C. Commencement of the installation by the CONTRACTOR shall indicate CONTRACTOR'S acceptance of the substrate, areas, and conditions.

3.4 PREPARATION

3-4.01. Sequence installation properly with the installation and protection of other WORK, so that neither will be damaged by the installation of the other.

3.5 INSTALLATION

3-5.01. Installation shall comply with the requirements of the Contract Documents, with applicable references, with the requirements of the CODE, ADAAG, ANSI A 117.1 and with Manufacturer's written instructions. Where a conflict occurs among these requirements, the more stringent shall apply, as directed by the ENGINEER.

A. Mount hardware units at heights indicated in the following applicable publications, except as specifically indicated or required to comply with the governing regulations.

1. The CONTRACTOR shall comply with DHI recommended locations for hardware as applicable for specified doors.

3-5.02. The CONTRACTOR shall provide corrosion resistant fasteners, anchors, and shims required for a complete installation, and shall be secure, plumb, and true to line, allowing for required movement, including expansion and contraction.

3-5.03. The CONTRACTOR shall provide separation of dissimilar materials to ensure no galvanic action occurs.

3-5.04. Where cutting and fitting is required to install hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation or application of surface protection with finishing WORK specified in the Division 9 Sections. Do not install surface-mounted items until finishes have been completed on the substrates involved.

3.6 CLEANING, FINISHING, AND PROTECTION

3-6.01. Adhesive papers used for masking which become firmly bonded when exposed to heat and/or light shall not be used.

A. Remove masking film and temporary labels as soon as possible after installation. Films and labels left in place after installation shall be the responsibility of the CONTRACTOR.

B. Residue shall not be left on any surfaces.

3-6.02. Upon completion of the installation, door hardware and appurtenances shall be cleaned of dirt and other foreign matter to the satisfaction of the ENGINEER.

A. Cleaning shall be performed again immediately prior to acceptance of the WORK, when directed by the ENGINEER.

B. Cleaning shall be performed in accordance with the Manufacturer's written instructions.

3-6.03. Adjusting and cleaning shall consist of ensuring smooth operation, lubricating and testing the door hardware.

A. Door hardware shall operate smoothly, quietly, and without squeaking and binding.

1. The CONTRACTOR shall adjust and check each operating item of hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate freely and smoothly or as intended for the application made.

2. Latches and bolts shall be installed to automatically engage in keepers, whether activated by closers or by manual push. In no case should additional manual pressure be required to engage latch or bolt in keepers.

3. Closers and hinges shall be carefully adjusted to operate the doors noiselessly and evenly, and hinges shall be installed so as not to bind. Closers, closer arms, and hold-open arms shall be attached with sex bolts.

4. Adjust door control devices to compensate for final operation of heating and ventilating equipment.

3-6.04. Door hardware shall be protected from damage from subsequent construction operations.

3-6.05. The CONTRACTOR shall make adjustments required and retest until accepted.

3-6.06. The CONTRACTOR shall remove scratches and blemishes to the satisfaction of the ENGINEER.

3-6.07. Damaged or defective items shall be removed and replaced at the direction of the ENGINEER.

3-6.08. When door hardware WORK is completed, remove unused materials, containers, and equipment, and clean the Site of door hardware debris.

3-6.09. The hardware Supplier shall do a final inspection prior to Substantial Completion to ensure that all hardware has been correctly installed and is in proper working order and shall provide a written report of this inspection to the ENGINEER the file.

3.7 HARDWARE SCHEDULE

3-7.01. The following schedule is furnished for whatever assistance it may afford the CONTRACTOR. The CONTRACTOR shall not consider it as entirely inclusive. Should any particular door or item be omitted in any scheduled hardware group, the CONTRACTOR shall

provide door or item with hardware same as required for similar purposes as accepted by the ENGINEER, and at no additional cost to the OWNER. Quantities listed are for each pair of doors, or for each single door.

3-7.02. Abbreviations:

A. BO – By Others.

B. MC – McKinney.

C. RX – Rixson.

D. SA – Sargent.

E. PMD – painted to match door.

Hardware Schedule:

1. ED – Double Exterior Doors:

Quantity	Device	Description
Per Spec.	Hinges	
1	Exit Device (ANSI 08)	8613 ET
1	Exit Device (ANSI 02)	8610
2	Closer	180 Degrees with Hold Open
2	Kick Plates	
1	Threshold	Pemko 2005AV Mill Aluminum
1	Weatherstrip/Gasketing	Pemko S88D at Head and Jambs
1	Door Top Drip	Pemko 346 at Door Head
2	Door Bottom	Pemko 321DN Annodized Aluminum

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 09940 - PROTECTIVE COATINGS

PART 1 - GENERAL

1-1. SCOPE

1-1.01. This section covers field applied protective coatings, including surface preparation, protection of surfaces, inspection, and other appurtenant work for equipment and surfaces designated to be coated with heavy-duty maintenance coatings. Regardless of the number of coats previously applied, at least two field coats in addition to any shop coats or field prime coats shall be applied to all surfaces unless otherwise specified.

1-2. GENERAL

1-2.01. Cleaning, surface preparation, coating application, and thickness shall be as specified herein and shall meet or exceed the coating manufacturer's recommendations. When the manufacturer's minimum recommendations exceed the specified requirements, Contractor shall comply with the manufacturer's minimum recommendations. When equivalent products are acceptable to Engineer, Contractor shall comply with this specification and the coating manufacturer's recommendations.

1-2.02. Governing Standards: All cleaning, surface preparation, coating application, thickness, testing, and coating materials (where available) shall be in accordance with the referenced standards of the following AWWA, ANSI, NACE, SSPC, NSF, and ASTM.

1-2.03. Delivery and Storage: All coating products shall be received and stored in accordance with the coating manufacturer's recommendations.

1-2.04 Coatings, Painting, and Linings Covered in Other Sections - Not used.

1-3. SUBMITTALS

1-3.01. Contractor shall submit color cards for all coatings proposed for use, together with complete descriptive specifications and the completed Coating System Data Sheets, to Engineer for review and color selection. Requests for review submitted directly to Engineer by coating suppliers will not be considered.

1-3.02. When the proposed products will be in contact with raw water, Contractor shall submit certifications that the proposed systems are in compliance with ANSI/NSF 61.

1-3.03. Contractor shall submit a Coating System Data Sheet for each separately identified surface in the Coating Schedule that will be used in the project. Each field coating system shall be acceptable to the coating material manufacturer. Each Coating System Data Sheet shall include application temperature limits including recoat time requirements for the ambient conditions at the site, including temperatures up to 130°F [54°C]. Temperature requirements shall be specified by the coating manufacturer.

1-3.04. Each proposed coating system shall be assigned a unique number with a prefix letter based on the following:

Prefix	Surfaces
A	Iron and steel
C	Concrete and concrete block
E	Equipment - submerged nonsubmerged
F	Nonferrous metal
G	Galvanized
H	High temperature
P	PVC and FRP

1-3.05. Each coating system that will be applied entirely in the field shall be assigned only a prefix letter and no suffix letter. When appropriate under the indicated conditions, the following suffix shall be added to the coating system numbers:

-F Each shop-applied coating system that includes a finish coat applied in the field.

1-3.06. A separate Coating System Data Sheet shall be developed and submitted for each variation or change in a coating system or surface to be coated.

1-3.07. The manufacturer’s standard colors will be acceptable for all coatings.

1-4. QUALITY ASSURANCE.

1-4.01. Coating System Data Sheet Certifications: The coating applicator and coating manufacturer shall review and approve in writing the coating manufacturer's written recommendations for the coating system and the intended service. Any variations from the specifications or the coating manufacturers published recommendations shall be submitted in writing and approved by the coating manufacturer. The coating manufacturer shall observe the surface preparation, mixing, and application of the coating systems and submit a written report of his observations and any additional recommendations.

1-4.02. Special Interior Coating Systems - Not used.

PART 2 - PRODUCTS

2.1. ACCEPTABLE MANUFACTURERS.

2-1.01 Alternative Manufacturers: In addition to the coatings listed herein, equivalent products of the following manufacturers will also be acceptable:

PPG
Rust-Oleum

2-1.02. Equivalent Coatings: Whenever a coating is specified by the name of a proprietary product or of a particular manufacturer or vendor, it shall be understood as establishing the desired type and quality of coating. Other manufacturers' coatings will be accepted, provided that sufficient information is submitted to enable Engineer to determine that the proposed coatings are equivalent to those named. Information on proposed coatings shall be submitted for review in

accordance with the Submittals section. Requests for review of equivalency will be accepted only from Contractor, and will be considered only after the contract has been awarded.

2.2. MATERIALS

2-2.01. All coatings shall be delivered to the job in original, unopened containers, with labels intact. Coatings shall be stored indoors and shall be protected against freezing. No adulterant, unauthorized thinner, or other material not included in the coating formulation shall be added to the coating for any purpose.

2-2.02. All coatings shall conform to the air quality regulations applicable at the location of use. Coating materials that cannot be guaranteed by the manufacturer to conform, whether or not specified by product designation, shall not be used.

2-2.03. The coatings specified have been selected on the basis of the manufacturer's statement that the VOC content of the product is 2.8 lbs per gallon or less; however, it shall be the Contractor's responsibility to use only coating materials that are in compliance with the requirements of all regulatory agencies. Local regulations may require some coatings to have a lower VOC content than specified herein. The coatings specified may meet the VOC limits in the unthinned (as shipped) condition, but may exceed the limits if thinned according to the manufacturer's recommendations. In such case, the coatings shall not be thinned beyond the 2.8 lbs per gallon limit, and if the product cannot be thinned to suit the application method or temperature limits, another manufacturer's coating shall be used, subject to acceptance by Engineer.

2-2.04. Contractor shall be responsible for ensuring the compatibility of field coatings with each other or with any previously applied coatings. Coatings used in successive field coats shall be produced by the same manufacturer. The first field coat over shop coated or previously coated surfaces shall cause no wrinkling, lifting, or other damage to underlying coats.

2-2.05. All coatings used on surfaces that will be in contact with potable or treated water shall be certified as being in compliance with ANSI/NSF 61. Coatings that cannot be so certified, whether or not specified by manufacturer and by product designation, shall not be used.

2-2.06. Primers :

Universal Primer	Ameron "Amercoat 385 Epoxy", Carboline "Rustbond", ICI Devoe "Devran 224HS", Tnemec "Series 27 F.C. Typoxy", or Sherwin-Williams "Macropoxy 646".
Epoxy Concrete Block Filler	Ameron "Amerlock 400BF Epoxy Block Filler", Carboline "Sanitile 600", ICI Devoe "Blox Filler 4000", Tnemec "Series 54-660", or Sherwin-Williams "Kem Cati-Coat HS".
Epoxy Concrete Filler and Surfacer	Tnemec "Series 63-1500", Ameron NuKlad 114A, or Carboline "Carboguard 510".

2-2.07. Intermediate and Finish Coatings :

Epoxy Enamel (NSF certified systems)	
Ferrous Metal Surfaces and Concrete Surfaces in Contact with Treated or Raw Water in Potable Water Facilities	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", ICI Devoe "Bar-Rust 233H" Tnemec "Series N140 Pota-Pox Plus", or Sherwin-Williams "Macropoxy 646NSF"; immersion service.
Epoxy Enamel	
Concrete Floors	Ameron "Amerlock 400", Carboline "Carboguard 890", ICI Devoe "Devran 224HS", Tnemec "Series N69 Hi-Build Epoxoline II", or Sherwin-Williams "Armorseal 1000HS"; nonskid.
Ferrous Metal Surfaces and Masonry or Concrete Surfaces Other Than Floors	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", ICI Devoe Devran "224HS", Tnemec "Series N69 Hi-Build Epoxoline II", or Sherwin-Williams "Macropoxy 646".
Aliphatic Polyurethane	Ameron "Amercoat 450H", Carboline "Carbothane 134HG", ICI Devoe "Devthane 379H" Tnemec "Series 1074 Endura-Shield II", or Sherwin-Williams "Acrolon 218HS".
Coal Tar Epoxy	High-build coal tar epoxy; Ameron "Amercoat 78HB Coal Tar Epoxy", Carboline "Bitumastic 300 M", Tnemec "46H-413 Hi-Build Tneme-Tar", or Sherwin-Williams "Hi-Mil Sher-Tar Epoxy".
Medium Consistency Coal Tar	Carboline "Bitumastic 50" or Tnemec "46-465 H.B. Tnemecol".
Vinyl Ester	Tnemec "Series 120 Vinester" Carboline "Plasite 4110" or Sherwin-Williams "Magnalux 304FF".
Heat-Resistant	Suitable for temperatures up to 400°F [207°C]; Ameron "Amerlock 400", Carboline "Thermaline 450", Tnemec "43-36 Chrome Aluminum", or Sherwin-Williams "Silver-Brite Aluminum".

High Heat-Resistant	Suitable for temperatures up to 1000°F [537°C]; Ameron " Amercoat 878", Carboline "Thermaline 4700 VOC", Tnemec "Series 39 Silicone Aluminum" or Sherwin-Williams "Silver-Brite Hi-Heat Silicone Aluminum".

2-2.08. Vinyl Ester With Graphite Filler Coating System: The corrosion protection system shall be a two component, 100 percent solids, solvent-free, vinyl ester resin, graphite filled, high-build protective and waterproofing coating, Dudick "Protecto-Coat 805". Concrete surface primer shall be a catalyzed vinyl ester resin containing conductive fillers, 100 percent solids, Dudick "Primer 27C". Finish coats shall be a two component, 100 percent solids, solvent-free, graphite filled vinyl ester resin.

PART 3 - EXECUTION

3.1. SURFACE PREPARATION

3-1.01. All surfaces to be coated shall be clean and dry and shall meet the recommendations of the coating manufacturer for surface preparation. Freshly coated surfaces shall be protected from dust and other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss on previously coated surfaces shall be dulled if necessary for proper adhesion of topcoats.

3-1.02. Surfaces shall be free of cracks, pits, projections, or other imperfections that would interfere with the formation of a smooth, unbroken coating film, except for concrete block construction where a rough surface is an inherent characteristic.

3-1.03. When applying touchup coating or repairing previously coated surfaces, the surfaces to be coated shall be cleaned as recommended by the coating manufacturer, and the edges of the repaired area shall be feathered by sanding or wire brushing to produce a smooth transition that will not be noticeable after the coating is applied. All coatings made brittle or otherwise damaged by heat of welding shall be completely removed.

3-1.04. Galvanized Surfaces: Galvanized surfaces shall be prepared for coating according to the instructions of the manufacturer of the epoxy enamel. Any chemical treatment of galvanized surfaces shall be followed by thorough rinsing with clean water.

3-1.05. Ferrous Metal Surfaces: Ungalvanized ferrous metal surfaces shall be prepared for coating by using one or more of the following cleaning procedures as specified: solvents (SSPC-SP1); blasting (SSPC-SP5, -SP6, -SP7, or -SP10); power tools (SSPC-SP3 or -SP11); or hand tools (SSPC-SP2). Oil and grease shall be completely removed in accordance with SSPC-SP1 before beginning any other cleaning method. Surfaces of welds shall be scraped and ground as necessary to remove all slag and weld spatter. Tools which produce excessive roughness shall not be used.

3-1.06. All components of equipment that can be properly prepared and coated after installation shall be installed prior to surface preparation. Components that will be inaccessible

after installation shall have the surfaces prepared and coated before installation. Motors, drive trains, and bearings shall be protected during surface preparation in accordance with the equipment manufacturer's recommendations.

3-1.07. All cut or sheared edges shall be ground smooth to a 1/8 inch minimum radius for all material 1/4 inch thickness and larger. For material thickness less than 1/4 inch all cut or sheared edges shall be ground smooth to a radius equal to 1/2 the material thickness. Grinding of rolled edges on standard shapes with a minimum radius of the 1/16 inch will not be required.

3-1.08. All ferrous metal surfaces shall have all welds ground smooth and free of all defects in accordance with NACE Standard RPO178, Appendix C, Designation C and sharp edges ground smooth, if not previously prepared in the shop. Instead of blending of the weld with the base metal as required by the NACE standard, it will be acceptable to furnish a welded joint that has a smooth transition of the weld to the base metal. All welds shall be ground smooth to ensure satisfactory adhesion of paint.

3-1.09. The cleaning methods and surface profiles specified herein are minimums, and if the requirements printed in the coating manufacturer's data sheets exceed the limits specified, the value printed on the data sheets shall become the minimum requirement.

3-1.10. Ferrous Metal Surfaces – Non-immersion Service: Ferrous metal surfaces, including fabricated equipment, in non-immersion service shall be cleaned to the degree recommended by the coating manufacturer for surfaces to be coated with coal tar epoxy, epoxy enamel, and heat-resistant coatings, except galvanized surfaces. Blast cleaning to at least SSPC-SP6 shall be used where recommended by the coating manufacturer, and may be used elsewhere at the option of Contractor, provided that no dust is permitted to settle on adjacent wet coating. Surface profile shall be as recommended by coating manufacturer, but not less than 2 mils.

3-1.11. Ferrous Metal Surfaces: Immersion Service. Surface preparation of ferrous metal surfaces in immersion service shall consist of blast cleaning to at least SSPC-SP10 and the first application of coating shall be performed on the same day. If more surface area is prepared than can be coated in one day, the uncoated area shall be blast cleaned again to the satisfaction of Engineer. Surface profile shall be as recommended by coating manufacturer, but not less than 3.5 mils.

3-1.12. Concrete Surfaces: All concrete surfaces shall be free of objectionable substances and shall meet the coating manufacturer's recommendations for surface preparation. Any other surface preparation recommended by the coating material manufacturer shall be brought to Engineer's attention and may be incorporated into the work if acceptable to Engineer.

3-1.13. All concrete surfaces shall be dry when coated and free from dirt, dust, sand, mud, oil, grease, and other objectionable substances. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started.

3-1.14. New concrete shall have cured for at least 4 weeks before coating is applied as recommended by the material manufacturer. Concrete surfaces shall be tested for capillary moisture in accordance with ASTM D4263. There shall be no capillary moisture when coatings are applied on concrete.

3-1.15. All surfaces to be coated shall be cleaned in accordance with ASTM D4258 and abraded in accordance with ASTM D4259. Surface profile shall be at least 25 percent of the dry

film thickness specified for the coating system. Prior to application of the coating, the surfaces shall be thoroughly washed or cleaned by air blasting to remove all dust and residue. Spalled areas, voids, and cracks shall be repaired in accordance with the Concrete section and as acceptable to the Engineer. Fins and other surface projections shall be removed to provide a flush surface before application of coating.

3-1.16. Except where epoxy enamel is applied as damp-proofing, the concrete surfaces, including those with bug holes less than 1 inch in any dimension, shall be prepared when required and as recommended by the manufacturer, using an epoxy concrete filler and surfacer. Where coating with a vinyl ester the concrete filler and surfacer shall be as recommended by the manufacturer to be compatible with vinyl ester.

3-1.17. Concrete Block Surfaces: Voids and openings in concrete block surfaces shall be pointed. All exposed exterior surfaces and surfaces to be coated with epoxy enamel, including the joints, shall be filled so that a continuous unbroken coating film is obtained.

3-1.18. Copper Tubing: All flux residue shall be removed from joints in copper tubing. Immediately before coating is started, tubing shall be wiped with a clean rag soaked in xylol.

3-1.19. Plastic Surfaces: All wax and oil shall be removed from plastic surfaces that are to be coated, including PVC and FRP, by wiping with a solvent compatible with the specified coating.

3-1.20. Hardware: Hardware items such as bolts, screws, washers, springs, and grease fittings need not be cleaned prior to coating if there is no evidence of dirt, corrosion, or foreign material.

3-1.21. Aluminum: When a coating system is required, remove all oil or deleterious substance with neutral detergent or emulsion cleaner or blast lightly with fine abrasive.

3-1.22. Stainless Steel: When a coating system is required, surface preparation shall conform to the coating manufacturer's recommendations.

3.2. MIXING AND THINNING

3-2.01. Coating shall be thoroughly mixed each time any is withdrawn from the container. Coating containers shall be kept tightly closed except while coating is being withdrawn.

3-2.02. Coating shall be factory mixed to proper consistency and viscosity for hot weather application without thinning. Thinning will be permitted only as necessary to obtain recommended coverage at lower application temperatures. In no case shall the wet film thickness of applied coating be reduced, by addition of coating thinner or otherwise, below the thickness recommended by the coating manufacturer. Thinning shall be done in compliance with all applicable air quality regulations.

3.3. APPLICATION

3-3.01. Coating shall be applied in a neat manner that will produce an even film of uniform and proper thickness, with finished surfaces free of runs, sags, ridges, laps, and brush marks. Each coat shall be thoroughly dry and hard before the next coat is applied. In no case shall coating be applied at a rate of coverage greater than the maximum rate recommended by the coating manufacturer.

3-3.02. Coating failures will not be accepted and shall be entirely removed down to the substrate and the surface recoated. Failures include but are not limited to sags, checking, cracking, teardrops, fat edges, fisheyes, or delamination.

3-3.03. Priming: Edges, corners, crevices, welds, and bolts shall be given a brush coat (stripe coat) of primer before application of the primer coat. The stripe coat shall be applied by a brush and worked in both directions. Special attention shall be given to filling all crevices with coating.

3-3.040. Abraded and otherwise damaged portions of shop-applied coating shall be cleaned and recoated as recommended by the manufacturer of the finish coating. Welded seams and other uncoated surfaces, heads and nuts of field-installed bolts, and surfaces where coating has been damaged by heat shall be given a brush coat of the specified primer. Before the specified spot or touchup coating of metal surfaces, edges, corners, crevices, welds, and bolts in the area of the spot or touchup coating shall be given a brush coat of primer. This patch, spot, or touchup coating shall be completed, and the paint film shall be dry and hard, before additional coating is applied.

3-3.05. Epoxy Enamel. When used, epoxy enamel shall be applied in accordance with the coating manufacturer's recommendations, including temperature limitations and protection from sunlight until top-coated.

3-3.06. When concrete is to be coated, coatings shall not be applied to concrete surfaces in direct sunlight or when the temperature of the concrete is rising. Preferably the coating shall be applied when the temperature of the concrete is dropping.

3-3.07. When applying high build epoxy coatings with a roller or brush and where a dry film thickness of at least 4-6 mils per coat is required, two or more coats shall be applied to achieve the recommended dry film thickness equal to a spray applied coating.

3-3.08. Coal Tar Epoxy. When used, the application of coal tar epoxy, including time limits for recoating, shall conform to the recommendations of the coating manufacturer.

3-3.09. When concrete is to be coated, coatings shall not be applied to concrete surfaces in direct sunlight or when the temperature of the concrete is rising. Preferably the coating shall be applied when the temperature of the concrete is dropping.

3-3.10. Vinyl Ester. When used, the application of vinyl ester coating system, including time limits for recoating and temperature requirements of the materials, shall conform to the recommendations of the coating manufacturer.

3-3.11. Film Thickness. The total coating film thickness including intermediate coats and finish coat, shall be not less than the following:

Type of Coating	Minimum Dry Film Thickness
Medium consistency coal tar	20 mils.
Coal tar epoxy (two coats)	20 mils.
Epoxy enamel	
Floors	5 mils.

Type of Coating	Minimum Dry Film Thickness
Surfaces with first coat of epoxy enamel and final coat of aliphatic polyurethane	7 mils (5 mils DFT for epoxy plus 2 mils DFT for aliphatic polyurethane).
Surfaces with first and second coat of epoxy enamel and final coat of aliphatic polyurethane	12 mils (10 mils DFT for epoxy plus 2 mils DFT for aliphatic polyurethane).
Other surfaces (two coats)	10 mils.
Immersion service (three coats)	15 mils.
Vinyl ester	30 mils.
Heat-resistant (silicone)	3 mils.
High heat-resistant (silicone)	3 mils.
Other surfaces (one coat)	5 mils.
Other surfaces (two coats)	10 mils.

3-3.12. Weather Conditions. Coatings shall not be applied, except under shelter, during wet, damp, or foggy weather, or when windblown dust, dirt, debris, or insects will collect on freshly applied coating.

3-3.13. Coatings shall not be applied at temperatures lower than the minimum temperature recommended by the coating manufacturer, or to metal surfaces such as tanks or pipe containing cold water, regardless of the air temperature, when metal conditions are likely to cause condensation. When necessary for proper application, a temporary enclosure shall be erected and kept heated until the coating has fully cured.

3-3.14. Coatings shall not be applied at temperatures higher than the maximum temperature recommended by the coating manufacturer. Where coatings are applied during periods of elevated ambient temperatures, Contractor and the coatings manufacturer shall be jointly responsible to ensure that proper application is performed including adherence to all re-coat window requirements. Precautions shall be taken to reduce the temperature of the surface application, especially for metal, at elevated temperatures above 100°F [38°C] including shading application area from direct sunlight, applying coating in the evening or at night, and ventilating the area to reduce the humidity and temperature,

3-3.15. Vinyl ester coating materials, when required, shall be maintained during transportation, storage, mixing, and application at the temperature required by the coating manufacturer, 35°F [2°C] to 90°F [32°C].

3.4. REPAIRING FACTORY FINISHED SURFACES

3-4.01. Factory finished surfaces damaged prior to acceptance by Owner shall be spot primed and recoated with materials equivalent to the original coatings. If, in the opinion of Engineer, spot repair of the damaged area is not satisfactory, the entire surface or item shall be recoated.

3.5. PROTECTION OF SURFACES.

3-5.01. Throughout the work Contractor shall use drop cloths, masking tape, and other suitable measures to protect adjacent surfaces. Contractor shall be responsible for correcting and repairing any damage resulting from its or its subcontractors' operations. Coatings spilled or spattered on adjacent surfaces which are not being coated at the time shall be immediately removed. Exposed concrete or masonry not specified to be coated which is damaged by coatings

shall be either removed and rebuilt or, where authorized by Owner, coated with two coats of masonry coating.

3.6. FIELD QUALITY CONTROL.

3-6.01. The following inspection and testing shall be performed: surface profile, visual inspection, and wet and dry film thickness testing. All inspection and testing shall be witnessed by Engineer.

3-6.02. Surface Profile Testing. The surface profile for ferrous metal surfaces shall be measured for compliance with the specified minimum profile. The surface profile for concrete shall comply with SSPC 13/NACE 6 Table 1 for severe service.

3-6.03. Visual Inspection. The surface of the protective coatings shall be visually inspected.

3.6.04. Film Thickness. Coating film thickness shall be verified by measuring the film thickness of each coat as it is applied and the dry film thickness of the entire system. Wet film thickness shall be measured with a gauge that will measure the wet film thickness within an accuracy of ±0.5 mil. Dry film thickness shall be measured in accordance with SSPC-PA 2.

3-6.05. Spark Testing. Not required.

3-6.06. Adhesion Testing. Not required.

3.7. FIELD PRIMING SCHEDULE.

3-7.01. In general, steel and cast iron surfaces of equipment are specified to be shop primed. Any such surfaces which have not been shop primed shall be field primed. Damaged or failed shop coatings which have been determined unsuitable by Engineer shall be removed and the surfaces shall be field coated, including prime coat (if any). Galvanized, aluminum, stainless steel, and insulated surfaces shall be field primed. Primers used for field priming, unless otherwise required for repair of shop primers, shall be:

Surface To Be Primed	Material
Equipment, surfaces to be coated with	
Aliphatic polyurethane	Universal primer.
Epoxy enamel	Same as finish coats.
Coal tar coating	Same as finish coats.
Vinyl ester	Same as finish coats.
Steel and cast iron, surfaces to be coated with	
Epoxy enamel	Same as finish coats.
Coal tar coating	Same as finish coats.
Aluminum	Epoxy enamel.
Galvanized	Epoxy enamel.
Copper	Epoxy enamel.
Stainless steel	Epoxy enamel.
Plastic surfaces, including PVC and FRP	Same as finish coats.

Surface To Be Primed	Material
Insulated piping	As recommended by manufacturer of finish coats.
Concrete, surfaces to be coated with epoxy enamel	
For damp-proofing	Epoxy enamel.
For all other surfaces	Epoxy concrete filler and surfacer.
Concrete block exposed in exterior locations	Epoxy concrete block filler.
Concrete block to be coated with epoxy enamel	Epoxy concrete block filler.

3-7.02. Unless otherwise recommended by the coating manufacturer or specified herein, priming will not be required on concrete, or concrete block, nor on metal surfaces specified to be coated with epoxy enamel, coal tar epoxy, and heat-resistant coatings. Concrete surfaces to be coated with epoxy enamel shall be filled with epoxy concrete filler and surfacer so that a continuous film is obtained, except where concrete is damp-proofed with epoxy enamel.

3.8. FINISH COATING SYSTEMS.

3-8.01. The following schedule lists coatings systems and coating system designations.

No.	Finish Coating Systems	Coating System Designation						
		A	C	E	F	G	H	P
1.	Epoxy enamel – One coat	x			x	x		
2.	Epoxy enamel – Two coats	x	x	x	x	x		x
3.	Epoxy enamel / NSF – Two coats		x	x				
4.	Epoxy enamel – Three coats	x	x	x				
5.	Epoxy enamel / NSF – Three coats		x	x				
6.	Epoxy enamel – First coat Aliphatic polyurethane – Finish coat	x	x	x	x	x		x
7.	Epoxy enamel – First and second coat Aliphatic polyurethane – Finish coat			x	x	x		
8.	Universal primer – First coat Aliphatic polyurethane – Finish coat	x		x				
9.	Medium consistency coal tar – Two coats	x	x	x				
10.	Coal tar epoxy – Two coats	x	x	x				
11.	Vinyl ester – Two coats			x				
12.	Heat resistant – Two coats						x	
13.	High heat resistant – Two coats						x	

3-8.02. Surfaces Not To Be Coated. Unless otherwise specified, the following surfaces shall be left uncoated:

a. Exposed aluminum, except ductwork.
b. Polished or finished stainless steel. Unfinished stainless steel, except flashings and counter flashings, shall be coated.
c. Nickel or chromium.
d. Galvanized surfaces, except piping, conduit, ductwork, and other items specifically noted.
e. Rubber and plastics, except as specified.
f. Exterior concrete.
g. Surfaces specified to be factory finished.

3-8.03. Shop Finishing. Items to be shop finished include the following. Shop finishing shall be in accordance with the coating schedule and the manufacturer's recommendations.

a. All pumps and valves.
b. Exhaust fans.

3-8.04. Field Coating. Items to be field coated include the following. Field coating shall be in accordance with the field priming schedule, the coating schedule, and the manufacturer's recommendations.

a. Surfaces not indicated to be shop finished and surfaces where blast cleaning can be performed in the field.
b. All interior ferrous metal surfaces except stainless steel.
c. Other items as otherwise specified.

3.9. METAL SURFACES COATING SCHEDULE

Surface To Be Coated	Finish Coating System
Non-galvanized structural and miscellaneous steel exposed to view or to the elements in exterior locations.	A6
Non-galvanized structural and miscellaneous steel exposed to view inside buildings.	A2
Unless otherwise specified, pumps, motors, speed reducers, and other machines and equipment exposed to view.	E8
Electrical equipment cabinets, and similar Items and equipment (unless factory finished) exposed to view.	E8
Cast Iron, ductile iron, and steel piping inside buildings, including valves, fittings, flanges, bolts, supports, and accessories, and galvanized surfaces after proper priming.	A2

Surface To Be Coated	Finish Coating System
Supports and miscellaneous metal for equipment handling corrosive chemicals.	Indoor - A2
Aluminum in contact with concrete.	F1
Aluminum and galvanized ductwork and conduit indoors.	F2 or G2
Aluminum and galvanized ductwork and conduit exposed to elements outdoors.	F7 or G7
Ductile iron piping, fittings, supports, valves, bolts, and accessories exposed above grade	A8

3.10. CONCRETE AND MASONRY SURFACES COATING SCHEDULE.

Surface To Be Coated	Finish Coating System
Concrete adjacent to corrosive chemical storage and feed equipment.	Vinyl Ester With Graphite Filler

3.11 MISCELLANEOUS SURFACES COATING SCHEDULE. - Not Used

3-12. PIPING IDENTIFICATION SCHEDULE

3-12.01. Exposed piping and piping in accessible chases shall be identified with lettering or tags designating the service of each piping system, marked with flow directional arrows, and color coded.

3-12.02. Piping scheduled to be color coded shall be completely coated with the indicated colors, except surfaces specified to remain uncoated shall include sufficiently long segments of the specified color to accommodate the lettering and arrows. All other piping shall be coated to match adjacent surfaces, unless otherwise directed by Engineer.

3-12.03. Location. Lettering and flow direction arrows shall be provided on pipe near the equipment served, adjacent to valves, on both sides of wall and floor penetrations, at each branch or tee, and at least every 50 feet in straight runs of pipe. If, in the opinion of Engineer, this requirement will result in an excessive number of labels or arrows, the number required shall be reduced as directed.

3-12.04. Lettering. Lettering shall be a vinyl label on piping or shall be applied as snap-on markers. Snap-on markers shall be plastic sleeves, Brady "Bradysnap-On B-915" or Seton "Setmark". Letter size shall be as follows:

Outside Diameter of Pipe or Covering	Minimum Height of Letters
5/8 inch and smaller	Metal tags -1/4 inch
3/4 to 4 inches	3/4 inch

Outside Diameter of Pipe or Covering	Minimum Height of Letters
5 inches and larger	2 inches

3-12.05. Color Coding and Lettering. All piping for the following services shall be color coded. Bands shall be 6 inches wide spaced along the pipe at 5 foot intervals. For services not listed, the color coding and lettering shall be as directed by the Engineer.

Piping Identification		
Service	**Color of Pipe**	**Color of Letters**
Ammonia	White	Black
Chlorine (solution)	Yellow	Black
Drain	Dark gray	White
Fire Protection Water	Red	White
Nonpotable or Raw Water	Clover (Tnemec)	Black
Plumbing Vents	Dark gray	White
Potable Water (hot or cold)	Safety blue	Black
Sample	Safety blue	Black
Service Water	Safety blue	Black
Caustic	Yellow with green bands	Black

3-12.06. Electrical conduit (with the exception of galvanized) shall be coated to match adjacent ceiling or wall surfaces as directed by Engineer. Vent lines shall be coated to match surfaces they adjoin.

3-12.07. In addition, special coating of the following items will be required:

Item	Color
Valve handwheels and levers	Match service piping color
Hoist hooks and blocks	Yellow and black stripes

3-12.08. Numerals at least 2 inches high shall be painted on or adjacent to all accessible valves, pumps, flowmeters, and other items of equipment which are identified on the drawings or in the specifications by number.

End of Section

THIS PAGE LEFT BLANK INTENTIONALLY

Section 10050
WELL REHABILITATION AND SPECIFIC CAPACITY TESTING

PART 1 – GENERAL

1-1 THE SUMMARY

This specification describes the scope of work needed for the typical rehabilitation of production wells that have lost specific capacity due to the precipitation of minerals (calcium carbonate) or biofouling caused by slime-producing bacteria that reduce the porosity and permeability of a well's production interval. These wells typically require mechanical brushing of the casing and jet development of the open hole to remove sediment or organic debris, disinfection and stimulation (acidization) using high concentration acid and well development. The CONTRACTOR should be prepared to access any wells within the wellfield that are deemed in need of rehabilitation. In addition, the construction specifications of the production wells may differ considerably, therefore the CONTRACTOR should review the specifications of all the wells within the wellfield to gain an understanding of typical casing and open hole diameters as well as casing and total depths.

The CONTRACTOR shall provide all labor, materials, transportation, tools, supplies, services, equipment, and appurtenances, unless specifically accepted hereinafter, required to complete the testing, evaluation and rehabilitation of the production wells.

1-2 REFERENCES

A. Standards referenced in this Section are listed below:

1. American Water Works Association (AWWA)

a) AWWA Standard for Water Wells

2. American National Standards Institute (ANSI)

a) ANSI 60 standard for Disinfection Chemicals used for Drinking Water Treatment

1-3 CONTRACTOR SUBMITTALS

A. The following information will be submitted by the CONTRACTOR to the ENGINEER for approval prior to the start of rehabilitation activities. The submittal shall include, but is not limited to the following items:

a. Equipment List
b. Calibration reporting for all flow meters
c. Information sheets for geophysical logging tools
d. List of subcontractors
e. Certified transport and site to dispose of any solids and liquid acids
f. Identification of laydown and storage areas for the pump and drop pipe appurtenances and other equipment.
g. Identification of OWNER-approved discharge areas
h. Certification for handling of acid and equipment, including safety plan
i. Field Work Schedule
j. Proposed methods for collecting and disposal of fluids including acid residuals,

development and test water

k. Well development plan including sediment removal methods and pumping systems
l. Size and volume of fractionation tank(s) need to complete activities
m. Acidization plan including list of acid vendor(s) and layout of equipment

B. Driller's Log shall be filled out and kept at the site for review by the ENGINEER at the end of each week. Electronic copies of this log shall be submitted to the ENGINEER. This log shall contain, but not limited to, the following information for each day's activity:

a. Number of crew on the Site and name of superintendent for each shift
b. Rehabilitation activities completed each day
c. Flow rates, test data and water quality samples collected
d. Emergency phone numbers of personnel involved in rehabilitation work

1-4 QUALITY ASSURANCE

A. Records:

1. The tests, records and daily logs, as described in 1-3(B), will be reviewed to assure the quality of the rehabilitation and site restoration prior to acceptance of Work by the ENGINEER.

B. The OWNER and ENGINEER will perform technical observation of all rehabilitation activities. The CONTRACTOR shall cooperate with the ENGINEER in performing this observation, which shall include, but not be limited to, specific capacity testing, pump string inspection, geophysical logging, down-hole video logs, mechanical scrubbing, jet development, acidization and well development.

C. Products used in the Work specified under this Specification shall be provided by manufacturers regularly engaged in the production of such items that have a successful history of product acceptability, as interpreted by the ENGINEER. Equipment of less quality or of inferior design to that specified will not be accepted.

D. The CONTRACTOR shall provide a Project Superintendent specific to this project as a supervisor to oversee proper performance of the Work. The Project Superintendent shall attend all meetings and have the authority to make decisions on behalf of the CONTRACTOR. Field personnel or designated responsible personnel shall be in attendance at the site at a minimum of once a day to evaluate the construction and to prepare a daily job report. The Project Superintendent shall be responsible for all coordination, document handling, submittal review and processing, quality control, and project scheduling. The Project Superintendent once approved by the ENGINEER shall not be replaced without prior consent by the ENGINEER.

1. The Project Superintendent shall be a direct employee of the CONTRACTOR.

2. The Project Superintendent shall fluently speak, read, and write in English.

PART 2 – PRODUCTS

2.1 MATERIALS

A. A nylon Casing Brush of appropriate diameter for each well similar to the J400 cleaning

brushes manufactured by Cotey Chemical Corporation or equivalent that is safe for brushing polyvinyl chloride (PVC) or stainless steel (SST) well casing.

B. A Jetting Tool recommended and provided by the CONTRACTOR and approved by the ENGINEER capable of creating a maximum water velocity of 25 feet per second horizontal flow within the open-hole interval. The jetting tool shall have a minimum of four horizontal jets, equally spaced at 90 degrees apart and be able to rotate 360 degrees.

C. A Sulfate-Reducing Bacteria (SRB), Iron-Reducing Bacteria (IRB) and SLYM-BART™ tester for each well, similar to the Biological Activity Reaction Test (BART) kits manufactured by HACH (Part No. 2434809).

D. Up to 5,000 gallons of 20 Baume (32%) Hydrochloric Acid with Inhibitor in acid totes or tanker from a reputable acid vendor for each well. The volume of acid needed for each well will be calculated by the ENGINEER and coordinated with the CONTRACTOR prior during the preconstruction meeting.

E. Sodium Bisulfate for water dichlorination prior to discharge.

F. Sodium Hypochlorite and/or calcium hypochlorite for well disinfection.

PART 3 – EXECUTION

The selected CONTRACTOR is required to attend a pre-construction meeting and well site visit with the OWNER and ENGINEER to be held at a meeting location to be determined by the OWNER to discuss the schedule and coordination necessary to complete the following tasks.

3-1 SPECIFIC CAPACITY TESTING AND WELLHEAD DISASSEMBLY

A. The CONTRACTOR shall perform pre-rehabilitation specific capacity testing, utilizing the OWNER's existing pump. The anticipated flow rate for all specific capacity testing is anticipated to range between 1,400 and 2,000 gallons per minute (gpm).

B. The CONTRACTOR shall assist the on-site ENGINEER with measuring the static and dynamic water levels in the well before, during and after specific capacity testing.

C. The CONTRACTOR shall furnish and install a pressure transducer to monitor water levels in the well before, during and after specific capacity testing. The transducer shall be placed at a depth of at least 75 feet bls and approved by the ENGINEER.

D. The pump must be turned off for at least 30 minutes prior to testing and after installation of the transducer, allowing background data collection of static conditions. The specific capacity test shall be run for one (1) hour with water level recording occurring in 1 second intervals. If needed, the CONTRACTOR shall adjust the flow rate so that the test can be run continuously for the full hour without pump cavitation. After the one (1) hour test, the pump shall be turned off and the

transducer shall remain in the well for an additional 30 minutes to collect water level recovery data.

E. The CONTRACTOR shall provide the testing kits and collect bacteriological samples using Sulfate-Reducing Bacteria (SRB), Iron-Reducing Bacteria (IRB) and SLYM-BART™ testers, similar to the BART testing kits manufactured by HACH, for collection after pre- rehabilitation specific capacity testing for both wells.

F. Following pre-rehabilitation specific capacity testing and prior to wellhead disassembly, the CONTRACTOR shall, to the satisfaction of the OWNER, properly shut off and temporarily disconnect power and all wiring from the wellhead. The CONTRACTOR shall coordinate with the on-site ENGINEER during well shut off and disassembly of wellhead. The on- site ENGINEER will communicate with OWNER staff to shut down the well from the OWNER's control center and will communicate with the CONTRACTOR when confirmation has been received from OWNER. The CONTRACTOR shall not disconnect power or manually shut down or disconnect the pumping equipment without coordinating with the on-site ENGINEER. The CONTRACTOR shall be responsible for damage to OWNER's equipment if the proper shut-down and disconnection procedures are not followed to OWNER's satisfaction. No more than two (2) wells can be shut off at any given time.

G. The CONTRACTOR shall carefully disassemble the wellhead and remove/disassemble the pump string as necessary and make every effort to control flow and minimize well discharge from the site. A thorough inspection shall be conducted while carefully disassembling the wellhead, including bolts, flanges, drop-pipe, couplings, O-Ring Seals, mechanical seals and/or other hardware.

H. The CONTRACTOR shall inspect the drop-pipe, pump wiring (if applicable) and pump assembly for visible signs of wear or damage and immediately coordinate with the on-site ENGINEER if replacement of hardware or repairs to the wellhead pump or wiring is deemed necessary. Each disassembled section of the pump string, including vertical turbine bowls, shall be carefully laid out on elevated plastic sheeting immediately adjacent to the well. The plastic sheeting must be of a suitable thickness (minimum of 6 mils) and be large enough so that it can be folded over to cover all pump string sections. The plastic sheeting must be secured in a manner to prevent direct exposure of the pump string during all testing, evaluation and rehabilitation activities. The ENGINEER shall coordinate with OWNER to determine the level of repair, the availability of the hardware and whether the CONTRACTOR'S Owner’s Allowance will need to be utilized.

3-2 PRE AND POST REHABILITATION GEOPHYSICAL LOGGING

A. The CONTRACTOR shall coordinate with the on-site ENGINEER to schedule geophysical and video logging for all fifteen (15) wells that will remain active. Geophysical logging of the wells shall be conducted pre rehabilitation activities as described in specification 11213.

The following pre rehabilitation geophysical logs are required during this project:

1. Four-Arm X-Y Caliper with Theoretical Borehole Volume (TBHV) calculations
2. Natural Gamma Ray
3. Dual Induction
4. Spontaneous-Potential
5. Fluid Temperature with Differential (static and dynamic)
    a. Fluid Resistivity/Conductivity/TDS (static and dynamic)
    b. Flow Meter (static and dynamic)
6. Flow Interpretation Log (Flow calculated from 0 to 100%)
7. Dynamic Color Video Survey (DCVS) - Color Dual-Axis Video (full 90-degree tilt) under dynamic conditions (water clarity must allow full view of casing and borehole).

The CONTRACTOR shall conduct post rehabilitation geophysical logs only on wells that have received rehabilitation according to section 3-4

B. The CONTRACTOR shall be required to provide geophysical logging data deliverables for the well. Each log will be submitted to the ENGINEER with a scale of 5 inches = 100 feet. The required deliverables are as follows:

1. Two (2) field copies of the recorded data (Hard Copy) delivered the day of logging.
2. Two (2) Copies of the electronic log files provided in Portable Document Format (PDF) delivered via thumb-drives or through email and file sharing links within 5 (5) days of logging the well.
3. Two (2) electronic copies of the video log should be delivered within 5 (5) days of the logging of the well.

3-3 BACTERIAL CLEARANCE

A. After all rehabilitation activities have been completed and the wellhead has been reassembled, the CONTRACTOR shall sanitize each well, pump and pump column using proper disinfection techniques in accordance with Sections 1 - 4 and Section 5.2 of American Water Works Association (AWWA) Standard C654, as incorporated into Rule 62-555.330, F.A.C. Proper sanitization includes a chlorine concentration of at least 50 mg/L for a minimum of 8 hours. Either sodium hypochlorite or calcium hypochlorite that meets NSF/ANSI 60 standard for chemicals used in sanitizing drinking water systems shall be used. At no time shall the chlorine concentration within the well exceed 200 mg/L. Any damage to the OWNER's equipment due to excessive chlorine concentrations shall be the responsibility of the well CONTRACTOR.

B. After a minimum of 8 hours shut-in time, the CONTRACTOR shall flush the well and piping to remove all chlorinated water to yield a “zero” chlorine residual. All water pumped from the well must be properly collected in a tank and dechlorinated using sodium bisulfite before disposal to a pre-approved discharge area. Field testing to ensure a chlorine residual of zero prior to disposal is required.

C. IF WELL IS OFFLINE FOR LESS THAN 6 MONTHS: In accordance with Rule 62-555.315(6)(a) and (c), the CONTRACTOR shall be required to contract a NELAC-certified lab to collect two (2) bacteria samples (Total Coliform Only) taken on separate days with at least six (6) hours between samples. The well must be purged for at least 15 minutes with no chlorine residual prior to sampling. Detection of any residual chlorine (>0.0 mg/L) will negate the bacteria results. The well can only be put back into service once the results of both consecutive bacteria samples are deemed negative and the results have been received from the lab. If either of the samples are positive for Total Coliform, the well must be re-sampled until two consecutive samples show the absence of coliform. The CONTRACTOR shall be responsible for clearance of the well to be placed back online including any additional bacteria samples required and/or additional disinfection if deemed necessary in coordination with the OWNER or ENGINEER. The CONTRACTOR shall work with the on- site ENGINEER and OWNER staff to discuss purging techniques for bacteria sampling prior to scheduling.

D. IF WELL IS OFFLINE FOR MORE THAN 6 MONTHS: In accordance with Rule 62-555.315(6)(a) and (b), the CONTRACTOR shall be required to contract a NELAC-certified lab to collect at least twenty (20) bacteria samples (Total Coliform and E. Coli). The CONTRACTOR may request from the FDEP that the number of bacteria samples be reduced to ten (10) samples. Up to two (2) samples may be collected on the same day if they are collected at least six (6) hours apart. The well must be purged for at least 15 minutes with no chlorine residual prior to sampling. Detection of any residual chlorine (>0.0 mg/L) will negate the bacteria results. If any sample shows the presence of E. coli or if more than ten percent (>1 sample) of the total number of samples collected show the presence of total coliform or if either of the last two samples collected shows the presence of total coliform, the well shall be required to be re-disinfected. The CONTRACTOR shall be responsible for clearance of the well to be placed back online including any additional bacteria samples required and/or additional disinfection if deemed necessary in coordination with the OWNER or ENGINEER. The CONTRACTOR shall work with the on-site ENGINEER and OWNER staff to discuss purging techniques for bacteria sampling prior to scheduling.

3-4 REHABILITATION OF PRODUCTION WELLS

A. The CONTRACTOR shall conduct pre-rehabilitation specific capacity testing in accordance with Section 3-1 and pre-rehabilitation geophysical logging in accordance with Section 3-2 for fifteen (15) wells prior to removing the existing pump and motor equipment.

B. Approval to proceed with well rehabilitation will be determined by the OWNER and ENGINEER based the results of geophysical logging of the wells and pre-rehabilitation specific capacity testing.

C. The CONTRACTOR shall brush the casing using a casing brush of appropriate diameter for each well as manufactured by Cotey Chemical Corporation or equivalent as approved by the OWNER AND/OR on-site ENGINEER, which is safe for brushing polyvinyl chloride (PVC) and stainless steel (SST) well casing. The CONTRACTOR shall introduce approximately 10 pounds of calcium hypochlorite granules to the well while brushing to neutralize any biofouling present. The casing brush shall run up and down the entire length of the casing a minimum of three times. After receiving the ENGINEER's authorization to proceed, the CONTRACTOR shall commence well development using a combination of air development, pump development and jet development using an approved jetting tool.

    1. The CONTRACTOR shall recommend and provide a jetting tool capable of creating a maximum water velocity of 25 feet per second horizontal flow within the open-hole interval. The jetting tool shall have a minimum of four horizontal jets, equally spaced at 90 degrees apart. The total flow rate delivered to the jetting tool shall not be more than 500 gpm.

    2. The CONTRACTOR shall rotate, raise, and lower the jetting tool in 30-foot sections (or other interval depending on the length of the drill rod or hydril tubing) throughout the open-hole interval or as directed by the OWNER and/or ENGINEER. The CONTRACTOR shall raise and lower the jetting tool no faster than 10 feet per minute during jet development. The CONTRACTOR shall make as many passes as required to ensure complete development but no fewer than three (3). Jet development shall not be performed within 10 feet of the bottom of casing to preserve the integrity of the well seal.

    3. Water for jetting shall be recycled using settling tanks. Prior to reintroduction into the borehole, jetting water shall be chlorinated to obtain a 50-parts per million (ppm) concentration. Water shall be clear and free of sand and suspended solids prior to reintroduction into the well. The CONTRACTOR shall use all means necessary to settle, clean, and chlorinate water prior to reintroduction into the well, including but not limited to the use of settling tanks.

D. The CONTRACTOR shall install an eductor or reverse airlift pipe at the base of the borehole to clear material from the base of the borehole. The water shall be directed into on-site settling tanks and dechlorinated with sodium bisulfate prior to discharge. The location of water discharge shall be coordinated with the ENGINEER and approved by OWNER. Best practices shall be used to minimize turbidity and erosion from the discharge. The CONTRACTOR shall be responsible for meeting all regulatory requirements for disposing of discharged groundwater from the well safely and

properly using Best Management Practices (BMPs). The chlorine residual in the well shall be tested to be less than 0.1 ppm prior to acidization. The CONTRACTOR shall be responsible for providing water on-site.

E. The WELL CONTRACTOR shall acidize the well as follows:

1. Install temporary, high-pressure, steel header at wellhead with injection ports, pressure gauges, a pressure relief discharge line and pressure-relief valves. A minimum 10,000-gallon tank should be available onsite to contain all discharge from the well.

2. Install 2-inch-diameter freshwater injection tubing to approximately 20 to 30 feet above the acid injection line as directed by the ENGINEER. Install 2-inch- diameter acid injection tubing shall be placed five (5) feet above the bottom on the casing or as directed by the on-site ENGINEER. The tubing and fittings are to be mild steel. No galvanized pipe shall come in contact with the acid.

3. Inject freshwater into freshwater tubing for ½ hour at an approximate rate of 50 gpm and evaluate flow versus wellhead pressure.

4. Evacuate air from the well casing and wellhead.

5. Begin acid injection of up to ½ of the total acid volume of 20 Baume (32%) Hydrochloric Acid with Inhibitor at an approximate rate of 50 gpm and monitor wellhead pressure and acid flow rate.

6. If wellhead pressure begins to increase, then decrease, or terminate injection of acid and continue pumping water. If wellhead pressure exceeds 60 pounds per square inch (psi), then pressure shall be vented at the wellhead through the pressure release valve with all discharge collected in the onsite storage tank(s).

7. After 1 hour, inject the remaining ½ of the total acid volume of 20 Baume (32%) Hydrochloric Acid, continue pumping water for one hour, and monitor pressure. Follow the same procedure if wellhead pressure exceeds 60 psi.

8. Pump freshwater in both tubes at 50 gpm for 30 minutes. Shut-in well overnight (minimum 12 hours) to allow acid to react with the formation, and release wellhead pressure as necessary.

9. After a minimum of 12 hours shut-in time, remove tubing and high-pressure steel header. Install a temporary pump or airlift system. Pump-off acid residuals and water into 10,000-gallon settling tanks. The CONTRACTOR shall be responsible for disposing of discharge water in accordance with Local, State and Federal regulations. Produced waters with a pH less than

6.0 SU must also be diverted to settling tanks and treated (neutralized) to increase the pH to between 6.0 and 8.0 SUs. Once pH readings are within this range, the on-site ENGINEER shall determine if the developed water is suitable for discharge to an OWNER-approved discharge location.

10. The CONTRACTOR shall reinstall the eductor or reverse airlift pipe to the base of the borehole to clear material from the base of the borehole. The water shall be directed into on-site settling tanks prior to discharge or shall be hauled from the site. The location of water discharge shall be coordinated with the on-site ENGINEER. Best practices shall be used to minimize turbidity and erosion from the discharge. The CONTRACTOR shall be responsible for meeting all regulatory requirements for disposing of discharged groundwater from the well safely and properly using BMPs.

F. The CONTRACTOR shall continue to develop the well until the turbidity is below 30 NTUs, pH is between 6.5 and 8.5 SU and specific conductance decreases to within 5% of pre-acidization levels.

G. The CONTRACTOR shall conduct post-rehabilitation geophysical logging in accordance with Section 3-2 only on wells that have received rehabilitation.

H. After installing the new equipment. The CONTRACTOR shall conduct a 30-minute leak test to ensure that the wellhead is properly sealed, and the pump is operating properly.

I. The CONTRACTOR shall conduct capacity testing and assist the on-site ENGINEER with measuring the static and dynamic water levels in the well before, during and after the Specific Capacity Test. The CONTRACTOR shall furnish and install a pressure transducer to monitor water levels in the well before, during and after the specific capacity test. The transducer shall be placed at a depth of at least 75 feet bls and approved by the ENGINEER. The pump must be turned off for at least 30 minutes prior to testing and post installation of the transducer allowing background data collection of static conditions. The specific capacity test shall be run for one (1) hour for water level monitoring. If needed, the CONTRACTOR shall adjust the flow rate of the specific capacity test so that the test can be run continuously for the full hour without pump cavitation. After the one (1) hour test, the pump must be turned off and the transducer shall remain in the well for an additional 30 minutes to collect the water level recovery data.

J. The CONTRACTOR shall disinfect and collect bacteria clearance samples of the well in accordance with Section 3-3.

K. OTHER REQUIREMENTS AND CONSIDERATIONS

1. The well rehabilitation and specific capacity testing shall be planned in coordination of all other plan improvements for this project. The well site

shall be protected to avoid any damages to other equipment. The CONTRACTOR is responsible for removing all trash and unused equipment. Any damage to the wellhead, pad, fencing or grounds that is the result of the CONTRACTOR'S activities shall be repaired by the CONTRACTOR at no cost to OWNER.

2. The CONTRACTOR shall protect the well pad, piping and surface equipment so that no damage to the well pad or system occurs during evaluation, testing, back-plugging or acidization activities.

3. The CONTRACTOR shall be responsible for repairing any damage caused by the performance of the project. This includes, but is not limited to sidewalks, walk paths, surface grading, sodding, landscaping replacement, pavement, curbing etc.

4. It is anticipated that temporary lay-flat discharge piping would be satisfactory to reach an approved water discharge area; however, the CONTRACTOR shall make the final determination during the pre-construction meeting.

5. Personal Protection Equipment (PPE) should be worn at all times, and pump hoists and other equipment used by the CONTRACTOR must be in good working order, appropriately cleaned and maintained for use on public supply wells and able to complete the proposed work in a timely manner.

6. Once work begins, the CONTRACTOR shall work continuously until the testing activities on a well are completed and the well is back into service. Work continuously means that the CONTRACTOR shall work until the well is brought back into service. Redirecting crews from the site for weeks or days at a time is not acceptable.

7. The CONTRACTOR shall closely coordinate with the on-site ENGINEER with emphasis on daily scheduling, inspection results, identification of replacement hardware and potential repairs and disassembly and reassembly of the wellhead. The CONTRACTOR shall provide an accurate daily schedule to the on-site ENGINEER and arrive at the well at the time communicated to the on-site ENGINEER.

8. Approval of any additional repairs to the wells will be at the OWNER's discretion, however repairs that are required to put the well back into service shall be identified by the CONTRACTOR as soon as possible.

9. It should be noted that any water pumped from the well during testing or flushing must be properly disposed of at OWNER-approved discharge areas. All discharge must be free of chlorine, possess a pH of 6.5 to 8.5 SU and turbidity less than 30 NTUs prior to discharge to a pre-approved area.

10. The CONTRACTOR may utilize the available power at each respective well site for their equipment and related purposes. The CONTRACTOR shall coordinate with OWNER's representative to properly connect to OWNER's power at each site.

11. It is the CONTRACTOR's responsibility to maintain compliance with all local and state regulatory requirements.

12. OWNER reserves the right to utilize the line-item costs submitted by the CONTRACTOR on the bid form to contract similar well-rehabilitation efforts at different OWNER production wells if needed during the project time frame.

END OF SECTION

SECTION 11000

EQUIPMENT GENERAL CONDITIONS

PART 1 - GENERAL

1-1. SCOPE OF WORK

1-1.01. The CONTRACTOR shall provide equipment and appurtenant WORK, complete and operable, in accordance with the Contract Documents.

1-1.02. The provisions of this Section shall apply to equipment throughout the Contract except where otherwise indicated.

1-1.03. **Equipment Arrangement:** Unless specifically indicated otherwise, the arrangement of equipment indicated is based upon information available at the time of design and is not intended to show exact dimensions particular to a specific manufacturer. Some aspects of the Drawings are diagrammatic and some features of the illustrated equipment arrangement may require revision to meet the actual equipment requirements. Structural supports, foundations, piping and valve connections, and electrical and instrumentation connections indicated may have to be altered to accommodate the equipment provided. No additional payment will be made for such revisions and alterations. Substantiating calculations and drawings shall be submitted prior to beginning the installation of equipment.

1-2. REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

1-2.01. Equipment shall be in accordance with the following standards, as applicable and as indicated in each equipment specification:

American Society for Testing and Materials (ASTM).

American National Standards Institute (ANSI).

American Society of Mechanical Engineers (ASME).

American Water Works Association (AWWA).

American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE).

American Welding Society (AWS).

National Fire Protection Association (NFPA).

Federal Specifications (FS).

National Electrical Manufacturers Association (NEMA).

Manufacturer's published recommendations and specifications.

General Industry Safety Orders (OSHA).

1-2.02. The following standards are referenced in this Section:

ASME B16.1	Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250, and 800
ASME B16.5	Pipe Flanges and Flanged Fittings, Steel, Nickel Alloy and other Special Alloys
ASME B46.1	Surface Texture
ANSI S12.6	Method for the Measurement of the Real-Ear Attenuation of Hearing Protectors
ASME B1.20.1	General Purpose Pipe Threads (Inch)
ASME B31.1	Power Piping
AWWA C206	Field Welding of Steel Water Pipe
AWWA C207	Steel Pipe Flanges for Waterworks Service - Sizes 4 In. Through 144 In. (100 mm through 3,600 mm)
AWWA D100	Welded Steel Tanks for Water Storage
ASTM A 48	Gray Iron Castings
ASTM A 108	Steel Bars, Carbon, Cold-Finished, Standard Quality

1-3. CONTRACTOR SUBMITTALS

1-3.01. Shop Drawings: Furnish complete drawings and technical information for equipment, piping, valves, and controls. Where indicated or required by the ENGINEER, Shop Drawings shall include clear, concise calculations showing equipment anchorage forces and the capacities of the anchorage elements proposed by the CONTRACTOR.

1-3.02. Spare Parts List: The CONTRACTOR shall obtain from the manufacturer and submit at the same time as Shop Drawings a list of suggested spare parts for each piece of equipment. CONTRACTOR shall also furnish the name, address, and telephone number of the nearest distributor for each piece of equipment.

1-4. QUALITY ASSURANCE

1-4.01. Costs: Responsibility shall be the CONTRACTOR'S for performing and paying the costs of inspection, startup, testing, adjustment, and instruction services performed by factory representatives. The OWNER will pay for costs of power and water. If available, the OWNER'S operating personnel will provide assistance in the field testing.

1-4.02. Inspection: The CONTRACTOR shall inform the local authorities, such as building and plumbing inspectors, fire marshal, OSHA inspectors, and others, to witness required tests for piping, plumbing, fire protection systems, pressure vessels, safety systems, and related items needed to obtain required permits and certificates and shall pay inspection fees.

1-4.03. Quality and Tolerances: Tolerances and clearances shall be as shown on the Shop Drawings and shall be closely adhered to.

- Machine WORK shall be of high-grade workmanship and finish, with due consideration to the special nature or function of the parts. Members without milled ends and which are to be framed to other steel parts of the structure may have a variation in the detailed length of not greater than 1/16-inch for members 30-feet or less in length, and not greater than 1/8-inch for members over 30-feet in length.

- Castings shall be homogeneous and free from non-metallic inclusions and defects. Surfaces of castings which are not machined shall be cleaned to remove foundry irregularities. Casting defects not exceeding 12.5 percent of the total thickness and where defects will not affect the strength and serviceability of the casting may be repaired by approved welding procedures. The ENGINEER shall be notified of larger defects. No repair welding of such defects shall be carried out without the ENGINEER'S written approval. If the removal of metal for repair reduces the stress resisting cross-section of the casting by more than 25 percent or to such an extent that the computed stress in the remaining metal exceeds the allowable stress by more than 25 percent, then the casting may be rejected. Costs of casting new material shall be the CONTRACTOR'S responsibility as part of the WORK.

- Materials shall meet the physical and mechanical properties in accordance with the reference standards.

1-4.04. Machine Finish: The type of finish shall be the most suitable for the application and shall be shown in micro-inches in accordance with ANSI B46.1. The following finishes shall be used:

- Surface roughness not greater than 63 micro-inches shall be required for surfaces in sliding contact.

- Surface roughness not greater than 250 micro-inches shall be required for surfaces in contact where a tight joint is not required.

- Rough finish not greater than 500 micro-inches shall be required for other machined surfaces.

- Contact surfaces of shafts and stems which pass through stuffing boxes and contact surfaces of bearings shall be finished to not greater than 32 micro-inches.

1-4.05. Manufacturer's Experience: Equipment manufacturer shall have a record of at least 5 years of successful, trouble free operation in similar applications and size equal or larger than the equipment in this Contract.

PART 2 - PRODUCTS

2-1. GENERAL REQUIREMENTS

2-1.01. Noise Level: When in operation, no single piece of equipment shall exceed the OSHA noise level requirement of 105 dBA for one hour exposure per day.

2-1.02. High Noise Level Location: The CONTRACTOR shall provide one personal hearing protection station at each high noise level location. Locations are defined as follows:

- Outdoor Location: Any single equipment item or any group of equipment items that produce noise exceeding OSHA noise level requirements for a 2 hour exposure. Where such equipment is separated by a distance of more than 20-feet, measured between edges of footings, each group of equipment shall be provided with a separate hearing protection station.

- Indoor Location: Any single equipment item or any group of equipment items located within a single room not normally occupied, that produces noise exceeding OSHA noise level requirements for a 2 hour exposure.

- Indoor Location: Any single equipment item or any group of equipment items located within a single room normally occupied by workers, that produces noise exceeding OSHA noise level requirements for an 8 hour exposure.

2-1.03. Personal Hearing Protection: The CONTRACTOR shall furnish 3 pairs of high attenuation hearing protectors in the original unopened packaging. The ear protectors shall be capable of meeting the requirements of ANSI S12.6 and shall produce a noise level reduction of 25 dBA at a frequency of 500 Hz. The hearing protectors shall have fluid filled ear cushions and an adjustable, padded headband. The protectors shall be stored in a weatherproof, labeled, steel cabinet, provided at an approved location near the noise producing equipment.

2-1.04. Drive Trains and Service Factors: Service factors shall be applied in the selection or design of mechanical power transmission components. Components of drive train assemblies between the prime mover and the driven equipment shall be designed and rated to deliver the maximum peak or starting torque, speed, and horsepower. All of the applicable service factors shall be considered, such as mechanical (type of prime mover), load class, start frequency, ventilation, ambient temperature, and fan factors. Drive train components include couplings, shafts, gears and gear drives, drive chains, sprockets, and V-belt drives. Unless otherwise indicated, the following load classifications shall apply in determining service factors:

Type of Equipment	Service Factor	Load Classification
Pumps centrifugal or rotary	1.0	Uniform

2-1.05. Mechanical Service Factors

	Mechanical Service Factors	
	Electric Motor	**Internal Combustion Engine**
Uniform	1.25	1.50
Moderate Shock	1.50	1.75
Heavy Shock	2.00	2.25

2-1.06. For thermal rating adjustments such as start frequency, ambient temperature, and hourly duty cycle factor, ventilation factor, and fan factor, refer to gear manufacturer sizing information.

2-1.07. For service factors of electric motors, see Section 11213 Submersible Deep Vertical Turbine Pumps.

2-1.08. Where load classifications are not indicated, service factors shall be for standard load classifications and for flexible couplings.

2-1.09. **Welding:** Unless otherwise indicated, welding shall conform to the following:

- Latest revision of AWWA D100.
- Latest revision of AWWA C206.
- Composite fabricated steel assemblies that are to be erected or installed inside a hydraulic structure, including any fixed or movable structural components of mechanical equipment, shall have continuous seal welds to prevent entrance of air or moisture.
- Welding shall be by the metal-arc method or gas-shielded arc method as described in the American Welding Society's "Welding Handbook" as supplemented by other pertinent standards of the AWS. Qualification of welders shall be in accordance with the AWS Standards.
- In assembly and during welding, the component parts shall be adequately clamped, supported, and restrained to minimize distortion and for control of dimensions. Weld reinforcement shall be as specified by the AWS code. Upon completion of welding, weld splatter, flux, slag, and burrs left by attachments shall be removed. Welds shall be repaired to produce a workmanlike appearance with uniform weld contours and dimensions. Sharp corners of material that are to be painted or coated shall be ground to a minimum of 1/32-inch on the flat.

2-1.10. Protective Coating: Equipment shall be painted or coated in accordance with the requirements specified in Section 11213 Deep Well Vertical Turbine Pumps. Non-ferrous metal and corrosion-resisting steel surfaces shall be coated with grease or lubricating oil.

Coated surfaces shall be protected from abrasion or other damage during handling, testing, storing, assembly, and shipping.

2-1.11. Potable water contact: Materials immersed in or exposed to potable water shall be listed as compliant with NSF Standard 61.

2-1.12. Protection of Equipment: Equipment shall be boxed, crated, or otherwise protected from damage and moisture during shipment, handling, and storage. Equipment shall be protected from exposure to corrosive fumes and shall be kept thoroughly dry. Pumps, motors, drives, electrical equipment, and other equipment having anti-friction or sleeve bearings shall be stored in weather tight storage facilities prior to installation. For extended storage periods, plastic equipment wrappers should be avoided to prevent accumulation of condensate in gears and bearings. In addition, motor space heaters shall be energized and shafts shall be rotated. Equipment delivered to the Site with rust or corroded parts shall be rejected. If equipment develops defects during storage, it shall be disassembled, cleaned, and recoated to restore it to original condition.

2-1.13. Identification of Equipment Items

- At the time of shipping, each item of equipment shall have a legible identifying mark corresponding to the equipment number in the Contract Documents for the particular item.
- After installation, each item of equipment shall be given permanent identification.
- Pumps, compressors, and blowers larger than 150 horsepower shall receive stainless steel plate stenciled nametags.

2-1.14. **Shop Fabrication:** Shop fabrication shall be performed in accordance with the Contract Documents and the Shop Drawings.

2-2. EQUIPMENT SUPPORTS AND FOUNDATIONS

2-2.01. Equipment Supports: Unless otherwise indicated, equipment supports, anchors, and restrainers shall be adequately designed for static, dynamic, wind, and seismic loads. The design horizontal seismic force shall be the greater of: that noted in the general structural notes or as required by the governing building code, or 10 percent of gravity. Submitted design calculations for equipment supports shall bear the signature and seal of an engineer registered in the State wherein the project is to be built, unless otherwise indicated. Calculations shall account for forces and distribution of forces on supporting structures resulting from normal operation, normal operation plus seismic loadings, and normal operation plus wind loadings.

2-2.02. Wall-mounted equipment weighing more than 250 pounds or which is within 18-inches above the floor shall be provided with fabricated steel supports. Pedestals shall be of welded steel. If the supported equipment is a panel or cabinet or is enclosed with removable sides, the pedestal shall match the supported equipment in appearance and dimensions.

2-2.03. Wind requirements: Exterior freestanding equipment shall be anchored in place by methods that satisfy the building code. Calculations shall be performed and signed and stamped, analyzing lateral and overturning forces and shall include a factor of safety against

overturning equal to 1.5. Calculations shall include the distribution of forces imposed on the supporting structure and anchors, verifying that each anchor can develop the required resistance forces.

2-2.04. **Anchors:** CONTRACTOR shall determine the size, type, capacity, location, and other placement requirements of anchorage elements. Anchoring methods and leveling criteria in the manufacturer's literature shall be followed. Submit methods and criteria with the Shop Drawings.

2-2.05. **Equipment Foundations:** Mechanical equipment, tanks, control cabinets, enclosures, and related equipment shall be mounted on minimum 3.5-inch high concrete bases, unless otherwise indicated. Equipment foundations are indicated on Drawings. The CONTRACTOR through the equipment manufacturer shall verify the size and weight of equipment foundation to ensure compatibility with equipment.

2-3. COUPLINGS

2-3.01. Mechanical couplings shall be provided between the driver and the driven equipment. Flexible couplings shall be provided between the driver and the driven equipment to accommodate slight angular misalignment, parallel misalignment, end float, and to cushion shock loads.

2-3.02. Each coupling size shall be determined based on the rated horsepower of the motor, speed of the shaft, and the load classification service factor. The CONTRACTOR shall have the equipment manufacturer select or recommend the size and type of coupling required to suit each specific application.

2-3.03. **Differential Settlement:** Where differential settlement between the driver and the driven equipment may occur, 2 sets of universal type couplings shall be provided.

2-3.04. Taper-Lock or equal bushings may be used to provide for easy installation and removal of shafts of various diameters.

2-4. SHAFTING

2-4.01. **General:** Shafting shall be continuous between bearings and shall be sized to transmit the power required. Keyways shall be accurately cut in line. Shafting shall not be turned down at the ends to accommodate bearings or sprockets whose bore is less than the diameter of the shaft. Shafts shall rotate in the end bearings and shall be turned and polished, straight, and true.

2-4.02. **Design Criteria:** Shafts shall be designed to carry the steady state and transient loads suitable for unlimited number of load applications, in accordance with ASME B106.1M - Design of Transmission Shafting. Where shafts are subjected to fatigue stresses, such as frequent start and stop cycles, the mean stress shall be determined by using the modified Goodman Diagram. The maximum torsional stress shall not exceed the endurance limit of the shaft after application of the factor of safety of 2 in the endurance limit and the stress concentration factor of the fillets in the shaft and keyway. Stress concentration factor shall be in accordance with ASME Standard B17.1 - Keys and Keyseats.

2-4.03. **Materials:** Shafting materials shall be appropriate for the type of service and torque transmitted. Environmental elements such as corrosive gases, moisture, and fluids shall be taken into consideration. Materials shall be as indicated unless furnished as part of an equipment assembly.

- Low carbon cold-rolled steel shafting shall conform to ASTM A 108, Grade 1018.
- Medium carbon cold-rolled shafting shall conform to ASTM A 108, Grade 1045.
- Other grades of carbon steel alloys shall be suitable for service and load.
- Corrosion-resistant shafting shall be stainless steel or Monel, whichever is most suitable for the intended service.

2-4.04. **Differential Settlement:** Where differential settlement between the driver and the driven equipment may occur, a shaft of sufficient length with 2 sets of universal type couplings shall be provided.

2-5. DRIVE GUARDS

2-5.01. Power transmission trains, prime movers, machines, shaft extensions, and moving machine parts shall be guarded to conform with the OSHA Safety and Health Standards (29CFR1910). The guards shall be constructed of minimum 10-gauge expanded, flattened steel with smooth edges and corners, galvanized after fabrication, and securely fastened. Where required for lubrication or maintenance, guards shall have hinged and latched access doors.

2-6. BEARINGS

2-6.01. **General:** Bearings shall conform to the standards of the American Bearing Manufacturers Association, Inc. (ABMA).

2-6.02. To assure satisfactory bearing application, fitting practice, mounting, lubrication, sealing, static rating, housing strength, and lubrication shall be considered in bearing selection.

2-6.03. Re-lubricatable type bearings shall be equipped with a hydraulic grease fitting in an accessible location and shall have sufficient grease capacity in the bearing chamber.

2-6.04. Lubricated-for-life bearings shall be factory-lubricated with the manufacturer's recommended grease to ensure maximum bearing life and best performance.

2-6.05. **Anti-Friction Type Bearing Life:** Except where otherwise indicated, bearings shall have a minimum L-10 life expectancy of 5 years or 20,000 hours, whichever occurs first. Where so indicated, bearings shall have a minimum rated L-10 life expectancy corresponding to the type of service, as follows:

Type of Service	Design Life, years	L-10 Design Life, hours
	(whichever comes first)	
8-hour shift	10	20,000
16-hour shift	10	40,000
Continuous	10	60,000

2-6.06. Bearing housings shall be of cast iron or steel and bearing mounting arrangement shall be as indicated or as recommended in the published standards of the manufacturer. Split-type housings may be used to facilitate installation, inspection, and disassembly.

2-6.07. **Sleeve Type Bearings:** Sleeve-type bearings shall have a cast iron or ductile iron housing and Babbitt or bronze liner. Bearing housing shall be bolted and doweled to the lower casing half. These housings shall be provided with cast iron caps bolted in place and the bearing end caps shall be bored to receive the bearing shells. Sleeve bearings shall be designed on the basis of the maximum allowable load permitted by the bearing manufacturer. If the sleeve bearing is connected to an equipment shaft with a coupling, the coupling transmitted thrust will be assumed to be the maximum motor or equipment thrust. Lubricant, lubrication system, and cooling system shall be as recommended by the bearing manufacturer.

2-6.08. **Plate Thrust Bearings:** Thrust bearings shall be the **Kingsbury** Type or approved Equal, designed and manufactured to maintain the shaft in the fixed axial position without undue heating or the necessity of adjustment or attention. Bearings shall be oil lubricated to suit the manufacturer's standard method of lubrication for the specific bearing. If bearing cooling is required, manufacturer shall provide necessary piping, filters, and valves.

2-7. PIPING CONNECTIONS

2-7.01. **Pipe Hangers, Supports, and Guides:** Pipe connections to equipment shall be supported, anchored, and guided to avoid stresses and loads on equipment flanges and equipment. Supports and hangers shall be in accordance with Standard Detail M-103.

2-7.02. **Flanges and Pipe Threads:** Flanges on equipment and appurtenances shall conform to ASME B16.1, Class 125, or B16.5, Class 150, unless otherwise indicated. Pipe threads shall be in accordance with ASME B1.20.1.

2-8. NAMEPLATES

2-8.01. Equipment nameplates of stainless steel shall be engraved or stamped and fastened to the equipment in an accessible location with No. 4 or larger oval head stainless steel screws or drive pins. Nameplates shall contain the manufacturer's name, model, serial number, size, characteristics, and appropriate data describing the machine performance ratings.

2-9. TOOLS AND SPARE PARTS

2-9.01. **Tools:** The CONTRACTOR shall furnish one complete set of special wrenches and other special tools necessary for the assembly, adjustment, and dismantling of the equipment. Tools shall be of best quality hardened steel forgings with bright finish. Wrench heads shall have work faces dressed to fit nuts. Tools shall be suitable for professional work and manufactured by **Snap On, Crescent, Stanley,** or approved equal. The set of tools shall be neatly mounted in a labeled toolbox of suitable design provided with a hinged cover.

2-9.02. Spare parts shall be furnished as indicated in the individual equipment sections. Spare parts shall be suitably packaged in a metal box and labeled with equipment numbers by means of stainless steel or solid plastic nametags attached to the box.

2-10. EQUIPMENT LUBRICANTS

2-10.01. The CONTRACTOR shall provide lubricants for equipment during shipping, storage, and prior to testing, in accordance with the manufacturer's recommendations. Lubricants that could come in contact with potable water shall be food grade lubricants. After satisfactory completion of all startup testing required by individual equipment sections, the CONTRACTOR shall conduct one complete lubricant change on all equipment. In addition, the CONTRACTOR shall be responsible for the proper disposal of used lubricants. The OWNER will then be responsible for subsequent lubricant changes.

PART 3 - EXECUTION

3-1. MANUFACTURER'S SERVICES

3-1.01 Inspection, Startup, and Field Adjustment: Where required by the specific pump Section, furnish an authorized service representative of the manufacturer at the Site continuously to supervise the following items and to certify in writing that the equipment and controls have been properly installed, aligned, lubricated, adjusted, and readied for operation:

- installation of the equipment
- inspection, checking, and adjusting the equipment
- startup and field testing for proper operation, efficiency, and capacity
- performance of field adjustments to ensure that the equipment installation and operation comply with the indicated requirements

3-1.02 Instruction of OWNER's Personnel: Where required by the individual pump Section, furnish an authorized training representative of the manufacturer at the Site for the number of Days indicated in the specific pump Section, to instruct the OWNER's personnel in the operation and maintenance of the equipment, including step-by-step troubleshooting with necessary test equipment.

- Furnish instruction specific to the model of equipment provided.
- Qualifications: Furnish a representative with at least 2 years' experience in training. Submit a resume for the representative.

- Schedule the training a minimum of 3 weeks in advance of the first session.

- Lesson Plan Review: Submit the proposed training material and a detailed outline of each lesson for review. Incorporate review comments into the material. The trainees will keep the training materials. The OWNER may videotape the training for later use with the OWNER's personnel.

3-2. INSTALLATION

3-2.01 **General:** Equipment shall be installed in accordance with the manufacturer's written recommendations.

3-2.02 **Alignment:** Equipment shall be field tested to verify proper alignment.

3-3. PACKAGED EQUIPMENT

3-3.01 When any system is furnished as pre-packaged equipment, the CONTRACTOR shall coordinate space and structural requirements, clearances, utility connections, signals, and outputs with Subcontractors to avoid later change orders.

3-3.02 If the packaged system has any additional features (as safety interlocks, etc.) other than required by the Contract Documents, the CONTRACTOR shall coordinate such features with the ENGINEER and provide material and labor necessary for a complete installation as required by the manufacturer.

3-4. FIELD ASSEMBLY

3-4.01 Studs, cap screws, bolt and nuts used in field assembly shall be coated with **Never Seize** compound or equal.

3-5. WELDING

3-5.01 Welds shall be cleaned of weld-slag, splatter, etc. to provide a smooth surface.

3-6. FIELD TESTS

3-6.01 Where indicated by the individual equipment sections, equipment shall be field tested after installation to demonstrate satisfactory operation without excessive noise, vibration, or overheating of bearings or motor.

3-6.02 The following field testing shall be conducted:

- Start equipment, check, and operate the equipment over its entire operating range. Vibration level shall be within the amplitude limits as indicated or as recommended by the reference applicable standards.

- Obtain concurrent readings of motor voltage, amperage, capacity, vibration, and bearing temperatures.

3-6.03 The ENGINEER shall witness field-testing. The CONTRACTOR shall notify the ENGINEER of the test schedule 3 Days in advance.

3-6.04 In the event that any equipment fails to meet the test requirements, the equipment shall be modified and retested until it satisfies the requirement.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 11200

PUMPS GENERAL

PART 1 - GENERAL

1-1. SCOPE OF WORK

1-1.01. Provide pumps and pumping appurtenances, complete and operable, as indicated in accordance with the Contract Documents.

1-1.02. The provisions of this Section shall apply to pumps and pumping equipment throughout the Contract Documents, except where otherwise indicated.

1-1.03. The requirements of Section 11000 – Equipment General Conditions, apply to this Section.

1-1.04. Unit Responsibility: The pump manufacturer shall be made responsible for furnishing the WORK and for the coordination of design, assembly, testing, and installation of the WORK of each specific pump Section. The CONTRACTOR shall be responsible to the OWNER for compliance with the requirements of each specific pump Section.

1-1.05. Single Manufacturer: Where 2 or more pump systems of the same type or size are required, provide pumps produced by the same manufacturer.

1-2. CONTRACTOR SUBMITTALS

1-2.01. Furnish submittals in accordance with the requirements of Section 01300 Submittals Procedures.

1-2.02. Shop Drawings

- Submit pump name, identification number, and specification Section number.
- Submit performance data curves showing head, capacity, horsepower demand, NPSHr3 required, and pump efficiency over the entire operating range of the pump.
- Require the equipment manufacturer to indicate the head, capacity, required horsepower, pump efficiency, and NPSHr corresponding to each flow condition indicated in the respective performance requirement paragraph of each individual pump specification section. Indicate in the pump curve minimum submergence required at maximum flow for vertical and submersible pumps.
- Submit performance curves at intervals no greater than 100 RPM from minimum speed to maximum speed for each centrifugal pump equipped with a variable speed drive.
- Require the manufacturer to indicate the limits on the performance curves recommended for stable operation without surge, cavitation, or excessive vibration.

Indicate on the pump performance curve the limits of the Preferred Operating Region (POR) and the Allowable Operating Region (AOR).

- Submit assembly and installation drawings, including shaft size, seal, coupling, bearings, anchor bolt plan, part nomenclature, material list, outline dimensions, and shipping weights.

- Where lead containing materials are used for drinking water service pumps submit a calculation to demonstrate that the weighted average of lead content of all wetted components do not exceed 0.25% to meet the requirement of the Reduction of Lead in Drinking Water Act.

- Submit data for the electric motor proposed for each pump.

- Submit an elevation drawing of the proposed local control panel, showing panel-mounted devices, details of enclosure type, a single-line diagram of power distribution, current draw of the panel, and a list of all terminals required to receive inputs or to transmit outputs from the local control panel.

- Submit a wiring diagram of field connections, with identification of terminations between local control panels, junction terminal boxes, and equipment items.

- Submit a complete electrical schematic diagram.

1-2.03. Rotodynamics and Structural Analyses: Not Used.

1-2.04. Technical Manual: Submit a Technical Manual containing the required information indicated in Section 01300 – Submittals Procedures and each specific pump Section.

- Submit a spare parts list containing the required information indicated in Section 01300 – Submittals Procedures and each specific pump Section.

1-2.05. Factory Test Data: For pumps that shall be factory witness tested, submit factory test plan showing piping diameter sizes and lengths, locations of valves and instruments that will be used during testing as part of shop drawing submittal. For pumps that shall be factory witness tested, submit current calibration certificates of all test instruments prior to testing. Submit signed, dated, and certified factory test data for each pump system which requires factory testing. Submit these data before shipment of equipment.

1-2.06. Submit the manufacturer's certification of proper installation.

1-2.07. Submit the CONTRACTOR's certification of satisfactory field testing.

PART 2 - PRODUCTS

2-1. GENERAL

2-1.01. Compliance with the requirements of the specific pump Sections may necessitate modifications to the manufacturer's standard equipment.

2-1.02. Performance Curves: Provide centrifugal pumps with a continuously rising pump curve, or with a pump curve that does not cross the system curve within the pump curve's "dip region". Unless otherwise indicated, the required shaft horsepower for the entire pump assembly at any point on the performance curve shall not exceed the rated horsepower of the motor or engine or encroach on the service factor. For VFD driven pumps, the rated horsepower of the selected motor shall be 110 percent of the maximum brake horsepower required by the pump.

2-1.03. Provide entirely compatible components of each pump system provided under the specific pump Sections. In each unit of pumping equipment, incorporate basic mechanisms, couplings, electric motors or engine drives, variable speed controls, necessary mountings, and appurtenances.

2-1.04. Unless otherwise specified the rotating assembly shall be dynamically balanced to ISO 1940 G6.3.

2-2. MATERIALS

2-2.01. Provide materials suitable for the intended application.

2-2.02. For materials not indicated, provide high-grade, standard commercial quality, free from defects and imperfections that might affect the serviceability of the product for the purpose for which it is intended, and conforming to the following requirements:

2-2.03. For drinking water service, use materials with weighted average of lead content of all wetted components not to exceed 0.25% to meet the requirement of the Reduction of Lead in Drinking Water Act.

2-2.04. All elastomeric materials such as gaskets, seals, O-rings in contact with water with chloramine and ozone shall be Teflon, Viton-A or other materials compatible with the fluid service. Test certificate from a material testing laboratory to provide proof of test shall be made available to the ENGINEER if requested.

2-2.05. Miscellaneous stainless steel parts shall be of Type 316.

2-2.06. Provide anchor bolts, washers, and nuts in standard service (non-corrosive application) of galvanized steel.

2-2.07. Provide anchor bolts, washers, and nuts in corrosive service of stainless steel.

2-2.08. Materials in contact with potable water shall be listed as compliant with NSF Standard 61. Test certificate from a material testing laboratory to provide proof of test shall be made available to the ENGINEER if requested

2-3. PUMP COMPONENTS - GENERAL

2-3.01 Flanges and Bolts: Provide suction and discharge flanges conforming to ASME B16.1 - Cast Iron Pipe Flanges and Flanged Fittings, or ASME B16.5 - Pipe Flanges and Flanged Fittings dimensions. Pressure class shall be suitable for the application or as otherwise recommended by the pump manufacturer.

2-3.02 Lubrication: Vertical pump shafts for clean water pumps shall be product water-lubricated, unless otherwise indicated. Provide deep-well pumps with product water lubricated bearings and seals, and open line shafts.

2-3.03 Hand Holes: Provide hand holes on pump casings shaped to follow the contours of the casing in order to avoid any obstructions in the water passage.

2-3.04 Drains: Provide and connect pipe gland seals, air valves, and cooling water drains to the nearest floor sink or drain, using galvanized steel pipe or copper tube that is properly supported with brackets.

2-3.05 Stuffing Boxes: Provide high pressure stuffing boxes for the pump seal, these stuffing boxes shall be of the best quality and compatible with the specified operating conditions, using the manufacturer's suggested materials best suited for the specific application.

2-3.06 Wiring: Wiring shall comply with the requirements of Division 16 – Electrical.

2-4. PUMP APPURTENANCES

2-4.01 Nameplates: Equip each pump with a stainless steel nameplate indicating serial number(s), rated head and flow, impeller size, pump speed, and manufacturer's name and model number.

2-4.02 Solenoid Valves: Require the pump manufacturer to provide solenoid valves on the water or oil lubrication lines and on cooling water lines. Provide solenoid valve electrical ratings compatible with the motor control voltage.

2-4.03 Gauges: Equip pumps with pressure gauges installed at the pump discharge lines. Located gauges in a representative location, where not subject to shock or vibrations, in order to achieve true and accurate readings. Where subject to shock or vibrations, wall-mount the gauges or attach the gauges to galvanized channel floor stands and connect by means of flexible connectors.

2-5. FACTORY TESTING

Conduct the following tests on each indicated pump system:

2-5.01 Motors

- Test electric motors in accordance with the requirements of Section 11213 Submersible Vertical Turbine Pumps.

- Furnish test results to the pump manufacturer prior to the pump test.

2-5.02 Certified Factory Non-Witnessed Tests

Perform factory non-witnessed tests on centrifugal pumps with drives up to and including 125 hp in accordance with the ANSI/HI 14.6, Rotodynamic Pumps for Hydraulic Performance Acceptance Test.

For pumps with drives 15 hp and larger shall meet hydraulic acceptance criteria Grade "1U" unless otherwise indicated. Such tests shall, at a minimum, consist of the following:

- Hydrostatic Test;
- Performance Test:
    - Conduct performance testing at maximum speed, obtain a minimum of 5 hydraulic test readings between shutoff head and 25 percent beyond the maximum indicated capacity, and record on data sheets as defined by the Hydraulic Institute Standards;
    - For variable speed driven pumps, test each pump between maximum and minimum speed at intervals no greater than 100 RPM;
    - Submit pump curves showing head, flow, bhp, NPSHr and efficiency results. The manufacturer's certification shall be visible on each submitted curve;
- Mechanical testing shall be limited to observation during the hydraulic performance test for any abnormal bearing temperature and pump vibration. Any deficiencies shall be corrected by the manufacturer.
- NPSHr3
    - Perform a net positive suction head required test (NPSHr3), if required by the specific pump Section.
    - Acceptance criteria shall be in accordance with ANSI/HI 14.6
    - If not required by the specific pump Section, submit the published manufacturer-calculated NPSHr3 curve.
- Additional tests as indicated in the specific pump specification sections.
- Perform tests using the completely assembled project pump, motor, and VFD system (if equipped with variable speed drive). Calibrated factory motor may be used in lieu of project motor subject to approval of the ENGINEER.
- Testing of prototype models will not be accepted.
- Submit certification signed by a senior official of the pump manufacturer that the required pump shaft horsepower did not exceed the rated motor horsepower of 1.0 service rating at any point on the curve.
- The OWNER reserves the right to have an OWNER's representative and/or the ENGINEER to be present during these tests. A minimum of 4 weeks notification prior to the tests shall be provided by the CONTRACTOR.
- If the OWNER decides to witness these tests, excluding salaries, all costs for the attendances of one representative for the OWNER shall be borne by the CONTRACTOR and shall be included in the Contract Price, including travel and

subsistence costs. The cost shall include repetitive visits, if required. If additional witnessed testing is required due to failure of the pumps to meet specified conditions, all expenses of the OWNER shall be covered by the CONTRACTOR.

- No equipment shall be shipped until the test data have been approved by the ENGINEER.

2-5.03 Acceptance: In the event of failure of any pump to meet any of the requirements, make necessary modifications, repairs, or replacements in order to conform to the requirements of the Contract Documents, and re-test the pump until found satisfactory. The CONTRACTOR and OWNER shall agree on the corrective measures prior to the CONTRACTOR proceeding with corrective work.

PART 3 - EXECUTION

3-1. MANUFACTURER'S SERVICES

3-1.01 For Inspection, Startup, Field Adjustments, and Instruction of OWNER's personnel see Section 11000 – Equipment General Conditions.

3-2. INSTALLATION

3-2.01 Install pumping equipment in accordance with the manufacturer's written recommendations.

3-2.02 Alignment: Field-test the equipment in order to verify proper alignment and freedom from binding, scraping, shaft run out, or other defects. Measure the pump drive shafts just prior to assembly in order to ensure correct alignment without forcing. Ensure that the equipment is secure in position and neat in appearance.

3-2.03 Lubricants: Provide the necessary oil and grease for initial operation.

3-3. PROTECTIVE COATING

3-3.01 Coat materials and equipment in accordance with the requirements of Section 11213 Submersible Deep Well Vertical Turbine Pumps.

3-4. FIELD TESTS

3-4.01 Field-test each pump system after installation simulating all of the operational scenarios as specified in order to demonstrate:

- Satisfactory operation without excessive noise and vibration;
- Meet indicated head, flow, and efficiency at the design point.

3-4.02 Conduct the following field testing:

- The pump is driven by constant speed, test the pump and motor at the maximum RPM.

- Obtain concurrent readings of motor voltage, amperage, pump suction head, and pump discharge head.

- Check each power lead to the motor for proper current balance.

- Ensure that electrical and instrumentation tests conform to the requirements of the Section under which that equipment is specified.

3-4.03 Field testing will be witnessed by the ENGINEER. Furnish 3 Days advance notice of field testing.

3-4.04 If the pumping system fails to meet the indicated requirements, modify or replace the pump and re-test as indicated above until it satisfies the indicated requirements.

3-4.05 Certification: After each pumping system has satisfied the requirements, certify in writing that it has been satisfactorily tested and that final adjustments have been performed. Certification shall include the date of the field tests, a listing of persons present during the tests, and the test data.

3-4.06 The CONTRACTOR shall be responsible for costs of field tests, including related services of the manufacturer's representative, except for power and water, which the OWNER will bear.

3-4.07 If available, the OWNER'S operating personnel will provide assistance in field testing.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 11213

SUBMERSIBLE DEEP WELL VERTICALTURBINE PUMPS

PART 1 -- GENERAL

1.1 REQUIREMENTS

A. The CONTRACTOR shall provide submersible deep well vertical turbine pumps, pump discharge wellhead and sole plate as well as all materials necessary for furnishing, installing and testing them, for these units to be complete and operable, in accordance with the Contract Documents.

B. The requirements of Section 11200 – Pumps, General, apply to this Section.

C. The Supplier shall examine the Site conditions, intended application, and operation of the pump system, and recommend the pump that will best satisfy the indicated requirements.

1.2 SCOPE OF WORK

A. Furnish and install all materials, equipment, and incidentals necessary for the replacement of the vertical turbine pumps, electrical motors, and all appurtenances as specified herein.

Pump Designations	VTP-150, VTP-151, VTP-153, VTP-154, VTP-155, VTP-156, VTP-158, VTP-159, VTP-160, VTP-164, VTP-165, VTP-166, VTP-167, VTP-168, VTP-169
Number of Pumps	15
Pump Location	Replacing well turbine pumps in 15 existing well sites. See drawings for locations.

B. Submersible Deep Well Turbine Pumps furnished under this contract, and all related components in contact with water shall be NSF 61 Certified.

C. This Specification does not purport to cover all materials or installation procedures which may be required. However, it is the intent of the OWNER to obtain a complete and working installation under this PROJECT, and any items of labor, equipment or materials which may reasonably be assumed as necessary to accomplish this end shall be supplied whether they are specifically shown on the PLANS or stated herein.

D. The existing pump pedestal at the 15 wells will be modified as part of the PROJECT in accordance with the pump manufacturer's recommendations. The replacement shall include a new pump sole plate with wellhead, anchor bolts or any other mounting equipment necessary for pump installation.

E. The CONTRACTOR shall submit a shop drawing in accordance with Section 01300 for the pump sole plate, anchor bolts and any miscellaneous component required to be replaced

to facilitate pump replacement. Anchor bolt calculations shall be provided in accordance with Section 01613 Structural Design, Support, and Anchorage.

1.3 SUBMITTALS

Submit to the OWNER or OWNER'S Representative, shop drawings and product data. Submittals shall include the following:

A. The shop drawings shall include details of pump assembly; installation layout and procedures; piping and electrical connections and requirements; types of materials used in pump construction; details on all pump accessories, such as couplings, discharge piping from pump to wellhead, wellhead, discharge bend, etc.; dimensions of major components; weights, structural and operating features, space required, clearances, type of finish or shop coat, and other pertinent data.

B. Literature and drawings describing the equipment in sufficient detail, including parts list and materials of construction, to indicate full conformance with the detail specifications.

C. Total weight of pumping unit, discharge piping and cables supported from the wellhead.

D. A list of manufacturer's recommended spare parts to be supplied, with the manufacturer's current price for each item.

E. Submit motor product data and test reports.

F. MANUFACTURER'S certified performance curves for each pump and motor combination furnished illustrating pump characteristics of head, discharge flow, efficiency, impeller size, motor speed, brake horsepower, and NSPH. Curves shall be submitted on 8 ½ inch by 11-inch sheets, at as large a scale as practical. The performance shall be plotted from no flow at shut off head to maximum pump run out head and flow allowed by the MANUFACTURER.

G. Certified shop test report/results. MANUFACTURER shall submit certified shop test report/results to the ENGINEER for approval before pumps are shipped.

1.4 DESIGN DATA

A. MANUFACTURER'S certified rating curves, to satisfy the specified design conditions, showing pump characteristics of discharge, anticipated field head, brake horsepower, bowl efficiency and guaranteed net positive suction head required (NPSHR). Curves shall show the full recommended range of performance and include shut-off head. This information shall be prepared specifically for the pump proposed. Catalog sheets showing a family of curves will not be acceptable.

1.5 FACTORY TEST REPORTS

A. Six (6) certified copies of the factory (shop) test reports shall be prepared by the MANUFACTURER and delivered to the ENGINEER prior to shipment of the pumps.

1.6 OPERATION AND MAINTENANCE DATA

A. Complete operating and maintenance instructions in accordance with Specification Section 01730 Operating and Maintenance Data shall be furnished for all equipment included under this Section. The maintenance instructions shall include troubleshooting data and full preventative maintenance schedules and complete spare parts lists with ordering information.

1.7 REFERENCE STANDARDS

A. Design, manufacturing, and assembly of elements of the equipment specified herein shall be in accordance with Section 01070 Abbreviations and Acronyms, and the following:

1. ANSI/AWWA E102

2. Hydraulic Institute Standards

B. Where reference is made to one of the above standards, the revision in effect at the time of award shall apply.

1.8 QUALITY ASSURANCE

A. Pumps, motors, discharge bend, discharge pipe column, bearings, sole plate, anchor bolts, wellhead and all other parts will be furnished by the pump MANUFACTURER. The CONTRACTOR and pump MANUFACTURER shall assume responsibility for the items specified herein and for the satisfactory installation and operation of the entire pumping system.

B. The equipment specified herein is intended to be standard pumping equipment of proven ability. Units specified herein shall be furnished by a single MANUFACTURER. The equipment furnished shall be designed, constructed, and installed to operate satisfactorily when installed into the existing conditions.

C. Pumps shall be designed and furnished in accordance with the Hydraulic Institute Standards and E102 AWWA Standard for Submersible Vertical Turbine Pumps, except where otherwise specified herein.

D. The pump MANUFACTURER shall be fully responsible for the design, arrangement, and operation of the pumping units and ensure that neither harmful nor damaging vibrations occur at design speed within the specified operating conditions.

E. Balance. All rotating parts shall be accurately machined and the impeller shall be statically and dynamically balanced to meet the requirements of ISO 1940 G6.3

1.9 DELIVERY STORAGE AND HANDLING

A. All parts shall be properly protected so that no damage or deterioration will occur during a prolonged delay from the time of shipment until installation is completed and the unit and equipment are ready for operation.

B. All equipment and parts must be properly protected against any damage during shipment. Pumps shall be shipped and handled in such manner as to prevent damage. At the job site, pumps and motors shall be stored in clean, dry, and protected locations.

C. Each pump package shall be properly labeled and should contain all parts for each pump. The label should indicate which production well number the pump is provided for and its net weight.

D. Factory assembled parts and components shall not be dismantled for shipment unless permission is received in writing from the OWNER.

E. The finished surfaces of all exposed flanges shall be protected by wooden or equivalent blank flanges, strongly built, and securely bolted thereto.

F. Finished iron or steel surfaces not painted shall be properly protected to prevent rust and corrosion.

G. No shipment shall be made until approved by the OWNER in writing.

H. After hydrostatic or other tests, all entrapped water shall be drained prior to shipment, and proper care shall be taken to protect part from the entrance of water during shipment, storage, and handling.

I. For protection of bearings during shipment and installation, the bearing shall be properly processed. Anti-friction bearings, if pre-lubricated, shall be protected in accordance with the bearing manufacturer's recommendations against formation of rust during a long period of storage while awaiting completion of installation and start-up of the machine in which they are used. Anti-friction bearings which are not pre-lubricated shall be properly treated in accordance with the bearing manufacturer's recommendation against formation of rust during a long period of storage while waiting completion of installation and start-up by the application of Exxon, Rust-Ban No. 392 or equal treatment.

PART 2 -- PRODUCTS

2.1 GENERAL CONDITIONS

A. The pumps shall be designed and constructed to operate satisfactorily with a reasonable service life.

B. The pumps shall be designed and built for 24-hour continuous service at any and all points within the required range of operation, without overheating, without cavitation and without excessive vibration or strain. All parts shall be so designed and proportioned as to have liberal strength, stability and stiffness and to be especially constructed to meet the specified requirements. Ample room and facilities shall be provided for inspection, repairs and adjustment.

C. All necessary bolts, nuts and washers shall be furnished and shall be stainless steel 316.

D. Each major piece of equipment shall be furnished with a stainless-steel nameplate (with embossed data) to be securely mounted to the discharge well head. As a minimum, the nameplate for the pumps shall include the manufacturer's name and model number, serial

number, rated flow capacity, head, speed, number of stages, column length and any other pertinent data.

E. If pumps do not mate, vertically and horizontally, to the existing piping, the CONTRACTOR shall replace/modify the existing pump foundation, mounting equipment, and/or piping at CONTRACTOR'S expense, so that the pumps are free from stresses imposed by the existing piping. CONTRACTOR shall submit shop drawings in accordance with specification Section 01300 Submittal Procedures for all foundation, mounting equipment, and/or piping modifications required. Pump foundations, sole plates, anchor bolts and any other mounting equipment in need of replacement shall conform with the pump MANUFACTURER'S recommendations.

F. All pumping units specified shall be furnished by a single manufacturer with standard dimensions so that parts will be interchangeable between the wells.

2.2 MANUFACTURERS:

A. **Goulds Pumps, Inc./Xylem**

B. **Peerless Pumps**

C. **Flowserve**

No other pump MANUFACTURERS will be accepted.

2.3 SPARE PARTS

Spare parts shall be provided and suitably packaged, with labels indicating the contents of each package. Spare parts shall be delivered to OWNER as directed. The following spare parts shall be furnished as part of this project:

Spare Part	Quantity
Bearings	4 per bearing type and size
Wear Rings (bowl and impeller)	4 per pump type
Rubber components and seals	1 set per pump type

2.4 OPERATING CONDITIONS

A. The pumping units shall be suitable for the following service conditions:

Type of environmental exposure.	Indoor
Ambient air temperature range.	35 to 120°F
Liquid temperature range.	55 to 85°F
Pumps start and stop against a closed isolation valve.	No
Site elevation.	Varies
Units subject to freezing temperatures.	No

No crane facilities available onsite. Should a temporary crane be necessary, it can be operated through the existing well house roof hatch to facilitate motor/pump removal. (See drawings for details)

All equipment furnished shall be designed to meet all specified conditions and to operate satisfactorily at the site elevation indicated.

Pumps for all the wells shall be designed for the conditions of service tabulated below.

Well No.	Pump Tag No.	Casing OD Size (in)	Pump Bowl Depth (ft)	Rated Flow (GPM)	Rated Head (FT)	Min Pump Efficiency at Rated Head (%)	Max Pump Speed (RPM))	Min Pump Column Size (in)	Pump Discharge Size(in)	Maximum Motor Size (hp)
150	VTP-150	16	80	1875	75	75%	1800	10	10	60
151	VTP-151	16	90	2000	100	75%	1800	10	10	75
153	VTP-153	16	80	1750	80	75%	1800	10	10	60
154	VTP-154	16	80	2000	70	75%	1800	10	10	60
155	VTP-155	16	90	1750	80	75%	1800	10	10	60
156	VTP-156	16	70	1750	80	75%	1800	10	10	60
158	VTP-158	16	90	2000	100	75%	1800	10	10	75
159	VTP-159	16	70	2000	70	75%	1800	10	10	60
160	VTP-160	16	70	2125	65	75%	1800	10	10	60
164	VTP-164	16	70	2000	70	75%	1800	10	10	60
165	VTP-165	16	70	2000	70	75%	1800	10	10	60
166	VTP-166	16	80	1750	80	75%	1800	10	10	60
167	VTP-167	16	100	1875	115	75%	1800	10	10	75
168	VTP-168	16	80	2000	107.5	75%	1800	10	10	75
169	VTP-169	16	110	1600	125	75%	1800	10	10	75

General Notes:
1. Pumps shall not be designed for reverse rotation.
2. Provide up to two (2) motor sizes at the same RPM. Max motor size shall be 75 HP.
3. Maximum length of any component or subassembly shall be 10 feet.

2.5 PUMP REQUIREMENTS

A. **Construction:** Construction of submersible deep well turbine pumps shall conform to the following requirements:

Bowls	Cast-iron. Interior water passages and exterior surfaces coated with 10- to 12-mils vitreous enamel for sizes 18-inches and smaller; interior and exterior of sizes 20-inches and larger coated with fusion bonded epoxy in accordance with Section 09940 - Protective Coating, except that DFT shall be 10- to 12-mils

Impeller (multi-stage vertical turbine)	ASTM B584 Alloy C903 or ASTM A351 Gr CF8M 316SS statically and dynamically balanced to meet the requirement of ISO 1940 G6.3
Impeller seal ring	Aluminum bronze
Impeller shaft method of connection	Type 316 stainless steel impeller lock collet
Wear rings	Bronze replaceable
Bowl shaft	Stainless steel, Type 410 or 416
Suction case and strainer	Stainless steel strainer, Type 316.Type 316 stainless steel shaft in max 10-ft lengths, turned, ground, and polished with min 8-mils thick hard chrome journals.
Column	Pipe should be AWWA C200 steel with threaded sleeve type steel coupling, A53, Grade B and a wall thickness not less than Schedule 40, epoxy-lined and coated, in maximum 10-ft lengths,
Motor Adaptor	Cast Iron
Suction case bearing	Bronze. For any bearing packed with grease, grease shall be water resistant and NSF 61 compliant.
Bowl bearing	Rubber with bronze
Pump to motor coupling	Stainless steel
Wellhead	Cast iron or carbon steel, epoxy-lined with flange, sole plate, and fittings to connect sounding tube, power cables and other connections as indicated on drawings constructed to support 150% of the weight of all items in the well. Tapping for electrical wire, instrumentation, sounder tube and venting shall be provided. A screened vent cap shall be included. The discharge head shall have lifting eyes. The discharge head shall rest on a sole plate mounted to the pump pedestals. A .25-inch neoprene gasket and cadmium plated stainless steel bolts with nuts shall seal the discharge head to the sole plate. If the well casing below the discharge head is to be encased in concrete the sole plate shall

	have tapped bolt holes. The discharge outlet shall be as indicated. Each sounding tube shall be 2" stainless steel and shall have sufficient length to insert level instrument into the pump column in a way that the instrument can drop straight down to water's level.

B. Drive

1. Motor Design

a. The pump manufacturer shall supply the pump-motor assembly and shall accept responsibility for this assembly. The pump manufacturer shall mate pumps and motors and adjust the pump thrust plug.

b. The motor shall comply with the latest NEMA standards applicable to submersible motors.

c. The motor shall be of the "squirrel cage" induction type, suitable for reduced voltage starting. The motor shall be liquid filled and be rated at 460-volt, 3-phase, 60 Hertz for continuous operation. Mercury-seal motors are not acceptable. The motor horsepower rating shall not be exceeded over the full range of pump operation specified from shut-off to maximum flow. It shall have a service factor of 1.15. The 1.15 service factor shall be achieved at a minimum cooling flow velocity of 1.5 fps. with 77°F water.

d. The motor shall be equipped with fill liquid lubricated radial and Kingsbury type thrust bearings. The motor thrust bearing shall be sized to carry the weight of all rotating parts plus the unbalanced thrust of the pump, regardless of the direction of rotation. A mechanical shaft seal shall be provided in the motor housing to prevent loss of fill liquid. Motor shall be equipped with a pressure relief valve, drain plug and filling device.

e. Provide a bearing rated for a minimum of 130 percent of the maximum pump downthrust load.

f. Fill the motor with a water and propylene glycol solution for cooling and lubrication.

g. Do not use oils or grease lubrication.

h. Provide a flexible diaphragm in order to permit expansion of internal motor fluid.

i. The shaft seal shall be a Nitrite rubber lip seal or a Nitrite, carbon, carbide or ceramic face seal.

j. A mercury-type shaft seal will not be accepted.

k. Provide exterior material construction of Type 316 or 316L stainless steel. Provide shaft and coupling of 400 series stainless steel. Provide fasteners of 316 stainless steel.

l. Do not exceed the nameplate horsepower shall not be exceeded at any point on the pump curve.

m. The motor shall be heavy-duty canned type NEMA design 1,800 RPM with outside diameter not to exceed 12 inches.

n. The motor power factor shall not be less than 0.65 at pump design flow. Motor starter overload relays shall be sized for motor full load current for +/- 10 percent voltage range.

o. Motor winding insulation shall be rated for continuous duty at not less than 130˚C.

2. Electrical Cable

a. Provide necessary cables for power connection, control wires, and overload protection, sheathed, coded, and suitable for submersible pumps, and of sufficient length for direct and continuous connection from the motor to the terminal boxes located above ground.

b. Conduit between the terminal boxes and the starter shall be sealed with polywater FST or approved equal.

c. Provide the surface plate with a power cable splice box that meets the requirements of the National Electrical Code.

d. If indicated, provide a junction box that meets the requirements of the National Electrical Manufacturer's Association (NEMA).

e. Connect cables to the pumps and test at the factory.

f. If the cables are not assembled in the factory, the field connection of the cable to the motor shall be supervised and certified by the pump manufacturer's representative.

g. Splicing of cable between the motor and the terminal box will not be accepted.

h. The size and type of cable shall be determined by the pump manufacturer, suitable for the application.

i. Fully contain the motor lead-to-electrical cable within the water-tight motor housing and conform to IEEE and NEC standards.

j. Provide an electrical wire of annealed, bare, 19-stranded copper conductors insulated with PVC.

k. Jacket the power conductors plus a ground conductor in a flat heavy-duty PVC jacketing.

l. Provide UL-listed cable in accordance with UL83 Type TW Construction A, as Deep Well Submersible Cable.

m. Size power conductors to allow no more than 3 percent voltage loss in the entire length.

n. Size the grounding conductor in accordance with Table 24.3 of UL83.

o. Fully contain the motor lead-to-electrical cable within the water-tight motor housing and conform to IEEE and NEC standards

p. The motor power cord shall be routed through a conduit equipped with an O.Z. Gedney cable gland. The cable shall be secured to the column pipe with 316 stainless steel hose clamps or tyraps at a maximum of 20-foot intervals. Care shall be exercised during installation of the pump to avoid damaging the motor power cord.

3. Cable Entry

a. Design the cable entry water seal such that it precludes specific torque requirements in order to ensure a watertight and submersible seal.

b. It shall permit no entry of water into any high voltage area even if the cable is severed below the water level.

c. Connect cables to the pumps and test at the factory. If the cables are not assembled in the factory, the field connection of the cable to the motor shall be supervised and certified by the pump manufacturer's representative.

4. Motor Protection

a. In cases where the pump manufacturer recommends or requires additional monitoring and interlocks for warranty purposes, the contractor shall furnish and install the required protection/monitoring. The contractor shall coordinate with the starter supplier to incorporate interlocks, vendor specific alarm relay devices, and indicators and connect the alarm signals to the PLC.

2.6 SURFACE PREPARATION AND SHOP PRIME PAINTING

A. Each pump and associated equipment shall be shop-primed and finished-coated in accordance with the manufacturer's standard practice prior to shipment. Color shall be selected by the OWNER or OWNER'S Representative and an adequate supply of touch-up paint shall be supplied by the MANUFACTURER.

B. All interior and exterior wetted surfaces of pump columns and discharge elbows and the exterior of the bowl assemblies shall be cleaned of all rust and mill scale. Surfaces of the equipment that will be inaccessible after assembly shall be protected for the life of the equipment.

C. Coating: Exterior of pump bowl assembly, sole plate and interior and exterior of suction pipe, discharge head, and column pipe shall be sand-blasted and coated with NSF 61 approved Carboline Carboguard 891, Tnemec Potapox N140 or equal which has passed AWWA C210, D102 criteria. 1st coat 4-6 mils. 2nd coat 4-6 mils.

D. Nuts and Bolts: All bolts and nuts shall be coated in the field with Never-Seez White Food Grade with PTFE by Bostik, Inc. (Middleton, MA) or equal

2.7 SHOP TEST

A. In addition to the factory tests in Section 11200, perform the following procedures with the factory test prior to shipment:

1. Hydrostatically test the hydraulic end of pump assembled to the motor not less than 150 percent of the shutoff head of the pump.

2. Leak-Test

   a. Leak-test the motor not less than 150 percent the maximum submergence at Site conditions.

   b. If the motor is to be installed inside an artesian well, leak-test the motor at a test of pressure equal to at least 150 percent of the static pressure above the centerline of the motor.

3. Acceptance criteria for hydrostatic and leak test shall be zero leak..

4. Verify the pump characteristic curves by testing at shutoff head, 25, 50, 75, 100, and 125 percent of the indicated design flow, and at maximum "run-out" flow, and recording the measured head and motor current for each flow.

5. Verify cavitation-free service and absence of motor overheating during conditions simulating the actual operating conditions after installation.

6. Design the motor seals for complete water tightness at 150 percent of the actual maximum submergence at the Site for 30 minutes, and submit data on factory testing and quality control with the Shop Drawings.

7. Properly lubricate and protect parts such that no damage or deterioration will occur even during a prolonged delay from the time of shipment until installation is completed and the pumps are ready for operation.

8. Properly protect unpainted finished ferrous surfaces in order to prevent rust and corrosion.

9. Protect the finished surfaces of exposed flanges by strong wooden blind flanges.

10. Properly crate each pump o protect against damage during shipment.

B. For each pump, the MANUFACTUER will conduct shop tests as described in ANSI/HI 14.6 for capacity, power requirements, and pump efficiency at specified rated head, evaluated head, shutoff head, operating head extremes, and at as many other points as necessary for accurate performance curve plotting but not less than ten. All tests and test reports shall be made in conformity with the requirements and recommendations of the Hydraulic Institute Standards. Acceptance testing shall be Table 14.6.3.4 Grade 1U, with no minus tolerance or margin allowed.

C. (6) certified copies of a report covering each test shall be prepared by the MANUFACTURER and delivered to the ENGINEER prior to shipment of the pumps. The report shall include data and test information as stipulated in the Hydraulic Institute Standards, copies of the test log originals, test reading to curve conversion equations, and certified performance curves. The curves shall include head, pump input power, pump efficiency, rpm, and shop test NPSH available, plotted against capacity. The curves shall be easily read and plotted to scales consistent with performance requirements, with all test points clearly shown.

PART 3 -- EXECUTION

3.1 DELIVERY, STORAGE, AND HANDLING

A. CONTRACTOR shall be responsible for the delivery, handling of products and shall coordinate storage of materials with operations staff.

B. Equipment shall be boxed, crated, or otherwise protected from damage, dirt, and moisture during shipment, handling, and storage. Equipment shall be protected from exposure to corrosive fumes and shall be kept thoroughly dry.

C. Each item of equipment shipped shall have a legible identifying mark corresponding to the equipment number shown or specified for the item.

D. Transport products by methods which prevent product damage. Deliver products in undamaged, dry condition in manufacturer's unopened containers or packaging. Promptly inspect shipments to assure that products comply with requirements, quantities are correct, and products are undamaged.

E. Load and unload equipment and appurtenances by hoists or skidding. Do not drop products. Do not skid or roll products on or against other products. Pad slings and hooks in a manner which prevents damage to products.

F. Store products in accordance with manufacturer's instructions, with seals and labels intact and legible. Store sensitive products in weather-tight enclosures; maintain within temperature and humidity ranges required by manufacturer's instructions. Store products which will be deteriorated by sunlight in a cool location out of direct sunlight. Rubber products shall not come in contact with petroleum products.

G. For exterior storage of fabricated products, place on sloped supports above ground. Cover products subject to deterioration with impervious sheet covering and as recommended by manufacturer; provide ventilation which avoids condensation.

H. Equipment having moving parts such as gears, bearings, and electric motors; instruments; control panels; motor control centers; and switchgear shall be stored in a temperature and humidity-controlled area until equipment is installed, and permanent HVAC systems are in operation.

I. Arrange storage to provide access for inspection. Periodically inspect to assure products are undamaged and are maintained under required conditions and in accordance with manufacturer’s requirements.

J. Promptly remove damaged products from the job site. Replace damaged products with undamaged products

3.2 INSTALLATION

A. Installation of pumping equipment shall be in strict accordance with the respective MANUFACTURER'S instructions and recommendations. Equipment shall be installed by experienced and mechanically skilled workmen with previous experience in similar installations. Installation shall include furnishing the required oil and grease for initial operation. The grades of oil and grease shall be in accordance with the MANUFACTURER'S recommendations.

B. All necessary piping, fittings, concrete pedestal, anchor bolts, grouting, etc. shall be provided to ensure a complete and satisfactory installation of the pumping equipment including pump, electric motor, line shafting, column pipe, electrical connections, and piping connections.

C. Hardware: All anchor bolts, nuts and washers, brackets and the hardware items shall be stainless steel 316.

D. Install piping, fittings, and other appurtenances to the pump installation in accordance with the MANUFACTURER'S installation instructions, the requirements of referenced Sections included with these Specifications and as shown on the Drawings. Equipment shall be installed in a workmanlike manner so that individual equipment will function properly and freely, and no individual parts shall be strained.

E. Noise and Vibrations: All equipment containing moving parts shall be installed level and plumb, unless otherwise indicated in the Drawings or in the Specifications; and shall be anchored securely in order that noise be suppressed to a minimum and that vibrations do not cause damage while in operation.

3.3 FACTORY SERVICE REPRESENTATIVE

A. The CONTRACTOR shall arrange for the services of a qualified factory service representative. This service shall be scheduled for three (3) trips requiring up to six (6) full working days per trip for a total of eighteen (18) full working days.

B. The duties of the service representative shall be as follows: After the equipment has been installed but before it is operated by others, the representative shall inspect the completed installation for soundness (no damaged or cracked components), completeness, correctness of setting and alignment, that the pumps are free from stresses imposed by attached piping, and for the adequacy and correctness of packing, sealing, and lubricants. The service representative shall start-up the equipment and instruct the OWNER'S personnel in proper operation and maintenance procedures. The responsibility of the CONTRACTOR regarding start-up shall be fulfilled when the start-up and testing are complete, the equipment is functioning properly, and has been accepted by the OWNER.

C. The service representative shall submit to the ENGINEER six (6) copies of a signed report of the result of his inspection, adjustments and start- up. The report shall include descriptions of the inspection, adjustments made, and the start-up. The report shall also

include a statement that the equipment is ready for permanent operation and that nothing in the installation will render the manufacturer's warranty null and void. Final payment shall not be made to the CONTRACTOR until this report has been submitted to and approved by the ENGINEER.

3.4 INSPECTION AND TESTING

A. After pump has been completely installed, the CONTRACTOR shall conduct, in the presence of the ENGINEER, testing of all mechanical equipment and piping as in operation to demonstrate capacity, correct alignment, smooth operation, proper adjustment, and freedom from noise, vibration, over-heating and leaking, and to ensure satisfactory compliance with the Specifications. All defects shall be corrected. The CONTRACTOR shall supply all oil, grease, and all other material necessary to complete the field tests related to the pump and motor.

B. If the pump performance does not meet the performance requirements, corrective measures shall be taken by the CONTRACTOR, or pump shall be removed and replaced with a pump which satisfies the conditions specified.

3.5 VIDEO LOG

A. Prior to installing the pump column, the CONTRACTOR shall Video Log the well in color on DVD. The Video Log shall render a detailed look at the condition of the well and provide a continuous depth profile characterizing casing, screen, rock, and fluid properties adjacent to the well. Two (2) copies of the Video Log for each well shall be provided to the OWNER.

3.6 DISINFECTION

A. Pump Disinfection: Prior to installing the pump in the well, all interior and exterior parts of the pump coming in contact with the water shall be disinfected with a five percent (5%) chlorine solution (chlorine bleach). The method of disinfecting the pump shall be approved by the OWNER or OWNER’S representative prior to installing the pump.

B. Well and Piping Disinfection: Piping, fittings, suction barrel, and appurtenances installed to connect the pump to existing piping, shall be disinfected and flushed in accordance with AWWA C651, the Ten States Standards for Water Works as incorporated by FDEP, other pertinent FDEP regulations, and the Florida Administrative Code. The method of disinfecting the pumps shall be approved by the OWNER or OWNER’S representative prior to installing the pump.

3.7 WARRANTY

A. All pumping equipment shall carry a manufacturer’s warranty of one (1) year that shall commence upon acceptance by the OWNER.

GENERAL NOTES:

1. PUMPS SHALL NOT BE DESIGNED FOR REVERSE ROTATION. MOTORS SHALL INCLUDE A NON-REVERSE RATCH.
2. PROVIDE UP TO THREE (3) MOTORS TYPE FOR THE ENTIRE WELLFIELD. MAX MOTOR SIZE SHALL BE 75 HP. MOTORS WITH THE SAME HP SHALL BE THE SAME RPM.

SECTION 13500

WELL ABANDONMENT

PART 1 – GENERAL

1-1. SCOPE OF WORK

1-1.01 The CONTRACTOR shall furnish all equipment and materials necessary to prepare the site for the plugging and formally abandon five (5) existing production wells, located at well sites MBR-152, MBR-157, MBR-161, MBR-162, and MBR-163 at the Morris Bridge Wellfield.

1-1.02. The work sequence shall be as follows:

a. Mobilization shall provide for the assembling of all personnel, materials, and equipment to the job sites.

b. For each well that needs to be abandoned, the CONTRACTOR shall disconnect and remove all electrical systems and remove the existing pump.

c. Following the previous step, for wells MBR-152 and MBR-157, the CONTRACTOR shall demolish and remove the top portion of the well casing to approximately 2 feet below existing grade, and then perform the well abandonment as described below. For wells MBR-161, MBR-162, and MBR-163 the CONTRACTOR shall cut the existing casing flush with the slab finished floor, and then perform the well abandonment as described below.

   The CONTRACTOR shall demolish all existing underground piping impacted by the well abandonment, unless noted otherwise in the CONTRACT DRAWINGS. For sections for the discharge pipe that will be abandoned in place, grouting of that section of pipe will be required as indicated in the CONTRACT DRAWINGS.

1-1.03. The well abandonment work shall be performed by a licensed Florida water well contractor with equipment which is adequate to complete all phases of well abandonment. If the CONTRACTOR's equipment is not capable of satisfactorily performing the work provided in these specifications, the CONTRACTOR at his own expense shall substitute equipment satisfactory to the ENGINEER.

1-1.04. The CONTRACTOR shall provide sound proofing barriers, provide mufflers on equipment, and take whatever steps necessary during well abandonment and all other work incidental thereto to ensure that noise levels conform to applicable noise ordinances. The CONTRACTOR shall take all necessary measures to limit access to the abandonment site to minimize public hazards.

1-1.05. All work performed shall be in full conformance with Southwest Florida Water Management District's (SWFWMD) and Florida Department of Environmental Protection's (FDEP) rules and regulations for well abandonment.

1-2. CONTRACTOR SUBMITTALS

1-2.01. **General:** All CONTRACTOR submittals shall conform to the applicable requirements of Section 01300 Submittal Procedures, and the supplementary requirements specified herein. All measurements of depths shall be referenced to existing ground surface at each well site.

1-2.02. **Equipment List:** The CONTRACTOR shall submit a list of the equipment it proposes to utilize on the project which shall include manufacturer's load capacities, horsepower, year of manufacture and year of purchase by the present owner. The list shall include drilling or pump rig, grout pump and grout mixer.

1-2.03. **Daily Log:** A daily log of abandonment activities shall be prepared by the CONTRACTOR. The log shall include types, additives, quantities, and measured setting depths of materials utilized, methods of material installation, and all other pertinent information pertaining to abandonment activities. The log will include all difficulties or unusual conditions met in daily activities. The daily log shall be always available for inspection at the site.

1-2.04. **Completion Report Required:** A Water Well Completion Report (Form 0124) must be filed and submitted within 30 days of completion of work to the applicable regulating agency. Two copies each of these reports shall be submitted to the ENGINEER.

1-2.05. **Final Description:** The final well description shall show the following: existing casing diameter, depth and material; depths, quantities and material composition of abandonment materials, final wellhead completion; and all other pertinent details.

1-3. QUALITY ASSURANCE

1-3.01. At the time of well abandonment utilizing grout, the CONTRACTOR will reserve grout samples in sturdy containers on site for inspection by the ENGINEER. The purpose of these samples will be to observe the grout curing process. If the grout mixture fails to fully cure within 48-hours or if gravel or grout depths are unacceptable to the ENGINEER, the well shall be drilled out and the abandonment materials satisfactorily reinstalled at the CONTRACTOR's expense.

1-4. MATERIALS DELIVERY, STORAGE AND PROTECTION OF MATERIALS

1-4.01. All materials shall be delivered in an undamaged condition and stored, if necessary, to provide protection against damage. All defective or damaged materials shall be replaced with new materials at the CONTRACTOR's expense.

1-5. CONTRACTOR'S EQUIPMENT

1-5.01. The CONTRACTOR's equipment shall be clean, well maintained, and in good operating condition when delivered to the site and during the entire operation.

1-5.02. The equipment shall be of adequate size, strength, horsepower, and capacity for the project and shall be of the type successfully utilized by the CONTRACTOR for the abandonment of similar wells within the last 2 years.

1-5.03. All equipment shall be provided with safety devices as required by governmental authorities having jurisdiction.

1-6. MOBILIZATION AND OPERATION REQUIREMENTS

1-6.01. The CONTRACTOR shall mobilize its equipment and personnel to effectively commence its abandonment operations within the time limit specified. A storage area for materials if required by the CONTRACTOR is provided as shown in the Drawings.

1-6.02. All equipment shall be carefully maintained during the CONTRACTOR's operations period. Any damage to the surrounding property and/or facilities of any nature due to the CONTRACTOR's operations shall be repaired or replaced at the CONTRACTOR's expense.

1-7. FINAL CLEANUP

1-7.01. The CONTRACTOR shall thoroughly clean the site after completion of its operations. All excess grout, gravel, debris, and other materials utilized during well abandonment shall be removed and disposed of by the CONTRACTOR.

1-7.02. The CONTRACTOR shall promptly remove its equipment, temporary facilities, and materials, and leave the site in a condition acceptable to the OWNER following completion of work activities. The CONTRACTOR shall repair any damage to property and facilities caused by its operation prior to final acceptance of the work.

PART 2 - PRODUCTS

2-1. MATERIALS AND EQUIPMENT

2-1.01. **Gravel Pack Material:** The CONTRACTOR shall identify and document the screened intervals of the wells to be abandoned. Gravel pack material shall be used to abandon the screened interval and the interval 10 feet above the screened interval of the well. All gravel shall be hard, well rounded, water-worn gravels washed clean of silt, dirt and foreign matter; crushed rock will not be accepted. The gravel shall be of a size approved by the ENGINEER. The gravel shall be placed in the screened interval of the well using the tremie method and shall extend a maximum of 10 feet above the top of the screen.

2-1.02. **Sand Pack Material:** The sand used for the 1-foot-thick sand pack shall be of medium size passing the U.S. Standard Sieve Mesh No. 35 and retained in the U.S. Standard Mesh No. 60 and consist of sound, non-reactive material. The sand pack shall be installed immediately above the gravel pack interval. Crushed aggregate shall not be accepted. The sand shall be free of vegetative matter and placed in the production well only above the gravel pack material.

2-1.03. **Sealing Material:** The sealing material shall be neat cement with 5 percent bentonite powder (by weight of cement). The neat cement shall be composed of one sack of Type II Portland cement (94 pounds) conforming to ASTM C 150 and SFWMD Rules Chapter 40E-3 F.A.C., 4.7 pounds of bentonite and 5 gallons of potable water to produce the slurry mixture capable of effectively sealing the well. Cement shall be emplaced in the production well above the sand seal.

2-1.04. **Grouting Method:** Tremie pipe shall be used to pressure grout all wells. The tremie pipe used for the production well abandonment shall be a minimum 2-inch Schedule 40 threaded and coupled or flush threaded black steel pipe. The CONTRACTOR shall furnish a grout mixer capable of mixing the volume of grout required to assure continuous grouting operations. The grout mixer shall have sufficient agitation by means of paddles or jetting of fluid to create a homogeneous mix of the cement, bentonite and clear water. The CONTRACTOR shall furnish a grout pump capable of providing sufficient pressure to overcome tremie pipe friction losses, fill the well intervals with grout, and displace any fluids in the well.

2-1.05. **Water Source:** The CONTRACTOR shall make all necessary provisions for conveying potable water to the wellsite for use during the abandonment operation.

PART 3 - EXECUTION

3-1. GENERAL

3-1.01. The work shall be performed in accordance with AWWA Standard for Water Wells A100-06 and adhere to all regulatory requirements by a competent crew with equipment which is sufficient to complete all phases of well abandonment.

3-1.02. All work required to be repeated, resulting form the CONTRACTOR's performance, including all additional materials, labor and equipment required, shall be furnished at the expense of the CONTRACTOR and no claim for additional compensation shall be made or be allowed therefore, except as specifically provided herein.

3-2. CONSTRUCTION OF WELLS TO BE ABANDONED

3-2.01. The exact locations of the wells are shown on the CONTRACT DRAWINGS. A summary of the well data can be found below in Table 1. The CONTRACTOR shall verify the depth of the wells prior to initiating abandonment operations.

Well	Diameter (inches)	Total Depth (feet bls)	Cased Depth (feet bls)	Screened or Open-Hole Interval
MBR-152	16	572	<220	Contractor to confirm
MBR-157	16	614	<222	Contractor to confirm
MBR-161	16	542	<221	Contractor to confirm
MBR-162	16	608	<217	Contractor to confirm
MBR-163	16	616	<220	Contractor to confirm

3-3. WELL ABANDONMENT

3-3.01. **Production Well:** All work associated with plugging and abandonment of a production or public supply well shall conform to State of Florida well drilling practices and to AWWA standards (AWWA; A100-06). SWFWMD oversees plugging and abandoning in the state of Florida and provides the required forms that the contractor submits once the abandonment activities are complete. Abandonment shall adhere to Rule 40D-3.531(5), Florida Administrative Code (F.A.C.). The 62-532.900 Permit for Water Well Construction, Repair, or Abandonment shall be obtained and submitted prior to any work performed by the licensed water well Contractor.

3-3.02. The Contractor is required to give SWFWMD a 24-hour notice prior to beginning abandonment procedures. All wells abandoned, including completed and incomplete wells shall be plugged by filling them from bottom to top with grout. Use of clean aggregate to bridge cavernous or lost circulation zones shall be allowed if measurements indicate loss of grout within the borehole or screened portion does not connect two (2) or more aquifers of differing water quality. Prior approval to use aggregate or other material must be obtained from SWFWMD. Obstructions must be cleared from all wells prior to plugging and abandoning. Upon completion of well abandonment, the SWFWMD Well Grouting/Abandonment Form must be submitted and can be filed at no charge.

3-4. WELLHEAD AND SITE COMPLETION

3-4.01. The CONTRACTOR shall terminate the well casing to a final depth as indicated on the CONTRACT DRAWINGS. The excavation shall be backfilled and compacted with previously excavated material and graded to match existing grade for MBR-152 and MBR-157. For wells MBR-161, MBR-162, and MBR-163, cut the existing casing flush with the slab finished floor and top concrete to match the existing top of concrete elevation, as shown on the CONTRACT DRAWINGS.

3-4.02. The CONTRACTOR shall remove all raw water piping located above grade. Below-grade piping serving an individual well site shall be removed up to the isolation gate valve closest to the main collection header pipe, unless noted otherwise in the CONTRACT DRAWINGS. For sections for the discharge pipe that will be abandoned in place, grouting of that section of pipe will be required as indicated in the CONTRACT DRAWINGS .

3-4.03. The CONTRACTOR shall provide an as-built record drawing for each well that has been abandoned. The as-built drawing shall be prepared in accordance with Section 01720 – Contract Closeout and Documentation, and shall indicate the extent of abandonment, removal, and abandonment in-place. The final below-grade elevation of each abandoned well casing shall be indicated on the as-built drawings.

3.5 DISPOSAL OF ABANDONMENT WASTES

3-5.01 The CONTRACTOR shall provide all facilities, equipment, and materials required for the removal of abandonment wastes and materials from the well site according to State and local regulations.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 15005

VALVES, GENERAL

PART 1 -- GENERAL

1.1 SUMMARY

1-1.01. Provide valves, actuators, and appurtenances, complete and operable, as indicated in accordance with the Contract Documents.

1-1.02. The provisions of this Section shall apply to all valves and valve actuators except where otherwise indicated.

1-1.03. Valves and actuators in particular locations may require a combination of units, sensors, limit switches, and controls, as indicated.

1-1.04. Support

1. Where a valve is to be supported by means other than the piping to which it is attached, obtain from the valve manufacturer a design for its support and foundation.

2. Submit the support design, including drawings and calculations sealed by an engineer, with the Shop Drawings.

1-1.05. Unit Responsibility

1. The Contractor shall assign a single manufacturer to be responsible for the supply, coordination of design, assembly, testing, and furnishing of each valve; however, the Contractor shall be responsible to the Owner for compliance with the requirements of each valve Section.

1-1.06. Single Manufacturer

1. Where 2 or more valves of the same type and size are required, the valves shall be furnished by the same manufacturer.

1.2 CONTRACTOR SUBMITTALS

1-2.01. Furnish submittals in accordance with the requirements of Section 01300 – Submittal Procedures.

1-2.02. Furnish the following information on Shop Drawings:

1. valve name, size, Cv factor, pressure rating, identification number (if any), and specification section number;

2. complete information on the valve actuator, hydraulic power units (HPU), pneumatic air supply system including size, manufacturer, model number, limit switches, and mounting;

3. cavitation limits for control valves;

4. assembly drawings showing part nomenclature, materials, dimensions, weights, and relationships of valve handles, hand wheels, position indicators, limit switches, integral control systems, needle valves, and control systems;

5. A valve-labeling schedule, listing the valves to be furnished with stainless steel tags, indicating in each case the valve location and the proposed wording for the label.

1-2.03. Furnish a technical manual containing the required information for each valve, as indicated.

1-2.04. Furnish a spare parts list, containing the required information for each valve assembly, as indicated.

1-2.05. Factory Test Data

1. Where indicated, submit signed, dated, and certified factory test data for each valve requiring certification, before shipping the valve.

2. Furnish a certification of quality and test results for factory-applied coatings.

1-2.06. Field Test Data

1. Submit signed, dated, and certified field test data for each valve.

PART 2 -- PRODUCTS

2.1 PRODUCTS

2-1.01. General

1. Provide valves and gates of new and current manufacture.

2. Provide valves 6-inch and larger with actuators with position indicators.

2-1.02. Protective Coating

1. Coat the exterior surfaces of valves and the wet interior surfaces of ferrous valves of sizes 2-inch and larger in accordance with the manufacturer standards for water supply.

2. The valve manufacturer shall certify in writing that the required coating has been applied and tested in the manufacturing plant prior to shipment, in accordance with the indicated requirements.

3. Do not coat the machined flange faces of valves except where such flanges are not adjoining a mating flange as shown in the Contract Documents. Apply rust inhibitor coating on machined surfaces of the flange prior to shipment.

2-1.03. Valve Labeling

1. Except when such requirement is waived by the Engineer in writing, provide a label on shut-off valves and control valves except for hose bibbs and chlorine cylinder valves.

2. Furnish a label composed of 1/16-inch plastic or stainless steel, a minimum of 2 inches by 4 inches in size and permanently attached to the valve or on the wall adjacent to the valve as directed by the Engineer.

2-1.04. Valve Testing

1. As a minimum, unless otherwise indicated or recommended by the reference standards, test valves 3 inches in diameter and smaller in accordance with the manufacturer's standard procedure.

2. Factory-test valves 4 inches in diameter and larger as follows:

   a. Hydrostatic Testing

      1) Subject valve bodies to an internal hydrostatic pressure equivalent to twice the water-rated pressure of the valve.

      2) Metallic valves rating pressures shall be based at 100 degrees F.

      3) Plastic valves rating pressures shall be based at 73 degrees F, or at a higher temperature according to material type.

      4) During the hydrostatic test, there shall be no visible leakage through the valve body, end joints, or shaft seals, nor shall parts of the valve be permanently deformed.

      5) Allow test duration of at least 10 minutes, in order to allow visual examination for leakage.

   b. Seat Testing

      1) Test the valves for leaks in the closed position, with the pressure differential across the seat equal to the water rated pressure of the valve.

      2) Provide test duration of at least 10 minutes, in order to allow visual examination for leakage.

      3) The leakage rate shall be the more stringent of the following:

         a) As recommended by the reference standard for that type of valve; or

         b) Leakage past the closed valve not to exceed one fluid ounce per hour per inch diameter for metal seated valves, and drop-tight for resilient seated valves.

c. Performance Testing

1) Shop-operate the valves from the fully-closed to the fully-open position, and reverse under no-flow conditions in order to demonstrate that the valve assembly operates properly.

2-1.05. Certification

1. Prior to shipment of valves with sizes larger than 12-inches in diameter, submit certified, notarized copies of the hydrostatic factory tests, showing compliance with the applicable standards of AWWA, ANSI, or ASTM.

2-1.06. Valve Markings

1. Permanently mark valve bodies in accordance with MSS SP25 - Standard Marking Systems for Valves, Fittings, Flanges, and Unions.

2.2 MATERIALS

2-2.01. General

1. Provide materials suitable for the intended application.

2. Provide materials in contact with potable water listed as compliant with NSF Standard 61.

3. Ensure that materials not indicated are of high-grade standard commercial quality, free from defects and imperfections that might affect the serviceability of the product for the purpose for which it is intended.

4. Unless otherwise indicated, provide valve and actuator bodies conforming to the following requirements:

a. Cast Iron: Close-grained gray cast iron, conforming to ASTM A 48 - Gray Iron Castings, Class 30, or to ASTM A 126 - Gray Iron Castings for Valves, Flanges, and Pipe Fittings

b. Ductile Iron: ASTM A 536 - Ductile Iron Castings, or to ASTM A 395 - Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures

c. Steel: ASTM A 216 - Steel Castings, Carbon Suitable for Fusion Welding for High-Temperature Service, or to ASTM A 515 - Pressure Vessel Plates, Carbon Steel, for Intermediate- and Higher-Temperature Service

d. Bronze: ASTM B 62 - Composition Bronze or Ounce Metal Castings, and valve stems not subject to dezincification shall conform to ASTM B 584 - Copper Alloy Sand Castings for General Applications. Bronze materials in contact with potable water service shall be free of lead content meeting the Lead Reduction Act.

e. Stainless Steel: Stainless steel valve and operator bodies and trim shall conform to ASTM A 351 - Steel Castings, Austenitic, for High-Temperature Service, Grade CF8M, or shall be Type 316 stainless steel

f. PVC: Polyvinyl chloride materials for valve body, flanges, and cover shall conform to Cell Classification 12454

g. CPVC: Chlorinated Poly Vinyl Chloride materials for valve body, flanges, and cover shall conform to Cell Classification 23447

h. NSF Standard 61: Materials shall be listed for use in contact with potable water.

i. Elastomeric materials used for seat, seals and O-rings shall be compatible with temperature, pressures and fluid or gas service.

   1) Elastomeric materials for water with chloramines shall be Teflon or Viton-A.

   2) Elastomeric materials for water with dissolved ozone residual shall be Teflon suitable for ozone service.

   3) Elastomeric materials for oxygen (LOX or GOX) shall be Teflon specially manufactured and packaged suitable for oxygen service.

2.3 VALVE CONSTRUCTION

2-3.01. Bodies

1. Provide valve bodies that are cast, molded (in the case of plastic valves), forged, or welded, of the materials indicated, and with smooth interior passages.

2. Provide wall thicknesses uniform and in agreement with the applicable standards for each type of valve, without casting defects, pinholes, and other defects that could weaken the body.

3. Perform welds on welded bodies by certified welders and ground welds smooth.

4. Provide valve ends as indicated, and rated for the maximum temperature and pressure to which the valve will be subjected.

2-3.02. Valve End Connections

1. Unless otherwise indicated, valves 2-1/2 inches in diameter and smaller may be provided with threaded end connections.

2. Provide valves 3 inches in diameter and larger with flanged end connections.

3. Flanges, bolts and gaskets shall be as specified in Section 40 05 00 - Piping, General.

2-3.03. Bonnets

1. Connect valve bonnets to the body by clamping, screwing, or flanging.

2. Provide bonnets of the same material, temperature, and pressure rating as the body.

3. Make provisions for the stem seal with the necessary glands, packing nuts, and yokes.

2-3.04. Stems

1. Provide valve stems of the materials indicated, or, if not indicated, of the best commercially-available material for the specific service, with adjustable stem packing, O-rings, chevron V-type packing, or other suitable seal. Bronze materials in contact with potable water shall be NSF 61 approved and free of lead. Elastomeric materials shall be compatible with fluid service.

2-3.05. Stem Guides

1. Provide stem guides spaced with an L/R ratio not to exceed 200:1. Submit calculations for L/R ratios and guide spacing to the Engineer for review.

2. Stem guides shall have slotted holes and shall be adjustable in two directions.

2-3.06. Internal Parts

1. Provide internal parts and valve trim as indicated for each individual valve.

2. Where not indicated, construct valve trim from Type 316 stainless steel or other material best-suited for the intended service.

2-3.07. Nuts and Bolts

1. Unless otherwise indicated, provide nuts and bolts on valve flanges and supports in accordance with the requirements of Section 15061 Ductile Iron Pipe 42 Inches and Smaller.

2.4 VALVE ACTUATORS

2-4.01. Provide standard manufacturer manual valve actuators.

2.5 VALVE ACCESSORIES

2-5.01. Provide valves complete with the accessories required to provide a functional system.

2.6 SPARE PARTS

2-6.01. Furnish the required spare parts, suitably packaged and labeled with the valve name, location, and identification number.

2-6.02. Furnish the name, address, and telephone number of the nearest distributor for the spare parts of each valve.

2-6.03. Spare parts are intended for use by the Owner, after expiration of the correction of defects period.

2.7 MANUFACTURERS

2-7.01. Valve manufacturers shall have a successful record of not less than 5 years in the manufacture of the indicated valves.

PART 3 -- EXECUTION

3.1 VALVE INSTALLATION AND TRIAL OPERATION

3-1.01. General

1. Install valves, actuating units, stem extensions, valve boxes, and accessories in accordance with the manufacturer's written instructions and as indicated.

2. Adequately brace gates in order to prevent warpage and bending under the intended use.

3. Firmly support valves in order to avoid undue stresses on the pipe.

3-1.02. Access

1. Install valves in a manner to provide easy access for actuation, removal, and maintenance, and to avoid interference between valve actuators and structural members, handrails, and other equipment.

3-1.03. Valve Accessories

1. Where combinations of valves, sensors, switches, and controls are indicated, properly assemble and install such items such that systems are compatible and operating properly.

2. Clearly note the relationship between interrelated items on Shop Drawing submittals.

3-1.04. Trial Operation

1. After installation, schedule trial operation witnessed by the Engineer and the Owner representative.

2. All valves shall be cleaned thoroughly of all foreign materials and final adjustments made. The valves shall then be operated through one complete cycle from a fully closed position to a fully open position and back to a fully closed position to verify that the assembly is functional.

3. For control valves that operate in multiple operating scenarios, the Contractor shall simulate all operational scenarios including the hydraulic power units, pilot control system or pneumatic air supply system to demonstrate compliance to the specifications.

4. A field leakage test meeting the maximum allowable specified requirement shall be conducted.

5. Test certificate shall be signed by the valve manufacturer and the Contractor and shall be submitted to the Engineer.

END OF SECTION

SECTION 15010

VALVE INSTALLATION

PART 1 - GENERAL

1-1. SCOPE

1-1.01. This section covers the installation of new valves and actuators purchased by CONTRACTOR as part of this WORK. Cleaning, disinfection, pressure and leakage testing, insulation, and pipe supports are covered in other sections. The following specification sections are applicable to valves to be installed:

Title
AWWA Butterfly Valves
Air Valves

1-2. GENERAL

1-2.01. Equipment installed under this section shall be erected and placed in proper operating condition in full conformity with DRAWINGS, SPECIFICATIONS, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by ENGINEER.

1-2.02. Coordination. Flanged connections to valves including the bolts, nuts, and gaskets are covered in the appropriate pipe specification section. Valve ends shall match piping.

PART 2 – PRODUCTS - Not Applicable.

PART 3 - EXECUTION

3-1. INSPECTION

3-1.01. All valves and accessories shall be inspected for damage and Cleanliness before being installed. Any material damaged or contaminated in handling on the job shall not be used unless it is repaired and re-cleaned to the original requirements by CONTRACTOR. Such material shall be segregated from the clean material and shall be inspected and approved by OWNER or his representative before its use.

3-2. INSTALLATION.

3-2.01. General. Valves shall be installed with sufficient clearance for proper operation of any external mechanisms, and with sufficient clearance to dismantle the valve for in-place maintenance. Installation shall be in accordance with the valve manufacturer’s recommendations.

3-2.02. Unless otherwise indicated on the DRAWINGS or specified, all valves installed in horizontal runs of pipe having centerline elevations 4 feet 6 inches or less above the finish floor shall be installed with their operating stems vertical. Valves installed in horizontal runs of piping having centerline elevations between 4 feet 6 inches and 6 feet 9 inches above the finish floor shall be installed with their operating stems horizontal. If adjacent piping prohibits this, the stems and operating handwheel shall be installed above the valve horizontal centerline as close to horizontal as possible. Valves installed in vertical runs of pipe shall have their operating stems oriented to facilitate the most practicable operation, as reviewed by ENGINEER.

3-2.03. Installation Checks. - Not used.

3-2.04. AWWA Butterfly Valves. Not used.

3-2.05. Whenever an actuator must be removed to permit installation of a valve, the actuator shall be promptly reinstalled.

3-2.06. Check Valves.

3-2.07. Swing Check Valves. Install valves oriented for the correct flow direction. Only valves designed for vertical installation shall be installed in vertical piping.

3-2.08. Plug Valves. - Not used.

3-2.09. Resilient Seated Gate Valves. – Resilient gate valves shall be installed with the shaft vertical unless otherwise necessary for proper operation or as acceptable to Engineer.

3-2.10. Air Release and Combination Air Valves. The exhaust from each valve shall be piped to a suitable point acceptable to ENGINEER or as indicated on the Drawings.

3-2.11. Hydrants. – Not used.

3-2.12. Valve Boxes. – Not used.

3-3. VALVE ACTUATORS

3-3.01. Valve actuators and accessories shall be factory mounted on the valve, calibrated, and tested by the valve or actuator manufacturer.

3-4. FIELD QUALITY CONTROL

3-4.01. Field Testing. After installation, all valves shall be tested in accordance with the Pipe and Valve Schedule on the CONTRACT DRAWINGS.

3-4.02. Pressure Tests. Pressure testing shall be in accordance with the Pipe and Valve Schedule on the CONTRACT DRAWINGS.

3-4.03. Leakage Tests. All valves shall be free from leaks. Each leak that is discovered within the correction period stipulated in the General Conditions shall be repaired by and at the expense of CONTRACTOR. This requirement applies whether pressure testing is required or not.

3-5. ADJUSTING

3-5.01. After installation, the opening and closing time shall be adjusted as needed for each pneumatic, hydraulic and electric actuated valve.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 15011

HEATING, VENTILATING, AND AIR CONDITIONING, GENERAL

PART 1 -- GENERAL

1.1 SUMMARY

1-1.01. The Contractor shall provide heating, ventilating, and air conditioning systems and associated equipment complete with supports, mounting frames, ventilators, ductwork, piping, louvers, panels, filters, grilles, electric drive units and controls, mechanical equipment, electrical work, appurtenances, testing, and balancing, as indicated in accordance with the Contract Documents.

1-1.02. The equipment shall be installed ready for operation.

1.2 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

1-2.01. The Work and materials shall be in full accordance with the latest rules and regulations or publications of the State Energy Resources Conservation and Development Commission, the State Fire Marshall, the Industrial Safety Orders, the Health and Safety Rules (Air Conditioning systems), the local plumbing code, the local building code, and other local codes.

1-2.02. Nothing in the Contract Documents shall be construed to permit Work in violation of the above codes, rules and regulations.

1-2.03. In the absence of applicable codes, the installation and workmanship shall follow the standards set by the American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE).

1.3 CONTRACTOR SUBMITTALS

1-3.01. Shop Drawings:

1. Submit complete shop drawings and certificates, test reports, affidavits of compliance, for all equipment, ductwork and piping systems, in accordance with the requirements in Section 01300 – Submittal Procedures, and as indicated in the individual equipment, piping or ductwork Sections.

2. Construction Drawings

    a. The HVAC Drawings define the general layout, configuration, routing, size and the general intent of the design. and are not fabrication drawings.

    b. The ductwork dimensions provided on the design drawings represent a free area and they are clear inside dimensions. The contractor shall be responsible to account for the loss of free area due acoustical lining, or any internal obstructions, and oversize the ductwork to provide the same free area as the one shown on the design drawings.

c. It shall be the Contactor's responsibility to develop the Shop Drawings required for the construction of the HVAC system.

3. The Shop Drawings shall include all necessary dimensions and details regarding equipment, pipe and ductwork joints, fittings, valves, appurtenances, design calculations, and material lists.

4. The submittals shall include detailed layout, spool, or fabrication drawings which shall show all fittings, and supports as necessary to accommodate the equipment as a complete and functional system.

1-3.02. Equipment Numbers:

1. Equipment is identified by assigned numbers for reference and location purposes in the Contract Documents.

2. Indicate the appropriate equipment numbers on the Shop Drawings and other submittals.

1-3.03. Furnish certified fan curves for each fan.

1.4 WARRANTY

1-4.01. Air conditioners, heaters, fans, ventilators, grilles, and the like, that are provided by the Contractor shall carry the manufacturer’s standard warranty.

1-4.02. Warranties shall be furnished to the Engineer upon final acceptance of the completed systems by the Owner.

1-4.03. Refrigerant compressors shall carry a manufacturer's 5-year warranty.

1-4.04. Control System:

1. The temperature and equipment control system shall be warranted free from defects in workmanship and material under normal use and service for a period of one year after acceptance by the Engineer.

2. Equipment that proves to be defective in workmanship or material during the warranty period shall be adjusted, repaired, or replaced by the automatic control manufacturer as part of the Contract.

PART 2 -- PRODUCTS

2.1 GENERAL

2-1.01. Quality:

1. Mechanisms and other parts shall be amply proportioned for the stresses which may occur during operation and for any other stresses which may occur during fabrication and erection.

2. Individual parts furnished which are alike in all units shall be alike in workmanship, design, and materials, and shall be of the manufacturer's top-line, industrial-commercial grade.

2-1.02. Supports:

1. Equipment and appurtenances shall be firmly anchored or connected to supporting members.

2. Equipment shall be supported on restrained spring-type vibration isolators.

3. Supports as required for the proper installation of the equipment, but not forming an integral part of the building structure, shall be provided unless otherwise indicated.

2-1.03. Noise and Vibration Control

1. The system shall be free of objectionable vibrations and noise.

2. Provide flexible connections in ducts and piping connections to fans, compressors, and other vibrating equipment.

2-1.04. Seismic Restraints

1. Design the equipment, duct and piping supports and restraints for static, dynamic, and seismic loads in Zone 4 in accordance with the International Building Code.

2. Seismic restraints shall not induce stresses in the equipment, ductwork and piping caused by thermal expansion and contraction.

3. Comply with Structural drawings and specifications for Seismic and Wind Design Criteria.

2.2 MOTORS

2-2.01. Motors provided with the equipment shall conform to the latest IEEE and NEMA requirements for mechanical and electrical characteristics, including service factors.

2-2.02. Each motor shall bear the manufacturer’s nameplate with complete motor data.

2-2.03. Each motor shall be of ample size and construction to continuously carry the loads which might be imposed by the equipment throughout the full range of operation of the equipment.

2-2.04. The maximum motor loading shall be less than or equal to the nameplate horsepower rating, exclusive of the service factor.

2.3 ELECTRICAL WORK

2-3.01. The Work of this section shall include:

1. Provide controls, sensors and control panels relating to the HVAC systems, including starters, thermostats, motorized dampers, louver operators and other equipment as indicated.

2. Provide control wiring of 120-volt and less as indicated in this Section and in conformance the requirements of Division 16 – Electrical and Division 17 – Instrumentation and Control.

2-3.02. The Work of Division 16 shall include:

1. Provide local power disconnects, where required.

2. Provide circuit breakers, starters in motor control centers, and 120-, 208-, 240- and 480-volt power feeders from the starters and circuit breakers to the HVAC equipment, as indicated.

2-3.03. Starters, whether as an integral or separate part of the equipment, shall be in accordance with the requirements of Division 16.

2-3.04. Enclosures shall be of the same NEMA class as the electrical equipment in the same area.

2-3.05. Starters shall be of the same manufacturer as the starters indicated under Division 16.

2-3.06. Low-voltage control wiring shall be in accordance with the National Electric Code.

2-3.07. Control wiring for line voltage 120-volt and higher shall be in conformance with the requirements of Division 16.

2-3.08. Control Panels shall be in conformance with the requirements of Division 16.

2-3.09. Conduit shall be in conformance with the requirements of Division 16.

2.4 WELDING

2-4.01. The welding of black steel or alloy pipe shall be carried out in strict accordance with AWS procedures and the codes and ordinance of the City of Tampa and the State of Florida pertaining to welded steel pipelines.

2-4.02. Welding shall be accomplished by means of the shielded electric arc process and performed by workers who are certified for this Work.

2.5 EXPANSION JOINTS AND LOOPS

2-5.01. Provide expansion loops or expansion joints at the indicated locations and as necessary to provide for the expansion of piping.

2-5.02. The maximum straight run of pipe without an expansion joint or loop installed shall not exceed 75 feet.

2-5.03. Provide an expansion joint or loop at every building construction joint.

2-5.04. Construction

1. The pipe expansion joints on metal piping 3-inch and smaller shall be of the 2-ply stainless steel bellows type, with a 1-1/2-inch compression stroke, a 1/2-inch extension and a total stroke of 2 inches.

2. The joints shall be suitable for a maximum operating temperature of 750 degrees F and a maximum working pressure of 175 psig.

3. The compensator shall have male pipe thread ends for steel pipe and female sweat ends for copper pipe.

2-5.05. Pipe Expansion Joints Manufacturers, or Equal

1. **Flexonics, Model H** for steel piping and **Model HB** for copper piping

2. **Keflex Series 7Q**

3. **Adsco Compensators**

2.6 HANGERS AND SUPPORTS

2-6.01. Anchorage and bracing for all suspended ductwork and other distribution systems needs to be provided per 2020FBC Section 1613/ASCE 7-10 Chapter 13

2-6.02. Provide all necessary hangers, supports, concrete inserts, anchors and guides for material and equipment to be installed.

2-6.03. No perforated strap hangers and no wire supports will be accepted.

2-6.04. Insulation Allowance:

1. Hangers supporting insulated pipe shall be sized to fit the pipe plus the insulation.

2. The insulation at support points shall be provided with a metal shield in order to prevent damage to the insulation.

2-6.05. Anchors and guides shall be constructed of steel, in accordance with approved Shop Drawings, and as indicated.

2-6.06. Anchors:

1. Anchorages shall be obtained by welding lugs onto the pipe and providing abutting surfaces against the lugs to restrict longitudinal movement.

2. Bolting materials shall be cadmium-plated.

2-6.07. Guides shall be located not more than 20 feet from each expansion loop or joint.

2-6.08. Hangers for ductwork and equipment shall be as indicated and in accordance with the guidelines of the Sheet Metal and Air Conditioning Contractors National Association (SMACNA).

2-6.09. Inserts shall be galvanized.

2.7 BACKDRAFT OR GRAVITY DAMPERS

2-7.01. General

1. Provide backdraft dampers on the exhaust fans and ventilators where indicated.

2. Damper sizes and capacities shall be as indicated on the Drawings.

2-7.02. Design and Construction

1. The dampers shall be of the multi-blade type, with soft-seating gaskets for minimizing noise and air leakage when closed.

2. Blades shall be constructed of 16-gauge aluminum, and shall be of an air foil design.

3. Frames shall be fabricated from 16-gauge extruded aluminum alloy.

4. The frames shall be totally out of the air stream, and arranged for flange mounting.

5. The dampers shall be designed to operate at 0.05 inch w.g. S.P., or less.

6. Blades shall be individually counterbalanced, and shall be provided with non-ferrous pins turning in nylon bearings.

2-7.03. Damper Manufacturers, or Equal

1. **Ruskin, Model CD40**

2. **Air Balance, Inc.**

3. **Air Dynamic.**

2.8 HIGH-PERFORMANCE HURRICANE WALL LOUVERS

2-8.01. General:

1. Provide high-performance hurricane wall louvers where indicated.

2. The louvers shall be of the stationary type, with horizontal drainable blades within a 6-inch-deep louver frame.

2-8.02. Fabrication:

1. Design: Extruded aluminum, stationary louvers with horizontally mounted drainable blades.

a. Miami-Dade Notice of Acceptance Number: 20-1015.06.

2. Application: Miami-Dade Approved Product for use in open structures or installations where the enclosed space is designed to accommodate water infiltration (wet rooms). Open structure building envelope protection for single unit sizes up to 88 inches wide by 120-inches high (2236 mm by 3048 mm). Factory assembly.

3. Miami-Dade County Protocols Compliance:

   a. TAS-201 Large and Small Missile Impact Test.

   b. TAS-202 Uniform Static Air Pressure Test.

   c. TAS-203 Cyclic Wind Pressure Test – Maximum Design Pressure Rating +/- 120 psf (5.75 kPa).

4. Florida Building Code (FBC) High Velocity Hurricane Zones: Test Application Standard. (Pending).

5. Florida Product Approval #FL 12226.2.

6. Frame:

   a. Frame Depth: 6 inches (152 mm), nominal.

   d. Wall Thickness: 0.081 inch (2.1 mm), nominal.

   e. Material: Extruded aluminum, Alloy 6063-T6.

7. Blades:

   a. Style: Drainable, horizontally mounted.

   b. Wall Thickness: 0.081 inch (2.1 mm), nominal.

   c. Material: Extruded aluminum, Alloy 6063-T6.

8. Minimum Assembly Size: 12 inches wide by 12 inches high (305 mm x 305 mm).

9. Maximum factory assembly size 88” x 120” (2236 x 3048).

10. Maximum field assembly size. Unlimited width by 120” (3048) high.

11. Unlimited height by 88 (2236) width in vertical configuration.

12. Recycled Content: 18% post-consumer. 55% pre-consumer, post-industrial, total 73% by weight.

2-8.03. Performance Data:

1. Based on testing 48 inches x 48 inches (1,219 mm x 1,219 mm) size unit in accordance with AMCA 500.

2. Free Area: 57 percent, nominal.

3. Free Area Size: 9.08 square feet (0.84 m²).

4. Maximum Recommended Air Flow through Free Area: 1,023 fpm (5.20 m/s).

5. Air Flow: 9,289 cfm (4.38 m³/s).

6. Maximum Pressure Drop at 1,023 fpm): 0.20 inches w.g. (0.05 kPa).

Design Wind load: Incorporate structural supports required to withstand wind load of ±148 psf (7.08 kPa).

2-8.04. Louvers shall be factory engineered to withstand the specified seismic loads.

1. Minimum design loads shall be calculated to comply with ASCE – 7, or local requirements of Authority Having Jurisdiction (AHJ).

2.9 ACCESSORIES

2-9.01. Bird Screen:

1. Aluminum: Aluminum, 5/8 inches by 0.040 inch (16 mm by 1 mm), expanded and flattened.

2. Frame: Removable. Rewirable.

2-9.02. Insect Screens:

1. Aluminum: 18-16 mesh, mill finish, .011 inch (0.3 mm) wire.

2. Frame: Aluminum.

2-9.03. Extended Sills:

1. Extruded aluminum, Alloy 6063-T6. Minimum nominal thickness 0.060 inch (1.5 mm).

2-9.04. Finish:

1. Provide louvers with a **Kynar® 500**, or equal, finish.

2. The color of the louver shall be submitted for the Engineer's approval.

2-9.05. High-performance Hurricane Wall Louvers Manufacturer, or Equal

1. **Ruskin Model ELF6375DXD**

2. **Greenheck**

2.10 VIBRATION ISOLATORS

2-10.01. General:

1. Provide vibration control isolation all rotating equipment except electric motors.

2. Where rotating units are part of factory-assembled package units, such as a package air handling unit, provide the isolator under the unit casing.

2-10.02. Support suspended equipment by a combination of spring and fiberglass isolation hangers, incorporating minimum 2-inch thick neoprene jacketed fiberglass inserts in series with springs, encased in steel brackets.

2-10.03. Mount floor-mounted or platform-mounted built-up or package air handling units on structural steel or concrete bases with isolator springs and brackets.

2-10.04. Springs used in the vibration isolators shall have approximately one inch of deflection under load, and shall have a minimum additional travel of 50 percent between the design height and the solid height.

2-10.05. All isolation equipment shall be provided in strict compliance with the manufacturer's recommendations.

2-10.06. Pads:

1. For vibration isolation between HVAC equipment and supports and where indicated, provide 3/4-inch-thick rubber pads for full contact between equipment and support.

2. The pads shall be **Mason Industries**, **Super W Pads**, or equal.

2.11 TEMPERATURE AND EQUIPMENT CONTROL

2-11.01. General:

1. Design and provide a complete electric-electronic system of automatic temperature control as indicated.

2. The temperature control equipment and devices shall be furnished by **Johnson Controls**, **Honeywell**, or **Barber Colman**.

2-11.02. Wiring and Switches:

1. Provide wiring incidental to the temperature control system, including electrical interlock.

2. Furnish detailed wiring diagrams along with necessary supervision.

3. Provide control wiring (line voltage or low voltage) as required to complete the temperature control system (by interconnecting starters, thermostats, PE switches, relays, and like devices) in accordance with the requirements of Division 16.

4. Provide HOA switches in accordance with the requirements of Division 16.

5. Switches shall be UL-listed and of a type to meet the current and voltage requirements of the particular application.

2-11.03. Thermostats:

1. Room thermostats shall be of the digital type, provided with heating and cooling setpoints.

2. Adjustment shall be accomplished by pressing the thermostat UP or DOWN arrows.

3. Comfort Setpoints: adjustable from 66 to 80 degrees F.

4. Setback Setpoints: adjustable from 55 to 70 degrees F for heating setback; adjustable from 75 to 90 degrees F for cooling setback.

5. Automatic Setback Time Period:

   a. 7-day setback programming;

   b. up to 2 automatic setback comfort time periods per day;

   c. built-in setback override, adjustable from 10 minutes to 40 hours;

   d. 7-day electric time clock; and

   e. heat/cool/fan annunciators to indicate equipment operation and automatic heating/cooling changeover

6. The thermostats shall meet the Energy Conservation Standard approval where required by the State having jurisdiction over the Project.

7. Provide an insulating back where exterior wall mounting is indicated.

8. Provide guards for room thermostats installed in areas other than administrative offices or control rooms.

2-11.04. Relays:

1. Provide 2-position relays, capacity relays, sequencing relays, and other controls as necessary in order to provide a properly operating automatic control system.

2. Relays shall be UL-listed and of a type to meet the current and voltage requirements of the particular application.

2-11.05. Control Panels:

1. General:

a. Control panels shall be provided with relays, control switches, transformers, pilot lights, timers, time clocks, step controllers, gages, thermostats (unless otherwise indicated), and other accessories necessary for the particular system.

b. The panels shall be of aluminum construction with a baked enamel finish, and shall be provided with a hinged front door and locking handle.

c. Manual switches and direct-reading gauges shall be flush-mounted on the front face, and identified by engraved and riveted Bakelite or laminated plastic nameplates with white letters on black background.

d. Manual switches shall be of heavy-duty, oil-tight construction.

2-11.06. Wiring:

a. Control devices shall be prewired internally.

b. Wires leaving the panel shall be terminated at separate numbered terminal strips.

c. Provide individual connectors for every item of mechanical equipment, integral and remote pilot lights, and other devices described for each panel.

d. Power and control circuit requirements shall be as indicated on the Electrical Drawings.

e. Identify wires by color coding or numerical tags at both ends.

f. Wire each control device to the terminal strip without splices.

g. Provide integral circuit protection for panel-mounted control devices.

h. Wire each panel with a single 20-amp, 120-volt, ac feeder in accordance with the requirements of Division 16.

2-11.07. Diagrams:

a. Secure the panel electrical wiring diagrams to the inside of the panel door.

2.12 PAINTING

2-12.01. Painting of the equipment and materials shall comply with the requirements of Section 09940 – Protective Coating.

2-12.02. Touch-Ups

1. Touch up factory-painted surfaces that are rusted or scratched.

2. Clean finishes to be touched up to bright metal, prime with a corrosion inhibitor, and finish with a coating to match the original finish.

PART 3 -- EXECUTION

3.1 GENERAL

3-1.01. Openings - New Construction

1. Provide necessary openings in walls, floors and roofs for the passage of heating and ventilating equipment in the buildings.

2. Openings shall be as indicated or as required to provide passage for heating and ventilating Work.

3. Provide hanger and support inserts into masonry or structural steel as required for proper completion of the Work.

3-1.02. Openings - Existing Construction

1. Provide openings required in the existing construction for piping and equipment that are not specifically indicated.

2. Openings shall be cut in a neat and orderly manner with as little damage to existing structures as possible.

3. The patching of openings that have been cut shall match the existing construction.

4. Provide hangers and supporting members installed in the existing masonry or structural steel as required for proper completion of the Work.

3.2 BALANCING AND TESTING

3-2.01. Testing of all equipment and systems shall be performed and completed by Contractor at their own cost.

3-2.02. Balancing Subcontractor

1. After the installation Work has been completed, the Contractor shall provide the services of an independent balancing subcontractor who shall perform necessary adjustments of volume dampers, volume controllers, exhaust blowers, exhaust fans, and supply registers.

2. The balancing subcontractor shall:

   a. Have at least 5 years of balancing experience, and experience in at least 5 projects of the Project type;

   b. Not be associated with any firms doing engineering or construction work in HVAC and/or Plumbing;

   c. Use the balancing methods approved by the Associated Air Balance Council; and,

d. Send a copy of all correspondence and reports, as they are written, pertaining to this project, directly to the Engineer.

3-2.03. The Contractor shall:

1. 15011 Submit to the Engineer an experience resume and project resume for approval of the balancing subcontractor;

2. Demonstrate to the Owner, in an extensive operating test covering every component of the installation, that the entire heating, ventilating and air conditioning system meets the indicated requirements and is ready for continuous, satisfactory operation; and,

3. Make repairs and revisions as necessary to make the system operative, as part of the Contract.

3.3 VIBRATION ISOLATORS

3-3.01. Install isolation equipment in strict compliance with the manufacturer's recommendations.

3.4 TEMPERATURE AND EQUIPMENT CONTROL

3-4.01. After completion of the installation, use trained personnel to adjust thermostats and sensors in the motors and other provided equipment, and place them in complete operating condition subject to the approval of the Engineer.

3-4.02. Instruct the operating personnel in the operation of the control system.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 15052

EXPOSED PIPING INSTALLATION

PART 1 - GENERAL

1-1. SCOPE

1-1.01. CONTRACTOR shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to install and test all exposed piping, fittings, and specials. The Work includes the following:

1. All types and sizes of exposed piping, except where exposed piping installations are specified under other Sections or other contracts.
2. Unless otherwise shown or specified, this Section includes all piping beginning at the outside face of structures or structure foundations and extending into the structure. Piping embedded in concrete within a structure or foundation shall be considered as exposed and is included herein. Piping that is permanently or intermittently submerged, or installed in sub-aqueous environments, is considered as exposed and is included in this Section.
3. Work on or affecting existing exposed piping.
4. Installation of all jointing and gasket materials, specials, flexible couplings, mechanical couplings, harnessed and flanged adapters, sleeves, tie rods, and all Work required for a complete exposed piping installation.
5. Supports, restraints, and other anchors.
6. Field quality control, including testing.
7. Cleaning and disinfecting.
8. Incorporation of valves, meters, and special items shown or specified into the piping systems per the Contract Documents and as required.

1-2. GENERAL

1-2.01. Review installation procedures under this and other Sections and coordinate installation of items that must be installed with or before exposed piping Work.

1-2.02. Coordinate with appropriate piping Sections of Division 15, Mechanical.

1-2.03. Related Sections.

Title
Section 09940, Protective Coatings.
Section 15094, Pipe Supports.

1-3. REFERENCES

1-3.01. Standards referenced in this Section are:

1-4. SUBMITTALS

The CONTRACTOR shall submit the following:

1-4.01. Shop Drawings:

1. Detailed drawings in plan and, as applicable, section.
2. Details of piping, valves, supports, accessories, specials, joints, harnessing, and main anchor supports, and connections to existing piping, structures, equipment, and appurtenances.
3. Laying schedules for concrete pipe and piping with restrained joints.

1-4.02. Testing Plans, Procedures, and Testing Limitations.

1. Submit description of proposed testing methods, procedures, and apparatus, and obtain ENGINEER's approval prior to testing.

1-4.03. Certificates:

1. Submit a certificate signed by manufacturer of each product certifying product conforms to applicable referenced standards.
2. Welder's Certificate to comply with Paragraph 3.1.E.7.c.
3. Source Quality Control Submittals:
    a. Submit copies of testing report for each test.
4. Site Quality Control Reports:
    a. Submit copies of testing report for each test.

1-4.04. Closeout Submittals:

1. Record Documentation:
    a. Maintain accurate and up-to-date record documents showing field and Shop Drawing modifications. Record documents for exposed piping Work shall show actual location of all piping and appurtenances on a copy of the Drawings, unless otherwise approved by ENGINEER.
    b. Include section drawings with exposed piping record documents when the Contract Documents include section Drawings.
    c. Conform to Section 01782, Record Documents.

1-5. DELIVERY, STORAGE AND HANDLING

1-5.01. Delivery:

1. Deliver products to Site to ensure uninterrupted progress of the Work.

2. Upon delivery, inspect pipe and appurtenances for cracked, gouged, chipped, dented, and other damage and immediately remove damaged products from Site.
3. Conform to requirements of Section 01651, Transportation and Handling of Materials and Equipment.

1-5.02. Storage:

1. Store products for convenient access for inspection and identification. Store products off the ground using pallets, platforms, or other supports. Protect packaged products from corrosion and deterioration.
2. Pipe and fittings other than thermoplastic materials may be stored outdoors without cover. Thermoplastic pipe and fittings stored outdoors shall be covered.
3. Conform to requirements of Section 01661, Storage and Protection of Products.

1-5.03. Handling:

1. Handle pipe, fittings, specials, and accessories carefully with approved handling devices. Do not drop or roll material of delivery vehicles. Do not otherwise drop, roll, or skid piping.
2. Avoid unnecessary handling of pipe.
3. Keep pipe interiors free of dirt and foreign matter.
4. Protect interior linings and exterior coatings of pipe and fittings from damage. Replace pipe and fittings with damaged lining regardless of cause of damage. Repair damaged coatings.
5. Conform to requirements of Section 01651, Transportation and Handling of Materials.

PART 2 - PRODUCTS

2-1. MATERIALS

2-1.01. Piping materials are specified in the Exposed Piping Schedule at the end of this section. Piping materials shall conform to Specification for each type of pipe and piping appurtenances in applicable sections of Division 15.

2-1.02. Markings and Identification:

1. Pipe Markings:
   a. Clearly mark each piece of pipe or fitting with a designation conforming to that shown on the approved Shop Drawings.
   b. Manufacturer shall cast or paint on each length of pipe and each fitting the pipe material, diameter, and pressure or thickness class.

2-1.03. Provide products that comply with Section 15094, Pipe Supports.

PART 3 - EXECUTION

3-1. INSPECTION

3-1.01. Examine conditions under which the Work is to be installed and notify ENGINEER in writing of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3-2. INSTALLATION

3-2.01. General:

1. Install piping as shown, specified and as recommended by the pipe and fittings manufacturer.
2. If there is a conflict between manufacturer's recommendations and the Contract Documents, request in writing instructions from ENGINEER before proceeding.
3. Provide pipe manufacturer’s installation specialist at Site as specified on this Section.

3-2.02. Temporary Blind Flanges, Plugs, Caps, and Bulkheads:

1. Temporarily plug installed pipe at the end of each day of work or other interruption of pipe installation to prevent entry of animals, liquids, and persons into pipe, and entrance or insertion of deleterious materials into pipe.
2. Install standard plugs in all bells at dead ends, tees, and crosses. Cap all spigot and plain ends.
3. Fully secure and block blind flanges, plugs, caps, and bulkheads installed for testing, designed to withstand specified test pressure.
4. Where plugging is required for phasing of Work or subsequent connection of piping, install watertight, permanent type blind flanges, plugs, caps, or bulkhead acceptable to ENGINEER.

3-2.03. Piping Installation:

1. Conform to manufacturer’s instructions and requirements of standards and manuals listed in this Section, as applicable:
2. Install straight runs true to line and elevation.
3. Install vertical pipe truly plumb in all directions.
4. Install piping parallel or perpendicular to walls of structures. Piping at angles and 45 degree runs across corners of structures will not be accepted unless specifically shown on the Contract Documents or approved by the ENGINEER.
5. Install small diameter piping generally as shown when specific locations and elevations are not indicated. Locate such piping as required to avoid ducts, equipment, beams, and other obstructions.

6. Install piping to leave all corridors, walkways, work areas, and similar spaces unobstructed. Unless otherwise approved by ENGINEER provide a minimum headroom clearance under piping and pipe supports of 7.5 feet. Clearances beneath piping shall be measured from the outermost edge of piping, flanges or other type of joint that extends beyond the nominal outside diameter of piping.
7. Protect and keep clean interiors, fittings, and valves of pipe that will convey potable water, chemicals, and other pipe designated by ENGINEER.
8. Cutting: Cut pipe from measurements verified at Site. Field cut pipe, where required, with a machine specially designed for cutting type of pipe being installed. Make cuts carefully without damage to pipe, coating, or lining, and with a smooth end at right angles to axis of pipe. Cut ends of push-on joint type pipe shall be tapered and sharp edges filed off smooth. Do not flame-cut pipe.

3-2.04. Jointing Pipe:

1. General:
    a. Make joints in accordance with pipe manufacturer's recommendations and Contract Documents.
    b. Cut piping accurately and squarely and install without forcing or springing.
    c. Ream out pipes and tubing to full inside diameter after cutting. Remove all sharp edges on end cuts.
    d. Remove all cuttings and foreign matter from inside of pipe and tubing before installation. Thoroughly clean all pipe, fittings, valves, specials, and accessories before installing.
2. Thermoplastic Pipe Joints – Not Used.

3-2.05. Closures:

1. Provide closure pieces, such as blind flanges and caps, shown or required to complete the Work.

3-3. WORK AFFECTING EXISTING PIPING

3-3.01. Locations of existing piping shown on Drawings is approximate. Determine the true location of existing piping to which connections are to be made, crossed, and that could be disturbed, and determine location of other facilities that could be affected by the Work.

3-3.02. When taking existing pipelines out of service conform to Section 01310 Project Coordination requirements.

3-3.03. Work on Existing Pipelines:

1. Cut or tap pipes as shown or required with machines and tools specifically designed for cutting or tapping pipelines.
2. Install temporary plugs to prevent entry of mud, dirt, water, and debris into pipe.
3. Provide necessary adapters, sleeves, fittings, pipe, and appurtenances required to

complete the Work.

4. Conform to applicable requirements of Section 01310, Project Coordination.

3-4. PAINTING

3-4.01. Field painting shall conform to Section 09940 Protective Coatings.

3-5. FIELD QUALITY CONTROL

3-5.01. Testing, General:

1. Test all piping, except as exempted in the Exposed Piping Schedule.
2. Notification:
    a. Notify ENGINEER at least 48 hours prior to testing.
    b. When authorities having jurisdiction are to witness tests, notify ENGINEER and authorities having jurisdiction in writing at least 48 hours in advance of testing.
3. Conduct all tests in presence of ENGINEER.
4. Remove or protect pipeline-mounted devices that could be damaged by testing.
5. Provide all apparatus and services required for testing, including:
    a. Test pumps, compressors, hoses, calibrated gages, meters, test containers, valves, fittings, and temporary pumping systems required to maintain OWNER's operations.
    b. Temporary bulkheads, bracing, blocking, and thrust restraints.
6. Provide air if an air test is required, power if pumping is required, and gases if gases are required.
7. Unless otherwise specified, OWNER will provide fluid required for hydrostatic testing. CONTRACTOR shall provide means to convey fluid for hydrostatic testing into the pipe being tested. CONTRACTOR shall provide fluid for other types of testing required.
8. Repair observed leaks and repair pipe that fails to meet acceptance criteria. Retest after repair.

9. Unless otherwise specified, testing shall include existing piping systems that connect with new piping system. Test existing pipe to nearest valve. Piping not installed by CONTRACTOR and that fails the test shall be repaired upon authorization of ENGINEER or OWNER. Repair of existing piping will be paid as extra work unless otherwise specified.

3-5.02. Test Schedule:

1. Refer to the Exposed Piping Schedule for type of test required and required test pressure.
2. Unless otherwise specified, the required test pressures are at lowest elevation of pipeline segment being tested.

3. For piping not listed in Exposed Piping Schedule:
    a. Hydrostatically test pipe that will convey liquid at a pressure greater than five psig. Provide process air pipe test for pipe that will convey air or gas under pressure or vacuum, except chlorine gas, which requires a separate test.
    b. Disinfect for bacteriological testing piping that conveys potable water.
4. Test Pressure:
    a. Use test pressures listed in Exposed Piping Schedule.
    b. If test pressure is not listed in Exposed Piping Schedule, or if a test is required for piping not listed in the Exposed Piping Schedule, test pressure will be determined by the ENGINEER based on the maximum anticipated sustained operating pressure and the methods described in the applicable ANSI/AWWA manual or standard that applies to the piping system.

3-5.03. Hydrostatic Testing:

1. Fill pipeline slowly to minimize air entrapment and surge pressures. Fill rate shall not exceed one foot of pipe length per second in the pipe being tested.
2. Expel air from pipe as required. Obtain approval of ENGINEER prior to tapping pipe for expelling air.
3. Examine joints and valves and make repairs to eliminate visible leakage.
4. After specified wetting period, add fluid as required to pressurize line to required test pressure. Maintain test pressure for a stabilization period of ten minutes before beginning test.
5. Timed test period shall not begin until after the pipe has been filled, exposed to the required wetting period, air has been expelled, and pressure stabilized.
6. Timed Test Period: After the stabilization period, maintain test pressure for at least two hours. During timed testing period, add fluid as required to maintain pressure within five psig of required test pressure. For HDPE pipe, after three hour expansion phase, reduce test pressure by ten psig and do not add liquid. The test pressure shall then remain steady for one hour, indicating no leakage.
7. Pump from a test container to maintain test pressure. Measure volume of fluid pumped from test container and record on test report. Record pressure at test pump at fifteen-minute intervals for duration of test.

3-5.04. Allowable Leakage Rates: Leakage is defined as the quantity of fluid supplied to pipe segment being tested to maintain pressure within five (5) psi of the test pressure during timed test period. No Leakage shall be allowed for pipes with flanged, welded, fused, threaded, soldered, or brazed joints.

3-5.05. Test duration shall be at least two hours.

3-5.06. Bacteriological Testing:

1. Bacteriological testing for potable water lines, finished water lines, and other

piping per Exposed Piping Schedule, is specified in Article 3.6 of this Section.

3-6. CLEANING AND DISINFECTION

3-6.01. Cleaning, General: Clean pipe systems as follows:

1. Thoroughly clean all piping, including flushing with water, dry air, or inert gas as required, in a manner approved by ENGINEER, prior to placing in service. Flush chlorine solution and sodium hypochlorite piping with water.
2. Piping 24-inch diameter and larger shall be inspected from inside and debris, dirt and foreign matter removed.
3. For piping that requires disinfection and has not been kept clean during storage or installation, swab each section individually before installation with a five percent hypochlorite solution.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 15060

DUCTILE IRON PIPE AND FITTINGS

42-INCH DIAMETER AND SMALLER

PART 1 – GENERAL

1-1. DESCRIPTION

1-1.01. Scope: The CONTRACTOR shall provide and install ductile iron pipe of the sizes 42-inch diameter and smaller and in the locations shown on the DRAWINGS and as specified herein.

1-1.02. Pipe shall be designed for a design working pressure of 50 psi with an additional surge pressure of 125 psi for a total working plus surge pressure of 175 psi.

1-2. QUALITY ASSURANCE

1-2.01. The pipe and fittings shall be manufactured, constructed and installed in accordance with established industry practices and methods and shall comply with these SPECIFICATIONS as applicable. All WORK specified herein shall conform to or exceed the requirements of the latest edition of the applicable portions of the following standards:

1. Cement mortar lining for water: AWWA C104.
2. Rubber gasket joints: AWWA C111.
3. Ductile iron pipe thickness: AWWA C150
4. Ductile iron pipe centrifugally cast in metal or sand lined molds: AWWA C151.
5. Ductile iron pipe flanges: ANSI B 16.1 and AWWA C115.
6. Ductile iron compact fittings: AWWA C153.
7. Ductile iron fittings: AWWA C110.
8. AWWA C600 Standard for Installation of Ductile Iron Water Mains and Appurtenances.
9. Drinking water treatment chemicals -Health effects: NSF No. 60.
10. Drinking water system components -Health effects: NSF No. 61.

1-2.02. Qualifications: All ductile iron pipe and cast iron fittings shall be furnished by SUPPLIERS who are fully experienced, reputable, and qualified in the manufacture of the materials to be furnished.

1-2.03. SUPPLIER (manufacturer): Pipe shall be as manufactured by the American Cast Iron Pipe Company, U.S. Pipe and Foundry Company or McWane Cast Iron Pipe Co., or equal.

1-3. SUBMITTALS

1-3.01. SHOP DRAWINGS: The CONTRACTOR shall submit SHOP DRAWINGS of pipe and fittings in accordance with the requirements of the CONTRACT DOCUMENTS, the requirements of AWWA C110, C150, C151, and the following supplemental requirements as applicable:

1. Certified Dimensional Drawings of all pipe, specials, and fittings.

2. Detailed and certified calculations of required joint restraint length.

1-3.02. Certifications: For pipe of all sizes the CONTRACTOR shall furnish a certified affidavit of compliance for all pipe and other products or materials furnished under this Section of the SPECIFICATIONS, as specified in ANSI/AWWA C105, C110, C150, and C151; respectively, and the following supplemental requirements:

1. Physical and chemical properties of all ductile iron.

2. Results of previously performed proof of design tests demonstrating that the proposed restrained joint arrangement can transmit the required forces.

3. Hydrostatic test reports.

4. Results of shop tests.

5. The SUPPLIER of the pipe shall submit through the CONTRACTOR an affidavit that the pipe, fittings and other products or materials furnished comply with all applicable provisions of these SPECIFICATIONS including all applicable AWWA standards.

1-3.03. All expenses incurred in making samples for certification of tests shall be borne by the CONTRACTOR.

1-4. DELIVERY, STORAGE AND HANDLING

1-4.01. All pipe shall be shipped and stored at the PROJECT site with wood lagging between pipes such that pipes do not make contact with one another.

1-4.02. The CONTRACTOR shall exercise extra care when handling lined pipe. Damage to the lining will render it unfit for use and shall require replacement.

PART 2 - PRODUCTS

2-1. MATERIALS

2-1.01. Ductile Iron Pipe shall conform to ANSI A21.51 and AWWA C151. The pipe thickness shall be in accordance with AWWA C150 and shall meet the following minimum requirements:

1. The minimum thickness of ductile iron pipe shall be:

   1.1. For buried pipe 20 inches in diameter and smaller: Class 350

   1.2. For pipe with flanges: Class 53. (Special Class)

2. Pipe shall be supplied in lengths not in excess of 20 feet having rubber-ring type push-on joints, standard mechanical joints or restrained joints where required for underground piping, and flanged joints piping for all above ground piping as shown on the DRAWINGS.

3. Coatings and Linings shall be in accordance with the following:

   3.1. The exterior of ductile iron pipe and fittings shall be:

      3.1.1. Buried pipe and fittings: Factory applied bituminous coating of coal tar varnish or asphalt base paint, one-mil thick.

      3.1.2. Buried ductile iron pipe shall be encased with polyethylene sleeves as specified in AWWA C105 minimum 8 mils thick. For pipe 16-inches through 42-inches in diameter, two 8-mil layers shall be provided. Only prefabricated sleeves secured by 4-inch polyethylene tape will be allowed. Polyethylene sleeves shall be blue in color, manufactured with ultraviolet inhibitors and installed by Method A in AWWA C105.

      3.1.3. Exposed above ground pipe and fittings shall be coated in accordance with Section 09940.

      3.1.4. The interior of ductile iron pipe and fittings shall be cement lined in accordance with ANSI A21.4 and AWWA C104.

2-1.02. Fittings: All ductile iron pipe fittings shall be rated for a minimum of 350 psi for pipe sizes 20-inches and smaller and in accordance with AWWA C110. All flanged fittings shall be Class 125 (ANSI B16.1) unless otherwise specifically noted.

2-1.03. Joints:

1. General: Joints in "runs" of aboveground piping shall be flanged. Joints in "runs" of buried piping shall be of the push-on or mechanical-joint type per AWWA C111

except where flanged joints are required to connect to valves, meters, and other equipment.

2. Flanges:

   2.1. All flanged fittings shall be rated for a minimum of 350 psi for pipe sizes 20-inches and smaller and in accordance with AWWA C110. All flanges shall be Class 125 (ANSI B16.1) unless otherwise specifically noted. Flanges shall be long-hub type screwed tightly on pipe by machine at the foundry prior to facing and drilling. Flange faces shall be coated with rust inhibitor immediately after facing and drilling. Field assembled screwed on flanges are prohibited.

   2.2. Gaskets: Gaskets shall be beaded ring-type, 1/4-inch thick; meeting the requirements of AWWA C111, rated for potable water service and suitable for service with chloramines. Gaskets shall be American "Tomseal", U.S. Pipe "Flange-Tyte" or approved equal.

   2.3. Bolts and Nuts for Flanges: Bolts and nuts for flanges shall be heavy head carbon steel, ASTM A 307, Grade B, "American Standard, Heavy". Bolts used in flange insulation kits shall conform to ASTM B193, Grade B7. Bolts and nuts shall comply with ASTM A 194, Grade 2H. All bolts and nuts shall be cadmium or zinc coated or galvanized.

3. Mechanical and push-on joints:

   3.1. Mechanical Joints: Jointing materials for mechanical joints shall be provided by the pipe and fitting SUPPLIER. Materials assembly and bolting shall be in strict accordance with ANSI/AWWA C111 and ANSI/AWWA C153, latest revisions. Tee head bolts and nuts for mechanical joints shall be manufactured of CORTEN, high strength, low alloy, corrosion resistant steel as manufactured by NSS Industries, Plymouth, Michigan or an approved equal.

   3.2. Single seal gasket push on type joints shall conform to the requirements of ANSI A21.1 1 and shall be "Tyton", "Fastite", "Super Bell Tite", "Altite", or approved equal.

4. Restrained Joints for buried pipe: Restrained joints shall be provided for all buried piping systems. Pipe joints and fittings shall be restrained as follows:

   4.1. Manufactured restrained joints shall be: Flex-Ring or Lok-Ring manufactured by the American Cast Iron Pipe Company; Lok-tyte or, Tr-Flex type manufactured by the United States Pipe Company or an equal approved by the ENGINEER. Joints shall be SUPPLIER'S (manufacturer's) standard specifically modified push-on type joints with joint restraint provided by ductile iron glands located

behind welded on retainer rings joined together by corrosion resistant, high strength steel tee head bolts and nuts or with joint restraint provided by a welded-on retainer ring and a split flexible ring or locking ring assembled behind the retainer ring. Restrained joint pipe and fittings shall be ductile iron only and shall comply with applicable portions of this SPECIFICATION. Manufactured restrained joints shall be capable of deflection after assembly. Deflection shall not exceed 75 percent of the SUPPLIER'S (manufacturer's) recommendations. Tee head bolts and nuts for restrained joints shall be manufactured of CORTEN, high strength, low alloy, corrosion resistant steel as manufactured by NSS Industries, Plymouth, Michigan, or an equal approved by the ENGINEER. Restrained joints utilizing tie rods, or retainer glands and set screws will not be allowed. Field Welding or grooving of the restrained joint or components will not be acceptable.

5. Gaskets: Gaskets shall be suitable for service with chloramines. Gaskets shall have plain tips unless otherwise specified and shall be fabricated and tested in accordance with AWWA C111.

6. Flanged Dismantling Joint:

   6.1. General: The CONTRACTOR shall furnish and install where required or where shown on the DRAWINGS, NSF-61 certified manufactured flanged dismantling joints for use in potable water piping.

   6.2. Rated Pressure: The entire dismantling joint unit shall be rated for working pressure plus surge pressure as a minimum.

   6.3. Construction: Coupling bodies shall be fabricated from steel, ASTM A 512 - Cold-Drawn Butt-Weld Carbon Steel Mechanical Tubing or A 513 - Electric-Resistance Welded Carbon and Alloy Steel Mechanical Tubing. Provide flanges in conformance with AWWA C207. The body shall be at least the same wall thickness as the pipe to which the coupling is connected, but not less than 1/4 inch thick. If the strength of the body material is less than the strength of the pipe material, the thickness of the middle ring shall be increased to have the same strength as the pipe. The follower flange shall be fabricated from steel, ASTM A 576 - Steel Bars, Carbon, Hot Wrought, Special Quality or AISI C1012.

   6.4. Coatings: Shop applied fusion bonded epoxy coating, NSF-61 certified for use in potable water systems.

   6.5. Bolts, Nuts and Washers: Provide bolts and nuts per AWWA C111/A21.11. Provide washers sized to mating bolt or rod and adequate to preserve the corrosion resistance of epoxy coated surfaces.

6.6. Deflections: Joint deflection shall be limited to 75% of the SUPPLIER'S (manufacturer's) recommended maximum.

6.7. Manufacturer: CONTRACTOR to supply dismantling joints model 975 as manufactured by Smith-Blair, Style 131 as manufactured by Dresser Industries, model 309 as manufactured by JCM Industries, or an ENGINEER approved equal.

7. Flanged Expansion Joints for above ground piping:

7.1. General: The CONTRACTOR shall furnish a restrained NSF No. 61 certified, flanged, single arch rubber expansion joint on each pump discharge pipe, as shown in the DRAWINGS.

7.2. Materials of Construction: The rubber expansion joint shall be NSF No. 61 certified made of EPDM tube and cover.

7.3. Flanges: The rubber expansion joint shall be provided with flanged connections per the requirements specified herein, under section 2.01.C.2

7.4. Restraint: The rubber expansion joint coupling shall be provided with thrust lugs and threaded tie rods, as required for the operating conditions, and indicated in the DRAWINGS.

7.5. Misalignment: Pipe misalignment may occur at this type of joints, but such movement shall never exceed 75% of the manufacturer’s recommended maximum allowable compression, extension, or deflection.

7.6. Manufacturer: CONTRACTOR to supply Garlock Style 206 Sure-Tec® NSF-61 EPDM expansion joint, Proco® Series 231 NSF-61 EPDM expansion joint, or ENGINEER approved equal.

PART 3 - EXECUTION

3-1. INSPECTION AND TESTING

3-1.01. All pipe shall be inspected and tested at the foundry.

3-1.02. The OWNER shall have the right to have any or all piping, fittings or special castings inspected and tested by an independent testing agency at the foundry or elsewhere. Such inspection and testing will be at the OWNER'S expense.

3-1.03. The CONTRACTOR shall mark as rejected and immediately remove from the PROJECT site, all pipe lengths showing a crack, damaged lining, or receiving a severe blow that may cause an incipient fracture, even though no such fracture can be seen.

3-2. INSTALLATION

3-2.01. The CONTRACTOR shall provide and install all required piping and accessories in strict accordance with the requirements of AWWA C600, CONTRACT DOCUMENTS and manufacturer's recommendations. The most stringent recommendations shall apply.

1. Push-on joints: SUPPLIER'S Recommendation and AWWA C600.

2. Bolted joints: SUPPLIER'S Recommendations and AWWA C600.

3. Flanged joints:

   3.1. Bolt holes of flanges shall straddle the horizontal and vertical centerlines of the pipe. The CONTRACTOR shall clean flanges by wire brushing before installing flanged fittings. The CONTRACTOR shall clean flange bolts and nuts by wire brushing, lubricate bolts with non-seizing lubricant.

   3.2. The CONTRACTOR shall insert the nuts and bolts (or studs) finger tighten, and progressively tighten diametrically opposite bolts uniformly around the flange to the proper tension.

   3.3. The CONTRACTOR shall carefully tighten joints to prevent undue strain upon valves, and other equipment.

   3.4. If flanges leak under pressure testing, the CONTRACTOR shall loosen or remove the nuts and bolts, reset or replace the gasket, reinstall or retighten the bolts and nuts, and retest the joints. Joints shall be watertight.

3-2.02. Fabrication:

1. Tapped connections:

   1.1. The CONTRACTOR shall make all tapped connections as shown on the DRAWINGS or as directed by the ENGINEER.

   1.2. The CONTRACTOR shall make all connections watertight and of adequate strength to prevent pullout.

   1.3. The CONTRACTOR shall drill and tap normal to the longitudinal axis of the pipe.

   1.4. The maximum sizes of taps in pipes and fittings without bosses shall not exceed the sizes listed in the appendix of ANSI A 21.51 based on two full threads.

2. Cutting:

2.1. The CONTRACTOR shall perform all cutting with machines having rolling wheel cutters or knives designed to cut ductile iron. The use of a hammer and chisel to cut pipe is prohibited.

2.2. The CONTRACTOR shall after cutting, examine all cut ends for possible cracks and advise the ENGINEER for observation.

2.3. The CONTRACTOR shall carefully 45 degree chamfer all cut ends to be used with push-on joints to prevent damage to gaskets when pipe is installed.

3-2.03. Pipe Deflection:

1. Push-on Mechanical Joints and Flexible Joints: The maximum deflection in any direction shall not exceed 75 percent of the SUPPLIER'S (manufacturer's) instructions and recommendations.

3-3. TESTING

After all piping has been placed, each run shall be tested between valves by the CONTRACTOR to the Field Test Pressure stated on the CONTRACT DRAWINGS. A low pressure test shall be conducted for a period of not less than four hours at a pressure of approximately 50 percent of the Field Test Pressure. The allowable leakage shall be one-half of the lesser amount as determined by the equations of Section 4.2.2 Allowable Leakage of AWWA C600. Upon successful completion of the low pressure test the pipe segment shall be tested to the full Field Test Pressure in accordance with AWWA C600. The observed leakage under full Field Test Pressure shall not exceed the lesser amount as determined by the equations of Section 4.2.2 Allowable Leakage of AWWA C600. The CONTRACTOR shall furnish all necessary meters, gauges, bulkheads, and other materials and appliances necessary to conduct the tests as herein required.

Every precaution must be taken to remove, valve-off or otherwise protect delicate control equipment in or attached to pipelines, to prevent damage or injury thereto.

3-4. DISINFECTION

After water lines are tested hydrostatically and immediately prior to being accepted for SUBSTANTIAL COMPLETION, disinfect pipes in accordance with AWWA C651 except as modified herein. Disinfection shall be done using calcium hypochlorite solution, liquid chlorine, or chlorine solution of strength to achieve not less than 50 parts per million of free chlorine in the pipeline. Fill the line with water and maintain line under pressure of not less than ten (10) pounds per square inch for not less than 48 hours. During this period when the line is under pressure, open and close all valves within the section being tested, as required to affect

disinfection of valve working parts. Following this period, flush the line clean for biological testing.

Any remaining superchlorinated water shall be neutralized using sodium thiosulfate or other acceptable neutralizing agent before allowing controlled flushing to surface ditches. Discharges shall be controlled in accordance with the permitted stormwater pollution prevention plan requirements with turbidity barriers, monitoring, and other acceptable measures. After flushing bacteriological sampling will then be performed. The CONTRACTOR will be required to submit a complete testing, disinfection and flushing plan for review and approval prior to the performance of any of these activities.

Repeat the disinfection process if biological testing shows unsatisfactory samples. All procedures shall be in conformance with the General Requirements. No cross-connection between the water mains and any pipe which has not been disinfected, shall be permitted. The CONTRACTOR shall furnish and install blind flanges or shall otherwise plug outlets for disinfection purposes.

3-5. WATER FOR USE IN THE TESTING AND DISINFECTION

The CONTRACTOR will be responsible to provide the water required for all pressure testing, flushing, and disinfection activities for this PROJECT.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 15091

MISCELLANEOUS BALL VALVES

PART 1 - GENERAL

1-1. SCOPE.

1-1.01. This section covers the furnishing of manually operated or remote activated two position (open-close) ball valves as specified herein.

Miscellaneous ball valves shall be provided where AWWA type ball valves are not required.

Piping, pipe supports, insulation, and accessories that are not an integral part of the valves or are not specified herein are covered in other sections.

1-2. GENERAL.

1-2.01. General Equipment Stipulations. The General Equipment Stipulations shall apply to all equipment and materials furnished under this section. If the requirements in this section are different from those in Section 01610 General Equipment Stipulations, the requirements in the section shall take precedence.

1-2.02. Permanent Number Tags. Tags shall be in accordance with Section 01615 - Equipment and Valve Identification.

1-3. SUBMITTALS.

1-3.01. Complete drawings, details, and specifications covering the valves and their appurtenances shall be submitted in accordance with the Submittals section. Included in the submittal shall be drawings by the valve manufacturer to indicate the position of the valve actuator and valve shaft.

1-4. DELIVERY, STORAGE, AND HANDLING.

1-4.01. Shipping shall be in accordance with the Shipping section. Handling and storage shall be in accordance with Section 01614 - Product Storage and Handling Requirements.

PART 2 - PRODUCTS

2-1. CONSTRUCTION.

2-1.01. Ball valves shown on the drawing, but not specified herein, shall be selected to match piping material they are installed in.

2-1.02. Valves Type VB-1.

VB CAV shutoff valve. 2 inch and smaller	Rating	Minimum 600 psig nonshock CWP
	Code	MSS SP-110
	Type	In-line, two piece, end entry, full port
	Body/Bonnet	ASTM B584–C84400 bronze
	Trim	
	Seat	Reinforced Teflon
	Ball	Brass, or chrome plated brass
	Stem	Brass or bronze
	Thrust Washer	Reinforced Teflon
	Stem Seal	Teflon or Viton
	End Connection	Threaded End
	Temp. Limitations	-20 to 400°F [-29 to 204°C]
	Valve Operator	Lever
	Manufacturers	Conbraco Industries "Apollo 77-100 Series"; or approved equal

2-1.03. Valves Type VB-10 - Not Used.

2-1.04. Valves Type VB-11 - Not Used.

2-1.05. Length Tolerance. Unless otherwise specified, the actual length of valves shall be within plus or minus 1/16 inch [1.6 mm] of the specified or theoretical length.

2-1.06. Shop Coatings. All ferrous metal surfaces of valves and accessories, both interior and exterior, shall be shop coated for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating.

Coating Materials	
Asphalt Varnish	Fed Spec TT-C-494.
Coal Tar Epoxy	High-build coal tar epoxy; Ameron "Amercoat 78HB Coal Tar Epoxy", Carboline "Bitumastic 300 M", Tnemec "46H-413 Hi-Build Tneme-Tar", or Sherwin-Williams "Hi-Mil Sher-Tar Epoxy".
Epoxy Enamel (for liquid service)	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline "Carboguard 891", or Tnemec "Series N140 Pota-Pox Plus".
Rust-Preventive Compound	As recommended by the manufacturer.

Surfaces To Be Coated

Unfinished Surfaces

Interior Surfaces

Liquid Service	Asphalt varnish (two coats) or epoxy enamel.
Exterior Surfaces of Valves To Be Buried, Submerged, or Installed in Manholes or Valve Vaults	Asphalt varnish or coal tar epoxy.
Exterior Surfaces of all other valves	Universal primer.

2-2. VALVE ACTUATORS.

2-2.01. Ball valves, except those which are equipped with power actuators or are designed for automatic operation, shall be provided with manual actuators. Unless otherwise specified or indicated on the CONTRACT DRAWINGS, each manual actuator shall be equipped with a lever operator.

2-3. ACCESSORIES.

2-3.01. If the drawings indicate the need for extension stems, stem guides; position indicator; floor boxes; valve boxes; or operating stands, refer to the Ball Valve Schedule.

PART 3 - EXECUTION

3-1. INSTALLATION.

3-1.01. Materials furnished under this section shall be installed in accordance with the Valve Installation section.

Notes:
(1) Abbreviations for the service are as indicated below:
RW Raw Water (Inside Wellhouse)

2) Abbreviations for installation types are as follows:

V20 Vault, depth 20 feet or less
V Vault, depth greater than 20 feet, actual depth of xx feet(Vxx)
IP In plant

3) Abbreviation for Ball Class as follows:
FP Full Port
SP Standard Port

4) If no design pressure data is specified, a shutoff pressure equal to the AWWA class of the valve shall be used in sizing the actuator.

5) If no maximum flow data is specified, a value of 35 fps shall be used in sizing the actuator.

6) Abbreviations for manual actuator types are as follows:

HW Handwheel
CW Chainwheel
WN Wrench Nut
L Lever

7) Abbreviations for limit switches on manual and cylinder operated valves.

EOT End of travel (open - close)
PSS Pump start - stop (two intermediate positions)
ELSCH See electrical schematics

SECTION 15093

CHECK VALVES

PART 1 - GENERAL

1-1. SCOPE

1-1.01. This section covers the furnishing of rubber flapper swing check valves as specified herein. Piping, pipe supports, and accessories that are not an integral part of these valves or are not specified herein are covered in other sections.

1-2. GENERAL

1-2.01. Equipment furnished under this section shall be fabricated and assembled in full conformity with DRAWINGS, SPECIFICATIONS, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by ENGINEER.

1-2.02. Valves shall be furnished with all necessary parts and accessories indicated on the DRAWINGS, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1-3. SUBMITTALS

1-3.01. Complete dimensional drawings, details, specifications, test certificates, parts list drawings, and operation and maintenance manuals covering the valves and their appurtenances shall be submitted in accordance with section 01330 Submittal Procedures.

PART 2 - PRODUCTS

2-1. RUBBER FLAPPER SWING CHECK VALVES

2-1.01. This section covers rubber flapper swing check valves for well pump discharge service.

A. Acceptable Products. The valve manufacturer shall have 5 years minimum experience in the manufacturing of rubber flapper swing check valves. The rubber flapper swing check valves shall be APCO Series 100, as manufactured by Valve & Primer Corporation, Schaumburg, Illinois; or equal.

B. Service Condition. The rubber flapper swing check valves shall be designed for a working pressure of not less than 250 psi. The rubber flapper swing check valves shall operate satisfactorily without excessive wear or flutter of the discs.

C. Materials. Materials used in the manufacture of the rubber flapper swing check valves shall be as follows:

Body and Cover	Ductile Iron ASTM A536 Gr.65-45-12 Class B

Flapper	Buna-N or other elastomers
Shop Coatings:	
Universal Primer (tie coat)	PPG Amercoat “Amercoat 385 Epoxy”, Carboline “Rustbond”, ICI Devoe “Devran 224HS”, Tnemec “Series 27 F.C. Typoxy”, or Sherwin-Williams “Dura Plate 235”.
Epoxy (NSF certified systems)	PPG Amercoat “Amerlock 400 High-Solids Epoxy Coating”, Carboline “Carboguard 891”, ICI Devoe “Bar-Rust 233H”, Tnemec “Series N140 Pota-Pox Plus”, or Sherwin-Williams “Dura Plate 235 NSF”; immersion service.
Rust-Preventive Compound	As recommended by manufacturer

E. Valve Construction. The valves shall be designed, manufactured and tested in accordance with ANSI/AWWA C508.

1. Valves shall be full body flanged type, with a domed access cover and only one moving part – the valve disc. Flange diameter and drilling shall conform to ANSI B16.1, Class 125.

2. The rubber flapper swing check valves shall have a heavily constructed ductile Iron body and cover. The body shall be long pattern design (not wafer) with integrally cast-on end flanges. The flapper shall be Buna-N having an O-ring seating edge and be internally reinforced with steel and nylon.

3. The flapper shall be captured between the body and the body cover in a manner to permit the flapper to flex from closed to full open position. The flapper shall be easily removed without the need to remove the valve from the pipeline. Rubber flapper swing check valves shall have full pipe size flow area. Seating surface shall be on a 45 degree angle requiring the flapper to travel only 35 degrees from closed to full open position for minimum head loss. Valves shall have non-slam closure characteristics.

4. The valve shall be proof of design cycle tested 1,000,000 times with no signs of wear or distortion to the valve disc or seat and shall remain drop tight at both high and low pressures. The test results shall be independently certified and submitted.

5. All valves shall be hydrostatically tested and seat tested to demonstrate zero leakage. The manufacturer shall provide test certificates.

2-2. SHOP PAINTING

2-2.01. All interior and exterior ferrous metal surfaces, except finished surfaces, bearing surfaces, and stainless steel components, of valves and accessories shall be shop painted for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the specified field painting.

The following surfaces shall be painted:

Unfinished Surfaces

Interior Surfaces	Epoxy
Exterior Surfaces	Universal primer.

Polished or Machined Surfaces

Flange Faces	Rust-preventive compound.
Other Surfaces	Epoxy.

2-2.02. Interior coatings shall comply with AWWA C550 and shall be free of holidays.

2-2.03. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils
Universal Primer	3 mils

PART 3 - EXECUTION

3-1. INSTALLATION

3-1.01. Materials furnished under this section will be installed in accordance with Valve Installation section.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 15094

PIPE SUPPORTS

PART 1 -- GENERAL

1-1. THE SUMMARY

1-1.01. The CONTRACTOR shall provide pipe supports, hangers, guides, and anchors, complete and in place, as indicated in accordance with the Contract Documents.

1-1.02. Where pipe support systems are not indicated on the Drawings, the CONTRACTOR shall design and provide the supports in accordance with this Section. The absence of pipe supports and details on the contract drawings does not relieve the Contractor of responsibility for sizing and providing the pipe supports.

1-1.03. The provisions of this Section shall apply to piping in Division 15.

1-1.04. The CONTRACTOR shall provide supporting devices for supporting and restraining piping as indicated on the Drawings. Where pipe support devices and/or restraining details are not indicated on the Drawings, it is the CONTRACTOR'S responsibility to develop the details necessary to support and restraint the piping for a complete and functional pipe support system.

1-2. CONTRACTOR SUBMITTALS

1-2.01. Furnish submittals in accordance with the requirements of Section 01300 – Submittal Procedures.

1-2.02. Shop Drawings.

1. Submit Shop Drawings which shall include the following information:

    a. Drawings of pipe supports, hangers, anchors, and guides.

    b. Pipe support schedule or layout indicating where the supports will be installed.

PART 2 -- PRODUCTS

2-1. GENERAL REQUIREMENTS

2-1.01. Code Compliance

1. Piping systems and pipe connections to equipment shall be properly anchored and supported in order to prevent undue deflection, vibration, and dislocation due to seismic events, line pressures, pipe weight, fluid weight, liquid movement, thermal changes, vibration, and probable forces applied during construction as well as stresses on piping, equipment, and structures.

2. Supports and parts thereof shall conform to the requirements of ASME B31.1 - Power Piping – Chapter II, Part 5 -Expansion, Flexibility, and Pipe Supporting

Element and design the pipe supporting elements in accordance with the rules of MSS SP-58 -Pipe Hangers and Supports – Materials, Design and Manufacture, except as supplemented or modified in this Section.

3. Supports for plumbing piping shall be in accordance with the latest edition of the applicable plumbing code or local administration requirements.

2-1.02. Structural Members

1. Wherever possible, pipes shall be supported from structural members.

2. Where it is necessary to frame structural members between existing members, such supplementary members shall be provided by the CONTRACTOR.

3. Supplementary members shall be in accordance with the requirements of the Building Code and the American Institute of Steel Construction, and shall be as acceptable to the ENGINEER.

2-1.03. Pipe Hangers

1. Pipe hangers shall be capable of supporting the pipe in operation, allowing free expansion and contraction of the piping and preventing excessive stress on equipment.

2. Hangers shall have a means of vertical adjustment after erection.

3. Hangers shall be designed to prevent becoming disengaged by any movement of the supported pipe.

4. Hangers subject to shock, seismic disturbances, or thrust imposed by the actuation of safety valves shall include hydraulic shock suppressors.

5. Hanger rods shall be subjected to vertical loading only.

2-1.04. Hangers Subject to Lateral or Axial Movement.

1. At hanger locations where lateral or axial movement is anticipated, suitable linkage shall be provided to permit such movement.

2. Where lateral or axial pipe movement is greater than 1/2 inch, or where the hanger rod deflection from the vertical is greater than 4 degrees from the cold-to-hot position of the pipe, the hanger rod and structural attachment shall be offset in such a manner that the rod is vertical in the hot position.

2-1.05. Freestanding Piping

1. Freestanding pipe connections to equipment such as chemical feeders and pumps shall be firmly attached to support frames fabricated from angles, channels, or I-beams anchored to the structure.

2. Exterior, freestanding overhead piping shall be supported on fabricated pipe stands consisting of pipe columns anchored to concrete footings, or with horizontal, welded steel angles, and U-bolts or clamps securing the pipes.

2-1.06. Materials of Construction

1. Pipe support assemblies, including framing, hardware, and anchors, shall be of steel construction, galvanized after fabrication, unless otherwise indicated.

2-1.07. Point Loads

1. Meters, valves, heavy equipment, and other point loads on PVC, FRP, or other plastic pipes, shall be supported on both sides, according to manufacturer's recommendations, in order to avoid undue pipe stresses and failures.

2. In order to avoid point loads, the supports on PVC, FRP, or other plastic piping shall be equipped with extra wide pipe saddles or galvanized steel shields for general service.

2-1.08. Concrete Anchors

1. Unless otherwise indicated, concrete anchors for pipe supports shall be according to the following table; consult the ENGINEER for any anchor applications not appearing on the table.

2. Anchor embedment shall be in accordance with the requirements of Section 05500 – Miscellaneous Metalwork.

Pipe Support Application	Type of Concrete Anchor
New Concrete	Use embedded concrete insert anchors on a grid pattern. Use **Grinnell (Anvil International), Tolco**, or equal.
Existing Concrete	Use non-shrink grouted anchors, expansion anchors, or epoxy anchors. Epoxy anchors are not permitted for vertical hanging applications or where sustained tension is exerted on the anchor. Exceptions: Expansion anchors and epoxy anchors are not permitted for pipe supports subject to vibrating loads. Epoxy anchors are not permitted where the concrete temperature is in excess of 100 degree F or higher than the limiting temperature recommended by the manufacturer.
Vibratory Loads and High-Temperature Conditions	Use non-shrink grouted anchors.

2-1.09. Noise Reduction

1. In order to reduce the transmission of noise in piping systems, copper tubes in buildings and structures shall be wrapped with a 2-inch wide strip of rubber fabric or similar suitable material at each pipe support, bracket, clip, or hanger.

2-2. SUPPORT SPACING

2-2.01. Supports for piping with the longitudinal axis in approximately a horizontal position shall be spaced to prevent excessive sag, bending, and shear stresses in the piping, with special consideration given where components such as flanges and valves impose concentrated loads.

2-2.02. Where pipe spacing are indicated on the Drawings and are referenced to a Standard Detail, that requirement shall take preference over the general requirements of this section.

2-2.03. Pipe support spacing shall not exceed the maximum indicated spans. Piping with grooved joint couplings, flexible joints, and bend fittings shall be balanced supported by a minimum of two pipe supports per pipe length, one at near each joint/fitting.

2-2.04. For temperatures other than ambient temperatures or those listed, and for other piping materials or wall thicknesses, the pipe support spacings shall be modified in accordance with the pipe manufacturer's recommendations.

2-2.05. Vertical supports shall be provided to prevent the pipe from being overstressed from the combination of loading effects.

2-2.06. Ductile Iron Pipe

1. Install supports for ductile iron pipe in accordance with the recommendations of the Ductile Iron Pipe Research Association (DIPRA) Design of Ductile Iron Pipe on Supports.

2. As a minimum, where support spacing is not indicated on the Drawings, the CONTRACTOR shall use the spacing indicated in the following schedule:

Nominal Pipe Diameter, inches	Support Configuration
All diameters	two supports per pipe length, with one of the two supports located at a joint

2-2.07. Other Pipe Materials

1. Support spacing for pipe constructed of other materials shall be based on design temperature and in accordance with the pipe manufacturer's recommendations.

2-3. MANUFACTURED SUPPORTS

2-3.01. Stock Parts

1. Where not specifically indicated, designs that are generally accepted as exemplifying good engineering practice and using stock or production parts shall be utilized wherever possible.

2. Such parts shall be locally available, new, of best commercial quality, and designed and rated for the intended purpose.

2-3.02. Manufacturers, or Equal

1. Basic PSA, Inc.

2. Bergen-Paterson Pipe Supports Group

3. Grinnell

4. Power Piping Company

5. TOLCO (Eaton B-Line)

2-4. COATING

2-4.01. Unless otherwise indicated, fabricated pipe supports other than stainless steel or non-ferrous supports shall be blast-cleaned after fabrication and hot-dip galvanized in accordance with ASTM A 123 - Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products and shall receive protective coatings in accordance with the requirements of Section 09940 – Protective Coating.

PART 3 -- EXECUTION

3-1. INSTALLATION

3-1.01. General

1. Pipe supports, hangers, brackets, anchors, guides, and inserts shall be installed in accordance with the manufacturer's printed instructions and per ANSI/MSS SP-58 Pipe Hangers and Supports- Materials, Design, Manufacture, Selection, Application and Installation.

2. Embedded concrete inserts for pipe hangers and supports shall be coordinated with the formwork.

3-1.02. Appearance

1. Pipe supports and hangers shall be positioned in order to produce an orderly, neat piping system.

2. Hanger rods shall be vertical, without offsets.

3. Hangers shall be adjusted to line up groups of pipes at the proper slope for drainage and venting, as close to ceilings or roofs as possible, and without interference with other WORK.

3-2. FIELD FABRICATION

3-2.01. Quality Control

1. Field fabricated pipe hangers and supports shall be fabricated and installed by experienced welders and fitters, using the best welding procedures available.

2. Hangers and supports shall be neat in appearance without sharp corners, burrs, or edges.

END OF SECTION

SECTION 15104

RESILIENT-SEATED GATE VALVES

PART 1 - GENERAL

1-1. SCOPE

1-1.01. This section covers furnishing resilient-seated non-rising stem AWWA gate valves for clear water service and as indicated in the Resilient-Seated Gate Valve Schedule. Resilient-seated gate valves shall be furnished complete with actuators and accessories as specified herein.

1-1.02. The minimum design working water pressure shall be 175 psig.

1-2. GENERAL

1-2.01. Equipment provided under this section shall be fabricated and assembled in full conformity with the CONTRACT DRAWINGS, CONTRACT SPECIFICATIONS, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by ENGINEER.

1-2.02. Valves shall be furnished with all necessary parts and accessories indicated on the DRAWINGS, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1-2.03. Governing Standard. Except as modified or supplemented herein, all resilient-seated gate valves shall conform to the applicable requirements of ANSI/AWWA C509.

1-3. SUBMITTALS

1-3.01. Complete DRAWINGS, details, and SPECIFICATIONS covering the valves and their appurtenances shall be submitted in accordance with the Submittals Procedures section.

1-3.02. All valves shall be tested in accordance with Section 5 of the governing standard. Certified copies of the results of all tests, together with an affidavit of compliance as indicated in Section 6.3 of the governing standard, shall be submitted to ENGINEER before the valves are shipped.

PART 2 - PRODUCTS

2-1. MATERIALS

2-1.01. Except as modified or supplemented herein, materials used in the manufacture of resilient-seated gate valves shall conform to the requirements of the governing standard.

2-1.02. Bronze Components. All bronze valve components in contact with liquid shall contain less than 16 percent zinc. All aluminum bronze components in contact with liquid shall not contain less than 79 percent copper.

2-1.03. Gaskets. Gaskets shall be free of asbestos and corrosive ingredients.

2-1.04. Shop Coatings.

Epoxy

For Raw or Treated Water Service in potable water facilities (NSF certified systems)	PPG Amercoat "Amerlock 400 High-Solids Epoxy ", Carboline "Carboguard 891", Sherwin-Williams “Dura Plate 235 NSF” or Tnemec "Series N140 Pota-Pox Plus".

Rust-Preventive Compound As recommended by manufacturer.

Universal Primer As recommended by manufacturer.

2-2. VALVE CONSTRUCTION

2-2.01. Ends. Valve ends shall be compatible with connecting piping. Buried valves shall be flanged or mechanical joint ends and as indicated in the Resilient-Seated Gate Valve Schedule. Above grade valves shall be flanged ends. Except as modified or supplemented herein, the ends shall conform to the applicable requirements of the governing standard.

2-2.02. Stem Seals. Valve stem shall be the non-rising type. O-ring stem seals shall be provided for all gate valves.

2-2.03. Rotation. The direction of rotation of the hand wheel or the wrench nut to open the valve shall be to the left (counterclockwise).

2-2.04. Shop Coatings. All interior and exterior ferrous metal surfaces of valves and accessories shall be shop coated for corrosion protection. The valve manufacturer’s standard fusion-bonded coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the specified field coating.

Surfaces shall be coated as follows:

Unfinished Surfaces

Interior Surfaces	Epoxy
Exterior Surfaces of Valves to be Buried	Epoxy
Exterior Surfaces of Valves to be Submerged	Epoxy
Exterior Surfaces of All Other Valves	Universal Primer.

Polished or Machined Surfaces	
Flange Faces	Rust-preventive compound.
Other Surfaces	Epoxy.

2-2.05. The interior surfaces of each valve shall be subjected to a nondestructive holiday test in accordance with ASTM G62, Method A, and shall be electrically void-free.

2-2.06. Interior coatings shall comply with ANSI/AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils.
Universal Primer	3 mils.

2-3. VALVE ACTUATORS

2-3.01. Requirements for valve actuators shall be as specified in the Resilient-Seated Gate Valve Schedule.

2-4. ACCESSORIES - Not Used

PART 3 - EXECUTION

3-1. INSPECTION

3-1.01. All valves and accessories shall be inspected for damage and cleanliness before being installed. Any material damaged or contaminated in handling on the job shall not be used unless it is repaired and re-cleaned to the original requirements by CONTRACTOR. Such material shall be segregated from the clean material and shall be inspected and approved by the OWNER or its representative before its use.

3-2. INSTALLATION

3-2.01. Valves shall be installed with sufficient clearance for proper operation of any external mechanisms, and with sufficient clearance to dismantle the valve for in-place maintenance. Installation shall be in accordance with the valve manufacturer's recommendations.

3-2.02. Unless otherwise indicated on the CONTRACT DRAWINGS, all valves installed in horizontal runs of pipe having centerline elevations 3 feet 6 inches or less above the finish floor shall be installed with their operating stems vertical. Valves installed in horizontal runs of piping having centerline elevations between 4 feet 6 inches and 6 feet 9 inches above the finish floor shall be installed with their operating stems horizontal. If adjacent piping prohibits this, the stems and operating hand wheel shall be installed above the valve horizontal centerline as close to horizontal as possible. Valves installed in vertical runs of pipe shall have their operating stems oriented to facilitate the most practicable operation, as reviewed by ENGINEER.

3-2.03. Installation Checks. An installation check by an authorized representative of the manufacturer is not required.

3-3. FIELD QUALITY CONTROL

3-3.01. Field Testing. After Installation, all valves shall be tested as indicated on the Pipe and Valve Schedule on the CONTRACT DRAWINGS.

1. Pressure Tests. Pressure testing shall be in accordance with the Pipe and Valve Schedule on the CONTRACT DRAWINGS.

2. Leakage Tests. All installed valves shall be free from leaks. Each leak that is discovered within the CORRECTION PERIOD stipulated in the General Conditions shall be repaired by and at the expense of CONTRACTOR. This requirement applies whether pressure testing is required or not.

SECTION 15108

AIR VALVES

PART 1 - GENERAL

1-1. SCOPE

1-1.01. This section covers furnishing combination air valves and air /vacuum valves as required by the WORK, and as indicated in the Air Valve Schedule.

1-2. GENERAL

1-2.01. Equipment provided under this section shall be fabricated and assembled in full conformity with the Drawings, Specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by ENGINEER.

1-2.02. Valves shall be furnished with all necessary parts and accessories indicated on the Drawings, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

1-2.03. General Equipment Stipulations

1-2.04. The General Equipment Stipulations shall apply to all equipment furnished under this section. If requirements in this specification differ from those in the General Equipment Stipulations, the requirements specified herein shall take precedence.

1-2.05. Governing Standard

1-2.06. Except as modified or supplemented herein, all valves furnished under this section shall conform to the applicable performance requirements of ANSI/AWWA C512.

1-2.07. Identification

1-2.08. Air valves shall be tagged in accordance with the Equipment and Valve Identification section.

1-3. SUBMITTALS

1-3.01. Complete assembly drawings, together with detailed specifications and data covering materials used and accessories forming a part of the valves furnished, shall be submitted in accordance with the Submittals Procedures section.

PART 2 - PRODUCTS

1-4. CONSTRUCTION

Three inch and smaller air release and vacuum relief valves for clean water applications shall be integral type, Apco model AVV 140 as manufactured by DeZurik, or Val-Matic “Combination Air Release Valve Series 201C.2 (Single body) as manufactured by Val-Matic Valve and Manufacturing Co, or ENGINEER approved equal.

2-2. MATERIALS

Except as modified or supplemented herein, materials of

construction shall comply with the governing standard.

Valve Body and Cover	ASTM A126 Class B cast iron
Float	Type 316 stainless steel
Shop Coatings	
Epoxy (NSF-61 Certified)	PPG Amercoat “Amerlock 400 High Solids Epoxy”, Carboline “Carboguard 891”, Sherwin-Williams "Macropoxy 646NSF" or Tnemec “Series N140 Pota-Pox Plus”.

PPG Amercoat “Amercoat 385 Epoxy”, Carboline “Carboguard 890”, Sherwin- Williams "Macropoxy 646" or Tnemec “Series N69 Hi-Build Epoxoline II”.

Rust-Preventive	As recommended by manufacturer.

2-3. SHOP PAINTING

All interior and exterior ferrous metal surfaces, except stainless steel components, shall be shop painted for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the specified field coating. Field painting is covered in the Protective Coatings section.

Surfaces shall be painted as indicated:

Interior Surfaces of Valves in Clean Water Applications (Raw or Treated Water in Potable Water Facilities)	NSF-61 Certified Epoxy.

Interior epoxy coatings for clean water valves shall comply with ANSI/AWWA C550/NSF 61. Interior coatings for all valves shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils
Universal Primer	3 mils

2-4. SHUTOFF VALVES

A shutoff valve shall be provided in the piping leading to each air valve. Shutoff valves shall be ball valves as specified in the Miscellaneous Ball Valves section.

PART 3 - EXECUTION

3-1. INSTALLATION

Combination air valves shall be installed in accordance with the Valve Installation section.

Section 15160

FLOW TUBES AND VENTURI TUBES

PART 1 – GENERAL

1-1. SCOPE

1-1.01. The Flow Tubes and Venturi Tubes section covers the furnishing and installation of venturi tubes.

1-2. GENERAL

1-2.01. Equipment furnished and installed under the Flow Tubes and Venturi Tubes section shall be fabricated and installed in full conformity with detail drawings, specifications, and engineering data of the equipment manufacturer, unless exceptions are noted by Engineer.

1-2.02. Equipment required for transmission, metering, and control is covered under other sections.

1-2.03. Workmanship and Materials. All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Equipment shall not have been in service at any time prior to delivery, except as required by tests.

1-2.04. Preparation and Shipment. All equipment shall be suitably packaged to facilitate handling and to protect against damage during transit and storage. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage. All equipment shall be protected from exposure to the elements and shall be kept dry at all times. Painted and coated surfaces shall be protected against impact, abrasion, discoloration, and other damage.

1-3. SUBMITTALS

1-3.01. Complete installation drawings, together with detailed specifications and data covering the equipment furnished, shall be made as specified in the Submittals Procedures section.

1-3.02. Submittals shall verify compliance with the Contract Documents and shall include drawings and descriptive information in sufficient detail to show the kind, size, arrangement, and the operation of component materials and devices; the external connections, anchorages, and supports required; the performance characteristics and flow curves; and dimensions needed for installation and correlation with other materials and equipment. Submittals shall be subject to review by Engineer and approval must be given prior to fabrication.

1-3.03. One (1) A standard calibration curve or tabulation for each flow tube shall be prepared and certified by the manufacturer. Each calibration curve or tabulation shall show the flow at various differentials across the tube, and shall cover the entire specified range of flow.

PART 2 - PRODUCTS

2-1. PERFORMANCE AND DESIGN REQUIREMENTS

2-1.01. Each tube shall produce a differential the square root of which is directly proportional to flow. The accuracy limit shall include all variations in flow coefficient and errors introduced by upstream and downstream piping as well as irregularities of manufacture. Each tube shall measure the actual flow within the accuracy, over a 10:1 flow range, at the design operating temperature and pressure.

2-1.02. The Venturi flow meter shall have an accuracy of +/-0.5% of actual flow above a pipe Reynolds number of 75,000 with a minimum discharge coefficient of 0.9900 which is independent of line size and Beta ratio. Permanent pressure loss not shall exceed 10% of the differential pressure being produced.

2-1.03. The Contractor shall verify that the piping supplied is suitable for installation of the tubes furnished and as specified on the drawings. Contractor shall provide the venturi manufacturer dimensional data for the upstream mating pipe, including pipe material, pipe class, flange class and bolting pattern, wall thickness, liner thickness, and confirmed inside diameter of the pipe being used immediately upstream the Venturi on the project.

2-1.04. Each tube shall withstand a hydrostatic pressure equal to that specified for the piping system in which the tube is to be installed.

2-2. ACCEPTABLE MANUFACTURERS

2-2.01. The basis of design and preapproved venturi meter is the PFS HVT-PIFS or HVT-FIFS. Venturi tubes shall be manufactured by Primary Flow Signal, or pre-approved equivalent in full compliance with the specifications herein.

2-2.02. Manufacturers shall provide evidence of experience in manufacturing insert Venturi primary devices with static-tapped upstream spools of similar size. The manufacturer and Venturi meter shall fully comply with all the requirements specified within this section and shall be required to provide proof of compliance with all specifications. Manufacturers proposals to contractors shall include the proposed Venturi sizing and flow calculations, Venturi drawings, manufacturing plan, complete flow laboratory calibration plan, and detailed explanation of exceptions to any specification.

2-3. MATERIALS AND CONSTRUCTION

2-3.01. Tube materials and construction shall be as specified herein. Interior sections shall be precision-shaped to the proper diameter and contour. All interior cross sections of tubes perpendicular to the tube axis shall be circular, with no inward projections. Flanges shall be compatible with the adjacent piping. Pressure rating of the venturi tube shall be equal or greater than the maximum expected operating pressure or test pressure of the adjacent piping.

2-3.02. Full Body Venturi Tubes. (NOT USED)

2-3.03. Insert Flow Tubes. Inlet and outlet cones, throat section and holding flange shall be provided as indicated below.

2-3.04. The Venturi manufacturer shall provide flange x flange 304 stainless steel static-tapped spool piece to be installed upstream from flow tube as indicated on the drawings. 304 Stainless steel piping shall match material of the flow tube, and all 304 stainless steel piping shall be furnished and installed as indicated in other Sections. The FL x FL static-tapped spool piece shall be provided and shipped to the site with the high-pressure sensing tap already installed in the correct location. The inside diameter of the upstream spool shall match the inside diameter of the upstream mating pipe.

2-3.05. Tapped connections shall be provided for the differential pressure lines of each insert tube, with a permanent marking for each connection on the holding flange. Pressure sensing taps shall be the manufacturer's standard size NPT.

2-3.06. The venturi inlet and outlet cones shall have a thickness that is suitable for long term service for air flow measurement in a wastewater pumping station environment.

2-3.07. Tube materials and construction shall be as follows:

2-3.08. Inlet and Outlet Cone Material: Stainless Steel Type 316, or polyester resin reinforced with glass, 30% by weight suitable for use up to 250 degrees Fahrenheit.

2-3.09. Throat Liner and Pressure Tap Bushings: Stainless Steel Type 316

2-3.10. Insert Venturi Holding Flange: Stainless Steel Type 316.

2-3.11. 2-3.03. Static Tap. The static tap shall be 3/4" NFT where it inserts into the spool piece. The static tap shall be completed by the venturi tube manufacturer.

2-3.12. 2-3.04. Vent Cleaner Assemblies. 316 stainless steel manual vent cleaner assemblies shall be provided by the manufacturer for each pressure port (low and high) of each venturi tube. The assembly shall include an isolating ball valve, 3/4"cross fitting, and cleanout rods.

2-3.13. 2-4.01. Shop Tests. Venturi tubes and metering spools shall be factory tested by a certified quality control expert. Venturi meters shall certify that critical cross-sectional measurements are taken using NIST traceable certified micrometers to confirm the correct shape and geometry has been thoroughly confirmed, and surface finish has been properly verified. The venturi shall be factory calibrated to confirm an accuracy of +/-0.5% of flowrate of flow down to 75,000 pipe Reynolds number.

2-3.14. 2-5. WARRANTY. The venturi tubes shall be warranted for a period of 25 years from date of installation against defects in workmanship and materials.

PART 3 - EXECUTION

3-1. INSTALLATION

3-1.01. An experienced, competent, and authorized representative of the manufacturer shall visit the site of the Work and inspect, check, adjust if necessary, and approve the equipment installation.

3-1.02. The manufacturer’s representative shall furnish a written report certifying that the equipment has been properly installed; is in accurate alignment; is free from any undue stress imposed by connecting piping or anchor bolts; and has been operated satisfactorily.

3-1.03. All costs for these services shall be included in the contract price.

3-1.04. Manufacturer shall include a minimum of one (1) eight-hour day and one (1) trip to the site.

3-1.05. Flow tubes shall be installed in accordance with the equipment manufacturer's instructions.

END OF SECTION

SECTION 15210

PIPING IDENTIFICATION

PART 1 -- GENERAL

1.1. THE SUMMARY

1-1.01. The CONTRACTOR shall provide identification for the piping and valves, complete and in place, in accordance with the Contract Documents.

1.2. REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

1-2.01. Commercial Standards

ASME A13.1 Scheme for the Identification of Piping Systems

1.3. CONTRACTOR SUBMITTALS

1-3.01. Furnish submittals in accordance with Section 01300 -Submittal Procedures.

1-3.02. Shop Drawings: Provide a list of the suggested wording for each pipe label and valve tag, prior to fabrication.

1-3.03. Samples

1. Sample of each type of identification device.

PART 2 -- PRODUCTS

2.1. EXPOSED PIPING OR ABOVE GROUND PIPING IDENTIFICATION

2-1.01. Pipe markers, type as indicated below, suitable for outdoor application from -40 degrees to 180 degrees Fahrenheit; in accordance with ASME A13.1 requirements.

1. Marker Type

   a. Adhesive: Vinyl or polyester sheet with UV- resistant ink, shaped similar to pipe curvature and coated with pressure sensitive adhesive.

2. Marker Area: Sized per pipe size according to ASME A13.1 and conforming to the color codes in the Identification Colors table below.

3. Lettering: Sized per pipe size according to ASME A13.1 and conforming to the color codes in the Identification Colors table below.

4. Arrows: At least one arrow at each marker area, showing direction of flow.

2-1.02. Pipe 1-inch diameter and smaller or pipe not suitable for the marker type(s) listed above shall be identified with aluminum or stainless steel pipe identification tags with stamped-in ¼” high identification lettering.

2-1.03. Manufacturer or Equal.

1. **Seton Identification Products**, Opti Code Pipe Markers (adhesive type)
2. **Grainger, Inc.** (adhesive, snap around)
3. **Marking Services, Inc.**(adhesive, snap around)

2.2. BURIED PIPELINE IDENTIFICATION

2-2.01. Underground Warning Tape

1. Material:
    a. Polyethylene tape or polyolefin film. The material and ink shall be chemically inert and shall not degrade when exposed to acids, alkalis and other destructive substances commonly found in soil.
    b. 6” wide tape with a minimum 4 mil thickness.
    c. Message: “CAUTION, LINE BURIED BELOW” with the name of the fluid service in black lettering on a colored background.
        1) Water: Blue
        2) Raw Water: Green
        3) Gas and other services: Yellow
        4) Other services: colors as approved by the OWNER.
2. Manufacturer, or Equal:
    a. Reef Industries, Inc.
    b. Seton Identification Products
    c. T. Christy Enterprises, Inc.

2-2.02. Tracer Wire

1. Material:
    a. Solid copper conductor with 30 mil HMWPE.
    b. 10 gauge or thicker wire.
2. Manufacturer, or Equal:
    a. Kris-Tech Wire

b. Corrpro Companies, Inc.

2-2.03. Witness Markers

1. Material:

   a. UV resistant glass fiber and resin reinforced thermosetting composite material.

   b. Constructed as a single pipe with pointer at the bottom end.

   c. Message of the markers “CAUTION, LINE BURIED BELOW” with the name of the fluid service, and the following information:

      1. Phone number for underground service alert.

      2. Phone number for OWNER in case of emergency.

      3. Application station number and offset information if marker is not directly over the pipe.

      4. Name of buried appurtenance or fitting if applicable.

2. Manufacturers, or Equal

   a. Carsonite Composites, Utility Marker

   b. Berntsen International, Inc.

2.3. EXISTING IDENTIFICATION SYSTEMS

2-3.01. In installations where existing piping identification systems have been established, the CONTRACTOR shall follow the existing system. Where existing identification systems are incomplete, utilize the existing system as far as practical and supplement with the system indicated herein.

2.4. IDENTIFICATION OF VALVES AND SHORT PIPE LENGTHS

2-3.01. Valves and sections of pipe that are too short to be identified with markers and arrows shall be identified with metal or plastic tags.

2-3.02. Metal tags shall be stainless steel with embossed lettering. Plastic tags shall be solid black plastic laminate with white embossed letters. Tags shall be designed to be firmly attached to the valves or short pipes or to the structure immediately adjacent to the valves or short pipes.

2-3.03. Wording on valve tags shall describe the exact function of each valve (e.g., "HWR-BALANCING," "CLS THROTTLING", "RAS-PUMP SHUT-OFF," etc.) and include the valve number as indicated in the Contract Drawings. Wording on small pipes shall describe the contents of the pipe.

PART 3 -- EXECUTION

3.1. GENERAL

3-1.01. Markers and identification tags shall be installed in accordance with the manufacturer's printed instructions, and shall be neat and uniform in appearance. Tags and markers shall be readily visible from all normal working locations.

3.2. VALVE TAGS

3-2.01. Valve tags shall be permanently attached to the valve or structure by means of 2 stainless steel bolts or screws.

3.3. MARKER LOCATIONS

3-3.01. Each pipe shall be marked at:

1. Intervals of 20-feet in straight runs.
2. At least once in every room.
3. Within 2 feet of turns, elbows, and valves.
4. On the upstream side of tees, branches, and other distribution points.
5. On both sides of walls and floors through which the piping passes.

3.4. IDENTIFICATION COLORS

1. Conform to the following color codes.

Pipe Contents		**Marker Color**	**Letter Color**	**Pipe Color**
Symbol	**Service**			
RW	RAW WATER	green	white	olive green

END OF SECTION

SECTION 15831 – FAN EQUIPMENT

PART 1 -- GENERAL

1-1. SUMMARY

1-1.01. Provide fans, blowers, ventilators, and appurtenances, complete and operable, as indicated in accordance with the Contract Documents.

1-1.02. Where 2 or more fans, blowers, ventilators or appurtenances of the same type or size are required, they shall be furnished by the same manufacturer.

1-2. CONTRACTOR SUBMITTALS

1-2.01. Furnish submittals in accordance with the requirements of Division 1.

1-2.02. Shop Drawings:

1. Submit certified fan curves for each fan.

1-2.03. O&M Data

1. Submittals shall include operation, maintenance, and inspection data, replacement part numbers and availability, and service depot location and telephone number.

1-3. EXTRA MATERIALS

1-3.01. Furnish, tag, and box for shipment and storage the following spare parts:

1. Drive Belts: Provide one for each fan .

1-4. REFERENCES

1-4.01. The following is a list of standards that may be referenced in this section:

1. Air Moving and Conditioning Association (AMCA):
    a. AMCA 300-14 Reverberant Room Method for Sound Testing of Fans.
    b. Standard 99, Standards Handbook, Reverberant Room Method for Sound Testing of Fans.
    c. Standard 210, Laboratory Methods of Testing Fans for Rating.
2. American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE):
    a. HVAC Applications chapter in “Seismic Restraint Design”.
    b. Structural drawings and specifications for Seismic and Wind Design Criteria.

3. Institute of Electrical and Electronics Engineers, Inc. (IEEE): 112, Standard Test Procedure for Polyphase Induction Motors and Generators.

4. National Electrical Manufacturers Association (NEMA): MG 112.53a, Motors and Generators.

5. National Fire Protection Association (NFPA):

   a. 70, National Electric Code (NEC).

   b. 90A, Standard for the Installation of Air Conditioning and Ventilating Systems.

6. Occupational Safety and Health Act (OSHA).

7. Underwriters Laboratories Inc. (UL): Product Directories.

1-5. MOTORS

1-5.01. All motors shall conform to the latest IEEE and NEMA requirements for mechanical and electrical characteristics, including service factors.

1-5.02. Motors shall be in accordance with the requirements of Division 16.

1-5.03. Each motor shall bear the manufacturer's nameplate with complete motor data.

1-5.04. Each motor shall be of ample size and construction to carry continuously all loads which might be imposed by the piece of equipment it drives throughout the full range of operation of the equipment, and the maximum motor loading shall in all cases be less than or equal to the nameplate horsepower rating, exclusive of the service factor.

1-5.05. All 2-speed motors shall be 2-winding motors.

PART 2 -- PRODUCTS

2-1. PROPELLER WALL FANS

2-1.01. Provide panel-mounted direct-driven propeller wall fans as indicated.

2-1.02. General Description:

1. Maximum continuous operating temperature 150° Fahrenheit (65° Celsius) with appropriate motor selection.

2. Minimum continuous operating temperature -10° Fahrenheit (-23° Celsius).

3. Each fan shall bear a permanently affixed manufacture's engraved metal nameplate containing the model number and individual unit serial number.

2-1.03. Propeller:

1. Propeller constructed of cast aluminum tapered airfoil blades and cast aluminum hub.

2. Securely attached to motor shaft with a standard square key, set screw and tapered bushing.

3. Statically and dynamically balanced in accordance with AMCA Standard 204-05.

4. The propeller and fan inlet will be aligned and shall have precise running tolerances for maximum performance and operating efficiency.

5. Propellers are not coated when fan coatings accessory is selected regardless of material type.

2-1.04. Motors:

1. AC Induction Motor:

   a. Motor enclosure: Totally Enclosed Fan Cooled.

   b. Motors are permanently lubricated, heavy duty ball bearing type to match with the fan load and pre-wired to the specific voltage and phase.

2-1.05. Drive Frame:

1. Drive frames and fan panels shall be bolted construction

2. Drive frame assemblies and fan panels shall be galvanized steel or painted steel

3. Drive frame shall be formed steel and fan panels shall have pre-punched mounting holes, formed flanges, and a deep formed inserted venturi

2-1.06. Disconnect Switches:

1. NEMA rated: 4X

2. Positive electrical shut-off.

3. Wired from fan motor to junction box.

2-1.07. Options/Accessories:

1. Dampers:

   a. Type: Gravity

   b. Prevents outside air from entering back into the building when fan is off.

   c. Balanced for minimal resistance to flow.

d. Galvanized frames with pre-punched mounting holes.

2. Dampers Guards:

a. Guard material: Aluminum.

b. Shall completely enclose the damper or wall opening on the discharge side of the fan.

3. Finishes:

a. Types: Hi-Pro Polyester.

4. Wall Housing:

a. Mounting arrangement: Flush Exterior.

b. Constructed of galvanized steel or painted steel with heavy gauge mounting flanges and pre-punched mounting holes.

c. Housing shall include OSHA approved motor guard.

d. Reduces installation time and provides maximum installation flexibility.

5. Wall Collar:

a. Constructed of galvanized steel or painted steel with heavy gauge mounting flanges and pre-punched mounting holes.

6. Motor Side Guard:

a. Guard type: OSHA Guard.

b. Protective guard completely enclose the motor and drive side of the fan.

2-1.08. Fans shall ha a spun-steel venturi mounting panel, a steel wire guard, a motor mount, and resilient anti-vibration pads at the mounting points of the panel.

2-1.09. Fans shall meet the following requirements:

Fan Identification	**EF-1**
Capacity, scfm	**800**
Static Pressure, inches H2O	**0.25**
Motor HP	**1/10**
Motor Voltage / Phase / Hertz	**115/1/60**
Motor RPM	**1350**

2-1.10. Manufacturers, or Equal:

1. Greenheck, Model SE
2. Cook
3. Twin City
4. Aerovent
5. Penn

PART 3 -- EXECUTION

3-1. INSTALLATION

3-1.01. Fans, blowers, ventilators, and hoods shall be installed in strict accordance with the manufacturer's recommendations.

3-1.02. Pipe the housing drains to the nearest utility drain.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 15950 – HVAC TESTING AND BALANCING

PART 1 -- GENERAL

1-1. SUMMARY

1-1.01. The Work included in this Section shall consist of the furnishing of all labor, instruments, tools, and services as required for the total system balancing of the heating, ventilating, and air conditioning (HVAC) systems as indicated in the Contract Documents.

1-1.02. The Work under this Section shall include the following items:

1. Preparation for balancing of air systems.
2. Preparation for balancing of hydronic and steam systems.
3. Preparation of control systems.
4. Notification requirements by the General Contractor of systems readiness.

1-2. REFERENCES

Associated Air Balance Council (AABC) MN-4	Test and Balance Procedures

PART 2 -- EQUIPMENT (NOT USED)

PART 3 -- EXECUTION

3-1. GENERAL

3-1.01. Testing, adjusting, and balancing (TAB) of the air conditioning systems and related ancillary equipment shall be performed by a certified, independent third-party, AABC Agency, selected and employed by the Contractor and approved by the Owner.

3-1.02. The preparation for and corrections necessary for the testing, adjusting, and balancing of these systems, as described herein, are the responsibility of the Contractor.

3-1.03. Make changes or replacements to fan sheaves and belts, dampers, valves, and the like, as may be required for correct balance as advised by the TAB firm, as part of the Work.

3-1.04. Provide and coordinate the services of qualified, responsible subcontractors, suppliers, and personnel, as required to correct, repair, or replace deficient items or conditions found during the course of the Project, including the testing, adjusting, and balancing period.

3-1.05. Operate the systems for the length of time necessary to properly verify their completion and readiness for TAB.

3-1.06. Testing of all equipment and systems shall be performed and completed by Contractor at their own cost.

3-1.07. Scheduling

1. Project completion schedules shall allow for sufficient time to permit the completion of TAB services prior to Owner occupancy.

2. Allow adequate time for coordinating Owner-required services associated with the testing and balancing activities during the construction period and prior to Substantial Completion.

3-1.08. Accessibility

1. Install valves, dampers, and miscellaneous adjustment devices in a manner that will leave them accessible and readily adjustable.

2. Should any such device not be readily accessible, provide access as requested by the TAB firm.

3. Malfunctions encountered by TAB personnel and reported to the Contractor shall be corrected by the Contractor immediately such that the balancing work can proceed with minimal delays.

3-1.09. The TAB firm shall check, adjust, and balance the components of the HVAC system in order to obtain the optimal performance of the equipment.

3-1.10. The Work is intended to be accomplished after the system components are installed and operating as indicated and required.

3-1.11. It shall be the responsibility of the Contractor to place the equipment into service.

3-1.12. The following components of the HVAC systems shall be tested, adjusted, and balanced:

1. air moving equipment;

2. control systems (testing and verification).

3-2. FIELD TESTING

3-2.01. During the progress of the work, tests shall be performed as indicated and as required by authorities having jurisdiction, including the local building department, the Owner, the Owner's insuring agency, and the Engineer.

3-2.02. Perform such tests as part of the Work, including qualified personnel, equipment apparatus, additional thermometer wells, gauge connections, instrument connections, and services as required to perform the tests.

3-2.03. Submit 6 copies of each complete test report to the Engineer for review, and send 2 copies of the accepted report to the Owner.

3-3. DEFECTIVE WORK

3-3.01. Leaks, damage, and defects discovered or resulting from tests shall be repaired or replaced to a like-new condition.

3-3.02. Leaky pipe joints, ductwork, and the like, shall be removed and replaced with acceptable materials.

3-3.03. Reporting

1. During the balancing process, as abnormalities and malfunctions of equipment or components are discovered by the TAB personnel, the TAB firm shall advise the Engineer and Owner in writing such that the conditions may be corrected by the Contractor.

2. The written document need not be formal, but must be understandable and legible.

3. The TAB firm shall not instruct or direct subcontractors in any of the Work.

3-4. CONTRACTOR'S RESPONSIBILITIES

3-4.01. Have the building and air conditioning systems in complete operational readiness for the TAB Work to begin.

3-4.02. Allow sufficient time for the TAB firm to perform their Work within the construction schedule.

3-4.03. Complete the Work by systems or floors, whichever is the more efficient method for testing systems.

3-4.04. Scheduling

1. Within 2 weeks after the construction schedule has been developed, schedule a TAB coordination meeting to include the TAB firm, the Contractor and primary subcontractors, the Engineer, and the Owner, Tampa Bay Water, for the purpose of developing a testing schedule for the Project.

2. Submit copies of the proposed schedule to the TAB firm at least one week prior to the coordination meeting.

3-4.05. Promptly correct deficiencies of materials and workmanship identified as delaying completion of the TAB firm's Work.

3-4.06. Assume responsibility for added costs to the Owner resulting from failure to have the building and air conditioning systems ready for TAB when scheduled, and from failure to correct deficiencies promptly.

3-4.07. Coordinate with the TAB firm to compile and submit:

1. One (1) set of HVAC specifications.

2. One (1) copy of relevant revisions, clarifications, and modifications.

3. One (1) complete set of Drawings, less the Civil and Structural sheets.

4. One (1) set of the HVAC floor plans of the conditioned spaces.

5. One (1) copy of approved submittal data for installed equipment.

6. One (1) copy of related changes as required to accomplish the indicated test procedures.

3-4.08. Provide all HVAC control communications software with the appropriate licenses and hardware interfaces.

3-5. TAB FIRM'S RESPONSIBILITIES

3-5.01. The following observations and tests shall be performed by the TAB firm:

1. During the construction submittal stage and before the submittal documents are finalized, review the mechanical and HVAC submittals, drawings and specifications for balance-ability and furnish commentary.

2. During construction, review approved HVAC submittals such as control diagrams, air handling devices, and the like, that pertain to TAB work and balancing.

3. Perform construction observations and submit a written report including the following topics.

   a. The ductwork prior to insulation and ceiling cover-up; and,

4. Perform a pre-balance site review and submit a written report.

3-6. OPERATIONAL READINESS

3-6.01. "Operational readiness," as referred to in this Section, shall be defined as the time when the construction status of the building permits the closing of doors, windows, ceilings, and the like, in order to obtain simulated or projected operating conditions.

3-6.02. Operational readiness of the HVAC system shall require that the following items have been accomplished:

1. Air Distribution Systems

   a. The installation conforms to the indicated design requirements.

   b. Dampers have tight closure and open fully with smooth and free operation.

   c. Fans (supply, return, and exhaust) are operating and verified for freedom from vibration, proper fan rotation and belt tension.

d. Motor amperage and voltage have been recorded on each phase at start-up, and verified that they do not exceed nameplate ratings.

2. Automatic Controls

a. A meeting has been held with the Engineer, the TAB firm, and the Owner, for a pre-submittal review of the proposed controls strategy.

b. Control components have been installed in accordance with project requirements and are functional, including electrical interlocks, damper sequences, air and water resets, fire and freeze stats, high- and low-temperature thermostats, safeties, and the like.

c. Controlling instruments have been calibrated and set for design operating conditions with the exception of components that require input from the TAB firm, but a default has been set.

1) Cooperate with the TAB firm and provide all software and interfaces in order to communicate with the system.

d. Controls, sensors, operators, sequences, and the like, have been checked before notifying the TAB firm that the Energy Management System is operational.

1) Furnish technical support (technicians and necessary computers) for a complete check of these systems.

e. A start-up report has been submitted.

1) The start-up report shall include the submitted and actual RPM, and the actual and nameplate voltage and amperage of all motors.

2) This requirement applies to each piece of electrically-driven air conditioning equipment in the system, including supply and exhaust fans, other fans of fractional horsepower, pumps, and the like.

3) Furnish the addresses and initial set points of all controlled devices.

3-7. NOTIFICATION OF SYSTEM READINESS

3-7.01. After the above operational readiness items have been accomplished, notify the Engineer in writing, certifying that the Work has been accomplished and that the building and the air conditioning systems are in operational readiness for testing, adjusting, and balancing.

3-7.02. With the notification, include a copy of tabulated data as required.

3-7.03. The Engineer will notify the TAB firm of the readiness for balancing, and forward copies of the Contractor's certification and tabulated motor voltages, currents, and RPM.

3-7.04. If the TAB firm has been notified as described above and the inspection reveals that the TAB services notification is premature, costs of the inspection and wasted work accomplished by the TAB firm shall be reimbursed to the appropriate parties by the Contractor.

3-8. TESTING AND BALANCING

3-8.01. In coordination with the TAB firm, submit an overview of system TAB procedures including:

1. An agenda.
2. Field observation reports.
3. System testing, including:
    a. Traverses to be made.
    b. Instrumentation to be used.
    c. How correction factors for grilles and diffusers will be obtained.
    d. How measurements will be verified at maximum and minimum.
    e. How control components will be verified.
4. Report forms with each systems components identified and numbered.

3-8.02. Personnel

1. All personnel employed on the Work shall be employees of the TAB firm.
2. The Work shall be performed under the direct supervision of an AABC-Certified Test and Balance Engineer.
3. Submit resumes for each person on the Project, including education, experience, and certification.

3-8.03. Warranty

1. The TAB firm shall submit a National Performance Guaranty in accordance with AABC National Standards.

3-9. INSTRUMENTATION

3-9.01. Ensure that instruments being used are currently calibrated and listed in the TAB report, showing instrument description, serial number, and date of calibration.

3-9.02. The accuracy of instruments used shall be as indicated in the current AABC National Standards.

3-10. FINAL AIR BALANCE

3-10.01. When systems are complete and ready for operation, the TAB firm shall perform a final air balance for all air systems and record the results.

3-10.02. The volume of air for the exhaust air equipment shall be tested and balanced within the tolerances of the AABC Standard.

3-10.03. Fan volumes shall be adjusted by changing fan speed.

3-10.04. The general scope of balancing by the TAB firm shall include the following items:

1. Filters: Check air filters and filter media and balance only systems with essentially clean filters and filter media.

2. Fan Speed: Measure and record RPM at each fan speed.

3. Voltage and Amperage Readings: Measure and record the final operating amperages and voltage for each motor.

4. Static Pressure Profile

    a. Static pressure profiles shall be measured and recorded across each supply fan, cooling coil, heating coil, return air fan, air handling unit filter, and exhaust fan, and at the furthest air device or terminal unit from the air handler supplying that device.

    b. Furnish static pressure profiles for systems which do not perform as designed.

5. Equipment Air Flow: Adjust and record exhaust, return, outside, and supply air CFM and temperatures, as applicable, at each fan and coil.

3-11. TESTING OF TEMPERATURE CONTROL SYSTEMS

3-11.01. Coordinate with the Contractor in order to ensure that the most effective total system operation is within the design limitations, and to obtain a mutual understanding of the intended control performance.

3-11.02. Verify that all control devices are properly connected and operated by the intended controller.

3-11.03. Observe that all valves are properly installed in the piping system in relation to direction of flow and location.

3-11.04. Observe the calibration of all controllers.

3-11.05. Verify the proper application of all normally opened and normally closed valves.

3-11.06. Sensors

1. Observe the locations of all sensors in order to verify whether their position will allow them to sense the intended temperatures and pressures of the media accurately.

2. The Contractor shall relocate the sensors as deemed necessary by the TAB firm.

    a. Verify that the sequence of operation for control modes is in accordance with approved Shop Drawings and as indicated.

    b. Verify the proper operation of all interlock systems.

    c. Perform variable volume system verification in order to assure the system and its components track, with changes from full flow to minimum flow.

3-12. REPORTS

3-12.01. The indicated TAB activities shall culminate in a report neatly typed and arranged.

3-12.02. Include with the data the date tested, personnel present, records of test instruments used, and a list of all measurements taken.

3-12.03. The intent of the final report is to provide a reference of actual operating conditions for the Owner’s operations personnel.

3-12.04. All measurements and recorded readings (air, water, electricity, and the like) that appear in the reports shall be certified by the TAB firm's TBE (Testing and Balancing Engineer).

3-12.05. Submit report data on forms approved by the Engineer.

3-12.06. Submit 6 copies of the final report to the Engineer and 2 copies to the Owner, indicating a summary of actual operating data and any abnormal operating conditions.

3-12.07. The report shall contain all required information as indicated herein, as well as information indicated in the AABC Standard.

3-13. TAB FINAL ACCEPTANCE AND BALANCING

3-13.01. At the time of TAB final acceptance inspection, the TAB firm shall recheck, in the presence of the Engineer, specific and random selections of data that were recorded in the certified test and balance report.

3-13.02. Points and areas for recheck shall be selected by the Engineer.

3-13.03. Measurements and test procedures shall be the same as the submitted and approved test and balance agenda.

3-13.04. Selections for verification, specific plus random, shall not exceed 10 percent of the total number tabulated in the report, except where special air systems require a complete recheck for safety reasons.

3-13.05. If 10 percent of the random verification tests demonstrate a measured flow deviation of 10 percent or more from that recorded in the certified test and balance report, the report shall be automatically rejected.

3-13.06. In the event the report is rejected, all systems shall be readjusted and tested, new data recorded, a new certified test and balance report submitted, and a new inspection test made, as part of the Work.

3-13.07. Final Acceptance will not occur until after the successful completion of the TAB verification process.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 16010

ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1-1. SUMMARY

1-1.01. Section Includes: General electrical requirements applicable to all electrical and controls work, pertinent to each building for Morris Bridge Wellfield fifteen (15) well houses, including to the following:

1. Provide electrical materials, installation and connection of equipment furnished that requires electric power and control.
2. Provide new electrical distribution equipment, including motor starter for well pump, lighting panels, transformers, circuit breakers and provide other electrical equipment as specified in other sections and as indicated on the Drawings.
3. Disconnect and remove existing electrical equipment indicated in each well house, and remove existing wiring and raceways connected to remaining ancillary electrical and control equipment.
4. Disconnect and remove existing underground electric service cable.

1-2. SYSTEM DESCRIPTION

1-2.01. Furnish and install a tested and working electrical system, as indicated on the Drawings and as specified. System includes all items not specifically mentioned in these Specifications or indicated on the Drawings or accepted Shop Drawings, but which are obviously necessary to make a complete working installation, and shall be deemed to be included herein.

1-2.02. Notify ENGINEER in writing of discrepancies within the Contract Documents and discrepancies between the Contract Documents and actual field conditions.

1-2.03. The Specifications and Drawings indicate or specify minimum sizes of equipment, electric devices, and other components of electrical system, but the Specifications and Drawings do not indicate every offset and fitting, or every structural or mechanical difficulty that may be encountered during the execution of the Work.

1-2.04. Install equipment at locations indicated on the Drawings as closely as field conditions permit. Obtain accepted equipment submittal dimensions prior to installing conduits.

1-2.05. Make minor variations to alignment of equipment and/or installation of raceway systems to avoid conflict with other portions of the Work.

1-2.06. Single Line Diagrams: Single line diagrams indicate circuit voltages for low voltage equipment, also indicate some wire and conduit sizes, circuit protection rating, and other pertinent data. Use single line diagrams to resolve conflicts.

1-2.07. Provide grounding for all electrical and controls equipment, and when not indicated on the Drawings, provide grounding in accordance with NEC Article 250 and as specified in Section 16062.

1-3. PERFORMANCE REQUIREMENTS

1-3.01. Operate electrical equipment successfully at full-rated load, without failure, at an ambient air temperature of 40 degrees Celsius, and rated for an altitude of 30 feet.

1-3.02. Coordination of Electrical Equipment Rating: Verify actual equipment, motor full-load, and locked-rotor current ratings. When providing equipment with different motor full-load and locked-rotor current ratings than indicated on the Drawings, coordinate branch circuit conductor sizes, motor overload protection, motor controllers, control power transformers, and branch circuit overcurrent protection required for equipment provided; confirm with Record Engineer.

1-3.03. Branch Circuit Conductor Current Carrying Capacity: Minimum 125 percent of the full-load current rating of equipment.

1-3.04. Branch Circuit Conductor Size: Adequate to prevent voltage drop greater than 2 percent from branch circuit protection device to equipment with equipment running at full-load and rated voltage. Include conductor derating in accordance with ambient temperature and conduit fill requirements.

1-3.05. Motor Running Overload Protection Devices: Rated or selected to trip at no more than the following percent of motor nameplate full-load current rating:

a) 125 percent for motors with marked service factor not less than 1.15.
b) 125 percent for motors with marked temperature rise not over 40 degrees Celsius.
c) 115 percent for all other motors.

1-3.06. Size and provide upon verification of actual motor or nameplate data.

1-3.07. Where power factor correction capacitors are provided on load side of motor running overload protection device, selection or setting shall be based on the improved power factor of motor circuit and not the full-load nameplate current of motors.

1-3.08. Overload Heaters Required for Motors with Temperature Rise of 50 Degrees Celsius: As selected from motor controller manufacturer's overload heater selection tables and required NEC temperature correction factors.

1-3.09. Motor Controller Size: Coordinated with horsepower size of motor.

1-3.010. Motor-Branch-Circuit Short Circuit and Ground Fault Protections Device: Capable of tripping open in 30 seconds or less on locked-rotor current of motor. This device shall also protect the motor-branch-circuit conductors and the motor control apparatus against overcurrent due to short-circuit or ground faults. Protect motor control circuits with device type

specified or as indicated on the Drawings.

1-4. SUBMITTALS

1-4.01. Shop Drawings and Product Data:

a) Include data on and details of control devices, wire, cables, raceways, and other electrical equipment specified or indicated on the Drawings.
b) Include protective device coordination study, short circuit fault analysis,
c) circuit breaker settings, and other calculations and studies as specified.
d) Install Arc Flash Labels.
e) Detailed schematic diagrams for control equipment. Schematic diagrams to show existing wiring.
f) Point-to-point interconnection diagrams, for all devices.
g) Calibration and testing forms.
h) Loop diagrams.
i) Factory testing procedures.
j) Functional testing plan.
k) Training plan for plant staff.

1-4.02. Project Record Documents:

a) Include drawings of wiring terminations at electrical equipment including, but not limited to:
b) Terminal/junction boxes.
c) Revised Shop Drawings reflecting modifications made during progress of the Work including testing, and revised Specifications and Drawings with conductors identified identically as on the Specifications and Drawings and accepted Shop Drawings. Updated Shop Drawings shall include all drafting work.

1-4.03. Acceptance Testing Information and Documents: Submit as specified in Section 16950.

1-4.04. Operating and Maintenance Data (Electrical Equipment): Manuals shall include the following:

a) Comprehensive index.
b) Complete “as-built” set of approved shop drawings.
c) Internal and interconnecting CAD-generated wiring and control diagrams with data to explain detailed operation and control of the equipment. Diagrams shall contain tabulated “as left” settings for all timing relays and alarm and trip setpoints.
d) A control sequence describing startup, operation and shutdown for all equipment functional modes as applicable (i.e., LOCAL- MANUAL, LOCAL-AUTOMATIC, REMOTE-MANUAL, REMOTE AUTOMATIC, etc.).
e) Description of the function of each principal item of equipment.
f) Installation and maintenance instructions.

g) Safety precautions.
h) Diagrams and illustrations.
i) Testing methods.
j) Performance data.
k) Pictorial “exploded” parts list with part numbers. Emphasis shall be placed on the use of special tools and instruments. The list shall indicate sources of supply, recommended spare parts, and name of servicing organization.
l) Appendix; list qualified permanent servicing organizations for support of the equipment, including addresses and certified qualifications.
m) Provide operations and maintenance (O&M) manuals.

1-5. QUALITY ASSURANCE

1-5.01. Regulatory Requirements: Perform electrical work, including connection to electrical equipment integral with mechanical equipment, in accordance with latest published requirements of the following codes and code/standard making organizations:

a) American National Standards Institute (ANSI).
b) American Society for Testing and Materials (ASTM).
c) Institute of Electrical and Electronics Engineers (IEEE).
d) Insulated Cable Engineers Association (ICEA).
e) National Electrical Code (NEC).
f) National Electrical Contractors Association (NECA).
g) National Electrical Safety Code (NESC).
h) National Electrical Manufacturers Association (NEMA).
i) National Fire Protection Association (NFPA).
j) National Fire Protection Association (NFPA); Standard for Fire Protection in Wastewater Treatment and Collection Facilities (NFPA- 820).
k) State of Florida Building Code and local codes.

1-5.02. When applicable, materials and equipment used in performance of electrical work shall be listed or labeled by Underwriters' Laboratories or other equivalent, recognized, and independent testing laboratory, for the class of service intended.

1-5.03. Manufacturer Qualifications:

a) Low Voltage Equipment: Manufacturer of proposed product with components uniquely selected by engineering review.
b) Proprietary bussing and enclosure designs listed by UL in manufacturer's own file for minimum 15 years with satisfactory performance record.
c) Capable of providing warranty for assembly when built-up with components from various manufacturers.
d) Experience and Requirements for Electrical Subcontractor: The electrical work shall be furnished and installed by a single electrical and controls specialty entity (or electrical

subcontractor) with at least 10 years of prior experience in electrical construction project for the water and/or wastewater process industry.

e) The electrical contracting entity shall have a specialty active license in the State of Florida.

1-6 DELIVERY, STORAGE, AND HANDLING

1-6.01. Ship electrical panels and other electrical distribution equipment in sealed dust and moisture-proof plastic sheet enclosures. Equipment containing dirt, dust, water, grease, rust, or damaged parts or components may be rejected.

1-6.02. Provide for delivery, unloading, transportation, and storage of equipment until installation. Protect electrical and instrumentation equipment and panels from physical and environmental damage. Store and maintain equipment in a weatherproof building until installed.

1-6.03. Store electrical equipment including instrumentation control panels and other enclosures that house electronic equipment rated for a specified ambient or environmental temperature range, in air conditioned buildings to protect equipment from temperatures above 100 degrees Fahrenheit and heated buildings to protect equipment from temperatures below 40 degrees Fahrenheit. Assume liability for the storage facilities or equipment stored therein.

1-6.04. Maintain storage facilities in neat condition with utilities. Maintain stored equipment in same condition as when received.

1-6.05. Provide continuous access for inspection of stored equipment.

1-7. SEQUENCING AND SCHEDULING

1-7.01. Coordinate work with OWNER, to minimize downtime of existing operating equipment and electrical distribution system and to preclude unsafe operations. Notify OWNER 10 days prior to power interruptions. Coordinate downtime with OWNER.

1-7.02. Prior to performing work on live or energized electrical equipment, identify the circuits and coordinate with Owner prior to de-energize the circuits. Also, provide necessary safety protection in accordance with Electrical Life Safety Code and OSHA requirements if work needs to be momentarily performed with energized circuits.

PART 2 – PRODUCTS – (NOT USED)

PART 3 - EXECUTION

3-1. PREPARATION

A. Cutting, Patching and Repairing: Where it becomes necessary to cut into existing work for the purpose of making electrical installations, use core drills for making circular holes. Other demolition methods for cutting or removing shall be reviewed

by the ENGINEER prior to starting the work.

3-1.01 INSTALLATION

A. Corrosion Protection:

1. Isolate dissimilar metals, except conduit and conduit fittings, that may come in contact, with neoprene washers, 9 mil polyethylene tape, or gaskets.
2. Restore factory finishes which are damaged or rusted to their original new condition in accordance with manufacturer's instructions.

B. Provide all insets and hangers required to support raceways and other electrical equipment. If the inserts, hangers, sleeves, or openings, are improperly placed or installed, do all necessary work to rectify the errors.

3-1.02 CLEANING

A. Clean each piece of electrical equipment, existing and new, both inside and outside, paint each equipment if necessary to match existing paint.

3-1.03 PROTECTION

A. Protect products in outdoor locations or air heated areas and provide heat to eliminate condensation until acceptance by OWNER.

END OF SECTION

SECTION 16062

GROUNDING

PART 1 - GENERAL

1-1. SUMMARY

A. Section Includes: Grounding electrode systems, consisting of bare ground conductors and ground rods.

1-2. REFERENCES

A. National Electrical Code (NEC), Article 250 - Grounding.

PART 2 - PRODUCTS

2-1. MATERIALS

A. Driven Ground Rods:

1. Copper-clad steel.

2. 3/4-inch diameter.

3. 10 feet long, minimum.

B. Ground Conductor: Bare copper.

C. Connections: Exothermic Weld

D. Precast Ground Wells: Eight inch or larger inside diameter with cast iron traffic rated cover.

1. Manufacturers: one of the following or equal:

a. Oldcastle Precast.
b. Christy, valve boxes.

PART 3 - EXECUTION

3-1 INSTALLATION

3-1.01. Provide grounding electrode system conductors continuously, interconnected with grounding rods, to structure ground ring or grounding system to provide a continuous grounding electrode system.

3-1.02. Bond electrical enclosures, including metallic raceways, panels, motor control center, enclosed circuit breaker and other similar metallic panels, cases and devices associated with power, instrumentation, and control systems to the grounding electrode system.

3-1.03. Drive new ground rods and install grounding conductors.

3-1.04. Extend grounding conductors through concrete to accessible points for grounding equipment and electrical enclosures.

3-1.05. Install grounding system at each structure where motor control centers, panelboards, panels, or other electrical equipment are installed.

3-1.06. Provide exothermic weld type connections for grounding cable to rods or cable.

3-1.07. When size is not indicated on the Drawings, size grounding conductors in accordance with NEC Table 250-66 and Table 250-122.

3-1.08. Provide a green insulated equipment grounding conductor, or multi- conductor cable with integral green insulated grounding conductor, with each feeder and branch circuit from the power source grounding means to the pump motor, electrical load equipment, lighting fixtures, instruments, control panels and wiring devices.

3-1.09. Provide ground bushings at both ends of rigid conduit runs. Do not use locknuts. Bond ground bushings to the grounding system.

3-1.10. When not indicated on the Drawings, provide a minimum size of No. 2/0 or larger grounding electrode systems in compliance with NEC-250.

3-1.11. Install precast ground well boxes in locations shown on the drawings, away from heavy traffic area and avoid interference with other underground utilities.

3-1.12. Existing ground system shall be inspected/tested for integrity and bonded to the new grounding system.

3-2 FIELD QUALITY CONTROL

3-2.01. Coordinate work schedule with ENGINEER to witness ground resistance testing.

3-2.02. Where maximum allowable ground resistance of 5 ohms is exceeded, install additional grounding mats or ground rods until ground resistance is equal to or below 5 ohms resistance required by the National Electrical Code.

END OF SECTION

SECTION 16100

ELECTRICAL EQUIPMENT INSTALLATION

PART 1 - GENERAL

1-1. SCOPE

1-1.01 This section covers the installation of electrical equipment.

1-2. GENERAL

1-2.01. Equipment specified to be installed under this section shall be erected and placed in proper operating condition in full conformity with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by ENGINEER.

1-3. COORDINATION

1-3.01. When manufacturer's field services are provided by the equipment manufacturer, CONTRACTOR shall coordinate the services with the equipment manufacturer. CONTRACTOR shall give ENGINEER written notice at least 14 days prior to the need for manufacturer's field services.

1-4. DELIVERY, STORAGE, AND HANDLING

1-4.01. Storage. Upon delivery, all equipment and materials shall immediately be stored and protected by CONTRACTOR in accordance with Section 01614, and in accordance with manufacturer's written instructions, until installed in the Work. Equipment shall be protected by CONTRACTOR against damage and exposure from the elements. At no time shall the equipment be stored on earth or grass surfaces or come into contact with earth or grass. CONTRACTOR shall keep the equipment clean and dry at all times. Openings shall be plugged or capped (or otherwise sealed by packaging) during temporary storage.

1-4.02. Handling. Electrical equipment shall be moved by lifting, jacking, or skidding on rollers as described in the manufacturer's instructions. Special lifting harness or apparatus shall be used when required. Lifting and jacking points shall be used when identified on the equipment. CONTRACTOR shall have required unloading equipment on site to perform unloading work on the date of equipment delivery.

1-5. ARC FLASH HAZARD LABELS

1-5.01. Permanent arc flash hazard labels indicating incident energy, arc flash protection boundary and PPE will be provided to the contractor by Stantec for installation on disconnects, switchgear, switchboards, motor control centers, motor control line-ups, and transfer switches (as applicable).

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3-1. INSTALLATION, TESTING, AND COMMISSIONING

3-1.01. All installation work shall be in accordance with manufacturer's written instructions.

3-1.02. All material, equipment, and components specified to be installed according to this Section shall be installed, tested, and commissioned for operation in compliance with NECA 1000 – NEIS Specification System. Where required in NECA 1000, testing and commissioning procedures shall be followed prior to energizing equipment.

3-1.03. Electrical equipment cubicles and vertical sections shall be installed plumb and level. Drawout equipment carriages, circuit breakers, and other removable components shall operate free and easy without binding or distortion.

3-1.04. Unless otherwise indicated or specified, all indoor floor-mounted electrical equipment and control cabinets shall be installed on concrete equipment pads four inches [102 mm] in height.

3-1.05. Cleaning. All deposits of oil, grease, mud, dirt, or debris shall be cleaned from the electrical equipment following installation and field wiring. A detergent water-based solution, or other liquid cleaners not harmful to material or equipment finishes, shall be used as recommended by the manufacturer. Dust shall be vacuum cleaned. Do not use blowers or compressed air to remove dust.

END OF SECTION

SECTION 16123

600 VOLT OR LESS WIRES AND CABLES

PART 1 - GENERAL

1-1. SUMMARY

1-1.01. Section Includes:

1. 600 volt class wire and cable.
2. Instrumentation class wire and cable.
3. Communication and Security System wire and cable.
4. Requirements for identification of existing wiring terminations.

1-1.02. Related Sections: Section 16130 - Conduits.

1-2. REFERENCES

1-2.01. American Society for Testing and Materials (ASTM):

a) B 3 - Standard Specification for Soft or Annealed Copper Wire.

b) B 8 - Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

1-2.02. Insulated Cable Engineers Association (ICEA).

1-2.03. National Electrical Code (NEC):

a) Article 250 - Grounding.

b) Article 310 - Conductors for General Wiring.

c) Article 725 - Class 1, Class 2, and Class 3 Remote - Control, Signaling, and Power-Limited Circuits.

d) Article 800 - Communication Circuits.

1-3. SUBMITTALS

1-3.01. Shop Drawings: Show splice locations. Submit cable pulling calculations for all cable feeder larger than 2/0 AWG and pulling lengths longer than 200 feet. Submit cable pulling calculations for all conductor runs longer than 400 feet.

1-3.02. Product Data: Include wires, cables, pulling compounds, and splicing materials.

1-4. QUALITY ASSURANCE

1-4.01. Conform to ASTM and ICEA standards.

1-4.02. Furnish mechanical conductor connector and heat-shrink type insulation by same manufacturer.

PART 2 - PRODUCTS

2-1. WIRE AND CABLE MATERIALS

2-1.01. Conductors: ASTM B 8, soft drawn copper, maximum 12 months old, minimum 97 percent conductivity. American Wire Gauge (AWG) sizes as indicated on the Drawings, Class B or C stranded.

A. Insulation Thickness: Minimum specified by NEC Article 310.

B. Conductor Sizes: As indicated on wiring schedules and Drawings.

2-2.02 600-VOLT CLASS CABLE

A. Power Wire and Cable:

1. Manufacturers: One of the following or equal:
   a. Okonite Company.
   b. General Cable.
   c. Rockbestos Company.
   d. Southwire Company

B. Control Wire and Cable:

1. Manufacturers: One of the following or equal:
   a. Okonite Company.
   b. General Cable.
   c. Rockbestos Company.
   d. Southwire Company

C. Insulation for Individual Wires or Multiple Conductor Cable for Power and Control Circuits:

1. Type XHHW-2 insulation for use in dry and wet locations and underground ductbanks.

D. Jackets for Multiple Conductor Cable for Power and Control Circuits: Type CPE.

E. Solid-conductor wire, Number 12 AWG and smaller, may be used only for lighting and receptacle circuits.

2-2.03. INSTRUMENTATION CLASS CABLE

A. Single Pair or Triad Applications:

1. Manufacturers: One of the following or equal:
   a. The Okonite Company, Okoseal-N Type P-OS.
   b. Equivalent manufactured by Cooper Industries, Belden Wire and Cable Division.

B. Multiple Pair or Triad Applications:

1. Manufacturers: One of the following or equal:
   a. The Okonite Company, Okoseal-N Type SP-OS.
   b. Equivalent manufactured by Cooper Industries, Belden Wire and Cable Division.

C. Approved for cable tray installation in accordance with the National Electrical Code.

D. Number of Individually Shielded, Twisted Pairs and Triads: As indicated on the Drawings or as necessary for the application.

E. Voltage Rating: 600 volts.

F. Cable Type: TC.

G. Temperature Rating: 90 degrees Celsius dry location, 75 degrees Celsius wet location.

H. Conductors: Bare, soft annealed copper in accordance with ASTM B 3, Class B, 7-strand concentric in accordance with ASTM B 8.

I. Conductor Insulation: Flame-retardant polyvinyl chloride, 15 mils nominal thickness, with nylon jacket 4 mils nominal thickness, 90 degrees Celsius temperature rating in accordance with Underwriter's Laboratory Subject 1277.

J. Color Code: Provide conductor color code as specified in Section 16075.

K. Single Pair or Triad Shielding:

1. Group Shielding: Minimum 1.35 mil double-faced aluminum/synthetic polymer-backed tape overlapped to provide 100 percent coverage.
2. Drain Wire: 7-strand tinned copper drain wire, 2 sizes smaller than conductor.

L. Jacket: Black, flame-retardant in accordance with Underwriters' Laboratory Subject 1277, 90 degrees Celsius temperature rating, rip cord laid longitudinally under jacket to facilitate removal.

M. Conductor Size: Number 16 AWG minimum unless otherwise indicated on the Drawings.

N. Numerically identify one conductor within each pair and triad.

2-3 RELATED MATERIALS

2-3.01 Splicing Material:
a. In conformance with ANSI C119.1, IEEE 383, and ICEA 5-19-81.

2-3.02. Manufacturers: One of the following or equal:
a. Elastimold.
b. Thomas-Betts.
c. Raychem, FCSM Series.

2-3.03 Wire Nuts (only applies to lighting/receptacles circuit):
a. Manufacturers: One of the following or equal:
- 3M.
- Thomas and Betts.

b. Rated 600 volt with live-spring feature for tight fitting connections.

2-3.04 Junction Boxes and Terminal Cabinets: As specified in Section 16134.

2-3.05 Pulling Compound: As recommended by conductor manufacturer.

2-4 WIRE AND CABLE FABRICATION

2-4.01. Permanently mark American Wire Gauge (AWG) size, grade of insulation, voltage, and manufacturer's name on outer covering at maximum 24 inch intervals.

2-4.02. Identify and mark conductors in accordance with NEC Article 310.

2-4.03. Color code wire and cable as specified in Section 16075.
a. Integral color insulation for Number 2 AWG and smaller.
b. Wrap colored tape around cable larger than Number 2 AWG.

2-4.04. Fabricate cable ends with provisions for field testing.

2-5. SOURCE QUALITY CONTROL

2-5.01. Test full lengths in accordance with ASTM and ICEA Standards.

PART 3 - EXECUTION

3-1. IDENTIFICATION OF EXISTING WIRING TERMINATION

3-1.01. Perform functional testing at each well house building of existing wiring connections, between existing motor control center (to be removed) and other remaining equipment such RTU

equipment, security equipment, ventilation fan, miscellaneous receptacles, instruments and lighting systems.

3-1.02. Create and provide necessary wiring diagrams of existing electrical and control system at each well house building, with identification of all wiring connections and terminations on remaining existing equipment that will be connected to new equipment in new motor control center. The required wiring diagrams shall be produced on 11”x17” drawing size paper or full size 22”X34” size paper, using AutoCAD drafting software, version 17 or newer version. Also, the diagrams shall include clear numeric identification of existing terminal blocks, for the termination of new wiring associated with new equipment in new motor control center.

3-2. INSTALLATION

3-2.01. Install continuous circuit conductors from source to load without splices or terminations in intermediate pull boxes, except for Number 10 AWG and smaller conductors for lighting and receptacles.

3-2.02. Splices:

a. Where splices are necessary because of extremely long wire or cable lengths that exceed standard manufactured lengths, install and label junction boxes for power conductors or termination cabinets for control and instrument conductors.
b. Power and control conductors routed in common raceways may be spliced in common junction boxes.
c. Install NEMA 4X junction and terminal boxes in wet and outdoor locations. Clearly label junction and terminal boxes containing splices with the word "SPLICE."
d. Leave sufficient slack at junction boxes and termination boxes to make proper splices and connections. Do not pull splices into conduits.
e. Splices in below grade pull boxes or in any box subject to flooding shall be made watertight using:

    1. A heat shrink insulating system listed for submersible applications.
    2. Or an epoxy resin splicing kit.

f. Properly coat wires and cables with pulling compound before pulling into conduits and prevent mechanical damage to conductors during installation.

3-3. 600-VOLT CLASS CABLE

3-3.01. Size power conductors in accordance with National Electrical Code when sizes are not indicated on the Drawings.

3-3.02. Install Number 12 AWG wiring and larger gauge where required per Code for power circuits unless otherwise specified or indicated on the Drawings, and Number 14 AWG for control wiring unless otherwise specified.

3-3.03. Install minimum 16 AWG for internal panel control wiring with type MTW or SIS insulation.

3-3.04. Do not exceed cable manufacturer's pulling tension and side-wall pressures.

3-3.05. Terminations and Splices (600 Volt or Less):

a. Terminations: Terminate control and instrument conductors in terminal boxes in accordance with Section 16134.
b. Splicing: Join conductors mechanically with splice connectors and install heat-shrink type insulation. Splice conductors in accordance with manufacturer's instructions. Make waterproof heat shrink type splices in wet and below grade locations.
c. Splice or weld grounding conductors of different sizes.
d. Conductor Number 10 AWG and smaller for lighting and receptacle circuits may be spliced in junction boxes with wire nuts.

3-3.06. All conductors for installation in underground conduits, in sizes No. 10 AWG and smaller shall be of the multi-conductor type with overall jacket.

3-4. INSTRUMENTATION CLASS CABLE

3-4.01. Install instrumentation class cables in separate raceway systems.

3-4.02. Install instrument cable in metallic conduit within non-dedicated pull boxes.

3-4.03. Install cable without splices between instruments or between field devices and instrument enclosures or panels.

3-4.04. Do not make intermediate terminations, except in designated terminal boxes indicated on the Drawings.

3-4.05. Ground cable shields at only one location, typically at panels, not at field instruments.

3-5. SIGNAL CABLE AND CONDUIT INSTALLATION

3-5.01. Separate and isolate electrical signal cables from sources of electrical noise and power cables by minimum 12 inches.

3-5.02. Install signal cables in dedicated raceways, including through underground vaults and pull boxes.

3-6. FIELD QUALITY CONTROL

3-6.01. Testing: Provided cable testing in accordance with requirements specified in Section 16950.

3-7. WIRING SUPPLEMENTAL REQUIREMENTS

3-7.01. CONTRACTOR shall include necessary conductors and wiring termination to provide complete functioning of any and all motorized equipment, electrical outlets, fixtures, communication outlets, instruments, and devices within 10 linear feet of location shown on the Drawings.

3-7.02. CONTRACTOR shall include necessary conductors and related materials to provide any and all pull boxes within 20 linear feet of location shown on the Drawings.

3-7.03. Prior to installation of any raceway or related items identified in paragraphs A and B above, the OWNER shall have the right to make changes related to preferred location, at no additional cost.

3-7.04. CONTRACTOR shall provide necessary conductors for all equipment specified, identified in wiring/raceway schedules, equipment schedules, panelboards schedules, electrical single line diagrams, block diagrams, process and instrumentation diagrams (P&IDs), fixture schedules, and devices. Said necessary conductors may not be shown on the plan drawings, but they shall be sized by CONTRACTOR in accordance with requirements of the National Electrical Code, and included in this allowance if the conductor are necessary for the complete operation of the included device or equipment.

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 16130

CONDUITS

PART 1 - GENERAL

1-1. SUMMARY

1-1.01. Section Includes:
1. Galvanized rigid steel conduit.
2. Flexible conduit, polyvinyl chloride-coated rigid steel conduit, and rigid nonmetallic polyvinyl chloride conduit.

1-2. REFERENCES

A. American National Standards Institute (ANSI):
1. C80.1 - Rigid Steel Conduit, Zinc Coated.

B. Electrical Manufacturers Association (NEMA):
1. RN-1 - Polyvinyl Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit.

C. National Electrical Code (NEC):
1. Table 300-5 - Minimum Cover Requirements (0 to 600 volts, Nominal).
2. Article 500 - Hazardous (Classified) Locations.
3. Table 10-4(b) - Minimum Cover Requirements (over 600 volts, Nominal).

D. Underwriters' Laboratories, Inc (UL):
1. UL 6 - Rigid Metal Conduit.

1-3. SUBMITTALS

1-3.01. Product data.

1-3.02. Shop Drawings:
Installation drawing shall include individual conduit numbers, routing, conduit sizes, circuit numbers contained in each conduit, and number and size of wires in each conduit.

PART 2 - PRODUCTS

2-1. CONDUIT

2-1.01. Galvanized Rigid Steel Conduit:
1. Domestic raw steel, made smooth, clean, and free of burrs and rough spots to enhance wire pulling; interior and exterior surfaces coated with solid, unbroken layer of zinc; threads hot dip galvanized after cutting; entire surface finish coated with secondary bichromate treatment applied over galvanizing able to extend surface protection and prevent oxidation; threads protected by color

coded end caps to provide quick trade size identification.

2. Manufacturers: One of the following or equal:
   a. Triangle PWC, Inc.
   b. Allied Tube and Conduit Corporation.

2-1.02. Liquid-tight Flexible Conduit: Grounding type, weatherproof, watertight, maximum 60-inch lengths.

1. Manufacturers: One of the following or equal:
   a. American Brass Company.
   b. General Electric.

2-1.03. Flexible Metal Conduit: Aluminum with minimum trade size of 1/2-inch, maximum length allowed 60 inches.

1. Manufacturers: One of the following or equal:
   a. ALFLEX.
   b. Allied Tube and Conduit Corporation.

2-1.04. Polyvinyl Chloride-coated Rigid Steel Conduit:

1. Galvanized rigid steel conduit with coating conforming to ANSI C80.1 and UL 6; bendable without damage to coatings.
2. Manufacturers: One of the following or equal:
   a. Perma Kote by Robroy Industries.
   b. OCAL, Inc.

2-1.05. Rigid Nonmetallic Polyvinyl Chloride Conduit:

1. High density, Schedule 40, 90 degrees Celsius, heavy-duty polyvinyl chloride, made from virgin polyvinyl chloride compound; maximum 6 grams per 100 grams smoke emission.
2. Manufacturers: One of the following or equal:
   a. Carlon.
   b. Triangle Conduit and Cable.

2-2. RELATED MATERIALS

2-2.01. Couplings, Connectors, and Fittings:

1. Threaded.
2. Manufactured with same materials and process as corresponding conduit.

2-2.02. Conduit Fittings:

With wedge nut covers, weathertight when located outdoors or in wet or corrosive locations indicated on the Drawings, matching type for corresponding conduit systems.

1. Manufacturers: One of the following or equal:
   a. Crouse-Hinds.
   b. Appleton.

2-2.03. Galvanized Rigid Steel Conduit Expansion Fittings for Exposed Locations:

1. Manufacturers: One of the following or equal:
   a) OZ/Gedney, Type AX with jumper.
   b) Appleton, Type XJ with Jumper.

2-2.04. Galvanized Rigid Steel Conduit Expansion Fittings at Structural Expansion Joints:
1. Manufacturers: One of the following or equal:
   a) Spring City, Type D.
   b) Crouse-Hinds, Type D.

2-2.05. Polyvinyl Chloride-coated Rigid Steel and Aluminum Conduit Couplings: One provided loose with each length of conduit.

2-2.06. Fasteners for Polyvinyl Chloride-Coated Rigid Steel Conduit: Polyvinyl chloride-coated steel fasteners with Type 316 stainless steel bolts, nuts, and hardware.

2-2.07. Fasteners for Galvanized Rigid Steel Conduit: Galvanized steel fasteners with Type 316 stainless steel bolts, nuts, and hardware.

2-2.08. Conduit Mounting Strut:
1. Type 316 stainless steel for mounting of polyvinyl chloride-coated rigid steel conduit.
2. Hot-dip galvanized for other conduit types.

2-2.09. Conduit Thruwall Seals:
1. Hot-dip galvanize.
2. Polyvinyl chloride oversize sleeve.
3. Manufacturers: One of the following or equal:
4. O-Z/Gedney, Type "WSK."

2-3. POLYVINYL CHLORIDE-COATED RIGID STEEL CONDUIT FABRICATION

2-3.01. Coat rigid steel conduit, conduit fittings, and hangers with polyvinyl chloride.

Conduit:

a) Ensure that surfaces, including galvanizing, remain intact and undisturbed on both inside and outside of conduit throughout preparation and application processing.
b) Bond polyvinyl chloride coating to outer surfaces of conduit except threads.
c) Provide bond between polyvinyl chloride coating and conduit surface that is greater than tensile strength of plastic.
d) Provide minimum 40 mil thick coating on conduit.
e) Coat interior of conduit and condulet fittings with nominal 2 mil thick corrosion-resistant urethane finish.
f) Coat threads with clear urethane finish.

2-3.02. Couplings:
a) Bond polyvinyl chloride coating to outer surfaces of couplings.
b) Extend polyvinyl chloride sleeve equal to outside diameter of uncoated conduit beyond both ends of coupling approximately 1 pipe diameter or 1-

1/2 inches, whichever is smaller.

c) Provide minimum 40 mil thick coatings on couplings and sleeves.
d) Bond polyvinyl chloride coating to outer surface of conduit bodies and fittings.
e) Extend polyvinyl chloride sleeves from hubs.
f) Provide same coating thickness on conduit bodies, fittings, and sleeve walls as on couplings in length and thickness.
g) Coat covers on conduit bodies on both sides so covers are completely interchangeable.
h) Coat interior of conduit couplings, sleeves, and conduit bodies with corrosion-resistant urethane finish.
i) Ensure that inside of conduit bodies remain undisturbed during processing and retain manufacturer's finish.

2-3.03. Polyvinyl Chloride Coated, Mounting Hardware, and Associated Fittings:

a) All mounting hardware and associated fittings shall be polyvinyl chloride coated in accordance with the intent of reference NEMA RN-1.
b) The polyvinyl chloride exterior coating shall have a normal thickness of 40 mils (.040 inch) except where part configuration or application otherwise dictate.
c) All fasteners for polyvinyl chloride coated fittings and mounting hardware shall be of the Type 316 stainless steel.

PART 3 - EXECUTION

3-1. INSTALLATION

3-1.01. Install conduit runs in accordance with schematic representation as indicated on the Drawings and as specified. Modify conduit runs to suit field conditions, as accepted by the ENGINEER.

3-1.02. Provide necessary conduits for wiring of existing lighting fixtures and receptacle outlets to be interconnected with new panelboard included in new motor control center, whether or not conduits are indicated on the Drawings.

3-1.03. Install straight and true conduit runs with uniform and symmetrical elbows, offsets, and bends. Make changes in direction with long radius bends or with condulet fittings.

3-1.04. Install conduit runs so that runs do not interfere with proper and safe operation of equipment and not block or interfere with ingress or egress, including equipment removal hatches.

3-1.05. Install exposed conduit runs within the well house buildings.

3-1.06. Securely fasten exposed conduits with clamps or straps. Run exposed conduit on walls and ceilings only, parallel to planes of walls or ceilings. Do not run conduit diagonally. Securely fasten exposed polyvinyl chloride- coated rigid steel conduits with Type 316 stainless steel clamps or straps.

3-1.07. Use flexible conduit for short lengths required to facilitate connections between rigid

conduit and motors, vibrating equipment, or control equipment. Maximum length shall be per NEC, Article 350.

3-1.08. Thoroughly ream conduit after threads have been cut to remove burrs. Seal joints with accepted conductive sealant compound and make watertight. Set up joints tight. Use bushings or conduit fittings at conduit terminations.

3-1.09. Install runs between pull boxes or junction boxes with total bends equaling not more than 270 degrees. Install NEC required pull boxes at locations acceptable to the ENGINEER. Plug conduits brought into pull boxes, manholes, handholes, and other openings until used to prevent entrance of moisture. Cap spare conduits and provide plastic pulling tape below threaded cap. Provide bonding bushing and bond wire.

3-1.10. Provide appropriate hangers, supports, and fasteners to suit applications.

3-1.11. After complete installation of 2 inch and larger conduit runs, snake conduits with conduit cleaner equipped with a cylindrical mandrel of a diameter not less than 85 percent of nominal diameter of conduit. Remove and replace conduits through which mandrel will not pass.

3-1.12. Clean and ensure that new and existing conduit runs are not crushed or creased. Verify internal dimensions of existing conduit prior to installation of conductors. Verify that no foreign objects or obstructions are present in conduit prior to installing conductors.

3-1.13. Install conduit system to provide firm mechanical assemblies with electrical conductivity throughout.

3-1.14. Install expansion fittings across expansion joints and at other locations where necessary to compensate for thermal or mechanical expansion and contraction as indicated on the Drawings.

3-1.15. Install conduits complete between outlets, boxes, and circuit source before conductors are installed.

3-1.16. Provide 1/4-inch polypropylene pull line in each empty electrical conduit.

3-1.17. Open-ended conduits containing SO (or similar) cable that continues outside the conduit to the utilization equipment shall be sealed with conduit sealing bushings.

3-1.18. Conduits terminating at a wireway shall be supported independently from the wireway. Provide a conduit support within 1 foot of the wireway. The weight of the conduit shall not bear on the wireway.

3-1.19. Rigid galvanized steel conduits which have been field cut and threaded shall be painted with cold galvanizing compounds. Provide polyvinyl chloride coating to match original on field cut threads for polyvinyl chloride coated rigid galvanized steel conduit.

3-1.20. PVC-coated galvanized rigid steel elbows shall be used for conduit stub-ups from underground conduit to exterior main circuit breaker for each well house

3-1.21. Underground conduits shall be temporarily sealed to prevent intrusion of foreign material

before conductors are installed.

3-2. POLYVINYL CHLORIDE-COATED RIGID STEEL

3-2.01. Attach cover to conduit body with Type 316 stainless steel screws.

3-2.02. Where patching is required, apply 40 mil thick polyvinyl chloride coating in accordance with manufacturer's instructions.

3-3. RIGID NONMETALLIC POLYVINYL CHLORIDE

3-3.01. Install at underground depths required by code. Provide clean backfill material for all underground conduit trenches.

3-3.02. Underground conduit trench backfill shall be compacted and final surface shall be patched to match new condition similar to existing surface finish.

3-4. SCHEDULES

3-4.01. Provided Conduit Sizes: In accordance with NEC, unless otherwise indicated on the Drawings or specified as follows:

a) Concealed Conduit in Partitions or Accessible Ceilings: Minimum 3/4 inch.
b) Exposed Conduit: Minimum 3/4 inch.
c) Rigid Steel Encased in Concrete: Minimum 1 inch.
d) Rigid Non-Metallic Polyvinyl Chloride Encased in Concrete where subject
e) to mechanical damage: Conduit Minimum size 2 inches.

Conduit Uses and Applications:

a) Rigid Steel Conduit: Typical, Exposed Conduit Runs in dry and non-corrosive locations, unless otherwise noted.
b) Liquid Tight Flexible Conduit: Final motor and instrument connection in non-hazardous areas.
c) Polyvinyl Chloride-Coated Rigid Steel Conduit: Entering or exiting concrete including minimum 12 inches above and below grade or finished floor, in corrosive NEMA 4X designated areas, plus exposed outdoor locations, and where indicated on the Drawings.

3-5. RACEWAYS SUPPLEMENTAL REQUIREMENTS

3-5.01. CONTRACTOR shall include necessary raceways and supports to provide any and all motorized equipment, electrical outlets, fixtures, communication outlets, instruments and devices within 10 linear feet of location shown on the Drawings.

3-5.02. CONTRACTOR shall provide necessary raceways for all equipment specified, identified in wiring schedules, equipment schedules, panel boards schedules, electrical single line diagrams, block diagrams, process and instrumentation diagrams (P&IDs), fixtures schedules, and devices. Said necessary conduits may not be shown on the plan drawings, but they shall be sized by CONTRACTOR in accordance with requirements specified and the

National Electrical Code, and include in this allowance, the raceways necessary for the installation of the conductors and for the complete operation of the included device or equipment.

3-6. RACEWAYS IDENTIFICATION

3-6.01. Each new conduit, new wireway, and new boxes shall be identified by a specific number. The numbering system shall be in accordance with identification named on the Drawings or the process equipment identification.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 16140

WIRING DEVICES

PART 1 - GENERAL

1-1 SUMMARY

1-1.01. Section Includes: Wiring devices including the following:
1. Snap switches and toggle switches.
2. Plugs and receptacles.
3. Enclosures and covers

1-2 SUBMITTALS

1-2.01 Product Data.

1-3 QUALITY ASSURANCE

1-3.01 Provide industrial grade products for wiring devices. Commercial grade products are not acceptable, unless otherwise specified or indicated on the Drawings.

1-4 WARRANTY

1-4.01 Submit manufacturer's standard warranty.

PART 2 – PRODUCTS

2-1 SNAP OR TOGGLE SWITCHES

2-1.01. Manufacturers: One of the following or equal:
1. Hubbell.
2. General Electric.
3. Leviton.
4. Bryant.

2-1.02. Number of Poles: As indicated on the Drawings.

2-1.03. Rating: 20 amperes, 125 volt.

2-1.04. Special Switches and Covers: As specified or indicated on the Drawings.

2-2. 120 VOLT RECEPTACLES

2-2.01. Manufacturers: One of the following or equal:
a) Hubbell.
b) General Electric.
c) Leviton.
d) Bryant.

2-2.02. Duplex Receptacles: 2-pole, 3-wire, grounded, 125 volts, industrial, rated at 20 amperes.

2-2.03. All receptacles shall be Ground Fault Interrupter Receptacles (GFI): Rated at 20 amperes at 125 volts alternating current, tripping at 5 mA. NEMA WD-1, Configuration 5-20R, and capable of interrupting 5,000 amperes without damage.

2-2.04. GFCIs shall be weather resistant-listed in accordance with NEC Article 406.8.

2-3. ENCLOSURES AND COVERS

2-3.01. Surface-mounted switches and receptacles shall be housed in FS or FD-type weatherproof conduit fittings

2-3.02. Receptacles shall be provided with a hinged die-cast aluminum cover/enclosure marked "Suitable for Wet Locations when in use" and "UL Listed."

2-3.03. Toggle switches shall have UL listed covers marked “Suitable for Wet Locations”

PART 3 - EXECUTION

3-1 INSTALLATION

A. Provide wiring devices in accordance with manufacturer's instructions.

B. Mount wiring devices as indicated on the Drawings.

1. Provide adequate supporting pillars for wiring devices to be located above ground or above decks, where there is no structural wall or surface for box mounting.

C. Provide checkout, field, and functional testing of wiring devices.

D. Test each receptacle for polarity and ground integrity, using a standard receptacle tester.

3-1.01 PROTECTION

A. Protect products until acceptance by OWNER.

END OF SECTION

SECTION 16276

PAD-MOUNTED, LIQUID-FILLED, MEDIUM-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1-1. SUMMARY

1-1.01. Section Includes

1. The supply of materials, design, assembly, fabrication, testing, and installation of pad-mounted, liquid-filled, medium voltage transformers.

2. The Contractor shall provide pad-mounted transformers complete and operable in accordance with this Specification, the Contract Documents and the transformer data sheets included in Part 4 of this Section.

1-2. REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

1-2.01. Reference Specifications

01300	Submittal Procedures
16010	Electrical Requirements
16062	Grounding

1-2.02. Reference Standards

ASTM INTERNATIONAL (ASTM)	
ASTM D117	Standard Guide for Sampling, Test Methods, and Specifications for Electrical Insulating Liquids
ASTM D3487	Standard Guide for Sampling, Test Methods, and Specifications for Electrical Insulating Liquids
INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)	
IEEE C57.12.00	IEEE Standard for General Requirements for Liquid-Immersed Distribution, Power and Regulating Transformers
IEEE C57.12.28	IEEE Standard for Pad-Mounted Equipment – Enclosure Integrity
IEEE C57.12.70	IEEE Standard for Terminal Markings and Connections for Distribution and Power Transformers
IEEE C57.12.80	IEEE Standard Terminology for Power and Distribution Transformers
IEEE C57.12.90	IEEE Standard Test Code for Liquid-Immersed Distribution Power, and Regulating Transformers
IEEE C57.13	IEEE Standard Requirements for Instrument Transformers

IEEE C62.11	Metal-Oxide Surge Arresters for AC Power Circuits (>1 kV)
IEEE 386	IEEE Standard for Separable Insulated Connector Systems for Power Distribution Systems Rated 2.5kV through 35kV
NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)	
NEMA TR 1	Transformers, Step Voltage Regulators and Reactors
NEMA 260	Safety Labels for Pad-Mounted Switchgear and Transformers Sited in Public Areas
INTERNATIONAL ELECTRICAL TESTING ASSOCIATION (NETA)	
ANSI/NETA ATS	Standard for Acceptance Testing Specifications for Electrical Power Equipment and Systems
ANSI/NETA MTS	Standard for Maintenance Testing Specifications for Electrical Power Equipment and Systems
USA Federal Regulations, Policies and Acts	
Energy Policy and Conservation Act 1975 & Energy Policy Act 2005	
10 CFR 429	Certification, Compliance, and Enforcement for Consumer Products and Commercial and Industrial Equipment
10 CFR 431	Energy Efficient Program for Certain Commercial and Industrial Equipment

1-2.03. Reference Codes

NFPA 70	NFPA 70 – National Electrical Code (NEC), 2017 Edition.

1-3. ACTION SUBMITTALS

1-3.01. Submit documents in accordance with Section 01330 – Contractor Submittals and Section 16010 – Electrical Requirements.

1-3.02. Product Data

1. Submit sufficient information to determine compliance with the Contract Documents, Drawings, and Transformer Data Sheet.

2. Identify submittal data with the specific equipment tags and/or service descriptions to which they pertain. Submittal data shall be clearly marked to identify the specific model numbers, options, and features of equipment.

3. Submit Manufacturer's data sheets or catalog pages clearly identifying the make, model, part number, equipment and component ratings, selected options, and selected accessories.

4. Submit Manufacturer's data for insulating liquid, including all relevant listings (i.e., UL, FM).

5. Submit descriptive bulletins, including accessories.

6. Recommended spare parts list.

1-3.03. Shop Drawings

1. Equipment dimension drawings, weights, conduit/cable entry details, and dimensioned anchoring information. Provide plan drawings and front and side elevation drawings drawn to scale.

2. Provide rating information of transformers, switches, fuses, and breakers, including:

   a. Primary and secondary voltages and winding configurations

   b. Voltage taps

   c. kVA ratings

   d. Number of phases

   e. Insulation rating and temperature rise

   f. Impedance

   g. Enclosure type / environmental ratings

3. Provide catalog data on all devices including pressure-relief valves, liquid sampling valves, gauges, fuses, fuse mounting methods, bushing wells, bushing inserts, spades, and separable connectors.

4. Submit time current curves for protective devices, transformer inrush and damage curve.

5. Associated equipment anchorage details.

6. Furnish manufacturer's installation manuals on the transformers and accessories.

7. Submit a list of spare parts and materials.

8. Winding materials.

1-3.04. Test and Evaluation Reports

1. Contractor shall submit, with shop drawings, sample test forms as specified herein.

1-4. CLOSEOUT SUBMITTALS

1-4.01. Operation and Maintenance Data

1. Contractor shall include the following operating and maintenance data for materials and products as per the requirements outlined in Division 01 and Section 16010 – Electrical General Requirements:

   a. Shop Drawings incorporating all changes made during fabrication and installation (as-built)

   b. Completed test forms

   c. Manufacturer's published operation and maintenance procedures

1-4.02. Warranty Documentation

1. Contractor shall provide manufacturer's warranty documentation. Submit this information with the operating and maintenance data.

1-4.03. Record Documentation

1. Contractor shall include as-left transformer tap and ancillary device settings such as alarm setpoints. Submit this information with the operating and maintenance data and as-built drawings.

1-5. SPARE PARTS

1-5.01. Contractor shall provide a recommended spare parts list with the following information provided as a minimum:

1. Contact information for the closest parts stocking location to the Owner.

2. Critical spare parts shall be identified as those parts being associated with long lead times and/or those being critical to the unit's operation.

3. Maintenance spares shall be identified as being those parts required to regularly perform scheduled maintenance on the furnished equipment. These spares shall include, but shall not be limited to, consumable spares that are required to be exchanged during scheduled maintenance periods.

1-5.02. Contractor shall provide spare parts for each type and size of unit furnished. At a minimum, the following shall be provided:

1. Provide the minimum spare parts recommended by the manufacturer.

1-5.03. Spare parts shall be properly marked and packaged for long term storage. Printed circuit boards shall be provided in separate anti-static containers.

1-6. TOOLS

1-6.01. Contractor shall provide any manufacturer specific special tool required to remove and/or install recommended or furnished spare parts.

1-7. QUALITY ASSURANCE

1-7.01. Manufacturer Qualifications:

1. Manufacturer shall be a firm engaged in the manufacture of specified products of types and sizes required, and whose products have been in satisfactory use in similar service for a minimum of ten years.

1-7.02. All materials used shall be marked in accordance with the National Electrical Code and installed in accordance with all applicable regulations and ordinances.

1. Equipment assemblies shall be UL listed and labeled and marked for intended use.

1-8. STORAGE AND HANDLING

1-8.01. Contractor shall handle and store the products in accordance with the manufacturer's written requirements.

1-8.02. Prior to delivery, ensure that suitable storage space is available to store materials in a well-ventilated area protected from weather, moisture, soiling, extreme temperatures, humidity, and corrosive atmospheres. Materials shall be protected during delivery and storage and shall not exceed the manufacturer-stated storage requirements. As a minimum, store indoors in clean, dry space with uniform temperature to prevent condensation. In addition, protect electronics from all forms of electrical and magnetic energy that could reasonably cause damage.

1-8.03. Deliver materials in supplier's or manufacturer's original wrappings and containers, labeled with supplier's or manufacturer's name, material or product brand name, and equipment tag number or service name as identified within the Contract Documents.

1-8.04. Inspect and report any concealed damage or violation of delivery, storage, and handling requirements.

PART 2 - PRODUCTS

2-1. PAD-MOUNTED, LIQUID-FILLED, MEDIUM VOLTAGE TRANSFORMERS

2-1.01. Regulatory Requirements

1. Transformers shall be designed, constructed, and rated in accordance with UL and NEMA standards. Transformers shall be UL listed and UL/FM certified to comply with NEC requirements for installations near buildings. Transformers shall comply with 10 CFR 431 as registered on US Department of Energy's Compliance Certification Database per 10 CFR 429.

2-1.02. Performance / Design Criteria

1. Site Conditions

   a. The transformer assembly and associated accessories shall be designed and constructed for operation under Site Conditions as listed in the Transformer Data Sheet in Part 4.

2. Ratings

   a. Continuous kVA Rating: 112.5 kVA ONAN

   b. Primary voltage, configuration, and basic impulse insulation level (BIL): 13200V, Delta, 95kV BIL

   c. Secondary voltage, configuration, and basic impulse insulation level (BIL): 480V, Grounded Wye, 30kV BIL

   d. The transformer shall be furnished with four, 2.5% voltage taps 2-FCAN, 2-FCBN, off load full capacity high-voltage taps.

   e. The average temperature rise of the windings shall be 65° C when the transformer is operated at rated kVA output in a 40° C ambient. The transformer shall be capable of being operated at rated load in a 30° C average, 40° C maximum ambient, as defined by IEEE C57.12.00 without loss of service life expectancy.

   f. The percent impedance voltage, as measured on the rated voltage connection, shall be: ~%5

   g. The transformer shall meet the energy efficiency requirements of the Department of Energy, Code of Federal Regulations 10 CFR 431 Subpart K Efficiency Levels.

   h. Transformer sound levels shall meet NEMA TR 1 requirements.

2-1.03. Transformer Construction

1. Pad-mounted enclosure shall contain all devices and accessories in a weather-resistant, tamper-proof enclosure. High and low voltage compartments shall be isolated from each other and interlocked such that the high voltage compartment cannot be opened unless the secondary compartment is opened.

2. Insulating Liquid shall be non-hazardous, biodegradable vegetable based FR3 oil, complying with ASTM D6871, and tested according to ASTM D117.

3. Transformer windings shall be copper.

4. The tank and components shall be gasketed and sealed to ensure a waterproof, leak-proof, corrosion-free unit. The cover shall be bolted or welded and the handhole fastenings tamper resistant.

5. Compartment depth shall be in accordance with IEEE Std C57.12.34 unless additional depth is specified in the transformer datasheet.

6. Door padlocking and secured with Hex or Penta-head type door bolts.

7. The base of the transformer shall be suitable for mounting on a flat slab type foundation and equipped with removable sills suitable for skidding, rolling or jacking.

8. Lifting lugs and jacking step with towing eye.

9. The exterior of the unit shall be painted green.

10. The tank shall be complete with a stainless steel laser engraved nameplate and connection diagram.

2-1.04. PRIMARY CONNECTION

1. The high voltage terminations and equipment shall be dead front.

2. Manually gang operated, oil immersed load break switching, Loop feed with two, two-position ON/OFF switches.

3. HV Bushings:

    a. Dead-front bushings shall be 200 Amp, either universal wells or one-piece integrated for use with separable connectors. Bushings shall be externally clamped and front removable. Provide each bushing well with matching bushing inserts and parking stands with insulated parking bushings.

4. Surge Arresters:

    a. Liquid-immersed Distribution Class Type: 10.2 kV MCOV rating in accordance with IEEE C62.11.

5. Fuse Protection:

    a. Provide Bay-O-Net liquid immersed fuses in series with oil immersed current-limiting fuses. Bay-O-Net fuses are to be externally replaceable with a hot-stick without opening the transformer tank.

6. Spare Fuses: For each transformer, provide three additional spare fuses, the same size as those installed. Spare fuses shall be shipped with the transformer.

7. External operated tap changer operable only when the transformer is deenergized. Equip with two 2 ½ % taps above and below normal. Equip with warning nameplate stating, “DO NOT OPERATE WHEN TRANSFORMER IS ENERGIZED.”

2-1.05. SECONDARY CONNECTION

1. Live-front construction

2. Secondary low-voltage molded epoxy bushings with externally removable tin plated copper spade terminals designed for copper conductors, dimensioned per ANSI C57.12.26. Number of holes shall be sufficient to accommodate the number of secondary conductors indicated on the drawings, with each pair of holes dedicated to one cable only.

3. Molded epoxy neutral bushing with neutral ground strap, removable, grounded to tank.

4. Grounding Pad

2-1.06. ACCESSORIES

1. Liquid level gauge, dial type.

2. Thermometer, dial type.

3. External drain valve with sampling device.

4. Pressure vacuum gauge

5. Pressure relief valve

2-2. IDENTIFICATION DEVICES

2-2.01. Provide equipment identification in accordance with the drawings and Section 16010 – Electrical Requirements.

2-3. SEISMIC RESTRAINTS

2-3.01. Design and fabricate transformers, and anchorage devices for them, to withstand static and seismic forces in any direction.

2-4. SOURCE QUALITY CONTROL

2-4.01. Factory Tests: Perform design and routine tests according to standards specified for components. Conduct transformer tests according to IEEE C57.12.90.

2-4.02. Factory Tests: Perform the following factory-certified tests on each transformer:

1. Resistance measurements of all windings on rated-voltage connection and on tap extreme connections.

2. Ratios on rated-voltage connection and on tap extreme connections.

3. Polarity and phase relation on rated-voltage connection.

4. No-load loss at rated voltage on rated-voltage connection.

5. Excitation current at rated voltage on rated-voltage connection.

6. Impedance and load loss at rated current on rated-voltage connection and on tap extreme connections.

7. Applied potential.

8. Induced potential.

PART 3 - EXECUTION

3-1. GENERAL

3-1.01. The work shall be installed as indicated in Section 16010 – Electrical General Requirements, and as described herein.

3-2. EXAMINATION/INSPECTION

3-2.01. Examine areas and conditions for compliance with requirements for pad-mounted transformers.

3-2.02. Examine roughing-in of conduits and grounding systems to verify the following:

1. Wiring entries comply with layout requirements.

2. Entries are within conduit-entry tolerances specified by manufacturer, and no feeders will have to cross section barriers to reach load or line lugs.

3-2.03. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

3-2.04. Verify that ground connections are in place and that requirements have been met as specified in Section 16062 - Grounding. Maximum ground resistance shall be 25 ohms at location of transformer.

3-2.05. Check factory made connections of transformer unit for mechanical security and electrical continuity.

3-2.06. Check transformer insulating liquid for correct quantity and specification according to manufacturer’s instructions.

3-2.07. Proceed with installation only after unsatisfactory conditions have been corrected.

3-3. INSTALLATION

3-3.01. Construct concrete bases of dimensions indicated on detailed shop drawings.

3-3.02. Ensure concrete pad is fully cured before transformer is installed.

3-3.03. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

3-3.04. Tack-weld or bolt transformers to channel-iron sills embedded in concrete bases. Install sills level and grout flush with floor or base.

3-3.05. Maintain minimum clearances and workspace at equipment according to manufacturer's written instructions and NFPA 70.

3-3.06. Make connections as indicated.

3-3.07. Connect transformer unit ground bus to system ground.

3-3.08. Ensure care is taken to prevent contamination of liquid and components when field filling transformers.

3-3.09. Use only metal hose when field-filling transformer with oil: never, under any circumstances, use rubber hose.

3-3.10. Set transformer taps to produce rated secondary voltage at no-load.

3-4. TESTING AND COMMISSIONING

3-4.01. Perform tests and document results in accordance NETA Standard for Acceptance Testing Specifications Section 7.2.2 Transformers, Liquid Filled and with Section 16010 - Electrical Requirements.

SECTION 16410

ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1-1. SUMMARY

1-1.01. Section Includes:
a. Non-fusible switches (Manual Transfer Switch).
b. Enclosed circuit breakers.
c. Enclosures.

1-1.02. Definitions
a. NC: Normally closed.
b. NO: Normally open.
c. SPDT: Single pole, double throw.

1-1.03. Action Submittals

1-1.04. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated.

1-1.05. Shop Drawings: For enclosed switches and circuit breakers. Include plans, elevations, sections, details, and attachments to other work.

1-1.06. Wiring Diagrams: For power, signal, and control wiring.

1-2. QUALITY ASSURANCE

1-2.01. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1-2.02. Comply with NFPA 70.

PART 2 - PRODUCTS

2-1. FUSIBLE SWITCHES

2-1.01 Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Eaton / Cutler-Hammer
b. General Electric Company
c. Siemens
d. Square D
e. Type GD, General Duty will not be accepted.
f. Type HD, Heavy Duty, Single Throw, 600-V ac: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position. The switch shall have label for on-off position.

2-1.02 Accessories:

a. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
b. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
c. Lugs: Suitable for number, size, and conductor material.

2-2. ENCLOSED CIRCUIT BREAKERS

2-2.01. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Eaton / Cutler-Hammer

b. General Electric Company

c. Siemens

d. Square D

2-2.02. General Requirements: Comply with UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents.

2-2.03. Circuit Breakers: Refer to Section 16412.

2-2.04. Features and Accessories:

a. Standard frame sizes, trip ratings, and number of poles.

2-2.05. Lugs: Suitable for number, size, trip ratings, and conductor material.

2-2.06. Application Listing: Appropriate for application.

2.3. ENCLOSURES

2-3.01. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.

2-3.02. Outdoor Locations: NEMA 4X, Type 304 Stainless Steel.

2-3.03. Indoor Locations: NEMA 4X, Type 304 Stainless Steel.

PART 3 - EXECUTION

3-1. INSTALLATION

3-1.01. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

3-1.02. Install fuses in fusible devices.

3-1.03. Comply with NECA 1.

3-2. IDENTIFICATION

3-2.01. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.

3-2.02. Label each enclosure with engraved metal or laminated-plastic nameplate.

3-3. FIELD QUALITY CONTROL

3-3.01. Perform tests and inspections.

3-3.02. Acceptance Testing Preparation:

a. Test insulation resistance for each enclosed switch and circuit breaker, component, connecting supply, feeder, and control circuit.
b. Test continuity of each circuit.

3-3.03. Tests and Inspections:

3-3.04. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

3-3.05. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

3-3.06. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

3-3.07. Prepare test and inspection reports, including a certified report that identifies enclosed switches and circuit breakers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 16412

LOW VOLTAGE CIRCUIT BREAKERS

PART 1 - GENERAL

1-1. SUMMARY

A. Section Includes: Low voltage circuit breakers as indicated on the Drawings and as specified.

1-1.01. References

A. National Electrical Manufacturers Association (NEMA): Standards Publication No. AB1.

B. National Electrical Code (NEC): Article 430-52.

PART 2 - PRODUCTS

2-1. MANUFACTURERS

2-1.01. Circuit Breakers: Manufacturers: One of the following or equal:

1. Cutler-Hammer.
2. General Electric Company.
3. Siemens.
4. Schneider Electric / Square D.

2-1.02. Motor Circuit Protectors: One of the following manufacturers or equal:

A. Cutler-Hammer.

B. General Electric Company.

C. Schneider Electric / Square D.

D. Siemens.

2-1.03. Circuit Breakers - Low Voltage

2-1.04. Circuit Breaker Frame and Trip Ratings: As indicated on the Drawings and coordinated with the ratings of the equipment actually furnished. Modify ratings where necessary to suit this equipment and in accordance with the short circuit fault analysis and protective device coordination study.

2-1.05. Circuit Breakers for Motor Control Centers: As specified and indicated on the Drawings. Where no indication of type is given on the Drawings, the following governs:

When an integral part of a UL-listed combination controller: Motor circuit protectors.

2-1.06. All other circuit breakers: Molded case circuit breakers.

2-1.07. Provide motor circuit protectors and circuit breakers with non-aluminum line and load terminals suitable for the required conductor type, size, and number of conductors.

2-1.08. Panelboard Circuit Breakers: Bolt-in type. Snap-in circuit breakers are not acceptable.

2-1.09. Breakers and Motor Circuit Protectors shall be listed and meet all applicable UL standards.

2-2. MOLDED-CASE CIRCUIT BREAKERS

2-2.01. The Main Service Circuit Breaker for each well house shall be for Separate Mounting: Air-break type, manually operated circuit breaker with electronic trip unit including adjustable longtime current setting, adjustable long time delay, adjustable short time pick-up, adjustable short time delay and frame size as indicated on the Drawings. The enclosure shall be 316 stainless steel.

2-2.02. Molded-Case Circuit Breakers: Ambient compensating which provides inverse time delay overload and instantaneous short circuit protection by means of a thermal magnetic element. Accomplish compensation by a secondary bimetal that will allow the breaker to carry rated current between 25 degrees Centigrade and 50 degrees Centigrade with tripping characteristics which are approximately the same throughout this temperature range.

2-2.03. On Breakers with Interchangeable, Thermal, Adjustable Magnetic Trip: The accessibility and position of the adjustment knob shall not be changed from those on the standard breaker.

2-2.04. Breakers: Operated by a handle and provided with a quick-make, quick- break switching mechanism that is mechanically trip free from the handle so that the contacts cannot be held closed against short circuits and abnormal currents.

2-2.05. Tripping Due to Overload, Short Circuit, or Ground Fault: Clearly indicate tripping by the handle automatically assuming a position between the manual ON and OFF positions.

2-2.06. Latch Surfaces: Ground and polished.

2-2.07. Poles: Constructed so they all open, close and trip simultaneously. Conform to the applicable requirements of NEMA Standard No. AB1.

2-2.08. Breakers: Completely enclosed in a molded case.

Non-Interchangeable Trip Breakers: Sealed covers.
Interchangeable Trip Breakers: Sealed trip unit to prevent tampering.
Ampere Ratings: Clearly visible.
Contacts: Non-welding silver alloy.
Arc Extinction: Accomplished by means of arc chutes.

2-2.09. Minimum Interrupting Ratings: At least equal to the available short circuit at the line terminals as determined by the CONTRACTOR's short circuit fault analysis and as accepted by the ENGINEER.

2-2.10. Molded Case Breakers shall meet standard UL-489

2-3. MOTOR CIRCUIT PROTECTORS

2-3.01. Motor Circuits: Protected by motor circuit protectors, as permitted by Item I below.

2-3.02. Motor Circuit Protectors: Operated by a handle and provided with a quick- make, quick-break switching mechanism that is mechanically trip free from the handle so that the contacts cannot be held closed against short circuits.

2-3.03. Tripping: Clearly indicated by the handle automatically assuming a position between the manual ON and OFF positions.

2-3.04. Latch Surfaces: Ground and polished.

2-3.05. Poles: Constructed so they all open, close, and trip simultaneously.

2-3.06. Motor Circuit Protectors: Completely enclosed in a molded case.

2-3.07. Trip Unit: Sealed to prevent tampering.

2-3.08. Ampere Ratings: Clearly visible.

2-3.09. Contacts: Non-welding silver alloy.

2-3.10. Arc Extinction: Accomplished by means of arc chutes.

2-3.11. Provide each pole of motor circuit protectors with instantaneous short circuit protection by means of a single adjustable magnetic only element. The single adjustment screw is to adjust all poles simultaneously.

2-3.12. Furnish motor circuit protectors with provision for locking the maximum achievable trip setting to values less than maximum obtainable trip setting. Each adjustment typically to have 8 main setting points and mid-setting points following a linear scale so that each point has a significant value within calibration tolerances.

2-3.13. Motor Circuit Protectors: Suitable for use with current limiters, having 100,000 ampere interrupting capacity and a built-in trip indicator, that are fully coordinated with the motor circuit protectors so that the motor circuit protectors will open all 3 phases if the limiter operates.

2-3.14. Current limiters shall be so constructed that they can only be replaced by an identical or similar limiter having the same interrupting capacity.

2-3.15. Minimum Interrupting Rating: At least equal to the available short circuit current at the line terminals as determined by the CONTRACTOR's short circuit fault analysis, but not less

than 65,000 RMS amperes.

2-3.16. Motor Circuit Protectors Continuous Current Rating: As specified herein or as indicated on the Drawings.

2-3.17. Setting: The motor circuit protectors setting shall be in accordance with the CONTRACTOR's protective device coordination study as accepted by the ENGINEER and in accordance with the motor circuit protectors manufacturer's recommendation based on motor nameplate current.

2-3.18. Utilize an instantaneous trip circuit breaker or motor circuit protector only as part of a listed combination motor controller which provides coordinated motor branch-circuit overload, and short-circuit and ground-fault protection in accordance with NEC Article 430-52.

PART 3 – EXECUTION

3-1. INSTALLATION

A. Provide separate mounted circuit breakers with adequate enclosure and handle for disconnecting means and lock-out features.

B. Provide circuit breakers on panelboards according to quantity and rating shown on panelboard schedule.

C. Mount circuit breakers as indicated on the Drawings.
   1. Provide adequate supporting pillars for circuit breakers to be located above ground or above decks, where there is no structural wall or surface for box mounting.

END OF SECTION

SECTION 16416

SURGE PROTECTIVE DEVICES

PART 1 - GENERAL

1-1. SUMMARY

A. Section Includes: Surge protective devices (SPD) for use on 480 and 208 volt, alternating current systems, including separate enclosure for mounting adjacent to motor control center, and separate enclosure for unit protecting power distribution panelboard in motor control center.

1-1.01. References

A. Underwriters' Laboratories, Inc. (UL):

1. 1449 - High Performance Suppression System, Rev.4
2. 1283 - High Frequency Extended Range Power Filter.

B. American National Standards Institute (ANSI):

1. C62.41 - Category C3 (Service Entrance).
2. C62.45 - Category C Surge.

1-1.02. Submittals

A. Shop Drawings: Include component layout and wiring terminations.

B. Product data.

C. Manufacturer's installation instructions.

D. Operating and maintenance data.

E. Warranties.

1-1.03. Quality Assurance

a) Manufacturer Qualifications: Manufacturer of surge protective device systems for minimum 5 years with satisfactory performance record.

b) Regulatory Requirements: UL rating of Surge protective device shall meet or exceed UL rating of panelboard, motor control center, or other equipment in which suppressor is installed. UL rating of equipment in which suppressor is installed shall not be affected by suppressor.

1-1.04. SEQUENCING AND SCHEDULING

Coordinate with and furnish suppressors to motor control center, and distribution panel manufacturer prior to shipment of equipment to site.

1-1.05. Warranty

Provide equipment with SPD protection and warranty to correct defective products for minimum period of 3 years in accordance with manufacturer's standard warranty.

PART 2 - PRODUCTS

2-2. SURGE PROTECTIVE DEVICES

2-2.01. Ratings: 277/480 volt grounded wye and 120/208 volt grounded wye.

2-2.02. Manufacturers: One of the following or equal:

1. Current Technology, TransGuard Model for motor control center installation or Series TG300 for external mounting.
2. Transtector, equivalent product.
3. Advanced Protection Technologies, equivalent product.
4. If furnished with MCC and/or panelboard, the manufacturer of the SPD unit can be the same as the MCC equipment.

2-2.03. Components:

1. 30 ampere circuit breaker and disconnect
2. Status indicating pilot lights.
3. Two dry contacts for remote status annunciation.
4. NEMA 4X enclosure.

2-2.04. Characteristics:

1. Single Pulse Surge Current Capacity per Phase: 600,000 amperes.
2. Capacity Per Protection Modes:

    a. L-N Mode: 300,000 amperes.
    b. L-G Mode: 300,000 amperes.
    c. N-G Mode: 300,000 amperes.
    d. L-L Mode: 300,000 amperes.

3. Surge Life Cycle: 1.2 by 50 micro-seconds 20 kilovolt open circuit voltage, 8/20 micro-second waveform 10 kiloamperes short circuit current Category C3 Bi-wave in accordance with ANSI C62.41 and C62.45.
4. Suppression and Filter Technology: Manufacturer's standard.
5. Continuous Operating Voltage: Minimum 115 percent of nominal.
6. Suppression Voltage In Protective Modes: As follows when tested in accordance with UL 1449:

a. For 480 volt systems:
   1) L-N: 800.
   2) L-G: 800.
   3) N-G: 800.
   4) L-L: 2000.

b. For 208 volt systems:
   1) L-N: 500.
   2) L-G: 500.
   3) N-G: 400.
   4) L-L: 600

7. EMI/RFI High Frequency Noise Power Filter:

Frequency	100 KHz	1 MHz	10 MHz	100 MHz
Attenuation (dB)	34	51	54	48
Attenuation Ratio	50:1	350:1	500:1	250:1

8. Minimum American Wire Gauge Copper in Surge or Noise Suppression Path: Number 6.
9. Field Replaceable Fusing: Current limiting, protecting each pole.

2-2.05. Spares: Furnish two of each unique surge protective device used in project as spare.

PART 3 - EXECUTION

3-1. INSTALLATION

A. Install suppressors in accordance with manufacturer's instructions.

END OF SECTION

SECTION 16470

PANELBOARDS AND GENERAL PURPOSE DRY TYPE TRANSFORMERS

PART 1 - GENERAL

1-1. THE SUMMARY

1-1.01. The CONTRACTOR shall provide panelboards and general purpose dry-type transformers, complete and operable, in accordance with the Contract Documents.

1-1.02. Single Manufacturer: Like products shall be the end product of one manufacturer in order to achieve standardization of appearance, operation, maintenance, spare parts, and manufacturer's services.

1-2. CONTRACTOR SUBMITTALS

a) Shop Drawings

b) Transformers

c) Dimension drawings

d) Technical certification sheets

e) Drawing of conduit entry/exit locations

f) Transformer ratings, including:

g) Voltage

h) Continuous current

i) Basic impulse level for equipment over 600 volts

j) KVA

k) Descriptive bulletins

l) Product sheets

m) Panelboards

n) Breaker layout drawings with dimensions and nameplate designations

o) Component list

p) Drawings of conduit entry/exit locations

q) Assembly ratings including:

r) Short circuit rating

s) Voltage

t) Continuous current

u) Cable terminal sizes

v) Descriptive bulletins

w) Product sheets

x) Installation information

y) Seismic certification and equipment anchorage details

PART 2 - PRODUCTS

2-1. GENERAL

2-1.01. Transformers.

2-1.02 The transformers shall be dry-type, designed, manufactured, and tested in accordance with the latest applicable standards of ANSI and NEMA.

2-1.03 Transformers shall be UL-listed and bear the UL label.

2-1.04. Panelboards.

2-1.05. Panelboards shall be dead front factory assembled. Panelboards shall comply with NEMA PB-1-Panelboards, as well as the provisions of UL 50 - Safety Enclosures for Electrical Equipment and UL 67 - Safety Panelboards. Panelboards used for service equipment shall be UL labeled for such use. Lighting panelboards shall be rated for 120/208 volt, 3 phase operation or 120/240 volt for single phase operation as indicated. Power panelboards shall be rated for 480 volts, 3 phase, 3 wire operation, unless indicated otherwise.

2-1.06. The manufacturer of the panelboard shall be the manufacturer of the major components within the assembly, including circuit breakers.

2-2. TRANSFORMERS

2-2.01. Energy Efficiency: Standard dry-type transformers shall meet the energy efficiency requirements of the Department of Energy Code of Federal Regulations (10 CFR PART 431), DOE 2016 Efficiency Levels.

2-2.02 Ratings.

2-2.03. KVA and voltage ratings shall be as indicated.

2-2.04. Transformers shall be designed for continuous operation at rated kVA, for 24 hours a day, 365 days a year operation, with normal life expectancy as defined in ANSI C57.96 - Guide for Loading Dry Type Distribution and Power Transformers.

Transformer sound levels shall not exceed the following ANSI and NEMA levels for self-cooled ratings:

Up to 9 kVA	40 dB
10 to 50 kVA	45 dB
51 to 150 kVA	50 dB

2-2.05. Construction

2-2.06 Insulation Systems

2-2.07 Transformers shall be insulated as follows:

a) 2 kVA and smaller: 150 deg C insulation system based upon 80 deg C rise.

b) to 15 kVA: 185 deg C insulation system based upon 115 deg C rise.

c) 15 kVA and larger: 220 deg C insulation system based upon 150 deg C rise.

d) Required performance shall be obtained without exceeding the above indicated temperature rise in a 40 deg C maximum ambient.

e) Insulation materials shall be flame-retardant and shall not support combustion as defined in ASTM D 635 - Test Method for Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position.

f) Transformer windings shall be copper.

g) Transformers shall have four 2-1/2 percent taps, 2 above and 2 below 480 volts.

h) Transformer shall include vibration dampeners between the core and the enclosure to minimize and isolate sound transmission.

i) Manufacturers: General Electric, Eaton, Schneider Electric/Square D Company, or equal.

2-3. PANELBOARDS

2-3.01. Ratings

1. Panelboards rated 240 VAC or less shall have short circuit ratings not less than 10,000 amperes RMS symmetrical or as indicated by the Short Circuit Study, whichever is greater.

2. Panelboards rated 480 VAC shall have short circuit ratings not less than 65,000 amperes RMS symmetrical or as indicated by the Protective Device Study, whichever is greater.

3. Panelboards shall be labeled with a UL short circuit rating. Series ratings are not acceptable.

2-3.02. CONSTRUCTION

1. Lighting and power distribution panels shall have tin-plated copper bus bars.

2. Breakers shall be one, 2, or 3 pole as indicated, with ampere trip ratings as required by the equipment. Breakers shall be quick-make and quick-break, inverse time trip characteristics, to trip free on overload or short circuit, and to indicate trip condition by the handle position.

3. The panels shall have hinged doors with combination catch and latch. The front panels shall be so arranged that when the plates are removed, the gutters, terminals and wiring will be exposed and accessible. The doors shall have inner doors within the plates to have only the breaker operating mechanism exposed when they are opened. Live conductors and terminals shall be concealed behind the plates.

4. Panelboards shall be rated for the intended voltage.

5. Circuit breakers shall be interchangeable and capable of being operated in any position as well as being removable from the front of the panelboard without disturbing adjacent units. No plug-in circuit breakers will be acceptable.

6. Panelboards shall be UL listed except for special enclosures which are not available with UL listing.

7. Panelboards shall be suitable for use as service entrance where indicated.

8. Manufacturers: General Electric, Eaton, Schneider Electric/Square D Company, or equal

PART 3 - EXECUTION

3-1. GENERAL

A. WORK of this Section shall be installed as indicated in Section 16010 - Electrical Requirements.

END OF SECTION

SECTION 16485

REDUCED VOLTAGE SOLID STATE MOTOR CONTROLLERS

PART 1 - GENERAL

1-1. QUALIFICATIONS

1-1.01. Manufacturer.

1. The manufacturer shall have a minimum of 25 years of experience in the manufacture of low voltage solid-state reduced-voltage controllers.

2. The approved manufacturers are:
   a) Rockwell Automation Allen-Bradley

1-1.02. Support.

1. The manufacturer shall maintain factory trained and authorized service facilities within 75 miles of the project and shall have a demonstrated record of service for at least the previous ten years.

2. Support personnel are to be direct employees of the manufacturer and be available 24 hours per day through a toll-free number.

3. The manufacturer shall provide all required start-up and training services.

1-1.03. Certification.

1. To ensure all quality and corrective action procedures are documented and implemented all manufacturing locations shall be certified to the ISO-9001 Series of Quality Standards.

2. Third party manufacturers and brand labeling shall not be allowed.

1-1.04. Definitions.

1. The Solid-State Reduced-Voltage Controller Unit shall refer to the actual controller unit with all specified accessories herein; that will be mounted within the specified enclosure.

1-2. REFERENCES

1-2.01. The controller shall be designed to meet or exceed the applicable requirements of the following agencies.

1. EN
2. UL

3. IEC

4. NEMA
5. IEEE

1-2.02. The following standards shall be met.

1. Creep distances and clearances 600V (UL) and 690V (IEC).

2. Power terminal markings per EN 50005 and EN 60947-4-2.

3. Dielectric withstand per UL 508 and IEC 947.

4. EMC Emission levels, Conducted Radio & Radiated: Class A per IEC60947-4-2.

5. EMC Immunity levels: per EN/IEC60947-4-2.

6. Surge withstand per IEEEC62.41 and IEC61000-4-5.

1-2.03. Environmental Requirements.

A. Confirm to specified service conditions during and after installation of products.

1-2.04. Submittals.

1-2.05. Refer to Section 16100 for procedure on submittal of final documentation.

1-2.06. The Contractor shall provide certification that the solid-state reduced-voltage controller has been installed in accordance with the manufacturer's instructions.

1-2.07. The Contractor shall provide certification that the Contractor has properly adjusted any timing devices required in the starting circuitry.

1-2.08. Final Drawings

1. The manufacturer shall provide final drawings reflecting the "As-Shipped" state of the installed equipment.

2. Manufacturer drawings shall be provided in DWG format.

3. Manufacturer drawings do not need to be stamped if a drawing schedule is provided that lists the drawing numbers, revision levels, and status of drawings (Preliminary, Approval, Final, etc.).

4. The Contractor shall be responsible for making any changes to the "As-Shipped" drawings from the manufacturer to reflect any field modifications. The manufacturer shall update the drawings to reflect the "As-Installed" condition based on the Contractor markups.

1-2.09. Test reports indicating manufacturer's standard testing were performed.

A. Maintenance Data

1. Solid-state reduced-voltage controller installation instructions and User Manual.

2. Installation / Operation instructions for major components such as circuit.

3. As-programmed parameter listing.

4. Field service report from start-up service.

5. Solid state reduced voltage controller spare parts listing and pricing.

6. Include name and phone number for a local distributor for the spare parts.

1-3. DELIVERY, STORAGE, AND HANDLING

1-3.01. The Contractor shall coordinate the shipping of equipment with the manufacturer.

1-3.02. The Contractor shall store the equipment in a clean and dry space.

1-3.03. The Contractor shall protect the units from dirt, water, construction debris and traffic.

1-3.04. During storage the Contractor shall connect internal space heaters (if specified) with temporary power and store the units in accordance with the manufacturer's written instructions.

1-3.05 FIELD MEASUREMENTS

A. The Contractor shall verify all field measurements prior to the fabrication of the solid state reduced voltage controller.

1-4. SPARE MATERIALS

1-4.01. Provide one (1) set of three (3) of each size power fuse utilized.

1-4.02. Provide spares equal to 10 percent of the installed quantity for primary and secondary control power fuses.

1-4.03. Provide one (1) spare control relay for each unique relay utilized on the project.

5-1. WARRANTY

1-5.01. The manufacturer shall provide their standard parts warranty for eighteen (18) months from the date of shipment or twelve (12) months from the date of being energized, whichever occurs first.

1-5.02. The manufacturer shall confirm this warranty as part of the submittal.

1-5.03. This warranty applies only to stand alone solid-state reduced-voltage controllers.

PART 2 - PRODUCTS

2-1. MANUFACTURER

2-1.01. The soft start shall be SMC-50 series as manufactured by Allen Bradley, no substitutions allowed.

2-1.02. RATINGS

A. The solid state reduced voltage controller shall accept an input voltage from 200…480V AC three-phase plus 10 percent or minus 15 percent.

B. The solid state reduced voltage controller shall have a short circuit current rating of 65 kA @ 480V

C. Environmental Ratings:

1. Storage ambient temperature range: -25…+75°C.

2. Operating ambient temperature range: -20…+50°C as standard and up to 65°C maximum with derating.

3. The relative humidity range: 5%…95% non-condensing.

4. Operating elevation: up to 2000 meters as standard and up to 4000 meters maximum with derating.

5. The manufacturer shall provide a tool for evaluating thermal capabilities of the solid state reduced voltage controller.

2-2. SOLID STATE REDUCED VOLTAGE CONTROLLER UNIT DESIGN

A. The enclosure-type controller device shall be modular, consisting of a power structure and a logic component.

B. Power Structure

1. The power structure shall include built-in electronic 3-phase current monitoring and overload protection.

2. Furnish starter with MOV protection modules.

3. The family of devices must be available from 1…520 A in a line motor connection

4. For devices rated 90…180 A, the power structure shall consist of three power poles with integral heat sinks in a single housing

5. For devices rated 210…520 A, the power structure shall consist of three power poles with integrated heat sinks and mounted separately for ease of maintenance

6. The power structure shall be modular in design and easily replaceable

7. Back-to-back SCR pairs shall be the only power switching semiconductor means acceptable. Diode-SCR (Silicon Controlled Rectifier) combinations shall not be acceptable.

8. SCRs shall have the following minimum repetitive peak inverse voltage ratings.
   a) 1400V for units rated 200…480V

9. SCRs shall have built in temperature monitoring sensors.

10. Use of an External bypass must be available as an option if internal bypass is not available, see drawings.

11. The manufacturer must supply guidance on obtaining Type 2 coordination per IEC 60947 4-2

12. Vendor to provide and install power available/phase sequence monitor. Monitor to be factor wired to terminal point ready for field installation.

    a) Manufacturer: Time Mark Corporation, Model C265

C. Logic Component / Control Module:

1. The logic component shall be a self-contained control module, compatible with the full range of power structures.

2. The control module shall provide continuous 32-bit digital microprocessor control and supervision of all controller operation, including pulse firing of all 6 SCRs.

3. The control module shall consist of the following.

   a) Self-tuning power supply accepting 24VDC control power input.
   b) SCR firing circuitry that incorporates an RC snubber network to prevent false firing.
   c) Input / output circuitry (two 24V DC inputs and 4 relay outputs standard).
   d) Four (4) DPI communication ports.
   e) Built in multi-color status LEDs.
   f) A reset push button on solid state reduced voltage controller.

4. The control terminals shall have the following characteristics

a) The control terminal wiring connector shall be easily removable and located on the front top of the device for easy access.
b) The terminals shall be UL rated for 600V, 7 mA maximum, and accept wires from #24 AWG…#14 AWG.
c) The terminals are UL Recognized to accept a maximum of two (2) #16 AWG wires per terminal.

5. The control module shall mount directly to the power structure.

6. The control module shall be easily removed from the power structure, without the need to disassemble associated printed circuit board assemblies.

7. The control module shall have conformal coated printed circuit boards as standard.

8. The control module shall have a battery backed time of day clock.

9. Additional selector switch (Hand, Off, Auto) shall be provided and mounted on the enclosure. The selector switch shall be factor wired utilizing the provided output to control and operated external well house exhaust fan.

D. Logic Components:

1. The controller shall have a dedicated bezel used to house an optional human interface module (HIM) for parameter configuration and monitoring.

The HIM shall have the following capabilities:

a) Full numeric tactile feedback keypad with integrated navigation.
b) Multi-language support.
c) Multi-line LCD display.
d) Dynamic soft keys that change function based on the display.
e) Remote mounting.

2. The controller shall have 4 option ports used to house user selectable option modules. These shall include the following:

a) Parameter configure module used to provide limited control parameter configuration using rotary position and SIP switches.
b) Digital input / output module: the module shall provide four (4) 24V DC inputs and four (4) relay outputs.
c) Motor PTC, ground fault, and external current transformer module. This module shall provide interface capability to all three (3) of the sensors.

2-3 SOLID STATE REDUCED VOLTAGE CONTROLLER UNIT MODES

A. Initial and Pre-Starting Modes:

1. Start Delay pre-start

a) Shall be programmable from 0…30 seconds.

2. Integral motor winding heater pre-start

a) The selectable start option will begin at the end of this option.
b) Programmable time from 0…1000 seconds.
c) Programmable current from 0…100% of full load current

3. Motor tuning function (initial start)

a) Either automatically initiated by the controller on the initial start sequence of the motor or manually initiated by user.

B. Starting Modes:

1. Soft start

a) Programmable initial torque value of 0…90% of locked rotor torque.
b) Programmable acceleration ramp time from 0…1000 seconds.
c) Current limit 50…600% of full load current.

2. Current limit start

a) Adjustable from 50…600% of motor full load current.
b) Adjustable ramp time from 0…1000 seconds.

3. Linear speed acceleration start

a) Programmable ramp time from 0…1000 seconds
b) Programmable initial torque value of 0…90% of locked rotor torque.
c) Programmable current limit from 50…600% of full load current.

4. Full voltage start

a) Provides across the line starting.
b) Ramp time shall be less than 0.1 seconds.

5. Selectable kickstart

a) A selectable kickstart, or boost, shall be provided at the beginning of the voltage ramp.
b) The kickstart shall provide an adjustable pulse of 0…90% of locked rotor torque.
c) The kickstart time shall be adjustable from 0…2 seconds.
d) Kickstart shall be available for soft start, current limit start, torque control start, pump start, and dual ramp start.

6. Pump start

a) Pump start and stop parameters are typically configured together.
b) Initial torque programmable from 0…90% of locked rotor torque.
c) Backspin timer programmable from 0…999 seconds.
d) Ramp time programmable from 0…1000 seconds.

7. Torque control start

a) Starting torque programmable from 0…300 percent of rated motor torque.
b) Maximum torque programmable from 0…300 percent of rated motor torque.
c) Ramp time programmable from 0…1000 seconds.

8. Dual ramp start

a) Provides two (2) separate start profiles with separately adjustable ramp times, current limit level, initial torque, starting and max torque, and kickstart time and level.
b) Ramp times programmable from 0…1000 seconds.
c) Current limit level programmable from 50…600% full load current.
d) Initial torque programmable from 0…90% of locked rotor torque.
e) Starting and maximum torque programmable from 0…300% of locked rotor torque.

9. Timed start

a) Forces the starting profile to complete the entire user-configured ramp time before applying full voltage.

10. Start delay

a) User configurable start delay of 0…30 seconds from the point when the start command is enabled until the start sequence actually occurs.
b) Applies to any start mode.

11. Backspin

a) Provided in order to avoid starting a motor into a backspin condition.
b) The user-configured time begins to count down after a stop maneuver is complete
c) All start inputs are ignored until the backspin timer has timed out.

C. Stopping Modes:

1. Coast-to-stop

a) No further parameters needed.

2. Soft stop

a) The soft stop option shall provide a voltage ramp-down for an extended motor stopping time.
b) Soft stop shall be initiated by a dedicated Soft Stop input. A coast-to-rest stop shall still be possible with a separate stop input.
c) Stop time programmable from 0…999 seconds.
d) The load shall stop when the motor voltage drops to a point where the load torque is greater than the motor torque.

3. Linear speed deceleration

a) Stop time programmable from 0…999 seconds.
b) Current limit level programmable from 50…600% of full load current.

4. Pump stop

a) The pump control option shall be implemented to provide closed loop control of a motor to match the specific torque requirements of centrifugal pumps for both starting and stopping.
b) This shall aid in eliminating the phenomena commonly referred to as “water hammer.”
c) Stop time programmable from 0…999 seconds.
d) Pump pedestal programmable from 0…50%.
e) See section 2.03 B 6 for more information.

D. Braking Control Modes:

1. Smart Motor Braking, SMB

a) Stop time programmable from 0…999 seconds.
b) Braking current programmable from 0…400% of full load current.

2. Accu-Stop

a) Provide a brake from full speed to a present slow speed and then a brake or coast to stop.
b) Requires four (4) settings:
    1. SMB setting
    2. A control input that is set for stop
    3. A second input that is set for start
    4. A third input that is set for slow speed

3. External Braking Control

a) Will remove power from the motor and enable an external mechanism to brake the motor during the user configured stop time from 0…999 seconds.
b) When the stop time is complete, the unit will open the auxiliary output and switch to the stopped state.

4. Preset slow speed

a) Provides a slow speed for applications requiring a slow speed.
b) The preset slow speed option shall provide two jog speeds in the forward direction: high (15% of base speed) and low (7% of base speed).
c) The preset slow speed option shall provide two jog speeds in the reverse direction: high (20% of base speed) and low (10% of base speed). Reverse operation of the motor shall be available in the jog mode without the use of a reversing contactor.
d) The starting current for the slow speed operation shall be user adjustable from 0…450% of the motor's full load current rating.
e) The running current for the slow speed operation shall be user adjustable from 0…450% of the motor's full load current rating.

E. Running Modes

1. SCR Control – Normal Run Operation

a) The unit shall run at full voltage when the unit is at full speed and no external bypass contactor is provided.

2. SCR Control – Energy Saver Run Operation

a) Only applies during light motor load situations when enabled by user
b) The controller reduces current to the motor and thereby saves energy

3. External Bypass – Run Operation (Optional Requirement – See Drawings)

a) An external bypass contactor shall be configured to operate the motor while running at full voltage and speed.
b) The controller shall control the external bypass contactor by using one of the auxiliary relay outputs configured to Ext. Bypass using the output's configuration parameter
c) For units rated 210…520 A operation in external bypass mode with current feedback can be accomplished using the internal current sensors and an optional current feedback mounting kit.

4. Emergency Run

a) A control terminal or network input can be configured as the Emergency Run command input.
b) When this input is active all faults are disabled.

2.4 SOLID STATE REDUCED VOLTAGE CONTROLLER UNIT FEATURES

A. Overload Protection

1. Shall meet applicable standards as a motor thermal protective device.

2. Shall utilize three-phase current sensing. The use of two current transformers shall be unacceptable.

3. Make available selectable trip class settings from 5…30 in increments of 1 as standard.

4. Electronic thermal memory shall provide enhanced motor protection.

5. Shall provide alternative overload capabilities based on Over Power conditions

B. Digital Outputs

1. A minimum of two (4) auxiliary contacts shall be provided, as standard, for customer use.

2. The contacts shall be rated for 120VAC maximum.

3. Functional operation of the contacts shall be programmable for: normal, up-to speed, Ext. bypass, Ext brake, aux control, network 1-4.

4. The relay contacts shall be programmable for normally open (N.O.) or normally closed (N.C.) operation.

5. The controller shall be scalable to enable adding up to nine (9) outputs.

C. DPI Serial Communication Port

1. Four (4) DPI serial communication ports shall be provided as standard.

2. A separate port that supports optional communication protocol interface modules that shall be available for connection to DH485, MODBUS/TCP, ControlNet, DeviceNet, RS485.

D. Metering – the controller shall provide the following motor and/or power system metering functions indicated through the optional LCD display.

1. Three-phase current
   a) Current per phase
   b) Current average

2. Three-phase voltage
   a) Volts per phase, phase to phase
   b) Volts, average phase to phase
   c) Volts, phase to neutral
   d) Volts, average phase to neutral

3. Torque in percent of maximum

4. Power in Mega Watts (MW)
   a) Real power per phase
   b) Real power

c) Real demand d) Maximum real demand

5. Reactive power in Mega VAR (MVAR)
   a) Reactive power per phase
   b) Reactive power
   c) Reactive demand
   d) Maximum reactive demand

6. Apparent power in Mega VA (MVA)
   a) Apparent power per phase
   b) Apparent power
   c) Apparent demand
   d) Maximum apparent demand

7. Energy in Mega Watt hours (MWh)
   a) Real energy
   b) Real demand

8. Apparent energy in Mega VA hours (MVAh)

9. Power factor
   a) Power factor

10. Energy savings in percent

11. Elapsed time in hours
   a) Elapsed time, resettable
   b) Elapsed time 2, not resettable

12. Running time in hours

13. Motor speed in percent of full speed

14. Actual start time (last 5 starts) in seconds

15. Peak start current (last 5 starts) in Amps

16. Total starts

17. Total Harmonic Distortion (THD)
   a) THD of voltage per phase in percent
   b) THD of current per phase in percent

18. Line frequency in Hertz

19. Current imbalance in percent

20. Voltage unbalance in percent

21. Event log of last 100 events including start, stops, faults, alarms, and parameter changes

E. Protection and Diagnostics

1. Pre-start line fault advising of shorted SCR or missing load connection with phase indication.

2. Running line fault advising power loss, shorted SCR, or missing load connection.

3. Pre-start power loss with phase indication.

4. Over temperature.

5. Open gate with phase indication.
.
6. The following programmable protection shall be provided as standard with the controller.

   a) Overload
   b) Underload
   c) Undervoltage
   d) Overvoltage
   e) Current imbalance
   f) Voltage unbalance
   g) Phase reversal
   h) High and low line frequency
   i) Stall
   j) Jam
   k) Real power
      1. Motor over power real
      2. Motor under power real
   l) Apparent power
      1. Motor over power apparent
      2. Motor under power apparent
   m) Power factor
   n) Excessive starts per hour
   o) Preventive maintenance
      1. Preventive maintenance hours
      2. Preventive maintenance starts
   p) Line loss
   q) Silicon-Controller Rectifier (SCR) Specific protection
      1. SCR shorted
      2. SCR over temperature
      3. Open SCR gate

7. When fault conditions are detected, the controller shall inhibit starting or shutting down SCR pulse firing.

8. A Snapshot record maintains historical data that describes certain conditions that existed prior to a protection fault. The following instantaneous values should be available:

   a) Volts Phase A-B
   b) Volts Phase B-C
   c) Volts Phase C-A
   d) Current Phase A
   e) Current Phase B
   f) Current Phase C
   g) Power Factor
   h) MtrTherm Usage
   i) Motor Speed
   j) THD Vave
   k) THD Iave
   l) Product Status
   m) Board Temp
   n) Line Frequency
   o) Peak Vline A-N (for Shorted SCR faults)
   p) Peak Vline B-N (for Shorted SCR faults)
   q) Peak Vline C-N (for Shorted SCR faults)
   r) Peak I A (for Shorted SCR faults)
   s) Peak I B (for Shorted SCR faults)
   t) Peak I C (for Shorted SCR faults)

9. Fault diagnostics shall be indicated by a multi-color LED as standard, four (4) diagnostic LEDs on the option module, or by descriptive text on the optional LCD display. (The exclusive use of fault codes is unacceptable.)

10. An auxiliary contact that is user programmable for fault indication shall be provided for customer use.

11. Meter accuracy for diagnostics shall be accurate to 3% over nominal sensing range for current and 1% over entire range for voltage.

2-5 HMI

A. LCD Display

1. An alphanumeric, backlit LCD display shall be provided for controller set-up, diagnostics, status and monitoring. The display shall be four-line, 16 characters minimum.

2. Digital parameter adjustment shall be provided through a keypad. Analog potentiometer adjustments are not acceptable.

3. Mount the HIM display on the starter door so it can be adjusted without opening the panel door.

PART 3 - EXECUTION

3-1 MANUFACTURER'S SERVICES

A. The service division of the manufacturer shall perform all start-up services.

B. Start-up personnel shall be direct employees of the manufacturer and shall be factory trained.

C. At a minimum, the start-up service shall include:

1. Pre-power check
   a) Megger motor resistance: phase-to-phase and phase-to-ground
   b) Verify system grounding per manufacturer's specifications
   c) Verify power and signal grounds
   d) Check connections
   e) Check environment

2. Power-up and commissioning
   a) Measure incoming power phase-to-phase and phase-to-ground
   b) Measure DC bus voltage
   c) Measure AC current unloaded and loaded
   d) Measure output voltage phase-to-phase and phase-to-ground
3. Recording of all measurements
4. Tuning for system operation
5. Providing a parameter list

3.-1.01 TRAINING

A. Manufacturer to provide a quantity of one (1) session of on-site instruction.

B. The service engineer shall perform training.

C. The instruction shall include the operational and maintenance requirements of the controller.

D. The basis of the training shall be the installed controller, the engineered drawings and the user manual. At a minimum, the training shall do the following:

1. Review of the engineered drawings identifying the components shown on the drawings.
2. Review starting / stopping options for the controller.
3. Review operation of the Human Interface for programming and monitoring of the controller.
4. Review the maintenance requirements of the controller.
5. Review safety concerns with operating the controller.

END OF SECTION

SECTION 16670

LIGHTNING PROTECTION SYSTEM

PART 1 - GENERAL

1-1. THE SUMMARY

1-1.01. The CONTRACTOR, through a qualified Subcontractor, shall design and provide a lightning protection system, complete and operable, as indicated in accordance with the Contract Documents.

1-1.02. The lightning protection Subcontractor shall be certified by the Lightning Protection Institute (LPI), for both the design and the installation of the lightning protection system.

1-1.03. Reference Specifications, Codes, And Standards

Codes

a) NFPA 780 Standard for the Installation of Lightning Protection Systems

b) NFPA 70 National Electric Code

c) UL 96A Lightning Protection Components

d) LPI-175 Lightning Protection Institute Installation Code

1-1.04. Contractor Submittals

1. Furnish Shop Drawings in accordance with the requirements of Section 16010 – Electrical Requirements.

2. Products: Furnish manufacturer’s catalog data for all materials.

3. Drawings.

4. Furnish a scaled drawing of the facility showing the lightning protection system.

5. The drawing shall show, at a minimum:

    a. The location of air terminals.

    b. The routing of conductors.

    c. Connections to the electrical grounding system and ground rods.

    d. Details of air terminal mounting and bonding to vents, chimneys, antennas, and other metallic structures.

    e. Cross-reference the materials provided with the manufacturer’s catalog numbers and cuts.

PART 2 - PRODUCTS

2-1 GENERAL

1. Products shall be UL-listed for use in lightning protection systems.

2. Products shall be Class I for structures not greater than 75 feet high and Class II for structures higher than 75 feet.

3. Air terminals shall be of copper construction.

2-1.01. Air Terminals

1. Air terminals shall project a minimum of 10 inches above the objects protected, and shall be located at intervals not exceeding 20 feet along ridges and around the perimeter of flat roof or gently sloping roofs.

2. Flat or gently sloping roofs exceeding 50 feet in width shall be provided with additional air terminals at intervals not exceeding 50 feet on the flat or gently sloping area.

3. Locate air terminals within 24 inches of the roof edge and outside corners of the protected area.

4. Provide air terminals for metal stacks, flues, and mechanical equipment having a metal thickness of less than 3/16 inch and not within a zone of protection of an air terminal.

5. Equipment with a metal thickness 3/16 inch or greater shall be bonded in accordance with code requirements.

6. Air terminals shall be No. 71, 1/2-inch by 12-inch (or longer, as required), constructed of solid copper, and shall use air terminal bases of cast bronze construction.

2-1.02. Conductors

1. Structures Less than 75 Feet High.

2. With Aluminum Roofs.

3. Main size conductors on the roof shall be No. 29, Class I copper lightning conductor, consisting of 29 strands of 17 AWG copper wire weighing 190 lbs. per 1000 feet.

4. Secondary bonding conductors shall be No. 14, secondary bonding conductor, consisting of 14 strands of 17 AWG copper wire.

2-1.03. Down Conductors

1. Down conductors shall be No. 29, Class I copper lightning conductor.

2. Conceal down conductors in exterior wall construction.

3. Use bimetallic connectors for the transition from aluminum roof conductors to copper down conductors.

2-1.04. Down Conductors

1. Down conductors shall be No. 29, Class I copper lightning conductor.

2. Conceal down conductors in exterior wall construction.

3. Provide buildings over 60 feet high with a conductor counterpoise cable constructed of 29/17 copper in conformance with NFPA code requirements.

2-1.05. Miscellaneous Hardware

1. Provide miscellaneous hardware as may be required for the installation of the lightning protection system.

2. The hardware shall be compatible with the indicated air terminal and conductor materials.

3. Nuts, bolts, and other fasteners shall be constructed of stainless steel.

4. Corrosion Protection

5. Provide corrosion protection at the junctions of dissimilar metals and at locations where the components of the lighting protection system may be subjected to corrosion.

6. Use bimetallic connectors and fittings for splicing and bonding dissimilar metals.

7. Bimetallic connectors shall be located not less than 18 inches above grade.

8. Copper components within 24 inches of a chimney or vent emitting corrosive gases shall be protected by a hot-dipped lead coating or by another method as approved by the ENGINEER.

2-1.06. Grounding Materials

1. Ground rods and ground conductors shall conform to the requirements of Section 16062 – Grounding.

2. Down conductors shall be connected to the ground rods using exothermic weld connections.

3. Structural Steel System.

4. Structural steel may be substituted for down conductors.

5. Roof penetrations from steel to perimeter cables shall be at intervals not exceeding 100 feet in accordance with the requirements of UL 96A, LPI 175, and NFPA 780.

6. Use exothermic welds for steel connections.

PART 3 - EXECUTION

3-1 GENERAL

1. The lightning protection system shall be installed in accordance with applicable code requirements by a Subcontractor certified in the following organizations:

    a. NFPA

    b. LPI

    c. UL

2. Bends in conductors shall be gradual, utilizing a radius of 8-inches or greater and forming an angle of at least 90 degrees.

3-1.01. Roof Penetrations

1. Roof penetrations shall be made using a conduit sleeve passing through a pitch pocket.

2. The CONTRACTOR shall construct the pitch pockets in such a way as to maintain the roofing integrity.

3-1.02. Interconnections Of Metals

1. Metal bodies within 6 feet of the conductor shall be bonded to the system with approved fittings and conductor.

2. Bonding of metallic objects and systems at roof levels and elsewhere on the structure shall be complete.

3. The primary bonds for metal bodies of conductance, which shall include the following items, shall be bonded with appropriate fittings and full-size conductor:

    - Roof mechanical equipment (where applicable).

    - Metal openings/hatches.

    - Exterior architectural metal fascia, curtain walls, or mullions, which extend the full height of the structure, shall be bonded, if not inherently bonded through the building frame.

    - Metal Bodies of Conductance

    - Metal bodies of inductance located within 6 feet of a conductor or object with secondary bonds shall be bonded with secondary cable and fittings.

4. Typical of these are:

    a) Roof flashings

    b) Parapet coping

    c) Gravel guards

    d) Isolated metal building panels or siding

    e) Roof drains and down spouts

    f) Roof insulation vents

    g) Other sizeable miscellaneous metal fabrications

3-1.03. Inspection And Acceptance

1. The lightning protection system shall be inspected, tested, and certified.
2. The CONTRACTOR shall retain the services of an independent inspector.
3. An LPI/UL Certificate of Inspection shall be furnished to the ENGINEER.

END OF SECTION

THIS PAGE LEFT BLANK INTENTIONALLY

SECTION 16951

FUNCTIONAL TESTING

PART 1 - GENERAL

1-1. SUMMARY

A. Section Includes: Electrical equipment and system testing requirements for the complete facility, including the following:

B.

1. Testing for each Well pump system

2. Operational Testing.

1-1.01. Submittals - Start-Up Plan

A. Provide functional testing plans and procedures for all project equipment and systems and for all modes of operation. Functional testing procedures shall be in the cause and effect format.

1-1.02. General Testing Procedures

A. Electrical Systems: As specified in this Section and the individual equipment specification sections.

1. Electrical testing shall be performed in two stages. The first stage shall consist of electrical equipment testing prior to energization and operation of electrical equipment. The following shall be submitted for OWNER and ENGINEER review prior to equipment startup and energization:

a. Completed field calibration, loop acceptance, and end-to-end acceptance testing data forms.
b. The following completed electrical equipment testing data forms:

1) Low-Voltage Cables.
2) Grounding Systems.
3) Rotating Machinery: AC Motors.

2. The second stage of testing shall involve the completion of functional testing which include all possible operating scenarios, alarm conditions, prohibitive interlocks, and indication functions. Contractor shall perform a “dry run” for all functional tests to ensure that systems are working properly prior to witnessing by the OWNER. After the “dry run” is successfully completed, CONTRACTOR shall provide minimum 48 hours notice to the OWNER that systems are ready for witnessed functional testing. The OWNER will witness functional testing and will initial all functional testing forms upon successful operation of systems.

1-1.03. Functional Testing

A. Functional testing shall not begin until Stages 1 of Electrical Testing have been completed for individual systems or pieces of equipment.

B. Functional testing shall be performed in multiple phases according to the completion and construction schedule of allowed maximum quantity of three to four well houses, that would be modified, in order to maintain the remainder wellfield in continuous operation.

C. The CONTRACTOR is responsible for functional testing for all project equipment and systems in all modes of operation.

D. Functionally test mechanical and electrical equipment for proper operation after general start-up and testing tasks have been completed for individual systems or pieces of equipment.

E. Verify that Controls of the well pump operate to the satisfaction of the Owner Representative.

F. Interconnection of the well pump controls and monitoring system with the new site PLC and SCADA command center controls shall be tested, and operation of the control system shall include verification with (Tampa Bay Water District) SCADA command center that the local well controls are functioning in remote mode, including well house control features such as existing security system, well level controls and existing ancillary instrumentation, such as water pressure transmitters and water flow meters.

1-1.04. Record Keeping

A. Maintain and submit following records generated during functional testing:

1. Daily logs of equipment testing identifying all tests conducted and outcome.

2. Data sheets of testing.

PART 2 – PRODUCTS (NOT USED)

PART 3 – EXECUTION (NOT USED)

END OF SECTION

SECTION 17500

INSTRUMENTATION AND CONTROL SYSTEM

PART 1 - GENERAL

1-1. SCOPE

1-1.01. This section covers the furnishing and installation of an instrumentation and control system The system shall be furnished as specified, complete with all hardware, input/output hardware, instrumentation, and all devices, accessories, appurtenances, testing, system commissioning and training necessary for proper operation.

1-1.02. PLC programming is the responsibility of Tampa Bay Water and is not in the scope of the contractor with exception for loading the PLC testing program furnished by Tampa Bay Water.

1-1.03. Associated Sections. This section also includes the equipment and services specified in the following sections.

Section 17530	PLC CONTROL PANELS
Section 17530-A	PLC INPUT OUTPUT LIST
Section 17560	INSTRUMENTATION – GENERAL REQUIREMENTS
Section 17562	FLOW INSTRUMENTS
Section 17563	PRESSURE INSTRUMENTS
Section 17565	MISCELLANEOUS INSTRUMENTS

1-2. GENERAL

1-2.01. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Designer.

1-2.02. General Equipment Stipulations. If requirements in this specification differ from those in a referenced General Equipment Stipulations, the requirements specified herein shall take precedence.

1-2.03. Drawings. The drawings indicate locations and arrangements of equipment and may include installation details, block DIAGRAMS, and one-line diagrams showing connections and interfaces with other equipment. The input/output (I/O) lists are attached as an appendix to the Programmable Logic Controllers section.

1-2.04. Principal components of the instrumentation systems shall be as indicated on the P&ID drawings and instrument device schedule attached to this section.

1-2.05. 1-2.03. Codes, Permits and Agency Approvals. All work performed and all materials used shall be in accordance with the 2020 National Electrical Code, and with applicable local regulations and ordinances. Where mandated by codes, panels, assemblies, materials, and equipment shall be listed by Underwriters' Laboratories. The Contractor shall, as part of his work, arrange for and obtain all necessary permits, inspections, and approvals by the authorities having local jurisdiction of such work. This shall include any third-party inspections and testing of panels and equipment.

1-2.06. Supplier's Qualifications. Equipment and software furnished under this section and under other related sections listed in the Scope paragraph above shall be designed, coordinated, and supplied by a single manufacturer or supplier, hereinafter referred to as the System Supplier. The System Supplier shall be regularly engaged in the business of supplying computer-based monitoring, control, and data acquisition systems. The Contractor shall utilize the services of a Tampa Bay Water pre-qualified System Supplier to coordinate all control system related items, to approve installation, calibrate and commission field instruments, and to perform all testing, training, and startup activities specified to be provided. Tampa Bay Water will supply an approved System Supplier list upon request.

1-2.07. Coordination. Systems supplied under this section shall be designed and coordinated by System Supplier for proper operation with related equipment and materials furnished by other suppliers under other sections of these specifications, under other contracts, and, where applicable, with related existing equipment. All equipment shall be designed and installed in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the manufacturer, and the manufacturer of the related equipment.

1-2.08. Related Equipment and Materials. Related equipment and materials may include, but will not be limited to, instrumentation, motor controllers, measuring devices, conduit, cable, and piping as described in other sections or furnished under other contracts.

1-2.09. Device Tag Numbering System. All devices shall be provided with permanent identification tags. The tag numbers shall agree with System Supplier's equipment drawings and shall be as close as practical to the tag numbers used on the project drawings and device schedules. All field-mounted transmitters and devices shall have stamped stainless steel identification tags. Panel, subpanel, and rack-mounted devices shall have laminated phenolic identification tags securely fastened to the device. Hand-lettered or tape labels will not be acceptable.

1-3. GENERAL REQUIREMENTS

1-3.01. The drawings and specifications indicate the extent and general arrangement of the systems.

1-3.02. If any departures from the drawings or specifications are deemed necessary by System Supplier, details of such departures and the reasons shall be submitted to ENGINEER for review with or before the first stage submittal. No departures shall be made without prior written acceptance.

1-3.03. The specifications describe the minimum requirements for hardware and software. Where System Supplier's standard configuration includes additional items of equipment or

software features not specifically described herein, such equipment or features shall be furnished as a part of the system and shall be warranted as specified herein.

1-3.04. Governing Standards. Equipment furnished under this section shall be designed, constructed, and tested in accordance with IEEE 519, ANSI C37.90, FCC Part 15 - Class A, and NEMA ICS-1-109.60.

1-3.05. Dimensional Restrictions. Layout dimensions will vary between manufacturers and the layout area indicated on the drawings is based on typical values. The System Supplier shall review the contract drawings, the manufacturer's layout drawings and installation requirements, and make any modifications requisite for proper installation subject to acceptance by ENGINEER. At least three feet of clear access space shall be provided in front of all components of the instrumentation and control system components.

1-3.06. Workmanship and Materials. System Supplier shall guarantee all equipment against faulty or inadequate design, improper assembly or erection, defective workmanship or materials, and leakage, breakage, or other failure. Materials shall be suitable for service conditions.

1-3.07. All equipment shall be designed, fabricated, and assembled in accordance with recognized and acceptable engineering and shop practice. Individual parts shall be manufactured to standard sizes and thicknesses so that repair parts, furnished at any time, can be installed in the field. Like parts of duplicate units shall be interchangeable. Equipment shall not have been in service at any time prior to delivery, except for testing.

1-3.08. Corrosive Fluids. All parts which are exposed to corrosive conditions shall be made from corrosion resistant materials. System Supplier shall submit certification that the instrument manufacturer approves the selection of materials of primary elements that are in contact with the specified process fluid to be inert to the effects of the process fluid.

1-3.09. Appurtenances. Signal converters, signal boosters, amplifiers, special power supplies, special cable, special grounding, and isolation devices shall be furnished as needed for proper performance of the equipment.

1-3.10. Programming Devices. A programming or system-configuring device shall be provided for systems that contain any equipment that requires such a device for routine calibration, maintenance, and troubleshooting. The programming device shall be complete, newly purchased for this project, and shall be in like-new condition when turned over to OWNER at completion of start-up.

1-4. SUBMITTALS

1-4.01. Complete dimensional, assembly, and installation drawings, wiring and schematic diagrams; and details, specifications, and data covering the materials used and the parts, devices and accessories forming a part of the system furnished, shall be submitted in accordance with the submittals section, and as described below.

1-4.02. Submittal data shall be grouped and submitted in three separate stages. The submittals for each stage shall be completed before submittals of subsequent stages are submitted. Incomplete submittals, submittals not conforming to the submittal requirements,

individual drawings and data sheets submitted at random intervals will not be accepted for review and returned.

1-4.03. Review or approval of submittals shall not relieve the Contractor from providing a complete and functional system.

1-4.04. Submit, in accordance with any referenced project submittals section and Section 01300, shop drawings to establish compliance with the project specifications and drawings. These shop drawings shall fully demonstrate that the equipment and services to be furnished will comply with the provisions of this Section and shall provide a true and complete record of the equipment as manufactured and delivered.

1-4.05. Submittals shall be made in both electronic and hardcopy format. Electronic submittal shall be in Adobe Portable Document Format 'pdf'. Hardcopy of submittals shall be bound in separate three-ring 'D' binders no larger than 3 inches, with an index, sectional dividers, and with all drawings reduced to a minimum size of 11-in by 17-in for inclusion within the binder. Submittals shall be made as follows:

1-4.06. 1-4.01. Field Instruments. This submittal shall provide complete documentation of all field instruments using ISA-20 format. A complete Bill of Materials (BOM) listing all instrumentation equipment shall be provided.

1-4.07. Provide ISA data sheets and/or equipment specification sheets for each instrument listing model numbers, options, and ancillary devices that are being provided. Provide an index, proper identification, and P&ID tag cross referencing. The sheets shall include, but not be limited to, the following information:

a. Instrument P&ID ISA tag number.
b. Instrument description, location and process function.
c. Manufacturer's complete model number.
d. Instrument maximum performance specifications.
e. Instrument calibrated range.
f. Instrument input - output signal characteristics.
g. Instrument accuracy.
h. Instrument repeatability.
i. Instrument materials of construction.
j. Environmental specifications.
k. Electrical and/or pneumatic requirements.
l. Electrical hazardous area classification.
m. Physical size with dimensions, enclosure NEMA classification, and mounting details.
n. Specific mounting or installation details including calibration manifolds, mounting brackets, etc. furnished with the instrument.
o. Calibration or communications protocols provided(Hart, fieldbus, etc).
p. Isolation diaphragm provided

q. Additional instrument options or calibration / test equipment provided
r. Instrument sizing calculations where applicable

1-4.08. PLC Control System Hardware: This submittal shall provide complete documentation of the proposed hardware (PLC's, termination cabinets, communication equipment, cables, peripherals, etc.). A complete Bill of Materials (BOM) listing all equipment shall be provided. The submittal shall include the following as a minimum:

a. A complete schematic system block diagram(s) showing the interconnections between major hardware components including, but not limited to: panels, power supplies, consoles, telemetry equipment, local PLC processors, Uninterruptible Power Supplies (UPS), and vendor supplied PLC equipment. Include Ethernet address, field bus node address, Modbus node address, etc. as applicable.
b. Furnish a manufacturer's cut sheet for each hardware component listing all model numbers, options, auxiliary and ancillary devices that are being provided. Provide an index, proper identification, and cross referencing. The cut sheets shall include, but not be limited to the following data: P&ID Drawing ISA tag number (if applicable), device name and function, manufacturer's complete model number, device location, device environmental and electrical requirements, communications protocols, and device hazardous area classification (if applicable).
c. Provide a PLC Input/Output(I/O) list for all signals connected to each PLC. The list shall be organized by PLCs. The I/O list shall be submitted in a Microsoft Excel™ 2019 or later electronic file format on a CD and on 8 ½ by 11 hard copy. The list shall contain the following fields: PLC tag, point ISA tag, point description, I/O type (AI, AO, DI, DO, Spare), analog calibrated range in engineering units, digital point active state and analog signal alarm limits.

1-4.09. Control Panels and Panel Mounted equipment. This submittal shall provide complete documentation of all control panels, panel instruments, field surge protection devices, and panel components. A complete Bill of Materials (BOM) listing all instrumentation and control equipment shall be provided. The submittal shall include the following:

a. Provide equipment specification cut sheets for each panel component provided clearly listing all model numbers, options, electrical characteristics, environmental characteristics and performance ratings. Provide an index, proper identification, and cross referencing to P&ID tags as applicable.
b. Provide a field wiring, panel wiring, panel field terminals, and conduit identification scheme for use in panel construction and field terminations.
c. Provide detailed drawings for all control panels, consoles and/or enclosures which shall include:
    1. Panel assembly and layout Drawings to scale. Drawings shall include base, front, and interior subpanel layouts.
    2. Panel materials of construction, NEMA rating, mounting details, and optional accessories (sun shields, air conditioning).
    3. Panel internal wiring diagrams showing all power connections, panel power

derivation and distribution, fuse and circuit breaker sizes, surge protection devices, and grounding arrangement.

4. Panel external loop wiring diagrams showing interconnections between panels and all field equipment including the field equipment terminal numbers and intermediate termination panel numbering if applicable.
5. Provide power requirements and heat dissipation calculations for each panel.

Provide color selection samples for selection by the OWNER.

1-4.10. Spare Parts This submittal shall provide a combined and complete listing of all spare parts from all specification sections on the project provided by the System Supplier.

a. The submittal shall be indexed by specification section number and list all spare parts and disposables provided under that specification section.
b. The submittal shall contain the specific specification paragraph reference for the component, the tag, description and complete model number, and the supplier and supplier's contact number.

1-4.11. Operation and Maintenance Manuals
Complete system documentation, in the form of Operation and Maintenance Manuals shall be submitted and approved before the commencement of field acceptance testing. O&M Manuals shall include:

a. Manufacturer's instruction manuals for each type of equipment furnished. When instruction booklets cover more than one specific model or range of device, product data sheets shall be included which indicate the device model number and other special features.
b. ISA type data sheets and calibration sheets for every instrument furnished. Include any additional calibration sheets for instruments not furnished, but require calibration for proper operation of the system.
c. As-Built panel fabrication and wiring drawings from control panel to final device including intermediate panels if used. Drawings include all terminal numbers and wire numbers.
d. Panel interconnection drawings to field device drawings including field terminal numbers.
e. Inventory and location list of all available spare parts provided including part description, quantity provided, model number, ordering part number, on site storage location, and supplier contact information. Any spare parts used during startup shall be replaced by the System Supplier.

1-4.12. Factory Acceptance Test Plan Within 45 days of the scheduled Factory Acceptance Test, the System Supplier shall submit the final Factory Acceptance Test plan. All documentation shall be submitted and approved before the commencement of any acceptance testing. The plan shall include as a minimum (submitted in both electronic and hardcopy):

a. A three ring 'D" notebook organized and indexed per the approved preliminary test plan, all signoff forms, all test procedures and methods, testing schedule, and any other pertinent data required for the test.

b. A list of items or equipment that can not be tested or simulated at the FAT and must be tested in the field.
c. Sample testing sign-off documents which support the proposed testing procedure.
d. An outline of the proposed testing sequence including anticipated duration for each test module. At a minimum, test outline and test documentation should provide for:
    1. PLC I/O verification.

1-4.13. System Installation, Startup and Site Demonstration Plan. Within 30 days of the scheduled Factory Acceptance Test, the System Supplier shall submit an equipment installation, I/O field testing and commissioning plan. The System Supplier, Contractor, and other Equipment Suppliers shall jointly determine a sequence and schedule for the installation of I&C components and subsequent testing. All installation and startup activities must be coordinated and approved by the OWNER before they can proceed.

1-4.14. Final System Documentation. Within 30 days of the successful completion of startup and commissioning, the Contractor shall submit final documentation for the project. The documentation shall reflect the As Installed and As Accepted final state of the system. This shall include:

a. Updated field wiring, panel wiring, or network drawings including any test or startup data.
b. Final calibration data sheets for all instrumentation.
c. Final configuration data for all devices including alarm and control setpoints, all device switch settings, and network settings.

1-5. PREPARATION FOR SHIPMENT

1-5.01. All electronic equipment and instruments shall be suitably packaged to facilitate handling and to protect against damage during transit and storage. All equipment shall be boxed, crated, or otherwise completely enclosed and protected during shipment, handling, and storage. All equipment shall be protected from exposure to the elements, shall be kept dry at all times, and shall not be exposed to adverse ambient conditions.

1-5.02. Painted surfaces shall be protected against impact, abrasion, discoloration, and other damage. Painted surfaces that are damaged prior to acceptance of equipment shall be repainted to the satisfaction of ENGINEER.

1-5.03. Each shipment shall include an appropriate shipping list that indicates the contents of the package, including the specific instrument tags. The shipping list shall be accessible without exposing the instruments to the atmosphere. The shipping list shall also contain any cautionary notes regarding storage of the instruments, including requirements to protect the instrument from static discharge, desensitizing chemicals (solvents, paints, etc.), or ambient atmospheric conditions.

1-5.04. Individual instruments shall be appropriately tagged or labeled to positively identify the device. All identification shall be visible without the need to unpack the instrument from its protective packaging.

1-5.05. Instrument shipment and storage requirements shall be coordinated with ENGINEER or OWNER prior to shipment. System Supplier shall provide adequate storage and be ready to accept the shipment before shipping any equipment to the site. Additional shipping and storage requirements shall be as detailed in the individual instrument specifications.

1-5.06. Components which are shipped loose due to transportation limitations shall be assembled and disassembled by the manufacturer prior to shipment to assure that all components fit together and are adequately supported.

1-6. DELIVERY, STORAGE, AND SHIPPING

1-6.01. Shipping shall be in accordance with the shipping section. Handling and storage shall be in accordance with the handling and storage section.

1-7. SPARE PARTS

1-7.01. Spare parts and consumable items are specified in other sections.

1-7.02. Packaging. All spare parts shall be delivered to OWNER before final acceptance of the system. Packaging of spare parts shall provide protection against dust and moisture and shall be suitable for storage. Circuit boards and other electronic parts shall be enclosed in anti-static material. All packages shall be clearly marked with the manufacturer's name, part number or other identification, date of manufacture, and approximate shelf life.

1-7.03. Replacement. System Supplier may utilize spare parts and supplies during system installation, de-bugging, startup, or training, but shall restore all such materials and supplies to the specified quantities before final acceptance of the systems.

PART 2 - PRODUCTS

2-1. GENERAL REQUIREMENTS

2-1.01. All equipment furnished under each section referenced in SCOPE is a part of this section and shall be selected by System Supplier for its superior quality and intended performance. Equipment and materials used shall be subject to review. Specific equipment shall be furnished as specified with no exceptions. These items are indicated in the applicable sections.

2-1.02. Standard Products. The systems furnished shall be standard products. When two or more units of the same type of equipment are supplied, they shall be the products of the same manufacturer; however, all components of the systems furnished hereunder need not be the products of one manufacturer unless specified herein.

2-1.03. To the extent possible, instruments used for similar types of functions and services shall be of the same brand and model line. Similar components of different instruments shall be the products of the same manufacturer to facilitate maintenance and stocking of repair parts. Whenever possible, identical units shall be furnished.

2-2. PERFORMANCE AND DESIGN REQUIREMENTS

2-2.01. The design of the systems furnished hereunder shall utilize concepts, techniques and features that provide maximum reliability and ease of maintenance and repair. The systems shall include board-level devices such as light emitting diodes or other indicators to facilitate quick diagnosis and repair. Diagnostic software shall be furnished to facilitate system-level troubleshooting.

2-2.02. When redundant hardware is provided, the system shall be capable of performing all specified functions, without reconfiguring hardware or software, with only one device of each category in service.

2-2.03. Factory Assembly. Equipment shall be shipped completely factory assembled, except where its physical size, arrangement, configuration, or shipping and handling limitations make the shipment of completely assembled units impracticable.

2-3. POWER SUPPLY AND INSTRUMENT SIGNALS

2-3.01. The power supply to all control system equipment will be 120 volts, 60 Hz, single phase. System Supplier shall be responsible for distribution of power among enclosures, consoles, peripherals, and other components of the system from the power supply receptacles and junction boxes indicated on the drawings. Power distribution hardware shall include cables and branch circuit over-current protection installed in accordance with the electrical section.

2-3.02. Unless otherwise indicated, the AC power to the instrumentation will be unregulated 120 volts ac. Unless otherwise indicated, all transmitted electronic analog instrument signals shall be 4-20 mA dc and shall be linear with the measured variable.

2-3.03. Power Supplies. Power supplies for voltages other than those listed above shall be an integral part of the equipment furnished. Internal power supplies shall be regulated, current limiting, and self-protected.

2-3.04. Surge Withstand. All equipment shall meet all surge withstand capability tests as defined in ANSI C37.90 without damage to the equipment.

2-3.05. Uninterruptible Power Supply. An individual UPS shall be provided with each PLC panel as indicated in this section or as shown in the drawings. The System Supplier shall be responsible for coordinating the size of the UPS unit with the equipment furnished hereunder, and shall advise ENGINEER if a unit of higher capacity is necessary. For 24VDC control power, The UPS shall be PULS UB10.245 or approved equal with external battery modules.

2-4. SERVICE CONDITIONS AND ENVIRONMENTAL REQUIREMENTS

2-4.01. The equipment provided for the instrumentation and control system shall be suitable for the service conditions specified in the attached equipment sections.

2-4.02. All equipment shall be designed and selected to operate without degradation in performance throughout the environmental extremes specified. Equipment shall be designed to

prevent the generation of electromagnetic and radio frequency interference and shall be in compliance with FCC Rules and Regulations, Part 15, for Class A computing devices.

2-4.03. Ambient Temperature and Elevation. All equipment located in non air conditioned indoor areas shall be suitable for an ambient temperature range of 0°C to 50°C and a relative humidity of 10 to 95 percent, non-condensing. All equipment located outdoors shall be suitable for operation in an ambient temperature range 0°C to 60°C and a relative humidity of 5 to 100 percent. Heaters and air conditioning/cooling equipment shall be provided where essential to maintain equipment within its manufacturer-recommended operating ranges.

2-4.04. All equipment and instruments shall be designed to operate at the site elevation of 500 ft

2-4.05. Deleterious Effects. All system equipment will be installed in areas without anti-static floor construction and without any provisions for control of particulates or corrosive gases other than ordinary office-type HVAC filtering. System Supplier shall furnish any additional air cleaning equipment, anti-static chair pads, or other protective measures necessary for proper operation of the system.

2-4.06. All input/output hardware shall meet or exceed, without false operation, all requirements of NEMA ICS-1-109.60, Electrical Noise Tests.

2-4.07. Lightning Protection. In addition to other environmental protection specified herein, the entire system shall be provided with lightning protection. Lightning protection measures shall include the following:

2-4.08. Grounding. All major components of the system shall be grounded in accordance with Section 16050-3-10. Any modifications recommended by System Supplier shall be submitted to OWNER and ENGINEER for review and approval.

2-4.09. Surge Suppressors. Surge and lightning suppressors shall be non-faulting, non-interrupting, self clearing, and shall protect against both line-to-line and line-to-ground surges. Surge devices shall be as specified in other Sections. Surge protective devices shall be applied for the following:

a. All 120 vac power connections to control panels, field instruments, and equipment.
b. All analog signal circuits shall be protected at both the transmitter and the control system end of the circuit. Surge protection devices shall not impede or interfere with the use of smart transmitter calibration/communication.
c. All metallic pair (twisted and untwisted) conductor local area network and data highway termination points where any part of the data highway cable is routed outside of the building envelope.
d. All serial PLC data highway and remote I/O network termination points where any part of the circuit is routed outside of the building envelope.

2-5. INSTALLATION TEST EQUIPMENT

2-5.01. All necessary testing equipment for calibration and checking of system components shall be provided by System Supplier. System Supplier shall also furnish calibration and maintenance records for all testing and calibration equipment used on the site if requested by ENGINEER.

PART 3 - EXECUTION

3-1. INSTALLATION REQUIREMENT

3-1.01. The installation of equipment furnished hereunder shall be by the Contractor or their assigned subcontractors.

3-1.02. Field Wiring. Field wiring materials and installation shall be in accordance with the electrical section.

3-1.03. Instrument Installation. Instruments shall be mounted so that they can be easily read and serviced and so that all appurtenant devices can be easily operated. Installation details for some instruments are indicated on the drawings.

3-1.04. Salvage of Existing Equipment. Existing equipment and materials removed or replaced under this contract shall be disposed of.

3-1.05. Any mounting brackets, enclosures, stilling wells, piping, conduits, wiring, or openings that remain after removal of equipment and support hardware shall be removed or repaired in a manner acceptable to OWNER and ENGINEER.

3-1.06. Transmitters or switches containing mercury shall be removed and disposed of by personnel trained in the handling of hazardous materials and using approved procedures.

3-2. SYSTEMS CHECK

3-2.01. System Supplier shall provide the services of a trained and experienced field supervisor to assist the installation contractor during installation, and to calibrate, test, and advise others of the procedures for installation, adjustment, and operation.

3-2.02. Field Manager. The System Supplier shall appoint a field services manager who shall be responsible for the coordination of all system check-out and startup activities, and who shall be immediately available to Engineer and Owner by phone or on site for the duration of this project.

3-2.03. Field Inspection at Delivery. The field supervisor shall inspect major equipment items within five working days of delivery, to assure that the equipment was not damaged during shipment and shall supervise or assist with unpacking, initial placement, and initial wiring of the system.

3-2.04. Field Calibration of Instruments. After each instrument has been installed, a technical representative of System Supplier shall calibrate each instrument and shall provide a

written calibration report for each instrument, indicating the results and final settings. The adjustments of calibrated instruments shall be sealed or marked, insofar as possible, to discourage tampering. Instrument calibration shall be done before checkout of the system operation. A typical instrument calibration report is attached to the end of this section. This shall include all new instrumentation provided by the System Supplier, and all existing instrumentation required by his control system for proper operation of the plant. If the existing instrumentation is unable to be calibrated, the System Supplier shall notify the OWNER and ENGINEER in writing and it will become the OWNER responsibility to repair or replace the instrument.

3-2.05. Training for Installation Personnel. The field supervisor shall train the installation personnel in reading and understanding submittal drawings, review any OWNER special coordination requirements or procedures, and in the correct installation and wiring procedures for the equipment. Two days shall be included for this training.

3-3. FIELD INSPECTION PRIOR TO START UP

3-3.01. After installation and wiring connections are complete, the field supervisor, with additional System Supplier's personnel shall verify that each external connection to the system is correctly wired and field process components and devices are functioning as intended.

3-3.02. Analog Signals. Analog input signals shall be simulated at the transmitting source, and verified to be received at the proper register addresses in the control system. Analog outputs shall be generated at the control system, and verified to be received with the correct polarity, at the respective receiving device.

3-3.03. Discrete Signals. Discrete input and output signals shall be simulated and verified that they are received at the respective receiving device, and at the proper voltage.

3-3.04. Devices by Other Suppliers. If interrelated devices furnished by other suppliers or under other contracts, such as valve actuators, motor controls, chemical feeders, and instruments, do not perform properly at the time of system checkout, the field supervisor shall use suitable test equipment to introduce simulated signals to and/or measure signals from these devices to locate the sources of trouble or malfunction.

3-3.05. System Check Out Report. The System Supplier shall submit a written report on the results of such tests to ENGINEER & OWNER. System Supplier shall prepare a testing procedure to be approved by OWNER and ENGINEER that shall demonstrate that the system conforms to the specifications. The testing procedure shall be submitted at least 30 days in advance of testing. The testing shall be conducted by System Supplier and witnessed by OWNER and/or ENGINEER.

3-3.06. System Supplier shall notify ENGINEER and OWNER in writing at least 14 days before any proposed testing date. If a test is concluded unsuccessfully, the test shall be repeated. System Supplier shall reimburse OWNER and ENGINEER for all expenses incurred in connection with attending repeated factory or site testing necessitated by system failure or inadequate preparation.

3-4. TESTING

3-4.01. The System Supplier shall test all provided equipment at his facility prior to shipment and again after installation. Unless specified in other specification sections, all equipment provided by the System Supplier shall test as a single, fully integrated system.

3-4.02. The System Supplier shall provide all required testing hardware and software to fully test the hardware functionality of the system. All components of the system shall be completely networked as shown on the system block diagram and all aspects of the communication system functional.

3-4.03. As a minimum, testing shall include:

a. Factory Acceptance Test (FAT)
b. Site Demonstration Test (SDT)

3-4.04. 3-5.01. Factory Acceptance Testing (FAT). After system assembly at System Supplier's facility, the system shall be tested before the system is shipped to the site. Testing shall be conducted which progressively demonstrate that the supplier supplied component subsystems conform to the specifications. Testing shall be in two phases, an unwitnessed phase and a witnessed phase.

3-4.05. The System Supplier shall be responsible for staging the equipment required for the FAT in a neat and orderly manner in an environmentally conditioned location approved by OWNER and ENGINEER.

3-4.06. Preliminary (Unwitnessed) Factory Acceptance Testing. The System Supplier shall be responsible for conducting an ongoing testing process during system assembly and staging to ensure that the system hardware meet the functional requirements as defined by the specifications. Preliminary testing will normally be unwitnessed; however the OWNER reserves the right to have OWNER staff and/or ENGINEER witness portions of the preliminary testing. At a minimum, preliminary testing shall be as described below.

3-4.07. The System Supplier shall perform a complete, end-to-end checkout for every I/O point from the field termination assembly. The I/O Point Checkout shall be conducted on all System Supplier furnished PLCs. System Supplier shall test every input and output point for proper operation, including wired spares. Test signals shall be injected to verify the operation of each Analog Input (AI) and Discrete Input (DI). Each Analog Output (AO) and Discrete Output (DO) shall be also tested for proper operation.

3-4.08. The System Supplier shall develop a Point Checkout Form for each I/O point. The checkout form shall include the point tag, descriptor, all checks performed for the point, date and time of the check, and a signoff block for the System Supplier's representative. The completed I/O Checkout forms for all points shall be submitted for OWNER and ENGINEER review prior to scheduling the FAT.

3-4.09. The following items shall be checked for each I/O point:

a. For each analog input point:
   - Value at 0%, 25%, 50%, 75%, & 100% of full scale (ramped in both directions)
b. For each analog output point:
   - Milliamp reading at 0%, 25%, 50%, 75%, & 100% of full scale (ramped in both directions).
c. For each analog (input and output) point:
   - Constant 50% signal for two (2) minutes to verify the absence of signal drift (test conducted with surge and isolator in circuit).
d. For each discrete input point:
   - Status and Alarm points - proper indication
e. For each discrete output point:
   - Proper operation (latching or momentary)

3-4.10. 3-5.03. Witnessed Factory Acceptance Testing. Prior to scheduling the witnessed FAT, the System Supplier shall have successfully completed the un-witnessed test using the approved test procedures. At least 14 days prior to the requested start date, the System Supplier shall submit a written request for scheduling the FAT. This written request shall include a certification by the System Supplier Project Manager that the FAT un-witnessed testing has been successfully completed and include and copies of the completed test documentation.

3-4.11. Using the approved FAT Procedures, System Supplier, ENGINEER and OWNER shall jointly conduct a Factory Acceptance Test replicating the un-witnessed tests referenced in 3-5.02 under simulated operating conditions.

3-4.12. The following equipment shall be staged for the factory test:

a. All PLCs provided by the System Supplier. These PLCs shall be fully constructed and installed in panels ready for shipment to the project site.

3-4.13. The test results shall be recorded in the test procedure document.

3-4.14. 3-5.04 Daily Testing Schedule. The System Supplier shall begin each day of witnessed testing by meeting with the OWNER and ENGINEER. The purpose of this meeting is to review the test results from the previous day and to preview the testing for the current day.

3-4.15. The System Supplier shall make two sets of the following documentation available for use by the OWNER and ENGINEER during the FAT:

a. All drawings, specifications, addenda and change-orders.
b. All FAT Procedures
c. Approved Shop drawings and hardware submittals for equipment being tested.
d. Preliminary O&M Manuals.

3-4.16. System Hardware Testing. Prior to the beginning of testing, all system components shall be inventoried. The System Supplier shall prepare a System Configuration Inventory List which contains each separate system component including manufacturer, model and part number, description, and serial number. This list shall be annotated to reflect the status of all system components at the time of FAT. The System Supplier shall maintain the System Configuration Inventory List until Final Acceptance. The Inventory List shall be updated to reflect any equipment replacement or substitutions.

3-4.17. A physical inspection shall be conducted for all hardware devices to assess structural integrity and component layout. As a minimum, the following items shall be inspected and verified:

a. Control panel frame structure, sub-panel mounting, paint work and finish, and panel dimensions.
b. Control panel wiring layout and control and power wire routing.
c. Equipment mounting and equipment tagging.
d. PLC and I/O system physical layout.
e. Panel ventilation, device clearances, and environmental conditioning.
f. UPS installation.

3-4.18. Processors, processor modules, and peripheral devices associated with the system shall be assembled together as they will be installed in the field and shall be tested. The test shall demonstrate proper operation of each hardware device and communications among devices. All standard hardware diagnostic programs shall also be demonstrated.

3-4.19. Uninterruptable Power Supply Testing. Each UPS shall be fully tested to verify conformity with the specifications. Testing shall include:

a. Load Capacity – Testing will confirm the UPS load capacity is greater than the system connected load plus specified excess capacity.
b. Backup Time – Test will confirm the UPS meets the specified backup time.
c. UPS Status and Alarm Signals – Test will confirm the specified UPS status and alarm signals are functional.
d. UPS Battery Recharge Time – Test will confirm the specified UPS fully discharged battery recharge time.

3-4.20. FAT Completion. Throughout the FAT, System Supplier shall maintain a listing of all discrepancies. At the conclusion of all formal testing, OWNER/ENGINEER shall review the FAT punch list with the System Supplier to determine resolution. If it is determined that discrepancies exist which affect critical system functions, the System Supplier shall correct those deficiencies and conduct an FAT retest prior to shipment. System Supplier shall reimburse OWNER and ENGINEER for all expenses incurred in connection with attending repeated factory or site testing.

3-4.21. If it is determined that the system deficiencies do not significantly affect system functionality, the OWNER and ENGINEER may grant the System Supplier written approval for shipment. However, all FAT punch list items shall be corrected and demonstrated to OWNER and ENGINEER prior to the start of the Site Demonstration Test.

3-4.22. Site Demonstration Test (SDT) After a successful FAT and written approval from the OWNER, the system may be shipped to the site. Field testing shall be conducted in two phases. The un-witnessed Preliminary Phase performed by the System Supplier, and the witnessed phase.

3-4.23. After field installation of the system and calibration of all field instruments necessary to the proper operation of the control system, the System Supplier shall perform a preliminary test to ensure all components and systems are still functioning properly, and that all field wiring is terminated correctly. The checkout shall be on a loop by loop basis.

3-4.24. Upon successful completion of the preliminary testing, the System Supplier shall notify the OWNER and ENGINEER and request a date to begin the witnessed SDT.

3-4.25. The SDT shall be performed to verify complete operation of the system, requiring a repeat of the Factory Acceptance Test but with the equipment installed at the permanent sites and connected to the process I/O, and shall include additional tests required to verify field-installed equipment which was not available at the factory.

3-4.26. The System Supplier shall:

a. Repeat the hardware tests used during FAT (complete with actual field wiring) connected to physical end point devices and instruments rather than simulation.
b. Demonstrate all equipment control and status monitoring functions. Actuation of field devices shall be closely coordinated with OWNER staff.
c. Record system performance parameters and system responses under field operational conditions.
d. Verify accuracy of documentation, especially operator’s manuals, software documentation, record drawings, and site operating instructions.

3-4.27. Completion of Test. Successful completion of the site acceptance test, including the operational demonstration, is prerequisite to Substantial Completion as specified in the Supplementary Conditions.

3-5. TRAINING

3-5.01. System Supplier shall conduct training courses for personnel selected by OWNER. Training shall be conducted by experienced instructors who are familiar with the specific system supplied. Where noted, the System Supplier shall contract the equipment manufacturer to provide the training. All training shall be at the OWNER facility.

Training Category	Hours/ Session	No. of Sessions	Provided By	Students Per Session	Total Hours
Instrument Maintenance	2	2	Instrument Supplier	10	4

3-5.02. General Training Requirements. In general, the System Supplier's standard training courses may be used to meet the training objectives specified. Where standard courses do not meet these objectives, additional coursework shall be developed. Clock hour requirements for each level of training are listed on the data sheet. A "clock hour" is defined as one hour of instruction or supervised training exercise. Training hour requirements noted in the data sheet are the number of hours of training to be provided for each student. Additional training time shall be provided if considered necessary to meet the training objectives.

3-5.03. Training Costs. All costs associated with the training program, including travel, lodging, and per diem expenses for OWNER personnel to attend off-site training programs, shall be the responsibility of System Supplier and shall be included in the contract price.

3-5.04. Lessons. Training lesson plans and other information for the second stage submittal as defined herein shall be submitted at least 30 days prior to the start of training.

3-5.05. Video Recording. All training sessions shall be video recorded for OWNER future use in training other personnel at the OWNERs discretion. Video recorded sessions shall be saved to DVD/R media for delivery to OWNER. Videos of System Supplier's standard training programs may be substituted if they cover the same topics and are developed for the same versions of hardware and software. Furnishing videos of standard training programs shall not relieve System Supplier from any of the training requirements specified herein.

3-5.06. Instrument Training. Training on the calibration, maintenance, troubleshooting, and repair for the instrument devices provided under this project shall be provided. Training shall also be provided for any hand-held or computer-based calibration devices and their associated software.

3-6. EXTENDED SUPPORT OR WARRANTY

3-6.01. The process control system shall be warranted for a period of one year(s) beginning immediately after written notice of final acceptance. The service shall include all travel and living expenses for repair of all equipment failures, and phone and personal support as needed.

SECTION 17530

PLC CONTROL PANELS

PART 1 - GENERAL

1-1. SCOPE

1-1.01. The contractor shall furnish and install PLC control panels as indicated on the drawings and accordance with the contract documents for each of the following well sites:

MBR-151, MBR-153, MBR-154, MBR-159, MBR-160, MBR-164,
MBR-150, MBR-155, MBR-156, MBR-158, MBR-165, MBR-166,
MBR-167, MBR-168, MBR-169

1-2. GENERAL

1-2.01. Equipment furnished and installed under this section shall be fabricated and assembled in full conformity with the drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by Engineer.

1-2.02. General Equipment Stipulations. The General Equipment Stipulations shall apply to all equipment and materials provided under this section. If requirements in this specification differ from those in the General Equipment Stipulations, the requirements specified herein shall take precedence.

1-2.03. Drawings. General dimensions and arrangements are indicated on the drawings. System Supplier shall be responsible for coordinating the console and enclosure sizes and arrangements to accommodate the equipment provided.

1-3. SUBMITTALS

1-3.01. Submittals shall be made as specified in the Instrumentation and Control System section.

1-4. DELIVERY, STORAGE, AND SHIPPING

1-4.01. Delivery, storage, and shipping shall be as per The Instrumentation and Control System section.

1-5. SPARE PARTS

1-5.01. Furnish two of each type of surge protector used.

PART 2 - PRODUCTS.

2-1. GENERAL PANEL DESIGN AND FABRICATION FEATURES

2-1.01. All panel enclosures furnished shall conform to the stipulations of NEMA ICS-6-1993. The following paragraphs describe general fabrication specifications for the PLC cabinets, instrument panels, consoles, enclosures, and subpanels. The System Supplier is to provide all necessary components and devices, brackets, wiring, fans, cooling, and heating devices necessary for a complete and operational system.

2-1.02. Panel Arrangement. Install all components and wiring in a neat and professional manner as to allow for easy maintenance and installation. Components should be installed and wired such that the removal of a single component does not affect the functionality of other components.

2-1.03. Power Entrance. The power entrance to each panel shall be provided with a surge protection device. Surge protectors shall be nominal 120 volts ac with a nominal clamping voltage of 200 volts. Surge protectors shall be of a non-faulting and non-interrupting design, with a response time of not more than 25 nanoseconds.

2-1.04. Power wiring: Power wiring shall be segregated from other wiring. Normal panel power is 120 VAC single phase. Where higher voltages are used in the panel, provide personnel shields to prevent accidental contact. Provide a warning label on panel front. Power distribution wiring on the line side of panel fuses shall be minimum 12 AWG. Secondary power distribution wiring shall be minimum 14 AWG. Wiring for ac power distribution, dc power distribution, and control circuits shall have different colors and shall agree with the color-coding legend on System Supplier's panel wiring diagrams. With the exception of electronic circuits, all interconnecting wiring and wiring to terminals for external connection shall be stranded copper, insulated for not less than 600 volts, with a moisture resistant and flame retardant covering rated for not less than 90°C.

2-2. INSTRUMENT AND CONTROL WIRING

2-2.01. All internal panel wiring shall be type MTW stranded copper wiring rated not less than 600 volts. Electronic analog circuits shall be twisted and shielded pairs rated not less than 300 volts. Analog circuits shall be separated from ac power circuits. Wires within the panel shall conform to the minimum size as shown in the table below.

Type	Min. Wire Size	Color
AC Control	14 AWG	Red
DC Control	14 AWG	Blue
Analog Circuits	18 AWG Twisted Pair	Red(+), Blk(-)

2-2.02. All wiring shall be grouped or cabled and firmly supported inside the panel. Each individual wire in power, control, and instrumentation circuits shall be provided with identification markers at each point of termination. The wire markers shall be positioned to be readily visible for inspection and the identification numbers shall match the identification on the supplier's panel wiring drawings. Wiring shall be bundled in groups and bound with nylon cable ties or routed in Panduit or similar nonmetallic slotted ducts. Ducts shall be readily accessible within the panel, with removable covers, and with space equal to at least 40 percent of the depth of the duct remaining available for future use after completion of installation and field wiring. Sufficient space shall be provided between cable groups or ducts and terminal blocks for easy installation or removal of cables. Splicing of wires is not permitted. Signal wiring for multiple units should be such that the removal of a single unit shall not affect the operation of an adjacent unit.

2-2.03. Signal Wiring. Surge protection shall be provided for all field analog and all PLC digital signals. The surge protection shall not interfere with the circuit normal operation and be maintenance free. Surge protection shall be connected to a good earth ground of limited length. If this is not possible, locate the surge protection devices in a termination enclosure where a good ground is available. Surge suppressors shall be DIN rail mounted.

2-2.04. Digital Surge Protectors. All digital circuits shall be protected at the panel end with surge protection. Surge protectors shall provide line-to line and line-to-ground protection.

2-2.05. Analog Surge Protectors All analog input and output circuits shall be protected at both the panel and field ends with surge protection.

2-2.06. Analog Signal Isolators All analog input and output circuits shall be isolated from the field with single channel, fixed standard range, three way signal isolators.

2-2.07. Terminal Blocks. Terminal blocks for external connections shall be suitable for 12 AWG wire and shall be rated 30 amperes at not less than 300 volts. Terminal blocks shall be fabricated complete with marking strip, covers, and pressure connectors. Terminals shall be labeled to agree with identification shown on the supplier's submittal drawings. A terminal shall be provided for each conductor of external circuits, plus one ground for each shielded cable. Not less than 10 inches of clearance shall be provided between the terminal strips and the base of vertical panels for conduit and wiring space. Not less than 25 percent spare terminals shall be provided. Each control loop or system shall be individually fused, and all fuses or circuit breakers shall be clearly labeled and located for easy maintenance. All terminals and terminal strips shall be labeled with permanent tags. Handwritten tags are not acceptable.

2-2.08. Device Tag Numbering System. All devices shall be provided with permanent identification tags. The tag numbers shall agree with the Instrument Device Schedule and with the supplier's equipment drawings. All field-mounted transmitters and devices shall have stamped stainless steel identification tags. Panel, subpanel, and rack-mounted devices shall have laminated phenolic identification tags securely fastened to the device. Hand-lettered labels or tape labels will not be permitted.

2-2.09. Nameplates: Nameplates shall be provided on the face of the panel or on the individual device. Panel nameplates shall have approximate dimensions and legends, as indicated on the drawings, and shall be made of laminated phenolic material having engraved letters approximately 3/16 inch [5 mm] high extending through the black face into the white layer. Nameplates shall be secured firmly to the panel. Panel face nameplates do not replace the requirement for device identification tags as specified under the Device Tag Numbering System paragraph.

2-2.10. Painting. Not Used

2-2.11. Component Layout Panel component arrangement shall provide all required manufacturers clearances, allow heat variations within the enclosure, and provide sufficient room to remove component wiring and/or components. Components should be installed and wired such that the removal of a single component does not affect the functionality of other components.

2-2.12. Factory Test. Panels shall be factory tested for electrical functionality, PLC and computer programming by the panel fabricator at the Factory Acceptance Test (FAT) per

requirements of 17500. The FAT must be passed and final approval given in writing by ENGINEER and OWNER before shipment.

2-3. ENCLOSURE

2-3.01. The following paragraphs specify the enclosure requirements.

2-3.02. Cabinets: Cabinets shall contain the system components indicated on the drawings, shall be NEMA Type 4X, suitable for wall mounting. The enclosure shall be fabricated from USS 14 gage, or heavier, stainless steel. Cabinets shall be equipped with full size gasketed doors with hinges and a chromium-plated or stainless steel three-point latch. Panels shall be pad lockable.

2-3.03. Subpanels: Subpanels shall be neatly arranged with sufficient space for future expansion as specified. Provision should be made for future wiring, field terminals, Panduit, etc., in the same ratio as in the finished panel. This space does not include any identified spare points.

- All field wiring shall terminate on field terminals and not on panel components.
- Panels may not have side sub-panels without approval of ENGINEER and OWNER.
- Power and AC wiring shall be routed in separate Panduit from analog, communication, or DC signals.
- Field wiring shall terminate only on one side of a terminal strip, and panel interior wiring on the other side.

2-4. PANEL INTERIOR MOUNTED DEVICES

2-4.01. PLC Processor. The PLC shall be the Automation Direct BX-DM1E-36ER3-D with BX-P-USB USB port or OWNER and ENGINEER pre-approved equal without exception.

2-4.02. Interchangeability. All programmable logic controller systems shall be products of the same manufacturer and of the same series or product line. Processors, local and remote input/output hardware, communications modules, and specialty modules such as coprocessors and ASCII modules shall be interchangeable among all I/O panels and systems.

2-4-03. PLC Arrangement. The PLCs shall be distributed and arranged as indicated on the drawings. The System Supplier shall meet all of the PLC manufacturer’s installation and operational requirements.

2-4.04. Expandability. Each PLC processor and associated I/O shall have future rack slot expandability. The enclosure shall be sized and constructed to easily accommodate installation and wiring for any type of PLC card utilizing the spare expansion slots.

2-4.05. Spare I/O . Each PLC input/output enclosure shall be provided with a minimum of 10% spare inputs and outputs of each type (AI,AO,DI,DO). Spare I/O shall be installed, wired, and interfaced properly to the terminal strip including surge suppressors, signal isolators and interposing relays. The spare I/O shall be in addition to any I/O installed and reserved for future process signals as may be indicated on the I/O list.

2-4.06. In addition, each PLC input/output enclosure shall be capable of accommodating 20 percent of additional input/output capacity of each type as originally assembled, without the need for additional expansion racks, communication adapters, cables, or field or PLC power supplies.

2-4.07. Appurtenances. The PLC processor and I/O hardware shall be provided as complete systems, as shown on the block diagram and schematic drawings. The PLCs shall include all necessary hardware and software for a complete working system. All special rack or panel mounted power supplies, special interconnecting and programming cables, special grounding hardware, or isolation devices shall be furnished for proper operation of the equipment. Signal converters, signal boosters, amplifiers, special power supplies, special cable, special grounding, intrinsically safe relays and current repeaters, surge suppression devices, and isolation devices shall be furnished and installed for proper operation of the equipment.

2-4.08. Power Supplies. Regulated dc power supplies for instrument loops or field contact wetting voltage shall be designed and arranged so that loss of one supply is bumpless and does not affect other loops in the system. Power supplies shall be suitable for an input voltage variation of ±10 percent, and the supply output shall be fused or short-circuit protected. Output voltage regulation shall be by the instrumentation equipment supplied.

2-4.09. Multi-loop or multi-system power supplies will be acceptable if backup power supply units are provided which will automatically supply the load upon failure of the primary supply. The backup supply systems shall be designed so either the primary or the backup supply can be removed, repaired, and returned to service without disrupting the instrument system operation. Multi-loop power supply connections shall be individually fused so a fault in one instrument loop will be isolated from the other loops being fed from the same supply. Fuses shall be of the blown indicating type, replaceable while the circuit is energized, and clearly labeled, grouped, and located for easy access. Multi-loop supply systems shall be oversized for an additional 50 percent future load. Failure of a multi-loop supply shall be indicated on the respective instrument panel or enclosure. Power Supplies shall:

a. Mounting: DIN Rail
b. Efficiency: >90%
c. Ripple: <40 mV (PP)
d. Parallel Operation: Yes
e. Status Output: Yes
f. Temperature: -25 to 60 Deg. C.
g. Regulation: 24 VDC, +/- 1%

2-4.10. Power supplies shall be Phoenix Contact Quint-PS or Mini-PS series, or approved equal.

2-4.11. Relays. Relays indicated to be provided in panels, enclosures, or systems furnished under this section shall be of the plug-in socket base type with dustproof plastic enclosures and retaining clips. Relays shall be UL recognized and shall have not less than double-pole, double-throw contacts. Control circuit relays shall have silver cadmium oxide contacts rated 10 amperes at 120 V ac. Electronic switching-duty relays shall have gold-plated or gold alloy contacts suitable for use with low-level signals. Relays used for computer input, alarm input, or indicating light service shall have contacts rated at least 3 amperes. Time delay relays shall have dials or switch

settings engraved in seconds and shall have timing repeatability of ±2 percent of setting. Latching and special purpose relays shall be for the specific application. Unless otherwise indicated, all relays shall have an integral pilot light that illuminates to indicate an energized condition. Relays and relay sockets shall be DIN rail mountable and have retaining clips. Relays shall be Eagle Signal "Series 22, 80"; IDEC "Series RR"; Potter & Brumfield "Series KRP, CB"; or Struthers-Dunn "Series A3, A4".

2-4.12. Panel Mounted Analog Surge Protectors. All analog input and output circuits shall be protected at both the panel and field ends with surge protection devices. Surge protectors shall provide line-to line and line-to-ground protection. The suppression circuit shall be a multistage hybrid device utilizing surge arresting diodes and gas discharge tubes. The surge protector shall consist of a DIN rail mounted base terminal block and a removable plug protection module

.

a.	Nominal Voltage	24 VDC
b.	Max. Operating Voltage	28 VDC
c.	Max. Operating Current @ 40 Deg C	450 ma
d.	Nominal Discharge Current (8 x 20 uS Waveform IEEE C62.41.2)	10 kA
e.	Nominal Discharge Current (10 x 350 uS Waveform IEC 1024	2.5 kA
f.	Output Voltage Limitation Sym. @ 1kv/uSec	< 40 Volts
g.	Series Resistance	2.2 ohm
h.	Temperature Range	-40 to +80 Deg C

2-4.13. Surge protectors shall be Phoenix Contact MCR-PlugTrab PT 2x2 series or approved equal.

2-4.14. Panel Mounted Digital Surge Protectors. All analog input and output circuits shall be protected at both the panel and field ends with surge protection devices. Surge protectors shall provide line-to line and line-to-ground protection. The suppression circuit shall be a multistage hybrid device utilizing surge arresting diodes and gas discharge tubes. The surge protector shall consist of a DIN rail mounted base terminal block and a removable plug protection module.

a.	Nominal Voltage	▪ DC Unit: 5 to 24 VDC models ▪ AC Unit: 60 to 230 VAC model
b.	Nominal Operating Current	▪ DC Unit: 300 ma ▪ AC Unit: 26 ampl
c.	Nominal Discharge Current (8 x 20 uS Waveform IEEE C62.41.2))	▪ DC Unit 10 kA ▪ AC Unit 10 kA
d.	Peak Clamping Voltage 1kV/uSec rise time	▪ DC Unit 41 VDC @ 24 VDC ▪ AC Unit 600 Volts

2-4.15. The DC unit surge suppressor shall be a Phoenix Contact PlugTrab PT 2x1 series, and the AC unit shall be a Phoenix Contact PlugTrab PT 2-PE/S series or approved equal.

2-4.16. Control Panel Main Power Surge Protectors. The control panel main power circuit shall have an overvoltage protection device for power system electrical transients. The unit shall be DIN rail mountable consisting of a hard-wired base and removable surge arrestor. Unit failure or removal shall not interrupt power flow to the panel.

a.	Nominal Operating Voltage	120 VAC
b.	Maximum Operating Voltage	150 VAC
c.	Maximum Operating Current	26 amps
d.	Maximum Discharge Surge Current (8x20 uSec)	10 KA
e.	Response Time (L-N)	< 25 nSec

2-4.17. The surge suppressor shall be a Phoenix Contact Mains-PlugTrab PT series or approved equal.

2-4.18. Strip Heaters. Electric strip heaters shall be provided as indicated on the drawings, as specified, and for the application. Strip heaters shall be sized to prevent condensation within the enclosure and to maintain the equipment above its minimum operating temperature. Strip heaters shall not present an Operator shock hazard. Strip heaters shall be located to avoid overheating electronic hardware or producing large temperature fluctuations. Strip heaters shall be controlled by adjustable thermostats with adjustment ranges of 30° to 90°F. A circuit breaker disconnect switch shall be provided within the enclosure.

2-4.19. Flow Totalizer. The flow totalizer shall feature the following:

a. Panel mounted.
b. Accepted 24VDC 4-20mA input.
c. Provide 24VDC 4-20mA output.
d. Totalize flow and display in gallons.
e. Retain data after loss of power.
f. Low-Flow Cutoff.
g. Square Root Linearization.
h. Manufacturer: Precision Digital PD6200 or approved equal.

2-5. SIGNAL CONVERTERS

2-5.01. Protocol converters shall be provided to allow connection of PLC serial Modbus RTU RS-232/RS-485 devices to the Ethernet network. The unit shall be locally configurable using its serial port, or remotely configurable over Ethernet using a common web browser.

2-5.02. The unit shall have the following features:

Serial Interface:

a.	Interface	RS-232, RS-485

b. Connector Screw terminals or RJ45
c. Data Rate 100 to 125,200 bps
d. Characters 7 or 8 data bits
e. Parity Odd, even, or none
f. Stop bits 1 or 2
g. Flow Control - Software XON/XOFF
h. Flow Control - Hardware RTS/CTS

Network Interface:
a. Standards TCP/IP
b. Interface 10/100BaseT Ethernet
c. Connector RJ45

Physical:
a. Isolation Ethernet-1500 Vrms, Serial-2000 Vrms
b. Power 9-30 VDC, 9-24 VAC, 3 watts max
c. Mounting DIN Rail – 35mm
d. Operating Temperature 32 to 140 deg F.

2-5.03. The signal converter shall be a Lantronix External Device Server, Model Xpress-DR-IAP for compatibility with existing equipment.

PART 3 - EXECUTION

3-1. GENERAL INSTALLATION REQUIREMENTS

3-1.01. Installation requirements are specified in the Instrumentation and Control System section. In addition, equipment furnished under this section shall conform to the following manufacturing stipulations.

3-1.02. Wiring. All wiring shall be grouped or cabled and firmly supported inside the panel. Wiring shall be bundled in groups and routed in Panduit or similar nonmetallic slotted ducts. Ducts shall be readily accessible within the panel with removable covers and shall have a space of at least 40 percent of the depth of the duct available for future use after installation is complete and all field wiring installed. Sufficient space shall be provided between cable groups or ducts and terminal blocks for easy installation or removal of cables.

3-2. FIELD SERVICES.

3-2.01. Manufacturer's field services shall be provided for installation, field calibration, startup, and training as specified in the Instrumentation and Control System section. Instruments shall not be shipped to the Work Site until two weeks prior to the scheduled installation. SYSTEM SUPPLIER shall be responsible for coordinating the installation schedule with the Installation Contractor. Each shipment shall contain a listing of protective measures required to maintain sensor operation, including a listing of any common construction or cleaning chemicals that may affect instrument operation.

3-3. PROGRAMMING AND TESTING

3-3.01. The OWNER will provide a TEST program for the contractor to load onto the PLC and run. The Contractor shall use the TEST program to validate panel wiring. Final PLC programming, SCADA integration will be by the OWNER.

3-4. NETWORK CONFIGURATION

3-4.01. The OWNER will perform configuration of the protocol converter and SCADA telemetry.

END OF SECTION

Item	PLC Panel ID	Type	Service Description	Field Device / System Tag	Analog Data			Discrete Data			Comments

SECTION 17560

INSTRUMENTATION GENERAL REQUIREMENTS

PART 1 - GENERAL

1-1. SCOPE

1-1.01. This section covers the furnishing of all instrumentation equipment required for the Computer Control System as indicated on the DRAWINGS and as required.

1-1.02. Principal components of the instrumentation systems shall be as indicated on the P&ID drawings; as indicated on the instrument device schedules attached to this Section 17560.

1-1.03. Note: Not all instruments shown in these sections may be required to be provided by the CONTRACTOR (or CONTRACTOR System Supplier), but may be provided by Others, or included for future use as specifically designated.

1-1.04. Control System. Section 17500 shall apply to all systems described in this section. All applicable requirements defined in Section 17500 shall apply to equipment and services provided under Section 17560.

1-1.05. Terminology. When the phrase "as required" is stated in this section it shall mean "as required in any attached Data Sheet(s)" or shown on the DRAWINGS.

1-1.06. GENERAL. CONTRACTOR or System Supplier shall select the equipment furnished under this section for its superior quality and the intended performance. The CONTRACTOR or System Supplier shall install all equipment in accordance with the manufacturer's instructions. Equipment and materials used shall be subject to review and shall comply with the following requirements.

1-1.07. General Equipment Requirements. Not used. When required, the General Equipment Requirements shall apply to all equipment provided under this section.

1-1.08. DRAWINGS. Supplementing this section, the drawings indicate locations and arrangement of instruments and enclosures, provide mounting details, and may show device schedules and other information regarding the connection and interaction with other equipment.

1-1.09. Governing Standards. Governing Standards for instruments shall be as indicated in Section 17500.

1-1.10. Corrosive Fluids. All parts, which are exposed to corrosive conditions, shall be made from corrosion resistant materials. CONTRACTOR shall submit certification that the instrument manufacturer approves the selection of materials of primary elements which are in contact with the specified process fluid to be inert to the effects of the process fluid.

1-1.11. Elevation and Temperature. All instruments shall be designed to operate within an elevation range of 1000 feet above sea level and temperature range of 0 to 104 degrees Fahrenheit. Provide heaters, pipe heat tracing, air conditioning, and equipment enclosures and

sub shields as required.

1-1.12. Power and Instrument Signals. Unless otherwise indicated, electric power supply to the instrumentation equipment will be unregulated 120 volts ac. Unless otherwise indicated, all transmitted electronic analog instrument signals shall be 4-20 mA dc and shall be linear with the measured variable.

1-1.13. Appurtenances. Signal converters, signal boosters, amplifiers, special power supplies, special cable, special grounding, calibration manifolds, isolation valves, and electronic isolation devices shall be furnished as needed for proper performance of the equipment. All field power supplies shall be redundant with bumpless transfer in the event of a failure.

- Provide control panel signal isolators for all analog signals.
- Provide surge suppression for all analog signals both at the transmitter and control panel termination.
- Provide manufacturer's stainless steel calibration manifolds for transmitters.
- Provide manufacturer's recommended stainless steel mounting brackets and hardware.
- Provide all instruments with Hart communications if available.

1-1.14. Field Mounted Transmitter Analog Surge Protectors. All analog input and output circuits shall be protected at both the panel and field ends with surge protection. Field (at instrument) surge protectors shall provide line-to line and line-to-ground protection. The suppression circuit shall be a multistage hybrid device utilizing surge arresting diodes and gas discharge tubes.

a.	Nominal Voltage	24 VDC
b.	Max. Operating Voltage	28 VDC
c.	Max. Operating Current	250 ma
d.	Nominal Discharge Current (8 x 20 uS Waveform)	▪ Normal Mode 10 kA ▪ Common Mode 10 kA
e.	Response Time	▪ Normal Mode 1 nSec ▪ Common Mode 100 nSec
f.	Series Resistance	10 ohm
g.	Pipe Nipple	▪ Material 304 SS ▪ Thread ¾" NPT ▪ Length 4"

1-1.15. The surge suppressor shall be a Phoenix Contact PipeTrab Model S-PT1-2PE-24DC without exception for compatibility with existing installations.

1-1.16. Four Wire Field Mounted Transmitter Surge Protectors.

1-1.17. All four-wire transmitters (120 VAC plus 4 to 20 ma) that are not UPS powered and/or are located outside of the building housing the monitoring PLC shall have power and signal surge protection at the transmitter. Refer to electrical drawings for exceptions. The surge protector is a

single hybrid unit contained in a NEMA 4X polycarbonate case. Field wiring is terminated with quick disconnect or barrier terminal strips.

a.	AC Input Voltage	120 VAC, 60 Hz. with LED indicator
b.	AC Max. Output Current	15 Amps fused
c.	AC Surge Protection	▪ Technology: 3-Stage Series Hybrid ▪ Max Surge Amps (8x20uS): 10 kA ▪ Response Time: < 5 nanoseconds
d.	DC Signal Protection	▪ Technology: Series Hybrid ▪ Peak Surge Amps: 10kA ▪ Response Time: < 1 nanosecond ▪ Voltage Clamp: 8 to 200 Volts Selectable
e.	DC Resistance	5 Ohms typical
f.	Nominal Outside Dimensions-Polycarbonate Case	6.9”H x 6.9”W x 3”D

1-1.18. The surge suppressor shall be an Emerson Network Power EDCO SLAC series without exception.

1-1.19. Interchangeability and Appearance. To the extent possible, instruments used for similar types of functions and services shall be of the same brand and model line. Similar components of different instruments shall be the products of the same manufacturer to facilitate maintenance and stocking of repair parts. Whenever possible, identical units shall be furnished. Where devices have standardized by the OWNER, no substitutions shall be allowed.

1-1.20. Programming Devices. For systems that require a dedicated programming or configuring device for calibration, maintenance, or troubleshooting; one such programming device shall be provided for each Owner facility (quantity and type required shall be as indicated in Paragraph 1-5). The programming device shall include appropriate operation manuals and shall be included in the training requirements. For systems that allow the programming device functions to be implemented in software running on a laptop computer, the software shall be provided instead of the programming device. The programming device shall be complete, newly purchased for this project, and shall be in like-new condition when turned over to OWNER at completion of startup.

1-1.21. Configuration Software/Serial Interface. Devices indicated as requiring a serial interface shall be provided with all accessories required to properly communicate over the serial link. An appropriate cable shall be provided to allow the transmitter serial interface to be connected to a personal computer.

1-1.22. One licensed copy of the diagnostic/interface software shall be provided for each Owner facility (quantity and type required shall be as indicated in Paragraph 1-5). Software shall be capable of running under the latest version of Microsoft’s Windows XP or Vista operating system. If the software furnished performs the same functions as the programming device, specified elsewhere, then the programming device shall not be furnished.

1-1.23. Interconnecting Cable. For systems where the primary element and transmitter are physically separated, interconnecting cable from the element to the transmitter shall be provided. The cable shall be the type approved by the instrument manufacturer for the intended purpose of interfacing the element to the transmitter. Length of cable shall be a minimum of three meters or as indicated in the drawings or Instrument Device Schedule.

1-1.24. Device Tag Numbering System. All devices shall be provided with permanent identification tags. The tag numbers shall agree with tag numbers used on the project DRAWINGS and device schedules. All field-mounted transmitters and devices shall have stamped stainless steel identification tags. Panel, subpanel, and rack-mounted devices shall have laminated phenolic identification tags securely fastened to the panel or subpanel using machine screws with tapped holes where possible. Hand-lettered or tape labels will not be acceptable.

1-2. SUBMITTALS.

1-2.01. Submittals shall be as required in Section 17500.

1-2.02. DELIVERY, STORAGE, AND SHIPPING. Delivery, storage and shipping shall be as required in Section 17500.

1-2.03. SPARE PARTS. Spare parts shall be provided specified below, and as specified in the applicable instrument section.

a.	Pressure Instruments	One
b.	Flow Instruments	(Venturi) - One DP flow transmitter

PART 2 - PRODUCTS

2-1. INDIVIDUAL DEVICE SPECIFICATIONS

2-1.01. Individual instruments and related devices shall be provided as specified in one or more of the following sections, as required:

17561	Panel Mounted Instruments
17562	Flow Instruments
17563	Pressure and Level Instruments
17564	Analytical Instruments
17565	Miscellaneous Instruments

PART 3 - EXECUTION

3-1. INSTRUMENTATION INSTALLATION REQUIREMENTS

3-1.01. Additional instrumentation installation requirements are outlined in Section 17500. Instruments shall be installed and calibrated in accordance with the following requirements.

3-1.02. Field Calibration. After each instrument has been installed, a technical representative of CONTRACTOR shall calibrate each instrument and shall provide a written calibration report for

each instrument, indicating the results and final settings. The adjustments of calibrated instruments shall be sealed or marked, insofar as possible, to discourage tampering. Instrument calibration shall be done before checkout of the system operation. A typical instrument calibration report is attached to the end of each section. Calibration Data Sheets shall be submitted in a single 3-ring binder when calibration of all instruments has been completed. Instruments shall be calibrated at 0, 25, 50 , 75 and 100 percent of its calibrated range.

3-1.03. Systems Check. A technical representative of CONTRACTOR shall participate in the checkout of instrumentation systems. Systems check requirements shall be as specified in Section 17500.

3-1.04. Installation Test Equipment. Unless specified otherwise, all test equipment for the calibration and checking of system components shall be provided by CONTRACTOR for the duration of the testing work and this test equipment will remain the property of CONTRACTOR.

3-1.05. Mounting of Field Instruments. Instruments shall be mounted so that they can be easily read and serviced, and so that all appurtenant devices can be easily operated. Typical installation details for some instruments are indicated on the DRAWINGS.

- Instruments shall be mounted such that all readouts upright and are easily readable from directly in front of the instrument.
- Instruments and process or electrical connections shall be made in a neat and professional manner such that they are not a trip hazard or interfere with routine maintenance.
- Instruments which require bleeding of process lines for calibration shall be located such that liquid is not spilled on other equipment or in areas where it could be considered a hazard or nuisance. If this is not possible, provide a means to drain or convey the liquid to a suitable location. The ENGINEER and OWNER shall make the final to determination if an installation is acceptable. Installations deemed not acceptable shall be modified by the CONTRACTOR at no additional cost to the OWNER.

3-2. CUSTOMER TRAINING

3-2.01. Instrumentation training requirements are outlined in Section 17500.

SECTION 17562

FLOW INSTRUMENTS

PART 1 - GENERAL

1-1. SCOPE

1-1.01. The Flow Instrument Section covers the furnishing of flow instruments and accessories required for the Instrumentation and Control System as indicated on the drawings.

1-1.02. Equipment and services provided under this section shall be subject to the Instrumentation and Control System section. This section shall be used and referenced only in conjunction with the Instrumentation and Control System section. Supplementing the Instrumentation and Control System section, instrument data, special requirements, and options are indicated on the drawings or the Instrument Device Schedule.

1-1.03. When multiple instruments of a particular type are specified, and each requires different features, the required features are described on the drawings or the Instrument Device Schedule.

1-2. DESIGN CRITERIA

1-2.01. Each device shall be a pre-assembled, packaged unit. Upon delivery to the work site, each device or system shall be ready for installation with only minor piping and electrical connections required by Contractor.

1-2.02. Primary elements shall derive any required power from the transmitter, unless otherwise indicated.

1-2.03. The instruments shall be installed to measure, monitor, or display the specified process at the ranges and service conditions indicated on the drawings or as indicated in the Instrument Device Schedule. The instruments shall be installed at the locations indicated on the drawings or in the Instrument Device Schedule.

1-2.04. Where possible, each instrument shall be factory wet flow calibrated to the full scale flow range of the sensors or calibration ranges indicated on the drawings or in the Instrument Device Schedule. Transmitters or similar measurement instruments shall be calibrated using National Institute of Standards and Testing (NIST) approved bench calibration procedures, when such procedures exist for the instrument type. Calibration and configuration data shall be stored digitally in each device, including the instrument tag designation indicated on the drawings or Instrument Device Schedule.

1-3. SUBMITTALS

1-3.01. Submittals shall be made as specified in the Instrumentation and Control System section.

1-4. SHIPMENT, PROTECTION, AND STORAGE

1-4.01. Equipment provided under this section shall be shipped, protected, and stored as specified in the Instrumentation and Control System section. Identification of packaging shall be as specified in the Instrumentation and Control System section.

PART 2 - PRODUCTS

2-1. GENERAL

2-1.01. The following paragraphs provide minimum device requirements. The drawings or Instrument Device Schedule shall be used to determine any additional instrument options, requirements, or service conditions.

2-1.02. Interconnecting Cable. For instruments where the primary element and transmitter are physically separated, interconnecting cable from the element to the transmitter shall be provided. The cable shall be the type approved by the instrument manufacturer for the intended purpose of interfacing the element to the transmitter. Length of cable shall be a minimum of three meters or as indicated on the drawings or in the Instrument Device Schedule. The interconnecting cable shall be provided in the length necessary for installation. Splices shall not be allowed in the installed cable.

2-1.03. Programming Device. For instruments that require a dedicated programming device for calibration, maintenance, or troubleshooting, one such programming device shall be provided for each Owner facility (quantity required shall be as indicated in the Instrumentation and Control System section). The programming device shall include appropriate operation manuals and shall be included in the training requirements. For systems that allow the programming device functions to be implemented in software, running on a laptop computer, the software shall be provided instead of the programming device.

2-2. FLOW INSTRUMENTATION

2-2.01. Premium Accuracy Differential Pressure (Flow) Transmitters. Transmitters shall be an all solid state, electronic, loop powered two-wire Premium Smart transmitters and have the minimum ratings as listed below.

a) Transmitters shall be the capacitance or single-crystal silicon resonant sensor type.

b) Process fluid shall be isolated from the sensing elements by AISI Type 316 stainless steel, or Hastelloy-C diaphragms as indicated on the drawings. The isolation diaphragm shall use a silicone oil fluid fill.

c) Differential pressure transmitters shall be furnished with a manufacturer supplied integral 3-way 316 SS isolation and calibration manifold with easy access calibration ports.

d) Transmitters shall have self-diagnostics and electronically adjustable span, zero, and damping.

e) The transmitter shall have a 2-wire, isolated, 4-20 ma analog output that is user selectable for linear or square root output.

f) Transmitters shall be enclosed in a NEMA Type 4X housing. All parts shall be stainless steel, or other corrosion-resistant materials as required by the application.

g) Transmitters shall have microprocessor-based smart electronics with HART protocol interface.

h) Transmitters shall be provided with integral lightning surge protection.

i) Transmitters shall not be damaged by reverse polarity.

j) Transmitters shall be factory calibrated to the required range.

k) Transmitters shall be provided with an engraved stainless steel tag with instrument tag ID and calibration data.

l) Transmitters installed outdoors or in a potentially corrosive environment shall be installed within a NEMA 4X enclosure with appropriate temperature controls to prevent freezing or overheating.

m) Transmitters shall be installed using 2" pipe bracket only unless alternative is pre-approved by OWNER. No direct mounting of the transmitter or manifold to a sub-panel or other fixture will be allowed.

Physical Specifications

a.	Enclosure	NEMA 4X aluminum
b.	Wetted Parts	316 SS or Hastelloy C-276
c.	Mounting Hardware	Manufacturer supplied 316 SS mounting brackets and hardware
d.	Analog Output	Linear, isolated 4-20 ma, 2-wire, 24 VDC
e.	Power Supply	12 to 45 VDC (Nominal 24 VDC)
f.	Transmitter LCD Display	5 digit LCD displaying 4 transmitter variables in rotation.
g.	FM Approvals	Explosion Proof For Class 1, 2 & 3 Division 1

Performance Specifications

a.	Accuracy	+/- 0.065 % of calibrated span
b.	Installed Stability	+/- 0.125% of URL (Upper Range Limit) for 5 years
c.	Operating Temperature	-40 to 185 Deg. F
d.	Relative Humidity	0 to 100% noncondensing
e.	Temperature Effect per 50 Deg. F	+/1(0.025% URL + 0.125% span) from 5:1 to 100:1 rangeability
f.	Ranageablility	100:1
g.	Span & Zero Adjustment	Continuous over range
h.	Static Overpressure Limit	3626 psig minimum

2-2.02. Transmitter shall be Rosemount Model 3051CD or Yokogawa Model EJX110A series or pre-approved equal.

2-2.03. Insert Flow Venturi Element with Integral Spool Piece Primary flow element shall be fiberglass reinforced plastic with metal flange, throat and pressure taps. End connections shall be integral center flange to fit between existing mating pipe. The insert shall be provided with an integral spool piece with static tap. Insert flow meter shall be the pressure vessel type.

2-2.04. Inlet and outlet cones, throat and holding flange shall be provided as specified in Instrument Device Schedule and Installation Drawings. If a plastic tube material is specified, but the manufacture's tube will not meet the temperature requirements, then a stainless steel insert tube or full body metal venturi shall be provided.

2-2.05. Tapped connections shall be provided for the differential pressure lines of each insert tube, with a permanent marking for each connection on the holding flange. Pressure sensing taps shall be 1/4" or 1/2" NPT.

2-2.06. The flowmeter shall be sized to provide approximately 200 inches of differential at maximum design flow for the installation.

2-2.07. Accuracy of the meter shall be bench calibrated to 0.50% full range, and 0.25% flow calibrated at the design average flow range. Temperature range shall be -60to 200°F. Beta range shall be from 0.30 to 0.75. The venturi shall be factory calibrated with the spool piece.

2-2.08. Tube materials and construction shall be as follows:

Inlet and Outlet Cone Material	Fiberglass reinforced plastic
Throat liner or Bushings	Stainless steel
Holding Flange Type	ANSI/ASME B16.5, Class 150, flat faced

2-2.09. The meter shall be as manufactured by Primary Flow Signal, Inc. model "HVT-PS" without exception.

PART 3 - EXECUTION

3-1. FIELD SERVICES

3-1.01. Manufacturer's field services shall be provided for installation, field calibration, startup, and training as specified in the Instrumentation and Control System section.

3-1.02. Instruments shall not be shipped to the Work Site until two weeks prior to the scheduled installation. The System Supplier shall be responsible for coordinating the installation schedule with the Installation Contractor. Each shipment shall contain a listing of protective measures required to maintain sensor operation, including a listing of any common construction or cleaning chemicals that may affect instrument operation.

END OF SECTION

SECTION 17563

PRESSURE INSTRUMENTS

PART 1 - GENERAL

1-1. SCOPE

1-1.01. The Pressure Instruments section covers the requirements for pressure and level instruments and accessories required for the Instrumentation and Control System as indicated on the drawings and documents. All instruments shown in this section may not be required to be provided by the CONTRACTOR or System Supplier. Refer to the Instrumentation Device Schedule, 17560-A and P&ID drawings for a tabulation of required instruments.

1-1.02. Equipment and services provided under this section shall be subject to the requirements of Instrumentation and Control System, Section 17500. This section shall be used and referenced only in conjunction with this section. Supplementing the Instrumentation and Control System section, instrument data, special requirements, and options are indicated on the drawings or the Instrument Device Schedule.

1-1.03. When multiple instruments of a particular type are specified, and each requires different features, the required features are described on the drawings or the Instrument Device Schedule.

1-1.04. Instrument wetted materials shall be selected by the System Supplier based on the application and are subject to approval by the ENGINEER and OWNER.

1-2. DESIGN CRITERIA

1-2.01. Each device shall be a pre-assembled, packaged unit. Upon delivery to the work site, each device or system shall be ready for installation with only minor piping and electrical connections required by Contractor.

1-2.02. Primary elements shall derive any required power from the transmitter, unless otherwise indicated.

1-2.03. The instruments shall be installed to measure, monitor, or display the specified process at the ranges and service conditions indicated on the drawings or as indicated in the Instrument Device Schedule. The instruments shall be installed at the locations indicated on the drawings or in the Instrument Device Schedule.

1-2.04. Where possible, each instrument shall be factory calibrated to the calibration ranges indicated in the drawings or in the Instrument Device Schedule. Transmitters or similar measurement instruments shall be calibrated using National Institute of Standards and Technology (NIST) approved bench calibration procedures, when such procedures exist for the instrument type. Calibration data shall be stored digitally in each device, including the instrument tag designation indicated on the drawings and/or Instrument Device Schedule.

1-3. SUBMITTALS

1-3.01. Submittals shall be made as specified in the Instrumentation and Control System section.

1-4. SHIPMENT, PROTECTION, AND STORAGE

1-4.01. Equipment provided under this section shall be shipped, protected, and stored in accordance with the requirements of the Instrumentation and Control System section. Identification of packaging shall be as described in the Instrumentation and Control System section.

PART 2 - PRODUCTS

2-1. GENERAL

2-1.01. The following paragraphs provide minimum device stipulations. The drawings or Instrument Device Schedule shall be used to determine any additional instrument options, requirements, or service conditions. Section 17560 stipulates general requirements applicable to all instruments.

2-2. PRESSURE INSTRUMENTATION

2-2.01. Premium Accuracy Gage Pressure Transmitters. Transmitters shall be an all solid state, electronic, loop powered two-wire Premium Smart transmitters and have the minimum ratings as listed below.

a) Transmitters shall be the capacitance or piezo-resistive type.

b) Process fluid shall be isolated from the sensing elements by AISI Type 316 stainless steel, or Hastelloy-C, diaphragms as indicated on the drawings. The isolation diaphragm shall use a silicone oil fluid fill.

c) Transmitters shall be provided with the manufacturers integral 316 SS 2-way isolation and calibration manifold.

d) Transmitters shall have self-diagnostics and electronically adjustable span, zero, and damping.

e) Transmitters shall be enclosed in a NEMA Type 4X housing. All parts shall be stainless steel, or other corrosion-resistant materials as required by the application.

f) Transmitters shall have microprocessor-based smart electronics with HART protocol interface.

g) Transmitters shall be provided with integral lightning surge protection.

h) Transmitters shall not be damaged by reverse polarity.

i) Transmitters shall be factory calibrated to the required range.

j) Transmitters shall be provided with an engraved stainless steel tag with instrument tag ID and calibration data.

Physical Specifications

a.	Enclosure	NEMA 4X aluminum
b.	Wetted Parts	316 SS or Hastelloy C-276
c.	Mounting Hardware	Manufacturer supplied 316 SS mounting brackets and hardware
d.	Analog Output	Linear, isolated 4-20 ma, 2-wire, 24 VDC
e.	Power Supply	12 to 45 VDC (Nominal 24 VDC)
f.	Transmitter LCD Display	5 digit LCD displaying 4 transmitter variables in rotation.
g.	FM Approvals	Explosion Proof For Class 1, 2 & 3 Division 1

Performance Specifications

a.	Accuracy	+/- 0.065 % of calibrated span
b.	Installed Stability	+/- 0.125% of URL (Upper Range Limit) for 5 years
c.	Operating Temperature	-40 to 185 Deg. F
d.	Relative Humidity	0 to 100% noncondensing
e.	Temperature Effect per 50 Deg. F	+/1(0.025% URL + 0.125% span) from 5:1 to 100:1 rangeability
f.	Ranageablility	100:1
g.	Span & Zero Adjustment	Continuous over range
h.	Static Overpressure Limit	3626 psig minimum

Transmitter shall be Rosemount Model 3051CG or Yokogawa Model EJX430A series or pre-approved equal.

2-2.02. Premium Accuracy Differential Pressure Transmitters. Differential pressure indicating transmitters shall have the requirements and specifications as the gage pressure transmitters above except for body type and as noted below.

- Differential pressure transmitters shall be furnished with a manufacturer supplied integral 3-way 316 SS isolation and calibration manifold with easy access calibration ports.
- The transmitter shall have a 2-wire, isolated, 4-20 ma analog output that is user selectable for linear or square root output.
- A 8.5 x 11 inch laminated flow verse differential pressure curve shall be provided.

Transmitter shall be Rosemount Model 3051CD or Yokogawa Model EJX430A series or pre-approved equal.

PART 3 - EXECUTION

3-1. FIELD SERVICES

3-1.01. Manufacturer's field services shall be provided for installation, field calibration, startup, and training as specified in the Instrumentation and Control System section.

3-1.02. Instruments shall not be shipped to the Work Site until two weeks prior to the scheduled installation. System Supplier shall be responsible for coordinating the installation schedule with the Installation Contractor. Each shipment shall contain a listing of protective measures required to maintain sensor operation, including a listing of any common construction or cleaning chemicals that may affect instrument operation.

END OF SECTION

SECTION 17565

MISCELLANEOUS INSTRUMENTS

PART 1 - GENERAL

1-1. SCOPE

1-1.01. The section covers the requirements for all miscellaneous instruments and accessories required for the Instrumentation and Control System as indicated on the drawings and documents. All instruments shown in this section may not be required to be provided by the System Supplier. Refer to the Instrumentation Device Schedule, 17560-A and P&ID drawings for a tabulation of required instruments.

1-1.02. Equipment and services provided under this section shall be subject to the requirements of Instrumentation and Control System, Section 17500. This section shall be used and referenced only in conjunction with this section. Supplementing the Instrumentation and Control System section, instrument data, special requirements, and options are indicated on the drawings or the Instrument Device Schedule.

1-1.03. When multiple instruments of a particular type are specified, and each requires different features, the required features are described on the drawings or the Instrument Device Schedule.

1-1.04. Terminology. When the phrase "as required" is stated in this section it shall mean "as required in any attached Data Sheet(s)" or shown on the DRAWINGS.

1-1.05. Design Criteria. Each device shall be a pre-assembled, packaged unit. Upon delivery to the work site, each device or system shall be ready for installation with only minor piping and electrical connections required by SYSTEM SUPPLIER.

1-1.06. Primary elements shall derive any required power from the transmitter, unless otherwise indicated.

1-1.07. Where possible, each instrument shall be factory calibrated to the calibration ranges indicated in the Instrument Device Schedule. Transmitters or similar measurement instruments shall be calibrated using National Institute of Standards and Technology (NIST) approved bench calibration procedures, when such procedures exist for the instrument type. For "smart" devices, calibration data shall be stored digitally in each device, including the instrument tag designation indicated on the Instrument Device Schedule.

1-1.08. Submittals. Submittals shall be made in accordance with the requirements of Section 17500.

1-1.09. Shipment, Protection, and Storage. Equipment provided under this section shall be shipped, protected, and stored in accordance with the requirements of Section 17500. Identification of packaging shall be as described in Section 17500.

PART 2 - PRODUCTS

2-1. GENERAL

2-1.01. The following paragraphs provide minimum device requirements. The Instrument Device Schedule shall be used to determine any additional instrument options, requirements, or service conditions.

2-1.02. Interconnecting Cable. For systems where the primary element and transmitter are physically separated, interconnecting cable from the element to the transmitter shall be provided. The cable shall be the type approved by the instrument manufacturer for the intended purpose of interfacing the element to the transmitter. Length of cable shall be a minimum of three meters or as indicated in the Instrument Device Schedule.

2-2. MISCELLANEOUS INSTRUMENTS

2-2.01. Panel Door Proximity Switches. Proximity switches shall be magnetic proximity type, consisting of two sensors. One sensor shall be fixed to the door and the other to the door frame. The sensor mounted to the door shall have no electrical connections. Switches shall be provided with DPDT contacts rated 5 amperes at 120 V ac. All necessary mounting hardware shall be provided to allow both the sensors to be installed at the locations indicated on the drawings.

2-2.02. Magnetic Door Intrusion Security Switch. Industrial, high security, wide gap, surface mount, magnetic intrusion switches shall be provided as shown on the drawings or documents.

The switch shall:

a.	The switch shall be enclosed in a brushed aluminum housing.
b.	The switch shall be a hermetically sealed reed switch in polyurethane potting.
c.	Switch contacts shall be DPDT form C rated for 30V AC/DC at 250 ma max. and biased with a Alinco VII magnetic.
d.	The switch will be difficult to defeat with an external magnet.
e.	The switch shall be UL-634 rated.
f.	The switch leads shall be in 3 feet of armored stainless steel cable permanently attached to the switch.
g.	The switch make/break distance shall be 0.2” minimum, and 0.6” maximum.
h.	The switch shall be surface mount, tamper resistant, and suitable for mounting on steel doors.

The switch shall be Model 2707AL as manufactured by General Electric Sentrol Division without exception.

2-2.03. Dual X-Band and PIR Motion Detectors Motion detectors shall be provided as shown on the drawings. The mounting shall be unobtrusive. The motion detector shall combine microwave (X-Band) and PIR technologies into a single unit with microprocessor based signal processing.

The motion detector shall:

- Shall be digital for fast and accurate detection.
- Shall be tamper protected.
- Shall have a Form C, 25 VDC, 125 ma Output Relay.
- Shall have sensitivity adjustment.
- Shall have self-adjusting detection thresholds.
- Shall have active IR for anti-masking.
- Shall have LRD diagnostics.
- Shall have digital fluorescent light filtering

Specifications:

a.	Power Requirements	50 ma max @ 12 VDC
b.	Temperature	32 to 120 Deg F
c.	PIR White Light Immunity	6500 LUX
d.	RFI Immunity	30 V/m, 10 MHz to 1000 MHz
e.	Microwave Frequency	X Band
f.	ESD Immunity	10 kV

The unit shall be as manufactured by Honeywell Model DT-900 or approved equal.

PART 3 - EXECUTION

3-1. FIELD SERVICES

3-1.01. Manufacturer's field services shall be provided for installation, field calibration, startup, and training as specified in Section 17560.

3-1.02. Instruments shall not be shipped to the work site until two weeks prior to the scheduled installation. The system supplier shall be responsible for coordinating the installation schedule with the installation contractor. Each shipment shall contain a listing of protective measures required to maintain sensor operation, including a listing of any common construction or cleaning chemicals that may affect instrument operation.

GENERAL SYMBOLOGY

- NEW CONSTRUCTION
- EXISTING (SCREENED)
- FUTURE (PHANTOM)
- EXISTING TO BE REMOVED OR DEMOLISHED

MATERIAL SYMBOLOGY

- CONCRETE (PLAN AND SECTION)
- GROUT OR SAND (PLAN AND SECTION)
- BRICK (PLAN AND SECTION)
- CMU (PLAN AND SECTION)
- STEEL/METAL/FRP (SMALL SCALE SECTION)
- CHECKER PLATE OR SOLID FRP GRATING (PLAN)
- CHECKER PLATE (SECTION)
- GRATING (PLAN)
- GRATING OR SOLID FRP GRATING (SECTION)
- SAFETY GRATING (PLAN)
- SAFETY GRATING (SECTION)
- RAILING (PLAN)
- WOOD (PLAN OR ELEVATION)
- LUMBER/FRAMING - NOMINAL
- LUMBER - TRIMMED (BLOCKING OR SHIMS)
- OR GLULAM (SECTION)
- GLULAM (ELEVATION)
- OR PLYWOOD (SMALL SCALE)
- FINISHED GRADE
- GRAVEL/DRAINROCK/AGGREGATE BASE

VALVE AND GATE ACTUATORS

- DIAPHRAGM OPERATOR
- D = DIGITAL
E/H = ELECTROHYDRAULIC
P = PNEUMATIC
S = SOLENOID
T = TEMPERATURE
- HAND / MANUAL OPERATOR
(ALSO SHOWN AS NO OPERATOR)
- MOTOR OPERATOR
- PISTON ACTUATOR
- PRESSURE BALANCED DIAPHRAGM ACTUATOR
- PRESSURE REGULATOR WITH EXTERIOR TAP
- PRESSURE REGULATOR (SELF CONTAINED)
- PRESSURE RELIEF OR SAFETY ACTUATOR
- WEIGHT BALANCED OPERATOR

VALVES

- 3 WAY MULTI-PORT VALVE
- 4 WAY MULTI-PORT VALVE
- AIR VACUUM, AIR RELEASE, OR
AIR VACUUM AND AIR RELEASE ASSEMBLY
- ANGLE VALVE
- BACK-PRESSURE VALVE
- BACKFLOW PREVENTER VALVE
- BACKWATER VALVE
- BALL VALVE
- BUTTERFLY VALVE
- CHECK VALVE
- CHECK VALVE - ANGLE
- CHECK VALVE - BALL
- CHECK VALVE - SILENT
- CHECK VALVE - STOP
- CONE VALVE
- DIAPHRAGM VALVE
- FLAP VALVE
- GATE VALVE
- GLOBE VALVE
- HOSE BIBB VALVE
FROM TOP, FRONT AND SIDE VIEW
- NEEDLE VALVE
- PINCH VALVE
- PLUG VALVE - ECCENTRIC
- PLUG VALVE - LUBRICATED
- OR PRESSURE REGULATING VALVE
- PRESSURE RELIEF VALVE
- SLEEVE VALVE
- TELESCOPING VALVE

GATES

- SLIDE GATE
(CAST IRON, ALUMINUM OR STAINLESS STEEL)
- STOP GATE OR SHEAR GATE

PUMPS & COMPRESSORS

- AIR DRIVEN DIAPHRAGM PUMP
- HORIZONTAL ANSI END SUCTION PUMP
- CENTRIFUGAL PUMP
- CENTRIFUGAL WET PIT PUMP
OR TURBINE PUMP
- CHEMICAL METERING PUMP
- CIRCULATING PUMP
- DRUM PUMP
- GEAR PUMP OR ROTARY
POSITIVE DISPLACEMENT BLOWER
- HORIZONTAL SPLIT CASED PUMP
- HOSE PUMP
- PISTON PUMP
- PROGRESSIVE CAVITY PUMP
- ROTARY LOBE PUMP
- SAMPLE PUMP
- SUBMERSIBLE PUMP
- SUBMERSIBLE TURBINE PUMP
- VERTICAL TURBINE PUMP
- PISTON DRIVEN COMPRESSOR
- COMPRESSOR

FLOW MEASUREMENT INSTRUMENTS

- DM DENSITY FLOWMETER
- DISPLACEMENT FLOWMETER
- FLOW ORIFICE
- FLOW ORIFACE WITH QUICK CHANGE FITTINGS
- FLOW TUBE
- FLOW TURBINE
- FLOW VANE
- FLUME

FLOW MEASUREMENT INSTRUMENTS (CONTINUED)

- MM MAGNETIC FLOWMETER
- PADDLE WHEEL METER
- PITOT TUBE METER (DOUBLE)
- PITOT TUBE METER (SINGLE)
- ROTAMETER / VARIABLE AREA FLOWMETER
- ULTRASONIC FLOWMETER
- VENTURI FLOWMETER
- VORTEX SHEDDING FLOWMETER
- WEIR METER

PIPING ENDS (SINGLE-LINE)

- BLIND FLANGE
- CAP - BREATHER
- CAP - SCREW / THREADED
- CAP - WELDED
- CAP - QUICK DISCONNECT
- EXPANSION JOINT
- FLANGED
- FLANGED COUPLING ADAPTER
- FLANGED COUPLING ADAPTER - RESTRAINED
- OR FLEXIBLE CONNECTION - BELLOWS TYPE
- GROOVED END COUPLING
- MECHANICAL JOINT
- PIPE MATERIAL CHANGE
- PUSH-ON JOINT - BELL AND SPIGOT
- PUSH-ON JOINT - RESTRAINED
- REDUCER - CONCENTRIC
- REDUCER - ECCENTRIC
- REMOVABLE SPOOL PIECE
- SLEEVE TYPE COUPLING
- SLEEVE TYPE COUPLING - RESTRAINED
- UNION
- WELDED

GENERAL NOTES

GENERAL

1. LOCATIONS, ELEVATIONS, AND DIMENSIONS OF EXISTING UTILITIES, STRUCTURES, AND OTHER FEATURES ARE SHOWN ACCORDING TO THE BEST INFORMATION AVAILABLE AT THE TIME OF THE PREPARATION OF THESE DRAWINGS, BUT DO NOT PURPORT TO BE ABSOLUTELY CORRECT. THERE MAY BE OTHER IMPROVEMENTS, UTILITIES, ETC., WHICH ARE WITHIN THE PROJECT AREA AND WHICH HAVE BEEN CONSTRUCTED SINCE THE PREPARATION OF THESE PLANS. PRIOR TO ORDERING MATERIALS AND BEGINNING CONSTRUCTION, THE CONTRACTOR SHALL VERIFY THE LOCATIONS, ELEVATIONS, AND DIMENSIONS OF ALL EXISTING UTILITIES, STRUCTURES, AND OTHER FEATURES AFFECTING THE WORK.

2. "SCREENED" (LIGHT) DELINEATION INDICATED ON THE DRAWINGS DENOTES EXISTING FACILITIES. "SCREENED" INFORMATION WAS TAKEN FROM EXISTING CONSTRUCTION DRAWINGS AND DATA, IS FOR REFERENCE ONLY, AND SHALL BE FIELD VERIFIED BY THE CONTRACTOR PRIOR TO THE ORDERING OF MATERIALS AND BEGINNINGS OF CONSTRUCTION. "BOLD" DELINEATION IS NEW WORK TO BE CONSTRUCTED UNDER THIS CONTRACT.

3. THE INFORMATION PROVIDED IN THESE PLANS IS TO ASSIST THE CONTRACTOR IN ASSESSING THE NATURE AND EXTENT OF THE CONDITIONS WHICH MAY BE ENCOUNTERED DURING THE COURSE OF THE WORK. ALL CONTRACTORS ARE DIRECTED, PRIOR TO PRICING PROJECT, TO CONDUCT WHATEVER INVESTIGATIONS THEY DEEM NECESSARY TO ARRIVE AT THEIR OWN CONCLUSIONS REGARDING THE ACTUAL CONDITIONS THAT WILL BE ENCOUNTERED, AND UPON WHICH, PRICING OF THE PROJECT WILL BE BASED.

4. THE CONTRACTOR'S ATTENTION IS CALLED TO THE FACT THAT THERE MAY BE UTILITY CONFLICTS. IT SHALL BE THE CONTRACTOR'S RESPONSIBILITY TO LOCATE AND PROTECT ANY AND ALL EXISTING UTILITIES ON THIS PROJECT. CALL BEFORE YOU DIG. CONTRACTOR SHALL VERIFY PRECISE LOCATIONS AND ELEVATIONS OF ALL UTILITIES AND STRUCTURES, WHETHER INDICATED ON THE DRAWINGS OR NOT, IN THE FIELD IN ADVANCE OF EXCAVATING, BY CONTACTING ALL REQUIRED AGENCIES, AND BY PROSPECTING. IF REQUIRED AFTER FIELD VERIFICATION, CONTRACTOR SHALL COORDINATE WITH THE ENGINEER TO DETERMINE ANY NECESSARY MODIFICATIONS TO THE WORK.

5. CONTRACTOR SHALL DEVELOP A STORM WATER POLLUTION PREVENTION PLAN (SWPPP) AND APPOINT A DESIGNATED SWPPP INSPECTOR FOR THE PROJECT SITE. THE CONTRACTOR SHALL PAY FOR AND FILE A NOTICE OF INTENT TO USE THE STATE OF FLORIDA DEPARTMENT OF ENVIRONMENTAL PROTECTION GENERIC PERMIT FOR STORM WATER DISCHARGE FROM LARGE AND SMALL CONSTRUCTION ACTIVITIES (REFERRED AS "FDEP GENERIC PERMIT") AT LEAST ONE WEEK PRIOR TO COMMENCEMENT OF CONSTRUCTION AND SHALL FILE A NOTICE OF TERMINATION TO USE THE FDEP GENERIC PERMIT AT THE COMPLETION OF THE PROJECT.

6. CONTRACTOR SHALL RETURN THE ENTIRE GRASSED OR PAVED AREAS DISTURBED BY CONSTRUCTION ACTIVITIES TO THE ORIGINAL CONDITION OR BETTER UPON COMPLETION OF THE WORK, IN ACCORDANCE WITH THE PROJECT SPECIFICATIONS. GRADE SHALL BE RETURNED TO ORIGINAL ELEVATION. DISTURBED GRASSED AREAS SHALL BE RE-GRADED AND SODDED.

7. CONTRACTOR'S OPERATIONS SHALL BE LIMITED TO WITHIN THE EASEMENTS. ACCESS TO OTHER AREAS OF SITE SHALL BE COORDINATED WITH OWNER.

8. WHERE REQUIRED, THE SOIL EROSION AND SEDIMENT CONTROL DEVICES SHALL BE INSTALLED PRIOR TO CONSTRUCTION, MAINTAINED THROUGHOUT CONSTRUCTION, AND UNTIL THE SITE IS PERMANENTLY STABILIZED. THE CONTRACTOR SHALL PROVIDE AND INSTALL SILT SCREENS AROUND THE PROPOSED CONSTRUCTION ACTIVITY, EACH WELL SITE, AND ALL ROADWAY WORK, AS NECESSARY, TO PREVENT THE TRANSPORT OF SEDIMENT DOWNSTREAM INTO STREET, STORM SEWERS, OPEN DITCHES, LAKES, DETENTION PONDS, ETC., AND SHALL PERFORM ALL NECESSARY INSPECTIONS. THESE AREAS, ACTIVITIES, AND REQUIRED BMPS OR OTHER MITIGATIONS WILL BE DETAILED IN THE REQUIRED CONTRACTOR DEVELOPED SWPPP.

9. THE CONTRACTOR IS RESPONSIBLE FOR OBTAINING ALL BUILDING PERMITS. INCLUDING THE REQUIRED NOTICE OF COMMENCEMENT FILED WITH THE CLERK OF THE COURT.

10. ALL DEMOLITION DEBRIS SHALL BE REMOVED FROM THE SITE AND LEGALLY DISPOSED OF.

11. CONTRACTOR SHALL LEGALLY DISPOSE OF ALL EXCAVATED MATERIALS REMOVED FROM THE SITE AND SHALL OBTAIN ALL NECESSARY PERMITS TO DO SO.

12. OPERATIONS AT THIS FACILITY ARE ONGOING AND, AS SUCH ANY SHUTDOWNS REQUIRED BY THE WORK MUST BE COORDINATED WITH THE OWNER. OWNER MUST BE NOTIFIED ACCORDING TO SPECIFICATION 01015 PROJECT REQUIREMENTS.

13. ANY DISTURBANCE TO ANY LAND OR OTHER APPURTENANCES, OUTSIDE THE EASEMENT LIMITS, CAUSED BY THE CONTRACTOR'S OPERATIONS SHALL BE REPAIRED BY THE CONTRACTOR TO THE SATISFACTION OF THE OWNER OF THE LAND OR APPURTENANCE. NO PAYMENT SHALL BE MADE FOR SUCH WORK.

14. CONTRACTOR'S LAYDOWN AREAS AND MATERIAL STORAGE AREA SHALL BE LIMITED TO WITHIN THE EASEMENTS, AND AS APPROVED IN WRITING BY THE OWNER AND ENGINEER. CONTRACTOR SHALL SUBMIT A PLAN DETAILING THE PROPOSED USE OF THESE AREAS AND TRAFFIC PATTERNS BETWEEN THESE AREAS AND THE WORK FOR OWNER ACCEPTANCE.

15. THE PROJECT SHALL BE CONSTRUCTED IN GROUPS AS NOTED IN THE CONTRACT DOCUMENTS TO ENSURE NECESSARY FLOW REQUIREMENTS, PER THE SPECIFICATION, ARE MET. PRIOR TO ANY WELL OR PIPELINE BEING PLACED BACK INTO SERVICE, THE SYSTEM MUST BE DISINFECTED, PRESSURE TESTED, AND CLEARED BY THE FLORIDA DEPARTMENT OF ENVIRONMENTAL PROTECTION. REFER TO MECHANICAL DRAWINGS AND SPECIFICATIONS.

16. NO WATER FROM TEMPORARY DEWATERING OPERATIONS SHALL BE DISCHARGED IN A LOCATION OR MANNER WHICH WILL CAUSE THE TRANSFER OF SEDIMENT INTO DITCHES OR OTHER WETLAND AREAS. REFER TO SPECIFICATION SECTION 02270 FOR DEWATERING REQUIREMENTS.

17. STOCKPILING OF FILL MATERIAL AND MATERIAL STORAGE CAN ONLY BE PLACED WITHIN AREAS THAT ARE PROTECTED USING APPROVED EROSION CONTROL MEASURES AS REQUIRED BY THE NPDES PROGRAM AND IN WRITING BY THE OWNER AND ENGINEER.

18. LOCATIONS AND DIMENSIONS OF THE EASEMENTS ARE BASED ON THE BEST AVAILABLE INFORMATION. CONTRACTOR SHALL VERIFY THE LIMITS OF THE EASEMENTS IN ORDER TO AVOID ENCROACHMENTS. ALL CONSTRUCTION SHALL BE COMPLETED WITHIN THE EASEMENT LIMITS.

19. ALL DISTURBED AREAS WITHIN THE RIGHT-OF-WAY WILL BE COMPACTED TO 95% OF MAXIMUM DENSITY AND SODDED.

SHEET 4 OF 120

User:SVADHAWKAR Spec:NAT CADD STD File:C:\PW_WORKING\WTR\SVADHAWKAR\D0154732\G-4.DWG Scale:1:1 SavedDate:11/19/2024 Time:15:09 Plot Date: Vadhawkar, Samir; 4/30/2025; 13:44 ; Layout:LAYOUT1

CIVIL GENERAL NOTES

GENERAL

1. THE CONTRACTOR SHALL TAKE ALL PRECAUTIONARY MEASURES NECESSARY TO PROTECT EXISTING IMPROVEMENTS WHICH ARE TO REMAIN IN PLACE FROM DAMAGE. ALL IMPROVEMENTS DAMAGED BY THE CONTRACTOR'S OPERATIONS SHALL BE EXPEDITIOUSLY REPAIRED OR RECONSTRUCTED AT THE CONTRACTOR'S EXPENSE WITHOUT ADDITIONAL COMPENSATION. THIS INCLUDES DIRT, GRAVEL, GRASSED, OR ASPHALT ROADS USED IN THE EXECUTION OF THE WORK.
2. THE CONTRACTOR SHALL PROPERLY DISPOSE OF ALL DEBRIS FROM DEMOLITION AT CONTRACTORS EXPENSE.
3. ALL BUILDING COORDINATES ARE TO OUTSIDE CORNER OF COLUMN OR BUILDING.
4. THE CONTRACTOR SHALL DISPOSE OF ALL NON-ORGANIC WASTES SUCH AS OLD GUNITE, PIPING, ROCK RUBBLE ETC. AT AN APPROVED LANDFILL OR, OTHER SUITABLE DISPOSAL SITES AT THE CONTRACTOR'S EXPENSE.
5. CONTRACTOR SHALL PROTECT ALL SURVEY MONUMENTS AND BENCHMARKS AND RESTORE ALL SURVEY MONUMENTS AND BENCHMARKS THAT ARE DAMAGED OR DESTROYED DURING CONSTRUCTION.
6. CONTRACTOR SHALL LIMIT ALL CONSTRUCTION ACTIVITIES WITHIN THE EASEMENT LIMITS AND SHALL ACQUIRE TEMPORARY EASEMENT TO ACCOMMODATE ANY CONSTRUCTION ACTIVITIES THAT FALL OUTSIDE EASEMENT.

UTILITIES

1. PRIOR TO THE START OF CONSTRUCTION, THE CONTRACTOR SHALL LOCATE ALL EXISTING UTILITIES IN AND AROUND THE AREAS OF NEW CONSTRUCTION. THE CONTRACTOR SHALL POTHOLE FOR EXISTING UTILITIES PRIOR TO SUBMITTAL OF SHOP DRAWINGS, FOR POINTS OF CONNECTIONS.
2. THE CONTRACTOR SHALL PROTECT ALL REMAINING EXISTING UTILITIES.
3. LOCATIONS OF UNDERGROUND UTILITIES SHOWN ON THE DRAWINGS WERE OBTAINED FROM AVAILABLE RECORDS. THE CONTRACTOR SHALL VERIFY ALL LOCATIONS AND ELEVATIONS AND SHALL TAKE ALL PRECAUTIONARY MEASURES NECESSARY TO PROTECT UTILITY LINES WHETHER SHOWN OR NOT SHOWN.
4. PRIOR TO ANY CONNECTION TO AN EXISTING UTILITY, THE CONTRACTOR SHALL COORDINATE WITH THE UTILITY OWNER. PRIOR TO ANY EXCAVATION IN THE VICINITY OF ANY EXISTING UNDERGROUND FACILITIES, INCLUDING ALL WATER, SEWER, STORM DRAIN, GAS, PETROLIUM PRODUCTS, OR OTHER PIPELINES; ALL BURIED ELECTRIC POWER, COMMUNICATIONS, OR TELEVISION CABLES; ALL TRAFFIC SIGNAL AND STREET LIGHTING FACILITIES; AND ALL ROADWAY, STATE HIGHWAY, AND RAILROAD RIGHTS-OF-WAY, THE CONTRACTOR SHALL NOTIFY THE RESPECTIVE AUTHORITIES REPRESENTING THE OWNERS OR AGENCIES RESPONSIBLE FOR SUCH FACILITIES NOT LESS THAN 3 DAYS NOR MORE THAN 7 DAYS PRIOR TO EXCAVATION SO THAT A REPRESENTATIVE OF SAID OWNERS OR AGENCIES CAN BE PRESENT DURING SUCH WORK IF THEY SO DESIRE. IN THE CASE OF THE UNDERGROUND UTILITY SERVICE ALERT CENTER, THIS NOTICE WILL GIVE THEM TIME TO MARK THE LOCATION OF THE UTILITIES. THE CONTRACTOR SHALL ALSO NOTIFY THE REGIONAL OR LOCAL UNDERGROUND SERVICE ALERT COMPANY AT LEAST 3 DAYS, BUT NO MORE THAN 7 DAYS, PRIOR TO SUCH EXCAVATION.

PIPING

1. THE CONTRACTOR SHALL COMPLY WITH THE STATE DEPARTMENT OF HEALTH SERVICES CRITERIA FOR THE SEPARATION OF WATER MAINS AND SANITARY SEWERS.
2. THE CONTRACTOR SHALL PROVIDE A MINIMUM OF 36 INCHES OF COVER ON ALL PIPELINES UNLESS OTHERWISE SHOWN OR DIRECTED.
3. STRAIGHT SLOPES SHALL BE MAINTAINED BETWEEN INVERT ELEVATIONS SHOWN OR SPECIFIED.
4. THE CONTRACTOR SHALL ADJUST ALL VALVE BOXES, PULL BOXES AND MANHOLES TO FINISHED GRADE UNLESS OTHERWISE SHOWN OR SPECIFIED. MANHOLES IN OPEN FIELDS SHALL BE SET ONE FOOT ABOVE GRADE. APPROXIMATE RIM ELEVATIONS ARE SHOWN ON DRAWINGS.
5. ALL PIPE TRENCHING AND BACKFILL SHALL BE IN ACCORDANCE WITH DETAIL C-601 FOR FLEXIBLE PIPE. THE PIPING SHOWN ON THESE PLANS SHALL BE RESTRAINED JOINT DESIGN AT ALL SLEEVE TYPE COUPLINGS.
6. ALL PIPING SHALL BE RESTRAINED JOINT DESIGN UNLESS INDICATED OTHERWISE. COUPLINGS AND RESTRAINED JOINTS SHALL BE PROVIDED WHETHER SHOWN ON THE DRAWINGS OR NOT. ALL OTHER PIPES, COUPLINGS AND RESTRAINED JOINTS SHALL BE APPROVED BY THE ENGINEER. ALL RESTRAINED JOINTS SHALL BE IN ACCORDANCE WITH THE PIPE MANUFACTURERS' RECOMMENDATIONS.

CIVIL GENERAL NOTES - CONTINUED

EROSION CONTROL

1. THE CONTRACTOR SHALL SUBMIT AN EROSION CONTROL PLAN FOR WORK DURING THE CONSTRUCTION, SIGNED AND STAMPED BY A REGISTERED CIVIL ENGINEER PRIOR TO THE START OF CONSTRUCTION.
   a. ALL SLOPES SHALL BE PROTECTED FROM EROSION DURING ROUGH GRADING OPERATIONS AND THEREAFTER, UNTIL INSTALLATION OF FINAL GROUNDCOVER (SEE LANDSCAPE PLANS FOR FINAL GROUNDCOVER).
   b. ALL SLOPE PROTECTION SWALES SHALL BE CONSTRUCTED AT THE SAME TIME AS BANKS ARE GRADED.
   c. THE CONTRACTOR IS RESPONSIBLE FOR IMPLEMENTATION AND MAINTENANCE OF EROSION CONTROL MEASURES CONTAINED WITHIN THE CONTRACT SPECIFICATIONS OR AS REQUIRED BY THE CITY, DISTRICT, OR OTHER REGULATORY AUTHORITY. CONCEPTUAL SILT FENCE LOCATIONS SHOWN ARE CONCEPTUAL AND THE CONTRACTOR IS REQUIRED TO FINALIZE SILT FENCE LOCATIONS AS PART OF THEIR SWPPP AND EROSION CONTROL PLAN. THE CONTRACTOR SHALL ALSO PROVIDE ANY ADDITIONAL EROSION CONTROL MEASURES (E.G. HYDROSEEDING, MULCHING OF STRAW, SAND BAGGING, DIVERSION DITCHES, ETC.) DICTATED BY FIELD CONDITIONS TO PREVENT EROSION OR THE INTRODUCTION OF DIRT, MUD, OR DEBRIS INTO EXISTING PUBLIC STREETS, WATERWAYS, OR ONTO ADJACENT PROPERTIES DURING ANY PHASE OF CONSTRUCTION OPERATIONS.

SURVEY AND CONTROL

1. THIS DOCUMENT IS NOT REFLECTIVE OF A BOUNDARY SURVEY. EASEMENT LIMITS SHOWN HEREIN HAVE BEEN GRAPHICALLY DEPICTED BASED ON INFORMATION PROVIDED BY TAMPA BAY WATER.

   THE UNDERSIGNED HAS PERFORMED A CURSORY REVIEW OF THIS PLOTTED EASEMENT INFORMATION IN RELATION TO RECORD DATA OBTAINED FROM THE SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT; AND IN RELATION TO THAT CERTAIN EASEMENT AGREEMENT RECORDED IN OFFICIAL RECORD BOOK 3114, PAGE 999, OF THE PUBLIC RECORDS OF HILLSBOROUGH COUNTY, FLORIDA.

   THE ABOVE NOTED REVIEW HAS INDICATED THAT THE PLOTTED EASEMENT DATA MAY CONTAIN ERRORS IN POSITIONING OF BETWEEN 0-3 FEET FOR CERTAIN WELL-SITES ALONG THE NORTHERN PORTION OF THE FLATWOODS PARK TRAIL LOOP; AND BETWEEN 0-9 FEET FOR CERTAIN WELL SITES ALONG THE SOUTHEN PORTION OF THE FLATWOODS PARK TRAIL LOOP. THESE ERRORS ARE GENERALLY IN AN EAST/WEST DIRECTION AND ARE REFLECTIVE ONLY OF POTENTIAL POSITIONING ERRORS BASED ON APPARENT INCONSISTENCIES FOUND BETWEEN THE VARIOUS DATA SOURCES CONSULTED. THIS STATEMENT IS NOT REFLECTIVE OF A FORMAL DETERMINATION OF THE EXISTENCE AND NATURE OF ANY SPECIFIC ERRORS AND NOTICE OF THESE CONDITIONS ARE BEING MADE AS THE RESOLUTION OF INCONSISTENCIES, IF ANY, IN EASEMENT INFORMATION PROVIDED TO STANTEC FOR USE IN PREPARING THIS MAP IS BEYOND STANTEC'S CONTRACTUAL SCOPE OF SERVICES.

2. AERIALS WERE OBTAINED FROM THE LAND BOUNDARY INFORMATION SYSTEM (LABINS) DATED 2020.
3. ELEVATIONS SHOWN HEREON ARE BASED ON THE NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD 88)
4. HORIZONTAL POSITIONS SHOWN HEREON ARE BASED ON THE FLORIDA STATE PLANE COORDINATE SYSTEM NORTH AMERICAN DATUM OF 1983 (2011 ADJUSTMENT), FLORIDA WEST (ZONE 0902)

PERMITTING

1. SEE SPECIFICATION SECTION 01060 FOR PERMITS AND REGULATORY REQUIREMENTS
2. THERE ARE NO NEW SEPTIC TANK OR SEWER LINE CONNECTIONS PROVIDED FOR THE PROJECT.
3. THE POWER DISTRIBUTION INFRASTRUCTURE SUPPLYING ALL WELLS SITES IS OWNED BY TAMPA BAY WATER.
4. WIRELESS CELLULAR RADIO CONNECTION SHALL BE FURNISHED AND INSTALLED BY TAMPA BAY WATER.

DRAINAGE SYMBOLS

- RIPRAP
- HAY BALE
- SILT FENCE

CORROSION CONTROL SYMBOLS

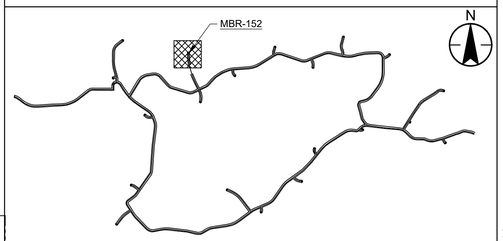
KEY PLAN



GENERAL SHEET NOTES

1. EASEMENT AS SHOWN INCLUDES VEGETATED AREAS. CONTRACTOR SHALL PROTECT ALL TREES AND SHRUBS.
2. CONTRACTOR SHALL SUBMIT A PLAN FOR USE OF THESE AREAS. SEE GENERAL NOTES ON SHEET G-4.
3. SEE SURVEY NOTES ON SHEET GC - 01 REGARDING ACCURACY OF EASEMENT LIMITS SHOWN.
4. SEE S SHEETS FOR STRUCTURAL DETAILS, M SHEETS FOR MECHANICAL DETAILS AND E SHEETS FOR ELECTRICAL DETAILS
5. SEE DS SHEETS FOR STRUCTURAL DEMOLITION DETAILS, DM SHEETS FOR MECHANICAL DEMOLITION DETAILS AND DE SHEETS FOR ELECTRICAL DEMOLITION DETAILS.
6. CONTRACTOR SHALL PROTECT FENCE IN PLACE OR REPLACE FENCE IN-KIND IF FENCE IS REMOVED FOR EASE OF CONSTRUCTION.
7. CONTRACTOR SHALL ACQUIRE TEMPORARY EASEMENT TO ACCOMMODATE CONSTRUCTION ACTIVITIES OUTSIDE EASEMENT.
8. LAYDOWN AREAS PROPOSED BY THE CONTRACTOR NEED TO BE WITHIN THE EXISTING TAMPA BAY WATER EASEMENTS AND WITHIN THE SILT FENCE/CONSTRUCTION AREAS.

TRENCH SECTION - TYPE I | TRENCH SECTION - TYPE II | TRENCH SECTION - TYPE III

NOTES:

1. 6" MIN FOR PIPE DIAMETER < 24"
   12" MIN FOR PIPE DIAMETER > 24"
2. MAX TRENCH WIDTH @ TOP OF PIPE:
   OD + 36" FOR, 18" AND LARGER PIPE OD
   OD + 24" FOR LESS THAN 18"
3. MIN TRENCH BOTTOM WIDTH:
   OD + 24" FOR MECHANICAL COMPACTION

A. FLEXIBLE PIPE REFERS TO ALL STEEL, DUCTILE-IRON, AND PLASTIC PIPES.

B. TYPICAL TRENCH SECTIONS (I, II AND III) ARE TO BE USED ONLY WHERE STABLE, COMPACT SOIL CONDITIONS EXIST. IF BOULDERS OR LARGE OBSTRUCTIONS ARE ENCOUNTERED, TRENCH SECTIONS MAY BE DEEPER OR WIDER THAN SHOWN. THE ENGINEER SHALL BE ADVISED SHOULD THIS OCCUR.

C. THE NEED FOR PROTECTIVE SYSTEMS AND EXCAVATION SLOPES SHALL BE DETERMINED CONSIDERING APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS AND REGULATIONS, AND GEOTECHNICAL CONSULTANTS' RECOMMENDATIONS.

D. PROTECTIVE SYSTEMS SHALL BE DESIGNED AND BUILT IN ACCORDANCE WITH THE APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS AND REGULATIONS.

E. SUPPORTING DOCUMENTATION SHALL BE SUBMITTED TO THE ENGINEER REGARDING PIPE DESIGN AND COMPLIANCE WITH APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS.

F. UNSUPPORTED VERTICAL AND/OR SLOPING TRENCH WALL SLOPES SHALL NOT BE STEEPER THAN ALLOWED BY APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS AND REGULATIONS, UNLESS SUPPORTING DOCUMENTATION IS SUBMITTED, ACCORDING TO AFOREMENTIONED SAFETY STANDARDS.

G. TRENCH SECTIONS OTHER THAN THE TYPICAL SECTIONS SHOWN MAY BE UTILIZED PROVIDED THEY COMPLY WITH APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS AND REGULATIONS. DOCUMENTATION SUPPORTING THIS COMPLIANCE AND PIPE DESIGN CALCULATIONS SHALL BE SUBMITTED TO THE ENGINEER.

H. IF OVER-EXCAVATION DUE TO POOR FOUNDATION MATERIAL IS ORDERED BY THE ENGINEER, THE BACKFILL MATERIAL SHALL BE ACCORDING TO THE EARTHWORK SECTION OF THE SPECIFICATIONS ARTICLE ENTITLED, "FILL AND BACKFILL MATERIAL REQUIREMENTS."

I. IF DURING CONSTRUCTION, THE WATER TABLE IS DISCOVERED TO BE ABOVE THE TRENCH BOTTOM, THE ENGINEER SHALL BE NOTIFIED, AND APPROPRIATE DEWATERING SHALL BE IMPLEMENTED TO LOWER THE WATER LEVEL BELOW THE TRENCH BOTTOM. THE BACKFILL MATERIAL SHALL BE ACCORDING TO THE EARTHWORK SECTIONS OF THE SPECIFICATIONS, OR AS ORDERED BY THE ENGINEER.

C-601 TRENCH SECTION FLEXIBLE PIPE

REV 010119

1. CONTRACTOR SHALL INSPECT ALL TEMPORARY SILT FENCES IMMEDIATELY AFTER EACH RAINFALL AND DAILY DURING PROLONGED RAINFALL.
2. CONTRACTOR SHALL MAKE A DAILY REVIEW OF THE LOCATION OF SILT FENCES IN AREAS WHERE CONSTRUCTION ACTIVITIES HAVE CHANGED THE NATURAL CONTOUR AND DRAINAGE RUNOFF TO ENSURE THAT THE SILT FENCES ARE PROPERLY LOCATED FOR EFFECTIVENESS.
3. CONTRACTOR SHALL REMOVE SEDIMENT DEPOSITS WHEN THE DEPOSIT REACHES APPROXIMATELY 1/2 OF THE VOLUME CAPACITY OF THE TEMPORARY SILT FENCE OR AS DIRECTED BY THE DISTRICT.
4. SILT FENCE SHALL BE PREFABRICATED WITH WOODEN POSTS.
5. SILT FENCE SHALL BE CHECKED WEEKLY AND REPAIRED BY CONTRACTOR AS NECESSARY.

GENERAL NOTES

GENERAL

THESE NOTES ARE GENERAL AND APPLY TO THE ENTIRE PROJECT EXCEPT WHERE SPECIFICALLY INDICATED OTHERWISE.

STRUCTURAL DIMENSIONS CONTROLLED BY OR RELATED TO MECHANICAL OR ELECTRICAL EQUIPMENT SHALL BE COORDINATED BY THE CONTRACTOR PRIOR TO CONSTRUCTION. BOLT SIZES, TYPES, AND PATTERNS SHALL BE VERIFIED WITH THE MANUFACTURER. ALL BOLT PATTERNS SHALL BE TEMPLATED TO ENSURE ACCURACY OF PLACEMENT.

MECHANICAL AND ELECTRICAL EQUIPMENT SUPPORTS, ANCHORAGES, OPENINGS, RECESSES AND REVEALS NOT SHOWN ON THE STRUCTURAL DRAWINGS BUT REQUIRED BY OTHER CONTRACT DRAWINGS, SHALL BE PROVIDED FOR PRIOR TO PLACING CONCRETE.

STRUCTURAL DRAWINGS SHALL BE USED IN COORDINATION WITH MECHANICAL, ELECTRICAL, CIVIL, ARCHITECTURAL AND SHOP DRAWINGS PROVIDED BY MANUFACTURERS OF EQUIPMENT.

STRUCTURES HAVE BEEN DESIGNED FOR OPERATIONAL LOADS ON THE COMPLETED STRUCTURES. THE STRUCTURES HAVE NOT BEEN DESIGNED TO RESIST THESE LOADS WHILE ONLY PARTIALLY CONSTRUCTED. DURING CONSTRUCTION, THE STRUCTURES SHALL BE PROTECTED FROM ALL CONSTRUCTION LOADS BY BRACING AND BALANCING UNTIL ALL STRUCTURAL ELEMENTS ARE IN PLACE, AND THE COMBINED MASONRY ASSEMBLAGE HAS REACHED THE SPECIFIED 28 DAY COMPRESSIVE STRENGTH. OVERLOADING OF ANY STRUCTURAL ELEMENT IS PROHIBITED.

UNLESS OTHERWISE SHOWN, ON ALL STRUCTURAL DRAWINGS THE FINISHED GRADE AROUND STRUCTURES IS SHOWN THUS, INDICATING EITHER GROUND SURFACE, TOP OF CONCRETE SLAB, OR AC PAVEMENT. FOR DETAILS OF FINISH SURFACES SEE CIVIL DRAWINGS.

CONCRETE (EXCEPT PRECAST CONCRETE)

UNLESS OTHERWISE NOTED OR SPECIFIED, ALL STRUCTURAL CONCRETE SHALL DEVELOP A MINIMUM COMPRESSIVE STRENGTH OF 4000 PSI IN 28 DAYS.

REINFORCEMENT STEEL SHALL BE DEFORMED BARS CONFORMING IN QUALITY TO THE REQUIREMENTS OF ASTM A-615, "SPECIFICATION FOR DEFORMED AND PLAIN CARBON-STEEL BARS FOR CONCRETE REINFORCEMENT", GRADE 60.

ALL DETAILING, FABRICATION AND PLACING OF REINFORCING BARS, UNLESS OTHERWISE INDICATED, SHALL BE IN ACCORDANCE WITH CRSI "MANUAL OF STANDARD PRACTICE" LATEST EDITION.

TOLERANCES IN PLACING REINFORCEMENT SHALL BE:

+/- 3/8 INCH FOR MEMBERS WITH DEPTH D </= 8 INCHES

+/- 1/2 INCH FOR MEMBERS WITH DEPTH D > 8 INCHES

ALL CONSTRUCTION JOINTS, SHALL BE ROUGH AND THOROUGHLY CLEANED FOR BOND.

LOCATION OF ALL CONSTRUCTION JOINTS SHALL BE AS SHOWN ON THE DRAWINGS OR APPROVED BY THE ENGINEER.

DOWELS, PIPE, WATERSTOPS AND OTHER INSTALLED MATERIALS AND ACCESSORIES SHALL BE HELD SECURELY IN POSITION WHILE CONCRETE IS BEING PLACED.

UNLESS OTHERWISE INDICATED, ASIDE FROM NORMAL ACCESSORIES USED TO HOLD REINFORCING BARS FIRMLY IN POSITION, THE FOLLOWING SHALL BE ADDED:

A) IN SLABS #5 RISER BARS AT 36 INCHES OC MAXIMUM TO SUPPORT TOP REINFORCING BARS.

B) IN WALLS WITH 2 CURTAINS #3 U OR Z SHAPE SPACERS AT 6 FEET OC EACH WAY.

SEALANT SHALL BE PLACED AT THE TOP OF ALL JOINTS RECEIVING EXPANSION JOINT FILLER. SEALANT DEPTH SHALL BE THE JOINT FILL THICKNESS OR 1/2", WHICHEVER IS LESS.

ALL GROUT SHALL BE NON-SHRINK GROUT, UNLESS INDICATED OTHERWISE.

UNLESS OTHERWISE SHOWN CONCRETE WALLS AND SLABS SHALL BE REINFORCED AS FOLLOWS: #4@12" EW, CENTER OF 6" SECTIONS; #5@12" EW, CENTER OF 8" SECTIONS; #4 @ 12" EW EF OF 10" SECTIONS; #5@12" EW EF OF 12" AND THICKER SECTIONS.

DOWELS SHALL BE WIRED OR OTHERWISE HELD IN POSITION. THEY SHALL NOT BE SHOVED INTO FRESHLY PLACED CONCRETE.

UNLESS OTHERWISE INDICATED ON THE DRAWINGS, LAPS OF REINFORCEMENT IN CONCRETE SHALL BE AS SHOWN ON DETAIL S-143.

REINFORCING BARS AND ACCESSORIES SHALL NOT BE IN CONTACT WITH ANY PIPE, PIPE FLANGE OR METAL PARTS EMBEDDED IN CONCRETE, A MINIMUM OF 2 INCHES CLEARANCE SHALL BE PROVIDED AT ALL TIMES.

ALL ITEMS EMBEDDED IN CONCRETE SHALL BE SPACED ON CENTER AT LEAST 4 TIMES THEIR OUTSIDE DIMENSION. THE OUTSIDE DIMENSION SHALL NOT EXCEED ONE THIRD OF THE MEMBER THICKNESS

UNLESS OTHERWISE SHOWN ON THE DRAWINGS CONCRETE COVER FOR REINFORCING BARS SHALL BE AS FOLLOWS:

FOR CONCRETE PLACED AGAINST EARTH (SEE CONSTRUCTION JOINT DETAILS FOR THIN SLABS-ON-GRADE. BOTTOM COVER MAY BE LESS THAN 3" IF SO INDICATED) — 3"

FOR SURFACES IN CONTACT WITH WATER OR WEATHER AND FORMED SURFACES IN CONTACT WITH EARTH — 2"

FOR CONCRETE NOT EXPOSED TO WEATHER, OR IN CONTACT WITH WATER OR EARTH — 1 1/2"

UNLESS OTHERWISE NOTED, WALLS AND SLABS SHOWN WITH A SINGLE LAYER OF REINFORCEMENT SHALL HAVE THAT REINFORCEMENT CENTERED

SLABS WITH SLOPING SURFACES SHALL HAVE THE INDICATED SLAB THICKNESS MAINTAINED AS THE MINIMUM. SLAB BOTTOMS MAY EITHER SLOPE WITH THE TOP SURFACE OR BE LEVEL. REINFORCING IN SLABS WITH SLOPING SURFACES SHALL BE PLACED AT THE REQUIRED CLEARANCE FROM THE SLAB SURFACES.

STRUCTURAL STANDARD DETAILS

DETAILS ON GS SHEETS ARE PART OF STANTEC'S STRUCTURAL STANDARD DETAILS.

THESE DETAILS ARE TO BE USED WHEN REFERRED TO OR WHEN NO OTHER MORE RESTRICTIVE OR DIFFERENT DETAILS ARE INDICATED ON THE DRAWINGS.

DESIGN CRITERIA

DESIGN IN ACCORDANCE WITH THE FLORIDA BUILDING CODE, EXISTING BUILDING, 8TH EDITION (2023), (2021 EDITION OF THE INTERNATIONAL BUILDING CODE) EXCEPT WHERE OTHER APPLICABLE CODES OR THE FOLLOWING NOTES ARE MORE RESTRICTIVE. CONSTRUCTION SHALL CONFORM TO FLORIDA BUILDING CODE, BUILDING, 8TH EDITION (2023) AND ASCE 7-22 REQUIREMENTS.

LOADINGS:

FLOOR LIVE LOADS:

UNIFORM LIVE LOAD (PSF): ---------- 200

ROOF LIVE LOADS:

ROOF LIVE LOAD (PSF): ---------- 30

WIND LOADS:

ULTIMATE DESIGN WIND SPEED, V_{ULT} (MPH): ---------- 155
NOMINAL DESIGN WIND SPEED, V_{ASD} (MPH): ---------- 120
WIND IMPORTANCE FACTOR (Iw): ---------- 1.0
RISK CATEGORY: ---------- IV
EXPOSURE CATEGORY: ---------- C
INTERNAL PRESSURE COEFFICIENT: ---------- ±0.18

FOR COMPONENT AND CLADDING DESIGN WIND PRESSURES, REFER TO TABULATION ON THIS DRAWING.

SEISMIC LOADS:

NOT APPLICABLE - EXEMPT PER FBC, 8TH EDITION (2023)

SNOW LOADS:

NOT APPLICABLE - EXEMPT PER FBC, 8TH EDITION (2023)

FLOOD LOADS:

FLOOD DESIGN CLASS:
NOT APPLICABLE. EXISTING STRUCTURE WITH NO SUBSTANTIAL IMPROVEMENT.

MASONRY

CONCRETE BLOCK MASONRY SHALL BE NORMAL WEIGHT, HOLLOW UNITS CONFORMING TO ASTM C 90 "SPECIFICATION FOR LOAD BEARING CONCRETE MASONRY UNITS". SIZE OF UNITS, COLOR AND TEXTURE SHALL BE PER THE SPECIFICATIONS.

GROUT ALL CELLS CONTAINING REINFORCING OF CONCRETE BLOCK MASONRY UNLESS OTHERWISE NOTED ON DRAWINGS.

UNLESS OTHERWISE INDICATED, LAPS OF REINFORCEMENT IN CMU SHALL BE AS SHOWN ON DETAIL S-415.

MORTAR SHALL BE IN ACCORDANCE WITH ASTM C 270 "SPECIFICATION FOR MORTAR FOR UNIT MASONRY", TYPE M OR S.

GROUT SHALL BE IN ACCORDANCE WITH ASTM C 476 "SPECIFICATION FOR GROUT FOR MASONRY", AND SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH OF 2000 PSI.

THE COMBINED MASONRY ASSEMBLAGE COMPRESSIVE STRENGTH AT 28 DAYS SHALL BE A MINIMUM OF f'm = 2000 PSI.

REINFORCEMENT SHALL BE TIED OR OTHERWISE SECURED IN POSITION PRIOR TO GROUTING.

ALL HORIZONTAL AND VERTICAL REINFORCEMENT SHALL BE CONTINUOUS OVER THE FULL EXTENT OF THE WALL WITH STANDARD SPLICES LOCATED AS NEEDED. WHERE IT IS NECESSARY TO INTERRUPT AN INDIVIDUAL BAR, AN EQUAL SIZED BAR SHALL BE LOCATED AS CLOSE AS POSSIBLE AND SHALL EXTEND A MINIMUM OF ONE SPLICE LENGTH BEYOND EACH SIDE OF THE INTERRUPTION.

DEFERRED SUBMITTALS:

DEFERRED SUBMITTALS ARE THOSE PORTIONS OF THE DESIGN WHICH ARE PROVIDED BY THE CONTRACTOR AND THEREFORE WERE NOT SUBMITTED AT THE TIME OF THE PERMIT APPLICATION, AND WHICH ARE TO BE SUBMITTED TO THE PERMITTING AGENCY PRIOR TO FABRICATION OR INSTALLATION OF THAT PORTION OF THE WORK. PORTIONS OF THE DESIGN INDICATED AS DEFERRED SUBMITTALS ARE DELEGATED DESIGNS AND SHALL COMPLY WITH THE REQUIREMENTS OF THE FBC FOR DELEGATED DESIGNS.

NO WORK SHALL BE PERFORMED FOR DEFERRED SUBMITTAL ITEMS UNTIL THE PLANS FOR SUCH WORK HAVE BEEN REVIEWED AND FOUND ACCEPTABLE BY THE ENGINEER OF RECORD AND APPROVED BY THE BUILDING OFFICIAL.

DRAWINGS AND CALCULATIONS FOR THESE ITEMS SHALL BE SIGNED AND SEALED BY A LICENSED FLORIDA PROFESSIONAL ENGINEER. NO FABRICATION SHALL COMMENCE UNTIL THE FINAL APPROVAL HAS BEEN ISSUED BY THE BUILDING OFFICIAL AND THE STRUCTURAL ENGINEER OF RECORD.

SPECIFICATION SECTION	ITEM
01613	STRUCTURAL DESIGN, SUPPORT AND ANCHORAGE

VERTICAL PUMP DESIGN CRITERIA

THE FOLLOWING DESIGN CRITERIA IS BASED ON PRELIMINARY MANUFACTURER INFORMATION AS THE DESIGN BASIS FOR THE CONCRETE PUMP PAD. ANY DEVIATION FROM THIS INFORMATION SHALL BE COORDINATED BY THE CONTRACTOR WITH THE ENGINEER PRIOR TO PROCUREMENT, FABRICATION, OR INSTALLATION OF THE CONCRETE PUMP PAD. DEVIATIONS MAY REQUIRE ALTERATION TO THE DETAILS INCLUDED FOR THE CONCRETE PUMP PAD. REFER TO PROCESS MECHANICAL DRAWINGS FOR RELEVANT CRITERIA AT EACH STATION.

BASIS OF ORIGINAL DESIGN DATA	50 HP PUMP	75 HP PUMP
OPERATING SPEED, RPM	1753	1753
EQUIPMENT WEIGHT, POUNDS	7000	7000
WATER COLUMN WEIGHT, POUNDS	5200	5200
LATERAL ANCHOR FORCE, POUNDS	1000	1000

NOTE:
IN ADDITION TO SPECIFIC REPAIRS INDICATED WITHIN THIS DRAWING SET, THE CONTRACTOR SHALL INCLUDE PRICING FOR THE FOLLOWING REPAIR ELEMENTS. REPAIRS SHALL BE PERFORMED IN ACCORDANCE WITH THE CONTRACT SPECIFICATION AND DETAILS. THE REPAIR QUANTITIES ARE AN ESTIMATE FOR BIDDING PURPOSES TO ESTABLISH PRICING TO BE USED AS DIRECTED BY THE ENGINEER.

REPAIR TABLE

WELL HOUSE	CRACKED VENEER (LF)	CAST-IN-PLACE CONCRETE CRACK (LF)	CMU MORTAR REPAIR (LF)
MBR-150A	--	10	120
MBR-151A	--	10	120
MBR-153A	--	10	120
MBR-154A	--	10	120
MBR-155A	--	10	120
MBR-156A	--	10	120
MBR-158A	--	10	120
MBR-159B	--	10	120
MBR-160B	--	10	120
MBR-164B	60	10	120
MBR-165B	60	10	120
MBR-166B	60	10	120
MBR-167B	60	10	120
MBR-168B	60	10	120
MBR-169B	60	10	120

NOTES:
1. REFER TO ARCHITECTURAL DRAWINGS AND SPECIFICATIONS FOR PROTECTIVE COATINGS, CLEANING, VENEER REPAIRS, ROOFING REPAIRS, FASCIA REPAIRS, AND DOOR REPLACEMENT.
2. REFER TO PROCESS MECHANICAL DRAWING FOR PIPE LOCATION.
3. DAMAGED CMU BLOCK SHALL BE REPLACED. A QUANTITY OF 6 BLOCKS SHALL BE ASSUMED FOR THE ENTIRE PROJECT.
4. MBR-150A THROUGH MBR-160B ARE SINGLE WYTHE CONCRETE MASONRY WALLS.

WIND PRESSURE ON COMPONENT (PSF) (SEE GENERAL SHEET NOTE 1)								
	WALLS		ROOF				ROOF OVERHANG

#8	16"	62" (81")	48" (62")
#9	19"	79" (102")	61" (79")
#10	22"	100" (130")	77" (100")
#11	24"	123" (160")	95" (123")

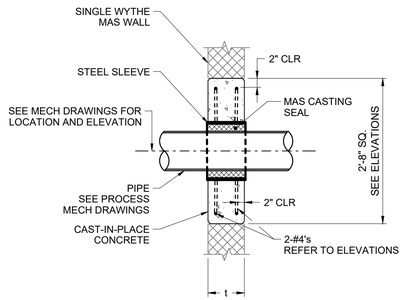
* USE LENGTH IN PARENTHESIS FOR WALL HORIZONTAL REBARS AND SLAB BARS WITH 12" OR MORE OF FRESH CONCRETE UNDERNEATH

NOTES:

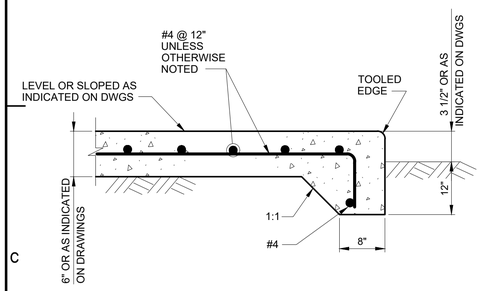
1. USE LAP LENGTHS AS DETERMINED FROM THESE TABLES UNLESS SHOWN OTHERWISE.
2. THE TABLES SHOWN ARE FOR f'c=4000psi, fy=60,000psi, 1.5" MIN CONCRETE COVER AND 3" MIN BAR SPACING.
3. MULTIPLY THE LAP AND E SHOWN IN THESE TABLES BY 1.5 FOR EPOXY COATED REINFORCING.
4. WHEN BARS OF DIFFERENT SIZES ARE LAP SPLICED, LAP LENGTH SHALL BE THE LARGER OF:

   EMBEDMENT LENGTH OF LARGER BAR
   LAP LENGTH OF SMALLER BAR
5. USE REINFORCING BAR COUPLERS FOR SPLICES OF #11 AND LARGER BARS UNLESS DRAWINGS INDICATE LAP SPLICES SHOWN IN TABLE ARE ACCEPTABLE.
6. ALL DOWEL BARS SHALL EXTEND AN EMBEDMENT LENGTH E INTO ANOTHER MEMBER OR ACROSS A CONSTRUCTION JOINT UNLESS SHOWN TO SPLICE WITH OTHER BARS OR TO EXTEND TO THE FAR FACE OF THE MEMBER AND END WITH A STANDARD HOOK.

S-143 STANDARD 90° BAR HOOKS, EMBEDMENT LENGTHS AND LAP LENGTHS REV 090616



S-903 SLEEVE DETAIL - SINGLE WYTHE WALL REV 103024



NOTES:

1. USE 2 MATS OF #5 @ 12" EW EF FOR SLABS 10" AND THICKER.
2. USE THIS DETAIL AT REPLACEMENT TRANSFORMER PADS.

S-190 SLAB-ON-GRADE REV 111424

BAR SIZE	8" CMU LAP AND EMBEDMENT LENGTHS (CENTERED)	12" CMU LAP AND EMBEDMENT LENGTHS (CENTERED)	8" OR 12" CMU LAP AND EMBEDMENT LENGTHS (OFF-CENTER) (NOTE 4)	8" OR 12" CMU LAP AND EMBEDMENT LENGTHS FOR DWLS IN CONCRETE (OFF-CENTER) (NOTE 4)	90° HOOK LENGTH (SEE BELOW)	ALLOWABLE HOOK EMBEDMENT LENGTH REDUCTION

LONG	LONGITUDINAL
LP	LOW POINT/ LOW PRESSURE/ LAMP POST
LPG	LIQUID PETROLEUM GAS
LT	LEFT/ LIGHT
LTS	LIME TREATED SOIL
LW	LOW WATER
LWL	LOW WATER LEVEL
LWR	LOWER

M

m	METER
M	MALE (PIPE THREAD)
mA	MILLIAMPS
MACH	MACHINE
MAG	MAGNETIC
MAINT	MAINTENANCE
MAN	MANUAL
MAS	MASONRY
MAT	MATERIAL
MAX	MAXIMUM
MB	MAIL BOX/ MACHINE BOLT
MCC	MOTOR CONTROL CENTER
MCR	MIDDLE OF CURB RETURN
MEAS	MEASURE
MECH	MECHANICAL
MED	MEDIUM
MEMB	MEMBER
MFR	MANUFACTURER
MFRD	MANUFACTURED
MGD	MILLION GALLONS PER DAY
MH	MANHOLE/ MAINTENANCE HOLE
MHT	MEAN HIGH TIDE
MHW	MEAN HIGH WATER
MI	MALLEABLE IRON/ MILE
MICRON	1/1,000,000 METER
MIL	MILITARY/ 1/1,000TH INCH
MIN	MINIMUM/ MINUTE
MIR	MIRROR
MISC	MISCELLANEOUS
MK	MARK
MLW	MEAN LOW WATER
mm	MILLIMETER
MO	MOTOR OPERATED/ MASONRY OPENING
MOD	MODEL
MON	MONUMENT
MOR	MORTAR
MS	MOP SINK
MSL	MEAN SEA LEVEL
MTC	MECHANICAL-TYPE COUPLING
MTD	MOUNTED
MTG	MOUNTING
MTL	METAL
MTR	MOTOR

N

N	NORTH
NaOCl	SODIUM HYPOCHLORITE
NaOH	SODIUM HYDROXIDE (CAUSTIC SODA)
NAVD 88	NORTH AMERICAN VERTICAL DATUM OF 1988
NC	NORMALLY CLOSED
NEC	NATIONAL ELECTRICAL CODE
NEMA	NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION
NF	NEAR FACE
NFPA	NATIONAL FIRE PROTECTION ASSOCIATION
NG	NATURAL GRADE/ NATURAL GAS
NIC	NOT IN CONTRACT
NO	NUMBER/ NORMALLY OPEN
NOM	NOMINAL
NPS	NOMINAL PIPE SIZE
NPT	NATIONAL PIPE THREAD
NRCP	NON-REINFORCED CONCRETE PIPE
NRS	NON-RISING STEM
NS	NEAR SIDE
NTS	NOT TO SCALE

O

OBJ	OBJECT
OC	ON CENTER/ OVER-CROSSING
OD	OUTSIDE DIAMETER/ OVERALL DIMENSION
OE	OUTER EDGE
OF	OVERFLOW/ OUTSIDE FACE
OFD	OVERFLOW DRAIN
OFF	OFFICE
OH	OVER HEAD
OHW	OVERHEAD WIRES
OPER	OPERATOR/ OPERATING
OPNG	OPENING
OPP	OPPOSITE
ORIG	ORIGINAL
OS&Y	OUTSIDE SCREW AND YOKE
OSA	OUTSIDE AIR
OSHA	OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION
OWG	OIL. WATER. GAS
OZ	OUNCE

P

P	POLE/ PAGE/ PIPE
P/S	POLE AND SHELF
PA	PLANTING AREA
PART	PARTITION
PAVMT	PAVEMENT
PB	POLYBUTYLENE/ PULL BOX
PC	POINT OF CURVATURE/ PRIMARY CLARIFIER/ PORTLAND CEMENT
PCC	PORTLAND CEMENT CONCRETE/ POINT OF COMPOUND CURVE
PCOTG	PRESSURE CLEANOUT TO GRADE
PCVC	POINT OF COMPOUND VERTICAL CURVE
PE	PLANT EFFLUENT/ POLYETHYLENE/ POLYELECTROLYTE POLYMER
PG	PRESSURE GAGE
pH	RECIPROCAL LOG OF HYDROGEN ION CONCENTRATION
PI	PLANT INFLUENT/ POINT OF INTERSECTION
PK	PARKING
PL	PLATE/ PROPERTY LINE/ PLACE
PLAS	PLASTER/ PLASTIC
PLT	PLANT
PLWD	PLYWOOD
PM	PRESSED METAL

P CONT'D

PNEU	PNEUMATIC
PNL	PANEL
POB	POINT OF BEGINNING
POC	POINT OF CONNECTION
POT	POINT OF TANGENT
PP	POWER POLE/ POLYPROPYLENE
PPD	POUNDS PER DAY
PPH	POUNDS PER HOUR
PPM	POUNDS PER MINUTE
PR	PAIR
PRC	POINT OF REVERSE CURVE
PRCT	PRECAST
PREFAB	PREFABRICATED
PRESS	PRESSURE
PROF	PROFILE
PRV	PRESSURE REGULATING, RELIEF OR REDUCING VALVE
PRVC	POINT OF REVERSE VERTICAL CURVE
PS	PRESSURE SWITCH
PSF	POUNDS PER SQUARE FOOT
PSI	POUNDS PER SQUARE INCH
PSIA	POUNDS PER SQUARE INCH ABSOLUTE
PSIG	POUNDS PER SQUARE INCH GAUGE
PT	POINT OF TANGENCY/ PAINT/ PRESSURE
PTFE	POLYTETRAFLUOROETHYLENE (TEFLON)
PV	PLUG VALVE
PVC	POLYVINYL CHLORIDE
PVDF	POLYVINYLIDENE FLUORIDE (KYNAR)
PW	POTABLE WATER

Q

QT	QUARRY TILE
QTY	QUANTITY
QUAD	QUADRANGLE/ QUADRANT

R

R	RADIUS/ RISER / RATE OF SLOPE
R&O	ROCK AND OIL
R/W	RIGHT OF WAY
RAC	RECYCLED ASPHALT CONCRETE
RAG	RETURN AIR GRILLE
RAP	RECLAIMED ASPHALT PAVEMENT
RAS	RETURN ACTIVATED SLUDGE
RC	REINFORCED CONCRETE
RCP	REINFORCED CONCRETE PIPE
RD	ROAD/ ROOF DRAIN/ ROUND
RED	REDUCER/ REDUCING
REF	REFERENCE/ REFER/ REFRIGERATOR
REG	REGULATING
REINF	REINFORCE/ REINFORCED
REQD	REQUIRED
RESIL	RESILIENT
RET	RETAINING/ RETURN
REV	REVISION
REW	RECLAIMED WATER
RF	ROOF/ RAISED FOUNDATION/ ROUGH FACE
RFG	ROOFING

NOTES:

1. REFER TO DRAWINGS DE-2 THROUGH DE-20 RELATIVE TO REMOVAL, REPLACEMENT, OR LEAVE-IN-PLACE STATUS.
2. EXISTING PADS AT MBR-150, MBR-153, MBR-154, MBR-155, MBR-156, MBR-159, MBR-160, MBR-164, MBR-165, MBR-166, MBR-169 ARE TO REMAIN. CONFIRM WITH ELECTRICAL PLANS AND SPECIFICATIONS.
3. REPLACEMENT PADS AS INDICATED ON THE ELECTRICAL DRAWINGS CAN BE DETAILED PER DETAIL S-190 ON DRAWING GS-2. THESE MAY BE OF CAST-IN-PLACE OR PRECAST CONCRETE. REFER TO ELECTRICAL DRAWINGS FOR SIZE.
4. DRAWING INFORMATION SHOWN ABOVE TAKEN FROM EXISTING CONTRACT DRAWINGS AND MAY VARY FROM WHAT IS SHOWN.
5. WELL HOUSES MBR-152 AND MBR-157 ARE TO BE COMPLETELY DEMOLISHED, INCLUDING THE TRANSFORMER PADS.

H TRANSFORMER PAD SECTION
DS-7 NO SCALE

GENERAL SHEET NOTES

1. EXISTING STRUCTURE DIMENSIONS AND CONFIGURATION ARE BASED ON AS-BUILT DRAWINGS AND ARE APPROXIMATE. THE CONTRACTOR SHALL CONFIRM AND COORDINATE ALL CONTROLLING FIELD DIMENSIONS PRIOR TO ORDERING OR FABRICATING ANY MATERIALS.
2. DETAILS PROVIDED ARE FOR WELLHOUSE TYPE I, II AND III. REFER TO DEMO SHEETS DS-1 THRU DS-5, AND DS-7 FOR WELLHOUSE DEMO PLANS, ELEVATIONS AND SECTIONS. REFER TO DS-6 FOR WELLHOUSE PARTIAL DEMOLITION AND REPAIRS
3. EXISTING REINFORCING PARTIALLY EMBEDDED IN EXISTING CONCRETE PUMP PAD TO REMAIN. REINFORCING SHALL BE MAINTAINED, CLEANED, AND INCORPORATED INTO THE PROPOSED WORK. THE CONTRACTOR SHALL NOT DAMAGE EXISTING REINFORCING.

SHEET KEYNOTE

A. DEMOLISH CONCRETE TO BOTTOM OF EXISTING SLAB. CONTRACTOR SHALL USE CARE TO NOT DAMAGE WELL CASING WHILE DEMOLISHING THE CONCRETE. DEMOLISH EXISTING REINFORCING TO 2" CLEAR FROM TOP OF THE PROPOSED EQUIPMENT PAD. CONTRACTOR SHALL MODIFY WELL CASING AS SHOWN IN THE DESIGN DRAWINGS, CUTTING THE CASING AND INSTALLING PUMP BASE PLATE AS INDICATED IN THE DESIGN DRAWINGS. CONTRACTOR SHALL NOT PERFORM DEMOLITION UNTIL PUMP MANUFACTURER APPROVED SUBMITTALS INDICATING COORDINATION WITH THE PUMP MANUFACTURER REQUIREMENTS FOR PUMP BASE PLATE AND FINAL ELEVATIONS HAVE BEEN COORDINATED.

B. EXISTING 3/4" EXPANSION JOINT TO BE DEMOLISHED. EXISTING CONCRETE SLAB TO BE CLEANED AND CLEARED OF ANY EXISTING EXPANSION JOINT MATERIALS.

C. RETAIN VERTICAL REINFORCEMENT TO PROVIDE ANCHORAGE INTO PROPOSED CONCRETE BASE PER STRUCTURAL DRAWINGS.

BUILDING CODE SUMMARY

OWNER: TAMPA BAY WATER	DATE: NOVEMBER 2024
PROJECT NAME: MORRIS BRIDGE WELLFIELD IMPROVEMENTS PROJECT	PROJECT NO: 177311389
PROJECT LOCATION: TAMPA, FLORIDA	ARCHITECT: SHANA WYGONIK
AREA/BUILDING: EXISTING WELL HOUSES (15)	LICENSE NO: AR96070
GOVERNING CODES	
BUILDING CODE: 2023 FLORIDA BUILDING CODE, EXISTING BUILDING (FBC)	ENERGY CODE: EXEMPT FROM 2023 FLORIDA BUILDING CODE PER C402.1.2
FIRE CODE: 2023 FLORIDA FIRE CODE (FFC)	OTHERS:
ACCESSIBILITY CODE: 2023 FLORIDA ACCESSIBILITY CODE FOR BUILDING CONSTRUCTION	

GENERAL NOTES

1. NOT ALL EQUIPMENT IS SHOWN FOR CLARITY. REFER TO APPROPRIATE DISCIPLINE DRAWINGS FOR SPECIFIC EQUIPMENT LAYOUT AND OTHER REQUIREMENTS.
2. DO NOT SCALE FROM THESE ARCHITECTURAL DRAWINGS. DRAWING CONFLICTS SHALL BE BROUGHT TO THE IMMEDIATE ATTENTION OF THE ENGINEER.
3. SEE CIVIL DRAWINGS FOR SIDEWALK AND ROAD PAVING. (UNLESS OTHERWISE INDICATED)
4. SEE STRUCTURAL DRAWINGS FOR SIZE AND LOCATION OF CONCRETE PADS, TRENCHES, VAULTS, SUMPS AND ETC.
5. MASONRY CONTROL JOINTS SHOWN ON THESE ARCHITECTURAL DRAWINGS REFER TO CONTROL JOINTS IN MASONRY VENEER (UNLESS OTHERWISE INDICATED).
6. STRUCTURAL ITEMS SUCH AS GROUTED / FILLED CELLS, BOND BEAMS, PRECAST LINTELS, AND MASONRY REINFORCEMENT SHOWN ON THESE ARCHITECTURAL DRAWINGS ARE FOR ILLUSTRATIVE PURPOSES ONLY. REFER TO STRUCTURAL DRAWINGS AND MASONRY SPECIFICATIONS FOR SPECIFIC LOCATIONS AND DETAILED REQUIREMENTS.
7. NOT ALL MASONRY JOINT REINFORCEMENT, WALL TIES AND ANCHORS ARE SHOWN ON THESE ARCHITECTURAL DRAWINGS, REFER TO MASONRY SPECIFICATIONS AND STRUCTURAL DRAWINGS FOR ADDITIONAL REQUIREMENTS.
8. PROFILE OF DOOR / WINDOW / LOUVER FRAMES MAY VARY DEPENDING ON MODEL SCHEDULED AND SPECIFIED, GLASS THICKNESS MAY ALSO VARY. SEE SCHEDULES AND SPECIFICATIONS.
9. ALL INTERIOR EXPOSED MASONRY SHALL BE FIELD PAINTED (UNLESS OTHERWISE INDICATED).
10. WELL HOUSES SHALL HAVE PRE-CONSTRUCTION PROTECTION AGAINST SUBTERRANEAN TERMITES AS ESTABLISHED BY THE FLORIDA DEPARTMENT OF AGRICULTURE AND CONSUMER GOODS. CERTIFICATE OF COMPLIANCE SHALL BE ISSUED.

TO THE BUILDING DEPARTMENT BY THE LICENSED PEST CONTROL COMPANY THAT CONTAINS THE FOLLOWING STATEMENT:

"THE BUILDING HAS RECEIVED A COMPLETE TREATMENT FOR THE PREVENTION OF THE SUBTERRANEAN TERMITES. TREATMENT IS IN ACCORDANCE WITH RULES AND LAWS ESTABLISHED BY THE FLORIDA DEPARTMENT OF AGRICULTURE AND CONSUMER GOODS."

ACCESSIBILITY DISCLAIMER

BUILDING'S INTENDED USE:

EXCEPT FOR REGULAR MONITORING AND MAINTENANCE OF EQUIPMENT, THIS BUILDING IS NOT INTENDED FOR HUMAN OCCUPANCY FOR EXTENDED PERIODS OF TIME. THIS BUILDING'S PRIMARY PURPOSE IS TO HOUSE EQUIPMENT ASSOCIATED WITH PUBLIC WATER UTILITIES.

HANDICAPPED ACCESSIBILITY:

THIS BUILDING IS EXEMPT FROM CHAPTER 11 OF THE 2023 FBC BASED ON THE FOLLOWING STATEMENT, "SPACES FREQUENTED ONLY BY PERSONNEL FOR MAINTENANCE, REPAIR, OR MONITORING OF EQUIPMENT ARE NOT REQUIRED TO BE ACCESSIBLE. SUCH SPACES INCLUDE, BUT ARE NOT LIMITED TO...MECHANICAL AND ELECTRICAL EQUIPMENT ROOMS, PIPING OR EQUIPMENT CATWALKS, WATER OR SEWAGE TREATMENT PUMP ROOMS AND STATIONS, ELECTRICAL SUBSTATIONS AND TRANSFORMER VAULTS, ETC.

THIS BUILDING IS EXEMPT FROM AMERICANS WITH DISABILITIES ACT (ADA) BASED ON THE FOLLOWING STATEMENT, "GENERAL EXCEPTIONS - EQUIPMENT SPACES: SPACES FREQUENTED ONLY BY PERSONNEL FOR MAINTENANCE, REPAIR OR MONITORING OF EQUIPMENT ARE NOT REQUIRED TO BE ACCESSIBLE. SUCH SPACES INCLUDE, BUT ARE NOT LIMITED TO...WATER OR SEWAGE TREATMENT PUMP ROOMS AND STATIONS." (ADA ACCESSIBILITY GUIDELINES FOR BUILDINGS AND FACILITIES 4.1.1 (5)(b)(11))

INSTRUMENT SYMBOLS

	CONTROL ROOM PANEL	FIELD MOUNTED	LOCAL PANEL
DISCRETE INSTRUMENTS	SD		
SHARED DISPLAY SHARED CONTROL eg. DCS = DISTRIBUTED CONTROL SYSTEM			
COMPUTER FUNCTION eg. FLOW METER			
PROGRAMMABLE LOGIC CONTROL (PLC) (RTU)	XXX	XXX	XXX (3, 1, 2, 4, 5, 6)

*SUBSCRIPT ABBREVIATION SPECIFIES INSTRUMENT FUNCTION OR LOCATION.
eg. IP#1 (INSTRUMENT PANEL #1), SD (SHUTDOWN)

FIELD MOUNTED INSTRUMENTS MAY BE POST OR WALL MOUNTED

- STATUS LIGHT SHOW COLOUR INSIDE SYMBOL
- I — SYSTEM LOGIC
- R — MANUAL RESET
- E — EMERGENCY SHUTDOWN LOGIC
- P — PURGE OR FLUSHING DEVICE
- AIR RELEASE VALVE
- M — MOTOR
- CHECK VALVE
- BALL VALVE
- FLEXIBLE JOINT
- GATE VALVE
- REDUCER
- BUTTERYFLY VALVE
- VENTURI FLOW METER
- VCP — LOCAL CONTROL PANEL INDLUDED IN VENDOR PACKAGE
- ACP — AREA CONTROL PANEL
- DIGITAL INPUT
- DIGITAL OUTPUT
- ANALOG INPUT
- ANALOG OUTPUT
- PULSE INPUT
- MODULATING DIGITAL OUTPUT

INSTRUMENT LINE SYMBOLS

- ELECTRICAL SIGNAL
- CONTROL SYSTEM DATA LINK DEVICENET OR ETHERNET AS NOTED
- DATA LINK OR SYSTEM BUS AND SOFT INTERAL LINK
- ELECTROMAGNETIC OR SONIC SIGNAL (GUIDED AND NON GUIDED)
- INTERLOCK
- FIBER OPTIC
- PNEUMATIC SIGNAL
- WIRELESS

NOTES:

1. FINAL INTERCONNECTION IS SUBJECT TO PRE-PACKAGED PROCESS EQUIPMENT VENDOR. CONTRACTOR TO PROVIDE ALL POWER, CONTROLS AND SIGNALS REQUIRED TO MEET THE REQUIREMENTS.
2. PANEL MOUNTED EQUIPMENT SHOWN FOR FUTURE FIELD DEVICES SHALL BE PROVIDED.

RELAY FUNCTION DESIGNATORS

≥	ADD	>	HIGH SELECT
△	SUBTRACT	<	LOW SELECT

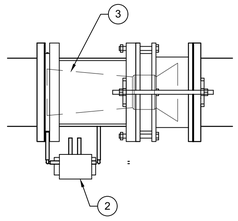
A PRESSURE TRANSMITTER AND GAUGE ASSEMBLY



SINGLE MEASUREMENT SYSTEM

GENERAL NOTES:

1. THREE VALVE MANIFOLD PRE-ASSEMBLED ON TRANSMITTER. TRANSMITTER ENCLOSURE SHALL BE INSTALLED BELOW CENTER LINE OF THE PIPE, AND AT CONVENIENT ELEVATION TO SERVICE AND VIEW LCD METER SCREEN. REFER TO SPECIFICATIONS FOR REQUIREMENTS, INCLUDE STATIC TAPS AND VENT CLEANING ASSEMBLIES.
2. REFER TO P&IDS OR PROCESS MECHANICAL DRAWINGS FOR PROCESS PIPING SIZE AND MATERIAL.
3. INSERTION TYPE VENTURI FLOWMETER.
4. TUBING, FITTINGS, ENCLOSURE, SUPPORTS AND MOUNTING HARDWARE SHALL BE 316 STAINLESS STEEL.
5. SHALL BE INSTALLED PER MANUFACTURER RECOMMENDATIONS.

KEYNOTES:

A. WALL OR INSTRUMENT-STAND MOUNT PER DETAIL B ON DRAWING GE-2.

B. 316 STAINLESS STEEL.

C. 1/2" TUBING SHALL BE SUPPORTED / BRACED EVERY 3-FT. THERMALLY INSULATING SPACER MATERIAL SHALL BE APPLIED TO SEPARATE THE TUBING FROM THE SUPPORTS. PIGTAIL LOOP REQUIRED FOR HIGH VIBRATION INSTALLATIONS ONLY.

GENERAL SHEET NOTES

1. THE CONTROL PANEL DETAILS HEREIN ARE DIAGRAMMATIC IN NATURE OF THE PURPOSE OF ILLUSTRATION DESIGN INTENT. CONTROL PANEL VENDOR TO PROVIDE SHOP DRAWINGS ILLUSTRATING ACTUAL LAYOUT AND ORIENTATION OF ALL MAJOR COMPONENTS.
2. THE CONTROL PANEL SHALL BE ASSEMBLED BY A UL- 508A CERTIFIED PANEL SHOP AND BEAR THE UL LABEL.
3. THE BILL OF MATERIALS REPRESENTS A BASIS OF DESIGN FOR MAJOR COMPONENTS AND IS NOT INTENDED TO BE COMPREHENSIVE OF ALL COMPONENTS REQUIRED FOR MANUFACTURE. THE PANEL MANUFACTURER SHALL COORDINATE AND PROVIDE A FINAL BILL OF MATERIALS WHICH INCLUDES ALL APPURTENANCES REQUIRED FOR A COMPLETE SYSTEM AND SHALL BE IN ACCORDANCE WITH PROJECT SPECIFICATIONS OR APPROVED EQUAL.
4. CONTROL PANEL ENCLOSURE SHALL BE NEMA 4X STAINLESS STEEL WITH 3 POINT LATCHING MECHANISM.
5. BATTERIES SHALL BE WIRED IN SERIES FOR 24VDC FOR UPS CONTROL POWER.
6. ALL CONDUCTORS SHALL BE SIZED PER THE LATEST ADOPTED NATIONAL ELECTRIC CODE (NEC).
7. ALL ANALOG INPUT AND OUTPUT CIRCUITS SHALL BE PROTECTED AT BOTH THE PANEL AND FIELD ENDS WITH SURGE PROTECTION DEVICES. SURGE PROTECTORS SHALL PROVIDE LINE TO LINE AND LINE TO GROUND PROTECTION. THE SUPPRESSION CIRCUIT SHALL BE A MULTISTAGE HYBRID DEVICE UTILIZING SURGE ARRESTING DIODES AND GAS DISCHARGE TUBES. THE SURGE PROTECTOR SHALL CONSIST OF A DIN RAIL MOUNTED BASE TERMINAL BLOCK AND A REMOVABLE PLUG PROTECTION MODULE. REFER TO SPECIFICATION SECTION 17530.

GENERAL MECHANICAL NOTES

GENERAL

1. ALL REMOVAL OF EXISTING PIPING AND EQUIPMENT CALLED FOR SHALL INCLUDE REMOVAL AND DISPOSAL OF ALL PIPE, FITTINGS, LOCATION TAPE/WIRE, SUPPORTS, BRACKETS, HARDWARE, AND ACCESSORIES.
2. CONTRACTOR SHALL NOT OPERATE ANY EXISTING VALVES. NECESSARY OPERATION OF EXISTING VALVES SHALL BE COORDINATED WITH OWNER.
3. PIPING SHALL BE INSTALLED WITH A MINIMUM COVER OF 36 INCHES.
4. ALL PIPE AND FITTINGS AND OTHER APPURTENANCES SHALL BE RESTRAINED.
5. ALL PIPING SHALL BE PRESSURE TESTED, AND LEAKAGE TESTED IN ACCORDANCE WITH APPLICABLE AWWA STANDARDS. ALL PIPING SHALL BE FLUSHED AND DISINFECTED IN ACCORDANCE WITH AWWA C-651, LATEST EDITION.

TYPICAL PIPE DESIGNATION:

GENERAL SHEET NOTES

1. ALTHOUGH SEVERAL PIPE MATERIAL GROUPS MAY BE LISTED ON THIS SHEET FOR A GIVEN FLUID SERVICE, CONTRACTOR SHALL PROVIDE ONLY THE PIPE MATERIAL GROUP SHOWN ON THE DRAWINGS AND SPECIFIED FOR THAT FLUID SERVICE.
2. CHANGE IN PIPING MATERIAL GROUP NUMBER IS INDICATED THUS: ——◆——

SHEET KEYNOTES

A. LEAKAGE ALLOWANCE IS AS FOLLOWS:

(A) PIPES SO DESIGNATED SHALL SHOW ZERO LEAKAGE.

(B) PIPES SO DESIGNATED SHALL SHOW ZERO LEAKAGE FOR UNBURIED PIPE AND NOT MORE THAN 0.02 GALLON PER HOUR PER INCH DIAMETER PER 100 FEET OF BURIED PIPE.

(C) PIPES SO DESIGNATED SHALL NOT SHOW A LEAKAGE OF MORE THAN 0.15 GALLON PER HOUR PER INCH OF DIAMETER PER 100 FEET OF PIPE

(D) PIPES SO DESIGNATED SHALL NOT SHOW A LOSS OF PRESSURE OF MORE THAN 5 PERCENT

(E) PIPE SO DESIGNATED SHALL NOT SHOW A LOSS OF VACUUM OF MORE THAN 4 INCHES MERCURY COLUMN

B. FOR FIELD TEST PROCEDURES AND ADDITIONAL TEST REQUIREMENTS, SEE PIPING SECTION OF SPECIFICATIONS.

C. NO SUBSTITUTIONS UNLESS ACCEPTED BY THE ENGINEER PER THE SPECIFICATIONS.

D. PIPING GROUP NUMBER SHOWN THUS * SHALL BE INSULATED. SEE PIPING SECTION OF SPECIFICATIONS FOR INSULATING MATERIALS.

E. STATIC WATER TEST WITH SURFACE 5 FEET ABOVE HIGH POINT OF PIPE.

F. FOR PIPE LINING AND COATING, SEE SPECIFICATIONS.

G. EXPOSED PIPING SHALL BE PAINTED IN ACCORDANCE WITH SPECIFICATIONS. COLORS TO BE SELECTED BY ENGINEER.

PIPING MATERIAL SCHEDULE Ⓑ

GROUP NO	PIPE Ⓓ	FITTINGS	VALVES, 6" AND SMALLER Ⓐ Ⓒ Ⓔ

* SEE MANUFACTURER

NOTES:

1. HOT DIP GALVANIZE PARTS AFTER FABRICATION, UNO. PROVIDE 316 SS PARTS AND BOLTS IN SUBMERGED OR CORROSIVE CONDITIONS.
2. PROVIDE CAST-IN-PLACE HEAVY HEX HEAD ASTM F1554 GR 36 ANCHORS, UNO.
3. REFER TO TABLE FOR MAXIMUM ALLOWABLE SERVICE LOAD ON EACH SUPPORT.
4. USE MK-2, UNLESS OTHERWISE INDICATED.
5. FOR 3/4" ANCHORS AND LARGER, PROVIDE SQUARE WASHERS PER AISC MANUAL OF STEEL CONSTRUCTION TABLE 14-2 WITH STD HOLES WELDED TO PLATE WITH 3/16" FILLETS. USE 1 3/4" SQx3/16" THICK WASHERS FOR 5/8" ANCHORS.
6. IF ADHESIVE ANCHORS ARE USED (SIMPSON SET XP, OR EQUAL), USE REDUCED MAX LOADS IN COLUMN 'M'. OVERSIZED HOLES AND WASHERS ARE NOT REQUIRED.

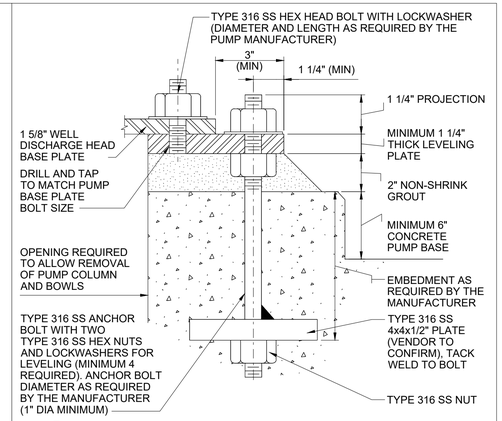
SEISMIC AND WIND COMPLIANT DESIGN CRITERIA

1. THE SUPPORTS ARE ADEQUATE FOR SEISMIC RESPONSE COEFFICIENT (SDS) GIVEN IN THE TABLE. SEISMIC FORCE ASSUMPTIONS (ASCE 7-10, EQN 13.3-1): ap=2.5, Rp=6, Ωo=2.5, Ip=1.0, z/h=1.0.
2. THE SUPPORTS, DESIGNED FOR SEISMIC LOADS, ARE ALSO ADEQUATE FOR A DESIGN WIND SPEED (Vult) OF UP TO 165 MPH WITH A MAXIMUM HEIGHT ABOVE GRADE OF 40'. WIND FORCE ASSUMPTIONS: EXPOSURE CATEGORY C, Kzt=1.0, Kz=1.04, Kd=0.95, G=0.85, Cf=1.2 (DESIGNED PER ASCE 7-10 SECTION 29.5 - OTHER STRUCTURES).

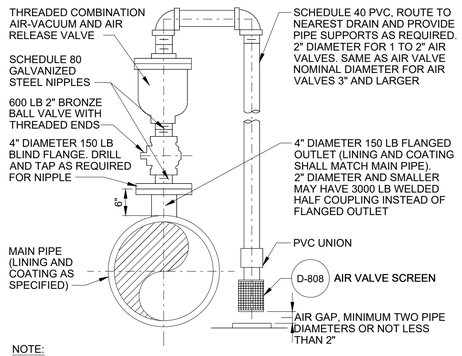
D-108 ADJ PIPE SUPPORT W OR W/O 'U' BOLT

(FOR PIPE 36" DIAMETER AND SMALLER)

REV 010119



D-135 WELL DISCHARGE HEAD MOUNTING BASE



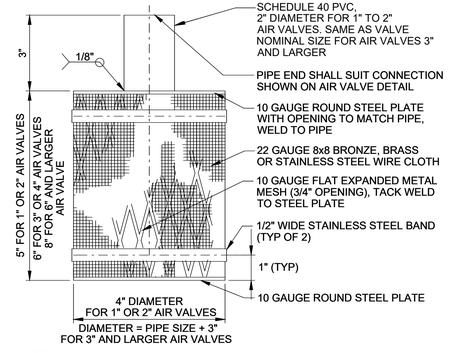
NOTE:

1. ALL COMPONENTS FOR PIPING SYSTEMS WITH SERVICE PRESSURE CLASS GREATER THAN 150 PSI SHALL BE SUITABLE FOR THE HIGHER PRESSURE.
2. PROVIDE INSULATION FITTINGS FOR BRONZE BALL VALVE CONNECTION.

D-804 AIR-VAC AND A/R VALVE ASSEMBLY

(3" AND SMALLER)

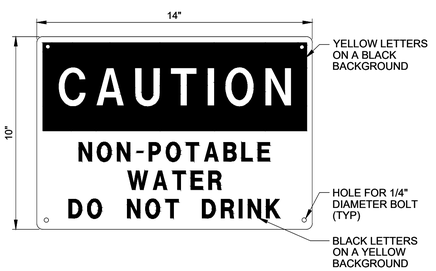
REV 010119



NOTE :

1. AIR VALVE SCREEN ASSEMBLY (EXCEPT WIRE CLOTH AND STAINLESS STEEL BANDS) SHALL BE COATED PER THE REQUIREMENTS OF THE SPECIFICATION 'PROTECTIVE COATING'.

D-808 AIR VALVE SCREEN

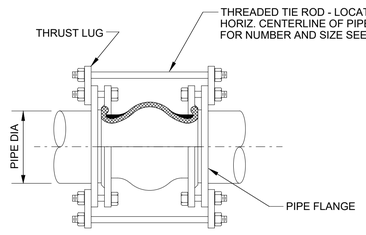


NOTES:

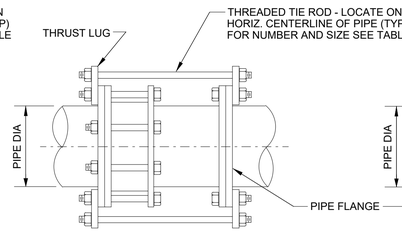
1. PROVIDE SIGN AT ALL HOSE BIBB LOCATIONS WHERE WATER IS NON-POTABLE.
2. SEE SPECIFICATIONS SECTION 'BUILDING SIGNAGE' FOR FURTHER REQUIREMENTS.

D-832 WARNING SIGN FOR NON-POTABLE WATER

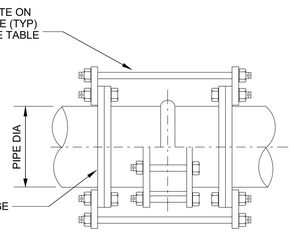
REV 010119



FLEXIBLE EXPANSION COUPLING



FLANGED COUPLING ADAPTER OR DISMANTLING JOINT



SLEEVE-TYPE OR MECHANICAL COUPLING

NOTES:

1. FABRICATE THRUST LUG FROM STEEL PLATE. MINIMUM THICKNESS TO BE SAME AS FLANGE FOR ALL SIZES.
2. HARNESS SET SHOWN DESIGNED FOR 150 PSI. FOR HIGHER PRESSURES OR LARGER PIPE SIZES, REFER TO AWWA MANUAL M-11.
3. FOR MATERIALS OF CONSTRUCTION REFER TO AWWA MANUAL M-11.

GENERAL SHEET NOTES

1. CENTER LINE ELEVATIONS ARE APPROXIMATE BASED ON EXISTING CONDITIONS. CONTRACTOR TO ADJUST BASED ON APPROVED EQUIPMENT.
2. WELL PUMPS AND MOTORS SHALL BE DEMOLISHED AND REPLACED PER PUMPS AND WELLS DETAILS (M-16) AND IN ACCORDANCE WITH CONTRACT SPECIFICATIONS.
3. ALL DUCTILE IRON PIPE CONNECTIONS SHALL BE FLANGED FOR ABOVE GROUND APPLICATIONS OR PARTIALLY BURIED FLANGES.
4. THE CONTRACTOR SHALL INFORM AND COORDINATE WITH THE CONSTRUCTION MANAGER WHENEVER ANY EXISTING EQUIPMENT MUST BE TEMPORARILY PLACED OUT OF SERVICE AS A RESULT OF DEMOLITION ACTIVITIES.
5. THE CONTRACTOR SHALL PROTECT FROM DAMAGE ANY EXISTING STRUCTURES AND EQUIPMENT NOT SHOWN TO BE REMOVED.
6. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE DISPOSAL OF ALL DEMOLITION ITEMS FROM THE SITE.
7. PROPOSED 45 DEGREE BENDS MAY NEED TO BE INSTALLED ROTATED TO ALIGN THE PROPOSED PIPE WITH EXISTING UNDERGROUND DISCHARGE PIPING.
8. EXISTING PUMP MOUNTING BASE BOLTS TO BE REPLACED. SIGNED AND SEALED CALCULATIONS TO BE PROVIDED BY THE CONTRACTOR. PUMP SOLE PLATE, PUMP PEDESTAL/PUMP BASE TO BE REPLACED. REFER TO STRUCTURAL DRAWINGS FOR PEDESTAL DETAILS .
9. CONTRACTOR SHALL SEGREGATE, STOCKPILE, AND PROTECT FROM CONTAMINATION CLEAN SOILS PRODUCED FROM EXCAVATIONS FOR USE AS BACKFILL.
10. BACKFILL EXCAVATIONS WITH CLEAN FILL AND COMPACT TO 95% MAXIMUM DENSITY.
11. TOP 6 INCHES SHALL BE TOPSOIL WITH BAHIA SOD MATCHING GRADE EXISTING PRIOR TO EXCAVATION.
12. FLOOR DRAINS TO BE CLEANED TO ENSURE PROPER DRAINING FROM AIR RELEASE VALVES.
13. CONTRACTOR SHALL BE RESPONSIBLE FOR PROPER DISPOSAL OF OIL FOR MOTORS REMOVAL.

SHEET KEYNOTES

A. CONTRACTOR TO VERIFY THAT THIS DISTANCE EXCEEDS THE LENGTH OF THE APPROVED VENTURI FLOW METER TO ALLOW PROPER REMOVAL AND INSTALLATION. MIN DISTANCE SHALL BE 24"

PLAN

SCALE: 1/2" = 1'-0"

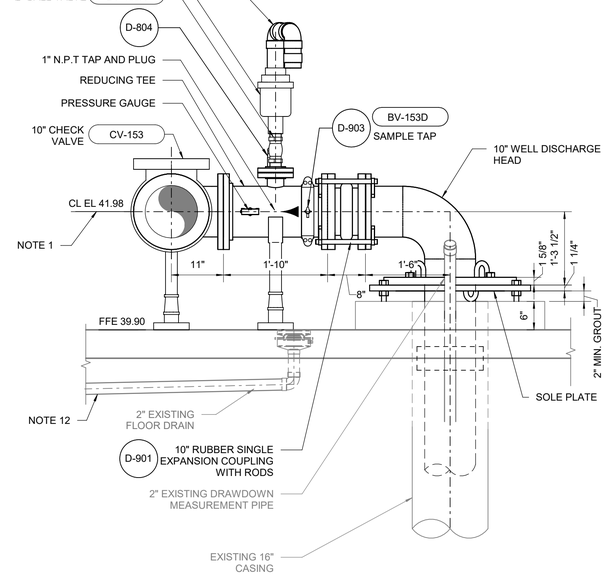
A SECTION

SCALE: 1/2" = 1'-0"



B SECTION

SCALE: 3/4" = 1'-0"

GENERAL SHEET NOTES

1. CENTER LINE ELEVATIONS ARE APPROXIMATE BASED ON EXISTING CONDITIONS. CONTRACTOR TO ADJUST BASED ON APPROVED EQUIPMENT.
2. WELL PUMPS AND MOTORS SHALL BE DEMOLISHED AND REPLACED PER PUMPS AND WELLS DETAILS (M-16) AND IN ACCORDANCE WITH CONTRACT SPECIFICATIONS.
3. ALL DUCTILE IRON PIPE CONNECTIONS SHALL BE FLANGED FOR ABOVE GROUND APPLICATIONS OR PARTIALLY BURIED FLANGES.
4. THE CONTRACTOR SHALL INFORM AND COORDINATE WITH THE CONSTRUCTION MANAGER WHENEVER ANY EXISTING EQUIPMENT MUST BE TEMPORARILY PLACED OUT OF SERVICE AS A RESULT OF DEMOLITION ACTIVITIES.
5. THE CONTRACTOR SHALL PROTECT FROM DAMAGE ANY EXISTING STRUCTURES AND EQUIPMENT NOT SHOWN TO BE REMOVED.
6. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE DISPOSAL OF ALL DEMOLITION ITEMS FROM THE SITE.
7. PROPOSED 45 DEGREE BENDS MAY NEED TO BE INSTALLED ROTATED TO ALIGN THE PROPOSED PIPE WITH EXISTING UNDERGROUND DISCHARGE PIPING.
8. EXISTING PUMP MOUNTING BASE BOLTS TO BE REPLACED. SIGNED AND SEALED CALCULATIONS TO BE PROVIDED BY THE CONTRACTOR. PUMP SOLE PLATE, PUMP PEDESTAL/PUMP BASE TO BE REPLACED. REFER TO STRUCTURAL DRAWINGS FOR DETAILS ON THE PEDESTAL.
9. CONTRACTOR SHALL SEGREGATE, STOCKPILE, AND PROTECT FROM CONTAMINATION CLEAN SOILS PRODUCED FROM EXCAVATIONS FOR USE AS BACKFILL.
10. BACKFILL EXCAVATIONS WITH CLEAN FILL AND COMPACT TO 95% MAXIMUM DENSITY.
11. TOP 6 INCHES SHALL BE TOPSOIL WITH BAHIA SOD MATCHING GRADE EXISTING PRIOR TO EXCAVATION.
12. FLOOR DRAINS TO BE CLEANED TO ENSURE PROPER DRAINING FROM AIR RELEASE VALVES.
13. CONTRACTOR SHALL BE RESPONSIBLE FOR PROPER DISPOSAL OF OIL FOR MOTORS REMOVAL.

SHEET KEYNOTES

A. CONTRACTOR TO VERIFY THAT THIS DISTANCE EXCEEDS THE LENGTH OF THE APPROVED VENTURI FLOW METER TO ALLOW PROPER REMOVAL AND INSTALLATION. MIN DISTANCE SHALL BE 24"

169	VTP-169	16	110	1600	125	75%	1730	10	10	75

GENERAL NOTES:

1. PUMPS SHALL NOT BE DESIGNED FOR REVERSE ROTATION. MOTORS SHALL INCLUDE A NON-REVERSE RATCHET.
2. PROVIDE UP TO THREE (3) MOTORS TYPE FOR THE ENTIRE WELLFIELD. MAX MOTOR SIZE SHALL BE 75 HP. MOTORS WITH THE SAME HP SHALL BE THE SAME RPM.
3. THE PUMP BOWLS DEPTHS FOR EACH WELL LISTED IN THE TABLE CORRESPOND TO THE DEPTH MEASURE FROM THE PUMP PEDESTAL.

2. FREE INSIDE DUCTWORK DIMENSION SHALL BE MAINTAINED ON LINED DUCTWORK

GENERAL HVAC NOTES

1. SCOPE OF WORK
 1.1. THE HVAC CONTRACTOR IS RESPONSIBLE FOR ALL WORK, MATERIALS, AND LABOR TO SATISFY A COMPLETE WORKING SYSTEM WHETHER SPECIFIED OR IMPLIED.
 1.2. ALL WORK IS TO BE PERFORMED IN STRICT COMPLIANCE WITH THE INTERNATIONAL MECHANICAL CODE, ALL LOCAL CODES AND ALL OTHER REGULATIONS GOVERNING THE WORK OF THIS NATURE.
 1.3. BEFORE SUBMITTING ANY PROPOSAL, THE HVAC CONTRACTOR SHALL EXAMINE THE PROPOSED SITE AND SHALL DETERMINE THE CONDITIONS THAT MAY AFFECT THE WORK. NO ALLOWANCE SHALL BE MADE BECAUSE THE HVAC CONTRACTOR FAILS TO MAKE SUCH EXAMINATIONS.
 1.4. ALL EQUIPMENT AND MATERIALS SHALL BE AS SPECIFIED OR "APPROVED EQUAL" BY THE ENGINEER.THE EQUIPMENT SPECIFIED ON THE DRAWINGS HAVE BEEN SELECTED AS THE BASIS OF DESIGN. THE USE OF REVIEWED OR SPECIFIED EQUALS SHALL BE COORDINATED BY THE CONTRACTOR AS TO SPACE REQUIREMENTS, EQUIPMENT DIMENSIONS AND PERFORMANCE. ANY ADDITIONAL COSTS EITHER DIRECTLY OR INDIRECTLY CAUSED BY EQUALS SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR
 1.5. DRAWINGS ARE DIAGRAMMATIC AND SHOW THE GENERAL DESIGN INTENT, ARRANGEMENT AND EXTENT OF SYSTEMS. DO NOT SCALE DRAWINGS NOR USE AS SHOP DRAWINGS. THE HVAC CONTRACTOR SHALL VERIFY THE ACTUAL DIMENSIONS OF THE EQUIPMENT AND ENSURE THAT IT WILL FIT IN THE AVAILABLE SPACE. WHERE ALTERNATE ROUTING, OFFSETS AND TRANSITIONS ARE REQUIRED FOR FIELD COORDINATION OF ALL TRADES, THIS CONTRACTOR SHALL MAKE CHANGES WITHOUT ADDITIONAL COSTS.
2. SHOP DRAWINGS
 2.1. REFER TO THE SPECIFICATIONS FOR SHOP DRAWING REQUIREMENTS.
3. DUCTWORK
 3.1. DUCTWORK MATERIAL SHALL BE PER SCHEDULE ON THIS SHEET.
 3.2. DUCTWORK SHALL BE CONSTRUCTED IN ACCORDANCE WITH SMACNA STANDARDS. ALL DUCTWORK SHALL BE THE LOW VELOCITY TYPE, UNLESS SPECIFIED OTHERWISE.
 3.3. THE HVAC CONTRACTOR SHALL PROVIDE AND INSTALL APPROVED FIRE DAMPERS AND PANELS IN ALL DUCTWORK THAT PENETRATES A HORIZONTAL OR VERTICAL FIRE PARTITION. UNLESS OTHERWISE SHOWN ON THE DRAWINGS.
 3.4. ALL BRANCH DUCTS SHALL HAVE VOLUME DAMPERS.
 3.5. WHERE FLOW EXCEEDS 150 CFM, THE CONTRACTOR SHALL USE SMOOTH RADIUS ELBOWS OR TURNING VANES.
 3.6. ALL DUCT JOINTS SHALL BE SEALED IN ACCORDANCE WITH SMACNA STANDARDS AND ACCEPTED GOOD PRACTICE.
 3.7. ALL DUCT DIMENSIONS ARE NET INSIDE VALUES. DIMENSIONS MAY BE CHANGED PROVIDED THAT THE NET FREE AREA IS MAINTAINED.
4. HVAC CONTROLS
 4.1. THE HVAC CONTRACTOR SHALL SUPPLY AND INSTALL ALL CONTROL WIRING AND THERMOSTATS AS REQUIRED.
5. ELECTRICAL
 5.1. THE HVAC CONTRACTOR SHALL COORDINATE WITH THE ELECTRICAL CONTRACTOR FOR LOCATION OF POWER WIRING TO EACH HVAC UNIT.
6. DUCTWORK AND PIPE SUPPORTS
 6.1. ALL DUCTWORK AND PIPE SHALL BE SUPPORTED FROM THE BUILDING STRUCTURE IN A NEAT AND WORKMANLIKE MANNER. THE USE OF WIRE OR METAL STRAPS TO SUPPORT PIPES WILL NOT BE PERMITTED. SPACING OF PIPE SUPPORTS SHALL NOT EXCEED 8 FEET FOR ALL PIPING. PLASTIC PIPING SHALL BE SUPPORTED EVERY 4 FEET.
7. MISCELLANEOUS
 7.1. WIND RESISTANCE: EXTERIOR MECHANICAL EQUIPMENT SHALL BE ANCHORED/TIED DOWN TO STRUCTURE OR CONCRETE PADS TO RESIST THE WIND PRESSURES DETERMINED IN ACCORDANCE WITH THE INTERNATIONAL BUILDING CODE, AND LOCAL REQUIREMENTS.
 7.2. SEISMIC RESISTANCE: MECHANICAL SYSTEM SUPPORTS SHALL BE DESIGNED AND INSTALLED FOR THE SEISMIC FORCES IN ACCORDANCE WITH THE INTERNATIONAL BUILDING CODE. RESTRAINTS SHALL BE DESIGN FOR THE PROJECT'S LOCATION'S SEISMIC DESIGN CATEGORY AND SEISMIC RISK CATEGORY.
 7.3. ALL EXTERIOR OPENINGS SHALL BE PROPERLY CAULKED AND SEALED TO PREVENT INFILTRATION OF OUTSIDE AIR INTO THE CONDITIONED SPACE.
 7.4. COORDINATE THE INSTALLATION OF ALL ROOF FLASHING AT ROOF PENETRATIONS.
 7.5. THE HVAC CONTRACTOR SHALL VERIFY ALL FIGURES, CONDITIONS, AND DIMENSIONS AT THE JOB SITE.
8. TESTING AND BALANCING
 8.1. THE HVAC SYSTEMS SHALL BE TESTED AND BALANCED PER SPECIFICATION 23 05 00 - HVAC TESTING AND BALANCING.
9. COMMISSIONING
 9.1. THE HVAC SYSTEMS SHALL BE COMMISSIONED PER SPECIFICATION 23 08 00 - HVAC COMMISSIONING
10. GUARANTEE
 10.1. MATERIALS, EQUIPMENT, AND INSTALLATION SHALL BE GUARANTEED FOR A PERIOD OF ONE (1) YEAR FROM THE DATE OF ACCEPTANCE. DEFECTS THAT APPEAR DURING THAT PERIOD SHALL BE CORRECTED AT THE CONTRACTOR'S EXPENSE.
 10.2. COMPRESSOR SHALL COME WITH MANUFACTURER'S STANDARD 5-YEAR WARRANTY.

SHEET 89 OF 120

Scale:1:1 Standard
4/30/2025 3:50:06 PM
File:<Pick location in Project Information>
Spec:NAT CADD STD
User:AI

GENERAL NOTES

1. ALL RACEWAYS AND EQUIPMENT SHALL BE INSTALLED AND GROUNDED IN ACCORDANCE WITH THE 2020 EDITION OF THE NATIONAL ELECTRICAL CODE AND APPLICABLE LOCAL CODES.
2. THE CONTRACTOR SHALL VERIFY THE EXACT LOCATION OF TERMINAL BOXES AND CONDUIT ENTRANCES OF ALL EQUIPMENT AGAINST APPROVED SHOP DRAWINGS BEFORE STUBBING UP CONDUITS.
3. CONDUIT RUNS ARE SHOWN DIAGRAMMATICALLY ONLY AND SHALL BE INSTALLED IN A MANNER TO PREVENT CONFLICTS WITH EQUIPMENT OR STRUCTURAL CONDITIONS. EXPOSED CONDUIT SHALL BE INSTALLED PARALLEL OR PERPENDICULAR TO BEAMS AND WALLS.
4. CONDUIT STUB-UPS SHALL NOT BE MORE THAN 6 INCHES FROM THE CENTERLINE OF TERMINAL BOXES.
5. IN THE EVENT OF INTERFERENCE BETWEEN ELECTRICAL EQUIPMENT SHOWN ON THE DRAWINGS AND OTHER EQUIPMENT, THE CONTRACTOR SHALL NOTIFY THE ENGINEER IN WRITING AND THE ENGINEER SHALL APPROVE PROPOSED CHANGES BEFORE THEY ARE MADE.
6. ALL SURFACE MOUNTED PANELS AND PANELBOARDS ON THE INTERIOR OF EXTERIOR WALLS ABOVE GRADE OR IN OTHER LOCATIONS CONSIDERED DAMP OR WET SHALL BE MOUNTED SO AS TO MAINTAIN A 1/4 INCH (MINIMUM) AIR SPACE BETWEEN THE ENCLOSURE AND THE WALL.
7. LOCATION OF PULLBOXES ARE APPROXIMATE. THE CONTRACTOR SHALL COORDINATE EXACT LOCATION WITH MECHANICAL PIPING AND SHALL BE 6 INCHES (MINIMUM) AWAY FROM MECHANICAL PIPING FLOW LINES.
8. ONLY MAJOR PULLBOXES ARE SHOWN. THE CONTRACTOR SHALL PROVIDE ADDITIONAL PULLBOXES WHERE REQUIRED TO MAKE A WORKABLE INSTALLATION.
9. THE WORK SHALL BE PERFORMED IN ACCORDANCE WITH THE DETAILS WHETHER OR NOT THEY ARE REFERENCED ON THE DRAWINGS.
10. ALL CONDUIT RUNS CROSSING EXPANSION JOINTS SHALL HAVE EXPANSION OR EXPANSION AND DEFLECTION TYPE FITTINGS. FOR LOCATIONS OF EXPANSION JOINTS, REFER TO THE STRUCTURAL DWGS.
11. ALL PANELBOARDS AND DISCONNECTS SHALL BE MOUNTED SO THAT THE DISTANCE FROM THE CENTERLINE OF THE TOP CIRCUIT BREAKER OPERATING HANDLE IN THE UPPERMOST POSITION TO THE FINISHED FLOOR SHALL NOT EXCEED 6'-7".
12. THE WIRING DIAGRAMS, QUANTITY AND SIZE OF WIRES AND CONDUIT REPRESENT A SUGGESTED ARRANGEMENT BASED UPON SELECTED STANDARD COMPONENTS OF ELECTRICAL EQUIPMENT. MODIFICATIONS ACCEPTABLE TO THE ENGINEER MAY BE MADE BY THE CONTRACTOR TO ACCOMMODATE EQUIPMENT ACTUALLY PURCHASED. THE BASIC SEQUENCE AND METHOD OF CONTROL MUST BE MAINTAINED AS INDICATED ON THE DRAWINGS AND/OR SPECIFICATIONS.
13. CONNECTIONS BETWEEN RIGID CONDUIT AND MOTOR TERMINAL BOXES OR SIMILAR EQUIPMENT SUBJECT TO VIBRATION SHALL BE FLEXIBLE LIQUID-TIGHT CONDUIT (LIMIT 2' MAX LENGTH)
14. CONDUITS SHALL BE TERMINATED SO AS TO PERMIT NEAT CONNECTION TO MOTORS AND OTHER EQUIPMENT.
15. ALL CONDUIT IN INTERIOR LOCATIONS SHALL BE METALLIC WITH THREADED FITTINGS.
16. ALL MOTOR STARTER CONTROL POWER TRANSFORMERS SHALL BE SIZED TO PROVIDE SUFFICIENT VOLT-AMPERE CAPACITY FOR OPERATING ALL LOCAL AND REMOTE ELECTRICAL DEVICES ASSOCIATED WITH CONTROL OF THE MOTOR IN ADDITION TO THE STARTER COIL AND MOTOR HEATERS..
17. ALL RECEPTACLES IN OUTDOOR AND ANTICIPATED WET AREAS SHALL BE GROUND FAULT CIRCUIT INTERRUPTER RECEPTACLES WITH WEATHERPROOF COVERS.
18. ELECTRICAL CONTRACTOR SHALL VISIT THE SITE PRIOR TO BIDDING THE PROJECT TO VERIFY THE SCOPE OF WORK WITH FIELD CONDITIONS. PARTICULAR ATTENTION SHOULD BE GIVEN TO NEW CONDUIT RUNS IN EXISTING BUILDINGS.
19. EQUIPMENT LOCKOUTS SHALL BE IN STRICT ACCORDANCE WITH OWNER'S REQUIREMENTS.
20. ANY GRASSED OR PAVED AREAS DISTURBED BY THE CONSTRUCTION SHALL BE RESTORED TO EQUAL OR BETTER CONDITION. DISTURBED GRASSED AREAS SHALL BE RE-GRADED AND SODDED.
21. ALL CONDUCTORS SHALL BE COPPER UNLESS OTHERWISE NOTED.
22. THE CONTRACTOR SHALL CONFORM TO OSHA REQUIREMENTS DURING THE CONSTRUCTION PHASE OF THIS PROJECT. JOB SITE SAFETY AND CONSTRUCTION PROCEDURES ARE THE SOLE RESPONSIBILITY OF THE CONTRACTOR. CONTRACTOR SHALL PROVIDE A PROJECT SPECIFIC, OSHA COMPLIANT SITE SAFETY MANUAL INCLUDING ALL MANUFACTURER DATA SHEETS FOR ANY PAINT, GLUE OR SOLVENT THAT HAS ODOR AND PROVIDE TO THE OWNER FOR ITS REVIEW AND APPROVAL.
23. REFER TO ELECTRICAL DRAWINGS FOR DETAILED INFORMATION.
24. IN CASE OF CONFLICT BETWEEN DRAWINGS, THE MOST RIGID REQUIREMENTS SHALL GOVERN.
25. IN CASE OF CONFLICT BETWEEN THE CONTRACT DRAWINGS AND THE SPECIFICATIONS, THE MOST RIGID REQUIREMENTS SHALL GOVERN.
26. THE CONTRACTOR SHALL VERIFY AND COORDINATE EXISTING CONDITIONS SHOWN ON DRAWINGS. IF THERE IS A DISCREPANCY BETWEEN DRAWINGS, IT IS THE CONTRACTORS RESPONSIBILITY TO NOTIFY THE ENGINEER PRIOR TO PERFORMING THE WORK.
27. ALL COSTS OF INVESTIGATION AND/OR REDESIGN DUE TO CONTRACTOR IMPROPER INSTALLATION OF THE ELECTRICAL EQUIPMENT OR OTHER ITEMS NOT IN CONFORMANCE WITH THE CONTRACT DOCUMENTS SHALL BE AT THE CONTRACTORS EXPENSE.
28. ALL CONSTRUCTION IS TO BE PERFORMED IN STRICT CONFORMANCE WITH ALL APPLICABLE TOWN, COUNTY & STATE AND/OR ANY OTHER GOVERNING BODY STANDARDS.
29. DO NOT SCALE THESE DRAWINGS, USE DIMENSIONS. CONTRACTOR SHALL CONDUCT FIELD SURVEY TO VERIFY DIMENSIONS SHOWN ON PLAN PRIOR TO INSTALLATION. IF THERE IS A DISCREPANCY IT IS THE CONTRACTORS RESPONSIBILITY TO NOTIFY THE ENGINEER IMMEDIATELY.

GENERAL NOTES (CONTINUED)

30. WIRING DIAGRAMS WERE REFERENCED FROM DRAWINGS PROVIDED BY VENDORS AND FIELD VERIFIED FOR EQUIPMENT LOCATION AND SIZING. THE EXACT WIRING CONFIGURATION, AND ELECTRICAL CONNECTIONS WERE NOT VERIFIED. THE CONTRACTOR SHALL CONDUCT A FIELD SURVEY TO VERIFY WIRING CONFIGURATION AND ELECTRICAL CONNECTIONS PRIOR TO INSTALLATION. IF THERE IS A DISCREPANCY, IT IS THE CONTRACTORS RESPONSIBILITY TO NOTIFY THE ENGINEER PRIOR TO PERFORMING THE WORK.
31. CONTRACTOR SHALL TEST SYSTEM PER COMMISSIONING PROCEDURES AS REQUIRED BY THE MANUFACTURER.
32. CONTRACTOR SHALL VALIDATE COMMUNICATION WITH ALL DEVICES DURING COMMISSIONING.
33. TEXT ON ALL LABELS SHALL BE OF ARIAL FONT-IT SHALL BE LEGIBLE AND CLEAR.
34. TEXT SIZE SHALL BE AS SHOWN BUT IN NO CASE TEXT SHALL BE SMALLER THAN 3/8" FOR TITLES (I.E. "WARNING") AND 3/16" HIGH FOR DATA.
35. SUBMIT ALL LABEL STENCILS WITH DIMENSIONS TO ENGINEER PRIOR TO PURCHASE.
36. LABELS SHALL BE EITHER ENGRAVED, MACHINE PRINTED OR ELECTRO-PHOTO PLATED AND BE OF METALLIC OR PLASTIC CONSTRUCTION. SIGNAGE SHALL BE WEATHERPROOF, CORROSION PROOF, UV-STABILZED AND FADE RESISTANT.
37. LABELS SHALL BE SECURELY FASTENED TO SPECIFIED LOCATIONS BY USING A WEATHER PROOF & DURABLE ADHESIVE SUITABLE FOR THE MATERIAL OF THE LABEL & LOCATION.
38. THE LABELS SHALL BE POSTED AT THE LOCATIONS SPECIFIED. IF FOR REASONS OF REDUCED ACCESS OR SPACE, THE LABELS SHALL BE POSTED AT THE CLOSEST LOCATION THAT BEST SERVES THE INTENT OF THE LABEL. NOTIFY THE ENGINEER/SUPERVISOR IN SUCH A CASE BEFORE ATTACHING.
39. ALL LABELS SHALL COMPLY WITH THE FOLLOWING COLOR SCHEMES UNLESS SPECIFICALLY INDICATED:

LABEL	TEXT	BACKGROUND
INFORMATIONAL	BLACK	WHITE
UTILITY/CAUTION	BLACK	YELLOW
WARNING	WHITE	RED

ELECTRICAL DEMOLITION NOTES

1. BIDDING CONTRACTORS SHALL VISIT THE SITE TO ASSESS THE SCOPE OF DEMOLITION, REMOVAL AND MODIFICATION WORK.
2. ELECTRICAL CONTRACTOR SHALL DE-ENERGIZE ALL WIRING PRIOR TO REMOVAL OF EQUIPMENT, DEVICES, MOTORS INSTRUMENTATION, CONTROL PANELS, ETC. CONTRACTOR SHALL OBTAIN PRIOR APPROVAL FROM THE OWNER.
3. EXPOSED RACEWAYS: REMOVE CONDUIT, WIRES, AND BOXES. PATCH TO MATCH EXISTING. FINISH-ALL OPENINGS IN WALLS AND FLOORS
4. CONCEALED CONDUITS IN THE SLAB: REMOVE EXISTING WIRES TO THE EXTENT POSSIBLE AND ABANDON CONDUITS IN THE SLAB. CUT CONDUIT FLUSH AND PATCH THE FLOOR TO MATCH EXISTING
5. CONTROL PANEL: ELECTRICAL CONTRACTOR SHALL DE-ENERGIZE AND REMOVE ALL CONDUIT AND WIRE AS DESCRIBED IN DEMOLITION NOTE 2. CONTRACTOR SHALL REMOVE PANELS AS NOTED ON THE CONTRACT DRAWINGS. REFER TO NOTE 4 ABOVE FOR DISPOSITION OF ENCASED CONDUITS.
6. THE CONTRACTOR SHALL DISPOSE OF ALL EQUIPMENT IDENTIFIED FOR DEMOLITION.

4. REFER TO LIGHTING PLAN FOR LIGHT FIXTURE TYPES AND LOCATIONS.
5. REFER TO GROUNDING PLAN FOR EQUIPMENT GROUNDING AND LIGHTING PROTECTION REQUIREMENT.
6. FOR CLARITY, NOT ALL EQUIPMENT IS REPRESENTED IN EVERY VIEW.
7. TRANSFORMER "A" IS LOCATED WITHIN 10 FEET OF THE WELL HOUSE. TYPICALLY ON OPPOSITE SIDE OF THE BUILDING DOOR. THE CONTRACTOR SHALL ROUTE NEW CONDUIT UNDERGROUND, FROM THE TRANSFORMER, AROUND STRUCTURE, TO MAIN DISCONNECT. REFER TO CIVIL PLANS FOR EXACT LOCATIONS. FOR SITES WITH NEW TRANSFORMERS, THE NEW TRANSFORMER AND PAD SHALL BE PLACED IN THE SAME LOCATION AS THE EXISTING TRANSFORMER BEING REPLACED.
8. TOP OF ELECTRICAL PANELS SHALL NOT EXCEED 6' FROM FINISHED FLOOR.

TYPICAL GROUNDING PLAN

SCALE: 1/2" = 1'-0"

GENERAL SHEET NOTES

1. GROUNDING IS SHOWN SCHEMATICALLY ONLY. CONTRACTOR SHALL AVOID ALL OBSTACLES AS MUCH AS PRACTICAL. EXACT LOCATION AND ROUTING SHALL BE DETERMINED IN THE FIELD AND APPROVED BY OWNER.
2. ALL MATERIALS AND INSTALLATIONS SHALL BE IN ACCORDANCE WITH THE LATEST ISSUE OF LOCAL AND NATIONAL ELECTRICAL CODES, ELECTRICAL SPECIFICATIONS AND DRAWINGS.
3. GROUND CABLE SHOWN WITHIN THE PUMP BUILDING LIMITS SHALL BE ABOVE GRADE. THE CONTRACTOR SHALL SUPPORT CABLE AS REQUIRED TO PREVENT DAMAGE.
4. GROUND CABLE SHOWN OUTSIDE OF THE BUILDING LIMITS SHALL BE BELOW GRADE. CONTRACTOR SHALL PROTECT GROUND CABLE AT ALL PENETRATIONS.
5. GROUND TEST WELLS ARE GENERALLY SHOWN ON THIS DRAWING. THE CONTRACTOR IS RESPONSIBLE TO FIELD DETERMINE EXACT INSTALLATION LOCATION. THE NEW GROUND TEST WELLS ARE TO BE OFF-SET AT A MINIMUM OF 3'-0" FROM THE BUILDING.
6. THE CONTRACTOR SHALL USE 1/0 BARE CU CONDUCTOR AND AND EXOTHERMIC WELD TO BOND THE NEW GROUND ROD TO THE EXISTING GROUNDING ELECTRODE SYSTEM.
7. CONTRACTOR SHALL BOND ALL EXISTING GROUNDING TO NEW GROUNDING.
8. DRAWING IS TYPICAL FOR ALL MBR WELL HOUSES BEING UPGRADED EXCLUDES: MBR-152, MBR-157, MBR-161, MBR-162, MBR-163
9. REFER TO TYPICAL BUILDING LAYOUT DRAWING FOR EQUIPMENT SCHEDULE AND LOCATIONS.

GENERAL LIGHTNING PROTECTION NOTES

1. THE CONTRACTOR SHALL FURNISH AND INSTALL A SYSTEM OF LIGHTNING PROTECTION. THE ENTIRE LIGHTNING PROTECTION SYSTEM SHALL BE DESIGNED AND INSTALLED IN ACCORDANCE WITH:
   - NFPA DOCUMENT #780
   - UL STANDARD #96A
   - LIGHTNING PROTECTION INSTITUTE (LP1) STD# 175
2. A FIRM SUITABILITY QUALIFIED AND LISTED WITH UL AND LP1 SHALL INSTALL THE SYSTEM AND SHALL FURNISH A UL MASTER LABEL AND LP1 SYSTEM CERTIFICATION UPON COMPLETION OF INSTALL.
3. ALL METAL BODIES WITHIN 6FT OF THE CONDUCTOR SHALL BE BONDED TO THE SYSTEM WITH APPROVED FITTINGS AND CONDUCTORS. CONNECTION BETWEEN DISSIMILAR METALS SHALL BE MADE WITH APPROVED BIMETALLIC CONNECTIONS. PRIMARY BONDS FOR CONDUCTING METAL BODIES SHALL BE BONDED WITH APPROPRIATE FITTINGS AND FULL SIZE CONDUCTORS, AND SHALL CONSIST OF, BUT NOT LIMITED TO THE FOLLOWING: LADDER AND RAIL SYSTEMS, VENTS AND PIPING. ALUMINUM TO COPPER CONNECTIONS SHALL BE MADE WITH BIMETALLIC CONNECTORS.
4. THE LIGHTNING PROTECTION SYSTEM SHALL BE DESIGNED TO PROTECT THE BUILDING AND ALL ROOFTOP EQUIPMENT.
5. DOWN CONDUCTORS SHALL BE PROTECTED.
6. ALUMINUM TO COPPER CONNECTIONS SHALL BE MADE WITH BIMETALLIC CONNECTORS. GROUNDS FOR ELECTRICAL AND LIGHTING PROTECTION SHALL BE TIED TOGETHER TO FORM A COMMON GROUND.
7. MINIMUM SIZE LIGHTNING PROTECTION CONDUCTORS SHALL CONSIST OF U.L. LISTED 29 STRANDS OF 17 GAUGE COPPER WIRE WEIGHING 190 LBS. PER 1000 FEET AND INSTALLED IN ACCORDANCE WITH THE U.L. CODE . (CLASS 1)

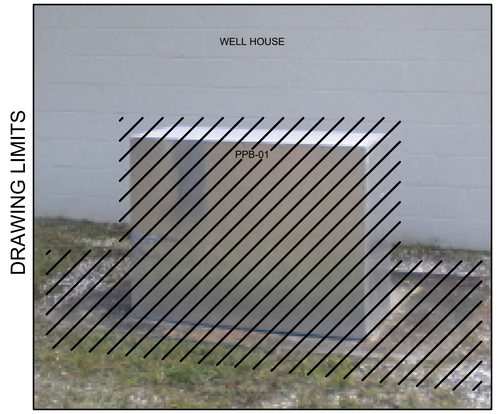
EQUIPMENT SCHEDULE

GENERAL SHEET NOTES

1. REMOVE ALL ELECTRICAL EQUIPMENT, RACEWAYS, WIRING, JUNCTION BOXES, LIGHT SWITCHES AND FIXTURES, RECEPTACLES, AND THE EXISTING PRIMARY POWER FROM THE PULL BOX.
2. FOLLOW ALL ON-SITE LOCK-OUT/TAG-OUT AND SAFETY PROCEDURES PRIOR TO WORKING ON ANY ELECTRICAL CIRCUITS. CONTRACTOR SHALL COORDINATE WITH TAMPA BAY WATER FOR PRIMARY POWER LOCKOUT.
3. CONTRACTOR SHALL DISPOSE OF ALL REMOVED DEVICES. EXCEPT THE FLOWMETER TOTALIZERS WHICH SHALL BE TURNED OVER TO TAMPA BAY WATER.
4. CONTRACTOR SHALL DEMOLISH THE PRIMARY POWER JUNCTION BOX AND INSTALL AN UNDERGROUND PULL BOX. SEE DRAWING GE-2 FOR TYPICAL DETAIL. ALL SPLICES WITHIN PULL BOX SHALL BE WATER-TIGHT.
5. EACH WELL SITE HAS AN EXISTING, UNUSED CONTROL CABLE, WHICH RUNS FROM A PULL BOX AT THE ROD TO THE RTU INSIDE THE WELL HOUSE. THIS RACEWAY SHALL BE CUT BACK, CAPPED UNDERGROUND AND ABANDONED IN PLACE.



NOTES:

1. CONTRACTOR SHALL DEMOLISH THE PRIMARY POWER JUNCTION BOX AND INSTALL AN UNDERGROUND PULLBOX. SEE DRAWING GE-2 FOR TYPICAL DETAIL. ALL SPLICES WITHIN PULLBOX SHALL BE WATER-TIGHT.

GENERAL SHEET NOTES

1. THE CONTRACTOR SHALL REMOVE ALL ELECTRICAL EQUIPMENT, PANELS, AND INSTRUMENTATION FROM INSIDE THE WELL HOUSE INCLUDING ALL APPURTENANCES, RACEWAYS, WIRING, JUNCTION BOXES, WIRING DEVICES, SWITCHES, LIGHTING, RECEPTACLES, INTRUSION SWITCHES, MOTION DETECTORS, AND INCOMING POWER CONDUCTORS. THE EXISTING OUTDOOR TRANSFORMER SHALL REMOVED AND REPLACED WITH NEW.
2. FOLLOW ALL ON-SITE LOCK-OUT/TAG-OUT AND SAFETY PROCEDURES PRIOR TO WORKING ON ANY ELECTRICAL CIRCUITS.
3. CONTRACTOR SHALL DISPOSE OF ALL REMOVED DEVICES. EXCEPT THE FLOWMETER TOTALIZERS WHICH SHALL BE TURNED OVER TO TAMPA BAY WATER.
4. DEMOLITION SHALL INCLUDE EXISTING CONDUIT AND CABLE TO/FROM EQUIPMENT SHOWN FOR DEMOLITION.
5. EACH WELL SITE HAS AN EXISTING, UNUSED CONTROL CABLE, WHICH RUNS FROM A PULL BOX AT THE ROD TO THE RTU INSIDE THE WELL HOUSE. THIS RACEWAY SHALL BE CUT BACK, CAPPED UNDERGROUND AND ABANDONED IN PLACE.

NOTES:

1. REMOVE THE EXISTING TRANSFORMER AND TRANSFORMER PAD.
2. FURNISH AND INSTALL NEW TRANSFORMER PAD AND TRANSFORMER AS SHOWN ON ONE-LINE DIAGRAM. TRANSFORMER PAD DIMENSIONS AND OPENINGS SHALL BE RECOMMENDED BY THE MANUFACTURER AND INCLUDED IN THE SHOP DRAWING SUBMITTAL. THE NEW TRANSFORMER PAD TOP OF SLAB SHALL BE NO LESS THAN 3" ABOVE THE SURROUNDING GRADE AND AT LEAST THE SAME ELEVATION AS WELL HOUSE FINISHED FLOOR.
3. MAINTAIN MANUFACTURER RECOMMENDED CLEARANCES AROUND THE TRANSFORMER. THE TRANSFORMER SHALL BE NO LESS THAN 3' FROM THE BUILDING.

EQUIPMENT SCHEDULE

GENERAL SHEET NOTES

1. THE CONTRACTOR SHALL REMOVE ALL ELECTRICAL EQUIPMENT, PANELS, AND INSTRUMENTATION FROM INSIDE THE WELL HOUSE INCLUDING ALL APPURTENANCES, RACEWAYS, WIRING, JUNCTION BOXES, WIRING, DEVICES, SWITCHES, LIGHTING, RECEPTACLES, INTRUSION SWITCHES, MOTION DETECTORS, AND INCOMING POWER CONDUCTORS. THE EXISTING OUTDOOR TRANSFORMER SHALL REMAIN.
2. FOLLOW ALL ON-SITE LOCK-OUT/TAG-OUT AND SAFETY PROCEDURES PRIOR TO WORKING ON ANY ELECTRICAL CIRCUITS.
3. CONTRACTOR SHALL DISPOSE OF ALL REMOVED DEVICES. EXCEPT THE FLOWMETER TOTALIZERS WHICH SHALL BE TURNED OVER TO TAMPA BAY WATER.
4. DEMOLITION SHALL INCLUDE EXISTING CONDUIT AND CABLE TO/FROM EQUIPMENT SHOWN FOR DEMOLITION.
5. EACH WELL SITE HAS AN EXISTING, UNUSED CONTROL CABLE, WHICH RUNS FROM A PULL BOX AND THE ROD TO THE RTU INSIDE THE WELL HOUSE. THE RACEWAY SHALL BE CUT BACK, CAPPED UNDERGROUND AND ABANDONED IN PLACE.

BIDDER'S RESPONSE FORMS

1. BID FORM

Failure to fully complete this form SHALL result in the Bidder being deemed NONRESPONSIVE.

OFFER

TO: Tampa Bay Water

The undersigned hereby offers and agrees to furnish the goods and/or services in compliance with all terms, scope of work, conditions, specifications, and addenda in this Invitation for Bids.

INVESTIGATION:

The undersigned, by submission of this Bid Form, certifies it has thoroughly examined all ITB documents, including any Existing Condition Documents and Project site in order to familiarize itself with all existing conditions. This may include the physical condition on the ground including, but not limited to, the soil borings and has satisfied itself that the number of borings and their locations are adequate or has made any additional soil tests or borings if they feel the number, type, or location of those provided by Tampa Bay Water are inadequate or incomplete.

OBLIGATION:

The undersigned, by submission of this Bid Form, hereby agrees to be obligated, if selected as the Contractor, to provide the stated goods and/or services to Tampa Bay Water for the term as stated herein, and to enter into a Contract with Tampa Bay Water, in accordance with all documents herein, together with any written addenda.

BID PRICE:

The undersigned agrees to abide by the pricing contained on the Price Form.

ADDENDA:

The Bidder acknowledges receipt of the addenda noted below and has incorporated the content of Addenda into this Bid:

#1 01/21/26 #2 01/29/26 #3 02/09/26 #_____

CONTRACTOR CONTRACT:

The Bidder agrees to the terms and conditions in the draft Contract included with this ITB **(initial one below)**:

X "As is" with no modifications.

____ With the changes requested in the attached document (attach to this form) and understands that Tampa Bay Water reserves the right to reject the change requests.

LITIGATION:

The Bidder understands it must disclose any past, pending or threatened litigation or regulatory action involving construction services provided by the Bidder **(initial one below):**

X None are known to exist.

____ Action exists, and a full explanation has been attached to this form.

CONFLICTS OF INTEREST:
The Bidder understands it must disclose any potential conflict of interest which would adversely affect the Bidder's ability to provide fair, loyal, and competitive services to Tampa Bay Water. Such disclosures shall include, but not be limited to, the Bidder's contractual obligations, property interests or clientele relationship or the property interests, contractual obligations or relationships of the Bidder's principals, officers, directors, employees or agents which are directly or indirectly related to Tampa Bay Water and its operations, its Agency Representative, the Southwest Florida Water Management District (SWFWMD), the Florida Department of Environmental Protection (FDEP), or any of our member governments **(initial one below):**

X___ None are known to exist.

____ Potential or apparent conflict exists, and a full explanation has been attached to this form.

COMPLIANCE WITH LAWS/PERMITS:
The Bidder certifies it is not currently in violation of any regulatory rules and regulations that may have an impact on the firm's operations, and it agrees to comply with all local, State, and Federal statutes, regulations, directives and orders as applicable to the services provided and offered to Tampa Bay Water. The Bidder further agrees it has not been placed on the Scrutinized Companies with Activities in Sudan List; the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; or the Scrutinized Companies that Boycott Israel List; nor has it engaged in a boycott of Israel and has no business operations in Cuba or Syria. (Per Section 287.135(5), Florida Statutes). Additionally, the Bidder certifies (pursuant to Subsection 287.134(2)(a), Florida Statutes) it has not been placed on the discriminatory vendor list.

NONCOLLUSION:
The undersigned, hereinafter called Bidder, declares and certifies that (i) all principals with an interest in this Bid have been named herein; (ii) this Bid is, in all respects, fair and without fraud; (iii) this Bid is made without collusion with any official of Tampa Bay Water or Engineer; and (iv) the Bid is made without any connection or collusion with any person submitting another Bid for the work.

CONTRACT EXECUTION:
The undersigned Bidder proposes and agrees that if this Bid is accepted, it shall enter into a Contract with Tampa Bay Water in the form included with the Contract documents and perform and furnish all work as specified or indicated in this ITB at the price bid and within the time specified, and in accordance with the other terms and conditions of the Contract documents.

CONTRACT MODIFICATION PRICING:
Bidder acknowledges and agrees that the separate prices on this Bid, where they are applicable and deemed acceptable by Tampa Bay Water, will be used by Tampa Bay Water and Bidder, if awarded the Contract documents, whenever similar work is added or deducted from the Contract documents.

PROJECT UNDERSTANDING:
Bidder represents that before making its Bid, Bidder has familiarized itself with the nature and extent of the Contract documents (as defined in the General Conditions), work, Project site, locality, and all local conditions and laws and regulations that may in any manner affect cost, schedule, progress, performance, or furnishing of the work.
Further, Bidder has read and studied carefully: reports of explorations and tests of surface and subsurface conditions; and those drawings of physical conditions in or relating to existing surface or

subsurface structures or underground utilities; and accepts the determinations established in 6.0 Supplemental Information for Bidders to the extent of the technical data contained in those reports and drawings upon which Bidder may rely, which in any manner affect cost, schedule, progress, performance, and furnishing of the work.
Further, Bidder has read and studied all information and data shown or indicated in the Contract documents about other work under separate Contracts at or near the Project site and assumes responsibility for all conditions and consequences which may result from other work and which in any manner affect cost, schedule, progress, performance, and furnishing of the work.
Further, Bidder has correlated the results of the activities, examinations, and studies as noted above, with the terms and conditions of the Contract documents and has exercised its own independent judgement in the interpretation of this information.

NOTICE OF ERRORS:
Bidder has given Tampa Bay Water notice of all conflicts, ambiguities, errors, or omissions, if any that Bidder has discovered in the ITB.

FIRM OFFER:
Bidder has read the Contract documents and accepts all of the terms and conditions of the Contract documents, including without limitation those dealing with the disposition of Bid Security. Bidder acknowledges all Bids shall remain firm for One-Hundred Twenty (120) days or as otherwise required by this ITB.

REQUIREMENTS IN EFFECT:
Reference to standard Specifications, manuals, or codes of any technical society, organization, or association, or to the Laws and Regulations of any governmental authority, whether such reference be specific or by implication, shall mean the latest standard specifications, manual, code, or Laws and Regulations in effect on the date of the receipt of Bids, except as may be otherwise specifically stated.

PUBLIC RECORDS:
Each Bidder, by submitting a Bid, acknowledges the agency's legal obligation in accordance with Chapter 119 of the Florida Statutes, to respond to all public records requests in a timely manner and expressly waives any right to contest, impede, prevent or delay such disclosure, or to initiate any proceeding that may have the effect of impeding, preventing or delaying such disclosure, unless the Bidder establishes its right to a public records exception. It is the responsibility of the Bidder alone to establish its right to any such exception. Under no circumstances will Tampa Bay Water be responsible or liable to a Bidder or any other party as a result of disclosing any such information or materials.

TRENCH SAFETY ACT:
Bidder acknowledges and agrees that the trench safety standards in effect at the time of this Bid and at the time(s) of performing the work shall be adhered to and compliance is the complete and sole responsibility of Bidder. The price on the Price Form includes Bidder's total cost for compliance with the Florida Trench Safety Act.

SUPPLIERS:
Bidder certifies that all suppliers, if acceptable to Tampa Bay Water, shall be supplying the material or equipment for the portions of the work identified in the list in the event Bidder is awarded the Contract.

Bidder acknowledges and agrees that the Trench Safety Standards in effect at the time of this Bid and at the time(s) of performing the work shall be adhered to and compliance is the complete and sole responsibility of the Bidder. The proposed Total Bid Price, as stated herein includes Bidder's total cost for compliance with the Florida Trench Safety Act.

4. FLORIDA BID BOND

Failure to fully complete this form SHALL result in the Bidder being deemed NONRESPONSIVE.

KNOW ALL MEN BY THESE PRESENTS:

That the "Bidder", Southeast Drilling Services, Inc., a corporation X, individual ____, partnership ____, of the state of Florida, qualified to do business in this State, as Principal, and the "Surety", Western Surety Company, a corporation of the state of South Dakota, authorized to do business as a surety in this State, as Surety, are hereby held and firmly bound unto the Tampa Bay Water as Obligees, in the sum of 5% of Total Bid Dollars ($5% of Bid), lawful money of the United States of America, which represents five percent (5%) of the sum of Bidder's proposed total Contract price, for the payment of which Bidder and the Surety hereby bind ourselves, our respective heirs, successors, legal representatives and assigns, jointly, and severally, firmly by these presents.

WHEREAS, Bidder has submitted to Tampa Bay Water, its Bid to which this Bond is attached, to enter into the Contract with Tampa Bay Water for the Morris Bridge Wellfield Improvements, Project No.: 50021, Contract No. 2026020 covered by the Contract documents prepared by Tampa Bay Water and the Engineer, which Contract documents are incorporated herein by this reference:

NOW, THEREFORE: THE CONDITION OF THIS OBLIGATION IS THAT, Bidder and Surety are jointly and severally bound by all of the provisions of this Bid Bond, and if Bidder faithfully performs and fulfills all the understandings, covenants, terms, conditions and requirements of this ITB (including addenda issued before the date of the opening of the Bid) within the time specified or any extension thereof, with or without notice to the Surety, or if Bidder fails to comply with all requirements of this ITB within the time specified or any extension thereof, with or without notice to the Surety, but pays Tampa Bay Water the full amount of the sum set forth in this Bid Bond as liquidated damages, then this obligation shall be null and void, otherwise to remain in full force and effect.

A. If Tampa Bay Water makes demand on the Surety to perform in accordance with the Surety's obligations under this Bond, then the full amount of the Bid Bond shall be immediately due and payable to Tampa Bay Water, and the Surety shall pay that sum without delay. Additionally, the Surety shall reimburse Tampa Bay Water for all costs of collection (including but not limited to attorney's fees).

B. The Surety, for value received, stipulates and agrees that the obligations of the Surety and this Bid Bond shall be in no way impaired or affected by any extension of the time within which Tampa Bay Water may accept the Bid, and the Surety does, by this Bid Bond, waive notice of any such extension.

C. The term this "State" means the State of Florida. Other defined terms (i.e., capitalized terms) used in this Bid Bond have the intent and meanings assigned to them in the General Conditions of the Contract documents, Definitions.

5. CERTIFICATE OF PRINCIPAL

I, William B Ziegler, certify that I am the Secretary of the Corporation X, or a General Partner _____ or Managing Partner _____ of the partnership, named as the Bidder in the attached Bid Bond; that William B Ziegler who signed the Bid Bond on behalf of the Bidder, was then President/ Sectretary/Treasurer of that organization X or partnership _____; that I know his/her signature, and on the Bid Bond is genuine; and that the Bid Bond was duly signed, sealed, and attested for and on behalf of that organization X or partnership _____ by authority of its governing body _____ or partners _____.

Authorizing By-Laws and Resolutions

ADOPTED BY THE SHAREHOLDERS OF WESTERN SURETY COMPANY

This Power of Attorney is made and executed pursuant to and by authority of the following By-Law duly adopted by the shareholders of the Company.

Section 7. All bonds, policies, undertakings, Powers of Attorney, or other obligations of the corporation shall be executed in the corporate name of the Company by the President, Secretary, and Assistant Secretary, Treasurer, or any Vice President, or by such other officers as the Board of Directors may authorize. The President, any Vice President, Secretary, any Assistant Secretary, or the Treasurer may appoint Attorneys in Fact or agents who shall have authority to issue bonds, policies, or undertakings in the name of the Company. The corporate seal is not necessary for the validity of any bonds, policies, undertakings, Powers of Attorney or other obligations of the corporation. The signature of any such officer and the corporate seal may be printed by facsimile.

This Power of Attorney is signed by Larry Kasten, Vice President, who has been authorized pursuant to the above Bylaw to execute power of attorneys on behalf of Western Surety Company.

This Power of Attorney may be signed by digital signature and sealed by a digital or otherwise electronic-formatted corporate seal under and by the authority of the following Resolution adopted by the Board of Directors of the Company by unanimous written consent dated the 27th day of April, 2022:

"RESOLVED: That it is in the best interest of the Company to periodically ratify and confirm any corporate documents signed by digital signatures and to ratify and confirm the use of a digital or otherwise electronic-formatted corporate seal, each to be considered the act and deed of the Company."

6. **TAMPA BAY WATER**
CONSULTANT AFFIDAVIT

STATE OF Florida
COUNTY OF Hillsborough

BEFORE ME, the undersigned authority, appeared W.B. Ziegler, who first being duly sworn hereby swears or affirms as follows:

1. I make this affidavit on personal knowledge.
2. I am over the age of 18 years and otherwise confident to make this Affidavit.
3. I am the President/ Sectretary/Treasurer of Southeast Drilling Services, Inc. (the "Consultant").
4. I am authorized by Southeast Drilling Services, Inc. to make this Affidavit on behalf of Consultant.

E-Verify

1. Consultant acknowledges that Section 448.09, Florida Statutes, makes it unlawful for any person to knowingly employ, hire, recruit, or refer, for private or public employment, an alien who is not duly authorized to work in the United States.
2. Consultant acknowledges that Section 448.095, Florida Statutes, prohibits public employers, contractors, and subcontractors from entering into a Contract unless each party to the Contract registers and uses E-Verify.
3. Consultant is in compliance with the requirements of Sections 448.09 and 448.095, Florida Statutes.
4. Consultant understands it shall remain in compliance with the requirements of Sections 448.09 and 448.095, Florida Statutes, during the term of any Contract with Tampa Bay Water.
5. Consultant's subcontractors are in compliance with the requirements of Sections 448.09 and 448.095, Florida Statutes.
6. Consultant shall ensure compliance with the requirements of Sections 448.09 and 449.095, Florida Statutes, by any and all of its subcontractors.
7. Neither the Consultant nor any subcontractor of Consultant has had a Contract terminated by a public employer for violating Section 448.095, Florida Statutes, within the year preceding the date of this Affidavit.
8. If the Consultant or any subcontractor of Consultant has a Contract terminated by a public employer for any such violation during the term of any Contract with Tampa Bay Water, it shall provide immediate notice thereof to Tampa Bay Water.

Anti-Human Trafficking

In accordance with Section 787.06(13), Florida Statues, the undersigned, on behalf of the entity listed below ("Entity"), hereby attests under penalty of perjury that Entity does not use coercion for labor or services as defined in Section 787.06, Florida Statutes, entitled "Human Trafficking".

Scrutinized Companies

A. Pursuant to Subsections 287.133(2) and (3), Florida Statutes, Respondent acknowledges that a person or affiliate who has been placed on the convicted vendor list following a conviction for a public entity crime may not submit a proposal on a Contract provide any goods or services to a public entity, may not submit a Proposal on a Contract with a public entity for the construction or repair of a public building or public work, may not submit Proposals on leases of real property to a public entity, may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a Contract with any public entity, and may not transact business with any public entity in excess of the threshold amount provided in Section 287.017 Florida Statutes, for CATEGORY TWO for a period of 36 months from the date of being placed on the convicted vendor list.
B. Pursuant to Subsection 287.134(2)(a), Florida Statutes, Respondent acknowledges that an entity or affiliate who has been placed on the discriminatory vendor list may not submit a bid, proposal, or reply

on a Contract to provide any goods or services to a public entity; may not submit a bid, proposal, or reply on a Contract with a public entity for the construction or repair of public building or public work; may not submit bids, proposals, or replies on leases of real property to a public entity; may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a Contract with any public entity; an may not transact business with any public entity.

C. Pursuant to Section 287.135, Florida Statutes, Respondent acknowledges that a company that has been placed on the Scrutinized Companies with Activities in Sudan List; the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; or the Scrutinized Companies that Boycott Israel List or a company that engages in a boycott of Israel, is ineligible and may not submit a bid, proposal, or enter into or renew a Contract with an agency for goods or services of $1 million or more. At the time of submission of a proposal for a Contract or Contract renewal for goods or services of $1 million or more, the company must certify that it is not on either such List and further that it does not have business operations in Cuba or Syria as required by Section 287.135(5), Florida Statutes.

D. Pursuant to Section 287.135, Florida Statutes, Respondent acknowledges that Tampa Bay Water has the option to terminate any Contract for goods or services of $1 million or more if the awarded company is found to have submitted a false certification as provided under Section 287.135(5), been placed on the Scrutinized Companies with Activities in Sudan List or the Scrutinized Companies with Activities in the Iran Petroleum Energy Sector List, or been engaged in Business operations in Cuba or Syria.

E. Pursuant to Section 287.135, Florida Statutes, Respondent acknowledges that Tampa Bay Water has the option to terminate any Contract for good or services of any amount if the awarded company is found to have or been placed on the Scrutinized Companies that Boycott Israel List or is engaged in a boycott of Israel.

Foreign Countries of Concern

Pursuant to Section 287.138, Florida Statues, Tampa Bay Water may not enter into a Contract with an entity that gives access to an individual's personal identifying information if the entity is owned, controlled or organized under the laws of a Foreign Country of Concern which includes the People's Republic of China, the Russian Federation, the Islamic Republic of Iran, the Democratic People's Republic of Korea, the Republic of Cuba, the Venezuelan regime of Nicolas Maduro, the Syrian Arab Republic, or any other entity or agency under the significant control of such Foreign Country of Concern.

7. NON-COLLUSION AFFIDAVIT

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

Owner: Tampa Bay Water
Engineer: Stantec Consulting
Project Name: Morris Bridge Wellfield Improvements
Project No.: 50021

Affiant, . W.B. Ziegler, being first duly sworn, deposes and says that: Affiant is (Title) President/ Sectretary/Treasurer of Southeast Drilling Services, Inc, ("Bidder"). Affiant has personal knowledge of the matters set forth in this Affidavit and is competent to testify about them.

Bidder has submitted to Tampa Bay Water, a Bid ("Bid") to construct the above referenced Project, also referred to in this Affidavit as the "work".

This Non-Collusion Affidavit is executed by Affiant for inclusion with the submission to Tampa Bay Water of the Bid and may be relied upon by Tampa Bay Water in considering the Bid.

Affiant is fully informed about the preparation and contents of the Bid and of all pertinent circumstances surrounding the Bid; has not entered into any illegal Contract, combination, conspiracy or other unlawful act; and the Bid is genuine and is not a collusive or sham Bid.

Neither Bidder nor any of its officers, partners, agents, representatives, employees or parties in interest, including this Affiant, have in any way entered or proposed to enter into any combination to prevent the making of any Bid, or to fix a price or prices (including any overhead, profit or other cost elements) for the Bid; or have made any Contract, or given or promised any consideration to induce any other person not to submit a Bid for the work, or to submit a Bid at a specified price; or have secured or intended to secure through any Contract an unlawful advantage against Tampa Bay Water, or any other person interested in the work.

The Bid is not intended to secure an unfair advantage or benefit from Tampa Bay Water or in favor of any person interested in the proposed work.

The prices proposed are fair and proper and are not tainted by any collusion, conspiracy, connivance, or unlawful Contract on the part of Bidder or any other of its agents, representatives, owners, employees, or parties in interest, including this Affiant; and neither Bidder nor any of its officers, partners, owners agents, representatives, employees, or parties in interest, including this Affiant, have divulged information regarding the Bid or any data about the Bid to any other person.

Name of Project: North Hillsborough Aquifer Recharge Project (NHARP)
8305 Montaque St, Tampa Fl

Contract Amount: $ 2,538,150.00 07-10-2017 **Final Cost:** $2,722,166.50 07/09/2019

Project Management : Bart Ziegler **Supervisor / Lead Driller**: Brian Ziegler

Owner / Engineer Hillsborough County BOCC \
601 East Kennedy Blvd., #18 Tampa, Fl 33602

Contact: Michael Townsel
813-663-3222
TownselM@HCFLGov.net

Percentage Completed by SED: 85%

Description of Work: Well Construction - The WORK of this contract includes the construction and outfitting of one (1) Recharge Well (NRW-1) (700 ft 500 wall casing TD

1200 ft) one (1) Recharge Zone Monitor Well (NRZMW-1) 16'', eight (8) temporary pad monitoring wells (PMW-1 through 8), and wellhead additions or modifications to two (2) existing monitoring wells (Suwannee Limestone Monitoring Well [SZMW-1] and Shallow Zone Monitoring Well [NSMW-1]), along with all appurtenant work including, logging, coring, acidization, specific capacity test, casing pressure tests, APTs, final pump, controls and electrical installation

Project 3:
Name of Project: Manatee SWWRF ASR Well (Well) Rehabilitation

Contract Amount: $ 2,018,025 **Final Cost: $2,185,786**

Project Superintendent: Bart Ziegler **Supervisor / Lead Driller: Brian Ziegler**

Owner / Engineer Manatee County/CH2M Hill/ASRrUS Completed: Aug. 2020

Contact: **Mark McNeal 813/765-7942, Mmcneal@asrus.net**

Neil Postlethwait 239/707-0883, Niel.Postlethwait@Jacobs.com

Percentage Completed by SED: 90%

Description of Work:

SWWRF ASR Well (Well) Rehabilitation
Construction to include rehabilitation of existing aquifer storage and recovery (ASR) well equipment to continue cycle testing and operation of the Well. This will include a Well video survey, geophysical logging, recovery pump replacement, pipe replacements, connection to high service pump station piping and to the reject lake, flow meter, pressure recorder, water level instrumentation, and associated electrical work. Also, monitor Well piping replacement.

Project4:
Name of Project: Hillsborough County Maintenance Contract
Well Drilling, Abandonment, Parts & Service.

Contract Amount: $ 3,662,528.00 **On Going thru July 21, 2024**

Project Superintendent: Bart Ziegler **Supervisor /Lead Driller: Brian Ziegler**

Owner / Engineer Hillsborough County BOCC
Contact: Michael Townsel 813-663-3222 TownselM@HCFLGov.net

Description of Work: As needed wellfield services and installation (26" by 6" FRP (700 ft) single zone monitor well to 850 ft, plugging and abandonment, acidization of existing 16" Recharge wells, testing, logging, pump repair, acidization, liner installation and new monitor wells – SHARP Work Order Acidification of Recharge Injection Well - RW-1 Apollo
The County requests to properly conduct acidification of the recharge well and Avon Park limestone to reduce the chemical precipitation of calcium carbonate within the fractures of the formation which is the primary cause of the reduced injection capacity of RW-1.

Company History and Services

Southeast Drilling Services, Inc. (Southeast) was formed in 1994 based in Tampa with an office in West Palm Beach, Florida. Southeast provides services in General Construction, Water Well Construction, Water Supply, Irrigation.

The firm has over 70 years of combined experience in construction and design of water resource and environmental projects. The overall company is versatile, mobile and can readily adapt to your project specific needs anywhere in the southeast.

The Water Well Construction division specializes in complete wellfield expansion projects, general water well construction, mechanical, pumping stations, acidization, and well rehabilitation. We provide services for aquifer performance testing, mechanical integrity testing, water plant maintenance, and well abandonment.

We structure our project teams to provide the technical and project experience required to efficiently execute your job specific needs. We have technicians and engineers registered in the state of Florida on staff and on call ready to assist with design, estimating and project execution.

Services

Southeast provides an array of diversified construction, drilling and mechanical services. Areas of specialization are as follows:

Wellfield Expansions

- *General Construction*
- *Production Wells (Surfical and Floridan)*
- *Pumping and Supply Systems*
- *Pipelines*
- *Electrical Services*
- *Instrumentation and Controls*

Southeast has performed overall construction and management services for wellfield expansion projects, which increased raw water capacity up to 22 million gallons per day.

General Well Construction

- *Cement Grouted (Rotary) and Driven (Cable Tool) Wells*
- *Public Supply Wells*
- *Well Rehabilitation*
  - *Acidization and Chlorination*
  - *Irrigation Supply*
- *Private and Municipal Supply*
- *Monitor Wells (OSHA Health and Safety Certifications)*

Well size range from 4-inch diameter to 30-inch and from 100 to over 2,000 feet below land surface.

Mechanical

- *Submersible/Vertical Turbine Pump Design, Installation, and Repair*
- *Mechanical and Wellhead Piping*
- *Pump Stations with Automated and Automatic Controls*
- *Chlorination and Chemical Feed Systems*
- *Generator and emergency standby equipment*

Specialty Services

- *Aquifer Performance Testing*
- *Mechanical Integrity Testing*
- *Aquifer Storage and Recovery Wells*
- *Water Plant Maintenance*
- *Well Abandonment*
- *Environmental Groundwater Screening*
- *Water Quality Sampling and Analysis*
- *Deep Injection Well Mechanical Integrity Testing*

Certifications

- *General Contractor License*
- *Licensed Water Well Contractor*
- *Licensed and Registered Professional Engineer*

BART ZIEGLER, P.E.
Water Resource Engineer

Education

B.S., Civil Engineering, University of Florida

Experience

Mr. Ziegler is the President of Southeast Drilling Services, Inc. (SED), a water well construction and environmental drilling company with over 133 combined years of experience. SED currently provides services throughout the state of Florida

Mr. Ziegler is also a Water Resources Engineer. He provides expertise in general civil engineering, hydrogeology, and groundwater projects for water supply and effluent disposal. His project experience includes water supply systems, deep injection wells, groundwater monitoring studies, toxic and hazardous waste investigations, park design, and regulatory permitting.

Mr. Ziegler was the Program Site Coordinator for an initial remedial investigation Hartford, CN. He was responsible for coordination of all subcontractors associated with the program which include engineering and construction services. He was also responsible for overseeing a successful innovative technology (Screening/Micro Wells) was used to delineate groundwater contamination prior to installation of permit monitoring of recovery wells.

He was the Project Manager/Project Engineer on the City of Boynton Beach Aquifer Storage and Recovery Project. The system was designed to store potable water in the Floridan Aquifer and recovery for distribution when plant capacity is insufficient to meet peak demands. Mr. Ziegler's responsibilities included permitting, design, communication with state and federal regulators, and inspection and testing during construction. He was also the Lead Engineer/Assistant Project Manager for the concentrate disposal well at the Boynton Beach Membrane Water Softening Facility at the West Water Treatment Plant.

Mr. Ziegler was the Project Manager for the successful mechanical integrity testing and operating permit renewal for Palm Beach County System No. 9(N) and No. 3 and Royal Palm Beach Deep Injection Wells. During the project, he was responsible for specification preparation and inspection of testing performed on the wells. Mr. Ziegler was also the project engineer during mechanical integrity testing of the four deep injection wells which provide effluent disposal at the G.T. Lohmeyer Wastewater Treatment Plant in Fort Lauderdale, Florida.

Mr. Ziegler was the project manager for permitting the regulatory communication for seven Floridan aquifer monitor wells and plugging of a boulder zone monitor well at Miami-Dade South District Wastewater Treatment Plant. He was also the program manager for an exploratory injection well in Tracy, California, which was designed for disposal of brines. Mr. Ziegler was the assistant project manager and project engineer for the installation of 30-mgd deep injection well system at the Palm Beach County Southern Region Wastewater Treatment

Plant. He was responsible for project management, design, and inspection during construction. He was also the project manager in the rehabilitation of one of the disposal wells at the facility.

He was the assistant project manager and project engineer for the City of Coconut Creek, Florida, Winston Park Nature Center. This park/sports complex is located in an environmentally sensitive area which required special consideration in developing the facilities. One such structure is a 750-foot boardwalk through an adjacent wetland area. Mr. Ziegler reduced the design for the park and provided inspection services during construction of the project.

For the City of Cooper City, Florida, Mr. Ziegler oversaw the construction of a well designed for groundwater monitoring and recovery. In related work, he supervised the construction of Floridan aquifer production well.

As the lead engineer on the deep injection well for Villages of Royal Palm Beach, Florida, he was responsible for inspection services throughout all phases of the construction. He also prepared the engineering report and operation and maintenance manual for the system.

Mr. Ziegler has participated in several contamination assessment projects in Florida for Dade County Aviation Department, The Port Everglades Environmental Company (PEECO), Northern Telecom Electronics, and the City of Cooper City. These projects determined the extent of toxic and hazardous waste contamination of groundwater at a site. Mr. Ziegler was active in project management, groundwater sampling, data tabulation and analysis, design work, preparation of plans and specifications, construction management, and preparation of engineering reports.

Prior to his employment with SED, Mr. Ziegler was employed by CH2M Hill, an international environmental consulting firm. He performed as a Client Coordinator in addition to the design and construction of general water resource projects.

More recent Project Management and Supervision as President of Southeast Drilling Service, Inc specific to the requirements for the Collier County Well Maintenance Program are listed in the attachments.

J. BRIAN ZIEGLER
Project Supervisor and Lead Driller

Education

Chamberlain High School 1981

Experience

Mr. Ziegler is currently Southeast Drilling Services, Inc.'s lead drilling and project supervisor, in addition to site safety coordinator for surficial, Floridan aquifer wells, and Deep Injection Well construction projects throughout the state. He also supervises and manages mechanical projects including underground and above ground piping, submersible and vertical turbine pump installation and general site civil construction.

He played a key role in the development and implementation of Southeast's Groundwater Screening Program that has been used throughout the southeast to identify and determine the extent of toxic and hazardous waste contamination in groundwater .

Prior to joining Southeast, Mr. Ziegler was employed by Drilling Consultants Inc. in Tampa, Florida. He served as the lead for drilling operations throughout the state. He was responsible for monitor well: public supply systems, irrigation wells, private well construction and primary and secondary drinking water sampling on public supply systems.

Mr. Ziegler started drilling in 1989 and obtained his Water Well Contractors license in 2011. He has been responsible for the construction of numerous production, monitor, Floridan, ASR, and dual zone monitor wells ranging in size from 2-inch to 30-inch and depths up to 1,900-feet. He has also been the lead on Deep Injection Well construction and Rehabilitation projects, including tubing and packer installation at depths up to 2,900-feet.

EXHIBIT C
PAYMENT AND PERFORMANCE BONDS

PERFORMANCE BOND

KNOW ALL MEN BY THESE PRESENTS: That _____ as Principal, located at _____ (Business Address) and _____as Surety, located at _____ (Business Address) are held and firmly bound to the Tampa Bay Water, A Regional Water Supply Authority as Obligee in the sum of _____ ($_____) for the payment whereof we bind ourselves, our heirs, executors, personal representatives, successors and assigns, jointly and severally.

Whereas, Principal has entered into a contract dated as of the _____ day of _____, 20__, with Obligee for the **Morris Bridge Wellfield Improvements, Project No.: 50021, Contract No. 2026020** in accordance with DRAWINGs and Specifications, which contract is incorporated by reference and made a part hereof, and is referred to as the Contract.

THE CONDITION OF THIS BOND is that if Principal:

1. Performs the Contract at the times and in the manner prescribed in the Contract; and
2. Pays Obligee any and all losses, damages, costs and attorneys' fees, including appellate proceedings, that Obligee sustains because of any default by Principal under the Contract including, but not limited to, all delay damages, whether liquidated or actual, suffered by Obligee; and
3. Performs the guarantee of all work and materials furnished under the Contract for the time specified in the Contract, then this bond is void; otherwise, it remains in full force.

BE IT FURTHER KNOWN:

1. Any changes, regardless of scope or amount, in or under the Contract and compliance or noncompliance with any formalities connected with the Contract or the changes do not affect Surety's obligation under this Bond.
2. The Surety, for value received, hereby stipulates and agrees that no changes, extensions of time, alterations or additions to the terms of the Contract or other work to be performed hereunder, or the Specifications referred to therein shall in anyway affect its obligations under this bond, and it does hereby waive notice of any such changes, extensions of time, alterations or additions to the terms of the Contract or to work or to the Specifications.
3. This Performance Bond is issued in compliance with the terms and conditions set forth in Florida Statute 255.05; however, it is intended to exceed the minimal coverage requirements established by that statute. The Notice and time limitations of Florida Statute 255.05 (2) are also, to the extent applicable, if any, incorporated herein by reference and made a part hereof.
4. In no event will the Surety be liable in the aggregate to Obligee for more than the penal sum of this Performance Bond regardless of the number of suits that may be filed by Obligee.
5. Whenever the Contractor shall be, and is declared by Tampa Bay Water to be in default under the Contract, Tampa Bay Water having performed Tampa Bay Water's obligations thereunder, the SURETY shall promptly remedy the default, as set forth below and at the sole option of Tampa Bay Water, by promptly:

   (a) Completing the Contract in accordance with its terms and conditions and paying Tampa Bay Water all of its losses, damages, costs and attorneys' and legal assistants' fees, whether at trial, on appeal or in bankruptcy, that Tampa Bay Water sustains because of any default by Principal under the Contract including, but not limited to, all delay damages, whether liquidated or actual. In the event Surety takes over and completes the Contract, then in such event it shall be entitled to receive the balance of the Contract Price, as defined in sub-paragraph 2 below; or

(b) Indemnifying Tampa Bay Water for all of its damages, expenses, costs, delay damages, attorneys' and legal assistant's fees, including appellate and bankruptcy proceedings, that Tampa Bay Water has incurred, suffered or sustained as a result of Tampa Bay Water's completion of the Contract or the Principal's default under the Contract, less the remaining unpaid balance of the Contract Price, if any. The term "balance of the Contract Price," as used in this Performance Bond, shall mean the total amount payable by Tampa Bay Water to the Contractor under the Contract and any amendments thereto, less the amount previously paid by Tampa Bay Water to the Contractor.

IN WITNESS WHEREOF, the above parties have executed this instrument this _____ day of _____, 20__, the name of each party being affixed and these presents duly signed by its undersigned representative, pursuant to authority of its governing body.

THIS IS TO FURTHER CERTIFY THAT:

1. The company issuing the General Liability Coverage hereby agrees to waive any right of subrogation it may acquire against Tampa Bay Water, its engineers, its consultants, and all other parties named as insured by reason of any payment made on account of personal injury, bodily injury, including death resulting therefrom, sustained by any employee of the insured or property damage arising out of the performance or furnishing of work under the above referenced Contract.

2. Each of the above-described policies contains a provision or endorsement that the coverage afforded will not be canceled, adversely changed or non-renewed until at least thirty (30) days prior written notice has been given to Tampa Bay Water by certified mail.

3. Each of the above listed companies hereby agrees to deliver to Tampa Bay Water new Certificate of Insurance at least fifteen (15) days prior to coverage renewals or binder within such period and a certificate within fifteen (15) days thereafter.

4. If requested, each of the above-listed companies hereby agrees to deliver two (2) copies of the policies purchased by the Agent to Tampa Bay Water.

5. Each of the above listed companies is authorized to do business and has an agent for service of process in Florida and has an "A" policy holders rating and a financial rating of at least Class VIII in accordance with the most current Best's rating. For self-insurance funds, financial statements are to be provided, if requested by Tampa Bay Water. (At Tampa Bay Water's option, a Best's rating or financial information regarding any self-insurance funds may be waived.)

Ref:	Tampa Bay Water Project No. 50021 – Morris Bridge Wellfield Improvements ITB Contract No. 2026020	**Date:**	March 12, 2026
Subject:	Bid Evaluation and Recommendation		

Summary

The bid opening for ITB Contract No. 2026020 Morris Bridge Wellfield Improvements took place on February 18th at 2:30PM at the office of Tampa Bay Water. There were two bidders: Southeast Drilling Services, Inc and C&T Contracting Services. Refer to table 1 for a summary of their bid results. Tampa Bay Water intends to select Southeast Drilling Services, Inc as the apparent lowest, responsive bidder with a base bid of $15,404,500.00 and provided Southeast Drilling Services, Inc's bid proposal to Stantec to be further evaluated.

Table 1. Bid Tabulation Summary and Analysis

Description	CIP Estimate	Southeast Drilling Services, Inc	C&T Contracting Services, LLC
Base Bid	**$14,861,000.00**	**$15,404,500.00**	**$19,248,540.00**
Bid Percent Difference from CIP Estimate	**-**	**3.66% higher**	**29.52% higher**

Stantec reviewed the information provided in Southeast Drilling Services, Inc's bid proposal including the bid schedule, acknowledgment of addenda, non-collusion affidavit, litigation history, consultant affidavit, major equipment list, major equipment manufacturers, subcontractors list, questionnaire, well contractor license, proposed superintendent and project manager resumes, Florida Bid Bond, and Consultant Affidavit.

Analysis

Stantec has reviewed the proposal from Southeast Drilling Services, Inc. and found no mathematical errors in their calculations. Based on the bid tabulation provided by Tampa Bay Water, the low bid is 19.97% less than the 2nd low bid. Both bid numbers shown above exclude Owner's Allowance, Permit Allowance, and Indemnification. The difference between 1st and 2nd low bid is $3,844,040.00.

The estimated capital improvement project (CIP) budget for this project is $14,861,000.00. Southeast Drilling Services, Inc's base bid price of $15,404,500.00 is $543,500.00 or 3.66% higher than the estimated CIP estimate.

Review of Qualifications

As part of the bid documents, Southeast Drilling Services, Inc submitted a list of contracts over $2,000,000.00 that their organization has performed during the last 7 years, the most recent one being a $9,611,899.00 project in 2024. Stantec

Reference: Bid Evaluation and Recommendation

has reviewed this information and confirmed that Southeast Drilling Services, Inc. possesses the appropriate experience and is capable of performing the work required for this project.

Licensing information provided indicates Southeast Drilling Services, Inc possesses a General Certified Contractor, and Water Well Contractor license that are both active and in good standing. Subcontractor information provided indicates that the electrical work will be furnished and installed by a single certified electrical subcontractor (Lavandera Electric Co). Similarly, subcontractor information indicates that the underground piping will be furnished and installed by a single certified underground utility and excavation subcontractor. (Blackhorse Underground, Inc). Based on the information provided, both subcontractors are certified with the required previous experience.

Additionally, based on the information provided, both the proposed project manager and superintendent meet the minimum requirements of having served in the same role in at least one project of similar scope in the past 5 years.

Review of Certified Public Accountant's copies of Southeast Drilling Services, Inc's most recent financial statements has been deemed outside Stantec's scope of work. Tampa Bay Water has confirmed review and approval of their financial performance.

Recommendation

Stantec recommends that Tampa Bay Water awards a contract in the amount of $16,299,600.00 (which includes the $895,100 Owner's Allowance) to Southeast Drilling Services, Inc for the Morris Bridge Wellfield Improvements Project.

Regards,

Stantec Consulting Services Inc.

Morris Bridge Wellfield Improvements Project Contract 2026-020

Agenda Item C.4
April 20, 2026

Nicole Thomas, PE, PMP
Senior Professional Engineer IV
Tampa Bay Water

Project's Purpose

- Installation of 15 new pumps and motors
- Refurbishment of 15 wellhouse buildings
- Properly abandoning and taking out of service 5 wells
- Donating 3 wellhouses to Hillsborough County Parks & Recreation Department

Contract Pricing

- Adjusted design/project approach to rehabilitation instead of new buildings/structures
- Owner Direct Purchase Program for tax savings
- Awarded EPA Grant Funding

Description	Total
Construction and Material Costs	$15,404,500
Owner's Allowance & Contingency	$895,100
Total	**$16,299,600***

* Sales taxes (~$300,000) will be deducted from the contract after implementation of ODP Program.

** EPA Grant (~$1,000,000) will be deducted from contract, if received.

Recommendation

Staff recommends that Contract 2026-020 be awarded to Southeast Drilling Services, Inc., in the amount of $16,299,600, inclusive of $895,100 Owner's Allowance.

TAMPA BAY WATER
Supplying Water To The Region

AGENDA ITEM C.5

DATE: March 30, 2026

TO: Board of Directors

THRU: Charles H. Carden, General Manager

FROM: Maribel Medina, Planning and Projects Director

SUBJECT: Cross Bar Ranch Wellfield Transmission Main Utility Conflict, (Project No. 07153), Contract No. 2026-017 with JDS Inc., dba JDS Pipe Inc. - *Approve*

SUMMARY

An Invitation to Bid for Contract No. 2026-017 was conducted to obtain construction services for the Cross Bar Ranch Wellfield Transmission Main Utility Conflict, Project No. 07153. JDS Inc., dba JDS Pipe Inc., was determined to be the lowest responsive, responsible bidder.

SUGGESTED ACTION

Approve Contract No. 2026-017 to the lowest responsive, responsible bidder, JDS Inc., dba JDS Pipe Inc., in the amount of $6,169,901 inclusive of $246,000 of Owner's Allowance and $100 Indemnification.

COST/FUNDING SOURCE

$6,169,901/Renewal and Replacement and Florida Department of Transportation Reimbursement Funds

DISCUSSION

On January 16, 2026, Tampa Bay Water posted an Invitation for Sealed Bids (ITB) for the Cross Bar Wellfield Transmission Main Utility Conflict, Project No. 07153, Contract No. 2026-017. Contractors were notified through advertisement on Euna Procurement (EUNA) and Tampa Bay Water's website. Tampa Bay Water added nine (9) known firms as supplemental contractors and forty-three (43) contractors downloaded the bid plans. A non-mandatory pre-bid conference meeting and site visit was conducted on February 18, 2026, with thirteen (13) contractors in attendance.

On March 17, 2026, five (5) sealed bids were received. Four (4) submittals were from Bidders new to Tampa Bay Water. The bids were publicly opened with results as follows:

Contractor	**Total Bid***
JDS Inc., dba JDS Pipe Inc.	$6,169,901
Garney Companies, Inc.	$6,194,848
Ric-Man Construction Florida (RMCF), Inc.	$6,994,637
Morgan Contracting, Inc.	$7,202,400
Midsouth Inc.	$7,831,920

*Total Bid amount includes a $246,000 Owner's Allowance and $100 indemnification.

Tampa Bay Water staff and the design engineering consultant, Wade Trim, reviewed and evaluated the bids and determined JDS Inc., dba JDS Pipe Inc., to be the lowest responsive, responsible bidder.

Staff recommends Contract No. 2026-017 be awarded to JDS Inc., dba JDS Pipe Inc., in the amount of $6,169,901, inclusive of an owner's allowance of $246,000 and indemnification of $100. This contract shall remain effective through the completion of this project.

The proposed contract is attached and has been reviewed and approved as to form by Tampa Bay Water's General Counsel. The Bid Price form and Wade Trim's recommendation letter are attached.

BACKGROUND

The Cross Bar Ranch Wellfield Transmission Main Utility Conflict, Project No. 07153, is included in the Capital Improvements Program and is the result of a utility conflict with the Florida Department of Transportation (FDOT) Financial Project ID 256334-1-56-02. The FDOT project proposes improvements to State Road 52 (SR-52) in Pasco County including road widening and drainage improvements which conflict with Tampa Bay Water's existing 60-inch Cross Bar Ranch Wellfield Transmission Main. Approximately 500 linear feet of Tampa Bay Water's wellfield transmission requires relocation to avoid conflict with FDOT's proposed 42-inch stormwater drainage components.

A portion of Tampa Bay Water's transmission main is located within an existing 50-foot-wide permanent easement, therefore, FDOT has agreed to reimburse Tampa Bay Water for approximately $4 million of the construction costs.

Re: Cross Bar Ranch Wellfield Water Transmission Main – Utility Conflict, Project No. 07153
Letter of Bid Recommendation for Contract No. 2026017

Dear Mrs. Keirsey:

Wade Trim has received the bid tabulation for this project and evaluated the apparent lowest bidder's response, along with supplemental information provided to Tampa Bay Water. Our findings are summarized below:

There were five bidders for this solicitation. Bid proposals are summarized below:

Bidder	Total Bid Price
JDS Inc., dba JDS Pipe, Inc.	$6,169,901.00
Garney Companies, Inc.	$6,194,848.00
Ric-Man Construction Florida (RMCF), Inc.	$6,994,637.00
Morgan Contracting, Inc.	$7,202,400.00
Midsouth Inc.	$7,831,920.00

The lowest responsive bidder is JDS Inc., dba JDS Pipe, Inc. (JDS). Based on our review of available licensing records and the dual-license requirement (General Contractor [GC] and Underground Utility Contractor [UGC]) stated in the Invitation to Bid Documents and Addendum No. 1 (response to Question Q1), JDS and affiliated organizations appear to hold both a GC and UGC license. The lowest bidder's response meets the United States-produced iron and steel products (US-produced) requirements. Considering marketplace conditions and incorporating US-produced costs, we evaluated that the bid results are acceptable.

We recommend Tampa Bay Water proceed with awarding this Contract to JDS, the lowest apparent bidder.

Regards,
Wade Trim, Inc.

CONTRACT

This Contract, made and entered into as of the _____day of _____, 2026, by and between Tampa Bay Water, A Regional Water Supply Authority ("Tampa Bay Water") and JDS Inc, d/b/a JDS Pipe Inc., a corporation of the State of Georgia, or other business entity authorized to do business in the State of Florida ("Contractor"), with respect to that certain Project consisting of the Work to be performed in accordance with the Contract Documents, supplementary conditions, general conditions, invitation to bid documents, bid price form, technical specifications and all issued addenda for Tampa Bay Water's Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, (Project 07153)

W I T N E S S E T H:

Tampa Bay Water and the Contractor in consideration of the mutual covenants and obligations contained herein, and for other good and valuable consideration, the sufficiency and adequacy of which are hereby acknowledged, agree as follows:

1.0 Work

1.1 The Contractor shall perform all of the Work in accordance with the Contract Documents (as that term is defined in the General Conditions which are attached to and made a part of this Contract).

1.2 Contractor shall perform the Work in accordance with generally accepted construction practice under the same or similar circumstances at the same time and in the same locality. Contractor shall have exclusive responsibility for all construction means, methods, techniques, sequences, and procedures necessary or desirable for the correct, prompt, and orderly prosecution and completion of the Work as required by this Contract and the Contract Documents.

1.3 The responsibility to provide the construction means, methods, techniques, sequences and procedures shall include, but not be limited to, the obligation of the Contractor to provide the following construction requirements, as applicable: temporary power and light; temporary offices and construction trailers; required design certifications; required approvals; weather protection; site clean-up and housekeeping; construction trade management; temporary parking; a construction safety plan; safety and first aid facilities; correction of or compensation for defective work or equipment; Subcontractors' insurance certificates; storage areas; workshops and warehouses; temporary fire protection; site security; temporary Utilities; including without limitations; potable water and water for use in performing the Work (in all cases, including a backflow preventer meeting ANSI A40.6); phone; sanitary; gas or fuel; Subcontractor and Supplier qualification; equipment and materials procurement and expediting; receipt and unloading and proper storage of delivered materials and equipment; erection rigging; temporary supports; submittal and shop drawings review and orderly filing system; construction and procurement critical path scheduling; construction coordination; and cooperation with Tampa Bay Water in implementation of Tampa Bay Water's owner's direct purchase sales tax savings program.

1.4 During the progress of the Work, Contractor shall at all times during normal working hours afford Tampa Bay Water and Engineer every reasonable opportunity for observing all Work. During any such observation, all representatives of Tampa Bay Water and Engineer shall comply with all safety and other rules and regulations applicable to presence in or at the Work site.

1.5 Contractor shall have full responsibility, to the extent applicable, for locating all underground Utilities in advance of excavation; scheduling excavation and uncovering in advance, unless it conflicts with Work already uncovered; shoring, blocking, and protecting underground

Utilities; repairing any damage done to the satisfaction of Tampa Bay Water and Engineer and the owners of those underground Utilities; promptly notifying Tampa Bay Water and Engineer of any newly discovered underground Utility; and the safety, protection and repairing of any damage done to any affected Work. Al1 costs involved and time required to perform these responsibilities shall be considered as having been included in the Contract Price.

1.6 Contractor shall use care and diligence, and shall take all appropriate precautions, to protect the Work and the Work site and the property of other persons (including any materials, equipment, or other items furnished by Tampa Bay Water) from damage due to the nature of the Work, the natural elements, carelessness of others, and from any cause, until final completion of the Work; and for such purpose, Contractor shall provide fencing, protective features (such as tarpaulins, boards, boxing, frames, canvas guards, and fireproofing), and other safeguards to the extent Contractor reasonably determines such are necessary and proper in the performance of the Work.

1.7 Contractor shall ensure that each employee, representative, Subcontractor, Supplier, and others acting for the Contractor use designated access roads and parking areas. Contractor shall employ watchmen on the Work site when necessary and shall also erect and maintain such strong and suitable barriers and such lights as shall effectively prevent the happening of any accident to health or to property or to any partially completed Work or to any materials stored on or adjacent to the Work site. Contractor shall employ any additional temporary fencing and gates to adequately protect the Work.

1.8 Stored materials shall be kept in a neat and orderly manner. Materials that are subject to deterioration by exposure to the sun, rain or other elements shall be kept adequately covered and protected. Contractor shall be responsible for protecting all stored materials and the Work site safe from theft and vandalism.

1.9 All costs involved and time required to perform these responsibilities shall be considered as having been included in the Contract Price.

1.10 Contractor shall notify owners of adjacent property (including underground Utility owners) not less than forty-eight (48) hours, or the time period required by Laws and Regulations, whichever period is longer, prior to commencing the Work, and shall coordinate and cooperate with them in the location, protection, removal, relocation, and/or replacement of their property. At least five (5) days prior to providing such notice to adjacent property owners, Contractor shall submit its proposed written notice to Tampa Bay Water for review and approval. All damage, injury or loss to property caused, directly or indirectly, in whole or part, by Contractor, any Subcontractor or Supplier or anyone for whose acts any of them may be liable, shall be remedied at Contractor's expense, which shall be considered to have been included in the Contract Price.

1.11 In case of damage or destruction to the Work, the Work site or adjacent properties resulting from any cause, and regardless of the extent thereof or the estimated cost of repair, replacement or restoration, and whether or not any insurance proceeds are sufficient or available for the purpose, Contractor shall immediately undertake and complete the repair, replacement and restoration of the damage or destruction to the character and condition existing immediately prior to the damage or destruction, all at Contractor's sole cost and expense, which shall be considered to have been included in the Contract Price, except in the event that such damage or destruction is caused by Tampa Bay Water, its employees, agents, representatives, including Engineer, or is the result of an Uncontrollable Circumstance.

1.12 Contractor shall notify Tampa Bay Water immediately of any damage or destruction to the Work, the Work site or any adjacent properties including, but not limited to, hazardous substance spills, damage to sensitive areas, permit or approval violations, fires and injuries. Additionally, Contractor shall notify the required Insurance carriers and Sureties of any damage or destruction to the Work, the Work site, or adjacent properties, or any accidents on the Work site, as promptly as possible after Contractor learns of any such damage, destruction

or accidents. As soon as practicable after learning of any such occurrence, Contractor shall submit a full and complete written report to Tampa Bay Water.

1.13 In case of an emergency which threatens loss or injury to persons or property, Contractor shall take appropriate remedial action, without previous instructions from Tampa Bay Water or Engineer, as the situation may warrant, and shall immediately provide Notice to Tampa Bay Water and Engineer of its action. Any claim for compensation by Contractor, together with substantiating documentation in regard to expense caused by emergency acts, shall be submitted to Tampa Bay Water and the amount of compensation if any, shall be determined by mutual contract, subject to cost substantiation.

2.0 Contract Time

2.1 Tampa Bay Water and the Contractor recognize that time is of the essence with respect to Contractor's performance of its obligation under the Contract Documents, and Tampa Bay Water shall suffer financial loss if Substantial Completion and Final Completion of the Work is not achieved within the Contract Time specified in Paragraph 2.2 below, or if the Well Collection Main Out-of-Service Period specified in Paragraph 1.5.A.9., of Section 01100, Special Project Procedures (the "Well Collection Main Out-of-Service Period") is exceeded. Accordingly, if the Contractor fails to achieve Substantial Completion or Final Completion of the Work within the Contract Time, or exceeds the Well Collection Main Out-Of-Service Period, it shall pay Tampa Bay Water Liquidated Damages in accordance with the terms stated below in Section 3, Liquidated Damages.

2.2 The Contractor shall commence the Work within ten (10) days after the date specified for the commencement of the Work in the Notice to Proceed and shall complete all Work hereunder as follows:

a. The Well Collection Main Out-Of-Service Period is fourteen (14) calendar days, as specified in Paragraph 1.5.A.9., of Section 01100, Special Project Procedures.
b. All facilities shall be manually operational to provide Tampa Bay Water at its option the full time use of the Project as intended by the Contract Documents and the Contractor shall perform the Work to achieve Substantial Completion within three-hundred seventy-eight (378) calendar days of issuance of Notice to Proceed as the commencement date of the Contract Time.
c. The Contractor shall perform the Work to achieve Final Completion within four hundred twenty-seven (427) calendar days of issuance of Notice to Proceed as the date of commencement of the Contract Time.

2.3 The completion deadlines in this Section 2 are subject to adjustment in accordance with the General Conditions.

3.0 Liquidated Damages

3.1 If the Contractor fails to achieve Substantial Completion or Final Completion of the Work within the Contract Time, or exceeds the Well Collection Main Out-of-Service Period, as said time periods may be adjusted pursuant to the terms of the Contract Documents, Contractor shall pay Tampa Bay Water Liquidated Damages in accordance with the following:

a. The Contractor shall pay Tampa Bay Water as Liquidated Damages, and not as a penalty, the amount of Two Thousand Dollars and 00/cents ($2,000.00) for each day that exceeds the Well Collection Main Out-of-Service Period. These Liquidated Damages are Tampa Bay Water's sole and exclusive Well Collection Main Out-of-Service Period delay related damages and represent a reasonable estimate of Tampa Bay Water's damages in the event the Well Collection Main Out-of-Service Period is exceeded. The Contractor agrees that these Well Collection Main Out-of-Service Period Liquidated Damages do not constitute a penalty or forfeiture. Also, Contractor agrees these Well Collection Main Out-of-Service Period Liquidated Damages are independent

of the Substantial Completion and Final Completion Liquidated Damages noted in Paragraphs 3.1.b. and c. below.

b. The Contractor shall pay Tampa Bay Water as Liquidated Damages, and not as a penalty, the amount One Thousand Dollars and 00/cents ($1,000.00) for each day that expires after the Contract Time specified above in Paragraph 2.2.b for Substantial Completion. These Liquidated Damages are Tampa Bay Water's sole and exclusive Substantial Completion delay related damages and represent a reasonable estimate of Tampa Bay Water's damages in the event Substantial Completion of the Work is delayed. The Contractor agrees that these Substantial Completion Liquidated Damages do not constitute a penalty or forfeiture.

c. The Contractor shall pay Tampa Bay Water as Liquidated Damages and not as a penalty, the amount of Five Hundred Dollars and 00 cents ($500.00) for each day that expires after the time specified in Paragraph 2.2.c for Final Completion. These Liquidated Damages are Tampa Bay Water's sole and exclusive Final Completion delay related damages and represent a reasonable estimate of Tampa Bay Water's damages in the event Final Completion of the Work is delayed. The Contractor agrees that these Final Completion Liquidated Damages do not constitute a penalty or forfeiture. Also, Contractor agrees these Final Completion Liquidated Damages are in addition to, and not duplicative of, the Substantial Completion Liquidated Damages noted in Paragraph 3.1.b above.

4.0 Contract Price

4.1 Tampa Bay Water hereby agrees to pay to the Contractor in lawful money of the United States for the faithful performance of all of the Contractor's obligations under the Contract Documents, and the Contractor agrees to accept in full payment the Contract Price of: Six Million One Hundred Sixty-Nine Thousand Nine Hundred One Dollars and No Cents ($6,169,901.00), (total price is inclusive of bid price of $5,923,801.00, Owner's Allowance of $246,000.00 and Indemnification of $100.00) and subject to the conditions governing payments to the Contractor in the Contract Documents. If the Contract Price includes any Unit Price amounts and the actual quantity of Unit Price items installed is different than the estimated quantity, then the Contract Price shall be adjusted in accordance with the Contract Documents. The Contract Price includes, if applicable, only those Alternates accepted by Tampa Bay Water, as identified in Paragraph 4.3 below. The Contract Price includes, if applicable, only those Allowances established by Tampa Bay Water, as identified in Paragraph 4.4 below.

4.2 The Unit Prices and associated estimated quantities included within the Contract Price are attached hereto and made a part hereof as Schedule A.

4.3 The following Bid Options have been accepted by Tampa Bay Water and are included within the Contract Price:

ALTERNATE	Price
None	$0.00

4.4 The following Allowances have been established by Tampa Bay Water and are included within the Contract Price:

ALLOWANCE	Price
Owner's Allowance	$246,000.00

Payment of Allowances shall only be authorized by issuance of Change Authorization signed by Tampa Bay Water in accordance with Article 7.2.1 of the General Conditions.

5.0 Payment

Payment procedures are outlined in the General Conditions, Article 7 Payment. All monies not paid when due shall bear interest at a rate not to exceed the interest rate allowed by law to be paid by governmental entities in Florida, provided that this does not exceed six percent per year simple interest.

Tampa Bay Water's payment to Contractor of any progress or final payment shall not release the Contractor of any liability and shall not be deemed evidence of performance or be construed as an acceptance of defective or improper Work, or Work that does not comply with the requirements of the Contract Documents.

6.0 Miscellaneous

6.1 All Contract Documents are hereby incorporated into and made a part of this Contract by this reference. The Contract Documents may only be amended, modified, or supplemented as provided in the Contract Documents. The Contract Documents represent the final and entire integrated Contract between the parties with respect to the Work. The Contract Documents supersede all prior oral or written Contracts, if any, between the parties, and any statement, representation, promise or inducement not set forth in the Contract Documents is null and void and not binding on Tampa Bay Water or the Contractor. Except for the warranty and third party beneficiary rights of Tampa Bay Water set forth herein, the Contract Documents shall not in any way create a relationship of any kind between the Engineer and the Contractor or between Tampa Bay Water and a Subcontractor or Supplier, or between Tampa Bay Water and any other person. If any provision(s) of the Contract Document is/are invalid, illegal, or unenforceable such provision(s) shall be considered divisible, and all other provisions of the Contract Documents shall nevertheless remain in full force and effect.

6.2 The Contractor shall not sell, assign, transfer or otherwise convey any of its rights and shall not delegate any of its duties under the Contract Documents without the prior and expressed written consent of Tampa Bay Water and the Surety. Any attempted sale, assignment, transfer, conveyance or delegation of the Contractor's rights under this Contract or the other Contract Documents in violation of the terms of this paragraph shall be void and shall relieve Tampa Bay Water of any further liability under the Contract Documents but shall not relieve the Contractor or the Contractor's Surety(ies) of any liability. If Tampa Bay Water consents in writing to an assignment, unless specifically stated to the contrary in the consent, the assignment shall not release or discharge the Contractor from any duty, responsibility or obligation set forth in the Contract Documents, and shall not release or discharge the Surety(ies) under the bonds required by the Contract Documents.

6.3 This Contract shall be binding on Tampa Bay Water, the Contractor, and all of their respective successors, heirs, legal representatives and, if Tampa Bay Water has consented to an assignment or delegation as provided in the previous paragraph, assigns and delegates.

6.4 Any waiver by Tampa Bay Water of any provision of the Contract Documents must be specific and in writing and shall apply only to the particular matter concerned and not to other similar or dissimilar matters. Any waiver of any breach of the Contract Documents shall not be held to be a waiver of any other or subsequent breach. Neither the failure of Tampa Bay Water to exercise any power given to Tampa Bay Water under the Contract Documents or to insist upon compliance by the Contractor with Contractor's obligations under the Contract Documents, nor any custom or practice of Tampa Bay Water and Contractor at variance with the terms of the Contract Documents, shall constitute a waiver of Tampa Bay Water's right to demand full and complete compliance by the Contractor with the terms and provisions of the Contract Documents.

6.5 Nothing contained in the Contract Documents shall in any manner authorize, empower or constitute the Contractor, its Subcontractors or Suppliers as agent(s) of Tampa Bay Water; authorize or empower the Contractor, its Subcontractors or Suppliers to assume or create any obligation or responsibility whatsoever, express or implied, on behalf of or in the name of

Tampa Bay Water; or authorize or empower the Contractor, its Subcontractors or Suppliers to bind Tampa Bay Water in any manner or make any representation, warranty, covenant, contract or commitment on behalf of Tampa Bay Water. The Contractor shall perform all Work under the Contract Documents as an independent contractor. This Contract does not create, and shall not be construed as creating, any rights enforceable by any person not a party to the Contract.

6.6 This Contract and the Contract Documents shall be governed by and construed in accordance with the Laws and Regulations of the State of Florida without giving effect to any rules governing conflict of laws.

6.7 The parties agree that for any litigation arising under the Contract Documents, venue shall be only in the state courts in and for Pinellas County, Florida.

6.8 All documents prepared or produced by Contractor or any of its Subcontractors pursuant to this Contract are the property of and belong to Tampa Bay Water, provided that Contractor is allowed to reuse such documents with the approval of Tampa Bay Water. If Contractor claims that any such document is proprietary or protected by trade secret or otherwise, Contractor has the burden to establish the basis of any such protection but until judicially declared otherwise, Tampa Bay Water shall have all rights of ownership and use of such documents.

6.9 In no event shall Tampa Bay Water be liable to Contractor, nor shall Contractor be liable to Tampa Bay Water, for any incidental, consequential, or punitive damages based upon claims arising out of or in connection with the performance or non-performance of a party's obligations under this Contract, or the material inaccuracy of any representation made by a party in this Contract, whether such claims are based upon contract, tort, negligence, warranty or other legal theory. Contractor acknowledges and agrees, however, that claims, which are brought by third parties against Tampa Bay Water and for which, but for the application of this paragraph, Contractor would otherwise have an indemnification obligation under this Contract, shall not be considered consequential damages under this paragraph.

6.10 All express representations, indemnifications, or limitations of liability made in or given in this Contract will survive its completion or termination for any reason.

6.11 To the extent permitted by applicable law, contractor and Tampa Bay Water hereby acknowledge and agree that any and all claims arising out of, connected with, or relating to this Contract or the relationship created hereby are matters which, if adjudicated, should be adjudicated by a court without a jury. Therefore, the parties hereby waive a trial by a jury. Neither Tampa Bay Water nor contractor or any successor thereof shall seek a trial by jury in any action or proceeding (whether at law or in equity, whether direct or collateral, whether in contract or in tort) arising out of or related to this Contract or the relationship created hereby. Neither Tampa Bay Water nor Contractor shall seek to consolidate any action or proceeding in which trial by jury has been waived with any other action or proceeding in which a jury trial cannot be or has not been waived. The provisions of this paragraph cannot be and have not been waived. The provisions of this paragraph have been fully discussed by the parties and their respective attorneys and the provisions hereof shall be subject to no exceptions. Tampa Bay Water and contractor acknowledge and agree that no one, including, without limitation, Tampa Bay Water's agents or contractors, has represented that the provisions of this paragraph or of any other paragraph of this Contract will not be fully enforced.

6.12 Contractor warrants that it has not employed or retained any company or person, other than a bona fide employee working solely for the Contractor to solicit or secure this Contract and that Contractor has not paid or agreed to pay any person, company, corporation, individual, or firm, other than a bona fide employee working solely for Contractor any fee, commission, percentage, gift or other consideration contingent upon or resulting from the award or making of this Contract.

7.0 Public Records and Audit Rights

7.1 Contractor shall keep all books, records, files, drawings, plans and other documentation, including all electronically stored items, which concern or relate to the services required hereunder (collectively referred to as "Records"), for a minimum of three (3) years from the date of expiration or termination of this Contract, or as otherwise required by any applicable law, whichever date is later. Tampa Bay Water, or any duly authorized agents or representatives of Tampa Bay Water, shall have the right to order, inspect and copy all such Records as often as they deem necessary during any such period of time. This right to audit, inspect and copy the Records shall include all of the Records of the Subconsultants.

7.2 If the Contractor has questions regarding the application of Chapter 119, Florida statutes, to the Contractor's duty to provide public records relating to this contract, contact Tampa Bay Water's custodian of public records via phone (727) 796-2355 x 2401; email records@tampabaywater.org; or mail at 2575 Enterprise Road, Clearwater, Florida 33763-1102.

7.3 Contractor must keep and maintain all public records required by the Agency in order to perform services under this Contract.

7.4 Upon request from the Agency's custodian of public records, Contractor shall provide the Agency with a copy of the requested public records or allow the records to be inspected or copied within a reasonable time at a cost that does not exceed the cost provided in Chapter 119, Florida Statutes, or as otherwise provided by law.

7.5 Contractor shall ensure that public records that are exempt or confidential and exempt from public records disclosure requirements are not disclosed except as authorized by law for the duration of the contract term and following completion of the contract if the Contractor does not transfer the records to the Agency.

7.6 Upon completion of the contract, Contractor shall transfer, at no cost, to the Agency all public records in the possession of the Contractor or keep and maintain public records required by the Agency to perform the service under this contract. If the Contractor transfers all public records to the Agency upon completion of the contract, the Contractor shall destroy any duplicate public records that are exempt or confidential and exempt from public records disclosure requirements. If the Contractor keeps and maintains public records upon completion of the Contract, the Contractor shall meet all applicable requirements for retaining public records. All records stored electronically must be provided to the Agency, upon request from the Agency's custodian of public records, in a format that is compatible with the information technology systems of the Agency.

8.0 Definitions

Defined terms used in this Contract have the intent and meanings assigned to them in the General Conditions, Article 1, Definitions.

9.0 Engineer

Tampa Bay Water has retained the firm of Wade Trim, Inc., to act as the Engineer, assume all of the duties and responsibilities and have the rights and authority assigned to the Engineer in the Contract Documents with respect to completion of the Work in accordance with the Contract Documents.

10.0 Public Entity Crime Statement

10.1 Pursuant to subsections 287.133(2) and (3), Florida Statutes, a person or affiliate who has been placed on the convicted vendor list following a conviction for a public entity crime may not submit a bid, proposal or reply on a contract to provide any goods or services to a public entity; may not submit a bid, proposal or reply on a contract with a public entity for the construction or

repair of a public building or public work; may not submit bids, proposals or replies on leases of real property to a public entity; may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a contract with any public entity; and may not transact business with any public entity in excess of the threshold amount provided in Section 287.017, Florida Statutes, for CATEGORY TWO, for a period of thirty-six (36) months following the date of being placed on the convicted vendor list.

10.2 Contractor hereby certifies and warrants that it has not been placed on any convicted vendor list for the past thirty-six (36) months and is in full compliance with the requirements of subsections 287.133(2) and (3), Florida Statutes.

11.0 Discrimination

Pursuant to Subsection 287.134(2)(a), Florida Statutes, an entity or affiliate who has been placed on the discriminatory vendor list may not submit a bid, proposal, or reply on a contract to provide any goods or services to a public entity; may not submit a bid, proposal, or reply on a contract with a public entity for the construction or repair of a public building or public work; may not submit bids, proposals, or replies on leases of real property to a public entity; may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a contract with any public entity; and may not transact business with any public entity. Contractor hereby certifies and warrants that it has not been placed on any discriminatory vendor list and is in full compliance with the requirements of subsections 287.134(2)(a), Florida Statutes.

12.0 Drawings and Specifications

The Drawings consist of the following:

Sheet No.	Sheet Description
G-1	Cover Sheet
G-2	Drawing Index, Notes & Abbreviations
G-3	Legend & Survey Control
G-4	Existing Conditions
C-1	Tree Removal and Limits of Disturbance
C-2	Plan Sheet
C-3	Profile Sheet
CP-1	Cathodic Protection Details
CP-2	Cathodic Protection Details
CP-3	Cathodic Protection Details
CP-4	Cathodic Protection Details
D-1	Tampa Bay Water Standard Details
D-2	Condensed Profile
D-3	Condensed Profile

The Specifications consist of the following:

Section	**Description**
01010	Summary of Work
01025	Measurement and Payment
01027	Payment Applications
01040	Project Coordination
01050	Field Engineering

Section	Description
01065	Permits and Easements
01100	Special Project Procedures
01300	Contractor Submittals
01310	Construction Progress Schedules
01313	Construction and Schedule Constraints
01410	Testing and Quality Control
01720	Contract Record and Close Out Documentation
02075	Microtunneling
02100	Demolitions
02220	Excavating, Backfilling, and Compacting
02270	Erosion and Sedimentation Control
02410	Shaft Excavation and Support
02431	Contact and Void Repair Grouting
02665	Carrier Pipe Installation and Backfill
02922	Sodding
03000	Concrete
03600	Grout
09940	Protective Coatings
134713	Cathodic Protection System
15065	Steel Pipe
15101	AWWA Butterfly Valves
15104	Resilient-Seated Gate Valves

13.0 Scrutinized Companies and Foreign Countries of Concern

13.1 Contractor certifies that it is in compliance with Section 287.135, Florida Statutes, which provides that a company that has been placed on the Scrutinized Companies with Activities in Sudan List; the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; the Scrutinized Companies that Boycott Israel List or is engaged in a Boycott of Israel is ineligible and may not submit a bid, proposal, or enter into or renew a contract with an Agency for goods or services of $1 million or more. At the time of submission of a bid or proposal for a contract or contract renewal for goods or services of $1 million or more, the company must certify that it is not on either such List and further that it does not have business operations in Cuba or Syria as required by Section 287.135(5), Florida Statutes.

13.2 Pursuant to Section 287.135, Florida Statutes, Tampa Bay Water reserves the right to terminate any contract for goods or services of $1 million or more if the awarded Contractor:

a. Has been found to have submitted a false Scrutinized Vendor List certification as provided under Section 287.135 subsection (5); or
b. Has been placed on the Scrutinized Companies Scrutinized Companies with Activities in Sudan List or the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; or
c. Has been engaged in business operations in Cuba or Syria.

13.3 Pursuant to Section 287.135, Florida Statutes, Tampa Bay Water reserves the right to terminate any contract for goods or services of any amount if the awarded Contractor has been placed on the Scrutinized Companies that Boycott Israel List or is engaged in a boycott of Israel.

13.4 Foreign Countries of Concern. Pursuant to Section 287.138, Florida Statutes, Tampa Bay Water may not enter into a contract with an entity that gives access to an individual's personal identifying

information if the entity is owned, controlled or organized under the laws of a Foreign County of Concern which includes the People's Republic of China, the Russian Federation, the Islamic Republic of Iran, the Democratic People's Republic of Korea, the Republic of Cuba, the Venezuelan regime of Nicolas Maduro, the Syrian Arab Republic, or any other entity or Agency under the significant control of such Foreign County of Concern. Tampa Bay Water reserves the right to terminate any contract for goods or services of any amount if the awarded Contractor is in violation of Section 287.138, Florida Statutes

14.0 Employee Verification

In accordance with Section 448.095 Florida Statutes, the Contractor agrees to register with and utilize the U.S. Department of Homeland Security's E-Verify system to verify the employment eligibility of all new employees hired during the term of the contract for the services specified in the contract. The Contractor must also include a requirement in subcontracts that the subcontractor must register with and utilize the E-Verify system to verify the employment eligibility of all new employees hired by the subcontractor during the contract term. If the Contractor enters into a contract with a subcontractor, the subcontractor must provide the Contractor with an affidavit stating that the subcontractor does not employ, contract with, or subcontract with an unauthorized alien. The Contractor shall maintain a copy of such affidavit for the duration of the Contract. If Tampa Bay Water has a good faith belief that the Contractor has knowingly violated Section 448.09(1), Florida Statutes, Tampa Bay Water shall terminate the Contract with the Contractor, and the Contractor may not be awarded a Contract with Tampa Bay Water for at least 1 year after the date on which the Contract was terminated. The Contractor is liable for any additional costs incurred by Tampa Bay Water as a result of the termination of the contract. If Tampa Bay Water has a good faith belief that a subcontractor knowingly violated the law, but the Contractor has otherwise complied with the law, Tampa Bay Water shall promptly notify the Contractor and order the Contractor to immediately terminate the award/contract with the subcontractor.

15.0 Anti-Human Trafficking

In accordance with Section s.787.06, Florida Statutes, the Contractor must provide Tampa Bay Water with an affidavit regarding Human Trafficking. Affidavit included herein must be completed by Contractor to attest, under penalty of perjury, that Contractor does not use coercion for labor or services as defined in s. 787.06, Florida Statutes.

IN WITNESS WHEREOF, Tampa Bay Water and Contractor have signed two (2) copies of this Contract, and all parts of the Contract Documents have been identified by Owner and Contractor. This Contract will be effective on the _____day of _____, 2026 (which is the Effective Date of the Contract).

This Contract may be signed in several counterparts, each of which is an original and all of which constitute one and the same instrument.

End of Contract

PERFORMANCE BOND

KNOW ALL MEN BY THESE PRESENTS: That _____ as Principal, located at _____ (Business Address) and _____as Surety, located at _____ (Business Address) are held and firmly bound to the Tampa Bay Water, A Regional Water Supply Authority as Obligee in the sum of **Six Million One Hundred Sixty-Nine Thousand Nine Hundred One Dollars and No Cents** (**$6,169,901.00**), (**total price is inclusive of bid price of $5,923,801.00, Owner's Allowance of $246,000.00 and Indemnification of $100.00**), **($6,169,901.00)**, for the payment whereof we bind ourselves, our heirs, executors, personal representatives, successors and assigns, jointly and severally.

Whereas, Principal has entered into a contract dated as of the _____ day of _____, 2026, with Obligee for Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, Project No.: 07153, Contract #2026017 in accordance with DRAWINGs and Specifications, which contract is incorporated by reference and made a part hereof, and is referred to as the Contract.

THE CONDITION OF THIS BOND is that if Principal:

1. Performs the Contract at the times and in the manner prescribed in the Contract; and

2. Pays Obligee any and all losses, damages, costs and attorneys' fees, including appellate proceedings, that Obligee sustains because of any default by Principal under the Contract including, but not limited to, all delay damages, whether liquidated or actual, suffered by Obligee; and

3. Performs the guarantee of all work and materials furnished under the Contract for the time specified in the Contract, then this bond is void; otherwise, it remains in full force.

BE IT FURTHER KNOWN:

1. Any changes, regardless of scope or amount, in or under the Contract and compliance or noncompliance with any formalities connected with the Contract or the changes do not affect Surety's obligation under this Bond.

2. The Surety, for value received, hereby stipulates and agrees that no changes, extensions of time, alterations or additions to the terms of the Contract or other work to be performed hereunder, or the Specifications referred to therein shall in anyway affect its obligations under this bond, and it does hereby waive notice of any such changes, extensions of time, alterations or additions to the terms of the Contract or to work or to the Specifications.

3. This Performance Bond is issued in compliance with the terms and conditions set forth in Florida Statute 255.05; however, it is intended to exceed the minimal coverage requirements established by that statute. The Notice and time limitations of Florida Statute 255.05 (2) are also, to the extent applicable, if any, incorporated herein by reference and made a part hereof.

4. In no event will the Surety be liable in the aggregate to Obligee for more than the penal sum of this Performance Bond regardless of the number of suits that may be filed by Obligee.

5. Whenever the Contractor shall be, and is declared by Tampa Bay Water to be in default under the Contract, Tampa Bay Water having performed Tampa Bay Water's obligations thereunder, the SURETY shall promptly remedy the default, as set forth below and at the sole option of Tampa Bay Water, by promptly:

(a) Completing the Contract in accordance with its terms and conditions and paying Tampa Bay Water all of its losses, damages, costs and attorneys' and legal assistants' fees, whether at trial, on appeal or in bankruptcy, that Tampa Bay Water sustains because of any default by Principal under the Contract including, but not limited to, all delay damages, whether liquidated or actual. In the event Surety takes over and completes the Contract, then in such event it shall be entitled to receive the balance of the Contract Price, as defined in Sub-Paragraph 2 below; or

(b) Indemnifying Tampa Bay Water for all of its damages, expenses, costs, delay damages, attorneys' and legal assistant's fees, including appellate and bankruptcy proceedings, that Tampa Bay Water has incurred, suffered or sustained as a result of Tampa Bay Water's completion of the Contract or the Principal's default under the Contract, less the remaining unpaid balance of the Contract Price, if any. The term "balance of the Contract Price," as used in this Performance Bond, shall mean the total amount payable by Tampa Bay Water to the Contractor under the Contract and any amendments thereto, less the amount previously paid by Tampa Bay Water to the Contractor.

IN WITNESS WHEREOF, the above parties have executed this instrument this _____ day of _____, 20__, the name of each party being affixed and these presents duly signed by its undersigned representative, pursuant to authority of its governing body.

PUBLIC PAYMENT BOND

KNOW ALL MEN BY THESE PRESENTS: That _____ as Principal, located at _____ (Business Address) and _____ as Surety, located at _____ (Business Address) are held and firmly bound to the Tampa Bay Water, A Regional Water Supply Authority as Obligee in the sum of **Six Million One Hundred Sixty-Nine Thousand Nine Hundred One Dollars and No Cents** (**$6,169,901.00**), (**total price is inclusive of bid price of $5,923,801.00, Owner's Allowance of $246,000.00 and Indemnification of $100.00**), **($6,169,901.00)**, for the payment whereof we bind ourselves, our heirs, executors, personal representatives, successors and assigns, jointly and severally.

Whereas, Principal has entered into a contract dated as of the _____ day of _____, 2026, with Obligee for Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, Project No.: 07153, Contract #2026017 in accordance with Drawings and Specifications, which contract is incorporated by reference and made a part hereof, and is referred to as the Contract.

THE CONDITION OF THIS BOND is that if Principal:

1. Promptly makes payment to all claimants as defined in Section 255.05(1), Florida Statutes, supplying Principal with labor, materials or supplies, used directly or indirectly by Principal in the prosecution of the work provided for in the Contract; and
2. Pays Obligee all losses, damages, expenses, costs, and attorneys' fees, including appellate proceedings that Obligee sustains because of default by the Principal under Paragraph 1 of this bond; then this bond is void; otherwise, it remains in full force.

BE IT FURTHER KNOWN:

1. Any changes, regardless of scope or amount, in or under the Contract and compliance or noncompliance with any formalities connected with the Contract or the changes do not affect Surety's obligation under this Bond.
2. The Surety, for value received, hereby stipulates and agrees that no changes, extensions of time, alterations or additions to the terms of the Contract or other work to be performed hereunder, or the Specifications referred to therein shall in anyway affect its obligations under this bond, and it does hereby waive notice of any such changes, extensions of time, alterations or additions to the terms of the Contract or to work or to the Specifications.
3. This Payment Bond is a statutory payment bond and is not intended to be a common law Payment Bond. This Payment Bond is issued in compliance with the terms and conditions set forth in Florida Statute 255.05. The Notice and time limitations of Florida Statute 255.05 (2) are also expressly incorporated herein by reference and made a part hereof. Any action instituted by a claimant under this bond must be in accordance with the Notice and Time limitations contained in Florida Statute 255.05 (2).

In no event shall the Surety be liable in the aggregate to claimants for more than the penal sum of this Payment Bond, regardless of the number of suits that may be filed by such claimants.

IN WITNESS WHEREOF, the above parties have executed this instrument this _____ day of _____, 20__, the name of each party being affixed and these presents duly signed by its undersigned representative, pursuant to authority of its governing body.

THIS IS TO FURTHER CERTIFY THAT:

1. The company issuing the General Liability Coverage hereby agrees to waive any right of subrogation it may acquire against Tampa Bay Water, its engineers, its consultants, and all other parties named as insured by reason of any payment made on account of personal injury, bodily injury, including death resulting therefrom, sustained by any employee of the insured or property damage arising out of the performance or furnishing of work under the above referenced Contract.

2. Each of the above-described policies contains a provision or endorsement that the coverage afforded will not be canceled, adversely changed or non-renewed until at least thirty (30) days prior written notice has been given to Tampa Bay Water by certified mail.

3. Each of the above listed companies hereby agrees to deliver to Tampa Bay Water new Certificate of Insurance at least fifteen (15) days prior to coverage renewals or binder within such period and a certificate within fifteen (15) days thereafter.

4. If requested, each of the above-listed companies hereby agrees to deliver two (2) copies of the policies purchased by the Agent to Tampa Bay Water.

5. Each of the above listed companies is authorized to do business and has an agent for service of process in Florida and has an "A" policy holders rating and a financial rating of at least Class VIII in accordance with the most current Best's rating. For self-insurance funds, financial statements are to be provided, if requested by Tampa Bay Water. (At Tampa Bay Water's option, a Best's rating or financial information regarding any self-insurance funds may be waived.)

IMPORTANT

If the certificate holder is an ADDITIONAL INSURED, the policy(ies) must be endorsed. A statement on this certificate does not confer rights to the certificate holder in lieu of such endorsement(s).

If SUBROGATION IS WAIVED, subject to the terms and conditions of the policy, certain policies may require an endorsement. A statement on this certificate does not confer rights to the certificate holder in lieu of such endorsement(s).

DISCLAIMER

The Certificate of Insurance on the reverse side of this form does not constitute a contract between the issuing insurer(s), authorized representative or producer, and the certificate holder, nor does it affirmatively or negatively amend, extend or alter the coverage afforded by the policies listed thereon.

ACORD 25 (2001/08)

SUPPLEMENTARY CONDITIONS

Supplementary Conditions to the General Conditions, Article 4, The Contractor and Its Employees.

The limits of liability for the following insurance required by the General Conditions, Article 4, The Contractor and Its Employees, as amended in the Supplementary Conditions, shall provide coverage for not less than the following amounts or greater where required by Laws and Regulations:

1. Commercial General Liability. The coverage(s) shall be no less than:
   (a) Minimum limits of $1,000,000 per occurrence combined single limit for all liability must be provided, with umbrella insurance making up the difference between the policy limits of underlying policies and the total amount of coverage required. The referenced limit shall be provided as a separate aggregate for the Work (Project Aggregate).

   (b) Minimum limits of $2,000,000 Aggregate single limit for all liability must be provided, with umbrella insurance making up the difference between the policy limits of underlying policies and the total amount of coverage required. The referenced limit shall be provided as a separate aggregate for the Work (Project Aggregate).

2. Business Automobile Liability. The coverage shall be no less than:
   (a) Minimum limits of $1,000,000 combined single limit for all liability must be provided.

3. Umbrella/Excess Liability. The coverage shall be no less than:
   (a) Minimum limits of $2,000,000 per occurrence must be provided.

   (b) Aggregate limits of $5,000,000 must be provided.

4. Worker's Compensation and Employer's Liability. The coverage shall include:
   (a) Coverage A:
   State: Statutory limits under the Laws of the State of Florida.
   Federal: Statutory limits under the Laws of the United State of America (e.g., Longshoremen's, etc.)

   (b) Coverage B:
   Employer's Liability, bodily injury, occupational sickness or disease, or death of Contractor's employees shall be no less than:
   1) $500,000 Each Accident
   2) $1,000,000 Each Disease
   3) $500,000 Each Employee

Tampa Bay Water requires Contractor employers to purchase workers compensation insurance for all their employees regardless of the number of employees they have and regardless of any other exemptions. Florida law permits employers who may be exempt from purchase of coverage to waive their exemptions and purchase the coverage. Tampa Bay Water requires the Contractor to purchase said coverage.

5. Builder's Risk "All Risk" or Installation Floater Insurance. Coverage shall be no less than the full insurable replacement value of the Work, including completed Work, Work in progress and all insurable building materials, structures, fences, lights, equipment, pumps, electrical components, and similar insurable property. Exceptions to insurable property include underground property (after installation), site work and road work.

6. Additional Requirements:
   (a). Tampa Bay Water must be listed as an Additional Insured on General Liability, Auto Liability and Excess policies;

   (b). Excess/Umbrella policies shall be written as "follow form";

   (c.) The insurance provided for Tampa Bay Water as Additional Insured shall apply as primary and non-contributory insurance;

   (d). The Additional Insured Endorsement utilized for General Liability must be form CG 20 10 (07/04) and CG 20 37 (07/04) or broader wording in Tampa Bay Water's favor as approved by Tampa Bay Water;

   (e). Contractor shall maintain General Liability coverage for itself and all Additional Insureds for the duration of the Work and maintain completed operations coverage for itself and Additional Insureds for five (5) years after completion of the Work;

   (f). All Contractor insurance policies will include a Waiver of Subrogation in favor of Tampa Bay Water;

   (g). Each of Contractor's insurance policies shall be endorsed to provide Tampa Bay Water with at least thirty (30) days written notice prior to any material change or cancellation of the policy, to the fullest extent commercially available;

   (h). Deductible amounts on Contractor policies shall not exceed $25,000 and shall require approval from Tampa Bay Water; and

   (i). In the event Contractor breaches any provision of the Insurance Requirements of the Contract, Tampa Bay Water may deduct the cost of any insurance from any funds Payable to Contractor under the Contract Documents.

GENERAL CONDITIONS

1. Definitions

Wherever in the Contract Documents the following terms are used, the intent and meaning shall be as follows:

1.1. Addenda: Instruments issued by Engineer for Tampa Bay Water prior to the advertised time for receipt of Bids that modify the Contract Documents by additions, deletions, clarifications, corrections, or other revisions.

1.2. Contract: The written Contract between Tampa Bay Water and the Contractor covering the Work to be performed.

1.3. Allowances: A specified sum included in the Contract Price to be utilized only at the discretion of Tampa Bay Water.

1.4. Alternates: A specified portion of the Work listed on the Bid which has been added to or deducted from the Base Bid, at Tampa Bay Water's discretion, as identified in the Contract.

1.5. As Approved: The words "As Approved," unless otherwise qualified, shall be understood to be for conformance with the Contract Documents.

1.6. As-Built Contract Documents: A set of the Contract Documents marked up by the Contractor to show the Work as constructed with all modifications from the original Contract Document.

1.7. Base Bid: The sum total of the combined Unit Prices, Lump Sum Prices and Allowances in the Bid, excluding all Alternates.

1.8. Bidder: The person(s), partnership, firm or corporation submitting a Bid for the Work.

1.9. Bid Documents: The "Bid Documents" consist of the Instruction of Bidders, Information to Bidders, Request for Bids, Bid and the Contract Documents.

1.10. Bid Security: The Bid Bond, certified check or cashier's check provided pursuant to this ITB to protect Tampa Bay Water from the unauthorized withdrawal of Bid or refusal to execute the Contract Documents. Electronic Bids received through Euna must be accompanied by a copy of a certified check, or cashier's check drawn on a bank in good standing, or the Florida Bid Bond included herein. The Bid Bond must be issued by a surety authorized to issue such bonds in the State of Florida, in the amount of Five percent (5%) of the proposed total Contract Price of the Bid submitted. The Florida Bid Bond included herein shall be given as a guarantee that the Bidder will not withdraw its Bid for a period of ninety (90) days after the opening of Bids.

When submitting the electronic bid, a copy of the Bid Bond should be submitted in the electronic package. The original Bid Bond must be delivered to Tampa Bay Water physically via mail, delivery service or in-person. If submitting electronically, banking information may be redacted on copies of checks. Original checks must be delivered physically and unaltered.

1.11. Business Day: The term Business Day means each day occurring Monday through Friday.

1.12. Change Authorization: A written instrument which, when recommended by the Engineer and signed by Tampa Bay Water, authorizes and directs the Contractor to perform changes in the Work as described in the Change Authorization, and/or gives the basis, if any, for a subsequent adjustment in Contract Price or Contract Time. Upon receipt of a Change Authorization, the Contractor is authorized and required to perform the subject changes in the Work.

1.13. Change Order: A written instrument which, when recommended by the Engineer and signed by Tampa Bay Water and the Contractor, amends the Contract Documents to provide for changes in the Work, and/or Contract Price, and/or Contract Time.

1.14. Construction Directive: A written instrument issued by the Engineer pursuant to Paragraph 7.2.9.

1.15. Contract Documents: The "Contract Documents" consist of the Contract, Addenda, Supplementary Conditions, General Conditions, Specifications, Drawings, Change Order, Change Authorizations, and all other documents expressly incorporated by specific reference thereto. The Contract Documents are sometimes collectively referred to as the "Contract".

1.16. Contractor: The person(s), partnership, firm, or corporation that entered into and is (are) identified in the Contract.

1.17. Contractor's Representative: The Contractor's superintendent, project manager or other person at the location of Work authorized to direct the Work and receive communications from Tampa Bay Water or Engineer.

1.18. Contract Price: The total compensation payable by Tampa Bay Water to the Contractor for the performance of the Work by the Contractor in accordance with the requirements of the Contract Documents, as stated in the Contract and adjusted by all Change Order and Change Authorizations.

1.19. Contract Time: Unless otherwise specified, the Contract Time for all or a designated part of the Work is the period of time allowed, subject to Change Order and Change Authorizations, for completion of a specified part of the Work. The first Day of Contract Time shall be that date as specified on the Notice to Proceed as the date the Contract Time shall commence.

1.20. Correction Period: The period of time established in Paragraph 4.20.2 hereafter for the correction of Defective Work.

1.21. Day: Unless otherwise specifically stated, the term Day shall be understood to mean calendar day.

1.22. Defective: A term used to refer to Work that is faulty, unsatisfactory, deficient, damaged or does not conform to the requirements of the Contract Documents and all applicable Laws and Regulations.

1.23. Drawings: The term Drawings refers to the various drawings, profiles, cross sections, elevations, details, plans and other working drawings and supplementary drawings, or reproductions thereof, sealed by the Engineer, which show the location, character, dimensions, details of the Work to be performed, all as identified in the Contract. Drawings may either be bound in the same book as the balance of the Contract Documents or bound in separate sets, and are a part of the Contract Documents, regardless of the method of binding.

1.24. Engineer: The person or organization identified as such in the Contract that provided the technical design. The term "Engineer" means the Engineer or its authorized representatives.

1.25. Final Completion: The completion of all the Work in accordance with the Contract Documents.

1.26. Laws And Regulations: Federal, State, and Local Statutes, Judicial and Administrative Decisions, Laws, By-Laws, Codes, Rules, Regulations, Resolutions, Ordinances, and/or Orders applicable to the Project.

1.27. Lump Sum Price: The price paid for a specified quantity of Work, which when performed, is paid for on the basis of an agreed price for the completed Work.

1.28. Notice: The term "Notice" or the requirement to notify, as used in the Contract Documents or applicable Laws and Regulations, shall signify a written communication delivered in person; or by certified or registered mail, return receipt requested, to the individual, to a member of the firm, or to an officer of the corporation for whom it is intended.

1.29. Notice Of Award: The written notice of acceptance of the Bid by Tampa Bay Water to the successful Bidder stating that upon compliance by the Bidder, within the time specified, with the requisite conditions stated in this ITB, Tampa Bay Water will deliver the Contract to the successful Bidder for its execution.

1.30. Notice to Proceed: The written Notice issued by Tampa Bay Water to the Contractor, authorizing it to proceed with the Work in accordance with the Contract Documents, and fixing the date for which the Contract Time shall commence.

1.31. Or Equal: The term "or equal" shall be understood to indicate that the "equal" product is the same or better than the named product in function, performance, reliability, quality, and general configuration. Determination of equality in reference to the Project design requirements will be made by the Engineer.

1.32. Partial Utilization: Use by Tampa Bay Water of a portion of the Work (as designated by Tampa Bay Water) before reaching Substantial Completion for all the Work.

1.33. Payment Application: The forms provided by Tampa Bay Water which shall be used by the Contractor in requesting partial or final payment.

1.34. Permit Allowance: The Permit Allowance is for Tampa Bay Water's use in reimbursing the Contractor for the actual cost of permit fees required by Laws and Regulations necessary to perform the Work. This is a pass-through cost and no mark-ups are allowed on the Permit Allowance.

1.35. Progress Report: A written report(s) indicating progress of the Work, estimated date for delivery of materials, and proposed plan for recovery of any delays to the timing and sequence of Work set forth in the Progress Schedule and proposed plan for recovery of any delays to the timing and sequence of Work set forth in the Progress Schedule.

1.36. Progress Schedule: Schedule which shows the timing and sequence of Contractor's proposed execution of the Work and all subsequently issued updates thereto, after said updates have been reviewed and accepted by Tampa Bay Water.

1.37. Project : The name of the Project is as identified in the Contract.

1.38. Project Allowance: The Project Allowance is solely for Tampa Bay Water's use in the payment for changes in the Work, where such changes have been approved pursuant to the Contract Documents.

1.39. Project Representative: The authorized representative(s) of the Engineer who is (are) assigned to the Project or any part thereof.

1.40. Record Drawings: Drawings that are prepared by the Engineer reflecting as-built information provided by the Contractor on Contractor's As-Built Contract Documents.

1.41. Shop Drawings: All drawings, diagrams, illustrations, schedules, and other data prepared by or for the Contractor to illustrate some part of the Work and all illustrations, brochures, standard schedules, performance charts, instructions, diagrams, and other data prepared by a Supplier and submitted by the Contractor to illustrate items of material or equipment.

1.42. Specifications: The term "Specifications" refers to those written technical descriptions of materials, equipment, construction systems, standards and workmanship as applied to the Work, and certain administrative details applicable thereto, all as identified in the Contract. Where standard Specifications, common to the construction industry and to standard engineering practice, are referenced to or are otherwise applicable, the applicable portions of the most current versions of such standard Specifications shall become a part of these Contract Documents. If referenced standard Specifications conflict with Specifications contained herein, the requirements contained herein shall control unless contrary to Laws and Regulations.

1.43. Subcontractor: An entity having a Contract with the Contractor for performing labor on the Work on the Project, or for performing both labor on the Project and furnishing materials or equipment.

1.44. Submittal: The term Submittal includes shop drawings, tests, samples, Progress Schedules and other schedules, Progress Reports and other reports, and any other documents required for submission by the Contract Documents.

1.45. Substantial Completion: Substantial Completion shall be that degree of completion of the Work or specified portion of the Work in accordance with the Contract Documents, as specified in the General Conditions, Article 2, Contract Time of the Contract, certified by the Engineer and approved by Tampa Bay Water as evidenced by the Engineer's issuance of a Certificate of Substantial Completion, sufficient to provide Tampa Bay Water, at its discretion, the full-time use of the Work or Partial Utilization of a specified portion of the Work for the purposes for which it was intended.

1.46. Supplier: A manufacturer, fabricator, distributor, material man, or vendor having an Contract with the Contractor for furnishing materials or equipment for the Project. Tampa Bay Water, A Regional Water Supply Authority/Owner: Tampa Bay Water, A Regional Water Supply Authority, is the Owner of the Work described in the Contract Documents. The term "Owner" and "Tampa Bay Water" are interchangeable. The Work shall be deemed substanitally complete after the new pipeline is fully operational and has successfully passed all testing and the old out of service pipeline has been removed and/or grouted in place, as noted on the drawings and in the specifications.

1.47. Uncontrollable Circumstance: Any act, event or condition affecting the Project, Contractor or Tampa Bay Water to the extent that it materially and adversely affects: (i) the ability of either party to perform any obligation hereunder (except for payment obligations); or (ii) the cost of such party's performance, if such act, event or condition is beyond the reasonable control and is not also the result of the willful or negligent act, error or omission or failure to exercise reasonable diligence on the party relying thereon as justification for not performing an obligation or complying with any condition required of such party under this Contract;

(1) *Inclusions*. Subject to the foregoing, such acts or events include the following:

(a) an act of God, hurricane, landslide, lightning, earthquake, fire, flood, plague, tornadoes, (but not including reasonably anticipated weather conditions for the geographic area of the Work site), explosion, sabotage or similar occurrence, acts of a public enemy, extortion, war, blockade or insurrection, riot or civil disturbance;

(b) a Change in Law;

(c) the failure of any appropriate governmental body or private utility having operational jurisdiction in the area in which the Project is located to provide and maintain Utilities to the Work site;

(d) any failure of title to the Work site or any enforcement of any encumbrance on the site or on any improvements thereon not consented to in writing by, or arising out of any action or Contract entered into by, the party adversely affected thereby;

(e) the preemption of materials or services by a governmental body in connection with a public emergency or any condemnation or other taking by eminent domain of any portion of the Project or Work site;

(f) the presence at the Work site of (i) subsurface structures, materials or conditions having archaeological significance; (ii) any habitat of endangered or similarly protected species; (iii) functioning subsurface structures at the site (to the extent not identified by Tampa Bay Water to Contractor); and (iv) subsurface conditions of which Contractor, through the exercise of reasonable diligence, could not reasonably be expected to have notice;

(g) strikes by an organized union of the Contractor's Subcontractors;

(h) the failure of Tampa Bay Water to obtain any permit or approval which is Tampa Bay Water's responsibility to obtain, on or prior to the dates set forth in the Project Schedule.

(2) *Exclusions*. It is specifically understood that none of the following acts or conditions shall constitute Uncontrollable Circumstances:

(a) general economic conditions, interest or inflation rates, or currency fluctuations or exchange rates;

(b) changes in the financial condition of Tampa Bay Water, Contractor or any Subcontractor affecting the ability to perform their respective obligations;

(c) the consequences of error, neglect or omissions by the parties and any Subcontractor in the performance of any Work or responsibilities under this Contract;

(d) any increase for any reason in premiums charged by the Contractor's insurers or the insurance markets generally for the required Insurance;

(e) the failure of Contractor to secure any patents or licenses in connection with the technology necessary to perform its obligations hereunder;

(f) the failure of any Subcontractor or Supplier to furnish labor, materials, services or equipment for any reason other than for acts or events specifically included herein as Uncontrollable Circumstances;

(g) equipment failure except when due to acts or events specifically enumerated herein as Uncontrollable Circumstances; or

(h) any Change in Law with respect to the issuance of any permit or approval, the enactment of any statute, or the promulgation of any regulation affecting the standards or requirements of performance, the terms and conditions of which do not impose more stringent or burdensome requirements on the Project or Contractor than in effect on the Effective Date of the Contract.

1.48 Unit Price: The price paid for units of Work which, when performed, is measured and paid for on the basis of units.

1.49 Work: The word "Work" within these Contract Documents shall include all material, labor, services, documentation, tools, equipment, fuel, utilities, temporary facilities and all appliances, machinery, transportation, and appurtenances necessary to perform and complete the Project in accordance with the Contract Documents, and such additional items not specifically indicated or described which can be reasonably inferred as belonging to the item described in the Contract Documents or indicated and as required by good practice to provide a complete and satisfactory system(s) or structure(s).

1.50 Working Hours: Working Hours shall mean the hours between 7:00 a.m. and 6:00 p.m., Monday through Friday, excluding legal holidays. Maintenance of equipment will be allowed outside of Working Hours.

1.51 Other terms not defined herein shall have the meanings assigned to them elsewhere in the Contract Documents, and if not assigned and where the context will permit, as used or defined in the Florida Statutes.

2. Contract Documents

2.1 Intent of Contract Documents

2.1.1. The Contract Documents comprise the entire Contract between Tampa Bay Water and the Contractor concerning the Work. The Contract Documents are complementary, and what is called for by one shall be as binding as if called for by all. The intent of the Contract Documents is to describe a functionally complete Project (or part thereof) to be constructed in accordance with the Contract Documents. Any work, materials, or equipment that may reasonably be inferred from the Contract Documents as being required to produce the indicated result shall be supplied whether or not specifically called for, with no increase in the Contract Price or extension of the Contract Time. When words which have a customary technical or trade meaning are used to describe work, materials, or equipment, such words shall be interpreted in accordance with that meaning, unless a contrary definition appears in the Contract Documents, in which case the Contract Documents shall control.

2.1.2. Whenever the terms "as ordered", "as directed", "as required", "as allowed", "As Approved", or terms of like effect, or the adjectives "reasonable", "suitable", "acceptable", "proper", or "satisfactory", or adjectives of similar effect, are used to describe a requirement, direction, review, or judgment of the Engineer or Tampa Bay Water as to the Work, it is intended that the requirement, direction, review, or judgment will be to evaluate the Work for compliance with the Contract Documents.

2.1.3. No use of any provision of any standard Specifications, manual, or code (whether or not expressly incorporated by reference in the Contract Documents), or Suppliers' instructions, shall be effective to (a) change the duties and responsibilities of the Contractor, Tampa Bay Water, or Engineer, or any of their consultants, agents, or employees from those assigned in the Contract Documents; or (b) to assign to the Contractor, Tampa Bay Water, or Engineer, or any of their consultants, agents, or Tampa Bay Water employees, any duty or authority to supervise or direct the execution of the Work or to assume responsibility contrary to the provisions of the Contract Documents.

2.2 Priority of the Contract Documents

2.2.1. In resolving inconsistencies or apparent conflicts among the Contract Documents, the first listed below shall take precedence and control over those following:

a. *Contract*
b. Supplementary Conditions
c. General Conditions
d. Specifications / Drawings
e. Front-Ends

2.2.2. In resolving inconsistencies between Drawings and Specifications, Contractor shall be obligated to comply with the more costly or stringent requirement, as determined by Tampa Bay Water. Figure dimensions on Drawings shall take precedence over scale dimensions. Detailed Drawings shall take precedence over general Drawings.

2.3 Examination and Verification of Contract Documents

2.3.1. Before undertaking each part of the Work, the Contractor shall carefully study and compare the Contract Documents with each other, check and verify pertinent figures and all applicable field measurements, and compare and coordinate related requirements for Work (i.e. location, dimensions, fit, completeness, consistency, etc.).

2.3.2. The Contractor shall, immediately upon discovery, report in writing to the Engineer any conflict, error, omission, or ambiguity in the Contract Documents which the Contractor discovers, whether prior to or while performing the Work, and shall obtain a written interpretation or clarification from the Engineer before proceeding with any affected Work. The Engineer shall promptly investigate the matter and until such interpretation or clarification is obtained from the Engineer, any Work done by the Contractor which is directly or indirectly affected by same, will be at the Contractor's risk and the Contractor shall bear all resultant costs and delays.

2.4 Documents to be kept on the Project Site

The Contractor shall keep at least one copy of the Contract Documents on the Project site in good order, available to Tampa Bay Water and its representatives. The Contractor shall maintain on a daily basis at the Project site, and make available to the Engineer on request, one current set of As-Built Contract Documents which have been accurately marked by Contractor to indicate all modifications in the completed Work that differ from the original Contract Documents. As a condition precedent to Final Completion of the Work, the Contractor shall give the Engineer one complete set of these As-Built Contract Documents.

2.5 Additional Contract Documents

The Engineer shall furnish to the Contractor one (1) set of sealed Drawings (24 X 36) hard copy, one PDF copy and one AutoCAD electronic copy; sets of sealed Drawings and one (1) reproducible set of the Contract Documents.

2.6 Ownership of Contract Documents

All portions of the Contract Documents, and copies thereof furnished by the Engineer are the property of Tampa Bay Water. They are not to be used on other work and are to be returned to the Engineer at the completion of the Work with the exception of the Contractor's record set. Any reuse or adaptation of these materials by Contractor without specific written permission by Tampa Bay Water is expressly prohibited and shall be at the risk of the Contractor and without liability or legal expense to Tampa Bay Water or Engineer. The Contractor shall hold Tampa Bay Water and Engineer harmless from any and all damages and claims, including reasonable attorneys' fees and legal assistants' fees, for such unauthorized use.

3. The Engineer

3.1 Authority of the Engineer

The Engineer shall be a representative of Tampa Bay Water during the Contract Time for performance of the Work. The Engineer shall have authority to reject Work which does not conform to the Contract Documents. However, the Engineer's authority shall not affect the Contractor's responsibility to perform the Work in accordance with the Contract Documents.

3.2 Duties and Responsibility of the Engineer

3.2.1. The Engineer shall make visits to the Project site at intervals appropriate to the various stages of construction to observe the progress and quality of the Work and to determine if the Work is proceeding in accordance with the Contract Documents. Visits and observations made by the Engineer are solely for the benefit of Tampa Bay Water and shall not relieve the Contractor of its obligations including, but not limited to, the Contractor's obligations to conduct comprehensive inspections of the Work and to furnish materials and perform acceptable work, and to provide adequate safety precautions, all in accordance with the Contract Documents.

3.2.2. The Engineer shall respond, in writing, within 21 days of receipt (unless more time is reasonably required for response), to all claims by Tampa Bay Water or the Contractor required for performance of the Work and requests for clarification or interpretation of the Contract Documents. The Engineer's response shall be of factual and/or technical nature, and shall not include the legal interpretation of the Contract Documents.

3.2.3. The Engineer may assign one or more Project Representatives to observe the Work. It is understood that such Project Representatives shall have authority to issue Notices of non-conformance and make decisions within the limitations of authority of the Engineer. The Contractor shall furnish all reasonable assistance required by the Engineer or Project Representative for proper observation of the Work. Observations by the Project Representative shall not relieve the Contractor of its obligations including, but not limited to, the Contractor's obligation to conduct comprehensive inspections of the Work and to furnish materials and perform work, and to provide adequate safety precautions, all in accordance with the Contract Documents.

3.2.4. On-site observations by the Engineer, Project Representatives and other assistants shall not relieve the Contractor from its obligation to perform the Work in accordance with the Contract Documents, nor constitute acceptance of Defective Work, nor give rise to any duty on their part to make the observations for the benefit of the Contractor.

3.2.5. The Engineer shall review Submittals within the times specified in the General Requirements, or if not specified, within 21 days of receipt (unless more time is reasonably required for review) for conformance with the design of the Project and for compliance with the Contract Documents. The Engineer's review shall not extend to means, methods, techniques, sequences, nor to procedures of construction (except where a specific means, method, technique, sequence, or procedure of construction is indicated in or required by the Contract Documents), nor to safety precautions or programs incident thereto.

3.3 Rejected Work

3.3.1. The Engineer shall have authority to disapprove or reject Work at any time during the performance of the Work, which the Engineer believes to be Defective; or to require special inspection or testing of the Work, whether or not the Work is fabricated, installed, or completed. The Engineer's authority does not relieve the Contractor from its responsibility to perform in accordance with the Contract Documents. When the Contractor is notified by the Engineer of rejection of Defective Work, the Contractor shall take immediate action to correct same.

3.3.2. All Defective Work, whether discovered before or after Final Completion, shall be removed and replaced by the Contractor, without cost to Tampa Bay Water, with Work which shall conform to the Contract Documents. Failure on the part of the Engineer to condemn or reject Defective Work shall not be construed to imply acceptance of such Work. Tampa Bay Water shall reserve and retain all of its rights and remedies at law or equity against the Contractor and its Surety for correction of or damages arising from any and all Defective Work.

3.4 Lines and Grades

Lines and grades shall be established as provided in the Drawings or the Supplementary Conditions. All information, stakes or marks shall be carefully preserved by the Contractor, and if the information, stakes or marks are destroyed or removed, all such information, stakes or marks shall be replaced at the Contractor's expense.

3.5 Detail Drawings and Instructions

If required, the Engineer shall furnish within 21 days (unless more time is reasonably required), in writing, additional instructions by means of Drawings or otherwise, as required for the proper execution of the Work. All such Drawings and instructions shall be in writing and consistent with the Contract Documents.

4. The Contractor and Its Employees

4.1 Contractor

4.1.1. The Contractor shall independently perform all Work included in the Contract Documents and shall not be considered an agent of Tampa Bay Water or of the Engineer, nor shall the Contractor's Subcontractors, Suppliers, or employees be agents of Tampa Bay Water or of the Engineer.

4.1.2. The Contractor shall provide competent, suitably qualified and reliable personnel, Subcontractors, and Suppliers to survey and lay-out the Work and furnish and perform the Work in accordance with the Contract Documents.

4.2 Subcontractors and Suppliers

4.2.1. The Contractor shall be responsible and liable to Tampa Bay Water for the acts and omissions of Contractor's employees, agents, and Subcontractors and Suppliers and their respective employees.

4.2.2. The Contractor shall list each Subcontractor or Supplier whom the Contractor intends to award a subcontract, other than those Subcontractors or Suppliers previously listed in the Bid,

by submitting to Tampa Bay Water in writing, for each additional Subcontractor and Supplier, the same information required to be set forth in the Bid.

4.2.3. Work performed by a Subcontractor or Supplier shall be through an appropriate written subcontract which expressly binds the Subcontractor or Supplier to the terms and conditions of the Contract Documents for the express benefit of Tampa Bay Water, and requires each of them to assume toward the Contractor all of the obligations which the Contractor assumes toward Tampa Bay Water.

4.2.4. The Contractor shall deliver to Tampa Bay Water a copy of each subcontract with a Subcontractor or Supplier within fifteen (15) Days after receiving the Notice to Proceed or the execution of the subcontract, as applicable.

4.2.5. The Contractor shall perform (with the Contractor's own employees) not less than fifty-one percent (51%) of the difference between the Contract Price minus the cost of materials for the Project.

4.2.6. Nothing contained in the Contract Documents or any subcontract shall create any contractual relationship between any Subcontractor or Supplier and Tampa Bay Water or Engineer. Provided, however, Tampa Bay Water shall be named an intended third party beneficiary under all such subcontracts.

4.3 Equal Opportunity

4.3.1. At all times during the performance of the Work, Contractor shall comply with Title VII of the Civil Rights Act of 1964 and the Florida Civil Rights Act of 1992. The Contractor shall not discriminate against any employee or applicant for employment because of race, color, religion, sex, national origin, age, handicap, or marital status. The Contractor shall take affirmative action to ensure that employment applications are used and that employees are treated without regard to their race, color, religion, sex, national origin, age, handicap or marital status for employment, upgrading, demotion, or transfer; recruitment advertising; layoff or termination; rates of pay, or other forms of compensation; and selection for training, including apprenticeship. The Contractor agrees to post in conspicuous places, available to employees and applicants for employment, notices setting forth the provisions of this non-discrimination clause.

4.3.2. The Contractor shall state in all solicitations or advertisements for employment placed by or on behalf of the Contractor that all qualified applicants will receive consideration for employment without regard to race, color, religion, sex, national origin, age, handicap, or marital status.

4.4 Indemnity

4.4.1. In consideration of One Hundred Dollars ($100.00) separately allocated from the first consideration paid hereunder, and other good and valuable consideration, including Tampa Bay Water's execution of the Contract, the sufficiency of which is hereby acknowledged by Contractor, Contractor shall indemnify and hold harmless Tampa Bay Water, its officers, employees, agents, representatives and consultants from and against all liabilities, costs, losses, and damages (including, but not limited to, all reasonable attorney's fees to the extent caused by the negligence, recklessness or intentional wrongful conduct of Contractor, any Subcontractor, or any individual or entity directly or indirectly employed or utilized by Contractor in the performance of the Work under this Contract. This indemnification shall also include all liabilities, damages, losses and costs including, but not be limited to, reasonable attorneys' fees arising out of any infringement of patents or copyrights incident to performing the Work by the Contractor, any Subcontractor or any person or organization employed by

Contractor to perform or furnish any of the Work, or anyone for whose acts any of them may be liable.

4.4.2. With respect to all claims against Tampa Bay Water or the Engineer by any employee of the Contractor, the indemnification obligation under this Article shall not be limited in any way by any limitation on the amount or type of damages, compensation or benefits payable by or for the Contractor (or any Subcontractor or Supplier) under workers' compensation, disability benefit or other employee benefit acts.

4.4.3. The separate consideration recited in Paragraph 4.4.1 above is in consideration of the indemnification obligation set forth in this Paragraph 4.4, as well as any other indemnification provided by Contractor under the Contract Documents.

4.4.4 Contractor acknowledges and agrees its indemnification obligations under Paragraph 4.4.1 shall be effective and fully enforceable even if any party indemnified hereunder is partially at fault or responsible for the claim; provided, however, Contractor shall not be liable or responsible for indemnifying any claim which is the result of the sole negligence of Tampa Bay Water, Engineer or any other party indemnified under Paragraph 4.4.1.

4.5 Bonds and Insurance

A. Performance Bonds, Payment Bonds and Other Bonds

4.5.1. The Contractor shall furnish Performance Bonds and Payment Bonds, each in an amount at least equal to the Contract Price, in accordance with the requirements of Sections 255.05, Florida Statutes, as security for the faithful performance and payment of all Contractor's obligations under the Contract Documents. These Bonds shall be in the forms specified in the Contract Documents. The Contractor shall also furnish any other bonds required in the Supplementary Conditions. All bonds shall be executed by such sureties as are named in the current list of "Companies Holding Certificates of Authority as Acceptable Reinsuring companies" as published in Circular 570 (amended) by the Audit Staff Bureau of Accounts, U.S. Treasury Department. Attorneys-in-Fact who sign Bonds shall attach a certified copy of their Power of Attorney.

B. The Contractor's Insurance – General

4.5.2. The Contractor shall purchase and maintain the coverage specified in this Article and the Supplementary Conditions, and shall be written for not less than the limits of coverage specified in the Supplementary Conditions. The Contractor shall submit certificates to Tampa Bay Water itemizing the policies issued, limits of coverage, expiration dates and endorsements provided, using the form provided in the Contract Documents.

4.5.3. The Contractor shall not start or continue to perform any Work unless it has in full force and effect all required insurance as per the Contract Documents. The Contractor shall submit the insurance certificates provided with these Contract Documents for review by Tampa Bay Water prior to performing any Work. All Subcontractors and Suppliers performing Work on the Project shall provide the same types and limits of insurance as is required of the Contractor hereunder, unless otherwise expressly waived in writing by Tampa Bay Water.

4.5.4. Insurance shall be provided by insurance companies authorized to transact business and which have an agent for service of process in the State of Florida, having at least an "A-" Best's Rating and a Class VIII or better financial size category in accordance with the most current A.M. Best Company rating.

4.5.5. All the policies of insurance shall be endorsed to provide that any failure of the Contractor to comply with any provisions will not prejudice coverage for Tampa Bay Water. Deductible amounts shall be reduced or eliminated upon Tampa Bay Water's written request in which case Contractor shall be entitled to payment of any additional costs for such reduction or

elimination of deductibles in accordance with Paragraph 7.2 of these General Conditions. The insurer's costs of providing the insured(s) a defense at trial in bankruptcy proceedings, and/or appeal, including attorneys' fees, and legal assistants' fees, shall not be included within the limits of the policy coverage, but shall remain the insurer's separate responsibility.

4.5.6. To the fullest extent commercially available, all the policies of insurance shall be endorsed to provide that the coverage afforded will not be cancelled, adversely changed or renewal refused until at least thirty (30) Days' prior written Notice has been given to Tampa Bay Water and the Engineer by certified mail, return receipt requested. Should any coverage approach expiration during the period in which it is to remain in full force and effect, it shall be renewed prior to its expiration, and certificate filed with Tampa Bay Water at least thirty (30) Days prior to expiration. Tampa Bay Water and Engineer, their officers, agents, and employees shall be named as Additional Insured(s) on the Contractor's and any Subcontractor's commercial general liability, comprehensive automobile liability insurance, umbrella/excess liability and builder's risk policies for any claims arising out of work performed under the Contract Documents.

4.5.7. In case of the breach of any provision of this Article, Tampa Bay Water, at its option, may take out and maintain, at the expense of the Contractor, such insurance as Tampa Bay Water may deem proper and may deduct the cost of such insurance from any monies which may be due or become due the Contractor under the Contract Documents.

4.5.8. In carrying out any of the provisions of the Contract Documents or in exercising any authority granted by the Contract Documents, there will be no personal liability upon any board member, officer, employee or agent of Tampa Bay Water.

C. The Contractor's Liability Insurance

4.5.9. The Contractor shall purchase and maintain commercial general liability and other insurance appropriate for the Work, in the limits of at least those specified in the Supplementary Conditions, and which shall provide protection from claims itemized below which may arise out of or result from the Contractor's performance and furnishing of the Work and the Contractor's other obligations under the Contract Documents, whether the Work and the obligations be performed or furnished by the Contractor, Subcontractor or any Supplier, to wit:

a. Claims under workers' compensation, disability benefits, and other applicable similar employee benefits acts;

b. Claims for damages because of bodily injury, occupational sickness or disease, or death of the Contractor's employees; claims for damages because of bodily injury, sickness or disease, or death of any person other than the Contractor's employees; claims for damages insured by personal injury liability coverage sustained by any person as a result of an offense directly or indirectly related to the employment of such person by the Contractor, or by any other person for any other reason; claims for damages, other than to the Work itself, because of injury to or destruction of tangible property wherever located, including loss of use; claims arising by operation of Laws and Regulations for damages because of bodily injury or death of any person or for damage to property; and

c. Claims for damages because of bodily injury or death of any person, or property damage arising out of ownership, maintenance, operation, use of loading and unloading of any owned, hired or non-owned motor vehicle used in the Work, including employee non-ownership use.

4.5.10. The Contractor's liability insurance shall include contractual liability coverage sufficient to cover the Contractor's indemnification obligations under the Contract Documents. The

Contractor agrees to pay on behalf of Tampa Bay Water, and to provide and pay for a defense for all claims covered by the Contractor's obligations under the indemnification provisions.

4.5.11. The Contractor's liability insurance shall be endorsed to include as additional insured: Tampa Bay Water, the Engineer, their consultants, any subsidiaries or affiliates, and each of their directors, officers, shareholders, agents, or employees. The insurance afforded to these additional insured shall be primary insurance, and neither the coverage nor the amount of insurance provided under the Contractor's policies shall be reduced or prorated by the existence of any other insurance applicable to any loss they may have sustained. If the Subcontractors and Suppliers do not purchase and maintain the coverage specified in this Article or the Supplementary Conditions, they shall be included in the Contractor's policies as additional insured.

4.5.12. The Contractor's liability insurance shall remain in effect until three (3) years after Final Completion and at all times after that when the Contractor may be correcting or removing and replacing Defective Work. Evidence of insurance shall be furnished to Tampa Bay Water yearly.

4.5.13. These requirements shall not be construed to limit the liability of the Contractor or its insurers. Tampa Bay Water does not represent that the specified coverage or limits of insurance are sufficient to protect the Contractor's interests or liabilities.

D. Property Insurance

4.5.14. The Contractor shall purchase and maintain builder's risk "all risk" completed value insurance coverage for physical loss or damage upon the Work at the Project site to its full insurable value, including completed Work and Work in progress. This insurance shall list Tampa Bay Water as an additional insured and shall include the interests of the Contractor, Subcontractors and Suppliers, the Engineer, and Tampa Bay Water's and the Engineer's consultants in the Work, all of whom shall be listed as additional insured. At a minimum, and not by way of limitation, it shall insure against extended coverage, perils of fire, lightning, windstorm, flood, rain, hail, explosions, riot, tornado, hurricane, sink holes, theft, vandalism and malicious mischief, collapse and water damage and shall include damages, losses and expenses arising out of or resulting from any insured loss incurred in the repair or replacement of any insured property (including but not limited to fees and charges of engineers, architects, attorneys and other professionals). If not covered under the "all risk" insurance, the Contractor shall purchase and maintain similar property insurance on parts of the Work stored on and off the Project site or in transit whether or not such Work is included in a Payment Application. The policy shall be endorsed to permit use or occupancy by Tampa Bay Water prior to Final Completion. The property insurance may have a deductible amount, which shall be borne by the Contractor, not exceeding $25,000.00. The property insurance shall comply with the requirements of this Article.

E. Waiver of Subrogation Rights

4.5.15. Tampa Bay Water and the Contractor intend that all policies of insurance shall protect Tampa Bay Water, the Contractor, and the Engineer, provide primary coverage for all losses and damages caused by the perils covered. Accordingly, all such policies shall be endorsed to provide that in the event of payment of any loss or damage the insurer shall have no rights of subrogation or other recovery against any of the parties named as insured or additional insured, and if the insurers require separate waiver forms to be signed by the Engineer or Tampa Bay Water's and the Engineer's consultants, Tampa Bay Water will obtain separate waiver forms, and if such forms are required of any Subcontractor or Supplier, the Contractor will so obtain them.

4.6 Taxes and Charges

The Contractor shall pay any and all sales and use taxes and all withholding taxes, whether State or Federal, and pay all Social Security charges and also all State Unemployment Compensation charges, and pay or cause to be withheld, as the case may be, any and all taxes, charges, fees, or sums whatsoever, which are now required to be paid or withheld under any laws, unless otherwise modified in the Supplementary Conditions.

4.6.2. Tampa Bay Water reserves the right to implement an Owner's Direct Purchase sales tax savings program with respect to the Project. In such event, Contractor shall cooperate and assist Tampa Bay Water, at no additional cost, with respect to the implementation of that sales tax savings program. Tampa Bay Water and Contractor shall work together to identify particular pieces of equipment and material that are suitable for direct purchase by Tampa Bay Water. As such items are identified, Tampa Bay Water shall issue purchase orders, in accordance with a schedule mutually acceptable to Tampa Bay Water and Contractor, to the appropriate Suppliers of such items for the direct purchase of those items by Tampa Bay Water. Tampa Bay Water shall pay the Supplier of such items directly and the title for such items shall pass directly from the Supplier to Tampa Bay Water. Notwithstanding the foregoing, Contractor shall remain responsible for the ordering, scheduling, coordinating, insuring, delivery, unloading, storage, installation, operation, and warranties of all such direct purchase items, as if Contractor had purchased the items itself for incorporation into the Work. In that regard, Tampa Bay Water shall assign to Contractor all contract and warranty rights Tampa Bay Water may have against any such Supplier, so as to permit Contractor to assert warranty or other contract claims for defective or nonconforming materials or equipment directly against the Supplier. As Tampa Bay Water issues purchase orders to the Suppliers of such items, Tampa Bay Water and Contractor shall execute a Change Order which deducts from the Contract Price the amount being paid by Tampa Bay Water, plus the amount of sales tax that otherwise would have been paid on such items. As an inducement to Contractor to more fully cooperate and facilitate this sales tax savings program, Contractor shall receive as a bonus, at the time final payment is to be made hereunder, a sum equal to ten percent (10%) of the total amount of sales tax saved by Tampa Bay Water as a result of these direct purchases.

4.7 Codes, Ordinances, Permits, and Licenses

4.7.1. The Contractor shall keep itself fully informed of all applicable Laws and Regulations, which in any manner affect the Work. All permits, licenses, inspection fees, impact fees, and other costs necessary for performance of, compliance with, and/or completion of the Work shall be obtained and paid for by the Contractor, unless otherwise modified in the Supplementary Conditions.

4.7.2. If Tampa Bay Water has obtained and paid for any permits or licenses applicable to the Work, the Contractor shall meet all requirements of those permits and licenses. The Contractor shall bear all costs arising from the Contractor's responsibilities under this Article.

4.7.3 All Work is to be performed by Contractor in accordance with the most current applicable Laws and Regulations. Provided, however, in the event of any changes to any applicable Laws and Regulations that take effect after the date Contractor submitted its Bid to Tampa Bay Water, and under the circumstances it is not reasonable to assume that Contractor was or should have been aware of such changes, and Contractor provides Notice to Engineer of the changes and Engineer thereupon directs Contractor in writing to perform the Work in accordance with such changes, and such changes impact the time and/or cost of Contractor's performance of the Work, a Change Order or Change Authorization shall be issued with respect to such changes.

4.8 Superintendence

4.8.1. The Contractor shall keep at the Project site supervisory personnel who shall direct the Work in a competent manner, applying the skills, expertise and attention necessary to perform the Work in accordance with the Contract Documents. The Contractor shall designate, in writing before starting Work, a competent Project superintendent who shall be an employee of the Contractor and shall have complete authority to represent and to act for the Contractor. The Contractor shall notify Tampa Bay Water and Engineer in writing prior to any change in superintendent assignment. If Tampa Bay Water objects to the Contractor's superintendent, the Contractor shall submit a replacement superintendent at no increase in Contract Price nor extension in Contract Time. The Contractor shall be responsible for all construction means, methods, techniques, sequences, and procedures, and for providing adequate safety precautions and coordinating all portions of the Work.

4.8.2. If Tampa Bay Water or the Engineer object to any of the Contractor's personnel, by reason of being unfit, incompetent, unskilled, disorderly, intemperate, or otherwise hindering the Work, the Contractor shall promptly correct the problem and, if required by Tampa Bay Water or the Engineer, remove such personnel from the Work. Failure to comply with this provision shall constitute a material breach of the Contract and be grounds for withholding payment.

4.9 Reception of Engineer's Communications

4.9.1. The Contractor's Representative at the Project site shall have authority to act on behalf of and contractually bind the Contractor. All communications given to the Contractor's Representative shall be deemed given to the Contractor. Communications of major importance will be confirmed in writing upon request from the Contractor.

4.9.2. The Engineer may schedule Project meetings for the purposes of discussing and resolving matters concerning the various elements of the Work. The time and place for these meetings and the names of persons required to be present shall be determined by Tampa Bay Water and the Engineer. The Contractor shall comply with these attendance requirements and shall also require its Subcontractors and Suppliers to comply.

4.10 Safety

4.10.1. The Contractor shall be solely responsible for the condition of the Project site, including the safety of all persons and property during performance of the Work. This requirement shall apply continuously and not be limited to normal Working Hours. Safety provisions shall conform to U.S. Department of Labor (OSHA), and all other applicable Laws and Regulations, as well as all applicable safety rules and regulations promulgated by Tampa Bay Water from time to time. Where any of these are in conflict, the more stringent requirement shall be followed. The Contractor's failure to thoroughly familiarize itself with the aforementioned safety provisions shall not relieve it from compliance with the obligations and penalties set forth therein

4.10.2. The Contractor shall develop and maintain for the duration of this Project a safety program, and a written safety plan specific to the Project that will effectively incorporate and implement all safety provisions required by any Laws and Regulations. The Contractor shall appoint an employee assigned to the Work who shall be responsible to supervise and enforce compliance with the safety program.

4.10.3. The Contractor, as a part of its safety program, shall maintain at its office or other prominent place at the Project site, the written safety plan and safety equipment applicable to the Work as prescribed by the aforementioned authorities and all Articles necessary for giving first aid to the injured. The written safety plan shall establish the procedures for the immediate removal to a hospital or a doctor's care of persons (including employees) who may be injured on the Project site.

4.10.4. The Contractor must give Tampa Bay Water and the Engineer prompt Notice of all accidents or injuries whatsoever arising out of, or in connection with, the performance of the Work, whether on or adjacent to the Project site, giving full details in writing, including statements of witnesses. The prompt Notice required hereunder shall be given within 24 hours with respect to any injuries, and within two (2) working days as to all other accidents.

4.10.5. If a claim is made by anyone against the Contractor or any Subcontractor for any reason including, but not limited to, any accident, the Contractor shall give Tampa Bay Water and the Engineer prompt Notice, giving full details of the claim.

4.11 Protection of Work and Property

4.11.1. The Contractor shall have full responsibility for locating all underground utilities in advance of excavation (whether they are indicated on the Contract Documents or indicated by visible markers); scheduling excavation and uncovering in advance, unless it conflicts with Work already uncovered; shoring, blocking, and protecting the underground utilities; repairing any damage done to the satisfaction of Tampa Bay Water or the owners of those underground utilities; giving prompt Notice to Tampa Bay Water and the Engineer of any newly discovered underground utility; and the safety, protection and repairing of any damage done to any affected Work. All costs involved and time required to perform these responsibilities shall be considered as having been included in the Contract Price and in the Progress Schedule for performing the Work within the Contract Time; except that in the case of newly-discovered underground utilities, those costs and times shall, upon proper documentation, be considered pursuant to the General Conditions, Article 6.8. Differing Site Conditions, for adjustment of the Contract Price and/or the Contract Time.

4.11.2. The Contractor shall at all times safely guard and protect from damage Tampa Bay Water's property, property on which the Project is located if not owned by Tampa Bay Water, adjacent property, and its own Work from injury or loss. The Contractor shall provide all facilities required for protection of the Work according to all Laws and Regulations and local conditions.

4.11.3. The Contractor shall protect its Work and materials from damage due to the nature of the Work, the natural elements, carelessness of others, or from any cause, until Final Completion of the Work.

4.11.4. The Contractor shall notify owners of adjacent property (including underground utility owners) not less than 48 hours, or the time period required by Laws and Regulations, whichever period is longer, prior to the Work affecting the property, and shall coordinate and cooperate with them in the location, protection, removal, relocation, and/or replacement of their property. All damage, injury or loss to property caused, directly or indirectly, in whole or part, by the Contractor, any Subcontractor or Supplier or anyone for whose acts any of them may be liable, shall be remedied at the Contractor's expense. The Contractor shall shore up, brace, underpin, and protect as may be necessary, all foundations and other parts of all existing structures adjacent to the Project site.

4.12 Responsibility of Contractor to Act in Emergency

In case of an emergency which threatens loss or injury to persons or property, the Contractor shall take appropriate remedial action, without previous instructions from Tampa Bay Water or Engineer, as the situation may warrant, and immediately provide Notice to Tampa Bay Water and the Engineer of its action. Any claim for compensation by the Contractor, together with substantiating documentation in regard to expense caused by emergency acts, shall be submitted to Tampa Bay Water and the Engineer and the amount of compensation if any, shall be determined by mutual Contract.

4.13 Materials and Appliances

4.13.1. Unless otherwise modified in the Supplementary Conditions, all materials to be incorporated into the Work shall be new. The Contractor shall furnish satisfactory evidence to the Engineer as to the kind and quality of materials.

4.13.2. In selecting and/or approving equipment and materials for installation in the Project, neither Tampa Bay Water nor the Engineer shall be responsible for injuries or claims resulting from failure of the equipment or material to comply with Laws and Regulations and applicable federal, state, and local safety codes or requirements, or other applicable safety requirements, or failure due to the Work being Defective.

4.14 Contractors' and Manufacturers' Compliance with State Safety Laws and Regulations, OSHA, and Other Code Requirements

The completed Work shall include all necessary permanent safety devices, such as machinery guards and similar safety items required by the state and federal (OSHA) industrial authorities and other Laws and Regulations. Further, any features of the Work subject to such safety regulations shall be fabricated, furnished, and installed (including installation of Tampa Bay Water-furnished equipment) in compliance with these requirements. Subcontractors and Suppliers shall be held responsible for compliance with the requirements included herein. The Contractor shall notify all Suppliers and Subcontractors of the provisions of this Article.

4.15 Submittals

4.15.1. After checking and verifying all field measurements and after complying with all applicable procedures, Contractor shall submit to the Engineer for its review all Submittals, which shall bear a stamp or specific written indication that the Contractor has satisfied Contractor's responsibilities under the Contract Documents with respect to Submittals. All Submittals shall be promptly submitted by Contractor so as to cause no delay to the completion of the Work. All Submittals shall be identified as Engineer may require. The data shown shall be complete with respect to quantities, dimensions, specified performance, and design criteria, materials, and similar data sufficient to enable Engineer to review the information.

4.15.2. All Submittals shall be identified clearly as to material, Supplier, pertinent data such as catalog numbers, and the use for which it is intended. The Contractor shall review all Submittals prior to submission, for compliance with the Contract Documents and shall provide specific written certification of compliance.

4.15.3. Before each submission, the Contractor shall have determined and verified all quantities, dimensions, specified performance criteria, installation requirements, materials, catalog numbers, and similar data with respect thereto and reviewed and coordinated each Submittal with other Submittals and with the requirements of the Work and for compliance with the Contract Documents. At the time of each submission, Contractor shall provide specific written Notice of each variation from the requirements of the Contract Documents, and in addition, shall cause a specific notation of each such variation to be made on each Submittal submitted for review and approval. In the absence of such notification, the approval of a Submittal shall not waive or alter the original requirements of the Contract Documents.

4.15.4. The Contractor shall make all corrections required by Engineer, and shall resubmit the required number of corrected copies of Submittals and new samples for review. The Contractor shall direct specific attention in writing to revisions other than the corrections called for by the Engineer on previous Submittals.

4.15.5. Where a Submittal or sample is required by the Contract Documents, any related Work performed prior to the Engineer's review and approval of the pertinent Submittal shall be at the Contractor's sole expense and responsibility.

4.15.6. Submittals are to demonstrate how the Contractor intends to conform with the design of the Project and the information given in the Contract Documents.

4.15.7. All costs incurred by Tampa Bay Water and the Engineer for the review of a particular Submittal after the Engineer's second review shall be borne by the Contractor, and shall be reimbursed by the Contractor to Tampa Bay Water. Tampa Bay Water may withhold such costs from payments to the Contractor.

4.15.8. The Contractor shall not be entitled to any claim for additional time or compensation caused by the review of any resubmittals.

4.16 Substitution of Materials

4.16.1. Whenever materials, equipment, type of construction, or process are described in the Contract Documents by using a brand name, make, manufacturer, supplier, patent, catalog number, or technique, the naming or Specifications of the item is intended to denote the standard of quality and essential characteristics of the item or process required by Tampa Bay Water. Unless words indicating that no substitution is permitted are used, items from prospective suppliers may be accepted by the Engineer if sufficient information is submitted by the Contractor in its written application for the substitution to allow the Engineer to determine whether the material or equipment proposed (1) will perform at least equally well, function, and achieve the results called for by the design, (2) is at least of equal materials of construction, quality and necessary essential design features, (3) is suited to the same use as that named or specified, (4) conforms to the desired detailed requirements for that item including, but not limited to, durability, strength, appearance, dimensions, aesthetics (where aesthetics are essential), safety, service, comparable usefulness, reliability, economy of operation, and ease of maintenance, (5) evidences a proven record of performance, and (6) will not extend the Contract Time or increase the Contract Price. Contractor shall be responsible for and shall pay all costs in connection with any inspection or testing required in connection with Tampa Bay Water's or Engineer's acceptance of a Supplier of materials or equipment proposed to be incorporated in the Work.

4.16.2. Each application for a substitution shall certify that the proposed substitute will meet each of the six criteria itemized in Paragraph 4.16.1., and that the evaluation and acceptance by the Engineer of the proposed substitute will not prejudice completion of the Work within the Contract Time. All variations of the substitute from the item named or specified shall be identified (operation, materials or construction finish, thickness or gauge of material dimensions, loads, tolerances, deleted/added features, etc.), and information regarding available maintenance, repair, and replacement service shall be indicated. The Contractor is solely responsible for verifying that substitutes are in accordance with the Contract Documents, and that dimensions, arrangement, design, and construction details, and all other features of substitutes are suited to the specified purpose.

4.16.3. A proposed substitute will be accepted as equivalent or "Or-Equal" to that named or specified if, in the Engineer's judgement, it meets the criteria in Paragraph 4.16.1. No substitute shall be utilized, ordered, or installed without the Engineer's prior written acceptance.

4.17 Tests, Samples, and Observations

4.17.1. The Contractor shall furnish, with no increase in Contract Price, the necessary test pieces and samples, including facilities and labor for obtaining the same, as required by the Contract Documents or requested by the Engineer. When required by the Contract Documents or requested by the Engineer, the Contractor shall furnish certificates of any designated tests of materials and equipment.

4.17.2. The Contractor shall establish a quality control system to ensure sufficient supervision, inspection and testing of all items of Work, including those of the Subcontractors and Suppliers, and to ensure conformance to the applicable Contract Documents with respect to products, workmanship, construction, maintenance, finish, functional performance, and identification. The Contractor's quality control system shall include checking, approval, and coordination of Submittals and the surveillance of all specified tests.

4.17.3. Tampa Bay Water, the Engineer, authorized government agents and their representatives shall at all times be provided safe access to the Work whenever it is in preparation or progress, and the Contractor shall provide facilities for such access and for observations, including maintenance of temporary and permanent access.

4.17.4. If the Contract Documents, Laws and Regulations or any public authority requires any Work to be specially tested or approved, the Contractor shall give timely Notice to the Engineer of its readiness for testing or approval.

4.17.5. If any testing, inspection, or approval reveals failure of any part of the Work to conform to the Contract Documents, the Contractor shall not recover any costs made necessary by that failure, and shall reimburse Tampa Bay Water for all direct, indirect, and consequential costs made necessary by that failure including those of repeated procedures, and compensation for the Engineer's services. Such reimbursement may be withheld from payment to the Contractor.

4.17.6. If a portion of the Work is covered contrary to the Engineer's request or to requirements specifically expressed in the Contract Documents, it must, if required by the Engineer, be uncovered for the Engineer's examination and be recovered at the Contractor's expense without change to the Contract Time or Contract Price. If any Work should be covered up without approval or consent of the Engineer, re-examination of questioned Work may be ordered by the Engineer, and if so ordered, the Work shall be uncovered by the Contractor. If it is found that such Work is Defective, Contractor shall bear all direct, indirect, and consequential costs of such uncovering, exposure, observation, inspection, correction of the Defective Work, and testing and of satisfactory reconstruction, (including but not limited to fees and charges of engineers, architects, attorneys, and other professionals) and Tampa Bay Water shall be entitled to reimbursement or to deduct the costs from payment to the Contractor. If it is found that such Work is not Defective, Tampa Bay Water shall reimburse Contractor for the cost of uncovering, inspecting, and recovering such Work.

4.18 Royalties and Patents

The Contractor shall pay all royalty and patent fees unless otherwise specified. Pursuant to the indemnity provisions of the General Conditions, Article 4.4, Indemnity, the Contractor shall defend all suits or claims for infringement of any patent rights and shall save Tampa Bay Water and the Engineer harmless from any and all loss, including reasonable attorneys' fees and legal assistants' fees on account thereof.

4.19 Contractor's Right to Terminate Contract

If the Work is stopped under an order of any court or other public authority for a period of more than 3 months, through no act or fault of the Contractor, its Subcontractors, or their respective employees, or if Tampa Bay Water should fail to pay the Contractor within forty-five (45) Days after the time specified in the General Conditions, Article 7.1. Partial Payments, any sum recommended by the Engineer and approved by Tampa Bay Water, then the Contractor may, upon fifteen (15) Days written Notice to Tampa Bay Water and the Engineer, suspend Work. If Tampa Bay Water fails to correct the conditions, which under this Article justify the Contractor's suspension of the Work, the Contractor may, after fifteen (15) Days additional written Notice to Tampa Bay Water and the Engineer, terminate the Contract.

Upon termination, the Contractor's sole and exclusive remedy shall be the same as and limited to those rights set forth in Paragraph 6.6.6 hereafter. Contractor shall not be entitled to any additional rights or remedies against Tampa Bay Water, including loss profits and other damages, all such other remedies being expressly waived by Contractor.

4.20 Warranty and Guarantee; Correction of Defective Work During Correction Period

4.20.1. The Contractor warrants and guarantees to Tampa Bay Water that all Work will be in accordance with the Contract Documents and will not be Defective, including all Work performed or furnished by any Subcontractor or Supplier. This warranty and guarantee is in addition to and shall survive the Contractor's obligations under the Correction Period set forth in this Article.

4.20.2. The Contractor shall make, at its own expense, all repairs or replacements necessitated by Defective Work, and pay for any damage (whether to the Work itself or other property), including routine repairs resulting from such Defective Work, which becomes evident within the one (1) year after the date of Substantial Completion established by the Engineer for the entire Work or for specified items of Work, or within one (1) year after the date of Final Completion of the Work if Tampa Bay Water did not operate or use the entire facility between the Substantial Completion date and Final Completion, or within such longer period of time as may be prescribed by Laws and Regulations or by the terms of any applicable special guarantee required by the Contract Documents ("Correction Period"). After the Correction Period, Contractor shall remain liable to Tampa Bay Water, and its successors, for Defective Work and damage resulting from such Defective Work, but such liability shall not include an obligation to make routine repairs, unless otherwise agreed to in writing.

4.20.3. Contractor's subcontracts with its manufacturer(s) and the Supplier(s) of all other materials and equipment used in the Project which have a cost of more than $1,000.00 shall require an express warranty from the manufacturer(s) and the Supplier(s) to Tampa Bay Water that the materials (1) are new, (2) have been manufactured and supplied in accordance with the requirements of the Contract Documents, and (3) are not Defective. Such express warranty shall be for a period of not less than the Correction Period.

4.20.4. Defective Work identified for correction during the Correction Period but remaining Defective after its expiration shall be considered as part of the obligations of the warranty or guarantee.

4.20.5. The Contractor agrees to defend, indemnify and hold Tampa Bay Water and the Engineer harmless from liability of any kind arising from damage due to Defective Work. The Contractor shall make all repairs and replacements promptly upon receipt of written order for same from Tampa Bay Water or the Engineer. If the Contractor fails to make the repairs and replacements promptly, or in an emergency, where delay would cause serious risk, loss, or damage, Tampa Bay Water may have the Defective Work corrected or the rejected Work removed and replaced, and the Contractor and its Surety shall be liable for the cost thereof.

4.20.6. Contractor's subcontracts with its manufacturer(s) and the Supplier(s) of all materials shall permit the Contractor to assign to Tampa Bay Water all express and implied warranties from the manufacturer(s) and the Supplier(S). Contractor hereby assigns to Tampa Bay Water all express and implied warranties from the manufacturer(s) and the Supplier(S) of all materials used in the Work.

4.20.7. The specified warranties and guarantees and the Contractor's obligations for correction of Work specified in this Article are in addition to and not in limitation of any other specific remedies provided in the Contract Documents or by Laws and Regulations.

4.20.8. Tests, inspections or approvals shall not in any way relieve the Contractor from its obligations to perform the Work in accordance with the Contract Documents, or to warrant and guarantee the Work as provided in the Contract Documents.

4.20.9. These provisions shall not be construed to prohibit Tampa Bay Water from seeking damages or any remedy at law or equity against Contractor for breach of the Contract, Defective Work or the warranties provided herein.

4.21 Allowances

Contractor shall not proceed with any Allowance item unless and until it has received express written authorization from Tampa Bay Water. The Contract Price shall be adjusted by Change Order or Change Authorization based upon the actual cost of the Allowance items authorized in writing by Tampa Bay Water.

4.22 Contractor's Representations:

4.22.1. Contractor has examined and carefully studied the Contract and Contract Documents.

4.22.2. Contractor has visited the Work Site and become familiar with and is satisfied as to the general, local, and site conditions that may affect cost, progress, and performance of the Work.

4.22.3. Contractor is familiar with and is satisfied as to all federal, state and local Laws and Regulations that may affect cost, progress, and performance of the Work.

4.22.4. Contractor has carefully studied all: (1) reports of explorations and tests of subsurface conditions (if any) at or contiguous to the Work site and all drawings of physical conditions in or relating to existing surface or subsurface structures at or contiguous to the Work site which have been identified or made available by Tampa Bay Water; and (2) reports and drawings of Hazardous Environmental Conditions (if any) at the Work site which have been identified or made available by Tampa Bay Water.

4.22.5. Contractor is aware of the general nature of Work to be performed by Tampa Bay Water and others at the Work site that relates to the Work to the extent indicated in the Contract Documents.

4.22.6. Contractor has correlated the information known to Contractor, information and observations obtained from visits to the Site, reports and drawings identified in the Contract Documents, and all additional examinations, investigations, explorations, tests, studies and data with the Contract Documents.

4.22.7. Contractor has given Tampa Bay Water written notice of all conflicts, errors, ambiguities or discrepancies that Contractor has discovered in the Contract Documents and the written resolution thereof by Tampa Bay Water is acceptable to Contractor.

4.22.8. The Contract Documents are sufficient to indicate and convey understanding of all terms and conditions for performance and furnishing of the Work.

4.22.9. Contractor's execution of this Contract is not based upon their reliance upon any representation, understanding or Contract not expressly set forth herein. Tampa Bay Water has not made any representation to Contractor except as expressly set forth herein.

4.22.10. Contractor is organized and exists under the laws of the State of Georgia and is in good standing in the State of Georgia and is authorized to do business in the State of Florida.

4.22.11. Contractor has the full power and authority to execute and deliver this Contract and to incur and perform the obligations provided for herein and therein, all of which have been duly authorized by all proper and necessary action of the governing body of the Contractor.

Contractor is in compliance with all laws and regulatory requirements to which they are subject.

4.22.12 Contractor executes this Contract as a free and voluntary act, without any duress, coercion, or undue influence exerted by or on behalf of Tampa Bay Water or any other party.

4.22.13 This Contract is a valid, binding and enforceable obligation of Contractor, and does not violate any law, rule, regulation, contract or Contract otherwise enforceable by or against Contractor, except as the same may be limited by bankruptcy, insolvency, reorganization or other similar laws affecting the rights of creditors generally.

5. Tampa Bay Water/Owner

5.1 General Provision

5.1.1. Written communications from Tampa Bay Water to the Contractor shall in general be issued through the Engineer, but if issued directly by Tampa Bay Water, a copy shall be provided to the Engineer.

5.1.2. Tampa Bay Water may issue without negotiation, and at its discretion, Change Authorizations, as provided in the Contract Documents. Only Tampa Bay Water is empowered under the Contract Documents to order changes in the Work that affect Contract Time or Contract Price or quality.

5.1.3. If the Work is Defective, or the Contractor fails to supply sufficiently skilled workers or suitable materials or equipment, or fails to furnish or perform the Work in a way that the completed Work will conform to the Contract Documents, Tampa Bay Water may order the Contractor to stop the Work, or any portion of the Work in question, until the cause for the stop order has been eliminated; however, this right of Tampa Bay Water to stop the Work shall not give rise to any duty on the part of Tampa Bay Water to exercise this right for the benefit of the Contractor or any other party. The Contractor shall not be allowed to recover any costs resulting from an order to stop the Work, and the Contractor shall reimburse Tampa Bay Water for all direct, indirect, or consequential costs attributable to an order to stop the Work; those costs to be documented as to reasonableness, and Tampa Bay Water shall be entitled to an appropriate decrease in Contract Price, or to withhold such decrease against any amounts recommended for payment. The Contractor shall remain responsible for maintaining and performing in accordance with the Progress Schedule and shall not be entitled to any extension in Contract Time or any increase in Contract Price.

5.1.4. Neither Tampa Bay Water, the Engineer, nor Tampa Bay Water's consultants will be responsible for the Contractor's means, methods, techniques, sequences, or procedures of construction, or the safety precautions, and programs related to safety, and neither Tampa Bay Water nor Engineer or any of their consultants shall be responsible for the Contractor's failure to perform or furnish the Work in accordance with Contract Documents.

6. Progress of the Work

6.1 Beginning of the Work

6.1.1. Prior to starting the Work, the Contractor shall prepare and submit to the Engineer, a Progress Schedule and a schedule for Submittals in a format acceptable to Tampa Bay Water and the Engineer and as specified in the General Requirements showing the dates on which each part or division of the Work is expected to be started and completed, and a schedule for Submittals.

6.1.2. No sooner than ten (10) Days before the Notice to Proceed is issued, a pre-construction conference shall be held to review the steps undertaken by the Contractor to comply with the schedule requirements; review the qualifications of the Contractor's on-site personnel; review

the Contractor's plans for lay-down and staging areas, construction traffic, and access to the Project site, parking, communications, procedures, and other similar matters.

6.2 Schedules and Progress Reports

6.2.1. The Progress Schedule or schedule recovery actions, once reviewed and accepted by Tampa Bay Water and Engineer, shall be utilized to report progress or schedule recovery actions, and to evaluate the Contractor's Payment Applications. The Contractor shall be required to keep Tampa Bay Water informed of the progress of the Work by delivering updated Progress Schedules prior to the seventh (7th) day of each month for Tampa Bay Water and Engineer' review and acceptance. Contractor's Submittal of acceptable monthly updates to the Progress Schedules is a condition precedent to Tampa Bay Water's obligation to make payments to Contractor hereunder. Notwithstanding anything in the Contract Documents to the contrary, it is expressly acknowledged and agreed that no review or acceptance of any Progress Schedule by Tampa Bay Water or Engineer shall be construed as an admission or acknowledgement by Tampa Bay Water or Engineer that any such Progress Schedule was either reasonable or achievable.

6.2.2. Prior to the seventh (7th) day of each month, the Contractor shall submit to the Engineer, an itemized Progress Report of the delivery status of purchased equipment and material, Shop Drawings and the status of shop and field fabricated Work. These Progress Reports shall indicate, but shall not be limited to, the dates of the purchase orders, the estimated delivery dates of any material and/or equipment, and cause(s) of delays, if any.

6.2.3. In addition to retainage, Tampa Bay Water shall have the right to withhold all or any portion of Progress Payments for the Work if the Contractor fails to update and submit the Progress Schedule(S) and Progress Reports as specified.

6.2.4. Neither Tampa Bay Water's nor the Engineer's review of the Contractor's Progress Schedule, or Tampa Bay Water's decision to raise or not to raise any objections about the Contractor's Progress Schedule, shall impose on Tampa Bay Water or the Engineer any responsibility for the timing, planning, scheduling, or execution of the Work, nor relieve Contractor of its obligation to complete the Work in a timely manner.

6.3 Prosecution of the Work

6.3.1. Tampa Bay Water and the Contractor agree that time is the essence with respect to Contractor's performance under the Contract Documents. The Contractor shall perform the Work at such time, and in or on such part(s) of the Project site as may be required to complete the Work as required by the Contract Documents.

6.3.2. If the Contractor desires to carry on Work at night or otherwise outside of the Working Hours, it shall give timely Notice to Tampa Bay Water and Engineer to allow satisfactory arrangements to be made for observing the Work in progress. The Contractor shall reimburse Tampa Bay Water for all of Tampa Bay Water's expenses associated with the Work performed outside of normal Working Hours.

6.3.3. The Contractor shall carry on the Work and adhere to the most recent approved Progress Schedule during all disputes or disagreements with Tampa Bay Water. No Work shall be delayed or postponed pending resolution of any disputes or disagreements. Upon receipt of a written order from the Engineer or Tampa Bay Water, the Contractor will immediately proceed with the Work regardless of whether a Change Order or Change Authorization has or has not been issued.

6.4 Tampa Bay Water's Right to Retain Imperfect Work

If any part or portion of the Work completed under the Contract Documents shall prove Defective, Tampa Bay Water shall have the right in its sole discretion, to retain such Work and may make such deductions in the payment due the Contractor as may be just and reasonable.

6.5 Tampa Bay Water's Right to do Work

Should the Contractor neglect to prosecute the Work in conformance with the Contract Documents or neglect or refuse at its own cost to remove and replace Work as shall have been rejected by the Engineer, then Tampa Bay Water may notify the Contractor and its Surety of the condition, and after seven (7) Days written Notice to the Contractor and its Surety, or without Notice if an emergency or danger to the Work or public exists, and without prejudice to any other right which Tampa Bay Water may have under the Contract Documents, take over that portion of the Work which has been improperly executed, and correct the deficiencies and deduct the cost thereof from the payments then or thereafter due the Contractor.

6.6 Tampa Bay Water's Right to Terminate

6.6.1. At any time, Tampa Bay Water may request the Contractor to provide adequate assurances of its ability to complete the Work in the manner and times designated in the Contract Documents. The types of adequate assurances shall be designated by Tampa Bay Water and shall consist of reasonable means for the Contractor to prove its ability to perform.

A. Termination for Cause

6.6.2. Tampa Bay Water, shall have full power and authority to terminate the services of the Contractor seven (7) Days after providing Notice to the Contractor and its Surety, or sooner if safety to persons or property is in question, because:

a. the Contractor refuses or fails to prosecute the Work, or separable part of the Work, with the diligence that will cause its completion within the corresponding Contract Time, including any authorized adjustments; supply sufficient skilled workers, materials or equipment in adherence with the Progress Schedule; or comply with the Progress Schedule requirements; or

b. the Contractor fails to complete the Work, or any separable part, within the corresponding Contract Time, including any authorized adjustments; or

c. the Contractor refuses or fails to make prompt payment to Subcontractors, disregards Laws and Regulations; refuses or fails to perform the Work in conformance with the Contract Documents; or violates any provision of the Contract Documents; or

d. the Contractor fails to provide Tampa Bay Water with adequate assurances in accordance with this Article, that the Contractor can complete the Work in accordance with the Contract Documents.

6.6.3. If, after the furnishing of said Notice, the Contractor and the Surety fail to cure or correct the default, Tampa Bay Water may terminate Contractor's right to perform the Work and take possession of the Project site and of all materials, tools, and appliances thereon, and require Contractor to assign to Tampa Bay Water any or all of Contractor's subcontracts with Subcontractors or Suppliers, as directed by Tampa Bay Water, and finish the Work by whatever method it may deem expedient and charge the cost thereof to the Contractor and Surety. In such case, the Contractor shall not be entitled to receive any further payment until the Work is finally completed. If the expense of completing the Work exceeds such unpaid balance of the Contract Price, the Contractor and its Surety shall pay the difference to Tampa Bay Water.

6.6.4. Where the Contractor's rights to perform the Work have been so terminated by Tampa Bay Water, the termination shall not affect any rights or remedies of Tampa Bay Water against the Contractor then existing or which may accrue after termination. Any retention or payment of monies due the Contractor by Tampa Bay Water shall not release the Contractor from its contractual liability or any other liability.

B. Termination for Convenience

6.6.5. Upon seven (7) Days written Notice to the Contractor and its Surety, Tampa Bay Water may, without cause and without prejudice to any other right or remedy, elect to terminate the Contractor's services under the Contract Documents in whole or in part. Upon receipt of such Notice, the Contractor shall immediately proceed in accordance with any specific provisions or instructions, to protect and maintain the Work, and make reasonable and diligent efforts to mitigate costs associated with the termination.

6.6.6. In any such termination for the convenience of Tampa Bay Water, the Contractor, as its sole and exclusive remedy, shall be entitled to payment for that portion of the Contract Price attributable to the Work completed, prior to receipt of the Notice of termination, in accordance with the Contract Documents, together with Contractor's reasonable and direct out-of-pocket termination expenses; provided, however, Contractor shall not be entitled to any further or additional recovery against Tampa Bay Water including, but not limited to, any lost profit on Work not performed or any other damages however categorized.

6.6.7. If, after Notice of termination for cause as provided in Paragraph 6.6.A above, it is determined the Contractor was not in default or that Tampa Bay Water was not entitled to the remedies set forth therein, the termination shall be deemed to have been for the convenience of Tampa Bay Water and Contractor's rights and remedies shall be the same as and limited to those set forth in Paragraph 6.6.6 above.

6.6.8. No waiver, express or implied, of any covenant, provision, right or remedy herein shall at any time thereafter be held to be a waiver of the terms and conditions of this Article.

6.7 Delays and Extensions of Time

6.7.1. If the Contractor is delayed in the progress of the Work by any act or neglect of Tampa Bay Water or the Engineer, or by any other contractor retained by Tampa Bay Water, or by strikes, lockouts, fire, adverse weather conditions not reasonably anticipated, or acts of nature, or any other cause beyond the fault and neglect of the Contractor, within 48 hours of the start of the occurrence, the Contractor shall provide Notice to Tampa Bay Water. Within seven (7) Days after the event which caused the delay has ended, the Contractor must provide full documentation of the impact of the delay. The Contract Time may be extended by Change Order or Change Authorization for such reasonable time as the Engineer and Tampa Bay Water determine. No extension of time will be granted to the Contractor for delays occurring to parts of the Work that have no measurable impact on the completion of the total Work. No extension of Contract Time will be considered for weather conditions reasonably anticipated for the area in which the Work is being performed. Reasonably anticipated weather conditions will be based on official records of monthly precipitation and other historical data. Adverse weather conditions, if determined by the Engineer to be of a severity that would impact progress of the Work, may be considered as cause for an extension of Contract Time. No request by the Contractor for an equitable adjustment to the Contract Time under this Article will be allowed, unless the Contractor has given the Notice and documentation within the times required.

6.7.2. Delays in delivery of equipment or material purchased by the Contractor or its Subcontractors or Suppliers shall not be considered as a cause for delay. The Contractor shall be fully

responsible for the timely ordering, scheduling, expediting, delivery, and installation of all equipment and materials.

6.7.3. Within 21 days (unless a longer period of time is reasonably required) after the Contractor submits to Tampa Bay Water and the Engineer a written request for an extension of time, the Engineer will present its written opinion to Tampa Bay Water as to whether an extension of time is justified and, if so, its recommendation as to the number of Days for time extension. Tampa Bay Water shall make the final decision on all requests for extensions to Contract Time.

6.7.4. The Contractor waives its right to file claims unless the claims are filed within the times specified in the Contract Documents. Tampa Bay Water's determination shall be final and binding on the Contractor unless the Contractor files suit within thirty (30) days after receipt of Tampa Bay Water's decision.

6.7.5. Notwithstanding anything in the Contract Documents to the contrary, no interruption, interference, inefficiency, suspension or delay in the commencement or the progress of the Work for any cause whatever, including those for which Tampa Bay Water or Engineer may be responsible, in whole or in part, shall relieve Contractor of its duty to perform or give rise to any right to damages or additional compensation from Tampa Bay Water. Contractor expressly acknowledges and agrees that it shall receive no damages for delay. Contractor's sole remedy, if any, against Tampa Bay Water will be the right to seek an extension to the Contract Time, in accordance with the procedures set forth in this Article 6.7; provided, however, the granting of any such time extension shall not be a condition precedent to the aforementioned "No Damage for Delay" provision. This paragraph shall expressly apply to claims for early completion, as well as to claims based on late completion. Notwithstanding the foregoing, if the Work is delayed due to the fault or neglect of Tampa Bay Water or Engineer, and such delays have a cumulative total of more than 30 calendar days, Contractor may make a claim, in accordance with the procedures set forth in Article 7.3, for its actual and direct delay damages accruing after said 30 calendar days.

6.8 Differing Site Conditions

6.8.1. The Contractor shall promptly, and before the conditions are disturbed, provide Notice to Tampa Bay Water and the Engineer of:

a. any subsurface or latent physical conditions at the Project site which differ materially from those (i) observed by Contractor prior to the Submittal of its Bid or (ii) indicated in the Contract Documents or the Existing Condition Documents referenced in the Information to Bidders,

or

b. any unknown physical conditions at the Project site, of an unusual nature, which differ materially from those ordinarily encountered and generally recognized as inherent in work of the character provided for in the Contract Documents.

6.8.2. The Engineer shall investigate the reported conditions promptly after receiving the Notice from the Contractor. If the conditions do materially differ and cause an increase or decrease in the Contractor's cost or time for performance of the work, an equitable adjustment shall be made in accordance with the procedures set forth in Articles 6.7 and 7.3 herein. Notwithstanding the provisions of this paragraph, if the reported condition in question would have been revealed by a thorough on-site inspection, Tampa Bay Water in its sole discretion shall have the right to deny any such claim for an adjustment in the Contract Price or Contract Time.

6.8.3. No request by the Contractor for an equitable adjustment to the Contract Price or Contract Time for differing site conditions will be allowed if made after the time periods set forth in Articles 6.7 or 7.3, or Final Completion, whichever first occurs.

6.9 Liquidated Damages

Should the Contractor fail to achieve Substantial Completion of the Work within the Contract Time, as that time may be adjusted pursuant to the terms of the Contract Documents, the Contractor shall pay to Tampa Bay Water the liquidated damages as set forth in the Contract. Tampa Bay Water shall have the right to deduct the liquidated damages from any amount due, or that may become due to the Contractor. If an insufficient amount of the Contract Price remains, the amount of liquidated damages shall be due and collectible from the Contractor and its Surety, jointly and severally.

6.10 Other Contracts

6.10.1. Tampa Bay Water reserves the right to let other contracts in connection with the Project. The Contractor shall afford other contractors reasonable opportunity for the introduction and storage of their equipment and materials for the execution of their work and shall properly interface and coordinate its Work with theirs.

6.10.2. If the execution of any part of the Work depends on the performance of any other contractor, utility service company or Tampa Bay Water, the Contractor shall promptly provide Notice to the Engineer of any defects or deficiencies that render it incompatible with the intended results of these Contract Documents. The Contractor's failure to provide the required Notice shall constitute an acceptance of the work by others as being fit and proper for integration with the Work.

6.11 Use of Premises

6.11.1. The Contractor shall confine its equipment, the storage of materials, and the operation of its workers to the areas shown on the Contract Documents or indicated by Laws and Regulations, permits, easements, licenses or directions of Tampa Bay Water or the Engineer. The Contractor shall provide, at its own expense, any rights-of-way or access to the Work which it may require outside the limits of Tampa Bay Water's property interests or easements and shall furnish Tampa Bay Water and the Engineer copies of permits and Contracts for use of property outside that provided by Tampa Bay Water prior to entering said properties.

6.11.2. The Contractor shall not load nor permit any part of any structure to be loaded in any manner that will endanger the structure, nor shall the Contractor subject any part of the Work or adjacent property to stresses or pressures that will endanger it.

6.11.3. The Contractor shall take all precautions to minimize inconvenience to residents living adjacent to the Project site by maintaining access to driveways and providing dust control for the Project site and noise control devices for dewatering equipment. Contractor shall assume full responsibility for any damage to any such land or area, or to the owner or occupant thereof, or of any land or areas contiguous thereto, resulting from the performance of the Work.

6.12 Substantial and Final Completion Dates

6.12.1. When the Contractor considers that the entire Work or designated portion thereof has progressed to the point where it is sufficiently complete in accordance with the Contract Documents, and it has been proven to be ready for its intended use, the Contractor shall provide Notice to Tampa Bay Water and the Engineer that the Contractor considers the Work or designated portion thereof, Substantially Complete (except for listed items to be completed or corrected prior to Final Completion). The Contractor shall prepare an initial list of items of Work to be corrected or completed for Final Completion and attach that list to the above

referenced Notice. Within a reasonable time after that, Tampa Bay Water, the Contractor, and the Engineer shall make an inspection to determine the status of completion.

6.12.2. If Tampa Bay Water and Engineer agree that Substantial Completion of the Work has been achieved, the Engineer shall issue a Certificate of Substantial Completion for the purpose of establishing the starting date for specific equipment warranties, and to establish the date that Tampa Bay Water shall assume the cost of operating such equipment. Said Certificate shall not be considered as Final Completion of any portion of the Work or relieve the Contractor from completing the remaining Work within the specified time and in compliance with the Contract Documents. The Engineer shall review and supplement the Contractor's initial list of items of Work to be corrected or completed for Final Completion and such revised and supplemental list shall be attached to the Certificate of Substantial Completion. Provided, however, the failure to include any incomplete or Defective Work on said list shall not relieve or excuse the Contractor from completing all of the Work in accordance with the requirements of the Contract Documents.

6.12.3. When the Contractor considers the entire Work has progressed to the point where it is complete in accordance with the Contract Documents, the Contractor shall provide Notice to Tampa Bay Water and the Engineer that the Contractor considers the Work to have reached Final Completion.

6.13 Performance Testing

Operating equipment and systems shall be performance tested in accordance with the General Requirements and in the presence of the Engineer to demonstrate compliance with the Contract Documents. The Contractor shall schedule such testing with the Engineer at least one (1) week in advance of the planned date for testing.

6.14 Tampa Bay Water's Use of Portions of the Work

Following issuance of the Notice of Substantial Completion, Tampa Bay Water may occupy and operate the Work. Such occupancy and operation shall not be considered as Final Completion of any portion of the Work, nor shall such occupancy or use be considered as cause for an extension of the Contract Time.

6.15 Cutting, Patching, or Fitting

The Contractor shall do all cutting, patching, or fitting of its Work that may be required to make its several parts come together properly and fit the Work to receive or be received by work of other contractors shown in or reasonably implied by the Contract Documents.

6.16 Cleaning Up

The Contractor shall, at all times, keep property on which Work is in progress and the adjacent property free from accumulations of waste material or rubbish caused by employees or by the Work. Upon completion of the construction, the Contractor shall remove all temporary structures, rubbish caused by employees, Suppliers, Subcontractors, or the Work, and waste materials resulting from its operations.

6.17 Intoxicants

The Contractor and persons under its employ shall not bring onto, possess, sell, or use alcohol, narcotics, drugs (other than prescription drugs, provided the person in possession of the drug has a valid prescription in his or her name, or over-the-counter drugs which may be purchased legally by the person), or controlled substances while on the Project site, including parking lots, at any time, including all breaks and lunch periods. The Contractor and persons under its employ shall not report to, or commence, or continue to work while under the influence of alcohol or any drugs, regardless of whether those drugs were legally or illegally taken. The Contractor and persons under its employ shall not undertake any activities at the Project site

which create a nuisance or improperly disturbs or interferes with Tampa Bay Water's operations at the Project site or the use and enjoyment of any adjacent properties by their respective owners. Gambling on the Project site is prohibited.

7. Payment

7.1 Partial Payments

A. General

7.1.1. Within ten (10) days after commencing the Work, but in any event prior to the Submittal of its first Payment Application, Contractor shall submit to Engineer, for Engineer's and Tampa Bay Water's review and approval, a proposed schedule of values which distributes the Contract Price among the various items and categories of Work to be performed. Said schedule of values shall be in such form and contain such detail as may be required by Engineer and Tampa Bay Water. The final approved schedule of values shall serve as the basis for partial payments and shall be incorporated into the Payment Application form provided by Tampa Bay Water. Nothing contained in this Article shall be construed to affect the right of Tampa Bay Water or Engineer to reject, the whole or any part of the Work, should such Work be found to be Defective. All estimated quantities of Work for which partial payments have been made are subject to review and correction on the final Payment Application. Payment by Tampa Bay Water and acceptance by the Contractor of partial payments based on Unit Price Work, shall not in any way constitute acceptance of the estimated Unit Price Work by Tampa Bay Water.

7.1.2. The Contractor shall provide Tampa Bay Water with copies of its written daily reports at weekly intervals. Refusal of the Contractor to provide its daily reports shall be cause for Tampa Bay Water to withhold payments until the Contractor's daily reports have been provided.

B. Estimate

7.1.3. The Contractor shall not submit more than one Payment Application per month with respect to the Work. Within twenty-five (25) Business Days following submission of a complete and accurate Payment Application to the Engineer, approved by the Engineer, and acceptable to Tampa Bay Water, Tampa Bay Water shall make partial payments to the Contractor on the basis of Work performed during the preceding calendar month by the Contractor. The final working day of each month shall be used as the day for measurement of Work performed.

7.1.4. The Engineer shall, within twenty-five (25) Business Days after receipt of each Payment Application for payment, provide Notice to Tampa Bay Water recommending payment to the Contractor, or return the request to the Contractor providing Notice of the Engineer's reasons for refusing to recommend payment. In the latter case, the Contractor may make the necessary corrections and resubmit the request. Payment shall be made by Tampa Bay Water within ten (10) Business Days after a corrected payment request is received.

7.1.5. The Engineer may refuse to recommend and Tampa Bay Water may refuse to pay the whole or any part of any payment, if in the Engineer's or Tampa Bay Water's opinion, the Contractor is not entitled to any such payment. The Engineer may also refuse to recommend and Tampa Bay Water may refuse to pay any payment or, because of subsequently discovered evidence or the results of subsequent inspections or tests of any Work, retract any previous recommendation or payment to such extent necessary in the Engineer's or Tampa Bay Water's opinion to protect Tampa Bay Water from loss for reasons not limited to:

a. The Work is Defective, or completed Work has been damaged requiring correction or replacement;

b. The Contract Price has been reduced because of Change Order;

c. Tampa Bay Water has been required to correct Defective Work or complete all or portions of the Work;

d. The Contractor's unsatisfactory prosecution of the Work in accordance with the Contract Documents;

e. Written claims have been made against Tampa Bay Water or liens have been filed in connection with the Work;

f. The Contractor's failure to make payment to Subcontractors OR Suppliers for labor, materials, or equipment;

g. Amounts owed by Contractor to Tampa Bay Water as Liquidated Damages; or

h. Any other amounts which may be owed to Tampa Bay Water by Contractor pursuant to the terms of the Contract Documents.

C. Deduction from Estimate

7.1.6. Unless modified in the Supplementary Conditions, Tampa Bay Water shall withhold from each partial payment, five percent (5%) of the amount earned for Work completed. A deduction and retainage of five percent (5%) shall be made on the estimated amount earned for approved items of material delivered to and properly stored at the Project site but not incorporated into the Work. The retainage is to be withheld by Tampa Bay Water until all Work has been performed in accordance with the Contract Documents and until such Work has been accepted by Tampa Bay Water.

7.1.7. Tampa Bay Water may deduct from each Payment Application an amount equal to Tampa Bay Water's estimate of the amount of Liquidated Damages then due, or which may become due.

D. Reimbursement

7.1.8. For Tampa Bay Water's expenses as defined in the General Conditions, Article 4.15. Submittals, and for testing that is performed by Tampa Bay Water or the Engineer which indicates Work is Defective, or for any other cost for which Tampa Bay Water is entitled to reimbursement from Contractor under the Contract Documents, at Tampa Bay Water's election, such reimbursement shall be deducted from the Contractor's monthly partial payments or shall be paid by Contractor within 30 days after Tampa Bay Water makes demand for same upon Contractor.

E. Qualification for Partial Payment for Materials Delivered

7.1.9. Partial payments for materials delivered but not yet incorporated into the Work shall be as described below:

a. Materials, as used herein, shall be considered to be those items which are fabricated and manufactured material and equipment. No consideration shall be given to individual purchases of less than $200.00 for any one item.

b. To receive partial payment for materials delivered to the Project site, but not incorporated in the Work, it shall be necessary for the Contractor to include a list of such materials with the Payment Application, the utilization of Tampa Bay Water provided forms is required. At its sole discretion, Tampa Bay Water, with the Engineer's advice, may approve items for which partial payment is to be made. Partial payments shall be based on the Contractor's actual cost for the materials as evidenced by invoices from the Supplier. Proper storage and protection shall be provided by the Contractor, As Approved by the Engineer. Final payment shall be made only for materials actually incorporated in the Work and upon acceptance of the Work, all materials remaining for which partial payments had been made

shall revert to the Contractor, unless otherwise agreed, and partial payments made for these items shall be deducted from the final payment for the Work.

c. Contractor warrants and guarantees that title to all items of Work requested in any Payment Application, whether incorporated in the Project or not, shall pass to Tampa Bay Water at the time of payment for such items, free and clear of all liens, claims, security interests, and encumbrances.

d. If requested by the Engineer, the Contractor shall provide, with subsequent Payment Applications, invoices receipted by the Subcontractor or Supplier showing payment in full has been made.

F. Payment

7.1.10. The amount of partial payment due the Contractor shall be equal to the current value of the Contract Price earned, less, any retainage, less any amounts previously paid, and any deductions for reimbursement as required by the Contract Documents.

7.2 Payment for Change Orders

7.2.1. Tampa Bay Water, without Notice to the Sureties, shall have the right to order changes to the Work. If the parties agree upon the terms for the change, including any appropriate adjustments to the Contract Price or Contract Time, a Change Order shall be issued. If the parties cannot agree upon the terms for the change, a Change Authorization may be issued by Tampa Bay Water. The terms of the Change Authorization shall be final and binding upon Contractor, unless Contractor makes a claim, within twenty-one (21) days of its receipt of the Change Authorization, challenging those terms it takes objection to, giving full details and supporting documentation for its specific objections. Any terms not specifically objected to within that twenty-one (21) day period shall be deemed final and accepted by Contractor. Regardless of whether or not Contractor files a timely claim with respect to any of the terms of the Change Authorization, Contractor shall proceed with the change to the Work, as set forth in the Change Authorization, as directed by Tampa Bay Water or Engineer.

7.2.2. At Tampa Bay Water's option, payment or credit for any changes covered by a Change Order or a Change Authorization, whether additive or deductive, shall be determined by one or a combination of the methods set forth in A, B, or C, below, as applicable:

A. Unit Prices

Those Unit Prices stipulated in the Contract shall be utilized where they are applicable. In the event the Change Order or Change Authorization results in a change in excess of twenty-five percent (25%) of the original Contract quantity, and the total dollar change in value of that item exceeds twenty-five percent (25%), Tampa Bay Water will review the Unit Price to determine if a new Unit Price shall be negotiated. Unit Prices for new unit items not listed in the Contract shall be negotiated and mutually agreed upon.

B. Lump Sum

A total lump sum amount for the Work negotiated and mutually acceptable to the Contractor and Tampa Bay Water. Lump Sum Price quotations for modifications to the Work shall include substantiating documentation with an itemized breakdown of Contractor and Subcontractor costs, including labor, material, rentals, approved services, overhead, and profit, all calculated as specified under "C" below.

C. Cost Reimbursement Work

The term "cost reimbursement work" shall be for changes to be compensated for on a time and expense basis, that is, on an accounting of the Contractor's forces, materials, equipment, and other items of direct cost as required for the change.

Tampa Bay Water, at its sole discretion, may direct the change to be accomplished on a cost reimbursement work basis, in which event the change will be priced based upon the labor, materials, equipment and other costs hereafter noted associated with such change. The cost items for cost reimbursement work shall be limited to the following items:

1. Labor, including superintendent and foremen, for those hours associated with the cost reimbursement work (actual payroll cost, including wages, fringe benefits as established by negotiated labor agreements, contracts, labor insurance and labor taxes as established by law). Expressly excluded from this item are all labor costs associated with negotiating the subject change. No other fixed labor burdens will be considered, unless approved in writing by Tampa Bay Water.
2. Material associated with the change, including sales tax, if paid for by the Contractor or its Subcontractor.
3. Rental, or equivalent rental cost of equipment, including necessary transportation for items having a rental value in excess of $100.00.
   Rental or equivalent rental cost shall be allowed for only those Days or hours during which the equipment is (or would have been for deductive changes) in actual use. Rental and transportation allowances shall not exceed the current rental rates prevailing in the locality. The rentals allowed for equipment shall, in all cases, be understood to cover all fuel, supplies, repairs, and renewals, and no further allowances shall be made for those items, unless specific Contract to that effect is made.
4. Additional bond as required and approved by Tampa Bay Water.
5. Additional insurance (other than labor insurance) as required and approved by Tampa Bay Water.
6. To the costs noted above, for net additive changes, there shall be added the following fixed fees for the Contractor or Subcontractor actually performing the change:

A. A fixed fee of twenty-five percent (25%) of the cost of item 1 above. For costs incurred for Work performed by Subcontractors, the Contractor's fee shall not exceed ten percent (10%) and the Subcontractor's fee shall be the same as for the Contractor; and

B. A fixed fee of ten percent (10%) added to the cost of items 2 and 3.

7.2.3. The fixed fees noted above in the previous paragraph shall be considered to be the full compensation for all cost of general supervision, overhead, profit, and any other general expense.

7.2.4. The Contractor's records shall make clear distinction between the direct costs of Work paid for on a cost reimbursement work basis and the costs of other Work. The Contractor shall furnish the Engineer report sheets in duplicate of each day's cost reimbursement work no later than the working day following the performance of said Work. The report sheets shall itemize the materials used, and shall cover the direct cost of labor and the charges for equipment rental, whether furnished by the Contractor, Subcontractor, or other forces. The report sheets shall provide names or identifications and classifications of workers, the hourly rate of pay and hours worked, and also the size, type, and identification number of equipment and hours operated.

7.2.5. Material charges shall be substantiated by valid copies of vendors' invoices. Such invoices shall be submitted with the daily reports or, if not available, they shall be submitted with subsequent daily report. Said daily report shall be signed by the Contractor or Contractor's Representative.

7.2.6. Tampa Bay Water reserves the right to furnish such materials and equipment as it deems expedient, and the Contractor shall have no claim for profit or added fees on the cost of such materials and equipment.

7.2.7. To receive partial payments and final payment for cost reimbursement work, the Contractor shall submit to the Engineer, in a manner approved by the Engineer and Tampa Bay Water, detailed and complete documented verification of the Contractor's and any of its Subcontractors' actual costs involved in the cost reimbursement work. Such costs shall be submitted within seven (7) Days after said Work has been performed.

7.2.8. Except for Change Authorizations and Change Order, no other written or oral order from Tampa Bay Water or the Engineer shall be treated as a change in the Work or entitle the Contractor to an adjustment to the Contract Price or Contract Time.

7.2.9. The Engineer, by issuing a Construction Directive, may order minor changes in the Work not involving extra cost, or additional times and not inconsistent with the purpose of the Project, but otherwise, except in an emergency endangering life or property, additions or deductions from the Work shall be performed only in pursuance of an approved Change Authorization or Change Order.

7.2.10. Any compensation paid in conjunction with the terms of a Change Order shall comprise the total compensation due the Contractor for the change defined in the Change Order. By signing the Change Order, the Contractor acknowledges that the stipulated compensation adjustment includes payment for alteration of the Work, payment for the interruption of schedules, extended overhead, delay, or any other impact claim or ripple effect, and by such signing specifically waives any reservation or claim for additional adjustment to compensation or time in respect to the subject Change Order.

7.2.11. Tampa Bay Water hereby delegates authority to its General Manager (and his/her designee) to approve any and all Change Order and Change Authorizations in its name, so long as each such Change Order or Change Authorization does not exceed $246,000.00, and further as long as the cumulative total of all Change Order or Change Authorizations does not exceed $246,000.00, unless otherwise approved by the Tampa Bay Water's Board. Each Change Order or Change Authorization over $246,000.00 or which cumulatively exceeds $246,000.00 must be expressly approved by Tampa Bay Water's Board before it shall be binding upon Tampa Bay Water.

7.3 Claims for Additional Compensation

7.3.1. In any case where the Contractor may seek additional compensation, except for an emergency threatening imminent property damage or personal injury, the Contractor shall provide Notice to Tampa Bay Water and the Engineer of its intent to make a claim for such compensation before it begins the Work on which it bases the claim, in order that such matter may be settled or other appropriate action promptly taken. If such notification is not given or the Engineer is not afforded proper facilities by the Contractor for keeping an accurate account of actual costs, the Contractor shall be deemed to have waived its claim for additional compensation.

7.3.2. The Contractor's written Notice, and the fact that the Engineer has kept account of the cost as aforesaid, shall not in any way be construed as proving the validity of the claim.

7.3.3. Claims for additional compensation shall be made in itemized detail and submitted in writing to Tampa Bay Water and Engineer within seven (7) Days following completion of that portion of the Work for which the Contractor bases its claim. If the claim is found to be acceptable by Tampa Bay Water and the Engineer, the Contractor shall be paid as provided in the General Conditions, Article 7.2. Payment for Change Orders. No request by the Contractor for an equitable adjustment to the Contract Price under this Article shall be allowed, unless the Contractor has given Notice within the times required.

7.3.4. The Contractor waives its right to file claims unless the claims are filed within the times specified in the Contract Documents. Tampa Bay Water's final determination shall be final

and binding on the Contractor unless the Contractor files suit within thirty (30) days after receipt of Tampa Bay Water's decision.

7.4 Release of Liens or Claims

The Contractor shall indemnify and hold harmless Tampa Bay Water and the Engineer from all claims for labor and materials furnished under the Contract Documents. Prior to the final payment, the Contractor shall furnish to Tampa Bay Water, as part of its final Payment Application, a certification that all of the Contractor's obligations on the Project have been satisfied and that all monetary claims and indebtedness have been paid. The Contractor shall furnish releases or waivers, satisfactory to Tampa Bay Water, from all Subcontractors and Suppliers and of all liens and notices arising out of or filed in connection with the Work. Tampa Bay Water may reduce the amount of retainage withheld upon receipt of an affidavit from Contractor identifying any amounts in dispute with Subcontractor or Suppliers, and provided the amount of retainage withheld continues to exceed the amount in dispute.

7.5 Final Payment

7.5.1. Upon completion of all of the Work, the Contractor shall provide Notice to the Engineer that it has completed its Work and shall request final payment. Upon receipt of such Notice, the Engineer, together with Tampa Bay Water, will inspect and, if acceptable, the Engineer will submit to Tampa Bay Water its recommendation as to acceptance of the Work and as to the final Payment Application of the Contractor. Within sixty (60) Days after the Contractor has submitted its final Payment Application, together with the Sureties' consent to final payment, and upon approval of this Payment Application request by Tampa Bay Water and compliance by the Contractor with provisions in the General Conditions, Article 7.4. Release of Liens or Claims, and all other provisions of the Contract Documents as may be applicable, Tampa Bay Water shall pay to the Contractor all monies due it under the provisions of these Contract Documents. Final payment is further subject to Tampa Bay Water's receipt from Contractor of all as-built DRAWINGs, certifications, maintenance manuals, operating instructions, written guarantees and warranties, and bonds relating to the Work, and assignment of all guarantees and warranties from Subcontractors, vendors, Suppliers or manufacturers, all as required by the Contract Documents.

7.5.2. Contractor and Tampa Bay Water agree that project closeout and release of retainage shall be in accordance with Chapters 218 and 255, Florida Statutes, as amended by Chapter 2023-134, Laws of Florida. Specifically, Contractor shall cooperate with Tampa Bay Water to prepare a punch-list with estimated costs of items to complete the Work. Within 20 business days of completion of said punch-list, Tampa Bay Water shall pay Contractor the remaining contract balance, including retainage previously withheld, less an amount equal to 150% of the estimated cost to complete the items on the punch-list, and also less any amounts that are subject to a good faith dispute made in writing to the Contractor by Tampa Bay Water.

7.6 No Waiver of Rights

Neither the inspection by Tampa Bay Water or the Engineer, nor any payment for or acceptance of the whole or any part of the Work by Tampa Bay Water or Engineer, nor any extension of time, nor any possession taken by Tampa Bay Water, shall operate as a waiver of any provision of the Contract Documents, or any right to damages, nor shall such waive any subsequent breach. Acceptance of final payment shall not release Contractor of any liability under the Contract Documents or otherwise, and shall not be deemed evidence of performance or be construed as acceptance of Defective or improper Work.

7.7 Acceptance of Final Payment Constitutes Release

The acceptance by the Contractor of the final payment shall release Tampa Bay Water and the Engineer from all claims and all liability to the Contractor for all things done or furnished in

connection with the Work, and every act of Tampa Bay Water and others relating to or arising out of the Work except claims previously made in writing and identified by Contractor in its final Payment Application as still unsettled. No payment, however, final or otherwise, shall operate to release the Contractor or its Sureties from obligations under the Contract Documents and the Performance Bonds, Payment Bonds, and other bonds and warranties, as herein provided.

7.8 Record Maintenance and Auditing Rights

Contractor shall keep all books, records, files and other documentation, including all electronically stored items, which concern or relate to the Work hereunder (collectively referred to herein as the "Records"), for a minimum of three (3) years from the date of expiration or termination of this Contract or the date of Final Completion or as otherwise required by law, whichever date is later. Tampa Bay Water, or any duly authorized agents or representatives of Tampa Bay Water, shall have the right to audit, inspect and copy all such Records as often as they deem necessary during any such period of time. This right to audit, inspect and copy Contractor's Records shall include all of the Records of the Subcontractors and Suppliers.

7.9 Hazardous Materials

If Contractor encounters on the Project site any materials reasonably believed by Contractor to be petroleum or petroleum-related products, or other hazardous or toxic substances which have not been rendered harmless, Contractor immediately shall (i) stop Work in the area affected and (ii) report such condition to Tampa Bay Water in writing. If the Work is so stopped and hazardous material is found, the Work in the affected area shall not thereafter be resumed except by Change Order. Any such Change Order shall include, but not be limited to, an adjustment to the Contract Time as appropriate. If no hazardous material is found after the Work has stopped, no Change Order is required to resume the Work in the affected area. Further, if the hazardous material was generated or caused by the Contractor, or any of its employees, agents, Subcontractors or Suppliers, no Change Order will be required for an adjustment in the Contract Time, and Contractor shall indemnify Tampa Bay Water for any costs incurred by Tampa Bay Water with respect to such hazardous material.

ADDENDUM NUMBER ONE

TO

REQUEST FOR PROPOSAL

FOR

CROSS BAR RANCH WELLFIELD WATER TRANSMISSION MAIN-UTILITY CONFLICT
CONTRACT NO. 2026017

RE: REMINDERS, CHANGES & QUESTIONS

This Addendum One consists of four (4) pages; accompanied by Revised Price Form Addendum One – Attachment "1" consisting of one (1) page; Revised Specification 01025 Measurement and Payment Addendum One – Attachment "2" consisting of nine (9) pages; and Revised Plan Sheets G-2, G-4, C-1, C-2 and C-3 Addendum One – Attachment "3" consisting of five (5) pages.

The following changes, additions, deletions, reminders, and/or inquiry responses are hereby made a part of the Request for Proposals for Tampa Bay Water's Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, Contract No. 2026017, as fully and completely as if the same were fully set forth therein.

REMINDERS: SUBMITTAL DUE DATE & TIME: **March 17, 2026, 2:00 p.m. (EDT)**.

CHANGES:

1) The Request for Proposal, Section 8.0 Bid Submittal Forms, #3. Price Form, on page 25, was revised in EUNA Procurement (EUNA) due to an error in the Estimated Quantity in Column E, for Item Nos. 3, 4, 5, 6, 9, 12, and 13. The Price Form has been revised in EUNA, however, if you previously downloaded the Price Form, please now use Revised Addendum One - Attachment "1" which has been updated in EUNA's electronic Price Form for the Project when you are submitting your Proposal.
2) ADDED "**Furnishing and installing 18 linear feet of 72-inch diameter casing pipe by open cut and casing spacers as shown on the drawings."** to Revised Addendum Attachment "2" Section 01025 Measurement and Payment, C. Item No. 3 Furnish and Install 60-inch Steel Water Main by Open Cut.
3) See Revised Addendum Attachment "3" Plan Sheets G-2, G-4, C-1, C-2 and C-3. Revisions are shown by clouded text and strikethroughs.

QUESTIONS:

Q1: Will the Owner allow award to a bidder holding only an active Florida General Contractor license, given that the scope of work does not appear to require an Underground Utilities

Contractor license and similar projects have historically been completed successfully under a GC license alone?

A1: No. Due to the nature of the work, Tampa Bay Water is requiring the contractor to hold both a General Contractor and Underground Utilities Contractor License in the State of Florida.

Q2 Are thrust blocks acceptable or will we need to bell restraint on the existing pipe?

A2: Existing pipe is shown to be replaced in place on both north and south connections to waive requirements of external bell restraints or thrust blocks. There is no need for thrust blocks or external bell restraints

Q3: Can the existing main be shut off with valves during tie-ins?

A3: Yes. The valve locations are shown on the condensed profiles on plan sheets D-2 and D-3. The valve closure will need to be coordinated with Tampa Bay Water prior to tie-in schedule. The pipe will need to be dewatered after the valves are closed, and the estimated volume of water is noted in the sequence of construction in Specification Section 01100.

Q4: Can tie ins be performed during the day or will it have to be night work?

A4: Tie-ins can be performed during the day. The existing pipeline shutdown period cannot exceed more than 14-days as indicated in Specification Section 01100.

Q5: Does this project have any minority goals/requirements?

A5: No.

Q6: Does this project have any Davis Bacon requirements?

A6: No.

Q7: Does this project have any Build by America requirements?

A7: This project does not include Build by America requirements. But in accordance with the requirements of Section 255.0993, Florida Statutes, any iron or steel product permanently incorporated in the project shall be produced in the United States. Bidders shall account for this requirement in preparing their Bid. In addition, this requirement will be stated in the final contract with the selected Bidder.

Q8: Does this project require a full time superintendent?

A8: Yes.

Q9: Will there be a link provided to watch the public bid opening online or will it only be in-person?

A9: The public bid opening will only be available "in-person". However, bidders are not required to attend in-person unless they choose to do so. A Bid Tabulation will be posted and available in EUNA for bidders to view by the end of the day.

Q10: Do contractors need to remove the existing water main?

A10: Existing water main is shown to be removed outside the existing FDOT roadway limits, as shown on plan sheet C-2. Approximately 95 LF of existing water main shall be filled with excavatable flowable fill, as shown on plan sheet C-2.

Q11: Will there be any owner direct purchase for valves or fittings on this project?
A11: Currently, there is no plan to use the Owner Direct Purchase (ODP) for this project. However, Tampa Bay Water reserves the right to implement ODP with respect to this project at later date. For all Bid submittals, please include all state and local sales and use taxes, as required by all laws and regulations, to be included in the unit pricing on the Price Form.

Q12: Can the casing size be reduced to 72" as this is more common size for MTBM equipment?
A12: Yes. The casing size is reduced to 72". Please refer to revised plan sheets.

Q13: Can the MTBM Crossing be lowered to gain additional cover between the top of casing and the existing utilities?
A13: The current plan provides approximately 24-inches between the deepest existing utility and top of casing pipe. Lowering of the microtunnel crossing may result in deeper shafts, additional dewatering and potential encroachment in the limestone layer. Any risks or costs borne by changes to the design will be responsibility of the Contractor.

Q14: For the butterfly valves required, are we to follow Section 2-3.01.01, Rubber-Seated Butterfly Valves 25 to 150 PSI Service (AWWA)? Or Section 2-3.01.02, Rubber-Seated Butterfly Valves 250 PSI Services (AWWA)?
A14: Follow Section 2-3.01.01, Rubber-Seated Butterfly Valves 25 to 150 PSI Service (AWWA).

Q15: What is the minimum thickness for the 78" steel casing installed by micro tunneling?
A15: Minimum thickness for the 72-inch steel casing pipe is 1-inch.

Q16: May Hobas Pipe USA be considered as a superior alternative to the currently specified 60" steel pipe for the project?
A16: Hobas Pipe is not considered as an alternative to the steel pipe for this project.

Q17: What are the allowed work hours of the project?
A17: Allowable work hours are Monday through Friday 7:00 AM through 6:00 PM. The microtunneling operation shall include continuous installation of the casing pipe until completed and shall be coordinated with Tampa Bay Water in advance. For the shutdown period, Tampa Bay Water may allow work outside the standard hours, however, this shall be coordinated with Tampa Bay Water in advance.

Q18: Can the owner provide details/drawings so we can account for the required materials and services needed to build the micro tunnel shaft properly?

A18: Contractor is expected to design the micro-tunnel shaft and shoring methods required for this project. Shaft construction is unique to micro-tunneling equipment and this is Contractor's means and methods. Refer to Specification Section 020410 Shaft Excavation and Support.

Q19: Given that the existing SR 52 is only about 40ft wide, and the widening of the road is supposed to start after the completion of this project, what is the reason 167ft of micro tunneling is required? Would installation of the 60" WM inside of the 78" casing pipe via open cut be possible on the south side of the road to save the owner cost?

A19: The project is currently permitted as a trenchless crossing with FDOT. The trenchless crossing was extended to 167 LF to avoid deep open cut excavation close to FDOT's current roadway and close to Tampa Bay Water's existing pipeline.

Q20: Is there a specific design reason why micro-tunneling is required for this project compared to another method such as jack & bore? From our experience and after careful review of the geo-tech report, it does not seem like any of the current conditions would deem micro-tunneling as necessary.

A20: A geotechnical investigation was performed for this project. The groundwater table in this area is high and the soil interface throughout the bore length is varying. Micro-tunneling is required for this project to mitigate risks and maintain accurate line and grade.

Q21: There appears to be an issue with the scaling of sheet C-2. The callouts for the different LF's of pipe items are not accurate to the lengths when take off. (ie., stationing scale is correct and then the callouts and the pipe lengths are not the same.) However, the LF callouts match sheet C-3. Can you confirm the callouts are correct and that the scale is incorrect, or vice-versa?

A21: The scaling is correct on the plan sheets. Please refer to revised plan sheets for all callouts.

Q22: No details or drawings are provided in the plans for the proper construction of the micro tunnel shafts. Can the owner provide details/drawings so we can account for the required materials and services needed to build the micro-tunnel shaft properly? (i.e., concrete thrust pads, shoring, etc.)

A22: Contractor is expected to design the micro-tunnel shaft and shoring methods required for this project. Shaft construction is unique to micro-tunneling equipment and this is Contractor's means and methods. Refer to Specification Section 020410 Shaft Excavation and Support.

END OF ADDENDUM ONE

TAMPA BAY WATER
Supplying Water To The Region

REVISED ADDENDUM ONE – ATTACHMENT "1"

3. PRICE FORM - CROSS BAR RANCH WELLFIELD WATER TRANSMISSION MAIN -UTILITY CONFLICT (Project #07153)

Failure to fully complete this form SHALL result in the Bidder being deemed NONRESPONSIVE.

Review this ITB in its entirety and provide pricing below that is inclusive of all expenses.

Item No. (a)	FDOT Pay Item No. (b)	Description (c)	Unit (d)	Estimated Quantity (e)	Unit Price ($) (f)	Total Estimated Price ($) (e)x(f)=(g) (g)
1	Misc.	General Conditions, Bonds and Insurance (2%)	Lump Sum	1	$_____	$_____

REVISED ADDENDUM ONE -ATTACHMENT "2"

SECTION 01025

MEASUREMENT AND PAYMENT

PART 1 - GENERAL

1.1 GENERAL

A. The CONTRACTOR shall receive and accept the compensation provided in the PROPOSAL and the AGREEMENT as full payment for furnishing all materials, labor, tools and equipment, for performing all operations necessary to complete the WORK and also as full payment for loss or damages arising from the nature of the WORK, or from any discrepancy between the actual quantities of WORK and quantities herein estimated by the ENGINEER, or from the action of the elements or from any unforeseen difficulties which may be encountered during the prosecution of the WORK until FINAL COMPLETION.

B. The prices stated in the PROPOSAL include all costs and expenses for taxes, labor, equipment, materials, commissions, transportation charges and expenses, patent fees and royalties, labor for handling materials during inspection, together with any and all other costs and expenses for performing and completing the WORK. The basis of payment for UNIT PRICE WORK shown in the PROPOSAL shall be in accordance with the description of the respective items in this Section.

C. The CONTRACTOR'S attention is called to the fact that the prices for the various items of work are intended to establish a total price for completing the WORK in its entirety. Should the CONTRACTOR feel that the cost for any item of WORK has not been established by the PROPOSAL form, the cost for that work shall be included in some other applicable PROPOSAL item, so that the PROPOSAL for the PROJECT does reflect the CONTRACTOR'S total price for completing the WORK in its entirety.

D. Unless specifically listed as a Bid Item, no separate payment will be made for the following items and the cost of such work shall be included in the applicable contract pay items of work.

1. Clearing and grubbing.
2. Excavation, including necessary pavement/slab removal.
3. Shoring and sheeting.
4. Dewatering and disposal of surplus water including well point dewatering as directed by Engineer.
5. Backfilling.
6. Grading.
7. Replacement or restoration of paved or unpaved roadways, grass and shrubbery plots outside of established pay limits.
8. Replacement or restoration of curbing, gutter, sidewalk, and site restoration of any areas damaged during construction activities.
9. Temporary facilities and controls during construction such as water/sanitary facilities,

traffic control and environmental protection, unless specifically provided for in a pay item.

10. Removing and disposing of waste material due to construction.
11. Cleanup.
12. Refill materials, except as hereinafter specified.
13. Testing and placing system in operation.
14. Any material or equipment required installed and/or used for the tests.
15. Maintaining the existing quality of service during construction.
16. Repair of sanitary sewer house laterals damaged during construction.
17. Repair and/or cleaning of storm sewers, inlets & catch basins damaged or filled with sediment during construction.
18. Color audio-video construction record.
19. Providing the services of an Independent Testing Laboratory for materials and compaction testing.
20. Providing the services of a professional land surveyor, licensed in the State of Florida, to establish horizontal and vertical control, layout the work, and assist with the preparation of record drawings.
21. Cost to reproduce drawings, specifications, shop drawings, and reports for the Contractor's use and for submissions to the OWNER
22. Temporary fencing.
23. Dust Control.
24. Noise suppression measures.
25. Removing, relocating, resetting existing street signage to facilitate construction.
26. Removing, relocating, resetting mailboxes to facilitate construction.
27. Utility notification and location and exploratory pits; and
28. All other appurtenant work as required for a complete and operable system.

1.2 MEASUREMENT

A. The quantities shown are approximate and are only given as a basis of calculation upon which the award of the CONTRACT is to be made. The OWNER does not assume any responsibility for the final quantities, nor shall the CONTRACTOR claim misunderstanding because of such estimate of quantities. The quantities for payment shall be determined by actual measurement of the completed items, in place, ready for service and accepted by the OWNER, in accordance with the applicable method of measurement therefore contained herein. Representatives of the CONTRACTOR and the ENGINEER shall witness all field measurements.

1.3 WORK OUTSIDE AUTHORIZED LIMITS

A. No payment will be made for WORK constructed outside the authorized limits of work.

1.4 MEASUREMENT STANDARDS

A. Unless otherwise specified for the particular items involved, all measurements of distance shall be taken horizontally or vertically.

1.5 PROPOSAL ITEM DESCRIPTIONS

Detailed descriptions for each PROPOSAL item follow:

A. Item No. 1 – GENERAL CONDITIONS, BONDS AND INSURANCE

The bid price for General Conditions, Bonds and Insurance shall be a lump sum amount included in the bid. This bid item shall include obtaining all permits, insurance, and bonds; providing a color audio-videotape of existing conditions of the construction site or route; and complying with all of the general conditions of the Contract as required for the proper performance and completion of the work.

Bid price for General Conditions, Bonds and Insurance shall not exceed 2% of the bid subtotal for installed items and Mobilization.

Payment for Bid Item #1 shall be made successfully upon successfully obtaining bonds, insurance and completing audio-video tape of preexisting conditions for the project.

Contractor shall submit original signed copies of bonds, provide copies of proof of insurance and an electronic copy of the audio-videotape of existing conditions prior to beginning any other construction activity on the projects and prior to invoicing for this bid item.

B. Item No. 2 – MOBILIZATION AND DEMOBILIZATION

The bid price for mobilization and demobilization shall be a lump sum amount calculated as a percentage of the subtotal of the bid items to be installed. This bid item shall include securing a staging area in proximity to the work if public lands are insufficient; moving onto the site all materials and equipment; furnishing and erecting temporary buildings, access roads and other items as necessary to complete the work; providing field trailers, sanitary facilities and potable water facilities as required for the proper performance and completion of the work.

Bid price for mobilization shall not exceed 5% of the bid subtotal for installed items.

Payment for mobilization will be on an incremental basis in accordance with the following:

Percent of Original Contract Amount Earned	Allowable Percent of the Lump Sum Price for the Item
5	15
10	25
25	50
50	75
75	85
100	100

C. Item No. 3 – FDOT PAY ITEM – 1050 61260 - FURNISH AND INSTALL 60-INCH STEEL WATER MAIN BY OPEN CUT

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all 60-inch diameter steel pipe via open cut trench. The installation of pipe shall include, but may not be limited to:

1. Performing all evaluations and calculations necessary for the proper implementation of the installation.
2. Furnishing, installing and maintaining all necessary Maintenance of Traffic measures;
3. Furnishing, installing and maintaining all necessary erosion control measures including but not limited to artificial coverings, mowing, sandbagging, slope drains,

sediment basins, hay bales, straw, floating silt barrier, staked silt barrier and seeding;

4. Maintaining the trench, which shall include dewatering, barricading, sheeting, shoring, containment, and berming as required or as directed by the Engineer;
5. Protecting existing utilities in place, including coordinating with third party to support poles where needed.
6. Installing the pipe;
7. Joining the pipe as required;
8. Furnishing and installing MJ adapters as necessary to connect steel pipe to other pipe materials, fittings, and valves;
9. Backfilling and compaction of trench;
10. Hydrostatic pressure testing and cleaning the pipe;
11. Disinfection, sampling and laboratory testing for bacteria;
12. All steel pipe joint testing by an independent third-party laboratory;
13. Cleaning up the job site which shall include removing excess materials and debris and re-grading the terrain;
14. Connecting piping to existing piping and/or structures; and
15. All other ancillary materials, equipment, labor, water, and power required for the complete installation of the piping.
16. **Furnishing and installing 18 linear feet of 72-inch diameter casing pipe by open cut and casing spacers as shown on the drawings.**

All work shall be in accordance with the Technical Specifications.

Payment for installing 60-inch steel pipe by open cut shall be based on the horizontal distance in linear feet of pipe measured along the top centerline of the installed, in place, complete and acceptable to the OWNER'S REPRESENTATIVE.

D. Item No. 4 – FDOT PAY ITEM – 1050 61160 - FURNISH AND INSTALL 60-INCH STEEL WATER MAIN BY MICROTUNNELING

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all 60-inch diameter steel pipe via microtunelling including the launch and receiving shafts. The installation shall include, but may not be limited to:

1. Furnishing, cutting and joining the steel casing pipe.
2. Microtunnel installation of the steel casing pipe.
3. Furnishing and installing the "casing spacers" on the carrier pipe.
4. Furnishing and installing the carrier pipe.
5. Furnishing and installing bulkheads or end seals to seal the annular space.
6. Furnishing and installing cement-fly ash slurry mix to grout the annular space.
7. Excavating the entrance and recovery shafts, including rock and muck excavation and removal;
8. Maintaining the entrance and recovery shafts including dewatering, sheeting, shoring and bracing as required;
9. Ground treatment to soften earth to allow installation of sheeting.
10. Conveyance of soil dewatering and initial and weekly testing.
11. Installation and removal of erosion control devices and control of runoff from the site;
12. Removal and replacement of fence and gates;
13. Removal and protection of trees as indicated on the CONTRACT DRAWINGS;

14. Backfilling and compaction of entrance and recovery shafts, including flowable fill cradle up to the springline of the lower bends in the shafts.
15. Settlement monitoring.
16. All surface restoration within limits of construction including mulching, seeding and appurtenant work.

Payment for 60-inch steel water main by microtunneling shall be based on actual linear feet of the casing pipe measured along the centerline of the pipe in place complete and acceptable to the OWNER'S REPRESENTATIVE.

E. Item No. 5 – FDOT PAY ITEM – 1050 61236 - FURNISH AND INSTALL 36-INCH STEEL WATER MAIN BY OPEN CUT

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all 36-inch diameter steel pipe via open cut. The installation of pipe shall include, but may not be limited to:

1. Performing all evaluations and calculations necessary for the proper implementation of the installation.
2. Furnishing, installing and maintaining all necessary Maintenance of Traffic measures;
3. Furnishing, installing and maintaining all necessary erosion control measures including but not limited to artificial coverings, mowing, sandbagging, slope drains, sediment basins, hay bales, straw, floating silt barrier, staked silt barrier and seeding;
4. Maintaining the trench, which shall include dewatering, barricading, sheeting, shoring, containment, and berming as required or as directed by the OWNER'S REPRESENTATIVE;
5. Protecting existing utilities in place, including coordinating with third party to support poles where needed.
6. Installing the pipe;
7. Joining the pipe as required;
8. Furnishing and installing MJ adapters as necessary to connect steel pipe to other pipe materials, fittings, and valves;
9. Backfilling and compaction of trench;
10. Hydrostatic pressure testing and cleaning the pipe;
11. Disinfection, sampling and laboratory testing for bacteria;
12. All steel pipe joint testing by an independent third-party laboratory;
13. Cleaning up the job site which shall include removing excess materials and debris and re-grading the terrain;
14. Connecting piping to existing piping and/or structures; and
15. All other ancillary materials, equipment, labor, water, and power required for the complete installation of the piping.

All work shall be in accordance with the Technical Specifications.

Payment for installing 36-inch steel pipe by open cut shall be based on the horizontal distance in linear feet of pipe measured along the top centerline of the installed, in place, complete and acceptable to the OWNER'S REPRESENTATIVE.

F. Item No. 6a – FDOT PAY ITEM – 1055 61160 - FURNISH AND INSTALL 60-INCH STEEL FITTINGS

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all steel fittings via open cut trench. The installation of fittings shall include, but may not be limited to:

1. Furnishing and installing appropriate fittings including tees and bends.
2. Performing all evaluations and calculations necessary for the proper implementation of the installation.
3. Joining fitting to the pipeline.

Payment for installation of 60-inch fittings shall be based on each fitting furnished and installed.

G. Item No. 6b – FDOT PAY ITEM – 1055 61136 - FURNISH AND INSTALL 36-INCH STEEL FITTINGS

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all steel fittings via open cut trench. The installation of fittings shall include, but may not be limited to:

1. Furnishing and installing appropriate fittings including tees and bends.
2. Performing all evaluations and calculations necessary for the proper implementation of the installation.
3. Joining fitting to the pipeline.

Payment for installation of 36-inch fittings shall be based on each fitting furnished and installed.

H. Item No. 7 – FDOT PAY ITEM – 1080 26102 - FURNISH AND INSTALL AIR RELEASE VALVES

The CONTRACTOR shall provide all labor, equipment, and materials to furnish and install the air release valve assembly of the size and type specified. The unit price shall include the cost of jointing materials, including rings, reducer(s), joint restraining, polyethylene wrap, bolts and gaskets, installation costs, concrete support, concrete valve box pad with bronze disc, air valve box, air valve lateral, and vent pipe.

The quantities for payment shall be the actual number of valves of each size and type specified herein, completed and accepted.

The quantities determined as specified above shall be paid at the unit price bid for each valve.

I. Item No. 8a – FDOT PAY ITEM – 1080 24160 - FURNISH AND INSTALL 60-INCH BUTTERFLY VALVES

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install the valves of the size and type specified. The unit price shall include the cost of jointing materials, including rings, reducer(s), joint restraining, polyethylene wrap, bolts and gaskets, installation costs, concrete support, and concrete valve box pad with bronze disc, where required, and extension stems and adjustment of valve boxes to existing grade.

The quantities for payment shall be the actual number of valves of each size and type specified herein, completed and accepted.

The quantities determined as specified above shall be paid at the unit price bid for each valve.

J. Item No. 8b – FDOT PAY ITEM – 1080 24136 - FURNISH AND INSTALL 36-INCH BUTTERFLY VALVES

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install the valves of the size and type specified. The unit price shall include the cost of jointing materials,

including rings, reducer(s), joint restraining, polyethylene wrap, bolts and gaskets, installation costs, concrete support, and concrete valve box pad with bronze disc, where required, and extension stems and adjustment of valve boxes to existing grade.

The quantities for payment shall be the actual number of valves of each size and type specified herein, completed and accepted.

The quantities determined as specified above shall be paid at the unit price bid for each valve.

K. Item No. 9 – FDOT PAY ITEM – 0400-603 - CATHODIC PROTECTION

Contractor shall furnish and provide labor, equipment and materials to install cathodic protection system for the steel pipelines as shown in the Contract Drawings and as indicated in the specifications and shall include, but is not limited to, installation of test stations, dielectric gaskets, anode beds, test station housing and terminal boards, welding, and testing complete, all necessary excavation, sheeting and bracing, shoring, dewatering, backfilling, disposal of excess excavated material, restraints, painting to OWNER'S standards, testing, restoration, cleanup, and all other items necessary to complete the job, whether specifically mentioned or implied.

Payment for installing cathodic protection shall be based on lump sum basis for all of the installed cathodic protection system, in place, tested, complete and acceptable to the Engineer.

L. Item No. 10 - FDOT PAY ITEM – E574 1 -SOD RESTORATION

Contractor shall furnish all labor, equipment, and materials to replace and maintain all sodded areas as specified and as shown on the Contract Drawings and as directed by the OWNER'S REPRESENTATIVE.

The quantity of lawn area, in square yards, to be measured for payment will be the actual area of sodded areas, placed within the limits of construction shown on the DRAWINGS except for the temporary construction easement, specified or as directed. Temporary construction easement shall be seeded and mulched.

Payment: Payment for sod restoration shall be made at the unit price bid per square yard.

M. Item No. 11 – FDOT PAY ITEM 0430830 - PLACE EXISTING PIPE OUT OF SERVICE BY GROUTING

The CONTRACTOR shall furnish all labor, equipment and materials to place existing pipe out of service by grouting it as designated, shown, specified or directed by the OWNER'S REPRESENTATIVE. The work also includes furnishing all labor and equipment for grouting existing pipe as shown.

Payment for grouting existing pipe shall be made per cubic yard of grout installed.

N. Item No. 12 – FDOT PAY ITEM 1050 16006 - PLACE EXISTING PIPE OUT OF SERVICE BY REMOVING

The CONTRACTOR shall furnish all labor, equipment and materials to remove pipe and appurtenances as designated, shown, specified or directed by the OWNER'S REPRESENTATIVE. The work also includes plugging the open ends of existing pipe to remain and be grouted, transporting the removed pipe

and appurtenances, without delay, to the CONTRACTOR's own place for proper disposal. The work includes disposal, excavation, backfill, compaction and restoration.

Payment for removal of existing pipe shall be based on actual linear feet of the pipe removed measured along the centerline of the pipe in place complete and acceptable to the OWNER'S REPRESENTATIVE.

O. Item No. 13 – INDEMNIFICATION

Payment for indemnification shall be made at the lump sum price ($100), which price and payment shall be full compensation for providing indemnification in accordance with the General Conditions, Article 4.4; Indemnity. Payment shall be included in the first payment request submitted.

P. Item No. 14 – PROJECT ALLOWANCE

Measurement for this item will be made for in accordance with the CHANGE ORDER authorized by the OWNER. The allowance is for payment of permit fees and extra work specifically authorized by the OWNER, the compensation for which shall be determined in accordance with the CHANGE ORDER provisions of the General Conditions. Said compensation shall be deducted from the allowance at the time the CHANGE ORDER is authorized by the OWNER.

Payment for permit fees will be made to the Contractor based on actual invoiced amounts paid by the Contractor to obtain required FDEP Notice of Intent to Discharge Stormwater from Construction Activities.

Payment will not be made for:

1. Contractor premiums or markups.
2. Fees incurred due to Contractor's negligence.
3. Permits required for items for the Contractor's convenience but not required by the Contract Documents or the Engineer.
4. Fees and costs associated with utility services to temporary construction trailers and electricity required by the Contractor during construction.

Payment from the project allowance shall be made on either a lump sum or unit price basis, per the CHANGE ORDER, only after authorization from the OWNER, and then in accordance with the CHANGE ORDER provisions of the General Conditions.

END OF SECTION

REVISED ADDENDUM ONE -ATTACHMENT "3"

REVISED PLAN SHEETS G-2, G-4. C1, C-2 AND C-3

GENERAL NOTES:

1. ALL ELEVATIONS SHOWN ON THE DRAWINGS AND IN THE SURVEY NOTES ARE REFERENCED TO NORTH AMERICAN VERTICAL DATUM OF 1988. STATE PLANE COORDINATES ARE REFERENCED TO NORTH AMERICAN DATUM OF 1983/90 (NAD 28/90).

2. LOCATIONS, ELEVATIONS AND DIMENSIONS OF EXISTING UTILITIES, STRUCTURES AND OTHER FEATURES ARE SHOWN ACCORDING TO THE BEST INFORMATION AVAILABLE AT THE TIME OF THE PREPARATION OF THESE DRAWINGS, BUT DO NOT PURPORT TO BE ABSOLUTELY CORRECT. THE CONTRACTOR SHALL OBTAIN THE LOCATIONS, ELEVATIONS AND DIMENSIONS OF ALL EXISTING UTILITIES, STRUCTURES AND OTHER FEATURES AFFECTING HIS WORK PRIOR TO CONSTRUCTION.

3. LAND SURVEY WAS OBTAINED FROM FDOT FPID 25633415201 PLANS DATED MARCH 2021.

4. UTILITIES AND STRUCTURES THAT ARE NOT SHOWN ON THE DRAWINGS TO BE REMOVED AND REPLACED OR RELOCATED, SHALL BE PROTECTED IN PLACE AND UTILITY SERVICE SHALL BE MAINTAINED. WHERE TEMPORARY CONFLICTS OCCUR BETWEEN EXISTING UTILITIES AND THE NEW CONSTRUCTION, PROTECT IN PLACE OR RELOCATE THE UTILITIES AND MAINTAIN UTILITY SERVICE ALL TO THE SATISFACTION OF THE UTILITY COMPANY. UTILITIES AND STRUCTURES SHOWN ON THE DRAWINGS TO BE REMOVED AND REPLACED OR RELOCATED, SHALL CONFORM TO THE REQUIREMENTS OF THE APPLICABLE TECHNICAL SPECIFICATIONS.

1 ~~5. PROVIDE ADEQUATE, TEMPORARY THRUST RESTRAINT AT BENDS AND TEES IN EXISTING WATER MAINS AND OTHER PRESSURIZED CONDUITS IN PROXIMITY TO EXCAVATIONS AS REQUIRED TO PREVENT DISLODGEMENT, SEPARATION OR LEAKAGE OF THESE FACILITIES.~~

6. DISCHARGE OF ANY NON-CONTAMINATED WATER FROM SOIL DEWATERING OPERATIONS TO SURFACE WATERS, IF ANY, SHALL CONFORM TO THE FDEP GENERAL PERMIT REQUIREMENTS.

7. PROVIDE AT LEAST 48 HOURS NOTICE TO THE VARIOUS UTILITY COMPANIES IN ORDER TO PERMIT THE LOCATION OF EXISTING UNDERGROUND UTILITIES IN ADVANCE OF CONSTRUCTION. NOTIFY THE VARIOUS UTILITY COMPANIES BY CALLING THE SUNSHINE ONE CALL CENTER (1-800-432-4770) OR IF NECESSARY, BY CONTACTING THE UTILITY COMPANIES INDIVIDUALLY.

8. CONFIRM UTILITY TO UTILITY CLEARANCES, HORIZONTAL AND VERTICAL, AND PIPE JOINT LOCATIONS IN ACCORDANCE WITH FLORIDA ADMINISTRATIVE CODE 62-555.314 AND 62-604.400.

9. THE HORIZONTAL ALIGNMENT OF THE REPLACEMENT WATER MAIN SHALL BE AS DIMENSIONED TO THE SURVEY BASELINE ON THE DRAWINGS. THE CONTRACTOR SHALL OBTAIN A COPY OF THE SURVEY AND LOCATE THE SURVEY BASELINE IN THE FIELD PRIOR TO CONSTRUCTION.

10. PIPE LAYING, LEAKAGE TESTING AND AS-BUILT DRAWINGS SHALL CONFORM TO ALL INFORMATION INDICATED ON THE PLANS AND DETAILS OR PROJECT TECHNICAL SPECIFICATIONS.

11. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO PROTECT ALL TREES WITHIN THE VICINITY OF THE PROPOSED CONSTRUCTION IN ACCORDANCE WITH PASCO COUNTY PROTECTION STANDARDS UNLESS OTHERWISE INDICATED FOR REMOVAL. PRUNING OF BRANCHES IS NOT AUTHORIZED WITHOUT PRIOR APPROVAL FROM THE COUNTY, AND SHALL BE COMPLETED BY A CERTIFIED ARBORIST.

12. CONTRACTOR TO COORDINATE WITH UTILITY POLE OWNERS TO PROVIDE SUPPORT DURING CONSTRUCTION. UTILITY POLE OWNERS REPRESENTATIVE TO APPROVE SUPPORT METHOD PRIOR TO BEGINNING EXCAVATION AROUND UTILITY POLES. ONCE WORK IN THE AREA HAS BEEN COMPLETED, UTILITY REPRESENTATIVE SHALL INSPECT AND APPROVE FINAL GRADING PRIOR TO SUPPORT BEING REMOVED.

13. REFER TO GENERAL REQUIREMENTS SECTION OF TECHNICAL SPECIFICATIONS FOR PERMIT AGENCY COMMENTS.

14. ALL EXCAVATION AND BACKFILLING SHALL BE IN STRICT CONFORMANCE WITH TAMPA BAY WATER AND FLORIDA DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS.

15. WHERE CONSTRUCTION ACTIVITIES OCCUR WITHIN THE DRIP LINES OF EXISTING TREES, TREES ARE TO BE PROTECTED PER PASCO COUNTY NATURAL RESOURCES DIVISION REQUIREMENTS. ANY ROOT OR CANOPY TRIMMING TO FACILITATE CONSTRUCTION OF PROPOSED FACILITIES IS TO BE PERFORMED AT THE DIRECTION OF A CERTIFIED ARBORIST.

1 16. ANY AREAS DISTURBED BY CONSTRUCTION SHALL BE GRADED TO THE ORIGINAL GRADE AND ~~SEEDED~~ SODDED AND MULCHED.

17. ADD TEMPORARY 1" THICK STEEL PLATES TO ACT AS SHOCK PADS OVER EXISTING 60" PIPE WITHIN PROJECT LIMITS TO PROTECT DURING CONSTRUCTION.

18. CONTACT INFORMATION:

    TAMPA BAY WATER
    NAME: DANIELLE KEIRSEY, PROJECT MANAGER
    PHONE: (727) 791-2377

19. TAMPA BAY WATER WILL CONTINUE TO MAINTAIN OWNERSHIP OF THE GROUTED, OUT-OF-SERVICE 60" WATER TRANSMISSION MAIN UNTIL ROADWAY PROJECT 256334-3-52-01 IS LET, WHERE IT WILL BE REMOVED DURING ROADWAY CONSTRUCTION, BY THE UAO.

FDOT NOTES:

1. CONTACT FDOT JAMES MEYER 48 HOURS BEFORE WORKING IN FDOT R/W 352-848-2600 TO ACTIVATE PERMIT.
2. SIDEWALKS SHOULD NOT BE CLOSED FOR MORE THAN 2 WEEKS FOR THE DURATION OF THE PERMIT. THE CONTRACTOR WILL NEED TO PROVIDE ACCOMMODATION FOR PEDESTRIANS.
3. RESTORE FDOT R/W WITH SOD ONLY.
4. CONTACT SCOTT BROWN PASCO COUNTY FOR LOCATES OF LIGHTING FIBER AND SIGNAL CONDUITS: PASCO COUNTY 727-849-6845
5. FOR MICROTUNNELS UNDER FDOT ROADWAYS THERE MUST BE A CONTINGENCY PLAN AND DEWATERING PLAN. CONTINGENCY SHOULD HAVE AN EMERGENCY ON CALL MOT/TTC CONTRACTOR AND AN EMERGENCY ASPHALT CONTRACTOR TO RESTORE THE ROADWAY IF SOMETHING SHOULD HAPPEN TO THE MICROTUNNEL.
6. FDOT RECOMMENDS GPR BE PERFORMED ALONG PATH OF MICROTUNNEL MINIMUM OF 10' ON EITHER SIDE OF THE CASING PIPE PRIOR TO PRE-DRILL MEETING WITH FDOT INSPECTOR WHICH IS REQUIRED.

1 7. CONTRACTOR SHALL NOT LEAVE ANYTHING IN THE CLEAR ZONE WHEN IT'S AN INACTIVE WORK ZONE.
8. ALL EROSION AND CONTROL DEVICES SHALL BE MAINTAINED DURING CONSTRUCTION.
9. COORDINATE WITH FDOT TO PLACE SIGNS OR MAINTAIN TEMPORARY TRAFFIC CONTROL PLAN FOR TRUCKS ENTERING AND EXITING THE HIGHWAY.

Description: Tampa Bay Water, a Regional Water Supply Authority, is soliciting formal bids for the construction of its Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict.

Important Notice: Tampa Bay Water issues its solicitations electronically through its contracted vendor, Euna Procurement ("Euna"). All Addenda to such solicitations will be issued exclusively through Euna. If you have obtained this solicitation from a source other than Euna, you will not be listed on the plan holders list and may not receive notification of any Addenda issued. Failure to receive any issued Addenda shall not relieve the Bidder from any obligation(s) contained in the Addenda. To access Tampa Bay Water solicitations, any resulting Addenda and Bid results, go to: https://tampabaywater.bonfirehub.com. If you need assistance in registering with Euna send an email to: Support@GoBonfire.com or visit Euna's help forum at https://vendorsupport.gobonfire.com/hc/en-us.

1.0 INTRODUCTION

1.1 PURPOSE

The purpose of this Invitation to Bid (ITB) is to solicit Bids from qualified firms or individuals to provide construction services to Tampa Bay Water's Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, Project No. 07153, under Contract #2026017 ("the Project"). The Project is located in Pasco County. The estimated construction budget for this project is $2,700,000.00.

1.2 SCOPE

The scope of the Work contemplated consists of all materials, labors, tools and equipment necessary to construct approximately 500 linear feet (LF) of 60-inch steel pipe for the transmission of raw groundwater under/across State Road (SR) 52 with open cut and micro-tunneling methods as indicated on the drawings and specifications. The existing pipe crossing SR 52 will be placed out of service and the new crossing will be connected to Tampa Bay Water's existing transmission main and placed into service. Portions of the out-of-service pipeline will be removed as shown on the drawings.

1.3 GENERAL INFORMATION

1.3.1 Tampa Bay Water is Florida's largest provider of wholesale drinking water. Our mission is to reliably provide clean, safe water to the Tampa Bay region now and for future generations. We are a regional Agency created by an inter-local agreement among our member governments through state enabling legislation. We have a nine-member Board of Directors made up of representatives from the three counties and three cities we serve: Hillsborough County, Pasco County, Pinellas County, New Port Richey, St. Petersburg, and Tampa.

1.3.2 Bidders can familiarize themselves with our Agency at www.tampabaywater.org. Tampa Bay Water was recreated in 1998 as the outgrowth of a two-year negotiation process that changed the name, structure, and operations of the West Coast Regional Water Supply Authority. Our predecessor, the West Coast Regional Water Supply Authority, was created in 1974. Tampa Bay Water is now a multi-source provider of drinking water including groundwater, surface water, and desalinated seawater. Tampa Bay Water is a non-profit governmental Agency funded through wholesale water rates by its member governments. Our member governments serve more than 2.5 million residents in the Tampa Bay area.

1.3.3 Tampa Bay Water has retained Wade Trim, Inc. ("Engineer") as its Agency Representative for this Project. Wade Trim, Inc., has responsibility for coordinating all activities associated with the design, construction, and commissioning of the Project. Tampa Bay Water and Wade Trim are working cooperatively to manage the ITB process, evaluate Bids, and support the negotiations of the Contract. Wade Trim, Inc., shall also provide Project oversight, including reviews for contract compliance, construction monitoring, start-up assistance, and environmental compliance oversight.

1.4 DEFINITIONS

All definitions are either listed below or are included in the General Conditions in the attached Contract.

1.4.1 **Agency** is used interchangeably with Tampa Bay Water.

1.4.2 **Agreement** or **Contract** are used interchangeably and refer to the document, along with any amendments, that constitutes authorization for, and commitment by the Contractor to provide construction services to Tampa Bay Water.

1.4.3 **Base Bid** is the sum stated in the Bid for which Bidders offer to perform the Work described in the Bidding Documents, to which work may be added or deleted by sums stated in Alternate Bids.

1.4.4 **Bid** refers to a Bidder's response to the requirements of this ITB.

1.4.5 **Bid Option** means a specified portion of the Work identified in the scope of work that may be added to or deducted from the Base Bid at Tampa Bay Water's discretion and identified in the Contract. If required, Bid Options shall be evaluated along with the Base Bid and may be used at the discretion of Tampa Bay Water to determine the lowest bid.

1.4.6 **Bidder** means a business that responds to this solicitation. If Bidder is a consortium, partnership, joint venture, or other organization, this definition shall include all partners, members, or participants.

1.4.7 **Contractor** means the Bidder who enters into a contract to provide construction services for this Project.

1.4.8 **Engineer** is the licensed design professional of record responsible for designing the Project.

1.4.9 **Project Site** is Tampa Bay Water's Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict located in Pasco County where the pipeline crosses under SR 52, as shown below.

2.0 BID PROCESS INFORMATION

2.1 PRE-BID CONFERENCE AND SITE VISIT

A Pre-Bid Conference and Site Visit will be held for this ITB at the date, time and location on the cover of this document. The Pre-Bid Conference and Site Visit are not mandatory; however, firms are highly encouraged to attend. This will be the only site visit/tour to be offered. Bidders are welcome to have suppliers/subcontractors in attendance. Bidders will need to drive to the location in their own vehicles and should dress in appropriate comfortable field tour attire (long pants and closed toe shoes). Tampa Bay Water reserves the right to cancel the site visit if inclement weather or wet/muddy road conditions warrant cancellation.

2.2 INQUIRIES AND ADDENDA

Tampa Bay Water is committed to a fair, open process for interested parties to receive information about the Project and the competitive procurement process that Tampa Bay Water is using for selection of a Contractor and award of the Contract. Inquiries for additional information or clarifications must be submitted on Euna's project page for this ITB at https://tampabaywater.bonfirehub.com or via email to purchasing@tampabaywater.org no later than the Inquiry Deadline on the cover of this ITB. Any general inquiries may be responded to directly. Any substantive inquiries resulting in information and changes deemed material to the ITB shall be provided in the form of a written addendum which will be published at least five (5) days prior to the Submittal Due Date on Euna and via link at Tampa Bay Water's web site at www.tampabaywater.org. Failure of any firm to receive any such addendum or interpretation shall not relieve said Bidders from any obligation contained therein.

2.3 BID SUBMISSION

2.3.1 Tampa Bay Water prefers and strongly encourages electronic submission of Bids through our EUNA e-procurement portal at https://tampabaywater.bonfirehub.com. **Bidders should allow sufficient time and at least one (1) day before the Submittal Due Date to begin the uploading process and finalize submissions.** To submit responses electronically, Bidders must register with Euna and follow the instructions in the portal. Minimum system requirements are Microsoft Edge, Google Chrome, Safari, or Mozilla Firefox. JavaScript and browser cookies must be enabled. Maximum upload file size is 1000 MB. Documents should not be embedded within uploaded files as the embedded files will not be accessible. Bidders will have the ability to modify their submissions up to the Submittal Due Date in Euna. Tampa Bay Water is not responsible for any technical problems with the electronic transmission and/or delay in receipt due to technical problems. Such electronic transmittal errors will not alter or affect the deadline date and time for receipt of Responses. If you require assistance, please contact Euna at Support@GoBonfire.com.

2.3.2 Bidders unable to submit electronically must deliver sealed Bids to the address provided on the cover of this document no later than the above-referenced Submittal Due Date. Include one clearly marked original and one digital copy on a flash drive enclosed in a sealed envelope or carton clearly marked with the name and contract number and delivered in person, by carrier or messenger, or by certified U.S. Mail.

2.3.3 Late Bids will not be considered. No Bid can be withdrawn after the Submittal Due Date without the written permission of Tampa Bay Water.

2.4 BID WITHDRAWAL OR RESUBMISSION

Bidders may withdraw their Bids by notifying Tampa Bay Water in writing at any time prior to the Submittal Due Date. Such notice shall be in writing over the signature of the Bidder, and it shall be so worded as not to reveal the amount of the original Bid. Bids not so withdrawn shall, upon opening, constitute an irrevocable offer for a period of one-hundred twenty (120) calendar days to provide the services set forth in this solicitation, unless extended by mutual agreement. Failure to agree to an extension shall not constitute grounds for forfeiting any bid bond or other security. Withdrawal of a Bid, as prescribed in this paragraph, shall not prejudice the right of a Bidder to resubmit a Bid prior to the Submittal Due Date indicated on the cover of this ITB.

2.5 RIGHT OF REJECTION

Tampa Bay Water reserves the right to reject any or all Bids.

2.6 IN-PERSON PUBLIC BID OPENING

Bids will be publicly opened at Tampa Bay Water's Administrative Offices located at 2575 Enterprise Road, Clearwater, FL 33763, on the date of the Bid Submittal Deadline, at 2:30 p.m. (EDT).

3.0 BID PREPARATION

3.1 PROJECT UNDERSTANDING

3.1.1 Beginning on the Issue Date on the cover of this ITB, complete sets of the ITB documents may be obtained through our Euna e-procurement portal at https://tampabaywater.bonfirehub.com. Any addenda shall be provided here as well. Prior to submission of its Bid, each Bidder must ascertain that it has received a complete and accurate set of ITB documents, including all addenda issued.

3.1.2 Bidders are expected to read and understand this ITB and associated documents in their entirety and inspect the project site to inform itself of the conditions related to the execution of the Work. Failure to do so will not relieve a successful Bidder of its obligations to furnish the services necessary to carry out all the requirements and provisions set forth in the contract. Bidders must be able to fully perform the tasks outlined herein, and in the timeline required.

3.1.3 Bidders shall, upon discovery of any conflict, ambiguity, error or omission in the ITB, the Project site or any other general, local or prevailing conditions, make a written request for interpretation or clarification in accordance with the inquiry process provided in the prior section.

3.1.4 If requested by a Bidder in writing within a reasonable time in advance of the date of the opening of the Bids, Tampa Bay Water will make a good faith attempt to provide or obtain access to the project site to allow the Bidder to conduct those reasonable explorations and tests the Bidder deems necessary for submission of a Bid (subject to a review by Tampa Bay Water and the Engineer). If access is granted, the Bidder shall clean up and restore any disturbed area to its former condition upon completion of such explorations and tests.

In consideration of Tampa Bay Water arranging and permitting access to the project site, Bidder acknowledges that by entering the project site, Bidder shall defend, indemnify and hold Tampa Bay Water, Engineer and their consultants harmless from any loss, expense, damage, injury, claim or suit arising out of or relating to Bidder's entry, exploration and testing upon the project site. As a condition to any Bidder being provided access to the project site, that Bidder shall execute and deliver to Tampa Bay Water a Release and Indemnification Agreement, which is available upon request.

3.1.5 Each Bidder shall have the responsibility to inform itself of, and if awarded the contract shall comply with, all laws and regulations. Examples of such laws and regulations include, but are not limited to, those relating to minimum wages, nondiscrimination in employment, protection of public and employee safety and health, environmental protection, building codes, fire protection, airport operation and safety, grading and drainage, use of explosives, vehicular traffic, access to streets and highways, restoration of lands and property under the control of the State or a Political Subdivision, nuisance control, taxes, permits, licensing, and fees.

3.1.6 Any oral statement, interpretation, clarification, correction, addition or deletion to the ITB documents will be binding only if issued as a written Addendum. Failure to read or reference the addenda in its Bid will not relieve a Contractor of its obligations to comply with the addenda.

3.2 BID CONTENTS: Include the following items:

- All forms in Section 8.0
- Bid Security detailed in Section 3.5
- Evidence that the Bidder is qualified and capable to complete the Work
- Any other information called for in this ITB.

3.3 QUALIFICATION OF BIDDER

3.3.1 Bidder and its key personnel to be assigned to the Work must meet the following minimum qualifications:

- Firm must hold an active license in the State of Florida as a General Contractor and Firm must hold an active license in the State of Florida as a Underground Utilities Contractor and shall provide said proof of licenses in its bid submittal;
- Firm must have performed one previous project of similar scope within the past five (5) years.
- Project Superintendent must have served as a Project Superintendent on at least one previous project of similar scope within the past five (5) years.
- Project Manager must have served as a Project Manager on at least one previous project of similar scope within the past five (5) years.

3.3.2 The Bidder must have the authority to perform the type of work in this ITB in accordance with laws and regulations applicable to the Project and local, county and municipal licensing requirements, or the Bidder must provide a covenant describing specific licenses or permits to be obtained prior to award of the Contract.

3.4 RESPONSIVENESS AND RESPONSIBILITY

3.4.1 If any information required by these Bid Documents is missing or incomplete, the Tampa Bay Water Purchasing Department, in its sole discretion, may deem the Bidder non-responsive and reject the Bid, or may waive immaterial or minor deviations or request clarifications that do not alter the substance of the Bid and do not provide competitive advantage to a Bidder.

3.4.2 The Bidder shall provide all information, sufficient to Tampa Bay Water, to evidence its qualifications to perform the work for the price included on the Price Form, within the time stated within this ITB, and in accordance with the requirements of this ITB. The Tampa Bay Water Purchasing Department may request and consider any further information to make a responsibility determination that a Bidder can satisfactorily perform the work.

3.4.3 Failure to deliver information for responsiveness and responsibility required in this ITB or as requested by Tampa Bay Water, within the required period (or within a reasonable time thereafter if agreed to by Tampa Bay Water), may result in the rejection of that Bidder's Bid as either non-responsive or non-responsible and shall constitute proof that the Bidder has relinquished its rights and interests in the award.

3.5 BID COMPLETION

3.5.1 Any Bid may be deemed non-responsive which contains omissions, erasures, alterations, or additions of any kind, or prices not requested, or which may be obviously unbalanced, or which in any manner shall fail to conform to the requirements of this ITB.

3.5.2 Only one Bid from any individual, firm, partner, partnership, or corporation, under the same or different names, shall be considered. If any Bidder has an interest in more than one Bid for the work contemplated, as determined by Tampa Bay Water, all Bids in which such Bidder has an interest shall be rejected.

3.6 BID SECURITY

Bids must be accompanied by a certified check, or cashier's check drawn on a bank in good standing, or a Bid Bond issued by a Surety authorized to issue such bonds in the State of Florida, in the amount of five percent (5%) of the proposed total contract price of the Bid submitted. This bid security shall be given as a guarantee that the Bidder will not withdraw its Bid for the period of time specified in 2.4 Bid Withdrawal or Resubmission, and if awarded the Contract, shall execute the Contract and comply with all its requirements. If the Bidder elects to furnish a Bid Bond, it shall use the Bid Bond form provided in this ITB. The Attorney-in-Fact who executes these bonds on behalf of the Surety must attach a notarized copy of its power-of-attorney as evidence of its authority to bind the Surety on the date of execution of the bonds. Where laws and regulations require certification by a resident agent, it shall also be provided.

3.7 BID PRICING

3.7.1 Bidders must submit either unit prices or fixed prices or a combination of such, as required by the Price Form herein. All items required to complete the Work, but not specifically included in the Price Form, shall be considered incidental and no additional costs for such items will be recognized or paid for by Tampa Bay Water.

3.7.2 Conflicts or Discrepancies found in bid prices stated both numerically and alphabetically shall have the alphabetical representation of the bid price take precedence over the numerical representation unless it is determined, at the sole discretion of Tampa Bay Water, that the conflict has led to a clearly erroneous or unreasonable result; in which case the amount stated numerically shall govern. However, in a case of a discrepancy between unit prices and extended totals, unit prices shall govern.

3.7.3 The estimate of quantities of items which are to be provided on a unit price basis are stated in the Price Form with as much accuracy as possible and is an approximation that shall be the basis for fair comparison of bids and upon which the award of the Contract shall be made. Payment to the Contractor for unit price work shall be made on the basis of units actually provided by the Contractor and accepted by Tampa Bay Water.

3.7.4 The Contractor shall pay all state and local sales and use taxes, as required by all laws and regulations. Tampa Bay Water reserves the right to implement an Owner's Director Purchase sales tax savings program with respect to this Project.

3.8 SUBCONTRACTORS AND SUPPLIERS

3.8.1 Each Bidder shall list, on the Subcontractor Form included in this ITB, the Subcontractors and Suppliers to whom that Bidder intends to award a subcontract in an amount of two percent (2%) or more of the total price on the Price Form. For each Subcontractor and Supplier identified, the Bidder shall provide all the information required by the forms.

3.8.2 If Tampa Bay Water has reasonable objection to any listed Subcontractor or Supplier, Tampa Bay Water may, after giving its intended Notice of Award, request the Bidder remove or replace that Subcontractor or Supplier, in which case that Bidder shall either perform the associated part of the work itself, if it holds a valid license for that classification and is so qualified, or nominate a substitute Subcontractor or Supplier, within the time period its Bid is to remain open, and without an increase in its price or time required to complete the work. If that Bidder declines, it shall not be awarded the Contract and its Bid shall be deemed withdrawn, but its declining to make the substitution will not constitute grounds for forfeiting its bid security. No Bidder shall be required to employ any Subcontractor or Supplier against whom it has reasonable objection.

3.9 TRADE SECRETS

Tampa Bay Water is subject to the Florida Public Records and Sunshine Laws. Each Bidder may clearly mark each page of the Bid that contains trade secrets or other confidential commercial or financial information which the Bidder believes should not be disclosed outside of the Agency. Disclosure of requested information will be determined in accordance with Florida laws, rules and regulations.

4.0 EVALUATION AND AWARD PROCESS INFORMATION

4.1 EVALUATION

All Bids received will be reviewed and tabulated by Tampa Bay Water. The tabulation will be posted on Euna and on Tampa Bay Water's website.

During the Bid review, Tampa Bay Water reserves the right to seek additional relevant information and clarification regarding any Bidder's qualifications to perform the work and to determine whether a Bidder is deemed responsive and responsible based on that information.

4.2 BID SUPPLEMENTS

After receipt of Bids, Tampa Bay Water shall notify the apparent low Bidder that it must, within two (2) days following notification, provide the following to Tampa Bay Water:

- A preliminary progress schedule, without specific dates, that will be used to track the Work;
- Bidder's three (3) most recent and current financial statements, certified by a Certified Public Accountant;
- Resumes for Bidder's project superintendent and other key personnel;
- Five references for recent and similar work performed by bidder; and
- Any additional information requested by Tampa Bay Water.

4.3 BASIS OF AWARD

4.3.1 The Notice of Award will be issued, if at all, by Tampa Bay Water on the basis of the Total Evaluated Bid Cost provided by the lowest responsive, responsible Bidder. The Total Evaluated Bid Cost is the adjusted amount of the Bidder's proposed total contract price, as determined by Tampa Bay Water, based upon such line items within the Bid which Tampa Bay Water elects to include in the Work.

4.3.2 In accordance with Section 287.05701, Florida Statutes, Tampa Bay Water may not consider a Bidder's social, political or ideological interest when determining if the Bidder is responsible.

4.3.3 Tampa Bay Water's Project Allowance and all other Allowances, as well as all Options as specified in the Bid, must be included in the total price on the Price Form.

4.4 AWARD OF CONTRACT

4.4.1 Tampa Bay Water shall have the right to investigate, among other things, the financial condition, experience record, and the equipment of each Bidder, and to determine to its satisfaction the competency of each to undertake the Project. Tampa Bay Water may request further and supplemental documentation from a Bidder. A Bidder's refusal to provide such documentation may result in the disqualification of its Bid. Tampa Bay Water shall have the sole discretion to determine which factors it deems significant.

4.4.2 The acceptance, if any, of a Bid will be by written Notice of Intent to Award which shall be posted in Euna project file. In the event of failure of the lowest responsive, responsible Bidder to sign the Contract and provide acceptable Performance Bonds and Payment Bonds, Tampa Bay Water may award the Contract to the next lowest responsive, responsible Bidder. Such an award, if made, will be made promptly after the failure of the first Bidder to comply with the award requirements.

4.4.3 Tampa Bay Water reserves the right to accept or reject all bids and to delay or cancel the Project prior to acceptance of any bid in the event Tampa Bay Water has failed to secure all the property or permits necessary for the Project. In addition, Tampa Bay Water reserves the right to include or exclude any Bid Options, and to waive any informalities or irregularities in Bids. Tampa Bay Water further reserves the right to seek clarification from any Bidder after the opening of the Bids and to award the Contract based on updated information obtained.

4.5 NOTIFICATION OF AWARD

Tampa Bay Water will select the lowest, qualified, responsive, responsible Bidder meeting the criteria and Specifications established herein to provide the services under this ITB. The awarded Contractor must be registered to do business in the State of Florida. Information regarding registration can be found at the Florida Department of State, Division of Corporations website at https://dos.myflorida.com/sunbiz. Notification of Tampa Bay Water's decision regarding this solicitation will be posted on Euna and via the link on Tampa Bay Water's website.

4.6 EXECUTION OF CONTRACT

The Notice of Award to a Bidder will be accompanied by two (2) unexecuted sets of the Contract documents. The successful Bidder shall within ten (10) days after receiving Notice of Award, sign and return to Tampa Bay Water the two (2) sets of Contract documents together with the Certificate of Insurance, Performance Bonds and Payment Bonds as required by the Contract documents. Within thirty (30) days after receiving the signed Contract documents including acceptable Performance Bonds and Payment Bonds from the successful Bidder, Tampa Bay Water's authorized agent will sign the Contract, whereupon Tampa Bay Water shall send the successful Bidder one fully executed copy of the Contract documents. Signature by both parties binds both parties to the Contract documents.

4.7 RIGHT TO PROTEST

Any person who is adversely affected by a Tampa Bay Water decision or intended decision may file a notice of protest in writing within 72 hours after the posting of the notice of decision or intended decision. The formal written protest shall be filed with the Purchasing Manager within ten (10) days after the date of the notice of protest is filed. Failure to file a timely notice of protest or failure to file a timely formal written protest shall constitute a waiver of proceedings. The formal written protest shall state with particularity the facts and law upon which the protest is based.

Failure to file a protest within the time prescribed in section 120.57(3), Florida Statutes, or failure to post a bond or other security required by law within the time allowed for filing a bond shall constitute a waiver of proceedings under Chapter 120, Florida Statutes. This includes, but is not limited to, any objection to or protest of this ITB, Notice of Award, and/or the actions of Tampa Bay Water.

4.8 NOTICE TO PROCEED

The Contract time shall begin on the day indicated in the Notice to Proceed. A Notice to Proceed may be given at any time within thirty (30) days after the date the Contract is executed by Tampa Bay Water. The Contractor shall begin the Work no later than ten (10) days after the date specified for commencement of the Work in the Notice to Proceed.

4.9 PERFORMANCE BONDS AND PAYMENT BONDS

The successful Bidder shall deliver to Tampa Bay Water a Performance Bond and a Payment Bond each on the forms set forth in this ITB. Each Bond shall be in the full amount of the total price on the Contract and in accordance with the requirements of Florida Statutes Section 255.05, as security for the faithful performance of the Contractor, and the payment of all persons supplying labor and/or materials for the construction of the Work, and to cover all guarantees against defective workmanship or materials, or both, during the warranty period following the date of final completion of the Work. The surety or sureties furnishing these bonds shall have a sound financial standing and a record of service satisfactory to Tampa Bay Water, shall be authorized to do business in the State of Florida, and shall be listed on the

current U.S. Department of Treasury Circular Number 570, or amendments thereto in the Federal Register, of acceptable Sureties for Federal Projects.

4.10 RETURN OF BID SECURITY

Within fifteen (15) days after the opening of the Bids, Tampa Bay Water will return the bid security to each Bidder whose Bid is not to be considered further in the award of the Contract. Retained bid securities shall be held until the Contract has been fully executed, after which time all bid securities other than those which have been forfeited, shall be returned to the respective Bidders.

5.0 SPECIAL TERMS AND CONDITIONS

5.1 SUBSTITUTES

The Contract shall be awarded, if at all, on the basis that the Bidder awarded the Contract shall furnish only items of material and equipment named or specified in the Contract documents. Each Bidder shall list the manufacturer and Supplier as required on the Major Equipment Manufacturers Form showing whom that Bidder intends to award a subcontract for furnishing each selected named or specified item. Substitutes shall not be considered until after the Notice of Award.

5.2 CHANGES IN QUANTITIES

Tampa Bay Water reserves the right to increase or decrease the quantity of any unit price work item shown in the bid that it may deem necessary, except that such increases or decreases in quantities of each item of unit price work awarded shall not affect the stated unit price rate if the quantity adjustment is not more than twenty-five percent (25%) of the total quantity shown on the bid for such item of unit price work. If the quantity is adjusted by more than twenty-five percent (25%), the unit price may be equitably adjusted by an appropriately issued change authorization or change order.

5.3 EMPLOYEE VERIFICATION

In accordance with Section 448.095, Florida Statutes, the Awardee/Contractor agrees to register with and utilize the U.S. Department of Homeland Security's E-Verify system to verify the employment eligibility of all new employees hired during the term of the award/contract for the services specified in the award/contract. The Awardee/Contractor must also include a requirement in subcontracts that the subcontractor must register with and utilize the E-Verify system to verify the employment eligibility of all new employees hired by the subcontractor during the award/contract term. If the Awardee/Contractor enters into a contract with a subcontractor, the subcontractor must provide the Awardee/Contractor with an affidavit stating that the subcontractor does not employ, contract with, or subcontract with an unauthorized alien. The Awardee/Contractor shall maintain a copy of such affidavit for the duration of the award/contract. If Tampa Bay Water has a good faith belief that the Awardee/Contractor has knowingly violated Section 448.09(1), Florida Statutes, Tampa Bay Water shall terminate the Contract with the Awardee/Contractor, and the Contractor may not be awarded a contract with Tampa Bay Water for at least 1 year after the date on which the award/contract was terminated. The Awardee/Contractor is liable for any additional costs incurred by Tampa Bay Water as a result of the termination of the award/contract. If Tampa Bay Water has a good faith belief that a subcontractor knowingly violated the law, but the Awardee/Contractor has otherwise complied with the law, Tampa Bay Water shall promptly notify the Awardee/Contractor and order the Awardee/Contractor to immediately terminate the award/contract with the subcontractor.

5.4 FOREGIN COUNTRIES OF CONCERN

Pursuant to Section 287.138, Florida Statutes, Tampa Bay Water may not enter into a contract with an entity that gives access to an individual's personal identifying information if the entity is owned, controlled or organized under the laws of a Foreign Country of Concern which includes the :People's Republic of China, the Russian Federation, the Islamic Republic of Iran, the Democratic People's Republic of Korea, the Republic of Cuba, the Venezuelan regime of Nicolas Maduro, the Syrian Arab Republic, or any other entity or Agency under the significant control of such Foreign Country of Concern.

5.5 ANTI-HUMAN TRAFFICKING

In accordance with Section s.787.06, Florida Statutes, the CONTRACTOR must provide TAMPA BAY WATER with an affidavit regarding Human Trafficking. A Consultant Affidavit included herein must be completed by CONTRACTOR to attest, under penalty of perjury, that CONTRACTOR does not use coercion for labor or services as defined in s. 787.06, Florida Statutes.

6.0 SUPPLEMENTAL INFORMATION FOR BIDDERS

6.1 The various reports, drawings and other documents listed in this section shall be collectively referred to as the "Existing Condition Documents". The Existing Condition Documents are made available solely to assist Bidders to make their own assessment of the Project. It is the responsibility of each Bidder, before submitting a Bid, to (a) examine the Existing Condition Documents thoroughly; (b) visit the Project site to become familiar with general, local and prevailing conditions; (c) familiarize itself with and consider all laws and regulations covering the Work; (d) study and carefully correlate the Bidder's observations with this package of ITB documents; and (e) request written interpretations or clarifications promptly after discovering any conflicts, ambiguities, errors or omissions in the ITB documents or Existing Condition Documents.

6.2 The Property Stipulation/Schedule Summary in this section contains information pertaining to scheduling of construction in easements acquired by Tampa Bay Water for this Project.

6.3 Tampa Bay Water and Engineer make no representation or warranty about the accuracy, correctness, or completeness of the Existing Condition Documents. Also, neither Tampa Bay Water nor the Engineer warrants or assumes any responsibility for the accuracy, correctness, reliability or completeness of information or data relating to surface or subsurface conditions, contained in any reports not prepared by Tampa Bay Water, the Engineer or their consultants, including information about underground utilities owned by others at or contiguous to the Project site furnished by the owners of those underground utilities or others.

6.4 Finally, neither Tampa Bay Water nor Engineer assumes any responsibility for any conclusions or interpretations made by any Bidder based on the data, non-technical data, interpretations or opinions contained in the Existing Condition Documents. Notwithstanding the foregoing, Bidders should refer to the Contract documents (especially Paragraph 6.8 of the General Conditions) for provisions concerning changes that may be permitted due to materially different site conditions.

8.0 BID SUBMITTAL FORMS

1. BID FORM

Failure to fully complete this form SHALL result in the Bidder being deemed NONRESPONSIVE.

OFFER

TO: Tampa Bay Water

The undersigned hereby offers and agrees to furnish the goods and/or services in compliance with all terms, scope of work, conditions, specifications, and addenda in this Invitation for Bids.

INVESTIGATION:

The undersigned, by submission of this Bid Form, certifies it has thoroughly examined all ITB documents, including any Existing Condition Documents and Project site in order to familiarize itself with all existing conditions. This may include the physical condition on the ground including, but not limited to, the soil borings and has satisfied itself that the number of borings and their locations are adequate or has made any additional soil tests or borings if they feel the number, type, or location of those provided by Tampa Bay Water are inadequate or incomplete.

OBLIGATION:

The undersigned, by submission of this Bid Form, hereby agrees to be obligated, if selected as the Contractor, to provide the stated goods and/or services to Tampa Bay Water for the term as stated herein, and to enter into a Contract with Tampa Bay Water, in accordance with all documents herein, together with any written addenda.

BID PRICE:

The undersigned agrees to abide by the pricing contained on the Price Form.

ADDENDA:

The Bidder acknowledges receipt of the addenda noted below and has incorporated the content of Addenda into this Bid:

#_____ #_____ #_____ #_____

CONTRACTOR CONTRACT:

The Bidder agrees to the terms and conditions in the draft Contract included with this ITB **(initial one below)**:

____ "As is" with no modifications.

____ With the changes requested in the attached document (attach to this form) and understands that Tampa Bay Water reserves the right to reject the change requests.

LITIGATION:

The Bidder understands it must disclose any past, pending or threatened litigation or regulatory action involving construction services provided by the Bidder **(initial one below):**

____ None are known to exist.

____ Action exists, and a full explanation has been attached to this form.

CONFLICTS OF INTEREST:

The Bidder understands it must disclose any potential conflict of interest which would adversely affect the Bidder's ability to provide fair, loyal, and competitive services to Tampa Bay Water. Such disclosures shall include, but not be limited to, the Bidder's contractual obligations, property interests or clientele relationship or the property interests, contractual obligations or relationships of the Bidder's principals, officers, directors, employees or agents which are directly or indirectly related to Tampa Bay Water and its operations, its Agency Representative, the Southwest Florida Water Management District (SWFWMD), the Florida Department of Environmental Protection (FDEP), or any of our member governments **(initial one below):**

____ None are known to exist.

____ Potential or apparent conflict exists, and a full explanation has been attached to this form.

COMPLIANCE WITH LAWS/PERMITS:
The Bidder certifies it is not currently in violation of any regulatory rules and regulations that may have an impact on the firm's operations, and it agrees to comply with all local, State, and Federal statutes, regulations, directives and orders as applicable to the services provided and offered to Tampa Bay Water. The Bidder further agrees it has not been placed on the Scrutinized Companies with Activities in Sudan List; the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; or the Scrutinized Companies that Boycott Israel List; nor has it engaged in a boycott of Israel and has no business operations in Cuba or Syria. (Per Section 287.135(5), Florida Statutes). Additionally, the Bidder certifies (pursuant to Subsection 287.134(2)(a), Florida Statutes) it has not been placed on the discriminatory vendor list.

NONCOLLUSION:
The undersigned, hereinafter called Bidder, declares and certifies that (i) all principals with an interest in this Bid have been named herein; (ii) this Bid is, in all respects, fair and without fraud; (iii) this Bid is made without collusion with any official of Tampa Bay Water or Engineer; and (iv) the Bid is made without any connection or collusion with any person submitting another Bid for the Work.

CONTRACT EXECUTION:
The undersigned Bidder proposes and agrees that if this Bid is accepted, it shall enter into a contract with Tampa Bay Water in the form included with the Contract documents and perform and furnish all Work as specified or indicated in this ITB at the price bid and within the time specified, and in accordance with the other terms and conditions of the Contract documents.

CONTRACT MODIFICATION PRICING:
Bidder acknowledges and agrees that the separate prices on this Bid, where they are applicable and deemed acceptable by Tampa Bay Water, will be used by Tampa Bay Water and Bidder, if awarded the Contract documents, whenever similar work is added or deducted from the Contract documents.

PROJECT UNDERSTANDING:
Bidder represents that before making its Bid, Bidder has familiarized itself with the nature and extent of the Contract documents (as defined in the General Conditions), Work, Project site, locality, and all local conditions and laws and regulations that may in any manner affect cost, schedule, progress, performance, or furnishing of the Work.
Further, Bidder has read and studied carefully: reports of explorations and tests of surface and subsurface conditions; and those drawings of physical conditions in or relating to existing surface or subsurface structures or underground utilities; and accepts the determinations established in 6.0

Supplemental Information for Bidders to the extent of the technical data contained in those reports and drawings upon which Bidder may rely, which in any manner affect cost, schedule, progress, performance, and furnishing of the Work.
Further, Bidder has read and studied all information and data shown or indicated in the Contract documents about other work under separate contracts at or near the Project site and assumes responsibility for all conditions and consequences which may result from other work and which in any manner affect cost, schedule, progress, performance, and furnishing of the Work.
Further, Bidder has correlated the results of the activities, examinations, and studies as noted above, with the terms and conditions of the Contract documents and has exercised its own independent judgement in the interpretation of this information.

NOTICE OF ERRORS:
Bidder has given Tampa Bay Water notice of all conflicts, ambiguities, errors, or omissions, if any that Bidder has discovered in the ITB.

FIRM OFFER:
Bidder has read the Contract documents and accepts all of the terms and conditions of the Contract documents, including without limitation those dealing with the disposition of Bid Security. Bidder acknowledges all Bids shall remain firm for 90 days or as otherwise required by this ITB.

REQUIREMENTS IN EFFECT:
Reference to standard Specifications, manuals, or codes of any technical society, organization, or association, or to the Laws and Regulations of any governmental authority, whether such reference be specific or by implication, shall mean the latest standard specifications, manual, code, or Laws and Regulations in effect on the date of the receipt of Bids, except as may be otherwise specifically stated.

PUBLIC RECORDS:
Each Bidder, by submitting a Bid, acknowledges the Agency's legal obligation in accordance with Chapter 119 of the Florida Statutes, to respond to all public records requests in a timely manner and expressly waives any right to contest, impede, prevent or delay such disclosure, or to initiate any proceeding that may have the effect of impeding, preventing or delaying such disclosure, unless the Bidder establishes its right to a public records exception. It is the responsibility of the Bidder alone to establish its right to any such exception. Under no circumstances will Tampa Bay Water be responsible or liable to a Bidder or any other party as a result of disclosing any such information or materials.

TRENCH SAFETY ACT:
Bidder acknowledges and agrees that the trench safety standards in effect at the time of this Bid and at the time(s) of performing the Work shall be adhered to and compliance is the complete and sole responsibility of Bidder. The price on the Price Form includes Bidder's total cost for compliance with the Florida Trench Safety Act.

SUPPLIERS:
Bidder certifies that all suppliers, if acceptable to Tampa Bay Water, shall be supplying the material or equipment for the portions of the Work identified in the list in the event Bidder is awarded the Contract.

I certify, under penalty of perjury, that I have the legal authorization to bind the firm hereunder: The individual signing this form certifies, under penalty of perjury, that (s)he has the authority to sign on behalf of the firm. (If signature is by an agent, other than an officer of the corporation or a member of a partnership, a notarized power-of-attorney must accompany the Bid.) The following is certified by the signing of this form:

This project provides an Owner's Allowance in the amount of $246,000.00 which is not included in the Price Form above. Contractor's use of Owner's Allowance is not guaranteed. (Usage of Owner's Allowance must be pre-approved by Tampa Bay Water in writing.)

Bidder acknowledges and agrees that the Trench Safety Standards in effect at the time of this Bid and at the time(s) of performing the Work shall be adhered to and compliance is the complete and sole responsibility of the Bidder. The proposed Total Bid Price, as stated herein includes Bidder's total cost for compliance with the Florida Trench Safety Act.

Bidder shall have an Indemnification responsibility in the amount of $100.00 which is not included in the Price Form above.

4. FLORIDA BID BOND

Failure to fully complete this form SHALL result in the Bidder being deemed NONRESPONSIVE.

KNOW ALL MEN BY THESE PRESENTS:

That the "Bidder", _____, a corporation _____, individual ____, partnership _____, of the state of Florida, qualified to do business in this State, as Principal, and the "Surety", _____, a corporation of the state of _____, authorized to do business as a surety in this State, as Surety, are hereby held and firmly bound unto the Tampa Bay Water as Obligees, in the sum of _____ _____ Dollars ($_____), lawful money of the United States of America, which represents five percent (5%) of the sum of Bidder's proposed total contract price, for the payment of which Bidder and the Surety hereby bind ourselves, our respective heirs, successors, legal representatives and assigns, jointly, and severally, firmly by these presents.

WHEREAS, Bidder has submitted to Tampa Bay Water, its Bid to which this Bond is attached, to enter into the Contract with Tampa Bay Water for the Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, Project No.: 07153, Contract #2026017, covered by the Contract documents prepared by Tampa Bay Water and the Engineer, which Contract documents are incorporated herein by this reference:

NOW, THEREFORE: THE CONDITION OF THIS OBLIGATION IS THAT, Bidder and Surety are jointly and severally bound by all of the provisions of this Bid Bond, and if Bidder faithfully performs and fulfills all the understandings, covenants, terms, conditions and requirements of this ITB (including addenda issued before the date of the opening of the Bid) within the time specified or any extension thereof, with or without notice to the Surety, or if Bidder fails to comply with all requirements of this ITB within the time specified or any extension thereof, with or without notice to the Surety, but pays Tampa Bay Water the full amount of the sum set forth in this Bid Bond as liquidated damages, then this obligation shall be null and void, otherwise to remain in full force and effect.

A. If Tampa Bay Water makes demand on the Surety to perform in accordance with the Surety's obligations under this Bond, then the full amount of the Bid Bond shall be immediately due and payable to Tampa Bay Water, and the Surety shall pay that sum without delay. Additionally, the Surety shall reimburse Tampa Bay Water for all costs of collection (including but not limited to attorney's fees).

B. The Surety, for value received, stipulates and agrees that the obligations of the Surety and this Bid Bond shall be in no way impaired or affected by any extension of the time within which Tampa Bay Water may accept the Bid, and the Surety does, by this Bid Bond, waive notice of any such extension.

C. The term this "State" means the State of Florida. Other defined terms (i.e., capitalized terms) used in this Bid Bond have the intent and meanings assigned to them in the General Conditions of the Contract documents, Definitions.

IMPORTANT: Sureties executing this Bid Bond shall be currently authorized to do business in the State of Florida as surety and, except as otherwise provided by the Florida Statutes, be on the U.S. Department of the Treasury Financial Management Service list of approved bonding companies. Bonds cannot be in excess of the amount indicated as approved by that list.

6. CONTRACTOR AFFIDAVIT

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

STATE OF _____
COUNTY OF _____

BEFORE ME, the undersigned authority, appeared _____, who first being duly sworn hereby swears or affirms as follows:

1. I make this affidavit on personal knowledge.
2. I am over the age of 18 years and otherwise confident to make this Affidavit.
3. I am the _____ of _____ (the "Contractor").
4. I am authorized by _____ to make this Affidavit on behalf of Contractor.

E-Verify

1. Contractor acknowledges that Section 448.09, Florida Statutes, makes it unlawful for any person to knowingly employ, hire, recruit, or refer, for private or public employment, an alien who is not duly authorized to work in the United States.
2. Contractor acknowledges that Section 448.095, Florida Statutes, prohibits public employers, contractors, and subcontractors from entering into a contract unless each party to the contract registers and uses E-Verify.
3. Contractor is in compliance with the requirements of Sections 448.09 and 448.095, Florida Statutes.
4. Contractor understands it shall remain in compliance with the requirements of Sections 448.09 and 448.095, Florida Statutes, during the term of any contract with Tampa Bay Water.
5. Contractor's subcontractors are in compliance with the requirements of Sections 448.09 and 448.095, Florida Statutes.
6. Contractor shall ensure compliance with the requirements of Sections 448.09 and 449.095, Florida Statutes, by any and all of its subcontractors.
7. Neither the Contractor, nor any subcontractor of Contractor, has had a contract terminated by a public employer for violating Section 448.095, Florida Statutes, within the year preceding the date of this Affidavit.
8. If the Contractor or any subcontractor of Contractor has a contract terminated by a public employer for any such violation during the term of any contract with Tampa Bay Water, it shall provide immediate notice thereof to Tampa Bay Water.

Anti-Human Trafficking

In accordance with Section 787.06(13), Florida Statues, the undersigned, on behalf of the entity listed below ("Entity"), hereby attests under penalty of perjury that Entity does not use coercion for labor or services as defined in Section 787.06, Florida Statutes, entitled "Human Trafficking".

Scrutinized Companies

A. Pursuant to Subsections 287.133(2) and (3), Florida Statutes, Respondent acknowledges that a person or affiliate who has been placed on the convicted vendor list following a conviction for a public entity crime may not submit a proposal on a Contract provide any goods or services to a public entity, may not submit a Proposal on a Contract with a public entity for the construction or repair of a public building or public work, may not submit Proposals on leases of real property to a public entity, may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a Contract with any public entity, and may not transact business with any public entity in excess of the threshold amount provided in Section 287.017 Florida Statutes, for CATEGORY TWO for a period of 36 months from the date of being placed on the convicted vendor list.

B. Pursuant to Subsection 287.134(2)(a), Florida Statutes, Respondent acknowledges that an entity or affiliate who has been placed on the discriminatory vendor list may not submit a bid, proposal, or reply on a contract to provide any goods or services to a public entity; may not submit a bid, proposal, or reply on a contract with a public entity for the construction or repair of public building or public work; may not submit bids, proposals, or replies on leases of real property to a public entity; may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a contract with any public entity; an may not transact business with any public entity.
C. Pursuant to Section 287.135, Florida Statutes, Respondent acknowledges that a company that has been placed on the Scrutinized Companies with Activities in Sudan List; the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; or the Scrutinized Companies that Boycott Israel List or a company that engages in a boycott of Israel, is ineligible and may not submit a bid, proposal, or enter into or renew a contract with an Agency for goods or services of $1 million or more. At the time of submission of a proposal for a contract or contract renewal for goods or services of $1 million or more, the company must certify that it is not on either such List and further that it does not have business operations in Cuba or Syria as required by Section 287.135(5), Florida Statutes.
D. Pursuant to Section 287.135, Florida Statutes, Respondent acknowledges that Tampa Bay Water has the option to terminate any contract for goods or services of $1 million or more if the awarded company is found to have submitted a false certification as provided under Section 287.135(5), been placed on the Scrutinized Companies with Activities in Sudan List or the Scrutinized Companies with Activities in the Iran Petroleum Energy Sector List, or been engaged in Business operations in Cuba or Syria.
E. Pursuant to Section 287.135, Florida Statutes, Respondent acknowledges that Tampa Bay Water has the option to terminate any contract for good or services of any amount if the awarded company is found to have or been placed on the Scrutinized Companies that Boycott Israel List or is engaged in a boycott of Israel.

Foreign Countries of Concern

Pursuant to Section 287.138, Florida Statues, Tampa Bay Water may not enter into a contract with an entity that gives access to an individual's personal identifying information if the entity is owned, controlled or organized under the laws of a Foreign Country of Concern which includes the People's Republic of China, the Russian Federation, the Islamic Republic of Iran, the Democratic People's Republic of Korea, the Republic of Cuba, the Venezuelan regime of Nicolas Maduro, the Syrian Arab Republic, or any other entity or Agency under the significant control of such Foreign Country of Concern.

7. NON-COLLUSION AFFIDAVIT

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

Owner: Tampa Bay Water
Engineer: Wade Trim, Inc.
Project Name: Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict
Project No.: 07153

Affiant, _____, being first duly sworn, deposes and says that:

Affiant is (Title) _____ of _____, ("Bidder"). Affiant has personal knowledge of the matters set forth in this Affidavit and is competent to testify about them.

Bidder has submitted to Tampa Bay Water, a Bid ("Bid") to construct the above referenced Project, also referred to in this Affidavit as the "Work".

This Non-Collusion Affidavit is executed by Affiant for inclusion with the submission to Tampa Bay Water of the Bid and may be relied upon by Tampa Bay Water in considering the Bid.

Affiant is fully informed about the preparation and contents of the Bid and of all pertinent circumstances surrounding the Bid; has not entered into any illegal contract, combination, conspiracy or other unlawful act; and the Bid is genuine and is not a collusive or sham Bid.

Neither Bidder nor any of its officers, partners, agents, representatives, employees or parties in interest, including this Affiant, have in any way entered or proposed to enter into any combination to prevent the making of any Bid, or to fix a price or prices (including any overhead, profit or other cost elements) for the Bid; or have made any Contract, or given or promised any consideration to induce any other person not to submit a Bid for the Work, or to submit a Bid at a specified price; or have secured or intended to secure through any Contract an unlawful advantage against Tampa Bay Water, or any other person interested in the Work.

The Bid is not intended to secure an unfair advantage or benefit from Tampa Bay Water or in favor of any person interested in the proposed Work.

The prices proposed are fair and proper and are not tainted by any collusion, conspiracy, connivance, or unlawful Contract on the part of Bidder or any other of its agents, representatives, owners, employees, or parties in interest, including this Affiant; and neither Bidder nor any of its officers, partners, owners agents, representatives, employees, or parties in interest, including this Affiant, have divulged information regarding the Bid or any data about the Bid to any other person.

[Attach Additional Pages If Necessary]

9. MAJOR EQUIPMENT LIST

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

To enable Tampa Bay Water to evaluate Bidder's qualifications to perform the Work, Bidder shall list all of the equipment it proposes to use in performing the Work.

Make/Model	Year	Owned or Leased	Condition	Availability for this Project

[Attach Additional Pages if Necessary]

10. MAJOR EQUIPMENT MANUFACTURERS

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

Line Item	Description	Equipment Type/Material	Manufacturer	Distributor or Supplier

[Attach Additional Pages If Necessary]

11. SUBCONTRACTORS LIST

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

Bidder shall perform (with Bidder's own employees) not less than fifty-one percent (51%) of the labor (total contract price less the cost of materials for the Project). For all remaining work, list each Subcontractor to whom Bidder intends to award a sub-contract in excess of two percent (2%) of the Total Price on the Price Form. These Subcontractors, if acceptable to Tampa Bay Water, shall be awarded subcontracts for the portions of the Work identified in the list, in the event Bidder is awarded the Contract.

Work To Be Performed	Name/Address	Percent of Total Bid Price

12. QUESTIONNAIRE

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

Owner: Tampa Bay Water
Engineer: Wade Trim, Inc.
Project Name: Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict
Project No.: 07153

The undersigned warrants that all statements and answers to questions hereinafter made are current, accurate, and complete as of the date indicated below.

Respond to the items below with sufficient information to show the Bidder has sufficient qualifications to perform the required Work. (See 3.2 Minimum Qualifications)

1. How many years has your organization been in business as a licensed general contractor under your present business name? _____.
2. Attach to this Form a list of all contracts comparable to this project that your organization has performed during the last five years. For each contract listed, include the owner's contract number, contract title, brief project description, original Contract Price, final Contract Price, substantial completion date or percent complete (if not completed), and the name, address and phone number of an individual from the owner to which your organization may refer.
3. Are there any current federal, state, or local tax liens filed on your organization? ___Yes ___No
   If yes, attach a list of all current tax liens and an explanation for each.
4. Has your organization failed to complete work awarded to it in the last five years? ____Yes ____No
   If yes, attach an explanation, including description of the project, identification of the owner, contract award date, and reason work was not completed.
5. Has your organization ever had a contract terminated for default in the last five years? ___Yes ____No
   If yes, attach an explanation, including description of the project, identification of the owner, contract termination date, and reason for each termination for default.
6. Has your organization ever had significant accidents or OSHA violations in the last five years? ___Yes ____No
   If yes, attach a list of each significant accident or OSHA violation, including a description and date of each event, and an explanation for each.
7. Has any officer or partner of your organization ever been an officer or partner of another organization that failed to complete a construction project? _____.
   If so, state name of individual, organization and reason therefore.
   _____
   _____
   _____
8. Does your organization or its key personnel now hold valid certificates of competency or licenses for which a specific license is required? _____.
   If so, attach copies of all licenses covering the Work under the Contract Documents together with the specific political jurisdiction issuing said licenses.
   Attachment _____, consisting of _____ pages.
9. Is your organization owned, controlled or organized under the law of a Foreign County of Concern as identified in Section 287.138, Florida Statutes? _____

By: _____
Print Name: _____

CONTRACT

This Contract, made and entered into as of the _____day of _____, 2026, by and between Tampa Bay Water, A Regional Water Supply Authority ("Tampa Bay Water") and _____, a corporation of the State of _____, or other business entity authorized to do business in the State of Florida ("Contractor"), with respect to that certain Project consisting of the Work to be performed in accordance with the Contract Documents, supplementary conditions, general conditions, invitation to bid documents, bid price form, technical specifications and all issued addenda for Tampa Bay Water's Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, (Project 07153)

W I T N E S S E T H:

Tampa Bay Water and the Contractor in consideration of the mutual covenants and obligations contained herein, and for other good and valuable consideration, the sufficiency and adequacy of which are hereby acknowledged, agree as follows:

Work

1.1 The Contractor shall perform all of the Work in accordance with the Contract Documents (as that term is defined in the General Conditions which are attached to and made a part of this Contract).

1.2 Contractor shall perform the Work in accordance with generally accepted construction practice under the same or similar circumstances at the same time and in the same locality. Contractor shall have exclusive responsibility for all construction means, methods, techniques, sequences, and procedures necessary or desirable for the correct, prompt, and orderly prosecution and completion of the Work as required by this Contract and the Contract Documents.

1.3 The responsibility to provide the construction means, methods, techniques, sequences and procedures shall include, but not be limited to, the obligation of the Contractor to provide the following construction requirements, as applicable: temporary power and light; temporary offices and construction trailers; required design certifications; required approvals; weather protection; site clean-up and housekeeping; construction trade management; temporary parking; a construction safety plan; safety and first aid facilities; correction of or compensation for defective work or equipment; Subcontractors' insurance certificates; storage areas; workshops and warehouses; temporary fire protection; site security; temporary Utilities; including without limitations; potable water and water for use in performing the Work (in all cases, including a backflow preventer meeting ANSI A40.6); phone; sanitary; gas or fuel; Subcontractor and Supplier qualification; equipment and materials procurement and expediting; receipt and unloading and proper storage of delivered materials and equipment; erection rigging; temporary supports; submittal and shop drawings review and orderly filing system; construction and procurement critical path scheduling; construction coordination; and cooperation with Tampa Bay Water in implementation of Tampa Bay Water's owner's direct purchase sales tax savings program.

1.4 During the progress of the Work, Contractor shall at all times during normal working hours afford Tampa Bay Water and Engineer every reasonable opportunity for observing all Work. During any such observation, all representatives of Tampa Bay Water and Engineer shall comply with all safety and other rules and regulations applicable to presence in or at the Work site.

1.5 Contractor shall have full responsibility, to the extent applicable, for locating all underground Utilities in advance of excavation; scheduling excavation and uncovering in advance, unless it

conflicts with Work already uncovered; shoring, blocking, and protecting underground Utilities; repairing any damage done to the satisfaction of Tampa Bay Water and Engineer and the owners of those underground Utilities; promptly notifying Tampa Bay Water and Engineer of any newly discovered underground Utility; and the safety, protection and repairing of any damage done to any affected Work. Al1 costs involved and time required to perform these responsibilities shall be considered as having been included in the Contract Price.

1.6 Contractor shall use care and diligence, and shall take all appropriate precautions, to protect the Work and the Work site and the property of other persons (including any materials, equipment, or other items furnished by Tampa Bay Water) from damage due to the nature of the Work, the natural elements, carelessness of others, and from any cause, until final completion of the Work; and for such purpose, Contractor shall provide fencing, protective features (such as tarpaulins, boards, boxing, frames, canvas guards, and fireproofing), and other safeguards to the extent Contractor reasonably determines such are necessary and proper in the performance of the Work.

1.7 Contractor shall ensure that each employee, representative, Subcontractor, Supplier, and others acting for the Contractor use designated access roads and parking areas. Contractor shall employ watchmen on the Work site when necessary and shall also erect and maintain such strong and suitable barriers and such lights as shall effectively prevent the happening of any accident to health or to property or to any partially completed Work or to any materials stored on or adjacent to the Work site. Contractor shall employ any additional temporary fencing and gates to adequately protect the Work.

1.8 Stored materials shall be kept in a neat and orderly manner. Materials that are subject to deterioration by exposure to the sun, rain or other elements shall be kept adequately covered and protected. Contractor shall be responsible for protecting all stored materials and the Work site safe from theft and vandalism.

1.9 All costs involved and time required to perform these responsibilities shall be considered as having been included in the Contract Price.

1.10 Contractor shall notify owners of adjacent property (including underground Utility owners) not less than forty-eight (48) hours, or the time period required by Laws and Regulations, whichever period is longer, prior to commencing the Work, and shall coordinate and cooperate with them in the location, protection, removal, relocation, and/or replacement of their property. At least five (5) days prior to providing such notice to adjacent property owners, Contractor shall submit its proposed written notice to Tampa Bay Water for review and approval. All damage, injury or loss to property caused, directly or indirectly, in whole or part, by Contractor, any Subcontractor or Supplier or anyone for whose acts any of them may be liable, shall be remedied at Contractor's expense, which shall be considered to have been included in the Contract Price.

1.11 In case of damage or destruction to the Work, the Work site or adjacent properties resulting from any cause, and regardless of the extent thereof or the estimated cost of repair, replacement or restoration, and whether or not any insurance proceeds are sufficient or available for the purpose, Contractor shall immediately undertake and complete the repair, replacement and restoration of the damage or destruction to the character and condition existing immediately prior to the damage or destruction, all at Contractor's sole cost and expense, which shall be considered to have been included in the Contract Price, except in the event that such damage or destruction is caused by Tampa Bay Water, its employees, agents, representatives, including Engineer, or is the result of an Uncontrollable Circumstance.

1.12 Contractor shall notify Tampa Bay Water immediately of any damage or destruction to the Work, the Work site or any adjacent properties including, but not limited to, hazardous substance spills, damage to sensitive areas, permit or approval violations, fires and injuries. Additionally, Contractor shall notify the required Insurance carriers and Sureties of any

damage or destruction to the Work, the Work site, or adjacent properties, or any accidents on the Work site, as promptly as possible after Contractor learns of any such damage, destruction or accidents. As soon as practicable after learning of any such occurrence, Contractor shall submit a full and complete written report to Tampa Bay Water.

1.13 In case of an emergency which threatens loss or injury to persons or property, Contractor shall take appropriate remedial action, without previous instructions from Tampa Bay Water or Engineer, as the situation may warrant, and shall immediately provide Notice to Tampa Bay Water and Engineer of its action. Any claim for compensation by Contractor, together with substantiating documentation in regard to expense caused by emergency acts, shall be submitted to Tampa Bay Water and the amount of compensation if any, shall be determined by mutual contract, subject to cost substantiation.

Contract Time

2.1 Tampa Bay Water and the Contractor recognize that time is of the essence with respect to Contractor's performance of its obligation under the Contract Documents, and Tampa Bay Water shall suffer financial loss if Substantial Completion and Final Completion of the Work is not achieved within the Contract Time specified in paragraph 2.2 below, or if the Well Collection Main Out-of-Service Period specified in Paragraph 1.5.A.9., of Section 01100, Special Project Procedures (the "Well Collection Main Out-of-Service Period") is exceeded. Accordingly, if the Contractor fails to achieve Substantial Completion or Final Completion of the Work within the Contract Time, or exceeds the Well Collection Main Out-Of-Service Period, it shall pay Tampa Bay Water Liquidated Damages in accordance with the terms stated below in *Article III, Liquidated Damages*.

2.2 The Contractor shall commence the Work within ten (10) days after the date specified for the commencement of the Work in the Notice to Proceed and shall complete all Work hereunder as follows:

a. The Well Collection Main Out-Of-Service Period is fourteen (14) calendar days, as specified in Paragraph 1.5.A.9., of Section 01100, Special Project Procedures.

b. All facilities shall be manually operational to provide Tampa Bay Water at its option the full time use of the Project as intended by the Contract Documents and the Contractor shall perform the Work to achieve Substantial Completion within three-hundred seventy-eight (378) calendar days of issuance of Notice to Proceed as the commencement date of the Contract Time.

c. The Contractor shall perform the Work to achieve Final Completion within four hundred twenty-seven (427) calendar days of issuance of Notice to Proceed as the date of commencement of the Contract Time.

2.3 The completion deadlines in this Section 2 are subject to adjustment in accordance with the General Conditions.

3.0 Liquidated Damages

3.1 If the Contractor fails to achieve Substantial Completion or Final Completion of the Work within the Contract Time, or exceeds the Well Collection Main Out-of-Service Period, as said time periods may be adjusted pursuant to the terms of the Contract Documents, Contractor shall pay Tampa Bay Water Liquidated Damages in accordance with the following:

a. The Contractor shall pay Tampa Bay Water as Liquidated Damages, and not as a penalty, the amount of Two Thousand Dollars and 00/cents ($2,000.00) for each day that exceeds the Well Collection Main Out-of-Service Period. These Liquidated Damages are Tampa Bay Water's sole and exclusive Well Collection Main Out-of-Service Period delay related damages and represent a reasonable estimate of Tampa Bay Water's damages in the event the Well Collection Main Out-of-Service Period is exceeded. The Contractor agrees that these Well Collection Main Out-

of-Service Period Liquidated Damages do not constitute a penalty or forfeiture. Also, Contractor agrees these Well Collection Main Out-of-Service Period Liquidated Damages are independent of the Substantial Completion and Final Completion Liquidated Damages noted in Paragraphs 3.1.b. and c. below.

b. The Contractor shall pay Tampa Bay Water as Liquidated Damages, and not as a penalty, the amount One Thousand Dollars and 00/cents ($1,000.00) for each day that expires after the Contract Time specified above in paragraph 2.2.b for Substantial Completion. These Liquidated Damages are Tampa Bay Water's sole and exclusive Substantial Completion delay related damages and represent a reasonable estimate of Tampa Bay Water's damages in the event Substantial Completion of the Work is delayed. The Contractor agrees that these Substantial Completion Liquidated Damages do not constitute a penalty or forfeiture.

c. The Contractor shall pay Tampa Bay Water as Liquidated Damages and not as a penalty, the amount of Five Hundred Dollars and 00 cents ($500.00) for each day that expires after the time specified in Paragraph 2.2.c for Final Completion. These Liquidated Damages are Tampa Bay Water's sole and exclusive Final Completion delay related damages and represent a reasonable estimate of Tampa Bay Water's damages in the event Final Completion of the Work is delayed. The Contractor agrees that these Final Completion Liquidated Damages do not constitute a penalty or forfeiture. Also, Contractor agrees these Final Completion Liquidated Damages are in addition to, and not duplicative of, the Substantial Completion Liquidated Damages noted in Paragraph 3.1.b above.

4.0 Contract Price

4.1 Tampa Bay Water hereby agrees to pay to the Contractor in lawful money of the United States for the faithful performance of all of the Contractor's obligations under the Contract Documents, and the Contractor agrees to accept in full payment the Contract Price of: _____ Dollars and _____Cents ($_____), (*contract price will be inserted upon award of contract*) subject to the conditions governing payments to the Contractor in the Contract Documents. If the Contract Price includes any Unit Price amounts and the actual quantity of Unit Price items installed is different than the estimated quantity, then the Contract Price shall be adjusted in accordance with the Contract Documents. The Contract Price includes, if applicable, only those Alternates accepted by Tampa Bay Water, as identified in paragraph 4.3 below. The Contract Price includes, if applicable, only those Allowances established by Tampa Bay Water, as identified in paragraph 4.4 below.

4.2 The Unit Prices and associated estimated quantities included within the Contract Price are attached hereto and made a part hereof as Schedule A.

4.3 The following Bid Options have been accepted by Tampa Bay Water and are included within the Contract Price:

ALTERNATE	Price

4.4 The following Allowances have been established by Tampa Bay Water and are included within the Contract Price:

ALLOWANCE	Price
Owner's Allowance	$246,000.00

Payment of Allowances shall only be authorized by issuance of Change Authorization signed by Tampa Bay Water in accordance with Section 7.2.1 of the General Conditions.

5.0 Payment

Payment procedures are outlined in the General Conditions, Article VII Payment. All monies not paid when due shall bear interest at a rate not to exceed the interest rate allowed by law to be paid by governmental entities in Florida, provided that this does not exceed six percent per year simple interest.

Tampa Bay Water's payment to Contractor of any progress or final payment shall not release the Contractor of any liability and shall not be deemed evidence of performance or be construed as an acceptance of defective or improper Work, or Work that does not comply with the requirements of the Contract Documents.

6.0 Miscellaneous

6.1 All Contract Documents are hereby incorporated into and made a part of this Contract by this reference. The Contract Documents may only be amended, modified, or supplemented as provided in the Contract Documents. The Contract Documents represent the final and entire integrated Contract between the parties with respect to the Work. The Contract Documents supersede all prior oral or written Contracts, if any, between the parties, and any statement, representation, promise or inducement not set forth in the Contract Documents is null and void and not binding on Tampa Bay Water or the Contractor. Except for the warranty and third party beneficiary rights of Tampa Bay Water set forth herein, the Contract Documents shall not in any way create a relationship of any kind between the Engineer and the Contractor or between Tampa Bay Water and a Subcontractor or Supplier, or between Tampa Bay Water and any other person. If any provision(s) of the Contract Document is/are invalid, illegal, or unenforceable such provision(s) shall be considered divisible, and all other provisions of the Contract Documents shall nevertheless remain in full force and effect.

6.2 The Contractor shall not sell, assign, transfer or otherwise convey any of its rights and shall not delegate any of its duties under the Contract Documents without the prior and expressed written consent of Tampa Bay Water and the Surety. Any attempted sale, assignment, transfer, conveyance or delegation of the Contractor's rights under this Contract or the other Contract Documents in violation of the terms of this paragraph shall be void and shall relieve Tampa Bay Water of any further liability under the Contract Documents but shall not relieve the Contractor or the Contractor's Surety(ies) of any liability. If Tampa Bay Water consents in writing to an assignment, unless specifically stated to the contrary in the consent, the assignment shall not release or discharge the Contractor from any duty, responsibility or obligation set forth in the Contract Documents, and shall not release or discharge the Surety(ies) under the bonds required by the Contract Documents.

6.3 This Contract shall be binding on Tampa Bay Water, the Contractor, and all of their respective successors, heirs, legal representatives and, if Tampa Bay Water has consented to an assignment or delegation as provided in the previous paragraph, assigns and delegates.

6.4 Any waiver by Tampa Bay Water of any provision of the Contract Documents must be specific and in writing and shall apply only to the particular matter concerned and not to other similar or dissimilar matters. Any waiver of any breach of the Contract Documents shall not be held to be a waiver of any other or subsequent breach. Neither the failure of Tampa Bay Water to

exercise any power given to Tampa Bay Water under the Contract Documents or to insist upon compliance by the Contractor with Contractor's obligations under the Contract Documents, nor any custom or practice of Tampa Bay Water and Contractor at variance with the terms of the Contract Documents, shall constitute a waiver of Tampa Bay Water's right to demand full and complete compliance by the Contractor with the terms and provisions of the Contract Documents.

6.5 Nothing contained in the Contract Documents shall in any manner authorize, empower or constitute the Contractor, its Subcontractors or Suppliers as agent(s) of Tampa Bay Water; authorize or empower the Contractor, its Subcontractors or Suppliers to assume or create any obligation or responsibility whatsoever, express or implied, on behalf of or in the name of Tampa Bay Water; or authorize or empower the Contractor, its Subcontractors or Suppliers to bind Tampa Bay Water in any manner or make any representation, warranty, covenant, contract or commitment on behalf of Tampa Bay Water. The Contractor shall perform all Work under the Contract Documents as an independent contractor. This Contract does not create, and shall not be construed as creating, any rights enforceable by any person not a party to the Contract.

6.6 This Contract and the Contract Documents shall be governed by and construed in accordance with the Laws and Regulations of the State of Florida without giving effect to any rules governing conflict of laws.

6.7 The parties agree that for any litigation arising under the Contract Documents, venue shall be only in the state courts in and for Pinellas County, Florida.

6.8 All documents prepared or produced by Contractor or any of its Subcontractors pursuant to this Contract are the property of and belong to Tampa Bay Water, provided that Contractor is allowed to reuse such documents with the approval of Tampa Bay Water. If Contractor claims that any such document is proprietary or protected by trade secret or otherwise, Contractor has the burden to establish the basis of any such protection but until judicially declared otherwise, Tampa Bay Water shall have all rights of ownership and use of such documents.

6.9 In no event shall Tampa Bay Water be liable to Contractor, nor shall Contractor be liable to Tampa Bay Water, for any incidental, consequential, or punitive damages based upon claims arising out of or in connection with the performance or non-performance of a party's obligations under this Contract, or the material inaccuracy of any representation made by a party in this Contract, whether such claims are based upon contract, tort, negligence, warranty or other legal theory. Contractor acknowledges and agrees, however, that claims, which are brought by third parties against Tampa Bay Water and for which, but for the application of this paragraph, Contractor would otherwise have an indemnification obligation under this Contract, shall not be considered consequential damages under this paragraph.

6.10 All express representations, indemnifications, or limitations of liability made in or given in this Contract will survive its completion or termination for any reason.

6.11 To the extent permitted by applicable law, contractor and Tampa Bay Water hereby acknowledge and agree that any and all claims arising out of, connected with, or relating to this Contract or the relationship created hereby are matters which, if adjudicated, should be adjudicated by a court without a jury. Therefore, the parties hereby waive a trial by a jury. Neither Tampa Bay Water nor contractor or any successor thereof shall seek a trial by jury in any action or proceeding (whether at law or in equity, whether direct or collateral, whether in contract or in tort) arising out of or related to this Contract or the relationship created hereby. Neither Tampa Bay Water nor Contractor shall seek to consolidate any action or proceeding in which trial by jury has been waived with any other action or proceeding in which a jury trial cannot be or has not been waived. The provisions of this paragraph cannot be and have not been waived. The provisions of this paragraph have been fully discussed by the parties and their respective attorneys and the provisions hereof shall be subject to no exceptions. Tampa

Bay Water and contractor acknowledge and agree that no one, including, without limitation, Tampa Bay Water's agents or contractors, has represented that the provisions of this paragraph or of any other paragraph of this Contract will not be fully enforced.

6.12 Contractor warrants that it has not employed or retained any company or person, other than a bona fide employee working solely for the Contractor to solicit or secure this Contract and that Contractor has not paid or agreed to pay any person, company, corporation, individual, or firm, other than a bona fide employee working solely for Contractor any fee, commission, percentage, gift or other consideration contingent upon or resulting from the award or making of this Contract.

7.0 Public Records and Audit Rights

7.1 Contractor shall keep all books, records, files, drawings, plans and other documentation, including all electronically stored items, which concern or relate to the services required hereunder (collectively referred to as "Records"), for a minimum of three (3) years from the date of expiration or termination of this Contract, or as otherwise required by any applicable law, whichever date is later. Tampa Bay Water, or any duly authorized agents or representatives of Tampa Bay Water, shall have the right to order, inspect and copy all such Records as often as they deem necessary during any such period of time. This right to audit, inspect and copy the Records shall include all of the Records of the Subconsultants.

7.2 If the Contractor has questions regarding the application of Chapter 119, Florida statutes, to the Contractor's duty to provide public records relating to this contract, contact Tampa Bay Water's custodian of public records via phone (727) 796-2355 x 2401; email records@tampabaywater.org; or mail at 2575 Enterprise Road, Clearwater, Florida 33763-1102.

7.3 Contractor must keep and maintain all public records required by the Agency in order to perform services under this Contract.

7.4 Upon request from the Agency's custodian of public records, Contractor shall provide the Agency with a copy of the requested public records or allow the records to be inspected or copied within a reasonable time at a cost that does not exceed the cost provide in Chapter 119, Florida Statutes, or as otherwise provided by law.

7.5 Contractor shall ensure that public records that are exempt or confidential and exempt from public records disclosure requirements are not disclosed except as authorized by law for the duration of the contract term and following completion of the contract if the Contractor does not transfer the records to the Agency.

7.6 Upon completion of the contract, Contractor shall transfer, at no cost, to the Agency all public records in the possession of the Contractor or keep and maintain public records required by the Agency to perform the service under this contract. If the Contractor transfers all public records to the Agency upon completion of the contract, the Contractor shall destroy any duplicate public records that are exempt or confidential and exempt from public records disclosure requirements. If the Contractor keeps and maintains public records upon completion of the Contract, the Contractor shall meet all applicable requirements for retaining public records. All records stored electronically must be provided to the Agency, upon request from the Agency's custodian of public records, in a format that is compatible with the information technology systems of the Agency.

8.0 Definitions

Defined terms used in this Contract have the intent and meanings assigned to them in the General Conditions, *Article I, Definitions.*

9.0 Engineer

Tampa Bay Water has retained the firm of Wade Trim, Inc., to act as the Engineer, assume all of the duties and responsibilities and have the rights and authority assigned to the Engineer in the Contract Documents with respect to completion of the Work in accordance with the Contract Documents.

10.0 Public Entity Crime Statement

10.1 Pursuant to subsections 287.133(2) and (3), Florida Statutes, a person or affiliate who has been placed on the convicted vendor list following a conviction for a public entity crime may not submit a bid, proposal or reply on a contract to provide any goods or services to a public entity; may not submit a bid, proposal or reply on a contract with a public entity for the construction or repair of a public building or public work; may not submit bids, proposals or replies on leases of real property to a public entity; may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a contract with any public entity; and may not transact business with any public entity in excess of the threshold amount provided in Section 287.017, Florida Statutes, for CATEGORY TWO, for a period of thirty-six (36) months following the date of being placed on the convicted vendor list.

10.2 Contractor hereby certifies and warrants that it has not been placed on any convicted vendor list for the past thirty-six (36) months and is in full compliance with the requirements of subsections 287.133(2) and (3), Florida Statutes.

11.0 Discrimination

Pursuant to Subsection 287.134(2)(a), Florida Statutes, an entity or affiliate who has been placed on the discriminatory vendor list may not submit a bid, proposal, or reply on a contract to provide any goods or services to a public entity; may not submit a bid, proposal, or reply on a contract with a public entity for the construction or repair of a public building or public work; may not submit bids, proposals, or replies on leases of real property to a public entity; may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a contract with any public entity; and may not transact business with any public entity. Contractor hereby certifies and warrants that it has not been placed on any discriminatory vendor list and is in full compliance with the requirements of subsections 287.134(2)(a), Florida Statutes.

12.0 Drawings and Specifications

The Drawings consist of the following:

Sheet No.	Sheet Description
G-1	Cover Sheet
G-2	Drawing Index, Notes & Abbreviations
G-3	Legend & Survey Control
G-4	Existing Conditions
C-1	Tree Removal and Limits of Disturbance
C-2	Plan Sheet
C-3	Profile Sheet
CP-1	Cathodic Protection Details
CP-2	Cathodic Protection Details
CP-3	Cathodic Protection Details
CP-4	Cathodic Protection Details
D-1	Tampa Bay Water Standard Details

D-2	Condensed Profile
D-3	Condensed Profile

The Specifications consist of the following:

Section	Description
01010	Summary of Work
01025	Measurement and Payment
01027	Payment Applications
01040	Project Coordination
01050	Field Engineering
01065	Permits and Easements
01100	Special Project Procedures
01300	Contractor Submittals
01310	Construction Progress Schedules
01313	Construction and Schedule Constraints
01410	Testing and Quality Control
01720	Contract Record and Close Out Documentation
02075	Microtunneling
02100	Demolitions
02220	Excavating, Backfilling, and Compacting
02270	Erosion and Sedimentation Control
02410	Shaft Excavation and Support
02431	Contact and Void Repair Grouting
02665	Carrier Pipe Installation and Backfill
02922	Sodding
03000	Concrete
03600	Grout
09940	Protective Coatings
134713	Cathodic Protection System
15065	Steel Pipe
15101	AWWA Butterfly Valves
15104	Resilient-Seated Gate Valves

13.0 Scrutinized Companies and Foreign Countries of Concern

13.1 Contractor certifies that it is in compliance with Section 287.135, Florida Statutes, which provides that a company that has been placed on the Scrutinized Companies with Activities in Sudan List; the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; the Scrutinized Companies that Boycott Israel List or is engaged in a Boycott of Israel is ineligible and may not submit a bid, proposal, or enter into or renew a contract with an Agency for goods or services of $1 million or more. At the time of submission of a bid or proposal for a contract or contract renewal for goods or services of $1 million or more, the company must certify that it

is not on either such List and further that it does not have business operations in Cuba or Syria as required by Section 287.135(5), Florida Statutes.

13.2 Pursuant to Section 287.135, Florida Statutes, Tampa Bay Water reserves the right to terminate any contract for goods or services of $1 million or more if the awarded Contractor:

a. Has been found to have submitted a false Scrutinized Vendor List certification as provided under Section 287.135 subsection (5); or
b. Has been placed on the Scrutinized Companies Scrutinized Companies with Activities in Sudan List or the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; or
c. Has been engaged in business operations in Cuba or Syria.

13.3 Pursuant to Section 287.135, Florida Statutes, Tampa Bay Water reserves the right to terminate any contract for goods or services of any amount if the awarded Contractor has been placed on the Scrutinized Companies that Boycott Israel List or is engaged in a boycott of Israel.

13.4 Foreign Countries of Concern. Pursuant to Section 287.138, Florida Statutes, Tampa Bay Water may not enter into a contract with an entity that gives access to an individual's personal identifying information if the entity is owned, controlled or organized under the laws of a Foreign County of Concern which includes the People's Republic of China, the Russian Federation, the Islamic Republic of Iran, the Democratic People's Republic of Korea, the Republic of Cuba, the Venezuelan regime of Nicolas Maduro, the Syrian Arab Republic, or any other entity or Agency under the significant control of such Foreign County of Concern. Tampa Bay Water reserves the right to terminate any contract for goods or services of any amount if the awarded Contractor is in violation of Section 287.138, Florida Statutes

14.0 Employee Verification

In accordance with Section 448.095 Florida Statutes, the Awardee/Contractor agrees to register with and utilize the U.S. Department of Homeland Security's E-Verify system to verify the employment eligibility of all new employees hired during the term of the award/contract for the services specified in the award/contract. The Awardee/Contractor must also include a requirement in subcontracts that the subcontractor must register with and utilize the E-Verify system to verify the employment eligibility of all new employees hired by the subcontractor during the award/contract term. If the Awardee/Contractor enters into a contract with a subcontractor, the subcontractor must provide the Awardee/Contractor with an affidavit stating that the subcontractor does not employ, contract with, or subcontract with an unauthorized alien. The Awardee/Contractor shall maintain a copy of such affidavit for the duration of the award/Contract. If Tampa Bay Water has a good faith belief that the Awardee/Contractor has knowingly violated Section 448.09(1), Florida Statutes, Tampa Bay Water shall terminate the Contract with the Awardee/Contractor, and the Contractor may not be awarded a Contract with Tampa Bay Water for at least 1 year after the date on which the award/Contract was terminated. The Awardee/Contractor is liable for any additional costs incurred by Tampa Bay Water as a result of the termination of the award/contract. If Tampa Bay Water has a good faith belief that a subcontractor knowingly violated the law, but the Awardee/Contractor has otherwise complied with the law, Tampa Bay Water shall promptly notify the Awardee/Contractor and order the Awardee/Contractor to immediately terminate the award/contract with the subcontractor.

15.0 Anti-Human Trafficking

In accordance with Section s.787.06, Florida Statutes, the Contractor must provide Tampa Bay Water with an affidavit regarding Human Trafficking. Affidavit included herein must be completed by Contractor to attest, under penalty of perjury, that Contractor does not use coercion for labor or services as defined in s. 787.06, Florida Statutes.

IN WITNESS WHEREOF, Tampa Bay Water and Contractor have signed two (2) copies of this Contract, and all parts of the Contract Documents have been identified by Owner and Contractor. This Contract will be effective on _____, 2026 (which is the Effective Date of the Contract).

This Contract may be signed in several counterparts, each of which is an original and all of which constitute one and the same instrument.

End of Contract

PERFORMANCE BOND

KNOW ALL MEN BY THESE PRESENTS: That _____ as Principal, located at _____ (Business Address) and _____as Surety, located at _____ (Business Address) are held and firmly bound to the Tampa Bay Water, A Regional Water Supply Authority as Obligee in the sum of _____ ($_____) for the payment whereof we bind ourselves, our heirs, executors, personal representatives, successors and assigns, jointly and severally.

Whereas, Principal has entered into a contract dated as of the _____ day of _____, 20__, with Obligee for Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, Project No.: 07153, Contract #2026017 in accordance with DRAWINGs and Specifications, which contract is incorporated by reference and made a part hereof, and is referred to as the Contract.

THE CONDITION OF THIS BOND is that if Principal:

1. Performs the Contract at the times and in the manner prescribed in the Contract; and

2. Pays Obligee any and all losses, damages, costs and attorneys' fees, including appellate proceedings, that Obligee sustains because of any default by Principal under the Contract including, but not limited to, all delay damages, whether liquidated or actual, suffered by Obligee; and

3. Performs the guarantee of all work and materials furnished under the Contract for the time specified in the Contract, then this bond is void; otherwise, it remains in full force.

BE IT FURTHER KNOWN:

1. Any changes, regardless of scope or amount, in or under the Contract and compliance or noncompliance with any formalities connected with the Contract or the changes do not affect Surety's obligation under this Bond.

2. The Surety, for value received, hereby stipulates and agrees that no changes, extensions of time, alterations or additions to the terms of the Contract or other work to be performed hereunder, or the Specifications referred to therein shall in anyway affect its obligations under this bond, and it does hereby waive notice of any such changes, extensions of time, alterations or additions to the terms of the Contract or to work or to the Specifications.

3. This Performance Bond is issued in compliance with the terms and conditions set forth in Florida Statute 255.05; however, it is intended to exceed the minimal coverage requirements established by that statute. The Notice and time limitations of Florida Statute 255.05 (2) are also, to the extent applicable, if any, incorporated herein by reference and made a part hereof.

4. In no event will the Surety be liable in the aggregate to Obligee for more than the penal sum of this Performance Bond regardless of the number of suits that may be filed by Obligee.

5. Whenever the Contractor shall be, and is declared by Tampa Bay Water to be in default under the Contract, Tampa Bay Water having performed Tampa Bay Water's obligations thereunder, the SURETY shall promptly remedy the default, as set forth below and at the sole option of Tampa Bay Water, by promptly:

(a) Completing the Contract in accordance with its terms and conditions and paying Tampa Bay Water all of its losses, damages, costs and attorneys' and legal assistants' fees, whether at trial, on appeal or in bankruptcy, that Tampa Bay Water sustains because of any default by Principal under

the Contract including, but not limited to, all delay damages, whether liquidated or actual. In the event Surety takes over and completes the Contract, then in such event it shall be entitled to receive the balance of the Contract Price, as defined in sub-paragraph 2 below; or

(b) Indemnifying Tampa Bay Water for all of its damages, expenses, costs, delay damages, attorneys' and legal assistant's fees, including appellate and bankruptcy proceedings, that Tampa Bay Water has incurred, suffered or sustained as a result of Tampa Bay Water's completion of the Contract or the Principal's default under the Contract, less the remaining unpaid balance of the Contract Price, if any. The term "balance of the Contract Price," as used in this Performance Bond, shall mean the total amount payable by Tampa Bay Water to the Contractor under the Contract and any amendments thereto, less the amount previously paid by Tampa Bay Water to the Contractor.

IN WITNESS WHEREOF, the above parties have executed this instrument this _____ day of _____, 20__, the name of each party being affixed and these presents duly signed by its undersigned representative, pursuant to authority of its governing body.

PUBLIC PAYMENT BOND

KNOW ALL MEN BY THESE PRESENTS: That _____ as Principal, located at _____ (Business Address) and _____ as Surety, located at _____ (Business Address) are held and firmly bound to the Tampa Bay Water, A Regional Water Supply Authority as Obligee in the sum of _____ ($_____) for the payment whereof we bind ourselves, our heirs, executors, personal representatives, successors and assigns, jointly and severally.

Whereas, Principal has entered into a contract dated as of the _____ day of _____, 20__, with Obligee for Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, Project No.: 07153, Contract #2026017 in accordance with Drawings and Specifications, which contract is incorporated by reference and made a part hereof, and is referred to as the Contract.

THE CONDITION OF THIS BOND is that if Principal:

1. Promptly makes payment to all claimants as defined in Section 255.05(1), Florida Statutes, supplying Principal with labor, materials or supplies, used directly or indirectly by Principal in the prosecution of the work provided for in the Contract; and
2. Pays Obligee all losses, damages, expenses, costs, and attorneys' fees, including appellate proceedings that Obligee sustains because of default by the Principal under paragraph 1 of this bond; then this bond is void; otherwise, it remains in full force.

BE IT FURTHER KNOWN:

1. Any changes, regardless of scope or amount, in or under the Contract and compliance or noncompliance with any formalities connected with the Contract or the changes do not affect Surety's obligation under this Bond.
2. 3. This Payment Bond is a statutory payment bond and is not intended to be a common law Payment Bond. This Payment Bond is issued in compliance with the terms and conditions set forth in Florida Statute 255.05. The Notice and time limitations of Florida Statute 255.05 (2) are also expressly incorporated herein by reference and made a part hereof. Any action instituted by a claimant under this bond must be in accordance with the Notice and Time limitations contained in Florida Statute 255.05 (2).

In no event shall the Surety be liable in the aggregate to claimants for more than the penal sum of this Payment Bond, regardless of the number of suits that may be filed by such claimants.

IN WITNESS WHEREOF, the above parties have executed this instrument this _____ day of _____, 20__, the name of each party being affixed and these presents duly signed by its undersigned representative, pursuant to authority of its governing body.

THIS IS TO FURTHER CERTIFY THAT:

1. The company issuing the General Liability Coverage hereby agrees to waive any right of subrogation it may acquire against Tampa Bay Water, its engineers, its consultants, and all other parties named as insured by reason of any payment made on account of personal injury, bodily injury, including death resulting therefrom, sustained by any employee of the insured or property damage arising out of the performance or furnishing of work under the above referenced Contract.

2. Each of the above-described policies contains a provision or endorsement that the coverage afforded will not be canceled, adversely changed or non-renewed until at least thirty (30) days prior written notice has been given to Tampa Bay Water by certified mail.

3. Each of the above listed companies hereby agrees to deliver to Tampa Bay Water new Certificate of Insurance at least fifteen (15) days prior to coverage renewals or binder within such period and a certificate within fifteen (15) days thereafter.

4. If requested, each of the above-listed companies hereby agrees to deliver two (2) copies of the policies purchased by the Agent to Tampa Bay Water.

5. Each of the above listed companies is authorized to do business and has an agent for service of process in Florida and has an "A" policy holders rating and a financial rating of at least Class VIII in accordance with the most current Best's rating. For self-insurance funds, financial statements are to be provided, if requested by Tampa Bay Water. (At Tampa Bay Water's option, a Best's rating or financial information regarding any self-insurance funds may be waived.)

IMPORTANT

If the certificate holder is an ADDITIONAL INSURED, the policy(ies) must be endorsed. A statement on this certificate does not confer rights to the certificate holder in lieu of such endorsement(s).

If SUBROGATION IS WAIVED, subject to the terms and conditions of the policy, certain policies may require an endorsement. A statement on this certificate does not confer rights to the certificate holder in lieu of such endorsement(s).

DISCLAIMER

The Certificate of Insurance on the reverse side of this form does not constitute a contract between the issuing insurer(s), authorized representative or producer, and the certificate holder, nor does it affirmatively or negatively amend, extend or alter the coverage afforded by the policies listed thereon.

ACORD 25 (2001/08)

SUPPLEMENTARY CONDITIONS

Supplementary Conditions to the General Conditions, *Article IV, The Contractor and Its Employees*.

The limits of liability for the following insurance required by the General Conditions, *Article IV, The Contractor and Its Employees*, as amended in the Supplementary Conditions, shall provide coverage for not less than the following amounts or greater where required by Laws and Regulations:

1. Commercial General Liability. The coverage(s) shall be no less than:
   (a) Minimum limits of $1,000,000 per occurrence combined single limit for all liability must be provided, with umbrella insurance making up the difference between the policy limits of underlying policies and the total amount of coverage required. The referenced limit shall be provided as a separate aggregate for the Work (Project Aggregate).

   (b) Minimum limits of $2,000,000 Aggregate single limit for all liability must be provided, with umbrella insurance making up the difference between the policy limits of underlying policies and the total amount of coverage required. The referenced limit shall be provided as a separate aggregate for the Work (Project Aggregate).

2. Business Automobile Liability. The coverage shall be no less than:
   (a) Minimum limits of $1,000,000 combined single limit for all liability must be provided.

3. Umbrella/Excess Liability. The coverage shall be no less than:
   (a) Minimum limits of $2,000,000 per occurrence must be provided.

   (b) Aggregate limits of $5,000,000 must be provided.

4. Worker's Compensation and Employer's Liability. The coverage shall include:
   (a) Coverage A:
   State: Statutory limits under the Laws of the State of Florida.
   Federal: Statutory limits under the Laws of the United State of America (e.g., Longshoremen's, etc.)

   (b) Coverage B:
   Employer's Liability, bodily injury, occupational sickness or disease, or death of Contractor's employees shall be no less than:
   1) $500,000 Each Accident
   2) $1,000,000 Each Disease
   3) $500,000 Each Employee

Tampa Bay Water requires Contractor employers to purchase workers compensation insurance for all their employees regardless of the number of employees they have and regardless of any other exemptions. Florida law permits employers who may be exempt from purchase of coverage to waive their exemptions and purchase the coverage. Tampa Bay Water requires the Contractor to purchase said coverage.

5. Builder's Risk "All Risk" or Installation Floater Insurance. Coverage shall be no less than the full insurable replacement value of the Work, including completed Work, Work in progress and all insurable building materials, structures, fences, lights, equipment, pumps, electrical components, and similar insurable property. Exceptions to insurable property include underground property (after installation), site work and road work.

6. Additional Requirements:
   (a). Tampa Bay Water must be listed as an Additional Insured on General Liability, Auto Liability and Excess policies;

   (b). Excess/Umbrella policies shall be written as "follow form";

   (c.) The insurance provided for Tampa Bay Water as Additional Insured shall apply as primary and non-contributory insurance;

   (d). The Additional Insured Endorsement utilized for General Liability must be form CG 20 10 (07/04) and CG 20 37 (07/04) or broader wording in Tampa Bay Water's favor as approved by Tampa Bay Water;

   (e). Contractor shall maintain General Liability coverage for itself and all Additional Insureds for the duration of the Work and maintain completed operations coverage for itself and Additional Insureds for five (5) years after completion of the Work;

   (f). All Contractor insurance policies will include a Waiver of Subrogation in favor of Tampa Bay Water;

   (g). Each of Contractor's insurance policies shall be endorsed to provide Tampa Bay Water with at least thirty (30) days written notice prior to any material change or cancellation of the policy, to the fullest extent commercially available;

   (h). Deductible amounts on Contractor policies shall not exceed $25,000 and shall require approval from Tampa Bay Water; and

   (i). In the event Contractor breaches any provision of the Insurance Requirements of the Contract, Tampa Bay Water may deduct the cost of any insurance from any funds Payable to Contractor under the Contract Documents.

GENERAL CONDITIONS

1. Definitions

Wherever in the Contract Documents the following terms are used, the intent and meaning shall be as follows:

1.1. Addenda: Instruments issued by Engineer for Tampa Bay Water prior to the advertised time for receipt of Bids that modify the Contract Documents by additions, deletions, clarifications, corrections, or other revisions.

1.2. Contract: The written Contract between Tampa Bay Water and the Contractor covering the Work to be performed.

1.3. Allowances: A specified sum included in the Contract Price to be utilized only at the discretion of Tampa Bay Water.

1.4. Alternates: A specified portion of the Work listed on the Bid which has been added to or deducted from the Base Bid, at Tampa Bay Water's discretion, as identified in the Contract.

1.5. As Approved: The words "As Approved," unless otherwise qualified, shall be understood to be for conformance with the Contract Documents.

1.6. As-Built Contract Documents: A set of the Contract Documents marked up by the Contractor to show the Work as constructed with all modifications from the original Contract Document.

1.7. Base Bid: The sum total of the combined Unit Prices, Lump Sum Prices and Allowances in the Bid, excluding all Alternates.

1.8. Bidder: The person(s), partnership, firm or corporation submitting a Bid for the Work.

1.9. Bid Documents: The "Bid Documents" consist of the Instruction of Bidders, Information to Bidders, Request for Bids, Bid and the Contract Documents.

1.10. Bid Security: The Bid Bond, certified check or cashier's check provided pursuant to this ITB to protect Tampa Bay Water from the unauthorized withdrawal of Bid or refusal to execute the Contract Documents. Electronic Bids received through Euna must be accompanied by a copy of a certified check, or cashier's check drawn on a bank in good standing, or the Florida Bid Bond included herein. The Bid Bond must be issued by a surety authorized to issue such bonds in the State of Florida, in the amount of Five percent (5%) of the proposed total Contract Price of the Bid submitted. The Florida Bid Bond included herein shall be given as a guarantee that the Bidder will not withdraw its Bid for a period of ninety (90) days after the opening of Bids.

When submitting the electronic bid, a copy of the Bid Bond should be submitted in the electronic package. The original Bid Bond must be delivered to Tampa Bay Water physically via mail, delivery service or in-person. If submitting electronically, banking information may be redacted on copies of checks. Original checks must be delivered physically and unaltered.

1.11. Business Day: The term Business Day means each day occurring Monday through Friday.

1.12. Change Authorization: A written instrument which, when recommended by the Engineer and signed by Tampa Bay Water, authorizes and directs the Contractor to perform changes in the Work as described in the Change Authorization, and/or gives the basis, if any, for a subsequent adjustment in Contract Price or Contract Time. Upon receipt of a Change Authorization, the Contractor is authorized and required to perform the subject changes in the Work.

1.13. Change Order: A written instrument which, when recommended by the Engineer and signed by Tampa Bay Water and the Contractor, amends the Contract Documents to provide for changes in the Work, and/or Contract Price, and/or Contract Time.

1.14. Construction Directive: A written instrument issued by the Engineer pursuant to Paragraph 7.2.9.

1.15. Contract Documents: The "Contract Documents" consist of the Contract, Addenda, Supplementary Conditions, General Conditions, Specifications, Drawings, Change Order, Change Authorizations, and all other documents expressly incorporated by specific reference thereto. The Contract Documents are sometimes collectively referred to as the "Contract".

1.16. Contractor: The person(s), partnership, firm, or corporation that entered into and is (are) identified in the Contract.

1.17. Contractor's Representative: The Contractor's superintendent, project manager or other person at the location of Work authorized to direct the Work and receive communications from Tampa Bay Water or Engineer.

1.18. Contract Price: The total compensation payable by Tampa Bay Water to the Contractor for the performance of the Work by the Contractor in accordance with the requirements of the Contract Documents, as stated in the Contract and adjusted by all Change Order and Change Authorizations.

1.19. Contract Time: Unless otherwise specified, the Contract Time for all or a designated part of the Work is the period of time allowed, subject to Change Order and Change Authorizations, for completion of a specified part of the Work. The first Day of Contract Time shall be that date as specified on the Notice to Proceed as the date the Contract Time shall commence.

1.20. Correction Period: The period of time established in paragraph 4.20.2 hereafter for the correction of Defective Work.

1.21. Day: Unless otherwise specifically stated, the term Day shall be understood to mean calendar day.

1.22. Defective: A term used to refer to Work that is faulty, unsatisfactory, deficient, damaged or does not conform to the requirements of the Contract Documents and all applicable Laws and Regulations.

1.23. Drawings: The term Drawings refers to the various drawings, profiles, cross sections, elevations, details, plans and other working drawings and supplementary drawings, or reproductions thereof, sealed by the Engineer, which show the location, character, dimensions, details of the Work to be performed, all as identified in the Contract. Drawings may either be bound in the same book as the balance of the Contract Documents or bound in separate sets, and are a part of the Contract Documents, regardless of the method of binding.

1.24. Engineer: The person or organization identified as such in the Contract that provided the technical design. The term "Engineer" means the Engineer or its authorized representatives.

1.25. Final Completion: The completion of all the Work in accordance with the Contract Documents.

1.26. Laws And Regulations: Federal, State, and Local Statutes, Judicial and Administrative Decisions, Laws, By-Laws, Codes, Rules, Regulations, Resolutions, Ordinances, and/or Orders applicable to the Project.

1.27. Lump Sum Price: The price paid for a specified quantity of Work, which when performed, is paid for on the basis of an agreed price for the completed Work.

1.28. Notice: The term "Notice" or the requirement to notify, as used in the Contract Documents or applicable Laws and Regulations, shall signify a written communication delivered in person; or by certified or registered mail, return receipt requested, to the individual, to a member of the firm, or to an officer of the corporation for whom it is intended.

1.29. Notice Of Award: The written notice of acceptance of the Bid by Tampa Bay Water to the successful Bidder stating that upon compliance by the Bidder, within the time specified, with the requisite conditions stated in this ITB, Tampa Bay Water will deliver the Contract to the successful Bidder for its execution.

1.30. Notice to Proceed: The written Notice issued by Tampa Bay Water to the Contractor, authorizing it to proceed with the Work in accordance with the Contract Documents, and fixing the date for which the Contract Time shall commence.

1.31. Or Equal: The term "or equal" shall be understood to indicate that the "equal" product is the same or better than the named product in function, performance, reliability, quality, and general configuration. Determination of equality in reference to the Project design requirements will be made by the Engineer.

1.32. Partial Utilization: Use by Tampa Bay Water of a portion of the Work (as designated by Tampa Bay Water) before reaching Substantial Completion for all the Work.

1.33. Payment Application: The forms provided by Tampa Bay Water which shall be used by the Contractor in requesting partial or final payment.

1.34. Permit Allowance: The Permit Allowance is for Tampa Bay Water's use in reimbursing the Contractor for the actual cost of permit fees required by Laws and Regulations necessary to perform the Work. This is a pass-through cost and no mark-ups are allowed on the Permit Allowance.

1.35. Progress Report: A written report(s) indicating progress of the Work, estimated date for delivery of materials, and proposed plan for recovery of any delays to the timing and sequence of Work set forth in the Progress Schedule and proposed plan for recovery of any delays to the timing and sequence of Work set forth in the Progress Schedule.

1.36. Progress Schedule: Schedule which shows the timing and sequence of Contractor's proposed execution of the Work and all subsequently issued updates thereto, after said updates have been reviewed and accepted by Tampa Bay Water.

1.37. Project : The name of the Project is as identified in the Contract.

1.38. Project Allowance: The Project Allowance is solely for Tampa Bay Water's use in the payment for changes in the Work, where such changes have been approved pursuant to the Contract Documents.

1.39. Project Representative: The authorized representative(s) of the Engineer who is (are) assigned to the Project or any part thereof.

1.40. Record Drawings: Drawings that are prepared by the Engineer reflecting as-built information provided by the Contractor on Contractor's As-Built Contract Documents.

1.41. Shop Drawings: All drawings, diagrams, illustrations, schedules, and other data prepared by or for the Contractor to illustrate some part of the Work and all illustrations, brochures, standard schedules, performance charts, instructions, diagrams, and other data prepared by a Supplier and submitted by the Contractor to illustrate items of material or equipment.

1.42. Specifications: The term "Specifications" refers to those written technical descriptions of materials, equipment, construction systems, standards and workmanship as applied to the Work, and certain administrative details applicable thereto, all as identified in the Contract. Where standard Specifications, common to the construction industry and to standard engineering practice, are referenced to or are otherwise applicable, the applicable portions of the most current versions of such standard Specifications shall become a part of these Contract Documents. If referenced standard Specifications conflict with Specifications contained herein, the requirements contained herein shall control unless contrary to Laws and Regulations.

1.43. Subcontractor: An entity having a Contract with the Contractor for performing labor on the Work on the Project, or for performing both labor on the Project and furnishing materials or equipment.

1.44. Submittal: The term Submittal includes shop drawings, tests, samples, Progress Schedules and other schedules, Progress Reports and other reports, and any other documents required for submission by the Contract Documents.

1.45. Substantial Completion: Substantial Completion shall be that degree of completion of the Work or specified portion of the Work in accordance with the Contract Documents, as specified in the General Conditions, *Article II, Contract Time* of the Contract, certified by the Engineer and approved by Tampa Bay Water as evidenced by the Engineer's issuance of a Certificate of Substantial Completion, sufficient to provide Tampa Bay Water, at its discretion, the full-time use of the Work or Partial Utilization of a specified portion of the Work for the purposes for which it was intended.

1.46. Supplier: A manufacturer, fabricator, distributor, material man, or vendor having an Contract with the Contractor for furnishing materials or equipment for the Project. Tampa Bay Water, A Regional Water Supply Authority/Owner: Tampa Bay Water, A Regional Water Supply Authority, is the Owner of the Work described in the Contract Documents. The term "Owner" and "Tampa Bay Water" are interchangeable. The Work shall be deemed substanitally complete after the new pipeline is fully operational and has successfully passed all testing and the old out of service pipeline has been removed and/or grouted in place, as noted on the drawings and in the specifications.

1.47. Uncontrollable Circumstance: Any act, event or condition affecting the Project, Contractor or Tampa Bay Water to the extent that it materially and adversely affects: (i) the ability of either party to perform any obligation hereunder (except for payment obligations); or (ii) the cost of such party's performance, if such act, event or condition is beyond the reasonable control and is not also the result of the willful or negligent act, error or omission or failure to exercise reasonable diligence on the party relying thereon as justification for not performing an obligation or complying with any condition required of such party under this Contract;

(1) *Inclusions*. Subject to the foregoing, such acts or events include the following:

(a) an act of God, hurricane, landslide, lightning, earthquake, fire, flood, plague, tornadoes, (but not including reasonably anticipated weather conditions for the geographic area of the Work site), explosion, sabotage or similar occurrence, acts of a public enemy, extortion, war, blockade or insurrection, riot or civil disturbance;

(b) a Change in Law;

(c) the failure of any appropriate governmental body or private utility having operational jurisdiction in the area in which the Project is located to provide and maintain Utilities to the Work site;

(d) any failure of title to the Work site or any enforcement of any encumbrance on the site or on any improvements thereon not consented to in writing by, or arising out of any action or Contract entered into by, the party adversely affected thereby;

(e) the preemption of materials or services by a governmental body in connection with a public emergency or any condemnation or other taking by eminent domain of any portion of the Project or Work site;

(f) the presence at the Work site of (i) subsurface structures, materials or conditions having archaeological significance; (ii) any habitat of endangered or similarly protected species; (iii) functioning subsurface structures at the site (to the extent not identified by Tampa Bay Water to Contractor); and (iv) subsurface conditions of which Contractor, through the exercise of reasonable diligence, could not reasonably be expected to have notice;

(g) strikes by an organized union of the Contractor's Subcontractors;

(h) the failure of Tampa Bay Water to obtain any permit or approval which is Tampa Bay Water's responsibility to obtain, on or prior to the dates set forth in the Project Schedule.

(2) *Exclusions*. It is specifically understood that none of the following acts or conditions shall constitute Uncontrollable Circumstances:

(a) general economic conditions, interest or inflation rates, or currency fluctuations or exchange rates;
(b) changes in the financial condition of Tampa Bay Water, Contractor or any Subcontractor affecting the ability to perform their respective obligations;
(c) the consequences of error, neglect or omissions by the parties and any Subcontractor in the performance of any Work or responsibilities under this Contract;
(d) any increase for any reason in premiums charged by the Contractor's insurers or the insurance markets generally for the required Insurance;
(e) the failure of Contractor to secure any patents or licenses in connection with the technology necessary to perform its obligations hereunder;
(f) the failure of any Subcontractor or Supplier to furnish labor, materials, services or equipment for any reason other than for acts or events specifically included herein as Uncontrollable Circumstances;
(g) equipment failure except when due to acts or events specifically enumerated herein as Uncontrollable Circumstances; or
(h) any Change in Law with respect to the issuance of any permit or approval, the enactment of any statute, or the promulgation of any regulation affecting the standards or requirements of performance, the terms and conditions of which do not impose more stringent or burdensome requirements on the Project or Contractor than in effect on the Effective Date of the Contract.

1.48 Unit Price: The price paid for units of Work which, when performed, is measured and paid for on the basis of units.

1.49 Work: The word "Work" within these Contract Documents shall include all material, labor, services, documentation, tools, equipment, fuel, utilities, temporary facilities and all appliances, machinery, transportation, and appurtenances necessary to perform and complete the Project in accordance with the Contract Documents, and such additional items not specifically indicated or described which can be reasonably inferred as belonging to the item described in the Contract Documents or indicated and as required by good practice to provide a complete and satisfactory system(s) or structure(s).

1.50 Working Hours: Working Hours shall mean the hours between 7:00 a.m. and 6:00 p.m., Monday through Friday, excluding legal holidays. Maintenance of equipment will be allowed outside of Working Hours.

1.51 Other terms not defined herein shall have the meanings assigned to them elsewhere in the Contract Documents, and if not assigned and where the context will permit, as used or defined in the Florida Statutes.

2. Contract Documents

2.1 Intent of Contract Documents

2.1.1. The Contract Documents comprise the entire Contract between Tampa Bay Water and the Contractor concerning the Work. The Contract Documents are complementary, and what is called for by one shall be as binding as if called for by all. The intent of the Contract Documents is to describe a functionally complete Project (or part thereof) to be constructed in accordance with the Contract Documents. Any work, materials, or equipment that may reasonably be inferred from the Contract Documents as being required to produce the indicated result shall be supplied whether or not specifically called for, with no increase in the Contract Price or extension of the Contract Time. When words which have a customary technical or trade meaning are used to describe work, materials, or equipment, such words shall be interpreted in accordance with that meaning, unless a contrary definition appears in the Contract Documents, in which case the Contract Documents shall control.

2.1.2. Whenever the terms "as ordered", "as directed", "as required", "as allowed", "As Approved", or terms of like effect, or the adjectives "reasonable", "suitable", "acceptable", "proper", or "satisfactory", or adjectives of similar effect, are used to describe a requirement, direction, review, or judgment of the Engineer or Tampa Bay Water as to the Work, it is intended that the requirement, direction, review, or judgment will be to evaluate the Work for compliance with the Contract Documents.

2.1.3. No use of any provision of any standard Specifications, manual, or code (whether or not expressly incorporated by reference in the Contract Documents), or Suppliers' instructions, shall be effective to (a) change the duties and responsibilities of the Contractor, Tampa Bay Water, or Engineer, or any of their consultants, agents, or employees from those assigned in the Contract Documents; or (b) to assign to the Contractor, Tampa Bay Water, or Engineer, or any of their consultants, agents, or Tampa Bay Water employees, any duty or authority to supervise or direct the execution of the Work or to assume responsibility contrary to the provisions of the Contract Documents.

2.2 Priority of the Contract Documents

2.2.1. In resolving inconsistencies or apparent conflicts among the Contract Documents, the first listed below shall take precedence and control over those following:

a. *Contract*
b. Supplementary Conditions
c. General Conditions
d. Specifications / Drawings
e. Front-Ends

2.2.2. In resolving inconsistencies between Drawings and Specifications, Contractor shall be obligated to comply with the more costly or stringent requirement, as determined by Tampa Bay Water. Figure dimensions on Drawings shall take precedence over scale dimensions. Detailed Drawings shall take precedence over general Drawings.

2.3 Examination and Verification of Contract Documents

2.3.1. Before undertaking each part of the Work, the Contractor shall carefully study and compare the Contract Documents with each other, check and verify pertinent figures and all applicable field measurements, and compare and coordinate related requirements for Work (i.e. location, dimensions, fit, completeness, consistency, etc.).

2.3.2. The Contractor shall, immediately upon discovery, report in writing to the Engineer any conflict, error, omission, or ambiguity in the Contract Documents which the Contractor discovers, whether prior to or while performing the Work, and shall obtain a written interpretation or clarification from the Engineer before proceeding with any affected Work. The Engineer shall promptly investigate the matter and until such interpretation or clarification is obtained from the Engineer, any Work done by the Contractor which is directly or indirectly affected by same, will be at the Contractor's risk and the Contractor shall bear all resultant costs and delays.

2.4 Documents to be kept on the Project Site

The Contractor shall keep at least one copy of the Contract Documents on the Project site in good order, available to Tampa Bay Water and its representatives. The Contractor shall maintain on a daily basis at the Project site, and make available to the Engineer on request, one current set of As-Built Contract Documents which have been accurately marked by Contractor to indicate all modifications in the completed Work that differ from the original Contract Documents. As a condition precedent to Final Completion of the Work, the Contractor shall give the Engineer one complete set of these As-Built Contract Documents.

2.5 Additional Contract Documents

The Engineer shall furnish to the Contractor one (1) set of sealed Drawings (24 X 36) hard copy, one PDF copy and one AutoCAD electronic copy; sets of sealed Drawings and one (1) reproducible set of the Contract Documents.

2.6 Ownership of Contract Documents

All portions of the Contract Documents, and copies thereof furnished by the Engineer are the property of Tampa Bay Water. They are not to be used on other work and are to be returned to the Engineer at the completion of the Work with the exception of the Contractor's record set. Any reuse or adaptation of these materials by Contractor without specific written permission by Tampa Bay Water is expressly prohibited and shall be at the risk of the Contractor and without liability or legal expense to Tampa Bay Water or Engineer. The Contractor shall hold Tampa Bay Water and Engineer harmless from any and all damages and claims, including reasonable attorneys' fees and legal assistants' fees, for such unauthorized use.

3. The Engineer

3.1 Authority of the Engineer

The Engineer shall be a representative of Tampa Bay Water during the Contract Time for performance of the Work. The Engineer shall have authority to reject Work which does not conform to the Contract Documents. However, the Engineer's authority shall not affect the Contractor's responsibility to perform the Work in accordance with the Contract Documents.

3.2 Duties and Responsibility of the Engineer

3.2.1. The Engineer shall make visits to the Project site at intervals appropriate to the various stages of construction to observe the progress and quality of the Work and to determine if the Work is proceeding in accordance with the Contract Documents. Visits and observations made by the Engineer are solely for the benefit of Tampa Bay Water and shall not relieve the Contractor of its obligations including, but not limited to, the Contractor's obligations to conduct comprehensive inspections of the Work and to furnish materials and perform acceptable work, and to provide adequate safety precautions, all in accordance with the Contract Documents.

3.2.2. The Engineer shall respond, in writing, within 21 days of receipt (unless more time is reasonably required for response), to all claims by Tampa Bay Water or the Contractor required for performance of the Work and requests for clarification or interpretation of the Contract Documents. The Engineer's response shall be of factual and/or technical nature, and shall not include the legal interpretation of the Contract Documents.

3.2.3. The Engineer may assign one or more Project Representatives to observe the Work. It is understood that such Project Representatives shall have authority to issue Notices of non-conformance and make decisions within the limitations of authority of the Engineer. The Contractor shall furnish all reasonable assistance required by the Engineer or Project Representative for proper observation of the Work. Observations by the Project Representative shall not relieve the Contractor of its obligations including, but not limited to, the Contractor's obligation to conduct comprehensive inspections of the Work and to furnish materials and perform work, and to provide adequate safety precautions, all in accordance with the Contract Documents.

3.2.4. On-site observations by the Engineer, Project Representatives and other assistants shall not relieve the Contractor from its obligation to perform the Work in accordance with the Contract Documents, nor constitute acceptance of Defective Work, nor give rise to any duty on their part to make the observations for the benefit of the Contractor.

3.2.5. The Engineer shall review Submittals within the times specified in the General Requirements, or if not specified, within 21 days of receipt (unless more time is reasonably required for review) for conformance with the design of the Project and for compliance with the Contract Documents. The Engineer's review shall not extend to means, methods, techniques, sequences, nor to procedures of construction (except where a specific means, method, technique, sequence, or procedure of construction is indicated in or required by the Contract Documents), nor to safety precautions or programs incident thereto.

3.3 Rejected Work

3.3.1. The Engineer shall have authority to disapprove or reject Work at any time during the performance of the Work, which the Engineer believes to be Defective; or to require special inspection or testing of the Work, whether or not the Work is fabricated, installed, or completed. The Engineer's authority does not relieve the Contractor from its responsibility to perform in accordance with the Contract Documents. When the Contractor is notified by the Engineer of rejection of Defective Work, the Contractor shall take immediate action to correct same.

3.3.2. All Defective Work, whether discovered before or after Final Completion, shall be removed and replaced by the Contractor, without cost to Tampa Bay Water, with Work which shall conform to the Contract Documents. Failure on the part of the Engineer to condemn or reject Defective Work shall not be construed to imply acceptance of such Work. Tampa Bay Water shall reserve and retain all of its rights and remedies at law or equity against the Contractor and its Surety for correction of or damages arising from any and all Defective Work.

3.4 Lines and Grades

Lines and grades shall be established as provided in the Drawings or the Supplementary Conditions. All information, stakes or marks shall be carefully preserved by the Contractor, and if the information, stakes or marks are destroyed or removed, all such information, stakes or marks shall be replaced at the Contractor's expense.

3.5 Detail Drawings and Instructions

If required, the Engineer shall furnish within 21 days (unless more time is reasonably required), in writing, additional instructions by means of Drawings or otherwise, as required for the proper execution of the Work. All such Drawings and instructions shall be in writing and consistent with the Contract Documents.

4. The Contractor and Its Employees

4.1 Contractor

4.1.1. The Contractor shall independently perform all Work included in the Contract Documents and shall not be considered an agent of Tampa Bay Water or of the Engineer, nor shall the Contractor's Subcontractors, Suppliers, or employees be agents of Tampa Bay Water or of the Engineer.

4.1.2. The Contractor shall provide competent, suitably qualified and reliable personnel, Subcontractors, and Suppliers to survey and lay-out the Work and furnish and perform the Work in accordance with the Contract Documents.

4.2 Subcontractors and Suppliers

4.2.1. The Contractor shall be responsible and liable to Tampa Bay Water for the acts and omissions of Contractor's employees, agents, and Subcontractors and Suppliers and their respective employees.

4.2.2. The Contractor shall list each Subcontractor or Supplier whom the Contractor intends to award a subcontract, other than those Subcontractors or Suppliers previously listed in the Bid,

by submitting to Tampa Bay Water in writing, for each additional Subcontractor and Supplier, the same information required to be set forth in the Bid.

4.2.3. Work performed by a Subcontractor or Supplier shall be through an appropriate written subcontract which expressly binds the Subcontractor or Supplier to the terms and conditions of the Contract Documents for the express benefit of Tampa Bay Water, and requires each of them to assume toward the Contractor all of the obligations which the Contractor assumes toward Tampa Bay Water.

4.2.4. The Contractor shall deliver to Tampa Bay Water a copy of each subcontract with a Subcontractor or Supplier within fifteen (15) Days after receiving the Notice to Proceed or the execution of the subcontract, as applicable.

4.2.5. The Contractor shall perform (with the Contractor's own employees) not less than fifty-one percent (51%) of the difference between the Contract Price minus the cost of materials for the Project.

4.2.6. Nothing contained in the Contract Documents or any subcontract shall create any contractual relationship between any Subcontractor or Supplier and Tampa Bay Water or Engineer. Provided, however, Tampa Bay Water shall be named an intended third party beneficiary under all such subcontracts.

4.3 Equal Opportunity

4.3.1. At all times during the performance of the Work, Contractor shall comply with Title VII of the Civil Rights Act of 1964 and the Florida Civil Rights Act of 1992. The Contractor shall not discriminate against any employee or applicant for employment because of race, color, religion, sex, national origin, age, handicap, or marital status. The Contractor shall take affirmative action to ensure that employment applications are used and that employees are treated without regard to their race, color, religion, sex, national origin, age, handicap or marital status for employment, upgrading, demotion, or transfer; recruitment advertising; layoff or termination; rates of pay, or other forms of compensation; and selection for training, including apprenticeship. The Contractor agrees to post in conspicuous places, available to employees and applicants for employment, notices setting forth the provisions of this non-discrimination clause.

4.3.2. The Contractor shall state in all solicitations or advertisements for employment placed by or on behalf of the Contractor that all qualified applicants will receive consideration for employment without regard to race, color, religion, sex, national origin, age, handicap, or marital status.

4.4 Indemnity

4.4.1. In consideration of One Hundred Dollars ($100.00) separately allocated from the first consideration paid hereunder, and other good and valuable consideration, including Tampa Bay Water's execution of the Contract, the sufficiency of which is hereby acknowledged by Contractor, Contractor shall indemnify and hold harmless Tampa Bay Water, its officers, employees, agents, representatives and consultants from and against all liabilities, costs, losses, and damages (including, but not limited to, all reasonable attorney's fees to the extent caused by the negligence, recklessness or intentional wrongful conduct of Contractor, any Subcontractor, or any individual or entity directly or indirectly employed or utilized by Contractor in the performance of the Work under this Contract. This indemnification shall also include all liabilities, damages, losses and costs including, but not be limited to, reasonable attorneys' fees arising out of any infringement of patents or copyrights incident to performing the Work by the Contractor, any Subcontractor or any person or organization employed by

Contractor to perform or furnish any of the Work, or anyone for whose acts any of them may be liable.

4.4.2. With respect to all claims against Tampa Bay Water or the Engineer by any employee of the Contractor, the indemnification obligation under this Article shall not be limited in any way by any limitation on the amount or type of damages, compensation or benefits payable by or for the Contractor (or any Subcontractor or Supplier) under workers' compensation, disability benefit or other employee benefit acts.

4.4.3. The separate consideration recited in paragraph 4.4.1 above is in consideration of the indemnification obligation set forth in this Article 4.4, as well as any other indemnification provided by Contractor under the Contract Documents.

4.4.4 Contractor acknowledges and agrees its indemnification obligations under paragraph 4.4.1 shall be effective and fully enforceable even if any party indemnified hereunder is partially at fault or responsible for the claim; provided, however, Contractor shall not be liable or responsible for indemnifying any claim which is the result of the sole negligence of Tampa Bay Water, Engineer or any other party indemnified under paragraph 4.4.1.

4.5 Bonds and Insurance

A. Performance Bonds, Payment Bonds and Other Bonds

4.5.1. The Contractor shall furnish Performance Bonds and Payment Bonds, each in an amount at least equal to the Contract Price, in accordance with the requirements of Sections 255.05, Florida Statutes, as security for the faithful performance and payment of all Contractor's obligations under the Contract Documents. These Bonds shall be in the forms specified in the Contract Documents. The Contractor shall also furnish any other bonds required in the Supplementary Conditions. All bonds shall be executed by such sureties as are named in the current list of "Companies Holding Certificates of Authority as Acceptable Reinsuring companies" as published in Circular 570 (amended) by the Audit Staff Bureau of Accounts, U.S. Treasury Department. Attorneys-in-Fact who sign Bonds shall attach a certified copy of their Power of Attorney.

B. The Contractor's Insurance – General

4.5.2. The Contractor shall purchase and maintain the coverage specified in this Article and the Supplementary Conditions, and shall be written for not less than the limits of coverage specified in the Supplementary Conditions. The Contractor shall submit certificates to Tampa Bay Water itemizing the policies issued, limits of coverage, expiration dates and endorsements provided, using the form provided in the Contract Documents.

4.5.3. The Contractor shall not start or continue to perform any Work unless it has in full force and effect all required insurance as per the Contract Documents. The Contractor shall submit the insurance certificates provided with these Contract Documents for review by Tampa Bay Water prior to performing any Work. All Subcontractors and Suppliers performing Work on the Project shall provide the same types and limits of insurance as is required of the Contractor hereunder, unless otherwise expressly waived in writing by Tampa Bay Water.

4.5.4. Insurance shall be provided by insurance companies authorized to transact business and which have an agent for service of process in the State of Florida, having at least an "A-" Best's Rating and a Class VIII or better financial size category in accordance with the most current A.M. Best Company rating.

4.5.5. All the policies of insurance shall be endorsed to provide that any failure of the Contractor to comply with any provisions will not prejudice coverage for Tampa Bay Water. Deductible amounts shall be reduced or eliminated upon Tampa Bay Water's written request in which case Contractor shall be entitled to payment of any additional costs for such reduction or

elimination of deductibles in accordance with paragraph 7.2 of these General Conditions. The insurer's costs of providing the insured(s) a defense at trial in bankruptcy proceedings, and/or appeal, including attorneys' fees, and legal assistants' fees, shall not be included within the limits of the policy coverage, but shall remain the insurer's separate responsibility.

4.5.6. To the fullest extent commercially available, all the policies of insurance shall be endorsed to provide that the coverage afforded will not be cancelled, adversely changed or renewal refused until at least thirty (30) Days' prior written Notice has been given to Tampa Bay Water and the Engineer by certified mail, return receipt requested. Should any coverage approach expiration during the period in which it is to remain in full force and effect, it shall be renewed prior to its expiration, and certificate filed with Tampa Bay Water at least thirty (30) Days prior to expiration. Tampa Bay Water and Engineer, their officers, agents, and employees shall be named as Additional Insured(s) on the Contractor's and any Subcontractor's commercial general liability, comprehensive automobile liability insurance, umbrella/excess liability and builder's risk policies for any claims arising out of work performed under the Contract Documents.

4.5.7. In case of the breach of any provision of this Article, Tampa Bay Water, at its option, may take out and maintain, at the expense of the Contractor, such insurance as Tampa Bay Water may deem proper and may deduct the cost of such insurance from any monies which may be due or become due the Contractor under the Contract Documents.

4.5.8. In carrying out any of the provisions of the Contract Documents or in exercising any authority granted by the Contract Documents, there will be no personal liability upon any board member, officer, employee or agent of Tampa Bay Water.

C. The Contractor's Liability Insurance

4.5.9. The Contractor shall purchase and maintain commercial general liability and other insurance appropriate for the Work, in the limits of at least those specified in the Supplementary Conditions, and which shall provide protection from claims itemized below which may arise out of or result from the Contractor's performance and furnishing of the Work and the Contractor's other obligations under the Contract Documents, whether the Work and the obligations be performed or furnished by the Contractor, Subcontractor or any Supplier, to wit:

a. Claims under workers' compensation, disability benefits, and other applicable similar employee benefits acts;

b. Claims for damages because of bodily injury, occupational sickness or disease, or death of the Contractor's employees; claims for damages because of bodily injury, sickness or disease, or death of any person other than the Contractor's employees; claims for damages insured by personal injury liability coverage sustained by any person as a result of an offense directly or indirectly related to the employment of such person by the Contractor, or by any other person for any other reason; claims for damages, other than to the Work itself, because of injury to or destruction of tangible property wherever located, including loss of use; claims arising by operation of Laws and Regulations for damages because of bodily injury or death of any person or for damage to property; and

c. Claims for damages because of bodily injury or death of any person, or property damage arising out of ownership, maintenance, operation, use of loading and unloading of any owned, hired or non-owned motor vehicle used in the Work, including employee non-ownership use.

4.5.10. The Contractor's liability insurance shall include contractual liability coverage sufficient to cover the Contractor's indemnification obligations under the Contract Documents. The

Contractor agrees to pay on behalf of Tampa Bay Water, and to provide and pay for a defense for all claims covered by the Contractor's obligations under the indemnification provisions.

4.5.11. The Contractor's liability insurance shall be endorsed to include as additional insured: Tampa Bay Water, the Engineer, their consultants, any subsidiaries or affiliates, and each of their directors, officers, shareholders, agents, or employees. The insurance afforded to these additional insured shall be primary insurance, and neither the coverage nor the amount of insurance provided under the Contractor's policies shall be reduced or prorated by the existence of any other insurance applicable to any loss they may have sustained. If the Subcontractors and Suppliers do not purchase and maintain the coverage specified in this Article or the Supplementary Conditions, they shall be included in the Contractor's policies as additional insured.

4.5.12. The Contractor's liability insurance shall remain in effect until three (3) years after Final Completion and at all times after that when the Contractor may be correcting or removing and replacing Defective Work. Evidence of insurance shall be furnished to Tampa Bay Water yearly.

4.5.13. These requirements shall not be construed to limit the liability of the Contractor or its insurers. Tampa Bay Water does not represent that the specified coverage or limits of insurance are sufficient to protect the Contractor's interests or liabilities.

D. Property Insurance

4.5.14. The Contractor shall purchase and maintain builder's risk "all risk" completed value insurance coverage for physical loss or damage upon the Work at the Project site to its full insurable value, including completed Work and Work in progress. This insurance shall list Tampa Bay Water as an additional insured and shall include the interests of the Contractor, Subcontractors and Suppliers, the Engineer, and Tampa Bay Water's and the Engineer's consultants in the Work, all of whom shall be listed as additional insured. At a minimum, and not by way of limitation, it shall insure against extended coverage, perils of fire, lightning, windstorm, flood, rain, hail, explosions, riot, tornado, hurricane, sink holes, theft, vandalism and malicious mischief, collapse and water damage and shall include damages, losses and expenses arising out of or resulting from any insured loss incurred in the repair or replacement of any insured property (including but not limited to fees and charges of engineers, architects, attorneys and other professionals). If not covered under the "all risk" insurance, the Contractor shall purchase and maintain similar property insurance on parts of the Work stored on and off the Project site or in transit whether or not such Work is included in a Payment Application. The policy shall be endorsed to permit use or occupancy by Tampa Bay Water prior to Final Completion. The property insurance may have a deductible amount, which shall be borne by the Contractor, not exceeding $25,000.00. The property insurance shall comply with the requirements of this Article.

E. Waiver of Subrogation Rights

4.5.15. Tampa Bay Water and the Contractor intend that all policies of insurance shall protect Tampa Bay Water, the Contractor, and the Engineer, provide primary coverage for all losses and damages caused by the perils covered. Accordingly, all such policies shall be endorsed to provide that in the event of payment of any loss or damage the insurer shall have no rights of subrogation or other recovery against any of the parties named as insured or additional insured, and if the insurers require separate waiver forms to be signed by the Engineer or Tampa Bay Water's and the Engineer's consultants, Tampa Bay Water will obtain separate waiver forms, and if such forms are required of any Subcontractor or Supplier, the Contractor will so obtain them.

4.6 Taxes and Charges

The Contractor shall pay any and all sales and use taxes and all withholding taxes, whether State or Federal, and pay all Social Security charges and also all State Unemployment Compensation charges, and pay or cause to be withheld, as the case may be, any and all taxes, charges, fees, or sums whatsoever, which are now required to be paid or withheld under any laws, unless otherwise modified in the Supplementary Conditions.

4.6.2. Tampa Bay Water reserves the right to implement an Owner's Direct Purchase sales tax savings program with respect to the Project. In such event, Contractor shall cooperate and assist Tampa Bay Water, at no additional cost, with respect to the implementation of that sales tax savings program. Tampa Bay Water and Contractor shall work together to identify particular pieces of equipment and material that are suitable for direct purchase by Tampa Bay Water. As such items are identified, Tampa Bay Water shall issue purchase orders, in accordance with a schedule mutually acceptable to Tampa Bay Water and Contractor, to the appropriate Suppliers of such items for the direct purchase of those items by Tampa Bay Water. Tampa Bay Water shall pay the Supplier of such items directly and the title for such items shall pass directly from the Supplier to Tampa Bay Water. Notwithstanding the foregoing, Contractor shall remain responsible for the ordering, scheduling, coordinating, insuring, delivery, unloading, storage, installation, operation, and warranties of all such direct purchase items, as if Contractor had purchased the items itself for incorporation into the Work. In that regard, Tampa Bay Water shall assign to Contractor all contract and warranty rights Tampa Bay Water may have against any such Supplier, so as to permit Contractor to assert warranty or other contract claims for defective or nonconforming materials or equipment directly against the Supplier. As Tampa Bay Water issues purchase orders to the Suppliers of such items, Tampa Bay Water and Contractor shall execute a Change Order which deducts from the Contract Price the amount being paid by Tampa Bay Water, plus the amount of sales tax that otherwise would have been paid on such items. As an inducement to Contractor to more fully cooperate and facilitate this sales tax savings program, Contractor shall receive as a bonus, at the time final payment is to be made hereunder, a sum equal to ten percent (10%) of the total amount of sales tax saved by Tampa Bay Water as a result of these direct purchases.

4.7 Codes, Ordinances, Permits, and Licenses

4.7.1. The Contractor shall keep itself fully informed of all applicable Laws and Regulations, which in any manner affect the Work. All permits, licenses, inspection fees, impact fees, and other costs necessary for performance of, compliance with, and/or completion of the Work shall be obtained and paid for by the Contractor, unless otherwise modified in the Supplementary Conditions.

4.7.2. If Tampa Bay Water has obtained and paid for any permits or licenses applicable to the Work, the Contractor shall meet all requirements of those permits and licenses. The Contractor shall bear all costs arising from the Contractor's responsibilities under this Article.

4.7.3 All Work is to be performed by Contractor in accordance with the most current applicable Laws and Regulations. Provided, however, in the event of any changes to any applicable Laws and Regulations that take effect after the date Contractor submitted its Bid to Tampa Bay Water, and under the circumstances it is not reasonable to assume that Contractor was or should have been aware of such changes, and Contractor provides Notice to Engineer of the changes and Engineer thereupon directs Contractor in writing to perform the Work in accordance with such changes, and such changes impact the time and/or cost of Contractor's performance of the Work, a Change Order or Change Authorization shall be issued with respect to such changes.

4.8 Superintendence

4.8.1. The Contractor shall keep at the Project site supervisory personnel who shall direct the Work in a competent manner, applying the skills, expertise and attention necessary to perform the Work in accordance with the Contract Documents. The Contractor shall designate, in writing before starting Work, a competent Project superintendent who shall be an employee of the Contractor and shall have complete authority to represent and to act for the Contractor. The Contractor shall notify Tampa Bay Water and Engineer in writing prior to any change in superintendent assignment. If Tampa Bay Water objects to the Contractor's superintendent, the Contractor shall submit a replacement superintendent at no increase in Contract Price nor extension in Contract Time. The Contractor shall be responsible for all construction means, methods, techniques, sequences, and procedures, and for providing adequate safety precautions and coordinating all portions of the Work.

4.8.2. If Tampa Bay Water or the Engineer object to any of the Contractor's personnel, by reason of being unfit, incompetent, unskilled, disorderly, intemperate, or otherwise hindering the Work, the Contractor shall promptly correct the problem and, if required by Tampa Bay Water or the Engineer, remove such personnel from the Work. Failure to comply with this provision shall constitute a material breach of the Contract and be grounds for withholding payment.

4.9 Reception of Engineer's Communications

4.9.1. The Contractor's Representative at the Project site shall have authority to act on behalf of and contractually bind the Contractor. All communications given to the Contractor's Representative shall be deemed given to the Contractor. Communications of major importance will be confirmed in writing upon request from the Contractor.

4.9.2. The Engineer may schedule Project meetings for the purposes of discussing and resolving matters concerning the various elements of the Work. The time and place for these meetings and the names of persons required to be present shall be determined by Tampa Bay Water and the Engineer. The Contractor shall comply with these attendance requirements and shall also require its Subcontractors and Suppliers to comply.

4.10 Safety

4.10.1. The Contractor shall be solely responsible for the condition of the Project site, including the safety of all persons and property during performance of the Work. This requirement shall apply continuously and not be limited to normal Working Hours. Safety provisions shall conform to U.S. Department of Labor (OSHA), and all other applicable Laws and Regulations, as well as all applicable safety rules and regulations promulgated by Tampa Bay Water from time to time. Where any of these are in conflict, the more stringent requirement shall be followed. The Contractor's failure to thoroughly familiarize itself with the aforementioned safety provisions shall not relieve it from compliance with the obligations and penalties set forth therein

4.10.2. The Contractor shall develop and maintain for the duration of this Project a safety program, and a written safety plan specific to the Project that will effectively incorporate and implement all safety provisions required by any Laws and Regulations. The Contractor shall appoint an employee assigned to the Work who shall be responsible to supervise and enforce compliance with the safety program.

4.10.3. The Contractor, as a part of its safety program, shall maintain at its office or other prominent place at the Project site, the written safety plan and safety equipment applicable to the Work as prescribed by the aforementioned authorities and all articles necessary for giving first aid to the injured. The written safety plan shall establish the procedures for the immediate removal to a hospital or a doctor's care of persons (including employees) who may be injured on the Project site.

4.10.4. The Contractor must give Tampa Bay Water and the Engineer prompt Notice of all accidents or injuries whatsoever arising out of, or in connection with, the performance of the Work, whether on or adjacent to the Project site, giving full details in writing, including statements of witnesses. The prompt Notice required hereunder shall be given within 24 hours with respect to any injuries, and within two (2) working days as to all other accidents.

4.10.5. If a claim is made by anyone against the Contractor or any Subcontractor for any reason including, but not limited to, any accident, the Contractor shall give Tampa Bay Water and the Engineer prompt Notice, giving full details of the claim.

4.11 Protection of Work and Property

4.11.1. The Contractor shall have full responsibility for locating all underground utilities in advance of excavation (whether they are indicated on the Contract Documents or indicated by visible markers); scheduling excavation and uncovering in advance, unless it conflicts with Work already uncovered; shoring, blocking, and protecting the underground utilities; repairing any damage done to the satisfaction of Tampa Bay Water or the owners of those underground utilities; giving prompt Notice to Tampa Bay Water and the Engineer of any newly discovered underground utility; and the safety, protection and repairing of any damage done to any affected Work. All costs involved and time required to perform these responsibilities shall be considered as having been included in the Contract Price and in the Progress Schedule for performing the Work within the Contract Time; except that in the case of newly-discovered underground utilities, those costs and times shall, upon proper documentation, be considered pursuant to the General Conditions, *Article 6.8. Differing Site Conditions*, for adjustment of the Contract Price and/or the Contract Time.

4.11.2. The Contractor shall at all times safely guard and protect from damage Tampa Bay Water's property, property on which the Project is located if not owned by Tampa Bay Water, adjacent property, and its own Work from injury or loss. The Contractor shall provide all facilities required for protection of the Work according to all Laws and Regulations and local conditions.

4.11.3. The Contractor shall protect its Work and materials from damage due to the nature of the Work, the natural elements, carelessness of others, or from any cause, until Final Completion of the Work.

4.11.4. The Contractor shall notify owners of adjacent property (including underground utility owners) not less than 48 hours, or the time period required by Laws and Regulations, whichever period is longer, prior to the Work affecting the property, and shall coordinate and cooperate with them in the location, protection, removal, relocation, and/or replacement of their property. All damage, injury or loss to property caused, directly or indirectly, in whole or part, by the Contractor, any Subcontractor or Supplier or anyone for whose acts any of them may be liable, shall be remedied at the Contractor's expense. The Contractor shall shore up, brace, underpin, and protect as may be necessary, all foundations and other parts of all existing structures adjacent to the Project site.

4.12 Responsibility of Contractor to Act in Emergency

In case of an emergency which threatens loss or injury to persons or property, the Contractor shall take appropriate remedial action, without previous instructions from Tampa Bay Water or Engineer, as the situation may warrant, and immediately provide Notice to Tampa Bay Water and the Engineer of its action. Any claim for compensation by the Contractor, together with substantiating documentation in regard to expense caused by emergency acts, shall be submitted to Tampa Bay Water and the Engineer and the amount of compensation if any, shall be determined by mutual Contract.

4.13 Materials and Appliances

4.13.1. Unless otherwise modified in the Supplementary Conditions, all materials to be incorporated into the Work shall be new. The Contractor shall furnish satisfactory evidence to the Engineer as to the kind and quality of materials.

4.13.2. In selecting and/or approving equipment and materials for installation in the Project, neither Tampa Bay Water nor the Engineer shall be responsible for injuries or claims resulting from failure of the equipment or material to comply with Laws and Regulations and applicable federal, state, and local safety codes or requirements, or other applicable safety requirements, or failure due to the Work being Defective.

4.14 Contractors' and Manufacturers' Compliance with State Safety Laws and Regulations, OSHA, and Other Code Requirements

The completed Work shall include all necessary permanent safety devices, such as machinery guards and similar safety items required by the state and federal (OSHA) industrial authorities and other Laws and Regulations. Further, any features of the Work subject to such safety regulations shall be fabricated, furnished, and installed (including installation of Tampa Bay Water-furnished equipment) in compliance with these requirements. Subcontractors and Suppliers shall be held responsible for compliance with the requirements included herein. The Contractor shall notify all Suppliers and Subcontractors of the provisions of this Article.

4.15 Submittals

4.15.1. After checking and verifying all field measurements and after complying with all applicable procedures, Contractor shall submit to the Engineer for its review all Submittals, which shall bear a stamp or specific written indication that the Contractor has satisfied Contractor's responsibilities under the Contract Documents with respect to Submittals. All Submittals shall be promptly submitted by Contractor so as to cause no delay to the completion of the Work. All Submittals shall be identified as Engineer may require. The data shown shall be complete with respect to quantities, dimensions, specified performance, and design criteria, materials, and similar data sufficient to enable Engineer to review the information.

4.15.2. All Submittals shall be identified clearly as to material, Supplier, pertinent data such as catalog numbers, and the use for which it is intended. The Contractor shall review all Submittals prior to submission, for compliance with the Contract Documents and shall provide specific written certification of compliance.

4.15.3. Before each submission, the Contractor shall have determined and verified all quantities, dimensions, specified performance criteria, installation requirements, materials, catalog numbers, and similar data with respect thereto and reviewed and coordinated each Submittal with other Submittals and with the requirements of the Work and for compliance with the Contract Documents. At the time of each submission, Contractor shall provide specific written Notice of each variation from the requirements of the Contract Documents, and in addition, shall cause a specific notation of each such variation to be made on each Submittal submitted for review and approval. In the absence of such notification, the approval of a Submittal shall not waive or alter the original requirements of the Contract Documents.

4.15.4. The Contractor shall make all corrections required by Engineer, and shall resubmit the required number of corrected copies of Submittals and new samples for review. The Contractor shall direct specific attention in writing to revisions other than the corrections called for by the Engineer on previous Submittals.

4.15.5. Where a Submittal or sample is required by the Contract Documents, any related Work performed prior to the Engineer's review and approval of the pertinent Submittal shall be at the Contractor's sole expense and responsibility.

4.15.6. Submittals are to demonstrate how the Contractor intends to conform with the design of the Project and the information given in the Contract Documents.

4.15.7. All costs incurred by Tampa Bay Water and the Engineer for the review of a particular Submittal after the Engineer's second review shall be borne by the Contractor, and shall be reimbursed by the Contractor to Tampa Bay Water. Tampa Bay Water may withhold such costs from payments to the Contractor.

4.15.8. The Contractor shall not be entitled to any claim for additional time or compensation caused by the review of any resubmittals.

4.16 Substitution of Materials

4.16.1. Whenever materials, equipment, type of construction, or process are described in the Contract Documents by using a brand name, make, manufacturer, supplier, patent, catalog number, or technique, the naming or Specifications of the item is intended to denote the standard of quality and essential characteristics of the item or process required by Tampa Bay Water. Unless words indicating that no substitution is permitted are used, items from prospective suppliers may be accepted by the Engineer if sufficient information is submitted by the Contractor in its written application for the substitution to allow the Engineer to determine whether the material or equipment proposed (1) will perform at least equally well, function, and achieve the results called for by the design, (2) is at least of equal materials of construction, quality and necessary essential design features, (3) is suited to the same use as that named or specified, (4) conforms to the desired detailed requirements for that item including, but not limited to, durability, strength, appearance, dimensions, aesthetics (where aesthetics are essential), safety, service, comparable usefulness, reliability, economy of operation, and ease of maintenance, (5) evidences a proven record of performance, and (6) will not extend the Contract Time or increase the Contract Price. Contractor shall be responsible for and shall pay all costs in connection with any inspection or testing required in connection with Tampa Bay Water's or Engineer's acceptance of a Supplier of materials or equipment proposed to be incorporated in the Work.

4.16.2. Each application for a substitution shall certify that the proposed substitute will meet each of the six criteria itemized in paragraph 4.16.1., and that the evaluation and acceptance by the Engineer of the proposed substitute will not prejudice completion of the Work within the Contract Time. All variations of the substitute from the item named or specified shall be identified (operation, materials or construction finish, thickness or gauge of material dimensions, loads, tolerances, deleted/added features, etc.), and information regarding available maintenance, repair, and replacement service shall be indicated. The Contractor is solely responsible for verifying that substitutes are in accordance with the Contract Documents, and that dimensions, arrangement, design, and construction details, and all other features of substitutes are suited to the specified purpose.

4.16.3. A proposed substitute will be accepted as equivalent or "Or-Equal" to that named or specified if, in the Engineer's judgement, it meets the criteria in paragraph 4.16.1. No substitute shall be utilized, ordered, or installed without the Engineer's prior written acceptance.

4.17 Tests, Samples, and Observations

4.17.1. The Contractor shall furnish, with no increase in Contract Price, the necessary test pieces and samples, including facilities and labor for obtaining the same, as required by the Contract Documents or requested by the Engineer. When required by the Contract Documents or requested by the Engineer, the Contractor shall furnish certificates of any designated tests of materials and equipment.

4.17.2. The Contractor shall establish a quality control system to ensure sufficient supervision, inspection and testing of all items of Work, including those of the Subcontractors and Suppliers, and to ensure conformance to the applicable Contract Documents with respect to products, workmanship, construction, maintenance, finish, functional performance, and identification. The Contractor's quality control system shall include checking, approval, and coordination of Submittals and the surveillance of all specified tests.

4.17.3. Tampa Bay Water, the Engineer, authorized government agents and their representatives shall at all times be provided safe access to the Work whenever it is in preparation or progress, and the Contractor shall provide facilities for such access and for observations, including maintenance of temporary and permanent access.

4.17.4. If the Contract Documents, Laws and Regulations or any public authority requires any Work to be specially tested or approved, the Contractor shall give timely Notice to the Engineer of its readiness for testing or approval.

4.17.5. If any testing, inspection, or approval reveals failure of any part of the Work to conform to the Contract Documents, the Contractor shall not recover any costs made necessary by that failure, and shall reimburse Tampa Bay Water for all direct, indirect, and consequential costs made necessary by that failure including those of repeated procedures, and compensation for the Engineer's services. Such reimbursement may be withheld from payment to the Contractor.

4.17.6. If a portion of the Work is covered contrary to the Engineer's request or to requirements specifically expressed in the Contract Documents, it must, if required by the Engineer, be uncovered for the Engineer's examination and be recovered at the Contractor's expense without change to the Contract Time or Contract Price. If any Work should be covered up without approval or consent of the Engineer, re-examination of questioned Work may be ordered by the Engineer, and if so ordered, the Work shall be uncovered by the Contractor. If it is found that such Work is Defective, Contractor shall bear all direct, indirect, and consequential costs of such uncovering, exposure, observation, inspection, correction of the Defective Work, and testing and of satisfactory reconstruction, (including but not limited to fees and charges of engineers, architects, attorneys, and other professionals) and Tampa Bay Water shall be entitled to reimbursement or to deduct the costs from payment to the Contractor. If it is found that such Work is not Defective, Tampa Bay Water shall reimburse Contractor for the cost of uncovering, inspecting, and recovering such Work.

4.18 Royalties and Patents

The Contractor shall pay all royalty and patent fees unless otherwise specified. Pursuant to the indemnity provisions of the General Conditions, *Article 4.4, Indemnity,* the Contractor shall defend all suits or claims for infringement of any patent rights and shall save Tampa Bay Water and the Engineer harmless from any and all loss, including reasonable attorneys' fees and legal assistants' fees on account thereof.

4.19 Contractor's Right to Terminate Contract

If the Work is stopped under an order of any court or other public authority for a period of more than 3 months, through no act or fault of the Contractor, its Subcontractors, or their respective employees, or if Tampa Bay Water should fail to pay the Contractor within forty-five (45) Days after the time specified in the General Conditions, *Article 7.1. Partial Payments,* any sum recommended by the Engineer and approved by Tampa Bay Water, then the Contractor may, upon fifteen (15) Days written Notice to Tampa Bay Water and the Engineer, suspend Work. If Tampa Bay Water fails to correct the conditions, which under this Article justify the Contractor's suspension of the Work, the Contractor may, after fifteen (15) Days additional written Notice to Tampa Bay Water and the Engineer, terminate the Contract.

Upon termination, the Contractor's sole and exclusive remedy shall be the same as and limited to those rights set forth in paragraph 6.6.6 hereafter. Contractor shall not be entitled to any additional rights or remedies against Tampa Bay Water, including loss profits and other damages, all such other remedies being expressly waived by Contractor.

4.20 Warranty and Guarantee; Correction of Defective Work During Correction Period

4.20.1. The Contractor warrants and guarantees to Tampa Bay Water that all Work will be in accordance with the Contract Documents and will not be Defective, including all Work performed or furnished by any Subcontractor or Supplier. This warranty and guarantee is in addition to and shall survive the Contractor's obligations under the Correction Period set forth in this Article.

4.20.2. The Contractor shall make, at its own expense, all repairs or replacements necessitated by Defective Work, and pay for any damage (whether to the Work itself or other property), including routine repairs resulting from such Defective Work, which becomes evident within the one (1) year after the date of Substantial Completion established by the Engineer for the entire Work or for specified items of Work, or within one (1) year after the date of Final Completion of the Work if Tampa Bay Water did not operate or use the entire facility between the Substantial Completion date and Final Completion, or within such longer period of time as may be prescribed by Laws and Regulations or by the terms of any applicable special guarantee required by the Contract Documents ("Correction Period"). After the Correction Period, Contractor shall remain liable to Tampa Bay Water, and its successors, for Defective Work and damage resulting from such Defective Work, but such liability shall not include an obligation to make routine repairs, unless otherwise agreed to in writing.

4.20.3. Contractor's subcontracts with its manufacturer(s) and the Supplier(s) of all other materials and equipment used in the Project which have a cost of more than $1,000.00 shall require an express warranty from the manufacturer(s) and the Supplier(s) to Tampa Bay Water that the materials (1) are new, (2) have been manufactured and supplied in accordance with the requirements of the Contract Documents, and (3) are not Defective. Such express warranty shall be for a period of not less than the Correction Period.

4.20.4. Defective Work identified for correction during the Correction Period but remaining Defective after its expiration shall be considered as part of the obligations of the warranty or guarantee.

4.20.5. The Contractor agrees to defend, indemnify and hold Tampa Bay Water and the Engineer harmless from liability of any kind arising from damage due to Defective Work. The Contractor shall make all repairs and replacements promptly upon receipt of written order for same from Tampa Bay Water or the Engineer. If the Contractor fails to make the repairs and replacements promptly, or in an emergency, where delay would cause serious risk, loss, or damage, Tampa Bay Water may have the Defective Work corrected or the rejected Work removed and replaced, and the Contractor and its Surety shall be liable for the cost thereof.

4.20.6. Contractor's subcontracts with its manufacturer(s) and the Supplier(s) of all materials shall permit the Contractor to assign to Tampa Bay Water all express and implied warranties from the manufacturer(s) and the Supplier(S). Contractor hereby assigns to Tampa Bay Water all express and implied warranties from the manufacturer(s) and the Supplier(S) of all materials used in the Work.

4.20.7. The specified warranties and guarantees and the Contractor's obligations for correction of Work specified in this Article are in addition to and not in limitation of any other specific remedies provided in the Contract Documents or by Laws and Regulations.

4.20.8. Tests, inspections or approvals shall not in any way relieve the Contractor from its obligations to perform the Work in accordance with the Contract Documents, or to warrant and guarantee the Work as provided in the Contract Documents.

4.20.9. These provisions shall not be construed to prohibit Tampa Bay Water from seeking damages or any remedy at law or equity against Contractor for breach of the Contract, Defective Work or the warranties provided herein.

4.21 Allowances

Contractor shall not proceed with any Allowance item unless and until it has received express written authorization from Tampa Bay Water. The Contract Price shall be adjusted by Change Order or Change Authorization based upon the actual cost of the Allowance items authorized in writing by Tampa Bay Water.

4.22 Contractor's Representations:

4.22.1. Contractor has examined and carefully studied the Contract and Contract Documents.

4.22.2. Contractor has visited the Work Site and become familiar with and is satisfied as to the general, local, and site conditions that may affect cost, progress, and performance of the Work.

4.22.3. Contractor is familiar with and is satisfied as to all federal, state and local Laws and Regulations that may affect cost, progress, and performance of the Work.

4.22.4. Contractor has carefully studied all: (1) reports of explorations and tests of subsurface conditions (if any) at or contiguous to the Work site and all drawings of physical conditions in or relating to existing surface or subsurface structures at or contiguous to the Work site which have been identified or made available by Tampa Bay Water; and (2) reports and drawings of Hazardous Environmental Conditions (if any) at the Work site which have been identified or made available by Tampa Bay Water.

4.22.5. Contractor is aware of the general nature of Work to be performed by Tampa Bay Water and others at the Work site that relates to the Work to the extent indicated in the Contract Documents.

4.22.6. Contractor has correlated the information known to Contractor, information and observations obtained from visits to the Site, reports and drawings identified in the Contract Documents, and all additional examinations, investigations, explorations, tests, studies and data with the Contract Documents.

4.22.7. Contractor has given Tampa Bay Water written notice of all conflicts, errors, ambiguities or discrepancies that Contractor has discovered in the Contract Documents and the written resolution thereof by Tampa Bay Water is acceptable to Contractor.

4.22.8. The Contract Documents are sufficient to indicate and convey understanding of all terms and conditions for performance and furnishing of the Work.

4.22.9. Contractor's execution of this Contract is not based upon their reliance upon any representation, understanding or Contract not expressly set forth herein. Tampa Bay Water has not made any representation to Contractor except as expressly set forth herein.

4.22.10. Contractor is organized and exists under the laws of the State of _____ and is in good standing in the State of _____ and is authorized to do business in the State of Florida.

4.22.11. Contractor has the full power and authority to execute and deliver this Contract and to incur and perform the obligations provided for herein and therein, all of which have been duly authorized by all proper and necessary action of the governing body of the Contractor.

Contractor is in compliance with all laws and regulatory requirements to which they are subject.

4.22.12 Contractor executes this Contract as a free and voluntary act, without any duress, coercion, or undue influence exerted by or on behalf of Tampa Bay Water or any other party.

4.22.13 This Contract is a valid, binding and enforceable obligation of Contractor, and does not violate any law, rule, regulation, contract or Contract otherwise enforceable by or against Contractor, except as the same may be limited by bankruptcy, insolvency, reorganization or other similar laws affecting the rights of creditors generally.

5. Tampa Bay Water/Owner

5.1 General Provision

5.1.1. Written communications from Tampa Bay Water to the Contractor shall in general be issued through the Engineer, but if issued directly by Tampa Bay Water, a copy shall be provided to the Engineer.

5.1.2. Tampa Bay Water may issue without negotiation, and at its discretion, Change Authorizations, as provided in the Contract Documents. Only Tampa Bay Water is empowered under the Contract Documents to order changes in the Work that affect Contract Time or Contract Price or quality.

5.1.3. If the Work is Defective, or the Contractor fails to supply sufficiently skilled workers or suitable materials or equipment, or fails to furnish or perform the Work in a way that the completed Work will conform to the Contract Documents, Tampa Bay Water may order the Contractor to stop the Work, or any portion of the Work in question, until the cause for the stop order has been eliminated; however, this right of Tampa Bay Water to stop the Work shall not give rise to any duty on the part of Tampa Bay Water to exercise this right for the benefit of the Contractor or any other party. The Contractor shall not be allowed to recover any costs resulting from an order to stop the Work, and the Contractor shall reimburse Tampa Bay Water for all direct, indirect, or consequential costs attributable to an order to stop the Work; those costs to be documented as to reasonableness, and Tampa Bay Water shall be entitled to an appropriate decrease in Contract Price, or to withhold such decrease against any amounts recommended for payment. The Contractor shall remain responsible for maintaining and performing in accordance with the Progress Schedule and shall not be entitled to any extension in Contract Time or any increase in Contract Price.

5.1.4. Neither Tampa Bay Water, the Engineer, nor Tampa Bay Water's consultants will be responsible for the Contractor's means, methods, techniques, sequences, or procedures of construction, or the safety precautions, and programs related to safety, and neither Tampa Bay Water nor Engineer or any of their consultants shall be responsible for the Contractor's failure to perform or furnish the Work in accordance with Contract Documents.

6. Progress of the Work

6.1 Beginning of the Work

6.1.1. Prior to starting the Work, the Contractor shall prepare and submit to the Engineer, a Progress Schedule and a schedule for Submittals in a format acceptable to Tampa Bay Water and the Engineer and as specified in the General Requirements showing the dates on which each part or division of the Work is expected to be started and completed, and a schedule for Submittals.

6.1.2. No sooner than ten (10) Days before the Notice to Proceed is issued, a pre-construction conference shall be held to review the steps undertaken by the Contractor to comply with the schedule requirements; review the qualifications of the Contractor's on-site personnel; review

the Contractor's plans for lay-down and staging areas, construction traffic, and access to the Project site, parking, communications, procedures, and other similar matters.

6.2 Schedules and Progress Reports

6.2.1. The Progress Schedule or schedule recovery actions, once reviewed and accepted by Tampa Bay Water and Engineer, shall be utilized to report progress or schedule recovery actions, and to evaluate the Contractor's Payment Applications. The Contractor shall be required to keep Tampa Bay Water informed of the progress of the Work by delivering updated Progress Schedules prior to the seventh (7th) day of each month for Tampa Bay Water and Engineer' review and acceptance. Contractor's Submittal of acceptable monthly updates to the Progress Schedules is a condition precedent to Tampa Bay Water's obligation to make payments to Contractor hereunder. Notwithstanding anything in the Contract Documents to the contrary, it is expressly acknowledged and agreed that no review or acceptance of any Progress Schedule by Tampa Bay Water or Engineer shall be construed as an admission or acknowledgement by Tampa Bay Water or Engineer that any such Progress Schedule was either reasonable or achievable.

6.2.2. Prior to the seventh (7th) day of each month, the Contractor shall submit to the Engineer, an itemized Progress Report of the delivery status of purchased equipment and material, Shop Drawings and the status of shop and field fabricated Work. These Progress Reports shall indicate, but shall not be limited to, the dates of the purchase orders, the estimated delivery dates of any material and/or equipment, and cause(s) of delays, if any.

6.2.3. In addition to retainage, Tampa Bay Water shall have the right to withhold all or any portion of Progress Payments for the Work if the Contractor fails to update and submit the Progress Schedule(S) and Progress Reports as specified.

6.2.4. Neither Tampa Bay Water's nor the Engineer's review of the Contractor's Progress Schedule, or Tampa Bay Water's decision to raise or not to raise any objections about the Contractor's Progress Schedule, shall impose on Tampa Bay Water or the Engineer any responsibility for the timing, planning, scheduling, or execution of the Work, nor relieve Contractor of its obligation to complete the Work in a timely manner.

6.3 Prosecution of the Work

6.3.1. Tampa Bay Water and the Contractor agree that time is the essence with respect to Contractor's performance under the Contract Documents. The Contractor shall perform the Work at such time, and in or on such part(s) of the Project site as may be required to complete the Work as required by the Contract Documents.

6.3.2. If the Contractor desires to carry on Work at night or otherwise outside of the Working Hours, it shall give timely Notice to Tampa Bay Water and Engineer to allow satisfactory arrangements to be made for observing the Work in progress. The Contractor shall reimburse Tampa Bay Water for all of Tampa Bay Water's expenses associated with the Work performed outside of normal Working Hours.

6.3.3. The Contractor shall carry on the Work and adhere to the most recent approved Progress Schedule during all disputes or disagreements with Tampa Bay Water. No Work shall be delayed or postponed pending resolution of any disputes or disagreements. Upon receipt of a written order from the Engineer or Tampa Bay Water, the Contractor will immediately proceed with the Work regardless of whether a Change Order or Change Authorization has or has not been issued.

6.4 Tampa Bay Water's Right to Retain Imperfect Work

If any part or portion of the Work completed under the Contract Documents shall prove Defective, Tampa Bay Water shall have the right in its sole discretion, to retain such Work and may make such deductions in the payment due the Contractor as may be just and reasonable.

6.5 Tampa Bay Water's Right to do Work

Should the Contractor neglect to prosecute the Work in conformance with the Contract Documents or neglect or refuse at its own cost to remove and replace Work as shall have been rejected by the Engineer, then Tampa Bay Water may notify the Contractor and its Surety of the condition, and after seven (7) Days written Notice to the Contractor and its Surety, or without Notice if an emergency or danger to the Work or public exists, and without prejudice to any other right which Tampa Bay Water may have under the Contract Documents, take over that portion of the Work which has been improperly executed, and correct the deficiencies and deduct the cost thereof from the payments then or thereafter due the Contractor.

6.6 Tampa Bay Water's Right to Terminate

6.6.1. At any time, Tampa Bay Water may request the Contractor to provide adequate assurances of its ability to complete the Work in the manner and times designated in the Contract Documents. The types of adequate assurances shall be designated by Tampa Bay Water and shall consist of reasonable means for the Contractor to prove its ability to perform.

A. Termination for Cause

6.6.2. Tampa Bay Water, shall have full power and authority to terminate the services of the Contractor seven (7) Days after providing Notice to the Contractor and its Surety, or sooner if safety to persons or property is in question, because:

a. the Contractor refuses or fails to prosecute the Work, or separable part of the Work, with the diligence that will cause its completion within the corresponding Contract Time, including any authorized adjustments; supply sufficient skilled workers, materials or equipment in adherence with the Progress Schedule; or comply with the Progress Schedule requirements; or

b. the Contractor fails to complete the Work, or any separable part, within the corresponding Contract Time, including any authorized adjustments; or

c. the Contractor refuses or fails to make prompt payment to Subcontractors, disregards Laws and Regulations; refuses or fails to perform the Work in conformance with the Contract Documents; or violates any provision of the Contract Documents; or

d. the Contractor fails to provide Tampa Bay Water with adequate assurances in accordance with this Article, that the Contractor can complete the Work in accordance with the Contract Documents.

6.6.3. If, after the furnishing of said Notice, the Contractor and the Surety fail to cure or correct the default, Tampa Bay Water may terminate Contractor's right to perform the Work and take possession of the Project site and of all materials, tools, and appliances thereon, and require Contractor to assign to Tampa Bay Water any or all of Contractor's subcontracts with Subcontractors or Suppliers, as directed by Tampa Bay Water, and finish the Work by whatever method it may deem expedient and charge the cost thereof to the Contractor and Surety. In such case, the Contractor shall not be entitled to receive any further payment until the Work is finally completed. If the expense of completing the Work exceeds such unpaid balance of the Contract Price, the Contractor and its Surety shall pay the difference to Tampa Bay Water.

6.6.4. Where the Contractor's rights to perform the Work have been so terminated by Tampa Bay Water, the termination shall not affect any rights or remedies of Tampa Bay Water against the Contractor then existing or which may accrue after termination. Any retention or payment of monies due the Contractor by Tampa Bay Water shall not release the Contractor from its contractual liability or any other liability.

B. Termination for Convenience

6.6.5. Upon seven (7) Days written Notice to the Contractor and its Surety, Tampa Bay Water may, without cause and without prejudice to any other right or remedy, elect to terminate the Contractor's services under the Contract Documents in whole or in part. Upon receipt of such Notice, the Contractor shall immediately proceed in accordance with any specific provisions or instructions, to protect and maintain the Work, and make reasonable and diligent efforts to mitigate costs associated with the termination.

6.6.6. In any such termination for the convenience of Tampa Bay Water, the Contractor, as its sole and exclusive remedy, shall be entitled to payment for that portion of the Contract Price attributable to the Work completed, prior to receipt of the Notice of termination, in accordance with the Contract Documents, together with Contractor's reasonable and direct out-of-pocket termination expenses; provided, however, Contractor shall not be entitled to any further or additional recovery against Tampa Bay Water including, but not limited to, any lost profit on Work not performed or any other damages however categorized.

6.6.7. If, after Notice of termination for cause as provided in paragraph 6.6.A above, it is determined the Contractor was not in default or that Tampa Bay Water was not entitled to the remedies set forth therein, the termination shall be deemed to have been for the convenience of Tampa Bay Water and Contractor's rights and remedies shall be the same as and limited to those set forth in paragraph 6.6.6 above.

6.6.8. No waiver, express or implied, of any covenant, provision, right or remedy herein shall at any time thereafter be held to be a waiver of the terms and conditions of this Article.

6.7 Delays and Extensions of Time

6.7.1. If the Contractor is delayed in the progress of the Work by any act or neglect of Tampa Bay Water or the Engineer, or by any other contractor retained by Tampa Bay Water, or by strikes, lockouts, fire, adverse weather conditions not reasonably anticipated, or acts of nature, or any other cause beyond the fault and neglect of the Contractor, within 48 hours of the start of the occurrence, the Contractor shall provide Notice to Tampa Bay Water. Within seven (7) Days after the event which caused the delay has ended, the Contractor must provide full documentation of the impact of the delay. The Contract Time may be extended by Change Order or Change Authorization for such reasonable time as the Engineer and Tampa Bay Water determine. No extension of time will be granted to the Contractor for delays occurring to parts of the Work that have no measurable impact on the completion of the total Work. No extension of Contract Time will be considered for weather conditions reasonably anticipated for the area in which the Work is being performed. Reasonably anticipated weather conditions will be based on official records of monthly precipitation and other historical data. Adverse weather conditions, if determined by the Engineer to be of a severity that would impact progress of the Work, may be considered as cause for an extension of Contract Time. No request by the Contractor for an equitable adjustment to the Contract Time under this Article will be allowed, unless the Contractor has given the Notice and documentation within the times required.

6.7.2. Delays in delivery of equipment or material purchased by the Contractor or its Subcontractors or Suppliers shall not be considered as a cause for delay. The Contractor shall be fully

responsible for the timely ordering, scheduling, expediting, delivery, and installation of all equipment and materials.

6.7.3. Within 21 days (unless a longer period of time is reasonably required) after the Contractor submits to Tampa Bay Water and the Engineer a written request for an extension of time, the Engineer will present its written opinion to Tampa Bay Water as to whether an extension of time is justified and, if so, its recommendation as to the number of Days for time extension. Tampa Bay Water shall make the final decision on all requests for extensions to Contract Time.

6.7.4. The Contractor waives its right to file claims unless the claims are filed within the times specified in the Contract Documents. Tampa Bay Water's determination shall be final and binding on the Contractor unless the Contractor files suit within thirty (30) days after receipt of Tampa Bay Water's decision.

6.7.5. Notwithstanding anything in the Contract Documents to the contrary, no interruption, interference, inefficiency, suspension or delay in the commencement or the progress of the Work for any cause whatever, including those for which Tampa Bay Water or Engineer may be responsible, in whole or in part, shall relieve Contractor of its duty to perform or give rise to any right to damages or additional compensation from Tampa Bay Water. Contractor expressly acknowledges and agrees that it shall receive no damages for delay. Contractor's sole remedy, if any, against Tampa Bay Water will be the right to seek an extension to the Contract Time, in accordance with the procedures set forth in this Article 6.7; provided, however, the granting of any such time extension shall not be a condition precedent to the aforementioned "No Damage for Delay" provision. This paragraph shall expressly apply to claims for early completion, as well as to claims based on late completion. Notwithstanding the foregoing, if the Work is delayed due to the fault or neglect of Tampa Bay Water or Engineer, and such delays have a cumulative total of more than 30 calendar days, Contractor may make a claim, in accordance with the procedures set forth in Article 7.3, for its actual and direct delay damages accruing after said 30 calendar days.

6.8 Differing Site Conditions

6.8.1. The Contractor shall promptly, and before the conditions are disturbed, provide Notice to Tampa Bay Water and the Engineer of:

a. any subsurface or latent physical conditions at the Project site which differ materially from those (i) observed by Contractor prior to the Submittal of its Bid or (ii) indicated in the Contract Documents or the Existing Condition Documents referenced in the Information to Bidders,

or

b. any unknown physical conditions at the Project site, of an unusual nature, which differ materially from those ordinarily encountered and generally recognized as inherent in work of the character provided for in the Contract Documents.

6.8.2. The Engineer shall investigate the reported conditions promptly after receiving the Notice from the Contractor. If the conditions do materially differ and cause an increase or decrease in the Contractor's cost or time for performance of the work, an equitable adjustment shall be made in accordance with the procedures set forth in Articles 6.7 and 7.3 herein. Notwithstanding the provisions of this paragraph, if the reported condition in question would have been revealed by a thorough on-site inspection, Tampa Bay Water in its sole discretion shall have the right to deny any such claim for an adjustment in the Contract Price or Contract Time.

6.8.3. No request by the Contractor for an equitable adjustment to the Contract Price or Contract Time for differing site conditions will be allowed if made after the time periods set forth in Articles 6.7 or 7.3, or Final Completion, whichever first occurs.

6.9 Liquidated Damages

Should the Contractor fail to achieve Substantial Completion of the Work within the Contract Time, as that time may be adjusted pursuant to the terms of the Contract Documents, the Contractor shall pay to Tampa Bay Water the liquidated damages as set forth in the Contract. Tampa Bay Water shall have the right to deduct the liquidated damages from any amount due, or that may become due to the Contractor. If an insufficient amount of the Contract Price remains, the amount of liquidated damages shall be due and collectible from the Contractor and its Surety, jointly and severally.

6.10 Other Contracts

6.10.1. Tampa Bay Water reserves the right to let other contracts in connection with the Project. The Contractor shall afford other contractors reasonable opportunity for the introduction and storage of their equipment and materials for the execution of their work and shall properly interface and coordinate its Work with theirs.

6.10.2. If the execution of any part of the Work depends on the performance of any other contractor, utility service company or Tampa Bay Water, the Contractor shall promptly provide Notice to the Engineer of any defects or deficiencies that render it incompatible with the intended results of these Contract Documents. The Contractor's failure to provide the required Notice shall constitute an acceptance of the work by others as being fit and proper for integration with the Work.

6.11 Use of Premises

6.11.1. The Contractor shall confine its equipment, the storage of materials, and the operation of its workers to the areas shown on the Contract Documents or indicated by Laws and Regulations, permits, easements, licenses or directions of Tampa Bay Water or the Engineer. The Contractor shall provide, at its own expense, any rights-of-way or access to the Work which it may require outside the limits of Tampa Bay Water's property interests or easements and shall furnish Tampa Bay Water and the Engineer copies of permits and Contracts for use of property outside that provided by Tampa Bay Water prior to entering said properties.

6.11.2. The Contractor shall not load nor permit any part of any structure to be loaded in any manner that will endanger the structure, nor shall the Contractor subject any part of the Work or adjacent property to stresses or pressures that will endanger it.

6.11.3. The Contractor shall take all precautions to minimize inconvenience to residents living adjacent to the Project site by maintaining access to driveways and providing dust control for the Project site and noise control devices for dewatering equipment. Contractor shall assume full responsibility for any damage to any such land or area, or to the owner or occupant thereof, or of any land or areas contiguous thereto, resulting from the performance of the Work.

6.12 Substantial and Final Completion Dates

6.12.1. When the Contractor considers that the entire Work or designated portion thereof has progressed to the point where it is sufficiently complete in accordance with the Contract Documents, and it has been proven to be ready for its intended use, the Contractor shall provide Notice to Tampa Bay Water and the Engineer that the Contractor considers the Work or designated portion thereof, Substantially Complete (except for listed items to be completed or corrected prior to Final Completion). The Contractor shall prepare an initial list of items of Work to be corrected or completed for Final Completion and attach that list to the above

referenced Notice. Within a reasonable time after that, Tampa Bay Water, the Contractor, and the Engineer shall make an inspection to determine the status of completion.

6.12.2. If Tampa Bay Water and Engineer agree that Substantial Completion of the Work has been achieved, the Engineer shall issue a Certificate of Substantial Completion for the purpose of establishing the starting date for specific equipment warranties, and to establish the date that Tampa Bay Water shall assume the cost of operating such equipment. Said Certificate shall not be considered as Final Completion of any portion of the Work or relieve the Contractor from completing the remaining Work within the specified time and in compliance with the Contract Documents. The Engineer shall review and supplement the Contractor's initial list of items of Work to be corrected or completed for Final Completion and such revised and supplemental list shall be attached to the Certificate of Substantial Completion. Provided, however, the failure to include any incomplete or Defective Work on said list shall not relieve or excuse the Contractor from completing all of the Work in accordance with the requirements of the Contract Documents.

6.12.3. When the Contractor considers the entire Work has progressed to the point where it is complete in accordance with the Contract Documents, the Contractor shall provide Notice to Tampa Bay Water and the Engineer that the Contractor considers the Work to have reached Final Completion.

6.13 Performance Testing

Operating equipment and systems shall be performance tested in accordance with the General Requirements and in the presence of the Engineer to demonstrate compliance with the Contract Documents. The Contractor shall schedule such testing with the Engineer at least one (1) week in advance of the planned date for testing.

6.14 Tampa Bay Water's Use of Portions of the Work

Following issuance of the Notice of Substantial Completion, Tampa Bay Water may occupy and operate the Work. Such occupancy and operation shall not be considered as Final Completion of any portion of the Work, nor shall such occupancy or use be considered as cause for an extension of the Contract Time.

6.15 Cutting, Patching, or Fitting

The Contractor shall do all cutting, patching, or fitting of its Work that may be required to make its several parts come together properly and fit the Work to receive or be received by work of other contractors shown in or reasonably implied by the Contract Documents.

6.16 Cleaning Up

The Contractor shall, at all times, keep property on which Work is in progress and the adjacent property free from accumulations of waste material or rubbish caused by employees or by the Work. Upon completion of the construction, the Contractor shall remove all temporary structures, rubbish caused by employees, Suppliers, Subcontractors, or the Work, and waste materials resulting from its operations.

6.17 Intoxicants

The Contractor and persons under its employ shall not bring onto, possess, sell, or use alcohol, narcotics, drugs (other than prescription drugs, provided the person in possession of the drug has a valid prescription in his or her name, or over-the-counter drugs which may be purchased legally by the person), or controlled substances while on the Project site, including parking lots, at any time, including all breaks and lunch periods. The Contractor and persons under its employ shall not report to, or commence, or continue to work while under the influence of alcohol or any drugs, regardless of whether those drugs were legally or illegally taken. The Contractor and persons under its employ shall not undertake any activities at the Project site

which create a nuisance or improperly disturbs or interferes with Tampa Bay Water's operations at the Project site or the use and enjoyment of any adjacent properties by their respective owners. Gambling on the Project site is prohibited.

7. Payment

7.1 Partial Payments

A. General

7.1.1. Within ten (10) days after commencing the Work, but in any event prior to the Submittal of its first Payment Application, Contractor shall submit to Engineer, for Engineer's and Tampa Bay Water's review and approval, a proposed schedule of values which distributes the Contract Price among the various items and categories of Work to be performed. Said schedule of values shall be in such form and contain such detail as may be required by Engineer and Tampa Bay Water. The final approved schedule of values shall serve as the basis for partial payments and shall be incorporated into the Payment Application form provided by Tampa Bay Water. Nothing contained in this Article shall be construed to affect the right of Tampa Bay Water or Engineer to reject, the whole or any part of the Work, should such Work be found to be Defective. All estimated quantities of Work for which partial payments have been made are subject to review and correction on the final Payment Application. Payment by Tampa Bay Water and acceptance by the Contractor of partial payments based on Unit Price Work, shall not in any way constitute acceptance of the estimated Unit Price Work by Tampa Bay Water.

7.1.2. The Contractor shall provide Tampa Bay Water with copies of its written daily reports at weekly intervals. Refusal of the Contractor to provide its daily reports shall be cause for Tampa Bay Water to withhold payments until the Contractor's daily reports have been provided.

B. Estimate

7.1.3. The Contractor shall not submit more than one Payment Application per month with respect to the Work. Within twenty-five (25) Business Days following submission of a complete and accurate Payment Application to the Engineer, approved by the Engineer, and acceptable to Tampa Bay Water, Tampa Bay Water shall make partial payments to the Contractor on the basis of Work performed during the preceding calendar month by the Contractor. The final working day of each month shall be used as the day for measurement of Work performed.

7.1.4. The Engineer shall, within twenty-five (25) Business Days after receipt of each Payment Application for payment, provide Notice to Tampa Bay Water recommending payment to the Contractor, or return the request to the Contractor providing Notice of the Engineer's reasons for refusing to recommend payment. In the latter case, the Contractor may make the necessary corrections and resubmit the request. Payment shall be made by Tampa Bay Water within ten (10) Business Days after a corrected payment request is received.

7.1.5. The Engineer may refuse to recommend and Tampa Bay Water may refuse to pay the whole or any part of any payment, if in the Engineer's or Tampa Bay Water's opinion, the Contractor is not entitled to any such payment. The Engineer may also refuse to recommend and Tampa Bay Water may refuse to pay any payment or, because of subsequently discovered evidence or the results of subsequent inspections or tests of any Work, retract any previous recommendation or payment to such extent necessary in the Engineer's or Tampa Bay Water's opinion to protect Tampa Bay Water from loss for reasons not limited to:

a. The Work is Defective, or completed Work has been damaged requiring correction or replacement;

b. The Contract Price has been reduced because of Change Order;

c. Tampa Bay Water has been required to correct Defective Work or complete all or portions of the Work;

d. The Contractor's unsatisfactory prosecution of the Work in accordance with the Contract Documents;

e. Written claims have been made against Tampa Bay Water or liens have been filed in connection with the Work;

f. The Contractor's failure to make payment to Subcontractors OR Suppliers for labor, materials, or equipment;

g. Amounts owed by Contractor to Tampa Bay Water as Liquidated Damages; or

h. Any other amounts which may be owed to Tampa Bay Water by Contractor pursuant to the terms of the Contract Documents.

C. Deduction from Estimate

7.1.6. Unless modified in the Supplementary Conditions, Tampa Bay Water shall withhold from each partial payment, five percent (5%) of the amount earned for Work completed. A deduction and retainage of five percent (5%) shall be made on the estimated amount earned for approved items of material delivered to and properly stored at the Project site but not incorporated into the Work. The retainage is to be withheld by Tampa Bay Water until all Work has been performed in accordance with the Contract Documents and until such Work has been accepted by Tampa Bay Water.

7.1.7. Tampa Bay Water may deduct from each Payment Application an amount equal to Tampa Bay Water's estimate of the amount of Liquidated Damages then due, or which may become due.

D. Reimbursement

7.1.8. For Tampa Bay Water's expenses as defined in the General Conditions, *Article 4.15. Submittals*, and for testing that is performed by Tampa Bay Water or the Engineer which indicates Work is Defective, or for any other cost for which Tampa Bay Water is entitled to reimbursement from Contractor under the Contract Documents, at Tampa Bay Water's election, such reimbursement shall be deducted from the Contractor's monthly partial payments or shall be paid by Contractor within 30 days after Tampa Bay Water makes demand for same upon Contractor.

E. Qualification for Partial Payment for Materials Delivered

7.1.9. Partial payments for materials delivered but not yet incorporated into the Work shall be as described below:

a. Materials, as used herein, shall be considered to be those items which are fabricated and manufactured material and equipment. No consideration shall be given to individual purchases of less than $200.00 for any one item.

b. To receive partial payment for materials delivered to the Project site, but not incorporated in the Work, it shall be necessary for the Contractor to include a list of such materials with the Payment Application, the utilization of Tampa Bay Water provided forms is required. At its sole discretion, Tampa Bay Water, with the Engineer's advice, may approve items for which partial payment is to be made. Partial payments shall be based on the Contractor's actual cost for the materials as evidenced by invoices from the Supplier. Proper storage and protection shall be provided by the Contractor, As Approved by the Engineer. Final payment shall be made only for materials actually incorporated in the Work and upon acceptance of the Work, all materials remaining for which partial payments had been made

shall revert to the Contractor, unless otherwise agreed, and partial payments made for these items shall be deducted from the final payment for the Work.

c. Contractor warrants and guarantees that title to all items of Work requested in any Payment Application, whether incorporated in the Project or not, shall pass to Tampa Bay Water at the time of payment for such items, free and clear of all liens, claims, security interests, and encumbrances.

d. If requested by the Engineer, the Contractor shall provide, with subsequent Payment Applications, invoices receipted by the Subcontractor or Supplier showing payment in full has been made.

F. Payment

7.1.10. The amount of partial payment due the Contractor shall be equal to the current value of the Contract Price earned, less, any retainage, less any amounts previously paid, and any deductions for reimbursement as required by the Contract Documents.

7.2 Payment for Change Orders

7.2.1. Tampa Bay Water, without Notice to the Sureties, shall have the right to order changes to the Work. If the parties agree upon the terms for the change, including any appropriate adjustments to the Contract Price or Contract Time, a Change Order shall be issued. If the parties cannot agree upon the terms for the change, a Change Authorization may be issued by Tampa Bay Water. The terms of the Change Authorization shall be final and binding upon Contractor, unless Contractor makes a claim, within twenty-one (21) days of its receipt of the Change Authorization, challenging those terms it takes objection to, giving full details and supporting documentation for its specific objections. Any terms not specifically objected to within that twenty-one (21) day period shall be deemed final and accepted by Contractor. Regardless of whether or not Contractor files a timely claim with respect to any of the terms of the Change Authorization, Contractor shall proceed with the change to the Work, as set forth in the Change Authorization, as directed by Tampa Bay Water or Engineer.

7.2.2. At Tampa Bay Water's option, payment or credit for any changes covered by a Change Order or a Change Authorization, whether additive or deductive, shall be determined by one or a combination of the methods set forth in A, B, or C, below, as applicable:

A. Unit Prices

Those Unit Prices stipulated in the Contract shall be utilized where they are applicable. In the event the Change Order or Change Authorization results in a change in excess of twenty-five percent (25%) of the original Contract quantity, and the total dollar change in value of that item exceeds twenty-five percent (25%), Tampa Bay Water will review the Unit Price to determine if a new Unit Price shall be negotiated. Unit Prices for new unit items not listed in the Contract shall be negotiated and mutually agreed upon.

B. Lump Sum

A total lump sum amount for the Work negotiated and mutually acceptable to the Contractor and Tampa Bay Water. Lump Sum Price quotations for modifications to the Work shall include substantiating documentation with an itemized breakdown of Contractor and Subcontractor costs, including labor, material, rentals, approved services, overhead, and profit, all calculated as specified under "C" below.

C. Cost Reimbursement Work

The term "cost reimbursement work" shall be for changes to be compensated for on a time and expense basis, that is, on an accounting of the Contractor's forces, materials, equipment, and other items of direct cost as required for the change.

Tampa Bay Water, at its sole discretion, may direct the change to be accomplished on a cost reimbursement work basis, in which event the change will be priced based upon the labor, materials, equipment and other costs hereafter noted associated with such change. The cost items for cost reimbursement work shall be limited to the following items:

1. Labor, including superintendent and foremen, for those hours associated with the cost reimbursement work (actual payroll cost, including wages, fringe benefits as established by negotiated labor agreements, contracts, labor insurance and labor taxes as established by law). Expressly excluded from this item are all labor costs associated with negotiating the subject change. No other fixed labor burdens will be considered, unless approved in writing by Tampa Bay Water.
2. Material associated with the change, including sales tax, if paid for by the Contractor or its Subcontractor.
3. Rental, or equivalent rental cost of equipment, including necessary transportation for items having a rental value in excess of $100.00.
   Rental or equivalent rental cost shall be allowed for only those Days or hours during which the equipment is (or would have been for deductive changes) in actual use. Rental and transportation allowances shall not exceed the current rental rates prevailing in the locality. The rentals allowed for equipment shall, in all cases, be understood to cover all fuel, supplies, repairs, and renewals, and no further allowances shall be made for those items, unless specific Contract to that effect is made.
4. Additional bond as required and approved by Tampa Bay Water.
5. Additional insurance (other than labor insurance) as required and approved by Tampa Bay Water.
6. To the costs noted above, for net additive changes, there shall be added the following fixed fees for the Contractor or Subcontractor actually performing the change:

A. A fixed fee of twenty-five percent (25%) of the cost of item 1 above. For costs incurred for Work performed by Subcontractors, the Contractor's fee shall not exceed ten percent (10%) and the Subcontractor's fee shall be the same as for the Contractor; and

B. A fixed fee of ten percent (10%) added to the cost of items 2 and 3.

7.2.3. The fixed fees noted above in the previous paragraph shall be considered to be the full compensation for all cost of general supervision, overhead, profit, and any other general expense.

7.2.4. The Contractor's records shall make clear distinction between the direct costs of Work paid for on a cost reimbursement work basis and the costs of other Work. The Contractor shall furnish the Engineer report sheets in duplicate of each day's cost reimbursement work no later than the working day following the performance of said Work. The report sheets shall itemize the materials used, and shall cover the direct cost of labor and the charges for equipment rental, whether furnished by the Contractor, Subcontractor, or other forces. The report sheets shall provide names or identifications and classifications of workers, the hourly rate of pay and hours worked, and also the size, type, and identification number of equipment and hours operated.

7.2.5. Material charges shall be substantiated by valid copies of vendors' invoices. Such invoices shall be submitted with the daily reports or, if not available, they shall be submitted with subsequent daily report. Said daily report shall be signed by the Contractor or Contractor's Representative.

7.2.6. Tampa Bay Water reserves the right to furnish such materials and equipment as it deems expedient, and the Contractor shall have no claim for profit or added fees on the cost of such materials and equipment.

7.2.7. To receive partial payments and final payment for cost reimbursement work, the Contractor shall submit to the Engineer, in a manner approved by the Engineer and Tampa Bay Water, detailed and complete documented verification of the Contractor's and any of its Subcontractors' actual costs involved in the cost reimbursement work. Such costs shall be submitted within seven (7) Days after said Work has been performed.

7.2.8. Except for Change Authorizations and Change Order, no other written or oral order from Tampa Bay Water or the Engineer shall be treated as a change in the Work or entitle the Contractor to an adjustment to the Contract Price or Contract Time.

7.2.9. The Engineer, by issuing a Construction Directive, may order minor changes in the Work not involving extra cost, or additional times and not inconsistent with the purpose of the Project, but otherwise, except in an emergency endangering life or property, additions or deductions from the Work shall be performed only in pursuance of an approved Change Authorization or Change Order.

7.2.10. Any compensation paid in conjunction with the terms of a Change Order shall comprise the total compensation due the Contractor for the change defined in the Change Order. By signing the Change Order, the Contractor acknowledges that the stipulated compensation adjustment includes payment for alteration of the Work, payment for the interruption of schedules, extended overhead, delay, or any other impact claim or ripple effect, and by such signing specifically waives any reservation or claim for additional adjustment to compensation or time in respect to the subject Change Order.

7.2.11. Tampa Bay Water hereby delegates authority to its General Manager (and his/her designee) to approve any and all Change Order and Change Authorizations in its name, so long as each such Change Order or Change Authorization does not exceed $246,000.00, and further as long as the cumulative total of all Change Order or Change Authorizations does not exceed $246,000.00, unless otherwise approved by the Tampa Bay Water's Board. Each Change Order or Change Authorization over $246,000.00 or which cumulatively exceeds $246,000.00 must be expressly approved by Tampa Bay Water's Board before it shall be binding upon Tampa Bay Water.

7.3 Claims for Additional Compensation

7.3.1. In any case where the Contractor may seek additional compensation, except for an emergency threatening imminent property damage or personal injury, the Contractor shall provide Notice to Tampa Bay Water and the Engineer of its intent to make a claim for such compensation before it begins the Work on which it bases the claim, in order that such matter may be settled or other appropriate action promptly taken. If such notification is not given or the Engineer is not afforded proper facilities by the Contractor for keeping an accurate account of actual costs, the Contractor shall be deemed to have waived its claim for additional compensation.

7.3.2. The Contractor's written Notice, and the fact that the Engineer has kept account of the cost as aforesaid, shall not in any way be construed as proving the validity of the claim.

7.3.3. Claims for additional compensation shall be made in itemized detail and submitted in writing to Tampa Bay Water and Engineer within seven (7) Days following completion of that portion of the Work for which the Contractor bases its claim. If the claim is found to be acceptable by Tampa Bay Water and the Engineer, the Contractor shall be paid as provided in the General Conditions, *Article 7.2. Payment for Change Orders.* No request by the Contractor for an equitable adjustment to the Contract Price under this Article shall be allowed, unless the Contractor has given Notice within the times required.

7.3.4. The Contractor waives its right to file claims unless the claims are filed within the times specified in the Contract Documents. Tampa Bay Water's final determination shall be final

and binding on the Contractor unless the Contractor files suit within thirty (30) days after receipt of Tampa Bay Water's decision.

7.4 Release of Liens or Claims

The Contractor shall indemnify and hold harmless Tampa Bay Water and the Engineer from all claims for labor and materials furnished under the Contract Documents. Prior to the final payment, the Contractor shall furnish to Tampa Bay Water, as part of its final Payment Application, a certification that all of the Contractor's obligations on the Project have been satisfied and that all monetary claims and indebtedness have been paid. The Contractor shall furnish releases or waivers, satisfactory to Tampa Bay Water, from all Subcontractors and Suppliers and of all liens and notices arising out of or filed in connection with the Work. Tampa Bay Water may reduce the amount of retainage withheld upon receipt of an affidavit from Contractor identifying any amounts in dispute with Subcontractor or Suppliers, and provided the amount of retainage withheld continues to exceed the amount in dispute.

7.5 Final Payment

7.5.1. Upon completion of all of the Work, the Contractor shall provide Notice to the Engineer that it has completed its Work and shall request final payment. Upon receipt of such Notice, the Engineer, together with Tampa Bay Water, will inspect and, if acceptable, the Engineer will submit to Tampa Bay Water its recommendation as to acceptance of the Work and as to the final Payment Application of the Contractor. Within sixty (60) Days after the Contractor has submitted its final Payment Application, together with the Sureties' consent to final payment, and upon approval of this Payment Application request by Tampa Bay Water and compliance by the Contractor with provisions in the General Conditions, *Article 7.4. Release of Liens or Claims*, and all other provisions of the Contract Documents as may be applicable, Tampa Bay Water shall pay to the Contractor all monies due it under the provisions of these Contract Documents. Final payment is further subject to Tampa Bay Water's receipt from Contractor of all as-built DRAWINGs, certifications, maintenance manuals, operating instructions, written guarantees and warranties, and bonds relating to the Work, and assignment of all guarantees and warranties from Subcontractors, vendors, Suppliers or manufacturers, all as required by the Contract Documents.

7.5.2. Contractor and Tampa Bay Water agree that project closeout and release of retainage shall be in accordance with Chapters 218 and 255, Florida Statutes, as amended by Chapter 2023-134, Laws of Florida. Specifically, Contractor shall cooperate with Tampa Bay Water to prepare a punch-list with estimated costs of items to complete the Work. Within 20 business days of completion of said punch-list, Tampa Bay Water shall pay Contractor the remaining contract balance, including retainage previously withheld, less an amount equal to 150% of the estimated cost to complete the items on the punch-list, and also less any amounts that are subject to a good faith dispute made in writing to the Contractor by Tampa Bay Water.

7.6 No Waiver of Rights

Neither the inspection by Tampa Bay Water or the Engineer, nor any payment for or acceptance of the whole or any part of the Work by Tampa Bay Water or Engineer, nor any extension of time, nor any possession taken by Tampa Bay Water, shall operate as a waiver of any provision of the Contract Documents, or any right to damages, nor shall such waive any subsequent breach. Acceptance of final payment shall not release Contractor of any liability under the Contract Documents or otherwise, and shall not be deemed evidence of performance or be construed as acceptance of Defective or improper Work.

7.7 Acceptance of Final Payment Constitutes Release

The acceptance by the Contractor of the final payment shall release Tampa Bay Water and the Engineer from all claims and all liability to the Contractor for all things done or furnished in

connection with the Work, and every act of Tampa Bay Water and others relating to or arising out of the Work except claims previously made in writing and identified by Contractor in its final Payment Application as still unsettled. No payment, however, final or otherwise, shall operate to release the Contractor or its Sureties from obligations under the Contract Documents and the Performance Bonds, Payment Bonds, and other bonds and warranties, as herein provided.

7.8 Record Maintenance and Auditing Rights

Contractor shall keep all books, records, files and other documentation, including all electronically stored items, which concern or relate to the Work hereunder (collectively referred to herein as the "Records"), for a minimum of three (3) years from the date of expiration or termination of this Contract or the date of Final Completion or as otherwise required by law, whichever date is later. Tampa Bay Water, or any duly authorized agents or representatives of Tampa Bay Water, shall have the right to audit, inspect and copy all such Records as often as they deem necessary during any such period of time. This right to audit, inspect and copy Contractor's Records shall include all of the Records of the Subcontractors and Suppliers.

7.9 Hazardous Materials

If Contractor encounters on the Project site any materials reasonably believed by Contractor to be petroleum or petroleum-related products, or other hazardous or toxic substances which have not been rendered harmless, Contractor immediately shall (i) stop Work in the area affected and (ii) report such condition to Tampa Bay Water in writing. If the Work is so stopped and hazardous material is found, the Work in the affected area shall not thereafter be resumed except by Change Order. Any such Change Order shall include, but not be limited to, an adjustment to the Contract Time as appropriate. If no hazardous material is found after the Work has stopped, no Change Order is required to resume the Work in the affected area. Further, if the hazardous material was generated or caused by the Contractor, or any of its employees, agents, Subcontractors or Suppliers, no Change Order will be required for an adjustment in the Contract Time, and Contractor shall indemnify Tampa Bay Water for any costs incurred by Tampa Bay Water with respect to such hazardous material.

SECTION 01010

SUMMARY OF WORK

PART 1 - GENERAL

1.1 PROJECT DESCRIPTION

A. The WORK described herein consists of the construction of approximately 500 LF of 60-inch replacement raw water transmission main across State Road 52 with open cut and microtunneling methods as indicated on the DRAWINGS and specified herein. The existing crossing will be placed out of service and the new crossing connected and placed into service as shown and specified.

B. The project is located as shown in the Contract Documents.

1.2 WORK DESCRIPTION

A. The WORK of this PROJECT consists of:

1. Furnish all materials, labor, tools, equipment, and incidentals necessary for the complete and proper construction of the WORK as shown on the construction DRAWINGS and specified herein.

B. All materials, equipment, skills, tools and labor which are necessary and incidental for the proper completion of the WORK, shall be furnished and installed by the CONTRACTOR at no additional cost to the OWNER, whether specifically indicated in the CONTRACT DOCUMENTS or not.

C. In carrying out the WORK, comply with all applicable basic materials and construction requirements specified in the CONTRACT DOCUMENTS.

1.3 CONTRACT PRICE

A. Construct the WORK based on the PROPOSAL. The CONTRACTOR's compensation for all construction, materials, equipment, and installation shown on the DRAWINGS and included in the SPECIFICATIONS will be deemed to be included in the unit Bid Schedule.

1.4 SUBSTANTIAL AND FINAL COMPLETION

A. Before substantial completion, inspect and take all necessary remedial measures of every portion of the WORK, whether remedial work was identified by the CONTRACTOR, ENGINEER or OWNER, to ensure the overall performance is in compliance with the terms of the CONTRACT DOCUMENTS.

B. The WORK shall be complete including all incidental mechanical, electrical, testing and

calibration, and disinfection and ready for the OWNER to assume operations.

C. SUBSTANTIAL and FINAL COMPLETION of the WORK shall be completed, tested and ready for operation in accordance with the dates as contained in the CONTRACT DOCUMENTS.

PART 2 - MATERIALS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01025

MEASUREMENT AND PAYMENT

PART 1 - GENERAL

1.1 GENERAL

A. The CONTRACTOR shall receive and accept the compensation provided in the PROPOSAL and the AGREEMENT as full payment for furnishing all materials, labor, tools and equipment, for performing all operations necessary to complete the WORK and also as full payment for loss or damages arising from the nature of the WORK, or from any discrepancy between the actual quantities of WORK and quantities herein estimated by the ENGINEER, or from the action of the elements or from any unforeseen difficulties which may be encountered during the prosecution of the WORK until FINAL COMPLETION.

B. The prices stated in the PROPOSAL include all costs and expenses for taxes, labor, equipment, materials, commissions, transportation charges and expenses, patent fees and royalties, labor for handling materials during inspection, together with any and all other costs and expenses for performing and completing the WORK. The basis of payment for UNIT PRICE WORK shown in the PROPOSAL shall be in accordance with the description of the respective items in this Section.

C. The CONTRACTOR'S attention is called to the fact that the prices for the various items of work are intended to establish a total price for completing the WORK in its entirety. Should the CONTRACTOR feel that the cost for any item of WORK has not been established by the PROPOSAL form, the cost for that work shall be included in some other applicable PROPOSAL item, so that the PROPOSAL for the PROJECT does reflect the CONTRACTOR'S total price for completing the WORK in its entirety.

D. Unless specifically listed as a Bid Item, no separate payment will be made for the following items and the cost of such work shall be included in the applicable contract pay items of work.
   1. Clearing and grubbing.
   2. Excavation, including necessary pavement/slab removal.
   3. Shoring and sheeting.
   4. Dewatering and disposal of surplus water including well point dewatering as directed by Engineer.
   5. Backfilling.
   6. Grading.
   7. Replacement or restoration of paved or unpaved roadways, grass and shrubbery plots outside of established pay limits.
   8. Replacement or restoration of curbing, gutter, sidewalk, and site restoration of any areas damaged during construction activities.

9. Temporary facilities and controls during construction such as water/sanitary facilities, traffic control and environmental protection, unless specifically provided for in a pay item.
10. Removing and disposing of waste material due to construction.
11. Cleanup.
12. Refill materials, except as hereinafter specified.
13. Testing and placing system in operation.
14. Any material or equipment required installed and/or used for the tests.
15. Maintaining the existing quality of service during construction.
16. Repair of sanitary sewer house laterals damaged during construction.
17. Repair and/or cleaning of storm sewers, inlets & catch basins damaged or filled with sediment during construction.
18. Color audio-video construction record.
19. Providing the services of an Independent Testing Laboratory for materials and compaction testing.
20. Providing the services of a professional land surveyor, licensed in the State of Florida, to establish horizontal and vertical control, layout the work, and assist with the preparation of record drawings.
21. Cost to reproduce drawings, specifications, shop drawings, and reports for the Contractor's use and for submissions to the OWNER
22. Temporary fencing.
23. Dust Control.
24. Noise suppression measures.
25. Removing, relocating, resetting existing street signage to facilitate construction.
26. Removing, relocating, resetting mailboxes to facilitate construction.
27. Utility notification and location and exploratory pits; and
28. All other appurtenant work as required for a complete and operable system.

1.2 MEASUREMENT

A. The quantities shown are approximate and are only given as a basis of calculation upon which the award of the CONTRACT is to be made. The OWNER does not assume any responsibility for the final quantities, nor shall the CONTRACTOR claim misunderstanding because of such estimate of quantities. The quantities for payment shall be determined by actual measurement of the completed items, in place, ready for service and accepted by the OWNER, in accordance with the applicable method of measurement therefore contained herein. Representatives of the CONTRACTOR and the ENGINEER shall witness all field measurements.

1.3 WORK OUTSIDE AUTHORIZED LIMITS

A. No payment will be made for WORK constructed outside the authorized limits of work.

1.4 MEASUREMENT STANDARDS

A. Unless otherwise specified for the particular items involved, all measurements of distance

shall be taken horizontally or vertically.

1.5 PROPOSAL ITEM DESCRIPTIONS

Detailed descriptions for each PROPOSAL item follow:

A. Item No. 1 – GENERAL CONDITIONS, BONDS AND INSURANCE

The bid price for General Conditions, Bonds and Insurance shall be a lump sum amount included in the bid. This bid item shall include obtaining all permits, insurance, and bonds; providing a color audio-videotape of existing conditions of the construction site or route; and complying with all of the general conditions of the Contract as required for the proper performance and completion of the work.

Bid price for General Conditions, Bonds and Insurance shall not exceed 2% of the bid subtotal for installed items and Mobilization.

Payment for Bid Item #1 shall be made successfully upon successfully obtaining bonds, insurance and completing audio-video tape of preexisting conditions for the project.

Contractor shall submit original signed copies of bonds, provide copies of proof of insurance and an electronic copy of the audio-videotape of existing conditions prior to beginning any other construction activity on the projects and prior to invoicing for this bid item.

B. Item No. 2 – MOBILIZATION AND DEMOBILIZATION

The bid price for mobilization and demobilization shall be a lump sum amount calculated as a percentage of the subtotal of the bid items to be installed. This bid item shall include securing a staging area in proximity to the work if public lands are insufficient; moving onto the site all materials and equipment; furnishing and erecting temporary buildings, access roads and other items as necessary to complete the work; providing field trailers, sanitary facilities and potable water facilities as required for the proper performance and completion of the work.

Bid price for mobilization shall not exceed 5% of the bid subtotal for installed items.

Payment for mobilization will be on an incremental basis in accordance with the following:

Percent of Original Contract Amount Earned	Allowable Percent of the Lump Sum Price for the Item
5	15
10	25
25	50
50	75
75	85
100	100

C. Item No. 3 – FDOT PAY ITEM – 1050 61260 - FURNISH AND INSTALL 60-INCH STEEL WATER MAIN BY OPEN CUT

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all 60-inch diameter steel pipe via open cut trench. The installation of pipe shall include, but may not be limited to:

1. Performing all evaluations and calculations necessary for the proper implementation of the installation.
2. Furnishing, installing and maintaining all necessary Maintenance of Traffic measures;
3. Furnishing, installing and maintaining all necessary erosion control measures including but not limited to artificial coverings, mowing, sandbagging, slope drains, sediment basins, hay bales, straw, floating silt barrier, staked silt barrier and seeding;
4. Maintaining the trench, which shall include dewatering, barricading, sheeting, shoring, containment, and berming as required or as directed by the Engineer;
5. Protecting existing utilities in place, including coordinating with third party to support poles where needed.
6. Installing the pipe;
7. Joining the pipe as required;
8. Furnishing and installing MJ adapters as necessary to connect steel pipe to other pipe materials, fittings, and valves;
9. Backfilling and compaction of trench;
10. Hydrostatic pressure testing and cleaning the pipe;
11. Disinfection, sampling and laboratory testing for bacteria;
12. All steel pipe joint testing by an independent third-party laboratory;
13. Cleaning up the job site which shall include removing excess materials and debris and re-grading the terrain;
14. Connecting piping to existing piping and/or structures; and
15. All other ancillary materials, equipment, labor, water, and power required for the complete installation of the piping.

All work shall be in accordance with the Technical Specifications.

Payment for installing 60-inch steel pipe by open cut shall be based on the horizontal distance in linear feet of pipe measured along the top centerline of the installed, in place, complete and acceptable to the OWNER'S REPRESENTATIVE.

D. Item No. 4 – FDOT PAY ITEM – 1050 61160 - FURNISH AND INSTALL 60-INCH STEEL WATER MAIN BY MICROTUNNELING

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all 60-inch diameter steel pipe via microtunelling including the launch and receiving shafts. The installation shall include, but may not be limited to:

1. Furnishing, cutting and joining the steel casing pipe.
2. Microtunnel installation of the steel casing pipe.
3. Furnishing and installing the "casing spacers" on the carrier pipe.
4. Furnishing and installing the carrier pipe.
5. Furnishing and installing bulkheads or end seals to seal the annular space.
6. Furnishing and installing cement-fly ash slurry mix to grout the annular space.
7. Excavating the entrance and recovery shafts, including rock and muck excavation and removal;
8. Maintaining the entrance and recovery shafts including dewatering, sheeting, shoring and bracing as required;
9. Ground treatment to soften earth to allow installation of sheeting.
10. Conveyance of soil dewatering and initial and weekly testing.
11. Installation and removal of erosion control devices and control of runoff from the site;
12. Removal and replacement of fence and gates;
13. Removal and protection of trees as indicated on the CONTRACT DRAWINGS;
14. Backfilling and compaction of entrance and recovery shafts, including flowable fill cradle up to the springline of the lower bends in the shafts.
15. Settlement monitoring.
16. All surface restoration within limits of construction including mulching, seeding and appurtenant work.

Payment for 60-inch steel water main by microtunneling shall be based on actual linear feet of the casing pipe measured along the centerline of the pipe in place complete and acceptable to the OWNER'S REPRESENTATIVE.

E. Item No. 5 – FDOT PAY ITEM – 1050 61236 - FURNISH AND INSTALL 36-INCH STEEL WATER MAIN BY OPEN CUT

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all 36-inch diameter steel pipe via open cut. The installation of pipe shall include, but may not be limited to:

1. Performing all evaluations and calculations necessary for the proper implementation of the installation.
2. Furnishing, installing and maintaining all necessary Maintenance of Traffic measures;
3. Furnishing, installing and maintaining all necessary erosion control measures including but not limited to artificial coverings, mowing, sandbagging, slope drains, sediment basins, hay bales, straw, floating silt barrier, staked silt barrier and seeding;
4. Maintaining the trench, which shall include dewatering, barricading, sheeting, shoring, containment, and berming as required or as directed by the OWNER'S REPRESENTATIVE;
5. Protecting existing utilities in place, including coordinating with third party to support poles where needed.
6. Installing the pipe;
7. Joining the pipe as required;
8. Furnishing and installing MJ adapters as necessary to connect steel pipe to other pipe

materials, fittings, and valves;
9. Backfilling and compaction of trench;
10. Hydrostatic pressure testing and cleaning the pipe;
11. Disinfection, sampling and laboratory testing for bacteria;
12. All steel pipe joint testing by an independent third-party laboratory;
13. Cleaning up the job site which shall include removing excess materials and debris and re-grading the terrain;
14. Connecting piping to existing piping and/or structures; and
15. All other ancillary materials, equipment, labor, water, and power required for the complete installation of the piping.

All work shall be in accordance with the Technical Specifications.

Payment for installing 36-inch steel pipe by open cut shall be based on the horizontal distance in linear feet of pipe measured along the top centerline of the installed, in place, complete and acceptable to the OWNER'S REPRESENTATIVE.

F. Item No. 6 – FDOT PAY ITEM – 1055 61160 - FURNISH AND INSTALL 60-INCH STEEL FITTINGS

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all steel fittings via open cut trench. The installation of fittings shall include, but may not be limited to:

1. Furnishing and installing appropriate fittings including tees and bends.
2. Performing all evaluations and calculations necessary for the proper implementation of the installation.
3. Joining fitting to the pipeline.

Payment for installation of 60-inch fittings shall be based on each fitting furnished and installed.

G. Item No. 7 – FDOT PAY ITEM – 1055 61136 - FURNISH AND INSTALL 36-INCH STEEL FITTINGS

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install all steel fittings via open cut trench. The installation of fittings shall include, but may not be limited to:

1. Furnishing and installing appropriate fittings including tees and bends.
2. Performing all evaluations and calculations necessary for the proper implementation of the installation.
3. Joining fitting to the pipeline.

Payment for installation of 36-inch fittings shall be based on each fitting furnished and installed.

H. Item No. 8 – FDOT PAY ITEM – 1080 26102 - FURNISH AND INSTALL AIR RELEASE VALVES

The CONTRACTOR shall provide all labor, equipment, and materials to furnish and install the air release valve assembly of the size and type specified. The unit price shall include the cost of jointing materials, including rings, reducer(s), joint restraining, polyethylene wrap, bolts and gaskets, installation costs, concrete support, concrete valve box pad with bronze disc, air valve box, air valve lateral, and vent pipe.

The quantities for payment shall be the actual number of valves of each size and type specified herein, completed and accepted.

The quantities determined as specified above shall be paid at the unit price bid for each valve.

I. Item No. 9 – FDOT PAY ITEM – 1080 24160 - FURNISH AND INSTALL 60-INCH BUTTERFLY VALVES

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install the valves of the size and type specified. The unit price shall include the cost of jointing materials, including rings, reducer(s), joint restraining, polyethylene wrap, bolts and gaskets, installation costs, concrete support, and concrete valve box pad with bronze disc, where required, and extension stems and adjustment of valve boxes to existing grade.

The quantities for payment shall be the actual number of valves of each size and type specified herein, completed and accepted.

The quantities determined as specified above shall be paid at the unit price bid for each valve.

J. Item No. 10 – FDOT PAY ITEM – 1080 24136 - FURNISH AND INSTALL 36-INCH BUTTERFLY VALVES

The CONTRACTOR shall provide all labor, equipment and materials to furnish and install the valves of the size and type specified. The unit price shall include the cost of jointing materials, including rings, reducer(s), joint restraining, polyethylene wrap, bolts and gaskets, installation costs, concrete support, and concrete valve box pad with bronze disc, where required, and extension stems and adjustment of valve boxes to existing grade.

The quantities for payment shall be the actual number of valves of each size and type specified herein, completed and accepted.

The quantities determined as specified above shall be paid at the unit price bid for each valve.

K. Item No. 11 – FDOT PAY ITEM – 0400-603 - CATHODIC PROTECTION

Contractor shall furnish and provide labor, equipment and materials to install cathodic protection system for the steel pipelines as shown in the Contract Drawings and as indicated in the specifications and shall include, but is not limited to, installation of test stations, dielectric gaskets, anode beds, test station housing and terminal boards, welding, and testing complete, all necessary excavation, sheeting and bracing, shoring, dewatering, backfilling, disposal of excess excavated material, restraints, painting to OWNER'S standards, testing, restoration, cleanup, and all other items necessary to complete the job, whether specifically mentioned or implied.

Payment for installing cathodic protection shall be based on lump sum basis for all of the installed cathodic protection system, in place, tested, complete and acceptable to the Engineer.

L. Item No. 12 - FDOT PAY ITEM – E574 1 -SOD RESTORATION

Contractor shall furnish all labor, equipment, and materials to replace and maintain all sodded areas as specified and as shown on the Contract Drawings and as directed by the OWNER'S REPRESENTATIVE.

The quantity of lawn area, in square yards, to be measured for payment will be the actual area of sodded areas, placed within the limits of construction shown on the DRAWINGS except for the temporary construction easement, specified or as directed. Temporary construction easement shall be seeded and mulched.

Payment: Payment for sod restoration shall be made at the unit price bid per square yard.

M. Item No. 13 – FDOT PAY ITEM 0430830 - PLACE EXISTING PIPE OUT OF SERVICE BY GROUTING

The CONTRACTOR shall furnish all labor, equipment and materials to place existing pipe out of service by grouting it as designated, shown, specified or directed by the OWNER'S REPRESENTATIVE. The work also includes furnishing all labor and equipment for grouting existing pipe as shown.

Payment for grouting existing pipe shall be made per cubic yard of grout installed.

N. Item No. 14 – FDOT PAY ITEM 1050 16006 - PLACE EXISTING PIPE OUT OF SERVICE BY REMOVING

The CONTRACTOR shall furnish all labor, equipment and materials to remove pipe and appurtenances as designated, shown, specified or directed by the OWNER'S REPRESENTATIVE. The work also includes plugging the open ends of existing pipe to remain and be grouted, transporting the removed pipe and appurtenances, without delay, to the CONTRACTOR's own place for proper disposal. The work includes disposal, excavation, backfill, compaction and restoration.

Payment for removal of existing pipe shall be based on actual linear feet of the pipe removed

measured along the centerline of the pipe in place complete and acceptable to the OWNER'S REPRESENTATIVE.

O. Item No. 15 – INDEMNIFICATION

Payment for indemnification shall be made at the lump sum price ($100), which price and payment shall be full compensation for providing indemnification in accordance with the General Conditions, Article 4.4; Indemnity. Payment shall be included in the first payment request submitted.

P. Item No. 16 – PROJECT ALLOWANCE

Measurement for this item will be made for in accordance with the CHANGE ORDER authorized by the OWNER. The allowance is for payment of permit fees and extra work specifically authorized by the OWNER, the compensation for which shall be determined in accordance with the CHANGE ORDER provisions of the General Conditions. Said compensation shall be deducted from the allowance at the time the CHANGE ORDER is authorized by the OWNER.

Payment for permit fees will be made to the Contractor based on actual invoiced amounts paid by the Contractor to obtain required FDEP Notice of Intent to Discharge Stormwater from Construction Activities.

Payment will not be made for:

1. Contractor premiums or markups.
2. Fees incurred due to Contractor's negligence.
3. Permits required for items for the Contractor's convenience but not required by the Contract Documents or the Engineer.
4. Fees and costs associated with utility services to temporary construction trailers and electricity required by the Contractor during construction.

Payment from the project allowance shall be made on either a lump sum or unit price basis, per the CHANGE ORDER, only after authorization from the OWNER, and then in accordance with the CHANGE ORDER provisions of the General Conditions.

END OF SECTION

SECTION 01027

PAYMENT APPLICATIONS

PART 1 - GENERAL

1.1 REQUIREMENTS INCLUDED

A. The CONTRACTOR shall submit PAYMENT APPLICATIONS to the OWNER or OWNER'S REPRESENTATIVE/ENGINEER in accordance with the schedule established in the General Conditions of the CONTRACT DOCUMENTS.

1.2 FORMAT AND DATA REQUIRED

A. The CONTRACTOR shall submit applications electronically into OWNER's Masterworks project management software.

B. The CONTRACTOR shall provide itemized data, including, line items and values, and any other supporting documentation required for processing in Masterworks software.

1.3 PREPARATION OF EACH PAYMENT APPLICATION

A. Application Form:

1. Complete required information, including that for CHANGE ORDERS executed prior to date of submittal of application. Pay applications are executed in two steps, Items Posting per Masterworks MW-SOP-21 which is reviewed and approved by the OWNER or designee and Pay Estimate step per MW-SOP-22 requirements.

2. Complete summary of dollar values to agree with respective totals indicated on continuation sheets.

3. By submitting a payment application into the Masterworks project management software, the CONTRATOR is certifying the payment application is correct and all subcontractor and suppliers have been paid to date. Submittal of payment application shall be per Masterworks MW-SOP-22 requirements.

B. Continuation Sheets:

1. Complete total list of all scheduled component items of work, with item number and dollar value for each item as specified in the finalized schedule of values as approved by the OWNER, as indicated in Masterworks MW-SOP-21 and -22 requirements.

2. Complete dollar value in each column for each scheduled line item when work has been performed or products stored on site.

3. List each CHANGE ORDER executed prior to date of submission, at the end of the continuation sheets. List by CHANGE ORDER Number, and description, as for an original component item of work.
4. Payment on component material stored on site shall be in accordance with the General Conditions.

1.4 SUBSTANTIATING DATA FOR PROGRESS PAYMENTS

A. When the OWNER requires substantiating data, the CONTRACTOR shall submit suitable information, with a cover letter identifying:

1. PROJECT

2. PAYMENT APPLICATION number and date.

3. Detailed list of enclosures.

4. For stored products: In accordance with the General Conditions.

B. The CONTRACTOR shall maintain an updated set of AS-BUILT DRAWINGS in accordance with Section 01720. As a prerequisite for monthly progress payments, the CONTRACTOR shall exhibit the updated AS-BUILT DRAWINGS for review by the OWNER or the ENGINEER.

1.5 SUBMITTAL PROCEDURE

A. The CONTRACTOR shall submit the PAYMENT APPLICATION to the OWNER at the time stipulated in the General Conditions. Pay applications are executed in two steps, Items Posting per Masterworks MW-SOP-21 which is reviewed and approved by the OWNER or designee and Pay Estimate step per MW-SOP-22 requirements.

B. The OWNER's ENGINEER shall perform the initial review of the PAYMENT APPLICATION and make recommendation to the OWNER for approval.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01040

PROJECT COORDINATION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section specifies administrative and supervisory requirements necessary for Project Coordination including, but not limited to:

1. Coordination;
2. Administrative and supervisory personnel;
3. General installation provisions; and,
4. Cleaning and protection.

B. Requirements for the CONTRACTOR'S Construction Schedule are included in Section 01300, Submittals.

1.2 COORDINATION

A. Coordination: Coordinate construction activities included under various Sections of these Specifications and CONTRACT DOCUMENTS to assure efficient and orderly installation of each part of the WORK. Coordinate construction operation included under different Sections of these Specifications and CONTRACT DOCUMENTS that are dependent upon each other for proper installation, connection, and operation.

1. Where installation of one part of the WORK is dependent on installation of other components, either before or after its own installation, schedule construction activities in sequence required to obtain the greatest results possible.

2. Where availability of space is limited, coordinate installation of different components to assure maximum accessibility for required maintenance, service and repair.

3. Make adequate provisions to accommodate items scheduled for later installation.

B. Administrative Procedures:

1. CONTRACTOR shall be responsible for training its staff as needed for proficiency in the OWNER's Masterworks program. A contact list of Masterworks users shall be provided to the OWNER

2. Coordinate scheduling and timing of required administrative procedures with

other construction activities to avoid conflicts and ensure orderly progress of the WORK. Such administrative activities include, but not limited to, the following:

a) Preparation of schedules;
b) Installation and removal of temporary facilities/structures;
c) Delivery and processing of submittals;
d) Progress meetings; and,
e) Project close-out activities.

1.3 COORDINATION WITH OWNER AND OTHER CONTRACTORS

A. It may be necessary for the CONTRACTOR to plan the WORK and coordinate with other contractors insofar as possible to prevent any interference and delay.

B. The CONTRACTOR shall at all times be required to coordinate two weeks in advance with the OWNER's staff for the CONTRACTOR's WORK onsite, to prevent any interference and delay.

1.4 SUBMITTALS

A. Comply with requirements contained in Section 01300, Submittals.

1. Staff Names: Within 15 days of Notice to Proceed, submit a list of the CONTRACTOR'S principal staff assignments, including the Superintendent and other personnel in attendance at the site; identify individuals, their duties and responsibilities; list their addresses, email and telephone numbers.

2. Provide a list of subcontractors with addresses, email and telephone numbers.

PART 2 - PRODUCTS (NOT USED)

PART 3 – EXECUTION

3.1 GENERAL INSTALLATION PROVISIONS

A. Inspection of Conditions: The CONTRACTOR and/or subcontractors of each major component shall inspect the conditions under which the work is to be performed. Do not proceed until unsatisfactory conditions have been corrected in an acceptable manner.

B. Manufacturer's Instructions: The CONTRACTOR shall comply with the manufacturer's installation instructions and recommendations, to the extent that those instructions and recommendations are more explicit or stringent than requirements contained in CONTRACT DOCUMENTS.

C. Inspect materials or equipment immediately upon delivery and again prior to installation. Reject damaged and defective items.

D. Recheck measurements and dimensions, before starting each installation

E. Install each component during weather conditions and PROJECT status that will ensure the best possible results. Isolate each part of the completed construction from incompatible material as necessary to prevent deterioration.

F. Coordinate temporary enclosures with required inspections and tests, to minimize the necessity of uncovering completed construction for that purpose.

3.2 CLEANING AND PROTECTION

A. During handling and installation, clean and protect construction in progress and adjoining materials in place.

B. Clean and maintain completed construction as frequently as necessary through the remainder of the construction period.

END OF SECTION

SECTION 01050

FIELD ENGINEERING

PART 1 - GENERAL

1.1 REQUIREMENTS INCLUDED

A. The CONTRACTOR shall provide and pay for field engineering services for the PROJECT including:

1. Survey work required in execution of the PROJECT.

2. Civil, structural or other professional engineering services specified or required to execute CONTRACTOR'S construction methods.

B. The CONTRACTOR shall retain the services of a registered land surveyor licensed in the State of Florida to identify existing control points and maintain an as-built survey during construction.

1.2 QUALIFICATIONS OF SURVEYOR OR ENGINEER

A. Qualified professional land surveyor, currently licensed in the State of Florida, acceptable to the OWNER.

B. Registered professional engineer of the discipline required for the specific service on the PROJECT, currently licensed in the State of Florida, acceptable to the OWNER.

1.3 SURVEY REFERENCE POINTS

The CONTRACTOR shall locate and protect control points prior to starting WORK, and preserve all permanent reference points during construction.

1.4 RECORDS

The CONTRACTOR shall maintain a complete, accurate log of all control and survey work as it progresses.

1.5 SUBMITTALS

A. Prior to commencing WORK, the CONTRACTOR shall submit the names and addresses of the Professional Land Surveyor and/or Professional Engineer to the OWNER for approval.

B. On request of the OWNER, the CONTRACTOR shall submit documentation to verify accuracy of field engineering work.

C. Prior to FINAL COMPLETION, the CONTRACTOR shall submit three (3) certificates signed by the approved registered land surveyor certifying that locations of improvements are in conformance, or non-conformance, with CONTRACT DOCUMENTS.

D. Prior to FINAL COMPLETION, the CONTRACTOR shall submit three (3) certified copies of a survey at the same scale as the ENGINEER'S line drawings indicating as-built locations.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01065

PERMITS AND EASEMENTS

PART 1 - GENERAL

A. The CONTRACTOR shall obtain and pay for all permits and licenses related to their WORK as provided in the General Conditions excepted as otherwise provided herein. Copies of all permits obtained by the CONTRACTOR shall be submitted to the OWNER in electronic PDF format along with copies of the permit applications. During PROJECT closeout, CONTRACTOR to provide documentation the permit has been closed.

B. WORK shall be conducted and shall result in construction of improvements of this PROJECT in full accordance with the conditions of the permits granted for the PROJECT.

C. Following permits will be obtained by the OWNER: Florida Department of Environmental Protection (FDEP) Specific Permit for Water Main Extensions, Florida Department of Transportation (FDOT) Utility Permit, and FDEP ERP Individual Permit.

D. Following permits will be obtained by the CONTRACTOR: FDOT Maintenance of Traffic Permit (if applicable), EPA National Pollutant Discharge Elimination System (NPDES) Permit and other permits as required for construction of the WORK complete.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01100

SPECIAL PROJECT PROCEDURES

PART 1 - GENERAL

1.1 PUBLIC NUISANCE

A. The CONTRACTOR shall not create a public nuisance including, but not limited to, encroachment on adjacent lands, odors, flooding of adjacent lands, or excessive noise. It is the CONTRACTOR's responsibility to adhere to and be aware of local ordinances, and to bear the burden of all such violations.

B. No claims shall be made for time lost or costs incurred due to work stoppage by the OWNER resulting from the creation of a public nuisance.

1.2 SUSPENSION OF WORK DUE TO WEATHER

A. During inclement weather, all WORK which might be damaged or rendered inferior by such weather conditions may be suspended by the OWNER. The orders and decisions of the OWNER as to suspensions shall be final and binding. During suspension of the WORK for any cause, the WORK shall be suitably covered and protected so as to preserve it from injury by the weather or otherwise; and, if the OWNER shall so direct, the rubbish and surplus materials shall be removed. If in the opinion of the OWNER, any component or function of the WORK or materials has been damaged by reason of failure on the part of the CONTRACTOR to so protect the WORK, such WORK and materials shall be removed and replaced with new materials and WORK at no additional cost to the OWNER.

1.3 TOOLS

A. Any special tools which may be necessary for the adjustment, operation, and maintenance of any equipment shall be furnished by the CONTRACTOR.

1.4 SPECIAL REQUIREMENTS

A. The following requirements shall govern:

1. No additional payment or time extension shall be made for pumping or other difficulties encountered due to groundwater or stormwater or pumping out residual water or wastewater liquids or sludges which may be required to complete the Work.

2. The CONTRACTOR shall, prior to interrupting operations, contact the OWNER and make arrangements for the interruption which shall be satisfactory to the OWNER.

3. All material delivered to the job site shall be properly protected from dirt, dust,

dampness, water, sunlight and any other condition detrimental to the life of the material from the date of delivery to the time that the material is installed and the OWNER assumes responsibility for it in writing.

1.5 SEQUENCE OF CONSTRUCTION

A. The CONTRACTOR shall be responsible to follow the following General sequence of the Work:

4. Set up best management practices for pollution and erosion control for the site. Establish maintenance of traffic controls.
5. Construct both tunnel shafts, stage microtunnel (MT) equipment and perform microtunnel to set 78-inch steel casing pipe. Snap fit casing pipe joints are acceptable if treated to minimize weep.
6. String 60-inch pipe in MT casing and construct additional 60-inch steel water main in open-cut trench up to both leakage test bulkheads. All new pipe shall have welded, restrained joints. Pipe trenches may be backfilled except at bulkheads.
7. Obtain water from existing 60-inch well collection main to fill and hydrostatically pressure test the new pipeline work. Water can be acquired from the existing 36-inch outlet or a newly tapped service outlet while this main remains in service. Alternatively, the existing main can be removed from service and accessed by cutting a hole in the crown and dropping in a centrifugal pump.
8. Successfully hydrostatically pressure test new pipeline work. Proceed to disinfect the new pipe. Contractor will collect bacteriological samples from each test bulkhead on consecutive days 24-hours apart and to an independent laboratory to provide analysis of samples. Upon receipt of successful laboratory results, grout the annulus of the tunnel with cement slurry and assemble end treatments and test stations. Confirm electrical isolation of casing pipe from carrier pipe.
9. During hydrostatic and disinfection tasks, simultaneously dewater contents of existing 60-inch water main. Analysis of the profile of the pipeline indicates that approximately 1.75 million gallons will require disposal. The existing grassed swale drainage system along State Road 52 should have enough capacity to convey at least 0.5 cubic feet per second or 250 gpm toward Cypress Creek. At this rate it would take approximately 5 days to dewater the pipeline to allow construction of connections to the new pipeline work. **Limit well collection main out-of-service period to no more than 14 days.**
10. Construct connections. Upon successful certified welding inspection of joints partially backfill trenches to leave the upper 45 degrees of pipe exposed (2 feet wide). Tampa Bay Water will slowly return the main to service. Observe new connection joints under full pressure for 2 hours. Correct any visible leaks. Complete backfilling.
11. Finish and successfully test cathodic protection system. Make repairs as necessary.
12. Complete all surface restoration and demobilize from the site.

1.6 RELOCATIONS

A. The CONTRACTOR shall be responsible for the relocation of structures, including but not limited to light poles, signs, sign poles, fences, piping, conduits and drains that interfere with the positioning of the WORK. The cost of all such relocations shall be included in the PROPOSAL. The CONTRACTOR shall install any test pits required to identify potential

points of interference.

1.7 SALVAGE

A. OWNER shall be entitled to retain ownership of any existing equipment or material including, but not limited to pipes, fittings, couplings, etc., which are to be removed or replaced as a result of the WORK and identified as such in the Contract Documents. CONTRACTOR shall carefully remove salvaged equipment and deliver undamaged to OWNER's facilities identified in the Contract Documents.

B. Any existing equipment or material which OWNER has not elected to keep as salvage shall become the property of the CONTRACTOR and shall be disposed of in a legal manner by the CONTRACTOR at a suitable off site location at no additional cost to the OWNER. CONTRACTOR shall provide OWNER notice and opportunity in writing that there are materials to be reviewed for salvage prior to CONTRACTOR removing them.

C. Any existing equipment or material marked for salvage which is damaged by the Contractor's actions during removal or transport shall be replaced with a new equivalent item at the Contractor's expense.

1.8 UTILITY CROSSING

A. Wherever existing utilities such as water, electrical or other service lines must be crossed, deflection of the pipe within recommended limits and cover shall be used to satisfactorily clear the obstruction or existing utilities unless otherwise indicated on the DRAWINGS. However, when, in the opinion of the OWNER or ENGINEER this procedure is not feasible or allowed, the CONTRACTOR may be directed by the OWNER or ENGINEER to use fittings for a utility crossing.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01300

SUBMITTALS

PART 1 - GENERAL

1.01 SCOPE

A. This SECTION includes definitions, descriptions, transmittal, and review of "Compliance" and "Miscellaneous" Submittals.

B. Within 10 days after the NOTICE OF AWARD, but prior to the pre-construction meeting, the CONTRACTOR shall submit the following items to the OWNER'S construction manager for review.

1. A preliminary schedule of SHOP DRAWING SUBMITTALS and Materials Submittals.

2. A list of all permits and licenses the CONTRACTOR shall obtain indicating the permitting agency, the type of permit, the expected date of application for the permit, required date for receipt of the permit, and permit fee.

C. Contractor shall use Masterworks for submittal review and approvals.

1.02 GENERAL INFORMATION

A. Definitions:

1. Compliance Submittals include Shop Drawings, product data, and samples which are prepared by the CONTRACTOR, Subcontractor, MANUFACTURER, or Supplier and submitted by the CONTRACTOR to the OWNER as a basis for approval of the use of Equipment and Materials proposed for incorporation in the WORK or needed to describe installation, operation, maintenance, or technical properties. CONTRACTOR to submit all submittals to OWNER via Masterworks.

a. Shop Drawings include custom-prepared data of all types including drawings, diagrams, performance curves, material schedules, templates, instructions, and similar information not in standard printed form applicable to other projects.

b. Product data includes standard printed information on materials, products and systems not custom-prepared for this Project, other than the designation of selections from available choices.

c. Samples include both fabricated and unfabricated physical examples of materials, products, and WORK; both as complete units and as smaller portions of units of WORK; either for limited visual inspection or (where indicated) for more detailed testing and analysis. Mock-ups are a special form of samples which are too large to be handled in the specified manner for transmittal of sample Submittals.

2. Miscellaneous Submittals are those technical reports, administrative Submittals, certificates, and guarantees not defined as Shop Drawings, product data, or samples.

a. Technical reports include laboratory reports, tests, technical procedures, technical records, CONTRACTOR's design analysis and CONTRACTOR's survey field notes for construction staking, before cross-sections and after cross-sections.

b. Administrative Submittals are those nontechnical Submittals required by the Contract Documents or deemed necessary for administrative records. These Submittals include maintenance agreements, workmanship bonds, Project photographs, physical work records, statements of applicability, copies of industry standards, as-constructed data, security/protection/safety data, and similar type Submittals.

c. Certificates and guarantees are those Submittals on Equipment and Materials where a written certificate or guarantee from the MANUFACTURER or Supplier is called for in the Specifications.

d. Reports as required by Contract describing CONTRACTOR's means and methods for items such as dewatering, earth and water retaining, erosion/turbidity control, and safety plans.

3. Refer to ARTICLE 1.03 and 1.04 of this Part for detailed lists of documents and specific requirements.

B. Quality Requirements:

1. Submittals such as Shop Drawings and product data shall be of the quality for legibility and reproduction purposes. Every line, character, and letter shall be clearly legible. Drawings such as reproducible shall be useable for further reproduction to yield legible hard copy.

2. Documents submitted to the OWNER that do not conform to these requirements shall be subject to rejection by the OWNER, and upon request by OWNER, CONTRACTOR shall resubmit conforming documents. If conforming Submittals cannot be obtained, such documents shall be retraced, redrawn, or photographically restored as may be necessary to meet such requirements. CONTRACTOR's (or his Subcontractor's) failure to initially satisfy the legibility quality requirements will not relieve CONTRACTOR (or his Subcontractors) from meeting the required schedule for Submittal of Shop Drawings and product data.

C. Language and Dimensions:

1. All words and dimensional units shall be in the English language.

2. Metric dimensional unit equivalents may be stated in addition to the English units.

D. Submittal Completeness:

1. Submittals shall be complete with respect to dimensions, design criteria, materials of construction, and other information specified to enable the OWNER to review the information effectively.

2. Where standard drawings are furnished which cover a number of variations of the general class of equipment, each such drawing shall be individually annotated to describe exactly which parts of the drawing apply to the equipment being furnished. Use hatch marks to indicate variations that do not apply to the Submittal. The use of "highlighting markers"

is not an acceptable means of annotating Submittals. Such annotation shall also include proper identification of the Submittal permanently attached to the drawing.

3. Reproduction or copies of Drawings or portions thereof will not be accepted as complete fabrication or erection drawings. The CONTRACTOR may use a reproduction of the OWNER-prepared Contract Drawings for erection drawings such as to indicate information on erection or to identify detail drawing references. Where the Drawings are revised to show this additional CONTRACTOR information, the OWNER's title block shall be replaced with a CONTRACTOR's title block and the OWNER's professional seal shall be removed from the Drawing. The CONTRACTOR shall revise these erection drawings for subsequent OWNER revisions to the Contract Drawings.

E. Cover Sheet:

1. Each submittal, must include a cover page to indicate at least:
    a. Name of the project
    b. Owner
    c. Design Engineer
    d. Submittal number
    e. Submittal Revision number
    f. Submittal Description
    g. Specification Section
    h. Drawing Sheet
    i. Submittal Date
    j. Contractor's Certification Statement
    k. Responses to the owner's comments/questions (if applicable)

1.03 COMPLIANCE SUBMITTALS

A. Items shall include, but not be limited to, the following:

1. MANUFACTURER's specifications
2. Catalogs, or parts thereof, of manufactured equipment
3. Material lists or schedules
4. Flowable Fill mix design information
5. All drawings, calculations, catalogs or parts thereof, MANUFACTURER's specifications and data, samples, instructions, and other information specified or necessary:
    a. For OWNER to determine that the Equipment and Materials conform to the design concept and comply with the intent of the Contract Documents.

B. Compliance Submittal Action Stamps:

1. The OWNER's review action stamp or designation, appropriately completed, will appear on all Compliance Submittals of CONTRACTOR when returned by the OWNER. Review status designations listed on OWNER's action stamp are defined as follows:

    a. "NO EXCEPTIONS TAKEN": Signifies Equipment or Material represented by the Submittal conforms to the design concept and complies with the intent of the Contract Documents and is acceptable for incorporation in the WORK. CONTRACTOR is to proceed with fabrication or procurement of the items and with related WORK.

    b. "MAKE CORRECTIONS AS NOTED": Signifies Equipment and Material represented by the Submittal conforms with the design concept and complies with the intent of the Contract Documents and is acceptable for incorporation in the WORK subject to the condition that as constructed it shall be in accordance with all notations and/or corrections indicated. CONTRACTOR is to proceed with fabrication or procurement of the items and with related WORK in accordance with OWNER's notations. Contractor shall provide a final copy of the submittal with responses to all OWNER's notations and/or corrections in the cover page. The responses must reference the page number and/or place in the submittal where the modifications have been incorporated.

    c. "REVISE AND RESUBMIT": Means that deviations from the requirements of the Contract Documents exist in the Submittal. CONTRACTOR is to resubmit revised information responsive to OWNER's annotations on the returned Submittal or written in the letter of transmittal. The responses must reference the page number and/or place in the submittal where the modifications have been incorporated. Fabrication or procurement of items represented by the Submittal and related WORK is not to proceed until the Submittal is approved.

    d. "REJECTED": Signifies Equipment and Material represented by the Submittal does not conform to the design concept or comply with the intent of the Contract Documents and is disapproved for use in the WORK. CONTRACTOR is to resubmit Compliance Submittals responsive to the Contract Documents.

    e. "FOR INFORMATION ONLY": Signifies Submittals which are for supplementary information only; pamphlets, general information sheets, catalog cuts, standard sheets, bulletins and similar data, all of which are useful to the OWNER in design, operation, or maintenance, but which by their nature do not constitute a basis for determining that items represented thereby conform with the design concept or comply with the intent of the Contract Documents. The OWNER reviews such Submittals for general content but not for substance.

C. Transmittal of Compliance Submittals:

1. All Compliance Submittals of Equipment and Materials furnished by Subcontractors, MANUFACTURERs, and Suppliers shall be submitted to the OWNER by CONTRACTOR in electronic and hard copy format as indicated below.

2. After checking and verifying all field measurements, transmit all Compliance Submittals to the OWNER for acceptance as follows:

a. Identify each Compliance Submittal by Submittal Number, Project name and number, Contract title and number, and the Specification SECTION and article number marked thereon or in the letter of transmittal. Unidentifiable Submittals will be returned for proper identification.

b. Check and stamp Compliance Submittals of Subcontractors, Suppliers, and MANUFACTURERS with CONTRACTOR's approval prior to transmitting them to the OWNER. CONTRACTOR's stamp of approval shall constitute a representation to the OWNER that CONTRACTOR has either determined and verified all quantities, dimensions, field construction criteria, materials, catalog numbers, and similar data, or he assumes full responsibility for doing so, and that he has coordinated each Compliance Submittal with the requirements of the WORK and the Contract Documents.

c. At the time of each submission, call to the attention of OWNER in the letter of transmittal any deviations from the requirements of the Contract Documents.

d. Provide all Submittals in electronic format, compatible with Adobe Professional, Version 8 (or higher), and submitted as a single file, using PDF bookmarks and/or chapters to identify divisions within the Submittal package.

e. The electronic Submittal shall include the required transmittal sheet and written confirmation by the CONTRACTOR that the electronic Submittal is complete. Note that the Submittal receipt date will be the date that the submittal is received by the OWNER via Masterworks or other web-based document control program.

f. Submittals with file sizes greater than ten (10) megabyte (MB) shall be transferred to an existing OWNER File Transfer Protocol (FTP) site, coupled with an electronic notification to the OWNER of the transfer. The FTP address, and associated password information, will be provided by the OWNER Project Manager.

g. Make all modifications noted or indicated by OWNER and return revised prints, copies, or samples until accepted. Revised Submittals must be complete and conformed, including all pages/sheets with the required revisions and any additional or replacement pages/sheets. The submittal shall include in the cover page responses to all the OWNER's comments from the previous submittal. The responses must reference the page number and/or place in the submittal where the modification has been incorporated. Direct specific attention in writing, or on revised Submittals, to changes other than the modifications called for by the OWNER on previous Submittals. Subsequent review cycles for returned or revised Submittals shall replicate the process described in items d. through f. above.

h. If the OWNER's review action is "ACCEPTED AS NOTED", the Submittal will be stamped as such, and electronically transmitted back to the CONTRACTOR. Upon receipt of this notification from the OWNER, The CONTRACTOR shall resubmit one (1) conformed hard copy with an electronic PDF file format to the OWNER for final distribution. The submittal shall include in the cover page responses to all the OWNER's comments from the previous submittal. The responses must reference the page number and/or place in the submittal where the modification has been incorporated. If the Submittal is required to be signed

and sealed by a Professional Engineer registered in the State of Florida, it shall be signed and sealed at this time. Submittal will not be considered final until all copies have been received by the OWNER. Prints of accepted Submittals transmitted for final distribution will not be further reviewed and are not to be revised. If errors are discovered during manufacture or fabrication, correct the Submittal and resubmit for review.

i. Following completion of the WORK and prior to final payment, furnish those drawings necessary to indicate "AS CONSTRUCTED" conditions, including field modifications, in the number of copies specified. Furnish additional copies for insertion in equipment instruction books as required. All such copies shall be clearly marked "AS BUILT DRAWING."

j. WORK requiring a Compliance Submittal shall not be commenced or shipped until the Submittal has been stamped "ACCEPTED AS SUBMITTED" or "ACCEPTED AS NOTED" by the OWNER.

k. Keep a copy or sample of each Compliance Submittal in good order at the Site.

3. Copies of the equipment CONTRACTOR's erection drawings and other Compliance Submittals required for the installation of equipment furnished by others under separate Contract for installation under this Contract will be transmitted to CONTRACTOR by the OWNER in the final distribution of such Submittals.

4. Information to MANUFACTURER's District Office: MANUFACTURERS and Suppliers of Equipment and Materials shall furnish copies of all agreements, drawings, specifications, operating instructions, correspondence, and other matters associated with this Contract to the MANUFACTURER's district office servicing the OWNER. Insofar as practicable, all business matters relative to Equipment and Materials included in this Contract shall be conducted through such local district offices.

D. OWNER's Review:

1. The OWNER will review and return Compliance Submittals to CONTRACTOR with appropriate notations within ten (10) business days of receiving. Instruction books and similar Submittals will be reviewed by the OWNER for general content but not for substance.

2. The OWNER's acceptance of Compliance Submittals will not relieve CONTRACTOR from his responsibility as stated in the Contract General Terms and Conditions.

1.04 MISCELLANEOUS SUBMITTALS

A. Miscellaneous Submittals are comprised of technical reports, administrative Submittals, and guarantees which relate to the WORK, but do not require OWNER's approval prior to proceeding with the WORK. Miscellaneous Submittals may include but are not limited to (at OWNER's discretion):

1. Dewatering plan

2. Field test reports

3. Concrete cylinder test reports

4. Soil test reports
5. Shipping or packing lists
6. Job progress schedules
7. Equipment and Material delivery schedules
8. Progress photographs
9. Warranties and guarantees
10. Surveying field notes, preliminary and final Surveyor's Reports
11. Written Certificates and Guarantees

B. Transmittal of Miscellaneous Submittals:

1. All Miscellaneous Submittals furnished by Subcontractors, MANUFACTURERS, and Suppliers shall be submitted to the OWNER by the CONTRACTOR in the form of an electronic PDF file format, in accordance with Part 2 of this SECTION.

    a. Identify each miscellaneous Submittal by Project name and number, Contract title and number, and the specification section and article number marked thereon or in the letter of transmittal. Unidentifiable Submittals will be returned for proper identification.

    b. Check and stamp Miscellaneous Submittals of Subcontractors, Suppliers, and MANUFACTURERS with CONTRACTOR's approval prior to transmitting them to the OWNER. CONTRACTOR's stamp of approval shall constitute a representation to the OWNER that CONTRACTOR has either determined and verified all information, or he assumes full responsibility for doing so, and that he has coordinated Miscellaneous Submittal with the requirements of the WORK and the Contract Documents.

    c. At the time of each submission, call to the attention of the OWNER in the letter of transmittal any deviations from the requirements of the Contract Documents.

    d. Make all modifications noted or indicated by OWNER and return revised prints, or copies until accepted. Direct specific attention in writing, or on revised Submittals, to changes other than the modifications called for by the OWNER on previous Submittals. After Submittals have been accepted, submit copies thereof for final distribution.

2. Test Reports:

    a. Responsibilities of CONTRACTOR and OWNER regarding tests and inspections of Equipment and Materials and completed WORK are set forth elsewhere in these Contract Documents.

    b. The party specified responsible for testing or inspection shall in each case, unless otherwise specified, arrange for the testing laboratory or reporting agency to distribute test reports in the form of one (1) hard copy with an electronic PDF file format to the following parties:

        i. OWNER

ii. Project Representative

iii. CONTRACTOR

iv. MANUFACTURER or supplier

C. OWNER'S Review:

1. OWNER will review Miscellaneous Submittals for indications of WORK or material deficiencies within ten (10) working days in OWNER's office for original Submittals and five (5) working days for reviewing resubmittals.

2. OWNER will respond to CONTRACTOR on those Miscellaneous Submittals which indicate WORK or material deficiency.

1.05 AS-BUILT DRAWINGS

A. AS-BUILT DRAWINGS shall be maintained by the CONTRACTOR in strict accordance with the GENERAL CONDITIONS.

B. PAYMENT APPLICATIONS will not be approved if the AS-BUILT DRAWINGS are not kept current and will not be approved until the AS-BUILT DRAWINGS show completely all information required and are current.

C. The final PAYMENT APPLICATION shall not be accepted by the OWNER until the AS-BUILT DRAWINGS are approved for conformance to the minimum requirements. The OWNER'S acceptance of the CONTRACTOR'S AS-BUILT DRAWINGS does not relieve the CONTRACTOR of the sole responsibility for the accuracy or completeness of the AS-BUILT DRAWINGS.

D. On AS-BUILT DRAWINGS the CONTRACTOR shall, at a minimum, note the limits, location, and depth of electrical conduits located by GPS coordinates.

F. All deviations shall be highlighted on the AS-BUILT DRAWINGS using a "cloud". If any revisions to the original plans required a CHANGE ORDER, the "cloud" shall include the CHANGE ORDER number.

G. The CONTRACTOR shall submit all AS-BUILT DRAWINGS after review and approval by the OWNER and ENGINEER in digital electronic format.

F. The OWNER will provide an AutoCAD latest version file of the conformed drawings for the CONTRACTOR to add his as-built information.

PART 2 - PRODUCTS

2.01 REQUIREMENTS FOR ELECTRONIC FILES

A. For all documents except Conformed Construction Record Drawings, each electronic copy shall be delivered via link to FTP site in Adobe Acrobat's Portable Document Format (PDF). The PDF file(s) shall be fully indexed using the Table of Contents, searchable with thumbnails generated and any extra blank pages removed.

B. Scanned images must be at a readable resolution. For most documents, they will be scanned at 300 dots per inch (dpi). Optical Character Recognition (OCR) capture must be performed on these images. OCR settings shall be performed with the "original image with hidden text" option in Adobe Acrobat Exchange.

C. One PDF document (PDF file) shall be created for each manual. The entire manual shall be converted to a single .PDF file via scanning or other method of conversion. Drawings or other graphics shall also be converted to .PDF format and included into the single PDF document. Pages that must be viewed in landscape format shall be rotated to the appropriate position for easy reading on screen.

D. The PDF documents shall have a bookmark created in the navigation frame for each major entry ("Section" or "Chapter") in the Table of Contents. Thumbnails shall be generated for each page or graphic in the PDF file.

E. The opening view for each PDF document shall be as follows:

1. Initial View: Bookmarks and Page

2. Magnification: Fit In Window

3. The file shall open to the cover page of the manual, with bookmarks to the left, and the first bookmark shall be linked to the Table of Contents.

PART 3 - EXECUTION

3.01 SUBMITTAL LOG

A. CONTRACTOR shall maintain an accurate Submittal Log and a Distribution List for the duration of the WORK, showing current status of all Submittals and Distributees at all times in a form acceptable to the OWNER. CONTRACTOR shall make the Submittal Log available to the OWNER for its review on request, and shall bring a copy of the Submittal Log to all Progress Meetings.

END OF SECTION

SECTION 01310

CONSTRUCTION PROGRESS SCHEDULE

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope of Work

The CONTRACTOR shall prepare and submit to the ENGINEER a PROGRESS SCHEDULE demonstrating complete fulfillment of all CONTRACT DOCUMENTS requirements to coordinate, plan, schedule and perform the WORK under this contract (including activities of SUBCONTRACTORS).

The PROGRESS SCHEDULE shall be used to control the WORK and to provide a definitive basis for determining project progress. The PROGRESS SCHEDULE shall be prepared, maintained and updated by the CONTRACTOR and historical dates agreed monthly with the ENGINEER. The CONTRACTOR shall submit a preliminary PROGRESS SCHEDULE and a PROGRESS SCHEDULE for acceptance by the OWNER and ENGINEER. These schedules shall be the CONTRACTOR's working schedules and shall be used to plan, organize and execute the WORK, record and report actual performance and progress, and show how the CONTRACTOR plans to complete all remaining WORK as of the end of each progress report period.

B. The PROGRESS SCHEDULE shall provide sufficient detail and clarity to reflect the intricacies and interdependencies of activities so the CONTRACTOR can plan, schedule, monitor, control and report on the progress of his work. In addition, it shall provide the ENGINEER and OWNER a tool to monitor and follow the progress for all phases of the WORK.

1.2 SUBMITTAL PROCEDURES

SUBMITTAL requirements shall include:

Narrative description of the logic and reasoning of the schedule.
Submittal Schedule
Procurement schedule outlining items with lead times longer than 2 weeks
Schedule for permit submittal and review
Individual construction activities with time phased logic schedule of WORK
Milestones
Shutdown and Startup Schedule
Electronic schedule files to be uploaded into Masterworks in .PDF, native file format and MS Project (if applicable).

1.3 PRELIMINARY PROGRESS SCHEDULE.

Within ten (10) calendar days after NOTICE TO PROCEED, the CONTRACTOR shall submit a preliminary PROGRESS SCHEDULE for review by the OWNER and ENGINEER. The preliminary PROGRESS SCHEDULE shall show detailed construction-related activities for the 30 days of the project. The remainder of the Contract activities shall be shown as summary bars within the Milestones of the Work. The OWNER shall complete its review of the proposed plan and schedule within five (5) days after receipt of diagram/schedule and state its acceptance or rejection of the schedule. Within five (5) days after the conclusion of the OWNER'S review, the CONTRACTOR shall revise the schedule as required and resubmit the tabulated schedule produced there from. The revised tabulated schedule shall be reviewed and accepted or rejected by the OWNER within five (5) days after receipt. The revised tabulated schedule shall be reviewed and accepted or rejected by the OWNER within five (5) days after receipt. No progress payments will be made during the period specified above for the preliminary PROGRESS SCHEDULE until the preliminary PROGRESS SCHEDULE has been accepted by the ENGINEER. The tabulated schedule when accepted by the OWNER shall constitute the PROGRESS SCHEDULE unless a revised PROGRESS SCHEDULE is required due to substantial changes in the WORK or a change in CONTRACT TIME(S), delinquency by CONTRACTOR requiring a recovery schedule, or as otherwise provided for herein below. Activities not occurring as scheduled are delinquent if they begin after late start or they finish after late finish.

A. The preliminary PROGRESS SCHEDULE shall:

1. Describe the activities to be accomplished during the WORK and their dependency relationships (predecessor/successor) and a tabulated schedule as herein defined.
2. Illustrate a feasible schedule for completion of the Work within the time and Milestones specified.
3. The schedule produced and submitted shall indicate interim milestone and SUBSTANTIAL and FINAL COMPLETION dates identical to the milestone and completion dates specified elsewhere herein.
4. Provide an elementary example of the schedule in the format to be used for the PROGRESS SCHEDULE.
5. Include the activity code structure as described in paragraph 19 of this specification.

C. Preliminary PROGRESS SCHEDULE Submittal Format

1. CONTRACTOR shall electronically submit a PDF and native file of the preliminary PROGRESS SCHEDULE. A brief narrative shall accompany the submittal, describing CONTRACTOR's scheduling approach to the project. The narrative shall include a description of the Contract Milestones, approach for construction activities during the period of the preliminary PROGRESS SCHEDULE, description of the general approach of the activities for the work beyond the preliminary PROGRESS SCHEDULE period, a description of the project's critical path, identification of critical long-lead submittals, and planned outages. The narrative shall also incorporate activity codes, calendars, weather days, Milestone constraints, and work breakdown structure in accordance with the requirements specified herein.

1.4 PROGRESS SCHEDULE

A. The PROGRESS SCHEDULE comprises all the construction-related activities for the Work and shall show the order in which the CONTRACTOR proposes to carry out the work. CONTRACTOR shall include Milestones, coordination necessitated by limited access and available work areas, and the availability and use of manpower, material and equipment. When the tabulated schedule has been accepted, the CONTRACTOR shall add calendar dates to the schedule corresponding to days from NOTICE TO PROCEED and shall submit to the OWNER an electronic, tabulated schedule in which the activities have been sequenced by activity numbers. The CONTRACTOR shall use the PROGRESS SCHEDULE to plan, schedule and coordinate the Work including activities of subcontractors, equipment vendors, and suppliers.

The ENGINEER'S review and acceptance of the CONTRACTOR'S PROGRESS SCHEDULE is for conformance to the requirements of the CONTRACT DOCUMENTS only. Review and acceptance by the OWNER of the CONTRACTOR'S PROGRESS SCHEDULE shall not relieve the CONTRACTOR of any of its responsibility whatsoever for the accuracy or feasibility of the PROGRESS SCHEDULE, or of the CONTRACTOR'S ability to meet the interim milestone date and the FINAL COMPLETION date, nor does such review and acceptance expressly or implicitly warrant, acknowledge or admit the reasonableness of the logic, durations, manpower or equipment loading of the CONTRACTOR'S PROGRESS SCHEDULE.

B. The PROGRESS SCHEDULE shall be to the level of detail acceptable to the ENGINEER, and shall include the following:

1. Organization and structural breakdown of the PROJECT;
2. Milestones and completion dates;
3. Type of work to be performed and the labor trades involved;
4. Purchase, manufacture and delivery activities for major materials and equipment;
5. Preparation, submittal, and acceptance of shop drawings and material samples;
6. Deliveries of owner-furnished equipment and/or materials;
7. Acceptances required by regulatory agencies and/or other third parties;
8. Access requirements to work areas;
9. Identification of interfaces and dependencies with preceding, concurrent and follow-on Contractors;
10. Tests, submittal of test reports and acceptance of test results;
11. Planning for phased or total acceptance by OWNER; including start up and commissioning;
12. Sequence of construction to maintain plant operations;
13. Planned outages.

C. The activities included in the PROGRESS SCHEDULE shall be defined in workdays. Durations shall be based on the labor (crafts), equipment, and materials required to perform each activity on a normal workday basis. Activity durations shall be 20 working days or less except in the case of non-construction activities such as procurement of materials, delivery of equipment, and concrete curing. All durations shall be the result of definitive manpower and

resource planning by CONTRACTOR to perform the Work, in consideration of contractually defined on-site work conditions and CONTRACTOR's planned means and methods.

D. Revised PROGRESS SCHEDULE: The CONTRACTOR, if requested by the ENGINEER, shall provide a revised PROGRESS SCHEDULE if, at any time, the ENGINEER considers the completion date to be in jeopardy because of "delinquent activities" or for other valid reasons. "Delinquent activities" are all activities behind schedule in the accepted PROGRESS SCHEDULE regardless of the existence of positive float on the activity. The revised PROGRESS SCHEDULE shall include a new tabulated schedule designed to show how the CONTRACTOR intends to accomplish the WORK to meet the completion dates or milestones. The form and method employed by the CONTRACTOR to modify the PROGRESS SCHEDULE shall be the same as the originally approved PROGRESS SCHEDULE.

   The updated PROGRESS SCHEDULE shall also show changes occurring since the previous submission of schedule, including:
   1. Major changes in scope.
   2. Activities modified since previous submission.
   3. Revised projections or progress and completion.
   4. Other identifiable changes approved by the ENGINEER.

E. When the PROGRESS SCHEDULE is accepted by the ENGINEER, the ENGINEER will save a copy of the PROGRESS SCHEDULE as the baseline schedule and will use it for analysis of CONTRACTOR's progress.

F. The CONTRACTOR shall update the PROGRESS SCHEDULE monthly.

1.6. CONSTRUCTION PROGRESS SCHEDULES

A. A copy of the PROGRESS SCHEDULE, shall be submitted monthly with that month's PROGRESS REPORT (in strict accordance with the General Conditions) or at the request of the ENGINEER.
B. With each PAYMENT APPLICATION, the CONTRACTOR shall submit a copy of the PROGRESS REPORT and the PROGRESS SCHEDULE marked to show the activities completed and partially completed, for which payment is requested.

1.5 ELECTRONIC PROGRESS SCHEDULE FORMAT AND REPORTING.

A. The PROGRESS SCHEDULE shall be created using software of choice. CONTRACTOR shall use ENGINEER's file-naming format throughout the project.
B. Native files shall be submitted with the baseline and with each progress update.

1.6 SUBMITTALS

A. The PROGRESS SCHEDULE and associated reports shall be submitted to the ENGINEER for acceptance within the period of the preliminary PROGRESS SCHEDULE specified herein. If the PROGRESS SCHEDULE is not submitted, no progress payments will be made after the due date until the PROGRESS SCHEDULE has been submitted.

B. Printouts and electronic layouts required as part of the PROGRESS SCHEDULE submittal and monthly updates are as follows:

1. Summary Schedule: one page milestone and summary schedule, sorted by total float, early-start, early-finish;
2. Detailed Project Schedule: organized by Work Breakdown Structure (WBS) or area of work; sorted by total float, early-start, early-finish;
3. Critical Path Schedule: sorted based on the total float, early-start, early-finish;
4. 60-Day Look Ahead Schedule: sorted by total float, early-start, early-finish;
   Activities in Progress: organized by WBS or area of work; sorted by total float, early-start, early-finish;
5. Out-of-sequence Report: tabular report showing work performed out-of-sequence.

C. CONTRACTOR shall submit additional layouts if directed by ENGINEER.

D. The submittal shall include the following:

1. Narrative report summarizing the contract milestones, critical path, project approach including phasing or use of crews, significant submittal and fabrication items, coordination or interface requirements, OWNER-provided items, and list of subcontractors and vendors.

2. Graphic reports including critical path report (longest path), summary schedule report, total float report by early-start early-finish, look-ahead report grouped by work breakdown structure or project phasing.

E. The PROGRESS SCHEDULE file shall be submitted in an executable format.

F. The narrative and graphic reports shall be provided on 8”x11” paper and E-size plots respectively.

1.7 MONTHLY SCHEDULE UPDATES.

Monthly PROGRESS SCHEDULE updates shall be submitted for the duration of the Contract on a date agreed to by the OWNER, ENGINEER, and CONTRACTOR. If monthly PROGRESS SCHEDULE updates are not submitted by the due date, progress payments will be withheld until the required information is submitted.

A. The updated schedule shall be reviewed each month in a meeting with ENGINEER to verify:

1. Actual start dates,
2. Actual completion dates,
3. Activity percent completion,
4. Revised logic (as-built and projected) and changes in activity durations, cost assigned,
5. Cost influence of change orders, if any,
6. Revisions due to extension of time.

B. Prior to each meeting, CONTRACTOR shall prepare a complete and accurate report of current procurement and construction progress through the end of the update period, and a depiction of how CONTRACTOR plans to continue the Work to meet all contract completion dates. All network changes and status data agreed to during each update meeting shall be considered as accepted by both parties unless written notice of any exceptions is given within five calendar days after the meeting.

C. For major network changes that cannot be agreed to during an updating meeting, CONTRACTOR shall submit the proposed changes for ENGINEER's acceptance prior to inserting such changes into the network. Submittals may be in the form of marked-up networks, fragnets, or schedule abstracts, provided they are submitted with a letter of transmittal. A fragnet is defined as a sequence of new activities and/or activity revisions that are proposed to be added to the existing schedule to demonstrate how project events have an impact on the schedule.

1.8 DATA

A. The data date is the re-settable date that serves as the end of a reporting period. The reporting period will be recorded on a monthly basis, e.g., January 1st through January 31st with the 31st as the data date. If required for coordination purposes by the OWNER, the ENGINEER will provide specific data dates to be used by the CONTRACTOR.

1.11 REVIEW PROCESS

A. ENGINEER will review CONTRACTOR's preliminary PROGRESS SCHEDULE and full PROGRESS SCHEDULE submittals within 20 calendar days after receipt of all required information.

B. At the request of OWNER or ENGINEER, CONTRACTOR shall participate in any meetings necessary to reach a mutual agreement and acceptance of the preliminary PROGRESS SCHEDULE, PROGRESS SCHEDULES, or Cash Flow Projections.

C. If any of the required submittals are returned to CONTRACTOR for corrections or revisions, they shall be resubmitted within ten calendar days after the return mailing date. Resubmittals shall include all information and media included in the first submittal. Review and response by ENGINEER will be given within 10 calendar days after receipt of each resubmittal.

D. Schedules shall show contract completion of the Work on the Contract completion date and with zero or positive total float even if the CONTRACTOR plans to finish early. In no event

shall acceptance of the schedule be a basis for a claim for delay against OWNER or ENGINEER by CONTRACTOR for an early finish. A PROGRESS SCHEDULE containing activities with negative float or that extend beyond the Contract completion date will not be acceptable.

E. Review and acceptance of the PROGRESS SCHEDULE by the OWNER or ENGINEER does not relieve CONTRACTOR of responsibility for the accuracy or feasibility of the PROGRESS SCHEDULE or of the CONTRACTOR'S ability to meet the interim milestone date and the FINAL COMPLETION date. Omissions and errors in the accepted PROGRESS SCHEDULE shall not relieve the CONTRACTOR of obligations under the Contract. Acceptance by ENGINEER in no way makes ENGINEER or OWNER an ensurer of the Schedule's success or liable for time or cost overruns. ENGINEER and OWNER hereby disclaim any obligation or liability by reason of acceptance of the PROGRESS SCHEDULE by the ENGINEER.

1.12 RESPONSIBILITY FOR SCHEDULE COMPLIANCE

A. Whenever it becomes apparent from the current PROGRESS SCHEDULE that the critical path is delayed and the contract completion date will not be met, CONTRACTOR shall mitigate the delay by taking some or all of the following actions at no additional cost to OWNER.

1. Increase construction manpower in such quantities and crafts as will bring the project back on schedule within the completion dates and milestones.

2. Increase the number of working hours per shift, shifts per day, working days per week, and the amount of construction equipment, or any combination of the foregoing, to substantially eliminate the backlog of work.

3. Re-schedule activities to achieve maximum practical concurrence of activities and to comply with the schedule date(s).

B. Within ten calendar days of the ENGINEER's request, CONTRACTOR shall submit a recovery schedule and written statement of the steps intended to remove or arrest the delay to the critical path in the schedule. If the CONTRACTOR fails to submit the required information or should fail to take measures acceptable to the ENGINEER, the ENGINEER with OWNER concurrence may direct CONTRACTOR to increase manpower, equipment and scheduled work hours to remove or arrest the delay to the critical path and the CONTRACTOR shall promptly provide such level of effort at no additional cost to OWNER.

C. In the event CONTRACTOR fails to follow the updated or revised recovery schedule, OWNER may elect to withhold progress payments until CONTRACTOR complies with the revised schedule.

D. Should CONTRACTOR's efforts not remove or arrest the delay to the critical path of the accepted schedule, then OWNER shall be entitled to supplement CONTRACTOR's workforce and equipment to remove and arrest any delay and shall be entitled to deduct all costs and

expenses associated therewith from payments due to the CONTRACTOR. If insufficient Contract funds remain, OWNER may recover such funds from CONTRACTOR and its Surety.

1.13 CHANGE ORDERS, DELAYS, AND EXTENSIONS OF TIME

A. When change orders or delays are experienced by CONTRACTOR and CONTRACTOR requests an extension of time, CONTRACTOR shall submit a written time impact analysis to the ENGINEER illustrating the influence of each change or delay to the current Contract Schedule completion date. Each time impact analysis shall include a fragnet incorporating the change order or delay into the PROGRESS SCHEDULE to demonstrate how CONTRACTOR was delayed.

B. Each time impact analysis shall demonstrate the estimated time impact based on the events of the change or the delay; the date the change was given to CONTRACTOR, or the delay incurred, the status of construction at that point in time, and the event time computation of all activities affected by the change or delay. The event times used in the analysis shall be those included in the latest update of the PROGRESS SCHEDULE or as adjusted for the events of delay.

C. Three copies of the time impact analysis and an electronic copy on compact disk shall be submitted within seven calendar days of delay occurrence or direction to proceed with a change is given to CONTRACTOR. No time extensions will be considered if the time impact analysis is not submitted within the specified time.

D. The ENGINEER will review CONTRACTOR's time impact analysis. CONTRACTOR shall furnish such justification and supporting evidence as the ENGINEER deems necessary to determine whether CONTRACTOR is entitled to an extension of time. ENGINEER's review of each time impact analysis will be made within 5 working days of receipt of the time impact analysis and additional information as required by the ENGINEER, unless subsequent meetings and negotiations are necessary.

E. The Contract completion time will be adjusted only for causes specified in paragraph 15. Time extensions will be granted only to the extent that equitable time adjustments for the activity or activities affected exceed the total or remaining float along the critical path at the time of actual delay. Delays in activities which are not on the critical path and do not affect Contract completion dates, will not be considered for an extension of time.

Upon approval of a CHANGE ORDER, the approved change shall be reflected in the next PROGRESS SCHEDULE submitted by the CONTRACTOR.

1.14 CAUSES FOR EXTENSIONS OF TIME

A. Additional positive total float in the PROGRESS SCHEDULE generated by efficiencies of OWNER or CONTRACTOR is a shared commodity to be reasonably used by either party, and

belongs exclusively to the PROJECT. The CONTRACTOR is not entitled to any additional compensation for completion of the project prior to expiration of the Contract Times.

1. OWNER-Initiated Changes

B. OWNER initiated changes to the Contract work that absorb float time will not be considered for an extension of time. OWNER-initiated changes that affect the critical path of the PROGRESS SCHEDULE shall be grounds for extending or shortening completion dates. Use of float time for CONTRACTOR initiated changes will require OWNER's concurrence. CONTRACTOR's changes, however, shall give way to OWNER-initiated changes competing for the same float time.

1. Outside CONTRACTOR's Control

C. Events outside of the CONTRACTOR's control that affect the critical path of the PROGRESS SCHEDULE will be considered for an extension or reduction of the Contract Times.

1. Weather Delays

D. ENGINEER will obtain weather data during construction from a reputable source and will maintain weather records.

E. Any weather-related extension of Contract time shall be non-compensable. Efficiencies gained as a result of favorable weather within a calendar month, where the number of days of normally anticipated weather days is less than expected, shall contribute to the project float and shall not affect the Contract Times.

F. Application for a weather-related extension of time shall be submitted to the ENGINEER and shall state the extension requested and be supported by the relevant weather data.

1.15. AS-BUILT SCHEDULE

A. As a condition precedent to release of final payment, the last update to the PROGRESS SCHEDULE submitted shall be identified by the CONTRACTOR as the "As-Built Schedule". The "As-Built Schedule" shall reflect the exact manner in which the project was actually constructed (including actual start and completion dates, activities, sequences, and logic) and shall be signed and certified by the CONTRACTOR's project manager.

1.16. SCHEDULE SOFTWARE SETTINGS AND RESTRICTIONS

A. The following shall apply unless otherwise directed by the ENGINEER.

1. Schedule Options:

i. Shall be defined only to "Use expected finish dates";

ii. Scheduling progressed activities to be set to "Use only retained logic", not progress override option;

iii. Critical Path activities defined as Total Float less than or equal to zero;

iv. Calculating start-to-start lag from "early start" dates; and computing total float as "finish float = late finish – early finish";

v. Calendar to be set for scheduling relationship lag as "Predecessor Activity Calendar."

2. Activity progress shall be shown using Remaining Duration. Date format shall be DDMMYY.

3. Default activity type shall be set to "Independent Task".

4. Date/time activity constraint(s), other than those required by the Contract, will not be allowed unless accepted by ENGINEER. CONTRACTOR shall identify proposed constraints and explain the constraint purpose in the Narrative Report.

5. Lags shall not be used in the creation of an activity that will perform the same function, e.g., concrete cure time. Lag durations contained in the project schedule shall not have a negative value. CONTRACTOR shall identify any lag proposed and explain the purpose of the lag in the Narrative Report.

6. Actual Start and Finish dates shall not be automatically updated by default mechanism that may be included in the CPM scheduling software system. Actual Start and Actual Finish dates on the CPM schedule shall be updated by actual work progression.

1.17 ACTIVITY CODES

A. The work breakdown structure (WBS) to be confirmed or revised by the ENGINEER are listed below. Confirmation or revision of the activity codes and WBS will be provided to the CONTRACTOR within three workdays of the Effective Date of the Agreement. Use of the ENGINEER prescribed activity codes and WBS is mandatory.

B. "Project Codes" are reserved for the OWNER. Only "Activity Codes" at Project Level will be permitted for CONTRACTOR use.

Activity Code	Code Value	Description
Phase	0005	Construction Phase
Construction Phase	A	Milestones
	BC	Administrative
	D	Submittals
	E	Construction Activities
		Closeout Phase
Submittals	SUB	Submittals
	R&A	Review & Approve
	F&D	Fabricate & deliver

Other Codes to be prescribed by ENGINEER or requested by CONTRACTOR for project specific criteria.

1.18. ACTIVITY RELATIONSHIPS

A. Relationships between activities shall be identified with the following information:

1. Predecessor and successor activity ID.

2. Relationship types:

i. FS - Finish to start

ii. SS - Start to start

iii. FF - Finish to finish

iv. SF - Start to finish – This relationship is not allowed, unless authorized by ENGINEER.

1.19. PROJECT CALENDARS

A. Project Calendars shall use workdays and calendar days as the planning unit for the schedule. Use of Global Calendars is reserved for OWNER. Each calendar shall be set to start on Mondays with holidays in accordance with OWNER policy. The following calendars shall be used for each activity except as otherwise accepted by ENGINEER:

1. 5-Day x 8 Hour Workweek (with holidays) shall be used for 5-day 40-hour workweek activities: Monday through Friday. All holidays and non-workdays shall be assigned to this

calendar. This calendar shall be used for all normal work activities, submittals, and fabricate and delivery activities. This calendar shall be the default calendar for the project unless otherwise specified.

2. 5-Day x 10-Hour Workweek (with holidays) shall be used for 5-day 50-hour workweek activities: Monday through Friday. All holidays and non-workdays shall be assigned to this calendar.

3. 6-Day x 10-Hour Workweek (with holidays) shall be used for 6-day 60-hour workweek activities. Monday through Saturday. All holiday and non-workdays shall be assigned to this calendar.

4. 7-Day Calendar (no holidays) shall be used for 7-day workweek activities. No non-workdays shall be entered into this calendar.

5. Additional Calendars may be assigned depending on need. However, CONTRACTOR shall consult with the ENGINEER before other calendars are entered and/or used in the Project schedule.

B. The workday to calendar day correlation shall be based on a single shift and 5-day work week with adequate allowance for holidays, adverse weather and all other special requirements of the Work. CONTRACTOR may, at his option, propose alternate baseline calendars to allow a second shift and/or a single shift on Saturdays subject to the concurrence and acceptance of OWNER. Under no circumstances will a schedule be accepted which allows regularly scheduled work on Sundays.

C. The holidays observed by the OWNER are as follows:

New Year's Day
Martin Luther King Jr. Day
Memorial Day
Juneteenth
Independence Day
Labor Day
Thanksgiving Day
Friday after Thanksgiving Day
Christmas Eve
Christmas Day

1.2. FLOAT

A. CONTRACTOR shall not use float suppression techniques, including preferential sequencing (arranging critical path through activities more susceptible to OWNER caused delay); lag logic restraints; zero total or free float constraints; extended activity times; or imposing constraint

dates other than as required by the Contract. Float suppression will be cause for rejection of the preliminary PROGRESS SCHEDULE or full PROGRESS SCHEDULE and its updates.

1.21. MANDATORY MILESTONES.

A. The Contract duration shall be equal to the time period between the Notice to Proceed and the completion Milestone. The following milestones are mandatory.

1. PROJECT Award

2. Notice to Proceed

3. Substantial Completion as established in the Bid Documents

4. Completion as established in the Bid Documents

B. The following additional milestones are to be considered and incorporated into the PROGRESS SCHEDULE in accordance with the Contract terms, if applicable.

1. Permit constraints

2. Facility shut down or outage milestone requirements

3. Applicable phasing milestones

4. Other milestones deemed appropriate by the ENGINEER

1.22. PROGRESS MEETINGS

A. For all progress meetings, the CONTRACTOR shall submit a three (3) week schedule showing all activities in progress, uncompleted or scheduled to be worked during the three weeks. The three-week schedule shall include the current week plus the next two. The three-week schedule shall list all activities which are scheduled for work during the period, which are currently planned to be worked even if out of sequence and work which is unfinished but scheduled to be finished. The schedule shall also show the planned resources and any deviations from that plan.

End of Section

SECTION 01313

CONSTRUCTION AND SCHEDULE CONSTRAINTS

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. WORK shall be scheduled, sequenced, and performed in a manner which minimizes disruption to the operation and maintenance of the existing facility.

B. The CONTRACTOR shall incorporate the construction and schedule constraints of this Section in preparing the construction schedules required under Section 01310 – Construction Schedules and under Section 01100 – Special Project Procedures.

1.2 EXISTING FACILITY

A. The WORK shall be executed while the existing facility is in operation. Operation of the existing facility shall not be jeopardized nor shall the efficiency as a result of the execution of the WORK.

B. Unless indicated otherwise, temporary pumping, piping, power, lighting, controls, instrumentation, alarms, security devices, and safety devices shall be provided by the CONTRACTOR whenever its activity or interruption due to its activity affects the existing facility.

C. The construction constraints in this Section do not include every item affecting the completion of the WORK but are intended to describe the sequence of critical events necessary to minimize disruption to the existing facility operation. It shall be understood and agreed by the CONTRACTOR that the critical events described are not inclusive and that additional items of WORK not included may be required to minimize disruption and ensure compliance. Deviation from or modification of these suggested sequences is permitted if techniques and methods known to the CONTRACTOR will result in less disruption, and if deviation is approved in advance by the ENGINEER.

1.3 OPERATION OF EQUIPMENT

A. Operational functions or shutdown required to facilitate CONTRACTOR's operation will be done by the OWNER's personnel only.

B. The OWNER’s operation and maintenance personnel will cooperate in every way that is practical in order to facilitate CONTRACTOR's operation. However, certain shutdowns and connections may only be permissible at times other than normal working hours such as nights or weekends. No additional payment will be made to the CONTRACTOR for any night, weekend, or holiday premium or overtime payments.

C. If it becomes necessary for the proper operation or maintenance of portions of the facility, the OWNER may require the CONTRACTOR to reschedule an approved shutdown. The CONTRACTOR shall then reschedule its operations so there shall be no conflict with necessary operations or maintenance of the facility. The CONTRACTOR shall, within two days of notice by the OWNER that a rescheduled shutdown is necessary, furnish the ENGINEER a revised outage request and a plan for rescheduling the shutdown in accordance with the requirements of the construction schedule.

1.4 OUTAGE REQUESTS

A. Modifications to existing facilities, the construction of new facilities, and the connection of new to existing facilities may require the temporary outage of existing facilities. In such cases, the CONTRACTOR shall coordinate WORK with the OWNER as described below. The CONTRACTOR shall submit a detailed outage plan and time schedule for construction activities which will make it necessary to remove a pipeline, electrical circuit, equipment, structure, road, or other facilities from service.

B. The outage plans shall be submitted to the OWNER for acceptance a minimum of two weeks in advance of the time that such outages are required. The outage plans shall be coordinated with the construction schedule and shall meet the restrictions and conditions of this Section. The outage plan shall describe the length of time required to complete the operation; any necessary temporary power, controls, instrumentation, or alarms required to maintain control and monitoring, the amount of manpower, and equipment which the CONTRACTOR shall provide in order to ensure proper operation of associated treatment units. Costs for preparing and implementing the outage plans shall be the responsibility of the CONTRACTOR as part of the WORK.

C. The CONTRACTOR shall not begin an alteration affecting existing facilities until specific written approval has been granted by the OWNER in each case.

D. The ENGINEER will coordinate the CONTRACTOR's planned procedure with the OWNER's personnel. The OWNER has the authority to modify any proposed shutdown procedures if such procedures would adversely impact the OWNER's operations.

E. The OWNER shall be notified in writing at least one week in advance of the required outage if the schedule for performing the WORK has changed or if revisions to the outage plan are required. The CONTRACTOR shall provide written confirmation of the shutdown date and time two days prior to the actual shutdown.

1.5 TEMPORARY CONNECTIONS

A. Making connections to existing facilities shall be thoroughly planned in advance, and required equipment, materials, and labor shall be on hand at the time of undertaking the connections. WORK shall be completed as quickly as possible and with as little delay as possible and shall proceed continuously (24 hours a day and seven days a

week), if necessary, to complete modifications and/or connections in the minimum time.

B. The cost of any temporary facilities and night, weekend, or holiday activity and overtime payments required during process interruptions shall be included in the WORK.

C. Temporary facilities and piping shall be located to minimize interference with CONTRACTOR's construction facilities and OWNER's operation and maintenance of the existing facilities. Unless otherwise indicated, each temporary pipeline shall be of the same size as its connection to the existing or permanent facility at the downstream end of the pipeline. Piping materials shall be suitable for the material being conveyed and be as required in the Contract Specifications.

D. When temporary electrical power, controls, instrumentation, or alarms are required for routine continuous operations of existing or new equipment, the CONTRACTOR shall provide the necessary equipment and appurtenances. Prior to installing said equipment and appurtenances, CONTRACTOR shall furnish a submittal on the proposed components and installation for ENGINEER's review and approval.

E. A plan showing the size and location of the temporary facilities and piping shall be submitted to the ENGINEER at the same time as the outage plan required under this Section. Costs for design, provision, operation, and removal of temporary facilities and piping shall be part of the WORK.

1.6 CONSTRUCTION SEQUENCING

A. Construction activities shall be scheduled and sequenced to ensure continuous operation of the existing facilities, unless otherwise noted in these CONTRACT DOCUMENTS. The CONTRACTOR's scheduling shall develop construction sequencing so that the WORK will not adversely impact OWNER's operations. The CONTRACTOR shall be responsible for development of the construction sequencing. In implementing the construction sequencing, the CONTRACTOR shall maintain the existing facilities in service until new facilities are constructed and are operational to supplement the existing capacity. When new facilities are operational and accepted by the OWNER, the existing facilities may be taken out of service. The following general guidelines shall be used by the CONTRACTOR in planning the sequence of construction.

1. Safe working conditions for personnel shall be maintained during rehabilitation, modification, and demolition WORK. The foregoing includes at least proper trench excavation, the provision of temporary equipment guards, supports, warning signs, walkways, covers over openings, handrailing, and protection of electrical equipment and power supply.

2. Temporary facilities shall be constructed in accordance with applicable codes and regulations to operate safely and properly.

3. Valves to be temporarily shut off during the WORK shall be tagged as such and shall be wired shut with a crimped lead seal and padlocked.

4. Electrical and mechanical equipment shall be similarly shut down.

B. Construction Restrictions: Project specific.

1. All proposed shut downs of OWNER'S facilities shall be submitted and approved in advance per Section 01010. The OWNER will have the sole authority as to when (seasonally and time of day) this work will be accomplished.

2. Existing raw water well collection main must be removed from service to dewater contents and construct connections. **There is a strict limit on how many calendar days the pipeline can be out of service. See section 01100**. This shut down is not to be scheduled during the rainy season (June 1 through September 30) and shall be coordinated in advance with the OWNER.

1.7 PERMITS

A. The CONTRACTOR shall abide by the conditions of permits and shall obtain proof of satisfaction of conditions from issuers of permits prior to acceptance of the WORK by the OWNER.

B. CONTRACTOR must comply with all permit conditions, but not limited to, in the following permits. Copies of the permit conditions are contained in the permit notebook available for review and on file at the offices of the ENGINEER.

1.8 SCHEDULE CONSTRAINTS

General: It is the CONTRACTOR's responsibility to coordinate and plan the construction activities to integrate each schedule constraint into performance of the overall WORK.

- END OF SECTION -

SECTION 01410

TESTING AND QUALITY CONTROL

PART 1 - GENERAL

1.1 SCOPE

A. Summary of Work:

1. The CONTRACTOR shall establish and implement a Quality Control Plan to perform sufficient inspection of all items of the WORK, including that of Subcontractors, to ensure conformance to the Technical Specifications and the Drawings with respect to the materials, workmanship, construction, equipment performance, and identification.

2. The CONTRACTOR's job supervisory staff may be used for quality control, supplemented as necessary by additional personnel for surveillance or special technicians to provide capability for the controls required by the Technical Specifications. The CONTRACTOR's Quality Control Plan must clearly identify the quality control leader and personnel organizational system. The leader must have the authority to direct the removal and replacement of defective work.

3. After the Contract is awarded and before the construction begins, the CONTRACTOR shall meet with the OWNER or its representative to discuss quality control requirements. The meeting shall develop mutual understanding relative to the details of the Quality Control Plan, including the appropriate forms to be used for recording the quality control operations, inspections, administration of the Quality Control Plan, and the interrelationship of the CONTRACTOR and the OWNER inspection.

4. The CONTRACTOR shall submit his written Quality Control Plan for review at or before the preconstruction meeting, describing the activities and listing those inspections and testing activities that the CONTRACTOR will perform prior to beginning the WORK. The CONTRACTOR's Quality Control Plan shall describe how he will communicate timely notification to allow for inspection activities performed by the OWNER, or its representatives, for on and off-site construction activities

5. All compliance inspections shall be recorded on the appropriate forms, including but not limited to the specific items required in each SECTION of the Technical Specifications. The completed forms, including record of corrective actions taken, shall be furnished to the OWNER. The OWNER's quality control representative will maintain a list of all deficiencies which are not corrected the same day as they are discovered.

6. Should recurring deficiencies in an item or items indicate that the Quality Control Plan is not adequate, the CONTRACTOR shall take corrective actions as directed by the OWNER to update the Quality Control Plan, to satisfactorily address and resolve any reoccurring deficiencies.

B. Related Work Specified Elsewhere:

SECTION 01300 – Submittals

1.2 TESTING LABORATORY SERVICES

All tests which require the services of a laboratory to determine compliance with the Contract Documents shall be performed by an independent commercial testing laboratory acceptable to the OWNER. The laboratory shall be staffed with experienced technicians, and shall be properly equipped, ACI certified, and fully qualified to perform the tests in accordance with the specified standards.

1.3 TESTING LABORATORY SERVICES FURNISHED BY CONTRACTOR

A. All testing required in connection with the performance of the WORK (which are identified as the CONTRACTOR's responsibility in the Contract Documents) shall be performed and paid for by the CONTRACTOR, and a certified copy of the results will be furnished to the OWNER within five (5) days of the test.

B. The CONTRACTOR is also responsible for all testing and inspection services required to achieve an effective Quality Control Program, to assure that the WORK strictly complies with the Contract requirements. The CONTRACTOR shall pay all costs for such services.

1.4 TRANSMITTAL OF TEST REPORTS

Written reports of test and engineering data furnished by the CONTRACTOR shall be submitted as specified in SECTION 01300, Submittals.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01720

CONTRACT RECORD AND CLOSE OUT DOCUMENTATIONS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section addresses documentation items that are required to be delivered through the OWNER'S REPRESENTATIVE to the OWNER prior to final payment and close out of the CONTRACT. The CONTRACTOR will assist, as directed by the OWNER'S REPRESENTATIVE, in acquiring the material necessary to assemble and deliver the various documentation items. Requirements set forth in other sections of these specifications shall be coordinated with this Section so that all documentation items required to close out the CONTRACT are delivered to the OWNER after it is reviewed and in the case of item 1.6, approved by the OWNER'S REPRESENTATIVE.

B. CONTRACT close out documentation items include:

- Major Equipment Shop Drawings (as designated by the OWNER'S REPRESENTATIVE), Pipe Laying Schedules, and Surveying Manual
- Operation and Maintenance Manual
- Warranties, Guarantees, and Certificates Manual
- Construction Photographs
- Conformed to Construction Records Drawings
- Permit Notebook
- Property Notebook

The requirements for these CONTRACT close out documentation items are described in this Section.

1.2 MAJOR EQUIPMENT SHOP DRAWINGS, PIPE LAYING SCHEDULES, AND SURVEYING MANUAL

A. This manual shall contain a copy of the accepted shop drawings for the major materials and equipment associated with the project. The manual shall be divided into sections with each section dedicated to a particular specification section. The manual shall contain CONTRACTOR redlines showing any associated changes from the CONSTRUCTION DOCUMENTS.

B. One electronic file copy is to be delivered to the OWNER.

1.3 OPERATION AND MAINTENANCE MANUAL

A. Operation and Maintenance Data shall be furnished as specified in Section 01730.

1.4 WARRANTIES, GUARANTEES, BONDS, AND CERTIFICATES MANUAL

A. This manual shall contain all warranties, guarantees, bonds, certificates, and similar documents, including those customarily provided by manufacturers and suppliers which cover a period greater than the one-year Contractor's correction period. Show OWNER as beneficiary on these documents. One electronic file copy is to be delivered to the OWNER.

1.5 CONSTRUCTION PHOTOGRAPHS

A. This manual shall contain construction photographs obtained from the CONTRACTOR, ENGINEER, and OWNER. All photographs are to be color digital compiled digitally and provided with a descriptive index of images with dates.

B. Electronic file copy to be delivered to the OWNER.

1.6 CONFORMED TO CONSTRUCTION RECORD DRAWINGS

A. As identified in General Conditions Article 2.4.1., the CONTRACTOR is to maintain on a daily basis at the PROJECT site one current set of AS-BUILT CONTRACT DOCUMENTS. The CONTRACTOR is to give the set of AS-BUILT CONTRACT DOCUMENTS to the OWNER'S REPRESENTATIVE who in turn will produce Conformed to Construction Record drawings.

One electronic file of each drawing in Windows based - AutoCAD latest version format and one electronic file of each drawing signed and sealed (seal must be inked) shall be scanned and saved as Win. OS - Tif 6.0 files with a resolution of 300 dpi, shall be provided to the OWNER in the most logical format listed by judging the size of the project. The files should be labeled by drawing title and page number and submitted electronically into Masterworks.

1.7 REQUIREMENTS FOR MANUAL HARD COPIES

All manuals to be provided in digital pdf format.

1.8 REQUIREMENTS FOR ELECTRONIC FILES

A. For all documents except Conformed to Construction Records Drawings, each electronic copy shall be delivered digitally in Adobe Acrobat's Portable Document Format (PDF). The PDF file(s) shall be fully indexed using the Table of Contents, searchable with thumbnails generated and any extra blank pages removed.

B. Scanned images must be at a readable resolution. For most documents, they will be scanned at

300 dots per inch (dpi). Optical Character Recognition (OCR) capture must be performed on these images. OCR settings shall be performed with the "original image with hidden text" option in Adobe Acrobat Exchange.

C. One PDF document (PDF file) shall be created for each manual. The entire manual shall be converted to a single .PDF file via scanning or other method of conversion. Drawings or other graphics shall also be converted to .PDF format and included into the single PDF document. Pages that must be viewed in landscape format shall be rotated to the appropriate position for easy reading on screen.

D. The PDF documents shall have a bookmark created in the navigation frame for each major entry ("Section" or "Chapter") in the Table of Contents. Thumbnails shall be generated for each page or graphic in the PDF file.

E. The opening view for each PDF document shall be as follows:

1. Initial View: Bookmarks and Page

2. Magnification: Fit In Window

3. The file shall open to the cover page of the manual, with bookmarks to the left, and the first bookmark shall be linked to the Table of Contents.

A. The PDF documents shall be uploaded to Masterworks in the appropriate project folder.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 02075

MICROTUNNELING

02075.01 GENERAL

A. Scope: Provide all labor, materials, equipment, supervision and incidentals required to excavate, dewater, protect existing structures and furnish and install casing pipe as shown on the Plans and specified utilizing the microtunneling method generally defined as follows:

1. Microtunneling (MT) - a remotely controlled, guided pipe jacking process that provides continuous support to the excavated face. The guidance system usually consists of a laser mounted in the drive shaft communicating a reference line to a target mounted inside the articulated steering head of the MT boring machine (MTBM). The MT process provides ability to control excavation face stability by applying mechanical and/or fluid pressure to counterbalance the earth and hydrostatic pressures.

2. Non-interlocked steel sheeting will not be permitted for shaft construction.

This Section also includes the provision for pipe support structures, access shafts, grout, construction bulkheads, disposal of waste material and the installation of the water carrier pipe.

Provide all items and temporary means, including but not limited to spoil transportation and separation, hoisting, lifting, safety and control equipment, needed to prevent discharge of sediment to drainage courses or structures from dewatering systems or other construction operations.

B. Intent: This Specification is intended to define in general terms the Work to be accomplished. CONTRACTOR assumes full responsibility for the selection of the means and methods, subject to review by the ENGINEER. Demonstrate to the ENGINEER that the proposed means and methods will complete the Work in accordance with the Specifications, this Section, applicable codes, permitting agency requirements and the Construction Schedule.

C. Special Caution: The Work of this Section involves the installation of access shafts and casing pipe support systems in or under critical and sensitive transportation facilities. Details of the soil borings and laboratory test results on samples taken can be found in the geotechnical information made available to perspective bidders. Conduct additional geotechnical investigations as deemed necessary. Assume full responsibility to judge how the geotechnical conditions and depth of cover will affect the means, methods, and progress of the work. Schedule continuous installation of the casing pipe at roadway crossings until completed, however 24 hours per day for 7 days per week work is not required. Be prepared to advance the support system in such a manner that at all times the stability of the excavation face

is maintained and undesirable ground loss is avoided. Include soil stabilization, if required, by grouting or other means ahead of the machine.

D. Materials to be Excavated: No classification of excavated material will be made. Excavation includes all materials regardless of type, character, composition, moisture, or condition thereof. Construction, regardless of materials encountered, will be measured for payment in accordance with the appropriate GMP Pay Item for microtunneling. Where rock is encountered during microtunneling, it will not be measured for separate payment under another GMP Pay Item. Any acceptable fill material the CONTRACTOR brings on to the site is at no additional cost to the OWNER.

02075.02 REFERENCES

A. Codes and standards referred to in this Section are:

1. ASTM A 36/36M - Specification for Carbon Structural Steel
2. ASTM A 139 - Specification for Electric-Fusion (Arc) - Welded Steel Pipe (NPS in 4 in. and Over)
3. OSHA PL-91-596 - Occupational Safety Health Act of 1970 Public Law 91-596

02075.03 SPECIALIST SUBCONTRACTORS

A. Utilize Specialist Subcontractors for all crossings requiring microtunneling construction techniques described in this Section. Provide names of Specialist Subcontractor proposed for this Work with the Bid Documents. Provide the following submittals within 10 working days of the Notice of Award:

a. Cover Sheet: List date, company name, address, telephone/telefax/e-mail, contact person , etc.

b. Summary sheet of previous projects performed: Submit selected projects that demonstrate expertise and experience with the means and methods selected for this project.

c. Three separate named projects completed using Microtunneling (MT) where the installation was successfully completed in similar ground conditions below surface features similar to this project.

For each of the named projects, provide the following detailed information:

- Full name of project
- Project location
- Owners name and address
- Owners contact person and telephone number
- Clients name and address

- Clients contact person and telephone number
- Any other references
- Employees in charge of the work at both the site and home office
- Description of the relevant work successfully completed, including site conditions and features under which pipe passed. Add additional information as necessary.

d. Resumes of key personnel: Submit resumes of key managerial, supervisory, and operational personnel who are expected to be available to perform the trenchless construction work. If operational personnel are expected to be supplied by the equipment manufacturer, provide details of their responsibility and resumes.

e. List of specialized equipment:
Provide details of owned or rented MT systems which have been used to install casing pipe of the sizes required for this Contract. Information shall at least include make, model number and age of base equipment.

f. General company data (Specialist Subcontractor):
   i. List all litigation, within the past five years, to which your company has been a party. For each instance, please provide the following information for each incident:
      1. Name of parties involved
      2. Explain result or status
      3. Briefly explain facts of the case

   ii. Has your company failed to complete any work awarded? If the answer to this question is Yes, please provide full details and circumstances.

   iii. Has your company ever had to utilize a performance and/or payment bond (or similar instrument) for a project to be completed? If the answer to this question is Yes, please provide full details and circumstances.

   iv. Provide company history, brochures and any other information you feel is relevant.

02075.04 SUBMITTALS

A. Review: Provide all required submittals as specified herein, in accordance with the General Conditions. All submittals will be reviewed for compliance with the requirements of this Section and the other contract documents and Drawings. Such review does not relieve the CONTRACTOR in any way of his responsibilities under the contract. No work shall commence on any Section requiring a prior submission until such submittals has been reviewed and accepted by the ENGINEER. All submitted calculations shall be stamped and signed by a professional engineer licensed in the State of Florida.

B. Design Criteria:

1. An intermediate jacking station will be installed if the calculated jacking forces reach or exceed 70 percent of the manufacturer's recommended safe design capacity of the jacking pipe, IJS pipe, jacking frame, or thrust block, whichever is lowest. Design intermediate jacking stations (IJS) using a continuous steel casing fabricated to the same outside diameter as the pipe. Use special recessed pipes to accommodate the IJS. Seal each side of the IJS with a double rubber gasketed joint to provide a watertight pipe joint. Design the IJS to distribute the jacking force uniformly to the ends of the adjacent pipe section. Design IJS to provide a watertight joint during operation and after removal. Design IJS to allow pipe joint to fully close and seal. IJS joint shall as a minimum have an equal level of protection as provided by jacking pipe joints.

2. Thrust reaction backstop shall be designed to support the maximum anticipated jacking load with a minimum factor of safety of 1.5. The thrust reaction backstop shall be square with the proposed pipe alignment and remain square throughout the jacking operation.

3. Steel pipe shall be designed based on the criteria herein. The safe jacking capacity of the pipe shall be determined by the ultimate jacking capacity divided by a safety factor of 2.5.

4. Control of Line and Grade:

- The CONTRACTOR shall establish the baseline and benchmarks indicated on the plans. Check these baselines and benchmarks at the beginning of the contract period and report any error or discrepancies to the ENGINEER.
- Horizontal Alignment: plus or minus four (4) inches from theoretical alignment at any point along the alignment shown on the Drawings.
- Vertical Alignment: plus or minus four (4) inches from theoretical alignment at any point along the alignment shown on the Drawings.
- When the excavation is off line or grade, return to the plan line and/or grade at a rate of not more than one (1) inch per

25 feet of tunnel advancement.

C. Submit the following for review:

1. Personnel - List names of all key personnel to be employed in the execution of this Work including managerial, supervisory, and operational personnel.

2. Equipment - Supply full details of the MT systems to be utilized including but not limited to:
   - Make, type and model number of whole system if from a single source or separate details for each element of the system if not from a single source.
   - Dates of manufacture
   - Cutter head details
   - System of alignment monitoring and steering control and activation
   - Spoil separation method for slurry systems

3. Methods - Supply full details of the procedures and resources which will be employed to carry out the Work including method and sequence of:
   - System set-up at the surface
   - Establishment of alignment and grade controls at the base of the shaft
   - System set-up in the access shaft including establishment of the jacking reaction backstop for MT systems
   - Spoil separation and disposal for slurry MT systems
   - Lubrication mixing and injection
   - Emergency/contingency procedures addressing the following:
     - A work plan/method statement for removal of obstructions.
     - Frictional jacking forces reaching the design capacity of the jacking pipe, jacking frame, or thrust wall.
     - Thrust block deforming excessively under jacking loads due to inadequate ground support behind the thrust block.
     - Damage to jacking pipe.

4. Materials - Supply full details of the following materials
   - Slurry additives if MT system is utilized
   - Lubricants additives

5. Shop Drawings
   - Layout Drawings showing the complete jacking/tunneling equipment set-up in the access shaft.

6. Information defining the proposed jacking system including:
   - Capacity, number, and arrangement of main jacks.
   - Details of thrust ring, jacking controls, pressure gages, and calibration data for jacks indicating pressure vs. load relationship. Procedure for

calibrating jacks prior to beginning the drive.

- Calculations of the maximum jacking force expected to be required to complete the drive and a comparison with the safe jacking load of the pipe, the capacity of the main jacks, and the intermediate jacking station (IJS) capacity. Use this information to plan intermediate jacking station placement locations, if required by 02075.04 B. 1. of this Section, and these calculations. Provide a layout of planned IJS locations. Provide calculations demonstrating that the proposed jacking pipe is capable of supporting the maximum stresses to be imposed during jacking. The calculations shall take into account earth and hydrostatic loads, jacking forces, external loads such as live loads due to traffic, and any other loads that may be reasonably anticipated during jacking. All loads shall be shown and described. Jacking force calculations shall account for both face pressures and frictional resistance along the pipe string. Calculations shall be stamped and signed by a professional engineer in the State of Florida.
- Provide calculations for the thrust resistance of the shaft wall and calculated shaft wall deflection at maximum thrust. Coordinate with shaft design and related shaft submittals. Calculations should demonstrate that the soils behind the thrust block can transfer the maximum jacking forces exerted by the main jacks to the ground during pipe installation with a factor of safety of at least 1.5, without excessive deflection or displacement.
- Calculations to show the push-back force on the machine when the jacks are retracted and the need for pipe restraint to prevent movement of the machine into the shaft during stoppages and main jack retractions.

7. If required by 02075.04 B. 1. and 02075.05 C. 6. of this Section, include details of intermediate jacking stations indicating:
   - Method of operation.
   - Procedures for installation and removal.
   - Drawings showing the size, location, capacity of all elements, pressure gages, and calibration data for jacks indicating pressure versus load relationship.
   - Design details including dimensions, shell materials, seals, load transfer, proposed spacing, and method of abandonment and final seal configuration.

8. Jacking Pipe: Submit details on the steel jacking pipe including the following:
   - Manufacturer's literature showing yield strength and end preparation
   - Calculations of the wall thickness, ultimate and safe jacking capacity
   - Details on intermediate jacking station pipes, including allowable loading
   - Details on manufacturing tolerances showing that the tolerances meet the requirements set forth herein.

9. Casing Spacers: Submit details on the casing spacers that will be used for the installation of the carrier pipe within the steel casing pipe installed by microtunneling. Provide manufacturer's literature, planned location of the casing spacers, and procedures for installation of the pipe with the casing spacers. Provide the number of runners as recommended by the manufacturer. Provide calculations prepared by the manufacturer, or a Florida Licensed Professional Engineer, indicating the structural adequacy to support the specified intended loads.

D. Submit for record purposes only:

1. Daily logs - Maintain a daily activity log during the MT operations and any associated delays. Submit the log to the ENGINEER on a daily basis. Log and submit the following information and activities:

- Start and finish time of advancement of each pipe section including the machine/shield sections.
- Total distance jacked/installed at the end of each pipe section.
- Horizontal alignment and vertical grade deviation from the datum of the machine/shield at not greater than three-foot intervals.
- Maximum jacking force exerted during the installation of each pipe section.
- The slurry feed and return flows during system operation and pipe advancement.
- Cutter head torque.
- General description for each discernable ground condition mined.
- Details and perceived reasons for delays greater than one hour other than normal breaks and shift changes.
- Details of any unusual conditions or events.
- Settlement monitoring readings.

02075.05 RECORD DRAWINGS

A. Maintain at the construction site a complete set of the field drawings for the recording of as-built conditions. Mark or note thereon all field information, properly dated, recording up-to-date as-built conditions.

02075.06 QUALITY ASSURANCE

A. Supervision: Each shift shall be supervised by at least one person with previous experience of the Work.

B. Operation: Utilize system operators that are experienced personnel with prior knowledge and ability in the proper operation of the systems being employed.

C. Sample: Take a sample of soil at intervals of not greater than 30 feet or when material type retrieved visibly changes. Clearly mark each sample bag with the

station position from where the sample was taken.

D. Drive start-up: Prior to the commencement of any drive, conduct a test run on the complete system with equipment set-up demonstrating that the required set-up procedures are complete, the system has been thoroughly checked, and all required materials are available. Do not commence drive until its reception shaft has been completed.

E. Operation: Operate all systems in accordance with manufacturer's instructions. Where applicable provide digital or hardcopy versions of operation manuals available to operational personnel on site at all times.

02075.07 DELIVERY, STORAGE AND HANDLING

A. Deliver, store and handle all products and materials as specified in the General Conditions.

02075.08 CRITERIA FOR DETERMINING CONSTRUCTION LOADS

A. Take into account for the criteria in determining construction loads as a minimum, construction phase earth and hydrostatic loads; construction loads including jacking forces and forces resulting in eccentric loading of a deviated pipeline; loads from handling and storage and loads from jacking operations including face loads and frictional forces along the pipeline.

B. Compatibility – Utilize MT techniques fully compatible with ground stabilization and ground water control methods. Utilize methods fully compatible with the ground conditions as found in the geotechnical information.

02075.09 JOB CONDITIONS

A. Submit an emergency/contingency plan that includes, but is not limited to, the following requirements:

1. A work plan/method statement for removal of obstructions.

2. Frictional jacking forces reaching the design capacity of the jacking pipe, jacking frame, or thrust wall.

3. Thrust block deforming excessively under jacking loads due to inadequate ground support behind the thrust block.

4. Damage to jacking pipe.

B. Safety requirements:

1. Perform work in a manner to maximize safety and avoid exposure of workers and equipment to hazardous and potentially hazardous conditions.

2. Whenever there is an emergency or stoppage of work which may potentially endanger surface facilities such as roads and utilities, water crossings, or adjacent structures, operate a full work force for 24 hours a day, including weekends and holidays, without intermission until the emergency or potentially hazardous conditions no longer jeopardize the stability and safety of the Work.

3. Perform MT operations in a manner that will minimize the movement of ground in front of and surrounding the pipeline. Minimize settlement of the surface. Prevent damage to structures and utilities above and in the vicinity of the underground operations.

4. Support the ground continuously in a manner to prevent loss of ground and keep the perimeters and face of the tunnel and the shaft bases stable.

C. Air quality:

Conduct operations by methods and with equipment that will positively control dust, fumes, vapors, gases, or other atmospheric impurities in accordance with OSHA, Federal, State, County and City requirements.

D. Ground conditions:

Review all available geotechnical and other data to enable proper design of the works by the construction technique selected to the alignments and locations shown on the Drawings and all other requirements of the Contract Documents. Where necessary, make additional investigations to ensure that to the maximum extent possible the selected techniques will satisfactorily complete the works of this Contract. Assume full responsibility to judge the geotechnical conditions and how such conditions will affect the means, methods and progress of the work.

02075.10 MATERIALS

A. Steel Casing Pipe:

1. Provide steel pipe for jacked casing pipe meeting the requirements of ASTM A 53, Grade B or ASTM A 139, Grade B.

2. Casing pipe to be of leak resistant construction capable of withstanding the jacking loads in combination with loads caused by two passing HS-20 trucks for highway crossings. Provide seamless pipe or pipe having not more than one longitudinal weld and meeting the following dimensional tolerances:

- Roundness – Maximum acceptable difference between the inside diameters at any point along a length of casing is 1/2 percent of the nominal diameter.

- Circumference – The outside circumference at any point in length of the pipe is one percent of the nominal circumference or within 1/2 inch, whichever is less.
- Straightness – The maximum allowable straightness deviation is 1/8 inch for any length of pipe.
- End of pipe – When measured with a straight edge and square along the end of the pipe, the pipe shall be within 1/16 inch per foot of diameter with a maximum deviation of 1/4 inch.

3. Design the minimum wall thickness based on the construction loads, criteria and all other applicable loads. Provide pipe with minimum wall thickness for highway crossings in accordance with the Florida Department of Transportation (FDOT). In no case provide casing with wall thickness less than is shown on the plans.

4. Provide casing pipe with outside diameter as shown on the Plans.

5. Connect adjacent pieces of steel pipe during MT operations by a machined integral press fit connection such as Permalok or equal, as long as loading and installation design criteria are met. Provide field buttwelding joints with full penetration single-vee groove, butt type welds around the entire circumference of the pipe only where such welding will not interfere with the continuous advancement of the cutter head while under roadway pavement. Press fit connections must be installed in accordance with the manufacturer's recommendations. If using machined integral press fit connections with radial bending joints, provide a layout drawing that identifies each piece of casing pipe, and mark each pipe segment with a unique ID that identifies the location of the pipe per the layout drawing.

6. Drill an adequate number of 2-inch diameter holes at not greater than 5-feet on center alternating 30-degrees with a vertical plane through the casing pipe, before installation to check for voids after the casing pipe is installed. Tap the holes for plugs. Furnish and install plugs.

B. Bentonite – Provide neat bentonite that is high quality Wyoming bentonite or equal.

C. Polymers – Provide non-toxic polymers when used as pipe lubricants or additives to the bentonite.

D. The use of slurry additives other than bentonite or polymers will require the approval of the ENGINEER.

02075.11 EQUIPMENT

A. Microtunneling (MT) Equipment

1. Provide a closed face capable of providing positive supporting pressure to the

full excavated area (face) at all times that must have the capability of controlling and measuring the pressure at the face. Achieve the balancing of earth and groundwater pressures by the use of slurry pressure, auger earth pressure balance or a combination of the two. Utilize a system capable of any adjustment required to maintain face stability for anticipated ground conditions. For equipment that uses slurry spoil transportation, control the earth and groundwater pressure at the face by the use of variable flow slurry pumps, pressure control valves and a minimum of two flow meters, one on the feed side and one on the return side.

2. Have sufficient power and ability in normal operation to cut or crush material of sizes up to one-third the internal diameter of the casing pipe and up to 20,000 psi compressive strength.

3. Have ability to control axial rotation to within +/- 3-degrees of normal operating datum.

4. Have the ability to articulate and steer to correct vertical and horizontal deviation from alignment datum by the remote activation of at least two steering jacks and a fixed link or three steering jacks.

5. Have a means to inject lubricant over the lead casing pipe.

6. Have a spoil transportation system that has the capacity for removal of spoil in balance with the excavation and advance.

7. If a slurry system is utilized, have a spoil separation system with sufficient capacity to remove solids from the flow while the system is excavating spoil, and operates in such a manner that recirculated or excess fluid can be discharged safely and with negligible remaining fines.

8. Have a guidance control system which accurately observes the boring machines vertical and horizontal displacement from a laser beam datum which has been accurately set to the required alignment and grade of the pipeline being installed.

9. Have a main jacking station at the driving shaft capable of exerting uniform load to the pipe ring and at a speed commensurate with the speed of excavation advance. Set the jacking hydraulic circuit to relieve pressure at the maximum safe working capacity of the casing pipe as established by the casing pipe manufacturer.

10. Provide intermediate jacking stations (IJS):
    - When the maximum anticipated jacking force exceeds 70 percent of the maximum allowable jacking force.
    - When the main jacks do not exceed the maximum anticipated jacking force by at least 20 percent.

- Capable of withstanding the maximum jacking force and construction load with a minimum Factor of Safety of 2.0.
- For drives over 500 feet, provide a minimum of two IJS on-site and ready for use at all times during the drive. Mount one of the two IJSs provided directly behind the machine.

02075.12 PREPARATION

A. Select means and methods for MT operations to ensure safety of the work, CONTRACTOR'S employees, ENGINEER, OWNER, the public, and adjacent property, whether public or private.

B. Maintain clean working conditions in the work zone and remove spoil, debris, equipment, and other material not required for the operation.

C. For construction below railroads, highways and utilities, perform the installation so as to prevent interference or disruption with the normal operation of these facilities.

D. Provide power generation equipment and any other equipment operating on or with fuel or lubrication oils with suitable barriers and safeguards to ensure no loss of oils to drains or watercourses or to contaminate the ground.

E. Locate shafts as required for the direction of MT shown on the Plans. Assume sole responsibility for selection of additional shaft sites for the CONTRACTOR'S convenience.

E. Make the size of the shaft such that adequate room is provided to meet operational requirements for the MT construction process, pipe installation and for backfilling

02075.13 INSTALLATION

A. Tolerances

1. Install casing pipe to within +/- 3 inches of the vertical and horizontal alignment shown on the contract Drawings.

2. Steering corrections made to the pipeline shall be carried out in such a manner that the joint to joint angle of any two adjacent pipes does not exceed 0.5 degrees.

3. If the jacked casing/support system is off design line or grade by an amount that requires redesign of the pipeline or associated structures, do so at no additional cost.

B. Obstructions

1. Define obstructions as an object or feature, larger than 30% of the outer diameter of the shield or cutter head (whichever is larger), that lies completely or partially within the cross-sectional area excavated by the machine and prevents forward movement of the microtunneling machine after all diligent efforts to break up the object and to advance past the object by the CONTRACTOR have failed.

2. If the microtunneling operations should encounter an object or condition that impedes the forward progress of the machine, the CONTRACTOR shall notify the ENGINEER immediately. The CONTRACTOR shall submit a plan to correct the condition, and remove, clear, or otherwise make it possible for the microtunneling machine and jacked pipe to advance past any and all objects or obstructions that impede forward progress of the machine. Upon written notification of the ENGINEER, the CONTRACTOR shall immediately proceed with removal of the object or obstruction by means of an obstruction removal shaft or by other approved methods, as submitted by the CONTRACTOR. The CONTRACTOR will receive compensation for removal of obstructions. Obstructions are as defined in Paragraph 02075.13 B. 2. Payment will be negotiated with the CONTRACTOR by the ENGINEER on a case-by-case basis. However, any removal process that does not allow direct inspection of the nature and position of the obstruction will not be considered for payment. The CONTRACTOR will receive no additional compensation for removing, clearing, or otherwise making it possible for the microtunneling machine to advance past objects consisting of cobbles, boulders, wood, non-reinforced concrete, and other nonmetallic objects or debris with maximum lateral dimensions less than 30% of the outer diameter of the shield or cutterhead, whichever is larger.

3. Allow ENGINEER visual access to verify object(s).

C. Alignment Establishment

1. The baseline and benchmarks are shown on the Plans. Check the baseline and benchmark at the beginning of the work and report any errors or discrepancies to the ENGINEER.

2. Use baselines and benchmarks to develop and maintain the reference control lines and grades for the installation of the casing pipe.

3. Establish and be responsible for accuracy of control for all aspects of the work at all times.

4. Establish construction control points sufficiently far from the operation not to be affected by ground movement.

D. Grouting

1. Within one week of completion of jacking operations for each drive, and with the pipe in its final position, fill under pressure any remaining annulus void around the periphery of the pipe with a cement-based grout in accordance with Section 02431 – Contact Grouting. Place grout, even when the annulus is known to contain bentonite or polymer lubricant. Inject grout through ports, around the pipe along the entire length of the alignment.

E. Installation of Carrier Pipe

1. Install water main in new casing pipe as shown on the Plans and as specified and in accordance with the manufacturer's recommendations and approved shop drawings.

2. Secure casing spacers to the carrier pipe at 6-foot intervals, or as required by the casing spacer manufacturer, inside the casing pipe. Arrange the supports to provide support for and to prevent floatation or shifting of the carrier pipe.

3. Provide casing spacers comprised of a shell of 14-gauge (minimum) Type 304 stainless steel with runners of ultra high molecular weight polymer as manufactured by Cascade Waterworks Manufacturing Company, Yorkville, IL, or equal. Line the shell with isolation material such as rubber or PVC and support the runners with Type 304 stainless steel risers. Provide the number of runners as recommended by the manufacturer. Provide calculations prepared by the manufacturer, or a Florida Licensed Professional Engineer, indicating the structural adequacy to support the specified intended loads. Fill the annular space between the casing and carrier pipe with grout in accordance with Section 02665 – Carrier Pipe Installation and Backfill.

F. Electrical Work: Comply with latest NEC, National Electrical Safety Code, ANSI, State and local Codes.

1. Use electrical power of 480 volts or less in shafts and tunnels

2. Properly ground electrical equipment

G. Lighting: Use lighting fixtures in all shafts and stairwells with fixtures, wattages, and guards meeting OSHA standards.

1. Furnish and install floodlights of an approved make for the illumination of the yards and ground adjacent to shafts meeting OSHA standards.

F. Shaft construction:

1. Install seal slab immediately following excavation to full shaft depth. Construct shaft seal slab in dewatered conditions to provide a homogeneous impermeable slab. Keep shafts dewatered until the seal slab has gained sufficient strength to counteract all forces that may act upon it. Provide drainage of the shaft bottom, including any under drains, as required by the encountered conditions. Install structural seal slab, as designed by CONTRACTOR's Professional Engineer. Design and install shaft break-outs and break-ins for temporary support of the MTBM during shaft exit and entry.

2. Grout any voids or seepage paths around shafts and adjoining tunnels immediately upon detection. Grout shaft linings sunk by the caisson method immediately following completion of sinking operations.

3. Thrust Block: Incorporate thrust blocks or suitable reactions needed for jacking equipment.

4. Surface Water Control. Divert surface water runoff from the shaft and protect the shafts from infiltration or flooding by surface water, including discharge from any dewatering operation.

5. Construct a suitable guardrail barrier around the periphery of the shaft, meeting applicable safety standards. Properly maintain the barrier throughout the period the shaft remains open. Repair broken boards, supports, and structural members. In addition, provide a full cover or other security barrier for each access shaft in which there is no construction activity or which is unattended by the CONTRACTOR's personnel.

6. Security fencing is required for all sites.

02075.14 GROUND/STRUCTURE MOVEMENT MONITORING

A. General requirements.

1. Carry out operations to minimize settlement and/or heave of the ground and nearby buildings and structures and be responsible for all damage due to settlement consolidation or heave from and construction induced activities.

2. Submit a settlement surveying and monitoring plan for review prior to construction. Identify the location of settlement monitoring points, reference benchmarks, and procedures and reporting formats.

3. Utilize surface monitoring points established at the ground surface suitably guarded and capable of withstanding HS-20 truck loading.

4. Establish benchmarks sufficiently removed from the construction to avoid errors in readings due to ground movement

5. Conduct the work in a manner such that settlements do not exceed 0.50 inches. In the event of objectionable movement (in excess of 0.5 inches) of the ground surface, structure or utility being monitored, stop, notify ENGINEER and secure the work. Before proceeding, provide corrective action plan to the ENGINEER within 24 hours and implement corrective action plan at CONTRACTOR's own expense. In the event of objectionable movement (in excess of 0.75 inches) of the ground surface, structure or utility being monitored, investigate damage that may have occurred and restore utility to original line and grade to mitigate damage, at the CONTRACTOR's own expense.

B. Surveying

1. Monitor the following minimum survey points at crossings:
   - Any Road Being Crossed by Microtunneling - Both edges of travel lanes being crossed and the center of road.
   - Any Railway Being Crossed by Microtunneling – Both edges of CSX property and if required by CSX monitoring of actual tracks.

2. Commence taking readings when the MT operation commences. Take readings daily. Continue monitoring for at least 1 week after completion of any drive section.

3. Immediately report to the ENGINEER any movement in excess of 0.10-inch, cracking, or settlement which is detected and take immediate remedial action in accordance with 02075.14 A. 5. above. Assume full responsibility for any damage caused.

END OF SECTION

SECTION 02100

DEMOLITIONS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:

1. CONTRACTOR shall provide all labor, materials, equipment and incidentals as shown, specified and required for demolitions, removal and disposal WORK.

2. Included, but not limited to, are demolition and removals of existing materials, equipment, or work necessary to install the WORK as shown and specified and to connect same with existing work in an approved manner.

3. Demolitions and removals, which may be specified under other Sections, shall conform to requirements of this Section.

4. CONTRACTOR shall pay for all disposal fees.

B. Related Sections:

1. Section 02220, Excavating, Backfilling, and Compacting.

1.2 SUBMITTALS

A. Schedule:

1. Submit proposed methods, equipment and operating sequences. Including, but not limited to, coordination for shut-off and start-up.

1.3 JOB CONDITIONS

A. Protection:

1. Perform all demolition and removal WORK to prevent damage or injury to structures, occupants thereof and adjacent features which might result from falling debris or other causes, and so as not to interfere with the use, and free and safe passage to and from adjacent structures.

2. Closing or obstructing of roadways, sidewalks, and passageways adjacent to the WORK by the placement or storage of materials will not

be permitted, and all operations shall be conducted with a minimum interference to traffic on these ways.

3. Erect and maintain barriers, lights, sidewalk sheds and other necessary protective devices.

4. Repair damage to facilities to remain, or to any property belonging to the OWNER.

B. Scheduling:

1. Carry out operations so as to avoid interference with OWNER operations and work in the existing facilities.

C. Notification:

1. At least 48 hours prior to commencement of a demolition or removal, notify ENGINEER, in writing, of proposed schedule thereof. OWNER will inspect the existing equipment and mark for identification those items, which are to remain the property of the OWNER. Do not start removals without the permission of the ENGINEER.

D. Explosives:

1. Do not bring explosives on site nor use explosives without written consent of authorities having jurisdiction. Such written consent will not relieve CONTRACTOR of total responsibility for injury or damage caused by CONTRACTOR'S blasting operations.

2. Perform all blasting, if permitted, in compliance with applicable governing regulations.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 GENERAL

A. All materials and equipment removed from existing work shall become the property of CONTRACTOR, except for those which the OWNER has identified and marked for their use. All materials and equipment marked by the OWNER to remain the property of the OWNER shall be carefully removed by CONTRACTOR so as not to be damaged, and shall be cleaned and stored on or adjacent to the Site in a protected location specified by the ENGINEER or loaded onto trucks provided by the OWNER.

B. CONTRACTOR shall dispose of all demolition materials, equipment, debris, and all other items not marked by the OWNER to remain, off the Site and in conformance with all existing applicable laws and regulations.

C. Surfaces of walls, floors, ceilings, or other areas which are exposed by any of the removals specified herein, and which will remain as architecturally finished surfaces shall be repaired and re-finished by CONTRACTOR with the same or matching materials as the existing adjacent surface or as may be otherwise approved by the ENGINEER.

D. Pollution Controls: Use water sprinkling, temporary enclosures, and other suitable methods to limit the amount of dust and dirt rising and scattering in the air to the lowest practical level. Comply with governing regulations pertaining to environmental protection.

1. Do not use water when it may create hazardous or objectionable conditions such as flooding and pollution.

2. Clean adjacent structures, facilities, and improvements of dust, dirt, and debris caused by demolition operations. Return adjacent areas to conditions existing prior to the start of the WORK.

3.2 STRUCTURAL REMOVALS

A. Remove structures to the lines and grades shown, unless otherwise directed by the ENGINEER. Where no limits are shown, the limits shall be 4-inches outside the item to be installed. The removal of masonry beyond these limits shall be at CONTRACTOR'S expense and these excess removals shall be reconstructed to the satisfaction of the ENGINEER, with no additional compensation to CONTRACTOR.

B. All concrete, brick, tile, concrete block, roofing materials, reinforcement, structural or miscellaneous metals, plaster, wire mesh and other items contained in or upon the structure shall be removed and taken from the Site, unless otherwise approved by the ENGINEER. Demolished items shall not be used in backfill adjacent to structures or in pipeline trenches.

C. After removal of parts or all of masonry walls, slabs and like work which tie into the WORK or existing work, the point of junction shall be neatly repaired so as to leave only finished edges and surface exposed.

D. The jambs, sills and heads of any windows, passageways, doors, or other openings cut into the WORK or existing work shall be dressed with masonry, concrete or metal to provide a smooth, finished appearance.

E. Where anchoring materials including bolts, nuts, hangers, welds and reinforcing steel, are required to attach the WORK to the existing work they shall be included under this Section, except where specified elsewhere.

3.3 MECHANICAL REMOVALS

A. Mechanical removals shall consist of dismantling and removing of existing piping, pumps, motors, equipment and other appurtenances as specified, shown, or required for the completion of the WORK. Mechanical removals shall include cutting, capping, and plugging as required.

B. When underground piping is to be altered or removed, the remaining piping shall be properly capped. Abandoned underground piping may be left in place, unless it interferes with the WORK or is shown or specified to be removed.

3.4 ELECTRICAL REMOVALS

A. Electrical removals shall consist of the removal of existing transformers, distribution switchboards, control panels, motors, conduits and wires, panelboards, and miscellaneous electrical equipment all as shown, specified, or required to perform the WORK.

B. All existing electrical equipment and fixtures to be removed shall be removed with such care as may be required to prevent unnecessary damage, to keep existing systems in operation and to keep the integrity of the grounding systems.

C. Motors shall be disconnected and removed where shown or specified. Motors not designated by the OWNER to be salvaged shall be removed from the Site. Motors or other electrical gear designated for reuse shall be stored in enclosed, climate controlled storage.

D. Conduits and wires shall be abandoned or removed where shown. All wires in abandoned conduits shall be removed, salvaged, and stored. The wire shall be removed back to the power source or control panel. Abandoned conduits concealed in floor or ceiling slabs, or in walls, shall be cut flush with the slab or wall at the point of entrance. The conduits shall be suitably plugged and the area repaired in a flush, smooth manner approved by the ENGINEER. Exposed conduits, junction boxes and other appurtenances and their supports shall be disassembled and removed from the Site. Repair all areas of the WORK to prevent rust spots on exposed surfaces.

E. Where shown or otherwise required, wiring in the underground duct system shall be removed. All such wiring shall be salvaged and stored as specified. CONTRACTOR shall verify the function of all wiring before disconnecting and removing it. Ducts that are not to be reused shall be plugged where they enter buildings and made watertight.

F. Where shown, direct-burial cable shall be removed. All such wiring shall be salvaged and stored, as specified. CONTRACTOR shall verify the function

of all wiring before disconnecting and removing it. All openings in buildings for entrance of direct-burial cable shall be patched and made watertight.

G. Existing panelboards, where shown, shall be removed and disposed of off the Site. Where shown or specified, they shall be replaced with panelboards at the same or adjacent locations. All cutting and patching necessary for the removal and replacement of panelboards shall be performed.

H. Other miscellaneous electrical equipment shall be removed and disposed of off the Site, as required. Care shall be taken in removing all equipment so as to minimize damage to architectural and structural members. Any damage incurred shall be repaired.

3.5 ALTERATIONS AND CLOSURES

A. Alterations shall conform to the CONTRACT DOCUMENTS and the directions and approvals of the ENGINEER.

B. Where alterations require cutting or drilling into existing floors, walls, and roofs, the holes shall be repaired in a manner acceptable to the ENGINEER. CONTRACTOR shall repair such openings with the same or matching materials as the existing floor, wall, or roof or as otherwise approved by the ENGINEER. All repairs shall be smoothly finished, unless otherwise approved by the ENGINEER.

C. Openings in existing concrete slabs, ceilings, masonry walls, floors and partitions shall be closed and sealed as shown or otherwise directed by the ENGINEER. The WORK shall be keyed into the existing work in a manner acceptable to the ENGINEER. Reinforcing steel shall be welded to the existing reinforcing. Welding shall conform to AWS D12.1, Reinforcing Steel Welding Code. In general, use the same or matching materials as the existing adjacent surface. The finished closure shall be a smooth, tight, sealed, permanent closure acceptable to the ENGINEER.

3.6 CLEAN-UP

A. CONTRACTOR shall remove from the Site all debris resulting from the demolition operations as it accumulates. Upon completion of the WORK, all materials, equipment, waste, and debris of every sort shall be removed and premises shall be left, clean, neat and orderly.

END OF SECTION

SECTION 02220

EXCAVATING, BACKFILLING, AND COMPACTING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope of Work: The CONTRACTOR shall perform all excavating, grading and backfilling as required for construction as shown on the DRAWINGS, latest FDOT guidelines and specified herein. The CONTRACTOR shall furnish all additional, approved fill material required in accordance with the SPECIFICATIONS.

B. Definitions:

1. Maximum Dry Density: Maximum dry weight in pounds per cubic foot of a specific material.
2. Optimum Moisture: Percentage of water in a specific material at maximum dry density.
3. Rock Excavation: Excavation of any hard natural substance which requires the use of special impact tools such as jack hammers, sledges, chisels or similar devices specifically designed for use in cutting or breaking rock, but exclusive of trench excavating machinery.
4. Suitable Materials: Suitable materials for fills shall be a non-cohesive, non-plastic granular local sand and shall be free from vegetation, organic material, marl, clay, silt, muck and deleterious debris. Hydric soils within wetland impact areas will be considered suitable material for the top 12-inches of backfill within the wetland impact areas.
5. Unsuitable Materials: Unsuitable materials are highly organic soil (peat or muck) classified as A-8 in accordance with AASHTO Designation M 145; clayey sands (Unified Soil Classification SC); plastic clays (United Soil Classification CL/CH); and organic debris. (This provision does not apply to the replacement of hydric soils in wetland impact areas.)

C. Plan For Earthwork: The CONTRACTOR shall be responsible for having determined the conformation of the ground, the character and quality of the substrata, the types and quantities of materials to be encountered, the nature of the groundwater conditions, the prosecution of the WORK, the general and local conditions and all other matters which can in any way affect the WORK. The CONTRACTOR shall consider, and the plan for earthwork shall reflect, the equipment and methods to be employed in the excavation, backfilling and compaction operations. No claims for extras based on soil or rock sub-strata or groundwater table conditions shall be allowed.

D. Trench Safety Act: The CONTRACTOR shall be responsible for complying with the Trench Safety Act (90-96, Florida Law) and OSHA Safety Standards for trench excavations, at a minimum.

1.2 QUALITY ASSURANCE

A. A Testing Laboratory shall be employed by the CONTRACTOR. The CONTRACTOR shall schedule the WORK so as to permit a reasonable time for testing before placing succeeding lifts and shall keep the laboratory informed of the progress. Costs for soil testing and re- testing shall be paid by the CONTRACTOR.

1.3 PROTECTION

A. Trench Cut Slopes: Trench cuts shall be sloped to guard against sidewall sloughing or collapse.

B. Pumping and Drainage:

1. The CONTRACTOR shall at all times during construction provide and maintain proper equipment and facilities to remove all water entering excavations.

PART 2 - PRODUCTS

2.01 MATERIALS

A. General:

1. All fill material shall be subject to the approval of the ENGINEER.
2. All fill material shall be free of organic material, trash, deleterious debris, roots, clay balls, rubble or other objectionable material (except for hydric soils as detailed here-in).
3. Excess or unsuitable material shall be removed from the job site by the CONTRACTOR at no additional cost to the OWNER.

B. Common Fill: Common fill shall be sand and shall not contain stones, rock, concrete or other rubble larger than one-half (½) inch in diameter. It shall have physical properties which allow it to be easily spread and compacted. Additionally, common fill shall have no more than 12 percent by weight finer than the U.S. No. 200 mesh sieve.

C. Select Fill: Select fill shall be as specified above for common fill, except that the material shall contain no stones larger than ¼ inch in largest dimension, and shall be no more than 12 percent by weight finer than the U.S. No. 200 mesh sieve.

D. Crushed Stone: Crushed stone shall be FDOT #57 washed and graded stone.

PART 3 - EXECUTION

3.01 EXCAVATION

A. Excavating for Roadways/Structures/Utilities:

1. Excavation shall be made to such dimensions as shall give suitable room for maintenance of traffic, building the foundations and the structures, for bracing and supporting, for pumping and draining, and for all other work required.

a. Pipeline: Excavation shall be to the design elevation as shown on the DRAWINGS unless unsuitable subgrade materials are encountered at the bottom of the pipeline excavation, in which case these unsuitable materials shall be undercut and removed a minimum of 24-inches below the bottom of the pipeline and shall be replaced with compacted approved select fill or crushed stone before placing the pipe. All organic laden sands or debris beneath the pipe bottom level shall be completely removed from beneath the pipe and replaced with compacted approved select fill or crushed stone.

b. Excavation for precast or prefabricated structures other than pipeline shall be carried to an elevation 2 feet lower than the proposed outside bottom of the structure to provide space for the bedding material. Prior to placing the bedding material, the excavation shall be sounded, if not dewatered, using a rigid pole to indicate to the satisfaction of the ENGINEER that the excavation has been carried to the proper depth and is reasonably uniform over the area to be occupied by the structure.

c. Excavation for structures constructed or cast in place in dewatered excavations shall be carried down to the bottom of the structure where dewatering methods are such that a dry excavation bottom is exposed and the naturally occurring material at this elevation is leveled and left ready to receive the WORK. Material disturbed below the foundation elevation in dewatered excavations shall be replaced with Class B concrete.

d. Footings: Cast-in-place concrete footing sides shall be formed immediately after excavation. Forming for footing sides is specified elsewhere.

2. The CONTRACTOR shall immediately document the location, elevation, size, material type and function of all new subsurface installations, and utilities encountered during the course of the WORK.

3. Excavation equipment operators and other concerned parties shall be familiar with subsurface obstructions as shown on the DRAWINGS and shall anticipate the encounter of unknown obstructions during the course of the WORK.

4. Encounters with subsurface obstructions shall be hand excavated and immediately brought to the attention of the ENGINEER.

5. Excavation and dewatering shall be accomplished by methods which preserve the undisturbed state of subgrade soils. Subgrade soils which become soft, loose, "quick" or otherwise unsatisfactory for support of pipes or structures as a result of inadequate dewatering or other construction methods, shall be removed and replaced with crushed stone as required by the ENGINEER at the CONTRACTOR'S expense.

6. All pavements shall be cut prior to removal, with saws or power tools approved by the ENGINEER.

7. Excavated material shall be stockpiled in such a manner as to prevent nuisance conditions. Surface drainage shall not be hindered.

8. All locations and elevations as required herein shall be permanently documented by the CONTRACTOR, on the AS-BUILT DRAWINGS.

9. Hydric soils within designated wetland impact areas shall be segregated and stockpiled separately during excavation. Excavation and stockpiling of hydric soils shall be in accordance with all appropriate permits.

3.3 UNDERCUT

A. If the bottom of any excavation is below that shown on the DRAWINGS or specified because of CONTRACTOR error, convenience, or unsuitable natural bedding material or subgrade due the CONTRACTOR'S excavation or dewatering methods, the excavation shall be refilled to the specified bottom of excavation grade with compacted approved select fill or crushed stone at no cost to the OWNER. Compaction method shall be as approved by the ENGINEER.

3.4 FILL AND COMPACTION

A. The CONTRACTOR shall compact and backfill excavations and construct embankment according to the following schedule. (Proctor Requirement shall be ASTM D-1557, modified Proctor):

Area	Material	Compaction
1. Pipe Bedding	Common Fill or Crushed Stone	95% of maximum dry density by modified Proctor method (in 12" loose lifts if additional bedding material is required).
2. Pipe Trench Backfill	Common Fill	12" loose lifts, 95% of maximum dry density by modified Proctor method

			(98% under roadways and drives). Note: Above the top of the pipe only, backfill material with a maximum fines content of 20% may be used.
3.	Bedding Beneath Structures(other than pipeline) and Beneath Buried Valves	Common Fill or Crushed Stone	12" loose lifts, compacted to 98 % of maximum dry density by modified Proctor method. Fill shall not be placed over any in-place soils until those deposits have been compacted to 98% modified Proctor.
4.	Backfill Around Structures	Common Fill	8" loose lifts, 98% of (other than pipeline) maximum dry density by modified Proctor method.

B. Excavations shall be backfilled to the original grade or as indicated on the DRAWINGS. Deviation from this grade because of settling shall be corrected. Backfill operation shall be performed to comply with all LAWS AND REGULATIONS and in such a manner that it does not create a nuisance or safety hazard. Care shall be used in operating compaction equipment to avoid damage to pipe or structures. Pipe bedding and trench backfill shall be firmly tamped under the pipe haunches along both sides of the pipe at the same time, taking care not to lift up the pipe off its bed. Backfilling shall continue by bringing the fill up equally on each side of the pipe to avoid displacing the pipe laterally.

C. After the pipe bedding has been compacted to the required density, tested and accepted by the ENGINEER; and prior to pipe placement, the pipe bedding materials shall be scarified or loosened (by a method and to a depth approved by the ENGINEER) to a depth of 6-9 inches for the entire width and length of the pipe to allow the pipe to be saddled by the loosened bedding. After the loosening method has been approved by the ENGINEER during initial pipe placement, the CONTRACTOR shall proceed with this approved procedure for the entire length of the pipeline, unless otherwise determined unacceptable by the ENGINEER.

D. Embankments shall be constructed true to lines, grades and cross sections shown on the DRAWINGS or ordered by the ENGINEER. Embankments shall be placed in successive layers of not more than 8 inches in thickness, loose measure, for the full width of the embankment. As far as practicable, traffic over the WORK during the construction phase shall be distributed so as to cover the maximum surface area of each layer.

E. If the CONTRACTOR requests approval to backfill utilizing lifts and/or methods other than those specified herein, such request shall be in writing to the ENGINEER. Approval will be considered only after the CONTRACTOR has performed tests, at the CONTRACTOR'S expense, to identify the material used and density achieved throughout the backfill area utilizing the method of backfill requested. The ENGINEER'S approval shall be in writing.

F. Hydric soils stockpiled during excavation shall be replaced within the top 12-inches of wetland impact areas and in accordance with all applicable permits.

3.5 DISPOSAL

A. The CONTRACTOR shall properly dispose of all excess or unsuitable material at no additional expense to the OWNER.

END OF SECTION

SECTION 02270

EROSION AND SEDIMENTATION CONTROL

PART 1 - GENERAL

1.1 DESCRIPTION

A. The CONTRACTOR shall furnish all necessary labor, equipment, material and transportation necessary to provide temporary and permanent erosion and sediment control, stormwater pollution prevention and associated inspection, maintenance and reporting, all as required by appropriate government agency permits, the DRAWINGS and this SPECIFICATION.

1.2 SUBMITTALS

A. The CONTRACTOR shall submit a site-specific erosion control plan at least fifteen (15) DAYS prior to commencing the WORK for review by the ENGINEER.

B. Prior to commencing the WORK, the CONTRACTOR shall provide a detailed PROGRESS SCHEDULE to indicate dates of major grading activities and determine sequencing of soil disturbing activities on all portions of the site.

PART 2 - PRODUCTS

2.01 STABILIZATION CONTROLS

A. Stabilization shall consist of seeding and mulch, in accordance with the appropriate sections of the SPECIFICATIONS.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The CONTRACTOR shall install temporary erosion and sediment control items in the area where construction activities are to commence prior to WORK in said area.

B. No disturbed area shall be denuded for more than thirty (30) calendar days unless otherwise authorized by the ENGINEER or OWNER. During construction, denuded areas shall be covered by mulches such as straw, hay, filter fabric, seed and mulch, sod, or other permanent vegetation.

C. The CONTRACTOR shall install temporary or permanent stabilization as soon as possible for areas of the site where construction activities have ceased, but in no case shall the time be greater than fourteen (14) calendar days after the construction activity has temporarily or permanently ceased.

D. Off-site runoff shall be diverted away or through the construction area.

E. Stabilized Construction Entrance: The CONTRACTOR shall provide a stabilized construction entrance for vehicles entering or exiting onto public roads. Stabilized construction entrances shall be provided for both on site and off site locations of stockpiled material. The CONTRACTOR shall be responsible for monitoring the system and modifying the system or procedures as needed, with the written approval of the OWNER.

F. Dewatering: Installation of the pipeline may require temporary dewatering prior to construction. The CONTRACTOR shall be responsible for discharging the dewatering flow to a temporary settling basin such as areas created by staked hay bales in dry grassed swales or other similar settling areas, however at no time shall the CONTRACTOR discharge dewatering flow directly to wetland areas.

G. Protection and Stabilization of Soil Stockpiles: Fill material stockpiles shall be protected at all times by on-site drainage controls which prevent erosion of the stockpiled material. Control of dust from such stockpiles shall be required.

H. Sediment Trapping Measures: Sediment basins and traps, perimeter berms, filter fences, berms, sediment barriers (hay bales), vegetative buffers and other measures intended to trap sediment and/or prevent the transportation of sediment onto adjacent properties, or into existing water bodies; shall be installed prior to commencement of construction.

3.2 MAINTENANCE AND REPAIRS OF CONTROLS

A. The CONTRACTOR shall be responsible for maintenance and repairs of erosion and sediment control devices, and removal of erosion and sediment control devices after SUBSTANTIAL COMPLETION of the WORK.

B. Maintenance and repair of the controls for abatement of erosion and water pollution shall be included in the CONTRACT PRICE.

C. All control measures shall be maintained daily by the CONTRACTOR. All measures shall be maintained in good working order. If a repair is necessary, it shall be initiated within 24 hours.

D. Built-up sediment shall be removed from silt fences and staked turbidity barriers should it reach one-third the height of the fence.

E. Temporary and permanent seeding and planting shall be inspected for bare spots, washouts, and healthy growth.

F. Stabilized construction entrances shall be maintained to prevent clogging of rock bedding which may impede the usefulness of the structure.

3.3 OTHER CONTROLS

A. Waste Disposal: The CONTRACTOR shall provide litter control and collection during construction activities. Litter and waste shall be cleaned daily from the construction area. All fertilizer, hydrocarbon, or other chemical containers shall be disposed of by the CONTRACTOR according to EPA's standard practices as detailed by the manufacturer. No solid materials including building and construction materials shall be discharged to wetlands or buried on-site.

B. Off-Site Vehicle Tracking: The CONTRACTOR shall control off-site vehicle tracking by covering loaded haul trucks with tarpaulins, removing excess dirt on roads daily and maintaining the stabilized construction accesses.

C. Sanitary Waste: The CONTRACTOR shall be responsible for all sanitary waste to be collected from portable units by a licensed sanitary waste management contractor as required by LAWS AND REGULATIONS.

3.4 INSPECTION

A. All erosion and water pollution abatement and control measures shall be inspected daily by the CONTRACTOR and make any necessary maintenance or repairs.

B. The cost of the CONTRACTOR'S inspections and reporting required for the control and abatement of erosion and water pollution shall be included in the proposed CONTRACT PRICE.

3.5 TRACKING AND REPORTING

A. The CONTRACTOR shall submit with the PROGRESS REPORT a report to the OWNER and the ENGINEER documenting the daily inspections, maintenance or repairs to the erosion and sediment control devices.

END OF SECTION

SECTION 02410

SHAFT EXCAVATION AND SUPPORT

PART 1 - GENERAL

1.01 SCOPE OF WORK

A. The CONTRACTOR shall design, furnish, install, and maintain a system of temporary supports, including all bracing and associated items, to retain excavations in a safe manner, to control ground movements and to control groundwater inflows. Upon completion of the required excavation and pipe installation, the CONTRACTOR shall remove the support system and backfill the excavations, as specified. Certain types of shoring may be cut off below grade and left in place below a specified depth. This section covers requirements for all shafts to be constructed under this Contract.

B. The CONTRACTOR shall have sole responsibility for sizing the shaft excavations to accommodate shoring, bracing, pipe and pipe installation to the specified lines, grades and tolerances to meet the CONTRACTOR's means and methods. The shafts shall also be sized to facilitate construction of connections, valves, vaults, manholes, and other permanent structures shown on the Plans.

C. The work shall include site grading; temporary access road construction; fencing and signage; construction staging areas; design and construction of shaft excavations and excavation support systems; material disposal; control and disposal of infiltrating groundwater, surface water, and construction water; backfilling and abandoning shafts; and site restoration.

D. Groundwater is anticipated above the elevation of the shaft floor, acceptable shaft types include drilled secant piles, drilled shafts, slurry panel walls, cutter soil mixing walls, sunken caissons, and interlocking sheet piles. The following shaft construction methods shall not be allowed: soldier piles and lagging, trench boxes, speed shores, or sloped open excavations in soil.

1.02 RELATED SECTIONS

A. SECTION 02075, MICROTUNNELING

B. SECTION 02665, CARRIER PIPE INSTALLATION AND BACKFILL

C. SECTION 02431, CONTACT AND VOID REPAIR GROUTING

1.03 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. ANSI/AWS D1.1 - Structural Welding Code.

B. ASCE/CI 36-15 – Standard Design and Construction Guidelines for Microtunneling

C. ASTM A 36 - Standard Specification for Carbon Structural Steel.

D. ASTM A 328 - Standard Specification for Steel Sheet Piling.

E. Florida Department of Transportation Standard Specifications for Road and Bridge Construction

1.04 SUBMITTALS

A. Submittals shall be made in accordance with Section 01300, SUBMITTALS AND SUBSTITUTIONS.

B. CONTRACTOR Qualifications and Experience: The CONTRACTOR performing the work specified herein shall have successfully completed at least three (3) shafts using the proposed shaft construction methods of similar size, depth, and complexity, and in similar ground conditions, within the past five (5) years.

C. The following submittals are required at least 30 days prior to the start of shaft excavation:

1. Shaft construction is a specialized type of construction. The CONTRACTOR shall provide proof of successful experience with shaft construction at the depths required, in the ground and groundwater conditions expected, with the shaft wall support/lining systems proposed, and with the equipment to be used.
2. The CONTRACTOR shall provide proof that the assigned shaft construction superintendent shall have had at least five (5) years of shaft and excavation construction experience and shall have worked on at least two (2) similar projects within the past five (5) years using similar types of equipment required for this WORK and in similar ground and groundwater conditions.
3. Name and qualifications of Civil Engineer, registered in the State of Florida, responsible for the design of the excavation support system. The Civil Engineer responsible for the design shall have a minimum of 15 years of experience in the design of similar structures for support of excavation of shafts and for launching and receiving a microtunnel machine as appropriate for the shaft. All designs and shop drawings shall be signed and sealed by the approved design engineer meeting these qualifications.

D. The following submittals and shop drawing information shall be submitted, complete, for each shaft or support system, at least 30 days prior to the start of shaft excavation:

1. Proposed schedules and methods of construction, equipment, facilities, method for removal of spoil from shaft excavation, and any other pertinent details.
2. For each shaft excavation, provide scaled drawings (plan and section views with dimensions and sizes) showing the proposed shaft support elements including connection details and installation sequence in relation to the excavation; groundwater control provisions; adjacent and nearby existing structures and utilities; details of all pipe penetrations; work areas for all shaft construction operations such as sheet pile storage, drilling fluid tanks, and/or caisson form storage at each site.
3. Details of procedures for preloading bracing members.
4. Methods and sequencing of excavation and installation of staged excavation support including a schedule with major milestones for shaft excavation and support such as driving of sheets, drilling secant piles, installation of reinforcement and placement of structural concrete in the caisson or secant pile, pouring of concrete working slab or plug in the base of the shaft, grouting, and dewatering of the shaft interior, etc.
5. Layout of the jacking thrust block and its reaction transfer connection details the shaft temporary support and base slab.
6. Methods and sequencing of launch/retrieval of the microtunnel boring machine through the shaft wall. Describe in detail the steps that will be taken to ensure the ground is stable and groundwater is controlled prior to boring through/removal of the shaft wall. The CONTRACTOR shall submit ground improvement methods and details of construction that will be used if necessary to stabilize soil encountered at the launch/retrieval locations to prevent inflow of ground and groundwater into the shaft.
7. An entry/ exit seal is required at each entry/ exit location. The CONTRACTOR shall also include details and drawings of the tunnel entry and exit seals that will be implemented at the launch and retrieval shafts for preventing loss of ground and groundwater inflow into the shafts.
8. Procedures for checking and maintaining plumbness of the shaft and ensuring proper elevation is reached.
9. Concrete mix information and placement procedures for the tremie plug and/or working slab. See SECTION 03300, CAST-IN-PLACE CONCRETE.
10. Contingency Plan for anticipated difficulties and proposed resolutions, including unfavorable performance of the selected construction method, excessive movement of shaft elements, tilting, flooding, settlement, and bottom heave.
11. Work Plan for backfilling of voids as required to minimize ground movement and protect adjacent property.
12. Describe procedure for control of groundwater inflows, method of maintaining bottom stability, and protection of subgrade.
13. Details for handrails and protective barriers, fences, and covers at each shaft location.
14. Method for establishing survey control and transferring line and grade to shaft entry and exit locations.

15. Plans and procedures for backfilling and removal of shaft wall components upon completion of all relevant work in the launch and retrieval shafts.
16. Procedures for disposal of excavated materials at an approved disposal site.

E. Design assumptions and calculations for each shaft or support system prepared, at least 30 days prior to starting shaft excavation, and sealed and signed by a Civil Engineer registered in the State of Florida including:

1. Calculations for the shaft support elements and all bracing, indicating it can withstand all earth and groundwater pressures, thrust forces, equipment, applicable traffic, and construction loads and other surcharge loads in accordance with the site conditions, and any other requirements described in the Contract Documents. The design shall include all elements of the support of the shaft excavations including maximum depths of excavation prior to installation of support as well as the design calculations of the thrust reaction block and the capacity of shaft wall to resist the reaction thrust if the thrust is transferred to the shaft wall.

2. Calculations for the structural design of the tremie plug and/or working slab, and uplift resistance of the shaft. Confirm that tremie plug and/or working slab weight, structural connection to shaft walls, weight of casing, determination of shaft wall embedment depth below bottom of excavation and any frictional resistance assumed along sidewalls of the shaft are adequate to resist uplift and that assumptions are reasonable and appropriate. Confirm that an adequate factor of safety against uplift of at least 1.5 is achieved under the most extreme loading conditions.

3. Estimated ground settlement and lateral deflection of each wall face and groundwater drawdown.

4. Calculations for shaft covers outside of the roadways.

F. Additional Considerations for Steel Sheet Pile Shafts for submittal at least 30 days prior to shaft excavation:

1. Describe construction sequence to be used to construct the sheet pile shafts.
2. Describe procedure for installing and sealing corners.
3. Describe procedure for installing concrete tremie plug and/or working slab to the required thickness and at the correct elevation.
4. Describe procedure for maintaining internal water head to balance external groundwater head where required based on anticipated ground and groundwater conditions and planned ground support system.
5. Describe procedures for providing control of groundwater inflows and soil inflows at launch/retrieval locations.

G. Additional Considerations for Concrete Caisson Shafts for submittal at least 30 days prior to shaft excavation:

1. Describe construction sequence and procedures to be used to construct the concrete caisson shafts including excavation, installation of steel reinforcement and placement of structural concrete. Steel reinforcement will not be permitted within the tunnel eye. If reinforcement is used at tunnel eyes it shall be Glass reinforced plastic (GRP) reinforcement.
2. Provide details for cutting shoe design on the leading caisson ring.
3. Describe procedure for installing and verifying elevation and thicknesses of tremie plug and working slab.
4. Describe procedures for providing control of groundwater and soil at launch/retrieval locations.
5. Concrete mix design whether using precast concrete segments or cast-in-place concrete segments.
6. Describe method of monitoring deviation of rings and proposed corrective measures to be implemented if necessary.

H. Additional Considerations for Drilled Shafts for submittal at least 30 days prior to shaft excavation:

1. Describe equipment to be used including cranes, drills, augers, bailing buckets, final cleaning equipment, desanding equipment, slurry pumps, core sampling equipment, triemies or concrete pumps, and shaft casing. Steel reinforcement will not be permitted within the tunnel eye. If reinforcement is used at tunnel eyes it shall be Glass reinforced plastic (GRP) reinforcement.
2. Details of overall construction operation sequence and the sequence of shaft construction in bents or groups.
3. When the use of slurry is anticipated, details of the mix design and its suitability for the subsurface conditions at the construction site, mixing and storage methods, maintenance methods, and disposal procedures.
4. Details of methods to clean the shaft excavation.
5. Details of reinforcement placement, including support and centralization methods.
6. Details of concrete placement, including proposed operational procedures for free fall, tremie or pumping methods.
7. Details of casing installation and removal methods.
8. Describe procedure for installing and verifying elevation and thicknesses of tremie plug and working slab.
9. Describe procedures for providing control of groundwater and soil at launch/retrieval locations.
10. Describe method of monitoring deviation of shaft from plumb and proposed corrective measures to be implemented if necessary.

I. Additional Considerations for Drilled Secant Pile Shafts for submittal at least 30 days prior to shaft excavation:

1. Description construction sequence and procedures to be used to construct the drilled secant pile shafts including excavation, installation of steel reinforcement and placement of structural concrete. Steel reinforcement shall not be permitted within the tunnel eye. If reinforcement is used at tunnel eyes it shall be Glass reinforced plastic (GRP) reinforcement.
2. Describe procedure for installing and backfilling the shafts, including sequence of operations and grout mixture.
3. Describe procedure for installing tremie plug and working slab to required thickness and at correct elevation.
4. Describe the procedure used to tie the shaft to the temporary support system for the adjacent riser sections of pipe, if utilized.
5. Describe procedures for providing control of groundwater and soil at launch/retrieval locations.

J. Construction Records: The CONTRACTOR shall submit the following to the ENGINEER at the times indicated.

1. Written daily progress reports shall be submitted during shaft construction. The progress reports shall have field logs recorded at intervals of five feet or less during excavation and shall be submitted to the ENGINEER within one working day of the shift for which the excavation occurred. As a minimum, the logs shall include:

    a. The date, starting time, and finish time.
    b. Equipment used and personnel on site.
    c. Actual quantities and descriptions of excavated material including soil/ rock types and presence of groundwater if encountered.
    d. Any unusual conditions, breakdowns, and delays, including problems with support, bottom instability and obstructions.
    e. Detailed description of the support installed, including sizes, lengths, spacing, and elevations relative to excavation elevation.
    f. Pumping rates from shafts and inflow conditions for all shafts or flooding levels for shafts excavated "in the wet."
    g. Deformation monitoring results, and record of action taken by the designer of record and the CONTRACTOR if deflections are excessive.

2. Results of all material and field tests shall be submitted at the end of each shift, and results of lab tests within one week of sampling.

K. Post-Construction: Within 15 days of backfill of excavations, the CONTRACTOR shall submit a detailed as-built location plan of all remaining buried shoring members including size, location, and cutoff elevation.

L. Reports and Records: The following shall be submitted daily:

1. Excavation monitoring data of horizontal and vertical deflections of shaft supports.
2. Settlement and deformation monitoring data associated with each shaft.

1.05 QUALITY CONTROL, TESTS, AND INSPECTIONS

A. The CONTRACTOR's design engineer shall provide quality control, testing, and inspection of their designs and in accordance with accepted submittals. The CONTRACTOR's design engineer shall visit the site to observe the shaft construction work in progress on at least a weekly basis or more frequently, if required by the ENGINEER, and provide an assessment of their inspection on the installation of the design engineer's approved drawings.

B. The CONTRACTOR shall coordinate with the ENGINEER regarding additional quality assurance testing to be provided at the OWNER's discretion. The CONTRACTOR shall permit free access during construction of shoring systems for the OWNER's testing staff and the ENGINEER. The CONTRACTOR shall allow access to the ENGINEER and shall furnish necessary assistance and cooperation to aid the ENGINEER in observations and data and sample collection at all times and at no additional cost to the OWNER.

C. All work shall be performed in the presence of the ENGINEER, unless the ENGINEER has granted prior approval in writing to perform such work in his absence.

D. The CONTRACTOR shall notify the ENGINEER, in writing, within 24 hours when any problems are encountered with equipment or materials, or if the CONTRACTOR believes the conditions encountered are materially and significantly different than those represented within the Contract Documents.

1.06 DESIGN CRITERIA

A. The type and design of shaft construction methods that meet the specification requirements herein are the CONTRACTOR's responsibility and shall be of a size large enough to facilitate all the necessary groundwater control, construction operations, pipeline equipment and operations, pipe jacking and tunneling or other trenchless operations, and to accommodate indicated connections to other reaches of the project. Shaft design is subject to review and approval by the ENGINEER. Allowable shaft construction options include:

1. Drilled Secant Pile Shafts
2. Drilled Shafts
3. Slurry Panel Wall Shafts
4. Cutter Soil Mixing Wall Shafts
5. Sunken Caisson
6. Sheet Piles

B. In all areas, excavation support systems shall be designed by the CONTRACTOR's design engineer to support earth pressure, unrelieved hydrostatic pressures, bottom heave, overall buoyancy, utility loads, equipment, applicable traffic loads, maximum safe jacking loads, and other surcharge loads in such manner as will allow safe construction and will prevent damage to adjacent structures (including existing highways, pipelines and utilities) and injury to workers and the public.

C. Shaft excavation support systems shall be designed to be compatible with the geologic conditions described in the geotechnical borings, including any adjacent slope support structures. Design support systems using pressures no lower than those shown on the lateral earth pressure diagrams presented in the design drawings, and a minimum factor of safety of 2.0 for lateral loads.

D. The support system shall be designed to protect adjacent utilities from damage and to limit movements to less than damaging values for deformation and groundwater variations.

E. Materials:

1. Structural Steel: ASTM A36 or better, unless approved otherwise.
2. Steel Sheet Piles: ASTM A328.
3. Concrete for cast-in-place secant piles shall be in accordance with the requirements for concrete as stated in Section 3300 CAST-IN-PLACE CONCRETE.
4. Concrete for precast caisson segments shall be in accordance with the requirements for concrete as stated in Section 3400 PRECAST CONCRETE.

F. The invert slab at each jacking or receiving shaft excavation where groundwater is above the invert of the shaft shall be designed to protect the excavation invert in accordance with these minimum design criteria:

1. Have a finished concrete tremie plug and working slab to seal the shaft from groundwater inflows and to resist uplift of the completed shaft. The tremie plug and working slab reinforcing shall be designed to structurally tie the slab to the shaft walls to take advantage of the shaft dead weight and sidewall friction in resisting uplift due to buoyancy. The minimum 28-day compressive strength of the concrete shall be 4,000 psi.
2. Be capable of resisting maximum hydrostatic uplift with an adequate safety factor, or equipped with a groundwater/pressure relief system to assure an adequate safety factor for reduced hydrostatic uplift pressures.
3. Be capable of supporting such combined dead and live loads as are required by the CONTRACTOR's means and methods.

G. Provide positive groundwater control for these shafts. Contractor is responsible for dewatering activities, monitoring and permit compliance. Contractor shall have a copy of the dewatering plan onsite.

H. Shaft support systems shall be constructed within 1% of vertical plumbness, i.e., within 1 foot in 100 feet.

I. The strength of the grout mixture used to fill the annulus between the sheet piles, or other support and the excavation shall be selected to allow the tunneling machine to excavate or advance through the grouted annulus during both launch and retrieval.

J. Interlocking Sheet Pile Shafts: Additional design criteria specific to sheet pile shafts are:

1. All corners shall be made watertight. Interlocks shall be fully engaged, or sealed by welding to prevent inflows.
2. Stability of entry and exit opening shall be confirmed by making incremental openings prior to full-size opening being cut in sheets.
3. Constructed sheet pile walls shall be designed to accommodate the maximum planned jacking forces exerted by the thrust block to the sheet pile wall without causing excessive deflection or separation of sheet piles during loading.
4. Sheet piles shall be driven or vibrated into place. Sheet piles shall be Pre-drilled as necessary to be installed.

K. Concrete Caisson Shafts: Additional design criteria specific to sheet pile shafts are:

1. A cutting shoe shall be utilized on the bottom ring of the concrete caisson to aid in sinking the ring after soil excavation.
2. If precast concrete segments are to be used for ring building, rubber gaskets shall be used between each segment and between each ring to control the inflow of groundwater.
3. Install caisson to the shaft tip elevations shown on the drawings.
4. Constructed concrete caisson walls shall be designed to accommodate the maximum planned jacking forces exerted by the thrust block to the caisson wall without causing excessive deflection or failure of caisson during loading.

L. Drilled Secant Pile Shafts: Additional design criteria specific to sheet pile shafts are:

1. The polymer or bentonite used to support the excavation shall have adequate viscosity, gel strength, and density to safely support earth and groundwater loads described in the Geotechnical Report.

2. The secant pile system shall be designed to resist lateral earth pressures and maximum groundwater pressures shown on the drawings.
3. The excavation shall be safely supported at all times during and after construction using polymer or bentonite, or any other approved means necessary.
4. Polymer or bentonite shall be disposed off site by CONTRACTOR, at CONTRACTOR's expense at an approved disposal facility.

M. Drilled Shafts: Additional design criteria specific to sheet pile shafts are:

1. The polymer or bentonite used to support the excavation shall have adequate viscosity, gel strength, and density to safely support earth and groundwater loads described in the Geotechnical Report.
2. The casing to be installed shall be designed to resist lateral earth pressures and maximum groundwater pressures shown on the drawings.
3. The excavation shall be safely supported at all times during and after construction using polymer or bentonite, or any other approved means necessary.
4. Polymer or bentonite shall be disposed off site by CONTRACTOR, at CONTRACTOR's expense at an approved disposal facility.

1.07 WARRANTY

A. The CONTRACTOR shall be solely responsible for, and bear the sole burden of cost for any and all damages resulting from improper shaft support.

B. The safety of workers, the protection of adjacent structures, property and utilities, and the installation of adequate supports for all excavations shall be the sole responsibility of the CONTRACTOR.

PART 2 – PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.01 GENERAL

A. Shaft excavations and site development shall commence only after approval of applicable submittals by the ENGINEER. Install excavation support systems in accordance with approved submittals.

B. Before beginning excavation, instrumentation shall be completely installed, adequately protect existing structures, utilities, trees, shrubs, and other existing facilities. The CONTRACTOR shall repair damage to existing facilities at no cost to the OWNER.

C. Excavation shall be performed in accordance with the requirements of SECTION 2220, Excavating, Backfilling, and Compacting and in sequence

with installation of shaft excavation and support in a manner that limits settlement of surrounding ground and adjacent utilities, vaults, structures, or roads and to offer no hazard to building movement or occupancy, train, truck, or automobile operations.

D. The CONTRACTOR shall notify the ENGINEER not less than 15 days before beginning any shaft excavation.

E. The CONTRACTOR shall conduct all excavation, shoring, shaft support, temporary facilities, materials storage, and construction traffic within construction easements established for this project. All work shall be in accordance with applicable permits.

F. All welding shall conform to the applicable provisions of ANSI/AWS D1.1.

G. Shaft staging areas shall be completely fenced in to prevent unauthorized access at all times.

H. Any correction of shaft deviation, and any construction and associated costs resulting from relocation of appurtenances inside the shaft, including pipe connections and the launch and retrieval seals, caused by the shaft's deviation from plumb or other deficiencies in workmanship shall be accomplished at the CONTRACTOR's expense and shall not be cause for schedule extension.

I. All excavated spoils, polymers, drilling fluids, or other materials used during shaft construction shall be completely contained when stockpiled on site.

J. Pumping from shaft sumps shall not result in boils, softening of the ground, or loss of fines. Sumps shall use suitable filters or screens so that fines are not removed from the formation.

K. Tunneling shall not begin until the CONTRACTOR has pre-grouted the soils at all entry and exit locations for the planned drive and behind thrust blocks or elements where necessary and as directed by the ENGINEER to stabilize weak, running or flowing soils, in accordance with this section and accepted submittals. The CONTRACTOR has confirmed that the ground has been improved to the extent that ground will remain stable without movement of soil or water while the entry/exit location shoring is removed for break-in and break-out and while the TBM or shield is being launched or received into a shaft or during jacking operations. The progressive steps identified below shall be used to confirm suitable ground improvements for all shaft types and entry/exit locations:
    1. After the CONTRACTOR believes that they have improved the ground sufficiently outside a given shaft seal, the CONTRACTOR shall demonstrate the suitability of the improvements by cutting a 2-inch diameter hole in the shoring wall near the center of the bore. If no obvious soil and less than 5 gpm of water enters the shaft, the

CONTRACTOR may progress to the next demonstration step. If any soil or greater than 5 gpm of water enters the shaft, the CONTRACTOR shall seal the demonstration hole and improve the ground before repeating the demonstration step.

2. After successful completion of the first demonstration step, the CONTRACTOR shall demonstrate the suitability of the ground improvements by cutting a 12-inch diameter hole in the shoring wall at the location of previous demonstration hole. If no soil and less than 5 gpm of water enters, the CONTRACTOR may progress to the next demonstration step. If any soil or greater than 5 gpm of water enters the shaft, the CONTRACTOR shall seal the demonstration hole and further improve the ground before repeating the demonstration step.
3. After successful completion of the first two demonstration steps, and if the CONTRACTOR believes the ground improvements are sufficient, the CONTRACTOR may proceed with remainder of the shaft wall penetration procedures.

3.02 STEEL SHEET PILING INSTALLATION

A. Steel sheet piling shall be used to the full depth of penetration required, and to proper alignment and plumbness, without damage to the sheet piling or rupture of its interlocks.

B. Sheet piles shall be pre-drilled as necessary to be installed.

C. Sheet piles shall be driven in plumb position with each sheet pile interlocked with adjoining piles for its entire length to form a continuous diaphragm throughout the length of each run of wall, bearing tightly against original ground. Sheet piles shall be driven to the depth indicated on the approved shop drawings. Care shall be exercised in driving so that interlocking members can be extracted without damaging adjacent structures or utilities. The methods of driving, cutting, and splicing shall conform to the approved shop drawings.

D. Sheet pile corners shall be installed with interlocks properly engaged for full depth of sheet piles. If interlocks cannot be properly engaged for full depth, corner connections shall be welded continuously to seal all cracks and avoid inflows of groundwater and soils.

E. Internal supports, including wales, struts, and corner braces, shall be installed sequentially as the shaft is excavated. At no time shall the unsupported excavation depth exceed the design spacing plus two (2) feet of horizontal support members as shown on approved submittals. All internal supports shall be installed within +/- 3 inches of design locations shown on approved submittals.

F. The sheet piles shall be flush with ground surface where traffic plates are required. The sheet piles may extend not more than 5 feet above ground surface where shafts are not within traffic lanes or shoulders.

G. Safety rails shall be installed in accordance with applicable safety regulations.

3.03 INTERNAL BRACING SUPPORT SYSTEM

A. The internal bracing support system for sheet pile shafts shall include wales, struts, and/or shores where necessary.

1. Struts with intermediate bracing shall be provided to enable sheet piles to carry maximum design loads without distortion or buckling.
2. Web stiffeners, plates, or angles shall be included as needed to prevent rotation, crippling, or buckling of connections and points of bearing between structural steel members. Allow for eccentricities caused by field fabrication and assembly.
3. All bracing support members shall be installed and maintained in tight contact with each other and with the surface being supported.
4. Bracing members shall be preloaded by jacking struts, if necessary, to control shoring movement. Bracing members shall be preloaded in accordance with methods, procedures, and sequence as described in the submittals. Excavation work shall be coordinated with installation of bracing and preloading. Steel shims and steel wedges shall be welded or bolted in place to maintain the preloading force in the bracing after release of the jacking equipment pressure. Support and preload shall be installed immediately after installation and prior to continuing excavation.
5. Procedures that produce uniform loading of bracing member shall be used without eccentricities or overstressing and distortion of members of the system.

3.04 SECANT PILE SHAFT INSTALLATION

A. At all times during drilling, reaming, and installation of reinforcement, the drilling mud/ polymer used to support the excavation shall be maintained at or above the ground surface to safely support the excavation and resist caving and sloughing. The polymer used shall have adequate viscosity, gel strength, and density to safely support earth and groundwater conditions described in the Geotechnical Report.

B. If groundwater is present in the drilled shaft holes, the hole shall be dewatered prior to placing concrete or concrete shall be placed using tremie methods. If temporary casing is used, care shall be taken to avoid the creation of voids in the completed shaft by withdrawing the casing during concrete placement while maintaining the concrete level above the bottom of the casing.

C. Overlap of adjacent secant pile shafts shall be sufficient to prevent soil and groundwater movement into the completed Work.

D. Care should be exercised during excavation to avoid damaging the concrete shafts.

E. Any voids in the completed shaft detected during excavation shall be immediately repaired to the satisfaction of the secant pile shaft designer before excavation progresses.

3.05 CONCRETE CAISSON SHAFTS:

A. Excavate a pit to a depth not exceeding the depth of the first caisson ring plus the depth of the cutting shoe in order to set and level the first caisson ring with cutting shoe attached into the excavation.
B. Once set and level, excavate soil below the ring to begin sinking the first caisson until top of the caisson is near ground level.
C. Install the next caisson ring on top of the leading ring and repeat the soil excavation process below the rings to continue sinking subsequently installed rings.

3.06 SHAFT WALL PENETRATION

A. Shaft entry and exit seals are required to be installed completely prior to initiating penetration through the shaft wall. The CONTRACTOR shall improve the ground outside the shaft seals as necessary to ensure stability, and as specified, to facilitate launching or receiving from a shaft. Ground shall be improved to the extent that the ground will remain stable without inflow of soil or water into the shaft while the machine is being launched or received.

B. Successful completion of shaft wall penetrations and related activities necessary to demonstrate such shall be at the CONTRACTOR's sole expense.

3.07 REMOVAL OF SUPPORT SYSTEM

A. Excavation support shall not be removed until support can be removed without damage to existing facilities, completed work, or adjacent property.

B. As a minimum, excavation support shall be removed from the existing adjacent surface grade to a depth of 5 feet. As-built drawings shall be prepared showing location of temporary shoring and bracing that remains in place.

C. The design, planning, installation and removal of all supports shall be accomplished in such a manner as to maintain stability of the required excavation and prevent movement of soil that may cause damage to adjacent shoring systems, structures and utilities, damage or delay the work, or endanger life and health.

D. Excavation support shall be removed in a manner that will maintain support as excavation is backfilled and will not leave voids in backfill. Removal of the support system shall be performed in a manner that will not disturb the pipeline, the compacted backfill, or adjacent construction or facilities.

E. Any void left by shoring system or voids created by the removal of the shoring system shall be filled with lean concrete, or cement grout, as approved by the ENGINEER to provide soil support between backfill zone and the native soil.

F. Sheet piling removal shall be performed in a manner that will avoid "vibro-consolidation" of sandy or granular material below the excavation that could lead to settlement of the pipeline or other works of construction.

G. The support system removed from the excavation shall remain the property of the CONTRACTOR and shall be removed from the site.

3.08 CLEANUP

A. The CONTRACTOR shall remove all construction debris, spoil, drilling fluid, oil, grease, and other materials from shafts, pipelines, and all surface work areas upon completion of construction to the satisfaction of the ENGINEER. Cleanup will be incidental to the construction. No separate payment shall be made for the cleanup.

END OF SECTION

SECTION 02431

CONTACT AND VOID REPAIR GROUTING

PART 1 - - GENERAL

1.01 SCOPE

A. The work described in this Section covers mix design requirements, testing, furnishing and production of grout for:

1. Filling exterior space between the initial tunnel support system or jacking pipe and the ground.

2. Filling voids in ground resulting from overbreak, overexcavation, or loss of ground.

1.02 RELATED WORK SPECIFIED ELSEWHERE

A. Section 02075 – Microtunneling

1.03 DEFINITIONS

A. Contact Grouting: Final exterior grouting used to fill the space between the initial tunnel support system or jacking pipe and the ground following completion of tunnel excavation.

B. Void Repair Grouting: Grout injected outside of the initial tunnel support or jacking pipe for immediate filling of voids as tunnel excavation is advancing.

C. Low-Strength Grout Mix: Mixes with strengths in compliance with 2.03B.1.

D. High-Strength Grout Mix: Mixes with strengths in compliance with 2.03B.2.

E. Cellular Concrete: A cementitious material that is mixed with preformed foaming agents to produce a stable air-cell structure and reduce the as-cast density of the concrete.

F. Neat Cement Grout: A grout consisting of cementitious materials and water.

G. Sand Cement Grout: A grout consisting of cementitious materials, sand, and water.

H. Bentonite Cement Grout: A grout consisting of cementitious materials, bentonite, and water.

I. Mix Design Acceptability Testing: Independent commercial laboratory testing performed to confirm that the selected products and mix designs will produce grouts that have the characteristics, qualities, and strength at prescribed maturity required per

the Contract.

J. Field Quality Control Testing: Independent commercial laboratory testing performed to confirm the material properties and strength of specimens obtained on-site during execution of the Work.

K. As-cast density: The final wet slurry density of a grout or cellular concrete, as measured at the time and point of placement.

1.04 REFERENCE STANDARDS

A. American Concrete Association (ACI):

1. ACI 523.1R – Guide for Cast-in-Place Low-Density Cellular Concrete

2. ACI 523.3R – Guide for Cellular Concretes above 50 pcf.

B. American Society for Testing and Materials (ASTM):

1. ASTM C39: Standard Test Method for compressive Strength of Cylindrical Concrete Specimens.

2. ASTM C138: Standard Test Method for Density (Unit Weight), Yield and Air Content (Gravimetric) of Concrete.

3. ASTM C144: Standard Specification for Masonry Mortar.

4. ASTM C150: Standard Specification for Portland Cement.

5. ASTM C494: Standard Specification for Chemical Admixtures for Concrete.

6. ASTM C618: Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete.

7. ASTM C937: Standard Specification for Grout Fluidifier for Preplaced-Aggregate Concrete.

8. ASTM C939: Standard Test Method for Flow of Grout for Preplaced-Aggregate Concrete.

9. ASTM C940: Standard Test Method for Expansion and Bleeding of Freshly Mixed Grouts for Preplaced-Aggregate Concrete in the Laboratory.

10. ASTM C942: Standard Test Method for Compressive Strength of Grouts for Preplaced-Aggregate Concrete in the Laboratory.

11. ASTM C953: Standard Test Method for Time of Setting of Grouts for Preplaced-Aggregate Concrete in the Laboratory.

12. ASTM C1017: Standard Specification for Chemical Admixtures for use in Producing Flowing Concrete.

13. U.S. Army Corps of Engineers CRD-C 621, Specification for Non-Shrink Grout.

1.05 SUBMITTALS

A. Conform to Section 01300 – Submittals.

B. Grout Work Plan

1. For each type of grouting operation, provide working drawings of proposed grouting systems detailing type and location of equipment, operational procedures, location of injection points, means of measuring grout pressures and volumes, method of venting, location of flowlines, grouting sequence, and schedule.

C. Grout Mix Design Report

1. Application.

2. Mix constituents and proportions, including materials by weight and volume.

3. Mix properties including as-cast density, initial set time, flow, bleed and compressive strength.

D. Mix Design Acceptability Testing Report

1. Provide mix design acceptability testing data in accordance with 3.01 of this section.

2. If previous acceptability testing is not available for the selected mix design, CONTRACTOR shall employ an independent commercial laboratory to perform the testing as prescribed herein.

E. Field Quality Control Testing

1. Provide field quality control testing data in accordance with 3.01 of this section.

F. Recordkeeping

G. Provide logs of grouting operations indicating location, wet density, pressure, and volume pumped for each grout placement, as part of the required Daily Reports.

PART 2 - - PRODUCTS

2.01 APPLICATIONS AND REQUIRED MIXES

A. Contact Grouting: Use high-strength grout mix.

B. Void Repair Grouting: Use high-strength or low-strength grout mix.

C. Low-strength grout mix:

1. Shall be sand-cement grout, neat cement grout, bentonite-cement grout, or cellular concrete.

2. Shall have a minimum compressive strength of 100 psi attained within 3 days, and 200 psi attained within 28 days.

D. High-strength grout mix:

1. Shall be sand-cement grout or neat cement grout.

2. High-strength grout mix shall have a minimum 28-day compressive strength of 1,000 psi.

3. Unit weight (as-cast density) shall be a minimum of 75 pounds per cubic foot.

2.02 MATERIALS

A. Cement:

1. Low Density Cellular concrete: ASTM C150, Type I or II.

2. All other grout mixes: ASTM C150 Type II.

B. Bentonite: Finely ground (200-mesh), premium-grade, high-yielding Wyoming sodium bentonite.

C. Fly ash: ASTM C618, Type F.

D. Foaming Agent: Foaming agent shall comply with ASTM C869 when tested in accordance with ASTM C796.

1. Type and Manufacturer: Mearl Geofoam Liquid Concentrate manufactured by Aerix Industries, Golden, CO; Foam Liquid Concentrate manufactured by Cellufoam Concrete Systems; Rheocell 30 manufactured by BASF Construction Chemicals, LLC of Cleveland, OH; Elastizell EF by Elastizell Corporation of America of Ann Arbor, MI; or approved equal.

E. Admixtures shall conform to the following:

1. ASTM C494 and/or ASTM C1017, as required to improve pumpability, to control set time, to hold sand in suspension and to reduce segregation and bleeding.

2. No calcium chloride or admixture containing chloride or other impurities from admixture ingredients will be acceptable.

3. Do not use admixtures that promote steel corrosion.

4. Ensure that admixtures used in any mix are compatible. Provide written confirmation from the admixture manufacturers of their compatibility.

5. If foaming agent is used, admixtures may only be used when specifically approved by foaming agent supplier in writing.

F. Water: Clean, fresh potable water free from deleterious amounts of alkali, acid, and organic materials which would adversely affect the setting time or strength of the grout.

2.03 MIX DESIGNS

A. General: Develop grout mixes based on the following criteria as applicable:

1. Volume of void between initial tunnel support or jacking pipe and the surrounding ground.

2. Pumping distances and characteristics, including pumpability, pot life and retardation.

3. Presence of groundwater.

B. Cellular concrete mixes shall be designed in accordance with the requirements of ACI 523.1R and/or ACI 523.3R and the additional requirements specified herein.

2.04 EQUIPMENT

A. For each type of grout, use equipment for mixing and injecting which is designed for the particular grout. Provide batching, mixing and pumping equipment that is compatible and of sufficient size and capacity to place the grout to the distances and volumes proposed by the CONTRACTOR.

B. Grouting equipment shall be capable of mixing grout to a homogeneous consistency and delivering grout to injection points at steady pressures. Equipment shall be configured to provide means of accurately measuring grout component quantities and accurately measuring pumping pressures.

C. Maintain equipment in good operating condition, capable of satisfactorily mixing, agitating, and forcing grout into injection ports at a uniform flow rate under the required constant pressure.

D. Grouting equipment shall be configured so flushing can be accomplished with grout intake valves closed, with water supply valve open, and with grout pump running at full speed.

E. An adequate inventory of spare parts or backup equipment shall be provided to ensure that operable backfill grouting equipment is available at all times during the work. Maintain sufficient quantities of spare pressure gauges, stop valves, and other wear parts on site.

F. Batch system shall provide graphical or digital printout records of batch scale readings, accurate to one (1) pound, of the dry mix ingredients before delivery to mixer.

G. At the point of injection, suitable valves and calibrated pressure gauges shall be provided so that the pressure and grout flow at the grout hole may be regulated and monitored. At or very near the point of injection, provide a system of valves in the line transporting the grout that will allow easy access for collection of test specimens. Provide an automatic bypass valve set to the maximum pressure specified. Provide suitable stop valves at the injection point for use in maintaining pressure, as required, until grout has set. Use hoses or pipes of proper type and diameter to withstand maximum injection pressures used.

PART 3 - - EXECUTION

3.01 TESTING

A. Testing: Employ an independent commercial testing laboratory, acceptable to the ENGINEER, to prepare and test each specimen. Testing for each specimen shall be as follows:

1. Unit weight (as-cast density):

    a. Determine the as-cast density of each cellular concrete specimen in accordance with ASTM C796.

    b. Determine the as-cast density of each grout specimen in accordance with ASTM C138

2. Compressive strength:

    a. Grout test specimens shall be made, cured, stored, and tested in accordance with ASTM C39.

    b. Cellular concrete test specimens shall be made, cured, stored, and tested in accordance with ASTM C495 and ASTM C796.

    c. Five sets of compression test cylinders (3 inches by 6 inches), three cylinders per set, shall be tested, one at each of the following ages:

i. 3 days

ii. 7 days

iii. 14 days

iv. 28 days

v. 56 days

B. Mix Design Acceptability Testing

1. General: Mix design acceptability testing shall be required prior to acceptance of CONTRACTOR'S selected mix design. These results will be compared with field test results to confirm consistent properties are obtained in the field.

2. Unit weight (as-cast density):

a. Unit weight tests shall be made:

i. After a change in mix design

ii. From each batch of grout from which compression test cylinders are made

b. Unit weight shall not be more than 5 pounds per cubic foot below the minimum unit weight specified. Adjust mix as required to meet the minimum specified as-cast density and compressive strength requirements.

3. Compressive Strength:

a. For Mix Design Acceptability Testing, compressive strength of grout shall be considered satisfactory if at 28-days both of the following requirements are met:

i. An average of three consecutive compressive strength tests equal or exceed the specified unconfined compressive strength.

ii. No individual compressive strength test is below the specified unconfined compressive strength by more than 20 percent.

C. Field Quality Control Testing

1. General: Field quality control testing shall be performed during application of contact grout. These results will be compared with Mix Design Acceptability Testing results to confirm consistent properties are obtained in the field.

a. The frequency specified herein for each field control test is approximate. A greater or lesser number of tests may be made, as required by the ENGINEER.

b. Test specimens shall be collected within the tunnel at or near the connection where the grout is being injected.

c. Supply all materials necessary for fabricating the test cylinders.

2. Unit Weight (as-cast density):

a. Unit weight tests shall be made:

i. From the first batch mixed each day

ii. After a change in mix design

iii. From each batch of grout from which compression test cylinders are made.

b. Unit weight at the point of placement shall be within plus or minus 5 pounds per cubic foot of the unit weight specified herein. Adjust the mix as required to obtain the specified as-cast density and compressive strength.

3. Compressive Strength:

a. One set of (15) compressive test cylinders shall be made at the beginning of each shift when grout is placed. One additional set of (15) test cylinders shall be made from each additional 20 cubic yards of grout placed in any one shift.

i. Test cylinders shall be made in the field, cured and stored in the laboratory, and tested.

ii. Each set of compression test cylinders shall be marked or tagged with a unique ID, the date and time of day the cylinders were made, the location (station) in the work where the grout represented by the cylinder was placed, batch number, and unit weight (as-cast density).

b. Compressive strength of grout shall be considered satisfactory at each age specified if both of the following requirements are met:

i. An average of three consecutive compressive strength tests equal or exceed the specified unconfined compressive strength.

ii. No individual compressive strength test is below the specified

unconfined compressive strength by more than 20 percent.

3.02 PREPARATION

A. CONTRACTOR shall submit grout mix design and acceptability testing for mix that meets the requirements of this section sufficiently in advance to modify mix design and perform additional acceptability testing as needed to gain compliance.

B. Notify ENGINEER at least 24 hours in advance of beginning any grouting operation.

C. Select and operate grouting equipment to avoid damage to new or existing underground utilities and structures.

D. In developing plan for grout placement, consider impacts to grout flow hydraulics and pressures. This shall include, but not be limited to: depth from surface, initial tunnel support or jacking pipe material, pumping capabilities, volume to be filled, external groundwater pressure, and volume of concrete to be grouted between grout ports.

E. Operate dewatering systems until the grouting operations are complete.

3.03 FINAL EXTERIOR GROUTING

A. Pump structural sand-cement grout to fill the exterior space between initial tunnel support or jacking pipe and the ground.

3.04 CONTACT GROUTING

A. Grouting shall be performed from inside the initial tunnel support or jacking pipe through grout ports. Grouting shall start in the ports at the lowest elevation and shall proceed until grout begins to flow from the ports at higher elevation. Lubricant shall be displaced by the grout. Displaced lubricant shall be disposed of off-site in accordance with applicable regulations and codes of all Federal, State, and local agencies.

B. Pump high-strength grout to completely fill the space between the initial tunnel support or jacking pipe and the ground.

1. Liquid grout pressure shall not exceed one-half of the existing overburden pressure.

C. CONTRACTOR shall open each port and inject grout. After initial set, CONTRACTOR shall remove each valve and observe each grout port. If flowing water is observed at a grout port, then the CONTRACTOR shall replace the valve and reapply grout to fill all voids. CONTRACTOR shall repeat this process until no flowing water is observed.

1. Removal of the valve and observation of the grout port shall occur in the presence of the ENGINEER.

2. Payment for the grouting will not be given until all grout ports can be opened and no flowing water is observed.

D. After grouting is complete, pressure shall be maintained by means of stopcocks or other suitable devices until the grout has set sufficiently in the judgment of the ENGINEER, or for a minimum of 24 hours, whichever is longer. If the tunnel is a two-pass installation, then after the grout is set, the grout ports shall be completely filled with high-strength grout and finished neatly without evidence of voids or projections. If the tunnel is a single pass tunnel, the grout ports through the jacking pipe shall be plugged in accordance with pipe manufacturer's recommendations.

3.05 VOID REPAIR GROUTING

A. Fill voids outside the limits of excavation caused by overexcavation, overbreak, or loss of ground. Such voids can be the result of boulder or obstruction removal, an existing void, or collapse of ground. Pump grout to temporarily fill all voids until tunnel shield has advanced beyond void repair area and initial tunnel support or jacking pipe is installed. Following completion of excavation, fill all voids in accordance with the requirements for contact grouting.

B. Placement of cellular concrete shall conform to ACI 523.1R and ACI 523.3R.

- END OF SECTION -

SECTION 02665
CARRIER PIPE INSTALLATION AND BACKFILL

PART 1 GENERAL

1.01 WORK INCLUDED

A. Section covers requirements for installation of the Carrier Pipe in the tunnel and backfilling the annulus between the Carrier Pipe and Initial Support with Backfill Grout.

B. Requirements in this Section apply to all tunnels on the project. Required submittal information must be provided for each type of tunnel separately.

1.02 RELATED WORK

A. Related Documents and Specification Sections include but are not necessarily limited to:

1. 02075 – Microtunneling
2. 02431 – Contact and Void Repair Grouting

1.03 DEFINITIONS

A. BULKHEAD: Material placed between the Carrier Pipe and the Initial Support to contain Backfill Grout. Bulkheads are typically required at both ends of a tunnel and may also be located at intermediate locations within a tunnel to contain the Backfill Grout in the annular space between the Carrier Pipe and Initial Support.

B. BACKFILL: Filling of the annular space between the Carrier Pipe and Initial Support.

C. BACKFILL GROUT: flowable material to be used in the Backfill operations; can be Cellular Grout.

D. CELLULAR GROUT: A low density, lightweight, cementitious material that contains stable air or gas cells as preformed foam uniformly distributed throughout the mixture.

E. CONTACT GROUTING: As defined in Section 02431 – Contact and Void Repair Grouting.

F. FLYASH GROUT: A self-leveling and self-compacting, cementitious material using pozzolanic flyash as the primary cementitious material.

1.04 REFERENCE STANDARDS

A. ASTM International (ASTM):

1. C495 – Standard Test Method for compressive strength of lightweight insulating concrete.
2. C618 – Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use as a Mineral Admixture in Concrete
3. C796 – Standard Test Method for foaming agents for use in producing Cellular Grout using preformed foam.
4. C869 – Standard Specification for foaming agents used in making

preformed foam for Cellular Grout.

5. C939 – Standard Test Method for Flow of Grout for Preplaced-Aggregate Concrete (Flow Cone Method)
6. D4832 – Standard Test Method for Preparation and Testing of Controlled Low Strength Material Test Cylinders
7. D5971 – Standard Practice for Sampling Freshly Mixed Controlled Low-Strength Material
8. D6023 – Standard Test Method for Density (Unit Weight), Yield, Cement Content, and Air Content (Gravimetric) of Controlled Low-Strength Material
9. D6103 – Standard Test Method for Flow Consistency of Controlled Low Strength Material

1.05 GENERAL REQUIREMENTS

A. Perform design, construction, and execution of the pipe installation and pipe backfill.

B. Minimum design requirements are presented herein. It is the CONTRACTOR's responsibility to develop and implement the design to fulfill the specified design requirements determined by the CONTRACTOR which are necessary for completion of the work.

C. Requirements
   1. Install Carrier Pipe without damage and to the grades shown and specified.
   2. Restrain Carrier Pipe from movement due to buoyant and other forces during Backfill Grouting.
   3. Backfill annulus outside Carrier Pipe fully with Backfill Grout.
   4. Where determined necessary by the CONTRACTOR, introduce Backfill Grout into the annulus outside the Carrier Pipe using grout lines (slick lines) secured to the Carrier Pipe or Initial Support or directly from the shafts. Grout ports through the Carrier Pipe are not allowed.
   5. Provide testing of materials and verification of material properties as required herein.
   6. Notification.
      a. Provide the OWNER's Designated Representative with a schedule of Carrier Pipe installation and Backfill Grouting activities at least two (2) weeks before beginning pipe installation, and update weekly.
      b. Notify the OWNER's Designated Representative at least 24 hours in advance of schedule changes.

D. Pipe Installation Methods
   1. Install Carrier Pipe in the tunnel either incrementally (by carrier or cart) or by jacking or pulling a pre-assembled pipe string as determined by the CONTRACTOR.
   2. Utilize casing spacers or other approved blocking method on the Carrier Pipe to prevent pipe movement.
   3. Utilize joint restraint methods or devices to prevent pull-out or over-assembling of Carrier Pipe joints.

1.06 QUALIFICATIONS

A. The CONTRACTOR shall be experienced in the installation of pipe in tunnels and backfilling annular spaces using methods, materials, and equipment comparable to this project.

B. Designate Installation and Backfill Grouting Experts. The Installation and Backfill Grouting Experts may be the same person. The Experts shall:
   1. Be thoroughly knowledgeable about the transportation, placement, and securement of prefabricated pipe in tunnels.
   2. Successfully have completed at least two (2) similar projects in which the pipe was placed in the Initial Support using the same methods as proposed for this project.
   3. Successfully have completed at least two (2) similar projects in which the pipe annulus in a tunnel was backfilled with Flyash Grout or Cellular Grout as applicable.
   4. Be thoroughly knowledgeable about mixing, pumping and placement of Backfill Grout, including Flyash Grout or Cellular Grout as applicable, in tunnels.

1.07 SUBMITTALS

A. Preconstruction:

   1. Qualifications of pipe Installation and Backfill Grouting Experts (may be the same person).
   2. Descriptions and shop drawings describing and illustrating methods and equipment proposed for installation of the Carrier Pipe in the tunnel. The submittal shall address, as a minimum, pipe:
      a. Transportation,
      b. Section joining,
      c. Line and grade surveying, and
      d. Line and grade control.
   3. Methods, procedures, and equipment for monitoring, controlling, and adjusting the alignment of the Carrier Pipe in the tunnel prior to Backfill Grouting.
   4. Descriptions, Shop Drawings, and calculations for securing the pipe during Backfill Grouting. Submit calculations which evaluate:
      a. Theoretical annulus volume for actual Initial Support ID and Carrier Pipe OD with adjustments for bells and spacers.
      b. Buoyant force(s) generated during backfilling of each stage.
      c. Loads and deflections of spacers.
      d. Maximum allowable backfill injection and head pressure (if a pump is used)
      e. The calculations shall be prepared, stamped, and signed by a Professional Engineer registered in the State of Florida.
   5. Description of equipment and methods proposed to mix Backfill Grout including:
      a. Mix design and results of preconstruction tests for the Backfill Grout. Results of tests on trial batches conducted as part of grout mix design and pre-grouting verification testing.

b. Mixing equipment
c. Quantity controls
d. Instrumentation
e. Description of trial batches, trial batch testing and proof of acceptable delivery and placement of Backfill Grout in the tunnel.

6. Description of injection methods for Backfill Grout including:
   a. Pumping equipment
   b. Delivery equipment (hoses, valves)
   c. Pumping distances and delivery points
   d. Flow rates
   e. Pressures
   f. Bulkhead details
   g. Proposed orientation of all grout and ventilation pipes.
   h. Methods and description of instrumentation to monitor and control placement of the backfill, and procedures to be used to verify backfill volumes.
   i. Method and procedures to handle excessive flowing water if criteria in Section 3.07 L. herein, are met.
7. Trial batch results demonstrating the same mix design that includes:
   a. Date of mix performed and reported
   b. Mix number
   c. Materials
   d. Sources
   e. Physical properties
   f. Compressive strength results

B. Construction: Submit the following to the ENGINEER during construction within the specified time restrictions:
   1. Survey results. Surveys shall be conducted and submitted as specified herein.
   2. Daily Field Reports.
   3. Field installation logs having as a minimum, stations and length of Carrier Pipe installed and volume of Backfill Grout delivered; Submit logs daily. Provide copies of reports as required by public authorities to the OWNER or Designated Representative within 72 hours following preparation and submittal to third party authority. These reports will be allowed for use as needed and for record purposes.

C. Postconstruction Submittals:
   1. Survey of the line and grade of the Carrier Pipe in the tunnel.
   2. Compressive strength results of Backfill Grout.

PART 2 EQUIPMENT, PRODUCTS AND MATERIALS

2.01 MATERIALS

A. Carrier Pipe: as shown on the Contract Drawings and as specified in the Contract Documents.

B. Backfill Grout shall have the following properties:

1. Flowable through delivery lines and in tunnel annulus
2. Have a heat of hydration that will not weaken or otherwise harm pipe materials
3. Viscosity shall be low enough to allow grout to completely fill all voids in the annulus between the Carrier Pipe and the ground.
    a. Efflux time through a Flow Cone per ASTM C939 shall be no greater than 22 seconds.
4. Average 28-day compressive strength of 100 psi. Test in accordance with ASTM C495.
5. Minimum wet density of 30 pcf, or per the direction of the ENGINEER.
6. Additives may be used only with review per approval of the OWNER or direction of the OWNER or Designated Representative.
7. Non-shrink mix.
8. Grout shall be a mix of water and cement and/or flyash or foamed Cellular Grout. No aggregates are allowed.
    a. Cellular Grout:
        1) Cement: Portland Type I/II.
        2) Foaming agent for Cellular Grout: in accordance with ASTM C869. a) Test in accordance with ASTM C796.
    b. Flyash Grout:
        1) Flyash Grout shall be composed of:
            a) Type C Flyash, water, and a set retarder, or
            b) Type F Flyash, cement, water, and a set retarder. Cement to Flyash ratio shall not be greater than 0.25:1 by weight.

C. Pipe Securement: secure pipe using prefabricated spacers or other approved bracing.

1. Spacers:

    a. Specifically designed for placing Carrier Pipe in tunnels and as skids for the pipe to ride on during installation.

    b. Design to have sufficient contact points with the Carrier Pipe and the tunnel Initial Support to resist damage/deformation to carrier from buoyancy caused by Backfill Grouting.
        1) Pre-fabricated units that provide necessary separation between carrier pipe and initial support (casing) while not allowing electrical contact or connection between the two structures.
        a) Spacers shall be supplied by a company specializing in manufacturing of tunnel or casing spacers and specifically designed for placing pipe in tunnels and as skids for the pipe to ride on during installation.
        b) Spacers shall be non-conducting material that is rigid under the imposed loads and does not damage the initial support.
        c) The spacers shall cathodically isolate the carrier pipe from the casing pipe with resistive material.

2. Bracing: Bracing with other materials is not allowed. However, wood blocking is allowed for carrier installation for the long microtunnel with horizontal curve.

D. Bulkhead Closure:

1. Provide Bulkheads at the ends of the pipe to prevent spillout of the Backfill Grout and not damage or degrade the Initial Support or Carrier Pipe during installation or over the life of the structure.
2. Provide venting at the crown of the annulus between Carrier Pipe and Initial Support at the highest elevation to ensure the tunnel is fully evacuated of water/air and filled with grout. Use drain line at the invert to drain any entrapped water.
3. Shall be brick and mortar or ENGINEER approved equivalent.

PART 3 EXECUTION

3.01 GENERAL

A. The Carrier Pipe shall have internal bracing, if necessary, to protect the pipe and control deflections including out-of-round distortions during transportation, handling, installation, and Backfill Grouting.

B. Pipe installation and Backfill Grouting shall be conducted under the direct supervision of the Installation and Backfill Grouting Expert(s).

3.02 PREPARATION

A. Do not commence with pipe installation until the tunnel is prepared for pipe installation in accordance with the following requirements:

1. The tunnel excavation has been stabilized and Contact Grouting has been completed outside the Initial Support as specified in Section 02431 – Contact and Void Repair Grouting.
2. The alignment of the tunnel has been surveyed and has been verified to allow for installation of the Carrier Pipe to the specified tolerances and clearances.
3. The tunnel has been cleaned as specified herein.

3.03 SURVEYS

A. Surveys shall be at intervals not exceeding 20 feet and shall be for both line and grade to an accuracy of 0.01 feet or better.

B. Conduct the following surveys:

1. Completed tunnel Initial Support prior to installation of the Carrier Pipe.
2. Carrier Pipe invert prior to Backfill Grouting.
3. Carrier Pipe invert after Backfill Grouting.

3.04 QUALITY CONTROL

A. Test methods shall be in accordance with ASTM C495.

1. Cast the specimens into cylinders at least 3 inches in diameter and 6 inches tall.
2. Separate and remove the specimens for testing by cutting and trimming the forming material surrounding the cylinders.

B. Backfill Grout Mix Design:

1. Two sets of compression test specimens shall be made.
2. Test one set of specimens at an age of 7 days and the other set at an age of 28 days.
3. Test mix for unit weight at the time of cylinder casting.

C. Index Testing of Backfill Grout:

1. Conduct set of index tests from the first batch of Backfill Grout mixed each day, after a change in mix design, and from each batch of Backfill Grout from which compression test specimens are made.
2. Conduct index tests at a frequency of one test per day of 25 CY and one additional test from each additional 50 cubic yards, or major fraction thereof, placed in any one day, but no more than three tests for each day.
3. Include as a minimum the following index tests at the time of placement:
   a. Wet unit weight (wet density)
   b. Ambient temperature
   c. Grout temperature
   d. Efflux time through Flow Cone

D. Compression Testing of Backfill Grout:

1. Make a minimum of one set of 5 specimens each day when up to 25 cubic yards of Backfill Grout is placed.
2. Make at least one additional set of specimens from each additional 50 cubic yards, or major fraction thereof, placed in any one day, but no more than three sets of specimens for each day.
3. Test two specimens of each set at an age of 7 days and 2 specimens at an age of 28 days.
   a. Hold one specimen in storage.

3.05 TOLERANCES AND CLEARANCES

A. The Carrier Pipe shall be installed to the line and grade specified in the Technical Specifications and Drawings.

B. The Carrier Pipe shall have a clearance of at least 3 inches between the outside of the pipe and the closest point of the Initial Support system in all directions.

C. Changes in Carrier Pipe alignment and grade shall be made gradually such that pipe joints are mated within the pipe manufacturer's specifications, fully functional, and not compromised in any way.

D. Reverse grades will not be allowed.

E. If the Carrier Pipe is off line and/or grade by more than the tolerances specified in 3.05 B., the CONTRACTOR shall make adjustments, repairs and changes as necessary to achieve the specified tolerances.

F. If the Carrier Pipe is off line and/or grade by an amount that requires, in the opinion of the ENGINEER, re-design of any structure, the CONTRACTOR shall be responsible for all redesign costs.

3.06 INSTALLATION METHODS

A. Install the pipe into the tunnels by sliding an assembled pipe string into the tunnels by jacking or pulling, or both. Alternatively, individual sections of pipe may be carried into the tunnel and mated in place.

B. Complete each joint by mating per the manufacturer's requirements and the Contract Documents.

C. Adjust the position of the Carrier Pipe within the spacers as necessary to achieve proper line and grade when the pipe is at the final position.

D. Securing: Ensure that the pipe and each pipe segment is firmly secured to prevent flotation, settlement, lateral and axial movement, and pipe deflection during Backfill Grouting.

3.07 BACKFILLING METHODS

A. Demonstrate the ability to pump the Backfill Grout mix the distances proposed without loss of Backfill Grout quality; may be based on previous projects.

B. Completely backfill the annulus between the Carrier Pipe and the Initial Support with Backfill Grout. Placement methods shall completely fill the spaces below the Carrier Pipe and around the Carrier Pipe support system components.

C. Place Backfill Grout in multiple lifts to prevent pipe flotation unless the use of stiffeners or pipe supports, appropriately designed casing spacers, and closely spaced blocking of sufficient structural rigidity or other approved submitted method are provided to prevent pipe flotation, movement, or damage to the pipe. Lift thickness required to prevent flotation and damage to the pipe shall be determined by the CONTRACTOR as represented in the required submittal calculations.

D. Backfill grout shall not be subject to free fall greater than 10 feet.

E. The pressure of the backfill against the Carrier Pipe shall not exceed manufacturer limitations at any time and at any location.

F. The CONTRACTOR may elect to inject Backfill Grout into the tunnel at the shaft(s). On long tunnels, grout may be injected from ground level through a slick line in the tunnel to bulkheads located within the tunnel not at the end of each tunnel.

G. Backfill grout shall be injected from the top of the shafts or pumped from the base of the shaft.

1. Vertical drop holes along the tunnel length will not be allowed.

H. If the complete filling of the annulus and voids is not verified during backfilling, conduct a secondary grouting program to fill the remaining annulus and voids.

I. Maintain supply of swabs the capability to use compressed air at the tunnel at the location of the backfilling operations or the bulkhead as appropriate to facilitate cleaning of

injection lines or outlets, as necessary.

J. To prevent contamination of the Backfill Grout, do not introduce water into the tunnel through injection lines.

K. Flowing Water - If water is inflowing from the ground into the tunnel at a rate greater than one gallon per minute at any location, that location shall be sealed and the flow reduced to less than one gallon per minute.

3.08 CONSTRUCTION RECORDS

A. The CONTRACTOR shall maintain Daily Field Reports for pipe installation and annular sealing. The Field Reports shall be signed by the site superintendent or shift foreman and shall contain the following:

1. Crews and subcontractors onsite with their personnel and equipment, and the work performed. The reports shall be broken down into work time and down/standby time for each crew and subcontractor;
2. Record of pipe installed;
3. Quantity of Backfill installed;
4. Materials testing agency including index testing and specimens;
5. Problems or unusual conditions encountered and actions taken to address these situations.

END OF SECTION

SECTION 02922

SODDING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope of Work: The CONTRACTOR shall furnish all labor, materials, equipment, incidentals necessary and place loam to finish grade, sod, and maintain all sodded areas as specified herein including all areas disturbed by the CONTRACTOR'S operations.

1.2 SUBMITTALS

A. A certification of seed quality shall be delivered to the ENGINEER ten days prior to use.

1.3 GUARANTEE

A. All restoration and revegetation work shall be subject to the one-year CORRECTION PERIOD as specified in the CONTRACT DOCUMENTS.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Fertilizer shall be complete commercial fertilizer, 6-6-6 grade. It shall be delivered to the site in the original unopened containers each showing the SUPPLIER'S (manufacturers) guarantee analysis.

B. Sod shall be Sod shall be of the same type as the surrounding grassed areas (unless specified otherwise), be free of weeds, and have well matted roots. The sod shall be live, fresh, and uninjured at the time of placing. Materials for sodding shall meet the applicable requirements of Sections 575 and 981 of the FDOT Standard Specifications, or the requirements of the governing permitting agency. Except as required to match surrounding grassed areas, sod may be St. Augustine, Bahia, or other varieties as selected by the OWNER.

C. Mulch shall be clean small-grain straw.

PART 3 - EXECUTION

3.1 APPLICATION RATES

A. Fertilizer shall be applied at the rate of 800 pounds per acre.

B. Sod shall be installed.

C. Mulch shall be applied at rate of 1-1/2 to 2 tons per acre.

D. Asphalt emulsion shall be applied at a rate of 300 gallons per acre. Asphalt

emulsion shall be applied uniformly to tack the mulch. Mechanical tacking will be considered on a case-by-case basis AS APPROVED by the OWNER and ENGINEER.

3.2 GROUND PREPARATION

A. The subgrade of all areas to be sodded shall be raked and all rubbish, sticks, roots, and stones larger than 2 inches shall be removed. Loam shall be spread and before it is raked to true lines and rolled, limestone shall be spread evenly over loam surface and thoroughly incorporated with loam. Lime shall be added in sufficient quantity to provide a soil pH of 6 to 7. The loam shall then be lightly compacted to finished grade. Compacted loam shall not be less than the depth specified. No loam shall be spread in water or while muddy.

3.3 APPLICATION OF FERTILIZER, SOD AND MULCH

A. The CONTRACTOR shall provide sodding, mulching and water as soon as possible for areas of the site where construction has temporarily ceased, but in no case shall the time be greater than fourteen (14) days.

B. Fertilizer shall be uniformly spread and immediately mixed with the upper 2 inches of topsoil.

C. Immediately following the seed shall be uniformly applied and lightly raked into the surface. Lightly roll the surface and water with fine spray.

D. All sodded areas shall be mulched.

3.4 WATERING AND MAINTENANCE

A. The CONTRACTOR shall keep all sodded areas watered and in good condition, resodding if and when necessary, until a good, healthy, uniform growth is established over the entire area sodded, and shall maintain these areas in an approved condition until FINAL COMPLETION.

B. On slopes, the CONTRACTOR shall provide against washouts. Any washout which occurs shall be regraded and resodded at the CONTRACTOR's expense until good sod is established.

C. The CONTRACTOR shall maintain the areas in grass in a neat manner by watering, mowing, raking clippings and leaves, and other appropriate measures until the WORK is completed.

END OF SECTION

SECTION 03000

CONCRETE

PART 1 - GENERAL

1.1 WORK INCLUDED

A. The WORK included under this section consists of furnishing all materials, forms, transportation and equipment, and performing all necessary labor to do all the plain and reinforced concrete WORK shown on the DRAWINGS, or incidental to the proper execution of the WORK, or as herein specified.

B. Concrete shall be composed of cement, fine aggregate, coarse aggregate, and water, so proportioned and mixed as to produce a plastic workable mixture in accordance with all requirements under this section suitable to the specific conditions of placement.

1.2 SUBMITTALS

A. All materials specified shall be certified by the producer or SUPPLIER (manufacturer) that the furnished material meets the specific requirements of the SPECIFICATIONS.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Cement:

1. Cement: Cement for all concrete shall be domestic Portland cement that conforms to the requirements of ASTM Designation C 150, Type I, Type II or Type III. Type III cement for high early strength concrete shall be used only for special locations and only with the approval of the ENGINEER.

2. Only one brand of cement shall be used in any individual structure unless approved by the ENGINEER. Cement which has become damaged, partially set, lumpy or caked shall not be used and the entire contents of the sack or container which contains such cement will be rejected. No salvaged or reclaimed cement shall be used.

B. Fine Aggregate: Fine aggregate shall conform to the requirements of the current edition of the Florida Department of Transportation "Standard Specifications for Road and Bridge Construction."

C. Coarse Aggregate: Coarse aggregate shall conform to the requirements of the current edition of the Florida Department of Transportation "Standard Specifications for Road and Bridge Construction," except that slag shall not be used and the gradation shall be Grade 57 AS APPROVED by the ENGINEER.

D. Water: Water shall be taken from a potable water supply and shall be fresh, clean and free from injurious amounts of oil, acid, alkali or organic matter.

E. Admixtures: No admixtures shall be used except by specific approval of the ENGINEER. Fly ash is not acceptable. When approved, admixtures shall meet the following minimum standards.

1. Air entraining agent: ASTM C 260.

2. Water Reducing and Retarding Admixture: ASTM C 494, Type D and free of chlorides.

F. Membrane Curing Compound: Membrane curing compound shall conform to the requirements of AASHTO Designation M 148, Type 1-clear, or Type 2-white pigmented.

G. Membrane: Membrane shall be a 6-mil polyethylene film.

H. Reinforcing Steel:

1. Reinforcing steel shall conform to the requirements of ASTM Designation A 615, Deformed Grade 60, except where otherwise indicated.

   a. The name of the SUPPLIER of the reinforcing steel shall be called out in the SHOP DRAWINGS together with a sketch showing the pattern of the deformation, including the mill mark.

   b. Bar reinforcement shall be accurately fabricated in accordance with the latest CRSI Manual of Standard Practice. The CONTRACTOR shall have prepared and shall submit to the ENGINEER necessary SHOP DRAWINGS and bar lists. The CONTRACTOR shall be responsible for errors made in SHOP DRAWINGS even though approved by the ENGINEER.

2. Bar Supports:

   a. Bar supports for reinforcing steel shall conform to the requirements of CRSI Manual of Standard Practice and shall be of a height to furnish the concrete cover called for on DRAWINGS. High chairs shall be furnished for bent or top bars in solid slabs. Bar supports to be in contact with exterior surfaces of concrete shall be Class C with plastic caps at least 1 inch in length on the leg tips, or Class E with stainless steel legs. Bar supports shall be spaced not more than 100 times the diameter of the

bars to be supported, with not more than 1/4 spacing from the end of the supported bars to the first chair.

b. Bar supports for slabs on grade shall be plain concrete blocks, 3 inches high by 4 inches square with tie wires embedded in support. Concrete strength shall be at 3,000 psi at time of use.

I. Forms: Forms shall be of wood, steel or other approved materials. The sheeting for all exposed surfaces shall be 5-ply plywood, unless otherwise specifically authorized. Forms of like character shall be used for similarly exposed surfaces in order to produce a uniform appearance. Forming for exposed exterior concrete from 1 foot below finished exterior grade to top of structure shall be carefully fabricated so as to provide a smooth finish without defects. The type, size, shape, quality and strength of all materials of which the forms are made shall be subject to the approval of the ENGINEER. If it is the ENGINEER's opinion that the interior surfaces of the forms are too irregular to produce the specified finish, they shall be lined with smooth, dense, moisture resistant hardboard or other material of which the ENGINEER approves.

2.2 CLASSIFICATION AND STRENGTH OF CONCRETE

A. Class and minimum strength requirements for concrete shall be as tabulated below. Unless otherwise specified, Class B concrete shall be used.

B. Strength Requirements: Concrete class and strength shall meet the minimum compressive strength requirements at the age of 7 and 28 days as shown in the following table. The compressive strengths shall be as determined by standard laboratory cylinder tests in accordance with the procedure set forth in ASTM Designation C 31 and C 39. (See Article 3.03 of this Section for testing of cylinders.)

Minimum Compressive Strength In Pounds Per Square Inch					
		3 Consecutive Cylinder Average		**Low Cylinder**	
Class	**For Design Purposes**	**7 Days**	**28 Days**	**7 days**	**28 Days**
A	4000	2950	4250	2600	3750
B	3000	2100	3520	1850	2800
Flowable Fill	50-150	---	---	50-150	50-150

2.3 PROPERTIES AND DESIGN OF CONCRETE MIX

A. Tests And Design Mix:

1. The CONTRACTOR shall submit for approval by the ENGINEER the proposed sources of the materials, or ready-mixed concrete, which the CONTRACTOR intends to use in the WORK. A design mix which has been used by the concrete SUPPLIER before may be submitted for approval provided the proportions and strengths meet the requirements of these SPECIFICATIONS.

2. The source and SUPPLIER of material after once having been approved shall not be changed by the CONTRACTOR, except AS APPROVED by the ENGINEER, and additional laboratory tests may be required by the ENGINEER to prove conformance with specification requirements.

3. If during the progress of the WORK, tests indicate that concrete is not being produced in accordance with these SPECIFICATIONS, the ENGINEER may order changes in the materials or their proportions so as to secure concrete as specified.

B. Slump: Slumps shall be as low as possible consistent with proper placing. Low slump concrete shall be used for footing and slabs on grade. Medium slump concrete shall be used for walls, columns and suspended slabs. Concrete shall conform to the limits specified in the following schedule:

Class of Concrete	Medium Slump	Low Slump
A	4 to 5 inch	2 to 3 inch
B	4 to 5 inch	2 to 3 inch

PART 3 - EXECUTION

3.1 PREPARATION

A. Concrete Mixing:

1. Equipment: The concrete shall be ready-mixed and the equipment shall conform to the applicable requirements of ASTM Designation C 94.

2. Measurement: Equipment necessary to positively determine and control the actual amounts of all materials entering the concrete shall be provided by the CONTRACTOR to the ENGINEER. All materials shall be measured by weight, except that water may be measured by volume.

3.2 INSTALLATION

A. Forms:

1. Construction:

a. Forms shall be built true to line and grade, and shall be mortar tight and sufficiently rigid to prevent displacement or sagging between supports. Particular attention shall be given to adequacy of supports and shoring, which is the CONTRACTOR'S responsibility. The surfaces of forms used for permanently exposed surfaces shall be smooth and free from irregularities, dents, sags, or holes. Forms for surfaces to receive stucco finish shall be suitable for its application. Bolts and rods used for internal ties shall be so arranged that, when the forms are removed, all metal is at least 1 1/2 inch from any concrete surface. Form ties shall be removed immediately after removal of forms, and holes shall be thoroughly plugged with grout within 24 hours after form removal and kept damp for 4 days to prevent shrinking.

b. Wire ties will not be permitted. All forms shall be so constructed that they can be removed without hammering or prying against the concrete. Unless otherwise indicated, suitable moldings shall be placed to bevel or round exposed edges at expansion joints or at any other corners that are to remain. Beams below grade shall have forms at both sides.

2. Coating: Prior to the placing of steel reinforcement or concrete, forms for exposed surfaces shall be coated with a nonstaining paraffin base oil or mineral oil. Forms for unexposed surfaces may be thoroughly wetted in lieu of oiling, immediately before the placing of concrete.

3. Removal: Forms and/or form supports shall not be removed from any concrete until it has obtained sufficient strength to support itself and any live loads it may be subjected to, and then only with the approval of the ENGINEER.

B. Reinforcing Steel: When placed in the forms, reinforcement shall be clean and free of all rust, scale, dust, dirt, paint, oil or other foreign material and shall be accurately and securely positioned in the forms as shown on the DRAWINGS before the placing of concrete. Reinforcing steel shall be wired or otherwise fastened together at intersections and shall be supported by concrete or metal supports, spacers or hangers. Bar supports, where adjacent to the ground, shall be set on precast concrete pads compressed into the subgrade. The CONTRACTOR shall obtain the ENGINEER's approval before fastening reinforcing steel at intersections by welding methods.

1. Splicing of reinforcement shall be held to a minimum and shall be placed at points of minimum stress. Bars shall be lapped at splices a minimum of 24 bar

diameters unless otherwise shown on the DRAWINGS or directed by the ENGINEER, and shall be rigidly wired or clamped.

2. Wire fabric shall be straightened before placing and shall overlap one full space of mesh at ends and edges and shall be securely fastened. Fabric shall be supported so as to occupy its proper location in the concrete as shown on the DRAWINGS. Fabric shall not cross any expansion joints.

C. Embedded Items: In addition to steel reinforcement, pipes, inserts and other metal objects as shown, specified or ordered shall be built into, set in, or attached to, the concrete. All necessary precautions shall be taken to prevent these objects from being displaced, broken or deformed. Embedded items shall be thoroughly clean and free from paint or other coating, rust, scale, oil, or any foreign matter. No wood shall be embedded in concrete. The concrete shall be packed tightly around pipes and other metal work to prevent leakage and to secure perfect adhesion. Drains shall be adequately protected from intrusion of concrete. Before concrete is placed, care shall be taken to determine that all embedded parts are firmly and securely fastened in place as indicated.

D. Concrete:

1. General: Reinforcement shall be secured in position, inspected and approved before placing concrete. Runways for transporting concrete shall not rest on reinforcing steel. Concrete not placed within 90 minutes from the time mixing is started will be rejected and shall be removed from the job by the CONTRACTOR. Concrete shall be deposited as nearly as practicable in final position. Concrete shall not be allowed to drop freely more than six feet. All concrete shall be placed in daylight and (excepting seal concrete) shall be placed in the dry unless otherwise authorized by the ENGINEER in writing.

2. Slabs Placed On Subgrade: Slab concrete placed on earth or fill subgrade shall be separated from direct contact with the subgrade by 6-mil polyethylene film or other approved membrane material. Sidewalks and walkways will not require a separation membrane. The membrane shall be lapped 4 inches on sides and 12 inches on ends.

3. Compaction: Concrete shall be compacted by internal vibrating equipment, supplemented by hand rodding and tamping as required. Vibrators shall in no case be used to move the concrete laterally inside the forms. Internal vibrators shall maintain a speed of at least 5000 impulses per minute when submerged in concrete. (At least one spare vibrator in working condition shall be maintained at the site during concrete placing operations.) Duration of vibration shall be limited to time necessary to produce satisfactory consolidation without causing segregation. Vibrator shall be moved constantly and placed in each specific spot only once.

4. Bonding: Before depositing new concrete on or against concrete that has set, the surfaces of the set concrete shall be thoroughly cleaned so as to expose the coarse aggregate and be free of laitance, coatings, foreign matter and loose particles. Forms shall be retightened. The cleaned surfaces shall be dampened, but not saturated, and then thoroughly covered with a coat of cement grout of similar proportions to the mortar in the concrete. The grout shall be as thick as possible on vertical surfaces and at least 1/2 inch thick on horizontal surfaces. The fresh concrete shall be placed before the grout has attained its initial set.

5. Protection: Rainwater shall not be allowed to increase the ratio of mixing water nor to damage the surface finish. Concrete shall be protected from disfigurement, damage, vibration, internal fractures and construction overloads.

E. Curing:

1. All concrete, including gunite, shall be water cured by covering with a double thickness of clean burlap, cotton mats, or other approved material kept thoroughly saturated with water. The forms shall be kept wet until removed and upon removal, the curing specified herein shall be started immediately. Concrete shall be cured for a period of 7 days for normal Portland cement or 4 days for high early strength cement. Concrete poured in the dry shall not be submerged until it has attained sufficient strength to adequately sustain the stress involved nor shall it be subjected to flowing water across its surface until it has cured 4 days. Curing of gunite shall be started as soon as possible without damaging surface and not later than 2 hours after placing.

2. In lieu of wet burlap or cotton mats as specified above, concrete slabs may be covered with wet sand and kept moist for the specified curing period. The initial curing period of not less than 24 hours shall consist of the wet burlap or cotton mat method, then the wet sand method may be utilized until the end of the curing period.

3. Concrete surfaces which are not to be coated, painted, plastered, stuccoed, covered with tile or floor covering or require a bonding surface may be cured by means of a membrane curing compound in lieu of the wet cure method. The curing compound shall be applied immediately after a satisfactory surface finish has been completed or forms have been removed. The rate of application of membrane curing compound shall be at least one gallon to every 200 square feet of exposed surface to be cured. The membrane curing compound and impervious covering shall be continuous and without defects and shall retain the required moisture in the concrete. Membrane curing compound that becomes damaged by rain, foot traffic or other conditions within 5 days of application shall be reapplied.

F. Finishes:

1. As soon as forms can safely be removed, all irregular projections shall be chipped off flush with the concrete surfaces. All voids produced by spacers or any honeycombing shall be pointed up with grout and troweled flush with the concrete surface immediately after removal of forms and water cured to prevent shrinkage. Honeycombing shall be cut out to expose a sound concrete surface prior to pointing. The use of mortar pointing or patching shall be confined to the repair of small defects in relatively green concrete. Where in the opinion of the ENGINEER substantial repairs are required, the defective concrete shall be cut out to sound concrete and repaired with gunite or the concrete shall be removed and reconstructed as directed.

2. Concrete surfaces that are not exposed in the completed work shall require no special finish other than such pointing up and rubbing as is necessary to leave them smooth and impervious.

3. Other surfaces which will be exposed in the completed work shall be finished by being rubbed smooth with a float and water or a carborundum brick. The final surface shall be smooth and dense, without pits, irregularities, blow holes or bubbles.

3.3 FIELD QUALITY CONTROL

A. General: The quality of the concrete as to conformance to the SPECIFICATIONS is the entire responsibility of the CONTRACTOR until it is accepted in place in the structure and verified by the final cylinder tests made by the laboratory. Arrangements and costs for field testing shall be made by the CONTRACTOR.

B. Compressive Tests: Standard laboratory compressive test cylinders shall be obtained by the laboratory when concrete is discharged from the mixer at the site of the WORK. A set of 6 cylinders shall be obtained for each 60 cubic yards or fraction thereof placed each day, for each type of concrete. The cylinders shall be cured under laboratory conditions and shall be tested in two groups of three at 7 and 28 days of age, respectively.

C. Slump Tests:. Slump tests shall be made for each 25 cubic yards or "pour" of concrete placed. Slump tests may be made on any batch and failure to meet specified slump requirements shall be sufficient cause for rejection of that batch.

D. Reports: Proper reports of all tests performed by the laboratory shall be prepared by the laboratory and submitted promptly to the ENGINEER and OWNER. Such reports shall be properly labeled so as to identify the portions of the project into which the materials have been placed.

END OF SECTION

SECTION 03600

GROUT

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Provide all labor, materials, tools and equipment and perform all grouting as specified hereinafter and indicated on the Drawings.

1.2 RELATED WORK

A. Section 03000, Concrete

1.3 SUBMITTALS

A. Submit manufacturer's literature for review on the following items:

1. Nonshrink grout data including grout properties, mixing, surface preparation and installation instructions.

1.4 DELIVERY AND STORAGE

A. Deliver and store grouting materials in unbroken containers with seals and labels intact as packaged by the manufacturer.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Grout for filling decommissioned pipelines to remain in place in buried applications shall be in accordance with FDOT Standard Specifications Section 121 Flowable Fill, Excavatable.

B. Nonshrink, Nonmetallic Grout: The Burke Company's Non-Ferrous, Non-Shrink Grout, Sauereisen F-100 Level Fill, Master Builders Masterflow 713, Euclid NS Grout, or equal.

C. Nonshrink, Metallic Grout: The Burke Company's Metallic Spec Grout, Master Builders Embeco 636 Grout pre-mixed type, or equal.

D. Epoxy Grout: Sikadur 42 Grout-Pak, or equal, for grouting sleeves for anchor bolts, etc.

PART 3 - EXECUTION

3.1 PREPARATION

A. Clean all bonding surfaces of dust and oil.

3.2 INSTALLATION

A. Nonshrink Grout:

1. Use nonshrink, nonmetallic grout for grouting precast concrete wall panel connections, column base plates, anchor bolts, reinforcing bars, pipe sleeves, machinery supports and pump base plates.

2. Mix and place nonshrink grout as recommended by the manufacturer.

3. Mix grout as close to the work area as possible and transport quickly to its final position in a manner which will not permit segregation of materials.

4. Cure nonshrink grout with water saturated burlap for at least three days or with an application of Super Rez Seal cure and seal compound applied immediately after grout placement.

5. Do not operate machinery set on grout pads until the grout has cured for at least 24 hours.

END OF SECTION

SECTION 09940

PROTECTIVE COATINGS

PART 1 - GENERAL

1.1 SCOPE

A. This Section covers field applied protective coatings, including surface preparation, protection of surfaces, inspection, and other appurtenant work for equipment and surfaces designated to be coated with heavy-duty maintenance coatings. Regardless of the number of coats previously applied, at least two field coats in addition to any shop coats or field prime coats shall be applied to all surfaces unless otherwise specified.

1.2 GENERAL

A. Cleaning, surface preparation, coating application, and thickness shall be as specified herein and shall meet or exceed the coating manufacturer's recommendations. When the manufacturer's minimum recommendations exceed the specified requirements, Contractor shall comply with the manufacturer's minimum recommendations. When equivalent products are acceptable to Engineer, Contractor shall comply with this specification and the coating manufacturer's recommendations.

B. Governing Standards

1. All cleaning, surface preparation, coating application, thickness, testing, and coating materials (where available) shall be in accordance with the referenced standards of the following AWWA, ANSI, NACE, SSPC, NSF, and ASTM.

C. Delivery and Storage

1. All coating products shall be received and stored in accordance with the coating manufacturer's recommendations.

1.3 SUBMITTALS

A. Contractor shall submit color cards for all coatings proposed for use, together with complete descriptive specifications and the completed Coating System Data Sheets, to Engineer for review and color selection. Requests for review submitted directly to Engineer by coating suppliers will not be considered.

B. When the proposed products will be in contact with treated or raw water in potable water treatment facilities, Contractor shall submit certifications that the proposed systems are in compliance with ANSI/NSF 61.

C. Contractor shall submit a Coating System Data Sheet for each separately identified surface in the Coating Schedule that will be used in the project, using the appropriate Coating

System Data Sheet forms (Figures 1-09940 and 2- 09940) at the end of this section. Each field coating system shall be acceptable to the coating material manufacturer. Each Coating System Data Sheet shall include application temperature limits including recoat time requirements for the ambient conditions at the site, including temperatures up to 130℉ [54℃]. Temperature requirements shall be specified by the coating manufacturer.

D. Each proposed coating system shall be assigned a unique number with a prefix letter based on the following:

Prefix	Surfaces	Figure
A	Iron and steel	2
C	Concrete and concrete block	1
E	Equipment - submerged nonsubmerged	1 2
F	Nonferrous metal	1
G	Galvanized	1
H	High temperature	1
P	PVC and FRP	1

E. Each coating system that will be applied entirely in the field shall be assigned only a prefix letter and no suffix letter. When appropriate under the indicated conditions, the following suffix shall be added to the coating system numbers:

-F Each shop-applied coating system that includes a finish coat applied in the field.

F. A separate Coating System Data Sheet shall be developed and submitted for each variation or change in a coating system or surface to be coated.

G. The manufacturer's standard colors will be acceptable for all coatings.

1.4 QUALITY ASSURANCE

A. Coating System Data Sheet Certifications

1. The coating applicator and coating manufacturer shall review and approve in writing the coating manufacturer's written recommendations for the coating system and the intended service. Any variations from the specifications or the coating manufacturers published recommendations shall be submitted in

writing and approved by the coating manufacturer. The coating manufacturer shall observe the surface preparation, mixing, and application of the coating systems and submit a written report of his observations and any additional recommendations.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Alternative Manufacturers

1. In addition to the coatings listed herein, equivalent products of the following manufacturers will also be acceptable:

    - PPG
    - Sigma
    - Rust-Oleum

B. Equivalent Coatings

1. Whenever a coating is specified by the name of a proprietary product or of a particular manufacturer or vendor, it shall be understood as establishing the desired type and quality of coating. Other manufacturers' coatings will be accepted, provided that sufficient information is submitted to enable Engineer to determine that the proposed coatings are equivalent to those named. Information on proposed coatings shall be submitted for review in accordance with the Submittals section. Requests for review of equivalency will be accepted only from Contractor, and will be considered only after the contract has been awarded.

2.2 MATERIALS

A. All coatings shall be delivered to the job in original, unopened containers, with labels intact. Coatings shall be stored indoors and shall be protected against freezing. No adulterant, unauthorized thinner, or other material not included in the coating formulation shall be added to the coating for any purpose.

B. All coatings shall conform to the air quality regulations applicable at the location of use. Coating materials that cannot be guaranteed by the manufacturer to conform, whether or not specified by product designation, shall not be used.

C. The coatings specified have been selected on the basis of the manufacturer's statement that the VOC content of the product is 2.8 lbs per gallon or less; however, it shall be the Contractor's responsibility to use only coating materials that are in compliance with the requirements of all regulatory agencies. Local

regulations may require some coatings to have a lower VOC content than specified herein. The coatings specified may meet the VOC limits in the unthinned (as shipped) condition, but may exceed the limits if thinned according to the manufacturer's recommendations. In such case, the coatings shall not be thinned beyond the 2.8 lbs per gallon limit, and if the product cannot be thinned to suit the application method or temperature limits, another manufacturer's coating shall be used, subject to acceptance by Engineer.

D. Contractor shall be responsible for ensuring the compatibility of field coatings with each other or with any previously applied coatings. Coatings used in successive field coats shall be produced by the same manufacturer. The first field coat over shop coated or previously coated surfaces shall cause no wrinkling, lifting, or other damage to underlying coats.

E. All coatings used on surfaces that will be in contact with potable or treated water shall be certified as being in compliance with ANSI/NSF 61. Coatings that cannot be so certified, whether or not specified by manufacturer and by product designation, shall not be used.

F. Primers

Universal Primer	Ameron "Amercoat 385 Epoxy", Carboline "Rustbond", ICI Devoe "Devran 224HS", Tnemec "Series 27 F.C. Typoxy", or Sherwin-Williams "Macropoxy 646".
Epoxy Concrete Block Filler	Ameron "Amerlock 400BF Epoxy Block Filler", Carboline "Sanitile 600", ICI Devoe "Blox Filler 4000", Tnemec "Series 54-660", or Sherwin-Williams "Kem Cati-Coat HS".
Epoxy Concrete Filler and Surfacer	Tnemec "Series 63-1500", Ameron NuKlad 114A, or Carboline "Carboguard 510".

G. Intermediate and Finish Coatings

Epoxy Enamel (NSF certified systems)

Ferrous Metal Surfaces and Concrete Surfaces in Contact with Treated or Raw Water in Potable Water Facilities	Ameron "Amerlock 400 High-Solids Epoxy Coating", Carboline in "Carboguard 891", ICI Devoe "Bar-Potable Water Facilities Rust 233H" Tnemec "Series N140 Pota-Pox Plus", or Sherwin-Williams "Macropoxy 646NSF"; immersion service.

Epoxy Enamel

Concrete Floors	Ameron "Amerlock 400", Carboline "Carboguard 890", ICI Devoe "Devran 224HS", Tnemec "Series N69 Hi-Build Epoxoline II", or Sherwin-Williams "Armorseal 1000HS"; nonskid.
Ferrous Metal Surfaces and Masonry or Concrete Surfaces Other Than Floors	Ameron "Amercoat 385 Epoxy", Carboline "Carboguard 890", ICI Devoe Devran "224HS", Tnemec "Series N69 Hi-Build Epoxoline II", or Sherwin-Williams "Macropoxy 646".
Aliphatic Polyurethane	Ameron "Amercoat 450H", Carboline "Carbothane 134HG", ICI Devoe "Devthane 379H" Tnemec "Series 1074 Endura- Shield II", or Sherwin-Williams "Acrolon 218HS".
Coal Tar Epoxy	High-build coal tar epoxy; Ameron "Amercoat 78HB Coal Tar Epoxy", Carboline "Bitumastic 300 M", Tnemec "46H-413 Hi-Build Tneme-Tar", or Sherwin-Williams "Hi-Mil Sher-Tar Epoxy".
Medium Consistency Coal Tar	Carboline "Bitumastic 50" or Tnemec "46-465 H.B. Tnemecol".

Vinyl Ester	Tnemec "Series 120 Vinester" Carboline "Plasite 4110" or Sherwin-Williams "Magnalux 304FF".
Heat-Resistant	Suitable for temperatures up to 400°F [207°C]; Ameron "Amerlock 400", Carboline "Thermaline 450", Tnemec "43-36 Chrome Aluminum", or Sherwin-Williams "Silver-Brite Aluminum".
High Heat-Resistant	Suitable for temperatures up to 1000°F [537°C]; Ameron " Amercoat 878", Carboline "Thermaline 4700 VOC", Tnemec "Series 39 Silicone Aluminum" or Sherwin-Williams "Silver-Brite Hi-Heat Silicone Aluminum".

H. Vinyl Ester With Graphite Filler Coating System

1. The corrosion protection system shall be a two component, 100 percent solids, solvent-free, vinyl ester resin, graphite filled, high-build protective and waterproofing coating, Dudick "Protecto-Coat 805". Concrete surface primer shall be a catalyzed vinyl ester resin containing conductive fillers, 100 percent solids, Dudick "Primer 27C". Finish coats shall be a two component, 100 percent solids, solvent-free, graphite filled vinyl ester resin.

PART 3 - EXECUTION

3.1 SURFACE PREPARATION

A. All surfaces to be coated shall be clean and dry and shall meet the recommendations of the coating manufacturer for surface preparation. Freshly coated surfaces shall be protected from dust and other contaminants. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started. The gloss on previously coated surfaces shall be dulled if necessary for proper adhesion of topcoats.

B. Surfaces shall be free of cracks, pits, projections, or other imperfections that would interfere with the formation of a smooth, unbroken coating film, except for

concrete block construction where a rough surface is an inherent characteristic.

C. When applying touchup coating or repairing previously coated surfaces, the surfaces to be coated shall be cleaned as recommended by the coating manufacturer, and the edges of the repaired area shall be feathered by sanding or wire brushing to produce a smooth transition that will not be noticeable after the coating is applied. All coatings made brittle or otherwise damaged by heat of welding shall be completely removed.

D. Galvanized Surfaces

1. Galvanized surfaces shall be prepared for coating according to the instructions of the manufacturer of the epoxy enamel. Any chemical treatment of galvanized surfaces shall be followed by thorough rinsing with clean water.

E. Ferrous Metal Surfaces

1. Ungalvanized ferrous metal surfaces shall be prepared for coating by using one or more of the following cleaning procedures as specified: solvents (SSPC-SP1); blasting (SSPC-SP5, -SP6, -SP7, or -SP10); power tools (SSPC-SP3 or -SP11); or hand tools (SSPC-SP2). Oil and grease shall be completely removed in accordance with SSPC-SP1 before beginning any other cleaning method. Surfaces of welds shall be scraped and ground as necessary to remove all slag and weld spatter. Tools which produce excessive roughness shall not be used.

2. All components of equipment that can be properly prepared and coated after installation shall be installed prior to surface preparation. Components that will be inaccessible after installation shall have the surfaces prepared and coated before installation. Motors, drive trains, and bearings shall be protected during surface preparation in accordance with the equipment manufacturer's recommendations.

3. All cut or sheared edges shall be ground smooth to a 1/8 inch minimum radius for all material 1/4 inch thickness and larger. For material thickness less than 1/4 inch all cut or sheared edges shall be ground smooth to a radius equal to 1/2 the material thickness. Grinding of rolled edges on standard shapes with a minimum radius of the 1/16 inch will not be required.

4. All ferrous metal surfaces shall have all welds ground smooth and free of all defects in accordance with NACE Standard RPO178, Appendix C, Designation C and sharp edges ground smooth, if not previously prepared in the shop. Instead of blending of the weld with the base metal as required by the NACE standard, it will be acceptable to furnish a welded joint that has a smooth transition of the weld to the base metal. All welds shall be ground smooth to ensure satisfactory adhesion of paint.

5. The cleaning methods and surface profiles specified herein are minimums, and if the requirements printed in the coating manufacturer's data sheets exceed the limits specified, the value printed on the data sheets shall become the minimum requirement.

F. Ferrous Metal Surfaces – Non-immersion Service

1. Ferrous metal surfaces, including fabricated equipment, in non-immersion service shall be cleaned to the degree recommended by the coating manufacturer for surfaces to be coated with coal tar epoxy, epoxy enamel, and heat-resistant coatings, except galvanized surfaces. Blast cleaning to at least SSPC-SP6 shall be used where recommended by the coating manufacturer, and may be used elsewhere at the option of Contractor, provided that no dust is permitted to settle on adjacent wet coating. Surface profile shall be as recommended by coating manufacturer, but not less than 2 mils.

G. Ferrous Metal Surfaces - Immersion Service

1. Surface preparation of ferrous metal surfaces in immersion service shall consist of blast cleaning to at least SSPC-SP10 and the first application of coating shall be performed on the same day. If more surface area is prepared than can be coated in one day, the uncoated area shall be blast cleaned again to the satisfaction of Engineer. Surface profile shall be as recommended by coating manufacturer, but not less than 3.5 mils.

H. Concrete Surfaces

1. All concrete surfaces shall be free of objectionable substances and shall meet the coating manufacturer's recommendations for surface preparation. Any other surface preparation recommended by the coating material manufacturer shall be brought to Engineer's attention and may be incorporated into the work if acceptable to Engineer.

2. All concrete surfaces shall be dry when coated and free from dirt, dust, sand, mud, oil, grease, and other objectionable substances. Oil and grease shall be completely removed by use of solvents or detergents before mechanical cleaning is started.

3. New concrete shall have cured for at least 4 weeks before coating is applied as recommended by the material manufacturer. Concrete surfaces shall be tested for capillary moisture in accordance with ASTM D4263. There shall be no capillary moisture when coatings are applied on concrete.

4. All surfaces to be coated shall be cleaned in accordance with ASTM D4258 and abraded in accordance with ASTM D4259. Surface profile shall be at least 25 percent of the dry film thickness specified for the coating system.

Prior to application of the coating, the surfaces shall be thoroughly washed or cleaned by air blasting to remove all dust and residue. Spalled areas, voids, and cracks shall be repaired in accordance with the Concrete section and as acceptable to the Engineer. Fins and other surface projections shall be removed to provide a flush surface before application of coating.

5. Except where epoxy enamel is applied as damp-proofing, the concrete surfaces, including those with bug holes less than 1 inch in any dimension, shall be prepared when required and as recommended by the manufacturer, using an epoxy concrete filler and surfacer. Where coating with a vinyl ester the concrete filler and surfacer shall be as recommended by the manufacturer to be compatible with vinyl ester.

I. Concrete Block Surfaces

1. Voids and openings in concrete block surfaces shall be pointed. All exposed exterior surfaces and surfaces to be coated with epoxy enamel, including the joints, shall be filled so that a continuous unbroken coating film is obtained.

J. Copper Tubing

1. All flux residue shall be removed from joints in copper tubing. Immediately before coating is started, tubing shall be wiped with a clean rag soaked in xylol.

K. Plastic Surfaces

1. All wax and oil shall be removed from plastic surfaces that are to be coated, including PVC and FRP, by wiping with a solvent compatible with the specified coating.

L. Hardware

1. Hardware items such as bolts, screws, washers, springs, and grease fittings need not be cleaned prior to coating if there is no evidence of dirt, corrosion, or foreign material.

M. Aluminum

1. When a coating system is required, remove all oil or deleterious substance with neutral detergent or emulsion cleaner or blast lightly with fine abrasive.

N. Stainless Steel

1. When a coating system is required, surface preparation shall conform to the coating manufacturer's recommendations.

3.2 MIXING AND THINNING

A. Coating shall be thoroughly mixed each time any is withdrawn from the container. Coating containers shall be kept tightly closed except while coating is being withdrawn.

B. Coating shall be factory mixed to proper consistency and viscosity for hot weather application without thinning. Thinning will be permitted only as necessary to obtain recommended coverage at lower application temperatures. In no case shall the wet film thickness of applied coating be reduced, by addition of coating thinner or otherwise, below the thickness recommended by the coating manufacturer. Thinning shall be done in compliance with all applicable air quality regulations.

3.3 APPLICATION

A. Coating shall be applied in a neat manner that will produce an even film of uniform and proper thickness, with finished surfaces free of runs, sags, ridges, laps, and brush marks. Each coat shall be thoroughly dry and hard before the next coat is applied. In no case shall coating be applied at a rate of coverage greater than the maximum rate recommended by the coating manufacturer.

B. Coating failures will not be accepted and shall be entirely removed down to the substrate and the surface recoated. Failures include but are not limited to sags, checking, cracking, teardrops, fat edges, fisheyes, or delamination.

C. Priming

1. Edges, corners, crevices, welds, and bolts shall be given a brush coat (stripe coat) of primer before application of the primer coat. The stripe coat shall be applied by a brush and worked in both directions. Special attention shall be given to filling all crevices with coating.

2. Abraded and otherwise damaged portions of shop-applied coating shall be cleaned and recoated as recommended by the manufacturer of the finish coating. Welded seams and other uncoated surfaces, heads and nuts of field-installed bolts, and surfaces where coating has been damaged by heat shall be given a brush coat of the specified primer. Before the specified spot or touchup coating of metal surfaces, edges, corners, crevices, welds, and bolts in the area of the spot or touchup coating shall be given a brush coat of primer. This patch, spot, or touchup coating shall be completed, and the paint film shall be dry and hard, before additional coating is applied.

D. Epoxy Enamel

1. When used, epoxy enamel shall be applied in accordance with the coating manufacturer's recommendations, including temperature limitations and

protection from sunlight until top-coated.

2. When concrete is to be coated, coatings shall not be applied to concrete surfaces in direct sunlight or when the temperature of the concrete is rising. Preferably the coating shall be applied when the temperature of the concrete is dropping.

3. When applying high build epoxy coatings with a roller or brush and where a dry film thickness of at least 4-6 mils per coat is required, two or more coats shall be applied to achieve the recommended dry film thickness equal to a spray applied coating.

E. Coal Tar Epoxy

1. When used, the application of coal tar epoxy, including time limits for recoating, shall conform to the recommendations of the coating manufacturer.

2. When concrete is to be coated, coatings shall not be applied to concrete surfaces in direct sunlight or when the temperature of the concrete is rising. Preferably the coating shall be applied when the temperature of the concrete is dropping.

F. Vinyl Ester

1. When used, the application of vinyl ester coating system, including time limits for recoating and temperature requirements of the materials, shall conform to the recommendations of the coating manufacturer.

G. Film Thickness

1. The total coating film thickness including intermediate coats and finish coat, shall be not less than the following:

Type of Coating	Minimum Dry Film Thickness
Medium consistency coal tar	20 mils.
Coal tar epoxy (two coats)	20 mils.
Epoxy enamel	
Floors	5 mils.
Surfaces with first coat of epoxy enamel and final coat of aliphatic polyurethane	7 mils (5 mils DFT for epoxy plus 2 mils DFT for aliphatic polyurethane).
Surfaces with first and second coat of epoxy enamel and final coat of aliphatic polyurethane	12 mils (10 mils DFT for epoxy plus 2 mils DFT for aliphatic polyurethane).
Other surfaces (two coats)	10 mils.
Immersion service (three coats)	15 mils.

Type of Coating (cont.)	Minimum Dry Film Thickness (cont.)
Vinyl ester	30 mils.
Heat-resistant (silicone)	3 mils.
High heat-resistant (silicone)	3 mils.
Other surfaces (one coat)	5 mils.
Other surfaces (two coats)	10 mils.

H. Weather Conditions

1. Coatings shall not be applied, except under shelter, during wet, damp, or foggy weather, or when windblown dust, dirt, debris, or insects will collect on freshly applied coating.

2. Coatings shall not be applied at temperatures lower than the minimum temperature recommended by the coating manufacturer, or to metal surfaces such as tanks or pipe containing cold water, regardless of the air temperature, when metal conditions are likely to cause condensation. When necessary for proper application, a temporary enclosure shall be erected and kept heated until the coating has fully cured.

3. Coatings shall not be applied at temperatures higher than the maximum temperature recommended by the coating manufacturer. Where coatings are applied during periods of elevated ambient temperatures, Contractor and the coatings manufacturer shall be jointly responsible to ensure that proper application is performed including adherence to all re-coat window requirements. Precautions shall be taken to reduce the temperature of the surface application, especially for metal, at elevated temperatures above 100℉ [38℃] including shading application area from direct sunlight, applying coating in the evening or at night, and ventilating the area to reduce the humidity and temperature,

4. Vinyl ester coating materials, when required, shall be maintained during transportation, storage, mixing, and application at the temperature required by the coating manufacturer, 35℉ [2℃] to 90℉ [32℃].

3.4 REPAIRING FACTORY FINISHED SURFACES

A. Factory finished surfaces damaged prior to acceptance by Owner shall be spot primed and recoated with materials equivalent to the original coatings. If, in the opinion of Engineer, spot repair of the damaged area is not satisfactory, the entire surface or item shall be recoated.

3.5 PROTECTION OF SURFACES

A. Throughout the work Contractor shall use drop cloths, masking tape, and other

suitable measures to protect adjacent surfaces. Contractor shall be responsible for correcting and repairing any damage resulting from its or its subcontractors' operations. Coatings spilled or spattered on adjacent surfaces which are not being coated at the time shall be immediately removed. Exposed concrete or masonry not specified to be coated which is damaged by coatings shall be either removed and rebuilt or, where authorized by Owner, coated with two coats of masonry coating.

3.6 FIELD QUALITY CONTROL

A. The following inspection and testing shall be performed: surface profile, visual inspection, and wet and dry film thickness testing. All inspection and testing shall be witnessed by ENGINEER.

1. Surface Profile Testing. The surface profile for ferrous metal surfaces shall be measured for compliance with the specified minimum profile. The surface profile for concrete shall comply with SSPC 13/NACE 6 Table 1 for severe service.

2. Visual Inspection. The surface of the protective coatings shall be visually inspected.

3. Film Thickness. Coating film thickness shall be verified by measuring the film thickness of each coat as it is applied and the dry film thickness of the entire system. Wet film thickness shall be measured with a gauge that will measure the wet film thickness within an accuracy of ±0.5 mil. Dry film thickness shall be measured in accordance with SSPC-PA 2.

3.7 FIELD PRIMING SCHEDULE

A. In general, steel and cast iron surfaces of equipment are specified to be shop primed. Any such surfaces which have not been shop primed shall be field primed. Damaged or failed shop coatings which have been determined unsuitable by Engineer shall be removed and the surfaces shall be field coated, including prime coat (if any). Galvanized, aluminum, stainless steel, and insulated surfaces shall be field primed. Primers used for field priming, unless otherwise required for repair of shop primers, shall be:

Surface To Be Primed	Material
Equipment, surfaces to be coated with	
Aliphatic polyurethane	Universal primer.
Epoxy enamel	Same as finish coats.
Coal tar coating	Same as finish coats.
Vinyl ester	Same as finish coats.
Steel and cast iron, surfaces to be coated with	
Epoxy enamel	Same as finish coats.
Coal tar coating	Same as finish coats.
Aluminum	Epoxy enamel.
Galvanized	Epoxy enamel.
Copper	Epoxy enamel.
Stainless steel	Epoxy enamel.
Plastic surfaces, including PVC and FRP	Same as finish coats.
Insulated piping	As recommended by manufacturer of finish coats.
Concrete, surfaces to be coated with epoxy enamel	
For damp-proofing	Epoxy enamel.
For all other surfaces	Epoxy concrete filler and surfacer.
Concrete block exposed in exterior locations	Epoxy concrete block filler.
Concrete block to be coated with epoxy enamel	Epoxy concrete block filler.

B. Unless otherwise recommended by the coating manufacturer or specified herein, priming will not be required on concrete, or concrete block, nor on metal surfaces specified to be coated with epoxy enamel, coal tar epoxy, and heat-resistant coatings. Concrete surfaces to be coated with epoxy enamel shall be filled with epoxy concrete filler and surfacer so that a continuous film is obtained, except where concrete is damp-proofed with epoxy enamel.

3.8 FINISH COATING SYSTEMS

A. The following schedule lists coatings systems and coating system designations.

No.	Finish Coating Systems	Coating System Designation						
		A	C	E	F	G	H	P
1.	Epoxy enamel – One coat	x			x	x		
2.	Epoxy enamel – Two coats	x	x	x	x	x		x
3.	Epoxy enamel / NSF – Two coats		x	x				
4.	Epoxy enamel – Three coats	x	x	x				
5.	Epoxy enamel / NSF – Three coats		x	x				
6.	Epoxy enamel – First coat Aliphatic polyurethane – Finish coat	x	x	x	x	x		x
7.	Epoxy enamel – First and second coat Aliphatic polyurethane – Finish coat			x	x	x		
8.	Universal primer – First coat Aliphatic polyurethane – Finish coat	x		x				
9.	Medium consistency coal tar – Two coats	x	x	x				
10.	Coal tar epoxy – Two coats	x	x	x				
11.	Vinyl ester – Two coats			x				
12.	Heat resistant – Two coats						x	
13.	High heat resistant – Two coats						x	

B. Surfaces Not To Be Coated. Unless otherwise specified, the following surfaces shall be left uncoated:

1. Exposed aluminum, except ductwork.
2. Polished or finished stainless steel. Unfinished stainless steel, except flashings and counter flashings, shall be coated.
3. Nickel or chromium.
4. Galvanized surfaces, except piping, conduit, ductwork, and other items specifically noted.
5. Rubber and plastics, except as specified.
6. Exterior concrete.
7. Surfaces specified to be factory finished.

C. Shop Finishing. Items to be shop finished include the following. Shop finishing shall be in accordance with the coating schedule and the manufacturer's recommendations.

1. Other surfaces where blast cleaning cannot be or is not recommended to be performed in the field.
2. Other items as otherwise specified.

D. Field Coating. Items to be field coated include the following. Field coating shall be in accordance with the field priming schedule, the coating schedule, and the manufacturer's recommendations.

1. Surfaces not indicated to be shop finished and surfaces where blast cleaning can be performed in the field.
2. All interior ferrous metal surfaces.
3. Other items as otherwise specified.

3.9 METAL SURFACES COATING SCHEDULE

Surface To Be Coated	Finish Coating System
Non-galvanized structural and miscellaneous steel exposed to view or to the elements in exterior locations.	A6
Non-galvanized structural and miscellaneous steel exposed to view inside buildings.	A2
Unless otherwise specified, pumps, motors, speed reducers, and other machines and equipment exposed to view.	E8
Heating and air conditioning units, convector covers, electrical equipment cabinets, and similar items and equipment (unless factory finished) exposed to view.	E8
Cast Iron and steel piping inside buildings, including valves, fittings, flanges, bolts, supports, and accessories, and galvanized surfaces after proper priming.	A2
Supports and miscellaneous metal for equipment handling corrosive chemicals.	Indoor - A2
Aluminum in contact with concrete.	F1
Aluminum and galvanized ductwork and conduit indoors.	F2 or G2
Aluminum and galvanized ductwork and conduit exposed to elements outdoors.	F7 or G7

Surface To Be Coated	Finish Coating System
Ductile iron piping, fittings, supports, valves, bolts, and accessories exposed above grade	A8

3.10 CONCRETE AND MASONRY SURFACES COATING SCHEDULE

Surface To Be Coated	Finish Coating System
Concrete adjacent to corrosive chemical storage and feed equipment.	Vinyl Ester With Graphite Filler

3.11. PIPING IDENTIFICATION SCHEDULE

A. Exposed piping and piping in accessible chases shall be identified with lettering or tags designating the service of each piping system, marked with flow directional arrows, and color coded.

B. Piping scheduled to be color coded shall be completely coated with the indicated colors, except surfaces specified to remain uncoated shall include sufficiently long segments of the specified color to accommodate the lettering and arrows. All other piping shall be coated to match adjacent surfaces, unless otherwise directed by ENGINEER.

C. Location.

1. Lettering and flow direction arrows shall be provided on pipe near the equipment served, adjacent to valves, on both sides of wall and floor penetrations, at each branch or tee, and at least every 50 feet in straight runs of pipe. If, in the opinion of Engineer, this requirement will result in an excessive number of labels or arrows, the number required shall be reduced as directed.

D. Lettering

1. Lettering shall be a vinyl label on piping or shall be applied as snap-on markers. Snap-on markers shall be plastic sleeves, Brady "Bradysnap-On B- 915" or Seton "Setmark". Letter size shall be as follows:

Outside Diameter of Pipe or Covering	Minimum Height of Letters
5/8 inch and smaller	Metal tags -1/4 inch
3/4 to 4 inches	3/4 inch
5 inches and larger	2 inches

E. Color Coding and Lettering.

1. All piping for the following services shall be color coded. Bands shall be 6 inches wide spaced along the pipe at 5 foot intervals. For services not listed, the color coding and lettering shall be as directed by the ENGINEER.

Piping Identification		
Service	**Color of Pipe**	**Color of Letters**
Ammonia	White	Black
Chlorine (solution)	Yellow	Black
Drain	Dark gray	White
Fire Protection Water	Red	White
Nonpotable or Raw Water	Clover (Tenemic)	Black
Plumbing Vents	Dark gray	White
Potable Water (hot or cold)	Safety blue	Black
Sample	Safety blue	Black
Service Water	Safety blue	Black
Caustic	Yellow with green bands	Black

2. Electrical conduit (with the exception of galvanized) shall be coated to match adjacent ceiling or wall surfaces as directed by ENGINEER. Vent lines shall be coated to match surfaces they adjoin.

3. Numerals at least 2 inches high shall be painted on or adjacent to all accessible valves, pumps, flowmeters, and other items of equipment which are identified on the drawings or in the specifications by number.

END OF SECTION

SECTION 15065

STEEL PIPE

PART 1 – GENERAL

1.01 WORK INCLUDED

A. The CONTRACTOR shall furnish lined and coated welded steel pipe, all in accordance with the requirements of these SPECIFICATIONS and the CONTRACT DOCUMENTS.

B. The CONTRACTOR shall furnish cement mortar lined and polyurethane coated steel pipe, fittings, and specials that conform to ANSI/AWWA C200, C205, and/or C222, subject to the requirements of these SPECIFICATIONS. Cement mortar lined taped coated steel pipe, fittings, and specials shall only be furnished as specified in the CONTRACT DOCUMENTS or as directed by the ENGINEER for field repairs of existing pipe or connections.

C. The pipe shall be of the diameter and meet the internal pressure and external load specified, shall be furnished complete with welded joints, as indicated in these SPECIFICATIONS, and all specials and fittings shall be provided as required under the CONTRACT DOCUMENTS.

D. The CONTRACTOR shall furnish all the materials, tools, labor, supervision, and appliances for and properly install, connect, adjust, test, disinfect, and place in continuous satisfactory service all welded steel pipe and fittings at the locations and to the elevations indicated on the DRAWINGS, specified or required for the proper completion of the WORK.

E. Wherever the WORK disturbs existing conditions or WORK already completed, the CONTRACTOR shall restore the same to its original condition in every detail. All such replacement and repair shall meet with the approval of the ENGINEER.

F. Welded steel pipe and fittings are not necessarily completely indicated or detailed on the DRAWINGS. The DRAWINGS are schematic only, and indicate pipe and fittings in a general way. The CONTRACTOR shall furnish all materials, pipe, and fittings required, and shall conform to all applicable LAWS AND REGULATIONS.

G. The CONTRACTOR shall provide an installation, complete in every detail, whether or not indicated on the DRAWINGS, or specified herein. The CONTRACTOR shall be responsible for all details, devices, accessories, and special construction necessary to properly furnish, install, adjust, test, disinfect, and place in continuous satisfactory service, and complete the WORK in an acceptable manner.

H. Full responsibility for designing, fabricating, and installing the steel pipe and fittings, for selecting materials of construction only from accepted alternative materials, and for demonstrating compliance with specified performance requirements shall rest with the CONTRACTOR and, through the CONTRACTOR, the SUPPLIER. SUPPLIER shall mean the pipe manufacturer,

unless otherwise noted. CONTRACTOR shall field verify all SUPPLIER furnished pipe dimensions upon delivery to the project site.

I. The ENGINEER'S acceptance of 1) the manufacture and installation of the welded steel pipe and fittings; 2) the use of materials included in these SPECIFICATIONS; and 3) alternative materials offered by the CONTRACTOR shall not relieve the CONTRACTOR and SUPPLIER of full responsibility for meeting all performance requirements and guarantees.

J. CONTRACTOR shall maintain an inventory of spare steel butt straps, pipe shorts, fittings, and specials for use in the event that adjustments must be made in the pipeline alignment during construction. These items shall have the interior and exterior coated as indicated in the Protective Coatings section for extended outside storage.

K. Welding Procedure Specification (WPS):
1. Qualified by testing in accordance with ASME BPVC SEC IX for shop welds and AWS D1.1/D1.1M for field welds.
2. PQRs conducted on unlisted base metal to be production welded as required in the referenced welding Code shall be traceable to heat lots.
3. Written WPS required for welds, both shop and field.

1.02 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Without limiting the generality of other requirements of these SPECIFICATIONS, all WORK specified herein shall conform to or exceed the applicable requirements of the referenced portions of the following documents to the extent that the requirements therein are not in conflict with the provisions of this Section.

1. Commercial Standards: (Latest Revision)

ANSI/ASME	B16.5	Pipe Flanges and Flanged Fittings and Other Special Alloys
ANSI/ASME	B16.9	Factory-Made Wrought Buttwelding Fitting
ANSI/ASME	B36.10 Welded and Seamless Wrought Steel Pipe	
ANSI/ASTM	A139	Specification for Electric Fusion Arc – Welded Steel Pipe (Sizes 4-in. and Over)
ANSI/ASTM	E165	Methods for Liquid Penetrant Inspection
ASNT	SNTTC1A	Recommended Practice for Personnel Qualification and Certification in Nondestructive Testing
ANSI/AWS	D1.1	Structural Welding Code-Steel

ANSI/AWWA	C200	Steel Water Pipe 6 IN. and Larger
ANSI/AWWA	C205	Cement-Mortar Protective Lining and Coating for Steel Water Pipe – 4 IN. and Larger - Shop Applied
ANSI/AWWA	C206	Field Welding of Steel Water Pipe
ANSI/AWWA	C207	Steel Pipe Flanges for Waterworks Service Sizes 4-IN. through 144 IN.
ANSI/AWWA	C208	Dimensions for Fabricated Steel Water Pipe Fittings
ANSI/AWWA	C209	Cold-Applied Tape Coatings for Steel Water Pipe, Special Sections, Connections, and Fittings
ANSI/AWWA	C210	Liquid Epoxy Coatings and Linings for Steel Water Pipe and Fittings
ANSI/AWWA	C216	Heat-Shrinkable Cross-Linked Polyolefin Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines
ANSI/AWWA	C219	Bolted, Sleeve-Type Couplings for Plain-End Pipe
ANSI/AWWA	C222	Polyurethane Coating Systems for the Interior and Exterior of Steel Water Pipe and Fittings
ANSI/AWWA	C602	Cement Mortar Linings In Place
ANSI/AWWA	C604	Installation of Buried Steel Water Pipe – 4 In. (100mm) and Larger
ANSI/AWWA	C606	Grooved and Shouldered Joints
ASTM	A36	Specification for Structural Steel
ASTM	A181	Specification for Forged or Rolled Steel Pipe Flanges, Forged Fittings, and Valves and Parts for General Service

ASTM	A283	Specification for Low and Intermediate Tensile Strength Carbon Steel Plates, Shapes, and Bars
ASTM	A285	Specification for Pressure Vessel Plates, Carbon Steel, Low and Intermediate-Tensile Strength
ASTM	A307	Specification for Carbon Steel Externally and Internally Threaded Standard Fasteners
ASTM	A325	Specification for High Strength Bolts for Structural Steel Joints
ASTM	A568	Specification for General Requirements for Steel, Sheet, Carbon, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled
ASTM	A572	Specification for High Strength Low Alloy Columbium-Vanadium Steels of Structural Quality
ASTM	A1011	Standard Specification for Steel, Sheet and Strip, Hot-Rolled Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength
ASTM	C150	Specification for Portland Cement
ASTM	E329	Standard Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection.
ASTM	E709	Standard Guide for Magnetic Particle Testing
ASTM	E1255	Standard Practice for Radioscopy.
ANSI	B1.1	Unified Inch Screw Threads (UN and UNR Thread Form)
ANSI/ASME	B16.1	Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250 and 800
ANSI	B18.2.1	Square and Hex Bolts and Screws, Including Askew Head Bolts, Hex Cap Screws, and Lag Screws

ANSI	B18.2.2	Square and Hex Nuts
ASME	BPVC	Boiler and Pressure Vessel Code, Section VIII
ASME	BPVC	Welding and Brazing Qualifications, Section IX
ANSI/ASTM	E709	Standard Guide for Magnetic Particle Testing
AWS	D1.1/D1.1M	Structural Welding Code – Steel
AWS	B2.1	Specification for Welding Procedure and Performance Qualifications
AWS	QC 1	Standard for AWS Certification of Welding Inspectors
AWWA	M-11	Steel Water Pipe – A Guide for Design and Installation
NSF	60	Drinking Water Treatment Chemicals – Health Effects
NSF	61	Drinking Water System Components – Health Effects

2. DEFINITIONS

A. Fittings: Including, but not limited to fittings, closure pieces, bends, reducers, tees, wyes, bifurcations, crosses, outlets, manifolds, nozzles, wall sleeves, bulkheads, and other piping and appurtenances fabricated from steel plate, sheet, or coils as required to provide the Work, complete. Fittings shall include piping above ground or inside structures.

B. Acronyms:
   1. CJP: Complete Joint Penetration.
   2. CWI: Certified Welding Inspector.
   3. MT: Magnetic Particle Testing.
   4. NDE: Nondestructive Examination.
   5. NDT: Nondestructive Testing.
   6. PJP: Partial Joint Penetration.
   7. PQR: Procedure Qualification Record.
   8. PT: Liquid Penetrant Testing.
   9. RT: Radiographic Testing.
   10. UT: Ultrasonic Testing.

11. VT: Visual Testing.
12. WPQ: Welder/Welding Operator Performance Qualification.
13. WPS: Welding Procedure Specification.

1.03 SUBMITTALS

A. Plant Certification: The CONTRACTOR shall provide the ENGINEER with evidence that the SUPPLIER and the proposed manufacturing plant have either received ISO 9000 Certification, or have been certified by the Steel Plate Fabricators Association as a quality steel pipe producer and facility before the start of manufacture of the pipe required for this PROJECT.

B. SHOP DRAWINGS: The CONTRACTOR shall submit SHOP DRAWINGS of pipe, fittings, specials, joints, interior linings, and coatings in accordance with the requirements of the CONTRACT DOCUMENTS, the requirements of AWWA M11 and ANSI/AWWA C200, C208, C205, C214, and C222 and the following supplemental requirements as applicable:

1. Certified dimensional drawings of all pipe, specials, and fittings.

2. Joint and pipe/fitting wall construction details that indicate the type and thickness of the steel wall; manufacturing tolerances; and all other pertinent information required for the manufacture and performance history of the product.

3. All fittings and specials shall be properly reinforced to withstand the internal pressure both circumferential and longitudinal, and the external loading conditions as indicated in the CONTRACT DOCUMENTS.

4. Design calculations, signed and sealed by a Registered Professional Engineer licensed to practice in the State of Florida, of each section of pipe wall, joint reinforcing, girth joints, and specials; all sufficient to ascertain conformance of pipe and fittings with these SPECIFICATIONS.

5. Laying schedule and marking diagrams that indicate the specific number (identifying number) of each pipe, fitting and special, and the location and direction of lay of each pipe and fitting in the completed line. The laying schedule shall be prepared based on the alignment survey provided by the CONTRACTOR's registered land surveyor. In addition, the laying schedule shall include: the pipe station and invert elevation at all changes in grade or horizontal alignment; the station and invert elevation to which the bell end of each pipe will be laid; all elements of curves and bends, both in horizontal and vertical alignment; and the limits of each reach of restrained and/or welded joints, or of concrete encasement.

6. Laying schedules shall be prepared based on the alignment survey provided by the CONTRACTOR's registered land surveyor and shall be submitted at a scale of not less than 1 inch equal to 40 feet. Drawings of special details such as reinforcement, cathodic protection system elements, testing stations, joint bonding, etc. shall be at a scale that clearly depicts the item being detailed and in general shall not be at a scale less than 1/8 inch equal to 1 foot.

7. Within ten (10) days after receipt of the NOTICE OF AWARD, the CONTRACTOR shall submit the proposed proof of design testing dates and production schedules of all materials to be used in the PROJECT. The actual testing and production dates shall be confirmed by the CONTRACTOR in writing to the ENGINEER not less than fourteen (14) days prior to the start of a test or production run.

8. Steel pipe and fittings shop spiral weld ultrasonic test reports as specified in Section 1.08.B.

9. Steel fittings manually welded ultrasonic tests as specified in Section 1.08.B.

10. Detailed drawings of joint bonds, corrosion test stations, and all corrosion protection systems required for the PROJECT.

11. The SUPPLIER shall submit through the CONTRACTOR an affidavit that the pipe, fittings and other products or materials furnished for this PROJECT comply with all applicable provisions of these SPECIFICATIONS.

12. Material lists and steel reinforcement schedules that include and describe all materials to be utilized.

13. Full and complete information regarding location, type, size, and extent of all welds shall be shown on the SHOP DRAWINGS. The SHOP DRAWINGS shall distinguish between shop and field welds. SHOP DRAWINGS shall indicate by welding symbols or sketches the details of the welded joints, and the preparation of parent metal required to make them. Joints or groups of joints in which welding sequence or technique are especially important shall be carefully controlled to minimize shrinkage stresses and distortion.

14. Certified mill test reports of all materials used in the manufacture and/or installation of the pipe.

15. The CONTRACTOR shall furnish lists, in duplicate, of all pieces of pipe and fittings in each shipment received, and these lists shall give the identifying number, weight, class, size, and description of each item received at the PROJECT site.

16 The CONTRACTOR's inventory of spare steel pipe shorts, fittings, and adapters shall be included in these lists.

17. Details of the stulling assembly.

18. A complete field pressure testing, flushing, and disinfection (if applicable) plan for review and approval prior to the performance of any of these activities.

C. Certifications: The SUPPLIER shall submit through the CONTRACTOR to the ENGINEER certified copies of the following supplemental data for all pipe, fittings, and specials:

1. Certified mill test reports (Section 1.03.B.14).

2. All Proof of Design Tests listed in Section 1.06.

3. Hydrostatic Test Reports listed in Section 1.07.B.

4. Certification of calibration of testing and measuring equipment as specified in Section 1.07.A.

5. Results of production and shop tests listed in Section 1.07.

6. Welders and welding methods.

7. All quality control check sheets used during the inspection and testing of pipe and fittings produced for this PROJECT.

8. The results of all shop and/or field repairs made to any pipe, fittings, lining or coating.

9. Results of shop holiday testing of coatings on all pipe, fittings and specials listed in Section 1.07.G.

10. Certification of installation observations by SUPPLIER'S field representative as specified in Section 3.15.

11. The SUPPLIER shall submit through the CONTRACTOR six (6) copies of the SUPPLIER'S sworn certificate of inspection and testing of all steel pipe and fittings used on the WORK. All pipe and fittings will be subject to inspection and acceptance by the ENGINEER during production and after delivery of material to PROJECT site. No broken, cracked, misshaped, imperfectly coated, damaged or otherwise unsatisfactory pipe or fittings shall be used. Such inspection by the ENGINEER shall not relieve the CONTRACTOR of full responsibility for the materials furnished and installed.

12. Certification of polyurethane applicators as specified in Section 3.07.A.

D. Design Report: The SUPPLIER shall submit through the CONTRACTOR a design report to the ENGINEER for acceptance prior to the start of fabrication of the pipe. This report shall contain sketches and calculations in sufficient detail to show that the applicable design limitations are satisfied under design conditions and that the design is in accordance with these SPECIFICATIONS. Design drawings shall be included showing all dimensions necessary to verify the design, including but not limited to:

1. Steel pipe thickness.

2. Grades of steel to be used in the fabrication of the pipe.

3. Design mixes for use for the cement mortar lining including sources of the materials.

4. SUPPLIER'S maximum recommended joint deflection.

5. Catalog cuts of proposed coating materials and application methods.

Specifications of the material to be used in the fabrication that vary from materials specified herein shall be included in the report with data and/or tests substantiating acceptability for use in the PROJECT and in sufficient detail to permit verification by the ENGINEER. Materials shall not be used until accepted by the ENGINEER. The design report shall be signed and sealed by a Registered Professional Engineer licensed to practice in the State of Florida.

E. All expenses incurred in making samples for certification of tests and in the preparation of the design report shall be borne by the CONTRACTOR.

1.04 QUALITY ASSURANCE

A. Materials and workmanship: The CONTRACTOR shall furnish materials under these SPECIFICATIONS that are new, unused, and as specified, or if not specified herein, which are the best of their respective kind, free of defects and imperfections, and suitable for the service intended, subject to the acceptance of the ENGINEER.

The CONTRACTOR shall provide workmanship that is first class in every respect and have installation performed by workers thoroughly experienced in such work. The finished WORK shall have an appearance in accordance with these SPECIFICATIONS and acceptable to the OWNER.

The CONTRACTOR shall perform the WORK in accordance with all applicable LAWS AND REGULATIONS.

B. General: The welded steel pipe furnished under these SPECIFICATIONS shall comply with ANSI/AWWA C200 except as it may be modified herein.

Welders and welding methods shall be certified to a nationally recognized welding specification for the type of steel and weld used to manufacture the pipe and fittings.

All test equipment used in activities affecting quality control shall be calibrated and certified at no longer than annual intervals unless otherwise specified or required.

All pipe shall be clean, sound, and without defects. If the pipe is determined by the ENGINEER not to be in compliance with this SPECIFICATION and repairs to the pipe are required, no manner of repair will be accepted unless otherwise specified or accepted by the ENGINEER.

The ENGINEER shall have the right to determine the rejection of pipe as defined in ANSI/AWWA C200 Section 5.1.3. "Rejection of Pipe".

1.05 SUPPLIER'S QUALIFICATIONS

A. All pipe, fittings, and specials shall be manufactured, fabricated, coated and lined by a single qualified SUPPLIER per Section 1.01. Fittings may be fabricated at a site other than where the pipe is manufactured; however, all testing and application of linings and coatings shall be performed where the pipe or fitting is manufactured and shall be subject to inspection by the OWNER and/or the ENGINEER. The SUPPLIER shall have at least five years' experience in supplying pipe, fittings, and specials greater than 36 inches in diameter. The SUPPLIER shall be required to show experience in supplying pipe in environments similar to those expected to exist on this PROJECT and that the pipe supplied in those environments has functioned satisfactorily.

B. The SUPPLIER(s) supplying pipe, fittings, and specials shall submit the following with the CONTRACTOR'S bid for review by the OWNER prior to award:

1. A list of 5 similar projects successfully installed and in operation for the last 5 years including: pipe diameters and length; project environment (to the extent available): project name and location; consulting engineer's name, address, phone number and reference contact; installation contractor's name, address, phone number and reference contact; owner's name, address, phone number and reference contact.

2. A quality assurance manual showing the existence and structure of an internal quality assurance program operating independently of production management, with check points and procedures to identify materials received and products manufactured, all as conforming to these Specifications.

3. Name of Supplier and evidence of plant and equipment capacity to perform the required pipe production, testing, fabrication, lining and coating, showing that all materials can be fabricated and installed within the Contract Time.

1.06 PROOF OF DESIGN TESTS

A. Proof of Design Tests (or previously performed Proof of Design Tests that were witnessed and certified by an independent testing laboratory for pipe of the diameter and joint design used on the PROJECT) shall be required for each joint configuration of each diameter of pipe to be supplied for the PROJECT except for butt weld and double-welded lap joints. Pipe to be tested shall be mortar lined and shall be representative in every way of the pipe to be supplied under these SPECIFICATIONS.

B. Testing, if performed, shall be witnessed and accepted by the ENGINEER or its designee. No production pipe shall be manufactured and no pipe shall be shipped to the PROJECT except at the CONTRACTOR'S sole risk until pipe Proof of Design Tests have been completed and accepted by the ENGINEER. The CONTRACTOR shall provide a minimum of fourteen (14) DAYS NOTICE to the ENGINEER prior to conducting the Proof of Design Tests.

C. Straight lengths of test pipe shall be a full length of pipe as that to be used on the PROJECT. Pipe that is used in and successfully passes the Proof of Design Tests can be supplied for use as pipe on the PROJECT if acceptable to the ENGINEER.

D. Joints shall be designed to resist thrust for the pressures and conditions specified or shown on the DRAWINGS. Proof of Design Tests shall be performed that show the restrained joint's ability to perform as indicated in these SPECIFICATIONS and that stresses in the pipe will not exceed those specified.

E. During the Proof of Design Test, no leaks, joint seepage, cracks (greater than 0.003 inches wide nor longer than 12 inches in length) in the mortar lining or disbonding of the lining shall occur.

F. Hydrostatic Proof of Design Test: Hydrostatic tests shall include at least 2 lengths of pipe. Pipe to be hydrostatically tested may be pre-wetted by maintaining a hydrostatic pressure of not more than the PROJECT working pressure for a period not to exceed 48 hours. Pipe shall be filled with water and suitably bulkheaded or, if prewetted, water shall be added. Pressure shall be increased to the Quality Assurance (QA) test pressure indicated in these SPECIFICATIONS. Test period shall start 5 minutes after pipe has reached QA test pressure. Pipe shall be hydrostatically tested and kept under the QA test pressure for at least 20 minutes. During the test period no leak or joint seepage shall occur.

G. Failing Proof of Design Tests: Any diameter of pipe or joint configuration failing any Proof of Design Test shall be redesigned by the SUPPLIER and retested until all tests are passed. The costs of any observation of retests by the OWNER or the ENGINEER shall be paid by the CONTRACTOR.

1.07 SHOP TESTS ON PRODUCTION PIPE

A. General: All tests required by ANSI/AWWA C200, C205, C208, C209, C210, C214, and C222 and as required herein shall be performed by the SUPPLIER and records of all tests shall be provided to the OWNER. Shop tests shall be subject to witness by the ENGINEER and/or OWNER and certified test reports shall be submitted by the SUPPLIER through the CONTRACTOR to the ENGINEER for acceptance. No lot of pipe shall be shipped to the site of the WORK until all required shop tests are completed and approved by the ENGINEER ..

The CONTRACTOR shall perform or have performed material tests at no additional cost to the OWNER. The OWNER and/or the ENGINEER shall have the right to witness all testing conducted by the CONTRACTOR; provided that, the CONTRACTOR'S schedule is not delayed for the convenience of the OWNER. It shall be the responsibility of the CONTRACTOR to provide NOTICE to the ENGINEER of proposed tests in accordance with this Section and the CONTRACT DOCUMENTS.

Tests and examinations to verify the quality of work shall be performed by persons other than those engaged in the activity being examined. Such persons shall not report directly to the production supervisor responsible for the manufacture of the pipe.

All instruments, gauges, and other testing and measuring equipment used in activities affecting quality shall be of proper range, type, and accuracy to verify conformance with SPECIFICATION requirements. Procedures shall be in effect to assure that all gauges and other testing and measuring equipment are calibrated and certified at no longer than annual intervals. Calibration shall be against measurement standards that have known relationship to national standards where

such exist. Gauges must be calibrated and certified for the piece of equipment of which they are a part and must remain on the piece of equipment following certification. The SUPPLIER shall submit through the CONTRACTOR to the ENGINEER certification of equipment calibration. Materials and items including products previously checked or manufactured with equipment found to be out of calibration or adjustment shall be considered unacceptable until it can be determined that all applicable requirements have been met.

The SUPPLIER's records of required tests and inspections shall include records of materials, manufacturing, examination, repairs, and test data taken before and during fabrication. The ENGINEER reserves the right to request that specific data be included in the records that may not otherwise be included. Whenever tests and examinations are performed on a pipe element or pipe, the appropriate pipe identification number shall be shown on the report. Copies of all records of tests conducted by the SUPPLIER, independent laboratory, or material manufacturers shall be submitted by the SUPPLIER through the CONTRACTOR to the ENGINEER in such form as to be appropriate for permanent records.

The ENGINEER shall have access to all records of tests and inspections related to pipe manufactured for use in the WORK.

In addition to those tests specifically required, the OWNER may request additional samples for testing by the OWNER. The cost for these additional samples shall be borne by the OWNER at no additional cost to the CONTRACTOR.

B. Hydrostatic Test: After the joint configuration is completed, and prior to lining or coating, each length of pipe and each fitting shall be hydrostatically shop tested and certified to a pressure that will induce a stress of not less than 75 percent of the specified minimum yield strength of the steel used in the manufacture of the pipe or fitting. Fittings fabricated from previously hydrostatically tested pipe need have only the new welds tested by a method acceptable to the ENGINEER.

C. Material Tests: Each heat of steel shall be tested for conformance to AWWA C200 for the following:
- tensile strength
- elongation
- yield strength
- thickness

D. Cement Mortar Lining: The cement mortar lining shall be non-destructively tested for thickness. The thickness shall be measured between 24 and 36 inches from each end at eight locations equally spaced around the circumference (45-degree arcs). The arithmetic mean value of the readings shall not be less than 94% of the nominal specified thickness, and no individual reading shall be less than 80% of the nominal specified thickness. Pipe with mortar lining that does not meet these criteria shall be cleaned and relined.

E. Inspection : No visible crack wider than allowed by ANSI/AWWA C205 shall be permitted in the lining of finished pipe. Loose areas of cement mortar linings in a pipe, fitting or special shall not be accepted.

F. Coating: The batch sampling, testing procedure, and basis of rejection for the polyurethane materials shall be in accordance with ANSI/AWWA C222, except that all tests will be conducted by the polyurethane SUPPLIER and shall be subject to witness by the ENGINEER and/or the OWNER at their discretion.

A certified report on test results for all coating material tests shall be submitted by the polyurethane SUPPLIER through the CONTRACTOR to the ENGINEER for acceptance prior to the onset of the coating application process. This report and the test data shall be generated by the coating SUPPLIER. Computer printouts on test data shall be sent to the coating applicator and shall be made available for review.

G. Holiday Testing: Each coated pipe, fitting, and special shall be electrically tested for flaws in the coating with a suitable holiday detector acceptable to the ENGINEER. Reference shall be made to ANSI/AWWA C222

All holidays detected, due to flaws or mislaps, shall be immediately repaired. The flawed or mislapped area shall be cleared of all affected material and coating repaired if necessary. The area shall then be rechecked with a holiday detector.

1.08 INSPECTION

A. General: The ENGINEER shall have the right to order any pipe, which in the ENGINEER'S opinion does not meet these SPECIFICATIONS, to be rejected and not shipped to the PROJECT site or returned from the PROJECT site at no cost to the OWNER.

The OWNER reserves the right to witness the testing of materials by the SUPPLIER or have same performed by an independent testing service. If the independent test results are found to meet the requirements of the SPECIFICATIONS, the costs for such testing shall be paid for by the OWNER. If the independent test results show that the pipe manufactured does not meet the requirements of these SPECIFICATIONS, the CONTRACTOR shall pay for all testing and retesting costs. The SUPPLIER shall make all plant laboratory facilities available to the OWNER and/or the ENGINEER and shall notify the ENGINEER at least fourteen (14) DAYS prior to start of production of the pipeline materials for the PROJECT.

B. Welding Procedures, Welder Qualifications, and Testing:

All welders shall be, as a minimum, qualified in positions as described in AWS B2.1. All welding procedures, welders, welding operators and tackers shall be qualified in accordance with ASME Section IX and AWS D1.1 and as defined in ANSI/AWWA C200

Prequalified welding procedures shall be required for, but not necessarily limited to, longitudinal and girth or spiral welds for pipe cylinders, reinforcing plates, ring flange welds, and plates for lug connections. Weld seam tolerances shall be in accordance with ANSI/AWWA C200.

Shop spiral welds on 100 percent of steel pipe lengths selected for testing through a random process, all shop spiral welds on fittings, and coil splice welds shall be ultrasonically tested by qualified and certified operators employed by the fabricator. Shop ultrasonic weld tests shall be in accordance with the latest edition of API 5L. All costs for ultrasonic shop testing shall be paid by the CONTRACTOR. The CONTRACTOR and the ENGINEER shall each be furnished a copy of all ultrasonic test reports.

All shop welds other than spiral welds shall be visually inspected and tested by ultrasonic or magnetic particle methods.

Personnel performing visual inspection of welds shall be qualified and currently certified as Certified Welding Inspectors (CWI) in accordance with AWS QC1, Standard for Qualification and Certification of Welding Inspectors. Personnel performing nondestructive tests shall be qualified and certified to the requirements of SNT-TC-1A.

Nondestructive examination procedures shall be submitted in accordance with the submittals section at the time welding procedures are submitted. Records of inspection, nondestructive examination, and material certification shall be furnished to the ENGINEER.

All costs for inspection of shop welds shall be paid by the CONTRACTOR.

PART 2 – PRODUCTS

2.01 GENERAL

A. Cement mortar lined and polyurethane coated steel pipe, fittings, and specials shall conform to ANSI/AWWA C200, C205, C214, and/or C222, subject to the following supplemental requirements. The pipe shall be of the diameter and pressure class specified, shall be furnished complete with welded joints, as indicated in these SPECIFICATIONS, and all specials and fittings shall be provided as required under the CONTRACT DOCUMENTS.

B. Markings: The CONTRACTOR shall legibly mark all pipe, fittings, and specials in accordance with the laying schedule. Each pipe shall be numbered in sequence and said number shall appear on the laying schedule in its proper location for installation. All special pipe sections and fittings shall be marked at each end with field top. The markings on each pipe shall be such that the OWNER can track the pipe through the entire manufacturing and installation process.

C. Handling: The pipe and fittings shall be handled by use of belt slings, padded cradles, or other devices, designed and constructed to prevent damage to the pipe, coating or lining. The use of chains, cables, hooks, or other equipment that might injure the pipe, coating or lining will not be permitted.

D. Damaged Materials: The CONTRACTOR shall be fully liable for the cost of replacement or repair of pipe that in the opinion of the ENGINEER is damaged.

E. Storage: Stockpiled pipe shall be stored on pallets, skids, sand or rock free berms, sand bags, old tires or other suitable means so that the coating will not be damaged. The pipe shall not be rolled, pushed, or slid into place and shall be secured to prevent accidental rolling.

F. Stulling: Adequate stulling, per the SUPPLIER'S recommendations, shall be provided on all specials, fittings, and straight pipe so as to maintain roundness and to avoid damage to the pipe and fittings during handling, storage, hauling and installation.

G. Laying Length: Maximum pipe laying lengths shall be 50 feet with shorter lengths provided as required by the DRAWINGS or to complete the WORK.

H. Lining: Shop cement-mortar lined pipe shall have smooth dense interior surfaces and shall be free from fractures, disbonding, excessive interior surface crazing and roughness.

I. Bonding and Electrical Conductivity: All unwelded pipe joints shall be bonded for electrical conductivity in accordance with these SPECIFICATIONS and the details shown on the DRAWINGS.

J. Closures and Correction Pieces: Closures and correction pieces shall be provided as required so that closures may be made due to different headings in the pipe laying operation and so that corrections may be made to adjust the pipe laying to conform to pipe stationing shown on the DRAWINGS.

K. Conformance with NSF Standards: All materials that may come in contact with the water being conveyed (linings, gaskets, lubricants, grout, disinfection agents, etc.) shall be in accordance with and approved by the appropriate NSF Standard 60 or 61.

2.02 DESIGN CRITERIA

A. General: The pipe furnished under this section shall be steel pipe, cement mortar lined and polyurethane coated, with field welded joints. The pipe shall consist of a steel wall, shop lined with cement mortar and an exterior coating of polyurethane. The finished inside diameter of the pipe shall be the inside diameter after the specified lining has been installed.

B. The pipe shall be designed per AWWA M11, manufactured, tested, inspected, and marked according to applicable measurements stated herein and, except as modified, shall conform to ASNI/AWWA C200.

C. Where shown on the DRAWINGS, or where required to meet the conditions shown on the DRAWINGS, the thickness of the pipe, fittings, and specials shall be as required to meet the following parameters:

		Pipeline Identification
Di	Finished Inside Dia. (in)	60
Pw	Working Pressure (PSI)	50
Pt	Surge Allowance (PSI)	50
Pw+Pt	QA Test Pressure (PSI)	100
Pf	Field Test Pressure (PSI)	100
Pv	Vacuum Pressure (PSI)	Full vacuum
Dx	Maximum Deflection	2% inside diameter of finished pipe
Wd	Dead Load	wHcBc. See Note (1)
Ww	Live Load	2 AASHTO H-20 Trucks Passing
E′	Maximum Soil Modulus	1,000 for standard bedding conditions.
D_1	Deflection Lag Factor	1.0
Hc	Height of fill over top of pipe (feet)	5 ft. to 10 ft. See Note (1)
w	Weight of Soil (lb/ft^3)	120 lb/ft^3
	Bedding Angle (Central)	90 Degrees
K	Bedding Constant	0.096
R	Mean Radius of Pipe Shell (inch)	Dependent upon Pipe Size, Ty, and Mortar Lining Thickness
EI	Pipe Wall Stiffness ($lb\text{-}in^2$)	See Note (2)
Ty	Wall Thickness (inch)	As calculated in Section 2.03

Dy or Bc	Outside Diameter (inch) (min)	Di + 2 (Ty+Mortar Lining Thickness)
Fy	Minimum Yield of Steel (psi)	In accordance with these SPECIFICATIONS
F	Impact Factor	1.5

Note (1): All pipe and fittings shall be designed for a single condition: the worst possible combination of internal pressure, dead load (Wd), and live load (Ww). The dead load shall be computed assuming soil weight of 120#/ft^3 and prism load condition. The determination of live load shall be as recommended by AASHTO in "Standard Specifications for Highway Bridges." The design shall utilize two AASHTO H-20 trucks passing each other.

Note (2): EI shall be based on the sum of the pipe wall stiffness, for the shop applied mortar lining and steel wall assuming it acts as a two-part laminar ring that considers no bond between the steel wall and the applied lining. The term "pipe wall stiffness" as used herein is defined as EI, where "E" is the modulus of elasticity (E=30,000,000 psi for steel and E=4,000,000 psi for mortar) and "I" is the transverse moment of inertia per unit length of pipe wall, the factors in the foregoing expression to be dimensionally compatible.

2.03 PIPE DESIGN

A. General: Steel pipe and fittings shall be designed to perform under the most critical situation of internal pressure, external loads, buckling, and handling as determined by the design procedures per AWWA M-11 and the provisions of these SPECIFICATIONS. Notwithstanding the minimum wall thickness as designated in subparagraph "E" the installed pipe shall be designed to withstand the conditions of subparagraphs "B", "C", and "D" below.

B. Steel Wall Thickness for Internal Pressure: For resistance to internal pressure, the thickness of the steel wall shall be greatest of that determined by the following three formulas:

$$1)\ Ty=\frac{(Pw)Dy}{2(0.5Fy)}$$

$$2)\ \mathrm{Ty}=\frac{(Pw+Pt)Dy}{2(0.75Fy)}$$

$$3)\ Ty=\frac{(Pf)Dy}{2(0.75Fy)}$$

C. External Load Design: Upon determination of the steel wall thickness as calculated for internal pressure, deflection of the pipe shall be checked by the following formula:

$$D=\frac{KR^3(D_1Wd+Ww)}{EI+0.0614E'R^3}$$

Should the calculated deflection exceed the maximum allowable as stated herein, the wall thickness shall be increased or E' increased to limit the calculated deflection to the maximum allowable. When computing pipe deflection, do not consider the effect of the cement mortar lining in the calculation of EI.

D. Buckling Design: Buckling shall be evaluated in accordance with AWWA M-11 and the wall thickness increased as necessary to prevent the pipe from buckling. The effect of the cement mortar lining may be taken into account in the calculation of EI when evaluating buckling conditions due to vacuum. Groundwater table shall be assumed to be at grade when calculating buckling design.

E. Minimum Thickness: The maximum allowable diameter over thickness ratio (Dy/Ty) for pipe supplied under these Specifications shall be 175.

The minimum wall thickness for any steel pipe shall not be less than that calculated for the worse conditions as described herein, ANSI/AWWA C200, AWWA M11 or the following table whichever is greater.

MINIMUM THICKNESS

Pipe Diameter (Inside)	Minimum Wall Thickness (inches)
60 inch	0.34375

(Note Tampa Bay Water minimum wall thicknesses exceed M11 minimum wall thickness $t=D/240$ for cement mortar lining as well as the first test $t=pD_0/(2S)$

2.04 MATERIALS

A. Steel for Pipe and Fittings: Pipe manufactured under ANSI/AWWA C200 shall be fabricated from sheet or coil conforming to the requirements of ASTM A36, or ASTM A1018, Grades 40 or 45, or from plate in coil form conforming to the requirements of ASTM A572, Grade 42, or coil conforming to the requirements of ASTM A139, Grades C or D. Steel used in the manufacture of pipe and fitting under these SPECIFICATIONS shall be produced by the continuous casting

method and shall be of domestic manufacture. All longitudinal and girth seams, whether straight or spiral, shall be full penetration butt welded using an electric-fusion weld process. Weld beads shall not exceed more than one-eighth (1/8) of an inch in height above the outside of the pipe wall. Care shall be taken to not grind the parent metal.

B. Steel for Small Diameter Outlets: Outlet pipes 24 inches in diameter or smaller shall be fabricated in compliance with the requirements of AWWA C200 Section 4.10.

C. Carbon Content/Elongation: All steel used for the fabrication of pipe shall have a maximum carbon content of 0.25 percent and shall have a minimum elongation of 20 percent in an 8-inch gauge length.

D. Tolerance of the Steel Wall: Plate and sheet shall be the thickness as determined considering the worse combination of all design factors described herein and in ANSI/AWWA C200 and AWWA M-11. Cement: Cement for mortar shall conform to the requirements of ANSI/AWWA C205;

F. Epoxy Bonding Agent: For the field repair of shop-applied cement mortar lining an epoxy bonding agent conforming to ASTM C881, Type II shall be used. The epoxy bonding agent shall be moisture insensitive and suitable for the service conditions.

G. Latex Admixtures: For the field repair of shop-applied cement mortar lining a latex admixture shall be used. The latex admixture shall be Euclid "Euco Flex-Con" or Sika "Sika Latex".

2.05 FITTINGS

A. General: Fittings shall be fabricated in accordance with ANSI/AWWA C200 from pipe conforming to these SPECIFICATIONS. Fittings fabricated from previously hydrostatically tested straight pipe shall require testing of only those welded seams that were not previously hydrostatically tested in the straight pipe. Spiral welds of fittings shall be ultrasonically tested. All butt welds made after hydrostatic or ultrasonic testing of straight pipe shall be magnetic particle tested in accordance with ASTM E709. Acceptance criteria shall be in accordance with ASME Code for magnetic particle testing.

B. Dimensions: Fittings shall conform to the dimensions of ANSI/AWWA C208 or may be fabricated into standard or special pipe lengths. Elbows 0 degrees through 22-1/2 degrees shall be two-piece, 23 degrees through 45 degrees shall be three piece, over 45 degrees through 67-1/2 degrees shall be 4 piece and over 67-1/2 degrees through 90 degrees shall be five piece. Elbows shall have a minimum centerline radius of 2-1/2 times the pipe O.D.

C. Reinforcing: All tees, laterals and outlets shall be reinforced in accordance with ASME Pressure Vessel Code, Section VIII Paragraph G-37 or AWWA M-11, whichever is more stringent.

2.06 JOINTS

A. General: The standard field joint for steel pipe shall be a single welded lap joint on the inside of the pipe. Restrained joints shall be welded joints as described in these SPECIFICATIONS. Mechanically coupled or flanged joints shall be required where shown on the DRAWINGS. Butt

strap joints shall be used where required for closures or where shown on the DRAWINGS. The joints furnished shall have the same or higher pressure rating as the abutting pipe.

B. Single Welded Lap Joints: Lap joints prepared for field welding shall be in accordance with ANSI/AWWA C200. Bell ends shall be formed by an expanding press in such a manner as to stretch the steel plate beyond its elastic limit to form a truly round bell of suitable diameter and shape. No process will be permitted in which the bell is formed by rolling. Preformed welded bell and spigot joints (carnegie shapes) shall not be allowed. Facing surfaces of the bell and spigot shall be essentially parallel, but in no case shall the bell slope vary more than 2 degrees from the longitudinal axis of the pipe. The bell for field welded lap joints shall provide a minimum deflected joint lap of three times the thickness of the belled pipe or 1 inch, whichever is larger. The maximum allowable joint pull shall be ¾-inch.

C. Joints in Tunnels, Casings, or Shafts: A double full fillet weld (full fillet weld on outside of the pipe and a full fillet weld on the inside of the pipe) shall be provided where steel pipe is installed in casing pipe, shafts, or tunnels, or otherwise noted on the DRAWINGS. Where double full fillet welds are used in tunnels, casings, or shafts, a threaded outlet shall be provided by the SUPPLIER to allow an air test of the joint by the CONTRACTOR. The threaded outlet shall be plugged following the successful air test in accordance with ANSI/AWWA C206.

D. Restrained Joints1: Where required near fittings and valves or bulkheads, restrained joints shall be field welded joints. In reaches of pipe with high longitudinal stresses (800 Kips +), special welded joints are required and single welded lap joints are not acceptable. Special welded joints shall be double full fillet welded lap joints or full penetration butt-joints at the CONTRACTOR'S option.

Where harnesses are required for flexible sleeve-type couplings, they shall be in accordance with the requirements of AWWA M-11.

E. Where connections are required to pipe made of other materials, the Contractor shall submit transition fitting for Engineer's approval in accordance with 1.03 Submittals.

2.07 INTERIOR LINING

A. General: All welded steel pipe, specials and fittings shall be furnished with shop applied cement mortar lining.

B. Cement Mortar Lining: The interior surfaces of all steel pipe, fittings, and specials shall be cleaned and lined in the shop with cement mortar applied by the centrifugally spinning method in conformance with ANSI/AWWA C205. During the lining operation and thereafter, the pipe shall be maintained in a round condition by suitable bracing or stulling. The lining machines shall be of a type that have been used successfully for similar work. Every precaution shall be taken to prevent damage to the lining.

1. The pipe and fittings shall be bare where field joints occur. Ends of the linings shall be square and uniform. Feathered or uneven edges shall not be allowed to be shipped to the PROJECT.

2. Cement mortar lining shall be held back per SUPPLIER'S recommendations on bell ends.

3. Protection of Pipe Lining: All pipe and fittings with cement mortar linings, shall be provided with a polyethylene or other suitable bulkhead, as acceptable to the ENGINEER, on the ends of the pipe and on all openings to prevent drying out of the lining. All bulkheads shall be substantial enough to remain intact during shipping and storage until the pipe is installed.

C. Reinforcement: Wire fabric reinforcement shall be used in the lining of all bends, reducers, fittings, and specials in accordance with ANSI/AWWA C205, Section 4.4. Wire fabric shall be a minimum 18-gauge wire in accordance with ASTM A82.

D. Lining Thickness: The lining thickness shall be as follows:

Pipe Diameter (inch)	Nominal Thickness (inch)	Tolerance (inch)
48-96	1/2	-1/32, +3/16

A thicker lining may be provided where conditions require, however, the specified finished inside diameter shall be maintained.

Where the mortar lining is included as a component in the calculation of the pipe wall stiffness (EI), the minimum mortar lining thickness shall be used in the calculation.

2.08 EXTERIOR COATING –Polyurethane

A. Exterior Coating of Exposed Piping: The exterior surfaces of pipe that will be exposed to the atmosphere inside structures or above ground shall be thoroughly cleaned and then given a shop coat of rust inhibitive primer conforming to the requirements of painting or protective coatings section of these SPECIFICATIONS.

B. Exterior Coating of Straight Pipe and Fittings: Polyurethane coating of straight pipe and fittings be applied in accordance with ANSI/AWWA C222 as modified below:

1. Coating Layers: The polyurethane coating shall be blue, or other color specified by the ENGINEER and shall have a total dry film thickness of at least 25 mils thick or the minimum dry film thickness required by the manufacturer to meet the requirements of ANSI/AWWA C222, whichever is greater. The coating may be applied as a single layer system.

2. Physical Properties: The overall impact resistance for the pipe coating system shall have a minimum average value of 75 in.-lbs. per ASTM G14 test. Other physical requirements of the polyurethane coating system shall equal or exceed the minimum physical property requirements tabulated in AWWA C222.

C. Application of Polyurethane Coating System

1. General:

a. The pipe coating system shall consist of, but not be limited to: pipe cleaning, surface blasting, coating application, and curing.

b. The application procedure for the pipe coating shall comply with the requirements of ANSI/AWWA C222.

c. The coating application shall be continuous, automated operation starting with 1) a properly prepared pipe surface and proceeding with 2) application of the polyurethane coating system directly over the pipe, 4) curing of the coating system, and 5) holiday testing and inspection of the cured pipe.

Note: If any coating repairs are required after testing and inspection, the pipe shall be reinspected for electrical continuity. The final pipe shall be holiday-free.

2. Pipe Preparation:

a. Prior to sand or shot blasting, the weld bead shall be ground down on the outside wall of the pipe a minimum distance to not interfere with jointing. The weld bead shall not exceed one-eighth (1/8) inch in height above the outside of the pipe wall prior to start of sandblasting. The entire weld bead height shall be checked using a weld reinforcement gauge. Any areas in excess of 1/8-inch shall be ground to meet tolerance.

b. After drying and removal of all loose foreign material the pipe surface shall be cleaned by blasting with sand, grit or shot to achieve a surface anchor pattern of at least the specified minimum defined in SSPC-SP-10, the pattern shall be a minimum of 2.5 mils deep.

c. For consistent surface finish, a stabilized abrasive working mix shall be maintained in abrasive recycling blasting machines by frequent small additions of new grit, shot or sand. All abrasive working mix in abrasive recycling blasting machines shall be maintained and clean of contaminants by continuous effective operation of blasting machine scalping and air wash separators. All blast material shall be removed from the interior of the pipe after it has been shop blasted. Blast material shall not be allowed to become trapped between the polyurethane coating and the pipe surface. If this should occur, the coating shall be removed, the surface cleaned, and the pipe re-coated.

d. The cleaned exterior pipe surface shall be inspected for adequate surface preparation. Surface imperfections such as slivers, scabs, burrs, weld spatter, and gouges shall be removed by hand filing or grinding if necessary

to prevent holidays to the coating during application.

e. Blast-cleaned pipe surfaces shall be protected from conditions of high humidity, rainfall, or surface moisture. No pipe shall be allowed to flash rust before coating. Pipe shall be free of moisture prior to coating application.

3. Coating Application:

a. The coating shall be applied directly onto the pipe surface, with the approved application equipment designed especially for this system.

b. Over coating shall only be permitted when using the same formulation of the previous coat. If the maximum recoat time of the previous layer has been exceeded, the surface must be brush blasted or thoroughly abraded to provide adequate mechanical bonding of the new coating layer.

c. The SUPPLIER shall use a data acquisition system that shall continuously monitor and record the line speed, roll body temperature of each layer at the point of application, the pipe temperature and the holiday detection. Complete records compiled by the data acquisition system shall be provided to the Owner.

D. Polyurethane Coating for Fabricated Fittings in the Shop: Surface preparation and priming procedures for polyurethane coating application of fabricated fittings shall comply with the applicable requirement of ANSI/AWWA C222, and the coating SUPPLIER's instructions. Pipe preparation shall include cleaning and blasting of fittings. Following the cleaning and inspection of these surfaces, they shall be with a SUPPLIER approved application system accepted by the Engineer. After application of coating, the fittings shall be electrically holiday tested using a minimum of 6,000 volts. Any holidays detected shall be repaired to the satisfaction of the Engineer.

E. Inspection Prior to Shipping: Prior to shipping, the pipe shall be visually inspected by the SUPPLIER for any damage, disbonding, or bubbling of the coating. Any areas that appear to be damaged, disbonded, or bubbled shall be given an electrical holiday test of a minimum of 6,000 volts per mil of dry film thickness. Damaged, disbonded, or bubbled areas shall be repaired as described in AWWA C222.

2.09 PIPE APPURTENANCES

A. Flanges: Steel used in the manufacture of flanges shall be of domestic manufacture. Where the working pressure is 150 psi or less and the working plus surge is 225 psi or less, flanges shall conform to ANSI/AWWA C207 Class D. Where the working plus surge pressure is greater than 150 psi, up to a maximum of 275 psi, flanges shall conform to ANSI/AWWA C207 Class E. Flanges shall have serrated faces and shall be attached with bolt holes straddling the field vertical axis of the pipe unless otherwise shown. Attachment of the flanges to the pipe shall conform to the applicable requirements of ANSI/AWWA C207.

Flanges shall be of the slip-on type, except that welding-neck or slip- on flanges welded to short lengths of pipe shall be used where installation of flanges in the field is permitted or required by ENGINEER and/or OWNER. Welding- neck flanges shall be manufactured conforming to the specifications of ASME B16.5 from material conforming to ASTM A105.

Ends to be fitted with slip-on flanges shall have the longitudinal or spiral welds ground flush to accommodate the type of flanges provided.

Flange faces shall be normal to the pipe axis with a maximum tolerance of 0.005 inch per foot of flange diameter. Angular deflection (or layback) of the flange face shall not exceed 0.75 degree from a plane surface and shall be uniform within 0.010 inch. All flanges, after welding to the pipe, shall be measured and shall be refaced, if necessary, to bring them within the specified tolerances.

The CONTRACTOR shall coordinate dimensions and drilling of flanges furnished with the flanges for the valves, or other appurtenances to be installed and shall be responsible for the proper fit of all flanges.

Blind flanges shall conform in diameter, drilling, and thickness to the flanges to which they attach and shall be reinforced as required to produce a watertight joint under the specified test pressure. Blind flanges shall be in accordance with ANSI/AWWA C207.

The machined faces of all flanges shall be shop coated with rust-preventive compound, Houghton "Rust-Veto 344" or Rust-Oleum "R-9." Edges and back faces of attached flanges shall be shop coated per AWWA C222 or with Carboline Carbo-Coat 150. The inside of blind flanges shall be cement mortar coated, the thickness to be the same as the cement mortar lining for pipe as stated herein. As an alternate for the lining and coating of blind flanges, ANSI/AWWA C210 epoxy or ANSI/AWWA C222 polyurethane may be used.

Refer to the Insulated Flanges Specification section for requirements regarding flange bolt holes and bolt length for insulated flanges.

B. Bolts and Nuts: The ends of all bolts shall be finished to the standard radius in an acceptable manner. All screw threads shall be "American Standard, Coarse Thread (N.C.)." Stud bolts shall be hexagonal, cold pressed semi-finished and made of medium open hearth steel. All dimensions shall be in accordance with "American Standard, Heavy." Bolts and nuts shall be cadmium or zinc plated at the point of manufacture by an approved process with a plating thickness of 0.0003

to 0.0005 inches. All bolts and nuts furnished shall be delivered to the field free from grease, rust, and dirt.

C. Gaskets: Gaskets shall be in accordance with ANSI/AWWA C207 and shall conform to Section 4.1.5, except as modified herein.

For working pressure plus surge pressure up to 150 psi, gaskets shall be manufactured of EPDM rubber material, ring type, and 1/8-inch thick. Rubber gaskets shall be hardness (Shore A) 80 ± 5, suitable for water service temperature to 200 degrees F with gasket yield pressure of 200 psi minimum to 1,200 psi maximum, conforming to ASTM D1330 grades I and II.

For working pressure plus surge pressure up to and including 275 psi, gaskets shall be manufactured of compressed fiber material, ring type, and 1/8-inch thick. The gasket shall be manufactured of a blend of synthetic fibers, fillers, and elastomeric binders suitable for potable water service and temperatures to 700 degrees F. Gaskets shall be have a minimum yield pressure of 4,800 psi. Gaskets shall be suitable for a maximum seating pressure of 15,000 psi.

Ring-gasket diameter shall be as follows: inside diameter (ID) = flange ID, and outside diameter (OD) = ID of bolt-hole circle less 1/16-inch.

Gaskets shall be suitable for service in potable water with a chloramines concentration of up to 5.0 ppm.

2.10 COMPRESSION SLEEVE COUPLINGS

A. General: The CONTRACTOR shall furnish and install where shown on the DRAWINGS manufactured compression sleeve couplings for steel pipe which conform to ANSI/AWWA C219. The compression couplings shall consist of two (2) steel follower flanges, one (1) steel middle ring with pipe stops removed, and sufficient rolled thread, track-head bolts to properly compress the gaskets. After fabrication, the middle and follower rings shall be cold expanded to size and dimension. The length of each middle ring shall not be less than 10 inches. Thickness of the middle ring shall be suitable for the pressures specified, and shall in no case be less than one-half (1/2) inch.

B. Rated Pressure: The entire compression sleeve coupling unit shall be rated for working pressure plus surge pressure as a minimum.

C. Coatings: All surfaces of middle rings of all compression sleeve couplings, including bolts, nuts and washers shall be coated with NSF 61 approved epoxy in accordance with ANSI/AWWA C210.

D. Deflections: Small deflections in steel pipe alignment may be made at compression type coupling joints, but such deflections shall not exceed three (3) degrees between any two (2) adjacent pipe sections. Where changes in line and grade in excess of three (3) degrees is required, the deflections shall be made by deflecting multiple joints or with steel pipe fittings acceptable to the ENGINEER. Joint deflections shall not exceed 75 percent of that allowed by ANSI/AWWA C219 and in no case shall exceed three (3) degrees.

PART 3 – EXECUTION

3.01 INSTALLATION OF PIPE

A. General: The CONTRACTOR shall transport, deliver, and distribute along the line of the WORK, the pipe, specials, and appurtenances.

B. Shipping: Pipe shall be loaded for shipment upon suitable cars or trucks that shall be provided with padded bunks with nylon belt tie-down straps or padded banding located approximately where pipe material is stulled. All steel water main pipe straights, fittings, and specials shall be stulled as required to maintain roundness of approximately one (1) percent during shipping and handling. In loading and unloading the pipe, care shall be taken to prevent any injury to the pipe, ends, coatings and protuberant steel connections. Such work shall be done slowly with the pipe at all times under control, and under no condition shall the pipe be dropped. Field repair of damaged pipe shall not be allowed, except for linings and coatings.

C. Handling: All pipe, fittings, etc., shall be carefully handled and protected against damage to the lining and coating/interior and exterior surfaces, impact shocks, and free fall. All pipe handling equipment shall be acceptable to the ENGINEER. Pipe handling equipment shall consist of wide belt slings, padded cradles, or other devices designed and constructed to prevent damage to the pipe or coatings. The use of chains, hooks, or other equipment that may damage the pipe or its coating shall not be allowed.

D. Stringing Pipe/Storage: In distributing the pipe in the field, each pipe shall be placed as nearly as possible to the point where it is to be laid, and facing in the proper direction. Pipe shall not be placed directly on rough ground but shall be supported in a manner that will protect the pipe against injury wherever stored at the trench site or elsewhere. Coated pipe shall be stored on padded skids, sand or dirt berm, sand bags, or other suitable means so that coating will not be damaged. Buried pipe fitting and specials shall not be exposed to sunlight for more than a total 6 months before it is buried. Pipe, fittings, and specials, which are placed in storage, streets or drives must be so arranged as not to cause undue inconvenience to traffic and must be protected sufficiently to prevent any damage. Pipe that has been improperly distributed and that must be moved longitudinally along the trench shall be reloaded on a suitable car or truck or lifted and swung by a derrick or moved by such means as may be satisfactory to the ENGINEER; sliding, dragging, or rolling of the pipe shall not be allowed.

E. Damaged Pipe: If in the process of manufacture, transportation, or handling, any steel pipe, fitting, or special receives any indentation or deformation to the pipe wall, steel ends or connections, such pipe, fitting, or special shall be rejected and replaced at the CONTRACTOR'S expense.

F. Inspection: In the presence of the ENGINEER, the CONTRACTOR shall verify all SUPPLIER furnished pipe dimensions upon delivery and inspect all pipe, fittings, and specials and mark as "rejected" all pipe lengths and fittings or specials exhibiting signs of damage to the exterior coating, interior cement mortar linings, joint ends, or pipe wall and CONTRACTOR shall at the CONTRACTOR'S expense immediately remove the same from the job site, or repair to the

ENGINEER'S satisfaction. Any pipe, fittings, or special deemed not suitable for installation shall be replaced in kind by the CONTRACTOR at the CONTRACTOR'S expense.

The CONTRACTOR shall inspect each pipe and fitting to ensure that there are no damaged portions of the pipe. If any defective pipe is discovered after having been laid, it shall be removed and replaced with a sound pipe or fitting in a satisfactory manner, by the CONTRACTOR at the CONTRACTOR'S own expense.

G. Pipe Cleaning: The CONTRACTOR shall thoroughly clean each pipe or fitting of any foreign substance that may have collected on or in it prior to the pipe or fitting being placed in the trench. The openings of all pipes and fittings in the trench shall be closed during any interruption of the WORK. As pipe laying progresses, the CONTRACTOR shall keep the pipe interior free of all debris. The CONTRACTOR shall completely clean the interior of the pipe of all sand, dirt, mortar splatter, and any other debris following completion of pipe laying, pointing of joints and any necessary interior repairs prior to testing and disinfecting the completed pipeline.

H. Pipe Laying: Pipe laid in trench shall be laid to a firm and even bearing for its full length. Precautions shall be taken against flotation. Pipe embedment and backfilling shall closely follow the installation and jointing of steel pipe in the trench to prevent flotation of the pipe by water and longitudinal movement caused by thermal expansion or contraction of the pipe. Not more than 160 feet of restrained joint pipe shall ever be exposed ahead of the backfilling in any section of trench. The backfill adjacent to field joints may be temporarily omitted to provide adequate space for field coating the joints. Closure welds on restrained joint pipe shall be made during the cool part of the day. Pipe shall be laid only after the trench has been excavated as described in the CONTRACT DOCUMENTS.

Pipe shall be laid directly on the bedding material. The bedding shall be such that it forms a continuous and uniform support for the full length of the pipe except that the grade may be disturbed for the removal of lifting tackle. Bell holes shall be formed at the ends of the pipe to prevent point loading at the bells or couplings. Excavation shall be made as needed outside the normal trench section at field joints to permit adequate access to the joints for field connection operations and for application of coatings on field joints.

Each section of pipe shall be laid in the order and position shown on the laying schedule. In laying pipe, it shall be laid to the set line and grade, within plus or minus one inch.

Where necessary to raise or lower the pipe due to unforeseen obstructions or other causes, the ENGINEER may change the alignment and/or the grades. Such change shall be made by the deflection of joints, by the use of bevel adapters, or by the use of additional fittings. However, in no case shall the deflection in the joint exceed 75% of the maximum deflection recommended by the pipe SUPPLIER.

Except for short runs that may be permitted by the ENGINEER, pipe shall be laid uphill on grades exceeding 10 percent. Pipe that is laid on a downhill grade shall be blocked and held in place until sufficient support is furnished by the following pipe to prevent movement.

I. Bedding and Backfilling: Bedding and Backfilling shall be in accordance with the CONTRACT DOCUMENTS.

Bedding shall be carefully worked into the area between the trench bottom and the pipe wall to keep it round. Fill shall not be deposited on top of the pipe, but alongside it, and in such a way that it rises evenly on both sides.

Pipe stulls shall be left in place until the bedding and backfilling operations have been completed. After the backfill has been placed, the stulls shall be removed and shall remain the property of the CONTRACTOR.

J. Flanged Connections: Care shall be taken in bolting flanged joints so that there is no restraint on the opposite end of one piece that would induce stresses in the pipe or fitting or prevent pressure from being evenly and uniformly applied upon the gasket. The pipe or fitting shall be free to move in any direction while bolting. Bolts shall be gradually tightened in a criss-cross pattern, to ensure a uniform rate of gasket compression around the entire flange.

All nuts and bolts that come in contact with water or are buried underground shall be painted in accordance with Specification Section 09940 Protective Coating.

K. Wrapper Plates: Length adjustments due to mill tolerances or caused by thermal length changes, shall be made in the field as necessary by making cuts or by use of wrapper plates (butt plates) in making closures. Wrapper plates, if used, shall be of the same thickness as the pipe, shall have full strength fillet welds both inside and outside, and shall provide a lap on each pipe end of not less than 3 inches, the space between pipe ends being not less than 3 inches.

L. Cold Weather Protection: No pipe shall be installed upon a foundation into which frost has penetrated or at any time that there is danger of the formation of ice or penetration of frost at the bottom of the excavation. No pipe shall be laid unless it can be established that the trench will be backfilled before the formation of ice and frost occurs.

M. Welded Closures: Welded closures for exterior lap welded pipe and restrained joints shall be delayed until the backfill has been completed to as near as practicable to the pipe ends and the pipe temperature has had time to stabilize. In order to minimize longitudinal movement of the pipe ends, closures shall be welded early in the morning when the air and pipe are coolest. Alternative methods of making closures shall be subject to the acceptance of the ENGINEER.

N. Inspection: Careful inspection shall be made of every joint to insure a smooth continuous interior surface. The interior of the pipe shall be thoroughly cleaned and any obstructions that may reduce the pipe's carrying capacity shall be removed.

P. Field Lining Patches: Patching of lining shall be required for any crack that exceeds the allowable crack and will be limited to areas not exceeding 100 square inches and that has no dimensions greater than 12 inches. In general, there shall not be more than two patches on the lining of any joint of pipe exclusive of the last three inches on each end of a joint of pipe.

Wherever necessary to patch the pipe, patch material shall be made with a mortar of one part Portland Cement and two parts clean, sharp sand; all measurements to be by weight. No pipe requiring the lining to be patched shall be installed until the patch is placed. Pipe thus patched shall not be installed until the patch has been properly and adequately cured and determined acceptable for laying by the ENGINEER.

3.02 FLANGED JOINTS

A. Positioning and Cleaning of Flanges: Bolt holes of flanges shall straddle the field horizontal and field vertical centerlines of the pipe. The CONTRACTOR shall clean flanges by wire brushing before installing flanged fittings, and clean flange bolts and nuts by wire brushing.

B. Assembly: The CONTRACTOR shall insert the nuts and bolts (or studs), finger tighten, and progressively tighten diametrically opposite bolts uniformly around the flange to the proper tension. The CONTRACTOR shall execute care when tightening joints to prevent any strain upon valves, pumps and other equipment. After tightening all bolts the stulls shall be removed from the interior of the pipe if it is not to be buried.

C. Connecting to Pumping Equipment: Special care shall be taken when connecting piping to pumping equipment to ensure that piping stresses are not transmitted to the pump flanges. All connecting pipe shall be permanently supported so that accurate matching of bolt holes and uniform contact over the entire surface of flanges are obtained before any bolts are installed in the flanges. In addition, pump connection piping shall be free to move parallel to its longitudinal center line while the bolts are being tightened.

Each pump shall be leveled, aligned, and wedged into position which will fit the connecting pipe, but shall not be grouted until the initial fitting and alignment of the pipe so that the pump may be shifted on its foundation if necessary to properly install the connecting pipe. Each pump shall, however, be grouted before final bolting of the connecting piping.

After final alignment and bolting, the pump connections shall be tested for applied piping stresses by loosening the flange bolts which, if the piping is properly installed, should result in no movement of the piping relative to the pump or opening of the pump connection joints. If any movement is observed, the piping shall be loosened and re-aligned as required and then the flanges bolted back together. The flange bolts then shall be loosened and the process repeated until no movement is observed.

D. Testing: If flanges leak under pressure testing, the CONTRACTOR shall loosen or remove the nuts and bolts, reset or replace the gasket, reinstall or retighten the bolts and nuts, and retest the joints. Flanged joints shall be watertight.

3.03 FIELD WELDS

A. General: All welding procedures and welder certifications shall be submitted through the CONTRACTOR to the ENGINEER prior to beginning the WORK.

Fourteen days prior to commencing field welding of pipe joints, the CONTRACTOR shall submit in writing to the ENGINEER for acceptance all proposed welding procedures, and materials and equipment proposed for use. Welding shall not begin until these procedures have been accepted by the ENGINEER.

An Affidavit of Compliance shall be submitted by the CONTRACTOR to the ENGINEER that states that field welding procedures and welder and welder operator qualifications comply with all applicable provisions of the governing LAWS AND REGULATIONS and these CONTRACT DOCUMENTS.

Exterior welding shall not be permitted when weather conditions are unsatisfactory and would impair the quality of welds. No welding shall be done in high winds, rain, dust or sand storms, unless authorized by the ENGINEER.

All welding shall be done using the procedures established as set forth in ANSI/AWWA C206. The CONTRACTOR shall provide the ENGINEER access to the WORK to be inspected, and shall provide reasonable facilities and space for inspecting, testing, and obtaining information related to the materials used and the progress and condition of the WORK. The CONTRACTOR shall be responsible for performing visual inspection and non-destructive testing of all welded joints in accordance with ANSI/AWWA C206 and these SPECIFICATIONS. Testing of the joints shall be by qualified personnel and shall be subject to witness by the ENGINEER. The CONTRACTOR shall provide weld inspection test reports that refer to the mark number on the laying schedule. Field lap welds shall be inspected by magnetic particle.

Field weld test specimens shall be furnished to the ENGINEER for testing by an independent testing laboratory whenever, in the judgement of the ENGINEER, a satisfactory weld is not being made. Test specimens shall also be furnished when the ENGINEER desires. All costs for this testing will be paid by the OWNER unless the welds are found to be defective, in which case, all costs for this testing will be paid by the CONTRACTOR.

Full and complete information regarding location, types, size and extent of all welds shall be clearly shown on the SHOP DRAWINGS. The SHOP DRAWINGS shall clearly distinguish between shop and field welds. Joints or groups of joints in which welding sequence is especially important or where technique is to be carefully controlled to minimize shrinkage stresses and distortion shall be so noted on the SHOP DRAWINGS. The SHOP DRAWINGS shall specify the groove depths applicable for the effective throat required for the welding process. The SHOP DRAWINGS shall clearly indicate by welding symbols or sketches the details of the welded joints and the preparation of parent metal required to make them. Joints meeting requirements of AWS Standard D1.1 Section 2, shall be so noted on SHOP DRAWINGS. Joints not meeting this requirement shall be qualified as outlined in AWS Standard D1.1, Section 5.

Welding equipment shall be maintained in such condition as to insure acceptable welds and continuity of operations. Any equipment that does not meet the requirements shall be repaired or replaced immediately. Welding electrodes shall be kept dry at all times.

B. Safety:

1. Qualification Site Safety: Welders shall demonstrate safe welding practices at all times, with special attention paid to the use of welding screens, grinders and ground clamps.

2. Combustible Gas Indication: Prior to welding in or around a structure or area containing gas, a thorough check shall be made with gas detection equipment to determine if a combustible gas mixture is present. A combustible gas indicator shall be used to sample the atmosphere above and below grade. Welding shall begin only when safe conditions are indicated.

3. Fire Extinguisher: Each welder shall be provided and have readily available during any welding operation a fire extinguisher meeting the requirement of the applicable LAWS AND REGULATIONS.

4. Welding on an Impressed Current (Rectified) Line: Care shall be taken when welding on an impressed current (rectified) line to assure that no short exists between the rectifier and the pipeline.

5. Welding Screens: An arc welding screen shall be used at all times when welding in business and residential areas or when directed by the ENGINEER. The screen shall be of sufficient size (3 ft. to 4 ft. by 4 ft. opening sections) and density to shield the weld arc and prevent possible damage to the eyes of persons in or about the welding area.

6. Grinders: Hand grinders used in the field shall be equipped with an instant trigger release or device that will shut off the current when the machine is released from the operator's hands. All personnel in the immediate grinding area shall wear protective eye covering. Ground fault interrupters shall be used with field grinders.

7. Clean-up: Welding rod and wire stubs shall be placed in a container during and after the welding operation. No equipment (rod containers, grinding disc, etc.), used in welding shall remain in the pipe or excavation upon completion of the welding operation.

8. Gas Cylinders: Gas cylinders (oxygen, acetylene, CO_2, etc.), shall be placed with valve end up when in use. The cylinders shall at all times be in a rack made for the purpose and secured by a chain or clamp. The cylinder valve-protection cap shall always be in place and hand tight when the cylinder is not in use.

    a) Gas shut-off device: Regulation diaphragms and torch valves shall not be used as a gas shut-off device when the gas is not being used.

    b) Non-return shut-off valve: When more than two cylinders of acetylene are connected to a manifold, the system shall contain a non-return type shut-off valve.

    c) Check valves: Check valves shall be used in all cutting torch units and shall be installed permanently in the oxygen and acetylene regulators. Teflon tape shall be used when installing check valves. Use of pipe dope sticks or liquid pipe dope for installation will not be permitted. Check valve shall be checked daily prior to the start of work or as needed.

d) Flashback arresters: Flashback arresters shall be used on oxygen and acetylene regulators in both cylinder and manifold applications. Teflon tape shall be used when installing flashback arresters. Use of pipe dope sticks or liquid pipe dope for installation will not be permitted. Flashback arresters shall be tested daily prior to the start of WORK.

9. Ground Clamps: External pressure type ground clamps shall be used when performing all welding functions. Ground clamps shall be fitted with copper or brass contact tips to prevent arc burn on the pipe surface. Should a welder tack the ground clamp or lead to a pipe or appurtenance, that welder shall be removed from the WORK immediately and shall not be allowed to perform additional welds.

C. Qualification of Welders and Welding Procedure: All welding shall be done by skilled welders, welding operators, and tackers who have had adequate experience in the methods and materials to be used. All welding procedures, welders, welding operators, and tackers shall be qualified under the provisions of ANSI/AWS D1.1 and as defined in ANSI/AWWA C206 not more than six months prior to commencing work on the pipeline. All qualifications shall be in accordance with all-position pipe tests as defined in Section 5 of AWS D1.1. Machines and electrodes similar to those used in the WORK shall be used in qualification tests. All welding tests for qualification shall be done in the presence of the testing agency or in the presence of a certified welding inspector appointed by the testing agency. The CONTRACTOR shall furnish all materials and bear the expense of qualifying welders.

Each welder employed by the CONTRACTOR shall be required to satisfactorily pass a welding test before being allowed to weld on the line. The welder qualification testing for field welding shall be conducted at the project site. Results of previous qualification tests will not be accepted. The CONTRACTOR shall provide the services of an independent testing laboratory to perform the welder qualification. Copies of all test data and certifications shall be submitted to the ENGINEER. All costs of welder qualification testing shall be paid by the CONTRACTOR.

Each welder shall be required to make a position weld on a pipe nipple of the same diameter and specification as the pipe in the line. Each test weld will be inspected and tested, using an accepted and approved testing method subject to the ENGINEER'S acceptance, administered by an independent testing laboratory retained by the CONTRACTOR. The independent testing laboratory shall be accepted by the ENGINEER prior to any welding test being performed.

After each welder has qualified in the preliminary tests referred to above, random and periodic inspections will be made of joints in the line. Any welder making defective welds shall not be allowed to continue to weld on the PROJECT.

The CONTRACTOR shall furnish each welder employed a steel stencil for marking the welds, so that the work of each welder may be identified. Each welder shall stencil the pipe adjacent to the weld at both spring lines with the stencil assigned. In the event any welder leaves the job, the welder's assigned stencil shall be voided and not duplicated if another welder is employed.

The quality of the welding and procedures shall be determined by testing the welder's ability to make sound welds under standard working conditions with the equipment to be used in the WORK on this PROJECT. All welds shall be in conformance with AWS D1.1. All welding procedures used to install pipe shall be prequalified under provisions of AWS Standard D1.1. Welding procedures shall be required for field attachments and field welded joints.

D. Tackwelds: Tackwelds used to secure alignment shall either be removed completely or their stopping and starting ends shall be properly prepared by grinding or other ENGINEER accepted means so that they may be satisfactorily incorporated into the final weld. Tackwelds, whether removed or left in place, shall be made using a weld procedure qualified in accordance with these SPECIFICATIONS. Tackwelds to be left in place shall be made by welders qualified in accordance with these SPECIFICATIONS and such welds shall be examined visually for defects, and if found to be defective shall be removed.

E. Preheating: All joints to be field welded shall be preheated in accordance with the requirements of ANSI/AWWA C206, and as required herein.

1. Preheat Requirements: Materials to be welded shall be preheated prior to welding if:

a) the ambient or material temperature is below 40 degrees Fahrenheit;

b) moisture is evident on the material;

c) additional metal is to be deposited on an uncompleted weld; or

d) additional metal is to be deposited on a repaired weld.

2. Preheat Equipment: Preheating of material shall be done by a torch equipped with a "preheating" top to allow the materials to reach and to maintain the proper temperature more evenly throughout the welding area.

3. Preheat Indicators: A temperature indicating crayon, "tempilstik" or equivalent, shall be used in determining proper temperature. The crayon of appropriate temperature designation shall be rubbed on the material a distance of three (3) inches from the ends to be welded. Heat shall be applied to the area of the weld until the crayon melts indicating the designated temperature has been reached.

F. Position Welding:

1. Horizontal Fixed Position Welding: Horizontal fixed position welding shall be used for all field welds, including bell hole welding, where the pipe or appurtenance is stationary and parallel to the ground, and the direction of welding is perpendicular to the pipe axis. The pipe joints shall not be moved until the hot pass (second bead) is completed.

2. Vertical fixed position welding: Vertical fixed position welding shall be avoided in the field whenever practicable and occurs where the pipe or appurtenance is stationary and perpendicular to the ground and the direction of welding is parallel to the ground.

3. When two or more welders are working on the same weld, they shall start to weld on opposite quadrants.

G. Welded Joints: All exposed ends of joint surfaces shall be wire brushed clean. The Spigot end of the pipe shall be inserted into the expanded bell end and pushed home then retracted up to the allowable limits to provide a minimum overlap of 1-1/2 inches at all points around the entire joint circumference.

Where bell and spigot field welded joints are required to be welded they shall provide for a 2-1/4-inches lap with a ¾-inch allowable pull (joint opening) for the required 1-1/2-inch minimum lap. Shop applied exterior coating shall be held back approximately 4-1/4-inches from the end of each pipe end of the joint to be welded. The interior cement mortar lining shall also be held back if so recommended by the SUPPLIER.

Where exterior welds are called for, adequate space shall be provided for welding and inspection of the joint.

In laying welded steel pipe with wrapper plates or lap joints, pipe deflection shall be limited to that which will produce a minimum lap of 1-1/2 inches and which will not cause a weld to be closer than ¾-inch to the nearest tangent of a bell radius. The pipe ends shall be cut straight on joints where wrapper plates are used for realignment, adjustment or deflection, and fillet welds shall be made as specified or required.

Any annular space between the facing surfaces of the bell and spigot shall be limited as defined in AWWA C206.

Where more than one pass is required, each pass except the first and the final one, shall be peened to relieve shrinkage stresses; and all dirt, slag and flux shall be removed before the succeeding bead is applied.

If the ends of the pipe are laminated, split or damaged to the extent that satisfactory welding contact cannot be obtained, the pipe shall be removed from the line, and inspected more thoroughly to determine the extent of damage. If necessary in the opinion of the ENGINEER, the joint of pipe shall be returned to the SUPPLIER for necessary repairs to be made. If such repairs are made, the ENGINEER shall approve the repair before the joint of pipe is used. The expense of such repairs shall be borne by the CONTRACTOR.

The pipe shall be backfilled to at least one foot above the top of the previously laid pipe except for the last 100 feet, the joints of which shall be left open for subsequent field welding and coating.

H. Visual Inspection and Testing: Field welds will be randomly inspected and tested by an independent testing laboratory as directed by the ENGINEER. Field lap welds will be inspected by magnetic particle. Field butt welds will be inspected by the radiographic method and in accordance with the acceptance criteria of API 1104. The CONTRACTOR shall inform the ENGINEER before welded joints are to be backfilled so that the joint may be inspected. The CONTRACTOR shall assume all costs of exposing joints that were backfilled before inspection.

CONTRACTOR shall randomly test approximately 10% of field welded joints. This percentage may increase if performance concerns arise from rejected welds.

Personnel performing visual inspection of welds shall be qualified and currently certified as Certified Welding Inspectors (CWI) in accordance with AWS QC1, Standard for Qualification and Certification of Welding Inspectors. Personnel performing nondestructive tests shall be qualified and certified to the requirements of SNT-TC-1A.

The ENGINEER may also order nondestructive testing by an independent testing laboratory in addition to any testing specified herein.

All costs for inspection and testing of field welds by the independent testing laboratory will be paid by the OWNER. If the weld is defective, the inspection costs shall be paid by the CONTRACTOR. Defective welds shall be repaired and retested at the CONTRACTOR's expense.

Test reports of all laboratory tests shall be submitted as provided for in the submittals section.

I. Rejection of Welds: A weld may be rejected as a result of visual inspection for one of the following causes:

1. the procedures, as specified in these SPECIFICATIONS are not complied with;

2. the weld shows evidence of poor workmanship;

3. the weld does not meet the requirements of Section 6, of the latest accepted edition of API Standard 1104 or with the ANSI/AWWA Standard C206;

4. the weld contains a crack;

5. the material being welded contains visible defects such as lamination, laps, or dimensional irregularities;

6. an arc burn is present;

7. a dent exists; or;

8. any weld whose history cannot be established and that has not been radiographed.

J. Repair of Weld Defects: Each weld that is unacceptable must be repaired in accordance with these SPECIFICATIONS or as accepted by the ENGINEER. Costs for repair of the defects and defective welds shall be at the expense of the CONTRACTOR.

All welds containing cracks regardless of location shall be rejected and repaired. No field weld repair of welds containing cracks will be permitted without the ENGINEER'S acceptance.

Each weld that is to be repaired shall have the defect removed down to clean metal. Each weld to be repaired shall be preheated in accordance with these SPECIFICATIONS. The repair shall be made with the same welding process as was originally used. No repair will be permitted in a previously repaired area.

Repaired welds shall be inspected by the same means, and to the same standards, as the original weld.
