Prepared health risk assessment of semi-volatile organic chemicals and metals for a fifty-year old wastewater treatment facility used at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

ANR Freight - Los Angeles, California

Prepared a comprehensive Preliminary Endangerment Assessment (PEA) of petroleum hydrocarbon and metal contamination of a former freight depot. This evaluation was as the basis for reaching closure of the site with lead regulatory agency.

Kaiser Ventures Incorporated, Fontana, California

Prepared comprehensive health risk assessment of semi-volatile organic chemicals and metals for 23-acre parcel of a 1,100-acre former steel mill. The health risk assessment was used to determine clean up goals and as the basis for granting closure of the site by lead regulatory agency. Air dispersion modeling using ISCST3 was performed to determine downwind exposure point concentrations at sensitive receptors within a 1 kilometer radius of the site. The results of the health risk assessment were presented at a public meeting sponsored by the Department of Toxic Substances Control (DTSC) in the community potentially affected by the site.

Unocal Corporation - Los Angeles, California

Prepared comprehensive assessment of petroleum hydrocarbons and metals for a former petroleum service station located next to sensitive population center (elementary school). The assessment used a probabilistic approach to estimate risks to the community and was used as the basis for granting closure of the site by lead regulatory agency.

Client: Confidential, Los Angeles, California

Managed oversight of remedial investigation most contaminated heavy metal site in California. Lead concentrations in soil excess of 68,000,000 parts per billion (ppb) have been measured at the site. This State Superfund Site was a former hard chrome plating operation that operated for approximately 40-years.

Client: Confidential, San Francisco, California

Coordinator of regional monitoring program to determine background concentrations of metals in air. Acted as liaison with SCAQMD and CARB to perform co-location sampling and comparison of accepted regulatory method with ASTM methodology.

Client: Confidential, San Francisco, California

Analyzed historical air monitoring data for South Coast Air Basin in Southern California and potential health risks related to ambient concentrations of carcinogenic metals and volatile organic compounds. Identified and reviewed the available literature and calculated risks from toxins in South Coast Air Basin.

IT Corporation, North Carolina

Prepared comprehensive evaluation of potential exposure of workers to air-borne VOCs at hazardous waste storage facility under SUPERFUND cleanup decree. Assessment used in developing health based clean-up levels.

Attn: Mr. Richard M. Franco

Subject: WATER RESOURCES REVIEW OF DRAFT ENVIRONMENTAL IMPACT REPORT, GIOVANNONI LOGISTICS CENTER, CITY OF AMERICAN CANYON, CALIFORNIA

Shannon & Wilson prepared this report and participated in this project as a consultant to Adams Broadwell Joseph & Cardozo PC. Our scope of services was specified in the proposal dated June 24, 2022, and was authorized by Mr. Richard Franco in email dated June 27, 2022. This report presents our review of the adequacy of the proposed water resource impact documentation and analyses and the adequacy of the associated proposed mitigation in the Giovannoni Logistics Center Draft Environmental Impact Report and was prepared by the undersigned. 1

We appreciate the opportunity to be of service to you on this project. If you have questions concerning this report, or we may be of further service, please contact us.

Sincerely,

SHANNON & WILSON

1 INTRODUCTION

This report summarizes the findings of our water resources reviews of Section 3.03 Biological Resources and Section 3.08 Hydrology and Water Quality of the Draft Environmental Impact Report (DEIR) (State Clearinghouse Number 2021010104), including referenced and supporting material, for the Giovannoni Logistics Center project (Project) in City of American Canyon, Napa County, California (City) (Firstcarbon Solutions, 2022). The reviews focused on adequacy of wetland, groundwater, and stormwater (collectively called water resources) impact analysis and adequacy of the associated proposed mitigation. Independent analyses and assessments have not been performed. This report summarizes the analyses presented in the DEIR and supporting documents upon which the findings of impacts on water resources are based. Depth and extent of review varies by discipline. Descriptions of the specific discipline reviews and the review findings are outlined in the sections below. 3

2 WETLAND RESOURCES REVIEW

2.1 Supporting Documentation

In addition to Section 3.03 of the DEIR, our review of the Project's wetland related impacts and mitigation relied on the following documents:

- DEIR Appendix C.1 – Giovannoni Logistics Center Biological Resources Report (Huffman-Broadway Group, Inc., 2021)
- DEIR Appendix C.2 – Monk and Associates 2016 Wetland Jurisdictional Delineation Report (Monk, 2016a) 4
- DEIR Appendix C.3 – USACE 2016 Wetland Verification Map (Monk, 2016b)
- DEIR Appendix C.6 – Monk 2018 Devlin Road Biological Resources Assessment (Monk, 2018)
- DEIR Appendix C.7 – Monk Green Island Road Widening Biological Resources Assessment (Monk, 2019)

2.2 Wetland Delineation

Project site wetlands were delineated by Monk in April and May of 2016 (Monk, 2016a). The 2016 delineation report states the wetland delineations were completed using the *1987 Corps of Engineers Wetlands Delineation Manual* (U.S. Army Corps of Engineers [Corps], 1987) 5a

and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (U.S. Army Engineer Research and Development Center [USAERDC], 2008). The delineation methodology described in the Monk 2016 report is consistent with the *State Water Boards State Wetland Definition and Procedures for Discharges of Dredge of Fill Material to Waters of the State* (State Procedures) (California State Water Resources Control Board [CSWRCB], 2019a). 5a

Of the 142 wetland determination data sheets included in the 2016 Monk report, we reviewed 20 representative data sheets for consistency with the Corps manuals identified above, including review of percent vegetative cover and dominant species calculations, species' indicator statuses, and consistency of observed soils with the chosen hydric soil indicators. We found errors in data sheets such as incorrect dominant species identification (Data Points [DPs] 89, 111, and 120), miscalculated absolute percent cover (DPs 42 and 43), and incorrectly identified hydric soil indicators (DP 43), none of which impacted the report's wetland and upland determinations. However, in data sheet DP 110, Monk incorrectly identifies *Helminthotheca echioides* as a Facultative Upland (FACU) species; the Corps 2020 National Wetland Plant List identifies the species as a Facultative (FAC) species in the current Arid West region (Corps, 2020). The Corps' 2014 Arid West Regional Wetland Plant List identified the species as FACU (Corps, 2014), but the Corps 2016 Arid West Regional Plant List incorporated the species' wetland indicator status change to FAC and was published April 28, 2016, making it the correct plant list to reference during the Monk data analysis and report preparation (report dated August 2016). Assigning *H. echiodes* a FAC wetland indicator status changes the findings on DP 110 from upland to wetland condition, meaning that more wetland was present on the project site during the Monk delineation fieldwork than is reflected in the Monk report and DEIR. A search for *H. echiodes* in the remaining wetland determination sheets identified DPs 40, 97, 98, and 105 as locations where application of the species' correct indicator status would change the data sheet finding from upland to wetland. The locations of DP 40 and 110, as shown on the 2016 delineation maps, approximately coincide with two of the areas the Project proposes to create wetland for mitigation of Project impacts (as shown on DEIR Exhibit 3.3-4). 5b

The Monk delineation and Corps Approved Jurisdictional Determination (AJD) is six years old. We reviewed recent Google Earth aerial imagery of the project site during spring and identified areas that appear to demonstrate potential wetland condition that were not identified as wetland in the 2016 Monk report, particularly the area north of No Name Creek (general location of DP 110). Corps AJDs are valid for five years and the Project will need to obtain an updated AJD (Corps, 2016a). The Corps applies the AJD expiration because wetland boundaries are expected to change over time due to both natural (e.g., climate patterns) and human-caused activities (Corps, 2005). Given the age of the delineation, the errors identified in the wetland determination data forms, and the 5c

associated potential for revised wetland extents, it is likely that the wetland boundaries are not accurately identified, and additional wetland is present on the site. 5c

2.3 Wetland Impacts

The DEIR states that the Project's Phases 1 and 2 will impact 0.496 acre and 3.7 acres, respectively, of wetland and notes that Phase 2 wetland impact quantities may change as design progresses. Our review covered the adequacy of the wetland impact analysis presented in the DEIR and supporting documents.

One of their main assumptions used to support the basis of the Project's impact analysis is not supported. The DEIR Project Description Section 2.3.13 states, "For the purposes of providing a conservative, worst-case scenario, this Draft EIR assumes that Phases 1 and 2 would be developed concurrently over a period of 18 months." However, a prolonged construction schedule that extends beyond 18 months and instead extends over several years (e.g., multiple nesting seasons and multiple "rainy seasons") increases the potential for construction-related impacts to aquatic resources (e.g., water quality issues and in-air construction noise). The DEIR does not explain or support their assumption. 6a

The DEIR does not include a functional assessment of the site wetlands and no functional impact analysis is provided. Wetland impact analyses are incomplete without a functional assessment that evaluates hydrologic, water quality, and habitat functions of the site wetlands. Functions typical of vernal pool and other seasonal wetlands, such as those on the Project site, typically include providing rest and forage for migratory waterfowl along the Pacific Flyway; breeding habitat for amphibians and invertebrates; flood storage potential; and filtration of pollutants and excess nutrients from surface water and groundwater. The DEIR states that a functional assessment, such as the California Rapid Assessment Method, will be completed with the Project's Wetland Mitigation and Monitoring Plan. As described below in Section 2.4, the Project's proposed wetland mitigation cannot be deemed adequate without including consideration of impacted and mitigated wetland functions. 6b

2.3.1 Wetland Impact Inconsistencies

Our review identified several discrepancies between the DEIR and supporting documents.

In comparing the itemized wetland impact areas in DEIR Table 3.3-1 with the wetland areas in the 2016 Monk report, we noted that the Project proposes to impact 189 square feet of Wetland W-89 while the Monk report quantifies W-89 size as 195 square feet, a discrepancy of 6 square feet. Although this does not change the Phase 1 impact quantity when converted to acres, the Project should count the entirety of the wetland as impacted. 7

We identified inconsistencies in the position and presence of Wetland IW-9 in the 2016 Monk report delineation figure and the AJD and DEIR wetland figures. In the 2016 Monk report, Wetland IW-9 is a 2,625-square-foot isolated linear wetland in the southeast portion of the project area that would partially coincide with or be immediately adjacent to the Project development footprint (DEIR Appendix C, p. C-129). The 2016 Monk report also includes Wetland IW-9 in its Attachment A Table of Aquatic Resources. However, the wetland is absent from the Monk October 2016 Confirmed Aquatic Resources Delineation Map/USACE 2016 Wetland Verification Map (DEIR Appendix C, p. C-419) and the wetlands are re-numbered accordingly. The wetland's absence is carried through in the DEIR figures and analysis. There is no wetland determination data sheet to support the wetland's inclusion or exclusion and no discussion of the change in the DEIR or supporting documents. It is not clear if the omission was purposeful or an oversight; however, IW-9, as originally shown in the 2016 Monk report, is not included in the DEIR impact analysis. 7

The DEIR Exhibit 3.3-3 includes Wetland W-90 within the Project footprint and excludes it from the proposed wetland preserve. However, there is no discussion of direct or indirect impacts to W-90 included in the DEIR.

2.3.2 Indirect and Cumulative Impacts

2.3.2.1 Hydrology Impacts

The DEIR states underground piping will convey stormwater from the Project's new pollutant generating impervious surfaces to bioretention and detention basins on the north boundary of the development. The DEIR Exhibit 3.3-4 identifies "passive or active control device to allow treated stormwater to enter the [created] wetland swale." However, the Project documents do not identify how site drainage patterns to and hydrology sources in the unimpacted wetlands will be maintained. Without pre-Project and post-Project water budget analyses for the site wetlands, their determination that additional wetlands will not be impacted is not supported. 8

2.3.2.2 Water Quality Impacts

The Project proposes use of a specialized biosoil in the bioretention facility to remove pollutants. However, DEIR Section 3.8.6 states: "The wetland preserve would facilitate the natural sequestration of pollutants of stormwater leaving the project site." Incorporation of the wetland preserve into the Project's post-construction stormwater management strategy would have long-term detrimental impacts to these wetlands and does not support their determination that additional wetlands will not be impacted. 9

2.3.2.3 Reduced Buffer Widths

The State Procedures manual (CSWRCB, 2019a) states that buffers help "ensure the long-term viability of those [aquatic] resources" and that "buffers may also provide habitat or corridors necessary for the ecological functioning of aquatic resources." The Corps South Pacific Division requires that mitigation plans "provide and maintain a buffer of at least 100 feet around all vernal pool preserves and mitigation sites" in their draft *Mitigation and Monitoring Guidelines for Vernal Pools* supplement (Corps, 2016b). Buffer widths between wetlands and the Project footprint are not provided, but use of the DEIR figures' scales suggests they are less than 100 feet in many places, particularly adjacent to the northern boundary of the Project footprint. 10a

DEIR Exhibit 3.3-3 Phase 1 Wetland Impacts, Wetlands IW-7, 8, 9 and 10, appear to show an approximately 100-foot buffer adjacent to the Project. However, the buffer areas are identified as 'Proposed Landscape Areas.' This is not further defined, and it is not clear if the proposed landscape area buffers will consist of native or ornamental plants and whether they will be intensely maintained as manipulated landscape areas. Indirect impacts to these wetlands through a disturbed or landscaped buffer are not discussed in the DEIR. 10b

Further, the connections and corridor between the wetlands in the southeastern Project area (Wetlands IW-7 to IW-10) and the remaining wetland complex to the north and east will disappear once the wetlands are flanked by the development. This corridor disconnection, the overall reduction of undeveloped buffer widths of wetlands that remain post-Project, and the indirect effects on the site wetlands are not analyzed or discussed. 10c

2.3.2.4 Cumulative Impacts

The State Procedures manual (CSWRCB, 2019a) requires that compensatory mitigation be developed using a watershed profile, which "shall include information sufficient to evaluate direct, secondary (indirect), and cumulative impacts of [a] project…" The DEIR does not include an analysis of indirect impacts to wetland function associated with reduced buffer widths and increased noise, lights, and traffic compared to that of the existing condition. The DEIR does not include an analysis of cumulative wetland impacts that incorporates current development trends in the area and the associated continued aquatic habitat fragmentation. 11

2.4 Proposed Mitigation

Our review of the adequacy of the Project's proposed mitigation in offsetting the Project's wetland-related impacts follows. 12

2.4.1 Wetland Mitigation

The DEIR includes a conceptual mitigation plan shown in Exhibit 3.34 that provides a proposed wetland preservation area adjacent to the northern boundary of the Project and states that a detailed Wetland Mitigation and Monitoring Plan will be prepared but is not included in the DEIR. The DEIR states that the plan will propose to preserve 7.58 acres of existing seasonal wetlands and 0.13 acre of vernal pools; create 0.992 acre of seasonal wetlands in advance of, or concurrent with, Phase 1; and create 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools in advance of Phase 2.

12

We are unable to evaluate if the proposed mitigation will adequately replace lost wetland function because the DEIR and supporting documentation does not include an assessment of impacted wetland function. Additionally, a water budget analysis, typically supported by hydrology monitoring in the proposed wetland creation areas, is not included. Overall, the Project does not provide the information necessary to determine that the proposed wetland acreages can be successfully created.

Our review of conceptual mitigation elements provided in the DEIR follows.

2.4.1.1 Mitigation Ratios

The Project proposes to mitigate for Phases 1 and 2 wetland impacts at 2:1 and 1:1 mitigation to impact ratios, respectively. The DEIR justifies the lower Phase 2 mitigation ratio because the mitigation will be constructed "at least 1 year prior to the start of Phase 2 construction." Both Devlin Road and Green Island Biological Resource reports, two nearby projects that have completed project permitting, identify 2:1 as the typical Corps and Regional Water Quality Control Board required ratio. Of note, unlike this Project, the Devlin Road and Green Island projects did not impact vernal pool wetlands (Monk, 2018 and 2019). The Corps' *Final 2015 Regional Compensatory Mitigation and Monitoring Guidelines for South Pacific Division* identifies vernal pools as both "difficult to replace resources" and "regionally significant habitat types," (Corps, 2015) making vernal pool wetland creation an inherently high risk mitigation that warrants a higher than typical mitigation ratio.

13a

A State guidance document that includes mitigation requirements, *Staff Report Including the Substitute Environmental Documentation for the State Policy for Water Quality Control: State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (Procedures Staff Report), lists the difficulties of wetland replacement, using vernal pools as an example, and identifies mitigation that requires supporting structures, such as the Project's proposed detention basin system and outfall, as factors that would increase required mitigation ratios (CSWRCB, 2019b). Successful wetland creation is largely driven by ability to provide appropriate hydrology, however, hydrologic analysis that

demonstrates wetland creation potential in the proposed mitigation area is not provided in the DEIR. 13a

The Procedures Staff Report also identifies use of a mitigation bank as an avenue to avoid mitigating for temporal wetland loss, similar to the Project's justification for mitigating Phase 2 at a 1:1 ratio. However, the construction schedule for Phase 2 is not set, with references to both concurrent and possibly back-to-back construction. Mitigation banks must demonstrate achieved wetland functions, frequently over several years, prior to the sale of credits. The Project's assumption that the proposed constructed wetlands will have replaced all lost wetland function at the time of Phase 2 construction is not supported by the information provided and therefore, neither is the proposed 1:1 mitigation ratio. Further, the Corps states that mitigation ratios greater than 1:1 are typically required because "mitigation sites often provide reduced functions compared to the impacted aquatic resources (Corps, 2015)." 13b

Although ultimately the required compensatory mitigation ratios will be provided and approved by the regulatory agencies, the proposed ratios in the DEIR are low given the information provided above.

2.4.1.2 Mitigation Sequencing

The 1990 Federal Mitigation Memorandum of Agreement between the Corps and U.S. Environmental Protection Agency (EPA) requires applicants to complete a thorough mitigation sequencing process, wherein impacts to aquatic resources are first avoided to the maximum extent practicable, remaining impacts are minimized, and unavoidable impacts are then offset through compensatory mitigation (Corps and EPA, 1990). The DEIR does not address how the Project completed the required mitigation sequencing process during design, including but not limited to design decisions regarding building size and/or location, and whether higher quality and higher functioning aquatic resources were prioritized for avoidance. 14

2.4.1.3 Mitigation Monitoring and Performance Standards

The Project proposes five years of monitoring, the minimum required in the State Procedures. The Corps *Regional Compensatory Mitigation and Monitoring Guidelines for the South Pacific Division* (Corps, 2015) identifies vernal pools as an aquatic resource that warrants longer monitoring periods than the standard five years: "Monitoring periods of more than 5 years are warranted for aquatic resources with slow development rates. Examples of such aquatic resources within the South Pacific Division include vernal pools… (Corps, 2015)." The Corps' *Draft Mitigation and Monitoring Guidelines for Vernal Pools* supplement further requires that vernal pool construction projects be monitored for a 15a

minimum of ten years. (Corps, 2016b). The DEIR proposed five-year mitigation monitoring period is not consistent with these federal guidelines. 15a

Mitigation measure BIO-3d in Section 3.3 of the DEIR provides performance standards to be incorporated into the Project mitigation plan. Performance standards are tools to assess achievement of the mitigation's stated goals and objectives. The DEIR Section 3-03 Mitigation Measure states that the "basic objective of the Wetland Mitigation and Monitoring Plan is to ensure that project wetland impacts, and compensatory mitigation proposed to offset the wetland impacts, shall provide a no-net loss of area of wetlands, and wetlands established/created shall be in-kind to the wetlands impacted." More detailed mitigation goals and objectives that would relate to the project's impacts to wetlands with varied habitat conditions (e.g., isolated vs. non-isolated) are not included in the DEIR. Without an understanding of the impacted wetland functions, there is no basis for establishing meaningful mitigation goals and associated meaningful ecological performance standards to achieve no net loss. 15b

The Procedures Staff Report outlines the problematic trend mirrored by the DEIR in focusing on mitigation area and vegetation cover requirements without replacing lost ecological function, resulting in failure to comply with the State's 'no net loss' policy (CSWRCB, 2019b). Further, the State Procedures manual states: "The use of reference aquatic resources to establish performance standards will help ensure that those performance standards are reasonably achievable, by reflecting the range of variability exhibited by the regional class of aquatic resources as a result of natural processes and anthropogenic disturbances." The DEIR does not describe use of reference wetlands in the mitigation approach, which is needed to define the performance standards.

2.4.2 Buffer Mitigation

City policy 8.3.1 requires, "Where riparian corridors are retained, they shall be protected by an adequate buffer width of a minimum 100-foot protection zone…" The Corps South Pacific Division requires that mitigation plans "provide and maintain a buffer of at least 100 feet around all vernal pool preserves and mitigation sites" in their draft *Mitigation and Monitoring Guidelines for Vernal Pools* supplement (Corps, 2016b). Proposed buffer widths associated with No Name Creek and the associated wetlands are not discussed in the DEIR or supporting documents nor labeled in the figures. However, an approximate use of the figure scale suggests that buffer widths adjacent to the Project are less than 100 feet in many places. 16a

DEIR Exhibit 3.3-4 Wetland Mitigation Plan states that the project will "plant trees and shrubs in select locations adjacent to established wetlands on the east and west side and adjacent to No Name Creek." The DEIR does not include extent (area) or specific locations 16b

of plantings and does not state whether these plantings will be maintained, incorporated into the mitigation performance standards, and monitored. The lack of Project buffer impact analysis makes it difficult to evaluate if the proposed buffer plantings are adequate compensation to replace lost buffer function. 16b

3 GROUNDWATER RESOURCES REVIEW

3.1 Supporting Documentation

Our review and assessment of potential impacts of the Project on groundwater resources relied on the following documents: 17

- Section 3.8 of the DEIR – Hydrology and Water Quality
- Draft Water Supply Assessment (DWSA) for the Giovannoni Logistics Center Project (Balance Hydrologics, 2021)

3.2 Water Supply Demand

The water supply to the Project, as defined in the DEIR, will not be derived from groundwater and therefore will not diminish groundwater levels.

The Project's water demand will be supplied by the City. Potential impacts to groundwater levels and flows due to the Project's water supply demand are therefore predicated on the sources of water from which the City derives its water supply and the degree to which the Project demand affects the City's projected future supplies. Both of these issues are discussed and evaluated in the DWSA, which relied on the 2015 Urban Water Management Plan (Kennedy Jenks Consultants, 2016). 18a

The DWSA states that, at present, the City does not rely on groundwater for any part of its supply. Section 2.3 of the DWSA does, however, indicate that the City may consider adding groundwater as a source, depending on needs and opportunities.

The DWSA indicates that the Project's stated water supply demand falls within the City's anticipated supply through 2040 and would not prevent the City from meeting the anticipated demands, even in progressively dry years. These conclusions are based on their following assumptions:

- Between 23% and 32% of the Project's water supply demand will be filled by recycled water. Achieving this goal is predicated on the Project being hooked up to the City's recycled water infrastructure. The DWSA indicates that use of the recycled water is feasible given the City's projected expansion in demand and their capacity to meet that demand. 18b

- The City will be able to capitalize on carryover water from the State Water Plan as described in Section 4.2.1 of the DWSA to make up for shortfalls during dry periods, or the City's actual consumption will continue to be significantly below projected demand as was recorded in the six years between 2015 and 2020.
- Project water demand conforms to the following stated estimates.

  Potable water use:

  - Phase 1: 10.8 acre-feet per year (afy)
  - Phase 2: 13.1 afy

  Recycled water use:

  - Phase 1: 37.0 afy
  - Phase 2: 45.0 afy

18b

The DWSA states that the Project will be required to comply with the City's Zero Water Footprint policy, which will require the Project to commit to offsetting their potable water demand through off-site conservation measures. The DEIR does not address this requirement. To meet this requirement, the Project will be required to offset 100% of their potable water consumption through one or more types of actions that reduce the City's water consumption. The DWSA describes some potential qualifying actions as follows.

18c

- Funding conversion of irrigated landscape areas to recycled water.
- Funding or assisting the City to improve the efficiency of the City's water distribution system by reducing system losses.

3.3 Loss of Recharge

The proximity of the Project to groundwater discharge areas limits reductions in groundwater recharge due to the conversion of open space to impervious surfaces.

The Project is located less than two miles from the wetland areas associated with the Napa River and Fagan Marsh, which are the discharge areas for the surficial aquifer in the Project area. The water table (uppermost groundwater level) within that proximity to groundwater discharge areas is expected to be shallow, leaving little space available for groundwater storage. Infiltration recharge is expected to be small and not expected to contribute significantly to groundwater flow. A reduction in pervious surface will therefore not likely change the groundwater water budget for the groundwater basin.

19

4 HIGH LEVEL STORMWATER REVIEW

4.1 Supporting Documentation

Our review and assessment of potential stormwater-related impacts of the Project focused only on the completeness of the analyses described in the DEIR with respect to the size and scope of the Project. The accuracy of the referenced studies was not evaluated. Our review relied on and was limited to the following documents. 20

- Section 3.8 of the DEIR – Hydrology and Water Quality
- Draft Water Supply Assessment (DWSA) for the Giovannoni Logistics Center Project (Balance Hydrologics, 2021)
- Memo on Preliminary Hydrologic and Hydraulic Modeling for the Proposed Giovannoni Logistics Center (Balance Hydrologics, 2020)

4.2 Summary

The DWSA acknowledges that the Project will be required to prepare a Stormwater Control Plan (SCP) in accordance with the Bay Area Stormwater Management Agencies Association Post-Construction Manual that must describe post-construction stormwater treatment measures, such as bioretention facilities and source control Best Management Practices, and a strategy for the ongoing maintenance of those facilities. A SCP has not been included in the DEIR.

The DEIR does describe the results of a preliminary assessment that focused on the potential change in peak runoff associated with Phase 1 of the Project. Important findings and dependencies include the following:

- The Project will leave approximately 22.6% (47 acres) of the 208 acres as open space. 21
- The Project will be required to demonstrate a 10% reduction in peak runoff flows from the current (pre-developed) condition.
- Modeling performed as part of the preliminary assessment demonstrates that more than the required 10% reduction in peak runoff flows will be achieved through the development and implementation of two detention basins, one bioretention area dedicated for water quality, and one basin sized to comply with both flood control and water quality treatment standards.
- Only Phase 1 was considered.
- The ability of the Project to meet the 10% reduction requirement for Phase 1 appears to be dependent on the construction of the Devlin Road extension, which will result in more than the required reductions in peak flow runoff.

- It does not appear that Phase 2 construction will benefit from the Devlin Road extension or a feature similar to it in function with respect to stormwater retention. It therefore appears likely that the size of the detention basins and bioretention areas for the Phase 2 component of the Project will likely have to be larger than those planned for Phase 1. 21

5 MAIN CONCLUSIONS

- More wetland was present on the project site during the 2016 Monk delineation fieldwork than is reflected in the Monk report and DEIR.
- Wetland impact analysis is not complete; namely, it is lacking analysis and discussion of impacted wetland functions, impacts associated with reduced buffer widths, impacts associated with modified surface water drainage, and cumulative impacts associated with the area's development trends.
- We are unable to evaluate if the proposed conceptual mitigation will adequately offset wetland impacts because impacted wetland functions are not evaluated nor has analysis been completed to support the probable success of wetland creation.
- Proposed wetland mitigation ratios for Phases 1 and 2 are low, given State and Federal guidance. 22
- The proposed five-year mitigation monitoring period is not consistent with Corps guidelines for compensatory mitigation involving vernal pool wetlands.
- The DEIR lacks detailed mitigation goals and objectives and associated performance standards. The provided conceptual mitigation does not incorporate reference wetlands in the strategy and as presented, is not sufficient to comply with the State's no-net-loss policy.
- The Project will not have a significant adverse impact on groundwater resources.
- It does not appear that Phase 2 construction will benefit from the Devlin Road extension or a feature similar to it in function with respect to stormwater retention.
- It appears likely that the size of the detention basins and bioretention areas for the Phase 2 component of the Project will have to be larger than those planned for Phase 1. The preliminary hydrologic assessment required for the proposed project is therefore incomplete.

SHANNON & WILSON, INC.

Todd R. Kincaid, PhD. | Senior Associate

Hydrogeologist

EDUCATION

PhD, Karst Geohydrology, University of Wyoming, 1999
MS, Hydrogeology, University of Florida, 1994
BS, Geology, University of Florida, 1991

SUMMARY - BIO

Todd is an expert in hydrogeologic modeling and karst hydrogeology having worked extensively on the characterization and computer simulation of complex groundwater flow regimes in numerous aquifers around the world for water resources, mining, groundwater contamination, and dam leakage projects. Since 1999, he has led a team focused on modeling geology, groundwater flow, and contaminant transport through varied types of complex aquifers including the karstifed limestones in Florida, heterogeneous glacial sediments in New York and Pennsylvania; fractured rocks in Pennsylvania and Washington; and structurally complex volcanic and sedimentary rocks underlying Yucca Mountain and the Nevada National Security Site, Nevada. He has also designed and conducted numerous successful groundwater tracing projects in karst and fractured rock aquifers of Florida, Brazil, and Washington, and developed methods of incorporating tracer-testing results into hybrid numerical models of groundwater flow and erodibility along dissolutionally enhanced fracture flow paths. Todd has also lectured extensively at professional and public meetings, designed and taught professional short courses on karst hydrogeology and modeling, and provided expert testimony regarding the reliability of groundwater models.

24

RELEVANT EXPERIENCE

HDR Engineering, Bounder Interceptor, Bounder CO. Hydrogeologist, Groundwater Modeler. Todd developed and implemented analytical groundwater models to predict the number of wells and pumping rates required to achieve target drawdown levels within excavation footprints along the a pipeline installation alignment that passed close to lakes and the unit extent boundary of a surficial aquifer; the depth and spatial extent of the cone-of-depression that will develop as a consequence of dewatering; and the distance from the excavation footprints over which the predicted drawdown will exceed 10 feet.

Water Services and Technologies, FEFLOW Model Review, Pontal Dam – Itabira Mining Complex, Minas Gerais Brazil. Hydrogeologist Groundwater Modeler. Todd reviewed modeling reports describing the construction and calibration of a finite-element numerical model of groundwater flow into, through, and under existing and proposed dykes developed to constrain dewatering discharge and precipitation runoff between mine tailings and waste rock piles. Todd developed an independent assessment of model reliability and provided suggestions for further analyses aimed at more fully documenting and reporting on model reliability and limitations.

Adams Broadwell Joseph & Cardozo, Environmental Impact Report (EIR) Review, Proposed Barton Road Logistics Center, Colton CA. Hydrogeologist. Todd reviewed the hydrogeologic and hydrologic sections of a draft EIR and supporting data; researched, compiled, and reviewed other relevant publicly available data; and prepared a report describing the potential impacts of a proposed development on groundwater levels with respect to California's Sustainable Groundwater Management Act (SGMA).

Laird Cowley PLLC, Hydrogeologic Data Review, Stillwater Mine, Red Lodge MT. Hydrogeologist. Todd compiled and reviewed hydraulic head, shut-in pressure, and surface water level data and analyses collected and prepared by the mine and other consultants and developed opinions regarding the probability of encountering high pressure water zones during drilling. Todd worked as part of a team of experts to inform legal staff during litigation regarding a tunnel flooding event.

Sound Transit, West Seattle – Ballard Link Extensions, Seattle/King WA. Hydrogeologist, Groundwater Modeler. Todd developed and implemented analytical groundwater models to predict the number of wells and pumping rates required to achieve target drawdown levels within station and crossover cavern excavation footprints along the tunnel alignment; the depth and spatial extent of the cone-of-depression that will develop as a consequence of dewatering; and the distance from the excavation footprints over which the predicted drawdown will exceed 10 feet.

Brown and Caldwell, OCSD TPAD Plant 2 Dewatering Assessment, Huntington Beach/Orange CA. Hydrogeologist, Groundwater Modeler. Todd developed and implemented a numerical groundwater flow modeling using the GMS software to predict the number of wells and pumping rates required to achieve target drawdown levels within the TPAD Plant 2 excavation footprint. Simulations were developed for scenarios involving natural conditions, cement deep soil mixing (CDSM) within the excavation footprint, and seven different cutoff wall configurations installed around the excavation/dewatering area. Todd used model results to delineate the depth and spatial extent of the cone-of-depression that will develop as a consequence of dewatering; and the distance from the excavation footprint over which the predicted drawdown will exceed 10 feet.

HDR Engineering, Lake Hills Trunk and Northwest Lake Sammamish Interceptor Project, Redmond/King WA. Hydrogeologist, Groundwater Modeler. Todd developed and implemented a numerical groundwater flow modeling using the GMS software to predict the number of wells and pumping rates required to achieve target drawdown levels within excavation footprints along the pipeline alignment; the depth and spatial extent of the cone-of-depression that will develop as a consequence of dewatering and the areas where the cone-of-depression will intersect critical aquifer recharge area (CARA) I and II zones; the distance from the excavation footprints over which the predicted drawdown will exceed 2 feet; and the percentage of pumped water for dewatering operations that will be drawn from the adjacent Sammamish River.

Southern Nevada Water Authority, Hydrostratigraphic Framework Model for Las Vegas Valley, Las Vegas/Clark NV. Geologic framework (EarthVision) modeler. The Southern Nevada Water Authority (SNWA) is developing a basin-scale numerical groundwater resource model to help them manage artificial aquifer recharge and groundwater withdrawals in the Las Vegas Valley. Todd developed a geologic framework model (GFM) of the Las Vegas Valley that will provide the hydrostratigraphic framework for numerical groundwater flow modeling. The modeling effort included the synthesis of multiple geophysical datasets and geologic maps into a map of the bottom of the basin fill material, modeling thrust and normal faults in the underlying basement rocks, synthesizing borehole data and published conceptual models into a hydrostratigraphic delineation of the basin fill, and assembling basement, volcanic, and basin fill units into a 3D model using ArcGIS and EarthVision™. Todd also trained SNWA staff on geologic modeling with the EarthVision software.

US Department of Energy, Geologic Structural Modeling, Nevada National Security Site, Las Vegas/Clark, NV. Todd led the development of a set of geological framework models to characterize the extent and magnitude of contamination resulting from historical underground nuclear testing. The models were created in EarthVision™ to simulate multiple faults that offset approximately 60 different discontinuous and variably thick hydrostratigraphic units, including carbonates, lava flows, welded and non-welded tuffs, and alluvial sediments. He and his team developed automated processes that allowed for rapid model revisions; a methodology for rapidly exporting the geological framework to flow modeling codes; and simulating radionuclide transport through the carbonate hydrostratigraphic units using FEFLOW™.

Puget Sound Energy, Groundwater Tracing & Numerical Modeling, Lower Baker Dam/Skagit, WA. Todd designed, constructed, and managed groundwater tracing programs at the Lower Baker Dam that defined connections and travel times between points of leakage in the forebay, discrete zones within boreholes drilled adjacent to the dam, and several discharge vents in the plunge pool. Managed the design and development of a numerical groundwater flow model constructed with the software FEFLOW™ that simulated leakage along discrete fracture flow pathways identified in a Leapfrog™ 3D geologic model and verified through groundwater tracing. Developed 3D models of simulated heads using EarthVision™ to create cross-sectional profiles of heads across key structural surfaces and calculate and rank erodibility along the fracture flow paths to support structural stability analyses.

Nexa Resources, Groundwater Tracing to an Underground Mine, Vazante, Brazil. Todd designed and conducted groundwater tracing studies that identified discrete leakage locations along a 10 km stretch of river flowing over karstic carbonate rocks and the locations of discharge into a 5 km section of underground mine tunnels spanning six elevation levels. The project involved numerous tracer injections into the river and long-term continuous sampling at more than a dozen locations within the underground mine workings using manual and automated samplers. Results included positive confirmation of connection to the river at multiple locations in the mine; and a hydrogeologic conceptual model of the mechanisms responsible for river water leakage into the mine tunnels.

Alachua County Environmental Protection Dept., Basin-Scale Water Budget Analysis, North Central Florida. Todd led an effort to define aquifer recharge in surficial aquifer and Floridan aquifer basins in north-central Florida that relied on streamflow data and a compilation of groundwater extraction records and estimates, swallet flow and lake storage measurements, and reported return flows to define recharge to surficial aquifer where present and unconfined portions of the upper Floridan aquifer as well as leakage from the surficial aquifer through the upper confining layers into the upper Floridan aquifer. There work culminated in the development of a spreadsheet tool that was delivered to County staff along with training on its use and the water budget science underlying the method. Their work is intended to support reviews of regional scale groundwater resource models and evaluation of impacts associated with consumptive use permitting.

Hull and Associates, HollyFrontier Corporation, Property Modeling, Tulsa/Tulsa, OK. Todd developed and inter-related 2D and 3D property models to delineate the horizontal and vertical extent of Light Non-aqueous Phase Liquid (LNAPL) plumes at an operational oil refinery and estimate total recoverable volumes. Models addressed geotechnical response properties, historical water table and apparent product thicknesses, underground structures, and key hydrostratigraphic surfaces. Property datasets included 4-channel Laser-Induced Fluorescence (LIF), Membrane Interface Probe (MIP) responses from a Flame Ionization Detector (FID) and Photo-Ionization

Detector (PID), Hydraulic Profiling Tool (HPT), and Electrical Conductivity (EC) responses recorded by all three tools.

HDR Engineering, Contaminant Transport Modeling, Central North Carolina. Lead Hydrogeologic Modeler. Todd led the development of five numerical models of dissolved phase cation and anion transport from coal ash basins through surficial and bedrock aquifer toward sensitive receptors including rivers and private and public supply water wells. The groundwater flow models were constructed in MODFLOW-NWT and MT3DMS. Modeled constituents included: antimony, chromium, hexavalent chromium, vanadium, and sulfate. Our team was part of a larger team of modelers assembled to complete modeling assessments required of HDR's client under a consent order agreement. All models were constructed, calibrated, and completed within an approximately six-month timeframe such that results could be included in the reports submitted to the North Carolina Department of Environment and Natural Resources within the required deadlines.

City of Tallahassee, Basin-Scale Water Budget Analysis, North Florida, South Georgia. Todd led an effort to define recharge into the surficial aquifer and leakage through the confining unit overlying the Floridan aquifer that relied on streamflow data for several sub-watershed basins in Georgia and Florida north of Tallahassee, FL. Leakage values for each basin were used to develop an empirical relationship between confining unit thickness and leakage that they used to provide the City with a map estimating recharge throughout the City on the basis of thickness of the underlying Miocene age confining unit. The maps were used by the City to help guide water reuse programs such that recharge to the Floridan aquifer was maximized.

ERM, Exxon-Mobile, Groundwater Flow & Contaminant Transport Modeling, Ontario/ San Bernardino, CA. Todd led an effort to develop a 3D digital conceptual site model and 3D numerical groundwater flow model of the West Coast Groundwater Basin surrounding Torrance, California using EarthVision™ and FEFLOW™. The model addressed hydrostratigraphic and structural relationships between the Gage/Gardena, Hollydale, Jefferson, Lynwood, and Silverado aquifers and the hydraulic properties of the Charnock Fault that crosses the upper half of the basin from northwest to southeast. The EarthVision CSM provided the framework for the FEFLOW groundwater flow model as well as a platform for the visualization of hydraulic communication between the aquifers through intervening confining layers. Regional water supply wells and the line of injection wells along the Pacific coast were included in the model such that predictions of the influence of pumping and injection on contaminant capture could be reliably rendered. Capture zones and the influence of the fault and regional wells were evaluated with 3D particle tracks exported from the FEFLOW model and visualized in GIS and the EarthVision CSM.

COAST, Nitrogen Loading to the Indian River Lagoon and Wakulla/St Marks River from OSTDS, St. Augustine/St. Johns, FL. Lead Hydrogeologic Modeler. Todd and his team identified the number and location of active onsite sewage treatment and disposal systems (OSTDS) and developed a numerical groundwater flow/contaminant transport model to quantify nitrogen loading to the Indian River from existing and projected OSTDS in southern Brevard County, FL. Modeling was performed using FEFLOW™. They identified 178,271 active OSTDS producing a total N load of 10,708 lbs/day to groundwater within the two basins. Their modeling showed that nitrogen loading from OSTDS results in groundwater concentrations up to 170 mg/l and estimated travel times between OSTDS locations and surficial water bodies ranging from days to 50 years with an average travel time of 5.1 years.

Tarmac America, Inc., Springs Mapping & Karst Aquifer Characterization, Waccasassa Bay Florida. Surveyed the Waccasassa Bay, west Central Florida to find, identify, and document spring discharges and karst features. Field verified hypothesized spring discharges based on the results of a USGS thermal anomaly survey of onshore and offshore regions using electrical conductivity surveys. Developed a conceptual model of groundwater flow patterns based on the results of the springs surveys, available potentiometric surface data, and aquifer performance tests performed at the proposed King Road quarry.

US Department of Defense, Tetra Tech EC, Geologic and Numerical Groundwater Modeling, DECP facility, Philadelphia/Philadelphia, PA. Todd led the development of a linked geological-groundwater flow model that simulates a 3D heterogeneous multi-aquifer system beneath the former DSCP facility in Philadelphia PA impacted by more than two million gallons of light non-aqueous phase liquid (LNAPL). Regional and site-scale solids models developed in EarthVision™ defined the geospatial relationship between the LNAPL plume, discrete discontinuous soil and rock zones, and buried utilities. A 3D numerical groundwater flow model constructed in FEFLOW™ was calibrated to 176 surficial aquifer and 20 deep aquifer wells using a Lipschitzian parameter optimization algorithm. Visualizations depicted flow paths from the LNAPL plume to property boundaries and into the deep aquifer in support of site closure plans.

Florida Geological Survey, Groundwater Tracing, Karst Aquifer Characterization and Numerical Groundwater Flow Modeling, Woodville Karst Plain, Woodville Karst Plain/North Florida. Todd was the lead scientist and project manager for a multi-faceted karst aquifer characterization effort that successfully established hydraulic connections between sinking streams and a municipal wastewater spray field, and several very large magnitude springs over distances of miles to tens of miles; and resulted in a first-of-its-kind dual-permeability numerical model of groundwater flow that simulated tracer defined groundwater flow paths, spring discharges, and regional pumping and head distributions. Also organized public education programs including workshops, short courses, field trips, and public presentations focusing on the ongoing results of the effort.

Coca-Cola North America, Hybrid Numerical Modeling of karstic groundwater flow, North Central Florida, Florida. Todd led the development of a regional-scale hybrid numerical model of groundwater flow through mapped, traced, and inferred conduits to numerous springs along the western Santa Fe River, and the exchange of groundwater between conduits and the aquifer matrix. Model was simultaneously calibrated to time periods representing high water and low water conditions; identified the impact of pumping on spring flows; and defined well and spring vulnerabilities to nitrate loading from intense agricultural operations and municipal wastewater disposal based on simulated travel times. Model-defined springshed boundaries were incorporated into the FDEP's BMAP.

Ginnie Springs Outdoors, Numerical Groundwater Model Evaluation, North Central Florida. Todd led an effort to test the validity and reliability of the predicted impacts of groundwater pumping to spring and river flows and upper Florida Aquifer groundwater levels generated by the Suwannee River Water Management District's regional numerical North Florida Model (NFM). Model evaluations included comparisons of: 1) assigned recharge to verifiable groundwater discharge; 2) simulated vs. tracer-defined flow paths and travel-times; 3) the identification of unreported residuals between simulated heads at rivers and springs and the target heads defined in river and drain node assignments; and 4) simulated vs. measured drawdowns at large municipal well fields.

Borton Lawson Engineering, Geologic and Groundwater Flow Modeling – Bucks County, PA. Lead Hydrogeologic Modeler. Todd and his team developed a geologic framework model and a 3D groundwater flow model that simulated groundwater flow through a complex faulted, folded fractured rock aquifer consisting of 65 stratigraphic units and multiple fault blocks. The geologic model was constructed from geologic maps that were used to project stratigraphic and structural surfaces using the EarthVision™ software. The surfaces were then used to construct a 35-layer finite-element groundwater flow model using the FEFLOW™ software. Both models were then used to simulate and visualize capture zones for municipal water wells owned and operated by five different municipalities from which wellhead protection zones were defined, published, and codified into municipal aquifer source water protection and land use ordinances.

H2H Associates, Buzzi-Unicem, Groundwater Modeling for Quarry Dewatering, Stockertown/Northampton, PA. Todd managed development of a groundwater model in a heavily karstified and geologically complex terrain in northeast Pennsylvania. Created multiple solids and groundwater flow models to simulate water table response to quarry dewatering and interactions with an adjacent stream. Identified probable karstic flow paths and defined a water budget for the quarry that quantified groundwater and re-circulated components of the pumpage. Published and resented results to PADEP and PADOT.

STV-PB Joint Venture, Metropolitan Transportation Authority, Geologic, Parameter, Groundwater Flow, Contaminant Transport Modeling, Long Island New York, NY. Todd developed a combined regional and site-scale 3D Geologic Framework Model (GFM) for the New York Metropolitan Transit Authority's East Side Access Project that delineated the spatial relationship between key geologic horizons, multiple sorbed-phase contaminant plumes, and various engineered features. The GFM was used as the framework for a numerical groundwater flow model from which his team developed mass transport models that simulated the movement of dissolved chlorinated volatile organic compounds through the complex geology and into or around large underground tunnel structures. Data generated from the respective process models was imported back into the GFM to develop visualizations and interpretations that were presented to project management, the New York Department of Environmental Conservation, and legal counsel.

SHORT COURSES, EDUCATIONAL EXHIBITS & VIDEOS

Karst Hydrogeology in Florida with Special Focus on the Santa Fe River Basin. Hydrogeology Consortium and University of Florida TREEO Center, August 23-24 2007, Gainesville Florida.

Karst Hydrogeology in Florida with Special Focus on the Woodville Karst Plain. Hydrogeology Consortium, December 5-6 2006, Tallahassee Florida.

Karst Hydrogeology in Florida with Special Focus on the Woodville Karst Plain. Hydrogeology Consortium, April 27-28 2006, Tallahassee Florida.

Karst Hydrogeology in Florida with Special Focus on the Woodville Karst Plain. Hydrogeology Consortium, November 14-15 2005, Tallahassee Florida.

Florida's Awesome Aquifer, 2002. A traveling poster exhibit and educational video on karst and groundwater flow in Florida. Developed for the Florida Geological Survey, Tallahassee, Florida.

Awesome Aquifer Adventure – 2001. A multi-media educational exhibit on aquifers and groundwater. Developed for the Reading Public Museum, Reading, Pennsylvania.
A Scientific Look at Underwater Caves - Spring, 1997 An educational video about underwater caves and groundwater flow in karst aquifers. Developed for the Geological Society of America Partners for Excellence Program, Boulder, Colorado.

Project KarstDive, Underwater Cave Exploration in Southern Turkey, 1997. A documentary video describing underwater cave exploration in Southern Turkey. Developed for the National Speleological Society-Cave Diving Section, Lake City, Florida.

Sarah C. Corbin, PWS, MSES | ASSOCIATE
Senior Biologist

EDUCATION
Bachelors of Arts, Biology and Environmental Studies, Whitman College, 2003
Masters of Environmental Science, Applied Ecology, Emphasis in Aquatic Ecology, Indiana University, 2008

REGISTRATIONS/CERTIFICATIONS
Certified Professional Wetland Scientist, No. 2375, 2013
Certified Erosion and Sediment Control Lead (CESCL), 70002, Expires 1/12/2025
WSDOT Certified Senior Biological Assessment Writer

ADDITIONAL TRAINING
Using the Revised Washington State Wetland Rating System in Western Washington
How to Determine the Ordinary High Water Mark, WA Department of Ecology
Oregon Streamflow Assessment Duration Method, US Army Corps of Engineers
Designing Compensatory Mitigation and Restoration Projects, WA Department of Ecology
Eelgrass Delineation Training, US Army Corps of Engineers
Completing habitat assessments for compliance with the 2008 NMFS Biological Opinion, FEMA

PROFESSIONAL SUMMARY
Sarah Corbin is a senior biologist and permit specialist with 14 years' experience providing wetland and stream delineations, aquatic functional assessments, environmental permitting, biological analyses, habitat assessments, and permit compliance for complex projects. She is a Professional Wetland Scientist with experience delineating and implementing the following regional supplements to the US Army Corps of Engineers' Delineation Manual: Western Mountains, Valleys, and Coast Region, Arid West Region, the Great Plains Region, and the Alaska Region. Sarah coordinates and provides local, state, and federal environmental permitting for hydropower facilities, restoration, linear transportation, utility, and railway projects; and performs additional technical field activities including Ordinary High Water Mark and High Tide Line determinations, rapid assessment stream surveys, bird nesting surveys, fish exclusion, and erosion control and water quality monitoring. She is experienced in writing biological assessments for Endangered Species Act compliance, providing NEPA documentation, writing wetland and stream delineation reports, identifying aquatic minimization and avoidance measures during project design and construction, and designing planting and mitigation plans.

25

RELEVANT EXPERIENCE

WSDOT, I-5 Joint Base Lewis McChord Congestion Relief Project, Pierce County, WA. Lead Wetland Biologist and assistant project manager. WSDOT is proposing improvements along I-5 in the vicinity of JBLM to reduce traffic congestion and improve person and freight mobility. Sarah was instrumental in developing the Environmental Scan for the first phase of the project and authored the wetland, fish, and wildlife sections of the report. Sarah performed wetland and OHWM stream delineations for the project's 14 wetlands and 3 streams and received WSDOT concurrence on all delineations. She documented existing habitat conditions for federally and state-listed species and worked with the design team to minimize project impacts. She authored the project's Wetland and Stream Delineation Report and developed the project's Conceptual Wetland Mitigation Plan. Sarah wrote the wetland section of the project's NEPA Environmental

Assessment. In assessing the project's impacts to stream and wetland resources, Sarah coordinated extensively with planners and specialists at JBLM, Camp Murray, Pierce County, and the Cities of DuPont and Lakewood.

Puget Sound Energy, Lower Baker Dam Seepage Reduction, Concrete, WA. Lead Wetland Biologist and Permitting Specialist. Sarah is the natural resource task lead for this project to reduce seepage below the 285-foot-high, concrete gravity-arch dam. Sarah coordinated the project fieldwork and prepared the project permit applications and supporting documents. Sarah delineated and rated over 20 slope, depressional, riverine, and lacustrine wetlands on the site, received Corps-concurrence on all delineations, authored the project Critical Areas Report/Delineation Report, and developed the project's mitigation strategy to use an out-of-service-area mitigation bank when other options were deemed unviable. She worked closely with PSE environmental staff to develop required permit documents including the JARPA and JARPA drawings, SEPA Checklist, Biological Assessment, Restoration Plan, and Bank Use Plan. Sarah supported PSE environmental staff at environmental regulatory agency meetings and helped to track and organize the project's local, state, and federal permits. She assisted PSE in revising the Biological Assessment and coordinating with the US Fish and Wildlife Service when the gray wolf was re-listed after the start of construction. Sarah continues to support PSE with environmental permit compliance and contractor submittal review during project construction.

City of Marysville, 71st Avenue NE, Soper Hill Road, and Sunnyside Boulevard Intersection Improvement Project, Marysville, WA. Lead Wetland Biologist. To support the project alternatives analysis, Sarah performed a wetland and stream reconnaissance in the vicinity of the proposed intersection improvements and identified seven potential wetlands. Sarah authored the reconnaissance report and detailed applicable regulatory requirements associated with the wetlands and proposed development.

City of Mukilteo, Harbour Reach Drive Extension Project, Mukilteo, WA. Wetland Biologist. The project constructed a new urban arterial connecting Beverly Park Road and Harbour Pointe Boulevard SW. Sarah delineated and documented the existing conditions of three streams and five wetlands. Construction was completed in July 2021. Sarah assisted in developing the mitigation strategy, including siting the on-site wetland and buffer restoration and enhancement and assisted in the mitigation as-built documentation.

City of Kent Public Works Department, Mill Creek Reestablishment Project, Kent, WA. Lead Wetland Biologist Review. In the City of Kent, Mill Creek flows through a highly urbanized landscape. The project proposes to remove accumulated sediments in 3.7 river miles of the stream to increase flood storage capacity. Sarah provided a field review of the wetland and ordinary high water mark delineation performed for the project, including over 60 riverine wetlands. She verified the delineated boundaries, dug additional wetland an upland soil pits to support the delineation and reviewed the Cowardin Class designation in each wetland.

City of Edmonds Parks, Recreation, and Cultural Services, Edmonds Marsh Buffer Restoration Project, Edmonds, WA. Lead Wetland Biologist. The City proposed to restore portions of the Edmonds Marsh buffer. Sarah delineated portions of Edmonds Marsh adjacent to the proposed buffer improvements and developed the Edmonds Marsh Buffer Restoration Plan, incorporating feedback from City's Parks, Recreation, and Cultural Services Department, City maintenance staff, and local environmental groups. The plan included removal of invasive species and planting plans for select areas with varying exposure, hydrology, topography, and proximity to public roadways and public use areas.

City of Mill Creek, 35th Avenue Southeast Reconstruction Project, Mill Creek, WA. Wetland Biologist. The road improvement project addressed road flooding issues and included stormwater improvements resulting in minor wetland impacts. Sarah completed the wetland and stream delineation to identify critical areas and support the project's permitting process. Sarah assisted with preparation of environmental applications and documentation to local, state, and federal agencies. When the agencies questioned the site wetland character, Sarah performed pH monitoring and functional assessment to support the wetland's bog designation. Sarah also provided guidance and oversight to the biologist performing environmental compliance during construction.

BNSF Railway Company, Box Elder Creek Emergency Stream Crossing, Laurel Subdivision MP 208.5, Cascade County, MT. Lead Wetland Biologist and Permit Specialist. In response to an active landslide affecting the railroad tracks, BNSF installed an emergency access road and stream crossing in order to access and stabilize the slide area. Sarah assisted BNSF in determining which regulations applied to the work, performed a wetland and stream delineation, produced a Corps-approved delineation report, and coordinated the post-project environmental permitting and restoration efforts. After the temporary stream crossing had been removed, Sarah assisted BNSF with permitting a permanent stream crossing in the same location.

Puget Sound Energy, Site Development Feasibility Studies, Centralia and Redmond, WA. Lead Wetland Biologist. Sarah visited potential Puget Sound Energy-owned parcels in Centralia and Redmond to identify critical areas as part of comprehensive site development feasibility studies Shannon & Wilson completed for each PSE site. The review included wetland and stream reconnaissance, identification of floodplains, and potential habitat for federal and state protected species. Sarah co-authored Critical Areas Reports for each site.

Washington Department of Fish and Wildlife, Skagit Wildlife Area Delineation, Skagit County, WA. Lead Wetland Biologist. To support WDFW plans to improve an office trailer at the Skagit Wildlife Area Headquarters, Sarah delineated two wetlands in the vicinity of Wiley Slough, in historic floodplain on the landward side of the Wiley Slough Dike. She characterized and rated the wetlands and authored the delineation to support the environmental permit process.

Washington Department of Fish and Wildlife, Wells Recreation Boat Launch Project, Douglas County, WA. Lead Wetland Biologist. To support WDFW plans to improve the Wells Recreation Area boat launch, Sarah delineated one wetland along the Columbia River (Lake Pateros). She characterized and rated the wetland and authored the delineation report necessary to complete the project's environmental permit process.

BNSF Railway Company, Culvert Replacement Project, Big Horn Subdivision MP 609.1, Gillette, WY. Wetland Biologist and Permit Specialist. BNSF proposed to replace a culvert beneath the access road adjacent to the BNSF railroad tracks. Sarah delineated the wetland and stream associated with the culvert and produced a delineation report to support the permitting for the project.

Port of Everett, Bay Wood Interim Action Cleanup and Shoreline Restoration Project, Everett, WA. Wetland Biologist. The project combined environmental cleanup, wetland habitat restoration, and buffer enhancements along a shoreline adjacent to an upland site redevelopment. Sarah documented the project's as-built condition and co-authored the as-built restoration monitoring report. She also assisted the Port of Everett with a site visit with the Department of

Ecology and the Tulalip Tribe and developed a replanting plan for areas disturbed during the upland development construction. Sarah will continue to support the Port in site restoration monitoring.

City of Bellevue, 120th Avenue NE Corridor Project, Bellevue, WA. Wetland Biologist. This road improvement project includes road realignment and widening, stormwater management improvements, and replacing an existing culvert crossing with a new fish-passable culvert. Sarah delineated and characterized three onsite wetlands and one stream and authored the project Critical Areas Report/Delineation Report.

City of Bothell, Horse Creek Improvement and Relocation Project, Bothell, WA. Supporting Biologist. The Horse Creek Improvements Project restored a stream that flowed in an underground pipe through downtown Bothell, Washington. The project realigned the stream into approximately 2,000 linear feet of new aboveground stream channel. To support the local permitting process Sarah wrote an ecological justification for the stream restoration design, which contrasted the pre-project stream water quality, hydrologic, and habitat function with those of the restored condition.

Washington Department of Fish and Wildlife, Wiley Slough Tidegate Replacement, Skagit County, WA. Lead Wetland Biologist. The Wiley Slough tidegate is located on the WDFW – Skagit Wildlife Preserve on Fir Island, near Conway, WA. The replacement designs included two 10-foot-wide by 8-foot-high tidegates attached to a concrete box culvert. Sarah completed the estuarine, palustrine, and riverine wetland and ordinary high water mark delineations on the project site and wrote the project delineation report. The delineations were approved without comment by the regulatory agencies.

Washington Department of Fish and Wildlife, Wiley Dike Repair Project, Skagit County, WA. Lead Wetland Biologist and Permit specialist. The Project will repair 5,800 feet of the existing Wiley Slough Dike to prevent dike overtopping and meet dike stability requirements. The project includes replacing the Wiley Slough tidegate, raising the dike, incorporating riprap within and along the waterward face of the dike, and re-establishing estuarine wetland in an area of dike retraction. Sarah delineated the estuarine, freshwater tidal, riverine, and palustrine wetlands on the project site and authored the project's Delineation Report, Bank Use Plan, and Restoration Plan. To facilitate permitting of the project explorations, Sarah worked with the design team to avoid impacts to wetlands, completed the shoreline exemption application, and wrote the No Effect letter to document Endangered Species Act compliance. Sarah continues to support WDFW through the main project's permit process.

Skagit County Public Works, Freestad Lake Barrier Lagoon Restoration, Samish Island, WA. Lead Wetland Biologist and Permit Specialist. The project proposed to restore tidal inundation and estuary habitat to a 20-acre farm field. Sarah delineated and characterized the existing onsite palustrine and estuarine wetland systems and assisted the County in developing a permitting approach for the project.

Reserve Silica Corporation, Reserve Silica Cement Kiln Dust Landfill, Ravensdale, WA. Lead Wetland Biologist. Shannon & Wilson assisted Reserve Silica to better understand the extent and impacts of cement kiln dust present on the property. Sarah completed a wetland delineation in an area downgradient of the cement kiln dust burial. During the delineation she took pH measurements in surface water and exposed ground water. Sarah documented the findings and summarized applicable natural resource related local, state, and federal permits to

assist Reserve Silica in understanding requirements associated with remediating a high pH pond within the delineated wetland complex.

Puget Sound Energy, Upper Baker Dam Spillway Stability Improvements and Tailrace Channel Rock Debris Removal Project, Whatcom County, WA
Lead Wetland Biologist and Permitting Specialist. Sarah is the natural resource and permit task lead for this project to improve spillway slope stability and remove accumulated rockfall debris in the tailrace channel downstream of the dam. Sarah is supporting PSE environmental staff by preparing local, state, and federal permit applications and attending environmental regulatory agency meetings with PSE to help track and coordinate permit process, permit requirements, and answer agency questions. Sarah wrote the project Critical Areas Report/Delineation Report, the JARPA, SEPA Checklist, and Restoration Plan, contributed to the Biological Assessment, and coordinated production of the JARPA drawings. She assisted PSE in revising the Biological Assessment and coordinating with the US Fish and Wildlife Service when the gray wolf was re-listed during the consultation process. Sarah continues to assist PSE through the environmental permit process.

City of Everett, Transmission Line 5 Replacement Crossing Pilchuck River Design-Build Project, Snohomish, WA. Lead Wetland Biologist, Environmental Compliance, and Permit Specialist. Project replaced City of Everett Transmission Line 5, a 51-inch steel pipe carrying potable water from Lake Chaplain reservoir to the City of Everett, where it crosses the Pilchuck River. Sarah performed the wetland and ordinary high water mark delineations and produced the delineation report and supporting permit documents, including the Joint Aquatic Resource Application and the restoration planting plan to facilitate the project's environmental permit process. Sarah also coordinated with the Army Corps and the Snoqualmie Tribe to resolve permitting issues and expedite the permit process. During in-water work construction, Sarah performed spot-check environmental compliance in accordance with project permit conditions and provided onsite guidance to the contractor and their subcontractors. Sarah designed the project planting plans and provided guidance during the restoration phase. Sarah also produced the monitoring reports required by USFWS and NMFS to successfully close out the environmental permits following construction.

WSDOT, SR 532 Corridor Improvements: Camano Island to Interstate 5, WA. Assistant Environmental Compliance Manager. As assistant Environmental Compliance Manager for the SR532 design build project, Sarah performed wetland delineations and stream ordinary high water mark determinations and provided on-site design change guidance to avoid and minimize sensitive area impacts. Sarah is the primary author of the SR532 Environmental Compliance Plan, as well as the Water Quality Monitoring Plan for the Clean Water Act (CWA) Section 401 Water Quality Certification. She managed the SR532 environmental commitments database for the project and reviewed construction daily to ensure compliance with environmental permit commitments and regulations. Sarah performed fish exclusion in fresh water and tidally influenced work areas, allowing construction to continue without significant delay. As the Lead CESCL Field Review for the project, Sarah performed weekly site inspections of Best Management Practices (BMPs) and monitored all construction stormwater discharge points throughout the 10 mile project corridor. She also performed water quality monitoring for in-water and over-water work to meet CWA Section 401 Water Quality Certification conditions, and performed TESC design review and aided in the environmental compliance training of construction personnel. Following construction, Sarah oversaw the planting of wetland mitigation areas, performed mitigation monitoring, and obtained permit closure from the Corps after one year of monitoring, in areas where the contractor was responsible for mitigation.

Southwest Suburban Sewer District, Lift Stations No. 14 and 15 Design Retrofit, Burien, WA. Lead Wetland Biologist and Permit Specialist. The SWSSD proposed to retrofit and upgrade an existing below grade sewer line located within the intertidal zone of public and private beaches along Puget Sound. Sarah performed a wetland reconnaissance and forage fish assessment for the project, prepared a Joint Aquatic Resource Permit Application and coordinated with the Washington Department of Fish and Wildlife to obtain a Hydraulic Project Approval to cover the project in-water work. Sarah also provided technical review of the SEPA Checklist prepared by the sewer district prior to submittal to the City.

City of Edmonds, Harbor Square Outfall Stormwater Improvements, Willow Creek Daylighting Project, Edmonds, WA. Wetland Biologist and Permit Specialist. As part of the Willow Creek Daylighting project, the City is assessing potential improvements to existing outfalls within Edmonds Marsh. Sarah delineated the wetland and ordinary high water mark of Edmonds Marsh and Stella's Marsh and authored the project's delineation report, providing an assessment of functional characterizations of the wetlands and outlining the applicable local, state, and federal permits for the project. Sarah also completed water quality monitoring and macroinvertebrate sampling and contributed to the project's quarterly monitoring reports.

Washington Department of Fish and Wildlife, Fir Island Farm Restoration Feasibility Study, Skagit County, WA. Wetland Biologist. The project evaluated multiple alternatives to restore tidal marsh and coastal shoreline habitat on a 200-acre site. Sarah performed surface water elevation monitoring and data synthesis to help describe existing hydrologic conditions on the site. Sarah also helped obtain local, state, and federal permitting for the project and reviewed the marsh restoration planting and seeding plan.

Skagit County Public Works, North Fork Skagit Levee Setback Feasibility Study, Skagit County, WA. Lead Wetland biologist. The project studied the feasibility of a levee setback project to restore salmon habitat on the Skagit River. Sarah performed a wetland reconnaissance and authored a wetland characterization report to establish baseline wetland and vegetation conditions on the site. Sarah evaluated the biological merit of several tidal channel design alternatives for the Conceptual Design Alternatives report and designed a proposed planting and seeding mix for the marsh restoration habitats.

U.S. Coast Guard, Storis Water Line Replacement, Kodiak, AK. Lead Biologist. The USCG proposes to upgrade existing water line and stormwater infrastructure on the USCG Base Kodiak. The project includes constructing new stormwater outfalls in Womens Bay. Sarah wrote the Biological Assessment to evaluate the project's impact to fish and wildlife species or critical habitat listed under the federal Endangered Species Act and essential fish habitat protected under the Magnuson-Stevens Fishery Conservation and Management Act.

U.S. Department of the Navy, Navy Culvert Tunnel Construction Monitoring Project, Bremerton, WA. Biologist, Environmental Compliance and Permit Specialist. Sarah coordinated the environmental tasks for the construction of a fish passage barrier correction along Union River through an active Navy railroad embankment. To restore fish passage upstream in Union River, Shannon & Wilson assisted Navy Facilitates Engineering Systems Command with the construction of a new tunnel, measuring 20-feet wide and 280-feet long and within a 70-foot-tall Navy railroad embankment which connects Naval Base Kitsap Bremerton and NAVBASE Kitsap Bangor. Sarah performed a bird nest survey for compliance with the Migratory Bird Treaty Act, managed fish removal and exclusion downstream of the project site and performed routine monitoring of the block nets to ensure proper function throughout the project. Sarah authored the project's Environmental Protection Plan, prepared the Stormwater Pollution and Prevention Plan,

applied for the construction stormwater NPDES permit, and served as one of the project's Certified Erosion and Sediment Control Leads (CESCL), conducting TESC site inspections and reporting for compliance throughout construction and site restoration.

BNSF Railway Company, Norfolk Embankment Repair Project, Larimer County, Colorado. Wetland biologist, environmental compliance and permit specialist. The project involved bank stabilization along 0.4 miles of BNSF Railway embankment in Larimer County, Colorado. Sarah performed a site wetland delineation, wrote the project's Stormwater Management Plan to meet Colorado State guidelines and designed a native erosion control seed mix for use during the restoration phase based on the area's climate, topography, and elevation.

International and C Street LLC, International Airport Road and C Street, Anchorage, AK. Wetland Biologist. The project involved constructing the Anchorage Neighborhood Health Center and associated office buildings, and the Hyatt House hotel and associated parking on a series of parcels located in Anchorage, Alaska. Shannon & Wilson obtained a US Army Corps of Engineers Section 404 Individual Permit to fill wetlands at the development site and designed and implemented a mitigation plan for the project. Sarah performed vegetation and wetland inundation mitigation monitoring for the project, confirmed and mapped wetland boundaries, and coordinated with the Corps to assess whether the mitigation plan's performance standards had been met.

Whatcom County, Deming Levee Upstream Improvements, Deming, WA. Wetland Biologist. The Deming Levee project was an engineering and environmental design and permitting project that extended the Deming Levee 1,000 ft to tie into and prevent overtopping of a substandard structure. Sarah delineated the existing wetlands in the project area, wrote the project delineation report, contributed to the conceptual mitigation plan, and monitored the surface and groundwater dataloggers for the project.

BNSF Railway Company, Kelso to Martin Bluff, Task 6, Kelso, WA. Wetland Biologist. The project included constructing an additional rail, as well as new bridge across the Coweeman River. Sarah delineated ten wetlands and the ordinary high water mark along the Coweeman River and Owl Creek and provided functional assessments to document existing conditions in the project area. Sarah authored the wetland discipline report as part of the project's Environmental Assessment.

City of Redmond, West Lake Sammamish Sewer Manhole #2, Redmond, WA. Wetland Biologist, and Permit Specialist. The project constructed a manhole in an existing sewer line along the shoreline of Lake Sammamish to facilitate City maintenance. Sarah delineated site wetlands and delineated the Lake Sammamish Ordinary High Water Mark to assist the design team in minimizing and avoiding impacts. She also authored the project's Biological Assessment, contributed to the Wetland Delineation Report, and applied for and obtained local, state, and federal permitting, including coordination and site visits with agency representatives. Sarah also contributed to the project's Mitigation Plan and performed the mitigation baseline monitoring.

Lake Washington School District, Juanita High School Replacement, Kirkland, WA. Project manager, wetland biologist, and permit specialist. The school district intends to replace Juanita High School on the existing school property, which is constrained by a wetland and stream system on 3 of the 4 parcel boundaries. Sarah delineated site wetlands and the ordinary high water mark of the site stream to assist the design team in minimizing and avoiding impacts to critical areas and their buffers and authored the project Wetland and Stream Delineation Report/Critical Areas Report. During the project's design process the City of Kirkland updated

their critical areas code in several iterations and Sarah coordinated with the City to identify the best permitting pathway for the project. Sarah designed a buffer mitigation plan to compensate for temporary buffer impacts. Sarah has also coordinated with Shannon & Wilson hydraulic engineers to provide permitting and hydraulic analyses for a pedestrian footbridge that crossed the project site's stream. Sarah will continue to assist the project following construction completion through mitigation construction oversight and mitigation monitoring.

Lake Washington School District, Peter Kirk Elementary School Replacement, Kirkland, WA. Project manager, wetland biologist, and permit specialist. The school district is to replacing Peter Kirk Elementary School on the existing school property. Sarah delineated site wetlands and the ordinary high water mark of the site stream to assist the design team in minimizing and avoiding impacts to critical areas and their buffers. During the project's design process, the City of Kirkland updated their critical areas code in several iterations and Sarah coordinated with the City to identify the best permitting pathway for the project. She authored the project's Wetland and Stream Delineation Report/Critical Areas Report and designed and wrote the Buffer Averaging and Enhancement Mitigation Plan. Sarah successfully advocated for the School District when the City of Kirkland attempted to impose critical areas code requirements that were not applicable to the project. Sarah helped the project avoid the unnecessary code constraints by developing a case-specific ecological assessment, detailed code analysis and hydraulic analysis; by assisting the School District at City meetings; and by successfully presenting the School District's case at the project's public hearing. Sarah provided buffer mitigation construction compliance and is performing the City-required buffer mitigation monitoring and reporting.

City of Edmonds School District, New Madrona K-8 School Replacement Project, Edmonds, WA. Wetland Biologist and Permitting Specialist. The Edmonds School District replaced the Madrona K-8 School on the school property. Sarah performed wetland delineations to identify critical area constraints on the school property and prepared technical documentation to support design selection and permit applications. She also provided local critical areas code interpretation to minimize impacts to critical areas and reduce the permitting effort. Sarah designed and wrote a buffer averaging and enhancement plan to facilitate approval of local permits. Sarah also successfully presented the mitigation strategy and code compliance summary on behalf of the School District at the project's public hearing examination. Sarah will continue to provide mitigation monitoring to complete the City's critical area code requirements.

City of Sammamish, Issaquah-Fall City Road Improvements, Sammamish, WA. Wetland biologist. The project improved SE Issaquah-Fall City Road between 242nd Avenue SE to just beyond the intersection with Klahanie Drive SE. Sarah delineated and documented the existing conditions of North Fork Issaquah Creek and three wetlands, characterized, and rated the onsite wetlands and contributed to the delineation report. Sarah also assisted in the onsite mitigation as-built monitoring documentation.

City of Mill Creek, Delineation Services for Cook, Dobson, and Remillard Properties, Mill Creek, WA. Wetland Biologist. Performed wetland delineations and delineation reports to support the City's planning and development decisions for three City properties. Reduced the City's site restrictions by identifying and correcting delineation inconsistencies performed previously by other consultants on the sites.

City of Snohomish, Stocker Property, Snohomish, WA. Wetland Biologist. The City of Snohomish purchased 20 acres of farmland along the Snohomish River in order to build a public boat launch and associated parking area. Sarah performed a wetland delineation on the 20-acre property, delineated the Ordinary High Water Mark on the Snohomish River to help the City better understand site constraints. Sarah also assisted the City in understanding the federal, state,

and local permitting implications for the project, which was located within both City of Snohomish and Snohomish County jurisdictions.

Clallam County, Dungeness River Levee Setback and Floodplain Restoration, Clallam County, WA. Wetland Biologist and Permit Support. Clallam County is proposing a 2,500-foot-long, river levee setback, roadway relocation, and 120-acre river floodplain restoration project along the Dungeness River. Shannon & Wilson is performing fluvial geomorphology analysis, multidimensional (2D) hydraulic modeling, erosion and scour protection design, groundwater studies, sea level rise and climate change analysis, drainage studies, geotechnical stability analyses, seismic analyses, wetland and stream delineations, wetland functional assessments, and environmental permitting coordination. Sarah delineated nine wetlands and the ordinary high water mark of site streams within the 125-acre site, rated the wetland function using the 2014 Ecology wetland rating system, and analyzed project impacts and mitigation credits made available from the floodplain restoration.

City of Kent, Green River Levee Improvements, Kent, WA. Wetland Biologist. Sarah performed wetland reconnaissance of nine project sites, which included proposed sheet pile walls, proposed road realignment and proposed earthen berms. Sarah assisted in wetland delineations of wetlands that would be impacted by the proposed projects and categorized the wetlands using the Washington State Wetland Rating System for Western Washington. She also authored a wetland delineation report and biological assessment for the proposed projects and authored a biological assessment addendum when the project design changed.

Raft Island Improvement Association, Raft Island Community Bridge Replacement Project, Pierce County, WA. Lead Biologist and Permit Specialist. Sarah facilitated the permitting for the Raft Island Geotechnical Explorations, which included seven over-water borings. The project received funding from the US Department of Agriculture, necessitating coordination between federal and local agencies. Sarah prepared an addendum to the Raft Island Biological Evaluation, the Joint Aquatic Resource Permit Application, wrote a Shoreline Exemption letter and coordinated with Pierce County to obtain permitting for the project.

King County Library System, Algona Pacific Library Expansion, Algona Pacific, WA. Wetland Biologist. Sarah performed a wetland reconnaissance and wetland delineation for the project, rated observed wetlands using the Revised Washington State Wetland Rating System in Western Washington, and prepared a wetland delineation report.

Port of Seattle, Consolidated Rental Car Facility, SeaTac, WA. Biologist. Sarah conducted a subgrade and soil conditions evaluation for the landscaped areas associated with the Consolidated Rental Car Facility in SeaTac, WA. She used detailed field documentation and soil fertility analytical tests to compile a soil evaluation report used by Port of Seattle and Turner Construction in a case against a sub-contractor.

Kitsap County, Central Kitsap Collection & Conveyance System Upgrades Project, Kitsap County, WA. Wetland Biologist. Kitsap County Public Works plans to upgrade three lift stations. As a biologist, Sarah performed a wetland and stream reconnaissance at the lift station locations and along two proposed force main replacement alignments. Sarah rated the observed wetlands using the Revised Washington State Wetland Rating System in Western Washington, and produced a wetland and stream reconnaissance report.

City of Gig Harbor, Cushman Trail Project Phases 3 and 4, Gig Harbor, WA. Wetland Biologist. The City of Gig Harbor plans to build a non-motorized trail through areas with existing wetlands and streams. Sarah performed a wetland and stream delineation, rated observed wetlands, produced a wetland and stream delineation report, and completed a WSDOT

Environmental Classification Summary (ECS) checklist and Joint Aquatic Resource Permit Application to assist in project design and permitting.

WSDOT, SR 520 Bridge Replacements and High Occupancy Vehicle (HOV) Program, I-5 to Medina, Seattle, WA. Biologist. Sarah provided drilling observation erosion control monitoring for over-water and land borings in the I-5 to Medina portion of the SR520 Bridge Replacement Program. As a Shannon & Wilson (SW) field representative, Sarah visually classified soil samples, compiled a field log of each boring, and returned the samples to the SW laboratory for further analysis and testing. She provided TESC Quality Control through her drilling observations and documented those BMPs implemented by WSDOT personnel. Sarah also performed field reconnaissance for boring locations, assessing factors such as impact to critical areas, and BMPs and site restoration requirements.

BNSF Railway Company, BNSF Seattle to Everett Slope Stability Study, Seattle, WA. Project research and data synthesis. The study identified areas of high landslide hazard, prioritized the areas based on landslide hazard, and provided conceptual-level landslide mitigation measures and conceptual-level order-of-magnitude costs to improve slope stability and reduce the landslide hazard to railroad operations. The study included approximately 900 landslide events recorded between 1914 and 2011. Sarah compiled, organized, evaluated, and presented geologic and landslide hazard information for the report.

U.S. Department of the Navy, P-834 Pier Extension Geotechnical Explorations at Naval Base Kitsap (NBK) – Bangor, Kitsap County, WA. Biologist. The project included in-water geotechnical borings in Hood Canal, as well as upland borings and test pits along the Bangor shoreline. Sarah assessed the potential of the project to affect species listed under the Endangered Species Act. Sarah also wrote the No Effect letter for geotechnical explorations on the NBK Bangor naval base, which documented that the project will have no effect on listed species. Sarah also completed the Joint Aquatic Resource Permit Application for the project.

Youngsman Property, Twin Bridge Marine Park Biological Evaluation Addendum, Swinomish Channel, Skagit County, WA. Biologist. The Twin Bridges Marina was originally permitted in 2002 to install in-water piling, and over-water access ramps and floats for 16 boat houses. In 2012, Twin Bridge Marina proposed to modify 13 existing boat slips by moving and re-driving in-water piling. Sarah assessed the potential of the revised project to affect species listed under the Endangered Species Act and authored an addendum to the Twin Bridge Biological Evaluation documenting that the project would not likely adversely affect listed species.

The Nature Conservancy, Fisher Slough Levee Setback Project, Skagit County, WA. Biologist. The project involved the construction of approximately 3,300 feet of new levee, demolition of existing levee, and habitat restoration of 120 acres of marsh habitat. Sarah completed the Notice of Intent and implemented the NPDES permit during the last phase of the project, which involved bank stabilization in a flood damaged stream channel. Sarah also performed fish exclusion in the stream prior to the bank stabilization work.

Port of Friday Harbor, Bulkhead Replacement Project, Friday Harbor, WA. Biologist. Project replaced an aging rockery bulkhead with a 175-foot long geogrid and concrete wall bulkhead in Friday Harbor on San Juan Island, WA. The project also included the removal of approximately 17, 12-inch derelict timber creosote-treated piles. Sarah performed a qualitative beach survey to assess riparian vegetation and habitat features, aquatic substrate and macroalgae. Sarah also contributed to the project Biological Evaluation assessing potential impacts to listed species under the federal Endangered Species Act and essential fish habitat under the Magnuson-Stevens Fishery Conservation and Management Act, which resulted in a *May Affect, not Likely to Adversely Affect* effects determination for the project.

Kitsap County, Central Kitsap Pump Stations 1, 6, 8, 18, and 38 Conveyance System Upgrades, Kitsap County, WA. Wetland Biologist and Permit Secialist. Kitsap County Public Works proposes to upgrade five pump stations and associated gravity sewers in Central Kitsap. Sarah delineated wetlands and streams along the project alignment and produced the wetland and stream delineation report needed to permit the project. Sarah also prepared the SEPA Checklist for the project on behalf of the County.

BNSF Railway Company, Lake Oahe MP 811.0 Landslide Repair, Mobridge, Corson County, SD. Wetland Biologist and Permit Specialist. Sarah assisted BNSF in permitting slope stabilization and repair measures near Lake Oahe, where an active, deep-seated landslide threatened the safety of train passage on the tracks above the landslide. Sarah successfully proposed and received Corps concurrence that onsite wetlands were hydrologically isolated from the lake and were therefore not regulated under the Clean Water Act, reducing project permitting effort and costs.

Stillaguamish Tribe of Indians, Harvey Creek Fish Ladder Replacement Project, Arlington, WA. Biologist and permit specialist. Project upgraded the Stillaguamish Tribe's Harvey-Armstrong Creek Hatchery, including replacing the fishway, fish ladder, and water intake to meet current fish passage criteria. Sarah wrote the project JARPA, completed the SEPA Checklist, and produced the project Biological Evaluation, documenting that the project was not likely to adversely affect ESA-listed species.

Alaska Department of Transportation and Public Facilities, Integrated Vegetation Management Plan, Alaska. Biologist. The Alaska Department of Transportation and Public Facilities (ADOT & PF) oversees 255 airports, 11 ferries, 5,619 miles of highway and 720 public facilities throughout the state of Alaska. Shannon & Wilson prepared an integrated vegetation management plan to assist ADOT & PF in using herbicide and non-chemical vegetation maintenance and control measures to improve public safety. Sarah conducted interviews with over a dozen ADOT & PF maintenance superintendents and completed site assessments of highway vegetative management throughout Alaska's ecoregions to evaluate maintenance challenges and prioritize effective management strategies. Sarah also completed factsheets on common herbicides to assist ADOT & PF maintenance operators and the public in understanding the potential risks associated with herbicide as described in the vegetation management plan.

Genesee & Wyoming, Inc., Seeding Specification for Milepost 522.3, Roseburg, OR. Lead Biologist. Genesee & Wyoming, Inc. planned slope stabilization efforts on the slopes above Milepost 522.3, where recent fires and surficial erosion resulted in vegetation loss on the slopes. To assist Genessee & Wyoming's slope stabilization efforts in the area, Sarah designing a seed mix of native, erosion control species appropriate for the area's climate and elevation and wrote the seeding specifications for the projects RFP.

Miller Hayashi Architects, Miller Hiyashi Wetland Reconnaissance, Seattle, WA. Wetland Biologist. Sarah performed a wetland reconnaissance evaluate existing conditions on a parcel within the City of Seattle. The reconnaissance and Sarah's coordination with the City of Seattle Department of Construction and Inspections was used to assist the client in the decision to purchase the subject parcel.

Lake Washington School District, Clara Barton (New North Redmond) Elementary School, Redmond, WA. Wetland Biologist, and Permit Specialist. The school district intends to build a new elementary school on a vacant parcel located in Redmond. Sarah performed a wetland and stream reconnaissance of the parcel, determined that none existed within the parcel, and provided

a letter report to the District documenting the findings. Sarah also assisted the School District during the SEPA comment review process.

Snohomish County, North Meander Stillaguamish River, Snohomish County, WA. Wetland Biologist. Performed wetland delineation and Ordinary High Water Mark delineation on a backwater area associated with the North Fork of the Stillaguamish River to support future geotechnical explorations and project design.

City of Renton, Ron Regis Park Restroom/Storage Facility, Renton, WA. Wetland Biologist and Permitting Specialist. The City of Renton is planning to construct a restroom and storage facility on Ron Regis Park. The park property is flanked by the Cedar River, Madsen Creek, and several associated wetlands, and lies within the 100-year floodplain of the Cedar River. Sarah delineated wetlands and streams on the park property and prepared the wetland delineation report to assist the City in understanding the extent of onsite wetland and stream buffers and building constraints. Sarah also wrote the Biological Assessment to assess project impacts on threatened and endangered species.

Kitsap County, Central Kitsap Treatment Plant, Kitsap County, WA. Wetland Biologist and Permitting Specialist. As a result of system improvements on the Central Kitsap Treatment Plant, the County constructed a wetland mitigation site on the treatment plant property. Sarah performed baseline and Years 1 through 5 of monitoring of the mitigation site and coordinated with the County on plant replacements, surface water monitoring, and maintenance requirements. Sarah also coordinated with the US Army Corps of Engineers in evaluating whether the project meets the mitigation success criteria. The mitigation site has successfully completed mitigation monitoring.

Kitsap County, South Central Force Main Project, Kitsap County, WA. Wetland Biologist and Permitting Specialist. The South Central Force Main project consisted of replacing approximately 6,500 feet of 30-inch-diameter techite force main from Paulson Road to the Central Kitsap Wastewater Treatment Plant (CKTP) with 34-inch high-density polyethylene pipe force main. The project included open trenching, installing the force main, and backfilling the trench with native soil. Mitigation for this project's impacts to wetlands and buffers generally consisted of restoring temporarily impacted areas to pre-construction conditions. Sarah performed mitigation monitoring over a period of 6 years and coordinated with the County on plant replacements and maintenance requirements. Sarah also coordinated with the US Army Corps of Engineers in evaluating whether the project meets the mitigation success criteria. The mitigation site has successfully completed mitigation monitoring.

Lake Washington School District, 2018 Bond Program School Reconnaissance, Cities of Kirkland, Redmond, and Sammamish, and Unincorporated King County, WA. Wetland Biologist, and Permitting Specialist. Sarah assisted the School District in evaluating several school locations that were previously identified for the 2018 Bond program. She provided wetland and stream reconnaissance, wildlife observations, and regulatory review at several proposed school sites to assist the School District in determining potential site constraints associated with critical areas. The schools under evaluation included Lake Washington High School, New Eastside School, Kamiakin Middle School, and Louisa May Alcott Elementary School.

University of Washington, University of Washington ICA Drainage Ditch Violation, City of Seattle, WA. Wetland biologist and Permitting Specialist. The University of Washington received a violation from the US Army Corps of Engineers and the WA State Department of Ecology for illegal placement of fill in a wetland during construction of the Husky Ballpark Stadium. Shannon

& Wilson assisted the UW in responding to the violation by assessing preconstruction condition and wetland function; coordinating with local, state, and federal agencies; and designing an agency-approved mitigation plan. Sarah performed oversight during mitigation site construction and will write the mitigation as-built or baseline monitoring report.

City of Edmonds Department of Parks, Recreation, & Cultural Services, Edmonds Marsh Critical Areas Report, City of Edmonds, WA. Wetland biologist. The City of Edmonds Department of Parks, Recreation, and Cultural Services is proposing to perform maintenance activities, including invasive species removal and native plantings within and in the vicinity of Edmonds Marsh. Sarah was the lead biologist in both field and aerial delineations of Edmonds Marsh, including performing a functional assessment of the marsh and identifying areas of salt and freshwater vegetation communities. Sarah wrote a Critical Areas Report to assist the City in obtaining approval to complete the proposed maintenance activities.

South Puget Sound Salmon Enhancement Group, Titlow Shoreline Restoration Project, City of Tacoma, WA. Permitting Specialist. To support the Titlow Shoreline Restoration Project, Shannon & Wilson performed geotechnical borings within existing BNSF right-of-way. The borings were located within shoreline jurisdiction and wetland buffer. Sarah obtained a City of Tacoma Shoreline Exemption to allow the borings to proceed.

City of Edmonds, Dayton Street Pump Station, City of Edmonds, WA. Permitting Specialist. The City of Edmonds proposes to upgrade the storm sewer system by constructing a stormwater pump station that connects to existing storm sewer in order to prevent flooding in the Dayton Street area. Sarah contributed to the SEPA Checklist and Shoreline Master Program Compliance Letter to facilitate local permitting for the project.

EXPERIENCE WITH OTHER FIRMS

Washington State Department of Ecology. As a biologist for the WA State Department of Ecology, Sarah led a stream habitat monitoring project in the Wenatchee sub-basin. She performed rapid assessment stream surveys through stream channel characterization, macroinvertebrate collection and water chemistry analysis in wadeable and non-wadeable streams. The project required coordination with federal and state agencies as well as local land owners. Sarah also assisted in electro-fishing for the National Rivers and Streams Assessment (NRSA). Sarah implemented the Environmental Protection Agency's Environmental Monitoring and Assessment Program (EMAP), and NOAA Fisheries' Integrated Status and Effectiveness Monitoring Program (ISEMP).

Subject: Comments on the Draft Environmental Impact Report for the Giovannoni Logistics Center Project

Dear Mr. Franco:

This letter contains my comments on the Draft Environmental Impact Report ("DEIR") prepared by the City of American Canyon ("City") for the Giovannoni Logistics Center Project ("Project"). Buzz Oates LLC ("Applicant") is proposing to develop a 2.4-million-square-foot logistics center on approximately 163 acres of an approximately 208-acre site located in the northwestern portion of the City of American Canyon. The remaining 44.8 acres of the site would serve as mitigation for the Project's impacts to wetlands.

I am an environmental biologist with 29 years of professional experience in wildlife biology and natural resources management. I have served as a biological resources expert for over 150 projects in California. My experience and scope of work in this regard has included assisting various clients with evaluations of biological resource issues; preparation and peer review of environmental compliance documents prepared pursuant to the California Environmental Quality Act ("CEQA") and the National Environmental Policy Act ("NEPA"); and preparation of written comments that address deficiencies with CEQA and NEPA documents. My work has included written and oral testimony for the California Energy Commission, California Public Utilities Commission, and Federal courts. My educational background includes a B.S. in Resource Management from the University of California at Berkeley, and a M.S. in Wildlife and Fisheries Science from the Pennsylvania State University. A copy of my current curriculum vitae is attached hereto. 1

The comments herein are based on my review of the environmental documents prepared for the Project, a review of scientific literature pertaining to biological resources known to occur in the Project area, and the knowledge and experience I have acquired during my 29-year career in the field of natural resources management.

ENVIRONMENTAL SETTING

Vernal Pool Fairy Shrimp

The Project site provides potential habitat for the vernal pool fairy shrimp, a federally threatened species. LSA conducted dry season vernal pool fairy shrimp surveys in summer of 2016, and Monk & Associates conducted wet season vernal pool fairy shrimp surveys in winter of 2016-2017. The results of those surveys are outdated and can no longer be used to assume absence of the species at the Project site.

Vernal pool fairy shrimp disperse among individual pools through flooding, wind, birds, other vertebrates, and various human activities.[1] As a result, vernal pool fairy shrimp can rapidly colonize new pools, or recolonize pools from which they have been extirpated.[2] 2

Thousands of vernal pool fairy shrimp were detected in a vernal pool near the Napa County Airport, approximately 2,700 feet northwest of the Project site.[3] Numerous studies have shown that viable cysts can survive passage through the digestive tract of waterfowl, as well as attach to feathers or feet of wading birds, thus promoting long-distance dispersal among pools.[4] Because waterfowl and shorebirds commonly travel among ephemeral wetlands (e.g., vernal pools) to satisfy their energy requirements,[5] it is reasonably possible that birds transported vernal pool fairy shrimp from the occupied pool near the airport to the Project site within the five years that have elapsed since the surveys were conducted. As a result, negative results from surveys conducted five years ago do not justify the DEIR's determination that the Project would have no impact on the vernal pool fairy shrimp.

Special-Status Birds

The DEIR acknowledges that bird species designated as Bird Species of Conservation Concern by the United States Fish and Wildlife Service ("USFWS") are considered special-status species 3

that "must be evaluated in the context of evaluation under CEQA."[6] However, the DEIR fails to disclose or analyze impacts to the following Bird Species of Conservation Concern that were detected at the Project site:[7] California gull, savannah sparrow, and marbled godwit.[8] Although the DEIR does not quantify the number of California gulls and savannah sparrows detected at the Project site, it states that "large flocks" of marbled godwits were observed probing the ground and cow patties.[9]

In addition, the DEIR fails to disclose and analyze potentially significant impacts to the cackling goose, which is considered a special-status species on its wintering grounds in California.[10] Large flocks of cackling geese have been detected at the Napa Logistics Park[11] (which is located immediately north of the proposed Project site), and they likely occur at the Project site.[12] Grasslands associated with vernal pool landscapes in California provide critical foraging habitat for cackling geese.[13]

3

Short-eared Owl

The DEIR states that short-eared owl does not occur at the Project site because "[s]uitable habitat is not present at the site."[14] The DEIR's statement that suitable habitat is not present at the Project site is inconsistent with scientific information. According to the authors of *California Bird Species of Special Concern*:

> "Nesting short-eared owls require open country that supports concentrations of microtine rodents and herbaceous cover sufficient to conceal their ground nests from predators. Suitable habitats may include salt- and freshwater marshes, irrigated alfalfa or grain fields, and ungrazed grasslands and old pastures. Tule marsh or tall grasslands with cover 30–50 cm in height can support nesting pairs."[15]

4

The Project site contains microtine rodents (e.g., voles), freshwater marshes, and ungrazed grasslands.[16] This constitutes prime habitat for the species. Indeed, a short-eared owl was

flushed from vegetation along No Name Creek during a recent survey at the Napa Logistics Park.[17] For these reasons, the DEIR must analyze the Project's potentially significant impacts on the short-eared owl and its habitat. 4

Rare Plants

Dr. Brent Helm conducted botanical field surveys at the Project site on April 7, 2021, May 4, 2021, and May 17, 2021. The DEIR states: "[b]ased on the Helm Biological Consulting botanical survey results, no special-status plant species occur on the project site. Therefore, no impacts to special-status species would occur from construction of the proposed project. No mitigation is warranted for special-status plants."[18] There are two reasons why the DEIR's conclusions are not warranted. First, the surveys were conducted during a drought year. Many vernal (or ephemeral) pool plant species have seeds that can remain dormant for many years, an adaptation that allows them to survive through periods of drought.[19] Dr. Helm's rare plant survey report admits that nine of the rare plant species that could occur at the Project site are wetland dependent, and that below annual rainfall that occurred in 2020/2021 could have affected Dr. Helm's ability to detect presence of those species.[20] 5a

Second, the surveys did not encompass the blooming periods of all of the target species. Specifically:

- Napa bluecurls (*Trichostema ruygtii*) is an annual herb that blooms between June and October.[21] Specimen records in the California Consortium of Herbaria provide evidence of times of year a species is identifiable (i.e., its identity can be verified by an herbarium). The California Consortium of Herbaria has 19 specimens of Napa bluecurls collected in Napa County. All of those specimens were collected between July and September.[22] Dr. Helm did not visit a reference site to provide evidence that Napa bluecurls would have been evident and identifiable when he conducted his surveys in May 2021.[23] 5b
- Pappose tarplant (*Centromadia parryi* ssp. *parryi*) is an annual herb that blooms between May and November, depending on ecoregion, climatic conditions, and other variables that influence plant phenology. Although Helm conducted surveys on May 4 and May 17, it is very rare for pappose tarplant to bloom that early in Napa County. The California Consortium of Herbaria has 42 specimens of pappose tarplant collected in Napa County. Only three of the specimens were collected during the month of May, two of which consisted of seedlings collected on May 5, 1957.[24] Most of the remaining

[24] Data provided by the participants of the Consortium of California Herbaria. Available at: <ucjeps.berkeley.edu/cch_archive/>. (Accessed July 5, 2022).

specimens were collected much later in the year (e.g., September and October).[25] Therefore, although pappose tarplant occasionally is detectable in May, Dr. Helm did not visit a reference site to confirm that pappose tarplant was evident and identifiable when he conducted his surveys in May 2021.[26]

5b

Because the surveys were not conducted when all potentially occurring rare plants were both evident and identifiable (as stipulated in the California Department of Fish and Wildlife ["CDFW"] survey protocol),[27] there is insufficient evidence to support the DEIR's determination that "no special-status plant species occur on the project site."

PROJECT IMPACTS ISSUES

Wetlands

According to the DEIR, the Project would impact 3.7 acres of palustrine emergent wetlands, seasonal wetlands, and vernal pools. However, nowhere does the DEIR discuss the ecological functions of the wetlands at the Project site, nor does it analyze the Project's indirect impacts on wetlands outside of the development footprint.

Vernal pool landscapes provide important habitat for birds at the local, regional, and continental scales.[28] On a local scale, vernal pools are part of a complex of habitats where a diversity of birds use various resources. On a regional scale, vernal pool landscapes enhance migratory bird habitats. On a continental scale, vernal pool landscapes provide vital links in the California portion of the Pacific Flyway corridor.

6

When flooded, vernal pools (or surrogates) are relatively shallow, resulting in optimal foraging depths for a variety of waterbirds. In addition, the relatively short hydroperiod of vernal pools (and surrogates) results in abundant wetland invertebrate fauna during spring, when birds require protein-rich resources to meet the energy demands of spring migration.[29]

Scientific literature has demonstrated that seasonal wetlands are critical to waterbird survival and recruitment.[30] For example, migratory shorebirds use temporary wetlands as stopover areas that may provide enough food to nearly double their body mass in a relatively short period. Grasslands associated with vernal pool landscapes in California also provide critical foraging habitat for birds. For example, during spring hyperphagia, cackling and Ross' geese spend considerable time grazing on protein rich plants in herbaceous habitats adjacent to vernal pools, while terrestrial gleaning shorebirds (e.g., curlews, plovers, and godwits) feed on beetles,

[29] *Ibid.*
[30] *Ibid.*

spiders, and bees. These protein rich resources enable the birds to build nutrient reserves sufficient to reach their northern breeding grounds in good condition.

It is clear that the wetlands and grasslands at the Project site provide important habitat for a variety of birds, including numerous waterfowl and shorebird species.[31] For example, Monk & Associates reported "large flocks of migrating and over-stopping marbled godwits (*Limosa fedoa*) and long-billed curlews (*Numenius americanus*)" probing for insects in the ground and cow "patties" at the Project site.[32]

The City has determined that implementation of the mitigation measures proposed in the DEIR "would offset permanent impacts in-kind to the palustrine emergent wetland and in-kind to the vernal pools and ensure there is no-net loss of wetland area, thus reducing potential impacts to a level considered less than significant."[33] Although the proposed mitigation might ensure no-net loss of *wetland area*, it would not ensure no-net loss of wetland functions and values (which is the goal of the Clean Water Act Section 404 and 401 programs).[34]

6

The mitigation proposed in the DEIR entails preservation and creation of wetlands in a 44.8-acre "Wetland Preserve." This "preserve" would: (a) be located between the Project site and the Napa Logistics Center Project site, (b) be bisected by the Devlin Road Vine Trail Extension Project, and (c) have no connectivity to any other open space lands.[35] Thus, the preserve would function as a habitat "island" surrounded by urban (industrial) development.

Human disturbance, which interrupts feeding, resting, and reproductive behaviors, and uses energy associated with flight, has been identified as a major factor influencing the distribution and abundance of birds and other wildlife.[36] The "Wetland Preserve" proposed in the DEIR would be subject to ongoing disturbance caused by traffic, noise, and human activity associated with the Project. Disturbance stimuli associated with the Project would degrade the preserve's functions as wildlife habitat. MM LU-3, which requires measures to reduce the attraction of birds to the wetland preserve, would further diminish the preserve's functions as habitat. As a result, MM BIO-2 and MM BIO-3 would not reduce the Project's impacts on wetlands to less-than-significant levels.

Swainson's Hawk

Swainson's hawks were observed foraging at the Project site during a site reconnaissance survey conducted during the nesting season.[37] According to the DEIR: "[d]evelopment of the proposed project would also provide and preserve in perpetuity approximately 45 acres of open space that would include habitat currently suitable for foraging by the Swainson's hawk as indicated by the observation of a Swainson's hawk foraging in the site in spring 2021."[38] Whereas the Project would preserve approximately 45 acres of foraging habitat, it would also result in the net loss of 163 acres of foraging habitat.[39] In addition, the Project "would be designed and managed to discourage wildlife use of the site," and MM LU-3 would incorporate measures "to reduce the bird attractant potential of the wetland area, consistent with the [Airport Land Use Compatibility Plan] policies."[40] The Federal Aviation Administration ("FAA") has ranked the relative hazard of various wildlife groups to aircraft. Hawks are one of the wildlife groups most commonly involved in damaging strikes to aircraft in the United States.[41] Therefore, it is reasonable to assume that the wildlife hazard reduction measures required under MM LU-3 would include measures to reduce the attraction of Swainson's hawks to the 45-acre open space preserve.

Loss of foraging habitat is one of the primary threats to Swainson's hawks in California.[42] In addition to generating a potentially significant impact under CEQA, the loss of foraging habitat from the Project site may result in the take (killing) of Swainson's hawks, which would be a violation of Section 2080 of California Fish and Game Code.[43] The DEIR provides the following analysis of this issue: 7a

> "Based upon the limited number of Swainson's hawk records within a 10-mile radius of the project site, there is sufficient foraging habitat in and within the vicinity of the project site. Based upon the limited number of known Swainson's hawk to occur within a 10 mile radius of the project site and the acreage of existing foraging habitat currently protected, the proposed project would not result in significant impacts to foraging habitat directly, indirectly, or cumulatively, therefore no mitigation is warranted for Swainson's hawk foraging habitat."[44]

There are several flaws with the DEIR's analysis. First, the DEIR fails to substantiate the assertion that there are only a "limited number of Swainson's hawk records within a 10-mile radius of the project site." To the contrary, the California Natural Diversity Database

[37] DEIR, Appendix C.1, Biological Resources Report, p. 28.
[38] DEIR, p. 3.3-24.
[39] DEIR, pp. 3.9-51 and -52.
[40] *Ibid.*
[41] Federal Aviation Administration. 2007. Hazardous Attractants on or near Airports. Advisory Circular 150/5200-33B. Federal Aviation Administration, Washington, D.C.
[42] California Department of Fish and Wildlife. 2016. Status Review: Swainson's Hawk (*Buteo swainsoni*) in California.
[43] California Department of Fish and Game. 1994. Staff report regarding mitigation for impacts to Swainson's hawks (*Buteo swainsoni*) in the Central Valley of California.
[44] DEIR, p. 3.3-24.

("CNDDB") has 8 "processed,"[45] and several additional "unprocessed,"[46] records of Swainson's hawk nest sites within a 10-mile radius of the Project site.[47] In addition, the eBird database has numerous records of Swainson's hawks within a 10-mile radius of the Project site (Figure 1, below).[48] 7a

Second, the Applicant's effort to locate Swainson's hawk nests that could be affected by the Project was limited to a single survey (on April 16, 2021), during which the Applicant's biologist drove roads within one mile of the Project site to inspect trees for raptor nest structures.[49] This survey effort was insufficient because it did not adhere to the Swainson's hawk survey protocol.[50] According to the Swainson's hawk survey protocol, three independent surveys need to be conducted between April 5 and April 20, and surveys during this period "may require a great deal of 'sit and watch' surveying."[51] The protocol's guidance is consistent with my experience monitoring Swainson's hawks: the nest often is not visible from ground level (e.g., due to position atop a tree with dense foliage) and is only detectable when one of the birds flies to or from the nest site (i.e., through extensive "sit and watch" surveying). 7b

Third, the DEIR provides no evidence (e.g., data) to support its claim that "there is sufficient foraging habitat in and within the vicinity of the project site." Based on my review of Google Earth imagery, much of the open space that remains in the vicinity of the Project site is comprised of vineyards, marshlands, or other land cover types that provide little to no value as foraging habitat for Swainson's hawks.[52]

To reverse the decline of Swainson's hawk populations, it is CDFW's policy that new development projects that adversely modify nesting or foraging habitat within 10 miles of an active nest should mitigate the project's impacts by providing compensatory mitigation.[53] Active Swainson's hawk nests are located within 5 miles of the Project site.[54] Therefore, in accordance with CDFW mitigation guidelines: 7c

> "Projects within 5 miles of an active nest tree but greater than 1 mile from the nest tree shall provide 0.75 acres of HM [Habitat Management] land for each acre of urban development authorized (0.75:1 ratio). All HM lands protected under this requirement may be protected through fee title acquisition or conservation

easement (acceptable to the Department) on agricultural lands or other suitable habitats which provide foraging habitat for Swainson's hawk."[55]

Because the Project site is known to provide foraging habitat for Swainson's hawks, and because the DEIR does not require compensatory mitigation for impacts to that habitat: (a) the Project would have an unmitigated, significant impact on the Swainson's hawk; and (b) the Project requires Fish and Game Code Section 2081 Management Authorizations from the CDFW.

7c

Golden Eagle

An HBG biologist observed a golden eagle foraging at the Project site on April 16, 2021.[56] The DEIR's analysis of impacts to the golden eagle is limited to the potential for Project construction activities to disturb golden eagle nests; the DEIR provide no analysis of the Project's impacts on golden eagle foraging habitat.

Habitat loss and fragmentation from development negatively affects golden eagles and can diminish prey populations.[57] In addition, golden eagles generally avoid areas with high levels of

9

development and human or vehicle disturbance.[58] In the unlikely event that golden eagles continue to forage at the Project site (i.e., at the proposed Wetland Preserve) after development of the Project, they could be subject to high mortality levels due to collisions with vehicles[59] traveling to and from the Project site.[60]

Best available scientific evidence suggests that the golden eagle population is declining in California and in many other portions of the species' range.[61] As a result, the USFWS has determined that the golden eagle population cannot withstand any additional "take" (e.g., mortality or decrease in productivity).[62] The loss of golden eagle foraging habitat can lead to take, as defined in the Bald and Golden Eagle Protection Act.[63] Because the DEIR does not incorporate mitigation for the Project's negative impacts on golden eagle foraging habitat, potentially significant impacts on the species remain unmitigated. 8

Northern Harrier

The northern harrier forages and may nest at the Project site.[64] The DEIR states that MM BIO-1c would reduce any potential impacts to nesting northern harriers to less-than-significant levels.[65]

One of the primary threats to northern harriers is the loss and degradation of nesting and foraging habitat.[66] Although the DEIR states "the proposed project would result in an approximately 163-acre reduction in avian foraging habitat,"[67] it provides no analysis of the significance of this impact on the northern harrier. Whereas mitigation measures BIO-1c (pre-construction surveys and nest buffers) might prevent direct impacts to northern harriers, the mitigation measure would do nothing to mitigate: (a) the Project's impacts on habitat, and (b) the potential loss of breeding territories, which are the ultimate source of recruitment (i.e., addition of new individuals to the population). Furthermore, the proposed wetland preserve would not mitigate the impacts because it would not provide the requisite habitat for the species. Northern harriers are susceptible to human disturbance and require a mosaic of large undisturbed habitats for nesting 9

[67] DEIR, p. 3.9-51.

and foraging.[68] As discussed previously, the proposed wetland preserve would be a habitat "island" that would be subject to various forms of disturbance associated with the Project. Thus, the wetland preserve would not provide a large patch of undisturbed habitat. For these reasons, the Project's impacts on habitat for the northern harrier remain potentially significant. 9

Burrowing Owl

Habitat loss caused by development is the most immediate threat to burrowing owls that reside in high growth areas of the San Francisco Bay Area.[69] "Essential Habitat" for burrowing owls includes nesting, foraging, wintering, and dispersal habitat.[70] Accordingly, CDFW's Staff Report on Burrowing Owl Mitigation states the following with regard to impact assessments:

> "The impact assessment evaluates the potential loss of nesting burrows, satellite burrows, foraging habitat, dispersal and migration habitat, wintering habitat, and habitat linkages, including habitat supporting prey and host burrowers and other essential habitat attributes. This assessment determines if impacts to the species will result in significant impacts to the species locally, regionally and range-wide per CEQA Guidelines §15382 and Appendix G. The significance of the impact to habitat depends on the extent of habitat disturbed and length of time the habitat is unavailable (for example: minor – several days, medium – several weeks to months, high - breeding season affecting juvenile survival, or over winter affecting adult survival)."[71] 10

The DEIR states that use of the site by burrowing owls cannot be ruled out.[72] However, contrary to CDFW's guidance, the DEIR provides no analysis of impacts to burrowing owl habitat. Breeding burrowing owls are believed to be extirpated from Napa County.[73] Due to their strong site tenacity, burrowing owls rarely colonize new sites, or re-colonize historical sites from which they have been extirpated.[74] That is, burrowing owls do not merely nest elsewhere when nesting habitat at a site is eliminated. As a result, the presence of nesting burrowing owls at the Project site would be extremely significant from a biological perspective, and elimination of the nesting habitat would be significant and unmitigable.

The DEIR does not require habitat compensation even if burrowing owls are detected at the Project site during pre-construction surveys (MM BIO-1d). In accordance with CDFW's Staff Report on Burrowing Owl Mitigation:

> "…the current scientific literature supports the conclusion that mitigation for permanent habitat loss necessitates replacement with an equivalent or greater habitat area for breeding, foraging, wintering, dispersal, presence of burrows, burrow surrogates, presence of fossorial mammal dens, well drained soils, and abundant and available prey within close proximity to the burrow."[75]

10

The proposed wetland preserve would not mitigate the impacts to burrowing owl habitat because it does not contain ground squirrel burrows (or surrogates).[76] As a result, Project impacts to burrowing owl habitat remain potentially significant.

Merlin and Ferruginous Hawk

The merlin and ferruginous hawk have been detected immediately north of the Project site[77] and the DEIR acknowledges that the Project site provides suitable foraging habitat for both species.[78] The Project would directly and functionally eliminate (i.e., through implementation of MM LU-3) habitat for these two species. The DEIR fails to disclose, analyze, or incorporate mitigation for this potentially significant impact.

11

Invasive Plants (GP Policy 8.4.3)

Invasive (alien) plants threaten biodiversity, alter ecosystem processes,[79] and can cause extinction of native species.[80] Indeed, next to habitat loss, invasive species pose the greatest threat to the nation's biodiversity and natural resources.[81]

12

The Project has the potential to introduce invasive plant species or facilitate their spread. Construction vehicles and equipment are common vectors for transporting invasive plant propagules from one place to another.[82] In addition, soil and vegetation disturbance associated with Project construction and maintenance activities creates suitable conditions for the establishment of invasive plants.[83]

[82] Cal-IPC. 2012. Preventing the Spread of Invasive Plants: Best Management Practices for Land Managers (3rd ed.). Cal-IPC Publication 2012-03. California Invasive Plant Council, Berkeley, CA.
[83] *Ibid.*

The DEIR fails to incorporate mitigation that would minimize the Project's potential to introduce invasive plant species or facilitate their spread. As a result, potentially significant impacts associated with the colonization and spread of invasive plants remain unmitigated, and the Project does not comply with General Plan Policy 8.4.3 (regarding control of alien plants). 12

Cumulative Impacts

CEQA Guidelines (14 Ca. Code Regs. § 15130(b)(3)) require lead agencies to define the geographic scope of the area affected by the cumulative effect and provide a reasonable explanation for the geographic limitation used. The DEIR states: "[t]he geographic scope of the cumulative biological resources analysis is a 0.5-mile radius of the project site."[84] The DEIR fails to provide an explanation for limiting the geographic scope to 0.5-mile, which is far too small to provide a valid assessment of cumulative impacts to biological resources that occur at the Project site.

The DEIR states: "[a]lthough there would be loss of foraging habitat, the cumulative loss of this resource would not be considerable due to the abundance of habitat in the American Canyon area."[85] This statement is not supported by evidence (e.g., data) and conflicts with the Biological Resources Analysis prepared for the Green Island Road Reconstruction and Widening Project. The Biological Resources Analysis for that project states: "the Giovannoni property is the only remaining natural, undisturbed habitat located in the vicinity of the project site…"[86] Furthermore, the DEIR's rationale is flawed because it applies two different geographic scales to the analysis. It is not possible to accurately analyze cumulative impacts by using one geographic scale (i.e., the "American Canyon area") to analyze the abundance of remaining habitat, but a much smaller scale (i.e., 0.5-mile) to analyze other projects that would impact foraging habitat. 13

CDFW's comments in response to the Project's Notice of Preparation state: "reduction of available habitat for a special-status species, should be considered cumulatively considerable without mitigation to minimize or avoid the impact."[87] The DEIR does not incorporate mitigation for the Project's contribution to habitat loss for special-status species. Although the proposed wetland preserve would maintain approximately 45 acres of open space, the preserve would have minimal (or no) value as habitat for special-status species and could function as an "ecological trap" due to implementation of MM LU-3 and the surrounding industrial land uses.[88] As a result, the Project's incremental contribution to cumulative impacts remains significant.

Impacts Caused by MM LU-3

Wetlands are attractive to many types of wildlife, including many which rank high on the list of species hazardous to aircraft.[89] As a result, the FAA recommends that wetland mitigation projects that may attract hazardous wildlife be sited at least 10,000 feet from the nearest aircraft operations area (for airports serving turbine-powered aircraft).[90] The wetland mitigation project ("preserve") proposed in the DEIR would be located approximately 3,000 feet from the aircraft operations area at the Napa County Airport.

MM LU-3 requires a wildlife hazard assessment that would identify measures to reduce the bird attractant potential of the proposed wetland preserve.[91] The DEIR does not identify the specific measures that might be implemented to reduce the abundance of birds at the proposed wetland preserve. However, potential measures generally fall into one of three categories: (1) modifying the landscape in order to deter wildlife, (2) hazing, or (3) removal of hazardous wildlife.[92] Modifying the landscape to deter wildlife does not appear to be a feasible option because it would preclude implementation of MM BIO-2 and MM BIO-3 (which require establishment of wetlands in the preserve). In addition, removal (i.e., translocation or killing) of wildlife does not appear to be a feasible option due to legal constraints and the potential abundance of birds at the preserve. Therefore, it appears that implementation of MM LU-3 would (or might) require hazing (e.g., pyrotechnics, propane cannons, or directional sonic/hailing devices). Although hazing may be effective, it could have adverse effects on non-target organisms, including special-status species. As a result, the DEIR must disclose, analyze, and mitigate any potentially significant impacts associated with implementation of MM LU-3. 14

MITIGATION ISSUES

MM BIO-1a (Swainson's Hawk)

MM BIO-1a provides conflicting information on the pre-construction survey requirements in relation to initiation of construction activities. MM BIO-1a first states that preconstruction surveys "shall be completed for at least two survey periods immediately prior to commencement of project construction" in accordance with the survey protocol developed by the Swainson's Hawk Technical Advisory Committee. However, MM BIO-1a then states:

> "If no nesting Swainson's hawk are found during the first non-optional survey period starting March 20, then project construction may commence. If during the third surveys (April 5–April 20) Swainson's hawk are found to be nesting in the project vicinity and construction has commenced, it shall be assumed the Swainson's hawk commenced nesting and thus the Swainson's hawk are 15

[90] Federal Aviation Administration. 2020. Hazardous Attractants on or near Airports. Advisory Circular 150/5200-33C. Federal Aviation Administration, Washington, D.C.
[91] DEIR, p. 3.9-52. [emphasis added].
[92] Federal Aviation Administration. 2020. Hazardous Attractants on or near Airports. Advisory Circular 150/5200-33C. Federal Aviation Administration, Washington, D.C.

> habituated to the ambient level of noise and disturbance emanating from the project site."

The survey protocol states: "[t]o meet the minimum level of protection for the species, surveys should be completed for at least the two survey periods immediately *prior to a project's initiation*."[93] Therefore, allowing construction to commence during the first non-optional survey period would violate the protocol and would not ensure protection for the species. Furthermore, the DEIR's rationale pertaining to habituation of Swainson's hawks nesting in the Project vicinity is flawed because it assumes: (a) noise, human activity, and other disturbances that may cause nest abandonment would not increase (or change) as construction progresses; and (b) that construction activities have no potential to cause take of "habituated" Swainson's hawks. These assumptions have not been substantiated and are not necessarily valid. For example, a nesting pair of Swainson's hawk may tolerate noise and human activity that is dispersed across the Project site (e.g., during the site preparation and grading phases) but not noise and human activity that is concentrated near the nest site (e.g., during the building construction phase). Furthermore, even if the Swainson's hawk pair does not abandon their nest in response to Project construction activities, those activities could cause adverse effects that are not readily apparent to humans. For example, a simulation model examining the cost of human disturbance found large reductions in the number of food items captured following disturbance.[94] This constitutes take under Fish and Game Code Section 2080.[95] 15

MM BIO-1a requires installation of a 1,000-foot buffer around Swainson's hawk nest sites. CDFW mitigation guidelines call for a ¼-mile buffer.[96] The DEIR does not provide evidence that a 1,000-foot buffer would be sufficient to prevent impacts, nor does it require monitoring to validate the adequacy of the reduced buffer. As a result, and because the DEIR does not require compensatory mitigation for the Project's impacts to foraging habitat, Project impacts on the Swainson's hawk remain potentially significant.

MM BIO-1b (Golden Eagle)

MM BIO-1b states:

> "No more than 30 days prior to the first ground disturbance activity, pre-construction golden eagle nesting surveys shall be conducted in the project site vicinity. Pre-construction surveys shall include investigation of all potential nesting trees within a 0.5-mile radius around all project activities. If active golden eagle active nests are identified within any trees within a 0.5-mile radius of the project site, a qualified Raptor Biologist shall establish a protection buffer at a minimum of 1,000 feet that is adequate to ensure noise or activity from the proposed project would not cause nest disturbance or young or adult bird 16a

[96] *Ibid*. p. 11.

> mortality. Buffer zones may vary in size as some golden eagles are more acclimated to disturbance than others. Size of buffer zone may be modified by the qualified Raptor Biologist considering the type of construction activity that may occur and the behavioral factors and extent that golden eagle may have acclimated to disturbance."

16a

There are several problems with MM BIO-1b. First, the mitigation measure does not require surveys that adhere to the USFWS survey protocol,[97] nor does it establish any standards for the survey techniques and level of effort. This is important because golden eagle nests may be difficult to detect unless special techniques (e.g., aerial surveys) are implemented.[98]

Second, the 1,000-foot buffer proposed in MM BIO-1b is inconsistent with USFWS guidelines, which recommend a one-mile no-disturbance buffer surrounding golden eagle nesting sites.[99]

Third, the DEIR provides no evidence that a reduced buffer might be sufficient for some eagles, nor does it explain how the qualified Raptor Biologist would be able to make the *a priori* determination that a particular eagle pair would be able to tolerate forthcoming construction activities. Instead the DEIR allows a trial and error approach with no monitoring or remedial action requirements.

16b

Golden eagles are known to be highly sensitive to many types of disturbance[100] and may react to human activity as far as 1,500 meters (4,921 feet) from nesting sites.[101] While golden eagles can develop tolerance of some forms of disturbance (e.g., hikers), there is no evidence that golden eagles can tolerate the high levels of disturbance caused by construction activities. Furthermore, Pauli et al. (2017) demonstrated that tolerance for even moderate levels of disturbance may not develop within a population at a sufficient rate to offset the adverse effects of the disturbance activity, particularly because the golden eagle is a long-lived species with low recruitment.[102]

MM BIO-1c (Northern Harrier)

MM BIO-1c states: "[a]n active northern harrier nest must be protected by implementing a minimum 500-foot radius buffer zone around the nest marked with orange construction fencing." The DEIR fails to provide evidence that a 500-foot buffer would be sufficient to prevent impacts to northern harrier nests, and thus the proposed buffer appears to be arbitrary. 17

MM BIO-1d (Burrowing Owl)

MM BIO-1d requires a no-disturbance buffer zone a minimum of 100 feet around any burrows occupied by burrowing owls. However, MM BIO-1d allows the Applicant to passively relocate owls if installation of the buffer zone would preclude construction activities.

The 100-foot buffer required under MM BIO-1d is inconsistent with CDFW mitigation guidelines, which recommend a 500-meter (1,640-foot) buffer between occupied burrows and activities causing a high level of disturbance (e.g., construction activities), regardless of season.[103] Because the DEIR allows the Applicant to install a buffer that is substantially (94%) less than the buffer recommended by CDFW, it does not ensure Project construction activities would avoid causing significant impacts to burrowing owls. 18a

<u>Passive Relocation (Burrow Exclusion)</u>

"Passive relocation" involves installation of one-way doors in burrow openings to evict burrowing owls and prevent burrow re-occupation. The DEIR does not disclose or evaluate impacts to burrowing owls due to burrow exclusion, nor does it identify mitigation measures sufficient to reduce such impacts below a level of significance. Consistent with CDFW guidelines, burrow exclusion is a potentially significant impact under CEQA that must be analyzed.[104] Specifically, burrow exclusion may result in: (a) significant loss of habitat for reproduction, refuge from predators, and shelter from weather; (b) increased stress on burrowing owls and reduced reproductive rates; (c) increased depredation; (d) increased energetic costs; and (e) risks posed by having to find and compete for available burrows.[105] 18b

The need for full analysis of potential impacts associated with passive relocation (i.e., exclusion) of burrowing owls is further supported by research that indicates most relocation projects have resulted in fewer breeding pairs of burrowing owls at the mitigation site than at the original site, and that relocation projects generally have failed to produce self-sustaining populations.[106] Investigators attribute the limited success of relocation to: (a) strong site tenacity exhibited by burrowing owls, and (b) potential risks associated with forcing owls to move into unfamiliar and perhaps less preferable habitats.[107]

[107] *Ibid.*

MM BIO-2 and BIO-3 (Wetlands)

Mitigation measures BIO-2 and BIO-3 propose compensation ratios of 2:1 and 1:1 for direct impacts to wetlands during Phase I and Phase II of the Project, respectively. The DEIR fails to provide evidence that the proposed ratios would be sufficient to mitigate Project impacts to less-than-significant levels.

In general, a ratio greater than 1:1 is required, in part due to scientific observations that compensatory mitigation sites often provide reduced functions compared to the impacted aquatic resources.[108] In addition, a compensation ratio greater than 1:1 may be needed to account for a project's indirect impacts, and for its contribution to cumulative impacts. In this case, the Project would have indirect impacts that would significantly reduce the habitat functions at the proposed wetland preserve. Indeed, the DEIR states:

> "The proposed project also would include landscaping and on-site drainage facilities that would be designed and managed to discourage wildlife use of the site. MM LU-3 requires the applicant to retain a qualified Biologist to prepare a wildlife hazard assessment that would identify measures to *reduce the bird attractant potential of the wetland area*, consistent with the ALUCP's policies."[109]

19

In general, compensatory mitigation projects that are conducted onsite are more likely to replace the ecological functions of the impacted wetlands. In this case, however, implementation of MM LU-3 would preclude the proposed preserve's ability to replace the wetland habitat functions that would be impacted by the Project. As a result, mitigation measures BIO-2 and BIO-3 do not reduce the Project's impacts on wetlands to less-than-significant levels.

MM BIO-4 (Breeding Birds)

MM BIO-4 requires a pre-construction breeding bird survey and installation of "appropriate" buffers around all active nests. There are three reasons why MM BIO-4 does not ensure that the Project's impacts on nesting birds would be less than significant:

First, MM BIO-4 fails to establish standards for the: (a) nest searching techniques, (b) minimum level of effort (i.e., survey hours per unit area), and (c) qualifications of the biologist conducting the survey. As explained below, the ability to successfully locate nests in the Project area is dependent on these three variables.

20a

Although the Project site lacks trees, it provides nesting substrates for ground-nesting birds. Most ground-nesting birds construct nests that are inconspicuous and thus hard to find.[110] As a

[108] National Research Council. 2001. Compensating for wetland losses under the Clean Water Act. National Research Committee on Mitigating Wetland Losses. National Academy Press, Washington DC, USA. Available at: <https://www.nap.edu/catalog/10134/compensating-for-wetland-losses-under-the-clean-water-act>.
[109] DEIR, p. 3.9-52. [emphasis added].
[110] Galligan EW, Bakken GS, Lima SL. 2003. Using a thermographic imager to find nests of grassland birds. Wildlife Society Bulletin 31(3):865-869.

result, successfully locating nests of ground-nesting birds requires special techniques.[111] Because MM BIO-4 does not require implementation of those techniques, it provides no assurances that the Project would avoid take of nesting birds.

Many biologists that conduct pre-construction surveys fail to devote the level of effort needed to locate all bird nests. Locating all nests within the Project site may require a considerable level of effort. To ensure all bird nests that may be affected by the Project are located, the DEIR must establish standards for the survey effort (e.g., minimum number of survey hours per unit area). 20a

The success of any nest-searching method depends on the surveyor's knowledge of where birds nest, how nesting birds behave, and the best time of day to search for nests.[112] Attaining this knowledge requires training and experience.[113] Because MM BIO-4 fails to establish standards for the "qualified biologist" that would conduct the nesting bird survey, it does not ensure the biologist would have the qualifications needed to successfully locate all nests within the Project area prior to construction.

Second, the DEIR fails to provide evidence that the buffer sizes proposed in MM BIO-4 would prevent negative impacts to nesting birds. Based on my review of scientific literature, the 50-foot buffer proposed for passerines and other non-raptors is grossly deficient for almost all species. Construction noise levels associated with the Project may reach 90 dBA at a distance of 50 feet.[114] Noise at that level far exceeds the level that is deleterious to most breeding birds.[115] Consequently, a 50-foot buffer would be insufficient to avoid significant impacts to nesting birds. For other projects, the CDFW has recommended a minimum no-disturbance buffer of 500 feet for unlisted raptors and 250 feet for other non-listed bird species.[116] 20b

Third, there are no performance standards, or monitoring and reporting requirements, for MM BIO-4. Monitoring is essential for two reasons: (1) to validate the adequacy of the nest buffers (and implement remedial actions if necessary), and (2) to ensure construction workers comply with the nest buffers. Based on my experience monitoring bird nests at construction sites, it is 20c

very difficult to ensure compliance with nest buffers unless a full-time biological monitor is present on site.

This concludes my comments on the DEIR. 20c

Sincerely,

Scott Cashen, M.S.
Senior Biologist

Scott Cashen, M.S.
Senior Wildlife Biologist

Scott Cashen has 28 years of professional experience in natural resources management. During that time he has worked as a field biologist, forester, environmental consultant, and instructor of Wildlife Management. Mr. Cashen focuses on CEQA/NEPA compliance issues, endangered species, scientific field studies, and other topics that require a high level of scientific expertise.

Mr. Cashen has knowledge and experience with numerous taxa, ecoregions, biological resource issues, and environmental regulations. As a biological resources expert, Mr. Cashen is knowledgeable of the various agency-promulgated guidelines for field surveys, impact assessments, and mitigation. Mr. Cashen has led field investigations on several special-status species, including ones focusing on the yellow-legged frog, red-legged frog, desert tortoise, steelhead, burrowing owl, California spotted owl, northern goshawk, willow flycatcher, Peninsular bighorn sheep, red panda, and various forest carnivores.

Mr. Cashen is a recognized expert on the environmental impacts of renewable energy development. He has been involved in the environmental review process of over 100 solar, wind, biomass, and geothermal energy projects. Mr. Cashen's role in this capacity has encompassed all stages of the environmental review process, from initial document review through litigation support. Mr. Cashen provided expert witness testimony on several of the Department of the Interior's "fast-tracked" renewable energy projects. His testimony on those projects helped lead agencies develop project alternatives and mitigation measures to reduce environmental impacts associated with the projects. 21

Mr. Cashen was a member of the independent scientific review panel for the Quincy Library Group project, the largest community forestry project in the United States. As a member of the panel, Mr. Cashen was responsible for advising the U.S. Forest Service on its scientific monitoring program, and for preparing a final report to Congress describing the effectiveness of the Herger-Feinstein Forest Recovery Act of 1998.

AREAS OF EXPERTISE

- CEQA, NEPA, and Endangered Species Act compliance issues
- Comprehensive biological resource assessments
- Endangered species management
- Renewable energy development
- Scientific field studies, grant writing and technical editing

EDUCATION

M.S. Wildlife and Fisheries Science - The Pennsylvania State University (1998)
Thesis: *Avian Use of Restored Wetlands in Pennsylvania*
B.S. Resource Management - The University of California, Berkeley (1992)

PROFESSIONAL EXPERIENCE

Litigation Support / Expert Witness

Mr. Cashen has served as a biological resources expert for over 125 projects subject to environmental review under the California Environmental Quality Act (CEQA) and/or the National Environmental Policy Act (NEPA). As a biological resources expert, Mr. Cashen reviews CEQA/NEPA documents and provides his clients with an assessment of biological resource issues. He then submits formal comments on the scientific and legal adequacy of the project's environmental documents (e.g., Environmental Impact Report). If needed, Mr. Cashen conducts field studies to generate evidence for legal testimony, or he can obtain supplemental testimony from his deep network of species-specific experts. Mr. Cashen has provided written and oral testimony to the California Energy Commission, California Public Utilities Commission, and U.S. district courts. His clients have included law firms, non-profit organizations, and citizen groups.

Forestry

Mr. Cashen has five years of experience working as a consulting forester on projects throughout California. Mr. Cashen has consulted with landowners and timber operators on forest management practices; and he has worked on a variety of forestry tasks including selective tree marking, forest inventory, harvest layout, erosion control, and supervision of logging operations. Mr. Cashen's experience with many different natural resources enable him to provide a holistic approach to forest management, rather than just management of timber resources.

REPRESENTATIVE EXPERIENCE

- Lead Consultant - CalFire fuels treatment projects *(SD and Riverside Counties)*
- Lead Consultant and supervisor of harvest activities – San Diego Gas and Electric Bark Beetle Tree Removal Project *(San Diego)*
- Crew Leader - Hillslope Monitoring Program *(CalFire: throughout California)*
- Consulting Forester – Forest inventories and timber harvest projects *(various clients throughout California)*

Grant Writing and Technical Editing

Mr. Cashen has prepared and submitted over 50 proposals and grant applications. Many of the projects listed herein were acquired through proposals he wrote. Mr. Cashen's clients and colleagues have recognized his strong scientific writing skills and ability to generate technically superior proposal packages. Consequently, he routinely prepares funding applications and conducts technical editing for various clients.

Subject: Giovanonni Logistics Center

Dear Mr. Franco,

I have reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the proposed Giovanonni Logistics Center Draft Environmental Impact Report ("DEIR"). I make the following findings:

1) Given that the tenants have not been identified, trip generation is highly uncertain. The DEIR applies the lowest rate of five different rates for high-cube warehouses in *Trip Generation*. Depending on the tenant and type of operation, the actual trip generation rate could be three times the rate used in the DEIR or even higher.
2) The DEIR assumes an unrealistically low employee commute trip length.
3) Given more realistic assumptions about employee commute length, the DEIR should include mitigation strategies to reduce project VMT, and also address workforce housing.
4) The combination of underestimating trip length and underestimating trip generation causes the DEIR to underestimate GHG.

1

1

Project Trip Generation Could Be Much Higher Than Assumed

The project is comprised of up to 2.4 million square feet of warehouse. (DEIR, p. 1) The tenants have not been identified, and the nature of the operations are unknown at this time.

The DEIR estimated trip generation using the *Trip Generation Manual* category: "High-Cube Transload and Short-Term Storage Warehouse." (DEIR, p. 3.12-11) The *Trip Generation Manual* (10th Edition)[1] states:

> A high-cube warehouse (HCW) is a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. A typical HCW has a high level of on-site automation and logistics management. The automation and logistics enable highly efficient processing of goods through the HCS.

The *Trip Generation Manual* presents trip generation rates for five types of high-cube warehouses:

2

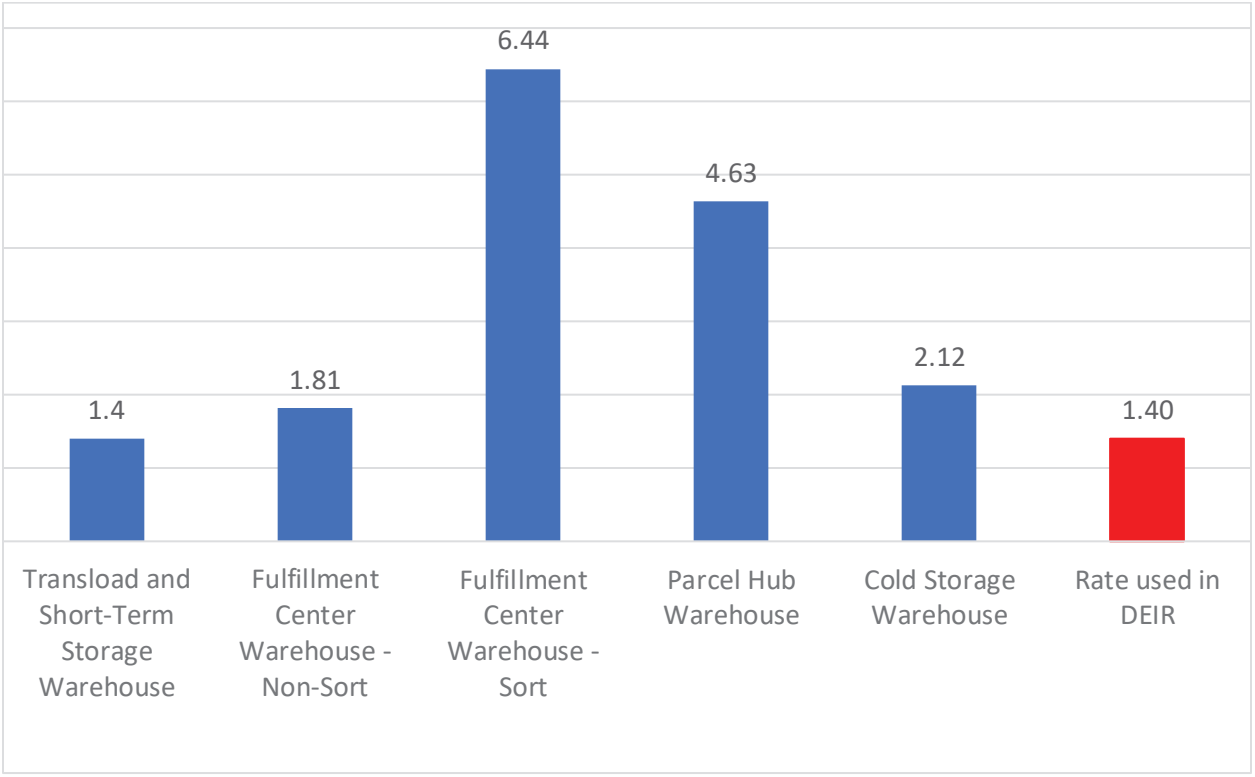
- High-Cube Transload and Short-Term Storage Warehouse (154) – Transload facilities have a primary function of consolidation and distribution of pallet loads (or larger) for manufacturer, wholesalers, or retailer. Short-term HCWs are high-efficiency distribution facilities often with custom/special features built into structure for movement of large volumes of freight with only short-term storage of projects.
- High-Cube Fulfillment Center Warehouse (155) – characterized by a significant storage function and direct distribution of ecommerce product to end users
    - A) Non-sort
    - B) Sort
- High-Cube Parcel Hub Warehouse (156) – typically serve as regional and local freight-forwarder facilities for time sensitive shipments via airfreight and ground carriers
- High-Cube Cold Storage Warehouse (157) – facilities typified by temperature-controlled environments for frozen food or other perishable products.

As shown in Figure 1, the trip generation rate per 1,000 square feet of high-cube warehouse varies significantly across these types. The DEIR used the category with the lowest trip rate.

[1] Institute of Transportation Engineers (2020).

2

Figure 1: Weekday Daily Trips for Different Types of High-Cube Warehouses



Source: *Trip Generation Manual 10th edition*

No justification is given for the choice to use the lowest trip generation category. In fact, it appears that the category is unknown now. The DEIR uses only the term "high-cube warehouse" which could be in any of the categories and the DEIR expressly recognizes that the proposed project may include cold storage.

The DEIR states:

> As the proposed project is a speculative warehouse development which could accommodate cold storage and accompanying Transport Refrigeration Units (TRU), this analysis considers two project scenarios: a cold warehouse project scenario and a dry warehouse project scenario. (p. 3.6-47)

So, at minimum, the Cold Storage Warehouse trip generation rate should have been used to be conservative as it is 51% higher and possible Cold Storage Warehouse usage is analyzed elsewhere in the DEIR.

A 2019 study of warehouse trip generation was done by WSP for the Western Riverside Council of Governments ("COG").[2] This study was based on counts at 16 warehouses, segmented between 11 fulfillment centers and 5 parcel hubs. The average rate across the 11 fulfillment centers was 2.13 per 1000 square feet, i.e., 50% higher than the rate used in the DEIR.

2

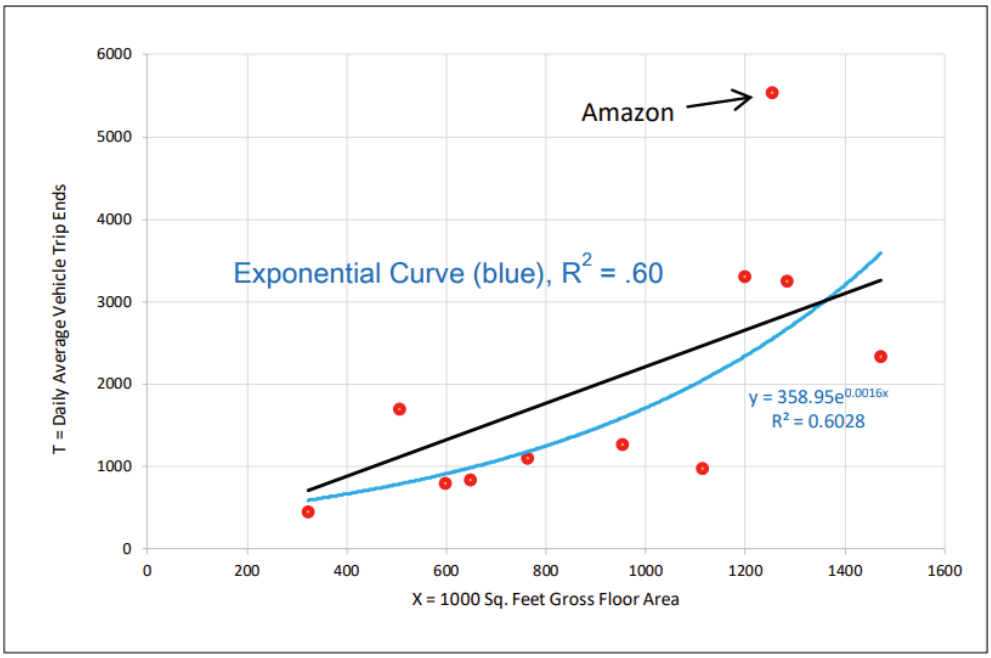
[2] https://wrcog.us/AgendaCenter/ViewFile/Agenda/_02212019-292

3

The data in the Western Riverside COG study are much more variable than the average rates suggest. As shown in the figure below, the different fulfillment center sites have wildly different trip generation rates, with an Amazon facility having an especially high rate.

Figure 2: Western Riverside COG Warehouse Trip Generation Study Exhibit 1

Exhibit 1: Data Plot for Daily Total Vehicle Trip Ends against Building Size (Fulfillment Center)



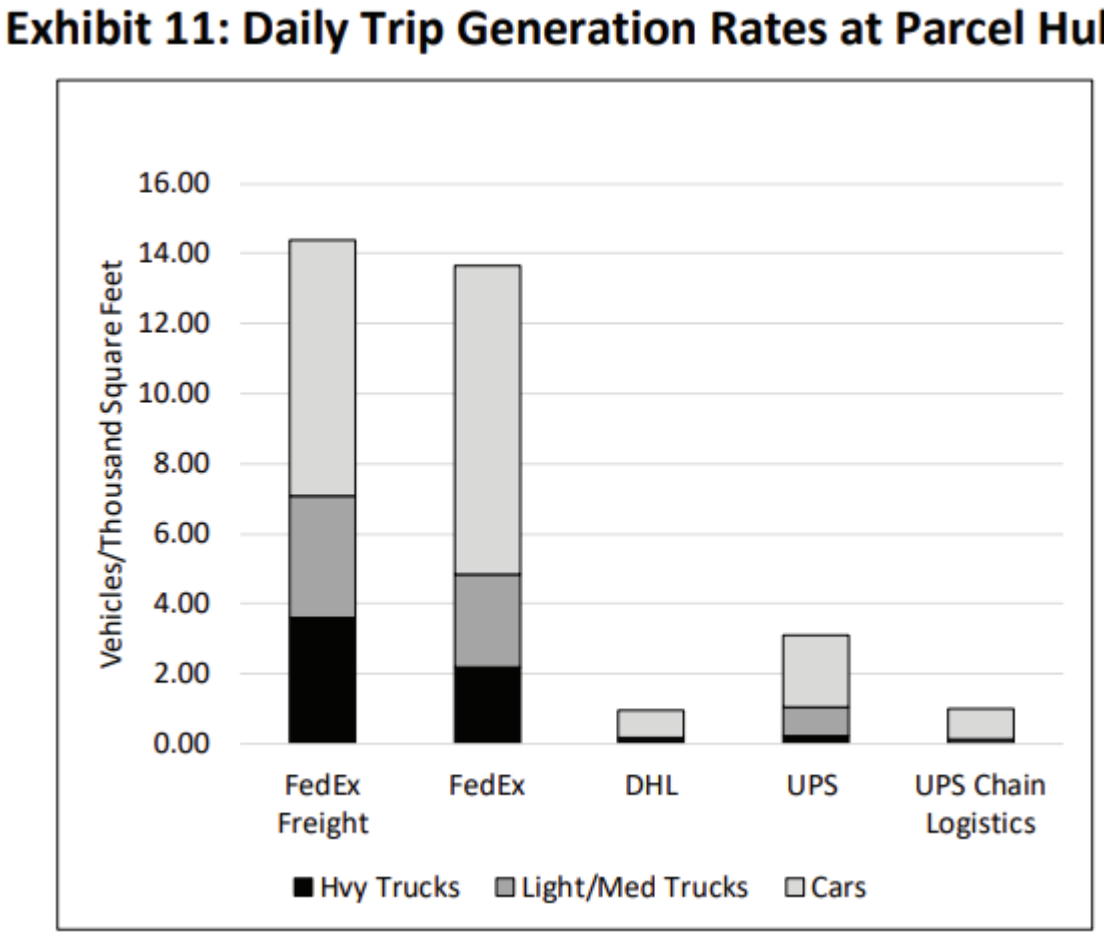
Other businesses are copying many of Amazon's logistics methods, so the higher rate could be applicable to many new operations. For example, the trip generation at the Walmart site in the study also is higher than the average used in the DEIR. If the Amazon rate were applied to the proposed Giovanonnii Logistics Center warehouses, project trip generation would be three times as high as estimated in the DEIR.

As shown in the figure below, the observed trip generation rates at two of parcel hub sites in the study are even higher, i.e., about ten times the rate used in the DEIR.

2

4

Figure 3: Western Riverside COG Warehouse Trip Generation Study Exhibit 11



The DEIR estimated a total of 2,832 daily trips at buildout. (Table 3-12-5, p. 3.12-12) The DEIR also estimated a total of 3,643 workers at buildout. If it is assumed:

- Workers make round trip commutes (number of workers x 2.0),
- Each worker works a 5-day week (x 5/7), and
- Most workers commute in single-occupant vehicles (x 95%), then

The 3,643 workers would make 4,944 commute trips on the average day, or more than 2,000 more than the trip generation estimate in the DEIR. And this represents commute trips only. It does not include any truck trips or trips associated with local delivery operations. The DEIR is trying to have it both ways – asserting a high employment count as an economic benefit and asserting a low trip generation estimate that implicitly assumes considerably lower employment.

In the Western Riverside study, the only warehouse site counted with over 2000 employees was the Amazon site which generates over 5000 trips per day.

Truck trip generation also would likely be much higher than assumed in the DEIR. The DEIR states that "the number of truck trips was … validated using local vehicle classification counts conducted in June 2021." (DEIR Appendix F, p. 13) The classification counts tell us only about the truck percentages in existing traffic today in the facility of the proposed project. These percentages tell us nothing about

2

5

truck trip generation for the proposed facility. This apparently is the basis for the 0.22 truck trip rate in the DEIR, but this application of the traffic count data is invalid.

In the Western Riverside study, the average truck generation per 1000 square feet was 0.454 for conventional warehouses and 0.379 for fulfillment centers, i.e., about twice the 0.22 rate assumed in the DEIR. 2

Project Area Does Not Have Short Average Commute Distances as Asserted in DEIR

The DEIR states:

> For this study, the regional average VMT is defined as the nine county Bay Area average. As reported by the City of Vallejo in their CEQA Transportation Impact Analysis Guidelines (dated October 2020), the Nine County Bay Area Average VMT per employee is 23.00 miles per employee. According to Statewide Travel Demand Model estimates, the proposed project is located within a Traffic Analysis Zone (TAZ) with a projected VMT per employee of 16.24 miles. Because this per capita VMT rate is lower than the significance threshold of 23.0 miles, the proposed project would be considered to have a less than significant VMT impact. It is noted that a more conservative methodology sometimes used by OPR for other employment-based land uses (such as office buildings) states that a project generating a VMT that is 15 percent or more below the regional average VMT, or 19.55 miles, is presumed to have a less than significant VMT impact. If this methodology were applied, the project would be considered to have a less than significant VMT impact since the VMT per employee of 16.24 miles is less than the threshold of 19.55 miles (p. 3.12-17) 3

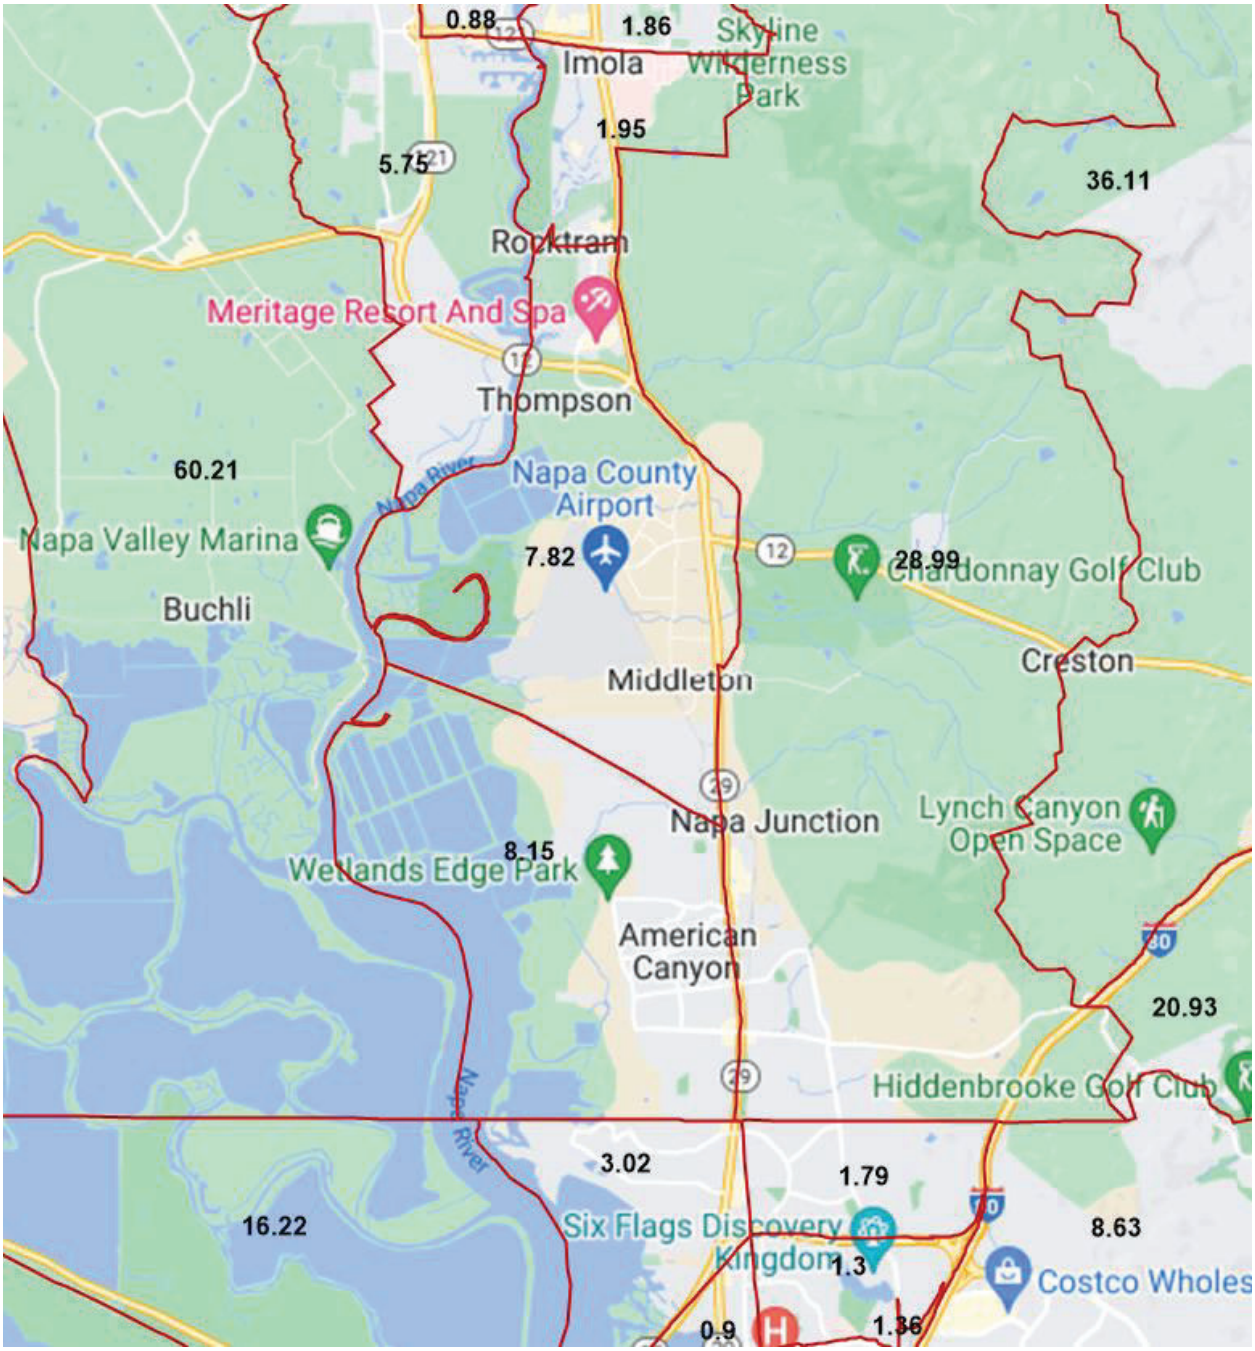
Regional travel demand models are commonly used to estimate VMT. However, the statewide model is too coarse to reliably estimate VMT for any particular project. The Caltrans statewide model homepage states:

> This model is not an appropriate tool for individual project level analysis.[3]

Most of the California Statewide Travel Demand Model (CSTDM) files are not available without making a special request to Caltrans. The TAZ layer is available for download. Figure 4 shows the TAZs in the vicinity of the project along with the area of each TAZ.

[3] https://dot.ca.gov/programs/transportation-planning/division-of-transportation-planning/data-analytics-services/statewide-modeling/california-statewide-travel-demand-model

Figure 4: CSTDM TAZs in the Vicinity of the Proposed Project Along with TAZ Areas (Square Miles)



The proposed project is between the American Canyon label and the airport logo, i.e., near the border between two TAZs, each sized about 8 square miles. In calculating model VMT, some workers would live close enough that both workplace and residence would be inside the same TAZ. Any trip completed within a single TAZ is assigned an arbitrary intrazonal trip length that cannot be determined without examining the model files. The model distance could be as small as a quarter mile, but the actual trips could be several miles in length. The travel distance in the model between any two TAZs is determined by where artificial "centroid connectors" are arbitrarily placed within each TAZ In the case of these two

3

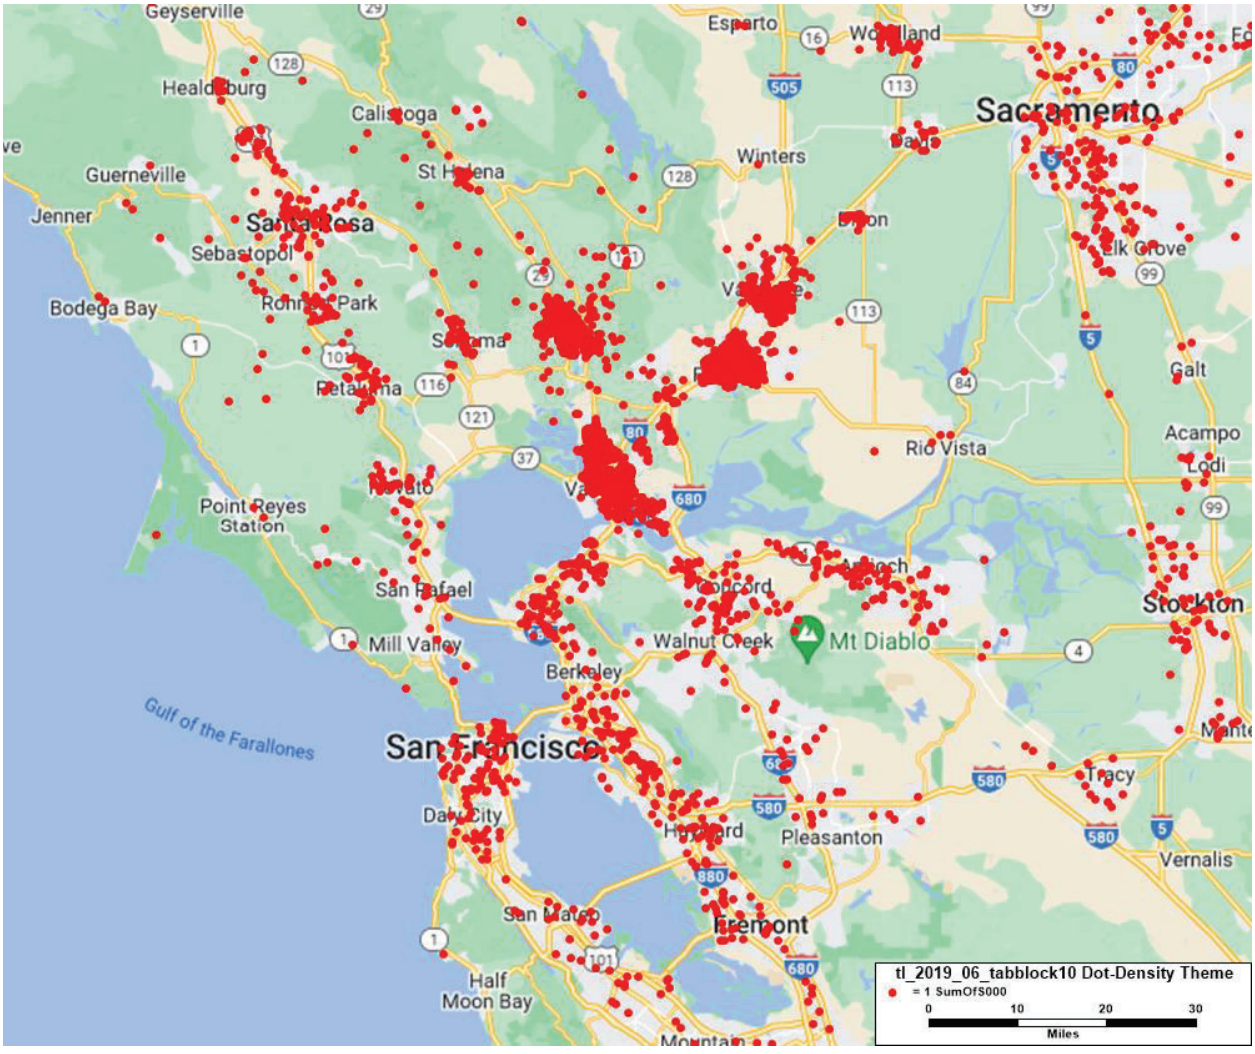
7

8-square-mile TAZs, it could be as little as a mile or as much as five miles or more. There is no way to know without examining the model files. The TAZs to the east and west are huge – 29 square miles and 60 square miles. The model travel distances to those TAZs are similarly dependent on the arbitrary placement of the centroid connectors. Model distances to more distant TAZs are similarly arbitrary. Multiplying the number of trips between pairs to TAZs by all these arbitrary distances is not a reliable way of estimating total project trip length or calculating average project trip length – especially when large TAZs are involved. In any event, it is impossible to know how the DEIR arrived at 16.24 as the Project VMT rate using the CSTDM, because neither the DEIR nor its technical appendices contain any detail, analysis or calculations supporting that figure.

It is much more accurate to look at existing commuting data. The U.S. Census Bureau publishes Longitudinal Employer-Household Dynamics (LEHD) Origin-Destination Employment Statistics (LODES) data that provide detailed geographic data about workers, jobs, and commutes at the Census Block level. Census Blocks are much smaller than TAZs with 236 Census Blocks in American Canyon City alone.

As shown in Figure 5, there are many long commutes today into American Canyon City.

Figure 5: Home Locations of 2019 American Canyon City Workers (Each Dot Represents 1 Worker)



Average (mean) commute distances to American Canyon City jobs were estimated from these LODES data by:

- calculating the direct ("crow flies") distance between the centers of each Census block,
- eliminating commutes of over 100 miles where the data may be spurious and would inflate the average, and
- multiplying by 110% to account for actual routing along roads

The resulting mean one-way commute distance is 22.0 miles.

However, to compare to daily VMT, this one-way commute distance needs to be factored further:

- x 2.0 to account for round trips,
- x 5/7 to account for 5-day work week, and
- x 95% to account for non-single-occupant auto commutes.

3

Resulting mean commute VMT per employee per day is 29.9, i.e., much higher than either the 16.24 estimate for the project or the 23.00 nine-county average cited in the DEIR.

The LODES data are segmented across 3 earnings groups:

- $1250/month or less
- $1251/month to $3333/month
- greater than $3333/month

As the lowest income category represents an annual income of only $15,000, most of these workers are either part-time and/or service workers at the bottom of the pay scale. The average one-way commute VMT for the two higher income categories working in American Canyon City is 31.3. This is almost twice the 16.24 value citied in the DEIR. Therefore, the project does not satisfy a low-VMT screen and additional VMT analysis should have been done.

The Project Should Mitigate Employee Commuting VMT

The DEIR states that one of the objectives of the proposed project is to: "Improve American Canyon's jobs-housing ratio by adding new employment opportunities. " (p. ES-2) This would make more sense if the anticipated employment were a tenth of the 3,643 the DEIR asserts it will be. The tenants will not be able to fill that many warehouse jobs with the local workforce. Instead, employment at that scale in a limited number of job classifications could only be achieved through the long commutes already taking place and illustrated in Figure 5.

4

Any employment site with 3,643 employees should have a comprehensive transportation demand management (TDM) program. TDM is challenging in the project area because as the DEIR states:

- Existing [transit] stops are not within an acceptable walking distance of the site … (p. 3.12-15)
- Given the nature of the study area and the surrounding industrial land use, it is reasonable to assume that very few project patrons and employees will desire to walk to reach the project site. (p. 3-12-16)

Employer-sponsored vanpools can be very effective in situations like this one where many employees working set shifts are concentrated at one location, but where the workforce is dispersed over a wide area.

Given the long existing commutes to American Canyon City, the applicant also should address workforce housing. The DEIR notes that the issue of "housing for project employees" was raised during the 30-day public review process. (p. ES-3) It does not appear that this issue has been addressed by the applicant. 4

DEIR Underestimates of Trip Generation and Trip Length Cause Underestimated GHG

The GHG emission estimates in DEIR Appendix B are based on the trip generation and trip length assumptions discussed above. The combination of underestimating trip length and trip generation causes the DEIR to also underestimate project GHG. The DEIR takes an unrealistically low average VMT per employee number of 16.24 miles discussed above and translates it to an "average of 8.12 miles per one-way vehicle trip." (p. 3.6-48) This is even lower than the CalEEMod default value. As discussed above, the actual average commute distance today to American Canyon is almost twice that far. A more realistic and higher average auto trip length would also cause higher estimated GHG emissions. 5

A higher trip generation rate, and especially a higher truck trip generation rate, would translate into higher estimated GHG emissions. As discussed above, depending on the type of warehouse operation, the actual trip generation rate could be three times as larger as assumed in the DEIR or even larger than that. This further causes the DEIR to underestimate project GHG.

Sincerely,

Norman L. Marshall

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

6

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

PUBLICATIONS AND PRESENTATIONS (partial list)

DTA Love: Co-leader of workshop on Dynamic Traffic Assignment at the June 2019 Transportation Research Board Planning Applications Conference.

Forecasting the Impossible: The Status Quo of Estimating Traffic Flows with Static Traffic Assignment and the Future of Dynamic Traffic Assignment. *Research in Transportation Business and Management* 2018.

Assessing Freeway Expansion Projects with Regional Dynamic Traffic Assignment. Presented at the August 2018 Transportation Research Board Tools of the Trade Conference on Transportation Planning for Small and Medium Sized Communities.

Vermont Statewide Resilience Modeling. With Joseph Segale, James Sullivan and Roy Schiff. Presented at the May 2017 Transportation Research Board Planning Applications Conference.

Napa-Solano Residents For Responsible Growth (NSRRG)

Note to Reader: This letter includes the attachment from James Clark (CLARK), Shannon & Wilson Inc. (S&W), Scott Cashen (CASHEN), and Smart Mobility (SM).

Response to NSRRG-1
The organization provided general introductory remarks, summarized the proposed project and asserted the Draft EIR failed to comply with CEQA requirements and expressed general opposition to the proposed project. The organization referenced four attachments from its consultants.

Responses to the four attachments are provided. As will be discussed in the following responses, there is no evidence to support the organization's claims that the Draft EIR failed to comply with CEQA requirements.

Response to NSRRG-2
The organization provided a statement of interest. No response is necessary.

Response to NSRRG-3
The organization provided general background regarding CEQA. No response is necessary.

Response to NSRRG-4
The organization asserted the Draft EIR failed to adequately describe the proposed project, alleging the project description is inconsistent and unstable, and the buildout horizon changed based on the topic.

The organization's specific comments in this regard are addressed in Responses to NSRRG-5a through NSRRG-5c.

Response to NSRRG-5a
The organization alleged the Draft EIR used inconsistent buildout assumptions, first citing a statement in Draft EIR Chapter 2, Project Description, page 2-9 to the effect the Draft EIR would assume Phase 1 would buildout first followed by Phase 2 and then citing a subsequent statement indicating that, as a practical matter, the proposed project would likely buildout over a period of years, if not decades. The organization alleged a prolonged construction schedule that extends over several years increases the potential for construction-related impacts to aquatic resources.

Buildout assumptions are addressed in Master Response 3.

Response to NSRRG-5b
The organization alleged the Draft EIR used a 20-month buildout period for construction air quality modeling instead of an 18-month period as stated in the Draft EIR. The organization also alleged the construction HRA assumed a 24-month buildout, which is inconsistent with 18-month buildout period stated in the Draft EIR.

The text in Draft EIR Chapter 2, Project Description, page 2-9 has been revised to state 20 to 24 months for consistency. The change is noted in Final EIR Section 5, Errata. The change simply brings the text on page 2-9 into alignment with the construction air quality analysis and does not change any conclusions or mitigation measures.

Health risk is measured on an annual basis (i.e., 12-month increments). Hence, a 12-month buildout period for each phase is the closest period available for each phase.

Refer to Master Response 3 for further discussion of buildout assumptions.

Response to NSRRG-5c
The organization alleged that the Draft EIR's air quality analysis used smaller building square footages than disclosed in Chapter 2, Project Description.

The construction air quality modeling evaluated Phase 1 and Phase 2 at 2.4 million square feet. Although there were discrepancies with the Phase 1 building square footage, all 2.4 million square feet were captured in the modeling. This is evidenced through the modeling summary and output files included in Appendix B to the Draft EIR (see pages 1, 34, 103, and 111). The Draft EIR disclosed a significant construction air quality impact would occur and set forth mitigation measures to reduce the impact to a level of less than significant. Hence, the discrepancies did not materially alter the conclusions and, thus, are harmless.

Response to NSRRG-6
The organization alleged the Draft EIR's hydrological analysis failed to evaluate construction and operation of Phase 2.

As indicated in Draft EIR Section 3.8, Hydrology and Water Quality, page 3.8-10, which was based in part on the modeling described in Appendix F to the Draft EIR, the evaluation of construction and operational water quality addressed both Phase 1 and Phase 2. The analysis described construction and operational activities have the potential to cause stormwater pollution and set forth MM HYD-1a, which applies to both Phase 1 and Phase 2.

It should be noted that because Phase 2 has not been designed, it was not possible to prepare hydrology calculations as was done for Phase 1. Hence, a qualitative analysis was done for Phase 2's operational impacts. When Phase 2 is designed, the applicant will commission a hydrology study that will include calculations that will be submitted to the City for review and approval.

Response to NSRRG-7
The organization alleged the Draft EIR's biological analysis failed to adequately describe the existing baseline conditions.

To preface this response, as discussed on Draft EIR Section 3.3, Biological Resources, pages 3.3-20 and 3.3-21, three separate biological consulting firms (HBG, Monk & Associates, and LSA Associates) assessed the project site between 2016 and 2021. The studies included biological resource reports, habitat assessments, botanical field surveys, and an aquatic resource delineation. Additionally, FirstCarbon Solutions (FCS) peer reviewed these biological firms' work prior to release of the Draft EIR and determined it to be adequate. In sum, the project site is perhaps the most biologically studied site in American Canyon in the last decade and, thus, there is an abundance of information about the baseline biological conditions of the project site.

With that in mind, the Draft EIR used this abundance of information to describe the existing biological conditions in Draft EIR Section 3.3, Biological Resources, on pages 3.3-1 through 3.3-7. This discussion included (1) climate; (2) hydrology; (3) topography and soils; (4) plant communities; (5) wildlife; (6) special-status plant and wildlife species; and (7) wetlands descriptions. Draft EIR Exhibit 3.3-1 provided a soils map and Exhibit 3.3-2 provided a plant communities map. Photographs of the project site were provided in Draft EIR Exhibit 2-3. By any objective standard, this constitutes an adequate description of the existing baseline conditions of the project site and is supported by substantial evidence.

Response to NSRRG-8
The organization reiterated Comments S&W-5a through S&W-5c about the wetland delineation.

Refer to Response to S&W-5a through Response to S&W-5c.

Response to NSRRG-9
The organization reiterated Comments S&W-5a through S&W-5c about the wetland delineation.

Refer to Response to S&W-5a through Response to S&W-5c.

Response to NSRRG-10
The organization reiterated Comments S&W-5a through S&W-5c about the wetland delineation.

Refer to Response to S&W-5a through Response to S&W-5c.

Response to NSRRG-11
The organization reiterated Comment CASHEN-2 about vernal pools and Comments CASHEN-5a and CASHEN-5b about rare plants.

Refer to Response to CASHEN-2, CASHEN-5a, and CASHEN-5b.

Response to NSRRG-12
The organization asserted that the Draft EIR failed to disclose, analyze, and mitigate potentially significant environmental impacts. No specific examples were provided.

Refer to Response to NSRRG-13 through Response to NSRRG-36.

Response to NSRRG-13
The organization asserted that the Draft EIR failed to disclose or adequately analyze transportation impacts and reiterated Comments SM-2 and SM-3

Refer to Response to SM-2, Response to SM-3, and Master Response 4.

Response to NSRRG-14
The organization asserted the VMT threshold is not based on substantial evidence and noted it differed from a VMT threshold used for the SDG Commerce 217 Distribution Center Project.

VMT is addressed in Master Response 4.

Response to NSRRG-15
The organization alleged the VMT analysis provided no justification the threshold of 23 miles per employee and improperly used the California Statewide Travel Demand Model. The organization referenced the VMT analysis for a 217,000-square-foot wine distribution warehouse (SDG Commerce 217 Distribution Center Project) less than 2 miles, which employed a different methodology and thresholds.

The VMT analysis is addressed in Master Response 4.

Response to NSRRG-16
The organization reiterated Comment SM-2 about trip generation and Comment SM-3 about VMT.

Refer to Response to SM-2 and Master Response 4.

Response to NSRRG-17
The organization asserted that the Draft EIR failed to adequately analyze GHG impacts.

Refer to Response to NSRRG-18 through Response to NSRRG-20.

Response to NSRRG-18
The organization cited BAAQMD guidance for evaluation of GHG emissions and stated that the VMT threshold for that analysis is not supported by substantial evidence.

VMT is addressed in Master Response 4.

Response to NSRRG-19a
The organization describes the approach taken in Impact GHG-2 of the Draft EIR to address the proposed project's consistency with applicable plans adopted to reduce GHG emissions. The organization argues the consistency analysis against the ARB's 2017 Scoping Plan, the Metropolitan Transportation Commission (MTC) Plan Bay Area 2050, and the City's Energy Efficiency Climate Action Plan (EECAP) is inappropriate because it is not clear whether any of these plans are "qualified" pursuant to CEQA Guidelines Section 15183.5(b).

The organization is incorrect in its assertion the consistency analysis contained in Impact GHG-2 must utilize a plan that is "qualified" pursuant to CEQA Guidelines Section 15183.5(b). As identified under Impact GHG-1, the EECAP is not considered "qualified" pursuant to CEQA Guidelines Section 15183.5(b). As such, the EECAP is not capable of satisfying Criterion B of the BAAQMD's significance thresholds utilized in Impact GHG-1. While the EECAP is not "qualified" pursuant to CEQA Guidelines Section 15183.5(b) and thus cannot satisfy an analytical pathway for analyzing GHG emission impacts under Impact GHG-1, it is still necessary to identify applicable plans adopted for the purpose of reducing GHG emissions under Impact GHG-2 and analyze the proposed project's consistency with those plans, whether those plans are considered "qualified" or not.

One of the primary benefits of having a "qualified" plan for the reduction of greenhouse gases prepared pursuant to CEQA Guidelines Section 15183.5 is the ability to streamline the cumulative impact analysis in environmental documents for later development projects. As subdivision (b)(2) of Section 15183.5 explains, "[a] plan for the reduction of greenhouse gas emissions, once adopted

following certification of an EIR or adoption of an environmental document, may be used in the cumulative impacts analysis of later projects. An environmental document that relies on a greenhouse gas reduction plan for a cumulative impacts analysis must identify those requirements specified in the plan that apply to the project, and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the proposed project. If there is substantial evidence that the effects of a particular project may be cumulatively considerable, notwithstanding the project's compliance with the specified requirements in the plan for the reduction of greenhouse gas emissions, an EIR must be prepared for the project."

The Draft EIR for the Giovanni Logistics Center project has not attempted to use a qualified plan for the reduction of greenhouse gases for such streamlining purposes. Rather, the Draft EIR includes a full section on the subject of Greenhouse Gas Emissions and Energy (refer to Section 3.6, Greenhouse Gas Emissions and Energy).

Another benefit of relying on a qualified plan for the reduction of greenhouse gases is the ability to rely on the policies of such a plan as sufficient mitigation for GHG-related impact. As subdivision (b) of Section 15183.5 explains, "a lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project complies with the requirements in a previously adopted plan or mitigation program."

The City of American Canyon has not done so here. Rather, Section 3.6 includes mitigation measures that have been formulated independent of any qualified plan for the reduction of greenhouse gases.

Section 15183.5, then, is simply not relevant to the discussion of GHG emissions in the EIR.

The Draft EIR's discussion of Impact GHG-2 explores the broader question of whether the proposed project would conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. This broader question applies to a universe of planning documents larger than the limited universe of GHG reduction plans that are "qualified" under Section 15183.5. Notably, CEQA Guidelines Section 15064.4, subdivision (b)(3), requires lead agencies, in assessing the significance of impacts from GHG emissions, to consider "[t]he extent to which the project complies with regulations or requirements adopted to implement a Statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions." Plans for the reduction of GHG emissions that are qualified pursuant to Section 15183.5 are just one example of the kinds of Statewide, regional, or local "regulations or requirements" that should be considered in this context. Section 15064.4, subdivision (b)(3), further provides that "[i]n determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies[.]" Such strategies are embodied in documents such as the ARB 2017 Scoping Plan. Indeed, the California Supreme Court, in *Cleveland National Forest Foundation v. SANDAG* (2017) 3 Cal.5th 497, 519, stated that planning agencies "must ensure that CEQA analysis stays in step with evolving scientific knowledge and State regulatory schemes."

In summary, the commenter incorrectly suggests the City erred by considering the proposed project's consistency with the ARB's 2017 Scoping Plan, the MTC Plan Bay Area 2050, and the City 's

EECAP. All three of these plans, though not "qualified" under Section 15183.5, were adopted for the purpose of reducing the emissions of GHGs.

Notably, moreover, significance criterion b—the potential the proposed project would conflict with any applicable plan, policy or regulation of an agency adopted to reduce greenhouse gas emissions—was not the sole significance criterion in Section 3.6. Rather, the City applied another entirely separate criterion, which is consistent with the questions posed about GHGs in the Initial Study checklist found in Appendix G to the CEQA Guidelines: whether the proposed project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. Additionally, Section 3.6 also applied two more significance criteria that, though expressly focused on energy usage, indirectly implicated GHG emissions: (i) whether the project would result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation, and (ii) whether the project would conflict with or obstruct a State or local plan for renewable energy or energy efficiency. Thus, it cannot be fairly argued that the City evaded a good faith consideration of GHG-related impacts by focusing on consistency with plans that fall short of being "qualified" under Section 15183.5.

Response to NSRRG-19b

The organization states that even if the plans identified under Impact GHG-2 were considered "qualified" pursuant to CEQA Guidelines Section 15183.5(b), the "analysis is riddled with holes and cannot support a finding of no significant impact. With respect to the MTC Plan Bay Area, the Draft EIR's analysis simply makes no sense . . . " The organization quotes a segment of the analysis contained in Impact GHG-2 and states that vague assertions that the proposed project is consistent with the overall goals of the MTC Plan Bay Area to support a finding of consistency.

As discussed in Impact GHG-2 of the Draft EIR, the MTC's Plan Bay Area is a high-level regional planning document that takes into account local government planned development areas to focus growth. The MTC does not stipulate specific actions that individual land use development projects must take to reduce GHG emissions; therefore, the fact that the proposed project is located within a planned development area for focused growth makes it generally consistent with the overall growth scenario and subsequent regional GHG emission forecasts that rely on the MTC's Plan Bay Area. Although the Draft EIR arguably need not have considered the proposed project's consistency with Plan Bay Area, there was certainly no harm in doing so. The analysis provided additional relevant information for the public and City decision-makers.

Response to NSRRG-19c

The organization comments the Draft EIR's GHG analysis does not sufficiently support a finding of no significant impact related to consistency with the ARB's 2017 Scoping Plan due to the presence of inapplicable measures contained in the 2017 Scoping Plan as they relate to individual land use development projects.

As discussed in Impact GHG-2 of the Draft EIR, the proposed project is analyzed for consistency with all applicable plans adopted for the purpose of reducing GHG emissions. As such, the EECAP is the most applicable plan adopted for this purpose as it identifies local actions that individual land use

can implement or otherwise demonstrate consistency with. The City found it prudent also to provide a consistency analysis for not just the EECAP but also the MTC Plan Bay Area as well as the ARB's 2017 Scoping Plan. As noted in Response to NSRRG-19a, CEQA Guidelines Section 15064.4, subdivision (b)(3), provides that "[i]n determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies[.]" The fact that those regional and Statewide plans contain many measures that are not applicable to the proposed project does not make the City's consideration of these plans a useless exercise. Notably, Table 3.6-6 identified one measure from the 2017 Scoping Plan—the Sustainable Freight Action Plan—that did apply to the proposed project, and with which the proposed project is consistent. (Draft EIR, page 3.6-67.) On this issue, the Draft EIR explained that "[t]his measure applies to owners and operators of trucks and freight operations. While the proposed project is industrial in nature and would support truck and freight operations, neither the proposed project's design nor nature would prevent truck fleet owners and operators from utilizing zero-emission or near-ZEVs by 2030. Moreover, as required by MM GHG- 1e, the proposed project would design and construct all automobile and truck parking areas to meet the Tier 2 electric vehicle (EV) charging infrastructure requirements of CALGreen. MM GHG- 1e would further accelerate the possible adoption of EVs and support this measure."

As with consideration of MTC Plan Bay Area, consideration of consistency with the 2017 Scoping Plan was a useful exercise because, by finding that the proposed project did not conflict with any policies or measures found in the Scoping Plan, the City was able to find the proposed project would not conflict with those two plans.

Response to NSRRG-19d
The organization purports the EECAP is not considered "qualified" pursuant to CEQA Guidelines Section 15183.5(b). The organization further states the solar-ready roof and water efficiency measures included in the proposed project are not binding or enforceable and therefore cannot support a finding of consistency with the EECAP.

Please refer to Response to NSRRG-19a for a response to the "qualified" aspect of this comment. The solar-ready roof and water efficiency measures included in the proposed project are enforceable and mandatory in that the proposed project would be required to be consistent with the California Building Standards Code (CBC) and CALGreen standards, which require such measures, as discussed in Draft EIR Section 3.6, Greenhouse Gas Emissions and Energy, Section 3.6.3, Regulatory Framework.

Response to NSRRG-20
The organization cited the energy analysis and reiterated prior comments about the VMT significance threshold being unsubstantiated.

VMT is addressed in Master Response 4.

Response to NSRRG-21
The organization reiterated Comments CLARK-3 through CLARK-7 about the air quality analysis.

Refer to Response to CLARK-3 through Response to CLARK-7.

Response to NSRRG-22

The organization reiterated Comments CLARK-4 through CLARK-6 about the HRA, though with references to two CEQA decisions, *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 518–522, and *Berkeley Keep Jets Over the Bay v. Bd. of Port Comm'rs*. (2001) 91 Cal.App.4th 1344, 1369–1371. The organization cited the first of these cases for the proposition that "CEQA mandates discussion, supported by substantial evidence, of the nature and magnitude of impacts of air pollution on public health." The organization cited the second case for the proposition that "an EIR must analyze the impacts from human exposure to toxic substances."

As is explained in Response to CLARK-4 through Response to CLARK-6, the analyses in the EIR meet the standards of these two court cases, in that the EIR adequately considered potential health effects of toxic air contaminants through the preparation of an HRA considering the effects of both on-site and off-site project emissions consistent with the BAAQMD's December 2020 Health Risk Assessment Modeling Protocol. Those responses explain why the technical critique offered by Clark & Associates failed to point out any actual flaws in the City's analyses.

On the issue of potential effects associated with *regional* pollutants, the Draft EIR had the following to say about its strategy for complying with *Sierra Club v. Fresno* on pages 3.2-30–3.2-31:

> In *Sierra Club v. County of Fresno* (*Friant Ranch, LP*) (2018) 6 Cal.5th 502, 510, 517- 522, the California Supreme Court held generally that an EIR should "make a reasonable effort to substantively connect a project' s air quality impacts to likely health consequences." A possible example of such a connection would be to calculate a project' s "impact on the days of nonattainment per year " (*Id*. at pp. 521). But the court recognized that there might be scientific limitations on an agency's ability to make the connection between air pollutant emissions and public health consequences in a credible fashion, given limitations in technical methodologies (*Id*. at pp. 520- 521). Thus, the court acknowledged that another option for an agency preparing an EIR might be "to explain why it was not feasible to provide an analysis that connected the air quality effects to human health consequences" (*Id*. at p. 522).
>
> Here, the BAAQMD is the primary agency responsible for ensuring the health and welfare of sensitive individuals to elevated concentrations of emissions in the Air Basin. At present, the BAAQMD has not provided any methodology to assist local governments in reasonably and accurately assessing the specific connection between mass emissions of ozone precursors (e.g., ROG and NO_X) and other pollutants of concern on a regional basis and any specific effects on public health or regional air quality concentrations that might result from such mass emissions. The City has therefore concluded that it is not feasible to predict how mass emissions of pollutants of regional concern from the proposed project could lead to specific public health consequences, changes in pollutant concentrations, or changes in the number of days for which the SFBAAB will be in nonattainment for regional pollutants.
>
> Ozone concentrations, for instance, depend upon various complex factors, including the presence of sunlight and precursor pollutants, natural topography, nearby structures that cause building downwash, atmospheric stability, and wind patterns. Because of the complexities of predicting ground- level ozone concentrations related to the NAAQS and

CAAQS, it is not possible to link health risks to the magnitude of emissions exceeding the significance thresholds. To achieve the health-based standards established by the EPA, the air districts prepare air quality management plans that detail regional programs to attain the Ambient Air Quality Standards (AAQS). However, if a project within the BAAQMD exceeds the regional significance thresholds, the proposed project could contribute to an increase in health effects in the basin until the attainment standards are met in the Air Basin.

On the other hand, it is technically feasible to predict with reasonable accuracy the potential localized health consequences of localized pollutants such as TACs and $PM_{2.5}$. As discussed below, the consultants who prepared this section prepared a Health Risk Assessment (HRA) that addresses the potential for additional incidences of cancer resulting from both the construction-related emissions and the operational emissions of the proposed project.

Response to NSRRG-23
The organization reiterated Comment CLARK-4 about building downwash.

Refer to Response to CLARK-4.

Response to NSRRG-24
The organization reiterated Comment CLARK-7 about feasible mitigation.

Refer to Response to CLARK-7 and Response to SWAPE-2e.

Response to NSRRG-25
The organization reiterated Comments S&W-12 through Comment S&W-16b about MM BIO-3a through MM BIO-3d.

Refer to Response to S&W-12 through Response to S&W-16b.

Response to NSRRG-26
The organization reiterated Comments S&W-6a through Comment S&W-11 about wetland impacts.

Refer to Response to S&W-6a through Response to S&W-11.

Response to NSRRG-27
The organization reiterated Comments S&W-6a through S&W-6b, Comments SW&-12 through S&W-16b, and CASHEN-6 about wetlands.

Refer to Response to S&W-6a through Response to S&W-6b, Response to S&W-12 through Response to S&E-16b, and Response to CASHEN-6.

Response to NSRRG-28
The organization reiterated Comments CASHEN-7a through CASHEN-7c about the Swainson's hawk.

Refer to Response to CASHEN-7a through Response to CASHEN-7, as well as Master Response 1.

Response to NSRRG-29
The organization reiterated Comments CASHEN-8 and CASHEN-16 about the golden eagle.

Refer to Response to CASHEN-8 and Response to CASHEN-15, as well as Master Response 1.

Response to NSRRG-30
The organization reiterated Comments CASHEN-9 and CASHEN-17 about the northern harrier.

Refer to Response to CASHEN-9 and Response to CASHEN-17.

Response to NSRRG-31
The organization reiterated Comment CASHEN-11 about the ferruginous hawk.

Refer to Response to CASHEN-11.

Response to NSRRG-32
The organization reiterated Comments CASHEN-20a through CASHEN-20c about MM BIO-4.

Refer to Response to CASHEN-20a through Response to CASHEN-20c.

Response to NSRRG-33
The organization reiterated Comment CASHEN-14 about MM LU-3.

Refer to Response to CASHEN-14.

Response to NSRRG-34
The organization reiterated Comments CASHEN-13 about cumulative impacts to biological resources.

Refer to Response to CASHEN-13.

Response to NSRRG-35a
The organization asserted the City may not make required findings to approve the proposed project entitlements because the proposed project is in conflict with Municipal Code Section 19.42.202 D.5, which states that a project will not be materially detrimental to the general health, safety, and welfare. The organization reiterated its previous comments about the alleged deficiencies of the HRA.

Refer to Response to CLARK-3 through Response to CLARK-7

Response to NSRRG-35b
The organization asserted the City may not make required findings to approve the proposed project entitlements because the proposed project is in conflict with Municipal Code Sections 19.41.050 C and 19.42.020 D1, which requires projects to be consistent with General Plan policies. The organization alleged the proposed project is inconsistent with Circulation Policy 1.1, citing its previous comments about the VMT analysis.

VMT is addressed in Master Response 4.

Response to NSRRG-35c
The organization asserted the City may not make required findings to approve the proposed project entitlements because the proposed project is in conflict with General Plan Natural and

Historic/Cultural Resources Policy 8.21, which requires evaluation and mitigation for impacts to sensitive natural resources. The organization cited its previous comments about the biological resources analysis.

Refer to Response to CASHEN-2 through Response to CASHEN-20c.

Response to NSRRG-35d
The organization asserted the City may not make required findings to approve the proposed project entitlements because the proposed project is in conflict with General Plan Natural and Historic/Cultural Resources Policy 8.31, which requires a 100-foot buffer for riparian zones. The organization alleged that the Draft EIR does not show the 100-foot buffer for No Name Creek.

Refer to Response to S&W-16a.

Response to NSRRG-35e
The organization asserted the City may not make required findings to approve the proposed project entitlements because the proposed project is in conflict with General Plan Natural and Historic/Cultural Resources Policy 8.41, which requires development projects to incorporate all reasonable mitigation measures to avoid significantly impacting vernal pools. The organization reiterated previous comments about the alleged deficiencies of the functional assessment of wetlands.

Refer to Response to S&W-5a through Response to S&W-7.

Response to NSRRG-35f
The organization asserted the City may not make required findings to approve the posed project entitlements because the proposed project is in conflict with General Plan Natural and Historic/Cultural Resources Policy 8.42, which requires preservation, where possible, of habitat for special-status species. The organization alleged the proposed project is inconsistent with this Policy, citing its previous comments about foraging habitat.

Foraging habitat is addressed in Master Response 1.

Response to NSRRG-35g
The organization asserted the City may not make required findings to approve the proposed project entitlements because the proposed project is in conflict with General Plan Natural and Historic/Cultural Resources Policy 8.43, which encourages activities to control alien plants. The organization reiterated previous comments about invasive plant species.

Refer to Response to CASHEN-12.

Response to NSRRG-36
The organization cited comments in its letter that the Draft EIR is wholly inadequate under CEQA and must be revised and recirculated.

As indicated in Response NSRRG-1 through Response to NSRRG-35g, none of the alleged deficiencies is supported by substantial evidence and, therefore, there is no legal basis to revise and recirculate the Draft EIR.

Response to CLARK-1
The commenter provided introductory remarks and no further response is required.

Response to CLARK-2
The commenter re-states the project description and provides the project site plan. No further response is required.

Response to CLARK-3
The commenter states the Draft EIR concludes significant and unavoidable impacts would occur related to Consistency with an Air Quality Management Plan and Cumulative Criteria Pollutant Emissions. The commenter asserts the Draft EIR's conclusions are not supported by substantial evidence and there are other project impacts and feasible mitigation measures that were not discussed in the Draft EIR. The comment concludes that a revised Draft EIR should be prepared to address these issues they identified.

The Draft EIR impact analysis is based on the City-approved Project Description and applicant provided site plans and information. This information was provided by architects, engineers, and planners with extensive knowledge of the proposed project and project operations. As described in Impact AIR-1, the Draft EIR considered project impacts in relation to the applicable AQP, the BAAQMD 2017 Clean Air Plan. As described in Impact AIR-2, the Draft EIR considered the cumulative impact of criteria pollutant emissions from the proposed project. The commenter does not provide a specific example of what significant impacts were not addressed. Furthermore, all potential mitigation measures were considered and ultimately, the mitigation measures included in the Draft EIR would be only measures that could feasibly be implemented by the City. The commenter does not elaborate on what specific feasible mitigation measures the City did not consider in the Draft EIR. See also Response to comment SWAPE-2e, in which the City addressed a long list of proposed additional mitigation measures suggested by another commenter.

Response to CLARK-4
The commenter states the air dispersion modeling tool used to model the proposed project's health risk impacts (AERMOD) does not account for the impact of building downwash. The commenter explains that building downwash could increase health risk impacts on nearby sensitive receptors and should be considered in a revised Draft EIR.

As disclosed in Section 3.2, Air Quality, as well as Appendix B of the Draft EIR, the HRA modeling on-site and off-site project emissions is consistent with the BAAQMD's December 2020 Health Risk Assessment Modeling Protocol, which states that "Building downwash for point sources that are within the area of influence of a building must be considered when running AERMOD. A building is considered sufficiently close to a stack to cause wake effects when the distance between the stack and the nearest part of the building is less than or equal to five times the lesser of the building

height or the projected weight of the building (PBW) . . . "[3] Because of the frequent mobilization of equipment and vehicles across the approximately 161-acre site during both construction and operation of the proposed project, project emissions were included in the HRA modeling as area sources rather than point sources. In addition, during Phase 1 construction, no building was present on-site that would create the downwash effect described by the commenter. Because the BAAQMD recommends the consideration of building downwash in air dispersion modeling when modeling point sources and because the proposed project did not include point sources, building downwash was not considered in the HRA modeling.

Moreover, as shown in Draft EIR Section 3.2, Air Quality, tables 3.2-14 and 3.2-15, the proposed project would not exceed applicable thresholds for health risks at the maximally impacted receptor or community wide. The Draft EIR considered both construction and operation when determining impacts related to health risks on nearby sensitive receptors. Furthermore, the HRA concluded that the main source of a cumulative community health risk within 1,000 feet of the project site are existing sources, not the proposed project. Thus, the addition of any building downwash impacts would be minimal and would not lead to exceedances of BAAQMD health risk thresholds.

Response to CLARK-5
The commenter states the Draft EIR must assess the impact for all toxic air compounds (TACs) that would be released during construction and operation of the project. The commenter describes types of TACs that could be emitted by the proposed project, the health risks those TACs pose to humans, and that the Draft EIR did not adequately consider all TACs that could be emitted. The commenter explains that only analyzing diesel particulate matter (DPM) emissions as part of the health risk analysis deems the Draft EIR incomplete and the City should prepare a revised Draft EIR.

The commenter is incorrect in asserting that "the City's analysis ignores the presence of TACs being emitted with diesel exhaust during the construction and operational phases of the project without making any attempt to quantify the impacts." The Draft EIR considered DPM as the primary TAC to contribute to health risks because of the proposed project's anticipated truck traffic and a 10-year ARB research program demonstrated that exhaust from diesel-fueled engines is a human carcinogen and that chronic (long-term) inhalation exposure to DPM poses a chronic long-term health risk. In addition, as described in the Draft EIR and by the California Almanac of Emissions and Air Quality, the majority of the estimated health risk from TACs for the State of California can be attributed to relatively few compounds, the most important of which is exhaust from diesel-fueled engines. Moreover, as described in the ARB's Consolidated Table of California Office of Environmental Health Hazard Assessment (OEHHA)/ARB Approved Risk Assessment Health Values, the cancer potency factor of 1.1 attributed to DPM, which was utilized in the HRA prepared for the proposed project, considers all speciated TACs included in DPM.[4] Therefore, the use of the cancer potency factor of 1.1 for DPM in the HRA incorporated consideration of the additional diesel-related TACs that would be emitted during project construction and operation.

Response to CLARK-6

The organization summarizes the requirements of MM AQ-2d and suggests the City should mandate the proposed project utilize newer model year heavy-heavy-duty (HHD) truck fleets. The organization explains it is possible to estimate emissions from on-road mobile sources in California using the ARB EMFAC model and presents their analysis for how using model year 2018 HHD trucks would reduce emissions from the proposed project truck operations.

As noted in the Draft EIR, the reason model year 2014 HHD trucks were used as the basis for MM AIR-2d is because this is the first model year that would result in a reduction in trucking emissions, assuming a worst-case scenario of 100 percent of trucks accessing the site to be that specific model year. More stringent and alternative trucking mitigation measures were considered for the proposed project but were ultimately determined to be financially infeasible due to the size of the proposed project and the anticipated volume of trucks. At present, few potential end users for the proposed project have entire fleets that, on an overall basis, meet the emissions profile for model years of 2018 or later. This economic reality reflects the substantial cost associated with the purchase of each new truck. Fleets typically contain trucks purchased in different years. Older trucks are gradually retired. Operators purchase new trucks with the expectation and need to get many years of use from each truck in order to justify the cost of the purchase. Because 2014 is now eight years in the past (as opposed to only four), and because some additional time will pass before the proposed project can be approved and become operational, the City determined that requiring the use of a fleet that meets the emissions profile for model year 2014 during project operation was a reasonable, if aggressive, mitigation measure. The City reasonably concluded that to require fleets to meet the emissions profiles for even newer model year trucks would be infeasible. The objective of MM AIR-2d is to require the proposed project to result in emission reductions from trucking activities without imposing unrealistic and infeasible burdens on future end users and the proposed project itself. The commenter's suggestion to alter the required minimum model year from 2014 to 2018 is unrealistic in the current marketplace and would place unreasonable financial burdens on the applicant and future tenants. If the City approves the proposed project, the City will want the project to succeed in the marketplace and thereby benefit the local and regional economies, generating employment and taxes that can fund government services.

Response to CLARK-7

The commenter lists mitigation measures recommended by the ARB and Air Districts that reduce operational nitrogen oxide (NO_X) and GHG emissions that were not included in the Draft EIR. The organization states the Draft EIR did not consider feasible mitigation measures that would further reduce NO_X and GHG emissions.

Only operational criteria pollutant emissions were found to have a significant unavoidable impact after mitigation. As such, no additional mitigation is required for construction criteria pollutant emissions, toxic air contaminant emissions, or GHG emissions because they would be less than significant after mitigation. Table 3-2 provides an analysis of the feasibility of implementing the additional mitigation measures suggested by the commenter. As indicated in the table, the proposed mitigation measures are either (1) not necessary; (2) not feasible; (3) already included as mitigation; or (4) included as new mitigation measures.

Table 3-2: Feasibility Analysis of Proposed Additional Mitigation Measures

Proposed Mitigation Measure	Analysis
Include contractual language in tenant lease agreements that requires tenants to use the cleanest vehicle technologies available, and to provide the necessary infrastructure to support zero-emission vehicles and equipment on-site.	**Already Included as Mitigation:** The fleet operator would be required to comply with MM Air-2d (truck fleets must meet or exceed model year 2014 for all heavy-duty trucks during operation of the proposed project), existing regulations such as Advanced Clean Trucks, ARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation, and Periodic Smoke Inspection Program. Transition to zero-emission fleet would advance with the technology and regulation. Furthermore, MM GHG-1d requires that parking areas for passenger vehicles shall be designed to accommodate EV charging stations, and each loading dock at the project site is required to be outfitted with at least one 240-volt outlet to accommodate truck and Transport Refrigeration Unit (TRU) charging and/or electrical power connection while goods are being loaded and unloaded from trucks.
Include contractual language in tenant lease agreements that requires all TRUs entering the project site be plug-in capable.	**Not Feasible:** Project end users are unknown at the time of Final EIR publication and, thus, it would be speculative to place restrictions on on-site equipment. Furthermore, imposing onerous requirements on the potential equipment of future unknown users could put the project at a competitive disadvantage by limiting the universe of potential future end users, and may also be technologically infeasible due to the performance needs of the end user. However, to support the transition to plug-in capable TRUs, MM GHG-1d requires that each loading dock at the project site be outfitted with at least one 240-volt outlet to accommodate truck and TRU charging and/or electrical power connection while goods are being loaded and unloaded from trucks.
Include contractual language in tenant lease agreements that requires future tenants to exclusively use zero-emission light and medium-duty delivery trucks and vans.	**Not Feasible:** Project end users are unknown at the time of Final EIR publication and, thus, no information is known about what types of light- and medium-duty vehicles would be used as part of business operations. Imposing onerous requirements on the potential vehicles of future unknown users could create hardships for future employees and visitors of the project site, could put the project at a competitive disadvantage by limiting the universe of potential future end users, and may also be technologically infeasible due to the performance needs of the end user.
Include contractual language in tenant lease agreements that requires all TRUs, trucks and cars entering the project site be zero-emission.	**Not Feasible:** Project end users are unknown at the time of Final EIR publication and, thus, it would be speculative to place restrictions on fleet equipment. Furthermore, imposing onerous requirements on the potential fleet of future unknown users could put the project at a competitive disadvantage by limiting the universe of

Proposed Mitigation Measure	Analysis
	potential future end users, and may be technologically infeasible due to the performance needs of the end user. An absolute prohibition on the use of vehicles with internal combustion engineers could create hardships for future employees and visitors of the project site. The State of California is the appropriate level of government for creating incentives and/or mandates regarding the electrification of the State vehicle fleet.
Include contractual language in tenant lease agreements that requires all heavy-duty trucks entering or on the project site to be model year 2019 or later, expedite a transition to zero-emission vehicles, and be fully zero-emission beginning in 2030.	**Not Feasible:** Project end users are unknown at the time of Final EIR publication and, thus, it would be speculative to place restrictions on fleet equipment. Furthermore, imposing onerous requirements on the potential fleet of future unknown users could put the project at a competitive disadvantage by limiting the universe of potential future end users, and may be technologically infeasible due to the performance needs of the end user. However, MM AIR-2d does require that truck fleets meet or exceed model year 2014 for heavy-duty trucks used during project operation, and MM AIR-2g requires that the project applicant provide information on available incentives to support the advanced deployment of clean fleets.
Include contractual language in tenant lease agreements that requires the tenant be in, and monitor compliance with, all current air quality regulations for on-road trucks including ARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation, Periodic Smoke Inspection Program (PSIP), and the Statewide Truck and Bus Regulation.	**Not Feasible:** ARB regulations are enforced by the State and local agencies, and operators must comply with State rules and regulations to legally operate in California. The measure would be onerous and difficult to enforce due to the unknown future operators of the proposed project and may put the project at a competitive disadvantage through the requirement of additional leasing terms, while not providing effective or quantifiable air quality or GHG emission reduction benefits.
Include contractual language in tenant lease agreements restricting trucks and support equipment from idling longer than 5 minutes while on-site.	**Already Included as Mitigation:** MM AIR-2e limits idling to no more than 5 minutes of idling in accordance with State law.
Include rooftop solar panels for each proposed warehouse to the extent feasible, with a capacity that matches the maximum allowed for distributed solar connections to the grid.	**Already Included as Mitigation:** MM GHG-1d requires the proposed project to be powered with 100 percent carbon-free electricity. This requirement could be met by installing on-site solar photovoltaic systems.
Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.	**Not Necessary:** Both Devlin Road and Green Island Road are designated truck routes. Thus, whichever way trucks turn, they would be on a truck route that connects to SR-29. Hence, this mitigation measure would not reduce emissions.
Limit the daily number of trucks allowed at the proposed project to levels analyzed in the CEQA document. If higher daily truck volumes are anticipated to visit the site, the City as the Lead	**Not Necessary:** As explained in Master Response 4, the traffic analysis conducted for the proposed project utilized the best available research studies to develop conservative estimates of the number of truck trips that

Proposed Mitigation Measure	Analysis
Agency should commit to reevaluating the proposed project through CEQA prior to allowing this land use or higher activity level.	would be expected to occur as a result of the proposed land uses for the project. The modeling for the project appropriately reflects the proposed land uses and anticipated traffic associated with the proposed land use. The transportation impact for the proposed project was found to be less than significant. CEQA only requires mitigation for significant impacts, therefore further mitigation is not necessary.
Ensure that any check-in point for trucks is well inside the project site to ensure that there are no trucks queueing outside of the facility.	**Not Effective:** This mitigation measure does not reduce emissions. However, the proposed project site plan does include adequate on-site roads and parking to ensure that any truck queueing would not be expected to occur outside of the facility.
Establish overnight parking within the industrial building where trucks can rest overnight.	**Not Effective and Not Feasible:** This mitigation measure does not reduce emissions, and because the potential end users of the facility are unknown, it would be onerous to require that a portion of the interior warehouse space be dedicated to truck parking.
Establish area(s) within the project site for repair needs.	**Not Effective:** This mitigation measure does not reduce emissions. Furthermore, as the potential end users of the project site are unknown, could put the project at a competitive disadvantage by limiting the universe of potential future end users, it would be onerous to require the establishment of a repair center when the operational details of the end user are unknown. However, it should be noted that the proposed project site plans do include adequate truck parking to ensure that vehicles potentially needing repair would be able to park on-site while repairs were being completed, in the event such an occurrence was a part of the future project operations.

Response to CLARK-8

The commenter suggests the on-site diesel-powered generator usage could increase compared to the Draft EIR analysis and result in further DPM emissions due to usage during extreme heat events (EHE) and subsequent Public Safety Power Shutoffs (PSPS). The commenter describes what an EHE is and how they occur, as well the resulting impacts on diesel generator usage.

As described in the Draft EIR, the BAAQMD regulates backup emergency generators, fire pumps, and other sources of TACs through its New Source Review (Regulation 2, Rule 5) permitting process.[5] The Draft EIR states the proposed project would include three backup diesel generators and three diesel-fueled fire pumps, each assumed to be rated at 50 horsepower and operate for a 4-hour maintenance period one day per month, totaling an estimated 48 hours of operation per year. In addition, the project applicant would be required to submit a permit application for each generator

[5] Bay Area Air Quality Management District (BAAQMD). 2016. New Source Review Permitting Guidance. Website: http://www.baaqmd.gov/permits/permitting-manuals/nsr-permitting-guidance. Accessed May 18, 2021.

to the BAAQMD and ensure compliance with the permit requirements. The regulation and permitting of backup generators is the jurisdiction of the BAAQMD. Renewable permits are issued by the BAAQMD, and compliance with permitting conditions is enforced by the air district. As such, compliance with the permit would satisfy all requirements of the BAAQMD and would not warrant a revised Draft EIR. It should be further noted that the commenter does not provide substantiating evidence to support the claim that backup (emergency) generators will be utilized on an increasing basis into the future, and this is a speculative assertion without supporting evidence.

Response to CLARK-9
The organization concludes that their facts identified in the comment letter demonstrates a revised Draft EIR should be prepared and must re-evaluate the significant impacts that would occur. As stated in Response to CLARK-3 through CLARK-8, none of the organization's statements change the validity of the Draft EIR and a revised Draft EIR is not warranted.

Response to CLARK-10
The organization's credentials are presented, and no further response is required.

Response to S&W-1
The comment consists of a cover letter. No response is necessary.

Response to S&W-2
The comment consists of the Table of Contents. No response is necessary.

Response to S&W-3
The commenters provided introductory remarks. No response is necessary.

Response to S&W-4
The commenters provided a list of documents supporting their comments. No response is necessary.

Response to S&W-5a
The commenters summarized the methodology Monk & Associates used to delineate the aquatic sources/wetlands on the project site. No response is necessary.

Response to S&W-5b
The commenters reviewed the Monk & Associates 2016 wetland jurisdictional delineation appended to the Draft EIR for consistency with the delineation methodology referenced in Comment S&W-5a. The commenters noted what they regard as errors in data points such as miscalculated absolute percent cover and incorrectly identified hydric soil indicators. The commenters noted data point (DP) DP-40, -97, -98, -105, and -110 incorrectly identified *Helminthotheca echioides* as Facultative Upland (FACU) when it should have been identified as Facultative (FAC). The commenters pointed out this error would change the findings at these data points from an upland to a wetland.

The City acknowledges the 2016 Monk & Associates delineation contains some minor errors mentioned by the commenter. *Helminthotheca echioides* was misidentified as FACU at those data points. DP-40, -98, -105, and -110 were also incorrectly identified as uplands. For DP-97 *Helminthotheca echioides* was misidentified, which would change the hydrophytic vegetation indicator from a "no" to a "yes"; however, this data point was lacking wetland hydrology and hydric

soils, so the conclusion that DP-97 was an upland is correct. The errors at issue, however, do not undermine the analysis or conclusions in the Draft EIR. The Draft EIR did not rely on the Monk & Associates 2016 wetland jurisdictional delineation report. Instead, wetland impacts were calculated using the United States Army Corp of Engineers (USACE) Approved Jurisdictional Delineation dated October 25, 2016.

Response to S&W-5c
The commenters noted the Approved Jurisdictional Delineation (AJD) was valid for 5 years and has since expired. The commenters stated the proposed project would need to obtain an updated AJD. The project applicant submitted an application to the USACE prior to the AJD expiring and received confirmation from the USACE Project Manager, Mr. Bryan Matsumoto, (via a phone call to HBG) that, because the application was submitted prior to the AJD expiring, the USACE will be using the AJD dated October 25, 2021, to process the permit. The AJD therefore remains valid and sufficient for the USACE.

The commenters also stated they reviewed Google Earth aerial imagery and it is their opinion, based on Google Earth aerial imagery, that wetland conditions may not have been identified in Monk & Associates 2016 wetland jurisdictional delineation report. The commenters do not indicate what year the Google Earth aerial imagery was reviewed, so the City is unable to confirm if this is a valid point. Nonetheless, the Draft EIR did not rely on the Monk & Associates 2016 wetland jurisdictional delineation report. Wetland impacts were calculated using the USACE AJD dated October 25, 2016. It should also be noted the USACE must submit a proposed AJD to the EPA for review prior to the USACE officially approving the jurisdictional delineation. This means that not only did the USACE review the Monk & Associates 2016 wetland jurisdictional delineation report and conduct their own site visit and analysis, but also that the EPA reviewed the USACE's determination and approved the AJD.

Response to S&W-6a
The commenters stated that Phase 1 will impact 0.496-acre of wetlands and Phase 2 will impact 3.7-acres, and that the Draft EIR based its assessment on Phase 1 and 2 being constructed concurrently over an 18-month period as the worst-case scenario. The commenters suggested a prolonged construction period that extends beyond 18 months and extends over several years (multiple nesting seasons, multiple "rainy seasons") increases the potential for construction-related impacts to aquatic resources (e.g., water quality issues and in-air construction noise) and requests an explanation to support this assumption.

Constructing Phase 1 and 2 concurrently over an 18-month period would impact 0.496-acre of wetlands for Phase 1 and 3.7 acres of wetlands for Phase 2 for a total of 4.196 acres of wetlands, which is the worst-case scenario, meaning the maximum acreage of wetland impacts would be 4.196 acres. The "worst-case scenario" assumption is not linked to the number of months it would take to complete each Phase but rather is a function of the acreage of wetland impacts. Phase 2 wetland impacts were assessed based on a full buildout with a maximum impact of 3.7 acres of wetlands. It is possible that, once Phase 2 has gone through the entitlement process, the site plan may be modified to reduce impacts to under 3.7 acres, just as Phase 1 has avoided impacts.

The project construction would occur over at least two nesting periods. If nesting does occur in the project vicinity and construction has commenced, it should be assumed the nesting bird(s) are habituated to the ambient level of noise and disturbance emanating from the project site. Therefore, a prolonged construction period that extends beyond 18 months would not increase construction-related impacts. It should be noted that if construction takes 18 months to complete or longer, all mitigation measures outlined in the Draft EIR would apply for the entirety of the construction period, including additional nesting bird surveys if construction is paused for more than seven (7) days. Therefore, there is no basis to assume new impacts would occur if Phases 1 and 2 take two months to complete or 24 months, or if it is split to where Phase 1 is constructed first and then Phase 2 is begins the following year. Regardless, for consistency and to address the commenters concerns, MM BIO-4 is revised to include the following language:

If construction activities are discontinued for more than 7 days, an additional nesting bird survey shall be performed.

The change is noted in Section 5, Errata.

See also Master Response 3.

Response to S&W-6b

The commenters stated the Draft EIR does not include a functional assessment of the wetlands or a functional impact analysis. The commenters suggested a wetland impact analysis is incomplete without a functional assessment that evaluates hydrologic, water quality, and habitat functions of the site wetlands.

Functional assessments were conducted to determine plant and animal communities supported on the project site, and these functional assessments were used in the impact analysis and subsequent mitigation requirements. The Draft EIR acknowledges the project site contains one upland plant community described as Annual Grassland, and two wetland plant communities, Seasonal Wetlands and Vernal Pools, as shown in Draft EIR Section 3.3, Biological Resources, Exhibit 3.3-2. Plant communities are assemblages of plant species growing in an area of similar biological environmental factors. One of the functions of wetlands are the plant communities they support. To determine whether the wetlands or uplands supported special-status plants, in support of CEQA and agency requirements, Helm Biological Consulting (HBC) conducted botanical survey assessments during spring 2021. As described in their rare plant survey, HBC identified the three plant communities. In addition to this plant communities assessment/rare plant survey conducted by HBC, the Draft EIR acknowledges that, based on a spring season site reconnaissance survey conducted on April 16 and May 24, 2021, HBG determined the site was suitable foraging habitat for State listed threatened Swainson's hawk and golden eagle. HBG also made an assessment of the potential for the wetlands to support each animal species noted in the CNDDB as occurring within a 10-mile radius of the project site, or that is known to occur in the general vicinity based on the knowledge of HBG Biologists. Over 40 animals were included in this assessment, as is discussed in the HBG report (Draft EIR, Appendix C), and this information was used to assess impacts to wetlands and species that could be using the wetlands or uplands. Therefore, a number of "functional" assessments were conducted

to determine CEQA impacts and recommend mitigation measures to offset these impacts to less than significant.

The Regional Water Quality Control Board (RWQCB) State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures) requires approved mitigation plans contain performance standards that assess whether the proposed project is achieving its objectives. Performance standards, according to the Procedures, must be based on objective and verifiable attributes using a functional assessment method, such as the California Rapid Assessment Method (CRAM). The purpose of the CRAM referenced in the Draft EIR in Section 3.3, Biological Resources, on page 3.3-34 is to satisfy this requirement. The Performance Standards listed in the Draft EIR in MM BIO-3d on page 3.3-33 are based on completed biological assessments (plant survey, wetland delineation, general habitat assessment etc.), and they include objective and verifiable attributes based on completed assessments and structured to assess whether the proposed project is achieving its objectives. Once CRAM is completed and the RWQCB has reviewed and commented on the mitigation plan, the Performance Standards may be modified to include additional attributes and performance standards, if warranted, to satisfy the Procedures.

Response to S&W-7
The commenters noted discrepancies in wetland acreages, shapes of wetlands, and numbering of each individual wetland when you compare the Monk & Associates 2016 wetland delineation maps and data to the USACE's AJD and the Draft EIR. One discrepancy noted is the Draft EIR provides the impact area to W-89 as 189 square feet while the AJD map has it listed as 195 square feet.

The Draft EIR impact calculation of 189 square feet is correct. The impact is based on the limit of fill material placed within the wetland. Based on calculations made by HBG, the fill material would impact 189 square feet and would avoid 6 square feet of W-89.

The commenters also noted that IW-9 was not included on the AJD map, which was used in the Draft EIR. The commenters questioned whether or not the USACE omitted IW-9 purposely or if it was an oversight, because there was not a data point supporting this change.

It is common for the USACE to request edits to a wetland delineation map after reviewing wetland delineation report data and conducting a site visit(s). The USACE may increase or decrease wetland area, which may change a wetland shape, add wetland areas that were missed, and/or remove areas mapped as wetlands that the USACE may determine not to meet the definition of a wetland. When the USACE staff conducts site visits to verify wetland delineation, they will often take data to verify changes they request. The data may be in the form of a wetland data sheet(s), notes, and/or photographs. The fact that Monk & Associates updated the numbering of all the wetlands on the AJD map based on this change, and the fact that the EPA had to review the data prior to the USACE finalizing the AJD, makes it very unlikely this was an oversight by the USACE.

Response to S&W-8
The commenters stated that treated stormwater would be delivered to newly created wetlands on the Wetland Preserve. The commenters suggested without a pre- and post-project water budget

analysis for the wetlands, the determination that additional wetlands would not be impacted is not supported.

The main source of hydrology for the unimpacted wetlands is direct precipitation and a significant amount of water flow from a culvert near the northeastern boundary which flows east to west toward No Name Creek. In addition, the site generally slopes from east to west across the Phase 1 and 2 project sites. The Phase 2 project also has topography that slopes from south to north. With the main sources of hydrology being direct precipitation and waterflow from a culvert near the northeastern boundary, and the topography of the site generally sloping from east to west, there is no basis to assume that proposed project development would indirectly impact the wetland hydrology of the remaining wetlands.

With respect to wetland mitigation, new wetlands would be created/established up and downstream of the remaining wetlands. As part of the Wetland Mitigation and Monitoring Plan that would be submitted to the RWQCB during the application review process, a water budget analysis would be conducted to ensure that the position of created/established wetlands do not indirectly impact the hydrology of existing wetlands.

Response to S&W-9

The commenters stated that the project proposed the use of specialized bio soils in the bioretention facility to remove pollutants. The commenters referenced a statement in the Draft EIR in Section 3.8, Hydrology and Water Quality, Section 3.8.6 that suggests that the Wetland Preserve would facilitate the natural sequestration of pollutants of stormwater that is leaving the project site.

The proposed project would not discharge untreated stormwater into the Wetland Preserve or created/established wetlands or the remaining unimpacted wetlands. Instead, all stormwater would be treated to City of American Canyon and RWQCB standards prior to being discharged off-site into the Wetland Preserve. The use of specialized bio soils in bioretention facilities are a standard practice that allow them to function optimally to remove solids and sequester contaminants in site-specific runoff before stormwaters leave the site. The fact that wetland preserve would contain biosoils is not an indication that water quality control is an intended primary function of the preserve.

Response to S&W-10a

The commenters suggested that the USACE “requires” a 100-foot buffer around vernal pools and references the draft Mitigation and Monitoring Guidelines for Vernal Pools that was released for public comment in 2016.

The USACE currently does not require buffers around vernal pool preserves or mitigation sites. The stated objective of the USACE’s draft Mitigation and Monitoring Guidelines for Vernal Pools is to provide “guidance” to select appropriate compensatory mitigation sites, construct compensatory vernal pools and complexes, and establish a monitoring program that will adequately assess compliance with the performance standards established in the mitigation plan. Within the guidance under “Construction Technique,” a minimum 100-foot buffer around a vernal pool preserve or mitigation site is suggested. These are guidelines, not requirements. More importantly, these

guidelines have not been finalized or incorporated into the South Pacific Division Final Regional Compensatory Mitigation and Monitoring Guidelines. Specific to this project site and the Wetland Preserve, the two unimpacted vernal pools' main source of hydrology are direct precipitation and surface water flow from a culvert near the northeastern boundary, which flows east to west toward No Name Creek. Therefore, the surface hydrology feeding the two unimpacted vernal pools and the proposed created/established vernal pool would not be impacted by the proximity of the proposed development to the vernal pools. In addition, although the bioretention basins may require periodic maintenance, the bioretention basins would also provide a minimum 100-foot buffer from the two unimpacted vernal pools.

Response to S&W-10b
The commenters noted that the buffer areas surrounding the unimpacted IW-7, -8, -9, and -10 appear to show an approximately 100-foot buffer and are labeled as "Proposed Landscaped Area." The commenters stated it is unclear if the buffer adjacent to IW-7, -8, -9, and -10 will consist of native or ornamental vegetation or if it will be intensely maintained as manipulated landscaped areas. The commenters stated indirect impacts through a disturbed or landscaped buffer are not discussed.

The final buffer widths would be determined during the permitting process with the RWQCB. The landscaping within the buffers would consist of native grasses and shrubs, approved by the RWQCB, that would require no maintenance once established. The mitigation plan would include temporary watering until the grasses and/or shrubs are established and then watering would cease. Maintenance may include invasive low intensity tasks such as removing trash and replacing grasses or shrubs as needed. Establishing a buffer with native grasses and or shrubs is not anticipated to indirectly impact the unimpacted wetlands IW-7, 8, 9, and 10. Therefore mitigation measures are not required.

Response to S&W-10c
The commenters suggested that development surrounding the unimpacted wetlands IW-7, -8, -9, and -10 will isolate these wetlands from the remaining wetland complex to the north, and that this disconnection and overall reduction in buffer widths is not analyzed or discussed.

Wetlands IW-7, -8, -9, and -10 are currently hydrologically isolated from the wetlands to the north, which was determined by Monk and Associates, verified by the USACE and EPA and reflected in the AJD. This hydrological isolation is an existing condition, and therefore does not warrant a discussion or mitigation measure. Given the small area of these wetlands, the currently isolated nature of the wetlands, and the non-native annual grasses surrounding these wetlands, the reduced buffer would not have an adverse effect on the hydrology or plant composition to wetlands IW-7, -8, -9, and -10. Therefore, mitigation measures are not required.

The Draft EIR does analyze and discuss in Impact BIO-4 in Section 3.3, Biological Resources, page 3.3-37 how the proposed development would impact the movement of any native resident or migratory fish or wildlife species, migratory wildlife corridors or use of wildlife nursery sites on the site. Although this analysis does not specifically reference IW-7, 8, 9, and 10, it does reference sensitive habitats and "wetlands," which would include IW-7, 8, 9, and 10.

Response to S&W-11

The commenters referenced language in the Procedures that requires compensatory mitigation to be developed using a watershed profile and requires that the watershed profile include information sufficient to evaluate direct, secondary (indirect), and cumulative impacts of project. The commenters stated that the Draft EIR does not address impacts to wetland functions associated with reduced buffer widths, increased noise, lights, and traffic compared to existing conditions.

Refer to Response S&W-6b, Response to S&W-10a through Response to S&W-10c regarding impacts to wetland functions associated with reduced buffer widths.

HBG determined that an increase in noise, lights and traffic generated by the project compared to existing conditions would not result in significant direct, indirect or cumulative impacts to wetland functions, and therefore do not require mitigation under CEQA Guidelines. This assessment is based on the following:

The project site is currently surrounded an all four sides by commercial development and is bisected by a new road and public trail extension, all of which generates noise, light, vehicle traffic and pedestrian noise and traffic. The entire northern boundary of the Wetland Preserve directly abuts the recently-constructed Napa Logistics Park commercial warehouse development. This development exposes the Wetland Preserve to vehicle and semi-truck noise, lights and traffic 24 hours a day 7 days a week. The eastern boundary of the Wetland Preserve abuts railroad tracks and commercial development and is less than 1,200 linear feet from SR 29, which generates a significant amount of traffic noise 24 hours a day 7 days a week. The western boundary of the Wetland Preserve is adjacent to a wine distribution warehouse and an ongoing construction site for a new warehouse that is part of the Napa Logistics Park project. The existing wine distribution warehouse and ongoing construction of the new Napa Logistics Park warehouses also exposes the Wetland Preserve to noise, light and traffic. The southern and southwestern boundary of the project site is bounded by railroad tracks, commercial development and Green Island Road. Green Island Road is a route semi-trucks use to deliver and receive goods from the many warehouses that currently surround the project site and Wetland Preserve. In addition, the City of American Canyon recently completed the Devlin Road and Vine Trail Extension Project. This project consists of a new road bisecting the project site and Wetland Preserve connecting Green Island Road with Devlin Road abutting the Napa Logistics Park commercial development. The new Devlin Road Extension and Vine Trail Extension directs semi-truck traffic, vehicle traffic and pedestrians through the project site bisecting the Wetland Preserve generating noise, light, vehicle traffic and pedestrian noise and traffic. Although the proposed project would increase noise, light and traffic, the Wetland Preserve is surrounded on all four sides by commercial development, and bisected by a road and pedestrian trail. Therefore, the avian and terrestrial species that use the wetlands and uplands within the Wetland Preserve have habituated to the significant level of noise, light, traffic and pedestrian disturbances that currently exist and the levels of disturbances that the proposed project would not result in significant direct, indirect or cumulative impacts to wetland functions, and therefore do not require mitigation under CEQA Guidelines.

The commenters also stated that the Draft EIR does not address cumulative wetland impacts that incorporate current development trends in the area and continued aquatic habitat fragmentation.

As discussed on pages 4-5 and 4-6 of the Draft EIR, the proposed project would potentially contribute to the cumulative loss of biological resources in the City of American Canyon and the effects of ongoing urbanization in the region. The proposed project, in conjunction with other development planned in the City of American Canyon and Napa County, would contribute to the cumulative loss of ruderal/annual grassland and wetland habitat for resident and migratory wildlife species and federal and State listed plants and animals. Compliance with the mitigation measures outlined in Draft EIR Section 3.3, Biological Resources, would reduce the impact of the proposed project's contribution to the cumulative impacts to less than significant. Therefore, a mitigation measure specific to cumulative wetland impacts is not required.

Response to S&W-12
The commenters suggested that they are unable to evaluate if the proposed mitigation will adequately replace lost wetland functions because the Draft EIR does not provide assessment of wetland functions, water budget analysis, and, in general, information necessary to determine whether the wetlands can be successfully created.

Refer to Response to S&W-6b and Response to S&W-8 regarding impacts to wetland functions and water budget analysis.

Response to S&W-13a
The commenters suggested that creating vernal pools is difficult and successful wetland creation is largely driven by ability to provide appropriate hydrology, and referenced federal and State guidelines which also speak of the difficulty in creating vernal pools. The commenters stated a hydrologic analysis that demonstrates wetland creation potential in the proposed mitigation area is not provided in the Draft EIR.

Establishing an appropriate hydroperiod (i.e., the timing and duration of inundation) is particularly critical to vernal pool ecosystems and can be difficult to create. Topographic and geologic factors can have a significant effect on vernal pool hydroperiod. The topography within the Wetland Preserve is relatively flat, which, topographically, makes this area ideal for creating/establishing vernal pools; and the United States Geological Survey (USGS) soil survey maps indicate the majority of the Wetland Preserve does support clay soils, which are also ideal for creating vernal pools. To ensure excavated depressions 1 to 3 feet below grade support clay soils and could pond and hold water for a duration long enough to support vernal pools, HBG and HBC conducted an assessment of the soil profile. Using a backhoe, 25 soil pits were dug to approximately 4 feet in depth. Soil texture and color were then recorded throughout the profile for each soil pit. Results indicated a restrictive layer composed of clay soil is found 12-30 inches below the surface. This layer of clay soil supports the existing vernal pool hydrology and would allow the establishment of vernal pools within the Wetland Preserve. Based on the Wetland Preserve's flat topography, restrictive layer of clay soil just below the surface, and the fact that the site currently supports vernal pools, HBG is confident vernal pools can be successfully established and functioning within a 5-year monitoring period. The location of each established vernal pool would be selected based on the soil profile, and water budget analysis referenced to Response to S&W-8.

Response to S&W-13b

S&W suggests that the Procedures and the USACE may require mitigation ratios greater than 1:1 for impacts to vernal pools, and the information in the Draft EIR does not support the conclusion that the proposed established/created wetlands would replace all the wetland functions at the time of Phase 2.

The proposed 1:1 wetland establishment mitigation ratio for permanent wetland impacts meets the federal and State "no-net-loss" of wetland area policy. Typically, the USACE and RWQCB will require a mitigation ratio greater than 1:1 if wetland mitigation is implemented after or concurrent with the start of project construction and if there is a low level of confidence a selected site can support wetlands.

S&W suggests that the Draft EIR does not support the conclusion that the proposed established/created wetlands would replace all the wetland functions at the time of Phase 2.

The impact analysis discussed in the Draft EIR under Impact BIO-2 states "to offset the loss of the 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools from Phase 2, and to ensure there is no-net loss of wetland or vernal pool area, the applicant shall establish/create 2.57 acres of seasonal wetlands (1:1 ratio) and of 1.13 acres of vernal pool wetlands (1:1 ratio) for Phase 2 at least 1 year prior to the start of Phase 2 construction." As discussed above in Response to S&W-13a, HBG has a high level of confidence that the Wetland Preserve can support the establishment of vernal pools, and that, when constructed a minimum of 1 year prior to the start of Phase 2 construction, these vernal pools will be functioning (e.g., providing flood storage, avian and terrestrial habitat, provide habitat suitable for vernal pool plants, etc.) similar to the vernal pools that would be impacted by Phase 2. Based on HBG's assessment, the Wetland Preserve is ideal for establishing vernal pools, and the vernal pools will begin functioning as vernal pools within 1 year after construction, and the 1:1 mitigation ratio that was proposed to offset wetland impacts for Phase 2 will be considered adequate.

Response to S&W-14
The commenters suggested that the 1990 Federal Mitigation Memorandum of Agreement between the USACE and EPA requires the applicant to complete a thorough mitigation sequencing wherein impacts to aquatic resources are first avoided, then minimized, and unavoidable impacts mitigated. The commenters stated the Draft EIR does not address how the proposed project completed this sequencing.

The 1990 Federal Mitigation Memorandum of Agreement is a federal process and an agreement, as stated by S&W, between two federal agencies. Although the requirements in this agreement will be assessed by the USACE and EPA during the Clean Water Act Section 404 permitting process, during the design process "practicable" alternatives were assessed to first avoid impacts to wetlands, then minimize impacts to wetlands, and where impacts were unavoidable, mitigation measures were proposed. The term 'practicable' was applied in accordance with 40 Code of Federal Regulations Section 230.3(q) meaning "available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes." During the design process, alternative site designs proposed to avoid and minimize impacts considered several specific constraints of a practicable project site plan that were needed in order to satisfy the overall project

purpose. These specific site design constraints included the need to: (1) provide sufficient building square footage capable of accommodating large manufacturing, and/or fulfillment and distribution tenants that require large surface and vertical area structures (i.e., high-cube warehouse buildings), (2) provide sufficient area to accommodate loading docks and circulation routes that can accommodate tractor-semitrailers and delivery vans, and parking to accommodate tractor-semitrailers, vans and personnel vehicles, (3) provide sufficient space to comply with Statewide General Permit for Stormwater Discharges Associated with Industrial Activities, (4) provide for water, sewer, and electric utilities sufficient for an industrial facility, or in an area where those utilities may be practicably extended to the project site, and (5) provide sufficient area to implement wetland mitigation to offset unavoidable impacts to aquatic resources.

Considering these constraints, the proposed Phase 1 design avoided 0.350 acres of wetlands and both Phase 1 and Phase 2 designs minimized impacts to existing wetlands within the Wetland Preserve area by positioning the bioretention basins between the Wetland Preserve and warehouse development.

Response to S&W-15a
The commenters stated that the proposed 5 years of mitigation monitoring is the minimum requirement in the State's Procedures. The commenters referenced the 10-year monitoring guidelines for vernal pools suggested in the draft Mitigation and Monitoring Guidelines for Vernal Pools.

The guidelines that the commenters referenced are in draft form and have not been finalized or incorporated into the South Pacific Division Final Regional Compensatory Mitigation and Monitoring Guidelines, and currently the USACE does not require 10 years of monitoring for vernal pools. Regardless, as discussed previously in Response to S&W-13a, the Wetland Preserve can support the establishment of vernal pools, and once constructed, these vernal pools will provide functions (e.g., provide flood storage, avian and terrestrial habitat, provide habitat suitable for vernal pool plants, etc.) similar to the vernal pools impacted within a short period of time. Based on HBG's assessment, the Wetland Preserve is ideal for establishing vernal pools, and the vernal pools will begin functioning as vernal pools within 1 year after construction, a 5-year monitoring period is sufficient to determine whether the vernal pools have met the performance standards and have replaced the functions of the vernal pools impacted.

Response to S&W-15b
The commenters summarized the Draft EIR MM BIO-3d and suggests that without an understanding of the impacted wetland functions, there is not a basis for establishing mitigation goals or ecological performance standards.

Refer to Response to S&W-6b.

Response to S&W-15c
The commenters suggested that the Draft EIR does not describe use of reference wetlands in the mitigation approach, which is needed to define the performance standards.

The Draft EIR acknowledges in MM BIO-3d that the Wetland Mitigation and Monitoring Plan shall be prepared in accordance with the California State Water Resources Control Board (State Water Board) Procedures. The Procedures require the use of "reference aquatic resources," as correctly stated by S&W. Therefore, MM BIO-3d requires, by referencing the Procedures in MM BIO-3d, the use of "reference aquatic resources" to assist in developing performance standards.

Response to S&W-16a
The commenters stated that City policy requires riparian corridors to be protected by an adequate buffer width and references the buffer guidelines for vernal pools suggested in the draft Mitigation and Monitoring Guidelines for Vernal Pools.

Although No Name Creek is referenced as a creek on the USGS map, it does not support riparian vegetation and is a seasonal wetland, therefore the City riparian corridor policy does not apply. As shown on the Draft EIR Exhibit 3.3-2 Plant Communities map, the area where No Name Creek occurs is labeled as a Seasonal Wetland Community, and it is also labeled as a wetland on the USACE AJD. Thus, the City's riparian corridor buffer policy does not apply on this project site. With respect to the vernal pool buffer comment please refer to Response to S&W-10a.

Response to S&W-16b
The commenters suggested that the lack of project buffer impact analysis makes it difficult to evaluate if the proposed buffer plantings referenced on the Draft EIR Exhibit 3.3-4 are adequate compensation to replace the lost buffer.

The purpose of the proposed tree and shrub plantings referenced on the Draft EIR Exhibit 3.3-4 is to provide vertical structure within the Wetland Preserve to enhance its habitat value. Currently there are no trees within the Wetland Preserve and few shrubs. The tree and shrub plantings were not proposed as "mitigation" or proposed to provide a "buffer" between the project site and the Wetland Preserve. With respect to buffers around unimpacted wetlands and vernal pools, please refer to Response to S&W-10a through Response to S&W-10-c and Response to S&W-11.

Response to S&W-17
The commenters summarized the resources used in their groundwater review. No response is necessary.

Response to S&W-18a
The commenters summarized the findings of the Water Supply Assessment and noted that the City of American Canyon does not use groundwater as part of its municipal water supply. No response is necessary.

Response to S&W-18a
The commenters summarized the findings of the Water Supply Assessment. No response is necessary.

Response to S&W-18c
The commenters summarized the findings of the Water Supply Assessment. The commenters noted that the Water Supply Assessment indicated that the proposed project would be required to comply with the City's Zero Water Footprint Policy and the Draft EIR did not address this requirement.

The Draft EIR's water supply analysis, which was based on the Water Supply Assessment, concluded that adequate water supplies would be available to serve the project and no mitigation was necessary. Hence, the Draft EIR's analysis did not rely on the City's Zero Water Footprint Policy to reach this CEQA conclusion.

The neighboring Napa Logistics Park Project, which involves similar types of end users as the proposed Giovannoni Logistics Center, achieved compliance with the Zero Water Footprint Policy. Therefore, it would be expected that the proposed project could achieve compliance as well. Regardless, how the applicant achieves compliance with the City's Zero Water Footprint Policy is outside the scope of the Draft EIR.

Response to S&W-19
The commenters stated that the loss of pervious surface coverage would not have a significant effect on groundwater recharge and, thus, would not change the groundwater budget for the basin. No response is necessary.

Response to S&W-20
The commenters summarized the resources used in their high-level stormwater review. No response is necessary.

Response to S&W-21
The commenters summarized the findings of their stormwater review and noted that Phase 2 does not appear to benefit from Devlin Road in terms of stormwater retention and, therefore, the stormwater basins and bioretention will likely have to be larger than Phase 1.

Phase 2 encompasses 113 acres and would support up to 1.3 million square feet. By virtue of having more square footage than Phase 1, it will likely have more impervious surface coverage and, thus, need larger basins and bioretention areas.

Response to S&W-22
The commenters reiterated their findings. Refer to Response to S&W-5 through Response to S&W-21.

Response to S&W-23
The commenter listed the references used. No response is necessary.

Response to S&W-24
The commenter provided his curriculum vitae. No response is necessary.

Response to CASHEN-1
The commenter provided introductory remarks. No response is necessary.

Response to CASHEN-2
The commenter disputed the Draft EIR's conclusion that the proposed project would not have any impact on vernal pool fairy shrimp. The commenter stated that the project site provides potential habitat for vernal pool fairy shrimp habitat and alleged that the 2016-2017 surveys for this species that did not find presence of this species are outdated. The commenter claimed that thousands of vernal pool shrimp were detected in vernal pools located 2,700 feet northwest of the project site.

Generally, when surveys are older than 5 years the United States Fish and Wildlife Service (USFWS) may request new surveys to be conducted, or they may not. Nonetheless, the referenced vernal pool branchiopod protocol surveys were less than 5 years old when the Draft EIR was released and, from a biological standpoint, the surveys were reliable and sufficient to support the conclusion that federally listed threatened vernal pool fairy shrimp do not occur on the project site. As the commentor notes, thousands of vernal pool fairy shrimp have occurred within 2,700 feet of the project site for many years, but the surveys show they have not become established within the project site. This indicates that the on-site seasonal wetland and vernal pool habitats are likely not sufficient to support vernal pool fairy shrimp. Therefore, no impacts to vernal pool fairy shrimp would result from construction of the proposed project.

Response to CASHEN-3
The commenter claimed that the Draft EIR failed to evaluate the following Bird Species of Conservation Concern: California gull, savannah sparrow, and marbled godwit. The commenter also stated that the Draft EIR failed to evaluate impacts to cackling geese, which likely occur on the project site because they have been detected at the neighboring Napa Logistics Park.

Marbled godwit, California gull, and savannah sparrow have all been documented within or flying over the project site by biologists with HBG and Monk & Associates. Marbled godwit is an abundant wintering shorebird found along the shoreline of San Francisco Bay, ocean beaches, and wetlands. They nest in the Northern Plains and are not included on CDFW's Special Animals List (latest update in July 2022). There is no reason that impacts to this abundant species needs to be a topic for evaluation in the EIR. California gull is a common wintering species in the San Francisco Bay Area that nests at primarily inland bodies of water in the American west. It is considered a CDFW Watch List species with respect to nesting colonies, none of which occur on or near the project site. By mentioning savannah sparrow, it appears that the commenter is referring to Bryant's savannah sparrow, a subspecies of the widespread and common savannah sparrow, which is considered a species of special concern in California primarily because of its limited range. The Bryant's subspecies of savannah sparrow occupies tidal marshes, moist grasslands and some adjacent ruderal areas within a narrow coastal strip between Humboldt Bay and Morro Bay, and would not be expected within the Giovannoni project site in American Canyon.

Cackling goose (*Branta hutchinsii*) is a goose species once considered conspecific with the common Canada goose (*Branta canadensis*). Cackling goose is a common species; however, the Aleutian subspecies of cackling goose was listed as endangered under the federal Endangered Species Act until its recovery to a population of over 100,000 individuals and its delisting from the Act in 2001. The Aleutian subspecies remains on the CDFW Watch List.

Note that MM BIO-4 requiring nesting surveys for all bird species during the breeding season would ensure significant impacts to all nesting bird species would not occur.

Response to CASHEN-4
The commenter disputed the Draft EIR's conclusion that the short-eared owl does not occur on the project site because of lack of suitable habitat. The commenter claimed that the project site does in fact provide suitable habitat including voles, freshwater marshes, and ungrazed grassland and noted that one was observed during a survey at the neighboring Napa Logistics Park.

The Draft EIR Appendix C.1 Biological Resources Report determined the project site did not support suitable habitat for the short-eared owl (a California Species of Special Concern and USFWS Bird Species of Conservation Concern), at least in part because the property is currently surrounded on all four sides by commercial development or heavily trafficked roadways and is bisected by a new road and public trail extension that create disturbances, all of which would not be conducive to nesting by this sensitive species. Although nesting by this species is not likely for this reason, nesting by short-eared owl, a species that resembles northern harrier in its habitat requirements and foraging habits (northern harrier by day and short-eared owl at night), is possible. For this reason, recommended nesting surveys for northern harrier (see MM BIO-1c) should include concurrent searches for nesting short-eared owl and mitigate for the presence of nesting birds, if found. Refer to Response to CDFW-8a for revised wording of MM BIO-1c, which now provides for the possibility of finding nesting short-eared owl as well as northern harrier. Implementation of MM BIO-1c would ensure potential impacts to short-eared owl, as well as those for northern harrier, would be less than significant.

Response to CASHEN-5a
The commenter noted that the Draft EIR concluded that the proposed project would not impact rare plants and stated that the rare plant surveys that were the basis of this conclusion are invalid because they were conducted in 2021, which was a drought year.

The Draft EIR did not rely solely on HBC's 2021 botanical surveys. Referenced in the Draft EIR Appendix C.1 Biological Resources Report, the biological evaluation also considered plant data in the aquatic resources delineation prepared by Monk & Associates, and Biological Resource Reports prepared by Monk & Associates for the Devlin Road and Vine Trail Extension Project and the Green Island Road Reconstruction and Widening Project. In addition, HBG's biological evaluation considered plant data in the CNDDB to determine whether populations of endangered, threatened, or rare species have occurred on the site historically or are currently known to exist in the project vicinity. All of this data was sufficient to analyze the proposed project's potential impacts to plant species. The data relied on included data taken in wet years as well as drought years.

Response to CASHEN-5b
The commenter claimed the rare plant surveys did not encompass the blooming periods of all target species, including Napa bluecurls and pappose tarplant and, thus, the Draft EIR's conclusion that the proposed project would not impact rare plants are not supported by sufficient evidence.

The blooming periods listed in Appendix A of the 2021 HBC rare plant survey report are general approximations provided by the California Native Plant Society and may vary depending on weather

patterns. Because of blooming periods varying from year to year, and in accordance with the CDFW's protocol, HBC conducted visits to several reference sites with known special-status plants targeted for field surveys to determine whether those special-status plants were identifiable at the times of year the botanical field surveys took place. HBC conducted botanical surveys during the spring of 2021 and survey dates were chosen based on the reference sites and when the special-status plants would likely be in bloom or otherwise visible. Because of significant early fall rainfall in 2020, lack of spring rainfall in 2021 and warm weather, the flowering periods were several months in advance of normal blooming periods. The last rainfall event that was not trace amounts, occurred on March 18, 2021. Based on the weather patterns leading up to the spring surveys for 2021 and based on the reference sites known to support the target plants, the dates HBC conducted the surveys on were reliable and sufficient to capture blooming periods or a visual image of the target species.

Response to CASHEN-6

The commenter noted the Draft EIR indicated that the proposed project would impact 3.7 acres of palustrine emergent wetlands, seasonal wetlands, and vernal pools but did discuss the ecological functions of wetlands or evaluate indirect impacts on wetlands outside the development footprint. The commenter claimed that the proposed Wetland Preserve would function as an island surrounded by urban development and would be subject to human disturbance. The commenter also noted MM LU-3 seeks to reduce the avian attractants and, thus, would further diminish the Wetland Preserve's functions. The commenter alleged that because of these reasons, MM BIO-2 and MM BIO-3 would not reduce the proposed project's impacts on wetlands to a less than significant level.

Functional assessments were conducted to determine plant and animal communities supported on the project site, and these functional assessments were then used in the impact analysis and subsequent mitigation requirements. Refer to Response to S&W-6b for further discussion.

As shown in Draft EIR Exhibit 3.3-3, the Wetland Preserve would contain No Name Creek, which is hydrologically connected to the Napa Logistics Park Wetland Preserve to the north. It would also be contiguous to wetland areas within the Biaggi Bros. property to the west. Thus, the commenter's claims that the Wetland Preserve would be an island are his opinion not supported by evidence.

With respect to the commenter's suggestion that MM LU-3 seeks to reduce the avian attractants and, thus, would further diminish the Wetland Preserve's please refer to CASHEN-14 for further discussion on the implications of MM LU-3.

Response to CASHEN-7a

The commenter noted the MM LU-3 would incorporate measures to reduce bird attractant potential of the wetland area and, therefore, it is reasonable to assume the wildlife hazard reduction measures required under MM LU-3 would include measures to reduce the attraction of Swainson's hawks to the Wetland Preserve. The commenter referenced the Draft EIR's discussion of Swainson's hawk foraging habitat and disputed the statement that there have been a limited number of occurrences of the species within a 10-mile radius of the project site. The commenter claimed that both the California Natural Diversity Database and eBird database have numerous records of Swainson's hawk occurrences within 10 miles of the project site.

With respect to the commenter's suggestion that MM LU-3 would include measures to reduce the attraction Swainson's hawks to the Wetland Preserve, refer to Response to CASHEN-14. The California Natural Diversity Data Base is a reliable source of scientific data and was used to determine the number of occurrences of Swainson's hawk within a 10-mile radius of the project site. The commenter references the eBird data base, which shows multiple sightings of Swainson's hawk in the project area; but a knowledgeable person's interpretation of the eBird data would recognize that the multiple sightings of Swainson's hawk are of multiple observers seeing the same bird(s) over and over. Based upon the limited number of known Swainson's hawk to occur within a 10-mile radius of the project site, the acreage of existing foraging habitat currently protected, and the addition of a 45-acre open space area providing suitable foraging habitat for the species, there is more than sufficient foraging habitat near the project site. Accordingly, the proposed project would not result in significant impacts to foraging habitat nor affect the nesting populations of Swainson's hawk near the project site either directly, indirectly, or cumulatively. Therefore, no mitigation is warranted for Swainson's hawk foraging habitat. Refer to Master Response 1—Impacts to Swainson's Hawk/Golden Eagle Foraging Habitat, for further discussion.

Response to CASHEN-7b
The commenter alleged that the Draft EIR's biological survey on included a single survey for the Swainson's hawk and did not adhere to Swainson's hawk survey protocol, which require three independent surveys to be completed.

Two surveys were conducted to analyze project impacts, not one as suggested by the commenter. The Draft EIR acknowledges in Section 3.3, Biological Resources, page 3.3-4 that HBG conducted spring season site reconnaissance surveys on April 16 and May 24, 2021, and HBG drove about 10 miles of local roads surrounding the project site during both the April and May 2021 field reviews to inspect trees for raptor nest structures. No Swainson's hawk nest structures were observed during either reconnaissance. The Draft EIR also acknowledges, by referencing Appendix C.1 Biological Resources Report, that the analysis relied on CNDDB data of Swainson's hawk locations, and Biological Resource Reports prepared by Monk & Associates for the Devlin Road and Vine Trail Extension Project and the Green Island Road Reconstruction and Widening Project. This data was sufficient to analyze potential impacts the project may have on Swainson's hawk. Some mitigation measures developed in the Giovannoni Draft EIR were in part based on the mitigation requirements spelled out in the Monk & Associates environmental reports, which were certified by the City of American Canyon for projects that have been constructed or a currently in construction. Implementation of MM BIO-1a and MM BIO-4 would ensure project impacts to Swainson's hawk are less than significant.

Response to CASHEN-7c
The commenter disputed a statement that there is sufficient Swainson's hawk foraging habitat in the project vicinity such that the development of the proposed project would not cause a significant loss of this habitat. The commenter referenced CDFW mitigation guidelines for Swainson's hawk foraging habitat and claimed that the proposed project would result in an unmitigated significant impact in this regard.

Swainson's hawk foraging habitat mitigation is addressed in Master Response 1 (Impacts to Swainson's Hawk/Golden Eagle Foraging Habitat).

Response to CASHEN-8

The commenter noted that the Draft EIR indicated that a golden eagle was spotted during a field survey and indicated the development of the proposed project would result in the loss of golden eagle foraging habitat.

Development of the proposed project would remove some foraging area for this species. Development of the proposed project would also provide and preserve in perpetuity approximately 45 acres of open space that would include habitat currently suitable for foraging by the golden eagle, as indicated by the observation of a golden eagle foraging on the site in spring 2021. The adjacent Napa Logistics Park Project has preserved 37 acres of grassland and wetlands in perpetuity that provides foraging habitat for golden eagle. Between these two preservation areas abutting and directly adjacent to the project site, approximately 82 acres of suitable habitat would be available for the golden eagle. In addition, there are several large open space preserves within 2 and 5 miles of the project site that combined provide approximately 2,000 acres of suitable foraging habitat. Based upon the limited number of golden eagle records within a 10-mile radius of the project site, there is sufficient foraging habitat in and within the vicinity of the project site. Based upon the limited number of known golden eagle to occur within a 10-mile radius of the project site, the acreage of existing foraging habitat currently protected, and the addition of a 45-acre open space of suitable golden eagle foraging habitat as part of the project, the proposed project would not result in significant impacts to foraging habitat directly, indirectly, or cumulatively. Therefore, no mitigation is warranted for golden eagle foraging habitat.

Importantly, the Golden Eagle Protection Act provides criminal penalties for persons who "take, possess, sell, purchase, barter, offer to sell, purchase or barter, transport, export or import, at any time or any manner, any bald eagle . . . [or any golden eagle], alive or dead, or any part (including feathers), nest, or egg thereof." The Act defines "take" as "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb." Regulations further define "disturb" as "to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, (1) injury to an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior" (50 Code of Federal Regulations [CFR] 22.6). Although the proposed project would result in a net loss of foraging habitat, such a net loss occurring in the particular area in which the project site is located would not result in a "take" as defined by the Golden Eagle Protection Act.

For further discussion refer to Master Response 1 (Swainson's Hawk/Golden Eagle Foraging Habitat Mitigation).

Response to CASHEN-9

The commenter claimed that the northern harrier forages and may nest at the project site. The commenter claimed that MM BIO-1c would do nothing to mitigate loss of habitat and the potential

loss of breeding territory. The commenter claimed that the proposed Wetland Preserve would not mitigate the loss of habitat for the species because it does not contain the requisite habitat.

Development of the proposed project would remove some foraging and breeding habitat for this species. Development of the proposed project would also provide and preserve in perpetuity approximately 45 acres of open space that would include habitat currently suitable for foraging and breeding habitat by the northern harrier as indicated by the observation of a northern harrier foraging in the site. The adjacent Napa Logistics Park Project has preserved 37 acres of grassland and wetlands in perpetuity that provides foraging habitat for northern harrier and there are several large open space preserves within 2 and 5 miles of the project site that combined provide approximately 2,000 acres of suitable foraging and breeding habitat. Based upon the number of known northern harrier to occur within a 10-mile radius of the project site, the acreage of existing northern harrier habitat currently protected, and the addition of a 45-acre open space area of suitable northern harrier foraging habitat as part of the project, the proposed project would not result in significant impacts to northern harrier directly, indirectly, or cumulatively, therefore no mitigation is warranted for northern harrier foraging or breeding habitat.

The operative significance threshold for impacts to northern harrier, an unlisted species, is whether the proposed project would have a substantial adverse effect on the species, either directly or through habitat modifications. Although the proposed project would result in a net loss of potential northern harrier foraging habitat, such a net loss occurring in the particular area in which the project site is located would not cause a substantial adverse effect on the species. There is no need to "net out the impact of a proposed project" for that impact to be less than significant. (See, *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 529.)

Response to CASHEN-10
The commenter stated that MM BIO-1d does not require habitat compensation if burrowing owls are detected and stated that the proposed Wetland Preserve would not mitigate the loss of habitat.

Similar to Response to CASHEN-8 and CASHEN-9, based upon the lack of burrowing owls and burrowing owl habitat on the project site, the number of known burrowing owls to occur within a 10-mile radius of the project site and the acreage of existing suitable habitat currently protected within 2 and 5 miles of the project site, the proposed project would not result in significant impacts to burrowing owl habitat directly, indirectly, or cumulatively, therefore no mitigation is warranted for burrowing owl habitat. It should be noted the applicant agrees that, if burrowing owl is ultimately found on the site and burrow eviction/relocation of burrowing owls during the non-nesting season is a selected strategy to move forward with the project without direct impacts to burrowing owl individuals, the applicant will coordinate this effort with CDFW and provide habitat mitigation consistent with the 2012 CDFW Staff Report on burrowing owl. Modifications to MM BIO-1d, as shown in the Errata, confirm this requirement.

Also note that mitigation recommendations in the CDFW 2012 Staff Report do not carry the force of law, as burrowing owls are not listed under CESA, and the Staff Report was not subject to any formal rulemaking process. Moreover, the operative significance threshold for impacts to burrowing owl, an unlisted species, is whether the proposed project would have a substantial adverse effect on the

species, either directly or through habitat modifications. Although the proposed project would result in the loss of burrowing owl nests or a net loss of potential burrowing owl foraging habitat, such losses would not cause a substantial adverse effect on the species. There is no need to "net out the impact of a proposed project" for that impact to be less than significant. (See, *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 529.)

Response to CASHEN-11
The commenter claimed the merlin and ferruginous hawk have been detected north of the project site and stated the project site provides foraging habitat. The commenter alleged MM LU-3 would directly functionally eliminate habitat for these two species.

Merlin and ferruginous hawk are raptor species on the CDFW Watch List with respect to wintering habitat. Both of these raptors are species with widespread winter ranges that include much of the western United States and beyond, including portions of the San Francisco Bay Area and inland valleys. They occur in small numbers throughout and can be found in grasslands, pastures, undeveloped and even developed urban to rural sites, golf courses, etc. Occasional use of the project site by either of these species is likely to occur, but there is nothing peculiar about the property that would warrant protection or mitigation on the basis of the site being an important wintering site for either species. In addition, similar to Response to CASHEN-8 and CASHEN-9, based on the acreage of existing suitable habitat currently protected within 2 and 5 miles of the project site, the proposed project would not result in significant impacts to merlin or ferruginous hawk habitat directly, indirectly, or cumulatively, therefore no mitigation is warranted for merlin or ferruginous hawk habitat. The operative significance threshold for impacts to these unlisted species is whether the proposed project would have a substantial adverse effect on the species, either directly or through habitat modifications. Although the proposed project would result in the loss of potential foraging habitat, such losses would not cause a substantial adverse effect on the species. There is no need to "net out the impact of a proposed project" for that impact to be less than significant. (See, *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 529.) In addition, implementation of MM LU-3 will not functionally eliminate the habitat for these two species. Refer to Response to CASHEN-14 for further discussion on the implications of MM LU-3.

Response to CASHEN-12
The commenter alleged the proposed project has the potential to introduce invasive plant species or facilitate their spread during construction. The commenter claimed that because the proposed project does not set forth mitigation for invasive plant species, it does not comply with General Plan Policy 8.4.3.

Based on the fact that the majority of the project site, once developed, will consist of hard surfaces (building foundations, asphalt parking lots, access roads etc.) that do not provide a growth medium for plants, the proposed developed portion of the project site could not support invasive plant species even if they were inadvertently introduced during or after construction. The managed landscaped areas within the development could provide a limited opportunity for an invasive plant; however, these areas are managed landscaped areas with planted trees and shrubs that would be managed, by techniques such as weeding, to allow for the growth of the plants, included in the landscape plan once proposed. Therefore, no mitigation is warranted for invasive plant species

during construction or after construction on the developed portion of the project site. If an invasive plant is introduced into the Wetland Preserve, the Draft EIR set forth mitigation measures under MM BIO-3d. MM BIO-3d provides mitigation measures in Draft EIR Section 3.3, Biological Resources, page 3.3-36 to monitor for the establishment of an invasive plant species in wetlands and provides a contingency measure on page 3.3-37 to address invasive plant species should the invasive plant performance standard not be met.

Response to CASHEN-13
The commenter noted that a 0.5-mile radius was used as the geographical area for the Draft EIR's cumulative biological analysis and no justification was provided as to why this was appropriate. The commenter claimed the Draft EIR discussed foraging habitat using a much larger geographical area and, thus, used two different geographical areas for the cumulative analysis. The commenter reiterated previous comments about loss of foraging habitat and Impact MM LU-3 would have on the Wetland Preserve as foraging habitat.

In Chapter 4, Cumulative Effects, the geographic scope for each topic is identified and the rationale for it is explained. For Biological Resources, 0.5-mile was used because of the project site's location between the marshes associated with the Napa River and urban development with the City of American Canyon. Thus, 0.5-mile would encompass this geographical area.

The discussion of the abundance of Swainson's hawk foraging habitat in the project vicinity in Section 3.3, Biological Resources, was a separate analysis. Regardless, much of that foraging habitat is within 0.5-mile of the project site. The discussion of impacts to the ability of the Wetland Preserve to provide foraging habitat is discussed below in CASHEN-7a.

Refer to Master Response 1 for further discussion of foraging habitat.

Response to CASHEN-14
The commenter alleged that MM LU-3 would preclude implementation of MM BIO-2 and MM BIO-3 because it would require modification of the landscape, hazing, or removal of hazardous wildlife species. The commenter suggested that implementation of MM LU-3 would require the use of pyrotechnics, propane cannons or directional sonic/hailing devices, the effects of which were not evaluated in the Draft EIR.

MM LU-3 is patterned after a similar mitigation measure set forth in the Napa Logistics Park Phase 2 EIR to minimize the avian attractant attributes of that project's 37-acre Wetland Preserve. In the case of Napa Logistics Park, the intent was to minimize the avian attractant attributes of where standing water would occur through design practices (i.e., employing certain shapes that are not appealing to avian species). Importantly, hazing or hazardous wildlife species removal was not employed in the Napa Logistics Park. Given that Napa Logistics Park is nearly built out and the Wetland Preserve has been established for several years, there is evidence that the successful implementation of MM LU-3 and MM BIO-2 and MM BIO-3 can be achieved. Furthermore, a Wildlife Hazard Assessment has already been prepared, in accordance with MM LU-3, and demonstrates that the construction of the proposed project would not cause an increase above the existing level of activity of birds or other wildlife, and would not present a hazard to Napa County Airport flight operations. It is predicted that

the overall wildlife activity on the property would remain at or below current levels. The Wildlife Hazard Memo is included in Appendix L of this Final EIR.

Lastly, the commenter's claim that pyrotechnics, propane cannons, or directional sonic/hailing devices would be used is speculative, unsupported by any statements in the Draft EIR.

Response to CASHEN-15
The commenter referenced MM BIO-1a and claimed it violates the Swainson's Hawk Technical Committee survey protocol by allowing construction to commence after the first survey, which may cause impacts on the species. The commenter also alleged that MM BIO-1a only requires a 1,000-foot buffer, whereas CDFW mitigation guidelines call for a 0.25-mile buffer.

There are no trees on the project site and, thus, the Swainson's hawk does not have the potential to nest on-site. Instead, MM BIO-1a applies to Swainson's hawk nesting within the zone of influence, which is generally defined as within 1,000 feet of the project site. Refer to Response to CDFW-5a and Response to CDFW-5b for further discussion.

See also Master Response 1 (Swainson's Hawk/Golden Eagle Foraging Habitat Mitigation).

Response to CASHEN-16
The commenter referenced MM BIO-1b and claimed that it does not require that the surveys adhere to USFWS survey protocol, does not include 1-mile non-disturbance buffer, and does not provide evidence that a reduced buffer would be sufficient to mitigate impacts on golden eagles.

As discussed in Draft EIR Section 3.3, Biological Resources, page 3.3-25, there are no trees on the project site and, thus, the golden eagle does not have the potential to nest on-site. Instead, MM BIO-1b applies to golden eagle nesting within the zone of influence, which is generally defined as within 1,000 feet of the project site. The USFWS Interim Golden Eagle inventory and monitoring protocols provides recommendations for determining and evaluating potential golden eagle use of habitat, including nest sites, roosts, and territories, as well as the rationale for identifying and evaluating foraging locations during breeding and non-breeding periods and buffer recommendations. The purpose of the data gathered is to provide information on the baseline circumstances for evaluation of permit applications and foundation for permit conditions during the National Environmental Policy Act (NEPA) process. A Pre-construction Notification was submitted to the USACE with information regarding golden eagle foraging habitat on the project site, known golden eagle sightings within a 10-mile radius of the project site, proposed 1,000-foot minimum buffer from a nest, and proposed pre-construction surveys that would be implemented prior to the start of construction. Based on the USACE's assessment, initiation of an Endangered Species Act Section 7 consultation for golden eagle was not warranted. Regardless, MM BIO-1b establishes a minimum 1000-foot buffer zone, which means the qualified Raptor Biologist could require a larger buffer than 1000 feet or adhere to the USFWS 1-mile buffer recommendation or establish a buffer greater than 1 mile if it is determined, by the qualified Raptor Biologist, that a larger buffer is warranted. Construction activities vary and may include low disturbance activities such as engineering surveys, high levels of disturbance such as large-scale grading, or there may be areas that may have no disturbances for long periods. The qualified Biologist shall establish an appropriate buffer to avoid

project impacts that could result in nest abandonment, loss of young, and/or injury or mortality of burrowing owls. Implementation of MM BIO-1b would ensure project impacts to golden eagle are less than significant.

Response to CASHEN-17
The commenter referenced MM BIO-1c and claimed that it does not provide evidence that a 500-foot buffer would be sufficient to protect northern harrier nest.

MM BIO-1c states the northern harrier nest must be protected by implementing a minimum 500-foot radius buffer zone around the nest, and that the qualified Raptor Biologist could modify the buffer zone considering the type of construction activity that may occur, physical barriers between the construction site and active nest, and the behavioral factors and extent that northern harrier may have acclimated to disturbance. This means the minimum buffer is a 500-foot radius; however, according to MM BIO-1c the qualified Raptor Biologist could increase the buffer radius if deemed necessary to protect the nest. Implementation of MM BIO-1c and MM BIO-4 would ensure project impacts to northern harrier are less than significant.

Response to CASHEN-18a
The commenter referenced MM BIO-1d and claimed that the 100-foot non-disturbance buffer for an occupied burrowing owl nest is inconsistent with CDFW mitigation guidelines, which recommend a 500-meter buffer from occupied burrows and activities causing a high level of disturbance.

As stated above, the CDFW mitigation guidelines recommend a 500-meter buffer from activities causing a high level of disturbance. Construction activities vary and may include low disturbance activities such as engineering surveys, high levels of disturbance such as large-scale grading, or there may be areas within a large construction site, such as the project site, that may have no disturbances for long periods. MM BIO-1d establishes a minimum 100-foot buffer zone, which means the qualified Raptor Biologist could require a larger buffer than 100 feet or 500 meters if it is determined, by the qualified Raptor Biologist, that a larger buffer is warranted based on the location of a nest, reaction of the burrowing owl to the disturbance, and the activity being conducted from the occupied nest to avoid project impacts that could result in nest abandonment, loss of young, and/or injury or mortality of burrowing owls.

Response to CASHEN-18b
The commenter referenced MM BIO-1d and claimed that passive relocation may have adverse impacts associated with loss of habitat, increased stress on burrowing owls, increased depredation, increase energetic costs, and competition for fewer available burrows.

MM BIO-1d does not allow passive relocation of burrowing owls during the breeding season. The passive relocation effort outlined in MM BIO-1d is restricted to relocating owls during the nonbreeding season often referred to as overwintering owls. If burrowing owl are found to be present during the breeding season (February 1 to August 31), the proposed project ground-disturbing activities shall follow the CDFW 2012 Staff Report recommended avoidance protocol whereby occupied burrows shall be avoided with a non-disturbance buffer. Therefore, implementation of MM BIO-1d would ensure project impacts to overwintering owls and breeding pairs would be reduced to less than significant.

It should be noted that the applicant agrees that, if burrowing owl is ultimately found on the site and burrow eviction/relocation of burrowing owls during the non-nesting season is a selected strategy to move forward with the project without direct impacts to burrowing owl individuals, the applicant will coordinate this effort with CDFW and provide habitat mitigation consistent with the 2012 CDFW Staff Report on burrowing owl. Modifications to MM BIO-1d, as shown in the Errata, confirm this requirement.

The operative significance threshold for impacts to burrowing owl, an unlisted species, is whether the proposed project would have a substantial adverse effect on the species, either directly or through habitat modifications. Although the project could lead to the loss of a burrowing owl nest during the nonbreeding season, such an impact will not cause a substantial adverse effect on the species. There is no need to "net out the impact of a proposed project" for that impact to be less than significant. (See, *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 529.)

Response to CASHEN-19
The commenter referenced MM BIO-2 and MM BIO-3 and claimed they failed to demonstrate why the mitigation ratios would be sufficient to mitigate wetland impacts. The commenter reiterated previous comments about MM LU-3 precluding implementation of MM BIO-2 and MM BIO-3.

With respect to the mitigation ratio comment please refer to Response to S&W-13b; with respect to the MM LU-3 comment refer to Response to CASHEN-14.

Response to CASHEN-20a
The commenter referenced MM BIO-4 and claimed it failed to established standards for nest searching techniques, minimum level of effort, and qualifications of the Biologist.

MM BIO-4 does establish standards for conducting pre-construction breeding bird survey. Standards include timeframes when the survey can begin, provides a specific survey geographic range outside of the project site for ground nesting birds, passerines, accipiters, and other raptors. MM BIO-4 establishes a standard for repeating surveys should project construction get delayed, and requires a qualified Biologist to conduct the survey. As correctly stated by CASHEN-20a, actually detecting a physical nest can be difficult especially for ground nesting birds. Typically, an experienced Biologist will mark the nest location but if a nest is not found the qualified Biologist would mark an area where a bird exhibiting nesting behavior is active.

Response to CASHEN-20b
The commenter referenced MM BIO-4 and claimed it failed to provide evidence that buffer sizes would prevent negative impacts to nesting birds. The commenter claimed construction noise levels may reach 90 A-weighted decibel (dBA) at a distance of 50 feet and, thus, a 50-foot buffer would not be sufficient.

To clarify, Draft EIR Section 3.10, Noise, page 3.10-17, disclosed construction noise levels may be as high as 90 dBA maximum noise/sound level (L_{max}) (i.e., instantaneous noise level). Actual average noise levels during construction activities would be lower. Regardless, the buffers outlined in MM BIO-4 are minimum buffers and may be increased should the qualified Biologist determine a larger buffer is warranted to protect a nest. Construction activities vary and may include low disturbance

activities such as pedestrian engineering surveys, high levels of disturbance such as large-scale grading or pile driving, or there may be areas within a large construction site, such as the project site, that may have no disturbances for long periods. MM BIO-4 establishes minimum buffer zone requirements, which means the qualified Raptor Biologist could require a 500-meter buffer for a passerine nest if it is determined, by the qualified Raptor Biologist, that a larger buffer is warranted based on the location of a nest, reaction of the bird species to the disturbance, and the activity being conducted from the occupied nest.

Response to CASHEN-20c
The commenter referenced MM BIO-4 and claimed it does not contain performance standards for validation of the adequacy of the nest buffers or compliance for construction workers.

The MM BIO-4 requires buffer zones to be maintained until it can be documented that either the nest has failed, or the young have fledged, which is the industry standard approach. The Biologist must document the nest has either failed or the young have fledged prior to the buffer being removed. With respect to ensuring construction crews abide by the nesting bird buffers, this would be required to be noted on construction plans and, thus, construction personnel would be aware of this requirement.

Response to CASHEN-21
The commenter provided his curriculum vitae. No response is necessary.

Response to SM-1
The commenter summarized the findings of his review. Refer to Response to SM-2 through Response to SM-5, as well as Master Response 4.

Response to SM-2
The commenter alleged that project trip generation could be much higher than assumed because it used the lowest Institute of Transportation Engineers (ITE) trip rate a warehouse land use. The commenter asserted that a Cold Storage Warehouse trip rate should have been used, which would have resulted in more peak-hour trips. The commenter referenced a study from Western Riverside County that showed that an Amazon warehouse with more than 2,000 employees generated more than 5,000 trips per day. The commenter also claimed that truck trip generation was under counted, citing the same study.

Although the ITE Trip Generation Manual (10th Edition) provides multiple rates for various types of High-Cube land uses, the "High-Cube Transload and Short-Term Storage Warehouse" land use was selected because these rates were based upon a compilation of approximately 100 separate surveys sites whereas the published rates for the other High-Cube land uses (High-Cube Fulfillment Center, High-Cube Parcel Hub, and High-Cube Cold Storage) consisted of five or fewer site surveys each. Therefore, the rates for the "High-Cube Transload and Short-term Storage Warehouse" were applied since they were the most statistically robust data set available when compared with the other remaining options.

Response to SM-3
The commenter claimed that the VMT analysis improperly used the Statewide model, which is too coarse for a particular project. The commenter claimed a regional travel demand model should have

been used and said a one-way commute VMT for the two higher income categories working in American Canyon is 31.3 miles.

The applied commute VMT per employee data of 16.24 miles was obtained from the California Statewide Travel Demand Model (CSTDM), which as noted in above responses produces VMT performance metrics that are directly comparable to those suggested for use in the OPR Technical Advisory, and accounts for local and regional demographic characteristics including the locations of jobs and housing. The alternative methodology suggested by the commenter entails using Longitudinal Employer-Household Dynamics (LEHD) and LEHD Origin-Destination Employment Statistics (LODES) information developed from US Census data, which while informative, does not produce results that can be directly compared to the applied significance threshold. This is evidenced by the substantial amount of factoring and adjusting used by the commenter to develop alternative estimates. The use of data produced by the CSTDM as applied is preferable since it similarly accounts for demographic patterns, more accurately accounts for actual driving distances on roadways, and requires substantially fewer assumptions and factoring adjustments than the approach suggested by the commenter.

Response to SM-4
The commenter stated that the Draft EIR should have required a TDM Program and noted some challenges for the proposed project in this regard.

This Final EIR includes a new mitigation measure, MM AIR-2f, which requires the implementation of a TDM Program. This change is included in Section 5, Errata.

The Draft EIR did discuss project accessibility to transit, bicycles, and pedestrians in Impact TRANS-1 and found that the proposed project would be accessible to these modes of transportation.

Response to SM-5
The commenter reiterated prior remarks about trip generation and alleged that the GHG emissions analysis may be underestimated. Refer to Response to SM-3.

Response to SM-6
The commenter provided his curriculum vitae. No response is necessary.

SECTION 4: RESPONSES TO JUNE 23, 2022, PLANNING COMMISSION MEETING COMMENTS

4.1 - Introduction

City of American Canyon solicited public comments on the Giovannoni Logistics Center Project Draft Environmental Impact Report (Draft EIR) (State Clearinghouse No. 2021010104) on June 23, 2022, at a Planning Commission meeting at American Canyon City Hall. Comments were provided in oral form and summarized in meeting minutes. Although the City of American Canyon is not obligated by the California Environmental Quality Act (CEQA) to provide written responses to oral comments, the City has nonetheless elected to respond to the comments made at the meeting in order to address concerns and questions related to the evaluation of the proposed project's environmental impacts in the Draft EIR. These written responses become part of the Final EIR for the project in accordance with CEQA Guidelines Section 15132.

This section is organized as follows:

- **Section 4.1—Introduction.** Provides an overview of the section.
- **Section 4.2—List of Speakers.** Provides the list of individuals who provided comments at the June 23, 2022, Planning Commission meeting.
- **Section 4.3—Planning Commission Transcript.**
- **Section 4.4—Responses to Planning Commission Comments.** Provides responses to all applicable verbal and written comments received at the Community Meetings.

4.2 - List of Speakers and Authors

A list of the speakers who provided verbal comments on each community meeting is presented below. Each speaker has been assigned a code. Individual comments within each communication have been numbered so comments can be crossed-referenced with responses.

June 23, 2022, Planning Commission Meeting

Speaker

Chris James
Joe Livaich
Planning Commission Chair Crystal Mallare
Planning Commission Vice Chair Tammy Wong
Planning Commissioner Tyrone Navarro

4.3 - June 23, 2022, Planning Commission Meeting Minutes

The meeting minutes are reproduced in the following pages are from the June 23, 2022, Planning Commission Meeting.

THIS PAGE INTENTIONALLY LEFT BLANK

CITY OF AMERICAN CANYON
REGULAR PLANNING COMMISSION MEETING

ACTION MINUTES
June 23, 2022

6:30 P.M. REGULAR MEETING
The meeting was called to order at 6:31 p.m.

CALL TO ORDER

PLEDGE
The pledge of allegiance was recited.

MEETING ANNOUNCEMENT
Chair Mallare made the meeting announcement.

ROLL CALL
Present: Commissioners Eric Altman, Tyrone Navarro, Vice Chair Tammy Wong, Chair Crystal Mallare
Absent: Commissioner Andrew Goff

PUBLIC COMMENT
Chair Mallare opened public comment. Written Comments: None. Oral Comments: None

AGENDA CHANGES
There were no agenda changes.

CONSENT CALENDAR

Minutes of May 26, 2022
Action: Approve the minutes of May 26, 2022

Action: Motion to approve the consent calendar was made by Commissioner Navarro, seconded by Vice Chair Wong and CARRIED by a roll call vote.

PUBLIC HEARINGS

Home2Suites Major Modification to revise Condition 40 of Resolution 2020-02 to substitute undergrounding overhead utilities and poles with two relocated overhead utility poles and two additional riser poles across the Project Frontage

Action: A Resolution of the Planning Commission of the City of American Canyon, California approving a Major Modification to Condition 40 of Resolution 2020-02 for the Home2Suites Design Permit to substitute a utility undergrounding requirement with two relocated overhead utility poles and two additional riser poles across the project Highway 29 frontage at 3701 Main St., APN 059-072-002 (PL22-0007)

Commissioners received a report from Associate Planner William He. Mark Stumm with Home2Suites provided additional information.

Chair Mallare recused herself from the item at 6:51 due to conflict of interest.

Commissioners discussed the item.

City Attorney William Ross provided information related to the end consistency of PG&E to underground utilities and provided direction to the Commission regarding their discretion related to a decision on in this item.

Vice Chair Wong opened Public Comment. Written comment: none Oral comment: Chris James was called to speak. Public comment was closed.

Speakers: Bret Tremblay on behalf of Home2Suites

Commissioners further deliberated on the item.

Action: Motion to continue the Public Hearing to next regularly scheduled Planning Commission meeting with a recommendation to City staff to begin exploring a comprehensive undergrounding plan and if possible, start initiating a conversation for such comprehensive plan with City Council, but most immediately addressing the concerns for the Home2Suites project. was made by Commissioner Altman, seconded by Commissioner Navarro and CARRIED by a roll call vote.

Chair Mallare resumed participation in the meeting at 7:58 p.m.

BUSINESS

Giovannoni Logistics Center Draft Environmental Impact Report (DEIR) Public Review Workshop

Action: Receive and file Giovannoni Logistics Center DEIR and provide comments on its environmental findings and conclusions.

Community Development Director Brent Cooper introduced the applicant Joe Livaich from Buzz Oats Construction and Grant Gruber and Mary Bean from First Carbon Solutions, who prepared the EIR. Grant Gruber from Frist Carbon Solutions shared a presentation.

Chair Mallare opened Public Comments
Written comments: none. Oral comments: Chris James was called to speak. Chair Mallare closed Public Comments

The applicant, Joe Livaich from Buzz Oats Construction provided additional information.

Commissioners discussed the item.

Action: The report was acknowledged and filed.

MANAGEMENT AND STAFF ORAL REPORTS

Active Planning Projects

Action: Review Active Planning Project List

Community Development Director Brent Cooper reported on Active Planning Projects including the hotel at Napa Valley Ruins and Gardens, the Residences at Napa Junction, Home2Suites, Fume Conditional Use Permit, SDG 217 project, General Plan Housing Element outreach, General Plan Notice of Preparation for Environmental Impact report, Napa Cove, Watson Ranch homes at the North end of Summerwood, Napa Junction medical building, Canyon Estates, PG&E, Paoli Watson Lane annexation, Oat Hill residential project.

Associate Planner William He provided an update on PG&E landscaping for their project.

COMMISSIONER ITEMS

Commissioners reported on items of interest.

ADJOURNMENT

The meeting adjourned at 8:44 p.m.

CERTIFICATION

Respectfully Submitted,

Nicolle Jones, Administrative Technician

4.4 - Responses to June 23, 2022, Planning Commission Meeting Comments

4.4.1 - Introduction

Responses to comments made at the June 23, 2022, Planning Commission meeting are provided through both master responses and individual responses. Master responses are provided in Section 2 of this document.

4.4.2 - Responses to Comments

Individual Responses

Responses have been prepared for all comments pertaining to the Draft EIR. An individualized response has been provided to each comment.

Chris James

Summary of Comments
Mr. James noted that that "this has come up so quickly" and lamented that State Route (SR) 29 has been turned into a "concrete thoroughfare." Mr. James expressed concern about air pollution from idling trucks and traffic congestion. He expressed general displeasure with the project vicinity being the "Warehouse District for Napa County."

Response to Comments
The applicant filed the application to develop the Giovannoni Logistics Center Project with the City of American Canyon in November 2020. The environmental review process began in January 2021 with the issuance of the Notice of Preparation (NOP). The Draft EIR was released for public review on May 20, 2022. By the time of the June 23, 2022, Planning Commission meeting, 19 months had elapsed since the filing of the application. When compared to the entitlement timeline of other recent development projects (e.g., Napa Logistics Park Phase 2, Napa Airport Corporate Center, and Broadway District Specific Plan), the timeline for the Giovannoni Logistics Center was equal to, if not a bit more prolonged, than the timelines for those projects. This greater amount of time devoted to the Giovannoni Logistics Center Project demonstrates that the City conducted a deliberate review of the project application and by no means has rushed it through the process.

Air pollution, including diesel particulate matter (DPM) from trucks, was addressed in the Draft EIR in Section 3.2, Air Quality. Mitigation Measure (MM) AIR-2d requires that the truck fleet serving the proposed project meet or exceed the emissions profile of Model Year 2014 heavy trucks. Furthermore, State law limits diesel engine idling to no more than 5 minutes and many truck fleets are equipped with auxiliary power units that allow the diesel engine to be shut off but still allow electrical systems to be powered. The Draft EIR found that impacts on nearby sensitive receptors from DPM emissions would be less than significant.

Lastly, the Green Island Business Park, as well as the Napa County Airport Industrial Area, are the two largest industrially zoned areas in Napa County. This reflects the following: (1) proximity to the SR-12/SR-29 junction; (2) compatibility with the Napa County Airport, the Napa Sanitation District Soscol Water Recycling Facility, and the Devlin Road Transfer Station; (3) the availability of freight rail

service; and (4) the land use restrictions set forth in Measure P, which make it extremely difficult to rezone agricultural, open space, and watershed land in unincorporated Napa County to urban use. Likewise, sensitive receptor land uses such as residential, schools, and convalescent facilities would be incompatible in the Green Island Business Park. In sum, light industrial/heavy commercial land uses (including warehouse) are the highest and best uses for the Green Island Business Park.

Joe Livaich

Note to Reader: Mr. Livaich is a representative of the applicant Buzz Oates

Summary of Comments

Mr. Livaich noted that Buzz Oates is a vertically integrated developer, signifying that it would entitle, develop, and operate the proposed project. He indicated that the types of tenants are "open ended" and could include bio tech, wine-related businesses, and advanced manufacturing.

Response to Comments

None of these issues pertain to the Draft EIR and, thus, no response is necessary.

Planning Commission Chair Crystal Mallare

Summary of Comments

Chair Mallare inquired about how Buzz Oates identifies tenants. Mr. Livaich noted that regional consolidation of separate smaller spaces into a single larger space is a trend Buzz Oates has observed and expects to see played out at the proposed project.

Response to Comments

None of these issues pertain to the Draft EIR and, thus, no response is necessary.

Planning Commission Vice Chair Tammy Wong

Summary of Comments

Vice Chair Wong inquired about how employment was calculated. Mr. Livaich noted employment was calculated using standard employment rates that are based on employees per square feet.

Response to Comments

The methodology used to calculate employment is explained in Response to GSEJA-8a in Section 3, Response to Written Comments.

Planning Commissioner Tryonne Navarro

Summary of Comments

Commissioner Navarro expressed concern about traffic from a project of this size.

Response to Comments

Transportation impacts were evaluated in Draft EIR Section 3.12, Transportation. The analysis found that all of the proposed project's transportation impacts were less than significant and did not require mitigation.

SECTION 5: ERRATA

The following are revisions to the Draft EIR for the Giovannoni Logistics Center Project. These revisions are minor modifications and clarifications to the document, and do not change the significance of any of the environmental issue conclusions within the Draft EIR. The revisions are listed by page number. All additions to the text are underlined (underlined) and all deletions from the text are stricken (~~stricken~~).

5.1 - Changes in Draft EIR

Section 2, Project Description

Page 2-9, First Sentence

A statement on Page 2-9 has been revised to reflect the schedule used in the air quality analysis. The text edit does not change any conclusions in the Draft EIR.

> For the purposes of providing a conservative, worst-case scenario, this Draft EIR assumes that Phases 1 and 2 would be developed concurrently over a period of 20 to 24~~18~~ months.

Section 3.2, Air Quality

Page 3.2-59, Mitigation Measures AIR-2e, AIR-2f, and AIR-2g

Mitigation Measures (MM) AIR-2e, MM AIR-2f, and MM AIR-2g have been added to reduce operational criteria pollutant emissions. However, the residual significance of Impact AIR-1 and AIR-2 remain significant and unavoidable.

MM AIR-2e Prior to the issuance of the certificate of occupancy for each building with dock doors, signage shall be posted identifying idling restrictions and contact information to report violations to the building manager.

MM AIR-2f Prior to the issuance of the certificate of occupancy for each building with a separate end user, the City shall confirm that the end user has prepared a Transportation Demand Management Plan (TDM Plan). The TDM Plan shall be prepared by a qualified transportation consultant and identify strategies to reduce single-occupant vehicle trips. Examples of TDM strategies may include but are not limited to:

- Ridesharing/Ride Matching
- Vanpools
- Transit subsidies
- Preferential parking for rideshare or vanpool vehicles
- Employee lockers
- Secure bicycle parking
- Employee locker rooms
- Provide TDM information in employee breakroom

MM AIR-2g As a part of future lease agreements, the project proponent shall provide all future tenants at the project site information on available California Air Resources Board (ARB) and Bay Area Air Quality Management District (BAAQMD) incentive programs, such as the Carl Moyer Program and the Voucher Incentive Program, that support upgrading truck fleets to clean air technology equipment.

Section 3.3, Biological Resources

Page 3.3-24, Last Paragraph, First Sentence

The first sentence has been corrected to indicate that Huffman Broadway Group (HBG) conducted Swainson's hawk nesting surveys in April and May 2021.

> Although eucalyptus and other large trees located within ~~about~~ 0.25 mile from the project site provide potential nesting habitat, no nesting by Swainson's hawk (or any raptor species) was noted during surveys for Swainson's hawk conducted by HBG ~~Helm Biological Consulting~~ in April and May 2021.

Pages 3.3-26 and 3.3-27, Mitigation Measure BIO-1a

MM BIO-1a has been revised to address comments made by the California Department of Fish and Wildlife (CDFW).

MM BIO-1a Pre-construction surveys for Swainson's hawk shall be conducted in the project ~~site~~ vicinity prior to initiation of project construction activities, and each year following initiation of construction if project activities are delayed or discontinued for 7 or more days prior to the second survey period (March 20 to April 5), and are scheduled to recommence construction activities during the second survey period but before August 1. These pre-construction surveys shall include investigation of all potential nesting trees within a half-mile radius around all project activities and shall be completed for at least two survey periods immediately prior to commencement of project construction. Surveys shall be conducted in accordance with the California Department of Fish and Wildlife (CDFW) "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" (CDFW 2000) ~~follow California Department of Fish and Wildlife (CDFW) guidelines for conducting surveys for Swainson's hawk that were developed by the Swainson's Hawk Technical Advisory Committee~~ to maximize the potential for locating nesting Swainson's hawk and reduce the potential for nest failures due to project activities and/or disturbances.

If no nesting Swainson's hawk are found during the ~~first non-optional~~ second survey period starting March 20, then project construction may commence. If during the third surveys (April 5–April 20) Swainson's hawk are found to be nesting in the project vicinity and construction has commenced, it shall be assumed the Swainson's hawk commenced nesting and thus the Swainson's hawk are habituated to the ambient level of noise and disturbance emanating from the project site.

If Swainson's hawk are found to be nesting within 1,000 feet of the project site, a non-disturbance buffer shall be established to keep all construction activities a minimum of 1,000 feet from the nest site. The CDFW shall be consulted regarding the adequacy of the buffer established by the qualified Raptor Biologist. At that time the necessity for acquiring a Fish and Game Section 2081 Incidental Take Permit (ITP) authorization would be determined. An ITP authorization shall be required if there were a valid concern the project activities would result in the "take" of an adult Swainson's hawk, eggs, or nestlings.

Surveys shall be conducted by a qualified Raptor Biologist with at least 2 years of experience surveying for and detecting Swainson's hawk pursuant to "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" survey protocol. No disturbance such as construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist.

Page 3.3-27, Mitigation Measure BIO-1b

MM BIO-1b has been revised to address comments made by the CDFW.

MM BIO-1b No more than 30 days prior to the first ground disturbance activity, pre-construction golden eagle nesting surveys shall be conducted in the project ~~site~~ vicinity by a qualified Raptor Biologist. The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting golden eagles. Pre-construction surveys shall include investigation of all potential nesting trees within a survey area determined by the qualified Raptor Biologist, but no less than a 0.5-mile radius around all project activities. ~~survey area for golden eagle be determined by the qualified Raptor Biologist.~~ If active golden eagle nests are identified within any trees within the survey areas ~~a 0.5-mile radius~~ of the project site, a qualified Raptor Biologist shall establish a protection buffer at a minimum of 1,000 feet that is adequate to ensure noise or activity from the proposed project would not cause nest disturbance or young or adult bird mortality. Buffer zones may vary in size as some golden eagles are more acclimated to disturbance than others. Size of buffer zone may be increased ~~modified~~ by the qualified Raptor Biologist considering the type of construction activity that may occur and the behavioral factors and extent that golden eagle may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young golden eagles have fledged or that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist. ~~Surveys shall be conducted by a qualified Raptor Biologist.~~

Pages 3.3-27 and 3.3-28, Mitigation Measure BIO-1c

MM BIO-1c has been revised to address comments made by the CDFW.

MM BIO-1c Prior to ground disturbance, a pre-construction nesting survey shall be conducted for northern harrier and short-eared owl by a qualified Raptor Biologist if construction is scheduled during the nesting season (February 1 through September 1). The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting northern harrier and short-eared owl. To determine whether northern harrier or short-eared owl is nesting on-site, a qualified Raptor Biologist(s) shall conduct walking transects through the project site grassland habitat searching for nests and minimum 500-foot radius from the project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc., the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars or a spotting scope. An active northern harrier or short-eared owl nest must be protected by implementing a minimum 500-foot radius buffer zone around the nest marked with orange construction fencing. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated where it intersects the project site. Size of buffer zone could be ~~modified~~ increased considering the type of construction activity that may occur, physical barriers between the construction site and active nest, and the behavioral factors and extent that northern harrier or short-eared owl may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is otherwise determined to be complete based on monitoring of the active nest by a qualified Raptor Biologist.

Page 3.3-28, Mitigation Measure BIO-1d

MM BIO-1d has been revised to address comments made by the CDFW.

MM BIO-1d Prior to any ground disturbance, pre-construction surveys for burrowing owl shall be conducted within a minimum of 150 meters of the project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc.), the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars or a spotting scope. The pre-construction surveys shall be conducted within 2 weeks prior to the onset of any ground-disturbing activities. Surveys shall be conducted by a qualified Biologist following California Department of Fish and Wildlife (CDFW) 2012 staff report survey methods and Biologist qualifications to establish the status of burrowing owl on the project site.

- If burrowing owl are found to occupy the project site during the nonbreeding season (September 1 to January 31), occupied burrows shall be avoided by establishing a no-disturbance buffer zone a minimum of 100 feet around the burrow. Buffers may be adjusted to address site-specific conditions using the

impact assessment approach described in the CDFW 2012 staff report. If a qualified Raptor Biologist determines the location of an occupied burrow/s may be impacted even with a 100-foot buffer, or the burrow(s) are in a location(s) on the project site where a buffer cannot be established without preventing the proposed project from moving forward, then a passive relocation effort may be instituted to relocate the individual(s) out of harm's way pursuant to a Burrowing Owl Exclusion Plan prepared in accordance with the CDFW 2012 staff report.

- If burrowing owl are found to be present during the breeding season (February 1 to August 31), the proposed project ground-disturbing activities shall follow the CDFW 2012 staff report recommended avoidance protocol whereby occupied burrows shall be avoided with a no-disturbance buffer.
- If burrowing owls are ultimately found on the site and burrow eviction/ relocation of burrowing owls during the non-nesting season is a selected strategy to move forward with the project without direct impacts to burrowing owl individuals, the applicant shall coordinate this effort with CDFW and provide habitat mitigation consistent with the 2012 CDFW Staff Report on burrowing owl.

Page 3.3-39, Mitigation Measure BIO-4

MM BIO-4 has been revised to address comments made by the CDFW.

MM BIO-4 If construction occurs during the breeding season of migratory and resident birds (February 1 to August 31), a qualified Biologist shall conduct a pre-construction breeding bird survey in areas of suitable habitat within ~~15~~ 7 days prior to the onset of construction activity. ~~Nesting bird surveys shall cover the proposed project footprint and adjacent areas.~~ Surveys shall be conducted within the project footprint and 50 feet from the construction limits for nesting passerines, 250 feet from the construction limits for nesting accipiters and 1,000 feet from the construction limits for nesting raptors. If the survey area is found to be absent of nesting birds, no further mitigation would be required. However, if construction activities are delayed by more than 7 days, an additional nesting bird survey shall be performed. If bird nests are found, appropriate buffer zones shall be established around all active nests to protect nesting adults and their young from direct or indirect impacts related to project construction disturbance. Size of buffer zones shall be determined per recommendations of the qualified Biologist based on site conditions and species involved. At a minimum a 1,000-foot buffer shall be established for nesting Swainson's hawk and golden eagle; 500-foot buffer for nesting tricolored blackbirds, northern harriers and other non-listed raptors; 250-foot buffer for nesting accipiters; and minimum 50-foot buffers shall be established for nesting passerines and all other non-raptor or passerine nesting birds. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated where it intersects the project site. Buffer zones shall be maintained until it can be documented that either the nest has failed, or the young have fledged.

Section 3.4, Cultural Resources

Page 3.4-22, Mitigation Measure CUL-2b

MM CUL-2b has been revised to strike the phrase 'and historical research' at the request of the Yocha Dehe Wintun Nation.

MM CUL-2b An Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology shall be present on-site during all earth disturbing activities. If prehistoric or historic-period archaeological resources are encountered, all construction activities within 100 feet of the find shall halt and the City of American Canyon shall be notified. Prehistoric archaeological materials may include obsidian and chert flaked stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or shellfish remains; and stone milling equipment (e.g., mortars, pestles, hand stones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic-period materials might include stone, concrete, or adobe footings and walls; filled wells or privies; and deposits of metal, glass, and/or ceramic refuse.

The Archaeologist shall inspect the findings within 24 hours of discovery. If it is determined the project could damage a historical resource or a unique archaeological resource (as defined pursuant to the CEQA Guidelines), mitigation shall be implemented in accordance with Public Resources Code Section 21083.2 and Section 15126.4 of the CEQA Guidelines, with a preference for preservation in place. Consistent with Section 15126.4(b)(3), this may be accomplished through planning construction to avoid the resource; incorporating the resource within open space; capping and covering the resource; or deeding the site into a permanent conservation easement. If avoidance is not feasible, a qualified Archaeologist shall prepare and implement a detailed treatment plan in consultation with the City of American Canyon. Treatment of unique archaeological resources shall follow the applicable requirements of Public Resources Code Section 21083.2. Treatment for most resources would consist of (but would not be limited to) sample excavation, artifact collection, and site documentation, ~~and historical research,~~ with the aim to target the recovery of important scientific data contained in the portion(s) of the significant resource to be impacted by the proposed project. The treatment plan shall include provisions for analysis of data in a regional context, reporting of results within a timely manner, curation of artifacts and data at an approved facility, and dissemination of reports to local and State repositories, libraries, and interested professionals.

Section 3.7, Hazards and Hazardous Materials

Page 3.7-14, Level of Significance Before Mitigation

The Level of Significance Before Mitigation statement has been corrected.

Level of Significance Before Mitigation

Less than significant impact. ~~Potentially significant impact.~~

Mitigation Measures

No mitigation is necessary.

Level of Significance After Mitigation

Less than significant impact.

RESOLUTION NO. 2022-29

A RESOLUTION OF THE BOARD OF DIRECTORS OF THE AMERICAN CANYON FIRE PROTECTION DISTRICT APPROVING THE MEMORANDUM OF UNDERSANDING BETWEEN THE AMERICAN CANYON FIRE PROTECTION DISTRICT AND BUZZ OATES LLC.

WHEREAS, the American Canyon Fire Protection District ("District") provides fire protection services to the City of American Canyon ("City"); and

WHEREAS, the commitments shall only take effect in the event the City approves the Giovannoni Logistics Center ("Project") and Buzz Oats LLC ("Applicant") or assignee build and implements the Project; and

WHEREAS, applicant is seeking entitlements from the City of American Canyon for the Project which is anticipated to be an entirely non-residential development project (with up to approximately 2.4 million square feet of high-cube warehouse building space; and

WHEREAS, if approved, the Project will include a 68.8-acre Phase 1, an 85.9-acre Phase 2, and a 44.8-acre open space preserve; and

WHEREAS, the Project will require fire protection services; and

WHEREAS, a fiscal impact analysis of the Project was conducted by Economic & Planning Systems, Inc (EPS). The EPS Study related to the District's ability to provide fire protection services to the Project. EPS projected that the District would face an annual operating deficit to provide fire services to the Project of $158,000; and

WHEREAS, the District charges a one-time fire mitigation fee at the time when the City issues building permits for new development in order to assist in funding fire protection services required by the development authorized by the building permit; and

WHEREAS, both the District and the Applicant have determined that the normal approach of a One-time Fire Mitigation Fee and Aerial Truck Ladder Fee is less desirable than an alternative approach that combines the payment of the One-Time Fire Mitigation Fee with the generation of annual payments on an ongoing basis in lieu of payment of the one-time Aerial Truck Ladder Fee; and

WHEREAS, Both the District and the Applicant have determined that such annual payments could be generated if the Applicant forms a Mello-Roos Community Facilities District or similar public financing mechanism (CFD); and

WHEREAS, for the benefit of the District, the Applicant shall use commercially reasonable efforts to form a Mello-Roos Community Facilities District or similar public financing mechanism (CFD); and

DocuSign Envelope ID: 3D0E19A0-8F07-4030-87A5-997B121BB787

WHEREAS, the assessor's parcel numbers (APNs) for the parcels that make up the Project currently include: 057-090-008, 057-130-034, and 057-130-036. Only Developable Property, estimated to be a total of 156 acres, shall be subject to the Special Tax, and only when that property becomes Developed Property.; and

WHEREAS, developed Property shall be defined in the CFD Rate and Method of Apportionment of Special Tax (RMA) to mean any parcel with a structure for which a building permit has been issued; and

WHEREAS, in consideration for the Applicant's willingness to generate an annual Special Tax, the District shall exempt the Applicant from the District's Aerial Truck Ladder Fee of $.50 per square foot. The Applicant will still be required to pay the one-time Fire Mitigation Fee of $.5512 per square foot or rate then in effect, at the time of issuance of building permits by the City.

NOW, THEREFORE, IT IS HEREBY RESOLVED by the Board of Directors of the American Canyon Fire Protection District approve the Memorandum of Understading between the American Canyon Fire Protection District and Buzz Oats, LLC.

PASSED, APPROVED AND ADOPTED this 25th day of October, 2022, by the following vote:

AYES: Board Member Mark Joseph, Vice-Chair Mariam Aboudamous, and Chair Leon Garcia
NOES: None
ABSENT: Board Members David Oro and Pierre Washington

RESOLUTION NO. 2022-29

A RESOLUTION OF THE BOARD OF DIRECTORS OF THE AMERICAN CANYON FIRE PROTECTION DISTRICT APPROVING THE MEMORANDUM OF UNDERSANDING BETWEEN THE AMERICAN CANYON FIRE PROTECTION DISTRICT AND BUZZ OATES LLC.

WHEREAS, the American Canyon Fire Protection District ("District") provides fire protection services to the City of American Canyon ("City"); and

WHEREAS, the commitments shall only take effect in the event the City approves the Giovannoni Logistics Center ("Project") and Buzz Oats LLC ("Applicant") or assignee build and implements the Project; and

WHEREAS, applicant is seeking entitlements from the City of American Canyon for the Project which is anticipated to be an entirely non-residential development project (with up to approximately 2.4 million square feet of high-cube warehouse building space; and

WHEREAS, if approved, the Project will include a 68.8-acre Phase 1, an 85.9-acre Phase 2, and a 44.8-acre open space preserve; and

WHEREAS, the Project will require fire protection services; and

WHEREAS, a fiscal impact analysis of the Project was conducted by Economic & Planning Systems, Inc (EPS). The EPS Study related to the District's ability to provide fire protection services to the Project. EPS projected that the District would face an annual operating deficit to provide fire services to the Project of $158,000; and

WHEREAS, the District charges a one-time fire mitigation fee at the time when the City issues building permits for new development in order to assist in funding fire protection services required by the development authorized by the building permit; and

WHEREAS, both the District and the Applicant have determined that the normal approach of a One-time Fire Mitigation Fee and Aerial Truck Ladder Fee is less desirable than an alternative approach that combines the payment of the One-Time Fire Mitigation Fee with the generation of annual payments on an ongoing basis in lieu of payment of the one-time Aerial Truck Ladder Fee; and

WHEREAS, Both the District and the Applicant have determined that such annual payments could be generated if the Applicant forms a Mello-Roos Community Facilities District or similar public financing mechanism (CFD); and

WHEREAS, for the benefit of the District, the Applicant shall use commercially reasonable efforts to form a Mello-Roos Community Facilities District or similar public financing mechanism (CFD); and

DocuSign Envelope ID: 3D0E19A0-8F07-4030-87A5-997B121BB787

WHEREAS, the assessor's parcel numbers (APNs) for the parcels that make up the Project currently include: 057-090-008, 057-130-034, and 057-130-036. Only Developable Property, estimated to be a total of 156 acres, shall be subject to the Special Tax, and only when that property becomes Developed Property.; and

WHEREAS, developed Property shall be defined in the CFD Rate and Method of Apportionment of Special Tax (RMA) to mean any parcel with a structure for which a building permit has been issued; and

WHEREAS, in consideration for the Applicant's willingness to generate an annual Special Tax, the District shall exempt the Applicant from the District's Aerial Truck Ladder Fee of $.50 per square foot. The Applicant will still be required to pay the one-time Fire Mitigation Fee of $.5512 per square foot or rate then in effect, at the time of issuance of building permits by the City.

NOW, THEREFORE, IT IS HEREBY RESOLVED by the Board of Directors of the American Canyon Fire Protection District approve the Memorandum of Understading between the American Canyon Fire Protection District and Buzz Oats, LLC.

PASSED, APPROVED AND ADOPTED this 25th day of October, 2022, by the following vote:

AYES: Board Member Mark Joseph, Vice-Chair Mariam Aboudamous, and Chair Leon Garcia

Travel Behavior Memorandum

THIS PAGE INTENTIONALLY LEFT BLANK

FEHR PEERS

Memorandum

Date:	June 16, 2022
To:	Joe Livaich, Buzz Oates Construction, Inc.
From:	Kevin Johnson & David Robinson, Fehr & Peers
Subject:	**American Canyon Industrial Warehouse Travel Behavior Data**

WC22-3900

This memorandum describes the travel behavior data collected for the proposed 208-acre high-cube industrial warehouse project (the Project) in American Canyon, CA. Fehr & Peers understands the uniqueness of warehousing and logistics facilities that make them extremely difficult to study with traditional data collection methods. Fehr & Peers combined traffic count data previously collected in San Joaquin County for similar warehousing uses with new mobile device origin-destination data from StreetLight for similar industrial warehouse sites around the Bay Area to provide Buzz Oates Construction, Inc. with detailed trip generation, vehicle origin-destination pattern, and average trip length data. This data will be used to support the ongoing VMT and GHG analyses. In the Draft EIR, heavy duty truck trips were not accounted for in either the VMT analysis or the GHG analysis, which relied in part on the VMT analysis. This omission of heavy-duty truck trips in the VMT analysis is consistent with guidance from the Office of Planning and Research. A primary objective of the analysis in this memorandum is to address whether VMT from such heavy-duty truck trips would be more or less than 15 percent below the regional average for the Bay Area.

Trip Generation Data Collection

The following section describes the traffic count data source used to understand the potential trip generation of the Project.

San Joaquin Countywide Warehousing Data Collection Effort

The data used to estimate the trip generation of the Project is from the San Joaquin Countywide Warehousing Data Collection effort. This data collection effort was undertaken by Fehr & Peers in June 2021 to better understand the travel behavior of existing warehousing buildings across San Joaquin County, as a review of local and regional planning studies revealed a lack of data and understanding of the travel characteristics of these types of facilities. Specifically, there was a lack of local or national trip generation data for warehousing uses, a lack of understanding of the travel patterns and demographics of warehouse users, and a lack of inclusion of these facilities in regional travel forecasting models.

Fehr & Peers coordinated the collection of 72 hours of driveway vehicle classification count data at 39 warehousing buildings across San Joaquin County in June 2021. The data collection was performed by National Data & Surveying Services (NDS) using cameras to count and classify vehicles entering and exiting the individual building driveways. Fehr & Peers staff visited each of the 39 warehousing buildings on one day during the data collection to observe the following:

- Check traffic and weather conditions
- Confirm the placement of the cameras
- Observe activity levels at the surveyed buildings
- Count the number of truck bays
- Classify the buildings
- Observe general operations and travel behavior

Fehr & Peers used this data to develop average trip generation rates per thousand square feet (KSF) for warehousing uses in San Joaquin County. The 39 warehousing buildings, including their occupying tenant, type of warehouse, and square footage, are listed below.

San Joaquin Countywide Warehousing Data Collection					
City	Tenant	Address	# Driveways	Type	Square Feet

Warehousing Trip Generation Data

The average trip generation rates per KSF of building space from the June 2021 San Joaquin Countywide Warehousing Data Collection effort, stratified by autos, medium-duty trucks, and heavy-duty trucks, are provided in **Table 1**. The trip generation rates were checked for reasonableness against trip generation data from the Institute of Institute of Transportation Engineers (ITE) Trip Generation Manual, which are also provided.

As shown in **Table 1**, the average daily trip generation per KSF of building space for all 39 buildings in San Joaquin County where driveway count data was collected in June 2021 is 0.078 medium-duty truck trips, 0.447 heavy-duty truck trips, and 0.995 auto trips. The average daily total trip generation rate of 1.52 vehicle trips per KSF is generally consistent with ITE trip generation data, being roughly ten percent lower than Code 152 from the 9th Edition and roughly nine percent higher than Code 154 from the 10th Edition. The average AM peak hour and PM peak hour total trip generation rates of 0.18 and 0.21 trips per KSF are both higher than ITE trip generation data and comprise a higher percentage of total daily trip generation. ITE does not provide trip generation rates for warehousing uses by vehicle classification for comparison.

Table 1: San Joaquin County Warehousing Trip Generation Rates per KSF

Source	AM Peak Hour				PM Peak Hour				Daily			
	Autos	Med Trucks	Heavy Trucks	Total	Autos	Med Trucks	Heavy Trucks	Total	Autos	Med Trucks	Heavy Trucks	Total

Trip Length Data Collection

The following section describes the mobile device data obtained from StreetLight used to understand the origin-destination patterns and average trip lengths of heavy-duty truck trips generated by similar industrial warehousing sites around the Bay Area.

Mobile Device Data from StreetLight

Fehr & Peers obtained StreetLight's GPS-based commercial vehicle data product for 23 existing industrial warehousing sites around the Bay Area, including eight sites in Napa County of which four were located within the City of American Canyon. We relied on StreetLight's "O-D to Pre-set Geography" product to analyze travel patterns to and from the land use zone system at the census block group level, which has over 23,000 zones within California.

Zone System

A land use zone system was developed for the 23 existing industrial warehousing sites, each of which included a separate zone for each of the existing buildings or groupings of buildings. The analysis tracked all heavy-duty truck trips starting or ending at one of these zones. The start of trips coming to the zones and end of trips leaving the zones were tagged to the national census block group system, allowing for aggregation to any desired geography such as the city or county level.

The land use zone system consisted of eight industrial warehousing sites in Napa County, which are listed below**,** and include similar existing warehousing sites in full operation during the data collection period. These sites were selected to understand the potential average trip length of heavy-duty truck trips generated by the Project.

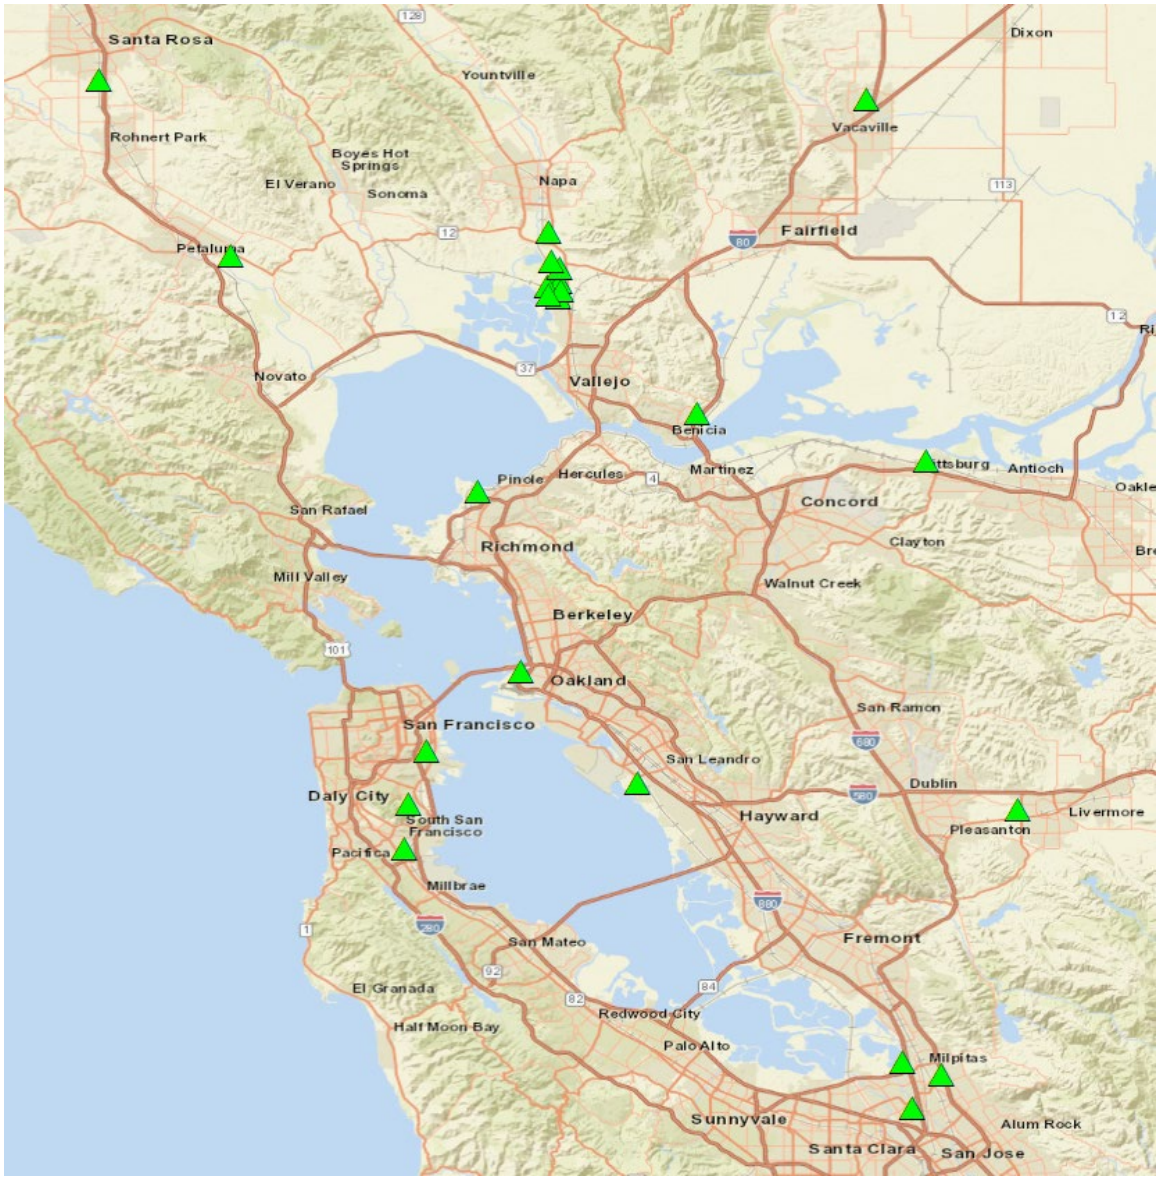
- Biagi Brothers - Napa County
- Valley Wine - American Canyon
- Vin Lux - American Canyon
- WineDirect - American Canyon
- Napa Corporate Center Warehouses - Napa
- American Canyon Warehouses
- Napa County Airport Warehouses
- Wineshipping - Napa County

The land use zone system also consisted of 15 industrial warehousing sites in other parts of the Bay Area, which are listed below**,** and include similar existing warehousing sites in full operation during the data collection period. These sites were selected to understand how the potential average trip length of heavy-duty truck trips generated by the Project compares to the existing average trip length for similar sites around the Bay Area.

- San Francisco County - Bayview Area
- San Mateo County - Brisbane Area
- San Mateo County - Prologis SFO Area
- Santa Clara County - Western Milpitas Area
- Santa Clara County - Milpitas I-680 Area
- Santa Clara County - San Jose Area
- Alameda County - Livermore Area
- Alameda County - Prologis Port of Oakland Area
- Alameda County - San Leandro Area
- Contra Costa County - Pittsburg Area
- Contra Costa County - Richmond Area
- Solano County - Benicia Area
- Solano County - Vacaville Area
- Sonoma County - Petaluma Area
- Sonoma County - Santa Rosa Area

The comparable industrial warehousing sites zone system is illustrated on **Figure 1**.

Figure 1: Comparable Industrial Warehousing Sites Zone System



Data Product

Fehr & Peers obtained the GPS-based origin and destination to pre-set geography data product from StreetLight for heavy-duty truck trips generated by similar industrial warehousing sites around the Bay Area.

Data Periods

Data was obtained for the Fall 2021 (September 1 through November 30) data period.

The data was stratified as described below.

- Day Type – average weekday (Tuesday to Thursday) and average weekend day (Saturday and Sunday)
- Day Part - Early AM, AM Peak Period (6 AM to 10 AM), Mid-Day, PM peak period (3 PM to 7 PM), Late-Night, and Daily 24-Hour

Premium trip metrics were also obtained for the origin-destination data, providing trip length and trip time information.

Data Analysis

The mobile device data from StreetLight was then analyzed to understand overall heavy-duty truck travel patterns at the census block group level. Trip length information was also analyzed to determine an average trip length associated with heavy-duty truck trips generated by the existing industrial warehousing sites.

Average Trip Length Data

StreetLight Data Sample Size

The data obtained from StreetLight included roughly 10,000 heavy-duty truck data samples for the Fall 2021 data period.

Warehousing Average Trip Length Data

The average trip lengths of heavy-duty truck trips generated by the 23 existing industrial warehousing sites over the daily 24-hour period on an average weekday (Tuesday to Thursday) from the Fall 2021 data period are summarized in **Table 2**.

Table 2: Heavy-Duty Truck Average Trip Lengths

Comparable Industrial Warehousing Site	Sample Size (Observed Trips)	Average Trip Length (miles)	Comparison to "All Bay Area Sites"
Biagi Brothers - Napa County	18	19.7	-66%
Valley Wine - American Canyon	80	18.7	-68%
Vin Lux - American Canyon	55	49.7	-15%
WineDirect - American Canyon	29	30.3	-48%
Napa Corporate Center Warehouses - Napa	37	38.7	-34%
American Canyon Warehouses	351	46.1	-21%
Napa County Airport Warehouses	194	28.8	-50%
Wineshipping - Napa County	90	19.7	-66%
Napa County Warehouses	854	35.6	-39%
San Francisco County - Bayview Area	85	41.7	-28%
San Mateo County - Brisbane Area	957	28.1	-52%
San Mateo County - Prologis SFO Area	15	114.4	97%
Santa Clara County - Western Milpitas Area	10	8.8	-85%
Santa Clara County - Milpitas I-680 Area	771	54.1	-7%
Santa Clara County - San Jose Area	749	69.5	19%
Alameda County - Livermore Area	629	91.3	57%
Alameda County - Prologis Port of Oakland Area	61	76.9	32%
Alameda County - San Leandro Area	744	78.2	34%
Contra Costa County - Pittsburg Area	30	48.1	-17%

Table 2: Heavy-Duty Truck Average Trip Lengths

Comparable Industrial Warehousing Site	Sample Size (Observed Trips)	Average Trip Length (miles)	Comparison to "All Bay Area Sites"
Contra Costa County - Richmond Area	196	114.0	96%
Solano County - Benicia Area	320	63.4	9%
Solano County - Vacaville Area	219	38.4	-34%
Sonoma County - Petaluma Area	147	59.9	3%
Sonoma County - Santa Rosa Area	92	44.9	-23%
Other Bay Area Warehouses	5,025	62.0	7%
All Bay Area Warehouses	5,879	58.2	0%
West Tracy Warehouses	3,840	56.1	-4%

Note: This table provides sample size and average trip length data for the daily 24-hour period on an average weekday (Tuesday to Thursday) from the Fall 2021 data period. Green font indicates the heavy-duty truck average trip length for the site is greater than the average trip length for all 23 Bay Area warehouses combined. Red font indicates the heavy-duty truck average trip length for the site is less than the average trip length for all 23 Bay Area warehouses combined.
Source: Fehr & Peers.

As shown in **Table 2**, the average trip length of heavy-duty truck trips generated by the eight existing Napa County industrial warehousing sites in full operation during the data collection period is 35.6 miles, which is roughly 39 percent lower than the average trip length for all 23 Bay Area warehousing sites combined. Furthermore, all eight industrial warehousing sites in Napa County had an observed heavy-duty truck average trip length less than the average trip length for all 23 Bay Area warehousing sites combined. This data suggests that industrial warehousing sites constructed in Napa County are intended to serve a more local area than warehouses built in other parts of the Bay Area.

Data for similar warehousing sites in West Tracy from the San Joaquin Countywide Warehousing Data Collection effort are provided for comparison and reasonableness checking purposes.

Heavy-Duty Truck Distribution Patterns

The heavy-duty truck inbound and outbound origin-destination distribution patterns generated by the 23 existing industrial warehousing sites from the Fall 2021 data period is presented on **Figure 3** and **Figure 4**, respectively.

Figure 3: Heavy-Duty Truck Inbound Distribution Pattern

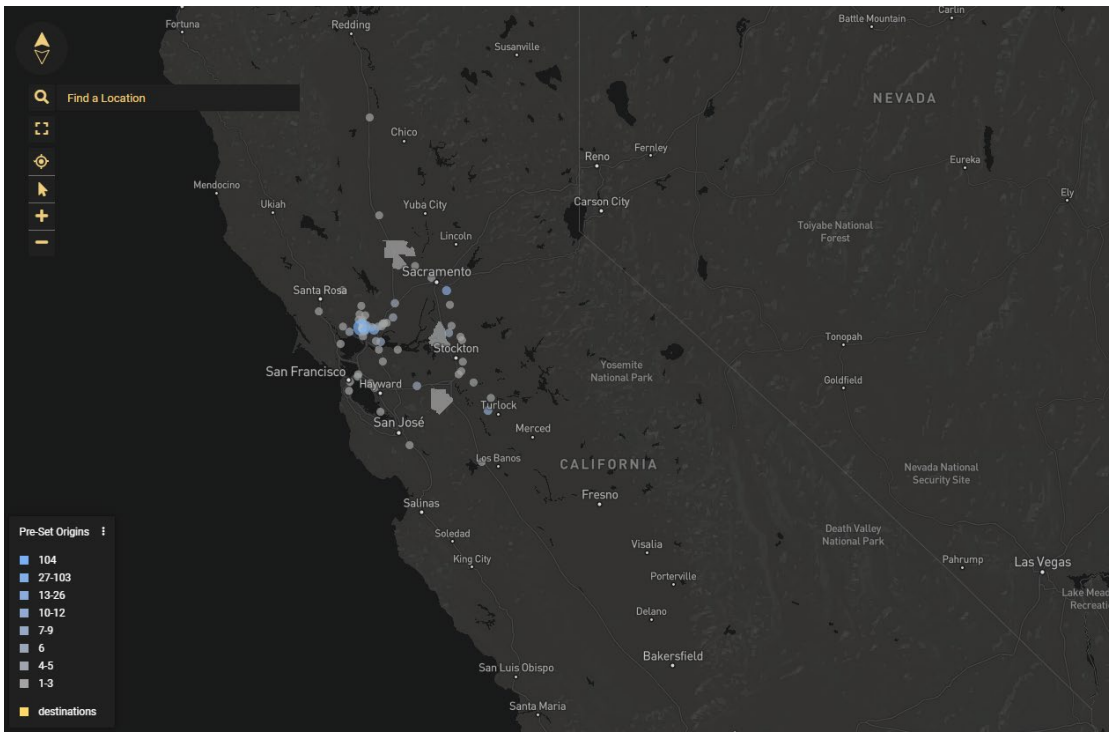


Figure 4: Heavy-Duty Truck Outbound Distribution Pattern

Key Findings

The following key data findings from the American Canyon industrial warehouse travel behavior data collection effort are suitable for use in the ongoing air quality analysis:

- The average daily trip generation per KSF of warehousing building space is 0.078 medium-duty truck trips, 0.447 heavy-duty truck trips, 0.995 auto trips, and 1.52 total vehicle trips.
- The average trip length of heavy-duty truck trips generated by the eight existing Napa County industrial warehousing sites in full operation during the data collection period is 35.6 miles.
- The average trip length of heavy-duty truck trips generated by the eight existing Napa County industrial warehousing sites is roughly 39 percent lower than the average trip length for all 23 Bay Area warehousing sites combined.

Introduction

Buzz Oates Construction, Inc. (Applicant) retained Economic & Planning Systems, Inc. (EPS) to evaluate the fiscal impacts of the proposed Giovannoni Logistics Center Project (Project) on the American Canyon Fire Protection District (Fire District). The Project is anticipated to be an entirely non-residential development project with up to approximately 2.4 million square feet of buildings that may be constructed. This memorandum summarizes an evaluation of the estimated fiscal impacts of the Project on the Fire District.

This fiscal impact analysis (Analysis) examines the Project's estimated fiscal impact on the Fire District's annual operating budget. Specifically, the Analysis estimates whether projected revenues from the Project will adequately cover the costs of delivering fire and emergency medical services to the Project's structures, employees and visitors. As described in the Draft Environmental Impact Report (EIR) for the Project, this Analysis is based on the assumption that the Fire District will provide these services.

The technical analysis, including data, assumptions, and detailed calculations underlying the Analysis, is provided in **Appendices A** through **D**.

Project Land Uses

The Project entitlement includes the ability to construct up to 5 buildings containing up to approximately 2.4 million building square feet. **Table A-2** in **Appendix A** summarizes the Project's land use plan at buildout.

The Economics of Land Use

Overview of Results

As shown in **Table 1**, the Project (at buildout) is estimated to generate approximately $198,000 in annual revenues to the Fire District as compared to approximately $306,000 in new Fire District expenditures for an annual estimated deficit of $108,000. Separately, the Project is anticipated to generate approximately $2.5 million in one-time Fire Mitigation Fee revenues for new Fire District capital equipment and facilities.

Table 2 provides more detail regarding the annual revenue and expenditure estimates in this fiscal analysis. The remainder of this memorandum briefly summarizes the methodologies used to derive these annual revenue and expenditure estimates.

Methodology and Assumptions

This section briefly summarizes the underlying methodology and assumptions used to estimate the fiscal impact of the Project on the Fire District. It describes assumptions concerning estimating the cost of fire service delivery and the methodology used to forecast the Project's anticipated revenues to the Fire District.

General Assumptions

The Analysis is based on the Fire District's Budget for Fiscal Year (FY) 2021–22 and information on the Fire District's Fire Mitigation Fee and Fire Services Fee. All costs and revenues are shown in constant 2022 dollars. General fiscal and demographic assumptions are detailed in **Table A-1** in **Appendix A**. This Analysis also used information from the following sources: Project Applicant, County Assessor and Auditor-Controller, and State Department of Finance (DOF).

It is important to note that the actual fiscal impacts of new development in the Project will vary from those presented in this Analysis if development plans or other assumptions (e.g., assessed valuations, building square footages) change from those presented in this Analysis.

General Fund Revenue- and Expenditure-Estimating Assumptions

The primary focus of this Analysis considers only discretionary revenues that will be generated by the Project. Discretionary revenues to the Fire District include the Fire District's share of the ad-valorem property tax plus payment of the Fire Services Fee. Separately, this report also quantifies the total estimated fire mitigation fees payable by the Project.

Development Assumptions

Listed below are brief summaries of land use and other development-related assumptions:

- **Land Use:** The Project is entitled to accommodate non-residential development as described above.
- **Employee Estimates:** Using an assumed 1,000 building square foot per employee, EPS estimated the total number of employees that may work within the Project. In estimating certain annual revenues and expenditures (service demands) related to the Project, EPS developed a "persons-served" population estimate to approximate the impacts of an employee in the Project relative to a resident. EPS uses a factor of 0.5 for every employee to derive the Project's persons-served population. **Table A-3** in **Appendix A** shows the estimated persons served anticipated to be generated by the Project.
- **Project Assessed Value:** The estimated assessed valuation of the Project was provided by Project Applicant based on comparable projects. Estimated buildout assessed values for the Project are calculated in **Table D-1** in **Appendix D**.

Revenue-Estimating Methodology

As described in more detail below, EPS used a marginal-revenue case-study approach to estimate Project-related revenues. The marginal-revenue case-study approach simulates actual revenue generation resulting from new development.

Table B-1 in **Appendix B** summarizes estimated annual and one-time revenues resulting from the Project. Ongoing annual revenues include property tax and the Fire Services Fee. One-time revenues include the Fire Mitigation Fee.

Property Tax

Estimated annual property tax revenue resulting from development in the Project is presented in **Table B-2** in **Appendix B**. The Fire District appears to receive approximately 4.8 percent of the total 1-percent ad-valorem property tax that is levied on assessed value. As shown in **Table B-2**, the Project is estimated to generate annual property tax revenue to the Fire District of approximately $186,000.

Fire Service Fee

Table B-3 shows the Project's estimated annual Fire Services Fee revenues of approximately $11,800 based on the Project's building characteristics and equivalent dwelling unit (EDU) calculations (See **Table B-4**) applicable for the Fire Services Fee.

One-Time Fire Mitigation Fee Revenue

Using the Fire District's fee schedule, **Table B-5** calculates the estimated Project's Fire Mitigation Fee payments of approximately $2.5 million.

Expenditure-Estimating Methodology

Average-Cost Expenditures

Expenditure estimates are based on the City's FY 2021-22 budget and EPS's estimates of persons served within the Project – as described earlier. This Analysis estimates expenditure impacts of the Project using an average-cost approach, which uses the City's FY 2021-22 budgeted expenditures on a Fire District-wide basis and calculates an average cost per-persons-served basis to forecast expenditures required to serve new development.

Table C-1 in **Appendix C** shows the two Fire District expenditure categories for which the average-cost method was used – General Operations Fund and Fleet, Facilities, and Equipment Capital Fund.

General Operations Fund

Table C-1 shows the FY 21-22 General Operations fund budget by category of expenditure and EPS's calculation of the average cost per-person-served. As depicted on **Table C-1**, the Analysis incorporates one adjustment to the average-cost approach specifically as it relates to Personnel costs. An adjustment factor of 70% was used for Personnel costs reflecting the fact that certain Fire District personnel costs (e.g., chief, assistant chief, administrative, etc.) are generally fixed and will not incrementally increase as a result of the Project. The adjustment factor in **Table C-1** accounts for the estimated fixed portion of personnel costs. Based on the information in **Table C-1** and on the estimated persons-served in the Project, **Table C-2** calculates the estimated annual expenditures required to serve the Project at buildout is provided in **Table C-2**.

Fleet, Facilities and Equipment Capital Fund

In addition to the General Operations Fund, this Analysis also considers the Fleet, Facilities and Equipment Capital Fund. This fund was included in the Analysis to be comprehensive noting that in the past the Fire District has elected to use a portion of its discretionary revenue to make periodic contributions to fleet, facilities, and equipment (i.e., capital items). With a project of this size and scale that will pay approximately $2.5 million in Fire Mitigation Fees to the Fire District, there may be discussions between the Applicant and Fire District whether the need to include this component in the Analysis is warranted or duplicative. As noted elsewhere in this Analysis, the Fire Mitigation Fee already includes a $0.50 per building square foot fee addition accounting for the size (height) of proposed buildings.

Technical Appendices

The technical calculations used in this Analysis are shown in **Appendices A** through **D** (**Tables A-1** through **D-3**):

- **Appendix A** indicates the proposed land uses and general assumptions used in this Analysis.
- **Appendix B** identifies the projected revenues that will be generated by the Project for the Fire Districts funds.
- **Appendix C** details the estimated expenditures for the Fire District to provide services to the Project.
- **Appendix D** shows the projected assessed value of the Project, which serves as the basis for calculating property tax revenues.

[1] An adjustment factor may be used to reflect the fact that new persons served may not increase certain expenditures at a 1:1 ratio. This analysis assumes an adjustment factor for personnel expenditures as costs pertaining to certain positions, such as the Fire Chief and Assistant Chief are fixed and would not grow with additional development within the District.
[2] Expenditure category not anticipated to be impacted by Project development.
[3] Specific for capital expenditures required due to Project development are not known at this time. As such, en estimate of facilities and equipment spending are estimates using a per persons served methodology based on the long term average cost for each category. Refer to Table C-3 for details.

BUZZ OATES

July 13, 2022

Mr. Geoff Belyea
Chief, American Canyon Fire Protection District
911 Donaldson Way East
American Canyon, CA 94503

Subject: Giovannoni Logistics Center (Project)

Applicant: Buzz Oates Construction, Inc. (Applicant)

Project Description: The Project is anticipated to be an entirely non-residential development project with up to approximately 2.4 million square feet of high-cube warehouse building space. The project contains a 68.8-acre Phase 1, creation of a 44.8-acre open space preserve, and a 85.9-acre Phase 2.

Issue: Estimated Annual Fiscal Impacts to the American Canyon Fire Protection District (Fire District) and costs of One-Time Fire Mitigation Fee.

Fiscal Impact Analysis: Economic & Planning Systems, Inc. (EPS) conducted a fiscal impact analysis of the Project forecasting estimated general operations fund revenues would accrue to the Fire District from the Project as compared to the Fire District's annual operating costs to serve the Project. In working with the Fire District's staff and financial consultant, the fiscal impact analysis projected the following annual operating deficit to the Fire District, prior to any fiscal mitigation.

Table 1: Estimated Annual Fiscal Impacts (2022 $)

Item	Estimated Revenues/Expenditures (Rounded)
Annual Fiscal Impact	
Annual Revenues	$198,000
Annual Expenditures	$356,000
Net Annual Surplus/(Deficit)	**($158,000)**

One-Time Fire Mitigation Fee Calculation: The table below shows the estimated one-time Fire District mitigation fee that could be applicable to the Project.

Table 2: One Time Fire Mitigation Fee (2022 $)

Item	Assumption/ Source	Building Square Footage	Fire Mitigation Fee Revenues (2022$)
Fire Mitigation Fee per Square Foot [1]	$1.0512		
Logistics Center Land Uses	Table A-2		
Building A		600,243	$630,975
Building B		469,512	$493,551
Building C		715,489	$752,122
Building D		292,480	$307,455
Building E		322,240	$338,739
Total Logistics Center		**2,399,964**	**$2,522,842**

Source: American Canyon Fire Protection District; Buzz Oates; EPS.

[1] The fire mitigation fee is a one-time service fee charged by the American Canyon Fire Protection District.

Proposal: For the benefit of the Fire District, the Applicant proposes to form a Mello-Roos Community Facilities District (CFD) or other similar public financing instrument for public safety services funding. The initial annual maximum special tax would be set equal to the estimated $158,000 in annual fiscal deficit (at project buildout), and would subject to annual escalation (as noted below). In consideration for this offer, Applicant proposes the Fire District exempt Applicant from the One-Time Fire Mitigation Fee.

Mello-Roos CFD Details: The CFD must be formed on full legal parcels and would include all legal parcels that are a part of the Project. Only developable land shall be subject to the tax with any publicly owned land or land that remains in open space, environmental mitigation or public use not being subject to the annual special tax. Project APNs currently include: 057-090-008, 057-130-034, and 057-130-036.

The initial annual special tax will be based on a maximum annual cost of $158,000 (in 2022 $) that would be apportioned to the estimated developable area within the CFD. The annual special tax is proposed to include an annual escalator equal to the consumer price index for all urban consumers (CPI – U) for San Francisco-Oakland-Hayward, subject to a maximum of 3 percent per year.

BUZZ OATES

As described below, only developed property would be subject to the annual special tax. Developed property will be defined in the CFD Rate and Method of Apportionment of Special Tax (RMA) to mean any parcel with a structure for which a building permit has been issued. Developed Property will be taxed at the maximum annual special tax rate once it becomes a Developed Property (i.e., after a building permit has been issued). Since undeveloped land places little demands on fire and emergency medical services, undeveloped property will not be subject to the maximum special tax. The CFD is not proposed to include a termination date and may be collected by the Fire District in perpetuity.

For example, the 38.8 acre Building A parcel would be subject to an annual tax special tax of $39,297.41.

($158,000 / 156 developable acres = $1,012.82 / acre * 38.8 Building A parcel = $39,297.41 annual tax)

The Giovannoni Logistics Center is the second project for the developer in the City of American Canyon, with the first being the 120,080 square foot warehouse at 100 Jim Oswalt Way.

We look forward to working with the Fire Protection District and City on this endeavor to create further lasting community benefits.

All the best,

Joe Livaich
Vice President, Planning & Preconstruction Services
Buzz Oates Construction, Inc.

Memo

Subject: Wildlife Hazard Assessment for the Giovannoni Logistics Center Property

Dear Mr. Livaich,

This memorandum describes the methods and results of the wildlife hazards assessment that was conducted for the Giovannoni Logistics Center (project), in the City of American Canyon, California (Figure 1). The 208-acre project site is semi-rectangular in shape, and is bounded by industrial development in the Green Island Business Park (west), the Napa Logistics Project and Devlin Road (north), the Napa Branch Line (east), and Green Island Road, a stone supply business, and a wine distribution warehouse (south). The airfield of the Napa County Airport is located less than one mile north of the project site.

The proposed project would develop a 2.4 million square foot logistics center on approximately 161 acres of the project site (Figure 2). The remaining 47 acres would be preserved as open space. In conjunction with the proposed project, the City of American Canyon would extend Devlin Road through the project site.

Phase 1 is comprised of the 94.7 acre-area east of the Devlin Road extension. This area will support two warehouse buildings totaling 1,069,904 square feet. A total of 0.496 acres of palustrine emergent wetlands will be permanently filled in Phase 1. As such, 0.992 acres of wetlands (a 2:1 ratio) will be established in the Proposed Wetland Preserve area in the northern portion of the project site. Phase 2, the 113.1-acre area west of Devlin Road, is conceptually proposed for the remaining 1.3 million square feet of high cube warehouse. Phase 2 would commence once Phase 1 is completed. If constructed, Phase 2 would impact approximately 3.7 acres of wetlands, which would be mitigated at a 1:1 ratio. The wetlands created within the 44.8 acre Proposed Wetland Preserve as part of project mitigation would total approximately 4.7 acres (*Biological Resources Report for Giovannoni Logistics Center*, Huffman-Broadway Group, May 28, 2021; Figures 3 and 4).

Policy 3.3.5 of the Airport Land Use Compatibility Plan (ALUCP) for the Napa County Airport and Parrett Field provides as follows:

> Land uses which may produce hazards to aircraft in flight shall not be permitted within any airport' s planning area. Specific characteristics to be avoided include: (1) glare or distracting lights which could be mistaken for airport lights; (2) sources of dust, steam, or smoke which may impair pilot visibility; (3) sources of electrical interference with aircraft communications or navigation; and (4) any use which may attract large flocks of birds, especially landfills and certain agricultural uses.

The Draft EIR for the Giovannoni Logistics Center includes Mitigation Measure LU-3, which is intended to ensure compliance with ALUCP Policy 3.3.5. That mitigation measure reads as follows:

> Prior to issuance of grading permits, the applicant shall retain a qualified Biologist to assess potential wildlife hazards to aviation. The assessment shall evaluate the characteristics of the emergent wetlands, drainages, other potential wildlife attractant features (i.e., ponded water) located within the open space area and identify management practices (e.g., storm drainage, vegetation, etc.) to prevent the creation of attractants for large flocks or birds or other wildlife species that may present safety hazards to aviation activities. As part of the assessment, the applicant shall consult with Napa County Airport and Napa County Airport Land Use Commission (ALUC) representatives, as appropriate, regarding findings and recommendations. The applicant shall submit a report to the City of American Canyon prepared by a qualified Biologist that confirms the wildlife hazard assessment' s findings and recommendations are incorporated into the design of the open space preserve.

This memorandum is intended to satisfy the requirement from Mitigation Measure LU-3 for the preparation of a wildlife hazard assessment for the project. The memorandum specifically addresses whether, and to what extent, the proposed land uses, including the wetland preserve component, could attract large flocks of birds or other wildlife species that may present safety hazards to the Napa County Airport.

Methods

A desktop review of project background documents, aerial imagery, and wildlife occurrence databases including the California Department of Fish and Wildlife's Natural Diversity Database (CNDDB) was conducted on September 22, 2022 to identify habitats and species with potential to occur within the survey area. The survey area encompassed the 208-acre parcel and an additional 250-foot buffer extending beyond the parcel boundaries. A pedestrian reconnaissance-level survey was conducted on September 22, 2022 by AECOM biologist Ranie Shreckengost. Hand-written notes, binoculars, and the ArcGIS Field Maps application were used to navigate the site, record observations, and document habitat types/quality and site conditions.

Results

The project site is surrounded by urban development in the City of American Canyon to the north, east, and south, with an adjacent, undeveloped, grassland-dominant parcel bordering Devlin Road immediately west of the project site. The vegetation is dominated by non-native annual grasses. Evidence of vegetation management and stormwater management channels was observed along Devlin Road which divides the property into eastern and western halves. A dry, ephemeral drainage channel was observed within the northern portion of the property and appeared to flow from east to west. This feature flows underneath Devlin Road via a stormwater management channel and shallow bridge. Small, intermittent, seasonal wetland features and hydrology was observed in the form of drainage patterns, microtopographic relief, and hydrophytic vegetation concentrated along the northern portion of the property. These features are primarily located within the extents of the Proposed Wetland Preserve area shown in Figure 2.

A large, square, elevated earthen mound was observed in the southeastern portion of the property at the approximate location of Proposed Building A (Phase 1) within the proposed project site (Figure 2). The vegetation growing upon and around this mound appeared to be mostly ruderal. Tarps were observed on the ground covering portions of the mound.

A single Cooper's hawk (*Accipiter cooperii*) was observed during the survey. Cooper's hawk is a CDFW Watch List species, and like most nesting birds and raptors, their nests are protected by the Migratory Bird Treaty Act of 1918. No special-status species were observed during the survey. No active or historic bird nests were observed. Wildlife and vegetation species observed during the field survey are listed below in **Table 1**.

A map depicting the location of the proposed development site is included as **Figure 1**, and the site plan, wetland impacts, and proposed wetland mitigation areas are shown in **Figures 2, 3, and 4**. Representative site photographs are provided in **Attachment A**.

Table 1. Plant and wildlife species observed during the September 22, 2022 reconnaissance survey.

Scientific Name	Common Name
Amphibians and Reptiles	
Sceloporus occidentalis	Western fence lizard
Birds	
Zenaida macroura	Mourning dove
Charadrius vociferus	Killdeer
Cathartes aura	Turkey vulture
Haemorhous mexicanus	House finch
Accipiter cooperii	Cooper's hawk
Tyrannus verticalis	Western kingbird
Corvus brachyrhynchos	American crow (12 individuals)
Mammals	
Lepus californicus	Black-tailed jackrabbit
Canis latrans	Coyote
Plants	
Taeniatherum caput-medusae	Medusa-head grass
Centaurea solstitialis	Yellow star-thistle
Poa sp.	Annual grasses
Avena barbata	California wild oat
Baccharis pilularis	Coyote brush
Helminthotheca echioides	Bristly oxtongue
Hemizonia congesta	Hayfield tarweed
Polypogon monspeliensis	Rabbitfoot grass
Rubus armeniacus	Himalayan blackberry
Nigella arvensis	Wild fennel

Discussion

The buildings associated with the project development site are not expected to result in a significant attraction of birds or other wildlife to the property. Some vegetation will be removed and replaced with buildings, resulting in the reduction of existing non-native grassland habitat within the development site. Anticipated changes to the existing wildlife habitat associated with the proposed construction activities include grading, excavation, permanent development, storm water controls, lighting, irrigation, noise, and increased human presence.

The development of Phase 1 and Phase 2 features is unlikely to result in an increase in wildlife activity due to the disturbances caused by the lighting, human presence, and noise associated with the new development site, in addition to the existing baseline noise and activity from nearby vehicular traffic and the Napa County Airport air and vehicular traffic. Natural or man-made features that could attract wildlife to the property post-construction include the proposed stormwater retention basins; however, the stormwater retention basins are unlikely to result in significant additional wildlife attraction because the systems are designed for quick drainage, and because the basins will be surrounded by development.

A majority of the wetland impacts will be mitigated at a 1:1 ratio, with only 0.496 acres of net gain in palustrine emergent wetlands across the site. The impacted wetlands are located within a contiguous grassland landscape and are, on average, no more than 1,500 feet south of the Proposed Wetland Preserve, where mitigation wetlands would be created among approximately 45 acres of existing wetlands. The creation of wetlands associated with the project is not expected to cause an overall increase in the current level of bird or other wildlife activity at the project site, because a majority of the wetlands being filled within the parcel would be replaced at a 1:1 ratio and would be located among existing wetland features that dominate the northern portion of the project site.

In summary, the construction and development associated with the Giovannoni Logistics Center would not cause an increase above the existing level of activity of birds or other wildlife. Therefore, the project land uses would not present a hazard to Napa County Airport flight operations. It is predicted that the overall wildlife activity on the property would remain at or below current levels, based on our understanding of the planned development and our best professional assessment of the existing habitat.

PREFACE

Section 21081.6 of the California Environmental Quality Act (CEQA) and CEQA Guidelines Section 15097 require a Lead Agency to adopt a Mitigation Monitoring and Reporting Program (MMRP) whenever it adopts a Mitigated Negative Declaration (MND) in conjunction with a project approval. The purpose of the MMRP is to ensure compliance with the mitigation measures occurs during project implementation.

The Draft Environmental Impact Report (Draft EIR) prepared for the proposed Giovannoni Logistics Center Project (proposed project) concluded that project implementation could result in potentially significant effects on the environment and mitigation measures were incorporated into the proposed project or are required as a condition of project approval that reduce these potential impacts to a less than significant level. This MMRP documents how and when the mitigation measures adopted by the Lead Agency will be implemented and confirms that potential environmental impacts are reduced to less than significant levels as identified in the Draft EIR.

This document does not discuss those subjects that the environmental analysis demonstrates would result in less than significant impacts and for which no mitigation was proposed or necessary.

THIS PAGE INTENTIONALLY LEFT BLANK

Table 1: Giovannoni Logistics Center Project Mitigation Monitoring and Reporting Program

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
3.1 Aesthetics, Light, and Glare					
MM AES-3: Prior to issuance of building permits for the proposed project, the project applicant shall prepare and submit a photometric plan to the City of American Canyon for review and approval which demonstrates that all exterior light fixtures would be directed downward or employ full cut-off fixtures to minimize light spillage and avoid interference with aviation operations at the Napa County Airport. The approved plan shall be incorporated into the proposed project.	Approval of plan	Prior to issuance of building permits for the proposed project	City of American Canyon		
3.2 Air Quality					
MM AIR-2a: The following Best Management Practices (BMPs), as recommended by the Bay Area Air Quality Management District (BAAQMD), shall be included in the design of the project and implemented during construction: • All active construction areas shall be watered at least two times per day. • All exposed non-paved surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and access roads) shall be watered at least three times per day and/or non-toxic soil stabilizers shall be applied to exposed non-paved surfaces. • All haul trucks transporting soil, sand, or other loose material off-site shall be covered and/or shall maintain at least 2 feet of freeboard. • All visible mud or dirt tracked out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited. • All vehicle speeds on unpaved roads shall be limited to 15 miles per hour.	Notes on construction plans; Site inspection	During construction	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
• All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used. • Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California Airborne Toxics Control Measure (ATCM) Title 13, Section 2485 of California Code of Regulations). Clear signage regarding idling restrictions shall be provided for construction workers at all access points. • All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation. • The prime construction contractor shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The City and the construction contractor shall take corrective action within 48 hours. The BAAQMD's phone number shall also be visible to ensure compliance with applicable regulations.					
MM AIR-2b: Prior to the issuance of grading or building permits, the project applicant shall provide the City with documentation demonstrating the use of "Low-VOC" architectural coatings during the proposed project's construction. "Low-VOC" architectural coatings used during project construction shall not exceed 50 grams of reactive organic gases (ROG) or volatile organic compounds (VOC) per liter of product.	Submittal of documentation	Prior to the issuance of grading or building permits	City of American Canyon		
MM AIR-2c: Prior to issuing any certificate of occupancy for the proposed project, the project applicant shall provide the City with documentation demonstrating the use of "Low-VOC"	Submittal of documentation	Prior to issuing any certificate of occupancy	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
architectural coatings and electric landscaping equipment during the operation of the proposed project. "Low-VOC" architectural coatings used during project construction shall not exceed 50 grams of reactive organic gases (ROG) or volatile organic compounds (VOC) per liter of product. Landscaping equipment referred to in this requirement shall include lawnmowers, leaf blowers, and chainsaws.		for the proposed project			
MM AIR-2d: Prior to issuing the certificate of occupancy for the proposed project, the project applicant shall provide the City with documentation demonstrating the use of a truck fleet that meets or exceeds model year 2014 for all heavy-duty trucks during operation of the proposed project. If the project applicant does not own the truck fleet that would be used during operation of the proposed project, the project applicant shall provide the City with documentation from the truck fleet owner or operator demonstrating that trucks utilized for operation of the proposed project will meet or exceed model year 2014. If any change occurs where a new truck fleet is utilized during operation of the proposed project, the project applicant shall provide the City with documentation demonstrating that the new truck fleet meets or exceeds this requirement. To monitor and ensure that trucks that meet a model year of 2014 or newer are used for the proposed project, the fleet operator shall maintain records of all trucks and equipment associated with the proposed project's operation and make these records available to the City upon request. Alternatively, the City may require periodic reporting and provision of written records by operators and conduct regular inspections of the records to the maximum extent feasible and practicable.	Submittal of documentation	Prior to issuing the certificate of occupancy for the proposed project	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
MM AIR-2e: Prior to the issuance of the certificate of occupancy for each building with dock doors, signage shall be posted identifying idling restrictions and contact information to report violations to the building manager.	Site inspection	Prior to the issuance of the certificate of occupancy for each building with dock doors	City of American Canyon		
MM AIR-2f: Prior to the issuance of the certificate of occupancy for each building with a separate end user, the City shall confirm that the end user has prepared a Transportation Demand Management Plan (TDM Plan). The TDM Plan shall be prepared by a qualified transportation consultant and identify strategies to reduce single-occupant vehicle trips. Examples of TDM strategies may include but are not limited to: • Ridesharing/Ride Matching • Vanpools • Transit subsidies • Preferential parking for rideshare or vanpool vehicles • Employee lockers • Secure bicycle parking • Employee locker rooms • Provide TDM information in employee breakroom	Submittal of documentation	Prior to the issuance of the certificate of occupancy for each building with a separate end user	City of American Canyon		
MM AIR-2g: As a part of future lease agreements, the project proponent shall provide all future tenants at the project site information on available California Air Resources Board (ARB) and Bay Area Air Quality Management District (BAAQMD) incentive programs, such as the Carl Moyer Program and the Voucher Incentive Program, that support upgrading truck fleets to clean air technology equipment.	Submittal of documentation	Prior to the issuance of the certificate of occupancy	City of American Canyon		
3.3 Biological Resources					
MM BIO-1a: Pre-construction surveys for Swainson's hawk shall be conducted in the project site vicinity prior to initiation of project construction activities and each year following initiation of construction if project activities are delayed or	Notes on construction plans; Submittal of documentation; Site inspection	Prior to initiation of project construction activities and each year following initiation of	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
discontinued for 7 or more days prior to the second survey period (March 20 to April 5), and are scheduled to recommence construction activities during the second survey period but before August 1. These pre-construction surveys shall include investigation of all potential nesting trees within a half-mile radius around all project activities and shall be completed for at least two survey periods immediately prior to commencement of project construction. Surveys shall be conducted in accordance with CDFW's "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" (CDFW 2000) to maximize the potential for locating nesting Swainson's hawk and reduce the potential for nest failures due to project activities and/or disturbances. If no nesting Swainson's hawk are found during the first second survey period starting March 20, then project construction may commence. If during the third surveys (April 5–April 20) Swainson's hawk are found to be nesting in the project vicinity and construction has commenced, it shall be assumed the Swainson's hawk commenced nesting and thus the Swainson's hawk are habituated to the ambient level of noise and disturbance emanating from the project site. If Swainson's hawk are found to be nesting within 1,000 feet of the project site, a non-disturbance buffer shall be established to keep all construction activities a minimum of 1,000 feet from the nest site. The CDFW shall be consulted regarding the adequacy of the buffer established by the qualified Raptor Biologist. At that time the necessity for acquiring a Fish and Game Section 2081 Incidental Take Permit (ITP) authorization would be determined. An ITP authorization shall be required if there were a valid concern the project activities would result in the "take" of an adult Swainson's hawk, eggs, or nestlings.		construction if project activities are delayed or discontinued for 7 or more days prior to the second survey period (March 20 to April 5)			

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
Surveys shall be conducted by a qualified Raptor Biologist with at least 2 years of experience surveying for and detecting Swainson's hawk pursuant to "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" survey protocol. No disturbance such as construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist.					
MM BIO-1b: No more than 30 days prior to the first ground disturbance activity, pre-construction golden eagle nesting surveys shall be conducted in the project vicinity by a qualified Raptor Biologist. The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting golden eagles. Preconstruction surveys shall include investigation of all potential nesting trees within a survey area determined by the qualified Raptor Biologist, but no less than a 0.5-mile radius around all project activities. If active golden eagle nests are identified within any trees within the survey areas a 0.5-mile radius of the project site, a qualified Raptor Biologist shall establish a protection buffer at a minimum of 1,000 feet that is adequate to ensure noise or activity from the proposed project would not cause nest disturbance or young or adult bird mortality. Buffer zones may vary in size as some golden eagles are more acclimated to disturbance than others. Size of buffer zone may be increased by the qualified Raptor Biologist considering the type of construction activity that may occur and the behavioral factors and extent that golden eagle may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young golden eagles have fledged or	Notes on construction plans; Submittal of documentation; Site inspection	No more than 30 days prior to the first ground disturbance activity	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist.					
MM BIO-1c: Prior to ground disturbance, a pre-construction nesting survey shall be conducted for northern harrier and short-eared owl by a qualified Raptor Biologist if construction is scheduled during the nesting season (February 1 through September 1). The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting northern harrier and short-eared owl. To determine whether northern harrier or short-eared owl is nesting on-site, a qualified Raptor Biologist(s) shall conduct walking transects through the project site grassland habitat searching for nests and minimum 500-foot radius from the project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc., the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars or a spotting scope. An active northern harrier or short-eared owl nest must be protected by implementing a minimum 500-foot radius buffer zone around the nest marked with orange construction fencing. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated where it intersects the project site. Size of buffer zone could be modified increased considering the type of construction activity that may occur, physical barriers between the construction site and active nest, and the behavioral factors and extent that northern harrier or short-eared owl may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is otherwise determined	Notes on construction plans; Submittal of documentation; Site inspection	Prior to ground disturbance	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
to be complete based on monitoring of the active nest by a qualified Raptor Biologist.					
MM BIO-1d: Prior to any ground disturbance, pre-construction surveys for burrowing owl shall be conducted within a minimum of 150 meters of the project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc.), the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars or a spotting scope. The pre-construction surveys shall be conducted within 2 weeks prior to the onset of any ground-disturbing activities. Surveys shall be conducted by a qualified Biologist following California Department of Fish and Wildlife (CDFW) 2012 staff report survey methods and Biologist qualifications to establish the status of burrowing owl on the project site. • If burrowing owl are found to occupy the project site during the nonbreeding season (September 1 to January 31), occupied burrows shall be avoided by establishing a no-disturbance buffer zone a minimum of 100 feet around the burrow. Buffers may be adjusted to address site-specific conditions using the impact assessment approach described in the CDFW 2012 staff report. If a qualified Raptor Biologist determines the location of an occupied burrow/s may be impacted even with a 100-foot buffer, or the burrow(s) are in a location(s) on the project site where a buffer cannot be established without preventing the proposed project from moving forward, then a passive relocation effort may be instituted to relocate the individual(s) out of harm's way pursuant to a Burrowing Owl Exclusion Plan prepared in accordance with the CDFW 2012 staff report. • If burrowing owl are found to be present during the breeding season (February 1 to August 31), the proposed	Notes on construction plans; Submittal of documentation; Site inspection	Prior to any ground disturbance	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
project ground-disturbing activities shall follow the CDFW 2012 staff report recommended avoidance protocol whereby occupied burrows shall be avoided with a no-disturbance buffer. • If burrowing owls are ultimately found on the site and burrow eviction/ relocation of burrowing owls during the non-nesting season is a selected strategy to move forward with the project without direct impacts to burrowing owl individuals, the applicant shall coordinate this effort with CDFW and provide habitat mitigation consistent with the 2012 CDFW Staff Report on burrowing owl.					
MM BIO-2: To offset the loss of the 0.496 acre of seasonal wetland impacts from Phase 1, and 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools from Phase 2, and to ensure there is no-net loss of wetland area, the applicant shall establish/create 0.992 acre of palustrine emergent wetlands (2:1 ratio) for Phase 1 concurrent with project construction, and 2.57 acres of seasonal wetlands (1:1 ratio) and 1.13 acres of vernal pool wetlands (1:1 ratio) for Phase 2 at least 1 year prior to the start of Phase 2 construction, on the 45-acre Wetland Preserve. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland.	Submittal of documentation	Prior to issuance of grading permits	City of American Canyon		
MM BIO-3a: Prior to issuance of the Phase 1 grading permit, the project applicant shall apply for and obtain a Nationwide Permit from the San Francisco District of the United States Army Corps of Engineers (USACE) for discharge within 0.004 acre of wetlands/waters of the United States under Clean Water Act Section 404 jurisdiction. For the USACE permit to be valid, the applicant shall apply for and obtain the accompanying Section 401 Water Quality Certification from the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB). The applicant shall apply for and	Submittal of documentation	Prior to issuance of the Phase 1 grading permit	City of American Canyon; San Francisco District of the United States Army Corps of Engineers; San Francisco Bay Regional Water Quality Control Board		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
obtain a separate Waiver of Waste Discharge Requirements from the San Francisco Bay RWQCB for impacts to 0.496 acre of wetlands/waters of the State. To offset the loss of 0.496 acre of permanent wetland impacts and to ensure there is no-net loss of wetland area, the applicant shall establish/create 0.992 acre of wetlands (2:1 ratio), prior to or concurrent with the start of construction, on the 45-acre Wetland Preserve. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The applicant shall implement the terms of the approved permit(s).					
MM BIO-3b: Prior to issuance of the Phase 2 grading permit, the project applicant shall apply for and obtain an Individual Permit from the San Francisco District of the United States Army Corps of Engineers (USACE) for the placement of fill material within approximately 3.7 acres of wetlands/waters of the United States under Clean Water Act Section 404 jurisdiction. For the USACE permit to be valid, the applicant shall apply for and obtain the accompanying Section 401 Water Quality Certification from the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB). The applicant shall apply for and obtain a separate Waiver of Waste Discharge Requirements from the San Francisco Bay RWQCB for the discharge of fill material within approximately 3.7 acres of waters of the State. To offset the loss of 3.7 acres of permanent wetland impacts and to ensure there is no-net loss of wetland area or permanent loss of functions and values, the applicant shall establish/create 2.57 acres of seasonal wetlands (1:1 ratio) and 1.13 acres of vernal pools (1:1 ratio), at a minimum of 1 year prior to the start of construction, on the 45-acre Wetland Preserve. The established/created wetlands and vernal pools shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The	Submittal of documentation	Prior to issuance of the Phase 2 grading permit	City of American Canyon; San Francisco District of the United States Army Corps of Engineers; San Francisco Bay Regional Water Quality Control Board		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
applicant shall implement the terms of the approved permit(s).					
MM BIO-3c: Prior to issuance of the Phase 1 grading permit, a Wetland Mitigation and Monitoring Plan shall be prepared and submitted to the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB) for review as part of the process for obtaining a permit from the agency. The Wetland Mitigation and Monitoring Plan shall address the loss of 0.496 acre of wetlands impact due to Phase 1 of the proposed project as well as the potential loss of approximately 3.7 acres of wetlands that as part of Phase 2. The Wetland Mitigation and Monitoring Plan shall include in irrevocable instrument (e.g., deed restriction or conservation easements) that shall restrict use of both the 0.992 acre of created wetlands for Phase 1 as well as approximately 3.7 acres of additional wetlands created for Phase 2. The Wetland Mitigation and Monitoring Plan shall also include a long-term endowment that would be fully funded by the proposed project to manage approximately 45-acre open space preserve and created wetlands in perpetuity. If additional wetland mitigation lands are required to compensate for wetland impacts associated with Phase 2, wetlands shall be established/created at a minimum 1:1 ratio (1 acre established/created for every acre permanently impacted) on appropriate mitigation land, approved by the RWQCB and United States Army Corps of Engineers (USACE), within the Phase 2 project site's Hydraulic Unit Code (HUC) 10 watershed. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The applicant shall implement the terms of the approved permit(s).	Submittal of documentation	Prior to issuance of the Phase 1 grading permit	City of American Canyon; San Francisco Bay Regional Water Quality Control Board		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
MM BIO-3d: Prior to issuance of the Phase 1 and Phase 2 grading permit, a Wetland Mitigation and Monitoring Plan shall be submitted to the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB) for review as part of the process for obtaining a permit from the agency. The Wetland Mitigation and Monitoring Plan shall be prepared in accordance with the Subpart J–Compensatory Mitigation for Losses of Aquatic Resources outlined in the California State Water Resources Control Board (State Water Board) Procedures, and in accordance with the State Water Board Implementation Guidance dated April 2020, and in accordance with the United States Army Corps of Engineers (USACE) Compensatory Mitigation Rule (33 Code of Federal Regulations Part 332) The basic objective of the Wetland Mitigation and Monitoring Plan is to ensure that project wetland impacts, and compensatory mitigation proposed to offset the wetland impacts, shall provide a no-net-loss of area of wetlands, and wetlands established/created shall be in-kind to the wetlands impacted. In summary, the Wetland Mitigation and Monitoring Plan shall at a minimum: 1. Preserve 7.58 acres of existing seasonal wetlands and 0.13 acre of vernal pools within the 45-acre Wetland Preserve. 2. Establish within the Wetland Preserve approximately 0.992 acre of seasonal wetlands in advance of or concurrent with implementation of Phase 1 impacts to 0.496 acre of palustrine emergent wetlands at a 2:1 ratio. 3. Establish within the Wetland Preserve approximately 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools in advance of implementation of future Phase 2, assuming Phase 2 is built out, to address the potential maximum losses of approximately 3.7 acres of wetlands that may occur.	Submittal of documentation	Prior to issuance of the Phase 1 and Phase 2 grading permit	City of American Canyon; San Francisco Bay Regional Water Quality Control Board		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
4. Provide financial assurances to ensure a high level of confidence that the compensatory mitigation shall be successfully completed, in accordance with applicable performance standards. 5. Design ecological performance standards to assess whether the Wetland Mitigation and Monitoring Plan is achieving the overall objectives, so that it can be objectively evaluated to determine whether it is developing into the desired resource type (vernal pool, seasonal wetland e.g.), and attaining any other applicable metrics such as acres, number of native plant species, water saturation and/or ponding depth etc. 6. Monitor the site for a duration necessary to determine whether the Wetland Mitigation and Monitoring Plan is meeting the performance standards. Established palustrine emergent wetlands and vernal pools typically develop quickly on soils with clay restrictive horizon. The 45-acre Wetland Preserve does have a clay restrictive layer approximately 8–18 inches below the surface therefore a 5-year monitoring period would be sufficient to determine whether performance standards are met. This monitoring period may be extended if performance standards are not met due to how the wetlands were constructed or natural events such as severe droughts. 7. Protect the approximately 45-acre Wetland Preserve in perpetuity using a conservation easement, and provide an endowment sufficient to fund the Long-Term Management Plan. 8. An overall assessment of the condition of the wetlands that shall be permanently impacted by the proposed project shall be conducted using the California Rapid Assessment Method (CRAM) for depressional wetlands, or a hybrid approach based on CRAM. Each similar wetland type that may be impacted shall be assessed to describe the floristic					

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
community and record the native and non-native dominant plants within the vernal pool and palustrine emergent wetlands. Physical structure such as topographic complexity and physical features that may provide habitat for aquatic species (e.g., boulders, woody debris etc.) shall be recorded and used to design the created/established wetlands. The purpose of this assessment is to ensure the design of the wetlands shall provide habitat that is similar to the wetlands being impacted to ensure the impacted wetlands are mitigated in-kind.					
MM BIO-4: If construction occurs during the breeding season of migratory and resident birds (February 1 to August 31), a qualified Biologist shall conduct a pre-construction breeding bird survey in areas of suitable habitat within 7 days prior to the onset of construction activity. Surveys shall be conducted within the project footprint and 50 feet from the construction limits for nesting passerines, 250 feet from the construction limits for nesting accipiters and 1,000 feet from the construction limits for nesting raptors. If the survey area is found to be absent of nesting birds, no further mitigation would be required. However, if construction activities are delayed by more than 7 days, an additional nesting bird survey shall be performed. If bird nests are found, appropriate buffer zones shall be established around all active nests to protect nesting adults and their young from direct or indirect impacts related to project construction disturbance. Size of buffer zones shall be determined per recommendations of the qualified Biologist based on site conditions and species involved. At a minimum a 1,000-foot buffer shall be established for nesting Swainson's hawk and golden eagle; 500-foot buffer for nesting tricolored blackbirds, northern harriers and other non-listed raptors; 250-foot buffer for nesting accipiters; and minimum 50-foot buffers shall be established for nesting passerines and all other non-raptor or	Notes on construction plans; Submittal of documentation; Site inspection	If construction occurs during the breeding season of migratory and resident birds (February 1 to August 31)	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
passerine nesting birds. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated where it intersects the project site. Buffer zones shall be maintained until it can be documented that either the nest has failed, or the young have fledged.					
3.4 Cultural Resources and Tribal Cultural Resources					
MM CUL-2a: No ground disturbance shall take place within 100 feet of informal archaeological resource 483A-001. The resource shall be preserved in place.	Notes on construction plans; Site inspection	During construction	City of American Canyon		
MM CUL-2b: An Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology shall be present on-site during all earth disturbing activities. If prehistoric or historic-period archaeological resources are encountered, all construction activities within 100 feet of the find shall halt and the City of American Canyon shall be notified. Prehistoric archaeological materials may include obsidian and chert flaked stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or shellfish remains; and stone milling equipment (e.g., mortars, pestles, hand stones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic-period materials might include stone, concrete, or adobe footings and walls; filled wells or privies; and deposits of metal, glass, and/or ceramic refuse. The Archaeologist shall inspect the findings within 24 hours of discovery. If it is determined the project could damage a historical resource or a unique archaeological resource (as defined pursuant to the CEQA Guidelines), mitigation shall be implemented in accordance with Public Resources Code Section 21083.2 and Section 15126.4 of the CEQA Guidelines, with a preference for preservation in place. Consistent with	Notes on construction plans; Site inspection; Submittal of documentation	During construction	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
Section 15126.4(b)(3), this may be accomplished through planning construction to avoid the resource; incorporating the resource within open space; capping and covering the resource; or deeding the site into a permanent conservation easement. If avoidance is not feasible, a qualified Archaeologist shall prepare and implement a detailed treatment plan in consultation with the City of American Canyon. Treatment of unique archaeological resources shall follow the applicable requirements of Public Resources Code Section 21083.2. Treatment for most resources would consist of (but would not be limited to) sample excavation, artifact collection, and site documentation, with the aim to target the recovery of important scientific data contained in the portion(s) of the significant resource to be impacted by the proposed project. The treatment plan shall include provisions for analysis of data in a regional context, reporting of results within a timely manner, curation of artifacts and data at an approved facility, and dissemination of reports to local and State repositories, libraries, and interested professionals.					
MM CUL-3: In the event of the accidental discovery or recognition of any human remains, CEQA Guidelines Section 15064.5, Health and Safety Code Section 7050.5, and Public Resources Code Sections 5097.94 and Section 5097.98 shall be followed. If during project construction, there is accidental discovery or recognition of any human remains, the following steps shall be taken: 1. There shall be no further excavation or disturbance within 100 feet of the remains until the County Coroner is contacted to determine whether the remains are Native American and if an investigation of the cause of death is required. If the Coroner determines the remains to be Native American, the Coroner shall contact the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall identify the person or persons it	Notes on construction plans; Site inspection; Submittal of documentation	During construction	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
believes to be the Most Likely Descendant (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work within 48 hours, for means of treating or disposing of, with appropriate dignity, the human remains, and any associated grave goods as provided in Public Resource Code Section 5097.98. 2 Where the following conditions occur, the landowner or authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the MLD or on the project site in a location not subject to further subsurface disturbance: • The NAHC is unable to identify an MLD or the MLD failed to make a recommendation within 48 hours after being notified by the commission. • The descendant identified fails to make a recommendation. • The landowner or authorized representative rejects the recommendation of the descendant, and mediation by the NAHC fails to provide measures acceptable to the landowner. Additionally, California Public Resources Code Section 15064.5 requires the following relative to Native American Remains: • When an initial study identifies the existence of, or the probable likelihood of, Native American Remains within a project, a lead agency shall work with the appropriate Native Americans as identified by the NAHC as provided in Public Resources Code Section 5097.98. The applicant may each develop a plan with respect to their respective individual development proposals for treating or disposing of, with appropriate dignity, the human remains, and any					

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
items associated with Native American Burials with the appropriate Native Americans as identified by the NAHC.					
MM CUL-4: A Tribal Monitor representing the Yocha Dehe Wintun Nation shall be present during all project-related ground disturbance. Additionally, the Yocha Dehe Wintun Nation's Treatment Protocol (Protocol) shall be followed with respect to Tribal Cultural Resources (TCRs). The purpose of the protocol is to formalize procedures for the treatment of Native American human remains, grave goods, ceremonial items, and items of cultural patrimony, if any are found in conjunction with development, including archaeological studies, excavation, geotechnical investigations, grading, and any ground-disturbing activity. This Protocol also formalizes procedures for Tribal Monitoring during archaeological studies, grading, and ground-disturbing activities. 1. Cultural Affiliation: The Yocha Dehe Wintun Nation (Tribe) traditionally occupied lands in Yolo, Solano, Lake, Colusa, and Napa Counties. The Tribe has designated its Cultural Resources Committee (Committee) to act on the Tribe's behalf with respect to the provisions of this Protocol. Any human remains which are found in conjunction with projects on lands culturally affiliated with the Tribe shall be treated in accordance with Section III of this Protocol. Any other cultural resources shall be treated in accordance with Section IV of this Protocol. 2. Inadvertent Discovery of Native American Human Remains**:** Whenever Native American human remains are found during the course of a project, the determination of Most Likely Descendant (MLD) under California Public Resources Code Section 5097.98 will be made by the Native American Heritage Commission (NAHC) upon notification to the NAHC of the discovery of said remains at a project site. If the location of the site and the history and prehistory of the	Notes on construction plans; Site inspection; Submittal of documentation	During construction	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
area is culturally affiliated with the Tribe, the NAHC contacts the Tribe; a Tribal member will be designated by the Tribe to consult with the landowner and/or project proponents. Should the NAHC determine that a member of an Indian tribe other than Yocha Dehe Wintun Nation is the MLD, and the Tribe agrees with this determination, the terms of this Protocol relating to the treatment of such Native American human remains shall not be applicable; however, that situation is very unlikely. 3. Treatment of Native American Remains: In the event that Native American human remains are found during development of a project and the Tribe or a member of the Tribe is determined to be MLD pursuant to Section II of this Protocol, the following provisions shall apply. The Medical Examiner shall immediately be notified, ground-disturbing activities in that location shall cease and the Tribe shall be allowed, pursuant to California Public Resources Code Section 5097.98(a), to (1) inspect the site of the discovery and (2) make determinations as to how the human remains and grave goods shall be treated and disposed of with appropriate dignity. The Tribe shall complete its inspection and make its MLD recommendation within 48 hours of getting access to the site. The Tribe shall have the final determination as to the disposition and treatment of human remains and grave goods. Said determination may include avoidance of the human remains, reburial on-site, or reburial on tribal or other lands that will not be disturbed in the future. The Tribe may wish to rebury said human remains and grave goods or ceremonial and cultural items on or near the site of their discovery, in an area which will not be subject to future disturbances over a prolonged period of time. Reburial of human remains shall be accomplished in compliance with the California Public Resources Code Sections 5097.98(a) and (b). The term					

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
"human remains" encompasses more than human bones because the Tribe's traditions call for the burial of associated cultural items with the deceased (funerary objects), and/or the ceremonial burning of Native American human remains, funerary objects, grave goods, and animals. Ashes, soils, and other remnants of these burning ceremonies, as well as associated funerary objects and unassociated funerary objects buried with or found near the Native American remains are to be treated in the same manner as bones or bone fragments that remain intact. 4. Non-Disclosure of Location of Reburials**:** Unless otherwise required by law, the site of any reburial of Native American human remains shall not be disclosed and will not be governed by public disclosure requirements of the California Public Records Act, California Government Code Section 6250 *et seq*. The Medical Examiner shall withhold public disclosure of information related to such reburial pursuant to the specific exemption set forth in California Government Code Section 6254(r). The Tribe will require that the location for reburial is recorded with the California Historic Resources Inventory System (CHRIS) on a form acceptable to the CHRIS center. The Tribe may also suggest the landowner enter into an agreement regarding the confidentiality of site information that will run with title on the property. 5. Treatment of Cultural Resources**:** Treatment of all cultural items, including ceremonial items and archaeological items will reflect the religious beliefs, customs, and practices of the Tribe. All cultural items, including ceremonial items and archaeological items, which may be found at a project site shall be turned over to the Tribe for appropriate treatment, unless ordered by a court or agency of competent jurisdiction. The project proponent shall waive any and all claims to ownership of Tribal ceremonial and cultural items,					

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
including archaeological items, which may be found on a project site in favor of the Tribe. If any intermediary, (for example, an Archaeologist retained by the project proponent) is necessary, said entity or individual shall not possess those items for longer than is reasonably necessary, as determined solely by the Tribe. 6. Inadvertent Discoveries**:** If additional significant sites or sites not identified as significant in a project environmental review process, but later determined to be significant, are located within a project impact area, such sites will be subjected to further archaeological and cultural significance evaluation by the project proponent, the Lead Agency, and the Tribe to determine whether additional mitigation measures are necessary to treat sites in a culturally appropriate manner consistent with CEQA requirements for mitigation of impacts to cultural resources. If there are human remains present that have been identified as Native American, all work will cease for a period of up to 30 days in accordance with Federal Law.					
3.5 Geology, Soils, and Seismicity					
MM GEO-1a: Prior to the issuance of building permits for each Phase 2 structure, the project applicant shall submit plans to the City of American Canyon for review and approval that demonstrate a minimum 50-foot setback between the West Napa Fault and each building. The approved plans shall be incorporated into the proposed project.	Submittal of documentation	Prior to the issuance of building permits for each Phase 2 structure	City of American Canyon		
MM GEO-1b: Prior to the issuance of building permits for each Phase 1 and 2 structure, the project applicant shall submit a design-level Geotechnical Investigation to the City of American Canyon for review and approval. The investigation shall be prepared by a qualified engineer and identify grading and building practices necessary to achieve compliance with the latest adopted edition of the California Building Standards	Submittal of documentation	Prior to the issuance of building permits for each Phase 1 and 2 structure	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
Code (CBC) geologic, soils, and seismic requirements, including abatement of expansive soil conditions. The report shall also determine the final design parameters for walls, foundations, foundation slabs, and surrounding related improvements (e.g., utilities roadways, parking lots, and sidewalks). The measures identified in the approved report shall be incorporated into the project plans and all applicable construction-related permits.					
MM GEO-5: If potential fossils are discovered during project implementation, all earthwork or other types of ground disturbance within 100 feet of the find shall stop immediately until a qualified professional Paleontologist can assess the nature and importance of the find. Based on the scientific value or uniqueness of the find, the Paleontologist shall either record the find and recommend that the City of American Canyon allow work to continue or recommend salvage and recovery of the fossil. The Paleontologist shall, if required, propose modifications to the stop-work radius based on the nature of the find, site geology, and the activities occurring on the site. If treatment and salvage is required, recommendations will be consistent with Society of Vertebrate Paleontology guidelines and currently accepted scientific practice. If required, treatment for fossil remains shall include preparation and recovery of fossil materials so that they can be housed in an appropriate museum or university collection, and, if required, shall also include preparation of a report for publication describing the finds.	Notes on construction plans; Site inspection; Submittal of documentation	During construction	City of American Canyon		
3.6 Greenhouse Gas Emissions and Energy					
MM GHG-1a: Prior to the issuance of any grading permits, the project applicant shall provide the City of American Canyon with documentation (e.g., site plans) demonstrating project construction will include the following construction Best Management Practices (BMPs):	Submittal of documentation; Notes on construction plans; Site inspection	Prior to the issuance of any grading permits	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
• At least 15 percent of the construction fleet for each project phase shall be alternatively fueled or electric. • At least 10 percent of building materials used for project construction shall be sourced from local suppliers. • At least 65 percent of construction and demolition waste materials shall be recycled or reused. • At least one contractor that has a business location in American Canyon shall be contracted for project construction. • All construction contracts shall include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers) using during construction be electrically powered. • Architectural coatings used for project construction shall be "Low-VOC," containing no greater than 50 grams of volatile organic compounds (VOC) per liter of product. • Project construction shall prohibit the use of generators and shall establish grid power connection to electrical equipment needs. • Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California Airborne Toxics Control Measure [ATCM] Title 13, Section 2485 of California Code of Regulations). Clear signage regarding idling restrictions shall be provided for construction workers at all access points. • All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation. • The prime construction contractor shall post a publicly visible sign with their telephone number and contractor to contact. The construction contractor shall take corrective					

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
action within 48 hours. The BAAQMD's phone number shall also be identified and visible to ensure compliance with applicable regulations.					
MM GHG-1b: Prior to the issuance of any building permits, the project applicant shall provide the City of American Canyon with documentation (e.g., site plans) demonstrating the proposed project is designed without the use of any natural gas -fueled appliances or natural gas plumbing.	Submittal of documentation	Prior to the issuance of any building permits	City of American Canyon		
MM GHG-1c: Prior to issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on-site plans), that the proposed buildings are designed and will be built to, at a minimum, the Tier 2 advanced energy efficiency requirements of the Nonresidential Voluntary Measures of the California Green Building Standards Code, Division A5.2, Energy Efficiency, as outlined under Section A5.203.1.2.2.	Submittal of documentation	Prior to the issuance of any building permits	City of American Canyon		
MM GHG-1d: Prior to issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on-site plans), that the proposed parking areas for passenger automobiles and trucks are designed and will be built to accommodate electric vehicle (EV) charging stations. At a minimum, the parking shall be designed to accommodate a number of EV charging stations equal to the Tier 2 Nonresidential Voluntary Measures of the California Green Building Standards Code, Section A5.106.5.3.2. Prior to the issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on-site plans), that each loading dock is outfitted with at least one 240-volt outlet to accommodate truck and Transport Refrigeration Unit (TRU)	Submittal of documentation	Prior to the issuance of any building permits	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
charging and/or electrical power connection while trucks are loading and unloading goods.					
MM GHG-1e: Prior to the issuance of any building permit for the proposed project, the project applicant shall provide the City with documentation (e.g., site plans) demonstrating to the City's satisfaction that the electricity demand will be supplied with 100 percent carbon-free electricity sources through the year 2045.	Submittal of documentation	Prior to the issuance of any building permit for the proposed project	City of American Canyon		
3.8 Hydrology and Water Quality					
MM HYD-1a: Prior to issuance of grading permits for the proposed project, the applicant shall submit to the City of American Canyon for review and approval a Storm Water Pollution Prevention Plan (SWPPP) in accordance with the requirements of the statewide Construction General Permit. The SWPPP shall be designed to address the following objectives: (1) all pollutants and their sources (e.g., runoff), including sources of sediment associated with construction, construction site erosion, and all other activities associated with construction activity, are controlled; (2) where not otherwise required to be under a Regional Water Quality Control Board (RWQCB) permit, all non-stormwater discharges are identified and either eliminated, controlled, or treated; (3) site Best Management Practices (BMPs) (e.g., silt fencing, street sweeping, routine inspection, etc.) are effective and result in the reduction or elimination of pollutants in stormwater discharges and authorized non-stormwater discharges from construction activity; and (4) stabilization BMPs are installed to reduce or eliminate pollutants after construction are completed. The SWPPP shall be prepared by a qualified SWPPP developer. The SWPPP shall include the minimum BMPs required for the identified Risk Level. BMP implementation shall be consistent with the BMP requirements in the most recent version of the California	Notes on construction plans; Site inspection; Submittal of documentation	Prior to issuance of grading permits for the proposed project	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
Stormwater Quality Association (CASQA) Stormwater Best Management Handbook–Construction or the California Department of Transportation (Caltrans) Stormwater Quality Handbook Construction Site BMPs Manual. The SWPPP shall be implemented during construction.					
MM HYD-1b: Prior to the issuance of building permits, the project applicant shall submit a Stormwater Control Plan to the City of American Canyon for review and approval. The plan shall be developed using the California Stormwater Quality Association (CASQA) "New Development and Redevelopment Handbook" and include applicable provisions of Section C.3 of the San Francisco Bay Regional Water Quality Control Board (RWQCB) Municipal Regional Permit (Order No. R2-2015-0049, NPDES Permit No. CAS612008 (or more recent permit). The Stormwater Control Plan shall identify pollution prevention measures and Best Management Practices (BMPs) to control stormwater pollution from operational activities and facilities and provide maintenance in perpetuity. The Stormwater Control Plan shall include Low Impact Development (LID) design concepts, as well as concepts that accomplish a "first flush" objective that remove contaminants from the first 2 inches of stormwater before it enters area waterways. The project applicant shall also prepare and submit an Operations and Maintenance Agreement to the City, identifying procedures to ensure stormwater quality control measures work properly during operations.	Site inspection; Submittal of documentation	Prior to the issuance of building permits	City of American Canyon		
3.9 Land Use					
MM LU-3: Prior to issuance of grading permits, the applicant shall retain a qualified Biologist to assess potential wildlife hazards to aviation. The assessment shall evaluate the characteristics of the emergent wetlands, drainages, other potential wildlife attractant features (i.e., ponded water) located within the open space area and identify management	Submittal of documentation	Prior to issuance of grading permits	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
practices (e.g., storm drainage, vegetation, etc.) to prevent the creation of attractants for large flocks or birds or other wildlife species that may present safety hazards to aviation activities. As part of the assessment, the applicant shall consult with Napa County Airport and Napa County Airport Land Use Commission (ALUC) representatives, as appropriate, regarding findings and recommendations. The applicant shall submit a report to the City of American Canyon prepared by a qualified Biologist that confirms the wildlife hazard assessment's findings and recommendations are incorporated into the design of the open space preserve.					
3.10 Noise					
MM NOI-1: Implementation of the following multi-part mitigation measure is required to reduce potential construction period noise impacts: • The construction contractor shall ensure that all equipment driven by internal combustion engines shall be equipped with mufflers that are in good condition and appropriate for the equipment. • The construction contractor shall ensure that unnecessary idling of internal combustion engines (i.e., idling in excess of 5 minutes) is prohibited. • The construction contractor shall utilize "quiet" models of air compressors and other stationary noise sources where technology exists. • At all times during project grading and construction, the construction contractor shall ensure that stationary noise-generating equipment shall be located as far as practicable from sensitive receptors and placed so that emitted noise is directed away from adjacent residences. • The construction contractor shall ensure that the construction staging areas shall be located to create the	Notes on construction plans; Site inspection	During construction	City of American Canyon		

Mitigation Measures	Method of Verification	Timing of Verification	Responsible for Verification	Verification of Completion	
				Date	Initial
greatest feasible distance between the staging area and noise-sensitive receptors nearest the project site. The construction contractor shall ensure that all on-site construction activities, including the operation of any tools or equipment used in construction, drilling, repair, alteration, grading, or demolition work, are limited to between the daytime hours of 7:00 a.m. to 7:00 p.m. Monday through Saturday. No construction shall be permitted on Sundays and federal holidays.

CEQA FINDINGS OF FACT AND STATEMENT OF OVERRIDING CONSIDERATIONS

1.1 - Introduction

The State Guidelines (Guidelines) promulgated pursuant to the California Environmental Quality Act (CEQA) provide:

> No public agency shall approve or carry out a project for which an EIR has been completed which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:
>
> (a) Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the Final EIR (hereinafter referred to as "finding (1)");
>
> (b) Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency (hereinafter referred to as "finding (2)"); or
>
> (c) Specific economic, legal, social, technological or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the Final EIR (hereinafter referred to as "finding (3)").

The required findings shall be supported by substantial evidence in the record. (Guidelines § 15091).

The Final EIR incorporates the Draft EIR. References herein to the "EIR" are to the collective documentation contained in the Draft EIR and Final EIR. All acronyms used within this document shall have the same meaning as defined in the Draft EIR.

1.2 - Statement of Findings

An Environmental Impact Report (EIR) pursuant to CEQA has been prepared by the City of American Canyon (Lead Agency). The EIR for the Giovannoni Logistics Center Project (proposed project) identifies significant effects on the environment, which may occur as a result of the proposed project.

Section 1.5. sets forth potential environmental effects of the proposed project for which it can be seen with certainty there is no potential for significant adverse environmental impacts.

Section 1.6 sets forth potential environmental effects of the proposed project which are not significant because of the proposed project's design or feasible mitigation to below a level of significance.

Section 1.7 discloses environmental impacts that remain significant and unavoidable even with incorporation of feasible mitigation.

Section 1.8 summarizes alternatives discussed in the Draft EIR and makes findings with respect to the feasibility of alternatives and whether the alternatives would lessen the significant environmental effects of the proposed project.

The following sets forth all significant effects of the proposed project and with respect to each effect, makes one or more findings set forth in Section 1.1, Introduction, and provides facts in support of such findings.

The EIR provides additional facts in support of the findings herein. The mitigation measures set forth in the Mitigation Monitoring and Reporting Program (MMRP) (Attachment A) are incorporated by reference in these findings, and the findings in Sections 1.6 and 1.7 refer to individual mitigation measures as appropriate. In the event of any inconsistencies between the mitigation measures set forth herein and the MMRP, the MMRP shall control.

1.3 - Project Summary

1.3.1 - Project Description

The applicant, Buzz Oates LLC, proposes to develop a 2.4-million-square-foot logistics center on approximately 163 acres of an approximately 208-acre project site. The remaining 44.8 acres would be preserved as open space/Wetland Preserve.

The applicant has developed design-level site plans for Phase 1 of the proposed project, which includes a 94.7-acre area east of Devlin Road. This area will support two high-cube warehouse buildings. One building would be rail-served by the adjacent Napa Branch Line. Each building would provide docks, grade level roll-up doors, and trailer parking stalls. The facility would be enclosed with a secure perimeter and access would be restricted to authorized users.

Phase 2 of the proposed project would occur on a 113.1-acre area west of Devlin Road. This area is conceptually proposed for the remaining 1.3 million square feet of high-cube warehouse. Phase 2 would commence once Phase 1 is completed. Accordingly, the EIR evaluates Phase 1 at a project level and Phase 2 at a program level of analysis.

Table 1: Giovannoni Logistics Center Project Summary

Phase	Acres	Building/Square Feet	End Use/Characteristics
1 (Project Level)	94.7	A/627,976	High-Cube Warehouse/36 feet clear height
		B/469,512	High-Cube Warehouse/36 feet clear height
		Subtotal: 1,097,488	—

Phase	Acres	Building/Square Feet	End Use/Characteristics
2 (Program Level)	113.1	1.3 million	High-Cube Warehouse
Total	**208**	**2.4 million**	—

Notes:
Total values are rounded
Source: RMW Architecture Interiors 2020.

Devlin Road Extension

As a separate City project, Devlin Road was extended approximately 3,000 linear feet from Green Island Road to Middleton Way (Napa Logistics Park), closing a gap in the City's roadway network. The extension was contemplated by the City of American Canyon General Plan Circulation Element. The extended roadway provides one lane in each direction. Driveway access to the proposed project would be taken from Devlin Road and Green Island Road.

The Napa Valley Vine Trail follows the Devlin Road extension.

Green Island Road Improvements

As a separate City project, Green Island Road would be improved. The roadway would be widened, and half width improvements would be installed along the project frontage. The new Green Island Road / Devlin Road intersection would provide turn lanes.

Open Space Preservation

The applicant would permanently preserve approximately 44.8 acres of the project site as open space. This area coincides with the northern portion of the project site where No Name Creek meanders. This would create a contiguous open space area with the adjoining 37-acre Napa Logistics Park Wetland Preserve.

Storm Drainage

The proposed project would provide 110,766 square feet (2.6 acres) of storm drainage retention on-site including bioswales and basins.

Utilities

Water

The City of American Canyon would provide potable water and recycled water service to the proposed project. Potable and recycled water infrastructure was installed within Devlin Road. Service laterals would extend from the Devlin Road water lines to project buildings.

Wastewater

The City of American Canyon would provide wastewater collection and treatment service to the proposed project. Sewer infrastructure was installed within Devlin Road. Service laterals would extend from the Devlin Road sewer line to project buildings.

Electricity and Natural Gas

Marin Clean Energy would procure, and Pacific Gas and Electric Company (PG&E) would deliver electricity to the proposed project. PG&E would procure and deliver natural gas to the proposed project. Electric and natural gas infrastructure was installed within Devlin Road. Service laterals would extend from the Devlin Road facilities to project buildings. However, the project will not utilize natural gas as a design feature.

1.3.2 - Project Objectives

The underlying purpose of the proposed project is to develop industrially-zoned, undeveloped land within the American Canyon city limits to its highest and best use.

The objectives of the proposed project are to:

1. Promote economic growth in American Canyon by attracting new industries.
2. Promote development that generates net positive tax revenues for the City by generating more in new tax revenues than are consumed by City expenditures on services provided to the development.
3. Create new employment opportunities for residents of Napa County and the surrounding region.
4. Develop compatible land uses near the Napa County Airport in the interests of avoiding interference with aviation operations.
5. Improve American Canyon's jobs-housing ratio by adding new employment opportunities.
6. Continue the orderly development of the Devlin Road corridor with a well-designed project.
7. Further the goals and policies of the City of American Canyon General Plan by developing land contemplated to support urban development to its highest and best use.
8. Preserve the most biologically sensitive portions of the project site as open space.
9. Install circulation improvements along Green Island Road and Devlin Road that provide efficient ingress and egress to the proposed project while also ensuring these facilities operate at acceptable levels.
10. Promote public safety by incorporating security measures into the project design.
11. Mitigate impacts on the environment through implementation of feasible mitigation measures.

1.3.3 - Required Approvals

Discretionary approvals and permits are required by the City of American Canyon for implementation of the proposed project. The project application would require the following discretionary approvals and actions, including:

- Use Permit

- Tentative Parcel Map
- Design Permits
- Lot Line Adjustment

Subsequent ministerial actions would be required to implement the proposed project, including issuance of grading and building permits.

1.4 - Background

The City of American Canyon released a Notice of Preparation (NOP) for public review from January 12, 2021, to February 10, 2021 (30-day review period). The NOP and copies of comments received are included as Appendix A to the Draft EIR.

The Draft EIR was initially circulated for a 45-day public review period between Friday, May 20, 2022, and 4:00 p.m. Tuesday, July 5, 2022. Subsequently, the City provided an updated Appendix A (NOP comment letters) and an updated Appendix C (additional supporting biological resource studies), and extended the public comment period by 15 days to July 20, 2022, to allow public agencies and interested parties a total of 62 days to review and submit comments on the Draft EIR. During the public review period, the Draft EIR, including the technical appendices, was available for review at the City of American Canyon offices and the American Canyon Library. In addition, the Draft EIR was posted on the City of American Canyon website at https://bit.ly/3MxXX2k during the public review period.

On February 2, 2021, a scoping meeting was held virtually through Zoom. The meeting was held at 3:00 p.m. during which individuals and organizations/agency representatives were invited to provide oral comments on the Giovannoni Logistics Center Project.

The City of American Canyon prepared a Final EIR, consisting of the comments received on significant environmental issues during the extended 62-day public review and comment period on the Draft EIR, written responses to those comments, and an errata making minor, non-substantive changes to the Draft EIR. For purposes of these Findings, the "EIR" shall consist of the Draft EIR, all appendices attached to the Draft EIR, and the Final EIR (consisting of the Introduction, Errata, and Responses to Comments).

Subsequently, public meetings were held by the Planning Commission on November 17, 2022 and by the City Council on December 6, 2022, at the American Canyon City Hall located at 4381 Broadway, Suite 201, American Canyon, CA 94503. Both meetings were held virtually and in-person, and individuals and organizations/agency representatives were invited to provide oral comments on the Final EIR.

The City of American Canyon subsequently considered all oral and written comments regarding environmental issues in the Final EIR and determined, based on all of the evidence presented, including but not limited to the EIR, written and oral testimony given at public meetings and hearings in connection therewith, and the submission of comments from the public, organizations and regulatory agencies, as well as all other relevant information in the administrative record, the

following environmental impacts associated with the proposed project are: (1) less than significant and do not require mitigation; or (2) potentially significant but will be avoided or reduced to a level of insignificance through the identified mitigation measures; or (3) significant and cannot be fully mitigated to a level of less than significant but will be substantially lessened to the extent feasible by the identified mitigation measures.

The City of American Canyon concludes that implementation of the proposed project could result in potentially significant and significant adverse environmental impacts. Accordingly, as discussed above, the City of American Canyon is required to make certain findings with respect to these impacts pursuant to CEQA Guidelines Section 15091. Accordingly, the City of American Canyon hereby makes these required findings, as set forth in this document ("Findings"). These Findings summarize the environmental determinations about the project's significant impacts before and after mitigation, and summarize the project's individual and cumulative impacts. These Findings do not attempt to describe the full analysis of each environmental impact. Instead, they provide a summary description of each significant impact and the applicable mitigation measures identified in the EIR and adopted by the City of American Canyon, and state the conclusions regarding the significance of each impact after incorporation of the identified mitigation measures. A comprehensive explanation of these environmental impact conclusions can be found in the EIR, as supplemented and explained in staff reports and materials presented by the project applicant, City of American Canyon staff and various project consultants, and other relevant materials in the administrative record.

The EIR contains substantial evidence to support all conclusions presented in these Findings.

As reflected in public comments, there is disagreement among various parties regarding particular conclusions in the EIR. Relevant case law interpreting the CEQA statute and Guidelines provides the standards for treating disagreement among experts in the context of an EIR, as follows: Where evidence and opinions conflict on an issue concerning the environment, and the Lead Agency knows of these controversies in advance, the EIR and/or related findings must acknowledge the controversies, summarize the conflicting opinions of the experts, and include sufficient information on the controversy. In making a decision on a project where there is disagreement among experts, the Lead Agency is not obligated to select the viewpoint that purports to be the most environmentally sensitive. Instead, decision-makers are vested with the discretion to weigh expert opinion and choose which they intend to rely on and are not required to resolve a dispute among experts. In their proceedings, decision-makers must consider comments received concerning the adequacy of the EIR and address any objections raised in these comments. However, decision-makers are not obligated to follow any directives, recommendations, or suggestions presented in comments on an EIR, and can certify an EIR without needing to resolve disagreements among experts.

In making its decision to certify the EIR and approve the proposed project, the City of American Canyon recognizes that a range of technical and scientific opinion exists with respect to certain environmental issues, particularly with respect to air quality impacts. As noted in the record of proceedings for the proposed project, the air quality analysis is based, in part, on technical inputs into the CalEEMod modeling that reflect the best professional judgment of the air quality specialists

at First Carbon Solutions who prepared the air quality analysis. This analysis was then reviewed by City of American Canyon planners with expertise in CEQA and environmental analysis. CalEEMod allows modelers to alter default assumptions in order to best reflect the circumstances and attributes of the particular projects being analyzed. The Lead Agency has acquired a comprehensive and well-rounded understanding of the range of this technical and scientific opinion by its review of the EIR; as well as by its review of the information provided by the experts who prepared the EIR; the Lead Agency's other consultants and its staff; along with testimony, letters, reports, and other relevant materials in the administrative record, as well as its own experience and expertise in these matters. The materials reviewed by the Lead Agency include conflicting expert opinions and conflicting statements of facts, as well as other comments on the environmental issues set forth in the EIR. This comprehensive review has enabled the Lead Agency to make its decisions after weighing and considering the various viewpoints on these important issues, and the Lead Agency has made determinations of significant effects based on substantial evidence, not public controversy or speculation. Accordingly, the Lead Agency hereby certifies that its Findings and determinations are based on all of the evidence contained in the EIR, as well as the evidence and other information in the record addressing the environmental impacts of the proposed project, and hereby elects to rely on the analysis and evidence set forth in the EIR.

The EIR is incorporated into these Findings in its entirety. Without limitation, this incorporation is intended to elaborate on the scope and nature of mitigation measures, the basis for determining the significance of impacts, the comparative analysis of alternatives, and the reasons for approving the proposed project in spite of the potential for associated significant and unavoidable adverse impacts.

1.5 - Potential Environmental Effects Which are Not Significant or Less Than Significant

The City of American Canyon has heard, been presented with, reviewed, and considered all of the information and data in the administrative record, including the Draft and Final EIR, and all oral and written evidence presented to it during all meetings and hearings. The EIR reflects the independent judgment of the City of American Canyon and is deemed adequate for purposes of making decisions on the merits of the proposed project.

Consistent with Public Resources Code Section 21002.1 and Section 15128 of the CEQA Guidelines, the EIR focused its analysis on potentially significant impacts, and limited discussion of other impacts for which it can be seen with certainty there is no potential for significant adverse environmental impacts. CEQA Guidelines Section 15091 does not require specific findings to address environmental effects that an EIR identifies as “no impact” or a “less than significant” impact and for which no mitigation is necessary. Based on its independent judgment and the entire administrative record before it, the City of American Canyon has determined that the following potential environmental effects will not be significant and no mitigation is necessary for the reasons stated below.

1.5.1 - Aesthetics, Light, and Glare

Potential Effect

Impact AES-1: The proposed project would not have a substantial adverse effect on a scenic vista (**Draft EIR Page 3.1-4–5**).

Findings: Less than significant impact (Draft EIR, Page 3.1-5). No mitigation is necessary.

Facts in Support of Findings

Neither the City of American Canyon nor the Napa County General Plan identifies the project site as a scenic vista or scenic resource. Additionally, the project site does not contain any scenic vistas or features associated with scenic vistas (e.g., ridgelines, peaks, overlooks), and none are visible from the project site.

The project site is located in a portion of the City of American Canyon that is generally not visible from park and recreational areas, community gathering facilities, or residential areas. There are no prominent long-distance views of the project site, and, as such, the proposed project would not have the potential to obstruct views from high vantage points or sensitive viewpoints of the City.

Potential Effect

Impact AES-2: The proposed project would not substantially degrade the existing visual character or quality of the site and its surroundings (**Draft EIR Page 3.1-5–6**).

Findings: Less than significant impact (Draft EIR, Page 3.1-6). No mitigation is necessary.

Facts in Support of Findings

Phase 1

The Phase 1 warehouses would be similar in appearance to the structures in the neighboring Napa Logistics Park and the Green Island Business Park. Additionally, an approximately 44.8-acre open space area containing No Name Creek and wetlands would be permanently preserved within the northern portion of the site. These are the most significant aesthetic features on the project site.

Phase 2

Though no design-level plans have been prepared at the time of this writing, it is expected that the Phase 2 buildings would be similar in appearance to the Phase 1 buildings.

The development of the proposed project would change the visual character of the project site; however, it would be compatible with surrounding uses and consistent with the City of American Canyon General Plan land use designation of “Industrial” for the project site. Therefore, the proposed project would not substantially degrade the visual quality of the project area or its surroundings.

Cumulative Impacts

The proposed project, in conjunction with other past, present, and reasonably foreseeable projects in the applicable geographic area, would not have a cumulatively significant impact related to light and glare. (**Draft EIR, Page 4-3–4**).

Findings: Less than significant cumulative impact (Draft EIR, Page 4-4). No mitigation is necessary.

Facts in Support of Findings

The geographic scope of the cumulative aesthetics, light, and glare analysis is the 0.25-mile radius surrounding the project site. This is the area within view of the project site and, therefore, the area most likely to experience cumulative changes in visual character or experience cumulative light and glare impacts.

Several of the projects listed in Table 4-1 of the Draft EIR are immediately adjacent to or within 0.25mile of the project site.

The project site and the surrounding area have long been planned to accommodate large industrial and warehouse uses and are isolated and separate from the residential areas of the City. The existing surrounding uses are large industrial uses. Although the development of the proposed project would fundamentally change the visual character of the project site, it would be compatible with surrounding industrial uses and would be consistent with the City of American Canyon General Plan land use designation for the project site. Because the proposed project would preserve approximately 44.8 acres of the project site that contain No Name Creek and associated wetlands, this area would continue to provide a visual buffer between the industrial uses and the undeveloped marsh area near the Napa River. The project site would feature attractive landscaping consisting of trees, shrubs, and groundcover. Design Permits would be required from the City to approve the specific building and site design on each lot, including building height. Furthermore, due to its location, the proposed project would not degrade any views of a scenic vista such as the Napa River or Sulphur Springs Hills. Other past projects, present projects under construction, and reasonably foreseeable projects in the surrounding area would be subject to similar landscaping and design requirements.

The past, present, and reasonably foreseeable developments near the project site have contributed to—and would continue to contribute to—ambient light and glare in the project vicinity. The proposed project would install new sources of light and glare on the project site from exterior building lighting, security lighting, and lights and glare associated with vehicles accessing the project site. Mitigation Measure (MM) AES-3 requires new exterior lighting fixtures to employ full cut-off fixtures to direct light downward and eliminate spillage. Other past, present, and reasonably foreseeable future developments in the project vicinity that involve the installation of new exterior lighting fixtures have been and would be required to implement similar standard measures to prevent light spillage.

1.5.2 - Air Quality

Potential Effect

Impact AIR-3: The proposed project would not expose sensitive receptors to substantial pollutant concentrations. (**Draft EIR Page 3.2-59–63**).

Findings: Less than significant impact (Draft EIR, Page 3.2-63). No mitigation is necessary.

Facts in Support of Findings

The proposed project could expose sensitive receptors to elevated pollutant concentrations if it causes or contributes significantly to elevated pollutant concentration levels. The closest sensitive receptors include a single-family residence located approximately 200 feet south of the project site, as well as Calvary Baptist Christian Academy (Draft EIR Page 3.2-15 –16). Localized emissions are typically evaluated in terms of air concentration rather than mass so they can be more readily correlated to potential health effects. A construction and operational Health Risk Assessment (HRA) was prepared for the proposed project (Draft EIR, Appendix B).

Construction and Operation

Construction and Operational Related Diesel Particulate Matter

The proposed project could accommodate the construction and operation of 2.4 million square feet of cold storage space and the subsequent operation of TRUs in addition to truck and passenger vehicle activities. Therefore, the HRA analyzes the cold storage project scenario as a conservative assessment.

The proposed project would develop Phase 1, which would become operational immediately following the completion of construction activities. As Phase 1 would become operational, Phase 2 of the proposed project would begin construction, resulting in an overlap of construction and operational emissions. The HRA analyzes the proposed project's Phase 1 construction diesel particulate matter (DPM) emissions for the first year, Phase 1 operational and Phase 2 construction DPM emissions for the second year, and Phase 1 and 2 operational DPM emissions for the remainder of the 30-year exposure duration, consistent with the Bay Area Air Quality Management District's (BAAQMD) Health Risk Assessment Guidelines. The HRA also analyzes the proposed project's Phase 1 construction DPM emissions for the first year; Phase 1 operational and Phase 2 construction DPM emissions for the second year; Phase 1 and 2 operational DPM emissions of school receptor exposure at the Calvary Baptist Christian Academy; and the proposed project's operational DPM emission concentrations for the remainder of the 13-year exposure duration for a K-12 school, consistent with the BAAQMD's Health Risk Assessment Guidelines. As shown in Table 3.2-14 of the Draft EIR, the proposed project would not result in significant health impacts to the maximally impacted residential or school receptors under the cold storage scenario.

Community Health Risk Assessment

A community HRA was conducted in accordance with BAAQMD recommendations. The cumulative health risk values were determined by adding the health risk values from refined modeling of the proposed project to the screening-level health risk values from each individual stationary and mobile

source within a 1,000-foot radius of the site. The HRA concluded that the main source of a cumulative community health risk within 1,000 feet of the project site are the existing sources. Health risks to nearby sensitive receptors would not exceed the BAAQMD community health risk significance thresholds. As the proposed project did not result in an exceedance of project-level BAAQMD significance thresholds, the proposed project would not result in a potentially significant impact and the proposed project's impacts would not be cumulatively considerable.

Carbon Monoxide Hotspot

The proposed project would not generate sufficient vehicle traffic during project operation to substantiate creating a CO hotspot.

Cumulative

Additionally, the proposed project's health risk impacts and $PM_{2.5}$ concentration at sensitive receptors are below BAAQMD cumulative impact thresholds and the proposed project would not result in a cumulatively considerable contribution to any potentially significant cumulative impact.

Potential Effect

Impact AIR-4: The proposed project would not result in emissions (such as those leading to odors) adversely affecting a substantial number of people. (**Draft EIR Pages 3.2-63—64**)

Findings: Less than significant impact. (Draft EIR Page 3.2-64). No mitigation is necessary.

Facts in Support of Findings

Construction

During construction activities, construction equipment exhaust and application of asphalt and architectural coatings would temporarily and intermittently generate odors. Additionally, noxious odors would be confined to the immediate vicinity of the construction equipment. It is anticipated that by the time such emissions reach any sensitive receptor sites, they would be diluted to well below any air quality or odor concern level.

Operation

The types of uses that are considered to have objectionable odors include wastewater treatments plants, compost facilities, landfills, solid waste transfer stations, fiberglass manufacturing facilities, paint/coating operations (e.g., auto body shops), dairy farms, petroleum refineries, asphalt batch plants, chemical manufacturing, and food manufacturing facilities. Specific uses of the proposed project's buildings have not been determined; however, it is not anticipated that a Wastewater Treatment Plant (WWTP) or solid waste transfer station would be accommodated. Food manufacturing plants and chemical manufacturing have odor screening distances of one mile and two miles, respectively, from the facility to sensitive receptors (Draft EIR, Table 3.2-8). Sensitive receptors surrounding the project site within these screening distances are generally to the south and consist of school and residential land uses. The future tenants propose the land use for distribution and/or sortation facilities, thus implementation of the proposed project would not create or expose a substantial number of people to objectionable odors.

The proposed project would not result in any localized construction fugitive dust impacts or any CO hotspots or project-level health risk impacts to sensitive receptors or create objectionable odors affecting a substantial number of people. Therefore, the proposed project would not contribute to any potential significant cumulative significant impact related to localized criteria pollutant impacts from fugitive dust, CO, or objectionable odors.

1.5.3 - Biological

Potential Effect

Impact BIO-5: The proposed project would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. (**Draft EIR Pages 3.3-39–40**).

Findings: Less than significant impact (Draft EIR Page 3.2-40). No mitigation is necessary.

Facts in Support of Findings

Phases 1 and 2

No trees are present on the project site and, therefore, no tree removal would occur. The proposed project would not conflict with any local policies related to protection of natural resources.

All work for the proposed project would take place consistent with biological requirements of the General Plan and Zoning Ordinance of the City of American Canyon. Studies of sensitive biological resources have been either conducted by Huffman Broadway Group (HBG) as part of the Biological Resources Report or were conducted by other consultants and independently reviewed and incorporated into the Biological Resources Report, consistent with General Plan Policy 8.2.1. The proposed project results in impacts to palustrine emergent wetlands and vernal pool wetlands and the applicant has prepared a conceptual plan to mitigate for these wetlands consistent with General Plan Policy 8.3.1.a, which requires the development plan to consider the nature of existing biological resources and all reasonable measures to avoid significant impacts, including retention of sufficient natural open space and undeveloped buffer zones; General Plan Policy 8.3.1.h, which requires in summary developments shall mitigate unavoidable adverse impacts to waters of the United States, wetlands, and riparian habitats by replacement on an in-kind basis and such replacement should occur on the original development site, whenever possible, and; General Plan Policy 8.4.3, which encourages activities that improve the biological value and integrity of the City's natural resources through vegetation restoration, control of alien plants and animals, and landscape buffering. The wetland mitigation would be accomplished through establishment of an approximately 45-acre Wetland Preserve within the project site to include preserving 7.58 acres of existing seasonal wetlands and 0.13 acres of vernal pools and establishment/creation of an additional approximately 3.56 acres of seasonal wetlands and 1.13 acres of vernal pools to compensate in-kind for permanent impacts to seasonal wetlands from the proposed project.

1.5.4 - Cultural and Tribal Cultural Resources

Potential Effect

Impact CUL-1: The proposed project would not cause a substantial adverse change in the significance of a historical resource pursuant to Guidelines §15064.5 (**Draft EIR Page 3.4-20—21**).

Findings: No impact (Draft EIR Page 3.4-21). No mitigation is necessary.

Facts in Support of Findings

Historic resources in this context refer to the built environment, mainly buildings and structures over 45 years in age that may be eligible for inclusion on the CRHR or NRHP. Records search results, conducted at the NWIC, identified one historic resource (P-28-001439) located within the project site and three historic resources (P-28-000384, P-28-002466 and NAP-HRI-001) located within the 0.5-mile records search radius. Historic resource P-28-001439 was evaluated relative to the four CRHR eligibility criteria and found to be ineligible to meet any of the criteria for historic and/or architectural significance required for listing on the NRHP, CRHR, or at the local level. No additional historic resources were encountered during the pedestrian field survey and evaluation.

1.5.5 - Greenhouse Gas Emissions

Potential Effect

Impact GHG-2: The proposed project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases (**Draft EIR Pages 3.6-62—69**).

Findings: Less than significant impact (Draft EIR Page 3.6-68). No mitigation is necessary.

Facts in Support of Findings

The following discusses project consistency with applicable plans adopted to reduce greenhouse gas (GHG) emissions, including the California Air Resources Board (ARB) 2017 Scoping Plan, MTC/Association of Bay Area Governments (ABAG) Plan Bay Area 2040, and the City of American Canyon Energy Efficiency Climate Action Plan (EECAP).

California Air Resources Board Scoping Plan

The principal State plan and policy for GHG emission reduction targets are set forth in Executive Order S-03-05, AB 32, and the subsequent SB 32. The quantitative goal of AB 32 was to reduce GHG emissions to 1990 levels by 2020. AB 32 required the ARB to develop a Scoping Plan that describes California's approach to reduce GHGs to achieve the 2020 emission target. SB 32 then accelerated the GHG emission reduction goals of AB 32. The 2017 Scoping Plan Update, the most recent update to the ARB Scoping Plan, reflects the 2030 target of a 40 percent reduction below 1990 levels as set by Executive Order B-30-15 and codified by SB 32. It applies to State agencies but is not directly applicable to cities, counties, or individual projects (i.e., the Scoping Plan does not require the City to adopt policies, programs, or regulations to reduce GHG emissions). However, new regulations adopted by the State agencies outlined in the Scoping Plan result in GHG emissions reductions at the

local level. As a result, local jurisdictions benefit from reductions in transportation emissions rates, increases in water efficiency in the building and landscape codes, and other Statewide actions that affect a local jurisdiction's emissions inventory from the top down.

Transportation Sector

Trucks

The following State strategies reduce GHG emissions from medium and heavy-duty trucks:

- ARB's Mobile Source Strategy focuses on reducing GHGs by transitioning to zero and low emission vehicles and from medium-duty and heavy-duty trucks.
- ARB's Sustainable Freight Action Plan establishes a goal to improve freight efficiency by 25 percent by 2030, deploy over 100,000 freight vehicles and equipment capable of zero-emission operation and maximize both zero and near-zero-emission freight vehicles and equipment powered by renewable energy by 2030.
- ARB's Truck and Bus Regulation requires diesel-fueled trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet PM filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent.
- ARB's Emissions Reduction Plan for Ports and Goods Movement (Goods Movement Plan) in California focuses on reducing heavy-duty truck-related emissions and the establishment of emissions standards for trucks, fleet turnover, truck retrofits, and restriction on truck idling. While the focus of the Goods Movement Plan is to reduce criteria air pollutant and air toxic emissions, the strategies to reduce these pollutants would also generally have a beneficial effect in reducing GHG emissions.

The proposed project would be subject to the above trucking and freight regulations which would contribute to controlling heavy-duty truck GHG emissions associated with the proposed project. The proposed project would not conflict with or inhibit these Statewide strategies. Any on-site trucks would be required to comply with ARB's Heavy-Duty (Tractor-Trailer) GHG Regulation, which requires SmartWay tractor trailers that include idle-reduction technologies, aerodynamic technologies, and low-rolling resistant tires that would reduce fuel consumption and associated GHG emissions. Furthermore, truck manufacturers would be required to comply with the ARB Advanced Clean Trucks (ACT) Rule, which requires manufacturers of medium- and heavy-duty trucks and vans to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. Under the ACT Rule, by 2035, zero-emission truck/chassis sales would need to be 55 percent of Class 2b to Class 3 truck sales, 75 percent of Class 4 to Class 8 straight truck sales, and 40 percent of truck tractor sales. As the proposed project would not include any feature or design which would prohibit the implementation of these vehicle emission standards, the proposed project would be consistent with these requirements.

Passenger Vehicles

Statewide strategies to reduce GHG emissions from passenger vehicles and the transportation sector in general include the Low Carbon Fuel Standard (LCFS) and changes in the Corporate Average Fuel Economy Standards (e.g., Pavley I and Pavley California Advanced Clean Cars program). Furthermore, Executive Order N-79-20 would also require that 100 percent of new passenger cars and trucks sold in California be zero-emission by 2035, which would indirectly contribute to the extent of electric vehicle (EV) utilization in the proposed project's passenger vehicle fleet beyond 2035. The proposed project would not include any feature or design which would prohibit the implementation of these vehicle emission standards and thus would be consistent with these requirements.

Energy Sector

Energy use generated by the proposed project represents the second largest source of emissions after considering mobile source GHG emissions (Draft EIR, Table 3.6-4). As required by MM GHG-1c, the proposed project would meet the Tier 2 energy efficiency requirements of the current CALGreen and Building Energy Efficiency Standards. Moreover, the proposed project would be sourcing electricity from on-site generation sources and/or utility providers in the State. As required by MM GHG-1e, any electricity consumed by the proposed project would be from carbon-free sources, such as an on-site photovoltaic system. If the proposed project secures electricity purchases from a utility provider, the proposed project would be required by MM GHG-1e to purchase 100 percent carbon-free electricity through the year 2045, at which time utility providers would be required to supply 100 percent carbon-free electricity for all in-state sales, as required by SB 100. As such, the proposed project would meet the requirements contained in the 2019 California Building Code and would be consistent with the State's current CALGreen and Building Energy Efficiency Standards and the State's renewable energy legislation, SB 100.

Other Sources

Other sources of GHG emissions include solid waste disposal, which is associated with landfilling municipal solid waste. The amount of methane emitted to the atmosphere as a fraction of the total amount of methane generated from landfills has declined as more landfills implement mitigation measures and existing systems are operated more efficiently as a result of ARB's Landfill Methane Control Measure. Therefore, the proposed project would be consistent with the State's goals for the recycling and waste sector.

Metropolitan Transportation Commission Plan Bay Area

As part of the implementing framework for Plan Bay Area 2050, local governments have identified planned development areas to focus growth. The project site is within the Napa County Airport Land Use Compatibility Plan area and is in an area with existing infrastructure. Thus, the proposed project would be consistent with the overall goals and the land use concept plan of Plan Bay Area 2050.

The closest public transit option would be the Vine bus system, operated by the Napa Valley Transportation Authority. The closest Vine stop is the American Canyon City Hall bus stop on Napa-Vallejo Connector Route 11. The stop is 1.5 miles from the project site. As such, it is not likely that many employees would travel to the project site using public transit.

City of American Canyon Energy Efficient Climate Action Plan

The EECAP identifies reduction measures and implementation responsibilities that the City used to achieve the State-recommended GHG emissions reduction target of 15 percent below 2005 emission levels by the year 2020 to fulfill the requirements of AB 32 and SB 375. The City would impose the requirements of these measures as applicable through local regulations and ordinances. As shown in Table 3.6-6 of the Draft EIR, the proposed project incorporates features that would contribute to the City's strategy to minimize GHG emissions. With these features, the proposed project would not conflict with the applicable measures and implementing actions identified by the City of American Canyon EECAP.

SB 32 2017 Scoping Plan Update

None of the 2017 Scoping Plan Update measures are applicable to the proposed project (Draft EIR, Table 3.6-6). Thus, the proposed project's implementation would not conflict with the reduction measures proposed in SB 32.

Potential Effect

Impact GHG-4: The proposed project would not conflict with State or local renewable efficiency objectives (**Draft EIR Pages 3.6-73—74**).

Findings: Less than significant impact (Draft EIR Page 3.6-74). No mitigation is necessary.

Facts in Support of Findings

The proposed project would comply with existing State energy standards and be consistent with the energy efficiency goals and measures contained in the City's General Plan Natural and Historic and Cultural Resources Element and EECAP.

The proposed project would be designed in accordance with Title 24, California's Energy Efficiency Standards for Nonresidential Buildings techniques and practices, ensuring that the proposed project would not result in the use of energy in a wasteful manner. Furthermore, the proposed project would be designed to accommodate rooftop photovoltaic electricity generation panel arrays for solar electricity generation and MM GHG-1e would require the proposed project to source its electricity from 100 percent carbon-free sources.

The City's General Plan Natural and Historic and Cultural Resources Element contains policies related to energy conservation that are relevant to the proposed project, such as Goal 8F to reduce consumption of nonrenewable energy sources and support the development and utilization of new energy sources. Compliance with Title 24 standards would help the project meet this goal, and implementation of MMs GHG-1a through GHG-1e would further serve to reduce project reliance on nonrenewable energy resources. Moreover, the proposed project would be consistent with the energy efficiency measures contained in the EECAP (Draft EIR, Table 3.6-5).

Cumulative Impacts

The proposed project, in conjunction with other past, present, and reasonably foreseeable planned and approved projects in the vicinity, would not have a cumulatively significant impact related to geology, soils, and seismicity. (**Draft EIR, Page 4-8–9**).

Findings: Less than significant impact (Draft EIR, Page 4-9). No cumulative mitigation is required.

Facts in Support of Findings

The geographic scope of the cumulative geology, soils, and seismicity analysis is the project vicinity. Adverse effects associated with geologic, soil, and seismic hazards tend to be site specific, because each project site has its own geologic and soils conditions, and each project has its own design characteristics, localized within the area near the project site most affected by project activities (generally within a 0.5-mile radius).

Past, present, and future development projects in the project vicinity have the potential to exacerbate exposure to seismic hazards. The West Napa Fault bisects the project site and, thus, the project site may be susceptible to fault rupture during a seismic event. The project's incremental contribution to cumulative impacts is less than significant and does not require additional mitigation. MM GEO-1a requires the project applicant to retain a qualified geotechnical consultant to prepare a fault investigation study and ensure project plans comply with all required setback requirements. Additionally, the project site may be subject to strong ground shaking during an earthquake; thus, MM GEO-1b requires the project applicant to retain a qualified geotechnical consultant to prepare a design-level geotechnical study and implement all California Building Standards Code applicable requirements into project plans. Other nearby past, present, and reasonably foreseeable development projects have and may exacerbate exposure to similar potential seismic hazards and would be required to comply with the relevant State and local laws designed to mitigate seismic hazards and mitigation measures imposed under CEQA.

Development activities could lead to increased erosion rates of on-site soils, which could cause unstable ground surfaces and increased sedimentation in nearby streams and drainage channels. MM HYD-1a requires implementation of standard stormwater pollution prevention measures to ensure earthwork activities do not result in substantial erosion off-site. This mitigation requires compliance with the National Pollution Discharge Elimination System (NPDES) stormwater permitting program, which requires the preparation and implementation of Stormwater Pollution Prevention Programs for construction activities that disturb more than 1 acre and the implementation of Best Management Practices (BMPs) that ensure the reduction of pollutants during stormwater discharges, as well as compliance with all applicable water quality requirements. The proposed project would be required to comply with these regulations, as have and would other nearby past, present, and reasonably foreseeable development projects.

The project site contains native soils that have shrink-swell characteristics, which may exacerbate exposure of project structures to expansive soil hazards. MM GEO-1b requires the project applicant to retain a qualified geotechnical consultant to prepare a design-level geotechnical study and

incorporate all California Building Standards Code applicable requirements into project plans. Other nearby past, present, and reasonably foreseeable development projects could be exposed to expansive soil hazards and, therefore, have been and would be required to implement similar mitigation measures based on State and local regulations and CEQA requirements.

Paleontological resources impacts tend to be localized, because the integrity of any given resource depends on what occurs in the immediate vicinity around that resource, such as disruption of soils; therefore, in addition to the project site itself, the area near the project site would be the area most affected by project activities (generally within a 0.5-mile radius). Given that the proposed project would not have a known, direct impact on any known paleontological resources, cumulative project impacts are less than significant. Construction activities associated with cumulative development projects in the project vicinity may have the potential to encounter undiscovered paleontological resources. These cumulative projects listed in Table 4-1 of the Draft EIR would be required to mitigate for impacts through compliance with applicable federal and State laws governing paleontological resources.

1.5.6 - Hazards and Hazardous Materials

Potential Effect

Impact HAZ-1: Buildout of the proposed project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials and would not create a significant hazard to the public or the environment through the foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment (**Draft EIR Pages 3.7-11—12**).

Findings: Less than significant impact (Draft EIR Page 3.7-12). No mitigation is necessary.

Facts in Support of Findings

The construction and operational activities of the proposed project would not create a significant hazard to the public or environment.

Construction

Potential hazardous materials transported, used, or disposed of during project construction would be limited to commonly used substances such as gasoline, diesel, oil, grease, mechanical fluids, paints, and cleaning solvents. Construction equipment would be serviced by trained technicians and potentially hazardous materials would be stored in secured facilities. Furthermore, the safe handling of these commonly used substances is governed by occupational health and safety laws and regulations and construction contract requirements. Therefore, the use of this equipment and these substances during construction would not present any undue risks to the public or the environment.

Operation

No large quantity hazardous materials users are contemplated as end users of the proposed project. Project end users would be expected to handle small quantities of commonly used hazardous substances, such as cleaning solvents and fuels, as part of daily operations. Given the small

quantities involved and the characteristics of use (e.g., routine maintenance and cleaning), their use would not be considered a potential risk to human health or the environment. The use of acutely hazardous materials of any quantity that have the potential to result in releases that could potentially expose substantial numbers of people or the environment to harm is not anticipated by project end uses.

Potential Effect

Impact HAZ-2: The proposed project would not be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would not create a significant hazard to the public or the environment (**Draft EIR Pages 3.7-12—13**).

Findings: Less than significant impact (Draft EIR Page 3.7-13). No mitigation is necessary.

Facts in Support of Findings

The proposed project would not be exposed to hazards or hazardous materials from past uses of the project site.

Cortese List

The project site is not listed on the Cortese List, which includes various hazardous materials databases compiled pursuant to Government Code 65962.5.

Four sites within 0.5 mile of the project site are listed on the Cortese List. All are listed as "Case Closed," signifying that the regulatory agency with jurisdiction has determined that no further action is necessary. Thus, they do not pose a risk to human health or the environment.

Agricultural Chemicals

The project site does not support cultivated agriculture. Aerial photographs and historic topographical maps indicate that the project site has not supported cultivated agricultural production. Thus, there is no basis to assume presence of agricultural chemicals, including herbicides and pesticides.

Hazardous Building Materials

The project site does not contain any structures. Aerial photographs and historic topographical maps indicate that the project site has not supported structures. Thus, there is no basis to assume presence of hazardous building materials including asbestos, lead, or PCBs.

Radon

No indoor radon tests performed by the California Department of Health Services in the project site area code, 94503, have indicated indoor radon levels above pCi/l. Moreover, the proposed project proposes slab-on-grade construction, which has a low susceptibility to radon intrusion.

Electromagnetic Fields

There are no high-voltage electrical facilities within 0.5 mile of the project site. As such, the proposed project site would not be exposed to high levels of low-frequency EMFs.

Potential Effect

Impact HAZ-3: The proposed project would not create aviation safety hazards for persons residing or working within 2 miles of the Napa County Airport. (**Draft EIR Pages 3.7-13—15).**

Findings: Less than significant impact (Errata). No mitigation is necessary.

The 208-acre project site is located 2,400 feet south of the Napa County Airport and is within Zone D of the Napa County Airport Land Use Compatibility Plan. The Napa County Airport Land Use Compatibility Plan states that most nonresidential uses are considered "normally acceptable" within Zone D. Schools, libraries, hospitals, nursing homes, large shopping malls, amphitheaters, and ponds are identified as "not normally acceptable" within Zone D. In addition, uses that are hazardous to flight are prohibited (i.e., features that attract large numbers of birds and are sources of smoke, glare, distracting lights, or electrical interference). The Airport Land Use Compatibility Plan (ALUCP) encourages clustering to maximize open land areas and requires limits on building envelopes and building heights on all development plans within 100 feet of approach zones. The proposed project's end uses are all nonresidential and are acceptable within Zone D. Finally, there are no project attributes that would produce sources of smoke, glare, distracting lights, or electrical interference. Therefore, the proposed project complies with the applicable safety requirements of Zone D. As such, the proposed project would not create aviation safety hazards for persons residing or working within 2 miles of the Napa County Airport. Impacts would be less than significant, and no mitigation is necessary.

Potential Effect

Impact HAZ-4: The proposed project would not impair emergency response or evacuation in the project vicinity (**Draft EIR Pages 3.7-14—15).**

Findings: Less than significant impact (Draft EIR Page 3.7-15). No mitigation is necessary.

Facts in Support of Findings

Phase 1 would have four driveways on Green Island Road and three driveways on Devlin Road providing vehicular access to the project site. Reciprocal access would be provided between the two Phase 1 buildings. Accordingly, the proposed project would provide two points of emergency access in compliance with California Fire Code requirements. Thus, the proposed project would enhance access by emergency responders and would not impair emergency response or evacuation in the project vicinity.

Cumulative Impacts

The proposed project, in conjunction with other past, approved, and reasonably foreseeable future projects, would not have a cumulatively significant impact related to hazards and hazardous materials. (Draft EIR, Page 4-10).

Findings: Less than significant cumulative impact (Draft EIR, Page 4-10). No mitigation is necessary.

Facts in Support of Findings

For most topics the geographic scope of the cumulative hazards and hazardous materials analysis is the project area. Adverse effects of hazards and hazardous materials tend to be localized; therefore, the area near the project area would be most affected by project activities. For the transport of hazardous materials, the geographic scope includes local and regional transportation facilities.

The proposed project would not result in any significant impacts associated with hazardous materials because there is no evidence of contamination from past uses, and any use or storage of hazardous materials during construction or operations would be subject to compliance with regulatory requirements and mitigation measures. As with the proposed project, other past, present, and reasonably foreseeable projects have been and would continue to be required to comply with applicable federal, State, and local regulatory requirements regarding the transport of hazardous materials, clean up of hazardous materials, and the use and storage of hazardous materials during construction and operation. Additionally, hazardous material impacts tend to be localized to individual project sites.

The proposed project would create a wetland preserve in the northern portion of the project site. Mitigation is proposed requiring the implementation of a wildlife management plan to minimize the avian attractant potential of the Wetlands Preserve to avoid creating hazards to aviation. Other past, present, and reasonably foreseeable projects would not create a wildlife attractant hazard for the Napa County Airport, because required compliance with the Napa County ALUCP and Federal Aviation Administration (FAA) regulations would ensure that inappropriate land uses do not locate near the airport. Additionally, stormwater and landscaping features of the proposed project and other land uses would include management plans to avoid or reduce the potential for wildlife hazards.

1.5.7 - Hydrology and Water Quality

Potential Effect

Impact HYD-2: The proposed project would not deplete the groundwater supplies or interfere substantially with groundwater recharge (**Draft EIR Pages 3.8-12 –13**).

Findings: Less than significant impact (Draft EIR Page 3.8-13). No mitigation is necessary.

Facts in Support of Findings

Groundwater Overdraft

The proposed project would not rely on groundwater wells as a water supply source and would not exacerbate groundwater overdraft (to the extent that it exists) or conflict with the provisions of a sustainable groundwater management plan.

Groundwater Recharge

The proposed project would result in an increase in additional pervious surfaces. However, the groundwater recharge potential of the project site is limited due to its relatively low elevation and its

proximity to the Napa River where groundwater levels tend to be high and soils in the lowest portions of the site are often saturated.

Potential Effect

Impact HYD-3: The proposed project would not create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems (**Draft EIR Pages 3.8-13—14**).

Findings: Less than significant impact (Draft EIR Page 3.8-14). No mitigation is necessary.

Facts in Support of Findings

The proposed project would increase the amount of impervious surface coverage on the project site and would create the potential for increased runoff leaving the project site that may create potential flooding conditions in downstream waterways. However, the proposed project would install a storm drainage system designed for a 15-year storm event. Inlets would capture surface runoff and convey it to four basins which would provide 110,766 square feet (2.6 acres) of stormwater retention.

Additionally, in accordance with Section C.3 of the San Francisco Bay Regional Water Quality Control Board (RWQCB) Municipal Regional Permit (Order No. R2-2015-0049, NPDES Permit No. CAS612008 (or more recent permit) as required under MM HYD-1b, the proposed project would implement Low Impact Development (LID) stormwater management methods into the on-site storm drainage system consisting of rainwater harvesting and use, infiltration, evapotranspiration, or biotreatment.

These measures would serve to slow, reduce, and meter the volume of runoff leaving the project site and ensure that downstream storm drainage facilities are not inundated with project-related stormwater.

Cumulative Impacts

The proposed project, in conjunction with other past, present, and reasonably foreseeable planned and approved projects in the vicinity, would not have a cumulatively significant impact related to hydrology and water quality. (**Draft EIR, Page 4-11**).

Findings: Less than significant cumulative impact (Draft EIR, Page 4-11). No mitigation is necessary.

Facts in Support of Findings

The geographic scope of the cumulative hydrology and water quality analysis is the No Name Creek watershed, which generally encompasses the area within 0.5 mile of the project site. Hydrologic and water quality impacts tend to be localized to a watershed; therefore, the area within the No Name Creek watershed would be most affected by project activities.

The proposed project would involve short-term construction and long-term operational activities that would have the potential to degrade water quality in downstream water bodies. These activities are subject to regulatory requirements that would ensure no significant adverse impacts would occur. MM HYD-1a and MM HYD-1b would require implementation of various construction and

operational water quality control measures that would prevent the release of pollutants into downstream waterways. These measures include preparation of a Stormwater Pollution Prevention Plan (SWPPP) in accordance with the requirements of the statewide Construction General Permit and compliance with the Municipal Regional Permit, including implementation of BMPs and LID features.

Other past, present, and reasonably foreseeable projects that propose new development have been and would be required to implement similar mitigation measures in accordance with applicable laws and regulations. The combined implementation of construction and operation water quality control measures by other past, present, and reasonably foreseeable projects would avoid, or reduce to a less than significant level, any related cumulative impacts on downstream waterways including the Napa River.

All other project-related hydrology impacts were found to be less than significant and did not require mitigation (e.g., groundwater and drainage). Other past, present, and reasonably foreseeable projects that result in groundwater and drainage impacts have been and would be required to comply with applicable laws and regulations designed to protect groundwater resources and ensure adequate drainage facilities are provided for all projects and include facilities to prevent and reduce runoff from development sites.

1.5.8 - Land Use

Potential Effect

Impact LU-1: The proposed project would not conflict with the applicable provisions of the City of American Canyon General Plan (**Draft EIR Pages 3.9-6—48**).

Findings: Less than significant impact (Draft EIR Page 3.9-48). No mitigation is necessary.

Facts in Support of Findings

Phase 1

The applicant has developed site design-level plans for Phase 1, the 94.7-acre area east of the Devlin Road extension. This area will support two high-cube warehouse buildings totaling 1,069,904 square feet. The Phase 1 end uses would be consistent with the types of permitted uses set forth in the General Plan. Additionally, Phase 1 would have a 0.26 floor area ratio (FAR) and would be within the General Plan's allowable FAR of 0.50 for labor-intensive uses and FAR of 0.70 for low labor uses. The proposed high-cube warehouses would have 36 feet clear height and, thus, be within the 40-foot height limit.

Phase 2

Phase 2, the 113.1-acre area west of Devlin Road, is conceptually proposed for the remaining 1.3 million square feet of high-cube warehouse. The Phase 2 end uses would be consistent with the types of permitted uses set forth in the General Plan. Additionally, Phase 2 would have a 0.26 FAR and would be within the General Plan's allowable FAR of 0.50 for labor-intensive uses and FAR of 0.70 for low labor uses.

Phases 1 and 2

Table 3.9-2 of the Draft EIR evaluates Phase 1 and Phase 2 consistency with the relevant goals, objectives, and policies of the City of American Canyon General Plan. As shown in the table, City staff concludes that the proposed project is consistent with all applicable goals, objectives, and policies.

Potential Effect

Impact LU-2: The proposed project would not conflict with the applicable provisions of the American Canyon Municipal Code (**Draft EIR Pages 3.9-48—49**).

Findings: Less than significant impact (Draft EIR Page 3.9-48). No mitigation is necessary.

Facts in Support of Findings

Phase 1

The applicant has developed site design-level plans for Phase 1, the 94.7-acre area east of the Devlin Road extension. This area will support two high-cube warehouse buildings totaling 1,069,904 square feet. The Phase 1 end uses would be consistent with the types of permitted uses set forth in the Zoning Ordinance for the General Industrial zoning district. Additionally, Phase 1 would have a 0.26 FAR and would be within the Zoning Ordinance's allowable FAR of 0.50 for labor-intensive uses and FAR of 0.70 for low labor uses. The proposed high-cube warehouses would have 36 feet clear height and, thus, be within the 40-foot height limit set by the Zoning Ordinance.

Phase 2

Phase 2, the 113.1-acre area west of Devlin Road, is conceptually proposed for the remaining 1.3 million square feet of high-cube warehouse. The Phase 2 end uses would be consistent with the types of permitted uses set forth in the Zoning Ordinance for the General Industrial zoning district. Additionally, Phase 2 would have a 0.26 FAR and would be within the General Plan's allowable FAR of 0.50 for labor-intensive uses and FAR of 0.70 for low labor uses. Impacts would be less than significant.

Cumulative Impacts

The proposed project, in conjunction with past, present, and reasonably foreseeable development, would not result in a cumulatively significant land use impact. (**Draft EIR, Page 4-11 –12**).

Findings: Less than significant cumulative impact (Draft EIR, Page 4-12). No mitigation is necessary.

Facts in Support of Findings

The geographic scope of the cumulative land use analysis is the area within 1 mile of the project site. Existing development in this area is predominantly industrial uses, including the airport. Projects under construction include the Napa Logistics Park Project, which is approved for warehouse and other similar uses. Foreseeable future development in the area includes the Napa Airport Corporate Center and the Devlin Road Transfer Station Construction and Demolition Debris Facility.

The proposed project would be consistent with the American Canyon General Plan, American Canyon Zoning Ordinance, and the Napa County ALUCP because its proposed uses are allowed under these plans. Projects under consideration in the area and reasonably foreseeable future projects would be required to be consistent with the General Plan, the City's Zoning Ordinance, and the ALUCP. Additionally, the proposed project and other nearby development would be and have been required to implement wildlife management plans to ensure compatibility with airport operations.

1.5.9 - Noise

Potential Effect

Impact NOI-2: The proposed project would not result in generation of excessive groundborne vibration or groundborne noise levels (**Draft EIR Pages 3.10-22 –23**).

Findings: Less than significant impact (Draft EIR Page 3.10-23). No mitigation is necessary.

Facts in Support of Findings

In general, if groundborne vibration levels do not exceed levels considered perceptible, then groundborne noise levels would not be perceptible in most interior environments. Because the City of American Canyon does not have quantitative groundborne vibration thresholds for construction or operation, the Federal Transit Administration (FTA) vibration impact criteria are utilized to analyze vibration impacts. A significant impact would occur if existing structures at the project site or in the project vicinity would be exposed to groundborne vibration levels in excess of levels established by the FTA's Construction Vibration Impact Criteria for the listed type of structure, as shown in Table 3.10-5 of the Draft EIR.

Construction

Large vibratory rollers could be used in the site preparation phase of construction. This equipment produces groundborne vibration levels ranging up to 0.201 inch per second (in/sec) PPV at 25 feet from the operating equipment, the greatest groundborne vibration levels of heavy construction equipment that could be used.

The façade of the commercial building south of the project site on Green Island Road would be located approximately 120 feet from the nearest point on the project site where the heaviest construction equipment would potentially operate. This is the nearest off-site receptor to the project construction footprint where the heaviest construction equipment would operate. At this distance, groundborne vibration levels would range up to 0.008 PPV from operation of the types of equipment that would produce the highest vibration levels. This is well below the FTA's Construction Vibration Impact Criteria of 0.2 PPV for this type of structure.

Operation

Implementation of the proposed project would not include any permanent sources that would expose persons in the project vicinity to groundborne vibration levels that could be perceptible without instruments at any existing sensitive land use in the project vicinity.

The Napa Branch Line railroad is located approximately 130 feet east of the nearest proposed façade of the project. Based on FTA vibration screening criteria, potential groundborne vibration impacts would be less than significant for the proposed type of structure. There are no other existing significant permanent sources of groundborne vibration in the project vicinity to which the proposed project would be exposed.

Potential Effect

Impact NOI-3: The proposed project would not expose people residing or working in the project area to excessive noise levels for a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport (**Draft EIR Page 3.10-24**).

Findings: Less than significant impact (Draft EIR Page 3.10-24). No mitigation is necessary.

Facts in Support of Findings

A significant impact would occur if the proposed project would expose people residing or working in the project area to excessive noise levels for a project located in the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport. The City's Policy 11.4.1 restricts the development of uses located within the 65 CNEL contour of Napa Airport to industrial, agricultural, or other open space uses. Policy 11.4.2 requires that development in the vicinity of Napa Airport comply with the noise standards contained in the ALUP.

The project site is not located within the vicinity of a private airstrip. However, the Napa County Airport is located approximately 1 mile north of the project site. The project site is located outside of the 55 dBA CNEL airport noise contours (Draft EIR, Exhibit 3.10-2). Though aircraft noise is occasionally audible on the project site from aircraft flyovers, aircraft noise associated with nearby airport activity would not expose people residing or working near the project site to excessive noise levels. These noise levels are considered normally acceptable for new industrial land use development within the City as shown in Exhibit 3.10-1 of the Draft EIR.

Cumulative Impacts

The proposed project, in conjunction with past, present, and reasonably foreseeable development, would not result in a cumulatively significant noise impact. (**Draft EIR, Page 4-12**).

Findings: Less than significant cumulative impact (Draft EIR, Page 4-12). No mitigation is necessary.

Facts in Support of Findings

The geographic scope of the cumulative noise analysis is the project vicinity, including surrounding sensitive receptors. Noise impacts tend to be localized; therefore, the area near the project site (approximately 0.25 mile) would be the area most affected by project activities. Furthermore, given the properties and the distance between other past, present, and reasonably foreseeable

development projects (more than 0.5 mile away), project-related noise would not combine with other sources further away.

The proposed project's construction noise levels may cause a temporary substantial increase in noise levels at nearby receptors. Mitigation is proposed that would require implementation of construction noise attenuation measures to reduce noise levels. Other projects in the project vicinity that could be under construction at the same time as the proposed project (such as Napa Logistics Park Phase 1 and Napa Corporate Center) could combine to expose nearby sensitive receptors to excessive construction noise from trucks and equipment. However, noise is a localized phenomenon, the properties of noise are not additive, construction activities on these projects may not overlap, and all projects would be subject to the City's noise ordinance requirements and mitigation measures.

The proposed project's construction and operational vibration levels would not exceed annoyance thresholds. Because vibration is a highly localized phenomenon, there would be no possibility for vibration associated with the proposed project to combine with vibration from other projects because of their distances from the project site.

As discussed in Section 3.9, Noise, of the Draft EIR, after mitigation the proposed project's vehicular trips would not make a substantial incremental contribution to ambient noise levels under baseline-with-project and future-with-project conditions. These noise levels account for existing vehicle trips as well as vehicle trips from future projects. Furthermore, the proposed project's contribution to vehicular noise levels would not exceed the applicable thresholds of significance, which take into account existing noise levels as well as noise from trips associated with other planned or approved projects. Finally, because most of the other projects included within the scope of the transportation analysis are more than 1 mile from the project site, cumulative vehicular trips would be unlikely to add to roadway noise levels in the project vicinity.

1.5.10 - Public Services

Potential Effect

Impact PS-1: The proposed project would not result in a need for new or expanded fire protection facilities that may have physical impacts on the environment (**Draft EIR Pages 3.11-4 –5**).

Findings: Less than significant impact (Draft EIR Page 3.11-5). No mitigation is necessary.

Facts in Support of Findings

The proposed project would be served with fire protection and emergency medical services provided by the American Canyon Fire Protection District. While the proposed project would increase the number of calls for service, the Fire District's existing facilities are adequate to serve the proposed project and there is no need to develop new or expanded fire protection facilities to serve the project.

The proposed project would take vehicular access from Green Island Road and the Devlin Road extension, which is currently under construction. All access points would be accessible to large

emergency vehicles such as fire engines. This would comply with California Fire Code requirements for emergency vehicle accessibility.

The project site is located 3.1 miles from Station 11, via Paoli Loop Road and Green Island Road. However, emergency responders can avoid Paoli Loop Road by making a left turn directly onto Green Island Road from State Route (SR) 29, reducing the travel distance to 2.2 miles. Assuming a travel speed of 35 miles per hour, response time from Station 11 to the project site would be 3 minutes and 46 seconds. This would be within the Fire District's 5-minute response time objective. However, congestion on SR-29 may increase travel time such that it exceeds the 5-minute response time objective.

The proposed project would be required to pay a "Fire Mitigation Fee," a one-time assessment to all new development, and a "Fire Service Fee," an annual assessment for each parcel. Additionally, the applicant and Fire District have agreed to a Memorandum of Understanding (MOU) for the applicant to fund Fire District operational shortfalls in perpetuity through the creation of a Community Facilities District (CFD).

Potential Effect

Impact PS-2: The proposed project would not result in a need for new or expanded police protection facilities that may have physical impacts on the environment (**Draft EIR Pages 3.11-5—6**).

Findings: Less than significant impact (Draft EIR Page 3.11-5). No mitigation is necessary.

Facts in Support of Findings

The proposed project would be served with police protection provided by the American Canyon Police Department. The proposed project would be surrounded with a secure perimeter and would only be accessible to authorized users via either a mechanical gate with key card access or a manned security booth, depending on the end user. The proposed project would be expected to be staffed 24 hours a day, 7 days a week. Security measures including exterior lighting, alarm systems, and video surveillance would be employed to deter and prevent criminal activity. The Police Department will have the opportunity to review and comment on security measures during the plan check review process. For these reasons, the proposed project would be expected to generate minimal calls for service and, therefore, would not create a need for new or expanded police facilities.

Cumulative Impacts

The proposed project, in conjunction with other past, present, and reasonably foreseeable developments, would not have a cumulatively significant impact related to police protection, fire protection and emergency medical services (**Draft EIR, Page 4-13**).

Findings: Less than significant cumulative impact (Draft EIR, Page 4-13). No mitigation is necessary.

Facts in Support of Findings

Fire Protection and Emergency Medical Services

The geographic scope of the cumulative fire protection and emergency medical services analysis is the American Canyon Fire Protection District service area, which includes the American Canyon city limits.

The project site is located within 3.1 miles of the nearest fire station and is within an acceptable response time for fire protection (5 minutes or less). As such, the proposed project would not create a need for new or expanded fire protection facilities and would not result in a physical impact on the environment. Additionally, the proposed project would comply with all applicable requirements of the California Fire Code, including provision of adequate emergency access points, and it would be accessible to fire apparatus. Other past, present, and reasonably foreseeable development projects in the Fire District service area have been and would be reviewed for impacts on fire protection and emergency medical services and have been and would be required to address any potential impact with mitigation. Additionally, the Fire District plans for service needs consistent with existing demands and growth anticipated in the City planning documents.

Police Protection

The geographic scope of the cumulative police protection analysis is the service area of the American Canyon Police Department, which consists of the American Canyon city limits.

The proposed project and other past, present, and reasonably foreseeable projects in the police service area have been and would continue to be reviewed for impacts on police services and also have been and would continue to be required to address any potential impact with mitigation. Additionally, the Police Department plans for service needs consistent with existing demands and growth anticipated in the City planning documents.

1.5.11 - Transportation

Potential Effect

TRANS-1: The proposed project would not conflict with a program plan, ordinance or policy of the circulation system, including transit, roadway, bicycle and pedestrian facilities (**Draft EIR Pages 3.12-13–16**).

Findings: Less than significant impact (Draft EIR Page 3.12-16). No mitigation is necessary.

Facts in Support of Findings

Phases 1 and 2

Existing Plus Project Conditions

Upon the addition of project-related traffic to the Existing volumes, all study intersections are expected to continue operating at Level of Service (LOS) C or better (Draft EIR, Table 3.12-7).

Future Conditions

Future (2040) AM and PM peak-hour volume projections for SR-29/South Kelly Road were derived from a buildout analysis which is contained in the Napa Junction III Transportation Impact Analysis Report, Omni-Means, LTD, 2011. Under the anticipated Future volumes, the study intersections are expected to operate acceptably during the AM and PM peak hours except for SR-29/South Kelly Road, which is expected to operate at LOS F during both peak hours. Future volumes are shown in Exhibit 3.12-5 of the Draft EIR and operating conditions are summarized in Table 3.12-8 of the Draft EIR.

Because SR-29 is exempt from the City's LOS standard and Caltrans no longer applies an LOS standard, the LOS F operation is considered acceptable. While there are future plans for SR-29 to have three through lanes in each direction through American Canyon, funding has not been identified for this capacity enhancement. Thus, the two through lanes configuration was used for the analysis.

Furthermore, the future year analysis results for facilities along SR-29 (specifically, the intersection of SR-29/South Kelly Road) is deemed to be more conservative than what was presented for this intersection in the Watson Ranch Specific Plan EIR (September 2018) which indicated LOS C and D operation for the AM and PM peak-hours, respectively.

Future Plus Project Conditions

Upon the addition of project-generated traffic to the anticipated Future volumes, all unsignalized study intersections are expected to operate acceptably. SR-29/South Kelly Road would continue to operate at LOS F during both peak-hours. Future Plus Project traffic volumes are shown in Exhibit 3.12-6 of the Draft EIR and operating conditions are summarized in Table 3.12-8 of the Draft EIR.

As discussed above, there are future plans for SR-29 to have three travel lanes in each direction through American Canyon. As required by the City in its Traffic Impact Fee Program, the proposed project would pay a proportional share fee toward the cost of this planned future infrastructure improvement.

Transit

While existing stops are not located within 0.5 mile of the project site, employees could ride a bicycle along Devlin Road to the nearest transit stop at the intersection of Airport Boulevard/Devlin Road. This is consistent with the various City of American Canyon General Plan policies that promote transit accessibility.

Bicycles

Access for bicyclists is provided by Class II bike lanes on Devlin Road between Middleton Way and South Kelly Road together with shared use of minor streets. The proposed project would include bicycle lanes along the project's Devlin Road frontage and a multimodal path along the north side of Green Island Road. Planned Class I and II bicycle facilities on South Kelly Road and Green Island Road, as well as the Napa Valley Vine Trail along Devlin Road, would improve bicycle connectivity near the project site. This is consistent with the various City of American Canyon General Plan policies that promote bicycle mobility.

Pedestrian

Upon completion of the project, sidewalks will be provided along Devlin Road between Green Island Road to South Kelly Road. The proposed project also includes construction of a multimodal path along Green Island Road, which would be available for use by pedestrians. This is consistent with the various City of American Canyon General Plan policies that promote pedestrian mobility.

Potential Effect

TRANS-2: The proposed project would not conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b) (**Draft EIR Pages 3.12-16–18**).

Findings: Less than significant impact (Draft EIR Page 3.12-18). No mitigation is necessary.

Facts in Support of Findings

Phases 1 and 2

The impact of a proposed project is determined by the increase in Vehicle Miles Traveled (VMT) because of the project. Because the City of American Canyon has no established thresholds of significance related to VMT and the Napa County travel demand model is not currently available for use as a source for VMT analysis, the project-related VMT impacts were quantitatively assessed based on guidance provided by the Governor's Office of Planning and Research (OPR) in the publication Transportation Impacts (SB 743) CEQA Guidelines Update and Technical Advisory, 2018.

Based on a review of established policies currently used by the OPR, Sacramento County, and the City of San José, a VMT impact would be identified at an industrial project if the project VMT per employee is higher than the regional average VMT per employee. This focus on employee trips, as opposed to truck traffic associated with the proposed land uses, reflects the focus in CEQA Guidelines Section 15064.3 on VMT associated with automobiles and light trucks.

For this study, the regional average VMT is defined as the nine county Bay Area average. As reported by the City of Vallejo in their CEQA Transportation Impact Analysis Guidelines (dated October 2020), the Nine County Bay Area Average VMT per employee is 23 miles per employee. According to Statewide Travel Demand Model estimates, the proposed project is located within a Traffic Analysis Zone (TAZ) with a projected VMT per employee of 16.24 miles. Because this per capita VMT rate is lower than the significance threshold of 23 miles, the proposed project would be considered to have a less than significant VMT impact. A more conservative methodology sometimes used by OPR for other employment-based land uses states that a project generating a VMT that is 15 percent or more below the regional average VMT is presumed to have a less than significant VMT impact. Under this methodology the project would be considered to have a less than significant VMT impact since the VMT per employee of 16.24 miles is less than the threshold of 19.55 miles. A summary of the VMT findings is provided in Table 3.12-9 of the Draft EIR.

Potential Effect

TRANS-3: The proposed project would not substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment) (**Draft EIR Pages 3.12-18 –19**).

Findings: Less than significant impact (Draft EIR Page 3.12-19). No mitigation is necessary.

Facts in Support of Findings

Phase 1

W-Trans evaluated site access and sight distance for Phase 1 of the proposed project.

Site Access

Vehicular access to Phase 1 would be provided via four driveways on Green Island Road and four driveways on Devlin Road. All driveways and internal roadways would be designed to current City standards to accommodate heavy vehicles, accommodating the access requirements for both emergency and passenger vehicles.

Sight Distance

Sight distances along Green Island Road from the project driveways were evaluated based on sight distance criteria contained in the Highway Design Manual published by Caltrans. Based on the posted speed limit of 40 miles per hour (mph), the minimum stopping sight distance required is 300 feet; a review in the field shows that sight distances at the project driveway locations on Green Island Road would be adequate, provided any vegetation or buildings are sited to ensure maintenance of adequate sight lines. The sight lines for driveways on the Devlin Road connection are expected to be adequate based on a review of the site plans.

Phase 2

Phase 2 access would be provided via Green Island Road and Devlin Road. Standard design and engineering practices would dictate that driveways would be aligned with those on the opposite side of both Green Island Road Devlin Road and spaced sufficiently from other driveways and the western Green Island Road railroad grade crossing to avoid conflicting turning movements or the creation of safety hazards.

Potential Effect

TRANS-4: The proposed project would not result in inadequate emergency access (**Draft EIR Pages 3.12-19–20**).

Findings: Less than significant impact (Draft EIR Page 3.12-20). No mitigation is necessary.

Facts in Support of Findings

Phase 1 and 2

Pursuant to the California Fire Code, a minimum of two points of access would need to be provided to each building. Compliance would ensure that adequate emergency response is provided.

Vehicular access to Phase 1 would be provided via four driveways on Green Island Road and four driveways on Devlin Road. Construction of the Devlin Road extension is expected to be completed by the time Phase 1 is completed. This would provide a parallel north–south route to SR-29, providing an alternative route for emergency response. Vehicular access to Phase 2 would be provided by driveways on Green Island Road and Devlin Road.

Cumulative Impacts

The proposed project, in conjunction with other past, present, and reasonably foreseeable developments, would not have a cumulatively significant impact related to transportation (**Draft EIR, Page 4-13–14**).

Findings: Less than significant cumulative impact (Draft EIR, Page 4-14). No mitigation is necessary.

Facts in Support of Findings

The geographic scope of the cumulative transportation analysis is the nine county San Francisco Bay Area region. VMT is evaluated and regulated at a regional level and, thus, the San Francisco Bay Area region is an appropriate geographical area.

Impact TRANS-1 concluded that the proposed project would not have a significant impact on the circulation system and, therefore, no mitigation would be necessary. As such, the proposed project would not have a cumulatively considerable contribution in this regard. Impact TRANS-2 concluded that the proposed project would not have a significant impact on VMT because the proposed project would have a VMT rate of 16.24, well below the regional average of 23.00. As such, the proposed project would not have a cumulatively considerable contribution to VMT.

With respect to Impact TRANS-3, the potential hazards from design features or incompatible uses are project site specific (e.g., site access, sight distance, etc.) and would not combine with other projects. The proposed project and other past, present, and reasonably foreseeable future projects have complied and must comply with local, standard requirements for transportation-related design features specifically adopted to avoid and reduce hazards from project design or the location of incompatible uses, thereby reducing the potential for significant cumulative impacts to less than significant levels.

With respect to Impact TRANS-4, the provision of adequate emergency access is site specific and would not combine with other projects. The proposed project and other past, present, and reasonably foreseeable future projects must comply with local, standard requirements for adequate emergency access specifically adopted to avoid or reduce the potential for inadequate access. Furthermore, the proposed project and other projects would not have significant impacts on the performance of the study intersections and, therefore, it can be inferred that it would also not impair emergency response to the project vicinity.

1.5.12 - Utilities and Service Systems

Potential Effect

Impact USS-1: The proposed project would not require the City of American Canyon to obtain additional water supplies in order to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years (**Draft EIR Pages 3.13-16—31**).

Findings: Less than significant impact (Draft EIR Page 3.13-31). No mitigation is necessary.

Facts in Support of Findings

The analysis in the water supply assessment (WSA) shows that the City's water supply is sufficient to meet projected demand, in all years and under all normal-, dry-, and multi-dry year scenarios. The analysis shows that demand will exceed supply during some dry years, but the City will still be able to meet demand through the use of carryover State Water Project (SWP) water or through some combination of carryover SWP water, Advanced Table A Water, demand reductions, and/or additional purchases on the open market. In addition, recycled water supply in the City is available to meet existing and projected demand and available in sufficient volume to support non-potable uses at the project site. Use of recycled water at the site will increase the City's utilization of this supply.

Phases 1 and 2

Potable water demand for the project was estimated by CBG Engineers based on demand factors contained in the 2016 City of American Canyon Potable Water Master plan (Draft EIR, Table 3.13-3). The average day demand of 0.015 gallons per day/square-foot used to calculate the estimates are believed to be an overly high estimate of water use for this project. To provide a more realistic estimate of potable water demand for the proposed Giovannoni Logistics Center Project, the WSA prepared for the proposed project (Draft EIR, Appendix I) averaged the demand rates of the Napa Airport Corporate Center (NACC) (0.006 gpd/square-foot), the CBG Engineers estimate (0.015 gpd/square-foot), and the Suisun Logistics Center (0.01 gpd/square-foot) (Draft EIR, Appendix B), resulting in an average day demand of 0.009 gpd/square-foot. The WSA estimates the total potable water demand of the proposed project at buildout to be 23.9 AFY (15.9 AFY less than the usage originally estimated by CBG Engineers) (Draft EIR, Table 3.13-3).

For the purposes of the WSA, all indoor water demand is assumed to be from potable water. In the future, recycled water could be used for non-potable indoor uses, further reducing potable water demand. Table 3.13-3 of the Draft EIR shows the estimated potable water demand for each building of the proposed project.

Recycled Water

The proposed project would use recycled water for all irrigation needs and for toilet flushing. Estimated recycled water use within the project is summarized in Table 3.13-3 of the Draft EIR. The current project plans do not have estimates for the area of irrigated landscaping; thus demand was approximated by applying the average ratio of 0.604 between irrigated area and building footprint from the neighboring NACC project, with a demand factor of 2.5 acre-feet/acre (from Table 3.13 in the 2010 Urban Water Management Plan (UWMP)). The irrigation demand of the proposed project may be lower if landscaping with lower-than-typical irrigation needs is used. Actual use per building may vary based on final site plans, but total use is expected to be consistent with (or less than) these assumptions (Draft EIR, Table 3.13-3).

Project Demand Comparison to Urban Water Management Plan

Potable Water Demand

The proposed project is expected to use 133.3 AFY less water than expected under the 2015 UWMP growth scenario. Implementation of the City's Zero Water Footprint Policy would result in an

additional 23.9-acre-foot reduction in potable water demand relative to the UWMP systemwide demand analysis (Draft EIR, Table 3.13-4).

Recycled Water

The American Canyon UWMP assumes irrigation use to be 2.5 acre-feet of water per acre of landscaping but did not project recycled water demand associated with particular parcels anticipated for development. Because recycled water use offsets demand for potable (or raw imported) water and it is in the City's best interest to maximize use of recycled water, the project's recycled water demand is assessed relative to the recycled water demand goals outlined in the UWMP.

The 2016 Recycled Water Master Plan showed a delivery of 248 acre-feet for an existing 21 users between August 2013 and July 2014. In 2019, 282 acre-feet of recycled water was delivered to customers which is still below the projected 391 acre-feet of recycled water in 2020. The proposed project would add an estimated 82.1 AFY of recycled water demand.

Systemwide Demand

Recent Actual System Demand

Table 3.13-5 of the Draft EIR shows the actual water usage within the City's distribution area since the 2015 UWMP was completed, as well as the interpolated yearly demand based on the projections in the UWMP. Since 2015, potable water demand has been much lower than that anticipated in the UWMP.

Projected System Demand

The 2015 UWMP projected future demand on a parcel-by-parcel basis relative to expected growth under the City's general plan. The analysis assumed that recycled water would be available to meet a portion of the total demand, with the remainder supplied by potable water. Table 3.13-6 of the Draft EIR shows the water demand as presented in the 2015 UWMP.

Unbilled Water Losses

The UWMP assumed that unbilled water losses would be 7.5 percent for each year between 2020-2040, consistent with standards adopted by the California Urban Water Conservation Council. In 2015, water delivery and water use records indicate that system losses were 22 percent. In 2015, the City replaced more than 120 segments of residential service lines as part of its program to reduce distribution system losses. The City assumed it would reduce system losses to 7.5 percent of the total potable and raw water deliveries by 2020.

Supply and Demand Comparison

The scenarios presented herein have been summarized from the 2015 UWMP analysis for citywide system planning. This analysis addresses potable and recycled water separately.

Potable Water

The City's potable water supply relies exclusively on imported water, both from the SWP and through the City of Vallejo. A percentage of the full contracted amount is assumed for each source type under each scenario. These percentages are based on guidance by California Department of Water

Resources (DWR), analysis in the City's UWMP and the Vallejo UWMP. The supply and demand for potable water under 'normal year,' 'single dry year,' and 'multiple dry year' scenarios is discussed as follows.

Normal Year

The UWMP concluded that future supply is available to meet anticipated demand in normal years through buildout in 2035, as does the analysis in the WSA (Table 8). Excess supply in normal years ranges from a low of 2,653 in 2040 to a high of 3,497 AFY in 2025 (Draft EIR, Table 3.13-9).

Single Dry Year

The 2015 UWMP shows that single dry year supply is not significantly currently constrained and the City will be able to reliably meet potable demand until the year 2030. Single dry year deficiencies are anticipated starting in 2035 (Draft EIR, Table 3.13-9). The City has several options available to resolve dry year supply deficiencies.

Multiple Dry Years

The multiple dry year scenario, as described in the UWMP, consists of three consecutive years of reduced water deliveries, though none are reduced to the same degree as the single dry year scenario. The 2015 UWMP projects that water supply will exceed demand during a 3-year drought through the full 2040 planning period (Draft EIR, Table 3.13-9).

Potable Water Deficiency Resolution

This section describes a series of options available to the City to eliminate supply shortages in several of the "dry year" and "multiple dry year" planning scenarios in order to provide reliable supply. Estimated SWP carryover water would be sufficient to eliminate dry year supply shortfalls and could also be used in combination with drought demand reductions to further improve supply reliability.

State Water Project Carryover Water

If the City does not use its entire allotment of Table A water in a given year, the remaining water will carry over to the following year, assuming there is adequate storage in SWP reservoirs to contain the excess supply. Between 2015 and 2020, the City has stored between 35 and 2,600 acre-feet of carryover water in a given year (Draft EIR, Table 3.13-10), which has helped to meet demand during recent dry years. This is not considered a consistent yearly supply for planning purposes, but it does allow the City extra flexibility during droughts. As such, the carryover water has been incorporated into the analysis in the WSA.

It is assumed that 1,156 acre-feet of carryover water would be available at the beginning of a dry year and the first year of a multi-year drought. Projected excess normal year supply ranges from 2,653 to 3,497 acre-feet for 2020-2040, suggesting that 1,156 acre-feet is a reasonable and somewhat conservative estimate for planning purposes. In the second and third year of a multi-year drought, the remaining carryover supply (presuming there is any) would continue to carry over to subsequent years to supplement supplies.

Under the above assumptions, the City would be able to meet projected supply deficiencies under all dry and multiple dry year scenarios within the planning period (2015-2040) through the use of available carryover water.

Advanced Table A Program

The Advanced Table A Program allows the Napa County Flood Control and Water Conservation District, the Solano County Water Agency, and Yuba City (along with subcontractors to those agencies, which includes American Canyon) to borrow against future SWP deliveries during times when annual deliveries are not sufficient to meet demand. Should all Table A and Table A carryover water be used, the City could request an advance of up to 949 acre-feet from future years' Table A allotments. The projections in Table 3.13-11 of the Draft EIR do not rely on the use of the Advanced Table A Program water to meet dry year demand, as estimated Table A carryover is enough to cover supply deficiencies for all scenarios. However, this program provides an important tool available to the City should unforeseen circumstances result in significantly lower-than-expected carryover.

Drought Year Demand Reductions

The demand projections in the 2015 UWMP and the analysis in the WSA were not explicitly adjusted for voluntary or mandatory water use reduction measures that may be implemented in response to drought conditions. The City has a Water Shortage Contingency Plan that outlines water demand reduction measures that could be utilized when water supply is constrained.

On June 1, 2021, the City declared a Stage 1 drought emergency that called for a voluntary reduction from residential and commercial customers. On July 20, 2021, the City declared a Stage 2 drought emergency requiring all water customers to reduce their water use by 20 percent. As of the end of August 2021, water conservation measures have resulted in an 18 percent decrease from residential customers and 13 percent decrease from commercial customers.

Because estimated carryover water was sufficient to satisfy projected shortages, the supply and demand analysis in Table 3.13-11 does not account for drought year demand reduction. However, the City may choose to use these measures to provide additional flexibility during droughts. Assuming drought reductions of 13 percent, similar to what was achieved in 2014, the City could be expected to reduce demand in future years ranging between 305 acre-feet in 2015 and 537 acre-feet in 2040 (Draft EIR, Table 3.13-12). These measures could be used in conjunction with the above measures to provide an additional buffer, as needed, if other supplies are unexpectedly curtailed.

Open Market Purchases

The City has the option to purchase additional water from a variety of other sources on an as-needed and as-available basis. These potential purchases were not considered as a reliable long-term supply for the purposes of the WSA. Open Market Purchases can provide additional operational flexibility for the City during dry periods when other supplies are reduced.

Recycled Water

The City's recycled water system has a supply capacity of up to 1,271 AFY by 2035, and NapaSan has agreed to provide up to 591 acre-feet to supply the northern portion of the Airport Industrial Area (which is located within the City's water service area). Practically, however, the City produces

recycled water to meet demand, as shown in Table 3.13-8. Recycled water is assumed to be 100 percent available during single- and multi-year-drought scenarios. Table 3.13-9 of the Draft EIR presents recycled water supply versus demand for the 2015-2040 planning period under various year-type scenarios.

The UWMP projected 1,862 acre-feet of recycled water use by 2035. Recent recycled water use has been much lower than projected in the UWMP. The City expects a significant expansion in the recycled water delivery system by 2035, allowing full use of the system by that time. Recycled water demand by sector is shown in Table 3.13-13 of the Draft EIR.

Potential Effect

Impact USS-2: The proposed project would not create a need for new or expanded wastewater collection or treatment facilities (**Draft EIR Pages 3.13-31—32**).

Findings: Less than significant impact (Draft EIR Page 3.13-32). No mitigation is necessary.

Facts in Support of Findings

Phases 1 and 2

The proposed project would be served by City of American Canyon for wastewater collection and treatment. The proposed project would connect to both an existing 12-inch diameter sewer line within Green Island Road and a future sewer line within the Devlin Road extension. Both lines convey effluent to the Green Island Road Sanitary Pump Station and ultimately the City's Water Reclamation Facility. The proposed project would generate 402,500 gallons of effluent per day (0.41 mgd) at buildout. Phase 1 of the proposed project would generate 276,800 gallons per day (0.28 mgd) and Phase 2 would generate 125,700 gallons (0.13 mgd) (Draft EIR, Table 3.13-14).

The Water Reclamation Facility has an existing design capacity of 2.5 mgd, with a phased improvement plan outlined to increase the plant capacity over time to 4 mgd. The proposed project's wastewater generation of 0.41 mgd would represent 16 percent of the existing treatment capacity and 10 percent of the future capacity. As such, existing and planned treatment capacity would be sufficient to serve the proposed project.

Potential Effect

Impact USS-3: The proposed project would not result in a need for new or expanded off-site storm drainage facilities (**Draft EIR Pages 3.13-32—33**).

Findings: Less than significant impact (Draft EIR Page 3.13-33). No mitigation is necessary.

Facts in Support of Findings

The proposed project would increase the amount of impervious surface coverage on the project site and would create the potential for increased runoff leaving the project site that may create potential flooding conditions in downstream waterways.

The proposed project would provide 110,766 square feet (2.6 acres) of storm drainage retention on-site. A network of underground piping ranging from 12- to 48-inches in diameter would convey runoff to bioretention and detention basins in the northern portion of the property.

In accordance with applicable provisions of Section C.3 of the San Francisco Bay RWQCB Municipal Regional Permit (Order No. R2-2015-0049, NPDES Permit No. CAS612008) (or more recent permit) as required under Mitigation Measure (MM) HYD-1b, the proposed project would implement LID stormwater management methods into the on-site storm drainage system consisting of rainwater harvesting and use, infiltration, evapotranspiration, or biotreatment.

These measures would serve to slow, reduce, and meter the volume of runoff leaving the project site and ensure that downstream storm drainage facilities are not inundated with project-related stormwater such that new or expanded facilities would be required.

Potential Effect

Impact USS-4: The proposed project's solid waste would not create a need for additional landfill capacity (**Draft EIR Pages 3.13-33—34**).

Findings: Less than significant impact (Draft EIR Page 3.13-34). No mitigation is necessary.

Facts in Support of Findings

This impact discussion assesses whether the proposed project would be served by a landfill with adequate capacity or comply with federal, State, and local statutes and regulations related to solid waste. Solid waste would be generated by construction and operational activities.

Construction Waste

Using a nonresidential construction waste generation rate published by the United States Environmental Protection Agency (EPA), development of the proposed project would generate an estimated 6,536 cubic yards of construction debris (Draft EIR, Table 3.13-15). This waste volume represents less than 0.01 percent of the 38.8 million cubic yards of remaining capacity at the Potrero Hills Landfill. Moreover, these values do not account for construction and demolition (C&D) debris recycling that would serve to divert waste from the landfill.

Operational Waste

Based on rates provided by Cal Recycle, the proposed project would generate an estimated 8,064 cubic yards of operational solid waste on an annual basis at buildout (Draft EIR, 3.13-16). This waste volume represents less than 0.01 percent of the 38.8 million cubic yards of remaining capacity at the Potrero Hills Landfill. Moreover, these values do not account for recycling and waste reduction activities that would serve to divert waste from the landfill.

Cumulative Impacts

The proposed project, in conjunction with other past, present, and reasonably foreseeable developments, would not have a cumulatively significant impact related to utilities and service systems (**Draft EIR, Page 4-14–16**).

Findings: Less than significant cumulative impact (Draft EIR, Page 4-16). No mitigation is necessary.

Facts in Support of Findings

Water

The geographic scope of the cumulative potable water analysis is the City of American Canyon Public Works Department service area, which includes the American Canyon city limits.

As previously discussed, the proposed project's demands would represent less than 1 percent of potable water supplies and 7 percent of recycled water supplies. Furthermore, the City of American Canyon's 2015 UWMP estimates that sufficient water is available to meet the needs of the service area through the year 2040, which accounts for the City of American Canyon's long-term growth assumptions. The City has adopted the Zero Water Footprint Policy that requires all new development to completely offset its potable water demand. The proposed project is required to comply with this policy, as would other projects listed in Table 4-1 of the Draft EIR that are served by the City of American Canyon's Water District.

For those projects that are located within the City's water service area and areas in the County that were included in the original water district service area, the 2015 UWMP anticipates adequate water supplies for all water year scenarios through 2040. These projects also would be required to demonstrate that they would be served with potable water service as a standard requirement of the development review process, and these projects may be required to implement water conservation measures and to meet the requirements of the Zero Water Footprint Policy. Furthermore, the proposed project does not require any off-site water facilities to be constructed and expanded and, thus, would not result in physical impacts on the environment from such activities.

Wastewater

The geographic scope of the cumulative wastewater analysis is the American Canyon Wastewater Treatment Plant service area, which encompasses the American Canyon city limits and areas within the Napa County Airport Industrial Park south of Fagan Creek.

The treatment plant has an existing design capacity of 2.5 million gallons per day (mgd) and the City has plans to increase it to 4 mgd over time. All future projects that are tributary to the American Canyon Wastewater Treatment Plant would be required to demonstrate that sewer service is available to ensure that adequate sanitation can be provided. As previously discussed, the proposed project's estimated wastewater generation would represent 10 percent of the average daily flow treated by the expanded WWTP.

The sewer flows assumed from the proposed project are significantly less than anticipated for industrial projects in previous City planning documents. This is a result of the conservation activities that reduce water use and, in turn, reduce sewer flows. The original planning documents were drafted prior to the State passing all the conservations laws (2008-2010) and before the City defined the Zero Water Footprint Policy. The City has verified that the treatment plant has enough capacity

to serve the planned development for Phases 1 and 2 of the proposed project, along with other projects that would be tributary to the WWTP.

Storm Drainage

All future development projects in the City are required to provide storm drainage facilities that collect and detain stormwater. The storm drainage facility shall include provisions for future upstream development and no development shall discharge at a rate that exceeds the capacity of any portion of the existing downstream system. Runoff from storms up to the 100-year return frequency are conveyed through storm facilities and disposed of in a manner that protects public and private improvements from flood hazards. The proposed project would install an on-site storm drainage system consisting of inlets, piping, and a series of detention basins. The peak discharge from the detention basin shall not exceed 90 percent of the undeveloped peak flow from the 24-hour, 100-year storm event. As such, the proposed project would ensure no net increase in stormwater would leave the project site during a peak storm event and would avoid cumulatively significant stormwater impacts to downstream waterways at times when capacity is most constrained. The proposed project would implement standard stormwater pollution prevention measures during construction to ensure downstream water quality impacts are minimized to the greatest extent possible. In addition, the proposed project would provide water quality measures to prevent pollution during project operations. Most past, and all present and reasonably foreseeable future development must comply with these State and local requirements that ensure no significant adverse cumulative impacts would result.

Solid Waste

The geographic scope of the cumulative solid waste analysis is the City of American Canyon. American Canyon Recology provides solid waste and recycling collection services to commercial customers in the City of American Canyon.

Many past and all present and reasonably foreseeable future development projects, which have or would generate construction and operational solid waste and, depending on the volumes and end uses, have been or would be required to implement recycling and waste reduction measures. As previously discussed, the proposed project's construction and operational solid waste generation would represent less than 1 percent of the remaining capacity at this facility. As such, landfill capacity is sufficient to serve the proposed project as well as existing and planned land uses in the City of American Canyon for the foreseeable future. Additionally, the nearby Devlin Road Transfer Station offers construction and demolition debris recycling and incentivizes such activities through pricing. Thus, it would be expected that some of the projects listed in Table 4-1 of the Draft EIR would use such debris recycling services, which would divert materials from landfills, thereby extending the operational life of Potrero Hills Landfill.

1.6 - Potential Environmental Effects Which Can Be Mitigated Below a Level of Significance

The City of American Canyon hereby finds that feasible mitigation measures have been identified in the EIR that will avoid or substantially lessen the following potentially significant environmental

impacts to a less than significant level. The potentially significant impacts, and the mitigation measures that will reduce them to a less than significant level, are as follows:

1.6.1 - Aesthetics

Potential Effect

Impact AES-3: The proposed project may create a new source of substantial light or glare which would adversely affect day or nighttime views in the area (**Draft EIR Page 3.1-6–7**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.1-7). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM AES-3 Prior to issuance of building permits for the proposed project, the project applicant shall prepare and submit a photometric plan to the City of American Canyon for review and approval which demonstrates that all exterior light fixtures would be directed downward or employ full cut-off fixtures to minimize light spillage and avoid interference with aviation operations at the Napa County Airport. The approved plan shall be incorporated into the proposed project.

Facts in Support of Findings

Phases 1 and 2

The proposed project development would result in the installation of new sources of light and glare on the project site. These new sources of light include additional street lighting along internal roadways, building-mounted light fixtures, and pole-mounted light fixtures within parking areas. Additionally, illuminated signage may be employed. Mitigation Measure (MM) AES-3 requires the project applicant to prepare and submit a photometric plan to the City of American Canyon for review and approval to demonstrate that all exterior light fixtures would be directed downward or employ full cut-off fixtures to minimize light spillage and avoid interference with aviation operations at the Napa County Airport. Downward-directed lighting and full cut-off fixtures would prevent the trespass of light and glare onto neighboring properties or conflict with aviation operations.

The City finds that MM AES-3 is feasible, is adopted, and will further reduce impacts related to light and glare. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts associated with aesthetics would be less than significant with mitigation incorporated.

1.6.2 - Biological Resources

Potential Effect

Impact BIO-1: The proposed project could have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or Unites States Fish and Wildlife Service (**Draft EIR Page 3.3-22–28**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.-26). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM BIO-1a Pre-construction surveys for Swainson's hawk shall be conducted in the project site vicinity prior to initiation of project construction activities and each year following initiation of construction if project activities are delayed or discontinued for 7 or more days prior to the second survey period (March 20 to April 5), and are scheduled to recommence construction activities during the second survey period but before August 1. These pre-construction surveys shall include investigation of all potential nesting trees within a half-mile radius around all project activities and shall be completed for at least two survey periods immediately prior to commencement of project construction. Surveys shall be conducted in accordance with the California Department of Fish and Wildlife (CDFW) "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" (CDFW 2000) to maximize the potential for locating nesting Swainson's hawk and reduce the potential for nest failures due to project activities and/or disturbances.

If no nesting Swainson's hawk are found during the second survey period starting March 20, then project construction may commence. If during the third surveys (April 5–April 20) Swainson's hawk are found to be nesting in the project vicinity and construction has commenced, it shall be assumed the Swainson's hawk commenced nesting and thus the Swainson's hawk are habituated to the ambient level of noise and disturbance emanating from the project site.

If Swainson's hawk are found to be nesting within 1,000 feet of the project site, a non-disturbance buffer shall be established to keep all construction activities a minimum of 1,000 feet from the nest site. The CDFW shall be consulted regarding the adequacy of the buffer established by the qualified Raptor Biologist. At that time the necessity for acquiring a Fish and Game Section 2081 Incidental Take Permit (ITP) authorization would be determined. An ITP authorization shall be required if there were a valid concern the project activities would result in the "take" of an adult Swainson's hawk, eggs, or nestlings.

Surveys shall be conducted by a qualified Raptor Biologist with at least 2 years of experience surveying for and detecting Swainson's hawk pursuant to "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" survey protocol. No disturbance such as construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist.

MM BIO-1b No more than 30 days prior to the first ground disturbance activity, pre-construction golden eagle nesting surveys shall be conducted in the project vicinity by a qualified Raptor Biologist. The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting golden eagles. Pre-construction surveys shall include investigation of all potential nesting trees within a survey area determined by the qualified Raptor Biologist, but no less than a 0.5-mile radius around all project activities. If active golden eagle nests are identified within any trees within the survey areas of the project site, a qualified Raptor Biologist shall establish a protection buffer at a minimum of 1,000 feet that is adequate to ensure noise or activity from the proposed project would not cause nest disturbance or young or adult bird mortality. Buffer zones may vary in size as some golden eagles are more acclimated to disturbance than others. Size of buffer zone may be increased by the qualified Raptor Biologist considering the type of construction activity that may occur and the behavioral factors and extent that golden eagle may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young golden eagles have fledged or that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist.

MM BIO-1c Prior to ground disturbance, a pre-construction nesting survey shall be conducted for northern harrier and short-eared owl by a qualified Raptor Biologist if construction is scheduled during the nesting season (February 1 through September 1). The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting northern harrier and short-eared owl. To determine whether northern harrier or short-eared owl is nesting on-site, a qualified Raptor Biologist(s) shall conduct walking transects through the project site grassland habitat searching for nests and minimum 500-foot radius from project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc., the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars or a spotting scope. An active northern harrier or short-eared owl nest must be protected by implementing a minimum 500-foot radius buffer zone around the nest marked with orange construction fencing. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated

where it intersects the project site. Size of buffer zone could be increased considering the type of construction activity that may occur, physical barriers between the construction site and active nest, and the behavioral factors and extent that northern harrier or short-eared owl may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is otherwise determined to be complete based on monitoring of the active nest by a qualified Raptor Biologist.

MM BIO-1d Prior to any ground disturbance, pre-construction surveys for burrowing owl shall be conducted within a minimum of 150 meters of the project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc.), the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars or a spotting scope. The pre-construction surveys shall be conducted within 2 weeks prior to the onset of any ground-disturbing activities. Surveys shall be conducted by a qualified Biologist following California Department of Fish and Wildlife (CDFW) 2012 staff report survey methods and Biologist qualifications to establish the status of burrowing owl on the project site.

- If burrowing owl are found to occupy the project site during the nonbreeding season (September 1 to January 31), occupied burrows shall be avoided by establishing a no-disturbance buffer zone a minimum of 100 feet around the burrow. Buffers may be adjusted to address site-specific conditions using the impact assessment approach described in the CDFW 2012 staff report. If a qualified Raptor Biologist determines the location of an occupied burrow/s may be impacted even with a 100-foot buffer, or the burrow(s) are in a location(s) on the project site where a buffer cannot be established without preventing the proposed project from moving forward, then a passive relocation effort may be instituted to relocate the individual(s) out of harm's way pursuant to a Burrowing Owl Exclusion Plan prepared in accordance with the CDFW 2012 staff report.
- If burrowing owl are found to be present during the breeding season (February 1 to August 31), the proposed project ground-disturbing activities shall follow the CDFW 2012 staff report recommended avoidance protocol whereby occupied burrows shall be avoided with a no-disturbance buffer.
- If burrowing owls are ultimately found on the site and burrow eviction/ relocation of burrowing owls during the non-nesting season is a selected strategy to move forward with the project without direct impacts to burrowing owl individuals, the applicant shall coordinate this effort with CDFW and provide habitat mitigation consistent with the 2012 CDFW Staff Report on burrowing owl.

Facts in Support of Findings

Implementation MM BIO-1a, MM BIO-1b, MM BIO-1c and MM BIO-1d would avoid the "take" of Swainson's hawk and golden eagle defined by California Endangered Species Act (CESA); avoid disturbing a northern harrier or burrowing owl active nest; and avoid harming a burrowing owl during the nonbreeding season if it is occupying a burrow within the project site.

Special-status Plants

HBG retained Dr. Brent Helm of Helm Biological Consulting, a division Tansley Team, Inc., to conduct botanical surveys for the presence of special-status plant species with the potential to occur at the site. These botanical surveys utilized CDFW protocols identified in "Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities" dated March 20, 2018.

Helm Biological Consulting conducted a 10-mile radius search using the California Natural Diversity Database (CNDDB) and determined 23 special-status plant species were associated with habitats that are known to occur near the project site. Helm Biological Consulting conducted botanical surveys during the spring of 2021 and survey dates were chosen based on when the special-status plants would be in bloom or otherwise visible. Based on the Helm Biological Consulting botanical survey results, no special-status plant species occur on the project site. Therefore, no impacts to special-status species would occur from construction of the proposed project.

Special-status Animals

Monarch Butterfly

No trees are present on the project site so there is no possibility for the presence of a monarch butterfly overwintering site at the project site. Studies of the site or portions of the site have not indicated the presence of milkweed plants of the genus Asclepias that serve as the larval host plant for monarchs. Therefore, no potentially significant impacts to monarch butterflies would result from construction of the proposed project.

Vernal Pool Fairy Shrimp

LSA Inc. conducted dry season vernal pool fairy shrimp surveys in summer of 2016, and Monk & Associates, Inc. conducted wet season vernal pool fairy shrimp surveys in winter of 2016-2017. Survey methods were conducted in accordance with the USFWS revised Survey Guidelines for the Listed Large Branchiopods (May 31, 2015). No vernal pool fairy shrimp were observed during the dry or wet season surveys. Therefore, no impacts to vernal pool fairy shrimp would result from construction of the proposed project.

California Red-legged Frog

A habitat assessment prepared for the project site by Rana Resources found that the project site lacks habitat necessary to support the California red-legged frog. There is no suitable breeding or rearing habitat for California red-legged frog on-site due to the shallow and ephemeral nature of the seasonal wetlands and the lack of any suitable riparian vegetation for cover. Therefore, no impacts to California red-legged frog would result from construction of the proposed project.

Western Pond Turtle

Suitable habitat for western pond turtle does not occur on the site due to the shallow and ephemeral nature of the seasonal wetlands, which are inundated for only about 3 to 4 months out of the year and even less in drought years. Surrounding uplands of suitable shrub/woodlands and appropriate basking sites are also lacking. No impacts to western pond turtle would result from development of the proposed project.

Swainson's Hawk

The operative significance thresholds for impacts to Swainson's hawk are (i) whether the proposed project would have a substantial adverse effect on the species, either directly or through habitat modifications, or (ii) whether the project would substantially reduce the number or restrict the range of the species. Although the project will result in a net loss of foraging habitat, such a net loss occurring in the particular area in which the project site is located will not cause either a substantial adverse effect on the species, a substantial reduction in its numbers, or a substantial restriction of its range. There is no need to "net out the impact of a proposed project" for that impact to be less than significant. (See *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 529). There are no trees located on the project site, and no large trees capable of supporting nesting by Swainson's hawk in the immediate project vicinity. The non-native grasslands and seasonal wetlands and swales found on the property provide suitable foraging habitat for Swainson's hawk that may nest away from the project site. Swainson's hawk was observed foraging on the site during surveys conducted in April and May 2021. Development of the proposed project would remove some foraging area for this species. However, development of the proposed project would also provide and preserve in perpetuity approximately 44.8 acres of open space that would include habitat currently suitable for foraging by the Swainson's hawk. The adjacent Napa Logistics Park Project has preserved 37 acres of grassland and wetlands in perpetuity that provides foraging habitat for Swainson's hawk. Between these two preservation areas abutting and directly adjacent to the project site, approximately 82 acres of suitable habitat would be available for the Swainson's hawk. In addition, there are several large open space preserves within 2 and 5 miles of the project site, which combined provide approximately 2,000 acres of suitable foraging habitat. The relatively small loss of foraging habitat on the project site will not affect the range of the species or cause the loss of substantial numbers of individual hawks. As discussed previously, the proposed 45-acre Wetland Preserve with its seasonal wetlands would be available to provide foraging habitat for the Swainson's hawk in perpetuity. Additionally, less than 2 miles from the project site are 620 acres of dedicated open space (Newell Open Space) that are also preserved in perpetuity. The Newell Open Space appears to primarily comprise annual grassland with discrete areas of oak woodland and riparian woodland. Further, the Newell Open Space abuts other dedicated open space preserves, including the 1,039-acre Lynch Canyon Open Space Park and the American Canyon 308-acre California red-legged frog preserve. Combined, these open spaces dedicate over 2,000 acres of open space that can be used for foraging by the Swainson's hawk because the open space supports the small mammals, amphibians, reptiles, and birds on which Swainson's hawks prey. This demonstrates that based on the limited number of Swainson's hawk records in Napa County, there is more than sufficient foraging habitat in the area that will be preserved in perpetuity to support actively nesting hawks and that further provide foraging habitat for other raptors of concern, specifically golden eagles and western burrowing owls. Accordingly, the proposed project would not result in significant

impacts to foraging habitat either directly, indirectly, or cumulatively. The net loss of foraging habitat resulting from the proposed project will not cause either a substantial adverse effect on the species, a substantial reduction in its numbers, or a substantial restriction of its range. Construction of the proposed project would not be expected to affect the nesting population of Swainson's hawk known from Napa County. Accordingly, additional preservation over and above the 45-acre Wetland Preserve is not warranted for the proposed project. Based upon the limited number of known Swainson's hawk to occur within a 10-mile radius of the project site and the acreage of existing foraging habitat currently protected, the proposed project would not result in significant impacts to foraging habitat directly, indirectly, or cumulatively. Therefore, no mitigation is warranted for Swainson's hawk foraging habitat.

Although eucalyptus and other large trees located within about 0.25 mile from the project site provide potential nesting habitat, no nesting by Swainson's hawk (or any raptor species) was noted during surveys for nesting Swainson's hawk conducted by HBG in April and May 2021. Pre-construction nesting surveys, as described in MM BIO-1a, are warranted to ensure that the proposed project will not impact Swainson's hawk.

Golden Eagle

There are no trees located on the project site, and no large trees capable of supporting nesting by golden eagle in the immediate vicinity of the project site; however, the non-native grasslands and seasonal wetlands and swales found on the property provide suitable foraging habitat for golden eagle that may nest away from the project site. Accordingly, for the same reasons the proposed project would not result in an indirect or cumulative loss of Swainson's hawk foraging habitat, it would also not result in a significant indirect or cumulative loss of golden eagle foraging habitat.

A single golden eagle was observed exhibiting foraging behavior on the site in spring 2021. No nesting by golden eagle (or any raptor species) was noted during surveys for nesting Swainson's hawk conducted in April and May 2021.

As golden eagle has been known to nest in the general area of the City of American Canyon, future nesting in suitable nest trees as close as about 0.25 mile from the project site cannot be ruled out. Pre-construction surveys for golden eagle, as described in MM BIO-1b, are warranted to ensure that construction activities do not result in impacts to nesting individuals of this species.

Northern Harrier

Suitable nesting habitat for the northern harrier (a State Designated Species of Special Concern) occurs within the non-native grasslands and seasonal wetlands and swales found within the project site. Northern harrier individuals were observed foraging over the project site during both winter and spring (breeding) seasons during surveys conducted by Helm Biological Consulting. Pre-construction surveys for northern harrier, as described in MM BIO-1c, are warranted to ensure that construction activities do not result in impacts to nesting harriers.

Burrowing Owl

A small number of burrowing owl have been recorded in the CNDDB within the general project vicinity, with the nearest reports from as close as about 1.7 miles north of the project site and about

2.5 miles south. No burrowing owl or occupied California ground squirrel burrows were observed on the project site during a field review conducted by Helm Biological Consulting in December 2020 and April and May 2021, or during previous biological studies conducted by Monk & Associates, LSA Associates, or Rana Resources. It is possible that ground squirrel could establish colonies on the site in the future prior to project construction, providing new occupiable habitats for burrowing owl. The proposed project shall implement MM BIO-1d to ensure that no burrowing owl would be impacted by construction activities.

Tricolored Blackbird

Helm Biological Consulting has concluded that vegetative characteristics of preferred nesting habitat for tricolored blackbird does not occur at the project site. Therefore, no impacts to tricolored blackbird nesting colonies would result from implementation of the proposed project.

The City finds that MM BIO-1a, MM BIO-1b, MM BIO-1c and MM BIO-1d are feasible, are adopted, and will further reduce impacts to related species. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts associated with biology would be less than significant with mitigation incorporated.

Potential Effect

Impact BIO-2: The proposed project could have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulation or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service (**Draft EIR Page 3.3-28–29**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.3-29). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM BIO-2 To offset the loss of the 0.496 acre of seasonal wetland impacts from Phase 1, and 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools from Phase 2, and to ensure there is no-net loss of wetland area, the applicant shall establish/create 0.992 acre of palustrine emergent wetlands (2:1 ratio) for Phase 1 concurrent with project construction, and 2.57 acres of seasonal wetlands (1:1 ratio) and 1.13 acres of vernal pool wetlands (1:1 ratio) for Phase 2 at least 1 year prior to the start of Phase 2 construction, on the 45-acre Wetland Preserve. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland.

Facts in Support of Findings

The proposed project would impact a total of 3.70 acres of wetland. Implementation of MM BIO-2 would offset permanent impacts to the palustrine emergent wetlands and vernal pools and ensure there is no net loss of wetland area.

The portion of the project site along the northern boundary contained within the confines of No Name Creek would be subject to the regulatory jurisdiction of the CDFW under Fish and Game Code Section 1602. No impacts would occur and there would be no requirement to obtain a Streambed Alteration Agreement from the CDFW. As the area of No Name Creek is contained within the approximately 45-acre Wetland Preserve, no impacts to the palustrine emergent wetland swale/seasonal wetland associated with No Name Creek would occur from either Phase 1 or 2 of the proposed project.

The City finds that MM BIO-2 is feasible, is adopted, and will further reduce impacts related to wetlands. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

Potential Effect

Impact BIO-3: The proposed project could have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruptions, or other means (**Draft EIR Page 3.3-29–36**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.3-32). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM BIO-3a Prior to issuance of the Phase 1 grading permit, the project applicant shall apply for and obtain a Nationwide Permit from the San Francisco District of the United States Army Corps of Engineers (USACE) for discharge within 0.004 acre of wetlands/waters of the United States under Clean Water Act (CWA) Section 404 jurisdiction. For the USACE permit to be valid, the applicant shall apply for and obtain the accompanying Section 401 Water Quality Certification from the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB). The applicant shall apply for and obtain a separate Waiver of Waste Discharge Requirements from the San Francisco Bay RWQCB for impacts to 0.496 acre of wetlands/waters of the State. To offset the loss of 0.496 acre of permanent wetland impacts and to ensure there is no-net loss of wetland area, the applicant shall establish/create 0.992 acre of wetlands (2:1 ratio), prior to or concurrent with the start of construction, on the 45-acre Wetland Preserve. The established/created wetlands shall be monitored for a minimum of 5

years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The applicant shall implement the terms of the approved permit(s).

MM BIO-3b Prior to issuance of the Phase 2 grading permit, the project applicant shall apply for and obtain an Individual Permit from the San Francisco District of the United States Army Corps of Engineers (USACE) for the placement of fill material within approximately 3.7 acres of wetlands/waters of the United States under Clean Water Act (CWA) Section 404 jurisdiction. For the USACE permit to be valid, the applicant shall apply for and obtain the accompanying Section 401 Water Quality Certification from the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB). The applicant shall apply for and obtain a separate Waiver of Waste Discharge Requirements from the San Francisco Bay RWQCB for the discharge of fill material within approximately 3.7 acres of waters of the State. To offset the loss of 3.7 acres of permanent wetland impacts and to ensure there is no-net loss of wetland area or permanent loss of functions and values, the applicant shall establish/create 2.57 acres of seasonal wetlands (1:1 ratio) and 1.13 acres of vernal pools (1:1 ratio), at a minimum of 1 year prior to the start of construction, on the 45-acre Wetland Preserve. The established/created wetlands and vernal pools shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The applicant shall implement the terms of the approved permit(s).

MM BIO-3c Prior to issuance of the Phase 1 grading permit, a Wetland Mitigation and Monitoring Plan shall be prepared and submitted to the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB) for review as part of the process for obtaining a permit from the agency. The Wetland Mitigation and Monitoring Plan shall address the loss of 0.496 acre of wetlands impact due to Phase 1 of the proposed project as well as the potential loss of approximately 3.7 acres of wetlands that as part of Phase 2. The Wetland Mitigation and Monitoring Plan shall include in irrevocable instrument (e.g., deed restriction or conservation easements) that shall restrict use of both the 0.992 acre of created wetlands for Phase 1 as well as approximately 3.7 acres of additional wetlands created for Phase 2. The Wetland Mitigation and Monitoring Plan shall also include a long-term endowment that would be fully funded by the proposed project to manage the approximately 45-acre open space preserve and created wetlands in perpetuity. If additional wetland mitigation lands are required to compensate for wetland impacts associated with Phase 2, wetlands shall be established/created at a minimum 1:1 ratio (1 acre established/created for every acre permanently impacted) on appropriate mitigation land, approved by the RWQCB and United States Army Corps of Engineers (USACE), within the Phase 2 project site's Hydraulic Unit Code (HUC) 10 watershed. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The applicant shall implement the terms of the approved permit(s).

MM BIO-3d Prior to issuance of the Phase 1 and Phase 2 grading permit, a Wetland Mitigation and Monitoring Plan shall be submitted to the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB) for review as part of the process for obtaining a permit from the agency. The Wetland Mitigation and Monitoring Plan shall be prepared in accordance with the Subpart J–Compensatory Mitigation for Losses of Aquatic Resources outlined in the California State Water Resources Control Board (State Water Board) Procedures, and in accordance with the State Water Board Implementation Guidance dated April 2020, and in accordance with the United States Army Corps of Engineers (USACE) Compensatory Mitigation Rule (33 Code of Federal Regulations Part 332)

The basic objective of the Wetland Mitigation and Monitoring Plan is to ensure that project wetland impacts, and compensatory mitigation proposed to offset the wetland impacts, shall provide a no-net-loss of area of wetlands, and wetlands established/created shall be in-kind to the wetlands impacted. In summary, the Wetland Mitigation and Monitoring Plan shall at a minimum:

1. Preserve 7.58 acres of existing seasonal wetlands and 0.13 acre of vernal pools within the 45-acre Wetland Preserve.
2. Establish within the Wetland Preserve approximately 0.992 acre of seasonal wetlands in advance of or concurrent with implementation of Phase 1 impacts to 0.496 acre of palustrine emergent wetlands at a 2:1 ratio.
3. Establish within the Wetland Preserve approximately 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools in advance of implementation of future Phase 2, assuming Phase 2 is built out, to address the potential maximum losses of approximately 3.7 acres of wetlands that may occur.
4. Provide financial assurances to ensure a high level of confidence that the compensatory mitigation shall be successfully completed, in accordance with applicable performance standards.
5. Design ecological performance standards to assess whether the Wetland Mitigation and Monitoring Plan is achieving the overall objectives, so that it can be objectively evaluated to determine whether it is developing into the desired resource type (vernal pool, seasonal wetland e.g.), and attaining any other applicable metrics such as acres, number of native plant species, water saturation and/or ponding depth etc.
6. Monitor the site for a duration necessary to determine whether the Wetland Mitigation and Monitoring Plan is meeting the performance standards. Established palustrine emergent wetlands and vernal pools typically develop quickly on soils with clay restrictive horizon. The 45-acre Wetland Preserve does have a clay restrictive layer approximately 8–18 inches below the surface, therefore a 5-year monitoring period would be sufficient to determine whether performance standards are met. This monitoring period may be extended if performance standards are not met due to how the wetlands were constructed or natural events such as severe droughts.

7. Protect the approximately 45-acre Wetland Preserve in perpetuity using a conservation easement and provide an endowment sufficient to fund the Long-Term Management Plan.
8. An overall assessment of the condition of the wetlands that shall be permanently impacted by the proposed project shall be conducted using the California Rapid Assessment Method (CRAM) for depressional wetlands, or a hybrid approach based on CRAM. Each similar wetland type that may be impacted shall be assessed to describe the floristic community and record the native and non-native dominant plants within the vernal pool and palustrine emergent wetlands. Physical structure such as topographic complexity and physical features that may provide habitat for aquatic species (e.g., boulders, woody debris etc.) shall be recorded and used to design the created/established wetlands. The purpose of this assessment is to ensure the design of the wetlands shall provide habitat that is similar to the wetlands being impacted to ensure the impacted wetlands are mitigated in-kind.

Facts in Support of Findings

Implementation of MM BIO-3a, MM BIO-3b, MM BIO-3c, and MM BIO-3d, would offset permanent impacts in-kind to the palustrine emergent wetland and in-kind to the vernal pools and ensure there is no net loss of wetland area.

Region 1 of the USFWS developed the "Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon" dated December 15, 2005. The recovery plan includes designated "core" areas that are specific sites necessary to recover endangered or threatened species or to conserve the species of concern addressed in this recovery plan. The project site is near two core areas referred to as the "Napa River Core Area." The project site itself is not within a core area and does not support vernal pool complexes that support plants and animals targeted in the USFWS recovery plan. Furthermore, Phase 1 of the proposed project would establish a 45-acre Wetland Preserve that may provide long-term, beneficial impacts to the adjacent Napa River Core Area and recovery plan by providing protected wetland and vernal pool habitat in proximity to the Napa River Core Area. For these reasons, no adverse impacts to the Napa River Core Area would occur from construction of the proposed project. No mitigation is warranted for the Napa River Core Area.

Phase 1

Grading activities would result in the permanent placement of fill material (soil) into 0.496 acres of palustrine emergent wetlands considered waters of the State under the Porter-Cologne Water Quality Control Act. Of the 0.496 acres of waters of the State, the USACE has determined 0.004 acres are considered waters of the United States under the federal CWA. The applicant would be required to obtain a Nationwide Permit from the USACE for discharge within 0.004 acre of wetlands under CWA Section 404 jurisdiction along with an accompanying Section 401 Water Quality Certification from the San Francisco Bay RWQCB. The applicant would also need to obtain a separate Waiver of Waste Discharge from the San Francisco Bay RWQCB for impacts to 0.496 acre of waters of the State, as described in MM BIO-3a. The City of American Canyon processed a separate Nationwide Permit for impacts to 0.21 acre on the 8.3-acre project site for the Devlin Road/Vine Trail Extension project.

Exhibit 3.3-4 of the Draft EIR depicts the Wetlands Mitigation Plan, and Draft EIR Table 3.3-1 details enumeration of the wetland impacts within the proposed project development.

Phase 2

Phase 2 of the proposed project would impact approximately 2.57 acres of seasonal wetlands and 1.13 acres of vernal pool wetlands considered both waters of the State and waters of the United States (Draft EIR, Exhibit 3.3-5). Per MM BIO-3b, the applicant would be required to obtain an Individual Permit from the USACE and submit a plan to compensate for wetland losses as well as a detailed alternatives analysis under the Section 404(b)(1) guidelines. A CWA Section 401 Water Quality Certification from the San Francisco Bay RWQCB and a Waiver of Waste Discharge Requirements for San Francisco Bay RWQCB pursuant to the Porter-Cologne Water Quality Control Act would also be required.

MM BIO-3d would require a detailed Wetland Mitigation and Monitoring Plan be prepared and submitted to the San Francisco Bay RWQCB for review as part of the process for obtaining a permit from the agency.

The City finds that MM BIO-3a, MM BIO-3b, MM BIO-3c and MM BIO-3d are feasible, are adopted, and will further reduce impacts related to riparian habitat, wetlands and natural communities. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts associated with biology would be less than significant with mitigation incorporated.

Potential Effect

Impact BIO-4: The proposed project could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impeded the use of wildlife nursery sites (**Draft EIR Page 3.3-37–39**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.3-39). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM BIO-4 If construction occurs during the breeding season of migratory and resident birds (February 1 to August 31), a qualified Biologist shall conduct a pre-construction breeding bird survey in areas of suitable habitat within 15 days prior to the onset of construction activity. Surveys shall be conducted within the project footprint and 50 feet from the construction limits for nesting passerines, 250 feet from the construction limits for nesting accipiters, and 1,000 feet from the construction limits for nesting raptors. If the survey area is found to be absent of nesting birds, no further mitigation would be required. However, if construction activities are delayed

by more than 7 days, an additional nesting bird survey shall be performed. If bird nests are found, appropriate buffer zones shall be established around all active nests to protect nesting adults and their young from direct or indirect impacts related to project construction disturbance. Size of buffer zones shall be determined per recommendations of the qualified Biologist based on-site conditions and species involved. At a minimum a 1,000-foot buffer shall be established for nesting Swainson's hawk and golden eagle; 500-foot buffer for nesting tricolored blackbirds, northern harriers and other non-listed raptors; 250-foot buffer for nesting accipiters; and minimum 50-foot buffers shall be established for nesting passerines and all other non-raptor or passerine nesting birds. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated where it intersects the project site. Buffer zones shall be maintained until it can be documented that either the nest has failed, or the young have fledged.

Facts in Support of Findings

Phases 1 and 2

The development of the proposed project would not result in significant impacts to movement of any native resident or migratory fish or wildlife species, migratory wildlife corridors or use of wildlife nursery sites on the site. As discussed previously, the proposed project contains mitigation measures to address impacts to sensitive habitat, including the preparation and implementation of a detailed Compensatory Wetland Mitigation Plan. As previously discussed, the site design includes the preservation of the approximately 45-acre Wetland Preserve. Any species of fauna that may be displaced during preparation of the site for development of the proposed project should find nearby available habitats, including habitats within the Wetland Preserve and the 37-acre preserve on the adjacent property. The major wildlife corridor along No Name Creek will remain unaffected as the entirety of No Name Creek shall be incorporated into the Wetland Preserve. The proposed project would not result in substantial change in animal populations at the site, nor would it cause a fish or wildlife population to drop below self-sustaining levels.

Nesting Birds

Nesting bird species protected by the federal Migratory Bird Treaty Act (MBTA) or California Fish and Game Code could be impacted during project construction. If construction occurs during the breeding season of migratory and resident birds (February 1 to August 31), MM BIO-4 would require a qualified Biologist conduct a pre-construction breeding bird survey in areas of suitable habitat within 15 days prior to the onset of construction activity in order to reduce any potential impacts to nesting birds to less than significant levels.

Water Quality

Construction activities for Phase 1 of the proposed project will occur within 0.496 acre of wetlands near areas within the upper reaches of No Name Creek. Construction of Phase 2 may affect 3.7 acres of wetlands near No Name Creek. However, implementation of a SWPPP, with identification of proper construction techniques and BMPs, would be required and would provide assurance that water quality of nearby waterways is not affected by on-site construction activities. Indirect impacts to resident animal populations in downstream areas would not result from the proposed project due

to elevated turbidity levels from increased sedimentation or increases in other contaminants in stormwater runoff.

The City finds that MM BIO-4 is feasible, is adopted, and will further reduce impacts related to biological resources. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts associated with biology would be less than significant with mitigation incorporated.

Cumulative Impacts

The proposed project's cumulative impacts related to biological resources would be less than significant. (**Draft EIR, Page 4-5–7**).

Findings: Less than significant cumulative impact with mitigation incorporated (Draft EIR, Page 4-7). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM BIO-1a, MM BIO-1b, MM BIO-1c, MM BIO BIO-1d, MM BIO-2, MM BIO-3a, MM BIO-3b, and MM BIO-4.

Facts in Support of Findings

The geographic scope of the cumulative biological resources analysis is a 0.5-mile radius of the project site. The project site is located at the transition between urban development and the marshes associated with the Napa River; accordingly, habitats in these areas tend to be disrupted and impacts would be localized.

The proposed project has the potential to impact special-status plant species and several special-status bird species, including Swainson's hawk, golden eagle, northern harrier, and burrowing owl. With the implementation of MM BIO-1a through MM BIO-2, impacts to these species as a result of development of the proposed project would be reduced to less than significant levels. Although there would be loss of foraging habitat, the cumulative loss of this resource would not be considerable due to the abundance of habitat in the American Canyon area. These mitigation measures would be consistent with other mitigation measures implemented for other projects within the local vicinity of the proposed project including the Devlin Road project and the Green Island Road Reconstruction and Widening project. With the implementation of these mitigation measures, any potentially significant cumulative impacts of the probable future projects in Table 4-1 of the Draft EIR, together with the proposed project, would be reduced to less than significant levels.

The proposed project would impact approximately 0.496 acres of palustrine emergent wetlands. Plans for wetland mitigation, including the preservation of an approximately 44.8-acre Wetland Preserve, to include existing wetlands as well as established/created wetlands, are intended to offset

wetland impacts of buildout development of the project site. No Name Creek is contained within the approximately 44.8-acre Wetland Preserve; no impacts to the palustrine emergent wetland swale associated with No Name Creek would occur from the proposed project in the area east of Devlin Road. No impacts would occur to areas that would be subject to California Department of Fish and Wildlife (CDFW) jurisdiction under Fish and Game Code Section 1602, therefore the development of the proposed project would not result in greater cumulative impacts to sensitive natural communities or riparian habitats.

The development of Phase 1 and 2 of the proposed project would impact 0.496 acres of palustrine emergent wetlands considered waters of the State under the Porter-Cologne Water Quality Control Act as well as 0.004 acres of palustrine emergent wetlands considered waters of the United States. As described in MM BIO-3a, these impacts would require that the applicant apply for and obtain a Nationwide Permit from the USACE and a Section 401 Water Quality Certification from the San Francisco Bay RWQCB for discharge within 0.004 acres of wetlands. The applicant would also need to apply for and obtain a separate Waiver of Waste Discharge from the San Francisco Bay RWQCB for impacts to 0.496 acres of waters of the State.

The development of Phase 2 of the proposed project would impact approximately 3.7 acres of wetlands considered both waters of the United States and State. These impacts would require that the applicant submit a separate application for an Individual Permit from USACE to include a plan to compensate for wetland losses as well as a detailed alternatives analysis under the Section 404(b)(1) guidelines to include a detailed evaluation of both on-site and off-site alternatives for the proposed project. Similar to Phase 1, these impacts would also require a Clean Water Act (CWA) Section 401 Water Quality Certification and a Waiver of Waste Discharge Requirements from the San Francisco Bay RWQCB, as described in MM BIO-3b.

As described in MM BIO-2, to compensate the loss of these wetlands an approximately 44.8-acre Wetland Preserve fronting the northern boundary of the project site would preserve 7.71 acres of existing wetlands and create approximately 4.7 acres of new wetlands within the Wetland Preserve. The creation of this Wetland Preserve and new wetlands would help offset any significant cumulative impacts to jurisdictional wetlands by the proposed project or other projects listed in Table 4-1 of the Draft EIR and reduce them to less than significant levels overall.

The wildlife corridor along No Name Creek would remain unaffected by the development of the proposed project and would be entirely contained and incorporated into the Wetland Preserve. Therefore, the proposed project would not result in substantial change in animal populations at the site, nor would it cause a fish or wildlife population to drop below self-sustaining levels. Additionally, the requirement for the implementation of a SWPPP would assure that water quality of nearby waterways is not affected by on-site construction activities. This mitigation measure would be consistent with other mitigation measure implemented for other projects listed in Table 4-1, including the Devlin Road project and the Green Island Road Reconstruction and Widening project. As a result, the proposed project would not result in greater cumulative impacts to potential wildlife corridors.

The development of the proposed project does have the potential to impact nesting birds if construction includes the removal of vegetation occurs during the breeding season (February 1 to August 31). However, the implementation of MM BIO-4 would avoid direct and indirect impacts to nesting birds by requiring pre-construction nesting bird surveys and establishing buffer zones around any active nests. This mitigation measure would be consistent with other mitigation measures implemented for other projects listed in Table 4-1 of the Draft EIR, including the Devlin Road project and the Green Island Road Reconstruction and Widening project. With the implementation of MM BIO-4a, any cumulative impacts by the proposed project would be reduced to less than significant levels.

The City finds that MM BIO-1a, MM BIO-1b, MM BIO-1c, MM BIO BIO-1d, MM BIO-2, MM BIO-3a, MM BIO-3b, and MM BIO-4 are feasible, are adopted, and will further reduce cumulative impacts related to biological resources. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, direct and indirect cumulative impacts associated with biology would be less than significant with mitigation incorporated.

1.6.3 - Cultural Resources and Tribal Cultural Resources

Potential Effect

Impact CUL-2: The proposed project could cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5 (**Draft EIR Pages 3.4-21–22**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.4-22). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM CUL-2a No ground disturbance shall take place within 100 feet of informal archaeological resource 483A-001. The resource shall be preserved in place.

MM CUL-2b An Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology shall be present on-site during all earth disturbing activities. If prehistoric or historic-period archaeological resources are encountered, all construction activities within 100 feet of the find shall halt and the City of American Canyon shall be notified. Prehistoric archaeological materials may include obsidian and chert flaked stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or shellfish remains; and stone milling equipment (e.g., mortars, pestles, hand stones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic-period materials might include stone, concrete, or adobe footings and walls; filled wells or privies; and deposits of metal, glass, and/or ceramic refuse.

The Archaeologist shall inspect the findings within 24 hours of discovery. If it is determined the project could damage a historical resource or a unique archaeological resource (as defined pursuant to the CEQA Guidelines), mitigation shall be implemented in accordance with Public Resources Code Section 21083.2 and Section 15126.4 of the CEQA Guidelines, with a preference for preservation in place. Consistent with Section 15126.4(b)(3), this may be accomplished through planning construction to avoid the resource; incorporating the resource within open space; capping and covering the resource; or deeding the site into a permanent conservation easement. If avoidance is not feasible, a qualified Archaeologist shall prepare and implement a detailed treatment plan in consultation with the City of American Canyon. Treatment of unique archaeological resources shall follow the applicable requirements of Public Resources Code Section 21083.2. Treatment for most resources would consist of (but would not be limited to) sample excavation, artifact collection, and site documentation, with the aim to target the recovery of important scientific data contained in the portion(s) of the significant resource to be impacted by the proposed project. The treatment plan shall include provisions for analysis of data in a regional context, reporting of results within a timely manner, curation of artifacts and data at an approved facility, and dissemination of reports to local and State repositories, libraries, and interested professionals.

Facts in Support of Findings

Records search results from the NWIC identified one informal archaeological resource (483A-001) within the project site and three prehistoric archaeological resources (P-28-000643, P-28-001156 and P-28-002458) located within the 0.5-mile records search radius. Additionally, the Sacred Lands Files search conducted by the Native American Heritage Commission (NAHC) came back positive for TCRs within the project site. Resource 483A-001 is located within 44.8 acres of the project site that will remain undeveloped for the purposes of environmental conservation, and will not be subjected to any ground-disturbing activities. MM CUL-2a ensures that no ground disturbance shall take place within 100 feet of informal archaeological resource 483A-001. The resource shall be preserved in place.

No additional archaeological resources were encountered during the pedestrian field survey; however, poor soil visibility and the presence of several archaeological resources in the immediate vicinity increases the possibility of resources being encountered during project construction.

Implementation of MM CUL-2b requires a qualified Archaeologist to be present on-site during all earth disturbing activities, reducing potential impacts to archaeological resources that may be discovered during project construction. If a potential resource is identified, construction would be required to stop until appropriate identification and treatment measures are implemented.

The City finds that MM CUL-2a and MM CUL-2b are feasible, are adopted, and will further reduce impacts related to archaeological resources. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid

the potentially significant impacts as identified in the EIR. Therefore, impacts associated with archaeological resources would be less than significant with mitigation incorporated.

Potential Effect

Impact CUL-3: The proposed project could disturb human remains, including those interred outside of formal cemeteries (**Draft EIR Pages 3.4-23–24**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.4-23). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM CUL-3 In the event of the accidental discovery or recognition of any human remains, CEQA Guidelines Section 15064.5, Health and Safety Code Section 7050.5, and Public Resources Code Sections 5097.94 and Section 5097.98 shall be followed. If during project construction, there is accidental discovery or recognition of any human remains, the following steps shall be taken:

1. There shall be no further excavation or disturbance within 100 feet of the remains until the County Coroner is contacted to determine whether the remains are Native American and if an investigation of the cause of death is required. If the Coroner determines the remains to be Native American, the Coroner shall contact the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall identify the person or persons it believes to be the Most Likely Descendant (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work within 48 hours, for means of treating or disposing of, with appropriate dignity, the human remains, and any associated grave goods as provided in Public Resource Code Section 5097.98.
2. Where the following conditions occur, the landowner or authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the MLD or on the project site in a location not subject to further subsurface disturbance:
   - The NAHC is unable to identify an MLD or the MLD failed to make a recommendation within 48 hours after being notified by the commission.
   - The descendant identified fails to make a recommendation.
   - The landowner or authorized representative rejects the recommendation of the descendant, and mediation by the NAHC fails to provide measures acceptable to the landowner.

Additionally, California Public Resources Code Section 15064.5 requires the following relative to Native American Remains:

- When an initial study identifies the existence of, or the probable likelihood of, Native American Remains within a project, a lead agency shall work with the appropriate Native Americans as identified by the NAHC as provided in Public Resources Code Section 5097.98. The applicant may develop a plan with respect to their respective individual development proposals for treating or disposing of, with appropriate dignity, the human remains, and any items associated with Native American Burials with the appropriate Native Americans as identified by the NAHC.

Facts in Support of Findings

While no formal cemeteries or areas containing human remains are known to be in the project vicinity, the possibility always exists that construction-related ground disturbance may uncover previously undiscovered human remains. In the unlikely event such a discovery is made, CEQA Guidelines Section 15064.5, Health and Safety Code Section 7050.5, and Public Resources Code Sections 5097.94 and Section 5097.98 must be followed. Implementation of MM CUL-3, which details inadvertent discovery procedures, would reduce potential impacts to previously undiscovered human remains to a less than significant level.

The City finds that MM CUL-3 is feasible, is adopted, and will further reduce impacts related to previously undiscovered human remains. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts associated with cultural resources would be less than significant with mitigation incorporated.

Potential Effect

Impact CUL-4: The proposed project may cause a substantial adverse change in the significance of a Tribal Cultural Resource (**Draft EIR Pages 3.4-24–26**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.4-26). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM CUL-4 A Tribal Monitor representing the Yocha Dehe Wintun Nation shall be present during all project-related ground disturbance. Additionally, the Yocha Dehe Wintun Nation's Treatment Protocol (Protocol) shall be followed with respect to Tribal Cultural Resources (TCRs). The purpose of the Protocol is to formalize procedures for the treatment of Native American human remains, grave goods, ceremonial items, and items of cultural patrimony, if any are found in conjunction with development, including archaeological studies, excavation, geotechnical investigations, grading, and any ground-disturbing activity. This Protocol also formalizes procedures for

Tribal Monitoring during archaeological studies, grading, and ground-disturbing activities.

1. Cultural Affiliation: The Yocha Dehe Wintun Nation (Tribe) traditionally occupied lands in Yolo, Solano, Lake, Colusa, and Napa Counties. The Tribe has designated its Cultural Resources Committee (Committee) to act on the Tribe's behalf with respect to the provisions of this Protocol. Any human remains which are found in conjunction with projects on lands culturally affiliated with the Tribe shall be treated in accordance with Section III of this Protocol. Any other cultural resources shall be treated in accordance with Section IV of this Protocol.
2. Inadvertent Discovery of Native American Human Remains: Whenever Native American human remains are found during the course of a project, the determination of Most Likely Descendant (MLD) under California Public Resources Code Section 5097.98 will be made by the Native American Heritage Commission (NAHC) upon notification to the NAHC of the discovery of said remains at a project site. If the location of the site and the history and prehistory of the area is culturally affiliated with the Tribe, the NAHC contacts the Tribe; a Tribal member will be designated by the Tribe to consult with the landowner and/or project proponents. Should the NAHC determine that a member of an Indian tribe other than Yocha Dehe Wintun Nation is the MLD, and the Tribe agrees with this determination, the terms of this Protocol relating to the treatment of such Native American human remains shall not be applicable; however, that situation is very unlikely.
3. Treatment of Native American Remains: In the event that Native American human remains are found during development of a project and the Tribe or a member of the Tribe is determined to be MLD pursuant to Section II of this Protocol, the following provisions shall apply. The Medical Examiner shall immediately be notified, ground-disturbing activities in that location shall cease and the Tribe shall be allowed, pursuant to California Public Resources Code Section 5097.98(a), to (1) inspect the site of the discovery and (2) make determinations as to how the human remains and grave goods shall be treated and disposed of with appropriate dignity. The Tribe shall complete its inspection and make its MLD recommendation within 48 hours of getting access to the site. The Tribe shall have the final determination as to the disposition and treatment of human remains and grave goods. Said determination may include avoidance of the human remains, reburial on-site, or reburial on tribal or other lands that will not be disturbed in the future. The Tribe may wish to rebury said human remains and grave goods or ceremonial and cultural items on or near the site of their discovery, in an area which will not be subject to future disturbances over a prolonged period of time. Reburial of human remains shall be accomplished in compliance with the California Public Resources Code Sections 5097.98(a) and (b). The term "human remains" encompasses more than human bones because the Tribe’s traditions call for the burial of associated cultural items with the deceased (funerary objects), and/or the ceremonial burning of Native American

human remains, funerary objects, grave goods, and animals. Ashes, soils, and other remnants of these burning ceremonies, as well as associated funerary objects and unassociated funerary objects buried with or found near the Native American Remains are to be treated in the same manner as bones or bone fragments that remain intact.

4. Non-Disclosure of Location of Reburials: Unless otherwise required by law, the site of any reburial of Native American human remains shall not be disclosed and will not be governed by public disclosure requirements of the California Public Records Act, California Government Code Section 6250 et seq. The Medical Examiner shall withhold public disclosure of information related to such reburial pursuant to the specific exemption set forth in California Government Code Section 6254(r). The Tribe will require that the location for reburial is recorded with the California Historic Resources Inventory System (CHRIS) on a form acceptable to the CHRIS center. The Tribe may also suggest that the landowner enter into an agreement regarding the confidentiality of site information that will run with title on the property.
5. Treatment of Cultural Resources: Treatment of all cultural items, including ceremonial items and archaeological items will reflect the religious beliefs, customs, and practices of the Tribe. All cultural items, including ceremonial items and archaeological items, which may be found at a project site shall be turned over to the Tribe for appropriate treatment, unless ordered by a court or agency of competent jurisdiction. The project proponent shall waive any and all claims to ownership of Tribal ceremonial and cultural items, including archaeological items, which may be found on a project site in favor of the Tribe. If any intermediary, (for example, an Archaeologist retained by the project proponent) is necessary, said entity or individual shall not possess those items for longer than is reasonably necessary, as determined solely by the Tribe.
6. Inadvertent Discoveries: If additional significant sites or sites not identified as significant in a project environmental review process, but later determined to be significant, are located within a project impact area, such sites will be subjected to further archaeological and cultural significance evaluation by the project proponent, the Lead Agency, and the Tribe to determine whether additional mitigation measures are necessary to treat sites in a culturally appropriate manner consistent with CEQA requirements for mitigation of impacts to cultural resources. If there are human remains present that have been identified as Native American, all work will cease for a period of up to 30 days in accordance with Federal Law.

Facts in Support of Findings

Records search results from the NWIC indicate several prehistoric sites are located within the project vicinity, and a review of the NAHC Sacred Lands File was positive for recorded TCRs being located within the project site. On February 9, 2021, a response was received from the Yocha Dehe Wintun Nation stating that the project site falls within the Tribe's traditional use area and could impact known cultural resources important to the Tribe, constituting a significant impact. Implementation of

Tribe-provided recommended mitigation measures and protocols, MM CUL-4, would reduce potential impacts to TCRs to a less than significant level.

The City finds that MM CUL-4 is feasible, is adopted, and will further reduce impacts related to TCRs. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts associated with cultural resources would be less than significant with mitigation incorporated.

Potential Effect

Impact CUL-5: The proposed project may cause a substantial adverse change in the significance of a tribal cultural resource (**Draft EIR Pages 3.4-26–27**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.4-27). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM CUL-2a, MM CUL-2b, MM CUL-3 and MM CUL-4.

Facts in Support of Findings

FCS sent letters containing project information and requesting any additional information to each tribal representative identified by the NAHC on February 8, 2021. A second follow up letter and/or email was sent on May 13, 2021. On May 21, 2021, a third and final attempt was made via phone call. On February 9, 2021, a response was received from the Yocha Dehe Wintun Nation stating that the project site falls within the Tribe's traditional use area and could impact known cultural resources important to the Tribe. The Tribe provided recommended mitigation measures and protocols (MM CUL-4).

Tribal consultation pursuant to AB 52 has been initiated by the City of American Canyon and is ongoing. The City of American Canyon, in its capacity as Lead Agency, has not identified any TCRs within the project site that are significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. However, the possibility remains that TCRs in the form of subsurface archaeological resources or human remains may be encountered during project construction. Implementation of MM CUL-2a, MM CUL-2b, MM CUL-3, and MM CUL-4 would require construction monitoring by a qualified Archaeologist and Native American Monitor. These measures would reduce potential impacts to TCRs to a less than significant level.

The City finds that MM CUL-2a and MM CUL-2b are feasible, are adopted, and will further reduce impacts related to archaeological resources. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid

the potentially significant impacts as identified in the EIR. Therefore, impacts associated with archaeological resources would be less than significant with mitigation incorporated.

Cumulative Impacts

With the implementation of mitigation, the proposed project would not result in a significant cumulative impact to cultural resources in the City of American Canyon or surrounding area. (**Draft EIR, Page 4-7–8**).

Findings: Less than significant cumulative impact with mitigation incorporated (Draft EIR, Page 4-8). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM CUL-2a, MM CUL-2b, MM CUL-3 and MM CUL-4.

Facts in Support of Findings

The geographic scope of the cumulative cultural resources analysis is a 0.5-mile radius of the project site. Cultural resource impacts tend to be localized because the integrity of any given resource depends on what occurs only in the immediate vicinity around that resource, such as disruption of soils; therefore, in addition to the project site (including the off-site construction areas), the area near the project site would be the area most affected by project activities (generally within a 500-foot radius).

No listed historic or archaeological resources are within the project boundaries. Thus, none would be adversely impacted by project construction, therefore no cumulative impacts would occur within the City of American Canyon or its immediate vicinity. Construction activities associated with cumulative development projects in the project vicinity may have the potential to encounter undiscovered cultural resources. The cumulative projects listed in Table 4-1 of the Draft EIR would be required to mitigate impacts through compliance with applicable federal and State laws governing cultural resources.

Additionally, the implementation of standard construction mitigation measures would ensure undiscovered cultural resources are not adversely affected by project-related construction activities, which would prevent the destruction or degradation of potentially significant cultural resources in the project vicinity. Given the standard archaeological resources mitigation measures that would apply to the cumulative projects listed in Table 4-1 (including the proposed project), the cumulative impact related to archaeological resources would be less than significant with mitigation (MM CUL-2a, 2b, and 3).

There is the possibility that previously undiscovered Tribal Cultural Resources (TCRs) could be encountered by subsurface earthwork activities associated with the cumulative projects; however, the implementation of MM CUL-4 would ensure that undiscovered TCRs are not adversely affected by cumulative project-related construction activities. Given the low potential for disruption, the

standard conditions of approval, and mitigation measures that cumulative projects would be required to implement, the proposed project, in conjunction with other planned and approved projects, would result in a less than significant cumulative impact with mitigation related to TCRs.

The City finds that MM CUL-2a, MM CUL-2b, MM CUL-3, and MM CUL-4, are feasible, are adopted, and will further reduce cumulative impacts related to cultural resources. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, the proposed project would not result in a significant cumulative impact to cultural resources in the City of American Canyon or surrounding area.

1.6.4 - Geology, Soils and Seismicity

Potential Effect

Impact GEO-1: The proposed project may expose people or structures to potential substantial adverse effects associated with seismic hazards (**Draft EIR Pages 3.5-12–14**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.5-14). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM GEO-1a Prior to the issuance of building permits for each Phase 2 structure, the project applicant shall submit plans to the City of American Canyon for review and approval that demonstrate a minimum 50-foot setback between the West Napa Fault and each building. The approved plans shall be incorporated into the proposed project.

MM GEO-1b Prior to the issuance of building permits for each Phase 1 and 2 structure, the project applicant shall submit a design-level Geotechnical Investigation to the City of American Canyon for review and approval. The investigation shall be prepared by a qualified engineer and identify grading and building practices necessary to achieve compliance with the latest adopted edition of the California Building Standards Code (CBC) geologic, soils, and seismic requirements, including abatement of expansive soil conditions. The report shall also determine the final design parameters for walls, foundations, foundation slabs, and surrounding related improvements (e.g., utilities roadways, parking lots, and sidewalks). The measures identified in the approved report shall be incorporated into the project plans and all applicable construction-related permits.

Facts in Support of Findings

Fault Rupture

Phase 1

There are no active earthquake faults within Phase 1. For these reasons, Phase 1 of the proposed project would not be subject to fault rupture during a seismic event nor would it exacerbate exposure to fault rupture hazards.

Phase 2

Cornerstone Earth Group conducted a Geological Fault Investigation in 2017 that identified the precise location of the West Napa Fault within Phase 2 of the project site. Pursuant to State law, a 50-foot setback must be established from the fault to the nearest building. Mitigation Measure (MM) GEO-1a requires the applicant to prepare and submit plans for Phase 2 when building permits are sought, demonstrating the required setbacks and ensuring that the proposed project does not exacerbate exposure to fault rupture hazards.

Strong Ground Shaking

Phases 1 and 2

Phase 1 is located in a seismically active region of California and is susceptible to strong ground shaking during a seismic event.

A design-level geotechnical report for the proposed project would be prepared by the time building permits are sought and would provide recommendations to minimize ground shaking hazards. Accordingly, MM GEO-1b would require the applicant to submit such a study to the City of American Canyon for review and approval. Standard soil engineering and building design practices would include standards for foundations and structural support of buildings to ensure that they withstand strong ground shaking during a seismic event and avoid the exacerbation of exposure to such hazards. The implementation of this mitigation measure would ensure that the proposed project is not exposed to strong ground shaking hazards.

Ground Failure and Liquefaction

Phases 1 and 2

The Geotechnical Engineering Report determined that the project site is underlain by high plasticity soils, which are considered too stiff and dense to be susceptible to liquefaction. Thus, the proposed project would not be susceptible to ground failure, liquefaction, or liquefaction-related phenomena and impacts would be less than significant and no mitigation is required.

Landslides

Phases 1 and 2

The project site contains relatively flat relief, with an approximately 15-foot difference in elevation across the site. There are no slopes near the project site that may be susceptible to landslides during a seismic event. There is no potentially significant environmental impact and no mitigation is required.

The City finds that MM GEO-1a and MM GEO-1b are feasible, are adopted, and will further reduce impacts related to fault rupture and ground shaking. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

Potential Effect

Impact GEO-2: The proposed project may result in substantial soil erosion or the loss of topsoil (**Draft EIR Pages 3.5-14–15**).

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.5-15). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM HYD-1a Prior to issuance of grading permits for the proposed project, the applicant shall submit to the City of American Canyon for review and approval a Storm Water Pollution Prevention Plan (SWPPP) in accordance with the requirements of the statewide Construction General Permit. The SWPPP shall be designed to address the following objectives: (1) all pollutants and their sources (e.g., runoff), including sources of sediment associated with construction, construction site erosion, and all other activities associated with construction activity, are controlled; (2) where not otherwise required to be under a Regional Water Quality Control Board (RWQCB) permit, all non-stormwater discharges are identified and either eliminated, controlled, or treated; (3) site Best Management Practices (BMPs) (e.g., silt fencing, street sweeping, routine inspection, etc.) are effective and result in the reduction or elimination of pollutants in stormwater discharges and authorized non-stormwater discharges from construction activity; and (4) stabilization BMPs are installed to reduce or eliminate pollutants after construction are completed. The SWPPP shall be prepared by a qualified SWPPP developer. The SWPPP shall include the minimum BMPs required for the identified Risk Level. BMP implementation shall be consistent with the BMP requirements in the most recent version of the California Stormwater Quality Association (CASQA) Stormwater Best Management Handbook–Construction or the California Department of Transportation (Caltrans) Stormwater Quality Handbook Construction Site BMPs Manual. The SWPPP shall be implemented during construction.

Facts in Support of Findings

The proposed project would involve grading, building construction, paving, and utility installation activities that may cause erosion and sedimentation which could accumulate in downstream waterways, resulting in the blockage of flows, potentially causing increased localized ponding or

flooding. MM HYD-1a in Section 3.8, Hydrology and Water Quality, of the Draft EIR would require the implementation of stormwater quality control measures during construction activities to prevent pollutants from entering downstream waterways.

The City finds that MM HYD-1a is feasible, is adopted, and will further reduce impacts related to erosion and sedimentation. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

Potential Effect

Impact GEO-4: The proposed project may create substantial risks to life or property as a result of expansive soil conditions on the project site (**Draft EIR Page 3.5-16)**.

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.5-16). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM GEO-1b Prior to the issuance of building permits for each Phase 1 and 2 structure, the project applicant shall submit a design-level Geotechnical Investigation to the City of American Canyon for review and approval. The investigation shall be prepared by a qualified engineer and identify grading and building practices necessary to achieve compliance with the latest adopted edition of the California Building Standards Code (CBC) geologic, soils, and seismic requirements, including abatement of expansive soil conditions. The report shall also determine the final design parameters for walls, foundations, foundation slabs, and surrounding related improvements (e.g., utilities roadways, parking lots, and sidewalks). The measures identified in the approved report shall be incorporated into the project plans and all applicable construction-related permits.

Facts in Support of Findings

The Geotechnical Engineering Report found that the project site is underlain by soils with high clay content and are therefore capable of being expansive. The design-level Geotechnical Investigation required by MM GEO-1b would outline standard grading and soil engineering practices to abate these potential hazards.

The City finds that MM GEO-1b is feasible, is adopted, and will further reduce impacts related to expansive soils. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially

significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

Potential Effect

Impact GEO-5: The proposed project may directly or indirectly destroy a unique paleontological resource or site or unique geologic feature (**Draft EIR Page 3.5-16—17)**.

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.5-17). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM GEO-5 If potential fossils are discovered during project implementation, all earthwork or other types of ground disturbance within 100 feet of the find shall stop immediately until a qualified professional Paleontologist can assess the nature and importance of the find. Based on the scientific value or uniqueness of the find, the Paleontologist shall either record the find and recommend that the City of American Canyon allow work to continue or recommend salvage and recovery of the fossil. The Paleontologist shall, if required, propose modifications to the stop-work radius based on the nature of the find, site geology, and the activities occurring on the site. If treatment and salvage is required, recommendations will be consistent with Society of Vertebrate Paleontology guidelines and currently accepted scientific practice. If required, treatment for fossil remains shall include preparation and recovery of fossil materials so that they can be housed in an appropriate museum or university collection, and, if required, shall also include preparation of a report for publication describing the finds.

Facts in Support of Findings

The surface of the project site consists of Holocene fan deposits (Qf), Holocene–Pleistocene fan deposits (Qpf), early to middle Pleistocenefan or terrace deposits (Qoa), and the Pliocene Huichica Formation (Th). Also in the surrounding 0.5-mile radius (dashed outline) are modern artificial fill (af, afbm), Holocene–Pleistocene landslide deposits (Qls), the Plio-Pleistocene Petaluma Formation (Tsp), the Pliocene Sonoma Volcanics andesite (Tsv), and the Cretaceous Great Valley Sequence (Kgv).

Modern and Holocene deposits are too young to be fossiliferous, whereas andesite is a nonfossiliferous volcanic rock. Additionally, there are no recorded vertebrate or plant localities within Napa County.

For these reasons, the project site is not located in an area that is considered likely to have paleontological resources present. However, if significant paleontological resources are discovered, implementation of MM GEO-5 will reduce this potential impact to a less than significant level. There are no unique geologic features present on the project site or off-site development areas.

The City finds that MM GEO-5 is feasible, is adopted, and will further reduce impacts related to undiscovered paleontological resources. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

1.6.5 - Greenhouse Gas Emissions and Energy

Potential Effect

Impact GHG-1: The proposed project would generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment (**Draft EIR Page 3.6-50—62)**.

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.6-62). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM GHG-1a Prior to the issuance of any grading permits, the project applicant shall provide the City of American Canyon with documentation (e.g., site plans) demonstrating project construction will include the following construction Best Management Practices (BMPs):

- At least 15 percent of the construction fleet for each project phase shall be alternatively fueled or electric.
- At least 10 percent of building materials used for project construction shall be sourced from local suppliers.
- At least 65 percent of construction and demolition waste materials shall be recycled or reused.
- At least one contractor that has a business location in American Canyon shall be contracted for project construction.
- All construction contracts shall include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers) used during construction be electrically powered.
- Architectural coatings used for project construction shall be “Low-VOC,” containing no greater than 50 grams of volatile organic compounds (VOC) per liter of product.
- Project construction shall prohibit the use of generators and shall establish grid power connection to electrical equipment needs.
- Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California Airborne Toxics Control Measure [ATCM] Title 13, Section 2485 of California

Code of Regulations). Clear signage regarding idling restrictions shall be provided for construction workers at all access points.

- All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.
- The prime construction contractor shall post a publicly visible sign with their telephone number and contractor to contact. The construction contractor shall take corrective action within 48 hours. The Bay Area Air Quality Management District (BAAQMD) phone number shall also be identified and visible to ensure compliance with applicable regulations.

MM GHG-1b Prior to the issuance of any building permits, the project applicant shall provide the City of American Canyon with documentation (e.g., site plans) demonstrating the proposed project is designed without the use of any natural gas -fueled appliances or natural gas plumbing.

MM GHG-1c Prior to issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on site plans), that the proposed buildings are designed and will be built to, at a minimum, the Tier 2 advanced energy efficiency requirements of the Nonresidential Voluntary Measures of the California Green Building Standards Code, Division A5.2, Energy Efficiency, as outlined under Section A5.203.1.2.2.

MM GHG-1d Prior to issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on site plans), that the proposed parking areas for passenger automobiles and trucks are designed and will be built to accommodate electric vehicle (EV) charging stations. At a minimum, the parking shall be designed to accommodate a number of EV charging stations equal to the Tier 2 Nonresidential Voluntary Measures of the California Green Building Standards Code, Section A5.106.5.3.2.

Prior to the issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on site plans), that each loading dock is outfitted with at least one 240-volt outlet to accommodate truck and Transport Refrigeration Unit (TRU) charging and/or electrical power connection while trucks are loading and unloading goods.

MM GHG-1e Prior to the issuance of any building permit for the proposed project, the project applicant shall provide the City with documentation (e.g., site plans) demonstrating to the City's satisfaction that the electricity demand will be supplied with 100 percent carbon-free electricity sources through the year 2045.

Facts in Support of Findings

The proposed project would generate GHG emissions during construction and operation. Neither the BAAQMD nor City have an emissions threshold for determining potentially significant impacts related to construction GHG emissions; therefore, the BAAQMD's recommended GHG-reducing BMPs were utilized as the basis for determining the proposed project's construction-related impact. The proposed project would include the applicable GHG-reducing BMPs during construction through implementation of MM GHG-1a. MM GHG-1a notably has more construction BMPs than those recommended by the BAAQMD. The project applicant has identified these additional construction BMPs as feasible and applicable means to maximize GHG emission reductions during project construction; therefore, MM GHG-1a incorporates additional BMPs beyond those recommended by the BAAQMD to further the proposed project's contribution to its "fair share" in GHG emission reductions during construction toward the State's long-term climate goal of carbon neutrality by 2045. Because MM GHG-1a would require the proposed project to meet and exceed implementation of the BAAQMD-recommended BMPs for reducing construction GHG emissions, project construction would be considered to commit its "fair share" of GHG emission reductions consistent with the State's long-term climate goal of carbon neutrality and would therefore be less than significant.

GHG emissions associated with full operation of the proposed project for the anticipated first operation in 2023 are shown in Table 3.6-4 of the Draft EIR, which incorporates implementation of MMs AIR-2c and AIR-2d. As discussed in Section 3.2, Air Quality, of the Draft EIR, MM AIR-2c would be required to ensure the use of low-VOC (i.e., reactive organic gas [ROG]) architectural coating products that contain no more than 50 grams of VOC per liter of product to reduce the generation of ROG emissions during project operation. Any GHG emissions generated during architectural coating reapplication would be captured under area-source emissions as shown in Table 3.6-4 of the Draft EIR. As shown therein, area-source emissions generated during project operation would be less than 0.5 MT CO_2e per year and was therefore rounded down to zero. As such, MM AIR-2c would result in a negligible effect on operational GHG emissions generated by the proposed project.

As discussed in Section 3.2, Air Quality of the Draft EIR, MM AIR-2d would be required to ensure the trucking fleet accessing the project site would be comprised of vehicles no older than model year 2014 to reduce tailpipe nitrogen oxide (NO_X) emissions. Model year 2014 was selected because it is the first homogenous model year for a trucking fleet in Napa County, based on EMFAC2017 data, to demonstrate a reduction in NO_X emissions when compared with unmitigated emission estimates. This is considered a feasible trucking mitigation measure as the ARB's Truck and Bus Regulation[101] would otherwise require trucks greater than a 26,000-pound gross vehicle weight rating which operate in California to be no older than 2010 model year by the time the proposed project would become operational in 2023. This would allow the proposed project to utilize trucks which are 9 years old and would not constitute an infeasible financial burden.

While the trucking fleet serving the proposed project would represent the greatest GHG emission source during project operation, as illustrated in Table 3.6-4 of the Draft EIR, MM AIR-2d was determined to be the most feasible trucking mitigation to reduce tailpipe emissions of all types, including GHG emissions, due to the size of the trucking fleet. With over 500 trucks accessing the proposed project each day, the financial burden associated with implementing more stringent

trucking mitigation is very likely to amount a cost greater than what a "prudent investor" would otherwise bear to develop the proposed project. In addition, the other principal emission source of passenger vehicles would not be possible to mitigate through project design as the operation of privately owned vehicles by employees and visitors would not be under the direct control of the proposed project.

Moreover, as discussed under Impact GHG-1, MMs GHG-1b through GHG-1e would ensure project consistency with the BAAQMD's proposed 2022 GHG significance thresholds, as refined by the City, by prohibiting the use of natural gas infrastructure, complying with the Tier 2 EV charging infrastructure requirements of CALGreen, complying with the Tier 2 energy efficiency standards of CALGreen, and sourcing project electricity consumption from carbon-free sources. In addition, MMs GHG-1b through GHG-1e would reduce the proposed project's reliance on fossil fuels and reduce the potential for wasteful, inefficient, or unnecessary consumption of energy resources.

Lastly, as discussed further under Impact GHG-1, the proposed project would demonstrate a 15 percent reduction in employee-generated VMT from the region's existing employee VMT, consistent with the BAAQMD's proposed 2022 GHG significance thresholds for VMT reductions for other identified land use types, including office uses, which the City has determined are similar to industrial uses. In addition, the proposed project's trucking operations would be subject to incrementally more stringent tailpipe emission standards and fleet turnover requirements through various ARB programs and rules, further facilitating the use of EVs and reducing the generation of truck-generated GHG emissions. The City finds that MM GHG-1a through MM GHG-1e are feasible, are adopted, and will further reduce impacts related to GHG emissions. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

Potential Effect

Impact GHG-3: The proposed project would not result in a potential significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation. (**Draft EIR Pages 6.6-69—73**)

Findings: Less than significant impact (Draft EIR Page 3.6-72). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

Implement Mitigation measures MM GHG-1a through MM GHG-1e.

Facts in Support of Findings

A significant impact would occur if the proposed project would result in the inefficient, wasteful, or unnecessary use of energy.

Construction

The anticipated construction schedule for the proposed project was assumed to begin in January 2022 and conclude in August 2023. If the anticipated construction schedule moves to later years, construction energy demand would likely decrease because of improvements in technology and more stringent regulatory requirements. Project construction would require energy for the manufacture and transportation of building materials, preparation of the site (e.g., site clearing, and grading), and the actual construction of the building. Petroleum-based fuels such as diesel fuel and gasoline would be the primary sources of energy for these tasks. Construction equipment is estimated to consume a total of 51,911 gallons of diesel fuel and an estimated 337,528 gallons of gasoline and diesel would be consumed by vehicle travel during construction (Draft EIR, Appendix B).

Other equipment could include construction lighting, field services (office trailers), and electrically driven equipment such as pumps and other tools. Singlewide mobile office trailers are commonly used in construction staging areas. A typical 720-square-foot office trailer would consume approximately 20,152 kilowatt-hours (kWh) during the 20-month construction phase (Draft EIR, Appendix B).

The proposed project's construction is not anticipated to result in unusually high energy use. Limitations on idling of vehicles and equipment and requirements that equipment be properly maintained would result in fuel savings. Similarly, compliance with State regulations would limit idling from both on-road and off-road diesel-powered equipment and are enforced by the ARB.

Additionally, the overall construction schedule and process is already designed to be efficient to avoid excess monetary costs. For example, equipment and fuel are not typically used wastefully due to the added expense associated with renting the equipment, maintaining it, and fueling it. Therefore, the opportunities for future efficiency gains during construction are limited. Therefore, it is anticipated that the construction phase of the proposed project would not result in wasteful, inefficient, and unnecessary consumption of energy.

Operation

Operation of the proposed project would consume an estimated 24,495,402 kWh of electricity and an estimated 9,060,000 kBTU of natural gas annually under the cold storage project scenario and an estimated 8,834,476 kWh of electricity and an estimated 8,260,000 kBTU of natural gas annually under the dry storage project scenario (Draft EIR, Table 3.6-7). As previously discussed, the proposed project would be considered to result in a potentially significant impact if it would result in wasteful, inefficient, or unnecessary consumption of energy resources. Considering the guidance provided by Appendix F of the CEQA Guidelines and the Appellate Court decision in *League to Save Lake Tahoe Mountain etc. v. County of Placer* (2022) 75 Cal.App.5th 63, 164-168, the proposed project would be considered to result in wasteful, inefficient, or unnecessary consumption of energy resources if it would conflict with the following energy conservation goals:

- Decreasing overall per capita energy consumption;
- Decreasing reliance on fossil fuels such as coal, natural gas, or oil; and
- Increasing reliance on renewable energy sources.

Decreasing Overall Per Capita Energy Consumption

The proposed project would result in an approximately 29 percent reduction in employee VMT from regional average estimates, which would result in an overall decrease in per capita transportation energy consumption with respect to employee transportation energy resources. Trucking activities envisioned by the proposed project would be generally controlled by new technologies and the mandatory turnover of fleets through medium and heavy-duty truck emission standards and regulations (Draft EIR Pages 3.6-50—60). Moreover, the movement of freight goods and trucking and locomotive travel distances subsequent to that activity is largely dictated by market demand rather than the implementation of specific development projects. As such, the proposed project would not change overall energy consumption related to trucking and locomotive activities, and overall energy consumption related to employee transportation would decrease from the region's current average employee transportation behavior.

Because energy consumption data for the City is not available, County estimates were used to determine the proposed project's per capita energy consumption. The County currently has estimated per capita energy consumption of 7,471 kWh and 28.45 MMBtu per year. The proposed project would result in up to 24,495,402 kWh per year and up to 9,060 MMBtu per year under a cold storage scenario starting in 2023 without considering any mitigation (Draft EIR, Table 3.6-7). The number of estimated employees is used to identify the proposed project's per capita energy consumption. The proposed project's estimated 3,643 employees would result in a per capita energy consumption of 6,724 kWh per year and 2.49 MMBtu per year, both of which would be below the County's average electricity and natural gas consumption rates.

With implementation of MM GHG-1c, the proposed project is likely to consume less electricity than what is disclosed in Table 3.6-7 of the Draft EIR due to the required additional energy efficiency improvements and the fact that CalEEMod Version 2020.4.0 assumes minimum energy efficiency design compliance with the 2019 California Building Code. Should the permitting of the proposed project occur after January 1, 2023, the proposed project would be subject to additional energy efficiency standards beyond what is currently required at the time of this analysis. Nonetheless, implementation of MM GHG-1b would require the proposed project to implement an all-electric building design, likely resulting in greater electricity consumption than what would otherwise occur but reducing natural gas-related energy consumption by 100 percent, thereby contributing to the overall decrease in per capita energy consumption.

Decreasing Reliance on Fossil Fuels

The proposed project would be considered to conflict with this criterion if it did not take steps to decrease the reliance on fossil fuels. The implementation of MMs GHG-1a, GHG-1b, and GHG-1d would actively promote the proposed project's decreased reliance on fossil fuels through the design and operation of the proposed project. MM GHG-1a would require the project applicant to utilize electric and alternatively fueled construction equipment and local contractors, among other requirements, which would reduce the proposed project's commitment of fossil fuel energy resources during project construction. MM GHG-1b would require the proposed project to prohibit the installation of natural gas infrastructure, thereby precluding the proposed project's future use of

natural gas. Lastly, MM GHG-1d would require the proposed project to source 100 percent of its electricity from carbon-free sources.

Increasing Reliance on Renewable Energy Sources

As previously discussed, MM GHG-1a and MM GHG-1b would increase the proposed project's reliance on renewable energy sources during project construction. MM GHG-1c would require the proposed project's buildings be designed and constructed in accordance with the State's Tier 2 Nonresidential Building Energy Efficiency Standards. The proposed project would also be designed to accommodate rooftop photovoltaic panel arrays should they be installed. MM GHG-1e would additionally require that the proposed project source its electricity consumption from carbon-free sources, either with on-site renewable generation technologies or through subscription with a 100 percent carbon-free electricity service with PG&E or MCE.

In addition, MM GHG-1d would require the proposed passenger vehicle and truck parking areas to accommodate more EV charging stations than would be required with minimum code compliance. Loading docks would also be required to contain 240-volt outlets to accommodate EV and TRU charging for trucks. At a minimum, the parking shall be designed to accommodate EV charging stations in an amount equal to the Tier 2 Nonresidential Voluntary Measures of the California Green Building Standards Code, Section A5.106.5.3.2. As a result, the proposed project's energy consumption would not be wasteful, inefficient, or unnecessary.

The City finds that MM GHG-1a through MM GHG-1e are feasible, are adopted, and will further reduce impacts related to GHG emissions. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

1.6.6 - Hydrology and Water Quality

Potential Effect

Impact HYD-1: Construction activities and changes to drainage patterns associated with the proposed project may degrade surface water quality in downstream water bodies (**Draft EIR Page 3.8-10—12)**.

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.8-12). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM HYD-1a Prior to issuance of grading permits for the proposed project, the applicant shall submit to the City of American Canyon for review and approval a Storm Water Pollution Prevention Plan (SWPPP) in accordance with the requirements of the statewide Construction General Permit. The SWPPP shall be designed to address the

following objectives: (1) all pollutants and their sources (e.g., runoff), including sources of sediment associated with construction, construction site erosion, and all other activities associated with construction activity, are controlled; (2) where not otherwise required to be under a Regional Water Quality Control Board (RWQCB) permit, all non-stormwater discharges are identified and either eliminated, controlled, or treated; (3) site Best Management Practices (BMPs) (e.g., silt fencing, street sweeping, routine inspection, etc.) are effective and result in the reduction or elimination of pollutants in stormwater discharges and authorized non-stormwater discharges from construction activity; and (4) stabilization BMPs are installed to reduce or eliminate pollutants after construction are completed. The SWPPP shall be prepared by a qualified SWPPP developer. The SWPPP shall include the minimum BMPs required for the identified Risk Level. BMP implementation shall be consistent with the BMP requirements in the most recent version of the California Stormwater Quality Association (CASQA) Stormwater Best Management Handbook–Construction or the California Department of Transportation (Caltrans) Stormwater Quality Handbook Construction Site BMPs Manual. The SWPPP shall be implemented during construction.

MM HYD-1b Prior to the issuance of building permits, the project applicant shall submit a Stormwater Control Plan to the City of American Canyon for review and approval. The plan shall be developed using the California Stormwater Quality Association (CASQA) "New Development and Redevelopment Handbook" and include the applicable provisions of Section C.3 of the San Francisco Bay Regional Water Quality Control Board (RWQCB) Municipal Regional Permit (Order No. R2-2015-0049, NPDES Permit No. CAS612008 (or more recent permit). The Stormwater Control Plan shall identify pollution prevention measures and Best Management Practices (BMPs) to control stormwater pollution from operational activities and facilities and provide maintenance in perpetuity. The Stormwater Control Plan shall include Low Impact Development (LID) design concepts, as well as concepts that accomplish a "first flush" objective that would remove contaminants from the first 2 inches of stormwater before it enters area waterways. The project applicant shall also prepare and submit an Operations and Maintenance Agreement to the City, identifying procedures to ensure stormwater quality control measures work properly during operations.

Facts in Support of Findings

Phases 1 and 2

Chemicals, such as gasoline, diesel fuel, lubricating oil, hydraulic oil, lubricating grease, automatic transmission fluid, paints, solvents, glues, and other substances, could be used during construction and an accidental release of any of these substances could degrade the quality of the surface water runoff and adversely affect receiving waters. As such, MM HYD-1a would require the development and implementation of a SWPPP to outline site-specific stormwater quality control measures (such as Best Management Practices [BMPs]) during construction activities to prevent pollutants from entering downstream waterways.

The increase in impervious area increases the efficiency by which sediment and other pollutants are delivered downstream. Concentration of flow by the storm drain system could increase the erosive energy of flows, thereby increasing sediment supply from the project site. Runoff from landscaped areas may also contain residual pesticides and nutrients. Consequently, there is potential for long-term degradation of runoff water quality from the implementation of the project. The project proposes the following post-construction stormwater management features, according to a three-tiered LID/BMP design approach:

- The purpose of site design BMPs is to maintain pre-development runoff characteristics, protect sensitive resource areas, and attempt to minimize new impervious areas. The site has been designed to limit the amount of disturbed area and new impervious areas.
- Source control BMPs use structural controls and operational procedures to limit pollutants at their source. The project would implement the following source control BMPs: mark "No Dumping! Flows to River" on storm drain inlets; plumb interior floor drains to sanitary sewer; carefully manage pesticide use for landscaped areas; post "Do Not Dump Hazardous Materials Here" on refuse areas; utilize enclosed trash compactors; grade loading docks to minimize run-on and contain spills; and drain parking areas to bioretention planters.
- Treatment control BMPs are designed to reduce the amount of pollutants in stormwater and to reduce runoff rates or volumes. All new impervious areas will be routed through either a bioretention basin or an infiltration planter. The floors of bioretention basins will be amended with a layer of gravel overlain by a layer of specialized biosoil. The biosoil will be a sandy loam material to promote infiltration while allowing for vegetation to establish. An underdrain will be installed to facilitate infiltration as the local soils have low infiltration potential. Bioretention basins have been configured to drain within 48 hours to prevent vector concerns.

Additionally, the wetland preserve would facilitate the natural sequestration of stormwater pollutants leaving the project site.

MM HYD-1b would require (1) that the Stormwater Control Plan be reviewed and verified by the City of American Canyon to ensure the proposed stormwater controls are adequate pursuant to the requirements of Order No. R2-2015-0049 (or more recent permit), and (2) that an operation and maintenance program is in place to ensure the long-term functionality of the stormwater controls. Various RWQCBs determined that BMPs in MM HYD-1b are known to be effective in protecting receiving waters.

The City finds that MM HYD-1a and MM HYD-1b are feasible, are adopted, and will further reduce impacts related to surface water quality. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

1.6.7 - Land Use

Potential Effect

Impact LU-3: The proposed project may conflict with the applicable provisions of the Napa County Airport Land Use Compatibility Plan (**Draft EIR Page 3.9-49—52)**.

Findings: Less than significant impact with mitigation incorporated (Draft EIR, Page 3.9-42). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM AES-3 and MM LU-3

MM LU-3 Prior to issuance of grading permits, the applicant shall retain a qualified Biologist to assess potential wildlife hazards to aviation. The assessment shall evaluate the characteristics of the emergent wetlands, drainages, other potential wildlife attractant features (i.e., ponded water) located within the open space area and identify management practices (e.g., storm drainage, vegetation, etc.) to prevent the creation of attractants for large flocks or birds or other wildlife species that may present safety hazards to aviation activities. As part of the assessment, the applicant shall consult with Napa County Airport and Napa County Airport Land Use Commission (ALUC) representatives, as appropriate, regarding findings and recommendations. The applicant shall submit a report to the City of American Canyon prepared by a qualified Biologist that confirms the wildlife hazard assessment's findings and recommendations are incorporated into the design of the open space preserve.

Facts in Support of Findings

Phases 1 and 2

Airport Land Use Compatibility Review

The project site falls within the Napa County ALUCP Area.

The (ALUCP) establishes policies and compatibility zones addressing four key focus areas: noise, safety, airspace protection, and overflight. The project site falls entirely within Zone D. Zone D encompasses the common traffic pattern. These areas are routinely overflown by aircraft. Zone D is characterized by moderate risk, frequent noise intrusion and routine overflights below 1,000 feet above ground level. Within Zone D, indoor uses are limited to densities of no more than 100 people per net acre. Uses with an outdoor component can have up to 150 people per net acre. The ALUCP does not limit the number of people that can be clustered in any one acre of the parcel within Zone D.

Additionally, the ALUCP prohibits residential uses and uses posing hazards to flight. Hazards to flight include objects that penetrate FAR Part 77 airspace surfaces, uses that would attract large numbers of birds, and uses that would create smoke, glare, distracting lights, or electronic interference.

Maximum Density

The proposed project includes several buildings that would facilitate development of industrial uses, including warehousing, manufacturing, and general office uses. These land uses are generally consistent with ALUCP criteria, provided that the uses do not attract large concentrations of people.

The ALUCP sets forth a maximum density criterion of 100 people per net acre for Zone D. The ALUCP identifies three methods for calculating density: (1) parking ordinance; (2) maximum occupancy; and (3) other methodologies in cases where density cannot be reasonably estimated based upon parking or square footage.

The maximum occupancy methodology is most appropriate because it is based on typical Building Code occupancy limits, which can be calculated based on the known project characteristics. Because the ancillary office space within each building is the most intense use, it has been broken out separately from the warehouse use.[2] Table 3.9-3 of the Draft EIR summarizes the maximum occupancy calculation.

The project complies with the density recommendation of no more than 100 persons per net acre (Draft EIR, 3.9-4).

Wildlife Attractants

The two aspects of the proposed project that have the greatest potential for creating aviation safety hazards are the open space area and the stormwater basins.

As previously discussed, a 45-acre Wetland Preserve will be established as part of the proposed project. This area contains wetlands that currently attract wildlife (e.g., avian species). Avian species are considered potential hazards to aviation activities due to the potential for bird strikes. The proposed project would create new wetland features to offset those impacted as result of the proposed project. However, it would not substantially increase the bird attractant potential because the new compensatory wetlands represent a small portion of the total open space area. Thus, the proposed project would not introduce new aviation hazards in this respect.

The proposed stormwater basins would be designed to drain out within 48 hours of a 10-year storm event, minimizing the amount of time the basins would hold standing water. This would reduce their avian attractant attributes. Additionally, basins would not represent a greater attractant than standing water in the project vicinity during and immediately after a storm event.

Furthermore, the proposed project would result in an approximately 163-acre reduction in avian foraging habitat as a result of the development of the proposed structures and infrastructure. The proposed project also would include landscaping and on-site drainage facilities that would be designed and managed to discourage wildlife use of the site. This would further minimize the avian attractant attributes of the project site relative to existing conditions.

Overall, the proposed project would not increase the avian attractant attributes of the project site or nearby areas under the Napa County Airport flight path compared to existing conditions.

The ALUCP indicates that projects that have the potential to attract wildlife are required to prepare a Wildlife Hazards Assessment and MM LU-3 would require the preparation of such an assessment and implementation of the recommendations into the design of the open space area.

Light, Glare, Dust, Steam, and Other Aviation Hazards

The ALUCP Policy 3.3.5 states the following:

Policy 3.3.5 Land uses which may produce hazards to aircraft in flight shall not be permitted within any airport's planning area. Specific characteristics to be avoided include: (1) glare or distracting lights which could be mistaken for airport lights; (2) sources of dust, steam, or smoke which may impair pilot visibility; (3) sources of electrical interference with aircraft communications or navigation; and (4) any use which may attract large flocks of birds, especially landfills and certain agricultural uses.

MM AES-3 requires all exterior lighting to use full cut-off fixtures and be directed downward to prevent interference with Napa County Airport operations. Together, the implementation of these two mitigation measures would ensure that the proposed project would not create hazards to aviation.

The City finds that MM AES-3 and MM LU-3 are feasible, are adopted, and will further reduce impacts related to land use. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

1.6.8 - Noise

Potential Effect

Impact NOI-1: The proposed project could generate a substantial temporary or permanent increase in ambient noise levels in noise-sensitive locations in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies (**Draft EIR Page 3.10-15—22)**.

Findings Less Than Significant Impact with Mitigation Incorporated (Draft EIR, Page 3.10-22). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR (State CEQA Guidelines § 15091(a)(1)).

Mitigation Measures

MM NOI-1 Implementation of the following multi-part mitigation measure is required to reduce potential construction period noise impacts:

- The construction contractor shall ensure that all equipment driven by internal combustion engines shall be equipped with mufflers that are in good condition and appropriate for the equipment.
- The construction contractor shall ensure that unnecessary idling of internal combustion engines (i.e., idling in excess of 5 minutes) is prohibited.
- The construction contractor shall utilize "quiet" models of air compressors and other stationary noise sources where technology exists.
- At all times during project grading and construction, the construction contractor shall ensure that stationary noise-generating equipment shall be located as far as practicable from sensitive receptors and placed so that emitted noise is directed away from adjacent residences.
- The construction contractor shall ensure that the construction staging areas shall be located to create the greatest feasible distance between the staging area and noise-sensitive receptors nearest the project site.
- The construction contractor shall ensure that all on-site construction activities, including the operation of any tools or equipment used in construction, drilling, repair, alteration, grading, or demolition work, are limited to between the daytime hours of 7:00 a.m. to 7:00 p.m. Monday through Saturday. No construction shall be permitted on Sundays and federal holidays.

Facts in Support of Findings

Construction

A significant impact would occur if construction noise impacts were greater than 75 dBA between the hours of 7:00 a.m. and 7:00 p.m. or greater than 60 dBA from 7:00 p.m. to 7:00 a.m., per the City's policies, and would result in a substantial temporary increase in ambient noise levels that could result in annoyance or sleep disturbance of nearby sensitive receptors.

Construction-related Traffic Noise

Short-term noise impacts could result from the transport of workers and construction equipment and materials to and from the project site. This would incrementally increase noise levels on access roads leading to the site. Because workers and construction equipment would use existing routes, noise from passing trucks would be similar to existing vehicle-generated noise on these local roadways. Typically, a doubling of the Average Daily Traffic (ADT) hourly volumes on a roadway segment is required in order to result in an increase of 3 dBA in traffic noise levels. This is the lowest change that can be perceptible to the human ear in outdoor environments. Project-related construction trips would not be expected to double the hourly or daily traffic volumes along any roadway segment in the project vicinity. For this reason, short-term intermittent noise from construction trips would not be expected to result in a perceptible increase in hourly or daily average traffic noise levels in the project vicinity.

Construction Equipment Operational Noise

Short-term noise impacts could result from construction activity related to the proposed project. Similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase.

The site preparation phase involves the use of earthmoving equipment, which tends to generate the highest noise levels. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 or 4 minutes at lower power settings.

Construction of the project is expected to require the use of scrapers, bulldozers, water trucks, haul trucks, and pickup trucks. The maximum noise level generated by each scraper, bulldozer and grader is assumed to be 85 dBA L_{max} at 50 feet from this equipment. (Draft EIR, Table 3.10-2). Each doubling of sound sources with equal strength increases a sound level by 3 dBA. Thus, a reasonable worst-case combined noise level during this phase of construction would be 90 dBA L_{max} at a distance of 50 feet from the acoustic center of a construction area. This would result in a reasonable worst-case hourly average of 86 dBA L_{eq}.

The closest façade of the closest noise-sensitive receptor to the project site would be located 1,240 feet from the acoustic center of construction activity where multiple pieces of heavy construction equipment would operate simultaneously during construction of the proposed parking areas near the project's northeastern boundary. At this distance, construction noise levels could range up to approximately 62 dBA L_{max}, with a relative worst-case hourly average of 57 dBA L_{eq} at this receptor. These noise levels could occur temporarily.

These construction noise levels are within the construction noise limits established by the City of no greater than 75 dBA during the hours of 7:00 a.m. to 7:00 p.m.; but these levels could exceed the City's nighttime threshold for construction noise of 60 dBA. Thus, MM NOI-1 would require all on-site construction activities be limited to between the daytime hours of 7:00 a.m. to 7:00 p.m. MM NOI-1 would further reduce impacts from construction noise by requiring mufflers on construction equipment powered by internal engines. MM NOI-1 also would require contractors to limit idling times of vehicles with internal combustion engines to 5 minutes or less and utilize quiet mode on air compressors and other stationary noise sources. Furthermore, MM NOI-1 would require contractors to locate stationary noise-generating equipment as far away as the equipment allows and also be placed such that noise is directed away from adjacent residential homes.

Operation

Implementation of the project would result in mobile and stationary operational noise sources.

Mobile Source Operational Noise Impacts

A significant impact would occur if implementation of the proposed project would result in a substantial increase in traffic noise levels compared with traffic noise levels existing without the project. A change of 5 dBA is considered the minimum readily perceptible change to the human ear in outdoor environments. Therefore, for purposes of this analysis, a 3 dBA or greater increase above traffic noise levels that would exist without the project would be considered a substantial permanent increase in traffic noise levels.

The traffic study prepared by W-Trans concluded that the highest traffic noise level increase with implementation of the proposed project would occur along South Kelly Road under Existing Plus Project conditions and would result in traffic noise levels ranging up to 59.1 dBA L_{dn} as measured at 50 feet from the centerline of the nearest travel lane, representing an increase of 2.5 dBA over

existing conditions for this roadway segment (Draft EIR, Table 3.10-6). This increase is less than a 3 dBA or greater increase that would be considered a substantial increase.

Stationary Source Operational Noise Impacts

A significant impact would occur if operational noise levels generated by stationary noise sources at the proposed project site would result in a substantial permanent increase in ambient noise levels in excess of the City's noise performance standards. The City requires that new industrial, commercial, and related land uses demonstrate that they would not directly cause ambient noise levels to exceed an exterior L_{dn} of 65 dBA in areas containing housing, schools, health care facilities, or other "noise-sensitive" land uses.

Parking Lot Activities

The proposed project would generate noise from parking lot activities. Typical parking lot activities generate noise levels ranging from approximately 60 dBA to 70 dBA L_{max} at 50 feet.

The closest façade of the nearest noise-sensitive receptor to the project site would be located 1,360 feet southwest of the nearest proposed parking areas. Noise levels associated with daily parking lot activities would attenuate to approximately 41 dBA L_{max} at this façade. Assuming a reasonable worst-case scenario of one parking movement for every parking stall within a single hour would result in an hourly average noise level of 24 dBA L_{eq} as measured at this nearest façade. If these noise levels were to occur every hour for a 24-hour period, they would result in a reasonable worst-case average noise level of 30 dBA L_{dn} as measured at this nearest receptor (Draft EIR, Appendix G).

Therefore, the proposed project's reasonable worst-case parking lot noise levels would not cause ambient noise levels to exceed an exterior L_{dn} of 65 dBA as measured at the nearest receptor. Existing traffic noise levels along Green Island Road are 62 dBA L_{dn} (Draft EIR, Table 3.10-6). Therefore, project parking lot activities would not result in a substantial permanent increase in ambient noise levels in the project vicinity.

Mechanical Equipment Operations

The proposed project would generate noise from new exterior mechanical equipment sources. A reference noise level for typical rooftop mechanical ventilation systems was used. Noise levels from commercially available rooftop mechanical ventilation equipment range from 50 dBA to 60 dBA L_{eq} at a distance of 25 feet.

The closest façade of the nearest noise-sensitive receptor to the project site would be located approximately 1,470 feet southwest of the nearest potential location for proposed rooftop mechanical ventilation equipment. At this distance, noise generated by typical rooftop mechanical ventilation equipment would attenuate to below 22 dBA L_{eq} at the nearest façade. If these noise levels were to occur every hour for a 24-hour period, they would result in a reasonable worst-case average noise level of 29 dBA L_{dn} as measured at this nearest receptor (Draft EIR, Appendix G).

Therefore, the proposed project's reasonable worst-case mechanical ventilation equipment operation noise levels would not cause ambient noise levels to exceed an exterior L_{dn} of 65 dBA as measured at the nearest receptor. As discussed above, existing traffic noise levels along Green Island

Road are 62 dBA L_{dn}. Therefore, noise levels from proposed mechanical ventilation equipment operations would not result in a substantial permanent increase in ambient noise levels in the project vicinity.

Truck Loading Activities

Noise would be also generated by truck loading and unloading activities at the loading docks along the western side of the proposed building and at the proposed surface level loading areas on the north and south sides of the building. Typical maximum noise levels from truck loading and unloading activity are 70 dBA L_{max} as measured at 50 feet.

The closest façade of the nearest noise-sensitive receptor to the project site would be located approximately 1,600 feet from the nearest loading docks. Assuming a reasonable worst-case scenario of one truck loading operation for every loading stall and every loading dock within a single hour would result in an hourly average noise level of 40 dBA L_{max} and 29 dBA L_{eq} as measured at the nearest façade of the residence. If these noise levels were to occur every hour for a 24-hour period, they would result in a reasonable worst-case average noise level of 35 dBA L_{dn} as measured at this nearest receptor (Draft EIR, Appendix G).

The proposed project's reasonable worst-case truck loading/unloading activity noise levels would not cause ambient noise levels to exceed an exterior L_{dn} of 65 dBA as measured at the nearest receptor. As discussed above, existing traffic noise levels along Green Island Road are 62 dBA L_{dn}. Therefore, project truck loading/unloading activities would not result in a substantial permanent increase in ambient noise levels in the project vicinity.

Stationary Source Operational Noise Impact Conclusion

None of the project stationary operational noise sources would result in an increase of 3 dBA or greater above the City's performance threshold of 65 dBA L_{dn} for stationary noise sources as measured at the nearest sensitive receptor. Table 3.10-7 of the Draft EIR provides a summary of the stationary source operation noise impacts.

The City finds that MM NOI-1 is feasible, is adopted, and will further reduce impacts related to noise. Accordingly, the City finds that, pursuant to Public Resources Code Section 21081(a)(1) and State CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the proposed project that mitigate or avoid the potentially significant impacts as identified in the EIR. Therefore, impacts would be less than significant with mitigation incorporated.

1.7 - Impacts Identified in the Draft EIR as Being Significant and Unavoidable Even After the Incorporation of All Feasible Mitigation Measures

The Lead Agency hereby finds that, despite the incorporation of mitigation measures outlined in the EIR and the attached MMRP, the following impacts from the proposed project and related approvals cannot be fully mitigated to a less than significant level and a Statement of Overriding Considerations is therefore included herein.

1.7.1 - Air Quality

Impact AIR-1: The proposed project would conflict with or obstruct implementation of the applicable air quality plan (**Draft EIR Pages 3.2-38–45**).

Findings: Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR. (State CEQA Guidelines, Section 15091(a)(1).) However, impacts would still remain significant and unavoidable even with mitigation incorporated. Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measure or project alternatives identified in the EIR. (State CEQA Guidelines, Section 15091(a)(3).) (Draft EIR, Page 3.2-45).

Mitigation Measures

MM AIR-2a The following Best Management Practices (BMPs), as recommended by the Bay Area Air Quality Management District (BAAQMD), shall be included in the design of the project and implemented during construction:

- All active construction areas shall be watered at least two times per day.
- All exposed non-paved surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and access roads) shall be watered at least three times per day and/or non-toxic soil stabilizers shall be applied to exposed non-paved surfaces.
- All haul trucks transporting soil, sand, or other loose material off-site shall be covered and/or shall maintain at least 2 feet of freeboard.
- All visible mud or dirt tracked out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
- All vehicle speeds on unpaved roads shall be limited to 15 miles per hour.
- All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
- Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California Airborne Toxics Control Measure (ATCM) Title 13, Section 2485 of California Code of Regulations). Clear signage regarding idling restrictions shall be provided for construction workers at all access points.
- All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.
- The prime construction contractor shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The City and the construction contractor shall take corrective action within 48 hours. The

BAAQMD's phone number shall also be visible to ensure compliance with applicable regulations.

MM AIR-2b Prior to the issuance of grading or building permits, the project applicant shall provide the City with documentation demonstrating the use of "Low-VOC" architectural coatings during the proposed project's construction. "Low-VOC" architectural coatings used during project construction shall not exceed 50 grams of reactive organic gases (ROG) or volatile organic compounds (VOC) per liter of product.

MM AIR-2c Prior to issuing any certificate of occupancy for the proposed project, the project applicant shall provide the City with documentation demonstrating the use of "Low-VOC" architectural coatings and electric landscaping equipment during the operation of the proposed project. "Low-VOC" architectural coatings used during project construction shall not exceed 50 grams of reactive organic gases (ROG) or volatile organic compounds (VOC) per liter of product. Landscaping equipment referred to in this requirement shall include lawnmowers, leaf blowers, and chainsaws.

MM AIR-2d Prior to issuing the certificate of occupancy for the proposed project, the project applicant shall provide the City with documentation demonstrating the use of a truck fleet that meets or exceeds model year 2014 for all heavy-duty trucks during operation of the proposed project. If the project applicant does not own the truck fleet that would be used during operation of the proposed project, the project applicant shall provide the City with documentation from the truck fleet owner or operator demonstrating that trucks utilized for operation of the proposed project will meet or exceed model year 2014. If any change occurs where a new truck fleet is utilized during operation of the proposed project, the project applicant shall provide the City with documentation demonstrating that the new truck fleet meets or exceeds this requirement.

To monitor and ensure that trucks that meet a model year of 2014 or newer are used for the proposed project, the fleet operator shall maintain records of all trucks and equipment associated with the proposed project's operation and make these records available to the City upon request. Alternatively, the City may require periodic reporting and provision of written records by operators and conduct regular inspections of the records to the maximum extent feasible and practicable.

MM AIR-2e Prior to the issuance of the certificate of occupancy for each building with dock doors, signage shall be posted identifying idling restrictions and contact information to report violations to the building manager.

MM AIR-2f Prior to the issuance of the certificate of occupancy for each building with a separate end user, the City shall confirm that the end user has prepared a Transportation Demand Management Plan (TDM Plan). The TDM Plan shall be prepared by a

qualified transportation consultant and identify strategies to reduce single-occupant vehicle trips. Examples of TDM strategies may include but are not limited to:

- Ridesharing/Ride Matching
- Vanpools
- Transit subsidies
- Preferential parking for rideshare or vanpool vehicles
- Employee lockers
- Secure bicycle parking
- Employee locker rooms
- Provide TDM information in employee breakroom

MM AIR-2g As a part of future lease agreements, the project proponent shall provide all future tenants at the project site information on available California Air Resources Board (ARB) and Bay Area Air Quality Management District (BAAQMD) incentive programs, such as the Carl Moyer Program and the Voucher Incentive Program, that support upgrading truck fleets to clean air technology equipment.

Facts in Support of Findings

The BAAQMD 2017 Clean Air Plan is a regional and multiagency effort to reduce air pollution in the Air Basin. A consistency determination with the 2017 Clean Air Plan fulfills the CEQA goal of informing decision-makers of the proposed project's environmental effects under consideration early enough to ensure that air quality concerns are fully addressed.

In part, the regional population, housing, and employment projections developed by the ABAG for the San Francisco Bay Area Air Basin (SFAAB) are based on cities' general plan land use designations. These projections form the foundation for the emissions inventory of the 2017 Clean Air Plan. Projects consistent with the local general plan are considered consistent with the regional air quality plan. The project site is designated "Industrial" by the City of American Canyon General Plan and zoned "General Industrial." The proposed project is consistent with these General Plan land use designations. Thus, the proposed project would generally be consistent with the underlying general plan land use designation and would not have the potential to substantially affect housing, employment, and population projections in the region that are the basis of the 2017 Clean Air Plan projections. The proposed project would not conflict with the control measures of the 2017 Clean Air Plan (Draft EIR, Table 3.2-9).

The BAAQMD's CEQA Air Quality Guidelines further recommend determining a project's consistency with the 2017 Clean Air Plan, in part, by determining a project's consistency with the significance thresholds presented in Table 3.2-7 of the Draft EIR. As discussed under Impact AIR-2 below, the proposed project would generate emissions which exceed the BAAQMD's significance thresholds after the implementation of applicable and feasible mitigation and would result in a significant and unavoidable impact. As discussed below under Impact AIR-2, implementation of MM AIR-2a and MM AIR-2b would sufficiently reduce project construction emissions to less than significant levels.

Implementation of MM AIR-2c and MM AIR-2d would not be sufficient to reduce project operation emissions to less than significant levels.

As discussed under Impact AIR-2, unmitigated project operation would result in ROG and NO_X emissions which exceed BAAQMD significance thresholds. NO_X emissions generated during project operation would principally be generated by the operation of the trucking fleet, irrespective of whether the fleet would accommodate the use of TRUs. MM AIR-2d would be required to ensure the trucking fleet accessing the project site would be comprised of vehicles no older than model year 2014 to reduce tailpipe NO_X emissions. MM AIR-2e would require that anti-idling signage be posted in loading dock areas. MM AIR-2f requires that a TDM Program be implemented.

As discussed further in Impact AIR-2 below, implementation of MM AIR-2c would result in a reduction of ROG emissions under both dry storage and cold storage scenarios; however, these emissions would still exceed the BAAQMD significance thresholds for ROG emissions of 10 tons per year and 54 average pounds per day. Furthermore, as discussed in Impact AIR-2, with the implementation of MM AIR-2d, NO_X emissions during project operation would be reduced under both dry storage and cold storage scenarios; however, emissions would still exceed the BAAQMD significance thresholds for NO_X emissions of 10 tons per year and 54 average pounds per day.

Because the proposed project would generate emissions which exceed the BAAQMD's significance thresholds and BAAQMD's CEQA Air Quality Guidelines recommend determining a project's consistency with the 2017 Clean Air Plan, in part, by determining a project's consistency with the BAAQMD significance thresholds, the proposed project would be inconsistent with the 2017 Clean Air Plan.

The City finds that MM AIR-2a through MM AIR-2g are feasible, are adopted, and will reduce impacts to the greatest extent feasible. However, impacts would still remain significant and unavoidable even with mitigation incorporated.

Impact AIR-2: The proposed project would result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable deferral or State ambient air quality standard (**Draft EIR Pages 3.2-45–59**).

Findings: Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR. (State CEQA Guidelines, Section 15091(a)(1).) However, impacts would still remain significant and unavoidable even with mitigation incorporated. Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measure or project alternatives identified in the EIR. (State CEQA Guidelines, Section 15091(a)(3).) (Draft EIR, Page 3.2-59).

Mitigation Measures

MM AIR-2a, MM AIR-2b, MM AIR-2c, MM AIR-2d, MM AIR-2e, MM AIR-2f and MM AIR-2g.

Facts in Support of Findings

This impact is related to the cumulative effect of a project's regional criteria pollutant emissions. The cumulative analysis focuses on whether a specific project would result in cumulatively considerable emissions. According to Section 15064(h)(4) of the CEQA Guidelines, the existence of significant cumulative impacts caused by other projects alone does not constitute substantial evidence that the project's incremental effects would be cumulatively considerable. Rather, the determination of cumulative air quality impacts for construction and operational emissions is based on whether the project would result in regional emissions that exceed the BAAQMD regional thresholds of significance for construction and operations on a project level. A project that would not exceed the BAAQMD thresholds of significance on the project level also would not be considered to result in a cumulatively considerable contribution to these regional air quality impacts.

Construction

Construction Fugitive Dust

The BAAQMD bases the determination of significance for fugitive dust on a consideration of the BMPs to be implemented. If all appropriate emissions control measures are implemented for a project as recommended by the BAAQMD, then fugitive dust emissions during construction are not considered significant. MM AIR-2a would ensure implementation of construction BMPs recommended by the BAAQMD irrespective of the emissions reductions achieved by those BMPs. With this mitigation measure, short-term construction fugitive dust impacts would be less than significant .

Construction Air Pollutant Emissions: ROG, NO_X, PM_{10}, $PM_{2.5}$

CalEEMod, Version 2020.4.0, was used to estimate the proposed project's construction emissions. Estimated construction emissions are compared with the applicable thresholds of significance established by the BAAQMD to assess ROG, NO_X, exhaust PM_{10}, and exhaust $PM_{2.5}$ construction emissions to determine significance for this impact. As the BAAQMD dust control measures would be required to ensure fugitive dust impacts are less than significant, the emission estimates shown below account for the implementation of MM AIR-2a.

ROG emissions generated mainly during architectural coating activities during project construction would exceed BAAQMD significance thresholds (Draft EIR, Table 3.2-10), requiring the implementation of MM AIR-2b, which would require the use of low-VOC (i.e., ROG) architectural coating products during project construction. MM AIR-2b would result in reducing ROG emissions from 68 average pounds per day to 33 average pounds per day, which is below the BAAQMD significance threshold of 54 pounds per day for ROG emissions during project construction (Draft EIR, Table 3.2-11). Therefore, project construction emissions would be less than significant with the implementation of MMs AIR-2a and AIR-2b.

Operation

Operational Air Pollutant Emissions: ROG, NO_X, PM_{10}, $PM_{2.5}$

Operational emissions would include area, energy, and mobile sources. Area sources would include emissions from architectural coatings, consumer products, and landscape equipment. Energy

sources include emissions from the combustion of natural gas for water heaters and other heat sources. Mobile sources include exhaust and road dust emissions from the automobiles that would travel to and from the project site. Mobile sources also include exhaust from trailer-mounted TRUs which would accompany any freight truck carrying refrigerated goods. Stationary sources include emissions from stationary source equipment, such as backup generators, that would require a permit issued by the BAAQMD. Pollutants of concern include ROG, NO_X, PM_{10}, and $PM_{2.5}$.

Project operations were analyzed at full buildout immediately following the completion of construction for Phase 2 in August 2023 as a conservative estimate of operational emissions beginning in the earliest year of full operation.

The cold storage project scenario would also include the operation of TRUs, which are analyzed using weighted averages for emission factors retrieved from the ARB's OFFROAD2017 database for in-state truck TRUs, in-state van TRUs, in-state gen-set TRUs, in-state trailer TRUs, out-of-state gen-set TRUs, out-of-state trailer TRUs, and locomotive TRUs, all utilizing aggregate horsepower bins. These vehicle categories encompass all possible TRU emission factors contained in the database. Each truck is assumed to be accompanied by a TRU and each of the 528 truck trips is one-way, this analysis assumes a truck and TRU population of 266. Each TRU is assumed to spend an average of four hours running on-site for unloading and loading purposes, and an average of two hours off-site traveling to and from the Port of Oakland.

The locomotive emission estimates assume a monthly average of 500,000 ton-miles of locomotive deliveries. Assuming an average travel distance of 50 miles and an average loaded railcar weight of 65 tons, this would represent nearly two loaded, 20-railcar locomotive deliveries per week. Operational emission estimates for the proposed project are contained in Table 3.2-12 of the Draft EIR. For detailed assumptions used to estimate emissions, see Draft EIR, Appendix B.

The proposed project would result in operational-related criteria air pollutants or ozone precursors which would exceed the BAAQMD's thresholds of significance, specifically with respect to ROG and NO_X emissions (Draft EIR, Table 3.2-12). MM AIR-2c would be required to ensure the use of low-VOC architectural coatings for any reapplication of paints and coatings and the use of electric landscaping equipment, including chainsaws, lawnmowers, and leaf blowers during project operation. The trucking fleet would generate the majority of operational NO_X emissions, thus MM AIR-2d would be required to ensure that a more fuel-efficient, lower-emission trucking fleet—one which demonstrates a model year 2014 or newer for all heavy-duty trucks upon first implementation—is utilized during project operation.

Under a dry storage scenario, implementation of MM AIR-2c would result in a reduction of ROG emissions during project operation from approximately 13 tons per year and 70 average pounds per day to approximately 12 tons per year and 64 average pounds per day, which would still exceed the BAAQMD significance thresholds for ROG emissions of 10 tons per year and 54 average pounds per day. Under a cold storage scenario, implementation of MM AIR-2c would result in a reduction of ROG emissions during project operation from approximately 16 tons per year and 90 average pounds per day to approximately 15 tons per year and 85 average pounds per day, which would still exceed the applicable BAAQMD significance thresholds (Draft EIR, Table 3.2-13).

Under a dry storage scenario, implementation of MM AIR-2d would result in a reduction of NO_X emissions during project operation from approximately 40 tons per year and 217 average pounds per day to approximately 35 tons per year and 192 average pounds per day, which would still exceed the BAAQMD significance thresholds for NO_X emissions of 10 tons per year and 54 average pounds per day. Under a cold storage scenario, implementation of MM AIR-2d would result in a reduction of NO_X emissions during project operation from approximately 71 tons per year and 388 average pounds per day to approximately 66 tons per year and 362 average pounds per day, which would still exceed the applicable BAAQMD significance thresholds (Draft EIR, Table 3.2-13).

CalEEMod, Version 2020.4.0, utilizes a Statewide average VOC (i.e., ROG) per building square-foot metric, irrespective of land use type, derived from the ARB's Statewide 2008 Consumer Product Inventory. Nonresidential land uses, such as the proposed project, are likely to result in fewer operational ROG emissions generated by the use of consumer products than what is demonstrated in this analysis. The principal source for operational ROG emissions would be the use of consumer products by employees and visitors and these uses would not be under the control of the property owner or tenant. As such, mitigation targeting the use of consumer products was omitted from this analysis.

Operational Carbon Monoxide Hotspot

The CO emissions from traffic generated by the proposed project are a concern at the local level.

The BAAQMD recommends a screening analysis to determine whether a project has the potential to contribute to a CO hotspot. The screening criteria identify when site-specific CO dispersion modeling is necessary. The proposed project would result in a less than significant impact to air quality for local CO if all the following screening criteria are met:

1. The project is consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, regional transportation plan, and local congestion management agency plans; and
2. The project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour; and
3. The project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway).

The Traffic Impact Study (TIS) prepared for the proposed project concluded that no intersections impacted by the proposed project would experience traffic volumes of 44,000 vehicles per hour. Nonetheless, accumulation of local CO concentration can occur when a transportation facility's design or orientation prevents the adequate dispersion of CO emissions from vehicles. However, adjacent roadways that would receive new vehicle trips generated by the proposed project do not include roadway segments where vertical or horizontal atmospheric mixing is substantially limited.

As discussed in Section 3.12, Transportation of the Draft EIR, all studied roadway segments and intersections would operate at acceptable levels of service with traffic generated by the proposed project in combination with existing traffic levels. Because the proposed project would operate at acceptable levels of service consistent with the City of American Canyon standards, the proposed project would be consistent with an adopted congestion management program. Therefore, the proposed project would not exceed the CO screening criteria and would have a less than significant impact related to CO.

Consequently, implementation of MM AIR-2a and MM AIR-2b would sufficiently reduce project construction emissions to less than significant levels; however, implementation of MM AIR-2c and MM AIR-2d would not be sufficient to reduce project operation emissions to less than significant levels. The City finds that MM AIR-2a through MM AIR-2g are feasible, are adopted, and will reduce impacts to the greatest extent feasible. However, impacts related to project operation emissions would remain significant and unavoidable even with mitigation incorporated.

Cumulative Impacts

Because of emissions from existing nearby projects, the proposed project would have a significant cumulative impact on air quality. (**Draft EIR, Page 4-4–5**).

Findings: Significant cumulative impact (Draft EIR, Page 4-5). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR. (State CEQA Guidelines, Section 15091(a)(1).) However, impacts would still remain significant and unavoidable even with mitigation incorporated. Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measure or project alternatives identified in the EIR. (State CEQA Guidelines, Section 15091(a)(3).)

Facts in Support of Findings

The geographic scope of the cumulative air quality analysis is the San Francisco Bay Area Air Basin, which covers all or portions of the counties of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Sonoma, and Solano. The BAAQMD CEQA Guidelines' cumulative significance criteria are used in the cumulative analysis of air quality.

A project would be judged to conflict with or obstruct implementation of the regional air quality plan if it would result in substantial new regional emissions not foreseen in the air quality planning process. Regional emissions forecasts in the air quality plan are based on population and employment forecasts based on City and County General Plans. The proposed project is consistent with land use designations and applicable goals and policies of the American Canyon General Plan, site zoning, and other applicable land use regulatory documents and thus is considered planned growth. Because the proposed project would not result in unplanned growth or in VMT, it would not conflict with or obstruct implementation of the air quality plan in this regard. Additionally, the

proposed project would meet all of the applicable Land Use Measures and Energy and Climate Measures contained in the BAAQMD's Clean Air Plan.

If a project does not exceed the BAAQMD established numerical thresholds, its emissions would not be cumulatively considerable, resulting in less than significant air quality impacts to the region's existing air quality conditions. As discussed in Impact AIR-2, the proposed project would emit operational criteria pollutant emissions (ROGs and oxides of nitrogen) at levels that would exceed the BAAQMD CEQA Guidelines and significance thresholds. Proposed mitigation would not reduce these emissions to below BAAQMD thresholds. Therefore, the proposed project would contribute to a cumulatively considerable (i.e., significant and unavoidable) regional air quality impact with regard to criteria pollutants and consistency with the BAAQMD's current Clean Air Plan.

1.7.2 - Greenhouse Gas Emissions and Energy

Cumulative Impacts

The proposed project's cumulative impacts related to greenhouse gas emissions would be cumulatively significant. (**Draft EIR, Page 4-9–10**).

Findings: Significant cumulative impact (Draft EIR, Page 4-10). Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the EIR. (State CEQA Guidelines, Section 15091(a)(1).) However, impacts would still remain significant and unavoidable even with mitigation incorporated. Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measure or project alternatives identified in the EIR. (State CEQA Guidelines, Section 15091(a)(3).)

Facts in Support of Findings

The geographic scope of the cumulative GHG emissions analysis is the San Francisco Bay Area Air Basin, which covers all or portions of the counties of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Sonoma, and Solano. In a larger sense, however, the relevant geographic area is the entire Earth, as explained by the California Supreme Court. "[B]ecause of the global scale of climate change, any one project's contribution is unlikely to be significant by itself." (*Center for Biological Diversity v. Department of Fish and Wildlife* (2015) 62 Cal.4th 204, 219.) "'With respect to climate change, an individual project's emissions would most likely not have any appreciable impact on the global problem by themselves, but they would contribute to the significant cumulative impact caused by GHG emissions from other sources around the globe. The question therefore becomes whether the proposed project's incremental addition of GHG emissions is "cumulatively considerable" in light of the global problem, and thus significant.'" (*Id.*, quoting Crockett, Addressing the Significance of Greenhouse Gas Emissions Under CEQA: California's Search for Regulatory Certainty in an Uncertain World (July 2011) Golden Gate U. Envtl. L.J. 203, 207–208).)

The proposed project would emit new GHG emissions, as would other past, present, and reasonably foreseeable projects within the Air Basin. The BAAQMD has not set a numerical threshold of

significance for GHG emissions from construction, but has set a threshold for GHG emissions from operation as well as a threshold on a per-service population basis. The proposed project would comply with relevant elements of the City of American Canyon EECAP, but would exceed both of the BAAQMD operational GHG thresholds and as such could be considered cumulatively significant. GHG emissions from the proposed project's potential new stationary source were found to exceed the BAAQMD significance threshold for GHG from stationary sources and as such could be considered cumulatively significant. Therefore, the proposed project, in conjunction with other past, present, and reasonably foreseeable future development in the Air Basin and around the world, would result in a significant cumulative GHG emissions impact.

1.8 - Findings Regarding Alternatives

1.8.1 - Introduction

This section presents findings regarding alternatives to the proposed project. The section provides a summary and discussion of the feasibility of the following alternatives evaluated in the Draft EIR:

- **Alternative 1: No Project/No Development Alternative.** The project site would remain undeveloped for the foreseeable future and no development would occur.
- **Alternative 2: No Project/Existing General Plan Alternative.** A 2.4-million-square-foot food and beverage processing facility would be developed on the project site.
- **Alternative 3: Reduced Density Alternative.** A 1.6-million-square-foot logistics center would be developed on the project site, which represents a 25 percent reduction in square footage relative to the proposed project. The layout and project boundaries would remain the same as the proposed project.
- **Alternative 4: Phase 1 Only Alternative.** Phase 1 of the proposed project would be developed, which consists of approximately 1.1 million square feet of high-cube warehouse on 95 acres. Phase 2 would not be developed, and the remaining 113 acres would remain undeveloped.

In accordance with CEQA Guidelines Section 15126.6, the EIR contained a comparative impact assessment of alternatives to the proposed project. The primary purpose of this analysis is to provide decision-makers and interested agencies, organizations and individuals with information about a reasonable range of potentially feasible project alternatives, which could avoid or reduce any of the proposed project's significant adverse environmental effects. Important considerations for the alternatives analyses are noted below:

- An EIR need not consider every conceivable alternative to a project;
- An EIR should identify alternatives that were considered by the lead agency, but rejected as infeasible during the scoping process;
- Reasons for rejecting an alternative include:
  - Failure to meet most of the basic project objectives identified in Section 1.3.2, Project Objectives;
  - Infeasibility; and

- Inability to avoid significant environmental effects.

CEQA does not require that an analysis of alternate sites always be included in an EIR. Pursuant to CEQA Guidelines Section 15126.6(f)(2), in making the decision to include or exclude analysis of an alternate site, the "key question and first step in analysis is whether any of the significant effects of the project would be avoided or substantially lessened by putting the project in another location. Only locations that would avoid or substantially lessen any of the significant effects of the project need to be considered for inclusion in the EIR."

The Draft EIR evaluates the feasibility of three alternative locations located within 1 mile of the project site either in the City of American Canyon or within unincorporated Napa County (Draft EIR, Exhibit 5-1). The three alternative locations considered in the Draft EIR are Sentinels of Freedom Property, Commerce Court, and Hess Vineyards. All three alternative locations do not constitute feasible alternatives because none of the properties are owned, controlled, or otherwise accessible to the project applicant and each of the properties are too small to accommodate the level of development contemplated by the proposed project. Furthermore, the Commerce Court location is the subject of an active development application and the Hess Vineyards location was re-designated from "Industrial" to "Agriculture, Watershed, and Open Space" by the Napa County Zoning Ordinance in 2008. None of these three sites would meet CEQA Guidelines criteria for a feasible alternative location (Draft EIR, Table 5-8).

Alternative 1: No Project/No Development Alternative.

CEQA Guidelines Section 15126.6(e) requires that an EIR evaluate a "No Project Alternative," which is intended to allow decision-makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project. In cases where the project constitutes a land development project, the No Project Alternative is the "circumstance under which the project does not proceed." For many projects, the No Project Alternative represents a "No Development" scenario, in which the project site remains in its existing condition and no development occurs for the foreseeable future. However, CEQA Guidelines Section 15126.6(e)(3)(B) establishes that "If disapproval of the project under consideration would result in predictable actions by others such as the proposal of some other project, this 'no project' consequence should be discussed." In the interests of informed decision-making, the EIR considered both a No Project/No Development Alternative and a No Project/Existing General Plan Alternative.

The No Project/No Development Alternative would avoid the proposed project's significant and unavoidable impacts and would avoid any potential impacts related to all environmental topical areas. However, this alternative would not advance any of the project objectives, including those related to facilitating the development of land planned for business park/industrial uses to its highest and best use; positively contributing to the local economy; providing the City of American Canyon with a high-quality, employment-generating industrial development; and serving local and regional demand for manufacturing, logistics warehouse, and other industrial uses. Finally, it should be noted that the project site is zoned for industrial use, has been the subject of previous industrial development proposals, and is currently served with infrastructure suitable for this type of

development. Thus, should the proposed project not advance, it would be expected that another industrial development proposal would be submitted.

Finding: Based on the discussion in the EIR and all other evidence before it, the City finds that the No Project/No Development Alternative does not advance project objectives. The City rejects this alternative as infeasible.

Alternative 2: No Project/Existing General Plan Alternative.

The No Project/Existing General Plan Alternative would not avoid the significant and unavoidable air quality and GHG emissions impacts associated with the proposed project and in fact would increase the severity of these impacts. The No Project/Existing General Plan Alternative would increase the severity of impacts associated with land use, noise, public services, transportation, and utilities. Additionally, the No Project/Existing General Plan Alternative would have similar impacts on aesthetics, biological resources, cultural resources, geology, hazards, and hydrology and water quality.

The No Project/Existing General Plan Alternative would advance most of the project objectives including those related to facilitating the development of land planned for business park/industrial uses to its highest and best use; positively contributing to the local economy; providing the City of American Canyon with a high-quality, employment-generating industrial development. However, the change of the end use would not advance the project objective concerning serving local and regional demand for logistics warehouse uses.

Finding: Based on the discussion in the EIR and all other evidence before it, the City finds that the No Project/Existing General Plan Alternative does not advance most of the project objectives. The City rejects this alternative as infeasible.

Alternative 3: Reduced Density Alternative.

The Reduced Density Alternative would lessen the severity of, but would not avoid, the significant and unavoidable air quality and GHG emissions impacts associated with the proposed project. Additionally, the Reduced Density Alternative would lessen the severity of several of the significant impacts that can be reduced to a level of less than significant with mitigation (e.g., hydrology and water quality, and noise).

The Reduced Density Alternative would advance all of the project objectives, with several advanced to a lesser degree. However, the reduction in square footage would result in fewer positive economic benefits and, thus, would advance the project objectives to a lesser degree. For example, this alternative would be expected to employ fewer workers than the proposed project. This includes objectives related to facilitating the development of land planned for business park/industrial uses to its highest and best use; positively contributing to the local economy; providing the City of American Canyon with a high-quality, employment-generating industrial development; and serving local and regional demand for logistics warehouse uses.

Finding: Based on the discussion in the EIR and all other evidence before it, the City finds that the Reduced Density Alternative advances several project objectives to a lesser degree than the proposed project. The City rejects this alternative as infeasible.

Alternative 4: Phase 1 Only Alternative.

The Phase 1 Only Alternative would lessen the severity of, but would not avoid, the significant and unavoidable air quality and GHG emissions impacts associated with the proposed project. Additionally, the Phase 1 Only Alternative would lessen the severity of several of the significant impacts that can be reduced to a level of less than significant with mitigation (e.g., biological resources, cultural resources, hydrology and water quality, and noise).

The Phase 1 Only Alternative would advance all of the project objectives, with several advanced to a lesser degree. However, the reduction in square footage would result in fewer positive economic benefits and, thus, would advance the project objectives to a lesser degree. For example, this alternative would be expected to employ fewer workers than the proposed project. This includes objectives related to facilitating the development of land planned for business park/industrial uses to its highest and best use; positively contributing to the local economy; providing the City of American Canyon with a high-quality, employment-generating industrial development; and serving local and regional demand for logistics warehouse uses.

As a practical matter, the project applicant has a 100-year lease agreement with the property owner, and it would be impractical to forgo development on the Phase 2 portion of the project site. Moreover, the project site is the single largest undeveloped site in the City of American Canyon and is zoned for industrial use. Preserving 113 acres of the site as a wetland preserve would not represent the highest and best use of the property, particularly since approximately 44.8 acres of the project site would be assigned for this use.

Finding: Based on the discussion in the EIR and all other evidence before it, the City finds that the Phase I Only Alternative advances several project objectives to a lesser degree than the proposed project. The City rejects this alternative as infeasible.

Environmentally Superior Alternative

Section 15126.6(e)(2) of the State CEQA Guidelines indicates that an analysis of alternatives to a proposed project shall identify an environmentally superior alternative among the alternatives evaluated in an EIR.

Three of the project alternatives would lessen the environmental impacts relative to the proposed project to a certain degree (as described above and further in the Draft EIR). The No Project/Existing General Plan Alternative would result in greater environmental impacts in some environmental topic areas. If the No Project/No Development Alternative is the environmentally superior alternative—which is the case here as it avoids all project impacts, but fails to satisfy any of the project objectives—the EIR must also identify another environmentally superior alternative among the remaining alternatives. Based on these Findings, of the three remaining alternatives, the Phase I

Only Alternative would be considered the environmentally superior alternative, even though it fails to fully implement project objectives and is therefore infeasible.

1.9 - Findings Regarding Cumulative Impacts

Consistent with CEQA's requirements, the EIR for the proposed project includes an analysis of cumulative impacts in every topical discussion. As discussed above, except as to cumulative air quality impacts, all other cumulative impacts associated with the proposed project are less than significant with the implementation of applicable mitigation and compliance with applicable regulations. Cumulative air quality impacts remain significant even with incorporation of all feasible mitigation.

1.10 - Findings Regarding Growth Inducement

State CEQA Guidelines Section 15126.2(e) requires a discussion of the ways in which a proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Typical growth-inducing factors might be the extension of urban services or transportation infrastructure to a previously unserved or underserved area, or the removal of major barriers to development.

There are two types of growth-inducing impacts that a project may have: direct and indirect. To assess the potential for growth-inducing impacts, the project's characteristics that may encourage and facilitate activities that individually or cumulatively may affect the environment must be evaluated (CEQA Guidelines § 15126.2(e)). CEQA Guidelines, as interpreted by the City, state that a significant growth-inducing impact may result if the project would:

- Induce substantial population growth in an area (for example, by proposing new homes and commercial or industrial businesses beyond the land use density/intensity envisioned in the general plan);
- Substantially alter the planned location, distribution, density, or growth rate of the population of an area; or
- Include extensions of roads or other infrastructure not assumed in the general plan or adopted capital improvements project list when such infrastructure exceeds the needs of the project and could accommodate future developments.

Direct growth-inducing impacts occur when the development of a project imposes new burdens on a community by directly inducing unplanned population growth, or by leading to the construction of additional developments in the same area. Also included in this category are projects that remove physical obstacles to population growth (such as a new road into an undeveloped area or a WWTP with excess capacity that could allow additional development in the service area). Construction of these types of infrastructure projects cannot be considered isolated from the development they facilitate and serve. Projects that physically remove obstacles to growth, or projects that indirectly induce growth may provide a catalyst for future unrelated development in an area such as a new residential community that requires additional commercial uses to support residents.

The proposed project does not include residential uses and therefore would not directly induce population growth.

The proposed project would develop approximately 2.4 million square feet of new high-cube warehouse uses and would employ an estimated 1,200 workers during construction and 3,643 workers when fully operational at buildout. The proposed project's warehouses would likely be built incrementally over a period of years and, thus, jobs would be added in phases as the project builds out. As such, there would not be an "overnight" influx of new employment opportunities.

The California Employment Development Department estimated the combined Napa-Solano labor force at 273,500 in October 2021, which is sufficiently large enough to fill the proposed project's estimated employment opportunities such that unplanned growth would not occur.

During the NOP review period, the County of Napa requested the Draft EIR evaluate whether there is sufficient housing for project employees. Because prospective employees have not been identified, statements about housing for project employees would be speculative. Nonetheless, the City of American Canyon has more than 2,400 dwelling units in the pipeline (Draft EIR, Table 4-1). The City's population was estimated to be 20,837. Thus, the addition of more than 2,400 dwelling units to the City's housing inventory would more than offset the employment growth attributable to the proposed project.

The proposed project would be served by connections to existing water, wastewater, storm drainage, electricity, and natural gas lines that exist in Green Island Road or Devlin Road. No extension of infrastructure into unserved areas would be required and, therefore, no removal of physical barriers to growth would occur. As such, the proposed project would not indirectly induce substantial population growth (Draft EIR, Pages 6-1—2).

1.11 - Findings Regarding Significant Irreversible Environmental Changes

According to Sections 15126(c) and 15126.2(d) of the State CEQA Guidelines, the Lead Agency must address any significant irreversible environmental changes that would occur should the project be implemented. Generally, a project would result in significant irreversible environmental changes if any of the following would occur:

- The project would involve a large commitment of nonrenewable resources;
- The primary and secondary impacts of the project would generally commit future generations to similar uses;
- The project involves uses in which irreversible damage could result from any potential environmental accidents; or
- The proposed consumption of resources is not justified.

Construction of the proposed project would include the consumption of resources that are not replenishable, or which may renew so slowly to be considered nonrenewable. These resources would include the following: certain types of lumber and other forest products; aggregate materials

used in concrete and asphalt such as sand, gravel, and stone; metals such as steel, copper, and lead; petrochemical construction materials such as plastics; and water. Fossil fuels such as gasoline and oil would also be consumed in the use of construction vehicles and equipment. Development would not be expected to involve an unusual commitment of nonrenewable resources, nor be expected to consume any resources in a wasteful manner. Construction-related impacts related to electricity and fuel consumption would be less than significant.

The irreversible long-term environmental changes associated with the proposed project would include an increase in local and regional vehicular traffic, and the resultant increase in air pollutants, GHG emissions, and noise generated by this traffic. The proposed project would also irreversibly increase the commitment of energy resources, potable water supply, wastewater treatment, solid waste disposal, and public services, such as providing police and fire services, to support the proposed project through its lifetime. However, features incorporated into the proposed project and proposed mitigation measures would minimize the significant effects of the environmental changes associated with the proposed project to the maximum degree feasible.

As explained in the Draft EIR, the proposed project will not result in the wasteful, inefficient, and unnecessary consumption of energy, will not cause the need for additional natural gas or electrical energy-producing facilities, and, therefore, will not create a significant impact on energy resources. Rather, the proposed project would be well-positioned to serve the North Bay Counties of Napa, Solano, and Sonoma due to its proximity to SR-29/SR-12 corridors.

1.12 - Findings Regarding Circulation

During the public review period after the Draft EIR was published, the Lead Agency received certain additional information. Lead Agency staff and consultants involved in preparing the various studies, reports and analyses included in the Draft EIR have also presented additional information since the publication of the Draft EIR. Some of this information was contained in comments submitted on the Draft EIR, and in responses to those comments contained in the Final EIR. Other information was presented at or before public meetings/hearings on the EIR. The EIR incorporates feasible mitigation, additions, clarifications, modifications, and other changes, in response to comments and as determined appropriate by Lead Agency staff and required under CEQA.

Under *Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal*. (1993) 6 C4th 1112 (Laurel Heights II) and the CEQA Guidelines (14 Cal Code Regs §15088.5(a)(3)), when information added to the Final EIR consists of a suggested additional mitigation measure, recirculation is required only if the new mitigation measure meets all of the following criteria (*South County Citizens for Smart Growth v. County of Nevada* (2013) 221 CA4th 316, 330):

- It is feasible;
- It is considerably different from the alternatives or mitigation measures already evaluated in the Draft EIR;
- It would clearly lessen the project's significant environmental impacts; and
- It is not adopted.

Recirculation is only required only if each of the above tests is met. (*South County Citizens*, *supra* at 330). As described in detail in Table 31 of the Final EIR, mitigation measures proposed during the public comment period are either (1) not necessary; (2) not feasible; (3) or are already included as mitigation. MM AIR-2e and MM AIR-2f have been adopted to further reduce air quality impacts as noted in Final EIR Section 5, Errata. Neither additional mitigation measure has any significant effects. However, the residual significance of Impact AIR-1 and AIR-2 remains significant and unavoidable even with the implementation of the additional mitigation.

The Lead Agency has considered all relevant information including the opinions and comments of interested agencies, organizations and individuals. The Lead Agency finds that the additional mitigation does not meet the test for recirculation. Additionally, the City finds that none of the additional information provided during the public comment period demonstrates any of the following situations requiring recirculation identified in CEQA Guideline 15088.5 have occurred:

- A new significant environmental impact that would result from the project (or any alternative) or from a new mitigation measure proposed to be implemented.
- A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
- A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project (or an alternative), but the project's proponents decline to adopt it.
- The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

Based on the foregoing and as explained in more detail in the Final EIR, and having reviewed all the information in the record of proceedings, the City of American Canyon hereby finds that this additional information does not constitute significant new information nor does it require recirculation of the EIR. The additional information merely clarifies or amplifies an adequate EIR.

1.13 - Statement of Overriding Considerations

CEQA requires that a Lead Agency balance the benefits of a project against its unavoidable environmental risk in determining whether to approve the project. If the benefits outweigh the unavoidable adverse effects, those effects may be considered “acceptable” pursuant to CEQA Guidelines Section 15093(a). CEQA requires that a Lead Agency support, in writing, the specific reasons for considering a project acceptable when significant impacts are infeasible to mitigate. Those reasons must be based on substantial evidence in the EIR or elsewhere in the administrative record pursuant to CEQA Guidelines Section 15093(b). The Lead Agency’s written reasons are referred to as a Statement of Overriding Considerations.

As explained in the above Findings of Fact, most of the project’s impacts on the environment would either be insignificant or, through the incorporation of mitigation measures as conditions of approval of the project, can be reduced to less than significant. However, as set forth in Section 1.7 above, even with implementation of all available mitigation, the proposed project would result in significant

unavoidable impacts related to project level inconsistencies with the BAAQMD regional air quality plan and cumulative criteria pollutant emissions. Further, as set forth in Section 1.8 above, there are no feasible alternatives to the project, which would mitigate or avoid those environmental impacts and which would meet project objectives. Accordingly, as set forth below, the City of American Canyon declares that pursuant to the State CEQA Guidelines Section 15093, the City of American Canyon has balanced the benefits of the proposed project against any unavoidable environmental impacts in determining whether to approve the proposed project. Pursuant to the State CEQA Guidelines, if the benefits of the proposed project outweigh the proposed project's unavoidable adverse environmental impacts, those impacts may be considered "acceptable."

Having reduced the adverse significant environmental effect of the proposed project to the extent feasible by adopting the mitigation measures contained in the EIR, the MMRP, and these Findings, having considered the entire administrative record on the proposed project, and having weighed the benefits of the proposed project against its unavoidable adverse impact after mitigation, the City of American Canyon has determined that each of the following social, economic and environmental benefits of the proposed project separately and individually outweigh all the potential unavoidable adverse impacts and render those potential adverse environmental impacts acceptable based upon the following overriding considerations:

- The project applicant would construct the Napa Valley Vine Trail segment along the project frontage with Devlin Road.
- The proposed project would provide and preserve in perpetuity approximately 45 acres of wetlands that would include habitat currently suitable for foraging by the Swainson's hawk. This permanent preservation respects the natural environment and provides both open space and aesthetic relief from developed urban areas.
- The proposed project would contribute to the City's economic base and is estimated to create 3,643 new local employment opportunities that would Improve American Canyon's jobs-housing ratio. The development of up to 3,643 new jobs in a housing-rich part of the Bay Area region would allow employees to work closer to where they live, thereby reducing vehicle miles traveled.
- The proposed project would stimulate capital investment and expand the tax base.
- The proposed project would meet demand for, bring new businesses to the City and develop compatible land uses near the Napa County Airport. By developing the proposed project's 2.4 million square feet of high-cube warehouse near the airport and transportation corridors, it would contribute to reducing trip length by locating these facilities closer to customers within this region.
- The proposed project would advance the City's goal of orderly development that maintains American Canyon's distinctive character. The proposed project would promote the development of industries that capitalize on the geographic advantages of the City while ensuring consistency with the patterns and distribution of use and density depicted on the Land Use Plan Map (Figure 1-1 of the General Plan).

- The proposed project would help maintain consistency with and carry out the goals, objectives, and policies of the City of American Canyon General Plan. The stated goals, objectives, and policies set forth in the City's Land Use and Planning element recognize the need to accommodate new development by providing a full mix of uses to support its population. Providing new commercial opportunities would help implement several General Plan goals as illustrated in Table 3.9-2 of the Draft EIR.

Custodian of Record; Scope and Content of Record

The documents and materials that constitute the record of proceedings on which these Findings have been based are located at the Community Development Department at 4381 Broadway Street, Suite 201, American Canyon, CA 94503. This information is provided in compliance with Public Resources Code Section 21081.6.

Various documents, information, testimony, reports, studies, analyses and other materials (both oral and written) constitute the record upon which the City bases these Findings and are the basis for the City's approval and/or adoption contained herein. These Findings cite specific pieces of evidence, but none of the City's findings are based solely on those cited pieces of evidence. Rather, these Findings are based upon the entire record, and the Lead Agency intends to rely upon all supporting evidence in the record for each of its conclusions contained herein.

The documents in the record include all items referenced in Public Resources Code Section 21167.6(e):

(i) All project application materials;

(ii) The project EIR (including the Draft EIR, the Final EIR, and all appendices attached thereto);

(iii) All staff reports and related documents prepared by the lead agency and/or consultants with respect to the lead agency's compliance with the substantive and procedural requirements of this division and with respect to the action on the project;

(iv) All staff reports and related documents prepared by the lead agency and written testimony or documents submitted by any person relevant to any findings or Statement of Overriding Considerations adopted by the lead agency pursuant to this division;

(v) All documentary and oral evidence received and reviewed at public hearings, public meetings, study sessions, and workshops on the Project EIR, and any transcript or minutes of the proceedings at which any advisory body or decision-making body heard testimony on, or considered the Project EIR;

(vi) All notices issued by the lead agency to comply with this division or with any other law governing the processing and approval of the project;

(vii) All written comments received in response to, or in connection with, the Project EIR, including comments on the Draft EIR;

(viii) All written evidence or correspondence submitted to, or transferred from, the lead agency with respect to compliance with this division or with respect to the project;

(ix) Any proposed decisions or findings submitted to the decision-makers by lead agency staff, or the project proponent, project opponents, or other interested agencies, organizations and/or individuals;

(x) The documentation of the final decision, including the Project EIR and all documents, in addition to those referenced in paragraph (c), cited or relied on in the findings or in a Statement of Overriding Considerations adopted pursuant to this division;

(xi) For documentary and informational purposes, all locally-adopted land use plans and ordinances, including, without limitation, general plans, specific plans and ordinances, master plans together with environmental review documents, findings, mitigation monitoring programs, and other documentation relevant to planned growth in the area;

(xii) Any other written materials relevant to the lead agency's compliance with this division or to its decision on the merits of the project, including any drafts of any environmental document or portions thereof, which have been released for public review, and copies of studies or other documents relied upon in any environmental document prepared for the project and either made available to the public during the public review period or included in the lead agency's files on the project, and all internal agency communications, including staff notes and memoranda related to the project or to compliance with this division;

(xiii) The full written record before any inferior administrative decision-making body whose decision was appealed to a superior administrative decision-making body prior to the filing of litigation; and

(xiv) Any additional items not included above if otherwise required by law.

Appendix A:
Mitigation Monitoring and Reporting Program

PLANNING SUBMITTAL DRAWINGS FOR:

GIOVANNONI LOGISTICS CENTER

GREEN ISLAND ROAD AT HIGHWAY 29
CITY OF AMERICAN CANYON, CA

ATTACHMENT 2.A

PERSPECTIVE RENDERINGS OF TYPICAL LOGISTIC CENTER BUILDINGS

PROJECT NARRATIVE:

Site: The project site is located along Lincoln Highway 29 & Green Valley Road. in the City of American Canyon, California. The project will include approximately +/- 70 acres of land and encompass two separate buildings. Buildings A and B will be located on the East side of Devlin Road. Total has a Gross Square Footage of all buildings will be +/- 1.07 million sf of floor space. See individual building square footages below:

Building A: 627,976 square feet.
Building B: 469,512 square feet.

Industrial buildings will be of Type VB construction, site cast, tilted concrete panels with a variety of architectural enhancements. The typical wall panels are to be enhanced with reveals and a textured elastomeric, multicolored coating system. The areas around the building entries are also enhanced with tinted glazing in aluminum frames with overhead steel-framed painted canopies. The placement of these enhancements is focused at those locations most visible from the public roadways.

Site Access and Parking:
Entry into the site can be accessed at three entrance drives proposed along Green Island Road. Additional site entry can be obtained at Delvin Road The site will include a semi-truck access aisles that will be separate from employee vehicle parking.

Signage: The proposed signage in this submittal includes is for reference only. Criteria for future tenant signage will be provided at a later and under a separate permit as required.

Landscaping: The project will be fully landscaped using plants appropriate for and indigenous to the City of American Canyon. Low water use plants will be used extensively, while moderate water use plants will be concentrated at accent points, such as driveways and building entries. For further landscaping design information, see "Design Notes" on the LP Preliminary Landscape Plan.

Sustainable Materials & Construction Practices: The project will incorporate a variety of sustainable materials and construction practices to include the following: 1) A storm water pollution prevention plan to minimize contamination, erosion, and dust pollution during construction. All storm water runoff from impervious surfaces (roofs and paving) will be routed through a specially designed water quality detention and treatment basin. Additionally, on-site detention will be provided to meet the City of American Canyon standards. 2) Storage and collection of recyclable materials. 3) Construction waste management. 4) Environmental tobacco smoke control. 5) Heat reflecting roof membranes. 6) Light pollution reduction. 7) Water efficient landscaping. 8) Water use reduction methods. 9) Low VOC emitting sealants, adhesives, coatings, floorings, and wood materials. 10) Roof structures designed to accommodate additional weight for roof-top photovoltaic electricity generation panel arrays. 11) California Green Building Code compliant electric vehicle charging stations at seven locations. 12) The project architect is a LEED accredited professional and will apply his knowledge of LEED techniques and practices to the project design and construction.

REQUIRED PARKING (NAPA COUNTY ZONING CH. 18.110.030):

- WAREHOUSE: 1 PER EACH 1,000 SQ. FT. FOR THE FIRST 10,000 SQ. FT., AND 1 PER 2,000 SQ. FT. FOR ALL WAREHOUSE AREA EXCEEDING 10,000 SQ. FT . (469,512 - 10,000 = 459,512 / 2,000 = 229.75 = 230 + 10 = 240 STALLS)
- OFFICE: 1 PER 300 SQ. FT. OF GROSS FLOOR AREA (OFFICE SPACE T.B.D.)

BICYCLE PARKING: (AMERICAN CANYON MUNICIPAL CODE, CH. 19.21, TABLE 19.21.050)

- TOTAL AUTOMOBILE PARKING SPACES: 200 - 299 = 8

(BICYCLE PARKING SHOULD BE LOCATED IN HIGHLY VISIBLE LOCATIONS AND SHOULD BE LOCKABLE)

ACCESSIBLE & DESIGNATED PARKING STALLS (REQUIRED AND PROVIDED) :

PER 2019 CBC TABLE 11B-208.2: 401 TO 500 STALLS, 9 ADA STALLS REQUIRED
VAN ACCESSIBLE STALLS: EVERY 6 OR FRACTION OF SIX, AT LEAST ONE SHALL BE VAN PARKING.
(9 STALLS = 2 VAN ACCESSIBLE)
10 ADA STALLS (INCLUDING 2 VAN ACCESSIBLE STALLS) PROVIDED.

PER 2019 CALIFORNIA GREEN BUILDING CODE TABLE 5.106.5.2: 201 AND OVER STALLS, AT LEAST 8% OF TOTAL (432 * 0.08 = 34.4 = 35)
PER 2019 CALIFORNIA GREEN BUILDING CODE TABLE 5.106.5.3.3, 201 AND OVER STALLS, 6% OF TOTAL STALLS TO BE ELECTRICAL VEHICLE CHARGING STATIONS (EVCS). (430 * 0.06 = 25.8 = 26)

PER CBC TABLE 11B-228.3.2.1, 26 TO 50 EVCS STALLS, 1 VAN ACCESSIBLE EVCS, 1 STANDARD ACCESSIBLE EVCS AND 1 AMBULATORY EVCS ARE REQUIRED.
OF THE 26 EVCS REQUIRED, 1 VAN EVCS AND 1 STANDARD ADA EVCS AND 1 AMBULATORY ARE PROVIDED AS SHOWN.
OF THE 34 CLEAN AIR STALLS, 26 ARE EVCS AND (35 - 26) = 9 STALLS ARE TO BE LABELED WITH PAINTED LETTERS PER CALGREEN SECTION 5.106.5.2.1 STATING "CLEAN AIR / VANPOOL / EV". THE LOWER EDGE OF THE LAST WORK IS TO ALIGN WITH THE END OF THE PARKING STALL.

SITE LEGEND:

- BUILDING AREA
- LANDSCAPE AREA
- CONCRETE AREA
- ASPHALT AREA
- BIOSWALE / STORMWATER DETENSION AREA
- UNAVOIDABLE WETLAND IMPACTS
- ISOLATED WETLANDS
- WATERS OF THE U.S. WETLANDS
- DEVLIN RD. / GREEN ISLAND RD. WETLAND IMPACT
- 50' WETLAND BUFFER
- NEW RAIL SPUR
- DOCK LEVEL OVERHEAD DOOR
- GRADE LEVEL OVERHEAD DOOR
- FUTURE DRIVE-IN DOOR KNOCK OUT

KEYNOTES:

1. EXISTING PROPERTY LINES.
2. PROPOSED PROPERTY LINES, SEE CIVIL DRAWINGS
3. STRIPED PATH OF TRAVEL TO TRASH ENCLOSURE
4. PARKING AND DRIVE ISLES TO BE ASPHALTIC CONCRETE
5. TYPICAL 6" TALL X 6" WIDE CONCRETE CURBS, SEE CIVIL DRAWINGS
6. TYPICAL 4" WIDE TRAFFIC STRIPING
7. TYPICAL PARKING:
   - A. STANDARD STALLS: 9' X 19' OR 9' X 17' WITH 2' PARKING OVERHANG
   - B. COMPACT STALLS: 8' X 16' OR 8' X 14' WITH 2' PARKING OVERHANG (35% MAX)
   - C. ACCESSIBLE PARKING STALLS: 9' X 18' MIN. WITH 2' PARKING OVERHANG WITH 5' OR 8' WIDE LOADING ZONE AS SHOWN SEE DETAIL 12 SHEET A01.3
   - D. DESIGNATED PARKING PER CAL-GREEN REQUIREMENTS FOR CAR/VAN POOL, FUEL EFFICIENT, EV & LOW-EMITTING VEHICLES.
   - E. ELECTRIC VEHICLE CHARGING SPACES (STALLS LABELED "ELECTRIC VEHICLE CHARGING"). PER CGBC 5.106.5.2, TO FACILITATE FUTURE INSTALLATION CONDUIT, RING AND STRING SHALL BE INSTALLED AT THIS TIME AS PART OF THE SHELL CONSTRUCTION.
   - F. ACCESSIBLE ELECTRIC VEHICLE CHARGING STALL, 1 VAN, 1 STANDARD. (RING AND STRING ONLY)
8. TYPICAL DRIVE ISLE, 26'-0" WIDE MINIMUM
9. CURB RAMP, SEE DETAIL 9/A01.7
10. PROPOSED LOCATION OF NEW SITE ACCESS DRIVE CURB CUT, SEE CIVIL DRAWINGS
11. NEW CONCRETE PEDESTRIAN WALKS. ASSUME ALL SIDEWALKS TO BE ACCESSIBLE PATH OF TRAVEL. SLOPE NOT TO EXCEED 1:20 (5%) IN DIRECTION OF TRAVEL. CROSS SLOPE NOT TO EXCEED 1:50 (2%) WHERE PARKING OVERHANG OCCURS, INCREASE WIDTH OF SIDEWALK TO 6'-0" MIN.
12. PROPOSED BUILDING EXTERIOR WALLS TO BE SITE CAST TILTED CONCRETE WALLS WITH REVEALS, A TEXTURED ELASTOMERIC COATING AND A MULTI-COLOR PAINT PALLET. SEE EXTERIOR ELEVATIONS, SHEET A03.1 A03.2 A03.3.
13. TRASH ENCLOSURE W/ 40FT. APPROACH, SEE DETAILS 1 & 2/A01.7
14. TYPICAL LANDSCAPE PLANTER AREA, SEE LANDSCAPE DRAWINGS
15. SEMI TRACTOR TRAILER TEMPLATE SHOWN FOR REFERENCE ONLY
16. 60' DEPRESSED CONCRETE TRUCK DOCK
17. LOADING DOCK ROLL UP DOOR, TYPICAL
18. GRADE LEVEL ROLL UP DOOR, TYPICAL
19. ACCESSIBLE PATH OF TRAVEL AT PUBLIC SIDEWALK
20. LOCATION OF SITE ENTRY SIGN REGARDING PARKING IN ACCESSIBLE PARKING STALLS. SEE DETAIL 15/A01.7
21. CURB WITH GUARDRAIL AT EACH SIDE OF DEPRESSED LOADING DOCKS, TYP. SEE DETAIL 18/A01.7
22. STORM WATER RETENTION BASIN, SEE CIVIL DRAWINGS
23. BICYCLE RACKS, SEE DETAIL 14/A01.7
24. EMERGENCY VEHICLE ACCESS WITH REMOVABLE BOLLARDS
25. PREFABRICATED PAINTED STEEL DOCK STAIR & BOLLARDS
26. LANDSCAPE SETBACK
27. EXISTING WETLAND AREA. SEE SITE LEGEND FOR MORE INFORMATION.
28. SITE LIGHTING, SEE PHOTOMETRIC PLANS
29. DASHED LINE INDICATED 2'-0" PARKING OVERHANG.
30. STRIPED PASSENGER PATH OF TRAVEL
31. TRAILER PARKING STALLS WITH CONCRETE DOLLY PADS
32. RED DASHED LINE INDICATES WETLAND BUFFER AREA. SEE SITE LEGEND FOR MORE INFORMATION.
33. SITE EASEMENT. SEE CIVIL DRAWINGS FOR MORE INFORMATION.
34. PROPOSED TRUCK ACCESS DRIVE AISLE.
35. LOCATION OF FIRE DEPARTMENT APPROVED "KNOX BOX" AT BUILDING PRIMARY ENTRY, MOUNT AT +6'-0" AFF. CONFIRM LOCATION, MOUNTING HEIGHT AND ALL OTHER CRITERIA WITH THE CITY OF AMERICAN CANYON FIRE DEPARTMENT
36. PROPOSED VEHICLE ACCESS DRIVE AISLE.
37. DETENTION BASINS, SEE CIVIL DRAWINGS

DESCRIPTION	CUT (CY)	FILL (CY)
ROUGH GRADING	139,500	146,900
UTILITY/DEVELOPMENT SPOILS	2,000	--
SUBTOTAL	141,500	146,900
NET (BALANCE)		5,400

EARTHWORK NOTES:

1. ALL SPOIL QUANTITIES ARE PRELIMINARY. QUANTITIES EXCLUDE BUILDING SPOILS, UTILITY SPOILS (BELOW BUILDING), FOOTING SPOILS, RETAINING WALL SPOILS, AND SPOILS FOR LANDSCAPE ELEMENTS AND TREES. CONTRACTOR TO VERIFY ALL SPOILS WITH FINAL UTILITY, ARCHITECTURAL, AND STRUCTURAL PLANS PRIOR TO CONSTRUCTION.
2. DETENTION BASIN/STORMWATER QUALITY BASIN EARTHWORK IS INCLUDED IN THE ROUGH GRADING QUANTITY. THIS INCLUDES CUT TO THE BOTTOM OF THE GRAVEL LAYER.
3. EARTHWORK QUANTITIES DO NOT INCLUDE ANY SHRINK OR SWELL ADJUSTMENT.

Loropetalum 'Ever Red'	Fringe Flower	Low	5 Gallon	6' OC	6' X 6'
Nandina varieties	Heavenly Bamboo	Low	5 Gallon	5' OC	5' X 5'
Raphiolepis 'Indian Princess'	Indian Hawthorne	Low	5 Gallon	5' OC	5' X 3'
Rosa Carpet varieties	Carpet Rose	Med	5 Gallon	5' OC	4' X 5'
Rosemarinus 'Tuscan Blue'	Tuscan Rosemary	Low	5 Gallon	5' OC	6' X 5'
Xylosma c. compacta	Compact Xylosma	Low	5 Gallon	6' OC	6' X 6'
Tulbaghia violacea	Society Garlic	Low	1 Gallon	2' OC	2' X 2'

GRASSES & ACCENTS

Achillea 'Moonshine'	Yarrow	Low	1 Gallon	2' OC	2' X 2'
Calamagrostis 'Karl Foerster'	Feather Reed Grass	Low	1 Gallon	3' OC	4' X 3'
Muhlebergia capillans	Pink Muhly Grass	Low	1 Gallon	4' OC	4' X 5'
Pennisetum 'Karley Rose'	Fountain Grass	Med	1 Gallon	3' OC	3' X 3'
Pennisetum s. Cupreum'	Red Fountain Grass	Low	1 Gallon	4' OC	4' X 4'
Tulbaghia violacea	Society Garlic	Low	1 Gallon	2' OC	2' X 2'

GROUNDCOVER

Coprosma p. 'Verde Vista'	NCN	Low	1 Gallon	3' OC	2' X 4'
Cotoneaster dammen	Bearberry	Low	1 Gallon	4' OC	1' X 6'
Juniper c. 'Blue Pacific'	Shore Juniper	Low	1 Gallon	4' OC	1' X 6'
Myoporum 'Pink'	NCN	Low	1 Gallon	5' OC	1' X 8'

COVER

Landscape Planters-3" Layer of Recycled Wood mulch in all landscape planters

BIO RETENTION TREATMENT

48 lbs. per acre Pacific Coast Seed

Apply Compact Bio Swale Mix via hydroseed at the following rates:

Bio Swale Seed Mix	48/lbs/ac
Mulch	2000 lbs/ac
M-Binder Tackifier	180 lbs/ac

WELO NOTES

1. ALL PLANTS AND TREES ARE WUCOLS LOW OR MEDIUM WATER VARIETIES.
2. SOIL AMENDMENTS WILL BE INCORPORATED PER SOILS TEST. COMPOST WILL BE ORGANIC COMPOSTED GREEN WASTE.
3. ALL PLANTER AREAS SHALL BE TREATED WITH A 3" LAYER OF RECYCLED MULCH.
4. A FULLY AUTOMATIC IRRIGATION SYSTEM THAT MEETS THE CURRENT WATER EFFICIENT LANDSCAPE ORDINANCE REQUIREMENTS SHALL BE INSTALLED INCLUDING THE FOLLOWING:
5. AN ET (SMART) CONTROLLER AND ET SENSOR SHALL BE USED FOR WEATHER BASED IRRIGATION CONTROL.
6. A MASTER VALVE AND FLOW SENSOR SHALL BE INSTALLED IN THE SYSTEM.
7. ALL PLANTER AREAS SHALL BE IRRIGATED WITH POINT SOURCE-DRIP IRRIGATION.
8. TREES SHALL RECEIVE DEEP WATER BUBBLERS ON SEPARATE VALVES.
9. WELO DOCUMENTATION SHALL BE SUBMITTED WITH LANDSCAPE IMPROVEMENT PLANS (CONSTRUCTION DOCUMENTS).

BUILDING A PRELIMINARY LANDSCAPE NOTES

1. THERE IS APPROXIMATELY 195,250 SQ' OF LANDSCAPE PLANTER AREA.
2. THERE IS 10.4% LANDSCAPE AREA WITHIN THE PARKING AND CIRCULATION AREAS.
3. THERE ARE 430 PARKING STALLS AND 143 SHADE TREES. REQUIREMENT OF 1 TREE PER 3 STALLS SINGLE LOADED AND 1 PER 6 STALLS DOUBLE LOADED HAS BEEN MET.

BUILDING B PRELIMINARY LANDSCAPE NOTES

1. THERE IS APPROXIMATELY 186,547 SQ' OF LANDSCAPE PLANTER AREA.
2. THERE IS 11.3% LANDSCAPE AREA WITHIN THE PARKING AND CIRCULATION AREAS.
3. THERE ARE 430 PARKING STALLS AND 139 SHADE TREES. REQUIREMENT OF 1 TREE PER 3 STALLS SINGLE LOADED AND 1 PER 6 STALLS DOUBLE LOADED HAS BEEN MET.

RESOLUTION NO. 2022-XX

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF AMERICAN CANYON, CALIFORNIA, RECOMMENDING THE CITY COUNCIL OF THE CITY OF AMERICAN CANYON APPROVE THE GIOVANNONI LOGISTICS CENTER PHASE 1 DESIGN PERMIT TO ALLOW UP TO 1,069,904 SQUARE FEET OF HIGH-CUBE WAREHOUSE USES ON 70.2 ACRES LOCATED NORTH OF GREEN ISLAND ROAD AND EAST OF DEVLIN ROAD, APN 057-090-008, 057-130-034, 057-130-036, (FILE NO. PL 20-0042)

WHEREAS, pursuant to Section 65300 of the State Planning and Zoning Law, the City of American Canyon (City) adopted a General Plan to provide comprehensive long-range planning and a blueprint of the City's future form, including land use and circulation maps that specify the roadway network and the distribution of types and intensities of land; and

WHEREAS, Buzz Oates LLC, ("applicant"), submitted a Giovannoni Logistics Center Phase 1 Design Permit application to develop a 70.2-acre area east of Devlin Road for two high-cube warehouse buildings totaling 1,069,904 square feet (the proposed project); and

WHEREAS, Building A, located at 300 Green Island Road, is proposed to be 627,976 square feet, and may be rail-served by the adjacent Napa Branch Line; and

WHEREAS, Building B, located at 1200 Devlin Road, is proposed to be 469,512 square feet; and

WHEREAS, both buildings would provide docks, grade level roll-up doors, and trailer parking stalls and enclosed with a secure perimeter; and

WHEREAS, access would be restricted to authorized users; and

WHEREAS, on November 17, 2022, the Planning Commission recommended the City Council certify that the Final Environmental Impact Report (EIR) (SCH# 2021010104) has been completed in compliance with the California Environmental Quality Act (CEQA) and as adequately reflects the City's independent judgement and analysis regarding the potential environmental impacts associated with the Giovannoni Logistics Center Project, and adopt CEQA Findings of Fact, a Statement of Overriding Considerations, for the Project, and adopt a the Mitigation Monitoring and Reporting Program for the Project; and

WHEREAS, the Giovannoni Logistics Center Final EIR specifically evaluated the Phase 1 Design Permit at a Project level and the Planning Commission reviewed and considered the information contained in the Final EIR prior to making recommendations concerning the approval of the proposed project; and

WHEREAS, on November 17, 2022, the Planning Commission conducted a duly-noticed public hearing to evaluate the Giovannoni Logistics Center Phase 1 Design Permit and heard all public speakers and considered all written materials including the staff report and oral testimony given at the meeting.

NOW, THEREFORE, BE IT RESOLVED that the Planning Commission recommends the City Council make all the required findings to approve the Giovannoni Logistics Center Phase 1 Design Permit, as follows:

SECTION 1: Design Permit Findings

Approval of the Design Permit requires all the following findings be made, pursuant to American Canyon Municipal Code Section 19.41.050:

A. The project complies with all applicable provisions of the Zoning Ordinance and any applicable approvals granted for the project by any decision-making authority.

The proposed two warehouses comply with the General Industrial zoning height, bulk, and setback regulations.

B. The project and its design comply with any applicable design guidelines.

The project complies with the design and development principles set out in the General Plan as Policy 1.22.4 and 1.22., as follows:

- *The architectural façade includes a variety of colors, materials, and articulating features. There are changes in color that vary from white and gray. The architectural detailing around windows, building corners, parapet, and articulated sidings of the main entrance gives a sense of human scale. There are also scoring lines on the concrete shell walls that break up the expanse.*

- *The main entry into the warehouse provides transparent building elements into the ground floor, and the exterior scoring lines gives the external appearance a modern look for an industrial facility. The ground floor of the southern elevation has store-front like windows that capture natural light.*

- *The façade includes articulation, gray painted squares, and a white parapet trim to provide visual relief and interest.*

- *The southwest building entrance is clearly identified with the articulated white and grey siding. The entrance also has storefront like windows for natural light.*

- *The building design includes tall parapet to screen rooftop structures and the mechanical equipment and a condition of approval requires adequate equipment screening at the time of building permit issuance.*

- *The site is well landscaped, including trees throughout the parking areas and along the southern, western, and northern edges of the site, and plantings within the stormwater bio-retention area that runs along the northwest side of the site.*

- *There are clearly marked pedestrian routes in the parking lot leading to the front office of the building.*

C. The project and its design comply with all applicable general plan policies.

The project complies with all applicable general plan policies because the proposed use is included in the Industrial use designation; the building and site design comply with the Design Guidelines set out in the General Plan as Policy 1.22.4 and 1.22.7; and the project will contribute to the provision of necessary transportation improvements called for in the 2018 Circulation Element update because it will pay the Traffic Impact Fees, as periodically adjusted.

D. The project complies with applicable policies of Napa County Airport Land Use Compatibility Plan.

The project site falls entirely within Zone D of the Napa County Airport Land Use Compatibility Plan (ALUCP) Area. Zone D is characterized by moderate risk, frequent noise intrusion, and routine overflights below 1,000 feet above ground level. The ALUCP indicates that warehousing, low intensity light industrial uses and office uses are normally acceptable uses.

The ALUCP sets forth maximum density criterion of 100 people per net acre for Zone D Therefore, the proposed project complies with the building height requirements of the Napa County Airport land use compatibility plan. As described in the Giovannoni Logistics Center Final EIR (SCH# 2021010104), the maximum site density complies with the density recommendation of no more than 100 persons per net acre.

In addition to the 70.2-acre development site, an additional 45 acres of the project site would be permanently preserved as a Wetland Preserve. This area contains wetlands that currently attract wildlife (e.g., avian species). Avian species are considered potential hazards to aviation activities due to the potential for bird strikes. The two aspects of the proposed project that have the greatest potential for creating aviation safety hazards are the open space area and the stormwater basins.

The proposed project would create new wetland features to offset those impacted as result of the proposed project. However, it would not substantially increase the bird attractant potential because the new compensatory wetlands represent a small portion of the total open space area. Thus, the proposed project would not introduce new aviation hazards in this respect.

The proposed stormwater basins would be designed to drain out within 48 hours of a 10-year storm event. This rapid drainage rate would minimize the amount of time the basins would hold standing water, which, in turn, would reduce their avian attractant attributes. Additionally, standing water would be prevalent in many areas in the project vicinity during and immediately after a storm event; thus, the basins would not represent a greater attractant in this respect. Moreover, the basins are not intended to hold water for extended periods or to be used as an aesthetic water feature.

Furthermore, the proposed project overall would result in an approximately 163-acre reduction in avian foraging habitat as a result of the development of the proposed structures and infrastructure. This would further minimize the avian attractant attributes of the project site relative to existing conditions.

The ALUCP indicates that projects that have the potential to attract wildlife are required to prepare a Wildlife Hazards Assessment. Accordingly, Mitigation Measure LU-3 requires the preparation of such an assessment and implementation of the recommendations into the design of the open space area. This would serve to minimize, if not eliminate, the wildlife attractant attributes in a manner that reduces impacts to a level of less than significant. This mitigation measure has already been satisfied through the preparation by biologists in the consulting firm AECOM of the September 27, 2022, Wildlife Hazard Assessment for the Giovannoni Logistics Center Property. This document concluded, for a variety of reasons, that the proposed project would not cause an increase above the existing level of activity of birds or other wildlife, and thus did not propose any recommendations to modify the open space area design.

The proposed project's end uses include high-cube warehouse and ancillary office, which are considered normally acceptable by the ALUCP as long as they do not create hazards. In this case, Mitigation Measure AES-3 requires all exterior lighting to use full cut-off fixtures and be directed downward to prevent interference with Napa County Airport operations. Moreover, the proposed project would reduce the amount of natural vegetation on the project site by 163 acres. The proposed project also would include landscaping and on-site drainage facilities that would be designed and managed to discourage wildlife use of the site. Mitigation Measure LU-3 requires the applicant to retain a qualified Biologist to prepare a

wildlife hazard assessment that would identify any measures needed to reduce the bird attractant potential of the wetland area, consistent with the ALUCP's policies. Collectively, the implementation of these two mitigation measures would ensure that the proposed project would not create hazards to aviation. As noted above, Mitigation Measure LU-3 has already been satisfied. The September 27, 2022, Wildlife Hazard Assessment for the Giovannoni Logistics Center Property summarized its key conclusions as follows:

> *The buildings associated with the project development site are not expected to result in a significant attraction of birds or other wildlife to the property. Some vegetation will be removed and replaced with buildings, resulting in the reduction of existing non-native grassland habitat within the development site. Anticipated changes to the existing wildlife habitat associated with the proposed construction activities include grading, excavation, permanent development, storm water controls, lighting, irrigation, noise, and increased human presence.*
>
> *The development of Phase 1 and Phase 2 features is unlikely to result in an increase in wildlife activity due to the disturbances caused by the lighting, human presence, and noise associated with the new development site, in addition to the existing baseline noise and activity from nearby vehicular traffic and the Napa County Airport air and vehicular traffic. Natural or man-made features that could attract wildlife to the property post-construction include the proposed stormwater retention basins; however, the stormwater retention basins are unlikely to result in significant additional wildlife attraction because the systems are designed for quick drainage, and because the basins will be surrounded by development.*
>
> *A majority of the wetland impacts will be mitigated at a 1:1 ratio, with only 0.496 acres of net gain in palustrine emergent wetlands across the site. The impacted wetlands are located within a contiguous grassland landscape and are, on average, no more than 1,500 feet south of the Proposed Wetland Preserve, where mitigation wetlands would be created among approximately 45 acres of existing wetlands. The creation of wetlands associated with the project is not expected to cause an overall increase in the current level of bird or other wildlife activity at the project site, because most of the wetlands being filled within the parcel would be replaced at a 1:1 ratio and would be located among existing wetland features that dominate the northern portion of the project site.*

In summary, the construction and development associated with the Giovannoni Logistics Center would not cause an increase above the existing level of activity of birds or other wildlife. Therefore, the project land uses would not present a hazard to Napa County Airport flight operations. It is predicted that the overall wildlife activity on the property would remain at or below current levels, based on our understanding of the planned development and our best professional assessment of the existing habitat.

E. The project's quality and character are compatible with the surrounding area, unless physically deteriorated or blighted, and will not be materially detrimental to existing development.

The project is compatible with the quality and character of the surrounding area because it maintains sufficient setbacks and has landscaped parking areas and perimeters. Additionally, the building is detailed with appropriate windows, doors, awnings, and a roofline with a parapet to screen roof level installations. The white and gray colors and sequential scoring match the adjacent warehouse buildings to the west and east of the site.

F. The proposed design is compatible with existing development in the area in terms of scale, height, bulk, proportion, materials, cohesiveness, and color, and the preservation of privacy.

The project is compatible with existing development in the area as adjacent planned buildings are a similar scale and height. The building is setback from Devlin Road and Green Island Road and screened with landscaping that is native or adapted to the region. The design, exterior materials, and colors are industrial in character, but fit with the palette of other newly-constructed industrial buildings.

G. The design improves the community's appearance by avoiding both excessive variety and monotonous repetition.

The project avoids monotonous repetition with architectural features around entrances and building corners, variation in elevation treatment, and a range of compatible colors on the exterior walls. The grey trim differentiates this building from its neighbors. The site also has many landscaped areas which create separation and interest in the design.

H. The proposed design promotes a harmonious transition in terms of scale and character between areas of different general plan land use designations and zoning districts.

The project consists of two one-story distribution facilities. The perimeter landscaping consists of numerous deciduous and evergreen trees that complement the surroundings. The project buildings will be painted gray and white. The buildings will also be scored and the offices will have soft corners with transparent glass walls to reduce monotony.

I. The proposed design provides for adequate and safe on-site vehicular and pedestrian circulation.

Each building will have two driveway access points to the adjacent street. Entry points for each building provide good sight lines. The parking lot provides accessible parking, electric vehicle parking, and striped pedestrian pathways. The site will also provide sidewalks for the street and building entries. The site has adequate parking lot lighting that illuminates at night without producing glare onto neighboring parcels. The site will safely accommodate vehicular and pedestrian movements related to this industrial project.

SECTION 2: Conditions of Approval

General

1. The Design Permit approval is granted for two high-cube warehouse buildings within the Project totaling 1,069,904 square feet on a 70.2-acre site east of Devlin Road and north of Green Island Road. Building A, located at 300 Green Island Road is proposed to be 627,976 square feet; and Building B, located at 1200 Devlin Road is proposed to be 469,512 square feet. (APN 057-360-007) as shown on Exhibit A. Exhibit A includes the following:
    a. Architectural Plans prepared by RMW Architecture, dated 11-11-2020 consisting of 12 sheets, including Photometric Renderings, Preliminary Site Plan, Roof Plan Floor Plan, and Elevations
    b. Civil Plans prepared by CBG Engineers, dated 09-17-21 consisting of 6 sheets, Tentative Map, Existing Site Conditions, Preliminary Grading and Drainage Plan, Preliminary Utility Plan, Preliminary Stormwater Control Plan, and Preliminary Fire Access Plan.
    c. Preliminary Planting Plan prepared by RMW Architecture, dated 11-11-2020 consisting of 1 sheet.
    d. Photometric Plans prepared by Cal Lighting, dated 11-13-2020 consisting of 4 sheets, showing proposed lighting and site photometric plan.

2. The applicant shall defend, indemnify, and hold harmless the City of American Canyon ("City"), its elected and appointed officials, officers, employees, attorneys, representatives, boards, commissions, consultants, volunteers and agents from and against all claims, actions, including actions to arbitrate

or mediate, damages, losses, judgments, liabilities, expenses and other costs, or proceedings against the City, its elected and appointed officials, officers, employees, attorneys, representatives, boards, commissions, volunteers, or agents to attack, modify, set aside, void, or annul an approval, conditional approval, permit, entitlement, environmental document, environmental clearance, mitigation plan, or any other document or any of the proceedings, acts, or determinations taken, done, or made prior to granting of such approval, conditional approval, permit, entitlement, environmental clearance, environmental document, mitigation plan, or other documents, by the City, including, without limitation, an action against an advisory agency, appeal board, or legislative body within the applicable limitation period.

The obligation to defend, indemnify and hold the City harmless shall include the payment of all legal costs and attorney's fees (including a third party award of attorney's fees), arising out of, resulting from, or in connection with the City's act or acts leading up to and including approval of any environmental document or mitigation plan granting approvals to the applicant, incurred on behalf of, or by, the City, its elected and appointed officials, officers, employees, representatives, attorneys, boards, commissions, volunteers and agents in connection with the defense of any claim, action, or proceeding challenging the entire or a portion of an approval, conditional approval, permit, entitlement or any other document of any related claim.

The obligation to defend, indemnify, and hold the City harmless shall include, but not be limited to, the cost of preparation of any administrative record by the City, staff time, copying costs, court costs, or attorney's fees arising out of a suit or challenge contesting the adequacy of a permit, approval, conditional approval, entitlement, environmental document, mitigation plan, environmental clearance, or any other document or approval related to the applicant's project.

The City will promptly notify the applicant of any claim, action, or proceeding and will cooperate fully in the defense. If the City fails to promptly notify the applicant of any claim, action, or proceeding, or the City fails to cooperate fully in the defense, the applicant shall not be responsible to defend, indemnify, or hold harmless the City.

In the event a legal challenge to a City permit, approval, conditional approval, environmental document, environmental clearance, mitigation plan, entitlement or any other document, proceeding, determination, or action related to the applicant's project is successful, and an award of attorneys' fees is granted against the City, the applicant shall be responsible to timely pay the full amount of such an award.

3. The applicant is responsible for paying all charges related to the processing of this discretionary case application within 30 days of the issuance of the final invoice or prior to the issuance of building permits for this project, whichever occurs first. Failure to pay all charges shall result in delays in the issuance of required permits or the revocation of the approval of this application.

4. The date upon which the approval is final shall be considered the day of the imposition of the fees, dedications, reservations and exactions required by these conditions approval for the purposes of protesting the imposition pursuant to California Government Code Section 66020.

5. The application shall not be deemed final until the applicant and property owner(s) execute and return the "Confirmation of Conditions of Approval" form as shown as Exhibit B to this Resolution.

6. Expiration of this Approval. In accordance with American Canyon Municipal Code (ACMC) Section 19.41.060 the approval shall become null and void and of no effect if no construction permits have been issued and construction commenced within two years of the date upon which this approval is final.

This provision shall not apply to applications approved in conjunction with another discretionary permit. In these cases, the expiration period shall coincide with that of the associated period.

An extension of time may be granted by the Community Development Director upon the written request by a responsible party before the expiration of the two-year period, provided that the Director can make the findings that there have been no substantial changes in the approved plans, and that there has been no change of circumstances which would prevent any of the required findings of approval to be made.

Planning

7. All plans submitted for review and approval and all development shall be in substantial conformance with the approved exhibits, except where modified by a condition of approval. The Community Development Director or designee may approve minor changes to the project as approved by the City Council on the plans submitted for the construction permits with a determination that the changes are in substantial compliance with the representation of the project as reviewed by the Planning Commission and City Council, that the proposed change will be in compliance with the required development standards, and the change will not materially affect adjacent private or public property.

8. The conditions of this Permit shall be printed on the first sheet of each plan set submitted for a building permit pursuant to this Design Permit, under the title 'Design Permit Conditions'. The second sheet may also be used if the first sheet is not of sufficient size to list all of the conditions. The sheet(s) containing the conditions shall be of the same size as those sheets containing the construction drawings; 8-1/2" by 11" sheets are not acceptable.

9. Plans submitted for building permits shall include all exterior site lighting including building mounted lighting, lighting within the parking areas and along walkways that provide a minimum of 1-foot candle illumination of these areas. Lighting shall be shielded as appropriate and avoid light spillage or glare from the project site. Exterior light fixtures on buildings shall be oriented downward and shall be shielded to return potential light and glare impacts.

10. All new roof top equipment is required to be screened with a parapet equal or taller than the mechanical equipment. Alternative methods and materials for screening will be subject to the review and approval of the Community Development Director.

11. This permit does not include approval for signs. The applicant shall obtain a separate sign permit prior to installation of any sign. The signs shall be subject to ACMC Section 19.23.

12. Prior to building permit issuance, the applicant shall submit final landscape plans that comply with the State of California Water Efficient Landscape Ordinance. The landscape architect shall document and attest to the compliance with the State ordinance on the landscape plans. The plans shall incorporate the following requirements:

    a. All trees must be 15 gallons in size or larger.

    b. Provide cross sections for the north and south landscaping areas showing trees, landscaping, etc. that ensure that proposed trees would not be planted above proposed utilities or inappropriately planted in bio-retention areas. Ensure the landscape plans are reconciled with the civil plans and continue to provide a robust tree palette.

13. Prior to the issuance of a certificate of occupancy, the project landscape architect shall certify that all plant materials have been installed in accordance with the approved landscape plan.

14. All tree stakes and ties shall be removed within one year following installation or as soon as trees are able to stand erect without support.

15. Clear sight triangles shall be maintained at all driveways. Low-lying plantings and other site fixtures, including signs, shall be no taller than 30 inches within the site vision triangles.

16. All planting shall be maintained in good growing condition. Such maintenance shall include, where appropriate, pruning, mowing, weeding, cleaning of debris and trash, fertilizing, and regular watering. Whenever necessary, planting shall be replaced with other plant materials to ensure continued compliance with applicable landscaping requirements. Required irrigation systems shall be fully maintained in sound operating condition with heads periodically cleaned and replaced when missing to insure continued regular watering of landscape areas, and health and vitality of landscape materials.

Building and Safety

17. Construction and grading activities on the site shall be limited to between 7:00 a.m. and 6:00 p.m. Monday through Friday. Work between the hours of 6:00 pm and 7:00 am and work on weekends and holidays requires prior written approval from the Building Official. If weekends and holiday work is approved construction and grading activities on the site shall be limited to between 8:00 a.m. to 6:00 p.m. on Saturdays, and between 10:00 a.m. and 6:00 p.m. on Sundays and State and Federal holidays.

18. All construction plans and buildings onsite shall conform to the California Code of Regulations, Title 24. All building plans shall include all necessary recommendations from the Geotechnical Report for the site, to be superseded only by the California Code if any conflicts arise.

19. According to CBC 11B-228.3.2.1, provide the applicable amount of electrical vehicle charging stations (EVCS) and van accessible EVCS spaces for the employee parking lot.

20. Prior to the final inspection, the applicant shall submit a letter of certification to the Building Official from the project architect, civil engineer, and landscape architect certifying that all improvements have been constructed in accordance with the approved building plans. A Certified Access Specialist (CASP) shall also submit a letter certifying that all improvements have been constructed in compliance with applicable state and federal accessibility standards. Determination of consistency shall be subject to the review and approval of the Building Official.

21. Construction and Demolition Debris Recycling: Prior to issuance of a building permit the applicant shall submit a Construction Waste Management (CWM) plan for the diversion of at least 70 percent of the debris from the building demolition and construction. The plan shall include the qualified recycler that will be used, the methods of managing diversion of construction materials on site, and the proposed documentation that will be submitted to confirm that the diversion goal has been met.

Fire Protection

The following Fire Protection conditions shall be satisfactorily addressed on the building permit submittal:

22. Prior to City issuance of the first building permit, in accordance with ACFPD Agreement 2022-29, the Applicant shall form a Mello-Roos Community Facilities District or similar public financing mechanism

(CFD) on full legal parcels that are a part of the Project. A copy of Agreement 2022-29 is included with this Resolution as Exhibit C.

23. In accordance with the standard mitigation measures and conditions of approval set forth by the City of American Canyon, the developer shall pay the Fire Impact Fees (see current Standard Fees and Charges adopted by resolution), prior to the issuance of any building permits.

24. New buildings and additions to existing buildings shall conform to requirements set forth in the currently adopted editions of the California Building Code, California Fire Code, City of American Canyon standards and Nationally Recognized Standards.

25. There shall be no deferred submittals for fire protection equipment and related utilities. Fire protection plans shall not be attached to or bound with the building plan submittal package. This includes but is not limited to Automatic Fire Sprinkler, Fire Alarm, Fixed Fire Protection, and Civil plans.

26. All Fire-related underground piping and fire appurtenances shall be shown on the Civil plan submittal. In addition to the Civil plan submittal, at least one (1) plan set under separate cover shall be submitted to American Canyon Building Division for routing to the American Canyon Fire Protection District detailing all underground piping and related fire appurtenances including but not limited to underground piping, underground sweep detail, underground trench details showing depth of burial, type of backfill, manufacturer's specifications of piping, valves joints, fittings and calculated size and locations of thrust blocks, hydrants locations (designate public or private), gate shut-off valves, PIV's, FDC's, fire pumps, fire pump and/or riser rooms. The applicant will need to submit all related Fire information on a separate plan for Fire review. The Fire-related portions of the civil plan shall not be bound with the building plan.

27. Underground utility contractor, architect and fire sprinkler contractor shall coordinate the location of risers and control valves prior to the issuance of a building permit.

28. An approved water supply capable of supplying the required fire flow for fire protection systems shall be provided to all premises upon which facilities or buildings are hereby constructed or moved into or within the City. Required fire flow and hydrant distribution shall be in accordance with Appendix B and C of the California Fire Code. Applicant shall demonstrate on plan submittal; square footage of each building on plan and provide the required fire flow information. Applicant shall demonstrate that the number and spacing of onsite fire hydrants meets with requirements of the California Fire Code. ***See sample below regarding fire flow and hydrant detail information needed.***

BUILDING FIRE FLOW REQUIREMENTS – CFC TABLES B105.2 & B105.1(2)

INFORMATION BELOW IS A SAMPLE AND FOR REFERENCE ONLY

Table B105.1(2) – Building size = 129, 600 square feet

Construction type = Type IIA

FF = 5,250 gpm at 20 psi

Duration = 4 hours

Table B105.2 – Fire sprinkler allowance = - 50%

5,250 – 2,625 = 2,625 gpm

FF = 2,625 gpm @ 20 psi

Duration = 2 hours

Table CC105.1 – Approximate number of hydrants = 3

Average spacing = 400 feet + 25% allowable increase = 500

Maximum distance from street or frontage = 225 feet = 50% allowable increase = 337.5

29. The fire protection equipment shall be located within an interior room having an approved exterior access door or in an exterior enclosure attached to the building, specifically, for the purpose of housing such equipment.

30. Prior to building permit issuance, provide a fire department circulation plan using the City's ladder truck and demonstrate clear turning movements into and out of the project. The final design of fire department access components shall be reviewed and approved by the Fire Marshal prior to installation. Please show how fire apparatus can position near the building on either side, with the ability to turn the apparatus around to leave the project site.

31. Fire Apparatus Access Roads shall be designed in accordance with provisions set forth in the California Fire Code Chapter 5 and Appendix D as amended by the City of American Canyon and the applicable Public Works Standard.

32. Fire apparatus access roads shall have an unobstructed minimum width of 20 feet (curb to curb) and a minimum unobstructed vertical clearance of 13' 6". They shall have an all-weather paved surface capable of supporting a GVW of 71,000 pounds.

33. Access roads shall be completed with all-weather surfaces prior to the stockpiling of combustible materials or beginning combustible construction. Fire apparatus access shall be provided to within 150 feet of the most remote portions of all building from an approved exterior route. If this cannot be achieved fire apparatus turn-arounds will be needed.

34. Fire apparatus access roads shall not be obstructed in any manner, including the parking of vehicles. Vertical traffic calming in the form of speed pumps, humps or dips are prohibited along fire access roads without prior approval of the fire Code Official. The minimum width and clearances established in Section 503.2.1 shall be maintained at all times.

35. When required by the Fire Chief, fire apparatus access roads shall be designated as Fire Lanes and appropriate signs and/or markings installed in accordance with the California Vehicle Code and approved City standards.

36. Where applicable, improvement plan submittals for permit shall include locations of fire lane red curbing and fire lane signage. Please refer to and include City Public Works Standard FP-2A & 2B with plan submittals for permitting.

37. The City of American Canyon requires that a fire hydrant be in service within 250 feet of the furthest point of construction prior to the stockpiling of combustible materials for the beginning of construction.

38. Fire Department Connections (FDC) shall be located not more than 100 ft. from the nearest fire hydrant.

39. Improvement Plans submitted for permit shall include City of American Canyon "Underground" standards, detail drawings and the applicable City of American Canyon Public Works Standard detail (W-7A, B, C or D) for Fire Service double detector check installations. *Also, a separate set of plans shall be submitted detailing all related underground Fire utilities and appurtenances including but not limited to; All underground piping, type, sizes, depth of burial, fittings, thrust blocks, risers, pumps, hydrants, FDC's, etc.*

40. System Protection Area Limitations NFPA 13 – 8.2.1 Maximum floor area on any one floor to be protected by sprinklers supplied by any one sprinkler system riser or combined system riser shall be as follows:

    1. Light Hazard – 52,000 sf – per riser
    2. Ordinary Hazard - 52,000 sf – per riser
    3. *Extra Hazard – Hydraulically calculated - 40,000 sf – per riser
    4. Storage – High-piled storage (as defined in 3.9.1.16) and storage covered by other NFPA standards – 40,000 sf – per riser

Public Works

General Conditions of Approval

41. The Applicant shall be responsible for all City plan check and inspection costs. The Applicant shall establish a Developer Deposit Account with the City upon the initiation of plan check services. The amount of the initial deposit shall be determined by the City Engineer. Additional funds may be required based upon actual costs.

42. All improvements shall be designed in accordance with the American Canyon Municipal Code (ACMC), City of American Canyon Engineering Standard Plans and Specifications for Public Improvements (City Standards), except as specifically noted otherwise in these conditions.

43. All new utilities to serve the project, shall be placed underground. Exceptions may be allowed for surface-mounted transformers, pedestal mounted terminal boxes, and meter cabinets.

44. Unless otherwise explicitly permitted, all existing wells, septic tanks, and/or underground fuel storage tanks shall be abandoned under permit and inspection of Napa County Department of Environmental Services or other designated agency. If there are none, the project engineer shall provide a letter describing the scope of the search done to make this determination.

45. A detailed Soils Investigation/Geotechnical Report shall be prepared and submitted for review. The report shall address, at a minimum, potential for liquefaction, R-values, expansive soils, and seismic risk. The improvement plans shall incorporate all design and construction criteria recommended in the Geotechnical Report.

46. A drainage report prepared by a California Registered Civil Engineer shall be submitted for review with the initial submittal of the Improvement Plans. The report shall include detailed hydrologic and hydraulic calculations to support the design and sizing of all public and private drainage facilities including storm drains and detention facilities. The report shall address existing downstream storm drain facilities and hydraulic conditions which may impact the design of proposed facilities and improvements.

47. A final detailed post-construction Stormwater Control Plan (SWCP) that identifies and sizes all permanent post-construction stormwater treatment BMPs shall be prepared and submitted for review and approval. The SCWP shall be prepared in accordance with the latest edition of the *Bay Area Stormwater Management Agencies Association (BASMAA) Post-Construction Manual* and the requirements of the State Water Resources Control Board Phase II Municipal Separate Storm Water System (MS4) General Permit (Order 2013-0001 DWQ). It is the City's discretion whether to accept alternative treatment facilities other than bioretention.

48. A Post Construction Stormwater Operations and Maintenance Plan that includes a plan sheet showing all storm drain and water quality infrastructure that is to be maintained, along with detailed instructions and schedules for the ongoing maintenance and operation of all post-construction stormwater BMPs shall be submitted for review and approval by the City Engineer. Once approved, the property owner(s) shall enter into an agreement with the City that provides the terms, conditions, and security associated with the ongoing requirements of the post-construction Stormwater Best Management Practices.

49. The Applicant shall secure all necessary rights-of-way and public and private easements for both onsite and offsite improvements. The applicant shall prepare all necessary legal descriptions and deeds.

50. To the extent any offsite public improvements require the acquisition of property not currently owned by the Applicant or the City, the Applicant shall first make a good-faith effort to acquire the necessary property rights, however if the Applicant makes such an effort and is unable to acquire such rights, then the Applicant may request the City acquire the necessary property rights through the exercise of eminent domain provided that the Applicant enters first into an agreement with the City to pay for all costs incurred by the City to acquire such rights and if the City does not acquire the rights necessary to allow the offsite public improvements to be completed by the Applicant within statutory timeline provided by law, then the Applicant shall be relieved of the obligation to construct those off-site improvements only to the extent they require property not currently owned by the Applicant or the City. The Applicant shall make a good-faith effort to identify and acquire the necessary property rights at the earliest opportunity.

51. The Applicant shall submit site Improvement Plans, prepared by a registered Civil Engineer, for review and approval of the City's Public Works Department. **Please be aware that this is separate submittal from the building permit application.** The final plan set shall include all civil, landscape and joint trench drawings under a single cover sheet. No final grading or other construction shall be performed until the Improvement Plans have been approved. The Applicant shall not begin clearing, grubbing, or rough grading at the site prior to approval of the Improvement Plans, unless explicitly approved by the City of American Canyon through the standard grading and utilities only permit process. An Encroachment Permit is required for any work within City right of way. Encroachment Permits will not be issued prior to the approval of the Improvement Plans.

52. All public water service laterals or services (domestic, recycled and fire water) shall include approved backflow prevention devices.

53. Cathodic protection shall be provided for all water valves, fittings, hydrants, meters, backflow devices and other metal appurtenances, regardless of the findings of any soils corrosivity analysis.

54. The Applicant shall keep adjoining public and private streets free and clean of project dirt, mud, materials, and debris during the construction period in accordance with SWPPP using appropriate BMPs and as is found necessary by the City Engineer.

55. If any hazardous material is encountered during the construction of this project, all work shall be immediately stopped and the Fire Department, Napa County Department of Environmental Services or other designated agency, and the City Inspector shall be notified immediately. Work shall not proceed until clearance has been issued by all of these agencies.

56. Prior to final preparation of the subgrade and placement of base materials, all underground utilities shall be installed, and service connections stubbed out behind the sidewalk. Public utilities, Cable TV, sanitary sewers, and water lines shall be installed in a manner that will not disturb the street pavement, curb, gutter and sidewalk, when future service connections or extensions are made.

57. Where soil or geologic conditions encountered in grading operations are different from that anticipated in the soil and/or geologic investigation report, or where such conditions warrant changes to the recommendations contained in the original soil investigation, a revised soil or geologic report shall be submitted for approval by the City Engineer. Additionally, if field conditions warrant installation of any subdrains, the location, size and construction details must be provided to the City for review and approval prior to construction.

58. All new fire hydrants shall be covered with burlap sacks until the hydrants have been tested and found to be in conformance with City flow requirements. No storage of combustible materials or construction of building shall be permitted until all hydrants meet City flow requirements.

59. Prior to placing the final lift of asphalt, all public storm drains and sanitary sewer lines shall be video inspected at the Applicant's expense. All video media (CD, DVD, or portable hard drive) shall be submitted to the City. If any inadequacies are found, they shall be repaired prior to the placement of the final lift of asphalt.

60. All streets, curbs, gutters, sidewalks or other public facilities damaged in the course of construction associated with this Project shall be the responsibility of the Applicant and shall be repaired to the satisfaction of the City at the Applicant's expense.

61. After all of the new underground utilities within existing public streets have been installed, the entire affected areas shall be milled and repaved to present a neat finished pavement area. Multiple trench patches are not acceptable.

62. All construction stormwater pollution prevention best management practices (BMP's) shall be installed as the first order of work and in accordance with the State Water Resources Control Board's General Construction Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order 2009-0009-DWQ, as amended), the Applicant's Storm Water Pollution Prevention Plan (SWPPP), and the City's Erosion and Sediment control Plan in accordance with the City's MS4 Permit. All stormwater BMP's shall be maintained to the satisfaction of the Qualified SWPPP Developer (QSD), Qualified SWPPP Practitioner (QSP), and the City Engineer.

63. With the exception of water used for loading and testing of potable water lines, all construction water used for the project shall be obtained from a source other than American Canyon potable water sources. The Applicant shall provide verification that an outside source of construction water, e.g., recycled water, has been established and will be available for the duration of the project construction.

64. The development shall comply with the City's Zero Water Footprint policy.

65. All landscaping shall be designed to use recycled water for irrigation. Recycled water landscaping shall be designed to comply with California Code of Regulations Title 22 and shall include design details to prevent runoff of recycled water. The irrigation system shall include an ET/SMART controller.

66. All buildings shall be dual plumbed to use recycled water for non-potable uses.

Public Works Special Conditions of Approval

67. The Applicant shall submit Improvement Plans prepared by a registered Civil Engineer (Engineer of Record) in substantial conformance with the preliminary civil plans titled "Giovannoni Logistics Center East Tentative Parcel Map" prepared by CBG Civil Engineers dated September 17, 2021, except as modified by these conditions.

68. Improvement Plans and Final Map shall be tied to the State of California coordinate system.

69. The Applicant shall construct all of the on-site private streets, water, recycled water, sewer, storm drainage and storm quality **"Private Improvements"** generally shown on the Preliminary Plans and more specifically described below. All private street, water, recycled water sewer, storm drainage and stormwater quality improvements shall be designed in accordance with the City of American Canyon Engineering Standard Plans and Specifications for Public Improvements (City Standards), except as specifically noted otherwise in these conditions.

    a. Storm Drain Facilities:
    Construct private on-site drainage facilities, detention facilities, and other appurtenances to collect and convey all surface drainage to an approved private storm drain facility or outfall. Onsite drainage facilities shall provide for the positive drainage of all adjacent upstream or upgrade properties to prevent ponding. Existing run-on from adjacent properties shall not be obstructed and shall be conveyed onsite. Off-site peak storm water discharge shall not exceed 90% of the undeveloped peak flow from the 24-hour, 100-year event. The storm drains and detention facilities shall be substantially consistent with the Preliminary Plans. However, the sizing of all storm drains and detention facilities shall be determined by the approved final drainage report.

    b. Stormwater Quality Facilities:
    Permanent on-site private post-construction stormwater treatment BMPs shall be designed and constructed in accordance with the approved final SWCP.

    c. Recycled Water Services:
    Separate recycled water services shall be provided for domestic non-potable uses and irrigation uses.

70. Per the Subdivision Improvement and Reimbursement Agreement between the City of American Canyon and DWF IV NLP II, LLC, Napa County Official Record 2018-0024204, the Applicant shall reimburse the City its fair share cost for the improvement of South Kelly Road from its intersection with Devlin Road up to intersection with Highway 29. The fair share cost is based on the project's proportional share of net new trips.

71. Per the Subdivision Improvement and Reimbursement Agreement between the City of American Canyon and DWF IV NLP II, LLC, Napa County Official Record 2018-0024204, the Applicant shall reimburse the City its fair share cost for the construction of the Permanent Sewer Solution, which

consists of new offsite public gravity sewer, pump station and force main which replaced the existing Green Island Pump Station. The fair share cost is based on the project's sewer flow.

72. Prior to SUBMITTAL OF THE IMPROVEMENT PLANS, the Applicant shall:

    a. Submit the City's "Improvement Plan Checklist".
    b. Pay an initial cash deposit for City plan check services in amount to be determined by the City prior to the time of submittal. The Project engineer shall contact City staff to discuss submittal details to determine initial deposit amount.
    c. Provide the following:
        (1) Public Street Repair Plan
        (2) Utility Plan and Joint Trench Plan
        (3) Construction Storm Water Pollution Prevention Plan (SWPPP) and a City Erosion and Sediment Control Plan
        (4) Drainage Report
        (5) Post-Construction Stormwater Control Plan (SWCP)
        (6) Geotechnical Report
        (7) Construction Traffic Control Plan.
        (8) Traffic Impact Study
        (9) Application for Water and Sewer Service

73. Pothole and physically determine (by way of a survey performed by the Engineer of record) the actual horizontal location and vertical depth of all existing underground utilities throughout the proposed area of work and provide the design of all new utility installations required to serve the project including a schedule for implementation of such work as to prevent disrupting of utility service to adjacent properties.

74. Prior to APPROVAL OF THE IMPROVEMENT PLANS, the Applicant shall:

    a. Merge the two existing parcels (APNs 057-130-034 and 057-130-036) into a single parcel through the recordation of a lot merger or lot line adjustment.

    b. Provide written acknowledgment by the Geotechnical Engineer of Record that the Plans incorporate all design and construction criteria specified in the Geotechnical Report.

    c. Furnish proof of the acquisition of all rights of entry and/or temporary and permanent easements necessary to construct the project and the location of all such rights on the Plans.

    d. Furnish proof that all permits that may be required by the California Department of Fish & Wildlife, State and Regional Water Quality Control Board, US Army Corps of Engineers and any other regulatory agencies with jurisdiction over the proposed construction have been obtained.

    e. Fill out and submit the City's Erosion and Sediment Control Plan (ESCP) Template. Applicant may refer to a SWPPP, as appropriate, by referencing page number within the SWPPP that addresses the requirements of the ESCP.

    f. Submit a copy of the Notice of Intent and Wastewater Discharge Identification Number (WDID#) for coverage under the State Water Resources Control Board's General Construction Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order 2009-0009-DWQ).

75. Prior to COMMENCEMENT OF CONSTRUCTION ACTIVITIES, the Applicant shall:

a. Pay off all current account balances with the City of American Canyon.

b. Pay an inspection fee in amount to be determined at the time of commencement for the City's inspection of the Public Improvements.

c. Conduct a pre-construction meeting with representatives of the City whereby the Applicant, the Legally Responsible Party (LRP), Qualified SWPPP Practitioner (QSP), Qualified SWPPP Developer (QSD), and/or the Contractor provides the following:

(1) Six (6) full-size bond copies of the approved Improvement Plans for the City's use.
(2) One (1) job-site copy of the latest edition of the City Standards for the Contractor use.
(3) One (1) job-site copy of the SWPPP for use by the LRP, QSP, QSD, and Contractor.
(4) Electronic copies of Improvement Plans and SWPPP.

76. Prior to APPROVAL OF A BUILDING PERMIT, the Applicant shall:

Pay all account balances and current City and American Canyon Fire District fees (Mitigation & Capacity) based on the rates in effect at the time of permit issuance. These fees include but may not be limited to the following: Traffic Mitigation, General Plan Update, Civic Facilities, Fire District, Water Capacity, Wastewater Capacity, Zero Water Footprint Mitigation, and Affordable Housing Nexus.

77. A. Prior to issuance of the first building permit, the Applicant shall enter into a Recorded a Transportation Demand Management (TDM) Program Agreement ("TDM Agreement") that ensures the cumulative Project trip generation does not exceed the Giovannoni Logistics Center Final EIR (SCH# 2021010104) Trip Generation assumptions. The TDM Agreement shall encompass the entire Giovannoni Logistics Center Project.

B. The TDM Agreement shall include a financial guarantee satisfactory to the City. The City shall deem the TDM program to be effective if the monitoring results indicate that AM peak-hour volumes are no more than 240 vehicles and PM peak-hour volumes are no more than 264 vehicles.

C. The TDM program shall be implemented at the applicant's cost, with no cost to the City, regardless of the eventual mix of uses and shall at a minimum include a permanent vehicle counting station at the single public access point. Examples of measures that may be considered as part of an effective TDM program include but are not limited to the following:

- Starting and ending workday shifts during off-peak hours (i.e., not between 7:00 a.m. to 9:00 a.m. or 3:00 p.m. to 6:00 p.m.).
- Implement shuttle service to key employment centers or park-and-ride lots in the area for those employees whose workday shift start during peak hours.
- Car-share program
- Shuttles to regional transit
- Transit subsidies
- Carpool/vanpool subsidies
- Employer-owned/sponsored vanpools
- Flex-time and telecommute programs
- Use of rail to transport employees and/or the delivery of goods

D. The Applicant shall retain a transportation planning/ engineering consultant to analyze the effectiveness of the TDM program in a written report. The TDM Report will include data collected from the permanent vehicle counting station and a determination of employee commute methods, which shall be informed by surveying all employees working at the site. The TDM Report shall be

submitted to the City on a periodic on-going basis and it shall form the basis of on-going determinations by the City as to the effectiveness of the TDM program. So long as the City deems the TDM program effective (i.e. when monitoring results indicate that AM peak-hour volumes are no more than 240 vehicles and PM peak-hour volumes are no more than 264 vehicles). At any time the City determines the Project exceeds the Giovannoni Logistics Center Final EIR (SCH# 2021010104) Trip Generation assumptions, the additional traffic impact shall be mitigated by Paragraph B.

E. If at any point the City determines the TDM program established as part of Paragraph A through D is not effective to reduce peak-hour traffic to within the TDM thresholds (240 vehicles during the AM peak hour and 264 vehicles during the PM peak hour), the Applicant shall pay an additional amount for each and every peak-hour trip that is recorded by the counting device that exceeds the TDM threshold, equal to the latest adopted Traffic Impact Fee ("TIF") program in effect at the time. The "on-going TIF" paid pursuant to this condition of approval is in addition to the "one-time TIF" paid at the time of issuance of the first building permit.

78. Prior to OCCUPANCY OF THE BUILDING, the Applicant shall:

    a. Restore all adjacent off-site road surfaces to pre-project conditions.

    b. Submit a certification by the Geotechnical Engineer of Record that all the work has been completed in substantial conformance with the recommendations in Soils Investigation/Geotechnical Report.

    c. Provide a mylar and digital copy of the Improvement Plans that include all as-built or field changes, in digital (.pdf) and AutoCAD (.dwg) format, compatible with the City's current version, and tied to the City's coordinate system.

    d. Provide a letter stating that all of the Developer's Conditions of Approval have been met.

    e. Provide a letter from the Civil Engineer of Record certifying that all the site improvements were constructed and inspected in substantial conformance with the approved plans and City Standards.

    f. Enter and record a post-construction Stormwater Operations and Maintenance Agreement with the City.

Mitigation Measures

79. MM AES-3: Prior to issuance of building permits for the proposed project, the project applicant shall prepare and submit a photometric plan to the City of American Canyon for review and approval which demonstrates that all exterior light fixtures would be directed downward or employ full cut-off fixtures to minimize light spillage and avoid interference with aviation operations at the Napa County Airport. The approved plan shall be incorporated into the proposed project.

80. MM AIR-2a: The following Best Management Practices (BMPs), as recommended by the Bay Area Air Quality Management District (BAAQMD), shall be included in the design of the project and implemented during construction:

    - All active construction areas shall be watered at least two times per day.
    - All exposed non-paved surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and access roads) shall be watered at least three times per day and/or non-toxic soil stabilizers shall be applied to exposed non-paved surfaces.

- All haul trucks transporting soil, sand, or other loose material off-site shall be covered and/or shall maintain at least 2 feet of freeboard.
- All visible mud or dirt tracked out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
- All vehicle speeds on unpaved roads shall be limited to 15 miles per hour. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
- Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California Airborne Toxics Control Measure (ATCM) Title 13, Section 2485 of California Code of Regulations). Clear signage regarding idling restrictions shall be provided for construction workers at all access points.
- All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.
- The prime construction contractor shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The City and the construction contractor shall take corrective action within 48 hours. The BAAQMD's phone number shall also be visible to ensure compliance with applicable regulations.

81. MM AIR-2b: Prior to the issuance of grading or building permits, the project applicant shall provide the City with documentation demonstrating the use of "Low-VOC" architectural coatings during the proposed project's construction. "Low-VOC" architectural coatings used during project construction shall not exceed 50 grams of reactive organic gases (ROG) or volatile organic compounds (VOC) per liter of product.

82. MM AIR-2c: Prior to issuing any certificate of occupancy for the proposed project, the project applicant shall provide the City with documentation demonstrating the use of "Low-VOC" architectural coatings and electric landscaping equipment during the operation of the proposed project. "Low-VOC" architectural coatings used during project construction shall not exceed 50 grams of reactive organic gases (ROG) or volatile organic compounds (VOC) per liter of product. Landscaping equipment referred to in this requirement shall include lawnmowers, leaf blowers, and chainsaws.

83. MM AIR-2d: Prior to issuing the certificate of occupancy for the proposed project, the project applicant shall provide the City with documentation demonstrating the use of a truck fleet that meets or exceeds model year 2014 for all heavy- duty trucks during operation of the proposed project. If the project applicant does not own the truck fleet that would be used during operation of the proposed project, the project applicant shall provide the City with documentation from the truck fleet owner or operator demonstrating that trucks utilized for operation of the proposed project will meet or exceed model year 2014. If any change occurs where a new truck fleet is utilized during operation of the proposed project, the project applicant shall provide the City with documentation demonstrating that the new truck fleet meets or exceeds this requirement.

    To monitor and ensure that trucks that meet a model year of 2014 or newer are used for the proposed project, the fleet operator shall maintain records of all trucks and equipment associated with the proposed project's operation and make these records available to the City upon request. Alternatively, the City may require periodic reporting and provision of written records by operators and conduct regular inspections of the records to the maximum extent feasible and practicable.

84. MM AIR-2e: Prior to the issuance of the certificate of occupancy for each building with dock doors, signage shall be posted identifying idling restrictions and contact information to report violations to the building manager.

85. MM AIR-2f: Prior to the issuance of the certificate of occupancy for each building with a separate end user, the City shall confirm that the end user has prepared a Transportation Demand Management Plan (TDM Plan). The TDM Plan shall be prepared by a qualified transportation consultant and identify strategies to reduce single-occupant vehicle trips. Examples of TDM strategies may include but are not limited to:

    - Ridesharing/Ride Matching
    - Vanpools
    - Transit subsidies
    - Preferential parking for rideshare or vanpool vehicles
    - Employee lockers
    - Secure bicycle parking
    - Employee locker rooms
    - Provide TDM information in employee breakroom

86. MM AIR-2g: Prior to the issuance of the certificate of occupancy, as a part of future lease agreements, the project proponent shall provide all future tenants at the project site information on available California Air Resources Board (ARB) and Bay Area Air Quality Management District (BAAQMD) incentive programs, such as the Carl Moyer Program and the Voucher Incentive Program, that support upgrading truck fleets to clean air technology equipment.

87. MM BIO-1a: Pre-construction surveys for Swainson's hawk shall be conducted in the project site vicinity prior to initiation of project construction activities and each year following initiation of construction if project activities are delayed or discontinued for 7 or more days prior to the second survey period (March 20 to April 5), and are scheduled to recommence construction activities during the second survey period but before August 1. These pre-construction surveys shall include investigation of all potential nesting trees within a half-mile radius around all project activities and shall be completed for at least two survey periods immediately prior to commencement of project construction. Surveys shall be conducted in accordance with CDFW's "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" (CDFW 2000) to maximize the potential for locating nesting Swainson's hawk and reduce the potential for nest failures due to project activities and/or disturbances.

    If no nesting Swainson's hawk are found during the first second survey period starting March 20, then project construction may commence. If during the third surveys (April 5–April 20) Swainson's hawk are found to be nesting in the project vicinity and construction has commenced, it shall be assumed the Swainson's hawk commenced nesting and thus the Swainson's hawk are habituated to the ambient level of noise and disturbance emanating from the project site.

    If Swainson's hawk are found to be nesting within 1,000 feet of the project site, a non-disturbance buffer shall be established to keep all construction activities a minimum of 1,000 feet from the nest site. The CDFW shall be consulted regarding the adequacy of the buffer established by the qualified Raptor Biologist. At that time the necessity for acquiring a Fish and Game Section 2081 Incidental Take Permit (ITP) authorization would be determined. An ITP authorization shall be required if there were a valid concern the project activities would result in the "take" of an adult Swainson's hawk, eggs, or nestlings.

88. Surveys shall be conducted by a qualified Raptor Biologist with at least 2 years of experience surveying for and detecting Swainson's hawk pursuant to "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" survey protocol. No disturbance such as construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist.

89. MM BIO-1b: No more than 30 days prior to the first ground disturbance activity, pre-construction golden eagle nesting surveys shall be conducted in the project vicinity by a qualified Raptor Biologist. The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting golden eagles. Preconstruction surveys shall include investigation of all potential nesting trees within a survey area determined by the qualified Raptor Biologist, but no less than a 0.5-mile radius around all project activities. If active golden eagle nests are identified within any trees within the survey areas a 0.5-mile radius of the project site, a qualified Raptor Biologist shall establish a protection buffer at a minimum of 1,000 feet that is adequate to ensure noise or activity from the proposed project would not cause nest disturbance or young or adult bird mortality. Buffer zones may vary in size as some golden eagles are more acclimated to disturbance than others. Size of buffer zone may be increased by the qualified Raptor Biologist considering the type of construction activity that may occur and the behavioral factors and extent that golden eagle may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young golden eagles have fledged or that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist.

90. MM BIO-1c: Prior to ground disturbance, a pre-construction nesting survey shall be conducted for northern harrier and short-eared owl by a qualified Raptor Biologist if construction is scheduled during the nesting season (February 1 through September 1). The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting northern harrier and short-eared owl. To determine whether northern harrier or short-eared owl is nesting on-site, a qualified Raptor Biologist(s) shall conduct walking transects through the project site grassland habitat searching for nests and minimum 500-foot radius from the project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc., the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars or a spotting scope. An active northern harrier or short-eared owl nest must be protected by implementing a minimum 500-foot radius buffer zone around the nest marked with orange construction fencing. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated where it intersects the project site. Size of buffer zone could be modified increased considering the type of construction activity that may occur, physical barriers between the construction site and active nest, and the behavioral factors and extent that northern harrier or short-eared owl may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is otherwise determined to be complete based on monitoring of the active nest by a qualified Raptor Biologist.

91. MM BIO-1d: Prior to any ground disturbance, pre- construction surveys for burrowing owl shall be conducted within a minimum of 150 meters of the project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc.), the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars or a spotting scope. The pre- construction surveys shall be conducted within 2 weeks prior to the

onset of any ground-disturbing activities. Surveys shall be conducted by a qualified Biologist following California Department of Fish and Wildlife (CDFW) 2012 staff report survey methods and Biologist qualifications to establish the status of burrowing owl on the project site.

a. If burrowing owl are found to occupy the project site during the nonbreeding season (September 1 to January 31), occupied burrows shall be avoided by establishing a no- disturbance buffer zone a minimum of 100 feet around the burrow. Buffers may be adjusted to address site-specific conditions using the impact assessment approach described in the CDFW 2012 staff report. If a qualified Raptor Biologist determines the location of an occupied burrow/s may be impacted even with a 100-foot buffer, or the burrow(s) are in a location(s) on the project site where a buffer cannot be established without preventing the proposed project from moving forward, then a passive relocation effort may be instituted to relocate the individual(s) out of harm's way pursuant to a Burrowing Owl Exclusion Plan prepared in accordance with the CDFW 2012 staff report.

b. If burrowing owl are found to be present during the breeding season (February 1 to August 31), the proposed project ground-disturbing activities shall follow the CDFW 2012 staff report recommended avoidance protocol whereby occupied burrows shall be avoided with a no-disturbance buffer.

c. If burrowing owls are ultimately found on the site and burrow eviction/ relocation of burrowing owls during the non-nesting season is a selected strategy to move forward with the project without direct impacts to burrowing owl individuals, the applicant shall coordinate this effort with CDFW and provide habitat mitigation consistent with the 2012 CDFW Staff Report on burrowing owl.

92. MM BIO-2: Prior to issuance of grading permits. To offset the loss of the 0.496 acre of seasonal wetland impacts from Phase 1, and 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools from Phase 2, and to ensure there is no-net loss of wetland area, the applicant shall establish/create 0.992 acre of palustrine emergent wetlands (2:1 ratio) for Phase 1 concurrent with project construction, and 2.57 acres of seasonal wetlands (1:1 ratio) and 1.13 acres of vernal pool wetlands (1:1 ratio) for Phase 2 at least 1 year prior to the start of Phase 2 construction, on the 45-acre Wetland Preserve. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland.

93. MM BIO-3a: Prior to issuance of the Phase 1 grading permit, the project applicant shall apply for and obtain a Nationwide Permit from the San Francisco District of the United States Army Corps of Engineers (USACE) for discharge within 0.004 acre of wetlands/waters of the United States under Clean Water Act Section 404 jurisdiction. For the USACE permit to be valid, the applicant shall apply for and obtain the accompanying Section 401 Water Quality Certification from the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB). The applicant shall apply for and obtain a separate Waiver of Waste Discharge Requirements from the San Francisco Bay RWQCB for impacts to 0.496 acre of wetlands/waters of the State. To offset the loss of 0.496 acre of permanent wetland impacts and to ensure there is no- net loss of wetland area, the applicant shall establish/create 0.992 acre of wetlands (2:1 ratio), prior to or concurrent with the start of construction, on the 45-acre Wetland Preserve. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The applicant shall implement the terms of the approved permit(s).

94. MM BIO-3c: Prior to issuance of the Phase 1 grading permit, a Wetland Mitigation and Monitoring Plan shall be prepared and submitted to the San Francisco Bay Regional Water Quality Control Board

(San Francisco Bay RWQCB) for review as part of the process for obtaining a permit from the agency. The Wetland Mitigation and Monitoring Plan shall address the loss of 0.496 acre of wetlands impact due to Phase 1 of the proposed project as well as the potential loss of approximately 3.7 acres of wetlands that as part of Phase 2.

The Wetland Mitigation and Monitoring Plan shall include in irrevocable instrument (e.g., deed restriction or conservation easements) that shall restrict use of both the 0.992 acre of created wetlands for Phase 1 as well as approximately 3.7 acres of additional wetlands created for Phase 2. The Wetland Mitigation and Monitoring Plan shall also include a long-term endowment that would be fully funded by the proposed project to manage approximately 45-acre open space preserve and created wetlands in perpetuity. If additional wetland mitigation lands are required to compensate for wetland impacts associated with Phase 2, wetlands shall be established/created at a minimum 1:1 ratio (1 acre established/created for every acre permanently impacted) on appropriate mitigation land, approved by the RWQCB and United States Army Corps of Engineers (USACE), within the Phase 2 project site's Hydraulic Unit Code (HUC) 10 watershed. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The applicant shall implement the terms of the approved permit(s).

95. MM BIO-3d: Prior to issuance of the Phase 1 and Phase 2 grading permit, a Wetland Mitigation and Monitoring Plan shall be submitted to the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB) for review as part of the process for obtaining a permit from the agency. The Wetland Mitigation and Monitoring Plan shall be prepared in accordance with the Subpart J– Compensatory Mitigation for Losses of Aquatic Resources outlined in the California State Water Resources Control Board (State Water Board) Procedures, and in accordance with the State Water Board Implementation Guidance dated April 2020, and in accordance with the United States Army Corps of Engineers (USACE) Compensatory Mitigation Rule (33 Code of Federal Regulations Part 332).

96. The basic objective of the Wetland Mitigation and Monitoring Plan is to ensure that project wetland impacts, and compensatory mitigation proposed to offset the wetland impacts, shall provide a no-net-loss of area of wetlands, and wetlands established/created shall be in-kind to the wetlands impacted. In summary, the Wetland Mitigation and Monitoring Plan shall at a minimum:

    a. Preserve 7.58 acres of existing seasonal wetlands and 0.13 acre of vernal pools within the 45-acre Wetland Preserve.

    b. Establish within the Wetland Preserve approximately 0.992 acre of seasonal wetlands in advance of or concurrent with implementation of Phase 1 impacts to 0.496 acre of palustrine emergent wetlands at a 2:1 ratio.

    c. Establish within the Wetland Preserve approximately 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools in advance of implementation of future Phase 2, assuming Phase 2 is built out, to address the potential maximum losses of approximately 3.7 acres of wetlands that may occur.

    d. Provide financial assurances to ensure a high level of confidence that the compensatory mitigation shall be successfully completed, in accordance with applicable performance standards.

    e. Design ecological performance standards to assess whether the Wetland Mitigation and Monitoring Plan is achieving the overall objectives, so that it can be objectively evaluated to determine whether it is developing into the desired resource type (vernal pool, seasonal wetland e.g.), and attaining any other applicable metrics such as acres, number of native plant species, water saturation and/or ponding depth etc.

f. Monitor the site for a duration necessary to determine whether the Wetland Mitigation and Monitoring Plan is meeting the performance standards. Established palustrine emergent wetlands and vernal pools typically develop quickly on soils with clay restrictive horizon. The 45-acre Wetland Preserve does have a clay restrictive layer approximately 8–18 inches below the surface therefore a 5- year monitoring period would be sufficient to determine whether performance standards are met. This monitoring period may be extended if performance standards are not met due to how the wetlands were constructed or natural events such as severe droughts.

g. Protect the approximately 45-acre Wetland Preserve in perpetuity using a conservation easement, and provide an endowment sufficient to fund the Long-Term Management Plan.

h. An overall assessment of the condition of the wetlands that shall be permanently impacted by the proposed project shall be conducted using the California Rapid Assessment Method (CRAM) for depressional wetlands, or a hybrid approach based on CRAM. Each similar wetland type that may be impacted shall be assessed to describe the floristic community and record the native and non-native dominant plants within the vernal pool and palustrine emergent wetlands. Physical structure such as topographic complexity and physical features that may provide habitat for aquatic species (e.g., boulders, woody debris etc.) shall be recorded and used to design the created/established wetlands. The purpose of this assessment is to ensure the design of the wetlands shall provide habitat that is similar to the wetlands being impacted to ensure the impacted wetlands are mitigated in-kind.

97. MM BIO-4: If construction occurs during the breeding season of migratory and resident birds (February 1 to August 31), a qualified Biologist shall conduct a pre-construction breeding bird survey in areas of suitable habitat within 7 days prior to the onset of construction activity. Surveys shall be conducted within the project footprint and 50 feet from the construction limits for nesting passerines, 250 feet from the construction limits for nesting accipiters and 1,000 feet from the construction limits for nesting raptors. If the survey area is found to be absent of nesting birds, no further mitigation would be required. However, if construction activities are delayed by more than 7 days, an additional nesting bird survey shall be performed.

    If bird nests are found, appropriate buffer zones shall be established around all active nests to protect nesting adults and their young from direct or indirect impacts related to project construction disturbance. Size of buffer zones shall be determined per recommendations of the qualified Biologist based on site conditions and species involved. At a minimum a 1,000-foot buffer shall be established for nesting Swainson's hawk and golden eagle; 500-foot buffer for nesting tricolored blackbirds, northern harriers and other non-listed raptors; 250-foot buffer for nesting accipiters; and minimum 50-foot buffers shall be established for nesting passerines and all other non-raptor or passerine nesting birds. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated where it intersects the project site. Buffer zones shall be maintained until it can be documented that either the nest has failed, or the young have fledged.

98. MM CUL-2a: No ground disturbance shall take place within 100 feet of informal archaeological resource 483A-001. The resource shall be preserved in place.

99. MM CUL-2b: An Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology shall be present on-site during all earth disturbing activities. If prehistoric or historic-period archaeological resources are encountered, all construction activities within 100 feet of the find shall halt and the City of American Canyon shall be notified. Prehistoric archaeological materials may include obsidian and chert flaked stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or

shellfish remains; and stone milling equipment (e.g., mortars, pestles, hand stones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic- period materials might include stone, concrete, or adobe footings and walls; filled wells or privies; and deposits of metal, glass, and/or ceramic refuse.

The Archaeologist shall inspect the findings within 24 hours of discovery. If it is determined the project could damage a historical resource or a unique archaeological resource (as defined pursuant to the CEQA Guidelines), mitigation shall be implemented in accordance with Public Resources Code Section 21083.2 and Section 15126.4 of the CEQA Guidelines, with a preference for preservation in place. Consistent with Section 15126.4(b)(3), this may be accomplished through planning construction to avoid the resource; incorporating the resource within open space; capping and covering the resource; or deeding the site into a permanent conservation easement. If avoidance is not feasible, a qualified Archaeologist shall prepare and implement a detailed treatment plan in consultation with the City of American Canyon. Treatment of unique archaeological resources shall follow the applicable requirements of Public Resources Code Section 21083.2. Treatment for most resources would consist of (but would not be limited to) sample excavation, artifact collection, and site documentation, with the aim to target the recovery of important scientific data contained in the portion(s) of the significant resource to be impacted by the proposed project. The treatment plan shall include provisions for analysis of data in a regional context, reporting of results within a timely manner, curation of artifacts and data at an approved facility, and dissemination of reports to local and State repositories, libraries, and interested professionals.

100. MM CUL-3: In the event of the accidental discovery or recognition of any human remains, CEQA Guidelines Section 15064.5, Health and Safety Code Section 7050.5, and Public Resources Code Sections 5097.94 and Section 5097.98 shall be followed. If during project construction, there is accidental discovery or recognition of any human remains, the following steps shall be taken:

a. There shall be no further excavation or disturbance within 100 feet of the remains until the County Coroner is contacted to determine whether the remains are Native American and if an investigation of the cause of death is required. If the Coroner determines the remains to be Native American, the Coroner shall contact the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall identify the person or persons it believes to be the Most Likely Descendant (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work within 48 hours, for means of treating or disposing of, with appropriate dignity, the human remains, and any associated grave goods as provided in Public Resource Code Section 5097.98.

b. Where the following conditions occur, the landowner or authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the MLD or on the project site in a location not subject to further subsurface disturbance:

- The NAHC is unable to identify an MLD or the MLD failed to make a recommendation within 48 hours after being notified by the commission.
- The descendant identified fails to make a recommendation.
- The landowner or authorized representative rejects the recommendation of the descendant, and mediation by the NAHC fails to provide measures acceptable to the landowner.

Additionally, California Public Resources Code Section 15064.5 requires the following relative to Native American Remains:

(1) When an initial study identifies the existence of, or the probable likelihood of, Native American Remains within a project, a lead agency shall work with the appropriate Native Americans as identified by the NAHC as provided in Public Resources Code Section 5097.98. The applicant may each develop a plan with respect to their respective individual development proposals for treating or disposing of, with appropriate dignity, the human remains, and any items associated with Native American Burials with the appropriate Native Americans as identified by the NAHC.

101. MM CUL-4: A Tribal Monitor representing the Yocha Dehe Wintun Nation shall be present during all project-related ground disturbance. Additionally, the Yocha Dehe Wintun Nation's Treatment Protocol (Protocol) shall be followed with respect to Tribal Cultural Resources (TCRs). The purpose of the protocol is to formalize procedures for the treatment of Native American human remains, grave goods, ceremonial items, and items of cultural patrimony, if any are found in conjunction with development, including archaeological studies, excavation, geotechnical investigations, grading, and any ground-disturbing activity. This Protocol also formalizes procedures for Tribal Monitoring during archaeological studies, grading, and ground-disturbing activities.

a. Cultural Affiliation: The Yocha Dehe Wintun Nation (Tribe) traditionally occupied lands in Yolo, Solano, Lake, Colusa, and Napa Counties. The Tribe has designated its Cultural Resources Committee (Committee) to act on the Tribe's behalf with respect to the provisions of this Protocol. Any human remains which are found in conjunction with projects on lands culturally affiliated with the Tribe shall be treated in accordance with Section III of this Protocol. Any other cultural resources shall be treated in accordance with Section IV of this Protocol.

b. Inadvertent Discovery of Native American Human Remains: Whenever Native American human remains are found during the course of a project, the determination of Most Likely Descendant (MLD) under California Public Resources Code Section 5097.98 will be made by the Native American Heritage Commission (NAHC) upon notification to the NAHC of the discovery of said remains at a project site. If the location of the site and the history and prehistory of the area is culturally affiliated with the Tribe, the NAHC contacts the Tribe; a Tribal member will be designated by the Tribe to consult with the landowner and/or project proponents.

   Should the NAHC determine that a member of an Indian tribe other than Yocha Dehe Wintun Nation is the MLD, and the Tribe agrees with this determination, the terms of this Protocol relating to the treatment of such Native American human remains shall not be applicable; however, that situation is very unlikely.

c. Treatment of Native American Remains: In the event that Native American human remains are found during development of a project and the Tribe or a member of the Tribe is determined to be MLD pursuant to Section II of this Protocol, the following provisions shall apply. The Medical Examiner shall immediately be notified, ground-disturbing activities in that location shall cease and the Tribe shall be allowed, pursuant to California Public Resources Code Section 5097.98(a), to (1) inspect the site of the discovery and (2) make determinations as to how the human remains and grave goods shall be treated and disposed of with appropriate dignity. The Tribe shall complete its inspection and make its MLD recommendation within 48 hours of getting access to the site. The Tribe shall have the final determination as to the disposition and treatment of human remains and grave goods. Said determination may include avoidance of the human remains, reburial on-site, or reburial on tribal or other lands that will not be disturbed in the future. The Tribe may wish to rebury said human remains and grave goods or ceremonial and cultural items on or near the site of their discovery, in an area which will not be subject to future disturbances over a prolonged period of time. Reburial of human remains shall be accomplished in compliance with the California Public Resources Code Sections 5097.98(a) and (b). The term "human remains"

encompasses more than human bones because the Tribe's traditions call for the burial of associated cultural items with the deceased (funerary objects), and/or the ceremonial burning of Native American human remains, funerary objects, grave goods, and animals. Ashes, soils, and other remnants of these burning ceremonies, as well as associated funerary objects and unassociated funerary objects buried with or found near the Native American remains are to be treated in the same manner as bones or bone fragments that remain intact.

d. Non-Disclosure of Location of Reburials: Unless otherwise required by law, the site of any reburial of Native American human remains shall not be disclosed and will not be governed by public disclosure requirements of the California Public Records Act, California Government Code Section 6250 et seq. The Medical Examiner shall withhold public disclosure of information related to such reburial pursuant to the specific exemption set forth in California Government Code Section 6254(r). The Tribe will require that the location for reburial is recorded with the California Historic Resources Inventory System (CHRIS) on a form acceptable to the CHRIS center. The Tribe may also suggest the landowner enter into an agreement regarding the confidentiality of site information that will run with title on the property.

e. Treatment of Cultural Resources: Treatment of all cultural items, including ceremonial items and archaeological items will reflect the religious beliefs, customs, and practices of the Tribe. All cultural items, including ceremonial items and archaeological items, which may be found at a project site shall be turned over to the Tribe for appropriate treatment, unless ordered by a court or agency of competent jurisdiction. The project proponent shall waive any and all claims to ownership of Tribal ceremonial and cultural items, including archaeological items, which may be found on a project site in favor of the Tribe. If any intermediary, (for example, an Archaeologist retained by the project proponent) is necessary, said entity or individual shall not possess those items for longer than is reasonably necessary, as determined solely by the Tribe.

f. Inadvertent Discoveries: If additional significant sites or sites not identified as significant in a project environmental review process, but later determined to be significant, are located within a project impact area, such sites will be subjected to further archaeological and cultural significance evaluation by the project proponent, the Lead Agency, and the Tribe to determine whether additional mitigation measures are necessary to treat sites in a culturally appropriate manner consistent with CEQA requirements for mitigation of impacts to cultural resources. If there are human remains present that have been identified as Native American, all work will cease for a period of up to 30 days in accordance with Federal Law.

102. MM GEO-1b: Prior to the issuance of building permits for each Phase 1 and 2 structure, the project applicant shall submit a design-level Geotechnical Investigation to the City of American Canyon for review and approval. The investigation shall be prepared by a qualified engineer and identify grading and building practices necessary to achieve compliance with the latest adopted edition of the California Building Standards Code (CBC) geologic, soils, and seismic requirements, including abatement of expansive soil conditions. The report shall also determine the final design parameters for walls, foundations, foundation slabs, and surrounding related improvements (e.g., utilities roadways, parking lots, and sidewalks). The measures identified in the approved report shall be incorporated into the project plans and all applicable construction-related permits.

103. MM GEO-5: If potential fossils are discovered during project implementation, all earthwork or other types of ground disturbance within 100 feet of the find shall stop immediately until a qualified professional Paleontologist can assess the nature and importance of the find. Based on the scientific value or uniqueness of the find, the Paleontologist shall either record the find and recommend that the City of American Canyon allow work to continue or recommend salvage and recovery of the fossil.

The Paleontologist shall, if required, propose modifications to the stop-work radius based on the nature of the find, site geology, and the activities occurring on the site. If treatment and salvage is required, recommendations will be consistent with Society of Vertebrate Paleontology guidelines and currently accepted scientific practice. If required, treatment for fossil remains shall include preparation and recovery of fossil materials so that they can be housed in an appropriate museum or university collection, and, if required, shall also include preparation of a report for publication describing the finds.

104. MM GHG-1a: Prior to the issuance of any grading permits, the project applicant shall provide the City of American Canyon with documentation (e.g., site plans) demonstrating project construction will include the following construction Best Management Practices (BMPs):

a. At least 15 percent of the construction fleet for each project phase shall be alternatively fueled or electric.

b. At least 10 percent of building materials used for project construction shall be sourced from local suppliers.

c. At least 65 percent of construction and demolition waste materials shall be recycled or reused.

d. At least one contractor that has a business location in American Canyon shall be contracted for project construction.

e. All construction contracts shall include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers) using during construction be electrically powered.

f. Architectural coatings used for project construction shall be "Low-VOC," containing no greater than 50 grams of volatile organic compounds (VOC) per liter of product.

g. Project construction shall prohibit the use of generators and shall establish grid power connection to electrical equipment needs.

h. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California Airborne Toxics Control Measure [ATCM] Title 13, Section 2485 of California Code of Regulations). Clear signage regarding idling restrictions shall be provided for construction workers at all access points.

i. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.

j. The prime construction contractor shall post a publicly visible sign with their telephone number and contractor to contact. The construction contractor shall take corrective action within 48 hours. The BAAQMD's phone number shall also be identified and visible to ensure compliance with applicable regulations.

105. MM GHG-1b: Prior to the issuance of any building permits, the project applicant shall provide the City of American Canyon with documentation (e.g., site plans) demonstrating the proposed project is designed without the use of any natural gas -fueled appliances or natural gas plumbing.

106. MM GHG-1c: Prior to issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on-site plans), that the proposed buildings are designed and will be built to, at a minimum, the Tier 2 advanced energy efficiency

requirements of the Nonresidential Voluntary Measures of the California Green Building Standards Code, Division A5.2, Energy Efficiency, as outlined under Section A5.203.1.2.2.

107. MM GHG-1d: Prior to issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on-site plans), that the proposed parking areas for passenger automobiles and trucks are designed and will be built to accommodate electric vehicle (EV) charging stations. At a minimum, the parking shall be designed to accommodate a number of EV charging stations equal to the Tier 2 Nonresidential Voluntary Measures of the California Green Building Standards Code, Section A5.106.5.3.2.

108. MM GHG-1d: Prior to the issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on-site plans), that each loading dock is outfitted with at least one 240-volt outlet to accommodate truck and Transport Refrigeration Unit (TRU) charging and/or electrical power connection while trucks are loading and unloading goods.

109. MM GHG-1e: Prior to the issuance of any building permit for the proposed project, the project applicant shall provide the City with documentation (e.g., site plans) demonstrating to the City's satisfaction that the electricity demand will be supplied with 100 percent carbon-free electricity sources through the year 2045. As City representative, the Planning Commission recommends the City Council require this mitigation measure be accomplished with on-site solar panel electricity.

110. MM HYD-1a: Prior to issuance of grading permits for the proposed project, the applicant shall submit to the City of American Canyon for review and approval a Storm Water Pollution Prevention Plan (SWPPP) in accordance with the requirements of the statewide Construction General Permit. The SWPPP shall be designed to address the following objectives: (1) all pollutants and their sources (e.g., runoff), including sources of sediment associated with construction, construction site erosion, and all other activities associated with construction activity, are controlled; (2) where not otherwise required to be under a Regional Water Quality Control Board (RWQCB) permit, all non-stormwater discharges are identified and either eliminated, controlled, or treated; (3) site Best Management Practices (BMPs) (e.g., silt fencing, street sweeping, routine inspection, etc.) are effective and result in the reduction or elimination of pollutants in stormwater discharges and authorized non-stormwater discharges from construction activity; and (4) stabilization BMPs are installed to reduce or eliminate pollutants after construction are completed. The SWPPP shall be prepared by a qualified SWPPP developer. The SWPPP shall include the minimum BMPs required for the identified Risk Level. BMP implementation shall be consistent with the BMP requirements in the most recent version of the California Stormwater Quality Association (CASQA) Stormwater Best Management Handbook–Construction or the California Department of Transportation (Caltrans) Stormwater Quality Handbook Construction Site BMPs Manual. The SWPPP shall be implemented during construction.

111. MM HYD-1b: Prior to the issuance of building permits, the project applicant shall submit a Stormwater Control Plan to the City of American Canyon for review and approval. The plan shall be developed using the California Stormwater Quality Association (CASQA) "New Development and Redevelopment Handbook" and include applicable provisions of Section C.3 of the San Francisco Bay Regional Water Quality Control Board (RWQCB) Municipal Regional Permit (Order No. R2-2015-0049, NPDES Permit No. CAS612008 (or more recent permit). The Stormwater Control Plan shall identify pollution prevention measures and Best Management Practices (BMPs) to control stormwater pollution from operational activities and facilities and provide maintenance in perpetuity. The Stormwater Control Plan shall include Low Impact Development (LID) design

concepts, as well as concepts that accomplish a "first flush" objective that remove contaminants from the first 2 inches of stormwater before it enters area waterways. The project applicant shall also prepare and submit an Operations and Maintenance Agreement to the City, identifying procedures to ensure stormwater quality control measures work properly during operations.

112. MM LU-3: Prior to issuance of grading permits, the applicant shall retain a qualified Biologist to assess potential wildlife hazards to aviation. The assessment shall evaluate the characteristics of the emergent wetlands, drainages, other potential wildlife attractant features (i.e., ponded water) located within the open space area and identify management practices (e.g., storm drainage, vegetation, etc.) to prevent the creation of attractants for large flocks or birds or other wildlife species that may present safety hazards to aviation activities. As part of the assessment, the applicant shall consult with Napa County Airport and Napa County Airport Land Use Commission (ALUC) representatives, as appropriate, regarding findings and recommendations. The applicant shall submit a report to the City of American Canyon prepared by a qualified Biologist that confirms the wildlife hazard assessment's findings and recommendations are incorporated into the design of the open space preserve.

113. MM NOI-1: Implementation of the following multi-part mitigation measure is required to reduce potential construction period noise impacts:

a. The construction contractor shall ensure that all equipment driven by internal combustion engines shall be equipped with mufflers that are in good condition and appropriate for the equipment.

b. The construction contractor shall ensure that unnecessary idling of internal combustion engines (i.e., idling in excess of 5 minutes) is prohibited.

c. The construction contractor shall utilize "quiet" models of air compressors and other stationary noise sources where technology exists.

d. At all times during project grading and construction, the construction contractor shall ensure that stationary noise- generating equipment shall be located as far as practicable from sensitive receptors and placed so that emitted noise is directed away from adjacent residences.

e. The construction contractor shall ensure that the construction staging areas shall be located to create the greatest feasible distance between the staging area and noise-sensitive receptors nearest the project site.

114. MM NOI-1: The construction contractor shall ensure that all on-site construction activities, including the operation of any tools or equipment used in construction, drilling, repair, alteration, grading, or demolition work, are limited to between the daytime hours of 7:00 a.m. to 7:00 p.m. Monday through Saturday. No construction shall be permitted on Sundays and federal holidays.

PASSED, APPROVED and **ADOPTED** at a specially scheduled meeting of Planning Commission of the City of American Canyon held on the November 17, 2022 by the following vote:

AYES:

Applicant Confirmation of Conditions of Approval
Giovannoni Logistics Center Design Permit
(FILE NO. PL20-0042)

As shown by my signature below, I confirm that I understand and agree to abide by the conditions of approval included in the City Council Resolution dated ___ , 2022.

Applicant's signature	Date
Applicant's name	
1st Property Owner's signature	Date
1st Property Owner's name	
2nd Property Owner's signature	Date
2nd Property Owner's name	

This approval shall not be effective until the applicant and property owner execute and return the "Applicant Confirmation of Conditions of Approval" form to the Community Development Department.

Please return signed confirmation to the City of American Canyon Community Development Department, 4381 Broadway, Suite 201, American Canyon, CA 94503

RESOLUTION NO. 2022-XX

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF AMERICAN CANYON, CALIFORNIA, RECOMMENDING THE CITY COUNCIL OF THE CITY OF AMERICAN CANYON APPROVE THE GIOVANNONI LOGISTICS CENTER TENTATIVE PARCEL MAP TO CREATE A TWO-LOT SUBDIVISION FOR UP TO 1,069,904 SQUARE FEET OF HIGH CUBE WAREHOUSE USES ON 70.2 ACRES; LOCATED NORTH OF GREEN ISLAND ROAD AND EAST OF DEVLIN ROAD, APN 057-090-008, 057-130-034, 057-130-036, (FILE NO. PL 20-0043)

WHEREAS, pursuant to Section 65300 of the State Planning and Zoning Law, the City of American Canyon (City) adopted a General Plan to provide comprehensive long-range planning and a blueprint of the City's future form, including land use and circulation maps that specify the roadway network and the distribution of types and intensities of land; and

WHEREAS, Buzz Oates LLC, ("applicant"), submitted a Giovannoni Logistics Center Tentative Parcel Map application to create a two-lot parcel map north of Green Island Road, and east of Devlin Road for up to 1,069,904 square feet of high-cube warehouse buildings (the proposed project); and

WHEREAS, Lot 1 located at 300 Green Island Road comprises 38.36 acres, and Lot 2 located at 1200 Devlin Road comprises 31.44 acres; and

WHEREAS, on November 17, 2022 the Planning Commission recommended the City Council certify that the Final Environmental Impact Report (EIR) (SCH# 2021010104) has been completed in compliance with the California Environmental Quality Act (CEQA) and as adequately reflects the City's independent judgement and analysis regarding the potential environmental impacts associated with the Giovannoni Logistics Center Project, and adopt CEQA Findings of Fact, a Statement of Overriding Considerations, for the Project, and adopt a the Mitigation Monitoring and Reporting Program for the Project; and

WHEREAS, the Giovannoni Logistics Center Final EIR specifically evaluated the Tentative Parcel Map at a Project level and the Planning Commission reviewed and considered the information contained in the Final EIR prior to making recommendations concerning the approval of the proposed project; and

WHEREAS, on November 17, 2022, the Planning Commission conducted a duly-noticed public hearing to evaluate the Giovannoni Logistics Center Tentative Parcel Map and heard all public speakers and considered written materials including the staff report and oral testimony given at the meeting.

NOW, THEREFORE, BE IT RESOLVED that the Planning Commission recommends the City Council make all the required findings to approve the Giovannoni Logistics Center Tentative Parcel Map, as follows:

SECTION 1: Tentative Parcel Map Findings

Approval of the Tentative Parcel Map requires **that none of** the following findings be made, pursuant to American Canyon Municipal Code Section 18.20.055:

A. That the proposed tentative parcel map is not consistent with the City's General Plan or its elements, or other applicable plans.

This Finding cannot be made. The project site is designated for high cube warehouse buildings consistent with allowable uses in the General Plan Industrial land use district. The General Industrial zoning district requires a minimum of 40,000 square feet for parcels. Both proposed Tentative Parcel Map lots are at least

31 acres. Both parcels have safe and adequate access to a public right-of-way and have been designed to accommodate needed utilities and stormwater drainage.

B. That the design and improvement of the proposed tentative parcel map is not consistent with the City's General Plan or its elements, or other applicable plans.

This Finding cannot be made. As required by the City's General Plan, the Tentative Map shows proposed roadways and infrastructure sufficient to accommodate up to 1,069,904 square feet of high-cube warehouse buildings.

C. That the site is not physically suitable for the type of development proposed.

This Finding cannot be made. The project site, with the conditions for offsite transportation and utility improvements, will be suitable for up to 1,069,904 square feet of high-cube warehouse buildings anticipated as part of the Giovannoni Logistics Center Project. The Geotechnical and Geologic Fault Investigation prepared by Cornerstone Earth Group (November 2, 2017 – Project No. 582-4-1) demonstrates that there is no geological fault within the proposed Tentative Parcel Map. The preliminary grading and drainage plan, stormwater plan, preliminary utility plan, and fire access plan prepared by CBG Engineers demonstrates that the proposed type of development proposed can be accommodated within the parcel map.

D. That the site is not physically suitable for the density of development proposed.

This Finding cannot be made. Please refer to the discussion under Findings No. A, B and C above.

E. That the design of the subdivision or the proposed improvements are likely to cause substantial environmental damage or substantially and avoidably injure fish or wildlife or their habitat.

This Finding cannot be made. The impacts of the proposed Project, including the Tentative Parcel Map remain within the impacts previously analyzed and the findings in the Giovannoni Logistics Center Final Environmental Impact Report (SCH# 2021010104). The draft Final Environmental Impact Report and statement of overriding considerations specifically contemplated the proposed Tentative Parcel Map. The Project has the potential to significantly impact the following resources: Aesthetics, Biological Resources, Cultural Resources, Geology, Soils and Seismicity, Greenhouse Gas Emissions and Energy, Hydrology and Water Quality, Land Use, and Noise. However, each of these potential impacts would be reduced to a less than significant level through the implementation of the mitigation measures contained in the Mitigation Monitoring and Reporting Program for the Project. The Project has significant and unavoidable impacts for Air Quality, and Greenhouse Gas Emissions and Energy. However, the draft Statement of Overriding Considerations concludes that economic, social, and environmental benefits of the Project outweigh the significant and unavoidable adverse impacts.

F. That the design of the subdivision or the type of improvements is likely to cause serious public health problems.

This Finding cannot be made. The proposed Giovannoni Logistics Center Tentative Parcel Map Project uses are consistent with the other adjacent industrial uses and the conditions of approval, particularly those related to mitigation measures identified in the Final EIR, required off-site roadway and utility improvements, will ensure that the proposed development will not create any nuisance or be materially detrimental to public health, or property in the area. The closest residence is 1,250 feet southwest of the project and is too far from the site for the project to cause serious public health problems to the residences.

G. That the design of the subdivision or the type of improvements will conflict with easements, acquired by the public at large, for access through or use of, property within the proposed subdivision.

<u>This Finding cannot be made</u>. There is no documentation that public easements for access through or use of the property have been established, other than the recorded easements identified on the parcel map, which will be maintained or replaced by equivalent easements to accommodate public utilities.

H. That the discharge of wastewater, including sewage and stormwater runoff, from the proposed subdivision would result in a violation of existing water quality requirements prescribed by the Regional Water Quality Control Board (RWQCB).

<u>This Finding cannot be made</u>. The proposed map has been reviewed by City staff and staff has determined that it complies with all applicable water quality requirements of the Regional Water Quality Control board and city standards.

SECTION 2: Conditions of Approval

General

1. The Tentative Parcel Map approval is granted for a subdivision that will create two industrial lots for up to 1,069,904 square feet on a 70.2-acre site east of Devlin Road and north of Green Island Road. Lot 1 located at 300 Green Island Road comprises 38.36 acres, and Lot 2 located at 1200 Devlin Road comprises 31.44 acres as shown on Exhibit A. Exhibit A includes the following:

    a. Civil Plans prepared by CBG Engineers, dated 09-17-21 consisting of 6 sheets, Tentative Map, Existing Site Conditions, Preliminary Grading and Drainage Plan, Preliminary Utility Plan, Preliminary Stormwater Control Plan, and Preliminary Fire Access Plan.

2. The applicant shall defend, indemnify, and hold harmless the City of American Canyon ("City"), its elected officials, officers, employees, attorneys, representatives, boards, commissions, consultants, volunteers and agents from and against all claims, actions, including actions to arbitrate or mediate, damages, losses, judgments, liabilities, expenses and other costs, or proceedings against the City, its elected officials, officers, employees, attorneys, representatives, boards, commissions, volunteers, or agents to attack, modify, set aside, void, or annul an approval, conditional approval, permit, entitlement, environmental document, environmental clearance, mitigation plan, or any other document or any of the proceedings, acts, or determinations taken, done, or made prior to granting of such approval, conditional approval, permit, entitlement, environmental clearance, environmental document, mitigation plan, or other documents, by the City, including, without limitation, an action against an advisory agency, appeal board, or legislative body within the applicable limitation period.

    The obligation to defend, indemnify and hold the City harmless shall include the payment of all legal costs and attorney's fees (including a third party award of attorney's fees), arising out of, resulting from, or in connection with the City's act or acts leading up to and including approval of any environmental document or mitigation plan granting approvals to the applicant, incurred on behalf of, or by, the City, its elected officials, officers, employees, representatives, attorneys, boards, commissions, volunteers and agents in connection with the defense of any claim, action, or proceeding challenging the entire or a portion of an approval, conditional approval, permit, entitlement or any other document of any related claim.

    The obligation to defend, indemnify, and hold the City harmless shall include, but not be limited to, the cost of preparation of any administrative record by the City, staff time, copying costs, court costs, or attorney's fees arising out of a suit or challenge contesting the adequacy of a permit, approval, conditional approval, entitlement, environmental document, mitigation plan, environmental clearance, or any other document or approval related to the applicant's project.

    The City will promptly notify the applicant of any claim, action, or proceeding and will cooperate fully in the defense. If the City fails to promptly notify the applicant of any claim, action, or proceeding, or

the City fails to cooperate fully in the defense, the applicant shall not be responsible to defend, indemnify, or hold harmless the City.

In the event a legal challenge to a City permit, approval, conditional approval, environmental document, environmental clearance, mitigation plan, entitlement or any other document, proceeding, determination, or action related to the applicant's project is successful, and an award of attorneys' fees is granted against the City, the applicant shall be responsible to timely pay the full amount of such an award.

3. The applicant is responsible for paying all charges related to the processing of this discretionary case application within 30 days of the issuance of the final invoice or prior to the issuance of building permits for this project, whichever occurs first. Failure to pay all charges shall result in delays in the issuance of required permits or the revocation of the approval of this application.

4. The date upon which the approval is final shall be considered the day of the imposition of the fees, dedications, reservations and exactions required by these conditions approval for the purposes of protesting the imposition pursuant to California Government Code Section 66020.

5. The application shall not be deemed final until the applicant and property owner(s) execute and return the "Confirmation of Conditions of Approval" form as shown as Exhibit B to this Resolution.

6. Expiration of this Approval. In accordance with American Canyon Municipal Code (ACMC) Section 18.20.060 the approval shall become null and void and of no effect if a final map has not been submitted for processing within twenty-four months from the date of final action by the city council to approve or conditionally approve a tentative parcel map.

   Where the City Engineer determines that a subdivider is required to expend one hundred twenty-five thousand dollars or more to construct or improve public facilities outside the boundaries of the tentative parcel map that are reasonably related to the proposed development on said site, a final parcel map shall be submitted for processing within thirty-six months from the date of final action by the city council to approve or conditionally approve a tentative parcel map.

   The City Council may extend the expiration date of a tentative parcel map for not more than twelve months at any one time. All actions of the city council to extend a tentative map shall be at a duly noticed public hearing in accordance with the provisions of this title.

Planning

7. All plans submitted for review and approval and all development shall be in substantial conformance with the approved exhibits, except where modified by a condition of approval. The Community Development Director or designee may approve minor changes to the project as approved by the City Council on the plans submitted for the construction permits with a determination that the changes are in substantial compliance with the representation of the project as reviewed by the Planning Commission and City Council, that the proposed change will be in compliance with the required development standards, and the change will not materially affect adjacent private or public property.

Building and Safety

8. Construction and grading activities on the site shall be limited to between 7:00 a.m. and 6:00 p.m. Monday through Friday. Work between the hours of 6:00 pm and 7:00 am and work on weekends and holidays requires prior written approval from the Building Official. If weekends and holiday work is approved construction and grading activities on the site shall be limited to between 8:00 a.m. to 6:00 p.m. on Saturdays, and between 10:00 a.m. and 6:00 p.m. on Sundays and State and Federal holidays.

9. All construction plans and buildings onsite shall conform to the California Code of Regulations, Title 24. All building plans shall include all necessary recommendations from the Geotechnical Report for the site, to be superseded only by the California Code if any conflicts arise.

10. According to CBC 11B-228.3.2.1, provide the applicable amount of electrical vehicle charging stations (EVCS) and van accessible EVCS spaces for the employee parking lot.

11. Prior to the final inspection, the applicant shall submit a letter of certification to the Building Official from the project architect, civil engineer, and landscape architect certifying that all improvements have been constructed in accordance with the approved building plans. A Certified Access Specialist (CASP) shall also submit a letter certifying that all improvements have been constructed in compliance with applicable state and federal accessibility standards. Determination of consistency shall be subject to the review and approval of the Building Official.

12. Construction and Demolition Debris Recycling: Prior to issuance of a building permit the applicant shall submit a Construction Waste Management (CWM) plan for the diversion of at least 70 percent of the debris from the building demolition and construction. The plan shall include the qualified recycler that will be used, the methods of managing diversion of construction materials on site, and the proposed documentation that will be submitted to confirm that the diversion goal has been met.

Fire Protection

The following Fire Protection conditions shall be satisfactorily addressed on the building permit submittal:

13. Prior to recordation of the Parcel Map, or City issuance of a building permit, whichever occurs first, the Applicant shall form a Mello-Roos Community Facilities District or similar public financing mechanism (CFD) on full legal parcels that are a part of the Project in accordance with ACFPD Agreement 2022-29. A copy of Agreement 2022-29 is included with this Resolution as Exhibit C.

14. In accordance with the standard mitigation measures and conditions of approval set forth by the City of American Canyon, the developer shall pay the Fire Impact Fees (see current Standard Fees and Charges adopted by resolution), prior to the issuance of any building permits.

15. New buildings and additions to existing buildings shall conform to requirements set forth in the currently adopted editions of the California Building Code, California Fire Code, City of American Canyon standards and Nationally Recognized Standards.

16. There shall be no deferred submittals for fire protection equipment and related utilities. Fire protection plans shall not be attached to or bound with the building plan submittal package. This includes but is not limited to Automatic Fire Sprinkler, Fire Alarm, Fixed Fire Protection and Civil plans.

17. All Fire related underground piping and fire appurtenances shall be shown on the Civil plan submittal. In addition to the Civil plan submittal, at least (1) plan set under separate cover shall be submitted to American Canyon Building Division for routing to the American Canyon Fire Protection District detailing all underground piping and related fire appurtenances including but not limited to underground piping, underground sweep detail, underground trench details showing depth of burial, type of backfill, manufacturer's specifications of piping, valves joints, fittings and calculated size and locations of thrust blocks, hydrants locations (designate public or private), gate shut-off valves, PIV's, FDC's, fire pumps, fire pump and/or riser rooms. The applicant will need to submit all related Fire information on a separate plan for Fire review. The Fire related portions of the civil plan shall not be bound with the building plan.

18. Underground utility contractor, architect and fire sprinkler contractor shall coordinate the location of risers and control valves prior to the issuance of a building permit.

19. An approved water supply capable of supplying the required fire flow for fire protection systems shall be provided to all premises upon which facilities or buildings are hereby constructed or moved into or within the City. Required fire flow and hydrant distribution shall be in accordance with Appendix B and C of the California Fire Code. Applicant shall demonstrate on plan submittal; square footage of each building on plan and provide the required fire flow information. Applicant shall demonstrate that the number and spacing of onsite fire hydrants meets with requirements of the California Fire Code. ***See sample below regarding fire flow and hydrant detail information needed.***

    BUILDING FIRE FLOW REQUIREMENTS – CFC TABLES B105.2 & B105.1(2)

    INFORMATION BELOW IS A SAMPLE AND FOR REFERENCE ONLY

    Table B105.1(2) – Building size = 129, 600 square feet

    Construction type = Type IIA

    FF = 5,250 gpm at 20 psi

    Duration = 4 hours

    Table B105.2 – Fire sprinkler allowance = - 50%

    5,250 – 2,625 = 2,625 gpm

    FF = 2,625 gpm @ 20 psi

    Duration = 2 hours

    Table CC105.1 – Approximate number of hydrants = 3

    Average spacing = 400 feet + 25% allowable increase = 500

    Maximum distance from street or frontage = 225 feet = 50% allowable

    increase = 337.5

20. The fire protection equipment shall be located within an interior room having an approved exterior access door or in an exterior enclosure attached to the building, specifically, for the purpose of housing such equipment.

21. Prior to building permit issuance, provide a fire department circulation plan using the City's ladder truck and demonstrate clear turning movements into and out of the project. The final design of fire department access components shall be reviewed and approved by the Fire Marshal prior to installation. Please show how fire apparatus can position near the building on either side, with the ability to turn the apparatus around to leave the project site.

22. Fire Apparatus Access Roads shall be designed in accordance with provisions set forth in the California Fire Code Chapter 5 and Appendix D as amended by the City of American Canyon and the applicable Public Works Standard.

23. Fire apparatus access roads shall have an unobstructed minimum width of 20 feet (curb to curb) and a minimum unobstructed vertical clearance of 13' 6". They shall have an all-weather paved surface capable of supporting a GVW of 71,000 pounds.

24. Access roads shall be completed with all-weather surfaces prior to the stockpiling of combustible materials or beginning combustible construction. Fire apparatus access shall be provided to within 150 feet of the most remote portions of all building from an approved exterior route. If this cannot be achieved fire apparatus turn-arounds will be needed.

25. Fire apparatus access roads shall not be obstructed in any manner, including the parking of vehicles. Vertical traffic calming in the form of speed pumps, humps or dips are prohibited along fire access roads without prior approval of the fire Code Official. The minimum width and clearances established in Section 503.2.1 shall be maintained at all times.

26. When required by the Fire Chief, fire apparatus access roads shall be designated as Fire Lanes and appropriate signs and/or markings installed in accordance with the California Vehicle Code and approved City standards.

27. Where applicable, improvement plan submittals for permit shall include locations of fire lane red curbing and fire lane signage. Please refer to and include City Public Works Standard FP-2A & 2B with plan submittals for permitting.

28. The City of American Canyon requires that a fire hydrant be in service within 250 feet of the furthest point of construction prior to the stockpiling of combustible materials for the beginning of construction.

29. Fire Department Connections (FDC) shall be located not more than 100 ft. from the nearest fire hydrant.

30. Improvement Plans submitted for permit shall include City of American Canyon "Underground" standards, detail drawings and the applicable City of American Canyon Public Works Standard detail (W-7A, B, C or D) for Fire Service double detector check installations. *Also, a separate set of plans shall be submitted detailing all related underground Fire utilities and appurtenances including but not limited to; All underground piping, type, sizes, depth of burial, fittings, thrust blocks, risers, pumps, hydrants, FDC's, etc.*

31. System Protection Area Limitations NFPA 13 – 8.2.1 Maximum floor area on any one floor to be protected by sprinklers supplied by any one sprinkler system riser or combined system riser shall be as follows:

    1. Light Hazard – 52,000 sf – per riser
    2. Ordinary Hazard - 52,000 sf – per riser
    3. *Extra Hazard – Hydraulically calculated - 40,000 sf – per riser
    4. Storage – High-piled storage (as defined in 3.9.1.16) and storage covered by other NFPA standards – 40,000 sf – per riser

Public Works

<u>General Conditions of Approval</u>

32. The Applicant shall be responsible for all City plan check and inspection costs. The Applicant shall establish a Developer Deposit Account with the City upon the initiation of plan check services. The amount of the initial deposit shall be determined by the City Engineer. Additional funds may be required based upon actual costs.

33. All improvements shall be designed in accordance with the American Canyon Municipal Code (ACMC), City of American Canyon Engineering Standard Plans and Specifications for Public Improvements (City Standards), except as specifically noted otherwise in these conditions.

34. All new utilities to serve the project, shall be placed underground. Exceptions may be allowed for surface mounted transformers, pedestal mounted terminal boxes and meter cabinets.

35. Unless otherwise explicitly permitted, all existing wells, septic tanks and/or underground fuel storage tanks shall be abandoned under permit and inspection of Napa County Department of Environmental Services or other designated agency. If there are none, the project engineer shall provide a letter describing the scope of the search done to make this determination.

36. A detailed Soils Investigation/Geotechnical Report shall be prepared and submitted for review. The report shall address, at a minimum, potential for liquefaction, R-values, expansive soils and seismic risk. The improvement plans shall incorporate all design and construction criteria recommended in the Geotechnical Report.

37. A drainage report prepared by a California Registered Civil Engineer shall be submitted for review with the initial submittal of the Improvement Plans. The report shall include detailed hydrologic and hydraulic calculations to support the design and sizing of all public and private drainage facilities including storm drains and detention facilities. The report shall address existing downstream storm drain facilities and hydraulic conditions which may impact the design of proposed facilities and improvements.

38. A final detailed post-construction Stormwater Control Plan (SWCP) that identifies and sizes all permanent post-construction stormwater treatment BMPs shall be prepared and submitted for review and approval. The SCWP shall be prepared in accordance with the latest edition of the *Bay Area Stormwater Management Agencies Association (BASMAA) Post-Construction Manual* and the requirements of the State Water Resources Control Board Phase II Municipal Separate Storm Water System (MS4) General Permit (Order 2013-0001 DWQ). It is the City's discretion whether to accept alternative treatment facilities other than bioretention.

39. A Post Construction Stormwater Operations and Maintenance Plan that includes a plan sheet showing all storm drain and water quality infrastructure that is to be maintained, along with detailed instructions and schedules for the ongoing maintenance and operation of all post-construction stormwater BMPs shall be submitted for review and approval by the City Engineer. Once approved, the property owner(s) shall enter into an agreement with the City that provides the terms, conditions, and security associated with the ongoing requirements of the post-construction Stormwater Best Management Practices.

40. A Final Map, as defined in the Subdivision Map Act, shall be prepared by a licensed surveyor or civil engineer. The Final Map shall show all parcels, rights-of-way, and easement(s), and shall be submitted to the City Engineer for review. The Final Map shall be in substantial conformance with the approved Tentative Map and all applicable conditions of approval. The Final Map is not valid until it has been approved by the City and recorded. Closure calculations shall be provided at the time of initial Final Map submittal. All calculated points within the map shall be based upon one common set of coordinates. All information shown on the Final Map shall be directly verifiable by information shown on the closure calculation printout. The point(s) of beginning shall be clearly defined. All lot acreages shall be shown on the Final Map and shall be verifiable from information

shown on the closure calculation printout. A current title report (within past 30 days) shall be submitted at the time of initial Final Map submittal.

41. The Applicant shall secure all necessary rights-of-way and public and private easements for both onsite and offsite improvements. The applicant shall prepare all necessary legal descriptions and deeds.

42. To the extent any offsite public improvements require the acquisition of property not currently owned by the Applicant or the City, the Applicant shall first make a good-faith effort to acquire the necessary property rights, however if the Applicant makes such an effort and is unable to acquire such rights, then the Applicant may request the City acquire the necessary property rights through the exercise of eminent domain provided that the Applicant enters first into an agreement with the City to pay for all costs incurred by the City to acquire such rights and if the City does not acquire the rights necessary to allow the offsite public improvements to be completed by the Applicant within statutory timeline provided by law, then the Applicant shall be relieved of the obligation to construct those off-site improvements only to the extent they require property not currently owned by the Applicant or the City. The Applicant shall make a good-faith effort to identify and acquire the necessary property rights at the earliest opportunity.

43. The Applicant shall submit site Improvement Plans, prepared by a registered Civil Engineer, for review and approval of the City's Public Works Department. **Please be aware that this is separate submittal from the building permit application.** The final plan set shall include all civil, landscape and joint trench drawings under a single cover sheet. No final grading or other construction shall be performed until the Improvement Plans have been approved. The Applicant shall not begin clearing, grubbing, or rough grading at the site prior to approval of the Improvement Plans, unless explicitly approved by the City of American Canyon through the standard grading and utilities only permit process. An Encroachment Permit is required for any work within City right of way. Encroachment Permits will not be issued prior to the approval of the Improvement Plans.

44. All public water service laterals or services (domestic, recycled and fire water) shall include approved backflow prevention devices.

45. Cathodic protection shall be provided for all water valves, fittings, hydrants, meters, backflow devices and other metal appurtenances, regardless of the findings of any soils corrosivity analysis.

46. The Applicant shall keep adjoining public and private streets free and clean of project dirt, mud, materials, and debris during the construction period in accordance with SWPPP using appropriate BMPs and as is found necessary by the City Engineer.

47. If any hazardous material is encountered during the construction of this project, all work shall be immediately stopped and the Fire Department, Napa County Department of Environmental Services or other designated agency, and the City Inspector shall be notified immediately. Work shall not proceed until clearance has been issued by all of these agencies.

48. Prior to final preparation of the subgrade and placement of base materials, all underground utilities shall be installed, and service connections stubbed out behind the sidewalk. Public utilities, Cable TV, sanitary sewers, and water lines shall be installed in a manner that will not disturb the street pavement, curb, gutter and sidewalk, when future service connections or extensions are made.

49. Where soil or geologic conditions encountered in grading operations are different from that anticipated in the soil and/or geologic investigation report, or where such conditions warrant changes to the recommendations contained in the original soil investigation, a revised soil or geologic report shall be submitted for approval by the City Engineer. Additionally, if field conditions warrant installation of any subdrains, the location, size and construction details must be provided to the City for review and approval prior to construction.

50. All new fire hydrants shall be covered with burlap sacks until the hydrants have been tested and found to be in conformance with City flow requirements. No storage of combustible materials or construction of building shall be permitted until all hydrants meet City flow requirements.

51. Prior to placing the final lift of asphalt, all public storm drains and sanitary sewer lines shall be video inspected at the Applicant's expense. All video media (CD, DVD, or portable hard drive) shall be submitted to the City. If any inadequacies are found, they shall be repaired prior to the placement of the final lift of asphalt.

52. All streets, curbs, gutters, sidewalks or other public facilities damaged in the course of construction associated with this Project shall be the responsibility of the Applicant and shall be repaired to the satisfaction of the City at the Applicant's expense.

53. After all of the new underground utilities within existing public streets have been installed, the entire affected areas shall be milled and repaved to present a neat finished pavement area. Multiple trench patches are not acceptable.

54. All construction stormwater pollution prevention best management practices (BMP's) shall be installed as the first order of work and in accordance with the State Water Resources Control Board's General Construction Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order 2009-0009-DWQ, as amended), the Applicant's Storm Water Pollution Prevention Plan (SWPPP), and the City's Erosion and Sediment control Plan in accordance with the City's MS4 Permit. All stormwater BMP's shall be maintained to the satisfaction of the Qualified SWPPP Developer (QSD), Qualified SWPPP Practitioner (QSP), and the City Engineer.

55. With the exception of water used for loading and testing of potable water lines, all construction water used for the project shall be obtained from a source other than American Canyon potable water sources. The Applicant shall provide verification that an outside source of construction water, e.g., recycled water, has been established and will be available for the duration of the project construction.

56. The development shall comply with the City's Zero Water Footprint policy.

57. All landscaping shall be designed to use recycled water for irrigation. Recycled water landscaping shall be designed to comply with California Code of Regulations Title 22 and shall include design details to prevent runoff of recycled water. The irrigation system shall include an ET/SMART controller.

58. All buildings shall be dual plumbed to use recycled water for non-potable uses.

<u>Public Works Special Conditions of Approval</u>

59. The Applicant shall submit Improvement Plans prepared by a registered Civil Engineer (Engineer of Record) in substantial conformance with the preliminary civil plans titled "Giovannoni Logistics Center East Tentative Parcel Map" prepared by CBG Civil Engineers dated September 17, 2021, except as modified by these conditions.

60. Improvement Plans and Final Map shall be tied to the State of California coordinate system.

61. The Applicant shall construct all of the on-site private streets, water, recycled water, sewer, storm drainage and storm quality **"Private Improvements"** generally shown on the Preliminary Plans and more specifically described below. All private street, water, recycled water sewer, storm drainage and stormwater quality improvements shall be designed in accordance with the City of American Canyon Engineering Standard Plans and Specifications for Public Improvements (City Standards), except as specifically noted otherwise in these conditions.

    a. Storm Drain Facilities:
    Construct private on-site drainage facilities, detention facilities, and other appurtenances to collect and convey all surface drainage to an approved private storm drain facility or outfall. Onsite drainage facilities shall provide for the positive drainage of all adjacent upstream or upgrade properties to prevent ponding. Existing run-on from adjacent properties shall not be obstructed and shall be conveyed onsite. Off-site peak storm water discharge shall not exceed 90% of the undeveloped peak flow from the 24-hour, 100-year event. The storm drains and detention facilities shall be substantially consistent with the Preliminary Plans. However, the sizing of all storm drains and detention facilities shall be determined by the approved final drainage report.

    b. Stormwater Quality Facilities:
    Permanent on-site private post-construction stormwater treatment BMPs shall be designed and constructed in accordance with the approved final SWCP.

    c. Recycled Water Services:
    Separate recycled water services shall be provided for domestic non-potable uses and irrigation uses.

62. Per the Subdivision Improvement and Reimbursement Agreement between the City of American Canyon and DWF IV NLP II, LLC, Napa County Official Record 2018-0024204, the Applicant shall reimburse the City its fair share cost for the improvement of South Kelly Road from its intersection with Devlin Road up to intersection with Highway 29. The fair share cost is based on the project's proportional share of net new trips.

63. Per the Subdivision Improvement and Reimbursement Agreement between the City of American Canyon and DWF IV NLP II, LLC, Napa County Official Record 2018-0024204, the Applicant shall reimburse the City its fair share cost for the construction of the Permanent Sewer Solution, which consists of new offsite public gravity sewer, pump station and force main which replaced the existing Green Island Pump Station. The fair share cost, based on the project's sewer flow, is 12% fair share cost. The current fair share cost is $144,774.

64. Prior to SUBMITTAL OF THE IMPROVEMENT PLANS, the Applicant shall:

    a. Submit the City's "Improvement Plan Checklist".
    b. Pay an initial cash deposit for City plan check services in amount to be determined by the City prior to the time of submittal. The Project engineer shall contact City staff to discuss submittal details to determine initial deposit amount.
    c. Provide the following:
        (1) Public Street Repair Plan
        (2) Utility Plan and Joint Trench Plan
        (3) Construction Storm Water Pollution Prevention Plan (SWPPP) and a City Erosion and Sediment Control Plan

(4) Drainage Report
(5) Post-Construction Stormwater Control Plan (SWCP)
(6) Geotechnical Report
(7) Construction Traffic Control Plan.
(8) Traffic Impact Study
(9) Application for Water and Sewer Service

65. Pothole and physically determine (by way of a survey performed by the Engineer of record) the actual horizontal location and vertical depth of all existing underground utilities throughout the proposed area of work and provide the design of all new utility installations required to serve the project including a schedule for implementation of such work as to prevent disrupting of utility service to adjacent properties.

66. Prior to APPROVAL OF THE IMPROVEMENT PLANS, the Applicant shall:

    a. Merge the two existing parcels (APNs 057-130-034 and 057-130-036) into a single parcel through the recordation of a lot merger or lot line adjustment.

    b. Provide written acknowledgment by the Geotechnical Engineer of Record that the Plans incorporate all design and construction criteria specified in the Geotechnical Report.

    c. Furnish proof of the acquisition of all rights of entry and/or temporary and permanent easements necessary to construct the project and the location of all such rights on the Plans.

    d. Furnish proof that all permits that may be required by the California Department of Fish & Wildlife, State and Regional Water Quality Control Board, US Army Corps of Engineers and any other regulatory agencies with jurisdiction over the proposed construction have been obtained.

    e. Fill out and submit the City's Erosion and Sediment Control Plan (ESCP) Template. Applicant may refer to a SWPPP, as appropriate, by referencing page number within the SWPPP that addresses the requirements of the ESCP.

    f. Submit a copy of the Notice of Intent and Wastewater Discharge Identification Number (WDID#) for coverage under the State Water Resources Control Board's General Construction Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order 2009-0009-DWQ).

67. Prior to RECORDATION OF THE FINAL MAP, the Applicant shall:

    a. Construct all of the Private Improvements to the satisfaction of the City. Alternatively, the Applicant may enter into a Subdivision Improvement Agreement with the City agreeing to complete all of the Private Improvements prior to Occupancy of the first unit. Such an Agreement will require the Applicant to provide bonds, proof of workers compensation insurance, and general liability insurance in the forms and amounts as deemed satisfactory to the City.

    b. Establish a Shared Maintenance Agreement between the owners of each parcel for the long term and ongoing maintenance and operation of all shared private improvements. Specifically, the parcel owners shall be responsible for the ongoing maintenance and operation of all onsite stormwater quality facilities and shared storm drains. The Shared Maintenance Agreement shall be prepared to run with the land of each parcel. The Shared Maintenance Agreement shall be submitted to the City for review and approval prior to recordation.

c. Generally, in substantial conformance with that which is shown on the approved Tentative Map, convey all easements and dedications, public and private, for the construction, use and/or maintenance of roads or other access, drainage facilities, utilities and post-construction storm water management facilities on the Final Map. All dedications to the City shall be Irrevocable Offers of Dedication. Specific conveyances include:

    i. Private reciprocal easements in favor of all parcels for all shared stormwater treatment facilities, shared storm drains, and for lot-to-lot surface stormwater runoff.

d. Furnish proof of the payment of the mapping service fee as required by Napa County Board of Supervisors Resolution No. 92-119.

68. Prior to COMMENCEMENT OF CONSTRUCTION ACTIVITIES, the Applicant shall:

    a. Pay off all current account balances with the City of American Canyon.

    b. Pay an inspection fee in amount to be determined at the time of commencement for the City's inspection of the Public Improvements.

    c. Conduct a pre-construction meeting with representatives of the City whereby the Applicant, the Legally Responsible Party (LRP), Qualified SWPPP Practitioner (QSP), Qualified SWPPP Developer (QSD), and/or the Contractor provides the following:

        i. Six (6) full-size bond copies of the approved Improvement Plans for the City's use.
        ii. One (1) job-site copy of the latest edition of the City Standards for the Contractor use.
        iii. One (1) job-site copy of the SWPPP for use by the LRP, QSP, QSD, and Contractor.
        iv. Electronic copies of Improvement Plans and SWPPP.

69. Prior to APPROVAL OF A BUILDING PERMIT, the Applicant shall:

    Pay all account balances and current City and American Canyon Fire District fees (Mitigation & Capacity) based on the rates in effect at the time of permit issuance. These fees include but may not be limited to the following: Traffic Mitigation, General Plan Update, Civic Facilities, Fire District, Water Capacity, Wastewater Capacity, Zero Water Footprint Mitigation and Affordable Housing Nexus.

70. A. Prior to issuance of the first building permit, the Applicant shall enter into a Recorded a Transportation Demand Management (TDM) Program Agreement ("TDM Agreement") that ensures the cumulative Project trip generation does not exceed the Giovannoni Logistics Center Final EIR (SCH# 2021010104) Trip Generation assumptions. The TDM Agreement shall encompass the entire Giovannoni Logistics Center Project.

    B. The TDM Agreement shall include a financial guarantee satisfactory to the City. The City shall deem the TDM program to be effective if the monitoring results indicate that AM peak-hour volumes are no more than 240 vehicles and PM peak-hour volumes are no more than 264 vehicles.

    C. The TDM program shall be implemented at the applicant's cost, with no cost to the City, regardless of the eventual mix of uses and shall at a minimum include a permanent vehicle counting station at

the single public access point. Examples of measures that may be considered as part of an effective TDM program include but are not limited to the following:

- Starting and ending workday shifts during off-peak hours (i.e., not between 7:00 a.m. to 9:00 a.m. or 3:00 p.m. to 6:00 p.m.).
- Implement shuttle service to key employment centers or park-and-ride lots in the area for those employees whose workday shift start during peak hours.
- Car-share program
- Shuttles to regional transit
- Transit subsidies
- Carpool/vanpool subsidies
- Employer-owned/sponsored vanpools
- Flex-time and telecommute programs
- Use of rail to transport employees and/or the delivery of goods

D. The Applicant shall retain a transportation planning/engineering consultant to analyze the effectiveness of the TDM program in a written report. The TDM Report will include data collected from the permanent vehicle counting station and a determination of employee commute methods, which shall be informed by surveying all employees working at the site. The TDM Report shall be submitted to the City on a periodic on-going basis and it shall form the basis of on-going determinations by the City as to the effectiveness of the TDM program. So long as the City deems the TDM program effective (i.e. when monitoring results indicate that AM peak-hour volumes are no more than 240 vehicles and PM peak-hour volumes are no more than 264 vehicles). At any time the City determines the Project exceeds the Giovannoni Logistics Center Final EIR (SCH# 2021010104) Trip Generation assumptions, the additional traffic impact shall be mitigated by Paragraph B.

E. If at any point the City determines the TDM program established as part of Paragraph A through D is not effective to reduce peak-hour traffic to within the TDM thresholds (240 vehicles during the AM peak hour and 264 vehicles during the PM peak hour), the Applicant shall pay an additional amount for each and every peak-hour trip that is recorded by the counting device that exceeds the TDM threshold, equal to the latest adopted Traffic Impact Fee ("TIF") program in effect at the time. The "on-going TIF" paid pursuant to this condition of approval is in addition to the "one-time TIF" paid at the time of issuance of the first building permit.

71. Prior to OCCUPANCY OF THE BUILDING, the Applicant shall:

    a. Restore all adjacent off-site road surfaces to pre-project conditions.

    b. Submit a certification by the Geotechnical Engineer of Record that all the work has been completed in substantial conformance with the recommendations in Soils Investigation/Geotechnical Report.

    c. Provide a mylar and digital copy of the Improvement Plans that include all as-built or field changes, in digital (.pdf) and AutoCAD (.dwg) format, compatible with the City's current version, and tied to the City's coordinate system.

    d. Provide a letter stating that all of the Developer's Conditions of Approval have been met.

    e. Provide a letter from the Civil Engineer of Record certifying that all the site improvements were constructed and inspected in substantial conformance with the approved plans and City Standards.

    f. Enter and record a post-construction Stormwater Operations and Maintenance Agreement with the City.

Mitigation Measures

72. MM AES-3: Prior to issuance of building permits for the proposed project, the project applicant shall prepare and submit a photometric plan to the City of American Canyon for review and approval which demonstrates that all exterior light fixtures would be directed downward or employ full cut-off fixtures to minimize light spillage and avoid interference with aviation operations at the Napa County Airport. The approved plan shall be incorporated into the proposed project.

73. MM AIR-2a: The following Best Management Practices (BMPs), as recommended by the Bay Area Air Quality Management District (BAAQMD), shall be included in the design of the project and implemented during construction:

    - All active construction areas shall be watered at least two times per day.
    - All exposed non-paved surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and access roads) shall be watered at least three times per day and/or non-toxic soil stabilizers shall be applied to exposed non-paved surfaces.
    - All haul trucks transporting soil, sand, or other loose material off-site shall be covered and/or shall maintain at least 2 feet of freeboard.
    - All visible mud or dirt tracked out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
    - All vehicle speeds on unpaved roads shall be limited to 15 miles per hour. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
    - Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California Airborne Toxics Control Measure (ATCM) Title 13, Section 2485 of California Code of Regulations). Clear signage regarding idling restrictions shall be provided for construction workers at all access points.
    - All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.
    - The prime construction contractor shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The City and the construction contractor shall take corrective action within 48 hours. The BAAQMD's phone number shall also be visible to ensure compliance with applicable regulations.

74. MM AIR-2b: Prior to the issuance of grading or building permits, the project applicant shall provide the City with documentation demonstrating the use of "Low-VOC" architectural coatings during the proposed project's construction. "Low-VOC" architectural coatings used during project construction shall not exceed 50 grams of reactive organic gases (ROG) or volatile organic compounds (VOC) per liter of product.

75. MM AIR-2c: Prior to issuing any certificate of occupancy for the proposed project, the project applicant shall provide the City with documentation demonstrating the use of "Low-VOC" architectural coatings and electric landscaping equipment during the operation of the proposed project. "Low-VOC" architectural coatings used during project construction shall not exceed 50 grams of reactive organic gases (ROG) or volatile organic compounds (VOC) per liter of product. Landscaping equipment referred to in this requirement shall include lawnmowers, leaf blowers, and chainsaws.

76. MM AIR-2d: Prior to issuing the certificate of occupancy for the proposed project, the project applicant shall provide the City with documentation demonstrating the use of a truck fleet that meets or exceeds model year 2014 for all heavy- duty trucks during operation of the proposed project. If the project applicant does not own the truck fleet that would be used during operation of the proposed project, the project applicant shall provide the City with documentation from the truck fleet owner or operator demonstrating that trucks utilized for operation of the proposed project will meet or exceed model year 2014. If any change occurs where a new truck fleet is utilized during operation of the proposed project, the project applicant shall provide the City with documentation demonstrating that the new truck fleet meets or exceeds this requirement.

    To monitor and ensure that trucks that meet a model year of 2014 or newer are used for the proposed project, the fleet operator shall maintain records of all trucks and equipment associated with the proposed project's operation and make these records available to the City upon request. Alternatively, the City may require periodic reporting and provision of written records by operators and conduct regular inspections of the records to the maximum extent feasible and practicable.

77. MM AIR-2e: Prior to the issuance of the certificate of occupancy for each building with dock doors, signage shall be posted identifying idling restrictions and contact information to report violations to the building manager.

78. MM AIR-2f: Prior to the issuance of the certificate of occupancy for each building with a separate end user, the City shall confirm that the end user has prepared a Transportation Demand Management Plan (TDM Plan). The TDM Plan shall be prepared by a qualified transportation consultant and identify strategies to reduce single-occupant vehicle trips. Examples of TDM strategies may include but are not limited to:

    - Ridesharing/Ride Matching
    - Vanpools
    - Transit subsidies
    - Preferential parking for rideshare or vanpool vehicles
    - Employee lockers
    - Secure bicycle parking
    - Employee locker rooms
    - Provide TDM information in employee breakroom

79. MM AIR-2g: Prior to the issuance of the certificate of occupancy, as a part of future lease agreements, the project proponent shall provide all future tenants at the project site information on available California Air Resources Board (ARB) and Bay Area Air Quality Management District (BAAQMD) incentive programs, such as the Carl Moyer Program and the Voucher Incentive Program, that support upgrading truck fleets to clean air technology equipment.

80. MM BIO-1a: Pre-construction surveys for Swainson's hawk shall be conducted in the project site vicinity prior to initiation of project construction activities and each year following initiation of construction if project activities are delayed or discontinued for 7 or more days prior to the second survey period (March 20 to April 5), and are scheduled to recommence construction activities during the second survey period but before August 1. These pre-construction surveys shall include investigation of all potential nesting trees within a half-mile radius around all project activities and shall be completed for at least two survey periods immediately prior to commencement of project construction. Surveys shall be conducted in accordance with CDFW's "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" (CDFW 2000) to

maximize the potential for locating nesting Swainson's hawk and reduce the potential for nest failures due to project activities and/or disturbances.

If no nesting Swainson's hawk are found during the first second survey period starting March 20, then project construction may commence. If during the third surveys (April 5–April 20) Swainson's hawk are found to be nesting in the project vicinity and construction has commenced, it shall be assumed the Swainson's hawk commenced nesting and thus the Swainson's hawk are habituated to the ambient level of noise and disturbance emanating from the project site.

If Swainson's hawk are found to be nesting within 1,000 feet of the project site, a non-disturbance buffer shall be established to keep all construction activities a minimum of 1,000 feet from the nest site. The CDFW shall be consulted regarding the adequacy of the buffer established by the qualified Raptor Biologist. At that time the necessity for acquiring a Fish and Game Section 2081 Incidental Take Permit (ITP) authorization would be determined. An ITP authorization shall be required if there were a valid concern the project activities would result in the "take" of an adult Swainson's hawk, eggs, or nestlings.

81. Surveys shall be conducted by a qualified Raptor Biologist with at least 2 years of experience surveying for and detecting Swainson's hawk pursuant to "Recommended timing and methodology for Swainson's Hawk Nesting Surveys in California's Central Valley" survey protocol. No disturbance such as construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist.

82. MM BIO-1b: No more than 30 days prior to the first ground disturbance activity, pre-construction golden eagle nesting surveys shall be conducted in the project vicinity by a qualified Raptor Biologist. The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting golden eagles. Preconstruction surveys shall include investigation of all potential nesting trees within a survey area determined by the qualified Raptor Biologist, but no less than a 0.5-mile radius around all project activities. If active golden eagle nests are identified within any trees within the survey areas a 0.5-mile radius of the project site, a qualified Raptor Biologist shall establish a protection buffer at a minimum of 1,000 feet that is adequate to ensure noise or activity from the proposed project would not cause nest disturbance or young or adult bird mortality. Buffer zones may vary in size as some golden eagles are more acclimated to disturbance than others. Size of buffer zone may be increased by the qualified Raptor Biologist considering the type of construction activity that may occur and the behavioral factors and extent that golden eagle may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young golden eagles have fledged or that the nesting cycle is complete based on monitoring of the active nest by a qualified Biologist.

83. MM BIO-1c: Prior to ground disturbance, a pre-construction nesting survey shall be conducted for northern harrier and short-eared owl by a qualified Raptor Biologist if construction is scheduled during the nesting season (February 1 through September 1). The qualified Raptor Biologist shall have at least 2 years of experience surveying for and detecting nesting northern harrier and short-eared owl. To determine whether northern harrier or short-eared owl is nesting on-site, a qualified Raptor Biologist(s) shall conduct walking transects through the project site grassland habitat searching for nests and minimum 500-foot radius from the project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc., the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars

or a spotting scope. An active northern harrier or short-eared owl nest must be protected by implementing a minimum 500-foot radius buffer zone around the nest marked with orange construction fencing. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated where it intersects the project site. Size of buffer zone could be modified increased considering the type of construction activity that may occur, physical barriers between the construction site and active nest, and the behavioral factors and extent that northern harrier or short-eared owl may have acclimated to disturbance. No construction or earthmoving activity shall occur within the established buffer zone until it is determined by a qualified Raptor Biologist that the young have fledged or that the nesting cycle is otherwise determined to be complete based on monitoring of the active nest by a qualified Raptor Biologist.

84. MM BIO-1d: Prior to any ground disturbance, pre- construction surveys for burrowing owl shall be conducted within a minimum of 150 meters of the project site. Where the survey area encroaches onto private property not accessible to the public (e.g., fenced in commercial property, residential backyard, etc.), the qualified Biologist shall either contact the property owner for permission to physically access the property or conduct a visual survey of adjacent areas by scanning with binoculars or a spotting scope. The pre- construction surveys shall be conducted within 2 weeks prior to the onset of any ground-disturbing activities. Surveys shall be conducted by a qualified Biologist following California Department of Fish and Wildlife (CDFW) 2012 staff report survey methods and Biologist qualifications to establish the status of burrowing owl on the project site.

    a. If burrowing owl are found to occupy the project site during the nonbreeding season (September 1 to January 31), occupied burrows shall be avoided by establishing a no- disturbance buffer zone a minimum of 100 feet around the burrow. Buffers may be adjusted to address site-specific conditions using the impact assessment approach described in the CDFW 2012 staff report. If a qualified Raptor Biologist determines the location of an occupied burrow/s may be impacted even with a 100-foot buffer, or the burrow(s) are in a location(s) on the project site where a buffer cannot be established without preventing the proposed project from moving forward, then a passive relocation effort may be instituted to relocate the individual(s) out of harm's way pursuant to a Burrowing Owl Exclusion Plan prepared in accordance with the CDFW 2012 staff report.

    b. If burrowing owl are found to be present during the breeding season (February 1 to August 31), the proposed project ground-disturbing activities shall follow the CDFW 2012 staff report recommended avoidance protocol whereby occupied burrows shall be avoided with a no-disturbance buffer.

    c. If burrowing owls are ultimately found on the site and burrow eviction/ relocation of burrowing owls during the non-nesting season is a selected strategy to move forward with the project without direct impacts to burrowing owl individuals, the applicant shall coordinate this effort with CDFW and provide habitat mitigation consistent with the 2012 CDFW Staff Report on burrowing owl.

85. MM BIO-2: Prior to issuance of grading permits. To offset the loss of the 0.496 acre of seasonal wetland impacts from Phase 1, and 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools from Phase 2, and to ensure there is no-net loss of wetland area, the applicant shall establish/create 0.992 acre of palustrine emergent wetlands (2:1 ratio) for Phase 1 concurrent with project construction, and 2.57 acres of seasonal wetlands (1:1 ratio) and 1.13 acres of vernal pool wetlands (1:1 ratio) for Phase 2 at least 1 year prior to the start of Phase 2 construction, on the 45-acre Wetland Preserve. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland.

86. MM BIO-3a: Prior to issuance of the Phase 1 grading permit, the project applicant shall apply for and obtain a Nationwide Permit from the San Francisco District of the United States Army Corps of Engineers (USACE) for discharge within 0.004 acre of wetlands/waters of the United States under Clean Water Act Section 404 jurisdiction. For the USACE permit to be valid, the applicant shall apply for and obtain the accompanying Section 401 Water Quality Certification from the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB). The applicant shall apply for and obtain a separate Waiver of Waste Discharge Requirements from the San Francisco Bay RWQCB for impacts to 0.496 acre of wetlands/waters of the State. To offset the loss of 0.496 acre of permanent wetland impacts and to ensure there is no- net loss of wetland area, the applicant shall establish/create 0.992 acre of wetlands (2:1 ratio), prior to or concurrent with the start of construction, on the 45-acre Wetland Preserve. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The applicant shall implement the terms of the approved permit(s).

87. MM BIO-3c: Prior to issuance of the Phase 1 grading permit, a Wetland Mitigation and Monitoring Plan shall be prepared and submitted to the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB) for review as part of the process for obtaining a permit from the agency. The Wetland Mitigation and Monitoring Plan shall address the loss of 0.496 acre of wetlands impact due to Phase 1 of the proposed project as well as the potential loss of approximately 3.7 acres of wetlands that as part of Phase 2.

    The Wetland Mitigation and Monitoring Plan shall include in irrevocable instrument (e.g., deed restriction or conservation easements) that shall restrict use of both the 0.992 acre of created wetlands for Phase 1 as well as approximately 3.7 acres of additional wetlands created for Phase 2. The Wetland Mitigation and Monitoring Plan shall also include a long-term endowment that would be fully funded by the proposed project to manage approximately 45-acre open space preserve and created wetlands in perpetuity. If additional wetland mitigation lands are required to compensate for wetland impacts associated with Phase 2, wetlands shall be established/created at a minimum 1:1 ratio (1 acre established/created for every acre permanently impacted) on appropriate mitigation land, approved by the RWQCB and United States Army Corps of Engineers (USACE), within the Phase 2 project site's Hydraulic Unit Code (HUC) 10 watershed. The established/created wetlands shall be monitored for a minimum of 5 years to ensure the wetlands meet the USACE's and RWQCB's definition of a wetland. The applicant shall implement the terms of the approved permit(s).

88. MM BIO-3d: Prior to issuance of the Phase 1 and Phase 2 grading permit, a Wetland Mitigation and Monitoring Plan shall be submitted to the San Francisco Bay Regional Water Quality Control Board (San Francisco Bay RWQCB) for review as part of the process for obtaining a permit from the agency. The Wetland Mitigation and Monitoring Plan shall be prepared in accordance with the Subpart J– Compensatory Mitigation for Losses of Aquatic Resources outlined in the California State Water Resources Control Board (State Water Board) Procedures, and in accordance with the State Water Board Implementation Guidance dated April 2020, and in accordance with the United States Army Corps of Engineers (USACE) Compensatory Mitigation Rule (33 Code of Federal Regulations Part 332).

89. The basic objective of the Wetland Mitigation and Monitoring Plan is to ensure that project wetland impacts, and compensatory mitigation proposed to offset the wetland impacts, shall provide a no-net-loss of area of wetlands, and wetlands established/created shall be in-kind to the wetlands impacted. In summary, the Wetland Mitigation and Monitoring Plan shall at a minimum:

    a. Preserve 7.58 acres of existing seasonal wetlands and 0.13 acre of vernal pools within the 45-acre Wetland Preserve.

b. Establish within the Wetland Preserve approximately 0.992 acre of seasonal wetlands in advance of or concurrent with implementation of Phase 1 impacts to 0.496 acre of palustrine emergent wetlands at a 2:1 ratio.

c. Establish within the Wetland Preserve approximately 2.57 acres of seasonal wetlands and 1.13 acres of vernal pools in advance of implementation of future Phase 2, assuming Phase 2 is built out, to address the potential maximum losses of approximately 3.7 acres of wetlands that may occur.

d. Provide financial assurances to ensure a high level of confidence that the compensatory mitigation shall be successfully completed, in accordance with applicable performance standards.

e. Design ecological performance standards to assess whether the Wetland Mitigation and Monitoring Plan is achieving the overall objectives, so that it can be objectively evaluated to determine whether it is developing into the desired resource type (vernal pool, seasonal wetland e.g.), and attaining any other applicable metrics such as acres, number of native plant species, water saturation and/or ponding depth etc.

f. Monitor the site for a duration necessary to determine whether the Wetland Mitigation and Monitoring Plan is meeting the performance standards. Established palustrine emergent wetlands and vernal pools typically develop quickly on soils with clay restrictive horizon. The 45-acre Wetland Preserve does have a clay restrictive layer approximately 8–18 inches below the surface therefore a 5- year monitoring period would be sufficient to determine whether performance standards are met. This monitoring period may be extended if performance standards are not met due to how the wetlands were constructed or natural events such as severe droughts.

g. Protect the approximately 45-acre Wetland Preserve in perpetuity using a conservation easement, and provide an endowment sufficient to fund the Long-Term Management Plan.

h. An overall assessment of the condition of the wetlands that shall be permanently impacted by the proposed project shall be conducted using the California Rapid Assessment Method (CRAM) for depressional wetlands, or a hybrid approach based on CRAM. Each similar wetland type that may be impacted shall be assessed to describe the floristic community and record the native and non-native dominant plants within the vernal pool and palustrine emergent wetlands. Physical structure such as topographic complexity and physical features that may provide habitat for aquatic species (e.g., boulders, woody debris etc.) shall be recorded and used to design the created/established wetlands. The purpose of this assessment is to ensure the design of the wetlands shall provide habitat that is similar to the wetlands being impacted to ensure the impacted wetlands are mitigated in-kind.

90. MM BIO-4: If construction occurs during the breeding season of migratory and resident birds (February 1 to August 31), a qualified Biologist shall conduct a pre-construction breeding bird survey in areas of suitable habitat within 7 days prior to the onset of construction activity. Surveys shall be conducted within the project footprint and 50 feet from the construction limits for nesting passerines, 250 feet from the construction limits for nesting accipiters and 1,000 feet from the construction limits for nesting raptors. If the survey area is found to be absent of nesting birds, no further mitigation would be required. However, if construction activities are delayed by more than 7 days, an additional nesting bird survey shall be performed.

    If bird nests are found, appropriate buffer zones shall be established around all active nests to protect nesting adults and their young from direct or indirect impacts related to project construction disturbance. Size of buffer zones shall be determined per recommendations of the qualified Biologist based on site conditions and species involved. At a minimum a 1,000-foot buffer shall be established

for nesting Swainson's hawk and golden eagle; 500-foot buffer for nesting tricolored blackbirds, northern harriers and other non-listed raptors; 250-foot buffer for nesting accipiters; and minimum 50-foot buffers shall be established for nesting passerines and all other non-raptor or passerine nesting birds. If an active nest is located outside of the project site, the buffer shall be extended onto the project site and demarcated where it intersects the project site. Buffer zones shall be maintained until it can be documented that either the nest has failed, or the young have fledged.

91. MM CUL-2a: No ground disturbance shall take place within 100 feet of informal archaeological resource 483A-001. The resource shall be preserved in place.

92. MM CUL-2b: An Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology shall be present on-site during all earth disturbing activities. If prehistoric or historic-period archaeological resources are encountered, all construction activities within 100 feet of the find shall halt and the City of American Canyon shall be notified. Prehistoric archaeological materials may include obsidian and chert flaked stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or shellfish remains; and stone milling equipment (e.g., mortars, pestles, hand stones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic- period materials might include stone, concrete, or adobe footings and walls; filled wells or privies; and deposits of metal, glass, and/or ceramic refuse.

    The Archaeologist shall inspect the findings within 24 hours of discovery. If it is determined the project could damage a historical resource or a unique archaeological resource (as defined pursuant to the CEQA Guidelines), mitigation shall be implemented in accordance with Public Resources Code Section 21083.2 and Section 15126.4 of the CEQA Guidelines, with a preference for preservation in place. Consistent with Section 15126.4(b)(3), this may be accomplished through planning construction to avoid the resource; incorporating the resource within open space; capping and covering the resource; or deeding the site into a permanent conservation easement. If avoidance is not feasible, a qualified Archaeologist shall prepare and implement a detailed treatment plan in consultation with the City of American Canyon. Treatment of unique archaeological resources shall follow the applicable requirements of Public Resources Code Section 21083.2. Treatment for most resources would consist of (but would not be limited to) sample excavation, artifact collection, and site documentation, with the aim to target the recovery of important scientific data contained in the portion(s) of the significant resource to be impacted by the proposed project. The treatment plan shall include provisions for analysis of data in a regional context, reporting of results within a timely manner, curation of artifacts and data at an approved facility, and dissemination of reports to local and State repositories, libraries, and interested professionals.

93. MM CUL-3: In the event of the accidental discovery or recognition of any human remains, CEQA Guidelines Section 15064.5, Health and Safety Code Section 7050.5, and Public Resources Code Sections 5097.94 and Section 5097.98 shall be followed. If during project construction, there is accidental discovery or recognition of any human remains, the following steps shall be taken:

    a. There shall be no further excavation or disturbance within 100 feet of the remains until the County Coroner is contacted to determine whether the remains are Native American and if an investigation of the cause of death is required. If the Coroner determines the remains to be Native American, the Coroner shall contact the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall identify the person or persons it believes to be the Most Likely Descendant (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work within 48 hours, for means of

treating or disposing of, with appropriate dignity, the human remains, and any associated grave goods as provided in Public Resource Code Section 5097.98.

b. Where the following conditions occur, the landowner or authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the MLD or on the project site in a location not subject to further subsurface disturbance:

- The NAHC is unable to identify an MLD or the MLD failed to make a recommendation within 48 hours after being notified by the commission.
- The descendant identified fails to make a recommendation.
- The landowner or authorized representative rejects the recommendation of the descendant, and mediation by the NAHC fails to provide measures acceptable to the landowner.

Additionally, California Public Resources Code Section 15064.5 requires the following relative to Native American Remains:

i. When an initial study identifies the existence of, or the probable likelihood of, Native American Remains within a project, a lead agency shall work with the appropriate Native Americans as identified by the NAHC as provided in Public Resources Code Section 5097.98. The applicant may each develop a plan with respect to their respective individual development proposals for treating or disposing of, with appropriate dignity, the human remains, and any items associated with Native American Burials with the appropriate Native Americans as identified by the NAHC.

94. MM CUL-4: A Tribal Monitor representing the Yocha Dehe Wintun Nation shall be present during all project-related ground disturbance. Additionally, the Yocha Dehe Wintun Nation's Treatment Protocol (Protocol) shall be followed with respect to Tribal Cultural Resources (TCRs). The purpose of the protocol is to formalize procedures for the treatment of Native American human remains, grave goods, ceremonial items, and items of cultural patrimony, if any are found in conjunction with development, including archaeological studies, excavation, geotechnical investigations, grading, and any ground-disturbing activity. This Protocol also formalizes procedures for Tribal Monitoring during archaeological studies, grading, and ground-disturbing activities.

a. Cultural Affiliation: The Yocha Dehe Wintun Nation (Tribe) traditionally occupied lands in Yolo, Solano, Lake, Colusa, and Napa Counties. The Tribe has designated its Cultural Resources Committee (Committee) to act on the Tribe's behalf with respect to the provisions of this Protocol. Any human remains which are found in conjunction with projects on lands culturally affiliated with the Tribe shall be treated in accordance with Section III of this Protocol. Any other cultural resources shall be treated in accordance with Section IV of this Protocol.

b. Inadvertent Discovery of Native American Human Remains: Whenever Native American human remains are found during the course of a project, the determination of Most Likely Descendant (MLD) under California Public Resources Code Section 5097.98 will be made by the Native American Heritage Commission (NAHC) upon notification to the NAHC of the discovery of said remains at a project site. If the location of the site and the history and prehistory of the area is culturally affiliated with the Tribe, the NAHC contacts the Tribe; a Tribal member will be designated by the Tribe to consult with the landowner and/or project proponents.

Should the NAHC determine that a member of an Indian tribe other than Yocha Dehe Wintun Nation is the MLD, and the Tribe agrees with this determination, the terms of this Protocol relating to the treatment of such Native American human remains shall not be applicable; however, that situation is very unlikely.

c. Treatment of Native American Remains: In the event that Native American human remains are found during development of a project and the Tribe or a member of the Tribe is determined to be MLD pursuant to Section II of this Protocol, the following provisions shall apply. The Medical Examiner shall immediately be notified, ground-disturbing activities in that location shall cease and the Tribe shall be allowed, pursuant to California Public Resources Code Section 5097.98(a), to (1) inspect the site of the discovery and (2) make determinations as to how the human remains and grave goods shall be treated and disposed of with appropriate dignity. The Tribe shall complete its inspection and make its MLD recommendation within 48 hours of getting access to the site. The Tribe shall have the final determination as to the disposition and treatment of human remains and grave goods. Said determination may include avoidance of the human remains, reburial on-site, or reburial on tribal or other lands that will not be disturbed in the future. The Tribe may wish to rebury said human remains and grave goods or ceremonial and cultural items on or near the site of their discovery, in an area which will not be subject to future disturbances over a prolonged period of time. Reburial of human remains shall be accomplished in compliance with the California Public Resources Code Sections 5097.98(a) and (b). The term "human remains" encompasses more than human bones because the Tribe's traditions call for the burial of associated cultural items with the deceased (funerary objects), and/or the ceremonial burning of Native American human remains, funerary objects, grave goods, and animals. Ashes, soils, and other remnants of these burning ceremonies, as well as associated funerary objects and unassociated funerary objects buried with or found near the Native American remains are to be treated in the same manner as bones or bone fragments that remain intact.

d. Non-Disclosure of Location of Reburials: Unless otherwise required by law, the site of any reburial of Native American human remains shall not be disclosed and will not be governed by public disclosure requirements of the California Public Records Act, California Government Code Section 6250 et seq. The Medical Examiner shall withhold public disclosure of information related to such reburial pursuant to the specific exemption set forth in California Government Code Section 6254(r). The Tribe will require that the location for reburial is recorded with the California Historic Resources Inventory System (CHRIS) on a form acceptable to the CHRIS center. The Tribe may also suggest the landowner enter into an agreement regarding the confidentiality of site information that will run with title on the property.

e. Treatment of Cultural Resources: Treatment of all cultural items, including ceremonial items and archaeological items will reflect the religious beliefs, customs, and practices of the Tribe. All cultural items, including ceremonial items and archaeological items, which may be found at a project site shall be turned over to the Tribe for appropriate treatment, unless ordered by a court or agency of competent jurisdiction. The project proponent shall waive any and all claims to ownership of Tribal ceremonial and cultural items, including archaeological items, which may be found on a project site in favor of the Tribe. If any intermediary, (for example, an Archaeologist retained by the project proponent) is necessary, said entity or individual shall not possess those items for longer than is reasonably necessary, as determined solely by the Tribe.

f. Inadvertent Discoveries: If additional significant sites or sites not identified as significant in a project environmental review process, but later determined to be significant, are located within a project impact area, such sites will be subjected to further archaeological and cultural significance evaluation by the project proponent, the Lead Agency, and the Tribe to determine whether additional mitigation measures are necessary to treat sites in a culturally appropriate manner consistent with CEQA requirements for mitigation of impacts to cultural resources. If there are human remains present that have been identified as Native American, all work will cease for a period of up to 30 days in accordance with Federal Law.

95. MM GEO-1b: Prior to the issuance of building permits for each Phase 1 and 2 structure, the project applicant shall submit a design-level Geotechnical Investigation to the City of American Canyon for review and approval. The investigation shall be prepared by a qualified engineer and identify grading and building practices necessary to achieve compliance with the latest adopted edition of the California Building Standards Code (CBC) geologic, soils, and seismic requirements, including abatement of expansive soil conditions. The report shall also determine the final design parameters for walls, foundations, foundation slabs, and surrounding related improvements (e.g., utilities roadways, parking lots, and sidewalks). The measures identified in the approved report shall be incorporated into the project plans and all applicable construction-related permits.

96. MM GEO-5: If potential fossils are discovered during project implementation, all earthwork or other types of ground disturbance within 100 feet of the find shall stop immediately until a qualified professional Paleontologist can assess the nature and importance of the find. Based on the scientific value or uniqueness of the find, the Paleontologist shall either record the find and recommend that the City of American Canyon allow work to continue or recommend salvage and recovery of the fossil. The Paleontologist shall, if required, propose modifications to the stop-work radius based on the nature of the find, site geology, and the activities occurring on the site. If treatment and salvage is required, recommendations will be consistent with Society of Vertebrate Paleontology guidelines and currently accepted scientific practice. If required, treatment for fossil remains shall include preparation and recovery of fossil materials so that they can be housed in an appropriate museum or university collection, and, if required, shall also include preparation of a report for publication describing the finds.

97. MM GHG-1a: Prior to the issuance of any grading permits, the project applicant shall provide the City of American Canyon with documentation (e.g., site plans) demonstrating project construction will include the following construction Best Management Practices (BMPs):

    a. At least 15 percent of the construction fleet for each project phase shall be alternatively fueled or electric.

    b. At least 10 percent of building materials used for project construction shall be sourced from local suppliers.

    c. At least 65 percent of construction and demolition waste materials shall be recycled or reused.

    d. At least one contractor that has a business location in American Canyon shall be contracted for project construction.

    e. All construction contracts shall include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers) using during construction be electrically powered.

    f. Architectural coatings used for project construction shall be “Low-VOC,” containing no greater than 50 grams of volatile organic compounds (VOC) per liter of product.

    g. Project construction shall prohibit the use of generators and shall establish grid power connection to electrical equipment needs.

    h. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California Airborne Toxics Control Measure [ATCM] Title 13, Section 2485 of California Code of Regulations). Clear signage regarding idling restrictions shall be provided for construction workers at all access points.

    i. All construction equipment shall be maintained and properly tuned in accordance with

manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.

j. The prime construction contractor shall post a publicly visible sign with their telephone number and contractor to contact. The construction contractor shall take corrective action within 48 hours. The BAAQMD's phone number shall also be identified and visible to ensure compliance with applicable regulations.

98. MM GHG-1b: Prior to the issuance of any building permits, the project applicant shall provide the City of American Canyon with documentation (e.g., site plans) demonstrating the proposed project is designed without the use of any natural gas -fueled appliances or natural gas plumbing.

99. MM GHG-1c: Prior to issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on-site plans), that the proposed buildings are designed and will be built to, at a minimum, the Tier 2 advanced energy efficiency requirements of the Nonresidential Voluntary Measures of the California Green Building Standards Code, Division A5.2, Energy Efficiency, as outlined under Section A5.203.1.2.2.

100. MM GHG-1d: Prior to issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on-site plans), that the proposed parking areas for passenger automobiles and trucks are designed and will be built to accommodate electric vehicle (EV) charging stations. At a minimum, the parking shall be designed to accommodate a number of EV charging stations equal to the Tier 2 Nonresidential Voluntary Measures of the California Green Building Standards Code, Section A5.106.5.3.2.

101. MM GHG-1d: Prior to the issuance of any building permits, the project applicant shall demonstrate to the satisfaction of the City of American Canyon (e.g., shown on-site plans), that each loading dock is outfitted with at least one 240-volt outlet to accommodate truck and Transport Refrigeration Unit (TRU) charging and/or electrical power connection while trucks are loading and unloading goods.

102. MM GHG-1e: Prior to the issuance of any building permit for the proposed project, the project applicant shall provide the City with documentation (e.g., site plans) demonstrating to the City's satisfaction that the electricity demand will be supplied with 100 percent carbon-free electricity sources through the year 2045. As City representative, the Planning Commission recommends the City Council require this mitigation measure be accomplished with on-site solar panel electricity.

103. MM HYD-1a: Prior to issuance of grading permits for the proposed project, the applicant shall submit to the City of American Canyon for review and approval a Storm Water Pollution Prevention Plan (SWPPP) in accordance with the requirements of the statewide Construction General Permit. The SWPPP shall be designed to address the following objectives: (1) all pollutants and their sources (e.g., runoff), including sources of sediment associated with construction, construction site erosion, and all other activities associated with construction activity, are controlled; (2) where not otherwise required to be under a Regional Water Quality Control Board (RWQCB) permit, all non-stormwater discharges are identified and either eliminated, controlled, or treated; (3) site Best Management Practices (BMPs) (e.g., silt fencing, street sweeping, routine inspection, etc.) are effective and result in the reduction or elimination of pollutants in stormwater discharges and authorized non-stormwater discharges from construction activity; and (4) stabilization BMPs are installed to reduce or eliminate pollutants after construction are completed. The SWPPP shall be prepared by a qualified SWPPP developer. The SWPPP shall include the minimum BMPs required for the identified Risk Level. BMP implementation shall be consistent with the BMP requirements in the most recent

version of the California Stormwater Quality Association (CASQA) Stormwater Best Management Handbook–Construction or the California Department of Transportation (Caltrans) Stormwater Quality Handbook Construction Site BMPs Manual. The SWPPP shall be implemented during construction.

104. MM HYD-1b: Prior to the issuance of building permits, the project applicant shall submit a Stormwater Control Plan to the City of American Canyon for review and approval. The plan shall be developed using the California Stormwater Quality Association (CASQA) "New Development and Redevelopment Handbook" and include applicable provisions of Section C.3 of the San Francisco Bay Regional Water Quality Control Board (RWQCB) Municipal Regional Permit (Order No. R2-2015-0049, NPDES Permit No. CAS612008 (or more recent permit). The Stormwater Control Plan shall identify pollution prevention measures and Best Management Practices (BMPs) to control stormwater pollution from operational activities and facilities and provide maintenance in perpetuity. The Stormwater Control Plan shall include Low Impact Development (LID) design concepts, as well as concepts that accomplish a "first flush" objective that remove contaminants from the first 2 inches of stormwater before it enters area waterways. The project applicant shall also prepare and submit an Operations and Maintenance Agreement to the City, identifying procedures to ensure stormwater quality control measures work properly during operations.

105. MM LU-3: Prior to issuance of grading permits, the applicant shall retain a qualified Biologist to assess potential wildlife hazards to aviation. The assessment shall evaluate the characteristics of the emergent wetlands, drainages, other potential wildlife attractant features (i.e., ponded water) located within the open space area and identify management practices (e.g., storm drainage, vegetation, etc.) to prevent the creation of attractants for large flocks or birds or other wildlife species that may present safety hazards to aviation activities. As part of the assessment, the applicant shall consult with Napa County Airport and Napa County Airport Land Use Commission (ALUC) representatives, as appropriate, regarding findings and recommendations. The applicant shall submit a report to the City of American Canyon prepared by a qualified Biologist that confirms the wildlife hazard assessment's findings and recommendations are incorporated into the design of the open space preserve.

106. MM NOI-1: Implementation of the following multi-part mitigation measure is required to reduce potential construction period noise impacts:

a. The construction contractor shall ensure that all equipment driven by internal combustion engines shall be equipped with mufflers that are in good condition and appropriate for the equipment.

b. The construction contractor shall ensure that unnecessary idling of internal combustion engines (i.e., idling in excess of 5 minutes) is prohibited.

c. The construction contractor shall utilize "quiet" models of air compressors and other stationary noise sources where technology exists.

d. At all times during project grading and construction, the construction contractor shall ensure that stationary noise- generating equipment shall be located as far as practicable from sensitive receptors and placed so that emitted noise is directed away from adjacent residences.

e. The construction contractor shall ensure that the construction staging areas shall be located to create the greatest feasible distance between the staging area and noise-sensitive receptors nearest the project site.

107. MM NOI-1: The construction contractor shall ensure that all on-site construction activities,

including the operation of any tools or equipment used in construction, drilling, repair, alteration, grading, or demolition work, are limited to between the daytime hours of 7:00 a.m. to 7:00 p.m. Monday through Saturday. No construction shall be permitted on Sundays and federal holidays.

PASSED, APPROVED and **ADOPTED** at a specially scheduled meeting of Planning Commission of the City of American Canyon held on the November 17, 2022 by the following vote:

AYES:
