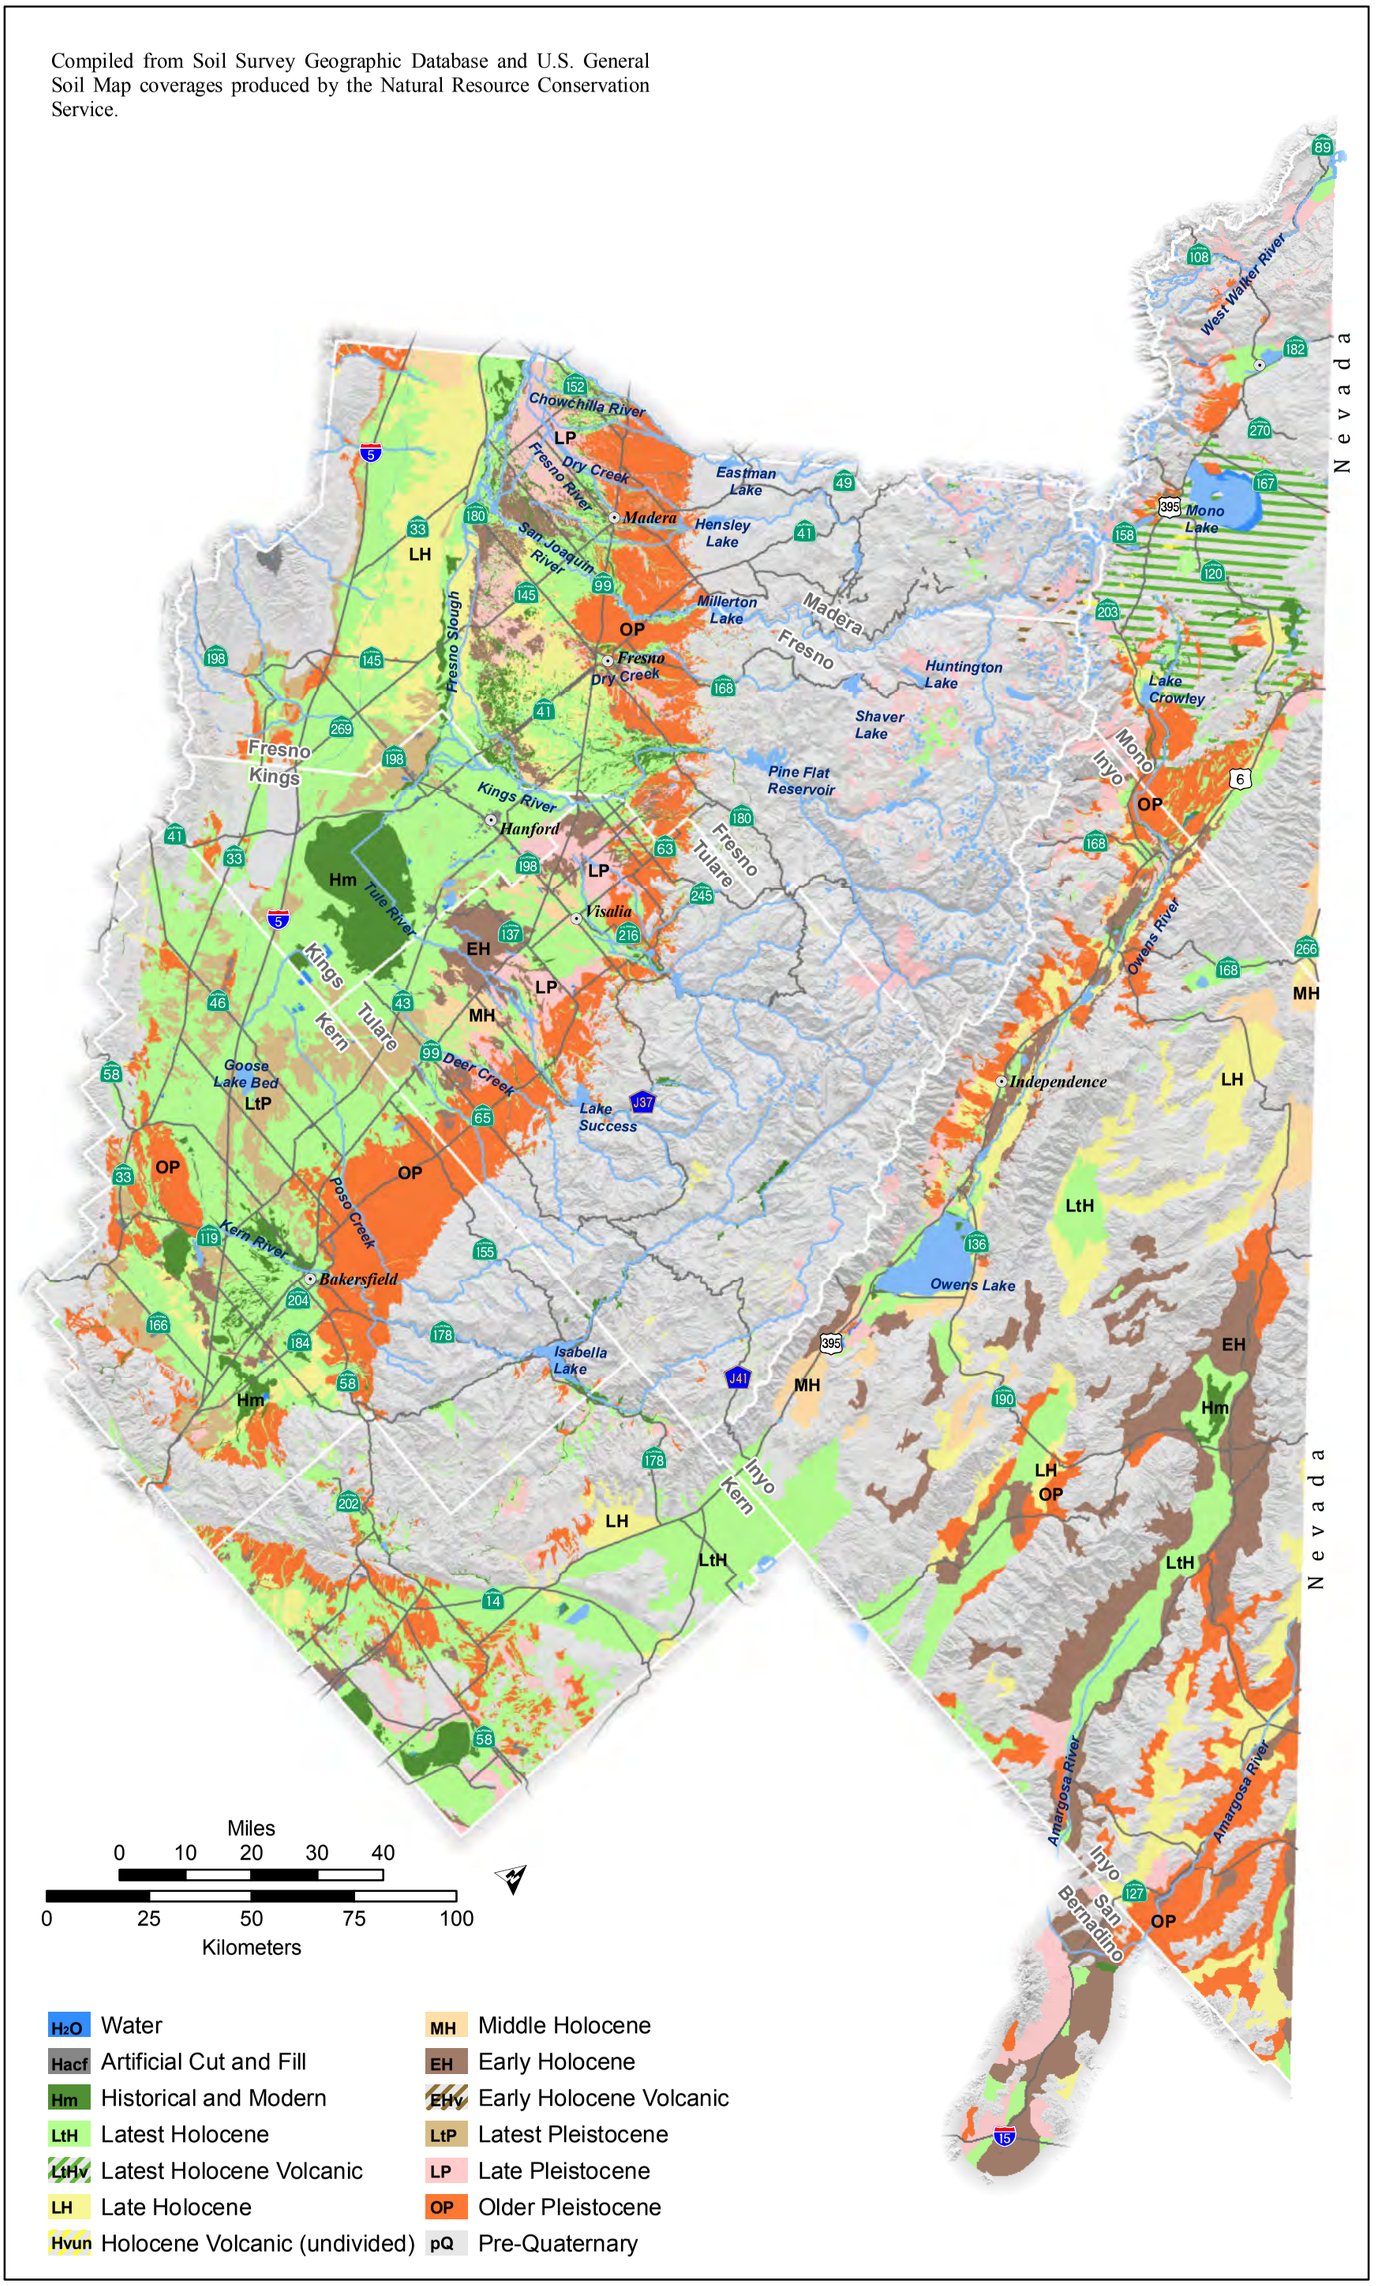

Figure 17. Depositional Landforms and Buried Archaeological Potential in Caltrans District 6/9.

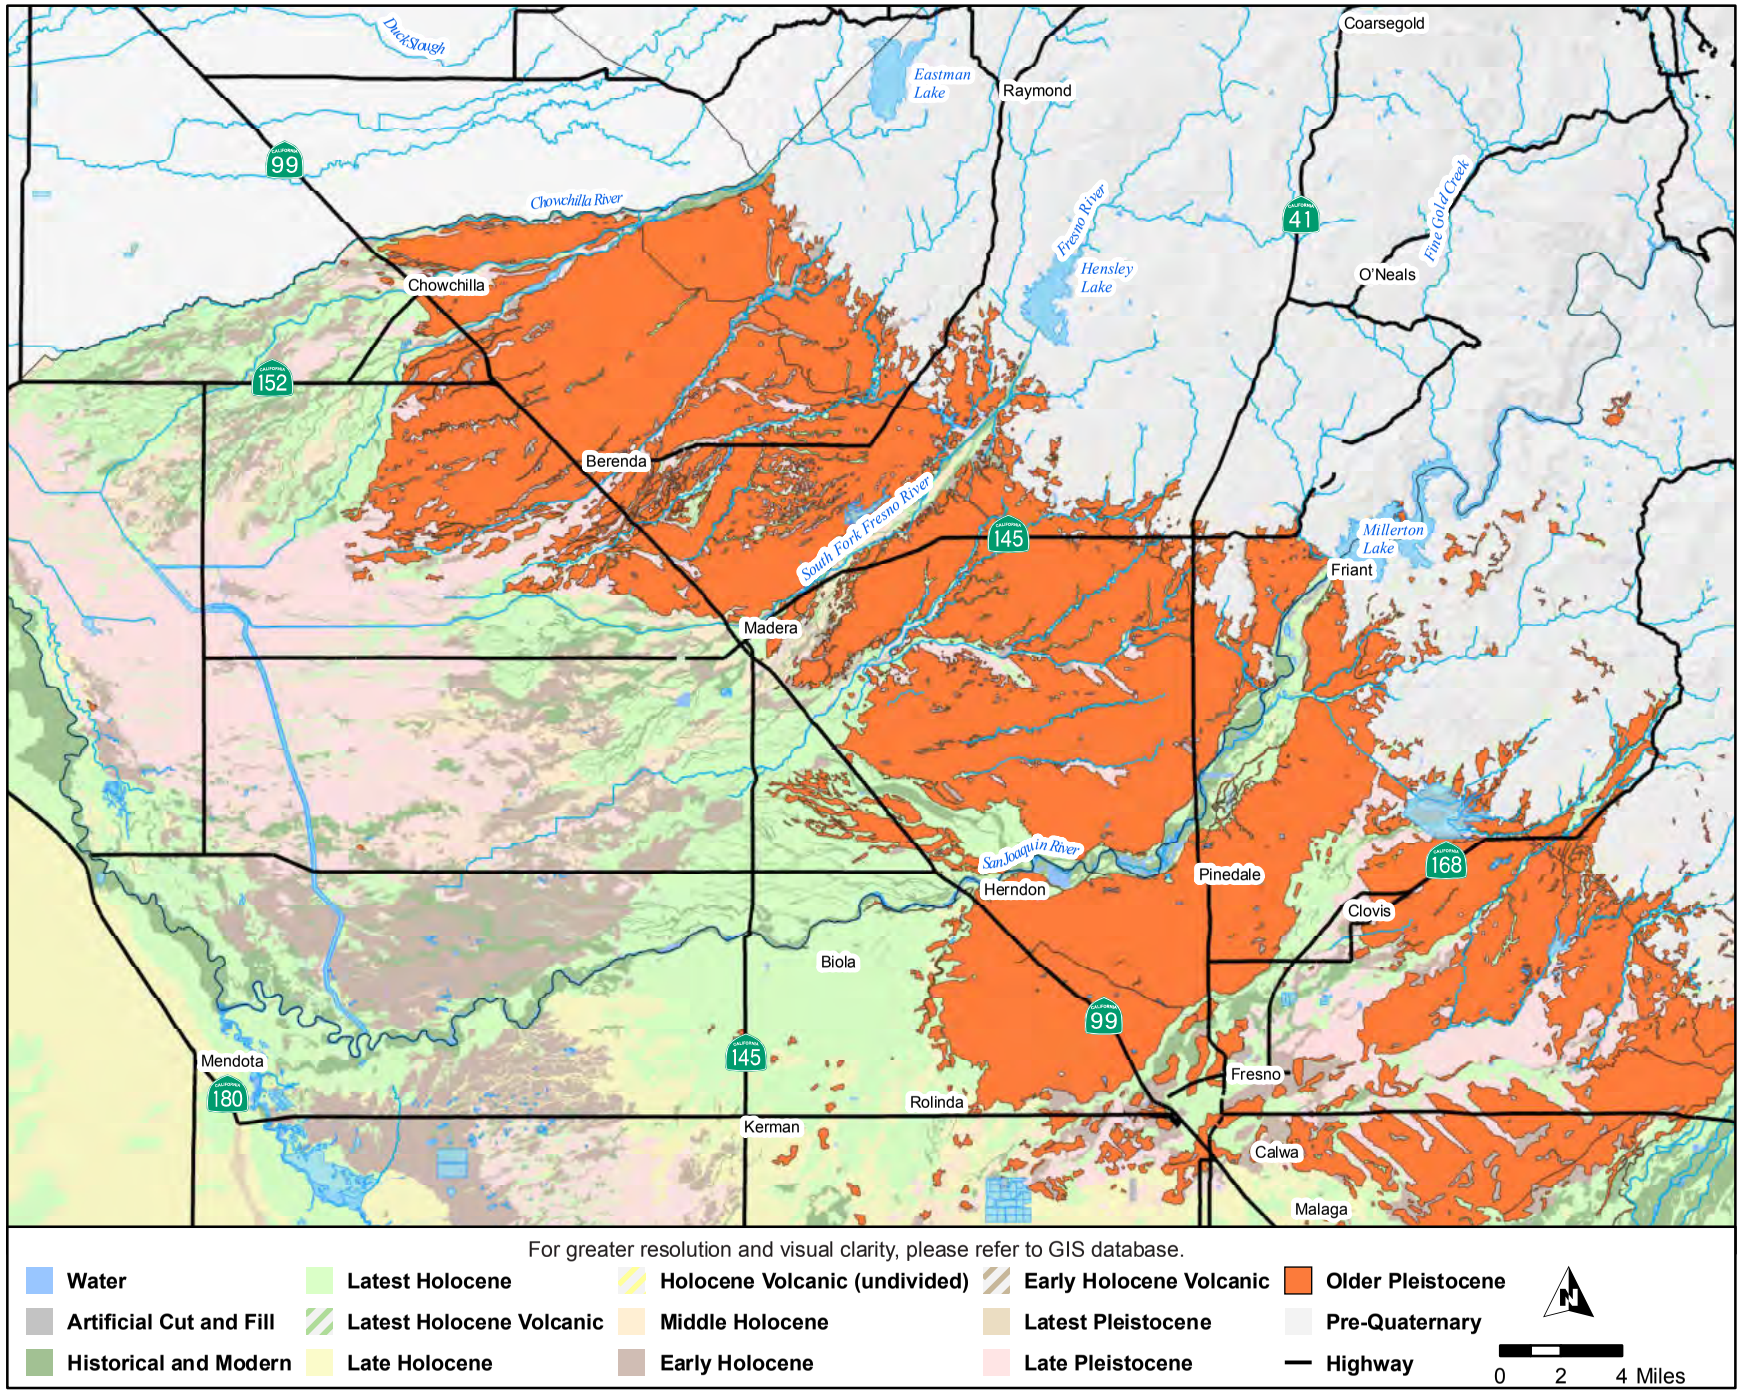

Figure 18. Older Pleistocene Fans Emanating from Glaciated and Unglaciated Drainages along the Eastern San Joaquin Valley.

(Table 9). The oldest of these (31,340 cal BP, OS-70220) was obtained for this study from a well- developed buried soil (4Bkb) exposed in the bank of Arroyo Hondo Creek in western Fresno County (Figure 19), where the surface soil is mapped as Millham series. The youngest date (26,352 cal BP, OS-70230) was likewise obtained for this study from a well-developed buried soil (3ABtb) exposed in a recently excavated detention basin near the Madera/Merced county line where the surface soil is mapped as Traver series (Figure 19). The remaining three dates were obtained from buried soils along the Cuyama River in eastern San Luis Obispo County by Delong and Arnold (2007), where the Panoche-series soil is mapped at the surface. The age and nature of these buried soils suggest that the inter-glacial period between the Tahoe/Tenaya and Tioga glaciations was dominated by land stability and soil formation.

Late Pleistocene (~25,000 to 15,000 cal BP)

During the last glacial maximum, the growth and movement of glacial ice was accompanied by intense weathering and mechanical erosion that stripped and transported large amounts of rock and other coarse sediments into the upper reaches of each glacial drainage, resulting in the deposition of glacial till, terminal and lateral moraines, and outwash terraces (Burke 2003; Gillespie and Zehfuss 2004; Kaufman et al. 2004; Matthes 1960; Wahrhaftig 1984; Wahrhaftig and Birman 1965). These processes also produced fine-grained sediments that were carried down slope on an almost continual basis by seasonal melt water, and more occasionally during periodic flood events caused by episodes of rapid melting, increased precipitation runoff, and/or failures of ice-dams or morainal ridges.

While much of this sediment presumably made its way to the valley floor, buried soils dated between about 20,000 and 19,000 cal BP on the Tuolumne River fan and within the axial San Joaquin River basin indicate that landform stability, soil formation, and channel incision prevailed between about 25,000 and 20,000 cal BP as the ice sheet advanced and reached its maximum extent. This suggests that most channels were not filled and overwhelmed by the initial pulse of glacial outwash, but were largely able to contain these sediments which were either deposited in enclosed basins, such as Buena Vista and Tulare lakes (Atwater et al. 1986), or were removed ("flushed") from the valley floor via the axial San Joaquin River. Though the channels were apparently large enough and/or competent enough to contain and transport initial loads of outwash, after 20,000 to 19,000 cal BP the amount of sediment appears to have increased and essentially exceeded the carrying capacity of these channels, particularly in the lower reaches of most drainages. As a result, most of the outwash associated with deglaciation filled existing basins and channels prior to spreading out laterally over the surface of adjacent fans and floodplains (Weissmann et al. 2003; Weissmann et al. 2005).

Radiocarbon evidence suggests that the initial depositional pulse was completed in 2,000 years or less, probably between about 18,500 and 16,500 years ago, as indicated by a mean age of 18,525 cal BP from seven well-developed buried soils at separate location in the Study Area (Table 9). A soil buried by the Traver series near the Merced/Madera county line produced the youngest of these dates (15,500 cal BP). The 2,000-year time frame for deposition is consistent with geomorphic models that show the release and reworking of glacially conditioned sediment is usually exhausted within 2,000 years or less (Ballantyne 2002a, 2002b). These dates also confirm that late Pleistocene-age landforms were buried in valleys west of the Sierra crest, with the oldest dating to 20,830 cal BP (OS-70251) at Arroyo Hondo Creek in western Fresno County (Figure 20). From this it appears that

Figure 20. Selected Views of Late Pleistocene Deposits in the San Joaquin Valley.

landscape elements relaxed to a state of non-deposition and relative stability by the time the Tioga glacial cycle was completed, which is consistent with the model of paraglacial landscape response proposed by Ballantyne (2002a, 2002b).

It is both telling and significant that late Pleistocene-age landforms are not nearly as well represented on the San Joaquin Valley floor as older Pleistocene landforms, but are instead relatively small and isolated. The largest and most extensive late Pleistocene surface deposits lie north and south of the San Joaquin River, just east of the valley's active depositional center (Figure 21). Other sizable areas occur along the valley's eastern side between the towns of Dinuba and Porterville, where these deposits form moderate-size alluvial fans that originate near the base of older Pleistocene fans (see Figure 17). However, the overall paucity of such surfaces suggests that either the magnitude and extent of late Pleistocene deposition have been greatly overestimated, post-glacial erosion has gone largely unrecognized and underappreciated, or landforms from this period were largely buried by younger sediments, in which case the amount and distribution of post-glacial deposits (i.e., Holocene) have been greatly underestimated and under-reported.

Latest Pleistocene (15,000 to 11,500 cal BP)

The environmental transition from glacial to non-glacial conditions brought with it fundamental transformations in plant and animal communities and substantial alterations in hydrologic and geomorphic systems that promoted landform instability in glaciated and unglaciated areas alike. The transition is marked by a series of relatively rapid climatic fluctuations that resulted in the advance and retreat of Recess Peak glaciers, between about 14,200 and 13,100 cal BP, and an overall reduction in temperature during the Younger Dryas cooling interval, between about 12,900 and 11,500 cal BP. The Recess Peak glaciation was, however, much smaller and short-lived than the previous Tioga glacial cycle, and the environmental influence of the Younger Dryas was also relatively short and subtle overall (Porinchu et al. 2003; Potito et al. 2006). This "transition" does not represent a unidirectional shift in environmental conditions as a whole, but is characterized by greater climatic variability and more heterogeneous responses that mark a period of increased environmental disequilibrium. This likely accelerated the rate of erosion and deposition as landforms and associated vegetation attempted to adjust to rapidly fluctuating conditions. As a result, latest Pleistocene-age landforms are even more prevalent and widely represented at the surface of the San Joaquin Valley floor than late Pleistocene-age landforms.

The largest and most continuous areas of latest Pleistocene surface deposits are found in and around the Tulare Lake Basin, which includes the lower Los Gatos Creek fan (i.e., "Lethent fan") to the northwest, and the lower portions of other east-side fans to the southwest, with Buttonwillow Ridge and Semi Tropic Ridge being part of the latter (Figure 22). Smaller and more discontinuous deposits occur along the valley's western margin, where they form alluvial fans, and just east of the Elk Hills where the lower Kern River fan appears to have blocked ("dammed") the north end of Buena Vista Lake Basin (see Figure 17).

Within the study area, 11 radiocarbon dates from latest Pleistocene-age buried soils range from about 13,835 cal BP (Beta-137204) to 11,625 cal BP (GX-13338), with a mean age of 12,955 cal BP. The majority (~54.5%), however, form a distinct cluster between about 13,900 and 13,000 cal BP (see Table 9). Among this group are buried soils from wide-spread locations including Nichols Meadow in Madera County (Koehler and Anderson 1994), Boggy Meadow in Tulare County (Wood 1975) the Sierra Foothills near Sonora (i.e., the Greenstone site [TUO-4557] in Meyer et al. 2008; Rosenthal 2008) and the Cuyama River in eastern San Luis Obispo County (Delong and Arnold 2007). Also relevant for this period is a date of 13,570 cal BP (Beta-14299) from basal channel deposits in the Stanislaus River Canyon (Peak and Crew 1990), which indicates a net decrease in runoff and waterflow occurred after that time.

Five latest Pleistocene dates were obtained from the western (distal) part of the Los Gatos Creek alluvial fan which lies near the center of the San Joaquin Valley in Fresno and Kings counties (Figure 22), one from a previous study (Milliken and Young 2000) and four specifically for this study. This fan is mapped in the Lethent soil series and extends around the northwestern side of Tulare Lake Basin where it appears to mark the lake's outer limit. To help determine the age of the Lethent fan, dates were obtained from three subsurface strata exposed along Omaha Canal Road, near the lake's former northwestern shore (Figure 23).

Figure 23. Selected Views of Radiocarbon-Dated Latest Pleistocene Deposits in the San Joaquin Valley.

It was found that the surface of the Lethent fan in this location is buried by a deposit of lacustrine clay that dates about 175 cal BP (OS-73445) based on a freshwater shell date of 200 ± 20 14C BP (no local reservoir correction applied). Soil samples from the buried Lethent fan surface and from two more deeply buried soils (3Ab and 5Ab) produced dates that range from about 13,795 to 13,395 cal BP (Beta-255484 and OS-72702, respectively). Although the samples are in reversed stratigraphic order (see Figure 23), it is evident that multiple episodes of deposition occurred on the distal part of the Lethent fan during the latest Pleistocene, and that the fan subsequently remained stable until the early Historic-era when it was finally capped by lacustrine sediment. The latter finding is important because it suggests that Tulare Lake reached its highest stand(s) during the latest Holocene to Historic-era, and not during the late Pleistocene or early Holocene as suggested by Atwater et al. (1986) and Negrini et al. (2006), respectively.

Notably, a similar date of 13,050 cal BP (OS-72832) was obtained from a well-developed soil (5ABtkb) buried by more than six meters (20 feet) of alluvium below the surface of the Tumey Gulch fan in western Fresno County (see Figure 23). This buried soil and those from the Lethent fan offer compelling proof that large amounts of sediment were delivered to the valley floor in the latest Pleistocene, and that a substantial part of this sediment was derived from the unglaciated western side of the valley.

The age and nature of these deposits suggest that land stability, soil formation, and channel incision generally prevailed during the time of the Recess Peak glacial advance, as landscape elements continued to relax from glacial conditions. By the time of the Recess Peak de-glacial phase, between about 13,600 and 13,100 cal BP, evidence shows that sediments began to accumulate within high elevation meadows, major river canyons, and at low elevations as alluvial fan and basin deposits on the San Joaquin Valley floor (see Figure 23). The stratigraphic sequence derived from the Lethent fan demonstrates that alluvium was being deposited in the Tulare Basin during the time that a purported "gap in sedimentation" or major erosional event is recognized elsewhere in the basin (Atwater et al. 1986; Davis 1999a). Lacustrine deposits that overlie distal parts of the Lethent fan suggest that earlier high lake stands did not attain the elevations reached during the latest Holocene to Historic-era (Negrini et al. 2006), further indicating that the history of Tulare Lake is out of phase with lake basins in eastern California.

It appears that environmental change during the last-half of Pleistocene-Holocene transition (~13,500 to 12,500 cal BP) was sufficiently rapid, intense, and widespread to destabilize landforms and generate a major pulse of deposition. The very presence of buried latest Pleistocene-age landforms indicates that many were subsequently overlain by younger Holocene-age deposits. A comparison of latest Pleistocene radiocarbon dates from buried and surface contexts illustrates that only about one-third (~33%) of dated late Pleistocene-age deposits occur at the present surface (Figure 24).

Early Holocene (11,500 to 7000 cal BP)

As the Pleistocene gave way to the Holocene, the Younger Dryas cooling interval ended and the transition from glacial to non-glacial conditions came to a close. Unlike the variability of the latest Pleistocene, the early Holocene marks a unidirectional shift toward warmer and drier conditions that was more homogeneous overall. As the warming and drying progressed incrementally, it reduced the vegetative cover on the landscape and caused many lakes, marshes, and springs to contract or disappear altogether, which forced associated plant and animal communities to adjust accordingly. As a consequence, the surface of most pre-existing landforms remained relatively stable and subject to soil formation as the rate of landscape change slowed. Reduced amounts of runoff concentrated the flow of water within existing channels, and caused many to become deeply incised and/or to migrate and erode laterally. This likely destabilized landforms adjoining channels, making them vulnerable to bank undercutting, slope bank failures, and head-ward gully erosion. As these processes continued, large amounts of sediment were either transported through the channels, or were made available for later transport. Thus, erosional and depositional processes became more localized during this time as the loci of both were shifted to more discrete segments of the landscape.

The limited distribution of early Holocene-age landforms at the surface of the valley floor (see Figure 17), and the number and extent of early Holocene-age buried landforms reflect this pattern. Surface deposits of

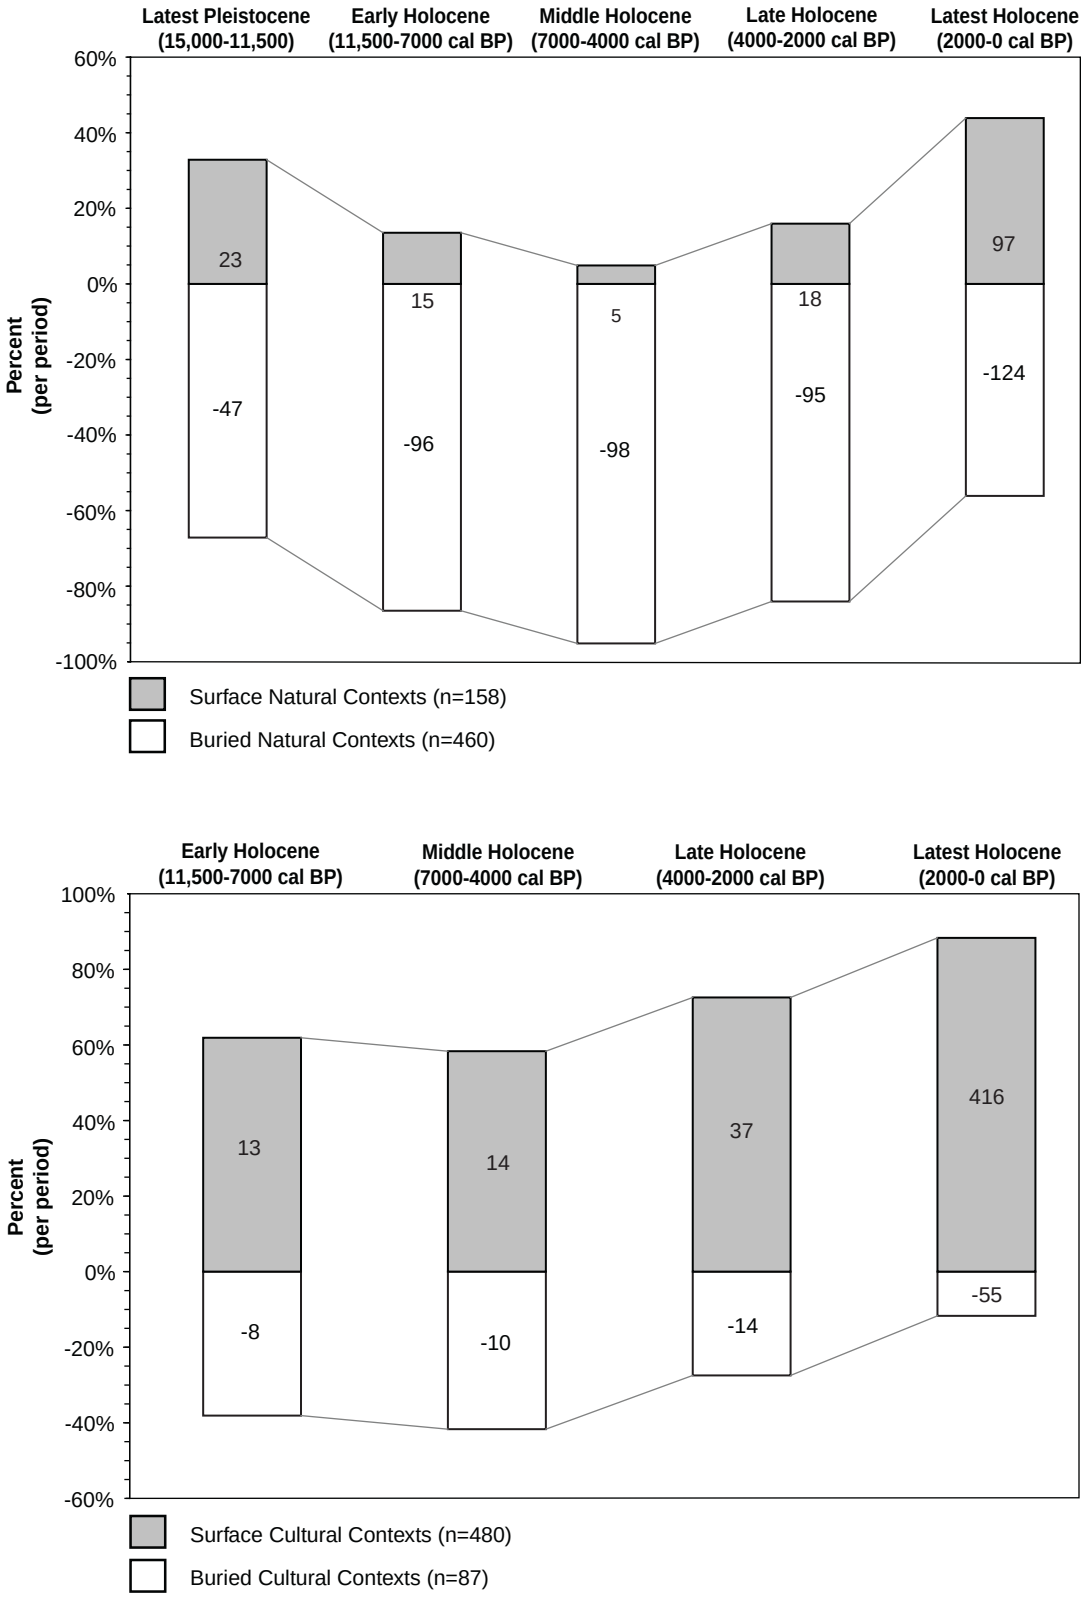

Figure 24. Count and Percent of Buried and Surface Natural (top) and Cultural (bottom) Contexts by Major Time Periods.

this age are most extensive and continuous north and south of the lower San Joaquin River, just east of the valley's central trough (Figure 25) and on the central (medial) part of fans formed along the lower Kaweah and Tulare rivers, just east of Tulare Lake (see Figure 17). Small surface deposits are also found on the central (medial) part of the Kings River fan, and around the margins of the Kern/Buena Vista Lake basin, at the San Joaquin Valley's southern end. This distribution clearly shows that most early Holocene surface deposits occur on the east side of the valley where they tend to form the central or lower parts of alluvial fans, or lie along the margins of basins such as Fresno Slough and Kern/Buena Vista Lake.

At least 30 early Holocene dates have been obtained on buried soils from locations in and near the Study Area. These dates range from about 11,320 cal BP (GX-13339) to 7085 cal BP (Beta-170151), with an overall mean age of about 9080 cal BP (see Table 9). Nearly three-quarters (n=22, 73%) fall between about 9800 and 7500 cal BP, and more than one half (n=17, 56.6%) occupy smaller clusters of about 9800 to 9300 cal BP and about 8300 to 7800 cal BP (Figure 26). These originate from a number of diverse environmental settings, including high elevation meadows in the Sierra Nevada (Koehler and Anderson 1994; Moratto 1984; Peak and Neuenschwander 1991; Wood 1975), alluvial fans and low-angle hillslopes in the Sierra Foothills (Dillon 1992; Meyer and Dalldorf 2004; Meyer et al. 2008), and alluvial fans, floodplains, and basins in the San Joaquin Valley (Davis 1999a; Negrini et al. 2006; Young 2003).

A date from freshwater mussel shell obtained for this study (8070 ± 80 BP, or 8971 cal BP, OS-70224) at archaeological site KIN-80 is associated with a discrete layer of cultural material (i.e., shell, charcoal, burnt bone, and chert flakes) buried at a depth of about 2.45 meters (8.04 feet) below the present ground surface (Figure 27). Apart from being buried, KIN-80 is important as one of the oldest cultural deposits so far identified in the San Joaquin Valley, and the presence of freshwater shell confirms that a lake was present in the basin during the early Holocene. The age of this deposit closely matches the buried cultural stratum identified at KER-116 along the shores of Buena Vista Lake, where the next oldest cultural date (8379 cal BP; LJ-1356) from the valley was obtained on freshwater mussel shell (Fredrickson and Grossman 1977).

An episode of early Holocene deposition is recognized within Tulare Lake Basin, where lacustrine sediments dating to 10,160 cal BP (OS-72700) are unconformably overlain by desiccated lake clay showing soil development, dating to about 8355 cal BP (OS-72699; Figure 27). A buried soil of similar age was also identified on the nearby Tulare River fan, between the towns of Corcoran and Tipton. In this location, two vertically stratified buried soils are overlain by surface soils of the Colpien series (Figure 27). The lower 3ABkb horizon yielded a date of 8379 cal BP (Beta-255483), matching the date from Tulare Basin, while the overlying 2ABkb horizon produced a date of about 7850 cal BP (OS-73065). The latter period of soil development is, in turn, matched along the Fresno River near the base of the Sierra foothills (Figure 27), where a nearly identical date of about 7845 cal BP (OS-70242) was derived from the deepest of five buried soils (5Ab). A date from the overlying soil (4Ab) at that location indicates that the early Holocene surface was buried before about 6920 cal BP (OS-71155). These examples demonstrate that two widespread, early Holocene buried soils are present on the eastern side of the San Joaquin Valley dating to about 8500 and 7800 cal BP, respectively, separated by an intervening period of deposition.

Evidence for early Holocene land stability and subsequent deposition can also be found within many alluvial landforms on the western side of the valley. At Tumey Gulch, for example, deposition is constrained between 13,050 cal BP (OS-72832) and 9815 cal BP (OS-72830) based on dates from a deeply buried soil (5ABtkb) and an overlying moderately developed buried soil (2Abkb); the later buried soil also indicates that deposition in this locality occurred sometime again after 9815 cal BP (Figure 27). A similar period of stability and deposition is also represented along Little Panoche Creek, where a well developed buried soil (4ABtb) was dated to about 9440 cal BP (OS-71213; Figure 27).

Further down Little Panoche Creek, a weakly developed soil near the base of the alluvial terrace dates to 8235 cal BP (OS-71197), while the overlying buried soil (2Ab) dates to about 6100 cal BP (OS-71158), indicating that deposition resumed and ceased within that time span (Figure 27). This matches a depositional episode along the Fresno River on the eastern side of the valley. Another example of substantial early Holocene deposition is found along Panoche Creek, where a date of about 7540 cal BP (OS-70249) was obtained from a burn layer exposed near the base of an alluvial terrace, now more than ten meters (33 feet) below the surface (Figure 27).

These examples show that land stability and soil formation was the dominate process on both side of the San Joaquin Valley during the early Holocene, with widespread buried soils dating about 9800 to 9400 cal BP, 8500 to 8200 cal BP, and 7800 to 7500 cal BP. Substantial depositional episodes occurred between these stable periods burying many early Holocene land surfaces. Sediment deposition occurred mainly around the margins of large basins and on the lower portions of alluvial fans and floodplains on both sides of the valley. Because the region was clearly occupied by people during this time, it is also likely that early Holocene-age archaeological sites in these settings were buried as well.

Middle Holocene (7000 to 4000 cal BP)

The climatic conditions of the middle Holocene have long been characterized as distinctly warmer and drier than today, based on studies from the Great Basin and Desert Southwest (Antevs 1955; Baumhoff and Heizer 1965). While some Sierra records support this view (e.g., dendrochronologic, paleohydrologic), pollen and macrofossil evidence indicates that conditions were cooler and wetter between about 7000 and 4000 cal BP (Anderson 1990; Anderson and Smith 1994; Davis et al. 1985; Davis and Moratto 1988; Davis et al. 1976; Koehler and Anderson 1994; Wood 1975; Woolfenden 1996). The nature and extent of landscape changes during this interval are further complicated as middle Holocene-age landforms only rarely occur at the surface. Despite a lack of consensus, the combined evidence suggests environmental conditions of the middle Holocene were variable and complex. The presence of submerged tree stumps beneath the waters of Lake Tahoe, dated between about 5,700 and 5,400 cal BP (Lindström 1990), however, provides proof of aridity and the extreme climatic variability of the middle Holocene.

As noted in a previous chapter, the middle Holocene represents a conspicuous "gap" in the stratigraphic record of Central California as no deposits of this age have been identified by previous geological studies in this region, either buried or at the surface (see Table 3, e.g., Hall 1984; Harden and Marchand 1980; Marchand and Allwardt 1981). However, middle Holocene radiocarbon dates from buried stratigraphic contexts are relatively common in this region (see Table 8). Included among these are 25 dates from buried soils identified in floodplains and meadows of the Sierra Nevada (Goldberg and Skinner 1990; Koehler and Anderson 1994; Peak and Neuenschwander 1991); alluvial fans and low-angle hillslopes in the Sierra foothills (Meyer and Dalldorf 2004; Meyer et al. 2008); alluvial fans, floodplains, and basins in the San Joaquin Valley (Atwater et al. 1990; Culleton et al. 2001; Gardner et al. 2005; Negrini et al. 2006; with most from this study); and a fault-related sag pond near the Tejon Pass (Madden and Dolan 2008). Most of these dates (n=17, 68%) range between about 6400 and 4500 cal BP (see Figure 26), with a mean age of about 5455 cal BP overall (see Table 9).

A period of widespread deposition at the beginning of the middle Holocene is evinced by the burial of early Holocene surfaces at several locations within the Study Area. A buried soil (2Ab) exposed below the surface of an alluvial terrace along Little Panoche Creek yielded a date of about 6100 cal BP (OS-71158). A slightly older date of 6920 cal BP (OS-71155) was obtained from a buried soil (4Ab) exposed in an alluvial terrace along the Fresno River in eastern Fresno County (Figure 28). These two buried soils were found above early Holocene surfaces dated to 8235 and 7845 cal BP, respectively, suggesting that a period of deposition occurred in this region after about 7800 years ago, but before 6900 years ago. Along the Fresno River, a second middle Holocene buried soil (3Ab), dated about 5590 cal BP (OS-71154), was also identified, matching the age of a buried land surface near Firebaugh in the San Joaquin Valley proper (Figure 28). In this locality, a buried soil (4Ab) exposed near water level in an alluvial terrace on the eastern side of the San Joaquin River produced a date of about 5285 cal BP (OS-70228). Likewise, a nearly identical date of 5235 cal BP (Beta-255479) was obtained from a truncated buried soil (3Btb) exposed along Berenda Creek near Chowchilla (Figure 28), also in the San Joaquin Valley. These localities on the eastern side of the valley suggest that a period of widespread middle Holocene land stability prevailed, following an initial period of deposition.

In western Fresno County, the channels of Panoche and Los Gatos creeks have become deeply incised, creating a series of extensive natural exposures that provide evidence for the rate and timing of middle Holocene deposition on the western side of the Valley (see Figure 28). Dates obtained from a large cut-bank near the confluence of Silver Creek with Panoche Creek indicate that more than five meters (16 feet) of sediment were

Figure 28. Selected Views of Radiocarbon-Dated Middle Holocene Deposits in the San Joaquin Valley.

deposited there between about 4870 cal BP (OS-71160) and 4685 cal BP (OS-70250) over an interval of less than 200 years. A similar pattern was found at Los Gatos Creek where more than seven meters (23 feet) of sediment were deposited between about 4650 cal BP (OS-70215) and 4330 cal BP (OS-71157) over an interval of no more than 320 years. The date of 4650 cal BP and another of 4365 cal BP (OS-71156) were obtained on wood from buried tree stumps rooted in formerly stable land surfaces (see Figure 28). Notably, the latter date is almost the same as 4330 cal BP (OS-71157) from a gray pine cone embedded in unweathered alluvium along the same creek (see Figure 28).

In addition, a thin mat of carbonized organic materials, buried more than ten meters (33 feet) below the surface of the Los Gatos Creek terrace (see Figure 28), appears to mark a very brief episode of plant growth at around 4550 cal BP (OS-70221). Further, one of the few middle Holocene-age archaeological sites identified in the study area was found along this same stretch of Los Gatos Creek (Atwater et al. 1990), buried at a depth of about seven meters (23 feet) below surface. It dates to about 5270 cal BP (C-1424).

Radiocarbon dates from buried land-surfaces along both Panoche and Los Gatos creeks, clearly demonstrate that extensive deposition occurred on the western side of the San Joaquin Valley between about 4800 and 4300 cal BP, delivering as much as five to ten meters (16 to 33 feet) of sediment in a period of just 200 to 300 years. As the depositional landform map developed for this study shows (see Figure 17), there are very few areas in the San Joaquin Valley where middle Holocene-age landforms are represented at the present surface. However, a moderate-size area is found in the lower drainage of Little Panoche Creek (western Fresno County), where soils of the Chateau, Deldota, and Paver series are mapped at the surface. A date of about 4755 cal BP (Beta-255481) from the Bk horizon of the Deldota soil confirms the middle Holocene age of these soils. Other middle Holocene-age surfaces occur along the lower drainages of the Kaweah and Tule rivers on the eastern side of the valley (Tulare County), mapped as having surface soils of the Akers and Tagus series (Figure 29). The age of these soil series was inferred based on geomorphic position and the type and degree of soil development compared to neighboring soil units.

In each of these areas, middle Holocene deposits form the central (medial) portions of alluvial fans generally occupy an intermediate position between older and younger deposits (i.e., early Holocene or more, late Holocene or less). Smaller and more isolated middle Holocene surfaces also occur along the eastern side of the valley in Fresno and Madera counties (mainly Pachappa Series at surface), where they form small alluvial fans, and stream terraces, and appear to fill small abandoned stream channels.

Overall, middle Holocene surface landforms are the least represented and the most spatially restricted of all those exposed at the surface of the San Joaquin Valley. In combination with evidence for extensive deposition toward the end of this period, the narrow distribution of these surfaces explains why no specific middle Holocene deposits or correlative stratigraphic units have previously been identified in the region (see Table 3; Hall 1984; Harden and Marchand 1980; and Marchand and Allwardt 1981).

These examples clearly show that the nature, pace, and magnitude of middle Holocene landscape changes varied greatly from one area to another. The assembled radiocarbon and stratigraphic data suggest that this interval is bracketed by at least two major depositional pulses: the earliest was between about 7000 and 6800 cal BP, and the latest centered between about 4500 and 4300 cal BP. During the intervening 2,200-year period (~6800 to 4500 cal BP) most or all landforms were essentially stable and passively undergoing soil development.

This paints an emerging picture of the middle Holocene as a time of environmental transition in which climates grew more variable and shifted more abruptly than during the early Holocene. While the overall trends may have been toward warmer and drier conditions and landscape stability, the substantial depositional episodes that bracket this interval require greatly increased and/or sustained levels of precipitation for sediment transport to occur at such a large scale. It also appears that most middle Holocene landforms have been buried. These surfaces tend to occur in relatively low landscape positions (e.g., incised arroyos and channels, inset terraces, distal fans, and basin rims) and have since became depositional loci for younger sediments (Meyer and Dalldorf 2004; Meyer et al. 2008; Meyer and Rosenthal 2008). Because of this, we expect that many middle Holocene archaeological sites are also buried in the same geomorphic settings where these buried soils tend to be preserved. The upper stratum at site KIN-80 is one such example, dated to about 4955 cal BP (Beta-167852). It lies buried along the

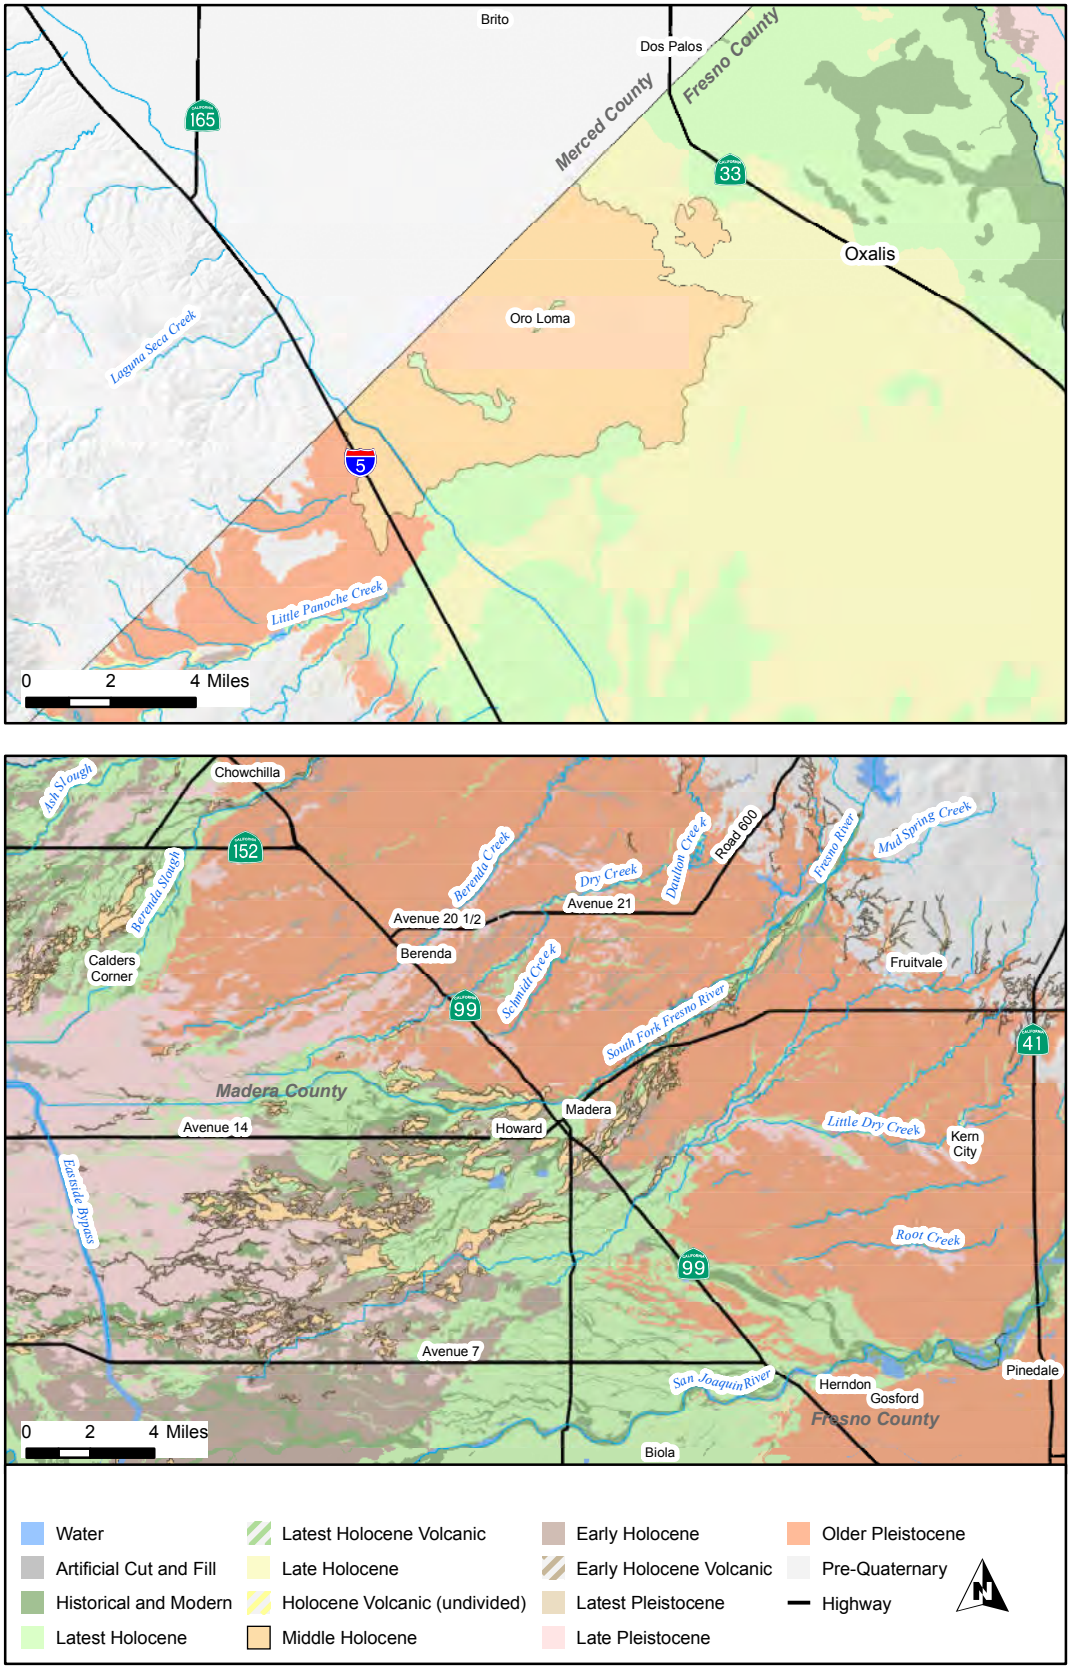

Figure 29. Middle Holocene Fan and Basin Deposits in the Western (top) and Eastern (bottom) San Joaquin Valley.

western rim of Tulare Lake Basin beneath more than 1.5 meters (4.9 feet) of alluvium (Gardner 2003; Gardner et al. 2005). Together, the Los Gatos Creek site and KIN-80 are the only middle Holocene sites so far identified in the lower San Joaquin Valley.

Late Holocene (4000 to 2000 cal BP)

Unlike the two previous intervals of the Holocene, climate during the late Holocene was generally cooler and wetter, thus heralding a transition to the mesic conditions that prevail today (West 2000). This overall trend is widely reflected in pollen records from high and low elevations on both sides of the Sierra Nevada (Anderson 1990; Anderson and Smith 1994; Benson et al. 2002; Davis 1999a, 1999b; Davis and Moratto 1988; Davis et al. 1985; Edlund 1991; Goman and Wells 2000; Jones and Waugh 1997; Koehler and Anderson 1994; Malamud-Roam et al. 2006; Smith 1979; Smith and Anderson 1992; Stine 1990; Wells and Goman 1995; West 1993, 2005; Wood 1975), in tree-ring and plant macrofossil records of the southern Sierra Nevada (Anderson 1990, 1994; Anderson and Smith 1997; Scuderi 1987), and Bristlecone Pine records from the White Mountains (Berkelhammer and Stott 2008; Ferguson 1970; LaMarche 1974).

Evidence of increased precipitation and runoff during this interval is recorded by high lake stands throughout the otherwise arid Great Basin and Mojave Desert regions, such as Mono and Owens lakes (Benson et al. 2002; Stine 1990), Searles Lake (Smith 1979), Silver Lake (Enzel et al. 1989, 1992), Walker Lake (Benson et al. 2002), Lower Pahranagat Lake and Diamond Pond (Wigand and Rhode 2002), as well as other lakes throughout the American West (Harrison and Metcalfe 1985). Together these records indicate that significant and widespread flooding occurred in the region between about 4000 and 3600 cal BP. Sediments within the Tulare Lake Basin also record a high stand during the first part of the late Holocene, but a low stand occurred around 2200 cal BP, marking a period of drought toward the end of this interval (Davis 1999a; Negrini et al. 2006).

These changes are also reflected in the depositional history of many alluvial fans and floodplains in central California, where multiple episodes of late Holocene deposition are recognized (Rosenthal and Meyer 2004a, 2004b). Roughly synchronous periods of fan and floodplain deposition are also documented on the western slope of the Sierra (Meyer and Dalldorf 2004) and in the Sacramento Valley (Meyer and Rosenthal 2008; White 2003b). Buried soils dating to the late Holocene are most commonly centered at about 2900 cal BP based on 25 radiocarbon dates from locations throughout the region (see Table 9). These records and others from around central California show that landform changes accelerated during the late Holocene as cooler/wetter conditions initially increased the amount of available sediment through erosion, and elevated the capacity of rivers and streams to carry these sediments downstream. The net result was widespread sediment deposition and the formation of new alluvial landforms. The continuation of cooler/wetter conditions eventually led to greater plant growth and vegetative cover which allowed landforms to become more stable, thus slowing the rate of landscape changes well before 2000 cal BP.

Based on the soil-age assignments of this study, late Holocene surface deposits are present on the east and west sides of the San Joaquin Valley, mainly in Fresno County, and at the valley's southern end in Kern County (see Figure 17). The largest and most continuous surface deposits occur along the western side of the valley where they form distal alluvial fans and basin deposits near the valley's main trough (Figure 30). Soils at the surface of these landforms are mapped as Calflax, Ciervo, Lillis, Tranquility, and Wekoda and consist mainly of clay, with Calflax clay loam being the only exception. The maximum age of the Calflax series is constrained by a date of about 4685 cal BP (OS-70250) from a buried soil (2Ab) immediately beneath the Calflax soil, and a second date of about 4870 cal BP (OS-71160) from the 2Cu-horizon in which the buried soil had formed, both from an alluvial terrace near the confluence of Panoche and Silver creeks in Fresno County (Figure 31). Other soil-ages were inferred based on their geomorphic position and the type and degree of soil development compared to neighboring soils radiocarbon-dated to the latest Holocene (i.e., Cerini, Excelsior, Panoche, and Posochanet series). Because these fan and basin deposits consist of sediments derived from western hill slopes, where the modern climate is normally arid, the large size and extent of these landforms suggest they formed at a time when rainfall and runoff levels were much higher than today, and possibly higher than the early and middle Holocene.

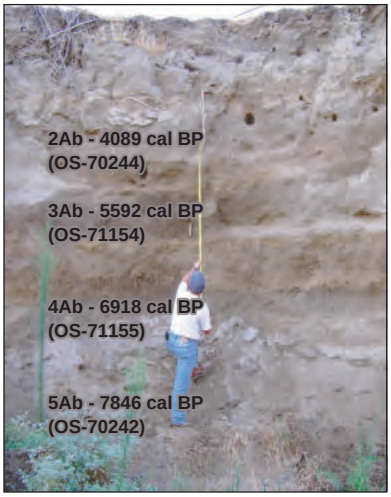

Figure 31. Selected Views of Radiocarbon-Dated Late Holocene Deposits in the San Joaquin Valley.

Along the eastern side of the valley trough, late Holocene deposits occur at the surface in an elongated area, where they occupy basin and floodplain positions (see Figure 30). Here the surface soils are mapped as the Altaslough, Merced, and Temple Series which are composed of fine-grained alluvium (mainly clay or clay loam). The minimum age of the Merced series is constrained by a date of about 970 cal BP (Beta-255482) from the A-horizon of this soil where it was buried (i.e., 2Ab) by younger deposits within Fresno Slough (see Figure 31). The ages of the Altaslough and Temple series were inferred based on their geomorphic position and degree of soil development, which is similar to the Merced series, and on comparisons with neighboring soils radiocarbon-dated to the latest Holocene (e.g., Chino and Grangeville series). While previous researchers have associated the Merced and Temple soils with both latest Pleistocene and Holocene landforms (see Table 6), we conclude that they are most likely late Holocene in age.

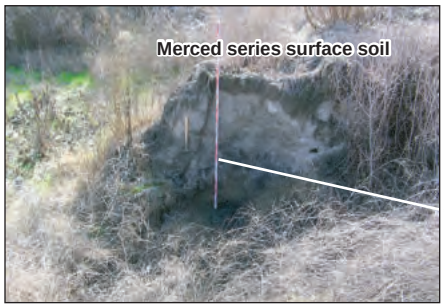
Because late Holocene deposits on the eastern side of the valley consist of sediments derived mainly from the Sierra Nevada, the size of these landforms again suggests they were deposited under conditions of greater rainfall and runoff. The extent and position of these landforms further suggest they were formed mainly by outwash from the Kings River fan, and were deposited within a basin created in part by blockage (damming) of the normal drainage outlet by sediments deposited near the town of Mendota (see Figure 30).

Late Holocene deposits also occur at the surface along the San Joaquin River west of Fresno, where they form small and segmented alluvial fans, floodplains, and stream terraces with soils of the Hesperia series. The age of the Hesperia Series is based on 15 radiocarbon dates obtained almost exclusively from cultural surface deposits at sites outside the San Joaquin Valley. These dates range from a maximum of about 3290 cal BP (Beta-158024) at INY-5275/H, to a minimum of only 130 cal BP (Beta-112083) at INY-3769 (Appendix B). Two dates below Hesperia soils, however, are from natural buried contexts, including one of about 5265 cal BP (USGS-0607) from Antelope Valley (Kern County), and one of about 2245 cal BP (OS-72794) from a buried soil (2AB) exposed in a terrace along the Kern River near Bakersfield (see Figure 31). Although the maximum surface date and minimum buried date from this soil series overlap by about 1,000 years, the best fit of all dates indicate that landforms with Hesperia soils date to the late Holocene in most areas, but may be latest Holocene in age (<2245 cal BP) in some regions (i.e., Kern River terrace). Like other soils, the Hesperia series has also been associated with both latest Pleistocene and Holocene landforms by previous studies (see Table 6).

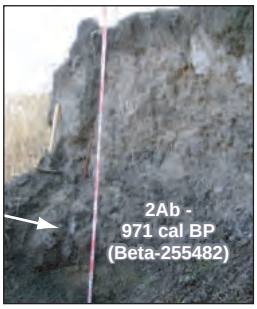
Late Holocene deposits are found in portions of the Kern and Buena Vista Lake basins at the southern end of the San Joaquin Valley, where they form smaller and less continuous alluvial fan, floodplain, and basin deposits. These landforms have soils of the Calflax, Hesperia, Tupman, and Zalvidea series mapped at their surfaces. The age of the Tupman and Zalvidea soils was inferred based on their relative geomorphic position and the type and degree of soil development compared to the Calflax and Hesperia series, and on neighboring soil bodies (i.e., Cerini, Excelsior, Kimberlina, and Posochanet series) that date to the latest Holocene. The distribution of these landforms in or near the margins of Kern and Buena Vista basins suggests they were deposited when water levels were higher within these lakes, which raised the hydrologic baseline for sediment deposition.

This evidence reinforces the view that a significant increase in rainfall initially occurred during the late Holocene that altered existing hydrologic systems, destabilized landscapes, and prompted widespread sediment deposition between about 4000 and 3600 cal BP. As conditions remained cooler and wetter, plant growth and greater vegetative cover allowed old and new landforms to stabilize and soil formation to prevail by about 2900 cal BP. It also appears that late Holocene deposition was more pronounced and/or extensive in the western and southern parts of the valley, where there is generally less rainfall and vegetation cover. While late Holocene landforms are also recognized along the east side of the valley and within the valley trough, the distribution of these landforms appears to be restricted to the alluvial fans of the Kings and San Joaquin rivers, and a corresponding portion of the lower valley trough. This suggests that deposition was not as pronounced or extensive at the base of the Sierra Nevada, perhaps due to the greater rainfall and vegetation cover normally associated with this region. At the same time, the large number of buried soils less than 2000 cal BP in age, provides strong evidence that a substantial part of the late Holocene landscape was buried during the latest Holocene (see Table 6; see Figure 26). The number of dated late Holocene-age cultural contexts in the region reflects this, with about 72.5 percent from surface contexts, and just over one-quarter (~27.5%) from buried contexts (see Figure 24).

Latest Holocene (2000 to 150 cal BP)

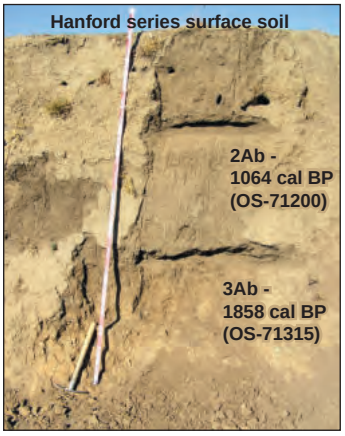


"More variable" best describes the contrast between the late and the latest Holocene climate. While it remained relatively cool and wet overall, there were also abrupt temperature swings and extreme precipitation shifts that were as dramatic as any in the Holocene. These changes include one or more episodes of increased rainfall between about 2000 and 1670 cal BP (Davis 1999a; Ingram et al. 1996; Negrini et al. 2006), two intense droughts within the Medieval Climatic Anomaly between about 1100 and 650 cal BP (Jones et al. 1999; Stine 1994), the rapid onset of the Little Ice Age (i.e., Matthes glacial) and return to cooler and wetter conditions after about 650 cal BP, and another severe drought between 482 and 370 cal BP (Hughes and Brown 1992; Meko et al. 2001). From these records, as many as four major droughts and precipitation cycles are apparent between about 2200 and 600 cal BP. Because of the rapid, repeated, and widespread nature of these changes, the present landscape still bears the lasting signature of latest Holocene climate variability.



Not surprisingly, evidence of large-scale flooding and deposition during the latest Holocene is found throughout much of central California. For example, the age of surface alluvial and colluvial deposits in the Sierra Nevada foothills is constrained between about 1400 and 150 cal BP by nearly one-dozen radiocarbon dates (see upper Keystone deposits of Meyer and Dalldorf 2004). Radiocarbon-dated sediments along the South Fork American River indicate that large floods occurred during the latest Holocene (1125-650 cal BP) and buried many older land surfaces and associated archaeological sites (Bureau of Reclamation 2002:34). In the northern Diablo Ranges of Contra Costa County, alluvial and colluvial surface deposits have been dated between about 660 and 250 cal BP (see Brentwood unit of Meyer and Rosenthal 1997:34-35).

Within the past 2,000 years, a sizable body of alluvium was also deposited across the central part of the lower San Joaquin Valley and in the narrow valleys along most rivers and streams draining the Coast Ranges and Sierra Nevada (Rosenthal and Meyer 2004b). These deposits form a nearly continuous belt of alluvium on either side of the San Joaquin River channel, broad basins and floodplains in the lower San Joaquin Valley, and marshes in the Delta region. Dozens of radiocarbon dates from the associated surface deposits indicate that these landforms are generally less than 1000 cal BP in age (Meyer and Rosenthal 2008). The soil-age based mapping used by this study shows that the majority of the San Joaquin Valley is covered by latest Holocene-age surface deposits (see Figure 17). These form an almost continuous series of alluvial fans, floodplains, and basins along both sides of the valley, as well as a uniform ribbon through the valley's central trough. The various soil series mapped at the surface of these landforms are far too numerous to mention individually but are listed in Appendix C. Nearly 700 latest Holocene-age radiocarbon dates are available from the Study Area, including several new dates obtained from soils of the Foster, Hanford, Kimberlina, and Wasco series (discussed below). Included among these are 49 dates from buried soils, ranging in age from about 1985 to 130 cal BP, with a mean age of about 1075 cal BP (see Table 6).



On the east side of the valley, along the San Joaquin River near Firebaugh, the age of the Foster-series is constrained by a date of about 2015 cal BP (OS-70227) from a buried soil (2Ab; Figure 32). The first buried soil (2Ab) below the Hanford series along Cottonwood Creek, also on the valley's eastern side, gave a limiting age of about 1130 cal BP (OS-71200), while a more deeply buried soil (3Ab) near the base of the same alluvial terrace (T2) yielded a maximum age of about 1880 cal BP (OS-71200). On the highest terrace (T3), a date of about 3635 cal BP was obtained from the eroded surface of an exposure of Atwater series soils capped by Hanford soils (see Figure 31). Thus, along Cottonwood Creek, it appears that Hanford-series soils are associated with more than one depositional episode, and possibly three. Along the San Joaquin River in Fresno County, a buried soil (2Ab) below Wunjey-series soils produced a much younger date of about 130 cal BP (OS-72582). This is interpreted as a minimum age for the Wunjey, as this particular exposure appears to be overlain by historic-era alluvium (Figure 32).

On the valley's western side, a maximum age of about 1605 cal BP (OS-67051) was obtained for the Kimberlina series from a cultural hearth feature exposed about 4.4 meters (14.4 feet) below surface in the side wall of Arroyo Hondo Creek (FRE-257) located near Interstate 5 in Fresno County (Figure 32). The minimum age of the Kimberlina series is constrained by a slightly younger date of about 1265 cal BP (Beta-188993) from buried cultural deposits at KER-3085 in the Elk Hills (Culleton 2006, Culleton et al. 2005). Figure 32. Selected Views of Radiocarbon-Dated Latest Holocene and Historic to Modern Deposits in the San Joaquin Valley.

alluvial fans on the valley's western side in Fresno County are not as extensive as their late Holocene predecessors, suggesting that rainfall and runoff were not as high and/or sustained in the latest Holocene as in the late Holocene, again pointing to more variable conditions overall (see Figure 17).

One of the single largest alluvial deposits formed in the valley during this time was the lower portion of the Kings River fan (Figure 33), which probably began blocking the northern Tulare Lake outlet between about 2000 and 600 cal BP. This suggests that the highest stands of Tulare Lake could only have occurred once the fan was deposited and the "dam" fully formed in the latest Holocene, instead of the latest Pleistocene as argued by Atwater et al. (1986). As noted above, and in the previous chapter, the lake does not appear to have reached its highest stand until about 175 cal BP (OS-73445) based on evidence from the Lethent fan. It is also possible that the northern side of the Kern and Buena basins was blocked by deposition on the lower Kern River fan in the latest Holocene (Figure 33) which could have raised lake levels and/or increased the lake's overall extent.

Given the widespread nature of these deposits, the latest Holocene emerges as one of the most influential periods of landscape change since humans first arrived in the San Joaquin Valley more than 11,500 years ago. Characterized by highly variable climatic conditions that alternated rapidly and repeatedly between intensely dry and extremely wet, these fluctuations destabilized many upland portions of the landscape and overloaded many rivers and streams with far more sediment than they could adequately transport. This caused widespread deposition on the San Joaquin Valley floor, and in other valleys, at a scale as aerially extensive as any depositional interval. Many hydrologic systems were also altered during this time, as once active channels were abandoned in favor of new ones, and major drainage basins (i.e., Tulare Lake) were impounded and/or enlarged.

Historical to Modern (150 to 0 cal BP)

The last major phase of landscape development occurred during the historical and modern eras in response to agriculture, irrigation, land reclamation, livestock grazing, timber logging, dredging, mining, quarrying, and the replacement of some native plants by nonnative species (Figure 34). Most of the San Joaquin Valley floor has been cultivated for crops or reclaimed for agricultural purposes, such as the area once occupied by Tulare Lake (Figure 34). Evidence of dredging or quarrying is found within river bottoms on the valley floor (e.g., San Joaquin River, Kaweah River), extensive deposits of mine-tailing also occur along many of the major stream and river channels. During the height of the gold rush in the late 1800s, hydraulic mining in the northern Sierra Nevada generated nearly one billion cubic meters of sediment that were released into channels draining the western slope (Gilbert 1917; Figure 11). Not surprisingly, this caused extensive flooding, channel migration, and widespread sediment deposition throughout the lower portions of the Sacramento and San Joaquin Valley (Thompson 1961: Figure 11).

During the 1880s, protective vegetation cover was greatly reduced by intense drought and livestock grazing, which made the land susceptible to erosion (Burcham 1982:171). This erosive period caused deep gullies and channels (i.e., arroyos) to form in many locations across the American West (Bryan 1925; Schumm and Hadley 1957), including some alluvial fans in western Fresno County (Bull 1964a, 1964b) and meadows in the southern Sierra (Dull 1995, 1999). Together these human-made changes have caused widespread erosion of the uplands and rapid sediment deposition in the lowlands, and fundamentally altered the drainage system, and the transport, deposition, and storage of sediment within the valley (Mount 1995).

More than 50 historic-era radiocarbon dates were identified from the study area, including four obtained for this study (see Table 8). These dates range in age from about 145 to 20 cal BP, with a mean age of around 100 cal BP (AD 1850), which puts most near the height of the gold rush period. Based on our mapping of the valley floor, deposits assigned to the historical and modern group are largely restricted to the active channels of modern fans and floodplains along perennial streams and rivers, such as the lower Kern and San Joaquin rivers (Figure 35), the lower Kings River, and within former lake basins that contained water during recent times (i.e., Buena Vista, Kern, and Tulare lakes).

The historical to modern map group also includes areas that were artificially cut and/or filled as a result of mining, construction, or urban development, which includes earthen dams, landfills, dredging piles, some highway and railroad embankments, and backdirt from quarries. While there is considerable variation in the

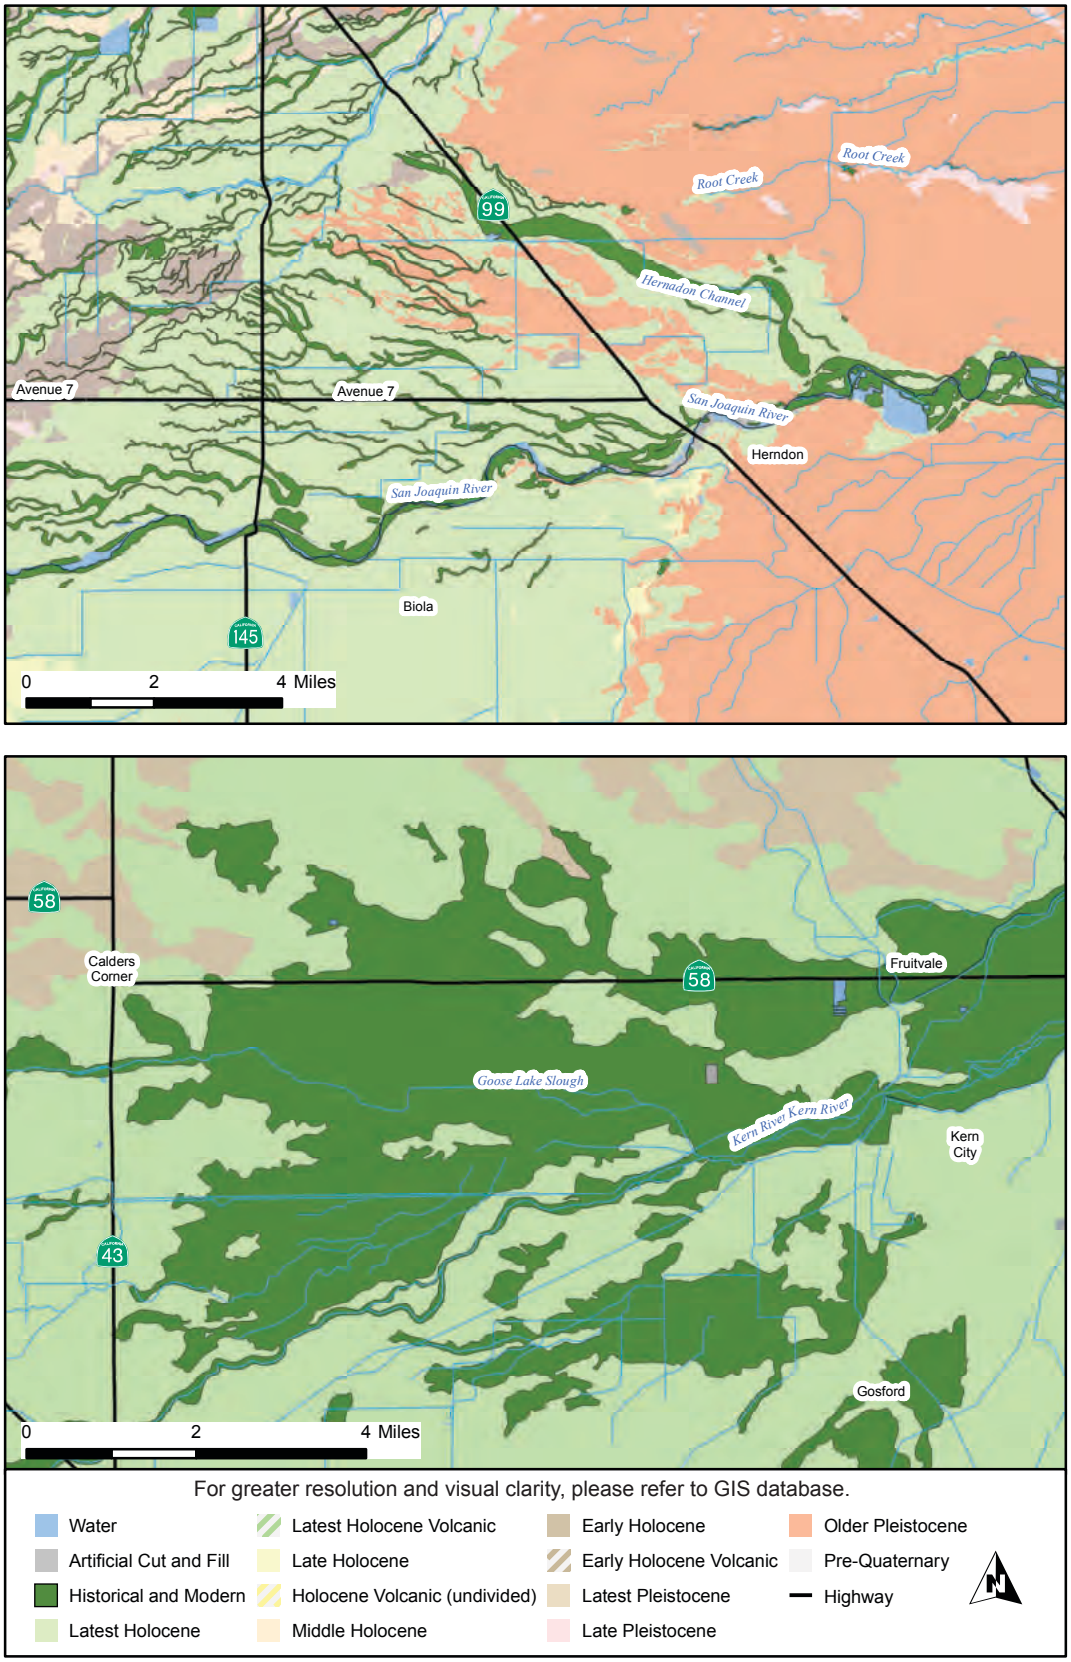

Figure 35. Historical to Modern Deposits in the San Joaquin Valley.

nature and texture of these deposits from location to location, they generally have undeveloped soil profiles, either because they have not been stable long enough, or because they were designed to resist weathering (e.g., dams, engineered fill). Modern artificial cut-and-fill deposits are still forming in the region.

GREAT BASIN AND MOJAVE DESERT

Geologic mapping in the Great Basin and Mojave Desert has focused on lithologic formations and structures of the prominent mountain ranges, with little attention to the "recent" valley fills (neotectonics and lake studies being prominent exceptions). The depositional units of the region lack cohesive naming conventions. Mojave and Great Basin fan systems have often been mapped in detail (see studies in Enzel et al. 2003; geoarchaeological contexts by Young 2007; 2009) but these tend to rely on idiosyncratic spatio-stratigraphic labels (for example, Qf1-Qf7, oldest to youngest) through which only cursory correlations are possible. Solving the riddles of basin-to-basin fan, stream terrace, dune, and lake correlations is well beyond the scope of this study; however, general chronological and processual relationships can be extrapolated across the Study Area. The degree of soil development provides an organizing principal for initiating a regional study of buried site potential.

Late Pleistocene and Older (>15,000 cal BP)

Glacial cycles that pre-date the Tioga glaciation (i.e., Tahoe and older) and tectonic uplift (mountainward) and downdrop (basinward) have resulted in relic outwash fans forming a broad alluvial bajada west of the Owens River at the foot of the steep mountain-fronts (Figure 36). Older Pleistocene surfaces are typically boulder-strewn, steeply to gently sloping fans and coalesced fans extending from the mountain-front to the level terraces of the Owens River. As observed on the western side of the range, the alpine valleys of the eastern Sierra appear to have experienced significant scouring during older Pleistocene glacial cycles; Tahoe-age (or post-Tahoe interstadial) scouring and outwash must have been especially competent. As a result, the later Tioga cycles, with some local exceptions, had less material to work with and less energy to deliver significant amounts of material to the valley margins.

In desert regions, older Pleistocene fans show intensive pavement development and are often uplifted relative to younger inset fans and valley margin deposits. Even in the arid environments of the eastern basins, these surfaces retain well-developed soil profiles with moderate to strong, calcium-, clay-, or oxide-rich B horizons. These landforms provide the foundation of the valley-bottom archaeological record.

Latest Pleistocene (15,000 to 11,500 cal BP)

Waning glaciation and high-amplitude fluctuations in larger lake basins were significant drivers of regional latest Pleistocene environmental change. As mentioned above, the Tioga glaciation may not have contributed large amounts of sediment to the eastern mountain front, and yet the hydrological cycling of wet-dry regimes resulted in active erosional and depositional cycles within eastside drainage systems. While smaller lakes in desert valleys, such as Searles and Eureka, returned but may not have reached earlier highstands, larger drainage systems experienced cyclical transgressions close to or reaching highstand levels. Lake Owens may have cycled between near-desiccation and sill-level overflow one or more times in several thousand years between glacial retreat and the close of the Pleistocene. Regional hydrological fluctuations, caused by atmospheric and oceanic perturbations as global systems responded to the termination of "ice-age" conditions (Benson et al. 1996; Benson et al. 1997; Phillips et al. 1996), produced concurrent erosion and deposition in valley-bottom environments. Large-scale geomorphic change became focused in riverine systems and lacustrine basins (valley floors), where prominent terraces formed along major drainages, deltas prograded into receding lakes, and littoral features (beaches and strands) were cut and occasionally reinterred. The strong Pleistocene linkage between global oceanic dynamics and regional atmospheric conditions (jet stream position/moisture content) was coming undone, so that geomorphic and environmental systems of the Great Basin, including areas immediately east of the Sierra Nevada, began to respond to much more local conditions than to global drivers. This de-coupling marked the Pleistocene to Holocene transition; approaching that temporal boundary, the latest Pleistocene was a period of dramatic though attenuated fluctuations as new equilibriums were established.

Figure 36. Older Pleistocene Fans Emanating from Glaciated and Unglaciated Drainages in the Owens Valley.

In the valleys east of the Owens River, large lake stands became rare but the cyclical character of wet-dry episodes supported small lakes and broad wetlands in valley-bottom settings, many of which were maintained into the early Holocene (Quade et al. 1998; Wigand and Rhode 2002). Relatively rapid changes in regional hydrology within each wet-dry cycle produced active cycles of erosion and deposition. Well into the southern Great Basin and northern Mojave, fan surfaces eroded to leave truncated paleosols near or at the modern surface. In Fremont Valley, south of Ridgecrest, the bajada of Pine Tree Wash preserves an eroded paleosol buried by relatively recent alluvium. Following a period of regional landform stability (i.e., the period of soil development), portions of the bajada surface were stripped by erosion, removing (truncating) the upper A-horizons and leaving the more resistant Bt and Btk horizons. Deposition shifted to the distal fan resulting in broad fan progradation. Radiocarbon dating on organics within the B horizon shows that the paleosol was well-developed at 15,030 cal BP (Beta-254726). This date provides a maximum for bajada erosion. A later paleosol dated at 10,760 cal BP (Beta-255187) on another area of the fan provides a minimum date for this phase of fan progradation at Pine Tree Wash and Fremont Valley.

Evidence of a similar landform sequence is found at Dove Springs Wash in Red Rocks State Park to the north. Although also buried by younger deposits, an eroded paleosol found throughout the Dove Springs and Red Rock area has been dated to 12,750 cal BP (Beta-18449; Whistler et al. 1990, 1994). The date comes from depositional organics (conifer fragments), and the paleosol formed soon after.

The Gunsight soil series formed on latest Pleistocene landforms in the northern Mojave (Figure 37). A series of radiocarbon dates on *Anadonta* shell in beach and bar features, now capped by the Gunsight soil, shows that these landforms were mostly deposited in the latest Pleistocene (Ore and Warren 1971; Wells et al. 1989). A period of highstands at Silver Lake corresponds with increased runoff and fan progradation throughout the Mojave River system at this time (Wells et al. 1989). Along the eastern front of the Sierra, latest Pleistocene deposits and corresponding soil series (e.g., Yermo and Timosea) are confined to upper fan segments and post-glacial features near the mountain front and in steep-sided canyons. The latest Pleistocene-age Polenta series near Bishop formed on remnant alluvial terraces abandoned by the Owens River (Figure 37 and Figure 38). A surface date of 7,245 cal BP (Beta-53846; Pinter et al. 1994) provides a minimum age for underlying deposits that form large, segmented river terraces on the western side of the Owens River. Hydrological cycling characteristic of the latest Pleistocene flushed out large amounts of sediment from the Owens Valley, setting the stage for a complex terrace system along much of the river reach. During this period deposition was focused along lower reaches of the river and in the delta and littoral area of Owens Lake. This material has been worked more recently into an extensive aeolian-deposited berm and dune system north and east of Owens Lake.

Early Holocene (11,500 to 7000 cal BP)

Hydrologic cycling continued into the early Holocene, though the amplitude of high and low streamflows and the transgression and regression of regional lake levels began to lessen. In general, Great Basin landforms of the early Holocene were relatively stable. Prominent, well-developed soils dating to this period are relatively common, though most are buried beneath younger fan surfaces. The downcutting of previous intervals may have allowed fan surfaces to stabilize by confining fluctuating streamflows to relatively incised channels. Fans continued to prograde and may have engulfed axial valleys with sediment. In fact, early Holocene age landforms make up a significant percentage of mapped deposits in the eastern side of the Study Area. This, combined with the prevalent occurrence of early Holocene paleosols, suggests a generally stable period, with longer-term effective moisture (Bacon et al. 2003) and more equitable seasonality in the form of increased summer rainfall (Wigand and Rhode 2002).

Although the early Holocene is often considered the initial phase of general Holocene drying, precipitation and overall capacity of stream systems may have been relatively high compared to later periods. Quade et al. (2003) have shown dramatic productivity in spring environments of the southern Great Basin. Black mats and lake deposits dated to this interval (10,640-9070 cal BP) at the Lava End Locality in Rose Valley, south of Owens Lake, provide evidence that the lower Owens system may have experienced mesic conditions. Based on dated lake deposits in Rose Valley, and evidence for a relatively deep lake in Searles Basin (Smith and Street-

Perrott 1983), it seems likely that Owens Lake reached its overflow sill at least once in the early Holocene (Phillips 2008; Orme and Orme 2008). Alternatively, groundwater connections and local surface flow (e.g., in Rose and Indian Wells valleys) may have been enough to supply water to the lower reaches of the Owens River. Springs may have been especially productive during the early Holocene, providing habitat refuges and predictable water sources during cyclical downturns.

In the Mojave River system, streamflows remained relatively high. The record of dated freshwater shell in the southern Great Basin and Mojave River (Figure 39) is particularly illustrative of the change in hydrologic conditions. Dated shell is common in latest Pleistocene deposits along the Owens and Mojave rivers. There is enough moisture in the river systems to maintain populations of freshwater shell through the early Holocene, but these shells disappear from the record in later periods; there are no dates on freshwater shells in the region from 8000 cal BP until very recent times. A highstand of Lake Thompson is also recognized at about 7660 cal BP (Beta-166446) in the Rosamond and Rogers lake basins in the western Mojave Desert (Orme 2008). This seems a significant proxy for continuation of healthy riparian environments throughout the Study Area during the early Holocene.

Early Holocene deposits are common along the Owens River. These are often positioned as abandoned terraces, with younger inset terraces between early Holocene landforms and the modern river course. The Division soil series, broken by the Lone Pine fault scarp north of Lone Pine, formed on a surface that stabilized in the early Holocene (Figure 40). Bacon et al. (2003) provided a series of well-dated profiles with stratigraphically organized dates between 14,820 and 10,330 cal BP from landforms with Division soils mapped at the surface. Deposition of many of the early Holocene Owens River terraces may have begun with latest Pleistocene scouring upstream, but final deposition and stability was established in the early Holocene. Because sediment originating from young fan surfaces to the west has not yet reached the Owens River, early Holocene terraces form a prominent level landscape between the valley-margin fans and incised river channel.

Early Holocene landform stability is also evidenced beneath the relatively young fan surfaces on the western margin of Owens Lake and beneath the pumice-capped fans near Mono Lake. Buried soils that formed during the early Holocene are common in the bajadas emanating from the eastern Sierra mountain front. Archaeological excavations at INY-4554 (Gilreath and Holanda 2000) revealed an early Holocene cultural assemblage resting on a prominent buried paleosol. The paleosol was also exposed in the arroyo of Ash Creek on the southern margin of the fan (1-1/4 miles south of the site [Figure 40]). Dates from the paleosol, derived from soil organics at both locations, ranged from 9390 to 7600 cal BP (Figure 41); this shows long-term soil development and general stability across broad stretches of the Ash Creek alluvial fan. Although fan stability and peaks in soil organics suggest relatively moist environmental conditions, Owens Lake may have been approaching desiccation, as evidenced by soil development on an exposed lakebed with dates of 9220 and 9240 cal BP (Benson et al. 1997; Benson et al. 2002); fish remains from a buried beach deposit on the lake's southeastern shore have been dated to 8265 cal BP (OS-72752), marking a prominent die-off and likely lake desiccation (Figure 41). Soils were also developing on stable alluvial fans and terraces in Indian Wells Valley in the early Holocene; now buried, these paleosols have been dated to between 10,250 and 9810 cal BP (Figure 41). This is key evidence for cyclical environmental conditions of the early Holocene.

Fan systems between Owens and Rose valleys are capped by the Ulymeyer soil series which displays a strong soil profile. These alluvial fans, which lie above the overflow-point of Owens Lake (beneath modern Haiwee Reservoir), have been long-stable, though periods of lateral surface erosion (i.e., planation) have resulted in periodic pauses in soil development. Nonetheless, these soils are probably correlates of the now-buried paleosols found in alluvial fans on either side of this relatively high landscape.

In the desert basins east of the Owens River, alluvial fans continued to prograde with significant extension into valley bottom areas during the early Holocene. In fact, most of the fan surfaces and near-surface deposits in Death, Panamint, and Silurian valleys are early Holocene in age as indicated by the Carrizo soil series. However, fans in each valley are complicated landforms with time-transgressive surface ages (i.e., youngest to oldest as one moves up-fan) and significant local variability. This is likely due to valley-to-valley variations in intense summer storms that tend to drive Holocene fan progradation in an idiosyncratic way.

Figure 41. Selected Views of Radiocarbon-Dated Early Holocene Deposits in Owens and Indian Wells Valleys.

Rearrangement of the landscape marked the close of the early Holocene as significant drying, likely accompanied by fewer but more intense summer storms, took hold of the region. It is difficult to split this episode of significant erosion and deposition between the early and middle Holocene periods. Geomorphic process influenced the preservation and modern distribution of the landforms of the former period, while environmental conditions characteristic of the latter period were beginning to take hold. There is a dearth of radiocarbon dates from buried paleosols at this boundary suggesting that landforms were being eroded and/or capped by new deposits; a regional absence of soil dates may be a good proxy for regional geomorphic activity. In the northern Great Basin, tephra from the eruption of Mount Mazama filled erosional gullies, choked narrow drainages, and was incorporated into new fan deposits (Davis 1978; Nials 1999.; Young in McGuire 2002:4). The Mazama ashfall occurred at about 7700 cal BP (Hallett et al. 1997) and, based on its depositional context, followed closely geomorphic rearrangement marking the early/middle Holocene boundary. Although not well-documented in the study area, deposits of Mazama tephra occur in the northern portions of Mono County (Sarna-Wojcicki et al. 1991; and see Chapter 5). Nevertheless, it provides a minimum date for the transitional period of punctuated landform rearrangement.

Middle Holocene (7000 to 4000 cal BP)

With the opening of the middle Holocene, relatively high aridity and prolonged droughts are evident in the valleys east of the Sierra Nevada (Grayson 1993; Wigand and Rhode 2002). Following the intensive down-cutting of the early/middle Holocene transition, points of alluvial erosion shifted toward mountain fronts and valley margins resulting in broad fan progradation and sheet deposition. Early Holocene paleosols near Owens Valley and along the Owens River terraces were buried by renewed fan deposition in mid-fan locations. Fans expanded in Fish Lake Valley and the northern reaches of Death Valley. Fan progradation was also influenced by major tectonic shifts in locations as disparate as Fish Lake Valley (Reheis 1994) and Fremont Valley (Gardner et al. 2002). Lower in the valleys, landforms either became stabilized (Rose Valley) or underwent pulses of aeolian re-working. Owens Lake desiccated completely (Bacon et al. 2003; Benson et al. 2002), and groundwater-charged Little Lake was limited to a tule and scirpus wetland (Mehringer and Sheppard 1978). With regional desiccation, aeolian transport of sand from drying streams, deltas, and lakes allowed the development of new dune fields (northeast and south of Owens Lake) and rejuvenation and reconfiguration of large dunes in many other locations (Mehringer and Warren 1976).

Radiocarbon dates on charcoal from distal fan deposits in Fremont Valley provide evidence of distal fan progradation beginning sometime after 8125 cal BP and continuing in repetitive pulses until almost 3690 cal BP (Young 2009). This broad fan progradation, originating near valley margins, resulted in deep burial of archaeological sites situated in incised drainages along the Garlock Fault on the western side of Fremont Valley. At Clark Wash (KER-3939), hearths and cultural burn zones formed in the early/middle Holocene (dates range from 8000 to 6300 cal BP) occupy a drainage where tectonic offset provided protection from subsequent erosion (Gardner et al. 2002); the site rests in an abandoned channel that was tectonically shifted away from local streamflow (i.e., canyon floods). Cultural materials were subsequently buried by sheet floods from the adjoining fan, filling the abandoned drainage and capping the archaeological site after 6300 cal BP.

The Cartago soil series marks landscapes formed during the middle Holocene. Early Holocene spring and lake deposits in Rose Valley are capped by fan and sand sheet deposits with well-developed soil profiles of the Cartago series (Figure 42). Radiocarbon dates on soil organics in a Cartago profile at the Lava End Locality in Rose Valley range from 7625 cal BP (Beta-260155) to 5050 cal BP (Beta-260152; Figure 43). At this locality the soil was capped by a thin sand sheet and is no longer developing; elsewhere in the valley the soil is at the modern surface. Along the Owens River terraces north of Owens Lake, the Cartago soil series formed on small fans that drape onto early Holocene terraces adjacent to the river (see Figure 42).

Archaeological sites are common on middle Holocene fans of the Cartago series. Almost always late or latest Holocene assemblages, with radiocarbon dates less than 2000 cal BP, the sites are typically surface or shallow manifestations in well-drained sediments of relatively young fans. Site INY-3826 at Little Lake was buried by artificial fill but rested directly on a Cartago soil profile. This site has a series of radiocarbon dates from near-

surface contexts that cluster between 1290 and 1045 cal BP (Byrd and Reddy 2004), providing a limiting age for the landform. A maximum age for the distal portion of the Little Lake Canyon fan is provided by buried early Holocene cultural deposits at the Stahl site (INY-182; Schroth 1994). Other assemblages with late Holocene dates resting on middle Holocene landforms marked by Cartago soils include INY-2284 (Faull 2006), INY-5281, and INY-5876 (Zeanah and Leigh 2002).

The Cartago soil and associated landforms may be the best temporally constrained landscape features in the eastern project area. In addition to examples from Little Lake and the Owens River, historic-era arroyos in the vicinity of Centennial shore on the southeastern side of Owens Lake have exposed a complex fan/lacustrine interface. Although overlain by late Holocene fan deposits, the Cartago soil generally outcrops near the top of local profiles and grades upward to form the modern surface of higher fans around the lake margin. As elsewhere, the Cartago soil is bracketed by a date of 6780 cal years BP (OS-72855) from a buried soil beneath this deposit and a date of 490 cal years BP (OS-71199) from a cultural hearth that directly overlies the buried Cartago profile (see Figure 42). These well-dated assemblages provide clear constraints for middle Holocene fan deposition and subsequent development of the Cartago soil.

The Great Basin notion of expansive and prevalent heat and aridity during the middle Holocene "Altithermal," as originally proposed by Antevs (1948), has been superseded by a nuanced view of local variability (Grayson 1993:216; Sutton et al. 2007). However, archaeologists continue to struggle with a relatively sparse archaeological record. In fact, the general outcome of middle Holocene drying seems to be relatively low population densities throughout large areas of the Great Basin and Mojave Desert (Grayson 1993:255). Pinto Series projectile points occur in widespread contexts throughout the region (Sutton et al. 2007:238), but dated sites are relatively rare. Most radiocarbon dates from sites with Pinto assemblages (e.g., Stahl, Clark Wash, [those of Pinto Basin, further afield]) fall within the early Holocene or occupy the early years of the middle Holocene. Sites with well-dated middle Holocene components tend to be in relatively well-watered positions that may have been resource refugia. Site MNO-891 is adjacent to Walker Creek (Carpenter 2001) in close proximity to remnants of glacial lakes where resources may have been somewhat buffered by orographically induced precipitation (see Figure 43). Although the Rose Spring site (INY-372) is famous for its late Holocene projectile point assemblage, the site may also provide a classic example of a spring-side refugia. The site appears to have been first occupied about 6,000 years ago and contains a well-dated middle Holocene component with multiple features and dense midden (Yohe 1992).

Late Holocene (4000 to 2000 cal BP)

The late Holocene period is marked by a general amelioration of the harsh aridity of the preceding interval, and a rebound toward more favorable environmental conditions. As a whole, the region experienced an increase in seasonality resulting in an overall increase in precipitation and concomitant reduction in evaporation. Unlike the punctuated erosional and depositional events that marked the opening of the middle Holocene, the regional transition from the middle to late Holocene was spatially and temporally transgressive. Pollen evidence and lake-inundated trees from the northern Great Basin suggest that increased precipitation may have arrived as early as 6,000 years ago (Wigand and Rhode 2002). Peat deposits in Ash Meadows near Las Vegas also show spring regeneration at about 6,000 years ago (Mehringer and Warren 1976; Wigand and Rhode 2002). Although this spring record is enticing, the shifting dune environments may have forced changes in deposition of spring organics. In any case, both Mono Lake and Owens Lake reached relative high stands around 4,000 years ago, (Bacon et al. 2006; Benson 2004; Stine 1990, 1994) pointing to a general increase in regional precipitation and runoff, a keystone of the late Holocene.

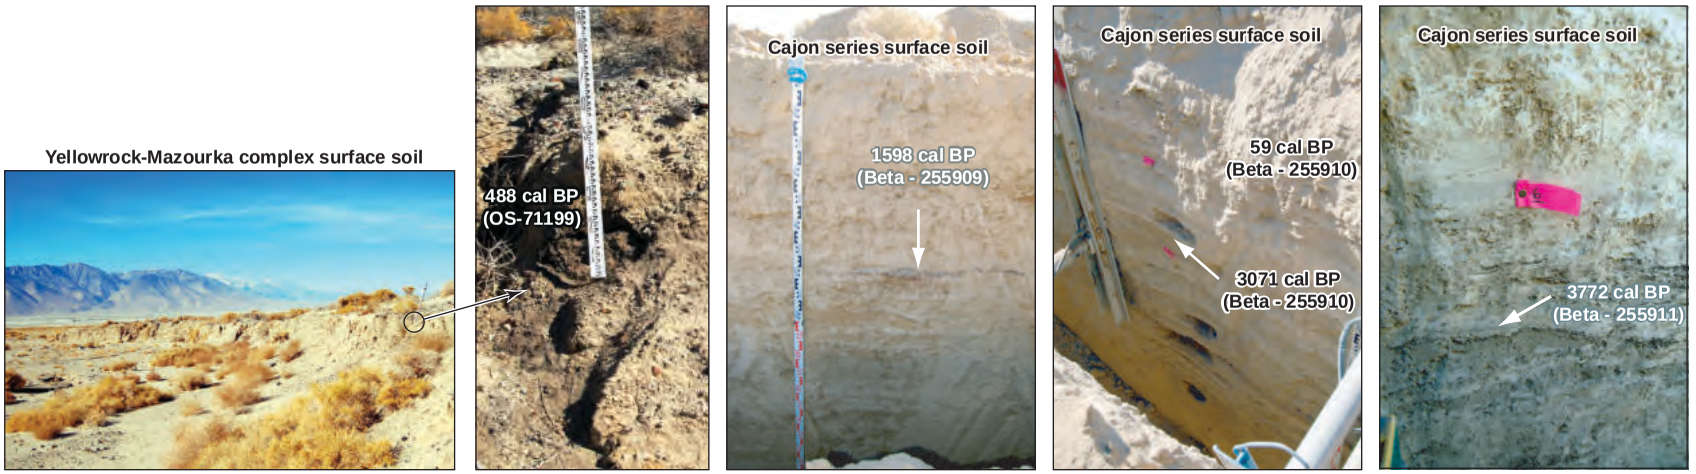
Concurrent with the regional increase in lake levels, some rising from near desiccation, regional landforms underwent a significant rearrangement. Although not as pronounced as the down-cutting and fan progradation episodes of the early to middle Holocene transition, there is a similar erosional and depositional period between about 4000 and 3500 years cal BP. After this transition, there are no dates on soil organics from late Holocene period landforms in the Great Basin or Mojave Desert. This may be a result of general sampling error, but it does suggest that geomorphic change and landform rearrangement was dominant through the period. Furthermore, late Holocene dates on non-cultural and cultural material buried within landforms are relatively

common. This is especially true in distal fan areas where fan progradation extended toward valley bottoms. Late Holocene deposition produced thick deposits in Fremont Valley (Figure 44) where movement on the Cantil/Garlock fault and increased run-off led to several meters of sediment (Young 2009). In the Mojave section of the Sierra front, these late Holocene deposits are capped by even younger (latest Holocene) sediment packages (i.e., latest Holocene or historic)

Further north, late Holocene fans are common adjacent to the Owens River terrace and are inset between older fans, typically middle Holocene and latest Pleistocene. Many of the modern fans emanating from the Sierra mountain front along the Owens River began development in the late Holocene (see Figure 17); similar progradation occurred at the foot of the White Mountains.

Soils on late Holocene landforms typically show weakly to moderately developed profiles because sediment deposition occurred relatively recently. While late Holocene landforms are often buried, late Holocene soils form the modern surface throughout much of the Owens River terrace system and, as mentioned, on alluvial fans adjacent to mountain fronts. The Yermo and Yellowrock soil series have formed on inset alluvial fans emanating from the western side of White and Inyo mountains, east of the Owens River terraces and floodplain (Figure 45). West of the river, contemporaneous landforms with Goodale soils and small areas of Yermo soils emanate from the bajada of the eastern Sierra Nevada.

Although these soil series have not been directly dated, archaeological sites on their surfaces have produced dates reflecting latest Holocene occupation. Site INY-2750 rests on a small fan with the Yermo series; Delacorte (1999) obtained a radiocarbon date of 1250 cal BP on an archaeological feature deposited on this soil. These young fan deposits are relatively thin, often resting on lacustrine or riverine deposits of Pleistocene vintage (Bacon et al. 2006).



Terraces on the Owens River, between Bishop and Owens Lake, form a complex system of erosional and depositional surfaces. Archaeological sites are relatively rare on the terraces in close proximity to the modern river channel, and the few sites that have been dated, such as INY-328 (Delacorte 1999), contain relatively shallow surface deposits resting on much older landforms. Sites are often found where late or latest Holocene fans and small dune sets extend onto late terraces. The dunes are reworked alluvial sediments derived from the terraces. These young terraces and late distal fans are marked by Mazourka soils (see Figure 38). Hesperia soils cap the distal fans and late Holocene dunes.

Radiocarbon dates derived from archaeological sites on and cut into Mazourka soils range from 1200 to 375 cal BP (Delacorte 1999). Sites on adjacent fans and dunes capping the terraces, marked by the Hesperia series, including INY-3769, INY-4646, and INY-5775, have radiocarbon suites falling within the same range (Delacorte 1999; Faull 2006; Zeanah and Leigh 2002).

Latest Holocene (2000 to 150 cal BP)

In general, latest Holocene landforms expanded in valley bottom settings throughout the Great Basin and Mojave Desert as fan progradation continued. There are, however, clear proxies and many seminal studies indicating that during the last 2,000 years environmental shifts increased in frequency and amplitude congruent with variations in the impacts of regional climatic drivers (e.g., El Nino). At about 2000 cal BP, drought conditions forced regression of lakes that had returned in the late Holocene. Well-developed beach berms associated with late Holocene high stands at Mono and Owens lakes (Stine 1990), were abandoned as lakes retreated and then fluctuated, to form a complex series of concentric low-elevation beaches and berms.

Variation in regional environmental conditions, across an interval of almost 600 years, culminated in closely spaced droughts at about 850 and 600 cal years BP, i.e., the Medieval Climate Anomaly (Stine 1994). These intense dry events were punctuated by periods of relatively abundant precipitation; submerged tree stumps provide direct evidence of a significant medieval drought. The droughts were of such duration that large trees expanded to elevations below modern lake level in the Mono Lake Basin and Walker River. When moisture returned, the trees were rapidly inundated and preserved in growth position (Stine 1994). Though the evidence for drought was clear, Stine and others subsequently realized that the medieval period was characterized more by fluctuations than simply one extensive drought and lake regression.

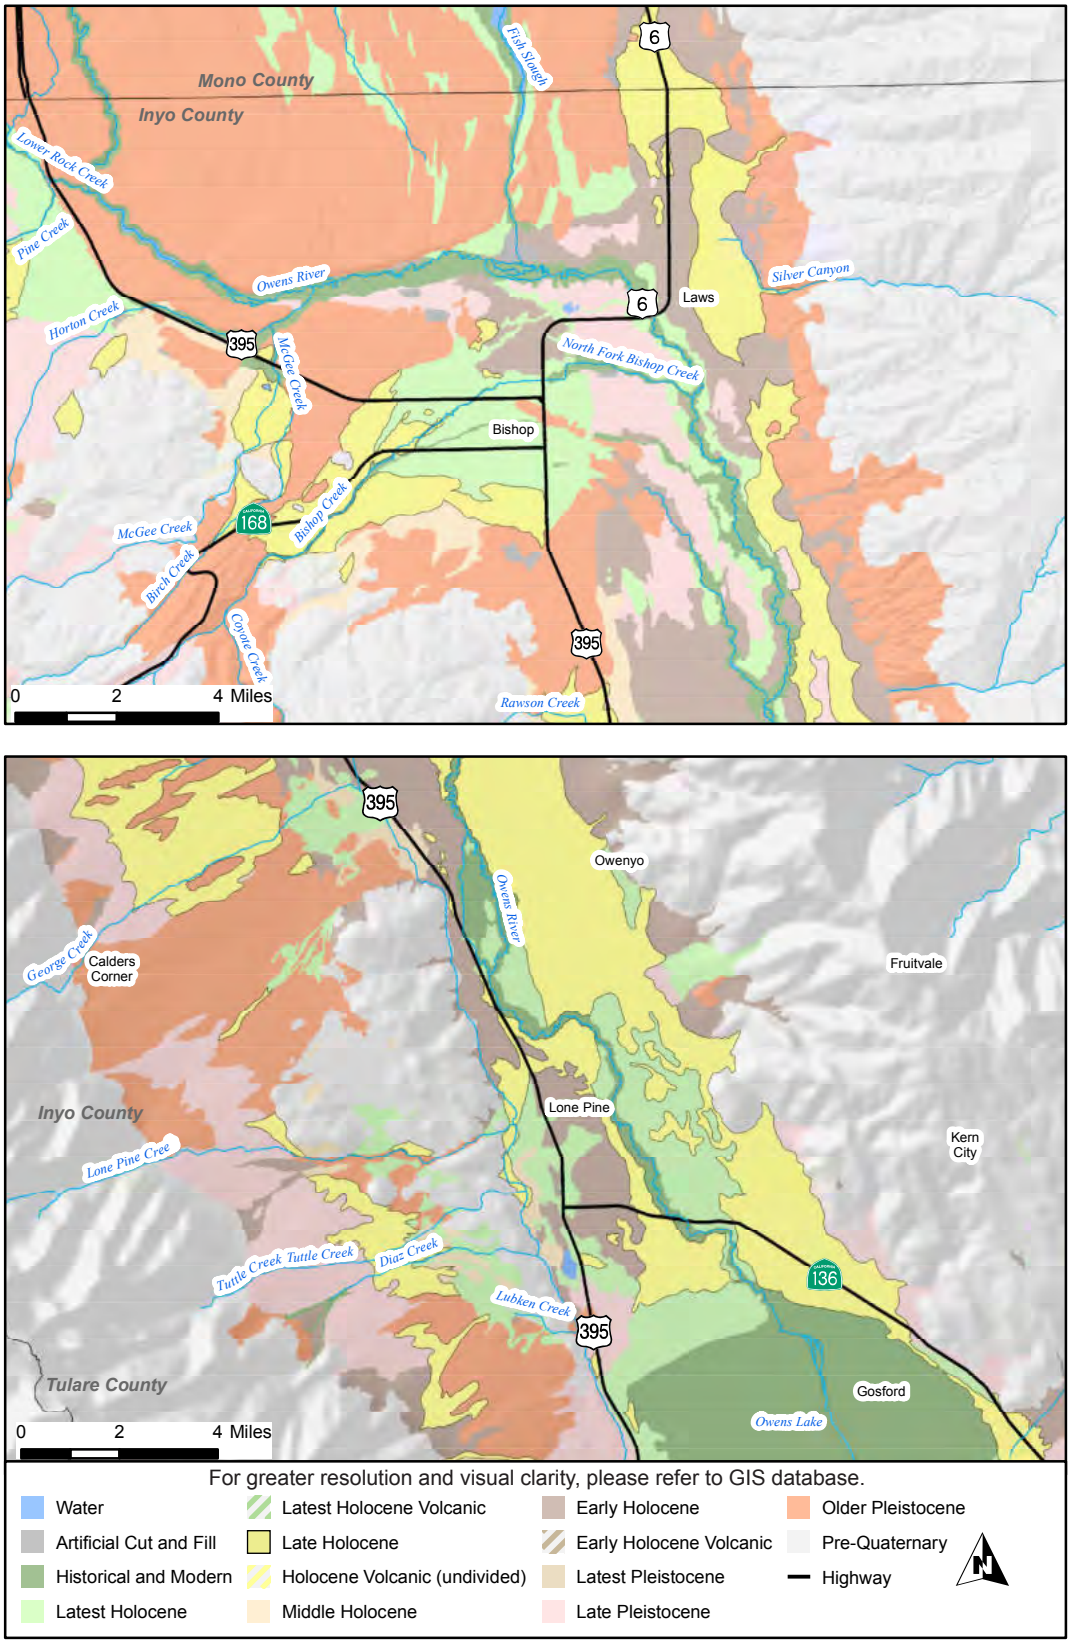

Figure 45. Late Holocene Deposits in the Upper Owens Valley (top) and Lower Owens Valley (bottom).

Fan progradation and fluctuating (though generally low) lakes and streams contributed large amounts of sediment toward valley bottoms. Stream flow in the Owens River appears to have cyclically flushed the fluvial system, delivering sediment to its drainage terminus at Owens Lake. Rearrangement of beaches and deltaic sediments resulted in the development of complex dunes and sand sheets on the basin margins. Radiocarbon dates from buried late and latest Holocene archaeological sites are relatively common, reflecting latest Holocene dune and lake-margin deposition (i.e., fans prograding to lake basins) in the basins of Mono Lake and Owens Lake. Landforms may have remained very unstable during fluctuations of the Medieval Climate Anomaly because equilibria between precipitation, surface cover, and runoff could not be maintained. Thus, environmental changes would have encouraged fan expansion and dune reworking, burying older landforms and associated archaeological sites. Fires may have also been common due to drying and wetting cycles and volcanism (see Chapter 5), allowing the incorporation of non-cultural charcoal commonly observed in latest Holocene deposits.

On the Owens floodplain, site MNO-584 contained surface archaeological features post-dating 500 cal BP (Garfinkel and Cook 1979). In Milner and Jeffrey Mine canyons in Mono County, non-cultural charcoal buried by active fans, including debris-flow facies, date to the beginning of the Medieval Climate Anomaly (Hubert and Filipov 1989). Incipient soil series, such as Brantel, Benemes, and Millner, have formed on these young fan and dune deposits.

The pattern continues further south. At site INY-1991, very recent archaeological features, most post-dating 500 cal BP (Byrd and Hale 2003; Markos et al. 1998) rest on young fans burying much older cultural deposits. Nearby, surface features at site INY-5967 are slightly older but still post-date the dramatic cycling of the Medieval Climate Anomaly (Byrd and Hale 2003). Lakeside fan segments expanded from late Holocene and earlier medial fan segments. A hearth buried by a small inset fan at the margin of Owens Lake (see Figure 44) returned a date of 490 cal BP (OS-71199). While this date provides age control for the late Holocene fan and soil series the feature was cut into, it also provides a maximum age for the youngest fans at the southeastern side of the lake. These fan deposits are marked by the widespread Cajon soil series.

In basins without significant river-lake systems, fan expansion and aeolian reworking filled valley-bottoms. The Cajon soil series has been described on expansive alluvial fills throughout much of the Mojave Desert segment of the Study Area, including on fans of southern Owens Valley, western Indian Wells Valley, Fremont Valley, and well into Antelope Valley (Figure 46). These broad basins, which are moderately sloping to almost level, often retain a very young surface veneer of distal fan and valley fills. Arcuate sand and silt dunes resting on very young distal fans are common at the margins of playas, such as Rosamond and Rogers lakes. Although pluvial histories of these shallow lakes are poorly understood, during much of the Holocene they functioned as catchment basins for fan runoff. Fluctuations encouraged dune development as the basins were repeatedly flooded, turbated, and then scoured.

At Rogers Lake, the Cajon and related Leuhman soil series formed on the distal fan segments and basin-side dunes (Figure 46). Radiocarbon dates on cultural material from buried and surface contexts in these soil series are consistently less than 2,000 years old (Byrd 1996; Byrd et al. 1994). The Cajon series extends northward into Fremont Valley on fans and valley fills. The latest Holocene fans form a thin alluvial veneer, and thicken near basin centers or along faulted troughs (Young 2009). Near Cantil, Sutton (1991) dated several deeply buried sites, including KER-2211, which provided three radiocarbon dates of less than 1210 cal BP. Nearby, Apple et al. (2008) and Young (2009) have dated numerous buried archaeological sites and other depositional contexts showing that the Cajon soil series formed on very young fan deposits (< 700 years old) and valley fill. Similar alluvial fan veneers extend from the mountain fronts on the western side of Indian Wells Valley. These shallow deposits, mapped as Cajon series soils, rest on abrupt contacts that pre-date 2000 cal BP. Young (2007) obtained a series of radiocarbon dates from underlying fan deposits which provides a maximum age of 2900 cal BP for these recent fans and the associated Cajon series (see Figure 44)

Contemporaneous fan progradation and dune activity occurred in Great Basin valleys east of the Owens Valley. In Deep Springs Valley, east of Bishop, archaeological charcoal buried by young fans mapped in the Veet soil series have been dated to 1290 cal BP (Ives et al. 1964; Lustig 1965; see Figure 44). Elsewhere in Deep Springs Valley, similarly young fans and dunes provided radiocarbon dates ranging from 1910 cal BP (buried) to 490 cal BP (surface; Lee et al. 2001); these dates succinctly bracket Medieval Climate Anomaly cycling.

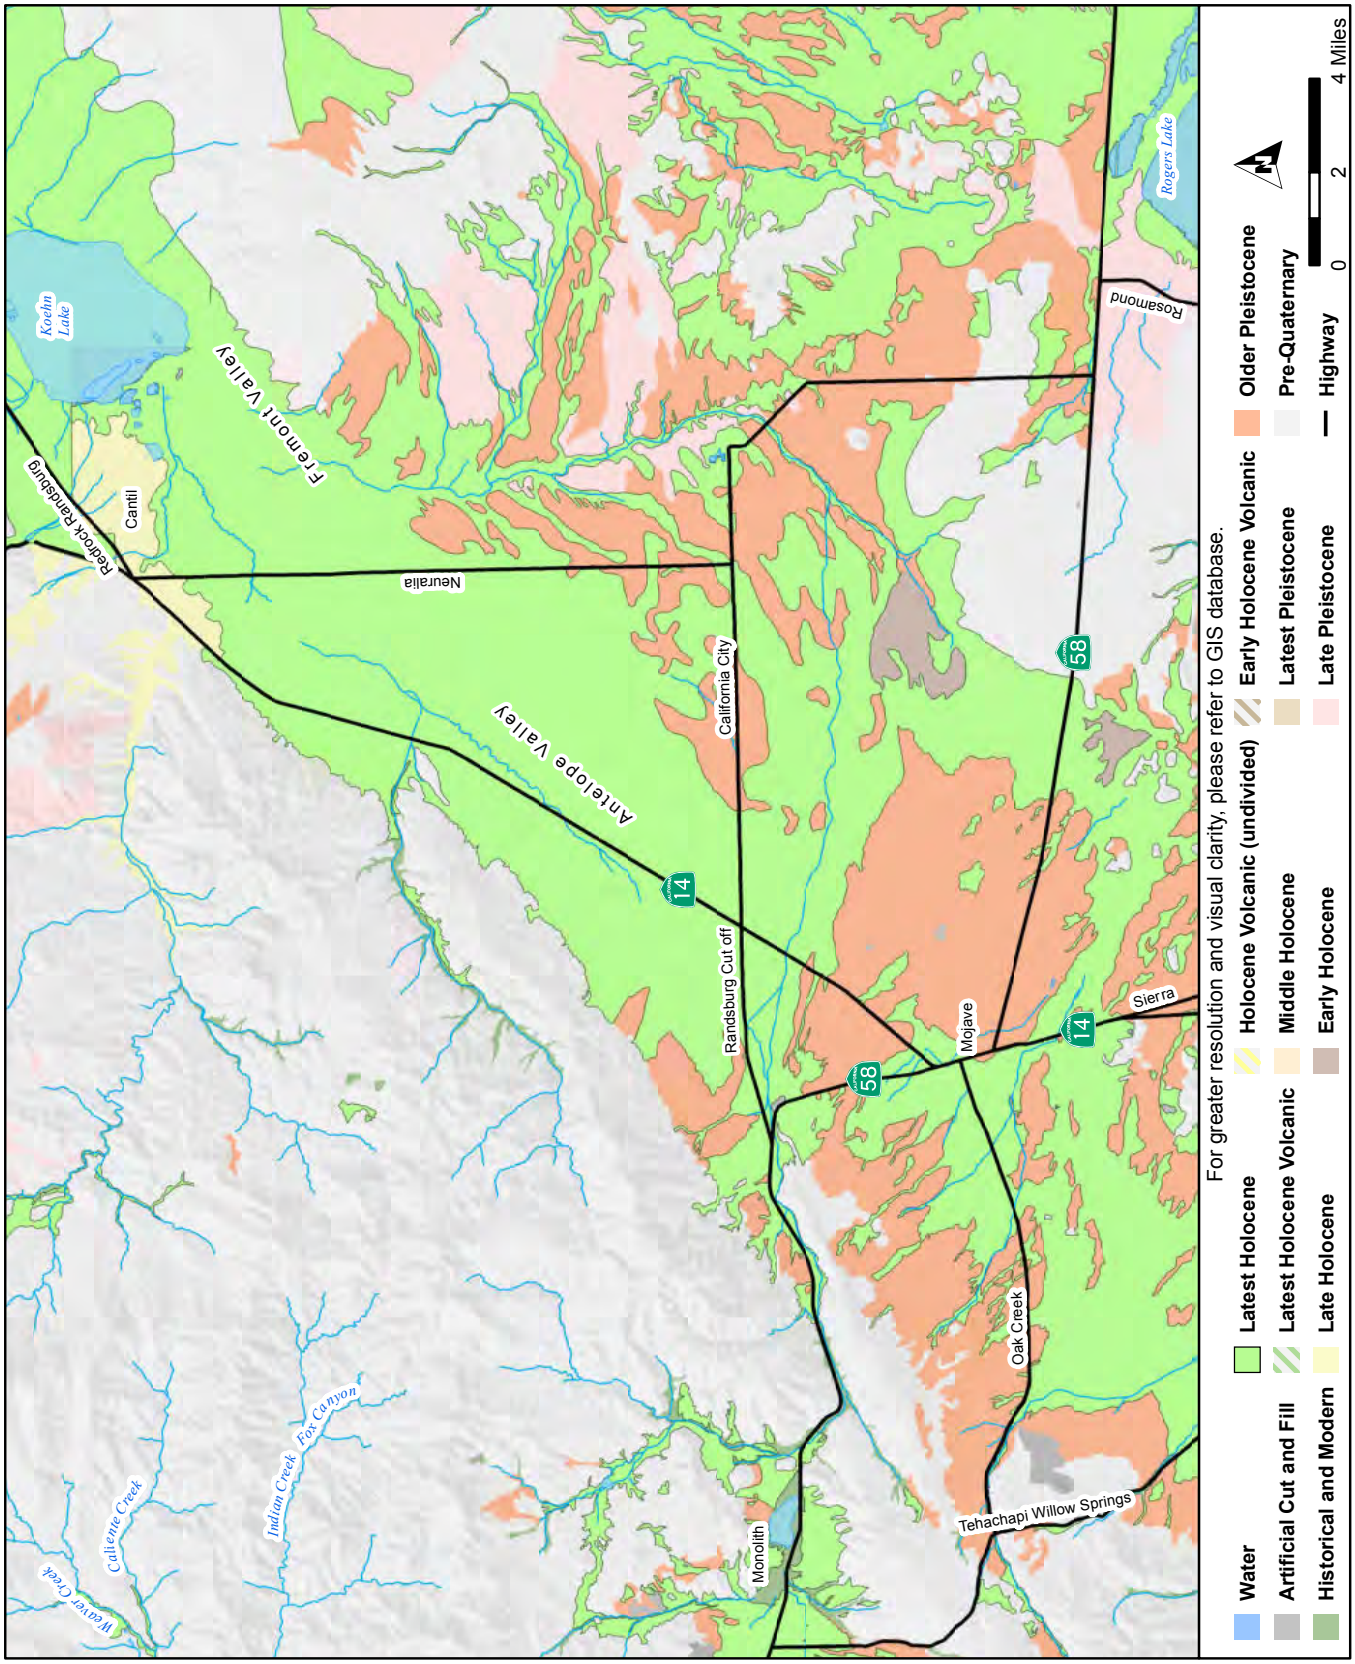

Figure 46. Latest Holocene Deposits in Antelope and Fremont Valleys.

In Panamint Valley and Death Valley, alluvial bajadas continued extensive progradation during the latest Holocene as alluvial fans encroached on valley centers. In dry periods, distal fan deposits and lacustrine relict landforms (e.g., beaches and berms) were reworked into the existing dune systems. Aeolian landforms throughout the Great Basin and Mojave Desert portion of the Study Area continued cycles of reworking initiated in the late Pleistocene and early Holocene. Radiocarbon dates from the active dunes are often very young, typically due to the highly idiosyncratic nature of dune preservation. Deflating cultural features in the Panamint Dunes are latest Holocene in age (Breschini et al. 1996). A burial at INY-2546, for example, was capped and then subsequently exposed by aeolian reworking over the past 750 years.

Because latest Holocene archaeological deposits occupy, and are readily visible on or very near the modern surface of all landforms, radiocarbon information and archaeological sites are well represented for this period. Understanding the extent and geometry of the latest Holocene landforms provides useful information on the potential for buried archaeological sites, primarily because the underlying surfaces may have been available for occupation for a very long period of time. A special case of this occurs in the Inyo/Mono region where volcanic deposits of very recent origin cap almost all landforms (see Chapter 5). This relatively unique situation makes surface archaeological inventory very limiting, as only those materials and sites post-dating latest Holocene eruptions will be visible.

Historic-Era to Modern (150 to 0 cal BP)

Of the small group of landforms dating to the Historic-era and modern period, most consist of playa surfaces, with all others relatively limited in size. The playas east of the Sierra Nevada are typically lakebed remnants of pluvial lakes (Benson 2004). Many of these basins experienced periodic inundations during the Holocene, reaching various high-stand elevations (Benson 2004; Benson et al. 1997; Stine 1990). Owens Lake, for example, may have reached its overflow sill in the earliest portion of the early Holocene and formed multiple shorelines and beach berms during lake transgressions, and brief stillstands in more recent times. In fact, a relatively large, though not too deep, lake might occupy the modern playa if upstream alterations (i.e., water diversions) had not occurred. So the Owens playa is a modern feature subject to aeolian deflation, not to mention human-engineered alteration. The playa and desiccated salt badlands of Death Valley, though encroached upon by valley margin alluvial fans, are also subject to deflation and other modern processes.

The playas of Rogers Lake and Rosamond Lake lack deep water deposits of the basins that once held vast pluvial lakes (Orme 2008), but the formation processes of playa development are similar. These basins were repeatedly inundated and occasionally held significant lake stands during the Holocene. Lake stands likely were short-lived, yet the basins may have supported wetland communities of plants and animals for periods of time. The surfaces, however, were mostly dry landscapes where deflation and nearby surface re-working were commonplace. Like the larger playa landforms in the Great Basin and northern Mojave Desert, these deflationary, occasionally flooded, features are grouped in the modern period.

In addition to these non-cultural deposits, a number of artificial landforms and engineered landscapes were created by human land-use changes in the Historic-era, with mining, agriculture, and the construction of transportation corridors (e.g., railroads, highways) and water impoundment and conveyance systems (e.g., dams and irrigation canals) being a few of the most obvious examples (Figure 48). By the early 1860s, valuable deposits of metallic minerals (i.e., silver, lead, gold, tungsten, and copper) and non-metals (e.g., borax, dolomite) were discovered and mined from several key areas known as the Bodie-Aurora, Late Mountain, Montgomery, Lone Pine, White Mountain, Keyes, Inyo, Russ, Coso, and Death Valley mining districts (Beddie 1864); listed roughly from north to south.

As mining activities reached a zenith between the 1870s and 1890s, food and forage demands of the miners and their livestock sparked a boom in local agriculture. By the 1870s, approximately 3,000 acres of the Owens River floodplain were already under cultivation and being systematically irrigated in the area between Alabama Hills and Poverty Hills (Lee 1912). As the population of people and mules reached into the thousands, a series of boom towns sprang up throughout the region (Figure 48). In the developed and populated town of Lone Pine, at least 27 (~10 %) of its residents were killed when a massive magnitude-8 earthquake struck the

Owens Valley in March of 1872 (Beanland and Clark 1994). That quake produced a large surface rupture that can be traced across much of the valley floor, creating a fault scarp with vertical displacement of as much as 4.4 meters (~14.4 feet) in some areas (Bacon et al. 2003; Beanland and Clark 1994; Lee et al. 2001).

By the early twentieth century, the growing demand for water prompted the city and county of Los Angeles to purchase land and the water rights to properties that stretched from the Mono Basin through all of Owens Valley, and parts of Rose and Antelope valleys. As a result, human activity and related ground disturbances (i.e., canals, dams, roads, and pipelines) increased dramatically as the first Los Angeles Aqueduct was constructed between about 1907 and 1912 (see Figure 48). As part of a second aqueduct project, a dam was constructed near the natural outlet of Long Valley, located in the upper Owens River drainage, and the lower part of the valley was flooded to create present day Lake Crowley (see Figure 48). Other dams were constructed along the Owens River north and south of Owens Lake, and portions of the valley flooded to create Tinemaha and Haiwee reservoirs. By the 1920s and 30s, many of the state rural highway routes were established and constructed, including much of State Route 395, with most segments located within the valleys of the region (see Figure 48).

Most of these artificial modifications to the landscape involved some amount of cutting or filling, which produced irregular surface contours that generally do not conform with the surrounding natural topography (i.e., abruptly steep or level), allowing many to be distinguished in the field. While not as extensive as deposits produced by natural processes, historical activities have undoubtedly disturbed or destroyed some archaeological sites, and buried or preserved others. Consequently, the role of Historic-era activities on the nature and completeness of the archaeological record is an important consideration for portions of the Great Basin and Mojave Desert regions.

SUMMARY AND DISCUSSION

Over the past 14,000 years, the stratigraphic and radiocarbon evidence amassed from the Study Area and surrounding region indicates that pervasive periods of land stability and soil formation, were interrupted by at least four major episodes of rapid sediment deposition that were equally widespread. The timing and extent of these geologic changes are, therefore, responsible for creating notable structural biases in the nature and completeness (e.g., visibility) of the region's archaeological record, as discussed below from the earliest to most recent.

Latest Pleistocene

Buried soils at several different locations record a period of latest Pleistocene land stability centered between about 13,900 and 12,900 cal BP (Figure 49). While these soils are best represented in the San Joaquin Valley, examples have also been documented at a handful of locations west of the Sierra crest, and at least two locations in the Mojave Desert. Dates from these soils and from some overlying deposits suggest they were buried by sediment deposited between about 12,900 and 11,500 cal BP, corresponding with the Younger Dryas cool interval and Pleistocene-Holocene climatic transition. Landforms of this age seem poorly represented at the present ground surface, with the only clear examples found in the San Joaquin Valley. These amount to only a little more than 4.5 percent of all depositional landforms exposed at the surface (see Figure 17). Consequently, the earliest evidence of human occupation in the region, such as Clovis and other components dating to the Paleo-Indian period, may be buried in association with these landforms.

Early Holocene

With the arrival of the Holocene came a renewed period of relative landform stability (soil formation) that extended through most of the early Holocene. As shown in Figure 49, buried soils dating to the early Holocene have been identified at dozens of locations in the upper Sierra Nevada, Great Basin, Mojave Desert, and San Joaquin Valley; none have yet been documented in the Temblor or Transverse ranges however. Though dates from these soils place the main period of stability between about 9800 and 7500 cal BP, the clustering of dates at 9800-9300 cal BP and at 8300-7800 cal BP suggests this period was interrupted, in

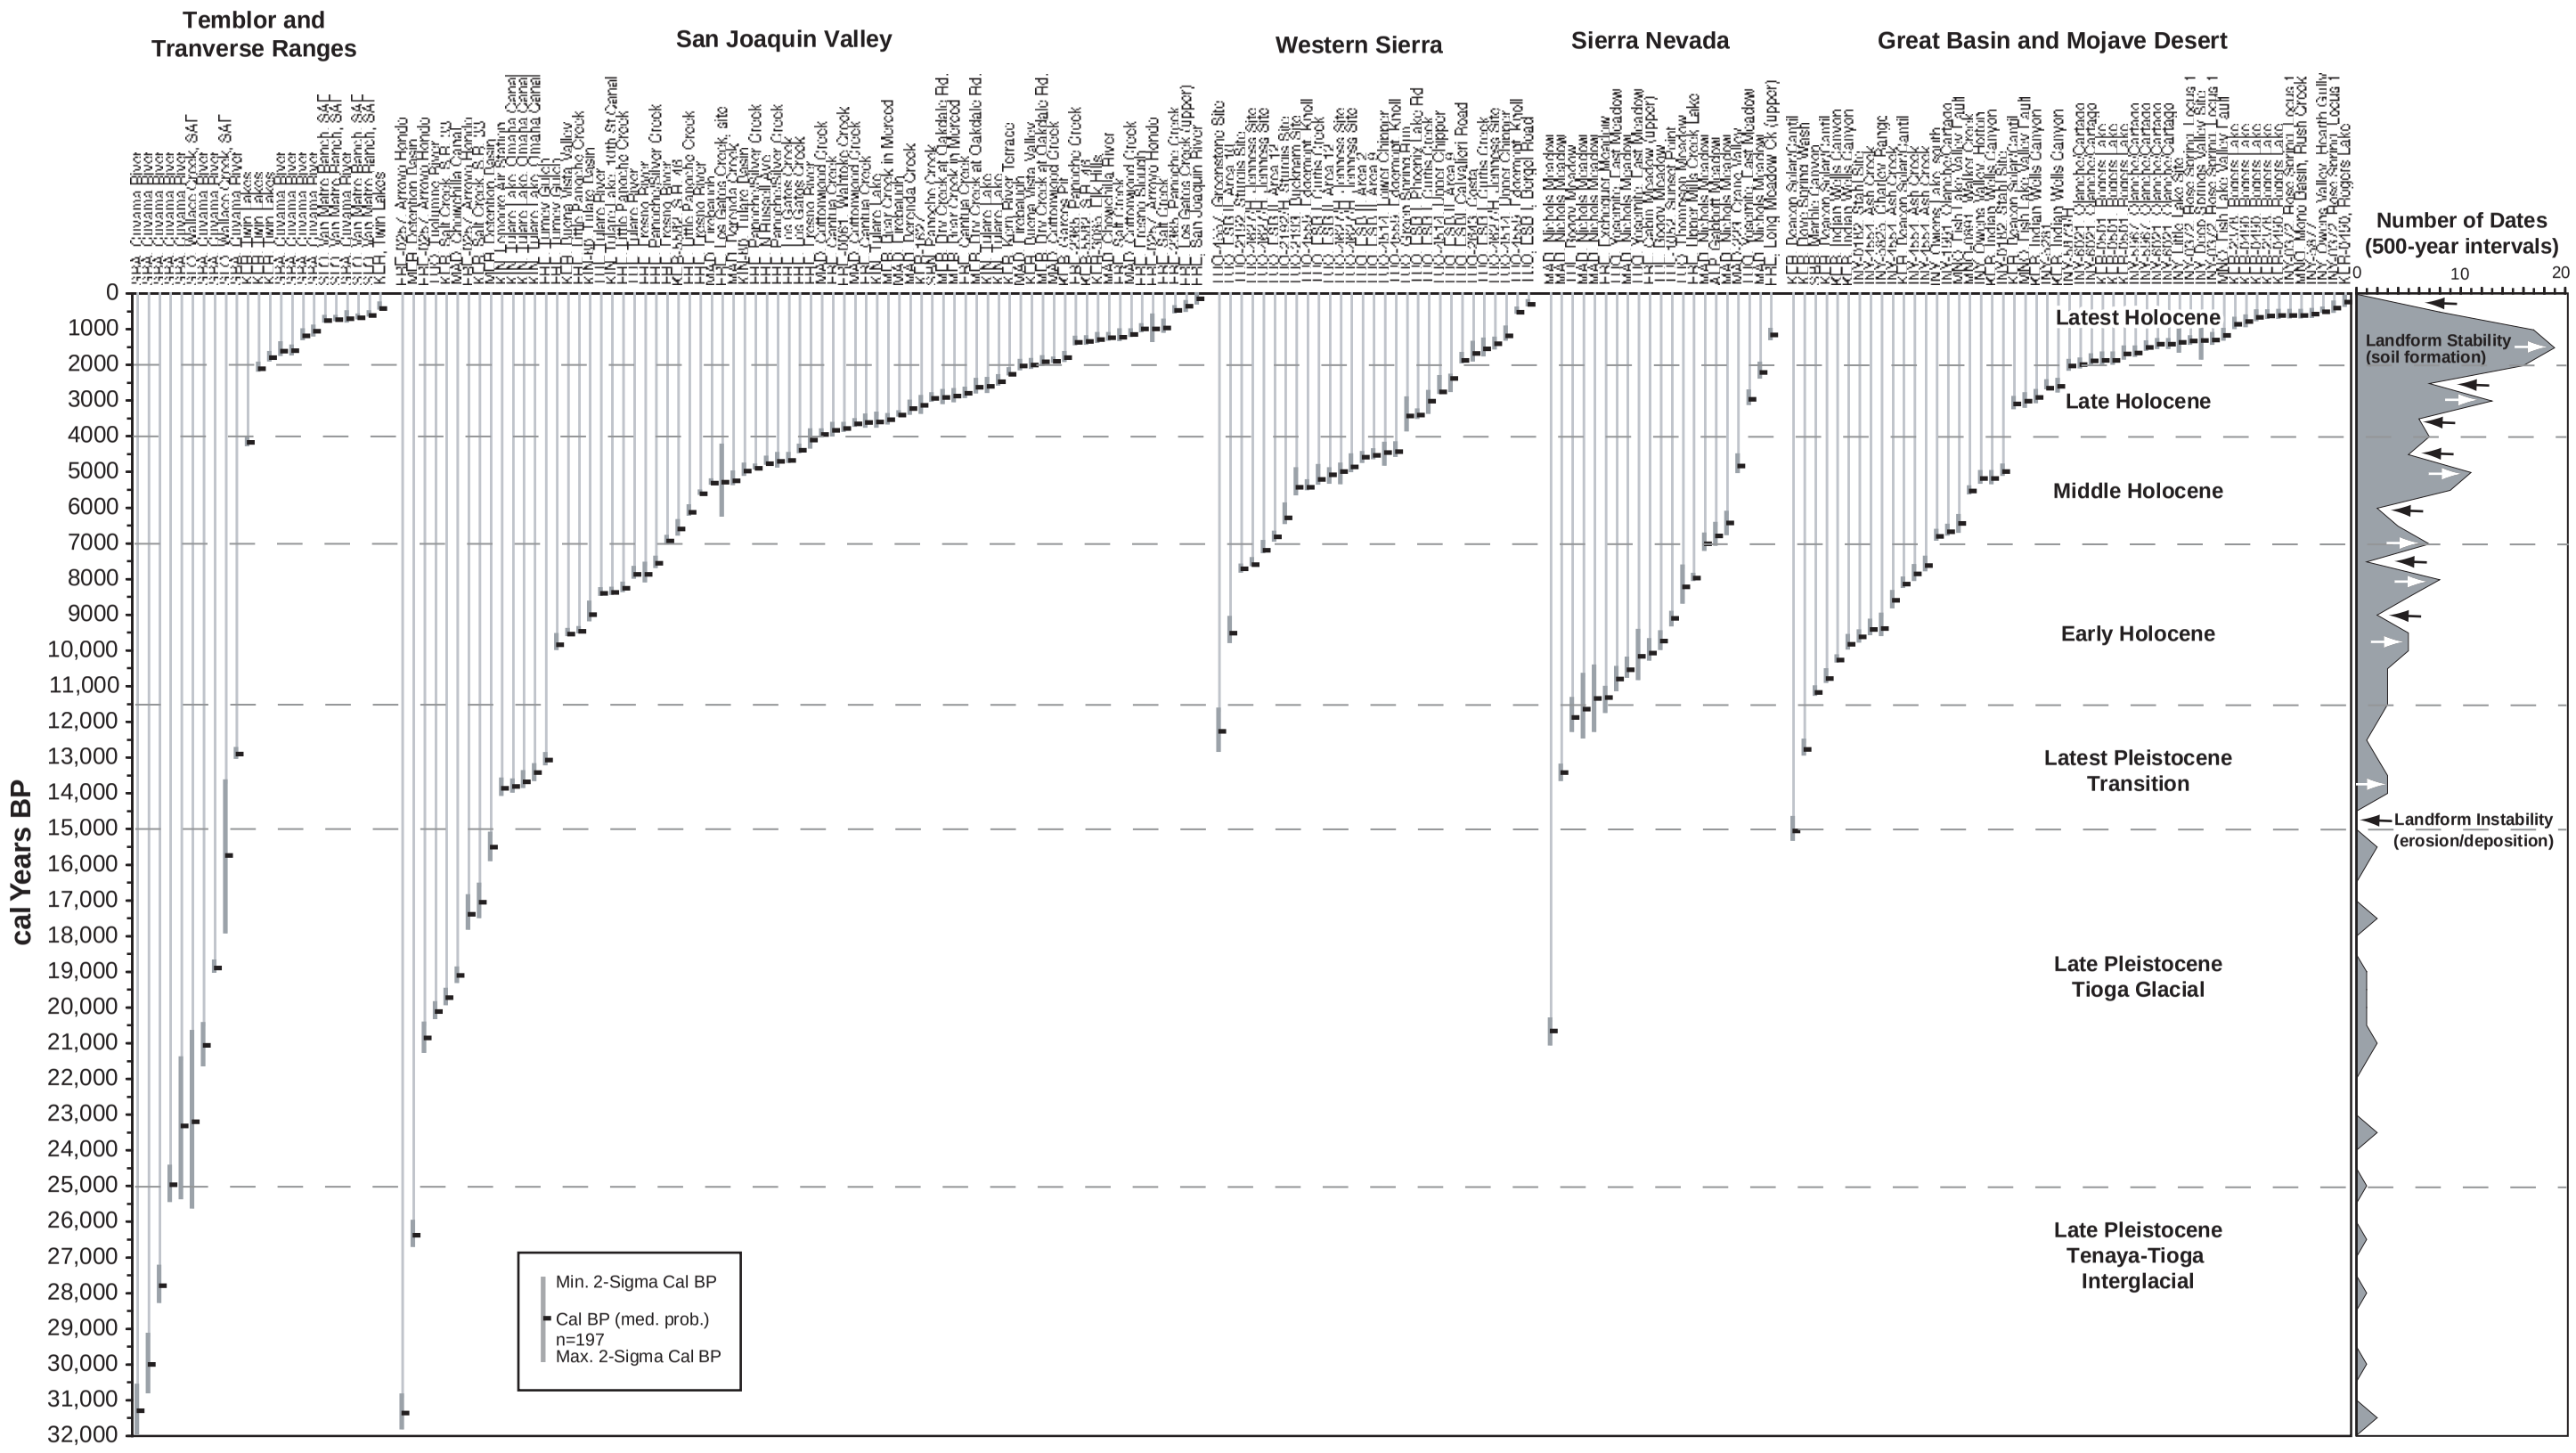

Figure 49. Comparison of Radiocarbon Dates from Buried Soils by Physiographic Region In and near District 6/9.

some areas, by deposition on one or more occasions. Land stability appears to have occurred earlier in the upper Sierra, Great Basin, and Mojave Desert regions than in the San Joaquin Valley, as no buried soils dating between about 13,000 and 9500 cal BP have yet been identified in the valley (see Figure 49).

During this stable period, the channels of many rivers and streams became deeply incised by down-cutting and/or widened by lateral migration. While relatively large bodies of early Holocene-age landforms occur at the surface in the eastern San Joaquin Valley, and in parts of Owens and Death valleys (see Figure 17), they account for 10.8 percent of all depositional landforms and 15.7 percent of all Holocene-age landforms exposed at the surface, including early Holocene volcanic deposits. Since landforms of this age are better represented in buried contexts than in surface contexts, it is likely that a substantial part of the early Holocene archaeological record is also buried (e.g., KER-116 and KIN-80).

Middle Holocene

Early Holocene soil formation and channel cutting were interrupted by a major depositional pulse between about 7000 and 6800 cal BP, widely evidenced in the Study Area and other parts of California (Meyer and Rosenthal 1997, 2008; Rosenthal and Meyer 2004a, 2004b). This likely resulted from increased precipitation and runoff that repeatedly met or exceeded the geomorphic threshold level, as explained at the beginning of this chapter. While most of these sediments were deposited in low-lying settings (i.e., basins, channels, and meander belts), they sometimes spilled onto the surface of surrounding floodplains as low-lying areas were overwhelmed. This pulse of instability was soon followed by another sustained period of soil development between about 6800 to 4500 cal BP, as indicated by more than two-dozen radiocarbon dates; most centering around 5400 cal BP (see Figure 49).

Middle Holocene-age surface landforms are very poorly represented in the Study Area, accounting for only 3.2 percent of all depositional landforms and 4.6 percent of all Holocene-age landforms exposed at the surface. Most are found in the arid valleys of the Great Basin/Mojave Desert (e.g., Rose Valley), and a few occur in portions of the San Joaquin Valley where they form relatively small and isolated bodies. Deposits of this age are most often found in buried contexts, and only rarely exposed at the present ground surface. Though middle Holocene sites can and do occur at or near the surface of landforms that are early Holocene or older, this pattern suggests that sites in certain locations (i.e., low-lying areas or near water) are under-represented because they were buried. This may explain why there is an apparent gap in the region's archaeological record during the middle Holocene as compared to earlier and later cultural periods.

Late Holocene

Landforms were once again destabilized between 4,400 and 3,600 years ago as arid conditions of the middle Holocene shifted toward wetter conditions of the late Holocene. This led to another major pulse of deposition around 4000 cal BP that is recognized throughout the region (Meyer and Rosenthal 1997, 2008; Rosenthal and Meyer 2004a, 2004b). These sediments were deposited mainly as alluvial fans, which are exposed at the surface in arid valleys of the Great Basin/Mojave Desert (e.g., Antelope, Fremont, Owens, and Saline valleys), and along part of the western San Joaquin Valley. Deposition was again followed by soil formation, as there are dozens of buried soils that date between about 3600 and 2200 cal BP, most centered at 2900 cal BP (see Figure 49). Though many occur in buried contexts, landforms of this age are more widely represented at the surface. They make up 11.4 percent of depositional landforms and 16.6 percent of all Holocene-age landforms. Since late Holocene landforms are more commonly exposed at the present ground surface, sites of this age should be better represented at the surface than those of earlier cultural periods.

Latest Holocene

As the climate became more variable after about 2200 cal BP, landforms again became unstable and a torrent of sediment was unleashed around 2000 cal BP (Meyer and Rosenthal 1997, 2008; Rosenthal and Meyer 2004a, 2004b). These sediments were deposited as extensive alluvial fans and floodplains that now form much of the present ground surface in valleys on both sides of the Sierra crest. A pronounced period of soil formation followed that may have been sustained and extended by drought conditions of the Medieval

Climatic Anomaly, as dates from latest Holocene-age buried soils center around 1100 cal BP (see Figure 49). While a second depositional pulse is recognized around 650 cal BP in some areas (Meyer 2008a; Meyer and Dalldorf 2004; Meyer and Rosenthal 1997, 2008; Rosenthal and Meyer 2004a, 2004b), it was not as intense or widespread as the 2000 cal BP episode.

While late Holocene deposits are often found in buried contexts, one-third (33.3%) of all depositional landforms and nearly one-half (47.7%) of all Holocene-age landforms have surface deposits that date to the latest Holocene. Latest Holocene landforms, therefore, make up more of the present ground surface than all Pleistocene-age surface deposits combined, which equal 31.5 percent overall). Thus, the current spatial extent of these landforms is greater than any deposit thought to have been formed by glacial outwash (i.e., Riverbank and Modesto formations). Since a large part of the present surface consist of latest Holocene landforms, sites of 2,000 years or less should be the best represented of any other cultural period.

CONCLUSION

Unlike previous models that relate landscape change to glacial cycles, this study shows that landscape evolution was driven by large-scale climatic shifts and associated environmental changes in the post-glacial era (i.e., Holocene). These changes are expressed in depositional sequences throughout the region as alternating cycles of landform stability and instability that occurred repeatedly during the Holocene, and often synchronously throughout the region (Figure 50). Though portions of the landscape have remained relatively stable since the last glacial maximum, others changed dramatically, long after prehistoric people had arrived and settled in the Study Area. While most sites in District 6/9 were buried by alluvial landscape changes, some sites were also buried by Holocene volcanic activity in portions of Inyo and Mono counties, as explored in the following chapter.

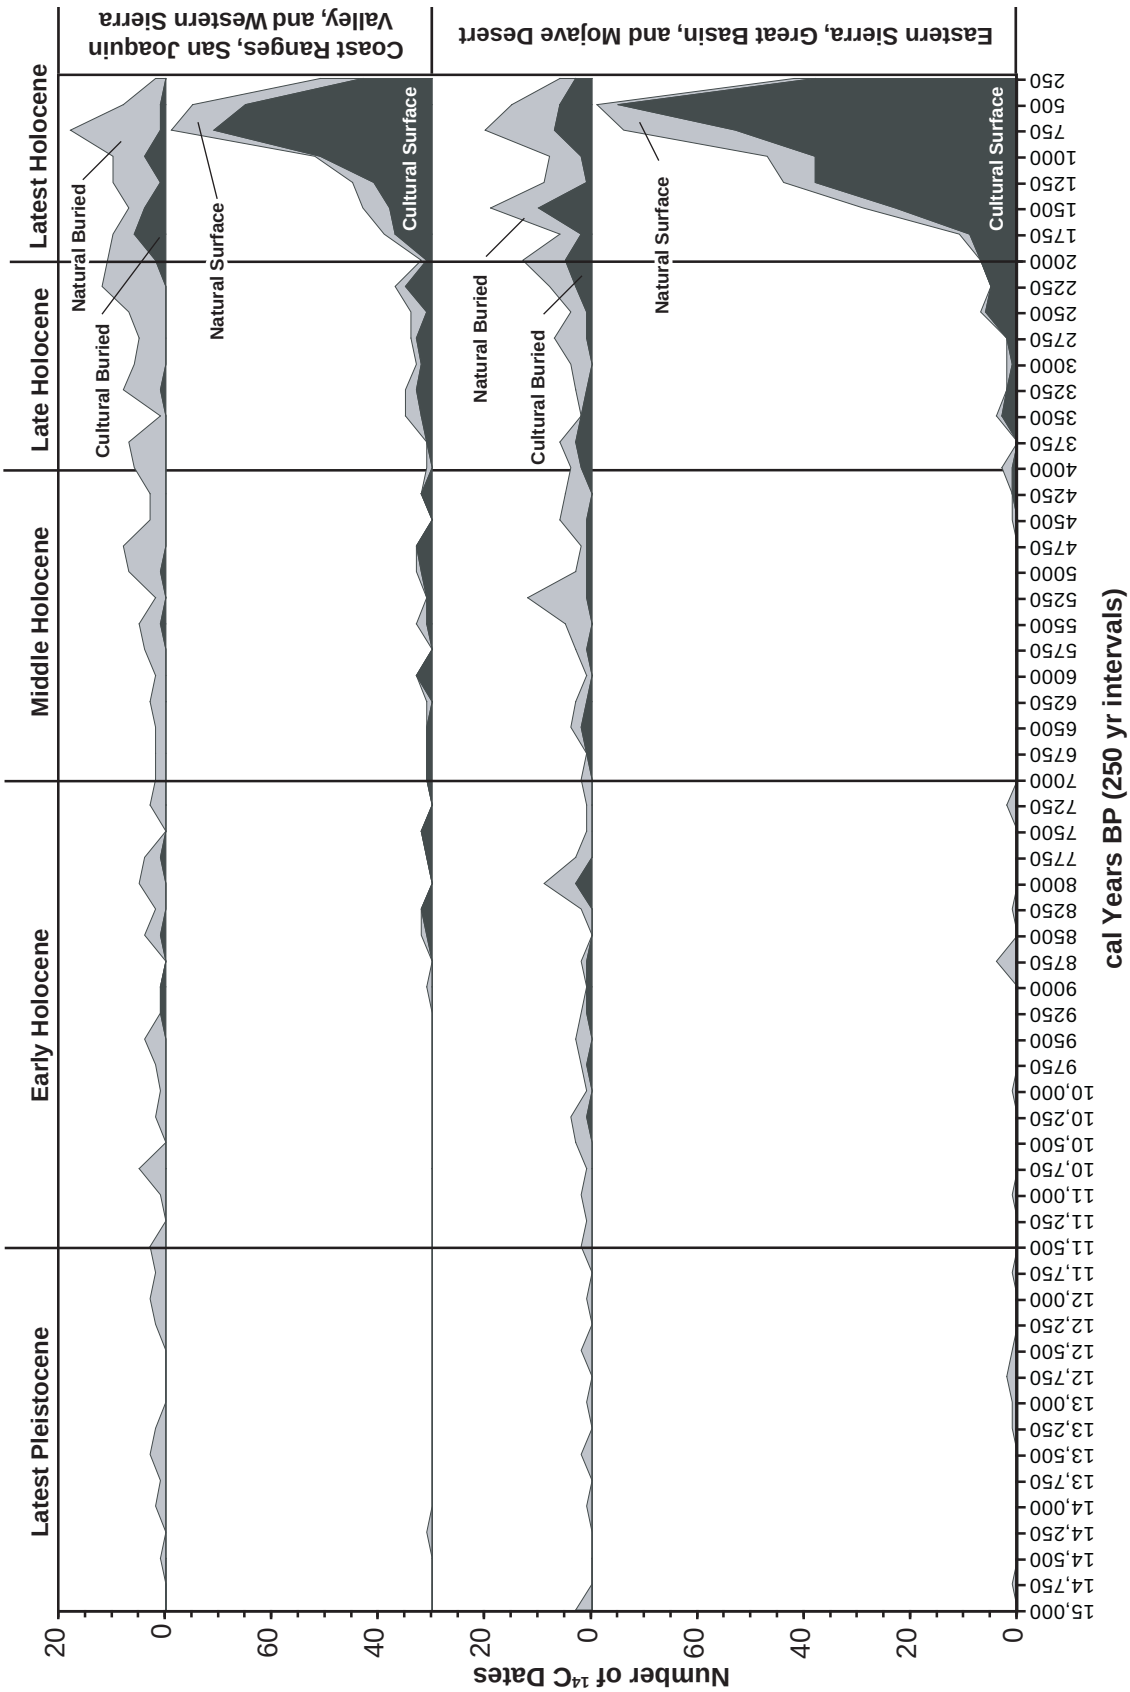

Figure 50. Comparison of Radiocarbon-Dated Surface and Buried Contexts from Eastern and Western Regions of District 6/9.

CHAPTER 5. ARCHAEOLOGY IN AN ACTIVE VOLCANIC REGION

The District 6/9 Study Area contains several major volcanic centers including the Kern, Kings, and San Joaquin volcanic fields west of the Sierra crest; the Big Pine, and Mono-Long Valley volcanic fields east of the Sierra crest; and the Aurora-Bodie, Darwin, Coso, Ricardo-El Paso Mountains, and Ubehebe volcanic fields further south and east in the Great Basin and Mojave Desert (Jessey 2009; Klinger 2001; Moore and Dodge 1980). These fields contain a variety of volcanic landforms such as ash (tephra) beds, coulees (sheets of solidified lava), cones, craters, domes, tuff rings, and flows, created by a combination of explosive (Plinian) eruptions, hydrothermal (phreatic) blasts, and the intrusion and extrusion of molten rock (magma) from craters and vents. Rocks produced by these processes typically include andesite, ash/tephra, basalt, dacite, rhyodacite, rhyolite, obsidian, pumice, and related rocks that are found in most but not all of the fields.

Volcanic landforms in the Study Area usually developed in a sequence that started with an explosive eruption, creating a tephra-rimmed crater, followed by pyroclastic flows and surges (Sieh and Bursik 1986). The sequence usually ended with the extrusion of viscous flows and the formation of a block-encrusted lava dome which sometimes grew until lava spilled over the tephra-rimmed crater to create a coulee (Wood 1977). Occasionally, the dome may have subsequently collapsed or exploded to produce a double crater.

Though south-central California has been volcanically active for several million years, only three of the volcanic fields, Coso, Mono-Long Valley, and Ubehebe, were active during the Holocene. While most of the Coso field, located in southern Inyo County, was formed more than 40,000 years ago (Moore and Dodge 1980), the field also contains a few cones, domes, and flows that are latest Pleistocene and Holocene in age (Monastero 2002; Monastero et al. 2005). To the north in Mono County, the Mono-Inyo volcanic chain contains dozens of Holocene-age magmatic and eruptive centers that extend more than 55 kilometers (34 miles) from near the south shore of Mono Lake to the southern end of the Long Valley caldera, along a north-south trending alignment (Miller 1985; Sieh and Bursik 1986).

Mono Craters contains at least 30 individual volcanic domes that are sequentially numbered from north to south in rough order (Bursik 1989; Bursik and Sieh 1989; Sieh and Bursik 1986). The Ubehebe volcanic field covers only about three square kilometers (1.2 square miles) at the northeastern end of the Cottonwood Mountains, near the intersection of the northern Death Valley and Tin Mountain fault zones, where it is blanketed mostly by basaltic cinders (Klinger 2001). The volcanic history of these fields is discussed below from the oldest to youngest examples.

VOLCANISM IN SOUTH-CENTRAL CALIFORNIA

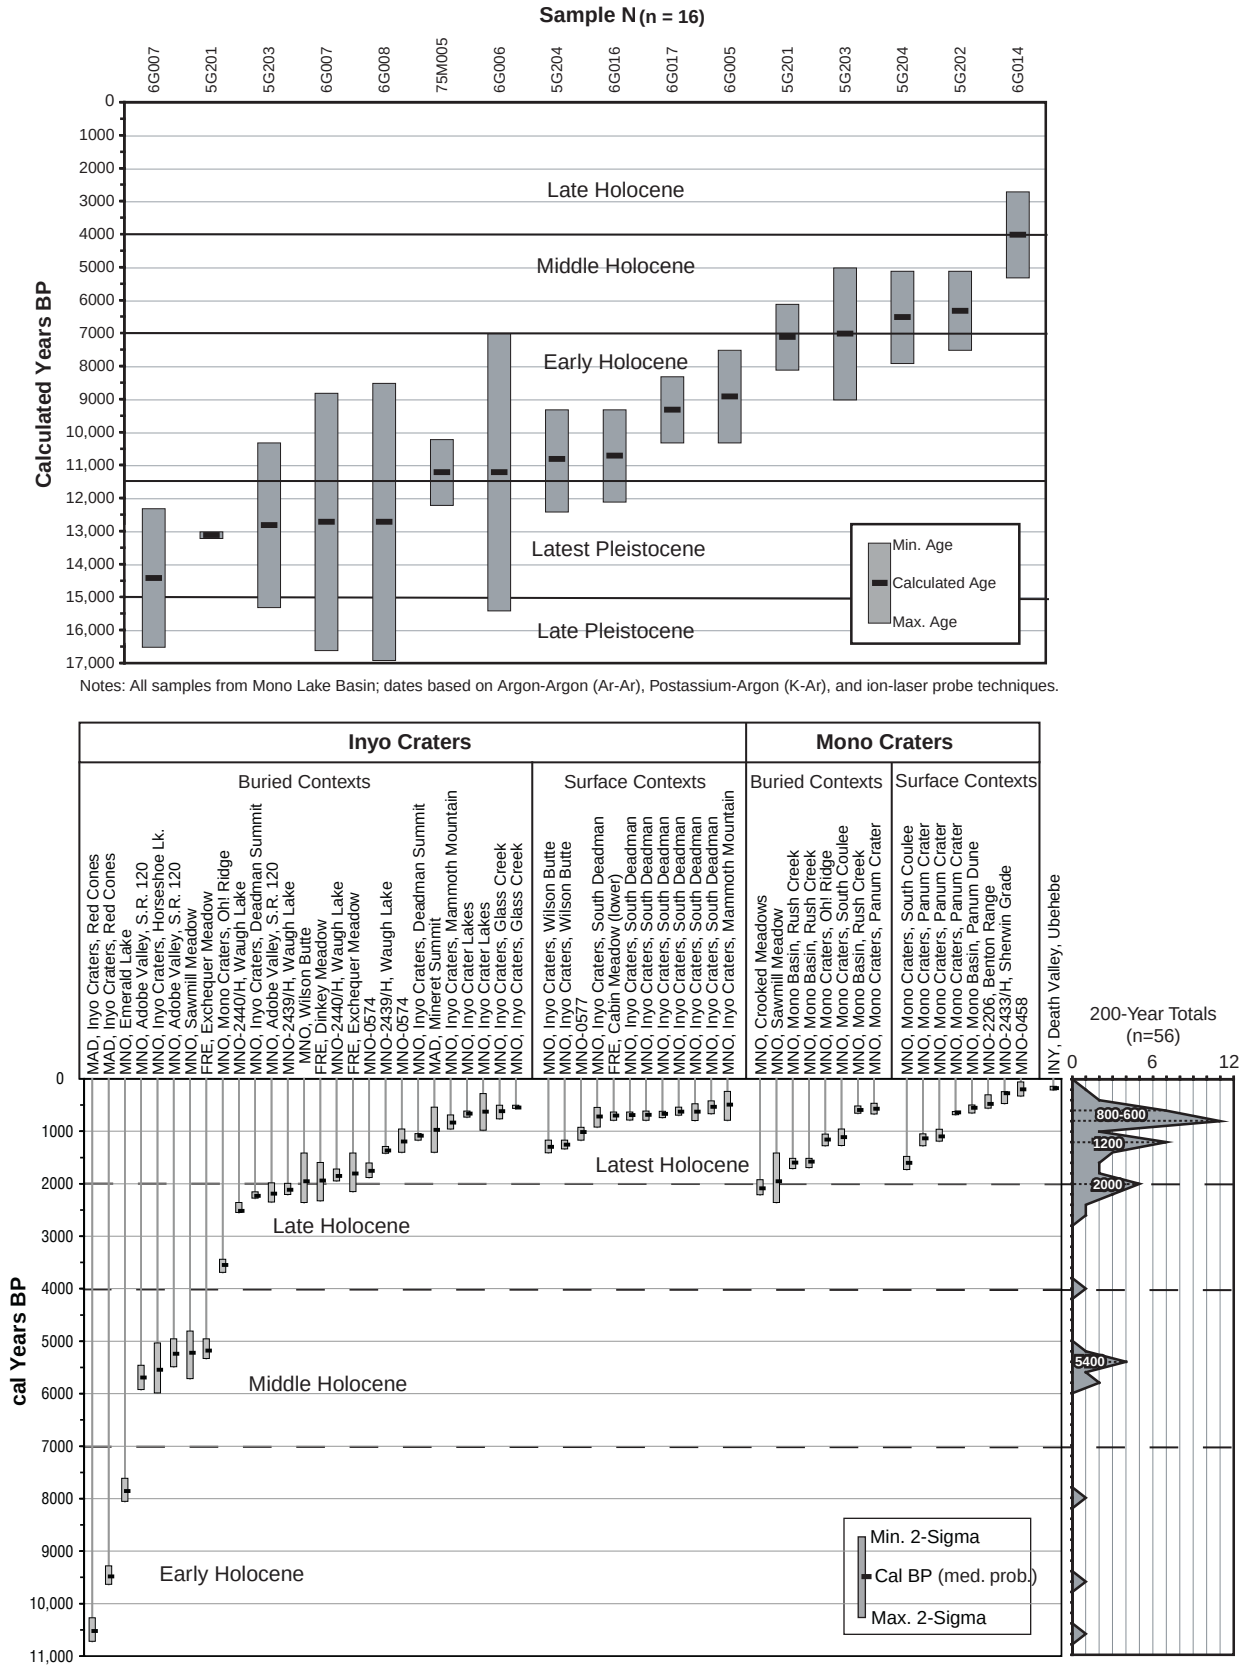
> A cloud . . . was ascending, the appearance of which I cannot give you a more exact description of than by likening it to that of a pine tree, for it shot up to a great height in the form of a very tall trunk, which spread itself out at the top into a sort of branches; . . . it appeared sometimes bright and sometimes dark and spotted, according as it was either more or less impregnated with earth and cinders . . . ashes began to fall again, this time in heavy showers. We rose from time to time and shook them off; otherwise we should have been buried and crushed beneath their weight.
>
> ~ Gaius Plinius Caecilius Secundus, "Pliny the Younger"
> (Extracts from "Letters of Pliny" translated by William Melmoth, revised by F. C. T. Bosanquet 1905)

As a witness to the 79 AD (1871 cal BP) eruption of Mount Vesuvius, Pliny the Younger provides a vivid account of a single "Plinian eruption" like those that occurred repeatedly along the Inyo-Mono volcanic chain. The chain has generated no less than 20 such eruptions over the past 11,000 years—most in the late Holocene (<4000 cal BP), with at least ten occurring after the Italian cities of Pompeii and Herculaneum were

buried by Vesuvian eruption. Though there are no oral or written records of eruptions in the Long Valley-Mono Basin region, the stratigraphic record unequivocally shows they were at least as frequent and of a comparable magnitude as those that buried or destroyed large areas in the Mediterranean region during the Holocene.

Together these eruptive events spread hundreds of thousands of cubic meters of material across large portions of the Study Area (Sieh and Bursik 1986), depositing multiple layers of volcanic ash (tephra), pumice, and other pyroclastics that form important stratigraphic and chronologic markers across the region. These deposits covered the pre-existing landscape, burying many plants and animals on which resident human groups relied, along with previous camps and village sites. While the buried sites may not compare with Pompeii or Herculaneum, the rapidly deposited volcanic material should have similarly preserved their contents and systemic relationships in an almost "time-capsule" fashion. Thus, the volcanic activity of the Study Area has important implications for the nature and completeness of the archaeological record, for archaeological research (Hall 1983), and for implementing appropriate archaeological survey and excavation methods, particularly in Long Valley and Mono Basin. To this end, the following section examines the timing and extent of latest Pleistocene and Holocene volcanism in eastern California.

Latest Pleistocene (15,000-11,500 BP)



Radiometric evidence (i.e., radiocarbon, argon-argon, and potassium-argon dates) indicates that volcanism was infrequent and restricted to a few portions of the Study Area during the latest Pleistocene. While the Coso volcanic field may contain a few isolated cones and flows of this age, most are found within the Mono Craters volcanic field where several cones and lava flows date roughly between 14,500 and 13,000 years old (Figure 51) based on obsidian hydration, ion micro-probing, argon-argon, and potassium-argon dating of volcanic rocks (Bursik 1989; Hu et al. 1994; Reid 2003; Wood 1983; Zartman and Bush 1995). The only latest Pleistocene-age volcanic deposits that have been radiocarbon dated are those from Black Point, located on the northwest shore of Mono Lake (Figure 52). Black Point is a flat-topped (Surtseyan-style) tuff cone that formed beneath glacial Lake Russell soon after 13,300 ± 500 14 BP, or 14,575 cal BP (Denham and Cox 1971; LaJoie 1968), when the lake was almost ten times deeper than at present (Hill 2006; Schneider 2001). While other latest Pleistocene volcanic deposits are likely present in Inyo and Mono counties, most have yet to be dated with radiometric techniques.

Early Holocene (11,500-7000 BP)

As with the latest Pleistocene, there is only limited evidence of early Holocene volcanism in the Study Area, which appears to have been restricted to the Coso and Mono-Long Valley fields. For example, no tephra layers occur in the lacustrine sediments that date between 13,261 cal BP (GaK-01425) and 6013 cal BP (GaK-02486) at Black Lake in Adobe Valley (Batchelder 1970). As Figure 51 shows, several argon-argon or potassium-argon dates have been obtained from volcanic deposits in the Mono Craters segment of the Long Valley field that range between about 11,000 and 7,000 years in age (Hu et al. 1994; Zartman and Bush 1995). The age of Red Hill, a cinder cone located in the Coso field at the southern end of Rose Valley near Fossil Falls (Figure 53), is estimated to be about 10,000 years old based on geomorphic evidence (Jessey 2007), as is Dome 18 at Mono Craters based on ion micro-probe dating of the mineral allanite (Reid 2003).

A pair of isolated cinder cones and related deposits, collectively known as Red Cones (Figure 53), located at the southern end of the Inyo volcanic chain, date to about 9500 cal BP (Figure 51) based on radiocarbon dates from underlying deposits (Demming 2002). Ion micro-probe dating of allanite from Dome 6 and Dome 30 at Mono Craters indicates they are roughly 8,200 and 7,000 years old, respectively (Reid 2003). In addition, it appears that an unnamed volcanic cone on the northeast shore of Mono Lake is also early Holocene in age, based on 15 potassium-argon dates associated with the Wassit-series soil mapped on the cone's surface (Zartman and Bush 1995). Besides these, a few other early Holocene-age cones or flows are probably within the Coso field (Monastero 2002; Monastero et al. 2005), but their ages have yet to be confirmed.

In addition to local volcanic sources, volcanic ash derived from the Crater Lakes area in Oregon is found in some alluvial, lacustrine, and meadow deposits in the northern part of the Study Area, including Mono Lake

Notes: All samples from Mono Lake Basin; dates based on Argon-Argon (Ar-Ar), Postassium-Argon (K-Ar), and ion-laser probe techniques.

(Davis 1999b; Sarna-Wojcicki et al. 1991) and Hidden Lake (Potito et al. 2006), both in northern Mono County. Ash that erupted from this distant source was deposited over a large part of the northwestern United States in two separate layers, known as the Tsoyowata and the Mazama tephras, which date to about 7855 cal BP and 7675 cal BP, respectively (Bacon 1983). While these tephras are discontinuous and have a limited distribution, they serve as important chrono-stratigraphic markers in some parts of the Study Area. A summary of the locations where these tephras have been identified in California is provided in Table 10.

Table 10. Identified Deposits of Tsoyowata and Mazama Tephra in Northeastern California.

Middle Holocene (7000-4000 BP)

The reduced volcanic activity in the early Holocene extended into the first part of the middle Holocene (Batchelder 1970; Bursik 1989; Bursik and Sieh 1989; Miller 1985). As noted above, the earliest direct evidence of renewed activity comes from Black Lake, where a tephra (Ash 5) was deposited after 6013 cal BP (GaK-02486) and before 5693 cal BP (GaK-1853); (Batchelder 1970). While two potassium-argon dates from domes in the Mono Craters segment suggest they are about 6500 to 6300 years old (see Figure 51; Dalrymple 1967; Zartman and Bush 1995), a recent reevaluation of obsidian hydration evidence suggests that the oldest middle Holocene-age domes in this segment (Domes 18, 23, 25, and 30) are between 5,400 and 4,200 years in age (Meyn 2007). Further, a rhyolite dome north of Deadman Creek ("North Deadman Dome") in the Inyo Craters segment is estimated to be about 6,000 years old based on obsidian hydration comparisons, but since no explosive or magmatic activity is associated with this eruption (Miller 1985), it was not a source of tephra. Subdued activity is further confirmed by the near absence of middle Holocene-age tephra in the lacustrine sediments of Mono Lake (Davis 1999b).

As shown in Figure 51, the age of some volcanic deposits has been constrained by a handful of radiocarbon dates from overlying or underlying non-volcanic deposits. These include dates of 5693 cal BP (GaK-1853) and 5243 cal BP (GaK-1852) from peat deposits below and between volcanic ash layers at Black Lake in Adobe Valley (Batchelder 1970), a date of 5547 cal BP (W-734) from deposits overlain by Inyo Crater pumice near Horseshoe Lake (Rubin and Alexander 1960), a date of 5223 cal BP (W-3473) from peat beneath multiple ash layers in Sawmill Meadow (Figure 54, Wood 1983), and a date of 5179 cal BP (Beta-17184) from organic sediment below Inyo Craters ash and above an unknown ash (possibly the Tsoyowata or Mazama tephra) at Exchequer Meadow in Fresno County (Davis and Moratto 1988). An unidentified ash found within the sediments of Mono Lake that dates to 4083 cal BP (AA-06837) is the youngest middle Holocene-age tephra yet identified in the region (Davis 1999b). This suggests that the Mono-Long Valley field experienced a modest increase in volcanism and explosive activity around 5400 cal BP that appears to have subsided or stopped completely by 4,000 years ago.

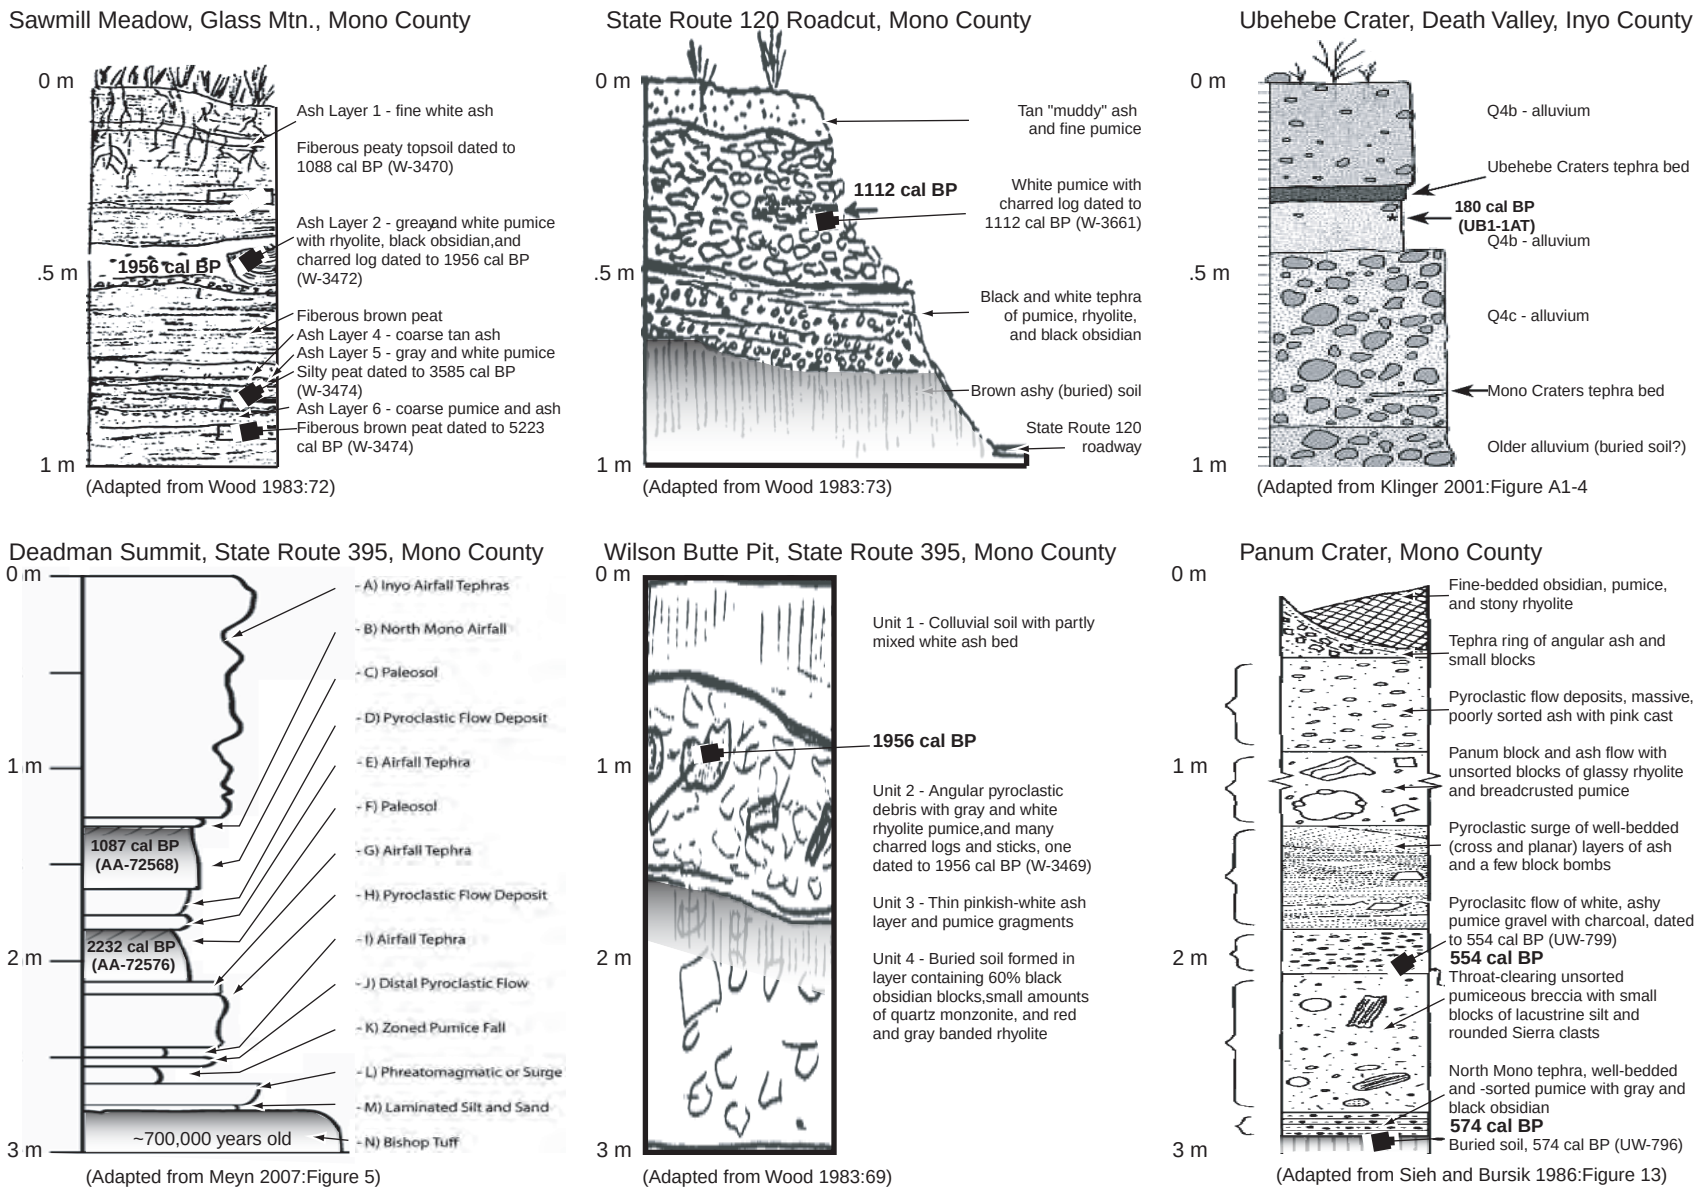

Figure 54. Radiocarbon-Dated Holocene-age Volcanic Strata in the Study Area.
(Note: different vertical scales on top and bottom rows.)

Thus, apart from the one tephra at Mono Lake and the tephras at Black Lake, there is comparatively little evidence of explosive volcanic activity in the region during the middle Holocene. It does appear, however, that during this time at least one dome (North Deadman) was emplaced in the Inyo Craters segment, and a few small domes and related flows were formed in the Mono Craters segment.

Late Holocene (4000-2000 BP)

For the next 1,800 years, between about 4000 and 2200 cal BP, volcanic activity was again subdued and restricted solely to the Mono-Inyo volcanic chain (Miller 1985; Sieh and Bursik 1986; Wood 1977, 1983). Obsidian hydration and potassium-argon evidence indicate that at least four silica-rich rhyolite domes (Dome 14, 17, 20, and 27) were emplaced at Mono Craters between about 4,000 and 3,000 years ago (see Figure 51; Dalrymple 1967; Meyn 2007; Wood 1983; Zartman and Bush 1995), with Dome 22 and 26 formed during a later episode around 2,070 years ago (Meyn 2007).

Deposits buried by volcanic ash at Deadman Summit along State Route 395 within the Inyo Craters segment record a sudden increase in explosive eruptions at 2232 cal BP (AA-72576; Figure 54; Meyn 2007). To the east, at Black Lake in Adobe Valley, a nearly identical date of 2192 cal BP (GaK-2476) was obtained from peat below a layer of ash originating from Mono or Inyo craters (Batchelder 1970). Tephra from Mono or Inyo craters also appears to overlie portions of archaeological site MNO-2439, located to the west near Waugh Lake, where the underlying cultural deposits date to 2115 cal BP (Beta-121306); (Jackson and Morgan 1999). Thus, tephra was deposited over much of the surrounding area between about 2,200 and 2,100 years ago.

Latest Holocene (2000-150 BP)

During the latest Holocene, a pronounced increase in volcanic activity occurred within the Mono-Inyo volcanic chain that was far more explosive and extensive than before, which equaled or exceeded that of the previous 10,000 years (Sieh and Bursik 1986; Miller 1985 Wood 1977, 1983). Obsidian hydration evidence, for instance, suggests that five of the Mono Crater domes (Dome 9, 13, 15, 22, and 22) were emplaced between about 1,800 and 1,000 years ago, with another five (Dome 3, 4, 5, 7, and 8) formed between about 800 and 600 years ago (Bursik 1989; Meyn 2007; Wood 1977, 1983). One of these domes generated the Mono Craters obsidian flow. The age of these domes are consistent with radiocarbon and stratigraphic evidence from volcanic deposits throughout the region which show a major episode of volcanism around 1200 cal BP, and another centered near 700 years ago (see Figure 51).

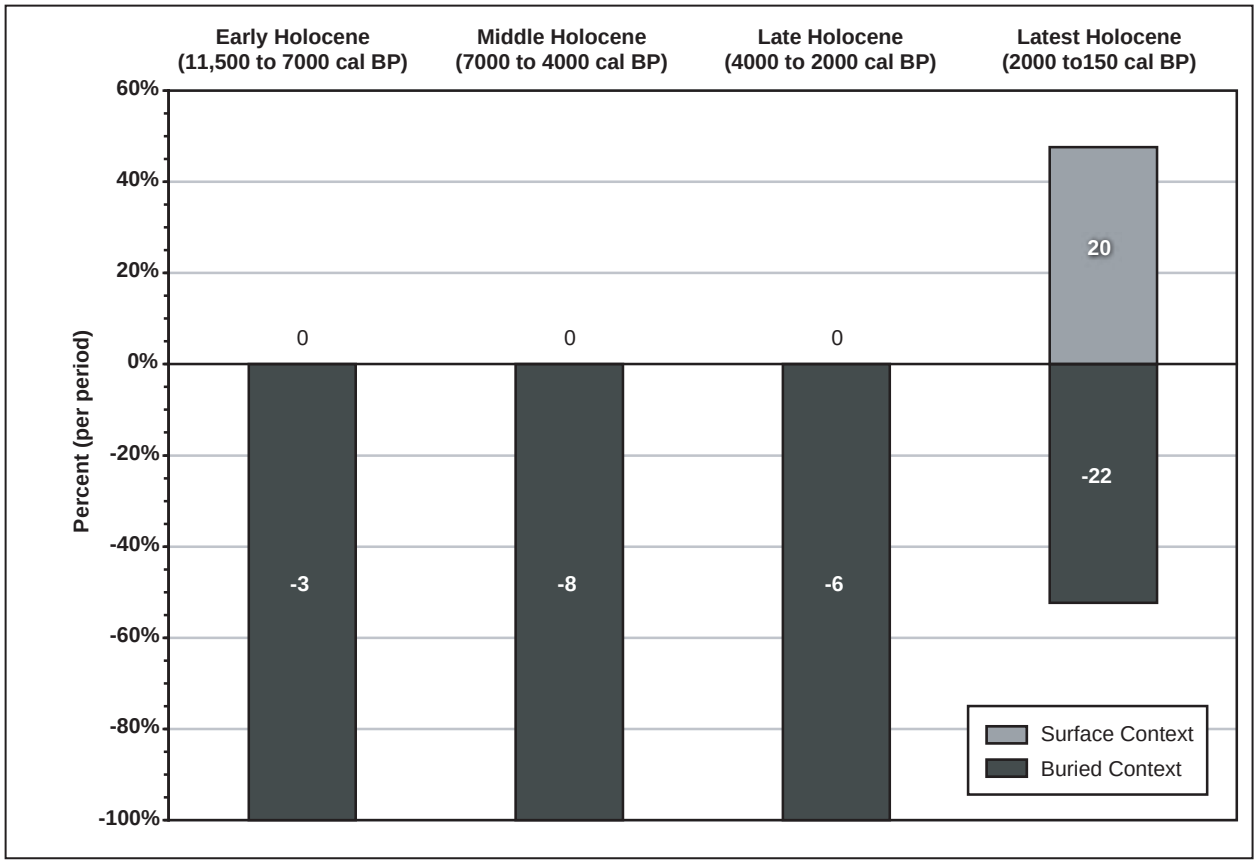
Volcanic deposits dating to the latest Holocene have been identified at dozens of locations throughout the region. Among these are identical dates of 1956 cal BP from charred logs found embedded within volcanic deposits in a gravel pit at Wilson Butte along State Route 395 north of Crestview (W-3469) and in Sawmill Meadow at Glass Mountain (W-3472), and a date of 1112 cal BP (W-3661) from a road cut along State Route 120 north of Benton (Wood 1983). As shown in Figure 54, Mono Craters ash from Sawmill Meadow (Wood 1983) and from Deadman Summit along State Route 395 produced next to identical dates of 1088 cal BP (W-3470) and 1087 cal BP (AA-72568; Meyn 2007). Additionally, at archaeological sites MNO-2440 and MNO-2439 near Waugh Lake, cultural deposits dating to 1854 cal BP (Beta-117216) and 1367 cal BP (Beta-121307), respectively, are buried by Mono or Inyo craters tephra (Jackson and Morgan 1999), while those at site MNO-574, located along State Route 395 near the Mammoth Scenic Loop junction, are between 1755 and 1197 cal BP (Beta-29480 and Beta-29479; Goldberg et al. 1990).

In the Mono Craters area, at least one moderate to large Plinian ash eruption may have occurred at Panum Crater between about 1135 and 1100 cal BP (Kilbourne and Anderson 1981; Wood and Brooks 1979), and another occurred between 574 and 554 cal BP, that spread a blanket of ash, pumice, and other pyroclastic debris (North Mono Craters tephra) over most of the Mono Lake Basin (Sieh and Bursik 1986). During the past 2,000 years, the intrusion of magma and episodic eruptions from beneath Mono Lake led to the formation of Negit Island, which lies in the north-central part of the lake (see Figure 52; Stine 1987). One exceptionally violent event around 1700 cal BP created thousands of blocks of vesicular pumice that floated on the lake until they shoaled around its shoreline. Near the center of Mono Lake lies Paoha Island (see Figure 52), which was created by a similar series of eruptive events around 265 cal BP, making it the youngest addition to the Mono Craters volcanic

chain (Stine 1987). Besides the creation of the Mono Islands, at least three of these volcanic episodes (Paoha Island included) generated ash that was presumably deposited throughout much of the Mono Basin.

Plinian-type eruptions and steam-driven (phreatic) explosions also occurred along the Inyo segment (i.e., Glass Creek and South Deadman domes) between about 600 and 500 cal BP that blew huge amounts of debris into the air (Miller 1985). Deposits of ash and pumice from at least three separate Inyo eruptions during this interval have been traced over hundreds to thousands of square kilometers, ranging from a few centimeters thick at the outer edges to as much as 25 meters (82 feet) thick near the source vents (Miller 1985; Wood 1977). Some of these materials were subsequently reworked and redeposited by alluvial processes and, in at least one case, pumice completely filled a formerly active channel of the Owens River just north of present-day Lake Crowley in Mono County (Bursik and Reid 2004; Reid et al. 1998).

The last major eruption of Inyo Craters around 478 cal BP caused a pyroclastic debris flow, known as a lahar, to move down the canyon of Glass Creek and into the upper Owens River Valley (Bursik and Reid 2004). The lahar ran up the sides of the canyon to a height of about 35 meters (115 feet) above the present stream level, and extend downstream to the present north shore of Lake Crowley; a distance of at least 30 kilometers (18.6 miles). The channel of Glass Creek has since become incised below the surface of these deposits, which now form a series of flat terraces in the canyon, generally less than ten meters (33 feet) wide. One of the largest and most recognizable segments of the lahar sits west of State Route 395 at Crestview, near a point where Glass Creek exits the canyon.



While the cause of the lahar is uncertain, some debris flows may have been triggered by the intense thunderstorms and rainfall that accompany some Plinian eruptions. This assertion is based on the repeated occurrence of undisturbed beds of Mono-Inyo tephra buried by debris flows at more than 20 sites in western Nevada, which generally date to less than 1400 cal BP (Bell and House 2007). Researchers argue that these stratigraphic associations are not random coincidence but are linked to the many Plinian eruptions generated by the Mono-Inyo volcanic chain over the past 1,400 years. They explain that the enormous ash plumes released by Plinian eruptions "can entrain very large quantities of moisture from exsolved magmatic water and condensation during atmospheric rise of the eruption column, possibly amounting to hundreds of metric tons of water" (Bell and House 2007:221). They also note that these eruption-driven storms are usually electrically charged, and can generate lightning that may have triggered widespread fires on the ground, and point to the regular associations of tephra, charcoal, and debris flows identified in the White Mountains and Fish Lake Valley near the California-Nevada state line (Reheis 1996). Thus, these eruptions not only resulted in the deposition of ash, but the ash deposits were in some cases buried and preserved by volcanically induced debris flows.

Implications for Human Occupation and Preservation of the Archaeological Record

From this review it is clear that latest Holocene volcanic activity was as active as any time since the arrival of people in south-central California. Because volcanism was extensive and recurrent over the last two millennia, it "may have had persistent direct and indirect, and cumulative effects on prehistoric economic, demographic, and land-use patterns in the eastern Sierra and adjacent region" (Hall 1983:191). The violent eruptions and pyroclastic fallout may have threatened and even killed some prehistoric residents, and likely forced others to relocate or adapt to the newly formed volcanic landscape. At the same time, many older archaeological sites within the Long Valley and Mono Basin area were likely buried by Mono-Inyo Craters tephra, and/or by the debris flows that accompanied some of the Plinian eruptions (Bell and House 2007). As shown in Figure 55, sites that post-date the highly eruptive period between about 2000 and 500 cal BP are probably far better represented at the surface than those that pre-date this period.

THE PREHISTORIC USE OF OBSIDIAN IN SOUTH-CENTRAL CALIFORNIA: TEMPORAL AND SPATIAL ASPECTS

In addition to the effects that Holocene volcanism may have had on site visibility and human populations that lived in eastern California (e.g., Hall 1983), obsidian deposits associated with each of these volcanic fields became an important prehistoric commodity that was widely used and traded across California and into western

Note: Dates from both natural and cultural contexts included.

Figure 55. Percentage of Radiocarbon Dates from Surface and Buried Volcanic Contexts.

Nevada, beginning as early as the latest Pleistocene. Within the District 6/9 Study Area there are no fewer than six geochemically distinct obsidian sources (Bodie Hills, Casa Diablo, Coso, Fish Springs, Mono Glass Mountain, Mono Craters), with numerous definable sub-sources that were quarried prehistorically (e.g., Ericson 1977; Hughes 1994; Jackson 1974). Despite the attention given to obsidian by archaeologists, we continue to know very little about the quarries themselves, the timing of obsidian exploitation at these localities, or the geographic distribution of this material through human conveyance. Initial studies of prehistoric exchange began the inquiry into broad-scale patterns of obsidian distributions (e.g., Ericson 1977; Jack 1976; Jackson 1974), but few recent studies have updated or refined this work (but see Bouey and Basgall 1984; Gilreath and Hildebrandt 1997; Sutton and Des Laurier 2002). For the most part, modern research has focused on obsidian use within more geographically restricted areas, forgoing extra-regional analyses to better understand local land-use patterns (e.g., Basgall 1989; Hughes and Bettinger 1984; King et al. 2008; Roper-Wickstrom 1992; Stevens 2002). Yet, broad-scale patterns remain important and local material conveyance cannot be adequately assessed without this regional context.

Along with studies that examine the distribution of different obsidian sources across the landscape, this material has also become an important chronological tool for archaeologists working throughout south-central California. Obsidian hydration measurements are now commonly used to provide relative age estimates for individual artifacts and entire site assemblages. In a few instances, source-specific hydration rates have been developed (e.g., Basgall 1990; Stevens 2002); however, most sources continue to lack a reliable hydration rate model, making it difficult to determine the true age of obsidian artifacts. Further, ongoing research has shown that a myriad of other intrinsic and environmental properties make hydration rate conversions imprecise and often grossly inaccurate. This is particularly true for the earliest time periods, where existing rate models prove most unreliable. Because of this, we are sorely in need of hydration anchors which provide limiting values for the earliest human-derived artifacts and allow for an assessment of the initial timing of quarry activities at each source locality. As a first step in this direction, the following discussion examines both the temporal and spatial parameters of obsidian use in south-central California.

The Timing of Obsidian Use in South-Central California

Among the well-studied obsidian quarries in the Study Area are those in the Coso Volcanic field where more than 4,000 obsidian hydration readings are available, revealing human use of this quarry from the latest Pleistocene through the Holocene (Gilreath and Hildebrandt 1997). Other studies of obsidian quarries such as Bodie Hills have been much more limited in scope, documenting mainly late Holocene exploitation (e.g., Jackson 1984; Singer and Ericson 1977); although, Halford (2008) has recently documented early Holocene use of secondary alluvial cobbles derived from the Bodie Hills source. The lack of focused hydration work at most quarries makes it difficult to judge when they were first used by early foraging groups. Furthermore, even when thousands of hydration readings are available, such as in the Coso Volcanic field, it has been difficult to separate evidence of early human activity from hydration bands that developed through natural breakage. To overcome this problem, we compiled 8,291 source identifications and obsidian hydration readings from 390 archaeological sites throughout the District 6/9 Study Area, the majority of which are located away from primary and secondary sources of obsidian. To better establish naturally from culturally derived hydration readings, we compared the regional obsidian hydration profiles to those obtained from 249 of the earliest well-documented obsidian tools in this region—fluted and basally thinned concave-base projectile points, Great Basin stemmed points, and flaked stone crescents. These data are summarized in Table 11 and Table 12 and Figure 56.

Multiple hydration readings from latest Pleistocene and early Holocene diagnostic artifacts were only available for four sources in the Study Area—Coso, Bodie Hills, Casa Diablo, and Fish Springs. Notwithstanding the three readings from early points made of Mono Glass Mountain, it appears that Coso, Casa Diablo, Bodie Hills, and to a much lesser extent, Fish Springs, were the main obsidian sources from south-central California utilized during the terminal Pleistocene and early Holocene. Fluted concave base points (c.f., Clovis) are typically believed to be the earliest point forms in western North America (e.g., Moratto 1984), an assumption supported by the limited obsidian hydration information available from these artifacts (see Table 11). The presence of fluted points made of Coso, Bodie Hills, and Mono Glass Mountain obsidians in the regional sample clearly shows that these source materials may have been used as early as 13,200 to 12,800 cal BP (Waters and Stafford 2007).

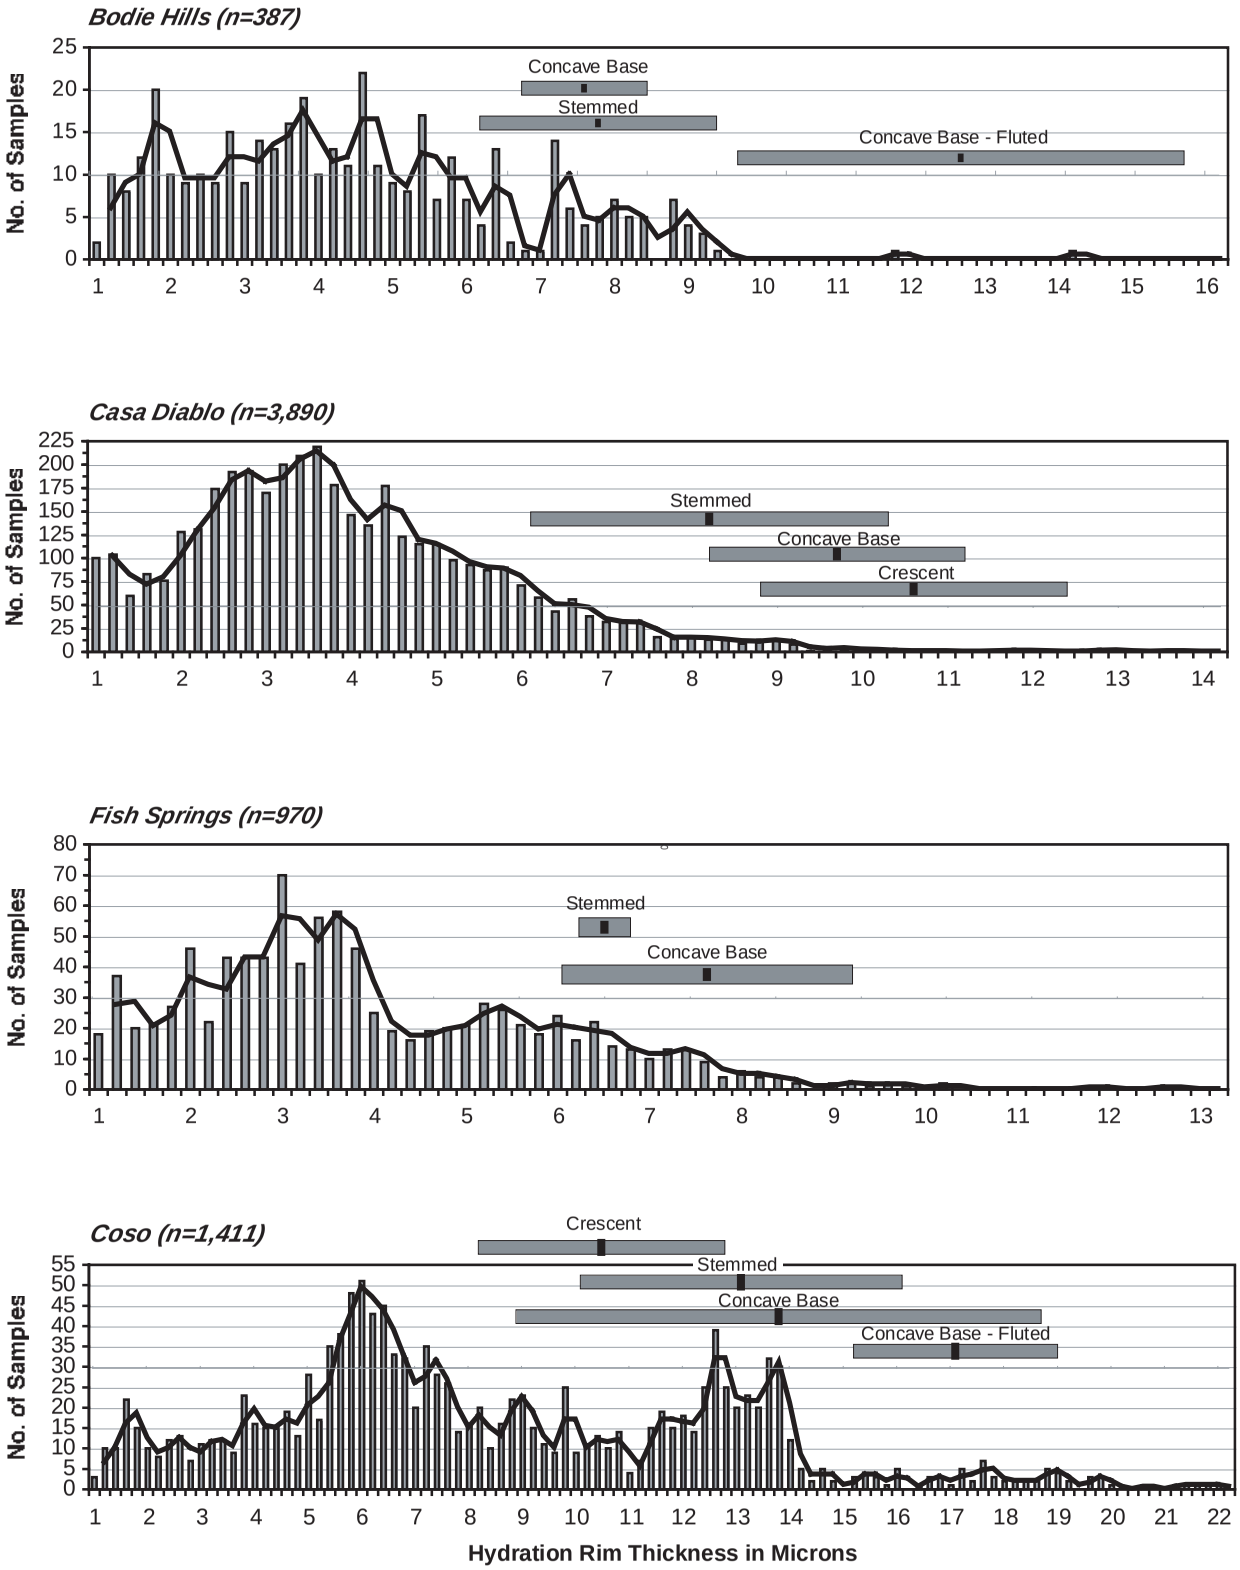

Figure 56. Obsidian Hydration Profiles for Main Sources Utilized in the Study Area.

As a baseline for human use of California obsidians, hydration information from fluted and other concave base points indicates that readings on Coso obsidian up to about 21 microns are likely to be legitimate evidence of latest Pleistocene use of this material (see Figure 56). Likewise, readings from Bodie Hills up about 15 microns and Mono Glass Mountain up to about 12 microns also appear to relate to latest Pleistocene or earliest Holocene human use (see Table 11). Although no fluted points are reported from Casa Diablo obsidian, hydration readings associated with this source material ranging up to about 14 microns may also derive from human use during the latest Pleistocene or early Holocene. Because drastically different temperature regimes prevailed east and west of the Sierra Nevada and between the Great Basin and Mojave Desert during the Holocene, it is expected that warmer regions (e.g., the Mojave Desert) will generate thicker hydration rims than cooler regions (e.g., the Sierra Nevada and western Great Basin). This result is evident in the data presented in Table 12, demonstrating that points from the Mojave Desert always produce larger hydration readings than similar types from cooler regions to the north and northwest. Likewise, points from the upper Sierra have thinner rims than those from the Sierra Foothills. These patterns indicate that different maximum values will characterize the earliest use of each obsidian source in different regions.

The largest readings from Bodie Hills and Coso obsidians originate from the Mojave Desert—14.7 and 21.1 microns, respectively. In the Bridgeport-Long Valley-Owens Valley region, where the Bodie Hills and Casa Diablo sources are located, maximum hydration readings on artifacts made of these source materials equal 11.9 and 12.2 microns, respectively, indicating that equivalent readings from the quarries likely signal some of the earliest human use. At the Coso quarries in the northern Mojave Desert, readings in the range of 21 microns are likewise indicative of terminal Pleistocene or earliest Holocene human activity. In the San Joaquin Valley, we can expect evidence of terminal Pleistocene to early Holocene human occupation to be signified by hydration readings from Casa Diablo and Coso obsidians up to at least 12.5 and 20 microns, respectively (see Table 11). Judging by maximum readings on Bodie Hills obsidian from the western Great Basin, this material in the San Joaquin Valley may generate readings in excess of 10.0 microns (Tuohy 1984).

As shown in Figure 56, hydration readings displayed at the early end of these histograms fall comfortably within the expected range of hydration values associated with the early artifacts just described. These data reveal that few readings from the terminal Pleistocene or earliest Holocene are recorded at regional sites, consistent with the rarity of early artifact types in this region. Further, there is virtually no evidence in the regional hydration record for pre-Clovis human occupation of south-central California. However, the possibility remains that such evidence may be uncovered when and if more focused research is conducted at the quarries. Lastly, the hydration evidence compiled from regional projectile points clearly shows a sequence of types beginning with fluted concave base forms, followed in time by un-fluted concave base points, and lastly Great Basin Stemmed forms. This sequence is largely consistent with those found elsewhere in North America, and suggests that concave base points likely preceded stemmed points in south-central California, and that un-fluted points are primarily younger than their fluted counterparts (e.g., Rondeau and Hopkins 2008).

The Holocene Distribution of Obsidian in South-Central California

Using the same data sets employed in the previous analysis, we examined the distribution of different obsidian types throughout the District 6/9 Study Area, as a measure of human land use and broader prehistoric interaction spheres (Figure 57). Several studies have previously considered the distribution of different obsidian materials within the Study Area beginning with Ericson (1977). For the most part this research has shown that obsidian moved mainly in an east-to-west direction over the Sierra Nevada (but see Basgall 1989; Delacorte 1999), with reasonably well-demarcated north-south divisions between the distributions of the various sources (Bouey and Basgall 1984; King et al. 2008; Roper-Wickstrom 1992; Sutton and Des Laurier 2002). The current analysis largely supports these previous findings. As shown in Figure 56, Coso is the dominant material found at sites throughout the Mojave Desert portion of the Study Area northward to just past Owens Lake and westward across the Sierra Nevada through the Kern River Canyon and into the Kern and Buena Vista lake basins of the San Joaquin Valley (Roper-Wickstrom 1992; Sutton and Des Laurier 2002). Fish Springs becomes the dominant obsidian source in the central Owens Valley from north of Owens Lake to just north of Big Pine and west across the Sierra Nevada to the upper portion of the western slope near the headwaters of the middle fork of the Kings

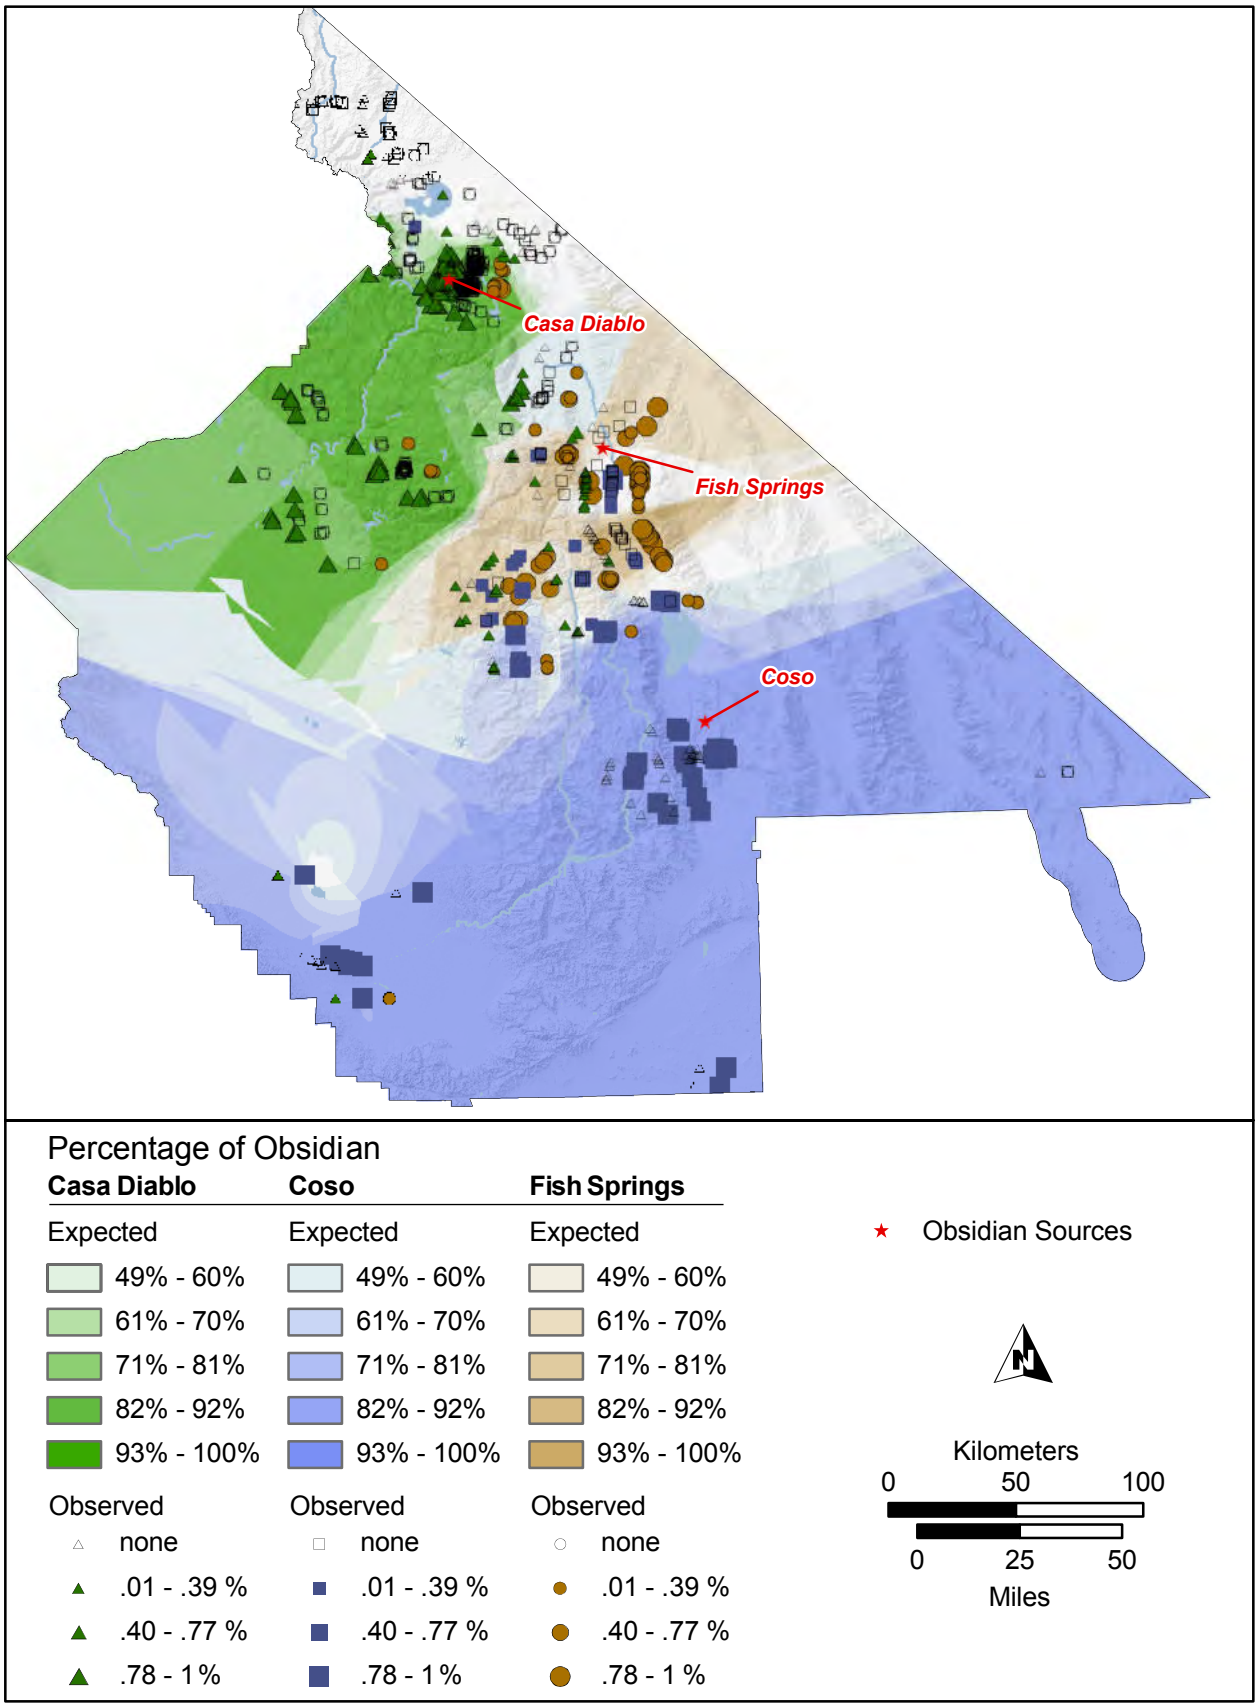

Figure 57. Distribution of the Three Primary Obsidian Types found in Archaeological Contexts within District 6/9.

River (Roper-Wickstrom 1992). Its absence in the San Joaquin Valley may, in part, be related to an absence of samples from valley sections immediately to the west, or may represent the western-most distribution of this material (Roper-Wickstrom 1992). Casa Diablo is the most common obsidian source north as far as the southern Mono Basin and on the western slope of the Sierra as far as the Tuolumne River (Jackson et al. 1994; King et al. 2008). Further north, Bodie Hills obsidian makes up the great majority of volcanic glass found on both sides of the Sierra as far as the Tahoe Basin and the American River watershed (King et al. 2008; Meyer and Rosenthal 2008). East-west distributions break down in the northern San Joaquin Valley during the late Holocene, where obsidian from Napa Valley in the southern North Coast Ranges becomes dominant and Casa Diablo obsidian extends much further north than its representation in the western Sierra (Rosenthal and Whitaker 2009).

Although these distribution patterns relate mainly to the late Holocene (i.e., 4000 cal BP; based on the age of most sampled components), limited information available from early Holocene sites shows that these patterns of distribution are long standing. For example, early Holocene sites at the southern end of the San Joaquin Valley include Coso obsidian almost exclusively (Jackson et al. 1998), while early artifacts found along the southern shore of Tulare Lake are mainly Casa Diablo (Gold et al. 2008). Likewise, Coso obsidian makes up virtually all of the obsidian from early sites in desert regions to the east (e.g., Basgall and Hall 1994). Further north, deeply buried early Holocene components at the Skyrocket site (CAL-629/630) and at Clarks Flat (CAL-342), north of the Tuolumne River, include 80 percent or more Bodie Hills obsidian (La Jeunesse and Pryor 1996; Peak and Crew 1990), similar to late Holocene sites from that same region (Rosenthal 2008).

While it remains unclear to what extent these distribution patterns represent the movement of people across the landscape or the exchange of commodities within broad interaction spheres, it is likely that early Holocene distributions represent something completely different than those associated with the late Holocene. These patterns also show that, while obsidian often moved quite far from its place of origin, the great majority of this material was deposited in a relatively tight radius around its source, extending more broadly in an east-west orientation than north to south.

CONCLUSIONS

Prehistoric human use of volcanically active regions east of the Sierra Nevada likely began in the latest Pleistocene and continued up to the historic period. This is evident not only in regional obsidian hydration profiles, but the earliest known human tools from this region are made of obsidian quarried within the Study Area. That all of the major obsidian sources were known to the makers of fluted points suggests that the region was thoroughly explored by the latest Pleistocene, leaving open the possibility that even earlier human use of south-central California may be uncovered in the future. Regional hydration profiles, however, do not show use of these obsidian sources earlier than indicated by hydration values from fluted points, further suggesting that if pre-Clovis occupations exist in the Study Area, they have yet to be discovered, or do not register in the considerable hydration evidence amassed to date. Nevertheless, beginning in the terminal Pleistocene obsidian from the Inyo-Mono and Coso regions was transported across a large area of south-central California, recovered from the earliest known archaeological sites both east and west of the Sierra Nevada. From that time through the latest Holocene, the distribution of obsidian from eastern California marks both the movement of people across the Sierra crest, and broad interaction spheres that developed between politically autonomous communities throughout much of California.

Over this time span, eastern California witnessed numerous volcanic events which transformed the geomorphic landscape and often delivered enormous amounts of ash and other volcanic debris over broad portions of the Study Area. While such events certainly had short-term effects on human populations, the numerous eruptions recognized in the Inyo-Mono region during the Holocene are not evident in obsidian hydration profiles from across south-central California (e.g., Laylander 1998). Despite the potentially devastating effects of such events, human use of this region appears to have continued unabated throughout the Holocene (c.f., Hall 1983). However, these volcanic events played a major role in structuring the archaeological record of the Inyo-Mono region, almost certainly obscuring much of the early and middle Holocene record beneath various types of volcanic ejecta and debris flows that originated during the late Holocene. Even sites from the latter time period have been buried by volcanic ash and debris, imposing a bias which cannot be overcome without concerted effort by archaeologists to account for the ways in which volcanic activity has structured the archaeological record of this region.

CHAPTER 6. BURIED SITE POTENTIAL IN DISTRICT 6/9

Buried site potential in District 6/9 is assessed here using landform age and key environmental characteristics thought to have a strong bearing on the location of past human settlements. A comprehensive map of Pleistocene- and Holocene-age landforms was constructed for the entire Study Area using digital soils surveys in combination with extensive radiocarbon-dating. To account for human land-use patterns, a model of buried site potential was developed based on landform age in combination with topographic relief and proximity to water. The resulting model allows Caltrans and other resource managers to make informed decisions regarding: (1) the need for further geoarchaeological studies; (2) appropriate inventory methods; and (3) the level of effort needed to identify buried sites in a given project area. In addition to increasing the likelihood that buried archaeological resources will be identified early in the planning process, this study provides a basis for evaluating potential biases in the nature and completeness of the archaeological record.

MAPPING STRATEGY AND METHODS

To better account for the entire record of human occupation in the Study Area, it was necessary to assess the age and extent of depositional landforms so that those with the potential to contain buried archaeological deposits could be distinguished from those that do not. A combination of radiocarbon dating and archival research was used to develop a map depicting the age of depositional landforms in District 6/9. Archaeological and geological studies, historical maps, soil surveys, and related digital files were identified, and critical datasets (i.e., soil descriptions, radiocarbon dates, and stratigraphic relationships) integrated to provide landform age assignments discussed in Chapter 4 and presented in Figure 17.

Radiocarbon Database

Recognizing that the use of relative age assignments based on soil development and landform position alone has created a number of problems with existing geological maps (see Chapter 3), 2,402 radiocarbon dates from 569 separate locations were compiled from published and unpublished sources. Relevant information, such as location, provenience, and stratigraphic context, was recorded for each date by obtaining and reviewing the primary source whenever possible. Sample locations include 284 archaeological sites and 285 from natural contexts. More than 1,713 dates (~71%) are from locations within District 6/9, while the remainder (689 or ~29%) are from adjoining counties with similar soil types (Table 13). Slightly more than one-third of the total dates (n=856, or 35%) are from "cultural" contexts, while 1,598 (65%) are from contexts judged to be "natural" or non-cultural in origin; the type and context of a small number of dates (n=6, or 0.02%) could not be determined and were not utilized in subsequent analyses.

Table 13. Summary of Radiocarbon Database.

Caltrans District No.	County or Counties	Cultural Contexts	Natural Contexts	Grand Total	% of total
5	San Benito	9	99	108	4.40%
6	Fresno, Kern, Kings, Madera, Tulare	335	479	814	33.20%
7	Los Angeles	0	1	1	0.04%
8	San Bernardino	4	285	289	11.92%
9	Inyo, Mono	339	618	957	38.83%
10	Alpine, Mariposa, Merced, Tuolumne	169	116	285	11.63%
Grand Total		856	1,598	2,454	100.00%
% of Total		34.9%	65.1%	100.0%	

Note: Includes 65 dates obtained for this study

In addition to dates compiled from existing literature, 65 new radiocarbon dates were obtained from 33 locations as part of the current study (Table 13). Radiocarbon sampling initially focused on distinguishing

Pleistocene- from Holocene-age landforms. This allowed for a more accurate correlation between characteristics of soil development and landform age in the Study Area. Subsequent dates were used to refine age assignments within the Holocene and clarify the temporal range of various soil types, particularly those with moderate degrees of profile development or in intermediate landscape positions.

For purposes of constraining the age of surface soils, radiocarbon dates were considered to be from buried contexts if they were associated with a geological stratum overlain by an unrelated depositional stratum. Using this criterion, some samples from shallow depths were considered buried, while others from relatively deep contexts were assigned to the surface stratum. Samples covered by deposits of artificial fill were also assigned to surface contexts because they were not naturally buried. In the absence of information on stratigraphic context, samples collected from depths of 100 centimeters or more were generally presumed to be from buried contexts.

All radiocarbon dates were calibrated using the CALIB software program (version 5.02) developed by Stuiver and Reimer (1993). Sample locations were linked to soil types at the surface of associated landforms using digital soil survey data. Fifty of the compiled dates are from unknown or suspect contexts and were excluded from further analyses, including some dates that the original researchers considered erroneous. Thirteen "modern" dates were also excluded because they were too young to calibrate with the CALIB program. Radiocarbon dating methods, laboratory sample sheets, and the resulting database are provided in Appendix B.

As shown in Table 14, the majority (~54.1%) of dates are late and latest Holocene in age, of which more than 1,000 (~42.3 %) date solely to the latest Holocene (<2,000 cal BP). Latest Holocene dates account for about 72 percent of those from cultural contexts and about one-quarter (26.1%) of those from natural contexts. It is telling that the number of dates from middle Holocene-age deposits (n=172, or ~7.2 %) is about one-half of those from the early Holocene (n=364, or 15.1%), pointing to the long-standing difficulty in finding middle Holocene-age geological contexts (Table 14).

Table 14. Summary of Radiocarbon Database by Time Interval and Context.

Time Interval	cal BP	Natural Contexts	% of Natural Contexts	Cultural Contexts	% of Cultural Contexts	Total per Interval	% per Interval
Historical-Modern	<150	25	1.6%	69	8.1%	94	3.9%
Latest Holocene	150-2000	404	26.2%	616	72.5%	1,020	42.7%
Late Holocene	2,000-4000	196	12.7%	85	10.0%	281	11.8%
Middle Holocene	4000-7000	117	7.6%	55	6.5%	172	7.2%
Early Holocene	7000-11,500	339	22.0%	25	2.9%	364	15.2%
Latest Pleistocene	11,500-15,000	186	12.1%	-	-	186	7.8%
Late Pleistocene	15,000-25,000	155	10.1%	-	-	155	6.5%
Older Pleistocene	25,000-1.9 million	119	7.7%	-	-	119	5.0%
Grand Total		1,541	100.0%	850	100.0%	2,391 [a]	100.0%

Notes: Included are all dates from District 6/9 and selected dates from adjoining counties; [a] 50 dates from unknown or suspect contexts and 13 "modern" dates that could not be calibrated are not included.

Digital Soils Surveys

The depositional landform map was created from digital soil data obtained from the Natural Resource Conservation Service (2009a, 2009b) Soil Survey Geographic Database. The soil data occur in two formats known as the Soil Survey Geographic (SSURGO) Database and the State Soil Geographic (STATSGO) Database. The SSURGO-data are the most detailed, representing an exact duplication of the original soil surveys mapped at a 1:24,000 scale (NRCS 2009a). The state-wide STATSGO data are far more generalized and include areas where SSURGO-level soil surveys were not needed, or have not yet been conducted (NRCS 2009b). For example, soils in agriculturally fertile areas such as the San Joaquin Valley are mapped at the detailed SSURGO-level, while those in less fertile areas such as the Mojave Desert and Sierra Nevada mountains are only mapped at the general STATSGO-level. For this reason, the spatial resolution of soils maps is generally better in lowland areas than in upland or desert regions. Though designed primarily for natural resource planning and management, SSURGO-level data have previously been used to develop reasonably detailed maps of depositional

landforms, including those created for geoarchaeological sensitivity studies elsewhere in central California (Meyer and Rosenthal 2008; Rosenthal and Meyer 2004a, 2004b) and other states (Monaghan and Lovis 2005). The STATSGO data were only used for those portions of the Study Area where SSURGO data are not available.

Currently, nearly 16 million acres (68.3%) of the Study Area are covered by detailed SSURGO data (mainly the San Joaquin Valley), with more general STATSGO data covering over seven million acres (31.7%), mainly east of the Sierra crest. The combined SSURGO and STATSGO dataset for the Study Area includes 1,000 individual soil series, families, or complexes, corresponding to 53,923 mapped polygons (soil map units), with almost one-quarter-million (246,976) assigned attributes or components (Table 15).

Table 15. Summary of Digital Soil Survey Data and Coverage.

Digital Soil Data (resolution)	No. of Soil Series or Map Units	No. of Soil Sub-types (phases)	No. of Polygons	No. of Related Components	Extent in Acres	Percent of Total Acres
SSURGO (detailed)	878	3,284	53,408	239,893	15,941,877	68.3%
STATSGO (general)	122	n/a	515	7,083	7,407,428	31.7%
Totals	1,000	3,284	53,923	246,976	23,349,305	100.0%

Limitations of the Soils Surveys

To understand the limitations of the landform map, it is important to know a little about how data were gathered and constructed by the original soil surveys. First, natural boundaries between different soils are often indistinct and sometimes imperceptible, as soils are complex three-dimensional bodies that merge gradually with one another across a landscape. Soil surveyors make divisions between different soils based on a very limited number of field observations and test pits (Reed 2006:19). Since this is the way that most soil maps are constructed, a certain amount of error, imprecision, and uncertainty always built into soil series boundaries. Further, as mapped, individual soil series often contain some percentage of other soil types, either too small or too spatially complex to be differentiated at the 1:24,000 mapping scale. As a result, the relative accuracy of the map produced for this study is not enhanced by increasing the scale beyond 1:24,000.

Because soils in different portions of the Study Area were often mapped at different times by different people, using different methods and criteria, it was sometimes difficult or impossible to match comparable soil series and associated age groups across adjoining survey boundaries. These types of matching problems are evident at several locations within the SSURGO-level data, with an example from the San Joaquin Valley shown in Figure 58. It is also apparent that the level of detail and spatial resolution provided by earlier surveys is greater in some areas (i.e., northeast side of the San Joaquin Valley) than those surveyed more recently (i.e., western Fresno and Tulare counties). While some of these differences likely reflect variations in the training and knowledge of particular surveyors, it is also true that many of the indicators used to map soil types and their boundaries continue to be obscured or destroyed by artificial landscape modifications, such as repeated cultivation, land leveling, soil reclamation, and drainage. These processes have only increased over the years. Mismatches also occur along boundaries between SSURGO and STATSGO datasets (Figure 58), which simply reflect differences in mapping resolution inherent to each.

No attempt was made to adjust the boundaries of existing soil polygons as mapped, including natural and artificial bodies of water (e.g., lakes and reservoirs). While the precision of map unit boundaries could be improved through stereoscopic comparisons of aerial photographs and topographic contours, this was not possible given the wide geographic scope of this study. Consequently, all map unit boundaries should be considered approximate, and the degree of spatial resolution is no better than the level of detail provided by the soils database. Because our map units are intended to emphasize temporal differences, and not depositional environments, multiple depositional environments may be represented in some map unit-age groups. Even so, obvious landform types (e.g., basins, channels fans, floodplains, and glacial deposits) can be recognized from the overall shape and location of map units. The general age, nature, and distribution of each map unit defined for this study are described in Table 16. Appendix C includes a detailed correlation of soil series, map unit designations, and buried site potential.

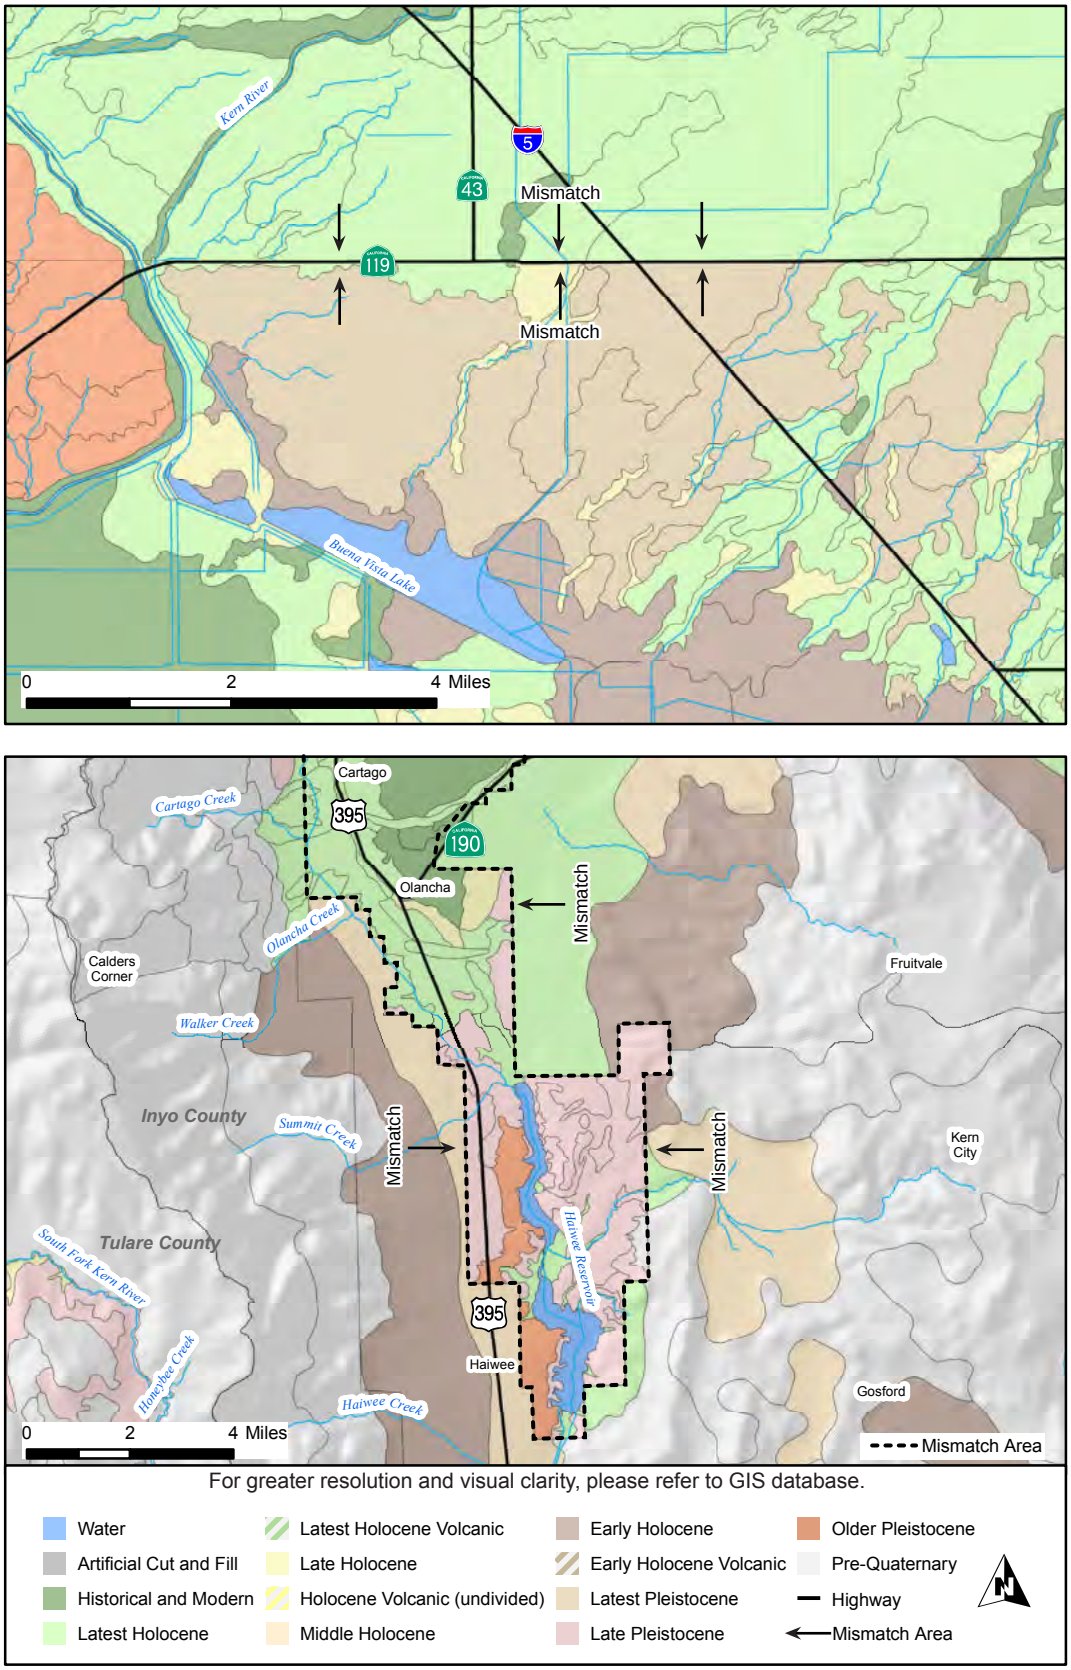

Figure 58. Mapping Discrepancies within SSURGO soil data (top) and between SSURGO and STATSGO soils data (bottom).

Table 16. Definitions of Landform Map Units.

Map Unit (abbreviation)	cal BP	Nature and Geomorphology	Soil Profile Development	General Distribution in Study Area
Artificial Cut/Fill (Hacf)	0-150	Created or modified by human activity, such as canals, dams, levees, mining debris, pits, quarries, and urban areas	Often lacks soil development, but varies greatly depending on nature and setting	Relatively small areas distributed throughout the Study Area.
Historical-Modern (Hm)	0-150	Nearly level alluvial fans, floodplains, lake beds, playas, inset terraces, and channels	Very weakly developed A/C profiles with no subsurface horizons	Distributed locally in Study Area in or along active channels, in canyons, and beds of former lakes
Latest Holocene (LtH)	150-2000	Alluvial/colluvial fans, nearly level floodplains, inset terraces, some dunes and volcanic deposits	Weakly developed A/C or A/Cg profiles, few weak Bk or Bw horizons	Distributed widely in valleys throughout the Study Area, mainly found in the San Joaquin Valley
Late Holocene (LH)	2000-4000	Alluvial/colluvial fans, floodplains, inset terraces, many dunes, some volcanic deposits	Weakly medially developed profiles, many with Bw horizons, some with Bk and/or Bss horizons	Distributed widely in valleys throughout Study Area, mainly Owens and San Joaquin valleys
Middle Holocene (MH)	4000-7000	Alluvial/colluvial fans, floodplains, inset terraces, and some dunes	Medially developed profiles, most with Bk and/or Bt horizons (clay films often faint and patchy), few Bn horizons	Surface distribution very limited in valleys, most often buried, found at surface in parts of Owens and Rose valleys
Early Holocene (EH)	7000-11,500	Alluvial/colluvial fans, floodplains, inset terraces, and some older lake beds, few volcanic deposits	Medial- to well-developed profiles, most with Bk and/or Bt horizons (common, faint clay films), many Bn horizons, some with weakly cemented silica horizon (Bq)	Surface distribution limited mainly to abandoned lake beds in parts of Owens Valley, distal fans in eastern San Joaquin Valley, and fan in parts of Great Basin and Mojave Desert (e.g., Death Valley, Antelope Valley)
Latest Pleistocene (LtP)	11,500-15,000	Alluvial fans and floodplains, some glacial deposits and few volcanic deposits with some surface dissection	Well-developed profiles, most with Bk, Bn and/or Bt horizons (common, distinct clay films), some with semi-cemented silica horizon (Bqm)	Surface distribution limited exclusively to parts of western San Joaquin Valley, such as "Lethent fan" northwest of Tulare Lake
Late Pleistocene (LP)	15,000-25,000	Alluvial fans and floodplains, common glacial deposits and some volcanic deposits, most with some surface dissection	Very well-developed profiles with strong Bk, Bn, Bt and/or Bqm horizons (many, distinct clay films)	Surface distribution limited mainly to valley margins, found in Owens Valley, eastern San Joaquin Valley, and parts of Great Basin and Mojave Desert (e.g., Antelope and Silurian valleys); glacial deposits in upper parts of Sierra Nevada and White Mountains, and along western margins of Owens Valley and Mono-Long valleys.
Older Pleistocene (OP)	25,000-1.9 my	Alluvial fans and floodplains, common glacial deposits and some volcanic deposits, all with surface dissection, many uplifted, and/or faulted	Extremely well-developed profiles with very strong Bk, Bn, Bt and/or Bqm horizons (many, distinct, thick clay films), often cemented and/or semi-consolidated	Surface distribution limited mainly to valley margins in Owens Valley, eastern and western San Joaquin Valley, and parts of Great Basin and Mojave Desert (e.g., Armargosa and Antelope valleys); glacial deposits in upper parts of Sierra Nevada and White Mountains, and along western margins of Owens Valley and Mono-Long valleys.
Pre-Quaternary (pQ)	1.9 my or more	Hills and mountains composed of volcanic, metamorphic, and sedimentary rocks, most often dissected, uplifted, and/or faulted	Profiles vary greatly due to erosion of most landforms, from weakly developed to extremely well developed, often consolidated and/or well-cemented	Bedrock outcrops found mainly in the Coast/Temblor Ranges, Transverse Ranges, Sierra Nevada, White Mountains, and other Great Basin ranges

Notes: Water (H20) map unit not described; my – million years.

Map Development

Because specific soil types are typically associated with landforms of a similar age and depositional environment, soil series were used to define the aerial extent and chronological relationship of different landform groups. Once compiled, soil survey data were uploaded to a customized software interface where they were reviewed and coded. The degree of soil profile development provided by official soil descriptions was used to make initial age estimates for each soils series, while boundaries between each series were used to define contacts between soils of different ages. In addition to relative soil development, age assignments for particular soil series were further based on the geomorphic position of associated landforms, cross-cutting relationships, and degree and extent of erosional dissection.

Each radiocarbon date in the database was then linked to their associated soil series and cross-checked against initial age assignments for each soil type. When contradictions were found, soil series ages were sometimes adjusted based on the new radiocarbon information, and all map polygons associated with that soil series were recoded with the revised age. Soil series found to have similar degrees of horizon development and in similar landscape positions as dated soils were also re-evaluated and, if necessary, also re-assigned to the new age group. After a series of these detailed comparisons, soil types of the same age were mapped in GIS using the SSURGO and STATSGO shape-files, with a simplified final version of the map shown in Figure 17.

Landform Map Limitations

As for any map, it is important to remember that the "map is not the territory." The landform map is no exception since its precision and accuracy depend mainly on the criteria, scale, and data used in its construction. In some desert areas, such as Death Valley and Panamint Valley, alluvial fans and floodplains are typically composed of different-age deposits with complex distributions that vary considerably over short distances. The ages and distributions of these landforms are over-generalized at the STATSGO level so that some include small areas of non-depositional landforms (e.g., pre-latest Pleistocene). The same applies to most mountainous areas, such as the upper Sierra Nevada, that are generally mapped as solely pre-Quaternary bedrock or pre-latest Pleistocene glacial deposits, even though many Holocene-age depositional landforms are present in these areas that are too small and localized to be mapped at the STATSGO scale. The landform map must, therefore, be used with the recognition that it is over-generalized in most settings.

For example, as shown in Table 17, upland landforms known to contain buried archaeological deposits include meadows, fans, footslopes, floodplains, inset terraces, and some bedrock hollows and hillslopes. Buried sites associated with older upland landforms include an early Holocene-age deposit and soil on a low-angle ridge spur at Sunset Point (TUL-1052) near Mountain Home (Dillon 1992), and middle and late Holocene culturaldeposits (TUO-2834) buried on a Pleistocene-age glacial moraine at Dana Meadows (Montague 1996). Other examples include site MNO-3 along Snow Creek near Mammoth Lakes (Burton 1990) and site TUL-879 in Rockhouse Basin (Garfinkel et al. 1984), which have late or latest Holocene cultural deposits more than 1.1 meters (3.6 feet) below surface even though both are located on glacial deposits.

Table 17. Age and Buried Site Potential of Depositional Landforms in the Sierra Nevada (adapted from Meyer and Rosenthal 2008).

Landform Type	Age Range (cal BP)	Description	Typical Age of Buried Soils/Sites
Meadows	15,000-150	Usually found in basins with level or nearly level surfaces at elevations of more than 1,829 meters (6,000 feet) above mean sea level.	Early, Middle, and Late Holocene
Fans and Footslopes	15,000-400	Typically have gently sloping surfaces (~9 degrees or less) that occur at the base of slopes and in concave landscape positions.	Early, Middle, and Late Holocene
Floodplains and Inset Terraces	4500-0	Usually form level or nearly level surfaces that are adjacent to modern stream or river channels	Middle and Late Holocene
Bedrock Hollows and Low-Angle Hillslopes	Pre-Holocene to 400	Includes broad low-angle benches at mid-slope positions or nearly level ridges and nose slopes	Middle and Late Holocene

Usual distinctions between depositional and non-depositional landforms are sometimes blurred and confounded in areas where Holocene-age deposits overlie older bedrock, or glacial deposits that are generally considered to be erosional. In the Sierra foothills near Sonora, for instance, buried Holocene-age soils and archaeological deposits were found on low-angle (~0.5 to 4.5 degrees) hill slopes underlain by granitic bedrock (Meyer 2008a; Meyer and Dalldorf 2004). These studies also determined that Holocene-age depositional landforms in the foothills tend to have concave surface topography and slopes of nine degrees or less, which likely applies to other upland areas in the Study Area.

LANDFORM AGE AND BURIED SITE POTENTIAL

Simply stated, there is generally an inverse relationship between landform-age and the potential for buried archaeological deposits. For example, archaeological deposits cannot be buried within landforms that developed prior to human colonization of North America (Rosenthal and Meyer 2004a, 2004b). Therefore, as a first step, landforms with the potential to contain buried sites must be distinguished from those that are too old to contain them, allowing older portions of the landscape to be confidently excluded from further consideration. While this basic distinction addresses the potential for buried sites, the relative probability of locating a buried site depends largely on a more fine-grained distinction between the ages of different Holocene-age landforms.

For the purposes of this study, buried site potential was determined by two main assumptions: (1) archaeological deposits from each successive time period are more common because the density of human populations increased over time; and (2) the longer a landform remained at the surface, the greater the probability that any one spot on that landform was occupied. Thus, the potential for buried archaeological deposits is elevated when landforms are buried later in time.

For example, early Holocene surface landforms are considered to have a low potential for buried sites, not because such sites are absent, but simply because these landforms can only contain sites from the latest Pleistocene or earliest Holocene, a relatively short 2,000- to 3,000-year interval. In addition, human populations are thought to have been comparatively low during this time period. Thus, we assume a small number of sites were created by the region's first inhabitants over a relatively brief period of time. Consequently, the probability of finding one of these sites within or below an early Holocene surface landform is reduced by these factors.

The relationship between time and archaeological potential can also be used to predict which landforms are likely to yield buried archaeological deposits from specific cultural periods, and which are not. For instance, latest Pleistocene to early Holocene surface landforms cannot contain buried sites from later cultural periods and, conversely, archaeological deposits from almost any cultural period may lie beneath latest Holocene-age surface landforms.

As depicted in Figure 17 and described in Table 16, 13 different landform units were identified and mapped throughout the Study Area, corresponding to nine different age groups (areas mapped as water are excluded). Based on the age and type of landform, five levels of buried site potential were associated with particular landform units and ranked from Very Low to High (Table 18). In keeping with the assumptions outlined above, latest Pleistocene-age or older landforms are ranked as having a Very Low potential for buried sites, while latest Holocene-age landforms are ranked as having a High potential. Based on the landform age criteria, the potential for buried sites is Low or Very Low in nearly three-fourths (74.4%) of the Study Area, and Moderate to High in only one-fourth (25.6%; Table 18).

Caltrans Right-of-Way

By adding a 10-meter- (32.8-foot-) wide right-of-way buffer along both sides of each Caltrans highway, the buried site potential of these roadways was evaluated (Appendix E). This assessment indicates that landform units with Very Low to Moderately Low buried site potential are associated with more than one-half of the total highway distance in the Study Area (n=14,695 linear acres, or 54%). In contrast, about one-third of the total highways traverse units with a High potential for buried resources (n=9,723 linear acres, or 35.7%), while only about 10 percent cross landforms with a Moderate buried site potential (n=2,810 linear

Table 18. Buried Site Potential and Size of Landform Map Units in the Study Area.

Landform Map Unit	Weighted Potential (score)					% of Total Acres
	Very Low (-1,or. 0)	Low (1)	Moderately Low (2)	Moderate (3)	High (4)	
Water (H20)	142,563	-	-	-	-	0.61%
Artificial Cut and Fill (Hacf)	37,001	-	-	-	-	0.16%
Historical and Modern (Hm)	-	659,354	-	-	-	2.82%
Latest Holocene Volcanic (LtHv)	-	-	-	-	421,970	1.81%
Latest Holocene (LtH)	-	-	-	-	3,848,815	16.48%
Late Holocene (LH)	-	-	-	1,318,099	-	5.65%
Holocene Volcanic-undivided (Hvun)	-	-	-	13,368	-	0.06%
Middle Holocene (MH)	-	-	365,252	-	-	1.56%
Early Holocene (EH)	-	1,244,584	-	-	-	5.33%
Early Holocene Volcanic (EHv)	-	17,189	-	-	-	0.07%
Latest Pleistocene (LtP)	521,561	-	-	-	-	2.23%
Late Pleistocene (LP)	881,404	-	-	-	-	3.77%
Older Pleistocene (OP)	2,243,131	-	-	-	-	9.61%
Pre-Quaternary (pQ)	11,634,845	-	-	-	-	49.83%
Total Acres	15,317,942	2,063,690	365,252	1,331,467	4,270,785	100.00%
% of Total Acres	65.6%	8.8%	1.6%	5.7%	18.3%	

Notes: 23,349,136 acres total.

acres, or 10.3%). Thus, the total length of roadways with low or moderate buried site potential is 18% less than the total with high potential, a difference that largely reflects the tendency for roads to be placed along paths of least topographic resistance (i.e., level valleys versus steep slopes).

ENVIRONMENTAL PARAMETERS AND BURIED SITE POTENTIAL

The age-based map provides a good basis for predicting which landforms may contain buried archaeological remains, and what cultural period(s) may be represented. It does not, however, explicitly account for other factors that likely determined the location of prehistoric sites. Consequently, buried site potential may be overestimated in some areas, and underestimated in others based on landform age alone. Given the large extent of Holocene-age surface landforms in the Study Area (see Figure 17), buried site potential was further refined by including environmental parameters that attempt to account for human settlement decisions.

Archaeological deposits are not distributed randomly throughout the landscape, but tend to occur in specific geo-environmental settings (Foster and Sandlelin 2003:4; Hansen et al. 2004:5; Pilgram 1987; Rosenthal and Meyer 2004a). Detailed site prediction models are, ideally, constructed for areas where it is possible to account for most of the variables that may have made a specific location more favorable for human occupation than another, such as a single valley, lake basin, or drainage network (e.g., Allen et al. 1999; Rosenthal and Meyer 2004a). While such a model based on the complexities of human decision-making are well beyond the scope of this study, we did utilize two environmental variables to better identify areas with the highest potential to contain buried archaeological sites: distance to water and landform slope. These variables are consistent with previous analyses in the southern Sierra foothills, indicating that most prehistoric occupation sites are associated with level or nearly level landforms (<10-degree slope), occurring near stream confluences where at least one stream is perennial (Pilgram 1987:44-47). Furthermore, geoarchaeological

studies conducted in the Sierra foothills near Sonora determined that Holocene-age depositional landforms tend to have surface slopes of nine degrees or less and often contain buried archaeological sites (Meyer 2008a; Meyer and Dalldorf 2004).

Distance to Water Sources and Degree of Slope

The relationship between site locations and environmental variables such as biotic zone, physiographic provenance, precipitation, soil productivity, stream order, and distance to water within District 6/9 were assessed using a GIS-based "weights of evidence analysis" (Bonham-Carter et al. 1989; see Appendix E-1 for a detailed discussion of the weights of evidence analysis). Artificial sources of water such as man-made canals, channels, ditches, lakes, ponds, and reservoirs were identified and excluded from further consideration to emphasize only prehistoric water sources. Similarly, since the lower reach of the Kern River channel was not established until the 1870s (Grunsky 1898a), it was excluded in favor of the pre-1870s river course as shown on historic-era maps.

This analysis revealed that prehistoric site locations in the Study Area are most strongly correlated with distance to the nearest water source, whether a lake, stream, or spring. It was also shown that sites tend to be located farther away from major lakes, streams, and rivers as compared to springs or small streams. Based on this, the order of perennial streams (i.e., their size and number of upstream confluences) throughout the Study Area was ranked using the Horton-Strahler method (Horton 1945; Strahler 1952), and the distance to water modeled by progressively increasing the distance for larger order streams using a roughly logarithmic scale, as shown in Table 19.

Surface slopes over the entire Study Area were modeled in 90-meter (295 feet) grid cells using data from NASA Shuttle Radar Topographic Mission (Jarvis et al. 2008). The calculated results were analyzed using a simple binary model to identify those portions of the Study Area that have surface slopes of less than 10 degrees located within the prescribed distance to water as determined by stream order. Because weights of evidence analysis showed that distance to water is more important than slope in determining site locations, proximity to water was given greater weight than slope. Thus, areas with surface slopes of 10-degrees or less that are located near water have a greater potential for buried sites than areas of similar slope away from water (Table 19).

Table 19. Parameters Used to Model Slope and Distance to Water.

Stream Order	Dependent Distance to Water (meters)	Presence of Water Source [a]	Type of Surface Slope (degrees)	
1	100		<10° (yes)	>10° (no)
2	250	<Distance (yes)	2	1
3	500	>Distance (no)	-1	-2
4	750			
5	1,000			
6	2,500			
7	5,000			
8	7,500			
9 or more	10,000			

Notes: [a] Water present or absent within dependent distance per stream order.

AN ENVIRONMENTAL MODEL OF BURIED SITE POTENTIAL

All portions of the Study Area were distinguished according to the two environmental criteria and the results merged with the landform-age map to develop a refined model of buried site potential. To arrive at an overall measure of buried site potential, scores generated by the environmental parameters were added to scores derived from the landform map as follows: distance to water/slope (ws) plus map score (ms) equals the overall score (ws + ms = os). For example, to calculate the score for areas with surface slopes greater than 10 degrees that are not near water, and associated with pre-Quaternary surface deposits, the slope and distance to

water score of -2 was added to the pre-Quaternary score of -1 for an overall score of -3, or Very Low. Conversely, areas with surface slopes of 10 degrees or less, which are near water, and associated with latest Holocene surface deposits, were calculated by adding the slope and distance to water score of 2 to the latest Holocene score of 4, for an overall score of 6, or Very High. The scoring system and possible scoring combinations are summarized in Table 20.

Table 20. Buried Site Potential Scoring System and Possible Score Combinations.

Landform Unit (Weight)	Combined Surface Slope and Distance to Water (Weights) and Landform Weights				Overall Score and Buried Site Potential
	(Wt. -2)	(Wt. -1)	(Wt. 1)	(Wt. 2)	
Water (0)	-2	-1	1	2	6 - Very High
Artificial Cut/Fill (-1)	-3	-2	0	1	5 - High
Historical-Modern (1)	-1	0	2	**3**	4 - Moderately High
Latest Holocene (4)	2	**3**	**5**	**6**	3 - Moderate
Late Holocene (3)	1	2	**4**	**5**	2 - Moderately Low
Middle Holocene (2)	0	1	**3**	**4**	1 - Low
Early Holocene (1)	-1	0	2	**3**	0 to -3 - Very Low
Latest Pleistocene (0)	-2	-1	1	2	
>Late Pleistocene (-1)	-3	-2	0	1	
Slope/Water Trends	(>slope/<water)		(<slope/>water)		

Notes: Moderate to Very High scores in **bold** and shaded cells.

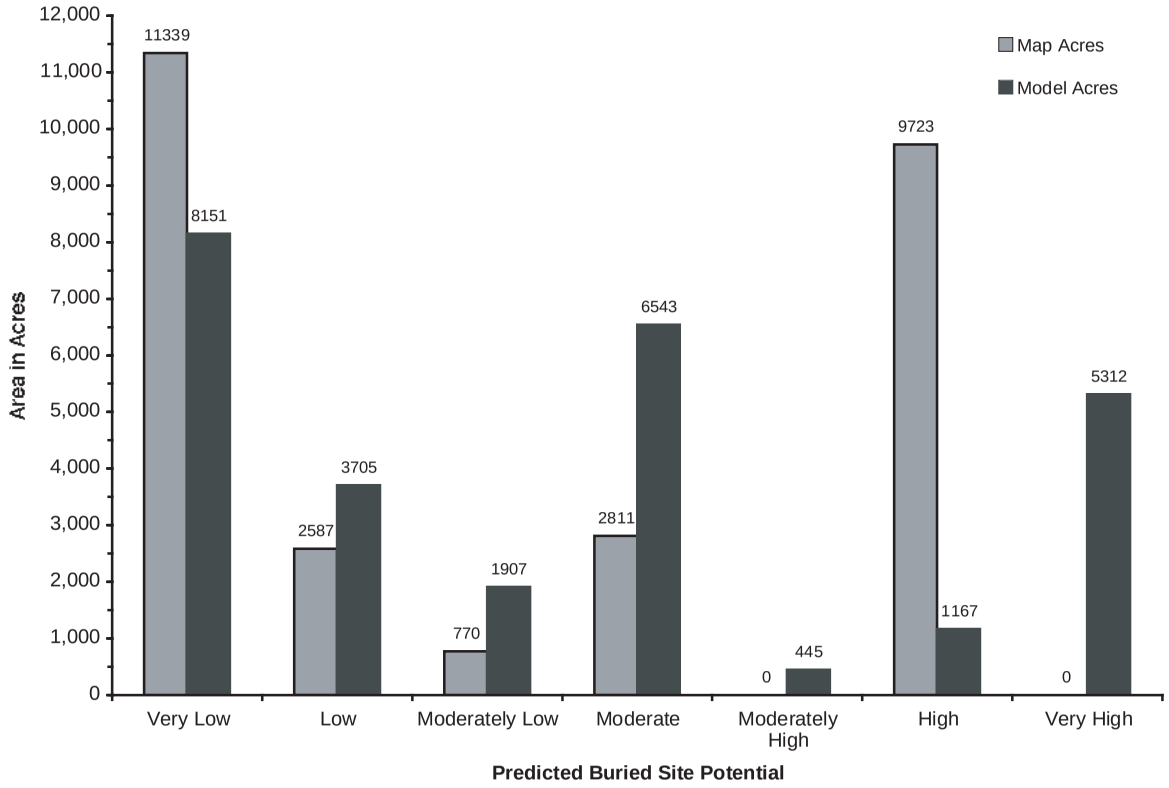
While the environmental predictive model itself does not alter or decrease a landform's "geologic potential" to contain buried sites, it does provide a rationale to further define and delimit areas with the greatest likelihood for buried sites within each of the landform map units. In doing so, the predictive model focuses attention on particular portions of sensitive landform units, while deemphasizing other parts of the same units.

Comparison of Buried Site Potential Using Landform Age and Environmental Parameters

The landform map alone identifies more than 4.2 million acres (~18 %) of the Study Area as having a High potential for buried sites. The landform map combined with variables of slope and distance to water identifies just 2.8 million acres (~12% of Study Area) as having High or greater potential for buried sites, which reduces the sensitive area by about 1.4 million acres (~6 %; Table 21).

Table 21. Comparison Buried Site Potential Scores, and Area Covered.

	Very Low, Low, and Moderately Low	% of Total	Moderate	% of Total	Moderately High, High, and Very High	% of Total
Landform Map (acres)	17,746,884	76.01%	1,331,467	5.70%	4,270,785	18.29%
Predictive Model (acres)	17,734,342	75.95%	2,793,642	11.96%	2,821,152	12.08%
Model minus Map (acres)	(12,542)	(0.05%)	**1,462,175**	**6.26%**	(1,449,633)	(6.21%)



Notes: Values in **bold** indicate a net increase, and those in (parentheses) indicate a net decrease, in area compared to the landform map assignment.

The environmental model also identifies some areas ranked as Moderate or lower potential by the landform map as having a slightly higher potential for buried sites. While this results in a net change in the buried site potential for only about 12,500 acres (less than 0.05%) of the overall Study Area (Table 21), specific map units show more significant changes (Table 22). For example, the buried site potential of some areas associated with early Holocene landforms shifts from Low to Moderately Low or Moderate, and the potential of some areas associated with middle Holocene landforms shifts from Low to Moderately Low or High. The landform map units, buried site potential scores, and area covered by each are summarized in Figure 59 and in Table 22.

Table 22. Buried Site Potential and Area Covered by Landform Map Units.

Map Unit	——Very Low (0, -1, -2, -3)——				Low	Mod. Low	Mod.	Mod. High	High	Very High	Total Acres	% of Acres

Notes: Values in ***bold italics*** indicate an increase, and those in (parentheses) indicate a decrease, in potential compared to the landform map assignment; Mod – Moderate.

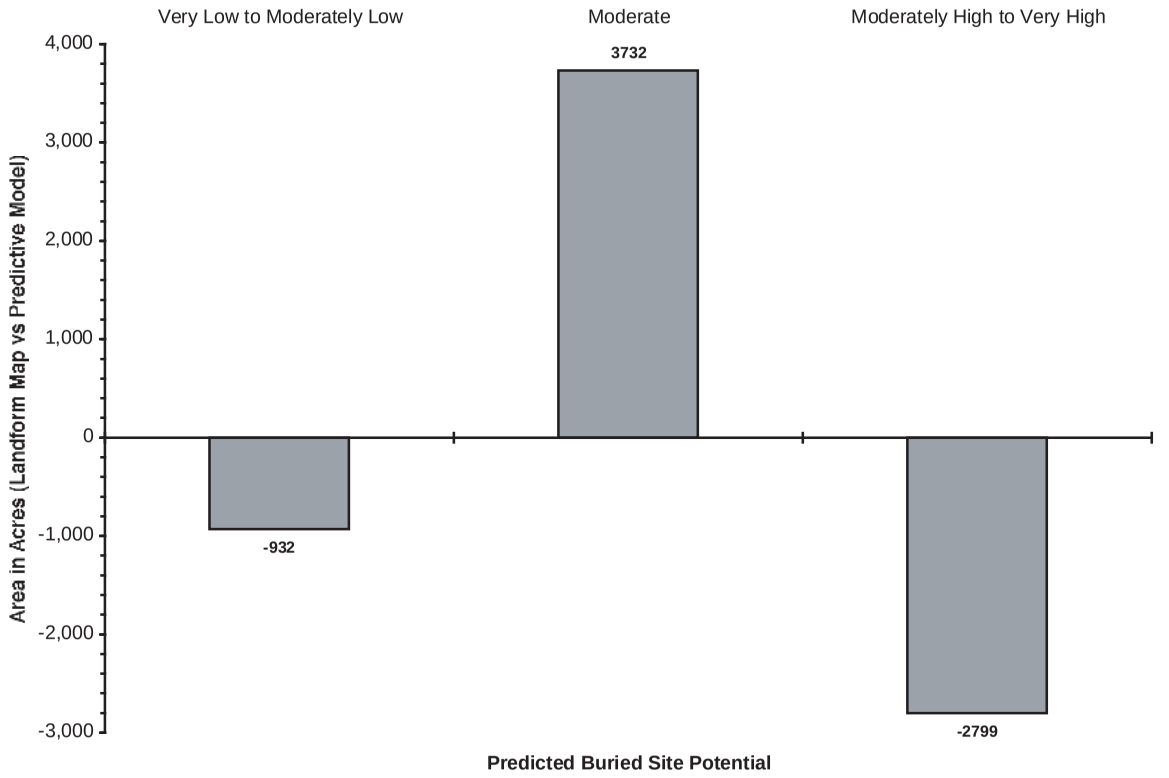

Figure 59. Extent of Buried Site Potential Based on the Landform Map Compared to the Predictive Model.

Caltrans Right-of-Way

To evaluate how the environmental parameters effect the overall buried site potential within Caltrans-owned right-of-way, the extent of each sensitivity level was calculated along each road alignment, (as shown in Appendix E), again with a 10-meter- (32.8-foot-) wide right-of-way buffer. When the two environmental parameters are added to the landform map, the resulting model estimates that the potential for buried resources is Very Low to Moderately Low along about 50.5 percent of all roadways (n=13,761 acres), compared to 54 percent estimated by the landform map alone; a reduction of about 3.5% or 932.3 acres overall (Table 23). About one-fourth of the total roadways (n=6,923 acres, or 25.4%) have a Moderately High to Very High buried site potential with the inclusion of environmental parameters, compared to 35.7 percent based on just the landform map; a reduction of more than 10 percent or about 2,800 acres total. These reductions are contrasted by a 13.7 percent (3,731.7 acres) increase in the amount of area estimated to have a Moderate buried site potential (about 24% or 6,542.5 acres). Thus, adding environmental parameters suggests buried potential is Moderate or lower along more roadway segments (74.5%) than estimates based on the landform map alone (64.3%).

Table 23. Buried Site Potential of Landform Map Compared to Environmental Parameters along all Roadways in District 6/9.

Buried Site Potential	Landform Map Acres	% Map Acres	Environment Acres	% Environment Acres	Environment vs. Map Acres	Environment vs. Map % Acres
Very High	0	0	5,312.1	19.5%	0.0	0.0%
High	9,723.3	35.7%	1,166.8	4.3%	-8,556.5	-31.4%
Moderately High	0	0	445.2	1.6%	0.0	0.0%
Moderately High to Very High Total	9,723.3	35.7%	6,924.0	25.4%	-2,799.3	-10.3%
Moderate Total	2,810.8	10.3%	6,542.5	24.0%	3,731.7	13.7%
Moderately Low	769.7	2.8%	1,907.4	7.0%	1,137.7	4.2%
Low	2,587.0	9.5%	3,705.1	13.6%	1,118.1	4.1%
Very Low	11,339.1	41.6%	8,151.0	29.9%	-3,188.1	-11.7%
Very Low to Moderately Low Total	14,695.8	54.0%	13,763.5	50.6%	-932.3	-3.4%

Roads with the greatest number of acres identified as having a Very Low to Moderately Low buried site potential account for nearly 2,600 acres, or about 9.5 percent of all roadways (Table 24). Those with the most acres of Moderately High to Very High buried site potential make up a little more than 2,000 acres, or about 7.5 percent of all roadways (Table 24). There is a Very Low to Moderately Low potential along 21 other roads that cover between about 110 and 303 acres each, and a Moderately High to Very High potential along 21 roads that cover between about 100 and 272 acres each (Appendix E). State Route KER-58 has some of the longest segments of both reduced and high potential of any roadway within District 6/9.

Overall, environmental parameters plus landform age estimates that the potential for buried sites is Moderately Low or less in the majority (~75%) of the Study Area (see Figure 59), and along more than half of the roadways (54%). At the same time, there is a Very High buried site potential in about nine percent of the Study Area, and along nearly 20 percent of the roadways, suggesting that only about one-fifth of the roadways may require the greatest level of scrutiny. By focusing attention on where buried sites are most likely to occur, the model can help narrow the size of the area that needs to be searched for potentially buried sites, thus increasing the likelihood that buried sites will be identified while reducing the amount of time and effort needed to do so.

Table 24. Roadways with the Greatest Linear Extent of Reduced or Elevated Buried Site Potential Based on Environmental Parameters.

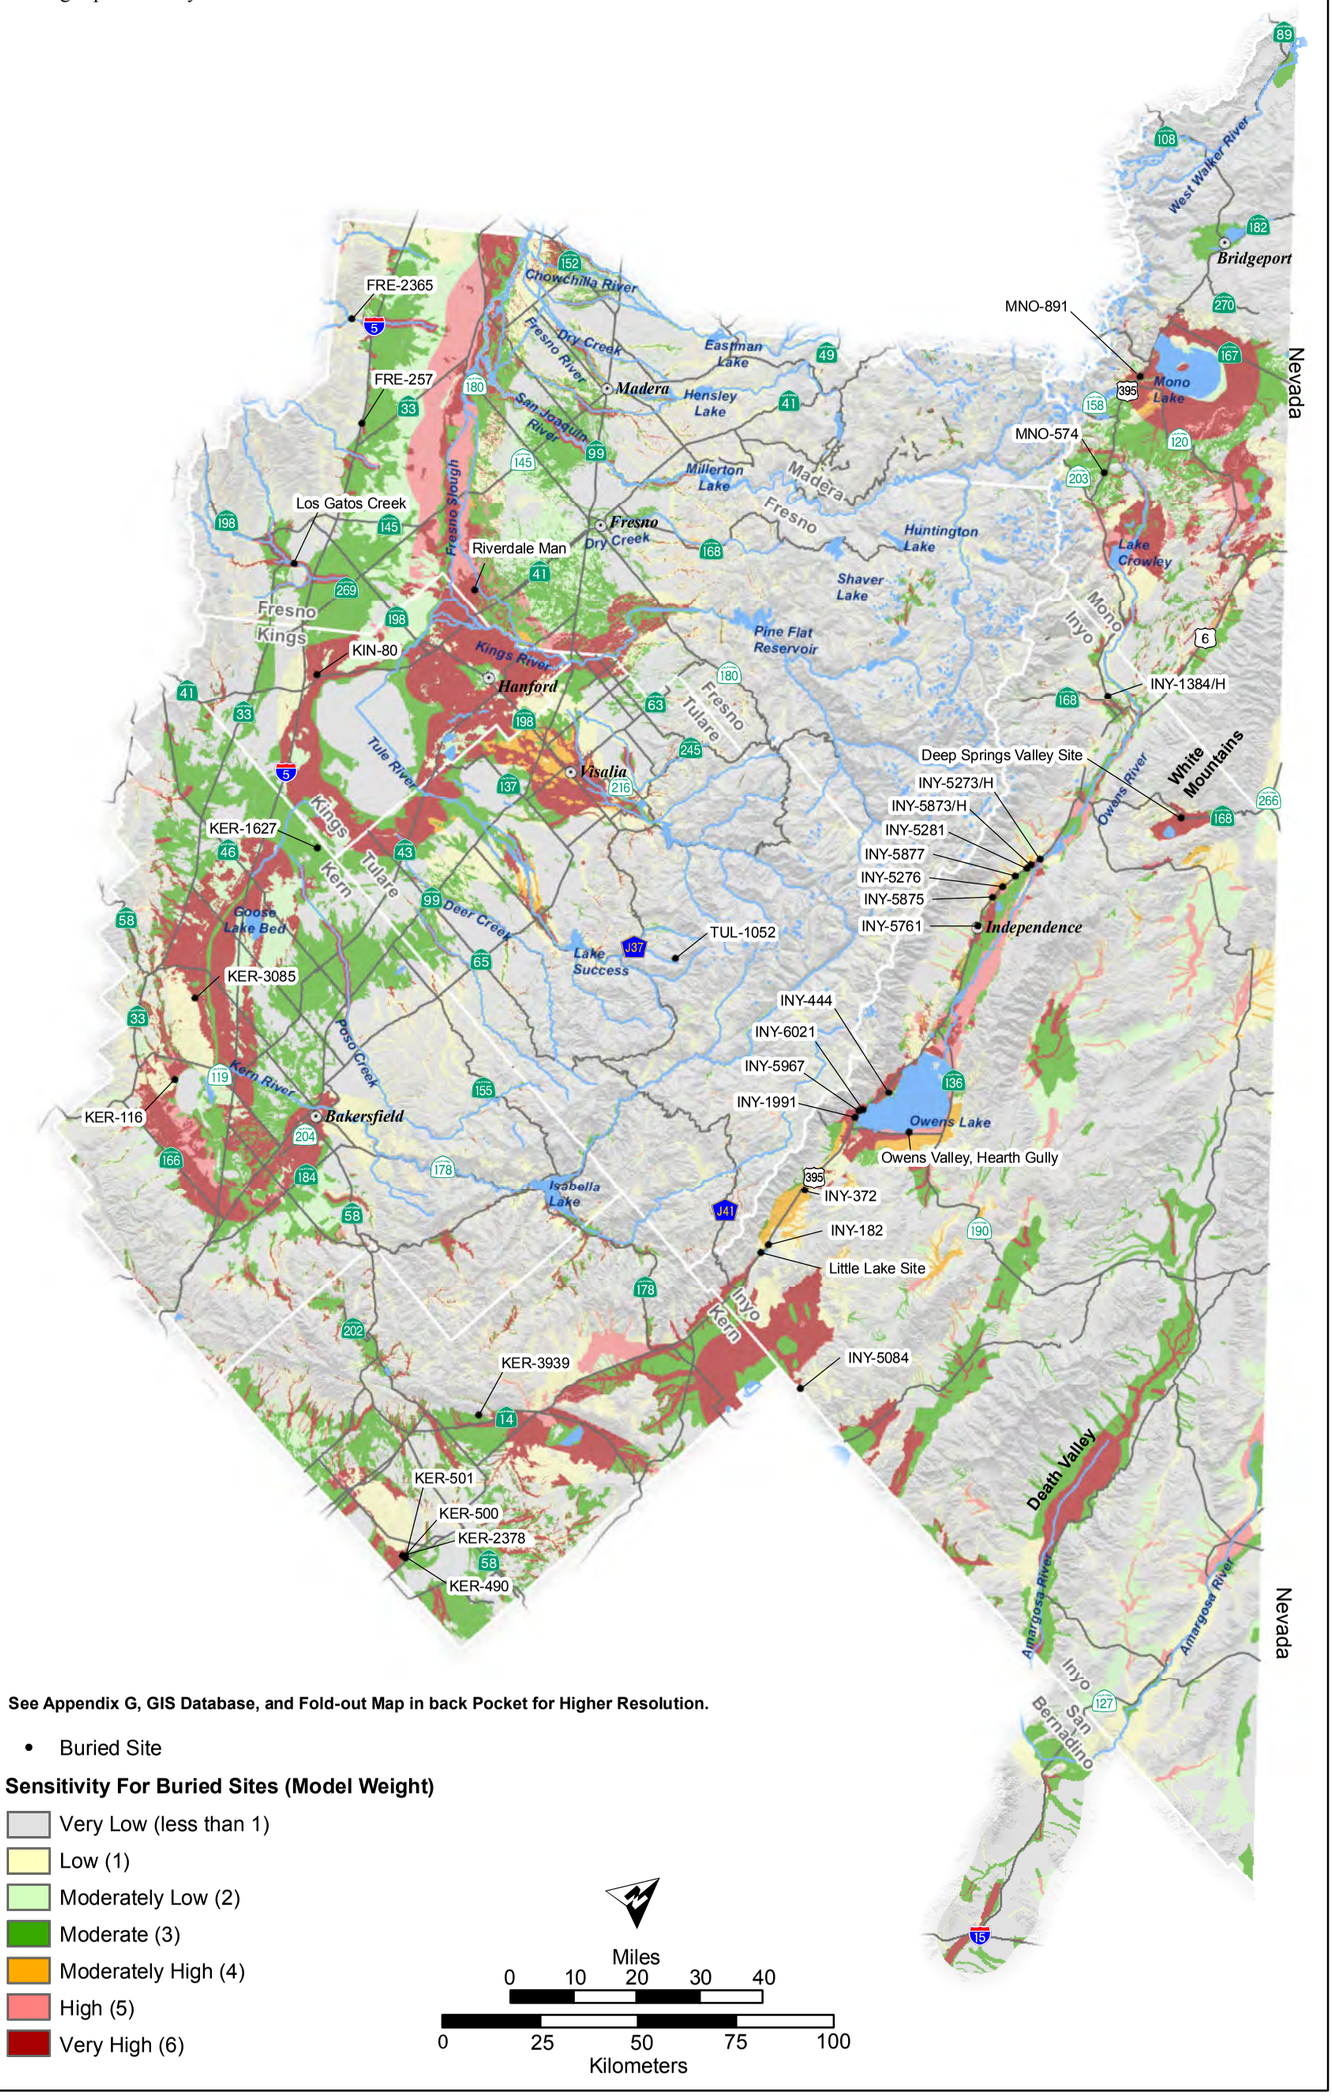
ESTIMATING BURIED SITE POTENTIAL: LIMITATIONS, PERFORMANCE, AND USE

Before selecting any single approach to address the buried site potential of an area, one should first consider the general accuracy and practical limitations of the landform-age map and environmental model based on that map. It should be kept in mind that the map and model were designed to function as general planning tools that allow for relatively quick assessments of buried site potential at the scale of single landforms or entire landscapes. While the map should be relatively accurate in identifying areas most likely to contain buried archaeological resources, neither it nor the model are designed to pin-point exactly where, within those landforms, buried sites will be found, because there are simply too many unknown and unknowable factors.

As a consequence, the age and extent of the landforms depicted in Figure 17 and the estimated buried site potential modeled in Figure 60 should only serve as an initial guide for planners, managers, and archaeologists. The following section examines the primary limitations of the map, and provides a preliminary evaluation of the model's accuracy, to help illustrate how they should and should not be used in the Study Area.

Limitations of Environmental Parameters



The overall utility and predictive power of the environmental model are undoubtedly affected by some obvious and, perhaps, not-so-obvious limitations that should be kept in mind. First and foremost, the environmental model shares the same inherent limitations as the landform map from which it is derived. Although the model attempts to compensate for some of the map's limitations by considering surface slope and distance to water, it does not change the predictions based on landform age. By emphasizing or de-emphasizing the variables considered most relevant for predicting specific site locations, the environmental model is at best an enhanced or extended version of the landform map, and should be viewed as such.

The spatial resolution of the environmental model is further limited by the size of the 90-x-90-meter (~295-x-295-foot), grid cells used to determine the degree of surface slope throughout the Study Area. Thus, the model does not convey all the actual variability of surface slopes or variations in buried site potential associated with differences in slope, overestimating it in some areas and underestimating it in others.

The model does not explicitly account for possible relationships between altitude, aspect, vegetation cover, and seasonal temperature variations on the distribution of human settlements as a function of metabolic (caloric) costs. While some metabolic cost functions may be embedded in the model's use of surface slopes (i.e., steep slopes less sensitive than gentle slopes), the model may overestimate the buried site potential in areas that tend to be cooler (i.e., high-altitudes and north-facing slopes) and/or areas that lack protective vegetation cover (i.e., arid plateaus and high-altitudes).

Note Regarding Sensitivity: The potential for buried archaeological resources depicted on this map is based on the distribution and age of geological deposits present at the modern ground surface, distance to water, and landform slope.

Compiled from Soil Survey Geographic Database and U.S. General Soil Map coverages produced by the Natural Resource Conservation Service.

- Moderately High (4)
- High (5)
- Very High (6)

Figure 60. Buried Site Potential Model for District 6/9 with Distribution of Known Buried Sites.

Because the distance to water criterion is based on the modern configuration of the landscape, it does not explicitly account for long-term changes in the position of stream and river channels. The present course of the lower Kern River represents one such example, as it was not established until sometime in the 1870s (Grunsky 1898b). Similarly, segments of many historic-era streams and rivers have been artificially straightened for purposes of flood control and other land-use changes. Since prehistoric streams and rivers did not always follow the same courses they do today, the locations of some prehistoric sites are not related to the position of currently active channels, but are instead related to the position of formerly active channels. Some areas with no visible evidence of a channel may actually have more potential to contain buried sites than an area located near a present day channel. Consequently, working assumptions about site locations and the distance to water must be viewed with caution, as present channel positions are not always reliable indicators of where prehistoric sites may be located.

Further, stream and river courses are often not conducive to the burial or preservation of archaeological deposits because they are generally zones of intense erosion and alluvial reworking while active. When channels become inactive they tend to quickly fill with sediments during floods, or become marshy or wetland areas (i.e., abandoned slough, cutoff meander, or oxbow lake) that are themselves unattractive settings for human settlement. In either case, abandoned channels usually do not contain any buried soils or archaeological sites because they are relatively unstable features of the landscape. This is clearly the case in areas where segments of historic-era stream or river channels were filled with relatively recent sediments, or were abandoned by artificial straightening of the channel. This is why the buried site potential of areas mapped as being Historic to Modern in age is judged to be no more than Moderate (see Table 22).

Given these imperfections, the environmental model cannot be expected to always provide accurate predictions of buried site potential, as there will undoubtedly be some misassignments, especially if no further thought, effort, or discretion is used in its application. If acknowledged and tested, however, many of these limitations may be overcome by adapting and revising the model's parameters to suit specific areas.

Testing the Landform Map and Environmental Model

While at least 34 radiocarbon-dated buried sites are located in a variety of settings throughout the Study Area (see Figure 60, Appendix F), few if any of these were identified as part of systematic geoarcheological investigations. A tabulation of the expected buried site potential at these site locations indicates more than 40 percent are situated in areas of Very High potential, while one-half (n=17, or 50%) are in the combined areas of High and Very High potential (Table 25). Almost two-thirds (~62%) of these sites fall within areas of Moderately High or greater potential, and almost 80 percent (~79%) occur within areas where the potential is Moderate or higher. Therefore, only about one-fifth (n=7, or ~21%) of the known buried sites fall within areas identified by the environmental model as having Moderately Low to Very Low buried site potential (Table 25).

However, two sites (INY-0182, Stahl Site and INY-5084, Burro Canyon) falling in the Low potential area, occur where landform age assignments are based on the general STATSGO soil data. The poor resolution of these data may explain the underestimated potential of these site areas. By excluding these two sites, the model correctly places nearly two-thirds (n=21, or 65.6%) of the 32 remaining buried sites in areas of elevated potential (i.e., Moderately High or greater), and almost 85 percent in areas with Moderate or greater potential. The presence of the other five buried sites in locations predicted to have Moderately Low to Very Low potential, may be related to the resolution of the SSURGO mapping, as these sites are in upland areas (e.g., TUL-1052) or eastern California, where depositional landforms tend to be heterogeneous and difficult to map in detail.

To further assess if the environmental model works better or worse than "pure chance," a Monte Carlo simulation (computer algorithm) was used to select sites at random 34 times from the approximately 1,500 sites identified by the District 6/9 TEA rural road surveys. After one hundred iterations, this process generated arandom sample of 3,400 sites that approximate an "expected by-chance" distribution. Table 26 summarizes the results of the simulation, and compares the predicted buried site potential at locations with buried sites to the predicted potential at sites identified in the random sample.

This table shows that the model outperforms the random sample in each category of elevated potential by margins 2.3 to 22.5 percent, and in two of the three categories of reduced potential by margins of 9.1 to 24.7

Notes: See Figure 60 for location and Appendix F for additional information on these buried sites; [a] Site in STATSGO area.

percent (Table 26). In the categories of Moderate and Moderately Low potential, however, the model and random sample are nearly identical, suggesting the model's predictive value may be no better than chance in these areas. The model is most predictive within the opposing categories of Very High and Very Low potential, and is generally reliable in predicting areas of elevated or reduced potential overall (see upper chart of Figure 61).

Next, a chi-square test was applied to determine if the predicted potentials at the 34 actual buried sites are similar to those of the random sample (i.e., accept null hypothesis), or whether they are different and statistically independent (i.e., reject null hypothesis). This test yields a probability value of less than zero (<0.001)

Table 26. Predicted Buried Site Potential at Actual Buried Sites Compared to Random Sample.

Predicted Buried Site Potential	Actual Buried Sites	Random Sample	% Total Actual	% Total Random	% Actual minus Random	Predictive Value
Very High	14	635	41.2%	18.7%	22.5%	positive
High	3	221	8.8%	6.5%	2.3%	positive
Moderately High	4	105	11.8%	3.1%	8.7%	positive

Very Low	1	939	2.9%	27.6%	-24.7%	positive
Totals	34	3,400	100.0%	100.0%	0.0%	

which is significantly less than the 0.05 value commonly considered as the critical threshold to reject the null hypothesis. This confirms that the environmental model as a whole operates independently of chance.

But how much better does the environmental model perform overall? If the chance of finding a buried site at random is assumed to be about "fifty-fifty" (a very generous estimate, given that only a small percentage of known sites in the study area are buried), then the model's performance can be measured against this baseline. Compared to this, the model is at least 18.6 percent better at predicting areas of elevated potential, and at least 24 percent better at predicting areas of Low or Very Low potential (see lower chart of Figure 61). Despite the many limitations outlined above, these results demonstrate that the model can and does predict where buried sites tend to occur with greater accuracy and reliability than random chance. Confident that it performs as designed and intended, the practical aspects of using the model to identify and sample buried sites is outlined in the following chapter (Chapter 7).

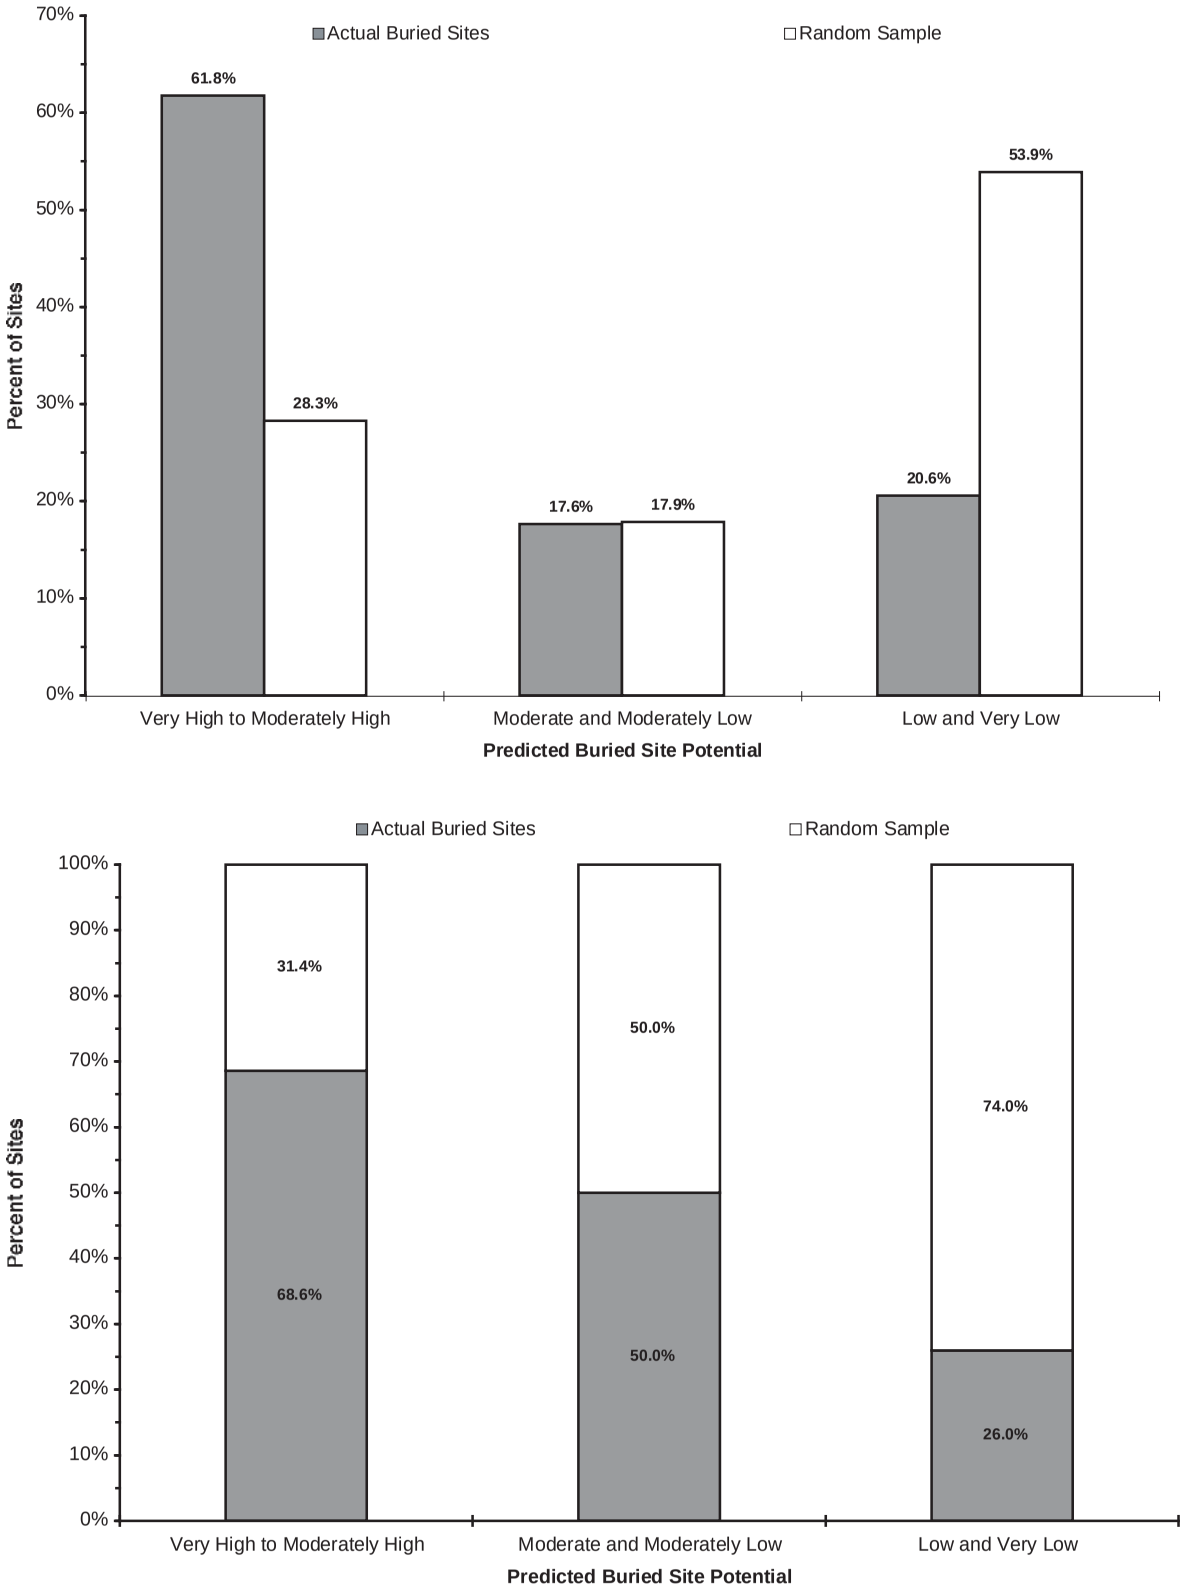

Figure 61. Predicted Potential for Buried Sites at Actual Buried Sites (observed) Compared to Random Sample of Sites in District 6/9.

CHAPTER 7. APPROACHES FOR IDENTIFYING AND SAMPLING BURIED SITES

The current overview and mapping effort represents an initial attempt to identify areas with elevated and reduced potentials for buried archaeological deposits useful for planners, resource managers, and archaeologists. To know where buried sites are likely or unlikely to occur, it is first necessary to understand the age, nature, and extent of depositional landforms. In this regard, the landform map (see Figure 17) should serve as a useful starting point for resource managers who need to evaluate buried site potential as part of preliminary planning and budgeting scenarios where the Area of Potential Effects (APE) and/or Area of Direct Impact (ADI) of a proposed project cannot yet be fully defined (e.g., large or linear areas with multiple alternatives). Since the vertical and horizontal extents of earth disturbances are equally important for considering possible impacts to potentially buried sites, the vertical dimension (i.e., depth) of an APE/ADI must also be defined. Once a three-dimensional APE is defined and the ADI known, the environmental model (see Figure 60) should be used to assess the buried site potential of areas where specific earth-disturbing activities are proposed, because it also considers the factors of surface slope and distance to water that are more localized.

When evaluating the need for additional archaeological studies or fieldwork, the crucial questions become: (1) what is the potential for buried sites within a project area?; and (2) is there reason to think that proposed project activities could impact buried sites? Generally speaking, projects that cross or are located within younger depositional landforms (i.e., late and latest Holocene) will usually need some further work because these landforms tend to have the greatest likelihood of containing buried archaeological sites. Conversely, no further work may be needed or warranted for projects that cross or are located within older (i.e., pre-Holocene) or non-depositional (e.g., most bedrock slopes) landforms, because they generally have the lowest potential for buried sites. Thus, depending on the nature and scope of a proposed project, areas of Moderately High through Very High potential may often require additional attention, perhaps leading to more focused geoarchaeological studies. These might include additional archival background research, field checking and examinations, subsurface explorations (e.g., trenching or coring), or more detailed modeling efforts.

Upland regions, such as the Sierra Nevada, White Mountains, and Coast and Transverse ranges, cannot be simply evaluated using landform age or the buried site potential model. The heterogeneity of these upland landscapes, combined with a lack of detailed soil and Quaternary maps, mandate that buried site potential be considered more carefully on a project-by-project basis. The types of potentially sensitive landforms listed in Table 17 should serve as a general guide, leading to more focused geoarchaeological studies in these contexts. However, because buried archaeological sites have been discovered in a number of landform contexts in the Sierra, including some hillslope positions, it is difficult at this point to predict precisely where such deposits will be found, beyond the general types of landforms noted. In these areas, it may be necessary to consult additional sources of information and conduct field inspections to determine if sensitive landforms are present. The predictive model developed for this study may prove useful for considering other important factors (i.e., slope and water) in these upland settings (see Figure 60). At the same time, whether sites are buried or at the surface, the value of personal insight, intuition, and understanding of a place or project area for predicting the locations of archaeological sites should not be underestimated.

SURVEY STRATEGIES AND SAMPLING METHODS

This section provides practical suggestions for how to implement the predictive model, and how a landscape approach can be used to guide archaeological research and field methods within the confines of compliance-based archaeology. It is hoped these suggestions will assist in the design of field strategies that are more efficient, and in the selection and use of methods that are more effective for identifying buried sites.

Phase I Survey

Because buried sites typically lack visible or obtrusive features that would indicate their presence to an observer in the field, most are not found by conventional pedestrian surface surveys (Bettis 1992:120). If it is accepted that buried sites "are probably always underrepresented in survey samples" (Nance 1983:349), then the

difficulty of locating these sites can be treated as a fundamental sampling problem that can be addressed by studies at the inventory and research design phases (McManamon 1984). Consequently, surface surveys are generally more efficient and effective in identifying sites, whether buried or not, when they are designed and executed with these expectations in mind.

For example, the landform map can be used to determine what parts of a survey area are composed of old non-depositional landforms and what parts contain young, depositional landforms (see Figure 17). More survey time and effort is often justified on the old non-depositional landforms because they are more likely to have surface sites. At the same time, since younger depositional landforms are more likely to contain buried sites, the amount of surface survey can sometimes be reduced with the focus placed on the examination of any subsurface exposures (e.g., cutbanks, roadcuts) instead. Due to these factors, shallow shovel test pits will usually be an appropriate and effective method for identifying sites at or near the surface of old, non-depositional landforms, but are comparatively inappropriate and ineffective for identifying sites that may be buried in depositional settings.

Phase I Extended "Subsurface" Survey

Before buried sites can be avoided, sampled, or otherwise "managed," they must first be identified. Early identification of buried sites is particularly important for transportation projects, which can suffer significant delays and incur unexpected costs if a buried site is discovered "late" in the design or construction phases. Thus to help insure that project schedules (critical path) and budgets are not inadvertently affected by late archaeological discoveries, it may be crucial that some type of subsurface exploration is conducted in areas where there is a reasonable potential that buried cultural resources are present and may be disturbed. When designed and conducted in an informed fashion, subsurface explorations help satisfy the Section 106 requirement that "a reasonable and good faith effort to carry out appropriate identification efforts" is made [800.4(b)(1)].

Subsurface surveys or explorations for buried archaeological sites have become an important part of the initial identification process in California and elsewhere across the country (Monaghan et al. 2006). The ability to locate buried sites in a given project area depends on whether or not appropriate methods are properly used to explore sensitive landforms. Independent testing of exploratory methods such as backhoe trenching, coring and auguring, and geophysical survey (resistivity, magnetometry, and ground-penetrating radar) has found that backhoe trenching is the most effective way to identify buried archaeological sites (Monaghan et al. 2006; Monaghan and Lovis 2005). This is reinforced by the authors' experience working throughout California. Coring or auguring, however, may be the only practical method in some locations—such as urban or wetland settings, or areas where Holocene-age deposits exceed the depth (thickness) accessible with a backhoe or excavator (about 4.5-7.3 meters [15-24 feet], respectively). Consequently, the selection of an appropriate sampling method will likely depend on the nature and extent of earth disturbances (i.e., horizontal and vertical area of potential effects) proposed in specific portions of a project area. But just how deep can we expect sites to be buried?

The age and depth of 367 radiocarbon-dated samples from buried natural and cultural deposits provide some indication of the depths at which sites of different ages may be buried. While there is considerable variability in the age and depth of these samples, they follow an overall trend of greater depth with increasing age, with natural deposits being slightly deeper than cultural deposits of the same age (Figure 62). Based on this, most of the natural deposits and all but one of the known buried sites appear to occur at depths of about 4.5 meters (~15 feet) or less, coincident with the maximum depth normally reached using a backhoe.

An interesting exception occurs among some middle Holocene samples which, along with the Los Gatos Creek site, form a perceptible cluster between about 6.5 to 13 meters (~21 to 42 feet) in depth (Figure 62). Further comparisons reveal that the mean depth of all middle Holocene-age contexts (3.74 meters, or ~12.3 feet) is greater than that for any major time period (Table 27). At only about 2.6 meters (~8.5 feet), the mean depth of early Holocene-age deposits is 1.15 meters (~3.8 feet) less than the middle Holocene, thus running counter to what one might expect if a simple time-depth model is assumed. This provides further evidence that middle Holocene-age deposits are not missing but were often formed in low-lying landscape positions that are now deeply buried along with any associated cultural deposits.

Figure 62. Comparison of the Age and Depth of Buried Natural and Cultural Contexts.

Table 27. Depth of Buried Radiocarbon Samples by Time Period.

Description	Latest Pleistocene	Early Holocene	Middle Holocene	Late Holocene	Latest Holocene
Mean Depth (meters)	3.69	2.59	3.74	2.48	1.54
Minimum Depth (meters)	0.75	0.28	0.35	0.43	0.18
Maximum Depth (meters)	13.60	10.45	13.00	10.85	9.75
Sample Count (n=367)	19	64	66	85	133
Mean Depth Compared to Middle Holocene (meters)	-0.5	-1.15	0	-1.26	-2.20

Note: Excludes dates from lacustrine and marsh deposits

Because buried sites are often associated with formerly stable land surfaces marked by buried soils, the identification of buried archaeological sites will be facilitated by the identification of buried soil horizons, which are often laterally extensive and traceable over considerable distances. Since the majority of known buried archaeological deposits occur at depths of 4.5 meters (~15 feet) or less, it appears that subsurface exploration using a backhoe would be the most appropriate method for identifying potentially buried sites in most of the sensitive portions of the project area. Given these factors, subsurface explorations will usually be needed in areas where earth disturbances are planned and the potential for buried sites is predicted to be Moderately High, High, or Very High (see Figure 60).

Phase II Test Evaluation and Phase III Data Recovery

Based on the timing and nature of landscape evolution and evidence from previously excavated archaeological sites, a number of general observations can be made about the structure of the archaeological record in the study area. These observations should assist in designing and implementing future field strategies and in interpreting the chronostratigraphic context of excavated sites.

The way in which radiocarbon dates, obsidian hydration readings, and other chronometric information is obtained and interpreted suggests that many archaeologists are searching for a simple time-depth relationship to the archaeological record. This assumption probably stems from the prevailing view of stratigraphy as discrete, well-defined layers built up over time, like those found in rock shelters and shell mounds. However, anthropogenic and natural sediment input was seldom sufficient to build chronostratigraphic structure in the archaeological record of central California. In fact, the dominant geomorphic process during the Holocene was landform stability, with little or no sediment input for hundreds or thousands of years at a time. When deposition did occur, it often resulted in large amounts of sediment accumulating on fans and floodplains in very short periods of time. Similar patterns of landform development are wide-spread in central California (Meyer 2000; Meyer et al. 1999; Meyer and Rosenthal 2008; Rosenthal and Meyer 2004a, 2004b) and have a number of implications for understanding the structure of the archaeological record.

1. Cultural stratigraphy often occurs at the scale of entire landforms. Brief intervals of deposition followed by extended periods of landform stability have resulted in multiple late Pleistocene and Holocene buried soils (i.e., buried land surfaces) in fans and floodplains throughout central California. Archaeological excavations and surveys that do not account for the entire Holocene depositional record will likely miss buried and potentially significant archaeological deposits.
2. Because sediment deposition was typically rapid, a significant amount of sterile sediment may separate a surface archaeological deposit and a buried one. Depositional episodes would likely have discouraged human occupation on actively aggrading landforms, at least temporarily. As a consequence, older portions of the archaeological record may be missed if hand excavation is halted after the surface archaeological deposit is exhausted, without accounting for the potential of more deeply buried materials. This is especially true for the alluvial fans and floodplains in lowland valleys, where Holocene-age soils are often found buried as deep as three to five meters (10 to 15 feet) below surface.

3. While buried sites are often temporally discrete they can also be chronologically mixed. Archaeological materials deposited over periods of long-term land stability may be discarded (super-imposed) on a common surface, whether or not that surface was subsequently buried. In addition, since human occupation was seldom continuous on aggrading landforms, archaeological materials found deeper in a soil profile are often the result of downward mixing from natural and cultural processes (biogenic and anthropogenic, respectively). Thus, deeper archaeological materials found in stable landforms may be no older than shallower materials.

These observations about the structure of the archaeological record should, in part, dictate the types of sampling strategies and methods employed during the identification phase and subsequent testing and data recovery investigations for archaeological studies. As an initial step, research on the age of project area landforms should be completed prior to any field investigations. This will allow for a focused study of landforms with a potential for buried deposits, and minimize effort in landforms lacking buried site potential. In addition, field methods should be designed to account for both the horizontal and vertical extent of Holocene-age geological deposits at an individual archaeological site or within a particular study area. These deposits will be bounded by stratigraphic unconformities, typically distinguished by buried soil profiles. The timing of soil development and alluvial and colluvial deposition has important implications for bracketing the age of buried archaeological sites, as well as defining the timing and nature of Holocene landscape evolution. Consequently, future studies should seek to identify and obtain radiocarbon dates for buried land surfaces and capping deposits to better refine the natural chronostratigraphic sequence of depositional landforms within District 6/9.

Further, the age of surface landforms is also relevant for identifying under-represented portions of the archaeological record, particularly sites older than latest Holocene in age. As shown in Figure 24, while most (86%) surface cultural contexts date to less than 2000 cal BP, nearly three-fourths (~73%) of buried natural contexts date to more than 2000 cal BP, as do more than one-third (~37%) of those from known buried cultural contexts. It should be expected, therefore, that older landforms and buried surfaces will contain earlier and/or under-represented portions of the archaeological record, which will have elevated significance from the standpoint of archaeological research and legal compliance. Thus, an informed and integrated geoarchaeological approach would likely help future archaeological studies in the region address these research and methodological issues.

USING THE BURIED SITE POTENTIAL MODEL

At a general level, it is relatively easy to predict that buried archaeological sites will be found in Holocene-age depositional landforms. Predicting exactly where they are located, however, is a far more difficult task which some have likened to "looking for a needle in a haystack." While the needle cannot be made larger, the size of the "Holocene haystack" can be reduced by dividing it into smaller and more manageable zones of buried site potential using the predictive model developed here. This approach should reduce the amount of area (i.e., volume of sediments) that may need to be searched and increase the likelihood that buried sites will be identified, if present.

At the same time, the buried site potential zones must be considered a best approximation, because their boundaries are derived from a number of working assumptions using a variety of different datasets. We do not believe the boundaries of sensitivity zones should be considered rigid depictions of where and where not to do subsurface explorations, but rather, should be employed in combination with professional judgment based on field observations.

The chances of actually finding a buried site are reduced even further when the search is confined to an auger or core hole, hand-excavated test unit, or backhoe trench, especially if a proper sampling interval is not used. We believe the success rate can be improved overall, however, by focusing the majority of the field effort in Moderately High to Very High zones and employing tight sampling intervals when buried soils are identified. Zones of Moderate and Moderately Low potential should be tested occasionally using a more intuitive approach with broader sampling intervals. If the model is correct, buried sites will not usually occur in zones of Low and Very Low potential, so these areas should only rarely be investigated. The actions and level of effort suggested for each of the buried site potential categories are summarized in Table 28.

Table 28. Suggested Actions and Level of Effort for Zones of Buried Site Potential.

Buried Site Potential (score)	% Compared to. Chance	Predictive Value	Suggested Action/ Effort Level	Suggested Sampling Interval
Very High	22.5%	positive	Testing almost always required	20 to 30 meters
High	2.3%	positive	Testing often required	30 to 50 meters
Moderately High	8.7%	positive	Testing usually required	50 to 100 meters
Moderate	-0.2%	neutral	Testing occasionally required	Intuitive
Moderately Low	0.5%	neutral	Testing occasionally required	Intuitive
Low	-9.1%	positive	Testing rarely required	Intuitive
Very Low	-24.7%	positive	Testing almost never required	None

From a management perspective, probably the most important variable to consider when choosing subsurface sampling locations is the depth and nature of proposed project-related impacts. Depending on the scope of the project, it might be reasonable to sample areas in the lowlands where earthmoving will be substantial, or where large foundations or footings will extend well below surface, regardless of sensitivity (although different sampling methods or intervals may be applied to different zones). Furthermore, depth of disturbance becomes more of an issue around valley margins where buried sites are expected to occur in shallower contexts, but less of an issue in valley bottoms where sites are likely to be buried much deeper. If no buried soils are present within the depth-range of project impacts in the valley bottoms, then additional subsurface testing may not be necessary. Conversely, if soils buried by Holocene-age deposits are found within the range of impacts, then these soils should be targeted and explored to determine if archaeological remains are present.

Since the model's overall utility can only be evaluated if it is systematically tested, most of the subsurface survey effort should first be directed to Very High potential zones. If no buried sites are encountered in these areas after a reasonable amount of investigation (i.e., several moderate to large projects), then the model should be re-evaluated. If buried sites are regularly found in Very High sensitivity zones, then additional effort by future projects should also be devoted to zones with High and Moderately High potential. This should be done to determine if the potential for buried sites in these zones is higher than currently estimated (i.e., 2.3-8.7%). If few or no sites are found in these areas after a reasonable number of projects, then field investigations should focus on the zones of Very High potential. Although subsurface exploration will generally not be needed in zones of Moderate and Moderately Low potential, some limited investigation may occasionally be warranted if additional information becomes available or if a buried site is uncovered by earth-moving activities. Finally, the zones of Low and Very Low potential should not be investigated unless there is a compelling reason to do so, such as field observations that suggest the mapping is inaccurate.

APPENDICES

Appendix A.	Radiocarbon Dates Documenting Tulare Lake Level History.
Appendix B.	Radiocarbon Dating Methods, Results, and Database.
Appendix C.	Soil Types, Age Assignments, and Definitions for Soil Horizons and Layers.
Appendix D.	Obsidian Hydration Methods, Results, and Database.
Appendix E.	Extent of Buried Site Potential along each State Route in District 6/9 Based on Landform Map and Predictive Model.
Appendix F.	Known Buried Prehistoric Archaeological Sites in Caltrans District 6/9.
Appendix G.	Quaternary Geology Map and Buried Site Potential Map for District 6/9. (Also included as fold-out maps in back pockets.)

APPENDIX B

RADIOCARBON DATING METHODS, RESULTS, AND DATABASE

General Statement of ^{14}C Procedures
at the National Ocean Sciences AMS Facility

All laboratory preparations for AMS radiocarbon analyses of submitted samples occur in the NOSAMS Sample Preparation Lab unless otherwise noted on the attached report of Final Results. Procedures appropriate to the raw material being analyzed include: acid hydrolysis (HY), oxidation (OC or DOC), or stripping of CO_2 gas from water (WS) samples. Carbon dioxide, whether submitted directly (GS) or generated at the NOSAMS Facility, is reacted with Fe catalyst to form graphite. Graphite is pressed into targets, which are analyzed by accelerator mass spectrometry along with primary and secondary standards and process blanks. The primary standard NBS Oxalic Acid I (NIST-SRM-4990) is used for all ^{14}C measurements. Every group of samples processed includes an appropriate blank, which is analyzed concurrently with the group. Process blank materials include IAEA C-1 Carrara marble and TIRI F Icelandic Doublespar for inorganic carbon and gas samples; FIRI A and B wood as well as FISONS acetanilide for organic carbon samples; a ^{14}C- free groundwater for DIC (dissolved inorganic carbon) samples; and Alfa Aeasar graphite powder for AMS machine background.

Fraction Modern (Fm) is a measurement of the deviation of the $^{14}C/C$ ratio of a sample from "modern." Modern is defined as 95% of the radiocarbon concentration (in AD 1950) of NBS Oxalic Acid I normalized to $\delta^{13}C_{VPDB}$ = -19 per mil (Olsson, 1970). AMS results are calculated using the internationally accepted modern value of $1.176 \pm 0.010 \times 10^{-12}$(Karlen, *et. al*.,1964) and a final ^{13}C-correction is made to normalize the sample Fm to a $\delta^{13}C_{VPDB}$ value of -25 per mil. NOSAMS has two accelerators for radiocarbon measurement, either a 3 Megavolt Tandetron system or a 500 kilovolt compact AMS system.

Stable isotope measurements of sample $\delta^{13}C$ are used to correct Fm values measured on the Tandetron system. These are typically made at the NOSAMS Facility with either a VG PRISM or VG OPTIMA mass spectrometer by analyzing a split of the CO_2 gas generated prior to graphite production. Some carbonate samples are reacted and measured directly with the VG PRISM ISOCARB. These $\delta^{13}C$ values and source used to calculate the Fm of a sample are specified in the report of Final Results.

AMS analyses made on the 500 kilovolt AMS system are corrected using measured $^{12}C/.^{13}C$ ratios. Measured $^{12}C/.^{13}C$ ratios are not reported.

Reporting of ages and/or activities follows the convention outlined by Stuiver and Polach (1977) and Stuiver (1980). Radiocarbon ages are calculated using 5568 (yrs) as the half-life of radiocarbon and are reported without reservoir corrections or calibration to calendar years. A $\Delta^{14}C$ activity normalized to 1950 is also reported according to these conventions. The activity, or $\Delta^{14}C$, of the sample is further corrected to account for the decay between collection (or death) and the time of measurement if a collection date is specified on the submittal form, otherwise $\Delta^{14}C$ is reported assuming that collection and measurement date are the same.

Atoms of ^{14}C contained in a sample are directly counted using the AMS method of radiocarbon analysis, therefore, internal statistical errors are calculated using the number of counts measured from each target in combination with the errors of the standard. An external error is calculated from the reproducibility of individual analyses for a given target. The error reported is the larger of the internal or external errors.

When reporting AMS results of samples run at the NOSAMS facility, accession numbers (e.g. OS-####'s) are required to be listed together with the results. To avoid confusion, we suggest tabulating OS-numbers and associated radiocarbon ages as they appear on the attached Final Report in addition to any subsequent corrections that may need to be made to the ages. We ask that published results acknowledge support from NSF by including the NSF Cooperative Agreement number, OCE-0753487. The NOSAMS facility would appreciate receiving reprints or preprints of papers referencing AMS analyses made at the NOSAMS facility.

Any sample material not consumed during sample preparation or AMS radiocarbon analysis is archived for two years at the NOSAMS Facility unless other arrangements are made by the submitter.

RE: Radiocarbon Dating Results For Samples MAD-BC-130-150, MAD-CC-310-330, FRE-RAC-30-40, FRE-NT-80-100, TUL-TR-280-290, KIN-TOC-70-80, KER-GP-50-70

Dear Dr. Hildebrandt and Ms. Honeysett:

Enclosed are the radiocarbon dating results for seven samples recently sent to us. They each provided plenty of carbon for accurate measurements and all the analyses proceeded normally. As usual, the method of analysis is listed on the report with the results and calibration data is provided where applicable.

As always, no students or intern researchers who would necessarily be distracted with other obligations and priorities were used in the analyses. We analyzed them with the combined attention of our entire professional staff.

If you have specific questions about the analyses, please contact us. We are always available to answer your questions.

The cost of analysis was previously invoiced. As always, if you have any questions or would like to discuss the results, don't hesitate to contact me.

Sincerely,

Darden Hood

REPORT OF RADIOCARBON DATING ANALYSES

Dr. William Hildebrandt/Liz Honeysett

Report Date: 2/19/2009

Far Western Anthropological Research Group, Incorporated

Material Received: 2/6/2009

Sample Data	Measured Radiocarbon Age	13C/12C Ratio	Conventional Radiocarbon Age(*)
Beta - 255479	4580 +/- 40 BP	-25.4 o/oo	4570 +/- 40 BP
SAMPLE : MAD-BC-130-150			
ANALYSIS : AMS-ADVANCE delivery			
MATERIAL/PRETREATMENT : (organic sediment): acid washes			
2 SIGMA CALIBRATION : Cal BC 3490 to 3460 (Cal BP 5440 to 5420) AND Cal BC 3370 to 3320 (Cal BP 5320 to 5270) Cal BC 3230 to 3110 (Cal BP 5180 to 5060)			
Beta - 255480	15870 +/- 70 BP	-23.3 o/oo	15900 +/- 70 BP
SAMPLE : MAD-CC-310-330			
ANALYSIS : AMS-ADVANCE delivery			
MATERIAL/PRETREATMENT : (organic sediment): acid washes			
2 SIGMA CALIBRATION : Cal BC 17360 to 16980 (Cal BP 19310 to 18920)			
Beta - 255481	4210 +/- 40 BP	-23.5 o/oo	4230 +/- 40 BP
SAMPLE : FRE-RAC-30-40			
ANALYSIS : AMS-ADVANCE delivery			
MATERIAL/PRETREATMENT : (organic sediment): acid washes			
2 SIGMA CALIBRATION : Cal BC 2910 to 2850 (Cal BP 4860 to 4800) AND Cal BC 2810 to 2750 (Cal BP 4760 to 4700) Cal BC 2720 to 2700 (Cal BP 4670 to 4650)			
Beta - 255482	1060 +/- 40 BP	-24.8 o/oo	1060 +/- 40 BP
SAMPLE : FRE-NT-80-100			
ANALYSIS : AMS-ADVANCE delivery			
MATERIAL/PRETREATMENT : (organic sediment): acid washes			
2 SIGMA CALIBRATION : Cal AD 890 to 1030 (Cal BP 1060 to 920)			
Beta - 255483	7540 +/- 40 BP	-23.8 o/oo	7560 +/- 40 BP
SAMPLE : TUL-TR-280-290			
ANALYSIS : AMS-ADVANCE delivery			
MATERIAL/PRETREATMENT : (organic sediment): acid washes			
2 SIGMA CALIBRATION : Cal BC 6470 to 6380 (Cal BP 8420 to 8330)			

Dates are reported as RCYBP (radiocarbon years before present, "present" = AD 1950). By international convention, the modern reference standard was 95% the 14C activity of the National Institute of Standards and Technology (NIST) Oxalic Acid (SRM 4990C) and calculated using the Libby 14C half-life (5568 years). Quoted errors represent 1 relative standard deviation statistics (68% probability) counting errors based on the combined measurements of the sample, background, and modern reference standards. Measured 13C/12C ratios (delta 13C) were calculated relative to the PDB-1 standard.

The Conventional Radiocarbon Age represents the Measured Radiocarbon Age corrected for isotopic fractionation, calculated using the delta 13C. On rare occasion where the Conventional Radiocarbon Age was calculated using an assumed delta 13C, the ratio and the Conventional Radiocarbon Age will be followed by "*". The Conventional Radiocarbon Age is not calendar calibrated. When available, the Calendar Calibrated result is calculated from the Conventional Radiocarbon Age and is listed as the "Two Sigma Calibrated Result" for each sample.

REPORT OF RADIOCARBON DATING ANALYSES

Dr. William Hildebrandt/Liz Honeysett

Report Date: 2/19/2009

Sample Data	Measured Radiocarbon Age	13C/12C Ratio	Conventional Radiocarbon Age(*)
Beta - 255484	11920 +/- 60 BP	-24.3 o/oo	11930 +/- 60 BP
SAMPLE : KIN-TOC-70-80			
ANALYSIS : AMS-ADVANCE delivery			
MATERIAL/PRETREATMENT : (organic sediment): acid washes			
2 SIGMA CALIBRATION : Cal BC 12010 to 11710 (Cal BP 13960 to 13660)			
Beta - 255485	1800 +/- 40 BP	-22.5 o/oo	1840 +/- 40 BP
SAMPLE : KER-GP-50-70			
ANALYSIS : AMS-ADVANCE delivery			
MATERIAL/PRETREATMENT : (organic sediment): acid washes			
2 SIGMA CALIBRATION : Cal AD 80 to 250 (Cal BP 1870 to 1700)			

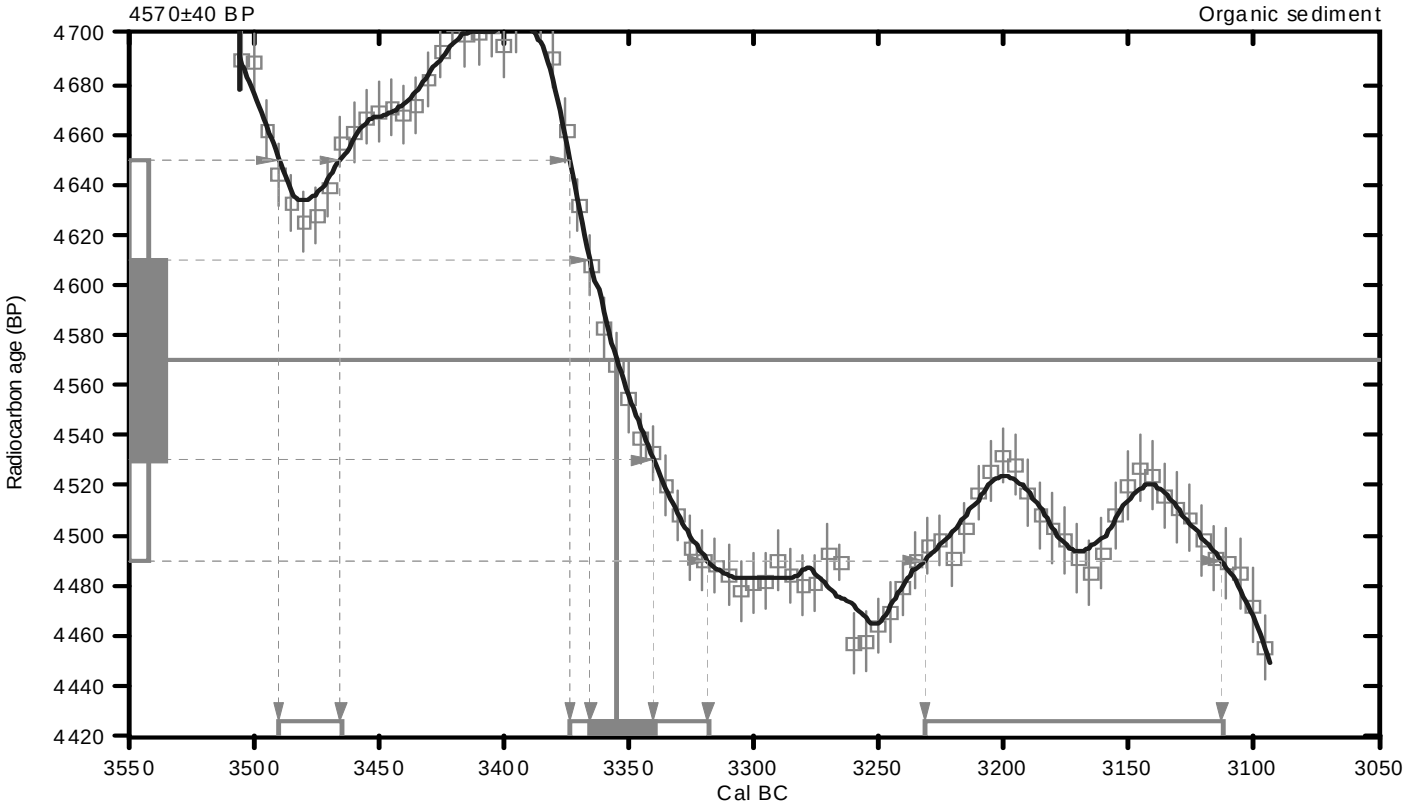
Dates are reported as RCYBP (radiocarbon years before present, "present" = AD 1950). By international convention, the modern reference standard was 95% the 14C activity of the National Institute of Standards and Technology (NIST) Oxalic Acid (SRM 4990C) and calculated using the Libby 14C half-life (5568 years). Quoted errors represent 1 relative standard deviation statistics (68% probability) counting errors based on the combined measurements of the sample, background, and modern reference standards. Measured 13C/12C ratios (delta 13C) were calculated relative to the PDB-1 standard.

The Conventional Radiocarbon Age represents the Measured Radiocarbon Age corrected for isotopic fractionation, calculated using the delta 13C. On rare occasion where the Conventional Radiocarbon Age was calculated using an assumed delta 13C, the ratio and the Conventional Radiocarbon Age will be followed by "*". The Conventional Radiocarbon Age is not calendar calibrated. When available, the Calendar Calibrated result is calculated from the Conventional Radiocarbon Age and is listed as the "Two Sigma Calibrated Result" for each sample.

CALIBRATION OF RADIOCARBON AGE TO CALENDAR YEARS

(Variables: C13/C12=-25.4:lab. mult=1)

Laboratory number: **Beta-255479**



Conventional radiocarbon age: **4570±40 BP**

2 Sigma calibrated results: (95% probability) **Cal BC 3490 to 3460 (Cal BP 5440 to 5420) and Cal BC 3370 to 3320 (Cal BP 5320 to 5270) and Cal BC 3230 to 3110 (Cal BP 5180 to 5060)**

Intercept data

Intercept of radiocarbon age with calibration curve: Cal BC 3360 (Cal BP 5300)

1 Sigma calibrated result: (68% probability) Cal BC 3360 to 3340 (Cal BP 5320 to 5290)

APPENDIX C

SOIL TYPES, AGE ASSIGNMENTS, AND DEFINITIONS FOR SOIL HORIZONS AND LAYERS

Appendix C. Soil Types and Age Assignments Used for this Study (Listed Alphabetically by Soil Series and then Soil Name)

Soil Series or Map Unit	Dataset	Soil Name and Surface Slope	Landform Age (map unit)												Grand Total
			pQ	OP	LP	LtP	EHv	EH	MH	LH	LtH	LtHv	Hm	Hacf	H2O	
Abgese	SSURGO	Abgese-Berent-Toeja families association, 30 to 70 percent slopes	1													1
		Risue-Abgese-Preston families association, 2 to 15 percent slopes	1													1
		Tweedy-Abgese families association, 1 to 15 percent slopes	1													1
Abgese family 2	SSURGO	Rock outcrop-Abgese-Pass Canyon families complex, 30 to 60 percent slopes	1													1
		Rock outcrop-Abgese-Pass Canyon families complex, 60 to 90 percent slopes	1													1
Academy	SSURGO	Academy loam, 0 to 3 percent slopes		1												1
		Academy loam, 3 to 9 percent slopes		1												1
Adelanto	SSURGO	Adelanto coarse sandy loam, 2 to 5 percent slopes		1												1
		Adelanto loamy sand, 2 to 5 percent slopes		1												1
Agnal	SSURGO	Agnal silty clay, 0 to 1 percent slopes								1						1
Agua Dulce family	SSURGO	Agua Dulce-Los Robles-Modjeska families association, 10 to 60 percent slopes											1			1
Ahwahnee	SSURGO	Ahwahnee and Auberry coarse sandy loams, 15 to 30 percent slope	1													1
		Ahwahnee and Auberry coarse sandy loams, 8 to 15 percent slopes	1													1
		Ahwahnee and Auberry rocky coarse sandy loams, 3 to 8 percent slopes	1													1
		Ahwahnee and Auberry rocky coarse sandy loams, 30 to 45 percent slopes	1													1
		Ahwahnee and Auberry rocky coarse sandy loams, 8 to 30 percent slopes	1													1
		Ahwahnee and auberry very rocky coarse sandy loams, 15 to 30 percent slopes	1													1
		Ahwahnee and auberry very rocky coarse sandy loams, 30 to 75 percent slopes	1													1
		Ahwahnee and Vista coarse sandy loams, 15 to 30 percent slopes	1													1
		Ahwahnee and Vista coarse sandy loams, 3 to 8 percent slopes	1													1
		Ahwahnee and Vista coarse sandy loams, 8 to 15 percent slopes	1													1
		Ahwahnee and Vista rocky coarse sandy loams, 3 to 8 percent slopes	1													1
		Ahwahnee and Vista rocky coarse sandy loams, 30 to 45 percent slopes	1													1
		Ahwahnee and Vista rocky coarse sandy loams, 8 to 30 percent slopes	1													1
		Ahwahnee and Vista very rocky coarse sandy loams, 15 to 30 percent slopes	1													1
		Ahwahnee and Vista very rocky coarse sandy loams, 30 to 75 percent slopes	1													1
		Ahwahnee coarse sandy loam, 15 to 30 percent slopes	1													1
		Ahwahnee coarse sandy loam, 3 to 9 percent slopes	1													1
		Ahwahnee coarse sandy loam, 30 to 45 percent slopes	1													1
		Ahwahnee coarse sandy loam, 9 to 15 percent slopes	1													1
		Ahwahnee very rocky coarse sandy loam, 3 to 30 percent slopes	1													1
		Ahwahnee very rocky coarse sandy loam, 30 to 45 percent slopes	1													1
		Ahwahnee very rocky coarse sandy loam, 45 to 70 percent slopes	1													1
		Ahwahnee very rocky coarse sandy loam, shallow, 3 to 30 percent slopes	1													1
		Ahwahnee very rocky coarse sandy loam, shallow, 30 to 70 percent slopes	1													1
		Ahwahnee-Sierra coarse sandy loams, 15 to 30 percent slopes	1													1
		Ahwahnee-Sierra coarse sandy loams, 30 to 45 percent slopes	1													1
		Ahwahnee-Tollhouse-Rock land complex, 45 to 70 percent slopes	1													1
Ahwahnee family	SSURGO	Ahwahnee family, 35 to 65 percent slopes	2													2
		AHWAHNEE FAMILY, 5 TO 35 PERCENT SLOPES	1													1
		Ahwahnee family-Rock outcrop complex, 35 to 75 percent slopes	2													2
Aido	SSURGO	Aido clay 30 to 50 percent slopes	1													1
		Aido clay, 50 to 75 percent slopes	1													1
		Aido clay, 9 to 30 percent slopes	1													1

Appendix C. Soil Types and Age Assignments Used for this Study (Listed Alphabetically by Soil Series and then Soil Name)

Soil Series or Map Unit	Dataset	Soil Name and Surface Slope	Landform Age (map unit)												Grand Total
			pQ	OP	LP	LtP	EHv	EH	MH	LH	LtH	LtHv	Hm	Hacf	H2O	
Aiken	SSURGO	Aiken loam, 3 to 9 percent slopes	1													1
		Aiken very rocky loam, 45 to 70 percent slopes	1													1
Akers	SSURGO	Akers-Akers, saline-Sodic, complex, 0 to 2 percent slopes							1							1
Alamedawell	SSURGO	Alamedawell gravelly substratum-Brantel association, 0 to 4 percent slopes										1				1
		Alamedawell loamy sand, 0 to 2 percent slopes										1				1
		Alamedawell sandy substratum-Deepwell association, 2 to 15 percent slopes										1				1
		Alamedawell sandy substratum-Deepwell association, non-saline, 2 to 15 percent slopes										1				1
		Alamedawell-Brantel association, 2 to 15 percent slopes										1				1
		Alamedawell-Conway-Xerofluvents complex, 0 to 4 percent slopes										1				1
		Alamedawell-Deepwell association, 2 to 15 percent slopes										1				1
		Alamedawell-Orecart complex, 0 to 4 percent slopes										1				1
		Alamedawell-Orecart complex, 4 to 15 percent slopes										1				1
Alamo	SSURGO	Alamo clay		1												1
		Alamo clay, 0 to 1 percent slopes		1												1
Alberti	SSURGO	Alberti complex, 15 to 50 percent slopes	1													1
		Alberti gravelly loam, 5 to 30 percent slopes	1													1
		Alberti-Urban land complex, 0 to 30 percent slopes	1													1
Alko	SSURGO	Alko-Neuralia sandy loams, 0 to 9 percent slopes			1											1
Altamont	SSURGO	Altamont clay, 5 to 8 percent slopes	1													1
		Vaquero-Altamont complex, 15 to 50 percent slopes	1													1
		Vaquero-Altamont complex, 50 to 75 percent slopes	1													1
Altaslough	SSURGO	Altaslough clay loam, 0 to 1 percent slopes								1						1
Amargosa	SSURGO	Amargosa rocky coarse sandy loam, 9 to 55 percent slopes, eroded	1													1
Anaheim variant	SSURGO	Anaheim variant very fine sandy loam, 2 to 30 percent s lopes	1													1
Anaverde	SSURGO	Anaverde gravelly loam, 30 to 50 percent slopes	1													1
		Anaverde gravelly loam, 50 to 75 percent slopes	1													1
		Anaverde loam, 15 to 30 percent slopes	1													1
		Anaverde rocky loam, 30 to 50 percent slopes	1													1
Anela	SSURGO	Anela very gravelly sandy loam, 0 to 2 percent slopes									1					1
		Anela-vernalis association, 0 to 5 percent slopes									1					1
		Cerini-Anela-Fluvaquents, saline-Sodic, association, 0 to 2 percent slopes									1					1
Angelwhine	SSURGO	Angelwhine-Hawkinspeak-Hawkridge association	1													1
		Hawkinspeak-Thiefridge-Angelwhine association	1													1
Aquandic Endoaquolls	SSURGO	Aquandic Endoaqolls, 0 to 5 percent slopes									1					1
Aquents	SSURGO	Aquents-Aquic torripsamments association, 0 to 2 percent slopes											1			1
		Aquents-Aquolls-Riverwash complex, 0 to 5 percent slopes, flooded											1			1
Aquic Cryoborolls	SSURGO	Aquic Cryoborolls, 5 to 30 percent slopes									1					1
Aquic Cryumbrepts	SSURGO	STECUM FAMILY-AQUIC CRYUMBREPTS ASSOCIATION, 1 TO 25 PERCENT SLOPES									1					1
Aquic Dystric Xerochrepts	SSURGO	AQUIC DYSTRIC XEROCHEPTS, 1 TO 15 PERCENT SLOPES									1					1
Aquic Haploxerolls	SSURGO	Aquic Haploxerolls, 0 to 9 percent slopes									1					1

Appendix C. Soil Types and Age Assignments Used for this Study (Listed Alphabetically by Soil Series and then Soil Name)

Soil Series or Map Unit	Dataset	Soil Name and Surface Slope	Landform Age (map unit)												Grand Total
			pQ	OP	LP	LtP	EHv	EH	MH	LH	LtH	LtHv	Hm	Hacf	H2O	
Aquic Torrifluvents	SSURGO	Aquic Torrifluvents-Torrifluventic Haploxerolls-Conway complex, 0 to 8 percent slopes											1			1
Aquic Torriorthents	SSURGO	Aquic Torriorthents-Aquents complex, 0 to 2 percent slopes											1			1
		Aquic Torriorthents-Aquents-Cashbaugh association, 0 to 15 percent slopes											1			1
		Aquic Torriorthents-Aquents-Deepwell complex, 0 to 15 percent slopes											1			1
		Aquic Torriorthents-Aquic torripsamments complex, 0 to 2 percent slopes											1			1
Aramburu	SSURGO	Aramburu very shaly clay loam, 15 to 30 percent slopes	1													1
		Aramburu very shaly clay loam, 30 to 50 percent slopes	1													1
		Aramburu very shaly clay loam, 50 to 75 percent slopes	1													1
		Aramburu-Temblor complex, 30 to 50 percent slopes	1													1
		Aramburu-Temblor complex, 50 to 75 percent slopes	1													1
	STATSGO	ARAMBURU-REWARD-POTTINGER (CA343)	1													1
ARAMBURU VARIANT	STATSGO	ARAMBURU VARIANT-MODJESKA FAMILY-COARSEGOLD (CA542)	1													1
Arburua	SSURGO	Arburua loam, 15 to 30 percent slopes	1													1
		Arburua loam, 2 to 8 percent slopes	1													1
		Arburua loam, 30 to 50 percent slopes	1													1
		Arburua loam, 8 to 15 percent slopes	1													1
		Arburua-Morenogulch association, 15 to 80 percent slopes	1													1

		Steuber stony sandy loam, 5 to 9 percent slopes									1					1
Stineway	SSURGO	Stineway-Kiscove association, 30 to 60 percent slopes	1													1
		Stineway-Kiscove association, 5 to 30 percent slopes	1													1
		Stineway-Kiscove-Rock outcrop association, 30 to 75 percent slopes	1													1
		Stineway-Kiscove-Urban land complex, 0 to 30 percent slopes	1													1
Strahle	SSURGO	Strahle-Rock outcrop-Sesame association, 30 to 60 percent slopes	1													1
Stumpatil	SSURGO	Stumpatil very gravelly sandy loam, 30 to 50 percent slopes			1											1
		Stumpatil very gravelly sandy loam, 8 to 30 percent slopes			1											1
		Stumpatil-Sonorapass-Snowtell association			1											1
Stutzville	SSURGO	Stutzville silty clay loam, strongly saline, 0 to 1 percent slopes								1						1
Sumeadow	SSURGO	Sumeadow association			1											1
		Sumeadow-Lostridge association			1											1
Sumine	SSURGO	Mascamp-Sumine families complex, 15 to 40 percent slopes	1													1
Sumine family	SSURGO	Sumine family-Rock outcrop complex, 2 to 30 percent slopes	1													1
Sunrise	SSURGO	Sunrise loam						1								1
		Sunrise sandy loam						1								1
		Sunrise sandy loam, shallow						1								1
Supervisor	SSURGO	Supervisor family-Rock outcrop, limestone-Bartine family association, 15 to 60 percent slopes	1													1
		Supervisor family-Rock outcrop, metasedimentary complex, 30to 60 percent slopes	1													1
		Supervisor family-Rock outcrop, metasedimentary complex, 5 to 30 percent slopes	1													1
Sur family 2	SSURGO	Waterman-Sur families-Rock outcrop complex, 15 to 30 percent slopes	1													1
Swamp	SSURGO	Swamp											1			1
Sween variant	SSURGO	Sween variant-rock outcrop complex, 5 to 30 percent slo pes	1													1
Sweetmount	SSURGO	Sweetmount-Hawkinspeak-Hawkridge association	1													1
Taboose	SSURGO	Taboose-Lava flows complex, 5 to 30 percent slopes		1												1
		Taboose-Lava flows complex, dry, 5 to 15 percent slopes		1												1

Appendix C. Soil Types and Age Assignments Used for this Study (Listed Alphabetically by Soil Series and then Soil Name)

Soil Series or Map Unit	Dataset	Soil Name and Surface Slope	Landform Age (map unit)												Grand Total
			pQ	OP	LP	LtP	EHv	EH	MH	LH	LtH	LtHv	Hm	Hacf	H2O	
	STATSGO	TABOOSE-ROCK OUTCROP-CINDER LAND (CA768)		1												1
Tachi	SSURGO	Tachi clay, 0 to 1 percent slopes									1					1
Tagus	SSURGO	Tagus loam, 0 to 2 percent slopes							1							1
Tehachapi	SSURGO	Tehachapi cobbly sandy clay loam, 2 to 30 percent slope s		1												1
		Tehachapi cobbly sandy clay loam, warm, 2 to 9 percent slopes		1												1
		Tehachapi gravelly loam, 5 to 30 percent slopes		1												1
		Tehachapi loam, 15 to 30 percent slopes, eroded		1												1
		Tehachapi loam, 2 to 5 percent slopes		1												1
		Tehachapi sandy loam, 2 to 15 percent slopes		1												1
Tehachapi variant	SSURGO	Tehachapi variant sandy clay loam, 15 to 50 percent slo pes		1												1
Temple	SSURGO	Temple clay								1						1
		Temple clay loam								1						1
		Temple clay loam, 0 to 1 percent slopes								1						1
		Temple clay loam, saline								1						1
		Temple clay loam, saline-alkali								1						1
		Temple clay loam, slightly saline, 0 to 1 percent slopes								1						1
		Temple clay, 0 to 1 percent slopes								1						1
		Temple loam								1						1
		Temple loam, 0 to 1 percent slopes								1						1
		Temple loam, saline								1						1
		Temple loam, saline-alkali								1						1
		Temple loam, slightly saline, 0 to 1 percent slopes								1						1
Tennco	SSURGO	Tennco fine sandy loam, 0 to 1 percent slopes				1										1
Terrace escarpments	SSURGO	Terrace escarpments		1												1
Theriot	SSURGO	Theriot-Kyler-Rock outcrop association	1													1
		Sanpete-Theriot families complex, 5 to 60 percent slopes	1													1
		Theriot family-Rock outcrop, limestone assiciation, 30 to 60 percent slopes	1													1
		Theriot family-Rock outcrop, limestone association, 15 to 30 percent slopes	1													1
		Theriot family-Rock outcrop, limestone association, 60 to 80 percent slopes	1													1
	STATSGO	THERIOT-ROCK OUTCROP-UHALDI (CA750)	1													1
Thiefridge	SSURGO	Dab-Longday-Thiefridge association	1													1
		Thiefridge-Rock outcrop complex, 30 to 75 percent slopes	1													1
Tibbcreek	SSURGO	Tibbcreek gravelly loam, 5 to 30 percent slopes	1													1
Timosea	SSURGO	Timosea-Neuralia complex, 2 to 9 percent slopes			1											1
		Timosea-Neuralia complex, warm, 2 to 9 percent slopes			1											1
Tinemaha	SSURGO	Tinemaha gravelly loamy coarse sand, 5 to 15 percent slopes		1												1
		Tinemaha gravelly loamy coarse sand, moist, 5 to 15 percent slopes		1												1
Tips	SSURGO	Tips-Erskine-Rock outcrop association, 30 to 60 percent slopes	1													1
		Tips-Hoffman-Cinco association, 30 to 60 percent slopes	1													1
Tivy	SSURGO	Tivy loam, 3 to 9 percent slopes	1													1
		Tivy loam, 30 to 45 percent slopes	1													1
		Tivy loam, 45 to 70 percent slopes	1													1

Appendix C. Soil Types and Age Assignments Used for this Study (Listed Alphabetically by Soil Series and then Soil Name)

Soil Series or Map Unit	Dataset	Soil Name and Surface Slope	Landform Age (map unit)												Grand Total
			pQ	OP	LP	LtP	EHv	EH	MH	LH	LtH	LtHv	Hm	Hacf	H2O	
		Tivy loam, 9 to 30 percent slopes	1													1
		Tivy very rocky loam, 3 to 30 percent slopes	1													1
		Tivy very rocky loam, 30 to 70 percent slopes	1													1
Toeja	SSURGO	Abgese-Berent-Toeja families association, 2 to 30 percent slopes	1													1
Toejom	SSURGO	Toejom-Glenbrook-Pimogran association	1													1
		Toejom-Pimogran-Rock outcrop association	1													1
		Toejom-Pimogran-Rock outcrop association, 50 to 75 percent slopes	1													1
Toem	SSURGO	Cagwin-Toem-Monache association, moderately steep	1													1
	STATSGO	TOEM-CAGWIN-ROCK OUTCROP (CA715)	1													1
Toem 2	SSURGO	Rock outcrop-Toem complex, 30 to 50 percent slopes	1													1
		Rock outcrop-Toem complex, 50 to 75 percent slopes	1													1
		Rock outcrop-Toem-Sirretta complex, 10 to 30 percent slopes	1													1
		Toem-Rock outcrop-Cagwin complex, 30 to 75 percent slopes	1													1
		Toem-Rock outcrop-Cagwin complex, 5 to 30 percent slopes	1													1
Toiyabe	SSURGO	Corbett-Toiyabe-Rock outcrop complex, 15 to 50 percent slopes	1													1
		Toiyabe-Corbett-Rock outcrop complex, 30 to 50 percent slopes	1													1
		Toiyabe-Corbett-Rock outcrop complex, 50 to 75 percent slopes	1													1
		Toiyabe-Corbett-Rock outcrop complex, 8 to 30 percent slopes	1													1
Toll	SSURGO	Toll loamy coarse sand, 2 to 9 percent slopes									1					1
Tollhouse	SSURGO	Tollhouse extremely rocky coarse sandy loam, 30 to 70 percent slopes	1													1
		Tollhouse rocky coarse sandy loam, 30 to 75 percent slopes	1													1
		Tollhouse-Chaix association, moderately steep	1													1
		Tollhouse-Edmundston-Sorrell association, 15 to 50 percent slopes	1													1
		Tollhouse-Martee-Edmundston association, 30 to 50 percent slopes	1													1
		Tollhouse-Martee-Rock outcrop complex, 30 to 75 percent slopes	1													1
