APPENDIX C

C3 – GLOSSORY OF TERMS FOR SOIL HORIZONS AND LAYERS

SELECTED GEOLOGICAL TERMS USED IN TEXT

Anticline – An upward fold shaped like an arch in cross-section; opposite of a syncline.

Argillic horizon – A subsurface accumulation of silicate clay as compared to the overlying soil material (see "B" and "t" in *C-4 Soil Designations*).

Calcic horizon – An illuvial horizon in which secondary calcium carbonate (CaCO3) or other carbonates have accumulated to a significant extent (see "B" and "k" in *C-4 Soil Designations*).

Cambic horizon – Physical alterations, chemical transformations, or removals, or a combination of two or more of these processes, that result in measurable color and/or structure differences in the subsurface of a soil profile as compared to the overlying and underlying soil material (see "B" and "w" in *C-4 Soil Designations*).

Cosmogenic Radionuclide – A radioactive isotope created when a high-energy cosmic ray interacts with the nucleus of an atom.

Cumulic horizon – A surface or near-surface horizon in which sediment deposition and soil development have kept pace with each other to form an over-thickened A horizon.

Igneous – Rocks formed by solidification of cooled magma (molten rock), with or without crystallization, either below the surface as intrusive (plutonic) rocks or on the surface as extrusive (volcanic) rocks.

Monocline – A sharp bend in a bed that has the same dip on either side of the bend.

Moraine – Any glacially formed deposit of unconsolidated debris.

Protalus Rampart – A arched (or curved) ridge consisting of boulders and other coarse debris marking the downslope edge of an existing or melted snowbank.

Sedimentary – Rocks formed from sediments.

Silicic – Rocks rich in silica.

Syncline – A downward fold shaped like the letter U in cross-section; opposite of anticline.

Till – Unsorted glacial sediment.

C4 – DESIGNATIONS FOR SOIL HORIZONS AND LAYERS

Adapted mainly from:
Internet Glossary of Soil Science Terms
Soil Science Society of America
https://www.soils.org/sssagloss/appendix2.html

Three kinds of symbols are used in combination to designate horizons and layers—capital letters, lower case letters, and arabic numbers. Capital letters are used to designate master horizons and layers, lower case letters are used as suffixes to indicate specific characteristics of the master horizon and layer, and arabic numerals are used both as suffixes to indicate vertical subdivisions within a horizon or layer and as prefixes to indicate discontinuities. Genetic horizons are not the equivalent of the diagnostic horizons of the U.S. soil taxonomy. Designations of genetic horizons express a qualitative judgment about the vector of changes that are believed to have taken place. Diagnostic horizons are quantitatively defined features used to differentiate between taxa in the U.S. system of soil taxonomy. Horizon symbols indicate the direction of presumed pedogenesis (soil evolution) while diagnostic horizons indicate the magnitude of that expression. The most commonly used symbols are defined below.

Master Horizons and Layers

O horizons – Layers dominated by organic material.

A horizons – Mineral horizons that formed at the surface or below an O horizon that exhibit obliteration of all or much of the original rock structure and are characterized by an accumulation of humified organic matter intimately mixed with the mineral fraction and not dominated by properties characteristic of E or B horizons (i); or have properties resulting from cultivation, pasturing, or similar kinds of disturbance (ii).

E horizons – Mineral horizons in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these, that leaves a concentration of sand and silt particles of quartz or other resistant materials.

B horizons – Horizons that formed below an A, E, or O horizon and are dominated by obliteration of all or much of the original rock structure and show one or more of the following:

- illuvial concentration of silicate clay, iron, aluminum, humus, carbonates, gypsum, or silica, alone or in combination;
- evidence of removal of carbonates;
- residual concentration of sesquioxides (any oxide with three oxegen atoms for every two metal atoms);
- coatings of sesquioxides that make the horizon conspicuously lower in value, higher in chroma, or redder in hue than overlying and underlying horizons without apparent illuviation of iron;
- alteration that forms silicate clay or liberates oxides or both and that forms granular, blocky, or prismatic structure if volume changes accompany changes in moisture content; or brittleness.

K horizons – A mineral horizon impregnated by carbonate such that the carbonate dominates its morphology; generally well cemented (not officially recognized by the Soil Conservation Service).

C horizons or layers – Horizons or layers, excluding hard bedrock, that are little affected by pedogenic processes and lack properties of O, A, E, or B horizons. The material of C horizons may be either like or unlike that from which the solum (set of related soil horizons) presumably formed. The C horizon may have been modified even if there is no evidence of pedogenesis.

R layers – Hard bedrock including granite, basalt, quartzite and indurated limestone or sandstone that is sufficiently coherent to make hand digging impractical.

Transitional Horizons

Two kinds of transitional horizons are recognized. In one, the horizon is dominated by properties of one master horizon but has subordinate properties of another. Two capital letter symbols are used, such as AB, EB, BE, or BC. The master horizon symbol that is given first designates the kind of master horizon whose properties dominate the transitional horizon. In the other transitional horizon, distinct parts of the horizon have recognizable properties of the two kinds of master horizons indicated by the capital letters. The two capital letters are separated by a virgule (/), as E/B, B/E, or B/C. The first symbol is that of the horizon that makes up the greater volume, (e.g., BE is a horizon with characteristics of both an overlying E horizon and an underlying B horizon, but which is more like the B than the E, while B/E is a horizon comprised of individual parts of E and B horizon in which the E component surrounds the B component but the latter is dominant).

Subordinate Distinctions within Master Horizons and Layers

a – Highly decomposed organic material where rubbed fiber content averages <1/6 of the volume.

b – Identifiable buried genetic horizons in a mineral soil.

c – Concretions or nodules with iron, aluminum, manganese or titanium cement.

d – Physical root restriction, either natural or manmade such as dense basal till, plow pans, and mechanically compacted zones.

e – Organic material of intermediate decomposition in which rubbed fiber content is 1/6 to 2/5 of the volume.

f – Frozen soil in which the horizon or layer contains permanent ice.

g – Strong gleying in which iron has been reduced and removed during soil formation or in which iron has been preserved in a reduced state because of saturation with stagnant water.

h – Illuvial accumulation of organic matter in the form of amorphous, dispersible organic matter-sesquioxide complexes.

i – Slightly decomposed organic material in which rubbed fiber content is more than about 2/5 of the volume.

k – Accumulation of pedogenic carbonates, commonly calcium carbonate.

m – Continuous or nearly continuous cementation or induration of the soil matrix by carbonates (km), silica (qm), iron (sm), gypsum (ym), carbonates and silica (kqm), or salts more soluble than gypsum (zm).

n – Accumulation of sodium on the exchange complex sufficient to yield a morphological appearance of a natric horizon.

o – Residual accumulation of sesquioxides.

p – Plowing or other disturbance of the surface layer by cultivation, pasturing, or similar uses.

q – Accumulation of secondary silica.

r – Weathered or soft bedrock including saprolite; partly consolidated soft sandstone, siltstone or shale; or dense till that roots penetrate only along joint planes and are sufficiently incoherent to permit hand digging with a spade.

s – Illuvial accumulation of sesquioxides and organic matter in the form of illuvial, amorphous, dispersible organic matter-sesquioxide complexes if both organic matter and sesquioxide components are significant and the value and chroma of the horizon are >3.

ss – Presence of slickensides (i.e., pressure faces created by shrinking and swelling of clay-rich soils).

t – Accumulation of silicate clay that either has formed in the horizon and is subsequently translocated or has been moved into it by illuviation (i.e., argillic horizon).

v – Plinthite is an iron-rich, humus-poor, reddish material that is firm or very firm when moist and that hardens irreversibly when exposed to the atmosphere under repeated wetting and drying.

w – Development of color or structure in a horizon but with little or no apparent illuvial accumulation of materials.

x – Fragic or fragipan (altered subsurface soil layers that restrict water flow and root penetration) characteristics that result in genetically developed firmness, brittleness, or high bulk density.

y – Accumulation of gypsum.

z – Accumulation of salts more soluble than gypsum.

APPENDIX D

OBSIDIAN HYDRATION METHODS, RESULTS, AND DATABASE

Tim Carpenter M.A.
ArchaeoMetrics Inc.
Obsidian Hydration Laboratory
P.O. Box 1762
Davis CA 95617-1762

3 November 2008

CA-KIN-80 (AM-08-30)

In all, four artifacts were submitted for analysis. Given that the artifacts showed signs of extreme to moderate weathering, areas with fractures and step fractures (that occurred during manufacture or resharpening) were targeted. Ventral and dorsal sides of the specimens were also examined. In all, four obsidian hydration rim values were obtained from the four artifacts. Of these, two artifacts yielded a single rim value, one yielded no rim value, and one artifact yielded two rim values. The multiple readings per artifact suggest that older tools were re-sharpened, retooled, or damaged during use

14 February 2009

Little Lake Geoarchaeological Testing (AM-09-05)

In all, ten artifacts were submitted for analysis. Given that the artifacts showed signs of moderate weathering, areas with fractures and step fractures (that occurred during manufacture or resharpening) were targeted. Ventral and dorsal sides of the specimens were also examined. In all, 12 hydration rim values were obtained from the 10 artifacts. Of these, eight artifacts yielded a single rim value and two artifacts yielded two rim values. The multiple readings per artifact suggest that older tools were re-sharpened, retooled, or damaged during use. While the outer surface most certainly reflects the weathered surface, retooled age, or recent damage, the interior step-fracture likely reflects the older age of the artifact (when it was initially made). Separate dorsal and ventral readings may suggest repeated episodes of core or tool manufacture. With debitage, the smaller measurement from the ventral surface of the flake reflects when the artifact was last retooled while the larger measurement on the dorsal surface reflects when a previous flake was struck from the tool or core.

Visual Identification

After thin sectioning, ten artifacts were examined microscopically and specific internal characteristics were noted. Microscopic attributes were then compared to multiple control samples from the region that had been geochemically sourced using XRF. Based on the microscopic and microscopic attributes, nine specimens were identified as Coso obsidian, which includes (Joshua Ridge, Sugarloaf, West Cactus Peak, and West Sugarloaf). One specimen was unknown due to lack of macroscopic and microscopic traits. Generally, these have some feature that suggests that they are likely Coso, Saline sources cannot be ruled out. A blind test conducted by Carpenter and Garfinkel (Garfinkel 2006) suggests that identification of regional sources using microscopic attributes is accurate roughly 90% of the time. However, when using microscopic attributes viewed from thin sections of small pressure flakes (Eerkens; personal communication) and from very old tools (e.g. Projectile points) the accuracy may be as low as 70% (Gold; personal communication). In this region, due to the plethora of obsidian sources, visual sourcing may only be as accurate between 70-90%.

Analytical Methods

Hydration results were accomplished at the ArchaeoMetrics Obsidian Hydration Laboratory. Initially, the best area in which to cut a portion of an obsidian specimen was determined. Two parallel cuts were then made on the appropriate portion of the specimen using a lapidary saw mounted with two four-inch diameter diamond-impregnated .004" blades. For projectile point the base or notches are cut. For debitage the platform is cut to determine if there is difference in dorsal, ventral or in some cases the platform readings. Weathered specimens are addressed in the same manner but step fractures are usually targeted for un-weathered hydration readings. On average the majority of cuts yielded samples average 0.35 millimeters in thickness. Samples were then mounted with Lakeside thermoplastic cement onto sequentially numbered microscope slides. Generally, five specimens were mounted on each slide.

The samples were then manually ground to reduce thickness allowing specimens to be read under the microscope. First, a slurry of water and 600 silicon abrasive grit was mixed on a glass plate. Grinding was accomplished in two steps. The initial grinding rendered the surface flat and removed the saw cut marks from one side of the specimen. The specimen was then flipped, remounted and the second side was ground to proper thickness for viewing under the microscope. Final thickness of the specimens was between 30-50 microns depending on opacity or unique source specific quantities such as hardness of obsidian vs. softer obsidians.

The prepared slides were then measured using a Meiji petrographic microscope fitted with a Lasico digital filar eyepiece. Once a defined hydration rim was observed on a color monitor screen, the hydration rim was centered in the middle of the monitor, to reduce parallax, and measured using the micrometer. Typically ten measurements are taken from each specimen. However, due to imperfections in the stone, weathering, or damage to the surface from the saw or grinding as few as three measurements were recorded. Surfaces exhibiting cortex were also recorded and identified as such. Hydration values are recorded to the 0.01 um and both the mean and standard deviation for each specimen were computed (Table attached).

Additional information on unique qualities is recorded in the "quality" column. These include:

BEV- (Beveled). Artifact cut or morphology has resulted in a beveling of the thin section.

BRE- (Break) The thin section was purposely cut across a broken edge of the artifact. Hydration measurements may reveal when the artifact was broken, relative to its time of manufacture.

BUR- (Burning). The characteristics of the specimen noted under the microscope are indicative of burning. Although the effects of burning are poorly understood, such occurrence may be identified as the complete absence of hydration or an obscured diffusion front.

C1 or C2- (Additional cut made). More than one thin section was prepared from an archaeological specimen; each is sequentially numbered. Multiple cuts (c1 or c2) may be made if the artifact is very large (e.g. Quarry reduction) In addition multiple cut may be made if there is some question that readings may not be consist across the artifact due to aberrant weathering (fluvial rolled artifacts). They are noted in sequential order and a diagram may be provided.

DES- (Destroyed). The specimen was destroyed in the process of thin section preparation. This may occur when mounting and grinding extremely small flakes (e.g. shark fins).

DFV- (Diffusion front vague) the diffusion front, or the visual boundary between hydrated and unhydrated portions of the specimen, is poorly defined. This can result in less precise measurements that can be obtained from sharper demarcated diffusion fronts. The technician must often estimate the hydration boundary because a vague diffusion front appears as a relatively thick, dark line or a gradation in color or brightness between hydrated and unhydrated layers.

DIS- (Discontinuous). A discontinuous or interrupted hydration rind was observed on the thin section.

HV- (Highly Variable). The hydration rind exhibits variable thickness along continuous surfaces.

IRR- (Irregular). The outer surface of the thin section is uneven and measurements are difficult.

ISO- (One surface only). Hydration was observed on one surface or side of the thin section (artifact).

ED- (Edge damaged). Reflects an isolated area damaged along the margin of the artifact.

EM- (Edge modified). Reflects an isolated area of modification usually along the margin of the artifact.

NHV- (No visible hydration). No visible hydration rind was observed. This does not imply that hydration is absent, only that hydration was not observed. Hydration rinds smaller than one micron are often too small to be seen via optical microscopy.

RC- (Recut). More than one thin section was prepared from an archaeological specimen. Multiple thin sections are made if preparation quality on the initial specimen is suspect or obviously poor. More than one recut is number sequentially (e.g. RC, RC2, etc.)

RC-**RB-** (Recut along recent break)**.** Recent hydration recut is made along a broken edge of an artifact of antiquity. Usually the lithic analysis is interested when the artifact was broken.

SKF- (Shark fin). Due to the small size of the specimen, the flake was snapped in half and mounted buy itself onto a slide.

UNR- (Unreadable). The measurement optical property of the hydration rind is so poor that accurate measurements are not possible. Poor thin section preparation is not the cause.

W-(Weathered). Visual surface characteristics and microscopically observed characteristics are noted to asses the reliability of the hydration rim value. Mild sandblasting is noted as W; moderate sand blasting is noted by **W+**. Generally, those noted as W or W+ retain enough integrity to assume a correct rim value. Excessive sand blasting (manifest as eroded flake scars) is noted as **W++**; while extreme weathering, pitting and severe weathering (manifest as rounding of all external edges) is noted as **W+++**. These later two notations indicate extremely weathered surfaces with less reliable or indeterminate rim values. For these specimens, we targeted areas that have unexposed hydration, such as hinge and step fractures or internal cracks.

NOT OBSIDIAN- Macro-visual or petrographic characteristics of the artifact indicate that it is not obsidian.

Additional information is recorded about unique qualities in the "hydration comments" column that pertain to technological comments. These include:

1 of 2- One of two distinctly different hydration rinds identified on one specimen. Occasionally one specimen will have one, two, or possibly three distinct hydration rinds. Generally, older (larger) rim values located near the midsection (interior) of the artifact

and younger or smaller rim values near the "margin". This notation is used to easily distinguish the different hydration rinds in the comments column used by the analyst.

S1-(Side 1).- Occasionally, one of possibly two distinctly different hydration rinds identified occur on different faces of an obsidian tool. Occasionally one specimen will have one (S1), two (S2), or possibly three distinct hydration rinds on various faces of the artifact. This notation is used to easily distinguish the different hydration rinds in the comments column used by the analyst.

V- (Side one - ventral)**.** Reading was taken on the ventral side surface of the artifact.

D- (Side two - dorsal)**.** Reading was taken on the dorsal surface of the artifact.

ED- (Edge damage)**.** Reading was taken on the margin of the artifact; ED indicated that edge damage is present.

P- (Platform)**.** Reading was taken on the platform or platform remnant.

RH- (Remnant hydration)**.** Reading was taken on a weather surface of the approximate thickness of the remaining or remnant hydration.

RB- (Recent break hydration)**.** Reading appears in a crack of a weather surface and its thickness and locating suggest this it is a recent phenomenon. Recent hydration can also include reworking and this notation is made after viewing the hydration location and looking at the artifact.

RB Margin- (Recently broken margin hydration)**.** Recent broken edges on debitage lacking platforms can be cut to determine if the dorsal and ventral surfaces differ from the broken edge. In this case the notation is used to note the artifact was cut along as surface that appears recently broken but may have readings consistent with the dorsal and ventral surfaces

Additional information regarding the type of feature selected and where hydration is reading are taken on the artifact is recorded in the "Hydration comments 2" column. These include:

CRACKS (C) - Rim measurement originated from an unweathered internal crack. This measurement may not be associated with artifact's modification. Discretion should be used for assigning age of the artifact.

STEP FRACTURE REMOVED AND CRACK (SF) - Rim measurement originated from an unweathered step fracture and internal crack associated with artifact modification. Step fractures art tabulated as they are found. Sfx2; notes that two independent step fractures were measured).

SURFACE (S) - Rim measurement originated from an unweathered, moderate or severely weather surface. Because some of the hydration rim has weathered away, these measurements are not accurate for assessing when the artifact was last modified (See SW in Comments2 column).

Additional information is recorded about unique surface qualities of weathered specimen or general comments are located in "Comments2".

Artifact Size (AS) – Larger artifacts of extreme size may yield multiple hydration values. Unless instructed by the client, one thin section is taken and general comment regarding multiple surface are only noted. This generally applies to specimens from quarries.

Surface Weathered (SW) – These rim measurement originated from an unweathered surface or weathered internal crack. This reading is estimated. The generalized measurement reflects that the artifact has lost a certain amount of hydration due to weathering.

APPENDIX E

EXTENT OF BURIED SITE POTENTIAL ALONG EACH STATE ROUTE IN DISTRICT 6/9 BASED ON LANDFORM MAP AND PREDICTIVE MODEL

WEIGHTS OF EVIDENCE ANALYTICAL APPROACH

Weights-of-evidence is one of several quantitative methods for assessing relationships between occurrences of a phenomenon and a series of predictor variables. The method was originally applied to medical diagnosis, but later expanded to spatial applications such as mineral exploration, fossil packrat-midden distributions, and archaeological site locations (Bonham-Carter et al. 1988, 1989; also see Agterberg et al. 1990; Bonham-Carter 1994; King 2004; Mensing et al. 1999; West et al. 2000). In spatial applications, the known occurrences of the phenomenon under study take the form of a set of point locations ("training points"), and the predictor variables take the form of thematic maps ("evidential themes"), usually reduced to binary patterns (i.e., presence/absence of an attribute). In the case of archaeological sensitivity, then, the training points would be known site locations, and the evidential themes would be environmental variables that are thought to influence site location, such as slope, distance to water, etc.

The set of training points is compared against each of the evidential themes, and a coefficient or weight assigned to each pattern in the theme according to how frequently the points are found to occur within and outside that pattern. Two weight values are assigned, an in-pattern weight (W+) and an out-of-pattern weight (W-). A high W+ value indicates a strong association between the occurrence of training points and areas within a pattern, while a strongly negative W- value conversely indicates a paucity of training points in out-of-pattern areas. The difference between these values is known as the contrast, and measures the overall strength of correlation between the pattern and the distribution of training points. Contrast values between 0 and 0.5 are weakly predictive; values between 0.5 and 1 are moderately predictive; and values greater than 1 are strongly predictive. Often, a pattern may show a W+ value close to zero, but have strongly negative W- values and thus a high contrast value overall. This indicates that in-pattern areas are not a strong predictor of the presence of training points, but that out-of-pattern areas are strongly associated with a relative lack of training points. Conversely, high contrast values can also result from a high W+ value coupled with a W- value close to zero. This indicates that in-pattern areas are a good predictor of the presence of training points but that out-of-pattern areas are not strongly associated with an absence of training points. The overall confidence in a contrast value can be reported by dividing by its standard deviation.

The method then compares the overall pattern of weights in a number of evidential themes through an application of the Bayes Rule, in which the prior probability, or the expectation of finding a training point in a given area under the expectation of randomness, is modified to produce a posterior probability. This is done by finding the set of unique conditions (i.e., every possible combination of binary patterns included in the analysis), and applying the weights from each of the evidential themes to each unique condition. For example, if two binary patterns were included in the analysis, then there would be four (2 x 2 = 4) unique conditions; if three binary patterns were included, then there would be eight (2 x 2 x 2 = 8). When the posterior probabilities associated with each unique condition have been calculated, a "response theme" depicting the spatial distribution of these probability values is produced. These probability values can then be reclassified into a more intuitively understandable map.

Weights-of-evidence modeling has the advantage over other multivariate methods (e.g., weighted logistic regression) of being able to take areas of missing data into consideration, and hence to expand the weights generated by data from a small area into a larger region (Agterberg et al. 1993). However, unlike other methods, it requires that each evidential theme be conditionally independent; this assumption can be evaluated through a standard chi-square test.

Archaeological sites are usually found in the context of a survey, which also generates negative evidence in the sense that it identifies large areas that are not archaeological sites. If one fails to account for this, sampling biases may affect the result. One approach to this problem is to conduct the initial study on surveyed areas only, and then extrapolate the analysis to the region as a whole.

While weights-of-evidence modeling can be a useful tool for archaeologists, several important caveats must be borne in mind. The quality of data available for modeling exercises can be highly

variable, in terms of both survey and site recordation. Reducing the complexities of this necessarily incomplete record to a series of training points involves a great deal of simplification. Even setting aside the question of data quality, archaeological sites do not reduce easily to training points, because they represent a wide range of different patterns of prehistoric land use, each of which may have been influenced by a different set of environmental conditions. Finally, it should be kept in mind that the evidential themes employed in any model are simply the ones that the researcher deems relevant (or possible to re-produce), and cannot ever fully represent the entire range of conditions influencing prehistoric land use. The evidential themes themselves may be highly interpretive in nature; e.g., a distance-to-water theme necessarily builds on a researcher's decision about what constitutes a source of water. Ultimately, it is up to the archaeologist to keep in mind the limitations of the datasets used to generate these types of models, and to recognize that the building of such models is an exploratory, iterative process that should be tested and refined as new information comes in.

METHODS

The analysis comprised several major components: 1) development of evidential themes; 2) compilation of a training-point theme (site locations); and 3) weights calculations and model building. Each of these is discussed in detail below. All analyses were carried out using ESRI ArcMap 9.3 and the Spatial Analyst extension; weights and modeling runs were performed using the Spatial Data Modeler Extension 3.1.76, which automates many of the tasks involved. All GIS datasets were saved as standard ESRI grids or shapefiles.

A few additional cautionary notes are in order. First, this model is intended to identify high-sensitivity areas on a local scale. Regional effects on site density have not been incorporated in this model, and are beyond the scope of this project. Second, this model is only as good as the input data. We assume the quality and distribution of the survey data to vary randomly, but this likely is not the case. Although we control for survey area, some bias may be introduced as a result of the low number of samples in some areas.

Development of Evidential Themes

The evidential themes for this analysis include slope, hydrology, distance to water, vegetation cover, precipitation, elevation, SSURGO Storie Index value and landform age.

Elevation and Slope

A digital elevation model (DEM) was acquired from the Shuttle Radar Tomography Mission. This dataset had 90 meters resolution and was processed by CGIAR to fill data voids. It was projected into the California Teale Albers (NAD 83) coordinate system used throughout this modeling task. This elevation dataset was used as a basis for derived datasets, including cost models and slope. Elevation was classified into 250 meter increments for analysis.

Slope was calculated from the DEM using the standard ArcMap routine. The resulting slope grid was then averaged over a 90-meter radius, and classified into six groups for further analysis, with the following, roughly logarithmic breaks in degree value: 0.5, 0.8, 1.5, 2.5, 4, 6, 10, 15, and 25.

Hydrology

Surface hydrology and spring locations were modeled using USGS National Hydrography Dataset (NHD) high-resolution data, which were digitized from 1:24,000 scale USGS quadrangles (US Geological Survey 1999b). These data include attribute codes distinguishing artificial features from natural ones and perennial streams from intermittent ones. Also, the drainage paths of selected historic streams and lakes were imported or digitized from historic maps (US Fish and Wildlife Service 1998; Grunsky 1898).

The hydrology layers that we built were used to examine various aspects of the role of water in site location. We generated a Euclidean distance to each of several hydrologic types (spring, lakes, streams, streams classified by Stahler order) as well as all permanent water sources. The same distance measurement classifications were used for each analyzed type: 500, 1,000, 1,500, 2,000, 3,500, 5,000, and 10,000 meters.

Landform Age

Landform age was based on the Quaternary geology layer developed for the project from SSURGO and STATSGO digital soils datasets. Age classes included Historical to Modern, Latest Holocene, Late Holocene, Middle Holocene, Early Holocene, Latest Pleistocene, Older Pleistocene, and Pre-Quaternary.

Storie Index

Soils data compiled from the SSURGO database was classified by Storie Index value. The Storie index value is a measure of soil productivity which could serve as a proxy for relative resource productivity. The index value ranges from 1-100. However, the SSURGO database is not consistent across the entire model area, so some places with SSURGO data were not able to be classified. Therefore, the final class breaks were ten percent increments with the addition of a "No Data" class.

Vegetation

We built a prehistoric habitat type map based on the best available vegetation maps. We identified four sources of suitable vegetation data (Table 1). These four data layers were ranked (Table 1) and, when combined, vegetation types from higher ranked layers supplanted lower ranked vegetation types. We normalized vegetation types using existing relationships between two elements of classification systems (California Wildlife Habitat Relationship "crosswalks"), vegetation type descriptions, and expert knowledge. The historic vegetation types in the Central Valley, Bay Atlas, and Küchler layers were reassigned to the closest Wildlife Habitat Relationships vegetation type. These vegetation types were the classes for our weights of evidence analysis.

Table 1. Sources and Ranking for Vegetation Data.

LAYER NAME	SOURCE	RANK	EXTENT
Central Valley Habitats	Chico State	1	Sacramento and San Joaquin Valleys
Bay Atlas Vegetation	Bay Atlas/Far Western	2	San Francisco Bay Area
Modern Vegetation	Fire and Resource Assessment Program/ United States Forest Service	3	California
Küchler Vegetation	Küchler 1977	4	California

Precipitation

Average annual precipitation data for the years 1971 to 2000 was acquired from the USDA PRISM program (USDA 2006). We reclassified the higher precipitation range values in the PRISM dataset into ten classes for the project area: 5, 7, 9, 11, 14, 18, 24, 34, 47, and 67 inches.

Training Points – Archaeological Sites and Survey Coverage

In order to generate the training points for the analysis, we relied on the record search sites and initial survey results associated with the TEA project. Therefore, all sites were included in the analysis, not just those located during systematic surveys. The record search extent served as a proxy for the survey extent. The survey extent totaled 279,769 acres (0.39 % of the project area). The record search contained 1,363 prehistoric sites (Table 2).

Table 2. Prehistoric Site Count and Survey Extent.

REGION	SITES	MODEL AREA
Sierra Foothills	215	38,153 acres (0.67 %)
Sierra	246	31,089 acres (0.27 %)
Great Valley	66	71,581 acres (0.58 %)
Mono	488	53,009 acres (0.83 %)
Mojave	327	61,227 acres (0.22 %)
Central Coast	21	24,710 acres (0.31 %)
TOTAL	1,363	279,769 acres (0.39 %)

Stratification

Due to the large spatial extent and varied geography of the project area we initially stratified training points by geographic region based on the "Sections" within Bailey's Ecoregions and Subregions of the United States (USFS 2004). A small portion of Kern County was not included in any analyitical strata since it is part of the Southern California Mountains and Valleys Section, but had no sites or survey extent (Figure 1).

Weights Calculation and Model Building

The finished training-point theme was used to assess the predictive potential of each of the evidential themes discussed above via a series of calculations of weights of evidence. Prior to building the model, we had to define the "unit area," which is the space that one training point is assumed to occupy. All weights were calculated using an 810-square-meter unit area and were calculated only for surveyed areas to avoid sampling bias.

An initial weights calculation was performed on each layer to generate contrast values and confidence estimates. These metrics were examined to identify break points to create binary patterns that would maximize contrast between in-pattern and out-of-pattern areas. Weights for those binary patterns were then calculated.

A last step before creating the final model was to check for correlation between input layers. Layers found to be correlated were examined and only the layer with the greater discriminatory ability was used in the final model. When binary-weights calculations were complete, an overall response theme was calculated using the weights calculated for the surveyed areas to extrapolate to the region as a whole.

Results

Initial analysis indicated several trends between site locations and environmental themes (Table 3). We generated binary layers for model building for each stratum and evaluated these for goodness of fit. In general, final models were poor and often consisted of one or two layers with poor discriminatory power. We pursued several alternatives for model building, including combining strata, modifying classifications and hand picking evidential themes; however we were not able to build satisfactory models. We attribute our model building problems to three main issues. First, we violated one assumption of weights of evidence analysis by not having complete survey coverage, therefore our "negative" survey extent may not have actually been without sites. Similarly, we violated the assumption that sites were located as a result of systematic survey. Finally, our survey coverage and site location are inherently biased since they are based on proximity to highways which are not randomly distributed across the landscape.

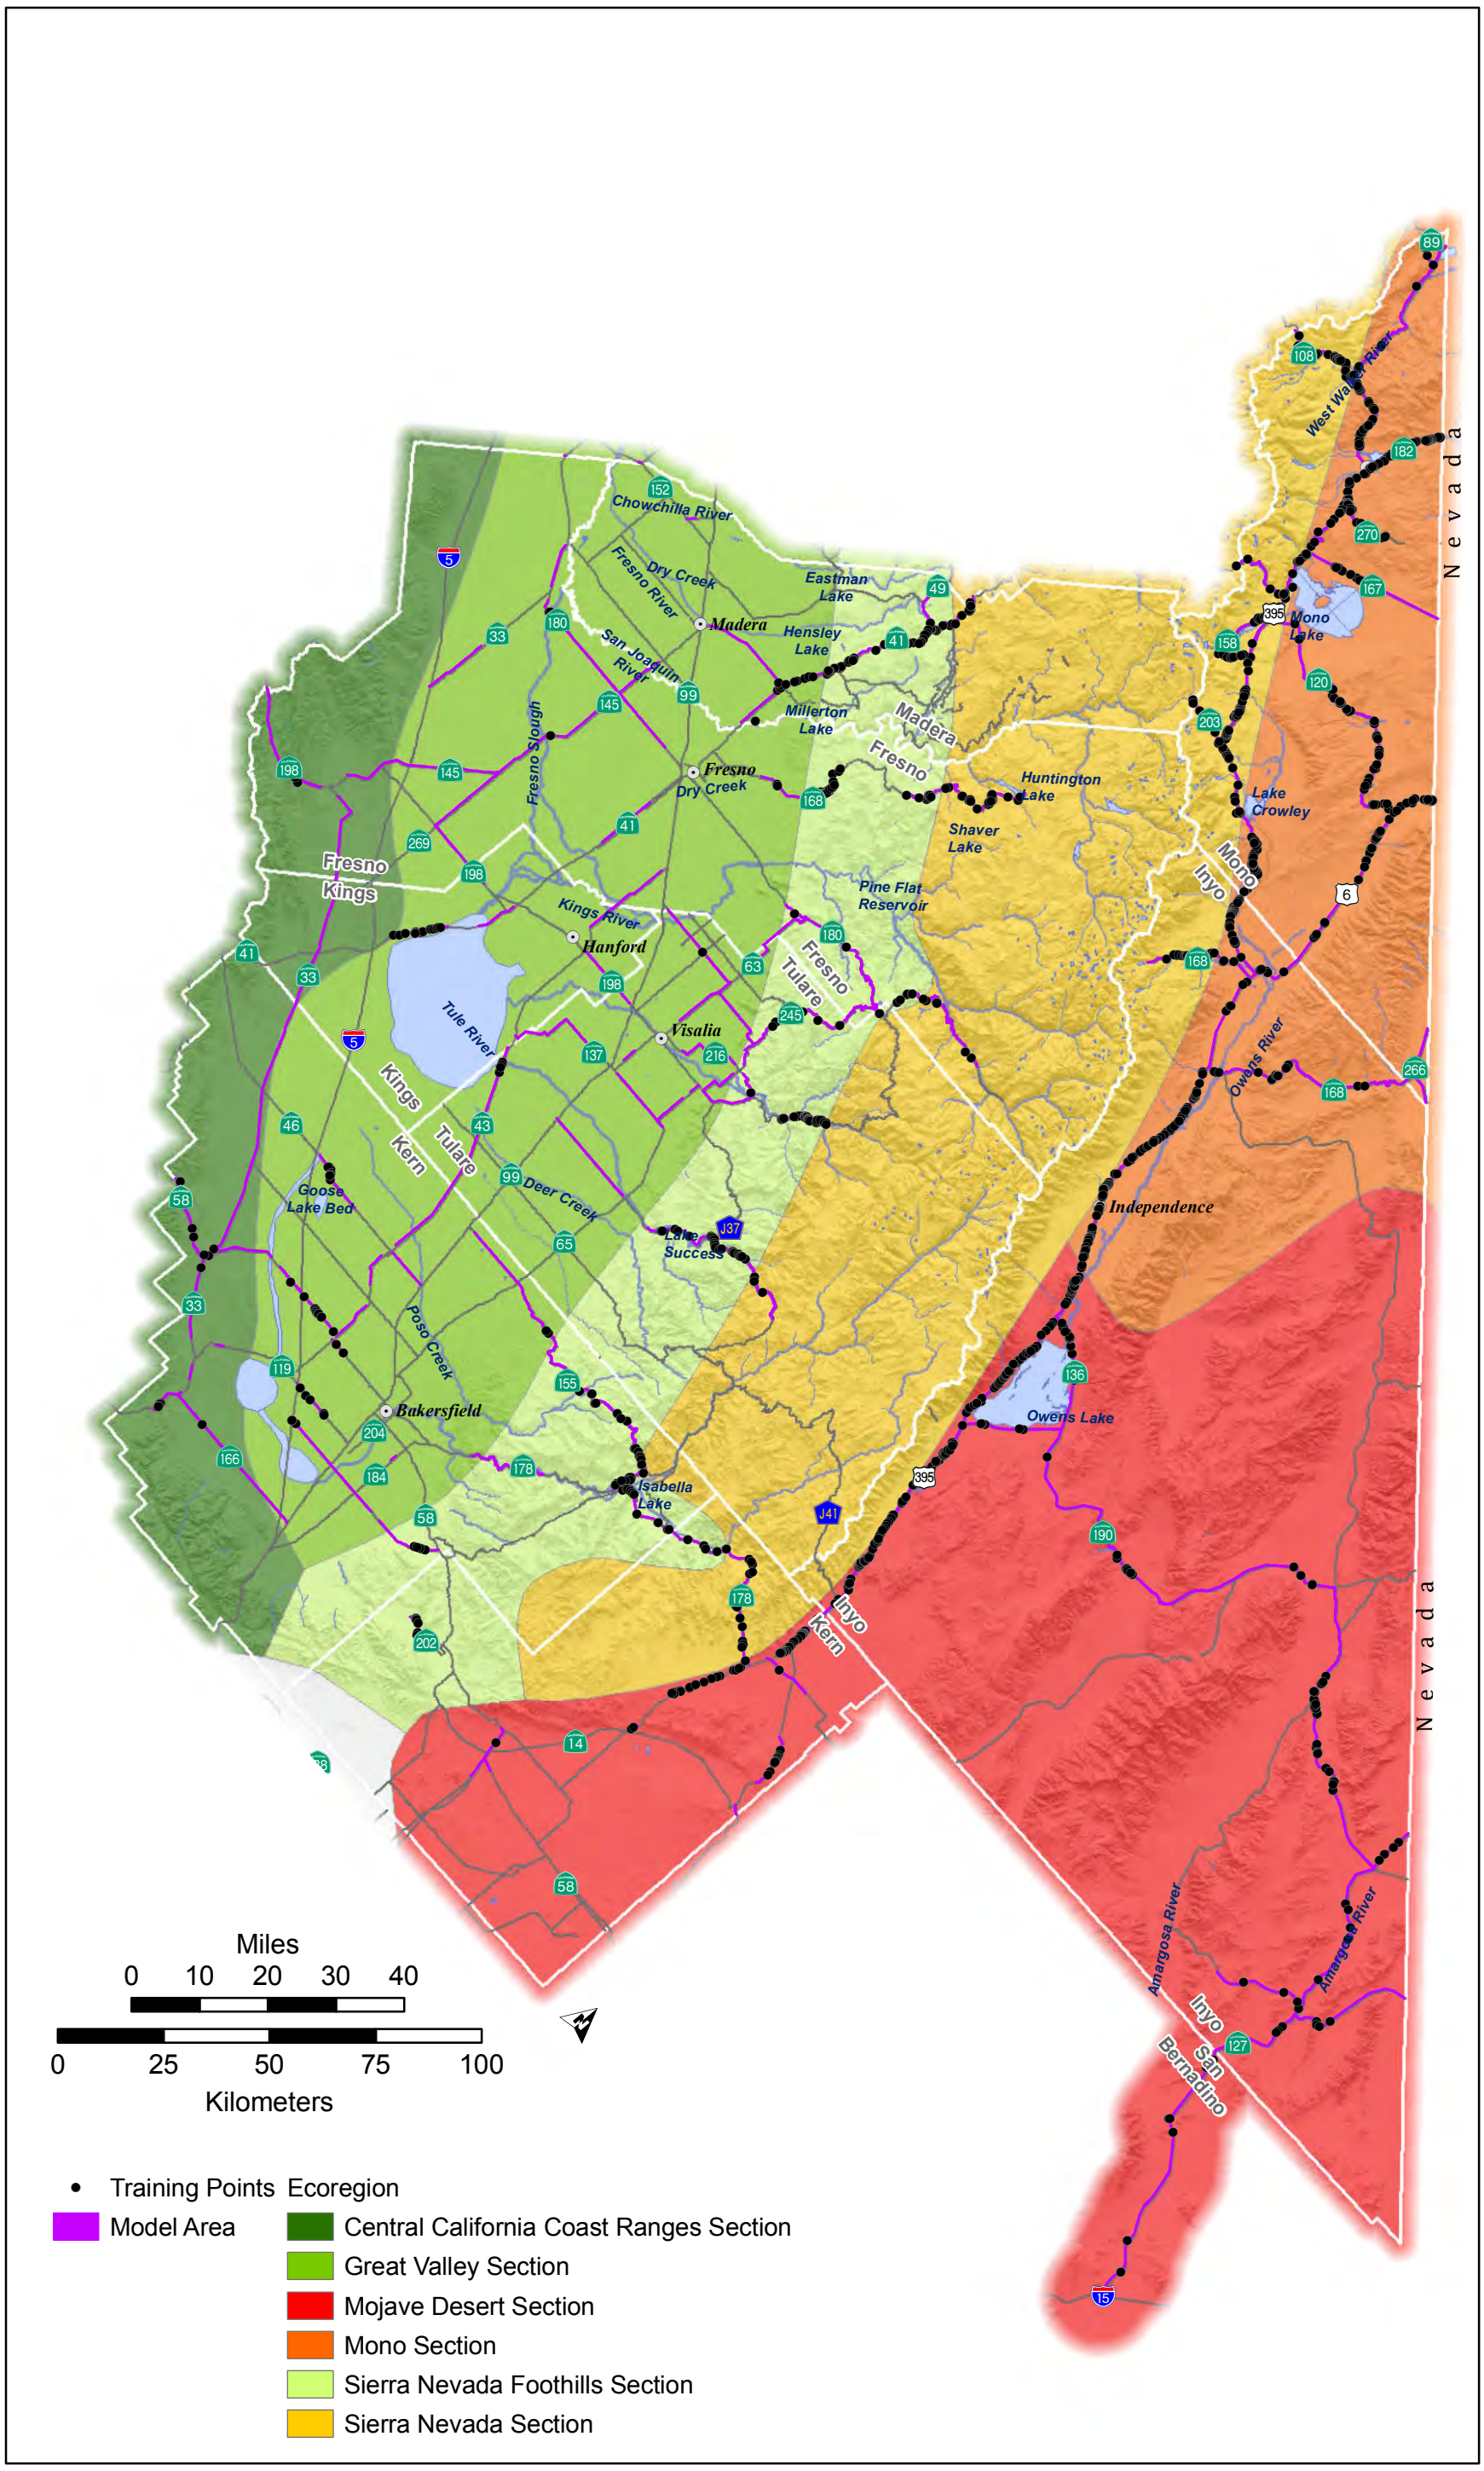

Figure 1. Model Extent and Model Strata.

Table 3. Preliminary Modeled Trends for Environmental Themes.

	Vegetation		Stream Order		Perm. Water		Streams		Springs		Lakes		Storie Index		Soil Age		Slope		Precipitation		Elevation

APPENDIX D:

Geotechnical Due Diligence Review

THIS PAGE INTENTIONALLY LEFT BLANK

SA GEOTECHNICAL
OPTIMIZED SOIL ENGINEERING

May 31, 2024

Project No. 24059-01

To: Meritage Homes
5 Peters Canyon Road, Suite 310
Irvine, California 92606

Attention: Ms. Emma Hill

Subject: Geotechnical Subsurface Exploration, Due Diligence Study, and Preliminary Geotechnical Recommendations, Proposed Residential Development, 95 Argonaut, City of Aliso Viejo, California

At your request, SA Geotechnical, Inc. (SA GEO) has conducted subsurface exploration and geotechnical due diligence study for the proposed residential development located at 95 Argonaut in the City of Aliso Viejo, California (Figure 1). The purpose of this study was to evaluate the geotechnical site conditions in light of the proposed grading and improvements in order to provide a geotechnical summary of conditions and preliminary geotechnical recommendations for project design, grading, and construction. Our evaluation included review of collected geologic and geotechnical engineering reports and maps pertinent to the subject site; a site-specific subsurface exploration; laboratory testing; geotechnical analysis; and preparation of this report.

The subject site is currently developed with a 2-story office building, retaining wall along the westerly property line, at-grade asphalt concrete paved parking lot and associated drive aisles, and hardscape/landscape improvements, all of which will be demolished as part of the proposed project. An approximately 20-foot-high descending slope is present along the easterly property boundary. Based on our review and field exploration, the primary geotechnical constraints include the presence of highly expansive silty/clayey soil that is diatomaceous and seismic shaking during a strong seismic event. The subsurface artificial fill soils at the site are primarily highly plastic silt/clay with minor interlayered clayey/silty sands. The artificial fill soils are generally diatomaceous and derived from Monterey Formation bedrock. Bedrock of the Monterey and Niguel Formations underlie the site at depth. Groundwater was encountered in one boring (H-4) during drilling, at a depth of 55 feet below ground surface. Onsite stormwater infiltration is not feasible considering that the site is underlain by relatively thick artificial fill, which are predominantly silty/clayey, overlying bedrock.

This report presents our findings, conclusions, and preliminary design recommendations for the subject residential development. Based on our review, the proposed grading and development is considered geotechnically feasible provided the recommendations in this report are implemented during design, grading, and construction. Additional evaluation and analysis may need to be performed once the project plans for grading and foundations are developed.

References pertinent to the site are included in Appendix A. Boring and laboratory test data are included in Appendix B and C, respectively. Seismic design parameters are presented in Appendix D. Slope stability analysis is presented in Appendix E. General earthwork and grading specifications are presented in Appendix F.

If you have any questions regarding this report, please contact our office. We appreciate the opportunity to provide our services.

Respectfully submitted,

EXECUTIVE SUMMARY

The subject site is underlain by relatively thick artificial fill material as a result of mass grading and development that occurred in the 1980s. Approximately 25 to 75 feet of fill was encountered in all borings which generally consisted of olive gray, olive brown, bluish gray, brown, and black clayey silt, clay, silty/sandy clay, clayey sand, and silty sand that was moist to wet and medium stiff to hard/medium dense to dense. The fine-grained fill materials are derived from the Monterey Formation and were found to be diatomaceous. Bedrock of the Monterey and Niguel Formations were encountered during drilling, underlying the artificial fill at depth.

The primary geotechnical constraints at the site include the following:

- Presence of highly expansive silty/clayey soils that are diatomaceous; and
- The potential for seismic shaking during an earthquake event.

Remedial grading for the site should consist of the removal and re-compaction of all weathered/disturbed fill materials. Remedial removals are anticipated to be on the order of 3 to 4 feet below existing grades within the proposed building pads. Remedial grading within the proposed drive areas may be limited to removal and re-compaction of the soils in the upper 1 to 2 feet. Deeper removals may be required where existing trees, utility lines, structures, and foundations are to be abandoned/removed. Considering that the onsite soils predominately consist of silty/clayey soils that are diatomaceous, achieving adequate compaction at acceptable moisture contents during fill placement may require additional mixing and compaction effort.

Groundwater was encountered in one boring (H-4) during our exploration, at a depth of 55 feet bgs (within Niguel Formation). Historic high groundwater is mapped 20 feet below original grades; however, this does not account for the mass grading and fill placement that occurred onsite. In general, we anticipate groundwater to remain at least 20 feet below existing grades upon the completion of grading. However, seepage/groundwater may be present at shallower depth locally and can fluctuate on an annual and seasonal basis.

Considering the relatively minor grading anticipated to achieve design grades, the laboratory test data, building foundations and slabs should be designed to tolerate a total settlement of 2 inches and a differential settlement of 1-inch over a span of 40 feet. Onsite soils are anticipated to have "High" expansion potential at the completion of grading and are considered corrosive to concrete ("S2").

Based on our findings, we conclude that the proposed residential development is feasible from a geotechnical viewpoint, provided it is designed and constructed in accordance with the recommendations presented in this report and the future design/plan review report(s). The site is not considered suitable for infiltration of storm water.

1.0 INTRODUCTION

1.1 Introduction and Scope of Services

At your request, SA Geotechnical, Inc. (SA GEO) has conducted subsurface exploration and geotechnical due diligence study for the proposed residential development located at 95 Argonaut in the City of Aliso Viejo, California (Figure 1). The purpose of our study was to assess the onsite geologic and geotechnical conditions and provide preliminary recommendations for design, grading, and construction of the proposed residential development. A Topographic Survey by X Engineering & Consulting, received on May 15, 2024, has been utilized as the base for our Geotechnical Map (Plate 1).

Our scope of services for this due diligence study included the following tasks:

- Review of available published geologic and geotechnical maps, reports, and data for the subject site and surrounding area, including an archive search of City of Aliso Viejo records. A list of references is included in Appendix A.
- Historic aerial photograph review, dating back to 1931.
- Notification and coordination with DigAlert to identify and clear boring locations of underground utilities.
- Subsurface exploration consisting of excavation, sampling and logging of four hollow-stem auger borings (H-1 through H-4) to depths ranging from 41.5 to 81.5 feet below ground surface (bgs). Boring logs are included in Appendix B.
- Laboratory testing of selected samples to determine engineering properties of onsite soils, including in-situ moisture and density, grain size distribution, Atterberg limits, maximum density and optimum moisture content, consolidation/collapse, shear strength, expansion potential, and soluble sulfate content. Laboratory test results are included in Appendix C.
- Geotechnical evaluation and analysis of the compiled data regarding the proposed grading and development.
- Evaluation of faulting, seismicity, and seismic and static settlement in accordance with the 2022 California Building Code (CBC).
- Preparation of this report including our findings, conclusions, preliminary recommendations, and accompanying illustrations.

SA GEO's expertise and scope of services do not include assessment of potential subsurface environmental contaminants or environmental health hazards.

1.2 Site Condition and History

The subject site is located at 95 Argonaut, Aliso Viejo, California (see Figure 1), and is legally described as Parcel 1 of Parcel Map No. 85-158, Assessor's Parcel Number (APN) 141-521-48. The approximately 2.85-acre site is bound by Glenwood Lane to the north, Argonaut Street to the west and south, a Moulton Niguel Water District reservoir/tank to the east, and other commercial properties to the southeast. The site is currently developed with an approximately 24,879 square-foot two-story commercial building with at-grade asphalt-paved parking lot, drive aisles, and

associated landscaping/hardscaping. The site is primarily flat, with elevations ranging from 440 to 448 feet above mean sea level. A retaining wall is present along the western property line, approximately 3 to 6 feet in height, with an ascending 3- to 4-foot-high 2H:1V slope above. There is an approximately 20-foot-high descending 2H:1V slope along the easterly property line extending offsite to the adjacent water reservoir/tank.

Based on our review of available historic aerial photographs dating back to 1931, the earliest land use at the subject site and surrounding areas were for agricultural purposes (ranching). Development of the surrounding area for commercial use began in the early 1980s, although the subject site remained an undeveloped natural drainage/swale. The site was mass graded between 1985 and 1987, concurrent with the construction of the water tank to the east. This mass grading appears to have occurred concurrent with the adjacent geotechnically-observed mass grading (Jack G. Raub Company, 1987), although no documents pertaining to the grading of the subject site were recovered during our archive search of City/County records. The geotechnical maps/report associated with the adjacent graded commercial lots overlap with the western portion of the subject site and detail a historical (pre-grading) topography ranging from 390 to 412 feet above sea level (Jack G. Raub Company, 1987); however, topography for the eastern and southern portion of the subject site were not included. This suggests a minimum of 30 to 60 feet of design fill associated with mass grading, although this does not account for any remedial grading/removal of alluvium during grading. The streets in the industrial complex were constructed by 1988, along with some of the other commercial buildings in the area. The existing two-story commercial building at the subject site was constructed by 1990. No significant changes were observed on the subject site since initial development and construction of the existing commercial building.

1.3 Proposed Grading and Improvements

Prior to any site development or grading, the existing structures, pavements, utilities, and hardscape will be demolished. Considering the site is relatively flat, we anticipate design grading to consist of cuts and fills on the order of 1 to 3 feet to reach pad grades and provide proper site drainage. Locally, deeper cuts/fills may be required were retaining structures are proposed.

The proposed project is anticipated to include grading/construction for residential development. Based on our review of the Site Plan provided by you, dated March 2024, we understand that the proposed project will consist of 8 multifamily buildings totaling 62 residential units. We anticipate the proposed structures will be 3- to 4-story and consist of wood-framed construction. The development will also include infrastructure improvements, parking/drive aisles, stormwater filtration devices and landscape/hardscape improvements.

1.4 Subsurface Exploration

Our field exploration was performed on April 22, 2024, and included excavation of four hollow stem auger borings (H-1 through H-4) to depths ranging from 41.5 to 81.5 feet bgs.

The borings were geologically logged, and samples were obtained at selected intervals. After completion of drilling, the excavations were backfilled with soil cuttings and tamped. Pavement at the boring locations was repaired with cold patch asphalt. The approximate boring locations are shown on Plate 1 (Geotechnical Map). Boring logs are included in Appendix B.

Soil sampling was performed using a Modified California ring sampler. Relatively undisturbed ring samples were obtained from the borings at various depths with a 2.5-inch inside-diameter, split-barrel sampler. The sampler was driven with a 140-pound, automatic trip hammer, free falling 30 inches. The sampling was used to assess the soil beneath the site as well as to obtain a measure of resistance of the soil to penetration (recorded as blows-per-foot on the geotechnical boring logs). Representative bulk samples of onsite soils were also collected from soil cuttings and used for additional soil identification purposes and laboratory testing.

1.5 Laboratory Testing

Representative samples of onsite soils collected during our field exploration were tested to characterize the engineering properties. Laboratory tests performed on selected relatively undisturbed and bulk soil samples included:

- Moisture content and dry density;
- Grain size analysis;
- Atterberg limits;
- Direct shear;
- Consolidation;
- Maximum density and optimum moisture content;
- Expansion potential; and
- Soluble sulfate.

Laboratory tests were conducted in general conformance with applicable ASTM International standards. The laboratory test results are provided in Appendix C.

2.0 GEOTECHNICAL FINDINGS

2.1 Geologic Setting and Earth Units

The subject site is located in the eastern foothills of the San Joaquin Hills, within the Peninsular Ranges geomorphic province of Southern California. The site is mapped by the U.S. Geological Survey (USGS, 2006) as underlain by sedimentary bedrock of the Monterey and Niguel Formations that is successively overlain by unconsolidated alluvium. Based on our subsurface exploration and understanding of the site history, the subject site was mass graded in the 1980's resulting in thick artificial fill materials placed over bedrock. No alluvium was encountered in any of our borings and is assumed to have been removed during mass grading. The earth unit distribution and our interpretation of the subsurface conditions are shown on the Geotechnical Map (Plate 1) and Geotechnical Cross-Sections A-A' and B-B' (Plates 2 and 3).

Our subsurface exploration encountered compacted **Artificial Fill (Af)** underlying the site as a result of original mass grading. Approximately 25 to 75 feet of artificial fill was encountered in all borings which generally consisted of olive gray, olive brown, bluish gray, brown, and black clayey silt, clay, silty/sandy clay, clayey sand, and silty sand that was moist to wet and medium stiff to hard. The fine-grained fill materials appear to be derived from the Monterey Formation and were found to be diatomaceous.

We encountered sedimentary bedrock of the **Monterey Formation (Tm)** and **Niguel Formation (Tn)** underlying the fill materials in all borings. Based on our review of the regional geologic mapping, the earth units are in fault contact below the site (see Figure 2). The fault is inactive/pre-Quaternary. The **Monterey Formation** bedrock generally consisted of olive gray, olive brown, brown, pale yellow, and white siltstone that was very moist to wet, very stiff to hard, and highly diatomaceous. Bedding was observed to be massive to well bedded with thin to laminated bedding.

The **Niguel Formation** was encountered in one boring (H-4) and the bedrock generally consisted of yellowish brown to yellowish gray sandstone that was saturated and very dense. The sandstone was observed to be massive, weakly indurated, and slightly friable.

2.2 Geotechnical Conditions

Based on our geotechnical exploration and laboratory testing, the site geotechnical conditions are generally as follows:

Soil Moisture Content and Dry Density: Onsite artificial fill materials had in-situ moisture contents and dry densities ranging from 10.9 to 84.2 percent and 50.6 to 117.9 pounds per cubic foot (pcf), respectively. Bedrock of the Monterey Formation had in-situ moisture contents ranging from 26.7 to 86.7 percent and dry densities ranging from 51.1 to 96.9 pcf. Please note that the high moisture contents and low densities in the artificial fill and Monterey Formation are typical of diatomaceous materials. Niguel Formation bedrock had in-situ moisture contents ranging from 15.4 to 23.8 percent and dry densities ranging from 96.6 to 115.2 pcf.

Blow counts (blows-per-foot of penetration) in the artificial fill generally ranged from 11 to 66 blows per foot. Blow counts in bedrock ranged from 22 blows per foot to 50 blows for 3.5 inches.

Soil Properties: Grain-size distribution tests were conducted on three bulk samples collected from the uppermost 5 feet. The samples were classified in accordance with the Unified Soil Classification System (USCS) as highly plastic silt (MH) with fines contents (passing No. 200 sieve) ranging from 64 to 73 percent.

Soil plasticity testing was performed on three bulk samples collected from the uppermost 5 feet. The samples were classified as highly plastic silt (MH) with Plasticity Indices ranging from 31 to 37 and Liquid Limits ranging from 70 to 83 percent.

Maximum dry density testing of one near surface sample (collected from the uppermost 5 feet) indicates that the silty soil (MH) has a maximum dry density of 94.1 pcf at optimum moisture content of 20.5 percent.

Shear Strength: Two direct shear tests (relatively undisturbed samples) were performed on samples collected at depths of 2.5 and 5 feet, representative of existing fill materials. The undisturbed direct shear test results indicate that the samples had ultimate internal friction angles of 24 and 26 degrees at cohesions of 400 and 450 pounds per square foot (psf), respectively. The peak internal friction angles were 28 and 29 degrees with cohesions of 450 and 775 psf, respectively.

Consolidation: Tests were performed on four samples collected at depths ranging from 2.5 to 15 feet, representative of existing fil materials. The testing showed that the diatomaceous fill materials are moderately compressible. However, the pre-consolidation pressures are relatively high (higher than 5 ksf). The samples generally had negligible collapse and swell upon the addition of water at a load of 3.2 ksf.

Expansion Potential: Expansion index testing was performed on two samples collected in the upper 5 feet. The results indicate a "High" expansion potential (EI = 91 and 104).

Soluble Sulfate: Soluble sulfate testing was performed on two bulk samples collected from the uppermost 5 feet. The results indicate negligible soluble sulfate content; however, per our experience with the Monterey Formation and review of the laboratory testing from the adjacent development (Jack G. Raub Company, 1987), we anticipate the soluble sulfate content of the onsite soils to be classified as "S2" per Table 19.3.1.1 of ACI-318-14.

2.3 Groundwater

Groundwater was encountered during our subsurface exploration in one boring (H-4) at a depth of 55 feet below ground surface (bgs) within the Niguel Formation. Groundwater was not encountered in boring drilled within the Monterey Formation to a depth of 81.5 feet bgs. The presence of the fault contact between Monterey and Niguel formations may act as a barrier for groundwater migration.

Historic high groundwater mapping indicates high groundwater is greater than 20 feet bgs (CDMG, 2001a). Please note that this is below original grades prior to mass grading and significantly raising grade across the site. Groundwater is anticipated to fluctuate both seasonally and annually, but it is expected to remain deep below the site.

2.4 Regional Faulting and Seismicity

Regional Faults: The site is not located within a fault-rupture hazard zone as defined by the Alquist-Priolo Special Studies Zones Act (CGS, 2018). Also, based on mapping by the State (Jennings and Bryant, 2010), there are no active faults mapped at the site. As discussed previously, the Monterey and Niguel Formations are in fault contact deep below the site; however, the fault is considered inactive (Pre-Quaternary). Regional Faults are presented on Figure 3.

Seismicity: Properties in southern California are subject to seismic hazards of varying degrees depending upon the proximity, degree of activity, and capability of nearby faults. These hazards can be primary (i.e., directly related to the energy release of an earthquake) or secondary (i.e., related to the effect of earthquake energy on the physical world). Since there are no active faults at the site, the potential for primary ground rupture is considered very low. The primary seismic hazard for this site is ground shaking during a future earthquake.

Using the USGS deaggregation computer program (USGS, 2024) and the site coordinates of 33.5946 north latitude and –117.7243 west longitude, the closest major active faults include the Newport-Inglewood and San Joaquin Hills Faults. The maximum moment magnitude for the controlling fault is 7.1 M_W, which would be generated from the San Joaquin Hills Fault; however, numerous other regionally active faults could also produce ground shaking at the site during an earthquake.

The site is not located within a mapped potential liquefaction hazard zone, as defined by the State's Seismic Hazard Mapping (CDMG, 2001b). Other secondary seismic hazards, such as tsunami and seiche are considered nil due to site elevation and distance from the ocean or other confined body of water (CGS, 2021).

2.5 Slope Stability

The site geologic/geotechnical conditions are generally favorable for overall stability of the existing slope along the eastern perimeter. The existing fill slope is approximately 20 feet in total height at an inclination of 2H:1V (horizontal:vertical). We prepared cross-section B-B' (Plate 3) depicting the existing descending slope at the site. Slope stability analysis was performed for a 2H:1V slope with a maximum height of 25 feet, using artificial fill soil strength parameters that were developed during this study and based on the direct shear test results. For our analysis, we used an internal friction angle of 24 degrees and a cohesion of 400 psf. For pseudo-static analysis, we applied a seismic horizontal coefficient (k_h) of 0.29 in accordance with Special Publication 117A, Guidelines for Evaluating and Mitigating Seismic Hazards in California (CGS, 2008).

The results of the slope stability analysis are presented in Appendix E. The existing fill slope at the site was found to be grossly stable with a factor of safety of well over 1.5 under static conditions and a factor of safety of over 1.1 for pseudo-static conditions.

2.6 Settlement and Foundation Considerations

In general, the anticipated settlements depend upon the building loads, type of foundations, and the geotechnical properties of the supporting subgrade. Considering the subsurface soil conditions and laboratory test data, and relatively lightly loaded residential structures, we estimate the total static settlement to be on the order of 2 inches and the differential static settlement to be on the order of 1-inch over a 40-foot span. This assumes remedial grading measures recommended in Section 3.2 of this report are implemented during site grading.

2.7 Stormwater Infiltration Feasibility

The site is underlain by thick (25 to 75 feet) silty/clayey artificial fill materials overlying bedrock. In accordance with County of Orange WQMP guidelines, stormwater infiltration should not be performed in compacted artificial fill and bedrock (OCPW, 2013). Furthermore, the fine-grained soils will not be conducive to infiltration. Also, considering the presence of slopes along the property boundaries and deep canyon fill, infiltration of stormwater can result in seepage or springs in locations where previously none existed, potentially impacting offsite properties and slopes. Stormwater infiltration is not considered feasible from a geotechnical viewpoint.

2.8 Shrinkage and Bulking

The shrinkage and bulking (reduction or increase in volume of excavated materials on recompaction as fill) varies by soil type and location. The volume change primarily depends on in-situ density and the maximum dry density of the soil type. Considering the site is underlain by compacted fill materials, we anticipated that shrinkage of site soils will be relatively low and less than 5 percent. Ground subsidence at the site is estimated to be on the order of 0.1 foot. These values exclude losses due to removal of pavement, vegetation and debris and are dependent on the accuracy of the site topographic survey and type of equipment and compaction method used by the contractor.

2.9 Existing Utilities and Pavement Section

Existing onsite utilities consisting of sewer, water, and gas/electric lines are present onsite supporting the existing office building and associated improvements. We anticipate that the existing utilities will be demolished as part of the proposed improvements and that new utilities and service connections will be established.

The existing pavement section was measured in Borings H-1 through H-4 excavated during this study. The pavement section consisted of 4 inches of asphalt concrete (AC) over 6 to 8 inches of aggregate base (AB).

3.0 CONCLUSION AND PRELIMINARY RECOMMENDATIONS

3.1 General Conclusion and Recommendation

Based on our review, construction of the proposed residential development, as described herein, is considered geotechnically feasible provided the preliminary recommendations in this report are implemented during design, grading, and construction. Grading, foundation, structural and wall plans for the project should be reviewed by the geotechnical consultant during the design phase. Updated recommendations should be provided once the project plans are finalized and as needed.

The recommendations in this report should be considered minimum and may be superseded by more restrictive requirements of others. In addition to the following recommendations, General Earthwork and Grading Specifications are provided in Appendix F.

3.2 Site Preparation and Earthwork

Site preparation and grading should be performed in accordance with the recommendations herein and the requirements of the City of Aliso Viejo/County of Orange.

3.2.1 Site Demolition and Clearing

Prior to remedial grading, the existing structures, foundations, hardscape/landscape, and utilities to be abandoned should be demolished and removed. Deleterious materials and debris should be cleared from the site and disposed of offsite. Concrete material may be mixed with onsite soils and placed as compacted fill provided it is broken into pieces that are smaller than 6 inches in the largest diameter. Asphalt concrete may also be used in compacted fill materials; however, it should not be placed under the residential pads. Placement of concrete and asphalt as compacted fill should be approved by the project environmental consultant. Excavations for the removal of existing foundations, utilities, and vegetation, including onsite trees, should be observed by the geotechnical consultant. Large roots, highly organic soils, and existing utilities should be removed and should not be incorporated into new fills.

Soil that is disturbed as part of excavations or removal of trees or underground utilities should be evaluated by the geotechnical consultant. Excavations that require backfill should be properly documented and compacted under the observation and testing of the geotechnical consultant in accordance with the recommendations provided in Section 3.2.4.

3.2.2 Protection of Existing Improvements and Utilities

Existing improvements, and utilities on or adjacent to the site that are to be protected in place should be located and visually marked prior to grading operations. Excavations adjacent to improvements to be protected in-place or any utility easement should be performed with care, so as not to undermine existing foundations or destabilize the adjacent ground.

Stockpiling of soils more than 5 feet in height at or near existing structures and over utility lines should not be allowed. If deeper removals are required, shoring or other special measures (i.e., setback or laybacks) to provide safety and mitigate the potential for lateral/vertical movements may be required.

3.2.3 Remedial Grading Measures

Remedial grading at the site should consist of removal of weathered/unsuitable fill materials. In general, we recommend that remedial grading for the proposed building pads consist of removal and recompaction of soils in the upper 3 to 4 feet (from existing grade) to remove any unsuitable/disturbed artificial fill material. The removals for building pads should extend a minimum of 4 feet laterally, beyond the building footprint. Removals within the proposed drive areas may be limited to removal and re-compaction of the upper 1 to 2 feet, below existing grades. Where deeper unsuitable material is encountered, the removals should be extended to the bottom of unsuitable materials to competent, unweathered/undisturbed artificial fill.

The geotechnical consultant should review and approve the removal bottoms prior to fill placement and should provide additional specific recommendations based on actual conditions, if necessary.

Excavations deeper than 4 feet will need to be laid back at a minimum inclination of 1:1 or provided with shoring. Shallow, unconfined excavations (4 feet or less) may consist of near-vertical excavation, locally, and upon review by the geotechnical consultant. Trench excavations should be performed in accordance with Cal/OSHA requirements for Soil Type "B". The contractor's qualified person should verify compliance with Cal/OSHA requirements. Excavations near existing structures (within a 1:1 projection) should be provided with shoring that is designed to support the surcharge load of the existing structure. Otherwise, excavations may need to be performed in sections (A/B/C slot cuts). Slot cuts should not exceed more than 20 feet in length. The conditions should be reviewed in the field by the project geotechnical consultant. Additional recommendations should be provided based on the actual conditions encountered during excavation and grading, as needed.

3.2.4 Fill Placement

Upon the completion of remedial grading measures, the approved removal bottoms should be scarified a minimum of 6 inches. The removal bottoms and fill materials should be compacted to at least 90 percent of the maximum dry density, as determined by ASTM Test Method D1557. Fill materials should be placed in loose lifts no thicker than 8 inches.

Fill materials should be relatively free of deleterious material. The existing fill materials are considered suitable for re-use as compacted fill provided any deleterious material is removed. Considering that the onsite soils predominately consist of silty/clayey soils that are diatomaceous, achieving adequate compaction at acceptable moisture contents during fill placement may require additional effort. The moisture content of the fill materials should be above the optimum moisture content but within the compactable levels.

Concrete material may be mixed with onsite soils and placed as compacted fill if it is broken into pieces that are smaller than 6 inches in the largest diameter. Asphalt concrete may also be used in compacted fill materials; however, it should not be placed under the residential pads. Placement of concrete and asphalt as compacted fill should be approved by the project environmental consultant.

3.2.5 Import

The geotechnical consultant should evaluate and accept any import soils prior to transportation to the subject site. We recommend that import soils have similar or better engineering properties to onsite soils. At minimum, the import materials should have an Expansion Index of less than 90 and a Plasticity Index of less than 25.

3.3 Settlement Potential

The amount of settlement will depend upon the type of foundation(s) selected and future loading by additional fill and structures. Based on our review of the subsurface data, considering the remedial grading recommendations provided in this report are implemented during grading, and structural loads typically associated with the anticipated 3- to 4-story residential units, we estimate that total and differential post-construction settlement will be on the order of 2 inches and 1-inch over a span of 40 feet, respectively.

SA GEO should be provided with the foundation plans and structural loads, once available, in order to further evaluate the potential for post-construction settlement of the proposed buildings and associated improvements. The parameters provided herein will then be confirmed/updated based on the planned foundations and loads and additional testing and/or analysis.

3.4 Foundation Design

The slab and foundations should be designed by the project structural engineer based on the proposed structure type and the anticipated loading conditions. The foundation soils are anticipated to have expansive soil conditions ("High" expansion potential) and will be subject to climatic and landscape moisture fluctuations. Post-tensioned slab should be anticipated for the proposed residential buildings. The following foundation recommendations are provided with the assumption that the recommendations included in Section 3.2 of this report are implemented during site grading. Caisson design parameters are provided in Section 3.5 of this report.

The recommended net allowable bearing capacity for continuous and isolated footings may be calculated based on the following equation:

$q_{all} = 500\ D + 150\ B + 1{,}500$ (but not to exceed 3,500 psf, see below for post-tensioned/mat slabs)

where:
D = embedment depth of footing, in feet
B = width of footing, in feet

Also, the following parameters may be used for design of foundation and slabs:

- Soil unit weight = 110 pcf
- Soil internal friction angle = 25 degrees
- Coefficient of Friction = 0.30
- Subgrade modulus (k) of 50 pci (corrected for large slabs)
- Soil elastic modulus (Es) of 1,000 psi
- Effective Plasticity Index (upper 15 feet) = 35

The allowable bearing capacity of 1,000 psf may be used for design of post-tensioned/mat foundation.

The dead load of concrete below adjacent grades (buried concrete foundations) may be neglected. The allowable bearing pressure and friction coefficient may be increased by one-third for wind and seismic loading.

We recommend that strip and isolated footings for the buildings have a minimum embedment depth of 18 inches below the lowest adjacent grade. Continuous footings should be at least 12 inches wide and isolated column footings should be at least 24 inches wide. The footings of freestanding and isolated structures, such as walls and pilasters, should have a minimum embedment depth of 18 inches into approved soils.

The following table provides our general guidelines and preliminary recommendations for design of post-tensioned foundations and slabs on expansive soil in accordance with the 2022 California Building Code (CBC) and Post-Tension Institute (PTI) DC 10.5 Edition provisions.

GEOTECHNICAL GUIDELINES
FOR DESIGN OF POST-TENSIONED SLABS

Parameter	Recommendation
Center Lift	
Edge Moisture Variation Distance, e_m	7.50 feet
Center Lift, y_m	0.90 inches
Edge Lift	
Edge Moisture Variation Distance, e_m	4.00 feet
Edge Lift, y_m	1.25 inch
Presaturation, as needed, to obtain the minimum moisture down to the minimum depth	1.3 x optimum down to 18 inches

We recommend that post-tensioned slabs have a thickened edge such that the slab is embedded a minimum of 18 inches below the lowest adjacent grade.

In addition, as indicated in the DC 10.5 Edition of PTI, shape factor calculations should be performed by the project structural engineer in order to determine if strengthening/modification of foundations are necessary. Per PTI guidelines, modifications to the foundations design should be considered if the shape factor (ratio of square of foundation perimeter over foundation area) exceeds 24.

If non-post-tensioned slabs-on-grade and foundations are considered at the site, an effective Plasticity Index of 35 is considered appropriate for the upper 15 feet of soil materials, in accordance with Wire Reinforcement Institute (WRI) method (per the 2022 California Building Code). For non-post-tensioned slabs, we recommend a minimum embedment of 18 inches below the lowest adjacent grade for the perimeter footings. Also, the upper 18 inches of subgrade soil should be pre-saturated to 130 percent of optimum moisture content prior to placement of moisture barrier and concrete.

The foundations and slabs should also be designed to tolerate the total and differential settlements discussed in Section 3.3 of this report.

For the design of pole-type foundations (i.e., light poles, shade structures, etc.), an allowable soil-bearing pressure (s_1) of 290 psf/ft may be used for Equation 18-1 (the "pole" equation) of the 2022 California Building Code (CBC) Section 1807.3.2.1 to determine the depth of embedment for the footings, considering level ground conditions. The equation is applicable for designed embedment depths of less than 12 feet for the purpose of computing lateral pressure. Also, for vertical loads on pole-type foundations, an allowable skin friction of 250 pounds per square foot may be used. Pole foundations should have a minimum embedment of 30 inches below adjacent grades. For cast-in-place pole-type foundations, the vertical end bearing pressure should be neglected.

3.5 Caisson Design

All caissons, if any, should have a minimum of 5 feet embedment into competent fill materials. An average skin friction value of 250 pounds per square foot may be utilized to calculate the axial capacity of caissons. The lateral capacity of caissons may be computed using a value of 290 psf/ft but should not exceed 4,400 psf/ft for level conditions. For caissons near the existing descending slope with passive envelope impacted by the slope, the passive pressure should be limited to 170 psf/ft. Passive resistance may be doubled for isolated piles/caissons spaced a minimum of 3 diameters apart center-to-center. The allowable bearing pressure (both axial and lateral) may be increased by one-third for wind or seismic loading. Other minimum footing dimensions should be provided by the Structural Engineer and should comply with Table 1809.7 of the 2022 CBC.

Caissons should be designed in accordance with ACI recommendations and applicable building code requirements. The accepted criteria for caisson installation are detailed below:

- Caissons should be constructed as pre-drilled cast-in-place elements. A representative of the geotechnical consultant should be present during drilling of all caisson excavations in order to verify proper embedment and to geotechnically review appropriate drilling methods.
- Caisson excavations should be cleaned of loose soil, cuttings and groundwater and should be reviewed by the project geologist prior to placement of steel or concrete.
- No caisson boring shall be excavated within 6 feet from the nearest edge of a completed caisson unless the completed caisson has been filled with concrete for more than 24 hours.

3.6 Retaining Walls Design and Lateral Earth Pressures

Recommendations for lateral earth pressures for permanent retaining walls and structures with approved onsite drained soils and above the groundwater table are as follows:

Conditions	*Level (pcf)*	*2:1 Sloping*
Active	40	60
At-Rest	65	85
Passive	290	170 (sloping down)

These parameters are based on a soil internal friction angle of 25 degrees, a cohesion of 100 pounds per square foot (psf) and soil unit weight of 110 pcf.

To design an unrestrained retaining wall, such as a cantilever wall, the active earth pressure may be used. For a restrained retaining wall, the at-rest pressure should be used. Passive pressure is used to compute lateral soils resistance developed against lateral structural movement. The passive pressures provided above may be increased by one-third for wind and seismic loads. The passive resistance is taken into account only if it is ensured that the soil against embedded structure will remain intact with time. Future landscaping/planting and improvements adjacent to the retaining walls should also be taken into account in the design of the retaining walls. Excessive soil disturbance, trenches (excavation and backfill), future landscaping adjacent to footings and over-saturation can adversely impact retaining structures and result in reduced lateral resistance.

For sliding resistance, the friction coefficient of 0.30 may be used at the concrete and soil interface. The coefficient of friction may be increased by one-third for wind and seismic loading. The retaining walls may also need to be designed for additional lateral loads if other structures or walls are planned within a 1H:1V projection.

If slopes above the retaining walls are relatively minor (in height), the additional load associated with the soil above the retaining wall and within the active wedge may be calculated as a **surcharge load** and applied to the retaining wall using a coefficient of active pressure (k_a) of 0.48.

The seismic lateral earth pressure for walls retaining more than 6 feet of soil may be estimated to be an additional 16 pcf for active and at-rest conditions. The earthquake soil pressure has a triangular distribution and is added to the static pressures. For the active and at-rest conditions, the additional earthquake loading is zero at the top and maximum at the base. The seismic lateral earth pressure does not apply to walls retaining less than, or equal to, 6 feet of soil (2022 CBC Section 1803.5.12).

Drainage behind walls retaining more than 30 inches of soil should also be provided in accordance with the attached Figure 4. Specific drainage connections, outlets and avoiding open joints should be considered for the retaining wall design.

3.7 Seismic Design Parameters

The following table summarizes the seismic design criteria for the subject site. The seismic design parameters are developed in accordance with ASCE 7-16 and 2022 CBC. Please note that, considering the proposed structures and anticipated structural periods, site-specific ground-motion hazard analysis was not performed for the site. Per Supplement 3 of ASCE 7-16, the value of S_{M1}, and therefore S_{D1}, have been increased by 50 percent. The seismic response coefficient, Cs, should be determined per the parameters provided below and using equation 12.8-2 of ASCE 7-16.

Selected Seismic Design Parameters from 2022 CBC/ASCE 7-16	*Seismic Design Values*	*Reference*
Latitude	33.5946 North	
Longitude	-117.7243 West	
Controlling Seismic Source	San Joaquin Hills	USGS, 2024
Site Class per Table 20.3-1 of ASCE 7-16	D	
Spectral Acceleration for Short Periods (Ss)	1.218 g	SEA/OSHPD, 2024
Spectral Accelerations for 1-Second Periods (S_1)	0.438 g	SEA/OSHPD, 2024
Site Coefficient F_a, Table 11.4-1 of ASCE 7-16	1.013	SEA/OSHPD, 2024
Site Coefficient F_v, Table 11.4-2 of ASCE 7-16	1.862	
Design Spectral Response Acceleration at Short Periods (S_{DS}) from Equation 11.4-4 of ASCE 7-16	0.822 g	SEA/OSHPD, 2024
Design Spectral Response Acceleration at 1-Second Period (S_{D1}) from Equation 11.4-4 of ASCE 7-16 (Includes 50% increase per Supplement 3)	0.816 g	
T_S, S_{D1} /S_{DS} 11.4.6 of ASCE 7-16	0.992 sec	
T_L, Long-Period Transition Period	8 sec	SEA/OSHPD, 2024
Peak Ground Acceleration Corrected for Site Class Effects (PGA_M) from Equation 11.8-1 of ASCE 7-16	0.566 g	SEA/OSHPD, 2024
Seismic Design Category, Section 11.6 of ASCE 7-16	D	SEA/OSHPD, 2024

3.8 Slope Stability and Slope Setback

No significant modifications to the existing fill slope along the eastern property line are planned as part of this project. The existing slope is composed of compacted artificial fill materials and the proposed improvements are not anticipated to adversely impact the slope. Based on our slope stability analysis (Appendix E), the existing slope was found to be grossly stable. In general, slopes are considered susceptible to surficial instability in the form of erosion, raveling, and slumping. Special care should be taken to ensure that onsite runoff is controlled and directed offsite in a non-erosive manner and that site drainage, and slopes are maintained over the life of the project.

Footings for structures located above descending slopes should be set back from the slope face in accordance with the minimum requirements of the City of Aliso Viejo and section 1808.7.1 of the 2022 CBC, whichever is greater. The setback distance is measured from the outside edge of the footing bottom along a horizontal line to the face of the slope.

The tables below summarize the minimum setback criteria for structures above descending slopes:

Case A – Building and Retaining Wall Footings Above Descending Slopes	
Slope Height [H] (feet)	*Minimum Setback from Slope face (feet)*
Less than 10	5
10 to 20	½ * H
20 to 30	10
Greater than 30	⅓ * H (maximum of 40')

Case B – Freestanding Wall Footings Above Descending Slopes	
Slope Height [H] (feet)	*Minimum Setback from Slope face (feet)*
Less than 10	5
10 to 20	½ * H
Greater than 20	Maximum of 10

For freestanding walls and other structures that are sensitive to lateral movement (e.g., smooth stucco finish, glass screens, etc.), SA GEO recommends that the structural setback requirements in accordance with Case A above be followed or that additional design measures be used to help control the potential for cracking and displacements. Otherwise, typical freestanding walls may have a setback in accordance with Case B.

3.9 Corrosivity

Soluble sulfates exposure in the onsite soils should be classified as "S2" per Table 19.3.1.1 of ACI-318-14. Structural concrete elements in contact with soil include footings and building slabs-on-grade. The flatwork and sidewalk concrete are typically not considered structural elements. Concrete mix for structural elements should be based on the "S2" soluble sulfate exposure class of Table 19.3.2.1 in ACI-318-14. Other ACI guidelines for structural concrete are recommended. Also, onsite soils are anticipated to be corrosive to metals.

3.10 Expansion Potential

At the completion of grading, we anticipate that onsite soils will have "High" expansion potential. The geotechnical recommendations provided in this report including the design parameters for foundations, slab-on-grade and flatwork improvement should be implemented during design and construction. Updated recommendations will be provided upon additional testing at the completion of grading at the site and as needed.

Homeowners and their design/construction team should be familiar with the recommendations in this report as well as principles described in a useful reference published by the California Geotechnical Engineers Association (CalGeo), titled, "Coexisting with Expansive Soil: An Informational Guide for Homeowners." This free booklet can be downloaded at www.calgeo.org.

3.11 Interior Slab Moisture Mitigation

In addition to geotechnical and structural considerations, the project owner should also consider interior moisture mitigation when designing and constructing slabs-on-grade.

The intended use of the interior space, type of flooring, and the type of goods in contact with the floor may dictate the need for, and design of, measures to mitigate potential effects of moisture emission from and/or moisture vapor transmission through the slab. Typically, for human occupied structures, a vapor retarder or barrier is recommended under the slab to help mitigate moisture transmission through slabs. The most recent guidelines by the American Concrete Institute (ACI 302.1R-04) suggest that the vapor retarder be placed directly under the slab (no sand layer). However, the location of the vapor retarder may also be subject to the builder's past successful practice. Placement of 1 or 2 inches of sand over the moisture retardant has been common practice by builders in southern California. Specifying the strength of the retarder to resist puncture and its permeance rating is important. These qualities are not necessarily a function of the retarder thickness. A minimum of 10-mil is typical but some materials, such as 10-mil polyethylene ("Visqueen"), may not meet the desired standards for toughness and permeance.

Vapor retarders, when used, should be installed in accordance with standards such as ASTM E 1643 and/or those specified by the manufacturer.

Concrete mix design and curing are also significant factors in mitigating slab moisture problems. Concrete with lower water/cement ratios results in denser, less permeable slabs that also "dry" faster with regard to when flooring can be installed (reduced moisture emissions quantities and rates). Rewetting of the slab following curing should be avoided since it can result in additional drying time required prior to flooring installation. Proper concrete slab testing prior to flooring installation is also important.

Concrete mix design, the type and location of the vapor retarder should be determined in coordination with all parties involved in the finished product, including the project owner, architect, structural engineer, geotechnical consultant, concrete subcontractors, and flooring subcontractors.

3.12 Exterior Concrete

The sidewalk, patio slabs, driveways and other flatwork elements should be at least 4 inches thick. Driveway approaches should be a minimum of 6 inches thick. We recommend that the concrete flatwork be reinforced with No. 3 bars be placed at 24 inches on center both ways. Concrete slabs should be provided with construction or weakened plane control joints at a maximum spacing of 6 feet. The control joints should have a thickness that is ¼ of the total concrete thickness. Upon the placement and compaction of subgrade soils (per Section 3.2 of these recommendations), the upper 18 inches of the subgrade soils should be pre-saturated to 130 percent of optimum moisture content prior to placement of concrete and reinforcement. We also recommend that 2 to 4 inches of granular materials/aggregate base be placed over the compacted subgrade prior to placement of reinforcement and concrete.

For exterior slabs, the use of a granular sublayer is primarily intended to facilitate presaturation and subsequent construction by providing a better working surface over the saturated soil. It also helps retain the added moisture in the native soil in the event that the slab is not placed immediately.

Exterior concrete elements such as curb and gutter, driveways, sidewalks, and patios are susceptible to lifting and cracking when constructed over expansive soils. With expansive soils, the impacts to flatwork/hardscape can be significant, generally requiring removal and replacement of the affected improvements. Please also note that reducing concrete problems is often a function of proper slab design, concrete mix design, placement, and curing/finishing practices. Adherence to guidelines of the American Concrete Institute (ACI) is recommended. Also, the amount of post-construction watering, or lack thereof, can have a very significant impact on the adjacent concrete flatwork.

On projects with expansive soils, additional measures such as thickened concrete edges/footings, subdrains and/or moisture barriers should be considered where planter or natural areas with irrigation are located adjacent to the concrete improvements. Design and maintenance of proper surface drainage is also very important. If the concrete will be subject to heavy loading from cars/trucks or other heavy objects, thicker pavement section will be required the design of which should be performed by the geotechnical consultant, as needed.

The above recommendations typically are not applied to curb and gutter but should be considered in areas with highly expansive soils.

3.13 Preliminary Asphalt Concrete Pavement Design

Final structural pavement sections should be based on R-value testing after the completion of grading and in accordance with city of Aliso Viejo requirements. Based on an R-value of 5 and estimated traffic indices (TIs), we recommend the following preliminary pavement sections:

Street Location	***Estimated TIs***	***Pavement Section***
Parking Stalls	TI – 4.0	3 inches of AC / 6 inches of AB
General Drives	TI – 5.5	4 inches of AC / 10 inches of AB
AC = Asphalt Concrete, AB = Aggregate Base		

Please note that for two-stage paving operations, we recommend that the final AC cap be a minimum of 0.10 foot thick and the base AC course have a minimum thickness of 0.25 foot.

If pavement repair is needed within the adjacent streets, the section should match the existing section and follow standard City/County guidelines for trench/pavement repair. The new pavement section should at minimum consist of 4 inches of AC over 10 inches of AB.

Asphalt concrete pavement should be placed in accordance with the requirements of Sections 301 and 302 of the Standard Specifications of Public Works Construction (the Greenbook). Prior to construction of pavement sections, the subgrade soils should be scarified to a minimum depth of 6 inches, moisture-conditioned as needed, and recompacted in-place to a minimum of 90 percent relative compaction (per ASTM D1557). Subgrade should be firm prior to AB placement.

AB materials can be crushed aggregate base or crushed miscellaneous base in accordance with the Greenbook (Section 200-2). The materials should be free of any deleterious materials. Aggregate base materials should be placed in 6- to 8-inch-thick loose lifts, moisture-conditioned as necessary, and compacted to a minimum of 95 percent relative compaction (per ASTM D1557). Asphalt concrete should also be compacted to a minimum relative compaction of 95 percent.

Unpaved median and parkway areas should be provided with vertical moisture barriers.

3.14 Vehicular PCC Pavements

For trash enclosures, we recommend 6 inches of PCC reinforced with No. 4 rebar at 18 inches on-center, both ways, over 4 inches of aggregate base placed over compacted subgrade. For parking stalls, the section may consist of 4 inches of PCC reinforced with No. 4 rebar at 18 inches on-center, both ways, over 4 inches of aggregate base over compacted subgrade.

The subgrade soils should be scarified to a minimum depth of 6 inches, moisture-conditioned as needed, and recompacted in place to a minimum of 90 percent relative compaction (per ASTM D1557).

Aggregate base materials can be crushed aggregate base or crushed miscellaneous base in accordance with the Greenbook (Section 200-2). The materials should be free of any deleterious materials. Aggregate base materials should be placed in 6- to 8-inch-thick loose lifts, moisture-conditioned as necessary, and compacted to a minimum of 95 percent relative compaction (per ASTM D1557).

3.15 Concrete Paver Section

For concrete pavers within **pedestrian** walkways, we recommend 60-millimeter-thick concrete pavers over approximately 1 inch of sand, over a minimum of 6 inches of AB, over compacted subgrade. This should also accommodate the rare maintenance cart or light truck that might drive up on these areas.

For concrete pavers within **vehicular** drive areas, if any, we recommend 80-millimeter-thick concrete pavers over 6 inches of concrete reinforced with No. 3 rebar at 24 inches on-center, over 4 inches of AB. Alternatively, the concrete low pour slab may be replaced with a minimum of 15 inches of AB over compacted subgrade; or 12 inches of AB over a layer of geotextile (e.g., Mirafi 600X or equivalent), over compacted subgrade.

A concrete band along the perimeter of the pavers should be provided for lateral restraint. The concrete band should, at minimum, be 12 inches deep and deepened to below the depth of disturbed soil, if adjacent to landscape/planter areas.

Also, a drainage system consisting of a 2-inch PVC drainage pipe should be installed at the low end of the concrete low pour at 10-foot intervals through the slab and filled with pea gravel. The PVC drainage pipe should drain to a minimum of 6-inch-diameter by 12-inch-deep drain pit filled with pea gravel below the pipe. The paver surfaces should slope away from structures a minimum of 2 percent. The concrete underlayment for the drive areas should be provided with weakened plane joints at maximum 6-foot intervals. If the pavers are to be set in mortar or are underlain with AB, this drainage system is not required.

Prior to construction of the paver sections, the subgrade soils should be scarified to a minimum depth of 6 inches, moisture conditioned as needed, and recompacted in place to a minimum of 90 percent relative compaction (per ASTM D1557). The upper 18 inches of subgrade for pedestrian walkway and patio areas should then be presaturated to 130 percent of optimum moisture content. Subgrade for vehicular pavers need not be pre-saturated.

Aggregate base materials can be crushed aggregate base or crushed miscellaneous base in accordance with the Greenbook (Section 200-2). The materials should be free of deleterious materials. Aggregate base materials should be placed in 6- to 8-inch-thick loose lifts, moisture-conditioned as necessary, and compacted to a minimum of 95 percent relative compaction (per ASTM D1557).

3.16 Trench Excavation and Backfill

Excavations should be performed in accordance with the requirements set forth by Cal/OSHA Excavation Safety Regulations (Construction Safety Orders, Section 1504, 1539 through 1547, Title 8, California Code of Regulations). In general, onsite soils may be classified as Type "B". Cal/OSHA regulations indicate that, for workmen in confined conditions, the steepest allowable slopes in Type "B" soils are 1:1. Locally, Type "C" soils may be encountered (saturated soils, seepage) and require slope layback of 1.5H:1V (horizontal:vertical). These laybacks apply to excavations 20 feet deep or less. Where there is no room for these layback slopes, we anticipate that shoring will be necessary. Adequate shoring (i.e., shields) should be provided, as deemed necessary. The soils within the adjacent streets are anticipated to be similar to onsite soils. Excavations should be reviewed periodically by the contractor's qualified person to confirm compliance with Cal/OSHA requirements.

Onsite soils should be suitable for use as trench backfill with the exception of wet/saturated materials, if encountered. Utility trench backfill should be in accordance with City of Aliso Viejo, County of Orange and/or the governing jurisdiction's specifications. Backfill materials should be compacted to a minimum of 90 percent relative compaction (per ASTM D1557). Rocks greater than 3 inches in largest diameter should generally not be used as trench backfill unless approved by the agency and geotechnical consultant of record. Excavation and backfilling of HDPE pipes (if any) should be in accordance with the manufacturer’s requirement and the Greenbook. Select granular backfill (i.e., clean sand with SE 30 or better) may be used in lieu of native soils but should also be compacted or densified with water jetting and flooding.

Trenches excavated next to structures and foundations should also be properly backfilled and compacted to provide full lateral support and reduce settlement potential.

3.17 Groundwater

Groundwater was encountered during our subsurface exploration at a depth of 55 feet in Boring H-4 (within Niguel Formation). While some saturated soil may be encountered during grading and/or utility trench excavation, we do not anticipate significant seepage or that mitigation measures will be necessary. In general, groundwater is anticipated to remain more than 20 feet below the proposed building foundations. However, shallow, perched water/seepage may occur on an annual and seasonal basis as a result of rainfall, irrigation and/or seepage from adjacent properties.

3.18 Stormwater Infiltration

As discussed previously (Section 2.7), considering the artificial fill thickness, and bedrock directly below the fill materials, and presence of fine-grained expansive soils, stormwater infiltration at the site is not feasible from a geotechnical viewpoint. Other methods of filtration/treatment should be evaluated by the project civil engineer.

3.19 Surface Drainage and Irrigation

Maintaining adequate surface drainage, proper disposal of run-off water, and control of irrigation will help reduce the potential for future moisture-related problems and differential movements from soil heave/settlement.

Surface drainage should be carefully taken into consideration during grading, landscaping, and building construction. Positive surface drainage should be provided to direct surface water away from structures and slopes and toward the street or suitable drainage devices. Ponding of water adjacent to the structures should not be allowed. Buildings should have roof gutter systems and the run-off should be directed to parking lot/street gutters by area drainpipes or by sheet flow over paved areas. Paved areas should be provided with adequate drainage devices, gradients, and curbing to prevent run-off flowing from paved areas onto adjacent unpaved areas.

Considering the climatic conditions in southern California and provided that the recommendations included in this report are implemented during grading and construction, a minimum two-percent slope away from structures is considered acceptable and in substantial compliance with the 2022 CBC. Also, swales with one-percent slopes are acceptable from a geotechnical standpoint and are common practice in this locale.

Construction of planter areas immediately adjacent to structures should be avoided if possible. If planter boxes are constructed adjacent to or near buildings, the planters should be provided with controls to prevent excessive penetration of the irrigation water into the foundation and flatwork subgrades. Provisions should be made to drain excess irrigation water from the planters without saturating the subgrade below or adjacent to the planters. Raised planter boxes may be drained with weepholes. Deep planters (such as palm tree planters) should be drained with below-ground, water-tight drainage lines connected to a suitable outlet. Moisture barriers should also be considered.

It is also important to maintain a consistent level of soil moisture, not allowing the subgrade soils to become overly dry or overly wet. Properly designed landscaping and irrigation systems can help in that regard.

3.20 Slope Maintenance, Lot Drainage, and Erosion Control

Maintenance of proper pad drainage, the design and construction of property improvements in accordance with sound engineering practices, and proper maintenance of landscaping, including regular pad and slope irrigation, should be performed. Irrigation should not be excessive or sporadic; maintaining a relatively constant level of soil moisture around structures and improvements is important. Oversteepening of slopes should be avoided.

Planters and landscape areas adjacent to structures should be avoided or provided with measures to mitigate the potential for water getting under the foundations and slabs. Water should not be allowed to pond and drainage should be maintained away from structures and tops of slopes.

Establishing and maintaining a rodent-control program is also recommended to reduce surficial slope deterioration often associated with rodent burrowing. The improvements at or near the tops of slopes may be subject to varying degrees of slope-creep related movements and should be designed with that in mind, meeting the setback criteria discussed in this report.

3.21 Additional Subsurface Exploration and Laboratory Testing

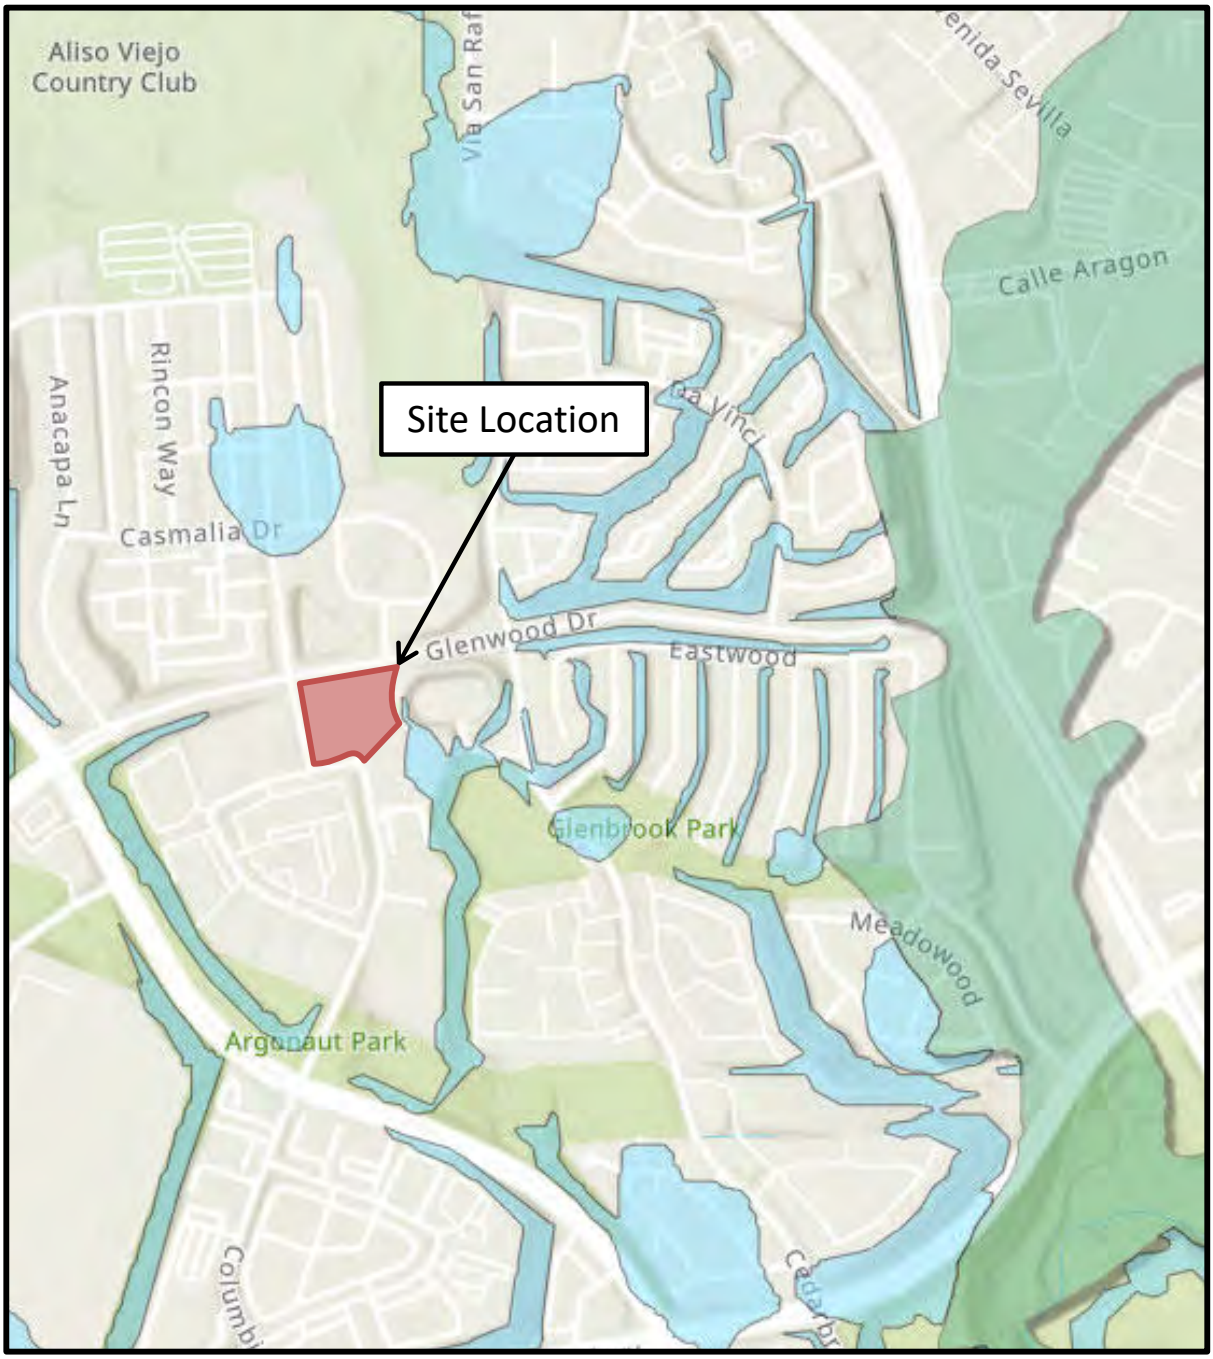
Additional subsurface exploration during the design phase of the project is not considered necessary unless significant plan changes occur. Additional laboratory testing should be performed during and upon completion of the grading to confirm/update the design parameters provided herein.

3.22 Review of Future Plans

The project grading, foundation, street improvement, wall, and landscape plans should be reviewed and accepted by the geotechnical consultant prior to grading and construction. Additional recommendations should be provided upon the review of the project plans and as needed.

3.23 Observation and Testing during Grading and Construction

Geotechnical observation and testing should be performed by SA GEO during the following phases of grading and construction:



- During site demolition, preparation and clearing;
- During excavations performed for the remedial grading and to relocate or remove existing underground improvements;
- During earthwork, including observation and acceptance of remedial removal bottoms and fill placement, including import material (if any);
- Following the completion of grading, in order to verify soil properties for foundations, slab-on-grade and pavements;
- Upon completion of any foundation or structural excavation, prior to pouring concrete;

- During slab and flatwork subgrade preparation prior to pouring of concrete;
- During placement of backfill for utility trenches;
- During construction of stormwater filtration devices;
- During placement of backfill for retaining structures;
- During installation and backfill of subdrainage systems; and
- When any unusual soil conditions are encountered.

4.0 LIMITATIONS

This report has been prepared for the exclusive use of our client, Meritage Homes, within the scope of services requested for the subject property described herein. This report or its contents should not be used or relied upon for other projects or purposes, or by other parties without the acknowledgement of SA GEO and the consultation of a geotechnical professional. The means and methods used by SA GEO for this study are based on local geotechnical standards of practice, care, and requirements of governing agencies. No warranty or guarantee, expressed or implied, is given.

Our findings, conclusions, and recommendations are professional opinions based on interpretations and inferences made from geologic and engineering data from specific locations and depths, observed or collected at a given time. By nature, geologic conditions can vary from point to point, can be very different in-between exploration points, and can also change over time. Our conclusions and recommendations are, by nature, preliminary and subject to verification and/or modification during grading and construction when more subsurface data is exposed.

Liquefaction
Areas where historic occurrence of liquefaction, or local geological, geotechnical and groundwater conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resource Code Section 2693(c) would be required.

Earthquake-Induced Landslides
Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resource Code Section 2693(c) would be required.

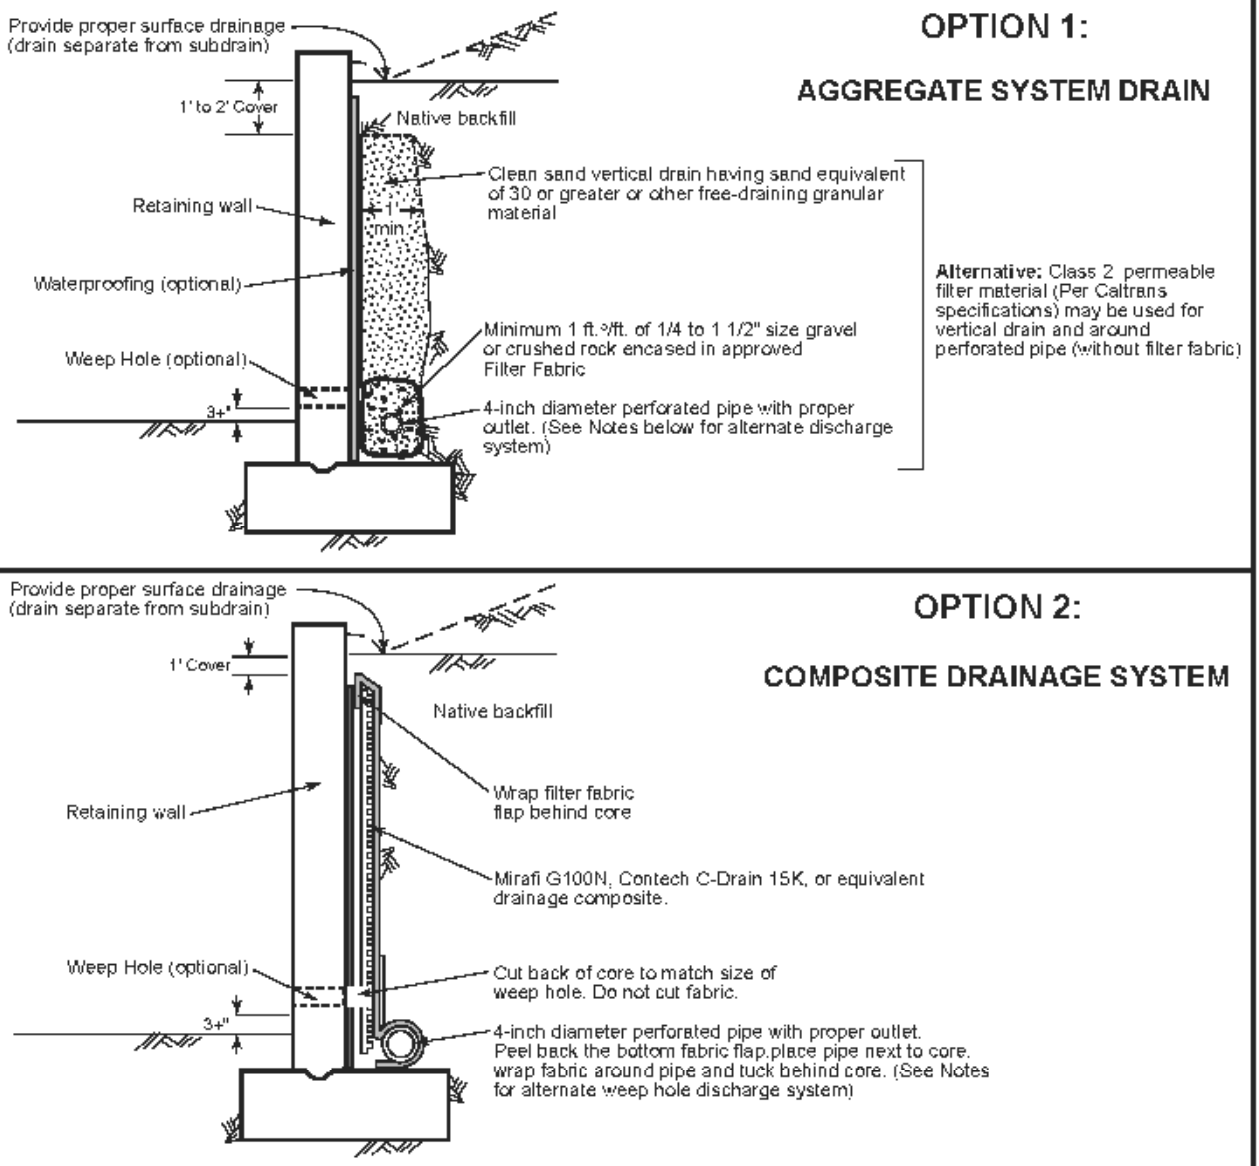
Source: Fault Activity Map of California (Jennings and Bryant, 2010)



Holocene fault displacement (during past 11,700 years) without historic record. Geomorphic evidence for Holocene faulting includes sag ponds, scarps showing little erosion, or the following features in Holocene age deposits: offset stream courses, linear scarps, shutter ridges, and triangular faceted spurs. Recency of faulting offshore is based on the interpreted age of the youngest strata displaced by faulting.

Late Quaternary fault displacement (during past 700,000 years). Geomorphic evidence similar to that described for Holocene faults except features are less distinct. Faulting may be younger, but lack of younger overlying deposits precludes more accurate age classification.

Quaternary fault (age undifferentiated). Most faults of this category show evidence of displacement sometime during the past 1.6 million years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age. Unnumbered Quaternary faults were based on Fault Map of California, 1975. See Bulletin 201, Appendix D for source data.

Pre-Quaternary fault (older that 1.6 million years) or fault without recognized Quaternary displacement. Some faults are shown in this category because the source of mapping used was of reconnaissnce nature, or was not done with the object of dating fault displacements. Faults in this category are not necessarily inactive.

NOTES:

1. **PIPE TYPE SHOULD BE PVC OR ABS, SCHEDULE 40 OR SDR35 SATISFYING THE REQUIREMENTS OF ASTM TEST STANDARD D1527, D1785, D2751 , OR D3034.**
2. **FILTER FABRIC SHALL BE APPROVED PERMEABLE NON-WOVEN POLYESTER, NYLON, OR POLYPROPYLENE MATERIAL.**
3. **DRAIN PIPE SHOULD HAVE A GRADIENT OF 1 PERCENT MINIMUM.**
4. **WATERPROOFING MEMBRANE MAY BE REQUIRED FOR A SPECIFIC RETAINING WALL (SUCH AS A STUCCO OR BASEMENT WALL).**
5. **WEEP HOLES MAY BE PROVIDED FOR LOW RETAINING WALLS (LESS THAN 3 FEET IN HEIGHT) IN LIEU OF A VERTICAL DRAIN AND PIPE AND WHERE POTENTIAL WATER FROM BEHIND THE RETAINING WALL WILL NOT CREATE A NUISANCE WATER CONDITION. IF EXPOSURE IS NOT PERMITTED, A PROPER SUBDRAIN OUTLET SYSTEM SHOULD BE PROVIDED.**
6. **IF EXPOSURE IS PERMITTED, WEEP HOLES SHOULD BE 2-INCH MINIMUM DIAMETER AND PROVIDED AT 25-FOOT MAXIMUM SPACING ALONG WALL. WEEP HOLES SHOULD BE LOCATED 3+ INCHES ABOVE FINISHED GRADE.**
7. **SCREENING SUCH AS WITH A FILTER FABRIC SHOULD BE PROVIDED FOR WEEP HOLES/OPEN JOINTS TO PREVENT EARTH MATERIALS FROM ENTERING THE HOLES/JOINTS.**
8. **OPEN VERTICAL MASONRY JOINTS (I.E., OMIT MORTAR FROM JOINTS OF FIRST COURSE ABOVE FINISHED GRADE) AT 32-INCH MAXIMUM INTERVALS MAY BE SUBSTITUTED FOR WEEP HOLES.**
9. **THE GEOTECHNICAL CONSULTANT MAY PROVIDE ADDITIONAL RECOMMENDATIONS FOR RETAINING WALLS DESIGNED FOR SELECT SAND BACKFILL.**

MAJOR DIVISIONS			SYMBOLS	TYPICAL DESCRIPTIONS
COARSE GRAINED SOILS MORE THAN 50% OF MATERIAL IS LARGER THAN NO. 200 SIEVE SIZE	*GRAVEL AND GRAVELLY SOILS* MORE THAN 50% OF COARSE FRACTION RETAINED ON NO. 4 SIEVE	*CLEAN GRAVELS* (LITTLE OR NO FINES)	**GW**	WELL-GRADED GRAVELS, GRAVEL - SAND MIXTURES, LITTLE OR NO FINES
			GP	POORLY GRADED GRAVELS, GRAVEL - SAND MIXTURES, LITTLE OR NO FINES
		GRAVELS WITH FINES (APPRECIABLE AMOUNT OF FINES)	**GM**	SILTY GRAVELS, GRAVEL - SAND - SILT MIXTURES
			GC	CLAYEY GRAVELS, GRAVEL - SAND - CLAY MIXTURES
	SAND AND SANDY SOILS MORE THAN 50% OF COARSE FRACTION PASSING NO. 4 SIEVE	*CLEAN SANDS* (LITTLE OR NO FINES)	**SW**	WELL-GRADED SANDS, GRAVELLY SANDS, LITTLE OR NO FINES
			SP	POORLY GRADED SANDS, GRAVELLY SANDS, LITTLE OR NO FINES
		SANDS WITH FINES (APPRECIABLE AMOUNT OF FINES)	**SM**	SILTY SANDS, SAND - SILT MIXTURES
			SC	CLAYEY SANDS, SAND - CLAY MIXTURES
FINE GRAINED SOILS MORE THAN 50% OF MATERIAL IS SMALLER THAN NO. 200 SIEVE SIZE	*SILTS AND CLAYS*	LIQUID LIMIT LESS THAN 50	**ML**	INORGANIC SILTS AND VERY FINE SANDS, ROCK FLOUR, SILTY OR CLAYEY FINE SANDS OR CLAYEY SILTS WITH SLIGHT PLASTICITY
			CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
			OL	ORGANIC SILTS AND ORGANIC SILTY CLAYS OF LOW PLASTICITY
	SILTS AND CLAYS	LIQUID LIMIT GREATER THAN 50	**MH**	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SANDY OR SILTY SOILS, ELASTIC SILTS
			CH	INORGANIC CLAYS OF HIGH PLASTICITY
			OH	ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY, ORGANIC SILTS
HIGHLY ORGANIC SOILS			**PT**	PEAT, HUMUS, SWAMP SOILS WITH HIGH ORGANIC CONTENTS

NOTE: Dual symbols are used to indicate gravels or sand with 5-12% fines and soils with fines classifying as CL-ML. Symbols separated by a slash indicate borderline soil classifications.

Sampler and Symbol Descriptions

- Modified California sample (D-#)
- Standard Penetration Test (S-#)
- Shelby tube sample (T-#)
- Large bulk sample (B-#)
- Small bulk sample (SB-#)
- Approximate depth of groundwater during drilling
- Approximate depth of static groundwater

Note: Number of blows required to advance driven sample 12 inches (or length noted).

Laboratory and Field Test Abbreviations

AL	Atterberg limits (plasticity)
CC	Chemical Testing incl. Soluble Sulfate
CN	Consolidation
DS	Direct Shear
EI	Expansion Index
GS	Grain Size Analysis (Sieve, Hydro. and/or -No. 200)
MD	Maximum Density and Optimum Moisture
RV	Resistance Value (R-Value)
SE	Sand Equivalent
UU	Unconsolidated Undrained Shear Strength

Notes:

1. Soil classifications are based on the Unified Soil Classification System and include color, moisture, and relative density or consistency. Field descriptions have been modified to reflect results of laboratory tests where deemed appropriate. Bedrock descriptions are based on visual classification and include rock type, moisture, color, grain size, strength, and weathering.
2. Descriptions on these boring logs apply only at the specific boring locations and at the time the borings were drilled. They are not warranted to be representative of subsurface conditions at other locations or times.

May 17, 2024

	Method	ASTM D4327		ASTM D4327	
Bore# / Description	**Depth**	**Sulfates** SO_4^{2-}		**Chlorides** Cl^-	
	(ft)	**(mg/kg)**	**(wt%)**	**(mg/kg)**	**(wt%)**
H-1 B-1	0-5	768.4	0.0768	156.2	0.0156
H-4 B-1	0-5	713.1	0.0713	82.9	0.0083

Cations and Anions, except Sulfide and Bicarbonate, tested with Ion Chromatography
mg/kg = milligrams per kilogram (parts per million) of dry soil weight
ND = 0 = Not Detected | NT = Not Tested | Unk = Unknown
Chemical Analysis performed on 1:3 Soil-To-Water extract
PPM = mg/kg (soil) = mg/L (Liquid)

Note: Sometimes a bad sulfate hit is a contaminated spot. Typical fertilizers are Potassium chloride, ammonium sulfate or ammonium sulfate nitrate (ASN). So this is another reason why testing full corrosion series is good because we then have the data to see if those other ingredients are present meaning the soil sample is just fertilizer-contaminated soil. This can happen often when the soil samples collected are simply surface scoops. This is why it's best to dig in a foot, throw away the top and test the deeper stuff. Dairy farms are also notorious for these items.

If one sample pops up much more corrosive than all others, we would recommend collecting more samples surrounding the problem sample location to determine if the peak is isolated to it. This allows us to conclude it was a contaminated sample and able to declare it an outlier.

Latitude, Longitude: 33.5945973, -117.7242937

Date	4/26/2024, 3:23:29 PM
Design Code Reference Document	ASCE7-16
Risk Category	II
Site Class	D - Stiff Soil

Type	Value	Description
S_S	1.218	MCE_R ground motion. (for 0.2 second period)
S_1	0.438	MCE_R ground motion. (for 1.0s period)
S_{MS}	1.233	Site-modified spectral acceleration value
S_{M1}	null -See Section 11.4.8	Site-modified spectral acceleration value
S_{DS}	0.822	Numeric seismic design value at 0.2 second SA
S_{D1}	null -See Section 11.4.8	Numeric seismic design value at 1.0 second SA

Type	Value	Description
SDC	null -See Section 11.4.8	Seismic design category
F_a	1.013	Site amplification factor at 0.2 second
F_v	null -See Section 11.4.8	Site amplification factor at 1.0 second
PGA	0.515	MCE_G peak ground acceleration
F_{PGA}	1.1	Site amplification factor at PGA
PGA_M	0.566	Site modified peak ground acceleration
T_L	8	Long-period transition period in seconds
SsRT	1.218	Probabilistic risk-targeted ground motion. (0.2 second)
SsUH	1.304	Factored uniform-hazard (2% probability of exceedance in 50 years) spectral acceleration
SsD	2.489	Factored deterministic acceleration value. (0.2 second)
S1RT	0.438	Probabilistic risk-targeted ground motion. (1.0 second)
S1UH	0.468	Factored uniform-hazard (2% probability of exceedance in 50 years) spectral acceleration.
S1D	0.82	Factored deterministic acceleration value. (1.0 second)
PGAd	1.017	Factored deterministic acceleration value. (Peak Ground Acceleration)

Type	Value	Description
PGA_{UH}	0.515	Uniform-hazard (2% probability of exceedance in 50 years) Peak Ground Acceleration
C_{RS}	0.934	Mapped value of the risk coefficient at short periods
C_{R1}	0.934	Mapped value of the risk coefficient at a period of 1 s
C_V	1.344	Vertical coefficient

PROFILE BOUNDARY SLOPES AND ANGLES

BND No.	Slope	Angle(Deg.)
1	0.000	0.000
2	0.500	26.565
3	0.000	0.000

MOHR-COULOMB SOIL PARAMETERS

1 Type(s) of Soil Defined

Soil Number and Description	Moist Unit Wt. (pcf)	Saturated Unit Wt. (pcf)	Cohesion Intercept (psf)	Friction Angle (deg)	Pore Pressure Ratio(ru)	(-Uw) Fact.	Water Surface No.	Water Option
1 Fill	110.0	110.0	400.00	24.00	0.000	0.0	1	0

TRIAL FAILURE SURFACE DATA

Circular Trial Failure Surfaces Have Been Generated Using A Random Procedure.

2000 Trial Surfaces Have Been Generated.

2000 Surfaces Generated at Increments of 0.0600(in) Equally Spaced Within the Start Range

Along The Specified Surface Between X = 55.00(ft)
and X = 65.00(ft)

Each Surface ends within a Range Between X = 110.00(ft)
and X = 140.00(ft)

All surfaces are generated left to right for both a left and right sliding slope.

Unless XCLUDE Lines Were Specified, The Minimum Elevation
To Which A Surface Extends Is Y = 400.00(ft)

Specified Maximum Radius = 100000.000(ft)

3.000(ft) Line Segments Were Used For Each Trial Failure Surface.

The Spencer Method Was Selected for FS Analysis.

Selected fx function = Constant (1.0)

```
SELECTED CONVERGENCE PARAMETERS FOR SPENCER METHOD:
Initial estimate of FS =  1.500
FS tolerance =  0.000001000
Initial estimate of theta(deg) =  15.00
Theta tolerance(radians) =  0.0001000
Minimum theta(deg) = -45.00 ; Maximum theta(deg) =  45.00
Theta convergence Step Factor = 5000.00
Maximum number of iterations = 50
Allowable negative side force = -1000.0(lbs)
Maximum force imbalance  = 100.000000(lbs)
Maximum moment imbalance = 100.000000 (ft/lbs)

Selected Lambda Coefficient =  1.00

Specified Tension Crack Water Depth Factor =   0.000

Total Number of Trial Surfaces Attempted = 2000

WARNING! The Factor of Safety Calculation for one or More Trial Surfaces
Did Not Converge in 50 Iterations.

Number of Trial Surfaces with Non-Converged FS = 242

Number of Trial Surfaces With Valid FS = 1758

Percentage of Trial Surfaces With Non-Converged and/or
Non-Valid FS Solutions of the Total Attempted =  12.1 %

Statistical Data On All Valid FS Values:
   FS Max =   7.876   FS Min =   2.381   FS Ave =   2.890
   Standard Deviation =    0.400   Coefficient of Variation =   13.85 %

Critical Surface is Sequence Number     860 of Those Analyzed.

*****BEGINNING OF DETAILED GEOSTASE OUTPUT FOR CRITICAL SURFACE FROM A SEARCH*****
```

BACK-CALCULATED CIRCULAR SURFACE PARAMETERS:

Circle Center At X = 73.583338(ft) ; Y = 471.872496(ft); and Radius = 51.705663(ft)

Circular Trial Failure Surface Generated With 25 Coordinate Points

Factor Of Safety For The Preceding Specified Surface = 2.381
Theta (fx = 1.0) = 17.25 Deg Lambda = 0.311

The Spencer Method Has Been Selected For Analysis.

Selected fx function = Constant (1.0)

SELECTED CONVERGENCE PARAMETERS FOR ANALYSIS METHOD:
Initial estimate of FS = 1.500
FS tolerance = 0.000001000
Initial estimate of theta(deg) = 15.00
Theta tolerance(radians) = 0.0001000
Minimum theta(deg) = -45.00 ; Maximum theta(deg) = 45.00
Theta convergence Step Factor = 5000.00
Maximum number of iterations = 50
Maximum force imbalance = 100.000000(lbs)
Maximum moment imbalance(if Applicable) = 100.000000 (ft/lbs)

Selected Lambda Coefficient = 1.00

Tension Crack Water Force = 0.00(lbs)

Specified Tension Crack Water Depth Factor = 0.000 (0.00% Filled)

Depth of Tension Crack (zo) at Side of Last Slice = 0.000(ft)

Depth of Water in Tension Crack = 0.000(ft)

Theoretical Tension Crack Depth = 11.199(ft)

NOTE: In Table 1 following, when a tension crack with water is present on the first slice (right facing slope) or on the last slice (left facing slope), the "side force" in the tension crack is set equal to the water pressure resultant.

*** Table 1 - Line of Thrust(if applicable) and Slice Force Data ***

DESCRIPTION: Global Stability of 25' High Slopes (Pseudo-Static)

PROFILE BOUNDARY DATA

3 Surface Boundaries
3 Total Boundaries

Boundary No.	X - 1 (ft)	Y - 1 (ft)	X - 2 (ft)	Y - 2 (ft)	Soil Type Below Bnd
1	0.000	422.000	60.000	422.000	1
2	60.000	422.000	110.000	447.000	1
3	110.000	447.000	160.000	447.000	1

User Specified X-Origin = 0.000(ft)

User Specified Y-Origin = 400.000(ft)

SURFACE BOUNDARY POINT COORDINATES
(Information Only-Not Used Directly)

Point No.	X-COORD	Y-COORD
1	0.000	422.000
2	60.000	422.000
3	110.000	447.000
4	160.000	447.000

SUBSURFACE BOUNDARY POINT COORDINATES
(Information Only-Not Used Directly)

Point No.	X-COORD	Y-COORD

PROFILE BOUNDARY SLOPES AND ANGLES

BND No.	Slope	Angle(Deg.)
1	0.000	0.000
2	0.500	26.565
3	0.000	0.000

MOHR-COULOMB SOIL PARAMETERS

1 Type(s) of Soil Defined

Soil Number and Description	Moist Unit Wt. (pcf)	Saturated Unit Wt. (pcf)	Cohesion Intercept (psf)	Friction Angle (deg)	Pore Pressure Ratio(ru)	(-Uw) Fact.	Water Surface No.	Water Option
1 Fill	110.0	110.0	400.00	24.00	0.000	0.0	1	0

SEISMIC (EARTHQUAKE) DATA

Specified Peak Ground Acceleration Coefficient (PGA) = 0.290(g)
Default Velocity = 1.450(ft) per second
Specified Horizontal Earthquake Coefficient (kh) = 0.29000(g)
Specified Vertical Earthquake Coefficient (kv) = 0.000(g)
(NOTE:Input Velocity = 0.0 will result in default Peak
Velocity = 2 times(PGA) times 2.5 fps or 0.762 mps)
Specified Seismic Pore-Pressure Factor = 0.000
Horizontal Seismic Force is Applied at Center of Gravity of Slices

TRIAL FAILURE SURFACE DATA

Circular Trial Failure Surfaces Have Been Generated Using A Random Procedure.

2000 Trial Surfaces Have Been Generated.

2000 Surfaces Generated at Increments of 0.0600(in) Equally Spaced Within the Start Range

Along The Specified Surface Between X = 55.00(ft)
and X = 65.00(ft)

Each Surface ends within a Range Between X = 110.00(ft)
and X = 140.00(ft)

All surfaces are generated left to right for both a left and right sliding slope.

Unless XCLUDE Lines Were Specified, The Minimum Elevation
To Which A Surface Extends Is Y = 400.00(ft)

Specified Maximum Radius = 100000.000(ft)

3.000(ft) Line Segments Were Used For Each Trial Failure Surface.

The Spencer Method Was Selected for FS Analysis.

Selected fx function = Constant (1.0)

SELECTED CONVERGENCE PARAMETERS FOR SPENCER METHOD:
Initial estimate of FS = 1.500
FS tolerance = 0.000001000
Initial estimate of theta(deg) = 15.00
Theta tolerance(radians) = 0.0001000
Minimum theta(deg) = -45.00 ; Maximum theta(deg) = 45.00
Theta convergence Step Factor = 5000.00
Maximum number of iterations = 50
Allowable negative side force = -1000.0(lbs)
Maximum force imbalance = 100.000000(lbs)
Maximum moment imbalance = 100.000000 (ft/lbs)

Selected Lambda Coefficient = 1.00

Specified Tension Crack Water Depth Factor = 0.000

Total Number of Trial Surfaces Attempted = 2000

WARNING! The Factor of Safety Calculation for one or More Trial Surfaces
Did Not Converge in 50 Iterations.

Number of Trial Surfaces with Non-Converged FS = 1779

Number of Trial Surfaces With Valid FS = 221

Percentage of Trial Surfaces With Non-Converged and/or

Non-Valid FS Solutions of the Total Attempted = 89.0 %

Statistical Data On All Valid FS Values:
FS Max = 1.907 FS Min = 1.458 FS Ave = 1.673
Standard Deviation = 0.100 Coefficient of Variation = 5.97 %

Critical Surface is Sequence Number 8 of Those Analyzed.

*****BEGINNING OF DETAILED GEOSTASE OUTPUT FOR CRITICAL SURFACE FROM A SEARCH*****

BACK-CALCULATED CIRCULAR SURFACE PARAMETERS:

Circle Center At X = 79.072422(ft) ; Y = 461.584595(ft); and Radius = 46.189706(ft)

Circular Trial Failure Surface Generated With 29 Coordinate Points

Point No.	X-Coord. (ft)	Y-Coord. (ft)

Factor Of Safety For The Preceding Specified Surface = 1.458
Theta (fx = 1.0) = 26.65 Deg Lambda = 0.502

The Spencer Method Has Been Selected For Analysis.

Selected fx function = Constant (1.0)

SELECTED CONVERGENCE PARAMETERS FOR ANALYSIS METHOD:
Initial estimate of FS = 1.500
FS tolerance = 0.000001000
Initial estimate of theta(deg) = 15.00
Theta tolerance(radians) = 0.0001000
Minimum theta(deg) = -45.00 ; Maximum theta(deg) = 45.00
Theta convergence Step Factor = 5000.00
Maximum number of iterations = 50
Maximum force imbalance = 100.000000(lbs)
Maximum moment imbalance(if Applicable) = 100.000000 (ft/lbs)

Selected Lambda Coefficient = 1.00

Tension Crack Water Force = 0.00(lbs)

Specified Tension Crack Water Depth Factor = 0.000 (0.00% Filled)

Depth of Tension Crack (zo) at Side of Last Slice = 0.000(ft)

Depth of Water in Tension Crack = 0.000(ft)

Theoretical Tension Crack Depth = 11.199(ft)

NOTE: In Table 1 following, when a tension crack with water is present on the first slice (right facing slope) or on the last slice (left facing slope), the "side force" in the tension crack is set equal to the water pressure resultant.

*** Table 1 - Line of Thrust(if applicable) and Slice Force Data ***

Slice No.	X Coord.	Y Coord.	h/H	Side Force (lbs)	fx	Force Angle (Deg)	Vert. Shear Force(lbs)

Appendix F

APPENDIX E

GENERAL EARTHWORK AND GRADING SPECIFICATIONS

1.0 GENERAL

1.1 **Intent:** These General Earthwork and Grading Specifications are for the grading and earthwork shown on the approved grading plan(s) and/or indicated in the geotechnical report(s). These Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the specific recommendations in the geotechnical report shall supersede these general Specifications. Observations of the earthwork by the project Geotechnical Consultant during grading may result in new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

1.2 **Geotechnical Consultant:** Prior to commencement of work, the project owner shall employ a geotechnical consultant. The geotechnical consultant shall be responsible for reviewing the approved geotechnical report(s) and accepting the adequacy of the preliminary geotechnical findings, conclusions, and recommendations prior to the commencement of grading.

Prior to commencement of grading, the Geotechnical Consultant shall review the "work plan" prepared by the Earthwork Contractor (Contractor) and schedule sufficient personnel to perform the appropriate level of observation, mapping, and compaction testing.

During grading and earthwork operations, the Geotechnical Consultant shall observe, map, and document the subsurface exposures to verify the geotechnical design assumptions. If the observed conditions are found to be significantly different than the interpreted assumptions during the design phase, the Geotechnical Consultant shall inform the owner, recommend appropriate changes in design to accommodate the observed conditions, and notify the review agency where required. Subsurface areas to be geotechnically observed, mapped, elevations recorded, and/or tested include natural ground after it has been cleared for receiving fill but before fill is placed, bottoms of all "remedial removal" areas, all keyway bottoms, and benches made on sloping ground to receive fill.

The Geotechnical Consultant shall observe the moisture-conditioning and processing of subgrade and fill materials and perform adequate relative compaction testing of fill to determine the attained level of compaction and assess if, in their opinion, if the work was performed in substantial compliance

with the geotechnical report(s) and these specifications. The Geotechnical Consultant shall provide test results to the owner on a routine and frequent basis.

1.3 The Earthwork Contractor: The Earthwork Contractor (Contractor) shall be qualified, experienced, and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing the grading in accordance with applicable grading codes, the project plans, and these specifications.

The Contractor shall prepare and submit to the owner and the Geotechnical Consultant a work plan that indicates the sequence of earthwork grading, the number of "spreads" of work and the estimated quantities of daily earthwork planned for the site prior to commencement of grading. The Contractor shall inform the owner and the Geotechnical Consultant of changes in work schedules and updates to the work plan at least 24 hours in advance of such changes so that appropriate observations and tests can be planned and accomplished. The Contractor shall not assume that the Geotechnical Consultant is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish the earthwork in accordance with the applicable grading codes and agency ordinances, these Specifications, and the recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of the Geotechnical Consultant, unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, insufficient buttress key size, adverse weather, etc., are resulting in a quality of work less than required in these specifications, the Geotechnical Consultant shall reject the work and may recommend to the owner that construction be stopped until the conditions are corrected.

2.0 PREPARATION OF FILL AREAS

2.1 Clearing and Grubbing: Areas to be excavated and filled shall be cleared and grubbed. Vegetation, such as brush, grass, roots, and other deleterious material, man-made structures, and similar debris shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies, and the Geotechnical Consultant. Borrow areas shall be cleared and grubbed to the extent necessary to provide a suitable fill material.

Concrete fragments that are free of reinforcing street may be placed in fills, provided they are placed in accordance with Section 3 and 4. Earth fill material

shall not contain more than 1 percent of organic materials (by volume). No fill lift shall contain more than 5 percent organic matter. Nesting of organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area. As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, etc.) have chemical constituents that are considered hazardous waste. As such, the indiscriminate dumping or spillage of such fluids may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed.

The Geotechnical Consultant shall not be responsible for the identification or analysis of potentially hazardous materials; however, if observations, odors, or soil discoloration are suspect, the Geotechnical Consultant may request from the owner the termination of grading operations until such materials are deemed not hazardous as defined by applicable laws and regulations.

2.2 **Evaluation/Acceptance of Fill Areas:** All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by the Geotechnical Consultant as suitable to receive fill. The Contractor shall obtain a written acceptance from the Geotechnical Consultant prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys, and benches.

2.3 **Processing:** Ground that has been declared satisfactory for support of fill by the Geotechnical Consultant shall be scarified to a minimum depth of 6 inches. Ground that is not satisfactory shall be removed/overexcavated as specified in the following section. Scarification shall continue until soils are broken down and free of large clay lumps or clods and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction. After scarification, the surface should be moisture conditioned, as necessary, to achieve the proper moisture content and compacted in accordance with Section 4 of these specifications.

2.4 **Overexcavation:** In addition to removals and overexcavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured, or otherwise unsuitable ground shall be overexcavated to competent ground as recommended by the Geotechnical Consultant during grading.

2.5 **Benching:** Fills to be placed on ground sloping steeper than 5H:1V (horizontal to vertical units) shall be stepped or benched. The lowest bench or key shall be a minimum of 15 feet wide and at least 2 feet deep, into competent material as evaluated by the Geotechnical Consultant. Other benches shall be excavated a minimum height of 4 feet into competent material or as otherwise recommended by the Geotechnical Consultant. Fill placed on ground sloping flatter than 5:1 shall also be benched or otherwise overexcavated to provide a flat subgrade for fill placement.

3.0 FILL MATERIAL

3.1 **General:** Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by the Geotechnical Consultant prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to the Geotechnical Consultant or mixed with other soils to achieve satisfactory fill material.

3.2 **Oversize:** Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 12 inches, shall not be buried or placed in fill unless location, materials, and placement methods are specifically accepted by the Geotechnical Consultant. Placement operations shall be such that nesting of oversized material does not occur and that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 vertical feet of finish grade or within 2 feet of future utilities or other underground construction.

3.3 **Import:** If importing of fill material is required for grading, proposed import material shall meet the requirements of Section 3.1 and/or requirements defined in the project geotechnical report(s). The potential import source shall be given to the Geotechnical Consultant at least 48 hours (2 working days) before import begins so that suitability can be determined, and appropriate laboratory tests performed.

4.0 FILL PLACEMENT AND COMPACTION

4.1 **Fill Layers:** Approved fill material shall be placed in areas prepared to receive fill (per Section 3.0) in near-horizontal layers not exceeding 8 inches in loose thickness. The Geotechnical Consultant may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

4.2 **Fill Moisture Conditioning:** Fill soils shall be watered, dried back, blended, and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture content tests shall be performed in accordance with ASTM International (ASTM Test Method D1557).

4.3 **Compaction of Fill:** After each layer has been moisture-conditioned, mixed, and evenly spread, it shall be uniformly compacted to not less than 90 percent of maximum dry density (ASTM Test Method D1557). Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction and uniformity.

Compaction of Fill Slopes: In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by backrolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet in fill elevation, or by other methods producing satisfactory results acceptable to the Geotechnical Consultant. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of maximum density per ASTM Test Method D1557.

4.4 **Compaction Testing:** Field tests for moisture content and relative compaction of the fill soils shall be performed by the Geotechnical Consultant. Location and frequency of tests shall be at the Consultant's discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

4.5 **Frequency of Compaction Testing:** Tests shall be taken at intervals required by the governing agency and as deemed necessary by the Geotechnical Consultant in order to adequately qualify the fill material. In general, it should be anticipated that tests will be taken at intervals not exceeding 2 feet in vertical rise and/or 1,000 cubic yards of compacted fill, unless recommended otherwise by the Geotechnical Consultant. In addition, test(s) shall be taken on slope faces and/or each 10 feet of vertical height of slope as deemed necessary by the Geotechnical Consultant. The Contractor shall assure that fill construction is such that the testing schedule can be accomplished by the Geotechnical Consultant. The Contractor shall stop or slow down the earthwork construction if these minimum standards are not met.

4.6 **Compaction Test Locations:** The Geotechnical Consultant shall document the approximate elevation and location of each compaction test. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so the Geotechnical Consultant can determine the test locations with sufficient accuracy. At a minimum, two grade stakes within a horizontal distance of 100 feet and vertically less than 5 feet apart from potential test locations shall be provided. Alternatively, GPS units may be used to determine the approximate location/coordinates of the field density tests.

5.0 SUBDRAIN INSTALLATION

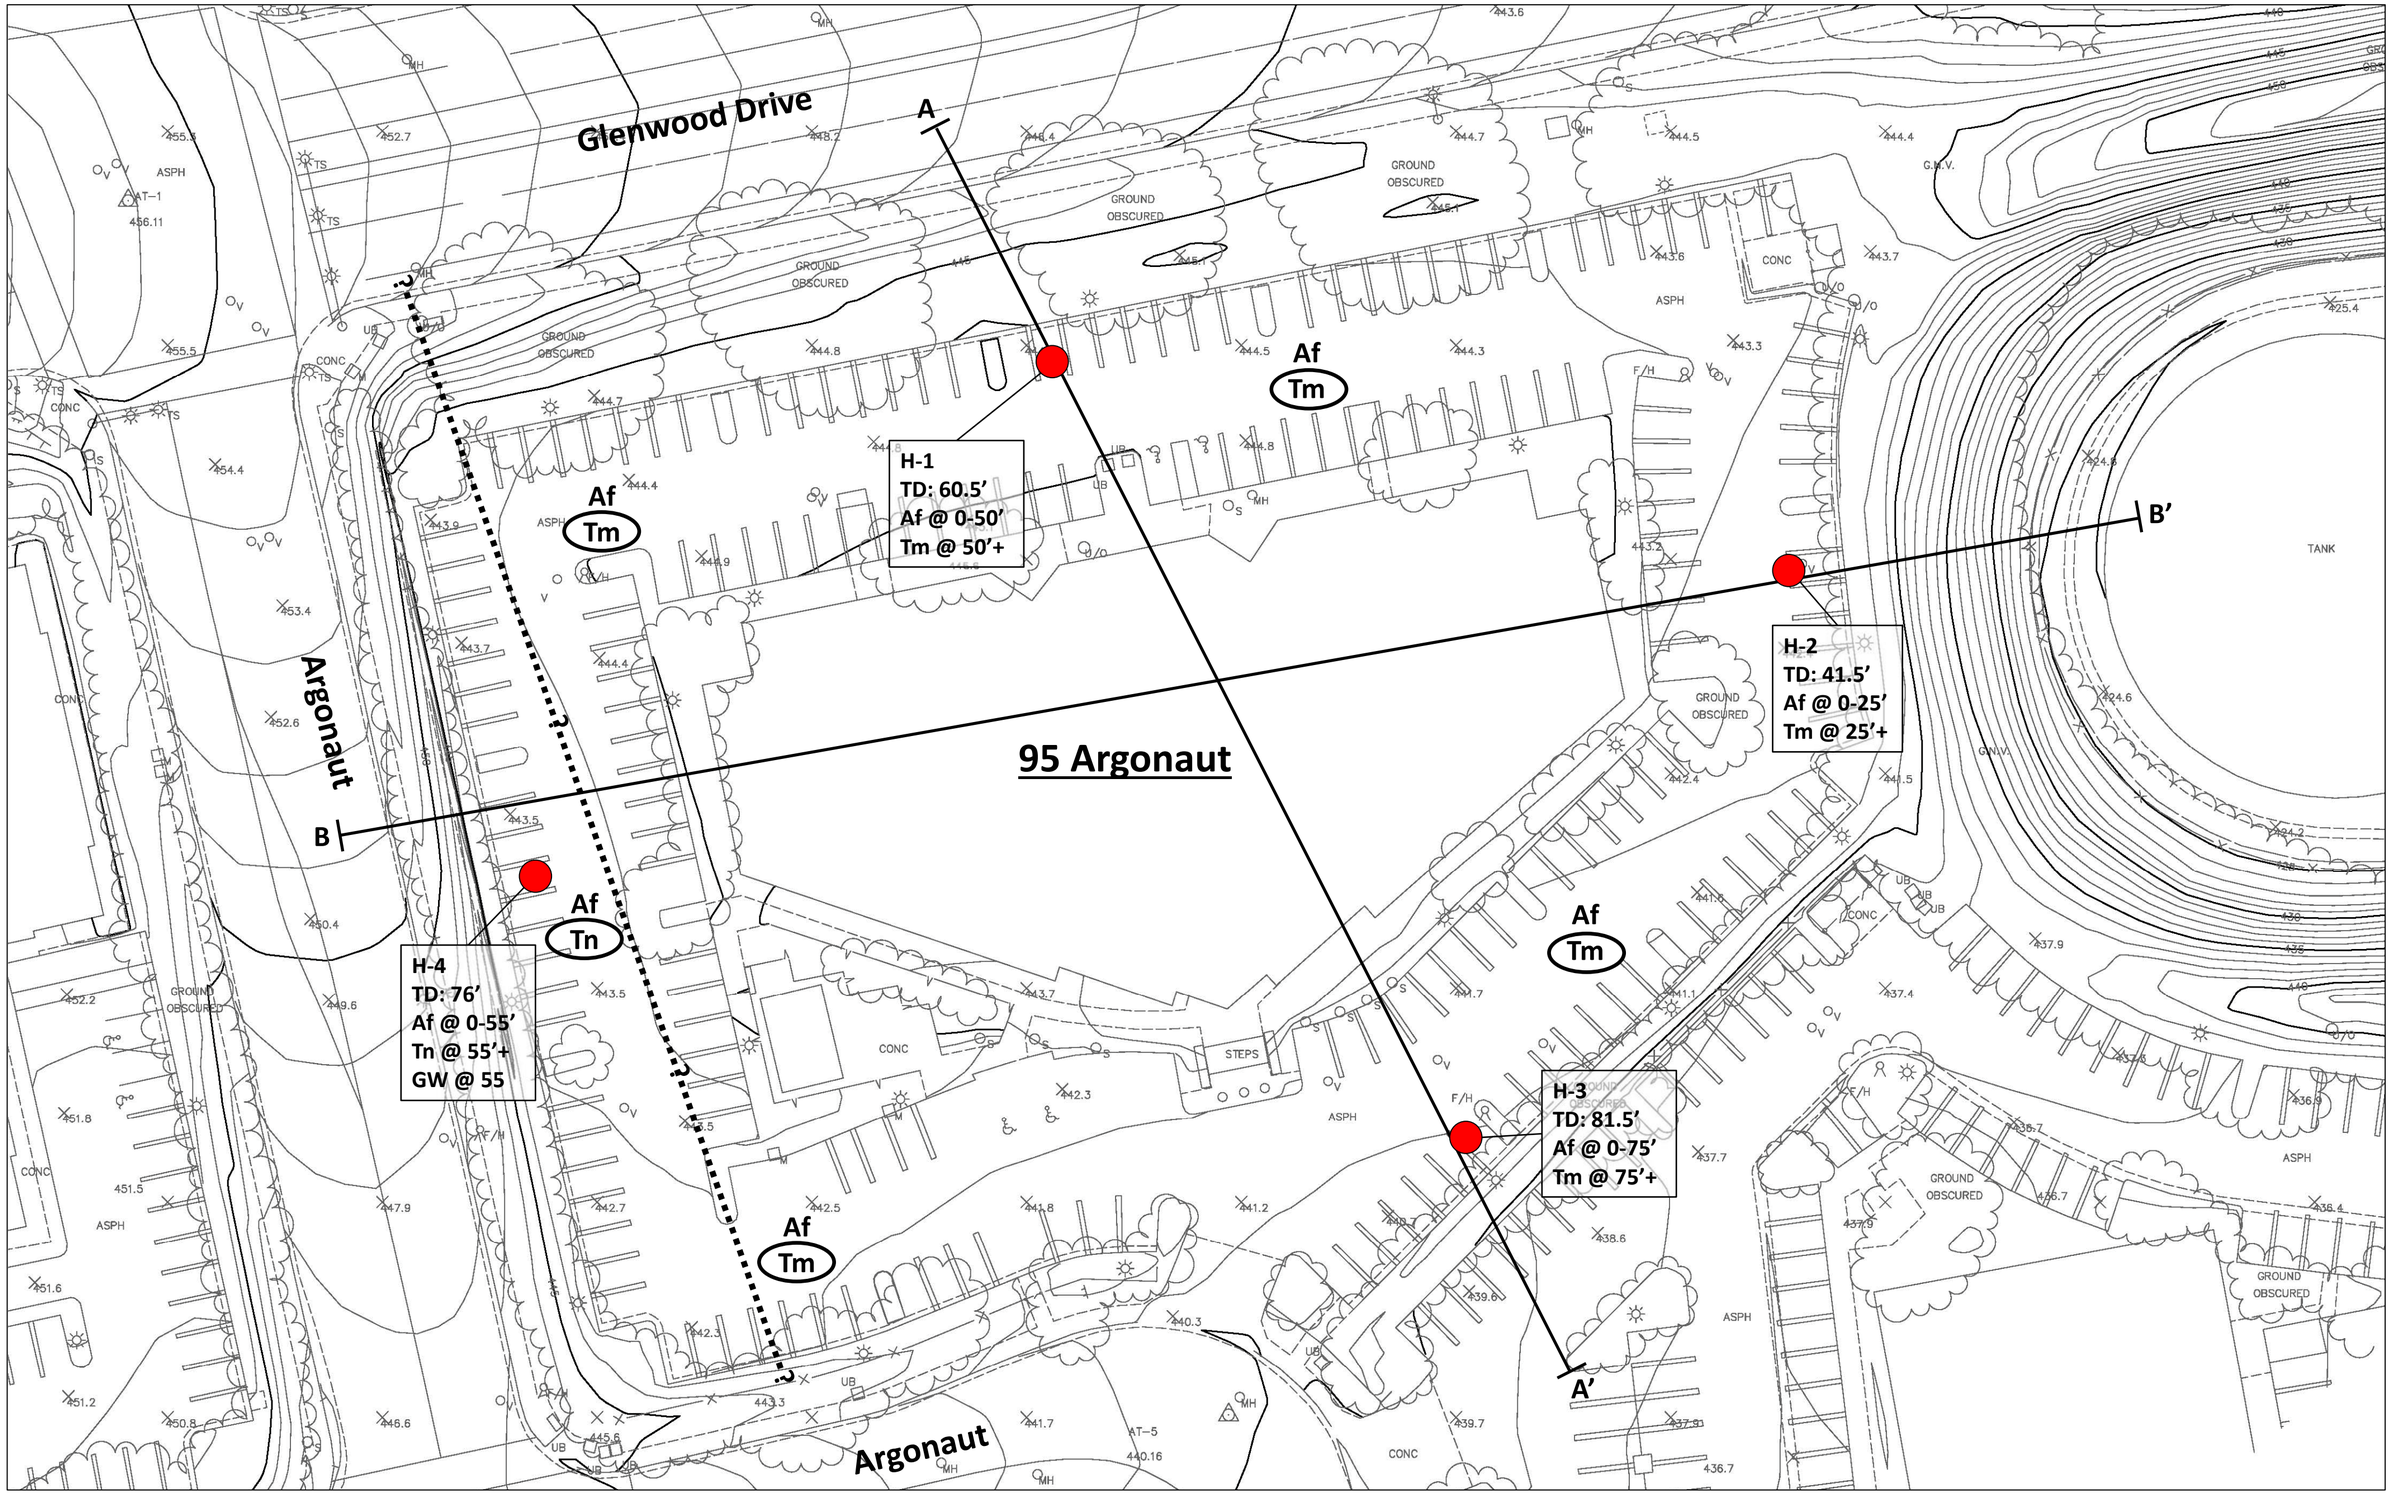
Subdrain systems shall be installed in accordance with the approved geotechnical report(s), the grading plan, and standard details. The Geotechnical Consultant may recommend additional subdrains and/or changes in subdrain extent, location, grade, or material depending on conditions encountered during grading. All subdrains shall be surveyed for line and grade after installation and prior to burial. Sufficient time should be allowed by the Contractor for these surveys. The Contractor should consider videoing the subdrains shortly after burial to check proper installation and functionality. The Contractor is responsible for the performance of subdrains.

6.0 EXCAVATION

Excavations, including over-excavation for remedial purposes, shall be evaluated by the Geotechnical Consultant during grading. Remedial removal depths shown on geotechnical report(s) and plans are estimates. The actual extent of removal shall be determined by the Geotechnical Consultant based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, evaluated, and accepted by the Geotechnical Consultant prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by the Geotechnical Consultant.

7.0 TRENCH BACKFILLS

7.1 Contractor shall follow all OHSA and Cal/OSHA requirements for safety of trench excavations.



7.2 Bedding and backfill of utility trenches shall be done in accordance with the applicable provisions of Standard Specifications of Public Works Construction. Bedding material shall have a Sand Equivalent greater than 30 (SE>30). The bedding shall be placed to 1 foot over the top of the conduit and densified by jetting. Backfill shall be placed and densified to a minimum 90 percent of maximum from 1 foot above the top of the conduit to the surface, except in traveled ways (see Section 7.6 below).

7.3 Jetting of the bedding around the conduits shall be observed by the Geotechnical Consultant.

7.4 Geotechnical Consultant shall test the trench backfill for relative compaction. At least one test should be made for every 300 feet of trench and 2 feet of fill, unless required differently by the governing agency or the Geotechnical Consultant.

7.5 Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to the Geotechnical Consultant that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method.

7.6 Trench backfill in the upper foot measured from finish grade within existing or future traveled way, shoulder, and other paved areas (or areas to receive pavement) should be placed to a minimum 95 percent relative compaction.

RE: Phase I Environmental Site Assessment
95 Argonaut
Aliso Viejo, California 92656
Hillmann Project No: C3-9987

Dear Ms. Emma Hill:

Hillmann Consulting LLC has completed a Phase I Environmental Site Assessment at the above referenced site. This assessment was performed in conformance with the scope and limitations of ASTM E1527-21, which is the latest version of the E1527 standard published by the ASTM.

We appreciate the opportunity to provide environmental consulting services. If you have any questions concerning this report, or if we can assist you in any other matter, please contact our office at 714-634-9500.

Sincerely,

Hillmann Consulting LLC

LIST OF ACRONYMS/ABBREVIATIONS

Hillmann may use the following abbreviations and acronyms for common terminology described in our report. Not all abbreviations or acronyms may be applicable to this report:

AOC	-Area of Concern
AST	-Above Ground Storage Tank
ASTM	-American Society for Testing Materials
BER	-Business Environmental Risk
CERCLA	-Comprehensive Environmental Response Compensation and Liability Act
CERCLIS	-Comprehensive Environmental Response Compensation and Liability Information System
CESQG	-Conditionally Exempt Small Quantity Generator
COC	-Chemicals of Concern
CORRACTS	-Corrective Action Sites
CREC	-Controlled Recognized Environmental Condition
DEC	-Department of Environmental Conservation
DEP	-Department of Environmental Protection
DHS	-Department of Health Services
DNPL	-Delisted National Priority List
DOB	-Department of Buildings
DOH	-Department of Health
DOT	-Department of Transportation
EPA	-Environmental Protection Agency
ERNS	-Emergency Response Notification System
FD	-Fire Department
FOI/FOIA/FOIL	-Freedom of Information / Freedom of Information Act / Freedom of Information Letter
HVAC	-Heating Ventilation & Air Conditioning
HREC	-Historical Recognized Environmental Condition
IAQ	-Indoor Air Quality
ISRA	-Industrial Site Recovery Act
LBP	-Lead-Based Paint
LCP	-Lead-Containing Paint
LQG	-Large Quantity Generator
LTANK	-Leaking Storage Tank
LUST	-Leaking Underground Storage Tank
SDS/MSDS	-Safety Data Sheet / Material Safety Data Sheet
NA	-Not Applicable
NFA	-No Further Action
NFRAP	-No Further Remedial Actions Planned
NPDES	-National Pollutant Discharge Elimination System
NPL	-National Priorities List
OPRA	-Open Public Records Act
PAH	-Polycyclic Aromatic Hydrocarbon
PCE	-Perchloroethylene
RAO	-Response Action Outcome
RCRA	-Resource Conservation and Recovery Act
RCRIS	-Resource Conservation and Recovery Information System
REC	-Recognized Environmental Concern
SDG	-Significant Data Gap
SEMS	-Superfund Enterprise Management System
SRP	-Site Remediation Program
SQG	-Small Quantity Generator

UST	-Underground Storage Tank
VEC	-Vapor Encroachment Condition
VOC	-Volatile Organic Compound

1.0 INTRODUCTION

1.1 Executive Summary

Hillmann Consulting LLC (Hillmann) has performed a Phase I Environmental Site Assessment (ESA) of 95 Argonaut, Aliso Viejo, California (the Subject Property) in accordance with our contracted scope of work and the ASTM Standard Practice E 1527-21 for Phase I Environmental Site Assessments and All Appropriate Inquiries (AAI) Final Rule 40 CFR Part 312. This section contains a summary of findings, opinions and conclusions made by this assessment. However, this section, alone, does not constitute the complete assessment. The report must be read in its entirety.

Summary of Project Details

Primary Street Address:	95 Argonaut				
City:	Aliso Viejo	County:	Orange	State:	California
Tax ID/Parcel Number:	623-091-01; Per Assessor				
Property Owner:	Argonaut Offices LLC (per the RealQuest.com and Lightbox)				
Zoning Designation:	Commercial; Per Assessor				
Approx. Property Area:	2.85 acres (per Assessor)				
Buildings:	One (1)				
Approx. Building Size:	49,975 feet (per Assessor)				
Approx. Year Built:	1989 (per Assessor)				
Commercial Occupants:	Various commercial office tenants-see rent roll attached in Appendix C				
Current Use:	Commercial Office				
Site Visit Personnel:	Vivianne Bisson				
Site Contact/Company:	Emma Hill / Meritage Homes				
Site Escort/Company:	Mayroth Urias / Lincoln Property Company				
Inspection Date:	April 16, 2024				
Weather Conditions:	70° F / clear

1.2 Findings, Opinions and Conclusions

Recognized Environmental Conditions & Significant Data Gaps

Hillmann has performed a Phase I Environmental Site Assessment in accordance with the scope and limitations of ASTM Practice E 1527-21 of the Subject Property as described in Section 2.2 of this report. Any additions to, exceptions to, or deletions from this practice are also described in Section 2 of this report.

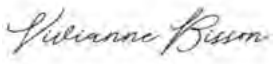
This assessment has revealed no recognized environmental conditions (RECs), controlled recognized environmental conditions (CRECs) or significant data gaps (SDGs) in connection with the Subject Property.

RECOGNIZED ENVIRONMENTAL CONDITIONS
No RECs were identified.
CONTROLLED RECOGNIZED ENVIRONMENTAL CONDITIONS
No CRECs were identified.
SIGNIFICANT DATA GAPS
No SDGs were identified.
RECOMMENDATIONS
Based on the finding of no RECs, CRECs or SGDs, it is Hillmann's opinion that no additional action or investigation is warranted at this time.

Historical Recognized Environmental Conditions (HRECs)

If identified, *historical recognized environmental conditions* (HRECs) in connection with the Subject Property are described below:

HISTORICAL RECOGNIZED ENVIRONMENTAL CONDITIONS
No HRECs were identified.



De Minimis and Other Environmental Conditions

If identified, *de minimis* and other environmental conditions are described below:

OTHER ENVIRONMENTAL CONDITIONS / DE MINIMIS CONDITIONS
The Property appears to have been developed as agricultural land from at least 1938 to 1981. Given the 43 years since any agricultural use as well as the grading activities of current development, it is Hillmann's opinion that any remaining pesticide contamination is unlikely and therefore this is not considered to be a REC in connection with the Property.

Environmental Professional Statement

I/We declare that, to the best of my professional knowledge and belief, I/we meet the definition of Environmental professional as defined in § 312.10 of 40 C.F.R. 312. I/we have the specific qualifications based on education, training and experience to assess a property of the nature, history and setting of the subject property. I/We have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 C.F.R. Part 312.

Vivianne Bisson
Environmental Professional

David Rutherford
Environmental Professional

1.3 Business Environmental Risks / Non-ASTM Scope

Hillmann has performed a limited review of the following potential *business environmental risks* (BER), also known as "*Non-ASTM Scope*" concerns, in accordance with the contracted scope of work scope for this assessment. Additional details of the scope of work and findings are included in Sections 2 and 7.

Subject	Findings	Not Appl.	Rpt. Ref.
Asbestos	Suspected ACM noted within the accessed building areas included drywall materials, vinyl floor tiles, ceiling tiles and mastic. Although not observed, roofing materials are also assumed ACM.		7.1
Lead Paint	No residential buildings built prior to 1978 were present at the Property.		7.2
Radon	Property is located in the USEPA radon designation Zone 2 or 'moderate risk' area for radon.		7.3
Mold/ Microbial Damage	No evidence of significant problems with moisture intrusion or mold/ microbial growth was noted at the Subject Property.		7.4
NWI Wetlands	A review of NWI Wetlands Mapper did not indicate regulated wetland areas on the Property.		7.5
Lead in Drinking Water	Potable water service at the Property is provided by a utility connection with Moulton Niguel Water District. A recently published water quality report from the utility indicated compliance with USEPA water quality standards for lead in drinking water.		7.6

2.0 GENERAL

2.1 Purpose and Scope

This assessment was conducted utilizing generally accepted Phase I ESA industry standards in accordance with the ASTM Standard Practice E 1527-21. The ASTM describes these methodologies as representing good commercial and customary practice for conducting an environmental site assessment of a parcel of commercial real estate with respect to the range of contaminants within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. § 9601) and petroleum products. This practice is intended to permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner or bona fide prospective purchaser limitations on CERCLA liability ("landowner liability protections," or "LLPs"): that is, the practice that constitutes all appropriate inquiries into the previous ownership and uses of the Subject Property consistent with good commercial and customary practice as defined at 42 U.S.C. §9601(35) (B). The goal of the processes established by ASTM E1527-21 is to identify *recognized environmental conditions* in connection with the Subject Property.

The term *recognized environmental condition* (REC) is defined by ASTM E1527-21 as "*(1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment.*"

The term *controlled recognized environmental condition* (CREC) is a type of recognized environmental condition and defined by ASTM E1527-21 as a "*recognized environmental condition affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of required controls (for example, activity and use limitations or other property use limitations).*"

The term *historical recognized environmental condition* (HREC) is defined as a "*previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations).*" The ASTM E1527-21 standard has clarified that a historical recognized environmental condition is not a recognized environmental condition.

The term *de minimis condition* is defined by the ASTM, "*…a condition related to a release that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.*" A condition determined to be a de minimis condition is not REC nor a CREC.

The chief components of this assessment are generally described as follows:

- A non-invasive visual reconnaissance of the Subject Property and adjoining properties in accordance with ASTM guidelines for evidence of RECs.

- Interviews of past and present owners and occupants and state and local government officials, seeking information related to the potential presence of RECs at the Subject Property.

- A review of standard physical record sources for available topographic, geologic and groundwater data.

- A review of standard historical record sources, such as fire insurance maps, city directories, aerial photographs, prior reports and interviews, etc., to determine prior uses of the Subject Property from the present, back to the Subject Property's first developed use, or back to 1940, whichever is earlier.

- A review of standard environmental record sources including federal and state environmental databases, and additional environmental record sources, to identify potential regulatory concerns with the Subject Property, adjoining properties and properties located within the surrounding area.

An evaluation of environmental or other regulatory compliance matters is excluded from the scope of this assessment.

These methodologies are described as representing good commercial and customary practice for conducting an Environmental Site Assessment of a property for the purpose of identifying recognized environmental conditions.

Business Environmental Risks/Non-ASTM Scope Considerations

Hillmann has performed a limited review of the following potential *business environmental risks* (BER), also known as "*Non-ASTM Scope*" concerns, in accordance with the contracted scope of work scope for this assessment. BER is defined by ASTM E 1527-21 as *"a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice."*

- Asbestos-Containing Materials (ACM): A cursory non-intrusive visual screening for the presence of suspect ACM within the accessed areas of buildings built prior to 1990 on the Subject Property. If the Subject Property contains buildings built in 1990 or later, the contracted scope of work excludes a cursory non-intrusive visual screening or any other level of evaluation for suspect ACM; however, the exclusion for buildings built ≥1990 should not be interpreted to suggest that any such buildings are free of ACM or would not warrant evaluation of building materials for ACM prior to disturbance. It is emphasized that this cursory non-intrusive visual screening does not constitute an asbestos survey/inspection of the premises. An asbestos survey/inspection should be sought by the report User(s) if a greater certainty is desired regarding ACM and potential asbestos hazards at the Subject Property. Furthermore, a review of regulatory compliance matters pertaining to asbestos is excluded from the scope of work.

- Lead-Based Paint (LBP): A cursory non-intrusive visual screening of the condition of painted surfaces in the accessed areas of residential buildings/units built prior to 1980 on the Subject Property. If the Subject Property contains buildings built in 1980 or later, the contracted scope of work excludes any cursory non-intrusive visual screening or other level of evaluation for suspect LPB; however, the scope of work exclusion for building built ≥1980 should not

be interpreted to suggest that any such buildings are free of LPB or other lead hazards. It is emphasized that this cursory non-intrusive visual screening does not constitute a comprehensive survey for LBP or potential lead hazards. A comprehensive inspection should be sought by the report User(s) if more certainty is desired regarding LBP at the Subject Property. Furthermore, a review of regulatory compliance matters pertaining to lead-based paint is excluded from the scope of work.

- USEPA Designated Radon Potential: Review of general non-site specific data published by the USEPA regarding the Radon Zone classification for the area of the Subject Property.

- Mold/Microbial Damage: A cursory non-intrusive visual screening within the accessed areas of buildings on the Subject Property for evidence of systemic microbial problems, including visible mold growth, water damaged building materials or musty odors. It is emphasized that this cursory non-intrusive visual screening does not constitute a comprehensive survey for moisture/mold/microbial damage. A more comprehensive inspection should be sought by the report User(s) if more certainty is desired regarding the potential for moisture/mold/microbial damages at the Subject Property.

- NWI Wetlands: The Subject Property has been reviewed for jurisdictional wetlands using the National Wetlands Inventory-Wetland Mapper to determine whether mapped federal wetlands have been indicated on the Subject Property. Any further evaluation or legal delineation of regulated wetlands areas is excluded from the scope of work. It is also emphasized that a field delineation of regulated wetlands by a qualified professional would be warranted to more fully determine the presence or absence of regulated wetlands at the Subject Property.

- Lead in Drinking Water: Review of the potential for elevated levels of lead in the drinking water by determining the source of the drinking water supply and a review of available testing or compliance data reports.

2.2 Property Location/Legal Description

Property location and legal description details are described as follows:

Primary Street Address:	95 Argonaut				
City:	Aliso Viejo	County:	Orange	State:	California
Tax ID/Parcel Number:	623-091-01; Per Assessor				
Approx. Land Area:	2.85 acres (per Assessor)				
Apprx. Latitude/Longitude:	North 33.5945930 - 33˚35’ 40.53” degrees/West 117.7244490 - 117˚43’ 28.01” degrees				
Additional Details (if appl.)	N/A				
Property Owner:	Argonaut Offices LLC (per the RealQuest.com and Lightbox)				
Zoning Designation:	Commercial; Per Assessor				

2.3 Data Gaps

A *data gap* is defined by the ASTM as a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. A data gap is only significant if other information and/or professional experience raises reasonable concerns involving the data gap and the ability to determine the presence or absence of recognized environmental conditions. The following table summarizes data gaps encountered during the assessment as well as a discussion of their significance.

Data Gap:	Significant (Yes/No)?	Discussion
Historical records data failure	No	Records gaps exceeding five years were encountered; however, no significant site use changes are suspected during these intervals.

2.4 ESA Report Component Dates/Viability

The ASTM E1527-21 standard states that an environmental site assessment (ESA) is presumed to be viable when it is conducted within 180 days prior to the date of acquisition of the Subject Property (or, for transactions not involving an acquisition such as a lease or refinance, the date of the intended transaction). Specifically, all of the following components must be conducted or updated within 180 days prior to the date of acquisition or prior to the date of the transaction. The following table summarizes the component completion dates:

ESA Component	Completion Date
Interviews:	April 15, 2024
Env. Lien Search:	Excluded from report scope.
Government Records Review:	April 11, 2024
Visual Inspections:	April 16, 2024
Env. Professional Declaration:	April 24, 2024

2.5 User Reliance

This report is for the exclusive use of MLC Holdings, Inc. and additional relying entities, if any, named on the front cover. No additional individuals or entities shall be permitted to rely upon any data, interpretation, reports or other information or documentation contained in this report, without first obtaining the consent of MLC Holdings, Inc.; and without obtaining written consent from Hillmann in the form of a reliance agreement/letter.

Hillmann may, in its sole discretion, withhold its consent to additional reliance and/or Hillmann may condition consent for reliance upon payment of a fee or other conditions.

2.6 Significant Assumptions

The following significant assumptions are made:

- The site operations at the time of the site visit are assumed to reflect typical site conditions relative to potential environmental conditions and that no concealment of environmental conditions or releases by site owners or occupants has occurred. Likewise, it is assumed that no areas of the Subject Property with potential environmental concerns or RECs were concealed or otherwise not reported, intentionally or unknowingly, by the Subject Property owners/occupants and/or site escort at the time of the site visit.

- For the purpose of estimating the approximate direction of groundwater flow in the absence of site-specific groundwater data, unless indicated otherwise, an assumption has been made that the gradient of groundwater flow follows the surface topography of the Subject Property and immediate surrounding area.

2.7 General Limitations and Exceptions

Limitations

The report turnaround time specified by the contract agreement for this assessment may present a limitation to the availability of pertinent regulatory agency records. Such limitations, if encountered, would be further specified in Section 4.1.

Significant limitations related to the condition or accessibility of the Subject Property at the time of the site reconnaissance, if encountered, are reported in Section 6.1.

Other Exceptions or Deletions

No other exceptions or deletions from the ASTM Standard E 1527-21 are reported.

Special Terms and Conditions

This Phase I Environmental Site Assessment has been prepared using reasonable efforts in each phase of its work to identify recognized environmental conditions associated with hazardous substances, wastes and petroleum products at the Subject Property. Findings within this report are based on information collected from observations made on the day of the site reconnaissance and from reasonably ascertainable information obtained from governing public agencies and private sources.

This report is not definitive and should not be assumed to be a complete or specific definition of the conditions above or below grade. Information in this report is not intended to be used as a construction document and should not be used for demolition, renovation, site development, redevelopment, or other construction purposes. No representation or warranty is made that the past or current operations at the Subject Property are, or have been, in compliance with all applicable federal, state and local laws, regulations and codes.

Findings, conclusions and recommendations presented in this report are based on visual observations of the Subject Property, interviews conducted, the records reviewed, information provided by the Client, and/or a review of readily available and supplied drawings and documents.

No warranty or guarantee is made of the accuracy or completeness of information that was obtained from ostensibly knowledgeable individuals, regulatory agency representatives or other secondary sources, including information obtained during the assessment, whether written, graphic or verbal, provided by the Subject Property contact(s) or as shown on any documents reviewed or received from the Subject Property contact, owner or agent, or government agency source. Independent verification of the accuracy or completeness of all information reviewed or received during the course of this assessment is not made and excluded from the scope of work for this assessment.

Regardless of the findings stated in this report, Hillmann is not responsible for consequences or conditions arising from facts that were concealed, withheld or not fully disclosed at the time the assessment was conducted.

This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated.

The regulatory database report provided is based on an evaluation of the data collected and compiled by a contracted data research company. Hillmann can neither warrant nor guarantee the accuracy or completeness of the information obtained from the regulatory database report provider during the course of this assessment.

Subsurface conditions may differ from the conditions implied by the surface observations and can only be reliably evaluated through intrusive techniques.

Reasonable efforts have been made during this assessment to identify aboveground and underground storage tanks and ancillary equipment. Reasonable efforts are limited to information gained from visual observation of largely unobstructed areas, recorded database information held in public record and available information gathered from interviews. Such methods may not identify surficial and subsurface features that may have been hidden from view due to parked automobiles and other vehicles, snow cover, vegetative growth, pavement, construction or debris pile storage or incorrect information from sources.

No guarantee, explicit or implied, is made that the records pertaining to historical ownership or occupancy which were reviewed represent a comprehensive or precise delineation of past Property ownership or tenancy for legal purposes.

The ASTM E1527-21 standard states that recommendations are not required to be included in a Phase I ESA report; however, further that recommendations are an additional service that may be useful in the User's analysis of landowner liability protections or business environmental risks; and that the User should consider whether recommendations for additional inquiries or other services are desired.

Recommended response actions offered in Section 1.3, if any, are provided as an option to the Client, and may have taken into account the Client's relation to the Subject Property and/or their intended purpose of this assessment. If included, it is not intended by Hillmann to represent the only course(s) of action, or inaction, to take. Furthermore, it is emphasized that additional response actions may become advisable depending on the outcome of the initial action(s) taken. Hillmann advises that Client and any additional authorized relying parties as specified on the report Cover and Section 2.5, or via letter of reliance extension, undertake consultation with

legal counsel familiar with environmental and real estate law would be beneficial to the decision making process for the type and timing of a response action to identified RECs or Business Environmental Risks, if any.

Due to the limited nature of our review of potential Business Environmental Risks, the User(s) of the report should consider whether to take additional action(s) to further define, properly manage and/or mitigate potential BERs.

The User(s) assumes responsibility for business decisions that it makes utilizing information in the report provided by Hillmann. Hillmann shall not be responsible for any conclusions, interpretations and/or decisions of the User(s).

In the event of any conflict between the terms and conditions of this report and the terms and conditions of the consulting services agreement for this project, the consulting services agreement shall control.

3.0 USER PROVIDED INFORMATION

The term "User" is defined by ASTM as the party seeking to use Practice E1527 to complete an environmental site assessment of the Subject Property; specifically, the entity or entities named on the front cover to which the report has been addressed.

3.1 Prior Environmental Reports/Documentation

No prior environmental reports/documentation were provided.

3.2 User Responsibilities

A User Questionnaire was provided to the User to assist in gathering information, as detailed below, that is required for disclosure during the assessment to meet All Appropriate Inquiry requirements. If completed and returned to Hillmann, a copy of the Questionnaire has been included in Appendix C.

A completed questionnaire was received by Hillmann. The following is a summary of the User's responses:

Question:	Yes/No:	Detail:
1. Search of Land Title and Judicial Records: Has the User performed a search of land title records and judicial records for environmental liens and/or Activity and Use Limitations (AULs) filed or recorded against the Subject Property?	No	N/A
1.a. If yes to Question 1: Did the search identify any environmental liens or Activity and Use Limitations (AUL), such as engineering controls, land use restrictions or institutional controls that are in place at the Subject Property and/or have been filed or recorded against the Subject Property under federal, tribal, state or local law?	N/A	N/A
1.b. If yes to Question 1: Has the User provided the result of the search of land title and judicial records to Hillmann?	N/A	N/A
2. Specialized knowledge or experience of the person seeking to qualify for the LLP: Do you have any specialized knowledge or experience related to the Subject Property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the Subject Property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?	No	N/A
3. Relationship of the purchase price to the fair market value of the Subject Property if it were not contaminated: Does the purchase price being paid for this property reasonably reflect the fair market value of the Subject Property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the Subject Property?	Yes	N/A
4. Commonly Known or Reasonably Ascertainable Information: Are you aware of commonly known or reasonably ascertainable information about the Subject Property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example:	No	None.
4.a. Do you know the past uses of the Subject Property?	Yes	Office Space

4.b. Do you know of specific chemicals that are present or were once present at the Subject Property?	No	N/A
4.c. Do you know of spills or other chemical releases that have taken place at the Subject Property?	No	N/A
4.d. Do you know of any environmental cleanups that have taken place at the Subject Property?	No	N/A
5. The degree of obviousness of the presence or likely presence of contamination at the Subject Property, and the ability to detect the contamination by appropriate investigation: Based on your knowledge and experience related to the Subject Property are there any obvious indicators that point to the presence or likely presence of releases at the Subject Property?	No	N/A
6. Litigation, Administrative Proceedings, Government Notices: As the User of this ESA, do you have knowledge of (1) any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the Subject Property; (2) any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on or from the Subject Property; and (3) any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.	No	N/A
7. User's Reason/Purpose for Performing Phase I ESA:	For due diligence of a future residential development.	

4.0 RECORDS REVIEW

4.1 Environmental Information

Physical Setting

Source	Discussion
USGS 7.5 minute Topo Map:	The Subject Property lies at an elevation of approximately 397 feet above mean sea level. An interpretation of topographic contour lines as well as a review of the EDR Geocheck-General Topographic Gradient suggested terrain sloping downward towards the southeast.
USDA Soil Data: (EDR GeoCheck)	The soil type at the Subject Property is classified as: Colleguas; well-drained, clay loam and sandy loam.
Geologic Data: (EDR GeoCheck)	The geologic formation in the vicinity of the Property is described as, Cenozoic Tertiary; Stratified Sequence
Prior Env. Reports: (Section 3.2)	Not applicable - no prior reports available.
Additional Sources/ Data:	No additional physical setting sources or data was obtained.
Groundwater Flow Discussion:	Based on a review of the above information as well as observation of the site, the direction of shallow groundwater flow at the site is inferred to be towards the southeast.

Federal, State and Tribal Environmental Record Sources

Standard government records were obtained and reviewed primarily via a third-party regulatory database report, titled EDR Radius Map™ Report, prepared by Environmental Data Resources of Shelton, CT. The report provided government records from the standard environmental resources and within minimum search distances specified by Section 8.2.2-Table 2 of the ASTM E1527-21; and were reviewed for the purpose of identifying potential RECs in connection with the Subject Property. Additional detail of the source and significance of the regulatory databases can be found in the regulatory database report in Appendix E. Hillmann has also included discussion of records pertaining to the Subject Property from other government record sources not specifically listed under Table 2, as applicable.

Reported distances for adjoining property listings, if applicable, are approximate and indicative of the presence of a public roadway or right-of-way between the adjoining site and Property.

The reported gradients have been estimated based on a number of factors including but not necessarily limited to field observation, review of topographic maps, database listing details and/or site specific geo-technical data.

Limited analysis of the details of on-site, adjoining and vicinity database sites was conducted to identify potential sources of sub-surface vapor encroachment. This review was based on elements of the ASTM “Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions” (ASTM E 2600-15); and also on elements of “Methodology for Identifying the Area of Concern Around a Property Potentially Impacted by Vapor Migration from Nearby Contaminated Sources” (Buonicore, 2011-S-103-AWMA). Vicinity database sites

pertaining to non-petroleum product releases within 1,760 feet of the Subject Property in the up-gradient direction, 365 feet of the Subject Property in the cross gradient direction and 100 feet of the Subject Property in the down gradient direction; and vicinity database sites pertaining to petroleum product releases within 528 feet of the Subject Property in the up-gradient direction, 165 feet of the Subject Property in the cross gradient direction and 100 feet of the Subject Property in the down gradient direction were reviewed to identify active contamination sites with the potential to affect subsurface vapor conditions at the Subject Property. The potential for vapor encroachment was considered in assessing whether or not a REC exists in connection with the Subject Property when reviewing applicable sites within those distances.

Regulatory database sites with active petroleum or non-petroleum releases that are considered to constitute a vapor encroachment condition (VEC) to the Subject Property, if any, are identified and discussed in this section.

The EDR Radius Map report is attached in Appendix D.

Subject Property Listings

The following listings of the Subject Property were identified:

Name/Address:	SUN ALLIANCE/95 ARGONAUT
Database(s):	HWTS
Data Discussion:	The site is listed in HWTS database from 1998 to 2000; EPA ID: "CAL000188181. " The status is listed as "Inactive." No other pertinent information is listed.
REC Discussion:	The listing does not represent a release to the site. Based on the details provided above, a REC is not suspected in connection with the Subject Property.
VEC Discussion:	Based on the reviewed data, a VEC is not suspected.

Adjoining Property Listings

The following adjoining property listings were identified.

Name/Address:	INCEPTUS MEDICAL/ 8 Argonaut, suite 100
Database(s):	RCRA NonGen / NLR
Dist./Dir./Gradient:	242 feet/SW/down and cross-gradient
Data Discussion:	EPA number: "CAL000188181." Opened on 02/23/1998, Closed on 06/30/2000. Status is listed as "Inactive". No violations reported. No other pertinent information given.
REC Discussion:	This listing is not an indication of a hazardous materials release to the environment and is down-gradient from the Subject Property. Based on the details provided above, a REC is not suspected in connection with the Subject Property.

VEC Discussion:	This listing is not an indication of a hazardous materials release to the environment and is down-gradient from the Subject Property. Based on the reviewed data, a VEC is not suspected.

Name/Address:	SOFT HEALTH TECHNOLO/ 8 Argonaut, suite 170
Database(s):	RCRA NonGen / NLR
Dist./Dir./Gradient:	242 feet/SW/down and cross-gradient
Data Discussion:	EPA number: "CAL000472373." No violations reported. NAICS Description: ALL OTHER MISCELLANEOUS MANUFACTURING. No other pertinent information given.
REC Discussion:	This listing is not an indication of a hazardous materials release to the environment and is down-gradient from the Subject Property. Based on the details provided above, a REC is not suspected in connection with the Subject Property.
VEC Discussion:	This listing is not an indication of a hazardous materials release to the environment and is down-gradient from the Subject Property. Based on the reviewed data, a VEC is not suspected.

Surrounding Area Findings

The following is a discussion of non-adjoining sites identified as located within the ASTM specified search distance surrounding the Subject Property. In order to keep this discussion informative and concise, discussion(s) is/are provided of the listed site(s) for each database category that appears most likely to impact the Subject Property based on distance, area topography and/or regulatory status. Listings of sites within the applicable search distances not specifically discussed below were reviewed and concluded not to be RECs in connection with the Subject Property or VECs based on various factors including distance, area topography, known or inferred groundwater flow direction and/or regulatory status.

Unmapped/Orphan List Sites

Hillmann has also reviewed a list of unmapped sites (a.k.a. “Orphan List” sites) indicated by the database report. Unmapped sites that were identified as falling within an applicable specific search distance or warranting discussion have either been discussed in the preceding tables or are detailed below:

Name/Address:	• Artistic Maintenance Inc/ SE Corner Moulton & Ridge Rout • Golden Rain Foundation of Lag Hill/ 24401 Moulton PKY
Database(s):	• CPS-SLIC, respectively • LUST, EMI, respectively
Dist./Dir./Gradient:	• Approximately, 10,560 feet northeast, respectively • Approximately, 15,840 feet northeast, respectively
Data Discussion:	• Artistic Maintenance is listed as a "Completed - Case Closed" release site, dated 1995. No other pertinent information is given. • Golden Rain Foundation of Lag Hill is listed as a "Case Closed" release site, dated 1985; soils only; gasoline. It is also listed in 2002, 2003 and 2004 as emitting, Organic Hydrocarbon Gases, Reactive Organic Gases, Carbon Monoxide, NOX - Oxides of Nitrogen, SOX - Oxides of Sulphur, and Particulate Matter. No other pertinent information is given.
REC Discussion:	The site is "Inactive" and is "Case Closed." Based on the details provided above, a REC is not suspected in connection with the Subject Property.
VEC Discussion:	The site is "Inactive" and is "Case Closed." Based on the reviewed data, a VEC is not suspected.

Additional Environmental Record Sources

Requests have been submitted to local, municipal and state agencies for pertinent records pertaining to the Subject Property, particularly with regard to potential environmental concerns such as petroleum storage tanks, storage and usage of hazardous substances and petroleum products, and/or known or suspected environmental contamination. Where applicable, internet research of government environmental regulatory databases was also conducted, as well as a general cursory internet search of the Subject Property address, for information indicative of a REC. The following table summarizes the findings of the research:

Source	Type of Request	Outcome
Orange Co. Health Care Agency CUPA	FOI request	A records request was submitted on April 10, 2024. A response was received on April 17, 2024. No records for the Subject Property were located.
CA GeoTracker database (geotracker.waterboards.ca.gov/)	Online search	Hillmann searched online for records pertaining to the Subject Property. No records pertaining to the Subject Property are currently listed.
CA DTSC Envirostor database (www.envirostor.dtsc.ca.gov/public/)	Online search	Hillmann searched online for records pertaining to the Subject Property. No records pertaining to the Subject Property are currently listed.
CA DTSC	Online search	Hillmann searched online for records pertaining to the Subject Property. No records pertaining to the Subject Property are currently listed.
South Coast Air Quality Management District (SCAQMD)	Online search	Hillmann searched online for records pertaining to the Subject Property. No records pertaining to the Subject Property are currently listed.
EPA Envirofacts (https://enviro.epa.gov/)	Online search	Hillmann searched online for records pertaining to the Subject Property. No records pertaining to the Subject Property are currently listed.
Cal EPA Regulatory Site Portal (https://siteportal.calepa.ca.gov/nsite/map/help)	Online search	Hillmann searched online for records pertaining to the Subject Property. No records pertaining to the Subject Property are currently listed.
DOGGR - Well Finder (https://maps.conservation.ca.gov/doggr/wellfinder/#openModal)	Online search	Hillmann searched online for records pertaining to the Subject Property. No records pertaining to the Subject Property are currently listed.
NPMS - National Pipeline Mapping System (https://pvnpms.phmsa.dot.gov/PublicViewer/)	Online search	Hillmann searched online for records pertaining to the Subject Property. No records pertaining to the Subject Property are currently listed.
SoCal Pipeline Mapping System (https://www.socalgas.com/stay-safe/	Online search	Hillmann searched online for records pertaining to the Subject Property. No records pertaining to the Subject Property are currently listed.

Source	Type of Request	Outcome
pipeline-and-storage-safety/ natural-gas-pipeline-map)		
FEMA Flood Maps (https://hazards-fema.maps.arcgis.com/apps/webappviewer/index.html?id=8b0adb51996444d4879338b5529aa9cd)	Online search	Hillmann searched online for records pertaining to the Subject Property. The Subject Property is listed in Flood Zone X; AREA OF MINIMAL FLOOD ALISO HAZARD.
Local Building/ Code Enforcement (https://alisoviejoca-energovpub.tylerhost.net/apps/SelfService#/search)	Online search	Hillmann searched online for records pertaining to the Subject Property. The following pertinent information was listed: Four (4) permits are listed as follows: • "Demo and new construction of self-storage site prelim meeting". 9/28/2022. • "Building to self-storage facility, with additional exterior single-story self-storage units on site at 95". 7/5/2023. • "Pre-Application Review for a proposed town-home development (62 townhomes, 2.85 acres, 2-4 bedrooms) at 95". 3/25/2024. • "Pre-Application Review for a proposed housing development: 54, 3-story townhomes at 95 Argonaut" 1/18/2024.
Orange Co. Assessor/ Real Quest	Online search	Hillmann searched online for records pertaining to the Subject Property. The following pertinent information was listed: • APN: 623-091-01 • Constructed in 1989 • Commercial • Owner: Cathie D Feilberg • 2.85 acres

4.2 Historical Research

Historical records have been compiled and analyzed for historical property information and developing a history of previous uses of the Subject Property, adjoining properties and surrounding area. These records were reviewed for the purpose of identifying the likelihood of past uses having led to RECs in connection with the Subject Property.

The historical record sources listed below have been sought with the objective to document past uses of the Subject Property from the present back to the Subject Property's first developed use, or back to 1940, whichever is earlier. The term "developed use" includes agricultural use, placement of fill dirt and other uses that do not involve structures. Hillmann has sought to review historical records in minimum intervals of five years.

Fire Insurance Maps

A Certified Sanborn Map Report was obtained from EDR for a review of published historical fire insurance maps for the Subject Property and surrounding area. The following is a summary of site uses and notable details depicted by the available maps:

Year(s)	Subject Property	Adjoining Properties
N/A	NO COVERAGE.	NO COVERAGE.

A copy of the Certified Sanborn Map Report is attached in Appendix E.

City Directories

An EDR City Directory Abstract report was reviewed for data of prior occupants of the Subject Property's street address. The following is a generalized summary of the findings of city directory research for past occupants of the Subject Property.

Subject Property Use(s) / Occupant(s)	Years
No Listings	1920 to 1981
Numerous commercial office tenants	1982 to 2020

The EDR City Directory Abstract report was also reviewed for listings of prior occupants of the adjoining properties. The following is a generalized summary of the findings of city directory research for past occupants of the adjoining properties:

Adjoining Property Use(s) / Occupant(s)	Years
No listings	1920 to 1969
Numerous general office listings (SE; 85 Argonaut)	1992 to 2020
Numerous general office listings (SW; 92 Argonaut)	1992 to 2020
Numerous general office listings (West; 1 Argonaut)	1992 to 2020
Numerous general office listings (West; 5 Argonaut)	1992 to 2020
Water tanks (East; 25343 Cedarbrook)	Not listed
Community Park/ B- MA GICA L, MIND-BODY, MEDICINAE, BULENT GUNDOGAR (North; 118 Playa Circle)	2014, 2020

A copy of the EDR City Directory report is attached in Appendix E.

Historical Topographic Maps

Historical topographic maps of the Property and vicinity obtained from an EDR Historical Topographic Map report (as attached in Appendix E) have been reviewed. The following interpretation of land usage was made by review of the maps:

Year(s)	Subject Property	Adjoining Properties
2022, 2018, 2015, 2012, 1981, 1974, 1968, 1949, 1948, 1942, 1902	No structures depicted. An intermittent creek is depicted along north-central portion of the site.	No structures depicted.

If obtained, copies of historical aerial photographs have been included in Appendix E.

Historical Aerial Photographs

Historical aerial photographs of the Property and vicinity obtained from an EDR Aerial Photo Decade Package report, as attached in Appendix E, were reviewed. The following interpretation of land usage was made by review of the aerial photographs:

Year(s)	Subject Property	Adjoining Properties
1938, 1946, 1952, 1963, 1967, 1972, 1974 and 1981	Appears to be a combination of vacant, graded land and agricultural land.	Appears to be a combination of vacant, graded land and agricultural land.
1989	Appears to be graded land with the footprint of current improvements.	Appears to be current improvements to the east, south, and west. Across a roadway to the north, appears to be vacant, graded land.
1994	Appears to be current improvements.	Appears to be no significant changes from prior photograph.
2002	Appears to be no significant changes from prior photograph.	Appears to be no significant changes from prior photograph to the east, south, west and northeast. Across a roadway to the northeast, appears to be developed with a park, a commercial building and parking lot.
2005	Appears to be no significant changes from prior photograph.	Appears to be no significant changes from prior photograph to the east, south, west and northeast. Across a roadway to the northeast, appears to be developed with a park, three (3) additional commercial buildings and a parking lot.

Year(s)	Subject Property	Adjoining Properties
2009	Appears to be no significant changes from prior photograph.	Appears to be no significant changes from prior photograph to the east, south, west and northeast. To the northwest and northeast across a roadway appears to be graded land partially developed with current improvements.
2012 to 2020	Appears to be no significant changes from prior photograph.	Appears to be current improvements.

If obtained, copies of historical aerial photographs have been included in Appendix E.

EDR High-Risk Historical Records

The EDR Radius Map™ report, which is discussed in greater detail in Section 4.1 and attached in Appendix D, provided a search of proprietary databases of potential historical high-risk uses at or in the vicinity of the Subject Property. These databases include EDR Hist Cleaner – a database of property addresses with records of historical occupancy by suspected cleaners businesses; EDR Hist Auto – a database of property addresses with records of historical occupancy by potential automotive gas/filling stations and repair facilities; and EDR MGP- a proprietary database of sites historically occupied by manufactured gas plants and related facilities.

EDR Database	On-site Listings	Adjoining/Off-site Listings
EDR Hist Cleaner: (on-site/adjoining only)	None identified	None identified
EDR Hist Auto: (on-site/adjoining only)	Corte Fina Homeowners Assoc-95 Argonaut is listed for the years 2007 and 2008 as "Gasoline Service Stations, NEC". No other information is listed. The listing appears to be an administrative listing only and does not indicate that a historical auto station previously existed at the Subject Property.	None identified
EDR MGP: (1-mile distance)	None identified	None identified

Petroleum/Natural Gas Well Review

No record of any historical petroleum/natural gas wells at or adjoining the Property was identified.

Additional Historical Data

Where applicable, the following additional pertinent historical data was obtained:

Interviews/ Anecdotal:	No additional pertinent historical data was obtained.
Local Gov't Records:	No additional pertinent historical data was obtained.
Prior Env. Reports:	Not applicable; no prior reports were provided.
Site Observations:	Indications of historic uses of the Property or adjoining properties were not observed during the site reconnaissance.
Other Sources:	No additional pertinent historical data was obtained.

Summary of Identified Historical Uses

The following table presents a summary of the types and approximate date ranges of identified prior uses of the Subject Property:

Date Range	Subject Property Use(s)
1938 to 1988	Agricultural
1989 to Present	Commercial office building with parking lot.

The following table presents a summary of the types of identified prior uses of the adjoining properties:

Date Range	Adjoining Property Use(s)
1938 to 1989	Agricultural
1990 to Present	Single-family residential, office buildings, and a community park.

Historical Records Data Failure

The ASTM E1527-21 standard defines data failure as failure to achieve the historical research objective even after reviewing the standard historical sources that are reasonably ascertainable and likely to be useful. The objective is to identify all obvious uses of the Subject Property from the present, back to the Subject Property's first developed use, or back to 1940, whichever is earlier. Furthermore, records of historical use/conditions were sought in intervals no less than approximately five years, unless the Subject Property conditions appear unchanged over a longer interval. In encountered, data failure and its significance as a data gap is discussed below:

Objective	Met?	Detail	Significant?
First developed use/ date determined?	No	The earliest documented use of the Property was agricultural land circa 1938.	No

Objective	Met?	Detail	Significant?
Record sources at 5-year intervals back to 1940 or first developed use?	No	Historical record gaps exceeding five years were encountered. However, significant site-use changes or undiscovered site uses appear unlikely to have occurred during the record gaps.	No
All obvious prior uses identified?	Yes	See Summary of Identified Past Uses of this section.	N/A

Please refer to Section 2.3 for additional discussion of data gaps and their significance to the findings of the assessment.

Historical Uses REC Discussion

The review of historical records did not indicate evidence of a REC in connection with the Property.

5.0 INTERVIEWS

5.1 Interviews with Owners, Operators and Occupants

Property Owner

Property Owner	Contact Name	Affiliation	Interview Type	Date
Argonaut Offices LLC (per the RealQuest.com and Lightbox)	Mayroth Urias	Owner's agent	Questionnaire	04/10/24
See Key Site Manager interview details below.				

Key Site Manager/Operator

Name	Company/Title	Yrs @ Site	Interview Type	Date
Mayroth Urias	Lincoln Property Company/Assistant Property Manager, Property Management	13	In person	04/16/24
An interview was conducted in person at the time of the site visit. Pertinent information, where applicable, is referenced in the appropriate sections of this report.				

Occupant(s)

Name	Company/Title	Yrs @ Site	Interview Type	Date
N/A				
No occupant interviews were conducted.				

Prior Owners/Operators/Occupant(s)

Name	Company/Title	Yrs @ Site	Interview Type	Date
N/A	N/A		N/A	
No interviews of prior owners, operators or occupants were conducted.				

Neighboring Property Owner(s)/Occupant(s)

Name	Company/Title	Yrs @ Site	Interview Type	Date
(none)	N/A		N/A	
The Subject Property was not an abandoned property with evidence of unauthorized uses or uncontrolled access; therefore, interviews with adjoining or nearby property owners or occupants were not conducted.				

5.2 Interviews with State and/or Local Government Officials

State and/or local governmental officials have been interviewed to obtain information of potential RECs in connection with the Subject Property. Many government agencies and their officials require submittal of written request for records in order to respond. The details in Section 4.1 list the various state and local government agencies contacted as part of this assessment, and the outcome of each inquiry. In addition, the details of regulatory database research in Section 4.1 may have included detail of interviews with officials pertinent to government records review and identification of RECs.

Additional interview of government officials not previously detailed in Sections 4.1 are discussed below, if applicable.

Name	Agency Name/Title	Interview Type
(None)	N/A	N/A
Interview Outcome/Findings:		
No additional local/state government officials were interviewed.		

6.0 SITE RECONNAISSANCE

6.1 Methodology and Limiting Conditions

A site reconnaissance was conducted to collect information and make observations to help identify RECs in connection with the Subject Property. This included visual and/or physical observations of the Subject Property and its structures, adjoining properties as viewed from the Subject Property boundaries and the surrounding area based on visual observations from adjoining public thoroughfares and accessed Subject Property structures. Subject property building exteriors were observed at ground level, unless otherwise indicated. Where applicable, building interiors were accessed and observed to the extent they were made safely accessible with the cooperation of the site escort.

Site Inspection Personnel:	Vivianne Bisson
Property Escort/ Company:	Mayroth Urias/Lincoln Property Company
Inspection Date:	April 16, 2024
Weather Conditions:	70° F / clear

Significant Inaccessible Areas

No significant areas of the Property inaccessible at the time of the inspection were noted.

Significant Limiting Site Conditions

No significant limiting site conditions were noted at the time of the site reconnaissance.

6.2 General Site Setting

Site and Vicinity Characteristics

Abutting Roadways:	Glenwood Drive to the north; and Argonaut to the west
Current Property Use:	Commercial Office
Evidence of Past Property Uses:	None
Evidence of Past Adjoining Property Uses:	Office buildings
Surrounding Area Uses:	Office buildings, water tanks, single-family residential dwellings and a community park.

Current Adjoining Property Uses

Dir	Street Address	Description
N	118 Playa Circle	Park Glen Community Park
E	25343 Cedar Brook	Moulton Niguel Water District - community water tanks
SE	85 Argonaut	Commercial office building
SW	8 Argonaut	Multiple commercial/light industrial buildings
W	1 and 5 Argonaut	Commercial/light industrial building
NW	Playa Circle, various addresses	Multi-family residential complex
NE	72 to 80 Summerland Circle	Single family residential

Topographic Characteristics

Terrain:	Flat to gently sloping
Direction of Downward Slope:	Southeast
On-site Water Bodies:	None
Other Significant Features:	None

General Description of Structures and Improvements

Buildings:	One (1)
Approx. Building Size:	49,975 feet (per Assessor)
Approx. Year Built:	1989 (per Assessor)
Number of Stories:	Two (2)
Subgrade Levels:	Zero (0)
Exterior Ground Cover:	Aphalt paved parking
Ancillary Structures:	None
Sources of Heating and Cooling:	SoCal Gas
Potable Water/Sewage Disposal:	Moulton Niguel Water District

6.3 Site Features and Conditions

Storage/Usage of Hazardous Substances and Petroleum Products

The following approximate number of containers, and general description of their contents, capacity, container types and storage conditions, were observed to be stored and/or used at the Subject Property:

Occupant	Substance	Qty/Container Type	Storage Conditions
N/A	(none)	N/A	N/A

Bulk Petroleum/Hazardous Material Storage Tanks

If identified or suspected, storage tanks for bulk petroleum or hazardous material storage are described as follows:

AST/UST	Product	Capacity	Construction	Year Installed	Status	Location/Notes
N/A	N/A	N/A	N/A	N/A	N/A	No storage tanks were identified.

Strong, Pungent or Noxious Odors and their Sources

No strong, pungent or noxious odors were noted at the Subject Property.

Standing Surface Water/Pools & Sumps

No standing water, pools or sumps containing liquids likely to be hazardous substances or petroleum products were noted.

Drums, Totes and Intermediate Bulk Containers

No hazardous substance or petroleum product drums were noted.

Unidentified Substance Containers

No unidentified substance containers suspected of containing hazardous substance or petroleum product were noted.

PCBs in Oil Filled Electrical/Hydraulic Equipment

The following oil-filled electrical/hydraulic equipment was identified at the Property: Elevator and transformers.

It is noted that identification of PCB containing fluorescent light ballasts, caulk, paint, or other materials located inside and are part of the building or structure is outside of the scope of the ASTM E1527-21 standard and this assessment.

Stains or Corrosion on Floors, Walls or Ceilings

No stains or corrosion of floors, walls or ceilings, excluding any staining from water, were noted.

Drains and Sumps

No floor drains or sumps were noted at the Subject Property.

Pits/Ponds/Lagoons

No pits, ponds or lagoons were identified in connection with waste treatment or disposal.

Stained Soil, Pavement/Stressed Vegetation

No stained soil, pavement or stressed vegetation was observed.

On-Site Solid Waste Disposal/Fill Material

No evidence of on-site disposal of trash, construction debris, demolition debris or other solid waste was observed.

Waste Water

Sanitary sewage generated at the Subject Property is discharged via a connection to the local public sewer system.

Septic Systems/Cesspools

No septic systems or cesspools were identified at the Subject Property.

Wells

No wells (including any dry wells, irrigation wells, injection wells, abandoned wells, or other wells) were identified at the Subject Property.

Railroad Spurs

No railroad spurs were identified on the Subject Property.

7.0 BUSINESS ENVIRONMENTAL RISKS

In accordance with the contract agreement for this assessment, Hillmann has performed cursory reviews of several potential Business Environmental Risks (also known as “Non-Scope Considerations”). The ASTM E1527-21 standard defines the term business environmental risk (BER) as, “a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice.”

7.1 Asbestos-Containing Material (ACM)

The contracted scope of work included a cursory visual screening of the accessed portions of buildings at the Subject Property built prior to 1990 for suspect asbestos containing materials (ACM). The information provided in this section, where applicable, is limited to identification of potential suspect materials in the readily accessible and observed areas of the building, and their general condition. This is not intended to be a comprehensive survey for the presence of ACM, and no testing has been conducted.

- Suspected ACM noted within the accessed building areas include: Acoustical ceiling tiles, adhesives/mastics, and drywall.

7.2 Lead-Based Paint

The contracted scope of work included a cursory visual screening of the condition of painted surfaces in the accessed areas of residential buildings/units built prior to 1980. This is not intended to constitute a comprehensive survey for LBP or potential lead hazards, and no testing has been conducted.

- No residential buildings were present at the Property.

7.3 Radon

Data compiled by the USEPA, as summarized by the regulatory database report, indicated that the Subject Property is located in an area classified as Zone 2 or 'moderate risk'. area for radon. Radon testing was not included in the scope of this assessment.

7.4 Mold/Microbial Damage

The contracted scope of work included a cursory visual screening of the accessed areas of the building for evidence of significant damage to building materials and finishes as result of moisture intrusion and/or mold/microbial growth.

- No evidence of significant problems with moisture intrusion or mold/microbial growth was noted at the Subject Property.

7.5 NWI Mapped Wetlands

The National Wetlands Inventory online Wetland Mapper was reviewed for indications of jurisdictional wetlands at or immediately adjoining the Subject Property. The scope of work for this assessment excluded a visual determination of regulated wetlands at the Subject Property. It is emphasized that, regardless of the data reviewed via the NWI Wetlands Mapper, a field delineation of regulated wetlands by a qualified professional would be warranted to determine the presence or absence of regulated wetlands at the Subject Property.

- A review of NWI Wetlands Mapper did not indicate regulated wetland areas on the Property.

7.6 Lead in Drinking Water

Potable water service at the Property is provided by a utility connection with *Moulton Niguel Water District*. The scope of work for this assessment included a review of the potential for elevated levels of lead in drinking water by determining the source of the drinking water supply and a review of available compliance or testing data.

Questionnaires / User Provided Information

HILLMANN CONSULTING

PHASE I ESA - ENVIRONMENTAL QUESTIONNAIRE

Instructions: This questionnaire should be completed by the property owner, or representative(s) designated by the owner as being most knowledgeable of the physical characteristics, site use history and environmental condition of the subject property. Please complete, sign at bottom of page 5, and return to Hillmann via email, or in person during the site inspection. ***Hillmann contact name:*** Kofi Bonner ***Email:*** Kbonner ***@hillmannconsulting.com***

Document Request/Environmental Report Disclosure: Copies of existing environmental reports and other documents pertinent to the environmental condition of the Property are requested for review. This includes, but is not necessarily limited to, the following types of documents.

- Environmental assessments (Phase I ESA, Transaction screen ESA, Preliminary Assessments, etc.)
- Subsurface or water testing: (Phase II, site investigation, subsurface testing, drinking water, groundwater monitoring, etc.)
- Site remediation documents, and any associated regulatory correspondences
- Petroleum storage tank testing/closure reports, and any associated regulatory documents.
- Building survey/inspection/testing reports for asbestos, lead, mold or radon; any associated O&M documents
- Environmental permits/registrations/certifications (bulk petroleum, waste discharge, emissions, potable wells, etc.).
- Environmental/health/fire code regulatory violations or citations

Please answer each question. Check "D/K" for "Don't Know". Additional space for comments/details is provided on Page 5.

Previous Environmental Investigations				
1.	Have any previous environmental investigations (see list on Page 1) been performed at the Property? *If YES, please briefly elaborate below and forward copies of the report(s):* Contract for Phase 1 from 2006 in files, but report not in files.	X **Yes**	**No**	**D/K**
Property & Adjoining Usage				
2.	To the best of your knowledge, is the Property or any adjoining property currently occupied or formerly occupied for industrial purposes? *If YES, please elaborate below:*	**Property:**		
			X	
		Yes	**No**	**D/K**
		Adj. Property:		
				X
		Yes	**No**	**D/K**
3.	Is the property or any adjoining property currently used, or have they ever been used, as a gasoline filling station, dry cleaning facility, automotive service/repair shop, auto body repair shop, commercial printing facility, photo development laboratory shop, junkyard, landfill, or as a waste treatment, storage disposal, recycling or processing facility? *If YES, please elaborate below:*	**Property:**		
				X
		Yes	**No**	**D/K**
		Adj. Property:		
				X
		Yes	**No**	**D/K**
4.	Have any hazardous substances or petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or any other waste materials been dumped above grade, buried and/or burned on the property?			X
		Yes	**No**	**D/K**
Bulk Storage Tanks				
5.	Are there currently, or have there been previously, any registered or unregistered above ground or underground storage tanks located at the Property? *If YES, please provide number, size, age of tanks, permits, closure reports, regulatory agency correspondence, and related information.*	**Currently:**		
				X
		Yes	**No**	**D/K**
		Previously:		
				X
		Yes	**No**	**D/K**
6.	Are there currently, or have there been previously, any vent pipes, or access ways indicating a fill pipe protruding from the ground on the property or adjacent to any structure located on the property? *If YES, please elaborate below:*	**Currently:**		
			X	
		Yes	**No**	**D/K**
		Previously:		
				X
		Yes	**No**	**D/K**
7.	Are there currently, or have there been previously, any leakage of hazardous substances or petroleum products from above ground or underground storage tank systems at the Property? *If YES, please elaborate below:*	**Currently:**		
			X	
		Yes	**No**	**D/K**
		Previously:		
				X
		Yes	**No**	**D/K**

HILLMANN CONSULTING

Spills, Releases, Wastes		
8.	Are there currently, or have there been previously, any waste discharges on or adjacent to the property, other than storm water or into a municipal sanitary sewer system? *If YES, please elaborate below:*	**Currently:** Yes: ; No: X; D/K: **Previously:** Yes: ; No: ; D/K: X
9.	Are there currently, or have there been previous, any septic systems, dry wells or leach fields on the property? *If YES, please elaborate below:*	**Currently:** Yes: ; No: X; D/K: **Previously:** Yes: ; No: ; D/K: X
10.	Are there currently, or have there been previously, any flooring, drains or walls located within the facility that are, or have been, stained by substances (or, in the case of drains, used for) other than water or are emanating foul odors? *If YES, please elaborate below:*	**Currently:** Yes: ; No: X; D/K: **Previously:** Yes: ; No: ; D/K: X
11.	Are there currently, or have there been previously, any spills or releases of hazardous substances or petroleum products within the building(s) or on the exterior of the Property? *If YES, please elaborate below:*	**Currently:** Yes: ; No: X; D/K: **Previously:** Yes: ; No: ; D/K: X
12.	Has any non-native and/or contaminated fill material been deposited on the Property? *If YES, please elaborate below:*	Yes: ; No: ; D/K: X
13.	Have any current or former property occupants generated hazardous wastes or other wastes (such as waste oil, or medical wastes) that required non-conventional storage, handling and/or disposal methods? *If YES, please indicate type of waste and the name of the waste handling contractor:*	Yes: ; No: ; D/K: X
Transformers/Hydraulic Equipment		
14.	Are any power transformers, capacitors, oil-filled switchgear or hydraulic equipment present at the Property? *If YES, please elaborate below; and indicate approximate age and ownership:* Transformers for powering building, Elevator is hydraulic	Yes: X; No: ; D/K:
15.	If hydraulic equipment is present, indicate approximate age of equipment & ownership: Transformers & elevator estimated install year: 1990	
Regulatory Disclosure		
16.	Have there been any environmental liens or governmental notification or involvement relating to past or current use or disposal of hazardous substances with respect to the property of any facility or structure located on the property? *If YES, please elaborate below:*	Yes: ; No: X; D/K:
17.	If the property is served by a private well or non-public water system, have contaminants been identified in the well or system that exceed guidelines applicable to the water system, or has the well been designated as contaminated by any government environmental/health agency? *(If YES, please elaborate below. If not applicable, please check* NO*)*	Yes: ; No: X; D/K:

18.	Is there any environmental litigation, administrative action or cleanup action involving the property related to a release or threatened release of any hazardous substance or petroleum product? *If YES, please elaborate below:*		X	
		Yes	**No**	**D/K**
19.	Are you aware of testing of any environmental media (soil, groundwater, surface water, etc.) at the property which identified levels of contaminants in excess of regulatory standards and/or cleanup guidelines? *If YES, please elaborate below:*		X	
		Yes	**No**	**D/K**
Additional Environmental/Building Conditions				
20.a.	Has testing of building materials for asbestos ever been conducted at the Property? *If YES, please forward a copy of test results and/or survey reports:*			X
		Yes	**No**	**D/K**
20.b.	Are any asbestos containing materials known to be present at the Property? *If YES, please elaborate*:			X
		Yes	**No**	**D/K**
20.c.	Is there an Asbestos Operations & Maintenance (O&M) program in place? *If YES, please forward a copy*.		X	
		Yes	**No**	**D/K**
21.a.	Has lead paint testing/risk assessment ever been conducted at the Property? *If YES, please forward a copy of test results.*			X
		Yes	**No**	**D/K**
21.b.	Is lead-based paint known to be present at the Property? *If YES, please elaborate:*			X
		Yes	**No**	**D/K**
21.c.	Is there a lead paint Operations & Maintenance (O&M) (or equivalent) program in place*? If YES, please forward a copy*.		X	
		Yes	**No**	**D/K**
21.d.	For any residential buildings built prior to 1987, has any testing for lead in drinking water been performed? *If YES, please provide a copy of all test results*.		X	
		Yes	**No**	**D/K**
21.e.	If Yes to 23.d., has any lead testing of drinking water indicated results exceeding 15 parts per billion (or microgram per liter)? *If YES, please elaborate and forward documentation of any mitigation performed to reduce lead concentration in drinking water.*		X	
		Yes	**No**	**D/K**
22.a.	Has radon testing ever been conducted at the Property? *If YES, please forward a copy of test results.*			X
		Yes	**No**	**D/K**
22.b.	Are there any radon mitigations systems at the Property? *If YES, please provide details of the systems including the most recent service records.*		X	
		Yes	**No**	**D/K**
23.a.	Are there any problems with water intrusion, water damaged surfaces or excessive mold growth within the buildings? *If YES, please elaborate*:		X	
		Yes	**No**	**D/K**
23.b.	Is there a Moisture Control (or Mold Management) Program in place *If YES, please forward a copy*.		X	
		Yes	**No**	**D/K**
24.a.	Are any pest control, pesticides or herbicides products utilized or applied at the Property? *If YES, please elaborate.* Exterior treatment for ants and spiders, interior treatment only as needed.	X		
		Yes	**No**	**D/K**
24.b.	If Yes to 24.a., are all products applied by licensed pest control contractor? *If YES, provide company name and any applicable license #s if available. If NO, please describe what products are utilized, who applies them and/or how they are applied or utilized.* Beltran & Sons Pest Control: License 58083	X		
		Yes	**No**	**D/K**

ASTM E 1527-21/AAI - USER QUESTIONNAIRE

Instructions: This form should be completed by a representative of the USER of the Phase I ESA report and returned to Hillmann via email or in-person. **The report USER is the entity on whose behalf the assessment is being prepared and that will be relying on the report for liability protections.**

In order to qualify for one of the Landowner Liability Protections (LLPs) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"),188 the USER must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. The user should provide the following information to the environmental professional. Failure to conduct these inquiries could result in a determination that "all appropriate inquiries" is not complete. Please complete the following questionnaire and provide any of the referenced information (if available) to Hillmann.

USER Company Name:	MLC Holdings	**USER Mailing Address:**	5 Peters Canyon Road, Suite 310, Irvine, CA 92606
Respondent Name & Email Address:	Johanna Crooker johanna.crooker@mlcholdings.net	**Date of Completion:**	4/3/24

Property Address:	95 Argonaut, Aliso Viejo, CA 92656	**YES**	**NO**	**DETAIL (optional):**
Search of Land Title Records and AULs: Has the User performed a review of land title records and judicial records for environmental liens and Activity and Use Limitations (AULs) filed or recorded against the property?			X	
If yes to the above question: Did the review identify any environmental liens or Activity and Use Limitations (AUL), such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?				
Specialized knowledge or experience of the person seeking to qualify for the LLP: Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?			X	
Relationship of the purchase price to the fair market value of the property if it were not contaminated: Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?		X		

HILLMANN
CONSULTING

Property Address:	95 Argonaut, Aliso Viejo, CA 92656	**YES**	**NO**	**DETAIL (optional):**
Commonly Known or Reasonably Ascertainable Information: Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? **ANSWER BELOW**				
- Do you know the past uses of the property?		X		Office Space
- Do you know of specific chemicals that are present or were once present at the property?			X	
- Do you know of spills or other chemical releases that have taken place at the property?			X	
- Do you know of any environmental cleanups that have taken place at the property?			X	
The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation: Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?			X	
Litigation/Administrative Proceedings/Government Notices As the User of this ESA, do you have knowledge of (1) any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property; (2) any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on or from the property; and (3) any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.			X	
User's Reason for performing Phase I ESA:	For due diligence of a future residential development purposes.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was identified in the following records. For more information on this property see page 9 of the attached EDR Radius Map report:

Site	Database(s)	EPA ID
CORTE FINA HOMEOWNER 95 ARGONAUT STE 160 ALISO VIEJO, CA 92656	EDR Hist Auto	N/A
SUN ALLIANCE 95 ARGONAUT ALISO VIEJO, CA 92656	HWTS	N/A

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL ---------- National Priority List
Proposed NPL ---------- Proposed National Priority List Sites
NPL LIENS ---------- Federal Superfund Liens

Lists of Federal Delisted NPL sites

Delisted NPL ---------- National Priority List Deletions

Lists of Federal sites subject to CERCLA removals and CERCLA orders

FEDERAL FACILITY ---------- Federal Facility Site Information listing
SEMS ---------- Superfund Enterprise Management System

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE ---------- Superfund Enterprise Management System Archive

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS ---------- Corrective Action Report

Lists of Federal RCRA TSD facilities

RCRA-TSDF ---------- RCRA - Treatment, Storage and Disposal

Lists of Federal RCRA generators

RCRA-VSQG ---- RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

Federal institutional controls / engineering controls registries

LUCIS ---- Land Use Control Information System
US ENG CONTROLS ---- Engineering Controls Sites List
US INST CONTROLS ---- Institutional Controls Sites List

Federal ERNS list

ERNS ---- Emergency Response Notification System

Lists of state- and tribal (Superfund) equivalent sites

RESPONSE ---- State Response Sites

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR ---- EnviroStor Database

Lists of state and tribal landfills and solid waste disposal facilities

SWF/LF ---- Solid Waste Information System

Lists of state and tribal leaking storage tanks

INDIAN LUST ---- Leaking Underground Storage Tanks on Indian Land
CPS-SLIC ---- Statewide SLIC Cases

Lists of state and tribal registered storage tanks

FEMA UST ---- Underground Storage Tank Listing
AST ---- Aboveground Petroleum Storage Tank Facilities
INDIAN UST ---- Underground Storage Tanks on Indian Land

Lists of state and tribal voluntary cleanup sites

INDIAN VCP ---- Voluntary Cleanup Priority Listing
VCP ---- Voluntary Cleanup Program Properties

Lists of state and tribal brownfield sites

BROWNFIELDS ---- Considered Brownfieds Sites Listing

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS ---- A Listing of Brownfields Sites

Local Lists of Landfill / Solid Waste Disposal Sites

WMUDS/SWAT ---- Waste Management Unit Database

SWRCY ---- Recycler Database
HAULERS ---- Registered Waste Tire Haulers Listing
INDIAN ODI ---- Report on the Status of Open Dumps on Indian Lands
ODI ---- Open Dump Inventory
DEBRIS REGION 9 ---- Torres Martinez Reservation Illegal Dump Site Locations
IHS OPEN DUMPS ---- Open Dumps on Indian Land

Local Lists of Hazardous waste / Contaminated Sites

US HIST CDL ---- Delisted National Clandestine Laboratory Register
HIST Cal-Sites ---- Historical Calsites Database
SCH ---- School Property Evaluation Program
CDL ---- Clandestine Drug Labs
Toxic Pits ---- Toxic Pits Cleanup Act Sites
US CDL ---- National Clandestine Laboratory Register

Local Lists of Registered Storage Tanks

HIST UST ---- Hazardous Substance Storage Container Database

Local Land Records

LIENS ---- Environmental Liens Listing
LIENS 2 ---- CERCLA Lien Information
DEED ---- Deed Restriction Listing

Records of Emergency Release Reports

HMIRS ---- Hazardous Materials Information Reporting System
CHMIRS ---- California Hazardous Material Incident Report System
LDS ---- Land Disposal Sites Listing
MCS ---- Military Cleanup Sites Listing
Orange Co. Industrial Site ---- List of Industrial Site Cleanups
SPILLS 90 ---- SPILLS 90 data from FirstSearch

Other Ascertainable Records

FUDS ---- Formerly Used Defense Sites
DOD ---- Department of Defense Sites
SCRD DRYCLEANERS ---- State Coalition for Remediation of Drycleaners Listing
US FIN ASSUR ---- Financial Assurance Information
EPA WATCH LIST ---- EPA WATCH LIST
2020 COR ACTION ---- 2020 Corrective Action Program List
TSCA ---- Toxic Substances Control Act
TRIS ---- Toxic Chemical Release Inventory System
SSTS ---- Section 7 Tracking Systems
ROD ---- Records Of Decision
RMP ---- Risk Management Plans
RAATS ---- RCRA Administrative Action Tracking System
PRP ---- Potentially Responsible Parties
PADS ---- PCB Activity Database System
ICIS ---- Integrated Compliance Information System
FTTS ---- FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
MLTS ---- Material Licensing Tracking System

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/04/2023 has revealed that there are 3

RCRA-LQG sites within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
AMBRY GENETICS CORPO EPA ID:: CAR000254599	7 ARGONAUT	WSW 0 - 1/8 (0.075 mi.)	B5	14

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/04/2023 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

Lists of state and tribal leaking storage tanks

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there is 1 LUST site within approximately 0.5 miles of the target property.

Lists of state and tribal registered storage tanks

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 4 UST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

CERS HAZ WASTE: List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, and RCRA LQ HW Generator programs.

A review of the CERS HAZ WASTE list, as provided by EDR, and dated 01/16/2024 has revealed that there are 6 CERS HAZ WASTE sites within approximately 0.25 miles of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 2 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/04/2023 has revealed that there are 9 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

UST FINDER: EPA developed UST Finder, a web map application containing a comprehensive, state-sourced national map of underground storage tank (UST) and leaking UST (LUST) data. It provides the attributes and locations of active and closed USTs, UST facilities, and LUST sites from states and from Tribal lands and US territories . UST Finder contains information about proximity of UST facilities and LUST sites to: surface and groundwater public drinking water protection areas; estimated number of private domestic wells and number of people living nearby; and flooding and wildfires.

A review of the UST FINDER list, as provided by EDR, and dated 06/08/2023 has revealed that there are 2 UST FINDER sites within approximately 0.25 miles of the target property.

UST FINDER RELEASE: US EPA's UST Finder data is a national composite of leaking underground storage tanks. This data contains information about, and locations of, leaking underground storage tanks. Data was collected from state sources and standardized into a national profile by EPA's Office of Underground Storage Tanks, Office of Research and Development, and the Association of State and Territorial Solid Waste Management Officials.

A review of the UST FINDER RELEASE list, as provided by EDR, and dated 06/08/2023 has revealed that there is 1 UST FINDER RELEASE site within approximately 0.5 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past

sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

Hazardous Waste Summary:

AMBRY GENETICS CORPORATION (Continued) **1018155097**

Waste Code: D001
Waste Description: Ignitable Waste

Waste Code: D002
Waste Description: Corrosive Waste

Waste Code: F002
Waste Description: The Following Spent Halogenated Solvents: Tetrachloroethylene, Methylene Chloride, Trichloroethylene, 1,1,1-Trichloroethane, Chlorobenzene, 1,1,2-Trichloro-1,2,2-Trifluoroethane, Ortho-Dichlorobenzene, Trichlorofluoromethane, And 1,1,2, Trichloroethane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F001, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F003
Waste Description: The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: U010
Waste Description: Azirino [2',3':3,4]Pyrrolo[1,2-A]Indole-4,7-Dione, 6-Amino-8-[[(Aminocarbonyl)Oxy]Methyl]-1,1a,2,8,8a,8b-Hexahydro-8a-Methoxy-5-Methyl-, [1as-(1aalpha, 8beta, 8aalpha, 8balpha)]- (Or) Mitomycin C

Waste Code: U150
Waste Description: L-Phenylalanine, 4-[Bis(2-Chloroethyl)Amino]- (Or) Melphalan

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	Ignitable Waste
Waste Code:	D002
Waste Description:	Corrosive Waste
Waste Code:	D022
Waste Description:	Chloroform
Waste Code:	F003
Waste Description:	The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	U002
Waste Description:	2-Propanone (I) (Or) Acetone (I)
Waste Code:	U007
Waste Description:	2-Propenamide (Or) Acrylamide

AMBRY GENETICS CORP (Continued) **1014922508**

Waste Code: U031
Waste Description: 1-Butanol (I) (Or) N-Butyl Alcohol (I)

Waste Code: U044
Waste Description: Chloroform (Or) Methane, Trichloro-

Waste Code: U188
Waste Description: Phenol

Waste Code: U239
Waste Description: Benzene, Dimethyl- (I,T) (Or) Xylene (I)

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Violation Date: 04-13-2018
Citation: 23 CCR 16 2641(j) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2641(j)
Violation Description: Failure of the leak detection equipment to be installed, calibrated, operated, and/or maintained properly.
Violation Notes: Returned to compliance on 04/13/2018. The unleaded test boot was still attached and the port was facing up. This boot was last used during the SB989 testing done 12/20/2017, so the system has been operated without secondary line leaks being found at the earliest possible point. The boot was pulled back during the montioring certification this date. This violation was abated during the inspection.

Citation:	22 CCR 15 66265.173 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.173
Violation Description:	Failure to properly close hazardous waste containers when not in active use.
Violation Notes:	Returned to compliance on 04/17/2017. There is a cubic yard crate stored by the property wall that contains several five gallon plastic buckets. The buckets contain a variety of hazardous materials and hazardous wastes. Some of these buckets are without lids. Cover all the buckets and determine which are usable product and which are waste. Properly identify the hazardous waste containers and have them picked up by a registered hazardous waste hauler.

Citation: HSC 6.7 25291(a)(2) - California Health and Safety Code, Chapter 6.7, Section(s) 25291(a)(2)
Violation Description: Failure to maintain secondary containment (e.g., failure of secondary containment testing).
Violation Notes: Returned to compliance on 06/04/2018. Review of SB989 testing done on 12/20/2017 shows that the unleaded tanks secondary piping, piping sump and udc all failed testing that date. The piping and UDC appear to have problems with cracked test boots and disintegrated penetration fittings and unsealed high electrical fittings. Please submit a plan check for repair of the failed components to this Agency within 30 days, repair of the penetration fittings and adding penetration fittings to the electrical fitting area will require a plan check, and subsequent retesting. If there is a question regarding the necessity of plan check for certain repairs or modifications, please contact this Agency for clarification. Plan Check Fees and the

KENNEDY PIPELINE CO (Continued) **S101631265**

Facility Modification Application can be found at www.occupainfo.com
Please schedule the retest for the failed components within 30 days.
Notify this Agency at least 48 hours prior to the testing event.

Eval Notes: Reviewed and declined disclosure in e submit. Please address the following: According to the last on site inspection, there is hazardous waste generated and stored (55 gallons or greater) at this facility. Check the top box in section II E of the Business Activity page. Un check the 4th box in this section. There is no treatment of hazardous waste at this facility. Also, un check box II B. Change the fire code hazard class from flammable to combustible liquid II for the diesel entry. Also make sure the maximum daily amount is correct. This refers to the maximum amount of diesel that would ever be stored in the tank. Check the maximum daily amount for the gasoline disclosure as well. Waste oil and waste coolant will need to be disclosed. Add an entry for both. The site map is missing the site orientation symbol (N arrow) and locations for the hazardous waste storage, emergency shut offs (electrical, water and natural gas), storm drain/sewer and any emergency [Truncated]

Eval Notes: On site for a routine compliance inspection. Martin Schwartz of Orange County Tank Testing currently performing a UST monitoring system certification. Current ICC, Franklin Fueling, F E Petro, Veeder-Root, VMI and TEI certifications provided. Facility consists of two tanks and two UDCs. Both tank annulars are liquid filled. Diesel fill is direct bury. Diesel turbine sump had less than one gallon of water in it (pumped out during inspection). The other four secondary containment sumps were free of liquid. All sensors were located at the low areas of secondary containment. Reviewed designated operator inspection reports for the past 12 months. Two alarms noted during that time period. Corrective action documentation available for review. Training provided to two employees on 8-6-13. Records reviewed on site. SB 989 testing performed on 12-28-11.

Eval Notes: Reviewed and declined designated operator submittal in e submit. The designated operator that has been contracted to do the inspections needs to be listed for the "name" regarding the primary designated operator. List the proper phone number, ICC number and expiration date. Reviewed and accepted business owner/operator, tank, monitoring plan and response plan forms in e submit. * Still need to submit certification of financial responsibility in the e submit portal. Complete the required fields and submit. This form is needed in order to reissue the permit to operate which expires on 6-30-15. > Sent the following e mail to Matt Trumble: Hi Matt, I accepted all but one of the forms that were submitted. Check the e submit portal and look at the comments regarding the designated operator form. Also, the certification of financial responsibility form needs to be submitted electronically in order to reissue the permit to operate which expires on 6-30-15.

Eval Notes: I received and reviewed copy of Secondary Containment Testing Report Form for retesting conducted on 2/3/21 on gasoline tank's (T1) secondary piping and piping sump, that failed initial tests on 12/15/20. The piping sump passed test on 2/3/21 after a new BRAVO rigid FRP clamshell repair test reducer was installed. The secondary piping did not pass test on 2/3/21 due to cracked test boot in UDC. Outstanding violation I382 regarding failure to maintain secondary containment cited in this agency's inspection report dated 1/6/21, cannot be corrected. Secondary piping failure must be repaired, retested and results be submitted to this agency within 30 days of this report.

Site Name: ALISO VIEJO TOWING AND RECOVERY
Violation Date: 07-11-2018
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description: Failure to complete and electronically submit a business plan when storing/handling a hazardous material at or above reportable quantities.
Violation Notes: Returned to compliance on 12/03/2018. Complete all three sections in CERS for your site (business activities, materials, map and business emergency plan) and submit for review within 30 days. The violation will be abated when the submittal is accepted.
Violation Division: Orange County Environmental Health
Violation Program: HMRRP
Violation Source: CERS,

Site ID: 445757
Site Name: ALISO VIEJO TOWING AND RECOVERY
Violation Date: 07-12-2018
Citation: 22 CCR 12 66262.11 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.11
Violation Description: Failure to determine if wastes generated are hazardous waste by using generator knowledge or applying testing method.
Violation Notes: Returned to compliance on 11/13/2018. The waste absorbent waste from below wrecked cars is presumed to be hazardous by this agency. Manage this waste as hazardous waste unless you can prove to this agency that the waste is non-hazardous by submitting to a certified lab for analysis. Because the absorbent waste is obtained from numerous locations when you pick up the vehicles, determining that it is not a hazardous waste is problematic. You must bring this waste back to your site and dispose of it as hazardous waste or if it is not saturated, you may continue to use the absorbent at your location until you dispose of it as a hazardous waste through your hazardous waste transporter. Until you have proven this waste absorbent is not hazardous, the waste absorbent generated at the pickup site and in the shop, must be managed as a hazardous waste. Obtain a lidded drum and label it as a hazardous waste- a label was left during the inspection.

ALISO VIEJO TOWING AND RECOVERY (Continued) **S123522862**

	Chapter 15, Section(s) 66265.173
Violation Description:	Failure to meet the following container management requirements: (a) A container holding hazardous waste must always be closed during storage, except when it is necessary to add or remove waste. (b) A container holding hazardous waste must not be opened, handled, or stored in a manner which may rupture the container or cause it to leak.
Violation Notes:	Returned to compliance on 11/13/2018. OBSERVATION: waste absorbent and waste oil filters are stored in sawed off plastic drums. All hazardous waste containers shall be closed at all times except when adding or removing waste. CORRECTIVE ACTION: Immediately obtain drums that can be maintained lidded, and close these containers and ensure all hazardous waste containers are closed when not adding or removing waste. Send me pictures of the labeled and closed waste absorbent and waste oil filter containers to abate the violation within 30 days.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 05/13/2017. OBSERVATION: The waste IPA and waste chemicals in the flammable cabinet were not labeled during the inspection and the waste oil, was missing the accumulation date and was labeled with accumulation date during the inspection. All hazardous waste containers shall be marked with the following information: 1) the words Hazardous Waste ; 2) name and address of generator; 3) hazardous properties; 4) physical state; 5) composition (contents); 6) accumulation start date. CORRECTIVE ACTION: Immediately label these containers and ensure that all hazardous waste containers are marked with all the required information as soon. Submit pictures of properly labeled IPA and IPA

Citation: 22 CCR 15 66265.173 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.173
Violation Description: Failure to meet the following container management requirements: (a) A container holding hazardous waste must always be closed during storage, except when it is necessary to add or remove waste. (b) A container holding hazardous waste must not be opened, handled, or stored in a manner which may rupture the container or cause it to leak.
Violation Notes: Returned to compliance on 05/13/2017. The waste oil drum was found with a funnel and no lid at the time of inspection. The drum bung was affixed to the container at the time of inspection. Train staff to ensure that all containers are maintained closed except when adding or removing waste.

Eval Notes: On site for routine hazardous waste inspection. Patricia Langraphi, Quality Manager, provided consent to inspect. The facility's hazardous waste storage contains used lubrication oils, waste

PARA TECH COATING INC (Continued) **1001815610**

isopropyl alcohol, various waste lab chemicals. Hazardous waste are stored in small containers and moved each day to the drums stored behind the building. A perimeter walk was conducted. Municipal dumpster are shared by other tenants and does not appear to contain any hazardous waste. Manifests from World Oil, and US Ecology were available and reviewed. Emergency response information is posted and employees are reported to be trained. No hazardous waste violations were observed on this date. Inspection report emailed to facility patricia.langraphi@cwst.com

Eval Division: Orange County Environmental Health
Eval Program: HMRRP
Eval Source: CERS,

Eval General Type: Compliance Evaluation Inspection
Eval Date: 05-02-2014
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: Inspected perimeter of facility including the dumpster area. Permission to inspect and take necessary photos granted by Brent Clawson. Hazardous waste properly stored and identified. Hazardous waste emergency response sticker completed and posted on site. Manifests for hazardous waste pickup reviewed on site. No violations noted at tis time.

Eval Division: Orange County Environmental Health
Eval Program: HW
Eval Source: CERS,

Eval General Type: Compliance Evaluation Inspection
Eval Date: 11-17-2020
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: An onsite hazardous materials inspection of this facility was conducted this date. Access to the facility was provided by Patricia Langraphi. The following materials were observed in amounts that meet or exceed the minimum volumes required for disclosure: - Waste alcohol - Alcohol - Lubricating oil - Oxygen NOTE: Liquid nitrogen is no longer used by this facility, and the maximum amount stored onsite of alcohol was approximately 165 gallons. Amend your CERS submittals to accurately reflect these changes. A copy of this inspection report will be emailed to: PLANGRAPHI@PARLYENE.COM

Eval General Type: Other/Unknown
Eval Date: 10-03-2014
Violations Found: Yes
Eval Type: Other, not routine, done by local agency
Eval Notes: Orange County Environmental Health as the Certified Unified Program Agency (OC CUPA) is the administrating agency for the Hazardous Materials Disclosure and Business Emergency Plan programs (HMD/BEP) previously administered by the Orange County Fire Authority. During the months of August and December of 2013, the OC CUPA sent out letters to regulated businesses requesting them to electronically submit their HMD/BEP forms. Electronic submission of these forms is a legal requirement. Failure to submit HMD/BEP forms is in violation of the California Health & Safety Code Chapter 6.95. According to our records there is no electronic submission for this facility. Please go to www.esubmit.ocgov.com to request a user name and password and submit your HMD/BEP forms within the next 30 days. Businesses may also submit forms via the California Environmental Reporting System. Please verify that all owner information that is pre populated on the E-Submit Portal is still [Truncated]

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Eval Notes: Reviewed submittal. The following modifications need to be made: Both gasoline disclosures should be listed as pure (gasoline has a CAS #). Mixture components box should then be blank. The mixture components box should be blank for the CO2 disclosure. The three disclosures listing 30 gallons as the maximum daily amount are below the disclosure requirement. Delete these chemicals from the disclosure. Propane has been removed from this facility. It also would not need to be disclosed because of the retail exemption. Delete propane from the disclosure. The site map appears to be acceptable. Re submit with modifications. * Emergency response and training plans accepted in CERS

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

CERS ID: 10156111
CERS Description: Chemical Storage Facilities

Violations:
Site ID: 79269
Site Name: UPS - Laguna
Violation Date: 01-07-2019
Citation: HSC 6.7 25291(a)(2) - California Health and Safety Code, Chapter 6.7, Section(s) 25291(a)(2)
Violation Description: Failure to maintain secondary containment (e.g., failure of secondary containment testing).
Violation Notes: Returned to compliance on 02/05/2019. Facility is still out of compliance on the failed SB989 tested components.
Violation Division: Orange County Environmental Health
Violation Program: UST
Violation Source: CERS,

Site ID: 79269
Site Name: UPS - Laguna
Violation Date: 01-16-2020
Citation: HSC 6.7 25284 - California Health and Safety Code, Chapter 6.7, Section(s) 25284
Violation Description: Failure to obtain a valid permit to operate from the UPA including but not limited to unpaid permit fees.
Violation Notes: This facility currently has an outstanding violation that has prevented the operator from obtaining a current Underground Storage Tank Permit from this agency. The following violation is uncorrected: I481 (dated 10/1/2019) - Facility has failed Secondary component for theT4 New oil piping sump and T5Waste oil piping sump.
Violation Division: Orange County Environmental Health
Violation Program: UST
Violation Source: CERS,

Site ID: 79269
Site Name: UPS - Laguna
Violation Date: 10-21-2020
Citation: HSC 6.7 25291(a)(1) - California Health and Safety Code, Chapter 6.7, Section(s) 25291(a)(1)
Violation Description: Failure to construct, operate, and maintain primary containment as product-tight.
Violation Notes: A test of Tank 1's (87 unleaded) annular space conducted in September 2020 indicates that the annular space is unable to hold vacuum pressure. Additionally the test report indicates the contents of the UST have been removed and water has subsequently entered the primary tank. Submit plans to this agency within 30 days (11/21/2020) detailing the repair or removal of this tank.

Violation Date: 08-16-2021
Citation: HSC 6.7 25291(a)(2) - California Health and Safety Code, Chapter 6.7, Section(s) 25291(a)(2)
Violation Description: Failure to maintain secondary containment (e.g., failure of secondary containment testing).
Violation Notes: Diesel West, New Oil and Waste Oil Lines, UDCs 2 and 8 South failed tests on 7/22/21. Investigation to determine all secondary containment failures must be conducted and if necessary, plans for repair/replacement must be submitted to this Agency within 30 days of this report.
Violation Division: Orange County Environmental Health
Violation Program: UST
Violation Source: CERS,

Site ID: 79269
Site Name: UPS - Laguna
Violation Date: 09-29-2021
Citation: 23 CCR 16 2712(b)(1)(G) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2712(b)(1)(G)
Violation Description: Failure to comply with one or more of the following overfill prevention equipment requirements: Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to

UNITED PARCEL SERVICE (Continued) **1000594559**

product due to overfilling. Install/retrofit overfill prevention equipment that does not use flow restrictors on vent piping to meet overfill prevention equipment requirements when the overfill prevention equipment is installed, repaired, or replaced on and after October 1, 2018. For USTs installed before October 1, 2018, perform an inspection by October 13, 2018 and every 36 months thereafter. For USTs installed on and after October 1, 2018, perform an inspection at installation and every 36 months thereafter. Inspected within 30 days after a repair to the overfill prevention equipment. Inspected using an applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Inspected by a certified UST service technician. Maintain records of overfill prevention equipment inspection for 36 months.

Violation Notes: Returned to compliance on 12/13/2021. The Shut-Off Valve in New Oil tank (T4) is broken and waste oil tank's overfill prevention equipment was not tested due to broken/disconnected probe wiring. Overfill prevention equipment for both new oil and waste oil tanks must replaced/repaired and retested within 30 day of this inspection report.

Citation:	HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description:	Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.
Violation Notes:	Returned to compliance on 02/14/2018. OBSERVATION: The facility has not accurately submitted the Hazardous Materials Inventory Chemical Description pages make the following changes and resubmit to the CUPA. 1. On the chemical disclosures for solids (which most are as you solidify most waste), change the units for solids to pounds, and delete all chemical disclosures that do not exceed 500 pounds for solids. In the case of the wastes from spills, review of your manifests show that the poundages for: waste flammable solids, waste oxidizing solids, waste organic peroxides, waste corrosive solids and waste other regulated solids are all well under the 500 pounds at all times. Review to verify then remove disclosures for these wastes as well as drain oil filters, drained paper filters, possibly the grease if max daily is less than 500 pounds, remove spent brake fluid, and possibly petroleum contaminated solid if less than 500 pounds stored onsite. 2. research the waste generated in April 2017, listed as 3 drums [Truncated]

Eval Notes: On site for a routine underground tank inspection and to observe the annual monitor certification for five underground tanks. Met with Bob Toomey of Packham/Toomey Inc. Current ICC, VMI and Veeder Root certifications provided. The tank top sumps and UDCs were free of liquid. Sensors were located at the low area of secondary containment. Secondary testing was performed on 7/20/15 and is current until 7/20/18. Financial certification is valid through 4-3-16. Reviewed monthly designated operator (DO) reports for the past 12 months. DO reports properly completed and followed up on when needed. Corrective action documentation available for review. DO training provided to five employees on 4-14-15. Reviewed latest UST submittal in CERS. DO certification is current (12-16-16). CFR is current. No violations noted at this time.

Eval Notes: I received and reviewed the following documents attached to an email with pictures documenting installation of new boot outside/beneath UDC: - Secondary Containment Testing Report Form for activities conducted on 3/3/22 not witnessed by this agency. UDC 8, secondary piping for new oil, waste oil and diesel west tanks were tested. All tested components passed except for waste oil tank secondary pipe. - Secondary Containment Testing Report Form for activities conducted on 4/19/22, after completion of repairs and witnessed by this agency. UDC 8 was tested and passed. Outstanding violation I382 regarding failure to maintain secondary containment, cited in inspection report dated 8/16/21, will be corrected when waste oil tank is removed/repaired.

Eval Type: Other, not routine, done by local agency
Eval Notes: Reviewed and declined submittal in CERS. Please address the following: Add [ATF 64743-57-0 %weight] to the mixture components box for the transmission fluid disclosure. Put something other than water in the mixture components box for car wash detergent [chemical name CAS# %weight]. Disclosure threshold for helium and argon/CO2(mixture) is 1000 cubic feet or greater. Maximum daily amount listed for both are below this threshold. Delete these from the disclosure if the maximum daily amounts are accurate. If the maximum daily amounts are at or above disclosure threshold, modify the quantities. Mixture components box for spent antifreeze is blank. Use [ethylene glycol 107-21-1 50%] on the line in the box. Mixture components boxes are blank for waste aerosols, waste flammable solids, waste oxidizing solids, waste organic peroxides, waste corrosive solids and other regulated substances. At least one line in these boxes need to be completed. Fill in the percent weights in [Truncated]

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 02/29/2024

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA Watch List

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.
