ERNS: Emergency Response Notification System
Source: National Response Center, United States Coast Guard
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/03
Date Made Active at EDR: 03/12/04
Database Release Frequency: Annually

Date of Data Arrival at EDR: 01/26/04
Elapsed ASTM days: 46
Date of Last EDR Contact: 04/26/04

FEDERAL ASTM SUPPLEMENTAL RECORDS

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/01/01
Database Release Frequency: Biennially

Date of Last EDR Contact: 03/16/04
Date of Next Scheduled EDR Contact: 06/14/04

CONSENT: Superfund (CERCLA) Consent Decrees
Source: EPA Regional Offices
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: N/A
Database Release Frequency: Varies

Date of Last EDR Contact: N/A
Date of Next Scheduled EDR Contact: N/A

ROD: Records Of Decision
Source: EPA
Telephone: 703-416-0223
Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 04/08/04
Database Release Frequency: Annually

Date of Last EDR Contact: 04/05/04
Date of Next Scheduled EDR Contact: 07/05/04

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: N/A
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 04/27/04
Database Release Frequency: Quarterly

Date of Last EDR Contact: 05/04/04
Date of Next Scheduled EDR Contact: 08/02/04

FINDS: Facility Index System/Facility Identification Initiative Program Summary Report
Source: EPA
Telephone: N/A
Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 04/08/04
Database Release Frequency: Quarterly

Date of Last EDR Contact: 04/05/04
Date of Next Scheduled EDR Contact: 07/05/04

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 02/17/04
Database Release Frequency: Annually

Date of Last EDR Contact: 04/20/04
Date of Next Scheduled EDR Contact: 07/19/04

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 04/19/04
Database Release Frequency: Quarterly

Date of Last EDR Contact: 04/05/04
Date of Next Scheduled EDR Contact: 07/05/04

MINES: Mines Master Index File
Source: Department of Labor, Mine Safety and Health Administration
Telephone: 303-231-5959

Date of Government Version: 03/05/04
Database Release Frequency: Semi-Annually

Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 02/02/04
Date of Next Scheduled EDR Contact: 05/10/04

US BROWNFIELDS: A Listing of Brownfields Sites
Source: Environmental Protection Agency
Telephone: 202-566-2777
Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: 04/14/04
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 03/15/04
Date of Next Scheduled EDR Contact: 06/14/04

RMP: Risk Management Plans
Source: Environmental Protection Agency
Telephone: 202-564-8600
When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

Date of Government Version: N/A

Database Release Frequency: Varies

Date of Last EDR Contact: 04/26/04
Date of Next Scheduled EDR Contact: 07/05/04

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 03/08/04
Date of Next Scheduled EDR Contact: 06/07/04

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-566-0250
Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/01
Database Release Frequency: Annually

Date of Last EDR Contact: 03/23/04
Date of Next Scheduled EDR Contact: 06/21/04

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-5521
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/02
Database Release Frequency: Every 4 Years

Date of Last EDR Contact: 03/05/04
Date of Next Scheduled EDR Contact: 06/07/04

FTTS INSP: FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
Source: EPA

Date of Next Scheduled EDR Contact: 05/31/04

US BROWNFIELDS: A Listing of Brownfields Sites
Source: Environmental Protection Agency
Telephone: 202-566-2777
Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

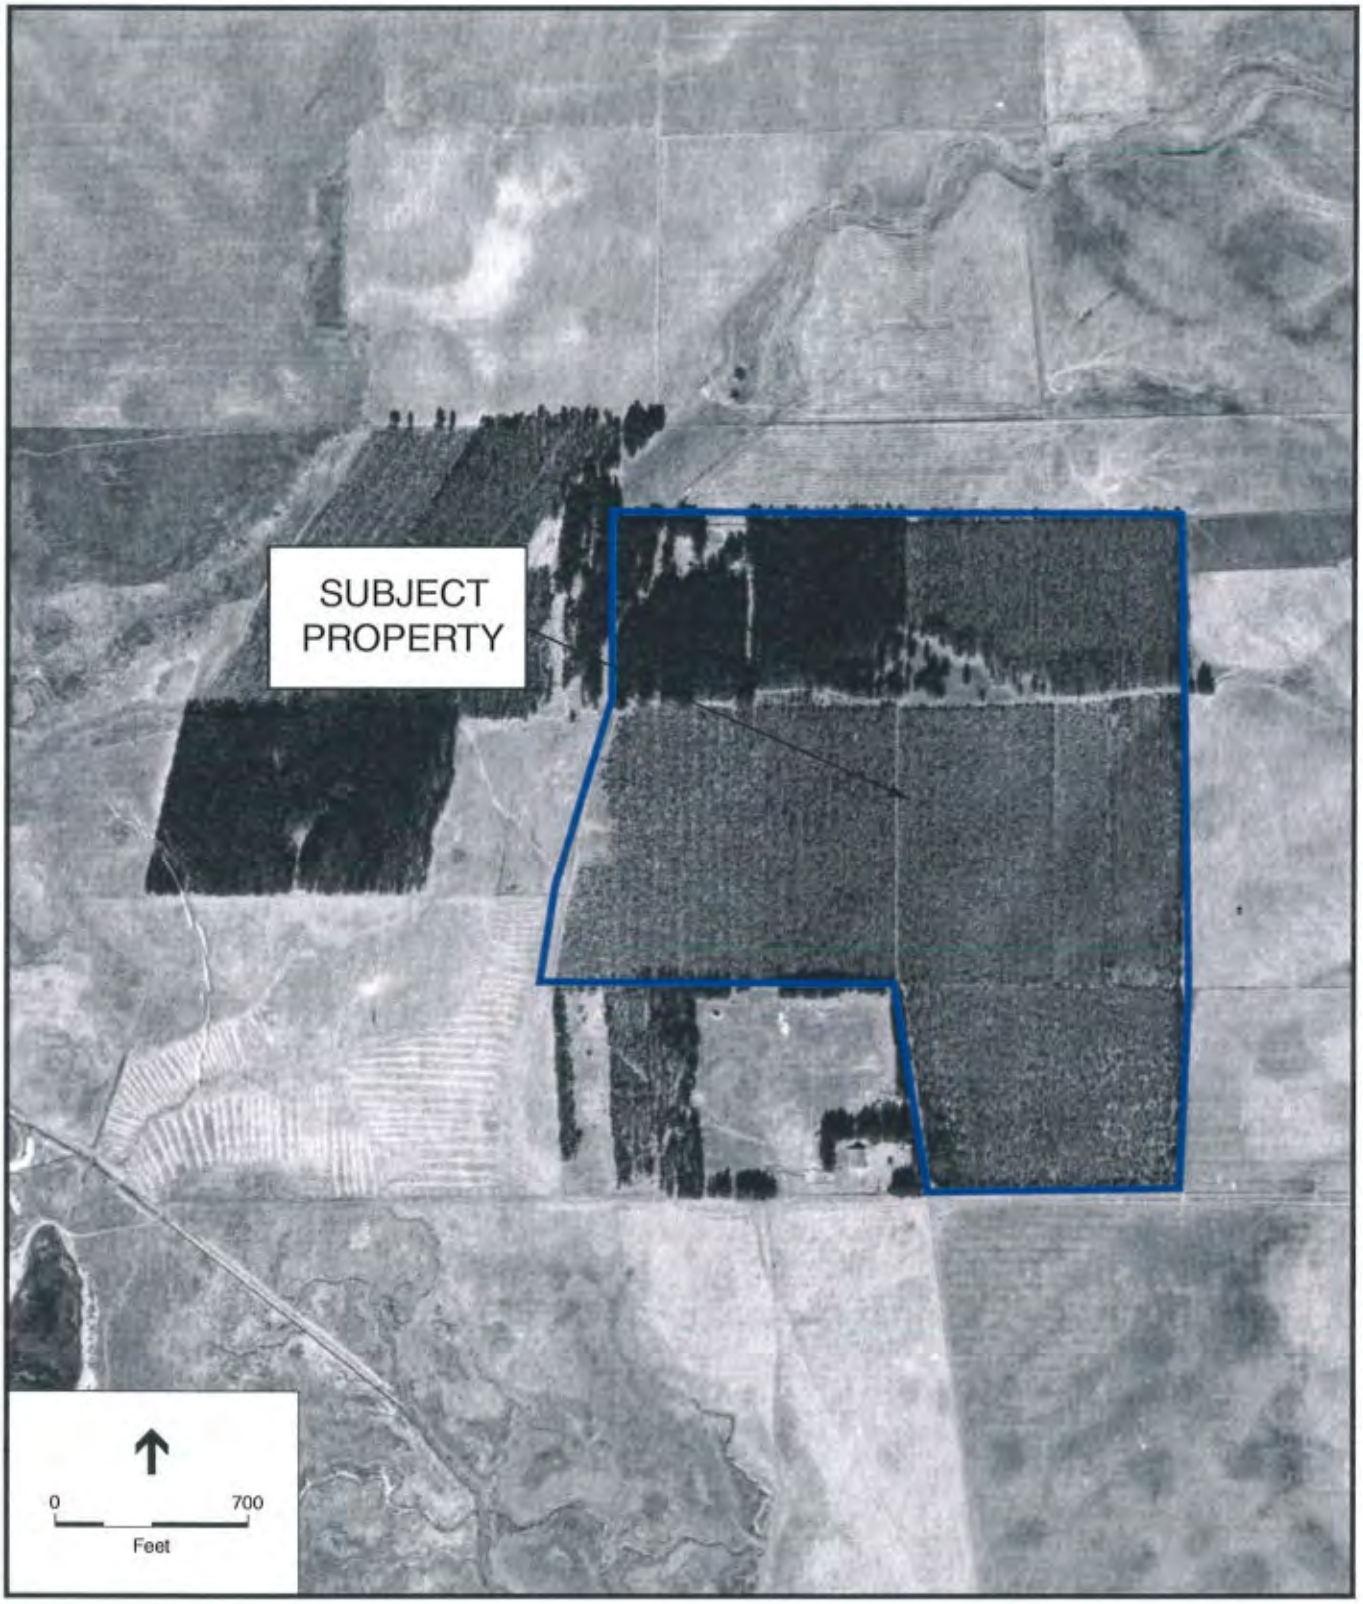
Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.



NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

Subject: Couch Property, #2 Eucalyptus Road, Am. Cyn.
APN #58-030-17 - Our File #HF 219

Date of
Inspection: November 19, 1990

Purpose: Site Investigation Under Inspection Warrant

Report
Prepared by: Catherine Moody, Senior Hazardous Materials Specialist, Department of Environmental Management, Hazardous Materials Section

On November 19, 1990, I accompanied members of the California Department of Forestry to inspect the property and to collect samples, take photographs and make notes regarding hazardous wastes and solid waste at the Couch Property in American Canyon.

The property is a one hundred sixty five acre parcel, heavily forested with eucalyptus trees. There are small dirt roads throughout much of the property. Pinpointing on specific locations on a map is difficult as there is a tremendous amount of all manner of debris, garbage, abandoned vehicles, machinery, equipment, trash heaps and concrete rubble,as well as 3 tanks and a railroad car. Trails and paths wind throughout the property.

Interspersed throughout the property are shelters where people are living, or were recently living. Some of these shelters used the debris piles as walls for their living quarters.

In addition, we found a box containing six cylindrical cardboard tubes, sealed on each end with wax and stenciled with the words "GAMMA-FLAME". The each tube is approximately ten inches in length, four inches in diameter. The cardboard tubing is approximately one-quarter inch in thickness. Inserted in this box was a piece of mail (unsealed) addressed to "Hollis Newman".

Scattered throughout the property are used automobile batteries and small containers of what is probably used oil and used antifreeze. There are also many small unlabeled containers, probably containing paint or automobile related wastes.

We observed many 55-gallon drums on the property however, most were empty, as determined either by observation (many lacked lids) or by tapping on the sides. Five drums were full or partially full. A sample was collected from each.

There are at least three tanks on the property. Two are of approximately ten-thousand gallon capacity and seemed empty. Apparently, these two tanks used to be underground storage tanks. One is of three-thousand capacity and was partially full of an oily liquid. A sample was collected from this tank.

There are many compressed gas cylinders scattered throughout the property; particularly propane cylinders. The propane cylinders was usually found in the garbage and debris piles.

Other compressed gas cylinders were grouped together in two areas: one group of five cylinders is in a wooden garage that presumably belongs to the Couch family. This garage is filled with all manner of clothes, trash, machinery, equipment, boxes and so forth and as well as five cylinders. (See photo #4).

Near the mobile home where the Couch family lives, adjacent to the road, are twenty-one compressed gas cylinders laying on the ground. Several of them were in a deteriorated condition with rust and corrosion forming on them. All of the cylinders looked like they have been outside for a long time; the paint was faded, the cylinders were scarred and rusty, and leaves and dirt had built up on them, partially burying them. We counted six acetylene cylinders, ten hydrogen cylinders, and five freon cylinders in this area.

Mr. Couch told me that he had tried to get the acetylene cylinders refilled but was refused due to the poor condition of the cylinder valves. He told me that he used the hydrogen cylinders to fill balloons. This concerned me since he seemed to me to be confusing hydrogen, a highly explosive and flammable gas, with helium, an inert gas commonly used to fill children's balloons.

In general, the hazardous wastes we observed fell into four categories;

1) oil or oily wastes
2) compressed gas cylinders
3) paints, lacquers, thinners and solvents
4) unknowns in small containers
5) automobile batteries

Sampling Summary:

All samples were collected by the Haz Mat Team composed of staff from of the California Department of Forestry and the American Canyon Fire Protection District. The Haz Mat Team also tested the two empty ten-thousand gallon tanks for the presence of volatile or toxic gases with hand-held meter device. The meter is a direct reading instrument that does not record findings. Neither tanks registered as having volatile or toxic gases.

A total of six liquid samples were collected. Five of the samples were taken from 55-gallon drums. One sample was taken from the three-thousand gallon tank. One of the cardboard cylinders stenciled "GAMMA-FLAME" was taken from the box if six.

One of the samples came from a drum located in area identified as Zone One; which was the southerly portion of the property that is either leased, rented or otherwise occupied by persons other than the Couch family. The drum was labeled Z-1-1. The sample was identified on the sample jar and on our Chain of Custody document as Sample Number One.

The other five liquid samples came from the drums and the tank located in Zone 3 and were identified on the sample jars and on our Chain of Custody document as Sample Numbers Two through Six.

Sample Z-1-2 consisted of one of the cardboard cylinders stenciled "GAMMA-FLAME". It was NOT included on the Chain of Custody document since we could not send it to a laboratory for analysis as there was concern that it might be explosive or incendiary device of some type, or possibly might contain a highly reactive metal. The device was subsequently x-rayed and opened by Sergeant Johnson of the Presidio Bomb Squad. It was found to be empty except for sawdust packing. Sergeant Johnson said he would list it on his report as a hoax device. He did say that the other cylinders were probably empty too.

Sample ID Number	Sample Type	Sample Jar #
Z-1-1	Liquid from drum	One
Z-1-2	Cardboard cylinder (Gamma-Flame)	N/A
Z-3-3	Liquid from drum	Two
Z-3-4	Liquid from ~~tank~~ drum	Three
Z-3-5	Liquid from ~~drum~~ tank	Four
Z-3-6	Liquid from drum	Five
Z-3-7	Liquid from drum	Six

Areas of Concern:

In terms of hazard potential, the cylinders of hydrogen would represent the most immediate concern. Also, the cylinders in deteriorated condition or of unknown contents have hazard potential. Neither this Department nor the Department of Forestry have the sampling equipment necessary for obtaining gas samples.

The unlabeled drums and tank represent a hazard in that they are unidentified as to contents. Drum Z-3-1 (lying on its side); showed leakage from the top rim. (See photo #17). Drums Z-3-4- and Z-3-5 were resting on a wooden pallet that is heavily stained, and therefore are believed to be leaking. (See photo #21).
The tank Z-3-3 is resting on the ground, without a cap on the fill hole, instead it had a chunk of wood stuck in it. In addition, the tank is not braced in anyway to prevent overturning and it rests on bare earth. (See photo #20).

There are at least two areas on Zone One where twenty or more small containers (one gallon or less) of what look to be various paints, sealers, epoxies, lacquers, engine treatments, wood stains and so forth area stored. Many are rusty or stained and therefore their contents are uncertain but they are mostly like paint and related materials. One group is stored in a fairly neat fashion on a wooden pallet, another group is stored haphazardly in wooden boxes and on the ground. (see Photo #6 and #7)

I observed a large pile of granular asphalt material and asphalt chunks, which would not usually represent an environment hazard unless placed in or along a waterway. (See photo #13).

Judging by the soil piles, asphalt piles, debris piles and abandoned automobiles on the property it appears that the property owners are allowing dumping to take place on their property, perhaps for revenue. Receiving off-site wastes constitutes operating a Solid Waste facility without a Permit or variance.

In addition, Napa County Ordinance #213 makes it unlawful to operate a refuse disposal area in the unincorporated area unless possessing a permit to do so.

An Order of Quarantine that forbids the removal of any hazardous wastes on the property for 30 days unless approval is received from this Department was present to Mr. Robert Couch by a representative of the Sheriff Department. Mr. Couch signed the Order verifying receipt. A copy appears as an attachment to this report.

Violative conditions:

Violative conditions are based wholly or partly on the following:

Section 25117(a), Chapter 6.5, Division 20, Health & Safety Code includes in the definition of a hazardous waste as any wastes or combination of wastes that pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported, or disposed of, or otherwise managed.

Section 25124(e), Chapter 6.5, Division 20, California Health & Safety Code includes in the definition of waste a material that poses a threat to public health or the environment and is either or both mislabeled or not adequately labeled or is packaged in deteriorated or damaged containers.

Based on those definitions, I have determined the following violations.

1. Section 66471, Title 22, California Code of Regulations. The generator (property owner) failed to determine if the wastes are hazardous wastes pursuant to this section in that five (5) drumsand one tank on the property were found (by laboratory analysis) to be hazardous. These containers were unlabeled and at least one container (drum #Z-3-7) did not contain the type of material Mr. Couch stated it to be. Both Robert Couch and David Couch believed all the containers held "cresote".

2. Section 66508, Title 22, California Code of Regulations. The generator (property owner) failed to satisfy the storage requirements for hazardous and the ninety (90) day accumulation time limit for hazardous wastes in that all five of the drums and the tank that were found to contain hazardous wastes were unlabeled and, according to my conversations with Robert Couch and with David Couch, and by my observations on the condition of the containers, these five drums, the tank and the cylinders have been stored on the property for years.

3. Section 67241, Title 22, California Administrative Code. The generator (property owner) failed to manage hazardous waste properly in that the cylinders were lying on their sides, on the ground, adjacent to a road. Several were severely rusted and all of which appeared to be in a deteriorated condition. At least three of drums were severely rusted, one was definitely leaking (Z-3-1) and two were suspected of leaking (Z-3-3 and Z-3-4).

4. Napa County Ordinance 213, Article VI, Section I makes it unlawful to operate a refuse disposal area in the unincorporated area unless possessing a permit from the Health Department to do so. Based on my observations and my discussion with David Couch the property owners have allowed dumping to take place on this property and have allowed refuse to accumulate on this property. (See all photos).

Couch Property
Report of 11-19-90
HF 219

Photo #	Description
1	Entrance to Couch Property. Note tractor-trailer exiting property.
2	Inside Couch property, west of entrance road. Note compressed gas cylinders lying on the ground.
3	Area near Couch residence. Note the drum, tank abandoned automobiles and debris.
4	Storage building. Note Compressed gas cylinders, paint & oil containers, debris.
5	Cardboard cylinders labeled "Gamma Flame". Either a "paint" game device or other hoax device.
6	Numerous containers of paint and related products.
7	Numerous containers of paint, epoxies, cleaners antifreeze, engine additives, etc.
8	Huge piles of debris.
9	Box of Gamma Flame cylinders.
10	Drums and debris pile. CDF staff labeling drum.
11	Debris & drums.
12	Abandoned autos, debris & living quarters for persons unknown.
13	Asphalt pile in foreground. Bus in the background is living quarters for a family, including small children and an infant. Poly drum on the top of pickup truck has plastic tubing that delivers water to the bus.
14	Apparently a former underground storage tank. CDF staff person is commencing to test it for explosive vapors.

Couch Property
Report 11-19-92
HF 219

Photo #	Description
15	Another view of the storage tank and debris pile
16	Eucalyptus tree grove. "Paint" games held here.
17	Toppled, leaking drum.
18	Another drum, full.
19	Another former underground storage tank. This tank contained an oily material. A sample was collected here.
20	Another view of the tank being sampled.
21	Two drums. Both appear to be leaking. One is toppled.
22	Compressed gas cylinders. Ten were labled as containing hydrogen. All of the 21 cylinders observed in this area were in a deteriorated condition.
23	Vehicle on property. Dog's skull nailed to vehicle. Trash in truck bed.
24	A living area for persons unknown.
25	Two horses tethered by chains. No water. Various vehicles in the background, used as living quarters.

COMMENTS:

ORDER OF QUARANTINE

You are hereby notified that an Order of Quarantine is issued on the hazardous wastes on this property; pursuant to the State of California Health & Safety Code, Division 20, Section 25187.6(a).

Pursuant to Section 25187.6(a)(2) No person shall remove, transfer, or dispose of the hazardous waste until permission for the removal, transfer or disposal is given by an authorized agent, identified in the document as the Napa County Department of Environmental Management or The Napa County Sheriffs Department.

Pursuant to Section 25187.6(a)(c), Chapter 6.5, Division 20, State of California Health & Safety Code this Order of Quarantine shall take effect upon issuance and shall remain effective for thirty (30) days or until an authorized agent as identified in this document shall remove this Order of Quarantine .

FUEL FINGERPRINT ANALYSIS
CAL DHS (TPH Draft) Method & EPA Method 8240/8260-(GC/MS)
Extracted by EPA Method 5030 (purge-and-trap)**

Napa County Department of
Environmental Management
625 Imperial Way, Suite 9
Napa, CA 94559

SAMPLE DESCRIPTION:
Proj #APN 58-030-17, Robert Couch Property
C#9011-288-6
Drum #6, Liquid

Compound Analyzed	Detection Limit in ug/l (PQL)*	Concentration in ug/l
Total Purgeable Petroleum Hydrocarbons		
(Diesel #2)	100.	4400.
(Gasoline, Stoddard Solvent, Kerosene, Jet Fuel, Mineral Spirits.....	100.	not found
Percent Surrogate Recoveries		93/97/87

*(Practical Quantitation Limit)
**Soils sonicated during extraction
Constituents reported as "not found" would have been reported if present at or above the listed practical quantitation limit.

NOTE: High concentration of some analytes caused the sample to be run diluted, resulting in raised Practical Quantitation Limits for all analytes. Refer to instrument Blank for undiluted Practical Quantitation Limits.

HAZARDOUS MATERIALS SECTION
DEPT. OF ENVIRONMENTAL MANAGEMENT

COUCH PROPERTY VIOLATIONS

I. Zoning and Building Violations

1. The property is only zoned for one single-family dwelling and for agricultural uses. Despite this, there are twenty other structures (ten of which are inhabited, and ten of which are built for storage or for housing chickens). Also inhabited are ten trailers, two buses, and a camper shell. None of these inhabited structures are permitted uses (NCC 12231, 12107)

2. The twenty stuctures all exceed 120 square feet of roof area and require building permits, which were not obtained (UBC 301(a)).

3. The one permitted dwelling is still under construction and has never been completed. An unapproved, unpermitted underground utility trench has been dug.

4. The owners are living in a mobile home which is to be in dead storage, but is being used as a residence by the owners (NCC 11010).

5. There is no approved water supply and there are two unapproved water wells that have been dug on the property (NCC 5505, 5230).

6. The entire parcel constitutes an illegal junk yard (NCC 6051).

7. Evidence exists regarding the occurrance of paint-ball games which have occurred and been advertised. There is no approved use permit for this activity.

8. All of the residents in the unpermitted structures are renting from the owners, a use not permitted in this zoning. (NCC 12231, 12107).

10. The property is being used to store heavy construction equipment (such as dump trucks, skip loaders, backhoes, and semitrailers), a use not contemplated by the zoning.

11. The entire parcel constitutes a public nuisance (NCC 12903, 11021).

II. Environmental Management-Health and Safety Problems

1. There is no approved sewage disposal or approved septic system present in the park. Sewage disposal ranges from holes in the ground, to merely allowing sewage to run on the ground to an outhouse type structure (NCC 5621, 5622, H&S 5411).

2. There is the illegal accumulation of refuse, debris, trash, and garbage in places located throughout the property. Owners are operating a refuse disposal area without a permit, in violation of Napa County Ordinance No. 213.

3. The property contains unlocked abandoned refrigerators, in violation of Penal Code Section 402(b).

III. Environmental Management-Toxics Problems

1. Small amounts of toxic wastes have been discovered on the property, including oil, compressed gas cylinders, paints, lacquers, thinners, solvents, used auto batteries, containers with antifreeze.

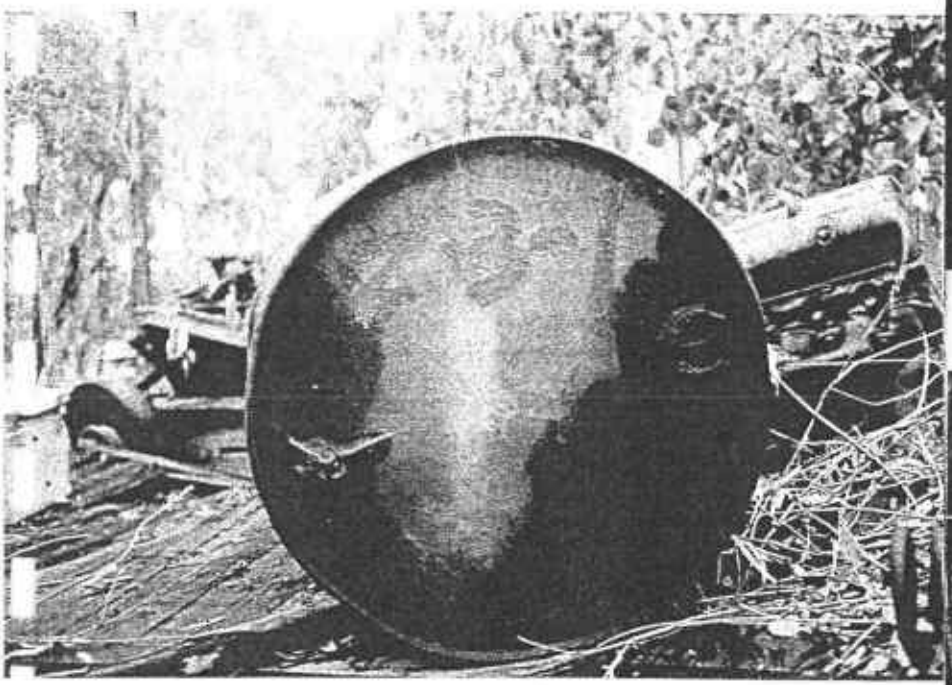
2. In addition, three large old abandoned underground storage tanks are present on the property, one of which is partially full of liquid that tested as hazardous waste.

3. The violations here range from storage of hazardous wastes over 90 days without a permit (22 CCR 66508, and H & S 25189.2) to failure of the generator to determine if his wastes are hazardous (22 CCR 66471) to failure to properly manage hazardous wastes (22 CCR 67243).

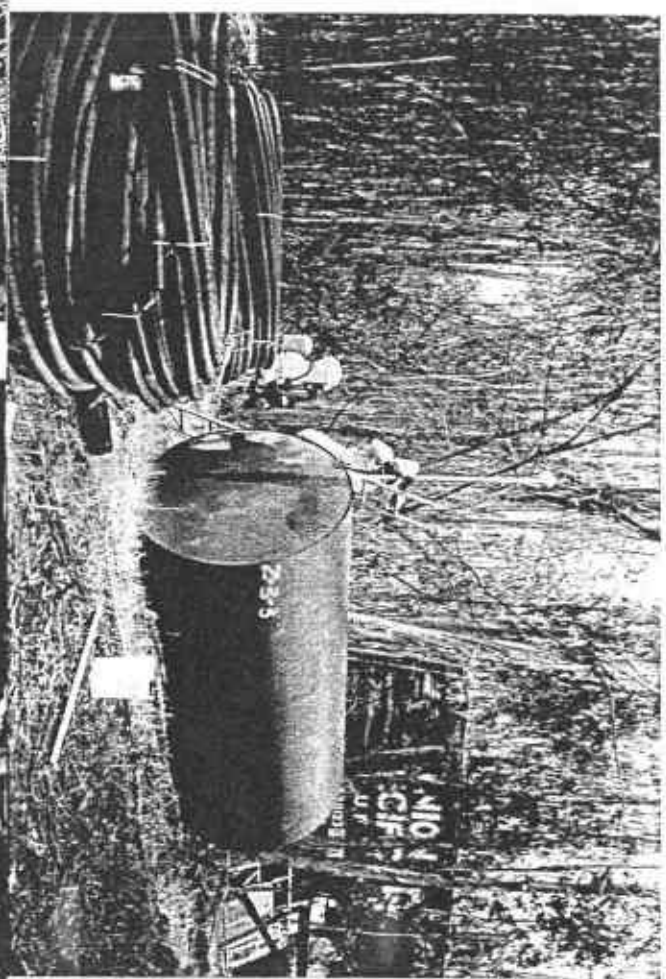
IV. Fire and Forestry Violations

1. There is not adequate clearance between combustable debris and material and the various residential structures (NCC 8871, Public Resources Code Section 4291).

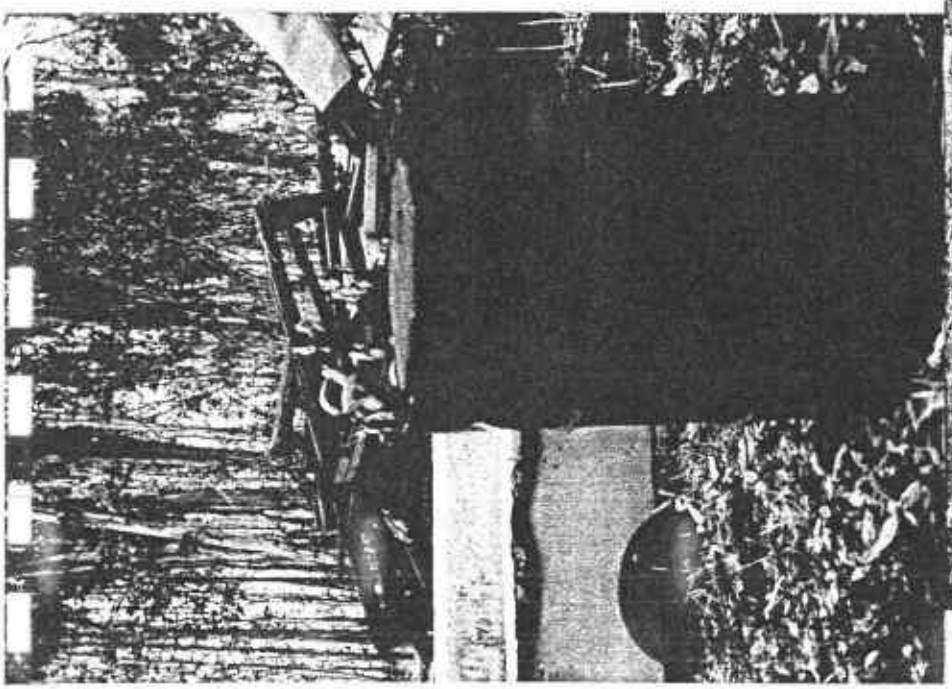
2. Residents have been found to be burning their household trash and garbage in violation of Bay Area Air Quality Management District Regulations (Regulation 5, Section 301).



V. CHP/Public Works Violations



1. The property contains over 230 abandoned vechicles (NCC 4700)



2. The proeprty contains numerous dismantled vehicles, for which the certificate of ownership, the registration card, and the license plates were not delivered to DMV before dismantling began (Vehicle Code Section 5500).

RE: CLEARING AND GRUBBING OF THE COUCH PROPERTY, AMERICAN CANYON, CALIFORNIA

Mr. Cave:

Thank you for the opportunity to submit our fees for the project referenced above. Below you will find our scope of work and our special provisions and exclusions.

SCOPE OF WORK
Demolish all structures and animal pens located on the Couch property, (prior to demolishing the structures an asbestos survey and a release from the air board will be required, along with county or city permits). This proposal does not include any abatement work or costs associated with abatement if any hazardous materials are discovered in the survey.

Remove and dispose of all miscellaneous debris and garbage.

Remove (2) 10,000-gallon fuel tanks, (tanks are presumed to be non-hazardous).

Remove all trees and stumps within the property, removing roots to a minimum of 2". Trees and stumps will be chipped onsite, with all chips and debris hauled offsite for recycling or disposal.

Provide dust control throughout our scope of work.

Our price for this work is: $ 714,000.00
This work is quoted during dry weather months only.

Breakdown of our services for budget purposes:

Remove structures, all animal pens, debris and garbage, working around and leaving the trees and stumps.
Our price for this work is: $ 434,000.00

Remove weeds, trees and stumps.
Our price for this work is: $ 280,000.00

EXCLUSIONS: Removal, transportation, or disposal of any hazardous waste, passage due to weather, import or export of soil, grading, backfill or compaction. Prevailing wage. Any special permits that maybe required other than those quoted above.

Best regards,

Jeff Kroeker
Manager

IN THE SUPERIOR COURT OF THE STATE OF CALIFORNIA

IN AND FOR THE COUNTY OF NAPA

THE PEOPLE OF THE STATE OF CALIFORNIA, PLAINTIFF, VS. ROBERT L. COUCH, et. al., DEFENDANTS.	NSC: 64010 FINAL JUDGMENT AND PERMANENT INJUNCTION

This matter came on regularly before the Court for trial on the 17th, 23rd, 24th of February, and the 1st of March, 1993. Appearance on behalf of plaintiff was made by Deputy District Attorney Daryl A. Roberts, appearance on behalf of Defendant Patricia K. Couch was made by Norbert U. Frost of Frost & Healy, and Defendant Robert L. Couch appeared on behalf of himself. Evidence having been presented and accepted by the Court, arguments having been made, the Court having considered the evidence and the pleadings in this matter, good cause appearing, and in the furtherance of justice,

IT IS HEREBY ORDERED, ADJUDGED, AND DECREED as follows:

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

I

FINDINGS OF FACT

The Court finds that Robert L. Couch and Patricia K. Couch, defendants herein, are co-owners of the property located at #2 Eucalyptus Drive, American Canyon, California, Napa County Assessor's Parcel No. 058-030-017.

The Court further finds that the evidence produced by plaintiff in this matter establishes the following with regard to defendants' property, located at #2 Eucalyptus Drive, American Canyon, California, Napa County Assessor's Parcel No. 058-030-017:

1. At least 100 and possibly as many as 286 abandoned motor vehicles are on the property, in violation of Napa County Code §4700;

2. Defendants' property contains an unknown but large number of accumulations or piles of garbage, refuse, debris, metals, broken concrete, spoils, contractor materials, rubber tires, vehicle parts, household trash, furniture, junked appliances, and other similar items, in violation of the Napa County Garbage Ordinance No. 213;

3. Probably less than 10 abandoned refrigerators are located on the property in violation of Penal Code §402(b);

4. There are numerous illegal sewage disposal systems ranging from holes in the ground and outhouses to septic systems installed, in violation of Napa County Code §§5621, 5622 and Health & Safety Code §5411;

5. For property zoned Agricultural-Watershed, of which the

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

only permitted use is one single family dwelling, a second dwelling unit and a guest cottage, a number of other inhabited structures existed on the property ranging from lean-tos to trailers and buses, which structures were on plots of land being rented by the defendants to various tenants and none of these structures had legal water supplies or permitted sewage disposal systems, all in violation of Napa County Code §§12231,12107;

6. All of these the inhabited structures, as well as approximately 10 chicken coops with roof areas exceeding 120 square feet, were constructed without benefit of building permits, in violation of the Uniform Building Code §301;

7. One water well had been installed or constructed on the property without benefit of permits, in violation of the Napa County Code §§5505 and 5230;

8. In a number of areas on the property, the storage of heavy construction equipment occurred, a use not allowed by the zoning, in violation of Napa County Code §§12231 and 12107;

9. Small amounts of hazardous waste have been illegally stored or disposed of on the property, in violation of Health & Safety Code §25189.2;

10. Defendants are living in a mobile home for which the use permit has expired, and the one dwelling for which a building permit was issued is still under construction, and contains an unapproved, unpermitted underground utility trench, in violation of Napa County Code §11010;

11. Tenants have burned their household trash or

ANTHONY PEREZ
DISTRICT ATTORNEY
JI C ADMINISTRATOR
(BLIC GUARDIAN
UNTY OF NAPA
931 PARKWAY MALL
APA, CALIFORNIA 94559

agricultural debris, in violation of Bay Area Air Quality Management District Regulations (Regulation 5, Section 301) and the Napa County Garbage Ordinance;

12. Adequate clearance does not exist between combustible debris and material and the residences of defendants in violation of Napa County Code §8871 and Public Resources Code §4291;

In addition to the above specific findings, the Court finds that Patricia K. Couch has cooperated with Plaintiff in its efforts to remedy the above-described conditions of defendants' property, including but not limited to, serving tenants with notices terminating tenancies and notices of building code violations, and cleaning and removing certain debris, garbage, refuse, trash and other similar items.

The Court finds that Robert L. Couch has accepted rent from at least one tenant in violation of the preliminary injunction issued by this Court.

II
CONCLUSIONS OF LAW

The Court finds that, based upon the evidence produced by plaintiff during trial, the defendants have been and are presently maintaining upon their property a public nuisance. Specifically, the Court bases this conclusion on both a public nuisance per se theory, as numerous conditions of defendants' property violate specific Napa County Code Sections relating to nuisances, as well as a common law nuisance theory, as the condition of the property meets the criteria as set forth in California case law regarding the existence of public nuisances.

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

In addition, based upon the evidence produced at trial, the Court finds that the defendants, by renting or leasing of portions of their property to tenants either for living on the property or for storage of belongings, engaged in unfair competition, as defined by Business & Professions Code §17200, as such activity was a business activity which violated the zoning laws of the County of Napa, and provisions of the Uniform Housing Code.

III
JURSIDICTION AND APPLICABILITY

The Court has jurisdiction of the subject matter hereof and the parties hereto.

The provisions of this final judgment are applicable to defendants Robert L. Couch and Patricia K. Couch, and to their agents, servants, employees, representatives, heirs, successors in interest, and any and all other persons acting in concert with or participating with defendants who have actual or constructive notice of this judgment.

IV
PROHIBITORY INJUNCTION

Defendants are permanently enjoined and restrained, pursuant to Civil Code §3494 and Business & Professions Code §17203, from doing, directly or indirectly, any of the following:

1. From leasing or renting any portion of the property unless any such lease or rental is in conformance with the zoning of the property and the terms of this judgment.

2. From bringing onto their property or causing to be

ANTHONY PEREZ
DISTRICT ATTORNEY
U IC ADMINISTRATOR
IBLIC GUARDIAN
OUNTY OF NAPA
931 PARKWAY MALL
APA, CALIFORNIA 94559

brought onto their property any of the following items:

a. Any junk, scrap, or dismantled or abandoned motor vehicles of any kind, including but not limited to automobiles, trucks, vans, buses, or motorcycles;

b. Any debris of any kind including but not limited to scrap lumber, scrap metal, broken concrete, other types of spoils, dirt, rubble, rock, or gravel unless the presence of such debris is consistent with the zoning of the property or not violative of any applicable law or ordinance;

c. Any junk of any kind, including but not limited to abandoned vehicle parts or components, junked appliances, junked appliance parts or components, tanks, machines, machinery parts or components;

d. Any garbage, rubbish, refuse, trash, or other similar type material;

e. Any hazardous wastes, including but not limited to waste oil, spent gasoline, gasoline products, gas cylinders, paints, lacquers, thinners, solvents, batteries, anti-freeze, or other similar material.

3. From constructing or maintaining any sewage disposal system unless defendants procure a valid and current permit to do so, and follow all conditions and requirements of said permit.

4. From erecting, constructing, enlarging, altering, repairing, moving, improving, or demolishing any structure or building on defendants property unless defendants comply with the provisions of Uniform Building Code §301, and follow all

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

conditions and requirements of any building permit required pursuant to the provisions of this section.

5. From installing or maintaining any water well on the property unless defendants procure a valid permit to do so, and follow all conditions and requirements of said permit.

6. From storing heavy construction equipment on the property unless the presence of such equipment would be consistent with the zoning of the property, or the equipment is being used to fulfill defendants' obligations under this judgment, or any construction or development performed is pursuant to a valid permit.

7. From storing or disposing of hazardous waste unless defendants do so in compliance with the provisions of the Hazardous Waste Control Act.

8. From allowing inadequate clearance between combustible debris material and any inhabited structure as required by Public Resources Code §4291.

9. From dismantling any motor vehicle unless done in compliance with the zoning laws of the parcel, and in compliance with Vehicle Code §5500.

10. From burning trash or other similar type debris, including agricultural debris, except as allowed by regulations promulgated by the Bay Area Air Quality Management District.

V
MANDATORY INJUNCTION

Defendants, are hereby ordered and mandated as follows:

1. Within 30 days from the filing of this judgment, Robert

ANTHONY PEREZ
DISTRICT ATTORNEY
C ADMINISTRATOR
BLIC GUARDIAN
UNTY OF NAPA
931 PARKWAY MALL
APA, CALIFORNIA 94559

L. Couch or Patricia K. Couch shall do the following:

a. Personally serve a written notice upon each person (other than defendants or members of their immediate family) residing on defendants' property, #2 Eucalyptus Drive, American Canyon, Napa County, California, which provides that each resident has 30 days from the receipt of the notice to remove themselves and all their personal belongings from defendants' property, and that their failure to move their belongings off the property within the time indicated in the notice will constitute an abandonment of those belongings and may be disposed of pursuant to Civil Code §1980 et. seq.

b. Personally serve each and every person who has left personal belongings on defendants' property but does not reside there with a notice requiring them, within 30 days of receipt of the notice, to remove those personal belongings from defendants' property, and that any property left on the premises after the 30 day period will be deemed abandoned and may be disposed of pursuant to Civil Code §1980 et. seq.

c. In the event defendants are unable to personally serve any person, defendants shall cause such notice to be posted in a conspicuous area where the belongings are situated and a copy of the notice mailed to such persons at their last known address. If defendants are unable to locate tenants or their last known address,

ANTHONY PEREZ
ISTRICT ATTORNEY
3LIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
31 PARKWAY MALL
A, CALIFORNIA 94559

they may apply to this Court for an order permitting publication of any notices required herein in the Napa Register, a newspaper of general circulation, to give tenants notice.

2. Within 45 days from the filing of this judgment, defendants shall cause to be filed unlawful detainer complaints against any and all tenants who remain on the property after the 30 day notice period has expired (as referred to above in paragraph 1), and shall properly serve each tenant with summons and complaint as required by law. In addition, defendants are hereby ordered to diligently pursue these unlawful detainer actions until all tenants have been removed from the property, and their property has been removed or been deemed abandoned. It is further ordered that to the extent the service of any tenants with required process and/or pursuit of these unlawful detainer actions prohibits defendants from meeting any time deadline, as set forth in this mandatory injunction, defendants shall be given an extension of time for meeting that deadline equivilant to the amount of time spent by defendant in pursuing these unlawful detainer actions.

3. Within 30 days of the filing of this judgment, each party to this action shall provide to the District Attorney's Office the name, address, and phone number of a scrap or junk dealer. The District Attorney's Office shall prepare a list of the scrap or junk dealers designated by each party and serve the list on defendants. Further, Defendants shall allow any scrap or

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

junk dealer so named to enter the property during reasonable times (8:00 a.m. to 6:00 p.m. Monday through Friday) for the purpose of assessing the status of the property and coming up with a bid for how much money that scrap or junk dealer would pay to remove all valuable items of scrap and abandoned motor vehicles (but excluding those items set aside by defendants pursuant to the provisions of paragraph 4, below) on the property. Only bids obtained within 90 days of the filing of this judgment shall be considered. The dealer offering the highest bid shall be chosen.

4. Defendants shall, within 105 days of the filing of this judgment, collect in one place on their property, unless physically impossible to do so, all operable motor vehicles, operable pieces of construction equipment or vehicle whose purpose is consistent with the agricultural zoning of the property, and any and all other valuable items that defendants contend are not scrap or junk, or an abandoned motor vehicle, and whose storage on the property is consistent with the zoning of the property. Once this has occurred, defendants shall then allow county officials to enter the property to inspect this collection of items to determine if their storage on the property would be consistent with the zoning of the property. If so, none of these items of property would be subject to any of the provisions set forth in paragraphs 5 and 15, below. In the event there is a dispute between defendants and county officials regarding any or all of these items of property, such dispute

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

shall be brought to hearing before this court upon 15 days written notice by either party. Opposition papers shall be filed at least 5 days before the hearing and reply papers shall be filed at least 3 days before the hearing. Defendants will be deemed to have abandoned all other items of scrap, junk, debris and abandoned motor vehicles on the property if not collected and set aside by the deadline set forth in this paragraph, or if ordered by court after hearing.

5. Robert L. Couch and/or Patricia K. Couch shall, within 105 days of the filing of this judgment, enter into a contract with the scrap or junk dealer chosen pursuant to paragraph 3, above, which contract will provide for the following:

a. It will set forth the price to be paid by the dealer for the abandoned motor vehicles and scrap to be removed from the property and it will require the dealer to remove all abandoned motor vehicles and not merely select and remove the motor vehicles and scrap bringing the dealer the highest and/or best price.

b. It will set forth a time period within which the scrap dealer is to remove all abandoned motor vehicles and valuable scrap from the property, with the period not to exceed 150 days, and the period to commence no later than 120 days from the filing of this judgment.

c. It will require the scrap dealer to keep legible records regarding the numbers of abandoned motor vehicles removed, and the weight of scrap removed, as well as legible records regarding

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
1127 PARKWAY MALL
NAPA, CALIFORNIA 94559
707.253-4211

the payment of moneys on either a price per vehicle or price per weight basis. Further, it will require the scrap dealer to, on weekly basis, provide these records both to defendants and to the District Attorney's Office.

d. The bid will require the dealer to handle and dispose of, in a lawful manner, all hazardous waste that may be generated by the removal of motor vehicles, including motor oil, gasoline, diesel fuel, brake fluid, transmission fluid, batteries, and catalytic converters, and any other similar hazardous materials that are commonly found in motor vehicles.

e. The bid will require the dealer to pay, on a weekly or monthly basis (to be negotiated), all moneys generated by the removal of abandoned motor vehicles and valuable scrap items to a trust fund, to be maintained by the District Attorney's Office, as more fully described in paragraph 13, below.

6. Defendants shall allow the chosen scrap or junk dealer to enter the defendants' property at reasonable times and shall not in any manner interfere with or obstruct the dealer's efforts to remove from the property all abandoned motor vehicles and valuable scrap items.

7. Defendants shall not in any manner interfere with or obstruct any and all County officials who may enter the property during reasonable hours to do the following: appraise any or all abandoned motor vehicles on the property for the purpose of issuing salvage certificates; monitor efforts to remove and properly dispose of hazardous wastes; monitor efforts to properly

ANTHONY PEREZ
STRICT ATTORNEY
LIC ADMINISTRATOR
UBLIC GUARDIAN
OUNTY OF NAPA
31 PARKWAY MALL
A, CALIFORNIA 94559

remove abandoned motor vehicles and scrap from the property; monitor efforts to remove or destroy all illegal sewage disposal systems on the property; monitor efforts to raze all structures which are abandoned or condemned; monitor all efforts to remove from the property all garbage, rubbish, trash, spoils, and other similar unpermitted materials.

8. Within 105 days of the date of the filing of this judgment, Robert L. Couch and/or Patricia K. Couch shall commence to remove or have others undertake the removal of trees, bushes, and shrubs required to create an approximate 30 foot firebreak around the mobile home in which defendants are residing, and any other structure inhabited by any other member of defendants' immediate family. Such removal shall be completed within 165 days of the filing of this judgment.

9. In the event the District Attorneys Office determines, at any time, that income generated from the removal of abandoned motor vehicles and other valuable scrap is insufficient to pay for the removal of hazardous waste, debris, garbage, rubbish, trash (and all other items referred to in paragraph 13), the razing of structures on the property and subsequent removal of razed debris, and the removal or destruction of the illegal sewage disposal systems, then the District Attorney's Office may notify the defendants in writing of such situation.

10. Within 30 days of receipt of the notice from the District Attorney's Office referred to in paragraph 9, above, each party shall provide to the District Attorney's Office the

ANTHONY PEREZ
STRICT ATTORNEY
ADMINISTRATOR
IC GUARDIAN
NTY OF NAPA
ARKWAY MALL
A, CALIFORNIA 94559

name, address, and phone number of a commercial harvester wood pulp processor or other wood products dealer for the purpose of obtaining a bid to remove or thin out the eucalyptus trees present on defendants property, and to sell the trees for firewood or other income generating purposes. Either defendant may designate the areas where the trees may be removed or thinned out. Further, Defendants shall allow any commercial harvester or processor so named to enter the property during reasonable times for the purpose of assessing the status of the property and arriving at a bid for how much money that harvester or processor would pay to remove or thin out trees for the purpose of resale as firewood or other purpose. Only bids obtained within 60 days of defendants receipt of the notice referred to in paragraph 10 shall be considered. The harvester or processor offering the highest bid shall be chosen.

11. Robert L. Couch and/or Patricia K. Couch shall, within 75 days of receipt of the notice referred to in paragraph 9, enter into a contract with the chosen harvester, which contract will provide for the following:

a. It will set forth the price to be paid by the harvester or processor for the removal of trees from the property, and the approximate number of trees, or cords of firewood or weight of wood pulp, to be removed from the property.

b. It will set forth a time period within which the harvester is to remove trees from the property, with the period not to exceed 120 days, and the period to commence no later than

ANTHONY PEREZ
DISTRICT ATTORNEY
BLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
PA, CALIFORNIA 94559
707-253-4211

120 days from the date of defendants' receipt of the notice referred to in paragraph 9.

c. It will require the harvester or processor to apply for a timber harvest plan with the California Department of Forestry, and will require the harvester or processor to follow all conditions and requirements of any such plan as approved by said Department of Forestry.

d. It will require the harvester or processor to keep legible records regarding the numbers of trees removed or the cords of firewood removed or weight of wood pulp removed, as well as legible records regarding the payment of moneys on either a price per tree or price per cord basis. Further, it will require the harvester to, on a weekly basis, provide these records both to defendants and to the District Attorney's Office.

e. The contract will require the harvester or processor to pay, on a weekly or monthly basis (to be negotiated), all moneys generated by the removal of trees to the trust fund to be maintained by the District Attorney's Office, as described in paragraph 13, below.

12. Defendants shall to allow the chosen harvester or processor to enter the defendants' property at reasonable times and shall not in any manner interfere with or obstruct the harvester's or processor's efforts to remove designated trees from the property.

13. The District Attorney's office shall maintain a trust fund whose primary purpose shall be to pay for removing from

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
PARKWAY MALL
APA, CALIFORNIA 94559
707-253-4211

defendants' property hazardous waste, the various piles and accumulations of debris, garbage, rubbish, trash, metals, scrap lumber, broken concrete, spoils, contractor materials, rubber tires, vehicle parts, junked furniture and appliances, and oth similar items from the property, removing and destroying all illegal sewage disposal systems, and razing all structures whi are abandoned or condemned and removing the debris produced from such razing. Defendants may be reimbursed from this trust fund for costs they have incurred themselves in cleaning up the property, upon presenting bills, receipts or invoices, but only after the primary purpose of the fund, as set forth above, has been met, and there is money remaining in the trust fund for such reimbursement. Any funds remaining in the trust fund after completion of all clean up activities required under this injunction shall be paid to defendants.

14. Within 150 days of the filing of this judgment, Robert L. Couch and/or Patricia K. Couch shall enter into a contract to retain the services of a licensed hazardous waste consultant, licensed hazardous waste hauler, or licensed hazardous waste dealer to identify and remove from the property any and all hazardous wastes present. The contract shall contain the following provisions:

a. It shall set forth a time period within which the consultant, hauler or dealer shall produce a plan to identify and remove all hazardous waste on defendants' property, with the plan to be produced by a date no later than 30 days from the date the

ANTHONY PEREZ
ISTRICT ATTORNEY
ILIC ADMINISTRATOR
UBLIC GUARDIAN
COUNTY OF NAPA
01 PARKWAY MALL

contract is entered into.

b. It shall provide a time period for which all hazardous wastes shall to be removed, with the period not to exceed 120 days, and to commence no later than 60 days from the date the contract is entered into;

c. It will set forth the price to be paid by the consultant, hauler or dealer for any hazardous waste removed from the property which has some value and will set forth the cost for properly disposing of all other hazardous wastes which are present on the property.

d. It would provide for the maintenance of hazardous waste manifests for the tracking of the hazardous waste removed and properly disposed of, with the requirement that the consultant, hauler or dealer shall provide forthwith copies of these manifests both to the defendants and to the District Attorneys Office.

15. Once all valuable scrap, abandoned motor vehicles, and designated trees for firebreak purposes have been removed from the property, defendants shall either obtain bids from solid waste haulers for the cost to clean up, raze structures and remove from the property all remaining items of waste or garbage (including all piles of debris, garbage, rubbish, trash, and similar materials on the property, all debris created from the razing of structures on the property, along with any items of scrap, and motor vehicles that were left on the property because they were not valuable or income generating and were not picked

up by any scrap dealer) or defendants or their designees may clean up and remove from the property all of these remaining items of waste or garbage.

a. If defendants act upon their own, they shall remove all remaining items of waste or garbage and any necessary clean up shall be completed within 60 days of the date that all valuable scrap, motor vehicles, and trees for firebreak purposes have been removed.

b. In the event defendants or their designees fail to meet the 60 day requirement as set forth in subparagraph a, above, then defendants shall within 30 days after the 60 day period has expired, obtain bids from solid waste haulers for the cost to clean up the property, as set forth above.

c. Within 45 days after the end of the 60 day period, Robert L. Couch and/or Patricia K. Couch shall enter into a contract with the solid waste hauler giving the lowest bid, which contract shall provide for the following:

(1) It shall provide a time period for which all structures shall be razed and all remaining wastes on the property shall be removed, with the period not to exceed 150 days, and to commence no later than 60 days after the expiration of the 60 day period noted above;

(2) It will set forth the price to be charged by the solid waste hauler for the removal of the remaining waste on the property, including the cost of properly disposing of all of these wastes at a State licensed solid waste landfill. It will

require the solid waste hauler to maintain legible records regarding the removal of the waste from the property and the costs incurred.

VI
RESERVATION OF JURISDICTION

The Court hereby reserves jurisdiction with regard to the following issues:

1. Issues pertaining to the need for defendants to obtain use permits or building permits for the structures on their property that they or their immediate family members reside in or otherwise intend to occupy;

2. Issues regarding the destruction of any unpermitted water wells that exist on the property;

3. Issues regarding the burning of household trash, garbage, or agricultural debris on the property;

4. Issues regarding the destruction or removal of any illegal sewage disposal systems on the property.

5. Issues regarding the razing of agricultural structures constructed on the property without benefit of building permits.

6. Issues regarding authorizing the County of Napa to enter defendants' property and conduct all clean-up and removal activities, including the removal of income generating items as have been addressed by this judgment, in the event defendants or either defendant fail to comply with the provisions of the mandatory injunction.

6. Issues regarding the issuance of civil penalties pursuant to Business & Professions Code §17206.

VII
MODIFICATION AND ENFORCEMENT

Any party to this judgment may seek leave of the court upon 15 days notice to the parties hereto and upon a showing of good cause, to modify, amend, or add to any of the provisions of this judgment.

The Court retains jurisdiction, in the event either Robert L. Couch or Patricia K. Couch individually, or both, interfere with, impede, refuse or fail to comply with any provision of this judgment, to make such orders as will prevent further contempt, prevent waste, and protect the property or title to the property, including but not limited to, appointing the defendant who is not in contempt, or a non-party, as a receiver for the purpose of ensuring compliance with this judgment, managing the subject property, and executing any agreements required to comply with this judgment. Further, jurisdiction is retained for the purpose of enabling any party to apply to the Court for such further orders and direction as may be necessary and appropriate for the construction or carrying out of this judgment, for the enforcement of compliance herewith, or for the punishment of violations thereof.

VIII
EFFECT AND ENTRY

This final judgment shall take effect immediately upon entry.

The Clerk is ordered to enter this final judgment forthwith.

KLEINFELDER
An employee owned company

July 25, 2005
File: 54912/2

Mr. Steven Brock
2555 West Bluff Avenue
Fresno, CA 93711

SUBJECT: Phase II Soil Investigation
Couch Property
2 Eucalyptus Drive
American Canyon, California

Dear Mr. Brock:

This report present the results of a soil investigation conducted at the Couch Property located at 2 Eucalyptus Drive in American Canyon, California (Plate 1). The objective of the investigation was to collect and assess the potential impact of chemical constituents associated with Recognized Environmental Conditions (REC's) as described in a Phase I Environmental Site Assessment and other areas as observed during a pre-field visit in April, 2005. To meet this objective, Kleinfelder placed borings and analyzed samples on the basis of: 1) the recommendations of the Phase I ESA, and 2) information acquired during a site inspection and conversations with Mr. Couch. Kleinfelder performed this investigation based on our proposal dated September 14, 2004; and approved with edits by email on February 15, 2005. In summary, this investigation did not reveal evidence for a significant contaminant release at the site.

BACKGROUND

Environmental Science Associates (ESA) identified several REC's in a Phase I Environmental Site Assessment conducted at the Couch Property (*Couch Property Phase I Environmental Site Assessment*, August 25, 2004). The REC's included past and present storage of hazardous materials and wastes on the property, soil staining, reported methamphetamine lab on the property, a wood-cutting area possibly contaminated with diesel fuel or fill dirt, unpermitted outhouses, and two water well locations.

ESA recommended that soil and groundwater be assessed for potential contamination at the site in areas that show stressed or no vegetation in areas used for battery storage and in a mechanic area. ESA also recommended that, "further investigation be conducted to determine the existence and location of soil containing oil that may have

Copyright 2005 Kleinfelder, Inc
KLEINFELDER 780 Chadbourne Road, Suite D, Fairfield, CA 94534 (707) 429-4070 (707) 429-4162 fax

been placed on the portion of the property that is used for a wood cutting operation" (within the southeast portion of the property).

ESA stated that water wells should be abandoned in accordance with California water well standards and Napa County protocol and the sewage disposal areas should be closed.

PRE-FIELD ACTIVITIES

Based on our review of ESA's Phase I Investigation, reports by Napa County Department of Environmental Management (NCDEM) (*Couch Property Violations*, 1991, and a letter *Clearing and Grubbing of the Couch Property, American Canyon, California*, 2003), conversations with the client, and field judgments, Kleinfelder designed a soil and groundwater investigation consisting of nine Hollow-stem auger borings, two test pits, four hand auger borings, and one four-point composite sample of a soil stockpile in areas of concern. Constituents of concern including petroleum hydrocarbons, pesticides, polynuclear aromatic hydrocarbons, volatile organic compounds, coliform, E. Coli, and metals, were identified based on observed and reported uses of areas of the property.

Kleinfelder placed borings and sample locations in areas designated as REC's in the Phase I report, as well as in areas near former above-ground storage tanks, possible underground storage tank locations, areas of oily soil, areas where site activities determined a need for sampling including woodcutting, landscaping materials storage areas, and areas adjacent to former outhouses and reported sewage disposal areas.

Kleinfelder was unable to locate the areas of stressed vegetation, as described in the Phase I report. In addition, the two water wells were non-operational. The current resident, George Couch, stated that the wells are no longer in use, and no potable water for human and domesticated animal consumption is derived from the property.

Kleinfelder obtained a boring permit from NCDEM prior to commencement of work (Appendix A).

Soil boring locations were marked in white paint. Kleinfelder notified USA who cleared the public areas of the site for underground utilities at boring locations.

FIELD ACTIVITIES

The investigation was conducted on March 31, April 1, April 4, April 13, April 20, and May 24, 2005 by Jeff Gilbert, Staff Engineer, under the direction of Jennifer Gomez, Senior Geologist and Environmental Department Manager. This investigation was conducted in conjunction with a Geotechnical report, under the direction of Tom Ries, P.E., Senior Engineer, which will be sent under separate cover. The environmental investigation consisted of nine Hollow-stem auger borings (7, 12, 13, 14, 15, 16, 17, 18,

Copyright 2005 Kleinfelder, Inc

19) four hand auger borings (2, 3, 4, 5), and two test pits (TP-1, TP-2) at the locations shown on Plate 2.

Hollow-stem auger borings were advanced by Woodward Drilling of Rio Vista, California, a C-57 licensed driller. A Kleinfelder engineer logged and classified the soil, and collected soil samples for laboratory analysis (Boring Logs, Appendix B). Hollow stem auger soil samples were collected at approximately every five feet to twenty feet, or until refusal. Hollow stem auger soil samples were obtained from the nine borings by advancing a Hollow stem auger core sampler, consisting of a 2-inch diameter hollow rod with new stainless steel tubing inside. The probe was driven over a 1.5-foot interval, and soil was contained inside the stainless steel tubing. Once the sampler was brought to the surface, the stainless steel tube was capped with Teflon sheets and plastic caps and put into an iced cooler, and the soil interval was logged and classified.

Kleinfelder collected five soil samples from four hand auger borings by advancing a hand auger to depths ranging from 0 to 1 foot. Each soil sample was collected by immediately filling a stainless steel tube with soil from the auger and capping each end with Teflon sheets and plastic caps.

One four-point composite soil sample (1 A-D) was collected from a soil stockpile. Four stainless steel tubes are filled with soil from the stockpile, then combined by the laboratory to create one composite representative sample that is analyzed.

Three soil samples were collected from two test pits. Each soil sample was collected by immediately filling a stainless steel tube with soil from the bottom of the pit as soon as overlying soil was removed by the backhoe bucket. Each end of the stainless steel tube was secured with Teflon sheets and plastic caps.

Groundwater was not encountered in any of the environmental borings. One boring, B-7, was left open overnight to determine if groundwater would collect in the boring. Groundwater was not present in this borehole. Groundwater was encountered in Geotechnical Boring B-4 at 31 feet below ground surface (bgs). Groundwater stabilized at 23 feet bgs within twenty minutes, however, this borehole was drilled using mud-rotary and drilling fluid, the use of which prevents the collection of an undisturbed and uncontaminated groundwater sample. This boring was left open for a short time to allow formation water to collect, however, upon return, the hole had caved, preventing groundwater sampling.

To prevent cross-contamination Hollow stem auger and hand auger sampling equipment was cleaned between borings with non-phosphate soap and rinsed with distilled water. The borings were backfilled at completion.

LABORATORY ANALYSIS

A total of 34 soil samples were submitted for analysis. Groundwater was not encountered during this investigation and therefore, not sampled. The soil samples

Copyright 2005 Kleinfelder, Inc

were submitted to Campbell Analytical in Pacheco, California who is accredited by the State of California for the analyses performed. The samples were transported under chain-of-custody documentation and were analyzed as follows:

Samples were collected at a variety of locations on the property, mostly near occupied areas. Borings 12, 13, 15, 16, 17, 18, and 19 were placed near the residences, sheds, equipment storage areas, possible areas where stressed vegetation may have been located, and mechanic storage areas. Borings 7 and 14 were placed down gradient from these activities in anticipation of a groundwater sample; however, groundwater was not encountered in any of these borings.

Soil samples from Borings 7, 12, 13, 14, 15, 16, 17, 18, and 19 were analyzed for:

- Total Petroleum Hydrocarbons-Extractable (TPH-d, TPH-mo);
- Total Petroleum Hydrocarbons-Purgeable (TPH-g);
- Benzene, Toluene, Ethylbenzene and Total Xylenes (BTEX);
- Methyl tertiary butyl Ether (MTBE);
- Polynuclear Aromatic Hydrocarbons (PAH);
- Total Coliform; and
- Cam 17 Metals.

The soil pile (1A-D) was located within the occupied area of the property, north of the dog pen, near some sheds and a possible former outhouse.

A four-point composite soil sample (1A-D) was taken from this stockpile and analyzed for:

- TPH-d, TPH-mo;
- TPH-g ;
- BTEX;
- MTBE;
- PAH; and
- Cam 17 Metals.

Hand Auger samples were located on an upslope area of the northeast corner of the property. Hand samples were required due to the limited access of this area to a drill rig. This area of the property was reportedly the location of two above ground storage tanks (removed by Napa County), possible underground storage tanks, possible stressed vegetation, and mechanic storage areas.

Copyright 2005 Kleinfelder, Inc

The Hand Auger sample 2, located adjacent to a possible former sewage dump or outhouse area, was analyzed for:

- PAH;
- Total Coliform;
- Cam 17 Metals; and
- E. Coli.

The Hand Auger samples 3, 4, and 5, all located in various areas of possible stressed vegetation and mechanic storage area were analyzed for:

- PAH; and
- Pesticides.

The Test Pit soil samples TP-1, TP-4 were located in the woodcutting area, reportedly the location of some dumped oily soil. Kleinfelder observed trash in the soil of these test pits at the depths sampled (TP1 at 2 feet and 3 feet bgs, TP4 at 2 feet bgs). These test pit samples were analyzed for:

- TPH-d, TPH-mo;
- TPH-g;
- MTBE; and
- BTEX.

All soil samples were analyzed on a standard five-day turnaround schedule.

ANALYTICAL RESULTS

Analytical results for the March 31, April 1, April 4, April 13, April 20, and May 24, 2005 sampling events are presented in Tables 1 and 2. Copies of analytical laboratory reports and chain-of-custody form are included in Appendix C.

None of the samples analyzed had detected levels of the following constituents above the Environmental Screening Levels (ESL's) as defined by the San Francisco Bay Water Board for residential shallow soils (<3m) where groundwater is currently or potentially a source of drinking water (February, 2005).

- TPH-d, TPH-mo;
- TPH-g;
- BTEX;
- MTBE;

Copyright 2005 Kleinfelder, Inc

- PAH;
- Pesticides; or
- E. Coli.

The two samples collected at Hand Auger boring 2 both had detected levels of Total Coliform at depths of 0 and 1 foot bgs, 2-0-I (960 MPN/ml) and 2-1-I (430 MPN/ml). Hand Auger boring 2 was located near a variety of wooden structures, adjacent to a structure that appeared to be a former outhouse (Plate 2).

Metals were detected above ESL's level in the following samples:

- 14-5-I: Vanadium
- 19-5-I: Chromium, Nickel, Vanadium
- 12-15-I: Chromium
- 18-5-II: Cobalt, Vanadium

DISCUSSION

The purpose of this investigation was to screen for potential contamination by sampling soil and groundwater at locations where contamination, if present, would be most likely. The locations and constituents of concern were selected on the basis of information provided by the Phase I ESA, Mr. Couch, and a site walk.

Petroleum hydrocarbons, gasoline additives, and polynuclear aromatic compounds were not detected in any of the samples collected from the borings, with the exception of sample 12-15-1 where gasoline and BTEX were detected in low concentrations. In addition, gasoline and diesel-range hydrocarbons were detected in very low concentrations within the soil stockpile. Therefore, no evidence for a significant release of petroleum hydrocarbons was found at the site.

Review of the metals data indicate, with the possible exception of four samples discussed below, that the concentration of metals in soil represent background conditions. Elevated concentrations of some metals from four samples, however, warrant discussion:

- The concentration of Chromium (130 mg/kg) in sample 12-15-I collected at 15 feet bgs is elevated relative to the majority of samples. However, chromium concentrations in two samples collected at shallower levels from the same boring are low. In addition, elevated levels of other contaminants that often coexist with chromium at sites with a similar history were not detected. Therefore, the data does not indicate that the elevated chromium concentration is due to a significant release.
- The concentrations of vanadium in samples 14-15-I (110 mg/kg) and 18-5-II (120 mg/kg) appear to be elevated as compared to the majority of samples. However,

Copyright 2005 Kleinfelder, Inc

because other metals and petroleum hydrocarbons are not elevated in these samples, and vanadium is an unusual contaminant, the levels of vanadium do not likely represent a significant release at this location.

- Concentrations of chromium (230 mg/kg), nickel (150 mg/kg) and vanadium (160 mg/kg) are elevated relative to the other samples in sample 19-5-I. However, these constituents do not appear to be significantly elevated in samples collected above and below this sample. The boring was located near the former battery storage location, but elevated levels of lead (as would be expected from a release from lead-acid batteries) was not detected. Therefore, the data does not appear to reflect a significant release at this location.

Total coliform as high as 960 MPN/ml was detected at Hand Auger location 2, adjacent to a possible former outhouse structure. These levels are probably related to the former use of a nearby outhouse and reported sewage disposal at this location. E Coli was not detected in these samples. Therefore, the total coliform does not appear to represent a health risk at the site.

Groundwater was not sampled during this investigation, so direct data regarding potential contaminant impacts are not available. However, because no evidence of a significant release that may act as a source of groundwater contamination was found, it may be inferred that the potential of impacts to groundwater from the site is low.

Two water well spigots were located, as described in the Phase I report. According to Mr. Couch, the wells are not operational. Kleinfelder recommends decommissioning these wells and abandoning them in accordance with Napa County Department of Environmental Management procedures.

LIMITATIONS

This report was prepared in general accordance with the standard of care that exists in Northern California at the time the investigation was performed. It should be recognized that definition and evaluation of subsurface conditions are difficult. Judgments leading to conclusions and recommendations are generally made with incomplete knowledge of the subsurface conditions present. The conclusions of this assessment are based on field observations obtained during the time of drilling and laboratory analytical results. More extensive studies may further reduce the uncertainties associated with this assessment. Kleinfelder should be notified for additional consultation if the Client wishes to reduce the uncertainties beyond the level associated with this report. No warranty, express or implied, is made.

This report may be used only by the client and only for the purposes stated within a reasonable time from its issuance, but in no event later than three years from the date of the report. Land or facility use, on and off-site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability

Copyright 2005 Kleinfelder, Inc

resulting from the use of this report by any unauthorized party and client agrees to defend, indemnify, and hold harmless Kleinfelder from any claim or liability associated with such unauthorized use or non-compliance.

Kleinfelder offers various levels of investigative and engineering services to suit the varying needs of different clients. Although risk can never be eliminated, more detailed and extensive investigations yield more information, which may help understand and manage the level of risk. Since detailed investigation and analysis involves greater expense, our clients participate in determining levels of service, which provide adequate information for their purposes at acceptable levels of risk.

If you have any questions or need additional information, please contact us at 707-429-4070.

Sincerely,

KLEINFELDER, INC.

Sarah Callahan
Staff Geologist

Bradley Erskine, Ph. D., P.G.
Area Manager

PHASE I ENVIRONMENTAL SITE ASSESSMENT
2 EUCALYPTUS DRIVE
AMERICAN CANYON, CALIFORNIA

1.0 INTRODUCTION

At the request of Mr. Aaron Ross-Swain of Standard Pacific Homes, Innovative and Creative Environmental Solutions (ICES) performed a Phase I Environmental Site Assessment (ESA) for 2 Eucalyptus Drive located in American Canyon, California ("the Site"; Figure 1). The accessors's parcel number (APN) for the Site is 058-030-056. This report presents:

1. A summary of relevant information obtained;

2. A description of the methods and sources used to obtain information concerning the Site;

3. Our interpretation of the information, with respect to potential environmental concerns; and

4. Our professional opinion concerning the likelihood of potential soil, groundwater, or surface-water degradation caused by the presence of hazardous substances, and the need, if any, for sampling and analysis to document site conditions.

The objectives of this ESA are to:

1. Assess the potential sources of hazardous substances at the Site as a result of on-site or off-site activities that may have affected site soil or groundwater quality; and

2. Evaluate the presence of chemically-affected soil on the Site to the extent indicated by visual observations, personal interviews, and regulatory records.

The ESA investigated past and present site uses, focusing on the use, handling, storage, release, or on-site disposal of hazardous substances, and examined the potential for migration of hazardous substances onto the Site from reported chemical releases, if any,

PAGE 6/26 * RCVD AT 3/24/2006 9:16:16 AM [Pacific Standard Time] * SVR:S30A1001/2 * DNIS:975 * CSID: * DURATION (mm-ss):07-58

in the site vicinity. The assessment was based solely on a review of available records, visual observations, and personal interviews. Field sampling was not performed as part of this ESA.

2.0 BACKGROUND

A eucalyptus grove has occupied the Site since the late 1950s. In the early 1980s, the northeastern portion of the Site was developed and used for residential applications. The southeastern portion of the Site appeared to have been used as a race track. Currently, the southeastern portion of the Site is used to cut and store wood. Paint ball fields are located at the western and central portions of the Site. A farm-like environment which is used to house animals is located directly south of the residential developed area at the northeastern portion of the Site.

A Phase I ESA was conducted by Environmental Science Associates of Sacramento, California in October 2004. Environmental Science Associates' assessment revealed that there was past and present undocumented and illegal storage of hazardous materials and waste on the Site. Additionally, Environmental Science Associates reported that a large amount of soil containing some type of oil was deposited at the southeastern portion of the Site in the 1970s for a motorcycle track. A site investigation was recommended based on their findings.

Kleinfelder of Fairfield, California performed a Phase II Site Investigation in March through May 2005. Soil samples were collected from sixteen sample locations and selectively analyzed for petroleum constituents, polynuclear aromatic hydrocarbons (PAHs), total coliform, ecoli, pesticides, and metals. Laboratory analytical results of the soil samples indicated non-detectable concentrations of PAHs, total coliform, ecoli, and pesticides; and low to non-detectable concentrations of petroleum hydrocarbons. The metal concentrations detected in the soil samples were generally below the California Regional Water Quality Control Board's Environmental Screening Levels (ESLs) for residential landuse, with the exception of arsenic, chromium, and vanadium. Arsenic, chromium, and vanadium concentrations which were at or above their respective residential ESLs were encountered in the surficial soil at the northeastern portion of the Site.

PAGE 7/26 * RCVD AT 3/24/2006 9:16:16 AM [Pacific Standard Time] * SVR:S30A1001/2 * DNIS:975 * CSID: * DURATION (mm-ss):07-58

3.0 SCOPE OF WORK

This Phase I ESA included the following tasks:

- Review of background information on site setting and history of site usage
- Field inspection of the Site and neighboring properties
- Review of regulatory records concerning the Site and surrounding area
- Data evaluation and report preparation

The findings associated with the above tasks are presented below.

4.0 SITE RECONNAISSANCE

ICES personnel conducted a walk-through site inspection, and performed a drive-by reconnaissance of the adjacent properties and the surrounding area on March 10 and 13, 2006.

4.1 Site Visit

The Site is located on the north side of Eucalyptus Drive and is within the legal jurisdiction of the City of American Canyon, in conjunction with Napa County and the State of California. The Site consists of one parcel (APN 058-030-056) covering an area of approximately 106 acres. The parcel falls distinctly from the northeast corner of the Site towards the central portion of the Site. The remaining areas of the Site are relatively flat.

A eucalyptus grove occupies the Site - a major portion is used by the Paint Ball Jungle (primarily during the weekends), and the remaining acreage is occupied by Mr. George Couch (the property owner) and a wood cutting and storage operation. The Paint Ball Jungle uses the western and central portions of the Site. Mr. Couch occupies the northeastern portion of the Site. A farm-like environment which is used to house animals is located directly south of Mr. Couch's residence. A cleared area used to cut and store wood is located at the southeastern portion of the Site. At the time of the site visit, several piles of wood chips, truck trailers, and equipment used for wood cutting were observed within the area.

A visual inspection of the paintball fields indicated that paint balls are scattered throughout the property and several forts have been built for the paint ball games. The forts house

PAGE 8/26 * RCVD AT 3/24/2006 9:16:16 AM [Pacific Standard Time] * SVR:S30A1001/2 * DNIS:975 * CSID: * DURATION (mm-ss):07-58

several empty 55-gallon plastic drums. An inspection of the northeastern portion of the Site indicated two residential structures, a concrete block structural foundation, an outhouse, several sheds, and a well. The areas surrounding the residential structures contained a lot of household items, wood debris, abandoned vehicles, machinery, equipment, small containers of unknown material, several water tanks, an underground storage tank that was sitting on the ground, tires, and refuse.

4.2 Drive-by Reconnaissance

A drive-by reconnaissance of the neighboring properties indicated that landuse in the vicinity of the Site is a mixture of residential and commercial.

The Site is bounded to the north by warehouse buildings and to the east by open pastures. The area south of the Site is occupied by open space and a residential subdivision. The American Canyon Sanitary Landfill, a eucalyptus grove, and wetlands are located west of the Site.

5.0 HISTORY OF THE SITE AND VICINITY

Historical records reviewed as part of this ESA included aerial photographs and Sanborn Fire Insurance maps.

5.1 Aerial Photographs Review

Historical aerial photographs of the Site and vicinity from 1959 through 1998 were provided by Environmental Data Resources, Inc. ("EDR") of Southport, Connecticut. A historical account of the landuse of the Site between 1959 and 1998 based on a review of available aerial photographs is presented below.

The Site

The 1959 aerial photograph showed that the Site was occupied by a eucalyptus grove. In 1965, a large section of the eucalyptus grove at the eastern portion of the Site had been harvested. Replanted eucalyptus trees were observed at the eastern portion of the Site by 1970. The 1982 aerial photograph showed that the northeastern portion of the Site was developed and used for residential applications. The southeastern portion of the Site appeared to have been used as a race track. There were no noticeable changes in the 1993 and 1998 aerial photographs relative to the 1982 aerial

PAGE 9/26 * RCVD AT 3/24/2006 9:16:16 AM [Pacific Standard Time] * SVR:S30A1001/2 * DNIS:975 * CSID: * DURATION (mm-ss):07-58

photograph.

Neighboring Area

The 1957 aerial photograph showed that the neighboring area surrounding the Site was generally undeveloped land. Eucalyptus groves were present northwest of the Site. Two structures were located adjacent to the southwestern portion of the Site. A residential development was observed on the south side of Eucalyptus Drive, southeast of the Site.

There were no appreciable changes to the neighboring area in the 1965 and 1970 aerial photographs relative to the 1957 aerial photograph.

The 1982 aerial photograph showed that the American Canyon Sanitary Landfill was located west of the Site. There were no noticeable changes to the neighboring area in the 1993 and 1998 aerial photographs relative to the 1982 aerial photograph.

5.2 Sanborn Maps Review

A Sanborn Map site search conducted by EDR indicated that there were no Sanborn Maps available for the Site and the immediate surroundings.

5.3 Personnel Interviews

ICES attempted to interview Mr. Couth on March 10 and 13, 2006 to obtain additional information regarding the historical and current uses of the Site. Mr. Couch declined to be interviewed.

6.0 REGIONAL PHYSIOGRAPHY

The U.S. Geological Survey Cuttings Wharf Quadrangle indicated that the elevation at the Site is approximately 12 feet above mean sea level and that the topography at the Site slopes in a southwesterly direction. The nearest major body of water is the Napa River, which lies approximately 1.0 mile west of the Site.

7.0 RADON POTENTIAL

The radon data presented in this section is based on the California Statewide Radon Survey Interim Results (CSRSIR) for the County of

PAGE 10/26 * RCVD AT 3/24/2006 9:16:16 AM [Pacific Standard Time] * SVR:S30A1001/2 * DNIS:975 * CSID: * DURATION (mm-ss):07-58

Napa. Radon is a known human carcinogen and is the second leading cause of lung cancer in the United States. The United States Environmental Protection Agency (EPA) recommends that action be taken to reduce radon levels when indoor radon levels exceed 4 pico curies per liter of air (pCi/l).

The CSRSIR predicts that 4.7 percent of homes in the Napa County would exceed 4 pCi/l. Additionally, of the 34 states participating in the radon survey, California ranks as the third lowest state for percentage of homes exceeding 4 pCi/l. The survey results are not intended to predict the radon exposure level measurement in an individual structure since other factors such as climatic conditions, soil permeability, house structure, and soil/house pressures besides geographic location can affect indoor radon levels. Indoor radon levels at the Site can only be obtained by sampling and testing existing or future structures. Radon levels were not measured at the Site.

The potential for radon concentrations to exceed 4 pCi/l at the Site is relatively low based on the small percentage of homes in the County of Napa predicted to exceed EPA's recommended exposure limit.

8.0 REVIEW OF REGULATORY RECORDS

A governmental records report for the Site and the surrounding areas was prepared by EDR dated February 27, 2006. The geographic database search was conducted following the American Society for Testing Materials standards for a government records review. A copy of the EDR report is included in Appendix A. The record search included sites on governmental environmental lists within a one-eight to one mile radius of the Site to determine if the Site or nearby properties have been identified by Federal or State regulatory agencies and to identify hazardous material handling, storage or storage disposal operations. Within the EDR report, a complete listing of agency records is provided.

A total of two cases with possible releases of chemicals of concern to the environment were identified within the area of the search. EDR's radius map list review identified:

<> one State Landfill;

within a one eighth-mile radius from the Site;

PAGE 11/26 * RCVD AT 3/24/2006 9:16:16 AM [Pacific Standard Time] * SVR:S30A1001/2 * DNIS:975 * CSID: * DURATION (mm-ss):07-58

2520

<> no cases;

within a one quarter-mile radius from the Site;

<> one WMDUS/SWAT case;

within a one half-mile radius from the Site;

<> no cases;

within a one mile radius from the Site.

Of the two cases, all two cases are not considered to have impacted the Site because of one of the following criteria:

1. No further action (NFA) status;
2. A De-listed status;
3. No violations; and
4. Their distance (approximately one-eight mile or greater) from the Site, and/or their relative location cross gradient from the Site.

A NFA status or a de-listed status for a site/case indicates that chemical releases to the environment had not occurred or had been successfully remediated. In addition, sites/cases with a "No Violations" notation have not had known releases of chemicals into the environment.

The local topography suggests that the local groundwater gradient flows in a southwesterly direction. It is, therefore, unlikely that properties situated in the down-gradient locations of the Site could have impacted the Site through groundwater flow.

9.0 SUMMARY AND CONCLUSIONS

A eucalyptus grove has occupied the Site since the late 1950s. In the early 1980s, the northeastern portion of the Site was developed and used for residential applications. The southeastern portion of the Site appeared to have been used as a race track. Currently, the southeastern portion of the Site is used to cut and store wood. Paint ball fields are located at the western and central portions of the Site. A farm-like environment which is used to house animals is located directly south of the residential developed area at the northeastern portion of the Site.

PAGE 12/26 * RCVD AT 3/24/2006 9:16:16 AM [Pacific Standard Time] * SVR:S30A1001/2 * DNIS:975 * CSID: * DURATION (mm-ss):07-58

A Phase I ESA was conducted by Environmental Science Associates of Sacramento, California in October 2004. Environmental Science Associates' assessment revealed that there was past and present undocumented and illegal storage of hazardous materials and waste on the Site. Additionally, Environmental Science Associates reported that a large amount of soil containing some type of oil was deposited at the southeastern portion of the Site in the 1970s for a motorcycle track. A site investigation was recommended based on their findings.

Kleinfelder of Fairfield, California performed a Phase II Site Investigation in March through May 2005. Soil samples were collected from sixteen sample locations and selectively analyzed for petroleum constituents, PAHs, total coliform, ecoli, pesticides, and metals. Laboratory analytical results of the soil samples indicated non-detectable concentrations of PAHs, total coliform, ecoli, and pesticides; and low to non-detectable concentrations of petroleum hydrocarbons. The metal concentrations detected in the soil samples were generally below the California Regional Water Quality Control Board's ESLs for residential landuse, with the exception of arsenic, chromium, and vanadium. Arsenic, chromium, and vanadium concentrations which were at or above their respective residential ESLs were encountered in the surficial soil at the northeastern portion of the Site.

Based on the findings of this ESA, ICES recommends that a supplementary investigation be conducted within the Site. Specifically, ICES recommends that the following task be performed to obtain additional information to adequately characterize the underlying sediments:

1. Collect soil samples from the surficial soil within the western portion of the Site to assess the potential presence of organochlorine pesticides, arsenic, lead, and mercury associated with the eucalyptus grove;

2. Collect soil samples from the surficial soil within the southeastern portion of the Site to assess the potential presence of petroleum hydrocarbons, semi-volatile organic compounds, and lead associated with the former motorcycle track and existing wood cutting and storage operations; and

3. Collect soil samples from the surficial soil within the northeastern portion of the Site to assess surficial sediments containing arsenic, chromium, and vanadium levels detected in a previous site investigation which exceeded residential ESLs.

PAGE 13/26 * RCVD AT 3/24/2006 9:16:16 AM [Pacific Standard Time] * SVR:S30A1001/2 * DNIS:975 * CSID: * DURATION (mm-ss):07-58

The evaluation is site specific, based on the information available at this time and could be revised if new information necessitating further review of the Site and adjacent facilities becomes available.

10.0 LIMITATIONS

The Scope of Work for this Phase I ESA did not include collection or analysis of soil and/or groundwater samples; assessment of the potential presence of asbestos in building materials; testing of electrical equipment for the potential presence of polychlorinated biphenyls; assessment of natural hazards such as naturally occurring asbestos, radon gas, or methane gas; assessment of the potential presence of radionuclides; or assessment of nonchemical hazards, such as the potential for damage from earthquakes or floods or the presence of endangered species or wildlife habitats. Therefore, a full and complete determination of environmental risks was not made. This Phase I ESA also did not include an assessment of the compliance status of the Site.

The observations and conclusions presented in this report are professional opinions based on the scope of activities and information obtained through the Phase I ESA described above. Opinions presented herein apply to site conditions at the time of our study, and cannot apply to site conditions or changes of which we are not aware, or which we have not had the opportunity to evaluate. It must be recognized that any conclusions drawn from these data rely on the integrity of the information available to ICES at the time of the investigation. Soil and/or groundwater sampling and analysis would provide additional level of confidence with respect to potential environmental risks at the Site.

This report is exclusively for the use of Mr. Aaron Ross-Swain of Standard Pacific Homes. Any reliance on this report by a third party shall be at such party's sole risk.

1. SUMMARY

A Phase I Environmental Site Assessment (ESA) was performed for American Canyon Flat Land Inc., for the property at 2 Eucalyptus Drive in American Canyon, California (Plate 1). This report was prepared in general accordance with the scope and limitations in the American Society for Testing and Materials (ASTM), *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* E1527-05 and the All Appropriate Inquiry (AAI) section of the Small Business Liability Relief and Revitalization Act (the Federal Brownfields Law). The property is hereafter referred to as the "subject site."

The subject site consists of 106.57 acres of land in American Canyon, California, occupied by a residence, outbuildings, and a recreational paintball operation, (Plate 1). Much of the site is used for agricultural purposes, occupied by eucalyptus trees that were harvested for firewood. The parcel number, as identified by the Napa County Assessor's office, is 058-030-056.

For ease of description, the site is divided into several areas and described counterclockwise from Eucalyptus Drive (Plate 2):

- Hurst Firewood Area: located adjacent to the north of Eucalyptus Drive, south of an east/west unpaved road, and east of the unpaved section of Commerce Blvd. that runs north/south through the site;
- Paintball Jungle Area (East): located north of the east/west unpaved road and Hurst Firewood, south of the animal pens and Couch Residential Area, and on both sides of Commerce Blvd;
- Animal Pens Area: located north of Paintball Jungle and south of the Couch Residential Area;
- Couch Residential Area: located north of the animal pens, south of the property boundary, east of Commerce Blvd;

Copyright 2009 Kleinfelder

- "Concentrated Area" (named in accordance with County investigation and legal document maps): located west of Commerce Blvd across from the Couch Residential Area; and

- Sherwood Forest Paintball & North Slough Creek Area: located at the northwest corner of the property, west of the Concentrated Area.

- Paintball Jungle Area (West): located on the western side of Commerce Boulevard, south of Sherwood Forest Paintball, north of the property line, east of the property line.

The site has been developed as a eucalyptus tree farm since at least 1937. A Phase I ESA was performed in 2004 by Environmental Science Associates (ESA) that covered the entire parcel, but findings and recommendations were restricted to the 2004 observations of conditions at the Couch Residence and Hurst Firewood Areas. A Phase II soil and groundwater investigation performed by Kleinfelder in 2005 was based on the recommendations from ESA's Phase I report and maps, and therefore addressed only a portion of the areas where previous dumping, spills, and leaks may have occurred. During the Phase II investigation, Kleinfelder collected soil samples but did not encounter groundwater for sampling.

This Phase I ESA represents a re-evaluation of the site based on new information provided to Kleinfelder since the original investigations.

The following is a summary of Kleinfelder's findings in each area.

Hurst Firewood Area:

This area is currently occupied by Hurst Firewood, a business owned by Mr. Hurst, used for cutting eucalyptus trees into firewood for sale. Previously, as few as 19 to as many as 30 people reportedly may have resided in this area, mainly north of area cleared of trees. These renters set up residences on small plots of land that were not connected to water, sewer, or electricity. According to Keith Caldwell, former American Canyon Fire Chief, many of these renters conducted short-scale engine and auto repairs and one methamphetamine lab was discovered and removed. In addition, Mr. Hurst previously stored approximately 50 vehicles and pieces of equipment at the site and

Copyright 2009 Kleinfelder

performed small-scale engine repairs on these vehicles. Kleinfelder observed several stockpiles of wood chips and soil and concrete debris during the site visit.

Paintball Jungle Area (East):
This area is currently occupied by paintball games operated under the name Paintball Jungle. According to permitting records, paintball operations have occurred at the site since at least 1990. Prior to paintball operations, the majority of this area was occupied by junked cars, vehicles, drums, containers, trash, and other debris.

Animal Pens Area:
This area is currently occupied by animals including horses, roosters, and hens. The Couch family reportedly rents stalls and pens for horse boarding. Several vehicles were observed in this area as well as various storage containers. Kleinfelder did not have interior access to this portion of the site so observations were made from the perimeter fence. This area was reported to be occupied by various animals and was the site of illegal animal fighting activities.

Couch Residential Area:
This area is currently occupied by one member of the Couch family who lives on the property in a reportedly unpermitted dwelling. Kleinfelder observed at least 10 vehicles and hundreds of other pieces of equipment, various containers of paints, transmission oil, motor oils, areas of dumped garbage, three unpermitted wells, several large containers including tanks, tanks on wheels, structures, locked storage containers or structures that Kleinfelder could not access, and various debris. Previously, this area reportedly contained over 150 vehicles, hundreds of tires, additional structures occupied by other members of the Couch Family and possibly additional renters, and many widespread areas of debris.

Kleinfelder reviewed various documentation related to the 1993 court-ordered cleanup. This area of the site contained drums that were sampled by Catherine Moody of NCDEM and found to be either diesel or phenols which Robert Couch and David Couch reportedly described as “cresol.” Various subsequent court documents describe cleanup activities at the site and provide copies of household waste disposal at Devlin Road landfill in American Canyon (a Class III municipal landfill), tire disposal at a recycler, scrap metal at a recycler, and junked car removal and disposal. The

Copyright 2009 Kleinfelder

documents do not include manifests for the hazardous materials found to be within drums, fluids from vehicles, and contents of small containers. These materials, if disposed of properly, would have been disposed of at the fire department or a Class II landfill by a certified waste hauler. However, Kleinfelder searched the DTSC and Cal-EPA database to obtain records of a possible RCRA generator ID number (required on the waste manifest for hazardous materials) and no RCRA ID number was found for the Couch Family. A RCRA ID was found for paintball operations only.

Concentrated Area:

This area was identified and labeled by Napa County investigators during previous investigations and information gathering. This area is currently occupied by a chain-link fence, wooden garage door barrier, outhouse, boat, boat trailer, and camper trailer. This area previously was occupied by various renters and reportedly was the site of an additional illegal methamphetamine lab, which was reportedly removed by the Napa County Sheriff's Department in approximately 2000.

Sherwood Forest Paintball Area:

This area, located on the northwest corner of the property, appears to be currently occupied by paintball operations, formerly operated under the name "Sherwood Forest" paintball. Kleinfelder is not sure whether this company still operates this portion of the site, or whether this area is used by Paintball Jungle. Kleinfelder observed several small structures in this area including an enclosure for CO_2 compressed gas containers, a pickup truck, and a wood chipping machine. This area previously was reported to be the "cleared area" and possible location of an outdoor fireplace. According to Keith Caldwell, this area reportedly was a location where drums may have been buried.

North Slough Creek (within Sherwood Forest Paintball Area):

A creek, which appears to drain southwest to the Napa River, is located on the northwest corner of the property near the site boundary. A rock and soil pile was observed along the eastern bank of the creek. It was reported to Kleinfelder by Mr. Michael Johnson that a concern exists regarding the runoff within the creek, which was based on a reported surface water quality violation that was issued to the adjacent American Canyon Wastewater treatment plant. According to Mr. Johnson, the wastewater treatment plant was concerned that the source for pollutants in the creek

Copyright 2009 Kleinfelder

was the Couch Property. Kleinfelder has not seen a copy of the complaint or the results of any sampling or analysis that may have been performed.

Paintball Jungle Area (West):
This area, which comprises the majority of the area west of unpaved Commerce Blvd, was previously and now is currently used for paintball games. Several structures constructed of wood and 55-gallon drums were observed as well as two outhouses. Minor dumping was reported along the roadside but no residences or tenants occupied this area.

Kleinfelder's Phase I ESA of the subject site revealed the following current and historic RECs associated with the site.

- There is ample evidence that residual petroleum hydrocarbons, solvents, and certain metals may have been released in shallow soil throughout the eastern portion (Hurst Firewood, Paintball Jungle (East), Animal Pens, and Couch Residential areas) of the site as well as within the western portion (Concentrated Area, Sherwood Forest Paintball and North Slough Creek area) of the site. These petroleum hydrocarbons were likely surface spills and dumping related to the storage of hundreds of pieces of equipment, at least 150 vehicles, areas of the site occupied by the current owner and areas rented to tenants, and areas of dumping.

- The majority of the site is currently used for paintball games. Depending on where the paintballs were manufactured, it is possible that paint within paintballs may have contained lead and was released to soil.

In addition, while not considered to be RECs by definition, the following other environmental conditions were revealed that could affect the subject site:

- A septic system exists at the subject site. The purpose of the septic system is to receive domestic sewage. If future construction activities encounter the septic system or the system is no longer in use, the system must be abandoned in accordance with applicable local permitting requirements and regulations.

Copyright 2009 Kleinfelder

- Although asbestos and lead is specifically excluded from the Phase I standards, Kleinfelder recommends that all structures be surveyed prior to demolition in compliance with EPA, Bay Area Air Quality Control Management District, and Napa County Building Department rules and regulations.

- Three wells were observed at the site. If these wells are no longer in use, they must be abandoned in accordance with applicable federal, state, and local regulations.

- A complaint and possible violation reportedly occurred related to waters of the creek, located on the property in the northwest corner. The City of American Canyon Water Treatment Facility was reportedly concerned by the possibility of source material leaching into the creek from materials on the Couch property.

Any deviations, historical environmental conditions, and de minimis findings are discussed in Section 8 of this report. This report is subject to the limitations in Section 2.5.

Copyright 2009 Kleinfelder

2. INTRODUCTION

Kleinfelder conducted a Phase I ESA of the subject site. The following report is a summary of work performed in general accordance with the scope and limitations in the ASTM Standard E-1527-05, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM Standard), the All Appropriate Inquiry (AAI) section of the Small Business Liability Relief and Revitalization Act (the Federal Brownfields Law), and our Master Services Agreement with American Canyon Flat Land Inc, dated November 7, 2009. This report also generally conforms to the ASTM Standard's suggested table of contents.

2.1 PURPOSE

The purpose of this Phase I ESA is to identify, to the extent feasible pursuant to the scope of work defined in our work order, and the limitations discussed in this report, RECs and other environmental issues related to the subject site. As defined in the ASTM Standard, a REC is:

> *The presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis are not recognized environmental conditions.*

This report describes Kleinfelder's assessment methodology and documents our assessment findings, subject to the limitations presented in Section 2.5 of this report.

Copyright 2009 Kleinfelder

2.2 DETAILED SCOPE OF SERVICES

The following sections describe Kleinfelder's work scope:

- Section 2, **Introduction**, includes a discussion of the purpose/reason for performing the Phase I ESA, additional services requested by the Client (i.e. an evaluation of business environmental risk factors associated with the subject site), significant assumptions (i.e. property boundaries if not marked in the field), limitations, exceptions, and special terms and conditions (i.e. contractual), and user reliance parameters.

- Section 3, **Site Description**, is a compilation of information concerning the site location, legal description (if provided), current and proposed use of the subject site, physical setting, and geologic and hydrogeologic conditions.

- Section 4, **History of the Site**, summarizes the history of land use at the site and on adjoining properties. The history was developed by conducting interviews, reviewing information provided to Kleinfelder by the client and by consulting various resources such as aerial photographs, agency files, and historic maps.

- Section 5, **Records Review**, is a compilation of Kleinfelder's review of several databases available from the Federal, State, and local regulatory agencies regarding hazardous substance use, storage, or disposal at the subject site; and for off-site facilities up to a one-mile radius around the site. This chapter includes interviews with the owner.

- Section 6, **Site Reconnaissance**, describes Kleinfelder's site observations during the site reconnaissance and observations of adjacent parcels.

- Section 7, **Interviews**, is a summary of telephone and personal interviews conducted with "Key Site Managers" that may include the owner/manager of the facility, occupants/tenants, local government officials, and the Client. Additional interview sources may be contacted if "Key Site Managers" are not available prior to production of this report, and may include adjoining landowners and people with historical knowledge of the area.

Copyright 2009 Kleinfelder

- Section 8, **Evaluation**, is a presentation of our findings and conclusions regarding the information in Chapters 3 through 6; and presents our opinion regarding the presence of Recognized Environmental Conditions of concern at the site.

- Section 9, **References**, is a summary of some of the resources used to compile this report.

The appendices contain certain pertinent documentation regarding the subject site. Appendix A presents site photographs. Appendix B contains the qualifications of the environmental professionals responsible for the preparation of this report. Appendices C, D, E, F, and G contain historical records review and database review records, user provided aerial photographs and documents, regulatory agency documentation, supporting documentation for interviews, and Kleinfelder's previous investigations, respectively.

2.3 SIGNIFICANT ASSUMPTIONS

The subject site is hereafter referred to as the "site" or "subject site". Kleinfelder does not guarantee the accuracy of information supplied by its sources, but reserves the right to rely on this information in forming a professional opinion regarding the potential for contamination at the site.

2.4 LIMITATIONS AND EXCEPTIONS

Phase I ESAs are non-comprehensive by nature and are unlikely to identify all environmental problems or eliminate all risk. The attached report is a qualitative assessment. Kleinfelder offers a range of investigative and engineering services to suit the needs of our clients, including more quantitative investigations.

The scope of this ESA does not incorporate ASTM Standard non-scope considerations, such as asbestos/lead-based paint, radon, lead in drinking water, wetlands, regulatory compliance, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, high voltage power lines, indoor air quality, and therefore vapor intrusion as a contributing indoor air quality issues.

Copyright 2009 Kleinfelder

Although risk can never be eliminated, more detailed and extensive investigations yield more information, which may help you understand and better manage your risks. Since such detailed services involve greater expense, we ask our clients to participate in identifying the level of service that will provide them with an acceptable level of risk. Please contact the signatories of this report if you would like to discuss this issue of risk further.

Kleinfelder performed this environmental site assessment in general accordance with the guidelines set forth in the ASTM and AAI Standards, and the proposed scope subsequently approved by our Client. No warranty, either expressed or implied, is made. Environmental issues not specifically addressed in this report were beyond the scope of our services and not included in our evaluation.

This report may be used only by the Client and only for the purposes stated within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land or facility use, on- and off-site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Since site activities and regulations beyond our control could change at any time after the completion of this report, our observations, findings, and opinions can be considered valid only as of the date of the site visit. This report should not be relied upon after 180 days from the date of its issuance (ASTM Standard, Section 4.6). Any party other than the Client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the Client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party, and Client agrees to defend, indemnify, and hold harmless Kleinfelder from any claim or liability associated with such unauthorized use or non-compliance.

2.5 SPECIAL TERMS AND CONDITIONS

No special terms and conditions in addition to those discussed previously were agreed to either by the Client and Kleinfelder in our work order for this project.

Copyright 2009 Kleinfelder

3. SITE DESCRIPTION

This section describes the condition of the site at the time the Phase I ESA was conducted and provides information about the site description and local geologic and hydrogeologic conditions.

3.1 SITE DESCRIPTION

The site is identified as a 106.57 acre site, located north of Eucalyptus Drive and west of Oat Hill. The site is occupied by a eucalyptus grove and for the purposes of clarity for this assessment; the site is divided into several sections defined by their use:

- **Hurst Firewood Area**
  Hurst Firewood was formerly operated by Mr. Hurst for cutting of eucalyptus trees into firewood, storage of vehicles & equipment, reported periodic engine repair. In addition, north of the firewood cutting operation, the Couch family rented the area within the trees to at least 19 residents. The residences were constructed without permits and consisted of tarps, garage doors, scrap wood, trailers, and vehicles. In addition, a methamphetamine lab was reportedly removed from one of the residences.

- **Paintball Jungle Area (East)**
  Paintball Jungle area has been commercially operated by an outside company for recreational paintball games since at least the early 1990's. Areas currently operated as paintball were previously occupied by over 150 vehicles, various debris including tarps, equipment, 55-gallon drums of known and unknown contents.

- **Animal Pens Area**
  The Animal Pens area has been used to board horses, chickens, roosters, and possibly other animals. The Couch family reportedly rents stalls and pens for animal owners to board and take care of their animals. This location was formerly used for illegal chicken fighting activities and reportedly raided several times by law enforcement.

Copyright 2009 Kleinfelder

- **Couch Residential Area**
  The Couch Family occupied this area from at least the early 1970's. Several building permits were issued for the construction of a home that was not completed. At least one mobile home was occupied by Robert and Patricia Couch, which burned to the ground in 1994. A garage was occupied by several people and is now used to store tools. A small dwelling, constructed of wood, is currently occupied by one of the Couch's sons. Various areas of the property were occupied by the Couch's other two sons. In addition to residences, most of this area previously contained equipment, vehicles, metal debris, petroleum products, tanks, repair equipment, tools, drums and other containers, and debris including garbage. Three water wells were observed within this area.

- **Concentrated Area**
  The "Concentrated Area" was named by Napa County investigators during previous investigations and information gathering site visits. This area was previously occupied by a trailer and a methamphetamine lab, removed in 2000 or 2001. This reported methamphetamine lab was located within a chain-link fenced area. A portion of this fence still exists. This area is currently occupied by a boat, boat trailer, and camper.

- **Sherwood Forest Paintball Area and North Slough Creek**
  This area is located along the northwest corner of the property and is currently occupied by paintball operations, several wooden structures, wood chipping equipment, a truck, and CO2 compressed air containers. The creek is located along the western border of the property in this location. This area was reportedly used for drum burial and used to contain a brick fireplace. The creek flows southwest to the Napa River.

- **Paintball Jungle Area (West)**
  This area is composed of the western side of the property, west of the unpaved Commerce Blvd. This area appears to have been used for recreational paintball operations since the early 1990's, possibly earlier. Several wooden walls and paintball related structures are currently present in this area.

Roads at the site consist of an unpaved section of Commerce Boulevard, which is situated in the center of the property. Several other unpaved roads exist at the site

Copyright 2009 Kleinfelder

including a road leading to the residence and various unpaved paths through the trees. An unpaved parking lot associated with the paintball operation exists along the southern portion of the Paintball Jungle Area (East). Each area of the site is described in further detail in Section 6.2.

Surrounding properties consist of American Canyon Wastewater Treatment Plant and undeveloped land to the northwest and west, former municipal landfill to the west and southwest, undeveloped property to the east, commercial warehouses to the north, and single-family residential property to the south. In addition, a 4-H garden area is located adjacent to the southwest across the unpaved Commerce Blvd segment from Hurst Firewood.

The information presented in Table 3.1 describes the physical location of the subject site. This information was obtained from maps, public records, and interviews.

TABLE 3.1: SITE SETTING

DESIGNATION	DESCRIPTION
Address	2 Eucalyptus Drive
Location	North of Eucalyptus Drive, west of Oat Hill, American Canyon, California
Township & Range	Township 4 North, Range 4 West, Sections 14 & 23
Assessor's Parcel Number	058-030-056
Acreage	106.57 acres
Current Use	Rural residential, recreational paintball, storage areas
Potable Water Supply	Current: City water connection; Past: imported by truck, and possible wells
Waste Water System	Septic System, surface dumping
USGS TOPOGRAPHIC QUADRANGLE Cuttings Wharf, California 7.5 Minute Series. 1949, photorevised 1981	The subject site is approximately 15 to 30 feet above mean sea level. The site topography slopes toward the west.
MUNGER MAP (ftp://ftp.consrv.ca.gov/pub/oil/maps/Dist6/W6-1/MapW6-1.pdf)	There are no mapped oil wells or dry holes located on the subject site.

Copyright 2009 Kleinfelder

3.2 SITE SOILS

According to the Soil Survey of Napa County soils at the site are mapped as Haire clay loam, and Fagan clay loam.

The Haire series consists of moderately well drained soils located on old terraces and alluvial fans. The Haire series has slow to medium runoff, depending on slope and the hazard of erosion is slight to moderate, depending on slope.

The Fagan series consists of well drained soils on uplands. The Fagan series has medium to rapid runoff, depending on slope and the hazard of erosion is moderate to high, depending on slope.

3.3 REGIONAL AND LOCAL GEOLOGY

3.3.1 Regional Geology

The site lies within the Coast Range Geologic Province of California. This province is characterized by northwest trending mountain ranges and intervening valleys, which are a reflection of the dominant northwest structural trend in bedrock of the region. The basement rock in the northwest portion of this province is dominantly highly deformed sedimentary, metamorphic and volcanic rock of the Franciscan Complex of Upper Jurassic to Cretaceous Age.

3.3.2 Local Geology

The site is underlain by a portion of Oat Hill, which is composed of Quaternary Holocene sandstone, siltstone, and shale. The higher elevation portion of the property is composed of Late Pleistocene alluvial fan deposits which grade to the southwest. The low-lying area of the site, mainly on the western side of Commerce Blvd, is composed of Quaternary Holocene Bay Mud.

3.4 GROUNDWATER

Depth to groundwater beneath the site has not been determined. Based on a limited Phase I ESA by ESA in 2004 and a subsequent soil investigation by Kleinfelder in 2005, groundwater was not encountered above 31 feet bgs. Kleinfelder assumes, based on

Copyright 2009 Kleinfelder

this limited data and site topography, that groundwater depth should be deeper on the northeastern portion of the site (in areas of higher topography) and become progressively shallower toward the west and southwest where the site elevation approaches the level of the slough south of Eucalyptus Drive and to the west where the site meets the surface creek that drains to the Napa River. General groundwater depth and direction may be influenced by local pumping, rainfall, and irrigation patterns. Evaluation of such factors is beyond the scope of this assessment.

Copyright 2009 Kleinfelder

4. HISTORY OF THE SITE

The history of the site was researched to identify obvious uses of the site from the present to first developed use or back to 1940, whichever is earlier. The objective was to evaluate the likelihood that past uses resulted in RECs. Table 4.1 summarizes the information reviewed during this assessment. Kleinfelder used this information to establish the site history.

TABLE 4.1: HISTORICAL INFORMATION REVIEWED

4.1 AERIAL PHOTOGRAPHS

A review of historical aerial photography may indicate past activities at a site that may not be documented by other means, or observed during a site visit. The effectiveness of this technique depends on the scale and quality of the photographs and the available coverage. Aerial photographs were obtained from several historical photograph collections through EDR. Copes of the aerial photographs obtained by Kleinfelder are included in Appendix D.

1937

The site is occupied by a planted crop of trees, likely similar trees to the Eucalyptus trees planted at the site today. A creek is shown along the western boundary. Surrounding properties consist of residential southwest of the site boundaries, similar tree grove to the west and undeveloped land to the north, east, and south. In addition, several unpaved roads are observed in the site vicinity.

1948

The site and surrounding properties appear essentially unchanged from the 1937 photograph.

1957

The site and surrounding properties appear essentially unchanged from the 1948 photograph.

1965

The site is shown essentially unchanged from the 1957 photograph with the exception that a white structure is shown along the northern boundary of the site.

1970

A cleared area exists on the northwest corner of the site, in addition, a smaller cleared area and unpaved road with possible vehicles or trailers are shown in the northeast corner of the site. The surrounding properties appear to be essentially unchanged from the 1965 photo.

Copyright 2009 Kleinfelder

1982

Additional unpaved roads are observed in the northwest portion of the site, along with several vehicles, possible trailer or structures, and larger cleared areas. An unpaved oval-shaped area is shown in the southern portion of the site. A round pond is shown along the western boundary of the site in the vicinity of the creek. Surrounding properties appear essentially unchanged from the 1970 photo. The overall photo quality is poor.

1993

Additional unpaved roads, vehicles, small structures are visible in the northwestern portion of the site, and many vehicles are visible within the trees in the west-central portion of the site. Additional unpaved roads are visible in the southern portion of the site, possible debris or vehicles are visible along the unpaved roads. The surrounding properties consist of undeveloped land and a tree grove immediately surrounding the site, commercial warehouses to the north, a structure on the top of Oat Hill to the east, and residential housing to the south. The rural residence previously located adjacent to the southwest is no longer present.

1998

The subject site and surrounding properties are essentially unchanged from the 1993 photograph, except the surrounding properties are slightly more densely developed and several structures are shown in the vicinity of the rural residential property adjacent to the southwest of the site.

2005

The southern portion of the site is cleared and approximately 20 vehicles and semi-truck trailers are visible. In addition, several areas of fill material piles are visible. The north-south road is wider and appears to have gravel on it. The central portion of the road is used for vehicle parking. In addition, an area on the eastern side of the property has a small paved area that appears to be used for vehicle parking. The northeastern corner of the property appears to have several trailers, vehicles and small structures. An area on the northwest corner of the site appears to be paved. Surrounding properties consist of commercial warehouses adjacent to the north, a water treatment plant to the west, residential houses to the south, and undeveloped land to the east.

Copyright 2009 Kleinfelder

4.2 SANBORN FIRE INSURANCE MAPS

Sanborn Fire Insurance Maps provide historical land use information for some metropolitan areas and small, established towns. Sanborn maps were not available for this site.

4.3 HISTORICAL TOPOGRAPHIC MAPS

Kleinfelder obtained information regarding historical topographic map of the site vicinity from EDR. The topographic maps reviewed for this assessment are summarized below. Copies of the maps are included in Appendix C.

NAPA, 30 Minute Series, 1902, 1 inch = 10,416 feet

The subject site is shown as undeveloped, located west of a prominent hill with an elevation marker of 260 feet, and east of a wetlands area that drains to the Napa River.

MARE ISLAND, 15 Minute Series, 1914, 1 inch = 5,208 feet

The subject site is shown as undeveloped. The present day Eucalyptus Drive is represented as an unpaved road. A structure is depicted adjacent to the north of Eucalyptus Drive. Surrounding properties are undeveloped, with a structure depicted to the north at the end of another unpaved road.

MARE ISLAND, 15 Minute Series, 1947, 1 inch = 4,166 feet

The subject site is depicted as a vegetated area. Surrounding properties consist of three structures adjacent to the southwest, a creek along the northeast corner, and undeveloped property to the north, south, east, and west. Oat Hill is depicted as a prominent feature to the east and the Napa River is shown to the west.

CUTTINGS WHARF, 7.5 Minute Series, 1951, 1 inch = 2,000 feet

The subject site is represented as undeveloped. North slough creek is mapped along the northwest side of the property. Two structures are mapped adjacent to the southwest at the end of a paved road that continues west as an unpaved road. Oat Hill is depicted adjacent to the east and a levee and the Napa River are depicted to the west.

Copyright 2009 Kleinfelder

CUTTINGS WHARF, 7.5 Minute Series, 1949 photorevised 1968, 1 inch = 2,000 feet
The subject site is represented as undeveloped, but within a vegetated area. Surrounding properties are shown essentially unchanged from the 1951 map.

CUTTINGS WHARF, 7.5 Minute Series, 1949 photorevised 1981, 1 inch = 2,000 feet
The subject site and surrounding properties are essentially unchanged from the 1968 map, with the exception of additional development to the southeast and southwest, with additional paved and unpaved roads.

4.4 PREVIOUS INVESTIGATIONS

Kleinfelder was provided several previous investigations for review.

Environmental Science Associates, Phase I ESA, 2004
A Phase I ESA was prepared for the site by Environmental Science Associates (ESA) in 2004. This Phase I ESA recommended a Phase II investigation focused on several areas of the Hurst Firewood operation and near the dwelling currently occupied by a member of the Couch Family that were identified as RECs. It is Kleinfelder's opinion that the Phase I ESA was limited in scope and area, and did not include important information in site records available at NCDEM, and Napa County Building and Planning. It also did not include a complete review of historic aerial photographs. In addition, the Phase I ESA was prepared well prior to the current ASTM standard and is considered to be out of date.

Kleinfelder, Phase II Soil Investigation, 2005
In 2005, Kleinfelder was tasked to rely entirely on the findings and recommendations of ESA's Phase I report, and based on the findings in the report, perform a Phase II investigation. Kleinfelder conducted Phase II soil sampling and attempted to collect groundwater. Kleinfelder collected 34 soil samples, 30 samples were from the Couch Residential portion of the site in various locations including near the reported site of former "USTs" now present aboveground, near the dwelling, near a dog pen, near structures, storage areas, and locations that appeared to be presently occupied. Soil samples were analyzed for the presence of petroleum hydrocarbons as gasoline, diesel, motor oil, methyl tert-butyl ether (MTBE), benzene, toluene, ethylbenzene, and total xylenes (BTEX), polyaromatic hydrocarbons (PAHs), total coliform, and CAM 17 metals.

Copyright 2009 Kleinfelder

In addition, a composite sample was taken from a soil stockpile reportedly located north of the dog pen near a shed.

Soil samples results were reported by the laboratory to not contain petroleum hydrocarbons, MTBE, BTEX, or PAHs above the San Francisco Bay Regional Water Quality Control Board Environmental Screening Level established at that time for shallow soils where groundwater is a source for drinking water. Since this investigation was conducted, the ESL has been revised and many ESL thresholds were lowered. Soil samples analyzed for metals were reported by the laboratory to contain several metals above the ESL, however, at that time, Kleinfelder believed many of the metals concentrations (Chromium, Nickel, Vanadium, Cobalt) may be naturally-occurring. In addition, total coliform was reported within one of the samples, collected from a location near a reported outhouse. Coliform levels are expected to be elevated near outhouses.

Based on new data presented in this ESA, it is Kleinfelder's opinion that additional investigation is required to assess the potential for impacts on the site. In addition, the ESL screening levels have also been revised in May of 2008; therefore, the current screening levels may not be the same as screening levels in 2005.

Kleinfelder, Preliminary Geotechnical Investigation, 2005

Concurrent with the Phase II ESA, Kleinfelder performed a Preliminary Geotechnical investigation at the subject site in 2005. Although site geology and soils data may remain similar to conditions encountered in 2005, the reliance limitations to this report have been exceeded. It is Kleinfelder's opinion that the geotechnical report be reviewed, and if indicted, additional geotechnical investigations be conducted to augment the data and confirm the previous results.

A copy of both the Kleinfelder Phase II report and Geotechnical Report are included in Appendix G.

4.5 USER-PROVIDED INFORMATION

Kleinfelder was provided an assembly of information gathered by a third party, on behalf of our client for this investigation. This information included public records available from Napa County Environmental Management, Napa County Building and Planning

Copyright 2009 Kleinfelder

Department, and Napa County Court records. Kleinfelder has summarized the information below. A copy of this information is included in Appendix E.

Napa County GIS Information

Kleinfelder was provided a printout of available information on the parcel, obtained from the Napa County GIS website. In addition, aerial photographs of the site from 2002 and 2007, obtained from the GIS site were included. The 2002 aerial photograph records many areas of the eastern side of the property to have vehicles, blue-tarped areas, trailers, debris, unpaved roads. The southern third of the site has been mostly cleared of trees and has many stockpiles of soil or wood chips and at least 75 truck trailers, vehicles, pieces of equipment, and small structures. The 2007 aerial photograph records fewer debris areas and vehicles, however, many vehicles, trailers, and areas of debris still exist.

User Provided Aerial Photos

Kleinfelder was provided a set of aerial photos by R.H. Hess Development Company (representative of the client), who had this area photographed in 2004. The aerial photos provided from 2004 document various areas of debris, vehicles, and structures. These photos are included in Appendix D.

Napa County Department of Environmental Management

1973 - Map, dated 1973 that records the subject site and the footprint of a proposed residence, garage, house trailer, well, and septic tank attached to a leach field. These plans are marked as "approved" by the Department of Public Health on October 17, 1973.

1990 – Order of Quarantine copy, issued on November 19, 1990 for the hazardous wastes observed on the property. The order states that "pursuant to Section 25187.6 (a)(2) no person shall remove, transfer, or dispose of the hazardous waste until permission for removal, transfer or disposal is given by an authorized agent, identified in the document as the Napa County Department of Environmental Management or The Napa County Sheriffs Department." This order is addressed to Robert Couch and signed by Mr. Couch with a date of November 19, 1990.

Copyright 2009 Kleinfelder

1993 – Copy of Superior Court Final Judgment and Permanent Injunction for the People of the State of California vs. Robert L. Couch, et al. The judgment describes the following findings at the property (summarized):

- At least 100 and possibly as many as 286 abandoned motor vehicles on the property;
- An unknown but significant number of piles of garbage, refuse, debris, metals, broken concrete, spoils, contractor materials, rubber tires, vehicle parts, household trash, furniture, junked appliances, and other similar items;
- Probably less than 10 abandoned refrigerators;
- Numerous illegal sewage disposal systems ranging from holes in the ground to outhouses and septic systems;
- Only one residence is permitted, however, a second dwelling, guest cottage, and other inhabited structures existed on the property including lean-tos, trailers, buses, structures on plots of land being rented to various tenants;
- Approximately 10 chicken coops constructed without permits;
- One water well installed without a permit;
- Storage of heavy construction equipment;
- Small amounts of hazardous waste illegally stored or disposed of at the property;
- Unpermitted mobile home, unpermitted underground utility trench;
- Burned trash areas near tenant spaces; and
- Inadequate clearance between residences and combustible material.

The judgment also states that this property is a public nuisance and orders a cleanup of the property, in addition to prohibiting future renting of property, dumping, burning, etc.

The property owners (defendants in this case) were ordered specifically to:

Copyright 2009 Kleinfelder

- Enter a contract with a junk dealer/ hauler to haul away scrap and vehicles;
- Obtain a commercial harvester to thin out trees;
- Retain the services of a licensed hazardous waste consultant, licensed hazardous waste hauler, or licensed hazardous waste dealer to identify and remove from the property any and all hazardous wastes present;
- Provide hazardous waste manifests for hazardous wastes removed and disposed of; and
- Obtain bids from solid waste haulers to raze structures and clean up debris that is not income-generating or valuable.

A timeline was submitted for the tasks outlined in the judgment and each activity was scheduled to be completed by the end of 1994.

Napa County Superior Court Records

Kleinfelder was provided a copy of the available court record, filed for this case in Napa County Superior Court. In addition to the 1993 judgment summarized above, copies of written declarations by various witnesses in this case were provided from the court case files. Witnesses included Ruben Oropeza, Environmental Health Specialist for Napa County Department of Environmental Management; John Morrow, Building Inspector for Napa County Department of Conservation Development and Planning; Michael Collins, Detective for Napa County Sheriff's Office; Catherine Moody, Senior Hazardous Materials Specialist for Napa County Department of Environmental Management. In addition to their statements, various information is attached including a site map of the property's tenants and approximate areas where they resided, testing information for the liquids sampled during the inspection, and copies of photographs. Copies of these materials are in Appendix D.

In summary, this information was used during the court proceedings to provide support for the court-ordered cleanup action.

Records dated 2003 describe the schedule and approximate cost for removal and disposal of items at the site identified within the 1993 judgment. Within this document, dated September 15, 2003, Mr. Norbert Frost, attorney for Patricia Couch, states that

Copyright 2009 Kleinfelder

"there are no known hazardous materials or substances at the property" and "the Couches would hire an environmental consultant to evaluate the property to make sure that there are no hazardous materials stored there."

Additional records dated 2003 describe the cleanup that has already been performed at the site and includes copies of disposal documents. Disposal of materials was conducted between 2001 and 2003 and generally disposed of at Devlin Road Transfer Station, various scrap tire facilities, and various metal recyclers.

Records dated by the judge on November 3, 2009, state that the following steps will be taken within 90 days following the release of funds and approval of this initial plan by the County. The plan includes the following items:

- Hurst Firewood lessee shall remove all vehicles and equipment unrelated to on-site production of firewood within 30 days;
- Accessory storage structures greater than 120 square feet that the defendants do not intend to seek a building permit for will be demolished an debris removed promptly. Permits for demolition shall be obtained from the County and Bay Area Air Quality Management District.
- Multiple debris boxes shall be rented and placed on site, all general debris, construction debris, and non-hazardous materials shall be dumped prior to the end of the 90 day initial cleanup period; and
- The approved September 5, 2009 fire mitigation plan shall be completed and maintained as specified in that plan.

In addition, this order grants $30,000 to be released from a court account to hire consultants to assist with plan and application preparations, on-site monitoring, and liaison with county staff, as well as, rent the necessary equipment to accomplish the initial clean up objectives.

Additional court records were provided to Kleinfelder which include information regarding eminent domain acquisition of a former part of the property, currently occupied by the City of American Canyon wastewater treatment plant.

Copyright 2009 Kleinfelder

American Canyon Fire Protection District
Kleinfelder was provided a copy of two letters from Keith Caldwell, Fire Chief.

The first letter is dated September 27, 1990. Mr. Caldwell describes his attempt, along with members of building department, environmental health, and zoning enforcement on September 26, 1990 to inspect the commercial uses of the property. During this inspection, George Couch asked them to leave. This letter is a request for an inspection warrant.

The second letter is dated October 18, 1990. Mr. Caldwell describes his observations at the site which include the following:

- North corner of the property - three- 10,000 underground gasoline tanks;
- South portion of the property fronting Eucalyptus Drive- approximately 30- 55 gallon drums, undetermined amount of smaller containers, some appearing to be military with undetermined contents, some equipment that appears to be from a chemical lab or industrial lab work;
- Middle property - northeast side- large flatbed trailer with approximately 30 to 40 drums;
- Middle property - two 40-foot trailers, pad locked; and
- Throughout the entire parcel – approximately 150 abandoned vehicles in various states of dismantle and 15 to 20 residences made up of RV's or tents with no sanitary facilities.

4.6 CITY DIRECTORIES

City directories provide information regarding property occupants by address. Kleinfelder reviewed available historic city directory listings for the subject site and nearby addresses, as provided by EDR. Directories from the following years were reviewed: 1972, 1977, 1983, 1989, 1995, 2000, and 2007.

Copyright 2009 Kleinfelder

The subject site was listed as residential in 1977, 1983, and 1989. Sherwood Forest Paintball was listed at the site address in 2007.

Nearby addresses on Eucalyptus Drive were reviewed. Listed addresses were reported as residential. In addition, Williams Construction was listed in 1983 and 1989 at 97 Eucalyptus Drive. It is Kleinfelder's opinion that Williams Construction is located too far from the site to pose an environmental concern to the subject site.

4.7 PRELIMINARY TITLE REPORT

A preliminary title report was not provided to Kleinfelder for review.

4.8 ENVIRONMENTAL LIENS

EDR researchers located available environmental lien information for the parcel associated with the property. Environmental liens were not reported by EDR for the subject site, however a quitclaim deed was found, dated July 7, 2008. A copy of the EDR environmental lien search is included in Appendix C.

4.9 VALUE REDUCTION

As part of the ASTM E 1527-05 process, information must be gathered regarding the prospective purchase price of the property relative to the fair market value of the subject site. If there appears to be a value reduction, that reduction must be identified with respect to whether the difference could be attributed to environmental degradation of the property. Kleinfelder requested that our client provide this information by filling out the "user questionnaire" form. According to Mr. Chris Koenig, on behalf of American Canyon Flat Land Inc., the purchase price is currently being litigated and it is likely that the purchase price will be greater than the fair market value of the property. In addition, Mr. Koenig reports that he believes there is potential for contamination on the site based on the court documents and report discovered as part of the due diligence he has conducted and provided to Kleinfelder.

A copy of the User Questionnaire form is included in Appendix F.

Copyright 2009 Kleinfelder

5. RECORDS REVIEW

5.1 REGULATORY AGENCY DATABASE REVIEW

The purpose of the records review is to obtain and review records that would help to reveal Recognized Environmental Conditions in connection with the subject site and bordering properties.

Federal, State and local regulatory agencies publish databases or “lists” of businesses and properties that handle hazardous materials or waste, or are known locations of a release of hazardous substances. These databases are available for review or purchase at the regulatory agencies, or they can be obtained through a commercial database service. Kleinfelder contracted with a commercial database service, Environmental Data Resources, Inc., to review the agency lists for references to the site and any listings within the appropriate ASTM minimum search distance from the site. The executive summary and maps from the database search report are included in Appendix A of the EDR report, Regulatory Agency Database Summary. The federal and state databases reviewed are summarized on Table 5.1.

Copyright 2009 Kleinfelder

TABLE 5.1: RECORDS REVIEWED/SEARCH DISTANCES

UST, CaFID, HistUST	Site & adjoining

A summary of facilities listed in the databases is presented in the executive summary of the EDR report, and each facility is cross-referenced with a radius map showing the location of the listed facility with respect to the subject property (Appendix A of the EDR

Copyright 2009 Kleinfelder

document). Kleinfelder conducted a review of the EDR report to assess which listings have a significant potential to impact the subject property. Factors used to screen the listed properties include distance to the site, geology, presumed or known direction of groundwater flow, type and magnitude of hazardous material release, and nature of sensitive receptors. Those considered to have a significant potential to impact the site were then subjected to a file review at appropriate regulatory agencies. A copy of the EDR report is included in Appendix C of this report.

5.2 RESULTS OF DATABASE SEARCH

The database report shows that:

- The site was not listed on the databases searched by EDR.

The two other cases, located within the search radius, are summarized below:

- **Envirostor:** One case was listed and is summarized below:
    1. **Sunshine Auto Salvage** (1578 Green Island Road), located approximately 4110 feet north-northwest of the subject site, is listed on the Envirostor database with leaks of metals and petroleum hydrocarbons to soil. Based on distance and direction from the subject site, it is Kleinfelder's opinion that this property is unlikely to pose an environmental concern to the subject site.

- **Solid Waste Facility / Land Fill (SWF/LF):** One site was listed and is summarized below:
    1. **American Canyon Sanitary Landfill** (Western Terminus of Eucalyptus Drive), located adjacent to the western edge of the property. This landfill was closed in 1994 and was previously operated by Napa-Vallejo Waste Management Authority as a municipal landfill.

Sites not plotted by EDR due to poor or inadequate address information are referred to as orphan sites. There is one unmapped site in the EDR Report, located in Sonoma County, which is too far from the subject site to pose an environmental concern. The orphan summary/unmapped sites report was reviewed to assess the potential for off-

Copyright 2009 Kleinfelder

site properties to be listed on databases that fall within the ASTM search distances. Based on our review this orphan site appears to be outside of the ASTM search distances.

5.3 REGULATORY AGENCY CONTACTS

The following additional sources of environmental records were reviewed during this Phase I ESA for the purposes of meeting the ASTM Standard. Local regulatory agencies were contacted for reasonably ascertainable and practically reviewable documentation regarding RECs present at the subject site and adjoining facilities (copies of file review information is included in Appendix E). Interviews with local regulatory agency representatives are included in Section 7 of this report. The following agencies were contacted for documentation:

TABLE 5.2: AGENCY CONTACTS SUMMARY

AGENCY	TYPE OF INFORMATION AND RESULTS
Napa County Department of Environmental Management (NCDEM)	Kleinfelder reviewed available files for the subject site; a summary of information gathered at NCDEM is located in Section 4.5 and in Section 5.3.1.
San Francisco Bay Regional Water Quality Control Board (SFRWQCB)	No files were available for the subject site address.
Napa County Building and Planning Department	Kleinfelder reviewed building permits at Napa County Building and Planning Department. Permits for the site dated back to 1966; a summary of information reviewed is located in Section 5.3.2.
State of California Fire Marshal Office of Pipeline Safety	No pipelines, jurisdictional to the State Fire Marshal's office, are located at the site.
State of California, Department of Conservation, Division of Oil and Gas	No oil or gas wells are depicted on or adjacent to the subject site.

5.3.1 NCDEM Records Review

Kleinfelder representative Sarah Kalika reviewed available site records at NCDEM on November 10, 2009. Available files were similar to information provided by the client and included two soil boring application permits dated March 2005 and March 2006,

Copyright 2009 Kleinfelder

records from the court judgment dated 1993, copies of correspondence from the hazardous materials testing performed in 1991 and inspections in 1990 and 1991, and additional correspondence dated 2003 and 2005. A more detailed description of the contents of this correspondence is included in Section 4.5, and copies of the information gathered are included in Appendix E.

5.3.2 Napa County Building and Planning Department

Kleinfelder representative Sarah Kalika reviewed one available file assigned to the parcel number at Napa County Building and Planning Department on November 10, 2009. The file contained records dating back to March 1966 and consist of the following:

- 1966: Planning department approval of a proposed dwelling
- 1967: Application for building permit and certificate of occupancy for a garage, tool sheds with foundations
- 1968: Electrical permit application
- 1973: Temporary use permit to Robert Couch, Jr. to utilize a construction trailer while completing a residence on a 170-acre parcel, limited to one year on until dwelling is constructed, whichever occurs first; dwelling permit application for 3,484 square foot house
- 1973: Sewage disposal system installed (septic tank and leach field)
- 1974: Use permit application to develop a recreation area to be utilized by American Canyon residents
- 1974: Temporary use permit renewal for construction trailer
- 1977: Correspondence regarding temporary use permit for trailer to Robert Couch, Jr., notice that temp use permit will expire on 3/9/77
- 1983: Correspondence that no work had been performed at proposed dwelling since 1976, permit cancelled, Board of Supervisors requires new permits for future work

Copyright 2009 Kleinfelder

- 1984: Request for inspection to see what progress has been made on construction. Inspection conducted 5/7/84, building has not been built.
- 1987: Permit application for new storage building, 3 storage containers (8x40 feet each), permit subsequently canceled on 3/13/93
- 1988: Order to comply, building permit required for shed roof and electrical permit for trailer
- 1990: Inspection warrant from Building Department to Assistant District Attorney Daryl Roberts "the property is in violation of Section 11206 (a), Ch1, Art 3 of Title XI of the Napa County Code."
- 1992: Negative Declaration for Paintball activities
- 1992: Use permit approved for paintball, to Robert D'Elia of Concord, CA.
- 1993: Approval of use permit for paintball (in area west of project site boundaries) to Gladis Jarquin
- 1994: Notice of paintball use permit approval with expiration of 5/28/97, notice to Dean Laing of Vacaville, CA with instruction "no paintball games to be conducted between 10/15 and 4/1 of any year unless all required road and parking improvements are installed and approved by Department of Public Works and Napa County Fire Department."
- 1994: Request for inspection to building department with note "trailer Couch was living in burnt completely last night, per Chief Caldwell"
- 1995: Use permit for paintball, no map attached
- 2001: Sherwood Forest Paintball use permit approved, no map attached

Copies of maps and correspondence collected during this file review are included in Appendix E.

Copyright 2009 Kleinfelder

6. SITE RECONNAISSANCE

Kleinfelder's assessment activities included a site reconnaissance. This section summarizes the findings from the site reconnaissance.

6.1 METHODOLOGY AND LIMITING CONDITIONS

Kleinfelder representative Sarah Kalika conducted a site reconnaissance on November 18, 2009, to assess and photograph present site conditions. Kleinfelder was accompanied by Mr. Chris Koenig of R.H. Hess Development Company, Mr. Michael Johnson of Griswold, LaSalle, Cobb, Dowd, and Gin, and a solid materials hauling contractor who is a potential bidder to remove solid waste material on behalf of our client. In addition, Mr. Glen Couch, his wife, and their attorney were also present to facilitate access to the Couch residence portion of the subject site.

The approximate site boundaries are shown on Plate 2 over an aerial photo from 2002. The northern portion of the 2002 aerial is shown on Plate 3, the central portion of the 2002 aerial photo from 2002 is shown on Plate 4, and the southern portion of the 2002 aerial photo from 2002 is shown on Plate 5. Color photographs of the site are shown in Appendix A. Site conditions discussed below are limited to readily apparent environmental conditions observed on the date of site reconnaissance.

6.2 ON-SITE OBSERVATIONS

The site consists of a eucalyptus grove, separated into several sections, as shown on Plate 2. The sections will be described as groups below.

Hurst Firewood Area: southern section of site, north of Eucalyptus Drive, south of Paintball Jungle operation, east of unpaved segment of Commerce Drive

Kleinfelder observed several piles of wood chips, concrete debris, approximately 11 abandoned pieces of equipment including heavy equipment, box trailers, semi-trucks, and one boat. None of the equipment appeared to be operational and several were observed to be leaking hydraulic fluid. One pole-mounted transformer was observed and was labeled "Non-PCB."

Copyright 2009 Kleinfelder

Paintball Jungle Area (East): eastern central section of site, north of Hurst Firewood area, east of unpaved segment of Commerce Drive, south of Couch Residential area

Kleinfelder observed paintball operations, several small shed structures, a fenced area of compressed CO2 gas cylinders, a semi-paved parking lot area, shooting range with many plastic 55-gallon drums. The plastic 55-gallon drums appeared to be relatively new and were labeled as previously containing olive oil or vinegar. Much of the ground, trees, drums, and other plastic or wooden barriers constructed related to paintball, were covered in paintball paint and unexploded paintballs.

Animal Pens Area: eastern central section of site, north and east of Paintball Jungle

Kleinfelder did not have access to the interior of this area. Observations and photographs were taken from fence line perimeter. Kleinfelder observed at least 10 horses, several chickens and roosters, three pickup trucks, many covered areas constructed of wood with corrugated metal roofs, several plastic and metal 55-gallon drums with unknown contents, and several portable containers, assumed to contain water.

Couch Residential Area: northeastern portion of site, north of Paintball Jungle and animal pens

Kleinfelder observed approximately four structures, one used as a residence, one a garage, and the others outbuildings, assumed to be sheds. One house foundation partially constructed is located near the garage. In addition, Kleinfelder observed many storage areas, covered areas, vehicles including several cars, two vans, at least three pickup trucks, one fire truck, one school bus with no front wheels, at least three pieces of heavy equipment or parts (excavator, bulldozer), one temporary office trailer, at least two metal storage containers, two boats, small wood chipper, camper shells, and travel trailers, tank on wheels, and a motorcycle.

Equipment at the site that may contain hazardous materials included, but is not limited to, many small tanks, one propane tank, one yellow flammables cabinet with hand-written sign “Anthrax Powder Storage Container” which Kleinfelder believes may be a

Copyright 2009 Kleinfelder

hoax label, several cans of paint, at least two air compressors, compressed air cylinders (helium or CO2 tanks), several gasoline cans, car batteries, fire extinguishers, and abandoned appliances.

Debris at the site included, but is not limited to, metal scrap, pipes, plastic debris, household garbage, old clothing, road signs, and several tires.

One gravestone was observed with several names as follows:

- Annie Hammond 1848-1922
- Sam'l B. Hammond 1878-1930
- Fred L. Hammond 1875-1931
- Mabel C. Hammond Sept 26 1886 aged 4 yrs, 11 mo, and 21 days
- Thomas Shields, native of Vermont (scratched out) 28, 1883 68 years, 15 days

It is Kleinfelder's opinion that the gravestone may have been transported from a cemetery or other source and not an actual gravesite.

Two wells were observed with adjacent small storage tanks (up to 150 gallons) that did not appear to be operating and did not appear to be connected to electricity or pipes.

One septic tank with buried pipe was observed near the house foundation.

One power pole was observed with three pole-mounted transformers, no PCB information was observed on the transformers, though they appeared to be in good condition without obvious signs of leaks.

"Concentrated Area": northern section of site, west of unpaved segment of Commerce Drive, east of Sherwood Forest Paintball

Kleinfelder observed a chain-link fenced area with debris including an outhouse, camper trailer, boat trailer, one boat, one enclosed & locked storage trailer, a few small bottles labeled motor oil, approximately 25 five-gallon buckets that appeared to be empty, a ladder, and various scrap pieces of plywood.

Copyright 2009 Kleinfelder

Sherwood Forest Paintball Area and North Slough Creek: western side of site, west of unpaved segment of Commerce Drive

Kleinfelder observed several wooden structures and shelters, assumed to be for paintball operations. In addition, one truck was observed in the northwest corner of the operation, east of the creek.

A creek was observed along the northwestern boundary of the property. The creek appeared to flow south.

The site is bounded by commercial warehouses to the north, American Canyon Wastewater Treatment Plant to the northwest, undeveloped land and former landfill to the west, 4-H garden west of the area occupied by Hurst Firewood, Eucalyptus Drive and single-family residential houses to the south, and undeveloped land (Oat Hill) to the east.

Site observations are tabulated in Table 6.1.

Burned or buried debris	Various locations of buried debris (plastic, wood, cloth) many areas buried by eucalyptus leaves	X	

6.3 OFF-SITE OBSERVATIONS

Kleinfelder conducted a brief drive-by survey of the parcels adjacent to the site on the same day as the site reconnaissance. A summary of the off-site properties is summarized in the following table:

TABLE 6.2
SURROUNDING PROPERTIES

North	Commercial warehouses
South	Eucalyptus Drive, single-family residential houses
East	Undeveloped land, Oat Hill
West	American Canyon Wastewater Treatment Plant, closed landfill, 4-H garden, undeveloped land, slough, Napa River

Copyright 2009 Kleinfelder

7. INTERVIEWS

Kleinfelder contacted “Key Site Managers” Michael Mochizuki of American Canyon Flat Land Inc., and Mr. Michael Johnson of Griswold, LaSalle, Cobb, Dowd, and Gin. Key Site Managers are contacted to obtain current and historical environmental information concerning the subject site. Mr. Mochizuki provided an interview questionnaire and “user questionnaire” form, completed by Mr. Chris Koenig, who has conducted due diligence research on behalf of American Canyon Flat Land Inc. A copy of this research has been provided to Kleinfelder and is included as “user provided information” in Appendix D and summarized in Section 4.5. A copy of the completed interview questionnaire as well as transmittal letter and backup information is included in Appendix F.

In addition to the completed questionnaire, Mr. Michael Mochizuki presented Kleinfelder with a letter that states that American Canyon Flat Land Inc. has been diligent in providing all of the information that they could find in regard to the history of the Couch Property. In addition, he states that the Couch’s have been unwilling to provide further information relating to the condition of the property and therefore American Canyon Flat Land has researched public records and conducted reasonable due diligence. He also states that American Canyon Flat Land Inc. cannot represent that there are not other potential environmental issues related to the Couch Property and ACFL has disclosed that which they have discovered through reasonable due diligence to determine potential issues relating to the Couch Property.

7.1 INTERVIEW WITH OWNER/MANAGER

Kleinfelder was unable to interview the current owner because no members of the Couch Family were willing to complete the interview form.

7.2 INTERVIEW WITH OCCUPANTS

The subject site is occupied by a member of the Couch Family who was not present during the site visit. No interviews were granted to Kleinfelder by the attorneys representing the current occupants.

Copyright 2009 Kleinfelder

7.3 INTERVIEWS WITH LOCAL GOVERNMENT OFFICIALS

Local government officials were contacted to obtain further information about environmental enforcement actions pending or ongoing at the site and adjacent facilities, or relevant permits (e.g. building, air quality, well abandonment, etc.) for the site and adjoining properties.

Napa County Department of Environmental Management

Kleinfelder contacted Napa County Department of Environmental Management. Kleinfelder reviewed available files for the property on November 10, 2009. A summary of records reviewed is located in Section 5.3.1.

San Francisco Bay Regional Water Quality Control Board

Kleinfelder contacted Melinda Wong of San Francisco Bay Regional Water Quality Control Board and requested to review any available files for the subject site. According to Ms. Wong, no files were available for the project site.

Napa County Building and Planning

Kleinfelder contacted the Napa County Department of Building and Planning. Kleinfelder reviewed available files for the property on November 10, 2009. A summary of records reviewed is located in Section 5.3.2.

Ed Colby, Napa County Planning

Kleinfelder interviewed Mr. Ed Colby, Planner III / Code Compliance for the Napa County Planning Department, on November 17, 2009. Mr. Colby stated that he has been associated with this site since 1990. Mr. Colby stated that he conducted a site visit, along with various County employees, Napa County Sheriff's Department, and Fire Department investigators in the early 1990's. Mr. Colby stated that he continues to perform periodic inspections of the property to assess progress on the cleanup order judgment of 1993. Mr. Colby stated that his most recent visit was in September 2008 and a report was issued in March 2009. A copy of this report is included in Appendix D, user provided information. During the interview, Mr. Colby reviewed the County Planning file for the site and described the various areas that County Code Enforcement divided the site into for ease of explanation in a report. Those areas include "Paintball 1, Concentrated Area, Staging Area, Area 1, Area 2" etc. Mr. Colby stated that the only

Copyright 2009 Kleinfelder

permitted activities at the site are paintball and firewood. Mr. Colby indicated that his inspections were exterior only; he personally has not entered any of the structures. Mr. Colby also stated that inspections by code enforcement were conducted at the request of county council, in response to requests by the Couch family to release Napa County cleanup funds for environmental and waste cleanup. Mr. Colby explained that County funding was set aside to assist in the cleanup and Code Enforcement was required to perform progress inspections before additional funds could be released. Mr. Colby stated that Mr. Keith Caldwell, current Napa County Supervisor and former American Canyon Fire District Chief reported that a methamphetamine lab was discovered and removed in 2000 somewhere onsite. Mr. Colby did not have knowledge of where the lab was discovered and suggested Kleinfelder speak to Mr. Caldwell directly. In addition, Mr. Colby recommended Kleinfelder speak to Mr. John Kara at Napa County Department of Environmental Management to obtain additional information regarding hazmat data collected at the site.

John Kara, Napa County Department of Environmental Management

Kleinfelder spoke briefly with Mr. John Kara of NCDEM on November 10, 2009. Mr. Kara stated that he could not provide additional information other than what was in the NCDEM file for the property.

Keith Caldwell, Napa County Supervisor- District 5 (American Canyon Area)

Kleinfelder interviewed Mr. Keith Caldwell, current Napa County Supervisor representing District 5, which includes American Canyon. Mr. Caldwell stated that he was formerly employed at the American Canyon Fire District as the Fire Chief. Mr. Caldwell stated that he was raised in American Canyon and has knowledge of the site dating back to when he was a teenager. Professionally, he was associated with the site since the mid 1980's. Mr. Caldwell provided an account from memory of various inspections associated with the warrant granted in the early 1990's and various times the Fire Department responded to emergencies at the site. Mr. Caldwell stated that a multi-agency team performed an inspection at the site under an inspection warrant based on many complaints and concerns about fire hazards and illegal living conditions. Mr. Caldwell stated that he observed over 100 cars, some drums, heavy equipment (construction equipment and some cars, some were stolen), a flatbed trailer with 20-25 drums, two meth labs, and many areas of dumping and illegal occupancy. Mr. Caldwell stated that he had heard rumors from local residents that drums were buried onsite, but

Copyright 2009 Kleinfelder

he was never able to find the locations. He was told by a local that drums may have been buried in the northwest corner of the site near an old stone fireplace. Mr. Caldwell identified two locations where meth labs were found and removed by the Sheriff's Department. One location was within the area identified by Napa County Code Enforcement as "Concentrated Area" within a chain-link fenced area. The other location was within the area currently occupied by Hurst Firewood. He stated that this location was approximately 100 yards west off of the eastern road within the area previously occupied by renters. Mr. Caldwell stated that red phosphorous was found and removed by the Sheriff's Department, and this chemical is typical of meth labs. Mr. Caldwell stated that within the firewood area, various motor oils and diesel fuel spills were observed and were minor. Mr. Caldwell described several fires within the Couch residential area of the site. Mr. Couch's mobile home burned in 1994; within the fire were guns, ammunition, and propane. Mr. Caldwell stated that the cars he observed were generally on the eastern side of the unpaved north-south road. Mr. Caldwell stated that within the Hurst Firewood area, Mr. Hurst sometimes performed engine repairs and that the approximately 30 people who lived in that portion of the site also periodically performed auto and engine repair.

In addition to environmental concerns, Mr. Caldwell stated that the area currently occupied by the American Canyon Wastewater Treatment Plant was cleared of eucalyptus trees, he heard that the trees were removed rather easily, but the root balls were approximately 10 feet in diameter and that "the biggest grinder west of the Mississippi" had to be hired to conduct stump grinding. Mr. Caldwell stated that a few root balls were transported to the 4-H area southwest of the site and are probably still there for viewing.

Copyright 2009 Kleinfelder

8. EVALUATION

Kleinfelder performed this Phase I ESA in accordance with the scope and limitations of ASTM Practice E-1527-05 and the All Appropriate Inquiry (AAI) section of the Small Business Liability Relief and Revitalization Act (the Federal Brownfields Law). The purpose of this assessment was to evaluate the likelihood of RECs resulting from the present or past usage, storage, or disposal of hazardous substances or petroleum hydrocarbons at the subject site and in the surrounding area. Kleinfelder's findings and conclusions are presented below.

8.1 FINDINGS

For ease of description, the site is divided into several areas and described counterclockwise from Eucalyptus Drive (Plate 2):

- Hurst Firewood Area: located adjacent to the north of Eucalyptus Drive, south of an east/west unpaved road, and east of the unpaved section of Commerce Blvd. that runs north/south through the site;
- Paintball Jungle Area (East): located north of the east/west unpaved road and Hurst Firewood, south of the animal pens and Couch Residential Area, and on both sides of Commerce Blvd;
- Animal Pens Area: located north of Paintball Jungle and south of the Couch Residential Area;
- Couch Residential Area: located north of the animal pens, south of the property boundary, east of Commerce Blvd;
- "Concentrated Area" (name in accordance with County investigation and legal document maps): located west of Commerce Blvd across from the Couch Residential Area; and
- Sherwood Forest Paintball & North Slough Creek Area: located at the northwest corner of the property, west of the Concentrated Area.

Copyright 2009 Kleinfelder

- Paintball Jungle Area (West): located on the western side of Commerce Boulevard, south of Sherwood Forest Paintball, north of the property line, east of the property line.

The site has been developed as a eucalyptus tree farm since at least 1937. A Phase I ESA was performed in 2004 by Environmental Science Associates (ESA) that covered the entire parcel, but findings and recommendations were restricted to the 2004 observations of conditions at the Couch Residence and Hurst Firewood Areas. A Phase II soil and groundwater investigation performed by Kleinfelder in 2005 was based on the recommendations from ESA's Phase I report and maps, and therefore addressed only a portion of the areas where previous dumping, spills, and leaks may have occurred. During the Phase II investigation, Kleinfelder collected soil samples but did not encounter groundwater for sampling.

This Phase I ESA represents a re-evaluation of the site based on new information provided to Kleinfelder since the original investigations.

The following is a summary of Kleinfelder's findings in each area.

Hurst Firewood Area:
This area is currently occupied by Hurst Firewood, a business owned by Mr. Hurst, used for cutting eucalyptus trees into firewood for sale. Previously, as few as 19 to as many as 30 people reportedly may have resided in this area, mainly north of area cleared of trees. These renters set up residences on small plots of land that were not connected to water, sewer, or electricity. According to Keith Caldwell, former American Canyon Fire Chief, many of these renters conducted short-scale engine and auto repairs and one methamphetamine lab was discovered and removed. In addition, Mr. Hurst previously stored approximately 50 vehicles and pieces of equipment at the site and performed small-scale engine repairs on these vehicles. Kleinfelder observed several stockpiles of wood chips and soil and concrete debris during the site visit.

Paintball Jungle Area (East):
This area is currently occupied by paintball games operated under the name Paintball Jungle. According to permitting records, paintball operations have occurred at the site

Copyright 2009 Kleinfelder

since at least 1990. Prior to paintball operations, the majority of this area was occupied by junked cars, vehicles, drums, containers, trash, and other debris.

Animal Pens Area:
This area is currently occupied by animals including horses, roosters, and hens. The Couch family reportedly rents stalls and pens for horse boarding. Several vehicles were observed in this area as well as various storage containers. Kleinfelder did not have interior access to this portion of the site so observations were made from the perimeter fence. This area was reported to be occupied by various animals and was the site of illegal animal fighting activities.

Couch Residential Area:
This area is currently occupied by one member of the Couch family who lives on the property in a reportedly unpermitted dwelling. Kleinfelder observed at least 10 vehicles and hundreds of other pieces of equipment, various containers of paints, transmission oil, motor oils, areas of dumped garbage, three unpermitted wells, several large containers including tanks, tanks on wheels, structures, locked storage containers or structures that Kleinfelder could not access, and various debris. Previously, this area reportedly contained over 150 vehicles, hundreds of tires, additional structures occupied by other members of the Couch Family and possibly additional renters, and many widespread areas of debris.

Kleinfelder reviewed various documentation related to the 1993 court-ordered cleanup. This area of the site contained drums that were sampled by Catherine Moody of NCDEM and found to be either diesel or phenols which Robert Couch and David Couch reportedly described as “cresol.” Various subsequent court documents describe cleanup activities at the site and provide copies of household waste disposal at Devlin Road landfill in American Canyon (a Class III municipal landfill), tire disposal at a recycler, scrap metal at a recycler, and junked car removal and disposal. The documents do not include manifests for the hazardous materials found to be within drums, fluids from vehicles, and contents of small containers. These materials, if disposed of properly, would have been disposed of at the fire department or a Class II landfill by a certified waste hauler. However, Kleinfelder searched the DTSC and Cal-EPA database to obtain records of a possible RCRA generator ID number (required on

Copyright 2009 Kleinfelder

the waste manifest for hazardous materials) and no RCRA ID number was found for the Couch Family. A RCRA ID was found for paintball operations only.

Concentrated Area:

This area was identified and labeled by Napa County investigators during previous investigations and information gathering. This area is currently occupied by a chain-link fence, wooden garage door barrier, outhouse, boat, boat trailer, and camper trailer. This area previously was occupied by various renters and reportedly was the site of an additional illegal methamphetamine lab, which was reportedly removed by the Napa County Sheriff's Department in approximately 2000.

Sherwood Forest Paintball Area:

This area, located on the northwest corner of the property, appears to be currently occupied by paintball operations, formerly operated under the name "Sherwood Forest" paintball. Kleinfelder is not sure whether this company still operates this portion of the site, or whether this area is used by Paintball Jungle. Kleinfelder observed several small structures in this area including an enclosure for CO_2 compressed gas containers, a pickup truck, and a wood chipping machine. This area previously was reported to be the "cleared area" and possible location of an outdoor fireplace. According to Keith Caldwell, this area reportedly was a location where drums may have been buried.

North Slough Creek (within Sherwood Forest Paintball Area):

A creek, which appears to drain southwest to the Napa River, is located on the northwest corner of the property near the site boundary. A rock and soil pile was observed along the eastern bank of the creek. It was reported to Kleinfelder by Mr. Michael Johnson that a concern exists regarding the runoff within the creek, which was based on a reported surface water quality violation that was issued to the adjacent American Canyon Wastewater treatment plant. According to Mr. Johnson, the wastewater treatment plant was concerned that the source for pollutants in the creek was the Couch Property. Kleinfelder has not seen a copy of the complaint or the results of any sampling or analysis that may have been performed.

Paintball Jungle Area (West):

This area, which comprises the majority of the area west of unpaved Commerce Blvd, was previously and now is currently used for paintball games. Several structures

Copyright 2009 Kleinfelder

constructed of wood and 55-gallon drums were observed as well as two outhouses. Minor dumping was reported along the roadside but no residences or tenants occupied this area.

8.2 OTHER ISSUES

In addition, while not considered by definition to be RECs, the following other environmental conditions were revealed that could affect the subject site:

- A septic system exists at the subject site. The purpose of the septic system is to receive domestic sewage. If future construction activities encounter the septic system or the system is no longer in use, the system must be abandoned in accordance with applicable local permitting requirements and regulations.
- Although asbestos and lead is specifically excluded from the Phase I standards, Kleinfelder recommends that all structures be surveyed prior to demolition in compliance with EPA, Bay Area Air Quality Control Management District, and Napa County Building Department rules and regulations.
- Three wells were observed at the site. If these wells are no longer in use, they must be abandoned in accordance with applicable federal, state, and local regulations.
- A complaint and possible violation reportedly occurred related to waters of the creek, located on the property in the northwest corner. The City of American Canyon Water Treatment Facility was reportedly concerned by the possibility of source material leaching into the creek from materials on the Couch property.

8.3 DEVIATIONS AND ADDITIONAL SERVICES

The scope of this ESA does not incorporate ASTM Standard non-scope considerations, such as asbestos/lead-based paint, radon, lead in drinking water, wetlands, regulatory compliance, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, and high voltage power lines.

Copyright 2009 Kleinfelder

8.4 CONCLUSIONS AND RECOMMENDATIONS

Kleinfelder's Phase I ESA of the subject site revealed the following current and historic RECs associated with the site.

- There is ample evidence that residual petroleum hydrocarbons, solvents, and certain metals may have been released in shallow soil throughout the eastern portion (Hurst Firewood, Paintball Jungle (East), Animal Pens, and Couch Residential areas) of the site as well as within the western portion (Concentrated Area, Sherwood Forest Paintball and North Slough Creek area) of the site. These petroleum hydrocarbons were likely surface spills and dumping related to the storage of hundreds of pieces of equipment, at least 150 vehicles, areas of the site occupied by the current owner and areas rented to tenants, and areas of dumping.

- The majority of the site is currently used for paintball games. Depending on where the paintballs were manufactured, it is possible that paint within paintballs may have contained lead and was released to soil.

Based on Kleinfelder's review of the 1990 and 1991 inspections, 1993 court judgment and cleanup order and related photographs, aerial photograph from 2002, and recent site visit, Kleinfelder recommends the following investigations:

- Each of the three wells should be sampled for water quality and presence of various constituents. These wells appear to be unpermitted and should be abandoned properly in compliance with Federal, State, and local regulations.

- A soil and groundwater investigation should be conducted within each area of the site to assess the extent of chemical constituents of concern in the soil and groundwater including, but not limited to, petroleum hydrocarbons, metals, and volatile organic compounds.

- Surface water and sediment should be sampled within the creek to assess the presence of leached materials that may travel off-site within creek runoff.

- The septic tank should be abandoned in accordance with applicable regulations, if no longer in use.

Copyright 2009 Kleinfelder

- A pre-demolition asbestos survey should be conducted in accordance with Federal, state, and local regulations.

8.4.1 Data Gaps

Although Kleinfelder attempted to obtain reasonably ascertainable information regarding the Site, some information was either not received or not readily available at the time of this report. Therefore, consistent with ASTM Standard E1527-05, the following data failures (data gaps) have been identified.

- Kleinfelder was not granted an interview with the current property owner.
- Kleinfelder was not granted an interview with the current site resident.
- Kleinfelder was not able to access the interior of the animal pens.
- Kleinfelder did not enter the interior of any locked vehicles, structure, or the dwelling.

Based on a review of the data gaps presented above, it is Kleinfelder's opinion that the data failure is not likely to have affected the identification of additional recognized environmental conditions at the site.

LIMITED SITE INVESTIGATION

2 EUCALYPTUS DRIVE
AMERICAN CANYON, CALIFORNIA

1.0 INTRODUCTION

This report presents the findings of the Limited Site Investigation that was conducted by Innovative and Creative Environmental Solutions (ICES) at the Hurst Firewood Area and the Paint Ball Jungle (West) located within 2 Eucalyptus Drive in American Canyon, California. ("the Site"; Figure 1).

The purpose of the investigation was to address the recommendations proposed in Kleinfelder's Phase I Environmental Site Assessment (ESA) report dated December 22, 2009 for parcels located within the Site. The investigation was limited to collecting soil samples from the shallow surface sediments within the Site and analyzing the samples for total petroleum hydrocarbons (TPH) as gasoline (TPHg); TPH as diesel (TPHd); TPH as motor oil (TPHmo); volatile organic compounds (VOCs); and metals.

2.0 SITE DESCRIPTION

The Site is located on the north side of Eucalyptus Drive and is within the legal jurisdiction of the City of American Canyon, in conjunction with Napa County and the State of California.

The Hurst Firewood Area is located adjacent to and north of Eucalyptus Drive. The Hurst Firewood Area consists of an approximately rectangular parcel covering an area of approximately 15.7 acres. The area is used as a storage yard and for cutting eucalyptus trees into firewood for sale.

The Paintball Jungle (West) is located northwest of the Hurst Firewood Area and is occupied by a eucalyptus grove covering an area of approximately 47.04 acres. The area is currently used

for paintball games.

3.0 BACKGROUND

Historically, the Site has been a eucalyptus grove. The Site has had numerous uses over the years, including reportedly illegal uses such as methamphetamine labs, hazardous waste storage, and temporary residential shelters. Currently, the southeastern portion of the Site is used as a storage yard and for cutting eucalyptus trees into firewood. Paint ball fields are located at the western portion of the Site.

A Phase I ESA was conducted by Environmental Science Associates of Sacramento, California in October 2004 for the Site and neighboring parcels. Environmental Science Associates' assessment revealed that there was past and present undocumented and illegal storage of hazardous materials and waste at the Hurst Firewood Area. Additionally, Environmental Science Associates reported that a large amount of soil containing some type of oil was deposited at the Hurst Firewood Area in the 1970s for a motorcycle track. A site investigation was recommended based on their findings.

Kleinfelder of Fairfield, California performed a Phase II Site Investigation in March through May 2005 for the Site and adjacent parcels. Soil samples were collected from sixteen sample locations and selectively analyzed for petroleum hydrocarbon constituents, polynuclear aromatic hydrocarbons (PAHs), total coliform, ecoli, pesticides, and metals. Laboratory analytical results of the soil samples indicated non-detectable concentrations of PAHs, total coliform, ecoli, and pesticides; and low to non-detectable concentrations of petroleum hydrocarbons. The metal concentrations detected in the soil samples were generally below the Regional Water Quality Control Boards Environmental Screening Levels (ESLs, where groundwater is a current or potential source of drinking water) for residential landuse, with the exception of arsenic, chromium, and vanadium. Arsenic, chromium, and vanadium concentrations which were at or above their respective residential ESLs were encountered in the surficial soil at the neighboring parcel, located directly north and east of the Site.

ICES conducted a Phase I ESA for the Site and neighboring parcels in March 2006. Based on the findings of the Phase I ESA, ICES recommended that a supplementary investigation be conducted at the Site.

A supplementary site investigation was performed by ICES in March 2006 for the Site and neighboring parcels. Laboratory analytical results indicated that soil samples collected from the Paintball Jungle (West) contained non-detectable concentrations of organochlorine pesticides; and concentrations of arsenic, chromium, lead, and mercury which were within typical background levels and also below their respective residential ESLs, with the exception of arsenic. Arsenic concentrations encountered in the soil samples exceeded the previous residential ESL of 5.5 mg/kg but were below the upper background range of 12 mg/kg. Results of the soil samples that were collected from the Hurst Firewood Area indicated non-detectable concentrations of SVOCs; and non-detectable to low concentrations of TPHd and TPHmo. The detectable TPHd and TPHmo contained in the soil samples were below the previous residential ESLs of 100 mg/kg and 500 mg/kg, respectively. Lead concentrations contained in the samples were within background levels and below the previous residential ESL of 150 mg/kg. Concentrations of arsenic, chromium, and vanadium contained in the soil samples collected from the neighboring parcel, located north and east of the Site, were within typical background levels and generally below their respective residential ESLs, with the exception of arsenic. Arsenic concentrations in nineteen of the twenty soil samples were above the residential ESL but at or below the upper bound of background range of 12 mg/kg.

Kleinfelder prepared an updated Phase I ESA for the Site and neighboring parcels in December 2009. Based on their findings, Kleinfelder recommended that a supplementary site investigation be performed.

4.0 LIMITED SITE INVESTIGATION

ICES collected soil samples on March 25, 2010. A total of eight soil samples were collected from eight sample locations. Samples TP-1 through TP-4 were collected within the Paintball Jungle (West) and samples TP-5 through TP-8 were collected at the Hurst Firewood Area. The approximate sample locations are shown in Figure 2.

Soil samples were collected from the shallow surficial soil at a depth of approximately 6 to 9 inches below the existing ground surface (bgs) by driving a precleaned brass tube into the floor of the shallow test pits.

After being sealed and labeled, the soil samples were immediately

placed in a chilled cooler containing crushed ice for transportation to the laboratory. Proper documentation and field chain-of-custody procedures were followed.

All equipment used during this investigation which might have come into contact with contaminated materials was thoroughly decontaminated before and after each use. This was accomplished by washing with Alconox (a laboratory-grade detergent) and rinsing with deionized or distilled water.

5.0 LABORATORY ANALYSIS

The soil samples were sent to McCampbell Analytical, Inc. of Pittsburg, California, a state-certified laboratory, and analyzed for:

- TPHg, TPHd, and TPHmo using EPA Method 8015B;
- VOCs using EPA Method 8260B; and
- CAM 17 Metals using EPA Method 6020A.

The samples were analyzed on a normal turnaround basis.

6.0 INVESTIGATION RESULTS

The laboratory analytical results are presented below and summarized in Tables 1 and 2. Laboratory certificates are included in Appendix A.

6.1 Laboratory Analytical Results

Analysis of the surficial soil samples indicated that:

Petroleum Hydrocarbons

- TPHg concentrations ranged from less than 1.0 mg/kg (not detected) to 2.6 mg/kg.
- TPHd concentrations ranged from 28 mg/kg to 160 mg/kg.
- TPHmo concentrations ranged from 28 mg/kg to 830 mg/kg.

Volatile Organic Compounds

- Acetone concentrations ranged from less than 0.05 mg/kg (not detected) to 0.066 mg/kg.
- 4-Isopropyl toluene concentrations ranged from less than 0.005 mg/kg (not detected) to 0.017 mg/kg.
- The remaining volatile organic compounds analyzed using EPA Method 8260B were below their respective detection limits.

Metals

- Antimony concentrations ranged from less than 0.5 mg/kg (not detected) to 1.1 mg/kg.
- Arsenic concentrations ranged from 4.9 mg/kg to 10 mg/kg.
- Barium concentrations ranged from 93 mg/kg to 500 mg/kg.
- Beryllium concentrations ranged from less than 0.5 mg/kg (not detected) to 0.60 mg/kg.
- Cadmium concentrations ranged from less than 0.25 mg/kg (not detected) to 0.43 mg/kg.
- Chromium concentrations ranged from 26 mg/kg to 40 mg/kg.
- Cobalt concentrations ranged from 5.5 mg/kg to 32 mg/kg.
- Copper concentrations ranged from 21 mg/kg to 50 mg/kg.
- Lead concentrations ranged from 19 mg/kg to 54 mg/kg.
- Mercury concentrations ranged from less than 0.05 mg/kg (not detected) to 0.29 mg/kg.
- Molybdenum concentrations ranged from less than 0.5 mg/kg (not detected) to 13 mg/kg.
- Nickel concentrations ranged from 27 mg/kg to 37 mg/kg.
- Selenium concentrations were less than 0.5 mg/kg (not detected).

- Silver concentrations were less than 0.5 mg/kg (not detected).
- Thallium concentrations were less than 0.5 mg/kg (not detected).
- Vanadium concentrations ranged from 25 mg/kg to 75 mg/kg.
- Zinc concentrations ranged from 34 mg/kg to 240 mg/kg.

7.0 DISCUSSION

Results of the soil samples collected from Paintball Jungle (West) indicated non-detectable to low concentrations of TPHg, TPHd, TPHmo, and VOCs. The detectable TPHg, TPHd, TPHmo, and VOCs detected in soil samples TP-1 through TP-4 were generally below their residential ESLs with the exception of sample TP-2. The TPHd contained in sample TP-2 of 160 mg/kg exceeded the residential ESL of 83 mg/kg. McCampbell Analytical, Inc. reported that oil range compounds were significant in sample TP-2. Based on the location of sample TP-2 within the eucalyptus grove, it appears that the elevated TPHd detected in the sample maybe the result of natural oil compounds from the eucalyptus trees.

Laboratory analytical results indicated that the samples collected from the Hurst Firewood Area contained non-detectable concentrations of TPHg; and detectable concentrations of TPHd and TPHmo. The detectable TPHd and TPHmo contained in samples TP-5 through TP-8 were generally below their respective residential ESLs with the exception of sample TP-8 (located at the southern portion of the area). Sample TP-8 contained TPHd and TPHmo concentrations of 140 mg/kg and 830 mg/kg which were above their respective residential ESLs of 83 mg/kg and 370 mg/kg.

Metal concentrations contained in the eight samples were generally within background levels and below their respective residential ESLs with the exception of arsenic and vanadium. Arsenic and vanadium concentrations in the soil samples were above their respective residential ESLs of 0.39 mg/kg and 16 mg/kg but within background levels.

Based on the findings of this and the previous investigations, it appears that the surficial soil within the Site has generally not been impacted by previous activities. The petroleum hydrocarbons encountered at the southern portion of the Hurst Firewood appears

to be limited to the surficial sediments within a low area at the entrance to the Hurst Firewood yard. The likely source of the petroleum hydrocarbons is from drips and leaks from the heavy equipment that were formerly used to handle the eucalyptus trees and associated firewood.

8.0 EXCLUSIONS

ICES assumes no responsibility or liability for the reliance hereon or use hereof of information contained in this report by anyone other than the party to whom it is addressed.

The evaluations and recommendations presented in this report are based on the limited site investigation results available at this time and could be revised if new information necessitating further review of the Site becomes available.

Comments

*water samples are reported in µg/L, product/oil/non-aqueous liquid samples and all TCLP / STLC / DISTLC / SPLP extracts are reported in mg/L, soil/sludge/solid samples in mg/kg, wipe samples in µg/wipe, filter samples in µg/filter.

means surrogate diluted out of range; ND means not detected above the reporting limit/method detection limit; N/A means not applicable to this sample or instrument.

TOTAL = Hot acid digestion of a representative sample aliquot.
TRM = Total recoverable metals is the "direct analysis" of a sample aliquot taken from its acid-preserved container.
DISS = Dissolved metals by direct analysis of 0.45 µm filtered and acidified sample.

Lab ID	Date Sampled	Date Extracted	Date Analyzed	Lab ID	Date Sampled	Date Extracted	Date Analyzed
1003757-001A	03/25/10	03/26/10	04/02/10 1:16 PM	1003757-002A	03/25/10	03/26/10	03/31/10 9:00 PM
1003757-003A	03/25/10	03/26/10	04/02/10 1:58 PM	1003757-004A	03/25/10	03/26/10	03/27/10 7:31 PM

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

£ TPH(btex) = sum of BTEX areas from the FID.

cluttered chromatogram; sample peak coelutes with surrogate peak.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = matrix interference and/or analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

*water samples are reported in µg/L, product/oil/non-aqueous liquid samples and all TCLP / STLC / DISTLC / SPLP extracts are reported in mg/L, soil/sludge/solid samples in mg/kg, wipe samples in µg/wipe, filter samples in µg/filter.

means surrogate diluted out of range; ND means not detected above the reporting limit/method detection limit; N/A means not applicable to this sample or instrument.

TOTAL = Hot acid digestion of a representative sample aliquot.
TRM = Total recoverable metals is the "direct analysis" of a sample aliquot taken from its acid-preserved container.
DISS = Dissolved metals by direct analysis of 0.45 µm filtered and acidified sample.

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

£ TPH(btex) = sum of BTEX areas from the FID.

cluttered chromatogram; sample peak coelutes with surrogate peak.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = matrix interference and/or analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

APPENDIX I

RESUMES

Gyan L. Rusconi–Rodrigues

Project Scientist

Branch Location

- San Ramon, California

Education

- BS, Environmental Science, Biology Emphasis, University of California, Berkeley, 5/2016

Professional Registrations/ Certifications

- Registration, #Number, Date
- Registration, #Number, Date

Specialized Training

- CPR and AED Certification

ATC Start Date

- 8/2017

Gyan Rusconi-Rodrigues recently joined the ATC office in San Ramon as a Project Scientist. He will be assisting the Due Diligence Practice Group. Gyan has a background in environmental science, policy, and management with a focus in biology. He is proficient with Geographic Information Systems (GIS) and Global Positioning System (GPS) technologies. Gyan is fluent in Spanish and French and has served as a Spanish-English translator.

Areas of Expertise

- Phase I and II Site Assessment Services
- Construction Environmental Oversight
- Water Resource Management
- Geographic Information Systems (GIS)

Project Experience

Storesund Consulting/Engineering LLC – Kensington, CA

Project Support Specialist: Duties included writing permits, reading blueprints/project plans and specifications, GIS analyses and field surveying for water conservation and ecology restoration projects for trout unlimited, American Rivers, and San Mateo County Resources Conservation District. Also, performed RTK GPS surveys, Nuclear Compaction Testing, Ground Based LiDAR surveys, utilized Quantum GIS software, and created AutoCAD drawings.

Basic Environmental Inc. – Oakland, CA

Environmental Research Intern: Conducted Environmental Transaction Screens and Phase I site reviews for various clients. Reviewed files to identify sites with “known” or “potential” contamination and environmentally sensitive business activities on or adjacent of subject property. Additional duties included: environmental database searches, site reconnaissance, historical searches, interviews, and summarization of reports.

BRYAN CAMPBELL, PG, CHG
Branch Manager

PROFESSIONAL SUMMARY

Mr. Campbell is a dedicated consulting professional with more than 20 years of responsible and diverse experience with expertise in:

- Environmental Assessment
- Vapor Intrusion
- Cost Estimating
- Groundwater Remediation
- Soil Gas/Vapor Assessment
- Peer Reviews
- Hydrogeology
- Soil Remediation
- Project Management

His qualifications include program and project management, the preparation of cost estimates and proposals, fostering client relationships, budget management, staff mentorship and training, and technical/editorial review of deliverables.

Mr. Campbell has acted as the Senior Geologist in charge for sites impacted with hydrocarbons, solvents, metals, pesticides, MTBE, and Volatile and Semi-Volatile Organic Compounds. He has overseen a variety of investigations including:

- Site Assessments: Direct-Push (GeoProbe™), Auger, MIP/CPT and Sonic Methods
- Remediation System: Design of Groundwater, Soil Vapor, and Dual-Phase Systems
- Vapor Intrusion Surveys: Utilizing RWQCB and DTSC Guidelines
- Corrective Action Plans (CAP) and Site Conceptual Models (SCM)
- Aquifer Testing and Analysis / Natural Attenuation Analysis
- Groundwater and Unsaturated Zone Modeling

Mr. Campbell has extensive health and safety training which includes HAZWOPER, behavior-based safety, driver safety training, and others. He has served as a Director of Health and Safety and as a Safety Manager for company-wide and program-wide safety programs. Mr. Campbell has personally performed and overseen hundreds of field inspections and has been the lead investigator on near miss and incident investigations. He has trained and educated staff in safe work practices and implemented new safety policies and procedures company-wide.

He is adept at negotiating environmental solutions with regulators, attorneys and clients. He has performed senior review of technical documents as part of litigation support and financial auditing on complex environmental cases in support of the settlement of environmental claims.

PROJECT EXPERIENCE

- **Program Manager** Preparation of work scopes and cost estimates totalling $18 million for national assessment and remediation projects for sites located in California, Washington, Texas, and Colorado which were impacted with hydrocarbons, solvents, metals, and pesticides. Senior Project Manager for projects with major clients including Wells Fargo Bank, Bank of the West, and JP Morgan Chase.

- **Senior Geologist, Walnut Creek, California** Mentored and trained new staff including project level geologists and engineers as well as Project Managers. Educated staff in both basic and complex environmental consulting practices and procedures. Review of over 600 assessment and remediation reports. Managed advanced remediation projects including those with dual-phase extraction, soil vapor extraction, in-situ remediation, air sparging, and groundwater extraction. Provided cost estimating for entire project lifecycles from assessment to closure.

- **Vapor Intrusion Specialist** Advanced training and experience with vapor intrusion (VI) and considered to be the “go-to” person for VI. Performed vapor intrusion risk assessments using the Johnson and Ettinger model for sites across the country.

- **Program Manager** Responsible for the coordination, tracking, and evaluation of environmental data for a $3.2 million annual portfolio of approximately 40 environmental cases with ExxonMobil over a 5-year period for a total of $16 million overall. Achieved regulatory case closure of 22 sites over a 5-year period. Managed, trained, and supervised an 8-person team of Project Managers, geologists, engineers, and technicians. Reported directly to the Board of Directors of the company.

- **Senior Manager** Part of the contract renewal team for contracts with ExxonMobil totaling $50 million in revenue over 5 years. Personally negotiated directly with upper-level ExxonMobil managers in Houston Texas on behalf of the company to establish new unit rate scopes. Performed scoping, forecasting, and estimating for all projects within the portfolio. Performed the final review of all project invoices and change orders.

- **Senior Geologist** Performed senior review of technical documents as part of litigation support and financial auditing on complex environmental cases in support of the settlement of environmental claims. Senior Geologist in responsible charge for sites impacted with hydrocarbons, MTBE and solvents. Managed the permitting, compliance, and operation of soil and groundwater remedial systems exceeding $400,000 each.

- **Safety Manager** Health and Safety Manager for the company-wide safety program and safety instructor for a behavior-based safety system.

Subject: Couch Property, #2 Eucalyptus Road, Am. Cyn.
APN #58-030-17 - Our File #HF 219

Date of Inspection: November 19, 1990

Purpose: Site Investigation Under Inspection Warrant

Report Prepared by: Catherine Moody, Senior Hazardous Materials Specialist, Department of Environmental Management, Hazardous Materials Section

On November 19, 1990, I accompanied members of the California Department of Forestry to inspect the property and to collect samples, take photographs and make notes regarding hazardous wastes and solid waste at the Couch Property in American Canyon.

The property is a one hundred sixty five acre parcel, heavily forested with eucalyptus trees. There are small dirt roads throughout much of the property. Pinpointing on specific locations on a map is difficult as there is a tremendous amount of all manner of debris, garbage, abandoned vehicles, machinery, equipment, trash heaps and concrete rubble,as well as 3 tanks and a railroad car. Trails and paths wind throughout the property.

Interspersed throughout the property are shelters where people are living, or were recently living. Some of these shelters used the debris piles as walls for their living quarters.

In addition, we found a box containing six cylindrical cardboard tubes, sealed on each end with wax and stenciled with the words "GAMMA-FLAME". The each tube is approximately ten inches in length, four inches in diameter. The cardboard tubing is approximately one-quarter inch in thickness. Inserted in this box was a piece of mail (unsealed) addressed to "Hollis Newman".

Scattered throughout the property are used automobile batteries and small containers of what is probably used oil and used antifreeze. There are also many small unlabeled containers, probably containing paint or automobile related wastes.

We observed many 55-gallon drums on the property however, most were empty, as determined either by observation (many lacked lids) or by tapping on the sides. Five drums were full or partially full. A sample was collected from each.

There are at least three tanks on the property. Two are of approximately ten-thousand gallon capacity and seemed empty. Apparently, these two tanks used to be underground storage tanks. One is of three-thousand capacity and was partially full of an oily liquid. A sample was collected from this tank.

There are many compressed gas cylinders scattered throughout the property; particularly propane cylinders. The propane cylinders was usually found in the garbage and debris piles.

Other compressed gas cylinders were grouped together in two areas: one group of five cylinders is in a wooden garage that presumably belongs to the Couch family. This garage is filled with all manner of clothes, trash, machinery, equipment, boxes and so forth and as well as five cylinders. (See photo #4).

Near the mobile home where the Couch family lives, adjacent to the road, are twenty-one compressed gas cylinders laying on the ground. Several of them were in a deteriorated condition with rust and corrosion forming on them. All of the cylinders looked like they have been outside for a long time; the paint was faded, the cylinders were scarred and rusty, and leaves and dirt had built up on them, partially burying them. We counted six acetylene cylinders, ten hydrogen cylinders, and five freon cylinders in this area.

Mr. Couch told me that he had tried to get the acetylene cylinders refilled but was refused due to the poor condition of the cylinder valves. He told me that he used the hydrogen cylinders to fill balloons. This concerned me since he seemed to me to be confusing hydrogen, a highly explosive and flammable gas, with helium, an inert gas commonly used to fill children's balloons.

In general, the hazardous wastes we observed fell into four categories;

1) oil or oily wastes
2) compressed gas cylinders
3) paints, lacquers, thinners and solvents
4) unknowns in small containers
5) automobile batteries

Sampling Summary:

All samples were collected by the Haz Mat Team composed of staff from of the California Department of Forestry and the American Canyon Fire Protection District. The Haz Mat Team also tested the two empty ten-thousand gallon tanks for the presence of volatile or toxic gases with hand-held meter device. The meter is a direct reading instrument that does not record findings. Neither tanks registered as having volatile or toxic gases.

A total of six liquid samples were collected. Five of the samples were taken from 55-gallon drums. One sample was taken from the three-thousand gallon tank. One of the cardboard cylinders stenciled "GAMMA-FLAME" was taken from the box if six.

One of the samples came from a drum located in area identified as Zone One; which was the southerly portion of the property that is either leased, rented or otherwise occupied by persons other than the Couch family. The drum was labeled Z-1-1. The sample was identified on the sample jar and on our Chain of Custody document as Sample Number One.

The other five liquid samples came from the drums and the tank located in Zone 3 and were identified on the sample jars and on our Chain of Custody document as Sample Numbers Two through Six.

Sample Z-1-2 consisted of one of the cardboard cylinders stenciled "GAMMA-FLAME". It was NOT included on the Chain of Custody document since we could not send it to a laboratory for analysis as there was concern that it might be explosive or incendiary device of some type, or possibly might contain a highly reactive metal. The device was subsequently x-rayed and opened by Sergeant Johnson of the Presidio Bomb Squad. It was found to be empty except for sawdust packing. Sergeant Johnson said he would list it on his report as a hoax device. He did say that the other cylinders were probably empty too.

Sample ID Number	Sample Type	Sample Jar #
Z-1-1	Liquid from drum	One
Z-1-2	Cardboard cylinder (Gamma-Flame)	N/A
Z-3-3	Liquid from ~~drum~~	Two
Z-3-4	Liquid from ~~tank~~	Three
Z-3-5	Liquid from ~~drum~~	Four
Z-3-6	Liquid from drum	Five
Z-3-7	Liquid from drum	Six

Areas of Concern:

In terms of hazard potential, the cylinders of hydrogen would represent the most immediate concern. Also, the cylinders in deteriorated condition or of unknown contents have hazard potential. Neither this Department nor the Department of Forestry have the sampling equipment necessary for obtaining gas samples.

The unlabeled drums and tank represent a hazard in that they are unidentified as to contents. Drum Z-3-1 (lying on its side); showed leakage from the top rim. (See photo #17). Drums Z-3-4- and Z-3-5 were resting on a wooden pallet that is heavily stained, and therefore are believed to be leaking. (See photo #21).
The tank Z-3-3 is resting on the ground, without a cap on the fill hole, instead it had a chunk of wood stuck in it. In addition, the tank is not braced in anyway to prevent overturning and it rests on bare earth. (See photo #20).

There are at least two areas on Zone One where twenty or more small containers (one gallon or less) of what look to be various paints, sealers, epoxies, lacquers, engine treatments, wood stains and so forth area stored. Many are rusty or stained and therefore their contents are uncertain but they are mostly like paint and related materials. One group is stored in a fairly neat fashion on a wooden pallet, another group is stored haphazardly in wooden boxes and on the ground. (see Photo #6 and #7)

I observed a large pile of granular asphalt material and asphalt chunks, which would not usually represent an environment hazard unless placed in or along a waterway. (See photo #13).

Judging by the soil piles, asphalt piles, debris piles and abandoned automobiles on the property it appears that the property owners are allowing dumping to take place on their property, perhaps for revenue. Receiving off-site wastes constitutes operating a Solid Waste facility without a Permit or variance.

In addition, Napa County Ordinance #213 makes it unlawful to operate a refuse disposal area in the unincorporated area unless possessing a permit to do so.

An Order of Quarantine that forbids the removal of any hazardous wastes on the property for 30 days unless approval is received from this Department was present to Mr. Robert Couch by a representative of the Sheriff Department. Mr. Couch signed the Order verifying receipt. A copy appears as an attachment to this report.

Violative conditions:

Violative conditions are based wholly or partly on the following:

Section 25117(a), Chapter 6.5, Division 20, Health & Safety Code includes in the definition of a hazardous waste as any wastes or combination of wastes that pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported, or disposed of, or otherwise managed.

Section 25124(e), Chapter 6.5, Division 20, California Health & Safety Code includes in the definition of waste a material that poses a threat to public health or the environment and is either or both mislabeled or not adequately labeled or is packaged in deteriorated or damaged containers.

Based on those definitions, I have determined the following violations.

1. Section 66471, Title 22, California Code of Regulations. The generator (property owner) failed to determine if the wastes are hazardous wastes pursuant to this section in that five (5) drumsand one tank on the property were found (by laboratory analysis) to be hazardous. These containers were unlabeled and at least one container (drum #Z-3-7) did not contain the type of material Mr. Couch stated it to be. Both Robert Couch and David Couch believed all the containers held "cresote".

2. Section 66508, Title 22, California Code of Regulations. The generator (property owner) failed to satisfy the storage requirements for hazardous and the ninety (90) day accumulation time limit for hazardous wastes in that all five of the drums and the tank that were found to contain hazardous wastes were unlabeled and, according to my conversations with Robert Couch and with David Couch, and by my observations on the condition of the containers, these five drums, the tank and the cylinders have been stored on the property for years.

3. Section 67241, Title 22, California Administrative Code. The generator (property owner) failed to manage hazardous waste properly in that the cylinders were lying on their sides, on the ground, adjacent to a road. Several were severely rusted and all of which appeared to be in a deteriorated condition. At least three of drums were severely rusted, one was definitely leaking (Z-3-1) and two were suspected of leaking (Z-3-3 and Z-3-4).

4. Napa County Ordinance 213, Article VI, Section I makes it unlawful to operate a refuse disposal area in the unincorporated area unless possessing a permit from the Health Department to do so. Based on my observations and my discussion with David Couch the property owners have allowed dumping to take place on this property and have allowed refuse to accumulate on this property. (See all photos).

HAZARDOUS MATERIALS SECTION
DEPT OF ENVIRONMENTAL MANAGEMENT

COUCH PROPERTY VIOLATIONS

I. Zoning and Building Violations

1. The property is only zoned for one single-family dwelling and for agricultural uses. Despite this, there are twenty other structures (ten of which are inhabited, and ten of which are built for storage or for housing chickens). Also inhabited are ten trailers, two buses, and a camper shell. None of these inhabited structures are permitted uses (NCC 12231, 12107)

2. The twenty stuctures all exceed 120 square feet of roof area and require building permits, which were not obtained (UBC 301(a)).

3. The one permitted dwelling is still under construction and has never been completed. An unapproved, unpermitted underground utility trench has been dug.

4. The owners are living in a mobile home which is to be in dead storage, but is being used as a residence by the owners (NCC 11010).

5. There is no approved water supply and there are two unapproved water wells that have been dug on the property (NCC 5505, 5230).

6. The entire parcel constitutes an illegal junk yard (NCC 6051).

7. Evidence exists regarding the occurrance of paint-ball games which have occurred and been advertised. There is no approved use permit for this activity.

8. All of the residents in the unpermitted structures are renting from the owners, a use not permitted in this zoning. (NCC 12231, 12107).

10. The property is being used to store heavy construction equipment (such as dump trucks, skip loaders, backhoes, and semitrailers), a use not contemplated by the zoning.

11. The entire parcel constitutes a public nuisance (NCC 12903, 11021).

II. Environmental Management-Health and Safety Problems

1. There is no approved sewage disposal or approved septic system present in the park. Sewage disposal ranges from holes in the ground, to merely allowing sewage to run on the ground to an outhouse type structure (NCC 5621, 5622, H&S 5411).

2. There is the illegal accumulation of refuse, debris, trash, and garbage in places located throughout the property. Owners are operating a refuse disposal area without a permit, in violation of Napa County Ordinance No. 213.

3. The property contains unlocked abandoned refrigerators, in violation of Penal Code Section 402(b).

III. Environmental Management-Toxics Problems

1. Small amounts of toxic wastes have been discovered on the property, including oil, compressed gas cylinders, paints, lacquers, thinners, solvents, used auto batteries, containers with antifreeze.

2. In addition, three large old abandoned underground storage tanks are present on the property, one of which is partially full of liquid that tested as hazardous waste.

3. The violations here range from storage of hazardous wastes over 90 days without a permit (22 CCR 66508, and H & S 25189.2) to failure of the generator to determine if his wastes are hazardous (22 CCR 66471) to failure to properly manage hazardous wastes (22 CCR 67243).

IV. Fire and Forestry Violations

1. There is not adequate clearance between combustable debris and material and the various residential structures (NCC 8871, Public Resources Code Section 4291).

2. Residents have been found to be burning their household trash and garbage in violation of Bay Area Air Quality Management District Regulations (Regulation 5, Section 301).

V. CHP/Public Works Violations

1. The property contains over 230 abandoned vechicles (NCC 4700)

2. The proeprty contains numerous dismantled vehicles, for which the certificate of ownership, the registration card, and the license plates were not delivered to DMV before dismantling began (Vehicle Code Section 5500).

FINAL JUDGMENT AND PERMANENT INJUNCTION

This matter came on regularly before the Court for trial on the 17th, 23rd, 24th of February, and the 1st of March, 1993. Appearance on behalf of plaintiff was made by Deputy District Attorney Daryl A. Roberts, appearance on behalf of Defendant Patricia K. Couch was made by Norbert U. Frost of Frost & Healy, and Defendant Robert L. Couch appeared on behalf of himself. Evidence having been presented and accepted by the Court, arguments having been made, the Court having considered the evidence and the pleadings in this matter, good cause appearing, and in the furtherance of justice,

IT IS HEREBY ORDERED, ADJUDGED, AND DECREED as follows:

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

I

FINDINGS OF FACT

The Court finds that Robert L. Couch and Patricia K. Couch, defendants herein, are co-owners of the property located at #2 Eucalyptus Drive, American Canyon, California, Napa County Assessor's Parcel No. 058-030-017.

The Court further finds that the evidence produced by plaintiff in this matter establishes the following with regard to defendants' property, located at #2 Eucalyptus Drive, American Canyon, California, Napa County Assessor's Parcel No. 058-030-017:

1. At least 100 and possibly as many as 286 abandoned motor vehicles are on the property, in violation of Napa County Code §4700;

2. Defendants' property contains an unknown but large number of accumulations or piles of garbage, refuse, debris, metals, broken concrete, spoils, contractor materials, rubber tires, vehicle parts, household trash, furniture, junked appliances, and other similar items, in violation of the Napa County Garbage Ordinance No. 213;

3. Probably less than 10 abandoned refrigerators are located on the property in violation of Penal Code §402(b);

4. There are numerous illegal sewage disposal systems ranging from holes in the ground and outhouses to septic systems installed, in violation of Napa County Code §§5621, 5622 and Health & Safety Code §5411;

5. For property zoned Agricultural-Watershed, of which the

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

only permitted use is one single family dwelling, a second dwelling unit and a guest cottage, a number of other inhabited structures existed on the property ranging from lean-tos to trailers and buses, which structures were on plots of land being rented by the defendants to various tenants and none of these structures had legal water supplies or permitted sewage disposal systems, all in violation of Napa County Code §§12231,12107;

6. All of these the inhabited structures, as well as approximately 10 chicken coops with roof areas exceeding 120 square feet, were constructed without benefit of building permits, in violation of the Uniform Building Code §301;

7. One water well had been installed or constructed on the property without benefit of permits, in violation of the Napa County Code §§5505 and 5230;

8. In a number of areas on the property, the storage of heavy construction equipment occurred, a use not allowed by the zoning, in violation of Napa County Code §§12231 and 12107;

9. Small amounts of hazardous waste have been illegally stored or disposed of on the property, in violation of Health & Safety Code §25189.2;

10. Defendants are living in a mobile home for which the use permit has expired, and the one dwelling for which a building permit was issued is still under construction, and contains an unapproved, unpermitted underground utility trench, in violation of Napa County Code §11010;

11. Tenants have burned their household trash or

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

agricultural debris, in violation of Bay Area Air Quality Management District Regulations (Regulation 5, Section 301) and the Napa County Garbage Ordinance;

12. Adequate clearance does not exist between combustible debris and material and the residences of defendants in violation of Napa County Code §8871 and Public Resources Code §4291;

In addition to the above specific findings, the Court finds that Patricia K. Couch has cooperated with Plaintiff in its efforts to remedy the above-described conditions of defendants' property, including but not limited to, serving tenants with notices terminating tenancies and notices of building code violations, and cleaning and removing certain debris, garbage, refuse, trash and other similar items.

The Court finds that Robert L. Couch has accepted rent from at least one tenant in violation of the preliminary injunction issued by this Court.

II
CONCLUSIONS OF LAW

The Court finds that, based upon the evidence produced by plaintiff during trial, the defendants have been and are presently maintaining upon their property a public nuisance. Specifically, the Court bases this conclusion on both a public nuisance per se theory, as numerous conditions of defendants' property violate specific Napa County Code Sections relating to nuisances, as well as a common law nuisance theory, as the condition of the property meets the criteria as set forth in California case law regarding the existence of public nuisances.

931 PARKWAY MALL
NAPA, CALIFORNIA 94559

In addition, based upon the evidence produced at trial, the Court finds that the defendants, by renting or leasing of portions of their property to tenants either for living on the property or for storage of belongings, engaged in unfair competition, as defined by Business & Professions Code §17200, as such activity was a business activity which violated the zoning laws of the County of Napa, and provisions of the Uniform Housing Code.

III
JURSIDICTION AND APPLICABILITY

The Court has jurisdiction of the subject matter hereof and the parties hereto.

The provisions of this final judgment are applicable to defendants Robert L. Couch and Patricia K. Couch, and to their agents, servants, employees, representatives, heirs, successors in interest, and any and all other persons acting in concert with or participating with defendants who have actual or constructive notice of this judgment.

IV
PROHIBITORY INJUNCTION

Defendants are permanently enjoined and restrained, pursuant to Civil Code §3494 and Business & Professions Code §17203, from doing, directly or indirectly, any of the following:

1. From leasing or renting any portion of the property unless any such lease or rental is in conformance with the zoning of the property and the terms of this judgment.

2. From bringing onto their property or causing to be

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

brought onto their property any of the following items:

a. Any junk, scrap, or dismantled or abandoned motor vehicles of any kind, including but not limited to automobiles, trucks, vans, buses, or motorcycles;

b. Any debris of any kind including but not limited to scrap lumber, scrap metal, broken concrete, other types of spoils, dirt, rubble, rock, or gravel unless the presence of such debris is consistent with the zoning of the property or not violative of any applicable law or ordinance;

c. Any junk of any kind, including but not limited to abandoned vehicle parts or components, junked appliances, junked appliance parts or components, tanks, machines, machinery parts or components;

d. Any garbage, rubbish, refuse, trash, or other similar type material;

e. Any hazardous wastes, including but not limited to waste oil, spent gasoline, gasoline products, gas cylinders, paints, lacquers, thinners, solvents, batteries, anti-freeze, or other similar material.

3. From constructing or maintaining any sewage disposal system unless defendants procure a valid and current permit to do so, and follow all conditions and requirements of said permit.

4. From erecting, constructing, enlarging, altering, repairing, moving, improving, or demolishing any structure or building on defendants property unless defendants comply with the provisions of Uniform Building Code §301, and follow all

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

conditions and requirements of any building permit required pursuant to the provisions of this section.

5. From installing or maintaining any water well on the property unless defendants procure a valid permit to do so, and follow all conditions and requirements of said permit.

6. From storing heavy construction equipment on the property unless the presence of such equipment would be consistent with the zoning of the property, or the equipment is being used to fulfill defendants' obligations under this judgment, or any construction or development performed is pursuant to a valid permit.

7. From storing or disposing of hazardous waste unless defendants do so in compliance with the provisions of the Hazardous Waste Control Act.

8. From allowing inadequate clearance between combustible debris material and any inhabited structure as required by Public Resources Code §4291.

9. From dismantling any motor vehicle unless done in compliance with the zoning laws of the parcel, and in compliance with Vehicle Code §5500.

10. From burning trash or other similar type debris, including agricultural debris, except as allowed by regulations promulgated by the Bay Area Air Quality Management District.

V
MANDATORY INJUNCTION

Defendants, are hereby ordered and mandated as follows:

1. Within 30 days from the filing of this judgment, Robert

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

L. Couch or Patricia K. Couch shall do the following:

a. Personally serve a written notice upon each person (other than defendants or members of their immediate family) residing on defendants' property, #2 Eucalyptus Drive, American Canyon, Napa County, California, which provides that each resident has 30 days from the receipt of the notice to remove themselves and all their personal belongings from defendants' property, and that their failure to move their belongings off the property within the time indicated in the notice will constitute an abandonment of those belongings and may be disposed of pursuant to Civil Code §1980 et. seq.

b. Personally serve each and every person who has left personal belongings on defendants' property but does not reside there with a notice requiring them, within 30 days of receipt of the notice, to remove those personal belongings from defendants' property, and that any property left on the premises after the 30 day period will be deemed abandoned and may be disposed of pursuant to Civil Code §1980 et. seq.

c. In the event defendants are unable to personally serve any person, defendants shall cause such notice to be posted in a conspicuous area where the belongings are situated and a copy of the notice mailed to such persons at their last known address. If defendants are unable to locate tenants or their last known address,

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
1031 PARKWAY MALL
NAPA, CALIFORNIA 94559

they may apply to this Court for an order permitting publication of any notices required herein in the Napa Register, a newspaper of general circulation, to give tenants notice.

2. Within 45 days from the filing of this judgment, defendants shall cause to be filed unlawful detainer complaints against any and all tenants who remain on the property after the 30 day notice period has expired (as referred to above in paragraph 1), and shall properly serve each tenant with summons and complaint as required by law. In addition, defendants are hereby ordered to diligently pursue these unlawful detainer actions until all tenants have been removed from the property, and their property has been removed or been deemed abandoned. It is further ordered that to the extent the service of any tenants with required process and/or pursuit of these unlawful detainer actions prohibits defendants from meeting any time deadline, as set forth in this mandatory injunction, defendants shall be given an extension of time for meeting that deadline equivilant to the amount of time spent by defendant in pursuing these unlawful detainer actions.

3. Within 30 days of the filing of this judgment, each party to this action shall provide to the District Attorney's Office the name, address, and phone number of a scrap or junk dealer. The District Attorney's Office shall prepare a list of the scrap or junk dealers designated by each party and serve the list on defendants. Further, Defendants shall allow any scrap or

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

junk dealer so named to enter the property during reasonable times (8:00 a.m. to 6:00 p.m. Monday through Friday) for the purpose of assessing the status of the property and coming up with a bid for how much money that scrap or junk dealer would pay to remove all valuable items of scrap and abandoned motor vehicles (but excluding those items set aside by defendants pursuant to the provisions of paragraph 4, below) on the property. Only bids obtained within 90 days of the filing of this judgment shall be considered. The dealer offering the highest bid shall be chosen.

4. Defendants shall, within 105 days of the filing of this judgment, collect in one place on their property, unless physically impossible to do so, all operable motor vehicles, operable pieces of construction equipment or vehicle whose purpose is consistent with the agricultural zoning of the property, and any and all other valuable items that defendants contend are not scrap or junk, or an abandoned motor vehicle, and whose storage on the property is consistent with the zoning of the property. Once this has occurred, defendants shall then allow county officials to enter the property to inspect this collection of items to determine if their storage on the property would be consistent with the zoning of the property. If so, none of these items of property would be subject to any of the provisions set forth in paragraphs 5 and 15, below. In the event there is a dispute between defendants and county officials regarding any or all of these items of property, such dispute

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559

shall be brought to hearing before this court upon 15 days written notice by either party. Opposition papers shall be filed at least 5 days before the hearing and reply papers shall be filed at least 3 days before the hearing. Defendants will be deemed to have abandoned all other items of scrap, junk, debris and abandoned motor vehicles on the property if not collected and set aside by the deadline set forth in this paragraph, or if ordered by court after hearing.

5. Robert L. Couch and/or Patricia K. Couch shall, within 105 days of the filing of this judgment, enter into a contract with the scrap or junk dealer chosen pursuant to paragraph 3, above, which contract will provide for the following:

a. It will set forth the price to be paid by the dealer for the abandoned motor vehicles and scrap to be removed from the property and it will require the dealer to remove all abandoned motor vehicles and not merely select and remove the motor vehicles and scrap bringing the dealer the highest and/or best price.

b. It will set forth a time period within which the scrap dealer is to remove all abandoned motor vehicles and valuable scrap from the property, with the period not to exceed 150 days, and the period to commence no later than 120 days from the filing of this judgment.

c. It will require the scrap dealer to keep legible records regarding the numbers of abandoned motor vehicles removed, and the weight of scrap removed, as well as legible records regarding

ANTHONY PEREZ
DISTRICT ATTORNEY
BLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
APA, CALIFORNIA 94559
707-253-4211

the payment of moneys on either a price per vehicle or price per weight basis. Further, it will require the scrap dealer to, on weekly basis, provide these records both to defendants and to the District Attorney's Office.

d. The bid will require the dealer to handle and dispose of, in a lawful manner, all hazardous waste that may be generated by the removal of motor vehicles, including motor oil, gasoline, diesel fuel, brake fluid, transmission fluid, batteries, and catalytic converters, and any other similar hazardous materials that are commonly found in motor vehicles.

e. The bid will require the dealer to pay, on a weekly or monthly basis (to be negotiated), all moneys generated by the removal of abandoned motor vehicles and valuable scrap items to a trust fund, to be maintained by the District Attorney's Office, as more fully described in paragraph 13, below.

6. Defendants shall allow the chosen scrap or junk dealer to enter the defendants' property at reasonable times and shall not in any manner interfere with or obstruct the dealer's efforts to remove from the property all abandoned motor vehicles and valuable scrap items.

7. Defendants shall not in any manner interfere with or obstruct any and all County officials who may enter the property during reasonable hours to do the following: appraise any or all abandoned motor vehicles on the property for the purpose of issuing salvage certificates; monitor efforts to remove and properly dispose of hazardous wastes; monitor efforts to properly

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
1031 PARKWAY MALL
NAPA, CALIFORNIA 94559

remove abandoned motor vehicles and scrap from the property; monitor efforts to remove or destroy all illegal sewage disposal systems on the property; monitor efforts to raze all structures which are abandoned or condemned; monitor all efforts to remove from the property all garbage, rubbish, trash, spoils, and other similar unpermitted materials.

8. Within 105 days of the date of the filing of this judgment, Robert L. Couch and/or Patricia K. Couch shall commence to remove or have others undertake the removal of trees, bushes, and shrubs required to create an approximate 30 foot firebreak around the mobile home in which defendants are residing, and any other structure inhabited by any other member of defendants' immediate family. Such removal shall be completed within 165 days of the filing of this judgment.

9. In the event the District Attorneys Office determines, at any time, that income generated from the removal of abandoned motor vehicles and other valuable scrap is insufficient to pay for the removal of hazardous waste, debris, garbage, rubbish, trash (and all other items referred to in paragraph 13), the razing of structures on the property and subsequent removal of razed debris, and the removal or destruction of the illegal sewage disposal systems, then the District Attorney's Office may notify the defendants in writing of such situation.

10. Within 30 days of receipt of the notice from the District Attorney's Office referred to in paragraph 9, above, each party shall provide to the District Attorney's Office the

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
1031 PARKWAY MALL
NAPA, CALIFORNIA 94559

name, address, and phone number of a commercial harvester wood pulp processor or other wood products dealer for the purpose of obtaining a bid to remove or thin out the eucalyptus trees present on defendants property, and to sell the trees for firewood or other income generating purposes. Either defendant may designate the areas where the trees may be removed or thinned out. Further, Defendants shall allow any commercial harvester or processor so named to enter the property during reasonable times for the purpose of assessing the status of the property and arriving at a bid for how much money that harvester or processor would pay to remove or thin out trees for the purpose of resale as firewood or other purpose. Only bids obtained within 60 days of defendants receipt of the notice referred to in paragraph 10 shall be considered. The harvester or processor offering the highest bid shall be chosen.

11. Robert L. Couch and/or Patricia K. Couch shall, within 75 days of receipt of the notice referred to in paragraph 9, enter into a contract with the chosen harvester, which contract will provide for the following:

a. It will set forth the price to be paid by the harvester or processor for the removal of trees from the property, and the approximate number of trees, or cords of firewood or weight of wood pulp, to be removed from the property.

b. It will set forth a time period within which the harvester is to remove trees from the property, with the period not to exceed 120 days, and the period to commence no later than

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
APA, CALIFORNIA 94559
707-253-4211

120 days from the date of defendants' receipt of the notice referred to in paragraph 9.

c. It will require the harvester or processor to apply for a timber harvest plan with the California Department of Forestry, and will require the harvester or processor to follow all conditions and requirements of any such plan as approved by said Department of Forestry.

d. It will require the harvester or processor to keep legible records regarding the numbers of trees removed or the cords of firewood removed or weight of wood pulp removed, as well as legible records regarding the payment of moneys on either a price per tree or price per cord basis. Further, it will require the harvester to, on a weekly basis, provide these records both to defendants and to the District Attorney's Office.

e. The contract will require the harvester or processor to pay, on a weekly or monthly basis (to be negotiated), all moneys generated by the removal of trees to the trust fund to be maintained by the District Attorney's Office, as described in paragraph 13, below.

12. Defendants shall to allow the chosen harvester or processor to enter the defendants' property at reasonable times and shall not in any manner interfere with or obstruct the harvester's or processor's efforts to remove designated trees from the property.

13. The District Attorney's office shall maintain a trust fund whose primary purpose shall be to pay for removing from

ANTHONY PEREZ
DISTRICT ATTORNEY
PUBLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
931 PARKWAY MALL
NAPA, CALIFORNIA 94559
707-253-4211

defendants' property hazardous waste, the various piles and accumulations of debris, garbage, rubbish, trash, metals, scrap lumber, broken concrete, spoils, contractor materials, rubber tires, vehicle parts, junked furniture and appliances, and oth similar items from the property, removing and destroying all illegal sewage disposal systems, and razing all structures whi are abandoned or condemned and removing the debris produced from such razing. Defendants may be reimbursed from this trust fund for costs they have incurred themselves in cleaning up the property, upon presenting bills, receipts or invoices, but only after the primary purpose of the fund, as set forth above, has been met, and there is money remaining in the trust fund for such reimbursement. Any funds remaining in the trust fund after completion of all clean up activities required under this injunction shall be paid to defendants.

14. Within 150 days of the filing of this judgment, Robert L. Couch and/or Patricia K. Couch shall enter into a contract to retain the services of a licensed hazardous waste consultant, licensed hazardous waste hauler, or licensed hazardous waste dealer to identify and remove from the property any and all hazardous wastes present. The contract shall contain the following provisions:

a. It shall set forth a time period within which the consultant, hauler or dealer shall produce a plan to identify and remove all hazardous waste on defendants' property, with the plan to be produced by a date no later than 30 days from the date the

ANTHONY PEREZ
DISTRICT ATTORNEY
BLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
831 PARKWAY MALL
PA, CALIFORNIA 94559

contract is entered into.

b. It shall provide a time period for which all hazardous wastes shall to be removed, with the period not to exceed 120 days, and to commence no later than 60 days from the date the contract is entered into;

c. It will set forth the price to be paid by the consultant, hauler or dealer for any hazardous waste removed from the property which has some value and will set forth the cost for properly disposing of all other hazardous wastes which are present on the property.

d. It would provide for the maintenance of hazardous waste manifests for the tracking of the hazardous waste removed and properly disposed of, with the requirement that the consultant, hauler or dealer shall provide forthwith copies of these manifests both to the defendants and to the District Attorneys Office.

15. Once all valuable scrap, abandoned motor vehicles, and designated trees for firebreak purposes have been removed from the property, defendants shall either obtain bids from solid waste haulers for the cost to clean up, raze structures and remove from the property all remaining items of waste or garbage (including all piles of debris, garbage, rubbish, trash, and similar materials on the property, all debris created from the razing of structures on the property, along with any items of scrap, and motor vehicles that were left on the property because they were not valuable or income generating and were not picked

ANTHONY PEREZ
ISTRICT ATTORNEY
LIC ADMINISTRATOR
UBLIC GUARDIAN
COUNTY OF NAPA

A, CALIFORNIA 94559
707-253-4211

up by any scrap dealer) or defendants or their designees may clean up and remove from the property all of these remaining items of waste or garbage.

a. If defendants act upon their own, they shall remove all remaining items of waste or garbage and any necessary clean up shall be completed within 60 days of the date that all valuable scrap, motor vehicles, and trees for firebreak purposes have been removed.

b. In the event defendants or their designees fail to meet the 60 day requirement as set forth in subparagraph a, above, then defendants shall within 30 days after the 60 day period has expired, obtain bids from solid waste haulers for the cost to clean up the property, as set forth above.

c. Within 45 days after the end of the 60 day period, Robert L. Couch and/or Patricia K. Couch shall enter into a contract with the solid waste hauler giving the lowest bid, which contract shall provide for the following:

(1) It shall provide a time period for which all structures shall be razed and all remaining wastes on the property shall be removed, with the period not to exceed 150 days, and to commence no later than 60 days after the expiration of the 60 day period noted above;

(2) It will set forth the price to be charged by the solid waste hauler for the removal of the remaining waste on the property, including the cost of properly disposing of all of these wastes at a State licensed solid waste landfill. It will

ANTHONY PEREZ
ISTRICT ATTORNEY
BLIC ADMINISTRATOR
PUBLIC GUARDIAN
COUNTY OF NAPA
31 PARKWAY MALL
PA, CALIFORNIA 94559

require the solid waste hauler to maintain legible records regarding the removal of the waste from the property and the costs incurred.

VI
RESERVATION OF JURISDICTION

The Court hereby reserves jurisdiction with regard to the following issues:

1. Issues pertaining to the need for defendants to obtain use permits or building permits for the structures on their property that they or their immediate family members reside in or otherwise intend to occupy;

2. Issues regarding the destruction of any unpermitted water wells that exist on the property;

3. Issues regarding the burning of household trash, garbage, or agricultural debris on the property;

4. Issues regarding the destruction or removal of any illegal sewage disposal systems on the property.

5. Issues regarding the razing of agricultural structures constructed on the property without benefit of building permits.

6. Issues regarding authorizing the County of Napa to enter defendants' property and conduct all clean-up and removal activities, including the removal of income generating items as have been addressed by this judgment, in the event defendants or either defendant fail to comply with the provisions of the mandatory injunction.

6. Issues regarding the issuance of civil penalties pursuant to Business & Professions Code §17206.

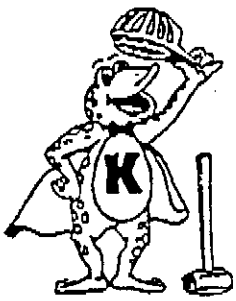
VII
MODIFICATION AND ENFORCEMENT

Any party to this judgment may seek leave of the court upon 15 days notice to the parties hereto and upon a showing of good cause, to modify, amend, or add to any of the provisions of this judgment.

The Court retains jurisdiction, in the event either Robert L. Couch or Patricia K. Couch individually, or both, interfere with, impede, refuse or fail to comply with any provision of this judgment, to make such orders as will prevent further contempt, prevent waste, and protect the property or title to the property, including but not limited to, appointing the defendant who is not in contempt, or a non-party, as a receiver for the purpose of ensuring compliance with this judgment, managing the subject property, and executing any agreements required to comply with this judgment. Further, jurisdiction is retained for the purpose of enabling any party to apply to the Court for such further orders and direction as may be necessary and appropriate for the construction or carrying out of this judgment, for the enforcement of compliance herewith, or for the punishment of violations thereof.

VIII
EFFECT AND ENTRY

This final judgment shall take effect immediately upon entry.



The Clerk is ordered to enter this final judgment forthwith.

RE: CLEARING AND GRUBBING OF THE COUCH PROPERTY, AMERICAN CANYON, CALIFORNIA

Mr. Cave:

Thank you for the opportunity to submit our fees for the project referenced above. Below you will find our scope of work and our special provisions and exclusions.

SCOPE OF WORK
Demolish all structures and animal pens located on the Couch property, (prior to demolishing the structures an asbestos survey and a release from the air board will be required, along with county or city permits). This proposal does not include any abatement work or costs associated with abatement if any hazardous materials are discovered in the survey.

Remove and dispose of all miscellaneous debris and garbage.

Remove (2) 10,000-gallon fuel tanks, (tanks are presumed to be non-hazardous).

Remove all trees and stumps within the property, removing roots to a minimum of 2". Trees and stumps will be chipped onsite, with all chips and debris hauled offsite for recycling or disposal.

Provide dust control throughout our scope of work.

Our price for this work is: $ 714,000.00
This work is quoted during dry weather months only.

Breakdown of our services for budget purposes:

Remove structures, all animal pens, debris and garbage, working around and leaving the trees and stumps.
Our price for this work is: $ 434,000.00

Remove weeds, trees and stumps.
Our price for this work is: $ 280,000.00

EXCLUSIONS: Removal, transportation, or disposal of any hazardous waste, passage due to weather, import or export of soil, grading, backfill or compaction. Prevailing wage. Any special permits that maybe required other than those quoted above.

Best regards,

Jeff Kroeker
Manager
jknapa

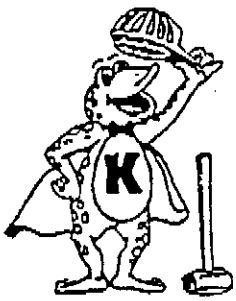
HF219
COR

SUBJECT: Status of Enforcement Action:
- Couch's Eucalyptus Grove
- Green Island Road Vehicle Dismantling Yards.

DATE: April 25, 2003

Eucalyptus Grove

On April 16, 2003, in response to a request by Chief Keith Caldwell, ACFPD, Deputy District Attorney, Rich Zimmerman and myself, plus the City of American Canyon's Chief Building Inspector, Joe Willer and newly-hired Code Enforcement Officer, James Cannon, drove through Eucalyptus Grove to make a visual inspection of the Couch's cleanup attempt. We observed many remaining chicken enclosures, another occupied area exhibiting a trailer and misc. storage and a vastly increased wood-cutting and processing operation leased by Bruce Hurst. Oak is now imported and processed at this location in addition to the on-site removal and cutting of existing eucalyptus trees. There are also two operating paintball game facilities on the property, one of which has not complied with the conditions of approval of its' use permit. Deputy District Attorney Rich Zimmerman is researching the current status of any existing legal action by the Napa Superior Court in Daryl Robert's absence. My plan is to send letters of violation to Mike Sinatra, the lessee/operator of "Sherwood Forest" and Bruce Hurst, the lessee/operator of "Oregon Firewood". Robert and Patricia Couch will, of course, be notified as property owners.



I did make two previous inspections of Eucalyptus Grove on October 22, 2001 and January 14, 2002, in response to a request by Deputy District Attorney Daryl Roberts. I have attached a copy of each inter-office memo for your review.

Green Island Road Dismantling Yards

There are four vehicle dismantling yards still operating on Green Island Road and a previously existing yard that was located at 2600 G. I. Road (*Uribe-Pantoja*, use permit revoked in 1999) that still continues to be a legal problem for the District Attorney's office. *California Auto Dismantling*, located at 1578 and *Brian Abbott Dismantling* located at 2580 Green Island Road are operating in compliance with their use permit conditions of approval. *Baker Auto Dismantling*, at 1678 G. I. Road, has been offered for sale and presently exhibits vehicle storage outside of the perimeter fencing. *Vallejo Pull-A-Part*, owned by Isiah ("Poochie") Lewis, located at 2744 Green Island Road, has been a long-standing problem and should be

the focus of our next public nuisance abatement action. There are no current actions taken against any of the yards mentioned above with the exception of the District Attorney's case against Celerino Uribe and Juan Pantoja-Guzman, owners of 2600 Green Island Road. Periodic monitoring of the dismantling yards along Green Island Road, as well as other south county locations, continues by this department and the Department of Environmental Management and often with the American Canyon Fire Protection District.

Re: City of American Canyon v. Couch

Dear Mr. Frost:

On December 9, 2004, I sent you a letter requesting an accounting of the trust funds being held to perform the required cleanup of the Couch property. To date, I have not received anything from you in this regard and would appreciate receiving such an accounting in the near future. I believe it is beneficial for all parties to know where we stand as to what funds remain to perform the necessary cleanup activities that remain.

There also remain numerous tasks listed in the Stipulated Order that need to be performed. I believe the following summarizes the major issues that remain (the identified paragraph numbers coincide with the Order):

1. Paragraph 1 - Identification of all tenants/occupants on the property. Other than Hurst Firewood and Sherwood Forest, please provide an update on who remains on the property or has some tenancy interest.

2. Paragraph 7 - The Order required the five trailers to be removed from the property by February 15, 2004, or obtain the appropriate permits for them to remain. This work remains uncompleted.

3. Paragraph 8 - The Couch's were required to demolish/remove the four underground tanks no later than May 1, 2004. These items still remain on the property.

4. Paragraph 10 - Scrap metal was to have been removed from the property by May 31, 2004. Although some has been removed, there still remain some such items on the property.

5. Paragraph 11 - By May 1, 2004, the Couch's were to remove all abandoned or dismantled motor vehicles (other than those belonging to the Couch's), and remove the fifteen pieces of heavy equipment. Numerous motor vehicles remain, and the County would like assurances that those remaining are in fact the personal property of the Couch's. Various pieces of heavy equipment have not yet been removed.

6. Paragraph 13 - All motor vehicle tires were to have been removed by March 1, 2004. Although the vast majority has been removed, there still remain some tires on the property.

7. Paragraph 15 - Appropriate permits were to have been obtained for Dave Couch's barn by May 1, 2004, or be demolished and removed by May 31, 2004. The barn remains and has not been permitted.

8. Paragraph 16 - Appropriate permits were to have been obtained for Robert Couch's garage and sheds or be demolished and removed by May 31, 2004. The requirements of this paragraph have not been complied with.

9. Paragraph 18 - All structures in Area 5 used by Glen Couch were to have been demolished and removed by May 31, 2004. The requirements of this paragraph have not been complied with.

10. Paragraph 19 - All structures in Area 5 used by George Couch were to have obtained necessary permits or have been demolished and removed by May 31, 2004. The requirements of this paragraph have not been complied with.

The timelines established in the Stipulated Order for completing the above referenced tasks have not been complied with. I would hope that your clients would continue with their cooperative efforts to bring the property into compliance with the terms and conditions set forth in the Stipulated Order. To that end, please provide me with a timeline in which your clients believe they can accomplish the necessary remaining work in the near future. Hopefully their proposal will be acceptable, which will obviate the need for the County to seek judicial assistance in having these tasks completed. Your prompt attention to these matters is requested.

Very truly yours,

Robert Paul

Robert Paul, Deputy County Counsel

cc: Daryl Roberts - District Attorney Office
Trent Cave - Director Environmental Management
Ed Colby - County Code Enforcement

RE: Use Permit #00308-UP
APN 58-030-~~017~~ 06

Dear Mr. Sinatra:

Please be advised that the above-referenced **Use Permit** was **APPROVED** by the Napa County Conservation, Development & Planning Commission on June 6, 2001 based on the attached conditions. The permit became effective on June 21, 2001, pursuant to Napa County Code Chapter 2.88.

Pursuant to Section 18.124.080 of the Napa County Code, the use permit must be activated within one year and ten calendar days from the approval date, or it shall automatically expire and become void on **June 17, 2002.**

An extension of time in which to activate the permit may be granted for a maximum of 12 months, upon application no more than 45 days prior to expiration, and payment of fees in effect at the time of application.

This letter is your only notice regarding expiration and procedures for extension of this permission.

Very truly yours,

Robert Miller for
Michael Miller
Deputy Planning Director

CONDITIONS OF APPROVAL
Use Permit #00308-UP (Sinatra/Couch)

1. The permit is limited to conducting paintball games within the area shown on the attached plot plan. A maximum of 50 participants may utilize the site at any one time. Any expansion or changes in use to be by separate use permit submitted for Commission consideration. Days and hours of operation shall be limited to weekends for general public use and weekdays by groups on a prior appointment basis, sunrise to sunset.

2. The permit shall be limited to a ten (10) year period, with department review at three (3) and six (6) years. The permit holder shall submit annual reports to the Department summarizing the activity of the past year. Such summary shall include the number of participants and hours of operation per month. The permit holder may seek use permit approval at the end of the ten (10) years.

3. A written maintenance agreement, which provides for annual inspections and recommended improvements of the on-site access road by the permit-holders engineer, shall be submitted to the Director and to the Department of Public Works on an annual basis.

4. A minimum of twenty (20) off-street parking spaces shall be maintained on a surface approved by the Department of Public Works.

5. Plans for any outdoor signs shall be submitted to the Department for review and approval in regard to design, area, height and placement.

6. Prior to activation of the use permit the applicant shall provide proof of liability insurance acceptable to the County's Risk Manager.

7. The permit holder shall comply with all applicable building codes, zoning standards and requirements of various County departments and other agencies as stated in the following:
   Department of Public Works letter of ~~April 25, 2001.~~ MAY 18, 2001 RP
   Department of Environmental Management memo of February 2, 2001.
   Napa County Fire Department memo of January 30, 2001.

8. An overflight and noise easement, acceptable to the Director of Aviation, shall be dedicated to the County of Napa prior to conducting any paintball games.

9. No tournaments or special events shall be conducted on the property.

10. No overnight camping or overnight stay in vehicles shall be allowed.

11. Fires and/or outdoor cooking shall be prohibited.

12. No motorcycles, off-road trucks or similar type vehicles shall be allowed off of the access roads.

13. No alcoholic beverages shall be consumed on-site.

14. The playing field boundary shall be clearly marked.

15. Access roads shall remain clear and gates unlocked during playing hours.

16. Security personnel shall be provided from among those in attendance.

17. At the end of each playing day, the site, access road and surrounding area shall be left in a clean and orderly condition.

18. All staff costs associated with monitoring compliance with these conditions and project revisions shall be borne by the applicant and/or property owner, other than those costs related to investigation of complaints of non-compliance which are determined to be unfounded. Costs shall be as established by Resolution #95-77 or as such Resolution may be amended from time to time.

PUBLIC WORKS DEPARTMENT
INTER-OFFICE MEMO

May 18, 2001

TO: Conservation Development and Planning Department

FROM: Annamaria Martinez, Junior Engineer

SUBJECT: **REVISED:** Sinatra/Sherwood Forest Paintball,
#2 Eucalyptus Drive, American Canyon
APN# 058-030-017, File #00308-UP

This application will allow the applicant to establish a paintball recreational operation and to construct eight new parking spaces on a 10-acre portion of a 165.5-acre parcel located on the north side of Eucalyptus Drive approximately 4,000-feet west of Donaldson Way.

EXISTING CONDITIONS:

1. Existing access road is 12-feet wide at the connection with Eucalyptus Drive, varying in width from 11 to 14-feet to the proposed entrance to the Paintball Park. The access road is roughly a four-inch thick gravel road.

2. An existing swale along Eucalyptus Drive is in disrepair near the access driveway and there is no visible culvert.

3. Parking surface is currently dirt and gravel.

RECOMMENDED CONDITIONS:

1. Access drive shall be a minimum of 18 feet wide with 2 feet of shoulder. Structural section shall be a minimum 5 inches of Class II Aggregate Base plus a double chip seal coat or equivalent. (County Road and Street Standards, Page 9, Par. 12)

   An exception to the Napa County Road and Street Standards was granted to the previous use permit holder for said property. The Public Works Department granted the exception for the access road due to the limited use of the property, i.e. weekend and dry-weather use only, and a letter written by a registered Civil Engineer, in which the engineer states that access road is acceptable for intended uses. The current applicant also proposes limited use of the property and has submitted, along with his application, a letter from Bartelt Engineering; therefore, the conditions of the previous exception also apply to this applicant.

2. Any parking proposed by the applicant or required by the Planning Commission as a condition of this use permit must have a minimum structural section of 5 inches of Class II Aggregate Base plus a double chip seal coat or equivalent.

   An exception to the Napa County Road and Street Standards for commercial parking areas was also granted to the previous use permit holder based on the limited use of the facility and the assertion by a licensed civil engineer that the access road and parking areas are acceptable for the intended use. (See #1 above)

3. Parking lot details shall conform to the requirements of the latest edition of the "Napa County Road and Street Standards."

4. Any necessary storm drainage improvements shall conform to the latest "Napa County Road and Street Standards."

   This includes the addition of a culvert and repair of the swale at the driveway connection with Eucalyptus Drive.

5. The applicant must obtain an encroachment permit for any work performed within the Napa County Right-of-Way, including item number 4, above.

Any changes in use may necessitate additional conditions for approval.

If you have any questions regarding the above items at this time please contact Annamaria Martinez or Larry Bogner of this office.

Use Permit Application for Michael Sinatra/Sherwood Forest Paintball
Located at2 Eucalyptus Drive
Assessor Parcel # 58-030-17
File # 00308-UP

We have reviewed the above proposal and recommend approval of the application providing the following are included as conditions of approval:

1. That adequate chemical toilets be provided. The chemical toilet service company must have a valid health permit issued by the Napa County Department of Environmental Management. Toilets which will be available to the special event guests, can be subtracted from the total amount of toilets required.

2. Adequate area must be provided for collection of recyclables. The applicant must contact the franchised garbage hauler for the service area in which they are located, in order to determine the area and the access needed for the collection site.

3. That all solid waste be stored and disposed of in a manner to prevent nuisances or health threats from insects, vectors and odors.

INTER-OFFICE MEMO

TO: Jeffrey Redding, Director
Conservation, Development, and Planning Department

FROM: Barbara Easter, Fire Department

DATE: January 30, 2001

SUBJECT: Sinatra/Sherwood Forest Paintball Use Permit Comments
Apn: 058-030-017 00308-UP

Site Address: 2 Eucalyptus Drive, American Canyon

The Napa County Fire Marshal staff has reviewed the Sinatra/Sherwood Forest Paintball Use Permit application to establish a paintball recreational operation on a 10-acre site. We recommend that the following items be incorporated as project conditions or mitigation measures if the commission approves the project.

1. Access roads from the public and/or private right-of- ways to the project/ building site shall comply with Napa County Road and Street Standards and shall be reviewed by the Napa County Public Works Department.

2. The request for beneficial occupancy ***will not*** be consider until all fire and life safety issues have been installed, tested and final.

3. Fire apparatus access roads shall be designed and maintained to support the imposed loads of fire apparatus and shall be provided with a surface so as to provide driving capabilities in all weather conditions. Said access shall be provided prior to any construction or storage of combustible materials on site.

4. The approved address numbers shall be placed on each building by the applicant in such a position as to be plainly visible and legible from the street fronting the property and shall be placed as to be seen from all entrances. Proposed address shall be indicated on the elevation drawings contained within the building plan submittal. The address numbers shall be a minimum of 10" in height, contrasting in color with their background and shall be illuminated.

5. An approved project sign shall be placed at vehicle access points into the project during construction to assist emergency responders. The sign shall identify the project name and address. Such signs shall be clearly visible and legible from the street fronting the project.

6. A Knox box or a Knox Cabinet shall be installed at approved location by the Napa County Fire Marshal's Office. If the building/suites are protected by a fire or burglar alarm system, the boxes will require "*tamper*" monitoring.

7. The Knox rapid entry system shall have one or all of the following items placed in the Knox box or Knox cabinet, dependant on requirements of this facility:

    1. A minimum of 2 master keys to the building(s) for emergency access.
    2. Scaled site plan of the facility, identifying all buildings, hydrants, fire department access around the facility, and location of all water, electric, and gas shut-off valves.
    3. Scaled floor plans of all buildings showing doors, offices, etc.
    4. Napa County Hazardous Materials Business including all MSDS forms, etc.

8. "Fire Plan Review and Inspection" fees shall be paid to the Fire Department for all applicable plan review and inspection work at the established deposit basis plus project consultation time at the hourly rate of $59 per hour (Napa County Resolution 92-65).

Use Permit Application for Michael Sinatra/Sherwood Forest Paintball
Located at2 Eucalyptus Drive
Assessor Parcel # 58-030-~~17~~ 66
File # 00308-UP

We have reviewed the above proposal and recommend approval of the application providing the following are included as conditions of approval:

1. That adequate chemical toilets be provided. The chemical toilet service company must have a valid health permit issued by the Napa County Department of Environmental Management. Toilets which will be available to the special event guests, can be subtracted from the total amount of toilets required.

2. Adequate area must be provided for collection of recyclables. The applicant must contact the franchised garbage hauler for the service area in which they are located, in order to determine the area and the access needed for the collection site.

3. That all solid waste be stored and disposed of in a manner to prevent nuisances or health threats from insects, vectors and odors.

PROJECT STATEMENT FOR MICHAEL SINATRA USE PERMIT APPLICATION

This application is for a use permit on behalf of Michael Sinatra doing business as "Sherwood Forest Paintball" for the operation of a paintball playing field on a 10-acre portion of a 165.5-acre parcel owned by Robert and Patricia Couch. That entire parcel is known as APN 58-030-17.

The applicant, Michael Sinatra, is an experienced operator of this type of recreational playing field. Since 1992 Mr. Sinatra operated a similar playing field on Mare Island and has operated another in the City of Rohnert Park since 1995. Due to a development project undertaken by the California Department of Transportation, Mr. Sinatra was forced to relocate his Mare Island operations with essentially no notice when Highway 37 improvements commenced. After an exhaustive search, the Couch property has been determined to be the only suitable location for Mr. Sinatra's business in the greater Bay Area.

This particular area of American Canyon has long since been associated with paint ball playing fields. With apparent recognition of the entertainment value of this activity for diverse segments of the population, these operations have been consistently granted use permits by the County to operate on the Couch property. Examples include:

1. Mr. Dean Laing previously operated a paintball playing field, use permit #93388-UP, on just one half of the 10-acre space covered by this application. With a lease on only approximately 5 acres, Mr. Laing obtained approval from the County for 20 people to use his playing field each day. That number of people was served by 12 parking spaces.

2. The "Paintball Jungle" business (known in Permit #94354-UP, as "Vallejo Paint Ball Park") is operating under a ten year use permit. This site is directly adjacent to the Sherwood Forest site and is operated by Robert D'Elia. It was first granted a use permit by the County in May of 1994. That use permit allows up to 50 people each day to play paintball games at this site. To accommodate them, a total of 20 parking spaces were created by the operator and approved by the County. One issue that caused particular concern to the County when that application was considered was the lack of quality access roads. In particular, there was concern that emergency vehicles would not have access to the playing field during winter months. That concern was subsequently addressed when the applicant presented an engineer's report in which he agreed to improve the access roads to conform with the Napa County Fire Department's standards.

3. Finally, Use Permit # 91541-UP previously was in effect for a paintball operation on another section of the Couch property.

Mr. Sinatra proposes to operate his playing field similar to the preexisting paintball operations on the Couch Property. As such, his playing field will be open from sunrise to sunset on weekends for general public use. Due to the success of paintball fields for a greater audience in recent years, he also proposes to use the playing field for weekdays by groups on a prior private appointment basis. The audiences he can reach with this weekday use include church groups, non-profit organizations, and youth civic, and corporate groups. With twice the space as Dean Laing, Mr. Sinatra has requested an increase in the operation's capacity up to 50 people each day. To accommodate these additional users, Mr. Sinatra proposes to increase his parking by 8 spaces up to a total of 20 spaces, the same number as has been required for the D'Elia operation, which also is permitted for up to 50 customers per day.

Mr. Sinatra is aware of concerns that the access road leading to his playing field may not permit emergency vehicles to reach his playing field in winter months. To this end, consistent with the requirements imposed on Mr. Elia, Mr. Sinatra proposes to retain the services of a qualified engineer to advise him regarding the work that needs to be performed to provide all weather access to the site. This plan would be submitted for approval by the Public Works Department as a condition of approval for the project. Customers will access Mr. Sinatra's portion of the Couch Property by turning off Eucalyptus Drive on the easterly edge of the eucalyptus grove in which the paintball activities take place, driving in a northerly direction along an existing uninmproved access road that Mr. Sinatra will improve. These improvements will substantially improve the quality of the access road serving Mr. Sinatra's site. They will also serve to improve the safety of the access to the entire Couch property.

Sherwood Forest Paintball Player History

I have operated Mare Island Paintball in Vallejo on land leased to me by the City of Vallejo for approximately ten years. I have been displaced by Cal Trans due to the Highway 37 widening project. It is important to stay in the same area because a majority of my players come from the local area of Napa, the Highway 29 corrider, American Canyon and Vallejo. This year at the Napa County Fair we had a booth promoting Paintball. The only advertising I am currently doing is on the AT&T cable message channel which covers Napa. I have many players from all walks of life from Napa who have enjoyed Paintball. This new location off Highway 29 brings me several miles closer to my playership.

Re: Sherwood Forest Paintball Facility, Eucalyptus Drive, Napa County, CA, APN 058-030-017

Dear Mr. Redding:

At the direction of Michael Sinatra, proprietor of Sherwood Forest Paintball Facility, I have evaluated the current condition of the existing access road. The location of the existing facility is in Napa County west of the city limits of American Canyon. The facility is accessed by an existing road north of Eucalyptus Drive, approximately 4,000 feet west of Donaldson Way. The road in question proceeds north approximately 650 feet from it's intersection with Eucalyptus Drive to the parking lot as shown on the attached site plan. My review included emergency vehicle accessibility to the site year round.

A site reconnaissance revealed that the existing access road and parking lot has a 2 inch to 4 inch layer of 1"-1½" clean, crushed drain rock over a firm, sound base. There was no evidence of base weakness throughout the roadway or parking lot. Additionally, there is sufficient roadway width, height and turning radii's for emergency vehicles access. I concluded that the site can be accessed all year round by appropriate emergency vehicles.

If you have any questions or comments regarding this project please feel free to call me.

Sincerely,

Paul N. Bartelt, P.E.
Principal

We have reviewed the above proposal and recommend approval of the application providing the following are included as conditions of approval:

1. That adequate chemical toilet facilities be provided. The chemical toilet service company must have a valid health permit issued by the Napa County Department of Environmental Management. Any permanent toilets which will be available to the special event guests, can be subtracted from the total amount of toilets required.

2. That all solid waste be stored and disposed of in a manner to prevent nuisances or health threats from insects, vectors and odors.

3. Adequate area must be provided for collection of recyclables. The applicant must contact the franchised garbage hauler for the service area in which they are located, in order to determine the area and the access needed for the collection site.

Burlingame, CA 94010

Dear Mr. Childress:

Reference is made to your inquiry as to the toxicity of paintballs to the skin and environment.

The ingredients used in Scherer paintballs are listed by the U.S. Food and Drug Adminstration's Center for Food Safety and Applied Nutrition as suitable for use in food products. In addition, the color additives are specifically listed as permitted for use in cosmetic products.

We wish you success on starting your indoor game.

Sincerely,

William E. Heary

Experience the
**** Excitement!***
**** Rush of adrenaline!***
**** Challenge of surviving!***
**** Sweet taste of victory!!***

CONGRATULATIONS! You're about to be introduced to the most thrilling and fastest growing sport of the 90's. PAINTBALL ADVENTURE GAMES. We're sure that once you've experienced a day of this exciting game, you and your friends will be back for more. A day of fun is GUARANTEED!

WHAT IS THE GAME OF PAINTBALL?
The basic two-team game is to capture the flag from the opposing team and successfully return with it to your own flag camp. Each player is armed with a special constant air gun designed to fire harmless paint pellets which mark their target on impact. Once a player is marked, he/she is eliminated. The game provides an opportunity to test your individual skills of stealth and tactics as well as stressing team work, planning and good humored competition.

WHO PLAYS THE GAME?
Anyone and everyone---men and women , all walks of life; office worker, college students, housewives, lawyers---everyone who wants to have a blast!
An ever increasing number of companies, both small and large, are discovering the game and forming department teams to challenge one another. (How about challenging your supervisory staff?!)

DO I NEED MY OWN EQUIPMENT?
No. Everything you need is at the field for rent. Once you get hooked you will most likely want to buy your own equipment. We also have limited equipment and supplies available for purchase.

IS THE GAME SAFE?
Absolutely. It is safer than most any competitive sports. Safety is stressed at our field. The CO2 powered pistol has been specifically engineered for this use. The "pellets" are soft water color marking capsules that are water soluble and do not harm the environment. SAFETY GOGGLES ARE PROVIDED AND WEARING THEM AT ALL TIMES IS REQUIRED.

IS THIS A RADICAL OR MILITANT ORGANIZATION?
Absolutely not! It's a game of strategy, hide and seek, cowboys and Indians all rolled up into one. These games are not a preparation for real combat. We have no affiliation with actual military groups. We're just here to have fun----- and lots of it!!

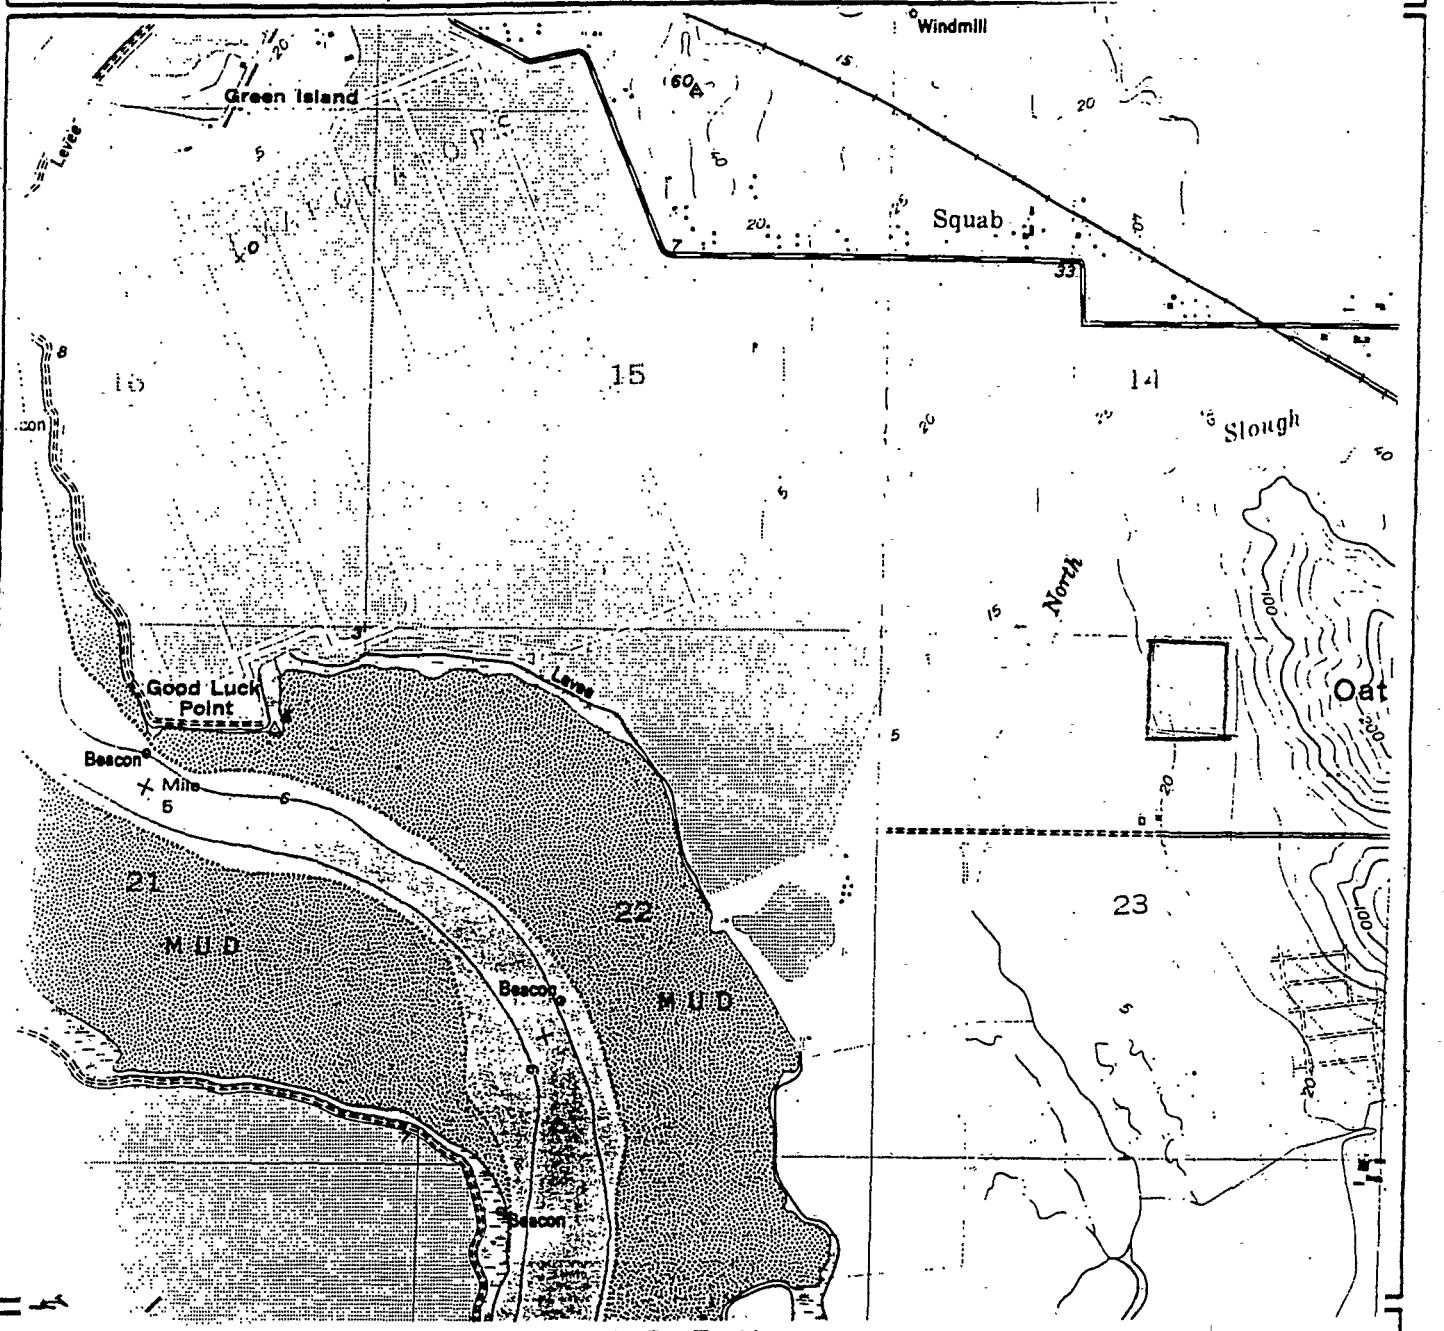
DO I NEED A TEAM TO PLAY?
No. You can come solo, with a couple of friends or a big group. We will divide everyone into two teams to ensure equitable levels of experience. Private games can also be arranged for groups of 30 or more.

WHAT DO I WEAR?
Any type of comfortable clothing (jeans, sweat shirt) is fine. Long-sleeves are recommended. The water dye should wash right out. We also have camouflage clothing available for rent on the field.

WHERE ARE THE GAMES PLAYED?
The field is outdoors on 36 acres located in a eucalyptus grove in Vallejo with thick brush, forts, bunkers and towers providing lots of cover to hide from the opposing team.

WHEN IS THE GAME PLAYED?
Every Saturday and Sunday. (Special arrangements to play during the week can be made for groups of 30 or more.) Players arrive usually around 9:00 a.m. and we wrap up the day approximately 4:00 p.m. (or later if players desire). Each game lasts approximately 20 to 30 minutes.

*** HOW MUCH DOES IT COST?**
Admission: $ 13.00 per person with own equipment.
Gun rentals: $ 10.00 for constant air gun. Includes 1st tank of air free,bulk loader, barrel plug, face mask + goggles . $ 20.00 for limited No. of semi-auto guns.
Paint pellets: $ 13.00 per box of 200 (save on purchase by the case.)



*** CLUB MEMBERSHIP**
A $ 10.00 membership card (valid for 3 months) will allow you to save substantially on all of the above costs.

HOW DO I ARRANGE TO PLAY?
Large groups require advance reservations + a deposit. Please call for information. Walk-ons may show up at the field but we suggest calling prior to the day of play to let us know you are coming.

OUR #1 GOAL IS CUSTOMER SATISFACTION. PLAN ON JOINING US SOON!

MEMORANDUM

TO: **Napa County Planning Dept. - Jeff Redding, Director**

FROM: **Dept. of Environmental Mgmt. - Chris Sechrist, R.E.H.S.**

SUBJECT: **Use Permit Application for Jarquin/Couch-Paintball**

DATE: **August 13, 1992**

APN 58-030-17 66 FILE # 91541-UP

We have reviewed the above proposal and recommend approval of the application providing the following are included as conditions of approval:

1. That adequate chemical toilet facilities be provided by a chemical toilet service company with a valid permit issued by the Napa County Dept. of Environmental Management. A minimum of one toilet will be required.

2. That all solid waste be stored and disposed of in a manner to prevent nuisances or health threats from insects, vectors and odors.

3. Adequate area must be provided for collection of recyclables. The applicant must contact the franchised garbage hauler for the service area in which they are located, in order to determine the area and the access needed for the collection site.

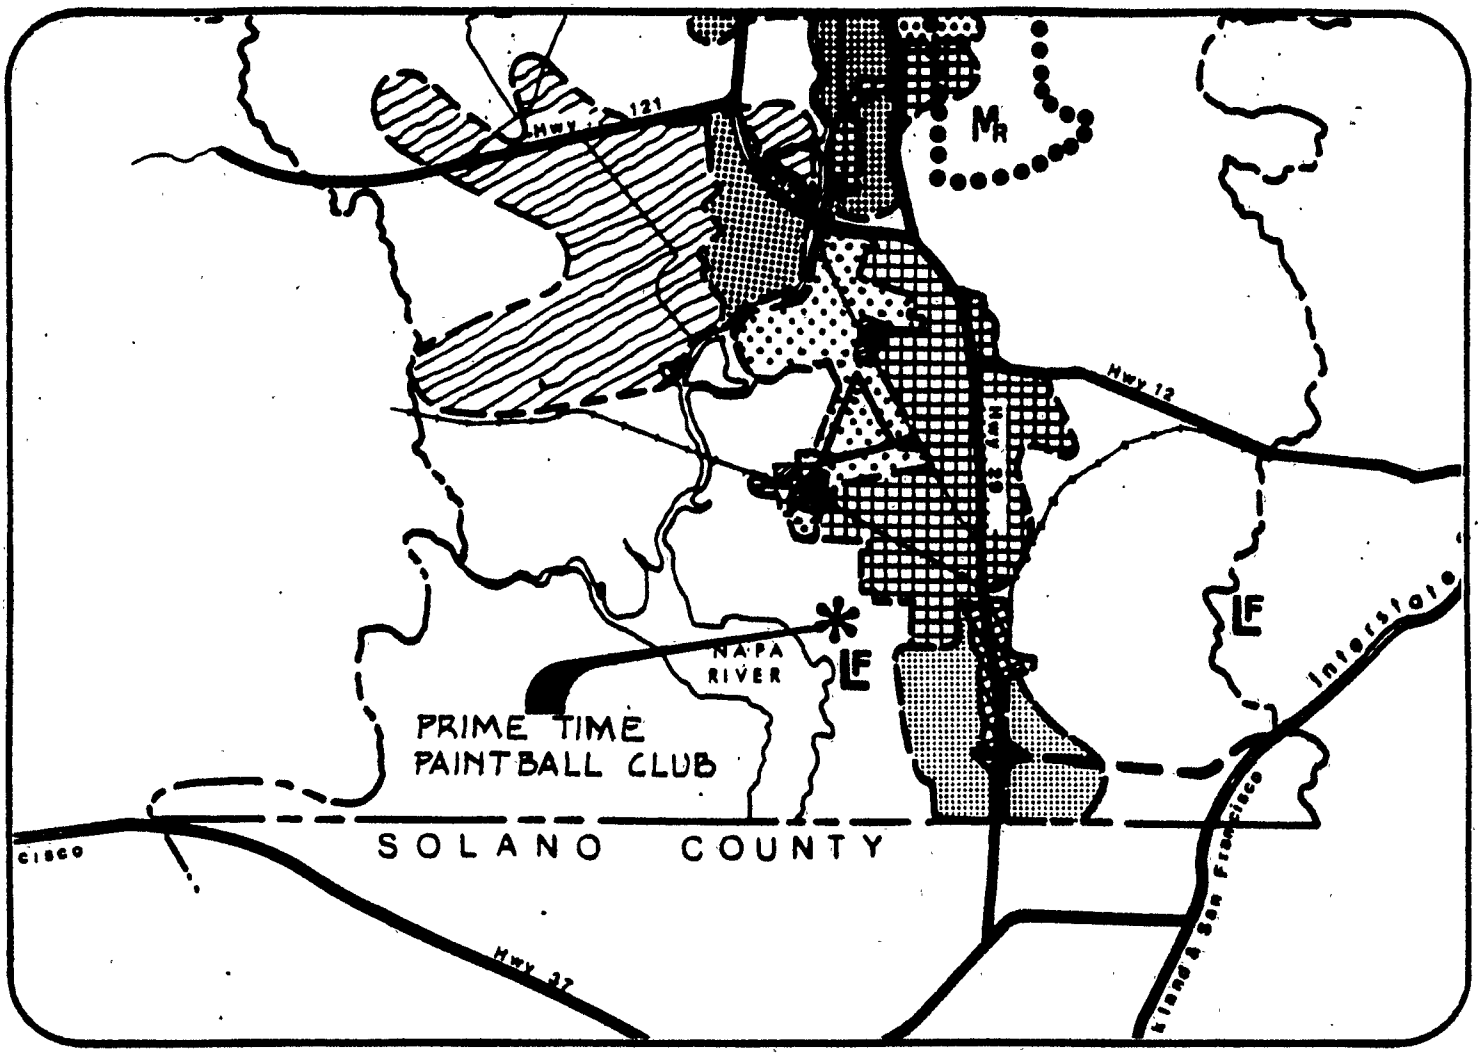
HAZARDOUS MATERIALS INFORMATION SHEET

List all acutely\extremely hazardous materials that will be used or stored at the site:

C.A.S.#	Chemical Name	Physical State	Largest Amount
None			



List the hazardous materials that are stored or handled at any one time, equal to or greater than any one of the following amounts: 500 pounds of solids, 55 gallons of liquids, 200 cubic feet of compressed gasses (s.t.p.). Aggregate amounts of the same hazard class are considered one type of hazardous material and must be listed individually below.

C.A.S.#	Chemical Name	Physical State	Largest Amount
	CO^2	Liquid	50 lbs.

If you are unsure about the C.A.S. #, etc., your distributor or supplier should be able to provide you with a M.S.D.S. (Material Safety Data Sheet) which will contain that information. Your Workman's Compensation Insurer and the local libraries may also have access to this information.

If you are a tenant, you are responsible for proper notification to the property owner.

DEPT. OF
ENVIRONMENTAL MANAGEMENT

Assessor's Parcel # 58-030-17

Robert D'Elia
3496 Hillsborough Dr.
Concord, CA 94520

Dear Mr. D'Elia:

Please be advised that **Use Permit Application Number 91435-UP** has been approved by the Napa County Conservation, Development and Planning Commission based upon the following conditions.

(SEE ATTACHED LIST OF CONDITIONS OF APPROVAL)

APPROVAL DATE: July 8, 1992 **EXPIRATION DATE: July 18, 1993**

The use permit becomes effective ten (10) working days from the approval date unless an appeal is filed with the Napa County Board of Supervisors pursuant to Title XIII of the Napa County Code. You may appeal the conditions of approval. In the event an appeal is made to the Board by another, you will be notified.

Pursuant to Section 12806 of the Napa County Code, the use permit must be activated by actual use of the facilities for the permitted purposes within one (1) year and ten (10) calendar days from the approval date or the use permit shall automatically expire and become void. A one-year extension of time in which to activate the use permit may be granted by the County provided that such extension request is made thirty (30) days prior to the expiration date. A request for an extension of time is subject to payment of a $300.00 filing fee.

This letter serves as the only notice you will receive regarding the expiration date of your permit or procedures for extension.

Very truly yours,

MICHAEL MILLER
Deputy Planning Director

cc: Jeffrey Redding, Director
John Tuteur, County Assessor
Gary Brewen, Building Codes Administrator
Bill Bickell, Director of Public Works
Trent Cave, Director of Environmental Management
Robert L. Couch, Jr., 2 Eucalyptus Dr., American Canyon 94589

CONDITIONS OF APPROVAL
Use Permit #91435-UP (Robert D'Elia) July 8, 1992

1. The permit be limited to conducting paintball games within the area shown on the attached plot plan. A maximum of 20 participants may utilize the site at any one time. Any expansion or changes in use to be by separate use permit submitted for Commission consideration.

2. The permit be limited to a three (3) year period. The applicant shall submit annual reports to the Department summarizing the activity of the past year. Such summary shall include the number of participants and hours of operation per month. The applicant may seek use permit approval at the end of the three (3) years.

3. No tournaments or special events shall be conducted on the property.

4. The hours of operation shall be limited to weekends and weekday holidays, sunrise to sunset.

5. No overnight camping or overnight stay in vehicles shall be allowed.

6. Fires or outdoor cooking is prohibited.

7. No motorcycles, off-road trucks or similar type vehicles shall be allowed off of the access roads.

8. No alcoholic beverages shall be consumed on-site.

9. Provision for twenty (20) off-street parking spaces shall be maintained on a surface approved by Public works.

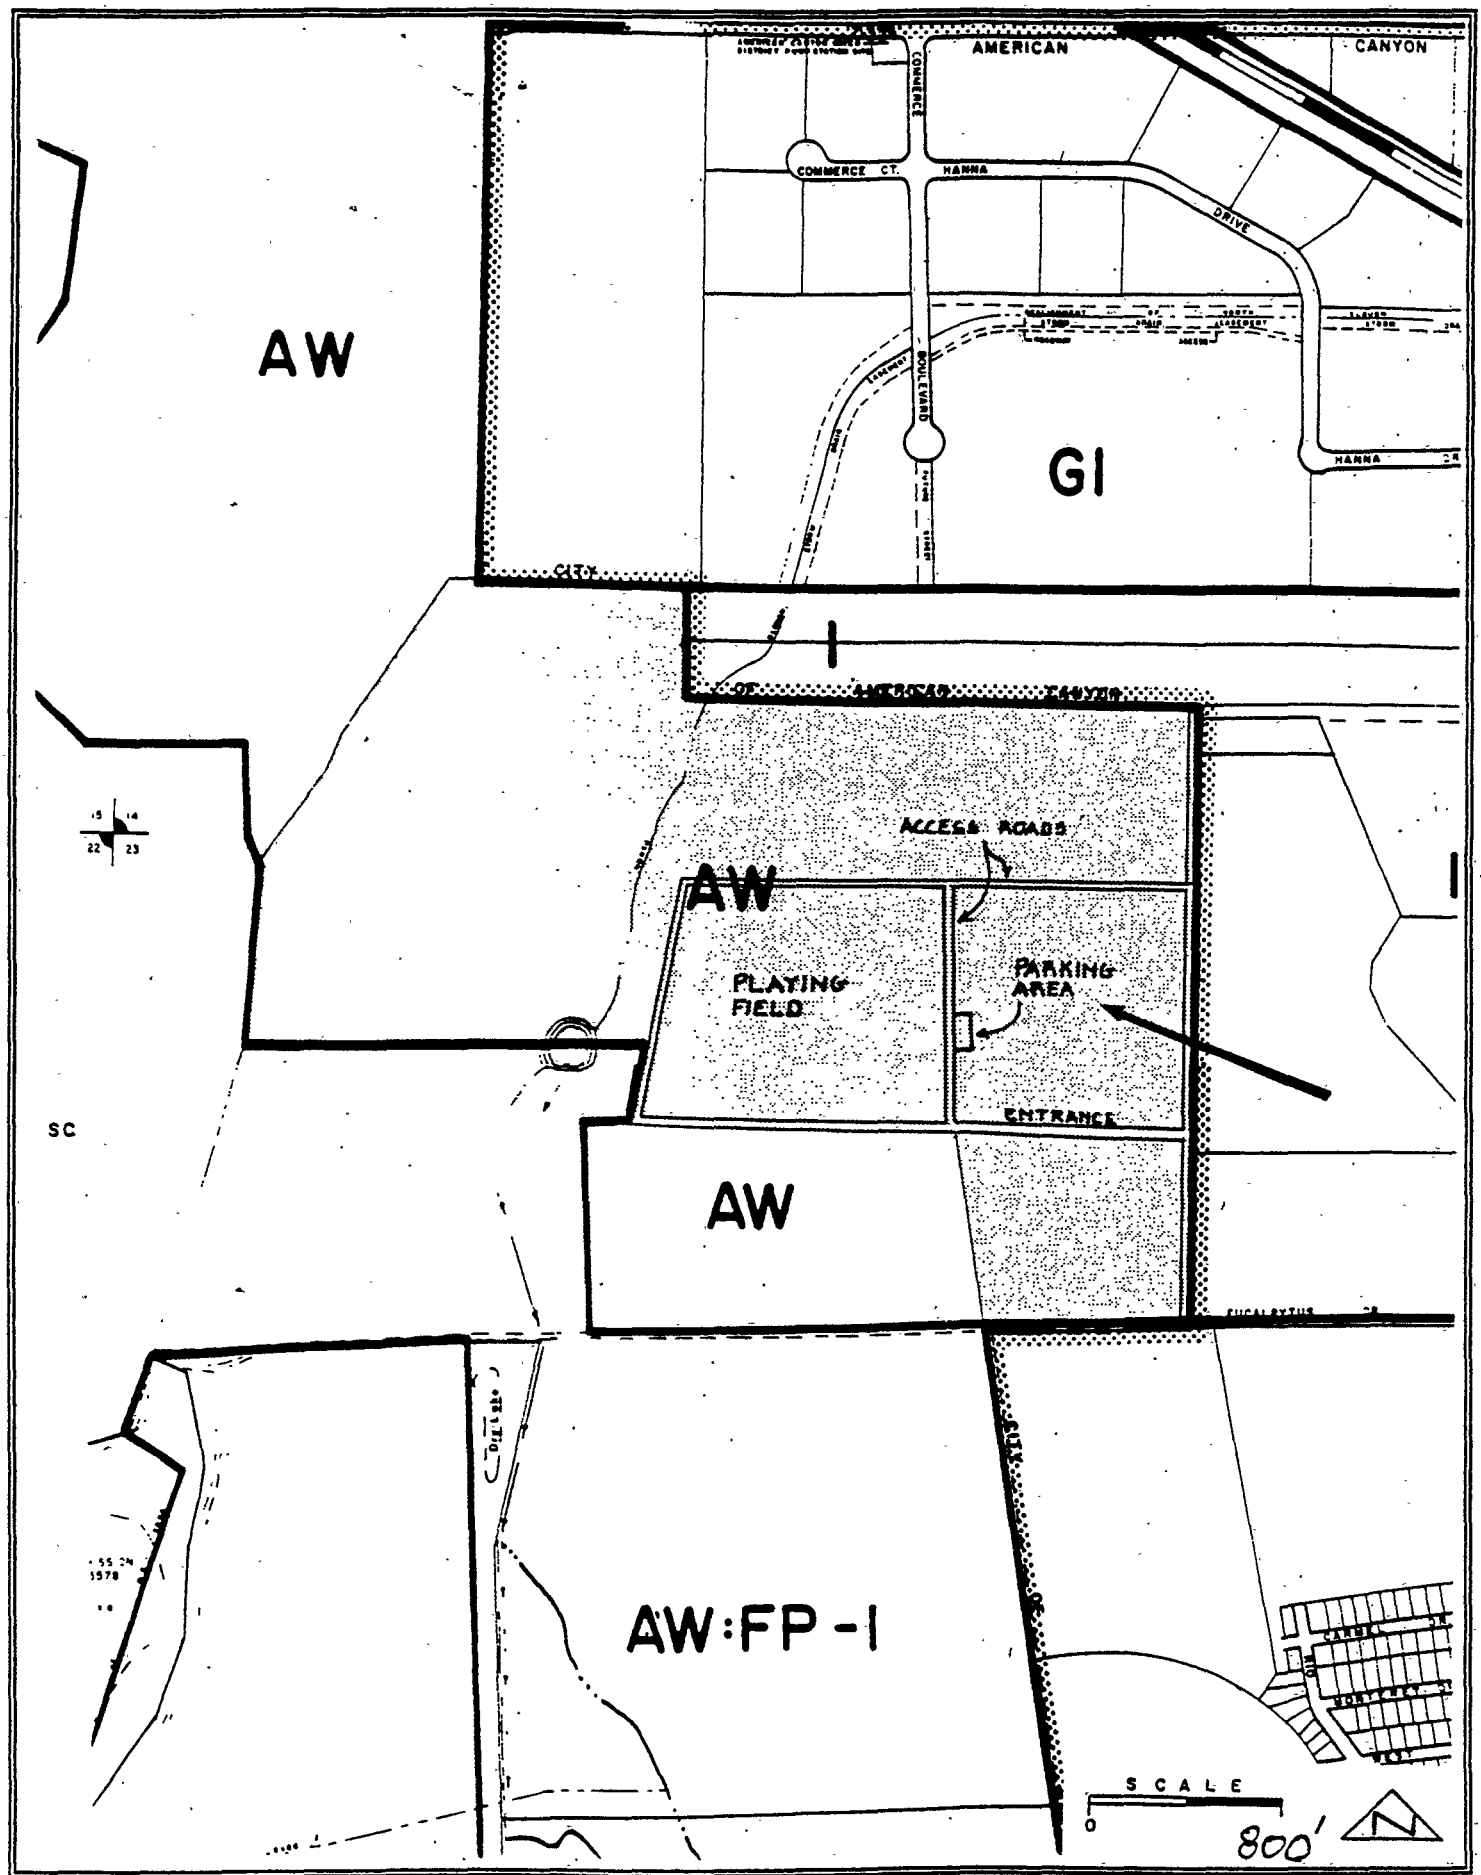
10. Plans for any outdoor signs shall be submitted to the Department for review and approval in regard to design, area, height and placement.

11. Prior to activation of the use permit the applicant shall provide proof of liability insurance acceptable to County Counsel.

12. The playing field boundary shall be clearly marked.

13. Access roads shall remain clear and gates unlocked during playing hours.

14. Security personnel shall be provided from among those in attendance.



15. At the end of each playing day, the site shall be left in a clean and orderly condition.

16. An overflight and noise easement shall be dedicated to the County of Napa prior to conducting any paintball games. The easement shall be acceptable to and approved by the Director of Aviation and the County Counsel.

17. Compliance with all applicable building codes, zoning standards and requirements of various County departments and other agencies.

MEMORANDUM

TO: Napa County Planning Dept. - Jeff Redding, Director

FROM: Dept. of Environmental Mgmt. - Chris Secheli, R.E.H.S.

SUBJECT: Use Permit Application for Robert D'Elia/Vjo Paintball Park

DATE: June 22, 1992

APN 58-030-17 66 FILE # 914235-UP

We have reviewed the above proposal and recommend approval of the application providing the following are included as conditions of approval:

1. That adequate chemical toilet facilities be provided by a chemical toilet service company with a valid permit issued by the Napa County Dept. of Environmental Management. A minimum of one toilet will be required.

2. That all solid waste be stored and disposed of in a manner to prevent nuisances or health threats from insects, vectors and odors.

3. Adequate area must be provided for collection of recyclables. The applicant must contact the franchised garbage hauler for the service area in which they are located, in order to determine the area and the access needed for the collection site.

TO: Environmental Management

APPLICATION TITLE: VALLEJO PAINTBALL PARK FILE #: 91435-UP

RESPONSE REQUEST DATE: 4/20/92 RESPONSE RETURN DATE: 5/4/92
FINAL REQUEST DATE: _____ FINAL RESPONSE DATE: _____

This application (see enclosed project description and/or maps) is being sent to you for your review and comment.

With respect to environmental analysis, the County is assuming Lead Agency status for the project and will be preparing the necessary environmental documents.

Please advise us as to which of your permits is required, your environmental concerns, and whether you recommend that a Negative Declaration or an Environmental Impact Report be prepared on this project. Due to the provisions of AB 884, it is essential that we receive your comments within the next 10 days.

1. Do you have jurisdiction by law over this project ☐ Yes ☐ No
   If yes, indicate required permits: _____
2. Indicate areas of environmental concern and availability of appropriate technical data: _____
3. Do you recommend: ☐ Negative Declaration ☐ Environmental Impact Report
4. If the project is approved, recommend conditions-of-approval (use additional page if needed): _____
5. Have you previously reviewed an application on any portion of this project?
   ☐ Yes ☐ No
6. Name of contact person: _____ Telephone: _____

Informational Trailer Permit Map
Conservation, Development & Planning Department

ROBERT L. COUCH
TRAILER PERMIT
REQUEST

To obtain a temporary trailer permit for watchman/caretaker purposes on a 171-acre parcel of land located approximately 3,200 feet west of State Highway 29 and 2,500 feet south of Green Island Road within an "M" District. (Assessor's Parcel #58-030-17)

The Director reported that this proposal had been continued by the Commission from the September 5th meeting pending review of use permit and building permit applications on file with the Conservation, Development and Planning Department. Department records, he said, had indicated that a Use Permit to build a residence on the property had been denied by the Commission on April 4, 1966 but approved by the Board of Supervisors on appeal on May 26, 1966. A building permit and certificate of occupancy had been issued to the applicant in March of 1967, within one year of Board approval, for the construction of a garage. Related electrical and plumbing permits had also been issued. It would appear, he continued, that that action had been taken within the required one-year period to start the construction of a residence on the property.

Based on the submitted information and further discussion with the applicant, it would also appear that a temporary construction trailer would be more appropriate to the situation than the request for a temporary watchman trailer. It was the recommendation of the Department, therefore, that the applicant's request for a temporary watchman trailer permit be denied and he be allowed to apply for a temporary construction trailer pending issuance of a building permit and with a waiver of the additional filing fee.

During public hearing, Mr. Couch appeared briefly in support of the proposal indicating his concurrence with the Department's recommendations.

No opponents were present

MOTION BY PELISSA, SECONDED BY MC FARLAND

that the Temporary Trailer Permit Request of Robert L. Couch be denied based on the findings of the Department and that he be allowed to file a new application without additional filing fee in the future for a temporary construction trailer when he was prepared to proceed with construction.

This motion carried on the following roll call vote:

AYES: Blaufuss, Ingalls, McFarland, Pellissa and Vanderschoot
NOES: None
ABSENT: None

Findings and recommendations on which the Commission based their denial of this request are as follows:

FINDINGS:

1. This proposal was continued by the Commission from its September 5, 1973 meeting pending review of use permit and building permit applications on file with the Conservation, Development and Planning Department. Department records indicate that:

   a. A use permit to construct a single-family residence on the property was denied by the Commission on April 4, 1966, but approved on appeal by the Board of Supervisors on May 26, 1966.
   b. The site and surrounding area was zoned M-2 at the time of use permit application. The M-2 zone allowed residences under use permit at the discretion of the Commission. The area was rezoned "M" in 1970. The "M" District does not allow permanent residences under any conditions.
   c. Since the Commission denied the use permit, there were no conditions of approval. The Board of Supervisors' minutes do not indicate any conditions of approval.
   d. Department files indicate problems with the Division of Environmental Quality Control in 1969 regarding methods of water supply and sewage disposal.
   e. Building division files show an application for building permit (#9653) and certificate of occupancy was issued to Robert Couch, Jr. on March 10, 1967, within one year of Board approval, for a garage. A plumbing permit (#5558) was also issued on March 10, 1967 for such fixtures as showers, lavatories, automatic washers, water closets, and water heater.

Building files also contain several electrical permits issued from March 10, 1967 to June 20, 1968.

2. Based on the submitted application, the applicant is:
   a. Living on the property in a garage.
   b. Requests permission to live in a trailer to be located adjacent to the garage until a permanent residence can be constructed on the property.
3. The garage is shown as being detached from a "future house". Construction of permanent residences is not allowed within "M" Districts.
4. An environmental assessment of this project is not required under adopted County guidelines.

CONCLUSION:
It appears that on approval by the Board of Supervisors in 1966, action was taken within one year to start construction of a residence on the property.

Based on the submitted information and further discussion with the applicant, it also appears sthat a temporary construction trailer permit would be more appropriate to this situation rather than the applicant's request for a temporary watchman trailer.

RECOMMENDATION: DENIAL

On the basis that:
1. The applicant be allowed to apply for a temporary construction trailer pending issuance of a building permit to finish construction of the residence started in 1967.
2. Fees paid for the temporary watchman trailer permit be applied to the temporary construction trailer permit.
3. Questions regarding the conversion of the garage to non-occupancy status be resolved with conditions to be attached to final approval of the building permit for completion of the residence.

NAPA COUNTY
CONSERVATION, DEVELOPMENT AND PLANNING DEPARTMENT

USE PERMITS

DEPARTMENT REPORT AND RECOMMENDATION
Meeting of May 18, 1994
Agenda Item: #11

APPLICATION DATA:

APPLICANT: **Dean Laing/Storm Paintball Park**
Use Permit Request #93388-UP Filed: 2/24/94

REQUEST FOR: Approval to operate a paintball playing field within a eucalyptus grove on weekends for twenty (20) people.

LOCATION: On a 5 acre portion of a 165.5 acre parcel located north of Eucalyptus Drive approximately 4,200 feet west of its intersection with Donaldson Way in an AW (Agricultural Watershed) zoning District. (Assessor's Parcel #58-030-~~17~~ 066

FINDINGS:

SPECIAL INFORMATION:

1. Details of the proposal are contained in the attached supplemental information sheet.

2. Comments and recommendations from various County departments and other agencies are attached.

3. Two other parts of the site have been used as a paintball playing field since 1987. The requested use of the site is for twenty (20) or fewer players during weekend daylight hours. Air guns are used to propel gelatin covered balls filled with water-soluble paint in games of hide and seek over a marked playing field with temporary wood barricades. Included is a staging and parking area with a portable latrine and a temporary open sided plastic or fabric shelter. The two other paintball playing fields previously approved on the parcel by the Commission are the Vallejo Paint Ball Park (D'Elia applicant) for maximum of 20 users, and the Prime Time Paintball Club (Jarquin applicant) for maximum of 30 users.

4. The proposed access road is a rutted dirt road with a fairly hard base. It is passable for passenger cars except in wet weather. The first part of the access road from Eucalyptus Drive to a point approximately 1,000 feet north is used by customers of both the Vallejo Paint Ball and Primetime Paint Ball. The access road for Primetime continues approximately another 700 feet northerly and approximately 2,400 feet westerly. The Department of Public Works requires paving the road from Eucalyptus Drive to the parking lot. Ambulances and fire

AGENDA ITEM NO. 11

engines can not reach a majority of the property due to seasonal mud.

5. Airport compatibility with Zone E and implementation of airport overflight avigation easement is necessary.

ENVIRONMENTAL ANALYSIS:

6. The project proposal limits the number of participants to maximum of 20 per day on weekends and holidays between sunrise and sunset and includes in the instruction manual procedures for litter control and cleanup of the site as well as sanitary facilities minimizing any potential noise and litter problems.

7. Impacts associated with the establishment of a paintball playing field would not be environmentally significant, individually or cumulatively. The eucalyptus grove is not being harvested. There would be no significant impact on wildlife or water habitat resources, as defined in Section 711.2 of the Fish and Game Code. The Department of Fish & Game offers no comments on this proposal. A Negative Declaration is recommended. (see attached copy).

PLANNING AND ZONING ANALYSIS:

8. The following findings must be made in order to approve the use permit:

   A. The Commission has the power to issue a Use Permit under the Zoning Regulations in effect as applied to the property.

      Analysis: Pursuant to Section 12232 (a) of the County Zoning Ordinance, the establishment of a paintball playing field is permitted in the AW zoning district with a use permit.

   B. The procedural requirements for a Use Permit set forth in Title XII of the Napa County Code (zoning regulations) have been met.

      Analysis: All applicable procedural requirements have been met.

   C. The grant of the Use Permit, as conditioned, will not adversely affect the public health, safety or welfare of the County of Napa.

      Analysis: The proposed use is compatible with the open space character of an area which includes agriculture, a sanitary landfill, a dirt quarry, residential development, industrial development and an incorporated city. Transitional land use of the site is important as an open space buffer strip between the following nearby uses:

      a) General Industrial District on Green Island Road northerly,
      b) Residential part of the City of American Canyon southeasterly,

c) Eventual reuse of the landfill southwesterly,
d) Port of Oakland marshland mitigation westerly, and
e) Cargill Salt Company land reuse northwesterly.

The proximity of the City of American Canyon and unincorporated industrial lands increases the possibility of this site and adjacent parcels being considered for more intensive land uses within the next few years. Therefore, the permit should be timed for future review.

D. The proposed use, as conditioned, complies with applicable provisions of the Napa County Code and is consistent with the policies and standards of the Napa County General Plan. The proposal is in conformance with the General Plan designation of Agriculture, Watershed and Open Space and the AW (Agriculture Watershed) zoning specified for the property.

Analysis:

- The activity proposed is a use which may be permitted within the AW zoning district. Outdoor parks and recreation facilities are compatible with agriculture.

- The proposed use is open space oriented and is consistent with Recreational Policy 2.2 of the Napa County General Plan, which encourages private recreational development that is beneficial to residents and visitors.

- The playing field is within the Airport Land Use Commission's referral area and Zone E of the Airport Land Use Compatibility Zones (see Exhibit "A"). Zone E is characterized as a zone of common flight paths and subject to limited risk and frequent noise intrusion. Overflight easements are required. A paintball playing field with a peak usage of 20 persons is an acceptable density in this zone.

RECOMMENDATION:

ENVIRONMENTAL:

1. Find that the Planning Commission has read and considered the Negative Declaration prior to taking action on said negative declaration and the proposed project.

2. Adopt the Negative Declaration.

PLANNING:

3. **APPROVAL** with Findings and subject to the attached Conditions of Approval.

JO:pjcB21\Laingpai.SR

CONDITIONS OF APPROVAL
Use Permit #93388-UP (Laing)

1. The permit be limited to conducting paintball games within the area shown on the attached plot plan. A maximum of 20 participants may utilize the site at any one time. Any expansion or changes in use to be by separate use permit submitted for Commission consideration. The hours of operation shall be limited to weekends and weekday holidays, sunrise to sunset.

2. The permit be limited to a three (3) year period. The applicant shall submit annual reports to the Department summarizing the activity of the past year. Such summary shall include the number of participants and hours of operation per month. The applicant may seek use permit approval at the end of the three (3) years.

3. No tournaments or special events shall be conducted on the property.

4. No overnight camping or overnight stay in vehicles shall be allowed.

5. Fires or outdoor cooking is prohibited.

6. No motorcycles, off-road trucks or similar type vehicles shall be allowed off of the access roads.

7. No alcoholic beverages shall be consumed on-site.

8. Provision for minimum of twenty (20) off-street parking spaces shall be maintained on a surface approved by Public works.

9. Plans for any outdoor signs shall be submitted to the Department for review and approval in regard to design, area, height and placement.

10. Prior to activation of the use permit the applicant shall provide proof of liability insurance acceptable to County Counsel.

11. The playing field boundary shall be clearly marked.

12. Access roads shall remain clear and gates unlocked during playing hours.

13. Security personnel shall be provided from among those in attendance.

14. At the end of each playing day, the site and surrounding area shall be left in a clean and orderly condition.

15. An overflight and noise easement, acceptable to the Director of Aviation, shall be dedicated to the County of Napa prior to conducting any paintball games.

16. Compliance with all applicable building codes, zoning standards and requirements of various County departments and other agencies as stated in the following:

    (a) Department of Environmental Management memo of March 3, 1994.
    (b) Department of Public Works letter of March 15, 1994.
    (c) American Canyon Fire Department comments of March 23, 1994.

INITIAL STUDY

PROJECT NAME: Dean Laing\Storm Paintball Park
FILE NO: 93388-UP

PROJECT DESCRIPTION: Request for use permit approval to operate a paintball playing field within a eucalyptus grove on weekends for twenty (20) people on a 5 acre portion of a 165.5 acre parcel located north of Eucalyptus Drive approximately 4200 feet west of its intersection with Donaldson Way in an AW:AC (Agricultural Watershed:Airport Compatibility) zoning district (Assessor's parcel #58-030-17).

JURISDICTIONAL BACKGROUND:
Public Plans and Policies

Based on an initial review, the following findings have been made for the purpose of the Initial Study and do not constitute a final finding by the County in regard to the question of consistency.

Is the project consistent with:	YES	NO	N/A
a) Regional and Subregional Plans and Policies?	X	—	—
b) LAFCOM Plans and Policies?	X	—	—
c) The County General Plan?	X	—	—
d) Appropriate City General Plans?	—	—	X
e) Adopted Environmental Plans and Goals of the Community?	X	—	—
f) Pertinent Zoning?	X	—	—

* Mitigable (see Mitigation Measures below)
° Cumulatively Significant Only

Responsible (R) and Trustee (T) Agencies	Other Agencies Contacted
None	Napa County Airport-American Canyon Fire Protection Dist.-Environmental Management City of American Canyon-California Division of Forestry-Public Works-Sheriff

ENVIRONMENTAL SETTING:

A nearly level site west of Oat Hill within a grove of eucalyptus trees at an elevation of approximately 20 feet above sea level adjacent to North Slough and the City of American Canyon. Surrounding land uses on the same parcel are the Vallejo Paintball Park with Robert B. D'Elia applicant located on a 40 acre portion of the parcel app. 400 feet westerly and the Prime Time Paint Ball Park of applicant Gladis Jarquin located on a 36 acre portion of the parcel approx. 2,400 feet westerly of the Vallejo Paintball Park. Also on Parcel #58-030-17 are abandoned vehicles, an illegal mobile home, and several illegal accessory buildings.

Surrounding land uses include open space northerly, westerly and southerly, a quarry easterly, and residences southeasterly.

ENVIRONMENTAL EFFECTS:
Normally Significant Individual Impacts

YES	NO		
		(Geology)	
__	X	1.	Exposure of new site users to substantial life and/or property hazards from geologic processes (*e.g.*, severe settlement, sliding, faulting, intense seismically induced ground shaking, seismically-induced ground failures, etc.).
__	X	2.	Exposure of existing area occupants to substantially increased life and/or property hazards from geologic processes.
__	X	3.	Damage, destruction or burial of any unique or scientifically important geologic or geomorphologic feature.

		(Traffic)	
__	X	34.	Exposure of new site users to substantial life and/or property hazards from traffic accidents.
__	X	35.	Exposure of the existing users of the roads providing access to the project site to substantially increased life and/or property hazards from traffic accidents.
__	X	36.	Exposure of the users of the roadways providing access to the project site to annoyance from noticeably increased traffic congestion.
__	X	37.	Increase in traffic on the roadways providing access to the project site which is substantial in relation to the existing traffic load and capacity of the street system.
__	X	38.	Creation of a substantial local parking problem.
		(Energy)	
__	X	39.	Increase in the demand for energy which is substantial in relation to the existing energy demands of the area.
__	X	40.	Creation of a facility or development which will use fuel or energy in a wasteful manner.
__	X	41.	Creation of a facility or development which will use substantially higher than average amounts of fuel or energy for transportation purposes.
		(Public Health)	
__	X	42.	Exposure of new site users to substantial health hazards from contaminated drinking water, inadequately treated sewage and/or insect or rodent pests.
__	X	43.	Exposure of existing area occupants to substantially increased health hazards from contaminated drinking water, inadequately treated sewage and/or insect or rodent pests.
__	X	44.	Exposure of new site users to substantial life and/or property hazards from fire.
__	X	45.	Exposure of existing area occupants to substantially increased life and/or property hazards from fire.

* Mitigable (see Mitigation Measures below)
° Cumulatively Significant Only

YES	NO		
		(Public Health)	
__	X	46.	Exposure of new site users to substantial life and/or property hazards from air crashes.
__	X	47.	Exposure of existing area occupants and/or existing air or heliport users to substantially increased life and/or property hazards from air crashes.
__	X	48.	Exposure of new site users or existing area occupants to substantial annoyance from insect or rodent pests.
		(Community Services)	
__	X	49.	Increase in the demand for a community service (*e.g.*, sewer, water, fire protection, schools, etc.) which is substantial in relation to the currently existing uncommitted capacity of the agency involved to provide such a service.
		(Commercial Resources)	
__	X	50.	Preclusion of the development of aggregate, rock product, or mineral resources of current or potential importance.
__	X	51.	Removal of a substantial amount of agricultural or grazing land from current or potential production.
		(Fiscal)	
__	X	52.	Creation of a development to which it would cost the community substantially more to provide services than it would return in taxes.
		(Growth Inducement)	
__	X	53.	Inducement of substantial residential, commercial, or industrial development.

Mandatory Findings of Significance

		YES	NO
Does the project:			
a)	Have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	__	X
b)	Have the potential to achieve short-term, to the disadvantage of long-term, environmental goals?	__	X
c)	Have possible environmental effects which are individually limited but cumulatively considerable?	__	X
d)	Have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	__	X

* Mitigable (see Mitigation Measures below)
° Cumulatively Significant Only

Impact Discussion

[All items checked above "YES", "YES, mitigable", or "YES, cumulatively significant" must be discussed below.]

Noise

Limited hours of operation, small number of participants (20) and use of air guns utilizing gelatin - coated paintballs (about the size of a marble) will keep noise levels at an insignificant level. The hours of operation for this field and the other nearby fields is proposed to be limited to weekends and weekday holidays, sunrise to sunset.

Litter

The operations manual for the activity includes that at the end of each playing day the site will be left in a clean and orderly condition. This will keep the playing area from becoming unsightly and unsanitary over time. Those items generally not removed on a daily basis include: staging area tent, portable latrine, temporary wood barricades and playing area markers. Also left behind is the multi-colored effects of the paint on the trees and temporary structures. The paint is non-toxic and water-soluble but tends to remain in place during the dry months of the year.

Fire

The property is located within a general area identified as low fire risk. Access roads should be kept clear and locked gates should remain open during playing hours.

MITIGATION MEASURES:

- X None Required
- ___ Identified By This Study - Unadopted (see attached Draft Project Revision Statement)
- ___ Included By Applicant As Part of Project (see attached Project Revision Statement)
- ___ Recommended For Inclusion As Part of Public Project (see attached Recommended Mitigation Measure List)

BASIS OF CONCLUSIONS:

The conclusions and recommendations contained herein are professional opinions derived in accordance with current standards of professional practice. They are based on a review of the Napa County Environmental Sensitivity Maps, the other sources of information listed in the file, and the comments received, conversations with knowledgeable individuals; the preparer's personal knowledge of the area; and, where necessary, a visit to the site. For further information, see the Environmental Background Information Form contained in the permanent file on this project.

Dean Laing/Storm Paintball Park
Initial Study

AGENCY STAFF PARTICIPATING IN THE INITIAL STUDY:

Resource Evaluation:	James O'Loughlin	Date: April 21, 1994
Site Review:	James O'Loughlin	Date: September 1, 1992
Planning/Zoning Review:	James O'Loughlin	Date: April 21, 1994

PRELIMINARY DETERMINATION:

X No reasonable possibility of environmental effect has been identified, and a Negative Declaration should be prepared.

___ A Negative Declaration cannot be prepared unless all identified impacts are reduced to a level of insignificance or avoided.

DATE: April 21, 1994

BY: James O'Loughlin

James O'Loughlin
Planner III

FINAL DETERMINATION:

On the basis of this preliminary evaluation:

X I find that the project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION should be approved.

___ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because the mitigation measures described on an attached sheet have been added to the project. A NEGATIVE DECLARATION should therefore be approved.

___ I find the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT would be required:

___ Mitigation measures to reduce all impacts to levels of insignificance or to avoid such impacts have been identified and may be adopted as part of the project.

___ A previously-certified Environmental Impact Report will fully address the impacts of the project, supplemented as necessary for public projects by additional mitigation recommended as part of the project.

___ A new, Subsequent or Supplemental Environmental Impact Report is appropriate for the project.

RE: Storm Paintball Park
Use Permit #93388
APN: 58-030-17
Eucalyptus Dr.

Commissioners:

This permit will allow the applicant to establish a 15 acre paintball playing field on a portion of a 165 acre parcel off of Eucalyptus Drive in southern Napa County.

The following conditions have been provided by the Napa County Public Works Department in order to help the applicant meet applicable County ordinances and standards:

EXISTING:

1. The access road is a rutted dirt road and is 12 to 15 feet wide.

CONDITIONS:

1. The applicant shall construct a sixteen foot Low Density Common Drive from Eucalyptus Drive to the proposed parking area. The minimum structural section on the roadway will be a double seal coat on five inches of Class II aggregate base.

2. The proposed parking area will have a dust free all weather surface i.e. a double seal coat on five inches of Class II aggregate base.

3. All Public Works related improvements will conform to the latest adopted "Napa County Road and Street Standards."

4. Parking lot, grading, and drainage improvements shall be constructed according to plans prepared by a registered civil engineer which are reviewed and approved by this office.

5. An engineering and inspection fee shall be paid to Napa County Public Works prior to approval of the engineered plans. This fee will be three percent of the cost of public works improvements as estimated by the applicant's engineer and approved by this office.

6. Any work performed within the right-of-way of Eucalyptus drive will be performed in accordance with an encroachment permit issued by this office.

The above requirements will become conditions of this use permit upon County approval of this application. If there are any questions regarding the above conditions, please do not hesitate to contact our office.

Very truly yours,

WILLIAM E. BICKELL

MEMORANDUM

TO: Napa County Planning Dept. - Jeff Redding, Director

FROM: Dept. of Environmental Mgmt. - Christine M. Secheli, R.E.H.S.

SUBJECT: Use Permit Application for Dean J. Laing, D.B.A. Storm Paintball Park

DATE: March 3, 1994

APN 58-030-17 FILE # 93388-UP

Located at No. 2 Eucalyptus Drive

We have reviewed the above proposal and recommend approval of the application providing the following are included as conditions of approval:

1. That adequate chemical toilet facilities be provided. The chemical toilet service company must have a valid health permit issued by the Napa County Department of Environmental Management. Any permanent toilets which will be available to the special event guests, can be subtracted from the total amount of toilets required.

2. That all solid waste be stored and disposed of in a manner to prevent nuisances or health threats from insects, vectors and odors.

3. Adequate area must be provided for collection of recyclables. The applicant must contact the franchised garbage hauler for the service area in which they are located, in order to determine the area and the access needed for the collection site.

APPLICATION TITLE: Dean Laing / Storm Paintball FILE #: 93388-up

RESPONSE REQUEST DATE: 3-11-94 RESPONSE RETURN DATE: 3-24-94
FINAL REQUEST DATE: _____ FINAL RESPONSE DATE: _____

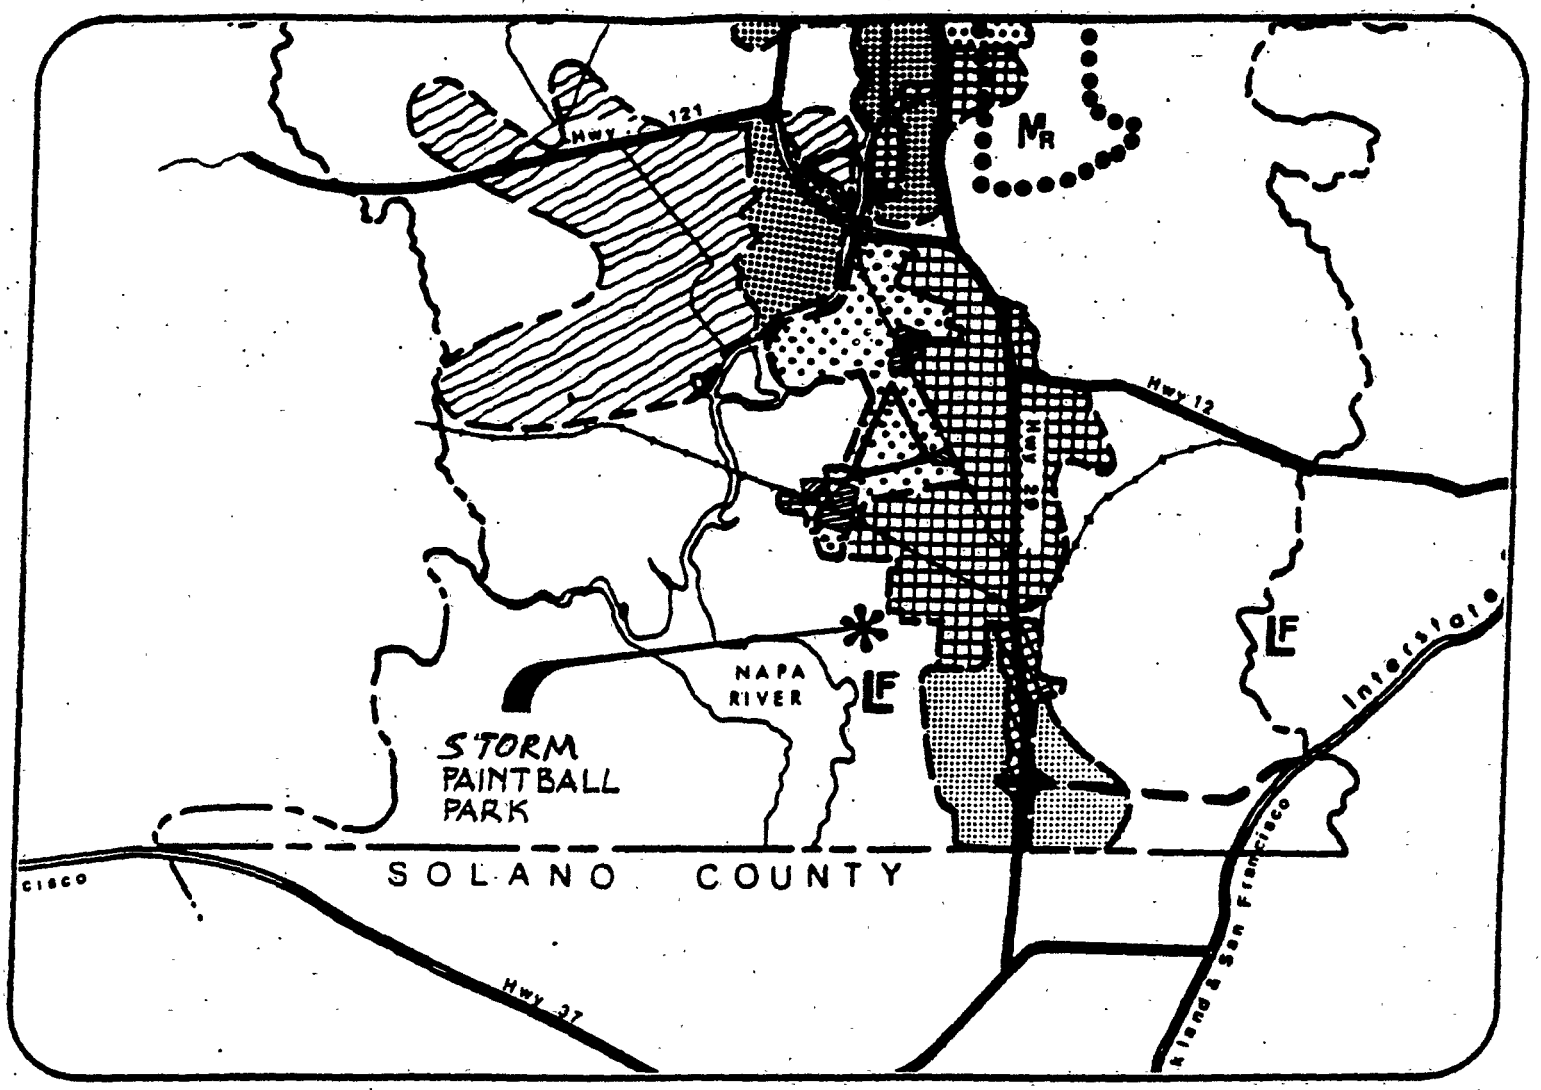
This application (see enclosed project description and/or maps) is being sent to you for your review and comment.

With respect to environmental analysis, the County is assuming Lead Agency status for the project and will be preparing the necessary environmental documents.

Please advise us as to which of your permits is required, your environmental concerns, and whether you recommend that a Negative Declaration or an Environmental Impact Report be prepared on this project. Due to the provisions of AB 884, it is essential that we receive your comments within the next 10 days.

1. Do you have jurisdiction by law over this project ☐ Yes ☒ No
   If yes, indicate required permits: _____

2. Indicate areas of environmental concern and availability of appropriate technical data:
   None At This Time



3. Do you recommend: ☒ Negative Declaration ☐ Environmental Impact Report
4. If the project is approved, recommend conditions-of-approval (use additional page if needed):
   Applicant should provide all-weather access roads and also provide public telephone for emergency notification. Parking area should be kept clear of combustible grasses and debri. Applicant to maintain fire breaks in and around proposed area.

5. Have you previously reviewed an application on any portion of this project?
   ☐ Yes ☒ No
6. Name of contact person: Keith Caldwell Telephone: (707) 642-2747
   Response Prepared by: Keith Caldwell
   Title: Fire Chief
   Date: 3/23/94

SDG Commerce 217 Project
Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
BIOLOGICAL RESOURCES				
Mitigation Measure BIO-1: A qualified western burrowing owl biologist shall conduct surveys in accordance with the California Department of Fish and Game (now CDFW) 2012 Staff Report on Burrowing Owl Mitigation survey methodology (see https://wildlife.ca.gov/Conservation/ Survey-Protocols#377281284-birds). Surveys shall encompass the project area and a sufficient buffer zone of approximately 200 to 500 feet depending on the neighboring terrain and vegetation as necessary to detect owls nearby that may be impacted by the project. Time lapses between surveys or project activities shall trigger subsequent surveys including but not limited to a final survey within 24 hours prior to ground disturbance before construction equipment mobilizes to the Project area. If no owls are found during these surveys, no further actions to protect burrowing owl would be necessary. 1) If burrowing owls are detected on or adjacent to the site, the following restricted activity dates and setback distances recommended per CDFW's Staff Report (2012) shall be implemented, unless reduced buffers are accepted by CDFW in writing based on site specific conditions: • From April 1 through October 15, low disturbance and medium disturbance activities shall have a 200-meter buffer while high disturbance activities shall have a 500-meter buffer from occupied nests and wintering sites.	1. A qualified biologist shall conduct a preconstruction burrowing owl survey per mitigation measure specifications and contact CDFG as necessary.	No more than 30 days prior to grading or land clearing operations	Community Development Department, CDFW	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
• From October 16 through March 31, low disturbance activities shall have a 50- meter buffer, medium disturbance activities shall have a 100-meter buffer, and high disturbance activities should have a 500-meter buffer from occupied nests and wintering sites. • No earth-moving activities or other disturbance should occur within the aforementioned buffer zones of occupied burrows. These buffer zones shall be marked with high visibility fencing or flagging.				
2) If burrowing owls are present outside of the nesting season, burrowing owls may be passively relocated from the project site and adjacent habitat using CDFW-accepted methods so that construction can proceed. Any required passive relocation of burrowing owls would require CDFW acceptance. If passive relocation of non-nesting burrowing owls is necessary, a qualified biologist shall prepare a Relocation Plan and submit it to CDFW.	2. If the site has burrowing owls, applicant shall follow restricted activity dates and setback distances from burrows as specified in the mitigation.	No more than 14 days prior to grading or land clearing operations	Community Development Department	
3) If a nesting season survey determines that a burrow or refugia on the project site is occupied by nesting burrowing owls, then compensatory mitigation in the form of a permanently protected, deed restricted set aside on open space land owned or obtained by the applicant shall be provided if such a protected area makes sense for protection of nesting owls. This permanently protected area would be recorded within 90 days after commencement of project construction. If burrowing owls are observed during surveys,	3. Applicant shall submit copies of preconstruction surveys and outcomes of any consultation with CDFG If burrowing owls are observed during surveys, notification shall also be submitted to the CNDDB. 3a. If burrowing owls are found on the site during preconstruction	Prior to grading or land clearing operations Prior to grading or land clearing		

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
notification shall also be submitted to the CNDDB.	surveys, passive relocation may occur as specified in the mitigation, upon CDFW approval. 3b. If the survey determines that the project site is actively being used by burrowing owls, then compensatory habitat mitigation shall be provided in accordance with the mitigation measure. The habitat mitigation/ compensation plan would be subject to approval of the CDFW. 3c. City mitigation monitor or designee shall perform site inspections.	operations Prior to grading Prior to grading or tree removal and ongoing during construction	 Community Development Department, CDFW Community Development Department	
Mitigation Measure BIO-2: If project activities must occur during the Swainson's hawk nesting season (i.e., typically March 1 through September 15), a qualified biologist (i.e., a biologist with at least two years' experience conducting surveys who has made Swainson's hawk detections) shall conduct pre-construction surveys for nesting Swainson's hawks within a half-mile radius around all project activities for at least two survey periods immediately prior to a project's initiation. The surveys shall be conducted in accordance with CDFW's "Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" (CDFG 2000), which identifies different survey windows throughout the	1. A qualified biologist shall conduct preconstruction nesting Swainson's hawk surveys and contact CDFG as necessary. 2. If Swainson's hawks are found to be nesting on the project site or within a 1/4-mile of the project site, buffers shall be established by the qualified biologist who conducted the surveys. 3. Applicant shall submit	As specified in CDFW guidance document Between January 1st and August 1st, as specified in CDFW guidance document Prior to grading	Community Development Department Community Development Department Community	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
pre-nesting and nesting season (ranging from January 1 through July 30/post-fledging) that have different survey methodologies and requirements. If Swainson's hawks are found to be nesting on the project site or within a 0.5-mile of the project site, the project proponent shall either, a) delay project activities until all Swainson's hawk nests within 0.5-mile of the Project site are no longer active, as determined by a qualified biologist, b) determine if the 0.5-mile buffer zone may be reduced in consultation with CDFW based on site specific conditions, or c) if take cannot be avoided, obtain a CESA Incidental Take Permit from CDFW prior to starting project activities.	copies of preconstruction surveys and outcomes of any consultation with CDFG. If Swainson's hawks are observed during surveys, notification shall also be submitted to the CNDDB. 4. City mitigation monitor or designee shall perform site inspections.	or land clearing operations Prior to grading or tree removal and ongoing during construction	Development Department, CDFG Community Development Department	
Mitigation Measure BIO-3: To ensure that impacts to nesting raptors are avoided, the following mitigation measures shall be implemented: 1) In order to avoid impacts to nesting raptors, a preconstruction nesting survey shall be conducted by a qualified biologist (i.e., a biologist with at least 2 years' experience conducting surveys for nesting raptors with detections) prior to commencing with earth-moving or construction work if this work would commence between February 1st and August 31st. The survey shall be conducted within 7 days prior to site disturbance. The raptor nesting surveys shall include examination of all trees and other suitable nesting structures/areas within 500 feet of the project site. 2) If nesting raptors are identified during the surveys, a qualified biologist shall determine appropriate, species-specific no-disturbance buffers around all	1. A qualified biologist shall conduct a preconstruction nesting bird survey. 2. If the site has trees with nesting birds a qualified biologist shall demarcate	No more than 14 days prior to grading or land clearing operations Between February 1st and August 31st Prior to grading or land clearing operations	Community Development Department Community Development Department Community Development Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
active nests. No-disturbance buffers shall be demarcated in the field with orange construction fencing or similar. If the tree or other nest site is located off the project site, then the buffer shall be demarcated per above where the buffer occurs on the project site. If nesting white-tailed kites are found during surveys, a suitable non-disturbance buffer shall be established by a qualified biologist (as defined above) but in no case shall the buffer be less than 200 feet. To ensure the no-disturbance buffers are adequate, a qualified biologist shall monitor the active nests within and adjacent to the project site daily for a minimum of one week and then weekly during construction. If the qualified biologist observes any nesting raptor displaying distress, the qualified biologist shall require that all project activities cease. In this event, the qualified biologist shall ensure proper measures are taken so that no harm comes to the nest/nesting attempt and all activities causing distress shall cease until the nesting attempt is completed as determined by a qualified biologist.	setback areas around the trees.			
3) If the preconstruction nesting survey identifies a large stick or other type of raptor nest that appears inactive at the time of the survey, but there are territorial raptors evident in the nest site vicinity, a protection buffer (as described above) shall be established around the potential nest site until the qualified biologist determines that the nest is not being used. In the absence of conclusive observations indicating the nest site is not being used, the buffer shall remain in place until a second follow-up nesting survey can be conducted to determine the status of the nest and eliminate the	3. City mitigation monitor or designee shall perform site inspections.	Prior to grading or tree removal and ongoing during construction	Community Development Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
possibility that the nest is utilized by a late-spring nesting raptor (for example, Cooper's hawk). This second survey shall be conducted even if construction has commenced. If during the follow-up late season nesting survey a nesting raptor is identified utilizing the nest, the protection buffer shall remain until it is determined by a qualified biologist that the nest is no longer active. If the nest remains inactive, the protection buffer can be removed and construction and earth-moving activities can proceed unrestrained.				
Mitigation Measure BIO-4: To ensure that impacts to nesting passerine birds are avoided, a qualified biologist shall conduct a survey within 7 days prior to commencing construction/ grading or tree removal activities if this work would commence between February 1 and September 1. If common passerine birds or special-status passerine birds are identified nesting on or adjacent to the project site within 200 feet, a qualified biologist shall determine appropriate, species-specific no-disturbance buffers for all nests. The no-disturbance buffers shall be clearly demarcated in the field with orange construction fencing or similar, prior to the start of project activities. Disturbance within the buffer shall be postponed until a qualified biologist determines that the young have fledged and have attained sufficient flight skills to leave the area, and that the nesting cycle has otherwise completed. To ensure the no-disturbance buffers are adequate, a qualified biologist shall monitor the active nests within and adjacent to the project site on a daily basis for a minimum of one week and then weekly during construction. If the qualified	1. A qualified biologist shall conduct a preconstruction nesting bird survey. 2. If the site has trees with nesting birds a qualified biologist shall demarcate setback areas around the trees. 3. City mitigation monitor or designee shall perform site inspections.	No more than 14 days prior to grading or land clearing operations Between February 1 and September 1 Prior to grading or land clearing operations Prior to grading or tree removal	Community Development Department Community Development Department Community Development Department Community Development	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
biologist observes any nesting bird displaying distress, the qualified biologist shall have the authority to require that all project activities cease until the nesting distress has been ameliorated. In this event, the qualified biologist shall ensure proper measures are taken so that no harm comes to the nest/nesting attempt until the nesting attempt is completed as determined by a qualified biologist. These measures may include increasing the no-disturbance buffer, postponing specific construction activities causing the distress until the nesting attempt is completed, or other appropriate protect measures as determined in the field.		and ongoing during construction	Department	
Mitigation Measure BIO-5: A qualified biologist (i.e., a biologist with at least 2 years' experience conducting surveys for western pond turtle detections) has prepared a wildlife exclusion plan for this project and has attached an exhibit of that fencing plan herein (please see attached Exhibit A). This wildlife exclusion fencing will be constructed of manufactured ERTEC wildlife exclusion fencing. This exclusion fencing shall be installed along the western perimeter of the project site returning back 50 feet to the north and 50 feet to the south preventing species from traveling from North Slough onto the project site during construction (see Exhibit A). A qualified biologist shall survey the project site and adjacent habitat within 72 hours of the start of project activities to determine if western pond turtle or their nests are present and guide the installation of the exclusion fence. If western pond turtles are discovered, a qualified biologist with experience handling and relocating the species shall move the species to the nearest suitable	Preconstruction fencing plan to be prepared by qualified biologist and submitted to CDFW. Fencing to be installed by project contractor.	Fencing shall be installed prior to ground disturbance	Community Development Department, CDFW	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
habitat outside of the project area and exclusion fencing. If western pond turtle nests are found, CDFW shall be notified prior to starting project activities, and the nest site plus a 50-foot buffer around the nest site shall be fenced with orange construction fence until eggs hatch and young turtles disperse to the adjacent North Slough. In addition, if nest(s) are located during surveys, moth balls (naphthalene) shall be sprinkled around the vicinity of the nest (no closer than 5 feet) to mask human scent and discourage predators. Grading within the nest site's 50-foot buffer area shall be delayed until the young leave the nest as determined by a qualified biologist. If the CDFW allows translocation of any nestling pond turtles this shall be completed by a qualified biologist under the direction of the CDFW.				
CULTURAL RESOURCES				
Mitigation Measure CUL-1: Archaeological deposits are defined as any historic-era resource (e.g., bottle dump, refuse scatter) or prehistoric resource that may be intact and/or retain qualities that satisfy criteria for eligibility for the California Register of Historical Resources. If potentially significant historic resources are encountered during subsurface excavation activities for the project area, all construction activities within a 100-foot radius of the resource shall cease until a qualified archaeologist determines whether the resource requires further study. The applicant shall include a standard inadvertent discovery clause in every construction contract to inform contractors of this requirement. Any previously undiscovered resources found during construction shall be	1. Applicant shall incorporate cultural resources mitigation measures into site plan specifications and construction contract.	Prior to issuance of grading permit	Community Development Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
recorded on appropriate California Department of Parks and Recreation (DPR) forms and evaluated for significance in terms of California Environmental Quality Act criteria by a qualified archaeologist. Potentially significant cultural resources consist of but are not limited to stone, bone, fossils, wood, or shell artifacts or features, including hearths, structural remains, or historic dumpsites. If the resource is determined to be significant under CEQA (i.e., a "historical resource") the City and a qualified archaeologist shall determine whether preservation in place is feasible. Such preservation in place is the preferred mitigation. If such preservation is infeasible, the qualified archaeologist shall prepare and implement a research design and archaeological data recovery plan for the resource. The archaeologist shall also conduct appropriate technical analyses, prepare a comprehensive written report and file it with the appropriate information center (California Historical Resources Information System), and provide for the permanent curation of the recovered materials.				
***Mitigation Measure CUL-2*:** If previously unknown human remains are encountered during construction activities, Section 7050.5 of the California Health and Safety Code applies, and the following procedures shall be followed: In the event of an accidental discovery or recognition of any human remains, Public Resource Code Section 5097.98 must be followed. Once project-related ground disturbance begins and if	2. A qualified cultural resources professional shall demarcate the no-construction area. 2a. The contractor or applicant shall provide written notification upon finding remains.	During construction During construction	Community Development Department Community Development Department;	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
there is accidental discovery of human remains, the following steps shall be taken: • There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the Napa County Coroner's Office is contacted to determine if the remains are Native American and if an investigation into cause of death is required. If the coroner determines the remains are Native American, the coroner shall contact the NAHC within 24 hours, and the NAHC shall identify the person or persons it believes to be the most likely descendant (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98.			County coroner; Native American Heritage Commission	
GEOLOGY & SOILS				
Mitigation Measure GEO-1: The applicant shall comply with all of the site preparation and foundation/building design recommendations in the Krazan & Associates Geotechnical Engineering Investigation for the site (Krazan 2019). The applicant's geotechnical consultant shall review and approve all geotechnical aspects of the project construction and grading plans (i.e., site preparation and grading, site drainage improvements, and design parameters for	Applicant shall incorporate geotechnical recommendations into site plan specifications and construction contract. Applicant's geotechnical consultant shall review construction and	Prior to the issuance of grading, encroachment, and building permits Prior to the issuance of	Public Works Department Public Works Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
foundations, retaining walls, street pavement, and driveway) to ensure that their recommendations have been properly incorporated. The results of the plan review shall be summarized by the applicant's geotechnical engineer in a letter to be submitted to the City Engineer and Building Official for review and approval prior to the issuance of grading, encroachment, and building permits.	grading plans and provide a written summary.	grading, encroachment, and building permits		
Mitigation Measure GEO-2: Prior to issuance of building permits and site grading, the applicant/ developer shall submit to the Public Works Department a Stormwater Pollution Prevention Plan using Best Management Practices to limit erosion and stormwater pollution during construction of the project. Because the project is constructed in phases, the project developer shall ensure that more permanent measures such as landscaping are used to prevent soil erosion. Measures would include but not be limited to: • Hydroseeding and/or establishment of appropriate plant materials/landscaping • Placement of straw wattles along slope contours and drainages • Lining of drop inlets with filter fabric/geotextile • Establishment of a single destination "wash-out" for construction subcontractors • Use of siltation fences • Use of sediment basins	Applicant shall submit erosion control plan to City Public Works department.	Prior to issuance of building or grading permits	Public Works Department	
Mitigation Measure GEO-3: The applicant shall comply with all recommendations in the Krazan & Associates Geotechnical Engineering	Applicant shall incorporate geotechnical recommendations into site plan specifications and construction contract.	Prior to the issuance of grading, encroachment,	Public Works Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
Investigation for the site (Krazan 2019). Krazan recommends that the upper 30 inches of soils within the slab-on-grade foundation site and adjacent flatwork areas consist of non-expansive engineered fill. As an alternative to the use of non-expansive soils, the upper 30 inches of soil supporting slab areas can consist of lime-treated clayey soils (Kazan 2019).	Applicant's geotechnical consultant shall review construction and grading plans and provide a written summary.	and building permits Prior to the issuance of grading, encroachment, and building permits	Public Works Department	
HYDROLOGY AND WATER QUALITY				
Mitigation Measure HYD-1: Prior to the issuance of grading permits or building permits (whichever occurs first), the project applicant shall obtain coverage under the State Construction General Permit (NPDES General Permit for Stormwater Discharges Association with Construction Activity (Order 2009-0009 DWQ) by preparing a Stormwater Pollution Prevention Plan (SWPPP) and submitting it along with a notice of intent, to the San Francisco Bay RWQCB. The City of American Canyon shall confirm that the applicant has prepared a SWPPP and obtained coverage under the general permit prior to issuance of grading or building permits. The SWPPP shall identify a practical sequence for BMP implementation and maintenance, site restoration, contingency measures, responsible parties, and agency contacts. The SWPPP shall include but not be limited to the following elements: • Temporary erosion control measures shall be employed for disturbed areas. • No disturbed surfaces shall be left without	1. Applicant shall provide copies of the NOP and SWPPP to the Public Works Department for review and approval.	Prior to excavation or grading	Public Works Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
erosion control measures in place during the winter and spring months. Cover disturbed areas with soil stabilizers, mulch, fiber rolls, or temporary vegetation. • Sediment shall be retained on site by a system of sediment basins, traps, or other appropriate measures. Drop inlets shall be lined with filter fabric/geotextile. • Discharge from the storm water system shall be diffused in such a way as to mimic existing overland flow conditions. • The construction contractor shall prepare Standard Operating Procedures for the handling of hazardous materials on the construction site to eliminate or reduce discharge of materials to storm drains. This may include locating construction-related equipment and processes that contain or generate pollutants in a secure area, away from storm drains and gutters, and wetlands; parking, fueling, and cleaning all vehicles and equipment in the secure area; designating concrete washout areas; and preventing or containing potential leakage or spilling from sanitary facilities. • BMP performance and effectiveness shall be determined either by visual means where applicable (e.g., observation of above-normal sediment release), or by actual water sampling in cases where verification of contaminant reduction or elimination (such as inadvertent petroleum release) is				

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
required by the RWQCB to determine adequacy of the measure. • In the event of significant construction delays or delays in final landscape installation, native grasses or other appropriate vegetative cover shall be established on the construction site as soon as possible after disturbance, as an interim erosion control measure throughout the wet season.				
***Mitigation Measure HYD-2*:** Prior to the issuance of grading permits for the proposed project, the project applicant shall submit a Stormwater Control Plan to the City of American Canyon for review and approval. The Stormwater Control Plan shall identify pollution prevention measures and practices to prevent polluted runoff from leaving the project site. The plan shall be implemented to the satisfaction of the City of American Canyon prior to building occupancy.	2. Applicant shall submit a storm drainage plan, which includes: • calculations of storm-water peak flows and facilities to handle the flow; • water quality/erosion control mitigations; • detailed plans for construction and maintenance of the seasonal detention basin.	Prior to excavation or grading	Public Works Department/City Engineer	
Mitigation Measure HYD-3: Prior to issuance of grading permits for the proposed project, the project applicant shall submit a final drainage plan as prepared by a qualified civil engineer to the City of American Canyon for review and approval. The approved plan shall be incorporated into the project design and constructed to the satisfaction of the City.	3. City mitigation monitor or designee shall perform site inspections to ensure that storm drainage plans are followed.	During construction of storm drainage facilities	Public Works Department	
Mitigation Measure HYD-4: The project sponsor (or successors-in-interest/owner) shall maintain in perpetuity the post-construction BMPs listed in the	4. Applicant (or successors-in-interest) shall maintain the detention and sediment basin(s)	Prior to issuance of building permit for the first year;	Public Works Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
Stormwater Operations and Management Plan to be agreed upon with the City of American Canyon. The owner shall make changes or modifications to the BMPs to ensure peak performance. The owner shall be responsible for costs incurred in operating, maintaining, repairing, and replacing the BMPs. The owner shall conduct inspection and maintenance activities and complete annual reports.	and traps, and provide a bond for this maintenance.	thereafter, annually for the life of the project		
Mitigation Measure HYD-5: The detention basin shall be maintained on a regular basis by the project sponsor (or successors-in-interest). Inspections of the basin shall be conducted at least once a year between July 1st and September 1st. During the dry periods of the year when minor storm events are insufficient to fully transport sediment and debris, accumulations may occur in detention basins. Therefore, basin and storm water inlet maintenance shall be done prior to the rainy season and during other extended dry spells, which will reduce the concentration of sediment and debris that typically collects in the bottom of inlets during storms. An annual inspection and maintenance report shall be prepared by the property owner and submitted to the Public Works Director by October 15 of each year, at the property owner's expense.	5. Applicant (or successors-in-interest) shall maintain the detention basin and pass annual inspections of the City Public Works Department.	Prior to issuance of building permit for the first year; thereafter, annually for the life of the project	Public Works Department	
NOISE				
Mitigation Measure NOISE-1: Construction activities shall be limited to daylight hours between 7:00 a.m. and 7:00 p.m., except for required nighttime construction for concrete pours onsite	The SDG Commerce 217 Project shall include all noise mitigation components and be reviewed and approved by Community	Prior to issuance of building permit	Community Development Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
that would comply with the City of American Canyon's Noise limits for construction activities. All property owners within 300 feet of the site and all residents who have expressed concern over nighttime construction noise during construction of the Commerce 330 project, or otherwise have requested notification regarding project construction, also shall be notified by the applicant. The City also shall be pre-notified of nighttime construction. ***Mitigation Measure NOISE-2:*** All construction equipment shall use noise-reduction features (e.g., mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.	Development Department. Construction contracts shall specify use of noise-reduction features in equipment.	 Prior to construction	 Community Development Department	
TRANSPORTATION/TRAFFIC				
Mitigation Measure TRA-1: Commerce Boulevard would meet the minimum PM peak hour volumes for installation of a separate right-turn lane with Existing Plus Project volumes (the proposed project would add to the existing warrant). Therefore, the applicant shall contribute its fair share to widening and/or re-striping northbound Commerce Boulevard at Green Island Road to include a separate right-turn lane and shared through/left-turn lane. Based on the proposed project's contribution to cumulative buildout volumes at the intersection, its "fair share" contribution towards this improvement would equal 2.7%.	Applicant shall provide mitigation fee.	Prior to issuance of building permit	Public Works Department	
Mitigation Measure TRA-2: The project shall construct a Class I bike path to fill in the approximately 300-foot gap in bike infrastructure between the cul-de-sac at the terminus of	Applicant shall construct the bikeway.	Prior to issuance of occupancy permit for building	Public Works Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
Commerce Court and the northern school driveway of the under-construction elementary school at the northeast corner of Eucalyptus Drive and Wetlands Edge Road, resulting in a continuous route connecting the residential areas to the south and the industrial land uses to the north.				
UTILITIES & SERVICE SYSTEMS				
Mitigation Measure UTIL-1: The project applicant shall demonstrate compliance with the City's Zero Water Footprint Policy by mitigating all new potable water demands with "wet-water" offsets by one or more of the following options to ensure the project results in a net zero increase in demand for potable water: • Reducing existing potable water demands onsite • Funding programs or constructing projects that would conserve an equivalent amount of water elsewhere within the water service area • Funding of and/or constructing projects that would Increase an equivalent amount of recycled water use elsewhere within the water service area where potable water is currently used and/or • Purchase new water supplies from other water providers. The Applicant's agreement with the City's April 17, 2020 Will-Serve letter would assure compliance with these requirements.	1. Applicant shall incorporate recycled water pipelines and hook-ups into construction plan specifications and make reference in construction contract.	Prior to building permits	Public Works Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
Mitigation Measure UTIL-2: The project shall be designed and constructed with purple irrigation pipe so that reclaimed water may be used for landscape irrigation purposes. The project shall connect to existing recycled water pipelines for irrigation, toilets, and urinals prior to occupancy.	2. City mitigation monitor or designee shall verify that recycled water is provided to the site and that all storm-water is retained on-site.	Prior to building permits	Public Works Department	
Mitigation Measure UTIL-3: Prior to issuance of a building permit, the applicant shall pay water capacity fees in accordance with the City's Municipal Code to provide funding for the City to acquire water resources and develop its treatment and distribution system. This would allow for the City to exercise additional options for potable water capacity and would also provide for maintenance of the recycled water system.	3. Applicant shall provide funding for the City's water conservation program.	Prior to occupancy	Public Works Department	
Mitigation Measure UTIL-4: Should additional project water be required, the project shall comply with the City's Ordinances and regulations in effect at the time of authorization for additional water use. In addition, such changes in project use would trigger a new City Discretionary Review process, which, in turn, would trigger re-evaluation of the project's water supply impacts.	4. Applicant shall comply with City regulations regarding changes in project use.	Prior to obtaining Use Permit for new use	Public Works Department	
Mitigation Measure UTIL-5: Prior to issuance of building permits, the project applicant shall submit landscaping plans to the City of American Canyon for review and approval demonstrating that landscaping would comply with the requirements in the City's Model Water Efficient Landscape	5. Applicant's landscaping plan shall be submitted to the City for review/approval prior to issuance of building permits.	Prior to issuance of Building Permit	Community Development Department	

Mitigation Measure	Implementation Method	Timing	Monitoring/ Enforcement Responsibility	Compliance Verification (Initials & Date)
Ordinance (AB 1881). The landscaping plan shall identify outdoor irrigation water conservation measures such as, but not limited to: • Drought-resistant vegetation • Irrigation systems employing the following features: o Drip irrigation o Low-precipitation-rate sprinklers o Bubbler/soaker systems o Programmable irrigation controllers with automatic rain shutoff sensors and flow sensing capabilities (ET Smart Controller) o Matched precipitation rate nozzles that maximize the uniformity of the water distribution characteristics of the irrigation system o Conservative sprinkler spacings that minimize overspray onto paved surfaces o Hydrozones that keep plants with similar water needs in the same irrigation zone • Minimally or gently sloped landscaped areas to minimize runoff and maximize infiltration • Organic topdressing mulch in non-turf areas to decrease evaporation and increase water retention.				

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

PC RESOLUTION 2021-03

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF AMERICAN CANYON, CALIFORNIA, APPROVING A CONDITIONAL USE PERMIT FOR A NEW 217,294 SQUARE FOOT SINGLE STORY 35-FOOT TALL WINE WAREHOUSE ON A 10.39-ACRE SITE AT 1075 COMMERCE COURT, APN 058-030-065 (FILE NO. PL20-0008)

WHEREAS, a Conditional Use Permit application (PL20-0008) was filed by Stravinski Development Group, LLC for a new 217,294 square-foot single story 35-foot tall wine warehouse on a 10.39-acre site with parking, truck and trailer loading spaces, drive aisles, landscaping, and a stormwater detention pond at 1075 Commerce Court, APN 058-030-065; and

WHEREAS, the Planning Commission adopted Resolution 2021-XX approving a Mitigated Negative Declaration and approval of the Mitigation Monitoring and Reporting Program for the project; and

WHEREAS, a duly-noticed public hearing was held by the City of American Canyon Planning Commission on January 28, 2021 and February 25, 2021, on the subject application, at which time all those in attendance were given the opportunity to speak on this proposal; and

WHEREAS, the Planning Commission has considered all of the written and oral testimony presented at the public hearing in making its decision.

NOW, THEREFORE, BE IT RESOLVED that the American Canyon Planning Commission approves a Conditional Use Permit for a wine warehouse (PL20-0008) based on the findings contained in Sections 1, and the conditions of approval contained in Section 2.

SECTION 1: CONDITIONAL USE PERMIT FINDINGS

A. Approval of the SDG Commerce 217 Wine Warehouse Conditional Use Permit requires that all of the following findings be made, pursuant to American Canyon Municipal Code Section 19.42.020:

1. The proposed use is consistent with the policies and programs of the general plan and any applicable master or specific plan.

The proposed use is consistent with the Recreation Designation in the General Plan because wine-related uses are permitted uses in this designation through implementation of the Commercial Recreation zoning district. The wine warehouse use is consistent with Policies 1.22.4 and 1.22.7 of the General Plan related to the design of industrial buildings as found in Section B.1 below.

The project will contribute to the provision of necessary transportation improvements called for in the 2013 Circulation Element update because it will pay the Traffic Impact fees adopted by City Council in January 2015. Additionally, the project will develop a segment of the bike lane connection from Eucalyptus Drive, see Mitigation Measures.

2. The proposed use is consistent with the purpose(s) and standards of the applicable zoning district(s).

A wine warehouse is an allowed use in the Commercial Recreation zoning district with issuance of a conditional use permit. The project complies with all applicable design standards.

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

3. The proposed use complies with applicable policies of the Napa County Airport land use compatibility plan.

The project is consistent with Zones D and E of the Napa County Airport Land Use Compatibility Plan. Warehouses are acceptable with recordation of an Avigation and Hazard Easement Deed. The property-owner completed the recordation in on July 26, 2019.

4. The project site is physically suitable for the type and intensity of land use being proposed.

The site is flat with few physical constraints. The site is physically suitable for a warehouse.

5. The proposed use will not be a nuisance or materially detrimental to the general health, safety, and welfare of the public or to property and residents in the vicinity.

The wine warehouse will not be a nuisance to detrimental to property and residents in the vicinity. No residential parcels are near the site.

6. The site for the proposed use has adequate access, and meets parking and circulation standards and criteria.

The wine warehouse use has adequate access and meets all parking and circulation standards.

7. There are adequate provisions for water and sanitary services, and other public utilities to ensure that the proposed use would not be detrimental to public health and safety.

Water, sewer and utilities will be extended to the wine warehouse.

B. The SDG Commerce 217 project requires the following additional findings related to design:

1. The project and its design complies with any applicable design guidelines.

Although this project is located in the Recreation designation in the General Plan, the project complies with the design and development principles set out in the General Plan as Policy 1.22.4 and 1.22.7 regarding industrial projects, in that the large scale of the building is broken up through the use of changes in color, variety in the parapet heights, and architectural detailing. Extensive landscaped is provided along the street frontage and in the parking lot. Truck access is safe and efficient.

2. The project's quality and character are compatible with the surrounding area, unless physically deteriorated or blighted, and will not be materially detrimental to existing development.

The project is compatible with the quality and character of the surrounding area because it maintains sufficient setbacks, and has landscaped parking areas and perimeters. The building is detailed with a varied roofline with a parapet to screen roof level installations.

3. The proposed design is compatible with existing development in the area in terms of scale, height, bulk, proportion, materials, cohesiveness, color, and the preservation of privacy.

The building will be designed with earth-tone colors with a style consistent with other recently approved warehouses. The site entry will be fully landscaped along with the north and east setback areas. The building will be screened with Western Redbuds, Crape Myrtles, and London Plane trees.

4. The design improves the community's appearance by avoiding both excessive variety and monotonous repetition.

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

The building offers articulation and visual interest through use of recessed panels and canopies around offices and corners of the building. The parapet wall varies in height with wall revels, wall caps and lintels to provide architectural relief. Defined entries are provided at the northeast and northwest corners, and at the mid-point of the north elevation. The site also has many landscaped areas which create separation and interest in the design.

5. The proposed design promotes a harmonious transition in terms of scale and character between areas of different general plan land use designations and zoning districts.

Surrounding properties to the west, south and east on in the same General Plan Recreation designation and Commercial Recreation zoning district. The properties to the west, south and east contain existing or proposed recreation uses, and extensive landscaping and substantial setbacks are provided along those property lines to help buffer and screen the building from recreation uses.

6. The proposed design provides for adequate and safe on-site vehicular and pedestrian circulation.

The warehouse site has a continuous driveway around the site providing emergency access to all portions of the site. Access to the warehouse is from Commerce Blvd that continues southward into Commerce Court. Pedestrian walkways are provided within the primary parking areas in the northern portion of the site.

SECTION 2. CONDITIONS OF APPROVAL

Planning Division
Approval, Exhibits, and Indemnification

1. The Conditional Use Permit approval is granted for a new 35-foot tall, single-story 217,294-square foot Wine Warehouse on a 10.39-acre site with parking, truck and trailer loading spaces, drive aisles, landscaping, and stormwater detention features at 1075 Commerce Circle, APN 058-030-065 (file no. PL20-0008), which shall be substantially as shown on file in the Community Development Department, except as modified by conditions contained in this approval. Exhibit A includes the following:
    1) Architectural Plans prepared by Ward Architects, consisting of 12 sheets showing the proposed site plans, building elevations, roof plans, and landscaping plans, submitted on 10-2-2020.
    2) Civil plans prepared by RSA+, consisting of 6 sheets showing the grading, utilities, and site layout plans submitted on 10-2-2020.

2. The applicant shall defend, indemnify, and hold harmless the City of American Canyon ("City"), its elected officials, officers, employees, attorneys, representatives, boards, commissions, consultants, volunteers and agents from and against all claims, actions, including actions to arbitrate or mediate, damages, losses, judgments, liabilities, expenses and other costs, or proceedings against the City, its elected officials, officers, employees, attorneys, representatives, boards, commissions, volunteers, or agents to attack, modify, set aside, void, or annul an approval, conditional approval, permit, entitlement, environmental document, environmental clearance, mitigation plan, or any other document or any of the proceedings, acts, or determinations taken, done, or made prior to granting of such approval, conditional approval, permit, entitlement, environmental clearance, environmental document, mitigation plan, or other documents, by the City, including, without limitation, an action against an advisory agency, appeal board, or legislative body within the applicable limitation period.

    The obligation to defend, indemnify and hold the City harmless shall include the payment of all legal costs and attorney's fees (including a third party award of attorney's fees), arising out of, resulting from, or in connection with the City's act or acts leading up to and including approval of any

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

environmental document or mitigation plan granting approvals to the applicant, incurred on behalf of, or by, the City, its elected officials, officers, employees, representatives, attorneys, boards, commissions, volunteers and agents in connection with the defense of any claim, action, or proceeding challenging the entire or a portion of an approval, conditional approval, permit, entitlement or any other document of any related claim.

The obligation to defend, indemnify, and hold the City harmless shall include, but not be limited to, the cost of preparation of any administrative record by the City, staff time, copying costs, court costs, or attorney's fees arising out of a suit or challenge contesting the adequacy of a permit, approval, conditional approval, entitlement, environmental document, mitigation plan, environmental clearance, or any other document or approval related to the applicant's project.

The City will promptly notify the applicant of any claim, action, or proceeding and will cooperate fully in the defense. If the City fails to promptly notify the applicant of any claim, action, or proceeding, or the City fails to cooperate fully in the defense, the applicant shall not be responsible to defend, indemnify, or hold harmless the City.

In the event a legal challenge to a City permit, approval, conditional approval, environmental document, environmental clearance, mitigation plan, entitlement or any other document, proceeding, determination, or action related to the applicant's project is successful, and an award of attorneys' fees is granted against the City, the applicant shall be responsible to timely pay the full amount of such an award.

3. Appeal. The approval shall become effective on the expiration of the appeal period, ten calendar days following the decision, unless an appeal to the City Council is filed. An appeal may be filed with the Community Development Director by filling out an Appeal Form accompanied by a fee of $703. This approval is also subject to return of the "Applicant Confirmation of Conditions of Approval" form signed by the property owner. Should an appeal period end on a Saturday, Sunday or holiday, the final day for filing an appeal shall be the following Monday, or the next business day following a holiday. If there is no appeal, this approval will be final on March 8, 2021.

4. The applicant is responsible for paying all charges related to the processing of this discretionary case application within 30 days of the issuance of the final invoice or prior to the issuance of building permits for this project, whichever occurs first. Failure to pay all charges shall result in delays in the issuance of required permits or the revocation of the approval of this application.

5. The date upon which the approval is final shall be considered the day of the imposition of the fees, dedications, reservations and exactions required by these conditions approval for the purposes of protesting the imposition pursuant to California Government Code Section 66020.

6. Expiration of this Approval. If no construction permits have been issued and construction commenced within one year of the date upon which this approval is final, the approval shall become null and void and of no effect. An extension of time may be granted by the Community Development Director upon the written request by a responsible party before the expiration of the one-year period, provided that the Director can make the findings that there have been no substantial changes in the approved plans, and that there has been no change of circumstances which would prevent any of the required findings of approval being made.

7. All plans submitted for review and approval and all development shall be in substantial conformance with the approved exhibits, except where modified by a condition of approval. The Community Development Director or designee may approve minor changes to the project as approved by the Planning Commission on the plans submitted for the construction permits with a determination that

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

the changes are in substantial compliance with the representation of the project as reviewed by the Planning Commission and City Council, that the proposed change will be in compliance with the required development standards, and the change will not materially affect adjacent private or public property.

8. The conditions of this Permit shall be printed on the first sheet of each plan set submitted for a building permit pursuant to this Conditional Use Permit, under the title "Conditional Use Permit Conditions". The second sheet may also be used if the first sheet is not of sufficient size to list all of the conditions. The sheet(s) containing the conditions shall be of the same size as those sheets containing the construction drawings; 8-1/2" by 11" sheets are not acceptable.

9. All new roof top equipment is required to be screened. The parapet shall be opaque and equal in height of the top of the rooftop mechanical equipment.

10. Plans submitted for building permits shall include all exterior site lighting including building mounted lighting, lighting within the parking areas and along walkways that provide a minimum of 1-foot candle illumination of these areas. Lighting shall be shielded as appropriate and avoid light spillage or glare from the project site. Exterior light fixtures on buildings shall be oriented downward and shall be shielded to return potential light and glare impacts.

Landscape and Irrigation Plans

11. The applicant shall agree to a licensing agreement that requires them to maintain the landscaping within the right-of-way along the project frontage. Prior to final inspection of the building permit, the applicant shall amend their facilities operation and maintenance plan (O&M plan) to include this activity.

12. The landscape plan shall comply with the requirements of the California Government Code 65591 et. seq. known as the Water Conservation in Landscaping Act as set out in the model water efficient landscape ordinance adopted by the California Department of Water Resources and amended in 2015. All plant material shall be served by a city-approved automatic irrigation system.

13. Prior to the issuance of a certificate of occupancy, all landscaping shall be completed and the project's landscape architect shall provide a written certification that all plant materials have been installed in accordance with the approved landscape plan.

14. All planting shall be maintained in good growing condition. Such maintenance shall include, where appropriate, pruning, mowing, weeding, cleaning of debris and trash, fertilizing and regular watering. Whenever necessary, planting shall be replaced with other plant materials to insure continued compliance with applicable landscaping requirements. Required irrigation systems shall be fully maintained in sound operating condition with heads periodically cleaned and replaced when missing to insure continued regular watering of landscape areas, and health and vitality of landscape materials.

15. All tree stakes and ties shall be removed within one year following installation or as soon as trees are able to stand erect without support.

16. Clear sight triangles shall be maintained at all driveways. Low-lying plantings and other site fixtures, including signs, shall be no taller than 30 inches within the site's vision triangles.

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

Signs

17. Signs for the project shall require a sign permit approval from the Community Development Department. This requirement does not apply to traffic signs, building addressing or directional signs for wayfinding.

Building and Safety

18. At plan submittal for building permit, provide a complete code study with occupancy, square feet, firewalls, and fire sprinklers.

19. The applicant shall have the detailed building and site plans reviewed by a Certified Accessibility Specialist to verify that the proposed construction will comply with accessibility requirements. Each application for site construction or building permit shall be accompanied by a written report from a Certified Accessibility Specialist verifying that the site and building design as shown on the submitted plans comply with all accessibility requirements.

20. All construction plans and buildings onsite shall conform to the California Code of Regulations, Title 24. All building plans shall include all necessary recommendations from the Geotechnical Report for the site, to be superseded only by the California Code if any conflicts arise.

21. Prior to the issuance of a certificate of occupancy, the applicant shall submit a letter of certification to the Building Official from the project architect and civil engineer certifying that all improvements have been constructed in accordance with the approved building plans. Determination of consistency shall be subject to the review and approval of the Building Official.

22. Site Improvement plans shall show slopes of all sidewalks and walkways and paths of travel to use site facilities including trash/recycling facilities. The applicant shall have the detailed building and site plans reviewed by a Certified Accessibility Specialist to verify that the proposed construction will comply with accessibility requirements. Each application for site construction or building permit shall be accompanied by a written report from a Certified Accessibility Specialist verifying that the site and building design as shown on the submitted plans comply with all accessibility requirements.

23. Recycling of Construction and Demolition Debris: Prior to issuance of a building permit the applicant shall submit a plan for the diversion of at least 70 percent of the debris from the building demolition and construction. The plan shall include the qualified recycler that will be used, the methods of managing diversion of construction materials on site, and the proposed documentation that will be submitted to confirm that the diversion goal has been met.

Fire Protection

24. In accordance with the standard mitigation measures and conditions of approval set forth by the American Canyon Fire Protection District, the developer shall pay the Fire Impact Fees (see current Standard Fees and Charges adopted by resolution), prior to the issuance of any building permits.

25. Fire District plan review shall be based on the information submitted at the time of permit application. Any changes to the approved/permitted scope of work including additions, alterations, demolition, repair or a change in occupancy/use may impact the project requirements, including but not limited to the installation of additional fire protection systems or components.

26. Prior to building permit issuance, provide a fire department circulation plan using the City's ladder truck and demonstrate clear turning movements into and out of the project. The final design of fire

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

department access components shall be reviewed and approved by the Fire Marshal prior to installation.

27. Fire Apparatus Access Roads shall be designed in accordance with provisions set forth in the California Fire Code Chapter 5 and Appendix D as amended by the American Canyon Fire Protection District and the applicable Public Works Standard.

28. Fire apparatus access roads shall have an unobstructed minimum width of 20 feet (curb to curb) and a minimum unobstructed vertical clearance of 13' 6". They shall have an all-weather paved surface capable of supporting a GVW of 75,000 pounds.

29. Access roads shall be completed with all-weather surfaces prior to the stockpiling of combustible materials or beginning combustible construction.

30. When required by the Fire Chief, fire apparatus access roads shall be designated as Fire Lanes and appropriate signs and/or markings installed in accordance with the California Vehicle Code and approved City standards.

31. Fire Protection systems shall be installed in accordance with provisions set forth in the California Fire Code as amended by the American Canyon Fire Protection District and the applicable National Fire Protection Association Standard.

32. There shall be no deferred submittals for fire protection equipment. Plans and calculations for all fire protection systems and features shall be submitted and approved prior to the issuance of a building permit.

33. An approved water supply capable of supplying the required fire flow for fire protection systems shall be provided to all premises upon which facilities or buildings are hereby constructed or moved into or within the City. Required fire flow and hydrant distribution shall be in accordance with Appendix B and C of the California Fire Code.

34. There shall be no more than 300 feet between public fire hydrants located along the public street frontage. (ACFPD ordinance)

35. The fire protection equipment shall be located within an interior room having an exterior access door or in an exterior enclosure attached to the building, specifically for the purpose of housing such equipment.

36. When fire sprinkler systems are required in buildings of undetermined use, they shall be designed and installed to have a sprinkler density of not less than that required for an Extra Hazard Group II use with a minimum design area of 2,500 square feet.

37. New buildings and additions to existing buildings shall conform to requirements set forth in the currently adopted editions of the California Building Code, California Fire Code, Fire District standards and Nationally Recognized Standards.

Public Works General Conditions of Approval

38. The Applicant shall be responsible for all City map check, plan check and inspection costs. The Applicant shall establish a Developer Deposit Account with the City upon the initiation of plan check services. The amount of the initial deposit shall be determined by the City Engineer. Additional funds may be required based upon actual costs.

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

39. All improvements shall be designed in accordance with the American Canyon Municipal Code (ACMC), City of American Canyon Engineering Standard Plans and Specifications for Public Improvements (City Standards), except as specifically noted otherwise in these conditions.

40. All existing overhead utilities, both on-site and along project frontages, and all new utilities to serve the project, shall be placed underground. Exceptions may be allowed for surface mounted transformers, pedestal mounted terminal boxes and meter cabinets.

41. Unless otherwise explicitly permitted, all existing wells, septic tanks and/or underground fuel storage tanks shall be abandoned under permit and inspection of Napa County Department of Environmental Services or other designated agency. If there are none, the project engineer shall provide a letter describing the scope of the search done to make this determination.

42. A detailed Soils Investigation/Geotechnical Report shall be prepared and submitted for review. The report shall address, at a minimum, potential for liquefaction, R-values, expansive soils and seismic risk. The improvement plans shall incorporate all design and construction criteria recommended in the Geotechnical Report.

43. A drainage report prepared by a California Registered Civil Engineer shall be submitted for review with the initial submittal of the Improvement Plans. The report shall include detailed hydrologic and hydraulic calculations to support the design and sizing of all public and private drainage facilities including storm drains and detention facilities. The report shall address existing downstream storm drain facilities and hydraulic conditions which may impact the design of proposed facilities and improvements.

44. A detailed post-construction Stormwater Control Plan (SWCP) that identifies and sizes all permanent post-construction stormwater treatment BMPs shall be prepared and submitted for review and approval. The SWCP shall be prepared in accordance with the latest edition of the *Bay Area Stormwater Management Agencies Association (BASMAA) Post-Construction Manual* and the requirements of the State Water Resources Control Board Phase II Municipal Separate Storm Water System (MS4) General Permit (Order 2013-0001 DWQ).

45. A Post Construction Stormwater Operations and Maintenance Plan that includes a plan sheet showing all storm drain and water quality infrastructure that is to be maintained, along with detailed instructions and schedules for the ongoing maintenance and operation of all post-construction stormwater BMPs shall be submitted for review and approval by the City Engineer. Once approved, the property owner(s) shall enter into an agreement with the City that provides the terms, conditions, and security associated with the ongoing requirements of the post-construction Stormwater Best Management Practices.

46. The Applicant shall secure all necessary rights-of-way and public and private easements for both onsite and offsite improvements. The Applicant shall prepare all necessary legal descriptions and deeds.

47. To the extent any offsite public improvements require the acquisition of property not currently owned by the Applicant or the City, the Applicant shall first make a good-faith effort to acquire the necessary property rights, however if the Applicant makes such an effort and is unable to acquire such rights, then the Applicant may request the City acquire the necessary property rights through the exercise of eminent domain provided that the Applicant enters first into an agreement with the City to pay for all costs incurred by the City to acquire such rights and if the City does not acquire the rights necessary to allow the offsite public improvements to be completed by the Applicant within statutory timeline provided by law, then the Applicant shall be relieved of the obligation to construct those off-site improvements only to the extent they require property not currently owned by the Applicant or the

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

City. The Applicant shall make a good-faith effort to identify and acquire the necessary property rights at the earliest opportunity.

48. The Applicant shall submit site Improvement Plans, prepared by a registered Civil Engineer, for review and approval by the City. The final plan set shall include all civil, landscape and joint trench drawings under a single cover sheet. No final grading or other construction shall be performed until the Improvement Plans have been approved. The Applicant shall not begin clearing, grubbing, or rough grading at the site prior to approval of the Improvement Plans, unless explicitly approved by the City of American Canyon through the standard grading and utilities only permit process. An Encroachment Permit is required for any work within City right of way. Encroachment Permits will not be issued prior to the approval of the Improvement Plans.

49. All public water service laterals or services (domestic, recycled and fire water) shall include approved backflow prevention devices.

50. Cathodic protection shall be provided for all water valves, fittings, hydrants, meters, backflow devices, ductile iron pipe, and other metal appurtenances, regardless of the findings of any soils corrosivity analysis.

51. The Applicant shall keep adjoining public and private streets free and clean of project dirt, mud, materials, and debris during the construction period in accordance with an approved SWPPP and Erosion and Sediment Control Plan using appropriate BMPs and as is found necessary by the City Engineer.

52. If any hazardous material is encountered during the construction of this project, all work shall be immediately stopped and the Fire Department, Napa County Department of Environmental Services or other designated agency, and the City Inspector shall be notified immediately. Work shall not proceed until clearance has been issued by all of these agencies.

53. Prior to final preparation of the subgrade and placement of base materials, all underground utilities shall be installed and service connections stubbed out behind the sidewalk. Public utilities, Cable TV, sanitary sewers, and water lines, shall be installed in a manner that will not disturb the street pavement, curb, gutter and sidewalk, when future service connections or extensions are made.

54. Where soil or geologic conditions encountered in grading operations are different from that anticipated in the soil and/or geologic investigation report, or where such conditions warrant changes to the recommendations contained in the original soil investigation, a revised soil or geologic report shall be submitted for approval by the City Engineer. Additionally, if field conditions warrant installation of any subdrains, the location, size and construction details must be provided to the City for review and approval prior to construction.

55. All new fire hydrants shall be covered with burlap sacks until the hydrants have been tested and found to be in conformance with City flow requirements. No storage of combustible materials or construction of building shall be permitted until all hydrants meet City flow requirements.

56. Prior to placing the final lift of asphalt, all public storm drain and sanitary sewer lines shall be video inspected at the Applicant's expense. All video media (CD, DVD, or portable hard drive) shall be submitted to the City. If any inadequacies are found, they shall be repaired prior to the placement of the final lift of asphalt.

57. All streets, curbs, gutters, sidewalks or other public facilities damaged in the course of construction associated with this Project shall be the responsibility of the Applicant and shall be repaired to the satisfaction of the City at the Applicant's expense.

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

58. After all of the new underground utilities within existing public streets have been installed, the entire affected areas shall be milled and repaved to present a neat finished pavement area. Multiple trench patches are not acceptable.

59. All construction stormwater pollution prevention best management practices (BMP's) shall be installed as the first order of work and in accordance with the *State Water Resources Control Board's General Construction Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order 2009-0009-DWQ, as amended)*, the Applicant's Storm Water Pollution Prevention Plan (SWPPP), and the City's Erosion and Sediment Control Plan in accordance with the City's MS4 Permit. All stormwater BMP's shall be maintained to the satisfaction of the Qualified SWPPP Developer (QSD), Qualified SWPPP Practitioner (QSP), and the City Engineer.

60. With the exception of water used for loading and testing of potable water lines, all construction water used for the project shall be obtained from a source other than American Canyon potable water sources. The Applicant shall provide verification that an outside source of construction water, e.g., recycled water, has been established and will be available for the duration of the project construction.

61. The development shall comply with the City's Zero Water Footprint policy.

62. All landscaping shall be designed to use recycled water for irrigation. Recycled water landscaping shall be designed to comply with California Code of Regulations Title 22 and shall include design details to prevent runoff of recycled water. The irrigation system shall include an ET/SMART controller.

Public Works Special Conditions of Approval

63. The Applicant shall submit Improvement Plans prepared by a registered Civil Engineer (Engineer of Record) in substantial conformance with the preliminary civil plans titled "SDG Commerce 217 Distribution Center Design Review & Conditional Use Permit Plans, prepared by RSA+, December 16, 2019 and last revised September 22, 2020 (Preliminary Plans), except as modified by these conditions.

64. Improvement Plans shall be tied to the State of California coordinate system.

65. As required by Mitigation Measure TRA-2 of the Initial Study for the SDG Commerce 217 Distribution Center Project, the Applicant shall construct all of the **Public Improvements** generally shown on the Preliminary Plans and more specifically described below.

    a. Class 1 Bicycle Path:
    A Portland cement concrete Class 1 bicycle path shall be constructed to fill in the approximately 800-foot gap in bike infrastructure between the cul-de-sac at the terminus of Commerce Court and the northwest corner of Eucalyptus Drive and Wetlands Edge Road. The concrete Class 1 bicycle path shall be 10 feet wide with a 2-foot wide unobstructed gravel shoulders on both sides and shall include associated signage, (3) street lights and irrigation sleeves for future irrigation and landscaping. The geotechnical report shall be updated to include design recommendations for this multi-use path.

66. The Applicant shall construct all of the on-site private water, recycled water, sewer storm drainage and storm quality **"Private Improvements"** generally shown on the Plans and more specifically described below. All private water, sewer, storm drainage and stormwater quality improvements shall be designed in accordance with the City of American Canyon Engineering Standard Plans and Specifications for Public Improvements (City Standards), except as specifically noted otherwise in these conditions.
    1) Sanitary Sewer Collection Facilities:

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

Sanitary sewer manholes shall be installed on both sewer laterals just upstream of the private sewer pump station. A sanitary sewer manhole shall be installed near the property line at the discharge point of the private 6" sanitary sewer force main.

2) Storm Drain Facilities:
Construct private on-site drainage facilities, detention facilities, and other appurtenances to collect and convey all surface drainage to an approved private storm drain facility or outfall. Onsite drainage facilities shall provide for the positive drainage of all adjacent upstream or upgrade properties to prevent ponding. Existing run-on from adjacent properties shall not be obstructed and shall be conveyed onsite. Off-site peak storm water discharge shall not exceed 90% of the undeveloped peak flow from the 24-hour, 100-year event. The storm drains and detention facilities shall be substantially consistent with the Preliminary Plans. However, the sizing of all storm drains and detention facilities shall be determined by the approved final drainage report.
The private storm drain system shall disperse the discharge in such a manner as to simulate the existing sheet flow conveyance. Calculations shall be provided for all spreaders to determine peak discharge velocities and depths for the 10-, 25- and 100-year events.
Stormwater Quality Facilities:
Permanent on-site private post-construction stormwater treatment BMPs shall be designed and constructed in accordance with the approved final SWCP. It is understood that minor revisions to the layout of the bio-retention facilities from what is shown on the Plans may be proposed during design and included in the final SWCP.

3) Recycled Water Services:
Separate recycled water services shall be provided for domestic non-potable uses and irrigation uses.

67. Prior to SUBMITTAL OF THE IMPROVEMENT PLANS, the Applicant shall:
    1) Submit the City's "Improvement Plan Checklist".
    2) Pay an initial cash deposit for City plan check services in amount to be determined by the City prior to the time of submittal. The Project engineer shall contact City staff to discuss submittal details to determine initial deposit amount.
    3) Provide the following:
        (1) Public Street Repair Plan
        (2) Utility Plan and Joint Trench Plan
        (3) Construction Storm Water Pollution Prevention Plan (SWPPP) and a City Erosion and Sediment Control Plan (ESCP)
        (4) Drainage Report
        (5) Post-Construction Stormwater Control Plan (SWCP)
        (6) Geotechnical Report
        (7) Construction Traffic Control Plan.
    4) Pothole and physically determine (by way of a survey performed by the Engineer of record) the actual horizontal location and vertical depth of all existing underground utilities throughout the proposed area of work and provide the design of all new utility installations required to serve the project including a schedule for implementation of such work as to prevent disrupting of utility service to adjacent properties.

68. Prior to APPROVAL OF THE IMPROVEMENT PLANS, the Applicant shall:
    1) Provide written acknowledgment by the Geotechnical Engineer of Record that the Plans incorporate all design and construction criteria specified in the Geotechnical Report.

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

2) Subject to the terms of Condition 10, furnish proof of the acquisition of all rights of entry and/or temporary and permanent easements necessary to construct the project and the location of all such rights on the Plans.
3) Furnish proof that all permits that may be required by the California Department of Fish & Game, State and Regional Water Quality Control Board, US Army Corps of Engineers and any other regulatory agencies with jurisdiction over the proposed construction have been obtained.
4) Complete and submit the City's Erosion and Sediment Control Plan (ESCP) Template. Applicant may refer to a SWPPP, as appropriate, by referencing page number within the SWPPP that addresses the requirements of the ESCP.
5) Submit a copy of the Notice of Intent and WDID# for coverage under the State Water Resources Control Board' General Construction Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order 2009-0009-DWQ).

69. Prior to COMMENCEMENT OF CONSTRUCTION ACTIVITIES, the Applicant shall:
    1) Pay off all current account balances with the City of American Canyon.
    2) Pay an inspection fee in amount to be determined at the time of commencement for the City's inspection of the Public Improvements.
    3) Conduct a pre-construction meeting with representatives of the City whereby the Applicant, the Legally Responsible Party (LRP), Qualified SWPPP Practitioner (QSP), Qualified SWPPP Developer (QSD), and/or the Contractor provides the following:
        (1) Six (6) full-size bond copies of the approved Improvement Plans for the City's use.
        (2) One (1) job-site copy of the latest edition of the City Standards for the Contractor use.
        (3) One (1) job-site copy of the SWPPP for use by the LRP, QSP, QSD, and Contractor.
        (4) Electronic copies of Improvement Plans and SWPPP

70. Prior to APPROVAL OF A BUILDING PERMIT, the Applicant shall:
    1) Pay all account balances and current City and American Canyon Fire District fees (Mitigation & Capacity) based on the rates in effect at the time of permit issuance. These fees include, but may not be limited to the following: Traffic Mitigation, General Plan Update, Civic Facilities, Fire District, Water Capacity, Zero Water Footprint Mitigation and Wastewater Capacity.

71. Prior to acceptance of improvements, the Applicant shall:
    1) Restore all adjacent off-site road surfaces to pre-project conditions.
    2) Submit a certification by the Geotechnical Engineer of Record that all the work has been completed in substantial conformance with the recommendations in Soils Investigation/Geotechnical Report.
    3) Provide a mylar and digital copy of the Improvement Plans that include all as-built or field changes, in digital Portable Document Format (.pdf) and AutoCAD (.dwg), compatible with the City's current Autocad version, and tied to the NAD83 (California Zone 2, feet) coordinate system.
    4) Provide a letter stating that all of the Developer's Conditions of Approval have been met.
    5) Provide a letter from the Civil Engineer of Record certifying that all the site improvements were constructed and inspected in substantial conformance with the approved plans and City Standards.

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

6) Enter into and record a post-construction Stormwater Operations and Maintenance Agreement with the City.

Mitigation Measures

The following are the applicable mitigation measures from the certified Mitigated Negative Declaration report. The following mitigation measures shall be complied with in accordance with the adopted Mitigation Monitoring and Reporting Program (MMRP) by the Planning Commission.

Biological Resources

72. ***Mitigation Measure BIO-1:*** A qualified western burrowing owl biologist shall conduct surveys in accordance with the California Department of Fish and Game (now CDFW) 2012 Staff Report on Burrowing Owl Mitigation survey methodology (see https://wildlife.ca.gov/Conservation/ Survey-Protocols#377281284-birds). Surveys shall encompass the project area and a sufficient buffer zone of approximately 200 to 500 feet depending on the neighboring terrain and vegetation as necessary to detect owls nearby that may be impacted by the project. Time lapses between surveys or project activities shall trigger subsequent surveys including but not limited to a final survey within 24 hours prior to ground disturbance before construction equipment mobilizes to the Project area. If no owls are found during these surveys, no further actions to protect burrowing owl would be necessary.

    1) If burrowing owls are detected on or adjacent to the site, the following restricted activity dates and setback distances recommended per CDFW's Staff Report (2012) shall be implemented, unless reduced buffers are accepted by CDFW in writing based on site specific conditions:
        i. From April 1 through October 15, low disturbance and medium disturbance activities shall have a 200-meter buffer while high disturbance activities shall have a 500-meter buffer from occupied nests and wintering sites.
        ii. From October 16 through March 31, low disturbance activities shall have a 50-meter buffer, medium disturbance activities shall have a 100-meter buffer, and high disturbance activities should have a 500-meter buffer from occupied nests and wintering sites.
        iii. No earth-moving activities or other disturbance should occur within the aforementioned buffer zones of occupied burrows. These buffer zones shall be marked with high visibility fencing or flagging.
    2) If a nesting season survey determines that a burrow or refugia on the project site is occupied by nesting burrowing owls, then compensatory mitigation in the form of a permanently protected, deed restricted set aside on open space land owned or obtained by the applicant shall be provided if such a protected area makes sense for protection of nesting owls. This permanently protected area would be recorded within 90 days after commencement of project construction. If burrowing owls are observed during surveys, notification shall also be submitted to the CNDDB.
    3) If the survey determines that a burrow or refugia on the project site is occupied by burrowing owls, then compensatory mitigation in the form of a permanently protected, deed restricted set aside on open space land owned or obtained by the applicant shall be provided if such a protected area makes sense for protection of nesting owls. This permanently protected area would be recorded before project construction. If burrowing owls are observed during surveys, notification shall also be submitted to the CNDDB.

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

73. ***Mitigation Measure BIO-2:*** If project activities must occur during the Swainson's hawk nesting season (i.e., typically March 1 through September 15), a qualified biologist (i.e., a biologist with at least two years' experience conducting surveys who has made Swainson's hawk detections) shall conduct pre-construction surveys for nesting Swainson's hawks within a half-mile radius around all project activities for at least two survey periods immediately prior to a project's initiation. The surveys shall be conducted in accordance with CDFW's "Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" (CDFG 2000), which identifies different survey windows throughout the pre-nesting and nesting season (ranging from January 1 through July 30/post-fledging) that have different survey methodologies and requirements.

    If Swainson's hawks are found to be nesting on the project site or within a 0.5-mile of the project site, the project proponent shall either, a) delay project activities until all Swainson's hawk nests within 0.5-mile of the Project site are no longer active, as determined by a qualified biologist, b) determine if the 0.5-mile buffer zone may be reduced in consultation with CDFW based on site specific conditions, or c) if take cannot be avoided, obtain a CESA Incidental Take Permit from CDFW prior to starting project activities.

74. ***Mitigation Measure BIO-3:*** To ensure that impacts to nesting raptors are avoided, the following mitigation measures shall be implemented:

    1) In order to avoid impacts to nesting raptors, a preconstruction nesting survey shall be conducted by a qualified biologist (i.e., a biologist with at least 2 years' experience conducting surveys for nesting raptors with detections) prior to commencing with earth-moving or construction work if this work would commence between February 1st and August 31st. The survey shall be conducted within 7 days prior to site disturbance. The raptor nesting surveys shall include examination of all trees and other suitable nesting structures/areas within 500 feet of the project site.

    2) If nesting raptors are identified during the surveys, a qualified biologist shall determine appropriate, species-specific no-disturbance buffers around all active nests. No-disturbance buffers shall be demarcated in the field with orange construction fencing or similar. If the tree or other nest site is located off the project site, then the buffer shall be demarcated per above where the buffer occurs on the project site. If nesting white-tailed kites are found during surveys, a suitable non-disturbance buffer shall be established by a qualified biologist (as defined above) but in no case shall the buffer be less than 200 feet. To ensure the no-disturbance buffers are adequate, a qualified biologist shall monitor the active nests within and adjacent to the project site daily for a minimum of one week and then weekly during construction. If the qualified biologist observes any nesting raptor displaying distress, the qualified biologist shall require that all project activities cease. In this event, the qualified biologist shall ensure proper measures are taken so that no harm comes to the nest/nesting attempt and all activities causing distress shall cease until the nesting attempt is completed as determined by a qualified biologist.

    3) If the preconstruction nesting survey identifies a large stick or other type of raptor nest that appears inactive at the time of the survey, but there are territorial raptors evident in the nest site vicinity, a protection buffer (as described above) shall be established around the potential nest site until the qualified biologist determines that the nest is not being used. In the absence of conclusive observations indicating the nest site is not being used, the buffer shall remain in place until a second follow-up nesting survey can be conducted to determine the status of the nest and eliminate the possibility that the nest is utilized by a

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

late-spring nesting raptor (for example, Cooper's hawk). This second survey shall be conducted even if construction has commenced. If during the follow-up late season nesting survey a nesting raptor is identified utilizing the nest, the protection buffer shall remain until it is determined by a qualified biologist that the nest is no longer active. If the nest remains inactive, the protection buffer can be removed and construction and earth-moving activities can proceed unrestrained.

75. ***Mitigation Measure BIO-4:*** To ensure that impacts to nesting passerine birds are avoided, a qualified biologist shall conduct a survey within 7 days prior to commencing construction/ grading or tree removal activities if this work would commence between February 1 and September 1. If common passerine birds or special-status passerine birds are identified nesting on or adjacent to the project site within 200 feet, a qualified biologist shall determine appropriate, species-specific no-disturbance buffers for all nests. The no-disturbance buffers shall be clearly demarcated in the field with orange construction fencing or similar, prior to the start of project activities. Disturbance within the buffer shall be postponed until a qualified biologist determines that the young have fledged and have attained sufficient flight skills to leave the area, and that the nesting cycle has otherwise completed. To ensure the no-disturbance buffers are adequate, a qualified biologist shall monitor the active nests within and adjacent to the project site on a daily basis for a minimum of one week and then weekly during construction. If the qualified biologist observes any nesting bird displaying distress, the qualified biologist shall have the authority to require that all project activities cease until the nesting distress has been ameliorated. In this event, the qualified biologist shall ensure proper measures are taken so that no harm comes to the nest/nesting attempt until the nesting attempt is completed as determined by a qualified biologist. These measures may include increasing the no-disturbance buffer, postponing specific construction activities causing the distress until the nesting attempt is completed, or other appropriate protect measures as determined in the field.

76. ***Mitigation Measure BIO-5:*** A qualified biologist (i.e., a biologist with at least 2 years' experience conducting surveys for western pond turtle detections) has prepared a wildlife exclusion plan for this project and has attached an exhibit of that fencing plan herein (please see attached Exhibit A). This wildlife exclusion fencing will be constructed of manufactured ERTEC wildlife exclusion fencing. This exclusion fencing shall be installed along the western perimeter of the project site returning back 50 feet to the north and 50 feet to the south preventing species from traveling from North Slough onto the project site during construction (see Exhibit A). A qualified biologist shall survey the project site and adjacent habitat within 72 hours of the start of project activities to determine if western pond turtle or their nests are present and guide the installation of the exclusion fence. If western pond turtles are discovered, a qualified biologist with experience handling and relocating the species shall move the species to the nearest suitable habitat outside of the project area and exclusion fencing. If western pond turtle nests are found, CDFW shall be notified prior to starting project activities, and the nest site plus a 50-foot buffer around the nest site shall be fenced with orange construction fence until eggs hatch and young turtles disperse to the adjacent North Slough. In addition, if nest(s) are located during surveys, moth balls (naphthalene) shall be sprinkled around the vicinity of the nest (no closer than 5 feet) to mask human scent and discourage predators. Grading within the nest site's 50-foot buffer area shall be delayed until the young leave the nest as determined by a qualified biologist. If the CDFW allows translocation of any nestling pond turtles this shall be completed by a qualified biologist under the direction of the CDFW.

Cultural Resources

77. ***Mitigation Measure CUL-1*:** Archaeological deposits are defined as any historic-era resource (e.g., bottle dump, refuse scatter) or prehistoric resource that my be intact and/or retain qualities that satisfy

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

criteria for eligibility for the California Register of Historical Resources. If potentially significant historic resources are encountered during subsurface excavation activities for the project area, all construction activities within a 100-foot radius of the resource shall cease until a qualified archaeologist determines whether the resource requires further study. The applicant shall include a standard inadvertent discovery clause in every construction contract to inform contractors of this requirement. Any previously undiscovered resources found during construction shall be recorded on appropriate California Department of Parks and Recreation (DPR) forms and evaluated for significance in terms of California Environmental Quality Act criteria by a qualified archaeologist. Potentially significant cultural resources consist of but are not limited to stone, bone, fossils, wood, or shell artifacts or features, including hearths, structural remains, or historic dumpsites.

If the resource is determined to be significant under CEQA (i.e., a "historical resource") the City and a qualified archaeologist shall determine whether preservation in place is feasible. Such preservation in place is the preferred mitigation. If such preservation is infeasible, the qualified archaeologist shall prepare and implement a research design and archaeological data recovery plan for the resource. The archaeologist shall also conduct appropriate technical analyses, prepare a comprehensive written report and file it with the appropriate information center (California Historical Resources Information System), and provide for the permanent curation of the recovered materials.

78. ***Mitigation Measure CUL-2*:** If previously unknown human remains are encountered during construction activities, Section 7050.5 of the California Health and Safety Code applies, and the following procedures shall be followed:

    In the event of an accidental discovery or recognition of any human remains, Public Resource Code Section 5097.98 must be followed. Once project-related ground disturbance begins and if there is accidental discovery of human remains, the following steps shall be taken:

    - There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the Napa County Coroner's Office is contacted to determine if the remains are Native American and if an investigation into cause of death is required. If the coroner determines the remains are Native American, the coroner shall contact the NAHC within 24 hours, and the NAHC shall identify the person or persons it believes to be the most likely descendant (MDL) of the deceased Native American. The MDL may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98

Geology, Soils, And Seismicity

79. ***Mitigation Measure GEO-1:*** The applicant shall comply with all of the site preparation and foundation/building design recommendations in the Krazan & Associates Geotechnical Engineering Investigation for the site (Krazan 2019). The applicant's geotechnical consultant shall review and approve all geotechnical aspects of the project construction and grading plans (i.e., site preparation and grading, site drainage improvements, and design parameters for foundations, retaining walls, street pavement, and driveway) to ensure that their recommendations have been properly incorporated. The results of the plan review shall be summarized by the applicant's geotechnical engineer in a letter to be submitted to the City Engineer and Building Official for review and approval prior to the issuance of grading, encroachment, and building permits.

80. ***Mitigation Measure GEO-2:*** Prior to issuance of building permits and site grading, the applicant/developer shall submit to the Public Works Department a Stormwater Pollution Prevention Plan

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

utilizing Best Management Practices to limit erosion and stormwater pollution during construction of the project. Because the project is constructed in phases, the project developer shall ensure that more permanent measures such as landscaping are used to prevent soil erosion. Measures would include but not be limited to:

- Hydroseeding and/or establishment of appropriate plant materials/landscaping
- Placement of straw wattles along slope contours and drainages
- Lining of drop inlets with filter fabric/geotextile
- Establishment of a single destination "wash-out" for construction subcontractors
- Use of siltation fences
- Use of sediment basins

81. ***Mitigation Measure GEO-3:*** The applicant shall comply with all recommendations in the Krazan & Associates Geotechnical Engineering Investigation for the site (Krazan 2019). Krazan recommends that the upper 30 inches of soils within the slab-on-grade foundation site and adjacent flatwork areas consist of non-expansive engineered fill. As an alternative to the use of non-expansive soils, the upper 30 inches of the supporting slab areas can consist of lime-treated clay soils (Krazan 2019).

Hydrology and Water Quality

82. ***Mitigation Measure HYD-1:*** Prior to the issuance of grading permits or building permits (whichever occurs first), the project applicant shall obtain coverage under the State Construction General Permit (NPDES General Permit for Stormwater Discharges Association with Construction Activity (Order 2009-0009 DWQ) by preparing a Stormwater Pollution Prevention Plan (SWPPP) and submitting it along with a notice of intent, to the San Francisco Bay RWQCB. The City of American Canyon shall confirm that the applicant has prepared a SWPPP and obtained coverage under the general permit prior to issuance of grading or building permits. The SWPPP shall identify a practical sequence for BMP implementation and maintenance, site restoration, contingency measures, responsible parties, and agency contacts. The SWPPP shall include but not be limited to the following elements:

- Temporary erosion control measures shall be employed for disturbed areas.
- No disturbed surfaces shall be left without erosion control measures in place during the winter and spring months. Cover disturbed areas with soil stabilizers, mulch, fiber rolls, or temporary vegetation.
- Sediment shall be retained on site by a system of sediment basins, traps, or other appropriate measures. Drop inlets shall be lined with filter fabric/geotextile.
- Discharge from the storm water system shall be diffused in such a way as to mimic existing overland flow conditions.
- The construction contractor shall prepare Standard Operating Procedures for the handling of hazardous materials on the construction site to eliminate or reduce discharge of materials to storm drains. This may include locating construction-related equipment and processes that contain or generate pollutants in a secure area, away from storm drains and gutters, and wetlands; parking, fueling, and cleaning all vehicles and equipment in the secure area;

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

designating concrete washout areas; and preventing or containing potential leakage or spilling from sanitary facilities.

- BMP performance and effectiveness shall be determined either by visual means where applicable (e.g., observation of above-normal sediment release), or by actual water sampling in cases where verification of contaminant reduction or elimination (such as inadvertent petroleum release) is required by the RWQCB to determine adequacy of the measure.

    - In the event of significant construction delays or delays in final landscape installation, native grasses or other appropriate vegetative cover shall be established on the construction site as soon as possible after disturbance, as an interim erosion control measure throughout the wet season.

83. ***Mitigation Measure HYD-2:*** Prior to the issuance of grading permits for the proposed project, the project applicant shall submit a Stormwater Control Plan to the City of American Canyon for review and approval. The Stormwater Control Plan shall identify pollution prevention measures and practices to prevent polluted runoff from leaving the project site. The plan shall be implemented to the satisfaction of the City of American Canyon prior to building occupancy.

84. ***Mitigation Measure HYD-3:*** Prior to issuance of grading permits for the proposed project, the project applicant shall submit a final drainage plan as prepared by a qualified civil engineer to the City of American Canyon for review and approval. The approved plan shall be incorporated into the project design and constructed to the satisfaction of the City.

85. ***Mitigation Measure HYD-4:*** The project sponsor (or successors-in-interest/owner) shall maintain in perpetuity the post-construction BMPs listed in the Stormwater Operations and Management Plan and agreed upon with the City of American Canyon. The owner shall make changes or modifications to the BMPs to ensure peak performance. The owner shall be responsible for costs incurred in operating, maintaining, repairing, and replacing the BMPs. The owner shall conduct inspection and maintenance activities and complete annual reports.

86. ***Mitigation Measure HYD-5:*** The detention basins shall be maintained on a regular basis by the project sponsor (or successors-in-interest). Inspections of the basins shall be conducted at least once a year between July 1st and September 1st. During the dry periods of the year when minor storm events are insufficient to fully transport sediment and debris, accumulations may occur in detention basins. Therefore, basin and storm water inlet maintenance shall be done prior to the rainy season and during other extended dry spells, which will reduce the concentration of sediment and debris that typically collects in the bottom of inlets during storms. An annual inspection and maintenance report shall be prepared by the property owner and submitted to the Public Works Director by October 15 of each year, at the property owner's expense.

Noise

87. ***Mitigation Measure NOISE-1:*** Construction activities shall be limited to daylight hours between 7:00 a.m. and 7:00 p.m., except for required nighttime construction for concrete pours onsite that would comply with the City of American Canyon's Noise limits for construction activities. All property owners within 300 feet of the site and all residents who have expressed concern over nighttime construction noise during the construction of the SDG Commerce 330 project, or otherwise have requested notification regarding project construction, also shall be notified by the applicant. The City shall be pre-notified of nighttime construction.

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

88. ***Mitigation Measure NOISE-2:*** All construction equipment shall use noise-reduction features (e.g., mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

Traffic and Transportation

89. ***Mitigation Measure TRA-1:*** Commerce Boulevard would meet the minimum PM peak hour volumes for installation of a separate right-turn lane with Existing Plus Project volumes (the proposed project would add to the existing warrant). Therefore, the applicant shall contribute its fair share to widening and/or re-striping northbound Commerce Boulevard at Green Island Road to include a separate right-turn lane and shared through/left-turn lane. Based on the proposed project's contribution to cumulative buildout volumes at the intersection, its "fair share" contribution towards this improvement would equal 2.7%.

90. ***Mitigation Measure TRA-2:*** The project shall construct a Class I bike path to fill in the gap in bike infrastructure between the cul-de-sac at the terminus of Commerce Court and the northeast corner of Eucalyptus Drive and Wetlands Edge Road, resulting in a continuous route connecting the residential areas to the south and the industrial land uses to the north.

Utilities and Service Systems

91. ***Mitigation Measure UTIL-1:*** The project applicant shall demonstrate compliance with the City's Zero Water Footprint Policy by mitigating all new potable water demands with "wet water" offsets by one or more of the following options to ensure the project results in a net zero increase in demand for potable water:

    - Reducing existing potable water demands onsite
    - Funding programs or constructing projects that would conserve an equivalent amount of water elsewhere within the water service area
    - Funding of and/or constructing projects that would Increase an equivalent amount of recycled water use elsewhere within the water service area where potable water is currently used and/or
    - Purchase new water supplies from other water providers

    The Applicant's agreement with the City's April 17, 2020 Will-Serve letter would assure compliance with these requirements.

92. ***Mitigation Measure UTIL-2:*** The project shall be designed and constructed with purple irrigation pipe so that reclaimed water may be used for landscape irrigation purposes. The project shall connect to existing recycled water pipelines for irrigation, toilets, and urinals prior to occupancy.

93. ***Mitigation Measure UTIL-3:*** Prior to issuance of a building permit, the applicant shall pay water capacity fees in accordance with the City's Municipal Code to provide funding for the City to acquire water resources and develop its treatment and distribution system. This will allow for the City to exercise additional options for potable water capacity and will also provide for maintenance of the recycled water system.

94. ***Mitigation Measure UTIL-4:*** Should additional project water used be required, the project shall comply with the City's Ordinances and regulations in effect at the time of authorization for additional

DocuSign Envelope ID: 87A33609-3DEE-4385-A9A2-F0288713358B

water use. In addition, such changes in project use would trigger a new City Discretionary Review process, which, in turn, would trigger re-evaluation of the project's water supply impacts.

95. ***Mitigation Measure UTIL-5:*** Prior to issuance of building permits, the project applicant shall submit landscaping plans to the City of American Canyon for review and approval demonstrating that landscaping will comply with the requirements in the City's Model Water Efficient Landscape Ordinance (AB 1881). The landscaping plan shall identify outdoor irrigation water conservation measures such as, but not limited to:

    - Drought-resistant vegetation
    - Irrigation systems employing the following features:
        - Drip irrigation
        - Low-precipitation-rate sprinklers
        - Bubbler/soaker systems
        - Programmable irrigation controllers with automatic rain shutoff sensors and flow sensing capabilities (ET Smart Controller)
        - Matched precipitation rate nozzles that maximize the uniformity of the water distribution characteristics of the irrigation system
        - Conservative sprinkler spacings that minimize overspray onto paved surfaces
        - Hydrozones that keep plants with similar water needs in the same irrigation zone
    - Minimally or gently sloped landscaped areas to minimize runoff and maximize infiltration
    - Organic topdressing mulch in non-turf areas to decrease evaporation and increase water retention

PASSED, APPROVED and **ADOPTED** at a regularly scheduled meeting of the Planning Commission of the City of American Canyon held on the 25th day of February, 2021, by the following vote:

AYES: Commissioners Altman, Goff, Wong, Vice Chair Mallare, Chair Navarro

GEOTECHNICAL ENGINEER:
Krazan & Associates, Inc.
4320 Orange Grove Avenue St E-F
Sacramento, CA 95841
916 564 2200

SCOPE OF WORK:

CONSTRUCT A NEW WINE STORAGE DISTRIBUTION CENTER ON AN APPROXIMATE 10.39 ACRE PARCEL ON COMMERCE COURT. THE DEVELOPMENT INCLUDES 21 LOADING DOCKS, 3 GRADE LEVEL OVERHEAD DOORS, AND PROVISIONS FOR FUTURE OFFICES SPACES. INTERIOR WILL INCLUDE WAREHOUSE LIGHTING AND REFRIGERATION.

THIS DEVELOPMENT INCLUDES WAIVER FOR A 60' YARD, CALIFORNIA BUILDING CODE SECTION 507, AT THE SOUTHERN PROPERTY LINE.

NOTES

1. CONTRACTOR SHALL UTILIZE A CONSTRUCTION WASTE MANAGEMENT PLAN (CWM) IN ACCORDANCE WITH CALGREEN SECTION 5.408, OF RECYCLING OR REUSE OF 65% OF NON HAZARDOUS DEMOLITION WASTE.
2. CONTRACTOR SHALL CONTROL POLLUTANTS DURING CONSTRUCTION IN ACCORDANCE WITH CALGREEN SECTION 5.504. PROVIDE PROTECTION TO DUCT OPENINGS AND MECHANICAL EQUIPMENT, COMPLY WITH AIR POLLUTION CONTROL MEASURES AND VOC LIMIT FOR ALL FINISH MATERIALS, ADHESIVES, SEALANTS AND CAULKS.
3. THE BUILDING SHALL BE EQUIPPED WITH AN ESFR FIRE SPRINKLER SYSTEM.
4. MONUMENT SIGN REQUIRES SEPARATE PERMIT.
5. RETAINING WALLS OVER 4 FEET IN HEIGHT REQUIRE A PERMIT.

Sacramento, CA 95841
916 564 2200

SCOPE OF WORK:

CONSTRUCT A NEW WINE STORAGE DISTRIBUTION CENTER ON AN APPROXIMATE 10.39 ACRE PARCEL ON COMMERCE COURT. THE DEVELOPMENT INCLUDES 21 LOADING DOCKS, 3 GRADE LEVEL OVERHEAD DOORS, AND PROVISIONS FOR FUTURE OFFICES SPACES. INTERIOR WILL INCLUDE WAREHOUSE LIGHTING AND REFRIGERATION.

THIS DEVELOPMENT INCLUDES WAIVER FOR A 60' YARD, CALIFORNIA BUILDING CODE SECTION 507, AT THE SOUTHERN PROPERTY LINE.

NOTES

1. CONTRACTOR SHALL UTILIZE A CONSTRUCTION WASTE MANAGEMENT PLAN (CWM) IN ACCORDANCE WITH CALGREEN SECTION 5.408, OF RECYCLING OR REUSE OF 65% OF NON HAZARDOUS DEMOLITION WASTE.
2. CONTRACTOR SHALL CONTROL POLLUTANTS DURING CONSTRUCTION IN ACCORDANCE WITH CALGREEN SECTION 5.504. PROVIDE PROTECTION TO DUCT OPENINGS AND MECHANICAL EQUIPMENT, COMPLY WITH AIR POLLUTION CONTROL MEASURES AND VOC LIMIT FOR ALL FINISH MATERIALS, ADHESIVES, SEALANTS AND CAULKS.
3. THE BUILDING SHALL BE EQUIPPED WITH AN ESFR FIRE SPRINKLER SYSTEM.
4. MONUMENT SIGN REQUIRES SEPARATE PERMIT.
5. RETAINING WALLS OVER 4 FEET IN HEIGHT REQUIRE A PERMIT.

_____
Approved: _____

Appeal Form *please print or type*

Project or application name: SDG Commerce 217 Distribution Center (PL20-0008)

Project or application address or APN(s): 1075 Commerce Court (Assessor Parcel Number 058-030-065)

Appellant name: LIUNA Local No. 324 Appellant address: 611 Berrellesa St

City, state, zip: Martinez, CA 94553 Phone no.: 510-836-4200 x. 1 Fax no.: _____

Bus License #: _____

Appellant representative: Michael Lozeau, Lozeau Drury LLP Representative address: 1939 Harrison Street, Suite 150

City, state, zip: Oakland, CA 94612 Phone no.: 510-836-4200 Fax no.: _____

Bus License #: _____

Type of appeal:

☐ Appeal of Staff administrative decision Date of decision: _____

☑ Appeal of Planning Commission decision Date of decision: February 25, 2021

Description of matter appealed:

☑ Approval of project or application

☐ Denial of project or application

☐ Conditions of project approval – number(s) _____

☐ Other _____

The grounds upon which this appeal is filed are (list all grounds relied upon in making this appeal; please attach additional sheets if more space is needed):

There is substantial evidence of fair arguments that the Project may have significant impacts from increases in vehicle miles travelled, significant wildlife impacts, air quality, GHG, and health risk impacts requiring the preparation of an EIR for the project. The MND also is not supported by substantial evidence. Each of these issues were raised in the comments submitted to the Planning Commission and attached hereto.

The specific action which the appellant wants the City Manager, Planning Commission or City Council to take is:

LIUNA requests the City Council rescind the approval of the project and its associated MND and require the preparation of a new MND that fully mitigates the Project's potential impacts or preparation of an EIR.

Appellant's Signature [redacted] Date: March 5, 2021

Representative's Signature [redacted] Date: March 5, 2021

Re: SDG Commerce 217 Distribution Center (PL20-0008) - Mitigated Negative Declaration (February 25, 2021 Planning Commission Meeting, Agenda Item No. 5.2

Dear Commissioners and Mr. He:

Please accept this brief comment on behalf of Laborers International Union of North America, Local 324 ("LIUNA") and its members living and working in and around the City of American Canyon regarding the Draft Initial Study and Mitigated Negative Declaration ("MND") prepared for the proposed SDG Commerce 217 Distribution Center Project (the "Project"). Thank you for the responses prepared to our earlier comments submitted to the Commission on January 17, 2021.

We appreciate the acknowledgement in the responses that the original VMT analysis was incorrect and employed bike trip lengths that could not be substantiated in fact or based on any effort to gather information on bike commuting in general or in the American Canyon area. It appears, however, that the City's consultant, in responding to those obvious shortcomings, has now embellished its VMT mitigation analysis with numerous other unsubstantiated claims and speculation. Rather than an objective analysis of the actual incremental VMT reductions that will

result from an 800-foot stretch of bike lane connecting two existing bike lanes, the effort seeks, without evidentiary basis, to achieve a desired outcome. The notion that an 800-foot connecting bike lane will, by itself, induce 96 new bike commuters to commute to jobs to the north of the Project and reduce VMTs by 1004 is farfetched. The only way the consultant generates such a number is by ignoring the terms of the federal guidance it claims to be applying, blatantly attempting to assign benefits of other parties' bike lane construction efforts to the applicant, and making believe that, without the connector bike lane, bike commuters from the neighborhood south of the Project heading north must ride on the shoulder of State Route 29. All of these efforts to invent a justification for not requiring sufficient VMT reductions to mitigate the Project's increases in VMT are not supported by the cited guidance or facts. These supplemental comments highlight this continued concern and the remaining fair argument that the Project may have significant environmental impacts from its unmitigated increase in VMTs.

1. GHD's analysis is inconsistent with the NCHRP guidelines it cites.

GHD claims to base its analysis of VMT reductions attributable to the bike lane connector on National Cooperative Highway Research Program Report 552, "Guidelines for Analysis of Investment in Bicycle Facilities." ("NCHRP Report"). The method set forth in the NCHRP Report for estimating induced bike commutes from a new bike facility relies on bike commuters from three buffer distances from a bike facility who would most likely use the facility. (NCHRP Report, p. 38.) These three buffers are less than 400 meters, 400 to 799 meters and 800 to 1599 meters. (*Id*., pp. 38, Appendix B, B-6.) As the NCHRP Report explains:

> Research for this project uncovered that people are more likely to ride a bicycle if they live within 1,600 m (1 mi) of a facility than if they live outside that distance (Appendix B). The likelihood of bicycling increases even more at 800 m and 400 m. The team therefore estimates existing and induced demand using 400-, 800-, and 1600-m buffers around a facility.

(*Id*.) The analysis identifies the population within each of those buffer areas and estimates the number of bike commuters in each buffer using the project region's "bicycle commute share." (*Id*.) The analysis also provides a method to calculate the total adult cyclists in the buffer areas. (*Id*.) The NCHRP Report developed "likelihood multipliers" for each of the three buffer zones to account for the fact that "people who live near a facility are more likely to bike than those that do not…." *Id*., pp. 38-39. A different likelihood multiplier is provided for each of the three NCHRP buffer zones.

Rather than abide by the NCHRP Report's methodology, GHD took the liberty of adding a buffer zone beyond 1600 meters – from 1600 to 2400 meters from the proposed bike lane. (Agenda Packet ("AP"), pp. 302-303.) Substantial evidence includes "facts, reasonable assumptions predicated upon facts, and ***expert opinion supported by facts***." (CEQA Guidelines, § 15384(b) (emphasis added).) Because there is no justification based on the NCHRP Report to inflate induced bike commuter use by randomly expanding the buffers to include people living 1600 to 2400 meters away from a proposed bike lane, GHD's analysis is not based on substantial evidence.

The inconsistencies of GHD's analysis with the NCHRP Report do not however end there. In its analysis, GHD does not include the closest buffer zone identified in the NCHRP Report – 0 – 400 meters. Instead, it uses a 0 – 799 meter buffer, an 800 to 1599 meter buffer and its third made-up buffer from 1600 meters to 2400 meters. However, in calculating how many of the residents in each of these areas are induced to use the new bike lane, GHD then applies the NCHRP's "likelihood multipliers" for the original NCHRP buffer distances. GHD references the likelihood multipliers "[e]stablished by NCHRP 552 research; see Appendix B." AP, p. 304. However, the NCHRP Report and its Appendix B do not establish a likelihood multiplier for GHD's newly minted buffer zone from 1600 to 2400 meters from a facility. So, GHD could not have been applying a number from the NCHRP Report to that area. GHD does not explain which likelihood multipliers it applied to the three zones it selected. If GHD applied the three multipliers calculated by NCHRP for the 400, 800 and 1600 buffer zones to GHD's 800, 1600, and 2400 buffer zones, there would be no evidentiary basis for GHD's new, induced bike commuter computation. In any event, GHD provides no evidence supporting its application of a multiplier factor for the fictitious buffer it seeks to add surreptitiously to the NCHRP Report's methodology. GHD also does not provide evidence of which likelihood multipliers it applied to the 800 meter and 1600 meter zones in its analysis. Without this evidence, the analysis is not substantial evidence.

2. GHD's effort to credit the Project with mitigation for the already completed Bay Trail bike facility adjacent to Wetlands Edge Road is entirely arbitrary and is not supported by evidence that the bike lane gap along 800-feet of Commerce Court is "non-traversable."

GHD further attempts to inflate the VMTs attributable to the proposed 800 feet bike lane by claiming the VMT analysis should include all bike commuters induced by the 1.7 miles of Bay Trail bike access that was constructed along the western side of Wetlands Edge Road many years ago. (AP, pp. 290, 302.) According to GHD, the 800-feet stretch of Commerce Boulevard where it proposes to add bike lanes currently blocks or limits would-be bike commuters heading north from using the Bay Trail bike lanes to the west of Wetlands Edge Road.

First, there is no evidence that the 800-feet stretch of Commerce Boulevard currently blocks or will block any bike commuters from heading north towards the businesses clustered at the north end of Commerce Boulevard or even further north. The MND does not describe in any way the current condition of that road or, more importantly, the condition that will exist upon the completion of the Napa Junction Elementary School project at the corner of Commerce Boulevard and Eucalyptus. The elementary school is scheduled for occupancy this fall. (AP, p. 101.) Construction of the SDG Warehouse project is expected to be ongoing after the school is completed and open. (*Id*., p. 124.)

The school project includes reconstructing Commerce Boulevard alongside the school property. (*See* Napa Junction Elementary School Replacement Project Draft Environmental Impact Report, p. 10-28 [available at https://drive.google.com/open?id=13Ny2i9F6u2R6NFJBqlifGoNeUqaUoqTk]; *see also id*., p.

10-29 ("the proposed project would improve the roadway with asphalt concrete pavement and sidewalk"); Figures 3-5, 3-15 and 3-16 (plans showing bike lanes on Commerce Blvd.) Despite this brand new roadway running from Eucalyptus Avenue north to the existing SDG Commerce 330, GHD contends that this stretch of Commerce Boulevard is a "'non -traversable' gap between the residential areas of American Canyon and the employment centers north that precludes viable bicycle commuting choices." (AP, p. 287.) Only from this premise does GHD then claim that bike commuters cannot get through this stretch of Commerce Boulevard and must instead head to State Route 29 "since the only connection to employment destinations north of Eucalyptus today is along the shoulders of SR 29 – a route navigable the only the most experienced and fearless riders." (AP, p. 302.) Contrary to GHD's assertions, a newly constructed stretch of Commerce Boulevard adjacent to the elementary school does not pose any barrier to bike commuters to travel between Eucalyptus Avenue and the bike path across from SDG Commerce 330. As a result, GHD's and the final MND's assertions that the proposed new bike lanes will unlock additional potential from the 1.7 miles of existing bikeway along Wetlands Edge Road is not supported by any substantial evidence. Well before the Project is completed, any commuting biker will be able to peddle unobstructed along the brand-new stretch of Commerce Boulevard whether the new bikeway is constructed or not.

Even if the stretch of Commerce Boulevard adjacent to the new elementary school did pose some limited impediment to bikers that required them to slow down for 800 feet does not justify GHD's random proposal to attribute half of the VMT reductions of an already completed 1.7 mile bikeway to the Project. This blatant effort to inflate the VMT benefits of the Project's proposed 800-foot bike lane has no basis in fact and is not a mitigation measure attributable to the Project.

Applying the NCHRP buffer zones that are actually included in that methodology (800 and 1600 meters) and the actual length of the bike facility proposed by the Project (800 feet), and assuming the rest of GHD's calculations are correct, the number of new bike commuters induced by the 800-foot bike lane is at most 22 cyclists. Assuming GHD's estimate of bike commute distance is reasonable, that amounts to, at most, a VMT reduction of 229 VMTs. As a result, substantial evidence of a fair argument exists that the Project's VMT increases may have a significant environmental impact.

3. GHD's estimate of commuter bike trip lengths does not eliminate the substantial evidence of a fair argument that average bike commute lengths in California are 1.5 miles as published by the California Air Resources Board.

GHD relies on a study of Portland, Oregon to borrow an estimated bike commute length for American Canyon. (AP, p. 290, citing "Understanding and Measuring Bicycling Behavior: a Focus on Travel Time and Route Choice", Oregon Transportation Research and Education Consortium, OTREC -RR -08 -03, December 2008.) GHD provides no rationale in its report why Portland bicycle commute lengths would be representative of American Canyon bicycle commute lengths. This is despite a CARB approved distance of 1.5 miles for bike trips used to calculate VMT reductions from bikeways. (AP, p. 684.) There is no substantial evidence to support the use of bike commute distances from a highly urbanized area like Portland versus a

more rural/suburban setting such as American Canyon. Using 1.5 miles as the lower end of a bike commute distance estimates yields a mere 33 VMT reduction form the 800-feet bike lane.

4. The inclusion of the new VMT calculations and efforts to justify the limited bike lane mitigation require the City to recirculate the MND for public review and comment.

The law is well-established that even if an EIR is not required, a revised negative declaration must be circulated for full public review if it adds new mitigation measures or identifies new impacts. *Gentry v. Murrieta*, 36 Cal.App.4th 1359, 1392, 1411, 1417. The MND's substantial 'changes to its VMT analysis and new mitigation proposals based on the so-called non-traversability of Commerce Boulevard are significant changes to the MND that should be recirculated to the public for review and comment.

Despite the responses to our earlier comments, substantial evidence of a fair argument still exists in the record that the Project may have significant health risks and impacts on wildlife. For all of these reasons and those discussed in our prior comment, the MND is inadequate and an EIR is required to analyze and mitigate the Project's potentially significant environmental impacts. Thank you for your attention to these supplemental comments.

Sincerely,

Michael Lozeau

Re: SDG Commerce 217 Distribution Center (PL20-0008) - Mitigated Negative Declaration

Dear Mr. He:

I am writing on behalf of Laborers International Union of North America, Local 324 ("LIUNA") and its members living and working in and around the City of American Canyon regarding the Draft Initial Study and Mitigated Negative Declaration ("MND") prepared for the proposed SDG Commerce 217 Distribution Center Project (the "Project").

After reviewing the MND prepared for the Project along with our experts, we believe there is a fair argument that the Project may have significant adverse environmental impacts and that an environmental impact report ("EIR") should therefore be prepared pursuant to the California Environmental Quality Act ("CEQA"), Public Resources Code §§ 21000, et seq.

LIUNA submits herewith the expert comments of wildlife ecologist Dr. Shawn Smallwood. Dr. Smallwood's expert comments and resume are attached hereto as Exhibit A. LIUNA also submits herewith comments on the Project's air and greenhouse gas emissions from the environmental consulting firm Soil/Water/Air Protection Enterprise ("SWAPE"). SWAPE's comments and the resumes of their consultants are attached hereto as Exhibit B.

PROJECT DESCRIPTION

The Project proposes to issue a conditional use permit to construct and operate a 217,294 square foot wine distribution center on a 10.39-acre parcel in close proximity to the Napa River and an area identified by the Audubon Society as an "Important Bird Area." In addition to the 10.39 acre building site, the Project also involves excavation and operation of a borrow area

covering most of the adjacent 10.17 acre parcel immediately to the south of the building site. The proposed building would be bordered by 134 parking stalls on the north edge of the building parcel and 21 truck docking bays on the north side of the proposed building. The building would be heavily insulated and refrigerated. Grading and filling will occur throughout the Project site as well as most of the adjacent borrow area parcel. During construction, about 17,000 cubic yards of stockpiled soil will be transported and another 21,000 cubic yards of soil will be excavated from the adjacent site. Construction of the project would be done in a single phase lasting approximately 9.5 months. Types of heavy diesel equipment to be used to construct the facility will include a self-loading dirt scraper, bulldozer, motor grader, compactor, roller, water truck, backhoe, excavator, trencher, drilling auger, front end loader, paving machine, laser screed, concrete finishing trowels, tractor, crane, forklift, generator, man lift, scissor lift, welding machine, and light tower. Operation of the Project is estimated to generate a total of 367 daily project trips and, prior to mitigation, increase the daily vehicle miles travelled ("VMT") in the area by 2,355 VMT. The closest residence is about 500 feet from the Project's borrow area.

LEGAL STANDARDS

As the California Supreme Court held, "[i]f no EIR has been prepared for a nonexempt project, but substantial evidence in the record supports a fair argument that the project may result in significant adverse impacts, the proper remedy is to order preparation of an EIR." (*Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 319-320 ["*CBE v. SCAQMD*"], citing, *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.3d 68, 75, 88; *Brentwood Assn. for No Drilling, Inc. v. City of Los Angeles* (1982) 134 Cal.App.3d 491, 504–505.) "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." (*Communities for a Better Environment v. Calif. Resources Agency* (2002) 103 Cal.App.4th 98, 109 ["*CBE v. CRA*"].)

The EIR is the very heart of CEQA. (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1214; *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, 927.) The EIR is an "environmental 'alarm bell' whose purpose is to alert the public and its responsible officials to environmental changes before they have reached the ecological points of no return." (*Bakersfield Citizens,* 124 Cal.App.4th at 1220.) The EIR also functions as a "document of accountability," intended to "demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action." (*Laurel Heights Improvements Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 392.) The EIR process "protects not only the environment but also informed self-government." (*Pocket Protectors,* 124 Cal.App.4th at 927.)

An EIR is required if "there is substantial evidence, in light of the whole record before the lead agency, that the project may have a significant effect on the environment." (Pub. Resources Code, § 21080(d); see also *Pocket Protectors,* 124 Cal.App.4th at 927.) In limited circumstances, an agency may avoid preparing an EIR by issuing a negative declaration, a written statement briefly indicating that a project will have no significant impact thus requiring no EIR (14 Cal. Code Regs., § 15371 ["CEQA Guidelines"]), only if there is not even a "fair

argument" that the project will have a significant environmental effect. (Pub. Resources Code, §§ 21100, 21064.) Since "[t]he adoption of a negative declaration . . . has a terminal effect on the environmental review process," by allowing the agency "to dispense with the duty [to prepare an EIR]," negative declarations are allowed only in cases where "the proposed project will not affect the environment at all." (*Citizens of Lake Murray v. San Diego* (1989) 129 Cal.App.3d 436, 440.)

Where an initial study shows that the project may have a significant effect on the environment, a mitigated negative declaration may be appropriate. However, a mitigated negative declaration is proper *only* if the project revisions would avoid or mitigate the potentially significant effects identified in the initial study "to a point where clearly no significant effect on the environment would occur, and…there is no substantial evidence in light of the whole record before the public agency that the project, as revised, may have a significant effect on the environment." (Public Resources Code §§ 21064.5 and 21080(c)(2); *Mejia v. City of Los Angeles* (2005) 130 Cal.App.4th 322, 331.) In that context, "may" means a *reasonable possibility* of a significant effect on the environment. (Pub. Resources Code, §§ 21082.2(a), 21100, 21151(a); *Pocket Protectors,* 124 Cal.App.4th at 927; *League for Protection of Oakland's etc. Historic Resources v. City of Oakland* (1997) 52 Cal.App.4th 896, 904–905.)

Under the "fair argument" standard, an EIR is required if any substantial evidence in the record indicates that a project may have an adverse environmental effect—even if contrary evidence exists to support the agency's decision. (CEQA Guidelines, § 15064(f)(1); *Pocket Protectors,* 124 Cal.App.4th at 931; *Stanislaus Audubon Society v. County of Stanislaus* (1995) 33 Cal.App.4th 144, 150-15; *Quail Botanical Gardens Found., Inc. v. City of Encinitas* (1994) 29 Cal.App.4th 1597, 1602.) The "fair argument" standard creates a "low threshold" favoring environmental review through an EIR rather than through issuance of negative declarations or notices of exemption from CEQA. (*Pocket Protectors, supra,* 124 Cal.App.4th at 928.)

The "fair argument" standard is virtually the opposite of the typical deferential standard accorded to agencies. As a leading CEQA treatise explains:

> This 'fair argument' standard is very different from the standard normally followed by public agencies in making administrative determinations. Ordinarily, public agencies weigh the evidence in the record before them and reach a decision based on a preponderance of the evidence. [Citations]. The fair argument standard, by contrast, prevents the lead agency from weighing competing evidence to determine who has a better argument concerning the likelihood or extent of a potential environmental impact. The lead agency's decision is thus largely legal rather than factual; it does not resolve conflicts in the evidence but determines only whether substantial evidence exists in the record to support the prescribed fair argument.

(Kostka & Zishcke, *Practice Under CEQA,* §6.29, pp. 273-274.) The Courts have explained that "it is a question of law, not fact, whether a fair argument exists, and the courts owe no deference to the lead agency's determination. Review is de novo, with a ***preference for resolving doubts in favor of environmental review***." (*Pocket Protectors,* 124 Cal.App.4th at 928 [emphasis in

original].)

As a matter of law, "substantial evidence includes . . . expert opinion." (Pub. Resources Code, § 21080(e)(1); CEQA Guidelines, § 15064(f)(5).) CEQA Guidelines demand that where experts have presented conflicting evidence on the extent of the environmental effects of a project, the agency must consider the environmental effects to be significant and prepare an EIR. (CEQA Guidelines § 15064(f)(5); Pub. Res. Code § 21080(e)(1); *Pocket Protectors*,124 Cal.App.4th at 935.) "Significant environmental effect" is defined very broadly as "a substantial or potentially substantial adverse change in the environment." (Pub. Resources Code, § 21068; see also CEQA Guidelines, § 15382.) An effect on the environment need not be "momentous" to meet the CEQA test for significance; it is enough that the impacts are "not trivial." (*No Oil, Inc.*, 13 Cal.3d at 83.) In *Pocket Protectors*, the court explained how expert opinion is considered. The Court limited agencies and courts to weighing the admissibility of the evidence. (*Pocket Protectors*, 124 Cal.App.4th at 935.) In the context of reviewing a negative declaration, "neither the lead agency nor a court may 'weigh' conflicting substantial evidence to determine whether an EIR must be prepared in the first instance." (*Id*.) Where a disagreement arises regarding the validity of a negative declaration, the courts require an EIR. As the Court explained, "[i]t is the function of an EIR, not a negative declaration, to resolve conflicting claims, based on substantial evidence, as to the environmental effects of a project." (*Id*.)

CEQA requires that an environmental document include a description of the project's environmental setting or "baseline." (CEQA Guidelines, § 15063(d)(2).) The CEQA "baseline" is the set of environmental conditions against which to compare a project's anticipated impacts. (*CBE v. SCAQMD*, 48 Cal.4th at 321.) CEQA Guidelines section 15125(a) states, in pertinent part, that a lead agency's environmental review under CEQA:

> …must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time [environmental analysis] is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant.

(See, *Save Our Peninsula Committee v. County of Monterey* (2001) 87 Cal.App.4th 99, 124-125 ["*Save Our Peninsula*"].)

A threshold of significance may be useful to determine whether an environmental impact normally should be considered significant. (CEQA Guidelines, § 15064.7(a).) "A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant." (*CBE v. California Resources* Agency, 103 Cal.App.4th at 111.)

"A threshold of significance is not conclusive, however, and does not relieve a public agency of the duty to consider the evidence under the fair argument standard." (*Mejia v. City of*

Los Angeles (2005) 130 Cal.App.4th 322, 342; see also *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1109; *CBE v. California Resources Agency*, 103 Cal.App.4th at 110-114; CEQA Guidelines, § 15064(b).) A public agency cannot, as the City does here, apply a threshold of significance or regulatory standard "in a way that forecloses the consideration of any other substantial evidence showing there may be a significant effect." (*CBE v. California Resources Agency*, 103 Cal.App.4th at 114.)

ANALYSIS

I. There is a Fair Argument That the Project May Have Significant Traffic and GHG Impacts Because the Purported Mitigation Measure for VMT is Not Supported by Substantial Evidence and Defies Common Sense.

The MND's analysis of the Project's VMT impacts is not based on substantial evidence because it relies upon entirely unrealistic assumptions about the distance a bike commuter would ride to and from work. The MND would have one believe that by constructing a 300 feet long Tier 1 bike lane down the street from the Project, 32 commuters would no longer drive an average of 34.6 miles to and from work, but would instead ***bike 34.6 miles*** to and from work. (MND, Appendix, GHD Draft Technical Memorandum, p. 6 (Nov. 19, 2020) ("VMT Memo").

The MND identifies a threshold of significance for assessing a Project's VMT-related impacts of requiring a 15 percent reduction in VMT for the Project "compared with current regional VMT generation for similar uses." (MND, p. 91.) Relying on an analysis conducted by GHD, the MND identifies that the "[c]ountywide average daily VMTs for employees and visitors are 11.7 and 31.3 miles, with an average of 17.4 daily VMT." (*Id*.) Based on these numbers, the MND states that the "average daily project trip length has been calculated to be 17.3 miles, with a total daily 2,355 VMT." (*Id*.) The MND identifies a baseline threshold of 1,354 VMT as the VMT level that is 15 percent less than the County's average VMT. (VMT Memo, p. 4.). Thus, in order to be consistent with the 15 percent reduction from the average VMT threshold, the MND states that the Project must reduce its estimated VMT of 2,355 by 1,001 VMT. (*Id*.)

GHD then recommends a single measure purporting to achieve this dramatic reduction in the Project's estimated VMT. GHD and the MND state that extending by a mere 300 feet the Class I bike path on Commerce Court, which currently runs past the existing SDG Commerce 330 warehouse, to connect to the northern driveway of the elementary school under construction would reduce the Project's VMT by 1,119 VMT. (*Id*., p. 6.) GHD's rationale for this assertion is based, in part, on an estimate of the number of new bike commuters that would be added to the City's bike network by the addition of the 300-foot connector lane. GHD estimates the new lane would entice 32 new bike commuters. (*Id*., p. 18.) GHD then claims that these 32 new bike commuters would take the place of 32 car commuters who otherwise would each have driven 34.6 miles to and from work. (*Id*.)

Assuming GHD's estimate of 32 new commuters biking to work as a result of constructing the 300-feet bike lane is correct, the car trip lengths that GHD claims those users' bike trips would replace are preposterous. There is no evidence that the new bike commuters

who would be enticed onto their bikes by the new 300-feet of bike lane would include any car commuter who currently travels 17.3 miles to and from their work. The 17.3 mile figure applied by GHD has nothing to do with the average length of bike commuter trips. Instead, that number is the average trip length for commuters traveling by ***automobile*** calculated for the project area. (*Id*., p. 4.)

The average length of a bike commuter trip is much lower than the average length of a commute by car. The California Air Resources Board ("CARB") has published a quantification methodology to estimate VMT reductions associated with bike facilities. (CARB, Quantification Methodology (Nov. 1, 2019) (attached as Exhibit C).) Equation 22 of that guidance provides a formula for estimating "VMT Reductions for Bicycle Facility or Walkway." (Id., p. 18.) GHD completely ignores this guidance in its analysis. Putting that aside, CARB's factors include its expert determination of the average bike trip length to be used in a VMT reduction calculation. CARB pins the "[a]verage length of auto trip replaced" at "1.5 miles for cycling." (*Id*. *See also* ITS Report, p. 5. *See id.*, p. 7 ("The trip length factor, L, is based on the average length of bicycle trips taken for any purpose, using the default 1.5-mile average from most recent California Household Travel Survey data") (attached as Exhibit D).)

Even assuming GHD's overly simplistic equation is otherwise correct, applying CARB's 1.5 mile average of auto trip replaced by a bike trip dramatically reduces the MND's inflated VMT reduction claim. Based on a realistic trip length for bicycles that would use the 300-feet lane, and according to GHD's truncated equation, the new 300-feet bike lane would only reduce VMT by 97.5 VMT (65 daily commute trips by new bike commuters x 1.5 bicycle trip length). Thus, GHD's claim that the 300-foot length of bike lane would miraculously remove 1,119 VMTs from Commerce Court is entirely without basis in evidence or common sense. Instead, that modest bike facility would only remove about 97.5 VMT, leaving the Project over 900 VMT short of the 15 percent reduction from the County average necessary to eliminate the Project's significant transportation impacts. As a result, the MND is inconsistent with the CEQA Guidelines, 14 Cal.Admin Code § 15064.3 which requires that "[a]ny assumptions used to estimate vehicle miles traveled and any revisions to model outputs should be documented and explained in the environmental document prepared for the project." Moreover, there is a fair argument that the Project may have significant transportation impacts requiring the preparation of a full EIR.

II. An EIR is Required because the Project will have Significant Impacts on Biological Resources.

A. THE MND Fails to Adequately Analyze Impacts to Biological Resources Because It Relies Upon an Incomplete Baseline and the Project May Have Adverse Impacts on Numerous Sensitive Species Currently Using the Site or Adjacent Areas.

On January 23, 2019 and January 5, 2021, Dr. Shawn Smallwood visited the site. (Smallwood Comments, p. 1.) His first-hand observations of wildlife at the site as well as his review of reliable bird sightings reported on eBird demonstrate that the MND relies upon a

truncated list of species present at the site and fails to address impacts on numerous sensitive species that currently use the site. Dr. Smallwood's observations and expert comments are substantial evidence that the Project may have significant biological impacts, including adverse impacts on bald eagles, northern harriers, peregrine falcons, Cooper's hawks, red-tailed hawks, great horned owls, Swainson's hawks, burrowing owls, Nuttall's woodpecker, and other bird species. (*Id*., p. 2.)

During his brief visit on January 23, 2019, Dr. Smallwood observed a bald eagle flying over and hunting the site and identified a northern harrier and Cooper's hawk foraging on the project site. (Smallwood Comments, pp. 2, 5.) He also observed numerous other bird species. (*Id*., pp. 2-9.) Many species were not just passing by the site but actively engaged in using the habitat available there. (*Id*., p. 2.) For example, Dr. Smallwood observed many species spending considerable time at the site and displaying courtship or territorial behaviors indicative of breeding. (*Id*.) Such species included red-winged blackbirds, Say's phoebe, red-tailed hawks, and American kestrels. (*Id*.) He also observed a great-horned owl perched immediately adjacent to the site. (*Id*.)

Dr. Smallwood also has gathered information regarding numerous bird sightings in and around the site that are posted on a web-based service called eBird. (Smallwood Comments, pp. 13-16.) Dr. Smallwood's experience with this service indicates that it is reliable source of bird sighting information, being based on the observations of reputable birders. (*See id*., p. 16.) He also points out the limitations of the MND only relying upon the California Natural Diversity Data Base ("CNDDB") to document the potential presence of wildlife species at and around the Project site. (*Id*., pp. 11, 16.) Numerous additional sensitive species are identified near the site that are not addressed in the biological report or the MND, including the endangered Willow flycatcher and species of concern including the Oak titmouse, Loggerhead shrike, tricolored blackbirds and many others. (*Id*., pp. 13-15.)

As a result of the omission of numerous sensitive species using the site and evidence of even more additional species in the immediate vicinity of the site, the MND's evaluation of the project's biological impacts is not supported by substantial evidence. Dr. Smallwood's observations and expert comment is substantial evidence of a fair argument that the project may have an adverse impact on bald eagles, various hawks, and other species currently utilizing the site for courtship, foraging habitat and for movement.

The MND does mention a number of species, including Swainson's hawks and burrowing owls. However, the biological report fails to disclose information that these species have been observed much closer to the project site than is indicated in the MND or the biological report. (Smallwood Comments, p. 16.) For example, the MND indicates that Swainson's hawks and burrowing owls are, respectively, 2.5 and 2.6 miles away from the project site. However, Dr. Smallwood identifies sightings of these two species within 0.2 miles of the site. As he states, this indicates a high likelihood that these species are using this open foraging area as well.

The MND is particularly unreliable regarding its treatment of another species of special concern, the Northern harrier. As Dr. Smallwood explains:

> Relying on CNDDB records, Monk & Associates (2020) claim the nearest northern harrier location was 2.7 miles away. However, not only did I see a northern harrier fly over the project site, but multiple other observers reported northern harrier sightings nearby.

(Smallwood Comments, p. 16.)

Regarding impacts to burrowing owls, the MND improperly downplays potential impacts by claiming that, although the site contains many ground squirrel burrows that are frequently relied upon by burrowing owls, their significance is downplayed because Monk & Associates claims they are of "recent origin." (Smallwood Comments, p. 12.) Dr. Smallwood, relying on his own studies of burrowing owls, refutes the relevance of the age of ground squirrel burrows to their likely use by burrowing owls. (*Id*.)

Likewise, the MND relies on a claim that because the site was cleared of eucalyptus trees in 2012, that somehow that activity over eight years ago continues to affect the site's use by wildlife. The MND asserts that "[t]he loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat." (MND, p. 33.) Dr. Smallwood discusses the scientific problems with this assertion, concluding that "[t]he [MND] misleads where it claims that the removal of a eucalyptus grove years ago doomed the occurrence of wildlife species there today." (Smallwood Comments, p. 12.)

Dr. Smallwood notes the likely presence of bats utilizing the site for foraging and movement. (Smallwood Comments, p. 16.) The MND claims that the Project will not impact bats because the Project site "contains no roosting or nesting habitat because it has no trees, rock faces, structures, or cliffs." (MND. p. 34.) However, as Dr. Smallwood points out, "Trees surround the site. Bats undoubtedly roost in those trees. The site supports those roosts by providing forage. Night roosts of pallid bat, in particular, are typically located close to forage on open ground." (Smallwood Comments, p. 16.)

Dr. Smallwood notes that the MND and accompanying biological report fail to provide the information necessary to corroborate the level of effort and adequacy of the reconnaissance level survey done by the City's consultant. As Dr. Smallwood explains:

> Monk & Associates reported no details of their surveys, such as who exactly did the surveys, when they arrived, how long they stayed, and what methods they used. The reporting did not include the most basic information that a wildlife ecologist would need for assessing whether the survey truly met due diligence standards.

(Smallwood Comments, p. 10.) This exacerbates the absence of substantial evidence to justify the MND's wildlife baseline.

Dr. Smallwood also debunks the MND's effort to bolster the cursory biological

assessment with a so-called peer review. As Dr. Smallwood notes, no description of the peer-review nor any responses to review comments is provided in the MND and the date of the peer review appears inconsistent with the date of Monk & Associates site visit. (Smallwood Comments, p. 10.)

The evidence of nearby sightings of numerous sensitive species and the flaws in the MND and accompanying biological report identified by Dr. Smallwood support a fair argument that the Project may have adverse impacts on their foraging and movement. For this reason and those discussed above, an EIR must be prepared to address impacts to these many sensitive bird and bat species.

B. The Project will have a Significant Impact on Wildlife Movement and Habitat Fragmentation.

The MND fails to adequately analyze the Project's impact on wildlife movement. Instead, the MND improperly dismisses the Project's potential to impact wildlife movement by claiming there needs to be a "corridor" on the site to effect wildlife movement, that other nearby areas are better movement areas, or otherwise asserting without evidence that this particular large warehouse would not disrupt wildlife movement. As Dr. Smallwood states:

> The project would obviously interfere with wildlife movement in the region. Having studied millions of GPS telemetry data from 35 golden eagles tracked since 2013, I noticed a strong avoidance of anthropogenic structures such as warehouses and residential neighborhoods. I assume bald eagles express a similar level of avoidance. If this is assumption is true, then the bald eagle I saw fly over the site in 2019 might not do so again since the SDG Commerce 330 warehouse was built. Many other species would continue to fly over the project site despite the neighboring warehouse. I have recorded many observations of animals moving across fields next to warehouses, including red-tailed hawks, peregrine falcons, and many others.

(Smallwood Comments, p. 20.) Dr. Smallwood's direct observations and expert opinion are substantial evidence of a fair argument that the Project may have adverse impacts on wildlife movement at the site and in the vicinity.

C. The MND Fails to Analyze the Project's Impacts on Wildlife from Additional Traffic Generated by the Project.

The MND contains no analysis of the impacts of the Project's added road traffic on special-status species of wildlife, including species such as the California red-legged frog and California tiger salamanders. (Smallwood Comments, p. 20-21.) Regardless of whether these species live on site, these and other special status species must cross roadways that will experience increased traffic volume as a result of the Project. (*Id*.)

As Dr. Smallwood explains, "[i]ncreased use of existing roads will increase wildlife

fatalities…." (*Id.*, p. 20.)

> The traffic would effectively extend the project's footprint well beyond the floor space, as trucks and cars traveling to and from the warehouse will drive over roads and highways that are also crossed by wildlife. On 23January 2019I saw two road-killed striped skunks on American Canyon Drive, and on 15 January 2021 I saw a road-killed striped skunk and an opossum killed on the same road–a road likely to be used by trucks and cars servicing the project. California red-legged frogs (Rana draytonii), which Monk & Associates (2020) concluded will suffer no impacts because CNDDB records are lacking west of Highway 29, will cross roads used by vehicles servicing the project. A shortfall of the [MND] is its failure to analyze the impacts of the project's added road traffic on special-status species of wildlife, including California red-legged frog, California tiger salamander (Ambystoma californiense), and American badgers (Taxidea taxus) that, regardless of whether they live on the site, mustcross roadways that will experience increased traffic volume caused by this project.

(*Id*.) Given the fair argument of a threat to wildlife posed by existing traffic and additional traffic from the Project, as discussed by Dr. Smallwood, an EIR is necessary to evaluate the direct and cumulative impacts of the Project's vehicle collisions with wildlife.

D. The MND Fails to Analyze the Project's Impacts from the use of Pest Control Measures.

The MND does not discuss the potential impact of using pesticides inside and outside of the proposed warehouse. As a wine storage distribution facility, there will likely be steps taken to abate pests. There are many businesses that provide services for controlling stored products pests, perching birds, and rodents and other mammal pests within and around distribution warehouses. (Smallwood, p. 21.) These businesses advertise exclusion strategies and fumigation for stored products pests, glue boards for rodents, and other measures including anticoagulant poisons and acute toxicants. "[T]he use of toxicants can harm non-target wildlife through direct exposure and indirect exposure via predation and scavenging." (*Id*.) "[P]est control involving toxicants can result in the spread of toxicants beyond the project site." (*Id*.)

An EIR is needed to analyze the potential impacts of animal damage control associated with the proposed Project. Anticipated animal control strategies at the Project should be detailed, and impacts mitigated.

E. The Project will have Cumulative Impacts on Biological Resources.

Dr. Smallwood concludes that the Project will have a significant cumulative impact on biological resources. (Smallwood Comments, p. 22.) An EIR is needed to fully analyze and mitigate the Project's cumulative biological impacts, including not only future projects but the existing impacts as well.

III. The IS Utilized Unsubstantiated Input and Output Parameters to Estimate Project Emissions.

A. The MND fails to explain how the City Calculated the Project's Average Daily Construction Emissions of ROGs and NOx.

The MND and Appendix B fail to provide sufficient information for a reviewer to understand and corroborate how the average daily emissions during construction were derived. As SWAPE explains, it is entirely unclear where the emissions estimates reported in the MND come from, because the estimates do not match those provided in any of the CalEEMod output files. (SWAPE Comments, pp. 2-3.) The MND provides the Project's emissions estimates in pounds per day. (MND, p. 22.) This indicates that the estimates should have come from either the winter or summer output file. (SWAPE Comments, pp. 2-3.) However, reviewing both the summer and winter output files and the emissions estimates, SWAPE's review could not match either. Insufficient details are provided in the MND either to inform the reader of the full extent of the air pollution and impacts that will result from the Project or how the insignificant determination was calculated and derived. The MND does not disclose a valid average daily emission calculation. For this reason, there is a fair argument that the Project may have significant air quality impacts.

B. The MND Used Improper Modeling Inputs, Including for Water Use for Parking and Solid Waste Generation.

Review of the Project's CalEEMod output files also demonstrates that the Project Applicant fails to adequately support substantial reductions in several air quality modelling inputs. In particular, the input for water use rate is decreased by almost 100 percent from the default value of 50,248,312.50 gallons per year ("gpy") to a mere 768 gpy. (SWAPE Comments, p. 8.) However, the Project is estimated to require an average of 142 gallons per day ("gpd") of potable water and 541 gpd of recycled water, resulting in a total daily water demand of 683 gpd or 249,295 gpy. Thus, the model underestimates the Project's total yearly water demand by approximately 239,186 gpy.

SWAPE also points out the lack of justification for the reduction in modeling inputs for solid waste generation by the Project. It is not explained how the Project would have dramatically lower solid waste rates than other typical projects. (SWAPE Comments, pp. 7-8.) Likewise, further corroboration that there would not be any weekend trips occurring at the facility or the lack of any potential for natural gas use by the Project should be further corroborated and explained in the MND. (*Id.*, pp. 5-7.) Lastly, the modelling relies on surface watering and limited vehicle speeds among other BMPs identified by BAAQMD. However, nothing in the MND sets forth these measures as mandatory BMPs or conditions of the Project. (*Id.*, pp. 9-11; MND, p. 23.) Because of the uncertainty resulting from inadequate justifications or miscalculation of annual water use, the MND's reliance on the CalEEMod analysis is not supported by substantial evidence that eliminates a fair argument that the Project may have significant air quality impacts.

IV. SWAPE's CalEEMod Modeling Run Indicates a Fair Argument That the Project May Have a Significant Air Quality Impact.

SWAPE reran the CalEEMod run for the Project adjusting for the deficiencies in the inputs that it identified. (SWAPE Comments, p. 11.) The resulting model result indicates that the Project may exceed the BAAQGM daily emission threshold of 54 lbs/day. This is substantial evidence of a fair argument that the Project may have a significant air quality impact.

V. The IS Inadequately Evaluates Emissions of Diesel Particulate Matter.

Diesel particulate matter ("DPM") is a known human carcinogen. The MND attempts to piggy-back on a health risk assessment performed for the nearby SDG Commerce 330 warehouse. (MND, p. 26.) This effort to borrow the HRA performed for that other project is problematic for a number of reasons.

A. The HRA Fails to Account for the Fact That the Nearest Sensitive Receptor to the Project's Emissions is Located Only 500 Feet From the Soil Borrow Site.

Although the MND notes that there is "one residence about 1,000 feet east of the site (on the Couch property)," this is referring to the site of the proposed warehouse building. (MND, p. 74.) In fact, the closest receptor is only 500-feet from the borrow pit portion of the Project. (*Id*., p. 77 (Table Noise-4).) For the SDG Commerce 330 project, the sensitive receptor distance was about 900 feet. Because the closest receptor to the Project's affected area is only 500 feet, a new health risk assessment specific to the Project must be prepared. (SWAPE Comments, pp. 12-14.) Based on the current MND, there remains a fair argument that the Project may have a significant health risk impact on the nearest sensitive receptor.

B. SWAPE's Analysis Provides Substantial Evidence of a Fair Argument that the Project may have Significant Health Risk Impacts from its Emissions of Toxic Air Contaminants.

Based on the limited information provided by the MND, a fair argument exists that the Project may have a significant health risk impact to nearby sensitive receptors. SWAPE has prepared a Level 2 health risk screening assessment ("HRSA") for the project. BAAQMD recommends a significance threshold of an increased cancer risk of 10 in one million and an increased cumulative cancer risk of 100 in a million from all local sources. Applying the U.S. Environmental Protection Agency's AERSCREEN model, as recommended by OEHHA and the California Air Pollution Control Officers Association, SWAPE calculates that construction and operation of the Project will result in cancer risks to adults, infants, children and nearby residents over the course of a 30-year residential lifetime of, respectively, 11 in one million, 86 in one million, 73 in one million, and 180 in one million, all in excess of BAAQMD's threshold. (SWAPE Comment, pp. 14-18.) Based on this substantial screening evidence, a fair argument is present that the Project may have significant health risk impacts on nearby residents.

VI. There is a Fair Argument That the Project May Have Significant GHG Impacts.

SWAPE also reviewed the MND's discussion of the Project's potential GHG impacts. In addition to the deficiencies in the air modelling discussed above, a number of glaring problems with the analysis demonstrates that a fair argument remains that the Project may have significant GHG impacts.

A. The MND's Reliance on the 1,100 MT CO2e Per Year Threshold is Only Designed to Achieve the GHG Reductions Required by 2020 and is Insufficient to Align the Project With the State's 2030 GHG Reduction Targets.

As the BAAQMD states in its 2017 CEQA guidelines, BAAQMD based its GHG "bright line" significance threshold on the amount of GHG reductions that were necessary in the Bay area to achieve the AB 32 reduction goals by 2020. (BAAQMD CEQA Guidelines, p. D-16 (available at https://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa_guidelines_may2017-pdf.pdf?la=en.) The threshold referenced in the MND is a bright-line threshold of 1,100 MT CO2e. (*Id.*, p. D-21. *See* SWAPE Comments, pp. 19-20.) That threshold was only intended to ensure compliance with AB 32's reduction goals required by 2020. (*Id.*) The 2020 GHG reduction goals sought to reduce business as usual GHG emissions to 1990 levels. In 2018, the Air Resources Board established the subsequent GHG reduction goal to reduce 1990 levels by another 40 percent by 2030. (California's 2017 Climate Change Scoping Plan, Executive Summary (Nov. 2017) (available at https://ww2.arb.ca.gov/sites/default/files/classic//cc/scopingplan/scoping_plan_2017_es.pdf).) That is the current goal with which the Project must ensure consistency order to claim no fair argument of a potential GHG impact.

As SWAPE points out, the Association of Environmental Professionals ("AEP") has derived a threshold of significance that is consistent with achieving the 2030 GHG reduction goals for projects coming online after 2020. AEP and SWAPE identify a "2030 Land Use Efficiency Threshold" of 2.6 metric tons of CO2 equivalents per service population per year ("MT CO2e/SP/year") as a threshold of significance necessary for any specific project to be consistent with the 2030 reduction goals. As AEP states:

> Once the state has a full plan for 2030 (which is expected in 2017), and then a project with a horizon between 2021 and 2030 should be evaluated based on a threshold using the 2030 target. A more conservative approach would be to apply a 2030 threshold based on SB 32 for any project with a horizon between 2021 and 2030 regardless of the status of the Scoping Plan Update.

(*Final White Paper Beyond 2020 and Newhall: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California*, October 18, 2016, p. 40 (available at: https://califaep.org/docs/AEP-2016_Final_White_Paper.pdf).)

Applying the Project's estimate that it will create 50 new jobs, SWAPE calculates the

2030 Land Use Efficiency Threshold for the project to be 11.80 MT CO2e/SP/year - well in excess of the calculated significance threshold of 2.6 MT CO2e/SP/year. (SWAPE Comments, pp. 20-21.) Based on this substantial evidence, there is a fair argument that the Project may have significant GHG impacts.

B. The Project's Failure to Reduce its Expected VMT and Its Levels of VMT Per Capita are Evidence of a Fair Argument That the Project May Have Significant GHG Emission Impacts.

In addition to failing to reduce its VMT by fifteen percent of the Project area average, as discussed above, the MND also is inconsistent with CARB's 2017 Scoping Plan's guidance on evaluating GHG impacts using a Project's VMT per capita calculations. CARB has provided County- and State-based VMT per capita baseline calculations and the necessary per capita reductions necessary to be consistent with the Scoping Plan's GHG reduction targets. (SWAPE Comments, p. 22, n. 44.) SWAPE has applied that guideline to calculate the Project's VMT per capita. (*Id.,* p. 22 & Attachment C.) Using the tables provided by CARB, SWAPE calculates that VMT per capita within Napa County must be reduced to 19.37 in order to be consistent with the 2030 GHG reduction target. (*Id*., p. 22.) SWAPE calculates the Project's daily VMT per capita to be 33.21, well in excess of the VMT per capita levels necessary to meet the State reduction goals for 2030. (*id*., p. 22.) As a result, the MND is incorrect in asserting that the Project is consistent with the 2017 Scoping Plan and AB 32. SWAPE's analysis is substantial evidence of a fair argument that the Project may have significant GHG emission impacts.

CONCLUSION

For the foregoing reasons, the MND is inadequate and an EIR is required to analyze and mitigate the Project's potentially significant environmental impacts. LIUNA reserves the right to supplement these comments in advance of and during public hearings concerning the Project. *Galante Vineyards v. Monterey Peninsula Water Management Dist*., 60 Cal. App. 4th 1109, 1121 (1997). Thank you for your attention to these comments.

Sincerely,

[redacted]

CITY OF AMERICAN CANYON
COMMUNITY DEVELOPMENT DEPARTMENT

30 DAY NOTICE OF INTENT TO ADOPT A MITIGATED NEGATIVE DECLARATION AND NOTICE OF PUBLIC HEARING

NOTICE IS HEREBY GIVEN that the City of American Canyon has prepared an Initial Study Checklist and Mitigated Negative Declaration for recirculation for the following described project in accordance with the California Environmental Quality Act (CEQA). The 30-day public comment period begins April 1, 2021 and ends May 3, 2021.

NOTICE IS FURTHER HEREBY GIVEN that the City Council will hold a public hearing on **Tuesday, May 18, 2021** at **6:30 p.m.,** at **4381 Broadway, Suite 201, American Canyon, CA 94503** (in the Council Chambers of the American Canyon City Hall), to consider the recirculated Initial Study Checklist and Mitigated Negative Declaration and the following applications:

Project Title:	SDG Commerce 217 Distribution Center
Project Number:	PL20-0008
Project Applicant:	SDG Commerce 217, LLC
Project Location:	1075 Commerce Court, American Canyon, Napa County, CA 94503.
Assessor Parcel(s):	058-030-065
Project Description:	Conditional Use Permit for a new 217,294 square foot wine warehouse distribution center with parking and landscaping. The site is located in the Recreation (REC) zoning district.

The basis for proposing a Mitigated Negative Declaration (MND) is the finding that the proposed project will not have a significant effect on the environment because mitigation measures that reduce the impacts to less than significant are being approved as part of project conditions. The MND includes mitigation measures for Air Quality, Biological Resources, Cultural Resources, Geology/Soils, Hazards and Hazardous Materials, Hydrology/Water Quality, Noise, Transportation/Traffic, and Utilities.

Copies of all documents that relate to the above-described project and proposed MND and Initial Study Checklist may be examined on the City's website at: https://bit.ly/3gAjtEs.

Comments on the MND, sent in writing, must be received by 5:00 p.m. on May 3, 2021, at whe@cityofamericancanyon.org or the following address:

William He, AICP, Associate Planner
City of American Canyon Community Development Department
4381 Broadway, Suite 201
American Canyon, CA 94503

Oral or written comments may be provided to the City Councilmembers at their meeting. All interested persons are invited to attend the meeting and be heard on this matter.

Public meetings/events sponsored or conducted by the City of American Canyon are held in accessible sites. Requests for accommodations may be made by calling (707) 647-4577 (voice) or 711 for the California Relay Service or by e-mailing the ADA Coordinator, Cherri Walton, at cwalton@cityofamericancanyon.org at least 72 hours in advance of the event. Copies of documents distributed at the meeting are available in alternative formats upon request.

RE: Request for Extension of Comment Period for MND for SDG Commerce 217 Distribution Center Project (Application PL20-0008), Follow Up Request for Access to MND Reference Documents, and Access to Responsive Documents Under the California Public Records Act

Dear Mr. He, Mr. Cooper, and Ms. Walton:

We are writing on behalf of the International Brotherhood of Electrical Workers Local 180, Plumbers & Steamfitters Union Local 343, Sprinkler Fitters Local 483, International Association of Sheet Metal, Air, Rail, and Transportation Workers Local Union 104, and the District Council of Ironworkers to request that the City extend the public comment period for the SDG Commerce 217 Distribution Center Project (Application PL20-0008) ("Project") by SDG Commerce 330 LLC ("Applicant") by at least thirty days from today's date (April 26, 2021) due to the failure of the City to provide timely access to all documents referenced, incorporated

printed on recycled paper

by reference, and relied upon in the Mitigated Negative Declaration ("MND") for the Project, as required under CEQA, and as requested on April 15, 2021.[1]

The extension request is made pursuant to CEQA, which requires that all documents referenced in an environmental review document be made available to the public for the entire comment period.[2] This request is also made pursuant to the CPRA,[3] which requires public records to be "open to inspection at all times during the office hours of the state or local agency" and provides that "every person has a right to inspect any public record."[4] As the City is aware, public records related to the Project include all documents in actual or constructive possession of the City, which includes the City's consultants' files.[5]

On April 15, 2021, our office submitted two letters to the City, the first seeking immediate access to all MND reference documents pursuant to CEQA, and the second seeking immediate access to all public records referring or related to the Project pursuant to the California Public Record Act ("CPRA").[6] We did not receive any response to the letters. On April 20, 2021, we followed up these letters with an email directed to Mr. He asking for an update on these document requests. We have still received no response from the City regarding either of the record requests or the email.

Without this critical information, our clients and other members of the public are unable meaningfully review and comment on the MND, and are deprived the opportunity to review the supporting information for the MND. Therefore, we renew our request that the City provide us with immediate access to all MND reference documents, as well as to all documents responsive to our CPRA request.

---

[1] Letter to William He, City of American Canyon from Darien Key, Adams Broadwell Joseph & Cardozo, Request for Immediate Access to Documents Referenced in the MND for SDG Commerce 217 Distribution Center Project (Application PL20-0008) (Apr. 15, 2021.)

[2] Pub. Res. Code § 21092(b)(1); 14 Cal. Code Regs. § 15072(g)(4).

[3] Gov. Code §§ 6250, et seq.

[4] *Id*. § 6253(a).

[5] *Consolidated Irrigation District v. Superior Court* (2012), 205 Cal.App.4th 697, 710.

[6] Letter to William He, City of American Canyon from Darien Key, Adams Broadwell Joseph & Cardozo, Request for Immediate Access to Public Records – SDG Commerce 217 Distribution Center Project (SCH Number 2020120302; Application PL20-0008) (Apr. 15, 2021.); Letter to William He, City of American Canyon from Darien Key, Adams Broadwell Joseph & Cardozo, Request for Immediate Access to Documents Referenced in the MND for SDG Commerce 217 Distribution Center Project (Application PL20-0008) (Apr. 15, 2021.)

printed on recycled paper

The courts have held that the failure to provide even a few pages of a CEQA document for a portion of the CEQA review period invalidates the entire CEQA process and that such a failure must be remedied by permitting additional public comment.[7] It is also well settled that a CEQA document may not rely on hidden studies or documents that are not provided to the public.[8] By failing to make all documents and underlying data referenced in the MND "readily available" during the current comment period, the City is violating the procedural mandates of CEQA.[9]

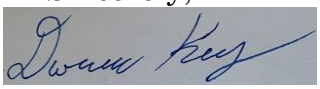
Therefore, we respectfully request that the District extend the public review and comment period on the MND for an additional 30 days from the date on which the MND releases all reference documents for public review.

In sum, we request the City:

1) Extend the public review and comment period on the MND **for at least 30 days from the date on which the MND releases *all* reference documents** for public review.

2) Immediately provide access to the reference documents, as described in our April 15, 2021 letter.

3) Immediately provide access to responsive documents pursuant to our CPRA request, as described in our April 15, 2021 letter.



Given the short time before the current comment deadline ends, please contact me as soon as possible with your response to this request, but no later than close of business on **Wednesday, April 28, 2021**.

Re: Request for Immediate Access to Public Records – *SDG Commerce 217 Distribution Center Project (SCH Number 2020120302; Application PL20-0008)*

Dear Mr. He, Mr. Cooper, and Ms. Walton:

We are writing on behalf of the International Brotherhood of Electrical Workers Local 180, Plumbers & Steamfitters Union Local 343, Sprinkler Fitters Local 483, International Association of Sheet Metal, Air, Rail and Transportation Workers Local Union 104, and the District Council of Ironworkers to request ***immediate access*** to any and all public records referring or related to the SDG Commerce 217 Distribution Center Project (Application PL20-0008) ("Project"), proposed by SDG Commerce 330 LLC ("Applicant"). This request includes, but is not limited to, any and all materials, applications, correspondence, resolutions, memos, notes, analyses, electronic mail messages, files, maps, charts, and/or any other documents related to the Project. This request *does not include* the MND or documents referenced or relied upon in the MND, which we have requested in a separate letter pursuant to the California Environmental Quality Act.

printed on recycled paper

The Applicant proposes to develop a 217,294 sq. ft. wine distribution center on the 10.39-acre parcel, which represents a 48% building coverage (0.48 FAR), at 1075 Commerce Court, in the Recreation zoning district. The Project also includes parking spaces, trucking docks, landscaping, and a 21,000 square-foot bio retention pond. The assumed 4,350 square feet of office space is an estimate as exact office build-outs would be determined in the future and reviewed by the City during the tenant-improvement phase of the project.

This request is made pursuant to the California Public Records Act, Government Code §§ 6250, et seq. This request is also made pursuant to Article I, section 3(b) of the California Constitution, which provides a constitutional right of access to information concerning the conduct of government. Article I, section 3(b) provides that any statutory right to information shall be broadly construed to provide the greatest access to government information and further requires that any statute that limits the right of access to information shall be narrowly construed.

We request ***immediate access*** to review the above documents pursuant to section 6253(a) of the Public Records Act, which requires public records to be "open to inspection at all times during the office hours of the state or local agency" and provides that "every person has a right to inspect any public record." Gov. Code § 6253(a). Therefore, the 10-day response period applicable to a "request for a copy of records" under Section 6253(c) does not apply to this request.

Re: Request for *Immediate Access* to Documents Referenced in the MND for *SDG Commerce 217 Distribution Center Project (Application PL20-0008)*

Dear Mr. He, Mr. Cooper, and Ms. Walton:

We are writing on behalf of the International Brotherhood of Electrical Workers Local 180, Plumbers & Steamfitters Union Local 343, Sprinkler Fitters Local 483, International Association of Sheet Metal, Air, Rail and Transportation Workers Local Union 104, and the District Council of Ironworkers to request ***immediate access*** to any and all documents referenced, incorporated by reference, and relied upon in the Initial Study Checklist and Mitigated Negative Declaration ("MND") prepared for the SDG Commerce 217 Distribution Center Project (Application PL20-0008) ("Project") by SDG Commerce 330 LLC ("Applicant"). This request excludes any documents that are otherwise available on the City of American Canyon website.

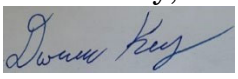
The Applicant proposes to develop a 217,294 sq. ft. wine distribution center on the 10.39-acre parcel, which represents a 48% building coverage (0.48 FAR), at 1075 Commerce Court, in the Recreation zoning district. The Project also includes parking spaces, trucking docks, landscaping, and a 21,000 square-foot bio retention

printed on recycled paper

pond. The assumed 4,350 square feet of office space is an estimate as exact office build-outs would be determined in the future and reviewed by the City during the tenant-improvement phase of the project.

Our request for immediate access to all documents referenced in the MND is made pursuant to the California Environmental Quality Act ("CEQA"), which requires that all documents referenced, incorporated by reference, and relied upon in an environmental review document be made available to the public for the entire comment period.[1]

We request ***immediate access*** to review the above documents pursuant to CEQA. If the requested documents are in electronic format and are 10 MB or less (or can be easily broken into sections of 10 MB or less), please email them to me as attachments. We will pay for any direct costs of duplication associated with filling this request up to $200. However, please contact me at (650) 589-1660 with a cost estimate before copying/scanning the materials.



Please send the above requested items to our South San Francisco Office as follows:

Subject: RE: [External] Request for Extension of Comment Period for MND for SDG Commerce 217 Distribution Center Project (Application PL20-0008), Follow Up Request for Access to MND Reference Documents, and Access to Responsive Documents Under the California Public…

Hello Alisha,

We have considered Adams Broadwell's request to extend the recirculated SDG 217 MND public review period an additional 30 days. The current public comment period is scheduled to end today **(May 3, 2021)**.

Please consider this email the City's agreement to extending the public comment period by 30 days. With a 30-day extension, the new public comment period will end **June 3, 2021**.

Sincerely,
Brent Cooper, AICP
Community Development Director
City of American Canyon | Broadway Street, Suite 201 | American Canyon, CA 94503
(707) 647-4335

COMMENTS AND RESPONSES ADDENDUM: FINAL RECIRCULATED DRAFT INITIAL STUDY FOR THE 217 COMMERCE DISTRIBUTION CENTER BUILDING PROJECT

Introduction

The following comments were received on the Recirculated Draft Initial Study:

A. Adams Broadwell Joseph & Cardoza Comment Letter, May 3, 2021
B. Lozeau Drury Comment Letter, May 3, 2021
C. Lozeau Drury Comment Letter, June 3, 2021

These comments are attached and numbered, followed by corresponding numbered responses, below.

A. Responses to Adams Broadwell Joseph & Cardoza Comment Letter, May 3, 2021

The following responses are keyed to the numbers of the comments in the "Analysis" section of the Adams Broadwell Joseph & Cardoza comment letter. The comment letter is included as Attachment A to this appendix.

General Comments

Comment A.1. *There is a fair argument that the Project will result in potentially significant impacts relating to air quality, public health, biological resources, energy, GHG, land use, noise, and transportation.*

Response: Please see responses to specific comments below. The IS found that, while a number of potentially significant impacts would occur from the proposed project, all can clearly be mitigated to a less-than-significant level.

Comment A.2. *The MND fails to adequately disclose, investigate, and analyze the project's potentially significant impacts, and fails to provide substantial evidence that impacts will be reduced to a less-than-significant level.*

Response: As described in the responses to comments below, the project, with mitigation identified in the IS, as modified in the Final IS, would not have any potentially significant impacts that cannot be mitigated to a less-than-significant level. Additionally, the revisions to the Draft IS included in this Final IS do not alter any of its significance determinations.

Comment A.3. *The City violated CEQA and improperly truncated the MND's public comment period by failing to make all documents referenced, incorporated by reference, and relied on in the MND available for public review during the public comment period.*

Response: At the request of the applicant, the City decided to re-circulate a revised Initial Study after receipt of the commenter's April 15 comment letters. The recirculated document included several substantive revisions made in response to the comments received on that original Draft IS. Therefore responses to comments on that prior IS are no longer required. The City originally proposed a 30-day comment period on the re-circulated Draft IS. However, in response to requests from concerned parties, that period was extended to 62 days, extending from April 1, 2021 to June 3, 2021, which provided the commenter with well over the required 30 days to review all of the requested documents referenced in the comment. The Ballentine email, while referenced in the IS, is not important in determining of impact significance or any potential land use conflict. Zoning compatibility is discussed on pp. 7 and 77 (PDF page) of the Draft IS, and was determined by the City Council in its approval of the Commerce 330 project.

Comment A.4. The MND fails to provide an accurate and complete project description by piecemealing its review of the project and related projects.

Response: The current document is not required to address the overall impacts of subdivision and full buildout of the larger subdivided property. The project has independent utility and does not cause any other projects to be built. Therefore, any such project would not be a part the currently proposed project (or vice versa), but rather part of potential future cumulative development. Cumulative impacts of the original subdivision were generally discussed in the Cumulative Impacts section of the Commerce 330 IS/MND, which stated on p. 98.

> "It is possible that the two additional parcels to be created by the proposed tentative map would be developed with project similar to that proposed for the project site. Development of those sites could add to cumulative traffic, noise, and air quality impacts of the proposed project. No projects are currently proposed for those sites, therefore assessment of those impacts would be speculative at this time."

Similarly, this IS addressed the potential cumulative impacts of development of the remaining subdivided parcel in the Cumulative Impacts discussion:

> "It is possible that the remaining parcel between the project site and the Commerce 330 site would be developed with project similar to that proposed for the project site. Development of [that site] could add to cumulative traffic, noise, biological resources, and air quality impacts of the proposed project, as with the project impacts. No projects are currently proposed for that site, therefore assessment of those impacts would be speculative at this time. Environmental review of that project would be required to also consider the proposed project, if approved.

Cumulative traffic conditions also were considered in the Commerce 330 Project IS.

The SDG 258 warehouse project is not adjacent to this site and was not a part of the original subdivision, wherefore is not in any way a part of a larger project including this project. It is

another project with similar uses proposed by the same applicant in the Green Island Road area. It is neither dependent on or causative of any element of the proposed project.

The fact that the CaLEEMoD model was modified from another project for use on this project is not relevant to whether or not the project description was piecemealed.

Air Quality Comments

Comment A.5. The City failed to update the MND's air quality baseline data and relevant analyses when it revised and recirculated the MND.

Response: The Comment is misinterpreting CEQA Guidelines Section 15125(a). As stated in CEQA Guidelines Section 15125(a)(1), "Generally, the lead agency should describe physical environmental conditions as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective." Nevertheless, the CalEEMod was reran to update the construction schedule since the Project has been delayed (raw model outputs are on file for review at the City Community Development Department office).

Construction activities were originally planned to commence March 1, 2021. Construction activities are now planned to commence March 1, 2022. Construction phases would take place in the same seasons as originally assumed in the IS/MND. However, since the Project has been delayed one year, construction emissions would be decreased compared to the emissions described in the MND since emission factors decrease annually due to cleaner engines and fuels. Table RTC-1 displays the updated average daily construction emissions vs the average daily construction emissions displayed in the IS/MND and compares them to BAAQMD's average daily construction emissions thresholds of significance.

Table RTC-1
Estimated Daily Construction Emissions (pounds/day)

Construction Year	ROG	NO_x	PM10 (exhaust only)	PM2.5 (exhaust only)	CO
Proposed Project Unmitigated Emissions					
MND Emissions (Year 2021)	**13.6**	**24.6**	**1.0**	**0.9**	**19.5**
Updated Emissions (Year 2022)	**12.0**	**22.0**	**0.8**	**0.8**	**18.8**
BAAQMD Significance Threshold	*54*	*54*	*82*	*54*	--
Threshold Exceeded?	**No**	**No**	**No**	**No**	--

Source: CalEEMod Version 2016.3.2

As shown in Table RTC-1, updated average daily construction emissions for year 2022 would be well below BAAQMD's average daily construction thresholds of significance and less than the average daily construction emissions displayed in the IS/MND for year 2021 Project construction

activities. Operational air emissions were calculated for summer, winter and annual scenarios and the delay in Project development would not change the operational emissions (other than a slight decrease due to cleaner engines and fuels since Project operation has been delayed one year), thus operational emissions would be well below the BAAQMD's operational thresholds of significance. Therefore, no significant impacts related to air quality would occur and an EIR is not required.

Comment A.6. The City failed to perform a project-specific Traffic Impact Analysis (TIA) for the project and is relying on a TIA for another project.

Response: This comment is incorrect. As referenced in the first paragraph of the Draft IS transportation section, GHD prepared a traditional level-of-service TIA for the SDG Commerce 217 Distribution Center (May 2020) in addition to an SB 743-compliant VMT impact analysis (March 2021). Both were discussed in the IS and included in full as Appendix F in the Draft IS.

Comment A.7. The City has not accurately reported the project's estimated daily construction emissions and failed to disclose significant air quality impacts during the construction phase.

Response: As stated in Table 2-1 on page 2-2 of the BAAQMD *CEQA Air Quality Guidelines* (May 2017)[1], BAAQMD's CEQA threshold of significance for construction-related activities are in the units of "Average Daily Emissions (lbs/day)." Per BAAQMD Guidance, the total emissions from the Project were divided by the total number of construction days to calculate the average daily emissions in order to compare them to the BAAQMD thresholds of significance. The results and emissions estimate for each phase were provided in the IS/MND's Air Quality Appendix, but were not included in the IS/MND's air quality section because they are not applicable for comparison to BAAQMD's significance thresholds. As described in Response to Comment A.5., above, updated average daily construction emissions for year 2022 would be well below BAAQMD's average daily construction thresholds of significance and less than the average daily construction emissions displayed in the IS/MND for year 2021 Project construction activities. Therefore, no significant impacts related to air quality would occur.

Comment A.8. The City fails to quantify the impact that transportation refrigeration units (TRUS) will have on air quality impacts from the proposed project**.**

Response: The proposed Project entry/exit and Commerce Blvd. is approximately 1,000 feet from the nearest sensitive receptor (mobile home on the Couch Property to the east). Napa Junction Elementary School is approximately 1,750 feet from the Project exit and approximately 2,150 feet from the Project entry. The residential neighborhood south of Napa Junction Elementary

[1] Bay Area Air Quality Management District (BAAQMD). 2017. California Environmental Quality Act (CEQA) Air Quality Guidelines. May 2017. https://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa_guidelines_may2017-pdf.pdf?la=en&rev=0d2d971e661d41f28a56953f1776bdde&hash=A8ECB7754057DCC18AF1CFF77E17F50C

School is approximately 2,100 feet from the Project exit and approximately 2,500 feet from the Project entry.

A Health Risk Assessment (HRA) has been prepared for the project and provided in Attachment D to this Responses to Comments document. The HRA analyzes health impacts on existing residences and school receptors from toxic air contaminants (TACs) such as diesel particulate matter (DPM) from diesel construction equipment and diesel truck activities (including TRUs) at loading docks and along roadways. The HRA concluded that the Project would have a less-than-significant impact on existing residential and school receptors, as the Project would be below BAAQMD's cancer risk significance threshold of 10 in one million, as well as thresholds for noncancerous risk (acute or chronic) and PM2.5.

GHG emissions were quantified for the Project with CalEEMod, which included mobile sources such as heavy trucks and heavy trucks with TRUs. CalEEMod calculates idling GHG emissions from mobile sources. GHG emissions from the Project would be less than significant. See also Response to Comment **A.29**.

Comment A.9. The City failed to quantify the health impacts from emissions from the project and incorrectly relies on a non-quantitative analysis performed for the SDG 330 Warehouse Project.

Response: See the Health Risk Assessment provided in Attachment D. See Response to Comment **A.8**, above.

Comment A.10. The use of Tier 2 equipment as mitigation would not enhance exhaust emission reductions and would increase the potential emissions from sources on site, resulting in increased health risk.

Response: Construction equipment greater than 25 horsepower having engines that meet or exceed USEPA or CARB Tier 2 off-road emission standards, AND engines that are retrofitted with a CARB Level 2 Verified Diesel Emissions Control Strategy was not a mitigation measure for the Project in the IS/MND. This was a mitigation measure for the previous SDG 330 Warehouse Project. The SDG 330 Warehouse Project HRA (February 2019) found that Project construction emissions would be less than significant with the implementation of the mitigation measure. Construction equipment for the proposed Project would be required to comply with the California Air Resource Board (CARB) In-Use Off-Road Diesel-Fueled Fleets Regulation and would be much cleaner than a Tier 2 construction fleet.

See Response to Comment A.8. See the Health Risk Assessment in Attachment D. While the HRA concluded that the Project would result in less than significant health impacts without mitigation, the applicant would include the following requirements into its construction contracts to further reduce emissions from construction equipment and to ensure no Tier 2 equipment is used for Project construction:

1. Where access to alternative sources of power are available, portable diesel engines shall be prohibited; and
2. All diesel-powered off-road equipment larger than 50 horsepower and operating at the site for more than two days continuously shall have engines that meet or exceed either USEPA or CARB Tier 3 (or better) off-road emission standards and Level 3 Diesel Particulate Filters.

Comment A.11. The logic used by the City to justify not producing a dispersion model of the Project's toxic air emissions and a quantitative health risk analysis for the either this Project or the SDG Commerce 330 Warehouse project is flawed and fails to comply with CEQA.

Response: See Response to Comment **A.8**. An HRA was performed for the SDG 330 Warehouse Project in February 2019 as part of the Final IS/MND. The HRA analyzed health impacts from Project construction and operation on existing residential sensitive receptors and future school receptors with the planned Napa Junction Elementary School. The HRA found that Project construction and operational emissions would be less than significant. Since the SDG 330 Warehouse Project is much closer to the existing sensitive receptors and future school receptors, the City found it was logical to conclude that the proposed Project's impacts would also be less than significant. Nevertheless, a new HRA was prepared for the proposed Project and found that all impacts would be below BAAQMD's thresholds of significance and thus less than significant (See Attachment D).

Comment A. 12. The City failed to assess the public health impacts from TACs that will be released during the construction and operational phases of the Project on the Napa Unified School District's new Napa Junction School.

Response: See the Health Risk Assessment in Attachment D. See Response to Comment A.8. The HRA analyzed health impacts on school receptors from toxic air contaminants (TACs) such as diesel particulate matter (DPM) from diesel construction equipment and diesel truck activities (including TRUs) at loading docks and along roadways (Project construction and operations). The HRA concluded that the Project would have a less-than-significant impact on school receptors, as the Project would be below BAAQMD's cancer risk significance threshold of 10 in one million, as well as thresholds for noncancerous risk (acute or chronic) and PM2.5.

Comment A. 13. The SDG 330 Project's Mitigation Measure AQ- 4 is insufficient to reduce the project's significant health risk to less than significant.

Response: See Response to Comments **A.8., A.9., A.10., A.11., and A.12**. The proposed Project would not include stationary sources, such as stationary diesel generators. Furthermore, any stationary source would require a permit from the BAAQMD where an HRA would be required prior to issuance of the permit.

Comment A.14. The IS must include a cumulative emissions analysis of the impacts from the project and surrounding projects.

Response: See Response to Comments **A.8., A.9., A.10., A.11., and A.12**. An HRA was performed for the proposed Project (See Attachment D). Since proposed Project construction and operational health risks are below the BAAQMD's project-level thresholds of significance, the proposed Project would have a less than cumulatively considerable contribution to cumulative health risk.

Furthermore, there are no stationary sources within 2,000 feet of the nearest sensitive receptor (mobile home on Couch Property) or within 3,000 feet of the new Napa Junction Elementary School. The nearest high-volume roadway, Highway 29, is approximately 4,000 feet away from the nearest sensitive receptor and the new Napa Junction Elementary School and the nearest rail line is approximately 3,000 feet from the nearest sensitive receptor and approximately 4,000 feet from the new Napa Junction Elementary School.

The zone of influence for BAAQMD's project-level and cumulative health risk thresholds of significance is a 1,000-foot radius from the property line of a sensitive receptor. Since there are no stationary sources or major roadways/rail lines within 1,000 feet of sensitive receptors in the Project vicinity, cumulative risk for nearby sensitive receptors would be well below BAAQMD's cumulative health risk thresholds of significance and would be less than significant.

Comment A.15. The MND relies on non-binding Best Management Practices (BMPs) to reduce emissions of dust and particulates.

Response: The City considers the BAAQMD's Basic Construction Mitigation Measures Recommended for ALL Proposed Projects to be required (Page 8-4 of the BAAQMD *CEQA Air Quality Guidelines,* May 2017)[2], as stated in the IS/MND as follows:

> *"The BAAQMD's CEQA Air Quality Guidelines consider these impacts to be less than significant if best management practices are employed to reduce these emissions. The BAAQMD requires the following best management practices (BMPs) to reduce emissions of dust and particulates:*
>
> - *All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.*
> - *All haul trucks transporting soil, sand, or other loose material off site shall be covered.*

[2] Bay Area Air Quality Management District (BAAQMD). 2017. California Environmental Quality Act (CEQA) Air Quality Guidelines. May 2017. https://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa_guidelines_may2017-pdf.pdf?la=en&rev=0d2d971e661d41f28a56953f1776bdde&hash=A8ECB7754057DCC18AF1CFF77E17F50C

- *All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.*
- *All vehicle speeds on unpaved roads shall be limited to 15 miles per hour.*
- *All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.*
- *A publicly visible sign shall be posted with the telephone number and person to contact at the Site Superintendent regarding dust complaints. This person shall respond and take corrective action with 48 hours. The Air District's phone number and Lead Agency contact information shall also be visible to ensure compliance with applicable regulations.*

The following measures also are required by regulation:

- *Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to five minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations). Clear signage shall be provided for construction workers at all access points.*
- *All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation."*

These measures would be included in the City's Conditions of Approval for the Project.

Biological Resources Comments

Comment A.16.: The MND fails to establish a baseline setting.

Response: As noted in M&A's March 2020 *Biological Resources Analysis* report, M&A biologists have a long history of field surveys associated with the approximately 35-acre parcel of which the approximately 10-acre project site is a part. GECo retained Vollmar Natural Lands Consulting (VNLC) to conduct a peer review of M&A's reports, which included a site visit by Jake Schweitzer, VNLC biologist.

M&A biologists have a long history of field surveys associated with the approximately 35-acre parcel of which the approximately 10-acre project site is a part. M&A biologists conducted site surveys on the entire 35-acre parcel on March 1 and April 27, 2006, June 14, 2011, February 14, March 21, and June 12, 2012, May 18, 2017, and on March 30, 2018, December 19 and December 27, 2019. In 2006, and again in 2011, M&A conducted a wetland delineation on the entire parcel. This delineation of "waters of the U.S." was confirmed by the Corps in 2012 and reverified by this agency in 2017. During the site surveys and wetland delineation, M&A biologists recorded

biological resources and assessed the likelihood of resource regulated areas on the project site. In addition to the wetland delineations, the survey involved searching all habitats on the site and recording all plant and wildlife species observed. M&A cross-referenced the habitats found on the project site against the habitat requirements of local or regionally known special-status species to determine if the proposed project could directly or indirectly impact such species.

California Environmental Quality Act (CEQA) Guidelines, Section 15125(a), requires that the IS discuss the "baseline" environmental conditions at and in the vicinity of the project site. CEQA Guidelines Section 15125 (see also Section 15126.6(e)(2)) states the following regarding the baseline condition:

> (a) [the CEQA review document] must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. The description of the environmental setting shall be no longer than is necessary to understanding the significant effects of the proposed project...

Therefore, the "baseline" is the combined circumstances existing at the time the CEQA document is published, which in the case of M&A's Biological Resources Analysis is March 2020, supplemented by M&A's September 3, 2020 study of the borrow site on the adjacent parcel.

Prior to preparing the biological resources analysis report, M&A researched the most recent version of CDFW's Natural Diversity Database, RareFind 5 application (CNDDB 2018) for historic and recent records of special-status plant and animal species (that is, threatened, endangered, rare) known to occur in the region of the project site. All special-status species records were compiled in tables. M&A examined all known record locations for special-status species to determine if special-status species could occur on the project site or within an area of effect. Therefore, in analyzing "baseline" conditions for biological resources, M&A considered past sightings and studies on the project site to the extent that they were still relevant.

Note that the proposed project site is only 10 acres of the original 35-acre parcel that M&A surveyed in 2006, 2011, and 2012, 2017, 2018, and 2019. M&A's Biological Resources Analysis report described wildlife habitats and species observed onsite during the 2020 baseline survey conducted as part of M&A's Biological Resources Analysis report for the project site.

Comment A.16.B: The MND identifies five special-status species that could be impacted by the Project: western burrowing owl, Swainson's hawk, northern harrier, white-tailed kite, and western pond turtle. The Applicant's biological resource consultant, Monk & Associates, did not conduct focused surveys to determine whether any of these species use the Project site (or adjacent eucalyptus grove) as nesting habitat.

The comment continues with:

"The California Department of Fish and Wildlife ("CDFW") recommends two types of surveys to assess and mitigate a project's impacts on special-status species: (1) "detection surveys," and (2) "take avoidance" surveys. Detection surveys are designed to maximize detection of a given species, and thus require implementation of specially-timed, species-specific survey techniques. The intent of detection surveys is to provide reliable information on the abundance, distribution, and seasonal (or life history) use patterns of a species within the area that would be directly or indirectly affected by the project. Detection surveys provide the information the lead agency, public, and natural resource agencies need to: (a) effectively assess potential impacts, and (b) formulate effective mitigation measures.

…..

It is not possible to effectively assess Project impacts until focused detection surveys have been conducted. As a result, the City must require detection surveys that adhere to CDFW standards."

Response: M&A's principal and senior associate biologists have been conducting biological field surveys for over 30 years and have never heard CDFW refer to "detection" surveys versus "take avoidance" surveys when commenting on CEQA documents. The comment does not provide a citation in reference to these two types of surveys; therefore, M&A is unable to refer to that specific CDFW publication referenced in the comment.

CEQA biology reports typically include a general assessment of the plant communities and wildlife habitats on a project site, and an evaluation of the likelihood of those communities/ habitats to support specific special-status species (i.e., threatened, endangered, rare species). The reports then determine if the proposed project could directly or indirectly impact such species. M&A's baseline surveys followed this approach, which is the standard of care for the industry for preparation of CEQA biological resources reports.

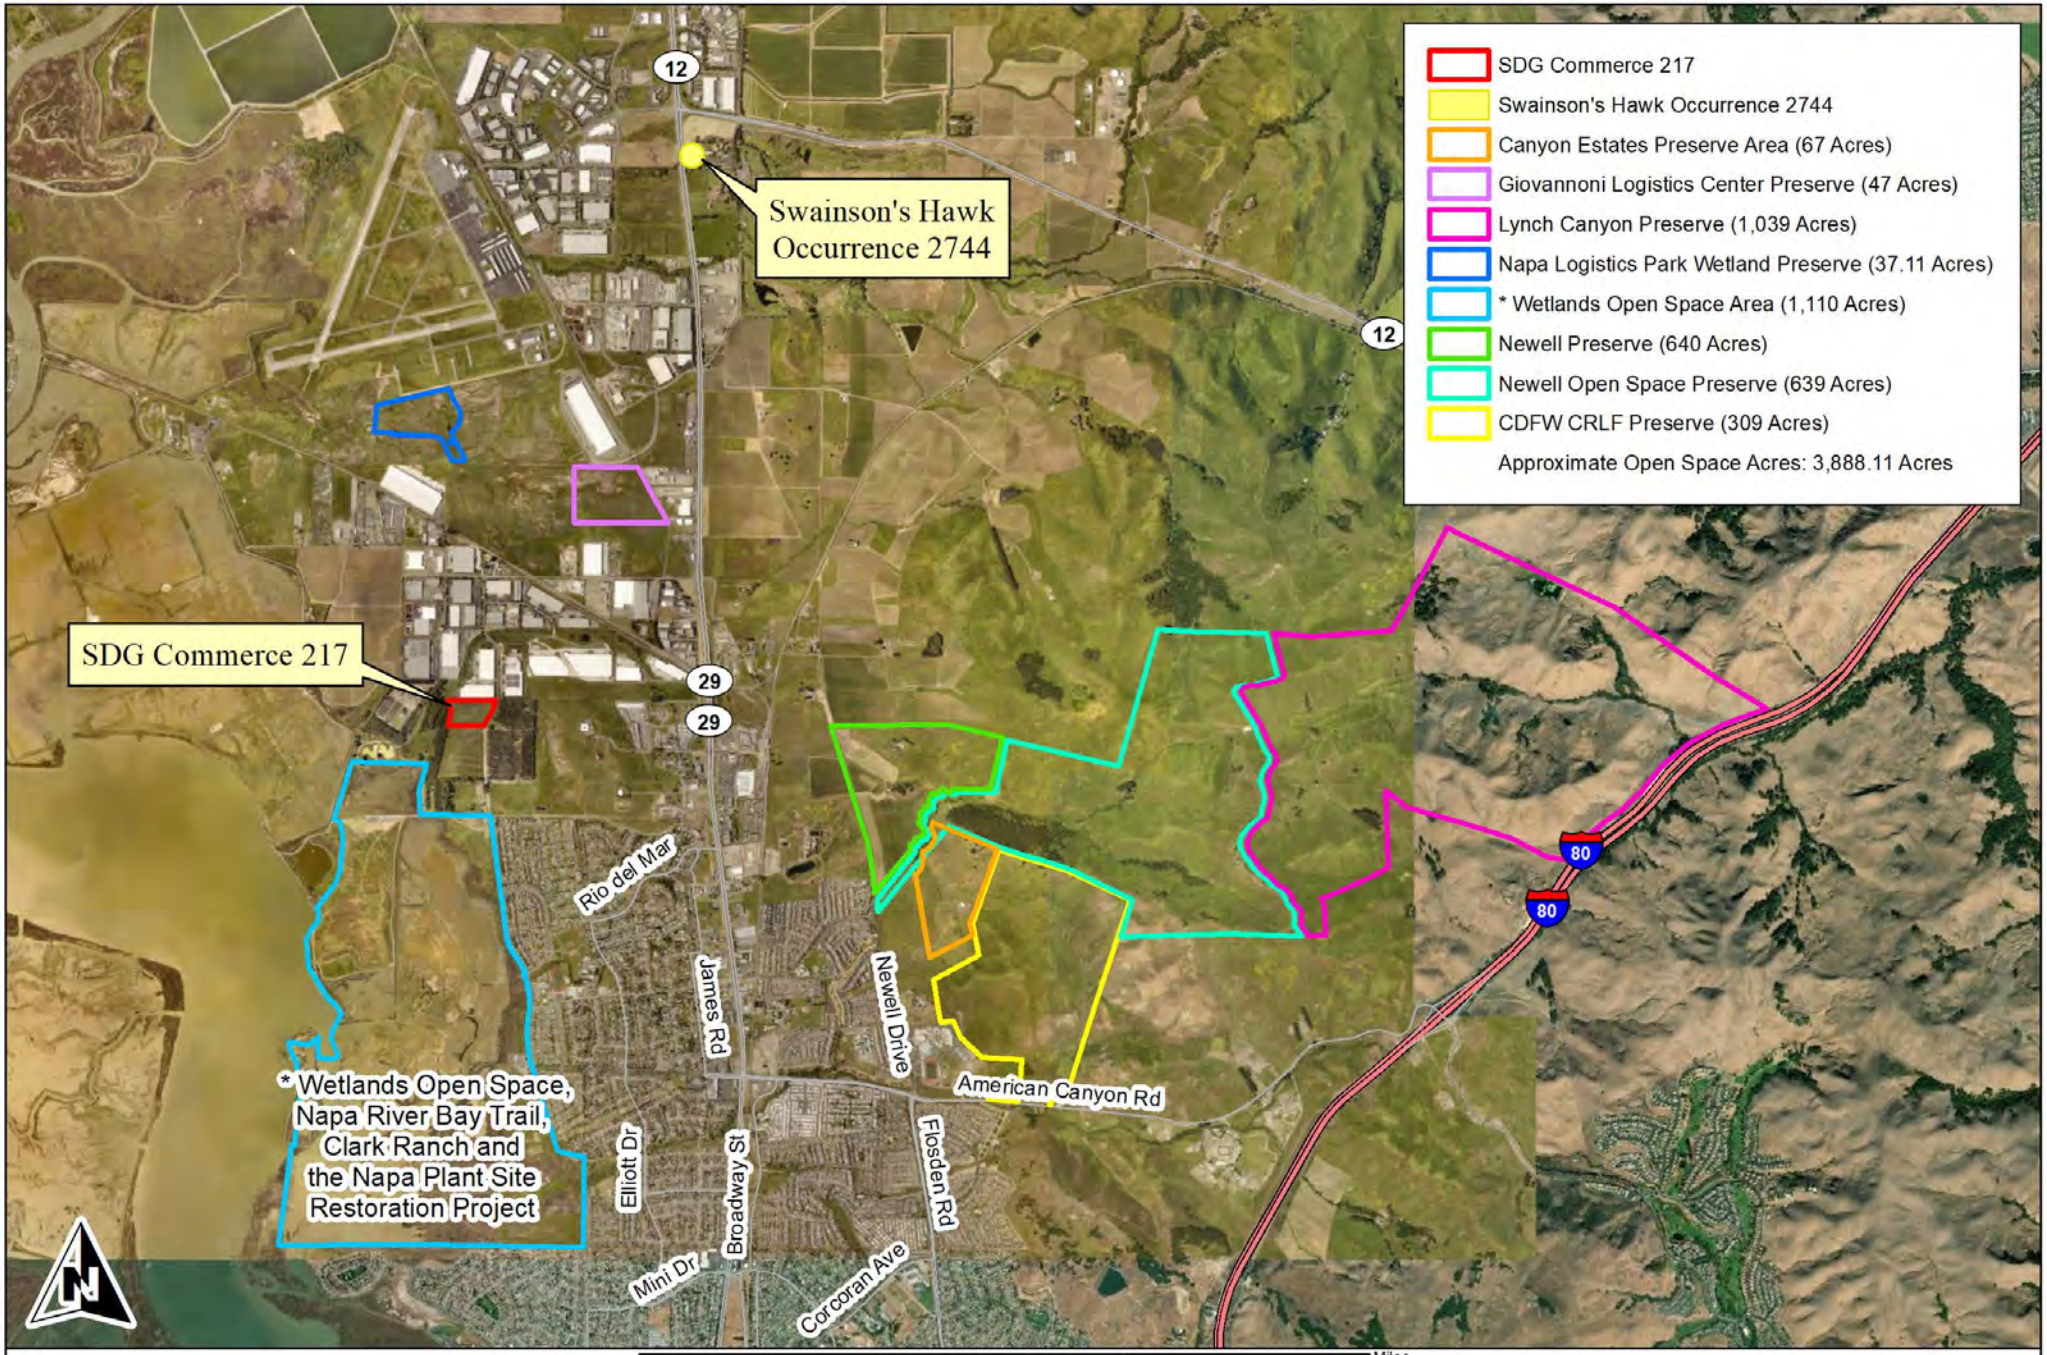
M&A biologists have a long history of field surveys associated with the approximately 35-acre parcel in which the approximately 10-acre project site is a part. M&A biologists conducted site surveys on the parcel on March 1 and April 27, 2006, June 14, 2011, February 14, March 21, and June 12, 2012, May 18, 2017, and on March 30, 2018, December 19 and December 27, 2019. On April 22, 2021, M&A also conducted a specific survey for nesting birds including raptors such as the Western Burrowing Owl, Northern Harrier, White-tailed Kite, and Swainson's Hawk. During all surveys M&A biologists also noted all plant species onsite, kept lists of plants observed and were able to conclusively state that no special-status plants were observed on the project site. Nine of the 11 surveys mentioned above were appropriately timed to identify rare plants, had they been present on the project site. Finally, no special-status raptors or other special-status animal species were observed onsite or nearby during M&A's numerous surveys. Nine of the 11 surveys mentioned above were conducted during the nesting season; thus, had raptors or special-status birds nested on or near the project site, they would have been readily detected during these surveys by M&A's trained biologists. Regardless, since M&A recognizes that birds

are mobile and change nesting locations from year to year, preconstruction surveys would be necessary to ensure that the proposed project did not result in "take" of nesting birds, their eggs or young, as prescribed in the MND.

Comment A.17: The MND Fails to Adequately Analyze and Mitigate Impacts to the Swainson's Hawk. The comment states that the City relied on the California Natural Community Database (CNDDB) for its knowledge of Swainson's Hawk records in the Napa County area and as such has no basis for its assumption that the nearest Swainson's hawk nesting record is 2.6 miles to the north of the project site. Further, the commenter states that the applicant did not conduct surveys to determine the current status of Swainson's hawk nests in the vicinity of the project site.

Response: Impacts to Swainson's hawk were adequately analyzed in the MND and mitigation prescribed for the project's potential impact to this species. M&A and the City did not rely on the CNDDB for knowledge of Swainson's hawk records. The CNDDB is only a part of the background research that goes into determining special-status species presence in an area. Thus, the fact that the MND states that the closest known occurrence of nesting Swainson's hawks is 2.6 miles to the north, as cited in the CNDDB and shown in Exhibit A, is not indicative of M&A solely relying on the CNDDB for special-status species data. M&A has conducted numerous studies in the City of American Canyon and southern Napa County, and has years of Swainson's hawk-specific local data from surveys that were conducted during the prescribed survey windows as specified by and in accordance with CDFW's *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (CDFG 1994). In fact, in 2019, surveys for nesting Swainson's hawks were conducted in two separate periods on the 35-acre parcel that encompasses this 10-acre project site. In total, six surveys were conducted on the 35 acres over the two survey periods; no nesting Swainson's hawks were found onsite or within a half-mile radius. Additionally, in March and April of 2021, M&A biologists conducted Swainson's hawk surveys for other projects in the City of American Canyon and the 0.5-mile survey radius for those studies included the 217 Commerce Center project site. No nesting Swainson's hawks were observed onsite or nearby during the March and April 2021 surveys (Sarah Lynch, Senior Biologist, Monk and Associates, pers. com.).

Comment A.17.B: the MND claims: "there are extensive foraging opportunities around the nesting location 2.6 miles north of the site and between this nesting location and the project site." However, the MND fails to provide evidence to support that claim or the implicit assumption that foraging habitats north of the Project site are sufficient to sustain the local Swainson's hawk population. Based on Mr. Cashen's review of Google Earth imagery, much of the open space that remains "around the nesting location 2.6 miles north of the site and between this nesting location and the project site" is comprised of vineyards or other land cover types that provide little to no value as foraging habitat for Swainson's hawks.



Response: M&A biologists have conducted numerous Swainson's hawk surveys of the undeveloped lands of American Canyon and southern Napa County over several decades, and, based on those studies, consider the comment's conclusion that the lands around the project site

and within 2.6 miles is comprised of "vineyards or other land cover types that provide little to no value as foraging habitat for Swainson's hawks" to be in error. Most of the undeveloped land east of the project site between Hess Road and Eucalyptus Drive (the Oat Hill area) is open grassland that provides suitable foraging habitat. Similarly, north of the project site, between Green Island Road and Devlin Road is the Giovannoni property which is approximately 208 acres of undeveloped grassland and seasonal wetland habitat. This land is perfect for foraging raptors such as the Swainson's hawk. Finally, the American Canyon wetlands south of the project site has plenty of upland habitat to support foraging Swainson's hawks, as demonstrated in the eBird sightings in this area. It is important to note that there is currently 2,092 acres of high-quality permanently preserved open space, comprised primarily of grassland with interspersed oak woodland, that is within 5.2 miles of the project site. These open space areas include Canyon Estates Preserve Area (67 acres), Lynch Canyon Preserve (1,039 acres), Napa Logistics Park Wetland Preserve (37.08 acres), Newell Preserve (640 acres), Newell Open Space Preserve (639 acres), and the CDFW California Red-Legged frog Preserve (309-acres) as shown on **Exhibit A,** below. Impacts to the 10-acre project site represents an insignificant loss of foraging habitat (0.48% of the preserved foraging habitat within 5.2 miles). More importantly, the Napa Logistics Park Wetland Preserve (37 acres) and the proposed Giovannoni Preserve (47 acres) (Exhibit A) are located 1 mile to 1.3 miles southwest of the aforementioned nesting occurrence (CNDDB Occurrence No. 2744) which is even closer than the project site. This should be more than adequate to support any nesting pairs within this area of southern Napa County.

Regardless, the Swainson's hawk has not been observed nesting onsite during appropriately timed, protocol-level surveys conducted in 2021, 2019, and 2018. Impacts to Swainson's hawks are unlikely to occur from the proposed project, and, in addition, mitigation measures are in place to ensure that any potential impacts to this species are reduced to a less-than-significant level.

Comment A.18: The MND Fails to Adequately Analyze and Mitigate Impacts to the Northern Harrier. The comment explains that one of the primary threats to northern harriers is the loss and degradation of nesting and foraging habitat. Although the MND acknowledges northern harriers may nest on the Project site, it fails to analyze the significance of the Project's permanent impacts on nesting habitat (i.e., the analysis is limited to disturbance of nesting harriers). The comment further states: Mr. Cashen explains that Mitigation Measure BIO-3 is limited to measures designed to minimize disturbance to raptor nests during the avian nesting season; the mitigation measure does nothing to mitigate the Project's permanent impacts on northern harrier habitat. He concludes that, because habitat loss is a primary threat to the northern harrier, potentially significant impacts on the species remain unmitigated.

Response: The northern harrier is a California "species of special concern." This raptor is not protected pursuant to either the State or Federal Endangered Species Acts. As such, loss of foraging habitat for this raptor (bird of prey) is not protected under any state or federal regulation. Protection of the northern harrier is limited to California Fish and Game Code sections that protect this bird, its active nests, its eggs and young. As such, the MND proposes mitigation to ensure that the project does not result in loss of nesting birds, eggs, or young. The mitigation

Map Preparation Date: June 1

measure prescribed for the northern harrier is sufficient given this raptor's legal status (a California species of special concern). Finally, though it is not a requirement pursuant to CEQA or the Fish and Game Code that protects this bird, suitable foraging habitat for this bird remains in the project vicinity as discussed above for Swainson's hawk, and as shown on Exhibit A.

Comment A.19.: The MND Fails to Adequately Analyze and Mitigate Impacts to the White-tailed Kite. Mr. Cashen explains that the City's white-tailed kite analysis suffers the same flaws as the analysis for the northern harrier: (1) the Project site historically provided foraging habitat (i.e., before the eucalyptus trees were planted); and (2) the City's analysis fails to apply the proper baseline conditions. White-tailed kites have relatively small home ranges and seldom hunt more than 0.5 mile from their nests when breeding. Habitat quality for white-tailed kites in California is largely dependent on the abundance and availability of California voles, which are known to occur at the Project site. Hawbecker (1940) provided evidence that a high population of voles was necessary for successful kite nesting, and that a nearby source of suitable food is just as necessary as the nest tree. Therefore, if white-tailed kites nest on or near the Project site, they would be significantly impacted by the loss of foraging habitat (from the Project site).

Response: The white-tailed kite is a "fully protected" species under California Fish and Game Code. Fully protected species may not be taken or kept in possession at any time (Fish and Game Code Section 3511). Thus, it is illegal to "take" white-tailed kites. "Take" is defined in Fish and Game Code Section 86 as "hunt, pursue, catch, capture or kill, or attempt to hunt, pursue, catch, capture or kill." Any proposed activity that could kill or otherwise take a white-tailed kite would be a significant adverse impact pursuant to CEQA. However, loss of white-tailed kite foraging habitat would not be considered a significant adverse impact pursuant to CEQA and it is not a CEQA requirement to set aside foraging habitat for this species. Additionally, the white-tailed kite has no special federal legal status. The MND has been correctly written to ensure the protection of individual and nesting white-tailed kites and their eggs and young. Finally, though it is not a requirement pursuant to CEQA or the Fish and Game Code, suitable foraging habitat for this bird remains in the project vicinity (as discussed above for Swainson's hawk), and as shown on Exhibit A.

Comment A.20: The MND Fails to Adequately Analyze and Mitigate Impacts to Burrowing Owl Habitat. According to the comment: "Essential Habitat" for burrowing owls includes nesting, foraging, wintering, and dispersal habitat (CDFW 2012 Staff Report). Contrary to CDFW's guidance, the MND provides no analysis of impacts to satellite burrows, foraging habitat, dispersal and migration habitat, wintering habitat, and habitat linkages. The impact assessment in the MND is limited to the following: the project site provides marginal nesting habitat for the western burrowing owl. Should burrowing owls occur on or near the project site, nesting activities and/or individual owls could be harmed by construction activities. Therefore, impacts to western burrowing owl could be potentially significant. Mitigation Measure BIO-1 would reduce this impact to a less-than-significant level. As Mr. Cashen explains, there are two problems with the City's analysis. First, Mitigation Measure BIO-1 would not reduce impacts on the nesting population to less-than-significant levels. Breeding burrowing owls are believed to be extirpated

from Napa County. Due to their strong site tenacity, burrowing owls rarely colonize new sites, or re-colonize historical sites from which they have been extirpated. In other words, burrowing owls do not merely nest elsewhere when their nesting habitat is eliminated. As a result, the presence of nesting burrowing owls at the Project site would be extremely significant from a biological perspective, and elimination of the nesting habitat would be significant and unmitigable.

Response: While CEQA requires an analysis of the project baseline at the time the CEQA report is initiated, the project site's history is relevant to this project's biological resources analysis. The project site and surrounding parcels were 100 percent choked with Eucalyptus trees between the 1950s (perhaps earlier) and January 2012 (UC Santa Barbara Aerial Photograph Library). During that 60-plus year period, no California ground squirrels would have been on the project site as this species is typically not found in dense Eucalyptus. The removal of the Eucalyptus "grove" did not result in attracting California ground squirrels to the area; biological surveys conducted by M&A onsite in 2018, 2019, and 2021 did not detect California ground squirrels onsite. In April 2021, two M&A biologists conducted a burrowing owl nesting survey on the project site walking systematic transects over the entire site. No California ground squirrels and no suitable donor burrows were observed onsite.

It is logical to assume that burrowing owls would not nest on the project site, or winter there, for many reasons. One, the fact that the site was covered with Eucalyptus trees for decades precluded use by ground squirrels and ground nesting birds. Two, the project site is still surrounded by Eucalyptus on two sides and buildings on two sides which offers ground nesting birds such as the burrowing owl a very narrow aerial view which makes scanning the sky for predators difficult and which also means that predators such as larger owls and eagles have readily accessible perches to observe the project site's open field for prey. Three, burrowing owls are not known to have historically nested in southern Napa County.[3] The commenter states that burrowing owls are extirpated from Napa County, but it is speculative to presume that they bred/nested/resided in the county initially. The only conclusion that may be drawn from the data at hand is that they are a transient bird of the open grassland/wetland habitats of southern Napa County/American Canyon. It is important to note that eBird records in the county for this species are spotty and do not date back earlier than 2013 which does not speak to the history of this species in the County. Based on M&A's numerous surveys on the project site and in the vicinity (M&A biologists have conducted site surveys on the overall 35-acre parcel on March 1 and April 27, 2006, June 14, 2011, February 14, March 21, and June 12, 2012, May 18, 2017, March 30, 2018, December 19 and December 27, 2019, and April 21, 2021), M&A is confident that this ground-nesting owl would not nest onsite or winter for more than a day or two, at most, due to an absence of secure refugia (burrows). Thus, the mitigation measure prescribed for this owl would reduce the project's proposed impact to this species to a less than significant level.

[3] Zeiner, D.C., W.F. Laudenslayer, Jr., K.E. Mayer, and M. White. 1990a. California's wildlife, volume II, birds. State of California, the Resources Agency, Department of Fish and Game, Sacramento, California.

Comment A.20: Second, CDFW submitted comments on the first MND that was issued for the Project. CDFW's comment letter states: "[i]f the survey determines that the project site is actively being used by burrowing owl, or any owls are passively relocated as described above, then compensatory habitat mitigation shall be provided." Thus, CDFW recommends compensatory mitigation if the Project site is actively being used by burrowing owls, irrespective of how the owls are using the site (e.g., nesting, foraging, sheltering), or the season of use. Mitigation Measure BIO-1, however, only requires compensatory mitigation if *nesting* burrowing owls are detected on the Project site; compensatory mitigation is not required if the site is being used to satisfy other life history requirements. Because the City's impacts analysis is limited to nesting habitat, and because MM BIO-1 only requires compensatory mitigation for nesting owls, Project impacts to foraging habitat, dispersal and migration habitat, and wintering habitat remain potentially significant.

Response: The western burrowing owl is a California species of special concern. It is not protected under the California Endangered Species Act nor is it protected under the Federal Endangered Species Act, which is the Act that can extend coverage to endangered species' *habitat* (unlike the CESA which only protects the listed species itself and not the habitat). Regardless, the project site does not provide habitat for the western burrowing owl as there are no burrows onsite or other suitable refugia (M&A April 2021 survey results). This ground- nesting owl has not been observed onsite during multiple surveys days conducted over multiple years in both the winter and the nesting season as described in other responses above. Thus, after many years of surveys there are no expected impacts to this owl, either wintering or breeding, from the proposed project. However, in an abundance of caution a mitigation measure for potential impacts to nesting burrowing owls was included in the MND in the remote possibility that this owl may occur onsite in the future. Keeping with our cautious approach, we have added to this mitigation measure the necessity of mitigating for impacts to wintering burrowing owls. This revised mitigation measure is provided below with red-line track changes showing where text was added to the measure.

> ***Mitigation Measure BIO-1:*** A qualified western burrowing owl biologist shall conduct surveys in accordance with the California Department of Fish and Game (now CDFW) 2012 Staff Report on Burrowing Owl Mitigation survey methodology (see https://wildlife.ca.gov/Conservation/Survey-Protocols#377281284-birds). Surveys shall encompass the project area and a sufficient buffer zone of approximately 200 to 500 feet depending on the neighboring terrain and vegetation as necessary to detect owls nearby that may be impacted by the project. Time lapses between surveys or project activities shall trigger subsequent surveys including but not limited to a final survey within 24 hours prior to ground disturbance before construction equipment mobilizes to the project area. If no owls are found during these surveys, no further actions to protect burrowing owl would be necessary.
>
> 1) If burrowing owls are detected on or adjacent to the site, the following restricted activity dates and setback distances recommended per CDFW's Staff Report (2012) shall be implemented, unless reduced buffers are accepted by CDFW in writing based on site specific conditions:

• From April 1 through October 15, low disturbance and medium disturbance activities shall have a 200-meter buffer while high disturbance activities shall have a 500-meter buffer from occupied nests and wintering sites.

• From October 16 through March 31, low disturbance activities shall have a 50- meter buffer, medium disturbance activities shall have a 100-meter buffer, and high disturbance activities should have a 500-meter buffer from occupied nests and wintering sites.

• No earth-moving activities or other disturbance should occur within the aforementioned buffer zones of occupied burrows. These buffer zones shall be marked with high visibility fencing or flagging.

2) If burrowing owls are present outside of the nesting season, burrowing owls may be passively relocated from the project site and adjacent habitat using CDFW-accepted methods so that construction can proceed. Any required passive relocation of burrowing owls would require CDFW acceptance. If passive relocation of non-nesting burrowing owls is necessary, a qualified biologist shall prepare a Relocation Plan and submit it to CDFW.

3) If a nesting season survey or wintering season survey determines that a burrow or refugia on the project site is occupied by burrowing owls, then compensatory mitigation in the form of a permanently protected, deed restricted set aside on open space land owned or obtained by the applicant shall be provided. This permanently protected area would be recorded within 90 days after commencement of project construction. If burrowing owls are observed during surveys, notification shall also be submitted to the CNDDB.

Comment A.21. b) The MND Fails to Adequately Analyze and Mitigate Impacts from Passive Relocation. The Project may involve excluding burrowing owls from their burrows in order to "passively relocate" them from the Project site and adjacent habitat. The MND fails to evaluate impacts to burrowing owls due to burrow exclusion, or to identify mitigation measures sufficient to reduce such impacts below a level of significance. Consistent with CDFW guidelines, burrow exclusion is a potentially significant impact under CEQA that must be analyzed.

Response: M&A biologists have received permission from the CDFW on multiple projects to exclude wintering burrowing owls from properties in order to prevent these owls from nesting onsite in the near future when construction is eminent and it would be more impactful to the owls to have them nesting onsite when construction commences. Excluding wintering burrowing owls from properties proposed for construction is an impact minimization measure that is recognized by conservation organizations and is prescribed in the San Joaquin Multi-Species Conservation Plan (SJMSCP) and in the East Contra Costa County HCP/NCCP as a recognized take avoidance/impact minimization measure. Also, please note that MND Mitigation Measure BIO-1 has been rewritten to provide compensatory mitigation for *wintering* western burrowing owls, although based on past surveys conducted onsite over multiple years, we believe it is highly unlikely that western burrowing owl will be observed onsite.

Comment A.22. The MND Fails to Adequately Analyze and Mitigate Cumulative Impacts. The MND indicates there are only four projects that are proposed or under construction in the City of American Canyon. This does not comport with the "Active Project List" (dated March 2021) available on the City's website. According to the Active Project List, there are several additional projects that would contribute to cumulative impacts on biological resources. These include the Giovannoni Logistics Center, Oat Hill Multi-Family, Canyon Estates, and Watson Ranch Specific Plan projects. Cumulatively, these projects would impact several hundred acres of habitat for special-status species (e.g., Swainson's hawk). The MND fails to disclose or analyze cumulative impacts due to *all* past, present, and probable future projects in American Canyon.

Response: The project site provides approximately 10 acres of ruderal herbaceous habitat that, for decades, was a eucalyptus forest (source: historic aerial photograph images, UC Santa Barbara). Eucalyptus trees have allelopathic chemicals in their leaves, bark and roots which prevents other plants from growing under them. Dense groves of eucalyptus also blot out sunlight from reaching the ground. Dense groves of eucalyptus typically thwart burrowing animals' attempts at establishing underground tunnels due to the dense root network of the closely planted trees. Removal of the trees allows the ground to recover and herbaceous vegetation to re-establish in the area but the recovery process of the soil is slow and continual management for fire control hinders a speedy ecological recovery. In summary, development of this approximately 10-acre property that abuts eucalyptus groves and warehouses does not constitute a cumulatively considerable contribution to overall cumulative impacts to biological resources in American Canyon. The habitat preserves that have been established on the eastern City limits and in the surrounding portions of Napa County, as discussed in the MND and as shown in attached Exhibit A, provide far greater habitat value to biological resources using or possibly using the project site. The mitigation measures prescribed in the MND appropriately address potential impacts to western burrowing owl, Swainson's hawk, nesting raptors and nesting passerine birds, and reduce those impacts to a less-than-significant level in both the project and cumulative contexts. Therefore, no additional cumulative impacts assessment is required in the MND.

Comment A.23. The MND Provides Inadequate Compensatory Mitigation for Potentially Significant Impacts to Biological Resources. a) Mitigation Measure BIO-1 (Burrowing Owl). The commenter continues the comment saying that the mitigation measure BIO-1 is vague in its mitigation details and that success criteria and other mitigation plan details are not provided in the mitigation measure.

Response: The details of the Relocation Plan and Exclusion Plan would be developed at the point such a plan is necessary, and would be submitted to the CDFW for their review, comment and ultimately, approval. Typically, success criteria and other details are not discussed in the CEQA review document but rather in the mitigation plan or permit application submitted to the agency with jurisdiction over the resource in question. Should mitigation for burrowing owl be necessary, the CDFW would review the proposed mitigation plan(s)(e.g., exclusion plan, etc.) and provide

comment at that time. Any such plan would undergo robust vetting by the CDFW prior to their approval.

Comment A.24. Mitigation Measure BIO-2 (Swainson's Hawk). CDFW has determined that compensatory mitigation is not required for projects in areas that have less than 5 acres of foraging habitat and are surrounded by existing urban development, unless the project area is within 1/4 mile of an active nest tree. For all other projects, the CDFW has concluded that the loss of foraging habitat may lead to the "take" of Swainson's hawks and that mitigation is required. According to CDFW mitigation guidelines, projects within five miles of an active nest tree shall provide habitat compensation at a 0.75:1 ratio. Even if the City determines the Project would not cause a significant reduction in available foraging habitat for the Swainson's hawk territories that occur north of the Project site, habitat compensation is required to support the needs of additional territories as the population recovers.

Response: In 1979, a report prepared by Dr. Peter Bloom estimated 375 (+ or -50) breeding pairs of Swainson's hawks remaining in California. Bloom's report noted that nesting numbers were greatest in the Central Valley and in the Great Basin area of northeastern California, with a few Swainson's hawk territories located in Shasta Valley, the Owens Valley, and the Mohave Desert. In 1988, a CDFW led survey effort revealed no change in Swainson's hawk distribution from the 1979 report. The 1988 effort led to an estimate of 430 pairs in the Central Valley and a state-wide estimate of 550 breeding pairs. In 2005, a state-wide survey was conducted in the known range. The results showed a state-wide estimate for the number breeding pairs at 2,081.

Circa 2005, Dr. Bloom noted that the Swainson's hawk population in California and indeed throughout its historic range in North America was suffering from acute poisoning from grasshopper insecticides that were being applied directly on their gregarious migration roosts in Argentina (pers. comm. with G. Monk). This practice has largely been stopped in Argentina within the last 15 years and the Swainson's hawk nesting population in California seems to be responding remarkably. The Swainson's hawk nesting distribution now occurs in many areas where the Swainson's hawk has not been known to nest for decades, if ever. Napa County, while considered within the historic distribution of the Swainson's hawk, was not known to support nesting sites for this hawk in the 1970s or 1980s. Similarly, the nesting population now extends into east Contra Costa County where nesting has not been recorded for many decades. Other nesting population recovery that Mr. Monk knows of includes areas of Southern California in the Antelope Valley and in Kern County. This widespread nesting recovery that is documented in the CNDDB and by the personal observations of many other biologists in California is yet to be incorporated into CDFW policy. Accordingly, the 1994 Staff report regarding *Mitigation for Impacts to Swainson's hawks (Buteo swainsonii) in the Central Valley of California* besides being geographically inappropriate for the proposed project in Napa County, is also not relevant to current nest territory expansion of the Swainson's hawk population into Napa County and elsewhere in the state. Thus, this document is not appropriately used as a basis for determining mitigation ratios for impacts to annual grassland (and in the case of the project site, ruderal herbaceous habitat) in Napa County. That *Staff Report* requires mitigation for projects that impact foraging habitat within 10 miles of an "active" Swainson's hawk nest (as defined by the

CDFW *Staff Report*). For the reasons provided above this mitigation requirement is not reflective of the current population expansion of the Swainson's hawk in California, and its use is geographically limited to the Central Valley.

It is noteworthy that other raptors that were state and federally listed when the Swainson's hawk was state listed in 1983 such as the Bald Eagle (*Haliaeetus leucocephalus*) and the peregrine falcon (*Falco peregrinus*) have been delisted (i.e., removed from protections provided by both the CESA and the FESA). The federal government conducted routine census surveys for these species and determined that the nesting populations of these species had fully recovered and thus that protection pursuant to the FESA was no longer warranted. The CDFW followed these delisting efforts. In contrast, the Swainson's hawk was never federally listed, and as the State of California does not have a recovery plan for the Swainson's hawk there is no guideline for what constitutes recovery. In addition, the Swainson's' hawk certainly has not a full "boots on the ground" nesting census to the extent that federally listed raptor species did. Thus, mitigation prescriptions developed 21 years ago are outdated today.

While the decline of the Swainson's hawk population may still be an issue in the Central Valley, the Napa County population may be overemphasized by the CDFW. While the CDFW published a 5-Year Status Review for the Swainson's hawk, the census data supporting this raptor's continued listed status was focused only on the known distribution of this species as detailed in Bloom 1980, which this document claims is consistent with the distribution and numbers outlined in the original status review that led to the listing of this species by CDFW. As referenced above, these data do not take into account the range expansions into areas where the Swainson's hawk had historically nested and the species was presumed extirpated, specifically Sonoma and Napa counties (page 14 of the 2016 CDFW Status Review) and from which may be difficult to prognosticate population trends. The CNDDB lists many new records within the geographic area of the project site that are not taken into account in the status review. These CNDDB records attest to the health and well-being of the Swainson's hawk within this area of Napa County where it is clear the Swainson's hawk population is expanding. Finally, there are well over 2,000 acres of open space preserves in the immediate area for Swainson's hawks to forage/nest in. The Jack & Bernice Newell Wilderness Preserve (Newell Preserve), the Lynch Canyon Preserve, Canyon Estates Preserve (proposed) and the CDFW California Red-Legged Frog Preserve represent over 2,000 acres of permanently protected contiguous open space east of the project site. The Wetlands Open Space, Napa River Bay Trail, Clark Ranch and the Napa Plant Site Restoration Project represent several hundred additional acres of preserved open space and valuable wildlife habitats that will be preserved in perpetuity. As such, mitigation for the project's impact to potential foraging habitat are not warranted as this impact would be less than significant.

Comment A.25. Mitigation Measure BIO-3 (Nesting Raptors). The MND fails to identify the variables the biologist would monitor to ensure the adequacy of the no-disturbance buffers. Mitigation Measure BIO-3 lacks assurances that the "qualified biologist" would establish appropriate, species-specific no-disturbance buffers around all active nests.

Response: The MND does not spell out all the variables that the biological monitor would watch for to determine if nesting adults are in distress from earth-moving/construction activities nearby; however, as required by the MND's mitigation measure, the biological monitor would be a trained and qualified raptor biologist, with a minimum of two years of experience conducting raptor nesting surveys with detections. He or she would know what behaviors to watch for that would indicate that an adult may be in distress (for example, in some raptor species this could be agitated behavior in adult birds with one adult circling overhead and calling repeatedly. In some raptor species it is a silent departure from the nest). These distress signals will be known to the experienced raptor biologist who would be monitoring the nest.

It also should be noted that some raptors are more acclimated to disturbance than others. For example, a raptor pair that nests next to a busy road or a noisy factory would be acclimated to noise, and adjacent construction would likely not phase the nesting pair. By having a qualified raptor biologist monitor the nest/nesting attempt from the start of the construction activity daily for a week to observe the nesting raptors' behavior during the ongoing work, the biologist can see how the raptors respond to the activity and what an appropriate non-disturbance buffer would be. Once this buffer is established, the nest would continue to be observed to see how the raptors are responding. Presuming that the raptors are undisturbed by the established buffer distance, the daily monitoring can be reduced to checks once a week to ensure there has been no change in the birds' behavior. Of course, if a new and potentially more disruptive type of machinery or construction method is introduced to the work area, biological monitoring could resume daily to check that this new activity does not adversely affect the birds. Biological monitoring is an adaptive process and the biologist would modify the frequency of the monitoring activity as necessary to ensure the success of the nesting attempt. Thus, the mitigation measure as written in the MND reduces the project impact to nesting raptors to a less-than-significant level pursuant to CEQA.

Comment A.26. Mitigation Measure BIO-4 (Nesting Passerines) Mitigation Measure BIO-4 suffers the same flaws as Mitigation Measure BIO-3: (1) the mitigation measure fails to ensure that the biologist has the expertise needed to determine appropriate, species-specific no-disturbance buffers for active nests; and (2) weekly monitoring during construction is not sufficient to ensure significant impacts to nesting birds are avoided.

Response: This response is similar to the response to comment A.24. The biological monitor who would be assigned to this task would be a well-trained and experienced biologist. He or she would know what distress signs to look for in the nesting passerines. Of course, if a new and potentially more disruptive type of machinery or construction method is introduced to the work area, biological monitoring could resume daily to check that this new activity does not adversely affect the birds. Biological monitoring is an adaptive process and the biologist will modify the frequency of the monitoring activity as necessary to ensure the success of the nesting attempt. Thus, the mitigation measure as written in the MND reduces the project impact to nesting passerines to a less than significant level pursuant to CEQA.

Comment A.27. Mitigation Measure BIO-5 (Pond Turtle) Mitigation Measure BIO-5 requires a pre-construction survey for western pond turtles. If western pond turtle nests are found during the survey: "the nest site plus a 50-foot buffer around the nest site shall be fenced with orange construction fence until eggs hatch and young turtles disperse to the adjacent North Slough." Mr. Cashen explains that the proposed measure would be sufficient for turtle nests located less than 50 feet from the Project boundary. However, he explains that it would not be effective for turtle nests located in interior portions of the Project site. After traveling 50 feet, the turtles would need to travel through the construction zone to reach North Slough. These turtles would be subject to being killed or injured by construction activities. To rectify this issue, Mitigation Measure BIO-5 needs to be modified such that it requires installation of a no-disturbance dispersal corridor between the nest site and North Slough.

Response: In response to the comment, the mitigation measure for western pond turtle has been modified to include a no-disturbance corridor between the nest site(s) (if one is found) and North Slough. New text is underlined in the modified mitigation measure below.

Mitigation Measure BIO-5: A qualified biologist (i.e., a biologist with at least 2 years' experience conducting surveys for western pond turtle with detections) has prepared a wildlife exclusion plan for this project and has attached an exhibit of that fencing plan herein (please see attached Exhibit A). This wildlife exclusion fencing will be constructed of manufactured ERTEC wildlife exclusion fencing. This exclusion fencing shall be installed along the western perimeter of the project site returning back 50 feet to the north and 50 feet to the south preventing species from traveling from North Slough onto the project site during construction (see Exhibit A). A qualified biologist shall survey the project site and adjacent habitat within 72 hours of the start of project activities to determine if western pond turtle or their nests are present and guide the installation of the exclusion fence. If western pond turtles are discovered, a qualified biologist with experience handling and relocating the species shall move the species to the nearest suitable habitat outside of the project area and exclusion fencing. If western pond turtle nests are found, CDFW shall be notified prior to starting project activities. The nest site plus a 50-foot buffer around the nest site and a <u>no-disturbance corridor between</u> <u>the nest site and North Slough</u> shall be fenced with orange construction fence until eggs hatch and young turtles disperse <u>along the protected no-disturbance corridor</u> to the adjacent North Slough. In addition, if nest(s) are located during surveys, moth balls (naphthalene) shall be sprinkled around the vicinity of the nest (no closer than 5 feet) to mask human scent and discourage predators. Grading within the nest site's 50-foot buffer area <u>and no-disturbance corridor</u> shall be delayed until the young leave the nest as determined by a qualified biologist. If the CDFW allows translocation of any nestling pond turtles this shall be completed by a qualified biologist under the direction of the CDFW.

Implementation of this mitigation measure reduces the project's impact to western pond turtle to a less than significant level because it meets or exceeds all standard resource agency requirements for this species, and is consistent with professionally accepted approaches to mitigating impacts to this species.

Energy Impacts

Comment A.28. Substantial evidence supports a fair argument that the project may result in potentially significant energy impacts

Response: The IS/MND described and quantified the proposed Project's energy use. Construction energy use was quantified in the IS/MND as follows:

> *"Construction of the proposed project would require consumption of gasoline and diesel fuel by construction worker vehicles travelling to and from the site, by haul trucks delivering construction materials and supplies to the site, and by onsite construction equipment. Once the construction is completed and the proposed project is occupied, gasoline and diesel fuel would continue to be consumed by motor vehicles from employees, deliveries and visitors. Electricity would be consumed for lighting, space and water heating, and landscape maintenance (i.e., electricity to control irrigation equipment), as well as the operation of typical office and warehouse equipment such as computers and electric forklifts.*
>
> *The air quality modeling (CalEEMod) described in detail in the air quality section of this Initial Study, utilized standard fuel consumption estimates to determine that project construction activities would require approximately 42,500 gallons of diesel fuel.3 For the finishing phase of construction, some electricity may be used (e.g., for power tools and work lighting). While this electricity usage cannot be quantified at this time, it is anticipated to be relatively minor compared to normal building operations. When not in use, electric equipment would be powered off to avoid unnecessary energy consumption. Natural gas would not be used during construction."*

Operational energy use was quantified in the IS/MND as follows:

> *"The proposed project's electricity consumption was based upon actual electricity usage from two nearby and almost identical warehouse buildings and was estimated to be approximately 652,000 kilowatt-hours (kWh) of electricity per year (See Appendix B for details). The proposed project would not require the use of natural gas. The daily weekday vehicle trip rate of 1.69 weekday trips per 1,000 square feet was used to estimate mobile vehicle emissions (367 weekday vehicle trips). Based on air quality modeling (CalEEMod), the estimated annual vehicle miles traveled for the proposed project would be approximately 765,788 miles, requiring approximately 35,000 gallons of gasoline per year. Additional information regarding the energy calculation details are found in Appendix B."*

Energy use was estimated with through the use of the CalEEMod performed for the air quality analysis. The default energy use settings were adjusted in CalEEMod and were based on actual electricity usage for other wine warehouses nearby the proposed Project site. This provided far more accurate energy use estimates for the proposed Project because CalEEMod uses an average energy use derived from refrigerated warehouses throughout California. The proposed Project's

energy use is specific to the Project type (wine storage), location/climate (City of American Canyon), and also takes into account specific Project design (i.e., night air cooling system to capture cold air from outside during night, motion sensor lighting). As concluded in the IS/MND, energy impacts would be less than significant.

GHG Impacts

Comment A.29. The GHG analysis relies on inapplicable thresholds in violation of CEQA

Response: As stated in the IS/MND,

> *"The GHG emissions from construction (amortized) plus operational emissions would be approximately 590 metric tons of CO_2e per year, which is below the BAAQMD threshold of 1,100 metric tons and thus, would be a* ***less-than significant*** *impact."*

On September 8, 2016, Governor Brown signed Senate Bill (SB) 32 into law, amending the California Global Warming Solution Act. SB 32 requires the California Air Resources Board (CARB) to ensure that statewide GHG emissions are reduced to 40 percent below 1990 levels by 2030, and CARB adopted an updated Climate Change Scoping Plan in December 2017 to provide a framework for achieving this more stringent 2030 target. BAAQMD has yet to publish a threshold for 2030 in response to SB 32 and the CARB Scoping Plan. So, in the interim, the City has decided to use a threshold of significance that is 40 percent below the 2020 BAAQMD targets, which is what many other lead agencies under BAAQMD jurisdiction have chosen to do until the BAAQMD updates its CEQA Guidelines. Consequently, for the purposes of the proposed Project, a bright-line threshold of 660 metric tons of CO2e per year is utilized based on the GHG reduction goals of SB 32 (40% below the 1,100 metric tons of CO2e per year threshold).

As stated in the IS/MND and shown above, the GHG emissions from construction (amortized) plus operational emissions would be approximately 590 metric tons of CO2e per year, which is below the 660 metric tons of CO2e per year threshold based on the GHG reduction goals of SB 32. Therefore, the Project would not conflict with the GHG reduction goals of SB 32 and GHG emissions impacts would be less than significant.

Land Use Impacts

Comment A.30. The project may result in significant land use impacts due to zoning designation non-compliance.

Response: The American Canyon City Council considered the appropriateness of the zoning for wine warehouse uses in its approval of the Commerce 330 project in 2019, and considered the proposed use compatible with that zoning. As described in the IS, this is consistent with the City Attorney's conclusions. It should be noted that whether or not a project conforms with the site's zoning is a planning issue and does not constitute a physical environmental issue under the

purview of CEQA. Therefore zoning non-conformance is not, in itself, a potentially significant environmental impact.

Noise Impacts

Comment A.31. The Project may have significant noise impacts because it will create a canyon noise effect on the north side since there will be two concrete walls now facing each other**.**

Response: The proposed Project building would be greater than 200 feet (60 meters) from the existing building to the north and in between there is a dense row of eucalyptus trees and City access road. A canyon noise effect is typically observed in highly urbanized areas in between two high rise buildings where the area between the two buildings is narrow, paved and subject to constant traffic noise.

Based on the distance, vegetation and proposed intensity of Project operations between the proposed Project building and existing building to the north, the proposed Project would likely not generate a perceptible canyon noise effect. Any added noise from reflections from the building to the north would send noise east and west of the area between the proposed Project building and existing building to the north, which are Eucalyptus groves with no sensitive receptors nearby. Therefore, no City noise standards would be exceeded and noise impacts would be less than significant.

Furthermore, no canyon noise effect was observed during onsite noise measurements between the building to the north of the Project site and the building north of the Couch property to east of the Project site. These two buildings are approximately the same distance apart as the proposed Project building and the existing building north of the Project site.

Comment A.32. The MND accounts for noise on site due to truck traffic, but does not account for any along the routes the trucks must take enter and exit the to the Project

Response: The IS/MND analyzed noise from on-site truck traffic as follows:

> *"The loudest noise generated from project operations would be traffic noise from trucks traveling to and from the warehouse as well as loading and unloading at the project site. Trucks would travel between the site and Highway 29 via Commerce Court and Green Island Road. The existing average traffic noise levels measured at Commerce Court (Site 5) were 52 to 59 dB Leq. Typically, traffic volumes need to double in order to result in a perceptible change in noise levels (i.e., 3-5 dB). The project is estimated to generate approximately 367 trips per day during weekdays with 35 AM peak- hour trips and 28 PM peak-hour trips, which would be less than one trip per minute during the peak hour traffic (GHD, 2020). Project traffic would not result in a doubling of traffic and would have a less than 3 dB increase and would have a minimal effect upon ambient noise levels in the project vicinity.*

> *Loading dock activities would include heavy trucks stopping (infrequent air brakes), backing into the loading docks (back up alarms), and pulling out of the loading docks (revving engines). The trucks would be unloaded from the inside of the warehouse and most of the unloading noise would be contained within the building and truck trailer. Noise would occur periodically for several minutes at a time during each delivery/pickup at the warehouse.*
>
> *The loading docks would be located on the north side of the warehouse building. At the nearest residence (to the southeast), noise levels from the project's loading dock and semi-truck movements would be far below ambient noise levels due to the large distance between source and receptor (approximately 1,400 feet) and additional shielding from the warehouse building and residential noise barrier. In addition, interior noise levels would be approximately 25 dB less inside the residence (Bollard, 2005; Bum, 1994).*
>
> *Noise from project operation would not exceed the 65 dB Ldn exterior noise standard for residential land uses contained in the City of American Canyon General Plan at the nearest residence. Operational noise generated by the project would be* ***less than significant****."*

Trucks would travel between the site and Highway 29 via Commerce Blvd. and Green Island Road (an industrial region of the City). Trucks would enter the Project site at the northeast corner of the Project site via Commerce Blvd. Trucks would exit the Project site at the southeast corner of the Project site via Commerce Blvd.

The Project entry/exit and Commerce Blvd. is approximately 1,000 feet from the nearest sensitive receptor (mobile home on the Couch Property to the east). Napa Junction Elementary School is approximately 1,750 feet from the Project exit and approximately 2,150 feet from the Project entry, and is shielded by very dense eucalyptus on the Couch Property (east of the Project site and north of Napa Junction Elementary School). The residential neighborhood south of Napa Junction Elementary School is approximately 2,100 feet from the Project exit and approximately 2,500 feet from the Project entry, and is also shielded by very dense eucalyptus on the Couch Property.

Heavy trucks have an Lmax of approximately 85 dB at 50 feet.[4] Based on line source attenuation for a soft site (the land between Commerce Blvd and the nearest sensitive receptor on the Couch Property is undeveloped), heavy trucks would have an Lmax of approximately 65 dB at 1,000 feet. Since trucks would be entering and exiting the facility intermittently during daytime hours and very dense eucalyptus exists between the Project entry/exit and the nearest sensitive receptor, which would further attenuate noise, traffic noise levels would be well below 65 dB Ldn at the mobile home on the Couch Property approximately 1,000 feet to the east. Furthermore, the

[4] California Department of Transportation (CalTrans). 2013. Technical Noise Supplement to the Traffic Noise Analysis Protocol. September 2013. https://dot.ca.gov/-/media/dot-media/programs/environmental-analysis/documents/env/tens-sep2013-a11y.pdf

majority of peak hour traffic is expected to be employee automobile trips, which would likely be imperceptible at the nearest sensitive receptor to the east. Therefore, traffic noise would not exceed the 65 dB Ldn exterior noise standard for residential land uses contained in the City of American Canyon General Plan and traffic noise impacts would be less than significant.

Comment A.33. The MND fails to describe how many concrete trucks will be necessary to complete the night time pours and whether the noise created from them would stay under 65dB as required by American Canyon Municipal Code.

Response: The IS/MND analyzed nighttime concrete pours as follows:

> *"Project construction would require approximately 15 days of nighttime construction activities for pouring concrete for the building slab, wall panel, and additional large paving due to the scale of the pour requiring that the plant and trucks being dedicated to it for the pour duration. Previous nighttime concrete pours occurred for the construction of the SDG Commerce 330 Distribution Center building approximately 1,000 feet south of the project. The City received a few calls from the residents to the southeast (the neighborhood southeast of the Eucalyptus Drive/ Wetlands Edge Road intersection) inquiring about nighttime construction noise. Once the pre-notification of nighttime construction dates and times were submitted to the City, the residents to the southeast were notified and understood the nature and timing of nighttime construction and submitted no further noise inquiries (Doswald, 2020). The concrete pours would occur during nighttime hours starting no earlier than 12:00 a.m.*
>
> *Concrete pouring activities would occur approximately 1,000 feet from the existing residence and 2,300 feet from the residential neighborhood. In addition, the existing SDG Commerce 330 Distribution Center building to the south would work as a noise barrier to the residences approximately 2,300 to the southeast. As shown in Table Noise-4, the maximum noise levels generated at 1,000 feet would be approximately 53 dB. This would be below the 60-dB nighttime noise limit for residential land uses contained in section 8.12.080 of the American Canyon Municipal Code. Similar to previous construction for the SDG Commerce 330 Distribution Center building, pre- notification of these night pour dates and times would be provided to the City of American Canyon and to residents that expressed concern with nighttime noise during the Commerce 330 Distribution Center construction."*

There was no noise monitoring conducted during the previous nighttime pours for the SDG 330 Warehouse Project, thus no information was provided in the IS/MND. The SDG 330 Warehouse Project was also significantly closer to the residential neighborhood south of Napa Junction Elementary School where residents previously called the City regarding nighttime noise (SDG

330 Warehouse was approximately 1,000 feet away and did not benefit from noise attenuation from the very dense eucalyptus on the Couch Property, and the proposed Project is approximately 2,300 feet away with intervening structures and vegetation in between). As stated above, the noise analysis in the IS/MND estimated concrete pouring activities including concrete trucks at approximately 53 dB Lmax at the nearest receptor approximately 1,000 feet to the east (mobile home on Couch Property). This estimate was considered conservative as it did not account for the attenuation from the dense eucalyptus that would act as a noise barrier between the Project site and the nearest receptor approximately 1,000 feet away. As stated in the IS/MND, nighttime pouring activities would be well below the 60-dB nighttime noise limit for residential land uses contained in section 8.12.080 of the American Canyon Municipal Code and would be less than significant. As an added measure, see MM-Noise 1, which requires pre-notification of night time pours.

Traffic Comments

Comment A.34. Potential warehousing uses of the project building may result in significantly higher trip generation than assumed in the MND.

Response: The intensification in use as described in the comment would not be allowable under the conditional use permit being sought. As described on Page 7 of the Initial Study, under "Current Zoning and General Plan Designations":

> *The General Plan designates the site as Commercial Recreation (CR) and the Zoning Map designates the site as Recreation (REC). The City's Municipal Code, Chapter 19.15.020 permits Wineries and non-winery uses with a conditional use permit in the Recreation Zoning District. A Conditional Use Permit is applied for in the attached Entitlement Application Form. It is anticipated that the distribution center would be used for "Winery" work in conjunction with viticulture related activities such as bottling, storage logistics, distribution, wine-packing, and wine related services.*

Comment A.35. The MND's Transportation section fails to address the serious operations and safety problems on SR 29 in the project vicinity.

Response: Since the statewide implementation of SB 743 on July 1, 2020, automobile congestion and delay are no longer considered to constitute a significant environmental impact under CEQA (Pub. Resources Code, §21099(b)(2)). Therefore, notwithstanding the existing congestion issues present on the corridor, as documented in the SR 29 Comprehensive Multimodal Corridor Plan, the proposed project's contribution towards automobile delay on SR 29 are no longer considered in the determination of potential transportation impacts under CEQA. From a traffic safety perspective, the project proposes no geometric changes to the roadways or intersections that

would contribute towards or introduce unsafe conditions on SR 29. Further, Caltrans, the agency with jurisdiction over SR 29, has reviewed the transportation analyses prepared in support of this project and made no comment requesting additional study of the SR 29 mainline or its intersections.

Comment A.36. The MND assumes implausible mitigation of the Project's significant VMT impacts.

Response: The approach GHD has applied to estimate VMT reduction associated with the completion of the bikeway connection between Eucalyptus Drive and Commerce Court represents a reasonably conservative estimate. The existing Wetlands Edge bikeway provides no commute benefit, as it currently fails to connect residential neighborhoods to employment destinations. The proposed 800-foot bikeway that would close the gap between Eucalyptus Drive and Commerce Court thereby induce additional bicycle commute demand for the existing Wetlands Edge bikeway by connecting a large residential area (south of Eucalyptus Drive) with the City's largest employment destinations (north of Commerce Court).

There is no existing designated bikeway connecting from Eucalyptus Drive to the recently constructed Class I Bike Path, located adjacent to the Commerce 330 site, connecting to Commerce Court. The unpaved gap in bicycle infrastructure is not a suitable bicycle commute route and is, for bicycle network planning purposes, a non-traversable gap. Constructing an accessible, paved, designated bikeway to Class I standards from Eucalyptus Drive to Commerce Court will provide a safe and efficient route for bicycle commuters.

The existing bikeway gap serves as a barrier to commuters that may desire to bicycle. It is necessary to include the existing Wetlands Edge bikeway in the induced bicycle commuting calculation, as it quantifies the extent of "latent demand" estimated to be present along the Wetlands Edge corridor. However, because there is a non-zero chance that some existing commuters may "traverse" the bikeway gap, notwithstanding the present unpaved dirt and gravel conditions, GHD presented and averaged the resulting calculations for induced bicycle commuting demand of both the full 1.85-mile bikeway and the proposed 800-foot gap closure in an effort to present a reasonably conservative estimate.

With respect to bicycle commute distance, GHD's technical analysis demonstrates that applying either the lower or higher bicycle commute distances (3.8 miles or 5.2 miles) would induce sufficient bicycle commuting to offset the project's VMT impact. GHD presented the results of both calculations and presented an average thereof. However, It is not necessary to average the results of this calculation to make the determination relative to the project's VMT impact.

Lastly, the annualization of daily VMT estimates (assuming 5 days per week, 47 weeks per year) is standard industry practice for converting daily traffic volumes, trip generation estimates, or VMT calculations to an annualized figure.

Comment A.37. There is substantial evidence supporting a fair argument that the Project may result in potentially significant adverse impacts that were not identified in the MND.

Response: The opinion expressed in the comment is noted. As discussed in this Final IS, there are no unmitigated potentially significant impacts associated with the project, therefore preparation of an environmental impact report is not required.

B. Lozeau Drury Comment Letter, May 3, 2021.

The following responses are keyed to the numbers of the comments in the "Analysis" section of the Lozeau Drury May 3, 2021 comment letter. The comment letter is included as Attachment B to this appendix.

Comment B.1. Constructing an 800-foot bike lane would reduce VMT of commuters in nearby neighborhoods by 733 VMT daily is not supported by substantial evidence because it assumes that cyclists cannot currently ride on Commerce Avenue from Eucalyptus Drive to the existing bike lane adjacent to the SDG Commerce 330 building. In addition, the VM<T reduction would be inadequate.

Response: See responses to **A.16,** above and **B.6,** below**.**

Comment B.2. The VMT Analysis fails to address the numerous non-commute trips generated by the Project.

Response: The consideration of commute trips only when establishing VMT baselines, VMT thresholds, and VMT estimates for employment projects is standard industry practice. Per the OPR Technical Advisory on Evaluating Transportation Impacts in CEQA (December 2018), with respect to recommended processes to establish VMT thresholds for office (work-based) projects, "where tour-based information is unavailable for threshold determination, […], **home-based work trip VMT should be used throughout all steps of the analysis**." (emphasis added)

Additionally, per the OPR Technical Advisory, the term "automobile" means on-road passenger vehicles, specifically cars and light trucks. Notwithstanding the fact that employment projects generate non-commute traffic and VMT, the selection of the commute VMT only provides a defensible apples-to-apples basis for establishing VMT baseline and thresholds against which all employment projects can be evaluated. Therefore, home-based work (i.e. commute) VMT, is the appropriate basis of analysis for this project.

Comment B.3. Substantial evidence of a fair argument exists that the project may have significant transportation impacts.

Response: See responses to **B.4, B.5,** and **B.6,** below. As discussed in those responses, the model inputs and assumptions made by GHD in preparation of the VMT analysis are considered conservative and rely on past studies most closely reflective on the characteristics of the proposed project. Therefore, the comment does not provide substantial evidence to support a fair argument of a significant impact.

Comment B.4. The MND's assertion that the proposed 800-foot bike lane should be credited with benefits for an additional 1.7 miles of existing bike lane is arbitrary and capricious.

Response: GHD's analysis does not "credit" VMT mitigation to the project from existing infrastructure. GHD's analysis quantifies the anticipated bicycle commute mode shift that could be reasonably expected to occur once the gap in the existing bikeway system is closed. See response to **A.36** for additional detail.

Comment B.5. The 5.2-mile average bicycle commute distance is based on an average bicycle commute trip distance documented in the Oregon Transportation Research and Education Consortium Report, *Understanding and Measuring Bicycling Behavior: a Focus on Travel Time and Route Choice* (OTREC 2008). This Report provides substantial evidence of the bicycle commute trip length because it collected statistically significant data, detailed bicycling behavior via GPS, and studied characteristics of bicycle commuters in an urbanized area. Since GHD's analysis is focused on bicycle commute mode shift in an urbanized area, use of bicycle commute trip length data from the OTREC study is appropriate, and is supported by substantial evidence.

The 3.8-mile average bicycle commute distance is reported in *Report 14. Bicycling and Walk Commuting* of *Commuting in America 2013: The National Report on Commuting Patterns and Trends* (AASHTO, 2015). This report is publicly available online and presents an average bicycle commute trip length of 3.8 miles based on nationwide household survey data. AASHTO is a nationally accepted and credible source and this study analyzed bicycle commuting nationwide with statistically significant data. GHD's analysis demonstrates that applying either the 3.8 mile or 5.2-mile distance to the calculation would result in sufficient induced bicycle commuting to offset the project's VMT impact.

The commenter suggests that the maximum potential bicycle commute that would be served by the bikeway is 0.75 miles. This is unreasonable, as the existing Wetlands Edge bikeway itself is nearly 2 miles long. It is, however, reasonable to assume that bicycle commuters could use the proposed bikeway gap closure to commute at least 5.2 miles to employment destinations on Commerce Court and along Green Island Road. South of the project, beyond the existing Wetlands Edge bikeway, there are low-stress residential streets and existing bikeways (i.e., bike lanes, bike routes) in American Canyon and in the City of Vallejo that will be connected to employment destinations via this gap closure.

Comment B.6. Applying CARB methodology to estimating VMT reductions induced by a bike facility, the proposed bike lane would induce only bike commutes replacing 24 VMTs.

Response: The CARB methodology is not appropriately applied in the comment. The equation utilizes an estimated 20 ADT on Commerce Court, which is a cul-de-sac. The intent of the CARB methodology is to use ADT as a proxy for latent bicycle commute demand where bikeways are not present. The correct application of the CARB methodology in this case would be to use the ADT of SR 29 (or a portion thereof) that is representative of the actual travel demand between Commerce Court and Eucalyptus Drive, were it connected by a public street instead of blocked by opposing cul-de-sacs.

Furthermore, the CARB methodology is not intended to estimate induced bicycle commute demand. The CARB methodology utilizes 1.5 miles as the average bicycle trip length. However, the 1.5-mile bicycle trip length presented by CARB represents the average distance of all bicycle trips, including commute trips, recreational trips, trips by children, shopping trips, and all other trip purposes. The methodology applied by GHD isolates induced demand to commute travel purposes only, which is required in order to maintain consistency with the home-based-work VMT calculations that establish a CEQA baseline and inform the determination of an impact.

C. Lozeau Drury Comment Letter, June 3, 2021.

The following responses are keyed to the numbers of the comments in the "Analysis" section of the Lozeau Drury June 3, 2021 comment letter. The comment letter is included as Attachment C to this appendix.

Comment C.1. For the many reasons identified in LIUNA's previous comments, the MND's estimate of VMT reductions that would result from the Project's proposed 800-foot bike lane are highly exaggerated. There is substantial evidence of a fair argument that the Project may have significant transportation impacts.

Response: See responses **B.1** through **B6,** to Lozeau Drury Comment Letter, May 3, 2021, above. As noted therein, there is not substantial evidence of a fair argument that the Project may have significant transportation impacts.

Comment C.2. For all of these reasons and those discussed in our prior comments, the MND is inadequate and an EIR is required.

Response: The comment's expressed opinion regarding the adequacy of the IS and need for an EIR is noted. Please see responses **B.1** through **B.6**, above.

RE: Comments on the Initial Study/Mitigated Negative Declaration for SDG Commerce 217 Distribution Center Project (Application PL20-0008; SCH Number 2020120302)

Dear Mr. He:

We write on behalf of American Canyon Residents for Responsible Development ("Residents") to provide comments on the Initial Study and Mitigated Negative Declaration ("MND") prepared by the City of American Canyon ("City") for the SDG Commerce 217 Distribution Center Project (Application PL20-0008; SCH Number 2020120302) ("Project"), proposed by SDG Commerce 217, LLC ("Applicant").

The Applicant seeks a Conditional Use Permit ("CUP") to construct a new 217,294 square foot wine warehouse distribution center with parking and landscaping at 1075 Commerce Court in the City of American Canyon, due north of the City of American Canyon Clarke Ranch open space/recreation area. The Project site is on the west side of Commerce Court and just south of the City's Utility Access Easement No. 2002-31363 and 1155 Commerce Blvd. The property is generally trapezoidal in shape, approximately 10.39 acres, and is the north parcel of a recently approved tentative parcel map. Access to the Project site is from SR-29 via Green Island Road to Commerce Court.

The Project site was previously part of a 35.85-acre parcel (APN: 058-030-065). A tentative parcel map was adopted by the City of American Canyon on

printed on recycled paper

February 28, 2019, that split the 35.85-acre parcel into three parcels. The 15.24-acre south parcel was previously approved as Project SDG 330 for an approximately 330,000 square-foot wine distribution center, which is nearing completion. Commerce Court was improved along the property frontage, with work completed October 13, 2020. The remaining middle parcel is approximately 10.17 acres in size[1]. According to the MND, there are no current plans for development of that parcel.[2]

Based upon our review of the MND and supporting documentation, we conclude that the MND fails to comply with the requirements of the California Environmental Quality Act[3] ("CEQA"). The MND fails to accurately describe the Project by piecemealing the City's environmental review of the Project from its related components. Additionally, it fails to identify the Project's potentially significant environmental impacts and fails to propose enforceable measures that can reduce those impacts to a less than significant level, as required by CEQA. 1

As explained in these comments, there is more than a fair argument that the Project will result in potentially significant impacts relating to air quality, public health, biological resources, energy, GHG, land use, noise, and transportation. The City may not approve the Project until it prepares an environmental impact report ("EIR") that adequately analyzes the Project's potentially significant direct, indirect and cumulative impacts, and incorporates all feasible mitigation measures to avoid or minimize these impacts.

We prepared these comments with the assistance of air quality and hazards experts James Clark, Ph.D., of Clark and Associates, Neil Shaw, FASA, FAES, Scott Cashen, M.S., and Daniel Smith Jr., P.E., of Smith Engineering & Management. Dr. Clark's technical comments and curricula vitae are attached hereto as **Attachment A**.[4] Mr. Shaw's technical comments and curricula vitae are attached hereto as

I. STATEMENT OF INTEREST

American Canyon Residents for Responsible Development is an unincorporated associations of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental and public service impacts of the Project. Residents includes American Canyon residents Robert Schwerin, Jason Moreno, and Anthony Ricker, the International Brotherhood of Electrical Workers Local 180, Plumbers & Steamfitters Union Local 343, Sprinkler Fitters Local 483, International Association of Sheet Metal, Air, Rail, Transportation Workers Local Union 104, and the District Council of Ironworkers, along with their members, their families, and other individuals who live and work in the City of American Canyon, and in Napa and Solano counties.

Individual members of Residents live, work, recreate, and raise their families in the City, in Napa and Solano counties, and in the surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist on site.

In addition, Residents has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for businesses and industries to expand in the region, and by making the area less desirable for new businesses and

printed on recycled paper

new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

II. AN EIR IS REQUIRED

CEQA requires that lead agencies analyze any project with potentially significant environmental impacts in an EIR.[8] "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made. Thus, the EIR protects not only the environment, but also informed self-government."[9] The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return."[10]

CEQA's purpose and goals must be met through the preparation of an EIR, except in certain limited circumstances.[11] CEQA contains a strong presumption in favor of requiring a lead agency to prepare an EIR. This presumption is reflected in the "fair argument" standard. Under that standard, a lead agency "shall" prepare an EIR whenever substantial evidence in the whole record before the agency supports a fair argument that a project may have a significant effect on the environment.[12]

In contrast, a mitigated negative declaration may be prepared only when, after preparing an initial study, a lead agency determines that a project may have a significant effect on the environment, but:

> (1) revisions in the project plans or proposals made by, or agreed to by, the applicant before the proposed negative declaration and initial study are released for public review

printed on recycled paper

> *would avoid the effects or mitigate the effects to a point where* <u>*clearly*</u> *no significant effect on the environment would occur*, and (2) there is *no substantial evidence* in light of the whole record before the public agency that the project, as revised, *may* have a significant effect on the environment.[13]

Courts have held that if "no EIR has been prepared for a nonexempt project, but substantial evidence in the record supports a fair argument that the project may result in significant adverse impacts, the proper remedy is to order preparation of an EIR."[14] The fair argument standard creates a "low threshold" favoring environmental review through an EIR, rather than through issuance of a negative declaration.[15] An agency's decision not to require an EIR can be upheld only when there is no credible evidence to the contrary.[16]

"Substantial evidence" required to support a fair argument is defined as "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached."[17] According to the CEQA Guidelines, when determining whether an EIR is required, the lead agency is required to apply the principles set forth in Section 15064, subdivision (f):

> [I]n marginal cases where it is not clear whether there is substantial evidence that a project may have a significant effect on the environment, the lead agency shall be guided by the following principle: If there is disagreement among expert opinion supported by facts over the significance of an effect on the environment, the Lead Agency shall treat the effect as significant and shall prepare an EIR.

---

[13] Pub. Resources Code, § 21064.5 (emphasis added).
[14] See, e.g., *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 319-320.

[16] *Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th, 1307, 1318; see also *Friends of B Street v. City of Hayward* (1980) 106 Cal.App.3d 988, 1002 (*Friends of B Street*) ("If there was substantial evidence that the proposed project might have a significant environmental impact, evidence to the contrary is not sufficient to support a decision to dispense with preparation of an EIR and adopt a negative declaration, because it could be 'fairly argued' that the project might have a significant environmental impact").
[17] CEQA Guidelines, § 15384, subd. (a).
5038-008acp

printed on recycled paper

Furthermore, CEQA documents, including EIRs and MNDs, must mitigate significant impacts through measures that are "fully enforceable through permit conditions, agreements, or other legally binding instruments."[18] Deferring formulation of mitigation measures to post-approval studies is generally impermissible.[19] Mitigation measures adopted after Project approval deny the public the opportunity to comment on the Project as modified to mitigate impacts.[20] If identification of specific mitigation measures is impractical until a later stage in the Project, specific performance criteria must be articulated and further approvals must be made contingent upon meeting these performance criteria.[21] Courts have held that simply requiring a project applicant to obtain a future report and then comply with the report's recommendations is insufficient to meet the standard for properly deferred mitigation.[22]

With respect to this Project, the MND fails to satisfy the basic purposes of CEQA. The MND fails to adequately disclose, investigate, and analyze the Project's potentially significant impacts, and fails to provide substantial evidence to conclude that impacts will be mitigated to a less than significant level. Because the MND lacks basic information regarding the Project's potentially significant impacts, the MND's conclusion that the Project will have a less than significant impact on the environment is unsupported.[23] The City failed to gather the relevant data to support its finding of no significant impacts. Moreover, substantial evidence shows that the Project may result in potentially significant impacts. Therefore, a fair argument can be made that the Project may cause significant impacts requiring the preparation of an EIR. 2

III. THE CITY FAILED TO PROVIDE TIMELY ACCESS TO MND REFERENCE DOCUMENTS

The City violated CEQA and improperly truncated the MND's public comment period by failing to make all documents referenced, incorporated by reference, and relied on in the MND available for public review during the public 3

[18] CEQA Guidelines, § 15126.4, subd. (a)(2).

printed on recycled paper

comment period.[24] As a result, Residents was unable to complete its review and analysis of the MND and its supporting evidence during the current public comment period. Our request for a further extension went unanswered, and was therefore presumptively denied. We therefore provide these preliminary comments on the MND and reserve our right to submit supplemental comments on the MND at a future date.

CEQA requires that all documents referenced, incorporated by reference, and relied upon in an MND be available for review and "readily accessible" during the entire comment period.[25] The courts have held that the failure to provide even a few pages of a CEQA document for a portion of the CEQA review period invalidates the entire CEQA process and that such a failure must be remedied by permitting additional public comment.[26] It is also well settled that a CEQA document may not rely on hidden studies or documents that are not provided to the public.[27] By failing to make all documents and underlying data referenced in the MND "readily available" during the current comment period, the City is violating the procedural mandates of CEQA.[28]

3 (cont.)

On April 15, 2021, our office submitted two letters to the City, the first seeking immediate access to all MND reference documents pursuant to CEQA, and the second seeking immediate access to all public records referring or related to the Project pursuant to the California Public Record Act ("CPRA").[29] We did not receive any response to the letters. On April 20, 2021, we followed up these letters with an email directed to Mr. He asking for an update on these document requests. On April 26, 2021, we filed a letter with the City again asking for immediate access to outstanding MND reference documents, and requesting an extension of the public comment period on the MND due to the City's failure to provide timely access to the

[24] *See* PRC § 21092(b)(1); 14 C.C.R § 15072(g)(4).

[27] *Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3rd 818, 831 ("Whatever is required to be considered in an EIR must be in that formal report; what any official might have known from other writings or oral presentations cannot supply what is lacking in the report.").
[28] Pub. Resources Code § 21092(b)(1); 14 C.C.R § 15072(g)(4).
[29] Letter to William He, City of American Canyon from Darien Key, Adams Broadwell Joseph & Cardozo, Request for Immediate Access to Public Records – SDG Commerce 217 Distribution Center Project (SCH Number 2020120302; Application PL20-0008) (Apr. 15, 2021.); Letter to William He, City of American Canyon from Darien Key, Adams Broadwell Joseph & Cardozo, Request for Immediate Access to Documents Referenced in the MND for SDG Commerce 217 Distribution Center Project (Application PL20-0008) (Apr. 15, 2021.)

printed on recycled paper

reference documents during the public comment period.[30] We have received no response from the City regarding either of the record requests or the email as of the date of this comment letter, and still have not been given access to numerous MND reference documents that are relevant to our review of the MND.

In particular, the City has failed to provide access to the following MND reference documents that have delayed Residents' full analysis of issues addressed in this letter:

- GHD, Trip Generation Comparison Development Site Repurpose; Green Island Wine Warehouse, Design memorandum to Mr. Neil Thompson (Stravinski Development Group) from Mr. Kamesh Vedula (GHD), September 27, 2018.

- Email from Jeff Ballantine, Contract Project Planner, City of American Canyon, to Richard Grassetti, GECo, August 8, 2018 regarding Commercial Recreation Land Use in the General Plan.

3 (cont.)

Without this critical information, our clients and other members of the public are unable to meaningfully review and comment on the MND and are deprived of the opportunity to review the supporting information for the MND. The City's actions violate both CEQA and CPRA disclosure requirements, and have resulted in a violation of Resident's due process rights.

IV. THE MND FAILS TO PROVIDE AN ACCURATE AND COMPLETE PROJECT DESCRIPTION

An accurate and complete project description is necessary to perform an evaluation of the potential environmental effects of a proposed project.[31] Without a complete project description, the environmental analysis will be impermissibly narrow, thus minimizing the project's impacts and undercutting public review.[32] The courts have repeatedly held that "an accurate, stable and finite project description

[30] Letter to William He, City of American Canyon from Darien Key, Adams Broadwell Joseph & Cardozo, Request for Immediate Access to Public Records – SDG Commerce 217 Distribution Center Project (SCH Number 2020120302; Application PL20-0008) (Apr. 26, 2021.)
[31] See, e.g., *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 376.

printed on recycled paper

is the *sine qua non* of an informative and legally sufficient [CEQA document]."[33] Only through an accurate view of the project may affected outsiders and public decision makers balance the proposal's benefit against its environmental costs.[34]

A. The City Violated CEQA by Piecemealing its Review of the Project and Related Projects

The Project is a component of a larger, phased warehouse development by the Applicant in the City. Yet, the MND does not include the Applicant's other warehouse projects in its description and fails to analyze the direct, indirect, and cumulative impacts of the Applicants' warehouse development project within the City as CEQA requires.[35] This approach, termed "piecemealing" or "segmenting," violates CEQA, as it inhibits the full disclosure, analysis and mitigation of impacts, and discussion of alternatives.[36]

4

The City within the last 5 years has reviewed the Project, the SDG 330 Project, the SGE 258 Warehouse Project, and the 2019 tentative map approval.[37] A review of the MNDs for the adjacent SDG 217 and SDG 330 Projects shows marked similarities between the two projects such as (1) having the same applicant, (2) similar LLC's who were organized by the same individual, (3) their Energy analysis in Appendix A-2 deferred actual analysis but instead stated the "CalEEMod default electrical usage was adjusted to be consistent with the SGE 258 Warehouse Project"

---

[33] *County of Inyo v. County of Los Angeles* (1977) 71 Cal.App.3d 185, 193.
[34] *Id*. at pp. 192-193.

[35] See generally, *Bozung v. LAFCO*, 13 Cal.3d 263, 283-84 (1975); *City of Santee v. County of San Diego*, 214 Cal.App.3d 1438, 1452 (1989); *Citizens Assn. for Sensible Development of Bishop Area v. County of Inyo*, 172 Cal.App.3d 151, 165 (1985).
[36] E.g., Pub. Resources Code, §21002, 210021.1(a); CEQA Guidelines, §§ 151363, 15121, 15140, 15151 (An EIR is informational document whose purpose is to disclose and mitigate impacts, analyze a reasonable range of alternatives, and select as the project any alternative which can achieve project objectives, but is more protective of the environment, consistent with CEQA's substantive mandate); CEQA Guidelines, § 15378 (project description must include all project components).

printed on recycled paper

because they were nearly identical[38], (4) they are proposed every two years,[39] (5) previously in 2016 the three separate lots were combined into one single lot.[40]

These Projects should have been considered as one project because "piecemealing" or "segmenting" violates CEQA, as it inhibits the full disclosure, analysis and mitigation of impacts, and discussion of alternatives.[41]

4 (cont.)

A project under CEQA means the "whole of an action which has the potential for resulting in either a direct physical change in the environment, or reasonably foreseeable indirect physical change in the environment."[42] CEQA prohibits a project proponent from seeking approval of a large project in a piecemeal fashion in order to take advantage of environmental exemptions or lesser CEQA review for smaller projects.[43] CEQA mandates "that environmental considerations do not become submerged by chopping a large project into many little ones - each with a minimal potential impact on the environment - which cumulatively may have disastrous consequences."[44] Before undertaking a project, the lead agency must assess the environmental impacts of all reasonably foreseeable phases of a project and a public agency may not segment a large project into two or more smaller projects in order to mask serious environmental consequences. As the Court of Appeal stated, "[t]he CEQA process is intended to be a careful examination, fully open to the public, of the environmental consequences of a given project, covering the entire project, from start to finish."[45]

5038-008acp

Here the Applicant every two years submits a nearly identical warehouse Project, with a nearly identical MND, in the exact same area in an apparent attempt to disguise the actual impacts on the environment of one large warehouse district.[46] The MND further explains that a tentative parcel map was adopted by the City on February 28, 2019, that split the previously 35.85-acre parcel into three separate parcels in order to facilitate the Project and the SDG 330 Project.[47] The 15.24-acre south parcel was approved for the approximately 330,000 square-foot SDG 330 wine distribution center, which was subsequently approved with a separate MND and is nearing completion.[48] The City failed to prepare a single EIR for the parcel map and subsequent warehouse projects on these parcels, despite the clear connection between these actions.

4 (cont.)

The City should have required an EIR for SGE 258, the subdivision map, SDG 330, and the Project, to determine whether future expansion would have occurred, similar to what is currently happening, in order to provide proper review. It was reasonably foreseeable from SDG 330 and on that the Applicant planned to turn the area into a warehouse district and so far has been allowed to do so with separate MNDs as environmental review, rather than a single EIR. This violates CEQA and cannot be permitted to continue.

The City must prepare an EIR to fully disclose, analyze, and mitigate the impacts of the current Project in conjunction with the cumulative impacts of the previous projects. In particular, an EIR is required to review the cumulative impacts of all these warehouses being built in the same area since this will now be the third one, with space for potentially one more. The EIR must analyze the environmental effects of other phases or future expansions of a project if the other activities are reasonably foreseeable consequences of the initial project.49

V. THERE IS A FAIR ARGUMENT THAT THE PROJECT MAY RESULT IN SIGNIFICANT IMPACTS THAT REQUIRE THE CITY TO PREPARE AN EIR

Under CEQA, a lead agency must prepare an EIR whenever substantial evidence in the whole record before the agency supports a fair argument that a project may have a significant effect on the environment.[50] The fair argument standard creates a "low threshold" favoring environmental review through an EIR, rather than through issuance of a negative declaration.[51] An agency's decision not to require an EIR can be upheld only when there is no credible evidence to the contrary.[52] Substantial evidence can be provided by technical experts or members of the public.[53] "If a lead agency is presented with a fair argument that a project may have a significant effect on the environment, the lead agency shall prepare an EIR even though it may also be presented with other substantial evidence that the project will not have a significant effect."[54]

As discussed below, there is a fair argument supported by substantial evidence that the Project may result in significant impacts relating to air quality, biological resources, energy, GHG, land use, noise, and transportation. The City is required to prepare an EIR to evaluate the Project's impacts and propose mitigation measures to reduce those impacts to a less-than-significant level.

---

A. There is Substantial Evidence that the MND Underestimates and Fails to Properly Mitigate Air Quality Impacts

1. The City Failed to Update the MND's Baseline Data and Relevant Analyses When It Revised and Recirculated the MND.

CEQA requires the lead agency to describe the baseline physical conditions that exist at a project site at the time its notice of intent to adopt a CEQA document is issued.[55] CEQA also requires the environmental document to accurately describe the severity of a project's impacts.[56]

The City issued its original Notice of Intent to adopt an MND on December 16, 2020. The City then decided to revise and recirculate the MND for a new round of public comment, and issued a new Notice of Intent on April 1, 2021.[57] When the City did this, it failed to update its baseline data and all the relevant timelines applicable to Project development, and rending several of its analyses inaccurate and unsupported.[58]

5

For example, the MND's CalEEmod analysis of construction and operational air emissions accounts for the seasons in which certain activities would take place to determine the proper emissions,[59] thus affecting the Air Quality analysis and the GHG analysis. The City's failure to update the CalEEmod analysis resulted in an inaccurate and unsupported air quality analysis because the revised MND does not accurately reflect the severity of emissions that will occur at different phases of Project construction and operation. The City must prepare an EIR to correct these errors.

printed on recycled paper

2. The City Failed To Perform A Project-Specific Traffic Impact Analysis (TIA) For The 217 Commerce Center Project And Is Relying On A TIA For Another Project

The City has failed to perform a TIA for the 217 Commerce Center project. Rather than assess the impacts the City relies on the 2018 TIA performed for the SDG Commerce 330 Warehouse Project. According to the introductory paragraph of the TIA Memorandum, the TIA was prepared to present the results of an analysis performed by GHD for a proposed new wine storage facility development at 330 Commerce Boulevard Wine Storage Facility project in the City of American Canyon. The TIA assumed the construction of a 330,528 square foot wine storage warehouse. According to the TIA Memorandum, 9 projects were included in the traffic analysis along with the SDG Commerce 330 Warehouse Project. Those projects include[60]:

1. Napa Logistics Park Phase 1 and 2
2. Canyon Estates
3. Napa Airport Corporate Center
4. Napa Airport Corporate Center Phase 1
5. Napa Junction III
6. Napa Logistics Park Phase I
7. Valley View Senior Housing
8. Village at Vintage Ranch
9. Green Island 258 Warehouse Project

6

The analysis showed that the conditions at State Route 29 and Green Island Road would drop from a Level of Service (LOS) C to LOS D in the AM peak hours.

The trip generation analysis used in the TIAM for the SDG Commerce 330 Warehouse assumed a generation rate of 1.69 vehicles for each 1,000 square feet of the wine warehouse constructed (1.69 * 330.528 = 558.59 or 559 vehicles). Clearly, the 2018 analysis does not consider the impact from the additional 367 vehicle trips (217.294 *1.69 = 367.22 or 367), an increase of approximately 66 percent (65.74% = ((367.22 + 558.59)/(558.59))). In addition, the TIA fails to account for the additional

[60] Clark Letter, p. 5.

printed on recycled paper

traffic burden/vehicle trips associated with the opening of the New Napa Junction School located at the corner of Eucalyptus Drive and Commerce Boulevard. Given the significant increase in trips from the unaccounted projects identified herein, the City must re-evaluate the traffic impacts from the project in an environmental impact report (EIR).[61] Given the unaccounted for increase in trips, the MND has understated its mobile emissions and GHGs as well.

6 (cont.)

3. The City Has Not Accurately Reported The Project's Estimated Daily Construction Emissions and Failed to Disclose Significant Air Quality Impacts During The Construction Phase

According to the MND, the Project's construction emissions are less than significant because they do not exceed the Bay Area Air Quality Management District's ("BAAQMD's") CEQA significance thresholds (See Table AQ-1) and because the proposed Project would also include Best Management Practices ("BMPs") required per the BAAQMD's CEQA Air Quality Guidelines.[62]

Table AQ-1: Estimated Daily Construction Emissions (pounds/day)

Construction Phase	Total Regional Pollutant Emissions (lbs/day)				
	ROG	NO_x	CO	Exhaust PM_{10}	Exhaust $PM_{2.5}$
Proposed Project Unmitigated Emissions					
2021	13.6	24.6	19.5	1.0	0.9
BAAQMD Significance Threshold	**54**	54	--	82	54
Emissions Exceed Threshold?	No	No	No	No	No

7

However, Dr. Clark explains that the City's analysis assumes one continuous phase of construction, ignoring the substantial highs and lows in emissions which commonly occur during each phase of construction (site preparation, grading,

[61] Clark Letter, p. 5.
[62] MND, p. 31.

printed on recycled paper

building construction, paving, and architectural coating).[63] The City has failed in its obligation to accurately report the Project's construction emissions by failing to accurately quantify the Project's emissions in each construction phase, and by mis-interpreting guidance from BAAQMD which the City claims to follow.[64] The City is legally obligated to accurately disclose the nature and extent of project's air quality impacts pursuant to CEQA which it failed to do here by failing to follow its own selected significance threshold.[65]

According to the 2017 CEQA Guidance From BAAQMD, "[t]he Air District recommends that for construction projects that are less than one year duration, Lead Agencies should annualize impacts over the scope of actual days that peak impacts are to occur, rather than the full year."[66] This means that, for each phase of construction, the Project's construction emissions should be presented and compared against the BAAQMD Significance Thresholds.[67]

7 (cont.)

As was previously pointed out in public comments on the original MND, the calculated daily construction emissions in the original MND were based on the total average emissions for the entire construction phase of the project. Dr. Clark explains that the City's continued use of the total average daily emissions in the revised MND ignores the substantial impacts that are associated with the maximum daily emission rates calculated by the CALEEMOD model of the Project.[68]

Construction Phase	Total Regional Pollutant Emissions (lbs/day)				
	ROG	NO_x	CO	Exhaust PM_{10}	Exhaust $PM_{2.5}$
Proposed Project Unmitigated Emissions					
Site Preparation	3.9558	40.5366	21.6621	2.04546	1.88178
Grading	2.5683	37.5613	17.7651	1.16798	1.07479
Building Construction	2.6831	24.2402	22.5509	0.9815	1.3558

[67] Clark Letter, p. 6.
[68] Clark Letter, pp. 6-7.
5038-008acp

Paving	1.7638	12.952	15.0764	0.6785	0.62424
Architectural Coatings	155.6296	1.5948	2.6922	0.09575	0.09562
BAAQMD Significance Threshold	**54**	54	--	82	54
Emissions Exceed Threshold?	**Yes**	No	No	No	No

Dr. Clark concludes the that the MND's failure to analyze construction emissions during the different phases of Project construction results in an underestimation of the Project's total construction emissions. As Dr. Clark explains, over the course of construction, the emissions of reactive organic gases ("ROGs"), precursors to the formation of ozone, increase substantially from a low of 1.76 lbs/day during the paving phase of the project to a high of 155.63 lbs/day during the Architectural Coatings phase of the project. The MND fails to reflect this increase.

7 (cont.)

While the MND's total averaged values over the whole construction period are lower than the BAAQMD Significance Threshold value of 54 lbs/day, the MND fails to describe the emissions fluctuations during different phases of construction. The City is obligated to assess impacts of emissions from each phase of the construction of the Project in order to accurately assess the nature and magnitude of the Project's construction emissions. The MND fails to comply with this basic CEQA requirement. The MND also fails to explain that short term exceedances of the significance thresholds may have significant local impacts on the air quality and the community at large.

The City must report the impacts from each step of the construction of the project in an EIR providing a clear analysis of the criteria and toxic air contaminants ("TACs") as well as the greenhouse gas ("GHG") emissions.[69]

[69] Clark Letter, p. 7.

printed on recycled paper

4. The City Fails To Quantify The Impact That Transportation Refrigeration Units (TRUs) Will Have On Air Quality Impacts From The Proposed Project.

The MND fails to analyze the impacts from diesel particulate matter ("DPM") emissions from transportation refrigeration units ("TRUs") installed on insulated cargo vans and trucks that will be used to transport the temperature sensitive goods stored at the Project site. The MND explains that, because the Project's warehouse building is proposed for warehousing and distribution of wine and/or other wine related products, it would be heavily insulated and refrigerated.[70] Dr. Clark explains that this use will also require TRU's to transport refrigerated products, yet the MND fails to analyze any emissions from mobile refrigeration.[71]

In 2019, CARB released a health risk analysis that documented the significant impact of TRU's. CARB calculated that the operation of one daily truck delivery, one daily trailer delivery, and one seasonal trailer TRUs for a total of 202 hours per week results in a cancer health risk of 190 in one million on site, 28 in one million at a residence 100 meters off-site, and 5 in one million at a residence 400 meters off site.[72]

8

The closest residence to the proposed Project site is identified by the City as being located 500 feet (approximately 150 meters off-site).[73] Dr. Clark concludes that, when the number of daily trucks is increased to 10 per day and daily trailers increased to 6 per day, the Project's onsite cancer risk increases to 610 in one million, the 100-meter offsite risk increases to 92 in one million, and the 400-meter offsite risk increase to 16 in one million.[74] These impacts from the use of TRUs at the Project Site exceed BAAQMD's cancer risk significance threshold of 10 in one million, resulting in a significant health risk and air quality impact for residents nearby to the Project site that the MND fails to disclose.[75]

The City must prepare an EIR to accurately disclose and mitigate these impacts. In addition to the health impacts from exposure to DPM that must be

printed on recycled paper

8 (cont.) assessed in an EIR, the impacts on GHG emissions from TRUs must also be included in an EIR of the Project.[76]

5. The City Failed To Quantify The Health Impacts From Emissions From The Project And Incorrectly Relies On A Non-Quantitative Analysis Performed For The SDG 330 Warehouse Project

The City failed to perform a quantitative analysis of the emissions from construction and operational emissions from the Project. Instead, the MND incorrectly relies on a non-quantitative 2019 analysis performed for a different project, the SDG 330 Warehouse Project.[77] The City's approach lacks merit and fails to comply with CEQA's requirements to quantify the impacts of a project's air emissions on human health.

CEQA mandates discussion, supported by substantial evidence, of the nature and magnitude of a project's impacts of air pollution on public health.[78] A CEQA document must analyze the impacts from human exposure to toxic substances.[79] The Supreme Court has held that a CEQA document fails to comply with CEQA's mandate to protect public health and safety when it fails to disclose the public health impacts from air pollutants that would be generated by a development project.[80] A lead agency's significance determination must also be supported by accurate scientific and factual data that is specific to the project being analyzed.[81] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[82] The MND fails to quantify the Project's DPM emissions and instead relies on a qualitative analysis of health impacts prepared for a different project. The MND's discussion of the Project's health risk fails to meet CEQA's basic legal requirements.

9

The MND acknowledges that sensitive receptors are located in close vicinity to the Project site. On page 35 of the MND, the City states that the nearest sensitive receptors to the Project include homes that could potentially be within

printed on recycled paper

1,000 feet of certain Project construction phases (site preparation and grading activities) and a school under construction only 1,500 feet away.[83] Nevertheless, the MND fails to disclose the exposure levels at these receptor sites to the Project's DPM and other TAC emissions.

The MND incorrectly attempts to justify this omission by relying on the SDG 330 Warehouse MND's claim that State health guidance does not require a health risk analysis of the Project's construction emissions because construction is a short-term impact. According to the City's analysis of the SDG 330 Warehouse Project, the "Office of Environmental Health Hazard Assessment (OEHHA) does not recommend assessing cancer risk for projects lasting less than two months (OEHHA, 2015). Site preparation and grading activities would last approximately 5 weeks and then subsequent construction phases (building construction and other construction activities) would be greater than 1,000 feet from the nearest sensitive receptor. Secondly, annual wind directions are frequently from the south-southwest (that is, wind blowing from the receptor towards the project site and rarely (northwesterly) from the project site towards the receptor).[84]

9 (cont.)

The SDG 330 Warehouse Project MND next adopted a mitigation measure requiring enhanced exhaust emissions to purportedly "ensure the proposed project's health impacts are less than significant" – Mitigation Measure AQ-4." Mitigation Measure AQ-4 assumed that all off-road equipment should have: :[85]

> "a. Engines that meet or exceed either USEPA or CARB Tier 2 off-road emission standards, and;
>
> b. Engines that are retrofitted with a CARB Level 2 Verified Diesel Emissions Control Strategy (VDECS). Acceptable options for reducing emissions include the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, add-on devices such as particulate filters, and/or other options as such are available."

10

However, as explained below and by Dr. Clark, the use of Tier 2 equipment would not enhance exhaust emission reductions and would, in fact, ***increase*** the potential emissions from sources on site, resulting in increased health risk at the

[83] MND, p. 35.
[84] See Clark Letter, p. 11.
[85] Clark Letter, p. 8.

printed on recycled paper

10 (cont.) SDG 330 project site, and at this Project site, if the same measure were adopted for the Project.[86]

The logic used by the City to justify not producing a dispersion model of the Project's toxic air emissions and a quantitative health risk analysis for the either this Project or the SDG Commerce 330 Warehouse project is flawed and fails to comply with CEQA. As explained by Dr. Clark, the City's reasoning also contradicts the BAAQMD CEQA guidance, on which the MND claims to rely.

Under Section 5.2.4, Sources Not Requiring A BAAQMD Permit, the BAAQMD states:

> For new land uses that would host a high number of non-permitted TAC sources, such as a distribution center, the incremental increase in cancer risk shall be determined by an HRA using an acceptable air dispersion model in accordance with BAAQMD's Recommended Methods for Screening and Modeling Local Risks and Hazards and/or CAPCOA's guidance document titled Health Risk Assessments for Proposed Land Use Projects. A Lead Agency may consult HRAs that have previously been conducted for similar land uses to determine whether it assesses the incremental increase in cancer risk qualitatively or by performing an HRA. This analysis shall account for all TAC and PM emissions generated on the project site, ***as well as any TAC emissions that would occur near the site as a result of the implementation of the project (e.g., diesel trucks queuing outside an entrance, a high volume of trucks using a road to access a quarry or landfill)***.[87]

11

Clearly, the City failed to assess the TAC and PM emissions from the SDG 330 Warehouse Project, and is relying on the same lack of analysis to avoid analyzing health risks from the current Project. The City also incorrectly assumes that Mitigation Measure AQ-4 (which is only required for the SDG 330 Project, and not for this Project) would reduce any TAC and PM emissions to a level that would not produce a risk above 10 in one million, without any supporting evidence. This hand waving does not meet the obligations that the City has under CEQA to quantify the impacts of the Project on the community. Furthermore, relying on this

[86] Clark Letter, p. 9.
[87] Clark Letter, p. 9.

printed on recycled paper

unsupported analysis to support the assertion that the SDG Commerce 217 Distribution Center project will not have a significant impact is patently false.

(11) (cont.)

The City must perform quantified health risk analysis of the Project's construction and operational emissions and assess the impact of those emissions in an EIR, consistent with the requirements of CEQA, and applicable guidance from OEHHA.[88]

6. The City Failed To Quantify The Health Impacts From Emissions From The Project On A New Elementary School (Sensitive Receptor) That Is Less Than 500 Meters Southeast of The Project Site.

The City failed to assess the public health impacts from TACs that will be released during the construction and operational phases of the Project on the Napa Unified School District's new Napa Junction School, being constructed at the corner of Eucalyptus Drive and Commerce Boulevard.

In the MND, the City states that there are no schools or daycare centers within 1,000 feet of the proposed project.[89] This is misleading. The new Napa Junction School is located approximately 450 meters (approximately 1500 feet) southeast of the Project site, and is scheduled to open in Fall 2021.[90] Schools are (12) considered sensitive receptors for purposes of CEQA analysis, and the MND explains that some Project construction activities during approximately nine weeks of site preparation and grading could be within 1,000 feet of the school property boundary.[91] Students and staff at the school will therefore be exposed to emissions from the construction and operational phases of the Project. Those emissions will include known human carcinogens, yet were ignored in the MND. The City's failure to analyze the health risk of the Project's emissions on the school violates CEQA.[92]

The BAAQMD CEQA Guidance Appendix also states that the "lead agency should enlarge the 1,000-foot radius on a case-by-case basis if an unusually large source or sources of risk or hazard emissions that may affect a proposed project is

[88] Clark Letter, p. 9.
[89] MND, p. 133.
[90] Clark Letter, p. 10.
[91] MND, p. 35; CEQA Appendix G, Section III.D.

printed on recycled paper

beyond the recommended radius."[93] Accordingly, in keeping with BAAQMD's recommendation, the City should expand the radius of influence to be evaluated to include all impacts on the school (not just within the 1,000-foot radius that will be impacted by construction). In order to accurately analyze the Project's health risk impacts on the school, Dr. Clark recommends that the City perform an EMFAC-compliant analysis of the increase in traffic from the project and the surrounding warehouses, perform dispersion model of the traffic emissions to determine the extent of DPM emissions that will impact the school, and perform a quantified health risk analysis to determine impacts on the staff and students of the school. The results of that analysis must be presented in a DEIR.[94]

12 (cont.)

7. The SDG 330 Project's Air Quality Mitigation Measure AQ-4 Is Insufficient To Reduce the Project's Significant Health Risk to Less than Significant Levels

In the City's analysis of air quality impacts for the SDG Commerce 330 Warehouse project, the preferred mitigation measure (AQ-4) for ensuring DPM emissions would remain below the significance thresholds was the use of U.S. EPA Tier 2 equivalent construction equipment. required ensure that the Project's health risk impacts are less than significant levels. The City stated at the time of the SDG 330 Project's MND release that the use of Tier 2 technology would keep emissions below a health risk of 10 in 1,000,000, without quantifying the actual health risk in the analysis. Tier 2 technology was first released in the mid-1990's and is not currently the recommended standard for diesel powered equipment.[95]

13

Far more effective technology is currently available. As Dr. Clark explains, the United States Environmental Protection Agency ("U.S. EPA") has slowly adopted more stringent standards to lower the emissions from off-road construction equipment since 1994. Since that time, Tier 1, Tier 2, Tier 3, Tier 4 Interim, and Tier 4 Final construction equipment has been phased in over time. Tier 4 Final represents the cleanest burning equipment and therefore has the lowest emissions compared to other tiers, including Tier 4 Interim equipment.[1] Dr. Clark concludes that requiring the use of Tier 2 or equivalent control technology for all equipment as

[93] BAAQMD, CEQA Guidelines May 2010, p. 2-5.
[94] Clark Letter, p. 10.
[95] Clark Letter, p. 10.

printed on recycled paper

a mitigation measure does not provide the community with greatest level of protection possible.[96]

For the operational phase of the Project, the City must promulgate mitigation measures to ensure that residents near the Project are not adversely affected by DPM emissions from any generator that may be installed onsite. Emissions from combustion engines for stationary uses, including diesel generators, are generally regulated by the U.S. EPA and CARB. Unlike Off-Road Diesel-Powered Engines for Mobile Sources (currently utilizing Tier 4 Interim and Final technology which reduce PM2.5 emissions by 90% and more), Dr. Clark explains that diesel back-up generators generally have U.S. EPA Tier II ratings and need to be outfitted with diesel particulate filters to achieve additional PM2.5 reductions. In addition, Dr. Clark recommends that diesel-powered generator engines should be fueled using ultra-low sulfur diesel fuel with a maximum sulfur content of 15 parts per million (ppm). If higher rated diesel generators are available, the City must require that the proponent purchase and maintain the generator that will achieve the highest amount of DPM reduction.

13 (cont.)

The City should prepare a DEIR which accurately discloses the extent of the Project's health risk from construction and operational DPM emissions, and which includes a Mitigation Monitoring and Reporting Program with enforceable mitigation measures to reduce the Project's health risk to the greatest extent feasible.[97]

8. The City Failed To Perform A Cumulative Analysis Of The Impacts From The Proposed Project and Surrounding Projects.

The City must assess the cumulative impacts from the Project and the adjacent projects that are likely to have cumulatively considerable impacts.[98] The City has allowed a significant number of overlapping projects to be developed in the immediate vicinity of the SDG 217 Project without quantifying the impact of construction emissions and operation emissions from each of the projects on the surrounding community. Those projects include:[99]

(14) (cont.)

The results of this cumulative analysis should then be presented in a DEIR.

9. The MND Relies On Non-Binding Best Management Practices (BMPs) To Reduce Emissions Of Dust And Particulates.

(15)

Mitigation measures must be enforceable through conditions of approval, contracts or other means that are legally binding.[100] This requirement is intended to ensure that mitigation measures will actually be implemented, not merely adopted and then ignored.[101] The MND's reliance on BMPs fails to meet this threshold requirement because the measures are not incorporated as binding mitigation measures. As a result, the MND fails to include any binding mechanism to ensure that the Applicant will be required to implement these measures for the Project. This is exacerbated by the fact that the BMPs themselves are framed in a way that makes them unenforceable by using phrases such as "where and when possible".

[100] PRC § 21081.6(b); 14 C.C.R § 15126.4(a)(2); *Lotus v. Dep't of Transp*. (2014) 223 Cal. App. 4th 645, 651-52.

5038-008acp

15 (cont.)

Without an enforceable mechanism, the BMPs described in the MND are little more than wishful thinking, and the MND's conclusions that the Project's impacts will be less than significant with these measures incorporated are unsupported. If the City intends to rely on BMPs as listed on page 32 to reduce impacts to less than significant levels, these measures must be incorporated into the Project's MMRP and Conditions of Approval.[102]

B. Substantial Evidence Supports a Fair Argument that the Project Will Have Significant, Unmitigated Impacts to Biological Resources

1. The MND Fails to Establish a Baseline Setting

16

The existing environmental setting is the starting point from which the lead agency must measure whether a proposed project may cause a significant environmental impact.[103] CEQA defines the environmental setting as the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, from both a local and regional perspective.[104] Describing the environmental setting accurately and completely for each environmental condition in the vicinity of the Project is critical to an accurate, meaningful evaluation of environmental impacts. The courts have clearly stated that, "[b]efore the impacts of a project can be assessed and mitigation measures considered, an [environmental review document] must describe the existing environment. It is only against this baseline that any significant environmental effects can be determined."[105] The City failed to establish a proper baseline setting by not performing detection surveys.[106]

The MND identifies five special-status species that could be impacted by the Project: western burrowing owl, Swainson's hawk, northern harrier, white-tailed kite, and western pond turtle.[107] The Applicant's biological resource consultant, Monk & Associates, did not conduct focused surveys to determine whether any of

printed on recycled paper

these species use the Project site (or adjacent eucalyptus grove) as nesting habitat.[108,109]

Mr. Cashen notes that the California Department of Fish and Wildlife ("CDFW") recommends two types of surveys to assess and mitigate a project's impacts on special-status species: (1) "detection surveys," and (2) "take avoidance" surveys.[110] Detection surveys are designed to maximize detection of a given species, and thus require implementation of specially-timed, species-specific survey techniques. The intent of detection surveys is to provide reliable information on the abundance, distribution, and seasonal (or life history) use patterns of a species within the area that would be directly or indirectly affected by the project. Detection surveys provide the information the lead agency, public, and natural resource agencies need to: (a) effectively assess potential impacts, and (b) formulate effective mitigation measures.[111]

16 (cont.)

Take avoidance surveys are conducted immediately prior to implementation of the project. The intent of take avoidance surveys is to: (a) determine whether there have been any changes in baseline conditions that affect implementation of mitigation. For example, take avoidance surveys might reveal that burrowing owls that had nested on the north side of the site, are now nesting on the south side of the site. In summary, detection surveys are conducted to satisfy the requirements of CEQA (and other regulatory review processes), whereas take avoidance surveys are conducted to ensure take avoidance when the project is actually constructed.[112]

Detection surveys were not conducted for the Project. Instead, the MND requires detection surveys as "mitigation," after the CEQA review process terminates. Mr. Cashen explains that this approach negates the value of detection surveys and is unacceptable because it precludes proper understanding of baseline conditions, and thus, the ability of the public and resource agencies to submit informed comments on the Project's impacts and proposed mitigation. Assuming a species may be present at the Project site (the approach taken in the MND) is generally not an acceptable substitute for baseline survey data because it precludes

[108] *Id*, p. 44; Cashen Letter, p. 2.
[109] According to the Revised Biological Resource Analysis ("BRA") prepared by Monk & Associates (March 2, 2020), the probability of western pond turtles on the Project site is "none" (*see* BRA, Table 4). However, according to the MND (p. 42): "there is a possibility of turtles nesting onsite."
[110] Cashen Letter, p. 2.
[111] Cashen Letter, p. 2.
[112] Cashen Letter, p. 2.
5038-008acp

understanding of the relative severity of the Project's impacts. For example, while the loss of nesting habitat for one pond turtle might not be significant, the loss of nesting habitat for five pond turtles would be very significant.[113]

16 (cont.)

It is not possible to effectively assess Project impacts until focused detection surveys have been conducted. As a result, the City must require detection surveys that adhere to CDFW standards, and the results of those surveys need to be released in a revised CEQA document so they can be thoroughly vetted by the public, resource agencies, and decision makers during the CEQA review process.[114]

2. The MND Underestimates the Project's Impacts on Sensitive Species

a) The MND Fails to Adequately Analyze and Mitigate Impacts to the Swainson's Hawk

Mr. Cashen explains that loss of foraging habitat is one of the primary threats to Swainson's hawks in California.[115] In addition to generating a potentially significant impact under CEQA, the loss of foraging habitat from the Project site may result in the take (killing) of Swainson's hawks, which would be a violation of Section 2080 of California Fish and Game Code.[116] The MND provides the following analysis of this issue:

17

> The loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat; there are extensive foraging opportunities around the nesting location 2.6 miles north of the site and between this nesting location and the project site; and as the project site is essentially surrounded by eucalyptus forest, it is not a foraging destination which would likely attract foraging Swainson's hawks.[117]

[117] MND, p. 43.

printed on recycled paper

Dr. Cashen identifies several flaws with the City's analysis. First, the City's analysis relies on California Natural Diversity Database ("CNDDB") data and assumes that the nearest nesting location is 2.6 miles north of the Project site.[118] However, the MND admits: "the nesting population appears to be increasing throughout its nesting range in northern California (recent CNDDB records and G. Monk general observations) and the eucalyptus trees growing adjacent to the project site provide suitable nesting habitat."[119] CNDDB data on Swainson's hawk nest locations in Napa County have not been updated since 2013,[120] and the Applicant did not conduct surveys to determine the current status of Swainson's hawk nests in the vicinity of the Project site.[121] As a result, the City does not have the basis for its assumption that the nearest nesting location is 2.6 miles from the Project site, and thus, that the loss of foraging habitat from the Project site would not have a significant impact on the species.[122]

17 (cont.)

Second, the Project site may provide important foraging habitat for Swainson's hawks even if the nearest nesting location is 2.6 miles away. Fleishman et al. (2016) found that the vast majority of adult Swainson's Hawks in the Natomas Basin (northern Central Valley, California) traveled distances up to 6.2 miles from the nest to forage.[123] Mr. Cashen provides substantial evidence documenting the likelihood of Swainson Hawk foraging activities in and around the Project site. He explains that Babcock found that Swainson's hawks in the Sacramento Valley foraged as far as 14 miles from the nest, and that ruderal fields was one of the vegetative cover types that ranked highest in foraging use.[124] Other studies have shown that Swainson's hawks may travel up to 18 miles from the nest to forage.[125]

Third, the fact that the Project site did not historically provide foraging habitat is irrelevant to its current function as foraging habitat for Swainson's

5038-008acp

hawks. Dr. Cashen explains that, to reverse the decline of Swainson's hawk populations, it is CDFW's policy that new development projects that adversely modify nesting or foraging habitat within 10 miles of an active nest should mitigate the project's impacts by providing compensatory mitigation.[126] According to CDFW, the 10-mile foraging radius recognizes the need to strike a balance between the biological needs of reproducing pairs (including eggs and nestlings) and the economic benefit of development(s) consistent with Fish and Game Code Section 2053.[127]

Fourth, the MND claims: "there are extensive foraging opportunities around the nesting location 2.6 miles north of the site and between this nesting location and the project site." However, the MND fails to provide evidence to support that claim or the implicit assumption that foraging habitats north of the Project site are sufficient to sustain the local Swainson's hawk population. Based on Mr. Cashen's review of Google Earth imagery, much of the open space that remains "around the nesting location 2.6 miles north of the site and between this nesting location and the project site" is comprised of vineyards or other land cover types that provide little to no value as foraging habitat for Swainson's hawks.[128]

17 (cont.)

Fifth, Mr. Cashen explains that there is no scientific evidence that the eucalyptus forest surrounding the Project site precludes the site from being "a foraging destination which would likely attract foraging Swainson's hawks." To the contrary, Mr. Cashen points to substantial evidence demonstrating that the Project site may attract foraging Swainson's hawks because it contains California voles (*Microtus californicus*)—the Swainson's hawk's primary prey.[129]

Sixth, Mr. Cashen points to data demonstrating that Swainson's hawks have consistently been detected approximately 2,200 feet south of the Project site.[130] In addition, two Swainson's hawks were detected approximately 3,500 feet northeast of the Project site on April 16, 2021.[131] Therefore, Mr. Cashen concludes that either:

printed on recycled paper

(a) the Project site is within the foraging radius of the Swainson's hawks that nest 2.6 miles north of the Project site, or (b) there is an undocumented Swainson's hawk nest in the vicinity of the Project site. Both scenarios undermine the validity of the rationale for the City's determination that impacts to foraging habitat would not be significant.[132]

17 (cont.)

The above reasons demonstrate substantial evidence that the MND failed to properly analyze impacts to the Swainson's Hawk. An EIR must be prepared to fully disclose and mitigate the Project's impacts on this special status species.

3. The MND Fails to Adequately Analyze and Mitigate Impacts to the Northern Harrier

Mr. Cashen explains that one of the primary threats to northern harriers is the loss and degradation of nesting and foraging habitat.[133] According to the MND: "[s]hould northern harrier nest on or near the project site, nesting activities could be disrupted by construction activities. Therefore, impacts to northern harrier could be potentially significant."[134] Although the MND acknowledges northern harriers may nest on the Project site, it fails to analyze the significance of the Project's permanent impacts on nesting habitat (i.e., the analysis is limited to disturbance of nesting harriers).[135]

18

The MND states the following with respect to the loss of foraging habitat: "[t]he loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat. Mitigation Measure BIO-3 would be implemented to reduce potential impacts to nesting northern harriers to a less-than-significant level."[136] The MND's statement regarding historic conditions is incorrect because historically the Project site provided habitat (for northern harriers) before the eucalyptus trees were planted (sometime between

[136] *Id*.

printed on recycled paper

1916 and 1942).[137] Nevertheless, the significance of the impact under CEQA is dependent on the environmental conditions at the time the CEQA document was published,[138] *not* the environmental conditions in 2012. Mr. Cashen explains that Mitigation Measure BIO-3 is limited to measures designed to minimize disturbance to raptor nests during the avian nesting season; the mitigation measure does nothing to mitigate the Project's permanent impacts on northern harrier habitat. He concludes that, because habitat loss is a primary threat to the northern harrier, potentially significant impacts on the species remain unmitigated.[139]

18 (cont.)

The above reasons demonstrate substantial evidence that the MND failed to properly analyze impacts to the Northern Harrier. An EIR must be prepared to fully disclose and mitigate the Project's impacts on this special status species.

4. The MND Fails to Adequately Analyze and Mitigate Impacts to the White-tailed Kite

Mr. Cashen explains that the City's analysis suffers the same flaws as the analysis it provided for the northern harrier: (1) the Project site historically provided foraging habitat (i.e., before the eucalyptus trees were planted); and (2) the City's analysis fails to apply the proper baseline conditions. White-tailed kites have relatively small home ranges[140] and seldom hunt more than 0.5 mile from their nests when breeding.[141] Habitat quality for white-tailed kites in California is largely dependent on the abundance and availability of California voles,[142] which are known to occur at the Project site.[143] Hawbecker (1940) provided evidence that a high population of voles was necessary for successful kite nesting, and that a nearby source of suitable food is just as necessary as the nest tree.[144] Therefore, if white-tailed kites nest on or near the Project site, they would be significantly

printed on recycled paper

impacted by the loss of foraging habitat (from the Project site). Mr. Cashen concludes that Mitigation Measure BIO-3 does not mitigate the impact because it is limited to actions designed to minimize construction-related disturbance to nests. As a result, potentially significant impacts on the white-tailed kite remain unmitigated.[145]

19 (cont.)

The above reasons demonstrate substantial evidence that the MND failed to properly analyze impacts to the White-tailed Kite. An EIR must be prepared to fully disclose and mitigate the Project's impacts on this special status species.

5. The MND Fails to Adequately Analyze and Mitigate Impacts to the Burrowing Owl

a) The MND Fails to Adequately Analyze and Mitigate Impacts to Burrowing Owl Habitat

"Essential Habitat" for burrowing owls includes nesting, foraging, wintering, and dispersal habitat.[146] Contrary to CDFW's guidance, the MND provides no analysis of impacts to satellite burrows, foraging habitat, dispersal and migration habitat, wintering habitat, and habitat linkages. The impact assessment in the MND is limited to the following:

> the project site provides marginal nesting habitat for the western burrowing owl. Should burrowing owls occur on or near the project site, nesting activities and/or individual owls could be harmed by construction activities. Therefore, impacts to western burrowing owl could be potentially significant. Mitigation Measure BIO-1 would reduce this impact to a less-than-significant level.[147]

20

As Mr. Cashen explains, there are two problems with the City's analysis. First, Mitigation Measure BIO-1 would not reduce impacts on the nesting population to less-than-significant levels. Breeding burrowing owls are believed to be extirpated from Napa County.[148] Due to their strong site tenacity, burrowing owls rarely colonize new sites, or re-colonize historical sites from which they have

[148] Townsend SE, Lenihan C. 2003. Burrowing Owl Status in the Greater San Francisco Bay Area. Proceedings of the California Burrowing Owl Symposium. Bird Populations Monographs No. 1:60-70.

printed on recycled paper

been extirpated.[149] In other words, burrowing owls do not merely nest elsewhere when their nesting habitat is eliminated. As a result, the presence of nesting burrowing owls at the Project site would be extremely significant from a biological perspective, and elimination of the nesting habitat would be significant and unmitigable.[150]

Second, CDFW submitted comments on the first MND that was issued for the Project. CDFW's comment letter states: "[i]f the survey determines that the project site is actively being used by burrowing owl, or any owls are passively relocated as described above, then compensatory habitat mitigation shall be provided."[151] Thus, CDFW recommends compensatory mitigation if the Project site is actively being used by burrowing owls, irrespective of how the owls are using the site (e.g., nesting, foraging, sheltering), or the season of use. Mitigation Measure BIO-1, however, only requires compensatory mitigation if *nesting* burrowing owls are detected on the Project site; compensatory mitigation is not required if the site is being used to satisfy other life history requirements. Because the City's impacts analysis is limited to nesting habitat, and because MM BIO-1 only requires compensatory mitigation for nesting owls, Project impacts to foraging habitat, dispersal and migration habitat, and wintering habitat remain potentially significant.[152]

20 (cont.)

b) The MND Fails to Adequately Analyze and Mitigate Impacts From Passive Relocation

The Project may involve excluding burrowing owls from their burrows in order to "passively relocate" them from the Project site and adjacent habitat.[153,154] The MND fails to evaluate impacts to burrowing owls due to burrow exclusion, or to identify mitigation measures sufficient to reduce such impacts below a level of significance. Consistent with CDFW guidelines, burrow exclusion is a potentially significant impact under CEQA that must be analyzed.[155] Specifically, burrow

21

[154] Although not discussed in the MND, burrow exclusion entails the installation of one-way doors on occupied burrows so owls can exit, but not re-enter, the burrows.
[155] California Department of Fish and Game. 2012. Staff Report on Burrowing Owl Mitigation, p. 10.

printed on recycled paper

exclusion may result in: (a) significant loss of habitat for reproduction, refuge from predators, and shelter from weather; (b) increased stress on burrowing owls and reduced reproductive rates; (c) increased depredation; (d) increased energetic costs; and (e) risks posed by having to find and compete for available burrows.[156] Consequently, the City must disclose and analyze impacts associated with the "passive relocation" of burrowing owls.[157]

As Mr. Cashen explains, the need for full analysis of potential impacts associated with passive relocation (i.e., burrow exclusion) of burrowing owls is further supported by research that indicates most relocation projects have resulted in fewer breeding pairs of burrowing owls at the mitigation site than at the original site, and that relocation projects generally have failed to produce self-sustaining populations.[158] Investigators attribute the limited success of relocation to: (a) strong site tenacity exhibited by burrowing owls, and (b) potential risks associated with forcing owls to move into unfamiliar and perhaps less preferable habitats.[159]

21 (cont.)

6. The MND Fails to Adequately Analyze and Mitigate Cumulative Impacts

The MND indicates there are only four projects that are proposed or under construction in the City of American Canyon.[160] This does not comport with the "Active Project List" (dated March 2021) available on the City's website.[161] According to the Active Project List, there are several additional projects that would contribute to cumulative impacts on biological resources. These include the Giovannoni Logistics Center, Oat Hill Multi-Family, Canyon Estates, and Watson Ranch Specific Plan projects. Cumulatively, these projects would impact several hundred acres of habitat for special-status species (e.g., Swainson's hawk). The MND fails to disclose or analyze cumulative impacts due to *all* past, present, and probable future projects in American Canyon.[162]

CEQA Guidelines § 15130(b)(3) state that lead agencies should define the geographic scope of the area affected by the cumulative effect and provide a reasonable explanation for the geographic limitation used. The geographic scope of the City's cumulative impacts analysis was the City of American Canyon.[163] The MND fails to provide an explanation for this geographic limitation. Moreover, the cumulative impacts analysis is fundamentally flawed because the City applied two different geographical scales to its analysis. The MND states:

> With respect to cumulative biological resources, over the past few decades the City of American Canyon has been transitioning from agricultural use to residential development. However, there are many open space preserves and parks that have become established to preserve and protect open space habitats within the City limits and in this region, as illustrated in Exhibit A of the Monk letter. The Jack & Bernice Newell Wilderness Preserve (Newell Preserve), the Lynch Canyon Preserve, Canyon Estates Preserve (proposed) and the CDFW California Red-Legged Frog Preserve represent over 2,000 acres of permanently protected contiguous open space east of the project site. The Wetlands Open Space, Napa River Bay Trail, Clark Ranch and the Napa Plant Site Restoration Project represent several hundred additional acres of preserved open space and valuable wildlife habitats that will be preserved in perpetuity.[164]

22 (cont.)

The Lynch Canyon Preserve (1,039 acres) and the CDFW California Red-Legged Frog Preserve (317 acres) are not located within the City of American Canyon. It is not possible to accurately analyze cumulative impacts by using one geographic scope for open space preserves, but a smaller geographic scope for development projects. Furthermore, the MND misrepresents the functions of the Wetlands Open Space, Napa River Bay Trail, Clark Ranch and the Napa Plant Site Restoration Project as habitat. The Clark Ranch Project is designed to be a multi-use community park with a bike skills loop, dog park, equestrian riding area, and several buildings (among other features that are incompatible with wildlife conservation).[165] Therefore, the Clark Ranch Project would contribute to cumulative impacts (that were not contemplated in the MND). The other three

printed on recycled paper

open space areas are negatively impacted by recreation activities,[166] are comprised primarily of salt ponds or wetlands, and generally do not provide habitat for the same suite of species as those that would be impacted by the Project.[167]

The MND provides the following analysis of cumulative impacts to biological resources:

> Implementation of the proposed project would result in cumulative impacts to ruderal habitats and less than significant impacts to common plant and animal species. While the project-related impacts would be considered cumulative with other projects in the region, the mitigation measures prescribed in the Mitigated Negative Declaration would offset cumulative impacts to special-status species and plant communities/wildlife habitats to levels regarded as less than significant. Therefore, conversion of 10.39 acres of ruderal habitat on the project site to commercial development would have a less-than-significant (not cumulatively considerable) cumulative impact in this regional context.

22 (cont.)

Although the MND states the Project would result in cumulative impacts to ruderal habitats, and that Project-related impacts would be considered cumulative with other projects, it fails to provide the City's determination on the significance of the cumulative impacts. In addition, the MND fails to identify what type(s) of Project-related impacts would be considered cumulative, and which species would be subject to the cumulative impacts.[168]

The City's determination regarding the significance of cumulative impacts to biological resources is vague and not supported by substantial evidence. On the CEQA Environmental Checklist Form, the City indicates the impact would be "Less Than Significant." However, the subsequent text in the MND states "[i]mplementation of the proposed project would result in cumulative impacts to ruderal habitats," but that "mitigation measures prescribed in the Mitigated Negative Declaration would offset cumulative impacts to special-status species and plant communities/wildlife habitats to levels regarded as less than significant."[169]

printed on recycled paper

The City's determination that mitigation measures prescribed in the MND would offset cumulative impacts to special-status species to less-than-significant levels is not supported by evidence or analysis. The Project would eliminate 10.39 acres of habitat. Mr. Cashen explains that habitat loss is the primary threat to special-status species that occur in the Project area. However, the mitigation measures proposed in the MND are almost entirely limited to measures (e.g., seasonal buffers) designed to avoid or minimize direct impacts to individual animals. Although the MND requires compensatory mitigation if nesting burrowing owls are detected onsite, it does not require compensatory mitigation if non-nesting burrowing owls are detected onsite, nor does it require compensatory mitigation if any other special-status species are detected onsite. Mr. Cashen concludes that this mitigation is inadequate to reduce impacts to less than significant levels. As a result, the City's determination that the proposed mitigation would offset cumulative impacts to less-than-significant levels is not supported by evidence.[170]

22 (cont.)

7. The MND Provides Inadequate Compensatory Mitigation for Potentially Significant Impacts to Biological Resources.

a) Mitigation Measure BIO-1 (Burrowing Owl)

Mitigation Measure BIO-1 states: "[i]f passive relocation of non-nesting burrowing owls is necessary; a qualified biologist shall prepare a Relocation Plan and submit it to CDFW." The proposed mitigation is vague because it does not establish minimum standards for the content of the Relocation Plan, nor does it require CDFW's approval of the Relocation Plan. According to CDFW's Staff Report on Burrowing Owl Mitigation: "burrowing owls should not be excluded from burrows unless or until:

23

- A Burrowing Owl Exclusion Plan (see Appendix E) is developed and approved by the applicable local DFG office;
- Permanent loss of occupied burrow(s) and habitat is mitigated in accordance with the Mitigating Impacts sections below. Temporary exclusion is mitigated in accordance with the item #1 under Mitigating Impacts below.
- Site monitoring is conducted prior to, during, and after exclusion of burrowing owls from their burrows sufficient to ensure take is avoided.

[170] Cashen Letter, p. 10.

printed on recycled paper

Conduct daily monitoring for one week to confirm young of the year have fledged if the exclusion will occur immediately after the end of the breeding season.
- Excluded burrowing owls are documented using artificial or natural burrows on an adjoining mitigation site (if able to confirm by band re-sight)."[171]

Mitigation Measure BIO-1 does not require these elements, nor does it establish success criteria for burrowing owls that are relocated from the Project site.[172]

Mitigation Measure BIO-1 further states:

> If a nesting season survey determines that a burrow or refugia on the project site is occupied by nesting burrowing owls, then compensatory mitigation in the form of a permanently protected, deed restricted set aside on open space land owned or obtained by the applicant shall be provided if such a protected area makes sense for protection of nesting owls. This permanently protected area would be recorded within 90 days after commencement of project construction. If burrowing owls are observed during surveys, notification shall also be submitted to the CNDDB.

23 (cont.)

As described below, the compensatory mitigation requirements of Mitigation Measure BIO-1 are far too vague to ensure impacts on nesting burrowing owls are reduced to less-than-significant levels.[173]

First, the MND fails to identify how much compensatory mitigation would be required. Mitigating Project impacts to burrowing owl habitat requires compensatory mitigation at a ratio of at least 1:1. As stated in CDFW's Staff Report on Burrowing Owl Mitigation:

> As set forth in more detail in Appendix A, the current scientific literature supports the conclusion that mitigation for permanent habitat loss necessitates replacement with an equivalent or greater habitat area for breeding, foraging, wintering, dispersal, presence of burrows, burrow surrogates, presence of fossorial mammal dens, well

[173] Cashen Letter, p. 11.

printed on recycled paper

drained soils, and abundant and available prey within close proximity to the burrow.[174]

Second, the MND fails to establish any criteria for selection of the compensatory mitigation site. These include: (a) geographic location, (b) habitat conditions, and (c) the status of burrowing owls at the site. These variables are critical to the mitigation site's ability to reduce Project impacts to less-than-significant levels. Most notably, permanent protection of a site that is not occupied by burrowing owls would not mitigate the Project's impacts to occupied nesting habitat.[175]

22 (cont.)

Third, the MND fails to establish a mechanism that would ensure the mitigation site is maintained and managed in perpetuity to conserve burrowing owls and their habitat. Burrowing owls are limited to habitats with relatively short vegetation and only sparse shrubs or taller vegetation.[176] Therefore, even if the Applicant acquires a mitigation site that currently contains burrowing owls, the site would not offset Project impacts unless the Applicant implements a mechanism (e.g., grazing or mowing) for maintaining short vegetation at the site. In addition, deed restrictions do not ensure habitat conservation in perpetuity because: (a) they can be changed or eliminated,[177] and (b) do not have a third party that can be designated to monitor and enforce the restriction.[178]

Fourth, the MND fails to establish performance standards or monitoring and reporting requirements for the mitigation site. Thus, Mitigation Measure BIO-1 provides no assurances that the mitigation site would effectively compensate for the loss of burrowing owl habitat from the Project site.[179]

5038-008acp

Finally, Mitigation Measure BIO-1 requires compensatory mitigation only "if such a protected area makes sense for protection of nesting owls." This condition is vague and confusing. The MND fails to explain the factors that the City would evaluate to determine whether a protected area "makes sense," nor does it explain how significant impacts to nesting burrowing owls would be mitigated if a protected area does not "makes sense."[180]

23 (cont.)

b) Mitigation Measure BIO-2 (Swainson's Hawk)

CDFW has determined that compensatory mitigation is not required for projects in areas that have less than 5 acres of foraging habitat and are surrounded by existing urban development, unless the project area is within 1/4 mile of an active nest tree.[181] For all other projects, the CDFW has concluded that the loss of foraging habitat may lead to the "take" of Swainson's hawks and that mitigation is required. According to CDFW mitigation guidelines, projects within five miles of an active nest tree shall provide habitat compensation at a 0.75:1 ratio.[182] Even if the City determines the Project would not cause a significant reduction in available foraging habitat for the Swainson's hawk territories that occur north of the Project site, habitat compensation is required to support the needs of additional territories as the population recovers.[183]

24

c) Mitigation Measure BIO-3 (Nesting Raptors)

Mitigation Measure BIO-3 states: "[i]f nesting raptors are identified during the [pre-construction] surveys, a qualified biologist shall determine appropriate, species-specific no-disturbance buffers around all active nests…To ensure the no-disturbance buffers are adequate, a qualified biologist shall monitor the active nests within and adjacent to the project site daily for a minimum of one week and then weekly during construction."[184]

25

Mitigation Measure BIO-3 defines a qualified biologist as "a biologist with at least 2 years' experience conducting surveys for nesting raptors with detections." The response of nesting birds to human-related disturbance activities is dependent

[183] Cashen Letter, p. 12.
[184] Cashen Letter, p. 13.

printed on recycled paper

on numerous site-specific and species-specific variables. Consequently, determining the appropriate buffer distance requires knowledge of species-specific responses to various types of disturbance in various settings. Many biologists that have experience conducting raptor surveys have no experience with (or knowledge of) avian responses to disturbance. As a result, Mitigation Measure BIO-3 lacks assurances that the "qualified biologist" would establish appropriate, species-specific no-disturbance buffers around all active nests.[185]

For buffer zones to be effective, they need to be based on empirical evidence of avian responses to disturbance. There is an overall lack of this type of empirical evidence.[186] As a result, monitoring is critical to validating the adequacy of a buffer. The MND fails to identify the variables the biologist would monitor to ensure the adequacy of the no-disturbance buffers. Nevertheless, there is no scientific basis for the assumption that a nesting raptor can tolerate an inadequate nest buffer for one week (i.e., the proposed interval of construction monitoring), especially without adverse effects to reproductive success and productivity. This issue is compounded by the absence of any success standards, or monitoring and reporting requirements, for Mitigation Measure BIO-3. For these reasons, the actions proposed in Mitigation Measure BIO-3 do not ensure significant impacts to nesting raptors are avoided. To rectify this issue, the City must require nest buffers consistent with the best available scientific information.[187]

25 (cont.)

Suter and Joness (1981) surveyed 74 raptor researchers to derive recommendations for nest site protection.[188] Based on the survey results, Suter and Joness (1981) recommended a buffer distance of at least one kilometer (3,281 feet) to prevent raptors from abandoning their nests in response to construction and similar noisy, extended activities.

d) Mitigation Measure BIO-4 (Nesting Passerines)

Mitigation Measure BIO-4 suffers the same flaws as Mitigation Measure BIO-3: (1) the mitigation measure fails to ensure that the biologist has the expertise needed to determine appropriate, species-specific no-disturbance buffers for active

5038-008acp

26 (cont.) nests; and (2) weekly monitoring during construction is not sufficient to ensure significant impacts to nesting birds are avoided.[189]

e) Mitigation Measure BIO-5 (Pond Turtle)

Mitigation Measure BIO-5 requires a pre-construction survey for western pond turtles. If western pond turtle nests are found during the survey: "the nest site plus a 50-foot buffer around the nest site shall be fenced with orange construction fence until eggs hatch and young turtles disperse to the adjacent North Slough." Mr. Cashen explains that the proposed measure would be sufficient for turtle nests located less than 50 feet from the Project boundary. However, he 27 explains that it would not be effective for turtle nests located in interior portions of the Project site. After traveling 50 feet, the turtles would need to travel through the construction zone to reach North Slough. These turtles would be subject to being killed or injured by construction activities. To rectify this issue, Mitigation Measure BIO-5 needs to be modified such that it requires installation of a no-disturbance dispersal corridor between the nest site and North Slough.[190]

Pursuant to Mr. Cashen's recommendations, the City must analyze the Project's significant impacts to Biological Resources the City must prepare an EIR.

C. Substantial Evidence Supports a Fair Argument that the Project May Result in Potentially Significant Energy Impacts

28 The MND fails to perform its own energy analysis and instead relies on the SGE 258 analysis.[191] Recent cases interpreting Appendix F hold that, to comply with CEQA, the lead agency must not only describe a project's energy impacts in a CEQA document, it must also quantify them.[192] This is consistent with

[189] Cashen Letter, p. 13.
[190] Cashen Letter, p. 14.
[191] Appendix B, p. 11.
[192] *Ukiah Citizens for Safety First v. City of Ukiah* ("*Ukiah Citizens*") (2016) 248 Cal.App.4th 256, 264-65 (energy impact analysis requires clarification and technical information regarding project-related energy usage and conservation features); *Spring Valley Lake Association v. City of Victorville* ("*Spring Valley*") (2016) 248 Cal.App.4th 91, 103 (CEQA doc must show factual basis of its assumptions that both energy use and greenhouse gas emissions will be reduced); *California Clean Energy Committee v. printed on recycled paper

longstanding precedent which holds that unsupported conclusions are entitled to no judicial deference.[193]

Here the City did not quantify the energy uses from the Project but instead relied on an MND analysis that was not provided. This Project's analysis of energy is at best superficial and merely puts forth the conclusion that because this Project is similar to others in the past, no energy analysis is required.[194] Even if the analysis under SGE 258 were appropriate here, it is impossible to tell from the face of this MND because that analysis can only be found after looking the MND of SGE 258 which is not part of the MND for this Project and was not included in the MND. The MND should have provided the analysis under SGE 258 in the discussion of Energy and the CalEEMod analysis under SGE 258.

28 (cont.)

D. Substantial Evidence Supports a Fair Argument that the Project May Result in Potentially Significant Impacts from Greenhouse Gas Emissions

1. The GHG Analysis Relies on Inapplicable Thresholds In Violation of CEQA

Under the CEQA Guidelines, which have been recently updated, a lead agency must analyze a project's impacts on GHG emissions.[195] The Guidelines allow for several approaches to this analysis, both qualitative and quantitative. The Guidelines explicitly mandate, however, that the "analysis should consider a timeframe that is appropriate for the project. The agency's analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes.[196]"

29

The MND's GHG analysis relies on the outdated tiered approach developed by BAAQMD for assessing the impacts of land use development projects. Under this approach, projects are first analyzed using a "bright-line" screening threshold of

printed on recycled paper

1,100 metric tons of carbon dioxide-equivalents per year ("MTCO2e/year").[197] If the project's annual emissions go beyond this threshold, it should be analyzed under an efficiency threshold.[198] The MND analyzed the Project's annual emissions and found they were below the "bright-line" threshold, ending the analysis there.[199]

BAAQMD's bright-line threshold, however, is not applicable to the Project, and relying on it violates CEQA. BAAQMD's thresholds, included in the district's 2017 CEQA Guidelines, were developed to comply with the state reduction target as it is embodied in AB 32,[200] which mandates that statewide greenhouse gas emissions be reduced to 1990 levels by the target year 2020.[201] In 2016, the state passed SB32,[202] which codified a new statewide 2030 GHG emissions reduction target of 40% below 1990 levels. Following the new legislation, CARB adopted in December 2017 a new scoping plan to outline the strategy needed to achieve SB 32 GHG targets. These are the binding "state regulatory scheme" that the CEQA Guidelines require agencies to account for.

29 (cont.)

The BAAQMD Guidelines do not account for or include any numeric threshold for compliance with SB 32 or the scoping plan and are therefore not applicable to projects that will be built and operated beyond the AB 32 target year.[203] Because the Project's first fully operational year would be 2021, and it would continue to operate many years beyond that, the City must analyze the Project for its compatibility with the state's mandated goals for, at the very least, the year 2030.[204]

---

[197] MND, p. 61.
[198] The Guidelines also allow for a CAP consistency analysis, but it is not applicable here.

[202] https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201520160SB32
[203] See also *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497.
[204] The MND contains a single paragraph which purports to analyze the Project's consistency with SB 32. MND, p. 62. However, the section lacks any detailed discussion of how the City asserts the Project would comply with SB 32 goals, stating merely that "[t]he assumption is that SB 32 and associated regulations will be successful in reducing GHG emissions and reducing the cumulative GHG emissions Statewide to meet 2030 goals and post-2030 goals," and that, for this reason, the Project's GHG impacts would be less than significant under a qualitative plan-based approach. This analysis is inadequate.
5038-008acp

BAAQMD *itself* advises lead agencies not to rely on its numeric significance thresholds and instead advises they make significance determinations based on the most recent state greenhouse gas reduction targets. For example, in recent comment letters to lead agencies, BAAQMD stated as follows:

> The Air District encourages the City to make a significance determination for greenhouse gas impacts based on the most recent State greenhouse gas targets and CEQA guidance. The Air District's 2010 CEQA guidelines are based on the State's 2020 greenhouse gas targets. These targets have been superseded by the State's 2030 and 2050 climate stabilization goals and by the most recent draft of the AB 32 Scoping Plan written by the California Air Resources Board.[205]

29 (cont.)

> The GHG impact analysis should include an evaluation of the Plan's consistency with the California Air Resources Board 2017 Scoping Plan and State and Air District climate stabilization goals for 2030 and 2050. Please be advised that the Air District is in the process of updating the CEQA guidelines/thresholds and current thresholds for GHGs should not be used for this plan.[206]

BAAQMD is in the process of updating its current CEQA Guidelines and thresholds of significance.[207] This is yet another reason why the MND cannot rely on BAAQMD's bright-line threshold.

The MND must be revised to include a detailed analysis of the Project's compatibility with the reduction targets set in SB 32, which go beyond those set in AB 32. As it is now, the MND's analysis violates both CEQA and the Supreme Court rulings on GHG analysis.

E. Substantial Evidence Supports a Fair Argument that the Project May Result in Potentially Significant Land Use Impacts.

The MND notes that the City Attorney has reviewed the allowed uses in the Recreation zone (which includes the proposed Distribution Center use) and determined they are consistent with the Commercial Recreation Land Use in the General Plan.[208]

30 While this may be substantial evidence of that fact, given the City's failure to provide said email, it is merely a conclusory statement and evidence of nothing. "Substantial evidence" includes facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts.[209] A legal opinion alone does not constitute substantial evidence.[210]

Since the email is not made available for review the City cannot rely on it in support of this MND.

F. Substantial Evidence Supports a Fair Argument that the Project May Result in Potentially Significant Noise Impacts

1. The New Building Will Form A Canyon With The Existing Building To The North.

31 Mr. Shaw concludes that the Project may have significant noise impacts because it will create a canyon noise effect on the north side since there will be two concrete walls now facing each other. The MND fails to describe or analyze this effect in its current calculations thus resulting in an underestimate for the test samples located in Table Noise-1. The MND needs to include analysis regarding how the ambient levels would change with this canyon effect.[211]

[211] Shaw Letter, p.1.
5038-008acp

2. The Project Does Not Account for the Truck Routes and Noise as a Result of those Routes.

The MND accounts for noise on site due to truck traffic, but does not account for any along the routes the trucks must take enter and exit the to the Project. The MND states there will be 35 peak hour trips in the morning which means there will be an average of 1.7 minutes between trips. For the 28 peak hour PM trips there will be an average of 2.1 minutes between trips. With the transit around the building as noted in Figure 2, Site Plan on page 14/701, this means there will be a continuous parade of trucks around the building. The MND fails to analyze noise during operations, except for those on the North side.[212] An EIR must be prepared to correct this omission.

32

3. The Project Does Not Properly Account for Noise as a Result of Night Time Construction

There will be construction activities at night for 15 nights. The MND fails to describe how many concrete trucks will be necessary to complete the night time pours and whether the noise created from them would stay under 65dB as required by American Canyon Municipal Code, Chapter 8.12. The MND should have provided this information along with noise levels from the previous night time pour since the last pour resulted in calls to the City regarding noise.[213] The impact from the concrete activities is thus not disclosed, rendering the MND significance conclusions unsupported.[214]

33

G. Substantial Evidence Supports a Fair Argument that the Project May Result in Potentially Significant Transportation Impacts

1. Potential Warehousing Uses of the Project Building May Result in Significantly Higher Trip Generation than Assumed in the MND

The MND and its Appendix F rely on studies of trip generation at six existing wine storage/distribution facilities in the Project's vicinity to estimate the proposed

34

[212] Shaw Letter, p.2
[213] MND p. 88.
[214] Shaw Letter, p. 2

printed on recycled paper

Project's motor vehicle trip generation. While Mr. Smith finds the MND's trip generation measurements performed at the nearby buildings to be reasonably consistent with the Institute of Transportation Engineer's authoritative publication *Trip Generation, 10th Edition* data for Land Use Category 150-Warehouse and for Category 154-High Cube Logistics Warehouse, he explains that the MND's trip generation fails to consider that the type of warehouse building planned for the Project is readily adaptable to much more traffic-intensive types of warehousing than calculated.

Mr. Smith explains that this type of building could easily be used as what *Trip Generation, 10th Edition* characterizes as Land Use Category 156 – Parcel Hub Warehouse or, to use the terminology of a major operator of such facilities, Amazon, a "Last Mile" facility.[215] These are facilities where goods are brought in directly from "fulfillment centers" or air freight terminals by heavy tractor-trailer truck rigs and trans-loaded to van-type vehicles for actual delivery to consumers. As Mr. Smith explains, the difference in trip generation of a "parcel hub warehouse" and a "wine warehouse" as analyzed in the MND is highly significant.

34 (cont.)

The MND estimates the trip generation for a wine warehouse in vehicles per thousand square feet of floor area as 1.69 daily, 0.16 in the AM peak and 0.125 in the PM peak. *Trip Generation, 10th Edition* indicates the trip generation for a "parcel hub warehouse" in vehicles per thousand square feet of floor area as 7.75 daily, 0.7 in the AM peak and 0.64 in the PM peak.[216] In other words, if used as a parcel hub instead of a wine warehouse, which is reasonably foreseeable, the Project's warehouse building would generate 4.6 times as much traffic daily, 4.4 times as much traffic in the AM peak and 5.1 times as much traffic in the PM peak as what is disclosed in the MND.[217]

The MND contains no condition or mitigation measures which would restrict the Project's warehouse use to the less trip-intensive use analyzed in the MND. Indeed, the fact that the proposed warehouse is apparently a 'spec' building (the MND says it could be occupied by up to 3 tenants implying that there were no tenant commitments at the time of writing) and its proximity to heavy jet-capable Napa County Airport, strengthen the possibility that the Project could end up being used as a parcel hub. Hence, to be adequate, the MND must consider the possibility

[215] Smith Letter, p. 1
[216] Smith Letter, p. 1.
[217] Smith Letter, p. 1.

printed on recycled paper

(34) (cont.) of this plausible and more traffic intense use, or the Conditional Use Permit must limit the warehouse to being used solely as a wine storage warehouse.[218]

2. The MND's Transportation Section Fails To Address the Serious Operations and Safety Problems on S.R. 29 in the Project Vicinity

Because of its location, most motor vehicle traffic to and from the Project must ultimately use parts of State Highway 29 ("SR 29").[219] This State Highway experiences considerable operational and safety problems, as is well documented in the *State Route 29 Comprehensive Multimodal Corridor Plan* dated May 2020.[220]

Mr. Smith explains that the City and its consultants, GHD, who prepared the transportation work supporting the MND, know this as they both were participants in the above-referenced SR 29 study.[221] Yet, the MND utterly fails to address the SR 29 issues or how the Project and others like it in the area contribute to the problem and can contribute to implementing the corridor study recommendations. Instead, the MND devotes much attention to studies of level of service, traffic signal (35) warrants and right-turn lane warrants at a single local intersection, that of Commerce Boulevard with Green Island Road. Mr. Smith concludes that the MND's lack of analysis of the Project's impacts on SR29 is a major omission which leaves out a critical component of the Project's transportation impacts.[222]

The MND is defective in failing to acknowledge and address the problems in the SR 29 corridor and the Project as a cumulative contributor to them.[223] As a result, the MND's conclusion that the Project will have less than significant impacts on traffic and transportation is not supported by substantial evidence. The City must prepare an EIR to fully disclose and mitigate the Project's traffic and transportation impacts from all reasonably foreseeable uses and on all reasonably foreseeable major thoroughfares.

5038-008acp

3. The MND Assumes Implausible Mitigation of the Project's Significant VMT Impacts

After considering highly disparate data sources regarding average employee trip lengths, the MND's transportation analysis finds that the Project, without mitigation, would generate an average of 16.28 daily vehicle miles traveled ("VMT") per employee compared to an impact significance threshold of 10.92 VMT per employee, resulting in a significant impact.[224] Hence, without mitigation, the Project would have significant transportation impacts. Translated to aggregate VMT numbers, the MND finds that the Project's employees would generate 2214 VMT each weekday, exceeding the significance threshold of 1485 VMT and requires mitigation that eliminates 729 VMT daily in order for the Project to be said to have no significant impact with mitigation.[225]

The MND goes on to assume that, because the Project is committed to pave what the MND claims is an 800 foot gap in the area bikeway network. This action, based on a theoretical formulation, would induce commuters on between 76 and 310 daily commute trips[226] to shift from commuting by auto to bicycle (or splitting the difference between the high and low estimate a so-called average of 193 trips) resulting in a purported daily VMT saving of between again splitting the difference between high and low estimates) of 733 to 1004 miles.[227] The MND asserts these theoretical VMT savings would be sufficient to fully mitigate the Project's the significant VMT impacts. However, Mr. Smith explains that the MND's analysis is flawed because it fails to consider what underlies the high and low estimates, and fails to justify the reasonableness of the MND's approach of just averaging between them.[228]

36

As Mr. Smith explains, both the high and low estimates in the MND are generated by a theoretical formula estimating the number of commuters who would be induced to travel by bike, instead of auto, as the result of a bikeway of certain length. The MND's low estimate reflects only the commuters induced to travel by bike solely by the 800 feet of paved path the Project proposes to provide. The high estimate credits the Project with the commute attractiveness of the entire 1.85 mile bikeway that has already existed for a number of years to the south of the 800 feet

[224] MND Appendix F, GHD Memorandum, p. 4.
[225] Smith Letter, p. 3.

[227] MND, p. 102.
[228] Smith Letter, pp. 3-4.

printed on recycled paper

of bikeway the Project will pave.[229] Mr. Smith concludes that averaging between an estimate that just reflects the length of bikeway the Project will pave and one that credits the Project with the entire 1.85 miles of bikeway that already existed is not supported by substantial evidence and is simply not reasonable.[230]

Mr. Smith further explains that the MND's high VMT-reduction estimate reflects a limited localized study by an Oregon research cooperative that found the average commute bike trip length was 5.2 miles, whereas the low estimate reflects a national study by the American Association of State Highway and Transportation Officials (AASHTO) that found the average bike commute trip length was 3.8 miles.[231] Mr. Smith opines that splitting differences is, in essence, placing equal credence on a limited local study as on one with a national data base. This assumption is unsupported. The MND also discloses by footnote that it assumes the bike commuters would do so 5 days per week for 47 weeks per year.[232] This is in essence every single work day per year, discounting vacation, sick leave and holidays. It leaves no allowance for days of substantial rain or when rain is forecast to fall before quitting time, days of high winds, very cold days or extreme summer heatwaves, or days where the commuter intends to make a trip at lunch hour or immediately after work for which travel by bike may be unsuitable.[233]

36 (cont.)

Finally, the MND's notion that the Project is "filling a gap" in the area bikeway network is an exaggeration. Mr. Smith identified aerial photo evidence which shows that a bikeable path has existed on the alignment of Commerce Boulevard at the supposed gap since the mid-1990s, if not before.[234] The aerial photos provide substantial evidence demonstrating that the Project's bike path is a minor addition to existing bike access, and is therefore not likely to produce significantly higher VMT reductions than currently provided by the existing bike lanes. Mr. Smith concludes that the Project is not supplying a missing link, it is just improving the pavement.[235]

It is unreasonable for the MND to assume that the Project's significant VMT impacts will be mitigated by simply paving a few hundred feet of bikeway. The

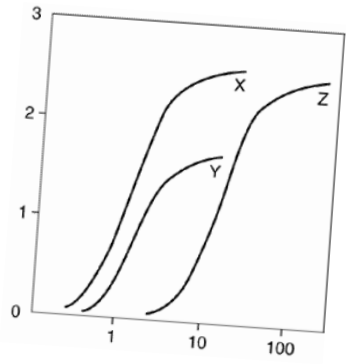
(36) (cont.) Project cannot be approved under an MND. [236] An EIR must be prepared to incorporate additional mitigation to reduce the Project's VMT impacts to less than significant levels.

VI. CONCLUSION

(37) There is substantial evidence supporting a fair argument that the Project may result in potentially significant adverse impacts that were not identified in the MND, and thus have not been adequately analyzed or mitigated. We urge the City to fulfill its responsibilities under CEQA by withdrawing the MND and preparing a legally adequate EIR to address the potentially significant impacts described in this comment letter and the attached expert comments. This is the only way the City and the public will be able to ensure that the Project's significant environmental impacts are mitigated to less than significant levels.

Thank you for your attention to these comments.

Sincerely,



Darien K. Key
Associate

Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Mr. Darien Key

Subject: Comment Letter on Recirculated Initial Study For The SDG Commerce 217 Distribution Center Project (PL20-0008), American Canyon, California

Dear Mr. Key:

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the 2021 City of American Canyon (the City) Recirculated Initial Study (RIS) of the above referenced project. The City circulated a draft Initial Study (DIS) for a 30-day public review on December 16, 2020. After receiving comments on the DIS, a Final IS was completed and adopted at the City's February 25, 2021 Planning Commission meeting. At that meeting, additional comments on the Final IS were received. The Planning Commission's project approval was appealed on March 5, 2021. The City elected to recirculate the Draft IS including modifications in response to comments received both during the initial public comment period and at the Planning Commission hearing.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the RIS. If we do not comment on a specific item, this does not constitute acceptance of the item.

Project Description:

The project site is located at 1075 Commerce Court in the City of American Canyon, due north of the City of American Canyon Clarke Ranch open space/recreation area. The project location is on the west

side of Commerce Court and just south of the City's Utility Access Easement No. 2002-31363 and 1155 Commerce Blvd. The property is generally trapezoidal in shape, approximately 10.39 acres, and is the north parcel of a recently approved tentative parcel map. Access to the project site is from SR-29 via Green Island Road to Commerce Court.

The project site was previously part of a 35.85-acre parcel (APN: 058-030-065). A tentative parcel map was adopted by the City of American Canyon on February 28, 2019, that split the 35.85-acre parcel into three parcels. The 15.24-acre south parcel was previously approved for an approximately 330,000 square-foot wine distribution center, which is nearing completion. Commerce Court was improved along the property frontage, with work completed October 13, 2020. The remaining middle parcel is approximately 10.17 acres in size; there are no current plans for development of that parcel.

The project applicant proposes to develop a 217,294 sq. ft. wine distribution center on the northern 10.39-acre parcel, which represents a 48% building coverage (0.48 FAR). The assumed 4,350 square feet of office space is an estimate. The proposed building would be approximately 324 feet deep from north to south, and average 658 feet wide from east to west. It would have perimeter concrete tilt wall panels with varying parapet heights and accent spandrel glass/metal canopy features around offices and corners of the buildings to provide additional modulation. The average roof height of the building would be approximately 35 feet and exterior walls would have various heights (33-37 feet) to provide architectural relief. The building would have earth-tone colors and style matching the SDG Commerce 330 Distribution Center building to the south. Building elevations are shown on Figure 4 of the RIS. The building has the potential of accommodating multiple tenants with provisions for up to three offices. It is anticipated that the distribution center would be used for wine storage and other wine-related storage, distribution, and warehousing activities (i.e. bottles, corks, barrels, etc.).

The building would have architecturally screened and covered trash enclosures for solid waste dumpsters for service by private waste haulers.

Because the building is proposed for warehousing and distribution of wine and/or other wine related products it would be heavily insulated and refrigerated, making it suitable for storage of wine and related products at approximately 58 degrees Fahrenheit. The microclimate of the area would

allow cool night air to be brought in with intake louvers and fans, thereby reducing the amount of refrigeration necessary.

A total of 134 car and 21 truck dock parking spaces would be provided. Six of the parking stalls would be designated for handicap access with 2 stalls designated for van accessibility and 4 stalls for Clean Air Vehicle parking. The building would have 21 truck loading docks.

Construction Activities and Schedule

According to the City, the construction of the proposed project would occur in one phase. This phase would include site grading and installation of underground utilities stubbed to the building pad. The detention/bioretention pond, treatment swales and Storm Water Pollution Prevention Measures (SWPPP) for the site would be completed during the initial construction phases. It is anticipated that approximately 9.5 months would occur from commencement of initial grading start to building construction completion. The grading component is anticipated to take approximately 9 weeks.

According to the RIS, the Project construction hours would occur from 7:00am to 6:00pm Monday through Friday except for the concrete building slab pour, wall panel and large concrete paving pours. These are required to be performed during nighttime hours starting no earlier than 12:00am. Pre-notification of these night pour dates and times will be provided to the City and nearby residents that expressed concerns during the SDG 330 nighttime concrete pours, as well as all property owners within 300 feet of the project site. The project is anticipated to have approximately 5 concrete night pours for the building slab, 4 for the large concrete paving, and 6 for the tiltup walls. Pours would start between 12am - 2am and continue into daytime hours. Maximum noise levels at the nearest residential receptor would be less than 53 dBA (See section XIII, Noise, for a complete discussion of concrete pour noise impacts). Nighttime pours are not optional due to cooler ambient nighttime temperatures, volume of concrete poured, morning traffic congestion that can prevent concrete trucks from arriving at the site on time, and concrete vendor conflict with other customers needing concrete during the day.

According to the RIS, typical construction equipment used at the site would include self-loading dirt scraper, bulldozer, motor grader, compactor, roller, water truck, backhoe, excavator, trencher, drilling auger, front end loader, paving machine, laser screed, concrete finishing trowels,

tractor, crane, forklift, generator, man lift, scissor lift, welding machine, and light tower. During the construction phase, it is typical for 12 to 24 workers on- site but can equal up to 80 workers.

Proposed Building Uses

It is anticipated that the building will operate 12-18 hours per day in up to 3 overlapping shifts during the peak season. During this time, up to 32 full-time employees and 18 part-time employees may work on-site at the same time. The employment estimates are approximations as there is no specific user identified with the application; however, they are substantiated with similar uses. The proposed uses for the building can be estimated that approximately 2 to 4 trips per day would be from clients or visitors to the site and will likely be during off-peak or normal working hour times.

The building is designed to accommodate three tenants. Office space within the building is incidental to the distribution center operation and usually occupies less than two percent of the building. Hours of operation are normally 6 AM to 6 PM Monday thru Friday and 6 AM to 12 PM Monday thru Friday during peak seasonal months, typically June through November.

General Comments:

The Proponent of the project has already constructed another building in the immediate vicinity that is exactly like the Commerce 217 Distribution Center (SDG Commerce 330 Warehouse Project) and has recycled the design and environmental analysis from that project for use in the SDG 217 project. It is clear that the Proponent is piecemealing a larger project by constructing the same project every two years. The City and the Proponent have failed in their obligations under CEQA to adequately describe and assess the impacts of the whole project on the surrounding community. The City is attempting to recirculate appealed DIS on March 5, 2021 without addressing serious concerns raised about the "Final" IS. The issues not addressed include exceedances of significance thresholds during the construction phase of the project, a lack of health risk analysis for increases in the diesel particulate matter that will be emitted from activities associated with the Site, health impacts and the lack of a quantitative health risk analysis for the air emissions associated with the Site.

In addition, the RIS fails to assess latent hazards that may be present in the soils present at the

site which will impact not only construction workers at the site but workers in adjacent businesses. The Phase II report of the subsurface investigation relied on an inadequate sampling program that failed to adequately characterize conditions across the site. The City must re-evaluate the impacts and compile them in a draft environmental impact report (DEIR).

Specific Comments:

1. The City Failed To Perform A Project Specific Traffic Impact Analysis (TIA) For The 217 Commerce Center Project And Is Relying On A TIA For Another Project

The City has failed to perform a TIA for the 217 Commerce Center project. Rather than assess the impacts the City relies on the 2018 TIA performed for the SDG Commerce 330 Warehouse Project. According to the introductory paragraph of the TIA Memorandum, the TIA was prepared to present the results of an analysis performed by GHD for a proposed new wine storage facility development at 330 Commerce Boulevard Wine Storage Facility project in the City of American Canyon. The TIA assumed the construction of a 330,528 square foot wine storage warehouse. According to the TIA Memorandum 9 projects were included in the traffic analysis along with the SDG Commerce 330 Warehouse Project. Those projects include:

1. Napa Logistics Park Phase 1 and 2
2. Canyon Estates
3. Napa Airport Corporate Center
4. Napa Airport Corporate Center Phase 1
5. Napa Junction III
6. Napa Logistics Park Phase I
7. Valley View Senior Housing
8. Village at Vintage Ranch
9. Green Island 258 Warehouse Project

The analysis showed that the conditions at State Route 29 and Green Island Road would drop from a Level of Service (LOS) C to LOS D in the AM peak hours.

The trip generation analysis used in the TIAM for the SDG Commerce 330 Warehouse assumed a generation rate of 1.69 vehicles for each 1,000 square feet of the wine warehouse

constructed (1.69 * 330.528 = 558.59 or 559 vehicles). Clearly, the 2018 analysis does not consider the impact from the additional 367 vehicle trips (217.294 *1.69 = 367.22 or 367), an increase of approximately 66 percent (65.74% = ((367.22 + 558.59)/(558.59))). In addition, the TIA fails to account for the additional traffic burden/vehicle trips associated with the opening of the New Napa Junction School located at the corner of Eucalytpus Drive and Commerce Boulevard. Given the significant increase in trips from the unaccounted projects identified herein, the City must re-evaluate the traffic impacts from the project in an environmental impact report (EIR).

2. **The City Has Not Accurately Reported The Estimated Daily Construction Emissions and Ignored The Significant Impacts During The Construction Phase**

According to the DIS and the RIS, the Project construction emissions are less than the significance thresholds (See Table AQ-1) and the proposed project would also include Best Management Practices (BMPs) required per the Bay Area Air Quality Management District's (BAAQMD's) CEQA Air Quality Guidelines. Therefore, project impacts from construction emissions would be less than significant. The City's analysis assumes one continuous phase of construction, ignoring the substantial highs and lows based on each phase of construction evaluated (site preparation, grading, building construction, paving, and architectural coating).

Table AQ-1: Estimated Daily Construction Emissions (pounds/day)

Construction Phase	Total Regional Pollutant Emissions (lbs/day)				
	ROG	NO_x	CO	Exhaust PM_{10}	Exhaust $PM_{2.5}$
Proposed Project Unmitigated Emissions					
2021	13.6	24.6	19.5	1.0	0.9
BAAQMD Significance Threshold	**54**	54	--	82	54
Emissions Exceed Threshold?	No	No	No	No	No

The City has failed in its obligations to accurately report the construction emissions by mis-interpreting guidance from BAAQMD. According to the 2017 CEQA Guidance From BAAQMD, "The Air District recommends that for construction projects that are less than one year duration, Lead Agencies should annualize impacts over the scope of actual days that peak impacts are to occur, rather

than the full year." This means that for each phase of construction emissions should be presented and compared against the BAAQMD Significance Thresholds.

As was previously pointed out in comments on the DIS, the calculated daily construction emissions in the RIS are based on the total average emissions for the entire construction phase of the project. The City's use of the total average daily emissions ignores the substantial impacts that are associated with the maximum daily emission rates calculated by the CALEEMOD model of the project.

Construction Phase	Total Regional Pollutant Emissions (lbs/day)				
	ROG	NO_x	CO	Exhaust PM_{10}	Exhaust $PM_{2.5}$
Proposed Project Unmitigated Emissions					
Site Preparation	3.9558	40.5366	21.6621	2.04546	1.88178
Grading	2.5683	37.5613	17.7651	1.16798	1.07479
Building Construction	2.6831	24.2402	22.5509	0.9815	1.3558
Paving	1.7638	12.952	15.0764	0.6785	0.62424
Architectural Coatings	155.6296	1.5948	2.6922	0.09575	0.09562
BAAQMD Significance Threshold	**54**	54	--	82	54
Emissions Exceed Threshold?	**Yes**	No	No	No	No

Over the course of the construction the emissions of reactive organic gases (ROGs), precursors to the formation of ozone, increase substantially from a low of 1.76 lbs/day during the paving phase of the project to a high of 155.63 lbs/day during the Architectural Coatings phase of the project. While the total averaged values over the whole are lower than the Significance Threshold value of 54 lbs/day, the City is obligated to assess impacts of emissions from each phase of the construction of the project. Short term exceedances of the significance thresholds may have significant local impacts on the air quality and the community at large. The City must report the impacts from each step of the construction of the project in an EIR providing a clear analysis of the criteria and toxic air contaminants as well as the greenhouse gas emissions.

3. The City Has Failed To Quantify The Impact That Transportation Refrigeration Units (TRUs) Will Have On Air Quality Impacts From The Proposed Project In The Alternative Project Analysis.

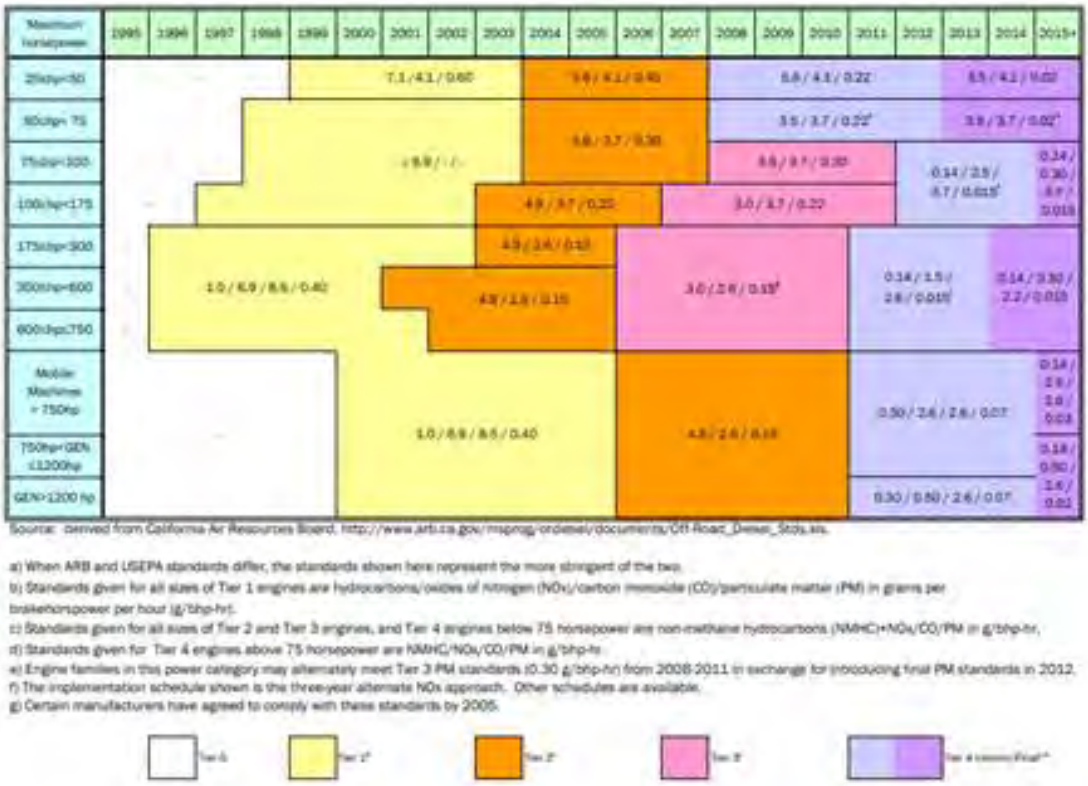
The RIS's assessment of the project does not include the impacts from diesel particulate matter (DPM) emissions from transportation refrigeration units (TRUs) installed on insulated cargo vans and trucks that will be used to transport the temperature sensitive goods stored at the project site. In 2019, CARB released a health risk analysis that documented the significant impact of TRU's. In CARB's analysis they calculated that the operation of one daily truck delivery, one daily trailer delivery, and one seasonal trailer TRUs for a total of 202 hours per week results in a cancer health risk of 190 in one million on site, 28 in one million at a residence 100 meters off-site, and 5 in one million at a residence 400 meters off site. The closest residence to the proposed project site is identified by the City as being located 500 feet (approximately 150 meters off-site). When the number of daily trucks is increased to 10 per day and daily trailers increased to 6 per day, the onsite risk increases to 610 in one million, the 100-meter offsite risk increases to 92 in one million, and the 400-meter offsite risk increase to 16 in one million. Clearly the impacts from the use of any TRUs at the Project Site will have a substantial impact on the air quality for residents and other sensitive nearby to the project site. Since the TRU mobile refrigeration unit emissions will have a significant health impact for workers on site and residents nearby the City must require mitigation measures to reduce that risk below BAAQMD thresholds. The mitigation measures at a minimum must

1. Track the number, types, and emissions of DPM from TRUs brought on-site;
2. Establish a baseline acceptable level based on a health risk analysis of the TRUs utilized (total DPM emissions allowable per year); and/or
3. Implement alternative systems for powering TRUs, including the use of electrified systems.

In addition to the health impacts from exposure to DPM that must be assessed in the analysis, the impacts on greenhouse gas (GHG) emissions from TRUs must be included in an EIR of the project.

4. The City's Reliance On Best Management Practices (BMPs) To Keep Emissions Below Significance Threshold Values Are Unenforceable.

The use of best management practices (BMPs) as a mitigation measure are an unenforceable measure. These measures rely on the good will of a third party (e.g., construction contractors) to ensure that mitigation is being performed on known sources of pollution. Without clear lines of authority to penalize for failure to meet stated goals (i.e., reports of daily dust emission monitoring at the fence line during the construction phase of the project) the BMPs become meaningless and counter-



productive.

5. The City's Air Quality Mitigation Measure AQ-4 Utilized In The Analysis of The SDG Commerce 330 Warehouse Project Was Insufficient To Reduce the Project's Significant Health Risk to Less than Significant Levels

In the City's analysis of air quality impacts for the SDG Commerce 330 Warehouse project, the preferred mitigation measure (AQ-4) for ensuring DPM emissions would remain below the significance thresholds was the use of U.S. EPA Tier 2 equivalent construction equipment. required ensure that the Project's health risk impacts are less than significant levels. The City stated at the time of the IS/MNDs release that the use of Tier 2 technology would keep emissions below a health risk of 10 in 1,000,000 without quantifying the actual health risk in the analysis. Tier 2 technology was first released in the mid-1990's and is not currently the recommended standard for diesel powered equipment.

The United States Environmental Protection Agency (U.S. EPA) has slowly adopted more stringent standards to lower the emissions from off-road construction equipment since 1994. Since that time, Tier 1, Tier 2, Tier 3, Tier 4 Interim, and Tier 4 Final construction equipment has been phased in over time. Tier 4 Final represents the cleanest burning equipment and therefore has the lowest emissions compared to other tiers, including Tier 4 Interim equipment.[1]

[1] "San Francisco Clean Construction Ordinance Implementation Guide for San Francisco Public Projects." August 2015, *available at:* https://www.sfdph.org/dph/files/EHSdocs/AirQuality/San_Francisco_Clean_Construction_Ordinance_2015.pdf, p. 6.

As demonstrated in the figure above, Tier 2 equipment has greater emission levels than Tier 3, Tier 4 Interim, and Tier 4 Final equipment.[2] Requiring the use of Tier 2 or equivalent control technology for all equipment as a mitigation measure does not provide the community with greatest level of protection possible.

For the operational phase of the project, the City must promulgate mitigation measures to ensure that residents near the Project are not adversely affected by DPM emissions from any generator that may be installed onsite. Emissions from combustion engines for stationary uses, including diesel generators, are generally regulated by the U.S. Environmental Protection Agency (U.S. EPA) and the California Air Resources Board (CARB). Unlike Off-Road Diesel-Powered Engines for Mobile Sources (currently utilizing Tier 4 Interim and Final technology which reduce PM2.5 emissions by 90% and more), diesel back-up generators generally have U.S. EPA Tier II ratings and need to be outfitted with diesel particulate filters to achieve additional PM2.5 reductions. In, addition, diesel-powered generator engines should be fueled using ultra-low sulfur diesel fuel with a maximum sulfur

[2] "San Francisco Clean Construction Ordinance Implementation Guide for San Francisco Public Projects." August 2015, *available at:* https://www.sfdph.org/dph/files/EHSdocs/AirQuality/San_Francisco_Clean_Construction_Ordinance_2015.pdf, p. 6.

content of 15 parts per million (ppm). If higher rated diesel generators are available, the City must require that the proponent purchase and maintain the generator that will achieve the highest amount of DPM reduction. The City should prepare a DEIR which accurately discloses the extent of the Project's health risk from construction and operational DPM emissions, and which includes a Mitigation Monitoring and Reporting Program with enforceable mitigation measures to reduce the Project's health risk to the greatest extent feasible.

6. The City Has Failed To Perform a Quantitative Health Risk Analysis Of The Emissions From The SDG Commerce 217 Project And Is Relying On A Non-Quantitative Analysis Performed On The SDG 330 Warehouse Project

The City must perform a quantitative analysis of the emissions from construction and operational emissions from the Project, instead of relying on a non-quantitative analysis provided in the SDG 330 Warehouse Project which lacks any merit. On page 25 of the Initial Study for the SDG 330 Warehouse Project, the City states that the nearest sensitive receptors to the project, a residential neighborhood, with two-to-three homes that could potentially be within 1,000 feet of certain project construction phases (site preparation and grading activities).

According to the City's analysis of the SDG 330 Warehouse Project, the "Office of Environmental Health Hazard Assessment (OEHHA) does not recommend assessing cancer risk for projects lasting less than two months (OEHHA, 2015). Site preparation and grading activities would last approximately 5 weeks and then subsequent construction phases (building construction and other construction activities) would be greater than 1,000 feet from the nearest sensitive receptor. Secondly, annual wind directions are frequently from the south-southwest (that is, wind blowing from the receptor towards the project site and rarely (northwesterly) from the project site towards the receptor).

To ensure the proposed project's health impacts are less than significant, this Initial Study implements the enhanced exhaust emissions reduction measures as Mitigation Measure AQ-4." Mitigation Measure AQ-4 assumed that all off-road equipment should have:

"a. Engines that meet or exceed either USEPA or CARB Tier 2 off-road emission standards, and;

b. Engines that are retrofitted with a CARB Level 2 Verified Diesel Emissions Control Strategy (VDECS). Acceptable options for reducing emissions include the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment

products, add-on devices such as particulate filters, and/or other options as such are available." As will be demonstrated in Comment 5 above, the use of Tier 2 equipment for the SDG 330 Warehouse Project would not have met the goal of enhancing exhaust emission reductions and would in fact increase the potential emissions from sources on site.

The logic used by the City to justify not producing an air dispersion model of emissions and a quantitative health risk assessment for the SDG Commerce 330 Warehouse project is flawed and contradicts the BAAQMD CEQA guidance. Under Section 5.2.4, Sources Not Requiring A BAAQMD Permit, the BAAQMD states that "For new land uses that would host a high number of non-permitted TAC sources, such as a distribution center, the incremental increase in cancer risk shall be determined by an HRA using an acceptable air dispersion model in accordance with BAAQMD's Recommended Methods for Screening and Modeling Local Risks and Hazards and/or CAPCOA's guidance document titled Health Risk Assessments for Proposed Land Use Projects. A Lead Agency may consult HRAs that have previously been conducted for similar land uses to determine whether it assesses the incremental increase in cancer risk qualitatively or by performing an HRA. This analysis shall account for all TAC and PM emissions generated on the project site, ***as well as any TAC emissions that would occur near the site as a result of the implementation of the project (e.g., diesel trucks queuing outside an entrance, a high volume of trucks using a road to access a quarry or landfill)***" (emphasis added).

Clearly the City has previously failed to assess the TAC and PM emissions from the SDG 330 Warehouse Project and is falsely assumed that Mitigation Measure AQ-4 would reduce any TAC and PM emissions to a level that would not produce a risk above 10 in one million without any supporting evidence. Applying the same hand waving of the facts to the SDG Commerce 217 Project does not meet the obligations that the City has under CEQA to quantify the impacts of the project on the community. Furthermore, relying on this unsupported analysis to support the assertion that the SDG Commerce 217 Distribution Center project will not have a significant impact is patently false. The City must quantify the diesel particulate emissions from all sources associated with the SDG Commerce 217 Distribution Center project (including TRUs that will be utilized onsite), perform an acceptable air dispersion model of the SDG Commerce 217 construction and operational emissions, and assess the impact of those emissions in a health risk assessment consistent with guidance from OEHHA. Additionally, the City must include a cumulative impact analysis that includes the emissions from all of the projects identified previously as having a potential impact on traffic in the vicinity. The

results of those analyses must be presented in a DEIR.

7. The City Has Failed To Quantify The Health Impacts From The Construction Emissions Of The Project On The New Elementary School Receptors That Are Less Than 500 Meters Southeast of The Project Site.

In the RIS, the City states that "Construction activities would occur intermittently for approximately 9.5 months and the vast majority of construction activities would be well beyond 1,000 feet from the nearest residence and 1,500 feet from the school. *Some construction activities during the approximately nine weeks of site preparation and grading for the project could be within 1,000 feet of the school property boundary, however, site preparation and grading activities are planned for March 2021 and the school is set to begin instruction in Fall 2021* (emphasis added). Project construction activities would be limited to the project site (1,500 feet away) when school is in-session during Fall 2021 and would therefore not warrant a healthrisk evaluation and would be considered less-than-significant by the BAAQMD" Given that it is now May, 2021 and a final RIS has not been approved by the City, it is clear that construction activities that will generate dusts and DPM that will affect the students and staff at the new school will occur during the start of the new school year. The City must now perform the health risk analysis and air dispersion modeling to ensure that the students and staff of the school are not adversely impacted and submit the results in a DEIR.

8. The City Has Failed To Quantify The Health Impacts From Operational Emissions From The Project On New Elementary School (Sensitive Receptor) That Is Less Than 500 Meters Southeast of The Project Site.

The City must assess the air quality impacts for all toxic air compounds that will be released during the operational phase of the project on the new Napa Unified School District new Napa Junction School constructed at the corner of Eucalytpus Drive and Commerce Boulevard. In the RIS, the City states that there are no schools or daycare centers within 1,000 feet of the proposed project. The new Napa Junction School is located approximately 450 meters (approximately 1500 feet) southeast of the project site and is scheduled to open in the Fall of 2021. Students and staff at the school will be exposed to emissions from the operational phase of the project. Those emissions were ignored in the

RIS and will include known human carcinogens.

The BAAQMD CEQA Guidance Appendix states " lead agency should enlarge the 1,000-foot radius on a case-by-case basis if an unusually large source or sources of risk or hazard emissions that may affect a proposed project is beyond the recommended radius." The City must expand the radius of influence to be evaluated, perform an EMFAC compliant analysis of the increase in traffic from the project and the surrounding warehouses, perform dispersion model of the traffic emissions to determine the extent of DPM emissions that will impact the school, and perform a health risk assessment to determine impacts on the staff and students of the school. The results of that analysis must be presented in a DEIR.

9. The City Has Failed To Quantify All Of The Health Impacts Emissions From The Project On The Surrounding Community.

The City must assess the air quality impacts for all toxic air compounds that will be released during the construction and operational phases of the project. CARB[3] defines diesel exhaust as a complex mixture of inorganic and organic compounds that exists in gaseous, liquid, and solid phases. CARB and U.S. EPA identify 40 components of the exhaust as suspected human carcinogens, including formaldehyde, 1,3-butadiene, and benzo[a]pyrene. The inhalation unit risk factor identified by OEHHA for use in risk assessments is for the particulate matter (DPM) fraction of diesel exhaust and not the vapor phase components identified by CARB and U.S. EPA.

The City attempts to argue that it is not required to analyze the health risk from operational exposure to TAC emissions. However, there is notable precedent requiring a quantitative analysis of TACs from diesel exhaust in CEQA documents. Moreover, the absence of this analysis renders the DEIR's health risk analysis incomplete. In a 2017 Air Quality Technical Report[4] submitted in support

[3] CARB. 1998. Report to the Air Resources Board on the Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, Part A, Public Exposure To, Sources and Emissions of Diesel Exhaust In California. April 22, 1998. Pg A-1.

[4] Ramboll Environ. 2017. Air Quality Technical Report Turk Island Landfill Consolidation And Residential Subdivision Project. Prepared For City of Union City, Union City, CA. Prepared by Ramboll Environ US Corporation, San Francisco, CA August, 2017. https://www.unioncity.org/DocumentCenter/View/1867/Turk-Island---App-D---AQ-Emissions-Report?bidId=

of a Draft EIR for the Turk Island Landfill Consolidation and Residential Subdivision[5], proponents accounted for the gaseous phase of diesel emission and detailed the speciated diesel total organic gas (TOG) emissions along with the DPM emissions for all construction equipment. The speciated diesel TOG emissions and DPM emissions were utilized in dispersion modeling to identify the maximally exposed individual sensitive receptor (MEISR) of the project to determine the health risks associated with all sources of air toxins from the construction phase of the project. This is a common and feasible analysis that is routinely performed for development projects like the SDG Commerce 217 Warehouse project.

Here, the City's analysis ignores the presence of TACs being emitted with diesel exhaust during the construction and operational phases of the project without making any attempt to quantify the impacts. This omission is a continuing flaw that must be addressed by the City. The results should then be presented in a DEIR.

10. The City Has Failed To Perform A Cumulative Analysis Of The Impacts From The Proposed Project and The Surrounding Projects Allowed Previously By The City.

The City must assess the cumulative impacts from the project and the adjacent projects it authorized in the last 10 years. The City has allowed a significant number of projects to be developed in the immediate vicinity of the SDG 217 Project without quantifying the impact of the emissions from each of the projects on the surrounding community. Those projects include:

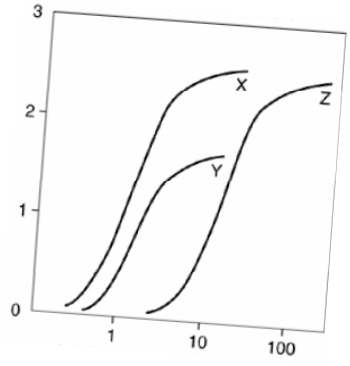
1. Napa Logistics Park Phase 1 and 2
2. Canyon Estates
3. Napa Airport Corporate Center
4. Napa Airport Corporate Center Phase 1
5. Napa Junction III
6. Napa Logistics Park Phase I
7. Valley View Senior Housing
8. Village at Vintage Ranch

[5] Union City. 2018. Draft Environmental Impact Report (DEIR) Turk Island Landfill Consolidation And Residential Subdivision Project. SCH Number 20008112107. Dated 3/15/2018. https://www.unioncity.org/DocumentCenter/View/1863/Turk-Island-DEIR?bidId=

9. Green Island 258 Warehouse Project
10. SDG Commerce 330 Warehouse Project

The results of this cumulative analysis should then be presented in a DEIR.

Conclusion



The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant unmitigated impacts if allowed to proceed. The City must prepare a DEIR to address these substantial concerns and to address the errors presented in the IS/MND.

Sincerely,

JAMES J. J. CLARK, Ph.D.

James J. J. Clark, Ph.D.

Principal Toxicologist

Toxicology/Exposure Assessment Modeling

Risk Assessment/Analysis/Dispersion Modeling

Education:

Ph.D., Environmental Health Science, University of California, 1995

M.S., Environmental Health Science, University of California, 1993

B.S., Biophysical and Biochemical Sciences, University of Houston, 1987

Professional Experience:

Dr. Clark is a well recognized toxicologist, air modeler, and health scientist. He has 20 years of experience in researching the effects of environmental contaminants on human health including environmental fate and transport modeling (SCREEN3, AEROMOD, ISCST3, Johnson-Ettinger Vapor Intrusion Modeling); exposure assessment modeling (partitioning of contaminants in the environment as well as PBPK modeling); conducting and managing human health risk assessments for regulatory compliance and risk-based clean-up levels; and toxicological and medical literature research.

Significant projects performed by Dr. Clark include the following:

LITIGATION SUPPORT

Case: James Harold Caygle, et al, v. Drummond Company, Inc. Circuit Court for the Tenth Judicial Circuit, Jefferson County, Alabama. Civil Action. CV-2009

Client: Environmental Litgation Group, Birmingham, Alabama

Dr. Clark performed an air quality assessment of emissions from a coke factory located in Tarrant, Alabama. The assessment reviewed include a comprehensive review of air quality standards, measured concentrations of pollutants from factory, an inspection of the facility and detailed assessment of the impacts on the community. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Rose Roper V. Nissan North America, et al. Superior Court of the State Of California for the County Of Los Angeles – Central Civil West. Civil Action. NC041739

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to multiple chemicals, including benzene, who later developed a respiratory distress. A review of the individual's medical and occupational history was performed to prepare an exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to respiratory irritants. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: O'Neil V. Sherwin Williams, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to petroleum distillates who later developed a bladder cancer. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Summary judgment for defendants.

Case: Moore V., Shell Oil Company, et al. Superior Court of the State Of California for the County Of Los Angeles

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to chemicals while benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Raymond Saltonstall V. Fuller O'Brien, KILZ, and Zinsser, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Richard Boyer and Elizabeth Boyer, husband and wife, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-7G.

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: JoAnne R. Cook, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-9R

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of an individual exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Patrick Allen And Susan Allen, husband and wife, and Andrew Allen, a minor, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-W

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Michael Fahey, Susan Fahey V. Atlantic Richfield Company, et al. United States District Court Central District of California Civil Action Number CV-06 7109 JCL.

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Constance Acevedo, et al., V. California Spray-Chemical Company, et al., Superior Court of the State Of California, County Of Santa Cruz. Case No. CV 146344

Dr. Clark performed a comprehensive exposure assessment of community members exposed to toxic metals from a former lead arsenate manufacturing facility. The former manufacturing site had undergone a DTSC mandated removal action/remediation for the presence of the toxic metals at the site. Opinions were presented regarding the elevated levels of arsenic and lead (in attic dust and soils) found throughout the community and the potential for harm to the plaintiffs in question.

Case Result: Settlement in favor of defendant.

Case: Michael Nawrocki V. The Coastal Corporation, Kurk Fuel Company, Pautler Oil Service, State of New York Supreme Court, County of Erie, Index Number I2001-11247

Client: Richard G. Berger Attorney At Law, Buffalo, New York

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the

known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Judgement in favor of defendant.

SELECTED AIR MODELING RESEARCH/PROJECTS

Client – Confidential

Dr. Clark performed a comprehensive evaluation of criteria pollutants, air toxins, and particulate matter emissions from a carbon black production facility to determine the impacts on the surrounding communities. The results of the dispersion model will be used to estimate acute and chronic exposure concentrations to multiple contaminants and will be incorporated into a comprehensive risk evaluation.

Client – Confidential

Dr. Clark performed a comprehensive evaluation of air toxins and particulate matter emissions from a railroad tie manufacturing facility to determine the impacts on the surrounding communities. The results of the dispersion model have been used to estimate acute and chronic exposure concentrations to multiple contaminants and have been incorporated into a comprehensive risk evaluation.

Client – Los Angeles Alliance for a New Economy (LAANE), Los Angeles, California

Dr. Clark is advising the LAANE on air quality issues related to current flight operations at the Los Angeles International Airport (LAX) operated by the Los Angeles World Airport (LAWA) Authority. He is working with the LAANE and LAX staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client – City of Santa Monica, Santa Monica, California

Dr. Clark is advising the City of Santa Monica on air quality issues related to current flight operations at the facility. He is working with the City staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client: Omnitrans, San Bernardino, California

Dr. Clark managed a public health survey of three communities near transit fueling facilities in San Bernardino and Montclair California in compliance with California Senate Bill 1927. The survey included an epidemiological survey of the effected communities, emission surveys of local businesses, dispersion modeling to determine potential emission concentrations within the communities, and a comprehensive risk assessment of each community. The results of the study were presented to the Governor as mandated by Senate Bill 1927.

Client: Confidential, San Francisco, California

Summarized cancer types associated with exposure to metals and smoking. Researched the specific types of cancers associated with exposure to metals and smoking. Provided causation analysis of the association between cancer types and exposure for use by non-public health professionals.

Client: Confidential, Minneapolis, Minnesota

Prepared human health risk assessment of workers exposed to VOCs from neighboring petroleum storage/transport facility. Reviewed the systems in place for distribution of petroleum hydrocarbons to identify chemicals of concern (COCs), prepared comprehensive toxicological summaries of COCs, and quantified potential risks from carcinogens and non-carcinogens to receptors at or adjacent to site. This evaluation was used in the support of litigation.

Client – United Kingdom Environmental Agency

Dr. Clark is part of team that performed comprehensive evaluation of soil vapor intrusion of VOCs from former landfill adjacent residences for the United Kingdom's Environment

Agency. The evaluation included collection of liquid and soil vapor samples at site, modeling of vapor migration using the Johnson Ettinger Vapor Intrusion model, and calculation of site-specific health based vapor thresholds for chlorinated solvents, aromatic hydrocarbons, and semi-volatile organic compounds. The evaluation also included a detailed evaluation of the use, chemical characteristics, fate and transport, and toxicology of chemicals of concern (COC). The results of the evaluation have been used as a briefing tool for public health professionals.

EMERGING/PERSISTENT CONTAMINANT RESEARCH/PROJECTS

Client: Ameren Services, St. Louis, Missouri

Managed the preparation of a comprehensive human health risk assessment of workers and residents at or near an NPL site in Missouri. The former operations at the Property included the servicing and repair of electrical transformers, which resulted in soils and groundwater beneath the Property and adjacent land becoming impacted with PCB and chlorinated solvent compounds. The results were submitted to U.S. EPA for evaluation and will be used in the final ROD.

Client: City of Santa Clarita, Santa Clarita, California

Dr. Clark is managing the oversight of the characterization, remediation and development activities of a former 1,000 acre munitions manufacturing facility for the City of Santa Clarita. The site is impacted with a number of contaminants including perchlorate, unexploded ordinance, and volatile organic compounds (VOCs). The site is currently under a number of regulatory consent orders, including an Immanent and Substantial Endangerment Order. Dr. Clark is assisting the impacted municipality with the development of remediation strategies, interaction with the responsible parties and stakeholders, as well as interfacing with the regulatory agency responsible for oversight of the site cleanup.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of perchlorate in environment. Dr. Clark evaluated the production, use, chemical characteristics, fate and transport, toxicology, and remediation of perchlorate. Perchlorates form the basis of solid rocket fuels and have recently been detected in water supplies in the United States. The results of this research

were presented to the USEPA, National GroundWater, and ultimately published in a recent book entitled *Perchlorate in the Environment*.

Client – Confidential, Los Angeles, California

Dr. Clark is performing a comprehensive review of the potential for pharmaceuticals and their by-products to impact groundwater and surface water supplies. This evaluation will include a review if available data on the history of pharmaceutical production in the United States; the chemical characteristics of various pharmaceuticals; environmental fate and transport; uptake by xenobiotics; the potential effects of pharmaceuticals on water treatment systems; and the potential threat to public health. The results of the evaluation may be used as a briefing tool for non-public health professionals.

PUBLIC HEALTH/TOXICOLOGY

Client: Brayton Purcell, Novato, California

Dr. Clark performed a toxicological assessment of residents exposed to methyl-tertiary butyl ether (MTBE) from leaking underground storage tanks (LUSTs) adjacent to the subject property. The symptomology of residents and guests of the subject property were evaluated against the known outcomes in published literature to exposure to MTBE. The study found that residents had been exposed to MTBE in their drinking water; that concentrations of MTBE detected at the site were above regulatory guidelines; and, that the symptoms and outcomes expressed by residents and guests were consistent with symptoms and outcomes documented in published literature.

Client: Confidential, San Francisco, California

Identified and analyzed fifty years of epidemiological literature on workplace exposures to heavy metals. This research resulted in a summary of the types of cancer and non-cancer diseases associated with occupational exposure to chromium as well as the mortality and morbidity rates.

Client: Confidential, San Francisco, California

Summarized major public health research in United States. Identified major public health research efforts within United States over last twenty years. Results were used as a briefing tool for non-public health professionals.

Client: Confidential, San Francisco, California

Quantified the potential multi-pathway dose received by humans from a pesticide applied indoors. Part of team that developed exposure model and evaluated exposure concentrations in a comprehensive report on the plausible range of doses received by a specific person. This evaluation was used in the support of litigation.

Client: Covanta Energy, Westwood, California

Evaluated health risk from metals in biosolids applied as soil amendment on agricultural lands. The biosolids were created at a forest waste cogeneration facility using 96% whole tree wood chips and 4 percent green waste. Mass loading calculations were used to estimate Cr(VI) concentrations in agricultural soils based on a maximum loading rate of 40 tons of biomass per acre of agricultural soil. The results of the study were used by the Regulatory agency to determine that the application of biosolids did not constitute a health risk to workers applying the biosolids or to residences near the agricultural lands.

Client – United Kingdom Environmental Agency

Oversaw a comprehensive toxicological evaluation of methyl-*tertiary* butyl ether (M*t*BE) for the United Kingdom's Environment Agency. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of M*t*BE. The results of the evaluation have been used as a briefing tool for public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of *tertiary* butyl alcohol (TBA) in municipal drinking water system. TBA is the primary breakdown product of M*t*BE, and is suspected to be the primary cause of M*t*BE toxicity. This evaluation will include available information on the production, use, chemical characteristics, fate and transport in the environment, absorption, distribution, routes of detoxification, metabolites, carcinogenic potential, and remediation of TBA. The results of the evaluation were used as a briefing tool for non-public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of methyl *tertiary* butyl ether (MTBE) in municipal drinking water system. MTBE is a chemical added to gasoline to increase the octane

rating and to meet Federally mandated emission criteria. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of MTBE. The results of the evaluation have been were used as a briefing tool for non-public health professionals.

Client – Ministry of Environment, Lands & Parks, British Columbia

Dr. Clark assisted in the development of water quality guidelines for methyl tertiary-butyl ether (MTBE) to protect water uses in British Columbia (BC). The water uses to be considered includes freshwater and marine life, wildlife, industrial, and agricultural (e.g., irrigation and livestock watering) water uses. Guidelines from other jurisdictions for the protection of drinking water, recreation and aesthetics were to be identified.

Client: Confidential, Los Angeles, California

Prepared physiologically based pharmacokinetic (PBPK) assessment of lead risk of receptors at middle school built over former industrial facility. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client: Kaiser Venture Incorporated, Fontana, California

Prepared PBPK assessment of lead risk of receptors at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

RISK ASSESSMENTS/REMEDIAL INVESTIGATIONS

Client: Confidential, Atlanta, Georgia

Researched potential exposure and health risks to community members potentially exposed to creosote, polycyclic aromatic hydrocarbons, pentachlorophenol, and dioxin compounds used at a former wood treatment facility. Prepared a comprehensive toxicological summary of the chemicals of concern, including the chemical characteristics, absorption, distribution, and carcinogenic potential. Prepared risk characterization of the carcinogenic and non-carcinogenic chemicals based on the exposure assessment to quantify the potential risk to members of the surrounding community. This evaluation was used to help settle class-action tort.

Client: Confidential, Escondido, California

Prepared comprehensive Preliminary Endangerment Assessment (PEA) of dense non-aqueous liquid phase hydrocarbon (chlorinated solvents) contamination at a former printed circuit board manufacturing facility. This evaluation was used for litigation support and may be used as the basis for reaching closure of the site with the lead regulatory agency.

Client: Confidential, San Francisco, California

Summarized epidemiological evidence for connective tissue and autoimmune diseases for product liability litigation. Identified epidemiological research efforts on the health effects of medical prostheses. This research was used in a meta-analysis of the health effects and as a briefing tool for non-public health professionals.

Client: Confidential, Bogotá, Columbia

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of a 13.7 hectares plastic manufacturing facility in Bogotá, Colombia The risk assessment was used as the basis for the remedial goals and closure of the site.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally cadmium) and VOCs from soil and soil vapor at 12-acre former crude oilfield and municipal landfill. The site is currently used as a middle school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and was used as the basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Managed remedial investigation (RI) of heavy metals and volatile organic chemicals (VOCs) for a 15-acre former manufacturing facility. The RI investigation of the site included over 800 different sampling locations and the collection of soil, soil gas, and groundwater samples. The site is currently used as a year round school housing approximately 3,000 children. The Remedial Investigation was performed in a manner

that did not interrupt school activities and met the time restrictions placed on the project by the overseeing regulatory agency. The RI Report identified the off-site source of metals that impacted groundwater beneath the site and the sources of VOCs in soil gas and groundwater. The RI included a numerical model of vapor intrusion into the buildings at the site from the vadose zone to determine exposure concentrations and an air dispersion model of VOCs from the proposed soil vapor treatment system. The Feasibility Study for the Site is currently being drafted and may be used as the basis for granting closure of the site by DTSC.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally lead), VOCs, SVOCs, and PCBs from soil, soil vapor, and groundwater at 15-acre former manufacturing facility. The site is currently used as a year round school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and will be basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of VOC vapor intrusion into classrooms of middle school that was former 15-acre industrial facility. Using the Johnson-Ettinger Vapor Intrusion model, the evaluation determined acceptable soil gas concentrations at the site that did not pose health threat to students, staff, and residents. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client –Dominguez Energy, Carson, California

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of 6-acre portion of a 500-acre oil and natural gas production facility in Carson, California. The risk assessment was used as the basis for closure of the site.

Kaiser Ventures Incorporated, Fontana, California

Prepared health risk assessment of semi-volatile organic chemicals and metals for a fifty-year old wastewater treatment facility used at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

ANR Freight - Los Angeles, California

Prepared a comprehensive Preliminary Endangerment Assessment (PEA) of petroleum hydrocarbon and metal contamination of a former freight depot. This evaluation was as the basis for reaching closure of the site with lead regulatory agency.

Kaiser Ventures Incorporated, Fontana, California

Prepared comprehensive health risk assessment of semi-volatile organic chemicals and metals for 23-acre parcel of a 1,100-acre former steel mill. The health risk assessment was used to determine clean up goals and as the basis for granting closure of the site by lead regulatory agency. Air dispersion modeling using ISCST3 was performed to determine downwind exposure point concentrations at sensitive receptors within a 1 kilometer radius of the site. The results of the health risk assessment were presented at a public meeting sponsored by the Department of Toxic Substances Control (DTSC) in the community potentially affected by the site.

Unocal Corporation - Los Angeles, California

Prepared comprehensive assessment of petroleum hydrocarbons and metals for a former petroleum service station located next to sensitive population center (elementary school). The assessment used a probabilistic approach to estimate risks to the community and was used as the basis for granting closure of the site by lead regulatory agency.

Client: Confidential, Los Angeles, California

Managed oversight of remedial investigation most contaminated heavy metal site in California. Lead concentrations in soil excess of 68,000,000 parts per billion (ppb) have been measured at the site. This State Superfund Site was a former hard chrome plating operation that operated for approximately 40-years.

Client: Confidential, San Francisco, California

Coordinator of regional monitoring program to determine background concentrations of metals in air. Acted as liaison with SCAQMD and CARB to perform co-location sampling and comparison of accepted regulatory method with ASTM methodology.

Client: Confidential, San Francisco, California

Analyzed historical air monitoring data for South Coast Air Basin in Southern California and potential health risks related to ambient concentrations of carcinogenic metals and volatile organic compounds. Identified and reviewed the available literature and calculated risks from toxins in South Coast Air Basin.

IT Corporation, North Carolina

Prepared comprehensive evaluation of potential exposure of workers to air-borne VOCs at hazardous waste storage facility under SUPERFUND cleanup decree. Assessment used in developing health based clean-up levels.

Ms. Christina Caro
Adams Broadwell Joseph & Cardozo
601 Gateway Blvd., Suite 1000
South San Francisco, California 94080

Subject: **Review of the Draft Initial Study for The SDG Commerce 217 Distribution Center Project (PL20-0008)**

Dear Ms. Caro,

Per Mr. Darien K. Key's request, Menlo Scientific Acoustics, Inc. (MSAI), reviewed the Draft Initial Study (DIS) for the SDG Commerce 217 Distribution Center Project (PL20-0008). The discussion below provides a brief summary of our review.

The items discussed below indicate ways in which the DIS does not adequately describe the Project's noise impacts, presents the impression the impacts are not significant when in fact they are potentially significant, does not account for potential noise sources and a discussion of their impacts from its analysis, and fails to mitigate potentially significant noise impacts. In short, the initial study fails to provide the details necessary to meaningfully review the Project's noise impacts and assess the mitigation needed to minimize them. The Project description lacks information critical for the reviewing public to meaningfully assess the DIS's conclusions in several ways.

14 **The New Building Will Form A Canyon with The Existing Building to The North**. This can concentrate the noise from operations on the north side of the proposed Project since the walls for the building to the north are concrete, which acts as an efficient reflector of sound. As such, the normal spreading of sound (a 6 dB decrease in level with each doubling of distance from the source to the receiver) that is implied in the noise propagation calculations in Section XIII, Noise, page 85, is not correct for the noise level vs distance from this location. A review of Table Noise-1 presents noise levels without the canyon effect, and there is no discussion is provided about how much it would increase due to the effect. The reflections from the building from the north, which are not identified in the DIS, will add to noise emanating from the Project to the east and west and so increase the level of this noise. Therefore, the impact noted in the DIS from these activities is not accurate and will result in levels that may be significant. To reduce the canyon effect the Project could incorporate barriers that limits the open areas between the buildings, but the impact from operations at the north side of the building may still be significant.

14 **The Project Does Not Account for the Truck Routes and Noise as a Result of those Routes.**

Figure 2, Site Plan, shows Project truck traffic to and from the site will first turn right (travel west) from the southbound lane of Commerce Court to access the loading docks on the north side of the building, then to exit the site, trucks will continue west to the northeast corner of the building, then turn south and travel along the west side of the building, then at the southwest corner of the building turn east and travel along the south side of the building, and at the south east corner of the building turn left to enter the Commerce Court northbound lane. The noise impact from the truck traffic route is not limited to the north side of the building but will also have an impact to the west, south, and east. The impact from the truck traffic around the perimeter of the proposed Project is not addressed nor is the continuous character of the noise from the truck traffic on DIS page 89 or elsewhere in Section XIII, Noise, and so, the impact noted in the DIS from these activities is not accurate. A possible mitigation may be to erect a barrier on the west and south sides of the building. Despite these measures, the impact from truck traffic leaving the site and then travelling north on Commerce Court will be un-mitigated and significant.

22 **The Project Does Not Properly Account for Noise as a Result of Night Time Construction**

There will be construction activities at night for 15 nights. The MND fails to describe how many concrete trucks will be necessary to complete the night time pours. The MND should have provided this information along with noise levels from the previous night time pour noted, since the last pour resulted in calls to the City regarding noise. The impact from the concrete activities is thus not disclosed and so the DIS conclusions are not accurate.

81 **Project Is Not Consistent with City Land Use Policies.**

In section XI Land Use and Planning, the DIS mentions Policy 11.2.9 and states the Project is "Consistent: The proposed Project would incorporate design features to help mitigate noise impacts to nearby receptors (See Section XII, Noise)" (correct Noise section is XIII). However, the DIS makes no mention of impact from construction vehicles or operational truck and other traffic nor discloses any design features to help mitigate noise. Therefore, the conclusion the proposed Project is consistent with Land USE and Planning is not accurate.

85 **The Project Underestimates the Increased Noise from Consistent Truck Traffic**.

In DIS Table Noise-1: Existing Noise Levels in the Project Area, for the Site 5 data (the noisiest site listed), a longer measurement period that also included information about the number and type of traffic, would better characterize the existing noise levels.

With this said, the reported noise level for Site 4 (the quietest site) is 41 dB Leq and 44 dB Leq. The future noise level at this location due to the proposed Project will be much higher due to the almost continuous truck traffic due to Project operational phase truck traffic.

89 The DIS states there will be 35 peak hour trips in the morning which means there will be an average of 1.7 minutes between trips. For the 28 peak hour PM trips there will be an average of 2.1 minutes between trips. With the transit around the building as noted in Figure 2, Site Plan on page 14/701, this means there will be a continuous parade of trucks around the building. The DIS does not adequately or accurately discuss this impact.

The DIS uses the noise at Site 5 in Table Noise-1 for the baseline Existing Noise Level. This is the noisiest site. Site 4 is more appropriate and the levels here are up to 18 dB less than that at Site 5. Therefore, the calculated impact is understated.
Although the trailers will be backed up to the building and load/unloaded into the building, the loading dock activities description does the not seem to note the tractors for the trucks will remain outside the building and the noise from the tractors in not mitigated.
And the "Noise would occur periodically for several minutes at a time during each delivery/pickup at the warehouse" will occur every 1.7 to 2.4 minutes while the truck noise from entering, circuiting the building, and the leaving the property can be almost continuous.
The quoted distance, 1400 feet, between the source and receptor is to which receptor? The Couch residence is about 700 feet from the source.
The 65 Ldn is an inappropriate measure. The American Canyon Municipal Code sections of concern are:

8.12.010 Purpose of provisions – Public nuisance determination

A. Certain noise levels and vibrations are detrimental to the public health, welfare, safety and quality of life, and are contrary to the public interest;

B. The making and creating of disturbing, excessive or offensive noises within the city is a public nuisance, and is unlawful, and the noise ordinance shall be enforced as provided in this chapter.

8.12.040 General noise restrictions designated.

B. 8. Whether the noise is continuous, recurrent or intermittent;

B. 9. Whether the noise is produced by a commercial or noncommercial activity.

8.12.070 Exterior Noise Limits – 10 p.m.- 7 a.m. 50 dBA, 7 a.m. to 10 p.m. 60 dBA

which provide the criteria for noise levels and general noise characteristic restrictions. Using Ldn allows for levels above the ACMC night time criteria.
The DIS conclusion that the impact is less than significant is inaccurate.

87 The distance from the east edge of the proposed Project and the Couch residence appears to be about 700 feet (MND say 1000 feet). The distance from the SE corner of the proposed property to the development to the south of Eucalyptus Drive appears to be about 2000 feet (MND say 2300 feet). Although these discrepancies will result in a small increase in the calculated levels, the protected Project noise levels are inaccurate.

224 **The Project Underestimates the Increased Noise from Consistent Truck Traffic to Nearby Receptors.**
There is no analysis of expected levels due to the large number of trucks during the operational phase. As noted for page 89, above, the conclusion the impact is less than significant is unsupported.

Please contact me to discuss at your convenience. Thank you for the opportunity to be of service.

Sincerely,

MENLO SCIENTIFIC ACOUSTICS, INC.

RESUME - NEIL A. SHAW

Education:

University of California, Los Angeles
B. S. Engineering, 1977, cum laude
M. S. Engineering, 1977

Cooper Union, New York, 1968 - 1970

Honors:

Kenward S. Oliphant Memorial Fellowship in Acoustical Engineering (awarded by Consulting Engineers Association of California)
Tau Beta Pi

Experience:

Menlo Scientific Acoustics, Inc., Topanga

Designer and manager for acoustic design projects including audio-visual systems, sound reinforcement systems, television and radio production systems, architectural room acoustics, electromagnetic compatibility system design and criteria development, electroacoustic and electronic signal processing equipment product performance criteria development, product design and development, environmental noise surveys and analysis, noise and vibrations control, sound isolation, and machine noise control.
1992 to present.
Principal.

University of Southern California, Thornton School of Music
2008 - 2010.

Southern California Institute of Architecture, Los Angeles
2003.

WEAL, Santa Monica

Design and construction services for sound reinforcement systems, television systems, A/V systems, paging systems, and masking noise systems for various production facilities, convention centers, airport terminals, auditoriums, places of worship, concert halls, athletic facilities, courtrooms, multipurpose rooms, gymnasiums, museums, banquet halls, lecture rooms and other facilities. Transportation ambient noise surveys and analysis, construction site noise measurements, and field STC and NIC measurements per ASTM E 336-84. Lead member of team to install, run and maintain database manager computer software for company projects and clients. Part of design, implementation and enhancement team for computer controlled laboratory data acquisition and processing for laboratory tests performed per ASTM E 90-85 and ASTM C 423-84a.
1975 to 1992.

Aero-acoustics Laboratory, UCLA

Responsibilities include computer programming, aero-acoustic measurements, acoustic measurements, database search and statistical processing, A/D anti-aliasing filter design and prototyping, multi-channel data acquisition and processing, post processing and display.
1978 to 1984.

Subject: Comments on the Recirculated Draft Initial Study and Mitigated Negative Declaration for the SDG Commerce 217 Distribution Center Project

Dear Mr. Key:

This letter contains my comments on the Recirculated Draft Initial Study and Mitigated Negative Declaration ("IS/MND") prepared by the City of American Canyon ("City") for the SDG Commerce 217 Distribution Center Project ("Project"). SDG Commerce 217, LLC ("Applicant") proposes to develop a 217,294 square foot wine distribution center on a 10.39-acre parcel in the City of American Canyon. Construction of the Project would require approximately 38,000 cubic yards of fill, which would be obtained from an abutting parcel to the south.

I am an environmental biologist with 28 years of professional experience in wildlife biology and natural resources management. I have served as a biological resources expert for over 125 projects in California. My experience and scope of work in this regard has included assisting various clients with evaluations of biological resource issues, reviewing environmental compliance documents prepared pursuant to the California Environmental Quality Act ("CEQA") and the National Environmental Policy Act ("NEPA"), and submitting written comments in response to CEQA and NEPA documents. My work has included the preparation of written and oral testimony for the California Energy Commission, CPUC, and Federal courts. My educational background includes a B.S. in Resource Management from the University of California at Berkeley, and a M.S. in Wildlife and Fisheries Science from the Pennsylvania State University. A copy of my curriculum vitae is attached hereto.

The comments herein are based on my review of the environmental documents prepared for the Project, a review of scientific literature pertaining to biological resources known to occur in the Project area, my experience with other projects in Napa County, and the knowledge and experience I have acquired during my 28-year career in the field of natural resources management.

Baseline Setting

The IS/MND identifies five special-status species that could be impacted by the Project: western burrowing owl, Swainson's hawk, northern harrier, white-tailed kite, and western pond turtle.[1] The Applicant's biological resource consultant, Monk & Associates, did not conduct focused surveys to determine whether any of these species use the Project site (or adjacent eucalyptus grove) as nesting habitat.[2,3]

The California Department of Fish and Wildlife ("CDFW") recommends two types of surveys to assess and mitigate a project's impacts on special-status species: (1) "detection surveys," and (2) "take avoidance" surveys. Detection surveys are designed to maximize detection of a given species, and thus require implementation of specially-timed, species-specific survey techniques. The intent of detection surveys is to provide reliable information on the abundance, distribution, and seasonal (or life history) use patterns of a species within the area that would be directly or indirectly affected by the project. Detection surveys provide the information the lead agency, public, and natural resource agencies need to: (a) effectively assess potential impacts, and (b) formulate effective mitigation measures.

Take avoidance surveys are conducted immediately prior to implementation of the project. The intent of take avoidance surveys is to: (a) determine whether there have been any changes in baseline conditions that affect implementation of mitigation. For example, take avoidance surveys might reveal that burrowing owls that had nested on the north side of the site, are now nesting on the south side of the site. In summary, detection surveys are conducted to satisfy the requirements of CEQA (and other regulatory review processes), whereas take avoidance surveys are conducted to ensure take avoidance when the project is actually constructed.

Detection surveys were not conducted for the Project. Instead, the IS/MND requires detection surveys as "mitigation," after the CEQA review process terminates. This approach is unacceptable because it precludes proper understanding of baseline conditions, and thus, the ability of the public and resource agencies to submit informed comments on the Project's impacts and proposed mitigation. Assuming a species may be present at the Project site (the approach taken in the IS/MND) is generally not an acceptable substitute for baseline survey data because it precludes understanding of the relative severity of the Project's impacts. For example, while the loss of nesting habitat for one pond turtle might not be significant, the loss of nesting habitat for five pond turtles would be very significant.

The need to establish baseline conditions prior to assessing impacts and formulating mitigation measures is emphasized in regulatory guidance documents. For example, CDFW's Staff Report on Burrowing Owl Mitigation states:

> The following three progressive steps are effective in evaluating whether projects will

[1] IS/MND, pp. 41 through 44.
[2] *Ibid*, p. 44.
[3] According to the Revised Biological Resource Analysis ("BRA") prepared by Monk & Associates (March 2, 2020), the probability of western pond turtles on the Project site is "none" (*see* BRA, Table 4). However, according to the IS/MND (p. 42): "there is a possibility of turtles nesting onsite."

> result in impacts to burrowing owls. The information gained from these steps will inform any subsequent avoidance, minimization and mitigation measures. The steps for project impact evaluations are: 1) habitat assessment, 2) surveys, and 3) impact assessment. ….Adequate information about burrowing owls present in and adjacent to an area that will be disturbed by a project or activity will enable the Department, reviewing agencies and the public to effectively assess potential impacts and will guide the development of avoidance, minimization, and mitigation measures…Detailed information, such as approximate home ranges of each individual or of family units, as well as foraging areas as related to the proposed project, will be important to document for evaluating impacts, planning avoidance measure implementation and for mitigation measure performance monitoring.[4]

Similarly, California Burrowing Owl Consortium mitigation guidelines state:

> There is often inadequate information about the presence of owls on a project site until ground disturbance is imminent. When this occurs there is usually insufficient time to evaluate impacts to owls and their habitat. The absence of standardized field survey methods *impairs adequate and consistent impact assessment during regulatory review processes, which in turn reduces the possibility of effective mitigation*.[5]

It is not possible to effectively assess Project impacts until focused detection surveys have been conducted. As a result, the City must require detection surveys that adhere to CDFW standards, and the results of those surveys need to be released in a revised CEQA document so they can be thoroughly vetted by the public, resource agencies, and decision makers during the CEQA review process.

PROJECT IMPACTS ISSUES

Swainson's Hawk

Loss of foraging habitat is one of the primary threats to Swainson's hawks in California.[6] In addition to generating a potentially significant impact under CEQA, the loss of foraging habitat from the Project site may result in the take (killing) of Swainson's hawks, which would be a violation of Section 2080 of California Fish and Game Code.[7] The IS/MND provides the following analysis of this issue:

> The loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat; there are extensive foraging opportunities around the nesting location 2.6 miles north of the site and between this nesting location and the project site; and as the project site is essentially surrounded by eucalyptus forest, it is not a foraging destination which would likely attract foraging Swainson's hawks.[8]

[7] California Department of Fish and Game. 1994. Staff report regarding mitigation for impacts to Swainson's hawks (*Buteo swainsoni*) in the Central Valley of California.
[8] IS/MND, p. 43.

There are several flaws with the City's analysis. First, the City's analysis relies on California Natural Diversity Database ("CNDDB") data and assumes that the nearest nesting location is 2.6 miles north of the Project site.[9] However, the IS/MND admits: "the nesting population appears to be increasing throughout its nesting range in northern California (recent CNDDB records and G. Monk general observations) and the eucalyptus trees growing adjacent to the project site provide suitable nesting habitat."[10] CNDDB data on Swainson's hawk nest locations in Napa County have not been updated since 2013,[11] and the Applicant did not conduct surveys to determine the current status of Swainson's hawk nests in the vicinity of the Project site.[12] As a result, the City does not have the basis for its assumption that the nearest nesting location is 2.6 miles from the Project site, and thus, that the loss of foraging habitat from the Project site would not have a significant impact on the species.

Second, the Project site may provide important foraging habitat for Swainson's hawks even if the nearest nesting location is 2.6 miles away. Fleishman et al. (2016) found that the vast majority of adult Swainson's Hawks in the Natomas Basin (northern Central Valley, California) traveled distances up to 6.2 miles from the nest to forage.[13] Babcock found that Swainson's hawks in the Sacramento Valley foraged as far as 14 miles from the nest, and that ruderal fields was one of the vegetative cover types that ranked highest in foraging use.[14] Other studies have shown that Swainson's hawks may travel up to 18 miles from the nest to forage.[15]

Third, the fact that the Project site did not historically provide foraging habitat is irrelevant to its current function as foraging habitat for Swainson's hawks. To reverse the decline of Swainson's hawk populations, it is CDFW's policy that new development projects that adversely modify nesting or foraging habitat within 10 miles of an active nest should mitigate the project's impacts by providing compensatory mitigation.[16] According to CDFW, the 10-mile foraging radius recognizes the need to strike a balance between the biological needs of reproducing pairs (including eggs and nestlings) and the economic benefit of development(s) consistent with Fish and Game Code Section 2053.[17]

Fourth, the IS/MND claims: "there are extensive foraging opportunities around the nesting location 2.6 miles north of the site and between this nesting location and the project site." However, the IS/MND fails to provide evidence to support that claim or the implicit assumption that foraging habitats north of the Project site are sufficient to sustain the local Swainson's hawk

[17] *Ibid*, p. 2.

population. Based on my review of Google Earth imagery, much of the open space that remains "around the nesting location 2.6 miles north of the site and between this nesting location and the project site" is comprised of vineyards or other land cover types that provide little to no value as foraging habitat for Swainson's hawks.[18]

Fifth, there is no scientific evidence that the eucalyptus forest surrounding the Project site precludes the site from being "a foraging destination which would likely attract foraging Swainson's hawks." To the contrary, there is evidence that the Project site may attract foraging Swainson's hawks because it contains California voles (*Microtus californicus*)—the Swainson's hawk's primary prey.[19]

Sixth, Swainson's hawks have consistently been detected approximately 2,200 feet south of the Project site.[20] In addition, two Swainson's hawks were detected approximately 3,500 feet northeast of the Project site on April 16, 2021.[21] Therefore, either: (a) the Project site is within the foraging radius of the Swainson's hawks that nest 2.6 miles north of the Project site, or (b) there is an undocumented Swainson's hawk nest in the vicinity of the Project site. Both scenarios undermine the validity of the rationale for the City's determination that impacts to foraging habitat would not be significant.

Northern Harrier

One of the primary threats to northern harriers is the loss and degradation of nesting and foraging habitat.[22] According to the IS/MND: "[s]hould northern harrier nest on or near the project site, nesting activities could be disrupted by construction activities. Therefore, impacts to northern harrier could be potentially significant."[23] Although the IS/MND acknowledges northern harriers may nest on the Project site, it fails to analyze the significance of the Project's permanent impacts on nesting habitat (i.e., the analysis is limited to disturbance of nesting harriers).

The IS/MND states the following with respect to the loss of foraging habitat: "[t]he loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat. Mitigation Measure BIO-3 would be implemented to reduce potential impacts to nesting northern harriers to a less-than-significant level."[24] The IS/MND's statement regarding historic conditions is incorrect because historically the Project site provided habitat

[23] IS/MND, p. 43.
[24] *Ibid*.

(for northern harriers) before the eucalyptus trees were planted (sometime between 1916 and 1942).[25] Nevertheless, the significance of the impact under CEQA is dependent on the environmental conditions at the time the CEQA document was published,[26] *not* the environmental conditions in 2012. Mitigation Measure BIO-3 is limited to measures designed to minimize disturbance to raptor nests during the avian nesting season; the mitigation measure does nothing to mitigate the Project's permanent impacts on northern harrier habitat. Because habitat loss is a primary threat to the northern harrier, potentially significant impacts on the species remain unmitigated.

White-tailed Kite

The IS/MND provides the following analysis of Project impacts to the white-tailed kite:

> The species typically nests in trees surrounded by open foraging habitat. The trees on and bordering the project site provide potential nesting habitat. Should white-tailed kite nest on or near the project site, nesting activities could be disrupted by construction activities. Therefore, impacts to white-tailed kite would be potentially significant. The loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat. Mitigation Measure BIO-3 would be implemented to reduce potential impacts to nesting white-tailed kites to a less-than-significant level.[27]

The City's analysis suffers the same flaws as the analysis it provided for the northern harrier: (1) the Project site historically provided foraging habitat (i.e., before the eucalyptus trees were planted); and (2) the City's analysis fails to apply the proper baseline conditions. White-tailed kites have relatively small home ranges[28] and seldom hunt more than 0.5 mile from their nests when breeding.[29] Habitat quality for white-tailed kites in California is largely dependent on the abundance and availability of California voles,[30] which are known to occur at the Project site.[31] Hawbecker (1940) provided evidence that a high population of voles was necessary for successful kite nesting, and that a nearby source of suitable food is just as necessary as the nest tree.[32] Therefore, if white-tailed kites nest on or near the Project site, they would be significantly impacted by the loss of foraging habitat (from the Project site). Mitigation Measure BIO-3 does not mitigate the impact because it is limited to actions designed to minimize construction-related disturbance to nests. As a result, potentially significant impacts on the white-tailed kite remain unmitigated.

Burrowing Owl

Habitat Impacts

"Essential Habitat" for burrowing owls includes nesting, foraging, wintering, and dispersal habitat.[33] Accordingly, CDFW's Staff Report on Burrowing Owl Mitigation states the following with regard to impact assessments:

> The impact assessment evaluates the potential loss of nesting burrows, satellite burrows, foraging habitat, dispersal and migration habitat, wintering habitat, and habitat linkages, including habitat supporting prey and host burrowers and other essential habitat attributes. This assessment determines if impacts to the species will result in significant impacts to the species locally, regionally and range-wide per CEQA Guidelines §15382 and Appendix G. The significance of the impact to habitat depends on the extent of habitat disturbed and length of time the habitat is unavailable (for example: minor – several days, medium – several weeks to months, high - breeding season affecting juvenile survival, or over winter affecting adult survival).[34]

Contrary to CDFW's guidance, the IS/MND provides no analysis of impacts to satellite burrows, foraging habitat, dispersal and migration habitat, wintering habitat, and habitat linkages. The impact assessment in the IS/MND is limited to the following:

> the project site provides marginal nesting habitat for the western burrowing owl. Should burrowing owls occur on or near the project site, nesting activities and/or individual owls could be harmed by construction activities. Therefore, impacts to western burrowing owl could be potentially significant. Mitigation Measure BIO-1 would reduce this impact to a less-than-significant level.[35]

There are two problems with the City's analysis. First, Mitigation Measure BIO-1 would not reduce impacts on the nesting population to less-than-significant levels. Breeding burrowing owls are believed to be extirpated from Napa County.[36] Due to their strong site tenacity, burrowing owls rarely colonize new sites, or re-colonize historical sites from which they have been extirpated.[37] In other words, burrowing owls do not merely nest elsewhere when their nesting habitat is eliminated. As a result, the presence of nesting burrowing owls at the Project site would be extremely significant from a biological perspective, and elimination of the nesting habitat would be significant and unmitigable.

CDFW submitted comments on the first MND that was issued for the Project. CDFW's comment letter states: "[i]f the survey determines that the project site is actively being used by burrowing owl, or any owls are passively relocated as described above, then compensatory habitat mitigation shall be provided."[38] Thus, CDFW recommends compensatory mitigation if

---

[33] California Department of Fish and Game. 2012. Staff Report on Burrowing Owl Mitigation, p. 24.
[34] *Ibid*, pp. 7 and 8.
[35] IS/MND, p. 42.
[36] Townsend SE, Lenihan C. 2003. Burrowing Owl Status in the Greater San Francisco Bay Area. Proceedings of the California Burrowing Owl Symposium. Bird Populations Monographs No. 1:60-70.
[37] Wilkerson RL, Siegel RB. 2010. Assessing changes in the distribution and abundance of burrowing owls in California, 1993-2007. Bird Populations 10:1-36.
[38] *See* IS/MND, p. 682.

the Project site is actively being used by burrowing owls, irrespective of how the owls are using the site (e.g., nesting, foraging, sheltering), or the season of use. Mitigation Measure BIO-1, however, only requires compensatory mitigation if *nesting* burrowing owls are detected on the Project site; compensatory mitigation is not required if the site is being used to satisfy other life history requirements. Because the City's impacts analysis is limited to nesting habitat, and because MM BIO-1 only requires compensatory mitigation for nesting owls, Project impacts to foraging habitat, dispersal and migration habitat, and wintering habitat remain potentially significant.

Impacts from Passive Relocation

The Project may involve excluding burrowing owls from their burrows in order to "passively relocate" them from the Project site and adjacent habitat.[39,40] The IS/MND fails to evaluate impacts to burrowing owls due to burrow exclusion, or to identify mitigation measures sufficient to reduce such impacts below a level of significance. Consistent with CDFW guidelines, burrow exclusion is a potentially significant impact under CEQA that must be analyzed.[41] Specifically, burrow exclusion may result in: (a) significant loss of habitat for reproduction, refuge from predators, and shelter from weather; (b) increased stress on burrowing owls and reduced reproductive rates; (c) increased depredation; (d) increased energetic costs; and (e) risks posed by having to find and compete for available burrows.[42] Consequently, the City must disclose and analyze impacts associated with the "passive relocation" of burrowing owls.

The need for full analysis of potential impacts associated with passive relocation (i.e., burrow exclusion) of burrowing owls is further supported by research that indicates most relocation projects have resulted in fewer breeding pairs of burrowing owls at the mitigation site than at the original site, and that relocation projects generally have failed to produce self-sustaining populations.[43] Investigators attribute the limited success of relocation to: (a) strong site tenacity exhibited by burrowing owls, and (b) potential risks associated with forcing owls to move into unfamiliar and perhaps less preferable habitats.[44]

Cumulative Impacts

The IS/MND states:

> A number of cumulative projects are proposed or under construction in the project area (City of American Canyon, Active Planning Projects, July 2020. The 330,000 sq. ft. Commerce 330 Distribution Center building is just south of the proposed project site. Copart Auto applied for a Conditional Use Permit to store vehicles at 1578 and 1660 Green Island Road. A new elementary school is under construction just southeast of the site at Commerce Blvd. and Eucalyptus Road. The only other large project planned is an

[39] IS/MND, p. 46 (MM BIO-1).
[40] Although not discussed in the IS/MND, burrow exclusion entails the installation of one-way doors on occupied burrows so owls can exit, but not re-enter, the burrows.
[41] California Department of Fish and Game. 2012. Staff Report on Burrowing Owl Mitigation, p. 10.
[42] *Ibid*, pp. 10 and 21.
[43] Smith BW, Belthoff JR. 2001. Burrowing owls and development: short-distance nest burrow relocation to minimize construction impacts. J. Raptor Research 35:385-391.
[44] *Ibid.*

> approximately 200,000 sq. ft. logistics center at 300 Boone Drive, near the Napa Airport, about a mile north of the site.[45]

The IS/MND indicates there are only four projects that are proposed or under construction in the City of American Canyon.[46] This does not comport with the "Active Project List" (dated March 2021) available on the City's website.[47] According to the Active Project List, there are several additional projects that would contribute to cumulative impacts. These include the Giovannoni Logistics Center, Oat Hill Multi-Family, Canyon Estates, and Watson Ranch Specific Plan projects. Cumulatively, these projects would impact several hundred acres of habitat for special-status species (e.g., Swainson's hawk). The IS/MND fails to disclose or analyze cumulative impacts due to *all* past, present, and probable future projects in American Canyon.

CEQA Guidelines § 15130(b)(3) state that lead agencies should define the geographic scope of the area affected by the cumulative effect and provide a reasonable explanation for the geographic limitation used. The geographic scope of the City's cumulative impacts analysis was the City of American Canyon.[48] The IS/MND fails to provide an explanation for this geographic limitation. Moreover, the cumulative impacts analysis is fundamentally flawed because the City applied two different geographical scales to its analysis. The IS/MND states:

> With respect to cumulative biological resources, over the past few decades the City of American Canyon has been transitioning from agricultural use to residential development. However, there are many open space preserves and parks that have become established to preserve and protect open space habitats within the City limits and in this region, as illustrated in Exhibit A of the Monk letter. The Jack & Bernice Newell Wilderness Preserve (Newell Preserve), the Lynch Canyon Preserve, Canyon Estates Preserve (proposed) and the CDFW California Red-Legged Frog Preserve represent over 2,000 acres of permanently protected contiguous open space east of the project site. The Wetlands Open Space, Napa River Bay Trail, Clark Ranch and the Napa Plant Site Restoration Project represent several hundred additional acres of preserved open space and valuable wildlife habitats that will be preserved in perpetuity.[49]

The Lynch Canyon Preserve (1,039 acres) and the CDFW California Red-Legged Frog Preserve (317 acres) are not located within the City of American Canyon. It is not possible to accurately analyze cumulative impacts by using one geographic scope for open space preserves, but a smaller geographic scope for development projects. Furthermore, the IS/MND misrepresents the functions of the Wetlands Open Space, Napa River Bay Trail, Clark Ranch and the Napa Plant Site Restoration Project as habitat. The Clark Ranch Project is designed to be a multi-use community park with a bike skills loop, dog park, equestrian riding area, and several buildings (among other features that are incompatible with wildlife conservation).[50] Therefore, the Clark Ranch Project would contribute to cumulative impacts (that were not contemplated in the IS/MND). The other three open space areas are negatively impacted by recreation activities,[51]

are comprised primarily of salt ponds or wetlands, and generally do not provide habitat for the same suite of species as those that would be impacted by the Project.

The IS/MND provides the following analysis of cumulative impacts to biological resources:

> Implementation of the proposed project would result in cumulative impacts to ruderal habitats and less than significant impacts to common plant and animal species. While the project-related impacts would be considered cumulative with other projects in the region, the mitigation measures prescribed in the Mitigated Negative Declaration would offset cumulative impacts to special-status species and plant communities/wildlife habitats to levels regarded as less than significant. Therefore, conversion of 10.39 acres of ruderal habitat on the project site to commercial development would have a less-than-significant (not cumulatively considerable) cumulative impact in this regional context.

Although the IS/MND states the Project would result in cumulative impacts to ruderal habitats, and that Project-related impacts would be considered cumulative with other projects, it fails to provide the City's determination on the significance of the cumulative impacts. In addition, the IS/MND fails to identify what type(s) of Project-related impacts would be considered cumulative, and which species would be subject to the cumulative impacts.

The City's determination regarding the significance of cumulative impacts to biological resources is vague and not supported by evidence. On the CEQA Environmental Checklist Form, the City indicates the impact would be "Less Than Significant." However, the subsequent text in the IS/MND states "[i]mplementation of the proposed project would result in cumulative impacts to ruderal habitats," but that "mitigation measures prescribed in the Mitigated Negative Declaration would offset cumulative impacts to special-status species and plant communities/wildlife habitats to levels regarded as less than significant."

The City's determination that mitigation measures prescribed in the MND would offset cumulative impacts to special-status species to less-than-significant levels is not supported by evidence or analysis. The Project would eliminate 10.39 acres of habitat. Habitat loss is the primary threat to special-status species that occur in the Project area. However, the mitigation measures proposed in the MND are almost entirely limited to measures (e.g., seasonal buffers) designed to avoid or minimize direct impacts to individual animals. Although the MND requires compensatory mitigation if nesting burrowing owls are detected onsite, it does not require compensatory mitigation if non-nesting burrowing owls are detected onsite, nor does it require compensatory mitigation if any other special-status species are detected onsite. As a result, the City's determination that the proposed mitigation would offset cumulative impacts to less-than-significant levels is not supported by evidence.

MITIGATION MEASURE ISSUES

Mitigation Measure BIO-1 (Burrowing Owl)

Mitigation Measure BIO-1 states: "[i]f passive relocation of non-nesting burrowing owls is necessary, a qualified biologist shall prepare a Relocation Plan and submit it to CDFW." The proposed mitigation is vague because it does not establish minimum standards for the content of the Relocation Plan, nor does it require CDFW's approval of the Relocation Plan. According to

CDFW's Staff Report on Burrowing Owl Mitigation: "burrowing owls should not be excluded from burrows unless or until:

- A Burrowing Owl Exclusion Plan (see Appendix E) is developed and approved by the applicable local DFG office;
- Permanent loss of occupied burrow(s) and habitat is mitigated in accordance with the Mitigating Impacts sections below. Temporary exclusion is mitigated in accordance with the item #1 under Mitigating Impacts below.
- Site monitoring is conducted prior to, during, and after exclusion of burrowing owls from their burrows sufficient to ensure take is avoided. Conduct daily monitoring for one week to confirm young of the year have fledged if the exclusion will occur immediately after the end of the breeding season.
- Excluded burrowing owls are documented using artificial or natural burrows on an adjoining mitigation site (if able to confirm by band re-sight)."[52]

Mitigation Measure BIO-1 does not require these elements, nor does it establish success criteria for burrowing owls that are relocated from the Project site.

Mitigation Measure BIO-1 further states:

> If a nesting season survey determines that a burrow or refugia on the project site is occupied by nesting burrowing owls, then compensatory mitigation in the form of a permanently protected, deed restricted set aside on open space land owned or obtained by the applicant shall be provided if such a protected area makes sense for protection of nesting owls. This permanently protected area would be recorded within 90 days after commencement of project construction. If burrowing owls are observed during surveys, notification shall also be submitted to the CNDDB.

As described below, the compensatory mitigation requirements of Mitigation Measure BIO-1 are far too vague to ensure impacts on nesting burrowing owls are reduced to less-than-significant levels.

First, the IS/MND fails to identify how much compensatory mitigation would be required. Mitigating Project impacts to burrowing owl habitat requires compensatory mitigation at a ratio of at least 1:1. As stated in CDFW's Staff Report on Burrowing Owl Mitigation:

> As set forth in more detail in Appendix A, the current scientific literature supports the conclusion that mitigation for permanent habitat loss necessitates replacement with an equivalent or greater habitat area for breeding, foraging, wintering, dispersal, presence of burrows, burrow surrogates, presence of fossorial mammal dens, well drained soils, and abundant and available prey within close proximity to the burrow.[53]

Second, the IS/MND fails to establish any criteria for selection of the compensatory mitigation site. These include: (a) geographic location, (b) habitat conditions, and (c) the status of burrowing owls at the site. These variables are critical to the mitigation site's ability to reduce

[52] California Department of Fish and Game. 2012. Staff Report on Burrowing Owl Mitigation, p. 11.
[53] *Ibid*, p. 8.

Project impacts to less-than-significant levels. Most notably, permanent protection of a site that is not occupied by burrowing owls would not mitigate the Project's impacts to occupied nesting habitat.

Third, the IS/MND fails to establish a mechanism that would ensure the mitigation site is maintained and managed in perpetuity to conserve burrowing owls and their habitat. Burrowing owls are limited to habitats with relatively short vegetation and only sparse shrubs or taller vegetation.[54] Therefore, even if the Applicant acquires a mitigation site that currently contains burrowing owls, the site would not offset Project impacts unless the Applicant implements a mechanism (e.g., grazing or mowing) for maintaining short vegetation at the site. In addition, deed restrictions do not ensure habitat conservation in perpetuity because: (a) they can be changed or eliminated,[55] and (b) do not have a third party that can be designated to monitor and enforce the restriction.[56]

Fourth, the IS/MND fails to establish performance standards or monitoring and reporting requirements for the mitigation site. Thus, Mitigation Measure BIO-1 provides no assurances that the mitigation site would effectively compensate for the loss of burrowing owl habitat from the Project site.

Finally, Mitigation Measure BIO-1 requires compensatory mitigation only "if such a protected area makes sense for protection of nesting owls." This condition is vague and confusing. The IS/MND fails to explain the factors that the City would evaluate to determine whether a protected area "makes sense," nor does it explain how significant impacts to nesting burrowing owls would be mitigated if a protected area does not "makes sense."

Mitigation Measure BIO-2 (Swainson's Hawk)

CDFW has determined that compensatory mitigation is not required for projects in areas that have less than 5 acres of foraging habitat and are surrounded by existing urban development, unless the project area is within 1/4 mile of an active nest tree.[57] For all other projects, the CDFW has concluded that the loss of foraging habitat may lead to the "take" of Swainson's hawks and that mitigation is required. According to CDFW mitigation guidelines, projects within five miles of an active nest tree shall provide habitat compensation at a 0.75:1 ratio.[58] Even if the City determines the Project would not cause a significant reduction in available foraging habitat for the Swainson's hawk territories that occur north of the Project site, habitat compensation is required to support the needs of additional territories as the population recovers.

[58] *Ibid,* p. 12.

Mitigation Measure BIO-3 (Nesting Raptors)

Mitigation Measure BIO-3 states: "[i]f nesting raptors are identified during the [pre-construction] surveys, a qualified biologist shall determine appropriate, species-specific no-disturbance buffers around all active nests…To ensure the no-disturbance buffers are adequate, a qualified biologist shall monitor the active nests within and adjacent to the project site daily for a minimum of one week and then weekly during construction."

Mitigation Measure BIO-3 defines a qualified biologist as "a biologist with at least 2 years' experience conducting surveys for nesting raptors with detections." The response of nesting birds to human-related disturbance activities is dependent on numerous site-specific and species-specific variables. Consequently, determining the appropriate buffer distance requires knowledge of species-specific responses to various types of disturbance in various settings. Many biologists that have experience conducting raptor surveys have no experience with (or knowledge of) avian responses to disturbance. As a result, Mitigation Measure BIO-3 lacks assurances that the "qualified biologist" would establish appropriate, species-specific no-disturbance buffers around all active nests.

For buffer zones to be effective, they need to be based on empirical evidence of avian responses to disturbance. There is an overall lack of this type of empirical evidence.[59] As a result, monitoring is critical to validating the adequacy of a buffer. The IS/MND fails to identify the variables the biologist would monitor to ensure the adequacy of the no-disturbance buffers. Nevertheless, there is no scientific basis for the assumption that a nesting raptor can tolerate an inadequate nest buffer for one week (i.e., the proposed interval of construction monitoring), especially without adverse effects to reproductive success and productivity. This issue is compounded by the absence of any success standards, or monitoring and reporting requirements, for Mitigation Measure BIO-3. For these reasons, the actions proposed in Mitigation Measure BIO-3 do not ensure significant impacts to nesting raptors are avoided. To rectify this issue, the City must require nest buffers consistent with the best available scientific information.

Suter and Joness (1981) surveyed 74 raptor researchers to derive recommendations for nest site protection.[60] Based on the survey results, Suter and Joness (1981) recommended a buffer distance of at least one kilometer (3,281 feet) to prevent raptors from abandoning their nests in response to construction and similar noisy, extended activities.

Mitigation Measure BIO-4 (Nesting Passerines)

Mitigation Measure BIO-4 suffers the same flaws as Mitigation Measure BIO-3: (1) the mitigation measure fails to ensure that the biologist has the expertise needed to determine appropriate, species-specific no-disturbance buffers for active nests; and (2) weekly monitoring during construction is not sufficient to ensure significant impacts to nesting birds are avoided.

[60] Suter GW III, Joness JL. 1981. Criteria for Golden Eagle, Ferruginous Hawk and Prairie Falcon Nest Site Protection. Raptor Research 15(1):12-18.

Mitigation Measure BIO-5 (Pond Turtle)

Mitigation Measure BIO-5 requires a pre-construction survey for western pond turtles. If western pond turtle nests are found during the survey: "the nest site plus a 50-foot buffer around the nest site shall be fenced with orange construction fence until eggs hatch and young turtles disperse to the adjacent North Slough." The proposed measure would be sufficient for turtle nests located less than 50 feet from the Project boundary. However, it would not be effective for turtle nests located in interior portions of the Project site. After traveling 50 feet, the turtles would need to travel through the construction zone to reach North Slough. These turtles would be subject to being killed or injured by construction activities. To rectify this issue, Mitigation Measure BIO-5 needs to be modified such that it requires installation of a no-disturbance dispersal corridor between the nest site and North Slough.

Conclusion

Substantial evidence demonstrates that the Project could have significant, unmitigated impacts on sensitive biological resources. The IS/MND that was prepared for the Project does not adequately disclose and analyze those impacts, nor does it provide the mitigation necessary to ensure significant impacts are reduced to less-than-significant levels. To comply with CEQA, the City needs to prepare an Environmental Impact Report for the Project.

Sincerely,

Scott Cashen, M.S.
Senior Biologist

Scott Cashen, M.S.
Senior Wildlife Biologist

Scott Cashen has 28 years of professional experience in natural resources management. During that time he has worked as a field biologist, forester, environmental consultant, and instructor of Wildlife Management. Mr. Cashen focuses on CEQA/NEPA compliance issues, endangered species, scientific field studies, and other topics that require a high level of scientific expertise.

Mr. Cashen has knowledge and experience with numerous taxa, ecoregions, biological resource issues, and environmental regulations. As a biological resources expert, Mr. Cashen is knowledgeable of the various agency-promulgated guidelines for field surveys, impact assessments, and mitigation. Mr. Cashen has led field investigations on several special-status species, including ones focusing on the yellow-legged frog, red-legged frog, desert tortoise, steelhead, burrowing owl, California spotted owl, northern goshawk, willow flycatcher, Peninsular bighorn sheep, red panda, and various forest carnivores.

Mr. Cashen is a recognized expert on the environmental impacts of renewable energy development. He has been involved in the environmental review process of over 100 solar, wind, biomass, and geothermal energy projects. Mr. Cashen's role in this capacity has encompassed all stages of the environmental review process, from initial document review through litigation support. Mr. Cashen provided expert witness testimony on several of the Department of the Interior's "fast-tracked" renewable energy projects. His testimony on those projects helped lead agencies develop project alternatives and mitigation measures to reduce environmental impacts associated with the projects.

Mr. Cashen was a member of the independent scientific review panel for the Quincy Library Group project, the largest community forestry project in the United States. As a member of the panel, Mr. Cashen was responsible for advising the U.S. Forest Service on its scientific monitoring program, and for preparing a final report to Congress describing the effectiveness of the Herger-Feinstein Forest Recovery Act of 1998.

AREAS OF EXPERTISE

- CEQA, NEPA, and Endangered Species Act compliance issues
- Comprehensive biological resource assessments
- Endangered species management
- Renewable energy development
- Scientific field studies, grant writing and technical editing

EDUCATION

M.S. Wildlife and Fisheries Science - The Pennsylvania State University (1998)
Thesis: *Avian Use of Restored Wetlands in Pennsylvania*
B.S. Resource Management - The University of California, Berkeley (1992)

PROFESSIONAL EXPERIENCE

Litigation Support / Expert Witness

Mr. Cashen has served as a biological resources expert for over 125 projects subject to environmental review under the California Environmental Quality Act (CEQA) and/or the National Environmental Policy Act (NEPA). As a biological resources expert, Mr. Cashen reviews CEQA/NEPA documents and provides his clients with an assessment of biological resource issues. He then submits formal comments on the scientific and legal adequacy of the project's environmental documents (e.g., Environmental Impact Report). If needed, Mr. Cashen conducts field studies to generate evidence for legal testimony, or he can obtain supplemental testimony from his deep network of species-specific experts. Mr. Cashen has provided written and oral testimony to the California Energy Commission, California Public Utilities Commission, and U.S. district courts. His clients have included law firms, non-profit organizations, and citizen groups.

Forestry

Mr. Cashen has five years of experience working as a consulting forester on projects throughout California. Mr. Cashen has consulted with landowners and timber operators on forest management practices; and he has worked on a variety of forestry tasks including selective tree marking, forest inventory, harvest layout, erosion control, and supervision of logging operations. Mr. Cashen's experience with many different natural resources enable him to provide a holistic approach to forest management, rather than just management of timber resources.

REPRESENTATIVE EXPERIENCE

- Lead Consultant - CalFire fuels treatment projects *(SD and Riverside Counties)*
- Lead Consultant and supervisor of harvest activities – San Diego Gas and Electric Bark Beetle Tree Removal Project *(San Diego)*
- Crew Leader - Hillslope Monitoring Program *(CalFire: throughout California)*
- Consulting Forester – Forest inventories and timber harvest projects *(various clients throughout California)*

Grant Writing and Technical Editing

Mr. Cashen has prepared and submitted over 50 proposals and grant applications. Many of the projects listed herein were acquired through proposals he wrote. Mr. Cashen's clients and colleagues have recognized his strong scientific writing skills and ability to generate technically superior proposal packages. Consequently, he routinely prepares funding applications and conducts technical editing for various clients.

ATTACHMENT D

SMITH ENGINEERING & MANAGEMENT

April 29, 2021

Mr. Darien Key
Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080-7037

Subject: SDG Commerce 217 Distribution Center Project

P21011

Dear Mr. Key:

Per your request, I reviewed the Recirculated Draft Initial Study/Mitigated Negative Declaration (the "ISMND") for the SDG Commerce 217 Distribution Project (the "Project") in the City of American Canyon (the "City") . My review is with respect to transportation and circulation considerations.

My qualifications to perform this review include registration as a Civil and Traffic Engineer in California, over 50 years professional consulting practice in these fields and both preparation and review of the traffic and transportation components of numerous environmental documents prepared under the California Environmental Quality Act ("CEQA"). My professional resume is attached hereto.

Potential Warehousing Uses of the Project Building Could Have Trip Generation Significantly Higher than Assumed in the ISMND Analysis

The ISMND and its Appendix F rely on studies of trip generation at six existing wine storage/distribution facilities in the Project's vicinity to estimate the proposed Project's motor vehicle trip generation. While we believe the trip generation measurements performed at the nearby buildings to be credible (in fact, the results are reasonably consistent with the Institute of Transportation Engineer's authoritative publication *Trip Generation, 10th Edition* data for Land

TRAFFIC • TRANSPORTATION • MANAGEMENT
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

Use Category 150-Warehouse and for Category 154-High Cube Logistics Warehouse), the problem is that this type of warehouse building is readily adaptable to much more traffic-intensive types of warehousing. In specific, this type of building could easily be used as what *Trip Generation, 10th Edition* characterizes as Land Use Category 156 – Parcel Hub Warehouse or, to use the terminology of a major operator of such facilities, Amazon, a "Last Mile" facility. These are facilities where goods are brought in directly from "fulfillment centers" or air freight terminals by heavy tractor-trailer truck rigs and trans-loaded to van-type vehicles for actual delivery to consumers. The difference in trip generation of a "parcel hub warehouse" and a "wine warehouse" as analyzed in the ISMND is highly significant. The ISMND estimates the trip generation for a wine warehouse in vehicles per thousand square feet of floor area as 1.69 daily, 0.16 in the AM peak and 0.125 in the PM peak. *Trip Generation, 10th Edition* indicates the trip generation for a "parcel hub warehouse" in vehicles per thousand square feet of floor area as 7.75 daily, 0.7 in the AM peak and 0.64 in the PM peak. In other words, used as a parcel hub instead of a wine warehouse, the proposed building would generate 4.6 times as much traffic daily, 4.4 times as much traffic in the AM peak and 5.1 times as much traffic in the PM peak as what is disclosed in the ISMND. The facts that the proposed warehouse is apparently a 'spec' building (the ISMND says it could be occupied by up to 3 tenants implying that there were no tenant commitments at the time of writing) and the proximity to heavy jet capable Napa County Airport strengthen the possibility that the building could end up being used as a parcel hub. Hence, to be adequate, the ISMND must consider the possibility of this plausible and more traffic intense use. Or, the Conditional Use Permit must limit the warehouse to being used solely as a wine storage warehouse.

The ISMND Transportation Section Fails To Address the Serious Operations and Safety Problems on S.R. 29 in the Project Vicinity

Because of its location, most motor vehicle traffic to and from the Project must ultimately use parts of State Highway 29 ("SR 29"). This State Highway experiences considerable operational and safety problems as is well documented in the *State Route 29 Comprehensive Multimodal Corridor Plan* dated May 2020. The City and its consultants, GHD, who prepared the transportation work supporting the ISMND know this as they both were participants in the above referenced SR 29 study. Yet the ISMND utterly fails to address the SR 29 issues or how the Project and others like it in the area contribute to the problem and can contribute to implementing the corridor study recommendations. Instead, it devotes much attention to trivial studies of level of service, traffic signal warrants and right turn lane warrants at a single local intersection, that of Commerce Boulevard with Green Island Road. The ISMND is defective in failing to acknowledge and address the problems in the SR 29 corridor and the Project as a cumulative contributor to them.

The ISMND Assumes Implausible Mitigation of the Project's Significant VMT Impacts

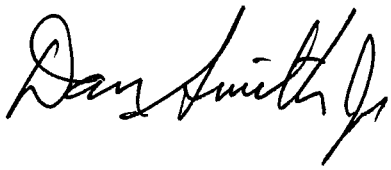
The ISMND transportation analysis, after considering highly disparate data sources regarding average employee trip lengths, finds that the Project, without mitigation, would generate an average of 16.28 daily vehicle miles traveled ("VMT") per employee compared to an impact significance threshold of 10.92 VMT per employee. Hence, without mitigation, the Project would have significant transportation impacts. Translated to aggregate vehicle miles traveled numbers, the ISMND finds that the Project's employees would generate 2214 VMT each weekday, exceeding the significance threshold of 1485 VMT and requires mitigation that eliminates 729 VMT daily in order for the Project to be said to have no significant impact with mitigation.

The ISMND goes on to assume that because the Project is committed to pave what the ISMND claims is an 800 foot gap in the area bikeway network, this action, based on a theoretical formulation, would induce commuters on between 76 and 310 daily commute trips[1] to shift from commuting by auto to bicycle (or splitting the difference between the high and low estimate a so-called average of 193 trips) resulting in a purported daily VMT saving of between again splitting the difference between high and low estimates) of 733 to 1004 miles. The ISMND asserts these theoretical VMT savings would be sufficient to fully mitigate the Project's the significant VMT impacts. However, one must consider what underlies the high and low estimates and the reasonableness of just averaging between them.

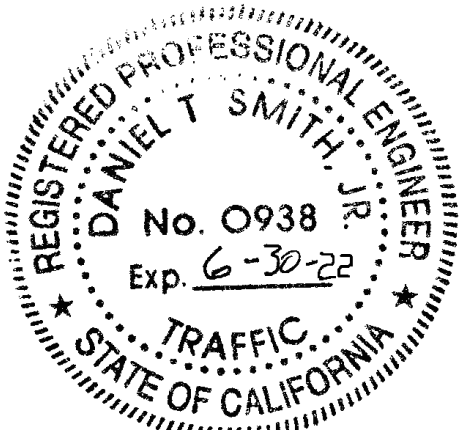
Both the high and low estimates are generated by a theoretical formula estimating the number of commuters who would be induced to travel by bike instead of auto as the result of a bikeway of certain length. The ISMND's low estimate reflects only the commuters induced to travel by bike solely by the 800 feet of paved path the Project proposes to provide. The high estimate credits the Project with the commute attractiveness of the entire 1.85 mile bikeway that has already existed for a number of years to the south of the 800 feet of bikeway the Project will pave. Averaging between an estimate that just reflects the length of bikeway the project will pave and one that credits the Project with the entire 1.85 miles of bikeway that already existed is simply not reasonable.

Also, the high estimate reflects a limited localized study by an Oregon research cooperative that found the average commute bike trip length was 5.2 miles. The low estimate reflects a national study by the American Association of State Highway and Transportation Officials (AASHTO) that found the average bike commute trip length was 3.8 miles. Splitting differences is in essence placing equal credence on a limited local study as on one with a national data base. The

[1] Commuters to the general area, not just to the Project itself.



ISMND analysis also discloses by footnote that it assumes the bike commuters would do so 5 days per week for 47 weeks per year. This is in essence every single work day per year, discounting vacation, sick leave and holidays. It leaves no allowance for days of substantial rain or when rain is forecast to fall before quitting time, days of high winds, very cold days or extreme summer heatwaves, or days where the commuter intends to make a trip at lunch hour or immediately after work for which travel by bike may be unsuitable.



Finally, the notion that the Project is 'filling a gap' in the area bikeway network is an exaggeration. Aerial photo evidence shows that a bikeable has existed on the alignment of Commerce Boulevard at the supposed gap since the mid-1990s if not before. The Project is not supplying a missing link, it is just improving the pavement.

Given all of the above, it is unreasonable to suppose that the Project's significant VMT impacts will be mitigated by paving a few hundred feet of bikeway. Consequently, the Project cannot be approved under a mitigated negative declaration.

Sincerely,

Smith Engineering & Management
A California Corporation

Daniel T. Smith Jr., P.E.
President

PROFESSIONAL EXPERIENCE

Smith Engineering & Management, 1993 to present. President.
DKS Associates, 1979 to 1993. Founder, Vice President, Principal Transportation Engineer.
De Leuw, Cather & Company, 1968 to 1979. Senior Transportation Planner.
Personal specialties and project experience include:

Litigation Consulting. Provides consultation, investigations and expert witness testimony in highway design, transit design and traffic engineering matters including condemnations involving transportation access issues; traffic accidents involving highway design or traffic engineering factors; land use and development matters involving access and transportation impacts; parking and other traffic and transportation matters.

Urban Corridor Studies/Alternatives Analysis. Principal-in-charge for State Route (SR) 102 Feasibility Study, a 35-mile freeway alignment study north of Sacramento. Consultant on I-280 Interstate Transfer Concept Program, San Francisco, an AA/EIS for completion of I-280, demolition of Embarcadero freeway, substitute light rail and commuter rail projects. Principal-in-charge, SR 238 corridor freeway/expressway design/environmental study, Hayward (Calif.) Project manager, Sacramento Northeast Area multi-modal transportation corridor study. Transportation planner for I-80N West Terminal Study, and Harbor Drive Traffic Study, Portland, Oregon. Project manager for design of surface segment of Woodward Corridor LRT, Detroit, Michigan. Directed staff on I-80 National Strategic Corridor Study (Sacramento-San Francisco), US 101-Sonoma freeway operations study, SR 92 freeway operations study, I-880 freeway operations study, SR 152 alignment studies, Sacramento RTD light rail systems study, Tasman Corridor LRT AA/EIS, Fremont-Warm Springs BART extension plan/EIR, SRs 70/99 freeway alternatives study, and Richmond Parkway (SR 93) design study.

Area Transportation Plans. Principal-in charge for transportation element of City of Los Angeles General Plan Framework, shaping nations largest city two decades into 21'st century. Project manager for the transportation element of 300-acre Mission Bay development in downtown San Francisco. Mission Bay involves 7 million gsf office/commercial space, 8,500 dwelling units, and community facilities. Transportation features include relocation of commuter rail station; extension of MUNI-Metro LRT; a multi-modal terminal for LRT, commuter rail and local bus; removal of a quarter mile elevated freeway; replacement by new ramps and a boulevard; an internal roadway network overcoming constraints imposed by an internal tidal basin; freeway structures and rail facilities; and concept plans for 20,000 structured parking spaces. Principal-in-charge for circulation plan to accommodate 9 million gsf of office/commercial growth in downtown Bellevue (Wash.). Principal-in-charge for 64 acre, 2 million gsf multi-use complex for FMC adjacent to San Jose International Airport. Project manager for transportation element of Sacramento Capitol Area Plan for the state governmental complex, and for Downtown Sacramento Redevelopment Plan. Project manager for Napa (Calif.) General Plan Circulation Element and Downtown Riverfront Redevelopment Plan, on parking program for downtown Walnut Creek, on downtown transportation plan for San Mateo and redevelopment plan for downtown Mountain View (Calif.), for traffic circulation and safety plans for California cities of Davis, Pleasant Hill and Hayward, and for Salem, Oregon.

TRAFFIC • TRANSPORTATION • MANAGEMENT
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

Transportation Centers. Project manager for Daly City Intermodal Study which developed a $7 million surface bus terminal, traffic access, parking and pedestrian circulation improvements at the Daly City BART station plus development of functional plans for a new BART station at Colma. Project manager for design of multi-modal terminal (commuter rail, light rail, bus) at Mission Bay, San Francisco. In Santa Clarita Long Range Transit Development Program, responsible for plan to relocate system's existing timed-transfer hub and development of three satellite transfer hubs. Performed airport ground transportation system evaluations for San Francisco International, Oakland International, Sea-Tac International, Oakland International, Los Angeles International, and San Diego Lindberg.

Campus Transportation. Campus transportation planning assignments for UC Davis, UC Berkeley, UC Santa Cruz and UC San Francisco Medical Center campuses; San Francisco State University; University of San Francisco; and the University of Alaska and others. Also developed master plans for institutional campuses including medical centers, headquarters complexes and research & development facilities.

Special Event Facilities. Evaluations and design studies for football/baseball stadiums, indoor sports arenas, horse and motor racing facilities, theme parks, fairgrounds and convention centers, ski complexes and destination resorts throughout western United States.

Parking. Parking programs and facilities for large area plans and individual sites including downtowns, special event facilities, university and institutional campuses and other large site developments; numerous parking feasibility and operations studies for parking structures and surface facilities; also, resident preferential parking .

Transportation System Management & Traffic Restraint. Project manager on FHWA program to develop techniques and guidelines for neighborhood street traffic limitation. Project manager for Berkeley, (Calif.), Neighborhood Traffic Study, pioneered application of traffic restraint techniques in the U.S. Developed residential traffic plans for Menlo Park, Santa Monica, Santa Cruz, Mill Valley, Oakland, Palo Alto, Piedmont, San Mateo County, Pasadena, Santa Ana and others. Participated in development of photo/radar speed enforcement device and experimented with speed humps. Co-author of Institute of Transportation Engineers reference publication on neighborhood traffic control.

Bicycle Facilities. Project manager to develop an FHWA manual for bicycle facility design and planning, on bikeway plans for Del Mar, (Calif.), the UC Davis and the City of Davis. Consultant to bikeway plans for Eugene, Oregon, Washington, D.C., Buffalo, New York, and Skokie, Illinois. Consultant to U.S. Bureau of Reclamation for development of hydraulically efficient, bicycle safe drainage inlets. Consultant on FHWA research on effective retrofits of undercrossing and overcrossing structures for bicyclists, pedestrians, and handicapped.

ENVIRONMENTAL DETERMINATION

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:
The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

	Aesthetics	X	Hazards and Hazardous Materials		Public Services
	Agriculture Resources	X	Hydrology/Water Quality		Recreation
X	Air Quality		Land Use/Planning		Tribal Cultural Resources
X	Biological Resources		Mineral Resources	X	Transportation/ Traffic
X	Cultural Resources	X	Noise	X	Utilities/Service Systems
X	Geology/Soils		Population/Housing		Mandatory Findings of Significance
	Greenhouse Gas Emissions				

DETERMINATION: On the basis of this initial evaluation:

I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION would be prepared.	
I find that although the proposed project could have a significant effect on the environment, there would not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.	**X**
I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.	
I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.	
I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

INITIAL STUDY FOR THE

SDG COMMERCE 330 WAREHOUSE PROJECT (PL18-0010, 0011)

This Initial Study has been prepared by the City of American Canyon, Community Development Department, 4381 Broadway, Ste. 201, American Canyon, CA 94503, pursuant to the California Environmental Quality Act (Public Resources Code Sections 21000 *et seq.*), CEQA Guidelines (Title 14, Section 15000 *et seq.* of the California Code of Regulations).

Organization of the Initial Study

This Initial Study is organized into the following sections:

SECTION I – SUMMARY: Provides summary background information about the project name, location, sponsor, and the date this Initial Study was completed.

SECTION II – PROJECT DESCRIPTION: Includes a project background and detailed description of the proposed project.

SECTION III – ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED: Identifies which environmental factors were determined to have additional significant environmental effects.

SECTION IV – INITIAL STUDY CHECKLIST AND DISCUSSION: Reviews the proposed project and states whether the project would have additional significant environmental effects (project-specific effects) that were not evaluated in the Napa Junction Phase III EIR (SCH#2010082062).

SECTION V – MANDATORY FINDINGS OF SIGNIFICANCE: States whether environmental effects associated with development of the proposed project are significant, and what, if any, added environmental documentation may be required.

SECTION VI – REFERENCES CITED: Identifies source materials that have been consulted in the preparation of the Initial Study.

APPENDICES - Including applicable technical studies and the Mitigation Monitoring and Reporting Program (MMRP)

I. SUMMARY

Project Applicant:	SDC Commerce 330 LLC Brian Doswald, Project Manager 413 W. Yosemite Ave, Suite 105 Madera, CA 93637 (559) 674-0906 bdoswald@icc-stravinski.com
Project Planner:	Tricia Stevens, Contract Project Planner; Brent Cooper, AICP, Community Development Director City of American Canyon 4381 Broadway, Ste. 201 American Canyon, CA 94503 (707) 647-4336
Property Owner:	American Canyon Flat Land Co., Inc. 7674 N. Woodson Ave. Fresno, CA 93711 (559) 908-6363
General Plan Designation:	Commercial Recreation (CR)
Zoning:	Recreation (REC)
Project Approvals:	Conditional Use Permit for 330,528 sq. ft. wine warehouse; Tentative Parcel Map to subdivide larger property into three parcels.
Date Initial Study Completed:	November 19, 2018

II. PROJECT DESCRIPTION

Project Location

The project site is located in the City of American Canyon on the west side of the unimproved Commerce Blvd. extension north of Eucalyptus Drive, and due north of the City of American Canyon Clarke Ranch open space/recreation area (see Figure 1, Project Location Map). The property proposed for development is at the south end of the expanded Green Island Industrial Area. The property is generally trapezoidal in shape, approximately 15.24 acres in size and is the south parcel of a proposed tentative parcel map (see Figure 2, Proposed Tentative Parcel Map). Access to the project site is from SR-29 via Green Island Road to Commerce Blvd.

The project site is currently one 35.85-acre parcel (APN: 058-030-065). A tentative parcel map is proposed that would divide the one 35.85-acre parcel into three parcels. The parcel proposed for development as a wine warehouse would be the 15.24-acre south parcel. The other two parcels to the north would be approximately 10.16 and 10.39 acres in size. The remaining 0.6 acres would be in the *cul de sac* turnaround, shown as Parcel A. No development is currently proposed for the other two parcels. The proposed parcel map is shown on Figure 2.

Site Conditions

Since 1937 the site was occupied by a planted crop of trees and at some time after that but before the late 1950's a eucalyptus grove was planted. Until 2001 the site remained relatively unchanged. Then in 2001 until around 2012 the northwest corner of the site was used as a paintball field (Sherwood Forest Paintball Area) with the eucalyptus trees remaining in place. In 2004 a warehouse was built directly to the north of the site which included Commerce Boulevard Cul-de-sac Road Improvements on the northeast corner of the site. Also in 2004, the City of American Canyon installed underground utilities and a rock-paved access road through the middle of the eucalyptus grove adjacent to the east side of this site. This work also included the installation of a sanitary sewer force main that bisects the northeast corner of the site. This utility and rock road work included removal of eucalyptus trees as required. In 2012 the site was cleared and grubbed of the eucalyptus trees and shrubs, and is currently a gently sloping open site covered primarily with ruderal vegetation.

The project is bounded on the north by open grassland. To the west is an 11.23-acre parcel owned by the Couch Family, which remains unimproved with a eucalyptus tree grove and a wire fence; on the south is the City-owned 24-acre parcel known as the Clarke Ranch West Open Space, partially covered eucalyptus trees, and including horse-riding facilities operated by Spirit Horse Riding Center; to the east is a 68-foot wide City Public Access and Utility Easement, with underground sewer, water, reclaimed water and sewer force lines, and PG&E has underground power with vaults; on each side of this 68-foot easement is a 5-foot-wide Public Utility Easement (PUE); to the east of these

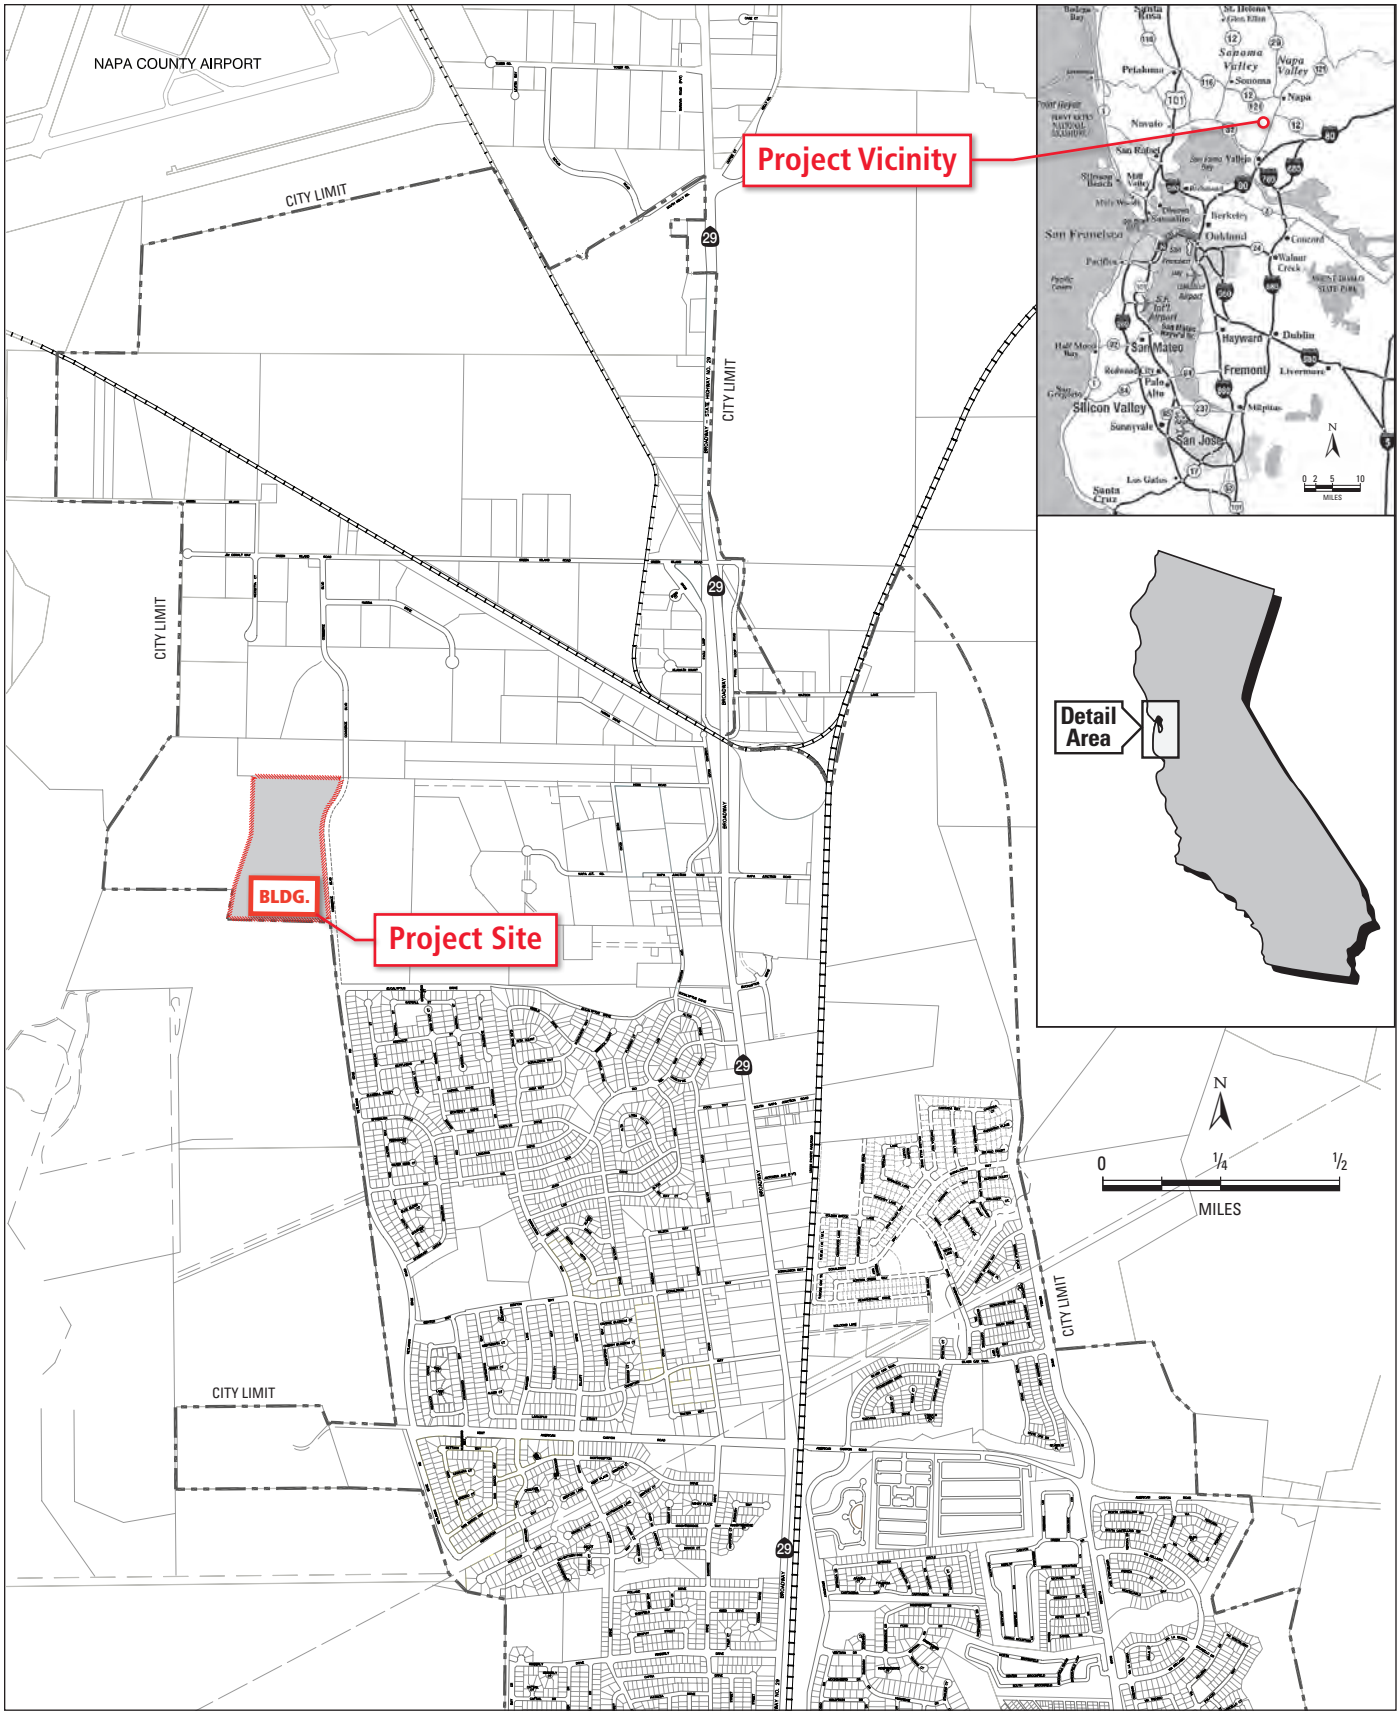

Figure 1

Project Location

Source: City of American Canyon General Plan

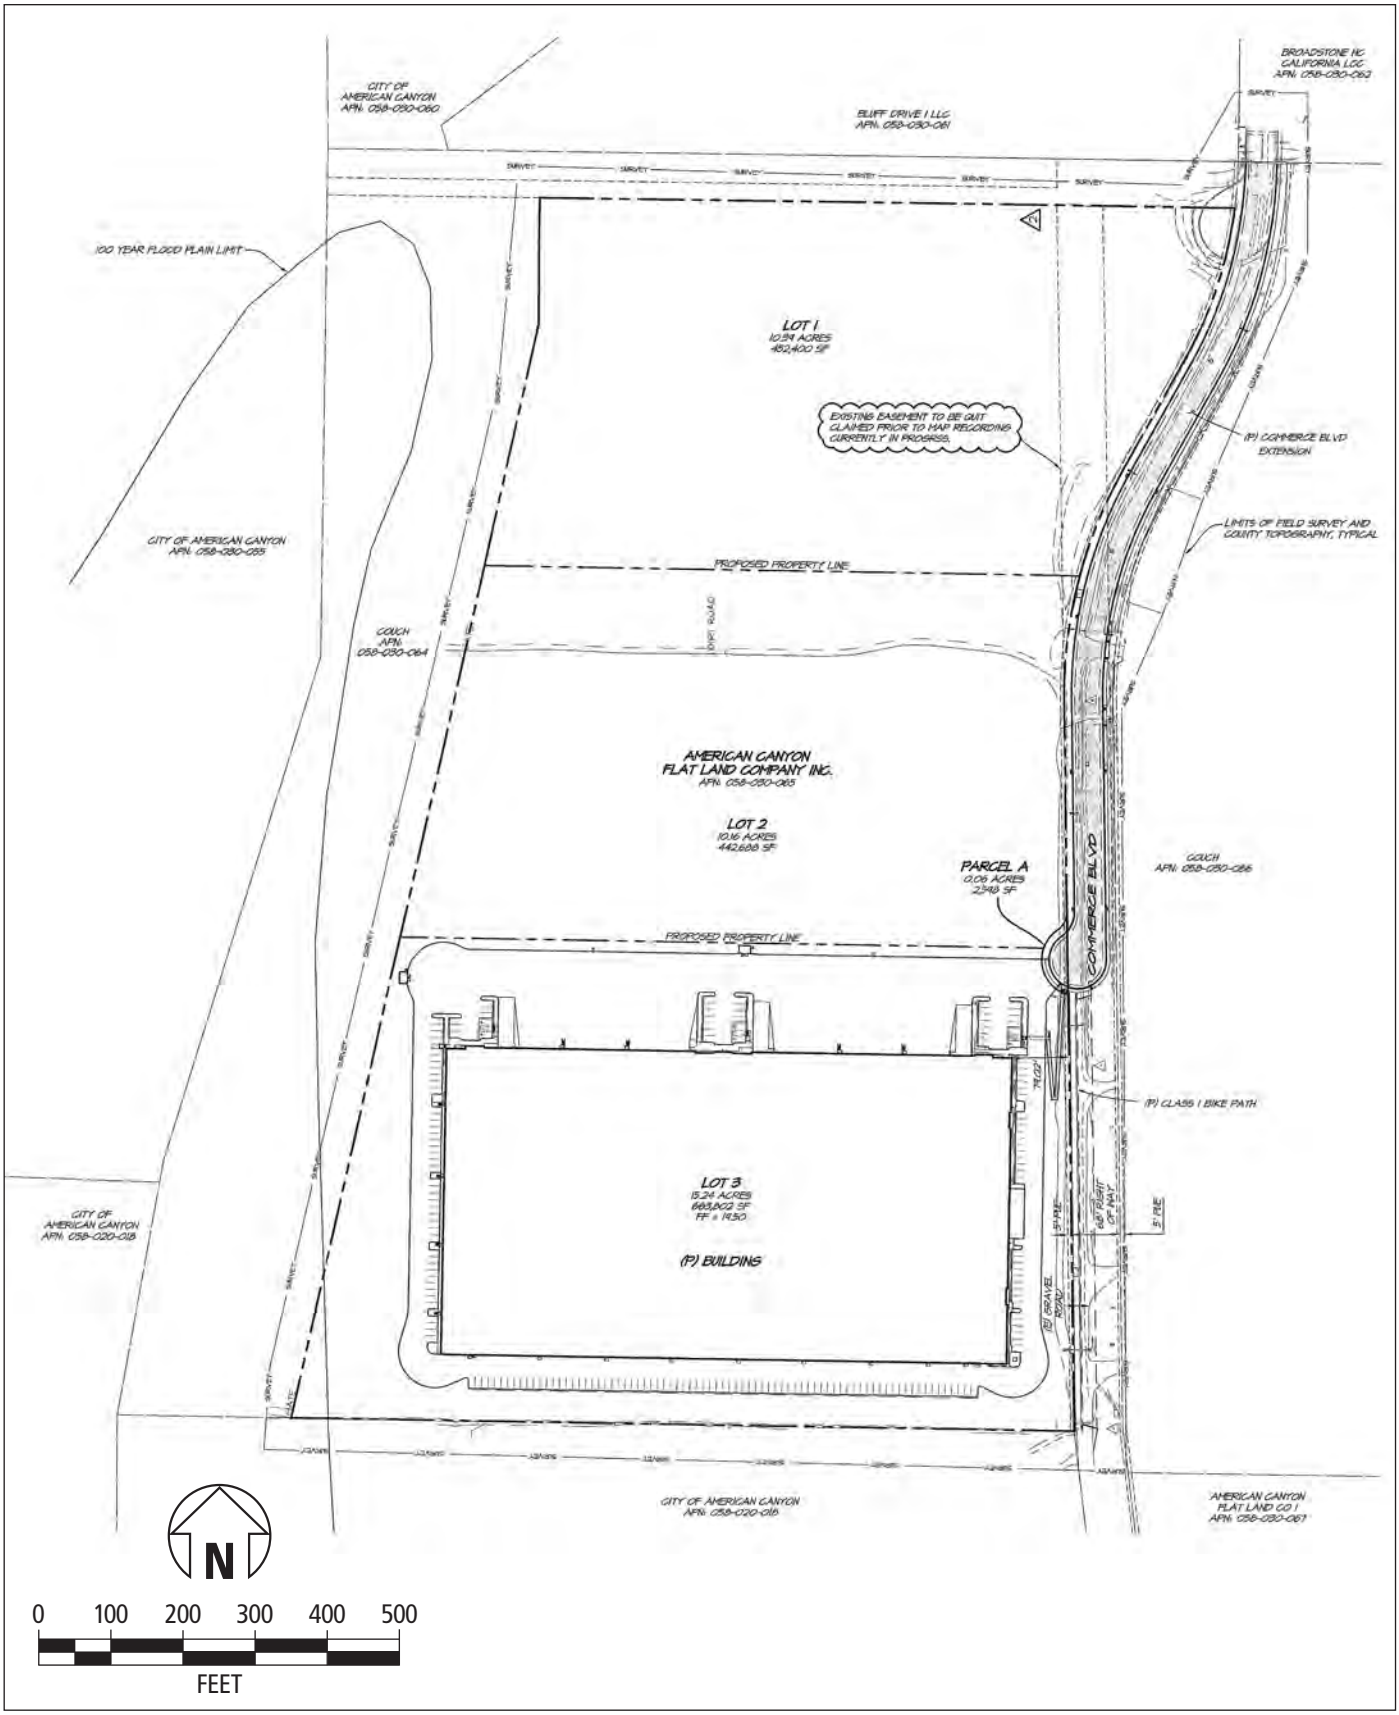

Figure 2

Tentative Parcel Map

Source: RSA+ Consulting Civil Engineers

easements is a 40-acre parcel owned by the Couch Family including a mobile home, dirt/gravel roads, various sheds and lean-to structures, and wire fences;

Current Zoning and General Plan Designations

The City's General Plan designates the site as Commercial Recreation (CR) and the Zoning Map indicates that the site as Recreation (REC). This Parcel is in the City's Recreation Zoning District (REC). A Recreation Zoning District Code Amendment (Ordinance No. 2018-01) was adopted by the City Council on January 16, 2018. The Ordinance that was adopted was "to make winery uses more feasible". The City's Municipal Code, Chapter 19.15.020 identifies the Recreation District as an area for Wineries and as a conditionally permitted use. An amendment to the Zoning Ordinance (No. 2018-01) was granted by the City Council on Dec. 19, 2017, expanding the Zoning to "allow limited non-winery uses with a conditional use permit".

Proposed Development

As discussed above, the project applicant proposes to subdivide the overall 35.85-acre parcel and develop a wine warehouse on the southern 15.24-acre parcel. The proposed warehouse development is described below.

Proposed Warehouse Building

The applicant proposes to develop a wine warehouse on the 15.24-acre parcel. The project would consist of one 330,528 square foot wine storage and distribution center on the 663,802 square foot site, which represents a 49.9% building coverage (0.499 FAR). The assumed 6,600 square feet of office space is an estimate as exact office build outs would be determined in the future and reviewed by the City during the Tenant improvement phase of the project. The building has the potential of accommodating multiple tenants with provisions for offices at two corners and midway on the north wall. It is anticipated that the warehouse would be used for wine storage and other wine-related storage and warehousing activities (i.e. bottles, corks, barrels, etc.). The proposed site plan is shown in Figure 3.

The building would be approximately 424 feet deep from north to south, and 780 feet wide from east to west. The building would have perimeter concrete tilt wall panels with varying parapet heights and accent spandrel glass/metal canopy features around offices and corners of the buildings to provide additional modulation. The average roof height of the building would be approximately 35 feet high and portions of the building exterior walls would have various heights to provide architectural relief. The building would be designed with earth-tone colors and in a style similar to the Green Island 258 Warehouse project and the Santa Clara/Yandell Warehouse, located on Green Island Road. Building elevations are shown on Figure 4.

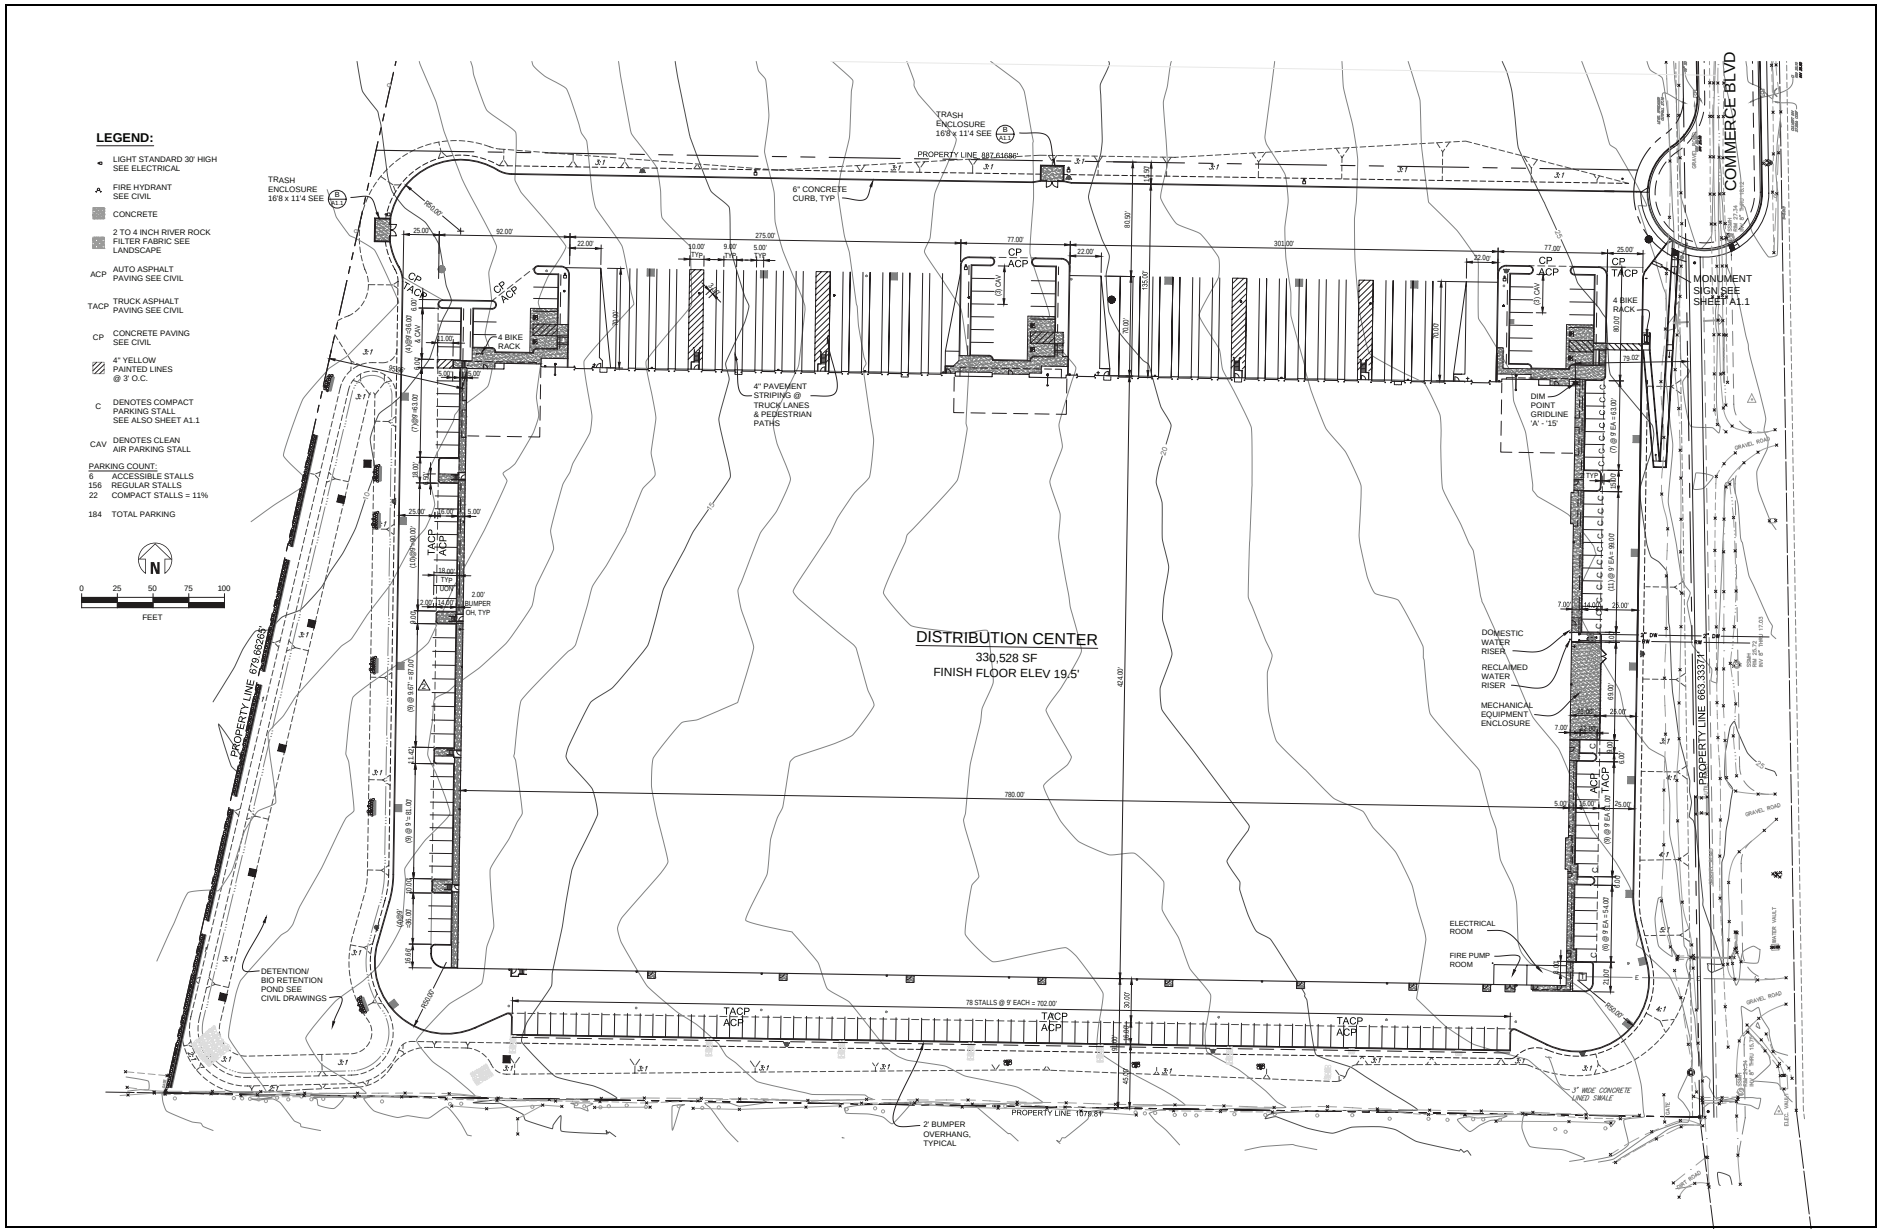

Figure 3

Site Plan

Source: Ward Architects, Inc.

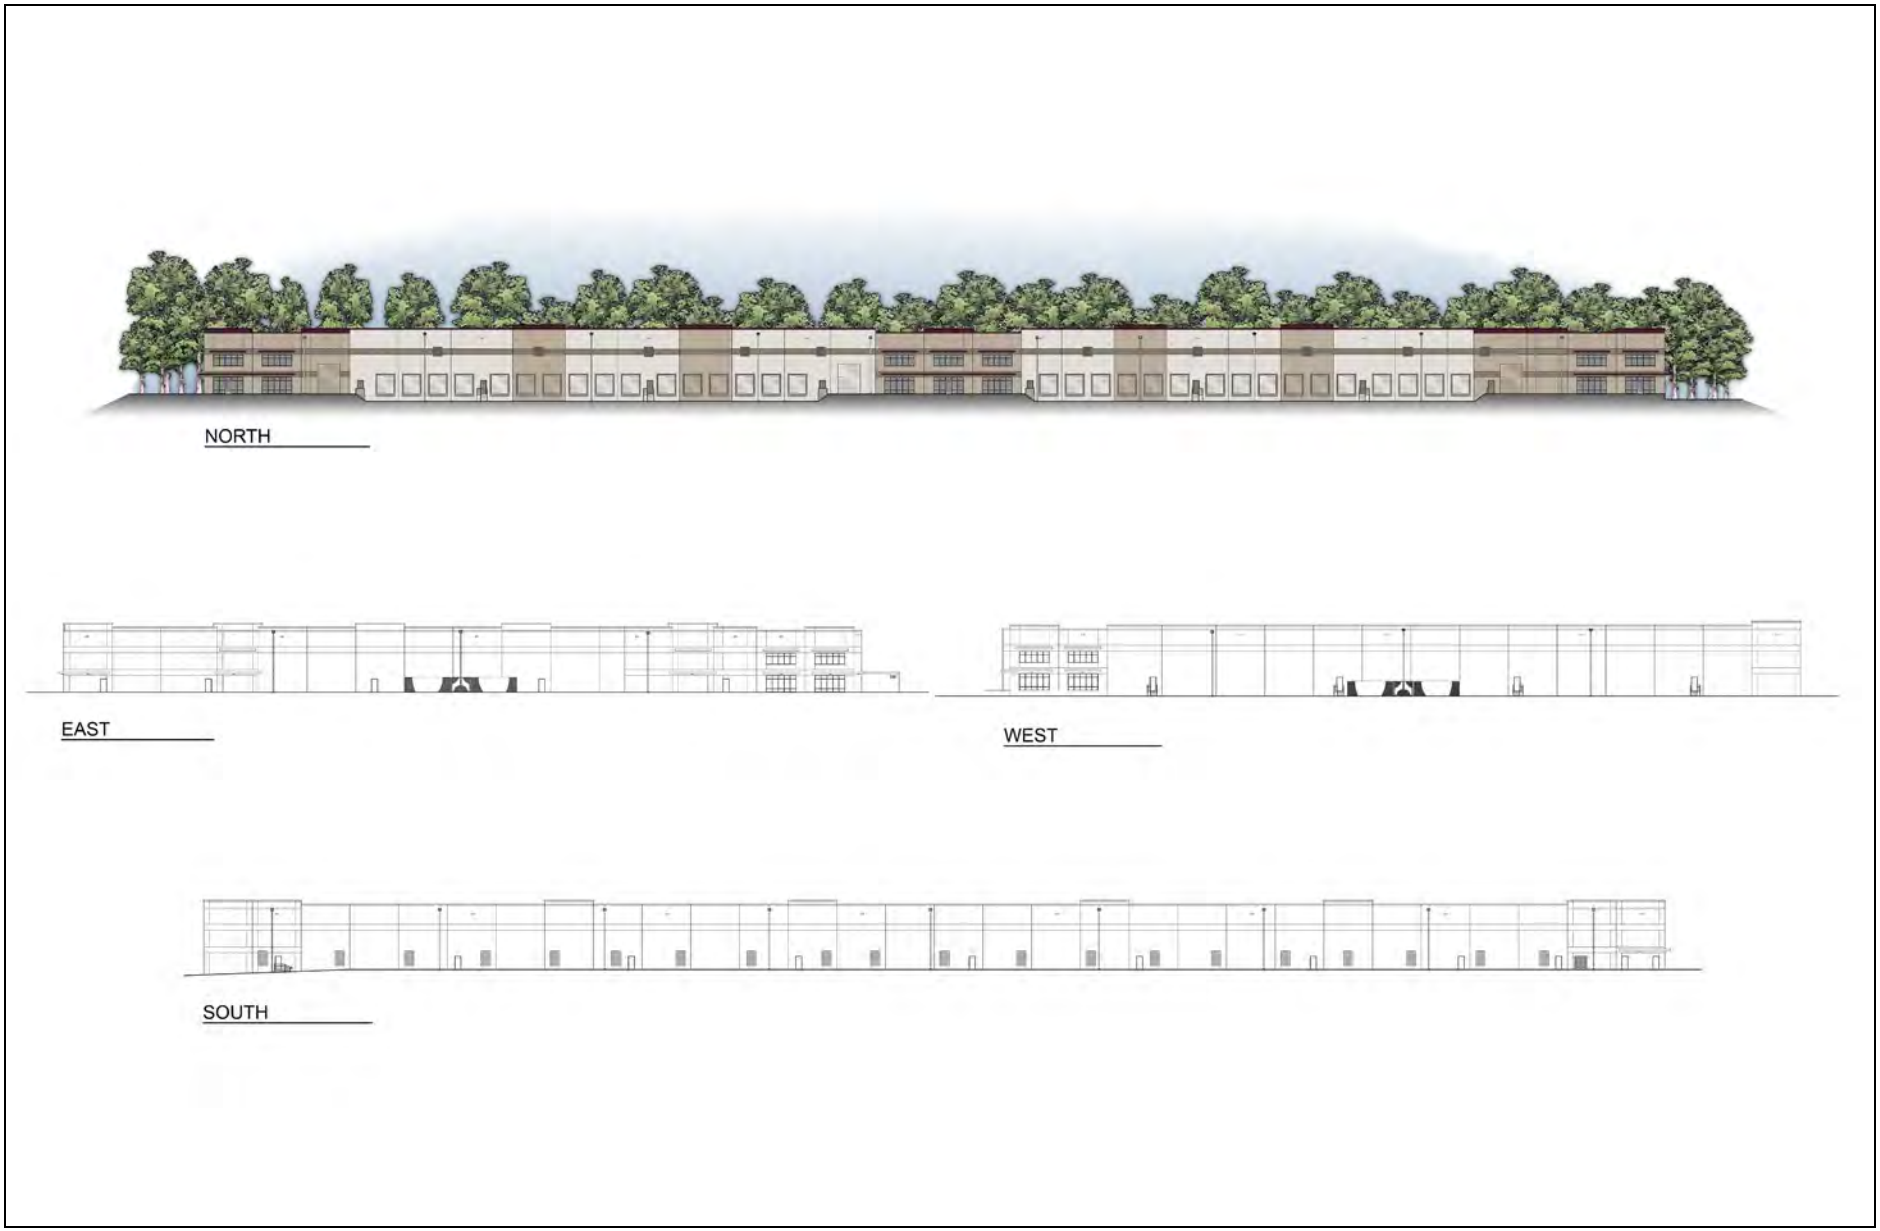

Figure 4

Elevations

Source: Ward Architects, Inc.

The building would have architecturally screened and covered trash enclosures for solid waste dumpsters for service by private waste haulers.

Because the building is proposed for warehousing and distribution of wine and/or other wine related products it would be heavily insulated and refrigerated, making it suitable for storage of wine and related products at approximately 58 degrees Fahrenheit. The microclimate of the area would allow cool night air to be brought in with intake louvers and fans, thereby reducing the amount of refrigeration necessary.

Parking and Truck Circulation

A total of 189 car and 32 truck dock parking spaces would be provided for the building. Of these parking stalls, 6 would be designated for handicap access with 3 stalls designated for van accessibility and 10 stalls for Clean Air Vehicle parking. The building would have a total of 32 truck loading docks. The developer would construct ADA accessible walkways between the ADA accessible stalls and the entrances to their respective offices to allow for pedestrian access on-site. Emergency ingress and egress would be provided around the full perimeter of the building.

Site circulation has been evaluated, specifically including fire truck movements and in-bound/ out-bound turning movements at the Commerce Boulevard entrance. This is discussed further in the Transportation section of this Initial Study.

Bicycle Facilities

Each end of the building would have a bike rack to accommodate up to 4 bicycles, 1 more than the required 7 stalls per the City's Zoning Ordinance Chapter 19.14.090 (A), Bicycle Parking Requirements.

Lighting

Exterior lighting for the proposed project would include lighting on the building and on parking lot poles on the north side of the property. Parking lot lighting would be consistent with that which is required by the City of American Canyon. The lights would be "shoebox" fixtures, with a height of 30 feet, dimmable LED fixtures which are designed to direct the light towards the ground and reduce glare to surrounding properties. A photometric study has been prepared to analyze the light pole spacing to maximize light coverage and minimize excessive light spillage off-site and is available for review at the City Community Development Department.

Signage

The site plan shows one proposed monument sign, (approximately 8-foot wide by 5 -foot tall) located at the entry to the site from Commerce Blvd. The applicant would submit a separate Sign Permit

application for City approval of the monument sign, as this proposed sign is not submitted with this application.

Grading and Retaining Structures

Grading of the property would consist of cuts of approximately nine (9) feet and fills of approximately seven (7) feet. A retaining wall that ranges in height from about 2 to 4.5 feet would be constructed along a portion of the east side of the site to accommodate the grade differential. These walls would be engineered to meet the requirements of the California Building Code and are proposed to be a pre-cast concrete block system. Excavations and fills and protection of adjoining property would comply with Chapter 33 of the California Building Code. The Applicant would ensure that adequate erosion protection is installed (see Hydrology discussion).

Landscaping

Landscaping would be provided around the site perimeter, around the building, in parking islands, ends of parking aisles. The south side auto parking would have a 45-foot landscaped/swale setback as a buffer to the Clarke Ranch Property. Mechanical equipment would be placed on the east t side of the building and out of view from the Clarke Ranch property. The irrigation system would be connected to the City's reclaimed water system thus eliminating the use of the City's potable water for landscape purposes. The project would have approximately 70,000 square feet (+/- 1.60 acres) of landscaping.

Utilities and Drainage Facilities

Major utility services (sewer, water, electricity, phone, etc.) are existing along the Commerce Boulevard extension project frontage. The building would have 6" domestic sewer service stubbed to the three (3) office locations and a sewer pump lift station located near the northeast corner of the building tying into the existing City sewer main line in Commerce Blvd. extension. Domestic water service, fire water service and reclaimed water service would be brought to the east side of the building from existing City mains in Commerce Blvd. extension. Gas service can be tied into the existing gas stub in the Commerce Blvd. extension to the north. Electric and telephone service is available along the project frontage on the Commerce Blvd. extension. Electric and Telephone service would be extended underground within the subject property to the southeast corner of the building.

As part of the proposed project, the parcel's storm water runoff would be directed via pipes and a bio-swale into the newly created detention/bioretention pond. This storm water detention/bioretention pond and bio-swale are designed to treat the storm water in conformance with federal, state, and regional requirements. The vegetated swale on the south would be planted with plant material as specified by the hydrology engineer to retain and filter runoff from the site. The roof drains would be

connected to the proposed detention/bioretention pond and storm drain systems surrounding the building by way of down spouts on the exterior of the building that would be painted to blend in with the building façade.

Building Energy Efficiency

The building will be installed with a night-air cooling system to capture the cold air from outside during the night, which reduces the demand to use the Refrigeration system. This greatly reduces the building's electricity demand and is a unique trait of the Napa Valley climate to allow such a cooling process.

The fork lifts used within the buildings would be powered by electricity instead of the typical natural gas-powered fork lifts.

Interior lighting would be designed to meet at minimum Title 24 standards; in addition, measures to increase efficiency and reduce excess energy usage inside the warehouse would be promoted. Features such as motion-sensor lighting would be installed for areas within the warehouse. This reduces heat generate inside, further reducing the energy demands to cool the warehouse. The most current PG&E incentives would be investigated and all attempts to incorporate them into the design would be made.

Construction Activities and Schedule

Construction of the proposed project would take place in one phase. Initial grading would be completed for the site and all underground utilities stubbed to the building pad. The detention/bio-retention pond, treatment swales and Storm Water Pollution Prevention Measures (SWPPP) for the site would be completed during the initial phases of construction. It is anticipated that from commencement of the initial grading it would take approximately 10 months to complete the construction of the building and associated facilities.

Typical construction equipment that would be used at the site would include self-loading dirt scraper, bulldozer, motor grader, compactor, roller, water truck, backhoe, excavator, trencher, drilling auger, front end loader, paving machine, laser screed, concrete finishing trowels, tractor, crane, forklift, generator, man lift, scissor lift, welding machine, and light tower. During the construction phase, 15 to 25 workers typically would be on- site, with a maximum near to 100 workers.

Proposed Building Uses

It is anticipated that the building might have approximately 50 full-time employees and up to 30 part-time employees working in up to 3 overlapping shifts and operating 12-18 hours a day during the peak season. These numbers are only approximations as there is no specific user identified with the

application; however, they are substantiated with similar uses. Warehousing and storage of wine and other wine related industries as a whole is not labor intensive on-site. The proposed uses for the building do not demand frequent client or user trips to the site and it can be estimated that approximately 3 to 5 trips per day would be from clients or visitors to the site and will likely be during off-peak or normal working hour times.

The proposed uses are generally of low intensity as the storage of wine is necessary for the aging process. The building is designed to accommodate four (4) tenants, however, our experience is that the building will generally have fewer tenants than planned. Office space within the buildings is incidental to the warehouse operation and usually occupies less than two percent of the building. Hours of operation are normally 6 AM to 6 PM Monday thru Friday and 6 AM to 12 PM Monday thru Friday during peak seasonal months, typically June through November.

Proposed Access Improvements

The Project would be accessed from the existing Commerce Blvd. to the north off of Green Island Road. The existing truck turn-around cul-de-sac at the south end of Commerce Blvd. would be relocated approximately 1,100 feet to the south, at the northeast corner of the project site. Commerce Blvd. would be extended this same length and would be a two-lane road (44 feet wide) with concrete curbs and gutters on its east and west sides. The fire access gate would be relocated just south the new *cul-de-sac* at the existing rock maintenance road to prohibit public access. The new Commerce Blvd. extension would have landscaping on the west side and street lights (both sides) in accordance with City Standards. The east side of the Commerce Blvd. extension would have a five-foot wide sidewalk to match Commerce Boulevard to the north, and a Class 2 bike path in the roadway. The east side frontage to the south of the new *cul-de-sac* would have a class 1 bike path on the west side, with the widened rock maintenance road.

Off-Site Wetlands

The proposed project would create a new off-site wetland to mitigate for a small existing isolated wetland (IW1) at the southeast corner of the property. A 0.05-acre newly created wetland habitat area is proposed on the Hanna Court 411 Warehouse Property – Open Space Easement Site (APN: 058-420-052), just north of the Hanna Court Warehouse access road to mitigate for 0.020 acres of “isolated” waters of the State (isolated seasonal wetlands) that would be affected by the project, which represents a 2.5:1 wetland replacement ratio. The soil within the mitigation wetland would be hydroseeded with a seed mix recommended by the consulting wetland biologist.

Application would be made to the Regional Water Quality Control Board for appropriate approvals, with the City as the lead agency.

Land Use Entitlements and other Agency Approvals

City of American Canyon

The applicant is requesting a Conditional Use Permit and a Tentative Parcel Map from the City of American Canyon for the project.

Other Agency Approvals

The project would require the following approvals from other agencies:

- Regional Water Quality Control Board, San Francisco Bay Region, Stormwater Pollution Prevention Plan and Permit.
- Regional Water Quality Control Board, San Francisco Bay Region, 401 Water Quality Certificate for coverage under Water Quality Order No. 2004-0004-DWQ for impacts to isolated waters on the project site.
- Napa County Airport Land Use Commission, Avigation Easement (an Avigation and Hazard Easement Deed) extends over the whole of the project site.

III. INITIAL STUDY CHECKLIST

The initial study checklist recommended by the CEQA Guidelines is used to describe the potential impacts of the proposed project on the physical environment.

I. Aesthetics

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect on a scenic vista?			**X**	
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?				**X**
c) Substantially degrade the existing visual character or quality of the site and its surroundings?			**X**	
d) Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?			**X**	

a, c) The project site is currently undeveloped open land covered with sparse, weedy vegetation, with some small seasonal wetland areas. The project is bounded on the north by open grassland and beyond that is the developed Green Island commercial and industrial area, containing large modern warehouses with parking lots aesthetically similar to the proposed warehouse. To the west is an 11.23-acre parcel owned by the Couch Family, which remains unimproved with a eucalyptus grove. To the south is a line of mature eucalyptus trees and beyond that is the City-owned 24-acre parcel known as the Clarke Ranch West Open Space. Clarke Ranch is utilized for horse-riding facilities operated by Spirit Horse Riding Center. Farther south on Commerce Boulevard is a residential neighborhood. To the east is a 40-acre parcel owned by the Couch Family including a mobile home and various lean-to buildings, and a large commercial recreational paintball facility known as American Canyon Paintball Jungle. A public school is proposed just southeast of the site, to the south of the paintball area, on open land at the corner of Eucalyptus Drive and Commerce Blvd Views of the project site from this eastern boundary can be seen in Figures 5-7.

Figure 5- View of the Site from cul-de-sac at northern part of Commerce Blvd. looking south. The eucalyptus line along the southern boundary constitutes the border between the Commerce 330 Parcel and the Clarke Ranch Site.

Figure 6 – View from the southwest corner of the site looking north.

Figure 7: View from the shoulder of the utility access road on the eastern site boundary looking west. Eucalyptus trees are at the western border of the site.

The site is visible from the northern end of Commerce Blvd., the unpaved extension of Commerce Blvd. from the south, as well as from the Couch property and the Paintball Jungle facility. Distant views of the site may be accessed from the crest of the Oat Hill. There are no views of the site from nearby residential neighborhoods as the property is screened from views by a dense stand of eucalyptus trees Clarke Ranch northern property frontage.

Implementation of the proposed project would replace the existing view of relatively level, undeveloped grassland with views of a new large warehouse structure and parking area. Views from the residential area from the South would be buffered by the line of mature eucalyptus trees along the Southern Boundary and by Clarke Ranch. In addition, the project's landscaping plan includes two rows of screening trees along the site's southern property line. Views of the hillsides and ridgelines visible from Eucalyptus Drive and Commerce Blvd. would not be disturbed.

The proposed project includes a landscape plan, which would soften views from both adjacent properties and Eucalyptus Drive. The project constitutes a visual extension of the existing warehouses that characterize views in the Green Island Road viewshed. Overall, the project would change the visual character of the site from one of a large, undeveloped field

to industrial. While this change would be substantial, the number of viewers affected would be small. For these reasons, the proposed project would not substantially degrade the visual character of the project site or its surroundings consistent. Impacts to a scenic vista or existing visual character of the site would be ***less than significant***.

b) The project site is located in the City of American Canyon, east of SR-29. Highway SR-29 is designated as an Eligible State Scenic Highway by Caltrans. The City's General Plan specifies that the SR-29 corridor provides opportunities for enhancing the City's visual quality and includes a policy to preserve significant views from areas along major arterial roadways (City of American Canyon 1994, as amended through January 2018). The project site is about 5,000 feet west of the SR-29 highway and is fully shielded from any views by intervening hillside terrain.

Because the proposed project would not be visible in views from that highway, it would have ***no impact*** to vistas from a state scenic highway.

The project would not remove any existing trees, historic buildings or rock outcroppings that would be considered scenic resources. Because there are no city-designated scenic vistas or scenic resources on this site or nearby that the project could adversely affect, development of this site would result in ***no impact*** on these resources.

d) The proposed project includes exterior lighting.

Project lighting would include building lights and lights in the parking lot areas which would increase artificial light in the project area and potentially generate glare. On-site lighting would be shielded and designed to cast light downward, thereby reducing spillover light and glare on adjacent properties. The applicant has prepared a photometric plan showing that project lighting spillover beyond the project site would be minimal (Bosley Electric, 2018). The lighting would be required to adhere to the City of American Canyon's performance standards for street lighting and glare. In reviewing the Conditional Use Permit application for the proposed project, the City would consider the proposed use of outdoor lighting prior to approval. The building design would not introduce a source of glare associated with large expanses of glass. Therefore, impacts from light or glare would be ***less than significant***.

The project applicant would also be required to submit a sign program (indicating location of any lighted signs) to the City for review and approval. The project applicant would be required to implement the sign program, as approved by the City. Visual impact from signage would be ***less than significant***.

II. Agricultural and Forestry Resources

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?				**X**
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?				**X**
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?				**X**
d) Result in the loss of forest land or conversion of forest land to non-forest use?				**X**
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?				**X**

a-e) The project site is undeveloped and located adjacent to a developed area of the City of American Canyon. The site has been rough graded and stripped of trees. The site is designated Recreation in the City's General Plan. Although portions of the site may have historically been used for small-scale agriculture, no such uses have occurred since at least the 1950s, when the site was planted with a eucalyptus grove. The project site contains no Prime Farmland, Unique Farmland, Farmland of Statewide Importance, or active agricultural operations. The most recent California Department of Conservation Important Farmland Maps for Napa County designates the site as Urban and Built Up Land (California Department of Conservation, California Important Farmland Finder,

accessed July 16, 2018 https://maps.conservation.ca.gov/DLRP/CIFF/). In addition, this site is located within the municipal boundaries of the City of American Canyon. There are no Williamson Act lands on the site. The proposed project would not involve any changes that could result in conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to a non-agricultural use or loss of forest land.

There are no forest lands on the site, nor is the site designated or zoned for timberland resources. Therefore, implementation of the project would not involve the loss of any forest land.

Therefore, there would be ***no impact*** to agricultural and forestry resources.

III. Air Quality

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Conflict with or obstruct implementation of the applicable air quality plan?		**X**		
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?		**X**		
c) Result in a cumulatively considerable net increase of any criteria for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?		**X**		
d) Expose sensitive receptors to substantial pollutant concentrations?		**X**		
e) Create objectionable odors affecting a substantial number of people?			**X**	

The air quality analysis was performed using methodologies and assumptions recommended within the Bay Area Air Quality Management District (BAAQMD) *CEQA Air Quality Guidelines* (May 2017).[1] This section describes existing air quality and air pollutant construction and operational impacts.

Air quality pollutants evaluated are carbon monoxide (CO), reactive organic compounds (ROG), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter equal to or less than 10 micrometers (coarse particulates or PM10), and particulate matter equal to or less than 2.5 micrometers (fine particulates or PM2.5). Greenhouse gas (GHG) emissions are addressed in Section VII, Greenhouse Gas Emissions.

[1] The May 2017 BAAQMD *CEQA Guidelines* includes revisions made to the BAAQMD's *2010 Guidelines* to address the California Supreme Court's 2015 opinion in Cal. Bldg. Indus. Ass'n vs. Bay Area Air Quality Mgmt. Dist., 62 Cal.4th 369. The May 2017 *CEQA Guidelines* update does not address outdated references, links, analytical methodologies or other technical information that may be in the Guidelines or Thresholds Justification Report. The BAAQMD is currently working to update any outdated information in the Guidelines.

The project site is located within the San Francisco Bay Area Air Basin (Air Basin) under the jurisdiction of the BAAQMD. The BAAQMD is the local agency responsible for the administration and enforcement of air quality regulations for the area. The Air Basin is currently designated "nonattainment" for state and national (1-hour and 8-hour) ozone standards, for the state PM10 standards, and for state and national (annual average and 24-hour) PM2.5 standards. The Air Basin is designated "attainment" or "unclassifiable" with respect to the other ambient air quality standards. Additional information regarding the air quality setting is found in Appendix A.

a) The BAAQMD's Clean Air Plan (2017 CAP) is the regional air quality plan for the Air Basin. The 2017 CAP updates the 2010 CAP, pursuant to air quality planning requirements defined in the California Health and Safety Code. The 2017 CAP provides a comprehensive strategy to improve air quality, protect public health, and protect the climate, utilizing all the tools and resources available to the BAAQMD. The BAAQMD recommends that the agency approving a project where a CAP consistency determination is required analyze a project with respect to the following questions. If the first two questions are concluded in the affirmative and the third question concluded in the negative, the BAAQMD considers the project consistent with air quality plans prepared for the Bay Area. Therefore, the following criteria are used for determining the proposed project's consistency with the 2017 CAP:

Criterion 1: Does the proposed project support the primary goals of the 2017 CAP?

The primary goals of the 2017 CAP are to:

- Protect air quality and health at the regional and local scale
- Protect the climate

As discussed in this section and the GHG Emissions section of this Initial Study, all air quality and GHG emissions impacts would be less than significant after implementation of MM AQ-1 through AQ-4. Therefore, the proposed project supports the primary goals of the 2017 CAP.

Criterion 2: Does the proposed project include applicable control measures from the 2017 CAP?

The 2017 CAP's control strategy includes 85 control measures designed to reduce ozone precursors in order to fulfill ozone planning requirements, protect public health by reducing emissions of ozone precursors, particulate matter and toxic air contaminants, and to serve as a regional climate protection strategy by reducing GHG emissions across a full range of economic sectors. The proposed project would include features that support applicable control measures such as water conservation, green buildings, and bicycle access/facilities. Therefore, the proposed project includes applicable control measures from the 2017 CAP.

Criterion 3: Does the proposed project disrupt or hinder implementation of any 2017 CAP control measures?

The BAAQMD provides examples of how a project may cause the disruption or delay of control measures. Examples include a project that precludes an extension of a transit line or bike path, or proposes excessive parking requirements. The proposed project would not cause a disruption or delay of the 2017 CAP's control measures.

The proposed project with mitigation measures would support the primary goals of the 2017 CAP and would be consistent with applicable 2017 CAP control measures, and would not disrupt or hinder implementation of any 2017 CAP control measures. Therefore, the proposed project would have a ***less than significant impact with mitigation***.

b) Construction activities were assumed to commence in spring 2019 with site preparation and grading. Building construction, paving and coating would follow and construction would be complete in approximately winter 2020. The proposed project would be constructed in a single phase estimated to require approximately ten months.

Project construction would generate short-term emissions of air pollutants, including fugitive dust and equipment exhaust emissions. The BAAQMD *CEQA Air Quality Guidelines* recommend quantification of construction-related exhaust emissions and comparison of those emissions to significance thresholds. The CalEEMod (California Emissions Estimator Model, Version 2016.3.2) was used to quantify construction-related pollutant emissions. Air quality calculation details and CalEEMod output worksheets are included in Appendix A.

Table AQ-1 provides the estimated short-term construction emissions that would be associated with the proposed project and compares those emissions to the BAAQMD's thresholds for construction exhaust emissions. As the construction phases (i.e., grading, building construction, paving, etc.) are sequential, the average daily construction period emissions (i.e., total construction period emissions divided by the number of construction days) were compared to the BAAQMD significance thresholds. All construction-related emissions would be below the BAAQMD significance thresholds. The air quality analysis includes use of paint compliant with BAAQMD Regulation 8, Rule 3 for architectural coatings. Regulation 8, Rule 3 limits the VOC content of the paint.

Construction activities, particularly during site preparation and grading would temporarily generate fugitive dust in the form of PM10 and PM2.5. Unless properly controlled, vehicles leaving the site would deposit mud on local streets, which could be an additional source of airborne dust after it dries. Fugitive dust emissions would vary from day to day, depending on the nature and magnitude of construction activity and local meteorological conditions. Fugitive dust emissions would also depend on soil moisture, silt content of soil, wind speed, and the amount of equipment operating. Larger dust particles would settle near the source, while fine particles would be dispersed over greater distances from the construction site.

Nearby receptors could be adversely affected by dust generated during construction activities.

Table AQ-1
Estimated Daily Construction Emissions (pounds/day)

Construction Year	ROG	NO_x	PM10 (exhaust only)	PM2.5 (exhaust only)	CO
Proposed Project Unmitigated Emissions					
2018-2019	**18.5**	**36.5**	**1.6**	**1.5**	**28.7**
BAAQMD Significance Threshold	*54*	*54*	*82*	*54*	--
Threshold Exceeded?	**No**	**No**	**No**	**No**	--
Proposed Project Mitigated Emissions					
2018-2019	**16.9**	**37.6**	**0.6**	**0.6**	**29.6**
BAAQMD Significance Threshold	*54*	*54*	*82*	*54*	--
Threshold Exceeded?	**No**	**No**	**No**	**No**	--

Source: CalEEMod Version 2016.3.2

The BAAQMD's *CEQA Air Quality Guidelines* consider these impacts to be less than significant if best management practices are employed to reduce these emissions. Mitigation Measures AQ-1 and AQ-2 address the implementation of best management practices to reduce fugitive dust and combustion exhaust emissions per BAAQMD's *CEQA Air Quality Guidelines*. Mitigation Measure AQ-3 addresses compliance with BAAQMD regulations concerning architectural coating.

The construction emissions are less than the significance thresholds (See Table AQ-1) and the proposed project would also include Mitigation Measures AQ-1 through AQ-3 per BAAQMD's *CEQA Air Quality Guidelines*. Therefore, project impacts from construction emissions would be ***less than significant with mitigation***.

Following the completion of construction activities, the proposed project would generate VOC, NO_x, CO, PM10, and PM2.5 emissions from mobile and stationary sources, including vehicular traffic, off-road warehouse equipment (electric forklifts) and area sources (space heating, water heating, maintenance of the buildings and landscaping). Complete details of the emissions calculations are provided in Appendix A.

Estimated maximum daily and annual operational emissions that would be associated with the proposed project are presented in Tables AQ-2 and 3 and are compared to BAAQMD's thresholds of significance. As indicated, the estimated operational emissions that would be

associated with the proposed project would be below the BAAQMD's significance thresholds and would be ***less than significant***.

Table AQ-2
Estimated Daily Operational Emissions (pounds/day)

Condition	ROG	NO_x	PM10	PM2.5	CO
Proposed Project Emissions					
Summer	11.1	22.0	4.7	2.0	28.2
Winter	10.9	22.4	4.7	2.0	28.5
Maximum Proposed Project	**11.1**	**22.4**	**4.7**	**2.0**	**28.5**
BAAQMD Significance Threshold	*54*	*54*	*82*	*54*	--
Threshold Exceeded?	**No**	**No**	**No**	**No**	--

Total Proposed Project	**1.8**	**2.9**	**0.6**	**0.3**	**3.6**
BAAQMD Significance Threshold	*10*	*10*	*15*	*10*	--
Threshold Exceeded?	**No**	**No**	**No**	**No**	--

Source: CalEEMod Version 2016.3.2

The BAAQMD has identified preliminary screening criteria for determining whether CO emissions would be exceeded. The screening criteria provide a conservative indication of whether the implementation of a project would result in CO emissions that are potentially significant. This methodology includes the following:

- Project is consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, regional transportation plan, and local congestion management agency plans.
- The project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per day.

- The project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per day where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway).

Based on the size of the proposed project and the anticipated resultant traffic volumes, the additional traffic would meet the screening criteria. Therefore, impacts that would be associated with long-term operational CO exhaust emissions would be ***less than significant***.

c) The BAAQMD *CEQA Air Quality Guidelines* recommend that cumulative air quality effects from criteria air pollutants also be addressed by comparison to the BAAQMD's mass daily and annual significance thresholds. As shown in Tables AQ-1 through AQ-3, proposed project-related emissions would be below the thresholds with implementation of the recommended mitigations measures. Therefore, the proposed project would not be cumulatively considerable and cumulative impacts would be ***less than significant with mitigation***.

d) The significance of impacts to sensitive receptors is dependent on the chance of contracting cancer from exposure to Toxic Air Contaminants (TACs) such as DPM or of having adverse health effects from exposure to non-carcinogenic TACs. A project is considered to be significant if the incremental cancer risk at a receptor exceeds 10 in a million. Health risk is evaluated for sensitive receptors within a 1,000-foot radius of a project's impact area. The nearest sensitive receptors, a residential neighborhood, is situated approximately 900 feet southeast of the proposed project boundary, with two-to-three homes that could potentially be within 1,000 feet of certain project construction phases (site preparation and grading activities).

The Office of Environmental Health Hazard Assessment (OEHHA) does not recommend assessing cancer risk for projects lasting less than two months (OEHHA, 2015). Site preparation and grading activities would last approximately 5 weeks and then subsequent construction phases (building construction and other construction activities) would be greater than 1,000 feet from the nearest sensitive receptor. Secondly, annual wind directions are frequently from the south-southwest (that is, wind blowing from the receptor towards the project site and rarely (northwesterly) from the project site towards the receptor).

To ensure the proposed project's health impacts are less than significant, this Initial Study implements the enhanced exhaust emissions reduction measures as Mitigation Measure AQ-4.

Implementation of Mitigation Measure AQ-4 would ensure the maximum cancer risk from project construction for a residential-adult and child receptors would be below 10 in a million. Thus, the cancer risk due to construction activities would be below the BAAQMD threshold of 10 per million and would be ***less than significant with mitigation***.

e) The BAAQMD's significance criteria for odors are subjective and are based on the number of odor complaints generated by a project. Generally, the BAAQMD considers any project with the potential to frequently expose members of the public to objectionable odors to cause a significant impact. With respect to the proposed project, diesel-fueled construction equipment exhaust would generate some odors. However, these emissions typically dissipate quickly and would be unlikely to affect a substantial number of people. Post construction odors would be minimal. Therefore, odor impacts associated with construction and operation of the proposed project would be ***less than significant***.

Mitigation Measures

Mitigation Measure AQ-1: The construction contractor shall reduce construction-related air pollutant emissions by implementing BAAQMD's basic fugitive dust control measures, including:

- All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.
- All haul trucks transporting soil, sand, or other loose material off site shall be covered.
- All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
- All vehicle speeds on unpaved roads shall be limited to 15 miles per hour.
- All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
- A publicly visible sign shall be posted with the telephone number and person to contact at the Site Superintendent regarding dust complaints. This person shall respond and take corrective action with 48 hours. The Air District's phone number and Lead Agency contact information shall also be visible to ensure compliance with applicable regulations.

Mitigation Measure AQ-2:. The construction contractor shall implement the following measures during construction to reduce construction-related exhaust emissions:

- Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to five minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations). Clear signage shall be provided for construction workers at all access points.
- All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.

Mitigation Measure AQ-3: Emissions of volatile organic compounds (VOC) due to the use of architectural coatings are regulated by the limits contained in Regulation 8: Organic Compounds, Rule 3: Architectural Coatings (Rule 8-3). The VOC architectural coating limits, which were effective on January 1, 2011, was projected to result in a 32 percent reduction of VOC emissions in the Bay Area associated with architectural coating applications. The project contractor shall use paints and solvents with a VOC content of 100 grams per liter or less for interior and 150 grams per liter or less for exterior surfaces.

Mitigation Measure AQ-4: The construction contractor shall implement the following measures during construction to further reduce construction-related exhaust emissions:

All off-road equipment greater than 25 horsepower (hp) and operating for more than 20 total hours over the entire duration of construction activities shall meet the following requirements:

1. Where access to alternative sources of power are available, portable diesel engines shall be prohibited; and
2. All off-road equipment shall have:
    a. Engines that meet or exceed either USEPA or CARB Tier 2 off-road emission standards, and;
    b. Engines that are retrofitted with a CARB Level 2 Verified Diesel Emissions Control Strategy (VDECS). Acceptable options for reducing emissions include the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, add-on devices such as particulate filters, and/or other options as such are available.

IV. Biological Resources

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?		X		
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?			X	
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?		X		
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?			X	
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?			X	
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?				X

Background Information

A Biological Resource Analysis (BRA) was prepared by Monk & Associates (Monk & Associates 2018a) that provides a description of existing biological resources on the project site and identifies potentially significant impacts that could occur to sensitive biological resources from the construction

of the proposed project site. Monk & Associates also conducted a jurisdictional wetland delineation in 2016, which was verified by the Army Corps of Engineers (Corps) on May 16, 2018 (USACE 2018). A wetland mitigation plan was also prepared (Monk & Associates 2018b) that when implemented would compensate for impacts to waters of the State that will occur from development of the proposed project. The full reports are on-file at the City of American Canyon. Pacific Biology conducted a site visit on August 10, 2018 to confirm the biological conditions of the project site as described in the biological documentation prepared for the project.

The approximately 15-acre project site is bordered to the east by Jungle Paintball, a 40-acre paintball park, and a large eucalyptus grove with scattered mobile homes. Further to the east is Oat Hill, a geographically prominent hill west of Highway 29. A mix of open space and large warehouses occurs north of the project site. The American Canyon Wastewater Treatment Plant and associated treatment ponds are located west of the project site. The Napa River and associated marsh habitat occurs greater than 300 feet west of the project site, and these habitats are separated from the site by a dense eucalyptus grove. Clark Ranch, open space owned by the City of American Canyon, borders the project site to the south, and Eucalyptus Drive and a residential subdivision are located further to the south.

The project site is dominated by ruderal vegetation including stinkwort (*Dittrichia graveolens*), Italian rye grass (*Festuca perennis*), ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), slender wild oat (*Avena barbata*), common vetch (*Vicia sativa*), red-stem filaree (*Erodium cicutarium*), bull thistle (*Cirsium vulgare*), Italian thistle (*Carduus pycnocephalus pycnocephalus*), bristly ox-tongue (*Helminthotheca echioides*), California burclover (*Medicago polymorpha*), and cut-leaf geranium (*Geranium dissectum*). Coyote brush (*Baccharis pilularis*), a native plant that responds to land disturbances, such as have occurred on the project site, is also common on the site.

Typically, ruderal communities provide habitat for those animal species adapted to humans. Examples of animals associated with these communities include wild turkey (*Meleagris gallopavo*), house finch (*Haemorhous mexicanus*), black phoebe (*Sayornis nigricans*), American crow (*Corvus brachyrhynchos*), mourning dove (*Zenaida macroura*), California ground squirrel (*Otospermophilus beecheyi*), California meadow vole (*Microtus californicus*), and Botta's pocket gopher (*Thomomys bottae*), all of which have been observed on the project site by Monk & Associates.

Various species of *Eucalyptus* trees have been planted in California for windbreaks, wood, pulp, and other uses. These areas constitute a plantation community (Holland and Keil 1995) and are usually composed of a single species in a very dense planting. On the project site, blue gum eucalyptus trees (*Eucalyptus globulus*) were once abundant throughout; these trees are now restricted to the southern project site boundary where they grow in a linear row, and a dense grow of eucalyptus borders the site to the west. Blue gum trees tower over all of the species native to the area. The trees shade the ground and litter the soil surface with fallen branches, leaves, fruits, and bark.

Rainwater passing through the leaves and branches carry dissolved chemicals that add to the substances leached from the fallen litter producing a significant allelopathic (growth inhibiting) effect on understory vegetation. The net result is that very few other plant species are able to grow around or under the blue gum trees. Consequently, the understory is often sparse if present at all. Thus, in areas where blue gum trees have been planted, they have almost completely replaced the native vegetation (Holland and Keil 1995). Red-shouldered hawk (*Buteo lineatus*), tree swallows (*Tachycineta bicolor*), Nuttall's woodpecker (*Picoides nuttallii*), and northern flicker (*Colaptes auratus*), among others, likely nest in the eucalyptus trees on the or bordering the project site.

There is a small (0.02 acre) seasonal wetland in the southeast corner of the project site. This isolated seasonal wetland is dominated by Italian rye grass, English plantain (*Plantago lanceolata*), Mediterranean grass, curly dock (*Rumex crispus*) and bristly ox-tongue; all of these plants are non-native species that are just as readily found in upland habitats as they are in wetland areas. Seasonal wetlands provide a temporary water source for amphibians such as the common Sierran tree frog (*Pseudacris sierra*) and California toad (*Anaxyrus boreas halophilus*) to mate, lay eggs, and forage through the winter and early spring months. Seasonal wetlands also provide drinking water for local wildlife such as the raccoon (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), and striped skunk (*Mephitis mephitis*).

a) Special-status plant species documented by the California Natural Diversity Database (CNDDB 2018) within approximately 3 miles of the project site are shown in Figure 8. No special-status plants have been mapped on or adjacent to the project site. However, according to the CDFW's CNDDB and CNPS' rare plant *Inventory*, a total of nine special-status plant species are known to occur in the region of the project site (Monk & Associates 2018a). Most of these plants occur in specialized habitats such as marshes, foothill grasslands, and vernal pools, none of which occur onsite. In the recent past, blue gum eucalyptus trees covered the majority of the project site dating back for several decades; these trees emit allelopathic (growth inhibiting) chemicals from their leaves, acorns and bark that prevent other plants from growing under them. Once bark and leaf debris collects on the ground beneath the trees, nearly nothing will grow there. Based on the negative findings during the multiple surveys conducted on this site in 2006, 2011, 2012, 2017 and 2018, special-status plants are not likely to be found onsite (Monk & Associates 2018a). Therefore, impacts to special-status plants would be less-than-significant.

   Special-status wildlife species documented by the California Natural Diversity Database (CNDDB 2018) within approximately 3 miles of the project site are shown in Figure 8. No special-status wildlife records have been mapped on or adjacent to the project site. However, a total of 16 special-status wildlife species are known to occur in the region of the project site (Monk & Associates 2018a). Due to the disturbed nature of the project site, and its past history as a eucalyptus grove, there is a very low likelihood of special-status species

occurring onsite (Monk & Associates 2018a). However, due to the sensitivity of four of the special-status wildlife species known to occur in the area and/or potential habitat on the site, these species are further discussed below. Additional information regarding these special-status species, as well as species known from the region but for which no suitable habitat occurs on or in areas to be impacted by the proposed project, is provided in Table 4 from the Biological Resource Analysis prepared for the project site by Monk & Associates (2018a); (included as Appendix B).

California red-legged frog (*Rana draytonii*) is federally listed as threatened and is a state species of special concern. The project site is located outside USFWS designated critical habitat for the species, but designated critical habitat occurs approximately 1.7 miles to the east. In the American Canyon/Napa area, there are no records for the California red-legged frog west of State Route 29 where the project site is located. The closest known California red-legged frog occurrence is 1.4 miles east of the project site (CNDDB Occurrence No. 896). The California red-legged frog at this location was found in a dry cement tank adjacent to a large quarry pond that supported bullfrogs (*Lithobates catesbeiana*). State Route 29 is located between this closest California red-legged frog record and the project site and constitutes an effective geographic barrier to overland California red-legged frog movements to/from the known record location and other extant California red-legged frog populations to the project site (Monk & Associates 2018a). There is no hydrologic connectivity over any undeveloped migration route between the known records for this species and the project site. Finally, the project site does not provide suitable habitat for the California red-legged frog. There are no drainages onsite and the isolated seasonal wetland habitat onsite does not hold water long enough to support California red-legged frogs, their eggs or their larvae (Monk & Associates 2018a). Based on all the available information, it can be concluded that the project site does not provide suitable habitat for the California red-legged frog. Similarly, the surrounding parcels with dense eucalyptus groves do not provide suitable habitat. Owing to the highly disturbed conditions on the project site due to prior grading and tree removal activities and the other factors discussed above, this species is not expected to occur on the project site. Therefore, impacts to California red-legged frog would be ***less-than-significant***.

Western burrowing owl (*Athene cunicularia*) is a California species of special concern. Its nest, eggs, and young are also protected under California Fish and Game Code (§3503, §3503.5, and §3800). The burrowing owl is also protected from direct take under the Migratory Bird Treaty Act (50 CFR 10.13). The closest CNDDB record was documented 2.5 miles southeast of the project site in an area that has since been developed (CNDDB Occurrence No. 109). The project site was severely disturbed during the eucalyptus removal in 2012; thus, ground squirrel burrows are few and of recent origin (Monk & Associates 2018a). The mobility of the western burrowing owl enables the species to colonize the recent burrows. Monk & Associates (2018b) did not observe western burrowing owls or any indirect

evidence that burrowing owls are using or residing on the project site during any of the site surveys. However, the project site provides marginal nesting habitat for the western burrowing owl. Should burrowing owls occur on or near the project site, nesting activities and/or individual owls could be harmed by construction activities. Therefore, impacts to western burrowing owl would be potentially significant. Mitigation Measure BIO-1 would be implemented to reduce this impact to a ***less-than-significant*** level.

Swainson's hawk (*Buteo swainsoni*) is a state listed threatened species afforded protection pursuant to the California Endangered Species Act (CESA). While it has no special federal status, it is protected from direct take under the Federal Migratory Bird Treaty Act of 1918 (16 U.S.C. 703-711). Swainson's hawks, their nests, eggs, and young are also protected under California Fish and Game Code (§3503, §3503.5, §3513, and §3800). The closest known record for nesting Swainson's hawk is 2.6 miles north of the project site (CNDDB Occurrence No. 2744). No Swainson's hawk nests have been observed on the site or offsite in the vicinity of the project site during M&A's project site surveys. However, the nesting population appears to be increasing throughout its nesting range in northern California (recent CNDDB records and G. Monk general observations) and the eucalyptus trees growing along the southern project site border and adjacent to the project site provide suitable nesting habitat. Therefore, there is the possibility that Swainson's hawks could nest near the project site in future years and that nesting could be disturbed by construction activities. Therefore, impacts to nesting Swainson's hawks would be potentially significant. The loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat; there are extensive foraging opportunities around the nesting location 2.6 miles north of the site and between this nesting location and the project site; and as the project site is essentially surrounded by eucalyptus forest, it is not a foraging destination which would likely attract foraging Swainson's hawks. Although it is unlikely that the proposed project would impact nesting Swainson's hawk, Mitigation Measure BIO-2 (preconstruction surveys and buffers) is included to ensure that any potential impacts are reduced to a ***less-than-significant*** level.

Northern harrier (*Circus cyaneus*) is a California species of special concern. The closest CNDDB record was documented 2.7 miles west of the project site (CNDDB Occurrence No. 29). The project site was severely disturbed during the eucalyptus removal in 2012. However, the project site provides marginal nesting habitat for the northern harrier (Monk & Associates 2018a). Should northern harrier nest on or near the project site, nesting activities could be disrupted by construction activities. Therefore, impacts to northern harrier would be potentially significant. The loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat. Mitigation Measure BIO-3

would be implemented to reduce potential impacts to nesting northern harriers to a ***less-than-significant*** level.

White-tailed kite (*Elanus leucurus*) is a state Fully Protected species. It inhabits grasslands, agriculture fields, oak woodlands, savanna and riparian habitats in rural and urban areas. The species typically nests in trees surrounded by open foraging habitat. The trees on and bordering the project site provide potential nesting habitat. Should white-tailed kite nest on or near the project site, nesting activities could be disrupted by construction activities. Therefore, impacts to white-tailed kite would be potentially significant. The loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat. Mitigation Measure BIO-3 would be implemented to reduce potential impacts to nesting white-tailed kites to a ***less-than-significant*** level.

In addition to the above special-status bird species, construction of the proposed project has the potential to affect species protected by the federal Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code (§3503), such as tree or ground nesting raptors or nesting passerine birds. Specific surveys for nesting raptors have not been conducted. In the absence of survey results indicating otherwise, it is conservatively assumed that implementation of the proposed project could cause nest abandonment and death of eggs or young. Passerine birds frequently change nesting locations from year to year and thus, past nesting histories are not necessarily indicative of future nesting activities. Similar to the raptors, construction activities could disturb or directly affect passerine birds, their eggs, and/or young. Therefore, impacts to nesting raptors and passerines are potentially significant, and Mitigation Measures BIO-3 and BIO-4 would reduce the impact to a ***less-than-significant*** level.

b) There is no riparian habitat at the project site, and no Streambed Alteration Agreement from CDFW would be necessary. Additionally, there are no sensitive plant communities on the project site. The project site is separated from the Napa River and associated marsh habitats by greater than 300 feet and by a dense eucalyptus grove. Therefore, related impacts are ***less than significant***. Wetlands are discussed below under c).

c) A formal wetland delineation was performed by Monk & Associates in in 2016, which was verified by the Army Corps of Engineers (Corps) on May 16, 2018. Based on the verified wetland delineation, the 0.02-acre seasonal wetland on the project site is “isolated” and is not under the jurisdiction of the Corps. However, this “isolated” wetland is considered a “Waters of the State” and is under the jurisdiction of the Regional Water Quality Control Board (RWQCB). The proposed project will result in impacts to the 0.02-acre of “isolated” wetlands (waters of the State) regulated by the RWQCB pursuant to the Porter-Cologne Water Quality Control Act. Impacts to “waters of the State” from the proposed project would be regarded

as a significant impact**.** Mitigation Measure BIO-5 would be implemented to reduce this impact to a ***less-than-significant*** level.

d) Wildlife corridors are linear and/or regional habitats that provide connectivity to other natural vegetation communities within a landscape fractured by urbanization and other development. Wildlife corridors have several functions: 1) they provide avenues along which wide-ranging animals can travel, migrate, and breed, allowing genetic interchange to occur; 2) populations can move in response to environmental changes and natural disasters; and 3) individuals can recolonize habitats from which populations have been locally extirpated (Beier and Loe 1992). All three of these functions can be met if both regional and local wildlife corridors are accessible to wildlife. Regional wildlife corridors provide foraging, breeding, and retreat areas for migrating, dispersing, immigrating, and emigrating wildlife populations. Local wildlife corridors also provide access routes to food, cover, and water resources within restricted habitats.

The proposed project will not substantially interfere with the movement of native wildlife. The project site has a history of disturbance associated with eucalyptus tree removal in 2012, and continued disturbance associated with the paint ball facility located immediately to the east. In addition, Clark Ranch to the south has frequent activity associated with a horse-riding facility, and warehouses and other development occur north of the project site. The eucalyptus grove and the marshes associated with the Napa River to the west of the project site provide a more valuable wildlife corridor for terrestrial wildlife, and these areas would not be impacted by the proposed project. Therefore, the proposed project would not substantially affect wildlife movement and related impacts would be ***less than significant***

e) The mature eucalyptus trees along the southern and western project boundaries will remain. In the project site's interior there are no mature trees, but there are a few small stump-sprouting eucalyptus trees that will be removed for the project. Since these are essentially stumps that have some green foliage, they do not meet the definition of a mature tree that is protected pursuant to the City of American Canyon tree ordinance (Monk & Associates 2018a); therefore, no tree replacement should be required and related impacts are ***less than significant.***

f) There are no Habitat Conservation Plans, Natural Community Conservation Plans, or other habitat conservation plans that include the proposed project site. Therefore, the project would have ***no impact*** to an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Mitigation Measures

Mitigation Measure BIO-1: A preconstruction survey for burrowing owls shall be conducted 14 days prior or less to initiating ground disturbance. As burrowing owls may recolonize a site after only a few days, time lapses between project activities trigger subsequent take avoidance surveys including but not limited to a final survey conducted within 24 hours prior to ground disturbance to ensure absence. If no owls are found during these surveys, no further actions to protect burrowing owl would be necessary.

1) Burrowing owl surveys shall be conducted by walking the entire project site. Pedestrian survey transects shall be spaced to allow 100 percent visual coverage of the ground surface. The distance between transect center lines shall be seven meters to 20 meters and should be reduced to account for differences in terrain, vegetation density, and ground surface visibility. Poor weather may affect the surveyor's ability to detect burrowing owls thus, avoid conducting surveys when wind speed is greater than 20 kilometers per hour and there is precipitation or dense fog. To avoid impacts to owls from surveyors, owls and/or occupied burrows shall be avoided by a minimum of 50 meters (approximately 160 feet) wherever practical to avoid flushing occupied burrows. Disturbance to occupied burrows shall be avoided during all seasons.

2) If burrowing owls are detected on the site, the following restricted activity dates and setback distances recommended per CDFW's Staff Report (2012) shall be implemented:

   - From April 1 through October 15, low disturbance and medium disturbance activities shall have a 200-meter buffer while high disturbance activities should have a 500-meter buffer from occupied nests.
   - From October 16 through March 31, low disturbance activities shall have a 50-meter buffer, medium disturbance activities shall have a 100-meter buffer, and high disturbance activities should have a 500-meter buffer from occupied nests.
   - No earth-moving activities or other disturbance should occur within the aforementioned buffer zones of occupied burrows. These buffer zones should be fenced as well. If burrowing owls are found in the project area, a qualified biologist shall delineate the extent of burrowing owl habitat on the site.

3) If burrowing owls are present outside of the nesting season, burrowing owls may be passively relocated from the project site using CDFW-approved methods so that construction can proceed. Any required passive relocation of burrowing owls would require CDFW approval.

Mitigation Measure BIO-2: Pre-construction surveys for nesting Swainson's hawks shall be conducted for a quarter-mile radius around all project activities and shall be completed for at least two survey periods immediately prior to a project's initiation. The surveys shall be conducted in accordance with CDFW's "Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" (CDFG 2000), which identifies different survey windows throughout the pre-nesting and nesting season (ranging from January 1 through July 30/post-fledging) that have different survey methodologies and requirements.

If Swainson's hawks are found to be nesting on the project site or within a ¼-mile of the project site, consultation with CDFW shall be required. The size of the nest protection buffer shall be determined during consultation with CDFW but at a minimum there will be a 300-foot non-disturbance buffer around the nest site.

Mitigation Measure BIO-3: To ensure that impacts to tree or ground nesting raptors are avoided, the following mitigation measures shall be implemented:

1) In order to avoid impacts to nesting raptors, a preconstruction nesting survey shall be conducted by a qualified raptor biologist prior to commencing with earth-moving or construction work if this work would commence between February 1st and August 31st. The survey shall be conducted within the 14-day period prior to site disturbance. The raptor nesting surveys shall include examination of all trees and ruderal habitat or grassland within 200 feet of the project site.

2) If nesting raptors are identified during the surveys, the dripline of the nest tree or ground-nesting site shall be fenced with orange construction fencing (provided the nest site is on the project site), and a 200-foot radius around the nest tree or nest site shall be staked with orange construction fencing. If the tree or nest site is located off the project site, then the buffer shall be demarcated per above where the buffer occurs on the project site. The size of the buffer may be altered if a qualified raptor biologist conducts behavioral observations and determines the nesting raptors are well acclimated to disturbance. If this occurs, the raptor biologist shall prescribe a modified buffer that allows sufficient room to prevent undue disturbance/harassment to the nesting raptors. No construction or earth-moving activity shall occur within the established buffer until it is determined by a qualified raptor biologist that the young have fledged (that is, left the nest) and have attained sufficient flight skills to avoid project construction zones. This typically occurs by August 1st. This date may be earlier or later, and shall be determined by a qualified raptor biologist. If a qualified biologist is not hired to watch the nesting raptors then the buffers shall be maintained

in place through the month of August and work within the buffer can commence on September 1st.

3) If the preconstruction nesting survey identifies a large stick or other type of raptor nest that appears inactive at the time of the survey, but there are territorial raptors evident in the nest site vicinity, a protection buffer (as described above) shall be established around the potential nesting tree until the qualified raptor biologist determines that the nest is not being used. In the absence of conclusive observations indicating the nest site is not being used, the buffer shall remain in place until a second follow-up nesting survey can be conducted to determine the status of the nest and eliminate the possibility that the nest is utilized by a late-spring nesting raptor (for example, red-tailed hawk). This second survey shall be conducted even if construction has commenced. If during the follow-up late season nesting survey a nesting raptor is identified utilizing the nest, the protection buffer shall remain until it is determined by a qualified raptor biologist that the young have fledged and have attained sufficient flight skills to avoid project construction zones. If the nest remains inactive, the protection buffer can be removed and construction and earth-moving activities can proceed unrestrained.

Mitigation Measure BIO-4: To ensure that impacts to nesting passerine birds are avoided, a nesting survey shall be conducted within 14 days prior to commencing construction/ grading or tree removal activities if this work would commence between February 1 and September 1. If common passerine birds or special-status passerine birds are identified nesting on the project site, a non-disturbance buffer of 75 feet shall be established or as otherwise prescribed by a qualified ornithologist. The buffer shall be demarcated with orange construction fencing. Disturbance within the buffer shall be postponed until it is determined by a qualified ornithologist that the young have fledged and have attained sufficient flight skills to leave the area or that the nesting cycle has otherwise completed.

Typically, most passerine birds in the region of the project site are expected to complete nesting by August 1st. However, many species can complete nesting by the end of June or in early to mid-July, and some species can complete nesting later in August. Regardless, nesting buffers shall be maintained until September 1 unless a qualified ornithologist determines that young have fledged and are independent of their nests at an earlier date. If buffers are removed prior to September 1st, the qualified biologist conducting the nesting surveys should prepare a report that provides details about the nesting outcome and the removal of buffers. This report should be submitted to the City of American Canyon Planning Department prior to the time that nest protection buffers are removed if the date is before September 1st.

Mitigation Measure BIO-5: Based on the Corps verified map, 0.02-acre of isolated seasonal wetland will be impacted by the proposed project. The RWQCB has a Water Quality Order No. 2004-004-DWQ (General WDRs), *Standard General Waste Discharge Requirements for Dredged or Fill Discharges to Waters Deemed by the U.S. Army Corps of Engineers to be Outside of Federal Jurisdiction*. This project will apply for coverage under Water Quality Order No. 2004-0004-DWQ for impacts to isolated waters on the project site. The requirements stipulated in this permit will become conditions of project approval.

The applicant is proposing to mitigate for project-related impacts to waters of the State at a 2:1 mitigation ratio as described in the *Wetland Mitigation Plan, SDF Commerce 330 Distribution Center, City of American Canyon, California* (Monk & Associates 2018b). The applicant will create approximately 0.05-acre of wetland to mitigate impacts to approximately 0.02-acre of waters of the State associated with construction of the proposed project. The applicant proposes to mitigate impacts to RWQCB jurisdictional seasonal wetlands via creation of seasonal wetland on a mitigation property that will be preserved in perpetuity via deed restriction. The mitigation wetlands shall be created, monitored, and evaluated for success as described in the wetland mitigation plan. The mitigation and monitoring plan will be submitted to the RWQCB for approval prior to project construction.

V. Cultural Resources

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Cause a substantial adverse change in the significance of a historic resource as defined in Section 15064.5?		X		
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?		X		
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?			X	
d) Disturb any human remains, including those interred outside of formal cemeteries?		X		

a) A cultural resources investigation of the project area was undertaken by Solano Archaeological Services (SAS) which consisted of a record search conducted through the Northwest Information Center (NWIC) of the California Historical Resources Information System, a field survey, outreach to the Native American community, and study documentation. The NWIC research indicates that sixteen previous cultural resources investigations were conducted within or in the vicinity of the project area between 1975, and 2009. None of these studies or other research identified any prehistoric or historic-era sites, features, or artifacts within the project area. One site (CA-NAP-727H), a historic period ranch complex, was identified approximately 200 meters south of the project area. Additional archival research and a field survey conducted by SAS also did not identify the locations of any potential cultural or historical resources in the project area.

The Native American Heritage Commission (NAHC) conducted a search of Sacred Lands File the results of which indicate that no Native American historical resources or other culturally sensitive properties are known to be present within or near the project area. Outreach to tribal organizations and individual representatives per a contacts list provided by the NAHC also did not result in the identification of properties or locations possessing cultural significance to the Native American community.

Archival research, outreach to the Native American community, and a field survey did not identify the present of any historical resources within the project area. However, field surveys cannot always identify the presence of sub-surface cultural remains that could be significant

per CEQA criteria. As a result, presently unidentified historical resources could be present within the project area. Mitigation Measure CUL-1, below, would reduce any impacts to presently unidentified historical resources to a ***less-than-significant*** level.

b) As described in a), above, an NWIC record search, archival research, NAHC and Native American community input, and a field survey did not identify any prehistoric or historic-era cultural sites, features, artifacts, or culturally significant properties within the project area. However, there remains a possibility that project ground-disturbing activities could uncover evidence of Native American or early historic period use and/or occupation of the project area. Mitigation Measure CUL-1, below, would reduce any impacts to such resources to a ***less-than-significant*** level.

c) A review of the University of California Museum of Paleontology (UCMP) on-line database indicates that very few paleontological specimens have been collected from Napa County. Only one specimen, an example of *Magnoliposida* (a flowering plant) was found in the general vicinity (City of Napa) approximately six miles north of the project area (UCMP 2018). In addition, according to the Geologic Map of the Cuttings Wharf 7.5' Quadrangle (Bezore et al. 2002), the project area is located solely within late Quaternary alluvial fan deposits. Quaternary alluvium is often devoid of fossil remains due to its high-energy depositional regime, and the subaerial nature of that deposition which generally precludes rapid burial. Organic remains are left exposed to the elements and degrade rapidly before they can be buried. Given the lack of previous paleontological discoveries in and near the project area and the low sensitivity of the landform, it is unlikely that significant paleontological remains or unique geological features would be encountered during project ground-disturbing activities. Therefore, this impact would be ***less than significant*.**

d) Archival research, Native American community outreach, an NWIC record search, and a field survey did result in the documentation of any known human remains within the project area However, the possibility exists that subsurface construction activities may encounter previously undiscovered human remains. Mitigation Measure CUL-2 would reduce this impact to a ***less-than-significant*** level.

Mitigation Measures

***Mitigation Measure CUL-1*:** If potentially significant historic resources are encountered during subsurface excavation activities for the project area, all construction activities within a 100-foot radius of the resource shall cease until a qualified archaeologist determines whether the resource requires further study. The applicant shall include a standard inadvertent discovery clause in every construction contract to inform contractors of this requirement. Any previously undiscovered resources found during construction shall be recorded on appropriate California Department of Parks and Recreation (DPR) forms and evaluated for significance

in terms of California Environmental Quality Act criteria by a qualified archaeologist. Potentially significant cultural resources consist of but are not limited to stone, bone, fossils, wood, or shell artifacts or features, including hearths, structural remains, or historic dumpsites. If the resource is determined to be significant under CEQA (i.e., a "historical resource") the City and a qualified archaeologist shall determine whether preservation in place is feasible. Such preservation in place is the preferred mitigation. If such preservation is infeasible, the qualified archaeologist shall prepare and implement a research design and archaeological data recovery plan for the resource. The archaeologist shall also conduct appropriate technical analyses, prepare a comprehensive written report and file it with the appropriate information center (California Historical Resources Information System), and provide for the permanent curation of the recovered materials.

***Mitigation Measure CUL-2*:** If previously unknown human remains are encountered during construction activities, Section 7050.5 of the California Health and Safety Code applies, and the following procedures shall be followed:

In the event of an accidental discovery or recognition of any human remains, Public Resource Code Section 5097.98 must be followed. Once project-related ground disturbance begins and if there is accidental discovery of human remains, the following steps shall be taken:

- There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the Napa County Coroner's Office is contacted to determine if the remains are Native American and if an investigation into cause of death is required. If the coroner determines the remains are Native American, the coroner shall contact the NAHC within 24 hours, and the NAHC shall identify the person or persons it believes to be the most likely descendant (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98.

VI. Geology and Soils

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to Division of Mines and Geology Special Publication 42.)				X
ii) Strong seismic ground shaking?		X		
iii) Seismic-related ground failure, including liquefaction?			X	
iv) Landslides?			X	
b) Result in substantial soil erosion or the loss of topsoil?		X		
c) Be located in a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?		X		
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?		X		
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?				X

A Geotechnical Investigation of the project site was prepared by Krazan and Associates, Inc.[2] (Krazan 2018). Krazan's geologists performed a geotechnical reconnaissance of the site and explored the subsurface conditions by drilling 26 borings to depths ranging from about 10 to 50 feet, followed by laboratory testing. Results of the Krazan study are summarized in responses to specific checklist questions below. The full report is available for review at the City Community Development Department.

a.i, ii, iii, iv) The project site is located in a seismically active region associated with the San Andreas Fault System. It is in close proximity to several major faults including the West Napa, Green Valley, Hayward-Rogers Creek, Mount Diablo Thrust, Calaveras, and San Andreas Faults (see Table GEO-1). Data presented by the Working Group on California Earthquake Probabilities (2008) estimates the chance of one or more large earthquakes (Magnitude 6.7 or greater) in the San Francisco Bay region between 2007 and 2036 to be approximately 63 percent. Therefore, future seismic shaking should be anticipated at the site. It would be necessary to design and construct the proposed warehouse and parking lot in strict adherence with current standards for earthquake-resistant construction.

Although the site is in close proximity to several faults, it is not within the mapped California Earthquake Fault Zone or Alquist-Priolo Earthquake Fault Zone (Krazan 2018). It is approximately 3,200 feet east of the West Napa fault and 600 feet east of the California Earthquake Fault Zone for the West Napa Fault zone. Therefore, the risk of fault rupture at the site is low.

Table GEO-1
Active Fault Proximity to the Project Site

Fault	Direction from Site	Distance from Site (miles)
San Andreas	W	30
Hayward-Rogers Creek	W	11
Mt. Diablo Thrust	S	24
Green Valley	E	8
West Napa	W	0.8
Calaveras	NW	29

Source: Krazan & Associates, 2018

[2] Krazan & Associates, Inc. Geotechnical Engineering Investigation, Proposed SDG Commerce 330 Distribution Center, Commerce Boulevard, American Canyon, California. April 20, 2018.

For the West Napa Fault, the maximum credible earthquake on this fault is approximately 6.5 moment magnitude[3] based on empirical data and the length of the fault. The 2014 South Napa earthquake was located to the south of Napa and to the northwest of American Canyon on the West Napa Fault. It had a magnitude of 6.0 on the moment magnitude scale, and with a maximum Mercalli intensity of VIII (Severe); the event was the largest in the San Francisco Bay Area since the 1989 Loma Prieta earthquake.

Liquefaction is a 'liquefying' of the ground under strong seismic shaking. Liquefaction occurs in water-saturated, loose, granular soils (such as sandy soils). Because of active faults near the site and high acceleration the site may be subject to liquefaction hazards. Krazan evaluated the site's liquefaction potential and determined that soils above a depth of 5 feet below the ground surface have no liquefaction potential because of an absence of groundwater; soils between 5 and 10 feet below the ground surface were determined to have a low to very low liquefaction potential. Total and differential seismic-induced ground settlement were calculated not to exceed 1 inch and 0.75-inch, respectively. There are three potential consequences of liquefaction: bearing capacity failure, lateral spreading toward a free face (e.g. riverbank) and settlement. Bearing capacity failure is sudden and extreme settlement of foundations that typically occurs when the liquefied layer is relatively close (typically within two times the footing width, depending on the loads) to the bottom of the foundation. This impact can be reduced to *a* ***less-than-significant*** level by implementing the recommendations of the Krazan report, per Mitigation Measure GEO-1 (Krazan 2018).

Lateral spreading (or lurching) is another type of ground failure that is generally caused by liquefaction. It involves movement of large surficial blocks of soil as a result of subsurface liquefaction. Lateral spreading can occur where continuous layers of liquefiable soil extend to a free face, such as a creek bank. There are no significant free faces in the vicinity of the site. Therefore, the potential for liquefaction-induced lateral spreading at the site is low.

Impacts associated with seismic shaking and associated ground failure issues can be reduced to a ***less-than-significant*** level by proper engineering and construction in accordance with the provisions of the Uniform Building Code and with other site stabilization, drainage, and, foundation design methods, as detailed in the Krazan report.

The project site is nearly flat, so landslide hazards would be minimal.

[3] "The **moment magnitude scale** (a successor to the Richter scale), is used by seismologists to compare the energy released by earthquakes. The constants in the equation are chosen so that estimates of moment magnitude roughly agree with estimates using other scales such as the Richter magnitude scale. One advantage of the moment magnitude scale is that, unlike other magnitude scales, it does not saturate at the upper end. For this reason, moment magnitude is now the most often used estimate of large earthquake magnitudes. The USGS does not use this scale for earthquakes with a magnitude of less than 3.5." (Wikipedia, 2005)

b) The proposed project would require site stripping, grading and excavation/re-compaction of soils, therefore, construction of the proposed project would result in soil erosion or loss of topsoil. All construction practices would be in accordance with the State of California UBC Title 24, 2013 and measures to control soil erosion found in the general construction activities non-point source storm-water permit (See Hydrology section of this IS). The RWQCB requires that Best Management Practices be incorporated into projects to reduce wind and water erosion (see Mitigation Measure GEO-2). This impact would be reduced to ***less than significant with mitigation***.

c) See responses to items aii, iii, and iv, above.

d) The upper soils on the site are predominantly silty sandy clay, silty clay, or sandy clay. These soils appear to have a moderate swell potential. Mitigation Measure GEO-3, below, would reduce hazards associated with potentially expansive soils to a level that is ***less than significant***.

e) The project would not use septic tanks or other on-site land disposal systems. ***No impac***t would occur.

Mitigation Measures

Mitigation Measure GEO-1: The applicant shall comply with all of the site preparation and foundation/building design recommendations in the Krazan & Associates Geotechnical Engineering Investigation for the site (Krazan 2018). The applicant's geotechnical consultant shall review and approve all geotechnical aspects of the project construction and grading plans (i.e., site preparation and grading, site drainage improvements, and design parameters for foundations, retaining walls, street pavement, and driveway) to ensure that their recommendations have been properly incorporated. The results of the plan review shall be summarized by the applicant's geotechnical engineer in a letter to be submitted to the City Engineer and Building Official for review and approval prior to the issuance of grading, encroachment, and building permits.

Mitigation Measure GEO-2: Prior to issuance of building permits and site grading, the applicant/developer shall submit to the Public Works Department a Stormwater Pollution Prevention Plan using Best Management Practices to limit erosion and stormwater pollution during construction of the project. Because the project is constructed in phases, the project developer shall ensure that more permanent measures such as landscaping are used to prevent soil erosion. Measures would include but not be limited to:

- Hydroseeding and/or establishment of appropriate plant materials/landscaping
- Placement of straw wattles along slope contours and drainages
- Lining of drop inlets with filter fabric/geotextile

- o Establishment of a single destination “wash-out” for construction subcontractors
- o Use of siltation fences
- o Use of sediment basins

Mitigation Measure GEO-3: **T**he applicant shall comply with all recommendations in the Krazan & Associates Geotechnical Engineering Investigation for the site (Krazan 2018). Krazan recommends that the upper 24 inches of soils within the slab-on-grade foundation site and adjacent flatwork areas consist of non-expansive engineered fill. Pads and pavement subgrades shall be treated to reduce the effects of soil expansion.

VII. Greenhouse Gas Emissions

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?			X	
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?			X	

The BAAQMD *CEQA Air Quality Guidelines* identify a project specific threshold of either 1,100 metric tons of carbon dioxide-equivalents[4] (CO_2e) per year or 4.6 metric tons of CO_2e per year per service population (i.e., the number of residents plus the number of employees associated with a new development) as resulting in a cumulatively considerable contribution of GHG emissions and a cumulatively significant impact. This analysis applies the 1,100 metric tons of CO_2e per year significance criterion.

a) The CalEEMod (Version 2016.3.2) model was used to quantify GHG emissions associated with proposed project construction activities (for informational purposes), as well as long-term operations associated with energy usage, area sources (landscape maintenance), water/wastewater conveyance, off-road mobile equipment (forklifts) and vehicles. Additional information regarding the GHG emissions setting and calculation details are found in Appendix A.

Estimated construction GHG emissions that would be associated with the proposed project are presented in Table GHG-1. The estimated construction GHG emissions are 652 metric tons of CO_2e (165 in 2018 and 487 in 2019). The BAAQMD does not recommend a threshold for GHG emissions from construction, so this analysis (similar to many other analyses prepared in the San Francisco Bay Area Air Basin) amortizes the construction emissions over the lifetime of the proposed project (30 years) and adds amortized construction emissions to the annual operational emissions. The 30-year amortized annual construction related GHG emissions would be approximately 22 metric tons of CO_2e.

[4] Because of the differential heat absorption potential of various GHGs, GHG emissions are frequently measured in "carbon dioxide-equivalents," which present a weighted average based on each gas's heat absorption (or "global warming") potential.

Table GHG-1 also provides the estimated operational GHG emissions that would be associated with the proposed project. The GHG construction (amortized) plus operational emissions would be approximately 892 metric tons of CO_2e per year, which is below the BAAQMD threshold of 1,100 metric tons and thus, would be a ***less-than significant*** impact.

Table GHG-1
Estimated Annual Construction Greenhouse Gas Emissions

Emission Source	GHG CO_2e Metric Tons Per Year
Construction (30-year amortized)	22
Operations	
Area	<1
Energy	154
Mobile	504
Off-Road Equipment (Forklifts)	211
Solid Waste	1
Water/Wastewater	<1
Total Emissions (including Construction)	**892**
BAAQMD Significance Threshold	1,100
Potentially Significant?	**No**

Source: CalEEMod Version 2016.3.2

b) The City of American Canyon has not adopted a Climate Action Plan regarding the mandatory reduction of GHG emissions. The applicable plan, policy or regulation adopted for the purpose of reducing the GHG emissions is Assembly Bill (AB) 32 and other State regulations with post-2020 goals such as Executive Order S-3-05 and B-30-15. The proposed project would result in a significant impact if it would be in conflict with AB 32 goals or post-2020 goals in other State regulations. The assumption is that AB 32 and associated regulations will be successful in reducing GHG emissions and reducing the cumulative GHG emissions Statewide to meet 2020 goals and post-2020 goals. The State has taken these measures, because no project individually could have a major impact (either positively or negatively) on the global concentration of GHGs. The proposed project has been reviewed relative to the AB 32 and associated regulations and it has been determined that the proposed project would not conflict with the goals of AB 32 and goals of other State regulations. Therefore, the proposed project would result in a ***less-than-significant*** impact.

VIII. Hazards and Hazardous Materials

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			X	
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?			X	
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?			X	
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?		X		
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?			X	
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing in the project area?				X
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			X	
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?			X	

A Phase I environmental site assessment (ESA) was conducted by ATC in June 2018 (ATC 2018). This ESA summarized the previous ESA's on the property conducted by Environmental Science Associates (October 2004), Kleinfelder (July 2005; December 2009), and ICES (April 2010). Those previous reports focused on the larger 106-acre Couch Property, of which the overall project site is 35.85 acres, with the proposed development site of about 15 acres. The ATC study also conducted additional site interviews, database reviews, and a new site reconnaissance. The results of that study are summarized in responses to the questions below.

a, b) Project construction activities may involve the use and transport of hazardous materials. These materials may include fuels, oils, mechanical fluids, and other chemicals used during construction. Transportation, storage, use, and disposal of hazardous materials during construction activities would be required to comply with applicable federal, state, and local statutes and regulations. Compliance would ensure that human health and the environment are not exposed to hazardous materials. In addition, the project applicant would be required to implement a Stormwater Pollution Prevention Plan and a Spill Prevention Plan during construction activities minimize the hazard of contamination from construction materials. Therefore***, no significant impacts*** would occur during construction activities.

The site was historically used for agricultural purposes and was occupied by a crop of planted Eucalyptus trees since sometime before circa late 1950's. Up until 2001 the site remained relatively unchanged. From 2001 until around 2012 the northwest corner of the site was used recreationally as a paintball field with the Eucalyptus trees remaining in place. In 2012 the property was cleared and grubbed of the Eucalyptus trees and shrubs.

The proposed project would not entail the large quantity storage or usage of hazardous materials on the site, other than cleaning supplies and materials that are typical of institutional land use. Small quantities of these hazardous materials would likely be used on site, including cleaning solvents (e.g., degreasers, paint thinners, and aerosol propellants), paints (both latex- and oil-based), acids and bases (which are included in many cleaners), disinfectants, chlorine (pool), and fertilizers. These substances would be containerized in small quantities within secure areas and would comply with all applicable storage, handling, usage, and disposal requirements. The potential risks posed by the use and storage of these hazardous materials are limited primarily to the immediate vicinity of the materials. With proper use they do not pose a health hazard to the people using them or occupants of the site. Any transport of these materials would be required to comply with various federal and state laws regarding hazardous materials transportation.

The City of American Canyon Fire Protection District and Napa County Sheriff would be the first responders in the event of a train derailment or spill. Fire and police are trained in how to address hazardous materials spills or fires and in emergency evacuation procedures in the event of a major emergency.

In summary, the proposed project would not create a significant hazard to the public or the environment from routine transport, use, or disposal of hazardous materials or through reasonably foreseeable upset and accident conditions. Impacts would be **less than significant.**

c) The proposed project site is located approximately 0.8 miles from Napa Junction Elementary School. Implementation of the proposed project would not result in emission of hazardous materials or wastes that would pose a serious health risk to school activities. There are no significant or extraordinary conditions associated with the project that would result in the release of hazardous or acutely hazardous materials, substances, or waste. A new elementary school is proposed across Commerce Blvd., approximately 0.25 miles southeast of the site. The project would not result in emission of hazardous materials or wastes that would pose a serious health risk to activities at that new school. Therefore, the impact would be ***less than significant*.**

d) Given the historical use of the property for agricultural purposes, potential concern is noted regarding the possible use of pesticides, herbicides and fertilizers. If these materials were stored, used and applied according to industry standards, they should not have significantly impacted the property. Evidence of large-scale use or disposal of pesticides, herbicides or fertilizers, such as mixing tanks, chemical storage areas, sprayers, etc. was not observed on the property. Evidence for the overuse of these materials, such as stressed vegetation or soil discoloration was not observed. The property has not been used for agricultural purposes since sometime prior to 2012. Therefore, ATC concluded that the historical use of the property for agricultural purposes and any potential residual pesticides, herbicides and fertilizers in the property soil does not represent a recognized environmental condition to the property (ATC 2018).

The eastern portion of the overall Couch property, to the east of the project site, where some past contamination had been noted, is buffered from the project parcel by the unpaved extension of Commerce Blvd. and about 70 feet of utility easements. It is possible that methamphetamine labs operated in the eucalyptus groves in the area of the Couch Property. Operations of these types of labs typically produce hazardous wastes including phosphine gas, solvent, benzene, chloroform and thionyl chloride. The report by ATC did not note any stressed vegetation or soil staining at the 15-acre site of proposed development that would indicate a potential environmental condition from these chemicals of concern.

Hazardous gases (vapor) from subsurface sources, such as contaminated soil or groundwater can migrate into residential, commercial, and industrial buildings with any foundation type, including basements, crawlspaces, or slabs. ATC considered the nature and extent of on-site and nearby sources of potential subsurface vapor migration by evaluating the current and historical usage of the property, the construction type and history, the physical setting, and the potential sources of subsurface vapor migration through the

review of regulatory agency database information. Based on the evaluation of the known or suspected releases of hazardous substances or petroleum products, distance from the property, potential pathways, and soil type, et al, no potential subsurface vapor migration sources were determined to represent a recognized environmental condition to the property.

The property is not listed within the Napa County Leaking Underground Storage Tank (LUST) database, and was not found in further database searches. However, Site Assessment was performed by Napa County in 1990 and the presence of underground storage tanks (USTs) was recorded (ATC 2018). The USTs are on the Eastern 40-acre parcel owned by the Couch Family. The property was reported to have three USTs sitting on the top of the ground in 2004, in an assessment by Environmental Science Associates. A Phase II soil investigation was conducted by Kleinfelder in July 2005, but groundwater sampling was not administered. The soil investigation found no hazards in concentrations above 2005 environmental screening levels except Chromium. The 130 milligrams per kilogram Chromium concentration is within new standards set by February 2016 environmental screening levels and thus constitutes a historical recognized environmental concern (ATC 2018). The current location of the USTs is unknown.

ATC concluded that a phase II soil investigation should be conducted; this is included in Mitigation Measure HZD-1. They also recommended a soil management plan be created; this recommendation is included in Mitigation Measure HZD-2. With implementation of mitigation measures HZD-1 and HZD-2 soil contamination is considered to represent ***a less than significant impact with mitigation***.

e) The Napa County Airport is located approximately 1.5 miles mile to the north of the project site. The Napa County Airport Land Use Commission establishes land use policies for areas located within the flight path surrounding Napa County airports. The Airport is a subdivision under the Public Works Department of Napa County. The Napa County Airport Land Use Compatibility Plan (Napa County 1991, revised 1999) identifies a series of zones with associated recommendations in relation to the proximity to aircraft over flight paths. This information is also included in the City of American Canyon General Plan. As indicated in the General Plan, most of the project site is located within Zone D of the Napa County Airport Land Use Compatibility Plan, with a small part of the southern end of the site potentially in Zone E. Zone D prohibits residential uses and requires overflight easements or deed notices for other uses. Most non-residential uses are normally acceptable in this zone, but large retail buildings, hotels/motels, restaurants, and assembly halls are normally not acceptable. The proposed wine warehouse would be an acceptable use with appropriate easements. Zone E is less restrictive, and allows all of the uses allowed in Zone D, plus certain additional uses.

Upon the City's approval of the project, an Avigation and Hazard Easement Deed extending over the whole of the property would be executed by the landowner and submitted to the Napa County Board of Supervisors for acceptance.

Therefore, the proposed project would not create aviation safety hazards for persons residing or working in the project vicinity, and impacts would be ***less than significant***.

f) The project is not located in the vicinity of a private airstrip. Therefore, there would ***be no impact*** associated with safety hazards from such airstrips.

g) The development of a wine warehouse on a 15.24-acre site at the end of Commerce Boulevard does not include any facilities or uses that would interfere with the City's emergency response or evacuation plans. The roadway extension would be developed per City standards. The project would be designed to facilitate emergency traffic through and around the site, in accordance with the City's Fire Protection District development standards. During construction, emergency routes would remain open and emergency response plans would not be affected. The impact would be ***less than significant.***

h) The project site is surrounded by parcels containing industrial and warehouse development, and open spaces with ruderal (weedy) vegetation, with marshlands to the West. These areas are not subject to wildlands fires. Development of the proposed project would include the installation of fire suppression systems (e.g., fire hydrants, fire sprinklers, smoke detectors). These systems would be designed in accordance with the latest requirements of the California Fire Code and would be considered adequate to provide fire suppression to the project site.

There is a potential for the dry vegetation on this undeveloped site to catch fire during grading. Equipment could create sparks that would ignite vegetation. Standard construction practices, such as installation of spark arresters on equipment, would reduce the likelihood of fire to a ***less-than significant*** level.

The American Canyon Fire Protection District would provide fire protection to the proposed project. The Fire District indicated in an email that mitigation fees would cover needs for fire services or facilities to serve the proposed project (Weeks 2018). For these reasons, the development of the proposed project would not expose persons or structures to wildland fire risks. Impacts would *be* ***less than significant***.

Mitigation Measures

Mitigation Measure HZD-1: Based on the fact that the locations of the former USTs on the eastern Couch parcel of land is unknown and the sampling done in the 2005 Kleinfelder Phase II soil investigation did not include groundwater sampling, the potential impacts from the USTs is a recognized environmental condition. Therefore, a Phase II soil investigation, including

groundwater sampling as applicable, shall be conducted, for the 15-acre proposed development site prior to approval of any building permits. All recommendations of that ESA shall be implemented as part of the project.

Mitigation Measure HZD-2: Following the Phase II ESA, a soil management plan shall be implemented. The plan would include contingencies for impacted areas. Also, if any septic systems and/or heating oil USTs are uncovered, they should be removed and disposed of per applicable regulations. In addition, if any wells are uncovered during development, it should be properly abandoned per applicable regulations

IX. Hydrology and Water Quality

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Violate any water quality standards or waste discharge requirements?		X		
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?			X	
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?		X		
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?		X		
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?		X		
f) Otherwise substantially degrade water quality?		X		
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?				X
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?				X
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?				X
j) Inundation by seiche, tsunami, or mudflow?				X

A Hydrology Report, and Stormwater Control Plan for the proposed project were prepared by RSA+ (2018a; 2018b). The project site is relatively flat with gentle slopes draining toward the west. Runoff from the property flows over the surface of the site to the west property line. Stormwater is ultimately conveyed to the Napa River (RSA+ 2018a). Downstream, the Napa River discharges into the San Pablo Bay through the Napa Sonoma Marsh.

a, c, d, f) Under Section 402 of the Clean Water Act, the U.S. EPA has established regulations through the National Pollution Discharge Elimination System (NPDES) Stormwater program to control Stormwater discharges, including those associated with construction activities. Authority for NPDES permitting has been delegated by the federal government to the California State Water Resources Control Board (SWRCB), which has nine regional boards; the San Francisco Bay Regional Water Quality Control Board (RWQCB) regulates water quality in the project area, which is in Napa County. The NPDES Stormwater permitting program regulates Stormwater quality from construction sites. The State Construction General Permit (CGP) requires the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) and the use of appropriate best management practices (BMPs) for erosion control and spill prevention during construction. Dischargers whose projects disturb one or more acres of soil or whose projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the CGP for Discharges of Stormwater Associated with Construction Activity (CGP Order 2009-0009DWQ). Development of the proposed project would require clearing ruderal vegetation and grading of the approximately 15.24-acre proposed development site. In addition, a new warehouse building, truck loading docks, and parking area would be constructed; landscaping would be installed; and bioretention facilities would be created. During construction activities there would be a potential for surface water to carry sediment from on-site erosion and small quantities of pollutants into the City's Stormwater system and local waterways. Soil erosion may occur along project boundaries during construction in areas where temporary soil storage is required. Small quantities of pollutants have the potential for entering the storm drainage system, thereby potentially degrading water quality.

Construction of the proposed project also would require the use of gasoline- and diesel-powered heavy equipment, such as bulldozers, backhoes, water pumps, and air compressors. Chemicals such as gasoline, diesel fuel, lubricating oil, hydraulic oil, lubricating grease, automatic transmission fluid, paints, solvents, glues, and other substances would likely be utilized during construction. On-site portable toilets could leak or tip over and spill, releasing sanitary waste, bacteria, solids, nutrients, and pathogens. An accidental release of any of these substances could degrade the water quality of the surface water runoff and add additional sources of pollution into the drainage system.

The proposed project would exceed the NPDES one-acre threshold; therefore, the project proponents would be required to comply with the CGP. The project applicant would be required to develop and implement a SWPPP that identifies appropriate construction BMPs in order to minimize potential sedimentation or contamination of storm water runoff generated from the project site. The SWPPP would identify the risk level for erosion and sedimentation and how much monitoring of potential pollutants is required. Implementation of a SWPPP as required would ensure that the construction of the proposed project would not violate any water quality standards or waste discharge requirements and reduce potential impacts to a less-than-significant level, as described in Mitigation Measure HYD-1.

As required under State Water Resources Control Board Order No. 2013-001 DWQ, the City of American Canyon requires regulated projects, such as this one to prepare a Stormwater Management Program (NPDES Permit No. CAS 612007). As one element of the program, the City requires regulated projects to address post construction stormwater quality. More specifically, the City of American Canyon requires regulated projects, such as this one, to prepare a Stormwater Control Plan (SWCP) in accordance with the Bay Area Stormwater Management Agencies Associated Post Construction Manual. The SWPC must include post-construction Stormwater treatment measures such as bio-retention facilities and source controlled BMPs. The SWMP must also address ongoing maintenance of those facilities.

The project site currently has no impervious surfaces. Development of the proposed project would increase impervious surface coverage on the project site through construction of the warehouse building, parking areas, internal roadways and driveways, and sidewalks. The increase in impervious surface coverage would create the potential for discharge of urban pollutants into downstream waterways. Leaks of fuel or lubricants, tire wear, and fallout from exhaust contribute petroleum hydrocarbons, heavy metals, and sediment to the pollutant load in runoff transported to receiving waters. Runoff from the proposed landscaped areas may also contain residual pesticides and nutrients.

A Stormwater Control Plan has been prepared for the proposed project in accordance with the Bay Area Stormwater Management Agencies Association-Post Construction Manual. The proposed project would incorporate low impact development design strategies. A detention pond would be designed with biotreatment and constructed on the western property line of project site, and a vegetated swale would be installed along the south side of the proposed warehouse to convey flows from upstream off-site to downstream off-site. (RSA+ 2018b).

The project proposes to use recycled water for landscape irrigation. Improper use or discharge of recycled water represents a threat to the quality of waters of the state and to human health and the environment. The City, as the purveyor of recycled water, is required

to comply with the State Water Resources Control Board's (SWRCB) General Waste Discharge Requirements for Landscape Irrigation Uses of Municipal Recycled Water. Coverage under the State's General Waste Discharge Requirements (WDRs) for Recycled Water Use (Water Quality Order 2009-006-DWQ) is limited to treated municipal wastewater for non-potable uses. The General Permit establishes requirements to manage recycled water for landscape irrigation uses in a manner that is protective of public health and the environment. The City is responsible for overseeing the recycled water system and compliance with specific BMPs set forth by the SWRCB which include implementation of operations and a management plan that provides for detection of leaks, and correction either within 72 hours of learning of a leak, or prior to the release of 1,000 gallons; proper design and operation of sprinkler heads; refraining from application during precipitation events; and management of any impoundment such that no discharge occurs unless the discharge is a result of a 25-year, 24-hour storm event or greater. In the event of an unauthorized discharge, the Executive Officer of the appropriate Regional Water Board shall be notified. In addition, as part of the site maintenance, the recycled water system is inspected monthly to verify there are no leaks or runoff from the landscaped area. The recycled water is managed by the City of American Canyon, and use of the recycled water by the proposed project would be a ***less-than-significant*** impact.

b) The proposed project would be served with potable water supplied by the City of American Canyon, and no additional groundwater wells or supplies would be required. Therefore, the proposed project would not contribute to depletion of groundwater supplies. The project's on-site drainage systems would consist of a detention pond and a vegetated detention swale. These features of the development would contribute to replenishing the groundwater supply. Therefore, the development of the proposed project would not interfere with groundwater recharge. As such, impacts would be ***less than significant***.

e) The proposed project's detention basin system would result in a net decrease in peak Stormwater (100-year, 24-hour storm event) runoff rates from the existing approximately 62.5 cubic feet per second (cfs) to 56.4 cfs with the proposed project. Potential impacts related to compliance with post-construction runoff would be would be reduced to ***less-than-significant*** with implementation of Mitigation Measures HYD-2, HYD-3, HYD-4, and HYD-5, which assure proper design, construction, and long-term maintenance of the Stormwater facilities.

g,h) The Federal Emergency Management Agency's Flood Insurance Rate Map No. 06055C0617F, Panel 617 out of 650 indicates that the project site is not located within a 100 year flood hazard area and is in an area of minimal flood hazard. Therefore, ***no impact*** would occur.

i) The project site is not located in a dam failure inundation zone, as depicted in the American Canyon General Plan (City of American Canyon 1994, as amended through January

2018). The project site is east of the Conn and Miliken Dams, Rector Reservoir, and Summit Reservoir inundation areas. The project site is not protected by any levees. These conditions preclude the possibility of the project site being inundated by floodwaters as a result of levee or dam failure. Therefore, the proposed project would have ***no impact*** related to exposing people or structures to risks associated with levee or dam failure.

j) Seiches and tsunamis are seismically induced large waves of water. The project site is distant from any water bodies that could result in a seiche or tsunami. Similarly, mudflows are not a concern in this area of the City. Therefore, the proposed project would have ***no impact*** to future residents relative to inundation by seiche, tsunami or mudflow.

Mitigation Measures

Mitigation Measure HYD-1: Prior to the issuance of grading permits or building permits (whichever occurs first), the project applicant shall obtain coverage under the State Construction General Permit (NPDES General Permit for Stormwater Discharges Association with Construction Activity (Order 2009-0009 DWQ) by preparing a Stormwater Pollution Prevention Plan (SWPPP) and submitting it along with a notice of intent, to the San Francisco Bay RWQCB. The City of American Canyon shall confirm that the applicant has prepared a SWPPP and obtained coverage under the general permit prior to issuance of grading or building permits. The SWPPP shall identify a practical sequence for BMP implementation and maintenance, site restoration, contingency measures, responsible parties, and agency contacts. The SWPPP shall include but not be limited to the following elements:

- Temporary erosion control measures shall be employed for disturbed areas.
- No disturbed surfaces shall be left without erosion control measures in place during the winter and spring months. Cover disturbed areas with soil stabilizers, mulch, fiber rolls, or temporary vegetation.
- Sediment shall be retained on site by a system of sediment basins, traps, or other appropriate measures. Drop inlets shall be lined with filter fabric/geotextile.
- Discharge from the storm water system shall be diffused in such a way as to mimic existing overland flow conditions.
- The construction contractor shall prepare Standard Operating Procedures for the handling of hazardous materials on the construction site to eliminate or reduce discharge of materials to storm drains. This may include locating construction related equipment and processes that contain or generate pollutants in a secure area, away from storm drains and gutters, and wetlands; parking, fueling, and cleaning all vehicles and equipment in the secure area; designating concrete washout areas; and preventing or containing potential leakage or spilling from sanitary facilities.

- BMP performance and effectiveness shall be determined either by visual means where applicable (e.g., observation of above-normal sediment release), or by actual water sampling in cases where verification of contaminant reduction or elimination (such as inadvertent petroleum release) is required by the RWQCB to determine adequacy of the measure.
- In the event of significant construction delays or delays in final landscape installation, native grasses or other appropriate vegetative cover shall be established on the construction site as soon as possible after disturbance, as an interim erosion control measure throughout the wet season.

***Mitigation Measure HYD-2*:** Prior to the issuance of grading permits for the proposed project, the project applicant shall submit a Stormwater Control Plan to the City of American Canyon for review and approval. The Stormwater Control Plan shall identify pollution prevention measures and practices to prevent polluted runoff from leaving the project site. The plan shall be implemented to the satisfaction of the City of American Canyon prior to building occupancy.

Mitigation Measure HYD-3: Prior to issuance of grading permits for the proposed project, the project applicant shall submit a final drainage plan as prepared by a qualified civil engineer to the City of American Canyon for review and approval. The approved plan shall be incorporated into the project design and constructed to the satisfaction of the City.

Mitigation Measure HYD-4: The project sponsor (or successors-in-interest/owner) shall maintain in perpetuity the post-construction BMPs listed in the Stormwater Operations and Management Plan to be agreed upon with the City of American Canyon. The owner shall make changes or modifications to the BMPs to ensure peak performance. The owner shall be responsible for costs incurred in operating, maintaining, repairing, and replacing the BMPs. The owner shall conduct inspection and maintenance activities and complete annual reports.

Mitigation Measure HYD-5: The detention basin shall be maintained on a regular basis by the project sponsor (or successors-in-interest). Inspections of the basin shall be conducted at least once a year between July 1st and September 1st. During the dry periods of the year when minor storm events are insufficient to fully transport sediment and debris, accumulations may occur in detention basins. Therefore, basin and storm water inlet maintenance shall be done prior to the rainy season and during other extended dry spells, which will reduce the concentration of sediment and debris that typically collects in the bottom of inlets during storms. An annual inspection and maintenance report shall be prepared by the property owner and submitted to the Public Works Director by October 15 of each year, at the property owner's expense.

X. Land Use and Planning

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Physically divide an established community?				**X**
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?			**X**	
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?				**X**

a) The project site is currently undeveloped open land covered mostly with ruderal vegetation, with some small wetland areas. The project is bounded on the north by open grassland. To the west is an 11.23-acre parcel owned by the Couch Family, which remains unimproved with a eucalyptus grove; on the south is the City-owned 24-acre parcel known as the Clarke Ranch West Open Space, partially covered eucalyptus trees, and including horse-riding facilities operated by Spirit Horse Riding Center; to the east is a 64-foot wide City Public Access and Utility Easement; on each side of this 68-foot easement is a 5-foot-wide Public Utility Easement (PUE); to the east of these easements is a 40-acre parcel owned by the Couch Family including a mobile home and various out-buildings, and a large commercial recreation facility (Paintball Jungle). Farther north on Commerce Blvd. are other warehouses similar to the proposed project. Farther south on Commerce is a residential neighborhood. A public school is proposed just southeast of the site, to the south of the paintball center, at the corner of Eucalyptus Drive and Commerce Blvd. The nearest established residential community is to the south of the proposed Commerce Blvd. extension, and would not be accessible via that extension. Therefore, the project would have no potential to divide any such community. Therefore, there would be ***no impact.***

b) The City's General Plan designates the site as Commercial Recreation (CR) and the Zoning Map indicates that the site as Recreation (REC). The General Plan describes typical

permitted used in the CR land use category as: *Recreation vehicle parks, interpretative nature centers and conference facilities, and similar uses*. (General Plan Land Use Element, Land Use Schedule Table, p. 1-9). The City Attorney has reviewed the allowed uses in the Recreation zone (which includes the proposed SDG 330 Distribution Center use) and determined they are consistent with the Commercial Recreation Land Use in the General Plan (email from Jeff Ballantine, Contract Project Planner, City of American Canyon, to Richard Grassetti, GECo, August 8, 2018).

A Recreation Zoning District Code Amendment (Ordinance No. 2018-01) was adopted by the City Council on January 16, 2018. The Ordinance that was adopted was "to make winery uses more feasible". The City's Municipal Code, Chapter 19.15.020 identifies the Recreation District as an area for Wineries and as a conditionally permitted use. The Zoning Ordinance defines "Winery" as including viticulture-related activities such as bottling, storage, logistics, distribution, wine packing, and wine-related services. Zoning Ordinance (No. 2018-01) was granted by the City Council on Dec. 19th, 2017, expanding the Zoning to "allow limited non-winery uses with a conditional use permit". The project is in compliance with the City's Zoning Code standards, with approval of a minor variation to height standards to allow a 37-foot height.

The following City General Plan land use policies applicable to the project are noted below.

Policy 1.2.2: Establish as a priority the development of projects that are contiguous with and infill the existing pattern of development, avoiding leap-frog development, except for large scale master-planned projects that are linked to and planned to be extensions of existing development and for which infrastructure and services are in place or funded.

> **Consistent:** The proposed project would be near the developed existing Green Island industrial/warehouse area. Although two open parcels would be created between the project and existing warehouses, it is likely that those would be similarly built out in the foreseeable future. Therefore, the project would be generally consistent with this policy.

Policy 1.3.4: Limit the total additional new development that can be accommodated in the City and its Urban Limit Line to the following provided that the highway improvements stipulated by the Circulation Element are implemented. Industrial development within the City is limited to 1,560,195 sq. ft., and within the Urban Limit Line the limit would be 5,778,500 sq. ft.

Policy 1.3.5 of the GP provides some flexibility in implementing Policy 1.3.4: Consider increases in development capacity when it can be demonstrated that additional transportation improvements have been implemented or are funded, or demands have

been reduced (based on highway level of service and vehicle trips), and such increases are consistent with community needs and desires. (I 1.9 and I 1.10)

Consistent: The project would contribute its fair share to traffic improvements that would assure that appropriate transportation improvements would be implemented. See Transportation/Traffic section of this IS for additional discussion.

Policy 1.22.3: 1.22.3 Permit development according to the following standards:
a. Labor-intensive uses: a maximum floor area ratio of 0.5.
b. Low labor uses (such as warehousing): a maximum floor area ratio of 0.7.

Consistent: The proposed project would have a floor area ratio of 0.498.

Policy 1.22.4: Require that development be designed to achieve a high level of quality and compatibility with existing uses including the consideration of the following:

1. architectural treatment of all building elevations;
2. use of extensive landscape along the primary street frontages and parking lots; and
3. enclosure of storage areas visible from principal highways (including Highway 29) and peripheral residential and commercial districts with decorative screening or other elements. (I 1.1, I 1.4-I 1.7, I 1.11, and I 1.14)

Consistent: The project includes architectural treatments for consistency with nearby warehouse developments. It includes a landscape plan for the street frontages, site perimeter, and storage areas.

Policy 1.27.1: Require that development comply with the land use and development conditions stipulated in the Napa County Airport Land Use Plan (ALUP).

Consistent: The project site is located mostly within ALUP Compatibility Zone D; a small portion of the southern end of the site may be in Zone E (the ALUP Compatibility Map is of low resolution, and it is not possible to definitively determine the exact boundary of the two zones from that map). The proposed project use (warehousing) would comply with the conditions of the ALUP. Therefore, the project would be consistent with this policy.

Policy 1.27.2: Review all applications for new development, expansion of existing uses, and re-use within Napa County Airport Compatibility Zones “A” through “E” for compliance with the appropriate use and development conditions.

Consistent: The proposed project site is mostly located within Zone D; a small part of the site may be in Zone E. Warehouse uses are permitted in these zones. In addition, the applicant proposes to place an Avigation Easement on the entire property. Therefore, the project would be consistent with this policy.

Policy 1.32.1: Require adherence to the *Design and Development Principles* prescribed in the General Plan and the City's Design Review Guidelines, which shall be updated periodically.

Consistent: The project has been designed to adhere to the *Design and Development Principles* prescribed in the General Plan as well as the City's Design Review Guidelines. Therefore, the project would be consistent with this policy.

Policy 1.32.2: Require that development projects subject to discretionary review submit and implement a landscape plan.

Consistent: Landscaping would be provided throughout the parking lot areas and along project site boundaries. Therefore, the project would be consistent with this policy.

Policy 1.32.4: Require developers to incorporate mature and specimen trees and other significant vegetation, which may exist on a site into the design of a development project for that site.

Consistent: The project includes a landscaping plan, which includes trees and other plants. There are no mature or specimen trees on the project site that can be incorporated as part of the project.

Policy 1.32.5: Require the use of drought-tolerant species in landscape design in accordance with the provisions of the Water Conservation and Landscape Act.

Consistent: Vegetative species included in the project landscape plan are generally native to California and are drought-tolerant where appropriate. Therefore, the project would be consistent with this policy.

Policy 1.32.6: Require that commercial, industrial, and multi-family residential development incorporate adequate drought-conscious irrigation systems and maintain the health of the landscape.

Consistent: The proposed project would incorporate drought-conscious irrigation systems and maintain the health of the landscape consistent with Policy 1.32.6. Therefore, the project would be consistent with this policy.

Policy 1.32.7: Require that all commercial, industrial, multi-family, and common area landscape be adequately irrigated with automatic irrigation systems.

> **Consistent:** The proposed project would include the use of automatic irrigation systems. Therefore, the project would be consistent with this policy.

Policy 1.32.8: Promote the use of reclaimed water for the irrigation of public and private landscape, as available.

> **Consistent:** The proposed project would include an on-site irrigation system that would use recycled irrigation water. Therefore, the project would be consistent with this policy.

Policy 1.33.1: Require that all structures be constructed in accordance with the requirements of the City's building and other pertinent codes and regulations; including new, adaptively reused, and renovated buildings.

> **Consistent:** The proposed project would be constructed in accordance with the City's building and other pertinent codes. Therefore, implementation of the proposed project would be consistent with this policy.

Policy 1.33.3: Require that all development be designed to provide adequate space for access, parking, supporting functions, open space, and other pertinent elements.

> **Consistent:** The project would provide sufficient space for access, parking, and open space consistent with Policy 1.33.1. Therefore, the project would be consistent with this policy.

Policy 4.9.3: Require that sufficient and secure bicycle parking be provided in all parking areas.

> **Consistent:** Bicycle parking is provided as part of the project. Therefore, the project would be consistent with this policy.

Policy 5.5: In order to reduce light and glare, ensure that lighting associated with new development or facilities (including street lighting, recreational facilities, and parking) is designed using City engineering standards and/or Best Management Practices to prevent artificial lighting from illuminating adjacent private property in residential neighborhoods and/or natural areas. If isolated areas are identified as having excessive spillover post construction, specific mitigations shall be implemented, e.g. installation of glare shields.

Consistent: The proposed project includes lights in the parking lot and on the building. The lighting has been designed to minimize spillover light, per City requirements. A lighting study has been prepared by the applicant showing minimal spillover lighting.

Policy 6.4.1: Continue to implement an ordinance requiring built-in fire protection for most building types, including single- and multi-family residential, to:

- minimize the potential for loss of life and property
- allow for the provision of a high level of fire protection services while reducing the needs for additional staff and equipment.

Consistent: The proposed project would be constructed to meet City and State fire code requirements. The proposed project would not require additional fire staff or equipment.

Policy 6.9.2: Require that landscaping in proximity to commercial, industrial, multi-family, and public structures be sited to allow for security surveillance.

Consistent: Landscaping would be planted in accordance with City standards to allow for security surveillance.

Policy 11.2.9: Require the utilization of site and architectural design features in conjunction with noise barriers to mitigate impacts on sensitive land uses. Design techniques capable of mitigating potential noise impacts include:

- Site Design
  - Using building setbacks and dedicating noise easements to increase the distance between the noise source and receiver;
  - Locating uses and orienting buildings that are compatible with higher noise levels adjacent to noise generators or in clusters to shield more noise-sensitive areas and uses;
  - Placing noise tolerant land uses, such as parking areas, between noise sources and receivers;
  - Using noise tolerant structures, such as garages or carports, to shield noise-sensitive areas; and
  - Clustering office, commercial, or multiple family residential structures to reduce interior open space noise levels.

Consistent: The proposed project would incorporate design features to help mitigate noise impacts to nearby receptors (See Section XII, Noise).

Napa County Airport

The Napa County Airport Land Use Commission regulates land use around the Napa County Airport by requiring compliance with the Napa County Airport Land Use Compatibility Plan (NCALUCP). The City of American Canyon's General Plan and Zoning Ordinance were found to be consistent with the NCALUCP. The project is consistent with the City's General Plan. The project site is located in Zones D and E of the Airport's land use compatibility map, which permit development of warehouse uses. Please see a comprehensive discussion of this issue in response to Item VIII e), above.

The project has been designed consistent with all applicable City land use and planning documents adopted to avoid or mitigate an environmental effect, as discussed throughout this Initial Study. Therefore, the impact is ***less than significant*.**

c) The project site is not located within the boundaries of a habitat conservation plan or a natural community conservation plan; therefore, the project would not conflict with any habitat plans and there would be ***no impact***.

XI. Mineral Resources

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				X
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?				X

a, b) The project site is designated Commercial Recreation in the City's General Plan and consists of a vacant parcel. The site is not identified in the City's General Plan as a site containing locally important mineral resources that would be of local, regional, or statewide importance; therefore, the project is not considered to have any impacts on mineral resources. The project does not propose to excavate the site for mineral resources; therefore, no impacts related to mineral resources would result from construction of the project. The project site does not contain any known mineral deposits or active mineral extraction operations. Therefore, there would be ***no impact*** to mineral resources.

XII. Noise

Would the project result in:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?		X		
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?			X	
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?		X		
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?		X		
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?			X	
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?				X

Existing Noise Levels and Sensitive Receptors

Noise-sensitive receptors (land uses associated with indoor and/or outdoor activities that may be subject to stress and/or significant interference from noise) include residential developments, schools, health care facilities, and libraries. Noise-sensitive receptors in the project vicinity include single-family residences southeast of the project site, with the closest residence being approximately 900 feet away and partially shielded by a noise barrier.

To quantify existing ambient noise levels at the project site and surrounding area, one long-term (72-hour) and several short-term (10-minute) noise measurements were conducted at and near the project site. The long-term meter was placed on the southern edge of the project site, and measured existing 24-hour noise levels. The short-term measurements were conducted at several locations on the project site to measure traffic noise from Eucalyptus Drive and Highway 29, and noise from adjacent properties.

The main source of noise in the project vicinity is aircraft noise from Napa County Airport. Secondary noise sources included traffic on nearby roadways, trains and train whistles, and pedestrians at the adjacent wetlands. The noise measurements are summarized in Table Noise-1, below. The Noise Appendix (Appendix D) includes noise measurement site locations, 24-hour noise plots and additional sound level data.

Table Noise-1: Existing Noise Levels in the Project Area

Location	Time Period	Noise Levels (dB[5])	Noise Sources
Site 1. Southern edge of project site. 480 feet west of the eastern property line.	Tuesday July 31, 12:00 a.m. through Thursday August 2, 11:59 p.m., 2018 72-hour measurement	Hourly Leq[6]s ranged from: 42-54 Ldn[7] s: 51, 52, 52 Hourly Lmax[8]s ranged from: 48-73	Unattended noise measurements do not specifically identify noise sources
Site 1. Southern edge of project site. 480 feet west of the eastern property line.	Monday July 30, 2018 12:08-12:18 p.m.	5-minute Leqs: 43, 42 5-minute Lmaxs: 49, 43	Airplanes were up to 49 dB. Quieter noises included distant traffic, back-up beeps, and roosters.
Site 1. Southern edge of project site. 480 feet west of the eastern property line.	Friday August 3, 2018 10:45-10:55 a.m.	5-minute Leqs: 44, 46 5-minute Lmaxs: 54, 55	Airplanes were up to 55 dB. Distant traffic was up to 47 dB. Quieter noises included back-up beeps and voices from Spirit Horse Riding Center.
Site 2. Southeast corner of Eucalyptus	Monday July 30, 2018	5-minute Leqs: 48, 51	Heavy truck passing by was 66 dB. Noise from

[5] A decibel (dB) is a unit of sound energy intensity. Sound waves, traveling outward from a source, exert a sound pressure level (commonly called "sound level") measured in dB. An A-weighted decibel (dBA) is a decibel corrected for the variation in frequency response to the typical human ear at commonly encountered noise levels. All references to decibels (dB) in this report would be A-weighted unless noted otherwise.

[6] The Equivalent Sound Level (Leq) is a single value of a constant sound level for the same measurement period duration, which has sound energy equal to the time–varying sound energy in the measurement period.

[7] Ldn is the day–night average sound level that is equal to the 24-hour A-weighted equivalent sound level with a 10-decibel penalty applied to night between 10:00 p.m. and 7:00 a.m.

[8] Lmax is the instantaneous maximum noise level for a specified period of time.

Location	Time Period	Noise Levels (dB[5])	Noise Sources
Drive and Wetlands Edge Road. 25 feet south of the Eucalyptus centerline.	10:56-11:06 a.m.	5-minute Lmaxs: 61, 66	summer camp activities was up to 62 dB. Cars passing by were 55-58 dB. Airplanes were 50-51 dB. Quieter noises included a distant motorcycle.
Site 2. Southeast corner of Eucalyptus Drive and Wetlands Edge Road. 25 feet south of the Eucalyptus centerline.	Friday August 3, 2018 11:37-11:47 a.m.	5-minute Leqs: 53, 56 5-minute Lmaxs: 69, 75	Mail truck passing by was 75 dB. Other cars were up to 68 dB. Airplanes were up to 55 dB. A distant motorcycle was 50 dB. Quieter noises included passing cyclists and pedestrians.
Site 3. Eastern edge of project site. 350 feet north of the southern property line.	Monday July 30, 2018 11:21-11:31 a.m.	5-minute Leqs: 44, 49 5-minute Lmaxs: 50, 62	Airplanes were up to 62 dB. Quieter noises included train whistles, roosters, and cows. The ambient noise level was approximately 40 dB.
Site 3. Eastern edge of project site. 350 feet north of the southern property line.	Friday August 3, 2018 11:20-11:30 a.m.	5-minute Leqs: 52, 44 5-minute Lmaxs: 67, 53	Airplanes were up to 63 dB. Passing cars were up to 56 dB. Distant traffic was up to 46 dB. Quieter noises included voices from Spirit Horse Riding Center and roosters.
Site 4. Northern area of project site. 350 feet west of the eastern property line and 460 feet north of the southern property line.	Monday July 30, 2018 11:40-11:50 a.m.	5-minute Leqs: 42, 43 5-minute Lmaxs: 49, 59	Wind was up to 49 dB. Distant traffic was up to 45 dB. Quieter noises included a distant airplane, back-up beeps, and roosters.
Site 4. Northern area of project site. 350 feet west of the eastern property line and 460 feet north of the southern property line.	Friday August 3, 2018 11:05-11:15 a.m.	5-minute Leqs: 43, 46 5-minute Lmaxs: 53, 59	Airplane was 58 dB. Quieter noises included traffic, back-up beeps, and voices from Spirit Horse Riding Center.
Site 5. Western edge of project site. 200 feet north of the southern property line.	Monday July 30, 2018 12:26-12:36 p.m.	5-minute Leqs: 42, 42 5-minute Lmaxs: 48, 51	Nearby birds were up to 51 dB. Airplanes were up to 45 dB. Quieter noises included a train whistle and distant traffic, as well as pedestrian voices from the Bay Trail.
Site 5. Western edge of project site. 200 feet north of the southern property line.	Friday August 3, 2018 10:26-10:36 a.m.	5-minute Leqs: 44, 46 5-minute Lmaxs: 63, 58	Airplanes were up to 57 dB. Distant motorcycles were up to 50 dB. Quieter noises included distant traffic and back-up beeps.

Source: RCH Group, 2018

Regulatory Framework

The City of American Canyon addresses construction noise in Section 8.12.080 of the American Canyon Municipal Code. Where technically and economically feasible, construction activities shall be conducted in such a manner that the maximum noise levels at affected properties would not exceed those listed in Table Noise-2.

Policy 11.7.1 of the City's General Plan Noise Element limits construction activities adjacent to noise-sensitive uses to daylight hours between 6:30 a.m. and 8:00 p.m. The Noise Element also requires construction activities to employ practical techniques and practices that minimize the generation of adverse and/or excessive noise impacts on adjacent land uses (Policy 11.7.2). Policy 11.2.4 of The Noise Element requires new industrial, commercial and related land uses to demonstrate that they would not directly cause ambient noise levels to exceed an exterior Ldn of 65dB in areas containing housing, schools, health care facilities, or other noise-sensitive land uses.

Table Noise-2: Noise Limits for Construction Activities (Lmax).

Timeframe	Residential	Commercial	Industrial
Daily: 7 a.m. to 7 p.m.	75 dB	80 dB	85 dB
Daily: 7 p.m. to 7 a.m.	60 dB	65 dB	70 dB

Source: American Canyon Municipal Code, Chapter 8.12

a, c, d) Construction and operational noise impacts are addressed below.

Construction Noise

The project could result in temporary, short-term increases in noise levels during project construction. Noise-sensitive receptors near the project site include single-family residences (to the southeast). Residents in those homes could experience short-term increases in noise levels during construction of the project.

The maximum noise levels for various types of construction equipment that would be required to build the project are provided in Table Noise-3, below. Maximum noise levels generated by construction equipment used for the project would range from 74 to 85 dB at a distance of 50 feet. Table Noise-4 shows the maximum estimated noise levels at the nearest residence that could occur during construction.

Table Noise-3: Typical Noise Levels from Construction Equipment (Lmax)

Construction Equipment	Noise Level (dB, Lmax at 50 feet)
Auger Drill Rig	84
Backhoe	78
Bulldozer	82
Compactor (ground)	83
Crane	81
Excavator	81
Front End Loader	79
Generator	81
Grader	85
Man Lift	75
Paver	77
Roller	80
Scraper	84
Slurry Trenching Machine	80
Tractor	84
Welder/Torch	74

Source: *Federal Highway Administration (FHWA) Roadway Construction Noise Model User's Guide,* 2006.

Table Noise-4: Estimated Maximum Construction Noise Level at Nearest Residence

Construction Activity	Approximate Distance to Residence (feet)	Noise Level (dB, Lmax) at Residence
Site Preparation, grading, and paving	900	54
Warehouse construction	1,000	53

Note: Noise levels were estimated using a reference noise level of 85 dB at 50 feet and attenuation rate of 7.5 dB per doubling of distance due to soft-site conditions at the project site.
Source: RCH Group 2018

As shown in Table Noise-1, ambient noise levels at the nearest residence (Site 2) were measured to be 48 to 56 dB, Leq. As shown in Table Noise-4, grading and paving activities would take place approximately 900 feet from the nearest residence and would generate maximum noise levels of approximately 54dB. The construction of the warehouse would take place approximately 1,000 feet from the residence and would generate maximum noise levels of approximately 53dB. Noise levels would be lower than these estimates most of the time, and maximum levels would only occur for a short duration when the construction equipment is at its closest point to the residence. Thus, noise levels resulting from project construction would be consistent with the ambient noise levels at the nearest residence, and would be far below the 65dB noise limit for residential land uses contained in section 8.12.080 of the American Canyon Municipal Code.

The implementation of Mitigation Measures NOISE-1 and NOISE-2 would reduce construction noise to the maximum extent feasible and would reduce impacts from temporary construction noise to ***less than significant with mitigation***.

Operational Noise

Operational noise from the project would include automobile and truck traffic travel to and from the site, loading dock activities, and parking lot activities. The warehouse building's cooling system would bring in cool night air with intake louvers and fans. Cooling equipment would be located greater than 1,000 feet from the nearest residence to the southeast and the noise from the operation of mechanical equipment would not be audible at the residence over ambient noise levels in the project vicinity.

Noise from parking lot activities would occur at the project site intermittently when warehouse employees arrive at the beginning of a shift and leave at the end of a shift. Representative parking activities such as employees conversing and doors slamming generate maximum noise levels of 60-70 dB at 50 feet (LSA Associates, 2012). The project includes parking spaces approximately 1,000 feet from the nearest residence to the southeast and, given this distance, parking lot noise would attenuate to a level far below ambient noise levels before reaching the residence.

The loudest noise generated from project operations would be traffic noise from trucks traveling to and from the warehouse as well as loading and unloading at the project site. Trucks would travel between the site and Highway 29 via Commerce Boulevard and Green Island Road. The existing average traffic noise levels measured at Commerce Boulevard (Site 3) were 44 to 52 dB Leq. Typically, traffic volumes need to double in order to result in a perceptible change in noise levels (i.e., 3-5 dB). The project is estimated to generate approximately 559 trips per day during weekdays (OmniMeans, 2016) including employee and truck trips. With about ten percent of these trips occurring during the peak traffic hour, the project would result in less than one trip per minute on Commerce Boulevard. Project traffic would result in a less than 3 dB increase, and would have a minimal effect upon ambient noise levels in the project vicinity.

Loading dock activities would include heavy trucks stopping (infrequent air brakes), backing into the loading docks (back up alarms), and pulling out of the loading docks (revving engines). The trucks would be unloaded from the inside of the warehouse and most of the unloading noise would be contained within the building and truck trailer. Noise would occur periodically for several minutes at a time during each delivery/pickup at the warehouse.

The loading docks would be located on the north side of the warehouse building. At the nearest residence (to the southeast), noise levels from the project's loading dock and semi-

truck movements would be far below ambient noise levels due to the large distance between source and receptor (approximately 1,400 feet) and additional shielding from the warehouse building and residential noise barrier. In addition, interior noise levels would be approximately 25 dB less inside the residence (Bollard, 2005; Bum, 1994).

Noise from project operation would not exceed the 65 dB Ldn exterior noise standard for residential land uses contained in the City of American Canyon General Plan at the nearest residence. Operational noise generated by the project would be ***less than significant***.

b) Construction operations have the potential to result in varying degrees of temporary ground vibration, depending on the specific construction equipment used and operations involved. The ground vibration levels associated with various types of construction equipment are summarized in Table Noise-6. Ground vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. The effects of ground vibration may be imperceptible at the lowest levels, low rumbling sounds and detectable vibrations at moderate levels, and slight damage to nearby structures at the highest levels.

At the highest levels of vibration, damage to structures is primarily architectural (e.g., loosening and cracking of plaster or stucco coatings) and rarely results in structural damage. For most structures, a peak particle velocity (ppv) threshold of 0.5 inch per second or less is sufficient to avoid structural damage. The Federal Transit Administration recommends a threshold of 0.5 ppv for residential and commercial structures, 0.25 ppv for historic buildings and archaeological sites, and 0.2 ppv for non-engineered timber and masonry building (FTA 2006).

The project would not involve the use of any equipment or processes that would result in potentially significant levels of ground vibration (i.e., pile drivers that could be above 0.5 ppv). Project construction would involve the use of a roller and a bulldozer, which could produce vibration levels of 0.210 and 0.089 ppv at 25 feet. Ground vibration generated by construction operations would be primarily associated with on-site trucks and excavation equipment and would result in vibration levels of less than 0.1 ppv at 25 feet. Construction activities would occur as close as approximately 900 feet from the nearest structure and the predicted vibration levels at the nearest structure would not exceed the 0.5 ppv threshold for residential and commercial structures. Therefore, vibrational impacts would be ***less than significant***.

e) The project site is located in Zone D of the Napa County Airport Land Use Compatibility Plan. Warehousing is listed in the American Canyon General Plan Noise Element as one of the uses that is normally acceptable in this zone. The project would not exceed the maximum density specified in the General Plan for Zone D and would be consistent with the land use designation in the Airport Land Use Plan and the General Plan's airport vicinity land use

compatibility criteria. The project would not expose people working on the project site to excessive noise levels. This impact would be considered ***less than significant***.

f) The project site is not located within the vicinity of a private airstrip. There are no private airstrips located in the City of American Canyon or near the city limits. Therefore, ***no impact*** would occur relative to exposing people to excessive airport related noise levels due to proximity to a private airport or airstrip.

Mitigation Measures

Mitigation Measure NOISE-1: Construction activities shall be limited to daylight hours between 7:00 a.m. and 7:00 p.m.

Mitigation Measure NOISE-2: All construction equipment shall use noise-reduction features (e.g., mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

XIII. Population and Housing

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?			X	
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?				X
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?				X

a) The proposed warehouse development would not directly increase the population because there is no housing component, but it would introduce new businesses to the area. As part of the project, infrastructure at the site would be expanded. This infrastructure would include an approximately 1100-foot-long paved roadway extension and widening of an existing rock-surfaced road, water and sewer main tie-ins, a sewer lift station, gas line extension, storm drainage facilities, and recycled water service. These improvements would serve the proposed project and the two additional parcels to be created by the tentative map. The project subdivision could induce similar warehouse development on the two parcels to be created to the north of the site. However, the number of new employees at each of these facilities would be small, similar to the project's employment (50 full-time employees and up to 30 part-time employees). Therefore, this impact would be considered ***less than significant***.

b, c) The project site is currently vacant and development of the proposed project would not displace existing housing or people. Therefore, there would be ***no impact*** associated with displacements.

XIV. Public Services

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Fire protection?			**X**	
b) Police protection?			**X**	
c) Schools?			**X**	
d) Parks?				**X**
e) Other public facilities?				**X**

a) As a light industrial/warehouse development, the proposed project would not directly increase the residential population of the City of American Canyon. The General Plan for the City evaluated impacts related to increased industrial development (City of American Canyon. 1994, as amended through January 2018).

The American Canyon Fire Protection District (ACFPD) provides fire protection and emergency medical services for the project site. The ACFPD station is located at 911 Donaldson Way East, approximately 3 miles driving distance from the project site. The ACFPD's goal is to respond to 90 percent of their calls in five minutes or less. The response time from this fire station is around five minutes, but may be longer depending on traffic and other variables. Therefore, the proposed development may exceed the District's target response time. In 2017, the ACFPD responded to 94 incidents in the Green Island Industrial area. In 32 percent of the incidents, response time of the first fire vehicle was within five minutes to this area. In 2013 the ACFPD and the City of American Canyon installed an emergency-vehicle-only left-turn lane onto Green Island Road from SR29 to improve access and response times for emergency vehicles into the industrial area (Weeks 2018, email correspondence).

The City covers needs for fire service and facilities through two different fees. The first fee, a Fire Mitigation Fee is a one-time assessment of new development, which is currently $0.5279 per square foot for industrial properties. The second fee is the Fire Service Fee, which is an annual assessment for each parcel based on a formula which includes structure construction type, the fire flow area (square feet), proximity of other structures, the type of occupancy, and the presence of fire protection devices. The ACFPD many need additional resources to address increased call volume and fire flow needed for the proposed project in the form of

additional facilities, apparatus, and staffing. With payment of the required Fire Service Fee, this impact would be reduced to a ***less-than-significant*** level (Weeks 2018).

b) The City of American Canyon contracts with the Napa County Sheriff's Department for staffing the American Canyon Police Department to provide police services. The California Highway Patrol is responsible for traffic related enforcement. The police headquarters are located at 911 Donaldson Way East, which is the same location as the fire district, approximately 2.1 miles from the project site. The Police Department has a force of 24 full-time sworn officers, two police technicians, and an administrative clerk (City of American Canyon 2018d).

Staff and equipment required to provide service to the proposed project would depend on the occupants of the industrial buildings. The Police Department generally does not require additional police personnel for warehouse projects. Such businesses typically provide some self-monitoring, such as video cameras in parking lots, which reduces police calls. The applicant would be responsible for mitigation/impact fees for the police station in accordance with the City of American Canyon's Mitigation Impact Fee schedule (City of American Canyon 2018b). With payment of the Mitigation Fee, the project would result in a ***less-than-significant impact*** on the City's police services.

c) The City of American Canyon is within the Napa Valley Unified School District (NVUSD). The proposed project would not affect schools, parks or other public facilities because this warehouse project would not directly increase the population. However, industrial developments in the City of American Canyon are required to pay school fees and a Civic Facilities Fee, in accordance with the City's Master Fee Schedule. With payment of the mitigation fees this potential impact would *be* ***less than significant***.

d) The proposed industrial project would not result in an increase in residents and therefore, would not increase demand for any parks facilities. Pursuant to the City's General Plan Policy 7.1.1, the City has a minimum parkland standard of 5.0 acres per 1,000 residents. The project would not displace recreational facilities nor would construction of the project increase use of existing public recreation facilities. Therefore, the project would have ***no impacts*** to parks and recreation facilities**.**

e) No other public facilities would be required by the proposed project. Therefore, Therefore, the project would have ***no impacts*** to any such facilities**.**

XV. Recreation

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that physical deterioration of the facility would occur or be accelerated?				**X**
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?				**X**

a, b) The proposed warehouse project would not result in demand for any parks facilities and does not include any such facilities. The project would not displace recreational facilities nor would construction of the project increase use of existing public recreation facilities. The project would be on land designated for recreation, but would not affect any such uses or facilities. Therefore the project would have ***no impact*** to recreational facilities.

XVI. Transportation/Traffic

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?		X		
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?		X		
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?			X	
d) Substantially increase hazards due to design features (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			X	
e) Result in inadequate emergency access?			X	
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?			X	

a, b) **Background/Existing Conditions**

A traffic analysis was conducted for the overall Green Island Road area, including Commerce Blvd, by Omni Means Engineering Solutions (Omni Means) in January 2016[9], and has been reviewed for adequacy by the City Public Works Department. It should be noted that the study did not include the Commerce 330 project, but did include all of the potentially affected intersections. A follow-up focused traffic analysis addressing the proposed project's impacts on the Green Island Road/Commerce Boulevard intersection was prepared by GHD on October 24, 2018[10]. That report found that the existing Levels of Service (LOS) at the Green Island Road/Commerce Boulevard intersection are LOS A in the morning peak hour and LOS B in the afternoon peak hour.

The 2016 Transportation Impact Analysis evaluated future conditions with and without the project. Consistent with the Napa Logistics Park Phase 2 Project Draft EIR the following projects were included in the analysis:

1. Napa Logistics Park Phase 1 and 2
2. Canyon Estates
3. Napa Airport Corporate Center
4. Napa Airport Corporate Center Phase I
5. Napa Junction III
6. Napa Logistics Park Phase I
7. Valley View Senior Housing
8. Village at Vintage Ranch
9. Green Island 258 Warehouse Project

The analysis showed that conditions at SR 29 and Green Island Road would drop from the current LOS C to LOS D in the AM peak hour. All other studied intersection operations would be at LOS B or C. No operations would be below LOS D.

[9] Omni Means Engineering Solutions, American Canyon Wine Warehouse Transportation Impact Analysis Report, January 2016.
[10] GHD, Traffic Impact Analysis Memorandum, 330 Commerce Boulevard Wine Storage Facility Project, October 24, 2018.

Table Traffic-1: Projected Background Conditions: Intersection Level of Service

#	Intersection	Control Type[1,2,3]	Target LOS	AM Peak Hour		PM Peak Hour	
				Delay	LOS	Delay	LOS
1	Paoli Loop Rd/Green Island Rd	TWSC	D	18.9	C	17.9	C
2	State Route 29 SB/Green Island Rd	On Ramp	D	15.5	B	28.2	D
3	State Route 29 NB/Paoli Loop Rd	On Ramp	D	28.2	D	18.3	C
Notes:							
1. TWSC = Two Way Stop Control							
2. LOS = Delay based on worst minor street approach for TWSC intersections							
3. Intersection was analyzed using HCS 2000 software instead of Synchro. This software was chosen because it can more accurately perform a merge analysis. This analysis is required for this intersection due to the ramp-style right-turn only configuration of this intersection. Intersection vehicle/capacity delay has been supplanted by a density measure.							

Source: Omni Means, January 2016

Project Impact

Existing Plus Project Conditions

To determine project trip generation, data were collected and analyzed for daily trips at seven locations with similar wine warehouse buildings (Omni Means, June 21, 2016; GHD, October 24, 2018). The seven study locations have an average of 1.54 daily trips per thousand square feet (ksf). Eliminating one outlier project, the remaining six projects resulted in an average of 1.69 daily trips/ksf. The project's traffic demands would be substantially similar to those that are currently found in the Green Island Industrial Park, and specifically, similar to those found on Hanna Drive and Commerce Boulevard. Based on traffic counts and peer reviewed studies of traffic in Green Island Industrial Park, the proposed project would be expected to contribute a total of 559 daily project trips with 53 trips in the AM peak hour and 43 trips in the PM peak hour (Onmi Means 2016; GHD 2018).

The City of American Canyon has identified a need for roadway improvements along Green Island Road. The City has proposed an expansion of the roadway by approximately 12 feet, making it a three-lane section to accommodate a two-way left turn lane down the center of Green Island Road. The applicant would be required to pay the City's Transportation Impact Fee. The project's impact on traffic on Green Island Road and associated intersections would therefore be ***less than significant***.

The 2018 GHD report evaluated turn pocket and traffic signal warrants for the intersection of Commerce and Green Island Road. That report projected no change from the existing LOS in either the AM or PM peak hour at the Green Island Road/Commerce Boulevard intersection. The intersection would continue to operate acceptably.

The Green Island Road/Commerce Boulevard intersection also has been evaluated for northbound right-turn movements and an exclusive right-turn lane. Based on existing peak hour count data at the intersection, the vast majority of turning movements from northbound Commerce Boulevard onto Green Island Road are right-turn movements (29 AM right-turns and 168 PM right-turns). With proposed project traffic, these movements are expected to increase to 49 AM right-turns and 195 PM right-turns. Essentially, the northbound approach lane of Commerce Boulevard at Green Island Road is functioning as an exclusive right-turn lane under existing conditions given the very low northbound left-turn movements at the intersection.

Based on the Transportation Research Board (TRB) Report 279 and AASHTO turn-lane requirements, a northbound right-turn lane would be warranted at the intersection based on an overall approach volume of 207 vehicles (PM peak hour worst-case) and a projected northbound right-turn movement of 195 vehicles. Mitigation Measure TRA-1 would address this issue and reduce this impact to a ***less-than-significant level***.

The Green Island Road/Commerce Boulevard intersection was also evaluated for traffic signal control warrants with Existing and Existing Plus Project Conditions. The Green Island Road/Commerce Boulevard intersection was evaluated for traffic signal control warrants with Existing and Existing Plus Project Conditions. The CaMUTCD manual identifies up to nine warrants which can be used and states that "An engineering study of traffic conditions, pedestrian characteristics, and physical characteristics of the location shall be performed to determine whether installation of a traffic control signal is justified at a particular location"[11]. However, the manual goes on to state that "The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal, since the installation of traffic signals may increase certain types of collisions. Delay, congestion, approach conditions, driver confusion, future land use or other evidence of the need for right of way assignment beyond that which could be provided by stop signs must be demonstrated." The manual recommends engineering judgment should ultimately be used when deciding the appropriateness of signal controls.

Six of the nine warrants were evaluated (three warrants concerning coordinated signal system, roadway network, and railroad crossing locations were not relevant). There are three warrants based on vehicle volumes and none of the three are met with Existing Plus Project Volumes. These include the “peak hour volume,” “8-hour volume,” and “4-hour volume” warrants. Overall hourly approach volumes at the Green Island Road/Commerce Boulevard intersection do not sustain the minimum volumes for signalization nor do the peak AM and PM periods.

[11] California Manual on Uniform Traffic Control Devices (CAMUTCD), Chapter 4C, Traffic Control Signal Needs Studies, 2014 Edition, Revision 3 (March 9, 2018).

Two warrants are based on pedestrian crossing volumes ("pedestrian volumes" and "adequate gaps" for pedestrians) which were applied to the pedestrian volumes in the area. However, while there is a pedestrian sidewalk on the north side of Green Island Road that extends from Commerce Boulevard west to Mezzetta Court and continues north on Green Island Road; there are no pedestrian crosswalks at this intersection. Pedestrian volumes at the Green Island Road/Commerce Boulevard are very light. During the AM and PM peak period only two pedestrians were observed and only one pedestrian crossed north-south on Green Island Road (jay-walked). Therefore, no pedestrian warrants are met at this time.

Finally, an accident search history was conducted for the Green Island Road/Commerce Boulevard intersection based on the California Highway Patrol Statewide Integrated Traffic Records System (SWITRS) for last three calendar years (2015-2017). The crash experience warrant requires at least five accidents at the intersection correctable by a traffic signal (or a combination of volume/pedestrian conditions). Based on the accident search history for the last three full calendar years; the Green Island Road/Commerce Boulevard intersection does not experience significant vehicle conflicts (0 recorded accidents).

Cumulative Development Plus Project Conditions

The 2018 GHD report evaluated cumulative-plus-project conditions for the intersection of Commerce and Green Island Road. That report projected the AM and PM LOSs at the Green Island Road/Commerce Boulevard intersection would decline from A to C and B to D, respectively. Even with this decline, the intersection would continue to operate at acceptable LOSs, given the City's minimum acceptable LOS of D.

Impacts After Mitigation

With Mitigation TRA-1, which recommends installation of a separate right-turn lane on northbound Commerce Boulevard at Green Island Road; overall intersection LOS would improve under Existing Plus Project and Cumulative Plus Project conditions during the PM peak hour (worst case). Specifically, intersection LOS would improve from LOS B (11.2 seconds) to LOS B (10.3 seconds) with Existing Plus Project conditions. Under Cumulative Plus Project conditions, intersection LOS would improve from LOS D (35.0 seconds) to LOS D (29.6 seconds). Therefore all intersection impacts would be reduced to a ***less-than-significant level with mitigation***.

c) The Napa County Airport is located approximately one mile northwest of the project site. The Napa County Airport Land Use Commission establishes land use policies for areas located within the flight path surrounding Napa County airports. The Airport is a subdivision under the Public Works Department of Napa County. The Napa County Airport Land Use Compatibility Plan (ALUCP) (Napa County 1991, revised 1999) identifies a series of zones

with associated recommendations in relation to the proximity to aircraft over-flight paths. This information is also included in the City of American Canyon General Plan. As indicated in the ALUCP, most of the project site is located within Zone D of the Napa County Airport Land Use Compatibility Plan. Zone D prohibits residential uses and requires overflight easements or deed notices for other uses. Most non-residential uses are normally acceptable in this zone, but large retail buildings, hotels/motels, restaurants, and assembly halls are normally not acceptable. The proposed wine warehouse would be an acceptable use with appropriate easements. A small portion of the site may be in Zone E, which is less restrictive than Zone D, and would allow the proposed project use.

Upon the City's approval of the project, an Avigation and Hazard Easement Deed extending over the whole of the property would be executed by the landowner and submitted to the Napa County Board of Supervisors for acceptance.

Therefore, the proposed project would not create aviation safety hazards for air traffic. Impacts would be ***less than significant***.

d, e) The project circulation plan is in compliance with standard traffic design standards and would not present any traffic hazards. The project's location at the end of Commerce Blvd. assures that traffic into and out of the site would not conflict with any other traffic movements. Internal circulation within the proposed project's parking and loading dock areas would consist of two-way aisles. Parking is proposed along the drive aisles at 90-degree angles. This design allows for efficient two-way circulation on all aisles. A truck turn-around area is included in the internal circulation plan. The project design does not include any features that would create a hazardous condition. A sidewalk would be built along the project site's Commerce Road frontage. Impacts of the proposed project would be ***less than significant***.

The circulation plan has been designed to allow 40-foot fire trucks to access all sides of the building. The access point to the project site from Commerce Blvd. would be a minimum of 30 feet wide, which would provide sufficient width for large emergency vehicles (e.g., fire engines).

A total of 189 car and 32 truck dock parking spaces will be provided for the building. Of these parking stalls, 6 will be designated for handicap access with 3 stalls designated for van accessibility and 10 stalls for Clean Air Vehicle parking. The building will have a total of 32 truck loading docks. The developer will construct ADA accessible walkways between the ADA accessible stalls and the entrances to their respective offices to allow for pedestrian access on-site. Emergency ingress and egress will be provided around the full perimeter of the building.

The City of Napa Fire Department, who conducts plan check and inspection for the American Canyon Fire Department, has reviewed and approved the single access design. Semi-trucks would not be allowed on the east, west and south sides of the Building. Only cars and Fire trucks would be allowed. Signage and the truck turnaround at the west end of the truck docks would assure these limitations on truck access are implemented. The City Engineering Department has also reviewed the single access design with the applicant and has no comments.

f) The City of American Canyon and Napa County adopted a Bicycle Plan in 2012 (City of American Canyon and Napa County Transportation and Planning Agency, American Canyon Bicycle Plan, January 2012). That plan (Figure 1) shows a proposed Primary Class II Bicycle Route and Class II Bike Lane on Green Island Road connecting to other areas of the City to the east and wetland and open space areas to the west and south.

The proposed project has been designed to encourage and support public transit as well as bicycle and pedestrian access to the site. Each end of the building will have a bike rack to accommodate up to 4 bicycles, 1 more than the required 7 stalls per the City's Zoning Ordinance Chapter 19.14.090 (A), Bicycle Parking Requirements.

The site plan and nearby off-site improvements appear to be compatible with walking, bicycling, and transit use and do not appear to create additional conflicts with intersections, streets, and highways near the site. Therefore, the project would not conflict with any adopted plans, policies or programs that address alternative transportation and this impact would be ***less than significant***.

Mitigation Measures

Mitigation Measure TRA-1: As described above, Commerce Boulevard would meet the minimum PM peak hour volumes for installation of a separate right-turn lane with Existing Plus Project volumes (the proposed project would add to the existing warrant). Therefore, the applicant shall contribute its fair share to widening and/or re-stripeing northbound Commerce Boulevard at Green Island Road to include a separate right-turn lane and shared through/left-turn lane. Based on the proposed project's contribution to cumulative buildout volumes at the intersection, its "fair share" contribution towards this improvement would equal 4.2% (43 trips / 1,019 cumulative volumes—PM peak hour).

XVII. Tribal Cultural Resources

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				X
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or				X
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significar pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.				X

a) I, ii. A Sacred Lands File search and SB-52 contact information request was forwarded to the Native American Heritage Commission (NAHC) on behalf of the City. The NAHC stated that there were no Tribal Cultural Resources (TCRs) or other potentially significant properties known to be present within or in the vicinity of the project area. In collaboration with the City, SAS contacted four tribal representatives per NAHC recommendations:

Charlie Wright, Chairperson (Cortina Rancheria – Klestal Dehe Band of Wintun Indians)

Jose Simon III, Chairperson (Middletown Rancheria)

Scott Gabaldon, Chairperson (Mishewal-Wappo Tribe of Alexander Valley)

Anthony Roberts, Chairperson (Yocha Dehe Wintun Nation)

Based on input from several of the above-listed individuals, additional contacts were made with Ms. Sally Peterson (Tribal Vice-Chair – Middletown Rancheria), and Mr. Raymond Rouse (GIS Specialist – Yocha Dehe Wintun Nation (Yocha Dehe). None of the initial contacts or subsequent contacts resulted in the identification of any TCRs or other culturally sensitive properties or locations in or near the project area. However, Ms. Peterson did request to be contacted if any Native American cultural resources were encountered during project implementation. Mr. Rouse stated that the Yocha Dehe would like to receive a copy of the final cultural resources report prepared for the project and requested that a specialist from the tribe provide archaeological/cultural sensitivity training to project construction crews.

Archival research, coordination with the NAHC, an archaeological field survey, and outreach to the Native American community did not result in the identification of any TCRs within or near the project area. Consequently, the project would have ***no impact*** on Tribal Cultural Resources

XVII. Utilities and Service Systems

Would the project:

Environmental Issue	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?			X	
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?			X	
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?		X		
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?		X		
e) Result in a determination by the wastewater treatment provider which serves the project that it has adequate capacity to serve the project's projected demand in addition of the provider's existing commitments?			X	
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?			X	
g) Comply with federal, state, and local statutes and regulations related to solid waste?			X	

This analysis is based on the City of American Canyon Will Serve Water Application for the project dated June 08, 2018 (City of American Canyon 2018a).

a ,b, e) The City of American Canyon would provide wastewater collection, treatment, and disposal services for the proposed project. Wastewater from the City's service area is

treated at the American Canyon Wastewater Treatment Plant on Mezzetta Court. This secondary/tertiary treatment plant handles domestic and industrial wastewater flows, and employs a Membrane Bio Reactor and ultraviolet light disinfection to produce a very high-quality effluent exceeding the standards set by the discharge permit (City of American Canyon 2017, 2018c). The facility, which was commissioned in 2002, has the capacity to treat 2.5 mgd with a 5.0 mgd wet weather peak flow. American Canyon's current average dry and wet weather daily flows are estimated at 1.3 and 2.7 million gallons, respectively. These daily flow amounts represent 52 percent and 54 percent of the treatment plant's design capacities (Ambrose, email communication). The proposed project would have an estimated domestic sewer demand of 0.37 AFY (275 gallons/day average), or peak sewer demand of 9,106 gallons per day, which would be less than 0.7% of plant capacity. The domestic sewer demand exceeds potable water demand because a portion of the wastewater would be reclaimed water used for toilets and urinals.

To the south of the treatment plant, 20 acres of constructed wetlands hold effluent from the wastewater plant prior to discharge into the Napa River, which has been designated by the regional Water Quality Control Board (RWQCB) as an impaired waterway. During the wet season from November 1 through April 30, effluent is discharged to North Slough, a tributary to the Napa River. Effluent can be discharged to constructed freshwater wetlands all year round, which eventually overflows to the North Slough. Year round, a portion of the effluent is reclaimed for irrigation (currently approximately 200 AFY). No large spills have been reported from this plant since 2007 (Steve Moore, City of American Canyon Water System Manager, personal communications August 7, 2018).

Discharge volumes of wastewater to the Napa River have been reduced by a wastewater reclamation and recycled water project implemented by the City. Approximately 87 percent of the effluent from the wastewater treatment plant is diverted to the constructed wetlands and the remaining 13 percent is available as recycled water for industrial, agricultural, landscaping, and other uses. The system continues to expand as new recycled lines added and new users are connected. The Wastewater Treatment Plant complies with the California Department of Public Health requirements for tertiary recycled water (California Department of Public Health 2009).

A six-inch sanitary sewer line will connect three office locations within the warehouse to a sewer pump lift station located near the northeast corner of the building tying into the existing City sewer main line in the Commerce Blvd extension.

The proposed project's domestic discharge (no industrial discharge is proposed) would not exceed wastewater treatment requirements of the Regional Water Quality Control Board and would not require the construction of new wastewater treatment facilities or expansion or upsizing of existing facilities. Therefore this impact would be ***less than significant.***

c) Stormwater runoff from the project site would be directed through natural surficial flow and a bioswale into a detention pond that would be constructed as part of the proposed project.

The proposed project would result in a net decrease in peak Stormwater (100-year, 24-hour storm event) runoff rates from the exiting 62.96 cubic feet per second (cfs) to the proposed project's peak runoff rate of 56.40 cfs from the site. New storm drainage facilities are described in IX Hydrology and Water Quality section based on a Hydrology Report (RSA 2018a), and Stormwater Control Plan (RSA 2018b) that were written for the proposed project. With the project's proposed storm drainage/detention facilities and Mitigation Measures HYD-2, HYD-3, HYD-4, and HYD-5, the impact from storm water facilities would be reduced to a ***less-than-significant*** level.

d) The City of American Canyon would provide water service to the site. The City receives water from the following sources:

- State Water Project (SWP);
- Permit (raw) water from the City of Vallejo;
- Treated water from the City of Vallejo;
- Emergency (raw) water from the City of Vallejo, and
- Recycled water from the City of American Canyon's wastewater treatment plant and Napa Sanitation District (City of American Canyon 2016a).

The amount of water delivered to the City of American Canyon from each of these sources can vary from year to year. For instance, deliveries from the SWP have varied between five percent (in 2014) and 100 percent (last occurring in 2006) of the contracted amount (City of American Canyon 2016a).

The City of American Canyon has two water treatment plants: a conventional sedimentation and filtration plant that was commissioned in 1976 and a membrane filtration plant, which has pores small enough to filter out contaminants, such as microorganisms, and that has been in use since 2004 (City of American Canyon 2016a). The proposed project's water demand of 1.84 AFY (0.30 AFY domestic and 1.54 AFY reclaimed interior and landscaping) could be handled by the existing water treatment plants.

California Water Code requires that water purveyors, such as the City of American Canyon, develop an Urban Water Management Plan (UWMP) and update it every five years. The City's Urban Water Management Plan of 2015 estimated an available year 2020 water supply of 5287 AFY, and a demand of 4412 AFY. (City of American Canyon 2015).

The Public Works Department of the City of American Canyon manages the City's water supply. As required by the City, the applicant submitted a Will-Serve Water Application to the Public Works Department for the proposed project. A Water Supply Report would be required by the City in accordance with the City's Methodology for Determining Zero Water Footprint and Developing Water Supply Reports. That report would address how water demand would

be offset and/or whether a payment of in lieu fee towards citywide water demand reduction would be acceptable to the City.

Based on the potable and reclaimed water use at the 718,000 square-foot Hanna Court wine storage warehouses at 644 and 677 Hanna Drive, approximately 1,700 feet south of the project site, the proposed project is estimated to use .308 AFY of domestic (potable) water. This is three percent of the UWMP's projected use at the site, and represents approximately equivalent water demand to a one single-family house in American Canyon (274 gpd for single family dwelling and 275 gpd for the proposed warehouse).

Domestic water would be limited to drinking fountains, sinks, and dishwashers, if any. Most of the water required for the proposed project would be reclaimed water (1.54 AFY), which would be used for landscape irrigation, toilets and urinals. Peak domestic water demand would be 692 gpd and peak reclaimed water demand would be 8,415 gpd (Stravinski Development Group 2018). Implementation of Mitigation Measures UTIL-1 through UTIL-5, below would reduce the project impacts to *a* ***less-than-significant*** level.

f, g) During project construction and operation, the project would generate solid waste requiring disposal. Recology American Canyon provides solid waste and recycling collection services to the commercial and residential customers in American Canyon. Solid waste from American Canyon is delivered by Recology American Canyon to the Devlin Road Transfer Station located at 889 Devlin Road in American Canyon. The transfer station is permitted to receive 1,440 tons of waste per day. From the Devlin Road Transfer Station, solid waste is sent to Keller Canyon Landfill in Pittsburg, CA. Keller Canyon Landfill has a maximum daily throughput of 3,500 tons/day and remaining capacity of 63.4 million cubic yards, which is 84 percent of the landfill's maximum permitted capacity. The anticipated closure date for the landfill is 2030 (CalRecycle 2018). Construction and demolition waste accepted at Keller Canyon Landfill is sorted for recyclable material, such as wood, plastics, and metal, which further helps to alleviate the amount of solid waste going to the landfill. Approximately 3-5 tons a month of reusable items are pulled aside and sent to St. Vincent de Paul in Eugene, Oregon (Napa Recycling and Waste Services 2018). The City of American Canyon is currently meeting its disposal rate waste diversion targets (CalRecycle 2018).

The warehouses project would produce small quantities solid waste, approximately equivalent to that produced by one or two houses. If significant amounts of recyclables, such as cardboard boxes, are generated, the tenant/operators would bale this waste and have it picked up separately from other solid wastes and removed by Recology American Canyon.

Green waste from landscape maintenance is minimal because there are no cultivated grass areas that would need to be mowed. Green wastes would be removed from the site. Natural areas would be left in their native state. If required for fire abatement purposes,

high weeds would be cut and left to decompose on-site (Stravinski Development Group LLC 2018). Solid waste impacts would be ***less than significant***.

Mitigation Measures

Mitigation Measure UTIL-1: The project applicant shall demonstrate compliance with the City's Zero Water Footprint Policy by mitigating all new potable water demands with "wet-water" offsets by one or more of the following options to ensure the project results in a net zero increase in demand for potable water:

- Reducing existing potable water demands onsite
- Funding programs or constructing projects that would conserve an equivalent amount of water elsewhere within the water service area
- Funding of and/or constructing projects that would Increase an equivalent amount of recycled water use elsewhere within the water service area where potable water is currently used and/or
- Purchase new water supplies from other water providers

Mitigation Measure UTIL-2: The project shall be designed and constructed with purple irrigation pipe so that reclaimed water may be used for landscape irrigation purposes. The project shall connect to existing recycled water pipelines for irrigation, toilets, and urinals prior to occupancy.

Mitigation Measure UTIL-3: Prior to issuance of a building permit, the applicant shall pay water capacity fees in accordance with the City's Municipal Code to provide funding for the City to acquire water resources and develop its treatment and distribution system. This would allow for the City to exercise additional options for potable water capacity and would also provide for maintenance of the recycled water system.

Mitigation Measure UTIL-4: Should additional project water be required, the project shall comply with the City's Ordinances and regulations in effect at the time of authorization for additional water use. In addition, such changes in project use would trigger a new City Discretionary Review process, which, in turn, would trigger re-evaluation of the project's water supply impacts.

Mitigation Measure UTIL-5: Prior to issuance of building permits, the project applicant shall submit landscaping plans to the City of American Canyon for review and approval demonstrating that landscaping would comply with the requirements in the City's Model Water Efficient Landscape Ordinance (AB 1881). The landscaping plan shall identify outdoor irrigation water conservation measures such as, but not limited to:

- Drought-resistant vegetation
- Irrigation systems employing the following features:
  - Drip irrigation
  - Low-precipitation-rate sprinklers

  - Bubbler/soaker systems
  - Programmable irrigation controllers with automatic rain shutoff sensors and flow sensing capabilities (ET Smart Controller)
  - Matched precipitation rate nozzles that maximize the uniformity of the water distribution characteristics of the irrigation system
  - Conservative sprinkler spacings that minimize overspray onto paved surfaces
  - Hydrozones that keep plants with similar water needs in the same irrigation zone
- Minimally or gently sloped landscaped areas to minimize runoff and maximize infiltration
- Organic topdressing mulch in non-turf areas to decrease evaporation and increase water retention.

V. MANDATORY FINDINGS OF SIGNIFICANCE

Environmental Issue	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant	No Impact
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of an endangered, rare or threatened species or eliminate important examples of the major periods of California history or prehistory?		X		
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?			X	
c) Does the project have environmental effects which would cause substantial adverse effects on human beings, either directly or indirectly?			X	

a) The proposed project could affect special-status habitat or seasonal wetlands, as discussed above in Section IV. Biological Resources. Although the site does not contain any known historic resources or prehistoric resources, unknown resources could potentially be affected by project implementation, as discussed above in Section V. Cultural Resources. Compliance with the mitigation measures for the unearthing of any unknown cultural resources as well as mitigation required for biological resources would ensure all potential impacts associated with biological and cultural resources would be reduced to ***less than significant***.

b) The proposed project would not result in cumulative impacts that could be cumulatively considerable and potentially affect the general public and the environment. No major new

projects are currently proposed with access to Commerce Blvd. or Green Island Road (City of American Canyon, Active Planning Projects, July 2018). A new elementary school is proposed just southeast of the site at Commerce Blvd. and Eucalyptus Road. That project is in the CEQA review process. The only other large project planned is an approximately 500,000 sq. ft. warehouse project at SR 29 and S. Kelly Road, near the Napa Airport, about a mile north of the site. A conditional use application for outdoor vehicle storage at 834 Green Island Road. It is unlikely that impacts of those projects other than the school would overlap those of this project, with the exception of regional air quality (addressed in this IS) and traffic along SR 29, which is addressed in the City's General Plan. It is possible that construction impacts from the new school could overlap those of the proposed project, however they are likely to be accessed from opposite ends of Commerce Boulevard, so overlap of noise and traffic would be minimal. The cumulative effects of the proposed project would therefore be ***less than significant*.**

It is possible that the two additional parcels to be created by the proposed tentative map would be developed with project similar to that proposed for the project site. Development of those sites could add to cumulative traffic, noise, and air quality impacts of the proposed project. No projects are currently proposed for those sites, therefore assessment of those impacts would be speculative at this time. Environmental review of those project would be required to also consider the proposed project, if approved.

c) The proposed project would generate an increase in air pollutant emissions and greenhouse gasses associated with project construction and operation. These emissions would not be considered great enough to directly or indirectly have an adverse effect on residents living in the area. Hazards associated with any soil contamination would be mitigated on site. The project's hazards would be less than significant, as described in Section VIII of this IS. The impact is considered ***less than significant*.**

Appendix A-1

Air Quality Setting and Regulatory Context

The project site is located within the San Francisco Bay Area Air Basin (Air Basin), which encompasses Alameda, Contra Costa, Santa Clara, San Francisco, San Mateo, Marin, and Napa Counties, and the southern portions of Solano and Sonoma Counties. The Air Basin is characterized by complex terrain which distorts normal wind flow patterns, consisting of coastal mountain ranges, inland valleys, and bays.

Regional Meteorology

Air quality is affected by the rate, amount, and location of pollutant emissions and the associated meteorological conditions that influence pollutant movement and dispersal. Atmospheric conditions, including wind speed, wind direction, stability, and air temperature, in combination with local surface topography (i.e., geographic features such as mountains, valleys, and San Francisco Bay), determine the effect of air pollutant emissions on local air quality.

The climate of the greater San Francisco Bay Area, including Napa County, is a Mediterranean-type climate characterized by warm, dry summers and mild, wet winters. The climate is determined largely by a high-pressure system that is often present over the eastern Pacific Ocean off the west coast of North America. In winter, the Pacific high-pressure system shifts southward, allowing storms to pass through the region. During summer and fall, air emissions generated within the Bay Area can combine with abundant sunshine under the restraining influences of topography and subsidence inversions to create conditions that are conducive to the formation of photochemical pollutants, such as ozone and secondary particulates, such as sulfates and nitrates.

The proposed project site lies in the Napa Valley climatological sub-region of the Bay Area. The Napa Valley is between the Mayacamas Mountains to the west and the Vaca Mountains to the east. These mountains, with an average ridge line height of about 2,000 feet, are effective barriers to the prevailing northwesterlies. The valley is 27 miles long with Napa and Calistoga defining its southern and northern ends, respectively.[1]

An upvalley wind frequently develops during warm summer afternoons drawing from air flowing through the San Pablo Bay. During the evening, especially in the winter, downvalley drainage flow can occur. The prevailing winds are upvalley, southwest through south southeasterly, and occur approximately 50 percent of the time. The second most common winds are down valley drainage winds, north northwesterly through northeasterly, which occur approximately 25 percent of the time. Wind speeds are low with almost 50 percent of the winds between calm and four miles per hour (mph) and an average speed of about five mph. Only five

[1] BAAQMD. Climate, Physiography, And Air Pollution Potential – Bay Area and Its Subregions http://hank.baaqmd.gov/dst/papers/bay_area_climate.pdf

percent of the winds are between 16 and 18 mph which represent strong summer time up valley winds and winter storm winds. Summer average maximum temperatures at the southern end of the valley are in the low 80's with extremes in the high 80's, and at the northern end are in the low 90's with extremes in the high 90's. Winter high temperatures are in the high 50's and low 60's with low temperatures in the high to mid-30's. Sunshine is plentiful and annual average precipitation is 24 inches at Napa.

Summer and fall prevailing winds can transport non-local and locally generated ozone precursors northward where the valley narrows, effectively trapping and concentrating the pollutants under stable conditions. The local upslope and downslope flows setup by the surrounding mountains may also recirculate pollutants adding to the total burden. Also, the high frequency of light winds and associated stable conditions during the late fall and winter, contributes to the buildup of particulates and carbon monoxide (CO) from automobiles, agricultural burning, and fireplace burning.

Local Air Quality

The Bay Area Air Quality Management District (BAAQMD) maintains a network of monitoring stations within the Air Basin that monitor air quality and compliance with applicable ambient standards. The monitoring station closest to and most representative of the project site is in Napa (Jefferson Street), approximately ten miles north of the proposed project site; where levels of ozone (O_3), particulate matter less than 10 micrometers (coarse or PM10), particulate matter less than 2.5 micrometers (fine or PM2.5), CO, and nitrogen dioxide (NO_2) are recorded.

Table A-1 summarizes the most recent three years of data (2015 through 2017) from the Napa air monitoring station. The federal PM2.5 standard was exceeded once in 2015. No State or federal standards were exceeded in 2016. The State ozone standard (24-hour) was exceeded once in 2017 and the federal ozone standard (8-hour) was exceeded twice in 2017. The federal PM2.5 standard was exceeded 13 times in 2017. No other State or federal air quality standards were exceeded during the three-year period.

The Bay Area is currently designated “nonattainment” for state and national (1-hour and 8-hour) ozone standards, for the state PM10 standards, and for state and national (annual average and 24-hour) PM2.5 standards. The Bay Area is designated “attainment” or “unclassifiable” with respect to the other ambient air quality standards.

Table A–1
Air Quality Data Summary (2015 through 2017)

Pollutant	Standard[a]	Monitoring Data by Year 2015	2016	2017
Ozone				
Highest 1 Hour Average (ppm)[b]	0.09	0.079	0.080	**0.098**
Days over State Standard		0	0	**1**
Highest 8 Hour Average (ppm)[b]	0.070	0.069	0.067	**0.084**
Days over National Standard		0	0	**2**
Nitrogen Dioxide (NO_2)				
Highest 1 Hour Average (ppm)[b]	0.180	0.043	0.039	0.053
Days over State Standard		0	0	0
Annual Average ($\mu g/m^3$)[b]	0.030/0.053	0.008	0.007	0.007
Carbon Monoxide (CO)				
Highest 1 Hour Average (ppm)[b]	9.0	3.3	2.2	5.6
Days over State Standard		0	0	0
Highest 8 Hour Average (ppm)[b]	20	1.6	1.5	4.7
Days over State Standard		0	0	0
Coarse Particulate Matter (PM10)				
Highest 24 Hour Average ($\mu g/m^3$)[b]	50	50	33	--
Days over State Standard		0	0	0
State Annual Average ($\mu g/m^3$)[b]	20	18.6	16.6	--
Fine Particulate Matter (PM2.5)				
Highest 24 Hour Average ($\mu g/m^3$)[b]	35	**38.2**	24.3	**199.1**
Days over National Standard		**1**	0	**13**
State Annual Average ($\mu g/m^3$)[b]	12	10.6	8.5	**13.7**

*NOTES: Values in **bold** are in excess of at least one applicable standard.*
Generally, state standards and national standards are not to be exceeded more than once per year.
ppm = parts per million; $\mu g/m^3$ = micrograms per cubic meter.
PM10 is not measured every day of the year. Number of estimated days over the standard is based on 365 days per year. A "—" denotes no information available.

Source: BAAQMD, Air Quality Summary Reports, April 17, 2018. http://www.baaqmd.gov/about-air-quality/air-quality-summaries

The BAAQMD's Community Air Risk Evaluation (CARE) program was initiated in 2004 to evaluate and reduce health risks associated with exposure to outdoor air toxics in the Bay Area. Based on findings of the latest report, diesel particulate matter (DPM) was found to account for approximately 85 percent of the cancer risk from airborne toxics. Carcinogenic compounds from gasoline-powered cars and light duty trucks were also identified as significant contributors: 1,3-butadiene contributed four percent of the cancer risk-weighted emissions, and benzene contributed three percent. Collectively, five compounds—DPM, 1,3-butadiene, benzene, formaldehyde, and acetaldehyde—were found to be responsible for more than 90 percent of the cancer risk attributed to emissions. All of these compounds are associated with emissions from internal combustion engines. The most important sources of cancer risk-weighted emissions were combustion-related sources of DPM, including on-road mobile sources (31 percent), construction equipment (29 percent), and ships and harbor craft (13 percent). A 75 percent reduction in DPM was predicted between 2005 and 2015 when the inventory accounted for

CARB's diesel regulations. Overall, cancer risk from toxic air contaminants (TAC) dropped by more than 50 percent between 2005 and 2015, when emissions inputs accounted for state diesel regulations and other reductions.[2]

Modeled cancer risks from TAC in 2005 were highest near sources of DPM: near core urban areas, along major roadways and freeways, and near maritime shipping terminals. Peak modeled risks were found to be located east of San Francisco, near West Oakland, and the maritime Port of Oakland. BAAQMD has identified seven impacted communities in the Bay Area:

- Western Contra Costa County and the cities of Richmond and San Pablo.
- Western Alameda County along the Interstate 880 corridor and the cities of Berkeley, Alameda, Oakland, and Hayward.
- San Jose.
- Eastern side of San Francisco.
- Concord.
- Vallejo.
- Pittsburgh and Antioch.

The proposed project is within the city of American Canyon, which is not part of the seven CARE program impacted communities in the Bay Area. The health impacts in the Bay Area, as determined both by pollution levels and by existing health vulnerabilities in a community, is approximately 160 cancer risk per million persons, while in American Canyon, the health impact is approximately 98 cancer risk per million persons.[3]

Nearby Sensitive Receptors

BAAQMD considers the relevant zone of influence for an assessment of air quality health risks to be within 1,000 feet of a project site. The project site is generally bound by open land to the north, a eucalyptus tree grove to the west, Clarke Ranch West Open Space to the south and a 64-foot wide City Public Access and Utility Easement to the east, with a mobile home and various sheds farther east. A residential neighborhood is approximately 900 feet southeast of the southern project site boundary. There are no schools or daycare centers within 1,000 feet of the proposed project.

3 BAAQMD. Identifying Areas with Cumulative Impacts from Air Pollution in the San Francisco Bay Area. March 2014. http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CARE%20Program/Documents/ImpactCommunities_2_Methodology.ashx?la=en

Air Quality Significance Thresholds

The significance of potential impacts was determined based on State CEQA Guidelines, Appendix G, and the BAAQMD *CEQA Air Quality Guidelines*. Using Appendix G evaluation thresholds, the proposed project would be considered to have significant air quality impacts if it were to:

A. Conflict with or obstruct implementation of the applicable air quality plan;

B. Violate any air quality standard or contribute substantially to an existing or projected air quality violation;

C. Expose sensitive receptors to substantial pollutant concentrations;

D. Create objectionable odors affecting a substantial number of people; or

E. Result in a cumulatively considerable net increase of any nonattainment pollutant, and/or health impacts (including releasing emissions that exceed quantitative thresholds for ozone precursors).

The air quality analysis follows the methodology presented in the BAAQMD 2017 CEQA Guidelines. The thresholds of significance applied to assess project-level air quality impacts are:

- Average daily construction exhaust emissions of 54 pounds per day of ROG, NO_x, or PM2.5 or 82 pounds per day of PM10;
- Average daily operation emissions of 54 pounds per day of ROG, NO_x, or PM2.5 or 82 pounds per day of PM10; or result in maximum annual emissions of 10 tons per year of ROG, NO_x, or PM2.5 or 15 tons per year of PM10;
- Exposure of persons by siting a new source or a new sensitive receptor to substantial levels of TACs resulting in (a) a cancer risk level greater than 10 in one million, (b) a noncancerous risk (chronic or acute) hazard index greater than 1.0, or (c) an increase of annual average PM2.5 of greater than 0.3 micrograms per cubic meter ($\mu g/m^3$). For this threshold, sensitive receptors include residential uses, schools, parks, daycare centers, nursing homes, and medical centers; or
- Frequently and for a substantial duration, create or expose sensitive receptors to substantial objectionable odors affecting a substantial number of people.

Assessment of a significant cumulative impact if it would result in:

- Exposure of persons, by siting a new source or a new sensitive receptor, to substantial levels of TACs during either construction or operation resulting in (a) a cancer risk level greater than 100 in a million, (b) a noncancer risk (chronic or acute) hazard index greater than 10.0, or (c) annual average $PM_{2.5}$ of greater than 0.8 $\mu g/m^3$.

The BAAQMD air quality significance thresholds are found in **Table A-2**.

The BAAQMD *CEQA Air Quality Guidelines* identify a project-specific threshold of either 1,100 metric tons of carbon dioxide equivalent (CO_2e) per year or 4.6 metric tons of CO_2e per year per service population (i.e., the number of residents plus the number of employees associated with

a new development), which is also considered a cumulatively considerable contribution to the global GHG burden and, therefore, a significant cumulative impact. This analysis applies the 1,100 metric tons of CO_2e per year significance criterion to proposed project GHG emissions.

Table A–2

BAAQMD Air Quality Significance Thresholds

Pollutant	Construction Thresholds	Daily Operational Thresholds	Annual Operational Thresholds
Criteria Air Pollutants			
Reactive Organic Compounds (ROG)	54	54	10
Nitrogen Oxides (NOx)	54	54	10
Coarse Particulate matter (PM10)	82	82	15
Fine Particulate Matter (PM2.5)	54	54	10
Carbon Monoxide (CO)	NA	9.0 ppm (8-hour) and 20.0 ppm (1-hour)	
Fugitive Dust	Best Management Practices	NA	
Project Health Risk and Hazards			
Excess Cancer Risk	10 per million	10 per million	
Chronic Hazard Index	1.0	1.0	
Acute Hazard Index	1.0	1.0	
Incremental Annual Average PM2.5	0.3 μg/m^3	0.3 μg/m^3	
Cumulative Health Risk and Hazards			
Excess Cancer Risk	100 per million	100 per million	
Chronic Hazard Index	10.0	10.0	
Acute Hazard Index	10.0	10.0	
Incremental Annual Average PM2.5	0.8 μg/m^3	0.8 μg/m^3	
Greenhouse Gas Emissions			
Annual Emissions	1,100 metric tons or 4.6 metric tons per capita

Air Quality Calculations

Construction Activities

Construction activities are expected to commence in October 2018 with site preparation and grading. Building construction would follow and paving and coating would occur during the summer of 2018. The proposed project would be constructed in a single phase estimated to require approximately ten months. **Table AQ-3** provides the estimated construction schedule for each phase: site preparation, grading, building construction, paving, and coating.

Table AQ–3

Estimated Construction Schedule

Phase	Description	Start	End	Working Days
1	Site Preparation	10/15/2018	10/19/2018	5
2	Grading	10/20/2018	11/16/2018	20
3	Building Construction	11/17/2018	7/26/2019	180
4	Paving	7/27/2018	8/23/2019	20
5	Architectural Coating	8/24/2018	9/6/2019	10

SOURCE: CalEEMod Version 2016.3.2.

Project construction would generate short-term emissions of air pollutants, including fugitive dust and equipment exhaust emissions. The BAAQMD *CEQA Air Quality Guidelines* recommend quantification of construction-related exhaust emissions and comparison of those emissions to significance thresholds. The CalEEMod (California Emissions Estimator Model, Version 2016.3.2) was used to quantify construction-related pollutant emissions. CalEEMod output worksheets are included in **Appendix A-2**.

The estimated construction equipment associated with the proposed project along with the number of pieces of equipment, daily hours of operation, horsepower (hp), and load factor (i.e., percent of full throttle) are shown in **Table A-4**.

Table A–4

Estimated Project Construction Equipment Usage

Phase	Equipment	Amount	Daily Hours	HP	Load Factor
Site Preparation	Rubber Tired Dozers	3	8	247	0.4
Site Preparation	Tractors/Loaders/Backhoes	4	8	97	0.37
Grading	Excavators	2	8	158	0.38
Grading	Graders	1	8	187	0.41
Grading	Rubber Tired Dozers	1	8	247	0.4
Grading	Tractors/Loaders/Backhoes	2	8	97	0.37
Grading	Scrapers	2	8	367	0.48
Building Construction	Cranes	1	7	231	0.29
Building Construction	Forklifts	3	8	89	0.2
Building Construction	Generator Sets	1	8	84	0.74
Building Construction	Tractors/Loaders/Backhoes	3	7	97	0.37
Building Construction	Welders	1	8	46	0.45
Paving	Pavers	2	8	130	0.42
Paving	Paving Equipment	2	8	132	0.36
Paving	Rollers	2	8	80	0.38
Architectural Coating	Air Compressors	1	6	78	0.48

SOURCE: CalEEMod Version 2016.3.2.

Based on CalEEMod, a total of approximately 87 vendor truck trips were estimated during building construction. During the construction, 15 to 25 workers would be at the site, with a maximum near 100 workers. **Table A-5** provides a list of the expected trips and trip lengths by construction phase of vendors and construction workers.

Table A–5

Construction Trips and Trip Lengths

Phase	Worker Trips	Vendor Trips	Haul Truck Trips	Worker Trip Length (mile)	Vendor Trip Length (mile)	Haul Trip Length (mile)
Site Preparation	18	0	0	10.8	7.3	20.0
Grading	20	0	0	10.8	7.3	20.0
Building Construction	222	88	0	10.8	7.3	20.0
Paving	15	0	0	10.8	7.3	20.0
Architectural Coating	44	0	0	10.8	7.3	20.0

SOURCE: CARB CalEEMod Version 2013.2.2.

The emissions generated from these construction activities include:

- Dust (including PM10 and PM2.5) primarily from "fugitive" sources (i.e., emissions released through means other than through a stack or tailpipe) such as material handling and travel on unpaved surfaces;

- Combustion emissions of criteria air pollutants (ROG, NO_x, CO, PM10, and PM2.5) primarily from operation of heavy off-road construction equipment and construction worker automobile trips (primarily gasoline-operated); and
- VOC emissions from coating.

Construction-related fugitive dust emissions would vary from day to day, depending on the level and type of activity, silt content of the soil, and the weather. In the absence of mitigation, construction activities may result in significant quantities of dust, and as a result, local visibility and PM10 concentrations may be adversely affected on a temporary and intermittent basis during construction. In addition, the fugitive dust generated by construction would include not only PM10, but also larger particles, which would fall out of the atmosphere within several hundred feet of the site and could result in nuisance-type impacts.

Erosion control measures and water programs are typically undertaken to minimize these fugitive dust and particulate emissions. A dust control efficiency of over 50 percent due to daily watering and other measures (e.g., limiting vehicle speed to 15 mph, management of stockpiles, screening process controls, etc.) was estimated. Based on CalEEMod, one water application per day reduces fugitive dust by 34 percent, two water applications per day reduces fugitive dust by 55 percent, and three water applications per day reduces fugitive dust by 61 percent.

Operations

The project site is located in the City of American Canyon on the west side of the unimproved Commerce Blvd. extension north of Eucalyptus Drive and due north of the City of American Canyon Clarke Ranch open space/recreation area. The property is at the south end of the expanded Green Island Industrial Area. The property is generally trapezoidal in shape and is approximately 15.21 acres in size.

The proposed project would consist of a 330,528 square foot wine storage warehouse and 6,600 square feet of office space on the 15.21 acre site. Because the building is proposed for warehousing and distribution of wine and/or other wine related products it would be heavily insulated and refrigerated. It is anticipated that the proposed project would have approximately 50 full-time employees and up to 30 part-time employees and operate 12 to 18 hours a day during the peak season. Approximately 3 to 5 vehicles trips per day would be from clients or visitors to the site.

A total of 184 car and 32 truck dock parking spaces would be provided for the building. Of these parking stalls, 10 stalls would be designated for Clean Air Vehicle parking. The project's traffic demands would be 559 weekday daily project trips (1.69 trips per 1,000 SF).[1]

The proposed project would be installed with a night-air cooling system to capture the cold air from outside during the night, which reduces the demand to use the refrigeration system. This reduces the building's electricity demand and is a unique trait of the Napa Valley climate to allow such a cooling process.

[1] OmniMeans. *Green Island Wine Warehouse Trip Generation Comparison*. June 21, 2016.

In many climates, night temperatures are cool even when daytime temperatures exceed economizer limits. Taking advantage of this resource, the air handler and economizer can flush the building with night air to cool down the building mass. The cool mass then acts as a heat sink the following day.

Setting controls for night precooling can save a significant amount of energy, depending on location. Studies indicate cost savings range from five percent in Phoenix, Arizona, to 18 percent in Denver, Colorado, for a typical office building. Night precooling also reduces peak demand. Simulation analyses show that precooling a 100,000 square foot three-story building in Sacramento, California, would reduce energy use by 12.6 percent and cause a peak demand reduction of 31.3 percent.[2]

Interior lighting for the proposed project would be designed to meet Title 24 standards; however, measures to increase efficiency and reduce excess energy usage inside the warehouse would be promoted. Features such as motion sensor lighting for areas within the warehouse would be installed. This is beneficial as it reduces energy bills and reduces heat generate inside, further reducing the energy demands to cool the warehouse. The most current Pacific Gas & Electric incentives would be investigated and all attempts to incorporate them into the design would be made.

The fork lifts used within the warehouse would be powered by electricity instead of the typical natural gas powered fork lifts. This reduces the GHG emitted by the fork lift and is more efficient and less impactful on the air within the building. Each end of the building would have a bike rack to accommodate up to four bicycles, one more than the required seven stalls.

CalEEMod default electrical usage was adjusted to be consistent with the SGE 258 Warehouse Project[3] but scaled up to 330,528 square feet. The SGE 258 Warehouse Project energy use of was estimated using actual electrical usage from two nearby and almost identical buildings. Both buildings are insulated and refrigerated to the same degree as the proposed project.

CalEEMod default natural gas usage was adjusted to zero, although available in the street the proposed project would not bring it on site as there is no need. The proposed project would, instead, use electric water heaters and heat pump for the offices.

GHG emissions rates associated with electricity consumption were adjusted to account for Pacific Gas & Electric's projected 2020 (year in which project becomes operational) CO_2 intensity rate. This intensity rate is based, in part, on the requirement of a renewable energy portfolio standard of 33 percent by the year 2020. CalEEMod uses a default rate of 641 pounds of CO_2 per megawatt of electricity produced. The Pacific Gas & Electric's projected 2020 CO_2 intensity rate is 290 pounds of CO_2 per megawatt of electricity produced.[4]

Appendix A-4

Greenhouse Gas Setting and Regulatory Context

"Global warming" and "global climate change" are the terms used to describe the increase in the average temperature of the earth's near-surface air and oceans since the mid-20th century and its projected continuation. Warming of the climate system is now considered to be unequivocal (IPCC, 2007), with global surface temperature increasing approximately 1.33 degrees Fahrenheit (°F) over the last 100 years. Continued warming is projected to increase global average temperature between 2 and 11°F over the next 100 years.

Natural processes and human actions have been identified as the causes of this warming. The International Panel on Climate Change (IPCC) concludes that variations in natural phenomena such as solar radiation and volcanoes produced most of the warming from pre-industrial times to 1950 and had a small cooling effect afterward. After 1950, however, increasing GHG concentrations resulting from human activity such as fossil fuel burning and deforestation have been responsible for most of the observed temperature increase. These basic conclusions have been endorsed by more than 45 scientific societies and academies of science, including all of the national academies of science of the major industrialized countries. Since 2007, no scientific body of national or international standing has maintained a dissenting opinion.

Increases in GHG concentrations in the earth's atmosphere are thought to be the main cause of human-induced climate change. GHGs naturally trap heat by impeding the exit of solar radiation that has hit the earth and is reflected back into space. Some GHGs occur naturally and are necessary for keeping the earth's surface inhabitable. However, increases in the concentrations of these gases in the atmosphere during the last 100 years have decreased the amount of solar radiation that is reflected back into space, intensifying the natural greenhouse effect and resulting in the increase of global average temperature.

Gases that trap heat in the atmosphere are referred to as GHGs because they capture heat radiated from the sun as it is reflected back into the atmosphere, much like a greenhouse does. The accumulation of GHGs has been implicated as the driving force for global climate change. The primary GHGs are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O), ozone, and water vapor.

While the presence of the primary GHGs in the atmosphere are naturally occurring, CO_2, CH_4, and N_2O are also emitted from human activities, accelerating the rate at which these compounds occur within earth's atmosphere. Emissions of CO_2 are largely by-products of fossil fuel combustion, whereas methane results from off-gassing associated with agricultural practices and landfills. Other GHGs include hydrofluorocarbons, perfluorocarbons, and sulfur

hexafluoride, and are generated in certain industrial processes. Greenhouse gases are typically reported in "carbon dioxide-equivalent" measures (CO_2e).[1]

There is international scientific consensus that human-caused increases in GHGs have and will continue to contribute to global warming. Potential global warming impacts in California may include, but are not limited to, loss in snow pack, sea level rise, more extreme heat days per year, more high ozone days, more large forest fires, and more drought years. Secondary effects are likely to include a global rise in sea level, impacts to agriculture, changes in disease vectors, and changes in habitat and biodiversity.[2]

Senate Bill 97

Senate Bill (SB) 97, signed in August 2007, acknowledges that climate change is a prominent environmental issue requiring analysis under CEQA. This bill directed the Governor's Office of Planning and Research (OPR) to prepare, develop, and transmit to the California Natural Resources Agency guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA, no later than July 1, 2009. The California Natural Resources Agency was required to certify or adopt those guidelines by January 1, 2010. On December 30, 2009, the Natural Resources Agency adopted amendments to the CEQA Guidelines, as required by SB 97. These CEQA Guidelines amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in draft CEQA documents. The amendments became effective March 18, 2010.

Assembly Bill 1493

In 2002, Assembly Bill (AB) 1493 was passed, which required the CARB to develop and adopt, by January 1, 2005, regulations that achieve "the maximum feasible reduction of GHGs emitted by passenger vehicles and light-duty trucks and other vehicles determined by the CARB to be vehicles whose primary use is noncommercial personal transportation in the state."

To meet the requirements of AB 1493, the CARB approved amendments to the California Code of Regulations (CCR) in 2004, adding GHG emissions standards to California's existing standards for motor vehicle emissions. Amendments to CCR Title 13, Sections 1900 and 1961 (13 CCR 1900, 1961), and adoption of Section 1961.1 (13 CCR 1961.1), require automobile manufacturers to meet fleet-average GHG emissions limits for all passenger cars, light-duty trucks within various weight criteria, and medium-duty passenger vehicle weight classes (i.e., any medium-duty vehicle with a gross vehicle weight [GVW] rating of less than 10,000 pounds and that is designed primarily for the transportation of persons), beginning with model year 2009. For passenger cars and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 pounds or less, the GHG emission limits for model year 2016 are approximately 37 percent

[1] Because of the differential heat absorption potential of various GHGs, GHG emissions are frequently measured in "carbon dioxide-equivalents," which present a weighted average based on each gas's heat absorption (or "global warming") potential.

[2] 2006 Final Climate Action Team Report to the Governor and Legislature. March 2006. http://www.climatechange.ca.gov/climate_action_team/reports/2006report/2006-04-03_FINAL_CAT_REPORT.PDF.

lower than the limits for the first year of the regulations, model year 2009. For light-duty trucks with an LVW of 3,751 pounds to a GVW of 8,500 pounds, as well as for medium-duty passenger vehicles, GHG emissions will be reduced approximately 24 percent between 2009 and 2016.

Because the Pavley standards (named for the bill's author, state Senator Fran Pavley) would impose stricter standards than those under the Federal CAA, California applied to the USEPA for a waiver under the Federal CAA. This waiver was initially denied in 2008. In 2009, however, the USEPA granted the waiver.

Executive Order S-3-05

In 2005, in recognition of California's vulnerability to the effects of climate change, then-Governor Arnold Schwarzenegger established Executive Order S-3-05, which sets forth the following target dates by which statewide GHG emissions would be progressively reduced: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; and by 2050, reduce GHG emissions to 80 percent below 1990 levels.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

California passed the California Global Warming Solutions Act of 2006 (AB 32; California Health and Safety Code Division 25.5, Sections 38500 - 38599). AB 32 establishes regulatory, reporting, and market mechanisms to achieve quantifiable reductions in GHG emissions and establishes a cap on statewide GHG emissions. AB 32 requires that statewide GHG emissions be reduced to 1990 levels by 2020. This reduction will be accomplished by enforcing a statewide cap on GHG emissions that will be phased in starting in 2012. To effectively implement the cap, AB 32 directs CARB to develop and implement regulations to reduce statewide GHG emissions from stationary sources. AB 32 specifies that regulations adopted in response to AB 1493 should be used to address GHG emissions from vehicles. However, AB 32 also includes language stating that if the AB 1493 regulations cannot be implemented, then CARB should develop new regulations to control vehicle GHG emissions under the authorization of AB 32.

AB 32 requires CARB to adopt a quantified cap on GHG emissions representing 1990 emissions levels and disclose how it arrived at the cap; institute a schedule to meet the emissions cap; and develop tracking, reporting, and enforcement mechanisms to ensure that the state reduces GHG emissions enough to meet the cap. AB 32 also includes guidance on instituting emissions reductions in an economically efficient manner, along with conditions to ensure that businesses and consumers are not unfairly affected by the reductions. Using these criteria to reduce statewide GHG emissions to 1990 levels by 2020 would represent an approximate 25 to 30 percent reduction in current emissions levels. However, CARB has discretionary authority to seek greater reductions in more significant and growing GHG sectors, such as transportation, as compared to other sectors that are not anticipated to significantly increase emissions. Under AB 32, CARB must adopt regulations to achieve reductions in GHG to meet the 1990 emissions cap by 2020.

Climate Change Scoping Plan

AB 32 required CARB to develop a Scoping Plan that describes the approach California will take to reduce GHG to achieve the goal of reducing emissions to 1990 levels by 2020. The Scoping Plan was first approved by CARB in 2008 and must be updated every five years. The initial AB 32 Scoping Plan contains the main strategies California will use to reduce the GHG that cause climate change. The initial Scoping Plan has a range of GHG reduction actions which include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms such as a cap-and-trade system, and an AB 32 program implementation fee regulation to fund the program. In August 2011, the initial Scoping Plan was approved by CARB.

The 2013 Scoping Plan Update builds upon the initial Scoping Plan with new strategies and recommendations. The 2013 Update identifies opportunities to leverage existing and new funds to further drive GHG emission reductions through strategic planning and targeted low carbon investments. The 2013 Update defines CARB climate change priorities for the next five years and sets the groundwork to reach California's long-term climate goals set forth in Executive Orders S-3-05 and B-16-2012. The 2013 Update highlights California progress toward meeting the near-term 2020 GHG emission reduction goals defined in the initial Scoping Plan. In the 2013 Update, nine key focus areas were identified (energy, transportation, agriculture, water, waste management, and natural and working lands), along with short-lived climate pollutants, green buildings, and the cap-and-trade program. On May 22, 2014, the First Update to the Climate Change Scoping Plan was approved by the Board, along with the finalized environmental documents.

Executive Order No. B-30-15

On April 29, 2015, Executive Order No. B-30-15 was issued to establish a California GHG reduction target of 40 percent below 1990 levels by 2030. Executive Order No. B-30-15 sets a new, interim, 2030 reduction goal intended to provide a smooth transition to the existing ultimate 2050 reduction goal set by Executive Order No. S-3-05 (signed by Governor Schwarzenegger in June 2005). It is designed so State agencies do not fall behind the pace of reductions necessary to reach the existing 2050 reduction goal. Executive Order No. B-30-15 orders "All State agencies with jurisdiction over sources of GHG emissions shall implement measures, pursuant to statutory authority, to achieve reductions of GHG emissions to meet the 2030 and 2050 targets." The Executive Order also states that "CARB shall update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent." CARB's second update to the Climate Change Scoping Plan (The 2017 Scoping Plan") reflects the 2030 reduction target and is described below.

Senate Bill 32

In September of 2016, Governor Brown signed Senate Bill (SB) 32 into law, which extended the goals of AB32 and set a goal 2030 goal of reducing GHG emissions 40 percent below 1990 levels by 2030. With SB 32, the Legislature passed companion legislation AB 197, which provided additional direction for developing the Scoping Plan.

In December of 2017, CARB adopted the second update to the Climate Change Scoping Plan, the 2017 Scoping Plan. The 2017 Scoping Plan provides a framework for achieving the 2030 target. The 2017 Scoping Plan Update builds upon the successful framework established by the initial Scoping Plan and the first update (the 2013 Update), while identifying new, technologically feasible, and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities. The 2017 Plan includes policies to require direct GHG reductions at some of the State's largest stationary sources and mobile sources. These policies include the use of lower GHG fuels, efficiency regulations, and the Cap-and-Trade Program, which constraints and reduces emissions at covered sources. The 2017 Plan also noted that the Recycling and Waste Sector generates two percent of California's total GHG emissions.

California Green Building Standards Code

The 2016 California Green (CALGreen) Building Standards Code (California Code Regulations, Title 24, Part 11) is a comprehensive and uniform regulatory code for all residential, commercial and school buildings. The 2016 Standards were effective January 1, 2017.

CALGreen does not prevent a local jurisdiction from adopting a more stringent code as state law provides methods for local enhancements. CALGreen recognizes that many jurisdictions have developed existing construction and demolition ordinances, and defers to them as the ruling guidance provided they provide a minimum 50-percent diversion requirement. CALGreen also provides exemptions for areas not served by construction and demolition recycling infrastructure. State building code provides the minimum standard, which buildings need to meet in order to be certified for occupancy. Enforcement is generally through the local building official.

The development of CALGreen is intended to (1) cause a reduction in GHG emissions from buildings; (2) promote environmentally responsible, cost-effective, healthier places to live and work; (3) reduce energy and water consumption; and (4) respond to the directives by the Governor. In short, CALGreen is established to reduce construction waste; make buildings more efficient in the use of materials and energy; and reduce environmental impacts during and after construction.

CALGreen contains requirements for construction site selection, storm water control during construction, construction waste reduction, indoor water use reduction, material selection, natural resource conservation, site irrigation conservation, and more. CALGreen provides for design options allowing the designer to determine how best to achieve compliance for a given site or building condition. CALGreen also requires building commissioning, which is a process for verifying that all building systems, like heating and cooling equipment and lighting systems, are functioning at their maximum efficiency. The following provides examples of CALGreen requirements:

- **Designated parking.** Provide designated parking in commercial projects for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles.

- **Recycling by Occupants.** Provide readily accessible areas that serve the entire building and are identified for the depositing, storage and collection of nonhazardous materials for recycling.

- **Construction waste.** A minimum 50-percent diversion of construction and demolition waste from landfills, increasing voluntarily to 65 and-75 percent for new homes and 80-percent for commercial projects. All (100 percent) of trees, stumps, rocks and associated vegetation and soils resulting from land clearing shall be reused or recycled.

- **Wastewater reduction.** Each building shall reduce the generation of wastewater by installation of water-conserving fixtures or using nonpotable water systems.

- **Water use savings.** 20-percent mandatory reduction in indoor water use with voluntary goal standards for 30, 35, and 40-percent reductions.

- **Water meters.** Separate water meters for buildings in excess of 50,000 square feet or buildings projected to consume more than 1,000 gallons per day.

- **Irrigation efficiency.** Moisture-sensing irrigation systems for larger landscaped areas.

- **Materials pollution control.** Low-pollutant emitting interior finish materials such as paints, carpet, vinyl flooring, and particleboard.

- **Building commissioning.** Mandatory inspections of energy systems (i.e. heat furnace, air conditioner, mechanical equipment) for nonresidential buildings over 10,000 square feet to ensure that all are working at their maximum capacity according to their design efficiencies.

Greenhouse Gas Regional Emission Estimates

In 2013, the United States emitted about 6.673 billion tons of CO_2e. Of the four major sectors nationwide - residential, commercial, industrial, and transportation – electrical generation accounts for the highest fraction of GHG emissions (approximately 31 percent); these emissions are entirely generated from direct fossil fuel combustion. . United States emissions increased by 2.0 percent from 2012 to 2013. Recent trends can be attributed to multiple factors including increased emissions from electricity generation, an increase in miles traveled by on-road vehicles, an increase in industrial production and emissions in multiple sectors, and year-to-year changes in the prevailing weather. Greenhouse gas emissions in 2013 were 9 percent below 2005 levels.[3]

The composition of gross GHG emissions in the United States in 2013 (expressed in terms of CO_2e) were as follows:

- CO_2 accounted for 82 percent;

---

[3] USEPA, *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2013, April 2015,* http://www.epa.gov/climatechange/Downloads/ghgemissions/US-GHG-Inventory-2015-Main-Text.pdf

- CH_4 accounted for 10 percent;
- N_2O accounted for 5 percent; and
- Fluorinated gases (HFCs, PFC, and SF_6) accounted for 3 percent.[4]

California's gross emissions of GHG decreased by 1.6 percent from 466.3 million metric tons of CO_2e in 2000 to 458.7 million metric tons in 2012, with a maximum of 492.7 million metric tons in 2004. During the same period, California's population grew by 11 percent from 34 to 37.8 million people. As a result, California's per capita GHG emissions have generally decreased over the last 12 years from 13.7 in 2000 to 12.1 million metric tons of CO_2e per person in 2012.[5] California has one of the lowest per capita GHG emission rates in the country, due to the success of its energy efficiency and renewable energy programs and commitments that have lowered the state's GHG emissions rate of growth by more than half of what it would have been otherwise. Another factor that has reduced California's fuel use and GHG emissions is its mild climate compared to that of many other states.

The transportation sector remains the largest source of GHG emissions in 2012, accounting for 36 percent of California's GHG emission inventory. Contributions from the transportation sector include emissions from on-road and off-road vehicles, aviation, rail and water-borne vehicles, and some other minor sources. Transportation-related GHG emissions have dropped 12 percent since reaching a maximum in 2007. In 2012, emissions from the on-road category decreased by 0.5 percent from the previous year.[6]

In the San Francisco Bay Area, the transportation sector and industrial/commercial sector represent the largest sources of GHG emissions, accounting for 36.4 percent each of the Bay Area's 95.8 million tons of CO_2e in 2007. Electricity/co-generation sources account for about 15.9 percent of the Bay Area's GHG emissions, followed by residential fuel usage at about 7.1 percent. Off-road equipment and agricultural/farming sources currently account for approximately three percent and 1.2 percent of the total Bay Area GHG emissions, respectively.[7]

1. INTRODUCTION

Monk & Associates, Inc. (M&A) has prepared this biological resource analysis for the proposed SDG Commerce 330 Distribution Center project site (herein referred to as the project site) located in the City of American Canyon, California (Figures 1 and 2). The purpose of our analysis is to provide a description of existing biological resources on the project site and to identify potentially significant impacts that could occur to sensitive biological resources from the construction of a warehouse and associated parking on the project site.

Biological resources include common plant and animal species, and special-status plants and animals as designated by the U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Wildlife (CDFW), National Marine Fisheries Service (NMFS), and other resource organizations, including the California Native Plant Society (CNPS). Biological resources also include waters of the United States and State, as regulated by the U.S. Army Corps of Engineers (Corps), California Regional Water Quality Control Board (RWQCB), and CDFW. Our analysis includes a formal delineation of "waters of the U.S." that was confirmed in 2012 and reverified by the Corps in 2017.

This biological resources analysis also provides mitigation measures for "potentially significant" and "significant" impacts that could occur to biological resources. Whenever possible, upon implementation, the prescribed mitigation measures would reduce impacts to levels considered less than significant pursuant to the California Environmental Quality Act (CEQA) (Pub. Resources Code §§ 21000 et seq.; 14 Cal. Code Regs §§ 15000 et seq). Accordingly, this report is suitable for review and inclusion in any review being conducted by the City of American Canyon for the proposed project pursuant to the CEQA.

2. PROPERTY LOCATION AND SETTING

The approximately 15-acre project site is located off an extension of Commerce Boulevard in the City of American Canyon, Napa County, California (Figures 1 and 2). The project site is bordered to the east by Jungle Paintball, a 40-acre paintball park, and a large eucalyptus grove with scattered mobile homes. Further to the east is Oat Hill, a geographically prominent hill west of Highway 29. A mix of open space and large warehouses occurs north of the project site and the American Canyon Wastewater Treatment Plant is located west of the project site. Clark Ranch, open space owned by the City of American Canyon, borders the project site to the south, and Eucalyptus Drive and a residential subdivision are located further to the south. Figure 3 provides an aerial photograph that shows the project site features and the surrounding land use.

The 15-acre project site is part of a larger 35.85-acre parcel (formerly known as Lot 3) that is comprised of a highly disturbed, ruderal (weedy) plant community, with minor depressions that were likely created by the heavy equipment that was used to clear the site of blue gum eucalyptus (*Eucalyptus globulus*) trees in 2012.

3. PROPOSED PROJECT

The applicant proposes to construct a 330,528-square foot warehouse with associated parking areas and a detention basin on the 15-acre project site. Access to the warehouse will be provided

by extending Commerce Boulevard to the south with a cul-de-sac located at the northeastern corner of the 15-acre project site, as illustrated on the Preliminary Site Plan (see attached Sheet C1).

4. ANALYSIS METHODS

Prior to preparing this biological resources analysis report, M&A researched the most recent version of CDFW's Natural Diversity Database, RareFind 5 application (CNDDB 2018) for historic and recent records of special-status plant and animal species (that is, threatened, endangered, rare) known to occur in the region of the project site. All special-status species records were compiled in tables. M&A examined all known record locations for special-status species to determine if special-status species could occur on the project site or within an area of affect.

M&A biologists have a long history of field surveys associated with the approximately 35-acre parcel. M&A biologists conducted site surveys on the parcel on March 1 and April 27, 2006, June 14, 2011, February 14, March 21, and June 12, 2012, May 18, 2017, and on March 30, 2018. In 2006, and again in 2011, M&A conducted a wetland delineation on the entire parcel. This delineation of "waters of the U.S." was confirmed by the Corps in 2012 and reverified by this agency in 2017. The Corps Confirmed Reverification of Aquatic Resources Delineation Map is provided as Sheet 2.

During the site surveys and wetland delineations, M&A biologists recorded biological resources and assessed the likelihood of resource regulated areas on the project site. In addition to the wetland delineations, the survey involved searching all habitats on the site and recording all plant and wildlife species observed. M&A cross-referenced the habitats found on the project site against the habitat requirements of local or regionally known special-status species to determine if the proposed project could directly or indirectly impact such species. The results of our literature research and field reconnaissance are provided in the sections below.

5. RESULTS OF RESEARCH AND PROJECT SITE ANALYSES

5.1 Topography

The project site is relatively flat with elevations ranging from 8 to 20 feet above sea level. The ground is undulating due to past land use disturbances including eucalyptus tree removal in 2012. The site slopes gently to the west towards North Slough and the Napa River.

5.2 Hydrology

There are no drainages on the project site. The only indicators of hydrology found onsite are contained within one small topographic depression which the Corps confirmed to be an "isolated" seasonal wetland (i.e., not within their jurisdiction) (Sheet 2).

5.3 Plant Communities and Associated Wildlife Habitats

A complete list of plant species observed on the project site is presented in Table 1. Nomenclature used for plant names follows *The Jepson Manual* Second Edition (Baldwin 2012) and changes made to this manual as published on the Jepson Interchange Project website

(http://ucjeps.berkeley.edu/interchange/index.html). Table 2 is a list of wildlife species observed on the project site. Nomenclature for wildlife follows CDFW's *Complete list of amphibian, reptile, bird, and mammal species in California* (CDFW 2016) and any changes made to species nomenclature as published in scientific journals since the publication of CDFW's list.

5.3.1 RUDERAL HERBACEOUS VEGETATION

On March 30, 2018, M&A biologists characterized the vegetation present on the project site. A complete list of plant species observed within the project site is presented in Table 1. The project site is dominated by ruderal vegetation including stinkwort (*Dittrichia graveolens*), Italian rye grass (*Festuca perennis*), ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), slender wild oat (*Avena barbata*), common vetch (*Vicia sativa*), red-stem filaree (*Erodium cicutarium*), bull thistle (*Cirsium vulgare*), Italian thistle (*Carduus pycnocephalus pycnocephalus*), bristly ox-tongue (*Helminthotheca echioides*), California burclover (*Medicago polymorpha*), and cut-leaf geranium (*Geranium dissectum*). Native, coyote brush (*Baccharis pilularis* subsp. *consanguinea*), a plant that responds to land disturbances, such as is found on the project site, is also common on this parcel.

Typically, ruderal communities provide habitat for those animal species adapted to humans. Examples of animals associated with these communities include wild turkey (*Meleagris gallopavo*), house finch (*Haemorhous mexicanus*), black phoebe (*Sayornis nigricans*), American crow (*Corvus brachyrhynchos*), mourning dove (*Zenaida macroura*), California ground squirrel (*Otospermophilus beecheyi*), California meadow vole (*Microtus californicus*), and Botta's pocket gopher (*Thomomys bottae*), all of which have been observed on the project site. Red-shouldered hawk (*Buteo lineatus*), tree swallows (*Tachycineta bicolor*), Nuttall's woodpecker (*Picoides nuttallii*), and northern flicker (*Colaptes auratus*), among others, likely nest in the eucalyptus trees that border the project site to the west, north and south.

5.3.2 EUCALYPTUS GROVE

Various species of *Eucalyptus* trees have been planted in California for windbreaks, wood, pulp, and other uses. These areas constitute a plantation community (Holland and Keil 1995) and are usually composed of a single species in a very dense planting. On the project site, blue gum eucalyptus trees (*Eucalyptus globulus*) were once abundant throughout; these trees are now restricted to the southern project site boundary where they grow in a linear row. Blue gum trees tower over all of the species native to the area. The trees shade the ground and litter the soil surface with fallen branches, leaves, fruits, and bark. Rainwater passing through the leaves and branches carry dissolved chemicals that add to the substances leached from the fallen litter producing a significant allelopathic (growth inhibiting) effect on understory vegetation. The net result is that very few other plant species are able to grow around or under the blue gum trees. Consequently, the understory is often sparse if present at all. Thus, in areas where blue gum trees have been planted, they have almost completely replaced the native vegetation (Holland and Keil 1995).

Red-shouldered hawk (*Buteo lineatus*), tree swallows (*Tachycineta bicolor*), Nuttall's woodpecker (*Picoides nuttallii*), and northern flicker (*Colaptes auratus*), among others, likely nest in the eucalyptus trees that border the project site to the west, north and south.

5.3.3 SEASONAL WETLANDS

The isolated seasonal wetland is dominated by Italian rye grass, English plantain (*Plantago lanceolata*), Mediterranean grass, curly dock (*Rumex crispus*) and bristly ox-tongue: all of these plants are non-native species that are just as readily found in upland habitats as they are in wetland areas.

Seasonal wetlands provide a temporary water source for amphibians such as the common Sierran tree frog (*Pseudacris sierra*) and California toad (*Anaxyrus boreas halophilus*) to mate, lay eggs, and forage through the winter and early spring months. Seasonal wetlands also provide drinking water for local wildlife such as the raccoon (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), and striped skunk (*Mephitis mephitis*). By the summer months seasonal wetlands are undetectable to the untrained eye and may appear to be a part of the adjacent upland ruderal herbaceous community.

5.4 Wildlife Corridors

Wildlife corridors are linear and/or regional habitats that provide connectivity to other natural vegetation communities within a landscape fractured by urbanization and other development. Wildlife corridors have several functions: 1) they provide avenues along which wide-ranging animals can travel, migrate, and breed, allowing genetic interchange to occur; 2) populations can move in response to environmental changes and natural disasters; and 3) individuals can recolonize habitats from which populations have been locally extirpated (Beier and Loe 1992). All three of these functions can be met if both regional and local wildlife corridors are accessible to wildlife. Regional wildlife corridors provide foraging, breeding, and retreat areas for migrating, dispersing, immigrating, and emigrating wildlife populations. Local wildlife corridors also provide access routes to food, cover, and water resources within restricted habitats.

The proposed project will not interfere with the movement of native wildlife. The project site has a history of disturbance associated with eucalyptus tree removal in 2012, and continued disturbance associated with the paint ball facility located immediately to the east. In addition, Clark Ranch to the south has frequent activity associated with a horse riding facility. The eucalyptus grove and the marshes associated with the Napa River to the west of the project site provide a more valuable wildlife corridor for terrestrial wildlife.

6. SPECIAL-STATUS SPECIES DEFINITION

6.1 Definitions

For purposes of this analysis, special-status species are plants and animals that are legally protected under the California and Federal Endangered Species Acts (CESA and FESA, respectively) or other regulations, and species that are considered rare by the scientific community (for example, the CNPS). Special-status species are defined as:

- plants and animals that are listed or proposed for listing as threatened or endangered under the CESA (Fish and Game Code §2050 *et seq*.; 14 CCR §670.1 *et seq.*) or the FESA (50 CFR 17.12 for plants; 50 CFR 17.11 for animals; various notices in the Federal Register [FR] for proposed species);

- plants and animals that are candidates for possible future listing as threatened or endangered under the FESA (50 CFR 17; FR Vol. 64, No. 205, pages 57533-57547, October 25, 1999); and under the CESA (California Fish and Game Code §2068);

- plants and animals that meet the definition of endangered, rare, or threatened under the California Environmental Quality Act (CEQA) (14 CCR §15380) that may include species not found on either State or Federal Endangered Species lists;

- Plants occurring on Ranks 1A, 1B, 2A, 2B, 3, and 4 of CNPS' electronic *Inventory* (CNPS 2001). The California Department of Fish and Wildlife (CDFW) recognizes that Ranks 1A, 1B, 2A and 2B of the CNPS inventory contain plants that, in the majority of cases, would qualify for State listing, and CDFW requests their inclusion in EIRs. Plants occurring on CNPS Ranks 3 and 4 are "plants about which more information is necessary," and "plants of limited distribution," respectively (CNPS 2001). Such plants may be included as special-status species on a case by case basis due to local significance or recent biological information (more on CNPS Rank species below);

- migratory nongame birds of management concern listed by U.S. Fish and Wildlife Service (Migratory Nongame Birds of Management Concern in the United States: The list 1995; Office of Migratory Bird Management; Washington D.C.; Sept. 1995);

- animals that are designated as "species of special concern" by CDFW (2018);

- Animal species that are "fully protected" in California (Fish and Game Codes 3511, 4700, 5050, and 5515).

- Bat Species that are designated on the Western Bat Working Group's (WBWG) Regional Bat Species Priority Matrix as: "RED OR HIGH." This priority is justified by the WBWG as follows: "Based on available information on distribution, status, ecology, and known threats, this designation should result in these bat species being considered the highest priority for funding, planning, and conservation actions. Information about status and threats to most species could result in effective conservation actions being implemented should a commitment to management exist. These species are imperiled or are at high risk of imperilment."

In the paragraphs below we provide further definitions of legal status as they pertain to the special-status species discussed in this report or in the attached tables.

Federal Endangered or Threatened Species. A species listed as Endangered or Threatened under the FESA is protected from unauthorized "take" (that is, harass, harm, pursue, hunt, shoot, trap) of that species. If it is necessary to take a Federal listed Endangered or Threatened species as part of an otherwise lawful activity, it would be necessary to receive permission from the USFWS prior to initiating the take.

State Threatened Species. A species listed as Threatened under the state Endangered Species Act (§2050 of California Fish and Game Code) is protected from unauthorized "take" (that is, harass, pursue, hunt, shoot, trap) of that species. If it is necessary to "take" a state listed Threatened species as part of an otherwise lawful activity, it would be necessary to receive permission from CDFW prior to initiating the "take."

California Species of Special Concern. These are species in which their California breeding populations are seriously declining and extirpation from all or a portion of their range is possible. This designation affords no legally mandated protection; however, pursuant to the CEQA Guidelines (14 CCR §15380), some species of special concern could be considered "rare." Pursuant to its rarity status, any unmitigated impacts to rare species could be considered a "significant effect on the environment" (§15382). Thus, species of special concern must be considered in any project that will, or is currently, undergoing CEQA review, and/or that must obtain an environmental permit(s) from a public agency.

CNPS Rank Species. The CNPS maintains an "Inventory" of special status plant species. This inventory has four lists of plants with varying rarity. These lists are: Rank 1, Rank 2, Rank 3, and Rank 4. Although plants on these lists have no formal legal protection (unless they are also state or federal listed species), CDFW requests the inclusion of Rank 1 species in environmental documents. In addition, other state and local agencies may request the inclusion of species on other lists as well. The Rank 1 and 2 species are defined below:

- Rank 1A: Presumed extinct in California;
- Rank 1B: Rare, threatened, or endangered in California and elsewhere;
- Rank 2A: Plants presumed extirpated in California, but more common elsewhere;
- Rank 2B: Rare, threatened, or endangered in California, but more common elsewhere.

All of the plants constituting Rank 1B meet the definitions of Section 1901, Chapter 10 (Native Plant Protection Act) or Sections 2062 and 2067 (California Endangered Species Act) of the Fish and Game Code, and are eligible for state listing (CNPS 2001). Rank 2 species are rare in California, but more common elsewhere. Ranks 3 and 4 contain species about which there is some concern, and are reviewed by CDFW and maintained on "watch lists."

Additionally, in 2006 CNPS updated their lists to include "threat code extensions" for each list. For example, Rank 1B species would now be categorized as Rank 1B.1, Rank 1B.2, or Rank 1B.3. These threat codes are defined as follows:

- .1 is considered "seriously endangered in California (over 80% of occurrences threatened/high degree and immediacy of threat)";
- .2 is "fairly endangered in California (20-80% of occurrences threatened)";
- .3 is "not very endangered in California (less than 20% of occurrences threatened or no current threats known)."

Under the CEQA review process only CNPS Rank 1 and 2 species are considered since these are the only CNPS species that meet CEQA's definition of "rare" or "endangered." Impacts to Rank 3 and 4 species are not regarded as significant pursuant to CEQA.

Fully Protected Birds. Fully protected birds, such as the white-tailed kite and golden eagle, are protected under California Fish and Game Code (§3511). Fully protected birds may not be "taken" or possessed (i.e., kept in captivity) at any time.

6.2 Potential Special-Status Plants on the Project Site

Figure 4 provides a graphical illustration of the known records for special-status species within 3 miles of the project site and helps readers visually understand the number of sensitive species that occur in the vicinity of the project site. No special-status plants have been mapped on or adjacent to the project site. However, according to the CDFW's CNDDB and CNPS' rare plant *Inventory*, a total of nine special-status plant species are known to occur in the region of the project site (Table 3). Most of these plants occur in specialized habitats such as marshes, foothill grasslands, and vernal pools, none of which occur onsite. In the recent past, blue gum eucalyptus trees covered the majority of the project site dating back for several decades; these trees emit allelopathic (growth inhibiting) chemicals from their leaves, acorns and bark that prevent other plants from growing under them. Once bark and leaf debris collects on the ground beneath the trees, nearly nothing will grow there. Based on the negative findings during the multiple surveys conducted on this site in 2006, 2011, 2012, 2017 and 2018, special-status plants are not likely to be found onsite and mitigation for special-status plants should not be warranted.

6.3 Potential Special-Status Animals in the Project Site

Figure 4 provides a graphical illustration of the known records for special-status species within three miles of the project site and helps readers visually understand the number of sensitive species that occur in the vicinity of the project site. No special-status animal records have ever been mapped on or adjacent to the project site. However, a total of 16 special-status animal species are known to occur in the region of the project site (Table 4). Due to the disturbed nature of the project site, and its past history as a eucalyptus grove, there is a very low likelihood of special-status species occurring onsite. Regardless, due to the sensitivity of four of the special-status animal species known to occur in the area, we further discuss these species below.

6.3.1 California red-legged frog

The California red-legged frog (*Rana draytonii*) was federally-listed as threatened on May 23, 1996 (Federal Register 61: 25813-25833) and as such is protected pursuant to the Federal Endangered Species Act. On March 16, 2010 the USFWS issued the final designation for California red-legged frog Critical Habitat (USFWS 2010). *The project site does not fall within mapped critical habitat, although it is adjacent* (see Figure 5).

The California red-legged frog is also a state "species of special concern." While the state designation "species of special concern" does not provide any legally mandated protection, species of special concern must be considered in any project undergoing a CEQA review.

The California red-legged frog is typically found in ponds, slow-flowing portions of perennial and intermittent streams that maintain water in the summer months. This frog is also found in hillside seeps that maintain pool environments or saturated soils throughout the summer months. Populations probably cannot be maintained if all surface water disappears (i.e., no available surface water for egg laying and larval development habitat). Larval California red-legged frogs

require 11-20 weeks of permanent water to reach metamorphosis (i.e., to change from a tadpole into a frog), in water depths of 10 to 20 inches (USFWS 2002). Riparian vegetation such as willows and emergent vegetation such as cattails are preferred red-legged frog habitats, though not necessary for this species to be present. Populations of California red-legged frog will be reduced in size or eliminated from ponds supporting non-native species such as bullfrog, Centrarchid fish species (such as sunfish, bluegill, or large-mouth bass), and signal and red swamp crayfish (*Pacifastacus leniusculus* and *Procambarus clarkii*, respectively), all of which are known California red-legged frog predators. However, the presence of these non-native species does not preclude the presence of the California red-legged frog.

California red-legged frogs also use upland habitats for migration and dispersal. The USFWS *Recovery Plan for the California Red-Legged Frog* states that frog overland excursions via uplands can vary between 0.25-mile up to 3 miles during the wet season, and that frogs "have been observed to make long-distance movements that are straight-line, point to point migrations rather than using corridors for moving in between habitats" (USFWS 2002). The information presented in the USFWS' Recovery Plan was taken from a publication by Bulger et al. (2003) that recounts a study in coastal redwoods in Santa Cruz area. M&A believes that such overland straight-line migrations are primarily limited to periods of heavy rainfall or during periods when ambient conditions exhibit high moisture levels such as in fog belts along the coast. Working in Pointe Reyes National Seashore on the coast of California, Fellers and Kleeman (2007) found approximately 31 percent of California red-legged frogs moved more than 30 meters from their breeding sites and about 69 percent moved less than 30 meters from their breeding site during seasonal movement periods. Similarly, Bulger et al. (2003) found that 60 percent of their radio tagged frogs stayed within 30 meters of their breeding sites.

In locations that are characterized by hot and seasonally dry climates, the California red-legged frog is inclined to stay closer to its aquatic environments or will not migrate. Tatarian (2005) who studied an inland population of California red-legged frogs in eastern Contra Costa County where the climate is far drier than the coastal environment, found that all movements started after the first 0.5 cm of rain in the fall, with more terrestrial movements being made in the fall pre-breeding season (57%) than in the winter breeding season (32%) or spring post-breeding season (11%). Tatarian (op. cit.) also found that California red-legged frogs moved greater average distances aquatically (84.6 m) than terrestrially (27.7 m). Greater terrestrial distances were moved in the pre-breeding season (35.2 m) than in the breeding season (15.5 m) or post-breeding season (16.3 m) with the majority of movements occurring for only one of the 3-4 day survey periods. The majority of frogs (57%) were position faithful within a pool, indicating they did not migrate at all. These data suggest that long forays across the landscape found in coastal populations are less likely in dry inland locations.

The USFWS *Recovery Plan for the California Red-Legged Frog* states that populations are "most likely to persist where multiple breeding areas are embedded within a matrix of habitats used for dispersal." "The primary constituent elements for California red-legged frogs are aquatic and upland areas where suitable breeding and non-breeding habitat is interspersed throughout the landscape and is interconnected by unfragmented dispersal habitat" (USFWS 2002).

In the American Canyon/Napa area, there are no records for the California red-legged frog west of State Route 29 where the project site is located. The closest known California red-legged frog occurrence is 1.4 miles east of the project site (CNDDB Occurrence No. 896). The California red-legged frog at this location was found in a dry cement tank adjacent to a large quarry pond that supported bullfrogs (*Lithobates catesbeiana*). State Route 29 is located between this closest California red-legged frog record and the project site, and constitutes an effective geographic barrier to overland California red-legged frog movements to/from the known record location and other extant California red-legged frog populations to the project site. There is no hydrologic connectivity over any undeveloped migration route between the known records for this species and the project site. Finally, the project site does not provide suitable habitat for the California red-legged frog. There are no drainages onsite and the isolated seasonal wetland habitat onsite does not hold water long enough to support California red-legged frogs, their eggs or their larvae. Based on all the available information, it can be concluded that the project site does not provide suitable habitat for the California red-legged frog. Similarly, the surrounding parcels with dense eucalyptus groves do not provide suitable habitat. Owing to the excessively disturbed conditions on the project site due to prior grading and tree removal activities, this species is not expected to occur on the project site. *Therefore, the proposed project will not impact the California red-legged frog and mitigation should not be warranted.*

6.3.2 SWAINSON'S HAWK

The Swainson's hawk (*Buteo swainsoni*) is a state-listed threatened species, protected pursuant to the California Endangered Species Act (CESA), and Title 14 of the California Code of Regulations. While it has no special federal status, it is protected from direct take under the Federal Migratory Bird Treaty Act of 1918 (16 U.S.C. 703-711). Swainson's hawks, their active nests, eggs, and young are also protected under California Fish and Game Code (§3503, §3503.5, §3513, and §3800).

Swainson's hawk inhabits open to semi-open areas at low to middle elevations in valleys, dry meadows, foothills, and level uplands (Kochert 1986). It nests almost exclusively in trees and will nest in almost any tree species that is at least 10 feet tall (Schmutz et. al. 1984). Nests are constructed in isolated trees that are dead or alive along drainages and in wetlands, or in windbreaks in fields and around farmsteads (Palmer 1988). Swainson's hawks occasionally nest in shrubs, on telephone poles, and on the ground. In the Central Valley of California, the majority of Swainson's hawk nests and territories are associated with riparian systems and nests are commonly found in cottonwoods and oaks (Schlorff et. al. 1984). They have also been documented nesting in eucalyptus (*Eucalyptus* spp.), black walnut (*Juglans hindsii*), black locust (*Robinia pseudoacacia*), almond (*Prunus dulcis*), Osage orange (*Maclura pomifera*), Arizona cypress (*Cupressus arizonica*), and pine (*Pinus* spp.).

Foraging habitats include grasslands, alfalfa fields, fallow fields, beet, tomato, and other low-growing row or field crops, dry-land and irrigated pasture, and rice land when not flooded (CDFG 1994). The Swainson's hawk generally forages in open habitats with short vegetation containing small mammals, reptiles, birds, and insects. Its primary prey in the Central Valley is California meadow vole (*Microtus californicus*). Agricultural areas are often preferred over more natural grassland habitats due to larger prey populations. In addition agricultural practices (planting, maintenance, harvesting, disking) allow for access to prey, and very likely increase

foraging success of Swainson's hawks by flushing prey (personal observations of G. Monk). During the nesting season Swainson's hawks usually forage within two miles of the nest. Swainson's hawk does not require habitats that contain many perches because it most often searches for prey aerially, therefore it can occupy habitats with few or no perches except the nest tree (James 1992).

Swainson's hawks are regular summer visitors and breeders throughout the western states. In the fall months, most Swainson's hawks migrate to Argentina before returning to the United States to breed in the late-spring (typically April). For decades, Argentina farmers were spraying insecticides over habitats that included gregarious night roosts of the Swainson's hawk, killing many thousands of these hawks. This practice was halted in the last 10 years and the Swainson's hawk population appears to be dramatically responding in California. While in the 1970s through 1990s there were only two relatively small populations of Swainson's hawks that remained resident in California year-round in the Davis area and in the Sacramento River Delta, resident and migrant populations of the Swainson's hawks are now dramatically expanding their nesting distribution in California since insecticide use over Argentinian wintering grounds was halted (G. Monk, personal observations). For example, Swainson's hawks were never recorded nesting in the Napa County area until relatively recently.

The closest known record for nesting Swainson's hawk is 2.6 miles north of the project site (CNDDB Occurrence No. 2744). No Swainson's hawk nests have been observed on the site or offsite in the vicinity of the project site during M&A's project site surveys. However, the nesting population appears to be increasing throughout its nesting range in northern California (recent CNDDB records and G. Monk general observations) and the eucalyptus trees growing along the southern project site border and adjacent to the project site provide suitable nesting habitat. Therefore, there is the possibility that Swainson's hawks could nest near this project site in future years. *Hence, prior to earth-disturbance or construction, nesting surveys must be conducted that confirm or negate this species' presence as a nesting bird on or adjacent to the project site. Accordingly, impacts to Swainson's hawk are regarded as potentially significant pursuant to the CEQA.* Mitigation could be implemented to reduce these impacts to levels regarded as less than significant pursuant to the CEQA. The Impacts and Mitigation Measures that follow in the sections below address these impacts.

6.3.3 WESTERN BURROWING OWL

The western burrowing owl (*Athene cunicularia hypugaea*) is a California "species of special concern." Its nest, eggs, and young are also protected under California Fish and Game Code (§3503, §3503.5, and §3800). The burrowing owl is also protected from direct take under the Migratory Bird Treaty Act (50 CFR 10.13). Finally, based upon this species' rarity status, any unmitigated impacts to rare species would be considered a "significant effect on the environment" pursuant to §21068 of the CEQA Statutes and §15382 of the CEQA Guidelines. Thus, this owl species must be considered in any project that will, or is currently, undergoing CEQA review, and/or that must obtain an environmental permit(s) from a public agency. When these owls occur on project sites, typically, mitigation requirements are mandated in the conditions of project approval from the CEQA lead agency.

Burrowing owl habitat is usually found in annual and perennial grasslands, characterized by low-growing vegetation. Often, the burrowing owl utilizes rodent burrows, typically California ground squirrel (*Otospermophilus beecheyi*) burrows, for nesting and cover. They may also on occasion dig their own burrows, or use man-made objects such as concrete culverts or rip-rap piles for cover. They exhibit high site fidelity, reusing burrows year after year. Occupancy of suitable burrowing owl habitat can be verified at a site by observation of these owls during the spring and summer months or, alternatively, its molted feathers, cast pellets, prey remains, eggshell fragments, or excrement (white wash) at or near a burrow. Burrowing owls typically are not observed in grasslands with tall vegetation or wooded areas because the vegetation obscures their ability to detect avian and terrestrial predators. Since burrowing owls spend the majority of their time sitting at the entrances of their burrows, grazed grasslands seem to be their preferred habitat because it allows them to view the world at 360 degrees without obstructions.

The closest CNDDB record was documented 2.5 miles southeast of the project site in an area that has since been developed (CNDDB Occurrence No. 109). The project site was severely disturbed during the eucalyptus removal in 2012; thus, ground squirrel burrows are few and of recent origin. The mobility of the western burrowing owl enables the species to colonize the recent burrows. M&A did not observe western burrowing owls or any indirect evidence that burrowing owls are using or residing on the project site during any of the site surveys. Regardless, the project site provides marginal nesting habitat for the western burrowing owl. *In order to confirm or negate the presence of western burrowing owls on site, surveys must be conducted prior to the commencement of earth-moving or construction*. *Accordingly, impacts to western burrowing owl are regarded as potentially significant pursuant to the CEQA.* Mitigation could be implemented to reduce these impacts to levels regarded as less than significant pursuant to the CEQA. The Impacts and Mitigation Measures that follow in the sections below address these impacts.

6.3.4 NORTHERN HARRIER

The northern harrier (*Circus cyaneus*) is a California species of special concern. This raptor is protected under California Fish and Game Code §3503.5 that protects nesting raptors and their eggs/young, and is also protected from direct take under the Migratory Bird Treaty Act (50 CFR 10.13). Northern harriers build grass-lined nests on the ground within dense, low-lying vegetation in a variety of habitats, though they are typically found nesting in grassland or marsh habitats. They usually nest on level to near level ground. This species is particularly vulnerable to ground predators such as coyotes (*Canis latrans*), red fox (*Vulpes vulpes*), and various snake species. Ground nesting birds in general are also subject to disturbance by agricultural practices. Northern harriers may forage over the project site and may nest in the open ruderal habitats onsite that provide suitable nesting habitat for this species. Hence, the proposed project could result in impacts to nesting northern harriers.

The closest CNDDB record was documented 2.7 miles west of the project site (CNDDB Occurrence No. 29). The project site was severely disturbed during the eucalyptus removal in 2012. Regardless, the project site provides marginal nesting habitat for the northern harrier. *In order to confirm or negate the presence of northern harriers on site, surveys must be conducted*

prior to the commencement of earth-moving or construction. Accordingly, impacts to northern harrier are regarded as potentially significant pursuant to the CEQA.

7. REGULATORY FRAMEWORK FOR NATIVE WILDLIFE, FISH, AND PLANTS

This section provides a discussion of those laws and regulations that are in place to protect native wildlife, fish, and plants. Under each law we discuss their pertinence to the proposed development.

7.1 Federal Endangered Species Act

The Federal Endangered Species Act (FESA) forms the basis for the federal protection of threatened or endangered plants, insects, fish and wildlife. FESA contains four main elements, they are as follows:

Section 4 (16 USCA §1533): Species listing, Critical Habitat Designation, and Recovery Planning: outlines the procedure for listing endangered plants and wildlife.

Section 7 (§1536): Federal Consultation Requirement: imposes limits on the actions of federal agencies that might impact listed species.

Section 9 (§1538): Prohibition on Take: prohibits the "taking" of a listed species by anyone, including private individuals, and State and local agencies.

Section 10: Exceptions to the Take Prohibition: non-federal agencies can obtain an incidental take permit through approval of a Habitat Conservation Plan.

In the case of salt water fish and other marine organisms, the requirements of FESA are enforced by the National Marine Fisheries Service (NMFS). The USFWS enforces all other cases. Below, Sections 9, 7, and 10 of FESA are discussed since they are the sections most relevant to the proposed project.

Section 9 of FESA as amended, prohibits the "take" of any fish or wildlife species listed under FESA as endangered. Under Federal regulation, "take" of fish or wildlife species listed as threatened is also prohibited unless otherwise specifically authorized by regulation. "Take," as defined by FESA, means "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." "Harm" includes not only the direct taking of a species itself, but the destruction or modification of the species' habitat resulting in the potential injury of the species. As such, "harm" is further defined to mean "an act which actually kills or injures wildlife; such an act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding or sheltering" (50 CFR 17.3). A December 2001 decision by the 9th Circuit Court of Appeals (Arizona Cattle Growers' Association, Jeff Menges, vs. the U.S. Fish and Wildlife Service and Bureau of Land Management, and the Southwest Center for Biological Diversity) ruled that the USFWS must show that a threatened or endangered species is present on a project site and that it would be taken by the project activities. According to this ruling, the

USFWS can no longer require mitigation based on the probability that the species could use the site. Rather they must show that it is actually present.

Section 9 applies to any person, corporation, federal agency, or any local or State agency. If "take" of a listed species is necessary to complete an otherwise lawful activity, this triggers the need to obtain a incidental take permit either through a Section 7 Consultation as discussed further below (for federal actions or private actions that are permitted or funded by a federal agency), or requires preparation of a Habitat Conservation Plan (HCP) pursuant to Section 10 of FESA (for state and local agencies, or individuals, and projects without a federal "nexus").

Section 7(a)(2) of the Act requires that each federal agency consult with the USFWS to ensure that any action authorized, funded or carried out by such agency is not likely to jeopardize the continued existence of an endangered or threatened species or result in the destruction or adverse modification of critical habitat for listed species. Critical habitat designations mean: (1) specific areas within a geographic region currently occupied by a listed species, on which are found those physical or biological features that are essential to the conservation of a listed species and that may require special management considerations or protection; and (2) specific areas outside the geographical area occupied by a listed species that are determined essential for the conservation of the species.

The Section 7 consultation process only applies to actions taken by federal agencies that are considering authorizing discretionary projects. Section 7 is by and between the NMFS and/or the USFWS and the federal agency contemplating a discretionary approval (that is, the "federal nexus agency," for example, the Corps or the Federal Highway Administration). Private parties, cities, counties, etc. (i.e., applicants) may participate in the Section 7 consultation *at the discretion of the federal agencies conducting the Section 7 consultation*. The Section 7 consultation process is triggered by a determination of the "action agency" – that is, the federal agency that is carrying out, funding, or approving a project - that the project "may affect" a listed species or critical habitat. If an action is likely to adversely affect a listed species or designated critical habitat, formal consultation between the nexus agency and the USFWS/NMFS is required. As part of the formal consultation, the USFWS/NMFS may resolve any issues informally with the nexus agency or may prepare a formal Biological Opinion assessing whether the proposed action would be likely to result in "jeopardy" to a listed species or if it could adversely modify designated critical habitat. If the USFWS/NMFS prepares a Biological Opinion it will contain either a "jeopardy" or "non-jeopardy" decision. If the USFWS/NMFS concludes that a proposed project would result in adverse modification of critical habitat or would jeopardize the continued existence of a federal listed species (that is, it will issue a jeopardy decision), the nexus federal agency would be most unlikely to authorize its discretionary permit. If the USFWS/NMFS prepares a "non-jeopardy" Biological Opinion, the nexus federal agency may authorize the discretionary permit making all conditions of the Biological Opinion conditions of its discretionary permit. A non-jeopardy Biological Opinion constitutes an "incidental take" permit that allows applicants to "take" federally-listed species while otherwise carrying out legally sanctioned projects.

For non-federal entities, for example private parties, cities, counties that are considering a discretionary permit, Section 10 provides the mechanism for obtaining take authorization. Under

Section 10 of FESA, for the applicant to obtain an "incidental take permit," the applicant is required to submit a "conservation plan" to the USFWS or NMFS that specifies the impacts that are likely to result to federally-listed species, and the measures the applicant will undertake to minimize and mitigate such impacts, and the funding that will be available to implement those steps. Conservation plans under FESA have come to be known as "habitat conservation plans" or "HCPs" for short. The terms incidental take permit, Section 10 permit, and Section 10(a)(1)(B) permit are used interchangeably by the USFWS. Section 10(a)(2)(B) of FESA provides statutory criteria that must be satisfied before an incidental take permit can be issued.

7.1.1 Responsible Agency

FESA gives regulatory authority to the USFWS for federally-listed terrestrial species and non-anadromous fish. The NMFS has regulatory authority over federally-listed marine mammals and anadromous fish.

7.1.2 Applicability to the Proposed Project

The closest known California red-legged frog occurrence is 1.4 miles east of the project site (CNDDB Occurrence No. 896). The California red-legged frog was found in a dry cement tank adjacent to a large quarry pond that supported bullfrogs. State Route 29 is located between the closest California red-legged frog record and the project site, and constitutes an effective geographic barrier to overland California red-legged frog movements to/from the known record location and other extant California red-legged frog populations to the project site. There is no hydrologic connectivity along any undeveloped migration route between the known records for this species and the project site. Finally, the project site does not provide suitable habitat for the California red-legged frog. The isolated seasonal wetland habitat onsite does not hold water long enough to support California red-legged frogs, their eggs or their larvae. Based on all the available information, it can be concluded that the project site does not provide suitable habitat for the California red-legged frog. Owing to the excessively disturbed conditions on the project site due to prior grading and tree removal activities, this species is not expected to occur on the project site. Therefore, the proposed project will not impact the California red-legged frog.

No other federally listed species are expected to occur on the project site. The project site does not provide fisheries habitat as it consists entirely of upland communities. Therefore, it can be stated with confidence that the proposed project would not impact federally listed plant, animal, or fish species.

7.2 Federal Migratory Bird Treaty Act

The Migratory Bird Treaty Act of 1918 (16 U.S.C. §§ 703-712, July 3, 1918, as amended 1936, 1960, 1968, 1969, 1974, 1978, 1986 and 1989) makes it unlawful to “take” (kill, harm, harass, shoot, etc.) any migratory bird listed in Title 50 of the Code of Federal Regulations, Section 10.13, including their nests, eggs, or young. Migratory birds include geese, ducks, shorebirds, raptors, songbirds, wading birds, seabirds, and passerine birds (such as warblers, flycatchers, swallows, etc.).

7.2.1 APPLICABILITY TO THE PROPOSED PROJECT

Western burrowing owl, northern harrier, Swainson's hawk, red-shouldered hawk, and red-tailed hawk (*Buteo jamaicensis*), among other raptors (birds of prey) could nest in the eucalyptus grove in the immediate vicinity of the project site. These raptors would be protected by the Migratory Bird Treaty Act. Also, the common songbirds that could forage on the site would be protected pursuant to this Act. As long as there is no direct mortality of species protected pursuant to this Act caused by development of the site, there should be no constraints to development of the site. To comply with the Migratory Bird Treaty Act, all active nest sites would have to be avoided while such birds were nesting. Upon completion of nesting, the project could commence as otherwise planned. Please review specific requirements for avoidance of nest sites for potentially occurring species in the Impacts and Mitigations section below.

7.3 **California Endangered Species Act**

7.3.1 SECTION 2081 OF THE CALIFORNIA ENDANGERED SPECIES ACT

In 1984, the state legislated the California Endangered Species Act (CESA) (Fish and Game Code §2050). The basic policy of CESA is to conserve and enhance endangered species and their habitats. State agencies will not approve private or public projects under their jurisdiction that would impact threatened or endangered species if reasonable and prudent alternatives are available. Because CESA does not have a provision for "harm" (see discussion of FESA, above), CDFW considerations pursuant to CESA are limited to those actions that would result in the direct take of a listed species.

If CDFW determines that a proposed project could impact a state-listed threatened or endangered species, CDFW will provide recommendations for "reasonable and prudent" project alternatives. The CEQA lead agency can only approve a project if these alternatives are implemented, unless it finds that the project's benefits clearly outweigh the costs, reasonable mitigation measures are adopted, there has been no "irreversible or irretrievable" commitment of resources made in the interim, and the resulting project would not result in the extinction of the species. In addition, if there would be impacts to threatened or endangered species, the lead agency typically requires project applicants to demonstrate that they have acquired "incidental take" permits from CDFW and/or USFWS (if it is a Federal listed species) prior to allowing/permitting impacts to such species.

If proposed projects would result in impacts to a state-listed species, an "incidental take" permit pursuant to §2081 of the Fish and Game Code would be necessary (versus a Federal incidental take permit for Federal listed species). CDFW will issue an incidental take permit only if:

1) The authorized take is incidental to an otherwise lawful activity;
2) the impacts of the authorized take are minimized and fully mitigated;
3) measures required to minimize and fully mitigate the impacts of the authorized take:
    a) are roughly proportional in extent to the impact of the taking on the species;
    b) maintain the project applicant's objectives to the greatest extent possible; and,
    c) capable of successful implementation; and,
4) adequate funding is provided to implement the required minimization and mitigation measures and to monitor compliance with, and the effectiveness of, the measures.

If an applicant is preparing a habitat conservation plan (HCP) as part of the federal 10(a) permit process, the HCP might be incorporated into the §2081 permit if it meets the substantive criteria of §2081(b). To ensure that an HCP meets the mitigation and monitoring standards in Section 2081(b), an applicant should involve CDFW staff in development of the HCP. If a final Biological Opinion (federal action) has been issued for the project pursuant to Section 7 of the federal Endangered Species Act, it might also be incorporated into the §2081 permit if it meets the standards of §2081(b).

No §2081 permit may authorize the take of a species for which the Legislature has imposed strict prohibitions on all forms of "take." These species are listed in several statutes that identify "fully protected" species and "specified birds." *See* Fish and Game Code §§ 3505, 3511, 4700, 5050, 5515, and 5517. If a project is planned in an area where a "fully protected" species or a "specified bird" occurs, an applicant must design the project to avoid all take.

Fish and Game Code §2080.1 allows an applicant who has obtained a "non-jeopardy*"* federal Biological Opinion pursuant to Section 7 of the FESA, or who has received a federal 10(a) permit (federal incidental take permit) pursuant to the FESA, to submit the federal opinion or permit to CDFW for a determination as to whether the federal document is "consistent" with CESA. If after 30 days CDFW determines that the federal incidental take permit is consistent with state law, and that all state-listed species under consideration have been considered in the federal Biological Opinion, then no further permit or consultation is required under CESA for the project. However, if CDFW determines that the federal opinion or permit is not consistent with CESA, or that there are state-listed species that were not considered in the federal Biological Opinion, then the applicant must apply for a state CESA permit under Section 2081(b). Section 2081(b) is of no use if an affected species is state-listed, but not federally-listed.

State and federal incidental take permits are issued on a discretionary basis, and are typically only authorized if applicants are able to demonstrate that impacts to the listed species in question are unavoidable, and can be mitigated to an extent that the reviewing agency can conclude that the proposed impacts would not jeopardize the continued existence of the listed species under review. Typically, if there would be impacts to a listed species, mitigation that includes habitat avoidance, preservation, and creation of endangered species habitat is necessary to demonstrate that projects would not threaten the continued existence of a species. In addition, management endowment fees are usually collected as part of the agreement for the incidental take permit(s). The endowment is used to manage any lands set-aside to protect listed species, and for biological mitigation monitoring of these lands over (typically) a five-year period.

7.3.2 Applicability to The Proposed Project

No state-listed plant species would likely occur on the project site due to an absence of habitat. While the majority of the project site is treeless and does not provide nesting habitat for the Swainson's hawk, suitable nesting habitat for this hawk exists in the eucalyptus trees along the project site's southern border and in the eucalyptus groves on the adjacent properties; thus, preconstruction nesting surveys will be necessary to ensure that earth-work or construction does not occur while this raptor is nesting nearby or that if it does, it does not disturb the nesting birds. If the proposed project follows the proposed mitigation measures as detailed in the Impacts and

Mitigation section below, *an Incidental Take Permit (ITP) from the CDFW should not be necessary for this project.*

7.4 California Fish and Game Code § 3503, 3503.5, 3511, and 3513

California Fish and Game Code §3503, 3503.5, 3511, and 3513 prohibit the "take, possession, or destruction of birds, their nests or eggs." Disturbance that causes nest abandonment and/or loss of reproductive effort (killing or abandonment of eggs or young) is considered "take." Such a take would also violate federal law protecting migratory birds (Migratory Bird Treaty Act).

All raptors (that is, hawks, eagles, owls) their nests, eggs, and young are protected under California Fish and Game Code (§3503.5). Additionally, "fully protected" birds, such as the white-tailed kite (*Elanus leucurus*) and golden eagle (*Aquila chrysaetos*), are protected under California Fish and Game Code (§3511). "Fully protected" birds may not be taken or possessed (that is, kept in captivity) at any time.

7.4.1 Applicability to the Proposed Project

Raptors that could be affected by the project include western burrowing owl, northern harrier, Swainson's hawk, red-shouldered hawk and red-tailed hawk. Preconstruction surveys would have to be conducted for these species to ensure that there is no direct take of these birds including their eggs, or young. Any active nests that were found during preconstruction surveys would have to be avoided by the project. Suitable non-disturbance buffers would have to be established around nest sites until the nesting cycle is complete. More specifics on the size of buffers are provided below in the Impacts and Mitigations section.

7.5 City of American Canyon General Plan

The City of American Canyon General Plan sets forth the following goals, objectives, and policies relevant to biological resources on the project site. Only those applicable to the proposed project are discussed herein:

7.5.1 Goal 8, Objective 8.1 and Policies 8.1.1 and 8.1.4

- **Goal 8:** Protect and preserve the significant habitats, plants and wildlife that exist in the City and its Planning Area.
- **Objective 8.1:** Maintain data and information regarding areas of significant biological value within the Planning Area to facilitate resource conservation and the appropriate management of development.
- **Policy 8.1.1:** Acquire and maintain the most current information available regarding the status and location of sensitive biological elements (species and natural communities) within the City and, as appropriate, within the Sphere of Influence and Urban Limit Line.
- **Policy 8.1.4:** Regularly monitor and review developments proposed within the City's Planning Area to assess their impacts on local biological resources and to recommend appropriate mitigation measures that the developer and/or government agency can implement.

7.5.2 Applicability to the Proposed Project

Consistent with General Plan Policies 8.1.1 and 8.1.4, this report provides a detailed assessment of the biological resources present on the project site and proposed impacts to these resources associated with development of the site. Proposed mitigation measures are detailed below in the Project Impacts and Mitigation Measures section.

7.5.3 Objective 8.2 and Policy 8.2.1

- **Objective 8.2:** Balance the preservation of natural habitat areas, including coastal saltmarsh, mixed hardwood forest, oak savannah, and wetland and riparian habitats, with new development in the City.
- **Policy 8.2.1:** Land use applications for developments located within sensitive habitats, including coastal saltmarsh, mixed hardwood forest, oak savannah, and riparian habitats (see Figure 8-1) [General Plan], or with areas potentially occupied by vernal pools (see Figure 8-2) [General Plan] shall be accompanied by sufficient technical background data to enable an adequate assessment of the potential for impacts on these resources, and possible measures to reduce any identifiable impacts. In addition to examining Figure 8-1 [General Plan] for information on these sensitive habitats, an on-site assessment shall be conducted by a City approved qualified biologist to determine if sensitive habitats exist on-site. In instances where the potential for significant impacts exists, the applicant must submit a Biological Assessment Report prepared by a qualified professional.

7.5.4 Applicability to the Proposed Project

Consistent with General Plan Policy 8.2.1, the project site has been evaluated for the presence of sensitive biological resources. This report represents a Biological Assessment Report documenting findings from background research, and presents the current habitats and species present on the project site.

7.5.5 Objective 8.3 and Policy 8.3.1

- **Objective 8.3:** Protect natural drainages and riparian corridors within the American Canyon Planning Area.
- **Policy 8.3.1:** Review proposed developments in wetlands and riparian habitats to evaluate their conformance with the following policies and standards:
    a. The development plan shall fully consider the nature of existing biological resources and all reasonable measures shall be taken to avoid significant impacts, including retention of sufficient natural open space and undeveloped buffer zones.

7.5.6 Applicability to the Proposed Project

Consistent with Policy 8.3.1.a, since avoidance of the isolated seasonal wetland onsite is not possible while still achieving the project's goals, the applicant will create approximately 0.05-acre of wetland on a mitigation property that will be preserved in perpetuity via deed restriction to mitigate impacts to approximately 0.02-acre of waters of the State associated with construction of the proposed project. This replacement will be at a 2:1 (replacement to impacts)

ratio and is consistent with the City's General Plan and is in general conformance with regulatory agency policy.

7.5.7 POLICY 8.3.1 B

- **Policy 8.3.1 b:** Development shall be designed and sited to preserve watercourses, riparian habitat, vernal pools, and wetlands in their natural condition, unless these actions result in an unfeasible project, in which case habitat shall be replaced in accord with subsection "g" (below).

7.5.8 APPLICABILITY TO THE PROPOSED PROJECT

The isolated wetland on the project site is located adjacent to the access road to the project site and cannot feasibility be avoided.

7.5.9 POLICY 8.3.1 E

- **Policy 8.3.1 e:** Development shall incorporate fences, walls, vegetative cover, or other measures to adequately buffer habitat areas, linkages or corridors from built environment.

7.5.10 APPLICABILITY TO THE PROPOSED PROJECT

The existing open space preserve (offsite mitigation site) is adequately buffered by a steep slope and embankment which prevents unauthorized access and use of this area.

7.5.11 POLICY 8.3.1 F

- **Policy 8.3.1 f:** Roads and utilities shall be located and designed such that conflicts with biological resources, habitat areas, linkages or corridors are avoided where feasible.

7.5.12 APPLICABILITY TO THE PROPOSED PROJECT

Consistent with Policy 8.3.1.f, and Policy 8.3.1.g roads and utilities have been designed to avoid conflicts with biological resources on the project site with the exception of the seasonal wetland onsite which will have to be impacted to construct a practical project.

7.5.13 POLICY 8.3.1 G

- **Policy 8.3.1 g:** Future development shall utilize appropriate open space or conservation easements in order to protect sensitive species or their habitats.

7.5.1 APPLICABILITY TO THE PROPOSED PROJECT

Consistent with Policy 8.3.1.g, the open space preserve will be protected in perpetuity via a deed restriction.

7.5.2 POLICY 8.3.1 H

- **Policy 8.3.1 h**: Future development shall mitigate unavoidable adverse impacts to waters of the United States, wetlands and riparian habitats (pursuant to the Federal Clean Water

Act and the California Fish and Game Code, Section 1600 et seq.) by replacement on an in-kind basis. Furthermore, replacement shall be based on a ratio determined by the California Department of Fish and Game and/or Army Corps of Engineers in order to account for the potentially diminished habitat values of replacement habitat. Such replacement should occur on the original development site, whenever possible. Alternatively, replacement can be effected, subject to state and federal regulatory approval, by creation or restoration of replacement habitats elsewhere (offsite but preferably within the City's Planning Area), protected in perpetuity by provision for an appropriate conservation easement or dedication.

7.5.1 Applicability to the Proposed Project

Consistent with Policy 8.3.1.h, the applicant will create approximately 0.05 acre of wetland to mitigate impacts to approximately 0.02-acre acre of waters of the State associated with construction of the proposed project. The applicant proposes to mitigate impacts to RWQCB jurisdictional seasonal wetlands via creation of seasonal wetland on a mitigation property that will be preserved in perpetuity via deed restriction. This replacement will be at a 2:1 (replacement to impacts) ratio and is consistent with General Plan and is in general conformance with regulatory agency policy.

7.5.2 Policies 8.3.5 and 8.3.6

- **Policy 8.3.5:** Establish a network of open spaces along the City's natural drainages and riparian corridors and link significant biological habitats. Any recreational use of these areas shall be designed to avoid damaging sensitive habitat areas.
- **Policy 8.3.6:** Preserve and integrate the City's natural drainages in new development, as opposed to their channelization or undergrounding, emphasizing opportunities for the development of pedestrian paths and greenbelts along their lengths throughout the City.

7.5.3 Applicability to the proposed project

There are no drainages on the project site or significant biological habitats onsite; hence, these policies do not apply to the proposed project.

7.5.4 Policy 8.4.3

- **Policy 8.4.3:** Encourage activities that improve the biological value and integrity of the City's natural resources through vegetation restoration, control of alien plants and animals, and landscape buffering.

7.5.5 Applicability to the proposed project

Consistent with Policy 8.4.3, the applicant will create approximately 0.05 acre of wetlands to mitigate impacts to approximately 0.02-acre acre of waters of the State associated with construction of the proposed project. The applicant proposes to mitigate impacts to RWQCB jurisdictional seasonal wetlands via creation of seasonal wetland on a mitigation property that will be preserved in perpetuity via deed restriction. This replacement will be at a 2:1

(replacement to impacts) ratio and is consistent with General Plan and is in general conformance with regulatory agency policy.

8. CITY OF AMERICAN CANYON –ORDINANCES

8.1 Trees (Ord. 18.40.110)

A. Existing trees shall be preserved on the site unless otherwise approved by the city council as a part of the site development plans.

B. Unless specifically approved by the city council, any tree removed shall be replaced on the site. Replacement trees shall be a minimum size of a twenty-four-inch box of the same species unless specifically approved by the city council. (Ord. 98-10 § 1 (part), 1998).

8.1.1 Applicability to the Proposed Project

The mature eucalyptus trees immediately south of the southern project site boundary will remain. In the project site's interior there are no trees but only a few small stump-sprouting eucalyptus trees that will be removed for the project. Since these are essentially stumps that have some green foliage, they do not meet the definition of a mature tree that is protected pursuant to the tree ordinance; therefore, no tree replacement should be required.

9. REGULATORY REQUIREMENTS PERTAINING TO WATERS OF THE UNITED STATES AND STATE

This section presents an overview of the criteria used by the U.S. Army Corps of Engineers, the California Regional Water Quality Control Board, the State Water Resources Control Board, and CDFW to determine those areas within a project area that would be subject to their regulation.

9.1 U.S. Army Corps of Engineers Jurisdiction and General Permitting

9.1.1 Section 404 of the Clean Water Act

Congress enacted the Clean Water Act "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters" (33 U.S.C. §1251(a)). Pursuant to Section 404 of the Clean Water Act (33 U.S.C. 1344), the U.S. Army Corps of Engineers (Corps) regulates the disposal of dredged or fill material into "waters of the United States" (33 CFR Parts 328 through 330). This requires project applicants to obtain authorization from the Corps prior to discharging dredged or fill materials into any water of the United States.

In the Federal Register "waters of the United States" are defined as, "...all interstate waters including interstate wetlands...intrastate lakes, rivers, streams (including intermittent streams), wetlands, [and] natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce..." (33 CFR Section 328.3).

Limits of Corps' jurisdiction:

(a) Territorial Seas. The limit of jurisdiction in the territorial seas is measured from the baseline in a seaward direction a distance of three nautical miles. (See 33 CFR 329.12)

(b) Tidal Waters of the United States. The landward limits of jurisdiction in tidal waters:

(1) Extends to the mean high tide line, or
(2) When adjacent non-tidal waters of the United States are present, the jurisdiction extends to the limits identified in paragraph (c) of this section.

(c) Non-Tidal Waters of the United States. The limits of jurisdiction in non-tidal waters:

(1) In the absence of adjacent wetlands, the jurisdiction extends to the ordinary high water mark, or
(2) When adjacent wetlands are present, the jurisdiction extends beyond the ordinary high water mark to the limit of the adjacent wetlands.
(3) When the water of the United States consists only of wetlands the jurisdiction extends to the limit of the wetland.

Section 404 jurisdiction in "other waters" such as lakes, ponds, and streams, extends to the upward limit of the ordinary high water mark (OHWM) or the upward extent of any adjacent wetland. The OHWM on a non-tidal water is:

- the "line on shore established by the fluctuations of water and indicated by physical characteristics such as a clear natural line impressed on the bank; shelving; changes in the character of soil; destruction of terrestrial vegetation; the presence of litter or debris; or other appropriate means that consider the characteristics of the surrounding areas" (33 CFR Section 328.3[e]).

Wetlands are defined as: "...those areas that are inundated or saturated by surface or ground water at a frequency and duration to support a prevalence of vegetation adapted for life in saturated soil conditions" (33 CFR Section 328.8 [b]). Wetlands usually must possess hydrophytic vegetation (i.e., plants adapted to inundated or saturated conditions), wetland hydrology (e.g., topographic low areas, exposed water tables, stream channels), and hydric soils (i.e., soils that are periodically or permanently saturated, inundated or flooded) to be regulated by the Corps pursuant to Section 404 of the Clean Water Act.

9.1.1.1 Significant Nexus of Tributaries

On December 2, 2008, the Corps and the Environmental Protection Agency (EPA) issued joint guidance on implementing the U.S. Supreme Court decision in the consolidated cases *Rapanos v. United States* and *Carabell v. United States* (herein referred to simply as "Rapanos") which address the jurisdiction over waters of the United States under the Clean Water Act. In this joint guidance these agencies provide guidance on where they will assert jurisdiction over waters of the U.S.

The EPA and Corps will assert jurisdiction over the following waters:

- Traditional navigable waters

- Wetlands adjacent to traditional navigable waters
- Non-navigable tributaries of traditional navigable waters that are relatively permanent where the tributaries typically flow year-round or have continuous flow at least seasonally (for example, typically three months).
- Wetlands that directly abut such tributaries.

The agencies generally will not assert jurisdiction over the following features:

- Swales or erosional features (e.g., gullies, small washes characterized by low volume, infrequent, or short duration flow); and
- Ditches (including roadside ditches) excavated wholly in and draining only uplands and that do not carry a relatively permanent flow of water.

The agencies will apply the significant nexus standard as follows:

- A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by all wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical and biological integrity of downstream traditional navigable waters; and

- Significant nexus includes consideration of hydrologic and ecologic factors.

9.1.1.2 Isolated Areas Excluded from Section 404 Jurisdiction

In addition to areas that may be exempt from Section 404 jurisdiction, some isolated wetlands and waters may also be considered outside of Corps jurisdiction as a result of the Supreme Court's decision in Solid Waste Agency of Northern Cook County (SWANCC) v. United States Army Corps of Engineers (531 U.S. 159 [2001]). Isolated wetlands and waters are those areas that do not have a surface or groundwater connection to, and are not adjacent to a navigable "Waters of the U.S.," and do not otherwise exhibit an interstate commerce connection.

9.1.1.3 Permitting Corps Jurisdictional Areas

To remain in compliance with Section 404 of the Clean Water Act, project proponents and property owners (applicants) are required to be permitted by the Corps prior to discharging or otherwise impacting waters of the United States. In many cases, the Corps must visit a proposed project area (to conduct a "jurisdictional determination") to confirm the extent of area falling under their jurisdiction prior to authorizing any permit for that project area. Typically, at the time the jurisdictional determination is conducted, applicants (or their representative) will discuss the appropriate permit application that would be filed with the Corps for permitting the proposed impact(s) to "waters of the United States."

Pursuant to Section 404 of the Clean Water Act, the Corps normally provides two alternatives for permitting impacts to the type of "waters of the United States" found in the project area. The first alternative would be to use Nationwide Permit(s) (NWP). The second alternative is to apply to the Corps for an Individual Permit (33 CFR Section 235.5(2)(b)). The application process for Individual Permits is extensive and includes public interest review procedures (i.e., public notice and receipt of public comments) and must contain an "alternatives analysis" that is prepared

pursuant to Section 404(b) of the Clean Water Act (33 U.S.C. 1344(b)). The alternatives analysis is also typically reviewed by the federal EPA and thus brings another resource agency into the permitting framework. Both the Corps and EPA take the initial viewpoint that there are practical alternatives to the proposed project if there would be impacts to waters of the U.S., and the proposed permitted action is not a water dependent project (e.g. a pier or a dredging project). Alternative analyses therefore must provide convincing reasons that the proposed permitted impacts are unavoidable. Individual Permits may be available for use in the event that discharges into regulated waters fail to meet conditions of NWP(s).

NWPs are a type of general permit administered by the Corps and issued on a nationwide basis that authorize minor activities that affect Corps regulated waters. Under NWP, if certain conditions are met, the specified activities can take place without the need for an individual or regional permit from the Corps (33 CFR, Section 235.5[c][2]). In order to use NWP(s), a project must meet 27 general nationwide permit conditions, and all specific conditions pertaining to the NWP being used (as presented at 33 CFR Section 330, Appendices A and C). It is also important to note that pursuant to 33 CFR Section 330.4(e), there may be special regional conditions or modifications to NWPs that could have relevance to individual proposed projects. Finally, pursuant to 33 CFR Section 330.6(a), Nationwide permittees may, and in some cases must, request from the Corps confirmation that an activity complies with the terms and conditions of the NWP intended for use (*i.e.,* must receive "verification" from the Corps).

Prior to finalizing design plans, the applicant needs to be aware that the Corps maintains a policy of "no net loss" of wetlands (waters of the United States) from project area development. Therefore, it is incumbent upon applicants that propose to impact Corps regulated areas to submit a mitigation plan that demonstrates that impacted regulated areas would be recreated (*i.e.,* impacts would be mitigated). Typically, the Corps requires mitigation to be "in-kind" (i.e., if a stream channel would be filled, mitigation would include replacing it with a new stream channel), and at a minimum of a 1:1 replacement ratio (i.e., one acre or fraction there of recreated for each acre or fraction thereof lost). Often a 2:1 replacement ratio is required. Usually the 2:1 ratio is met by recreation or enhancement of an equivalent amount of wetland as is impacted, in addition to a requirement to preserve an equivalent amount of wetland as is impacted by the project. In some cases, the Corps allows "out-of-kind" mitigation if the compensation site has greater value than the impacted site. For example, if project designs call for filling an intermittent drainage, mitigation should include recreating the same approximate jurisdictional area (same drainage widths) at an offsite location or on a set-aside portion of the project area. Finally, there are many Corps approved wetland mitigation banks where wetland mitigation credits can be purchased by applicants to meet mitigation compensation requirements. Mitigation banks have defined service areas and the Corps may only allow their use when a project would have minimal impacts to wetlands.

9.1.2 Applicability to the Proposed Project

M&A originally prepared a preliminary wetland delineation map of the 35 acre parcel in 2006; however, this map was never submitted to the Corps. In 2011, a formal wetland delineation was conducted on July 14th and July 20th by M&A biologists Ms. Hope Kingma and Mr. Tim O'Donnell. The wetland delineation report and map were submitted to the Corps on August 22, 2011, requesting confirmation of the extent of Corps jurisdiction at the American Canyon Flat

Lands site. In a letter dated January 31, 2012 the extent of Corps jurisdiction was confirmed, based on a field investigation on September 21, 2011. That jurisdictional determination expired five (5) years from the date of that letter.

M&A biologists Ms. Hope Kingma and Mr. Devin Jokerst conducted another wetland delineation of the entire 35.85-acre parcel (known as Lot 3) which includes this project site on November 16, 2016 to re-verify the extent of jurisdictional areas on the site. M&A used the Corps' 1987 *Wetlands Delineation Manual* in conjunction with the *Regional Supplement for the Arid West Region*. The jurisdictional determination request and the Draft Aquatic Resources Delineation Map (Sheet 2) were submitted to the Corps in December 2016. Mr. Bryan Matsumoto of the Corps conducted a site verification visit on May 18, 2017. On May 16, 2018 the Corps issued the jurisdictional determination confirming their jurisdiction over 0.043-acre of waters of the U.S. on the 35.43-acre parcel which includes the presence of 0.020-acre of "isolated" wetlands on the 35.85-acre parcel (known as Lot 3). The confirmed Jurisdictional Delineation Map (Sheet 2) and letter are attached. *The "isolated" wetland on the 15-acre project site does not fall under the Corps' jurisdiction pursuant to the SWANCC decision (see Section 9.1.1.2, above); however, the isolated wetland would still be regulated by the RWQCB pursuant to the Porter-Cologne Water Quality Control Act, as discussed below.*

9.2 State Water Resources Control Board (SWRCB) / California Regional Water Quality Control Board (RWQCB)

9.2.1 Section 401 of the Clean Water Act

The SWRCB and RWQCB regulate activities in "waters of the State" (which includes wetlands) through Section 401 of the Clean Water Act. While the Corps administers a permitting program that authorizes impacts to waters of the United States, including wetlands and other waters, any Corps permit authorized for a proposed project would be inoperative unless it is a NWP that has been certified for use in California by the SWRCB, or if the RWQCB has issued a project specific certification of water quality. Certification of NWPs requires a finding by the SWRCB that the activities permitted by the NWP will not violate water quality standards individually or cumulatively over the term of the permit (the term is typically for five years). Certification must be consistent with the requirements of the federal Clean Water Act, the California Environmental Quality Act, the California Endangered Species Act, and the SWRCB's mandate to protect beneficial uses of waters of the State. Any denied (i.e., not certified) NWPs, and all Individual Corps permits, would require a project specific RWQCB certification of water quality.

9.2.2 Applicability to the Proposed Project

The Corps' Confirmed Reverification Aquatic Resources Delineation Map, dated May 22, 2017 is provided as Sheet 2. Since the RWQCB does not have a formal method for technically defining what constitutes waters of the State, M&A expects that the RWQCB should remain consistent with the Corps' determination. The proposed project will impact the isolated wetland/waters of the State. This isolated wetland would be regulated by the RWQCB pursuant to the Porter-Cologne Water Quality Control Act (see below).

9.2.3 PORTER-COLOGNE WATER QUALITY CONTROL ACT

The Porter-Cologne Water Quality Control Act, Water Code § 13260, requires that "any person discharging waste, or proposing to discharge waste, that could affect the waters of the State to file a report of discharge" with the RWQCB through an application for waste discharge (Water Code Section 13260(a)(1). The term "waters of the State" is defined as any surface water or groundwater, including saline waters, within the boundaries of the State (Water Code § 13050(e)). It should be noted that pursuant to the Porter-Cologne Water Quality Control Act, the RWQCB also regulates "isolated wetlands," or those wetlands considered to be outside of the Corps' jurisdiction pursuant to the SWANCC decision (see Corps Section above).

The RWQCB generally considers filling in waters of the State to constitute "pollution." Pollution is defined as an alteration of the quality of the waters of the state by waste that unreasonably affects its beneficial uses (Water Code §13050(1)). The RWQCB litmus test for determining if a project should be regulated pursuant to the Porter-Cologne Water Quality Control Act is if the action could result in any "threat" to water quality.

The RWQCB requires complete pre- and post-development BMPs of any portion of the project site that is developed. This means that a water quality treatment plan for the pre- and post-developed project site must be prepared and implemented. Preconstruction requirements must be consistent with the requirements of the National Pollutant Discharge Elimination System (NPDES). That is, a SWPPP must be developed prior to the time that a site is graded (see NPDES section below). In addition, a post construction BMPs plan, or a Stormwater Management Plan (SWMP) must be developed and incorporated into any site development plan.

9.2.4 APPLICABILITY TO THE PROPOSED PROJECT

Since any "threat" to water quality could conceivably be regulated pursuant to the Porter-Cologne Water Quality Control Act, care will be required when constructing the proposed project to be sure that adequate pre-and post-construction BMPs are incorporated into the project implementation plans.

While impacts to the "isolated" wetland on the project site are outside of Clean Water Act jurisdiction regulated by the Corps pursuant to Section 404 of the Clean Water Act and by the RWQCB pursuant to Section 401 of the Clean Water Act, impacts associated construction of the warehouse would nonetheless be regulated by the RWQCB pursuant to the Porter-Cologne Water Quality Control Act. The RWQCB has a Water Quality Order (Water Quality Order No. 2004-0004-DWQ) that provides coverage for "threats to waters of the State when there is no Clean Water Act jurisdiction (i.e., for projects that do not require a Corps permit). This type of permit has particular applicability if impacts include features outside of the Corps jurisdiction. To be eligible for coverage under Water Quality Order No. 2004-0004-DWQ, Finding 9 of the General WDRs specifies that projects regulated be restricted to not more than two-tenths of an acre (0.20) and 400 linear feet. In addition, Section II (A) regarding eligibility to use this Order states that the discharge shall not be subject to Section 404 of the CWA, or Section 10 of the Federal Rivers and Harbors Act. As such the proposed project should obtain a "Notice of Applicability (NOA)" from the RWQCB for use of Water Quality Order No. 2004-0004-DWQ. To obtain this coverage the applicant should submit a formal "Request for Concurrence of

Applicability of Proposed Project with State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ" to the RWQCB.

The proposed project will result in impacts to 0.02-acre of "isolated" wetlands (waters of the State). Any impacts to waters of the State would have to be mitigated to the satisfaction of the RWQCB prior to the time this resource agency would issue a permit for impacts to such features. The applicant will create approximately 0.05-acre of wetland to mitigate impacts to approximately 0.02-acre acre of waters of the State associated with construction of the proposed project. The applicant proposes to mitigate impacts to RWQCB jurisdictional seasonal wetlands via creation of seasonal wetland on a mitigation property that will be preserved in perpetuity via deed restriction. A detailed mitigation and monitoring plan will be submitted to the RWQCB for approval prior to project construction.

It should also be noted that prior to issuance of any permit from the RWQCB, this agency will require submittal of a Notice of Determination from the City of American Canyon indicating that the proposed project has completed a review conducted pursuant to CEQA. The pertinent sections of the CEQA document (typically the biology section) are often submitted to the RWQCB for review prior to the time this agency will issue a permit for a proposed project.

9.3 California Department of Fish and Wildlife Protections

9.3.1 Section 1602 of California Fish and Game Code

Pursuant to Section 1602 of the California Fish and Game Code: "An entity may not substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake, unless all of the following occur:

(1) CDFW receives written notification regarding the activity in the manner prescribed by CDFW. The notification shall include, but is not limited to, all of the following:
   (A) A detailed description of the project's location and a map.
   (B) The name, if any, of the river, stream, or lake affected.
   (C) A detailed project description, including, but not limited to, construction plans and drawings, if applicable.
   (D) A copy of any document prepared pursuant to Division 13 (commencing with Section 21000) of the Public Resources Code.
   (E) A copy of any other applicable local, state, or federal permit or agreement already issued.
   (F) Any other information required by CDFW" (Fish & Game Code 2014).

Please see Section 1602 of the current California Fish and Game Code for further details.

Please also note that while not stated in the regulations above, CDFW typically considers its jurisdiction to include riparian vegetation (that is, the trees and bushes growing along the stream). Thus, any proposed activity in a natural stream channel that would substantially adversely affect an existing fish and/or wildlife resource, including its riparian vegetation, would require entering into

a Streambed Alteration Agreement (SBAA) with CDFW prior to commencing with work in the stream. However, prior to authorizing such permits, CDFW typically reviews an analysis of the expected biological impacts, any proposed mitigation plans that would be implemented to offset biological impacts and engineering and erosion control plans.

9.3.2 APPLICABILITY TO THE PROPOSED PROJECT

There are no streams or drainages on the project site that would likely be regulated by CDFW. Hence, a SBAA with CDFW would not be necessary for this project.

10. STATE WATER RESOURCES CONTROL BOARD (SWRCB)/RWQCB – STORM WATER MANAGEMENT

10.1 Construction General Permit

While federal Clean Water Act NPDES regulations allow two permitting options for construction related stormwater discharges (individual permits and General Permits), the State Water Resources Control Board (SWRCB) has elected to adopt only one statewide Construction General Permit at this time that will apply to all stormwater discharges associated with construction activity, except from those on Tribal Lands, in the Lake Tahoe Hydrologic Unit, and those performed by the California Department of Transportation (CalTrans).

The Construction General Permit requires all dischargers where construction activity disturbs greater than one acre of land or those sites less than one acre that are part of a common plan of development or sale that disturbs more than one acre of land surface to:

1. Develop and implement a Storm Water Pollution Prevention Plan (SWPPP) which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting stormwater with the intent of keeping all products of erosion from moving off site into receiving waters.

2. Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation. Achieve quantitatively-defined (i.e., numeric) pollutant-specific discharge standards, and conduct much more rigorous monitoring based on the project's projected risk level.

3. Perform inspections of all BMPs.

This Construction General Permit is implemented and enforced by the nine California Regional Water Quality Control Boards (RWQCBs). It is also enforceable through citizens' suits and represents a dramatic shift in the State Water Board's approach to regulating new and redevelopment sites, imposing new affirmative duties and fixed standards on builders and developers.

Types of Construction Activity Covered by the Construction General Permit

- clearing,
- grading,
- disturbances to the ground such as stockpiling, or excavation that results in soil disturbances of at least one acre or more of total land area.

Construction activity that results in soil disturbances to a smaller area would still be subject to this General Permit if the construction activity is part of a larger common plan of development that encompasses greater than one acre of soil disturbance, or if there is significant water quality impairment resulting from the activity.

Construction activity does not include:

- routine maintenance to maintain original line and grade,
- hydraulic capacity, or original purpose of the facility,
- nor does it include emergency construction activities required to protect public health and safety.

The Construction General Permit includes several "post-construction" requirements. These requirements entail that site designs provide no net increase in overall site runoff and match pre-project hydrology by maintaining runoff volume and drainage concentrations. To achieve the required results where impervious surfaces such as roofs and paved surfaces are being increased, developers must implement non-structural off-setting BMPs, such as landform grading, site design BMPs, and distributed structural BMPs (bioretention cells, rain gardens, and rain cisterns). This "runoff reduction" approach is essentially a State Water Board-imposed regulatory requirement to implement Low Impact Development ("LID") design features. Volume that cannot be addressed using non-structural BMPs must be captured in structural BMPs that are approved by the RWQCB.

Improving the quality of site runoff is necessary to improve water quality in impaired and threatened streams, rivers, and lakes (that is, water bodies on the EPA's 303(d) list). The RWQCB prioritizes the water bodies on the 303(d) list according to potential impacts to beneficial uses. Beneficial uses can include a wide range of uses, such as nautical navigation; wildlife habitat; fish spawning and migration; commercial fishing, including shellfish harvesting; recreation, including swimming, surfing, fishing, boating, beachcombing, and more; water supply for domestic consumption or industrial processes; and groundwater recharge, among other uses. The State is required to develop action plans and establish Total Maximum Daily Loads (TMDLs) to improve water quality within these impaired water bodies. The TMDL is the quantity of a pollutant that can be safely assimilated by a water body without violating the applicable water quality standards.

Pursuant to the CWA, the RWQCB regulates construction discharges under the National Pollutant Discharge Elimination System (NPDES). The project sponsor of construction or other

activities that disturb more than 1 acre of land must obtain coverage under NPDES Construction General Permit Order 2009-0009-DWQ, administered by the RWQCB[1].

10.1.1 Applicability to The Proposed Project

To obtain coverage under the SWRCB administered Construction General Permit, the applicant (typically through its civil engineer) must electronically file a number of permit-related compliance documents (Permit Registration Documents (PRDs), including a Notice of Intent (NOI), a risk assessment, site map, signed certification, Stormwater Pollution Prevention Plan (SWPPP), Notice of Termination (NOT), NAL exceedance reports, and other site-specific PRDs that may be required. The PRDs must be prepared by a Qualified SWPPP Practitioner (QSP) or Qualified SWPPP Developer (QSD) and filed by a Legally Responsible Person (LRP) on the RWQCB's Stormwater Multi-Application Report Tracking System (SMARTS). (QSDs are typically civil engineers, professional hydrologists, engineering geologists, or landscape architects.) Once filed, these documents become immediately available to the public for review and comment. At a minimum, the SWPPP shall identify Best Management Practices (BMPs) for implementation during project construction that are in accordance with the applicable guidance and procedures contained in the California Stormwater Quality Association's *California Stormwater Best Management Practices Handbook* (2015).

10.2 RWQCB Municipal Storm Water Permitting Programs

The federal Clean Water Act (CWA) was amended in 1987 to address urban stormwater runoff pollution of the nation's waters. In 1990, the U.S. Environmental Protection Agency (USEPA) promulgated rules establishing Phase 1 of the National Pollutant Discharge Elimination System (NPDES) stormwater program. The Phase 1 program for Municipal Separate Storm Sewer System (MS4s) requires operators that serve populations of 100,000 or greater to implement a stormwater management program to control polluted discharges from these MS4s. While Phase 1 of the municipal stormwater program has focused on large urban areas, Phase 2 of the municipal stormwater program was promulgated by the USEPA for smaller urban areas including non-traditional Small MS4s, which are governmental facilities such as military bases, public campuses, and prison and hospital complexes.

MS4 permits require the discharger (or dischargers that are permitted by the MS4 permittees) to develop and implement a Storm Water Management Plan/Program (SWMP) with the goal of reducing the discharge of pollutants to the maximum extent practicable (MEP). MEP is the performance standard specified in Section 402(p) of the Clean Water Act. The management programs specify what best management practices (BMPs) will be used to address certain program areas. The program areas include public education and outreach; illicit discharge detection and elimination; construction and post-construction; and good housekeeping for municipal operations. In general, medium and large municipalities are required to conduct chemical monitoring, though small municipalities are not.

[1] CGP Order 2009-0009-DWQ remains in effect, but has been amended by CGP Order 2009-0014-DWQ, effective February 14, 2011, and CGP Order 2009-0016-DWQ, effective July 17, 2012. The first amendment merely provided additional clarification to Order 2009-0009-DWQ, while Order 2009-0016-DWQ eliminated numeric effluent limits on pH and turbidity (except in the case of active treatment systems), in response to a legal challenge to the original order.

10.2.1 NPDES C.3 REQUIREMENTS

The NPDES C.3 requirements went into effect for any project (public or private) that is "deemed complete" by the City or County (Lead Agency) on or after February 15, 2005, and which will result in the creation or replacement (other than normal maintenance) of at least 10,000 square feet of impervious surface area (roofs, streets, patios, parking lots, etc. Provision C.3 requires the onsite treatment of stormwater prior to its discharge into downstream receiving waters. Note that these requirements are in addition to the existing NPDES requirements for erosion and sedimentation controls during project construction that are typically addressed through acquisition of coverage under the SWRCB administered Construction General Permit. The C.3 requirements are typically required to be implemented by MS4 permittees (and their constituencies).

Projects subject to Provision C3 must include the capture and onsite treatment of all stormwater from the site prior to its discharge, including rainwater falling on building rooftops. Project applicants are required to implement appropriate source control and site design measures and to design and implement stormwater treatment measures in order to reduce the discharge of stormwater pollutants to the *maximum extent practicable.* While the Clean Water Act does not define "maximum extent practicable," the Stormwater Quality Management Plans required as a condition of the municipal NPDES permits identify control measures (known as Best Management Plans, or BMPs) and, where applicable, performance standards, to establish the level of effort required to satisfy the maximum extent practicable criterion. It is ultimately up to the professional judgment of the reviewing municipal staff in the individual jurisdictions to determine whether a project's proposed stormwater controls will satisfy the maximum extent practicable criterion. However, there are numeric criteria used to ensure that treatment BMPs have been adequately sized to accommodate and treat a site's stormwater. The C3 requirements are quite extensive, and their complete explanation is not provided here. However, the following are minimums that should be understood and adhered to:

- The applicant must provide a detailed and realistic site design *and impervious surface area calculations*. This site design *and calculations* will be used by the Lead Agency (County or City) to determine/*verify* the amount of impervious surface area that is being created or replaced. It should include all proposed buildings, roads, walkways, parking lots, landscape areas, etc., that are being created or redeveloped. If large (greater than 10,000 square feet) lots are being created an effort will need to be made to determine the total impervious surface area that could be created on that parcel. For example, if only a portion of the lot is shown as a "building envelope" then the lead agency will need to consider that a driveway will have to be constructed to access the envelope and that the envelope will then be developed as shown. If the C.3 thresholds are met (creation/redevelopment of 10,000 square feet of impervious surface area), a Stormwater Control Plan (SWCP) (if required by the Lead Agency, or whatever steps for compliance with Provision C3 are required locally) must accompany the application.

- If a SWCP is required by the Lead Agency for the project it must be stamped by a Licensed Civil Engineer, Architect, or Landscape Architect.

10.2.2 APPLICABILITY TO THE PROPOSED PROJECT

The Water Board issued county-wide municipal stormwater permits in the early 1990s to operators of MS4s. On November 19, 2015, the Water Board re-issued these county-wide municipal stormwater permits as one Municipal Regional Stormwater NPDES Permit to regulate stormwater discharges from municipalities and local agencies. Permittees in the San Francisco Bay area are included in a Municipal Regional Permit (MRP), issued to 76 cities, counties and flood control districts in 2009 and revised in 2015. Each of the Permittee's must file an Annual Report that is comprised of three parts: regional, countywide, and individual. Some requirements of the MRP are being implemented by the Bay Area Stormwater Management Agencies Association (BASMAA) on behalf of all the MRP Permittees. Other elements are being implemented collaboratively by the Permittees through their respective countywide programs. As such, BASMAA and the countywide programs have submitted Annual Report elements on the regional and countywide collaborative tasks, respectively, on behalf of the MRP Permittees and the individual MRP Permittees have also submitted Annual Report elements on the Permit Provisions they have implemented individually.

It is the applicant's responsibility to ensure that the project civil engineer prepares all required Storm Water Planning documents for submittal to the City of American Canyon to comply with its MS4 permit requirements. In addition, if the project includes a requirement to obtain a Clean Water Act Section 401 permit from the RWQCB, the Storm Water Management Plan (or equivalent plan) must be submitted to the RWQCB with the application package submitted for acquisition of a Section 401 permit (aka "water quality certification").

The applicant is proposing to treat all stormwater falling on imperious surfaces in Detention/Bioretention Facilities located in the southern and western sides of the project site (see Sheet C4). Once treated, stormwater would be conveyed to "level spreader outfalls" that will be installed along the western project site boundary. The detail for the level spreader is provided on the Exhibit LS.Detail. The level spreader outfalls consist of perforated pipe set on contour that will discharge flows uniformly across a gradual slope covered by riprap, which will mimic sheet flow conditions similar to current project site runoff. Accordingly, the project will not violate any water quality standards.

The applicant is currently in discussion with the City of American Canyon regarding a new municipal stormwater outfall that will be constructed in uplands adjacent to the marsh habitat at the confluence of North Slough and the Napa River, immediately south of the project parcel. Construction of the new municipal stormwater outfall will not result in impacts to waters of the U.S. or State. When this outfall is constructed, the applicant will divert some or all of the project site runoff from the level spreaders to the new municipal outfall.

11. CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) REGULATIONS

A CEQA lead agency must determine if a proposed activity constitutes a project requiring further review pursuant to the CEQA. Pursuant to CEQA, a lead agency would have to determine if there could be significant adverse impacts to the environment from a proposed project. Typically, if within the city limits, the city would be the CEQA lead agency. If a discretionary permit (i.e., conditional use permit) would be required for a project (e.g. an occupancy permit

must be issued), the lead agency typically must determine if there could be significant environmental impacts. This is usually accomplished by an "Initial Study." If there could be significant environmental impacts, the lead agency must determine an appropriate level of environmental review prior to approving and/or otherwise permitting the impacts. In some cases, there are "Categorical Exemptions" that apply to the proposed activity; thus the activity is exempt from CEQA. The Categorical Exemptions are provided in CEQA. There are also Statutory Exemptions in CEQA that must be investigated for any proposed project. If the project is not exempt from CEQA, the lowest level of review typically reserved for projects with no significant effects on the environment would be for the lead agency to prepare a "Negative Declaration." If a proposed project would have only minimal impacts that can be mitigated to a level of no significance pursuant to the CEQA, then a "Mitigated Negative Declaration" is typically prepared by the lead agency. Finally those projects that may have significant effects on the environment, or that have impacts that can't be mitigated to a level considered less than significant pursuant to the CEQA, typically must be reviewed via an Environmental Impact Report (EIR). All CEQA review documents are subject to public circulation, and comment periods.

Section 15380 of CEQA defines "endangered" species as those whose survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors. "Rare" species are defined by CEQA as those who are in such low numbers that they could become endangered if their environment worsens; or the species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered "threatened" as that term is used in FESA. The CEQA Guidelines also state that a project will normally have a significant effect on the environment if it will "substantially affect a rare or endangered species of animal or plant or the habitat of the species." The significance of impacts to a species under CEQA, therefore, must be based on analyzing actual rarity and threat of extinction to that species despite its legal status or lack thereof.

This report has been prepared as a Biology section that is suitable for incorporation into an Mitigated Negative Declaration. This document addresses potential impacts to species that would be defined as endangered or rare pursuant to Section 15380 of the CEQA and can be incorporated by the CEQA lead agency (in this case City of American Canyon) into an initial study or higher levels of CEQA review including incorporation into the biology section of an Environmental Impact Report.

12. IMPACTS ANALYSIS

Below the criteria used in assessing impacts to Biological Resources is presented.

12.1 Significance Criteria

A significant impact is determined using CEQA and CEQA Guidelines. Pursuant to CEQA §21068, a significant effect on the environment means a substantial, or potentially substantial, adverse change in the environment. Pursuant to CEQA Guideline §15382, a significant effect on the environment is further defined as a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water,

minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance. Other Federal, State, and local agencies' considerations and regulations are also used in the evaluation of significance of proposed actions.

Direct and indirect adverse impacts to biological resources are classified as "significant," "potentially significant," or "less than significant." Biological resources are broken down into four categories: vegetation, wildlife, threatened and endangered species, and regulated "waters of the United States" and/or stream channels.

12.1.1 THRESHOLDS OF SIGNIFICANCE

12.1.1.1 Plants, Wildlife, Waters

In accordance with Appendix G (Environmental Checklist Form) of the CEQA Guidelines, implementing the project would have a significant biological impact if it would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

- Have a substantial adverse effect on federally protected "wetlands" as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

12.1.1.2 Waters of the United States and State.

Pursuant to Section 404 of the Clean Water Act (33 U.S.C. 1344), the U.S. Army Corps of Engineers (Corps) regulates the discharge of dredged or fill material into waters of the United States, which includes wetlands, as discussed in the bulleted item above, and also includes "other waters" (stream channels, rivers) (33 CFR Parts 328 through 330). Substantial impacts to Corps regulated areas on a project site would be considered a significant adverse impact. Similarly, pursuant to Section 401 of the Clean Water Act, and to the Porter-Cologne Water Quality

Control Act, the RWQCB regulates impacts to waters of the state. Thus, substantial impacts to RWQCB regulated areas on a project site would also be considered a significant adverse impact.

12.1.1.3 Stream Channels

Pursuant to Section 1602 of the California Fish and Game Code, CDFW regulates activities that divert, obstruct, or alter stream flow, or substantially modify the bed, channel, or bank of a stream which CDFW typically considers to include riparian vegetation. Any proposed activity that would result in substantial modifications to a natural stream channel would be considered a significant adverse impact.

13. IMPACT ASSESSMENT AND PROPOSED MITIGATION

In this section we discuss potential impacts to sensitive biological resources including special-status animal species and waters of the United States and/or State. We follow each impact with a mitigation prescription that when implemented would reduce impacts to the greatest extent possible. This impact analysis is based on the Preliminary Site Plan (Sheet 1).

13.1 Impact BIO-1. Development of the Project Could Have a Potentially Significant Impact on Western Burrowing Owl (Potentially Significant)

The western burrowing owl is a California Species of Special Concern. This raptor (that is, bird of prey) is also protected under the Migratory Bird Treaty Act (50 CFR 10.13) and its nest, eggs, and young are protected under California Fish and Game Code Sections 3503, 3503.5. While western burrowing owls have not been observed on the project site and their likelihood of presence on the project site is considered to be low, limited suitable nesting habitat occurs on the project site. Since the western burrowing owl is a mobile species that could move onto the project site prior to development, preconstruction surveys would be necessary to determine its presence. Thus, the project may result in impacts to the western burrowing owl; this would be a *potentially significant impact pursuant to CEQA***.** This impact could be mitigated to a level considered less than significant pursuant to CEQA.

13.2 Mitigation Measure BIO-1. Mitigation for Potential Impacts to Western Burrowing Owl

Based on the presence of this species in the project vicinity and the potential habitat found on the project site, a preconstruction survey for burrowing owls should be conducted 14 days prior or less to initiating ground disturbance. As burrowing owls may recolonize a site after only a few days, time lapses between project activities trigger subsequent take avoidance surveys including but not limited to a final survey conducted within 24 hours prior to ground disturbance to ensure absence. If no owls are found during these surveys, no further regard for the burrowing owl would be necessary.

a. Burrowing owl surveys should be conducted by walking the entire project site. Pedestrian survey transects should be spaced to allow 100 percent visual coverage of the ground surface. The distance between transect center lines should be 7 meters to 20 meters and should be reduced to account for differences in terrain, vegetation density, and ground surface visibility. Poor weather may affect the surveyor's ability to detect burrowing owls thus, avoid conducting surveys when wind speed is greater than 20 kilometers per hour and there is precipitation or

dense fog. To avoid impacts to owls from surveyors, owls and/or occupied burrows should be avoided by a minimum of 50 meters (approximately 160 ft.) wherever practical to avoid flushing occupied burrows. Disturbance to occupied burrows should be avoided during all seasons.

b. If burrowing owls are detected on the site, the following restricted activity dates and setback distances are recommended per CDFW's Staff Report (2012).

- From April 1 through October 15, low disturbance and medium disturbance activities should have a 200 meter buffer while high disturbance activities should have a 500 meter buffer from occupied nests.
- From October 16 through March 31, low disturbance activities should have a 50 meter buffer, medium disturbance activities should have a 100 meter buffer, and high disturbance activities should have a 500 meter buffer from occupied nests.
- No earth-moving activities or other disturbance should occur within the afore-mentioned buffer zones of occupied burrows. These buffer zones should be fenced as well. If burrowing owls were found in the project area, a qualified biologist would also need to delineate the extent of burrowing owl habitat on the site.

Implementation of these mitigation measures would reduce potential impacts to burrowing owls to a level considered less than significant pursuant to CEQA.

13.3 Impact BIO-2. Development of the Project Would Have a Potentially Significant Impact on Nesting Swainson's hawks (Potentially Significant)

The Swainson's hawk is a state listed threatened species. While the Swainson's hawk has no special federal status it is protected from direct take under the Federal Migratory Bird Treaty Act of 1918 (16 U.S.C. 703-711). Swainson's hawks, their nests, eggs, and young are also protected under California Fish and Game Code (§3503, §3503.5, §3513, and §3800).

No Swainson's hawk nests have been observed on the site or offsite in the vicinity of the project site during M&A's multiple project site surveys; however, the nesting population appears to be increasing (G. Monk general observations) throughout its nesting range in northern California and thus, it could conceivably nest in trees near the project site in the future.

If Swainson's hawks are found to be nesting adjacent to the project site, implementation of the proposed project could be viewed by CDFW as a project that could impact nesting Swainson's hawks. Nest site disturbance which results in: (1) nest abandonment; (2) loss of young; (3) reduced health and vigor of eggs and/or nestlings (resulting in reduced survival rates), may ultimately result in the take (killing) of nestling or fledgling Swainson's hawks incidental to otherwise lawful activities. The taking of Swainson's hawks in this manner can be viewed by CDFW as a violation of the Section 2080 of the Fish and Game Code. This interpretation of take has been judicially affirmed by the landmark appellate court decision pertaining to CESA (CDFG v. ACID, 8 CA App. 4, 41554) (CDFG 1994).

Typically, CDFW requires that any impact to a Swainson's hawk nest be permitted through a Fish and Game Section 2081 management authorization. If an active nest is found adjacent to the

project site within an area of influence (which is generally considered to be within 1,000 feet of the project site) "to avoid potential violation of Fish and Game Code 2080 (i.e., killing of listed species), project-related disturbance at active Swainson's hawk nesting sites should be reduced or eliminated during critical phases of the nesting cycle (March 1- September 15 annually)" (CDFG 1994). If disturbance would occur, a Fish and Game Section 2081 management authorization would be required. As such, in the absence of survey results, it must be concluded that impacts to Swainson's hawk from the proposed project would be *potentially significant pursuant to CEQA.* This impact could be mitigated to a level considered less than significant pursuant to CEQA.

13.4 Mitigation Measure BIO-2. Mitigation for Potential Impacts to Nesting Swainson's Hawk

Preconstruction surveys shall be conducted for a quarter-mile radius around all project activities and shall be completed for at least two survey periods immediately prior to the project's initiation. The survey period timing and methodology shall be conducted in accordance with CDFW's *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (CDFG 2000), which identifies different survey windows throughout the pre-nesting and nesting season (ranging from January 1 through July 30/post-fledging) that have different survey methodologies and requirements.

If Swainson's hawks are found to be nesting on the project site or within a ¼-mile of the project site, consultation with CDFW shall be required. The size of the nest protection buffer shall be determined during consultation with CDFW but at a minimum there will be a 300-foot non-disturbance buffer around the nest site.

Implementation of this mitigation measure would reduce potential impacts to nesting Swainson's hawk to a level considered less than significant pursuant to CEQA.

13.5 Impact BIO-3: Development of the Project Would Have a Potentially Significant Impact on Tree or Ground Nesting Raptors (Swainson's Hawk Excluded; See Impact BIO-2) (Potentially Significant)

Tree or ground nesting raptors that could be affected by the project include western burrowing owl, northern harrier, Swainson's hawk, red-shouldered hawk and red-tailed hawk. Nesting raptors are protected by the federal Migratory Bird Treaty Act (MBTA) (16 U.S.C. 703-711 and 50 CFR 10.13). All nesting raptors, their eggs and young are protected pursuant to California Fish and Game Code §3503.5. Specific surveys for nesting raptors have not been conducted. In the absence of survey results indicating otherwise, it is conservatively assumed that implementation of the proposed project may impact nesting raptors which could result in nest abandonment and death of eggs or young. Therefore, impacts to nesting raptors are regarded as *potentially significant pursuant to CEQA***.** This impact could be mitigated to a level considered less than significant pursuant to CEQA.

13.6 Mitigation Measure BIO-3: Mitigation for Potential Impacts to Tree or Ground Nesting Raptors Except Swainson's Hawk.

To ensure that impacts to tree or ground nesting raptors are avoided or offset, the following mitigation measures will be implemented:

a. In order to avoid impacts to nesting raptors, a preconstruction nesting survey will be conducted by a qualified raptor biologist prior to commencing with earth-moving or construction work if this work would commence between February 1st and August 31st. The survey should be conducted within the 30 day period prior to site disturbance. The raptor nesting surveys will include examination of all trees and ruderal habitat within 200 feet of the project site.

b. If nesting raptors are identified during the surveys, the dripline of the nest tree or ground-nesting site must be fenced with orange construction fencing (provided the nest site is on the project site), and a 200-foot radius around the nest tree or nest site must be staked with orange construction fencing. If the tree or nest site is located off the project site, then the buffer should be demarcated per above where the buffer occurs on the project site. The size of the buffer may be altered if a qualified raptor biologist conducts behavioral observations and determines the nesting raptors are well acclimated to disturbance. If this occurs, the raptor biologist should prescribe a modified buffer that allows sufficient room to prevent undue disturbance/harassment to the nesting raptors. No construction or earth-moving activity should occur within the established buffer until it is determined by a qualified raptor biologist that the young have fledged (that is, left the nest) and have attained sufficient flight skills to avoid project construction zones. This typically occurs by August 1st. This date may be earlier or later, and would have to be determined by a qualified raptor biologist. If a qualified biologist is not hired to watch the nesting raptors then the buffers should be maintained in place through the month of August and work within the buffer can commence on September 1st.

c. If the preconstruction nesting survey identifies a large stick or other type of raptor nest that appears inactive at the time of the survey, but there are territorial raptors evident in the nest site vicinity, a protection buffer (as described above) should be established around the potential nesting tree until the qualified raptor biologist determines that the nest is not being used. In the absence of conclusive observations indicating the nest site is not being used, the buffer should remain in place until a second follow-up nesting survey can be conducted to determine the status of the nest and eliminate the possibility that the nest is utilized by a late-spring nesting raptor (for example, red-tailed hawk). This second survey should be conducted even if construction has commenced. If during the follow-up late season nesting survey a nesting raptor is identified utilizing the nest, the protection buffer should remain until it is determined by a qualified raptor biologist that the young have fledged and have attained sufficient flight skills to avoid project construction zones. If the nest remains inactive, the protection buffer can be removed and construction and earth-moving activities can proceed unrestrained.

Implementation of these mitigation measures would reduce potential impacts to nesting raptors to a level considered less than significant pursuant to CEQA.

13.7 Impact BIO-4: Development of the Project Would Have a Potentially Significant Impact on Nesting Passerine Birds. (Potentially Significant)

Nesting passerine birds (i.e., perching birds) including nesting special-status passerine birds are protected by the federal Migratory Bird Treaty Act (MBTA) (16 U.S.C. 703-711 and 50 CFR 10.13) and by California Fish and Game Code §3503 and §3503.5 which protects nesting birds,

their eggs and young. These birds frequently change nesting locations from year to year and thus, past nesting histories are not necessarily indicative of future nesting activities. Accordingly, impacts to nesting passerine birds, their eggs, and/or young resulting from the proposed project are considered potentially significant. This impact could be mitigated to a level considered less than significant pursuant to CEQA.

13.8 Mitigation Measure BIO-4: Mitigation for Potential Impacts to Nesting Passerine Birds.

To ensure that impacts to nesting passerine birds are avoided or offset, a nesting survey shall be conducted 15 days prior to commencing construction/ grading or tree removal activities if this work would commence between March 1 and September 1. If common passerine birds or special-status passerine birds are identified nesting on the project site, a non-disturbance buffer of 75 feet shall be established or as otherwise prescribed by a qualified ornithologist. The buffer shall be demarcated with orange construction fencing. Disturbance within the buffer shall be postponed until it is determined by a qualified ornithologist that the young have fledged and have attained sufficient flight skills to leave the area or that the nesting cycle has otherwise completed.

Typically, most passerine birds in the region of the project site are expected to complete nesting by August 1st. However, many species can complete nesting by the end of June or in early to mid-July. Regardless, nesting buffers shall be maintained until August 1st unless a qualified ornithologist determines that young have fledged and are independent of their nests at an earlier date. If buffers are removed prior to August 1st, the qualified biologist conducting the nesting surveys should prepare a report that provides details about the nesting outcome and the removal of buffers. This report shall be submitted to the City of American Canyon Planning Department prior to the time that nest protection buffers are removed if the date is before August 1st.

Implementation of this mitigation measure would reduce potential impacts to common and special-status nesting passerine birds to a level considered less than significant pursuant to CEQA.

13.9 Impact BIO-5. Development of the Project Would Have a Significant Impact on Waters of the State (Significant)

The proposed project will result in impacts to 0.02-acre of "isolated" wetlands (waters of the State) regulated by the RWQCB pursuant to the Porter-Cologne Water Quality Control Act. Impacts to "waters of the State" from the proposed project would be regarded as a *significant impact***.** This impact could be mitigated to a level considered less than significant pursuant to CEQA.

13.10 Mitigation Measure BIO-5. Mitigation for Impacts to Waters of the State

Based on the Corps confirmed map, 0.02-acre of isolated seasonal wetland will be impacted by the proposed project. The RWQCB has a Water Quality Order No. 2004-004-DWQ (General WDRs), *Standard General Waste Discharge Requirements for Dredged or Fill Discharges to Waters Deemed by the U.S. Army Corps of Engineers to be Outside of Federal Jurisdiction.* This project will apply for coverage under Water Quality Order No. 2004-0004-DWQ for impacts to

isolated waters on the project site. The requirements stipulated in this permit will become conditions of project approval.

The applicant is proposing to mitigate for project-related impacts to waters of the State at a 2:1 mitigation ratio. The applicant will create approximately 0.05-acre of wetland to mitigate impacts to approximately 0.02-acre of waters of the State associated with construction of the proposed project. The applicant proposes to mitigate impacts to RWQCB jurisdictional seasonal wetlands via creation of seasonal wetland on a mitigation property that will be preserved in perpetuity via deed restriction. A detailed mitigation and monitoring plan will be submitted to the RWQCB for approval prior to project construction. This wetland creation/mitigation would need to be approved by the RWQCB at the time the permit application is applied for/issued.

Implementation of this mitigation measure would reduce impacts to waters of the State to a level considered less than significant pursuant to the CEQA.

**Sonchus asper subsp. asper*	Prickly sow-thistle

Brassicaceae

**Hirschfeldia incana*	Short-podded mustard
**Sinapis alba*	White mustard

Caryophyllaceae

**Stellaria media*	Common chickweed

Convolvulaceae

**Convolvulus arvensis*	Bindweed

Fabaceae

**Medicago polymorpha*	California burclover
**Trifolium repens*	White clover
**Vicia sativa*	Common vetch

Geraniaceae

**Erodium cicutarium*	Red-stem filaree
**Geranium dissectum*	Cut-leaf geranium

Montiaceae

Claytonia perfoliata	Miner's lettuce

Myrsinaceae

**Lysimachia arvensis*	Scarlet pimpernel

Orobanchaceae

**Parentucellia viscosa*	Yellow glandweed

Papaveraceae

**Fumaria parviflora*	Fumaria

Plantaginaceae

**Plantago lanceolata*	English plantain

Polygonaceae

**Rumex crispus*	Curly dock

Ranunculaceae

**Ranunculus muricatus*	Spiny-fruit buttercup

Rubiaceae

Galium aparine	Goose grass

* Indicates a non-native species

Table 1

Plant Species Observed on the SDG Commerce 330 Distribution Center Project Site.

Angiosperms -Monocots

Iridaceae

Sisyrinchium californicum	Golden-eyed-grass

Juncaceae

Juncus occidentalis	Slender rush

Poaceae

**Avena barbata*	Slender wild oat
**Bromus diandrus*	Ripgut grass
**Bromus hordeaceus*	Soft chess
Elymus triticoides	Creeping wildrye
**Festuca perennis*	perennial ryegrass
**Hordeum murinum*	Wall barley
Phalaris angusta	Canary timothy grass

* Indicates a non-native species

Table 2
Wildlife Species Observed on the SDG Commerce 330 Distribution Center Project Site.

Amphibians	
Sierran treefrog	*Pseudacris sierra*
Birds	
Northern flicker	*Colaptes auratus*
Red-shouldered hawk	*Buteo lineatus*
Wild turkey	*Meleagris gallopavo*
Mourning dove	*Zenaida macroura*
Nuttall's woodpecker	*Picoides nuttallii*
Black phoebe	*Sayornis nigricans*
American crow	*Corvus brachyrhynchos*
Tree swallow	*Tachycineta bicolor*
Violet-green swallow	*Tachycineta thalassina*
Bushtit	*Psaltriparus minimus*
Western bluebird	*Sialia mexicana*
Red-winged blackbird	*Agelaius phoeniceus*
House finch	*Haemorhous mexicanus*
Mammals	
Black-tailed jackrabbit	*Lepus californicus*
California ground squirrel	*Otospermophilus beecheyi*
Botta's pocket gopher	*Thomomys bottae*
California meadow vole	*Microtus californicus*

Table 3

Special-Status Plant Species Known to Occur Within 3 Miles of the SDG Commerce 330 Distribution Center Project Site.

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Asteraceae					
Balsamorhiza macrolepis Big-scale balsam-root	Fed: - State: - CNPS: Rank 1B.2	March-June	Cismontane woodland; chaparral; valley and foothill grassland; [sometimes serpentinite]. 90 - 1555 meters	The closest record of this species is located 2.8 miles east of the project site (Occurrence No. 7).	None, negative survey findings during multiple surveys. Site is highly disturbed by tree removal.
Symphyotrichum lentum Suisun Marsh aster	Fed: - State: - CNPS: Rank 1B.2	August-November	Marshes and swamps (brackish and fresh water)	The closest record of this species is located 2.3 miles northwest of the project site (Occurrence No. 128).	None, negative survey findings during multiple surveys. Site is highly disturbed by tree removal.
Chenopodiaceae					
Extriplex joaquinana San Joaquin spearscale	Fed: - State: - CNPS: Rank 1B.2	April-October	Chenopod scrub; meadows; valley and foothill grassland; [alkaline].	The closest record of this species is located 1.6 miles south of the project site (Occurrence No. 37).	None, negative survey findings during multiple surveys. Site is highly disturbed by tree removal.
Cyperaceae					
Carex lyngbyei Lyngbye's sedge	Fed: - State: - CNPS: Rank 2	May-August	Marshes or swamps (brackish or freshwater)	The closest record of this species is located 2.3 miles northwest of the project site (Occurrence No. 28).	None, negative survey findings during multiple surveys. Site is highly disturbed by tree removal.
Fabaceae					
Astragalus tener tener Alkali milkvetch	Fed: - State: - CNPS: Rank 1B.2	March-June	Playas; mesic grasslands (adobe clay), vernal pools (alkaline).	The closest record of this species is located 1.6 miles south of the project site (Occurrence No. 50).	None, negative survey findings during multiple surveys. Site is highly disturbed by tree removal.

Table 3

Special-Status Plant Species Known to Occur Within 3 Miles of the SDG Commerce 330 Distribution Center Project Site.

Family Taxon Common Name	Status*	Flowering Period	Habitat	Area Locations	Probability on Project Site
Lathyrus jepsonii jepsonii Delta tule pea	Fed: - State: - CNPS: Rank 1B.2	May-September	Marshes and swamps (freshwater and brackish).	The closest record of this species is located 2.5 miles northwest of the project site (Occurrence No. 13).	None, negative survey findings during multiple surveys. Site is highly disturbed by tree removal.
Trifolium amoenum Showy Indian clover	Fed: FE State: - CNPS: Rank 1B.1	April-June	Valley and foothill grassland (sometimes serpentinite)	The closest record of this species is located 1.1 miles east of the project site (Occurrence No. 23).	None, negative survey findings during multiple surveys. Site is highly disturbed by tree removal.
Orobanchaceae					
Castilleja affinis neglecta Tiburon paintbrush	Fed: FE State: CT CNPS: Rank 1B.2	April-June	Valley and foothill grassland [serpentinite]	The closest record of this species is located 2.8 miles southeast of the project site (Occurrence No. 5).	None, negative survey findings during multiple surveys. Site is highly disturbed by tree removal.
Chloropyron molle molle Soft salty bird's-beak	Fed: FE State: CR CNPS: Rank 1B.2	July-September	Marshes and swamps (coastal salt).	The closest record of this species is located 2.2 miles north of the project site (Occurrence No. 3).	None, negative survey findings during multiple surveys. Site is highly disturbed by tree removal.

State:
CE - California Endangered
CT - California Threatened
CR - California Rare
CC - California Candidate
CSC - California Species of Special Concern

CNPS:
Rank 1A - Presumed extinct in California
Rank 1B - Plants rare, threatened, or endangered in California and elsewhere
Rank 1B.1 - Seriously endangered in California (over 80% occurrences threatened/ high degree and immediacy of threat)
Rank 1B.2 - Fairly endangered in California (20-80% occurrences threatened)
Rank 1B.3 - Not very endangered in California (<20% of occurrences threatened or no current threats known)

CNPS Continued:
Rank 2 - Plants rare, threatened, or endangered in California, but more common elsewhere
Rank 2A - Extirpated in California, common elsewhere
Rank 2B.1 - Seriously endangered in California, but more common elsewhere
Rank 2B.2 - Fairly endangered in California, but more common elsewhere
Rank 2B.3 - Not very endangered in California, but more common elsewhere
Rank 3 - Plants about which we need more information (Review List)
Rank 3.1 - Plants about which we need more information (Review List) Seriously endangered in California
Rank 3.2 - Plants about which we need more information (Review List) Fairly endangered in California
Rank 4 - Plants of limited distribution - a watch list

Table 4

Special-Status Wildlife Speceis Known to Occur Within 3 Miles of the SDG Commerce 330 Distribution Center Project Site

Species	*Status	Habitat	Closest Locations	Probability on Project Site
Invertebrates				
Vernal pool fairy shrimp *Branchinecta lynchi*	Fed: FT State: - Other:	Endemic to the grasslands of the Central Valley, central coast mountains, and south coast mountains. Inhabit static rain-filled/vernal pools, small, clear water sandstone-depression pools and grassed swale, earth slump, or basalt-flow depression	Record for this species located 1.6 miles north of the project site (CNDDB Occurrence No. 232).	None. No vernal pools or suitable habitat onsite. No impacts to this species are anticipated.
Fish				
Steelhead - Central California Coast DPS *Oncorhynchus mykiss irideus*	Fed: FT State: - Other:	From Russian River south to Soquel Creek, and to Pajaro River. Also found in San Francisco & San Pablo Bay Basins. Spawn in clear, cool, well oxygenated streams greater than 18 cm deep.	Record for this species located 0.3 miles southwest of the project site (CNDDB Occurrence No. 4).	None. No streams or rivers on the project site. No impacts to this species are anticipated.
Longfin smelt *Spirinichus thaleichthys*	Fed: -- State: CT Other:	Endemic to the Sacramento-San Joaquin River system. Inhabits open waters in the Delta and Suisun Bay. After spawning, larvae are carried downstream to brackish nursery areas.	Record for this species located 1.1 miles east of the project site (CNDDB Occurrence No. 26).	None. No stream or river habitat located on the project site. No impacts to this species are anticipated.
Sacramento splittail *Pogonichthys macrolepidotus*	Fed: State: CSC Other:	Endemic to the lakes and rivers of the Central Valley; now confined to the delta, Suisun Bay, and associated marshes. Inhabits slow moving river sections and dead-end sloughs. Needs flooded vegetation for spawning.	Record for this species located 2.8 miles southwest of the project site (CNDDB Occurrence No. 12).	None. No streams or rivers on the project site. No impacts to this species are anticipated.
Amphibians				
California red-legged frog *Rana draytonii*	Fed: FT State: CSC Other:	Occurs in lowlands and foothills in deeper pools and streams, usually with emergent wetland vegetation. Requires 11-20 weeks of permanent water for larval development.	Record for this species located 1.4 miles east of the project site (CNDDB Occurrence No. 896).	Unlikely to occur onsite due to lack of suitable habitat and presence of a eucalytpus grove onsite for many decades. See text.

Table 4

Special-Status Wildlife Speceis Known to Occur Within 3 Miles of the SDG Commerce 330 Distribution Center Project Site

Species	*Status	Habitat	Closest Locations	Probability on Project Site
Reptiles				
Western pond turtle ** *Actinemys marmorata marmorata*	Fed: - State: CSC Other:	Inhabits ponds, marshes, rivers, streams, and irrigation ditches with aquatic vegetation. Needs suitable basking sites and upland habitat for egg laying. Occurs in the Central Valley and Contra Costa County.	Record for this species located 0.5 miles north of the project site (CNDDB Occurrence No. 552).	None. No streams or open water onsite. No impacts to this species are anticipated.
Birds				
Swainson's hawk *Buteo swainsoni*	Fed: - State: CT Other:	Migratory and resident raptor that breeds in open areas with scattered trees. Prefers riparian and sparse oak woodland habitats for nesting. Requires nearby grasslands, grain fields, or alfalfa for foraging.	Record for this species located 2.6 miles north of the project site (CNDDB Occurrence No. 2744).	Low potential to nest in the eucalyptus adjacent to the project site. A pre-constuction nesting survey will be conducted. See text.
Ferruginous hawk *Buteo regalis*	Fed: -- State: WL Other:	Winter migrant to California where they prefer grasslands, cultivated fields and arid areas with an abundance of prey species, such as pocket gophers, black-tailed hares, and cottontails.	Record for this species located 2.4 miles north of the project site (CNDDB Occurrence No. 28).	None. This species does not nest in California. No impacts to this species are anticipated.
California black rail *Laterallus jamaicensis coturniculus*	Fed: -- State: CT Other:	Inhabits salt marshes bordering larger bays. Prefers tidal salt marshes of pickleweed.	Record for this species located 2.3 miles north of the project site (CNDDB Occurrence No. 13).	None. No marsh habitat located on the project site. No impacts to this species are anticipated.
California Ridgway's rail *Rallus obsoletus obsoletus*	Fed: FE State: CE Other:	Inhabits salt water and brackish marshes with tidal sloughs in San Francisco Bay. Prefers dense pickleweed for cover, but forages for invertebrates along mud-bottomed sloughs.	Record for this species located 2.3 miles Northwest of the project site (CNDDB Occurrence No. 16).	None. No marsh habitat located on the project site. No impacts to this species are anticipated.

Table 4

Special-Status Wildlife Speceis Known to Occur Within 3 Miles of the SDG Commerce 330 Distribution Center Project Site

Species	*Status	Habitat	Closest Locations	Probability on Project Site
Western burrowing owl *Athene cunicularia hypugaea*	Fed: -- State: CSC Other:	Found in open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel.	Record for this species located 2.5 miles southeast of the project site (CNDDB Occurrence No. 109).	Low. Few burrows observed onsite. No owls were observed during suveys. A pre-constuction survey will be conducted. See text.
Salt marsh common yellowthroat *Geothlypis trichas sinuosa*	Fed: - State: CSC Other:	Resident of freshwater and salt water marshes in the San Francisco Bay region. Requires thick, continuous cover for foraging and tall grasses, tules, or willows for nesting.	Record for this species located 2.3 miles north of the project site (CNDDB Occurrence No. 37).	None. No nesting habitat located on the project site. No impacts to this species are anticipated.
San Pablo song sparrow *Melospiza melodia samuelis*	Fed: -- State: CSC Other:	More properly known as Samuels Song Sparrow. Resident of salt marshes along the north side of San Francisco and San Pablo Bays. Inhabits tidal sloughs in the California marshes; nests in grindelia bordering slough channels.	Record for this species located 2.6 miles west of the project site (CNDDB Occurrence No. 17).	None. No marsh habitat located on the project site. No impacts to this species are anticipated.
Tricolored blackbird *Agelaius tricolor*	Fed: - State: CC Other: CSC	Colonial nester in dense cattails, tules, brambles or other dense vegetation. Requires open water, dense vegetation, and open grassy areas for foraging.	Record for this species located 1.6 miles northeast of the project site (CNDDB Occurrence No. 243).	None. Insufficent cover for nesting and no permanent open water onsite. No impacts to this species are anticipated.
Mammals				
Salt marsh harvest mouse *Reithrodontomys raviventris*	Fed: FE State: CE Other:	Inhabits saline marshes in the San Francisco Estuary. Prefers pickleweed marshes. Requires higher areas for escaping high water.	Record for this species located 2.2 miles south of the project site (CNDDB Occurrence No. 150).	None. No marsh habitat located on the project site. No impacts to this species are anticipated.

Traffic Memoranda

Memorandum

October 24, 2018

To:	Mr. Neil Thompson Stravinski Development Group	Project:	330 Commerce Boulevard Wine Storage Facility Project
From:	Kamesh Vedula, P.E. Peter Galloway, Senior Transportation Planner	Ref/Job No.:	11181445
CC:		File No.:	C2106MEM006.DOCX

Subject: Traffic Impact Analysis Memorandum

Introduction

This traffic impact analysis memorandum (TIAM) has been prepared to present the results of a traffic impact analysis performed by GHD for a proposed new wine storage facility development at 330 Commerce Boulevard in the City of American Canyon. The term "project" used in this memorandum refers to the proposed new 330,528 square foot wine storage warehouse. This study builds on a recent trip generation comparison performed by GHD which evaluated traditional "warehouse" development and specialized wine warehouse sites within the same geographic area of American Canyon.[1] The project site is located on Commerce Boulevard south of Green Island Road and Hanna Drive at the terminus of the roadway.

Included in this technical memorandum are analyses and discussion of the following transportation components:

- Quantification of updated daily and peak hour trip generation rates as well as trip distribution associated with proposed wine warehouse uses;
- Existing and future daily and peak hour roadway and intersection operations;
- Right-turn lane analysis for the northbound right-turn movement from Commerce Boulevard onto Green Island Road;
- Traffic signal warrant analysis for the Green Island Road/Commerce Boulevard intersection.

Consistent with previous transportation analyses conducted for the proposed project and City direction the following traffic scenarios were analyzed for this project:

- Existing Conditions
- Existing Plus Project Conditions
- Cumulative (No Project) Conditions
- Cumulative Plus Project Conditions

[1] GHD, Trip Generation Comparison Development Site Repurpose; Green Island Wine Warehouse, Design memorandum to Mr. Neil Thompson (Stravinski Development Group) from Mr. Kamesh Vedula (GHD), September 27, 2018.

GHD
943 Reserve Drive Roseville California 95678 USA
T 916 782 8688 F 916 782 8689 W www.ghd.com

The following study intersection was identified and analyzed for this project:

- Green Island Road/Commerce Boulevard—All-Way-Stop-Control

The *Existing Conditions* analysis represents current operations of roadway and intersections based on newly collected traffic count data (October, 2018);

The *Existing Plus Project Conditions* represent the net increase in project trips that are then added to existing traffic volumes to quantify potential impacts from proposed project uses;

The *Cumulative (No Project) Conditions* represent future traffic conditions based on the City of American Canyon General Plan to the Year 2030;

The *Cumulative Plus Project Conditions* represent the net increase in project trips added to cumulative (no project) volumes to quantify impacts from proposed project uses. Care is given not to "double count" proposed project trips based on assumed land uses for the proposed project site used in City's General Plan.

Existing Traffic Volumes

Existing traffic volumes for this analysis are based on new daily and peak hour traffic volume data collected during the first week of October, 2018 at the Green Island Road/Commerce Boulevard intersection as well as on Green Island Road east and west of Commerce Boulevard and on Commerce Boulevard north south of Green Island Road (see Appendices for Supporting Data Information).[2]

The AM peak hour is defined as the one-hour of peak traffic flow (which is the highest total volume over four consecutive 15-minute count periods) counted between 7:00 am and 9:00 am on a typical weekday. The PM peak hour is defined as the one-hour of peak traffic flow counted between 4:00 pm and 6:00 pm on a typical weekday. The peak hours chosen within the study coincide with the peak commute hour at which time the roadways typically experience maximum traffic.

As part of the overall traffic data collection effort, the amount of heavy vehicles (truck traffic) was included in the field data collection. Given the industrial/light industrial nature of the area truck traffic can make between 20-30% of traffic volumes on Green Island Road or Commerce Boulevard depending on the time of day and delivery patterns.

Analysis Level of Service Methodologies/Policies

City of American Canyon Traffic Study Thresholds of Significance

The City of American Canyon Traffic Study Thresholds of Significance establishes the following significance criteria for intersection operation. Specifically, a project-related or cumulative traffic impact is considered to be significant if the proposed project:

[2] National Data and Surveying Services (NDS), AM peak period (7:00-9:00), PM peak period (4:00-6:00) intersection count at the Green Island Road/Commerce Boulevard intersection, October 2, 2018. Average daily traffic (ADT) counts on Green Island Road (east and west of Commerce Boulevard) and Commerce Boulevard (north and south of Green Island Road, October 2, 3, 4, 2018.

"Causes the existing baseline level of service to degrade to worse than LOS D (LOS E at American Canyon Road/SR 29) at any intersection as stipulated in the City's General Plan, Circulation Element."

Project-Specific Significance and Mitigation Thresholds

In accordance with the City of American Canyon Traffic Study Thresholds of Significance, the following thresholds of significance are used to determine if an impact is significant and requires mitigation:

Unsignalized Intersections:
The project is considered to have a significant impact if it would:

- Result in an unsignalized intersection that will operate at an acceptable LOS in the *No Project* condition to deteriorate to an unacceptable LOS in the *Plus Project* condition; or,
- Increase the delay by more than 5 seconds at an unsignalized intersection that is already operating or will operate at an unacceptable LOS in the *No Project* condition.

Existing Intersection Operations

Methodology

Intersection operation is one of the primary factors in evaluating the carrying capacity of a roadway network. Traffic conditions are measured by Level of Service (LOS), which applies a letter ranking to successive levels of intersection performance. LOS 'A' represents optimum conditions with free-flow travel and no congestion. LOS 'F' represents severe congestion with long delays at the approaches. For intersections with minor street stop control, the LOS reflects the delays experienced by the minor street approach. For all-way-stop-control intersections it is the average delay for all approaches.

Intersection levels-of-service have been based on the most recent Highway Capacity Manual (*HCM 6*) operations methodology for unsignalized all-way-stop-control intersections using *Synchro-Simtraffic* software (version 10). In addition, peak hour factors (PHF's) for each intersection approach have been incorporated into all existing and future intersection LOS calculations. The PHF is a measure of the traffic flow rate at each of the intersection's approaches. Based on field count data, these PHF's ranged from .75 to .87 dependent on the peak hour. Intersection approaches with lower approach volumes typically have lower (and more conservative) PHF's.

Intersection

Table 1 provides a summary of the *Existing* peak hour intersection delay and level of service at the Green Island Road/Commerce Boulevard intersection using the most recent Synchro model.

Table 1: Existing Conditions: Intersection LOS

#	Intersection	Control Type[1,2,3]	Target LOS	AM Peak Hour		PM Peak Hour	
				Delay	LOS	Delay	LOS
1	Green Island Rd./Commerce Blvd.	AWSC	D	9.5	A	10.6	B

Notes:
1. AWSC = All Way Stop Control
2. LOS = Delay based on average delay (in seconds) of all four stop-sign controlled approaches.
3. Intersection was analyzed using HCM 6 Synchro-Simtraffic software (version 10) for unsignalized all-way-stop-controlled intersections. Allows for multiple approach delay LOS calculations.

As shown in Table 1, the Green Island Road/Commerce Boulevard intersection is currently operating at acceptable LOS during both peak hours.

Project Description

The proposed 330 Commerce Boulevard Wine Storage Facility project would be located in the City of American Canyon at the far south end of Commerce Boulevard (south of Green Island Road). Based on the latest correspondence and site plan from the project applicant the proposed project would consist of a 330,528 square foot wine storage warehouse. At this time, vehicle and truck access to/from the proposed facility would be to/from Commerce Boulevard via Green Island Road.

Project Trip Generation

Consistent with previous transportation analyses conducted for wine warehouse and storage facilities in the American Canyon area; daily and peak hour trip generation has been based on observed daily and peak hour traffic volumes at six (6) different wine warehouse buildings in American Canyon located on Mezzetta Court, Airpark Road, Tower Road, Commerce Boulevard, Hanna Drive, and Lombard Drive.[3] From this trip generation analysis an average daily trip rate of 1.69 trips/1,000 square feet of wine warehouse was developed using multiple day 24-hour driveway count data at the six facilities. Using the same methodology for the AM peak hour (between 7:00-9:00) and PM peak hour (between 4:00-6:00) peak hour trip generation has been compared in Tables 2 and 3.

Table 2: AM and PM Peak Hour Trip Generation Comparison--Tuesday

Tuesday Trip Rates				
Warehouse Location	Facility Size (ksf)	Date	Observed Peak Hour Trips AM/PM Trips	Trip Rate Based on Observed Traffic (Trips/KSF) AM/PM Peak Hour Trip Rates
125 Mezzetta Court	396	10-May-16	61 / 42	0.15 / 0.11
787 Airpark Road	377		27 / 37	0.07 / 0.10
175 & 177 Tower Road	254		30 / 31	0.12 / 0.12
Commerce Boulevard	692	16-Feb-16	72 / 93	0.10 / 0.13
Hanna Drive	718		151 / 109	0.21 / 0.15
Lombard Drive	287		50 / 33	0.17 / 0.12
Six Site Combined Average Tuesday Trip Rate				**0.14 / 0.12**

[3] Omni-Means, Ltd., Trip Generation Rates---Green Island Wine Warehouse, Memorandum to Mr. Jason Holley, P.E. (City of American Canyon) from Mr. Kamesh Vedula, P.E., Omni-Means (now GHD), June 1, 2016.

Table 3: AM and PM Peak Hour Trip Generation Comparison---Wednesday

Wednesday Trip Rates				
Warehouse Location	Facility Size (ksf)	Date	Observed Peak Hour Trips AM/PM Trips	Trip Rate Based on Observed Traffic (Trips/KSF) AM/PM Peak Hour Trip Rates
125 Mezzetta Court	396	11-May-16	57 / 34	0.14 / 0.09
787 Airpark Road	377		54 / 24	0.14 / 0.06
175 & 177 Tower Road	254		51 / 36	0.20 / 0.14
Commerce Boulevard	692	17-Feb-16	99 / 133	0.14 / 0.19
Hanna Drive	718		164 / 128	0.23 / 0.18
Lombard Drive	287		57 / 38	0.20 / 0.13
Six Site Combined Average Wednesday Trip Rate				**0.18 / 0.13**

The AM and PM peak hour trip generation recorded for the six warehouse-wine storage sites tends to correlate with the size of the facility. This trend is evidenced by the larger Commerce Boulevard and Hanna Drive facilities generating higher AM and PM peak hour trips than the remaining four sites that generate fewer peak hour trips (under 400ksf). These peak hour trip characteristics of the warehouse-wine storage facilities are also consistent with previous transportation analyses that evaluated the daily trip generation of the sites (establishing a daily rate of 1.69 trips/ksf). In addition, the trip generation surveys of the six sites also found that the facilities tend to generate a greater number of vehicle/truck trips during the AM peak period. This is due primarily to the majority of employees arriving on-site during this morning period as well as a greater number of truck deliveries to/from the facilities. The PM peak period is more dispersed relative to site trip generation with many employees leaving the site prior to the 4:00-6:00 p.m. window and fewer truck deliveries occurring during this period based on field observations.

As shown in Tables 2 and 3, the average AM peak hour trip generation rates for the two-day counts were 0.14 trips/ksf and 0.18 trip/ksf , respectively. The resulting AM peak hour trip rate for wine warehouse/storage facilities is 0.16 trips/ksf. During the PM peak hour the average rates for the two-day counts were 0.12 trips/ksf and 0.13 trips/ksf resulting in an overall average PM peak hour rate of 0.125 trips/ksf. Combined with the previously established daily trip rate of 1.69 trips/ksf the proposed project's daily and peak hour trip generation has been shown in Table 4.

Table 4: Project Trip Generation; Daily and Peak Hour

Observed Daily and Peak Hour Trip Rates	Unit[1]	Daily Trip Rate/Uni	AM Peak Hour Trip Rate/Unit			PM Peak Hour Trip Rate/Unit		
			Total	In %	Out %	Total	In %	Out %
Wine Warehouse/Storage	ksf	1.69	0.16	60%	40%	0.13	35%	65%
Project Name	**Quantity**	**Daily Trips**	**AM Peak Hour Trips**			**PM Peak Hour Trips**		
			Total	**In**	**Out**	**Total**	**In**	**Out**
330 Commerce Wine Storage	331	559	53	32	21	43	15	28
Net New Project Trips		**559**	**53**	**32**	**21**	**43**	**15**	**28**
Notes:								
1. 1 ksf = 1,000 square feet								
2. Trip rates based on daily traffic driveway counts at six (6) different wine warehouse/storage facilities in the Ameri								
focusing on the 24-hour and AM and PM peak hours between (7:00-9:00 am and 4:00-6:00 pm).								

As calculated in Table 4, the proposed project would be expected to generate 559 daily trips with 53 AM peak hour trips and 43 PM peak hour trips.

Project Distribution

Overall project distribution has been based on existing peak hour traffic flow volumes at the Green Island Road/Commerce Boulevard intersection, vehicle and truck access to/from State Route 29, and local circulation patterns that access Green Island Road from the east and west. Based on these factors, it is estimated that 95% of the vehicle/truck traffic would be to/from the east on Green Island Road (to Commerce Boulevard). The remaining 5% of the proposed project trips would be to/from the west via Green Island Road.

Existing Plus Project Traffic Conditions

Existing plus Project conditions were simulated by superimposing AM and PM peak hour traffic by the proposed project onto *Existing* intersection traffic volumes.

Intersection Operation

Table 5 provides a summary of *Existing Plus Project* peak hour intersection delay and level of service that were derived through use of the Synchro model.

Table 5: Existing Plus Project Conditions: Intersection LOS

#	Intersection	Control Type[1,2,3]	Target LOS	AM Peak Hour		PM Peak Hour	
				Delay	LOS	Delay	LOS
1	Green Island Rd./Commerce Blvd.	AWSC	D	10.0	A	11.2	B
Notes:							
1. AWSC = All Way Stop Control							
2. LOS = Delay based on average delay (in seconds) of all four stop-sign controlled approaches.							
3. Intersection was analyzed using HCM 6 Synchro-Simtraffic software (version 10) for unsignalized all-way-stop-controlled intersections. Allows for multiple approach delay LOS calculations.							

As shown in Table 5, the study intersection of Green Island Road/Commerce Boulevard would operate acceptably during both the AM and PM peak hours with existing and proposed project traffic.

Signal Warrants

The Green Island Road/Commerce Boulevard intersection was evaluated for traffic signal control warrants with *Existing* and Existing *Plus Project* Conditions. The CaMUTCD manual identifies up to nine warrants which can be used and states that "*An engineering study of traffic conditions, pedestrian characteristics, and physical characteristics of the location shall be performed to determine whether installation of a traffic control signal is justified at a particular location*".[4] Traffic signals can have several advantages which are outlined in the manual. These include: maintaining orderly movement of traffic; increasing capacity, reducing the frequency of certain

[4] California Manual on Uniform Traffic Control Devices (CAMUTCD), Chapter 4C, Traffic Control Signal Needs Studies, 2014 Edition, Revision 3 (March 9, 2018).

accident types (right-angles), provide continuous movement of traffic at a definite speed, and permit minor street traffic/pedestrians to cross the major street.

However, the manual goes on to state that "*The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal, since the installation of traffic signals may increase certain types of collisions. Delay, congestion, approach conditions, driver confusion, future land use or other evidence of the need for right of way assignment beyond that which could be provided by stop signs must be demonstrated*." The manual recommends engineering judgment should ultimately be used when deciding the appropriateness of signal controls.

Six of the nine warrants were evaluated (three warrants concerning coordinated signal system, roadway network, and railroad crossing locations were not relevant). The signal warrant worksheets are attached in the Appendix.

There are three warrants based on vehicle volumes and none of the three are met with Existing Plus Project Volumes. These include the “peak hour volume,” “8-hour volume,” and “4-hour volume” warrants. Overall hourly approach volumes at the Green Island Road/Commerce Boulevard intersection do not sustain the minimum volumes for signalization nor do the peak AM and PM periods.

Two warrants are based on pedestrian crossing volumes (“pedestrian volumes” and “adequate gaps” for pedestrians) which were applied to the pedestrian volumes in the area. However, while there is a pedestrian sidewalk on the north side of Green Island Road that extends from Commerce Boulevard west to Mezzetta Court and continues north on Green Island Road; there are no pedestrian crosswalks at this intersection. Pedestrian volumes at the Green Island Road/Commerce Boulevard are very light. During the AM and PM peak period only two (2) pedestrians were observed and only one pedestrian crossed north-south on Green Island Road (jay-walked). Therefore, no pedestrian warrants are met at this time.

Finally, an accident search history was conducted for the Green Island Road/Commerce Boulevard intersection based on the California Highway Patrol Statewide Integrated Traffic Records System (SWITRS) for last three calendar years (2015-2017). The crash experience warrant requires at least five accidents at the intersection correctable by a traffic signal (or a combination of volume/pedestrian conditions). Based on the accident search history for the last three full calendar years; the Green Island Road/Commerce Boulevard intersection does not experience significant vehicle conflicts (0 recorded accidents).

Right-Turn Lane Requirements

At the City’s request, the Green Island Road/Commerce Boulevard intersection has been evaluated for northbound right-turn movements and an exclusive right-turn lane. Based on existing peak hour count data at the intersection, the vast majority of turning movements from northbound Commerce Boulevard onto Green Island Road are right-turn movements (29 AM right-turns and 168 PM right-turns). With proposed project traffic, these movements are expected to increase to 49 AM right-turns and 195 PM right-turns. Essentially, the northbound approach lane of Commerce Boulevard at Green Island Road is functioning as an exclusive right-turn lane under existing conditions given the very low northbound left-turn movements at the intersection.

Based on the Transportation Research Board (TRB) Report 279 and AASHTO turn-lane requirements, a northbound right-turn lane would be warranted at the intersection based on an overall approach volume of

207 vehicles (PM peak hour worst-case) and a projected northbound right-turn movement of 195 vehicles (see Appendices; Right-Turn Lane Volumes).[5]

Cumulative (No Project) Conditions

Cumulative (No Project) conditions were based on cumulative AM and PM peak hour volume projections found in the *Napa Logistics Park Phase 2 Project Draft EIR*. Peak hour volume projections for Green Island Road west of Paoli Loop Road were used for this analysis and encompass all future vehicle trips originating from industrial and light industrial areas in the Mezzetta Court, Jim Oswalt Way, Hanna Drive, and Commerce Boulevard areas. As a conservative measure, the *No Shift Change Reduction* volumes were utilized.

Intersection Operation

Table 6 provides a summary of Cumulative (No Project) peak hour intersection delay and level of service that were derived through the use of a Syncho-Simtraffic model.

Table 6: Cumulative (No Project) Conditions: Intersection LOS

#	Intersection	Control Type[1,2,3]	Target LOS	AM Peak Hour		PM Peak Hour	
				Delay	LOS	Delay	LOS
1	Green Island Rd./Commerce Blvd.	AWSC	D	14.6	B	29.6	D
Notes:							
1. AWSC = All Way Stop Control							
2. LOS = Delay based on average delay (in seconds) of all four stop-sign controlled approaches.							
3. Intersection was analyzed using HCM 6 Synchro-Simtraffic software (version 10) for unsignalized all-way-stop-controlled intersections. Allows for multiple approach delay LOS calculations.							

As shown in Table 6, the Green Island Road/Commerce Boulevard intersection would operate at acceptable LOS during both peak hours.

Cumulative Plus Project Conditions

Cumulative Plus Project conditions were simulated by superimposing traffic generated by the proposed project onto *Cumulative (No Project)* intersection traffic volumes.

Intersection Operation

Table 7 provides a summary of Cumulative (No Project) peak hour intersection delay and level of service that were derived through the use of a Syncho-Simtraffic model.

[5] Transportation Research Board, Intersection Channelization Design Guide, Chapter 4, Guidelines for Design of Channelized Intersections, Figure 4-23, Traffic volume guidelines of right-turn lanes, 1995.

Table 7 Cumulative Plus Project: Intersection LOS

#	Intersection	Control Type[1,2,3]	Target LOS	AM Peak Hour		PM Peak Hour	
				Delay	LOS	Delay	LOS
1	Green Island Rd./Commerce Blvd.	AWSC	D	16.5	C	35.0	D
Notes:							
1. AWSC = All Way Stop Control							
2. LOS = Delay based on average delay (in seconds) of all four stop-sign controlled approaches.							
3. Intersection was analyzed using HCM 6 Synchro-Simtraffic software (version 10) for unsignalized all-way-stop-controlled intersections. Allows for multiple approach delay LOS calculations.							

As shown in Table 7, the Green Island Road/Commerce Boulevard intersection would continue to operate at acceptable LOS with *Cumulative Plus Project* volumes during both peak hours.

Summary/Mitigation

The proposed 330 Commerce Boulevard Wine Storage Facility project would not significantly affect AM and PM peak hour traffic operations at the Green Island Road/Commerce Boulevard intersection. With *Existing Plus Project* and *Cumulative Plus Project* volumes, the intersection would continue to operate at acceptable levels during the AM and PM peak hours (LOS D or better). Analyses of intersection signal warrant satisfaction at the Green Island Road/Commerce Boulevard location indicates that no signal warrant would be satisfied under *Existing Plus Project* volumes. At the City's request, the northbound right-turn lane from Commerce Boulevard was evaluated for operations. Based on TRB and AASHTO guidelines for the installation of a right-turn lane; Commerce Boulevard would meet the minimum PM peak hour volumes for installation of a separate right-turn lane with Existing Plus Project volumes (the proposed project would add to the existing warrant). In response, the following measure is recommended:

- Widen and/or re-stripe northbound Commerce Boulevard at Green Island Road to include a separate right-turn lane and shared through/left-turn lane. Based on the proposed project's contribution to cumulative buildout volumes at the intersection, its "fair share" contribution towards this improvement would equal 4.2% (43 trips / 1,019 cumulative volumes—PM peak hour).

  With recommended improvements for a separate right-turn lane on northbound Commerce Boulevard at Green Island Road; overall intersection LOS would improve under *Existing Plus Project* and *Cumulative Plus Project* conditions during the PM peak hour (worst case). Specifically, intersection LOS would improve from LOS B (11.2 seconds) to LOS B (10.3 seconds) with *Existing Plus Project* conditions. Under *Cumulative Plus Project* conditions, intersection LOS would improve from LOS D (35.0 seconds) to LOS D (29.6 seconds).

NOISE APPENDIX

Noise Descriptors

Sound is mechanical energy transmitted by pressure waves through a medium such as air. Noise is defined as unwanted sound. Sound pressure level has become the most common descriptor used to characterize the "loudness" of an ambient sound level. Sound pressure level is measured in decibels (dB), with zero dB corresponding roughly to the threshold of human hearing, and 120 to 140 dB corresponding to the threshold of pain. Decibels are measured using different scales, and it has been found that A-weighting of sound levels best reflects the human ear's reduced sensitivity to low frequencies, and correlates well with human perceptions of the annoying aspects of noise. The A-weighted decibel scale (dBA) is cited in most noise criteria. All references to decibels (dB) in this report will be A-weighted unless noted otherwise.

Several time-averaged scales represent noise environments and consequences of human activities. The most commonly used noise descriptors are the equivalent A–weighted sound level over a given time period (Leq)[1]; day–night 24-hour average sound level (Ldn)[2] with a nighttime increase of 10 dB to account for sensitivity to noise during the nighttime; and community noise equivalent level (CNEL)[3], also a 24-hour average that includes both an evening and a nighttime sensitivity weighting.

Table 1 identifies decibel levels for common sounds heard in the environment.

Noise Attenuation

Stationary point sources of noise, including construction equipment, attenuate (lessen) at a rate of 6 to 7.5 dB per doubling of distance from the source, depending on ground absorption. Soft sites attenuate at 7.5 dB per doubling because they have an absorptive ground surface such as soft dirt, grass, or scattered bushes and trees. Hard sites have reflective surfaces (e.g., parking lots or smooth bodies of water) and therefore have less attenuation (6.0 dB per doubling). A street or roadway with moving vehicles (known as a "line" source), would typically attenuate at a lower rate, approximately 3 to 4.5 dB each time the distance doubles from the source, which also depends on ground absorption (Caltrans, 1998b). Physical barriers located between a noise source and the noise receptor, such as berms or sound walls, will increase the attenuation that occurs by distance alone.

Temporary Construction Noise

The noise levels generated by construction equipment would vary greatly depending upon factors such as the type and specific model of the equipment, the operation being performed, the condition of the equipment and the prevailing wind direction. **Table 2** shows typical noise levels from construction equipment. **Table 3** shows noise levels from construction activities, which typically range from 81 to 88 dB Leq at 50 feet, depending on the construction phase.

[1]The Equivalent Sound Level (Leq) is a single value of a constant sound level for the same measurement period duration, which has sound energy equal to the time–varying sound energy in the measurement period.

[2]Ldn is the day–night average sound level that is equal to the 24-hour A-weighted equivalent sound level with a 10-decibel penalty applied to night between 10:00 p.m. and 7:00 a.m.

[3]CNEL is the average A-weighted noise level during a 24-hour day, obtained by addition of 5 decibels in the evening from 7:00 to 10:00 p.m., and an addition of a 10–decibel penalty in the night between 10:00 p.m. and 7:00 a.m.

Table 1: Typical Noise Levels

Noise Level (dB)	Outdoor Activity	Indoor Activity
90+	Gas lawn mower at 3 feet, jet flyover at 1,000 feet	Rock Band
80–90	Diesel truck at 50 feet	Loud television at 3 feet
70–80	Gas lawn mower at 100 feet, noisy urban area	Garbage disposal at 3 feet, vacuum cleaner at 10 feet
60–70	Commercial area	Normal speech at 3 feet
40–60	Quiet urban daytime, traffic at 300 feet	Large business office, dishwasher next room
20–40	Quiet rural, suburban nighttime	Concert hall (background), library, bedroom at night
10–20		Broadcast / recording studio
0	Lowest threshold of human hearing	Lowest threshold of human hearing

Source: modified from Caltrans, 1998a

Groundborne Vibration

Construction operations have the potential to result in varying degrees of temporary ground vibration, depending on the specific construction equipment used and operations involved. The ground vibration levels associated with various types of construction equipment at a distance of 25 feet are summarized in **Table 4**. Ground vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. The effects of ground vibration may be imperceptible at the lowest levels, low rumbling sounds and detectable vibrations at moderate levels, and slight damage to nearby structures at the highest levels.

At the highest levels of vibration, damage to structures is primarily architectural (e.g., loosening and cracking of plaster or stucco coatings) and rarely results in structural damage. For most structures, a peak particle velocity (PPV) threshold of 0.5 inches per second (in/sec) or less is sufficient to avoid structural damage. The Federal Transit Administration recommends a PPV threshold of 0.5 in/sec for residential and commercial structures, 0.25 in/sec for historic buildings and archaeological sites, and 0.2 in/sec for non-engineered timber and masonry buildings (FTA, 2006).

State Guidelines

State Land Use Compatibility standards for Community Noise (**Table 5**) are provided in the State of California General Plan Guidelines.

Table 5: Land Use Compatibility for Community Noise Environment

	Normally Acceptable	Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
	Conditionally Acceptable	New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features are included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.
	Normally Unacceptable	New construction or development should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirement must be made and needed noise insulation features included in the design.
	Clearly Unacceptable	New construction or development generally should not be undertaken.

Comments:

Cost of Water Supply Report/Will-Serve Letters – The cost to process a Will-Serve application shall be fully borne by the applicant and will be based on the actual cost of staff time. If the City elects to use consultant services, the applicant shall pay the consultant's rate plus 15% for administrative overhead. An initial deposit of $2,000 shall be included at the time of application submission.

Owner & Applicant Acknowledgements and Notification

I declare under penalty of perjury that I am the owner of said property. I certify that all of the submitted information is true and correct to the best of my knowledge and belief. I understand that any misrepresentation of submitted data may invalidate any approval of this application. I agree to pay all fees and recoverable costs for processing the application.

Property Owner Signature(s) _____ Date 06-20-2018

I declare under penalty of perjury that I have the written authority from property owner to file this application. I certify that all of the submitted information is true and correct to the best of my knowledge and belief. I understand that any misrepresentation of submitted data may invalidate any approval of this application. I agree to pay all fees and recoverable costs due to the City for processing the application, whether it is approved, denied, or appealed.

Applicant Signature(s) _____ Date 6/18/18

Partnerships & Corporations

In the case of a partnership, all general and limited partners shall be identified. In the case of a corporation, all shareholders owning 10% or more of the stock and all officers and directors shall be identified.

Name	Address	Signature

Additional recipients of project correspondence

If you desire project correspondence and notice of meetings to be sent to parties other than the Applicant and Property Owner, please list their names, address and telephone numbers below.

Name	Address	Telephone number

Indemnification Agreement by Applicant

The applicant shall defend, indemnify, and hold harmless the City of American Canyon ("City"), its elected officials, officers, employees, attorneys, representatives, boards, commissions, volunteers and agents from and against all claims, actions, including actions to arbitrate or mediate, damages, losses, judgments, liabilities, expenses and other costs, or proceedings against the City, its elected officials, officers, employees, attorneys, representatives, boards, commissions, volunteers, or agents to attack, modify, set aside, void, or annul an approval, conditional approval, permit, entitlement, environmental document, environmental clearance, mitigation plan, or any other document or any of the proceedings, acts, or determinations taken, done, or made prior to granting of such approval, conditional approval, permit, entitlement, environmental clearance, environmental document, mitigation plan, or other document, by the City, including, without limitation, an action against an advisory agency, appeal board, or legislative body within the applicable limitation period.

The obligation to defend, indemnify and hold the City harmless shall include the payment of all legal costs and attorney's fees (including a third party award of attorney's fees), arising out of, resulting from, or in connection with the City's act or acts leading up to and including approval of any environmental document or mitigation plan granting approvals to the applicant, incurred on behalf of, or by, the City, its elected officials, officers, employees, representatives, attorneys, boards, commissions, volunteers and agents in connection with the defense of any claim, action, or proceeding challenging the entire or a portion of an approval, conditional approval, permit, entitlement or any other document of any related claim.

The obligation to defend, indemnify, and hold the City harmless shall include, but not be limited to, the cost of preparation of any administrative record by the City, staff time, copying costs, court costs, or attorney's fees arising out of a suit or challenge contesting the adequacy of a permit, approval, conditional approval, entitlement, environmental document, mitigation plan, environmental clearance, Water Supply Report, Will-Serve Letter or any other document or approval related to the applicant's project.

The City will promptly notify the applicant of any claim, action, or proceeding and will cooperate fully in the defense. If the City fails to promptly notify the applicant of any claim, action, or proceeding, or the City fails to cooperate fully in the defense, the applicant shall not be responsible to defend, indemnify, or hold harmless the City.

In the event a legal challenge to a City permit, approval, conditional approval, environmental document, environmental clearance, mitigation plan, entitlement or any other document, proceeding, determination, or action related to the applicant's project is successful, and an award of attorneys' fees is granted against the City, the applicant shall be responsible to timely pay the full amount of such an award.

As an authorized representative of the applicant, I hereby consent by my signature below, that I understand the following:
The service of processing an application for a new or increased water demand through the City of American Canyon is of primary benefit to the applicant. The cost of processing an application is charged according to the hours spent by staff in reviewing and analyzing the project including checking plans, writing reports, conducting water audits, and verifying water demand estimates. The applicant receiving the benefit from the service shall pay the cost of these services. Total cost varies according to the size of the project and the complexity of the issues involved. At the City's sole discretion, a consultant may process the application. Pursuant to City Council Resolution 2008-79 for development applications, the applicant will pay all costs for consultant services inclusive of any applicable "in-house" administrative costs. Project specific expenditures such as City Attorney services, postage for mailing public notices, advertising, etc. have been excluded from the hourly rates. These project specific expenditures will be billed "at cost" on a project by project basis to the applicant.

The deposit creates an open account to which processing time is charged. Processing charges will automatically be drawn against the deposit funds until the minimum balance is remaining. All service charges will be invoiced to the applicant on a monthly basis. Accompanying the invoice will be a statement, which will include a description of services rendered during the billing period. Payment is due within 15 days of the invoice. **If payment is not received within 7 working days after the invoice due date, all development activities will be suspended until payment is received.**

At the conclusion of the Will-Serve process, after full payment of all invoices is received, any remaining deposit amounts will be refunded to the applicant.

Re: SDG Commerce 217 Distribution Center (PL20-0008) – Recirculated Mitigated Negative Declaration and Conditional Use Permit

Dear Mayor Garcia, Vice-Mayor Joseph, Council Members Aboudamous, Oro, and Washington and Mr. He:

I am writing on behalf of Laborers International Union of North America, Local 324 ("LIUNA") and its members living and working in and around the City of American Canyon regarding the Recirculated Draft Initial Study and Mitigated Negative Declaration ("MND") prepared for the proposed SDG Commerce 217 Distribution Center Project (the "Project"). This comment letter supplements and incorporates by reference our previous written comments dated January 19, 2021 and February 25, 2021 (attached hereto as Exhibits C and D).

1 We have requested the assistance of Registered Professional Traffic Engineer Tom Brohard of Tom Brohard and Associates in reviewing the MND's discussion of the Project's increase in vehicle miles traveled ("VMT"), resulting transportation effects and the adequacy of the proposed mitigation measure. Tom Brohard and Associates Comments (April 30, 2021 (attached as Exhibit A.) Mr. Brohard prepared the attached expert comment regarding the Project's VMT analysis and identified numerous significant flaws in that analysis. Fundamentally, the claim that constructing an 800-foot bike lane would reduce VMT of commuters in nearby neighborhoods by 733 VMT daily is not supported by substantial evidence because it assumes that cyclists cannot currently ride on Commerce Avenue from Eucalyptus Drive to the existing bike lane adjacent to the SDG Commerce 330 building. Commuting cyclists already can ride without hindrance along that stretch of Commerce Avenue. As a result, the claimed VMT reductions of the new bike lane stretch are blatantly exaggerated by the Project and its consultant. As Mr. Brohard's analysis points out, a more realistic estimate of the VMT reductions based on guidance prepared on behalf of the California Air Resources Board ("CARB") would be a VMT reduction of 24 VMT. Using the methodology in the 2006 report

cited by the City's consultant – NCHRP Report 552 "Guidelines for Analysis of Investments in Bicycle Facilities" – Mr. Brohard calculates the bike lane would reduce VMT by 28 VMT. IN either case, the proposed 800-foot bike lane does not come close to mitigating the Project's increases in VMT. Because Mr. Brohard's expert comments are substantial evidence of a fair argument that the Project may have a significant transportation impact, the Council should elect not to approve the MND and instead instruct staff to prepare an environmental impact report ("EIR") for the Project.

1 (cont.)

A. The VMT Analysis Fails to Address the Numerous Non-commute Trips Generated by the Project.

The MND and Appendix F estimate that there will be 367 new daily trips generated by the Project, including "employee trips, visitor trips, delivery trips, and truck trips." (GHD Memorandum, p. 5 (March 21, 2021). GHD calculates that 37% of the total trips, i.e., 136 trips, are employee commute trips. (*Id*.) There is no information in the MND identifying which vehicle type the remaining 231 trips involve. The non-commute employee trips (e.g., lunch trips) as well as the delivery vehicle trips would all add additional VMTs to the project. As Mr. Brohard states, it is reasonable to estimate that up to half of those non-commute trips – 115 trips - are not semi-truck trips. (Brohard Comment, p. 2.) GHD states that the non-commute trip lengths are 23.8 miles. (GHD Memorandum, p. 18.) The VMTs associated with these non-commute Project trips may surpass the commute VMTs – 2,737 non-commute VMT vs. 2,214 commute VMT. (Brohard Comment, p. 2.) Those VMTs must be disclosed in order to evaluate the Project's VMT impacts and also for the City to consider how those trips should be factored into the VMT impact analysis. Because the MND omits any discussion of this transportation impact, it is insufficient as an informational document under CEQA.

2

B. Substantial Evidence of a Fair Argument Exists That the Project May Have a Significant Transportation Impacts.

As we noted in our prior comments, under the "fair argument" standard, an EIR is required if any substantial evidence in the record indicates that a project may have an adverse environmental effect—even if contrary evidence exists to support the agency's decision. (CEQA Guidelines, § 15064(f)(1); *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, 927, 931. "[I]t is a question of law, not fact, whether a fair argument exists, and the courts owe no deference to the lead agency's determination. Review is de novo, with a ***preference for resolving doubts in favor of environmental review***." (*Pocket Protectors*, 124 Cal.App.4th at 928 [emphasis in original].) Likewise, as a matter of law, "substantial evidence includes . . . expert opinion." (Pub. Resources Code, § 21080(e)(1); CEQA Guidelines, § 15064(f)(5).) Where experts have presented conflicting evidence on the extent of the environmental effects of a project, the agency must consider the environmental effects to be significant and prepare an EIR. (CEQA Guidelines § 15064(f)(5); Pub. Res. Code § 21080(e)(1); *Pocket Protectors*,124 Cal.App.4th at 935.) An effect on the environment need not be "momentous" to meet the CEQA test for significance; it is enough that the impacts are "not trivial." (*No Oil, Inc.,* 13 Cal.3d at 83.)

3

(3) (cont.) Traffic engineer Brohard's expert review and comment is substantial evidence. His thorough critique of the GHD methodology to assess the VMT benefits of the proposed bike lane as well as his application of CARB guidance demonstrate a fair argument that the Project may have significant transportation impacts.

a. The MND's assertion that the proposed 800-foot bike lane should be credited with benefits for an additional 1.7 miles of existing bike lane is arbitrary and capricious.

MND Appendix F states that "the only connection to employment destinations north of Eucalyptus today is along the shoulders of SR 29…." (GHD Memorandum, p. 22 (March 21, 2021).) Appendix F also claims that "[t]he Wetlands Edge bike path is used recreationally, but has limited utility for commuter use, as it does not provide a connection between American Canyon residents west of SR 29 to employment destinations north of Eucalyptus." (*Id*.) Neither of these assertions are supported by any substantial evidence. There was no investigation by the City or applicant of bike usage of the Wetlands Edge bike path or the number of bike commuters using that path. More importantly, recent photos of the roadway from Eucalyptus Drive to the existing bike path adjacent to SDG Commerce 330 shows that the route is entirely accessible to commuting cyclists. Photos obtained from the Napa County Bicycle Coalition show a well-maintained road that extends from Eucalyptus to the existing bike path. (Brohard Comments, Attachments.) The entrance to the bike path is signed instructing bikes to yield to pedestrians – a clear indication that the route is used by cyclists. (*Id*.) There is no evidence supporting the claim that bikes must ride out to SR 29 to travel to the north side of the Project site.

(4) GHD and the MND rely upon the false notion that commuting cyclists cannot access the existing bike path in order to claim that the 800-foot length of bike path proposed by the Project should get to take credit for inducing commuting cyclists all along the 1.7 mile stretch of the Wetlands Edge Bike Path extending south of Eucalyptus Drive. Because the underlying premise that there is no connection to the existing bike path is incorrect, the entire exercise to inflate the VMT mitigation benefits is not supported by substantial evidence. Even if there was no connection as claimed, the analysis conducted to attribute half of the benefits of an existing 1.7 miles of bike lane to an 800-foot stretch is entirely random and unsupported by any rational basis. (Brohard Comments, p. 3.) Moreover, the analysis is inconsistent with the NCHRP Report GHD purports to follow. GHD adds a zone extending out from 1601 to 2400 meters from the existing Wetlands Edge Bike Path. As Mr. Brohard explains, "the NCHRP Report 552 does not provide a basis for calculating induced bike commuters from a zone extending from 1601 to 2400 m from the proposed bike path." (Brohard Comments, p. 4.) Likewise, Mr. Brohard notes the flaw in GHD randomly averaging VMT forecasts of a presumed 1.85 mile long bike path and the proposed 800-feet bike path. (Id., pp. 7-8.) Limiting the NCHRP Report 552 methodology to the 800-feet bike lane proposed by the applicant leads to an estimate of 28 new bike commuters induced by the new bike lane. (*See* GHD Memorandum, p. 23 (March 21, 2021).)

///
///
///

b. The commuting bike trip lengths of 5.2 miles claimed by the MND and GHD's analysis is not supported by any substantial evidence.

The VMT reduction claimed for the proposed bike lane is based on an assumption that commuting cyclists originating from the residential neighborhood south and east of Eucalyptus Drive will on average bike 5.2 miles to their place of employment. (GHD Memorandum, pp. 9, 24 (March 21, 2021).) GHD's third iteration of its analysis includes an alternative figure of a 3.8 mile average bicycle commute. (*Id*.) This number is purportedly supported by an AASHTO report which is not available for sale or otherwise on-line. (Brohard Comments, pp. 1-2.) Contrary to either of these self-serving estimates, there is no evidence in the record that a cyclist could travel more than about 0.75 miles north of Eucalyptus Drive. (*Id*., p. 6. *See* Google Earth Image dated October 2020 attached as Exhibit B). It appears that, once a cyclist reaches Green Island Road, he/she then would have to travel out to SR 29 in order to proceed north to the airport and beyond. Ironically, this is the true disconnect – not Commerce Avenue – to bike commutes proceeding north of Green Island Road. As a result, any cycling commute trips induced by the proposed 800-foot bike lane logically must be limited to .75 miles in length. (Brohard Comments, p. 6.)

5

c. Applying CARB methodology to estimating VMT reductions induced by a bike facility, the proposed bike lane would induce only bike commutes replacing 24 VMTs.

Mr. Brohard applies a methodology identified by CARB for estimating the number of bike trips induced by a new bike facility. (Brohard Comments, pp. 7-8.). Mr. Brohard's application of the CARB methodology estimates the proposed bike lane would induce new bike commuters that would reduce VMT from nearby neighborhoods by 24 VMT. Whether employing the VMT reduction of 729 VMT estimated by GHD or approximately 3,400 VMT after taking into account the other vehicle trips resulting from the Project, there is a fair argument that the VMT reduction based on new commuter cyclists on the proposed 800-foot bike lane does not come close to mitigating the Project's transportation impacts to a less than significant level.

6

In addition to these potential transportation impacts, LIUNA also previously submitted substantial evidence of fair arguments that the Project may have significant health risks and impacts on wildlife. For all of these reasons and those discussed in our prior comments, the MND is inadequate and an EIR is required to analyze and mitigate the Project's potentially significant environmental impacts. Thank you for your attention to LIUNA's appeal and these comments.

Sincerely,

Michael R Lozeau

SUBJECT: Proposed Wine Distribution Center at 1075 Commerce Court in the City of American Canyon – Vehicle Miles Traveled (VMT) Issues

Dear Mr. Lozeau:

Tom Brohard, P.E., has reviewed the transportation aspects of the December 2020 Initial Study/Mitigated Negative Declaration (MND) to construct a 217,294 square foot wine distribution center at 1075 Commerce Court in the City of American Canyon. I also reviewed the February 21, 2021 Staff Report to the Planning Commission as well as the May 8, 2020 Traffic Impact Analysis Memorandum and the February 11, 2021 Focused Traffic Impact Analysis for Vehicle Miles Traveled (VMT) prepared by GHD. Various technical publications regarding VMT including NCHRP Report 552 "Guidelines for Analysis of Investments in Bicycle Facilities" published in 2006 by TRB, "Understanding and Measuring Bicycle Behavior: A Focus on Travel Time and Route Choice" published in December 2008 by the Oregon Transportation Research and Education Consortium, and "Quantification Methodology for California Climate Investments" published on November 1, 2019 by the California Air Resources Board were also reviewed.

From the February 21, 2021 Staff Report and Agenda Packet, the Proposed Wine Distribution Center will have 32 full-time and 18 part-time employees with 12 bicycle parking spaces on-site. Table 3.2 of the GHD Report calculates Project VMT for employees of the Proposed Project. According to the table, daily project trip generation will be 367 ADT including 136 employee trips (37%). The table then indicates the VMT reduction to meet the baseline threshold should be 729 VMT. Table 4.1 then summarizes GHD's conclusion that the Project's proposed 800-foot-long bike lane on Commerce Court would reduce VMT by commuters living in the residential areas to the south by 1,004 VMT by crediting the Project with 1.7 miles of already constructed bike facility to the south of Eucalyptus Avenue and an average one-way commuter bike trip length of 5.2 miles based on limited Oregon data, not California data.

Table 4.1 has now been revised again (Page 256 of the current Staff Report) to add a 3.8-mile bicycle commute which now results in a daily VMT reduction of 733. The 3.8-mile bicycle commute is footnoted to "Commuting in America 2013; Report 14. Bicycle and Walk Commute" AASHTO January 2015." This Report is not available from AASHTO for purchase or on their website. The revised conclusion for the VMT Reduction Analysis Findings (Page 257) then

81905 Mountain View Lane, La Quinta, California 92253-7611
Phone (760) 398-8885
Email tbrohard@earthlink.net

averages these additional calculations and erroneously concludes that "... using a blended average of the 'Minimum' and 'Maximum' assessment, which would result in a reduction in VMT of 733 to 1,004 vehicle trip miles, which is sufficient to reduce the total Project VMT to a value less than the threshold established in this memorandum." Averaging the averages is not appropriate.

The Focused VMT Analysis prepared by GHD upon which the recent Staff Report relies is fatally flawed. The estimate of VMT that will be generated by the Project is incomplete, leaving out the additional VMT that will be generated by non-commute, non-semi-truck trips that will result from the Project. In addition, excessive credit for an 800-foot-long bicycle path has been taken as the mitigation measure to reduce VMT for the Proposed Project. This letter points out various deficiencies, errors, and inconsistencies that must be addressed before the City of American Canyon considers the Wine Distribution Center Project at 1075 Commerce Court.

Education and Experience

Since receiving a Bachelor of Science in Engineering from Duke University in Durham, North Carolina in 1969, I have gained over 50 years of professional traffic engineering and transportation planning experience. I am licensed as a Professional Civil Engineer both in California and Hawaii and as a Professional Traffic Engineer in California. I formed Tom Brohard and Associates in 2000 and have served many diverse communities as the City Traffic Engineer and/or the Transportation Planner. During my career in both the public and private sectors, I have reviewed numerous environmental documents and traffic studies for various projects as shown in a short summary of my experience in the enclosed resume.

Vehicle Miles Traveled (VMT) Issues

Based on the information in the various documents, each of the following issues relating to calculation of VMT and proposed mitigation measures for the proposed Wine Distribution Center must be fully addressed and evaluated:

1) VMT Calculation Uses Only Employee Commute VMTs and Ignores Other Employee and Visitor VMTs

   As mentioned above, employee commute trips in Table 3.2 account for 37% of the daily project trip generation. This leaves 63% of the project trips as those generated by visitors or by employees outside of their commute trip. Each of these trips also generates VMT and represent more VMT than will be generated by just the employee commute trips. No mitigation measures have been proposed to reduce the majority of the VMT forecast for the Proposed Project.

There is no breakdown anywhere in the prior agenda packet of the percentage of semi-trucks versus passenger and light trucks that are expected to comprise the 231 daily non-commute trips expected at the facility. Assuming that half of those non-commute trips are non-automobile trips, the remaining 115 vehicle trips also must be included in the calculation of VMT to be added by the Project. GHD states that the average trip length for the non-commuter trips is 23.8 miles. Agenda Packet, p. 298 (Table A.3). Applying that average trip length, the Project's VMT for non-commute, non-semitruck trips amounts to 2,737 VMT. Assuming GHD's calculation of the Project's VMT generated by commuter trips is accurate the Project's total VMT would be 2,214 + 2,737 = 4,951 VMT. As a result, in order to achieve the baseline threshold of 1,485 VMT, the Project must reduce VMT in the relevant area by 3,466 VMT.

2) VMT Reduction Cannot Take Credit for Existing Bay Trail Bike Facility

GHD attempts to attribute VMT reductions to the Project for the Bay Trail bike facility that already is in place along Wetlands Edge Road extending south from Eucalyptus Drive. GHD claims that "The Wetlands Edge bike path is used recreationally, but has limited utility for commuter use, as it does not provide a connection between American Canyon residents west of SR 29 to employment destinations north of Eucalyptus." Feb. 25, 2021 Agenda Packet, p. 302. Likewise, GHD asserts that "the only connection to employment destinations north of Eucalyptus today is along the shoulders of SR 29 – a route navigable by only the most experienced and fearless riders." *Id.* Based on that assertion, GHD treats the proposed 800-foot-long bike facility as a 1.85-mile-long bike facility. *Id.* GHD then purports to apply the methodology for calculating facility benefits set forth in NCHRP Report 552 – "Guidelines for Analysis of Investments in Bicycle Facilities" (2006) for the 800-foot bike facility (the "Minimum" calculation) as well as a 1.85-mile-long facility (the "Maximum" calculation". *Id.,* pp. 301-304. GHD then asserts that "some commute benefit likely exists on the existing [Wetlands Edge] trail" and uses the average of the two calculations as the purported VMT increase that will result from the addition of the 800-foot-long bike path.

The NCHRP Report 552 is based upon data collected in 2000 in Minneapolis/Saint Paul, Minnesota. According to the report, a bicycle facility would have a statistically significant effect on persons living very close (less than 400 meters, ¼ mile) to the bicycle facility. In addition, those living within 400 and 800 meters, ¼ to ½ mile, would have increased, but not statistically significant, the odds of bicycle use.

GHD's analysis of the number of bike commuters on the proposed 800-foot-long bike facility on Commerce Court is flawed for a number of significant reasons as follows:

- First, there is no principled reason why a developer constructing a short length of bike trail should be able to take credit for VMT reductions resulting from 1.7 miles of already constructed bike path built by someone else (perhaps even with taxpayer funds). Even if it were true that, but for the 800-foot-long bike path, bike commuters on the existing path would increase exponentially, SDG should not receive VMT credits for other entities' work and expenditures.

- Second, GHD cites no evidence for its assertion that the stretch of road between Eucalyptus Drive and the SDG 330 Commerce bike path does not provide a bike connection and is not navigable by bike. Half of that distance will be a newly paved road adjacent to the elementary school for which construction is being completed this summer. The northern portion of this segment is a well-maintained, compacted dirt surface as it reaches the SDG 330 facility. The enclosed photos of this segment indicate that it is easily navigated by a bicyclist. As a result, the whole premise of GHD's analysis that it should get credit for other facilities beyond the proposed 800-foot-long facility because the stretch of Commerce Court is impassable or an obstruction to bike commuters is not supported by any evidence.

- Third, GHD's ad hoc calculations of new bike commuters from the 800-foot-long bike path are inconsistent with the methodology in NCHRP Report 552. The NCHRP Report 552 provides a basis for calculating potential new bike commuters from three zones which are employed in its equation. The three zones are zero to 400 meters from the facility, 401 to 800 meters from the facility, and 800 to 1600 meters from the facility. The NHRCP provides an equation employing "likelihood multipliers" it models for those three zones. NCHRP Report 552, pp. 38-39. For each zone, the equation to determine induced commuter cyclists is:

  New commuters = $\sum$(Existing Commuters * (L_d - 1))

  d = 400, 800, 1,600 and L_{400m} = 2.93, L_{800m} = 2.11, L_{1600m} = 1.39

  Existing commuters = 0 within 400; 9 from 401 to 800; 47 from 801 to 1,600 (number of existing commuters provided by GHD)

  New commuters = (0 * 1.93) + (9 * 1.11) + (47 * 0.39)
  New commuters = 0 + 10 + 18
  New commuters = 28

  Id., p. 39. Contrary to GHD's analysis, the NCHRP Report 552 does not provide a basis for calculating induced bike commuters from a zone extending from 1601 to 2400 m from the proposed bike path. There is no evidence of any subsequent updates or amendments to NCHRP Report

552 providing any basis for a likelihood multiplier for the additional extended zone added by GHD.

Applying the above NCHRP Report 552 equation for calculating induced bike commuters from the 800-foot-long bike facility proposed by SDG results in an estimated 28 new bike commuters induced by the facility.

3) Commuter Bike Trip Lengths Are Overstated by GHD

GHD assumes that commuter bicycle trip lengths from the neighborhoods to the south of the Project will be on average 5.2 miles in length each way. The premise of the proposed 800-foot bike facility is to facilitate bicycle riders commuting to businesses north of the Project.

a) Oregon Study Does Not Support Assumed 5.2-mile Commute Length

GHD relies on a report entitled "Understanding and Measuring Bicycle Behavior: A Focus on Travel Time and Route Choice", December 2008 to estimate bike commute trip lengths in American Canyon in the vicinity of the Project. The Oregon Transportation Research and Education Consortium published this report based upon data involving 164 adults collected in Portland between March and November 2007. The overall median trip distance was 2.8 miles with 25% of trips to/from work. Work trips had a median distance (middle number) of 3.8 miles and a mean distance (arithmetic average) of 5.2 miles. In describing limitations of this report, the Study itself states "One limitation is that the study was only conducted in one region. Caution must always be used when conclusions based upon data from one area are used to make recommendations for another area."

From the Portland, Oregon data, Table B.2, VMT Reduction Associated with Induced Demand/Bicycle Mode Shift, indicates the average one-way commute trip length will be 5.2 miles with the construction of the proposed 800' long bicycle connection. GHD does not explain or support why a relatively small sample of bicycle observations from 2007 in Portland should be used to forecast trip lengths in the City of American Canyon, California.

It is not appropriate to use outdated information and data from Portland, Oregon. to forecast possible VMT reductions associated with the 800-foot-long bicycle path proposed in American Canyon, California.

b) No Evidence Bike Commuters to Employment Could Travel 5.2 Miles

A large portion of the City's bike network plan between the Project and

the Napa Airport is not yet proposed, funded, or built that would connect Green Island Road to Devlin Road. Currently, that stretch of the City's bike path network is open fields and there is no indication that gap in the network will be constructed any time in the foreseeable future.

The City of American Canyon most recently updated its Bicycle Plan within the Circulation Element of its General Plan on February 4, 2020. The enclosed figure illustrates the City's current Bicycle Plan map.

At the February 21, 2021 Planning Commission meeting, the Project Applicant presented the enclosed graphic depicting a Commuter Bike Route through the area connecting the single-family residences to the south with the industrial development to the north of the Proposed Project. I have reviewed this route as shown on the most recent Google Earth aerial photos taken in 2019. Most of the bicycle facilities are not signed or marked in accordance with the accepted standards published by Caltrans in the latest edition of the 2014 Manual of Uniform Traffic Control Devices. The yellow line to the north of the Project site is the missing bike facility necessary to link Green Island Road to Devlin Road. Without this stretch, the farthest a typical bike commuter could travel to work north on Commerce Court would be to the businesses clustered at Green Island Road and Commerce Court.

While bicyclists can ride in streets where roadways and streets exist, they cannot ride through fields on private property where no roadway or bikeway facilities exist. As identified above, there is a significant missing link between Devlin Road and Green Island Road. This missing link restricts and essentially eliminates bicycle access to the industrial area north of Green Island Road. The residential area will only be connected to the very southern portion of the industrial area and will not connect to the Napa County Airport area. The average trip length to the accessible portions of the industrial area then drops to only 0.75 miles north of Eucalyptus Drive, significantly less than the 2.8 miles shown on the Applicant's Commuter Bike Route Map or the 5.2 miles it claims the average bike commuter would travel using the new 800-foot-long bike facility. When properly applying the NCHRP Report 552 or using the applicable CARB data and methodology as discussed below, the value of the connection in reducing VMT is much less than identified by GHD.

The bike commuter trip length for calculating the proposed 800-foot bike facility's VMT reductions from induced bike commutes should be limited to 0.75 miles - the actual physical limit on bike commute lengths to the north of the proposed bike path. Even if the bike facility link between Green Island Road and Devlin Road was foreseeable, the predicted bike commute trip length should either be based on data collected from

existing bike commuters in American Canyon or should rely on the value of 1.5 miles employed by CARB in its VMT methodology. "Quantification Methodology for California Climate Investments for the Affordable Housing and Sustainable Communities Program" (Nov. 1, 2019).

4) Induced Bike Facility VMT Does Not Mitigate the Project's VMT

The correct use of the NCHRP Report 552 calculation of induced bike commuters indicates that 28 additional bike commuters could be expected from the proposed 800-foot-long bike facility on Commerce Drive. An average bike commute of 0.75 miles to businesses north of the Project generates a displaced VMT of 42 (0.75 * 2 * 28) = bike commuter VMT). Using CARB's bike commute trip length of 1.5 miles would double to 84 VMT. That VMT reduction is far short of the necessary, though truncated, reduction calculated by GHD of 729 VMT. It also does not come close to the reduction of 3,466 VMT necessary to mitigate the Project's commuter trips as well as non-commuter automobile and light truck trips.

CARB's "Quantification Methodology for California Climate Investments for the Affordable Housing and Sustainable Communities Program" at Pages 18 and 19 (attached) provides a formula for VMT reductions from a new bicycle facility using the following equation:

VMT Displaced = D * ADT * (A + C) * L where:

D = Default annual days of use of new facility
ADT = Average two-way daily traffic on road parallel to facility
A = Adjustment factor for active transportation (from table)
C = Credit for key destinations near facility (see Table 6)
L = Average length of auto trip displaced (1.5 miles for cycling)

Applying this formula also establishes that the Project has not mitigated its significant VMT impacts. For consistency, I have also used 235 days per year for commuters which equates to 47 weeks of commuting. For ADT, I have assumed 20 vehicles per day on the portion of Commerce Boulevard parallel to the proposed 800-foot-long facility. This stretch of Commerce Boulevard is a dead end. The only cars would be associated with the existing paintball facility. When the new school opens this year, traffic would be limited to and from the student pick-up area on a portion of Commerce Boulevard near Eucalyptus Avenue. Absent any data provided by the City or applicant, it is reasonable to estimate about 20 vehicles per day driving this stretch of road parallel to the proposed bike facility. For the A value, I used 0.0019 from Table 5 and 0.0015 from Table 6. Putting the numbers into the formula for VMT displaced yields and solving the equation yields:

VMT Displaced = 235 * 20 * (0.0019 + 0.0015) * 1.5 = 24

Using the California Air Resources Board formula indicates that the proposed bicycle link will cause a shift of 24 VMT from auto trips to cycling on the proposed bicycle path. Even assuming 100 vehicles will travel on the adjacent stretch of Commerce Drive results in an estimated VMT reduction of 120 VMT using the CARB formula.

To be effective in offsetting VMT from the Proposed Project, at least 729 VMT need to be reduced according to GHD and as noted above, 3,466 VMT need to be reduced applying all of the VMTs induced by the Project. With only from 24 to 84 VMT forecast to be induced by the proper application of the NCHRP Report 552 methodology or the CARB equation, the 800-foot-long bike facility connection by itself is insufficient and additional mitigation measures are required.

5) Random Averaging of Minimum and Maximum VMT Forecasts Is Not Supported by Analysis or Facts

Without any meaningful explanation, GHD averages their minimum 800' actual bike facility length and maximum 1.85-mile combined bike facility length to forecast daily VMT reduction associated with the 800-foot-long bicycle path. The random decision to average the minimum and maximum VMT forecasts is not supported by any reasoned analysis or facts.

In their most recent report, GHD now averages the averages and concludes that the daily VMT reduction will be 733 VMT with a 3.8-mile bicycle commute from a publication that is not available from AASHTO or 1,004 VMT by using an unrealistically long average one-way trip length of 5.2 miles. Neither of these purported VMT reductions are supported by substantial evidence, and GHD continues to find "new" reports to support their incorrect conclusion that the total Project VMT will be less than the required threshold.

6) Additional VMT Mitigation Measures Are Required

GHD has failed to properly calculate VMT for the proposed bike lane. As demonstrated above, the Project exceeds the applicable VMT significance thresholds. Neither the applicant nor the City can categorically ignore the significant VMTs generated by the Project's visitors. Mitigation measures are required to also reduce these daily trips as Conditions of Approval. Further study must be undertaken, particularly regarding VMT, and more detailed information must be provided to properly identify and address mitigation measures for excessive and unmitigated VMT that will be created by the Proposed Project.

Education: 1969 / BSE / Civil Engineering / Duke University

Experience: 50 Years

Memberships: 1977 / Institute of Transportation Engineers – Fellow, Life
1978 / Orange County Traffic Engineers Council - Chair 1982-1983
1981 / American Public Works Association – Life Member

Tom is a recognized expert in the field of traffic engineering and transportation planning. His background also includes responsibility for leading and managing the delivery of various contract services to numerous cities in Southern California.

Tom has extensive experience in providing transportation planning and traffic engineering services to public agencies. In addition to conducting traffic engineering investigations for Los Angeles County from 1972 to 1978, he has previously served as City Traffic Engineer in the following communities:

- Bellflower ..... 1997 - 1998
- Bell Gardens ..... 1982 - 1995
- Big Bear Lake..... 2006 - 2015
- Indio..... 2005 - 2019
- Huntington Beach ..... 1998 - 2004
- Lawndale..... 1973 - 1978
- Los Alamitos ..... 1981 - 1982
- Oceanside..... 1981 - 1982
- Paramount ..... 1982 - 1988
- Rancho Palos Verdes ..... 1973 - 1978
- Rolling Hills ..... 1973 - 1978, 1985 - 1993
- Rolling Hills Estates ..... 1973 - 1978, 1984 - 1991
- San Fernando..... 2004 - 2019
- San Marcos..... 1981
- Santa Ana ..... 1978 - 1981
- Westlake Village ..... 1983 - 1994

During these assignments, Tom has supervised City staff and directed other consultants including traffic engineers and transportation planners, traffic signal and street lighting personnel, and signing, striping, and marking crews. He has secured over $10 million in grant funding for various improvements. He has managed and directed many traffic and transportation studies and projects. While serving these communities, he has personally conducted investigations of hundreds of citizen requests for various traffic control devices. Tom has also successfully presented numerous engineering reports at City Council, Planning Commission, and Traffic Commission meetings in these and other municipalities.

In his 14 years of service to the City of Indio, Tom accomplished the following:

- Oversaw preparation and adoption of the 2008 Circulation Element Update of the General Plan including development of Year 2035 buildout traffic volumes, revised and simplified arterial roadway cross sections, and reduction in acceptable Level of Service criteria under certain conditions.

- Oversaw preparation of fact sheets/design exceptions to reduce shoulder widths on Jackson Street and on Monroe Street over I-10 as well as justifications for protected-permissive left turn phasing at I-10 on-ramps, the first such installations in Caltrans District 8 in Riverside County; reviewed plans and provided assistance during construction of both $2 million projects to install traffic signals and widen three of four ramps at these two interchanges under Caltrans encroachment permits.

- Reviewed traffic signal, signing, striping, and work area traffic control plans for the County's $45 million I-10 Interchange Improvement Project at Jefferson Street.

- Reviewed traffic impact analyses for Project Study Reports evaluating different alternatives for buildout improvements of the I-10 Interchanges at Jefferson Street, Monroe Street, Jackson Street and Golf Center Parkway.

- Oversaw preparation of plans, specifications, and contract documents and provided construction assistance for over 70 traffic signal installations and modifications.

- Reviewed and approved over 2,000 work area traffic control plans as well as signing and striping plans for all City and developer funded roadway improvement projects.

- Oversaw preparation of a City-wide traffic safety study of conditions at all schools.

- Obtained $47,000 grant from the California Office of Traffic Safety and implemented the City's Traffic Collision Database System. Annually reviews "Top 25" collision locations and provides traffic engineering recommendations to reduce collisions.

- Prepared over 1,500 work orders directing City forces to install, modify, and/or remove traffic signs, pavement and curb markings, and roadway striping.

- Oversaw preparation of engineering and traffic surveys to establish enforceable speed limits on over 500 street segments.

- Reviewed and approved traffic impact studies for more than 35 major projects and special events including the annual Coachella and Stagecoach Music Festivals.

- Developed and implemented the City's Golf Cart Transportation Program.

Since forming Tom Brohard and Associates in 2000, Tom has reviewed many traffic impact reports and environmental documents for various development projects. He has provided expert witness services and also prepared traffic studies for public agencies and private sector clients.

CHAPTER 4

BENEFIT-COST ANALYSIS OF BICYCLE FACILITIES

INTRODUCTION AND PURPOSE

Based on the research conducted for this project, the team crafted a set of guidelines to be used by transportation professionals and government agencies to better integrate the planning of bicycle facilities into the transportation planning process. The web-based guidelines will assist state DOTs and other state, regional, and local agencies in considering bicycling in all transportation projects. Additionally, the guidelines will support local agencies' review of bicycle projects as part of the transportation improvement plan.

Transportation planners will be able to use the guidelines for the following purposes:

- Estimating the likely cost of specific facilities based on type and on key characteristics,
- Estimating how a facility will impact the overall bicycling environment in an area, and implicitly how it will affect the amount of riding based on characteristics of the facility and of the surrounding area,
- If information is available for calibration, estimating the usage of a facility (and the change in usage of complementary and competing facilities), and
- Estimating the specific types of benefits and their relative sizes based on characteristics of the facility and of the surrounding area.

TRANSLATING DEMAND AND BENEFITS RESEARCH INTO GUIDELINES

Demand

Estimating the use of a new facility rests on two main assumptions. First, all existing commuter bicyclists near a new facility will shift from some other facility to the new one. Second, the new facility will induce new bicyclists as a function of the number of existing bicyclists. Research for this project uncovered that people are more likely to ride a bicycle if they live within 1,600 m (1 mi) of a facility than if they live outside that distance (Appendix B). The likelihood of bicycling increases even more at 800 m and 400 m. The team therefore estimates existing and induced demand using 400-, 800-, and 1600-m buffers around a facility.

Estimates of existing bicycling demand are based on U.S. census journey to work mode shares. Establish the number of residents within 400-, 800-, and 1,600-m buffers of the facility by multiplying the area of each buffer by a user-supplied population density. Multiply the number of residents in each buffer (R) by 0.4, assuming the national averages of 80% of residents are adults and 50% of adults are commuters, to calculate the number of daily commuters. Then multiply this number of commuters in each buffer by the region's bicycle commute share (C). Use the bicycle commute share for the Metropolitan Statistical Area (MSA) as the default value; the user has the option to enter a commute share for the specific area if it is known.

$$\text{Daily existing bicycle commuters} = R \cdot C \cdot 0.4$$

Adult commuters represent only a portion of adult bicyclists. The team compared U.S. census commute shares to NHTS data and found that the total adult bicycling rate ranges from the census commute rate at the low end to 0.6% plus three times the commute rate at the high end (Appendix A). This allows the use of readily available census commute shares to extrapolate total adult bicycling rates (T).

$$T_{\text{high}} = 0.6 + 3C$$

$$T_{\text{moderate}} = 0.4 + 1.2C$$

$$T_{\text{low}} = C$$

Multiply the estimated low, moderate, and high rates by the number of adults—estimated to be 80% of the population—in each buffer to arrive at the total number of daily adult cyclists.

$$\text{Total daily existing adult cyclists} = T_j \cdot R \cdot 0.8$$

Additional research (Appendix B) found that people who live near a facility are more likely to bike than those that do not; multipliers were developed to describe these probabilities. Multiplying the numbers of both commuters and total adult cyclists by the likelihood multipliers found in this research for various buffers around the proposed facility provides an estimated number of induced cyclists in each group.

$$\text{New commuters} = \sum\left(\text{Existing commuters} * \left(L_d - 1\right)\right)$$
$$d = 400,\ 800,\ 1{,}600$$
$$\text{New adult cyclists} = \sum\left(\text{Existing adult cyclists} * \left(L_d - 1\right)\right)$$
$$d = 400,\ 800,\ 1{,}600$$

Where

$L_{400m} = 2.93$
$L_{800m} = 2.11$
$L_{1600m} = 1.39$

Mobility Benefit

This research, based on stated preference analysis, found that bicycle commuters are willing to spend, on average 20.38 extra minutes per trip to travel on an off-street bicycle trail when the alternative is riding on a street with parked cars (*6*). Commuters are willing to spend 18.02 min (M) for an on-street bicycle lane without parking and 15.83 min for a lane with parking. Assuming an hourly value of time (V) of \$12, the per-trip benefit is \$4.08, \$3.60, and \$3.17, respectively. Multiply the per-trip benefit for the appropriate facility by the number of daily existing *and* induced commuters, then double it to include trips both to and from work. This results in a daily mobility benefit. Multiplying the daily benefit by 50 weeks per year and 5 days per week results in the following annual benefit:

$$\text{Annual mobility event} = M \cdot V/60 \cdot \left(\text{existing commuters} + \text{new commuters}\right) \cdot 50 \cdot 5 \cdot 2$$

It should be noted that this methodology assumes that no bicycle facility previously existed nearby, aside from streets with parking. In the this equation, V is divided by 60 because the M is in minutes and V is in hours; dividing V by 60 converts it to minutes so that the result can easily be multiplied by the minutes.

Health Benefit

An annual per-capita cost savings from physical activity of \$128 is determined by taking the median value of 10 studies (Appendix E). Then multiply \$128 by the total number of new bicyclists to arrive at an annual health benefit.

$$\text{Annual health benefit} = \text{total new cyclists} \cdot \$128$$

Recreation Benefit

The "typical" day involves about 1 hr of total bicycling activity, which is valued at \$10 (D), based on a wide variety of studies of outdoor recreational activities (Appendix G). From both NHTS and Twin Cities TBI, the average adult cycling day includes about 40 min of cycling. This is the amount used, plus some preparation and cleanup time. Multiply this by the number of new cyclists minus the number of new commuters. (The value of the facility to new commuters is counted in the mobility benefit.)

$$\text{Annual recreation benefit} = D \cdot 365 \cdot \left(\text{new cyclists} - \text{new commuters}\right)$$

Reduced Auto Use Benefits

These benefits apply only to commuter and other utilitarian travel, because it is assumed that recreational riding does not replace auto travel. These include reduced congestion, reduced air pollution, and user cost savings. Multiply the total benefit per mile by the number of new commuters, multiplied by the average round trip length from NHTS (L).

Then consider two offsetting adjustments that ultimately leave the total number unchanged. First, there are utilitarian riders in addition to commuters and some of these trips will replace auto trips. Second, not all new bike commuters and utilitarian riders would have made the trip by car; evidence from NHTS suggests that something less than half of bike commuters use driving as their secondary commuting mode. For simplicity, assume that these two factors offset each other, and thus the total amount of new bike commuter mileage is a reasonable number to use to represent the total amount of new bike riding substituting for driving.

The benefit per mile of replacing auto travel with bicycle travel is a function of location and the time of day. There will be no congestion-reduction benefits in places or at times when there is no congestion. Pollution-reduction benefits will be higher in more densely populated areas and lower elsewhere. User cost savings will be higher during peak periods when stop-and-go traffic increases the cost of driving.

Based on reasoning documented in Appendix G, congestion savings will be 0 to 5 cents per mile and pollution savings from 1 to 5 cents per mile depending on conditions. Assume the high end of this range in central city areas, the middle range in suburban areas, and the low end in small towns and rural areas. For simplicity, assume that all commuting and utilitarian trips are during congested periods. User cost savings were determined to be 3 cents per mile during congested peak periods and 0 otherwise; thus, these are scaled by location in the same way as congestion savings.

Overall, the savings per mile (S) is 13 cents in urban areas, 8 cents in suburban areas, and 1 cent in small towns and rural areas.

$$\text{Reduced auto use benefit} = \text{new commuters} \cdot L \cdot S \cdot 50 \cdot 5$$

C. New Bicycle Facility or Walkway

The emission reductions from new bicycle facilities or walkways are calculated as the emission reductions from displaced autos.

Equation 22: VMT Reductions from Bicycle Facility or Walkway

$$VMT\ Displaced = D * ADT * (A + C) * L$$

Where,		Units
VMT Displaced	= Annual passenger VMT replaced by cycling or walking trips	miles/year
D	= Default annual days of use of new facility (200 days)	days/year
ADT	= Average two-way daily traffic on road parallel to facility	vehicle trips/day
A	= Adjustment factor for active transportation (see Table 5)	unitless
C	= Credit for Key Destinations near facility (see Table 6)	unitless
L	= Average length of auto trip replaced (1.5 miles for cycling; 0.3 miles for walking)	miles

Table 5. Active Transportation Adjustment Factors

Average Daily Traffic (vehicle trips per day)	One-way Facility Length[18] (miles)	Adjustment Factor for Population > 250,000 or Non-university Town with Population < 250,000	Adjustment Factor University Town with Population < 250,000
1 to 12,000	≤ 1	0.0019	0.0104
	1.01 to 2	0.0029	0.0155
	> 2	0.0038	0.0207
12,001 to 24,000	≤ 1	0.0014	0.0073
	1.01 to 2	0.0020	0.0109
	> 2	0.0027	0.0145
24,001 to 30,000	≤ 1	0.0010	0.0052
	1.01 to 2	0.0014	0.0078
	> 2	0.0019	0.0104

[18] The length of bicycle facilities and walkways should be measured in one direction because average daily traffic accounts for two-way traffic volume. Crosswalks should not be included in the length of sidewalks since they are accounted for as traffic calming measures.

Table 6. Key Destination Credits

Number of Key Destinations	Credit Within ½ Mile of Facility	Credit Within ¼ Mile of Facility
0 to 2	0	0
3	0.0005	0.001
4 to 6	0.0010	0.002
≥ 7	0.0015	0.003

Equation 23: Auto Emission Reductions from Bicycle Facility or Walkway

$$Auto\ Emission\ Reductions = \left(\frac{VMT\ Displaced * EF_{Yr1} + VMT\ Displaced * EF_{YrF}}{2}\right) * UL * U^{-1}$$

Where,			Units
Auto Emission Reductions	=	Auto GHG or criteria and toxic air pollutant emission reductions for useful life of bicycle facility or walkway	$MTCO_2e$ or lbs
VMT Displaced	=	Annual passenger VMT replaced by cycling or walking trips, from Equation 22	miles/year
EF_{Yr1}	=	County-specific auto vehicle emission factor for first year of useful life	g/mile
EF_{YrF}	=	County-specific auto vehicle emission factor for final year of useful life	g/mile
UL	=	Useful life of bicycle facility or walkway (20 years for Class I bike path or walkway; 15 years for Class II bike lane or Class IV separated bikeway)	years
U	=	Unit conversion factor (1,000,000 for grams to metric tons; 453.59 for grams to pounds)	g/MT or g/lb

Re: SDG Commerce 217 Distribution Center (PL20-0008) - Mitigated Negative Declaration (February 25, 2021 Planning Commission Meeting, Agenda Item No. 5.2

Dear Commissioners and Mr. He:

Please accept this brief comment on behalf of Laborers International Union of North America, Local 324 ("LIUNA") and its members living and working in and around the City of American Canyon regarding the Draft Initial Study and Mitigated Negative Declaration ("MND") prepared for the proposed SDG Commerce 217 Distribution Center Project (the "Project"). Thank you for the responses prepared to our earlier comments submitted to the Commission on January 17, 2021.

We appreciate the acknowledgement in the responses that the original VMT analysis was incorrect and employed bike trip lengths that could not be substantiated in fact or based on any effort to gather information on bike commuting in general or in the American Canyon area. It appears, however, that the City's consultant, in responding to those obvious shortcomings, has now embellished its VMT mitigation analysis with numerous other unsubstantiated claims and speculation. Rather than an objective analysis of the actual incremental VMT reductions that will

result from an 800-foot stretch of bike lane connecting two existing bike lanes, the effort seeks, without evidentiary basis, to achieve a desired outcome. The notion that an 800-foot connecting bike lane will, by itself, induce 96 new bike commuters to commute to jobs to the north of the Project and reduce VMTs by 1004 is farfetched. The only way the consultant generates such a number is by ignoring the terms of the federal guidance it claims to be applying, blatantly attempting to assign benefits of other parties' bike lane construction efforts to the applicant, and making believe that, without the connector bike lane, bike commuters from the neighborhood south of the Project heading north must ride on the shoulder of State Route 29. All of these efforts to invent a justification for not requiring sufficient VMT reductions to mitigate the Project's increases in VMT are not supported by the cited guidance or facts. These supplemental comments highlight this continued concern and the remaining fair argument that the Project may have significant environmental impacts from its unmitigated increase in VMTs.

1. GHD's analysis is inconsistent with the NCHRP guidelines it cites.

GHD claims to base its analysis of VMT reductions attributable to the bike lane connector on National Cooperative Highway Research Program Report 552, "Guidelines for Analysis of Investment in Bicycle Facilities." ("NCHRP Report"). The method set forth in the NCHRP Report for estimating induced bike commutes from a new bike facility relies on bike commuters from three buffer distances from a bike facility who would most likely use the facility. (NCHRP Report, p. 38.) These three buffers are less than 400 meters, 400 to 799 meters and 800 to 1599 meters. (*Id*., pp. 38, Appendix B, B-6.) As the NCHRP Report explains:

> Research for this project uncovered that people are more likely to ride a bicycle if they live within 1,600 m (1 mi) of a facility than if they live outside that distance (Appendix B). The likelihood of bicycling increases even more at 800 m and 400 m. The team therefore estimates existing and induced demand using 400-, 800-, and 1600-m buffers around a facility.

(*Id*.) The analysis identifies the population within each of those buffer areas and estimates the number of bike commuters in each buffer using the project region's "bicycle commute share." (*Id*.) The analysis also provides a method to calculate the total adult cyclists in the buffer areas. (*Id*.) The NCHRP Report developed "likelihood multipliers" for each of the three buffer zones to account for the fact that "people who live near a facility are more likely to bike than those that do not…." *Id*., pp. 38-39. A different likelihood multiplier is provided for each of the three NCHRP buffer zones.

Rather than abide by the NCHRP Report's methodology, GHD took the liberty of adding a buffer zone beyond 1600 meters – from 1600 to 2400 meters from the proposed bike lane. (Agenda Packet ("AP"), pp. 302-303.) Substantial evidence includes "facts, reasonable assumptions predicated upon facts, and ***expert opinion supported by facts***." (CEQA Guidelines, § 15384(b) (emphasis added).) Because there is no justification based on the NCHRP Report to inflate induced bike commuter use by randomly expanding the buffers to include people living 1600 to 2400 meters away from a proposed bike lane, GHD's analysis is not based on substantial evidence.

The inconsistencies of GHD's analysis with the NCHRP Report do not however end there. In its analysis, GHD does not include the closest buffer zone identified in the NCHRP Report – 0 – 400 meters. Instead, it uses a 0 – 799 meter buffer, an 800 to 1599 meter buffer and its third made-up buffer from 1600 meters to 2400 meters. However, in calculating how many of the residents in each of these areas are induced to use the new bike lane, GHD then applies the NCHRP's "likelihood multipliers" for the original NCHRP buffer distances. GHD references the likelihood multipliers "[e]stablished by NCHRP 552 research; see Appendix B." AP, p. 304. However, the NCHRP Report and its Appendix B do not establish a likelihood multiplier for GHD's newly minted buffer zone from 1600 to 2400 meters from a facility. So, GHD could not have been applying a number from the NCHRP Report to that area. GHD does not explain which likelihood multipliers it applied to the three zones it selected. If GHD applied the three multipliers calculated by NCHRP for the 400, 800 and 1600 buffer zones to GHD's 800, 1600, and 2400 buffer zones, there would be no evidentiary basis for GHD's new, induced bike commuter computation. In any event, GHD provides no evidence supporting its application of a multiplier factor for the fictitious buffer it seeks to add surreptitiously to the NCHRP Report's methodology. GHD also does not provide evidence of which likelihood multipliers it applied to the 800 meter and 1600 meter zones in its analysis. Without this evidence, the analysis is not substantial evidence.

2. GHD's effort to credit the Project with mitigation for the already completed Bay Trail bike facility adjacent to Wetlands Edge Road is entirely arbitrary and is not supported by evidence that the bike lane gap along 800-feet of Commerce Court is "non-traversable."

GHD further attempts to inflate the VMTs attributable to the proposed 800 feet bike lane by claiming the VMT analysis should include all bike commuters induced by the 1.7 miles of Bay Trail bike access that was constructed along the western side of Wetlands Edge Road many years ago. (AP, pp. 290, 302.) According to GHD, the 800-feet stretch of Commerce Boulevard where it proposes to add bike lanes currently blocks or limits would-be bike commuters heading north from using the Bay Trail bike lanes to the west of Wetlands Edge Road.

First, there is no evidence that the 800-feet stretch of Commerce Boulevard currently blocks or will block any bike commuters from heading north towards the businesses clustered at the north end of Commerce Boulevard or even further north. The MND does not describe in any way the current condition of that road or, more importantly, the condition that will exist upon the completion of the Napa Junction Elementary School project at the corner of Commerce Boulevard and Eucalyptus. The elementary school is scheduled for occupancy this fall. (AP, p. 101.) Construction of the SDG Warehouse project is expected to be ongoing after the school is completed and open. (*Id*., p. 124.)

The school project includes reconstructing Commerce Boulevard alongside the school property. (*See* Napa Junction Elementary School Replacement Project Draft Environmental Impact Report, p. 10-28 [available at https://drive.google.com/open?id=13Ny2i9F6u2R6NFJBqlifGoNeUqaUoqTk]; *see also id*., p.

10-29 ("the proposed project would improve the roadway with asphalt concrete pavement and sidewalk"); Figures 3-5, 3-15 and 3-16 (plans showing bike lanes on Commerce Blvd.) Despite this brand new roadway running from Eucalyptus Avenue north to the existing SDG Commerce 330, GHD contends that this stretch of Commerce Boulevard is a "'non -traversable' gap between the residential areas of American Canyon and the employment centers north that precludes viable bicycle commuting choices." (AP, p. 287.) Only from this premise does GHD then claim that bike commuters cannot get through this stretch of Commerce Boulevard and must instead head to State Route 29 "since the only connection to employment destinations north of Eucalyptus today is along the shoulders of SR 29 – a route navigable the only the most experienced and fearless riders." (AP, p. 302.) Contrary to GHD's assertions, a newly constructed stretch of Commerce Boulevard adjacent to the elementary school does not pose any barrier to bike commuters to travel between Eucalyptus Avenue and the bike path across from SDG Commerce 330. As a result, GHD's and the final MND's assertions that the proposed new bike lanes will unlock additional potential from the 1.7 miles of existing bikeway along Wetlands Edge Road is not supported by any substantial evidence. Well before the Project is completed, any commuting biker will be able to peddle unobstructed along the brand-new stretch of Commerce Boulevard whether the new bikeway is constructed or not.

Even if the stretch of Commerce Boulevard adjacent to the new elementary school did pose some limited impediment to bikers that required them to slow down for 800 feet does not justify GHD's random proposal to attribute half of the VMT reductions of an already completed 1.7 mile bikeway to the Project. This blatant effort to inflate the VMT benefits of the Project's proposed 800-foot bike lane has no basis in fact and is not a mitigation measure attributable to the Project.

Applying the NCHRP buffer zones that are actually included in that methodology (800 and 1600 meters) and the actual length of the bike facility proposed by the Project (800 feet), and assuming the rest of GHD's calculations are correct, the number of new bike commuters induced by the 800-foot bike lane is at most 22 cyclists. Assuming GHD's estimate of bike commute distance is reasonable, that amounts to, at most, a VMT reduction of 229 VMTs. As a result, substantial evidence of a fair argument exists that the Project's VMT increases may have a significant environmental impact.

3. GHD's estimate of commuter bike trip lengths does not eliminate the substantial evidence of a fair argument that average bike commute lengths in California are 1.5 miles as published by the California Air Resources Board.

GHD relies on a study of Portland, Oregon to borrow an estimated bike commute length for American Canyon. (AP, p. 290, citing "Understanding and Measuring Bicycling Behavior: a Focus on Travel Time and Route Choice", Oregon Transportation Research and Education Consortium, OTREC -RR -08 -03, December 2008.) GHD provides no rationale in its report why Portland bicycle commute lengths would be representative of American Canyon bicycle commute lengths. This is despite a CARB approved distance of 1.5 miles for bike trips used to calculate VMT reductions from bikeways. (AP, p. 684.) There is no substantial evidence to support the use of bike commute distances from a highly urbanized area like Portland versus a

more rural/suburban setting such as American Canyon. Using 1.5 miles as the lower end of a bike commute distance estimates yields a mere 33 VMT reduction form the 800-feet bike lane.

4. The inclusion of the new VMT calculations and efforts to justify the limited bike lane mitigation require the City to recirculate the MND for public review and comment.

The law is well-established that even if an EIR is not required, a revised negative declaration must be circulated for full public review if it adds new mitigation measures or identifies new impacts. *Gentry v. Murrieta*, 36 Cal.App.4th 1359, 1392, 1411, 1417. The MND's substantial 'changes to its VMT analysis and new mitigation proposals based on the so-called non-traversability of Commerce Boulevard are significant changes to the MND that should be recirculated to the public for review and comment.

Despite the responses to our earlier comments, substantial evidence of a fair argument still exists in the record that the Project may have significant health risks and impacts on wildlife. For all of these reasons and those discussed in our prior comment, the MND is inadequate and an EIR is required to analyze and mitigate the Project's potentially significant environmental impacts. Thank you for your attention to these supplemental comments.

Sincerely,

Michael Lozeau

Re: SDG Commerce 217 Distribution Center (PL20-0008) - Mitigated Negative Declaration

Dear Mr. He:

I am writing on behalf of Laborers International Union of North America, Local 324 ("LIUNA") and its members living and working in and around the City of American Canyon regarding the Draft Initial Study and Mitigated Negative Declaration ("MND") prepared for the proposed SDG Commerce 217 Distribution Center Project (the "Project").

After reviewing the MND prepared for the Project along with our experts, we believe there is a fair argument that the Project may have significant adverse environmental impacts and that an environmental impact report ("EIR") should therefore be prepared pursuant to the California Environmental Quality Act ("CEQA"), Public Resources Code §§ 21000, et seq.

LIUNA submits herewith the expert comments of wildlife ecologist Dr. Shawn Smallwood. Dr. Smallwood's expert comments and resume are attached hereto as Exhibit A. LIUNA also submits herewith comments on the Project's air and greenhouse gas emissions from the environmental consulting firm Soil/Water/Air Protection Enterprise ("SWAPE"). SWAPE's comments and the resumes of their consultants are attached hereto as Exhibit B.

PROJECT DESCRIPTION

The Project proposes to issue a conditional use permit to construct and operate a 217,294 square foot wine distribution center on a 10.39-acre parcel in close proximity to the Napa River and an area identified by the Audubon Society as an "Important Bird Area." In addition to the 10.39 acre building site, the Project also involves excavation and operation of a borrow area

covering most of the adjacent 10.17 acre parcel immediately to the south of the building site. The proposed building would be bordered by 134 parking stalls on the north edge of the building parcel and 21 truck docking bays on the north side of the proposed building. The building would be heavily insulated and refrigerated. Grading and filling will occur throughout the Project site as well as most of the adjacent borrow area parcel. During construction, about 17,000 cubic yards of stockpiled soil will be transported and another 21,000 cubic yards of soil will be excavated from the adjacent site. Construction of the project would be done in a single phase lasting approximately 9.5 months. Types of heavy diesel equipment to be used to construct the facility will include a self-loading dirt scraper, bulldozer, motor grader, compactor, roller, water truck, backhoe, excavator, trencher, drilling auger, front end loader, paving machine, laser screed, concrete finishing trowels, tractor, crane, forklift, generator, man lift, scissor lift, welding machine, and light tower. Operation of the Project is estimated to generate a total of 367 daily project trips and, prior to mitigation, increase the daily vehicle miles travelled ("VMT") in the area by 2,355 VMT. The closest residence is about 500 feet from the Project's borrow area.

LEGAL STANDARDS

As the California Supreme Court held, "[i]f no EIR has been prepared for a nonexempt project, but substantial evidence in the record supports a fair argument that the project may result in significant adverse impacts, the proper remedy is to order preparation of an EIR." (*Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 319-320 ["*CBE v. SCAQMD*"], citing, *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.3d 68, 75, 88; *Brentwood Assn. for No Drilling, Inc. v. City of Los Angeles* (1982) 134 Cal.App.3d 491, 504–505.) "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." (*Communities for a Better Environment v. Calif. Resources Agency* (2002) 103 Cal.App.4th 98, 109 ["*CBE v. CRA*"].)

The EIR is the very heart of CEQA. (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1214; *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, 927.) The EIR is an "environmental 'alarm bell' whose purpose is to alert the public and its responsible officials to environmental changes before they have reached the ecological points of no return." (*Bakersfield Citizens,* 124 Cal.App.4th at 1220.) The EIR also functions as a "document of accountability," intended to "demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action." (*Laurel Heights Improvements Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 392.) The EIR process "protects not only the environment but also informed self-government." (*Pocket Protectors,* 124 Cal.App.4th at 927.)

An EIR is required if "there is substantial evidence, in light of the whole record before the lead agency, that the project may have a significant effect on the environment." (Pub. Resources Code, § 21080(d); see also *Pocket Protectors,* 124 Cal.App.4th at 927.) In limited circumstances, an agency may avoid preparing an EIR by issuing a negative declaration, a written statement briefly indicating that a project will have no significant impact thus requiring no EIR (14 Cal. Code Regs., § 15371 ["CEQA Guidelines"]), only if there is not even a "fair

argument" that the project will have a significant environmental effect. (Pub. Resources Code, §§ 21100, 21064.) Since "[t]he adoption of a negative declaration . . . has a terminal effect on the environmental review process," by allowing the agency "to dispense with the duty [to prepare an EIR]," negative declarations are allowed only in cases where "the proposed project will not affect the environment at all." (*Citizens of Lake Murray v. San Diego* (1989) 129 Cal.App.3d 436, 440.)

Where an initial study shows that the project may have a significant effect on the environment, a mitigated negative declaration may be appropriate. However, a mitigated negative declaration is proper *only* if the project revisions would avoid or mitigate the potentially significant effects identified in the initial study "to a point where clearly no significant effect on the environment would occur, and…there is no substantial evidence in light of the whole record before the public agency that the project, as revised, may have a significant effect on the environment." (Public Resources Code §§ 21064.5 and 21080(c)(2); *Mejia v. City of Los Angeles* (2005) 130 Cal.App.4th 322, 331.) In that context, "may" means a *reasonable possibility* of a significant effect on the environment. (Pub. Resources Code, §§ 21082.2(a), 21100, 21151(a); *Pocket Protectors,* 124 Cal.App.4th at 927; *League for Protection of Oakland's etc. Historic Resources v. City of Oakland* (1997) 52 Cal.App.4th 896, 904–905.)

Under the "fair argument" standard, an EIR is required if any substantial evidence in the record indicates that a project may have an adverse environmental effect—even if contrary evidence exists to support the agency's decision. (CEQA Guidelines, § 15064(f)(1); *Pocket Protectors*, 124 Cal.App.4th at 931; *Stanislaus Audubon Society v. County of Stanislaus* (1995) 33 Cal.App.4th 144, 150-15; *Quail Botanical Gardens Found., Inc. v. City of Encinitas* (1994) 29 Cal.App.4th 1597, 1602.) The "fair argument" standard creates a "low threshold" favoring environmental review through an EIR rather than through issuance of negative declarations or notices of exemption from CEQA. (*Pocket Protectors*, *supra*, 124 Cal.App.4th at 928.)

The "fair argument" standard is virtually the opposite of the typical deferential standard accorded to agencies. As a leading CEQA treatise explains:

> This 'fair argument' standard is very different from the standard normally followed by public agencies in making administrative determinations. Ordinarily, public agencies weigh the evidence in the record before them and reach a decision based on a preponderance of the evidence. [Citations]. The fair argument standard, by contrast, prevents the lead agency from weighing competing evidence to determine who has a better argument concerning the likelihood or extent of a potential environmental impact. The lead agency's decision is thus largely legal rather than factual; it does not resolve conflicts in the evidence but determines only whether substantial evidence exists in the record to support the prescribed fair argument.

(Kostka & Zishcke, *Practice Under CEQA*, §6.29, pp. 273-274.) The Courts have explained that "it is a question of law, not fact, whether a fair argument exists, and the courts owe no deference to the lead agency's determination. Review is de novo, with a ***preference for resolving doubts in favor of environmental review***." (*Pocket Protectors*, 124 Cal.App.4th at 928 [emphasis in

original].)

As a matter of law, "substantial evidence includes . . . expert opinion." (Pub. Resources Code, § 21080(e)(1); CEQA Guidelines, § 15064(f)(5).) CEQA Guidelines demand that where experts have presented conflicting evidence on the extent of the environmental effects of a project, the agency must consider the environmental effects to be significant and prepare an EIR. (CEQA Guidelines § 15064(f)(5); Pub. Res. Code § 21080(e)(1); *Pocket Protectors*,124 Cal.App.4th at 935.) "Significant environmental effect" is defined very broadly as "a substantial or potentially substantial adverse change in the environment." (Pub. Resources Code, § 21068; see also CEQA Guidelines, § 15382.) An effect on the environment need not be "momentous" to meet the CEQA test for significance; it is enough that the impacts are "not trivial." (*No Oil, Inc.,* 13 Cal.3d at 83.) In *Pocket Protectors*, the court explained how expert opinion is considered. The Court limited agencies and courts to weighing the admissibility of the evidence. (*Pocket Protectors,* 124 Cal.App.4th at 935.) In the context of reviewing a negative declaration, "neither the lead agency nor a court may 'weigh' conflicting substantial evidence to determine whether an EIR must be prepared in the first instance." (*Id*.) Where a disagreement arises regarding the validity of a negative declaration, the courts require an EIR. As the Court explained, "[i]t is the function of an EIR, not a negative declaration, to resolve conflicting claims, based on substantial evidence, as to the environmental effects of a project." (*Id*.)

CEQA requires that an environmental document include a description of the project's environmental setting or "baseline." (CEQA Guidelines, § 15063(d)(2).) The CEQA "baseline" is the set of environmental conditions against which to compare a project's anticipated impacts. (*CBE v. SCAQMD*, 48 Cal.4th at 321.) CEQA Guidelines section 15125(a) states, in pertinent part, that a lead agency's environmental review under CEQA:

> …must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time [environmental analysis] is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant.

(See, *Save Our Peninsula Committee v. County of Monterey* (2001) 87 Cal.App.4th 99, 124-125 ["*Save Our Peninsula*"].)

A threshold of significance may be useful to determine whether an environmental impact normally should be considered significant. (CEQA Guidelines, § 15064.7(a).) "A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant." (*CBE v. California Resources* Agency, 103 Cal.App.4th at 111.)

"A threshold of significance is not conclusive, however, and does not relieve a public agency of the duty to consider the evidence under the fair argument standard." (*Mejia v. City of*

Los Angeles (2005) 130 Cal.App.4th 322, 342; see also *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1109; *CBE v. California Resources Agency*, 103 Cal.App.4th at 110-114; CEQA Guidelines, § 15064(b).) A public agency cannot, as the City does here, apply a threshold of significance or regulatory standard "in a way that forecloses the consideration of any other substantial evidence showing there may be a significant effect." (*CBE v. California Resources Agency*, 103 Cal.App.4th at 114.)

ANALYSIS

I. There is a Fair Argument That the Project May Have Significant Traffic and GHG Impacts Because the Purported Mitigation Measure for VMT is Not Supported by Substantial Evidence and Defies Common Sense.

The MND's analysis of the Project's VMT impacts is not based on substantial evidence because it relies upon entirely unrealistic assumptions about the distance a bike commuter would ride to and from work. The MND would have one believe that by constructing a 300 feet long Tier 1 bike lane down the street from the Project, 32 commuters would no longer drive an average of 34.6 miles to and from work, but would instead ***bike 34.6 miles*** to and from work. (MND, Appendix, GHD Draft Technical Memorandum, p. 6 (Nov. 19, 2020) ("VMT Memo").

The MND identifies a threshold of significance for assessing a Project's VMT-related impacts of requiring a 15 percent reduction in VMT for the Project "compared with current regional VMT generation for similar uses." (MND, p. 91.) Relying on an analysis conducted by GHD, the MND identifies that the "[c]ountywide average daily VMTs for employees and visitors are 11.7 and 31.3 miles, with an average of 17.4 daily VMT." (*Id*.) Based on these numbers, the MND states that the "average daily project trip length has been calculated to be 17.3 miles, with a total daily 2,355 VMT." (*Id*.) The MND identifies a baseline threshold of 1,354 VMT as the VMT level that is 15 percent less than the County's average VMT. (VMT Memo, p. 4.). Thus, in order to be consistent with the 15 percent reduction from the average VMT threshold, the MND states that the Project must reduce its estimated VMT of 2,355 by 1,001 VMT. (*Id*.)

GHD then recommends a single measure purporting to achieve this dramatic reduction in the Project's estimated VMT. GHD and the MND state that extending by a mere 300 feet the Class I bike path on Commerce Court, which currently runs past the existing SDG Commerce 330 warehouse, to connect to the northern driveway of the elementary school under construction would reduce the Project's VMT by 1,119 VMT. (*Id*., p. 6.) GHD's rationale for this assertion is based, in part, on an estimate of the number of new bike commuters that would be added to the City's bike network by the addition of the 300-foot connector lane. GHD estimates the new lane would entice 32 new bike commuters. (*Id*., p. 18.) GHD then claims that these 32 new bike commuters would take the place of 32 car commuters who otherwise would each have driven 34.6 miles to and from work. (*Id*.)

Assuming GHD's estimate of 32 new commuters biking to work as a result of constructing the 300-feet bike lane is correct, the car trip lengths that GHD claims those users' bike trips would replace are preposterous. There is no evidence that the new bike commuters

who would be enticed onto their bikes by the new 300-feet of bike lane would include any car commuter who currently travels 17.3 miles to and from their work. The 17.3 mile figure applied by GHD has nothing to do with the average length of bike commuter trips. Instead, that number is the average trip length for commuters traveling by ***automobile*** calculated for the project area. (*Id*., p. 4.)

The average length of a bike commuter trip is much lower than the average length of a commute by car. The California Air Resources Board ("CARB") has published a quantification methodology to estimate VMT reductions associated with bike facilities. (CARB, Quantification Methodology (Nov. 1, 2019) (attached as Exhibit C).) Equation 22 of that guidance provides a formula for estimating "VMT Reductions for Bicycle Facility or Walkway." (Id., p. 18.) GHD completely ignores this guidance in its analysis. Putting that aside, CARB's factors include its expert determination of the average bike trip length to be used in a VMT reduction calculation. CARB pins the "[a]verage length of auto trip replaced" at "1.5 miles for cycling." (*Id*. *See also* ITS Report, p. 5. *See id.*, p. 7 ("The trip length factor, L, is based on the average length of bicycle trips taken for any purpose, using the default 1.5-mile average from most recent California Household Travel Survey data") (attached as Exhibit D).)

Even assuming GHD's overly simplistic equation is otherwise correct, applying CARB's 1.5 mile average of auto trip replaced by a bike trip dramatically reduces the MND's inflated VMT reduction claim. Based on a realistic trip length for bicycles that would use the 300-feet lane, and according to GHD's truncated equation, the new 300-feet bike lane would only reduce VMT by 97.5 VMT (65 daily commute trips by new bike commuters x 1.5 bicycle trip length). Thus, GHD's claim that the 300-foot length of bike lane would miraculously remove 1,119 VMTs from Commerce Court is entirely without basis in evidence or common sense. Instead, that modest bike facility would only remove about 97.5 VMT, leaving the Project over 900 VMT short of the 15 percent reduction from the County average necessary to eliminate the Project's significant transportation impacts. As a result, the MND is inconsistent with the CEQA Guidelines, 14 Cal.Admin Code § 15064.3 which requires that "[a]ny assumptions used to estimate vehicle miles traveled and any revisions to model outputs should be documented and explained in the environmental document prepared for the project." Moreover, there is a fair argument that the Project may have significant transportation impacts requiring the preparation of a full EIR.

II. An EIR is Required because the Project will have Significant Impacts on Biological Resources.

A. THE MND Fails to Adequately Analyze Impacts to Biological Resources Because It Relies Upon an Incomplete Baseline and the Project May Have Adverse Impacts on Numerous Sensitive Species Currently Using the Site or Adjacent Areas.

On January 23, 2019 and January 5, 2021, Dr. Shawn Smallwood visited the site. (Smallwood Comments, p. 1.) His first-hand observations of wildlife at the site as well as his review of reliable bird sightings reported on eBird demonstrate that the MND relies upon a

truncated list of species present at the site and fails to address impacts on numerous sensitive species that currently use the site. Dr. Smallwood's observations and expert comments are substantial evidence that the Project may have significant biological impacts, including adverse impacts on bald eagles, northern harriers, peregrine falcons, Cooper's hawks, red-tailed hawks, great horned owls, Swainson's hawks, burrowing owls, Nuttall's woodpecker, and other bird species. (*Id*., p. 2.)

During his brief visit on January 23, 2019, Dr. Smallwood observed a bald eagle flying over and hunting the site and identified a northern harrier and Cooper's hawk foraging on the project site. (Smallwood Comments, pp. 2, 5.) He also observed numerous other bird species. (*Id*., pp. 2-9.) Many species were not just passing by the site but actively engaged in using the habitat available there. (*Id*., p. 2.) For example, Dr. Smallwood observed many species spending considerable time at the site and displaying courtship or territorial behaviors indicative of breeding. (*Id*.) Such species included red-winged blackbirds, Say's phoebe, red-tailed hawks, and American kestrels. (*Id*.) He also observed a great-horned owl perched immediately adjacent to the site. (*Id*.)

Dr. Smallwood also has gathered information regarding numerous bird sightings in and around the site that are posted on a web-based service called eBird. (Smallwood Comments, pp. 13-16.) Dr. Smallwood's experience with this service indicates that it is reliable source of bird sighting information, being based on the observations of reputable birders. (*See id*., p. 16.) He also points out the limitations of the MND only relying upon the California Natural Diversity Data Base ("CNDDB") to document the potential presence of wildlife species at and around the Project site. (*Id*., pp. 11, 16.) Numerous additional sensitive species are identified near the site that are not addressed in the biological report or the MND, including the endangered Willow flycatcher and species of concern including the Oak titmouse, Loggerhead shrike, tricolored blackbirds and many others. (*Id*., pp. 13-15.)

As a result of the omission of numerous sensitive species using the site and evidence of even more additional species in the immediate vicinity of the site, the MND's evaluation of the project's biological impacts is not supported by substantial evidence. Dr. Smallwood's observations and expert comment is substantial evidence of a fair argument that the project may have an adverse impact on bald eagles, various hawks, and other species currently utilizing the site for courtship, foraging habitat and for movement.

The MND does mention a number of species, including Swainson's hawks and burrowing owls. However, the biological report fails to disclose information that these species have been observed much closer to the project site than is indicated in the MND or the biological report. (Smallwood Comments, p. 16.) For example, the MND indicates that Swainson's hawks and burrowing owls are, respectively, 2.5 and 2.6 miles away from the project site. However, Dr. Smallwood identifies sightings of these two species within 0.2 miles of the site. As he states, this indicates a high likelihood that these species are using this open foraging area as well.

The MND is particularly unreliable regarding its treatment of another species of special concern, the Northern harrier. As Dr. Smallwood explains:

> Relying on CNDDB records, Monk & Associates (2020) claim the nearest northern harrier location was 2.7 miles away. However, not only did I see a northern harrier fly over the project site, but multiple other observers reported northern harrier sightings nearby.

(Smallwood Comments, p. 16.)

Regarding impacts to burrowing owls, the MND improperly downplays potential impacts by claiming that, although the site contains many ground squirrel burrows that are frequently relied upon by burrowing owls, their significance is downplayed because Monk & Associates claims they are of "recent origin." (Smallwood Comments, p. 12.) Dr. Smallwood, relying on his own studies of burrowing owls, refutes the relevance of the age of ground squirrel burrows to their likely use by burrowing owls. (*Id*.)

Likewise, the MND relies on a claim that because the site was cleared of eucalyptus trees in 2012, that somehow that activity over eight years ago continues to affect the site's use by wildlife. The MND asserts that "[t]he loss of foraging habitat associated with the project is not considered substantial as the entire project site consisted of a eucalyptus grove until 2012, and thus did not historically provide potential foraging habitat." (MND, p. 33.) Dr. Smallwood discusses the scientific problems with this assertion, concluding that "[t]he [MND] misleads where it claims that the removal of a eucalyptus grove years ago doomed the occurrence of wildlife species there today." (Smallwood Comments, p. 12.)

Dr. Smallwood notes the likely presence of bats utilizing the site for foraging and movement. (Smallwood Comments, p. 16.) The MND claims that the Project will not impact bats because the Project site "contains no roosting or nesting habitat because it has no trees, rock faces, structures, or cliffs." (MND. p. 34.) However, as Dr. Smallwood points out, "Trees surround the site. Bats undoubtedly roost in those trees. The site supports those roosts by providing forage. Night roosts of pallid bat, in particular, are typically located close to forage on open ground." (Smallwood Comments, p. 16.)

Dr. Smallwood notes that the MND and accompanying biological report fail to provide the information necessary to corroborate the level of effort and adequacy of the reconnaissance level survey done by the City's consultant. As Dr. Smallwood explains:

> Monk & Associates reported no details of their surveys, such as who exactly did the surveys, when they arrived, how long they stayed, and what methods they used. The reporting did not include the most basic information that a wildlife ecologist would need for assessing whether the survey truly met due diligence standards.

(Smallwood Comments, p. 10.) This exacerbates the absence of substantial evidence to justify the MND's wildlife baseline.

Dr. Smallwood also debunks the MND's effort to bolster the cursory biological

assessment with a so-called peer review. As Dr. Smallwood notes, no description of the peer-review nor any responses to review comments is provided in the MND and the date of the peer review appears inconsistent with the date of Monk & Associates site visit. (Smallwood Comments, p. 10.)

The evidence of nearby sightings of numerous sensitive species and the flaws in the MND and accompanying biological report identified by Dr. Smallwood support a fair argument that the Project may have adverse impacts on their foraging and movement. For this reason and those discussed above, an EIR must be prepared to address impacts to these many sensitive bird and bat species.

B. The Project will have a Significant Impact on Wildlife Movement and Habitat Fragmentation.

The MND fails to adequately analyze the Project's impact on wildlife movement. Instead, the MND improperly dismisses the Project's potential to impact wildlife movement by claiming there needs to be a "corridor" on the site to effect wildlife movement, that other nearby areas are better movement areas, or otherwise asserting without evidence that this particular large warehouse would not disrupt wildlife movement. As Dr. Smallwood states:

> The project would obviously interfere with wildlife movement in the region. Having studied millions of GPS telemetry data from 35 golden eagles tracked since 2013, I noticed a strong avoidance of anthropogenic structures such as warehouses and residential neighborhoods. I assume bald eagles express a similar level of avoidance. If this is assumption is true, then the bald eagle I saw fly over the site in 2019 might not do so again since the SDG Commerce 330 warehouse was built. Many other species would continue to fly over the project site despite the neighboring warehouse. I have recorded many observations of animals moving across fields next to warehouses, including red-tailed hawks, peregrine falcons, and many others.

(Smallwood Comments, p. 20.) Dr. Smallwood's direct observations and expert opinion are substantial evidence of a fair argument that the Project may have adverse impacts on wildlife movement at the site and in the vicinity.

C. The MND Fails to Analyze the Project's Impacts on Wildlife from Additional Traffic Generated by the Project.

The MND contains no analysis of the impacts of the Project's added road traffic on special-status species of wildlife, including species such as the California red-legged frog and California tiger salamanders. (Smallwood Comments, p. 20-21.) Regardless of whether these species live on site, these and other special status species must cross roadways that will experience increased traffic volume as a result of the Project. (*Id.*)

As Dr. Smallwood explains, "[i]ncreased use of existing roads will increase wildlife

fatalities…." (*Id*., p. 20.)

> The traffic would effectively extend the project's footprint well beyond the floor space, as trucks and cars traveling to and from the warehouse will drive over roads and highways that are also crossed by wildlife. On 23January 2019I saw two road-killed striped skunks on American Canyon Drive, and on 15 January 2021 I saw a road-killed striped skunk and an opossum killed on the same road–a road likely to be used by trucks and cars servicing the project. California red-legged frogs (Rana draytonii), which Monk & Associates (2020) concluded will suffer no impacts because CNDDB records are lacking west of Highway 29, will cross roads used by vehicles servicing the project. A shortfall of the [MND] is its failure to analyze the impacts of the project's added road traffic on special-status species of wildlife, including California red-legged frog, California tiger salamander (Ambystoma californiense), and American badgers (Taxidea taxus) that, regardless of whether they live on the site, mustcross roadways that will experience increased traffic volume caused by this project.

(*Id*.) Given the fair argument of a threat to wildlife posed by existing traffic and additional traffic from the Project, as discussed by Dr. Smallwood, an EIR is necessary to evaluate the direct and cumulative impacts of the Project's vehicle collisions with wildlife.

D. The MND Fails to Analyze the Project's Impacts from the use of Pest Control Measures.

The MND does not discuss the potential impact of using pesticides inside and outside of the proposed warehouse. As a wine storage distribution facility, there will likely be steps taken to abate pests. There are many businesses that provide services for controlling stored products pests, perching birds, and rodents and other mammal pests within and around distribution warehouses. (Smallwood, p. 21.) These businesses advertise exclusion strategies and fumigation for stored products pests, glue boards for rodents, and other measures including anticoagulant poisons and acute toxicants. "[T]he use of toxicants can harm non-target wildlife through direct exposure and indirect exposure via predation and scavenging." (*Id*.) "[P]est control involving toxicants can result in the spread of toxicants beyond the project site." (*Id*.)

An EIR is needed to analyze the potential impacts of animal damage control associated with the proposed Project. Anticipated animal control strategies at the Project should be detailed, and impacts mitigated.

E. The Project will have Cumulative Impacts on Biological Resources.

Dr. Smallwood concludes that the Project will have a significant cumulative impact on biological resources. (Smallwood Comments, p. 22.) An EIR is needed to fully analyze and mitigate the Project's cumulative biological impacts, including not only future projects but the existing impacts as well.

III. The IS Utilized Unsubstantiated Input and Output Parameters to Estimate Project Emissions.

A. The MND fails to explain how the City Calculated the Project's Average Daily Construction Emissions of ROGs and NOx.

The MND and Appendix B fail to provide sufficient information for a reviewer to understand and corroborate how the average daily emissions during construction were derived. As SWAPE explains, it is entirely unclear where the emissions estimates reported in the MND come from, because the estimates do not match those provided in any of the CalEEMod output files. (SWAPE Comments, pp. 2-3.) The MND provides the Project's emissions estimates in pounds per day. (MND, p. 22.) This indicates that the estimates should have come from either the winter or summer output file. (SWAPE Comments, pp. 2-3.) However, reviewing both the summer and winter output files and the emissions estimates, SWAPE's review could not match either. Insufficient details are provided in the MND either to inform the reader of the full extent of the air pollution and impacts that will result from the Project or how the insignificant determination was calculated and derived. The MND does not disclose a valid average daily emission calculation. For this reason, there is a fair argument that the Project may have significant air quality impacts.

B. The MND Used Improper Modeling Inputs, Including for Water Use for Parking and Solid Waste Generation.

Review of the Project's CalEEMod output files also demonstrates that the Project Applicant fails to adequately support substantial reductions in several air quality modelling inputs. In particular, the input for water use rate is decreased by almost 100 percent from the default value of 50,248,312.50 gallons per year ("gpy") to a mere 768 gpy. (SWAPE Comments, p. 8.) However, the Project is estimated to require an average of 142 gallons per day ("gpd") of potable water and 541 gpd of recycled water, resulting in a total daily water demand of 683 gpd or 249,295 gpy. Thus, the model underestimates the Project's total yearly water demand by approximately 239,186 gpy.

SWAPE also points out the lack of justification for the reduction in modeling inputs for solid waste generation by the Project. It is not explained how the Project would have dramatically lower solid waste rates than other typical projects. (SWAPE Comments, pp. 7-8.) Likewise, further corroboration that there would not be any weekend trips occurring at the facility or the lack of any potential for natural gas use by the Project should be further corroborated and explained in the MND. (*Id*., pp. 5-7.) Lastly, the modelling relies on surface watering and limited vehicle speeds among other BMPs identified by BAAQMD. However, nothing in the MND sets forth these measures as mandatory BMPs or conditions of the Project. (*Id*., pp. 9-11; MND, p. 23.) Because of the uncertainty resulting from inadequate justifications or miscalculation of annual water use, the MND's reliance on the CalEEMod analysis is not supported by substantial evidence that eliminates a fair argument that the Project may have significant air quality impacts.

IV. SWAPE's CalEEMod Modeling Run Indicates a Fair Argument That the Project May Have a Significant Air Quality Impact.

SWAPE reran the CalEEMod run for the Project adjusting for the deficiencies in the inputs that it identified. (SWAPE Comments, p. 11.) The resulting model result indicates that the Project may exceed the BAAQGM daily emission threshold of 54 lbs/day. This is substantial evidence of a fair argument that the Project may have a significant air quality impact.

V. The IS Inadequately Evaluates Emissions of Diesel Particulate Matter.

Diesel particulate matter ("DPM") is a known human carcinogen. The MND attempts to piggy-back on a health risk assessment performed for the nearby SDG Commerce 330 warehouse. (MND, p. 26.) This effort to borrow the HRA performed for that other project is problematic for a number of reasons.

A. The HRA Fails to Account for the Fact That the Nearest Sensitive Receptor to the Project's Emissions is Located Only 500 Feet From the Soil Borrow Site.

Although the MND notes that there is "one residence about 1,000 feet east of the site (on the Couch property)," this is referring to the site of the proposed warehouse building. (MND, p. 74.) In fact, the closest receptor is only 500-feet from the borrow pit portion of the Project. (*Id*., p. 77 (Table Noise-4).) For the SDG Commerce 330 project, the sensitive receptor distance was about 900 feet. Because the closest receptor to the Project's affected area is only 500 feet, a new health risk assessment specific to the Project must be prepared. (SWAPE Comments, pp. 12-14.) Based on the current MND, there remains a fair argument that the Project may have a significant health risk impact on the nearest sensitive receptor.

B. SWAPE's Analysis Provides Substantial Evidence of a Fair Argument that the Project may have Significant Health Risk Impacts from its Emissions of Toxic Air Contaminants.

Based on the limited information provided by the MND, a fair argument exists that the Project may have a significant health risk impact to nearby sensitive receptors. SWAPE has prepared a Level 2 health risk screening assessment ("HRSA") for the project. BAAQMD recommends a significance threshold of an increased cancer risk of 10 in one million and an increased cumulative cancer risk of 100 in a million from all local sources. Applying the U.S. Environmental Protection Agency's AERSCREEN model, as recommended by OEHHA and the California Air Pollution Control Officers Association, SWAPE calculates that construction and operation of the Project will result in cancer risks to adults, infants, children and nearby residents over the course of a 30-year residential lifetime of, respectively, 11 in one million, 86 in one million, 73 in one million, and 180 in one million, all in excess of BAAQMD's threshold. (SWAPE Comment, pp. 14-18.) Based on this substantial screening evidence, a fair argument is present that the Project may have significant health risk impacts on nearby residents.

VI. There is a Fair Argument That the Project May Have Significant GHG Impacts.

SWAPE also reviewed the MND's discussion of the Project's potential GHG impacts. In addition to the deficiencies in the air modelling discussed above, a number of glaring problems with the analysis demonstrates that a fair argument remains that the Project may have significant GHG impacts.

A. The MND's Reliance on the 1,100 MT CO2e Per Year Threshold is Only Designed to Achieve the GHG Reductions Required by 2020 and is Insufficient to Align the Project With the State's 2030 GHG Reduction Targets.

As the BAAQMD states in its 2017 CEQA guidelines, BAAQMD based its GHG "bright line" significance threshold on the amount of GHG reductions that were necessary in the Bay area to achieve the AB 32 reduction goals by 2020. (BAAQMD CEQA Guidelines, p. D-16 (available at https://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa_guidelines_may2017-pdf.pdf?la=en.) The threshold referenced in the MND is a bright-line threshold of 1,100 MT CO2e. (*Id.*, p. D-21. *See* SWAPE Comments, pp. 19-20.) That threshold was only intended to ensure compliance with AB 32's reduction goals required by 2020. (*Id.*) The 2020 GHG reduction goals sought to reduce business as usual GHG emissions to 1990 levels. In 2018, the Air Resources Board established the subsequent GHG reduction goal to reduce 1990 levels by another 40 percent by 2030. (California's 2017 Climate Change Scoping Plan, Executive Summary (Nov. 2017) (available at https://ww2.arb.ca.gov/sites/default/files/classic//cc/scopingplan/scoping_plan_2017_es.pdf).) That is the current goal with which the Project must ensure consistency order to claim no fair argument of a potential GHG impact.

As SWAPE points out, the Association of Environmental Professionals ("AEP") has derived a threshold of significance that is consistent with achieving the 2030 GHG reduction goals for projects coming online after 2020. AEP and SWAPE identify a "2030 Land Use Efficiency Threshold" of 2.6 metric tons of CO2 equivalents per service population per year ("MT CO2e/SP/year") as a threshold of significance necessary for any specific project to be consistent with the 2030 reduction goals. As AEP states:

> Once the state has a full plan for 2030 (which is expected in 2017), and then a project with a horizon between 2021 and 2030 should be evaluated based on a threshold using the 2030 target. A more conservative approach would be to apply a 2030 threshold based on SB 32 for any project with a horizon between 2021 and 2030 regardless of the status of the Scoping Plan Update.

(*Final White Paper Beyond 2020 and Newhall: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California*, October 18, 2016, p. 40 (available at: https://califaep.org/docs/AEP-2016_Final_White_Paper.pdf).)

Applying the Project's estimate that it will create 50 new jobs, SWAPE calculates the

2030 Land Use Efficiency Threshold for the project to be 11.80 MT CO2e/SP/year - well in excess of the calculated significance threshold of 2.6 MT CO2e/SP/year. (SWAPE Comments, pp. 20-21.) Based on this substantial evidence, there is a fair argument that the Project may have significant GHG impacts.

B. The Project's Failure to Reduce its Expected VMT and Its Levels of VMT Per Capita are Evidence of a Fair Argument That the Project May Have Significant GHG Emission Impacts.

In addition to failing to reduce its VMT by fifteen percent of the Project area average, as discussed above, the MND also is inconsistent with CARB's 2017 Scoping Plan's guidance on evaluating GHG impacts using a Project's VMT per capita calculations. CARB has provided County- and State-based VMT per capita baseline calculations and the necessary per capita reductions necessary to be consistent with the Scoping Plan's GHG reduction targets. (SWAPE Comments, p. 22, n. 44.) SWAPE has applied that guideline to calculate the Project's VMT per capita. (*Id.,* p. 22 & Attachment C.) Using the tables provided by CARB, SWAPE calculates that VMT per capita within Napa County must be reduced to 19.37 in order to be consistent with the 2030 GHG reduction target. (*Id*., p. 22.) SWAPE calculates the Project's daily VMT per capita to be 33.21, well in excess of the VMT per capita levels necessary to meet the State reduction goals for 2030. (*id*., p. 22.) As a result, the MND is incorrect in asserting that the Project is consistent with the 2017 Scoping Plan and AB 32. SWAPE's analysis is substantial evidence of a fair argument that the Project may have significant GHG emission impacts.

CONCLUSION

For the foregoing reasons, the MND is inadequate and an EIR is required to analyze and mitigate the Project's potentially significant environmental impacts. LIUNA reserves the right to supplement these comments in advance of and during public hearings concerning the Project. *Galante Vineyards v. Monterey Peninsula Water Management Dist*., 60 Cal. App. 4th 1109, 1121 (1997). Thank you for your attention to these comments.

Sincerely,

Michael R Lozeau

RE: SDG Commerce 217 Warehouse

Dear Mr. Cooper,

I write to comment on the biological resources study (Monk & Associates 2020) and Initial Study ("IS") (City of American Canyon 2020) prepared for the proposed SDG Commerce 217 Warehouse project at 1075 Commerce Court, which I understand would be 217,294 square feet of new distribution warehousing on 10.39 acres (11.23 acres according to 'For Sale' sign on property).

My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I subsequently worked for four years as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, interactions between wildlife and human infrastructure and activities, and conservation of rare and endangered species. I performed research on wildlife mortality caused by wind turbines, electric distribution lines, agricultural practices, and road traffic. I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and the Raptor Research Foundation, and I've been a part-time lecturer at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-five years, including at many proposed project sites. My CV is attached.

SITE VISIT

I visited the proposed project site on 5 January 2021 for 62 minutes starting at 08:23 hours. Prior to the construction of SDG Commerce 330, I had also visited the site on 23 January 2019 from 06:15 hours to 10:50 hours. Both times I walked along Commerce Way, the first time in cool, sunny weather and the second time in fog. During my first visit I detected 41 species of vertebrate wildlife within 155 minutes, and during my second visit I detected 9 species within 65 minutes (Table 1). I also walked a portion of the Napa River and Bay Trails south and west of the site for 125 minutes in 2021 and for an unrecorded time in 2019. At and near the site I detected 61 species of vertebrate wildlife between my two visits. Add my observations to those of Monk & Associates (2020), and the list grows to 86 vertebrate species of wildlife seen at or near the site

over only a few surveys in the last two years. The project area is rich in wildlife. Had I stayed longer, or had I visited during additional times of year and times of day, I would have seen many more species of wildlife. Given the abundance of roost sites amongst the surrounding eucalyptus groves, I expect multiple species of bats are present. An EIR needs to be prepared to address potential project impacts on wildlife.

In 2019, I saw a juvenile bald eagle fly over the project site (Photos 1 and 2). Bald eagles are protected by the Bald and Golden Eagle Protection Act and the California Endangered Species Act. In 2021, I saw a peregrine falcon just west of the project site, but it was too fast for me to photograph it. I saw a northern harrier (Photo 3) and Cooper's hawk (Photo 4) on the project site, both species of which have been assigned special-status in addition to the 'birds of prey' statute. I saw American kestrels (Photos 5 and 6), Anna's hummingbirds (Photo 7 and 8), pied-billed grebes (Photo 9), mourning doves (Photo 10), a house wren (Photo 11), golden-crowned sparrows (Photo 12), white-crowned sparrows (Photos 13 and 14), Say's phoebe (Photo 15), red-winged blackbirds (Photo 16), fox sparrows (Photo 17), and song sparrows (Photo 18).

Some animals flew over, including Canada geese, mallards, Herring gulls, ring-billed gulls, and swallows. Most, however, spent considerable time on and around the site. Some species displayed courtship or territorial behaviors indicative of breeding, including red-winged blackbirds, Say's phoebe, red-tailed hawks, and American kestrels. In 2019, a juvenile bald eagle hunted the site by carefully using the Eucalyptus trees for cover, but numerous small birds raised a ruckus, alerting of the eagle's approach. Also foraging on site were the northern harrier and Cooper's hawk in 2019. In 2019, two American kestrels harassed a perched great-horned owl, who hooted for about 10 minutes after the kestrels relented.

PROJECT DESCRIPTION

The Napa River and Bay Trails wrap around the project from the south to the west. The site is next to an Audubon Society-designated Important Bird Area.

BASELINE ASSESSMENT

Project Description: The IS (page 6) did not reveal the nearness of Clark Ranch and Napa River and Bay Trails as surrounding land uses, instead attempting to cast the 300-foot distance as a mitigating buffer (*See, e.g.* IS, p. 34). Clark Ranch has been dedicated as open space. The Napa River and Bay Trails not only provide public access to wildlife viewing, but is also designated by Audubon Society as one of its Important Bird Areas ("IBA"). An EIR is needed to address project impacts on the IBA, Napa River and Bay Trails, and Clark Ranch.

Table 1. Species of wildlife I observed during visits on 23 January 2019 and 5 January 2021 at the site of the proposed SDG Commerce 217 Warehouse. The offsite visit was made during my 2021 survey, and includes a walk along Napa River and Bay Trails just south and west of the project site.

Species	*Scientific name*	Status[1]	Visit Onsite		Offsite
Canada goose	*Branta canadensis*		2019		
Mallard	*Anas platyrhynchos*		2019		
Northern shoveler	*Anas clypeata*				Yes

Reconnaissance surveys: Monk & Associates (2020) performed surveys on the site on 19 and 27 December 2019. However, Monk & Associates reported no details of their surveys, such as who exactly did the surveys, when they arrived, how long they stayed, and what methods they used. The reporting did not include the most basic information that a wildlife ecologist would need for assessing whether the survey truly met due diligence standards.

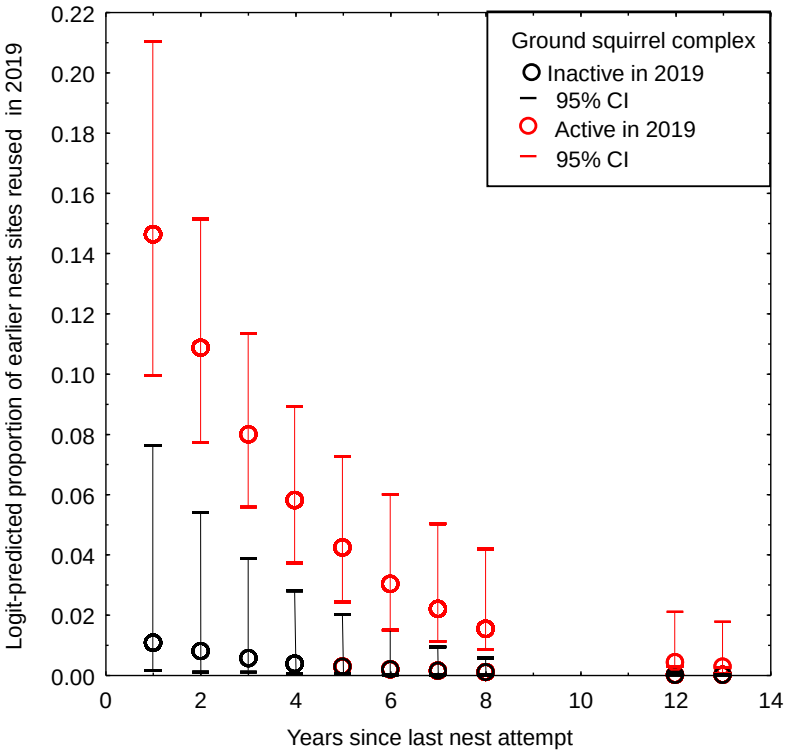
Peer review: The IS (page 29) assures that Monk & Associates (2020) was peer reviewed. However, the date of the site visit in support of the peer review was 10 August 2018, which was prior to the Monk & Associates surveys of 2019. and prior to their 2020 report. If the date was correct for the peer-review site visit, then it is unclear what was peer-reviewed.

In claiming Monk & Associates (2020) was peer reviewed, the IS misapplies a process routinely used by scientists to improve their work. The purpose of peer review is to (1) improve the reporting of scientific research results, and (2) contribute to an editor's decision over whether to accept or reject a manuscript, or to require minor or major revisions before making the decision to accept or reject. The conclusions of peer reviewers are not necessarily right while the authors' conclusions are wrong. Peer review comments contribute to the scientific process by adding additional perspectives that the authors can use to improve their product, despite whether the product was rejected by the institution administering the peer review. Peer reviews also assess manuscripts according to scientific standards and to written guidelines maintained by the organization to which the manuscript was submitted. Peer review comments are supposed to be constructive. The important point here is that a "peer review" provided by Vollmar Natural Lands Consulting would have contributed nothing to Monk & Associates (2020) unless it resulted in constructive revisions to the report. Perhaps improvements were made to the report, but the reader cannot tell because the IS provides no report of the peer-review nor any responses to review comments.

To qualify as independent peer review, the administrator of the peer review as well as the reviewers themselves must not benefit financially or professionally from the outcome of the review. There must not be any hint of bias for a review to be considered independent. Another qualification is that the reviewers must be the authors' peers, meaning that reviewers possess sufficient experience performing research on the same or similar topic area as the authors, and that the reviewers understand the theoretical foundation of the topic at hand and the research challenges faced by the authors. In my experience, targeted reviews are prone to bias because the paid reviewer understands the desired outcome; it is in the reviewer's financial interest to review the client's work product favorably if the reviewer is to acquire repeat business. City of American Canyon needs to explain its relationship with Vollmar Natural Lands Consulting and between Vollmar Natural Lands Consulting and Monk & Associates.

Determinations of occurrence likelihoods: Monk & Associates (2020) mostly relied on California Natural Diversity Data Base (CNDDB) records to assess the likelihood of occurrence of special-status wildlife species whose geographic range maps

overlap the project site. Whereas consulting CNDDB is fine for confirming presence of a species, it is inappropriate for determining absence and hence narrowing a list of potentially occurring species. CNDDB is voluntary and not based on scientific sampling or equal access to properties. The limitations of CNDDB are well-known, and they are summarized in a warning presented by CDFW on the CNDDB web site (https://www.wildlife.ca.gov/Data/CNDDB/About): "*We work very hard to keep the CNDDB and the Spotted Owl Database as current and up-to-date as possible given our capabilities and resources. However, we cannot and do not portray the CNDDB as an exhaustive and comprehensive inventory of all rare species and natural communities statewide. Field verification for the presence or absence of sensitive species will always be an important obligation of our customers*..." Therefore, the foundation of many conclusions in the is consists partly of a misapplication of CNDDB and needs to be replaced by a sound methodology in an EIR.



Consulting eBird reveals many sightings of special-status species near the project site (Table 2), many of which Monk & Associates (2020) conclude are less likely to occur at the site due to distant nearest-CNDDB records. My review of eBird and iNaturalist reveals 66 special-status species of vertebrate wildlife likely to rely on the site at one time or another, 15 of which have been confirmed at or near the site during surveys performed by Monk & Associates (2020) and myself (Table 2). The IS, on the other hand, identifies only 3 such species as unlikely to occur at the site, including northern harrier which I saw on site, and Swainson's hawk and burrowing owl which have both been reported nearby in eBird. The IS falls grossly short of a comprehensive and accurate assessment of occurrence likelihoods of special-status species.

The inadequacy of IS's assessment of species occurrences stems mostly from two fallacious arguments: (1) that the site is unsuitable for nesting, and (2) the site was previously disturbed by the removal of a eucalyptus grove. The first fallacy is that habitat can be divided distinctly by functionality. Specific to this project, the IS distinguishes nesting habitat as the only type of habitat to be concerned about. But no animals can breed without finding sufficient forage, cover and stopover opportunities; no species can breed without surviving both the breeding and nonbreeding seasons. There is no clear distinction between types of habitat, as every portion of an animal's habitat is critical to its survival and its productivity.

The second fallacy is that some previous disturbance – the removal of a eucalyptus grove in this case – diminishes or destroys habitat of a species today. CEQA reviews are supposed to be based on existing conditions, rather than to some past event that a project proponent can claim without evidence to have prevented the site from ever again being used by a species. This CEQA standard noted, I must add that the scientific literature is full of examples of wildlife populating places that have been severely disturbed, such as the slopes of Mount St. Helens following the 1980 eruption, and wildlife reinhabiting the forests surrounding Ukraine's Chernobyl Nuclear Plant since its meltdown and massive radioactive release. Multiple scientific journals focus on habitat restoration, which involves deliberate, major disturbances to generate new complexes of

vegetation intended to benefit wildlife. The IS misleads where it claims that the removal of a eucalyptus grove years ago doomed the occurrence of wildlife species there today. The IS (page 32) further misleads that only ground squirrel burrows of ancient origin are useful to burrowing owls. Specifically, the IS claims burrowing owls are unlikely because "...ground squirrel burrows are few and of recent origin (Monk & Associates 2020)." The IS cites no evidence in support of this notion. It is also inconsistent with my research experience. For example, in a revisit to nearly 800 burrowing owl nest sites I had mapped over 9 years in the Altamont Pass Wind Resource Area, I found reuse of the nest sites in 2019 to have been much greater within actively used ground squirrel burrows previously used more recently (Figure 1). Further misleading is the IS's argument that "Monk & Associates (2020) did not observe western burrowing owls or any indirect evidence that burrowing owls are using or residing on the project site during any of the site surveys." This is misleading because negative findings cannot be supported in the absence of detection surveys such as those recommended by CDFW (2012). It does not matter that Monk & Associates found no evidence of burrowing owls because they did not perform the appropriate detection surveys.

Figure 1. Proportion of revisited burrows that were either actively or inactively used by ground squirrels and where burrowing owls attempted re-nesting in 2019 declined quickly with years since the previous nest attempt.

The IS (page 33) claims that the loss of foraging habitat of northern harrier is "not considered substantial." However, the IS provides no evidence in support this conclusion. By what measure is the loss of foraging habitat judged substantial? Further, this conclusion neglects the possibility that the site is used by northern harrier for nesting as well as foraging. I saw a northern harrier fly over the site – the same site where the IS also says northern harriers would be unlikely to occur. The IS's analysis of potential impacts to northern harrier is flawed.

Table 2. Species reported on eBird (https://eBird.org) or iNaturalist on or near the proposed project site, where those in bold font were also seen on or near the site by myself or Monk & Associates (2020).

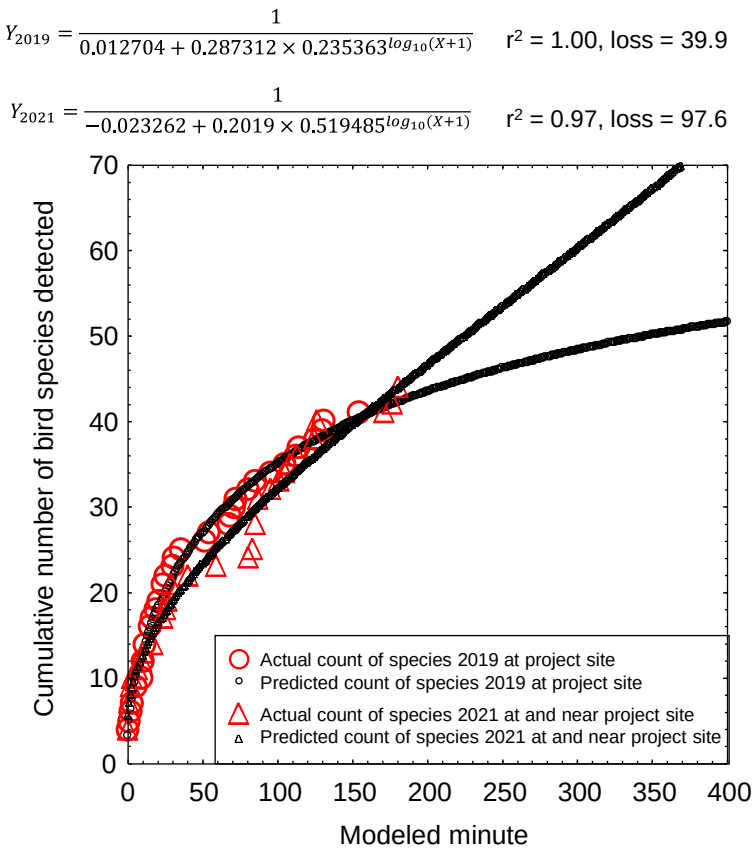
[1] Listed as FT & FE = federal threatened and endangered, BGEPA = Bald and Golden Eagle Protection Act, BCC = U.S. Fish and Wildlife Service Bird species of Conservation Concern, BCC = federal Bird Species of Conservation Concern, CT & CE = California threatened and endangered, CFP = California Fully Protected (FGC Code 3511), FGC 3503.5 = California Fish and Game Code 3503.5 (Birds of prey), and SSC1, SSC2 and SSC3 = California Bird Species of Special Concern priorities 1, 2 and 3, respectively (Shuford and Gardali 2008), and TWL = Taxa to Watch List (Shuford and Gardali 2008), WBWG = Western Bat Working Group with low, medium and high conservation priorities.

The IS (page 34) is also wrong in its conclusion of no impact to bats. The argument is that the site "...contains no roosting or nesting habitat because it has no trees, rock faces, structures, or cliffs." Trees surround the site. Bats undoubtedly roost in those trees. The site supports those roosts by providing forage. Night roosts of pallid bat, in particular, are typically located close to forage on open ground.

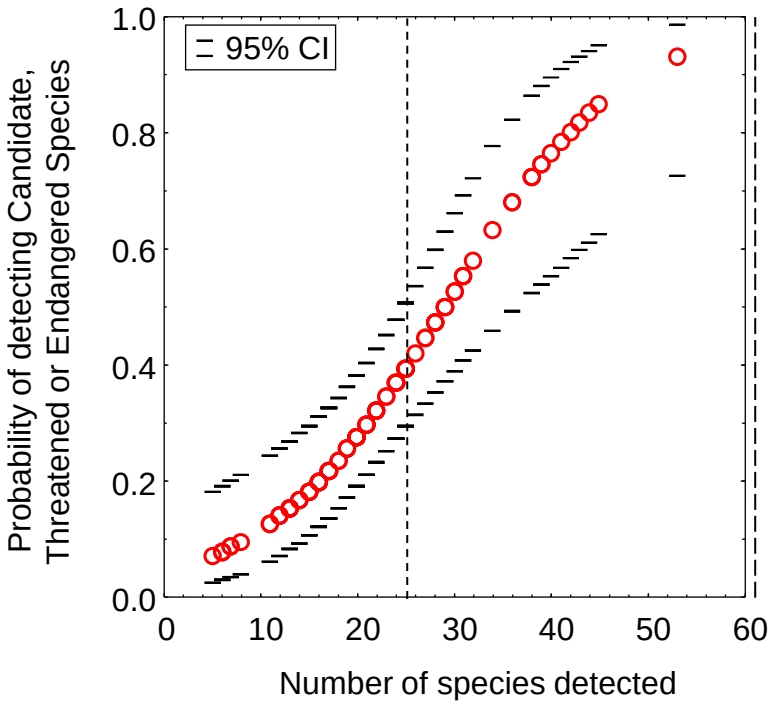
By relying solely on CNDDB for determining occurrence likelihoods, the IS overlooks occurrences reported in other data bases. For example, whereas nearest CNDDB records have Swainson's hawks and burrowing owls 2.5 and 2.6 miles away from the project site, eBird records show these species much closer. According to eBird, a Swainson's hawk was seen only 0.2 miles from the project site. Given the space used by Swainson's hawks, there should be no doubt that a Swainson's hawk 0.2 miles away would have also used the project site. Burrowing owls were seen by multiple observers only 0.2 miles from the project site. One of the observers is a good bird observer with whom I have worked for many years; his observation was as trustworthy.



Relying on CNDDB records, Monk & Associates (2020) claim the nearest northern harrier location was 2.7 miles away. However, not only did I see a northern harrier fly over the project site, but multiple other observers reported northern harrier sightings nearby.

Additional special-status species neglected by Monk & Associates include peregrine falcon and loggerhead shrike, both of which have been reported multiple times on eBird as having been seen near the project site. I saw a peregrine falcon right next to the site. And there are multiple others in addition to these species. I assert that Monk & Associates (2020) inadequately assessed potential project impacts to wildlife. Relying on CNDDB was inappropriate and inadequate. And after making multiple site visits, the number of wildlife species detected by Monk & Associates numbered only 25, whereas mine numbered more than twice as many.

That the environmental setting has yet to be accurately characterized is further supported by known trends in species detections with survey effort. Figure 2 shows my counts of species detected at the site with time into each of my two surveys – it simply shows the cumulative number of species detected with increasing survey time. Just as I have seen for many other survey efforts, nonlinear regression models fit the data very well, explaining 97% of the variation in the data in 2021 and nearly 100% of the variation in the data in 2019, and for both surveys they showed progress towards the inevitable asymptotes of the nonlinear prediction curve where the same survey methods will eventually detect no more species. I note that the 2019 count of species was specific to the project site, whereas my 2021 count of species included areas around the project site. One model shows that had I continued doing what I was doing on 23 January 2019, I would have eventually detected about 55 species of terrestrial vertebrate wildlife on the project site, or more than double the number detected by Monk & Associates (2020). The other model shows that had I continued doing what I was doing on 5 January 2021, I would eventually have detected hundreds of terrestrial vertebrate



wildlife in the project area, confirming the wisdom of Audubon Society's designation of an IBA there.

Figure 2. Actual and predicted relationships between the number of vertebrate wildlife species detected and the elapsed survey time based on visual scan on 23 January 2019 and 5 January 2021. Note that the relationships would differ if the surveys were based on another method, another time of day, or during another season. Also note that the cumulative number of vertebrate species across all methods, times of day, and seasons would increase substantially.

The likelihood of detecting special-status species is typically lower than that of more common species. This difference can be explained by the fact that special-status species tend to be rarer than common species. Special-status species also tend to be more cryptic, fossorial, or active during nocturnal periods when general biological surveys are not performed. Another useful relationship from careful recording of species detections and subsequent comparative analysis is the probability of detection of listed species as a function of increasing number of vertebrate wildlife species detected (Figure 3). (Note that listed species number fewer than special-status species, which are inclusive of listed species.) As demonstrated in Figure 2, the number of species detected is a function of survey effort. Therefore, greater survey effort increases the likelihood that listed species will be detected. The survey effort committed to the project site by City of American Canyon carried a 40% chance of detecting a listed species, whereas the effort committed by myself carried a nearly 100% chance of detecting a listed species. In fact, I detected 2 listed species, one on site and one just offsite, so my model prediction was accurate. Monk & Associates beat the odds by detecting white-tailed kite – a California Fully Protected species. Had we surveyed longer or using different methods, we would have detected more listed species. A fair argument can be made for the need to prepare an EIR to more comprehensive and more carefully analyze baseline conditions and potential project impacts to wildlife.

Figure 3. Probability of detecting ≥1 Candidate, Threatened or Endangered Species of wildlife listed under California or federal Endangered Species Acts, based on survey outcomes that I logit-regressed on the number of wildlife species I detected as an expert witness during 106 site visits throughout California. The vertical short-dashed line represents the number of species detected by Monk & Associates (2020), whereas the vertical short-dashed line depicts the number I detected between two site visits.

Habitat Loss

A recent study documented a 29% decline in overall bird abundance across North America over the last 48 years – a decline driven by multiple factors including habitat loss and habitat fragmentation (Rosenberg et al. 2019). Habitat loss not only results in the immediate numerical decline of wildlife, but also in permanent loss of productive capacity. For example, studies in grassland/wetland/woodland complexes documented total bird nesting densities of 32.8 nests per acre (Young 1948) and 35.8 nests per acre (Yahner 1982), averaged at 34.3 nests per acre. Assuming the project site in the absence of wetlands immediately on site, would support a third of the total nesting density measured by Young (1948) and Yahner (1982), a density of 11.4 nests per acre multiplied against the project's take of 11.23 acres would predict the loss of 128 bird nest sites. After 100 years and further assuming an average bird generation time of 5 years, and assuming an average 2.9 chicks fledged per nest (Young 1948), the lost capacity of both breeders and annual fledgling production would total 42,240 {(nests/year × chicks/nest × number of years) + (2 adults/nest × nests/year) × (number of years ÷ years per generation)}. These predicted losses would be substantial, and would qualify as significant impacts that have yet to be addressed by City of American Canyon. A fair argument can be made for the need to prepare an EIR to analyze the impacts of habitat destruction.

Habitat fragmentation, which is the reduction of connectivity of remaining habitat patches on a landscape, can further diminish the productive capacity of a site

(Smallwood 2015). Habitat fragmentation is one of the cumulative effects of this project that needs to be analyzed in an EIR.

Wildlife Movement

The IS accurately defines the concept of a wildlife corridor as a connector between already-fragmented habitat patches (see Smallwood 2015), but then inaccurately asserts that significant impacts to wildlife movement in a region can only happen with the interference of an existing wildlife corridor. One problem with this assertion is that a finding of significance would first require that habitat in the project area had already been fragmented and then a corridor constructed to reduce the effects of fragmentation. The assertion precludes a finding of significance where habitat has not been fragmented and no corridor constructed. The IS asserts a false CEQA standard for determining whether a project would interfere with wildlife movement in the region.

The primary phrase of the CEQA standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. In fact, wildlife movement in the region is often diffuse rather than channeled (Runge et al. 2014, Taylor et al. 2011), and includes stop-over habitat used by birds and bats (Taylor et al. 2011), staging habitat (Warnock 2010), and crossover habitat used by nonvolant wildlife during dispersal, migration or home range patrol. The existence of a wildlife corridor is unnecessary for a project to interfere with wildlife movement in the region.

The IS (page 35) also speculates that the site's history of disturbance in the form of tree removal somehow precludes any possible project interference with wildlife movement. This speculation, however, is vulnerable to abuse, because it could be extended to any earlier site condition when terrestrial wildlife might not have been able to move across it, such as when it might have been under the sea. The site's use for movement by wildlife needs to be analyzed based on conditions existing at the time of the environmental review, consistent with CEQA's standard.

The IS (page 35) further speculates that wildlife movement in the region is prevented by "...continued disturbance associated with the paint ball facility located immediately to the southeast and construction of the SDG Commerce 330 facility to the south." Paint ball facilities do not prevent wildlife movement. I have recorded many wildlife observations at a paint ball facility near where I live, and have noticed no effect on bird activity. Northern harriers, white-tailed kites, American kestrels, Swanson's hawks, and many other species perch on site, using it for foraging, territory patrol and stopover habitat. The IS cites no evidence that paintball facilities interfere with wildlife movement or would do so on adjacent properties.

The IS (page 35) speculates even further by claiming, "The eucalyptus grove and the marshes associated with the Napa River to the west of the project site provide a more valuable wildlife corridor for terrestrial wildlife..." But without evidence that a eucalyptus grove is more valuable to wildlife movement, this claim is nothing more than

convenient speculation. I can agree that the marsh would be more valuable for wetland-adapted species, but not for all species.

The project would obviously interfere with wildlife movement in the region. Having studied millions of GPS telemetry data from 35 golden eagles tracked since 2013, I noticed a strong avoidance of anthropogenic structures such as warehouses and residential neighborhoods. I assume bald eagles express a similar level of avoidance. If this is assumption is true, then the bald eagle I saw fly over the site in 2019 might not do so again since the SDG Commerce 330 warehouse was built. Many other species would continue to fly over the project site despite the neighboring warehouse. I have recorded many observations of animals moving across fields next to warehouses, including red-tailed hawks, peregrine falcons, and many others. A fair argument can be made for the need to prepare an EIR to analyze the project's impacts on wildlife movement in the region.

Traffic Impacts on Wildlife

According to City of American Canyon (2020:88), the project would generate 367 daily vehicle trips. No analysis is provided in the IS of this traffic's impacts to wildlife in the area. The traffic would effectively extend the project's footprint well beyond the floor space, as trucks and cars traveling to and from the warehouse will drive over roads and highways that are also crossed by wildlife. On 23 January 2019 I saw two road-killed striped skunks on American Canyon Drive, and on 5 January 2021 I saw a road-killed striped skunk and an opossum killed on the same road – a road likely to be used by trucks and cars servicing the project. California red-legged frogs (*Rana draytonii*), which Monk & Associates (2020) concluded will suffer no impacts because CNDDB records are lacking west of Highway 29, will cross roads used by vehicles servicing the project. A shortfall of the IS is its failure to analyze the impacts of the project's added road traffic on special-status species of wildlife, including California red-legged frog, California tiger salamander (*Ambystoma californiense*), and American badgers (*Taxidea taxus*) that, regardless of whether they live on the site, must cross roadways that will experience increased traffic volume caused by this project.

Increased use of existing roads will increase wildlife fatalities (see Figure 7 in Kobylarz 2001). Across North America traffic impacts have taken devastating tolls on wildlife (Forman et al. 2003). In Canada, 3,562 birds were estimated killed per 100 km of road per year (Bishop and Brogan 2013), and the US estimate of avian mortality on roads is 2,200 to 8,405 deaths per 100 km per year, or 89 million to 340 million total per year (Loss et al. 2014). Local impacts can be more intense than nationally.

In a recent study of traffic-caused wildlife mortality, investigators found 1,275 carcasses of 49 species of mammals, birds, amphibians and reptiles over 15 months of searches along a 2.5 mile stretch of Vasco Road in Contra Costa County, California (Mendelsohn et al. 2009). Using carcass detection trials performed on land immediately adjacent to the traffic mortality study (Brown et al. 2016) to adjust the found fatalities for the proportion of fatalities not found due to scavenger removal and searcher error, the

estimated traffic-caused fatalities was 12,187. This fatality estimate translates to a rate of 3,900 wild animals per mile per year killed along 2.5 miles of road in 1.25 years. In terms comparable to the national estimates, the estimates from the Mendelsohn et al. (2009) study would translate to 243,740 animals killed per 100 km of road per year, or 29 times that of Loss et al.'s (2014) upper bound estimate and 68 times the Canadian estimate. An analysis is needed of whether increased traffic on roads to and from the project site would similarly result in intense local impacts on wildlife.

Wildlife roadkill is not randomly distributed, so can be predicted. Causal factors include types of roadway, human population density, and temperature (Chen and Wu 2014), as well as time of day and adjacency and extent of vegetation cover (Chen and Wu 2014, Bartonička et al. 2018), and intersections with streams and riparian vegetation (Bartonička et al. 2018). For example, species of mammalian Carnivora are killed by vehicle traffic within 0.1 miles of stream crossings >40 times other than expected (K. S. Smallwood, 1989-2018 unpublished data). These factors also point the way toward mitigation measures, which should be formulated in an EIR.

Pest Control and Target and Non-target Mortality

As I understand it, the proposed project would store and distribute wine. The Initial Study did not mention the likelihood that pest control would be needed to protect stored products. Because multiple businesses advertise their services on the internet for controlling stored products pests, perching birds, and rodent and other mammal pests within and around warehousing and food processing buildings (e.g., https://www.catseyepest.com/pest-control/ commercial-pest-control/warehouse-and-distribution-facilities, http://advancedipm .com /commercial/ commercial-pest-management-for-warehouses-and-distribution-centers/, https://www.terminix.com/blog/commercial/how-pests-impact-warehouses/, I assume pest control would be necessary. These types of businesses advertise exclusion strategies, as well as fumigation for stored products pests, glue boards for rodents, and 'other measures.' Having a background in animal damage control, I am familiar with 'other methods,' including the use of anticoagulant poisons and acute toxicants such as strychnine. In my experience, the use of toxicants can harm non-target wildlife through direct exposure and indirect exposure via predation and scavenging (also see Gabriel et al. 2012). In other words, pest control involving toxicants can result in the spread of toxicants beyond the project site.

I reviewed the scientific literature on animal damage control associated with distribution warehousing. Little to no serious scientific attention has been directed toward animal damage control in these settings. That businesses are advertising their animal damage control services in these settings indicates either an awareness or an assumption that damage from wildlife is an issue. It is important, therefore, that an EIR be prepared to address the potential impacts of animal damage control associated with this proposed project. Industry practices related to animal damage control should be detailed, as well as anticipated practices at this project. Potential impacts caused by these practices need to be assessed, and suitable mitigation measures formulated along with assurances that they will be implemented.

Cumulative Impacts

City of American Canyon (2019:97) concludes the project will result in no cumulative impacts because only one other new project is planned. The cumulative impacts analysis is flawed by considering only the single new project, and none of those under construction or already built. Had City of American Canyon listed all projects -- past, present and reasonably foreseeable projects -- then the need for a serious cumulative effects analysis would emerge as obvious. City of American Canyon has sprawled across nearly all of the available spaces between neighbor cities, hills to the east and San Pablo Bay to the west, leaving a fragmented mosaic of fields and woodlots as stop-over habitat for use by birds and bats. The project would also obviously be seen as adding more traffic extending the project's and the region's impacts far beyond their respective footprints.

When it comes to wildlife, cumulative effects can often be interpreted as effects on the numerical capacity (Smallwood 2015), breeding success, genetic diversity, or other population performance metrics expressed at the regional scale. In the case of migrating birds, the project's cumulative effects could be measured as numerical reductions of breeding birds at far-off breeding sites, as migrating adults and next-year's recruits lose access to stop-over habitat. These effects could be predicted and measured. If birds were to lose all stop-over habitat across City of American Canyon, then the numerical capacity of migration might decline for multiple species. Unfortunately, little is known about stop-over habitat requirements, such as how often migrants lose their lives for lack of stop-over habitat. Nevertheless, crude assessments are possible and imperative.

An EIR needs to be prepared to appropriately analyze the project's contribution to cumulative impacts. It also needs to present mitigation measures to minimize impacts, or to compensate for cumulative impacts. An EIR should assess the combined impacts of all projects, including this one. An EIR is needed to formulate appropriate mitigation for cumulative traffic-caused wildlife mortality.

MITIGATION MEASURES

MM BIO-1 I concur that preconstruction surveys are needed for burrowing owls. However, a preconstruction survey cannot serve as a surrogate for detection surveys. Preconstruction surveys have a specific purpose, which is take-avoidance salvage of readily detectable individuals in immediate jeopardy of harm just prior to construction. The purposes of detection surveys are to detect the species if it is present, to support determinations of absence, and to inform the CEQA review, preconstruction surveys about where the species is likely to be found on the project site, and the formulation of mitigation. To be consistent with the CDFW (2012) guidelines on burrowing owl mitigation, detection surveys are needed for burrowing owls and they need to be performed according to the guidelines. After the detection surveys are completed, then an impacts analysis is needed, and so is the formulation of mitigation measures, which might include compensatory mitigation. Based on the outcome of

detection surveys, an EIR should be prepared to adequately address impacts and mitigation related to burrowing owls.

MM BIO-2 I concur that preconstruction surveys are needed for Swainson's hawks. However, detection surveys are also needed. It is already established on eBird that Swainson's hawks are in the area and that at minimum the project would remove foraging habitat. This impact needs to be analyzed in an EIR and mitigated.

MM BIO-3 I concur that preconstruction surveys are needed for nesting raptors. However, detection surveys are needed first. Preconstruction surveys are intended to buffer or salvage nests immediately threatened by the tractor blade, but they do not inform of how many nests will be taken. The magnitude of the impact must be known or estimated in order to formulate appropriate minimization and compensatory mitigation. Detection surveys are needed to inform an EIR, which is needed to analyze potential impacts to nesting raptors.

MM BIO-4 I concur that preconstruction surveys are needed for nesting passerine birds. However, detection surveys are needed first. The same issues apply here as those I raised in MM BIO-1 through MM BIO-3. I will add that additional bird species might nest on the project site other than raptors and passerines. Killdeer might nest there, in addition to others. Detection surveys are needed for nests of all species protected by both the California and federal Migratory Bird Treaty Acts.

Additional Comments on Mitigation

The IS provides no mitigation for adverse impacts on regional movement of wildlife, nor for cumulative impacts on wildlife or even for direct impacts. At a minimum, an EIR needs to include substantial compensatory mitigation in response to the project's impacts on habitat loss and wildlife movement, including impacts to birds using the site as stop-over or staging during migration.

Compensatory mitigation is needed for the increased wildlife mortality that will be caused by the project's contribution to increased road traffic in the region. I suggest that this mitigation can be directed toward funding of research to identify fatality patterns and effective impact reduction measures.

Compensatory mitigation ought also to include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Most of the injuries will likely be caused by the increased trip generation of cars and trucks. Many animals need treatment caused by collision injuries and an increasing number appear to be injured by the turbulence of passing trucks.

Mitigation measures are also needed for management of vertebrate pests on the project site. The project site is adjacent to Clark Ranch and to Napa River and Bay Trails, so any pest control on site needs to be prevented from spilling over into designated open spaces.

The IS (page 11) says, "The Building's roof structure is designed to accommodate solar panels and the building electrical infrastructure is designed to accept solar generation…" I suggest the building, if constructed, should include PV solar panels to the extent the roof can sustain. The project would use electrical energy, which if not generated on site will likely come from renewable energy sources. Utility-scale renewable energy is known to kill many members of many species of birds and bats. Onsite generation would kill many fewer birds and bats, if any (no fatalities have been documented to date as a result of collisions with rooftop solar).

Thank you for your attention,

_____

Born May 3, 1963 in
Sacramento, California.
Married, father of two.

Ecologist

Expertise

- Finding solutions to controversial problems related to wildlife interactions with human industry, infrastructure, and activities;
- Wildlife monitoring and field study using GPS, thermal imaging, behavior surveys;
- Using systems analysis and experimental design principles to identify meaningful ecological patterns that inform management decisions.

Education

Ph.D. Ecology, University of California, Davis. September 1990.
M.S. Ecology, University of California, Davis. June 1987.
B.S. Anthropology, University of California, Davis. June 1985.
Corcoran High School, Corcoran, California. June 1981.

Experience

- 665 professional publications, including:
- 88 peer reviewed publications
- 24 in non-reviewed proceedings
- 551 reports, declarations, posters and book reviews
- 8 in mass media outlets
- 87 public presentations of research results

Editing for scientific journals: Guest Editor, *Wildlife Society Bulletin*, 2012-2013, of invited papers representing international views on the impacts of wind energy on wildlife and how to mitigate the impacts. Associate Editor, *Journal of Wildlife Management*, March 2004 to 30 June 2007. Editorial Board Member, *Environmental Management*, 10/1999 to 8/2004. Associate Editor, *Biological Conservation*, 9/1994 to 9/1995.

Member, Alameda County Scientific Review Committee (SRC), August 2006 to April 2011. The five-member committee investigated causes of bird and bat collisions in the Altamont Pass Wind Resource Area, and recommended mitigation and monitoring measures. The SRC reviewed the science underlying the Alameda County Avian Protection Program, and advised

the County on how to reduce wildlife fatalities.

Consulting Ecologist, 2004-2007, California Energy Commission (CEC). Provided consulting services as needed to the CEC on renewable energy impacts, monitoring and research, and produced several reports. Also collaborated with Lawrence-Livermore National Lab on research to understand and reduce wind turbine impacts on wildlife.

Consulting Ecologist, 1999-2013, U.S. Navy. Performed endangered species surveys, hazardous waste site monitoring, and habitat restoration for the endangered San Joaquin kangaroo rat, California tiger salamander, California red-legged frog, California clapper rail, western burrowing owl, salt marsh harvest mouse, and other species at Naval Air Station Lemoore; Naval Weapons Station, Seal Beach, Detachment Concord; Naval Security Group Activity, Skaggs Island; National Radio Transmitter Facility, Dixon; and, Naval Outlying Landing Field Imperial Beach.

Part-time Lecturer, 1998-2005, California State University, Sacramento. Instructed Mammalogy, Behavioral Ecology, and Ornithology Lab, Contemporary Environmental Issues, Natural Resources Conservation.

Senior Ecologist, 1999-2005, BioResource Consultants. Designed and implemented research and monitoring studies related to avian fatalities at wind turbines, avian electrocutions on electric distribution poles across California, and avian fatalities at transmission lines.

Chairman, Conservation Affairs Committee, The Wildlife Society--Western Section, 1999-2001. Prepared position statements and led efforts directed toward conservation issues, including travel to Washington, D.C. to lobby Congress for more wildlife conservation funding.

Systems Ecologist, 1995-2000, Institute for Sustainable Development. Headed ISD's program on integrated resources management. Developed indicators of ecological integrity for large areas, using remotely sensed data, local community involvement and GIS.

Associate, 1997-1998, Department of Agronomy and Range Science, University of California, Davis. Worked with Shu Geng and Mingua Zhang on several studies related to wildlife interactions with agriculture and patterns of fertilizer and pesticide residues in groundwater across a large landscape.

Lead Scientist, 1996-1999, National Endangered Species Network. Informed academic scientists and environmental activists about emerging issues regarding the Endangered Species Act and other environmental laws. Testified at public hearings on endangered species issues.

Ecologist, 1997-1998, Western Foundation of Vertebrate Zoology. Conducted field research to determine the impact of past mercury mining on the status of California red-legged frogs in Santa Clara County, California.

Senior Systems Ecologist, 1994-1995, EIP Associates, Sacramento, California. Provided consulting services in environmental planning, and quantitative assessment of land units for their conservation and restoration opportunities basedon ecological resource requirements of 29 special-status species. Developed ecological indicators for prioritizing areas within Yolo County

to receive mitigation funds for habitat easements and restoration.

Post-Graduate Researcher, 1990-1994, Department of Agronomy and Range Science*, U.C. Davis*. Under Dr. Shu Geng's mentorship, studied landscape and management effects on temporal and spatial patterns of abundance among pocket gophers and species of Falconiformes and Carnivora in the Sacramento Valley. Managed and analyzed a data base of energy use in California agriculture. Assisted with landscape (GIS) study of groundwater contamination across Tulare County, California.

Work experience in graduate school: Co-taught Conservation Biology with Dr. Christine Schonewald, 1991 & 1993, UC Davis Graduate Group in Ecology; Reader for Dr. Richard Coss's course on Psychobiology in 1990, UC Davis Department of Psychology; Research Assistant to Dr. Walter E. Howard, 1988-1990, UC Davis Department of Wildlife and Fisheries Biology, testing durable baits for pocket gopher management in forest clearcuts; Research Assistant to Dr. Terrell P. Salmon, 1987-1988, UC Wildlife Extension, Department of Wildlife and Fisheries Biology, developing empirical models of mammal and bird invasions in North America, and a rating system for priority research and control of exotic species based on economic, environmental and human health hazards in California. Student Assistant to Dr. E. Lee Fitzhugh, 1985-1987, UC Cooperative Extension, Department of Wildlife and Fisheries Biology, developing and implementing statewide mountain lion track count for long-term monitoring.

Fulbright Research Fellow, Indonesia, 1988. Tested use of new sampling methods for numerical monitoring of Sumatran tiger and six other species of endemic felids, and evaluated methods used by other researchers.

Projects

Repowering wind energy projects through careful siting of new wind turbines using map-based collision hazard models to minimize impacts to volant wildlife. Funded by wind companies (principally NextEra Renewable Energy, Inc.), California Energy Commission and East Bay Regional Park District, I have collaborated with a GIS analyst and managed a crew of five field biologists performing golden eagle behavior surveys and nocturnal surveys on bats and owls. The goal is to quantify flight patterns for development of predictive models to more carefully site new wind turbines in repowering projects. Focused behavior surveys began May 2012 and continue. Collision hazard models have been prepared for seven wind projects, three of which were built. Planning for additional repowering projects is underway.

Test avian safety of new mixer-ejector wind turbine (MEWT). Designed and implemented a before-after, control-impact experimental design to test the avian safety of a new, shrouded wind turbine developed by Ogin Inc. (formerly known as FloDesign Wind Turbine Corporation). Supported by a $718,000 grant from the California Energy Commission's Public Interest Energy Research program and a 20% match share contribution from Ogin, I managed a crew of seven field biologists who performed periodic fatality searches and behavior surveys, carcass detection trials, nocturnal behavior surveys using a thermal camera, and spatial analyses with the collaboration of a GIS analyst. Field work began 1 April 2012 and ended 30 March 2015 without Ogin installing its MEWTs, but we still achieved multiple important scientific advances.

Reduce avian mortality due to wind turbines at Altamont Pass. Studied wildlife impacts caused by 5,400 wind turbines at the world's most notorious wind resource area. Studied how impacts are perceived by monitoring and how they are affected by terrain, wind patterns, food resources, range management practices, wind turbine operations, seasonal patterns, population cycles, infrastructure management such as electric distribution, animal behavior and social interactions.

Reduce avian mortality on electric distribution poles. Directed research toward reducing bird electrocutions on electric distribution poles, 2000-2007. Oversaw 5 founds of fatality searches at 10,000 poles from Orange County to Glenn County, California, and produced two large reports.

Cook *et al*. v. Rockwell International *et al*., No. 90-K-181 (D. Colorado). Provided expert testimony on the role of burrowing animals in affecting the fate of buried and surface-deposited radioactive and hazardous chemical wastes at the Rocky Flats Plant, Colorado. Provided expert reports based on four site visits and an extensive document review of burrowing animals. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals. I testified in federal court in November 2005, and my clients were subsequently awarded a $553,000,000 judgment by a jury. After appeals the award was increased to two billion dollars.

Hanford Nuclear Reservation Litigation. Provided expert testimony on the role of burrowing animals in affecting the fate of buried radioactive wastes at the Hanford Nuclear Reservation, Washington. Provided three expert reports based on three site visits and extensive document review. Predicted and verified a certain population density of pocket gophers on buried waste structures, as well as incidence of radionuclide contamination in body tissue. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals.

Expert testimony and declarations on proposed residential and commercial developments, gas-fired power plants, wind, solar and geothermal projects, water transfers and water transfer delivery systems, endangered species recovery plans, Habitat Conservation Plans and Natural Communities Conservation Programs. Testified before multiple government agencies, Tribunals, Boards of Supervisors and City Councils, and participated with press conferences and depositions. Prepared expert witness reports and court declarations, which are summarized under Reports (below).

Protocol-level surveys for special-status species. Used California Department of Fish and Wildlife and US Fish and Wildlife Service protocols to search for California red-legged frog, California tiger salamander, arroyo southwestern toad, blunt-nosed leopard lizard, western pond turtle, giant kangaroo rat, San Joaquin kangaroo rat, San Joaquin kit fox, western burrowing owl, Swainson's hawk, Valley elderberry longhorn beetle and other special-status species.

Conservation of San Joaquin kangaroo rat. Performed research to identify factors responsible for the decline of this endangered species at Lemoore Naval Air Station, 2000-2013, and implemented habitat enhancements designed to reverse the trend and expand the population.

Impact of West Nile Virus on yellow-billed magpies. Funded by Sacramento-Yolo Mosquito and Vector Control District, 2005-2008, compared survey results pre- and post-West Nile Virus epidemic for multiple bird species in the Sacramento Valley, particularly on yellow-billed magpie and American crow due to susceptibility to WNV.

Workshops on HCPs. Assisted Dr. Michael Morrison with organizing and conducting a 2-day workshop on Habitat Conservation Plans, sponsored by Southern California Edison, and another 1-day workshop sponsored by PG&E. These Workshops were attended by academics, attorneys, and consultants with HCP experience. We guest-edited a Proceedings published in Environmental Management.

Mapping of biological resources along Highways 101, 46 and 41. Used GPS and GIS to delineate vegetation complexes and locations of special-status species along 26 miles of highway in San Luis Obispo County, 14 miles of highway and roadway in Monterey County, and in a large area north of Fresno, including within reclaimed gravel mining pits.

GPS mapping and monitoring at restoration sites and at Caltrans mitigation sites. Monitored the success of elderberry shrubs at one location, the success of willows at another location, and the response of wildlife to the succession of vegetation at both sites. Also used GPS to monitor the response of fossorial animals to yellow star-thistle eradication and natural grassland restoration efforts at Bear Valley in Colusa County and at the decommissioned Mather Air Force Base in Sacramento County.

Mercury effects on Red-legged Frog. Assisted Dr. Michael Morrison and US Fish and Wildlife Service in assessing the possible impacts of historical mercury mining on the federally listed California red-legged frog in Santa Clara County. Also measured habitat variables in streams.

Opposition to proposed No Surprises rule. Wrote a white paper and summary letter explaining scientific grounds for opposing the incidental take permit (ITP) rules providing ITP applicants and holders with general assurances they will be free of compliance with the Endangered Species Act once they adhere to the terms of a "properly functioning HCP." Submitted 188 signatures of scientists and environmental professionals concerned about No Surprises rule US Fish and Wildlife Service, National Marine Fisheries Service, all US Senators.

Natomas Basin Habitat Conservation Plan alternative. Designed narrow channel marsh to increase the likelihood of survival and recovery in the wild of giant garter snake, Swainson's hawk and Valley Elderberry Longhorn Beetle. The design included replication and interspersion of treatments for experimental testing of critical habitat elements. I provided a report to Northern Territories, Inc.

Assessments of agricultural production system and environmental technology transfer to China. Twice visited China and interviewed scientists, industrialists, agriculturalists, and the Directors of the Chinese Environmental Protection Agency and the Department of Agriculture to assess the need and possible pathways for environmental clean-up technologies and trade opportunities between the US and China.

Yolo County Habitat Conservation Plan. Conducted landscape ecology study of Yolo County to spatially prioritize allocation of mitigation efforts to improve ecosystem functionality within the County from the perspective of 29 special-status species of wildlife and plants. Used a hierarchically structured indicators approach to apply principles of landscape and ecosystem ecology, conservation biology, and local values in rating land units. Derived GIS maps to help guide the conservation area design, and then developed implementation strategies.

Mountain lion track count. Developed and conducted a carnivore monitoring program throughout California since 1985. Species counted include mountain lion, bobcat, black bear, coyote, red and gray fox, raccoon, striped skunk, badger, and black-tailed deer. Vegetation and land use are also monitored. Track survey transect was established on dusty, dirt roads within randomly selected quadrats.

Sumatran tiger and other felids. Upon award of Fulbright Research Fellowship, I designed and initiated track counts for seven species of wild cats in Sumatra, including Sumatran tiger, fishing cat, and golden cat. Spent four months on Sumatra and Java in 1988, and learned Bahasa Indonesia, the official Indonesian language.

Wildlife in agriculture. Beginning as post-graduate research, I studied pocket gophers and other wildlife in 40 alfalfa fields throughout the Sacramento Valley, and I surveyed for wildlife along a 200 mile road transect since 1989 with a hiatus of 1996-2004. The data are analyzed using GIS and methods from landscape ecology, and the results published and presented orally to farming groups in California and elsewhere. I also conducted the first study of wildlife in cover crops used on vineyards and orchards.

Agricultural energy use and Tulare County groundwater study. Developed and analyzed a data base of energy use in California agriculture, and collaborated on a landscape (GIS) study of groundwater contamination across Tulare County, California.

Pocket gopher damage in forest clear-cuts. Developed gopher sampling methods and tested various poison baits and baiting regimes in the largest-ever field study of pocket gopher management in forest plantations, involving 68 research plots in 55 clear-cuts among 6 National Forests in northern California.

Risk assessment of exotic species in North America. Developed empirical models of mammal and bird species invasions in North America, as well as a rating system for assigning priority research and control to exotic species in California, based on economic, environmental, and human health hazards.

Burger, J., J. Estep, S. Orloff, S. Smallwood, and J. Yee. 2010. SRC Comments on CalWEA Research Plan. SRC document P174, County of Alameda, Hayward, California.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, J. Burger, and J. Yee). SRC Comments on Monitoring Team's Draft Study Plan for Future Monitoring. SRC document P168, County of Alameda, Hayward, California.

Smallwood, K. S. 2010. Second Review of American Kestrel-Burrowing owl (KB) Scavenger Removal Adjustments Reported in Alameda County Avian Monitoring Team's M21 for the Altamont Pass Wind Resource Area. SRC document P171, County of Alameda, Hayward, California.

Smallwood, K. S. 2010. Assessment of Three Proposed Adaptive Management Plans for Reducing Raptor Fatalities in the Altamont Pass Wind Resource Area. SRC document P161, County of Alameda, Hayward, California.

Smallwood, K. S. and J. Estep. 2010. Report of additional wind turbine hazard ratings in the Altamont Pass Wind Resource Area by Two Members of the Alameda County Scientific Review Committee. SRC document P153, County of Alameda, Hayward, California.

Smallwood, K. S. 2010. Alternatives to Improve the Efficiency of the Monitoring Program. SRC document P158, County of Alameda, Hayward, California.

Smallwood, S. 2010. Summary of Alameda County SRC Recommendations and Concerns and Subsequent Actions. SRC document P147, County of Alameda, Hayward, California.

Smallwood, S. 2010. Progress of Avian Wildlife Protection Program & Schedule. SRC document P148, County of Alameda, Hayward, California. SRC document P148, County of Alameda, Hayward, California.

Smallwood, S. 2010. Old-generation wind turbines rated for raptor collision hazard by Alameda County Scientific Review Committee in 2010, an Update on those Rated in 2007, and an Update on Tier Rankings. SRC document P155, County of Alameda, Hayward, California.

Smallwood, K. S. 2010. Review of American Kestrel-Burrowing owl (KB) Scavenger Removal Adjustments Reported in Alameda County Avian Monitoring Team's M21 for the Altamont Pass Wind Resource Area. SRC document P154, County of Alameda, Hayward, California.

Smallwood, K. S. 2010. Fatality Rates in the Altamont Pass Wind Resource Area 1998-2009. Alameda County SRC document P-145.

Smallwood, K. S. 2010. Comments on Revised M-21: Report on Fatality Monitoring in the Altamont Pass Wind Resource Area. SRC document P144, County of Alameda, Hayward, California.

Smallwood, K. S. 2009. SRC document P129, County of Alameda, Hayward, California.

Smallwood, K. S. 2009. Smallwood's review of M32. SRC document P111, County of Alameda, Hayward, California.

Smallwood, K. S. 2009. 3rd Year Review of 16 Conditional Use Permits for Windworks, Inc. and Altamont Infrastructure Company, LLC. Comment letter to East County Board of Zoning Adjustments. 10 pp + 2 attachments.

Smallwood, K. S. 2008. Weighing Remaining Workload of Alameda County SRC against Proposed Budget Cap. Alameda County SRC document not assigned. 3 pp.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, J. Burger, and J. Yee). 2008. SRC comments on August 2008 Fatality Monitoring Report, M21. SRC document P107, County of Alameda, Hayward, California.

Smallwood, K. S. 2008. Burrowing owl carcass distribution around wind turbines. SRC document P106, County of Alameda, Hayward, California.

Smallwood, K. S. 2008. Assessment of relocation/removal of Altamont Pass wind turbines rated as hazardous by the Alameda County SRC. SRC document P103, County of Alameda, Hayward, California.

Smallwood, K. S. and L. Neher. 2008. Summary of wind turbine-free ridgelines within and around the APWRA. SRC document P102, County of Alameda, Hayward, California.

Smallwood, K. S. and B. Karas. 2008. Comparison of mortality estimates in the Altamont Pass Wind Resource Area when restricted to recent fatalities. SRC document P101, County of Alameda, Hayward, California.

Smallwood, K. S. 2008. On the misapplication of mortality adjustment terms to fatalities missed during one search and found later. SRC document P97, County of Alameda, Hayward, California.

Smallwood, K. S. 2008. Relative abundance of raptors outside the APWRA. SRC document P88, County of Alameda, Hayward, California.

Smallwood, K. S. 2008. Comparison of mortality estimates in the Altamont Pass Wind Resource Area. SRC document P76, County of Alameda, Hayward, California.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, J. Burger, and J. Yee). 2010. Guidelines for siting wind turbines recommended for relocation to minimize potential collision-related mortality of four focal raptor species in the Altamont Pass Wind Resource Area. SRC document P70, County of Alameda, Hayward, California.

Alameda County SRC (J. Burger, Smallwood, K. S., S. Orloff, J. Estep, and J. Yee). 2007. First DRAFT of Hazardous Rating Scale First DRAFT of Hazardous Rating Scale. SRC document P69, County of Alameda, Hayward, California.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, J. Burger, and J. Yee). December 11, 2007. SRC selection of dangerous wind turbines. Alameda County SRC document P-67. 8 pp.

Smallwood, S. October 6, 2007. Smallwood's answers to Audubon's queries about the SRC's recommended four month winter shutdown of wind turbines in the Altamont Pass. Alameda County SRC document P-23.

Smallwood, K. S. October 1, 2007. Dissenting opinion on recommendation to approve of the AWI Blade Painting Study. Alameda County SRC document P-60.

Smallwood, K. S. July 26, 2007. Effects of monitoring duration and inter-annual variability on precision of wind-turbine caused mortality estimates in the Altamont Pass Wind Resource Area, California. SRC Document P44.

Smallwood, K. S. July 26, 2007. Memo: Opinion of some SRC members that the period over which post-management mortality will be estimated remains undefined. SRC Document P43.

Smallwood, K. S. July 19, 2007. Smallwood's response to P24G. SRC Document P41, 4 pp.

Smallwood, K. S. April 23, 2007. New Information Regarding Alameda County SRC Decision of 11 April 2007 to Grant FPLE Credits for Removing and Relocating Wind Turbines in 2004. SRC Document P26.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, and J. Burger [J. Yee abstained]). April 17, 2007. SRC Statement in Support of the Monitoring Program Scope and Budget.

Smallwood, K. S. April 15, 2007. Verification of Tier 1 & 2 Wind Turbine Shutdowns and Relocations. SRC Document P22.

Smallwood, S. April 15, 2007. Progress of Avian Wildlife Protection Program & Schedule.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, J. Burger, and J. Yee). April 3, 2007. Alameda County Scientific Review Committee replies to the parties' responses to its queries and to comments from the California Office of the Attorney General. SRC Document S20.

Smallwood, S. March 19, 2007. Estimated Effects of Full Winter Shutdown and Removal of Tier I & II Turbines. SRC Document S19.

Smallwood, S. March 8, 2007. Smallwood's Replies to the Parties' Responses to Queries from the SRC and Comments from the California Office of the Attorney General. SRC Document S16.

Smallwood, S. March 8, 2007. Estimated Effects of Proposed Measures to be Applied to 2,500 Wind Turbines in the APWRA Fatality Monitoring Plan. SRC Document S15.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, J. Burger, and J. Yee). February 7, 2007. Analysis of Monitoring Program in Context of 1/1//2007 Settlement Agreement.

Smallwood, S. January 8, 2007. Smallwood's Concerns over the Agreement to Settle the CEQA Challenges. SRC Document S5.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, J. Burger, and J. Yee). December 19, 2006. Altamont Scientific Review Committee (SRC) Recommendations to the County on the Avian Monitoring Team Consultants' Budget and Organization.

Reports to Clients

Smallwood, K. S. 2020. Comparison of bird and bat fatality rates among utility-scale solar projects in California. Report to undisclosed client.

Smallwood, K. S., D. Bell, and S. Standish. 2018. Skilled dog detections of bat and small bird carcasses in wind turbine fatality monitoring. Report to East Bay Regional Park District, Oakland, California.

Smallwood, K. S. 2018. Addendum to Comparison of Wind Turbine Collision Hazard Model Performance: One-year Post-construction Assessment of Golden Eagle Fatalities at Golden Hills. Report to Audubon Society, NextEra Energy, and the California Attorney General.

Smallwood, K. S., and L. Neher. 2018. Siting wind turbines to minimize raptor collisions at Rooney Ranch and Sand Hill Repowering Project, Altamont Pass Wind Resource Area. Report to S-Power, Salt Lake City, Utah.

Smallwood, K. S. 2017. Summary of a burrowing owl conservation workshop. Report to Santa Clara Valley Habitat Agency, Morgan Hill, California.

Smallwood, K. S., and L. Neher. 2018. Comparison of wind turbine collision hazard model performance prepared for repowering projects in the Altamont Pass Wind Resources Area. Report to NextEra Energy Resources, Inc., Office of the California Attorney General, Audubon Society, East Bay Regional Park District.

Smallwood, K. S., and L. Neher. 2016. Siting wind turbines to minimize raptor collisions at Summit Winds Repowering Project, Altamont Pass Wind Resource Area. Report to Salka, Inc., Washington, D.C.

Smallwood, K. S., L. Neher, and D. A. Bell. 2017. Mitigating golden eagle impacts from repowering Altamont Pass Wind Resource Area and expanding Los Vaqueros Reservoir. Report to East Contra Costa County Habitat Conservation Plan Conservancy and Contra Costa Water District.

Smallwood, K. S. 2016. Review of avian-solar science plan. Report to Center for Biological Diversity. 28 pp

Smallwood, K. S. 2016. Report of Altamont Pass research as Vasco Winds mitigation. Report to NextEra Energy Resources, Inc., Office of the California Attorney General, Audubon Society, East Bay Regional Park District.
