When a lamination, split end, or a cracked seam occurs in a joint length, the entire length shall be removed. When pipe defects are cut out, the defective section shall have a minimum of eight (8) inches of acceptable metal on each side of the defect. When pipe defects occur in the welding area, the ENGINEER shall be notified.

All arc burns shall be repaired as herein specified. Arc burn repairs shall not be permitted unless the resulting wall thickness after repair is equal to or greater than the normal pipe wall thickness. The CONTRACTOR shall submit a written request for repair to the ENGINEER. The ENGINEER will then determine if the repair is appropriate. If accepted, the repair shall be made in the following manner:

1. Remove arc burn by grinding of filing;

2. Remove all sharp edges to a smooth, overall contour;

3. Swab a 20% ammonium persulfate solution over the notched area to determine if additional grinding or filing is necessary;

4. Confirm that the remaining wall thickness is equal to or greater than the nominal wall thickness utilizing an appropriate gauge, or other means acceptable to the ENGINEER;

5. All unrepaired or unsatisfactorily repaired arc burns shall be cut from the pipeline as a cylinder.

3.04 COMPRESSION SLEEVE COUPLINGS

A. Cleaning: Thoroughly clean with a wire brush all surfaces that will be in contact with the gaskets.

B. Assembly: Slip the follower rings over the pipe ends, then slip the gaskets that have been lubricated with an approved vegetable based lubricant over the pipe ends. Place the middle ring over the previously laid pipe then insert the end of the joining pipe into the middle ring. Position both gaskets evenly in the middle ring gasket grooves. Insert bolts in bolt holes of follower rings. Tighten nuts in the sequence and the torque requirements of the coupling SUPPLIER (manufacturer). After tightening all bolts the stulls shall be removed from the interior of the pipe if it is not to be buried.

All nuts and bolts that come in contact with water or are buried underground shall be painted with two (2) heavy coats of an approved coal tar epoxy, in accordance with the painting or protective coatings section of these SPECIFICATIONS.

3.05 OUTLETS

Where shown on the DRAWINGS or where required, steel pipe, fittings or specials shall be welded to receive drainage outlets, air relief outlets, or other pipe or plugs for pressure testing or chlorination. Welded outlets shall be provided in the shop. Holes shall be drilled accurately and at right angles to the axis of the pipe or fitting.

Where size of the outlet pipe to be connected is such as to require reinforcement saddles for making the connection, the CONTRACTOR shall furnish such outlet connections with welded reinforcement saddles welded as indicated on the DRAWINGS or as acceptable to the ENGINEER.

3.06 CLOSURE PIECES

Where closures are required in the field for steel pipe the CONTRACTOR shall be required to make all measurements for the same and shall be responsible for the correctness of the steel pipe sections needed to complete the WORK. Where steel pipe closures are cut with acetylene torch or by a similar method the burned ends of the cut ends of pipe shall be ground and made smooth before completing the joints. Pipe coatings damaged in the cutting off of the ends of closure pieces shall be repaired in accordance with ANSI/AWWA C214, to the satisfaction of the ENGINEER.

3.07 JOINT COATING AND LINING

A. General: The interior and exterior joint recesses shall be thoroughly wiped clean of all water, loose scale, dirt, and other foreign material.

B. Coating applicators shall be trained and certified by the coating system SUPPLIER.

D. Field Application of Heat Shrink Sleeve: Heat shrink sleeves shall be furnished and installed in accordance with ANSI/AWWA C216 where lap joints are to be welded on the inside after the pipe has been bedded and backfilled. The heat shrink sleeve coating system shall be compatible with, and of the same color as the specified pipe coating system.

1. Provide heat shrink sleeve with a cross-linked polyolefin wrap or sleeve with a mastic sealant. Sleeve shall be a minimum of 85 mils recovered total thickness. Sleeve shall completely enclose pipe or fitting with no gaps or voids. Canusa Aqua- Shield Aqua-Sleeve, High Shrink Type (75 mil) or approved equal.

2. Heat shrink sleeve shall provide a minimum adhesion of 40- pounds per inch width.

3. Provide suitable primer type if recommended by heat shrink sleeve manufacturer.

4. Provide primer and heat shrink sleeve type suitable for pipeline operating temperature and burial conditions.

5. Provide filler bar or filler tape, skirting, or other step-down materials as recommended by heat shrink sleeve manufacturer suitable for joints with heat shrink sleeves. Step-down material type and size shall be as recommended by heat shrink sleeve manufacturer for each specific type of pipe and joint.

6. For high soil stress conditions such as swelling clays, provide high adhesive type and heat as recommended by heat shrink sleeve manufacturer for type of pipe and joint.

7. Provide high-recovery sleeve material for high profile type joints (flexible couplings, etc.) as recommended by heat shrink sleeve manufacturer with minimum of 40 percent recovery.

8. Provide high-recovery sleeve material for large size pipe (equal to or greater than 60-inch diameter) as recommended by heat shrink sleeve manufacturer with minimum of 40 percent recovery.

9. Provide only propane torches or wrap-around heaters for pipeline shrink sleeves as recommended by heat shrink sleeve manufacturer.

10. Provide safety equipment (heat resistant gloves, heat resistant pads, safety glasses, hard hat, flame retardant clothing, etc.) as recommended by heat shrink sleeve manufacturer.

11. Provide rolling tools (weld bead or seam roller, flat or profiled roller, etc.) as recommended by heat shrink sleeve manufacturer.

Store, handle, and apply field heat shrink sleeve coating system per AWWA C216, and the sleeve manufacturer's written directions. The joint coating shall cover all pipe surfaces not coated by the existing pipe coating system.

Provide sleeve length so as to provide a minimum of 4-inches overlap of installed sleeve onto intact pipe coating. Contact sleeve manufacturer for correct sleeve model, thickness, length, and size required for the specific type of joint and pipe. Recommended sleeve length and width shall take into account installed sleeve shrinkage due to installation procedure and joint profile.

D. Holiday Testing: All polyurethane, or sleeve coated joints shall be tested with an electrical flaw detector capable of at least a 12,000 volt output. The tests shall be made using a voltage of as recommended in the AWWA standard for the coating being tested. Any holidays found shall be repaired by the CONTRACTOR at no expense to the OWNER. Heat shrink sleeves shall be test after installation and prior to backfill and compaction of joint.

E. Field Repairs of Exterior Polyurethane Coating System:

Repairing damage to the polyurethane coating shall be in accordance with AWWA C222. Damaged or improperly applied coating shall be removed by scraping or abrasive blasting. Any uncured coating shall be removed until only the well-adhered coating remains.

The substrate shall be clean, dry, free of dust, loose residues and other materials interfacing with adhesion. The repair area shall be prepared as recommended by the manufacturer.

Only materials compatible with the originally applied coating shall be used for repairs. Repair materials shall be applied as recommended by the manufacturer. The repaired materials shall be applied to the same thickness or greater as originally specified for the coating being repaired but shall not exceed the thickness recommended by the manufacturer.

All repaired areas shall be inspected for electrical continuity per these SPECIFICATIONS.

F. Field Repair of Shop-Applied Cement Mortar Lining: Upon completion of backfill and all cleanup of the pipe trench, the stulls shall be removed. Any dirt, or trash that has collected in the joint shall be cleaned out and the mortar surfaces of the joint space shall be moistened by spraying or brushing with a wet brush.

Field repair of interior joint surfaces of field-welded joints shall be done in accordance with ANSI/AWWA C205, except that an epoxy bonding agent and latex admixture shall be used in conjunction with the sand and cement mortar. The addition of lime, pozzolan or fly ash will not be permitted. All materials that may come in contact with the water being conveyed (linings, gaskets, lubricants, grout, disinfection agents, etc.) shall be in accordance with and approved by the appropriate NSF Standard 60 or 61.

The exposed steel shall be thoroughly cleaned and all grease shall be removed. A coat of epoxy bonding agent shall be applied over the area to be lined in accordance with the manufacturer's recommendations. A soupy mixture of cement and water shall be applied over the epoxy after it becomes tacky.

Cement mortar to which the latex admixture has been added shall then be packed into the area to be patched and screeded off level with the adjacent cement mortar lining. The patched area shall be given an initial floating with a wood float, followed by a steel trowel finish.

Defective or damaged shop-applied cement mortar linings shall be removed, the surfaces cleaned, and the lining repaired as specified above for joint repair.

Cement shall be Type II or Type III with the modification that the cement shall contain not more than five percent (5%) tricalcium aluminate. Cement shall comply with ASTM C-150 and sand shall conform to ASTM C-150 OR C3544.

3.08 PIPE DEFLECTION

After completion of backfilling, removal of stulls, and before acceptance of the Work, all pipe shall be tested for excessive deflection by measuring the actual inside vertical diameter. Deflection measurements will be made by the ENGINEER. Pipe with diametral deflection exceeding 2 percent of the normal inside diameter shall be uncovered and the bedding and backfill replaced as required to prevent excessive deflection. After replacing bedding and backfill, the pipe shall be retested.

3.09 FINAL INSPECTION BEFORE BACKFILLING

All phases of the installation shall be done in such a manner so as to prevent any damage to the pipe coating. Prior to backfilling any section of the pipeline, these surfaces shall receive a final visual inspection, and an overall electrical flaw inspection using an approved "holiday detector." Any defects noted shall be repaired and the surfaces retested until satisfactory results are obtained.

3.10 JOINT BONDING

Joint Bonding: Except where otherwise specified, all joints except for welded joints and dielectric joints shall be electrically bonded and cathodically protected in accordance with the details shown on the DRAWINGS and Section 134713 of these SPECIFICATIONS. The pipe shall be cleaned to bare bright metal at the point where the bond is installed.

3.11 FIELD PAINTING

The CONTRACTOR shall perform all painting of exposed pipe and fittings as specified under the painting or protective coatings section of these SPECIFICATIONS.

The CONTRACTOR shall remove all debris, dirt, grease, mortar, and other foreign material by the use of soap and water or other solvent as may be required.

3.12 WATER FOR USE IN TESTING AND DISINFECTION

A. The OWNER will provide the water required for pressure testing and preliminary disinfection required by the CONTRACTOR for the entire pipeline PROJECT. For quantities of water required by the CONTRACTOR for retests, the CONTRACTOR shall pay to the OWNER the actual cost incurred to produce the water as determined by the OWNER.

B. The CONTRACTOR shall prepare and provide to the ENGINEER a testing and disinfection plan that will provide for: the conservation of water; that will meet the testing and disinfection requirements; and that will indicate how the CONTRACTOR will manage the disposal of testing and disinfection water so that there will be no adverse impacts to the environment and to the public.

3.13 TESTING

The CONTRACTOR shall perform pressure and leakage tests between valves on all pipe installed under this CONTRACT. The CONTRACTOR shall furnish all necessary testing equipment and material, make all taps, and provide all closure pieces in the pipe as required. The PROJECT REPRESENTATIVE shall monitor the tests.

The CONTRACTOR shall furnish the following equipment and materials for the tests:

2 Approved graduated containers

2 Pressure gauges
1 Hydraulic force pump acceptable to the PROJECT REPRESENTATIVE with suitable hose and suction pipe as required.

The CONTRACTOR shall backfill all pipe, fittings, and specials and provide all thrust blocking, whether permanent or temporary, before hydrostatic testing. The PROJECT REPRESENTATIVE may direct the CONTRACTOR to leave certain joints and connections uncovered until testing has been completed.

After the pipe has been backfilled or partially backfilled as hereinbefore specified, the CONTRACTOR shall fill the pipe section or segment with water and expel all air. The CONTRACTOR shall control the filling operation to prevent the static or transient pressure from exceeding 100% of the specified test pressure. The test pressure shall be measured at the low point in the pipeline, and the CONTRACTOR shall furnish all required taps and gauges for measuring this pressure. Installed blow-offs may be used for pressure measurement provided they are at the low point of the line being tested.

The pipe shall be slowly filled with water by the CONTRACTOR and allowed to stand for 48 hours under slight pressure to allow the cement-mortar lining to absorb water. The specified test pressure shall be applied, by continuous pumping for the entire test period if necessary, and measured at the lowest elevation, or where specified by the ENGINEER.

The pump shall take its suction from a barrel or other calibrated container, or metered in a manner approved by the PROJECT REPRESENTATIVE, so that the amount of water required to maintain these test pressures may be measured accurately.

The hydrostatic test shall be performed in accordance with AWWA C600 in as much as it applies. A low pressure hydrostatic test shall be performed to a pressure of approximately 50% of the PROJECT working pressure for four hours. The allowable leakage shall be one-half of the lesser amount as determined by the equations of AWWA C600. Upon successful completion of the low pressure test the pipe segment shall be tested to the full Field Test Pressure in accordance with AWWA C600. The observed leakage under full Field Test Pressure shall not exceed one-half of the lesser amount as determined by the equations of AWWA C600.

Should any test of installed pipe indicate the leakage exceeds the allowable limits the CONTRACTOR shall locate, install, repair and retest the defective joints or pipe until the leakage form subsequent testing is within the specified allowance.

All exposed areas of pipelines will be inspected by the PROJECT REPRESENTATIVE for visible leakage under test pressure. Visible leaks shall be repaired by the CONTRACTOR at no additional cost to the OWNER.

Every precaution must be taken to remove, valve-off or otherwise protect delicate control equipment in or attached to pipe lines, to prevent damage or injury thereto.

3.14 DISINFECTION

The required disinfection work shall be performed by a SUBCONTRACTOR specializing in such work or, with the permission of ENGINEER, CONTRACTOR may provide the necessary equipment and do the work with his own employees. In either case, all work shall be done under the direct superintendence and authority of a competent and experienced specialist in such work.

Personnel performing the disinfection shall demonstrate a minimum of 5 years' experience in the chlorination and dechlorination of similar pipelines.

Unless otherwise specified, not less than 14 days prior to starting any cleaning and disinfection work, the CONTRACTOR shall submit to the ENGINEER a detailed cleaning and disinfection plan. The plan shall cover the method and procedure proposed, necessary coordination, qualifications of personnel performing the disinfection work, testing schedule, sequence of operations, the limits of the pipeline to be cleaned and disinfected, the location of temporary bulkheads, equipment to be used, the manner of filling and flushing of lines, chlorine injection points, sampling points, potable water sources, neutralization and disposal of wasted water, and all other methods and procedures to be followed in performing the cleaning and disinfection work.

After waterlines are tested hydrostatically and immediately prior to being accepted for SUBSTANTIAL COMPLETION, the CONTRACTOR shall disinfect pipes in accordance with ANSI/AWWA C651 except as modified herein and the requirements of the CONTRACT DOCUMENTS. Disinfection shall be done using calcium hypochlorite solution, or chlorine solution of strength to achieve not less than 50 parts per million of free chlorine in the pipeline. The CONTRACTOR shall fill the line with water and maintain line under pressure of not less than ten (10) pounds per square inch for not less than 48 hours. As an alternative the CONTRACTOR may utilize the slug method in accordance with AWWA C651. During this period, while the line is under pressure, the CONTRACTOR shall open and close all valves within the section being disinfected as required to affect disinfection of valve working parts. Following this period, flush the line clean for biological testing.

Any remaining super chlorinated water shall be neutralized in accordance with AWWA C651 using sodium thiosulfate or other acceptable neutralizing agent before allowing controlled flushing to surface ditches. Discharges shall be controlled in accordance with the permitted stormwater pollution prevention plan requirements with turbidity barriers, monitoring and other acceptable measures. After flushing bacteriological sampling will then be performed by the OWNER.

Repeat the disinfection process if biological testing shows unsatisfactory samples. All procedures shall be in conformance with Division 1 - General Requirements. No cross-connection between the water mains and any pipe that has not been disinfected, shall be permitted. The CONTRACTOR shall furnish and install blind flanges or shall otherwise plug outlets for disinfection purposes.

3.15 SUPPLIER'S FIELD SERVICE

The CONTRACTOR shall, at no additional cost to the OWNER, arrange for a SUPPLIER'S field representative to be on-site to provide instruction to each crew working on the installation of a minimum of four welded joints. The SUPPLIER'S field representative shall verify that the

installations observed were satisfactorily completed and all pipe installation crews were familiar with the proper methods and procedures for the pipeline installations.

END OF SECTION

SECTION 15101

AWWA BUTTERFLY VALVES

PART 1 – GENERAL.

1-1. SCOPE. This section covers furnishing AWWA butterfly valves for cold water service in sizes 14 inches and larger and as indicated in the AWWA Butterfly Valve Schedule. AWWA butterfly valves shall be furnished complete with actuators and accessories as specified herein, as indicated in the schedule, and as specified in the Valve Actuator section.

1-2. GENERAL. Equipment provided under this section shall be fabricated and assembled in full conformity with DRAWINGS, SPECIFICATIONS, engineering data, instructions, and recommendations of the equipment manufacturer, unless exceptions are noted by ENGINEER.

Valves shall be furnished with all necessary parts and accessories indicated on the DRAWINGS, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of one of the manufacturers specified in this section.

1-2.01. Governing Standard. Except as modified or supplemented herein, all butterfly valves and manual actuators shall conform to the applicable requirements of ANSI/AWWA C504 or ANSI/AWWA C516.

1-2.02. Marking. Supplementing the requirements of Section 6.1 of the governing standard, the country of origin of all castings and an identifying serial number shall be stamped on a corrosion-resistant plate attached to the valve body.

1-2.03. Permanent Number Plates. All buried AWWA butterfly valves shall be provided with a permanent TAMPA BAY WATER standard bronze identification plate. The location of identification plates shall be as indicated on the DRAWINGS.

1-3. SUBMITTALS. Complete DRAWINGS, details, torque calculations and SPECIFICATIONS covering the valves and their appurtenances shall be submitted in accordance with the SUBMITTALS section. Included in the SUBMITTAL shall be DRAWINGS by the valve manufacturer to indicate the position of the valve actuator and valve shaft. CONTRACTOR shall review and confirm the actuator orientation and handwheel clearances. SUBMITTAL DRAWINGS shall clearly indicate the country of origin of all cast gray iron and ductile iron valve components.

DRAWINGS shall include separate wiring diagrams for each electrically operated or controlled valve and the electrical control equipment. Each DRAWING shall be identified with the valve number or name as specified in this section.

Certified copies of test results for tests described in Section 4.1.3 Tests, 4.2.8.6.12, 4.2.8.6.14, 5.1.1 Performance tests, 5.1.2 Leakage tests, 5.1.3 Hydrostatic test, and 5.1.4 Proof-of-design tests of the governing standard, shall be submitted to ENGINEER before the valves are shipped. An affidavit of compliance with the governing standard for valves 72 inches and smaller shall be provided as indicated in Section 6.3 of ANSI/AWWA C504. For valves 78 inches and larger provide an affidavit of compliance that the valves provided comply with the applicable provisions of the governing standard ANSI/AWWA C516, including proof-of-design testing.

PART 2 – PRODUCTS.

2-1. ACCEPTABLE PRODUCTS. Butterfly valves shall be limited to the following manufacturers. Butterfly valves by other manufacturers will not be acceptable.

Manufacturer

De Zurik
M&H
Pratt (Mueller)
Val-Matic

2-2. MATERIALS. Except as modified or supplemented herein, materials used in the manufacture of butterfly valves shall be suitable for chloramines service and shall conform to the requirements of the governing standard.

Acceptable shop coatings are listed in the following table.

Epoxy (NSF Certified)	PPG Amercoat "Amerlockt 400 High Solids Epoxy", Carboline "Carboguard 891", Sherwin-Williams "Macropoxy 646NSF" or Tnemec "Series N140 Pota-Pox Plus".
Rust-Preventive Compound	As recommended by manufacturer.

2-3. VALVE CONSTRUCTION.

2-3.01. Valve Bodies. Valves shall be short-body type. The use of a stop or lug cast integrally with or mechanically secured to the body for the purpose of limiting disc travel by means of direct contact or interference with the valve disc (in either the open or closed position) will not be acceptable.

2-3.01.01. Rubber-Seated Butterfly Valves 25 to 150 PSI Service (AWWA). Butterfly valves for steady-state water working pressures and steady-state differential pressure up to 150 psi shall conform to ANSI/AWWA C504 or ANSI/AWWA C516 and shall be Class 150B with actuator sized for Class 150B.

2-3.01.02. Rubber-Seated Butterfly Valves 250 PSI Service (AWWA). Butterfly valves for sizes 14 inches through 48 inches and for steady-state water working pressures and steady-state differential pressures up to 250 psi shall be designed and manufactured in accordance with ANSI/AWWA C504 Class 250B. Butterfly valves for sizes greater than 48 inches and for steady-state water working pressures and steady-state differential pressures up to 250 psi shall be designed and manufactured in accordance with the intent of ANSI/AWWA C504 except valves shall be suitable for 250 psi pressure service.

2-3.02. Flanges. Flanges shall be finished to true plane surfaces within a tolerance limit of 0.005 inch. The finished face shall be normal to the longitudinal valve axis within a maximum angular variation tolerance of 0.002 inch per foot (0.017 percent) of flange diameter. Flanges for all Class 150B and Class 250B valves shall have diameter and drilling in accordance with ANSI B16.1 Class 125. Valves shall be rated for buried service.

2-3.03 Mechanical Joint Ends. Mechanical joint ends shall be either mechanical joint or push-on ends conforming to ANSI/AWWA C111/A21.11.

2-3.04. Valve Shafts. Valve shafts for Class 150B valves shall be fabricated of AISI Type 304 or 316 stainless steel. Valve shafts for Class 250B valves shall be fabricated of ASTM A564 Type 630, UNS Designation S17400, condition H1150. The use of shafts having a hexagonal cross section will not be acceptable. The connection between shaft and disc shall be in accordance with the governing standard.

The connection between the shaft and the disc shall be mechanically secured by means of solid, smooth sided, stainless steel or monel taper pins or dowel pins. Each taper pin or dowel pin shall extend through or shall wedge against the side of the shaft and shall be mechanically secured in place. The use of set screws, knurled or fluted dowel pins, expansion pins, roll pins, tension pins, spring pins, or other devices instead of the pins specified herein will not be acceptable.

2-3.05. Valve Seats. Valve seats shall be EPDM. Acceptable seating surfaces mating with EPDM are AISI Type 304 or 316 stainless steel, monel, or plasma-applied nickel-chrome overlay for all valves; bronze for 20 inch and smaller valves; and alloy cast iron for 20 inch and smaller manually operated valves.

Table 15101-1

Butterfly Valve Seat Information		
BFV Size (in.)	**Seat Location**	**Type of Seat Retaining Methods Allowed**
14 inches Through 42 inches	In Valve Body or On Disc	• Molded Seat Bonded to the Valve Body or Disc • Seat Retained Within a Dovetail Groove and Locked in Place by an Epoxy Wedge • Seat Retaining Rings with Cap Screws
48 inches And Larger	In Valve Body or On Disc	• Seat Retaining Rings with Cap Screws

Valve seat configurations which rely on the mating pipe flange to hold the seat in position in the valve body will not be acceptable.

2-3.06. Shaft Seals. Shaft seals shall be of the chevron type.

2-3.07. Thrust Bearings. Each valve shall be provided with one or more thrust bearings in accordance with the governing standard. Thrust bearings which are directly exposed to line liquid and which consist of a metal bearing surface in rubbing contact with an opposing metal bearing surface will not be acceptable.

2-3.08. Rotation. The direction of rotation of the handwheel or the wrench nut to open the valve shall be to the left (counterclockwise).

2-4. VALVE ACTUATORS. Valve actuators shall be manual actuators with square operating nut with spur gears and shall be rated for buried service. .

If valves with an AWWA class designation higher than specified are furnished, actuator torque capabilities shall be increased accordingly and be acceptable to ENGINEER.

Actuators shall be installed at the factory by the valve manufacturer using the heaviest available grade of material.

2-4.01. Valve Actuator Sizing. The valve manufacturer shall size the actuator in accordance with the governing standard, the operating conditions and requirements indicated in the AWWA Butterfly Valve Schedule, and the valve manufacturer's requirements.

Unless otherwise indicated or specified, actuator torque requirements shall be based on a maximum differential pressure across the valve equal to the maximum pressure associated with the valve class and a maximum velocity through the valve of 16 feet per second or a safety factor of 1.5 to the required torque at the stated differential pressure, whichever is greater.

Valves with operating stands shall have the maximum actuator torques increased by 25 percent. Actuator torques determined by the above requirements shall be increased by any design factors required by paragraph 4.2.8 of ANSI/AWWA C504 for valves 72 inches and smaller, or paragraph 4.3.7 of ANSI/AWWA C516 for valves 78 inches and larger or as specified herein.

The valve manufacturer shall provide torque calculations showing dynamic torque at maximum flow conditions, with valve seat on the correct side of flow direction and prove that actuators are sized correctly with the required safety factors.

2-5. SHOP PAINTING. All interior and exterior ferrous metal surfaces, except finished surfaces, bearing surfaces, and stainless steel components, of valves and accessories shall be shop painted for corrosion protection. The valve manufacturer's standard coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the specified field painting. Epoxy coatings shall be ANSI/NSF 61 certified.

Surfaces shall be painted as follows:

Unfinished Surfaces	
Interior Surfaces	Epoxy.
Exterior Surfaces of Buried Valves	Epoxy.
Exterior Surfaces of Valves to be Submerged	Epoxy.
Exterior Surfaces of All Other Valves	Universal Primer.
Polished or Machined Surfaces	
Flange Faces	Rust-preventive Compound.
Other Surfaces	Epoxy.

Interior coatings shall comply with ANSI/AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils
Universal Primer	3 mils

2-6. ACCESSORIES. Requirements for extension stems and stem guides, position indicators, floor boxes, operating stands, torque tubes, valve boxes, and extension bonnets shall be as indicated in the AWWA Butterfly Valve Schedule and as specified in the Valve Actuators section.

PART 3 – EXECUTION.

3-1. FACTORY LEAKAGE TESTS. Regarding Section 5 of the governing standard, valves shall be tested on both sides.

3-2. WITNESSING OF FACTORY TESTS. For valves 48 inches and larger, TAMPA BAY WATER or a designated representative reserves the right to witness the tests specified in Section 5 of the governing standard.

3-1. INSTALLATION. Butterfly valves shall be installed with the shaft horizontal unless otherwise necessary for proper operation or as acceptable to ENGINEER.

Butterfly valves shall be installed with the flat face/adjustment side of the disc on the downstream side of the valve.

Whenever an actuator must be removed to permit installation of a valve, the actuator shall be promptly reinstalled and shall be inspected and readjusted by a representative of the valve manufacturer.

End of Section

SECTION 15104

RESILIENT-SEATED GATE VALVES

PART 1 - GENERAL

1.01. SCOPE

A. This section covers furnishing resilient-seated non-rising stem AWWA gate valves for clear water service and as indicated in the Resilient-Seated Gate Valve Schedule. Resilient-seated gate valves shall be furnished complete with actuators and accessories as specified herein and as specified in the Valve Actuator section.

B. The minimum design working water pressure shall be 200 psig.

1.02. GENERAL

A. Equipment provided under this section shall be fabricated and assembled in full conformity with the DRAWINGS, SPECIFICATIONS, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by ENGINEER.

B. Valves shall be furnished with all necessary parts and accessories indicated on the DRAWINGS, specified, or otherwise required for a complete, properly operating installation and shall be the latest standard products of a manufacturer regularly engaged in the production of valves.

C. Governing Standard. Except as modified or supplemented herein, all resilient-seated gate valves shall conform to the applicable requirements of ANSI/AWWA C509.

1.03. SUBMITTALS.

A. Complete DRAWINGS, details, and SPECIFICATIONS covering the valves and their appurtenances shall be submitted in accordance with the Submittals Procedures section.

B. All valves shall be tested in accordance with Section 5 of the governing standard. Certified copies of the results of all tests, together with an affidavit of compliance as indicated in Section 6.3 of the governing standard, shall be submitted to ENGINEER before the valves are shipped.

PART 2 - PRODUCTS

2.01. MATERIALS

A. Except as modified or supplemented herein, materials used in the manufacture of resilient-seated gate valves shall conform to the requirements of the governing standard.

B. Bronze Components. All bronze valve components in contact with liquid shall contain less than 16 percent zinc. All aluminum bronze components in contact with liquid shall not contain less than 79 percent copper.

C. Gaskets. Gaskets shall be free of asbestos and corrosive ingredients.

D. Shop Coatings.

Epoxy

For Raw or Treated Water Service in potable water facilities (NSF certified systems)	PPG Amercoat "Amerlock 400 High-Solids Epoxy ", Carboline "Carboguard 891", Sherwin-Williams "Dura Plate 235 NSF" or Tnemec "Series N140 Pota-Pox Plus".
Rust-Preventive Compound	As recommended by manufacturer.
Universal Primer	As recommended by manufacturer.

2.02. VALVE CONSTRUCTION.

A. Ends. Valve ends shall be compatible with connecting piping. Buried valves shall be flanged or mechanical joint ends and as indicated in the Resilient-Seated Gate Valve Schedule. Above grade valves shall be flanged ends. Except as modified or supplemented herein, the ends shall conform to the applicable requirements of the governing standard.

B. Stem Seals. Valve stem shall be the non-rising type. O-ring stem seals shall be provided for all gate valves.

C. Rotation. The direction of rotation of the hand wheel or the wrench nut to open the valve shall be to the left (counterclockwise).

D. Shop Coatings. All interior and exterior ferrous metal surfaces of valves and accessories shall be shop coated for corrosion protection. The valve manufacturer's standard fusion-bonded coating will be acceptable, provided it is functionally equivalent to the specified coating and is compatible with the specified field coating.

Surfaces shall be coated as follows:

Unfinished Surfaces

Interior Surfaces	Epoxy
Exterior Surfaces of Valves to	

be Buried	Epoxy
Exterior Surfaces of Valves to be Submerged	Epoxy
Exterior Surfaces of All Other Valves	Universal Primer.
Polished or Machined Surfaces	
Flange Faces	Rust-preventive compound.
Other Surfaces	Epoxy.

The interior surfaces of each valve shall be subjected to a nondestructive holiday test in accordance with ASTM G62, Method A, and shall be electrically void-free.

Interior coatings shall comply with ANSI/AWWA C550 and shall be free of holidays. The total dry film thickness of shop-applied coatings shall be not less than:

Type of Coating	Minimum Dry Film Thickness
Epoxy	10 mils.
Universal Primer	3 mils.

2.03. VALVE ACTUATORS.

A. Requirements for valve actuators shall be as specified in the Valve Actuator section and as indicated in the Resilient-Seated Gate Valve Schedule.

2.04. ACCESSORIES.

A. When the DRAWINGS or the Resilient-Seated Gate Valve Schedule indicate the need for extension stems, stem guides, position indicators, floor boxes, valve boxes, or operating stands, refer to the Valve Actuator section.

PART 3 - EXECUTION

3.01. INSPECTION.

A. All valves and accessories shall be inspected for damage and cleanliness before being installed. Any material damaged or contaminated in handling on the job shall not be used unless it is repaired and re-cleaned to the original requirements by CONTRACTOR. Such material shall be segregated from the clean material and shall be inspected and approved by TAMPA BAY WATER or its representative before its use.

3.02. INSTALLATION.

A. Valves shall be installed with sufficient clearance for proper operation of any external mechanisms, and with sufficient clearance to dismantle the valve for in-place maintenance. Installation shall be in accordance with the valve manufacturer's recommendations.

B. Unless otherwise indicated on the DRAWINGS, all valves installed in horizontal runs of pipe having centerline elevations 3 feet 6 inches or less above the finish floor shall be installed with their operating stems vertical. Valves installed in horizontal runs of piping having centerline elevations between 4 feet 6 inches and 6 feet 9 inches above the finish floor shall be installed with their operating stems horizontal. If adjacent piping prohibits this, the stems and operating hand wheel shall be installed above the valve horizontal centerline as close to horizontal as possible. Valves installed in vertical runs of pipe shall have their operating stems oriented to facilitate the most practicable operation, as reviewed by ENGINEER.

C. Installation Checks. An installation check by an authorized representative of the manufacturer is not required.

3.03. FIELD QUALITY CONTROL.

A. Field Testing. After Installation, all valves shall be tested in accordance with the Pipeline Pressure and Leakage Testing Section.

1. Pressure Tests. Pressure testing shall be in accordance with the Pipeline Pressure and Leakage Testing section.

2. Leakage Tests. All installed valves shall be free from leaks. Each leak that is discovered within the CORRECTION PERIOD stipulated in the General Conditions shall be repaired by and at the expense of CONTRACTOR. This requirement applies whether pressure testing is required or not.

End of Section

SECTION 13 47 13
CATHODIC PROTECTION SYSTEM

PART 1 - GENERAL

1.1 THIS SECTION INCLUDES

A. The WORK of this Section includes providing a complete galvanic cathodic protection (CP) system for the following structures as outlined in this Section and on the Drawings:

1. The pipeline consists of approximately 500 feet of 60-inch diameter polyurethane-coated welded steel pipe.

B. Electrical isolation of the pipelines from adjacent metallic structures, steel reinforced concrete structures, casings, structures of dissimilar metal or dissimilar coatings, conduits, and all other metallic components that may impact the operation of the CP system.

C. Electrical bonding of all non-insulated, non-welded pipe joints and mechanical joints to provide electrical continuity.

D. Installation of galvanic anodes, insulating joints, test stations, other components associated with the CP system, and all other work described herein and on the Drawings.

E. Testing of CP system during installation.

F. Cleanup and restoration of work site.

G. System Commissioning: Testing of CP system after installation and backfilling.

1.2 REQUIREMENTS

A. If the products installed as part of this Section are found to be defective or damaged or if the WORK of this Section is not in conformance with these Specifications, then the products and WORK shall be corrected at the CONTRACTOR's expense.

B. Any retesting required due to inadequate installation, failure to meet performance or acceptance criteria, or due to defective materials shall be paid for by the CONTRACTOR at no additional cost to the owner.

C. The WORK also requires that one Supplier or Subcontractor accept responsibility for the WORK, as indicated, but without altering or modifying the CONTRACTOR's responsibilities under the Contract Documents.

D. The WORK also requires coordination of assembly, installation, and testing between the pipeline contractor and any CP material supplier or subcontractor.

E. All electrical WORK shall be in accordance with NEC and local requirements.

1.3 RELATED SECTIONS

A. The WORK of the following Sections applies to the WORK of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this WORK.

1. 02220 – Excavation, Trenching, Backfilling, and Compacting
2. 03000 – Concrete
3. 03600 – Grout
4. 09940 – Protective Coatings
5. 15065 – Steel Pipe

1.4 REFERENCED SPECIFICATIONS, CODES AND STANDARDS

A. The WORK of this Section shall comply with the current editions of the codes and standards referenced in this specification, including the following:

1. AASHTO — American Association of State Highway and Transportation Officials
   a. H20 — Specification for Highway Bridges
2. ACI — American Concrete Institute
   a. 523.1 — Guide for Cast-in-Place Low Density Cellular Concrete
   b. 523.3R — Guide for Cellular Concretes above 50 pcf
3. ASTM — ASTM International
   a. A123 — Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
   b. A615 — Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement
   c. B3 — Standard Specification for Soft or Annealed Copper Wire
   d. B8 — Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
   e. B80 — Standard Specification for Magnesium-Alloy Sand Castings
   f. B187 — Standard Specification for Copper, Bus Bar, Rod, and Shapes and General Purpose Rod, Bar, and Shapes

g. B843 Standard Specification for Magnesium Alloy Anodes for Cathodic Protection

h. C94 Standard Specification for Ready-Mixed Concrete

i. D1000 Standard Test Methods for Pressure-Sensitive Adhesive-Coated Tapes Used for Electrical and Electronic Applications

j. D1248 Standard Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable

k. D1785 Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120

l. D2220 Standard Specification for Poly (Vinyl Chloride) Insulation for Wire and Cable, 75°C Operation

m. D3005 Standard Specification for Low-Temperature Resistant Vinyl Chloride Plastic Pressure-Sensitive Electrical Insulating Tape

n. D4388 Standard Specification for Nonmetallic Semi-Conducting and Electrically Insulating Rubber Tapes

o. D6386 Standard Practice for Preparation of Zinc (Hot-Dip Galvanized) Coated Iron and Steel Product and Hardware Surfaces for Painting

p. G97 Standard Test Method for Laboratory Evaluation of Magnesium Sacrificial Anode Test Specimens for Underground Applications

4. AWWA American Water Works Association

a. C217 Petrolatum and Petroleum Wax Tape Coatings for the Exterior of Connections and Fittings for Steel Water Pipelines

5. NSF National Sanitation Foundation

a. NSF 61 Drinking Water System Components

6. NACE International, the Corrosion Society

a. SP0375 Field-Applied Underground Wax Coating Systems for Underground Pipelines: Application, Performance, and Quality Control

b. SP0169 Control of External Corrosion on Underground or Submerged Metallic Piping Systems

c. SP0286 Electrical Insulation of Cathodically Protected Pipelines

d. TM0497 Measurement Techniques Related to Criteria for Cathodic Protection on Underground or Submerged Metallic Piping Systems

7. NEMA National Electrical Manufacturers Association

a. TC2 Electrical Polyvinyl Chloride (PVC) Tubing and Conduit

b. TC3 PVC Fittings for Use with Rigid PVC Conduit and Tubing

8. NFPA National Fire Protection Association

a. NFPA 70 National Electric Code (NEC)

9. UL Underwriters Laboratories

a. 6 Rigid Metal Conduits

b. 467 Grounding and Bonding Equipment

c. 489 Molded Case Circuit Breakers, Molded Case Switches and Circuit Breaker Enclosures

d. 506 Standard for Specialty Transformers

e. 514B Fittings for Cable and Conduit

B. Whenever the Drawings or these Specifications require a higher degree of workmanship or better quality of material than indicated in the above codes and standards, these Drawings and Specifications shall prevail.

1.5 PERMITS AND JOB ACCESS

A. Prior to the start of construction, the CONTRACTOR shall apply to the required authorities for permits required for installation of the CP system.

B. The CONTRACTOR shall contact Sunshine 811 prior to commencing construction to locate existing utilities in the area of construction. Existing utilities include, but are not limited to, water lines, gas lines, telephones, streetlights, sewer and storm drains, and overhead and underground electric utilities.

C. If traffic control is necessary, it shall satisfy the requirements of the governing locality.

1.6 QUALITY ASSURANCE

A. Installation of the CP equipment shall be performed by individuals having at least five years of experience in the installation of the CP equipment described herein.

B. All testing required to be performed by a "Corrosion Technician" shall be performed by a NACE certified Corrosion Technician under the supervision of a Corrosion Engineer. A Corrosion Technician is a minimum of a NACE CP2 (CP Technician). A Corrosion Engineer is a Registered Professional Corrosion Engineer or a NACE CP4 (CP Specialist).

1.7 SUBMITTALS

A. The following shall be submitted to the ENGINEER prior to any equipment installation.

1. A copy of this specification section, with addenda updates, with each paragraph check marked to show specification compliance or marked to show deviations.

2. Catalog cuts, bulletins, brochures, or data sheets for all materials specified herein.

3. Statement that the equipment and materials proposed meet the Specifications and the intent of the Specifications.

4. Statement of installation and testing experience required.

5. Schedule, including the expected start date and planned completion date.

6. Copy of well drilling or surface disturbance permits if permits are required by local jurisdiction.

7. Description of power system to be provided for rectifiers, including cut sheets, meter sizing, power company requirements, and copy of permits.

8. Manufacturer's anode connection resistance test results.

9. CONTRACTOR's System Commissioning Test Plan and Procedures. The test plan shall outline the organization, schedule, allocation of resources, and documentation requirements associated with the commissioning tests.

B. The following shall be submitted to the ENGINEER after completion of the WORK.

1. Wire connection testing.

2. Insulating joint testing, before and after backfilling.

3. Electrical isolation testing from structures or rebar.

4. Casing insulator testing, before and after backfilling.

5. Joint bond testing, before and after backfilling.

6. System Commissioning Report documenting all test results. The test report shall include the findings, results, and comments derived from the commissioning tests.

7. Record Drawings shall be submitted to and approved by the ENGINEER before the WORK is considered complete.

1.8 INTERFERENCE AND EXACT LOCATIONS

A. The locations of CP equipment, test stations, devices, outlets, and appurtenances, as indicated, are approximate only. Exact locations shall be determined by the CONTRACTOR in the field subject to the approval of the ENGINEER.

B. The CONTRACTOR shall field-verify all data and final locations of work done under other Sections of the Specifications required for placing of the electrical work.

C. In case of interference with other work, foreign pipeline, or erroneous locations with respect to equipment or structures, the CONTRACTOR shall furnish all labor and materials necessary to complete the WORK in an acceptable manner to the OWNER. Deviations from the Drawings and Specifications shall be submitted to the OWNER for approval.

PART 2 - PRODUCTS

2.1 GENERAL

A. All materials installed must be new. All equipment and materials supplied shall be similar to that which has been in satisfactory service for at least 5 years.

B. All materials in contact with potable water shall be NSF 61 approved.

2.2 GALVANIC ANODES

A. High-potential magnesium anodes: Cast magnesium anodes shall conform to ASTM B843 Type M1C. Anodes shall have an open circuit potential of −1.70 volts or more electronegative and a current efficiency of at least 48% when tested in accordance with ASTM G97. Anodes shall have the following size, form, and shape. Anodes shall be supplied by Farwest, Corrpro, Mesa, Matcor, or an approved equivalent.

Ingot				**Packaged**		
Weight (lb)	**Width (inch)**	**Height (inch)**	**Length (inch)**	**Weight (lb)**	**Diameter (inch)**	**Length (inch)**
60	4 to 5	4	60	126 to 130	6 to 7	64

B. Galvanic anodes shall be pre-packaged in a cloth bag containing backfill of the following composition: 75% gypsum, 20% bentonite, and 5% sodium sulfate. The anodes shall be of the size indicated on the Drawings and placed where indicated on the Drawings.

C. Anode lead wire:

1. The wire attached to the anodes shall be of the size and type indicated on the Drawings. The anode lead wire shall conform to the specifications given for "Wires" in this specification.

2. Connection of wire to the anode shall have a pulling strength that exceeds the wire's tensile strength.

3. Anode lead wires shall be of one continuous length, without splices, unless otherwise indicated on the Drawings, from the anode connection to the test station.

2.3 READY-MIXED CONCRETE

A. Ready-mixed concrete shall be in accordance with ASTM C94, permit requirements, and the Specification section for cast-in-place concrete.

2.4 REINFORCING STEEL

A. Reinforcing steel shall be in accordance with ASTM A615, permit requirements, and the Specification section for reinforcing steel.

2.5 FLUSH-MOUNTED TEST STATION

A. Flush-mounted test station boxes shall be traffic boxes rated to withstand AASHTO H20 traffic loading.

B. The traffic boxes shall be G05 Utility Boxes, as manufactured by Christy Concrete Products, Inc.; No. 3RT Traffic Valve Box, as manufactured by Brooks Products; or an approved equivalent.

C. Traffic box covers for test stations shall be cast iron with welded bead legend and labeled "CP TEST" or "ANODE," as required.

2.6 TERMINAL BOARDS

A. Terminal boards shall be made of 1/4-inch thick phenolic plastic and sized as indicated on the Drawings.

B. Connection hardware shall be brass or bronze. All connections shall be double nutted bolts with serrated lock washers.

C. Copper bus bar shall be 1/8-inch thick and sized to fit. The copper bus bar shall be per ASTM B187 with 98% conductivity.

2.7 MECHANICAL LUGS

A. Mechanical lugs shall be brass or copper with a brass, copper, or stainless steel set screw. Tin plating on the lugs is optional. Aluminum lugs shall not be permitted. Zinc-plated steel set screws shall not be permitted. The lug shall be listed per UL 467, suitable for direct burial, and appropriately sized for the incoming wires. The lug shall be ILSCO Type XT-6DB, Burndy GKA8C, or an approved equivalent.

2.8 SHUNTS

A. Shunts shall be selected by the size indicated on the Drawings.

B. 0.01-ohm, 6-amp shunts shall be manganin wire type, as indicated. Shunts shall be Type RS, as manufactured by Holloway, or an approved equivalent.

2.9 CONDUIT AND FITTINGS

A. The minimum conduit size shall be 1 inch unless otherwise indicated. Refer to NFPA 70 (NEC) for additional conduit size requirements.

B. Conduit and fittings placed below grade shall be Schedule 80 PVC in accordance with NEMA TC2 and NEMA TC3.

C. Conduit and fittings placed above grade shall be rigid steel. Rigid Steel conduit shall be galvanized and conform to UL 6.

D. Conduit clamps shall be galvanized steel, 304 stainless steel, or 316 stainless steel.

E. Fittings for use with rigid steel conduit shall be galvanized cast ferrous metal, with gasketed covers, Crouse Hinds Condulets, Appleton Unilets, or an approved equivalent. Rigid metallic conduit fittings shall be galvanized, conform to NEMA FB 1, and listed to UL 514B.

F. Union couplings for conduit shall be Erickson or Appleton Type EC, 0-Z Gedney 3-piece Series 4, or an approved equivalent.

G. Non-metallic insulating end bushings shall be used at conduit terminations regardless of the conduit material used and shall conform to NFPA 70 (NEC). Insulating bushings shall be Emerson Type A for threaded ended conduits, Arlington fit-in for non-threaded conduits, or approved equivalents.

2.10 CAUTION TAPE

A. The caution tape shall be an inert plastic film designed for prolonged underground use. The caution tape shall be a minimum of 3 inches wide and a minimum of 4 mils thick.

B. The caution tape shall be continuously printed over the entire length with the wording "CAUTION: CATHODIC PROTECTION CABLE BURIED BELOW."

C. The wording shall be printed using bold black letters. The color of the tape shall be red.

2.11 WIRES

A. Conductors shall consist of stranded copper of the gauge indicated on the Drawings. Wire sizes shall be based on American Wire Gauge (AWG). Copper wire shall be in conformance with ASTM B3 and ASTM B8.

B. Insulation Type and Colors: As shown on the Drawings.

1. High molecular weight polyethylene (HMWPE) wires shall be rated for 600 volts and shall conform to ASTM D1248, Type 1, Class C, Grade 5.

2.12 WIRE IDENTIFICATION TAGS

A. Wire identification tags shall be the wrap-around type with a high resistance to oils, solvents, and mild acids. Wrap-around markers shall fully encircle the wire with imprinted alpha-numeric characters for pipe identification. The height of the letters and numbers shall be 3/16 inch at a minimum.

2.13 GALVANIC ANODE HEADER WIRE-TO-ANODE LEAD WIRE SPLICES

A. The anode header wire shall be connected to the anode lead wire using a split bolt encased in resin. Splice kit shall be a resin splice kit that completely encapsulates the wire and splice connection and shall be designed for CP splices. Splice kit shall be Scotchcast Wye Resin Splice Kit 82-B1, as manufactured by 3M, or an approved equivalent.

2.14 EXOTHERMIC WELDS

A. Exothermic welds shall be in accordance with the manufacturer's recommendations. Exothermic welds shall be Cadweld manufactured by Erico, Thermoweld manufactured by Burndy, or an approved equivalent.

B. Prevent molten weld metal from leaking out of the mold, where necessary, by using Duxseal packing manufactured by Johns-Manville, Thermoweld packing material manufactured by Burndy, Cadweld T403 Mold Sealer manufactured by Erico, or an approved equivalent.

C. The shape and charge of the exothermic weld shall be chosen based on the following parameters and based on manufacturer recommendations:

1. Pipe material
2. Pipe size
3. Wire size and requirement for sleeves
4. Number of wires to be welded
5. Orientation of weld (vertical or horizontal)

2.15 EXOTHERMIC WELD COATING

A. After exothermic welding, repair coatings and linings in accordance with the coating and lining manufacturer's recommendation.

B. For dielectrically coated steel pipe, weld caps with integrated primer shall be used to cover the exothermic weld connecting the wire to the pipe. The weld cap shall be a 10-mil thick durable plastic sheet that has a dome filled with a moldable compound to assure complete encapsulation of the exothermic weld and a layer of elastomeric adhesive with integrated primer. The adhesive and primer shall be compatible with the pipe material and pipe coating material. Adhesion to steel shall be at least 10 lb/in per ASTM D1000. Weld cap with integrated primer shall be Handy Cap IP manufactured by Royston or an approved equivalent for wire size up to 8 AWG and Handy Cap XL IP manufactured by Royston or an approved equivalent for wire size up to 2 AWG.

2.16 DIELECTRIC INSULATING FLANGE KITS

A. Insulating flange kits shall include full-faced gaskets, insulating sleeves and washers, and 316 stainless steel bolts, nuts, and washers. The complete assembly shall have a pressure rating equal to or greater than the flanges between which it is installed. Sleeves, gaskets, and insulating washers shall have a minimum dielectric constant of 300 volts per mil. Stainless steel washers shall fit well within the bolt facing on the flange. Insulating washers shall fit within the bolt facing the flange over the outside diameter of the sleeve.

1. Insulating gasket shall be full-faced, Type E, and 1/8-inch thick. Acceptable gasket materials include nitrile faced phenolic, G-10, or a material with approved equivalent or increased performance. Acceptable seal materials include EPDM, PTFE, or a material with approved equivalent or increased performance. When used in potable water systems, gasket and seal shall be NSF 61 approved.

2. Insulating sleeves shall be 1/32-inch thick and equal the number of bolts on the flange. Acceptable materials include Mylar, G-10, or a material with approved equivalent or increased performance.

3. Insulating washers shall be 1/8-inch thick and equal to twice the number of bolts on the flange. Acceptable materials include phenolic, G-10, or a material with approved equivalent or increased performance.

B. Dielectric insulating flange kits shall be manufactured by Pipeline Seal and Insulator, Inc., Advance Products & Systems Inc., GPT Industries, or an approved equivalent.

C. For bell and spigot pipe, provide electrical isolation through the installation of the following materials:

1. Flange connection to lock joint bell adapter.

2. Flange connection to lock joint spigot adapter.

2.17 MONOLITHIC INSULATING JOINTS

A. Monolithic insulating joints shall be designed to provide for the electrical isolation of piping sections and shall be completely factory assembled. Monolithic insulating joints shall be designed so that they are welded into the field piping during installation.

B. Monolithic insulating joints shall have the same or better pressure rating and hydrostatic performance as the pipeline where it will be installed.

C. The electrical resistance in dry air shall be greater than or equal to 5 MΩ at 1000 V_{DC}. The breakdown voltage in dry air shall be at least 3 kV_{AC} at 50 Hz for 1 minute.

D. When used in potable water systems, the internal coating shall be NSF approved.

E. Monolithic insulating joints shall be manufactured by Advance Products & Systems Inc., GPT Industries, or an approved equivalent.

2.18 CASING SPACERS

A. The following are minimum requirements for effective electrical isolation between the pipeline and its casing. Refer to the pipeline specification for additional requirements:

1. For piping installed in tunnels or cased crossings, install insulating casing spacers between the piping and the casing or tunnel liner to provide electrical isolation.

2. Inside diameter of the casing or tunnel liner must be at least 4 inches greater in diameter than the outside diameter of the piping. In the case of mechanically coupled piping, the casing must be a minimum of 4 inches greater in diameter than the outside diameter of the coupling at its largest point.

3. Use 12-inch wide steel insulators with 2-inch wide glass reinforced runners, Model Ranger II as manufactured by GPT Industries, Model C12G-2 as manufactured by Pipeline Seal and Insulator, Inc., Model SI as manufactured by Advance Products and Systems, or an approved equivalent.

2.19 CASING END SEAL

A. Casing end seal shall seal the annular space between the carrier pipe and casing. A casing end seal shall be installed on each end of the casing. The casing end seal shall be designed to last the life of the piping system.

B. Casing end seal shall be at least 1/8-inch thick neoprene, nitrile, or EPDM. The seal shall be secured with 316 stainless steel banding straps.

C. In addition to casing end seals, link-seals should be installed to seal the annular space. Link-seals shall be installed on each end of the casing and shall be designed to last the life of the piping system.

D. Link-seal insulators shall be made with a non-conductive elastomer, such as EPDM, nitrile, or silicone.

E. Link-seal metallic components shall be 316 stainless steel. No metallic components shall be in direct contact with the pipeline or the casing.

2.20 GROUT

A. Dielectric grout shall be in accordance with the Specification section for grouts. An acceptable dielectric grout mix shall be composed of closed-cell, low-density cellular grout and conform with ACI 523.1 and ACI 523.3. Use of any other type of grout shall be approved by the ENGINEER.

2.21 PETROLATUM WAX TAPE

A. Petrolatum wax tape shall meet or exceed the requirements of AWWA C217 and shall consist of three parts: Surface primer, wax tape, and outer covering. All three parts shall be the product of a single manufacturer and suitable for their operating environment.

B. The primer shall be a blend of petrolatums, plasticizers, and corrosion inhibitors having a paste-like consistency. Primer shall be Wax-Tape Primer manufactured by Trenton, Denso Paste manufactured by Denso, or an approved equivalent.

C. The wax tape shall be synthetic-fiber felt, 45 to 90 mils thick, saturated with a blend of micro-crystalline wax, petrolatums, plasticizers, and corrosion inhibitors that are capable of easy conformability over irregular surfaces. Wax tape shall be #1 Wax-Tape manufactured by Trenton, Denso Tape manufactured by Denso, or an approved equivalent.

D. The outer covering shall be a plastic wrap consisting of one 150-gauge sheet or three 50-gauge sheets wound together as a single sheet, clear polyvinylidene chloride, shrink wrap that is flexible enough to conform to irregular surfaces. Outer wrapping shall be Poly-Ply by Trenton, Poly-Wrap by Denso, or an approved equivalent.

PART 3 - EXECUTION

3.1 MATERIAL AND EQUIPMENT STORAGE

A. All materials and equipment to be used in construction shall be stored in such a manner to be protected from detrimental effects from the elements. If warehouse storage cannot be provided, materials and equipment shall be stacked well above ground level and protected from the elements with plastic sheeting or another method, as appropriate.

3.2 EXCAVATION AND BACKFILL

A. Buried wires shall have a minimum cover of 30 inches.

B. Caution tape shall be installed above the buried wire. Caution tape shall be installed a minimum of 6 inches above underground wires and conduits.

C. Wire identification tags shall be placed on the wires prior to placing the wire in conduit or backfilling.

3.3 SURFACE GROUND BED FOR GALVANIC ANODES

A. Prepackaged anodes shall be installed at the locations indicated on the Drawings.

B. Plastic or paper wrapping shall be removed from the anode prior to lowering the anode into the hole. Anodes shall not be suspended by the lead wires. Damage to the canvas bag, anode-to-wire connection, copper wire, or wire insulation before or during installation will require replacement of the entire anode assembly. Anodes shall be inspected and approved prior to backfilling.

C. Anodes shall be backfilled with native soil. Backfilling with native soil shall proceed in 6-inch lifts, compacting the soil around the anode during each lift, until the backfill has reached grade. Upon completion of compaction of backfill to the top of the anode, and prior to filling the hole and compacting the backfill to the surface, a minimum of 10 gallons of fresh water shall be poured into the hole to saturate the prepackaged anode backfill and surrounding soil.

D. Anode lead wires shall be routed and terminated on the panel board as shown in the Drawings.

3.4 TEST STATIONS

A. Test stations shall be installed at the approximate locations shown on the Drawings. The CONTRACTOR shall field verify all final locations, subject to acceptance by the ENGINEER. Test stations shall be located within the pipeline easement. Test stations shall be located in areas not subject to vehicular traffic, such as sidewalks, unless otherwise approved by the ENGINEER.

B. For flush-mounted test stations, place the bottom of the test box on native soil. Do not place rock, gravel, sand, or debris in the box. Install 4,000 psi concrete collar with reinforcement after placement of the test box to finished grade. Provide sufficient sloping in the concrete pad or surrounding pavement to provide drainage away from the test box.

C. Connect wires to the terminal board as shown on the Drawings. Provide sufficient slack in wires (12 inches at minimum) to allow for pipe settlement, removal of the terminal board for testing, and future maintenance. Each wire shall be identified with a permanent wire identifier within 4 inches of the termination. After installation, all wire connections in the test station shall be tested by the Contractor to ensure they meet the requirements herein.

D. The CONTRACTOR shall provide global positioning system (GPS) coordinates for each test station location with a minimum accuracy of 1 meter or 3 feet. The CONTRACTOR shall submit the GPS coordinates of the test stations to the ENGINEER after installation.

3.5 WIRES

A. Buried wires shall be laid straight without kinks. Each wire run shall be continuous in length and free of joints or splices, unless otherwise indicated. Care shall be taken during installation to avoid punctures, cuts, or other damage to the wire insulation. Damage to insulation shall require replacement of the entire length of wire at the CONTRACTOR's expense.

B. Wire shall not be bent into a radius of less than eight times the overall wire diameter.

C. The wire conduits must be of sufficient diameter to accommodate the wires. This shall be determined by the number and size of wires in accordance with the applicable codes and standards.

D. Conduit shall be installed to a minimum depth of 30 inches below grade.

E. Install caution tape a minimum of 6 inches above buried wire and conduits. Every 3 feet, double over the tape for a distance of 8 inches to increase the apparent flexibility of the tape.

F. Use PVC conduit underground and galvanized rigid steel conduit above grade. The portion of galvanized steel conduit that is underground before it transitions to PVC shall be primed and tape wrapped along the entire length with half-lap, 10-mil polyethylene tape.

3.6 WIRE IDENTIFICATION TAGS

A. All wires shall be coded with wire identification tags within 4 inches of the wire end indicating diameter and type of pipe, structure, anode type and size, or reference electrode.

B. Wire identification tags shall be placed on all wires prior to backfilling and installation of test stations.

3.7 GALVANIC ANODE HEADER WIRE-TO-ANODE LEAD WIRE SPLICES

A. Install split bolt according to manufacturer's instructions, including torque specifications.

B. Install the splice kits in accordance with the manufacturer's instructions.

3.8 JOINT BONDS

A. Joint bonding shall be provided across flexible couplings and all non-welded joints to ensure electrical continuity, except where insulating joints have been installed to provide electrical isolation. Joint bonds shall be of the type, size, length, and number shown on the Drawings and installed as indicated.

B. Bonding wires shall allow at least 2 inches of movement in the pipe joint. The wire shall be attached by exothermic welding. At least 2 bond wires shall be provided between all discontinuous joints.

C. For ductile iron pipe, the CONTRACTOR may, at his or her own expense, provide weld plates that are installed by the pipe manufacturer at the spigot end of the pipe. Provision of the weld plates does not relieve the CONTRACTOR from responsibility for repair of damage to the coating or lining as a result of exothermic welding of the pipe. Coating repairs shall be performed in accordance with the coating manufacturer's recommendations.

3.9 EXOTHERMIC WELD CONNECTIONS

A. Exothermic weld connections shall be installed in the manner and at the locations indicated. Exothermic welds shall be spaced at least 6 inches apart from other exothermic welds, fittings, and circumferential welds.

B. Coating materials shall be removed from the surface over an area of sufficient size to make the connection and as indicated on the Drawings. The surface shall be cleaned to bare metal per SSPC SP11 prior to welding the conductor. The use of resin-impregnated grinding wheels will not be allowed.

C. Only enough insulation shall be removed such that the copper conductor can be placed in the welding mold. If the wire conductor diameter is not the same as the opening in the mold, then a copper adapter sleeve shall be fitted over the conductor.

D. The CONTRACTOR shall be responsible for testing all test lead and bond wire welds. The ENGINEER, at his or her discretion, shall witness these tests. After the weld has cooled, all slag shall be removed and the metallurgical bond shall be tested for adherence by the CONTRACTOR. A 22-ounce hammer shall be used for adherence testing by striking a blow to the weld. A weld that can be removed or compromised by the hammer blow shall be rejected. Care shall be taken to avoid hitting the wires. All defective welds shall be removed and replaced in a new location at least 6 inches away from the original weld location.

E. All exposed surfaces of the copper and steel shall be covered with insulating materials.

1. For dielectrically coated or polyethylene encased pipes, a plastic weld cap with integrated primer shall cover the exothermic weld and surrounding area. All surfaces must be clean, dry, and free of oil, dirt, loose particles, and all other foreign materials prior to application of the weld cap.

F. The CONTRACTOR shall inspect both the interior and exterior of the pipe to confirm that all coatings and linings removed or damaged as a result of the welding have been repaired. The CONTRACTOR shall furnish all materials, clean surfaces, and repair protective coatings and linings damaged as a result of the welding. Repair of any coating or lining damaged during welding shall be performed in accordance with the coating or lining manufacturer's recommendations.

G. After backfilling the pipe, all test lead pairs shall be tested for broken welds using a standard ohmmeter. The resistance shall not exceed 150% of the theoretical wire resistance, as determined from published wire data.

3.10 DIELECTRIC INSULATING FLANGE KITS

A. All insulating components of the insulating flanged gasket set, and mating surfaces shall be cleaned of dirt, grease, oil, and other foreign materials immediately prior to assembly. If moisture, soil, or other foreign matter contacts any portion of these surfaces, disassemble the entire joint and clean with a suitable solvent. Dry the entire joint. Once completely dry, reassemble the joint.

B. Care shall be taken to prevent any excessive bending or flexing of the gasket. Creased or damaged gaskets shall be rejected and removed from the job site at the CONTRACTOR's expense.

C. Bolt holes in mating flanges shall be properly aligned at the time bolts and insulating sleeves are inserted to prevent damage to the insulation. Follow the manufacturer's recommended bolt tightening sequence. Center the bolt insulating sleeves within the insulation washers so that the insulating sleeve is not compressed and damaged.

D. After flanged bolts have been tightened, each insulating washer shall be inspected for cracks or other damage. All damaged washers shall be replaced.

E. When the flange is determined to be properly functioning to the full satisfaction of the OWNER, approval will be granted to proceed with the installation. Do not proceed with coating, lining, or backfilling the insulating joint prior to gaining approval to proceed. If the coating or lining is applied prior to gaining approval to proceed, the coating or lining shall be completely removed and replaced to the satisfaction of the OWNER at the CONTRACTOR's expense. If the insulating joint is backfilled prior to gaining approval from the OWNER, the CONTRACTOR shall completely excavate the insulating joint at the CONTRACTOR's expense.

F. After testing and acceptance by the OWNER, coat the exterior of the insulating flange with the petrolatum wax tape system specified herein for a minimum of three feet beyond the gasket with a minimum of six inches of overlap with the factory-applied coating on the pipeline.

G. After testing and acceptance by the OWNER, line the interior of the insulating flange with the lining system that is compatible with the existing factory lining and recommended by the existing lining manufacturer. The coating shall comply with NSF 61. Follow the manufacturer's surface preparation and application procedures.

3.11 MONOLITHIC INSULATING JOINTS

A. Install monolithic insulating joints in accordance with the manufacturer's instructions. Do not attempt to disassemble the joint at any time.

B. Before installation, inspect the bore for foreign particles and clean if necessary. When lifting and moving the monolithic insulating joint, support with strapping on both sides of the hub. Do not lift the monolithic insulating joint by the ends.

C. Install by butt-welding each end of the factory assembled joint to attaching pipe or fitting. When welding, equipment shall be grounded on the side of the joint being welded.

D. Do not remove the original coating with solvent or abrasion. This may damage the insulating gaskets or create a residue that is conductive.

3.12 CASING SPACERS

A. Assemble and securely fasten casing spacers to the pipeline to be installed in casings or tunnels.

B. Avoid inadvertent metallic contact between casing and carrier pipe. Place spacers close enough to ensure that the pipe is adequately supported throughout its length, particularly at the ends, to offset settling and possible electrical shorting. The end spacer must be within 6 inches of the end of the casing pipe, regardless of the size of casing and pipe or type of spacer used.

C. Grade the bottom of the trench adjacent to each end of the casing to provide a firm, uniform, and continuous support for the pipe. If the trench requires some backfill to establish the final trench bottom grade, place the backfill material in 6-inch lifts and compact each layer.

D. After the casing or tunnel liner has been placed, pump and maintain a dry trench until the casing spacers and end seals are installed.

E. Install the casing spacers in accordance with the manufacturer's instructions, these Specifications, and as shown on the Drawings. Correctly assemble, evenly tighten, and prevent damage during tightening of the insulators and pipe insertion.

F. Insulator Spacing:

1. Insulators shall be spaced in accordance with the manufacturer's recommendations, these Specifications, and as shown on the Drawings, but in no case shall the distance between spacers be greater than 10 feet for 4- to 12-inch diameter pipe and 8 feet for 16-inch diameter pipe.

2. If the casing or pipe is angled or bent, reduce the distance between spacers.

3.13 CASING END SEAL

A. Assemble hard elastomeric Link-Seals around the pipe and slide into the annular space between the pipe and casing. Evenly tighten the bolts to provide a positive seal, as applicable.

B. Place pull-on synthetic rubber end seals on the pipe and pull over the end of the casing. Securely fasten stainless steel bands, as applicable.

3.14 GROUT

A. The annular space between the carrier pipe and casing shall be filled with dielectric grout in accordance with the specification section for grout.

3.15 PETROLATUM WAX TAPE

A. Petrolatum wax tape systems shall be applied on the 60-inch Steel pipe sections connecting to the existing 60-inch PCCP, joints, and non-cathodically protected metallic appurtenances and fittings, regardless of whether they are bare or factory coated, as indicated in the Drawings. Extend the petrolatum wax tape coating system over any adjacent pipe coating by a minimum of 12-inches. Petrolatum wax tape systems shall be applied in accordance with NACE SP0375, AWWA C217, these Specifications, and the Manufacturer's recommendations.

B. Surfaces shall be cleaned of all dirt, grease, oil, and other foreign materials immediately prior to coating. Loose rust, loose paint, and other foreign matter shall be removed in accordance with SSPC SP2 or SP3.

C. A prime coating shall be applied in a uniform coating over the entire surface to be wrapped. A liberal coating shall be applied to threads, cavities, shoulders, pits, and other irregularities. A filler putty or profiling mastic may be used for complex fittings to produce an acceptable surface for the application of the wax tape system.

D. Petrolatum wax tape shall be applied immediately after applying the primer using a 1-inch overlap. A spiral wrap shall be used, and slight tension shall be applied to ensure that there are no air pockets or voids. For bolts, nuts, and other irregular shapes, cut strips of wax tape and apply them by gloved hand so that there are no voids or spaces under the tape. Apply a sufficient amount of tape to completely encapsulate all exposed steel surfaces. After applying the tape, the applicator shall firmly press and smooth out all lap seams and crevice areas. The tape shall be in tight intimate contact with all surfaces. The minimum wax tape thickness shall be 70 mils over smooth surfaces and 140 mils over sharp and irregular surfaces, or more as required to fill all voids.

E. Apply two layers of outer covering over the wax tape coating by tightly wrapping it around the pipe such that it adheres and conforms to the wax tape. Secure the outer covering to the pipe with adhesive tape.

3.16 CONTINUITY TESTING

A. Continuity testing of joint bonds shall be performed by the CONTRACTOR's qualified corrosion technician as defined in this section after backfilling. The electrical continuity test may additionally be performed before backfilling at the CONTRACTOR's option.

B. The pipe shall be tested for electrical continuity. Continuity shall be verified using the linear resistance method. The pipe should be tested in spans that are no less than 250 feet, unless the pipe is shorter than 250 feet, and no more than 1,000 feet, if test station locations are available. Each test span shall have two test leads connected to the pipe at each end. Existing test stations can be used. A direct current shall be applied through the pipe using two of four test leads. The potential across the test span shall be measured using the other two test leads. The current applied and voltage drop shall be recorded for a minimum of three different current levels.

C. The theoretical resistance of the pipe shall be calculated. It shall include the pipe wall thickness, material, and joint bonds.

D. The average measured resistance shall be compared to the theoretical resistance of the pipe and bond wires. If the measured resistance is greater than 125% of the theoretical resistance, then the joint bonds shall be considered deficient and shall be repaired and retested at the CONTRACTOR's expense. If the measured resistance is less than 100% of the theoretical resistance, then the test and/or calculated theoretical resistance shall be considered deficient and the test span shall be retested and/or recalculated at the CONTRACTOR's expense. If the piping forms a loop, which allows current to flow both in and out of the test span, then consideration shall be made for current circulating through both the loop and the test span.

E. Alternative continuity testing methods can be submitted to the ENGINEER for consideration and approval.

3.17 ISOLATION TESTING

A. The CONTRACTOR shall test the performance of insulating joints, insulating corporation stops, and casing insulators before and after backfilling. Insulating joints are used to electrically isolate two segments of the pipeline. Insulating corporation stops are used to electrically isolate the main pipeline from copper service laterals. Casing insulators are used to electrically isolate the carrier pipe from the casing.

B. Before backfilling, the CONTRACTOR shall test the integrity of the insulators using an above-ground insulator tester. Acceptable above-ground insulator testers are Gas Electronics Model No. 601 Insulation Checker, Miller Insulation Checker (M.I.C.) by M.C. Miller, Model RF-IT by Tinker & Rasor, or an approved equivalent. If the testing results indicate less than 100% insulation, then the insulators shall be repaired and retested at the CONTRACTOR's expense.

C. After backfilling, testing shall be performed by measurement of native pipe-to-soil potentials on both sides of the insulator. If the difference in native pipe-to-soil potentials is greater than 100 mV, then the insulator shall be considered effective. If the difference in native pipe-to-soil potentials between pipe and casing is less than 100 mV, then additional testing shall be performed, as follows. Temporary CP current shall be applied to one side of the insulator. "On" and "Instant Off" pipe-to-soil potentials shall be measured on both sides of the insulator. If the "Instant Off" potential of the opposing side is more electronegative than its native potential, then the insulator is not effective and shall be repaired and retested at the CONTRACTOR's expense.

3.18 SYSTEM COMMISSIONING

A. Upon completion of the installation, the CONTRACTOR shall provide testing of the completed system by a Corrosion Technician, and the data shall be reviewed by a Corrosion Engineer to ensure conformance with the Contract Documents, NACE SP0169, and NACE SP0286.

B. The testing described herein shall be in addition to and not a substitution for any required testing of individual items at the manufacturer's plant and during installation.

C. Testing shall be performed at all test leads of all test stations, junction boxes, and locations of the exposed pipe as soon as possible after installation of the CP system.

D. Testing shall include the following and shall be conducted in accordance with NACE TM0497:

1. Measure and record native pipe-to-soil, casing-to-soil, and anode-to-soil potentials at all test locations BEFORE the cathodic protection system is energized.

2. Verify electrical isolation at all insulating joints, casing insulators, and insulating corporation stops per NACE SP0286.

3. Confirm electrical continuity of the cathodically protected pipeline in accordance with this Section.

4. Measure and record the "On" and "Instant Off" structure-to-soil potentials at each location after the pipeline has been given adequate time to polarize.

5. Measure the induced AC pipe-to-soil potential at each test location after CP system activation. Notify the Corrosion Engineer immediately if measured potentials are 15 V_{AC} or higher as this poses a safety hazard condition. AC potentials shall be measured with AC mitigation system in place and activated.

6. Measure and record the current output of each anode when the CP system is initially turned on and again after it has been given adequate time to polarize.

E. Test results shall be analyzed to determine compliance with NACE SP0169.

F. Test results shall be analyzed to determine if stray current interference is present. Stray current interference is defined as a ±50 mV shift in a pipeline's pipe-to-soil potential that is caused by a foreign current source. Stray current interference shall be tested on the project pipeline and foreign pipelines that have a reasonable chance of being affected by stray currents. Cooperative interference testing shall be coordinated with foreign pipeline and structure owners.

G. The CONTRACTOR shall provide a written report, prepared by the Corrosion Engineer, documenting the results of the testing and recommending corrective work, as required to comply with the Contract Documents. Any deficiencies of systems tested shall be repaired and re-tested by the CONTRACTOR at no additional cost to the OWNER.

GENERAL NOTES:

1. ALL ELEVATIONS SHOWN ON THE DRAWINGS AND IN THE SURVEY NOTES ARE REFERENCED TO NORTH AMERICAN VERTICAL DATUM OF 1988. STATE PLANE COORDINATES ARE REFERENCED TO NORTH AMERICAN DATUM OF 1983/90 (NAD 28/90).
2. LOCATIONS, ELEVATIONS AND DIMENSIONS OF EXISTING UTILITIES, STRUCTURES AND OTHER FEATURES ARE SHOWN ACCORDING TO THE BEST INFORMATION AVAILABLE AT THE TIME OF THE PREPARATION OF THESE DRAWINGS, BUT DO NOT PURPORT TO BE ABSOLUTELY CORRECT. THE CONTRACTOR SHALL OBTAIN THE LOCATIONS, ELEVATIONS AND DIMENSIONS OF ALL EXISTING UTILITIES, STRUCTURES AND OTHER FEATURES AFFECTING HIS WORK PRIOR TO CONSTRUCTION.
3. LAND SURVEY WAS OBTAINED FROM FDOT FPID 25633415201 PLANS DATED MARCH 2021.
4. UTILITIES AND STRUCTURES THAT ARE NOT SHOWN ON THE DRAWINGS TO BE REMOVED AND REPLACED OR RELOCATED, SHALL BE PROTECTED IN PLACE AND UTILITY SERVICE SHALL BE MAINTAINED. WHERE TEMPORARY CONFLICTS OCCUR BETWEEN EXISTING UTILITIES AND THE NEW CONSTRUCTION, PROTECT IN PLACE OR RELOCATE THE UTILITIES AND MAINTAIN UTILITY SERVICE ALL TO THE SATISFACTION OF THE UTILITY COMPANY. UTILITIES AND STRUCTURES SHOWN ON THE DRAWINGS TO BE REMOVED AND REPLACED OR RELOCATED, SHALL CONFORM TO THE REQUIREMENTS OF THE APPLICABLE TECHNICAL SPECIFICATIONS.
5. PROVIDE ADEQUATE, TEMPORARY THRUST RESTRAINT AT BENDS AND TEES IN EXISTING WATER MAINS AND OTHER PRESSURIZED CONDUITS IN PROXIMITY TO EXCAVATIONS AS REQUIRED TO PREVENT DISLODGEMENT, SEPARATION OR LEAKAGE OF THESE FACILITIES.
6. DISCHARGE OF ANY NON-CONTAMINATED WATER FROM SOIL DEWATERING OPERATIONS TO SURFACE WATERS, IF ANY, SHALL CONFORM TO THE FDEP GENERAL PERMIT REQUIREMENTS.
7. PROVIDE AT LEAST 48 HOURS NOTICE TO THE VARIOUS UTILITY COMPANIES IN ORDER TO PERMIT THE LOCATION OF EXISTING UNDERGROUND UTILITIES IN ADVANCE OF CONSTRUCTION. NOTIFY THE VARIOUS UTILITY COMPANIES BY CALLING THE SUNSHINE ONE CALL CENTER (1-800-432-4770) OR IF NECESSARY, BY CONTACTING THE UTILITY COMPANIES INDIVIDUALLY.
8. CONFIRM UTILITY TO UTILITY CLEARANCES, HORIZONTAL AND VERTICAL, AND PIPE JOINT LOCATIONS IN ACCORDANCE WITH FLORIDA ADMINISTRATIVE CODE 62-555.314 AND 62-604.400.
9. THE HORIZONTAL ALIGNMENT OF THE REPLACEMENT WATER MAIN SHALL BE AS DIMENSIONED TO THE SURVEY BASELINE ON THE DRAWINGS. THE CONTRACTOR SHALL OBTAIN A COPY OF THE SURVEY AND LOCATE THE SURVEY BASELINE IN THE FIELD PRIOR TO CONSTRUCTION.
10. PIPE LAYING, LEAKAGE TESTING AND AS-BUILT DRAWINGS SHALL CONFORM TO ALL INFORMATION INDICATED ON THE PLANS AND DETAILS OR PROJECT TECHNICAL SPECIFICATIONS.
11. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO PROTECT ALL TREES WITHIN THE VICINITY OF THE PROPOSED CONSTRUCTION IN ACCORDANCE WITH PASCO COUNTY PROTECTION STANDARDS UNLESS OTHERWISE INDICATED FOR REMOVAL. PRUNING OF BRANCHES IS NOT AUTHORIZED WITHOUT PRIOR APPROVAL FROM THE COUNTY, AND SHALL BE COMPLETED BY A CERTIFIED ARBORIST.
12. CONTRACTOR TO COORDINATE WITH UTILITY POLE OWNERS TO PROVIDE SUPPORT DURING CONSTRUCTION. UTILITY POLE OWNERS REPRESENTATIVE TO APPROVE SUPPORT METHOD PRIOR TO BEGINNING EXCAVATION AROUND UTILITY POLES. ONCE WORK IN THE AREA HAS BEEN COMPLETED, UTILITY REPRESENTATIVE SHALL INSPECT AND APPROVE FINAL GRADING PRIOR TO SUPPORT BEING REMOVED.
13. REFER TO GENERAL REQUIREMENTS SECTION OF TECHNICAL SPECIFICATIONS FOR PERMIT AGENCY COMMENTS.
14. ALL EXCAVATION AND BACKFILLING SHALL BE IN STRICT CONFORMANCE WITH TAMPA BAY WATER AND FLORIDA DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS.
15. WHERE CONSTRUCTION ACTIVITIES OCCUR WITHIN THE DRIP LINES OF EXISTING TREES, TREES ARE TO BE PROTECTED PER PASCO COUNTY NATURAL RESOURCES DIVISION REQUIREMENTS. ANY ROOT OR CANOPY TRIMMING TO FACILITATE CONSTRUCTION OF PROPOSED FACILITIES IS TO BE PERFORMED AT THE DIRECTION OF A CERTIFIED ARBORIST.
16. ANY AREAS DISTURBED BY CONSTRUCTION SHALL BE GRADED TO THE ORIGINAL GRADE AND SEEDED AND MULCHED.
17. ADD TEMPORARY 1" THICK STEEL PLATES TO ACT AS SHOCK PADS OVER EXISTING 60" PIPE WITHIN PROJECT LIMITS TO PROTECT DURING CONSTRUCTION.
18. CONTACT INFORMATION:

    TAMPA BAY WATER
    NAME: DANIELLE KEIRSEY, PROJECT MANAGER
    PHONE: (727) 791-2377
19. TAMPA BAY WATER WILL CONTINUE TO MAINTAIN OWNERSHIP OF THE GROUTED, OUT-OF-SERVICE 60" WATER TRANSMISSION MAIN UNTIL ROADWAY PROJECT 256334-3-52-01 IS LET, WHERE IT WILL BE REMOVED DURING ROADWAY CONSTRUCTION, BY THE UAO.

FDOT NOTES:

1. CONTACT FDOT JAMES MEYER 48 HOURS BEFORE WORKING IN FDOT R/W 352-848-2600 TO ACTIVATE PERMIT.
2. SIDEWALKS SHOULD NOT BE CLOSED FOR MORE THAN 2 WEEKS FOR THE DURATION OF THE PERMIT. THE CONTRACTOR WILL NEED TO PROVIDE ACCOMMODATION FOR PEDESTRIANS.
3. RESTORE FDOT R/W WITH SOD ONLY.
4. CONTACT SCOTT BROWN PASCO COUNTY FOR LOCATES OF LIGHTING FIBER AND SIGNAL CONDUITS: PASCO COUNTY 727-849-6845
5. FOR MICROTUNNELS UNDER FDOT ROADWAYS THERE MUST BE A CONTINGENCY PLAN AND DEWATERING PLAN. CONTINGENCY SHOULD HAVE AN EMERGENCY ON CALL MOT/TTC CONTRACTOR AND AN EMERGENCY ASPHALT CONTRACTOR TO RESTORE THE ROADWAY IF SOMETHING SHOULD HAPPEN TO THE MICROTUNNEL.
6. FDOT RECOMMENDS GPR BE PERFORMED ALONG PATH OF MICROTUNNEL MINIMUM OF 10' ON EITHER SIDE OF THE CASING PIPE PRIOR TO PRE-DRILL MEETING WITH FDOT INSPECTOR WHICH IS REQUIRED.

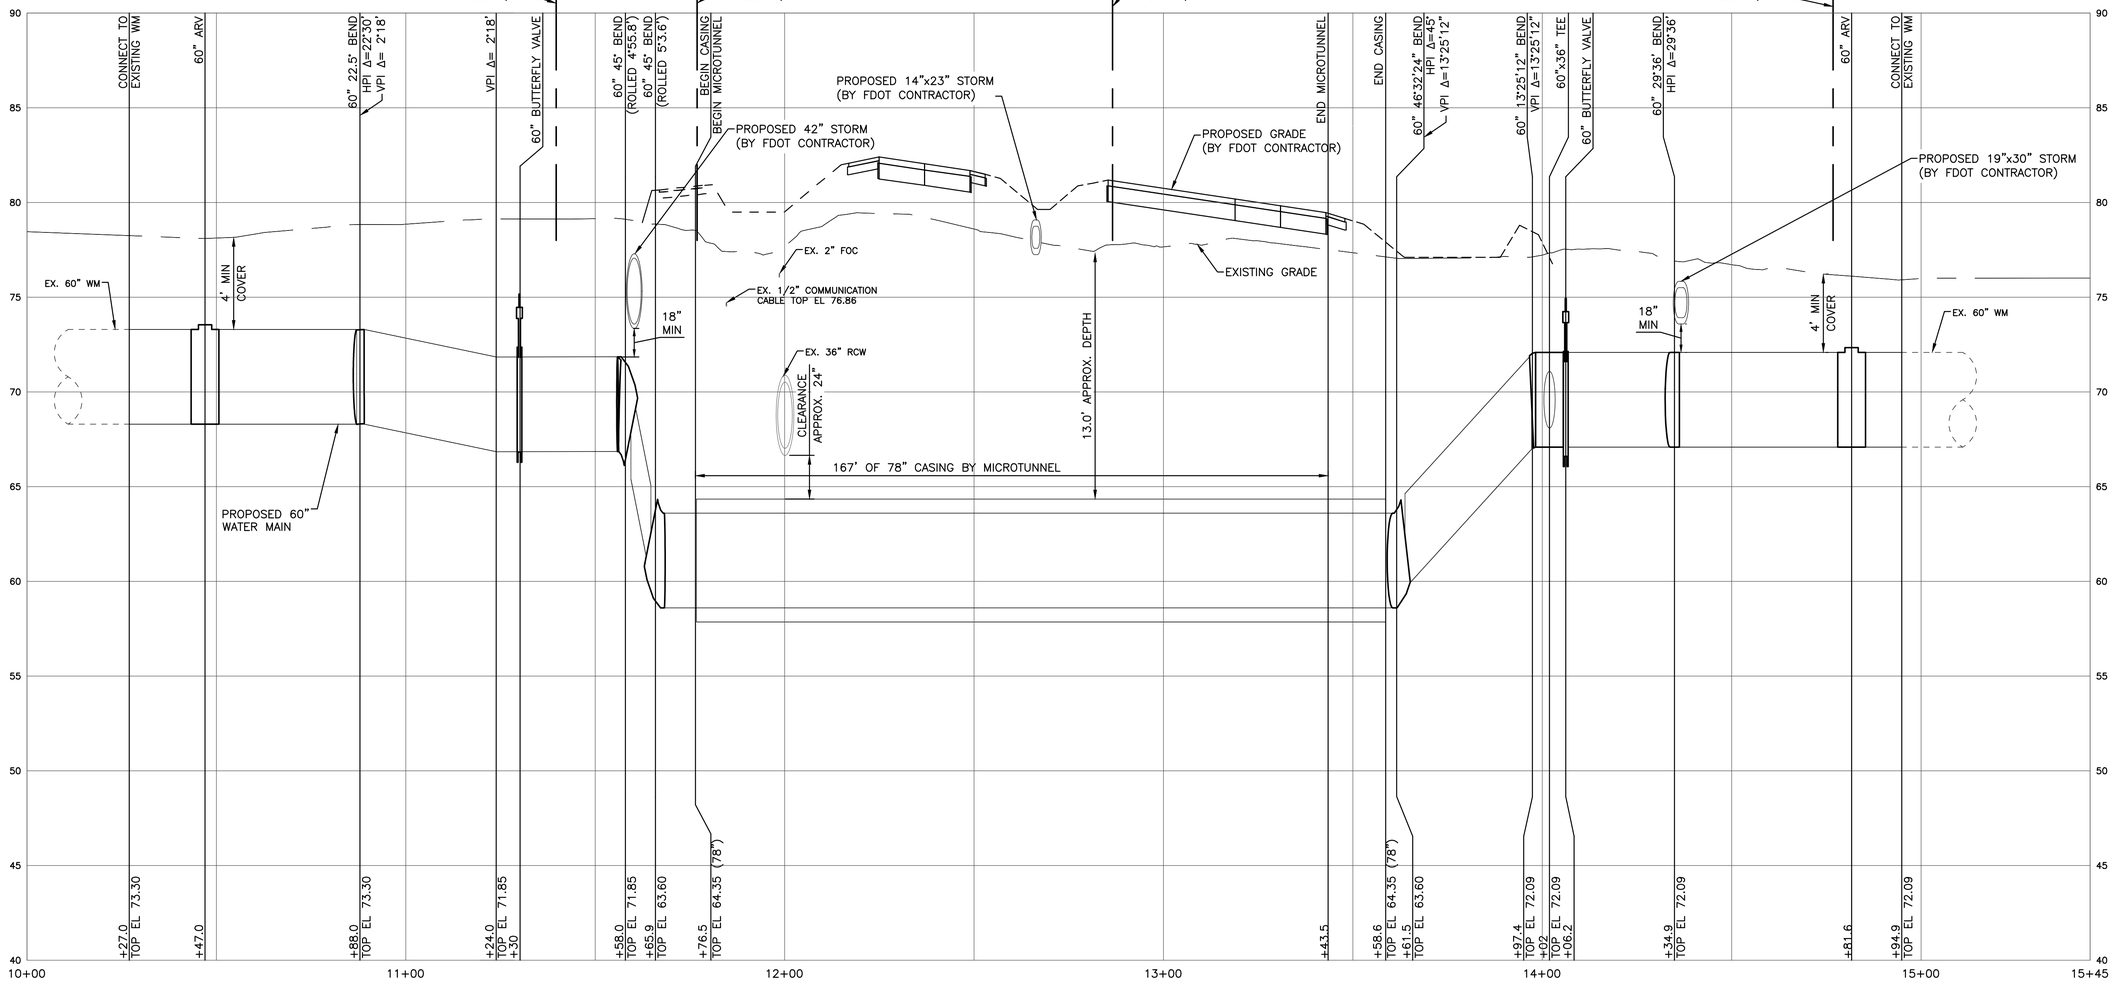
RESTRAIN EVERY PIPE JOINT



NOTE 1. CONTRACTOR SHALL USE SUITABLE EXCAVATED MATERIALS TO COMPACT AND BACKFILL SHAFT AND PIPE EXCAVATIONS IN ACCORDANCE WITH TECHNICAL SPECIFICATION SECTION 02220, 3.4 A. IN ADDITION, ALL EXCAVATIONS LOCATED UNDER OR WITHIN CLOSE PROXIMITY TO THE FUTURE FDOT ROADWAY PAVEMENT AND ROADWAY SHOULDERS AS SHOWN IN PROFILE VIEW ON THIS PLAN SHEET SHALL MEET FDOT STANDARD SPECIFICATIONS FOR ROAD AND BRIDGE CONSTRUCTION, PARTICULARLY SECTIONS 120 AND 125, AND OTHER RELATED STANDARDS IN REGARDS TO COMPACTION AND BACKFILLING. FLOWABLE FILL CAN BE USED AS A BACKFILL ALTERNATIVE IN CERTAIN SITUATIONS, FOLLOWING THE REQUIREMENTS IN SECTION 121 OF FDOT.

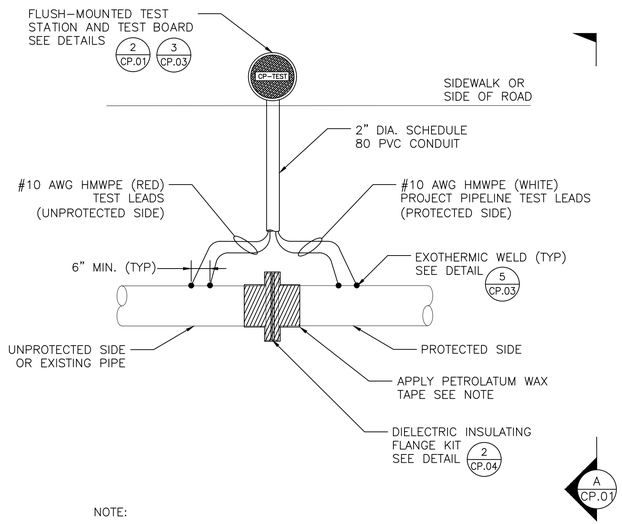
NOTES:

1. CONTRACTOR HAS THE OPTION AND MUST CHOOSE BETWEEN USING A DIELECTRIC INSULATING FLANGED JOINT OR A MONOLITHIC INSULATING JOINT FOR THE PROJECT PIPELINE TO ACHIEVE ISOLATION FROM METALLIC CONNECTIONS. BOTH OPTIONS HAVE BEEN PRESENTED IN THIS PACKAGE.
2. ALL VALVES AND NON WELDED JOINTS MUST FEATURE A MIN. OF TWO #2 AWG HMWPE (BLACK) JOINT BOND WIRES TO ACHIEVE ELECTRICAL CONTINUITY WITH THE PROJECT PIPELINE.



NOTE:

COAT THE EXTERIOR OF THE INSULATING FLANGE WITH PETROLATUM WAX TAPE FOR A MINIMUM OF 3 FEET BEYOND THE GASKET WITH A MINIMUM OF 6 INCHES OF OVERLAP WITH THE FACTORY-APPLIED COATING ON THE PIPELINE.

RE: Report of Geotechnical Engineering Services
Tampa Bay Water: SR 52 Water Main Relocation
Pasco County, Florida
Tierra Project No.: 6511-21-295-001

Ms. Naik:

Tierra, Inc. (Tierra) has completed the geotechnical engineering study for the above referenced project. The results of the study are provided herein.

Should there be any questions regarding this report, please do not hesitate to contact our office at (813) 989-1354. Tierra would be pleased to continue providing geotechnical services throughout the implementation of the project. We look forward to working with you and your organization on this and future projects.

Respectfully Submitted,

TIERRA, INC.

1.0 PROJECT DESCRIPTION

Project Information

The project, as we understand it, consists of relocating a portion of Tampa Bay Water's collection main to new casing beneath SR 52. The new pipeline will cross SR 52 between Secretariat Road and Philips Highway based on information provided by Wade Trim, Inc.

The geotechnical services herein provide subsurface soil conditions at selected locations along the project alignment and relevant geotechnical engineering information as they pertain to the proposed water main relocation.

Scope of Services

The objective of our study was to identify existing soils and groundwater conditions at selected test locations along the proposed water main relocation alignment. Geotechnical services were provided as follows:

1. Reviewed soil information from the "Soil Survey of Pasco County, Florida" published by the United States Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS). Reviewed potentiometric and topographic information published by the United States Geological Survey (USGS).

2. Performed two (2) Standard Penetration Test (SPT) borings to a depth of approximately 30 feet below grade.

3. Classified and stratified the soil samples encountered in accordance with the American Association of State and Highway Traffic Officials (AASHTO).

4. Conducted laboratory testing on select soil samples to confirm the visual classification.

5. Prepared this geotechnical report that summarizes the course of study pursued, the field data generated, laboratory test results, subsurface conditions encountered and geotechnical considerations.

The scope of our services did not include an environmental assessment for determining the presence or absence of wetlands or hazardous or toxic materials in the soil, bedrock, groundwater, or air, on or below or around this site. The scope of our services did not include determination of the potential for sinkhole activity. Any statements in this report or on the boring logs regarding odors, colors, unusual or suspicious items or conditions are strictly for the information of our client.

2.0 REVIEW OF PUBLISHED DATA

2.1 USGS Quadrangle Maps

Based on a review of the "Ehren, Florida" USGS Quadrangle Map, it appears that the natural elevation in the vicinity of the project site is on the order of approximately +80 to +90 feet National Geodetic Vertical Datum of 1929 (NGVD 29).

2.2 Potentiometric Surface Maps

Based on a review of the "Potentiometric Surface Elevation of the Upper Floridan Aquifer" map published by the USGS, the potentiometric surface elevation of the upper Floridan Aquifer in the project vicinity is on the order of approximately +70 to +80 feet, NGVD 29.

2.3 Pasco County Soil Survey

The Pasco County Soil Survey published by the USDA NRCS was reviewed for the project site. Three (3) soil mapping units were identified. The published soil information is provided in the following paragraphs and table:

Smyrna fine Sand (Map Unit 21): The Smyrna, non-hydric component makes up 70 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats on marine terraces on coastal plains. The parent material consists of sandy marine deposits. The depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is low. Shrink-swell potential is low. This soil is not flooded, nor is it ponded. The seasonal zone of water saturation is at 12 inches during June, July, August, and September. Organic matter content in the surface horizon is about 3 percent.

Basinger fine sand (Map Unit 23): The Basinger, depressional component makes up 92 percent of the map unit. Slopes are 0 to 1 percent. This component is on depressions, coastal plains. The parent material consists of sandy marine deposits. The depth to a root restrictive layer is greater than 60 inches. The natural drainage class is very poorly drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is low. Shrink-swell potential is low. This soil is not flooded; however it is frequently ponded. The seasonal zone of water saturation is at 0 inches during January, February, May, June, July, August, September, October, November, and December. Organic matter content in the surface horizon is about 5 percent.

Narcoossee fine sand (Map Unit 26): The Narcoossee component makes up 90 percent of the map unit. Slopes are 0 to 2 percent. This component is on rises on marine terraces on coastal plains. The parent material consists of sandy marine deposits. The depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is very low. Shrink-swell potential is low. This soil is not flooded. It is not ponded. The seasonal zone of water saturation is at 33 inches during June, July, August, September, October, November. Organic matter content in the surface horizon is about 4 percent.

SUMMARY OF USDA SOIL SURVEY PASCO COUNTY, FLORIDA

	13-25	SP-SM, SM	A-2-4, A-3	0.6 - 6.0	3.5-5.0		
	25-80	SP-SM, SP	A-3	6.0 - 20.0	3.5-5.0		
	0-5	SP-SM, SP	A-2-4, A-3	6.0 - 20.0	3.5-5.0	0.0-0.5	Jun-Sep
	5-13	SP-SM, SP	A-2-4, A-3	6.0 - 20.0	3.5-5.0		
	13-25	SP-SM, SM	A-2-4, A-3	0.6 - 6.0	3.5-5.0		
	25-80	SP-SM, SM	A-3	6.0 - 20.0	3.5-5.0		
(23) Basinger Depressional	0-3	SP-SM	A-2-4	6.0 - 50.0	3.5-7.3	+2.0-0.0	Jan-Feb, May-Dec
	3-8	SP-SM, SP	A-3, A-2-4	6.0 - 50.0	3.5-7.3		
	8-24	SP-SM, SP	A-3, A-2-4	6.0 - 50.0	3.5-7.3		
	24-80	SP-SM, SP	A-3	6.0 - 50.0	3.5-7.3		
(26) Narcoossee	0-5	SP-SM, SM	A-2-4	6.0 - 20.0	3.5-6.0	2.0-3.5	Jun-Nov
	5-22	SP-SM, SM	A-2-4	6.0 - 20.0	3.5-6.0		
	22-26	SP-SM, SM	A-2-4, A-3	2.0 - 6.0	3.5-6.0		
	26-36	SP-SM, SM	A-2-4	6.0 - 20.0	3.5-6.0		
	36-80	SP-SM, SM	A-2-4	6.0 - 20.0	3.5-6.0		

It should be noted that information contained in the USDA/NRCS Soil Survey may not be reflective of current subsurface conditions, particularly if recent development in the project vicinity has modified existing soils or surface/subsurface drainage.

3.0 LABORATORY TESTING

Representative soil samples collected from the borings were classified and stratified based on the AASHTO Soil Classification Systems. Our classification was based on visual observations, using the results from the laboratory testing as confirmation. These tests included fines content, Atterberg Limits series, natural moisture content, organic content, environmental corrosion testing, and Limerock Bearing Ratio Tests. The following list summarizes the laboratory tests performed and respective test methods utilized.

Fines Content Analyses – The fines content analyses were conducted in general accordance with AASHTO test designation T-088 (ASTM test designation D-1140).

Atterberg Limits – The liquid limit and the plastic limit tests ("Atterberg Limits") were conducted in general accordance with the AASHTO test designations T-089 and T-090, respectively (ASTM test designation D-4318).

Natural Moisture Content – The laboratory moisture content tests were conducted in general accordance with the AASHTO test designation T-265 (ASTM test designation D-2216).

Environmental Corrosion – The environmental corrosion tests were conducted in general accordance with the FDOT test designations FM 5-550, FM 5-551, FM 5-552, and FM 5-553.

The laboratory test results are presented on the **Report of Core Borings** and **Summary of Laboratory Test Results for Environmental Classification** table in the **Appendix**.

4.0 SUBSURFACE EXPLORATION

4.1 Soil Borings

Tierra performed two (2) SPT borings at selected locations to depths of approximately 30 feet below the existing ground surface to evaluate the subsurface conditions in the vicinity of the pipe alignment.

The borings were located in the field using hand-held Garmin Global Positioning System (GPS) equipment with a reported accuracy of ±10 feet. The approximate boring locations are presented on the **Report of Core Borings** sheet in the **Appendix**. The SPT borings were performed with the use of a drill rig using Bentonite Mud drilling procedures. The soil sampling was performed in general accordance with American Society for Testing and Materials (ASTM) Test Designation D-1586. The initial 6 feet were manually hand augered to verify utility clearance. SPT resistance N-values were then recorded continuously to the boring termination depth. The soil samples were classified in the field and transported to our laboratory for review and stratification. The soil strata encountered in the SPT borings performed at the project site are summarized in the following table:

Stratum Number	Soil Description	AASHTO Symbol
1	Dark Brown to Brown Sand to Sand with Silt	A-3
2	Light Brown to Gray Silty Sand	A-2-4
3	Gray Clayey Sand	A-2-4/A-2-6
4	Green to Gray Silt	A-7-5
5	Weathered Limestone	---(1)
(1) AASHTO does not provide a symbol for weathered limestone.		

The subsurface soil stratification is of a generalized nature to highlight the major subsurface stratification features and material characteristics. The soil profiles included in the **Appendix** on the **Report of Core Boring** sheet should be reviewed for specific information at the boring locations. The profile includes soil description, stratification, and penetration resistances, when applicable. The stratifications shown on the boring profiles represent the conditions only at the actual boring location. Variations did occur and should be expected within the project area. The stratification represents the approximate boundary between subsurface soils and the actual transition may be gradual.

4.2 Groundwater Information

At the time of our field exploration, the groundwater levels were measured within the SPT borings at depths ranging from 3 feet to 4½ feet. The measured groundwater levels are depicted adjacent to the respective soil profile on the attached **Report of Core Borings** sheet.

It should be noted that groundwater levels tend to fluctuate during periods of prolonged drought and extended rainfall and may be affected by man-made influences. Groundwater levels along the proposed force main alignment may be affected by tidal influences. A seasonal effect will also occur in which higher groundwater levels are normally recorded in rainy seasons.

5.0 RECOMMENDATIONS AND CONSIDERATIONS

5.1 General

Tierra recommends utilizing the current FDOT Standard Specifications and applicable Pasco County Specifications (if applicable) as guidelines for construction of the proposed pipeline. All earthwork activities including the site preparation, clearing and grubbing, removal and utilization/placement of soils, compaction of subgrade soils and selection of fill materials should be accomplished in accordance with the project plans and FDOT Specifications for Road and Bridge Construction (SSRBC) including Section 125 - Excavation for Structures and Pipes.

5.2 Soil Parameters

The results of the borings performed are presented on the **Report of Core Borings** sheet in the **Appendix**. A **Soil Parameters** table is also included in the **Appendix**. The contractor should review the soil profiles and evaluate the soil types as they relate to their installation methods for the project. The profiles represent the conditions only at the actual boring location. Variations did occur and should be expected within the project area.

5.3 Soil Suitability

The suitability for utilization/placement of soils, compaction of subgrade soils and selection of fill materials should be accomplished in accordance with the project plans and FDOT SSRBC and FDOT Standard Plans Index 120. The following are general considerations for the soils encountered within the borings.

In general, the soils of Stratum 1 (A-3) may be moved and used for pipe backfill, provided it is free of organic materials, clay, debris or any other material deemed unsuitable for construction.

Stratum 2 soils (A-2-4) will retain excess moisture and may be difficult to dry and compact. They should be used above the water level existing at the time of construction.

Strata 3 (A-2-4/A-2-6) and 4 (A-7-5) are plastic materials. If encountered during construction, this material will be difficult to dry and compact and may yield if disturbed or saturated. If this becomes the case, the plastic soils should be over excavated a minimum of 1 foot and replaced with compacted granular fill.

Stratum 5 is natural limestone formation. Variations in the depth and strength of this material should be anticipated. Specialized equipment and/or methods may be required to excavate and/or dewater this material. Tierra recommends the following note be included in the plans:

> *Weathered limestone (Stratum 5) was encountered within the borings. This material is rock. Excavations into and/or through limestone will be difficult and will require non-conventional construction techniques and specialized equipment. Limestone is also porous and difficult to dewater. Utilize construction methods capable of excavating and dewatering materials encountered during construction at no additional cost to the owner.*

5.3 Potentiometric Surface

Based on a review of the "Potentiometric Surface Elevation of the Upper Floridan Aquifer" map and the "Ehren, Florida" quadrangle map published by the USGS, Tierra recommends the following note be included in the plans:

> *Based on a review of the "Potentiometric Surface Elevation of the Upper Floridan Aquifer" map published by the USGS, the potentiometric surface elevation of the upper Floridan Aquifer at the project site is on the order of +70 to +80 feet, NGVD 29. The natural ground elevation at the project site ranges from approximately +80 to +90 feet, NGVD 29. Utilize construction methods capable of handling potentiometric surface levels up to +80 feet, NGVD 29, at no additional cost to the owner.*

5.4 Dewatering

The contractor's means and methods for dewatering should be sufficient to achieve compaction at the lowest levels of the excavation and pipe bedding (i.e. maintain a dry working condition). Tierra anticipates the required dewatering depth will be a minimum of 1 foot below the lowest excavation elevation. However, the actual dewatering depth required may be deeper in order to obtain the required compaction.

5.5 Environmental Classification

Environmental corrosion tests were performed on soil samples obtained from the borings performed. Environmental corrosion tests were conducted in accordance with the FDOT test designations FM 5-550, FM 5-551, FM 5-552, and FM 5-553. Environmental corrosion tests measure parameters including pH, resistivity, sulfate content and chloride content. The test results are presented in the **Summary of Laboratory Test Results for Environmental Classification** in the **Appendix**.

5.6 Excavations

Excavations and temporary side slopes should comply with the Occupational Safety and Health Administration's (OSHA) trench safety standards, 29 C.F.R., s. 1926.650, Subpart P, all subsequent revisions or updates of OSHA's referenced standard adopted by the Department of Labor and Employment Security and Florida's Trench Safety Act, Section 553.62, Florida Statutes.

We are providing this information solely as a service to our client. Tierra does not assume responsibility for construction site safety or the contractor's or other party's compliance with local, state, and federal safety or other regulations.

REPORT LIMITATIONS

The information contained in this report are opinions based on the site conditions and project layout described herein and further assume that the conditions observed in the exploratory borings are representative of the subsurface conditions throughout the site, i.e., the subsurface conditions elsewhere on the site are the same as those disclosed by the borings. If, during construction, subsurface conditions different from those encountered in the exploratory boring are observed or appear to be present beneath excavations, we should be advised at once so that we can review these conditions and reconsider our recommendations where necessary.

If there is a substantial lapse in time between the submittal of this report and the start of work at the site, or if conditions or project layout are changed due to natural causes or construction operations at or adjacent to the site, we recommend that this report be reviewed to determine the applicability of conclusions and recommendations considering the changed conditions and time lapse.

This report was prepared for the exclusive use of Wade Trim, Inc., and their client for evaluating the design of the project as it relates to the geotechnical aspects discussed herein. It should be made available to prospective contractors for information on factual data only and not as a warranty of subsurface conditions included in this report. Unanticipated soil conditions may require that additional expense be made to attain a properly constructed project. Therefore, some contingency fund is recommended to accommodate such potential extra costs.

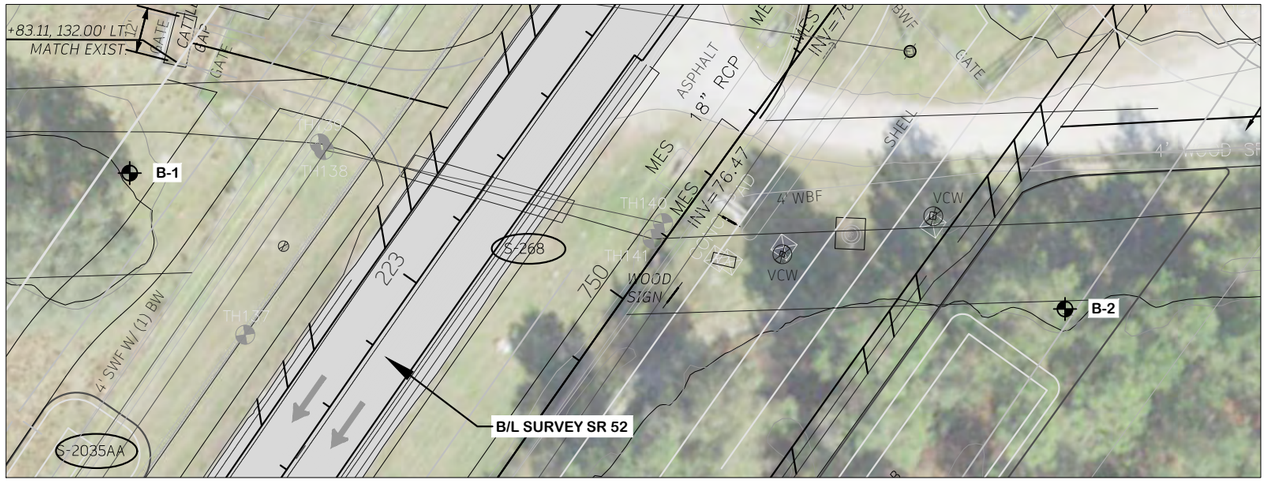
Soil Parameters

BORING LOCATION PLAN

0 40'

PLAN SCALE



NOTE:
BASED ON A REVIEW OF THE "POTENTIOMETRIC SURFACE ELEVATION OF THE UPPER FLORIDAN AQUIFER" MAP PUBLISHED BY THE USGS, THE POTENTIOMETRIC SURFACE ELEVATION OF THE UPPER FLORIDAN AQUIFER AT THE PROJECT SITE IS ON THE ORDER OF +70 TO +80 FEET, NGVD 29. THE NATURAL GROUND ELEVATION AT THE PROJECT SITE RANGES FROM APPROXIMATELY +80 TO +90 FEET, NGVD 29. UTILIZE CONSTRUCTION METHODS CAPABLE OF HANDLING POTENTIOMETRIC SURFACE LEVELS UP TO +80 FEET, NGVD 29, AT NO ADDITIONAL COST TO THE OWNER.
WEATHERED LIMESTONE (STRATUM 5) WAS ENCOUNTERED WITHIN THE BORINGS. THIS MATERIAL IS ROCK. EXCAVATIONS INTO AND/OR THROUGH LIMESTONE WILL BE DIFFICULT AND WILL REQUIRE NON-CONVENTIONAL CONSTRUCTION TECHNIQUES AND SPECIALIZED EQUIPMENT. LIMESTONE IS ALSO POROUS AND DIFFICULT TO DEWATER. UTILIZE CONSTRUCTION METHODS CAPABLE OF EXCAVATING AND DEWATERING MATERIALS ENCOUNTERED DURING CONSTRUCTION AT NO ADDITIONAL COST TO THE OWNER.

WORK DESCRIPTION

The Applicant(s) requests permission from the Florida Department of Transportation (FDOT) to construct, operate, and maintain the utilities as described below and as depicted in the incorporated documentation.

Tampa Bay Water Project No. 07153 Cross Bar Ranch Wellfield Water Transmission Main project includes relocation of approximately 500 LF of existing 60-inch diameter raw water transmission main across SR 52. The project is needed due to FDOT roadway expansion and proposed conflicts with FDOT utilities. The project consists of 194 LF of trenchless construction across proposed SR 52 roadway improvements along with remaining pipeline to be constructed via open cut installation ... (see work description cont. page)

Utility Work No:

Additional sheets are attached and are incorporated into this permit Yes ☑ No ☐

For FDEP certification, the FDOT agency report is attached in accordance with UAM Section 2.4.1 (13) Yes ☐ No ☑

TRAFFIC CONTROL (TCP)

☑ The TCP will comply with the following 600 series index(es) 601, 602

☐ A TCP has been attached and incorporated into this permit application in compliance with UAM Section 2.4.2.

MOT Technician's contact information (may be supplied at the two (2) business day notification to FDOT):

Name: _____ Telephone _____ Email: _____

COMMENCEMENT OF WORK

The UAO and/or Utility Builder shall commence actual construction in good faith within sixty (60) calendar days after approval of the permit application. If the beginning date is more than sixty (60) calendar days from the date of approval, the UAO and/or Utility Builder must review the permit with the FDOT Approving Engineer listed to make sure no changes have occurred to the transportation facility that would affect the permit's continued approval. The UAO and/or Utility Builder shall make good faith efforts to expedite the work and complete the work within the calendar days indicated.

Anticipated Start Date: 1/1/2026

Calendar days needed to completed: 300

PERMIT NO: 2025-H-798-00264

APPLICANT SIGNATURE

By the below signature(s) the UAO and/or Utility Builder agree(s) to construct, operate, and maintain the work as noted in the above Work Description, shown in plans and incorporated documents, in compliance with the UAM, all instructions noted in the FDOT Special Instructions Box, and special instructions incorporated into this permit. The UAO and/or Utility Builder declares, the location of all existing utilities that it owns or has an interest in, both aerial and underground, are accurately shown on the plans of the work areas. In accordance with UAM Section 2.8, the UAO and/or Utility Builder further declares that a letter of notification was delivered to the owners of other facilities within the work areas and that those listed below are the only facility owners known to be involved or potentially impacted by the proposed work.

Date Notified:	Name of other facility owners (attach additional sheets if necessary).
1/18/2024	Withlacoochee River Electric Cooperative
1/18/2024	Frontier Communications
1/18/2024	Pasco County Utilities

FDOT PROJECT INFORMATION

Pursuant to UAM Section 2.1(10), the utility work is within FDOT projects listed below and must have a Utility Work Schedule for each project approved prior to commencement of work within the FDOT project limits:

FDOT construction is proposed or underway. Refer to Financial Project Id: FDOT Project #256334-3-52-01

TBW will construct their proposed pipe, then grout-fill the existing pipe, prior to FDOT construction. FDOT Brooksville Ops has agreed that FDOT will remove the grouted pipe and will absorb the cost for that removal, during FDOT construction.

FDOT SPECIAL INSTRUCTIONS

In accordance with UAM Section 2.7, FDOT incorporates the below and attached special instructions into this permit.

Contact FDOT James Meyer 48 hours before working in FDOT R/W 352-848-2600, to activate permit.

Provide MOT Technician "Name, Phone Number, Certification, Email Address". and schedule Pre-Construction Meeting.

The UAO shall have a complete copy of the approved permit at the jobsite when

Additional FDOT Special Instructions are attached and incorporated into this permit. Yes ☑ No ☐

PERMIT APPROVAL

By signature below, FDOT gives permission to the UAO and /or Utility Builder to construct, operate, and maintain the utilities indicated in this Utility Permit in compliance with the UAM, all incorporated documents, and special instructions. Any changes to the approved work must be approved by the FDOT's Approving Engineer and attached and incorporated into this permit in accordance with UAM Section 2.11.

Approving Engineer: James A. Meyer (digital signature) Date: 10/8/2025

Name: James A. Meyer

Title: MAINTENANCE MANAGER/PERMITS

Notification of Utility Work to be provided to: Telephone (352) 848-2600 ext. 2610 or Email: james.meyer@dot.state.fl.us

An FDOT Representative is required to be present on the worksite prior to commencement of work. Yes ☑ No ☐

Rep. Name: Michael G. Mcclurg Telephone 3528482611 Email: michael.mcclurg@dot.state.fl.us

UTILITY PERMIT

PERMIT NO: 2025-H-798-00264

CERTIFICATION

I, the undersigned UAO and/or Utility Builder, hereby CERTIFY that the utilities were constructed and inspected in compliance with the UAM all incorporated documents, and special instructions. Pursuant to UAM Section 2.11, all changes have been approved by the FDOT's Approving Engineer and incorporated into this permit along with all other material certifications, test results, bore logs, approved plans changes, as-built plans or other required documentation.

I also CERTIFY that work began on _____ and was completed on _____ and that the area was left in as good or better condition than when the work began.

Utility Agency/Owner	Utility Builder (when applicable)
Signature: _____ Date _____	Signature:_____ Date _____
Name (printed): _____	Name (printed): _____
Title: _____	Title: _____

FINAL INSPECTION OF WORK

☐ The work was inspected and found to be in non-compliance as noted below:

☐ All issues of non-compliance listed above have been brought into compliance and/or FDOT has no outstanding issues that need to be addressed by the UAO and/or Utility Builder. However, this final inspection does not release the UAO and/or Utility Builder of their continuing responsibilities pursuant to Rule 14-46.001, the UAM, all incorporated documents, and special instructions.

PERMIT NO.: 2025-H-798-00264

The complete Work Description could not fit in the space allotted on Page 1 of the Utility Permit so it is displayed below.

Work Description

Tampa Bay Water Project No. 07153 Cross Bar Ranch Wellfield Water Transmission Main project includes relocation of approximately 500 LF of existing 60-inch diameter raw water transmission main across SR 52. The project is needed due to FDOT roadway expansion and proposed conflicts with FDOT utilities. The project consists of 194 LF of trenchless construction across proposed SR 52 roadway improvements along with remaining pipeline to be constructed via open cut installation. Exhibit A includes the project drawings and Exhibit B includes site photos. Microtunnel shafts are proposed to be located 31 LF on the north side and 105 LF on the south side of existing pavement.

Approved
2025-H-798-00264
James A. Meyer
10/8/2025

PERMIT NO.: 2025-H-798-00264

STATE ROAD INFORMATION:

NAME OF OTHER FACILITY OWNERS / DATE NOTIFIED:
Facility Name: Frontier Communications, Date Notified: 6/9/2025

FDOT PROJECT INFORMATION:
FDOT construction is proposed or underway. Refer to Financial Project Id: FDOT Project #256334-3-52-01

TBW will construct their proposed pipe, then grout-fill the existing pipe, prior to FDOT construction. FDOT Brooksville Ops has agreed that FDOT will remove the grouted pipe and will absorb the cost for that removal, during FDOT construction. Removal pay items would be included in the Roadway plans.
This work is NOT related to an approved Utility Work Schedule.

THE WORK WAS INSPECTED AND FOUND TO BE IN NON-COMPLIANCE AS NOTED BELOW:

Approved
2025-H-798-00264
James A. Meyer
10/8/2025

PERMIT NO.: 2025-H-798-00264

The complete special instructions could not fit in the space allotted on Page 2 of the Utility Permit so they are displayed below.

Special FDOT Instructions

Contact FDOT James Meyer 48 hours before working in FDOT R/W 352-848-2600, to activate permit.

Provide MOT Technician “Name, Phone Number, Certification, Email Address”.
and schedule Pre-Construction Meeting.

The UAO shall have a complete copy of the approved permit at the jobsite when crews are present. 2017 UAM 2.1 (3) (DW)

Restore FDOT R/W with Sod only.

Contact Scott Brown Pasco County for locates of lighting fiber and signal conduits Pasco County
727-849-6845.

For microtunnels under FDOT roadways there must be a contingency plan and dewatering plan. Contingency should have an emergency on call MOT/TTC contractor and an emergency Asphalt contractor to restore the roadway if something should happen to the microtunnel.

Provide Contingency Plan and Dewatering Plan before starting work in FDOT R/W.

FDOT recommends GPR be performed along path of microtunnel minimum of 10' on either side of the casing pipe prior to pre-drill meeting with FDOT inspector which is required.

FDOT Project #256334-3-52-01

TBW will construct their proposed pipe, then grout-fill the existing pipe, prior to FDOT construction. FDOT Brooksville Ops has agreed that FDOT will remove the grouted pipe and will absorb the cost for that removal, during FDOT construction. Removal pay items would be included in the Roadway plans.

Enter in the FDOT’s One Stop Permitting – “Certify Construction Complete” or provide, original signed copy of Permit Application (pg. 3 of 3) and As-builts. Once construction is completed for permit close out.

GENERAL NOTES:

1. ALL ELEVATIONS SHOWN ON THE DRAWINGS AND IN THE SURVEY NOTES ARE REFERENCED TO NORTH AMERICAN VERTICAL DATUM OF 1988. STATE PLANE COORDINATES ARE REFERENCED TO NORTH AMERICAN DATUM OF 1983/90 (NAD 28/90).
2. LOCATIONS, ELEVATIONS AND DIMENSIONS OF EXISTING UTILITIES, STRUCTURES AND OTHER FEATURES ARE SHOWN ACCORDING TO THE BEST INFORMATION AVAILABLE AT THE TIME OF THE PREPARATION OF THESE DRAWINGS, BUT DO NOT PURPORT TO BE ABSOLUTELY CORRECT. THE CONTRACTOR SHALL OBTAIN THE LOCATIONS, ELEVATIONS AND DIMENSIONS OF ALL EXISTING UTILITIES, STRUCTURES AND OTHER FEATURES AFFECTING HIS WORK PRIOR TO CONSTRUCTION.
3. LAND SURVEY WAS OBTAINED FROM FDOT FPID 25633415201 PLANS DATED MARCH 2021.
4. UTILITIES AND STRUCTURES THAT ARE NOT SHOWN ON THE DRAWINGS TO BE REMOVED AND REPLACED OR RELOCATED, SHALL BE PROTECTED IN PLACE AND UTILITY SERVICE SHALL BE MAINTAINED. WHERE TEMPORARY CONFLICTS OCCUR BETWEEN EXISTING UTILITIES AND THE NEW CONSTRUCTION, PROTECT IN PLACE OR RELOCATE THE UTILITIES AND MAINTAIN UTILITY SERVICE ALL TO THE SATISFACTION OF THE UTILITY COMPANY. UTILITIES AND STRUCTURES SHOWN ON THE DRAWINGS TO BE REMOVED AND REPLACED OR RELOCATED, SHALL CONFORM TO THE REQUIREMENTS OF THE APPLICABLE TECHNICAL SPECIFICATIONS.
5. PROVIDE ADEQUATE, TEMPORARY THRUST RESTRAINT AT BENDS AND TEES IN EXISTING WATER MAINS AND OTHER PRESSURIZED CONDUITS IN PROXIMITY TO EXCAVATIONS AS REQUIRED TO PREVENT DISLODGEMENT, SEPARATION OR LEAKAGE OF THESE FACILITIES.
6. DISCHARGE OF ANY NON-CONTAMINATED WATER FROM SOIL DEWATERING OPERATIONS TO SURFACE WATERS, IF ANY, SHALL CONFORM TO THE FDEP GENERAL PERMIT REQUIREMENTS.
7. PROVIDE AT LEAST 48 HOURS NOTICE TO THE VARIOUS UTILITY COMPANIES IN ORDER TO PERMIT THE LOCATION OF EXISTING UNDERGROUND UTILITIES IN ADVANCE OF CONSTRUCTION. NOTIFY THE VARIOUS UTILITY COMPANIES BY CALLING THE SUNSHINE ONE CALL CENTER (1-800-432-4770) OR IF NECESSARY, BY CONTACTING THE UTILITY COMPANIES INDIVIDUALLY.
8. CONFIRM UTILITY TO UTILITY CLEARANCES, HORIZONTAL AND VERTICAL, AND PIPE JOINT LOCATIONS IN ACCORDANCE WITH FLORIDA ADMINISTRATIVE CODE 62-555.314 AND 62-604.400.
9. THE HORIZONTAL ALIGNMENT OF THE REPLACEMENT WATER MAIN SHALL BE AS DIMENSIONED TO THE SURVEY BASELINE ON THE DRAWINGS. THE CONTRACTOR SHALL OBTAIN A COPY OF THE SURVEY AND LOCATE THE SURVEY BASELINE IN THE FIELD PRIOR TO CONSTRUCTION.
10. PIPE LAYING, LEAKAGE TESTING AND AS-BUILT DRAWINGS SHALL CONFORM TO ALL INFORMATION INDICATED ON THE PLANS AND DETAILS OR PROJECT TECHNICAL SPECIFICATIONS.
11. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO PROTECT ALL TREES WITHIN THE VICINITY OF THE PROPOSED CONSTRUCTION IN ACCORDANCE WITH PASCO COUNTY PROTECTION STANDARDS UNLESS OTHERWISE INDICATED FOR REMOVAL. PRUNING OF BRANCHES IS NOT AUTHORIZED WITHOUT PRIOR APPROVAL FROM THE COUNTY, AND SHALL BE COMPLETED BY A CERTIFIED ARBORIST.
12. CONTRACTOR TO COORDINATE WITH UTILITY POLE OWNERS TO PROVIDE SUPPORT DURING CONSTRUCTION. UTILITY POLE OWNERS REPRESENTATIVE TO APPROVE SUPPORT METHOD PRIOR TO BEGINNING EXCAVATION AROUND UTILITY POLES. ONCE WORK IN THE AREA HAS BEEN COMPLETED, UTILITY REPRESENTATIVE SHALL INSPECT AND APPROVE FINAL GRADING PRIOR TO SUPPORT BEING REMOVED.
13. REFER TO GENERAL REQUIREMENTS SECTION OF TECHNICAL SPECIFICATIONS FOR PERMIT AGENCY COMMENTS.
14. ALL EXCAVATION AND BACKFILLING SHALL BE IN STRICT CONFORMANCE WITH TAMPA BAY WATER AND FLORIDA DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS.
15. WHERE CONSTRUCTION ACTIVITIES OCCUR WITHIN THE DRIP LINES OF EXISTING TREES, TREES ARE TO BE PROTECTED PER PASCO COUNTY NATURAL RESOURCES DIVISION REQUIREMENTS. ANY ROOT OR CANOPY TRIMMING TO FACILITATE CONSTRUCTION OF PROPOSED FACILITIES IS TO BE PERFORMED AT THE DIRECTION OF A CERTIFIED ARBORIST.
16. ANY AREAS DISTURBED BY CONSTRUCTION SHALL BE GRADED TO THE ORIGINAL GRADE AND SEEDED AND MULCHED.
17. ADD TEMPORARY 1" THICK STEEL PLATES TO ACT AS SHOCK PADS OVER EXISTING 60" PIPE WITHIN PROJECT LIMITS TO PROTECT DURING CONSTRUCTION.
18. CONTACT INFORMATION:

    TAMPA BAY WATER
    NAME: DANIELLE KEIRSEY, PROJECT MANAGER
    PHONE: (727) 791-2377
19. TAMPA BAY WATER WILL CONTINUE TO MAINTAIN OWNERSHIP OF THE GROUTED, OUT-OF-SERVICE 60" WATER TRANSMISSION MAIN UNTIL ROADWAY PROJECT 256334-3-52-01 IS LET, WHERE IT WILL BE REMOVED DURING ROADWAY CONSTRUCTION, BY THE UAO.

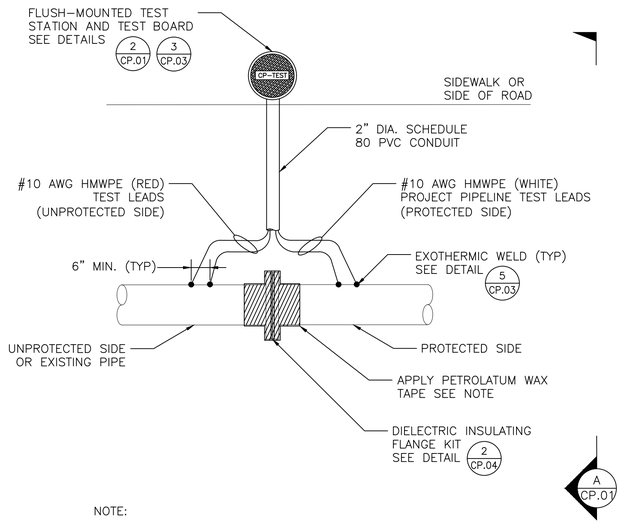
NOTES:

1. CONTRACTOR HAS THE OPTION AND MUST CHOOSE BETWEEN USING A DIELECTRIC INSULATING FLANGED JOINT OR A MONOLITHIC INSULATING JOINT FOR THE PROJECT PIPELINE TO ACHIEVE ISOLATION FROM METALLIC CONNECTIONS. BOTH OPTIONS HAVE BEEN PRESENTED IN THIS PACKAGE.
2. ALL VALVES AND NON WELDED JOINTS MUST FEATURE A MIN. OF TWO #2 AWG HMWPE (BLACK) JOINT BOND WIRES TO ACHIEVE ELECTRICAL CONTINUITY WITH THE PROJECT PIPELINE.



NOTE:

COAT THE EXTERIOR OF THE INSULATING FLANGE WITH PETROLATUM WAX TAPE FOR A MINIMUM OF 3 FEET BEYOND THE GASKET WITH A MINIMUM OF 6 INCHES OF OVERLAP WITH THE FACTORY-APPLIED COATING ON THE PIPELINE.

SEE THE PERMIT - PART 2: Engineer responsible for inspection, PART 3: Completion date, PART 4: General Provisions, PART 5: Special Provisions.

SPECIAL PROVISIONS

This Permit subject to the following provisions, conditions and stipulations: This Permit issuances DOES NOT in any way approve the applicant's plan.

1. **Notification:** Contact the Florida Department of Transportation (FDOT) 48 hours before starting construction. (A pre-construction meeting and **liability insurance is required for all permits –see Permit Category, Permit page 1, part 1 Permit Information).**

   Contact: James Meyer, Permits Manager OR Brooksville Operations Program Engineer 16411 Spring Hill Dr. Brooksville, FL.34604 * 352- 848-2600 Monday -Thursday 7:00 A.M. to 5:30 P.M.

2. **Work and Material Standards -Specifications:** ***The FDOT standards, specifications and Permit take priority over the permittee's plans.*** All construction work and materials must (mandatory) be FDOT certified and in conformance with the latest edition of the FDOT ***Standard Plans for Road and Bridge Construction (Standard Plans), Utility Accommodation Manual, Standard Specifications (Spec.s), Florida Design Manual*** and ***Flexible Pavement Design Manual for New Construction and Pavement Rehabilitation.***
3. **Maintenance of Traffic:** All Maintenance of Traffic (TTC) signs and markings (including for bicycles, sidewalks and pedestrians), for lane/road closures, detours and right of way work for construction and/or maintenance must be in conformance with the ***Standard Plans 102 - 600 series (use appropriate SP for the work type - multi or two lanes, urban or rural roadways).*** All work only during daytime unless otherwise approved, and off-peak work hours may be required. All night work or overnight MOT must be approved by the FDOT. Submit lane closure calculations as required. All MOT must be set up and maintained by a certified MOT work site safety supervisor.
4. **Driveway/Connection Design:** The driveway must be in conformance with the ***Standard Plans 000-515*** (Rural or Urban) including the radius, slopes and remove/replace the paved shoulder in front of the driveway (see Pavement Structure) to a matching roadway structural section. The driveway profile grade maximum is 10% for commercial and 28% for residential. Urban flared driveway with sidewalk must have the correct walkaround, flares, slopes, ramps and detectable warnings. See ***Standard Plans 522-001, 522-002 and 000-515 sheets 2,3,4 of 7.***
5. **Roadway Widening Design:** All rural or urban roadway widening for more lanes in conjunction with a driveway must match existing roadway and slope (usually 2-3%) with a 11 feet wide outside paved shoulder (usually 5 feet wide with 6% slope paved and 6 feet wide 6% slope unpaved shoulder, left turn lane shoulders match existing median shoulders). The shoulder front ditch slope is usually 1 (rise) to 6 (run). Maintain clear recovery zone distances and if required use guardrails and handrails for excessive slopes and obstructions. The widening approach solid/skip striping pattern must be in conformance with ***Standard Plan 711-001, sheet 5-14***.
6. **Drainage - Mitered End Sections:** All project drainage should be away from the FDOT roadway and right-of-way. The connection must drain away from the roadway for at least 5 feet. A Drainage Permit or exemption is required for any drainage work within or discharge to the FDOT right of way. The driveway and mitered end section ***(Standard Plan 430-022)*** including (correctly sized with beveled/radii corners and splash pads), pipe size and type, shoulder width and 1v:4h side slopes must be in conformance with ***Standard Plan 430-022, 430-001 and 000-515.*** All other drainage work and materials must be in conformance with F.D.M. and ***Standard Plan 425-001 to 524-001***.
7. **Construction Stages –Time Period:** The permittee's engineer is responsible for inspection. All construction must be done in stages with each stage (for example) subgrade, base, etc. inspected and approved by the FDOT (or the inspection must be waived by the FDOT) before starting the next stage. Complete the construction in a timely manner and within one year of issuance as noted on the permit.
8. **Turn Lanes - Sight Distance:** The median opening and spacing, left turn lane transitions, queues and lengths must be in conformance with FDM. The sight distance and length must be in conformance with FDM***.***
9. **Signs and Striping:** All traffic signs, striping, raised pavement markers and pavement markings must be in conformance with FDOT Standard ***Plan 11000 and 17000 series***. See ***Standard Plan*** for pavement markings, thermoplastic and traffic signs. Apply thermoplastic 14 days (no wait for concrete) after paving and apply interim striping until thermoplastic is applied. Remove existing striping by mill and resurface with matching asphalt (water blasting and grinding are not allowed). A rural commercial driveway must have at a minimum a high intensity reflective 36" R1-1 STOP sign with a 24" wide stop bar located between 12-25 feet away from the roadway.
10. **Sod and Erosion Control**: All areas in the right of way disturbed during construction must be restored, compacted, sodded and watered in conformance with the ***Standard Specifications, Section 104*** and ***Standard Plan 570-001, 570-010.*** Excess shoulder lime rock must be removed or mixed with a sufficient amount of soil and fertilizer to ensure growth. During construction install erosion control, silt fences, turbidity barriers etc. in conformance with ***Standard Specifications, Section 104***, NPDES/DEP and SWPPP (Stormwater permit/plan) requirements.
11. **Pavement:** The mainline widening etc. (and the mainline shoulder in front of the connection must be removed and replaced), MUST match the mainline thickness, type of stabilization, base and structural course, friction course (FC), and aggregates etc. (course or fine graded), unless otherwise directed by the FDOT/engineer. Submit approved testing laboratory certification for the design mix and density test results. The density tests must be a minimum of 3 per section of widening for each lift, unless otherwise directed by the FDOT/engineer. The paving seam lines must align with striping, and if needed use compatible mill and overlay, resurface, leveling etc., over entire existing roadway to reduce old/new pavement joints. **Driveway Pavement:** The minimum driveway pavement section: (this driveway pavement is not for the mainline and does not replace a better or match existing pavement or as specified by the FDOT/engineer. For roadway widening see Pavement Design Manual design criteria; traffic volumes, rural/urban, multi/single lanes, loads, soil, speed etc.):

    A. Sub-base: Stabilized 12 inch below the base* or ***Skip to Option A-1***
    Base: 8-inch-thick primed lime rock (double course – 4-inch lifts) or B-12.5 (Superpave asphalt base) if required
    Surface: 1.5-inch-thick asphalt type SP or type S (and **FC shoulder as needed) (and/or match existing structural & FC)

    A-1. Sub-base: No sub grade is required
    Base: 12-inch-thick primed lime rock (6-inch lifts) * or B-12.5 (Superpave asphalt) if required (1.5 x 8" = 12" base)
    Surface: 1.5-inch-thick asphalt surface type SP or type S and **FC as needed (and/or match existing structural & FC)

    or B. Sub-base: No compaction specified*
    Base: 8-inch-thick Sand Asphalt Hot Mix (triple course – 3 lifts) 800 lb. stability
    Surface: 1.5-inch-thick asphalt type SP or type S and **FC as needed

    or C. 6-inch-thick of FDOT approved Class I 3000 psi concrete (6" for traffic bearing & 4" for sidewalk) on suitable soil with expansion joints as required. See ***Standard Specifications 346 and 350***

    * The sub-base (stabilization) must extend 4 inches beyond the base above and/or the base must extend 4 inches beyond the pavement section above (or 4 inches beyond back of curb)
    **The FC may not be required on low volume/speed driveways beyond the mainline shoulder, providing the mainline and driveway surface difference ("lip") does not exceed the limit.

12. **Lime rock Base:** The lime rock base material must be from a FDOT approved source. At no time must a lift course thickness exceed 6 inches. The lime rock base must be in conformance with FDOT ***Design Standards 514*** and ***Standard Specifications, Section 200.*** The Type B-12.5 asphalt black base may be required by the FDOT to expedite work or for wet conditions etc.
13. **Site/Other Approvals/Permits**: The permittee must comply with all federal, state, county and local ordinances with proof of local site plan approval, Southwest Florida Water Management District and Turnpike District permits/approval, utility company notifications/locates and coordination with other FDOT projects etc. This connection must not be of any cost to the FDOT or interfere with other or FDOT projects.
14. **Easements/Dedications:** The permittee/engineer must ensure that all easements and dedications are recorded and submitted to FDOT before final acceptance of the permit.
15. **Quality Control and Acceptance:** The permittee and/or permittee's engineer is/are responsible for inspecting the work and materials and meet all FDOT indices, standards, specifications, conditions, qualified/approved/certified products and provisions of the permit. Submit a ***Record Drawings Report by Permittee's Professional Engineer*** (FDOT form 850-040-19) and AS BUILTS (if needed). The permit issuance

Meeting Minutes

Cross Bar Ranch Wellfield Water Transmission Main – Utility Conflict Tampa Bay Water Project No. 07153 – Coordination Meeting

July 30, 2025
3:30 PM– 4:30 PM
Teams Meeting

Item	Action On
1. **Attendees** –	
a. Tampa Bay Water: Danielle Keirsey; Justin Fox	
b. FDOT: Sally Prescott; Rohan Abraham; Mark Chianese; Joe Goddard; Tyler Matthews; James Meyer; Ashley Miller	
c. Wade Trim: Nita Sharma; Jayna Horton	
2. **Discussion**	
a. The attendees went through introductions.	
b. Danielle Keirsey ran through the initial considerations Tampa Bay Water focused on during the design of the 60" transmission main replacement across SR 52. The approach to remove the existing 60" pipe up until the current FDOT ROW and fill and grout the pipe under the roadway was taken to minimize impact to SR 52. Danielle also highlighted the intention of Tampa Bay Water to complete the relocation prior to FDOT beginning construction, therefore leaving the pipe filled and grouted for FDOT to remove as they move through with their project. This mindset was also taken to eliminate multiple contractors in the field for more efficient construction.	
c. Sally Prescott brought up the concern of leaving the existing 60" transmission main in the roadway initially came from the Maintenance department. She also posed the question of constructability and price issues if the pipe were to remain filled and grouted in the roadway.	
d. Tyler Matthews and Joe Goddard both confirmed if the plans noted the grouted pipe, FDOT would have the necessary equipment on site to remove. This should not affect constructability of the FDOT project. Ron Abraham noted the necessity of the Project Manager accepting the additional cost.	Wade Trim and Tampa Bay Water to adjust CLSM specification prior to bidding.

Approved
2025-H-798-00264
James A. Meyer
10/8/2025

Item	Action On
e. Justin Fox stated Tampa Bay Water would be willing to do CLSM grout to make it easier for the contractor to excavate. Nita Sharma confirmed the grouted pipe would be excavatable. f. Sally Prescott also asked about the additional MOT required for pipe removal. Tyler Matthews responded that the pipe removal would not heavily impact current MOT plans and the FDOT project could be phased to limit traffic. g. Tyler Matthews mentioned looking into a UWHCA agreement for handling the cost of pipe removal. Justin Fox responded that Tampa Bay Water would have to look into the original agreement between FDOT and Tampa Bay Water when the existing 60" pipe was constructed. The pipe pre-dates current FDOT regulations. h. Danielle Kiersey states Tampa Bay Water did not anticipate this additional cost for pipe removal and would have to discuss internally before committing to anything. i. Sally Prescott will remain the point of contact. j. Note after the meeting FDOT confirmed that FDOT will absorb the cost of pipeline removal withing FDOT's roadway contract. See attached email dated 7/30/25.	Sally Prescott to send the UWHCA to Tampa Bay Water.

"The above notes represent the writer's understanding of the items discussed and conclusions reached at the meeting. Please notify the writer immediately if your understanding is different. A clarification or correction will be issued to all parties. This document will be considered accurate if no corrections or clarifications are received within one week of issuance."

Subject: RE: FPN 256334-3 // SR 52 - Water Transmission Main removal work
Attachments: E-301-AWWA-C301-Product-Sheet2.pdf

This message originated outside of Wade Trim

Good afternoon Sally, Thank you for coordinating yesterday's meeting and for following up. This option would be preferred by Tampa Bay Water.

The existing pipe is a pre-stressed concrete cylinder pipe (PCCP). I've attached a modern cutsheet for this pipe material. The actual pipe was likely manufactured by Price Brothers or Interpace, so the weights may be slightly different than what is listed here. We don't have any known asbestos pipes in our system – it wasn't used in that large of pipe diameters. Our record drawings for this pipe are available for download using this link https://acrobat.adobe.com/id/urn:aaid:sc:VA6C2:81739d38-8ce3-4c70-8001-cbe606bf9c32. I believe sheet M-7 is where we cross SR 52.

We propose using FDOT's standard specification for excavatable flowable fill (strength 100 psi) – **Section 121** https://fdotwww.blob.core.windows.net/sitefinity/docs/default-source/specifications/by-year/2017/july-2017/ebook/717ebook.pdf?sfvrsn=e0b7d16b_0 .

As noted during yesterday's call, we are packaging up our 100% design plans and specifications for bidding. We will update the plans to specify filling the old pipe per FDOT's flowable fill spec section 121.

Once you have an opportunity to review, please let me know if you have any follow up questions.

Thank you,

Danielle Keirsey, PMP
Senior Project Manager - Engineer

Subject: FPN 256334-3 // SR 52 - Water Transmission Main removal work

Danielle & Jusn ,

Our Maintenance and Construco n teams discussed the situao n a8er the meen g and are considering having our roadway contractor to absorb the removal work within our roadway contract, at FDOT's expense. Could you provide us with more informao n about the pipe material and the details/specificao ns of the grout material / requirements that you will use, and any other pern ent informao n that we can provide to our contractor? Is there potena l asbestos?

Thank you for your assistance.

Sally

EXHIBIT C

FRAC-OUT CONTINGENCY PLAN

The specific objectives of this plan are to:

- Minimize the potential for a frac-out associated with microtunneling and directional drilling activities.
- Provide for a timely detection of frac-outs.
- Protect environmentally sensitive areas.
- Ensure an organized, timely, and "minimum-impact" response in the event of a frac-out and release of drilling bentonite, and
- Ensure that all appropriate notifications are made immediately public, project management and personnel, and environmental agencies.

1.0 Best Management Practices (BMP)

The construction team (Team) will implement all Best Management Practices (BMPs) described in this section to minimize the potential for adverse environmental impacts during the Microtunneling Process. BMPs for erosion control within the staging areas will be implemented and properly maintained at all times during construction of the upland entry/exit pits and drilling operations to prevent siltation and turbid discharges in excess of State water quality standards in accordance with Florida Statutes 62-302 F.A.C. Methods will include, but are not limited to the use of stalked hay bales, staked filter cloth, sodding, seeding and mulching as appropriate; staged construction; and the installation and maintenance of turbidity screens around the immediate project site when adjacent or near to open water.

To provide an additional level of resource protection, the volume of bentonite in the drill string will be monitored at all times during the trenchless operations.

All entry and exit areas have been located in uplands. All construction staging will occur in these upland areas. Exit and entry pits are also a part of the work areas and will be enclosed by silt fences and hay bales. A spill kit will be onsite and used if a frac-out occurs. A vacuum truck will be readily available onsite or offsite within 15 minutes of deployment prior to and during all drilling operations. Containment materials (hay bales, silt fencing, sandbags, frac-out spill kits, etc.) will be staged onsite at locations where they are readily available and easily mobilized for immediate use in the event of an accidental release of drilling mud (frac-out). If necessary, barriers (hay bales or sedimentation fences) between the bore site and the edge of the wetland will be constructed, prior to drilling, to prevent released bentonite material from reaching the water/wetlands.

The site supervisor/foreman will ensure all waste materials are properly containerized, labeled, and removed from the site to an approved disposal facility by personnel experienced in the removal, transport, and disposal of drilling mud.

The site supervisor/foreman will be familiar with all aspects of the drilling activity, the contents of this Plan and the conditions of approval under which the activity is permitted to take place. The site supervisor/foreman will have the authority to stop work and commit the resources (personnel and

Approved
2025-H-798-00264
James A. Meyer
10/8/2025

equipment) necessary to implement this plan. The site supervisor/foreman will assure that a copy of this plan is available (onsite) and accessible to all construction personnel.

2.0 Equipment

The site supervisor/foreman will ensure that:

- All equipment and vehicles are being checked and maintained daily to prevent leaks of hazardous materials.
- Spill kits and spill containment materials are available onsite at all times and that the equipment is in good working order.
- Equipment required to contain and clean up a frac-out release on land or underwater, including vacuum devices and hoses, will either be available at the work sire or readily available at an offsite location within 15 minutes of the bore site.
- Silt Fences, absorbent pads, and plastic sheeting for placement beneath motorized equipment will be available should any visual evidence of engine fluids leakage be observed.
- Water containing mud, silt, bentonite, or pollutants from equipment washing or other activities will not be allowed to enter the adjacent wetlands. The bentonite used in the drilling process will either be disposed of at an approved disposal facility or recycle in an approved manner. Other construction materials and wastes will be recycled, or disposed of, as appropriate.
- A vacuum truck will be staged at a location from which it can be mobilized and relocated so that at any place along the drill shot can be reached by the apparatus within 10 minutes of a frac-out.

3.0 Training

Prior to the start of construction, the site supervisor/foreman will ensure that crew members receive training in the following:

- The provisions of the trenchless Plan, equipment maintenance and site-specific permit and monitoring requirements.
- Inspection procedures for release prevention and containment equipment and materials.
- Contactor/crew member responsibilities in the event of a release.
- Operation of release prevention and control equipment and the location of the release control materials, as necessary and appropriate.
- Protocols for communication with agency representatives who might be onsite during the cleanup effort.

4.0 Frac-out Monitoring

The trenchless plan will be available on site and the following procedures will be followed each day, prior to the start of work. The site supervisor/foreman will be onsite at any time that drilling is occurring or is planned to occur. The site supervisor/foreman will ensure that a job briefing meeting is held at the start of each day or drilling to review the plan and appropriate procedures to be followed

Approved
2025-H-798-00264
James A. Meyer
10/8/2025

in case of a frac-out. Questions will be answered and clarification given on any points of concern.

5.0 Pressure Monitoring

Drilling pressures will be closely and continuously monitored so they do not exceed those needed to penetrate the formation. Pressure levels will be set at a minimum level to prevent frac-outs. Cutters and reamers will be pulled back into previously-drilled sections after each new joint of pipe is added.

Once the drill rig is in place and the drilling begins, the drill operator will stop work whenever the pressure in the drill rig drops or there is a lack of returns in the entrance pit. At this time the site supervisor/foreman will be informed of the potential frac-out. The site supervisor/foreman and the drill rig operator(s) will work to identify the likely location of the frac-out. The location of the frac-out will be recorded and notes made on the location and measures taken to address the concern. The following subsections will be adhered to when addressing a frac-out situation.

Drilling operations will be halted by the drill rig operators immediately upon detection of a drop in drilling pressure or other evidence of a frac-out. The clean-up of all spills will begin immediately. The Management & Safety Department will be notified immediately of any spills and will be consulted regarding clean-up procedures. A spill kit will be onsite and be used if a frac-out occurs. A vacuum truck, hose(s), and containment materials such as straw bales, will also be onsite or offsite within 15 minutes of deployment prior to and during all operations. The information will include the location of the frac-out and an estimate of the volume of drilling fluids accidentally released. See section 6.0, Notification, for all agency points of contact, as well as all information to be included in written reports.

The site supervisor/foreman will be immediately notified. In the event of a frac-out, the site supervisor/foreman will conduct an evaluation of the situation and direct recommended actions in accordance with the following sections. The SWC site supervisor/foreman will maintain communication with the FDEP contact to provide a schedule of the activities if requested.

6.0 Frac-out Contingency Plan

The response of the field crew to a frac-out release will be immediate and in accordance with procedures identified in this Plan. All appropriate emergency actions that pose additional threats to sensitive resources will be taken, as follows:

- Trenchless activities will stop immediately.
- The machine will be pulled back to relieve pressure on frac-out.
- The site supervisor/foreman will be notified to ensure that management and the safety department is notified, adequate response actions are taken and notifications are made.
- The site supervisor/foreman will evaluate the situation and recommend the type and level of response warranted, including the level of notification required.
- The site supervisor will notify all agency contacts identified in Section 6.0, Notification.
- If the frac-out is minor, easily contained, has not reached the surface and is not threatening

sensitive resources, the viscosity of the drilling fluids may be increased and/or a leak stopping compound previously approved by the Florida Department of Environmental Protection (DEP) will be used to block the frac-out. If the use of the leak stopping compound is not fully successful, the bore stem will be redirected to a new location along the desired drill path where a frac-out has not occurred.

- lf a frac-out has reached the surface, any material contaminated with bentonite will be removed by hand, contained and properly disposed of, as required by law. A dike or berm may be constructed around the frac-out to entrap released drilling fluid, if necessary. Clean sand will be placed, and the area returned to pre-project contours.
- If a frac-out occurs on land, reaches the surface and becomes widespread, the site supervisor/foreman will authorize a readily accessible vacuum truck and equipment stored offsite to be mobilized. The vacuum truck may be positioned at either end of the line of the drill so that the frac-out can be reached by crews on foot or may be pulled by a piece of equipment so that contaminated soils can be vacuumed up.

6.0 Notification

In the event a frac-out reaches a wetland or water source, the site supervisor/foreman will notify the Engineer of Record and immediately notify the appropriate resource agencies. All agency notifications will occur within 24 hours and proper written documentation will be submitted to agencies within 10 business days. The following information will be provided in these written reports:

- Name and telephone number of person reporting.
- Location of the release.
- Date and time of the release.
- Type, quantity, and estimated size of drilling fluid release.
- How the release occurred.
- The type of activity that was occurring around the area of the frac-out.
- Description of any sensitive areas and their location in relation to the frac-out.
- Description of the methods used to clean up or secure the site.
- Listing of the current permits obtained for the project.

7.0 Contingency Mitigation Plan

Following the clean-up of a frac-out, the Team will conduct an evaluation of the situation and coordinate with all environmental regulatory agencies to develop a mitigation plan to fully offset any impacts to the wetlands. The plan will be based on a functional assessment that describes how the proposed mitigation would offset both direct and indirect impacts to these resources.

Florida Department of Transportation

Attention: Michael G. Mcclurg
Permit Coordinator

Re: Response to First Request for Information (RFI)
Florida Department of Transportation
Utility Permit 2025-H-798-00715
Tampa Bay Water Project No. 07153 Cross Bar Ranch Wellfield Water Transmission Main Relocation

Dear Mr. Mcclurg:

The purpose of this letter is to respond to the Additional Comments received for the above-mentioned project on **07/21/2025** and to notify the Reviewer of a change in the proposed pipeline alignment**.** The pipeline shift is necessary to avoid wetland impacts. The pipeline casing will still extend past the existing and proposed FDOT roadways as required. In order to satisfy FDOT's request for the 60" transmission main to be relocated prior to the letting of Project 256334-3, removing potential wetland impacts is imperative. In regard to the RFI comments below, questions are included in regular font and responses are in **bold** font.

1. Comment: Please include the following FDOT Notes: "Tampa Bay Water will continue to maintain ownership of the grouted, out-of-service 60 water transmission main until roadway project 256334-3-52-01 is let, where it will be removed during roadway construction, by the UAO." "Contact FDOT James Meyer 48 hours before working in FDOT R/W 352-848-2600, to activate permit." "Sidewalks should NOT be closed more than 2 weeks for the duration of the permit. The contractor will need to provide accommodation for pedestrians." "Restore FDOT R/W with Sod only." "Contact Scott Brown Pasco County for locates of lighting fiber and signal conduits: Pasco County 727-849-6845."

   Response: Above-listed notes added to sheet G-2 under General Notes and FDOT Notes.

2. Provide MOT Technician "Name, Phone Number, Certification, Email Address".

   Response: Contact to be determined after project is bid later this year. Contact will be provided to FDOT prior to construction within FDOT ROW as required.

3. For permit close out once construction is completed: Enter in the FDOT's One Stop Permitting – "Certify Construction Complete" or provide, original signed copy of Permit Application (pg. 3 of 3) and As-builts. Once construction is completed for permit close out.

   Response: Acknowledged. Wade Trim and Tampa Bay Water will follow the above-mentioned methods for ensuring proper permit closeout once construction has completed.

Approved

James A. Meyer
10/8/2025

4. Sheet C-2: Was the 167' of 60" WM to remain in place and grout-filled coordinated with FDOT #256334-3 project manager?

   Response: Yes, coordination with the FDOT #256334-3 project manager has been ongoing and this method has been discussed and approved during the meeting held on July 30, 2025. See attached meeting minutes for reference (Exhibit D). The corresponding fill and grout callout has also been updated on sheet C-2 to reference FDOT specs as agreed upon.

5. Please provide the following: Microtunnels under FDOT roadways there must be a contingency plan and dewatering plan. Contingency should have an emergency on call MOT/TTC contractor and an emergency Asphalt contractor to restore the roadway if something should happen to the Microtunnel.

   Response: This note has been added to sheet G-2 for the contractor.

6. Provide Contingency Plan and Dewatering Plan before starting work in FDOT R/W.

   Response: The Frac Out Contingency plan has been added to the permit submittal as Exhibit C. The Contractor's dewatering plan will be provided prior to construction.

7. FDOT recommends GPR be performed along path of microtunnel minimum of 10' on either side of the casing pipe prior to pre-drill meeting with FDOT inspector which is required.

   Response: Acknowledged. General note 2 on sheet G-2 requires the contractor to locate all the utilities prior to construction. This note has also been added as part of the FDOT notes in the plan set.

Very truly yours,

Wade Trim, Inc.

This message originated outside of Wade Trim

The purpose of this meeting is to discuss the grout filling and removal of Tampa Bay Water's 60" water main that crosses SR 52, within the limits of FDOT project 256334-1 and associated with right of way use permit application number 2025-H-798-00175 .

Sally, please forward this invitation to the appropriate FDOT staff.

Thank you,

Danielle Keirsey, PMP

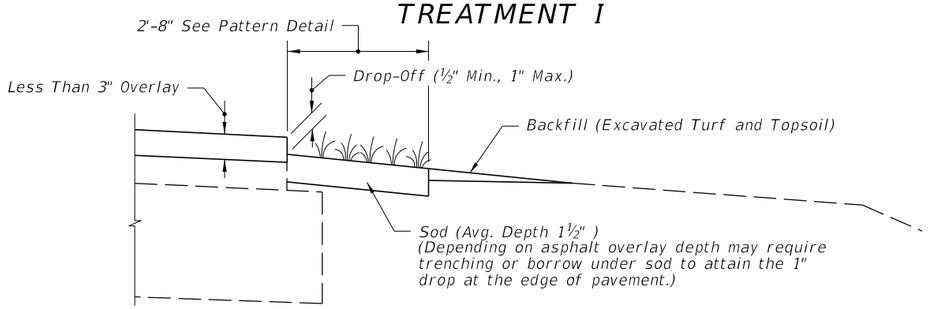
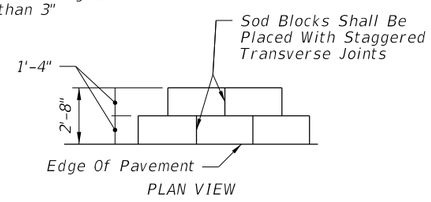
TREATMENT I



COMPLETED SHOULDER

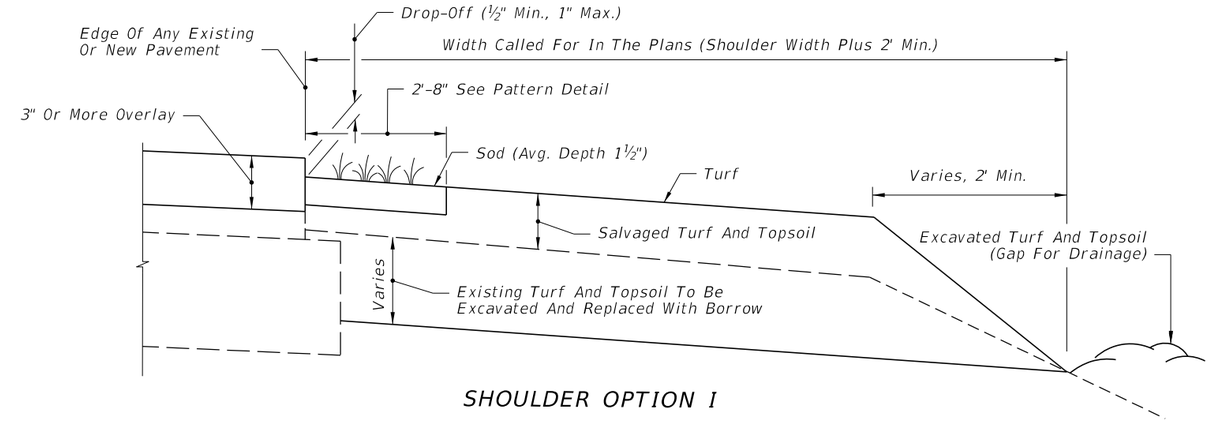
CRITERIA FOR USING TREATMENT I

Project___
- is resurfacing, widening and resurfacing or construction of shoulder pavement
- is rural or is urban without curb and gutter
- resurfacing build-up is less than 3"

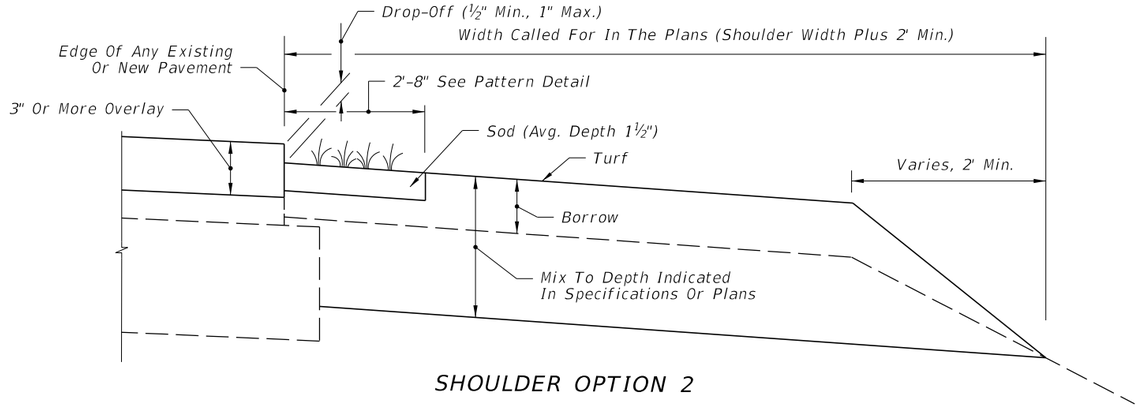


PATTERN DETAIL

TREATMENT II



SHOULDER OPTION I



SHOULDER OPTION 2

CRITERIA FOR USING TREATMENT II

Project___
- is resurfacing or construction of shoulder pavement
- is rural or is urban without curb and gutter
- resurfacing build-up is 3" or more

A SIMILAR TREATMENT MAY BE USED FOR PROJECTS THAT REQUIRE SHOULDER WIDENING. DETAILS ARE TO BE SHOWN IN THE PLANS.

GENERAL NOTES

1. Treatment I:

   If trenching under sod is necessary to achieve the required Drop-Off, excavated topsoil is to be used for filling voids and low areas at the edge of pavement or for flushing along the edge of sod. Excess material to be uniformly distributed over the shoulder.

2. Treatment II:

   A. Borrow must meet the requirements for a "Select" material in accordance with Index 120-001 and Specification 120.

   B. Borrow may be used in lieu of excavated turf and topsoil when economically feasible. There will be no additional payment for substituting borrow for excavated turf and topsoil.

3. Special attention is to be directed at achieving the required Drop-Off at the edge of pavement, within the dimension range shown.

4. Activities such as clearing, grading, and excavating that will disturb one or more acres of land require coverage under the Generic Permit for Stormwater Discharge from Large and Small Construction Activities from the Florida Department of Environmental Protection, and implementation of appropriate pollution prevention measures to minimize erosion and sedimentation and properly manage stormwater.

5. Turf Establishment:

   A. Wildflowers destroyed by shoulder sodding and turf operations are to be reestablished under the seeding rates prescribed for permanent wildflower #2 Group shown by table on Index 570-001.

   B. Establish turf in accordance with Specification 570.

Background

The National Pollutant Discharge Elimination System (NPDES) is a stormwater permitting program managed by the Florida Department of Environmental Protection (FDEP) which regulates construction activities that disturb one or more acres of land. Projects less than one acre may be regulated if the activity is part of a larger common plan of development or sale that will exceed the one-acre threshold. Disturbance includes clearing, grading, and excavating. The NPDES program also regulates municipal storm sewer systems that serve highways, area roads, and streets in your neighborhood.

Preventing Illicit Discharges & Water Pollution

Illicit Discharges are point sources of discharge which negatively impact stormwater, which eventually drains into local natural water systems. The most effective way to eliminate these discharges is to dispose of pollutants correctly.

Below are common examples:

- Yard clippings and leaves
- Fertilizers and herbicides
- Pet waste
- Trash
- Used motor oil and filters
- Antifreeze and transmission fluid
- Paint
- Solvent and degreaser
- Cooking grease

For more information on the proper disposal of wastes contact FDEP at: (813)-470-5700

Dear Charles Carden:

Enclosed is the Environmental Resource Permit, DEP Project No. 51-0459255-002-EI, issued pursuant to Part IV of Chapter 373, Florida Statutes, and Title 62, Florida Administrative Code.

Appeal rights for you and for any affected third party are described in the text of the permit along with conditions that must be met when authorized activities are undertaken.

You, as the applicant, are responsible for all aspects of permit compliance. You should therefore review this permit document carefully to ensure compliance with the general conditions and specific conditions contained herein.

Please be aware of permit General Condition number 4, which states, "At least 48 hours prior to beginning the authorized activities, the permittee shall submit to the Agency a fully executed Form 62-330.350(1), 'Construction Commencement Notice.'"

If you have any questions about this document, please contact me at Jessica.t.hamilton@floridadep.gov or at 813-470-5956. Thank you for your participation in the permit process and in managing the natural resources of the State of Florida.

Sincerely,

Jessica Hamilton

Environmental Resource Permit

Permittee: Tampa Bay Water c/o Charles Carden
Permit No: 51-0459255-002-EI

PROJECT LOCATION

The activities authorized by this permit are located within the Right-Of-Way on State Road 52, Land O' Lakes, Florida 34637, Parcel ID: 07-25-19-0000-29900-0000, in Section 7, Township 25 South, Range 19 East in Pasco County, at latitude 28° 19' 18.62" and longitude -82° 26' 39.83".

PROJECT DESCRIPTION

The permittee is authorized to relocate approximately 500 linear feet of an existing 60-inch diameter raw water transmission line. Those activities include the micro tunneling under the roadway and roadside swale, and the remaining pipeline will be constructed within uplands by open cut trenching. No impacts to wetlands or surface waters are proposed. Authorized activities are depicted on the attached exhibits.

AUTHORIZATIONS

Cross Ranch Water Transmission

Environmental Resource Permit
The Department has determined that the activity qualifies for an Environmental Resource Permit. Therefore, the Environmental Resource Permit is hereby granted, pursuant to Part IV of Chapter 373, Florida Statutes (F.S.), and Chapter 62-330, Florida Administrative Code (F.A.C.).

Sovereignty Submerged Lands Authorization
As staff to the Board of Trustees of the Internal Improvement Trust Fund (Board of Trustees), the Department has determined the activity is not on submerged lands owned by the State of Florida. Therefore, your project is not subject to the requirements of Chapter 253, F.S., or Rule 18-21, F.A.C.

Federal Authorization
Your proposed activity as outlined on your application and attached drawings **does not qualify** for Federal authorization pursuant to the State Programmatic General Permit and a **SEPARATE permit** or authorization **shall be required** from the Corps. You must apply separately to the Corps using the Application for Department of the Army Permit (ENG 4345) or alternative as allowed by Corps regulations. More information on Corps permitting may be found online in the Jacksonville District Regulatory Division Sourcebook:

(https://www.saj.usace.army.mil/Missions/Regulatory/Source-Book/).
Authority for review - an agreement with the USACOE entitled "Coordination Agreement Between the U. S. Army Corps of Engineers (Jacksonville District) and the Florida Department of Environmental Protection (or Duly Authorized Designee), State Programmatic General Permit", Section 10 of the Rivers and Harbor Act of 1899, and Section 404 of the Clean Water Act.

Coastal Zone Management Consistent
Issuance of this authorization also constitutes a finding of consistency with Florida's Coastal Zone Management Program, as required by Section 307 of the Coastal Zone Management Act.

Water Quality Certification Granted
This permit also constitutes a *grant* of water quality certification under Section 401 of the Clean Water Act, 33 U.S.C. Section 1341. Pursuant to Rule 62-330.062, F.A.C. issuance of the individual or conceptual approval permit under this chapter shall constitute certification of compliance with water quality standards.

Other Authorizations
You are advised that authorizations or permits for this activity may be required by other federal, state, regional, or local entities including but not limited to local governments or municipalities. This permit does not relieve you from the requirements to obtain all other required permits or authorizations.

The activity described may be conducted only in accordance with the terms, conditions and attachments contained in this document. Issuance and granting of the permit and authorizations herein do not infer, nor guarantee, nor imply that future permits, authorizations, or modifications will be granted by the Department.

PERMIT CONDITIONS

The activities described must be conducted in accordance with:

- **The Specific Conditions**
- **The General Conditions**
- **The limits, conditions and locations of work shown in the attached drawings**
- **The term limits of this authorization**

You are advised to read and understand these conditions and drawings prior to beginning the authorized activities, and to ensure the work is conducted in conformance with all the terms, conditions, and drawings herein. If you are using a contractor, the contractor also should read and understand these conditions and drawings prior to beginning any activity. Failure to comply with these conditions, including any mitigation requirements, shall be grounds for the Department to revoke the permit and authorization and to take appropriate enforcement action. Operation of the facility is not authorized except when determined to be in conformance with all applicable rules and this permit authorization, as described.

SPECIFIC CONDITIONS

1. Submittals required herein (e.g., progress reports, as-built drawings, etc.) shall include the permittee's name and permit number 51-0459255-002-EI and shall be directed by e-mail to SW_ERP_CAP@floridadep.gov with a subject line of "Compliance: permit number 51-0459255-002-EI", or by mail to:

   Department of Environmental Protection
   Southwest District
   ATTN: ERP Compliance Assurance
   13051 North Telecom Parkway, Suite 101
   Temple Terrace, FL 33637-0926

2. The structure/work authorized by this permit shall not be placed/conducted on any property, other than that owned by the permittee, without the prior written approval of that property owner.

3. In the event the permittee files for bankruptcy prior to completion of work permitted and required by this permit, the permittee must notify the Department within 30 days of filing. The notification shall identify the bankruptcy court and case number and shall include a copy of the bankruptcy petition.

SPECIFIC CONDITIONS – PRIOR TO ANY CONSTRUCTION

4. Best management practices for erosion control shall be implemented prior to construction commencement and shall be maintained at all times during construction to prevent siltation and turbid discharges in excess of State water quality standards (>29 NTU's above background, pursuant to Rule 62-302, F.A.C. Methods may include but are not limited to the use of staked hay bales, staked filter cloth, sodding, seeding, staged construction and the installation of turbidity screens around the immediate project site.

SPECIFIC CONDITIONS – CONSTRUCTION ACTIVITIES

5. Wetland areas or waterbodies that are outside the specific limits of construction authorized by this permit, must be protected from erosion, sedimentation, siltation, scouring, excess turbidity, and/or dewatering. There shall be no discharge in violation of the water quality standards in Chapter 62-302, F.A.C. Turbidity/erosion controls shall be installed prior to clearing, excavation or placement of fill material, shall be maintained until construction is completed, disturbed areas are stabilized, and turbidity levels have fallen to less than 29 NTU's above background. The turbidity and erosion control devices shall be removed within 14 days once these conditions are met.

6. Areas of exposed soils shall be isolated from wetlands or other surface waters to prevent erosion and deposition of these soils into wetlands or other surface waters during construction and operation of permitted activities.

7. Side slopes, exposed and/or disturbed land surfaces shall be stabilized with sod, seed or mulch within 48 hours following completion of final grades at the project site to prevent erosion, sedimentation, siltation or scouring.

8. The permittee shall be responsible for ensuring erosion control devices/procedures are inspected and maintained daily during all phases of construction authorized by this permit until areas disturbed during construction are sufficiently stabilized to prevent erosion, siltation, and turbid discharges.

9. Staked filter cloth shall be positioned at the edge of the permitted fill slopes adjacent to wetlands to prevent turbid run-off and erosion.

10. There shall be no discharge of construction debris into the waters of the state as conditioned by this permit enforceable under the Florida Litter Law 403.413, F.S., by all law enforcement officers.

11. This permit does not authorize the removal of any vegetation within the jurisdictional area. No dredging, filling, or other construction activity, including the removal of tree stumps and/or vegetative root masses, shall be conducted within the wetlands other than that performed within the specifically authorized work corridor.

12. Unauthorized impacts to wetlands as a result of the authorized construction shall be reported to the Department within 24 hours.

13. Storage or stockpiling of tools and materials (i.e., lumber, pilings, debris) within wetlands or other surface waters is prohibited.

SPECIFIC CONDITIONS FOR LISTED SPECIES

14. This permit does not authorize the permittee to cause any adverse impact to or "take" of state listed species and other regulated species of fish and wildlife. Compliance with state laws regulating the take of fish and wildlife is the responsibility of the owner or permittee associated with this project. Please refer to Chapter 68A-27 of the Florida Administrative Code for definitions of "take" and a list of fish and wildlife species. If listed species are observed onsite, Florida Fish and Wildlife Conservation Commission (FWC) staff are available to provide decision support information or assist in obtaining the appropriate FWC permits. Most marine endangered and threatened species are statutorily protected and a "take" permit cannot be issued. Requests for further information or review can be sent to ConservationPlanningServices@MyFWC.com.

15. If new information (e.g. listing of new species, new critical habitat, etc.) shows that the magnitude of impacts to federally listed species has the potential for adverse effects, the U.S. Fish and Wildlife Service (USFWS) will notify the Department. The Department will initiate coordination with the permittee and with the USFWS to determine what adverse impacts are likely and if additional minimization measures, reporting, or monitoring are

required in order to be consistent with the Endangered Species Act, as deemed necessary by USFWS.

16. The Permittee shall report any injured, sick, or dead federally or state listed animal(s) discovered onsite to the Florida Fish and Wildlife Conservation Commission Wildlife Alert number at 888-404-FWCC (3922).

SPECIFIC CONDITIONS – HORIZONTAL DIRECTIONAL DRILL

17. The hydraulic directional drill (HDD) bore pits and all staging shall be within uplands.

18. The permittee shall follow the approved Frac-Out Contingency Plan (attached).

19. All HDD activities shall take place during daylight hours only.

20. Within 2 hours of the HDD punch out and subsequent back-reams, the permittee shall perform a visual inspection of the submerged lands along the subaqueous portions of the HDD corridor to inspect for bentonite releases or frac-outs. Within 7 days of the HDD punch out and subsequent back-reams, the permittee shall submit a written summary report to the Department that includes the following information:

    a. timeline of the outfall/pit installations
    b. any complications encountered during outfall installations
    c. details of any dye detection and subsequent bentonite clean-up operation
    d. discussion of possible causes of bentonite discharges (frac-outs); and
    e. suggestions for future frac-out prevention measures

21. If a frac-out occurs during the subaqueous crossing installation which results in adverse impacts wetlands, submerged or emergent vegetation, or other biological resources, restoration and mitigation shall be required to offset adverse impacts.

22. Within 30 days of each pit installation, the permittee shall fully restore the staging area to its original condition. Paved surfaces shall be repaired, and unpaved surface areas shall be replanted with appropriate non-nuisance native vegetation.

SPECIFIC CONDITIONS – CONSTRUCTION COMPLETION

The permittee shall comply with the following conditions prior to the transfer to operation phase of the facility. All documentation required below shall be included with the permittee's request to transfer the project to the operation phase [Form No. 62-330.310(2), F.A.C.]

23. Within 30 days after completion of construction of the permitted or authorized activity, and prior to transfer to operation, the permittee shall submit photographs of the completed structure. The photographs shall show the size and dimensions of all existing structures and activities within the permitted project area. Constructed deviations may require a permit

modification and/or easement.

24. The permittee shall submit one set of signed, dated and sealed as-built drawings to the Department via email at SW_ERP_CAP@floridadep.gov for review and approval within 30 days of completion of construction. (Please contact the Department for files that are too large to email for alternative means of submitting electronically.) The as-built drawings shall be based on the Department permitted construction drawings and any pertinent specific conditions, which should be revised to reflect changes made during construction. Both the original design and constructed elevations must be clearly shown. The plans must be clearly labeled as "as-built" or "record" drawings. Surveyed dimensions and elevations required shall be verified and signed, dated and sealed by a Florida registered professional. *As-builts shall be submitted to the Department regardless of whether or not deviations are present. In addition, the permittee shall submit the "As-Built Certification and Request for Conversion to Operation Phase" form (Ch. 62-330.310(1), F.A.C.); as required in General Condition #6.*

    The following information shall be verified on the as-built drawings from the engineering drawings signed and sealed by Nita Naik Sharma, P.E., No.79670 on June 12, 2025, and Glenn Willson No. 86800 on September 23, 2025:

GENERAL CONDITIONS FOR INDIVIDUAL PERMITS

The following general conditions are binding on all individual permits issued under this chapter, except where the conditions are not applicable to the authorized activity, or where the conditions must be modified to accommodate project-specific conditions.

1. All activities shall be implemented following the plans, specifications and performance criteria approved by this permit. Any deviations must be authorized in a permit modification in accordance with Rule 62-330.315, F.A.C. Any deviations that are not so authorized may subject the permittee to enforcement action and revocation of the permit under Chapter 373, F.S.

2. A complete copy of this permit shall be kept at the work site of the permitted activity during the construction phase and shall be available for review at the work site upon request by the Agency staff. The permittee shall require the contractor to review the complete permit prior to beginning construction.

3. Activities shall be conducted in a manner that does not cause or contribute to violations of state water quality standards. Performance-based erosion and sediment control best

management practices shall be installed immediately prior to, and be maintained during and after construction as needed, to prevent adverse impacts to the water resources and adjacent lands. Such practices shall be in accordance with the *State of Florida Erosion and Sediment Control Designer and Reviewer Manual (Florida Department of Environmental Protection and Florida Department of Transportation June 2007)*, and the *Florida Stormwater Erosion and Sedimentation Control Inspector's Manual (Florida Department of Environmental Protection, Nonpoint Source Management Section, Tallahassee, Florida, July 2008)*, which are both incorporated by reference in subparagraph 62-330.050(9)(b)5., F.A.C., unless a project-specific erosion and sediment control plan is approved or other water quality control measures are required as part of the permit.

4. At least 48 hours prior to beginning the authorized activities, the permittee shall submit to the Agency a fully executed Form 62-330.350(1), "Construction Commencement Notice," (October 1, 2013), (http://www.flrules.org/Gateway/reference.asp?No=Ref-02505), incorporated by reference herein, indicating the expected start and completion dates. A copy of this form may be obtained from the Agency, as described in subsection 62-330.010(5), F.A.C., and shall be submitted electronically or by mail to the Agency. However, for activities involving more than one acre of construction that also require a NPDES stormwater construction general permit, submittal of the Notice of Intent to Use Generic Permit for Stormwater Discharge from Large and Small Construction Activities, DEP Form 62-621.300(4)(b), shall also serve as notice of commencement of construction under this chapter and, in such a case, submittal of Form 62-330.350(1) is not required.

5. Unless the permit is transferred under Rule 62-330.340, F.A.C., or transferred to an operating entity under Rule 62-330.310, F.A.C., the permittee is liable to comply with the plans, terms and conditions of the permit for the life of the project or activity.

6. Within 30 days after completing construction of the entire project, or any independent portion of the project, the permittee shall provide the following to the Agency, as applicable:

   a. For an individual, private single-family residential dwelling unit, duplex, triplex, or quadruplex – "Construction Completion and Inspection Certification for Activities Associated With a Private Single-Family Dwelling Unit" [Form 62-330.310(3)]; or

   b. For all other activities – "As-Built Certification and Request for Conversion to Operational Phase" [Form 62-330.310(1)].

   c. If available, an Agency website that fulfills this certification requirement may be used in lieu of the form.

7. If the final operation and maintenance entity is a third party:

   a. Prior to sales of any lot or unit served by the activity and within one year of permit issuance, or within 30 days of as- built certification, whichever comes first, the permittee shall submit, as applicable, a copy of the operation and maintenance documents (see sections 12.3 thru 12.3.3 of Volume I) as filed with the Department of State, Division of

Corporations and a copy of any easement, plat, or deed restriction needed to operate or maintain the project, as recorded with the Clerk of the Court in the County in which the activity is located.

b. Within 30 days of submittal of the as- built certification, the permittee shall submit "Request for Transfer of Environmental Resource Permit to the Perpetual Operation Entity" [Form 62-330.310(2)] to transfer the permit to the operation and maintenance entity, along with the documentation requested in the form. If available, an Agency website that fulfills this transfer requirement may be used in lieu of the form.

8. The permittee shall notify the Agency in writing of changes required by any other regulatory agency that require changes to the permitted activity, and any required modification of this permit must be obtained prior to implementing the changes.

9. This permit does not:

a. Convey to the permittee any property rights or privileges, or any other rights or privileges other than those specified herein or in Chapter 62-330, F.A.C.;

b. Convey to the permittee or create in the permittee any interest in real property;

c. Relieve the permittee from the need to obtain and comply with any other required federal, state, and local authorization, law, rule, or ordinance; or

d. Authorize any entrance upon or work on property that is not owned, held in easement, or controlled by the permittee.

10. Prior to conducting any activities on state-owned submerged lands or other lands of the state, title to which is vested in the Board of Trustees of the Internal Improvement Trust Fund, the permittee must receive all necessary approvals and authorizations under Chapters 253 and 258, F.S. Written authorization that requires formal execution by the Board of Trustees of the Internal Improvement Trust Fund shall not be considered received until it has been fully executed.

11. The permittee shall hold and save the Agency harmless from any and all damages, claims, or liabilities that may arise by reason of the construction, alteration, operation, maintenance, removal, abandonment or use of any project authorized by the permit.

12. The permittee shall notify the Agency in writing:

a. Immediately if any previously submitted information is discovered to be inaccurate; and

b. Within 30 days of any conveyance or division of ownership or control of the property or the system, other than conveyance via a long-term lease, and the new owner shall request transfer of the permit in accordance with Rule 62-330.340, F.A.C. This does not apply to the sale of lots or units in residential or commercial subdivisions or condominiums where

the stormwater management system has been completed and converted to the operation phase.

13. Upon reasonable notice to the permittee, Agency staff with proper identification shall have permission to enter, inspect, sample and test the project or activities to ensure conformity with the plans and specifications authorized in the permit.

14. If prehistoric or historic artifacts, such as pottery or ceramics, projectile points, stone tools, dugout canoes, metal implements, historic building materials, or any other physical remains that could be associated with Native American, early European, or American settlement are encountered at any time within the project site area, the permitted project shall cease all activities involving subsurface disturbance in the vicinity of the discovery. The permittee or other designee shall contact the Florida Department of State, Division of Historical Resources, Compliance Review Section (DHR), at (850)245-6333, as well as the appropriate permitting agency office. Project activities shall not resume without verbal or written authorization from the Division of Historical Resources. If unmarked human remains are encountered, all work shall stop immediately and the proper authorities notified in accordance with section 872.05, F.S. For project activities subject to prior consultation with the DHR and as an alternative to the above requirements, the permittee may follow procedures for unanticipated discoveries as set forth within a cultural resources assessment survey determined complete and sufficient by DHR and included as a specific permit condition herein.

15. Any delineation of the extent of a wetland or other surface water submitted as part of the permit application, including plans or other supporting documentation, shall not be considered binding unless a specific condition of this permit or a formal determination under Rule 62-330.201, F.A.C., provides otherwise.

16. The permittee shall provide routine maintenance of all components of the stormwater management system to remove trapped sediments and debris. Removed materials shall be disposed of in a landfill or other uplands in a manner that does not require a permit under Chapter 62-330, F.A.C., or cause violations of state water quality standards.

17. This permit is issued based on the applicant's submitted information that reasonably demonstrates that adverse water resource-related impacts will not be caused by the completed permit activity. If any adverse impacts result, the Agency will require the permittee to eliminate the cause, obtain any necessary permit modification, and take any necessary corrective actions to resolve the adverse impacts.

18. A Recorded Notice of Environmental Resource Permit may be recorded in the county public records in accordance with subsection 62-330.090(7), F.A.C. Such notice is not an encumbrance upon the property.

19. In addition to those general conditions in subsection (1), above, the Agency shall impose any additional project-specific special conditions necessary to assure the permitted activities will not be harmful to the water resources, as set forth in rules 62-330.301 and 62-330.302,

F.A.C., Volumes I and II, as applicable, and the rules incorporated by reference in this chapter.

NOTICE OF RIGHTS

This action is final and effective on the date filed with the Clerk of the Department unless a petition for an administrative hearing is timely filed under Sections 120.569 and 120.57, F.S., before the deadline for filing a petition. On the filing of a timely and sufficient petition, this action will not be final and effective until further order of the Department. Because the administrative hearing process is designed to formulate final agency action, the hearing process may result in a modification of the agency action or even denial of the application.

Petition for Administrative Hearing

A person whose substantial interests are affected by the Department's action may petition for an administrative proceeding (hearing) under Sections 120.569 and 120.57, F.S. Pursuant to Rule 28-106.20 and 28-106.301, F.A.C., a petition for an administrative hearing must contain the following information:

(a) The name and address of each agency affected and each agency's file or identification number, if known;
(b) The name, address, any e-mail address, any facsimile number, and telephone number of the petitioner, if the petitioner is not represented by an attorney or a qualified representative; the name, address, and telephone number of the petitioner's representative, if any, which shall be the address for service purposes during the course of the proceeding; and an explanation of how the petitioner's substantial interests will be affected by the agency determination;
(c) A statement of when and how the petitioner received notice of the agency decision;
(d) A statement of all disputed issues of material fact. If there are none, the petition must so indicate;
(e) A concise statement of the ultimate facts alleged, including the specific facts that the petitioner contends warrant reversal or modification of the agency's proposed action;
(f) A statement of the specific rules or statutes that the petitioner contends require reversal or modification of the agency's proposed action, including an explanation of how the alleged facts relate to the specific rules or statutes; and
(g) A statement of the relief sought by the petitioner, stating precisely the action that the petitioner wishes the agency to take with respect to the agency's proposed action.

The petition must be filed (received by the Clerk) in the Office of General Counsel of the Department at 3900 Commonwealth Boulevard, Mail Station 35, Tallahassee, Florida 32399-3000, or via electronic correspondence at Agency_Clerk@dep.state.fl.us. Also, a copy of the petition shall be mailed to the applicant at the address indicated above at the time of filing.

Time Period for Filing a Petition

In accordance with Rule 62-110.106(3), F.A.C., petitions for an administrative hearing by the applicant and persons entitled to written notice under Section 120.60(3), F.S., must be filed within 21 days of receipt of this written notice. Petitions filed by any persons other than the applicant, and other than those entitled to written notice under Section 120.60(3), F.S., must be filed within 21

days of publication of the notice or within 21 days of receipt of the written notice, whichever occurs first. You cannot justifiably rely on the finality of this decision unless notice of this decision and the right of substantially affected persons to challenge this decision has been duly published or otherwise provided to all persons substantially affected by the decision. While you are not required to publish notice of this action, you may elect to do so pursuant Rule 62-110.106(10)(a).

The failure to file a petition within the appropriate time period shall constitute a waiver of that person's right to request an administrative determination (hearing) under Sections 120.569 and 120.57, F.S., or to intervene in this proceeding and participate as a party to it. Any subsequent intervention (in a proceeding initiated by another party) will be only at the discretion of the presiding officer upon the filing of a motion in compliance with Rule 28-106.205, F.A.C. If you do not publish notice of this action, this waiver will not apply to persons who have not received written notice of this action.

Extension of Time
Under Rule 62-110.106(4), F.A.C., a person whose substantial interests are affected by the Department's action may also request an extension of time to file a petition for an administrative hearing. The Department may, for good cause shown, grant the request for an extension of time. Requests for extension of time must be filed with the Office of General Counsel of the Department at 3900 Commonwealth Boulevard, Mail Station 35, Tallahassee, Florida 32399-3000, or via electronic correspondence at Agency_Clerk@dep.state.fl.us, before the deadline for filing a petition for an administrative hearing. A timely request for extension of time shall toll the running of the time period for filing a petition until the request is acted upon.

Mediation
Mediation is not available in this proceeding.

FLAWAC Review
The applicant, or any party within the meaning of Section 373.114(1)(a) or 373.4275, F.S., may also seek appellate review of this order before the Land and Water Adjudicatory Commission under Section 373.114(1) or 373.4275, F.S. Requests for review before the Land and Water Adjudicatory Commission must be filed with the Secretary of the Commission and served on the Department within 20 days from the date when this order is filed with the Clerk of the Department.

Judicial Review
Once this decision becomes final, any party to this action has the right to seek judicial review pursuant to Section 120.68, F.S., by filing a Notice of Appeal pursuant to Florida Rules of Appellate Procedure 9.110 and 9.190 with the Clerk of the Department in the Office of General Counsel (Station #35, 3900 Commonwealth Boulevard, Tallahassee, Florida 32399-3000) and by filing a copy of the Notice of Appeal accompanied by the applicable filing fees with the appropriate district court of appeal. The notice must be filed within 30 days from the date this action is filed with the Clerk of the Department.

Permit Expiration: 12/18/2030

GENERAL NOTES:

1. ALL ELEVATIONS SHOWN ON THE DRAWINGS AND IN THE SURVEY NOTES ARE REFERENCED TO NORTH AMERICAN VERTICAL DATUM OF 1988. STATE PLANE COORDINATES ARE REFERENCED TO NORTH AMERICAN DATUM OF 1983/90 (NAD 28/90).
2. LOCATIONS, ELEVATIONS AND DIMENSIONS OF EXISTING UTILITIES, STRUCTURES AND OTHER FEATURES ARE SHOWN ACCORDING TO THE BEST INFORMATION AVAILABLE AT THE TIME OF THE PREPARATION OF THESE DRAWINGS, BUT DO NOT PURPORT TO BE ABSOLUTELY CORRECT. THE CONTRACTOR SHALL OBTAIN THE LOCATIONS, ELEVATIONS AND DIMENSIONS OF ALL EXISTING UTILITIES, STRUCTURES AND OTHER FEATURES AFFECTING HIS WORK PRIOR TO CONSTRUCTION.
3. LAND SURVEY WAS OBTAINED FROM FDOT FPID 25633415201 PLANS DATED MARCH 2021.
4. UTILITIES AND STRUCTURES THAT ARE NOT SHOWN ON THE DRAWINGS TO BE REMOVED AND REPLACED OR RELOCATED, SHALL BE PROTECTED IN PLACE AND UTILITY SERVICE SHALL BE MAINTAINED. WHERE TEMPORARY CONFLICTS OCCUR BETWEEN EXISTING UTILITIES AND THE NEW CONSTRUCTION, PROTECT IN PLACE OR RELOCATE THE UTILITIES AND MAINTAIN UTILITY SERVICE ALL TO THE SATISFACTION OF THE UTILITY COMPANY. UTILITIES AND STRUCTURES SHOWN ON THE DRAWINGS TO BE REMOVED AND REPLACED OR RELOCATED, SHALL CONFORM TO THE REQUIREMENTS OF THE APPLICABLE TECHNICAL SPECIFICATIONS.
5. PROVIDE ADEQUATE, TEMPORARY THRUST RESTRAINT AT BENDS AND TEES IN EXISTING WATER MAINS AND OTHER PRESSURIZED CONDUITS IN PROXIMITY TO EXCAVATIONS AS REQUIRED TO PREVENT DISLODGEMENT, SEPARATION OR LEAKAGE OF THESE FACILITIES.
6. DISCHARGE OF ANY NON-CONTAMINATED WATER FROM SOIL DEWATERING OPERATIONS TO SURFACE WATERS, IF ANY, SHALL CONFORM TO THE FDEP GENERAL PERMIT REQUIREMENTS.
7. PROVIDE AT LEAST 48 HOURS NOTICE TO THE VARIOUS UTILITY COMPANIES IN ORDER TO PERMIT THE LOCATION OF EXISTING UNDERGROUND UTILITIES IN ADVANCE OF CONSTRUCTION. NOTIFY THE VARIOUS UTILITY COMPANIES BY CALLING THE SUNSHINE ONE CALL CENTER (1-800-432-4770) OR IF NECESSARY, BY CONTACTING THE UTILITY COMPANIES INDIVIDUALLY.
8. CONFIRM UTILITY TO UTILITY CLEARANCES, HORIZONTAL AND VERTICAL, AND PIPE JOINT LOCATIONS IN ACCORDANCE WITH FLORIDA ADMINISTRATIVE CODE 62-555.314 AND 62-604.400.
9. THE HORIZONTAL ALIGNMENT OF THE REPLACEMENT WATER MAIN SHALL BE AS DIMENSIONED TO THE SURVEY BASELINE ON THE DRAWINGS. THE CONTRACTOR SHALL OBTAIN A COPY OF THE SURVEY AND LOCATE THE SURVEY BASELINE IN THE FIELD PRIOR TO CONSTRUCTION.
10. PIPE LAYING, LEAKAGE TESTING AND AS-BUILT DRAWINGS SHALL CONFORM TO ALL INFORMATION INDICATED ON THE PLANS AND DETAILS OR PROJECT TECHNICAL SPECIFICATIONS.
11. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO PROTECT ALL TREES WITHIN THE VICINITY OF THE PROPOSED CONSTRUCTION IN ACCORDANCE WITH PASCO COUNTY PROTECTION STANDARDS UNLESS OTHERWISE INDICATED FOR REMOVAL. PRUNING OF BRANCHES IS NOT AUTHORIZED WITHOUT PRIOR APPROVAL FROM THE COUNTY, AND SHALL BE COMPLETED BY A CERTIFIED ARBORIST.
12. CONTRACTOR TO COORDINATE WITH UTILITY POLE OWNERS TO PROVIDE SUPPORT DURING CONSTRUCTION. UTILITY POLE OWNERS REPRESENTATIVE TO APPROVE SUPPORT METHOD PRIOR TO BEGINNING EXCAVATION AROUND UTILITY POLES. ONCE WORK IN THE AREA HAS BEEN COMPLETED, UTILITY REPRESENTATIVE SHALL INSPECT AND APPROVE FINAL GRADING PRIOR TO SUPPORT BEING REMOVED.
13. REFER TO GENERAL REQUIREMENTS SECTION OF TECHNICAL SPECIFICATIONS FOR PERMIT AGENCY COMMENTS.
14. ALL EXCAVATION AND BACKFILLING SHALL BE IN STRICT CONFORMANCE WITH TAMPA BAY WATER AND FLORIDA DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS.
15. WHERE CONSTRUCTION ACTIVITIES OCCUR WITHIN THE DRIP LINES OF EXISTING TREES, TREES ARE TO BE PROTECTED PER PASCO COUNTY NATURAL RESOURCES DIVISION REQUIREMENTS. ANY ROOT OR CANOPY TRIMMING TO FACILITATE CONSTRUCTION OF PROPOSED FACILITIES IS TO BE PERFORMED AT THE DIRECTION OF A CERTIFIED ARBORIST.
16. ANY AREAS DISTURBED BY CONSTRUCTION SHALL BE GRADED TO THE ORIGINAL GRADE AND SEEDED AND MULCHED.
17. ADD TEMPORARY 1" THICK STEEL PLATES TO ACT AS SHOCK PADS OVER EXISTING 60" PIPE WITHIN PROJECT LIMITS TO PROTECT DURING CONSTRUCTION.
18. CONTACT INFORMATION:

    TAMPA BAY WATER
    NAME: DANIELLE KEIRSEY, PROJECT MANAGER
    PHONE: (727) 791-2377
19. TAMPA BAY WATER WILL CONTINUE TO MAINTAIN OWNERSHIP OF THE GROUTED, OUT-OF-SERVICE 60" WATER TRANSMISSION MAIN UNTIL ROADWAY PROJECT 256334-3-52-01 IS LET, WHERE IT WILL BE REMOVED DURING ROADWAY CONSTRUCTION, BY THE UAO.

FDOT NOTES:

1. CONTACT FDOT JAMES MEYER 48 HOURS BEFORE WORKING IN FDOT R/W 352-848-2600 TO ACTIVATE PERMIT.
2. SIDEWALKS SHOULD NOT BE CLOSED FOR MORE THAN 2 WEEKS FOR THE DURATION OF THE PERMIT. THE CONTRACTOR WILL NEED TO PROVIDE ACCOMMODATION FOR PEDESTRIANS.
3. RESTORE FDOT R/W WITH SOD ONLY.
4. CONTACT SCOTT BROWN PASCO COUNTY FOR LOCATES OF LIGHTING FIBER AND SIGNAL CONDUITS: PASCO COUNTY 727-849-6845
5. FOR MICROTUNNELS UNDER FDOT ROADWAYS THERE MUST BE A CONTINGENCY PLAN AND DEWATERING PLAN. CONTINGENCY SHOULD HAVE AN EMERGENCY ON CALL MOT/TTC CONTRACTOR AND AN EMERGENCY ASPHALT CONTRACTOR TO RESTORE THE ROADWAY IF SOMETHING SHOULD HAPPEN TO THE MICROTUNNEL.
6. FDOT RECOMMENDS GPR BE PERFORMED ALONG PATH OF MICROTUNNEL MINIMUM OF 10' ON EITHER SIDE OF THE CASING PIPE PRIOR TO PRE-DRILL MEETING WITH FDOT INSPECTOR WHICH IS REQUIRED.

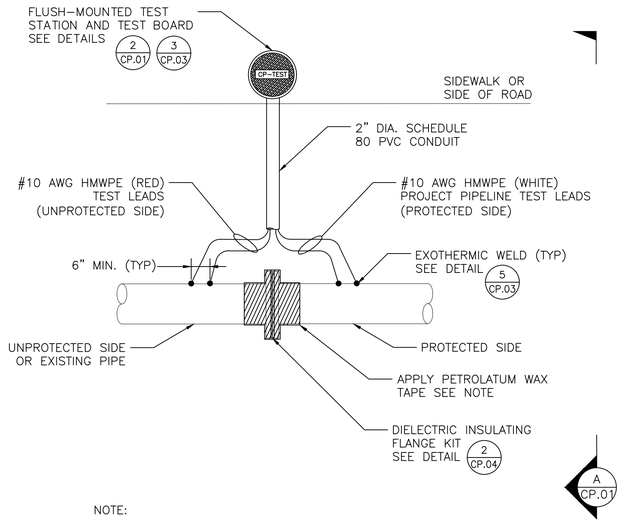
NOTES:

1. CONTRACTOR HAS THE OPTION AND MUST CHOOSE BETWEEN USING A DIELECTRIC INSULATING FLANGED JOINT OR A MONOLITHIC INSULATING JOINT FOR THE PROJECT PIPELINE TO ACHIEVE ISOLATION FROM METALLIC CONNECTIONS. BOTH OPTIONS HAVE BEEN PRESENTED IN THIS PACKAGE.
2. ALL VALVES AND NON WELDED JOINTS MUST FEATURE A MIN. OF TWO #2 AWG HMWPE (BLACK) JOINT BOND WIRES TO ACHIEVE ELECTRICAL CONTINUITY WITH THE PROJECT PIPELINE.



NOTE:

COAT THE EXTERIOR OF THE INSULATING FLANGE WITH PETROLATUM WAX TAPE FOR A MINIMUM OF 3 FEET BEYOND THE GASKET WITH A MINIMUM OF 6 INCHES OF OVERLAP WITH THE FACTORY-APPLIED COATING ON THE PIPELINE.

Sheet No.: 14 OF 14

FRAC-OUT CONTINGENCY PLAN

The specific objectives of this plan are to:

- Minimize the potential for a frac-out associated with microtunneling and directional drilling activities.
- Provide for a timely detection of frac-outs.
- Protect environmentally sensitive areas.
- Ensure an organized, timely, and "minimum-impact" response in the event of a frac-out and release of drilling bentonite, and
- Ensure that all appropriate notifications are made immediately public, project management and personnel, and environmental agencies.

1.0 Best Management Practices (BMP)

The construction team (Team) will implement all Best Management Practices (BMPs) described in this section to minimize the potential for adverse environmental impacts during the Microtunneling Process. BMPs for erosion control within the staging areas will be implemented and properly maintained at all times during construction of the upland entry/exit pits and drilling operations to prevent siltation and turbid discharges in excess of State water quality standards in accordance with Florida Statutes 62-302 F.A.C. Methods will include, but are not limited to the use of stalked hay bales, staked filter cloth, sodding, seeding and mulching as appropriate; staged construction; and the installation and maintenance of turbidity screens around the immediate project site when adjacent or near to open water.

To provide an additional level of resource protection, the volume of bentonite in the drill string will be monitored at all times during the trenchless operations.

All entry and exit areas have been located in uplands. All construction staging will occur in these upland areas. Exit and entry pits are also a part of the work areas and will be enclosed by silt fences and hay bales. A spill kit will be onsite and used if a frac-out occurs. A vacuum truck will be readily available onsite or offsite within 15 minutes of deployment prior to and during all drilling operations. Containment materials (hay bales, silt fencing, sandbags, frac-out spill kits, etc.) will be staged onsite at locations where they are readily available and easily mobilized for immediate use in the event of an accidental release of drilling mud (frac-out). If necessary, barriers (hay bales or sedimentation fences) between the bore site and the edge of the wetland will be constructed, prior to drilling, to prevent released bentonite material from reaching the water/wetlands.

The site supervisor/foreman will ensure all waste materials are properly containerized, labeled, and removed from the site to an approved disposal facility by personnel experienced in the removal, transport, and disposal of drilling mud.

The site supervisor/foreman will be familiar with all aspects of the drilling activity, the contents of this Plan and the conditions of approval under which the activity is permitted to take place. The site supervisor/foreman will have the authority to stop work and commit the resources (personnel and

equipment) necessary to implement this plan. The site supervisor/foreman will assure that a copy of this plan is available (onsite) and accessible to all construction personnel.

2.0 Equipment

The site supervisor/foreman will ensure that:

- All equipment and vehicles are being checked and maintained daily to prevent leaks of hazardous materials.
- Spill kits and spill containment materials are available onsite at all times and that the equipment is in good working order.
- Equipment required to contain and clean up a frac-out release on land or underwater, including vacuum devices and hoses, will either be available at the work sire or readily available at an offsite location within 15 minutes of the bore site.
- Silt Fences, absorbent pads, and plastic sheeting for placement beneath motorized equipment will be available should any visual evidence of engine fluids leakage be observed.
- Water containing mud, silt, bentonite, or pollutants from equipment washing or other activities will not be allowed to enter the adjacent wetlands. The bentonite used in the drilling process will either be disposed of at an approved disposal facility or recycle in an approved manner. Other construction materials and wastes will be recycled, or disposed of, as appropriate.
- A vacuum truck will be staged at a location from which it can be mobilized and relocated so that at any place along the drill shot can be reached by the apparatus within 10 minutes of a frac-out.

3.0 Training

Prior to the start of construction, the site supervisor/foreman will ensure that crew members receive training in the following:

- The provisions of the trenchless Plan, equipment maintenance and site-specific permit and monitoring requirements.
- Inspection procedures for release prevention and containment equipment and materials.
- Contactor/crew member responsibilities in the event of a release.
- Operation of release prevention and control equipment and the location of the release control materials, as necessary and appropriate.
- Protocols for communication with agency representatives who might be onsite during the cleanup effort.

4.0 Frac-out Monitoring

The trenchless plan will be available on site and the following procedures will be followed each day, prior to the start of work. The site supervisor/foreman will be onsite at any time that drilling is occurring or is planned to occur. The site supervisor/foreman will ensure that a job briefing meeting is held at the start of each day or drilling to review the plan and appropriate procedures to be followed

in case of a frac-out. Questions will be answered and clarification given on any points of concern.

5.0 Pressure Monitoring

Drilling pressures will be closely and continuously monitored so they do not exceed those needed to penetrate the formation. Pressure levels will be set at a minimum level to prevent frac-outs. Cutters and reamers will be pulled back into previously-drilled sections after each new joint of pipe is added.

Once the drill rig is in place and the drilling begins, the drill operator will stop work whenever the pressure in the drill rig drops or there is a lack of returns in the entrance pit. At this time the site supervisor/foreman will be informed of the potential frac-out. The site supervisor/foreman and the drill rig operator(s) will work to identify the likely location of the frac-out. The location of the frac-out will be recorded and notes made on the location and measures taken to address the concern. The following subsections will be adhered to when addressing a frac-out situation.

Drilling operations will be halted by the drill rig operators immediately upon detection of a drop in drilling pressure or other evidence of a frac-out. The clean-up of all spills will begin immediately. The Management & Safety Department will be notified immediately of any spills and will be consulted regarding clean-up procedures. A spill kit will be onsite and be used if a frac-out occurs. A vacuum truck, hose(s), and containment materials such as straw bales, will also be onsite or offsite within 15 minutes of deployment prior to and during all operations. The information will include the location of the frac-out and an estimate of the volume of drilling fluids accidentally released. See section 6.0, Notification, for all agency points of contact, as well as all information to be included in written reports.

The site supervisor/foreman will be immediately notified. In the event of a frac-out, the site supervisor/foreman will conduct an evaluation of the situation and direct recommended actions in accordance with the following sections. The SWC site supervisor/foreman will maintain communication with the FDEP contact to provide a schedule of the activities if requested.

6.0 Frac-out Contingency Plan

The response of the field crew to a frac-out release will be immediate and in accordance with procedures identified in this Plan. All appropriate emergency actions that pose additional threats to sensitive resources will be taken, as follows:

- Trenchless activities will stop immediately.
- The machine will be pulled back to relieve pressure on frac-out.
- The site supervisor/foreman will be notified to ensure that management and the safety department is notified, adequate response actions are taken and notifications are made.
- The site supervisor/foreman will evaluate the situation and recommend the type and level of response warranted, including the level of notification required.
- The site supervisor will notify all agency contacts identified in Section 6.0, Notification.
- If the frac-out is minor, easily contained, has not reached the surface and is not threatening

sensitive resources, the viscosity of the drilling fluids may be increased and/or a leak stopping compound previously approved by the Florida Department of Environmental Protection (DEP) will be used to block the frac-out. If the use of the leak stopping compound is not fully successful, the bore stem will be redirected to a new location along the desired drill path where a frac-out has not occurred.

- lf a frac-out has reached the surface, any material contaminated with bentonite will be removed by hand, contained and properly disposed of, as required by law. A dike or berm may be constructed around the frac-out to entrap released drilling fluid, if necessary. Clean sand will be placed, and the area returned to pre-project contours.
- If a frac-out occurs on land, reaches the surface and becomes widespread, the site supervisor/foreman will authorize a readily accessible vacuum truck and equipment stored offsite to be mobilized. The vacuum truck may be positioned at either end of the line of the drill so that the frac-out can be reached by crews on foot or may be pulled by a piece of equipment so that contaminated soils can be vacuumed up.

6.0 Notification

In the event a frac-out reaches a wetland or water source, the site supervisor/foreman will notify the Engineer of Record and immediately notify the appropriate resource agencies. All agency notifications will occur within 24 hours and proper written documentation will be submitted to agencies within 10 business days. The following information will be provided in these written reports:

- Name and telephone number of person reporting.
- Location of the release.
- Date and time of the release.
- Type, quantity, and estimated size of drilling fluid release.
- How the release occurred.
- The type of activity that was occurring around the area of the frac-out.
- Description of any sensitive areas and their location in relation to the frac-out.
- Description of the methods used to clean up or secure the site.
- Listing of the current permits obtained for the project.

7.0 Contingency Mitigation Plan

Following the clean-up of a frac-out, the Team will conduct an evaluation of the situation and coordinate with all environmental regulatory agencies to develop a mitigation plan to fully offset any impacts to the wetlands. The plan will be based on a functional assessment that describes how the proposed mitigation would offset both direct and indirect impacts to these resources.

CONSTRUCTION COMMENCEMENT NOTICE

Instructions: In accordance with Chapter 62-330.350(1)(d), F.A.C., complete and submit this form at least 48 hours prior to commencement of activity authorized by permit.

Permit No. _____ Application No. _____

Project Name _____ Phase _____

Construction of the system authorized by the above referenced Environmental Resource Permit and Application, is expected to commence on _____ , 20 _____ and will have an estimated completion date of _____ , 20 _____

PLEASE NOTE: If the actual construction commencement date is not known within 30 days of issuance of the permit, District staff should be so notified in writing. As soon as a construction commencement date is known, the permittee shall submit a completed construction commencement notice form.

Permittee's or Authorized Agent's Signature _____ Company _____

Print Name _____ Title _____ Date _____

E-mail _____ Phone Number _____

As-Built Certification
And Request for Conversion to Operation Phase

Instructions: Complete and submit this page within 30 days of completion of the entire project, or any independent portion of the project, as required by the permit conditions. The operation phase of the permit is effective when the construction certification for the entire permit/application is approved by the Agency. If the final operation and maintenance entity is not the permittee, the permittee shall operate the project, system, works, or other activities temporarily until such time as the transfer to the operation entity is finalized (use Form 62-330.310(2)).

Permit No: Application No: Permittee:

Project Name: Phase or Independent Portion (if applicable):

I HEREBY CERTIFY THAT (please check only one box):

☐ To the best of my knowledge, information, and belief, construction of the project has been completed in substantial conformance with the plans specifications and conditions permitted by the Agency. Any minor deviations will not prevent the project from functioning in compliance with the requirements of Chapter 62-330, F.A.C. Attached are documents to demonstrate satisfaction of the outstanding permit conditions, other than long term monitoring and inspection requirements.

☐ Construction of the project was NOT completed in substantial conformance with the plans and specifications permitted by the Agency. Any deviations or independent phasing will not prevent the project from functioning in compliance with the requirements of Chapter 62-330, F.A.C. (Contact the permitting agency to determine whether a modification of the permit will be required in accordance with Rule 62-330.315, F.A.C.) Attached is a description of substantial deviations, a set of as-built drawings, and documents to demonstrate satisfaction of the outstanding permit conditions, other than long term monitoring and inspection requirements.

☐ Construction of the project was NOT completed in substantial conformance with the plans and specifications permitted by the Agency. There are substantial deviations that prevent the project from functioning in compliance with the requirements of Chapter 62-330, F.A.C. I acknowledge that corrections to the project and/or a modification of the permit will likely be required, and that conversion to the operation phase cannot be approved at this time. As-built or record drawings reflecting the substantial deviations are attached.

Drawings and Information Checklist

Following is a list of information that is to be verified and/or submitted by the Registered Professional or Permittee:

1. All surveyed dimensions and elevations shall be certified by a registered Surveyor or Mapper under Chapter 472, F.S.

2. The registered professional's certification shall be based upon on-site observation of construction (scheduled and conducted by the registered professional of record or by a project representative under direct supervision) and review of as-built drawings, with field measurements and verification as needed, for the purpose of determining if the work was completed in accordance with original permitted construction plans, specifications, and conditions.

3. If submitted, the as-built drawings are to be based on the permitted construction drawings revised to reflect any substantial deviations made during construction. Both the original design and constructed condition must be clearly shown. The plans need to be clearly labeled as "as-built" or "record" drawings that clearly highlight (such as through "red lines" or "clouds") any substantial deviations made during construction. As required by law, all surveyed dimensions and elevations required shall be verified and signed, dated, and sealed by an appropriate registered professional. The following information, at a minimum, shall be verified on the as-built drawings, and supplemental documents if needed:

    a. Discharge structures - Locations, dimensions and elevations of all, including weirs, orifices, gates, pumps, pipes, and oil and grease skimmers;
    b. Detention/Retention Area(s) – Identification number, size in acres, side slopes (h:v), dimensions, elevations, contours, or cross-sections of all, sufficient to determine stage-storage relationships of the storage area and the permanent pool depth and volume below the control elevation for normally wet systems,
    c. Side bank and underdrain filters, or exfiltration trenches - locations, dimensions, and elevations of all, including clean-outs, pipes, connections to control structures, and points of discharge to receiving waters;
    d. System grading - dimensions, elevations, contours, final grades, or cross-sections to determine contributing drainage areas, flow directions, and conveyance of runoff to the system discharge point(s);
    e. Conveyance - dimensions, elevations, contours, final grades, or cross-sections of systems utilized to divert off-site runoff around or through the new system;
    f. Benchmark(s) - location and description (minimum of one per major water control structure);
    g. Datum- All elevations should be referenced to a vertical datum clearly identified on the plans, preferably the same datum used in the permit plans.

4. Wetland mitigation or restoration areas - Show the plan view of all areas, depicting a spatial distribution of plantings conducted by zone (if plantings are required by permit), with a list showing all species planted in each zone, numbers of each species, sizes, date(s) planted, and identification of source of material; also provide the dimensions, elevations, contours, and representative cross-sections depicting the construction.

5. A map depicting the phase or independent portion of the project being certified, if all components of the project authorized in the permit are not being certified at this time.

6. Any additional information or outstanding submittals required by permit conditions or to document permit compliance, other than long-term monitoring or inspection requirements.

OPERATION AND MAINTENANCE INSPECTION CERTIFICATION

Instructions: Submit this form to the Agency within 30 days of completion of the inspection, or after any failure of a stormwater management system or deviation from the permit. This form will be used to document inspections required under Section 12.5 of Applicant's Handbook Volume I.

Permit No.: _____ Application No.: _____ Date Issued: _____

Identification or Name of Stormwater Management System: _____

Phase of Stormwater Management System (if applicable): _____

Inspection Date: _____

Included Documentation: (check all that are attached)

☐ Form 62-330.311(X) "Inspection Checklist" (Required for permitted inspection frequency)

☐ Updated O&M cost estimate

☐ Updated O&M Plan

☐ Monitoring Reports

Inspection results: (check all that apply)

☐ The undersigned hereby certifies that the works or activities are functioning in substantial conformance with the permit. This certification is based upon on-site observation of the system conducted by me or my designee under my direct supervision and my review of as-built plans.

☐ The following maintenance was conducted since the last inspection (attach additional pages if needed):

_____

☐ The undersigned hereby certifies that I or my designee under my direct supervision has inspected this surface water management system and the system does not appear to be functioning in substantial conformance with the permit. I am aware that maintenance or alteration is required to bring the system into substantial compliance with the terms and conditions of the permit. As appropriate, I have informed the owner of the following:

a) The system does not appear to be functioning properly;
b) That maintenance or repair is required to bring the system into compliance; and
c) If maintenance or repair measures are not adequate to bring the system into compliance, the system may have to be replaced or an alternative design constructed subsequent to approval by the agency below.

The following components of the system do not appear to be functioning properly (attach additional pages if needed):

_____

Any components of the constructed system that are not in substantial conformance with the permitted system shall require a written request to modify the permit in accordance with the provisions of Rule 62-330.315, F.A.C. If such modification request is not approved by the agency below, the components of the system that are not in conformance with the permit are subject to enforcement action under Sections 373.119, 373.129, 373.136, and 373.430, F.S.

Request for Transfer of Environmental Resource Permit to the Perpetual Operation and Maintenance Entity

Instructions: Complete this form to transfer the permit to the operation and maintenance entity. This form can be completed concurrently with, or within 30 days of approval of, the As-Built Certification and Request for Conversion to Operation Phase (Form 62-330.310(1)). Please include all documentation required under Section 12.2.1(b) of Applicant's Handbook Volume I (see checklist below). **Failure to submit the appropriate final documents will result in the permittee remaining liable for operation and maintenance of the permitted activities.**

Permit No.: Application No(s):

Project Name: Phase (if applicable):

A. Request to Transfer: The permittee requests that the permit be transferred to the legal entity responsible for operation and maintenance (O&M).

By: _____ _____
Signature of Permittee — Name and Title

_____ _____
Company Name — Company Address

_____ _____
Phone/email address — City, State, Zip

B. Agreement for System Operation and Maintenance Responsibility: The below-named legal entity agrees to operate and maintain the works or activities in compliance with all permit conditions and provisions of Chapter 62-330, Florida Administrative Code (F.A.C.) and Applicant's Handbook Volumes I and II.

The operation and maintenance entity does not need to sign this form if it is the same entity that was approved for operation and maintenance in the issued permit.

Authorization for any proposed modification to the permitted activities shall be applied for and obtained prior to conducting such modification.

By: _____ _____
Signature of Representative of O&M Entity — Name of Entity for O&M

_____ _____
Name and Title — Address

_____ _____

Enclosed are the following documents, as applicable:

☐ Copy of recorded transfer of title to the operating entity for the common areas on which the stormwater management system is located (unless dedicated by plat)
☐ Copy of all recorded plats
☐ Copy of recorded declaration of covenants and restrictions, amendments, and associated exhibits
☐ Copy of filed articles of incorporation (if filed before 1995)
☐ Copy of operation and maintenance plan
☐ Copy of the cost estimate required under Section 12.3 of Applicant's Handbook Volume I

☐ Copy of signed Form 62-330.301(26), “Certification of Financial Capability for Perpetual Operations and Maintenance Entities”

☐ Completed documentation that the operating entity meets the requirements of Section 12.3 of Applicant’s Handbook Volume I. (Note: this is optional, but aids in processing of this request)

Request to Transfer
Environmental Resource and/or State 404 Program Permit

Instructions: To be completed, executed, and submitted by the new owner to the Agency within 30 days after any transfer of ownership or control of the real property where the permitted activity is located.

Use of this form is not required when a valid ERP permit is in the operation and maintenance phase. In such case, the owner must notify the Agency in writing within 30 days of a change in ownership or control of the entire real property, project, or activity covered by the permit. The notification may be by letter or email, or through use of this form, and must be sent to the office that issued the permit. A processing fee is not required for this notice. The permit shall automatically transfer to the new owner or person in control, except in cases of abandonment, revocation, or modification of a permit as provided in Sections 373.426 and 373.429, F.S. (2013). If a permittee fails to provide written notice to the Agency within 30 days of the change in ownership or control, or if the change does not include the entire real property or activity covered by the permit, then the transfer must be requested using this form.

Permit No(s): Application No(s).: Acres to be Transferred:

Permitted Project: Proposed Project Name (if different):

Phase of Project (if applicable):

I hereby notify the Agency that I have acquired ownership or control of the land on which the permitted system is located through the sale or other legal transfer of the land. By signing below, I hereby certify that I have sufficient real property interest or control in the land in accordance with subsection 4.2.3(d) of Applicant's Handbook Volume I; attached is a copy of my title, easement, or other demonstration of ownership or control in the land, including any revised plats, as recorded in the Public Records. I request that the permit(s) be modified to reflect that I agree to be the new permittee. By so doing, I acknowledge that I have examined the permit terms, conditions, and drawings, and agree to accept all rights and obligations as permittee, including agreeing to be liable for compliance with all of the permit terms and conditions and to be liable for any corrective actions required as a result of any violations of the permit after approval of this modification by the Permitting Agency. Also attached are copies of any recorded restrictive covenants, articles of incorporation, and certificate of incorporation that may have been changed as a result of my assuming ownership or control of the lands. As necessary, I agree to furnish the Agency with demonstration that I have the ability to provide for the operation and maintenance of the system for the duration of the permit in accordance with subsection 12.3 of Applicant's Handbook Volume I.

DEP File No. 0030575-028-WC/M1
County: Pasco

NOTICE OF PERMIT ISSUANCE

Enclosed is Permit Number 0030575-028-WC/M1 to construct public water system component/effluent transmission water main, issued pursuant to Section 403.861(9), Florida Statutes.

This action is final and effective on the date filed with the Clerk of the Department unless a petition for an administrative hearing is timely filed under Sections 120.569 and 120.57, F.S., before the deadline for filing a petition. On the filing of a timely and sufficient petition, this action will not be final and effective until further order of the Department. Because the administrative hearing process is designed to formulate final agency action, the hearing process may result in a modification of the agency action or even denial of the application.

Petition for Administrative Hearing

A person whose substantial interests are affected by the Department's action may petition for an administrative proceeding (hearing) under Sections 120.569 and 120.57, F.S. Pursuant to Rules 28-106.201 and 28-106.301, F.A.C., a petition for an administrative hearing must contain the following information:

(a) The name and address of each agency affected and each agency's file or identification number, if known;
(b) The name, address, any e-mail address, any facsimile number, and telephone number of the petitioner, if the petitioner is not represented by an attorney or a qualified representative; the name, address, and telephone number of the petitioner's representative, if any, which shall be the address for service purposes during the course of the proceeding; and an explanation of how the petitioner's substantial interests will be affected by the agency determination;
(c) A statement of when and how the petitioner received notice of the agency decision;
(d) A statement of all disputed issues of material fact. If there are none, the petition must so indicate;
(e) A concise statement of the ultimate facts alleged, including the specific facts that the petitioner contends warrant reversal or modification of the agency's proposed action;

(f) A statement of the specific rules or statutes that the petitioner contends require reversal or modification of the agency's proposed action, including an explanation of how the alleged facts relate to the specific rules or statutes; and
(g) A statement of the relief sought by the petitioner, stating precisely the action that the petitioner wishes the agency to take with respect to the agency's proposed action.

The petition must be filed (received by the Clerk) in the Office of General Counsel of the Department at 3900 Commonwealth Boulevard, Mail Station 35, Tallahassee, Florida 32399-3000, or via electronic correspondence at Agency_Clerk@FloridaDEP.gov. Also, a copy of the petition shall be mailed to the applicant at the address indicated above at the time of filing.

Time Period for Filing a Petition

In accordance with Rule 62-110.106(3), F.A.C., petitions for an administrative hearing by the applicant and persons entitled to written notice under Section 120.60(3), F.S., must be filed within 14 days of receipt of this written notice. Petitions filed by any persons other than the applicant, and other than those entitled to written notice under Section 120.60(3), F.S., must be filed within 14 days of publication of the notice or within 14 days of receipt of the written notice, whichever occurs first. You cannot justifiably rely on the finality of this decision unless notice of this decision and the right of substantially affected persons to challenge this decision has been duly published or otherwise provided to all persons substantially affected by the decision. While you are not required to publish notice of this action, you may elect to do so pursuant Rule 62-110.106(10)(a), F.A.C.

The failure to file a petition within the appropriate time period shall constitute a waiver of that person's right to request an administrative determination (hearing) under Sections 120.569 and 120.57, F.S., or to intervene in this proceeding and participate as a party to it. Any subsequent intervention (in a proceeding initiated by another party) will be only at the discretion of the presiding officer upon the filing of a motion in compliance with Rule 28-106.205, F.A.C. If you do not publish notice of this action, this waiver may not apply to persons who have not received a clear point of entry.

Extension of Time
Under Rule 62-110.106(4), F.A.C., a person whose substantial interests are affected by the Department's action may also request an extension of time to file a petition for an administrative hearing. The Department may, for good cause shown, grant the request for an extension of time. Requests for extension of time must be filed with the Office of General Counsel of the Department at 3900 Commonwealth Boulevard, Mail Station 35, Tallahassee, Florida 32399-3000, or via electronic correspondence at Agency_Clerk@dep.state.fl.us, before the deadline for filing a petition for an administrative hearing. A timely request for extension of time shall toll the running of the time period for filing a petition until the request is acted upon.

Mediation
Mediation is not available in this proceeding.

Judicial Review
Once this decision becomes final, any party to this action has the right to seek judicial review pursuant to Section 120.68, F.S., by filing a Notice of Appeal pursuant to Florida Rules of Appellate Procedure 9.110 and 9.190 with the Clerk of the Department in the Office of General Counsel (Station #35, 3900 Commonwealth Boulevard, Tallahassee, Florida 32399-3000) and by filing a copy of the Notice of Appeal

accompanied by the applicable filing fees with the appropriate district court of appeal. The notice must be filed within 30 days from the date this action is filed with the Clerk of the Department.

PERMITTEE:
Tampa Bay Water Cypress Creek WTP
Charles Carden, General Manager
2575 Enterprise Road
Clearwater, FL 33763
permitting@tampabaywater.org

PWS ID NUMBER: 651-2230
PERMIT NUMBER: 0030575-028-WC/M1
DATE OF ISSUE: **November 12, 2025**
EXPIRATION DATE: **November 11, 2030**
COUNTY: Pasco
PROJECT: Cross Bar Ranch Wellfield Water Transmission Main

This permit is issued under the provisions of Chapter 403, Florida Statutes (F.S.), and Florida Administrative Code (F.A.C.) Chapters 62-4, 62-550, 62-555 and 62-560. The above named permittee is hereby authorized to perform the work or operate the facility shown on the application and approved drawings, plans, and other documents attached hereto or on file with the Department and made a part hereof and specifically described as follows:

TO CONSTRUCT: A relocation of existing 60-inch diameter raw water transition main (TM) across State Road (SR) 52 for the Cypress Creek Water Treatment Plant.

PROPOSED CONSTRUCTION INCLUDES:

1. A relocation of approximately 500 linear feet of existing 60-inch diameter raw water transition main (TM).

The permitted operating maximum-day capacity of this plant, 110,000,000 gpd, will not be affected by this project.

IN ACCORDANCE WITH: preliminary design report, engineering drawings and related documents, prepared by Nita Naik Sharma, P.E., [Wade trim, Inc.].

LOCATION: The proposed pipeline is adjacent to existing Tampa Bay Water easement crossing SR 52, approximately 1.7 miles west of the intersection of SR 52 and Ehren Cutoff in Pasco County.

A. **General Conditions**

The permittee shall be aware of and operate under the Permit Conditions below. These applicable conditions are binding upon the permittee and enforceable pursuant to Chapter 403, Florida Statutes. [F.A.C. Rule 62-555.533(1)]

1. The terms, conditions, requirements, limitations and restrictions set forth in this permit, are "permit conditions" and are binding and enforceable pursuant to Sections 403.141, 403.727, or 403.859 through 403.861, F.S. The permittee is placed on notice that the Department will review this permit periodically and may initiate enforcement action for any violation of these conditions.

2. This permit is valid only for the specific processes and operations applied for and indicated in the approved drawings or exhibits. Any unauthorized deviation from the approved drawings, exhibits, specifications, or conditions of this permit may constitute grounds for revocation and enforcement action by the Department.

3. As provided in Subsections 403.087(6) and 403.722(5), F.S., the issuance of this permit does not convey any vested rights or any exclusive privileges. Neither does it authorize any injury to public or private property or any invasion of personal rights, nor any infringement of federal, state, or local laws or regulations. This permit is not a waiver of or approval of any other department permit that may be required for other aspects of the total project which are not addressed in this permit.

4. This permit conveys no title to land or water, does not constitute State recognition or acknowledgment of title, and does not constitute authority for the use of submerged lands unless herein provided and the necessary title or leasehold interests have been obtained from the State. Only the Trustees of the Internal Improvement Trust Fund may express State opinion as to title.

5. This permit does not relieve the permittee from liability for harm or injury to human health or welfare, animal, or plant life, or property caused by the construction or operation of this permitted source, or from penalties therefore; nor does it allow the permittee to cause pollution in contravention of Florida Statutes and Department rules, unless specifically authorized by an order from the Department.

6. The permittee shall properly operate and maintain the facility and systems of treatment and control (and related appurtenances) that are installed and used by the permittee to achieve compliance with the conditions of this permit, as required by Department rules. This provision includes the operation of backup or auxiliary facilities or similar systems when necessary to achieve compliance with the conditions of the permit and when required by Department rules.

7. The permittee, by accepting this permit, specifically agrees to allow authorized Department personnel, upon presentation of credentials or other documents as may be required by law and at reasonable times (reasonable time may depend on the nature of the concern being investigated), access to the premises where the permitted activity is located or conducted to:

    a. Have access to and copy any records that must be kept under conditions of the permit;
    b. Inspect the facility, equipment, practices, or operations regulated or required under this permit; and
    c. Sample or monitor any substances or parameters at any location reasonably necessary to assure compliance with this permit or Department rules.

8. If, for any reason, the permittee does not comply with or will be unable to comply with any condition or limitation specified in this permit, the permittee shall immediately provide the Department with the following information:

    a. A description of and cause of noncompliance; and
    b. The period of noncompliance, including dates and times; or, if not corrected, the anticipated time the noncompliance is expected to continue, and steps being taken to reduce, eliminate, and prevent recurrence of the noncompliance. The permittee shall be responsible for any and all damages which may result and may be subject to enforcement action by the Department for penalties or for revocation of this permit.

9. In accepting this permit, the permittee understands and agrees that all records, notes, monitoring data and other information relating to the construction or operation of this permitted source which are submitted to the Department may be used by the Department as evidence in any enforcement case involving the permitted source arising under the Florida Statutes or Department rules, except where such use is prescribed by Sections 403.111 and 403.73, F.S. Such evidence shall only be used to the extent it is consistent with the Florida Rules of Civil Procedure and appropriate evidentiary rules.

10. The permittee agrees to comply with changes in Department rules and Florida Statutes after a reasonable time for compliance; provided, however, the permittee does not waive any other rights granted by Florida Statutes or Department rules. A reasonable time for compliance with a new or amended surface water quality standard, other than those standards addressed in Rule 62-302.500, shall include a reasonable time to obtain or be denied a mixing zone for the new or amended standard.

11. This permit is transferable only upon Department approval in accordance with Rule 62- 4.120 and 62-730.300, F.A.C., as applicable. The permittee shall be liable for any non-compliance of the permitted activity until the transfer is approved by the Department.

12. This permit or a copy thereof shall be kept at the work site of the permitted activity.

13. This permit also constitutes:

    a. Determination of Best Available Control Technology (BACT)
    b. Determination of Prevention of Significant Deterioration (PSD)
    c. Certification of compliance with State Water Quality Standards (Section 401, PL 92-500)
    d. Compliance with New Source Performance Standards

14. The permittee shall comply with the following:

    a. Upon request, the permittee shall furnish all records and plans required under Department rules. During enforcement actions, the retention period for all records will be extended automatically unless otherwise stipulated by the Department.

    b. The permittee shall hold at the facility or other location designated by this permit records of all monitoring information (including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation) required by the permit, copies of all reports required by this permit, and records of all data used to complete the application for this permit. These materials shall be retained at least three years from the date of the sample, measurement, report, or application unless otherwise specified by Department rule.

    c. Records of monitoring information shall include:
        i. the date, exact place, and time of sampling or measurements;
        ii. the person responsible for performing the sampling or measurements;
        iii. the dates analyses were performed;
        iv. the person responsible for performing the analyses;
        v. the analytical techniques or methods used;
        vi. the results of such analyses.

15. When requested by the Department, the permittee shall within a reasonable time furnish any information required by law which is needed to determine compliance with the permit. If the permittee becomes aware the relevant facts were not submitted or were incorrect in the permit application or in any report to the Department, such facts or information shall be corrected promptly.

B. Regulatory Section

1. All construction must be in accordance with this permit. Before commencing work on project changes for which a construction permit modification is required per 62-555.536(1), the permittee shall submit to the Department a written request for a permit modification. Each such request shall be accompanied by one copy of a revised construction permit application, the proper processing fee and one copy of either a revised preliminary design report or revised drawings, specifications and design data. [F.A.C. Rule 62-555.536].

2. Permitted construction or alteration of public water supply systems must be supervised during construction by a professional engineer registered in the State of Florida if the project was designed under the responsible charge of a professional engineer licensed in the State of Florida. The permittee must retain the service of a professional engineer registered in the State of Florida to observe that construction of the project is in accordance with the engineering plans and specifications as submitted in support of the application for this permit. [F.A.C. Rule 62-555.520(3)].

3. If prehistoric or historic artifacts, such as pottery or ceramics, stone tools or metal implements, dugout canoe remains, or any other physical remains that could be associated with Native American cultures, or early colonial or American settlement are encountered at any time within the project site area, the permitted project should cease all activities involving subsurface disturbance in the immediate vicinity of such discoveries. The permittee, or other designee, should contact the Florida Department of State, Division of Historical Resources, Compliance and Review Section at 850.245.6333 or 800.847.7278, as well as the appropriate permitting agency office. Project activities should not resume without verbal and/or written authorization from the Division of Historical Resources and the permitting agency. In the event that unmarked human remains are encountered during permitted activities, all work shall stop immediately and the proper authorities notified in accordance with Section 872.05, *Florida Statutes*.

4. If delays will cause project completion to extend beyond the expiration date of this permit, the permittee shall submit to the Department a request to extend the expiration date of this permit including the appropriate processing fee. This request shall specify the reasons for the delay and shall be submitted to the Department for approval prior to the expiration date of this permit. Note that no specific construction permit shall be extended so as to remain in effect longer than five years. [F.A.C. Rule 62-555.536(4)]. {OPTIONAL}

5. In accordance with General Condition #11 of this permit, this permit is transferable only upon Department approval. Persons proposing to transfer this permit must apply jointly for a transfer of the permit within 30 days after the sale or legal transfer of ownership of the permitted project that has not been cleared for service by the Department using form, 62-555.900(8), Application for Transfer of a PWS Construction Permit along with the appropriate fee. [F.A.C. Rule 62-555.536(5)]

6. This permit satisfies Drinking Water permitting requirements only and does not authorize construction or operation of this new transmission main (TM) prior to obtaining all other necessary permits from other program areas within the Department, or required permits from other state, federal, or local agencies.

7. If gasoline contamination is found at the construction site, work shall be stopped and the proper authorities notified. With the approval of the Department, ductile iron pipe and fittings, and solvent resistant gaskets materials shall be used in the contaminated area. The ductile pipe shall be used in the contaminated area. The ductile iron pipe shall extend 100 feet beyond any solvent noted. Any contaminated soil that is excavated shall be placed on an impermeable mat, covered with waterproof covering, and held for disposal. <u>If the site cannot be properly cleaned, then consultation with the Department is necessary prior to continuing with the project construction.</u>

8. This permit does not constitute approval of construction on jurisdictional wetland areas; therefore such approval must be obtained separately from the Water Management District or from DEP ERP Section, as applicable, Permittee shall provide a copy of the permit approval to the Department if water main installation involves activities on wetlands.

C. Construction Standards

1. All products, including paints, which shall come into contact with potable water, either directly or indirectly, shall conform with National Sanitation Foundation (NSF) International, Water Chemicals Codex, Food Chemicals Codex, American Water Works Association (AWWA) Standards and the Food and Drug Administration, as provided in Rule 62-555.320(3), F.A.C.

2. Water supply facilities, including mains, pipe, fittings, valves, fire hydrants and other materials shall be installed in accordance with the latest applicable AWWA Standards and Department rules and regulations. The system shall be pressure and leak tested in accordance with AWWA Standard C600 C603, or C605, as applicable, and disinfected in accordance with AWWA Standard C651-653, as well as in accordance with Rule 62-555.340, F.A.C.

3. The installation or repairs of any public water system, or any plumbing in residential or nonresidential facilities providing water for human consumption, which is connected to a public water system shall be lead free in accordance with Rule 62-555.322, F.A.C.

4. When any existing asbestos cement (AC) pipes are replaced under this permit, the permittee shall do so in accordance with the applicable rules of Federal Asbestos Regulation and Florida DEP requirements. For specific requirements applicable to AC pipes, the permittee should contact the Air and Waste Management section managers prior to commencing any such activities at 813.470.5700. Please be aware that a notification is required to be submitted to the Department for a regulated project.

5. Permittee shall ensure that there shall be no cross-connection with any non-potable water source in accordance with Rule 62-555.360, F.A.C.

6. The new or altered aboveground piping at the drinking water treatment plant shall be color coded and labeled as recommended in Section 2.14 of "Recommended Standards for Water Works, 1997 Edition". [F.A.C. Rule 62-555.320(10)]

7. Permittee shall ensure that there shall be no cross-connection with any non-potable water source in accordance with Rule 62-555.360, F.A.C.

D. Operational Requirements

1. The current operational requirements for this water treatment plant are not changed by the project.

2. The supplier of water shall operate and maintain the public water system so as to comply with applicable standards in F.A.C. Rule 62-550 and 62-555.350.

2. The permittee shall have complete record drawings produced for the project in accordance with Rule 62-555.530(4), F.A.C.

E. Monitoring Provisions

1. The current monitoring requirements for this water treatment plant are not changed by the project.

2. Permittee shall follow the guidelines of Chapters 62-550, 62-555, and 62-560, F.A.C., regarding public drinking water system standards, monitoring, reporting, permitting, construction, and operation.

F. Clearance Requirements

1. The permittee must instruct the engineer of record to request system clearance from the Department within sixty (60) days of completion of construction, testing and disinfecting the system. Bacteriological test results

shall be considered unacceptable if the test were completed more than 60 days before the Department received the results. [F.A.C. Rule 62-555.340(2)(c)]

Permitted construction or alteration of a public water system may not be placed into service until a letter of clearance has been issued by this Department. [F.A.C. Rule 62-555.345]

2. Prior to placing this project into service, Permittee shall submit, at a minimum, all of the following to the Department for evaluation and approval for operation, as provided in Rules 62-555.340 and 62-555.345, F.A.C.:
   a. the engineer's *Certification of Construction Completion and Request for Clearance to Place Permitted PWS Components Into Operation* {DEP Form 62-555.900(9)};
   b. certified record drawings, if there are any changes noted for the permitted project.
   c. two consecutive days of satisfactory bacteriological analytical results (see paragraph 3 below).
   d. copy of a satisfactory pressure test of the process piping performed in accordance with AWWA Standards. [F.A.C. Rule 62-555.320(21)(a)(1)]

3. The new facilities shall be cleaned, disinfected, and bacteriologically cleared in accordance with Chapter 62-555, F.A.C. The bacteriological clearance data representative of the storage tank (two samples on consecutive days), the well discharge piping and water main (in accordance with the instructions for Bacteriological Sampling Locations shown below) and the untreated well water (two samples per day for 5 consecutive days collected at least six hours apart for each of the two wells) shall be submitted to the Department with the engineer's certification of construction completion. [Section 62-555.340 and 62-555.315(6)(b), F.A.C.]

   Bacteriological Sampling Locations: Copies of satisfactory bacteriological analyses taken from locations within the distribution system or water main extension to be cleared, in accordance with Rules 62-555.315 (6), 62-555.340 and 62-555.330, F.A.C. and American Water Works Association (AWWA) Standard C 651-92 as follows:

   - *The endpoint of the proposed addition;*
   - *Any water lines branching off a main extension;*
   - *Every 1,200 feet of water main;*
   - *Each location shall be sampled on two separate days (at least 6 hours apart) with sample point locations and chlorine residual readings **clearly indicated** on the report and/or drawings.*
   - *Bacteriological sample results will be considered unacceptable if the tests were completed more than 60 days before the Department receives the results.*

In order to facilitate the issuance of a letter of clearance, the Department requests that all of the above information be submitted as one package.

Southwest District

LOCATION OF PUBLIC WATER SYSTEM MAINS IN ACCORDANCE WITH RULE 62-555.314, F.A.C.

Other Pipe	Horizontal Separation	Crossings (1)	Joint Spacing @ Crossings (Full Joint Centered)
Storm Sewer, Stormwater Force Main, Reclaimed Water (2)			Vacuum Sanitary Sewer			Gravity or Pressure Sanitary Sewer, Sanitary Sewer Force Main, Reclaimed Water (4)			On-Site Sewage Treatment & Disposal System	10 ft. minimum	---	---

(1) Water main should cross above other pipe. When water main must be below other pipe, the minimum separation is 12 inches.

(2) Reclaimed water regulated under Part III of Chapter 62-610, F.A.C.

(3) 3 ft. for gravity sanitary sewer where the bottom of the water main is laid at least 6 inches above the top of the gravity sanitary sewer.

(4) Reclaimed water not regulated under Part III of Chapter 62-610, F.A.C.

EXCEPTIONS TO MINIMUM SEPARATION REQUIREMENTS

Where it is not technically feasible or economically sensible to comply with the requirements of 62-555.314(1) or (2), F.A.C., **the Department shall allow exceptions to these requirements if suppliers of water or construction permit applicants provide technical or economic justification for each exception and provide alternative construction features that afford a similar level of reliability and public health protection.**

Acceptable alternative construction features include the following:

LOCATION OF PUBLIC WATER SYSTEM MAINS IN ACCORDANCE WITH 62-555.314(5)(a), F.A.C.

Other Pipe	Horizontal Separation	Joint Spacing @ Crossings (Full Joint Centered)
Gravity or Pressure Sanitary Sewer, Sanitary Sewer Force Main, Reclaimed Water, Vacuum Sanitary Sewer, Storm Sewer, Stormwater Force Main		
Where an underground water main is being laid **less than the required minimum horizontal distance** from another pipeline and where an underground water main is **crossing another pipeline and joints in the water main are being located less than the required minimum distance from joints in the other pipeline**:

1. Use of pressure-rated pipe conforming to the American Water Works Association standards incorporated into Rule 62-555.330, F.A.C., for the other pipeline if it is a gravity- or vacuum-type pipeline;

2. Use of welded, fused, or otherwise restrained joints for either the water main or the other pipeline; **or**

3. Use of watertight casing pipe or concrete encasement at least four inches thick for either the water main or the other pipeline.

LOCATION OF PUBLIC WATER SYSTEM MAINS IN ACCORDANCE WITH 62-555.314(5)(b), F.A.C.

Other Pipe	Horizontal Separation	Crossings
Gravity or Pressure Sanitary Sewer, Sanitary Sewer Force Main, Reclaimed Water, Vacuum Sanitary Sewer, Storm Sewer, Stormwater Force Main		

Where an underground water main is being laid **less than three feet horizontally** from another pipeline and where an underground water main is **crossing another pipeline and is being laid less than the required minimum vertical distance from the other pipeline**:

Use of pipe, or casing pipe, having high impact strength (i.e., having an impact strength at least equal to that of 0.25-inch-thick ductile iron pipe) or concrete encasement at least four inches thick for both the water main **and** for the other pipeline if it is new and is conveying wastewater or reclaimed water.

Disclaimer – This document is provided for your convenience only. Please refer to Rule 62-555.314, F.A.C., for additional construction requirements.

EXHIBIT B
BIDDER'S RESPONSE FORMS

1. BID FORM

Failure to fully complete this form SHALL result in the Bidder being deemed NONRESPONSIVE.

OFFER

TO: Tampa Bay Water

The undersigned hereby offers and agrees to furnish the goods and/or services in compliance with all terms, scope of work, conditions, specifications, and addenda in this Invitation for Bids.

INVESTIGATION:

The undersigned, by submission of this Bid Form, certifies it has thoroughly examined all ITB documents, including any Existing Condition Documents and Project site in order to familiarize itself with all existing conditions. This may include the physical condition on the ground including, but not limited to, the soil borings and has satisfied itself that the number of borings and their locations are adequate or has made any additional soil tests or borings if they feel the number, type, or location of those provided by Tampa Bay Water are inadequate or incomplete.

OBLIGATION:

The undersigned, by submission of this Bid Form, hereby agrees to be obligated, if selected as the Contractor, to provide the stated goods and/or services to Tampa Bay Water for the term as stated herein, and to enter into a Contract with Tampa Bay Water, in accordance with all documents herein, together with any written addenda.

BID PRICE:

The undersigned agrees to abide by the pricing contained on the Price Form.

ADDENDA:

The Bidder acknowledges receipt of the addenda noted below and has incorporated the content of Addenda into this Bid:

#1 #_____ #_____ #_____

CONTRACTOR CONTRACT:

The Bidder agrees to the terms and conditions in the draft Contract included with this ITB **(initial one below)**:

_____ "As is" with no modifications.

_____ With the changes requested in the attached document (attach to this form) and understands that Tampa Bay Water reserves the right to reject the change requests.

LITIGATION:

The Bidder understands it must disclose any past, pending or threatened litigation or regulatory action involving construction services provided by the Bidder **(initial one below):**

_____ None are known to exist.

Action exists, and a full explanation has been attached to this form.

CONFLICTS OF INTEREST:

The Bidder understands it must disclose any potential conflict of interest which would adversely affect the Bidder's ability to provide fair, loyal, and competitive services to Tampa Bay Water. Such disclosures shall include, but not be limited to, the Bidder's contractual obligations, property interests or clientele relationship or the property interests, contractual obligations or relationships of the Bidder's principals, officers, directors, employees or agents which are directly or indirectly related to Tampa Bay Water and its operations, its Agency Representative, the Southwest Florida Water Management District (SWFWMD), the Florida Department of Environmental Protection (FDEP), or any of our member governments **(initial one below):**

____ None are known to exist.

____ Potential or apparent conflict exists, and a full explanation has been attached to this form.

COMPLIANCE WITH LAWS/PERMITS:

The Bidder certifies it is not currently in violation of any regulatory rules and regulations that may have an impact on the firm's operations, and it agrees to comply with all local, State, and Federal statutes, regulations, directives and orders as applicable to the services provided and offered to Tampa Bay Water. The Bidder further agrees it has not been placed on the Scrutinized Companies with Activities in Sudan List; the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; or the Scrutinized Companies that Boycott Israel List; nor has it engaged in a boycott of Israel and has no business operations in Cuba or Syria. (Per Section 287.135(5), Florida Statutes). Additionally, the Bidder certifies (pursuant to Subsection 287.134(2)(a), Florida Statutes) it has not been placed on the discriminatory vendor list.

NONCOLLUSION:

The undersigned, hereinafter called Bidder, declares and certifies that (i) all principals with an interest in this Bid have been named herein; (ii) this Bid is, in all respects, fair and without fraud; (iii) this Bid is made without collusion with any official of Tampa Bay Water or Engineer; and (iv) the Bid is made without any connection or collusion with any person submitting another Bid for the Work.

CONTRACT EXECUTION:

The undersigned Bidder proposes and agrees that if this Bid is accepted, it shall enter into a contract with Tampa Bay Water in the form included with the Contract documents and perform and furnish all Work as specified or indicated in this ITB at the price bid and within the time specified, and in accordance with the other terms and conditions of the Contract documents.

CONTRACT MODIFICATION PRICING:

Bidder acknowledges and agrees that the separate prices on this Bid, where they are applicable and deemed acceptable by Tampa Bay Water, will be used by Tampa Bay Water and Bidder, if awarded the Contract documents, whenever similar work is added or deducted from the Contract documents.

PROJECT UNDERSTANDING:

Bidder represents that before making its Bid, Bidder has familiarized itself with the nature and extent of the Contract documents (as defined in the General Conditions), Work, Project site, locality, and all local conditions and laws and regulations that may in any manner affect cost, schedule, progress, performance, or furnishing of the Work.

Further, Bidder has read and studied carefully: reports of explorations and tests of surface and subsurface conditions; and those drawings of physical conditions in or relating to existing surface or subsurface structures or underground utilities; and accepts the determinations established in 6.0

Supplemental Information for Bidders to the extent of the technical data contained in those reports and drawings upon which Bidder may rely, which in any manner affect cost, schedule, progress, performance, and furnishing of the Work.
Further, Bidder has read and studied all information and data shown or indicated in the Contract documents about other work under separate contracts at or near the Project site and assumes responsibility for all conditions and consequences which may result from other work and which in any manner affect cost, schedule, progress, performance, and furnishing of the Work.
Further, Bidder has correlated the results of the activities, examinations, and studies as noted above, with the terms and conditions of the Contract documents and has exercised its own independent judgement in the interpretation of this information.

NOTICE OF ERRORS:
Bidder has given Tampa Bay Water notice of all conflicts, ambiguities, errors, or omissions, if any that Bidder has discovered in the ITB.

FIRM OFFER:
Bidder has read the Contract documents and accepts all of the terms and conditions of the Contract documents, including without limitation those dealing with the disposition of Bid Security. Bidder acknowledges all Bids shall remain firm for 90 days or as otherwise required by this ITB.

REQUIREMENTS IN EFFECT:
Reference to standard Specifications, manuals, or codes of any technical society, organization, or association, or to the Laws and Regulations of any governmental authority, whether such reference be specific or by implication, shall mean the latest standard specifications, manual, code, or Laws and Regulations in effect on the date of the receipt of Bids, except as may be otherwise specifically stated.

PUBLIC RECORDS:
Each Bidder, by submitting a Bid, acknowledges the Agency's legal obligation in accordance with Chapter 119 of the Florida Statutes, to respond to all public records requests in a timely manner and expressly waives any right to contest, impede, prevent or delay such disclosure, or to initiate any proceeding that may have the effect of impeding, preventing or delaying such disclosure, unless the Bidder establishes its right to a public records exception. It is the responsibility of the Bidder alone to establish its right to any such exception. Under no circumstances will Tampa Bay Water be responsible or liable to a Bidder or any other party as a result of disclosing any such information or materials.

TRENCH SAFETY ACT:
Bidder acknowledges and agrees that the trench safety standards in effect at the time of this Bid and at the time(s) of performing the Work shall be adhered to and compliance is the complete and sole responsibility of Bidder. The price on the Price Form includes Bidder's total cost for compliance with the Florida Trench Safety Act.

SUPPLIERS:
Bidder certifies that all suppliers, if acceptable to Tampa Bay Water, shall be supplying the material or equipment for the portions of the Work identified in the list in the event Bidder is awarded the Contract.

I certify, under penalty of perjury, that I have the legal authorization to bind the firm hereunder: The individual signing this form certifies, under penalty of perjury, that (s)he has the authority to sign on behalf of the firm. (If signature is by an agent, other than an officer of the corporation or a member of a partnership, a notarized power-of-attorney must accompany the Bid.) The following is certified by the signing of this form:

AMERICAN
SPIRALWELD PIPE

THE RIGHT WAY

Clayton Simons
Territory Manager

March 13, 2026

Crossbar Ranch Wellfield Water Transmission Main – Utility Conflict
Tampa, FL

This letter certifies that American SpiralWeld Pipe (ASWP) meets the experience requirements in specification section 15065 – 1.05.B.1-3.

American SpiralWeld Pipe Company, LLC is a fully owned subsidiary of American Cast Iron Pipe Company. American Cast Iron Pipe Company, Inc. (ACIPCO) is an employee-owned company, headquartered in Birmingham, AL, which employs approximately 2,600 people in 18 facilities in the U.S. and South America. Since it was founded in 1905, ACIPCO has operated on the principle of the Golden Rule: Treat others the way you want to be treated.

American SpiralWeld Pipe manufactures spiral-welded steel pipe and has production facilities in Columbia, South Carolina (constructed in 2000), Flint, Michigan (constructed in 2014) and Paris, Texas (constructed in 2021). No other facility in the U.S. can match the capacity of AMERICAN's spiral mills that manufacture high quality steel pipe in sizes up to 144" in diameter. Production rates through the facilities vary according to pipe size and wall thickness. ASWP is certified by the Steel Plate Fabricator's Association (SPFA), which is a quality assurance program specific to the manufacture of AWWA C200 Steel Water Pipe.

This letter certifies that ASWP has sufficient production capacity available for the volume of work of the subject project. The quantity of pipe required for this project represents a very small percentage of our overall production capacity. ASWP will be able to meet the pipe shipment requirements of the installing contractor for the subject project so that the contractor can meet the contract time.

Please see the attached list of similar projects manufactured and successfully installed and in operation for the last 5 years.

Attached to this letter is our quality assurance manual as requested.

Please let me know if you need additional information.

Sincerely,

Clayton Simons
Territory Manager
American SpiralWeld Pipe Company, LLC

4. FLORIDA BID BOND

Failure to fully complete this form SHALL result in the Bidder being deemed NONRESPONSIVE.

KNOW ALL MEN BY THESE PRESENTS:

That the "Bidder", JDS Inc., a corporation X, individual ____, partnership ____, of the state of Florida, qualified to do business in this State, as Principal, and the "Surety", Harco National Insurance Company, a corporation of the state of IL, authorized to do business as a surety in this State, as Surety, are hereby held and firmly bound unto the Tampa Bay Water as Obligees, in the sum of Five Percent of Amount Bid ____ Dollars ($5%), lawful money of the United States of America, which represents five percent (5%) of the sum of Bidder's proposed total contract price, for the payment of which Bidder and the Surety hereby bind ourselves, our respective heirs, successors, legal representatives and assigns, jointly, and severally, firmly by these presents.

WHEREAS, Bidder has submitted to Tampa Bay Water, its Bid to which this Bond is attached, to enter into the Contract with Tampa Bay Water for the Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, Project No.: 07153, Contract #2026017, covered by the Contract documents prepared by Tampa Bay Water and the Engineer, which Contract documents are incorporated herein by this reference:

NOW, THEREFORE: THE CONDITION OF THIS OBLIGATION IS THAT, Bidder and Surety are jointly and severally bound by all of the provisions of this Bid Bond, and if Bidder faithfully performs and fulfills all the understandings, covenants, terms, conditions and requirements of this ITB (including addenda issued before the date of the opening of the Bid) within the time specified or any extension thereof, with or without notice to the Surety, or if Bidder fails to comply with all requirements of this ITB within the time specified or any extension thereof, with or without notice to the Surety, but pays Tampa Bay Water the full amount of the sum set forth in this Bid Bond as liquidated damages, then this obligation shall be null and void, otherwise to remain in full force and effect.

A. If Tampa Bay Water makes demand on the Surety to perform in accordance with the Surety's obligations under this Bond, then the full amount of the Bid Bond shall be immediately due and payable to Tampa Bay Water, and the Surety shall pay that sum without delay. Additionally, the Surety shall reimburse Tampa Bay Water for all costs of collection (including but not limited to attorney's fees).

B. The Surety, for value received, stipulates and agrees that the obligations of the Surety and this Bid Bond shall be in no way impaired or affected by any extension of the time within which Tampa Bay Water may accept the Bid, and the Surety does, by this Bid Bond, waive notice of any such extension.

C. The term this "State" means the State of Florida. Other defined terms (i.e., capitalized terms) used in this Bid Bond have the intent and meanings assigned to them in the General Conditions of the Contract documents, Definitions.

IMPORTANT: Sureties executing this Bid Bond shall be currently authorized to do business in the State of Florida as surety and, except as otherwise provided by the Florida Statutes, be on the U.S. Department of the Treasury Financial Management Service list of approved bonding companies. Bonds cannot be in excess of the amount indicated as approved by that list.

KNOW ALL MEN BY THESE PRESENTS: That **HARCO NATIONAL INSURANCE COMPANY**, a corporation organized and existing under the laws of the State of Illinois, and **INTERNATIONAL FIDELITY INSURANCE COMPANY**, a corporation organized and existing under the laws of the State of New Jersey, and having their principal offices located respectively in the cities of Rolling Meadows, Illinois and Newark, New Jersey, do hereby constitute and appoint

William Reidinger

their true and lawful attorney(s)-in-fact to execute, seal and deliver for and on its behalf as surety, any and all bonds and undertakings, contracts of indemnity and other writings obligatory in the nature thereof, which are or may be allowed, required or permitted by law, statute, rule, regulation, contract or otherwise, including but not limited to Proposal Bonds and Consents of Surety, and the execution of such instrument(s) in pursuance of these presents, shall be as binding upon the said **HARCO NATIONAL INSURANCE COMPANY** and **INTERNATIONAL FIDELITY INSURANCE COMPANY**, as fully and amply, to all intents and purposes, as if the same had been duly executed and acknowledged by their regularly elected officers at their principal offices.

This Power of Attorney is executed, and may be revoked, pursuant to and by authority of the By-Laws of **HARCO NATIONAL INSURANCE COMPANY** and **INTERNATIONAL FIDELITY INSURANCE COMPANY** and is granted under and by authority of the following resolution adopted by the Board of Directors of **INTERNATIONAL FIDELITY INSURANCE COMPANY** at a meeting duly held on the 3rd day of June 2025 and by the Board of Directors of **HARCO NATIONAL INSURANCE COMPANY** at a meeting held on the 3rd day of June 2025.

"**RESOLVED**, that (1) the Chief Executive Officer, President, Executive Vice President, Senior Vice President, Vice President, or Secretary of the Corporation shall have the power to appoint, and to revoke the appointments of, Attorneys-in-Fact or agents with power and authority as defined or limited in their respective powers of attorney, and to execute on behalf of the Corporation and affix the Corporation's seal thereto, bonds, undertakings, recognizances, contracts of indemnity and other written obligations in the nature thereof or related thereto; and (2) any such Officers of the Corporation may appoint and revoke the appointments of joint-control custodians, agents for acceptance of process, and Attorneys-in-fact with authority to execute waivers and consents on behalf of the Corporation; and (3) the signature of any such Officer of the Corporation and the Corporation's seal may be affixed by facsimile to any power of attorney or certification given for the execution of any bond, undertaking, recognizance, contract of indemnity or other written obligation in the nature thereof or related thereto, including but not limited to Proposal Bonds and Consents of Surety, such signature and seals when so used whether heretofore or hereafter, being hereby adopted by the Corporation as the original signature of such officer and the original seal of the Corporation, to be valid and binding upon the Corporation with the same force and effect as though manually affixed."

IN WITNESS WHEREOF, **HARCO NATIONAL INSURANCE COMPANY** and **INTERNATIONAL FIDELITY INSURANCE COMPANY** have each executed and attested these presents on this 17th day of March, 2026

6. CONTRACTOR AFFIDAVIT

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

STATE OF Georgia
COUNTY OF Barrow

BEFORE ME, the undersigned authority, appeared Eric Malvin, who first being duly sworn hereby swears or affirms as follows:

1. I make this affidavit on personal knowledge.
2. I am over the age of 18 years and otherwise confident to make this Affidavit.
3. I am the Vice President - FL of JDS Inc. (the "Contractor").
4. I am authorized by JDS Inc. to make this Affidavit on behalf of Contractor.

E-Verify

1. Contractor acknowledges that Section 448.09, Florida Statutes, makes it unlawful for any person to knowingly employ, hire, recruit, or refer, for private or public employment, an alien who is not duly authorized to work in the United States.
2. Contractor acknowledges that Section 448.095, Florida Statutes, prohibits public employers, contractors, and subcontractors from entering into a contract unless each party to the contract registers and uses E-Verify.
3. Contractor is in compliance with the requirements of Sections 448.09 and 448.095, Florida Statutes.
4. Contractor understands it shall remain in compliance with the requirements of Sections 448.09 and 448.095, Florida Statutes, during the term of any contract with Tampa Bay Water.
5. Contractor's subcontractors are in compliance with the requirements of Sections 448.09 and 448.095, Florida Statutes.
6. Contractor shall ensure compliance with the requirements of Sections 448.09 and 449.095, Florida Statutes, by any and all of its subcontractors.
7. Neither the Contractor, nor any subcontractor of Contractor, has had a contract terminated by a public employer for violating Section 448.095, Florida Statutes, within the year preceding the date of this Affidavit.
8. If the Contractor or any subcontractor of Contractor has a contract terminated by a public employer for any such violation during the term of any contract with Tampa Bay Water, it shall provide immediate notice thereof to Tampa Bay Water.

Anti-Human Trafficking

In accordance with Section 787.06(13), Florida Statues, the undersigned, on behalf of the entity listed below ("Entity"), hereby attests under penalty of perjury that Entity does not use coercion for labor or services as defined in Section 787.06, Florida Statutes, entitled "Human Trafficking".

Scrutinized Companies

A. Pursuant to Subsections 287.133(2) and (3), Florida Statutes, Respondent acknowledges that a person or affiliate who has been placed on the convicted vendor list following a conviction for a public entity crime may not submit a proposal on a Contract provide any goods or services to a public entity, may not submit a Proposal on a Contract with a public entity for the construction or repair of a public building or public work, may not submit Proposals on leases of real property to a public entity, may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a Contract with any public entity, and may not transact business with any public entity in excess of the threshold amount provided in Section 287.017 Florida Statutes, for CATEGORY TWO for a period of 36 months from the date of being placed on the convicted vendor list.

B. Pursuant to Subsection 287.134(2)(a), Florida Statutes, Respondent acknowledges that an entity or affiliate who has been placed on the discriminatory vendor list may not submit a bid, proposal, or reply on a contract to provide any goods or services to a public entity; may not submit a bid, proposal, or reply on a contract with a public entity for the construction or repair of public building or public work; may not submit bids, proposals, or replies on leases of real property to a public entity; may not be awarded or perform work as a contractor, supplier, subcontractor, or consultant under a contract with any public entity; an may not transact business with any public entity.

C. Pursuant to Section 287.135, Florida Statutes, Respondent acknowledges that a company that has been placed on the Scrutinized Companies with Activities in Sudan List; the Scrutinized Companies with Activities in the Iran Petroleum Energy Section List; or the Scrutinized Companies that Boycott Israel List or a company that engages in a boycott of Israel, is ineligible and may not submit a bid, proposal, or enter into or renew a contract with an Agency for goods or services of $1 million or more. At the time of submission of a proposal for a contract or contract renewal for goods or services of $1 million or more, the company must certify that it is not on either such List and further that it does not have business operations in Cuba or Syria as required by Section 287.135(5), Florida Statutes.

D. Pursuant to Section 287.135, Florida Statutes, Respondent acknowledges that Tampa Bay Water has the option to terminate any contract for goods or services of $1 million or more if the awarded company is found to have submitted a false certification as provided under Section 287.135(5), been placed on the Scrutinized Companies with Activities in Sudan List or the Scrutinized Companies with Activities in the Iran Petroleum Energy Sector List, or been engaged in Business operations in Cuba or Syria.

E. Pursuant to Section 287.135, Florida Statutes, Respondent acknowledges that Tampa Bay Water has the option to terminate any contract for good or services of any amount if the awarded company is found to have or been placed on the Scrutinized Companies that Boycott Israel List or is engaged in a boycott of Israel.

Foreign Countries of Concern

Pursuant to Section 287.138, Florida Statues, Tampa Bay Water may not enter into a contract with an entity that gives access to an individual's personal identifying information if the entity is owned, controlled or organized under the laws of a Foreign Country of Concern which includes the People's Republic of China, the Russian Federation, the Islamic Republic of Iran, the Democratic People's Republic of Korea, the Republic of Cuba, the Venezuelan regime of Nicolas Maduro, the Syrian Arab Republic, or any other entity or Agency under the significant control of such Foreign Country of Concern.

7. NON-COLLUSION AFFIDAVIT

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

Owner: Tampa Bay Water
Engineer: Wade Trim, Inc.
Project Name: Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict
Project No.: 07153

Affiant, Eric Malvin, being first duly sworn, deposes and says that:

Affiant is (Title) Vice President - FL of JDS Inc, ("Bidder"). Affiant has personal knowledge of the matters set forth in this Affidavit and is competent to testify about them.

Bidder has submitted to Tampa Bay Water, a Bid ("Bid") to construct the above referenced Project, also referred to in this Affidavit as the "Work".

This Non-Collusion Affidavit is executed by Affiant for inclusion with the submission to Tampa Bay Water of the Bid and may be relied upon by Tampa Bay Water in considering the Bid.

Affiant is fully informed about the preparation and contents of the Bid and of all pertinent circumstances surrounding the Bid; has not entered into any illegal contract, combination, conspiracy or other unlawful act; and the Bid is genuine and is not a collusive or sham Bid.

Neither Bidder nor any of its officers, partners, agents, representatives, employees or parties in interest, including this Affiant, have in any way entered or proposed to enter into any combination to prevent the making of any Bid, or to fix a price or prices (including any overhead, profit or other cost elements) for the Bid; or have made any Contract, or given or promised any consideration to induce any other person not to submit a Bid for the Work, or to submit a Bid at a specified price; or have secured or intended to secure through any Contract an unlawful advantage against Tampa Bay Water, or any other person interested in the Work.

The Bid is not intended to secure an unfair advantage or benefit from Tampa Bay Water or in favor of any person interested in the proposed Work.

The prices proposed are fair and proper and are not tainted by any collusion, conspiracy, connivance, or unlawful Contract on the part of Bidder or any other of its agents, representatives, owners, employees, or parties in interest, including this Affiant; and neither Bidder nor any of its officers, partners, owners agents, representatives, employees, or parties in interest, including this Affiant, have divulged information regarding the Bid or any data about the Bid to any other person.

8	Plug Valves	ARV	Dezurik	Ferguson Ent.
9	60" Butterfly	Valve	Dezurik	Ferguson Ent.
10	36" Butterfly	Valve	Dezurik	Ferguson Ent.

[Attach Additional Pages If Necessary]

11. SUBCONTRACTORS LIST

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

Bidder shall perform (with Bidder's own employees) not less than fifty-one percent (51%) of the labor (total contract price less the cost of materials for the Project). For all remaining work, list each Subcontractor to whom Bidder intends to award a sub-contract in excess of two percent (2%) of the Total Price on the Price Form. These Subcontractors, if acceptable to Tampa Bay Water, shall be awarded subcontracts for the portions of the Work identified in the list, in the event Bidder is awarded the Contract.

Work To Be Performed	Name/Address	Percent of Total Bid Price
Micro-Tunnel	Bradshaw Construction 175 West Liberty Rd. 410-970-8300	$2,978,000 Eldersburg, MD 21784
Pipe Welding	National Welding Inc 7025 Commerce Park Dr. Midvale, UT 84047 801-255-5959	$75,000

12. QUESTIONNAIRE

Failure to fully complete this form may result in the Bidder being deemed NONRESPONSIVE.

Owner: Tampa Bay Water
Engineer: Wade Trim, Inc.
Project Name: Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict
Project No.: 07153

The undersigned warrants that all statements and answers to questions hereinafter made are current, accurate, and complete as of the date indicated below.

Respond to the items below with sufficient information to show the Bidder has sufficient qualifications to perform the required Work. (See 3.2 Minimum Qualifications)

1. How many years has your organization been in business as a licensed general contractor under your present business name? 5+.
2. Attach to this Form a list of all contracts comparable to this project that your organization has performed during the last five years. For each contract listed, include the owner's contract number, contract title, brief project description, original Contract Price, final Contract Price, substantial completion date or percent complete (if not completed), and the name, address and phone number of an individual from the owner to which your organization may refer.
3. Are there any current federal, state, or local tax liens filed on your organization? ___Yes ✓No
   If yes, attach a list of all current tax liens and an explanation for each.
4. Has your organization failed to complete work awarded to it in the last five years? ____Yes ✓No
   If yes, attach an explanation, including description of the project, identification of the owner, contract award date, and reason work was not completed.
5. Has your organization ever had a contract terminated for default in the last five years? ___Yes ✓No
   If yes, attach an explanation, including description of the project, identification of the owner, contract termination date, and reason for each termination for default.
6. Has your organization ever had significant accidents or OSHA violations in the last five years? ___Yes ✓No
   If yes, attach a list of each significant accident or OSHA violation, including a description and date of each event, and an explanation for each.
7. Has any officer or partner of your organization ever been an officer or partner of another organization that failed to complete a construction project? no.
   If so, state name of individual, organization and reason therefore.
   n/a
8. Does your organization or its key personnel now hold valid certificates of competency or licenses for which a specific license is required? no.
   If so, attach copies of all licenses covering the Work under the Contract Documents together with the specific political jurisdiction issuing said licenses.
   Attachment _____, consisting of _____ pages.
9. Is your organization owned, controlled or organized under the law of a Foreign County of Concern as identified in Section 287.138, Florida Statutes? no

By: _____

4. FLORIDA BID BOND

Failure to fully complete this form SHALL result in the Bidder being deemed NONRESPONSIVE.

KNOW ALL MEN BY THESE PRESENTS:

That the "Bidder", JDS Inc., a corporation X, individual ____, partnership ____, of the state of Florida, qualified to do business in this State, as Principal, and the "Surety", Harco National Insurance Company, a corporation of the state of IL, authorized to do business as a surety in this State, as Surety, are hereby held and firmly bound unto the Tampa Bay Water as Obligees, in the sum of Five Percent of Amount Bid Dollars ($5%), lawful money of the United States of America, which represents five percent (5%) of the sum of Bidder's proposed total contract price, for the payment of which Bidder and the Surety hereby bind ourselves, our respective heirs, successors, legal representatives and assigns, jointly, and severally, firmly by these presents.

WHEREAS, Bidder has submitted to Tampa Bay Water, its Bid to which this Bond is attached, to enter into the Contract with Tampa Bay Water for the Cross Bar Ranch Wellfield Water Transmission Main-Utility Conflict, Project No.: 07153, Contract #2026017, covered by the Contract documents prepared by Tampa Bay Water and the Engineer, which Contract documents are incorporated herein by this reference:

NOW, THEREFORE: THE CONDITION OF THIS OBLIGATION IS THAT, Bidder and Surety are jointly and severally bound by all of the provisions of this Bid Bond, and if Bidder faithfully performs and fulfills all the understandings, covenants, terms, conditions and requirements of this ITB (including addenda issued before the date of the opening of the Bid) within the time specified or any extension thereof, with or without notice to the Surety, or if Bidder fails to comply with all requirements of this ITB within the time specified or any extension thereof, with or without notice to the Surety, but pays Tampa Bay Water the full amount of the sum set forth in this Bid Bond as liquidated damages, then this obligation shall be null and void, otherwise to remain in full force and effect.

A. If Tampa Bay Water makes demand on the Surety to perform in accordance with the Surety's obligations under this Bond, then the full amount of the Bid Bond shall be immediately due and payable to Tampa Bay Water, and the Surety shall pay that sum without delay. Additionally, the Surety shall reimburse Tampa Bay Water for all costs of collection (including but not limited to attorney's fees).

B. The Surety, for value received, stipulates and agrees that the obligations of the Surety and this Bid Bond shall be in no way impaired or affected by any extension of the time within which Tampa Bay Water may accept the Bid, and the Surety does, by this Bid Bond, waive notice of any such extension.

C. The term this "State" means the State of Florida. Other defined terms (i.e., capitalized terms) used in this Bid Bond have the intent and meanings assigned to them in the General Conditions of the Contract documents, Definitions.

IMPORTANT: Sureties executing this Bid Bond shall be currently authorized to do business in the State of Florida as surety and, except as otherwise provided by the Florida Statutes, be on the U.S. Department of the Treasury Financial Management Service list of approved bonding companies. Bonds cannot be in excess of the amount indicated as approved by that list.

Please Note: A licensee may only transact insurance with an active appointment by an eligible insurer or employer. If you are acting as a surplus lines agent, public adjuster, or reinsurance intermediary manager/broker, you should have an appointment recorded in your own name on file with the Department. If you are unsure of your license status you should contact the Florida Department of Financial Services immediately. This license will expire if more than 48 months elapse without an appointment for each class of insurance listed. If such expiration occurs, the individual will be required to re-qualify as a first-time applicant. If this license was obtained by passing a licensure examination offered by the Florida Department of Financial Services, the licensee is required to comply with continuing education requirements contained in 626.2815 or 648.385, Florida Statutes. A licensee may track their continuing education requirements completed or needed in their MyProfile account at https://dice.fldfs.com. To validate the accuracy of this license you may review the individual license record under "Licensee Search" on the Florida Department of Financial Services website at www.myfloridacfo.com/division/agents.

POWER OF ATTORNEY
HARCO NATIONAL INSURANCE COMPANY
INTERNATIONAL FIDELITY INSURANCE COMPANY
Member companies of IAT Insurance Group, Headquartered: 4200 Six Forks Rd, Suite 1400, Raleigh, NC 27609

Bond # Bid Bond

Principal JDS Inc.

Obligee Tampa Bay Water

KNOW ALL MEN BY THESE PRESENTS: That **HARCO NATIONAL INSURANCE COMPANY**, a corporation organized and existing under the laws of the State of Illinois, and **INTERNATIONAL FIDELITY INSURANCE COMPANY**, a corporation organized and existing under the laws of the State of New Jersey, and having their principal offices located respectively in the cities of Rolling Meadows, Illinois and Newark, New Jersey, do hereby constitute and appoint

William Reidinger

their true and lawful attorney(s)-in-fact to execute, seal and deliver for and on its behalf as surety, any and all bonds and undertakings, contracts of indemnity and other writings obligatory in the nature thereof, which are or may be allowed, required or permitted by law, statute, rule, regulation, contract or otherwise, including but not limited to Proposal Bonds and Consents of Surety, and the execution of such instrument(s) in pursuance of these presents, shall be as binding upon the said **HARCO NATIONAL INSURANCE COMPANY** and **INTERNATIONAL FIDELITY INSURANCE COMPANY**, as fully and amply, to all intents and purposes, as if the same had been duly executed and acknowledged by their regularly elected officers at their principal offices.

This Power of Attorney is executed, and may be revoked, pursuant to and by authority of the By-Laws of **HARCO NATIONAL INSURANCE COMPANY** and **INTERNATIONAL FIDELITY INSURANCE COMPANY** and is granted under and by authority of the following resolution adopted by the Board of Directors of **INTERNATIONAL FIDELITY INSURANCE COMPANY** at a meeting duly held on the 3rd day of June 2025 and by the Board of Directors of **HARCO NATIONAL INSURANCE COMPANY** at a meeting held on the 3rd day of June 2025.

"**RESOLVED**, that (1) the Chief Executive Officer, President, Executive Vice President, Senior Vice President, Vice President, or Secretary of the Corporation shall have the power to appoint, and to revoke the appointments of, Attorneys-in-Fact or agents with power and authority as defined or limited in their respective powers of attorney, and to execute on behalf of the Corporation and affix the Corporation's seal thereto, bonds, undertakings, recognizances, contracts of indemnity and other written obligations in the nature thereof or related thereto; and (2) any such Officers of the Corporation may appoint and revoke the appointments of joint-control custodians, agents for acceptance of process, and Attorneys-in-fact with authority to execute waivers and consents on behalf of the Corporation; and (3) the signature of any such Officer of the Corporation and the Corporation's seal may be affixed by facsimile to any power of attorney or certification given for the execution of any bond, undertaking, recognizance, contract of indemnity or other written obligation in the nature thereof or related thereto, including but not limited to Proposal Bonds and Consents of Surety, such signature and seals when so used whether heretofore or hereafter, being hereby adopted by the Corporation as the original signature of such officer and the original seal of the Corporation, to be valid and binding upon the Corporation with the same force and effect as though manually affixed."

IN WITNESS WHEREOF, **HARCO NATIONAL INSURANCE COMPANY** and **INTERNATIONAL FIDELITY INSURANCE COMPANY** have each executed and attested these presents on this 17th day of March, 2026

To Whom It May Concern:

This letter is to confirm that JDS Inc., together with its affiliated and related entities (collectively, "JDS"), completed the acquisition of one hundred percent (100%) of the issued and outstanding equity interests of Spectrum Underground, Inc. (the "Company" or "Spectrum") on February 23, 2026 (the "Acquisition").

Following the closing of the Acquisition, the Spectrum continues its operations as a wholly owned subsidiary of JDS. In connection with the Acquisition, all key employees of Spectrum have accepted employment with JDS and/or its JDS continues to support the ongoing business operations of the Company.

Steven J. Archer CEO/President

Harlan Sunquist, Jr. CEO/ President

Cross Bar Ranch Wellfield Transmission Main Utility Conflict Contract 2026-017

Agenda Item C.5

April 20, 2026

Danielle Keirsey, PMP
Senior Project Manager
Tampa Bay Water

Project Overview

- ~300 feet 60-inch diameter steel pipe via open cut
- ~170 feet 60-inch diameter steel pipe via microtunneling
- Valves (36-inch and 60-inch diameter)
- Cathodic Protection
- ~250 feet 60-inch diameter steel pipe to be removed

Recommendation

- Staff recommends Board approval of the of Contract 2026-017 with JDS Inc., dba JDS Pipe, Inc. in the amount of $6,169,901 inclusive of $246,000 for Owner's Allowance.

Questions?

TAMPA BAY WATER
Supplying Water To The Region

AGENDA ITEM D.1

DATE: April 6, 2026

TO: Board of Directors

FROM: Charles H. Carden, General Manager

SUBJECT: Member Government Report - City of St. Petersburg - *Presentation*

SUMMARY

City of St. Petersburg utility staff will provide a presentation on its water supply system and current topics of interest.

SUGGESTED ACTION

Receive Report.

COST/FUNDING SOURCE

N/A

DISCUSSION

Each member government utility is given the opportunity to present its current water operations and any other topics of interest on a rotational basis. A member of the City of St. Petersburg Utility staff will present on behalf of the city.

D.1 Member Government Update - City of St. Petersburg

ST. PETERSBURG WATER RESOUCES DEPARTMENT

TAMPA BAY WATER BOARD MEETING

April 20, 2026

John E. Palenchar, Director

TAMPA BAY WATER
Supplying Water To The Region

AGENDA ITEM F.1

DATE: April 3, 2026

TO: Board of Directors

THRU: Charles H. Carden, General Manager

FROM: Division Officers and Directors

SUBJECT: Agency Division Activity Reports for February and March 2026 - *Receive Report*

SUMMARY

The following is an update on current activities for each Tampa Bay Water Division for the months of February and March 2026.

SUGGESTED ACTION

Receive and File.

COST/FUNDING SOURCE

N/A

DISCUSSION

The following is an update on current activities for each Tampa Bay Water Division for the months of February and March 2026.

Business Strategies Division

The Business Strategies Division manages relationships that are critical to the agency's success including with staff, elected officials, member governments, stakeholders and the public. The division oversees the agency's board services, continuous improvement, human resources, legislative affairs, public engagement, safety services and strategic planning functions.

Continuous Improvement Department

The Continuous Improvement Department is responsible for establishing and implementing continuous improvement programs and projects for the agency and ensuring the safety and security of the agency's employees and assets.

Continuous Improvement

- Convened eleven cross-functional working group sessions to assess corrective and preventive actions, recommend efficiencies, and document improvements to strengthen agency-wide operations.
- Conducted review of the current Strategic Plan for updates or changes to maintain alignment of priorities, resources, and outcomes with the agency’s mission and vision.
- Completed developing a Strategic Asset Management Plan.
- Completed the first draft of the agency’s next five-year Strategic Plan.
- Met with K2i Team to discuss various solutions to common regional challenges.

Business Process Improvement

- Conducted three process mapping sessions to aid agency departments in the creation of controlled documents and process maps.
- Expanded the PowerDMS document library with 35 newly published documents while initiating an effort to consolidate related materials into department-specific manuals to improve usability and reduce overall document volume.
- Developed a formal knowledge-retention interview process for departing staff and partnered with Human Resources to strengthen and standardize the offboarding process, helping preserve institutional knowledge and continuity.

Emergency Management

- Participated in the Hillsborough Regional Kickoff Meeting to strengthen coordination and collaboration with regional partners.
- Attended a Disaster and Resilience Conference to remain current on emerging technologies, best practices, and advancements in emergency preparedness.
- Enhanced the Everbridge platform by standardizing scribe guides and expanding training resources, while deploying the Everbridge 360 Mobile interface with custom forms to streamline in-field reporting and improve the consistency, quality, and usability of submitted information.

Human Resources Department

The Human Resources Department is responsible for establishing and administering human resources policies and procedures in accordance with federal, state and local laws and requirements, under the oversight and approval by the agency's general manager and board of directors. In addition, Human Resources is responsible for employee recruitment and retention, benefits administration, employee relations, training and development, employee compensation, workers compensation and oversight of the Employee Appreciation Team.

- Human Resource Administration: Began the Pay and Class Study - provided documentation and scheduled manager meetings with Cody and Associates. Researched new process for FMLA, ADA and workplace investigations.
- Benefits: Reviewed current benefit data in preparation for insurance renewals.
- Employee Appreciation: Held annual Chili Cookoff and Employee Appreciation Day events.
- Recruitment and Hiring: Recruited for Data Analytic Co-Op, Public Communication Co-Op, Demand Management Co-op, Engineering Co-OP, Electricians (2), Executive Administrative Strategist, Mechanical Tech, Water Plant Operator Trainee, Water Quality Scientist. Hired Mechanical Technician, Executive Administrative Strategist, Water Plant Operator Trainee,
- Training and Development: Held bi-monthly Leadership Team Meeting and provided training; Arranged Safety Training through Florida Safety Council; Reviewed annual employee survey for areas of improvement.

Grant Funding and Government Affairs Department

Grant Funding and Government Affairs develops strategic initiatives to advocate for the agency and its members and is responsible for developing and implementing strategic positions and priorities for the Agency’s legislative, grant funding and regulatory policy initiatives.

- Attended the quarterly TBRPC Agency on Bay and Coastal Management meeting on behalf of Tampa Bay Water.
- Participated in Hillsborough Commissioner Chris Boles' Community Town Hall, to bring awareness to members of the community about Tampa Bay Water, the South Hillsborough Pipeline, and water conservation.
- Hosted Congresswoman Luna’s District Director to provide a Tampa Bay Water security briefing.
- Monitored committee meetings and reviewed newly filed legislation for potential implications for Tampa Bay Water.
- Coordinated with federal consultants to advance Tampa Bay Water’s federal advocacy priorities, including monitoring developments related to the Water Resources Development Act and federal appropriations.
- Coordinated with Jones Walker Consultants and relative Congressional delegates to identify community project request sponsors for ongoing CIP priority projects.

Public Communications Department

The Public Communication Department builds and maintains the agency reputation through various communications tools and methods; provides education, information and outreach on agency projects, programs and policies to stakeholders; and develops and implements critical water supply plans.

Project Public Engagement

Tampa Bay Water includes public outreach and public engagement in each agency project – from conception to completion. The agency has several on-going projects through the renewal & replacement program, capital improvement program and Long-term Master Water Plan.

- **South Hillsborough Pipeline** – Public information and outreach on this project can be found in the South Hillsborough Pipeline Status Report.
- **Long-term Master Water Plan Feasibility Studies** – For the Eastern Pasco Wellfield Feasibility Study, the project team responded to resident inquiries via the project hotline and email address. A letter was finalized and is ready for distribution to residents within the project area informing them of a future aquifer performance test. The project team conducted an internal workshop on February 17, 2026, to review current project status. For the Tampa Bay Seawater Desalination Plant Expansion, the project team submitted the final draft of the project fact sheet to Tampa Bay Water for review and approval. For the Consolidated Water Use Permit, there was no activity.

Public Communications, Outreach and Education

Public Communications, Outreach and Education develop and execute strategic communications programs that support and promote agency projects, policies and initiatives, and build and maintain relationships with agency stakeholders.

- Hosted 18 facility tours for 197 guests and staff at the Tampa Bay Water Desalination Plant, Regional Reservoir, and Surface Water Treatment Plant.
- Marketing and Document Creation - Completed the 2025 Water Quality Report and posted it to the website; Prepared marketing materials and made website updates for the 2026 Tampa Bay Community Water Wise Awards program application period.
- Events: Supported CIP Open House events with the Planning and Projects team; Coordinated and hosted the Surface Water Treatment Plant Expansion Groundbreaking; Exhibited at the St. Pete Science Festival; Judged entries at the Pasco County Schools Science Fair; Visited Pasco County Schools District Environmental Education Program locations for signage opportunities; Attended the Keep Pinellas Beautiful Awards Luncheon.
- Media: Participated in a live local TV News segment for the Tampa Bay Water Wise rebate program; Coordinated and participated in two live local TV News segment for the Tampa Bay Water Wise rebate program; Coordinated a press conference on Tampa Bay Water's stage three drought alert; Coordinated and participated in two live national TV segments regarding Tampa Bay's drought.
- Created and distributed social media content for current drought conditions and conservation,

World Water Day, Fix a Leak Week, South Hillsborough Pipeline construction methods, the Surface Water Treatment Plant Expansion Groundbreaking, World Wetlands Day, the South Hillsborough Pipeline project, Community Water Wise Awards winners, water conservation, St. Pete Science Festival, Tampa Bay Water's engineering open house, and other content.

Safety Services Department

Safety Services is responsible for the agency Safety and Security programs.

- Completed 218 site inspections.
- Visited TECO site for safety and security overview.
- Completed a Quarterly Business Review with vendor Convergint, including IT.
- Introduced the concept of "Tailgate Talks" to the Agency.
- Completed two vehicle incident investigations.
- Completed the Annual Sling/Strap/Lift Equipment inspection for the Agency (First time in-house).
- Introduced the re-vamp of the Near Miss program.
- Introduced the concept of Departments holding a "Safety Moment" at their meetings.

Planning and Projects Division

The Planning and Projects Division is responsible for the delivery of the Agency's Capital Improvements Program including, design, permitting, and construction of capital projects. Additionally, the Division is responsible for engineering evaluations, surveying, utility conflict management, and real estate management and acquisition.

Division staff continues to work in the following critical projects/programs. Projects and Programs detailed reports are included in the project specific status reports in this agenda.

- Surface Water Treatment Plant Expansion (Project 01014)
- South Hillsborough Pipeline (Projects 01610/01616)
- Long-term Master Water Plan Feasibility Program and Developmental Alternative (Projects 11020/11021/112022/11025)

Construction

Construction administers capital projects construction contracts to be following the design, permitting, regulatory requirements, property rights, budget, schedule, and all related agreements.

- Eldridge–Wilde Wellfield Improvements (Project No. 50016): Pumps and motors have been installed for all seven Group 2 wells. Disinfection and flushing activities are complete, and bacteriological sampling is underway to confirm compliance.
- Lake Bridge Water Treatment Plant – Pump No. 4 (Project No. 07542): Submittals for the new pump, motor, and variable frequency drive are currently under review.
- Cypress Creek Water Treatment Plant – Chemical Piping Replacement (Project No. 50051):

Installation of new chemical piping, storage tanks, and feed pumps has been completed for sodium hypochlorite and caustic. Work has begun on the chemical piping and feed pumps for the third and final chemical, ammonia.

- Surface Water Treatment Plant – Renewal and Replacement Program (Project No. 50075): Construction is complete. The project is scheduled for closeout at the May 2026 Board meeting.
- Cosme Water Treatment Plant – Yard Piping Improvements (Project No. 07131): Construction is complete. The project is scheduled for closeout at the April 2026 Board meeting.
- Tampa Bay Desalination Facility – VFD Replacement (Project No. 50055)
  Installation of new power cells has been completed for three additional VFDs. Ten of the twelve VFDs are now complete, with the remaining two scheduled for completion in August 2026.

Engineering

Engineering conducts limited in-house design; provides capital projects project management services in as-needed basis; conducts engineering studies and assessments; manage Agency design standards and specifications; ensure that all capital projects meet Agency's engineering standards and specifications; and provides quality review of capital projects design completed by outsourced services.

- High Service Pump Station VFDs (Project No. 50070): Action items resulting from the VFD vendor workshop held back in February are ongoing. The Consultant is drafting reference questionnaires to multiple medium-voltage VFD owners. Instrumentation and Control (I&C) coordination meetings are also being planned.
- Cypress Creek Generators Study (Project No. 50037): The final report was submitted to Tampa Bay Water for review.
- Arc Flash Program – Standard Operating Procedure (SOP): A Standard Operating Procedure (SOP) was developed for arc flash calculations, studies, mitigation measures, and equipment labeling. Final deliverables are expected in May 2026, after which the project will be closed out.
- Cathodic Protection Systems Program (Project No. 11018): The Cathodic Protection (CP) Systems Program is designed to assess the condition of critical facilities and pipelines and to repair CP equipment, infrastructure, and associated components. Monitoring reports are completed annually on half of the CP Systems, with the remaining half assessed the following year. This approach provides a full system assessment over a two-year cycle. The 2025 monitoring and survey report identified required repairs and recommended improvements. Most repairs were completed in fall 2025 and again during February and March 2026. The next round of CP assessments is scheduled for April and May 2026.
- Morris Bridge Wellfield Improvements (Project No. 50021): Coordination with Hillsborough County Flatwoods Park staff continues, including periodic project updates to ranger staff. The project was advertised in November 2025, with bids received on February 18, 2026. A pre-bid meeting was held on December 17, 2025. Construction bid approval is anticipated at the April 2026 Board meeting.
- Source Water Quality and Business Case Evaluation (Project No. 11026): A project kick-off meeting was held on November 4, 2025. A data-gathering plan and report list were developed, and data is being retrieved from DataMart. The project team is reviewing data requests,

researching and pulling reports, and supplying information for the evaluation. The next step includes conducting internal Tampa Bay Water staff interviews and hosting a group workshop to clarify data and findings.

- 045 System Hydraulic and Emergency Scenario Analysis Report (Project No. 11023)
  The final report is currently under Quality Control review. Submittal of the final report to the Board is tentatively anticipated for the May 2026 Board Meeting.

Project Management

The Project Management Department manages and implements the update of the Agency's Capital Improvements Program, the Long-term Master Water Plan, and the Energy Management Program and other Agency critical plans and reports and provides capital projects project management services. They also are responsible for the development of all processes and procedures for effective project management following project management best practices.

- FY 2027–2036 Capital Improvements Program: The Capital Improvements Program (CIP) Plan update is ongoing. New projects have been identified, with statements of work, cost estimates, and schedules developed. A prioritization workshop was held to score and rank projects and project cash flows have been completed. The draft updated CIP Plan will be included in the April 2026 Board Budget Workshop.
- Cypress Creek Water Treatment Plant – 72 Inch Valve (Project No. 50073): The Consultant has completed the 90% design. Guaranteed Maximum Price (GMP) Proposal No. 1 for early material procurement was approved by the Board of Directors at the January meeting.
- Cypress Creek Wellfield Improvements (Project No. 01602): Tampa Bay Water requested a change order to the engineering consultant to include standby generators in the Basis of Design Report, based on findings from the Cypress Creek Generator Study (Project No. 50037). Following approval of this change order, the design consultant is advancing toward completion of the 30% design and the updated Basis of Design Report in late April 2026.
- Tampa Bay Desalination Facility – Reverse Osmosis Trains (Project No. 01622): A change order to the Operations, Maintenance, and Management (OM&M) contract with U.S. Water–Acciona is being negotiated for the construction of Reverse Osmosis Racks 6 and 7. This change order will be presented to the Board for approval at the May 2026 meeting.
- Cosme Collection Main – Utility Conflict (Project No. 06914): The 60% design is currently under review by Hillsborough County. An initial agreement has been reached to enter into a Joint Project Agreement (JPA) with Hillsborough County, allowing the project to be constructed concurrently with the County's Walker Middle School Circulation Improvement Project.
- Cypress Creek Wellfield Surface Water Improvements – Phase 3 (Project No. 09108): A task order has been negotiated with an as needed civil contractor to complete construction activities under this project. The task request will be presented at the April 2026 Board meeting for approval.
- Tampa Bypass Canal (MLK) Pumps (Project No. 07070): This project has entered the planning phase. The project team is reviewing and finalizing the Statement of Work prior to negotiating scope and fee with an as needed contractor to perform the routine maintenance activities

identified for this project.

- Cross Bar Ranch Wellfield Water Transmission Main – Utility Conflict (Project No. 07153): The construction contract was advertised in January 2026, and five bids were received on March 17, 2026. A recommendation to award to the lowest responsive bidder, JDS Pipe, Inc., will be presented at the April 2026 Board Meeting for approval. Coordination with the Florida Department of Transportation is ongoing.
- Cypress Creek Pump Station Repump Improvements (Project No. 07544): Staff are confirming the project scope and will proceed with negotiating a scope and fee for professional engineering services with an as needed consultant.
- Surface Water Treatment Plant Water Quality Pilot Study (Project No. 03511): The project is currently in the Professional Services Selection phase. The team is working with Veolia Water North America Operating Services, LLC to develop the project design proposal, which is planned for presentation at the April 2026 Board meeting for approval.
- Surface Water Treatment Plant – SCADA System Upgrades (Project No. 06912): The project has reached the 90% design milestone, and Value Engineering activities have been completed to identify construction cost reduction opportunities. The design consultant is finalizing the design and preparing the draft Guaranteed Maximum Price (GMP) for the upcoming construction phase.
- BUD Wells 5 and 7 – Water Quality Treatment Improvements (Projects No. 03505 and 03512): This project is in the Professional Services Selection phase. Procurement documents have been provided to Purchasing, with a planned Request for Proposals (RFP) release date of April 28, 2026. Final scope development and RFP issuance are contingent upon Board direction regarding water quality projects at the April 2026 Board meeting.

Real Estate

Real Estate is responsible for the negotiation and acquisition of property rights for capital projects and supports other departments by verifying that property rights under existing agreements allow proposed projects and other activities. Additionally, it manages existing lease and license agreements, property address changes, verifies taxes due or exemption status annually, and disposes of surplus property.

- South Hillsborough Pipeline (Projects No. 01610 / 01616): A detailed report of activities is included in the South Hillsborough Program and Property Acquisition agenda items.
- South Hillsborough Wellfield (Project No. 01612): A detailed report of activities is included in the South Hillsborough Program agenda item.
- Cypress Creek Wellfield Improvements (Project No. 01602): The District has granted Tampa Bay Water permission to access District property under the existing license agreement. This authorization applies to all Tampa Bay Water employees, consultants, contractors, and the U.S. Army Corps of Engineers performing work associated with this project.
- Parsons Professional Park – Lots 10 and 11: Lots 10 and 11 have been offered to Hillsborough County for acquisition. If the County declines, the lots will be offered for sale to the general public through advertisement. No responses were received from letters sent via certified mail to abutting property owners more than 30 days ago.
- Brandon Urban Dispersed No. 7: Discussions are ongoing with the property owner adjacent to

BUD 7 regarding acquisition of property in fee, or alternatively, the granting of an easement along Tampa Bay Water's driveway to provide additional truck turnaround space. Tampa Bay Water submitted a backup offer through the listing agent to purchase the property in fee after the initial contract did not close as scheduled on April 1, 2026.

- Starkey Wellfield: The District has confirmed it will begin drafting a formal Management Agreement to replace the current License Agreement. The new agreement will address responsibilities for maintenance and engineering reporting related to the wooden access bridge.

Surveying

Surveying manages the utility conflicts and cathodic protection programs; manages and conducts surveys; manages and maintain record drawings; and maintain and develop computer-aided design (CAD) and geospatial data for the Agency. They also assist with engineering, construction, real estate, and geographic information systems (GIS) activities.

- Cypress Creek Transmission Main – Review and Impacts: Multiple utility conflicts along the Cypress Creek Transmission Main corridor have been reviewed. Tasks and schedules are being developed for multiple phases of additional surveying needed to address identified impacts. Efforts are also underway to inventory above ground pipeline appurtenances and verify their locations.
- Cypress Bridge Transmission Main: The contractor continues locating infrastructure between the Cypress Creek Pump Station and Cypress Bridge Well No. 2, with approximately 70% of the infrastructure located to date. Additional efforts have begun to consolidate Cypress Bridge Transmission Main Contract B CAD record drawings. Ongoing updates to the Contract A CAD as built drawings for the pipeline and appurtenances will reflect and reference ongoing field verification efforts.
- Starkey Collection Main: The contractor has completed utility locating and surveying efforts along DeCubellis Road in Pasco County. Final survey documents have been completed and delivered. This work supports identification of Tampa Bay Water's underground pipelines and above ground appurtenances in advance of a planned roadway widening project.
- Section 21 Wellfield: A scope of work has been prepared to locate above ground and underground infrastructure along Van Dyke Road in support of a potential sidewalk installation project. Contractors are currently clearing vegetation within the project limits to reduce overall scope and survey costs.
- Desalination Transmission Main: A contractor is locating a segment of the Desalination Transmission Main at the intersection of 78th Street in preparation for proposed roadway modifications and additional utility installations.

Finance and Administration Division

The Finance and Administration Division is responsible for finances, procurement, inventory, risk and vital records. Departments include Finance, Purchasing and Warehouse and Records.

Finance

Finance manages the budget, payroll, account payables and receivables, capital assets, cash and investments, debt management and financial compliance for the Agency. They also assist with the training and maintenance of the accounting software, Munis.

- Four Finance staff members participated in training at the Munis Conference.
- Met with staff from member governments to review and address questions regarding the proposed Fiscal Year 2027 budget.
- Completed the Fiscal Year 2025 Popular Annual Financial Report (PAFR).

Purchasing and Warehouse

Purchasing issues, processes and administers the appropriate solicitations and ensures that all procurement activities are conducted in compliance with statutes, policies and provides best value solutions for the Agency. They also are responsible for the management and accountability of the agency's warehouse and inventory items.

- Purchasing & Warehouse Manager and one Purchasing Specialist II attended the 2026 NIGP Leadership Summit.
- Purchasing & Warehouse Manager and three purchasing staff participated in the 2026 CIP Project Open House for engineering firms, answering inquiries and leading training sessions on how to conduct business with Tampa Bay Water
- Purchasing & Warehouse Manager was voted 2026 Manager of the Year by the Tampa Bay Area Chapter of NIGP
- Purchasing Specialist II was voted 2026 Buyer of the Year by the Tampa Bay Area Chapter of NIGP
- Purchasing & Warehouse Manager attended the Tampa Bay Water 5-year Strategic Plan Alignment meeting
- Four purchasing staff attended the Tampa Bay Area Chapter of NIGP Spring Symposium, hosted and organized by one of the agency's Purchasing Specialist II

Administrative Services

Management of board services, including overseeing the monthly board agenda process, legal liaison services that include coordinating activities between staff and general counsel, and management of the agency liability insurance and records programs.

- Met with insurance team to discuss changes to flood zone map and potential for additional coverage. Begin review of additional facilities to determine eligibility.
- Completed renewal for aircraft (drone) coverage.
- Conducted annual insurance tour of RWTP and Land O' Lakes with STARR to evaluate property risks and changes for upcoming renewals.

Information Technology Division

The Information Technology (IT) department supports Tampa Bay Water's computer, communications, and data systems. IT staff design, build, support, manage, procure, and maintain various technology systems to ensure the ability for staff to accomplish their key objectives and optimize productivity. The group is responsible for the management and security of the Agency's data, electronic information, and network systems. The department is composed of three core cross-functional teams: Applications, Systems, and SCADA (Supervisory and Control and Data Acquisition).

Applications

The Applications team supports data and software systems built within various technologies. This includes development, maintenance, and procurement for custom applications, databases and flows, and third-party software including GIS systems.

- Long Term Demand Forecast System – Completed various software and data tasks in support of next execution of the forecast.
- Data Management Program – Kicked off the governance phase of the program, project plan completed.
- Integrated Hydrological Model – Completed additional enhancements supporting the ongoing migration from a structured to an unstructured grid.
- Chemical Ordering System – Launched development effort for automating chemical ordering. Completed architecture research and technical solution design and finalized planning.
- Financial System – Completed system improvements and modernization efforts to support implementation of automation features.
- OROP (Optimized Regional Operations Plan) - Completed report updates and data support activities.
- Completed SCADA to data warehouse data pipeline improvements including development and testing sub-daily data refresh capability.

Systems

The Systems team manages Agency's enterprise technology infrastructure encompassing: PCs, computer peripherals, servers, networks, data centers, cloud environments, and telecommunication systems. The team also oversees cybersecurity systems, polices, risk assessments, and vulnerability scanning, including ongoing system patching and backups.

- The Enterprise Network Infrastructure Strategy:
    - Network Hardware Replacement activities continue, network hardware is being deployed to replace existing aged equipment in a phased manner.
    - Completed additional network architecture enhancements as per the project plan.
- Completed data communications upgrades at several locations to provide better performance of our physical security system (cameras and access controls.)
- Began project to assess and improve cellular and wireless network coverage at several key

locations.
- Began server operating system upgrade project, upgrading operating system across our server environment.
- Continued the migration of cellular data connections for field collection devices to a new account with public service pricing and features.
- Supported the replacement and decommissioning of the agency's multi-function printing devices.

SCADA

The SCADA (Supervisory and Control and Data Acquisition) system is a mission critical component of Tampa Bay Water managing and monitoring water production facilities both physically and wirelessly connected. The team is responsible for the ongoing development, maintenance, and security of the SCADA system, including managing dedicated hardware, software, networks, and telecommunications.

- Completed multiple modifications and enhancements to SCADA database and graphics at the request of Operations and Maintenance.
- Fulfilled multiple operational data requests (historical data, time series, flow data).
- Completed upgrades to network perimeter protection devices.
- Completed implementation of additional data replicator on corporate network for redundancy/testing
- Participated in cybersecurity assessment activities.
- Tested and verified backup communication pathways using wireless gateways.
- Completed data historian improvements and security changes.
- Participated in Industrial Control Systems (ICS) cybersecurity training and certification efforts.
- Continued design reviews for the CIP - 06912 SCADA System Upgrades Design Surface Water Treatment Plant SCADA Upgrade.
- Alarm Management Optimization Project: Continued application of alarm enhancements. The team is updating one site at time in close coordination with the Operations department.

Science Division

The Science Division provides water resource technical support for planning, operations, demand management, water quality and regulatory functions of the Agency and manages the Tampa Bay Water Wise conservation rebate program.

Systems Decision Support

Addresses the Agency's system-wide decision support needs on a multi-scale time horizon; designs, implements, and maintains water resources optimization tools, integrated hydrological models, risk and reliability analysis tools, water demand management and forecasting programs and models all in support of operational, annual budgeting and long-range planning needs; leads the Agency's effort in climate variability and climate change assessment and adaptation.

- Master Water Plan Modeling Support: Updated environmental weights and model constraints in the System Wide Reliability Evaluation model and completed multiple baseline condition scenarios with the Integrated Hydrologic Model for the groundwater project feasibility studies. Worked with project consultant to determine infrastructure sizing for the Lake Tarpon surface water feasibility study.
- Completed initial calibration of a regional system hydraulic model for part of the Tampa Bay Water regional system. Developed the ability to link OROP projections of demand and supply for upcoming weeks with the hydraulic model to analyze scenarios under different operational conditions; currently validating these codes.
- Staff prepared two technical sessions and presented agency technical work at the University of Florida Biennial Water Symposium.

Tampa Bay Water Wise

Tampa Bay Water Wise is the agency's water conservation rebate program. The goal is to save up to 3.8 million gallons of potable water per day by 2030 and cost-effectively defer the need for equivalent new water supplies.

- The Tampa Bay Water Wise program has saved 1,102,651 gallons per day from March 2020 through March 20, 2026. The majority of water savings come from multi-family retrofits of bathroom fixtures, and the remainder comes from indoor and outdoor measures implemented by homeowners and commercial properties.
- To achieve the high savings target for 2026, the program has enhanced some of the rebate offerings over the past few months. In addition to the increased toilet rebate adopted in 2025, the program has recently enhanced the commercial irrigation rebate offering to cover up to 50% of efficiency improvement projects. The Working Group is currently reviewing changes to the residential Sprinkler System rebate to increase the water saving opportunities for customers and contractors.

Permitting

The Water Use Permitting Department is responsible for the acquisition and renewal of, and compliance with, Agency Water Use Permits including implementation of the Domestic Well Mitigation Program and environmental/hydrologic/hydrobiologic monitoring. Work also includes monitoring and management of wetland impacts associated with construction and/or past operation of Agency facilities and infrastructure and management of lands owned by the Agency to maintain an appropriate natural habitat.

- Completing responses to District questions for the groundwater credit quantities to be acquired from four permits held by Land Reserve Inc. and Farmland Reserve, Inc. and transferred to our Balm Farm permit.
- Continued technical and project coordination support for the Consolidated Permit increase and East Pasco Wellfield feasibility projects for the Master Water Plan. Completed aquifer performance test data analysis at a Dade City location to collect additional data for the East Pasco

Wellfield feasibility study.

- Compiling and analyzing data for the annual compliance reports due July 1 for all Agency water use permits and completed environmental analyses for the biennial Optimized Regional Operations Plan compliance report.
- Reviewing data analysis and water budget models to evaluate augmentation levels at four lakes adjacent to the Cross Bar Ranch Wellfield as part of Water Use Permit renewal application documents.

Environmental/Hydrologic Monitoring

- Completed all permit-required environmental data collection.
- Completed bi-annual calibration of all agency rain gauges.

Water Quality Services

Water Quality Services is responsible for laboratory testing, water quality compliance reporting, source water assessment and protection, and water quality treatment support to operations.

Laboratory

- Completed analytical compliance sampling for monthly drinking water quality samples collected in February and March 2026 per Exhibit D and state/federal requirements.
- Completed analyses of samples collected for regional delivery system monthly performance monitoring, including analysis of supplemental parameters for operational studies and source water characterization.
- Laboratory Manager continued cross training a senior laboratory scientist on quality control functions and continued updating standard operating procedures.
- Laboratory Manager continued preparing staff for a third-party independent laboratory performance assessment. to maintain State analytical certifications. The assessment was performed on March 3-5, 2026. The Laboratory is working on action items identified in assessor's written report.
- Collected and analyzed third quarter PFAS compliance samples in February and March 2026 and continued preparation for conducting the annual water quality monitoring in April 2026 in accordance with state and federal requirements.

Source Water Assessment and Protection

- S::CAN and YSI advanced water quality instrumentation monitoring and maintenance continued at the Alafia River pump station intake and TBC lower and middle pool intakes. These data assist in source water selection and improve treatment efficiency at the Regional Surface Water Treatment Plant.
- Continued instrument data integration with the Aquarius Webportal platform to enhance useability by water production operators and water quality scientists and technicians.
- Continued providing source water quality support to Engineering Department consultant to

evaluate options for improving yield reliability of the Regional Surface Water Treatment Plant and surface water supplies under extreme water quality events and other conditions.

Water Quality Support

- Facilitated the Water Quality Working Group meetings with members on February 12, 2026 and March 12, 2026.
- The Carollo Engineers final technical memorandum report updating their Regional Water Quality Study (RWQS) concept designs, implementation plan recommendations based on PFAS bench-scale treatability studies and CIP-based cost projections for the RWQS implementation plan recommendations were presented to the Board on February 23, 2026.
- Completed a comparative review of analytical results from the agency's first, second and third PFAS quarterly compliance monitoring data with post-UCMR5/PFAS supplemental monthly analytical data that further support RWQS treatment recommendations.
- Continued evaluating alternative water treatment chemical equipment and real-time water quality monitoring technologies to optimize removal of total organic carbon and other parameters with existing treatment processes.
- The Water Research Foundation previously approved funding for a study of an ion exchange process for treatment of total organic carbon and PFAS. Staff worked with the Water Research Foundation to finalize contract terms. This project will be led by Carollo Engineers with active participation and co-funding by the City of Tampa and Tampa Bay Water. The findings of this study will directly benefit and inform ongoing RWQS work.

Water Production Division

The Water Production Division is responsible for the operation and maintenance of the agency's water production assets that provide drinking water to the members. Departments within the division include: Buildings & Grounds and Fleet Services, Maintenance Planning & Reliability, and Operations & Maintenance.

- Provided drinking water to meet member government demands in compliance with Exhibit D and Safe Drinking Water Act water quality standards.
- Provided support for the Surface Water Treatment Plant Expansion project and several other active CIP projects.

Buildings & Grounds and Fleet Services

The Buildings & Grounds and Fleet Services team is responsible for maintaining the primary physical plants of each facility, including HVAC systems, roadways, fire safety systems, and roofing and coating systems. The team also takes care of the acquisition and maintenance of fleet vehicles for the entire agency. Highlights from the Buildings, Grounds, and Fleet Services team include:

- Replaced the aging fluorescent Morris Bridge WTP Lighting in both electrical buildings and the

Analyzer building with LED lighting.
- Repaved the remaining 5 miles of the Reservoir Toe Road and the parking area. This completes the sequenced multi-year reservoir paving effort.
- Restriped and marked the parking lots at Cypress Creek, Lake Bridge, Morris Bridge, US 41 Booster, Regional, Lithia H2S Facility and BUD 5.
- Cleared trees and brush along one mile of Van Dyke Rd as part of a surveying effort supporting road widening in that area.
- Completed the Clearwater office second floor server room renovation effort.
- Cleared trees and brush in the Cypress Creek Facility north fence-line area and along the Cypress Creek Wellfield Roadways to allow better access.
- Painted all pumps and interior/exterior piping at US 41 Booster Station and the Pinellas County POC Piping at Keller.

Maintenance Planning & Reliability

The Maintenance Planning & Reliability team is responsible for overseeing the Agency's Asset Management System, including the MAXIMO software and the Renewal and Replacement Program. Highlights from the Maintenance Planning & Reliability team include:

- Asset tags - Installed at Maytum, Crossbar, and Cypress Creek.
- Asset tags – Added 39 new assets to Maximo and printed 39 assets tags in March.
- 3 jobplans modified in February and 34 jobplans modified in March.
- 1 PM modified in February and 1 PM modified in March.
- Wrote SOP's for process documentation.
- Testing Dynamic jobplans in Maximo.
- Attended Florida Maximo User Group Meeting – planner / scheduler training.

Operations & Maintenance

The Operations & Maintenance team is responsible for ensuring that the Agency's production assets are maintained and operated in a sustainable and resilient manner to fulfill the drinking water needs of the member governments. They provide continuous attention to the system, adjusting to changing conditions and in compliance with permit and environmental recovery constraints. Highlights from the Operations & Maintenance team include:

- The Surface Water Treatment Plant produced an average of 54.48 million gallons per day (mgd) during February and March 2026.
- The Seawater Desalination Facility produced an average of 12.18 mgd during February and 15.12 mgd during March 2026.
- As of the end of March 2026, the level in the regional reservoir is 104.33 feet, corresponding to 5.77 billion gallons of storage.
- Submitted the FY25 Comprehensive Annual Reservoir Report (CARR) to FDEP.
- Submitted the FY25 Annual Flow Meter Calibration Report to member government utility directors and SWFWMD.

- Submitted FY25 Tier II Facility Reports to USEPA.
- Completed the replacement of the Da/d flow control valves on the aeration system at the Reservoir.
- Completed the UPS replacement at the Maytum New Port Richey Water Treatment Plant.
- Completed the Sodium Hypochlorite bulk tank replacement at the Keller Hydrogen Sulfide Removal Facility.
- Completed the piping installation and disinfection process to allow a connection of the Cosme Transmission Main and South Pasco 42-in Transmission Main while St. Petersburg's Cosme Water Treatment Plant is offline for construction.
- Completed the installation of soft starts on six Cosme wells.
- Completed the conversion to Ammonium Sulfate at Lake Bridge and Bud-5 Water Treatment Plants.
- Completed the controller replacement for the Tampa Bypass Canal generator.
- Completed the isolation valve replacements for the Regional High Service Pump Station – Mixing Station pump.
- Completed five pump and motor repairs for various treatment facilities and wells.

TAMPA BAY WATER
Supplying Water To The Region

AGENDA ITEM F.2

DATE: April 6, 2026

TO: Board of Directors

FROM: Kelly M. Fernandez, General Counsel

SUBJECT: Legal Services Activity Report for February and March 2026 - *Receive Report*

SUMMARY

The General Counsel Activity Report summarizes the major activities and work effort of the General Counsel and provides an update on the status of ongoing litigation and any other matters being handled by Special Counsel.

SUGGESTED ACTION

Receive and File.

COST/FUNDING SOURCE

Uniform Rate

DISCUSSION

The General Counsel's Office provides legal services to the Board and agency staff and manages Special Counsel in their representation of Tampa Bay Water. During February and March 2026, the major activities and work effort for legal services included:

Board of Directors

- Attended the February regular Board meeting and advance briefings with Board members.

Facilities and Property

- Assisted with property acquisition and easement matters related to the South Hillsborough Pipeline project.
- Assisted staff with matters related to the South Hillsborough Wellfield.
- Continued working with staff on the disposition of surplus properties.
- Continued working on issues related to potential acceptance of donated parcel from Pinellas County.
- Attended groundbreaking event for Surface Water Treatment Plant expansion.

Contracts and Procurement

- Reviewed contracts and contract amendments for commodities, construction, grants, and professional services.
- Continued coordinating with staff on a review and update of procurement forms.
- Continued work with staff and consultants on various contractual matters related to next phases of Surface Water Treatment Plant Expansion and South Hillsborough Pipeline projects, and operations for the Surface Water Treatment Plant and Desalination Plant.

Coordination with Agency Management

- Participated in weekly meetings with the General Manager and Executive Team.
- Continued working with staff on point of connection and interconnect matters.
- Conferred with staff and reviewed various draft policies.
- Attended meeting with staff and Southwest Florida Water Management District on potential emergency order due to drought.
- Participated with staff in meetings with City of Tampa regarding surplus water agreement.

Legislative and Grant Funding

- Reviewed legislative reports and bills of interest.
- Attended legislative team meetings.

Litigation

Tampa Bay Water v. E.I. Dupont de Nemours and Company, et al.
Case No. 2:20-cv-1867 RMG, United States District Court for the District of South Carolina, Charleston Division

Counsel: Frazer PLC, Napoli Shkolnik, PLLC, Ventura Law, and Frank Charles Miranda, P.A.

Issue: Complaint for damages pertaining to PFAS and related compounds including counts for strict liability, failure to warn, design defect, negligence, private nuisance, public nuisance, and fraudulent

conveyance.

Status: Complaint filed May 14, 2020. Litigation sampling performed and results posted to agency website in April 2023. Submitted agency's supplemental response to fact sheet in August 2023. Judge Gergel issued a Final Approval Order and Judgment for the DuPont settlement on February 26, 2024. On March 29, 2024, a Final Approval Order and Judgment for the 3M settlement was entered.On July 25, 2024, Tampa Bay Water filed its claims for the DuPont and 3M settlements with the assistance of special counsel for Tampa Bay Water. On August 26, 2024, Tampa Bay Water filed a special needs claim with the assistance of special counsel. During the summer of 2024, settlements were reached with TYCO/Chemguard ($750 million) and BASF ($312,500 million). Claims for these settlements were filed by Tampa Bay Water in early April 2025. Agreements have also been reached in the Kidde-Fenwal bankruptcy case, which if approved through both the bankruptcy court and this class action case, will result in $129.2 million to be distributed to the water provider litigations. Claims against other defendants remain pending. The Claims Administrator will allocate compensation to all eligible class members as the claims review periods conclude for each settlement. Tampa Bay Water has thus far been awarded approximately 181 million points in both the 3M and Dupont settlements. A portion of the first 3M settlement payment in the net amount of $2,961,827.37 was received by Tampa Bay Water on approximately June 24, 2025, with the remainder of the first settlement payment received in August 2025. The second 3M settlement payment in the net amount of $8,076,613.10 was received in September 2025. The settlement payment for DuPont (one lump sum) was received in November 2025. The TYCO/BASF settlement payment is expected by mid-year 2026.

WPC Industrial Contractors, LLC and Randall Environmental, Inc. v. Tampa Bay Water
Case No. 24-5494-CI, Circuit Court for Pinellas County, Florida

Counsel: GrayRobinson, P.A.

Issue: Complaint for damages alleging Tampa Bay Water breached its contract with WPC Industrial Contractors, LLC and Randall Environmental, Inc. for the Eldridge-Wilde Wellfield Pumps and Motors Replacement Project and the Cypress Trails Property Improvements Project.

Status: Complaint filed in Hillsborough County on October 29, 2024. Motion to Dismiss filed by Tampa Bay Water on November 21, 2024 due to improper venue (Hillsborough County instead of Pinellas County as required by the contract). The case was transferred to Pinellas County on December 19, 2024. An Answer and Affirmative Defenses was filed on behalf of Tampa Bay Water on January 14, 2025. The Board approved the filing of a counterclaim at its January 2025 meeting, and it was filed on February 4, 2025. The Plaintiffs filed an Amended Complaint on February 25, 2025. On July 18, 2025, a Motion for Leave to Amend Answer and Counterclaim was filed on behalf of Tampa Bay Water, which was granted on August 7, 2025. Counsel for Tampa Bay Water learned that WPC Industrial Contractors' assets were liquidated and distributed to creditors in a proceeding in Duval County. As a result, there likely will not be any assets against which to collect a judgment from WPC Industrial Contractors if awarded. Randall Environmental was the only entity named on the applicable insurance policy, allowing pursuit of full relief against it on the counterclaim. Discovery and initial

negotiations are ongoing. An Initial Case Management Conference was held on August 6, 2025, and February 2027 is presently targeted for a trial. Per GrayRobinson, as of early January 2026 the Plaintiffs had not been actively pursuing their claim; however, to comply with court scheduling requirements GrayRobinson will be proceeding with the retention of experts and scheduling of depositions.

Polk Regional Water Cooperative v. Tampa Bay Water and Southwest Florida Water Management District - Case No. 25-5480, Division of Administrative Hearings

Counsel: Gunster Yoakley & Stewart, P.A.

Issue: Petition for Formal Administrative Hearing filed by Polk Regional Water Cooperative challenging the Southwest Florida Water Management District's issuance of a water use permit to Tampa Bay Water to increase its surface water withdrawal from the Alafia River from 10% to 19% above the minimum flow threshold.

Status: On September 29, 2025, the Polk Regional Water Cooperative filed a Petition for Formal Administrative Hearing against Tampa Bay Water and the Southwest Florida Water Management District ("District"), challenging the District's issuance of a water use permit to Tampa Bay Water to increase its surface water withdrawal from the Alafia River from 10% to 19% above the minimum flow threshold. The District forwarded the Petition to the Division of Administrative Hearings on October 14, 2025. Tampa Bay Water filed a Motion to Dismiss Petition for Lack of Standing, which was denied. On January 28, 2026, Polk Regional Water Cooperative filed a Motion for Leave to Amend Petition, and a Response in Opposition was filed by Tampa Bay Water on February 5, 2026. Mosaic Fertilizer, LLC filed a Motion to Intervene on February 4, 2026 in support of the permit modification and to protect their existing legal user status. The administrative hearing set for March 4-11, 2026 was canceled after terms of settlement were agreed to during a mediation held on February 12, 2026. The settlement has been approved by Polk Regional Water Cooperative and the District and will be considered by the Tampa Bay Water Board at its April 20 meeting.

TAMPA BAY WATER
Supplying Water To The Region

AGENDA ITEM F.3

DATE: April 2, 2026

TO: Board of Directors

FROM: Kelly M. Fernandez, General Counsel

SUBJECT: Legal Services Budget Report for February & March 2026 - *Receive Report*

SUMMARY

This item presents the status of the budget for the General Counsel and legal services paid in February & March 2026.

SUGGESTED ACTION

Receive and File.

COST/FUNDING SOURCE

Uniform Rate/Bond Funds

DISCUSSION

Legal expenditures paid in February & March totaled $406,381.83. These expenditures were associated with general operations activities and appropriately paid for from the uniform rate. In February & March there were expenditures in the amount of $125,709.18 paid from bond funds for legal services for the South Hillsborough Pipeline. Attached are spreadsheets showing payments made to each law firm.

TAMPA BAY WATER
Supplying Water To The Region

AGENDA ITEM F.4

DATE: April 1, 2026

TO: Board of Directors

THRU: Charles H. Carden, General Manager

FROM: Christina Sackett, Chief Financial Officer

SUBJECT: Comprehensive Check List with Delegated Check Approval Items for February and March 2026 - *Receive Report*

SUMMARY

Attached is a list of all checks and wire transfers written for the months of February and March 2026. Additional information is provided for checks over $50,000 and for delegated approval items.

SUGGESTED ACTION

Receive and File.

COST/FUNDING SOURCE

N/A

DISCUSSION

The attached report lists all checks and wire transfers which have been written during the months of February and March 2026. To provide the Board additional information, a description is included for all delegated approval item payments. Delegated approval items were authorized by the General Manager under his delegated approval authority and are marked “Delegated Approval”.

Items with delegated approval are generally items such as payroll taxes, Florida Retirement System, utilities, and so forth, which are approved by the board in the budget process but for which there is not a

specific approved contract or agenda item.

By policy, the General Manager is authorized to approve all expenditures of $150,000 or less. All contractual obligations or purchase orders issued in excess of $150,000 are approved by the Board through the contract approval, agenda approval, or budget approval processes. The comprehensive check list includes a description for all payments over $50,000 and identifies those items previously approved by the board with “Receive”.

N/A

DISCUSSION

The two workstation/office desk were discarded and replaced with newer units as they no longer met the needs of the agency. The Hach CL17 chlorine analyzer was no longer in operational condition and was cannibalized for its useful parts and replaced with a newer unit. The BK Precision 2542C Oscilloscope was no longer in operational condition and was discarded. The two Swan AMI Turbiwell analyzers (one in Feb/one in March) were no longer in operational condition and were cannibalized for their useful parts and replaced with a newer units. The miscellaneous lab equipment was no longer needed by the agency and was sold as surplus at auction. The Hach SC200 was discarded as it was no

longer in operational condition. The Thermo-Fisher Heratherm OGS180 Oven was no longer cost-effective to maintain and has since been discarded and replaced with a newer, more efficient unit. The Ingersoll-Rand air compressor was no longer in operational condition and has been discarded. The AP 7000 Probe was part of a pilot program that is no longer in use as it was determined that a more accurate and efficient S-CAN probe would be used going forward. The Siemens TOC M5310C portable analyzer was in disrepair and determined not cost-effective to repair. The miscellaneous computer equipment was surplus and no longer met the needs of the agency and has been replaced with newer, more efficient units.

AGENDA ITEM F.6

DATE: April 1, 2026

TO: Board of Directors

THRU: Charles H. Carden, General Manager

FROM: Christina Sackett, Chief Financial Officer

SUBJECT: Financial Statements - February and March 2026 - *Receive Report*

SUMMARY

The attached Statement of Revenues and Expenditures summarizes the Agency's uniform rate basis financial activity for February and March 2026.

SUGGESTED ACTION

Receive and File.

COST/FUNDING SOURCE

N/A

DISCUSSION

Financial Statement - Summary of Major Points:

Revenues – Operating revenue consists of water sales (fixed and variable components), sales from the Tampa Bypass Canal to the City of Tampa, operating grants, other additional surcharges revenue and the board-approved balance carried forward from the previous year through the Rate Stabilization Fund. Fixed rate revenue is earned in level monthly increments and only catches up to the expenditures at year end. Non-Operating Income consists of investment income, miscellaneous income, litigation recoveries and capital contributions.

Expenditures - Throughout the year, actual expenditures normally lag behind by at least one to two months. This is due to the fact that vendor bills and the subsequent payment of those bills generally lag behind the actual performance of the services by 30 to 45 days. When the fiscal year end approaches, the books are held open to allow for all fiscal year activity to be accounted for and shown in the appropriate fiscal year. Variable rate expenditures will have seasonal peaks as the agency enters the dry season and adjusts the supply sources.

The “Encumbrance” balance shown on the bottom of the financial statements represents the amount of open purchase orders (committed funds and blanket purchase orders) as of the end of the month, including purchase orders carried forward from the previous year. Although the encumbrance is presented for informational purposes, it gives a projected contractual commitment against current year funds. There are many purchase orders established at the beginning of the year that will be spent through the year and monthly revenue will be collected through the year to offset that expense, some of the categories with larger encumbrances at the beginning of the year include Water Treatment Chemicals, Power, and Professional Services. Professional service tasks frequently carry over beyond the end of a fiscal year, in which case the applicable open purchase orders and the associated budget dollars are carried into the next fiscal year to allow for completion of those tasks as mentioned above.

DISCUSSION

The attached Chandler Asset Management Consolidated Statement and Bond Market Review provide a monthly summary of the agency's asset allocations and the drivers of the economy that may affect investment performance.

Chandler Asset Management, the Board's contracted investment advisor, manages a portion of the agency's funds to earn a higher return, without sacrificing or risking principal.

As of March 31, 2026, the funds currently managed by Chandler Asset Management had a Market Value $182,259,106 and are detailed in the attached statement. all the investments are held in a third-party trust account with US Bank as custodian.

As of March 31, 2026, the Agency had $617,599,985 held in deposit accounts or certificates of deposits with multiple banking institutions, with interest rates ranging from 2.07% to 3.70%. In addition, these banking institutions participate in the State of Florida Public Funds pool and are designated Public Funds. Under this program, each participating bank is required to post collateral with the State at a percentage of the amount of Public Funds held by that bank. The percentage of collateral required is determined by the State and may vary by institution. Of the funds held by Tampa Bay Water, 93% are restricted as to purpose. An additional $30.6 million in the Utility Reserve Fund is not restricted as to purpose but must be maintained at levels sufficient to ensure compliance with debt coverage requirements.

BACKGROUND

Resolution 2017-002 approves the Agency's Investment Policy.

US Government Securities - Treasuries (100%) - Collective term used to describe debt instruments backed by the US Government and issued through the US Department of Treasure.

US Government Agency (50%) – A debt instrument issued by one of the Federal Agencies.

Federal Instrumentalities (80%) - A government sponsored/owned entity created by US Congress.

Mortgage-Backed Securities (20%) – An ownership interest in a pool of mortgage loans made by financial institutions to finance the borrower's purchase of a home or other real estate.

Repurchase Agreements (50%) - A short-term investment vehicle where an investor agrees to buy securities from a counterparty and simultaneously agrees to resell the securities back to the counterparty at an agreed upon time for an agreed upon price.

Commercial Paper (25%) – Short term unsecured promissory note issued by a company or financial institution. Issued at a discount and matures for par or face value.

Corporate Note (25%) – A debt instrument issued by a corporation with a maturity of greater than one year and less than ten years.

Bankers' Acceptances (25%) – A draft or bill of exchange drawn upon and accepted by a bank.

Municipal Note/Bond (20%) – A debt instrument issued by a state, local government or public agency.

Supranationals (15%) – A debt instrument issued by the International Bank for Reconstruction and Development, International Finance Corporation or Inter-American Development Bank.

Money Market Mutual Funds (50%) – Market in which short-term debt instruments are issued/traded.

Intergovernmental Investment Pool (25%) – An investment by local governments in which their money is pooled as a method for managing local funds.

February 2026

Bond Market Review

Market Summary

Recent economic data point to moderating inflation and a continued rebalancing in labor market conditions. Although price pressures remain modestly above the Federal Reserve's longer-run target, the unemployment rate has declined to 4.3%. As the data flow stabilizes, the Chandler team expects further yield curve steepening as the Federal Reserve gradually guides the policy rate toward a more neutral range. One additional 25-basis-point rate cut may occur in the first half of 2026, while U.S. trade and fiscal policy remain key sources of elevated market uncertainty.

The Federal Reserve's January Federal Open Market Committee meeting concluded with policymakers maintaining the target range at 3.50%–3.75%, following three consecutive 25-basis-point cuts at the end of 2025. However, officials remained divided on the policy outlook, as Governors Christopher Waller and Stephen Miran dissented in favor of an additional rate reduction. Meanwhile, the future policy regime began to take shape with President Trump's announcement of Kevin Warsh as his nominee for the next Federal Reserve Chair.

The US Treasury yield curve steepened in January, as the 2-year Treasury yield rose 4 basis points to 3.52%, the 5-year Treasury was up 6 basis points to 3.79%, and the 10-year Treasury yield was 7 basis points higher at 4.24%. The spread between the 2-year and 10-year Treasury yield points on the curve was 2 basis points wider from December at +71 basis points at January month-end. The spread between the 2-year Treasury and 10-year Treasury yield one year ago was +56 basis points. The spread between the 3-month and 10-year Treasury yield points on the curve was +58 basis points in January versus +54 basis points in December.

The U.S. Treasury market was not immune to the volatility that struck capital markets in January. Geopolitical turmoil and concerns over tech and software stocks' AI exposure roiled equities and whipsawed the MOVE Index. The month ended with a slightly steeper yield curve, reflecting an almost parallel upward shift across maturities. Escalating conflicts across all four hemispheres—along with Federal Reserve officials facing DOJ subpoenas—could drive Treasury yields lower via a flight-to-quality trade in the first half of 2026.

World Stock Market Index Descriptions

S&P 500–The S&P 500 is a market value-weighted index of 500 large-capitalization stocks. The 500 companies included in the index capture approximately 80% of available US market capitalization. NASDAQ–The NASDAQ Composite Index is the market capitalization-weighted index of over 3,300 common stocks listed on the NASDAQ stock exchange. Dow Jones–The Dow Jones Industrial Average is an index that tracks 30 large, publicly-owned companies trading on the New York Stock Exchange and the NASDAQ. The Financial Times Stock Exchange Group (FTSE)–The FTSE is a share index of the 100 companies listed on the London Stock Exchange with the highest market capitalization. DAX–The Deutscher Aktienindex (DAX) is a blue chip stock market index consisting of the 30 major German companies trading on the Frankfurt Stock Exchange. Hang Seng–The Hang Seng Index is a freefloat-adjusted market-capitalization-weighted stock market index in Hong Kong. It is used to record and monitor daily changes of the largest companies of the Hong Kong stock market and is the main indicator of overall market performance in Hong Kong. Nikkei–Japan's Nikkei 225 Stock Average is a price-weighted index composed of Japan's top 225 blue-chip companies traded on the Tokyo Stock Exchange.

Economic Roundup

Consumer Prices

On the headline basis, inflation moderated in January with the Consumer Price Index (CPI) rising 0.2% for the month, down from 0.3% in December. On an annual basis, headline CPI eased to 2.4% from 2.7% a year earlier. Core CPI, which excludes volatile food and energy prices, edged up to 0.3% in January from 0.2% the previous month, while the annual rate eased slightly to 2.5% from 2.6%. The Personal Consumption Expenditures (PCE) Index for October and November, released on January 22, showed headline inflation rising 0.2% in each month, driven by increases in both goods and services. On an annual basis, headline PCE inflation advanced 2.7% in October and 2.8% in November. Core PCE, which excludes food and energy, also rose 0.2% month-over-month in both months, while the annual rate edged up from 2.7% to 2.8% in November.

Retail Sales

Inclement weather may have contributed to Retail Sales missing analyst estimates in December. Advanced Retail Sales were unchanged on a month-over-month basis for the second consecutive month and increased at 2.4% on an annual basis. The control group measure, which feeds into GDP, unexpectedly declined -0.1% versus an estimate to rise 0.4% from November. The government shutdown may have weighed on consumer confidence regarding jobs, incomes, and overall financial conditions, both current and in the future. The Conference Board's Consumer Confidence Index declined by 9.7 points to 84.5 in January from an upwardly revised 94.2 in December, sinking to its lowest level since 2014 and resuming the downtrend after a brief year-end uptick. Consumers grew more pessimistic about both current and future business conditions and the labor market.

Labor Market

The January Nonfarm Payrolls report exceeded expectations, adding 130,000 jobs compared to the forecast of 65,000. Job gains were concentrated in the private education and health services sectors, while government employment posted the largest decline. Meanwhile, the unemployment rate declined for a second straight month to 4.3% in January, according to the Bureau of Labor Statistics. Taken together, the data suggest the labor market may be showing signs of stabilization at the start of 2026.

Housing Starts

The S&P CoreLogic Case-Shiller 20-City Composite Home Price Index rose 1.4% year over year in November, holding near the slowest annual pace since mid-2023. Short-term momentum softened further, with 15 of the 20 tracked markets reporting month-over-month declines on a non-seasonally adjusted basis as elevated mortgage rates and affordability challenges continued to weigh on demand. Housing starts declined in October to an annualized rate of 1.25 million units, adding 875,000 single-family starts and 372,000 multifamily starts. The Freddie Mac 30-year fixed mortgage rate trended lower, ending January at 6.10%.

This report is provided for informational purposes only and should not be construed as specific investment or legal advice. The information contained herein was obtained from sources believed to be reliable as of the date of publication, but may become outdated or superseded at any time without notice. Any opinions or views expressed are based on current market conditions and are subject to change. This report may contain forecasts and forward-looking statements which are inherently limited and should not be relied upon as an indicator of future results. Past performance is not indicative of future results. This report is not intended to constitute an offer, solicitation, recommendation, or advice regarding any securities or investment strategy and should not be regarded by recipients as a substitute for the exercise of their own judgment. Fixed income investments are subject to interest rate, credit, and market risk. Interest rate risk: The value of fixed income investments will decline as interest rates rise. Credit risk: the possibility that the borrower may not be able to repay interest and principal. Low-rated bonds generally have to pay higher interest rates to attract investors willing to take on greater risk. Market risk: the bond market, in general, could decline due to economic conditions, especially during periods of rising interest rates. The S&P Corelogic Case-Shiller home price index tracks monthly changes in the value of residential real estate in 20 metropolitan regions across the nation.

March 2026

Bond Market Review

Market Summary

February economic data continued to reflect the measured disinflationary progression that has characterized conditions throughout the post-pandemic normalization cycle, with price pressures maintaining a trajectory toward the Federal Reserve longer-run objective while remaining modestly above the 2.0% target. The unemployment rate edged up to 4.4%, remaining in a historically lower range and affirming that the labor market has shown recent stability following an extended sequence of gradual softening. With no Federal Open Market Committee (FOMC) meeting scheduled for February, the target range of 3.50% to 3.75% remained unchanged throughout the month, and market participants continued to assign meaningful probability to at least one additional 25-basis point rate reduction in 2026. U.S. trade and fiscal policy continue to represent important sources of elevated market uncertainty, while escalating geopolitical tensions contributed to a notable flight-to-quality bid in Treasury securities that drove yields sharply lower across the curve.

The Federal Reserve did not convene in February, consistent with its scheduled meeting calendar, with the next policy decision anticipated at the March Federal Open Market Committee meeting. The target range remains at 3.50% to 3.75%, following three consecutive 25-basis-point reductions at the end of 2025. Senate confirmation proceedings for Kevin Warsh, President Trump nominee to succeed Chair Jerome Powell as Federal Reserve Chair, advanced during February, introducing a consequential dimension of institutional uncertainty into an already divided policy outlook. Market-implied probabilities for a rate reduction at the March FOMC meeting remained subdued, while the Chandler team continues to expect a 25 basis point cut in the second half of 2026. Although the February outcome represented a temporary departure from this view and a steeper term structure, the medium-term expectation for yield curve steepening remains intact, supported by ongoing Federal Reserve policy normalization.

The US Treasury yield curve flattened in February as yields fell across all maturities, driven by escalating trade policy uncertainty, emerging stagflation concerns, and intensifying geopolitical risk that collectively prompted investors to seek the relative safety of U.S. Treasuries.

The 10-year Treasury yield declined 30 basis points to close the month at 3.94%, crossing below the psychologically significant 4.0% threshold for the first time in several months, while the 2-year yield fell 15 basis points to 3.38%, its lowest closing level since August 2022. The 5-year Treasury was down 29 basis points to 3.50%.

The spread between the 2-year and 10-year Treasury yield points on the curve was 15 basis points tighter from January at +56 basis points at February month-end. The spread between the 2-year Treasury and 10-year Treasury yield one year ago was +22 basis points. The spread between the 3-month and 10-year Treasury yield points on the curve was +28 basis points in February versus +58 basis points in January.

World Stock Market Index Descriptions

S&P 500–The S&P 500 is a market value-weighted index of 500 large-capitalization stocks. The 500 companies included in the index capture approximately 80% of available US market capitalization. NASDAQ–The NASDAQ Composite Index is the market capitalization-weighted index of over 3,300 common stocks listed on the NASDAQ stock exchange. Dow Jones–The Dow Jones Industrial Average is an index that tracks 30 large, publicly-owned companies trading on the New York Stock Exchange and the NASDAQ. The Financial Times Stock Exchange Group (FTSE)–The FTSE is a share index of the 100 companies listed on the London Stock Exchange with the highest market capitalization. DAX–The Deutscher Aktienindex (DAX) is a blue chip stock market index consisting of the 30 major German companies trading on the Frankfurt Stock Exchange. Hang Seng–The Hang Seng Index is a freefloat-adjusted market-capitalization-weighted stock market index in Hong Kong. It is used to record and monitor daily changes of the largest companies of the Hong Kong stock market and is the main indicator of overall market performance in Hong Kong. Nikkei–Japan's Nikkei 225 Stock Average is a price-weighted index composed of Japan's top 225 blue-chip companies traded on the Tokyo Stock Exchange.

Economic Roundup

Consumer Prices

Inflation firmed slightly in February on a headline basis, with the Consumer Price Index (CPI) rising 0.3% for the month, following a 0.2% increase in January. On an annual basis, headline CPI rose 2.4%, unchanged from January. Core CPI, which excludes volatile food and energy prices, increased 0.2% in February, down from January's 0.3% pace, while the annual rate held steady at 2.5%. The Personal Consumption Expenditures (PCE) Index rose 0.3% in January, easing from a 0.4% gain in December. On a year-over-year basis, headline PCE also edged down to 2.8% from 2.9% the prior month. Core PCE held steady at 0.4% on the month but ticked up to 3.1% annually from 3.0% in December, driven largely by higher healthcare services costs.

Retail Sales

Retail sales edged down 0.2% in January from December, driven by a decline in vehicle sales, but were up 3.2% on a seasonally adjusted annual basis. The control group measure, which feeds directly into GDP calculations, rose 0.3% from the prior month, matching expectations. Adverse winter weather continued to restrain retail activity during the month. The Conference Board's Consumer Confidence Index rose to 91.2 in February from an upwardly revised 89.0 in January. Confidence improved amid signs of labor market stability and moderating inflation. However, the survey noted an increase in respondents citing concerns about the overall cost of goods as well as political and trade uncertainties.

Labor Market

The February Nonfarm Payrolls report showed an unexpected decline of 92,000 jobs, contrasting with expectations for a 55,000 increase. The loss partly reflected a month-long strike involving more than 30,000 Kaiser Permanente employees, while severe winter weather further weighed on hiring. Even so, payroll declines were broad-based across several industries. The unemployment rate rose to 4.4% in February, according to the Bureau of Labor Statistics. The unexpectedly weak jobs report may prompt renewed concerns about the labor market's recent stability.

Housing Starts

Housing starts rose 7.2% in January to an annualized pace of 1.487 million units, including 935,000 single-family and 552,000 multifamily starts. The December S&P Cotality Case-Shiller 20-City Composite Home Price Index posted a 1.3% year-over-year gain in 2025 on a non-seasonally adjusted basis—the weakest annual increase since 2011. Notably, inflation outpaced home price appreciation in the second half of the year, ending a 10-year trend of positive real returns. Over the same period, the Freddie Mac 30-year fixed mortgage rate continued to edge lower, reaching 5.98 percent by the end of February.

Past performance is not indicative of future results. This report is not intended to constitute an offer, solicitation, recommendation, or advice regarding any securities or investment strategy and should not be regarded by recipients as a substitute for the exercise of their own judgment. Fixed income investments are subject to interest rate, credit, and market risk. Interest rate risk: The value of fixed income investments will decline as interest rates rise. Credit risk: the possibility that the borrower may not be able to repay interest and principal. Low-rated bonds generally have to pay higher interest rates to attract investors willing to take on greater risk. Market risk: the bond market, in general, could decline due to economic conditions, especially during periods of rising interest rates. The S&P Corelogic Case-Shiller home price index tracks monthly changes in the value of residential real estate in 20 metropolitan regions across the nation.

Supplying Water To The Region

AGENDA ITEM F.8

DATE: April 1, 2026

TO: Board of Directors

THRU: Charles H. Carden, General Manager

FROM: Christina Sackett, Chief Financial Officer

SUBJECT: True-Up of Fixed Costs between Member Governments through February and March 2026 - *Receive Report*

SUMMARY

Member Government actual contributions are adjusted at year-end to the current year's budgeted fixed costs, based upon their pro-rata portion of current year production. The process is referred to as True-Up and occurs after each fiscal year has closed (September 30). The attached tables report the members' potential allocation of fixed costs through February and March 2026.

SUGGESTED ACTION

Receive and File.

COST/FUNDING SOURCE

N/A

DISCUSSION

To assist our Members in their planning and budgeting, we present a monthly schedule that shows the potential true-up adjustment due each September based on the water production to date for the current fiscal year. This is done to ensure that each member is aware of the upcoming true-up billing and that the member government will have time to take appropriate planning measures for the September 2026 year-end closeout.

Each member is billed for fixed charges through the year based upon their respective pro-rata share of the prior year's production.

BACKGROUND

As required by the Master Water Supply Contract, each member's actual contributions are adjusted at year-end to the current year's budgeted fixed costs, based upon their pro-rata portion of current year production.

Supplying Water To The Region

AGENDA ITEM F.9

DATE: April 1, 2026

TO: Board of Directors

THRU: Charles H. Carden, General Manager

FROM: Christina Sackett, Chief Financial Officer

SUBJECT: Vendor's Status Reports for February and March 2026 - *Receive Report*

SUMMARY

Attached are status reports of As-Needed Professional Service Contractors and Vendors utilized by Tampa Bay Water for February and March 2026.

SUGGESTED ACTION

Receive and File.

COST/FUNDING SOURCE

N/A

DISCUSSION

Attached are summaries of the as-needed contracted services being utilized by the agency for February and March 2026. This report shows total contract values, cumulative purchase orders issued against the contracts, and actual expenditures made under the contracts.

TAMPA BAY WATER
Supplying Water To The Region

AGENDA ITEM G.1

DATE: April 3, 2026

TO: Board of Directors

FROM: Kelly M. Fernandez, General Counsel

SUBJECT: Attorney-Client Session between the Board of Directors and legal counsel pursuant to Section 286.011(8), F.S., pertaining to Polk Regional Water Cooperative v. Southwest Florida Water Management District and Tampa Bay Water (Florida Division of Administrative Hearings Case No.: 25-005480) - *Discussion and Action*

SUMMARY

In accordance with Section 286.011(8), Florida Statutes, the Board will convene a private attorney-client briefing session during the Board meeting concerning this litigation matter in order to discuss settlement negotiations and/or strategy related to the litigation expenditures.

SUGGESTED ACTION

Post-session, consider approval of the Notice of Change of Agency Action and Settlement and Coordination Agreement Between Polk Regional Water Cooperative, Tampa Bay Water, & Southwest Florida Water Management District.

COST/FUNDING SOURCE

N/A

DISCUSSION

A Private Attorney-Client Session, pursuant to Section 286.011(8), F.S., will be held to discuss Polk Regional Water Cooperative v. Southwest Florida Water Management District and Tampa Bay Water . In attendance will be General Counsel Kelly Fernandez, Deputy General Counsel R. David Jackson, Special Counsel Timothy Riley, Elizabeth Ross, and Greg Munson, Chair Lisset Hanewicz, Vice Chair

Seth Weightman, Board Members Harry Cohen, Dave Eggers, Charlie Miranda, Chopper Davis, Ron Oakley, Kathleen Peters, and Joshua Wostal, General Manager Charles Carden, and a certified court reporter. The expected duration is sixty (60) minutes.

Post-session, formal action by the Board on the Notice of Change of Agency Action and Settlement and Coordination Agreement Between Polk Regional Water Cooperative, Tampa Bay Water, & Southwest Florida Water Management District ("Settlement") will be requested. The Settlement has been formally approved by the Polk Regional Water Cooperative and the Southwest Florida Water Management District.

Notice of Change of Agency Action and Settlement Agreement Between PRWC, TBW, & SWFWMD
Notice of Final Agency Action-Approval

NOTICE OF CHANGE OF AGENCY ACTION
AND
SETTLEMENT AND COORDINATION AGREEMENT BETWEEN POLK REGIONAL WATER COOPERATIVE, TAMPA BAY WATER, & SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT

This Notice of Change of Agency Action and Settlement and Coordination Agreement Between Polk Regional Water Cooperative, Tampa Bay Water, & Southwest Florida Water Management District ("Agreement") is entered into by and among the Polk Regional Water Cooperative, an interlocal entity organized under sections 163.01 and 373.713, Florida Statutes, ("PRWC"), Tampa Bay Water, a Regional Water Supply Authority, an interlocal entity organized under sections 163.01 and 373.715, Florida Statutes, ("TBW"), and the Southwest Florida Water Management District, an independent special district of the State of Florida ("District"). PRWC, TBW, and the District are each a Party and collectively the Parties.

WHEREAS, portions of the Alafia River begin in Polk County flow west into and through Hillsborough County and eventually discharge into Hillsborough Bay; and

WHEREAS, the District has established minimum flows in the Alafia River pursuant to Sections 373.042 and 373.0421, Florida Statutes, and Rule 40D-8.041(11) and (12), Florida Administrative Code; and

WHEREAS, the minimum flow established by the District for the Lower Alafia River in Rule 40D-8.041(12)(c), Florida Administrative Code, limits consumptive use of the river to no more than 19% of the daily flow to the Lower Alafia River System that is above 120 cubic feet per second ("cfs"); and

WHEREAS, Water Use Permit No. 20011794.002 (the "Existing Permit"), which was issued by the District to TBW on November 27, 2012, authorizes TBW to withdraw no more than 10% of the available flow above the Minimum Flow threshold up to a maximum daily diversion of 60 million gallons per day ("mgd"); and

WHEREAS, on May 22, 2025, TBW applied to the District for Water Use Permit No. 200111794.003 (the "Proposed Permit"), which requested modification of its Existing Permit to increase the withdrawal from 10% to 19% of the available flow above the Minimum Flow threshold up to a maximum daily diversion of 75 mgd; and

WHEREAS, on June 17, 2025, the PRWC submitted Water Use Permit Application No. 20021263.000, requesting to withdraw an annual average of 15 to16 mgd of surface water from the North and South Prongs of the Alafia River for public supply use ("PRWC Permit Application"); and

WHEREAS, on July 22, 2025, the District issued a Notice of Final Agency Action approving the Proposed Permit at the flow rates requested by TBW; and

WHEREAS, on September 29, 2025, the PRWC petitioned for a formal administrative hearing challenging that action, which proceeding is pending before the Florida Division of Administrative Hearings as Case No. 25-5480 ("DOAH Proceeding"); and

WHEREAS, on February 12, 2026, mediation between the Parties' representatives began and initially resulted in a general basis for amicable settlement on points of agreement which has resulted in an abeyance of the DOAH Proceeding until April 22, 2026, to allow time for the Parties to reach a written settlement agreement; and

WHEREAS, the Parties desire to resolve the DOAH Proceeding and avoid additional litigation concerning TBW's Alafia River withdrawals, to modify and extend the duration of TBW's Alafia River Water Use Permit, to withdraw PRWCS's Permit Application, as well as to establish a structured, collaborative planning and technical coordination process that respects each Party's statutory authority and fiscal constraints; and

WHEREAS, the District's staff has reviewed Tampa Bay Water's application for the Proposed Permit and the Notice of Final Agency Action issued on July 22,

2025, together with the applicable minimum flows and levels and the District's water use permitting standards and Basis of Review; and

WHEREAS, based on that review, the District has determined that certain revisions to the Proposed Permit are consistent with the applicable criteria for issuance of a water use permit, including extending the permit expiration date to 2040 and amending Special Condition 9 to clarify the calculation of Baseline Flow, the flow-based diversion schedule, and a coordinated allocation provision that operates in conjunction with any qualifying PRWC water use permit application submitted in 2032 or later consistent with this Agreement, together with conforming clarifications; and

WHEREAS, the Parties desire to provide notice of the revisions to the Proposed Permit contemplated by this Agreement and completely settle, release, and discharge all claims among themselves regarding the DOAH Proceeding, including the PRWC Permit Application; and

NOW THEREFORE, in consideration of the mutual covenants in this Agreement and other good and valuable consideration, the receipt and adequacy of which are hereby acknowledged, the Parties agree, as follows:

I. **EFFECTIVE DATE.** This Agreement shall become effective on the date it is duly executed by all of the Parties. The last date of execution by all the Parties shall be known as the "Effective Date" of this Agreement.

II. **CONTINGENT.** This Agreement is contingent upon the District's Final Order granting TBW a Final Permit that is in substantially the same form as that contained in the attached Exhibit A, Draft Final Permit, including the changes to the "Total Quantities Authorized Under This Permit" section, Special Condition 9.d., and an expiration date to extend fourteen (14) years after the date of issuance.

III. **DURATION**. This Agreement shall remain in effect for thirty-five (35) years from the date of the issuance of the Final Permit.

IV. RELINQUISHING JURISDICTION, DISMISSAL, AND WITHDRAWAL OF PRWC PERMIT APPLICATION. Within five (5) days of the Agreement's Effective Date, the Parties shall file a joint motion in the DOAH Proceeding requesting the Administrative Law Judge accept the Agreement and relinquish jurisdiction to the District for the Parties to act in compliance with this Agreement. This process will allow the District to enter a Final Order dismissing the Petition with prejudice, issuing the Final Permit, and closing the case at its next monthly Governing Board business meeting. Furthermore, the PRWC will withdraw its pending PRWC Permit Application within five (5) days from the date of the District's Final Order issuing the Final Permit.

V. PRWC COVENANT NOT TO CHALLENGE TBW. If TBW seeks to modify or renew Water Use Permit 20011794 et seq. with the District on or before 2040, the PRWC agrees that it shall not contest any agency action that results from TBW's water use permit modification or renewal application. This includes not opposing a permit application when it is being processed at the District and not filing, pursuing or participating as an intervenor in an administrative challenge pursuant to Chapter 120, Florida Statutes, or any successor statute, or initiating or participating in any other judicial action seeking to challenge any agency action that results from TBW's renewal. Additionally, the PRWC will not support or finance any third party bringing either an administrative or judicial challenge to any agency action on Water Use Permit 2001194 et seq.

VI. TBW COVENANT NOT TO CHALLENGE PRWC. If the PRWC proceeds with submitting a water use permit application to the District after December 31, 2032, but before December 31, 2040, to withdraw surface water from the North or South Prongs of the Alafia River consistent with the terms of this Agreement, TBW agrees that it will not contest any agency action that results from the PRWC's application submittal. This includes not opposing this permit application when it is being processed at the District and not filing, pursuing or participating as an intervenor in an administrative challenge pursuant to Chapter 120, Florida Statutes, or any successor statute, or initiating or participating in any other judicial action seeking to challenge any agency action that results from the PRWC's application for withdrawals from the North or South prongs of the Alafia River . Additionally, TBW will not support or finance any third party bringing either an

administrative or judicial challenge to any agency action against the PRWC water use permit for withdrawals from the North or South Prongs of the Alafia River.

VII. TBW PERMIT.

a. Modification of the Proposed Permit. The Parties agree to the modifications of the Proposed Permit, as attached hereto and incorporated herein as Exhibit A. Special Condition 9 shall only be modified before 2040 if the PRWC accepts an Alternative Project as set forth in the Settlement Agreement.

b. TBW's Obligation to Modify Final Permit

After December 31, 2032, PRWC shall give TBW written notice at least ninety (90) days prior to commencement of the actual withdrawal of water for potable water use by the PRWC from the North or South Prongs of the Alafia River, at which time within thirty (30) days, TBW shall submit a letter to the District to limit its permitted withdrawal from the Lower Alafia River based on the below modified diversion schedule to be effective upon the first day of actual withdrawal water for potable supply by the PRWC.

1. No diversion from the Alafia River may occur when the calculated Baseline Flow for the previous day is 128 cfs (82.7 mgd) or less.

2. For a calculated Baseline Flow between 128 cfs (82.7 mgd) and 149 cfs (96.3 mgd) for the previous day, the daily diversion is limited to the difference between the Baseline Flow and 128 cfs (82.7 mgd).

3. For a calculated Baseline Flow of 149 cfs (96.3 mgd) or greater for the previous day, the daily diversion is limited to 14% of the Baseline Flow.

4. The maximum diversion on any single day shall not exceed 75 mgd (116.1 cfs).

If the PRWC does not submit a written request for TBW to limit its permitted withdrawal from the Alafia River prior to the expiration date of the Final Permit in

2040, then TBW shall no longer be required to reduce its withdrawal from the Alafia River.

VIII. WATER SUPPLY PLANNING COMMITTEE. Within thirty (30) days of the Effective Date, the Parties will designate a representative to be the single point of contact for meeting scheduling. Within three (3) months of the Effective Date, representatives of TBW, PRWC, and the District shall schedule and attend quarterly meetings for the Water Supply Planning Committee to participate in structured planning and regulatory coordination to improve collaboration and align regional planning assumptions. Such coordination shall at a minimum include: (a) Identification of potential water supply projects, and TBW and District cooperation with feasibility studies if so undertaken by the PRWC, to provide an annual average of 12 mgd to meet the PRWC's water demands from sources other than the Alafia River; (b) Joint participation in the District's 2030 Regional Water Supply Planning process; (c) Identification of regional water resources and water supply development options; and, (d) Use of existing planning forums or technical workgroups to facilitate a dialogue on regional water supply planning activities.

IX. PRWC WATER SUPPLY PROJECT. The PRWC has until December 31, 2032, to identify alternative water supply project(s) as described below, or elect to pursue a project on the Alafia River, otherwise the PRWC waives any claim to withdraw water from the Alafia River pursuant to this Agreement. If the Parties identify water supply project(s) with an annual average capacity 12 mgd or greater before December 31, 2032, the PRWC will decide if the project(s) is/are feasible to replace the Alafia River as a potential water supply. The PRWC's decision shall be approved by the PRWC's Board of Directors on or before December 31, 2032. If the PRWC selects the identified alternative water supply projects(s), it waives any claim to withdraw water from the Alafia River pursuant to this Agreement. If no water supply project(s) with an annual average capacity of 12 mgd or greater is/are identified, or if the PRWC determines in its sole discretion the identified project(s) is/are not feasible, the PRWC may pursue a withdrawal from the Alafia River in accordance with this Agreement if such project has been determined feasible by the PRWC no later than December 31, 2032, otherwise TBW is released from its obligation to potentially reduce its allocation from 19% to 14%.

X. TERMINATION. This Agreement may only be terminated by written consent of all the Parties.

XI. MISCELLANEOUS PROVISIONS.

a. Notice. Notices under this Agreement must be in writing and delivered by hand, nationally recognized overnight courier, or email with confirmation of receipt, to the following representatives (or successors designated by notice):

As to the TBW:	Tampa Bay Water 2575 Enterprise Road Clearwater, Florida 33763 Attn: Chuck Carden General Manager Phone: (727) 796-2355 Fax: (727) 791-2388
With a copy to: (Which Shall Not Constitute Notice)	Persson, Cohen, Mooney, Fernandez & Jackson, P.A. 236 Pedro Street Venice, Florida 34285-2322 Attn: Kelly Fernandez, Esq. Phone: (941) 306-4730 Fax: (941) 306-4832
As to the PRWC	Polk Regional Water Cooperative 330 W. Church Street Bartow, FL 33831-9005 Attn: Eric DeHaven Executive Director Phone: (863) 534-6475 Fax: (863) 534-7069

With a copy to:	de la Parte, Gilbert, McNamara & Caldevilla, P.A.
(Which Shall Not Constitute Notice)	101 E. Kennedy Boulevard Suite 3100 Tampa, FL 33602 Attn: Edward P. de la Parte, Jr., Esq. Phone: (813) 229-2775 Fax: (813) 229-2712
As to the District:	Southwest Florida Water Management District 7601 U.S. Highway 301 North Tampa, FL 33637 Attn: Brian Armstrong Executive Director Phone: (352) 505-1298 Fax: (352)754-3493
With a copy to:	Office of the General Counsel, Southwest Florida Water Management District
(Which Shall Not Constitute Notice)	7601 U.S. Highway 301 North Tampa, FL 33637 Attn: Chris Tumminia General Counsel Phone: (813) 985-7481 Fax: (813) 367-9776

b. Authority to Enter Agreement. The Parties each have the power, authority, and legal right to enter into and perform the obligations set forth in this Agreement, and the execution and delivery and performance hereof by the Parties has been duly authorized by the governing authority of each of the Parties.

c. Entire Agreement. This Agreement represents the entire understanding and agreement between the Parties with respect to the subject matter and supersedes or replaces all prior representations, statements, and

understandings between the Parties with respect to the matters and things addressed herein, either written or oral.

d. Binding Effect. All of the terms and provisions of this Agreement, whether so expressed or not, shall be binding upon, inure to the benefit of, and be enforceable by the Parties and their respective legal representatives, successors and permitted assigns.

e. Default and Remedy.

i. Default. Failure on the part of any Party to observe, comply with, perform or maintain in any material way any term, covenant, condition, duty, obligation, representation or express warranty contained in this Agreement shall constitute a Default under this Agreement.

ii. Notice of Default and Opportunity to Cure. Upon occurrence of an alleged Default by any Party, the other Party shall deliver written notice to the Party allegedly in Default that identifies the specific nature of the alleged Default. The Party receiving such notice shall have thirty (30) days within which to cure the alleged Default. Provided that, if the alleged Default is of such nature that it cannot be reasonably cured within thirty (30) days, the Party allegedly in Default shall have such additional time as may be reasonably necessary to cure the alleged Default, so long as within said period, the alleged defaulting Party commences the cure and diligently prosecutes such cure until completion.

iii. Remedy for Default. For any alleged Default not cured as provided in Article XI.e.ii of this Agreement, the non-Defaulting Party may seek any remedy it may have available in law or in equity against the alleged Defaulting Party once completing the Dispute Resolution and Mediation provisions within Article XI.e.iv.

iv. Dispute Resolution and Mediation. Prior to seeking any legal remedy for Default, the Parties shall be required to engage in dispute resolution and mediate the dispute with all the Parties. A Party shall submit a dispute to be resolved by delivering to the other Parties a written notice requesting resolution of the dispute. Within ten (10) business days after receipt of the written notice, the Parties will first confer in good faith at the executive level in attempt to resolve the dispute.

If that first meeting is unsuccessful, the Party submitting a dispute to be resolved shall deliver to the other Parties a written notice requesting mediation and include a list of three (3) potential mediators for consideration. Within ten (10) business days of the receipt of written notice, the Parties will select one of the proposed mediators or mutually agree to a mediator. To the extent practicable, all mediators shall have special competence and experience with respect to the subject matter under consideration. Within thirty (30) days following the selection, mediation will be scheduled. This mediation shall occur in-person and be held at location mutually selected by the Parties, or at a location of the mediator's choosing if the Parties cannot agree. The Parties shall share equally in the fees and expenses of the mediator. Each Party shall pay their respective attorney's fees, expert fees and other expenses related to the mediation. Any settlement achieved through mediation shall be made in writing and approved by the Parties.

If a settlement is not reached within one hundred and eighty (180) days after the initiation of mediation or, if the mediator declares an impasse, then a Party may seek any and all legal or equitable remedies for the alleged Default. The mediation process set forth herein is intended to be a waiver of or a substitute or replacement for the conflict resolution process set forth in Chapter 164, Florida Statutes, which is acknowledged by all Parties.

f. Time Extensions. The Parties by joint written consent may extend or change any of the deadlines specified in this Agreement.

g. Amendment or Modification. This Agreement may not be amended or modified without prior written consent of all of the Parties to this Agreement. Any amendments or modifications, in whole or in part, will be documented through a written instrument that sets forth such changes and which is signed by all of the Parties.

h. Waiver. Any failure by a Party to exercise any right, power or privilege under this Agreement shall not constitute a waiver of that right, power, or privilege under this Agreement.

i. Assignability. This Agreement may not be assigned without the prior written consent of all of the Parties to this Agreement.

j. Third Parties. Nothing in this Agreement, whether express or implied, is intended to confer any rights or remedies under or by reason of this Agreement, on any person other than the Parties, their legal representatives, successors and permitted assigns. Nothing in this Agreement is intended to relieve or discharge the obligation of any third person to any Party, nor shall any provision of this Agreement be interpreted to give any third person any right of subrogation or action over or against the Parties.

k. Recording. The Parties intend this Agreement to be an interlocal agreement pursuant to section 163.01, Florida Statutes, and it shall be recorded by the PRWC with the Clerk of the Circuit Court in and for Polk, Hillsborough, Pasco, and Pinellas Counties, Florida.

l. Severability. If any part of this Agreement is contrary to, prohibited by or deemed invalid under applicable law or regulation, such provision shall be inapplicable and deemed omitted to the extent so contrary, prohibited or invalid, but the remainder shall not be invalidated and shall be given full force and effect so far as possible.

m. Governing Law and Venue. This Agreement and all transactions contemplated by this Agreement shall be governed by and construed and enforced in accordance with the laws of the State of Florida without regard to any contrary conflicts of law principle. Venue of all proceedings in connection with this Agreement shall be exclusively in Sarasota County, Florida and each Party waives whatever their respective rights may have been in the selection of venue.

n. Headings. The headings contained in this Agreement are for convenience of reference only, and shall not limit or otherwise affect in any way the meaning or interpretation of this Agreement.

o. Attorney's Fees. The Parties agree that each Party shall bear its own attorney's fees and costs incurred in connection with this Agreement.

p. Waiver of Jury Trial. The Parties expressly and specifically waive the right to a jury trial as to any issue in any way connected to this Agreement.

q. Counterparts and Electronic Signature. This Agreement may be executed in counterparts, each of which is an original, and by electronic signature or scanned copies, each of which is deemed an original.

r. No Construction Against Drafting Party. The Parties to this Agreement expressly recognize that this Agreement results from a negotiation process in which each Party was given the opportunity to consult with counsel and contribute to the drafting of this Agreement. Given this fact, no legal or other presumptions against the Party drafting any portion of this Agreement concerning its construction, interpretation, or otherwise shall accrue to the benefit of any Party to this Agreement and each Party expressly waives the right to assert such presumption in any proceeding or disputes connected with, arising out of, or involving this Agreement.

s. Public Records and Sunshine Compliance. Each Party shall comply with applicable public records and open meetings laws. The Parties acknowledge that documents created or received under this Agreement may be public records subject to disclosure.

t. Preservation of Authority. Each Party expressly preserves its statutory authority and discretion, including but not limited to, the District's authority to regulate consumptive uses of water, evaluate and act on applications, and ensure adequate water supply; TBW's authority under its interlocal agreement and governing statutes; and PRWC's authority under its interlocal agreement and governing statutes.

u. Miscellaneous Provisions.

i. No Party shall be deemed to be an agent of any other Party nor shall represent that it has the authority to bind any other Party.

ii. In computing any time period under this Agreement, any reference to days shall mean calendar days, unless business days are specifically referenced. In computing any period of time under this Agreement, exclude the day of the event that triggers the computation of the period of time. If the last day of a period of time is a Saturday, Sunday or legal holiday, the period of time shall run until the end of the next calendar day which is not a Saturday, Sunday or legal holiday.

iii. Nothing in this Agreement shall be deemed a waiver of any Party's police powers.

[Signatures begin on the following pages]

IN WITNESS WHEREOF, the Parties have caused this Agreement to be executed by their duly authorized officers as of the Effective Date.

Subject: **Notice of Final Agency Action – Approval**
Water Use Permit No.: 20 011794.003
Project Name: Alafia River Withdrawal Facility
County: Hillsborough

Dear Sir/Madam:

The Southwest Florida Water Management District (District) is in receipt of your application for Water Use Permit No. 20 011794.003. Based upon a review of the information you submitted, the application was approved by the District's Governing Board. A copy of the permit is enclosed for your records. Please refer to the attached Notice of Rights to determine any legal rights you may have concerning the District's agency action on the permit application described in this letter.

The District's action in this matter only becomes closed to future legal challenges from members of the public if such persons have been properly notified of the District's action and no person objects to the District's action within the prescribed period of time following the notification. The District does not publish notices of agency action. If you wish to limit the time within which a person who does not receive actual written notice from the District may request an administrative hearing regarding this action, you are strongly encouraged to publish, at your own expense, a notice of agency action in the legal advertisement section of a newspaper of general circulation in the county or counties where the activity will occur. Publishing notice of agency action will close the window for filing a petition for hearing. Legal requirements and instructions for publishing notices of agency action, as well as a noticing form that can be used, are available from the District's website at www.WaterMatters.org/permits/noticing. If you publish notice of agency action, a copy of the affidavit of publication provided by the newspaper should be sent to the District's Tampa Service Office for retention in this permit's File of Record.

Please be advised that the Governing Board has formulated a water shortage plan referenced in a Standard Water Use Permit Condition (Exhibit A) of your permit, and will implement such a plan during periods of water shortage. You will be notified during a declared water shortage of any change in the conditions of your Permit or any suspension of your Permit, or of any restriction on your use of water for the duration of any declared water shortage. Please further note that water conservation is a condition of your Permit and should be practiced at all times.

The ID tags for your withdrawals shall be installed by a District representative. This representative will attempt to contact you within 30 days to discuss placement of your tags. If you have any questions or concerns regarding your tags, please contact Joseph Hagin at 813-278-7784 in the Tampa Service Office. If you have any questions or concerns regarding your permit or any other information, please contact the Water Use Permit Bureau in the Tampa Service Office.

Sincerely,

April Breton Electronically Signed

April Breton

SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT
WATER USE PERMIT
Individual PERMIT
NO. 20 011794.003

PERMIT ISSUE DATE:	EXPIRATION DATE:	May [SW Board Mtg Date]__, 2040
July 22, 2025		

The Permittee is responsible for submitting an application to renew this permit no sooner than one year prior to the expiration date, and no later than the end of the last business day before the expiration date, whether or not the Permittee receives prior notification by mail. Failure to submit a renewal application prior to the expiration date and continuing to withdraw water after the expiration date is a violation of Chapter 373, Florida Statutes, and Chapter 40D-2, Florida Administrative Code, and may result in a monetary penalty and/or loss of the right to use the water. Issuance of a renewal of this permit is contingent upon District approval.

TYPE OF APPLICATION: Modification

GRANTED TO: Tampa Bay Water/Attn: Cathleen Beaudoin Jonas
2575 Enterprise Road
Clearwater, FL 33763

PROJECT NAME: Tampa Bay Water Alafia River Project

WATER USE CAUTION AREA(S): SOUTHERN WATER USE CAUTION AREA

COUNTY: Hillsborough

TOTAL QUANTITIES AUTHORIZED UNDER THIS PERMIT (in gallons per day)	
ANNUAL AVERAGE	32,200,000 gpd *
MAXIMUM	75,000,000 gpd

* The actual quantities authorized under the permit are based on the flows in the Alafia River as described in Special Condition No. 9. The annual average quantity shown above is a projection based on Historical Flows.

ABSTRACT:

This is a modification of an existing water use permit for public supply and authorizes a maximum daily withdrawal of 75 mgd of water from the Alafia River. Actual withdrawals are not limited by the Annual Average quantity and instead will be based on withdrawals in accord with permit conditions including the percentage withdrawal schedule provided below, which is increased from the previous revision of 10% to 19% of the available flow above the Minimum Flow threshold. Tampa Bay Water is a regional utility that relies on multiple sources to meet demand, including the Alafia River Withdrawal Facility which has been developed for conjunctive use to meet regional demand, optimize wellfield withdrawals, and relieve associated environmental stresses. There is no change in Use Type from the previous revision. The Annual Average quantity is an estimate only of the long-term average yield. The Maximum Daily quantity represents maximum system pumping capacity.

TBW ALAFIA RIVER DIVERSION SCHEDULE

Permitted daily withdrawal	When baseline flow for previous day is:
No withdrawals	≤128 cfs (82.7 mgd)
All flow above 128 cfs (82.7 mgd)	>128 cfs (82.7 mgd) and ≤ 158 cfs (102.1 mgd)
19% of Flow, up to 116.1 cfs (75 mgd)	>158 cfs (102.1 mgd)

Special Conditions include those that require the Permittee to submit the Annual Surface Water Withdrawal Report by July 1 of each year, monthly reporting of withdrawals, continued monitoring of river stage, streamflow and spring discharge. Report compliance with the Minimum Flow for the Alafia River, daily calculations of Baseline Flow and permitted withdrawal rates, and continued implementation of the Hydrobiological Monitoring Plan, with annual data and periodic interpretive reports also due by July 1 of each year.

Southwest Florida
Water Management District

STANDARD CONDITIONS:

The Permittee shall comply with the Standard Conditions attached hereto, incorporated herein by reference as Exhibit A and made a part hereof.

SPECIAL CONDITIONS:

1. All reports and data required by condition(s) of the permit shall be submitted to the District according to the due date(s) contained in the specific condition. If the condition specifies that a District-supplied form is to be used, the Permittee should use that form in order for their submission to be acknowledged in a timely manner. The only alternative to this requirement is to use the District Permit Information Center (www.swfwmd.state.fl.us/permits/epermitting/) to submit data, plans or reports online. There are instructions at the District website on how to register to set up an account to do so. If the report or
data is received on or before the tenth day of the month following data collection, it shall be deemed as a timely submittal.

   All mailed reports and data are to be sent to:

   Southwest Florida Water Management District
   Tampa Service Office, Water Use Permit
   Bureau 7601 U.S. Hwy. 301 North
   Tampa, Florida 33637-6759

   Submission of plans and reports: Unless submitted online or otherwise indicated in the special condition, the original and two copies of each plan and report, such as conservation plans, environmental analyses, aquifer test results, per capita annual reports, etc. are required.

   Submission of data: Unless otherwise indicated in the special condition, an original (no copies) is required for data submittals such as crop report forms, meter readings and/or pumpage, rainfall, water level, evapotranspiration, or water quality data.

   (499)

2. The Annual Average Daily quantity for District ID No. 1, Permittee ID No. 1, shown in the Withdrawal Point Quantity Table, is an estimate only of the long-term average yield, and is not intended to restrict the withdrawal quantities authorized from the Alafia River. The quantities withdrawn from the Alafia River are limited by Special Conditions in this Permit and the Maximum Daily quantity of 75 MGD.(221)

3. The Permittee shall investigate complaints related to withdrawals. This condition shall be an ongoing effort for the duration of this permit. All complainants will make an application to the Permittee and must receive an investigation report, including any action to be taken within a reasonable time by the Permittee. The Permittee shall file a report of the complaint, the findings of facts, and any mitigation action taken or to be taken by the Permittee, to the Water Use Bureau Chief for review and approval within 90 days of the receipt of any complaint. The report shall include:

   a. The name and address of each complainant;
   b. The date and nature of the complaint;
   c. A summary of the Permittee's investigation;
   d. A summary of the Permittee's determination, including details of any mitigation activities; and
   e. Cost of mitigation activity for each complaint.

   Full mitigation shall not exceed 180 days from complaint receipt, unless additional time is granted by the District. A summary of the investigations of complaint and mitigation activities related to the Alafia River Withdrawal Facility for the annual reporting period shall be provided in the Annual Report.(448)

4. The Permittee shall submit a concise individual annual report ("Alafia River Surface Water Withdrawal Annual Report") to the District which compiles the data collected during the course of the year, by Special Condition of this permit and as part of the HBMP, and provides an assessment of the water resources and environmental systems in the area of the Alafia River. The Surface Water Withdrawal

Annual Report shall concisely summarize the elements listed below, and any other elements within this

permit which require annual environmental reporting, with emphasis on the interactions between these elements, where appropriate. Three hard copies of each Surface Water Withdrawal Annual Report, plus one copy in electronic format, shall be submitted to the Water Use Bureau Chief by July 1 of each year. The report shall cover the preceding water year from October 1 to September 30.

1. Hydrologic Data and Water Production Summary. Flow metering, stage, streamflow and spring discharge monitoring data collected as part of this permit shall be summarized. This section shall also include a summary of activities conducted to maintain accuracy of flow metering, and discussion as to how this facility is operated in compliance with the Tampa Bay Water Optimized Regional Operations Plan.
2. Environmental Conditions and HBMP Implementation. Data collected as part of the HBMP shall be summarized and analyzed by the Permittee to document any effects of surface water withdrawals on the Alafia River and its estuary. Each annual report will contain a HBMP data report of all raw data collected during the past year. A brief summary of any recommended changes to the monitoring requirements shall also be included. More comprehensive analyses for the HBMP shall be included in the HBMP Interpretive reports which shall be submitted every five years.
3. Investigation of Complaints. A summary of the investigations of all complaints concerning adverse impacts to existing legal users, land uses and environmental features, as well as all of the Permittee's efforts to mitigate such adverse impacts, shall be provided for each reporting period. (524)

5. This Permit is located within the Southern Water Use Caution Area (SWUCA). Pursuant to Section 373.0421, Florida Statutes, the SWUCA is subject to a minimum flows and levels recovery strategy, which became effective on January 1, 2007. The Governing Board may amend the recovery strategy, including amending applicable water use permitting rules based on an annual assessment of water resource criteria, cumulative water withdrawal impacts, and on a recurring five-year evaluation of the status of the recovery strategy up to the year 2025 as described in Chapter 40D-80, Florida Administrative Code. This Permit is subject to modification to comply with new rules.(652)

6. A. Flow Metering
Flow data recorded at the Alafia River intake structure pipeline shall represent the total surface water source pumpage for the Alafia River Withdrawal Facility. For flow monitoring points equipped with SCADA, the Permittee shall maintain the following for each flow monitoring point: one venturi-type flow meter or other approved flow meter, one non-resettable totalizing recording device at each monitoring point, and one remote transmitter unit that transfers the recorded flow data by telemetry to the remote SCADA master station. The SCADA master station flow data shall be recorded on a daily basis for each flow monitoring point and for the combined facility pumpage. For all SCADA-equipped monitoring points, the non-resettable totalizing recording device at each monitoring point shall be recorded on an annual basis, and reported in the Annual Report with a comparison to the SCADA-retrieved cumulative flow for each monitoring point. If and when any part of the facility becomes equipped with SCADA, the provisions of this paragraph shall apply.

The Permittee shall undertake regular and routine testing, calibration and preventive/corrective maintenance for all flow meters to ensure that they have and maintain an accuracy within 5 percent of actual flow as installed. Within 3 working days of identification of a meter that does not meet this standard, the Permittee shall inform the District in writing of the facts regarding the problem. Until the problem is corrected, flows through the metered point shall be estimated. The Permittee shall correct the problem within 15 days following identification of the problem, or discontinue use of the withdrawal until the problem is corrected, unless an extension is confirmed in writing from the Water Use Permit Bureau Chief. The Annual Report shall summarize activities conducted to maintain accuracy of flow metering.

B. Stage, Streamflow and Spring Discharge Monitoring
The Permittee shall monitor the average daily stage and estimated average daily flow for the Alafia River, and the average daily stage and spring discharge for Buckhorn and Lithia Springs at the sites and frequencies listed in Exhibit D. The sites listed in Exhibit D are currently monitored in accordance with the South Central Hillsborough Regional Wellfield (SCHRWF) and Brandon Urban Dispersed Wellfield (BUDWF) Water Use Permits (WUPs 4352 and 11732, respectively). The Permittee may utilize data obtained from the SCHRWF and BUDWF to satisfy the permit monitoring requirements for this condition. However, should monitoring at the sites listed in Exhibit D cease to be required under

permit, or establish new District-approved sites to replace the lost sites.

The sites listed in Exhibit D shall continue to be monitored and reported in accordance with the SCHRWF and BUDWF permits. Data from these sites shall not be reported for this permit as long as the data is submitted in support of the SCHRWF and BUDWF permits. For the purpose of this permit, data obtained from the listed sites during the annual reporting period shall be summarized in the Annual Report required by this permit. Any proposed changes to the recording frequency and locations shall be approved by the Water Use Permit Bureau Chief, and shall be summarized in the Annual Report as described in the applicable Special Condition.

(675)

7. The Permittee shall continue implementation of the Tampa Bypass Canal/Alafia River Water Supply Projects Hydrobiological Monitoring Plan 2010 Update (HBMP), dated February 2011 and as modified on 8/1/2012, which is incorporated herein as Exhibit C. Any proposed changes to the HBMP should be submitted in writing to the Water Use Permit Bureau Chief for review and approval.

The HBMP includes an annual Data report due by July 1 each year, and periodic Interpretive reports on a five-year cycle with the next due by July 1, 2026. Upon completion of each five-year cycle of the HBMP, a draft Interpretive report shall be submitted to the District as part of the overall annual Data report. The District shall review and provide written comments within 45 days of the submittal of each draft Interpretive report. Final Interpretive reports shall be submitted by the Permittee within 90 days of receipt of District comments.

The District will review the results of these reports to determine if the withdrawals have or are expected to result in unacceptable environmental impacts to the natural resources of the Alafia River and its estuary as addressed in Section 4 of the District's Basis of Review, Water Use Permit Information Manual, Part B. If unacceptable environmental impacts have or are expected to occur due to the withdrawals, then the District shall require a revision to the withdrawal schedule.(676)

8. The following withdrawal facilities shall continue to be maintained and operated with existing, non-resettable, totalizing flow meter(s) or other measuring device(s) as approved by the Water Use Permit Bureau Chief:

District ID No. 1, Permittee ID No. 1 (Alafia River Withdrawal Facility intake near Bell Shoals Road)
District ID No. 2, Permittee ID No. ALF-2 (Influent meter into the Regional Water Treatment Plant from all sources)

Meter reading and reporting, as well as meter accuracy checks every five years shall be in accordance with instructions in Exhibit B, Metering Instructions, attached to and made part of this permit.(719)

9. Surface water withdrawals at DID No.1 will be based on adjusted previous day's average flow of the Alafia River at the "Alafia River at Lithia" gage (USGS Gage 02301500) combined with weekly measured flows at Buckhorn Springs and Lithia Springs Major. This will be referred to as Baseline Flow and shall be determined on a daily basis using the following formula:

1. Average daily river flow as measured at the Lithia gage for the previous day shall be multiplied by a factor of 1.117, to account for additional watershed contributions between the gage and the Alafia River Withdrawal Facility intake.
2. The most recent springflow measured at Buckhorn Springs and Lithia Springs Major shall be added to the product in Step One.
3. The Annual Average Daily withdrawal of 5.06 MGD (approximately 8 cfs) permitted to upgradient existing legal user Mosaic (WUP 1532) shall be added to the sum in Step Two.
4. The resulting quantity is the Baseline Flow for purposes of determining Tampa Bay Water's permitted daily withdrawal.

Baseline Flow shall be calculated and recorded on a daily basis and reported to the Permit Data Section (using District approved forms) on or before the fifteenth (15th) day of the following month, as DID No. 110. The recordings shall include daily average water flow in million gallons per day (MGD), and daily average water flow in cubic feet per second (cfs).

The quantities withdrawn from the lower Alafia River by Tampa Bay Water are limited by the adopted Minimum Flow, delineated in Rule 40D-8.041(8), Florida Administrative Code, and the maximum diversion capacity, and are set forth as referenced below:
a. No diversion from the Alafia River may occur when the calculated Baseline Flow for the previous day is 128 cfs (82.7 mgd) or less, representing the Low Flow Threshold of 120 cfs plus the Annual Average Daily withdrawal of 8 cfs permitted to Mosaic;
b. For a calculated Baseline Flow between 128 cfs (82.7 mgd) and 158 cfs (102.1 mgd) for the previous day, the daily diversion is limited to the difference between the Baseline Flow and 128 cfs (82.7 mgd).
c. For a calculated Baseline Flow of 158 cfs (102.1 mgd) or greater for the previous day, the daily diversion is limited to 19% of the Baseline Flow.
d. The maximum diversion on any single day shall not exceed 75 MGD (116.1 cfs).

Potential Adjustment of Special Condition 9:

(i) Existing Legal User Status: After December 31, 2032, but before 2040, if the Polk Regional Water Cooperative (PRWC) submits a water use permit application to the District for the withdrawal of surface water from the North or South Prongs of the Alafia River for potable public water use solely for its members located in Polk County consistent with the Settlement and Coordination Agreement Between Polk Regional Water Cooperative, Tampa Bay Water, & Southwest Florida Water Management District (Settlement Agreement), Tampa Bay Waters's existing legal user status, as defined, in part, under condition 9.3. above, shall be limited to 14% of Baseline Flow, unless a different percentage is determined based on the Settlement Agreement for a prorata reduction.

(ii) Tampa Bay Water Alafia River Allocation Modification: After December 31, 2032, but before December 31, 2040, upon the request of PRWC, within thirty (30) days, Tampa Bay Water shall submit a letter to the District to modify its permit to limit its permitted withdrawal from the Lower Alafia River based on the following modified diversion schedule, to become effective upon actual commencement of the withdrawal of surface water for potable water use by the PRWC from the North or South Prongs of the Alafia River located in Polk County.

(iii) Modification or Deletion of Special Condition 9: Special Condition 9 may only be modified or deleted before the expiration date of this permit in 2040 if the PRWC accepts an Alternative Project as set forth in the Settlement Agreement, PRWC fails to determine an Alafia River project is feasible as set forth in the Settlement Agreement, or the parties to the Settlement and Coordination Agreement agree in writing otherwise.

1. No diversion from the Alafia River may occur when the calculated Baseline Flow for the previous day is 128 cfs (82.7 mgd) or less.

2. For a calculated Baseline Flow between 128 cfs (82.7 mgd) and 149 cfs (96.3 mgd) for the previous day, the daily diversion is limited to the difference between the Baseline Flow and 128 cfs (82.7 mgd).

3. For a calculated Baseline Flow of 149 cfs (96.3 mgd) or greater for the previous day, the daily diversion is limited to 14% of the Baseline Flow.

4. The maximum diversion on any single day shall not exceed 75 mgd (116.1 cfs). (990)

10. This permit and the facilities governed by the permit shall be operated in accordance with the Tampa Bay Water Optimized Regional Operations Plan, and all modifications thereof, as approved by the District.(991)

11. Total influent quantities delivered to the C.W. Bill Young Reservoir shall be calculated on a daily basis and reported to the District as District ID No. 4, Permittee ID No. RES INF by the fifteenth day of each month.(992)

12. The remedies for violation of this permit are cumulative. Thus, the pursuit of one remedy shall not preclude the pursuit of other remedies provided by this permit or by applicable law. The pursuit of any remedy provided in this permit or by applicable law shall not constitute a forfeiture or waiver of any other remedy. The waiver of one violation shall not be deemed a waiver of any other violation. Forbearance to enforce one or more of the remedies provided by this permit or by applicable law on

an event of violation shall not be deemed or construed to constitute a waiver of the right to any remedy for that violation.(995)

40D-2
Exhibit A

WATER USE PERMIT STANDARD CONDITIONS

1. With advance notice to the Permittee, District staff with proper identification shall have permission to enter, inspect, collect samples, take measurements, observe permitted and related facilities and collect and document any information deemed necessary to determine compliance with the approved plans, specifications and conditions of this permit. The Permittee shall either accompany District staff onto the property or make provision for access onto the property.

2. When necessary to analyze impacts to the water resource or existing users, the District shall require the Permittee to install flow metering or other measuring devices to record withdrawal quantities and submit the data to the District.

3. A District identification tag shall be prominently displayed at each withdrawal point that is required by the District to be metered or for which withdrawal quantities are required to be reported to the District, by permanently affixing the tag to the withdrawal facility.

4. The Permittee shall mitigate any adverse impact to environmental features or offsite land uses as a result of withdrawals. When adverse impacts occur or are imminent, the District shall require the Permittee to mitigate the impacts. Examples of adverse impacts include the following:
   A. Significant reduction in levels or flows in water bodies such as lakes, impoundments, wetlands, springs, streams or other watercourses; or
   B. Damage to crops and other vegetation causing financial harm to the owner; and
   C. Damage to the habitat of endangered or threatened species.

5. The Permittee shall mitigate any adverse impact to existing legal uses caused by withdrawals. When adverse impacts occur or are imminent, the District may require the Permittee to mitigate the impacts. Adverse impacts include:

   A. A reduction in water levels which impairs the ability of a well to produce water;
   B. Significant reduction in levels or flows in water bodies such as lakes, impoundments, wetlands, springs, streams or other watercourses; or
   C. Significant inducement of natural or manmade contaminants into a water supply or into a usable portion of an aquifer or water body.

6. Permittee shall notify the District in writing within 30 days of any sale, transfer, or conveyance of ownership or any other loss of permitted legal control of the Project and / or related facilities from which the permitted consumptive use is made. Where Permittee's control of the land subject to the permit was demonstrated through a lease, the Permittee must either submit documentation showing that it continues to have legal control or transfer control of the permitted system / project to the new landowner or new lessee. All transfers of ownership are subject to the requirements of Rule 40D-1.6105, F.A.C. Alternatively, the Permittee may surrender the consumptive use permit to the District, thereby relinquishing the right to conduct any activities under the permit.

7. All withdrawals authorized by this WUP shall be implemented as conditioned by this permit, including any documents submitted as part of the permit application incorporated by reference in a permit condition. This permit is subject to review and modification, enforcement action, or revocation, in whole or in part, pursuant to Section 373.136 or 373.243, F.S.

8. This permit does not convey to the Permittee any property rights or privileges other than those specified herein, nor relieve the Permittee from complying with any applicable local government, state, or federal law, rule, or ordinance.

9. The Permittee shall cease or reduce surface water withdrawal as directed by the District if water levels in lakes fall below the applicable minimum water level established in Chapter 40D-8, F.A.C., or rates of flow in streams fall below the minimum levels established in Chapter 40D-8, F.A.C.

10. The Permittee shall cease or reduce withdrawal as directed by the District if water levels in aquifers fall below the minimum levels established by the Governing Board.

11. A Permittee may seek modification of any term of an unexpired permit. The Permittee is advised that section 373.239, F.S., and Rule 40D-2.331, F.A.C., are applicable to permit modifications.

12. The Permittee shall practice water conservation to increase the efficiency of transport, application, and use, as well as to decrease waste and to minimize runoff from the property. At such time as the Governing Board adopts specific conservation requirements for the Permittee's water use classification, this permit shall be subject to those requirements upon notice and after a reasonable period for compliance.

13. The District may establish special regulations for Water-Use Caution Areas. At such time as the Governing Board adopts such provisions, this permit shall be subject to them upon notice and after a reasonable period for compliance.

14. Nothing in this permit should be construed to limit the authority of the District to declare a water shortage and issue orders pursuant to chapter 373, F.S. In the event of a declared water shortage, the Permittee must adhere to the water shortage restrictions, as specified by the District. The Permittee is advised that during a water shortage, reports shall be submitted as required by District rule or order.

15. This permit is issued based on information provided by the Permittee demonstrating that the use of water is reasonable and beneficial, consistent with the public interest, and will not interfere with any existing legal use of water. If, during the term of the permit, it is determined by the District that a statement in the application and in the supporting data are found to be untrue and inaccurate, the use is not reasonable and beneficial, in the public interest, or does impact an existing legal use of water, the Governing Board shall modify this permit or shall revoke this permit following notice and hearing, pursuant to sections 373.136 or 373.243, F.S. The Permittee shall immediately notify the District in writing of any previously submitted information that is later discovered to be inaccurate.

16. Within the Southern Water Use Caution Area, if the District determines that significant water quantity or quality changes, impacts to existing legal uses, or adverse environmental impacts are occurring, the District, upon reasonable notice to the Permittee, including a statement of facts upon which the District based its determination, may reconsider the quantities permitted or other conditions of the permit as appropriate to address the change or impact, but only after an opportunity for the Permittee to resolve or mitigate the change or impact or to request a hearing.

17. All permits are contingent upon continued ownership or legal control of all property on which pumps, wells, diversions or other water withdrawal facilities are located.

Exhibit B
Instruction
s

METERING INSTRUCTIONS

The Permittee shall meter withdrawals from surface waters and/or the ground water resources, and meter readings from each withdrawal facility shall be recorded on a monthly basis within the last week of the month. The meter reading(s) shall be reported to the Water Use Permit Bureau on or before the tenth day of the following month for monthly reporting frequencies.

For bi-annual reporting, the data shall be recorded on a monthly basis and reported on or before the tenth day of the month
following the sixth month of recorded data.

The Permittee shall submit meter readings online using the Permit Information Center at www.swfwmd.state.fl.us/permits/epermitting/ or on District supplied scanning forms unless another arrangement for submission of this data has been approved by the District. Submission of such data by any other unauthorized form or mechanism may result in loss of data and subsequent delinquency notifications. Call the Water Use Permit Bureau inTampa at (813) 985-7481 if difficulty is encountered.

The meters shall adhere to the following descriptions and shall be installed or maintained as follows:

1. The meter(s) shall be non-resettable, totalizing flow meter(s) that have a totalizer of sufficient magnitude to retain total gallon data for a minimum of the three highest consecutive months permitted quantities. If other measuring device(s) are proposed, prior to installation, approval shall be obtained in writing from the Water Use Permit Bureau Chief.
2. The Permittee shall report non-use on all metered standby withdrawal facilities on the scanning form or approved alternative reporting method.
3. If a metered withdrawal facility is not used during any given month, the meter report shall be submitted to the District indicating the same meter reading as was submitted the previous month.
4. The flow meter(s) or other approved device(s) shall have and maintain an accuracy within five percent of the actual flow as installed.
5. Meter accuracy testing requirements:
   A. For newly metered withdrawal points, the flow meter installation shall be designed for inline field access for meter accuracy testing.
   B. The meter shall be tested for accuracy on-site, as installed according to the Flow Meter Accuracy Test Instructions in this Exhibit B, every five years in the assigned month for the county, beginning from the date of its installation for new meters or from the date of initial issuance of this permit containing the metering condition with an accuracy test requirement for existing meters.
   C. The testing frequency will be decreased if the Permittee demonstrates to the satisfaction of the District that a longer period of time for testing is warranted.
   D. The test will be accepted by the District only if performed by a person knowledgeable in the testing equipment used.
   E. If the actual flow is found to be greater than 5% different from the measured flow, within 30 days, the Permittee shall have the meter re-calibrated, repaired, or replaced, whichever is necessary. Documentation of the test and a certificate of re-calibration, if applicable, shall be submitted within 30 days of each test or re-calibration.
6. The meter shall be installed according to the manufacturer's instructions for achieving accurate flow to the specifications above, or it shall be installed in a straight length of pipe where there is at least an upstream length equal to ten (10) times the outside pipe diameter and a downstream length equal to two (2) times the outside pipe diameter. Where there is not at least a length of ten diameters upstream available, flow straightening vanes shall be used in the upstream line.
7. Broken or malfunctioning meter:
   A. If the meter or other flow measuring device malfunctions or breaks, the Permittee shall notify the District within 15 days of discovering the malfunction or breakage.
   B. The meter must be replaced with a repaired or new meter, subject to the same specifications given above, within 30 days of the discovery.

C. If the meter is removed from the withdrawal point for any other reason, it shall be replaced with another meter having the same specifications given above, or the meter shall be reinstalled within 30 days of its removal

from the withdrawal. In either event, a fully functioning meter shall not be off the withdrawal point for more than 60 consecutive days.

8. While the meter is not functioning correctly, the Permittee shall keep track of the total amount of time the withdrawal point was used for each month and multiply those minutes times the pump capacity (in gallons per minute) for total gallons. The estimate of the number of gallons used each month during that period shall be submitted on District scanning forms and noted as estimated per instructions on the form. If the data is submitted by another approved method, the fact that it is estimated must be indicated. The reason for the necessity to estimate pumpage shall be reported with the estimate.

9. In the event a new meter is installed to replace a broken meter, it and its installation shall meet the specifications of this condition. The permittee shall notify the District of the replacement with the first submittal of meter readings from the new meter.

FLOW METER ACCURACY TEST INSTRUCTIONS

1. Accuracy Test Due Date - The Permittee is to schedule their accuracy test according to the following schedule:

A. For existing metered withdrawal points, add five years to the previous test year, and make the test in the month assigned to your county.

B. For withdrawal points for which metering is added for the first time, the test is to be scheduled five years from the issue year in the month assigned to your county.

C. For proposed withdrawal points, the test date is five years from the completion date of the withdrawal point in the month assigned to your county.

D. For the Permittee's convenience, if there are multiple due-years for meter accuracy testing because of the timing of the installation and/or previous accuracy tests of meters, the Permittee can submit a request in writing to the Water Use Permit Bureau Chief for one specific year to be assigned as the due date year for meter testing. Permittees with many meters to test may also request the tests to be grouped into one year or spread out evenly over two to three years.

E. The months for accuracy testing of meters are assigned by county. The Permittee is requested but not required to have their testing done in the month assigned to their county. This is to have sufficient District staff available for assistance.

January	Hillsborough
February	Manatee, Pasco
March	Polk (for odd numbered permits)*
April	Polk (for even numbered permits)*
May	Highlands
June	Hardee, Charlotte
July	None or Special Request
August	None or Special Request
September	Desoto, Sarasota
October	Citrus, Levy, Lake
November	Hernando, Sumter, Marion
December	Pinellas

* The permittee may request their multiple permits be tested in the same month.

2. Accuracy Test Requirements: The Permittee shall test the accuracy of flow meters on permitted withdrawal points as follows:

A. The equipment water temperature shall be set to 72 degrees Fahrenheit for ground water, and to the measured water temperature for other water sources.

B. A minimum of two separate timed tests shall be performed for each meter. Each timed test shall consist of measuring flow using the test meter and the installed meter for a minimum of four minutes duration. If the two tests do not yield consistent results, additional tests shall be performed for a minimum of eight minutes or

longer per test until consistent results are obtained.

C. If the installed meter has a rate of flow, or large multiplier that does not allow for consistent results to be obtained with four- or eight-minute tests, the duration of the test shall be increased as necessary to obtain accurate and consistent results with respect to the type of flow meter installed.

D. The results of two consistent tests shall be averaged, and the result will be considered the test result for the meter being tested. This result shall be expressed as a plus or minus percent (rounded to the nearest one-tenth percent) accuracy of the installed meter relative to the test meter. The percent accuracy indicates the deviation (if any), of the meter being tested from the test meter.

3. Accuracy Test Report: The Permittees shall demonstrate that the results of the meter test(s) are accurate by submitting the following information within 30 days of the test:

A. A completed Flow Meter Accuracy Verification Form, Form LEG-R.101.00 (5/14) for each flow meter tested. This form can be obtained from the District's website (www.watermatters.org) under "ePermitting and Rules" for Water Use Permits.

B. A printout of data that was input into the test equipment, if the test equipment is capable of creating such a printout;

C. A statement attesting that the manufacturer of the test equipment, or an entity approved or authorized by the manufacturer, has trained the operator to use the specific model test equipment used for testing;

D. The date of the test equipment's most recent calibration that demonstrates that it was calibrated within the previous twelve months, and the test lab' s National Institute of Standards and Testing (N.I.S.T.) traceability reference number.

E. A diagram showing the precise location on the pipe where the testing equipment was mounted shall be supplied with the form. This diagram shall also show the pump, installed meter, the configuration (with all valves, tees, elbows, and any other possible flow disturbing devices) that exists between the
pump and the test location clearly noted with measurements. If flow straightening vanes are utilized, their location(s) shall also be included in the diagram.

F. A picture of the test location, including the pump, installed flow meter, and the measuring device, or for sites where the picture does not include all of the items listed above, a picture of the test site with a notation of distances to these items.

WELL COMPLAINT INSTRUCTIONS

The permittee shall adhere to the following process for handling water resource, surface or ground water withdrawal point impact, dewatering complaints, or discharge/seepage of water from their property:

1. Within 48 hours of a complaint received by the Permittee related to their withdrawal or use of water or dewatering activity, the Permittee shall notify the District, perform a preliminary investigation to determine whether the Permittee's pumpage, dewatering activity, or discharge/seepage from their property may have caused the problem.
2. If this preliminary assessment indicates that the Permittee may be responsible, the Permittee shall, within 72 hours of complaint receipt, supply the complainant with any water necessary for health and safety purposes, such as drinking water.
3. If the resulting investigation determines that the Permittee was not responsible for the well problem, the Permittee shall document the reasons for this determination.
4. If the detailed investigation confirms that the complainant's problem was caused by the Permittee's pumpage, dewatering, or discharge or water impoundment activities:
   A. The complainant's problem shall be fully corrected within 15 days of complaint receipt.
   B. Impacts to wells: Full correction shall be restoration of the complainant's well to pre-impact condition or better, including the aspects of pressure levels, discharge quantity, and water quality. This

detailed investigation shall include, but not be limited to, an analysis of water levels and pumpage impacts at the time of the complainant's problem, well and pump characteristics including depths, capacity, pump

curves, and irrigation system requirements.

5. The Permittee shall file a report of the complaint, the findings of facts, appropriate technical data, and any mitigating action taken or to be taken by the Permittee, to the Water Use Permit Bureau Chief, for review and approval within 20 days of the receipt of any complaint. The report shall include:
   A. The name and address of each complainant;
   B. The date and nature of the complaint;
   C. A summary of the Permittee's investigation;
   D. A summary of the Permittee's determination, including details of any mitigation activities; and
   E. Cost of mitigation activity for each complaint.
6. A copy of the report shall be sent to the complainant within 20 days of complaint receipt.

April Breton Electronically Signed

Authorized Signature
SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT

This permit, issued under the provision of Chapter 373, Florida Statues and Florida Administrative Code 40D-2, authorizes the Permittee to withdraw the quantities outlined above, and may require various activities to be performed by the Permittee as described in the permit, including the Special Conditions. The permit does not convey to the Permittee any property rights or privileges other than those specified herein, nor relieve the Permittee from complying with any applicable local government, state, or federal law, rule, or ordinance.

1.0 Introduction

Special conditions in the Southwest Florida Water Management District (SWFWMD or District) Water Use Permits (WUPs) 2011794.00 and 2011796.00 required development and implementation of comprehensive hydrobiological monitoring programs (HBMPs) for the Alafia River and the Tampa Bypass Canal/Hillsborough River Water Supply Projects. Because of the consistent elements and the close proximity of the two water supply projects, a single, integrated HBMP was designed and implemented to meet the permit requirements for both projects (PBS&J, 2000).

This document, the HBMP 2010 Update, incorporates all previously approved program modifications and reflects the current HBMP as of July 2010.

1.1. Background

Design of the Alafia River/Tampa Bypass Canal HBMP began in May 1999. The HBMP was designed in a series of workshops and subcommittee meetings attended by regulatory agency and local government representatives, and other stakeholders. A final HBMP design document was completed in late 1999 (PBS&J, 2000).

HBMP field sampling was initiated in April 2000, and continued implementation of the HBMP has been required under special conditions for the renewed and modified water use permits for these regional public water supply projects. The HBMP was intended to be routinely modified based on field conditions and the ongoing evaluation of HBMP data.

In the ten years since the acceptance of the final HBMP design by both the design group and the Tampa Bay Water Board, several modifications have been made to the HBMP design. These modifications were in response to requests by the District and other stakeholders, logistical problems encountered during early implementation, and the sampling modifications identified based on evaluations of HBMP data.

Potential modifications to improve the monitoring program have been provided in HBMP annual and multi-year interpretative reports and discussed at Annual HBMP Meetings. All modifications approved by the District and incorporated into the program are listed in Appendix A.

1.2. HBMP Goals and Objectives

In accordance with the District's Basis for Review for water use permitting, the minimal goal of the HBMP is to generate information at an appropriate scale and resolution to determine if the permitted water supply projects are in compliance with District rules. Accordingly, the overall goals established for the HBMP are consistent with the District's performance standards provided in the Basis of Review.

The goal of the HBMP is to ensure that reduced flows in the Tampa Bypass Canal, Hillsborough River and Alafia River attributable to Tampa Bay Water's permitted surface water withdrawals do not deviate from the normal rate and range of fluctuation to the extent that:

- Water quality, vegetation, and animal populations are adversely impacted in streams and estuaries
- Salinity distributions in tidal streams and estuaries are significantly altered as a result of withdrawals
- Recreational use or aesthetic qualities of the resource are adversely impacted.

In addition to the above stated goals, the 1999 design process also generated programmatic objectives to address the District's process for evaluating compliance with these Water Use Permits. Accordingly, stakeholders agreed upon HBMP objectives as follows:

- Document existing conditions in the potentially affected waterbodies
- Enable the detection of changed conditions in the potentially affected waterbodies
- Determine if the detected changed conditions are attributable to reductions in freshwater inflows
- Provide a scientifically defensible means to evaluate whether the permitted surface water withdrawals are causing or significantly contributing to the detected changed conditions
- Determine whether the detected changed conditions constitute or could result in unacceptable adverse impacts
- Recommend appropriate management actions or operational changes designed to eliminate or mitigate unacceptable adverse impacts if they occur or are expected to occur.

As reflected in the above listed objectives, the overall purpose and scope of the HBMP extend beyond just data acquisition, analysis, and reporting. The HBMP also incorporates programmatic criteria that have been developed to ensure that the permitted withdrawals are consistent with District rules throughout the lifetime of the permits.

1.3. HBMP Monitoring Areas

Stakeholders involved in the 1999 design process came to consensus that any potential impacts from the permitted surface water withdrawals would likely first be manifested in the river systems where surface water withdrawals will take place, and possibly Hillsborough Bay. Therefore, the potentially affected waterbodies or portions of waterbodies were identified based on geographic areas of concern; these were defined as "reporting units" for purposes of monitoring program design.

HBMP reporting units were established for each of five potentially affected waterbodies:

- The lower Alafia River below Bell Shoals Road
- The Tampa Bypass Canal/Palm River below Structure S-160
- McKay Bay
- The lower Hillsborough River below the City of Tampa dam
- Hillsborough Bay

The design stakeholder group concluded that Hillsborough Bay proper could be potentially affected by the permitted water supply projects, but that additional sampling in Hillsborough Bay

as a component of the HBMP was not warranted for two reasons. First, impacts from Tampa Bay Water withdrawals should be detected in the other reporting units before being detected in Hillsborough Bay. Second, the data gathered from existing long-term EPCHC and FWRI monitoring programs can be used to characterize the status of this reporting unit.

1.4. HBMP Monitoring Elements

The HBMP has three monitoring program elements:

- Hydrology/Water quality
- Biota
- Habitat/Vegetation

During the design of the HBMP, critical indicators were identified for each monitoring element in each reporting unit. Critical indicators are units of measure that describe the status of the statistical populations or subpopulations of interest, usually in response to some environmental stressor. Structural and hydrobiological differences among the reporting units necessitate slightly different groups of critical indicators for each.

Specific monitoring objectives for each of the three HBMP elements adopted by the stakeholder group are summarized briefly below.

- Hydrology/Water Quality
    - Estimate the daily freshwater inflows, freshwater withdrawals, and water levels in each reporting unit.
    - Estimate the distribution of water quality indicators by reporting unit on an appropriate temporal basis.

Estimates of freshwater inflows and withdrawals, and water levels, are to be made on a daily basis. The temporal basis is consistent for all water quality indicators; however, the temporal basis differs among the spatial reporting units. All reporting units have adequate sample size to ensure both annual and seasonal estimates of water quality conditions.

- Biota
    - Estimate by reporting unit on an appropriate temporal basis, the species composition (to the lowest practical identifiable level), and abundance and distribution of:
        - Juvenile and adult fishes
        - Benthic macroinvertebrate infauna and epifauna
        - Ichthyoplankton and other macrozooplankton.

As with water quality, the temporal basis is consistent for all biotic indicators, however, the temporal basis differs among the spatial reporting units. All reporting units have adequate sample size to ensure both annual and seasonal estimates of biotic conditions in all reporting units.

An additional indicator for the biota element, "estimate the species composition (to the lowest practical identifiable level) and abundance of water-dependent birds in upper McKay Bay and

the Alafia Banks on an appropriate temporal basis", was included in the initial design, but was discontinued from the program based on evaluation of data collected (see Appendix A).

- Habitat/Vegetation
  - Estimate the areal extent and upstream/downstream limits of emergent vegetation communities by reporting unit on a periodic basis.
  - Estimate species composition and relative abundance of submerged aquatic vegetation communities in the Alafia River on periodic basis.
  - Estimate the distribution of sediment grain size and sediment total organic matter by reporting unit on an appropriate temporal basis (derived from benthic sampling).

Typically, there is little within-year variation in the habitat indicators, therefore, estimation of the status of these indicators on an annual or multi-year basis was considered appropriate. The temporal basis is consistent for all habitat indicators across all spatial reporting units. All reporting units have adequate sample size to ensure annual estimates of habitat conditions.

2.0 HBMP Design Approach

This section provides an overview of the sampling techniques and strategies used in the HBMP. Sections 2.1 and 2.2 discuss the general design of the program. Section 2.3 discusses the general indicators used in the program. HBMP geographic reporting units, spatial strata and randomization, temporal stratification, and considerations for each reporting unit are discussed in Sections 2.4-2.6.

2.1. HBMP Design - General Considerations

Appropriate environmental monitoring programs are critical components of effective resource management. According to the National Research Council (1990), effective environmental monitoring:

- Provides the information needed to evaluate the effectiveness of, and to appropriately adjust, resource management actions
- Provides an early warning system, allowing for lower cost solutions to environmental problems
- Contributes to the knowledge of ecosystems and how they are affected by human activity, and such knowledge allows for the establishment of priorities for environmental protection and for the assessment of status and trends
- Provides information that helps to answer layperson questions
- Is essential for the construction, adjustment, and verification of quantitative predictive models which are an important basis for evaluating, developing, and selecting environmental management strategies
- Provides resource managers the scientific rationale for setting environmental standards
- Determines legal compliance with established environmental standards and conditions as set forth in regulatory programs.

Environmental monitoring programs need to have clearly articulated goals and objectives to minimize data gaps and unanswered critical questions. Therefore, monitoring programs need to be properly designed at the outset, and monitoring methods appropriately applied, if they are to meet the multiple expectations of all those who rely on the information generated. Even when monitoring programs are technically sound, it is their overall design and institutional context that often limits the usefulness of the resulting information.

The National Research Council (1990) has identified the following factors for sound program design and objective implementation of monitoring programs:

- The goals and objectives of the monitoring program must be clearly articulated in terms that pose questions that are meaningful to the public and that provide the basis for scientific investigation
- Not only must data be gathered, but attention must also be paid to their management, synthesis, interpretation, and analysis
- Procedures for quality assurance are needed, including multiple levels of peer review

- Well-designed monitoring programs often result in unanswered questions about environmental processes or human impacts. Therefore, where feasible, supportive research should be provided
- Adequate resources are needed not only for data collection but also for detailed analysis, evaluation, and reporting over the long term
- Programs should be sufficiently flexible to allow for their modification when and where changes in conditions or new information suggests the need
- Provision should be made to ensure that monitoring information is made available to all interested parties in a form that is useful to them.

2.2. General Design Criteria Associated with HBMP Monitoring Elements

The initial step undertaken in the development of the HBMP was to define those parameters that were thought to be indicators of potential changes in each of the potentially affected water bodies. The next step was to define the geographical areas where data collection should be implemented. It was agreed that the HBMP sampling design should provide technically sound and practical methods for collecting the data needed to obtain unbiased population, subpopulation, and variance estimates.

Unbiased population and subpopulation estimates are metrics whose average value, taken over all possible samples, is equal to the population parameter value of the metric. In other words, the estimate gives the correct value for some measure of the population. Here, the term **population** refers to the totality of individual observations about which inferences are to be made within a definitely specified sampling area limited in space and time.

Cochran et al. (1954) point out that the population to be sampled (the *sampled* population) should coincide with the population about which inferences are to be drawn (the *target* population). Cochran (1977) further states that at times, for reasons of practicability or convenience, the sampled population is more restricted than the target population. In such cases, it should be noted that conclusions drawn from the sample apply to the sampled population. Judgment must be used to determine the extent to which the conclusions will also apply to the target population. One way in which this problem can be avoided is to ensure at the design phase that the sampled population is carefully defined to closely agree with the target population definition.

A **subpopulation** is a specific portion of the population, defined either in space or time. For example, the subpopulation may be the shallow portion (defined by some specific depth) of the waterbody of concern. A subpopulation could also be all measurements made in a particular season of the year (e.g., wet or dry season subpopulations).

Sampling theory was employed to determine the best design for the HBMP sampling strategy. There are basically two common types of sampling strategies (Cochran, 1977):

Probability Sampling - Employing this approach requires a definition of the set of distinct samples that the sampling program is capable of sampling if applied to a specific population.

Each possible sample must have a known probability of selection. The samples are selected by a random process in which each sample receives its appropriate probability of being selected.

Nonprobability Sampling - Common approaches include: sampling a restricted portion of the population that is readily accessible (e.g., fixed station sampling of salinity from a bridge); haphazard sample selection without conscious planning; and a selection of "typical" or "representative" sample units that are considered close to the average of the target population.

If conditions are appropriate, each of the methods can provide useful results. However, the only way to verify if an estimate is unbiased is to compare it with the actual population values or an estimate derived from a probability sampling approach. Even if such a test comparison demonstrates that the nonprobability sampling estimate is unbiased, this does not necessarily mean that method will continue to give unbiased results under all circumstances. For example, future changes in drainage patterns in a watershed may cause more or less runoff to enter the waterbody of concern. Therefore, in this example, checks of the unbiased nature of the nonprobability sample estimate would have to continue throughout the length of the monitoring program. A probability sampling approach yields unbiased estimates regardless of changing conditions.

Unbiased variance estimates will provide a measure of uncertainty in the population and subpopulation estimates. In order to ensure that variance estimates are unbiased, it is recommended that the sampling design follow the basic rules for probability sampling and variance estimation. Thus, for all elements of the sampling design, at least two samples must be collected from each subpopulation for which an unbiased estimate of variance is required, and each sampling unit in the subpopulation must have a known, non-zero probability of inclusion in the sample. In addition, the pairwise inclusion probabilities of all possible combinations of the two samples must be known and non-zero. Logistical constraints may require that some sampling units have a lower inclusion probability than others, and can be incorporated into the sampling design, if necessary. The inclusion probabilities used to select sampling units will be specified quantitatively, introduced as weights in all computations of estimates and associated variances, and hence allow all estimates to be unbiased.

Given the above conditions, and based on the efforts of the HBMP design stakeholder group, it was concluded that a probability-based design was best suited to meet the programmatic goals and objectives of the HBMP. It should, however, be noted that several other data needs were also identified that would not be best addressed using a probability-based approach. These informational needs were anticipated to be addressed separately as "special studies" (see Appendix A and PBS&J, 2000 for additional information).

To implement the design approach, a series of decisions were made regarding the specifics of the monitoring program design. First, specific **monitoring objectives** were defined. Second, the **indicators** of the status of the population (or subpopulations) were defined. Third, the **reporting units** were defined with respect to both space and time.

The general probability sampling approach allows inferences to be drawn not only about the target populations but also a variety of subpopulations. As a general rule of thumb, if it is desired

to draw an inference with regard to a particular subpopulation, then that subpopulation or **stratum** should be designed into the overall monitoring plan (Summers and Maddox, 1999). The use of strata within a sampling design enhances the power to detect differences because it optimizes the design based on the natural variability characteristics of the indicators being measured.

Cochran (1977) concludes that incorporating strata into the sampling design, referred to as **stratified random sampling**, is a common and indicated technique if:

- Data of known precision are wanted for certain subpopulations, in which case it is advisable to treat each such subdivision as a "population" in its own right
- Convenience dictates the use of stratification
- Sampling problems differ markedly in different parts of the population
- It is desired to increase the precision of estimates of the characteristics of the population as a whole.

The HBMP design stakeholder group concluded that a stratified random sampling approach was the best sampling design to meet HBMP objectives.

2.3. General Indicator Characteristics for HBMP Monitoring Elements

Following the identification of specific measurable monitoring objectives, the next step in the monitoring design process is the definition of appropriate indicators. Indicators are units of measure that describe the status of the statistical populations, or subpopulations, of interest, usually in response to some environmental stressor. The term **indicator** in this context is somewhat analogous to the term *parameter*, as it is applied in environmental monitoring jargon; however, it is broader in scope.

Indicators can be generally broken down into two classes: 1) desirable indicators, and 2) critical indicators. General characteristics for each of these are listed below.

General characteristics of desirable indicators include:

- Sampling Unit Stable - measurements of the response indicator taken at a sampling unit should be stable over the course of the sampling period
- Available Method - should have a generally accepted, standardized method of measurement that can be applied on a regional scale
- Historical Record - has a historical database, or a historical database can be generated from acceptable data sources
- Retrospective - can be related to past conditions via retrospective analyses
- Anticipatory - provides an early warning of widespread changes in ecosystem processes or conditions
- Cost-Effective - has low incremental cost relative to its information value
- New Information - provides new information; does not merely duplicate data already collected by other agencies or investigators

General characteristics of critical indicators include:

- Regionally Responsive - must reflect changes in ecosystem conditions and respond to stressors of concern across most resource classes and habitats in a region
- Unambiguously Interpretable - must be related to an assessment endpoint or relative exposure or habitat variable that forms part of the investigators' overall conceptual model of ecological structure and function
- Low Measurement Error - exhibits low measurement error and stability of regional cumulative frequency distribution during the index period
- Simple Quantification - can be quantified by cost-effective synoptic or automated monitoring
- Environmental Impact - sampling must have minimal environmental impact
- Low Year-to-Year Variability - must have sufficiently low natural inter-annual variation to detect ecologically significant changes within a reasonable time frame

It is important to note that, with respect to surface water supply projects, all potentially applicable response indicators must have either a direct relationship to changes in freshwater inflows, or an indirect relationship (e.g., center of fish population distribution). Indicators with a direct relationship to freshwater inflows are typically physical or chemical in nature (e.g., salinity), and respond more or less instantaneously to changing inflows. Indicators with an indirect relationship to freshwater inflows are typically biological in nature (e.g., center of fish population distribution), are mediated by physical and chemical changes, and generally respond on a slower time scale (e.g., days, months, and seasons).

The HBMP design stakeholder group deliberated on critical and desirable indicators over the course of several workshops, applied the criteria described above, and generated a list of potential indicators for each of the three identified monitoring elements: hydrology/water quality, biota, and habitat. This list was ultimately reduced to a final recommended suite of critical indicators for each monitoring element (see PBS&J, 2000) that is summarized in the following sections.

2.4. Reporting Units and Spatial Strata

The spatial and temporal extents, statistically often referred to as the *target population*, of the sampling program were defined during the development of the HBMP.

The potentially affected waterbodies or portions of waterbodies were identified based on geographic areas of concern; these were defined as spatial "reporting units" for purposes of program design and monitoring for withdrawal-related changes on an annual basis.

HBMP spatial reporting units include:

- Lower Hillsborough River – Figure 2.4.1
- Tampa Bypass Canal/Palm River - Figure 2.4.2
- McKay Bay – Figure 2.4.3
- Lower Alafia River – Figure 2.4.4
- Hillsborough Bay – Figure 2.4.5

HBMP sampling is conducted in each of the four primary reporting units: the lower Hillsborough River, the Tampa Bypass Canal/Palm River, McKay Bay, and the lower Alafia River.

For the fifth reporting unit, Hillsborough Bay, the HBMP design stakeholder group concluded that this reporting unit could be affected by the permitted water supply projects, but that additional sampling in Hillsborough Bay as a component of the HBMP was not warranted for two reasons. First, impacts from Tampa Bay Water withdrawals should be detected in the other reporting units before being detected in Hillsborough Bay. Second, the data gathered from existing monitoring programs can be used to characterize the status of this reporting unit.

HBMP data collection sites in Hillsborough Bay are located near the mouth of each primary reporting unit. The Environmental Protection Commission of Hillsborough County (EPCHC) and the FWRI have long-term monitoring programs in Hillsborough Bay that are independent of the HBMP. In Water Year 2005, the Fisheries Independent Monitoring Program of the Fish and Wildlife Research Institute (FWRI) also began HBMP-specific sampling in Hillsborough Bay at the mouth of the Alafia River. Results from these programs comprise the majority of the data evaluated by the HBMP for Hillsborough Bay reporting unit.

2.5. Spatial Randomization

To develop the HBMP stratified random sampling design, a randomized method for choosing monthly sampling sites is used for each of the spatial strata within each reporting unit. The centerlines of the linear reporting units were generated using an ARCINFO function that interpolates intermediate topographic contours. The function used the riverbanks as contours and interpolated the centerlines as intermediate contours between the banks. The centerlines were then divided into 1-meter long segments, and each of these was defined as a potential sampling station and named according to its distance from the river mouth and the strata in which it was located.

HBMP monthly sampling stations for the linear reporting units are selected by stratum. Each station in the stratum is assigned a unique consecutive whole number. A series of random numbers is then created using the SAS "ranuni()" statement. These random numbers are matched with the numbers assigned to the stations, and the corresponding stations are selected. Lists of primary and alternate stations by stratum are provided to the field staff. In the event that a primary station cannot be sampled, field staff must choose the first alternate station (not the closest station). If an alternate station cannot be sampled, field staff must choose the next alternate station in the sequence.

A "right", "left", or "center" ("shallow right", "shallow left", or "deep" in the Palm River) designation is also chosen in the monthly sample selection process. A "left" designation instructs the field staff to take a sample on the left 33% of the river (with left defined as the left side looking upstream). A "center" designation instructs the crew to sample in the center 33% of the river and a "right" designation in the right 33%. The designations are the same for the Palm River except that the "shallow" stations are sampled in water less than 2 meters deep. The lateral positions are randomly selected using the SAS "ranuni()" statement. Each portion of a river has

an equal chance of being selected for any given station. The depth strata of the Palm River are treated as substrata. Lateral position is not randomly selected in the deep Palm River substrata. The "left" or "right" lateral positions are randomly selected in the Palm River shallow strata.

Stations for water quality, benthos, and fish sampling are randomly selected for each monthly sampling. Stations for plankton sampling were randomly selected one time at the beginning of the program.

McKay Bay monthly stations are grouped by hexagon or cell. Initially a cell is randomly selected for sampling. Then the station within the selected cell is selected in a manner consistent with the technique described above for the linear reporting units. Lists of the primary and alternate stations are provided to the field staff. There is only one primary station in each cell. If that station cannot be sampled, field staff must select the first alternate station. If an alternate station cannot be sampled, crews must select the next alternate station in that cell. There are no lateral sample station designations in McKay Bay.

McKay Bay cells are selected using a method weighted for the number of stations in each cell. Each of the McKay Bay cells is the same size, but some of the cells on the edge of the bay overlap land areas. These overlap areas do not constitute valid stations. McKay Bay cells are selected using a weighted formula in SAS. Each cell is assigned a sequential percentage of the values from 0 to 1 in accordance with the proportion of the total stations in McKay Bay located in that cell. For instance, if Cell 1 contains 15% of the total stations it would be assigned values from 0.00001 to 0.15000 in the formula. If Cell 2 contained 5% of the stations in McKay Bay, it would be assigned values from 0.15001 to 0.20000 in the formula. Though the water quality, benthos, fish, and plankton efforts may sample the same cell during a given month, a single sampling element is never sampled twice within one cell in a given month.

2.6. Temporal Strata

Temporal strata are specific to each of the four reporting units. In general, these strata were defined to ensure that the key within-year sources of variation were taken into account. Specifically, two sources of within-year variation were considered critical. One source dealt with the intra-annual variation in flows due to the seasonal differences in rainfall. Typically, flows are higher in the normal wet season period (July through September) when compared to flows observed in the dry season (October through June). Flows in the months of April and May in particular can be extremely low due to prolonged periods of low rainfall. The second within-year source of expected variation in flows would be the manifestation of the permitted withdrawal schedules. Since the withdrawal schedules vary as a function of ambient flow, the reductions in freshwater flow due to the withdrawals will not be consistent throughout the year. Based on historical flow conditions, the greatest daily withdrawals will typically occur during the months of July through September.

Two other sources of temporal variation, tides and diel variability, were considered during the development of the sampling program but were determined to be adequately addressed to meet HBMP objectives based on other sampling criteria and constraints.

2.6.1. Lower Hillsborough River

The general temporal sampling strategy for the lower Hillsborough River ensures that an adequate sample size is available for drawing inferences about river-wide status on an annual or seasonal basis. A temporally even sampling effort exists for water quality, fish, and plankton sampling. By comparison, the benthic sampling program currently includes two different sampling intensities. Benthic sampling effort in both the wet season (i.e., July through September) and in the late dry season (April through June) is greater than that during the periods of October through December and January through March. Thus, the lower Hillsborough River sampling strategy for benthos is on a wet season/dry season basis.

In addition, continuous monitoring (every 15 minutes) of conductivity and temperature is conducted at three permanent fixed locations (Sligh Ave., Columbus Ave., and a third station located between Sligh and Columbus). These stations provide information on short-term responses in water quality to changes in freshwater flow. Rainfall and flow measurements are determined on a daily basis. Vegetation sampling consists of aerial photography and shoreline surveys conducted every three years between October and December.

2.6.2. TBC/Palm River

The temporal sampling strategy for the TBC/Palm River focuses on the expected differences in river status that are likely to occur between the wet and dry seasons. Sampling for benthos and water quality during the wet season, when mean daily withdrawals will be largest, is more intense than during the dry season. To this end, there are two temporal sampling strata for both water quality and benthos, with adequate sampling intensity for inferences to be made regarding the status of water quality or benthos in the river for both the wet and dry seasons. Equivalent sampling intensities are employed across all months of the year for zooplankton sampling. Based on stakeholder consensus and District approval, fish sampling in the TBC/Palm River was discontinued in Water Year 2009 (see Appendix A).

Continuous monitoring (every 15 minutes) of conductivity and temperature is conducted at the Maydell Drive recorder. This monitoring provides information on short-term responses in water quality to changes in freshwater flow. Rainfall and flow measurements are collected on a daily basis. Vegetation sampling consists of aerial photography and shoreline surveys conducted every three years during the months of October through December.

2.6.3. McKay Bay

The temporal sampling strategy for McKay Bay closely follows that for the TBC/Palm River and focuses on the expected differences in the status of McKay Bay between the wet and dry seasons. Continuous monitoring (every 15 minutes) of conductivity and temperature is conducted at the 22nd Street Causeway station. Sampling of benthos and water quality is more intense during the wet season, when mean daily withdrawals are expected to be greatest based on historical flow conditions. Equivalent sampling intensities are employed across all months for both fish and plankton sampling.

The sampling schedule is based on temporal randomization around a selected day within each month. This method provides estimates of within-temporal stratum variability, increases the power of any tests of significance, and also best represents the range of flow conditions expected.

2.6.4. Lower Alafia River

The temporal sampling strategy for the lower Alafia River is very similar to that defined for the lower Hillsborough River. Equal sampling intensities are employed across all months for water quality, benthos, fish, and plankton sampling. The sampling intensity is meant to be sufficient to allow meaningful river-wide inferences regarding each of these HBMP elements to be drawn on a quarterly basis. An additional fish sampling effort occurs once annually in the freshwater stratum.

During the HBMP design process, stakeholders recommended that an inset stratum for benthic sampling be specifically addressed, extending approximately 1 km upstream and 1 km downstream of the freshwater interface based on an analysis of pre-operational water quality data. Additional benthic sampling is currently conducted in the inset stratum during the months of June through August. This sampling was initially designed to be sufficiently intense to allow inferences to be drawn about the status of this stratum during the wet season.

Continuous monitoring (every 15 minutes) of conductivity and temperature is conducted at one fixed station currently located on the River south of Buckhorn Creek. In addition, the USGS collects data from two additional fixed sites on the Alafia River. These data provide information on short term responses in water quality to changes in freshwater flow. The frequency of rainfall and flow measurements is daily. Vegetation sampling consists of aerial photography and shoreline surveys conducted every three years during the October through December period. Submerged aquatic vegetation is currently monitored every five years in two strata.

3.0 Tampa Bypass Canal/Hillsborough River HBMP

3.1. Introduction

This section describes the special permit conditions, flow, water quality, and biological data collection efforts in the lower Hillsborough River, Tampa Bypass Canal (TBC), and McKay Bay conducted under the HBMP. The sampling programs for these reporting units are summarized in Tables 3.1.1 through 3.1.3 at the end of this section. Modifications to the initial HBMP sampling design and the rationale for these modifications are provided in Appendix A.

Additional information and specific procedures for sample collection and analysis are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

3.2. Lower Hillsborough River, Tampa Bypass Canal and McKay Bay Reporting Units

The Lower Hillsborough River (HR) reporting unit (Figure 2.4.1) extends from the mouth of the river at Platt Street to the City of Tampa Dam, covering a distance of 16.34 river kilometers. This spatial reporting unit was divided into six strata, five of equal length (2.55 km) below Sulphur Springs, and one of 3.61 km in length from Sulphur Springs upstream to the dam. These strata are used for all of the HBMP elements (i.e., water quality, benthos, adult and juvenile fish, ichthyoplankton and vegetation).

The TBC/Palm River reporting unit (Figure 2.4.2) extends from the mouth upstream to Structure S-160. This spatial reporting unit is divided into 3 strata of equal length (1.75 km). In addition to these longitudinal strata, it was also recognized during HBMP design that significant variation in both water quality and benthos might exist due to differences in depth. Therefore, both shallow and deep water substrata within each longitudinal stratum were defined in the Palm River for both water quality and benthos monitoring elements.

The McKay Bay reporting unit (Figure 2.4.3) extends from the 22nd Street Causeway to the mouth of the TBC. This spatial reporting unit was divided into 2 strata: 1) the channel that runs approximately along the centerline of the Bay; and 2) the shallow remainder of the Bay. The channel portion was further divided into 2 strata of equal length (1.1 km). Sample selection for water quality and benthic sampling locations is based on a hexagonal grid framework, similar to that used by the Environmental Protection Commission of Hillsborough County (EPCHC), except using a finer grid scale of approximately 0.2 km^2. These hexagons were then divided into a 1-m^2 grid and potential sample stations established at the 1-m^2 grid nodes. The hexagons, grids, and stations were generated by Janicki Environmental (PBS&J, 2000).

3.3. Lower Hillsborough River and Tampa Bypass Canal Permit Conditions

Water Use Permit 20011796.002 for the Tampa Bypass Canal (TBC)/Hillsborough River Water Supply Projects authorizes Tampa Bay Water to divert water from the Hillsborough River and withdraw water from Tampa Bypass Canal according to the schedule provided in the permit.

This permit requires that Tampa Bay Water continue to implement the approved TBC/Hillsborough River HBMP in order to address the following objectives:

- Use baseline conditions to compare the effects of the permitted water use upon streamflow rates, salinity distributions, and selected water quality and biologic variables within the lower Hillsborough River below Tampa Dam, TBC, Palm River, and McKay Bay
- Monitor diversions from the Hillsborough River and withdrawals from the TBC at the withdrawal points and evaluate streamflow data for the lower Hillsborough River at the Tampa Dam, and the TBC at the District's Structures 160 and 162
- Evaluate the ecological relationships of the lower Hillsborough River below Tampa Dam, TBC, Palm River, and McKay Bay to freshwater flows
- Monitor selected water quality and biologic variables in order to determine if the ecological characteristics of the lower Hillsborough River below Tampa Dam, TBC, Palm River, and McKay Bay relate to freshwater flow change over time
- Determine the relative effect of permitted diversions and withdrawals on any ecologic changes that may occur in the lower Hillsborough River below Tampa Dam, TBC, Palm River, and McKay Bay
- Determine if these withdrawals cause or significantly contribute to any unacceptable adverse environmental impacts to the natural resources of the lower Hillsborough River below Tampa Dam, TBC, Palm River, and McKay Bay exhibit as a result of changes in freshwater flows. The HBMP shall identify criteria that will be used to determine unacceptable adverse environmental impacts to the resources
- Coordinate with appropriate agencies that have or are currently collecting data that can be incorporated into the HBMP to avoid duplication of effort and to facilitate the most efficient use of resources.

3.4. Sampling Site Selection

All but one of the monthly sample sites (stations) for water quality, fish, benthos, and plankton are randomly selected. There is a fixed water quality sampling station at the mouth of the Hillsborough River and East Bay. This station is collocated with EPCHC water quality sampling Station 52. Sampling stations for water quality, fish, and benthos are randomly selected each month. Sampling stations for plankton were randomly selected at the beginning of the HBMP and remain fixed.

Sampling stations for the Hillsborough River and TBC are identified by stratum and location relative to the mouth of the river. Thus, the station in Hillsborough River Stratum 1, 1000 meters from the mouth of the river, is identified as "HR101000". The prefix "HR1" designates the river and stratum and the suffix "01000" identifies the distance from the mouth of the river. The "HR"

and "PR" designations identify Hillsborough and Palm River stations, respectively. All potential stations and their corresponding latitude and longitude have been determined and are listed in the project database. Stations are chosen in each stratum by randomly selecting from the list of potential stations.

Plankton sampling stations in McKay Bay are identified by the "MB" prefix and are oriented on a centerline that begins at the 22nd Street Causeway Bridge and ends at the downstream terminus of the TBC centerline. Plankton sampling in McKay Bay occurs in two strata. The naming convention for McKay Bay plankton stations follows that of the rivers with the distance designation representing meters from the 22nd Street Causeway. The TBC stations for water quality, fish, benthos, and plankton are also defined in meters from the 22nd Street Causeway.

In addition to the station location along the river's length, the location relative to the river's width (left, middle, or right) is also randomly selected for water quality, fish, and benthos sampling. Finally, the starting point of a day's sample collection (e.g. river mouth or upstream boundary) is randomly selected each month for water quality.

River width and starting point selection parameters are not used for water quality, fish, or benthos sampling in McKay Bay, as the McKay Bay sampling design is not based upon linear stratification. For sampling purposes, McKay Bay has been divided into hexagons, which are further partitioned into 1-meter cells. Each potential sample station is located within a single grid cell. Stations are selected by randomly selecting a hexagon, then randomly selecting a grid cell within the hexagon. The prefix "M" and a unique suffix number that identifies the hexagon and grid cell identify McKay Bay stations.

The week in which sampling is conducted for each month is randomly selected for water quality and fish. Plankton sampling dates are chosen based upon the appropriate correspondence of tide stage with time of day. The Environmental Protection Commission of Hillsborough County (EPCHC) performs water quality and benthos sampling in Hillsborough Bay at fixed sampling stations during fixed weeks of the month or a late summer/early fall index period.

3.5. Hydrology / Water Quality

Current data collection activities for the hydrology/water quality element of the TBC/Hillsborough River HBMP are described briefly below. Specific procedures for sample collection and analysis are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

River flow and rainfall measurements are obtained from Tampa Bay Water maintained equipment or equipment maintained and operated by USGS. Salinity data are obtained from HBMP continuous water quality recording stations installed specifically for this project; these stations were installed in the early part of Water Year 2001.

Water quality samples and measurements are taken monthly in each of the three reporting units, lower Hillsborough River, TBC, and McKay Bay. Water quality sampling consists of a water column profile and an associated grab sample. The water column profiles measure temperature,

specific conductance, pH, salinity (calculated from specific conductance), and dissolved oxygen. These measurements are typically made at the water column surface, bottom, and 0.5 meter increments from the surface. The grab samples are analyzed by a subcontracted laboratory for parameters specific to each reporting unit. Sampling is typically conducted over a two- to three-day period. An increased number of samples are taken during the summer wet-season as shown in the HBMP sampling summary tables below. Hydrologic and water quality parameters measured in the lower Hillsborough River, TBC, and McKay Bay are shown in Table 3.5.1. In addition, the EPCHC collects water quality samples once monthly at fixed stations in Hillsborough Bay. This effort measures all water quality parameters included in the HBMP.

As described above, the HBMP maintains one continuous water quality recorder in the TBC, one in McKay Bay, and three in the Hillsborough River (Sligh Ave., Columbus Ave., and between Sligh and Columbus). These recorders were installed in Water Year 2001 as part of the HBMP and are listed in the sampling summary tables (Tables 3.7.1-3.7.3). In addition, the USGS maintains several long-term real-time water quality recorders that are used for the HBMP.

Table 3.5.1. Hydrologic and water quality parameters measured in the three reporting units.

Lower Hillsborough River	Tampa Bypass Canal Lower Palm River	McKay Bay
stream flow	stream flow	stream flow
surface water elevation	surface water elevation	surface water elevation
salinity	salinity	salinity
specific conductance	specific conductance	specific conductance
temperature	temperature	temperature
pH	pH	pH
dissolved oxygen	dissolved oxygen	dissolved oxygen
chlorophyll *a*	chlorophyll *a*	chlorophyll *a*
----------	color	color
orthophosphorus*	orthophosphorus*	orthophosphorus*
total phosphorus*	total phosphorus*	total phosphorus*
ammonia/ammonium *	ammonia/ammonium *	ammonia/ammonium *
nitrate+nitrite*	nitrate+nitrite*	nitrate+nitrite*
total Kjeldahl nitrogen*	total Kjeldahl nitrogen*	total Kjeldahl nitrogen*
total nitrogen*	total nitrogen*	total nitrogen*

*Sampling for these parameters is not specified or required in the original or the current HBMP design. These parameters have been collected during certain water years for other Tampa Bay Water projects.

3.6. Biota

Current data collection activities for the biota element of the TBC/Hillsborough River HBMP (benthic macroinvertebrates, ichthyoplankton and other zooplankton, and fish) are described

briefly below. Specific procedures for sample collection and analysis are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

3.6.1. Benthic Macroinvertebrates

Benthic macroinvertebrate samples are also taken monthly in each of the three reporting units. Sampling is typically conducted over a three- to four-day period. A greater number of samples are taken during the summer wet-season. Hillsborough River samples are archived in an unsorted condition in April, May, June, October, November, and December. Samples during these months were not included in the draft HBMP design. During its review of the draft HBMP design, SWFWMD requested that samples be collected during these months, but archived for potential future analysis (see Appendix A). Samples for the remainder of the year are sorted and analyzed.

The sample collection and analysis techniques of the HBMP and the EPCHC programs are the same. The EPCHC benthos-sampling program includes Hillsborough Bay. EPCHC samples once per year during a late summer/early fall index period.

Water column casts or profiles and Secchi-depth measurements are performed at each station. Sediment samples are also taken at each station to be analyzed for percent fines and organic matter content. Benthic macroinvertebrate samples are sieved and stored for later sorting and analyses by the subcontracted invertebrate taxonomy laboratory.

3.6.2. Ichthyoplankton and other Zooplankton

Plankton collections are made monthly in each reporting unit by University of South Florida (USF) staff. The sampled locations within each reporting unit were selected using a one-time stratified-random approach as described above.

Dates of sampling are chosen to correspond with the occurrence of night-time flood tides. Night-time zooplankton catches are known to be generally larger than daytime catches. This phenomenon was confirmed during preliminary sampling of the lower Alafia River prior to 2000. Similarly, existing data indicate that, during flood tides, the estuarine water column tends to contain more organisms that are moving upstream or are trying to maintain position within the estuary, whereas ebb tidal waters tend to contain more organisms that are in the process of leaving the estuary. Night-time flood tides were therefore chosen as the standard conditions for zooplankton sampling. A water column profile is performed at the end of each tow.

3.6.3. Fish

Fish sampling is conducted once monthly in each reporting unit except the TBC by Florida Fish and Wildlife Research Institute (FWRI) staff. The sampling effort in each stratum typically consists of utilizing two 21-m seines and one 6.1-m otter trawl, though some strata in the Hillsborough River are not sampled with trawls. Most of the animals traditionally sampled by the FWRI Fisheries Independent Monitoring Program are included in this effort. These include all fishes, blue crabs, stone crabs, horseshoe crabs and penaeid shrimp. A water profile is performed at each station.

3.7. Habitat / Vegetation

Current data collection activities for the habitat/vegetation element of the TBC/Hillsborough River HBMP are described briefly below. Specific procedures for sample collection and analysis are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

Vegetation sampling consists of interpretation of aerial photography and shoreline surveys conducted every three years during the October through December period. The boundaries of floodplain vegetation associations delineated during previous HBMP mapping events are plotted on false-color infrared aerial photographs provided by Tampa Bay Water. Paper and/or electronic versions of the photographs and boundaries are used in the field to map changes in floodplain vegetation. These photographs are supplemented with other aerial photographs if necessary. The observed vegetation-association boundaries are compared with the previous event's boundary to determine any shifts. Changes in vegetation boundaries are made by creating a copy of the previous event's coverage and editing only those polygons with changed boundaries or shapes. This procedure is designed to minimize observer bias.

If changes are identified on paper maps, the resulting polygons are digitized to create a GIS coverage for each reporting unit. Inter-annual changes in the area and extent of major vegetation associations in the reporting units are calculated by comparing the association boundaries and areas over time. These vegetation association polygons are also used to calculate linear estimates of vegetation shoreline extents. Estimation of the first and last occurrence of vegetation community indicator species (e.g., black needlerush (*Juncus roemerianus*)) for each monitoring event is based on the population occurrence of each species rather than the occurrence of individual plants of each species.

4.0 Alafia River HBMP

4.1. Introduction

This section described the flow, water quality, and biological data collection efforts in the lower Alafia River conducted under the HBMP. The sampling program for this reporting unit is summarized in Table 4.1.1 at the end of this section. Modifications to the initial sampling design and the rationale for these modifications are provided in Appendix A.

Additional information and specific procedures for sample collection and analysis are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

4.2. Lower Alafia River Reporting Unit

The current lower Alafia River (AR) spatial reporting unit (Figure 2.4.4) is about 18.5 kilometers long. The estuarine portion of the river extends from the mouth to approximately river kilometer 14 (Rkm 14). This estuarine portion of the river was divided into 6 strata of equal length (2.33 km). The remaining 4.5 kilometers of the reporting unit, from kilometer 14 to kilometer 18.5 slightly upstream of Bell Shoals Road, is generally considered to be a freshwater system. An additional freshwater segment, upstream of the intake (stratum AR8, Rkm 18.5 to 21.0) was removed from the original HBMP design because the sampling methods required in this stratum were not compatible with those used in the other strata, and potential impacts related to withdrawals are most likely to be observed downstream of Tampa Bay Water's intake near Bell Shoals Road.

These strata are used for all of the HBMP study elements. An additional inset stratum for benthos sampling was defined in consultation with Hillsborough County and the SWFWMD. This stratum extends approximately 1 km upstream (Rkm 13) and 1 km downstream (Rkm 7) of the freshwater interface and includes additional sampling for portions of Strata AR4 and AR6 and all of AR5.

4.3. Alafia River Permit Conditions

Water Use Permit 2011794.01 for the Alafia River authorizes Tampa Bay Water to withdraw water from the Alafia River at Bell Shoals Road according to the schedule provided in the permit.

The original water use permit (Permit 2011794.00) required Tampa Bay Water to develop and implement an HBMP) for the Alafia River. The permit specified that the HBMP address the following objectives:

- Establish baseline conditions prior to permitted use for streamflow rates, salinity distributions, and selected water quality and biological variables within the Alafia River and its estuary

- Monitor withdrawals from the Alafia River at the withdrawal point and evaluate streamflow data for the river at all applicable locations
- Evaluate the ecological relationships of the Alafia River and its estuary to freshwater flows
- Monitor selected water quality and biological variables in order to determine if the ecological characteristics of the river and its estuary related to freshwater flow change over time
- Determine the relative effect of permitted withdrawals from the Alafia River on any ecologic changes that may occur in the river and its estuary
- Determine if these withdrawals cause or significantly contribute to any unacceptable environmental impacts that the river and its estuary exhibit as a result of changes in freshwater flows
- Coordinate with appropriate agencies that have or are currently collecting data that can be incorporated into the HBMP to avoid duplication of effort and to facilitate the most efficient use of resources.

4.4. Sampling Site Selection

All but one of the monthly sample sites (stations) for water quality, fish, benthos, and plankton are randomly selected. There is a fixed water quality sampling station at the mouth of the Alafia River. This station corresponds to EPCHC water quality Station 8. Sampling stations for water quality, fish, and benthos are randomly selected each month. Sampling stations for plankton and for fixed-station vegetation monitoring were randomly selected at the beginning of the HBMP and remain fixed.

Sampling stations for the Alafia River are identified by stratum and location relative to the mouth of the river. Thus, the station in Alafia River Stratum 1, 1000 meters from the mouth of the river, is identified as "AR101000". The prefix "AR1" designates the river and stratum and the suffix "01000" identifies the distance from the mouth of the river. All potential stations and their corresponding latitude and longitude have been determined and are listed in the project database. Stations are chosen in each stratum by randomly selecting from the list of potential stations.

In addition to the station location along the river's length, the location relative to the river's width (left, middle or right) is also randomly selected for water quality, fish and benthos sampling. Finally, the starting point of a day's sample collection (e.g., river mouth or upstream boundary) is randomly selected each month for water quality. The week in which sampling is conducted for each month is randomly selected for water quality and fish. Plankton sampling dates are chosen based upon the appropriate correspondence of tide stage with time of day.

4.5. Hydrology / Water Quality

Current data collection activities for the hydrology/water quality element of the Alafia River HBMP are described briefly below. Specific procedures for sample collection and analysis are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

River flow and rainfall measurements are obtained from Tampa Bay Water maintained equipment or equipment maintained and operated by the USGS. Salinity data are obtained from the HBMP continuous water quality recording station installed on the Alafia River downstream of Buckhorn Creek; this station was installed in the early part of Water Year 2001.

Water quality samples and measurements are taken once a month. Water quality sampling consists of a water column profile and an associated grab sample. The water column profiles measure temperature, specific conductance, pH, salinity (calculated from specific conductance), and dissolved oxygen. These measurements are typically made at the water column surface, at the bottom, and at 0.5 meter increments from the surface. The grab samples are analyzed by a subcontracted laboratory for the parameters listed in Table 4.6.1. Sampling is typically conducted over a two-day period.

Table 4.5.1. Hydrologic and water quality parameters measured in the Alafia River.

Lower Alafia River

ammonia/ammonium*
nitrate+nitrite*
total Kjeldahl nitrogen*
total nitrogen*

*Sampling for these parameters is not specified or required in the original or the current HBMP design. These parameters have been collected during certain water years for other Tampa Bay Water projects.

4.6. Biota

Current data collection activities for the biota element of the Alafia River HBMP (benthic macroinvertebrates, ichthyoplankton and other zooplankton, and fish) are described briefly below. Specific procedures for sample collection and analysis are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

4.6.1. Benthic Macroinvertebrates

Benthic macroinvertebrate samples are also taken once monthly in the Alafia River reporting unit. Sampling is typically conducted over a three- to four-day period. A greater number of samples are taken during the summer wet-season in an index stratum in the middle of the Alafia River. Early modeling efforts and subsequent analyses suggested that were salinity changes to occur as a result of Tampa Bay Water operations, they would most likely occur in this stratum.

Water column casts or profiles and Secchi-depth measurements are performed at each station. Sediment samples are also taken at each station to be analyzed for percent fines and organic matter content. Benthic macroinvertebrate samples are sieved and stored for later sorting and analyses by the subcontract invertebrate taxonomy laboratory.

4.6.2. Ichthyoplankton and other Zooplankton

Plankton collections are made monthly in the reporting unit by University of South Florida (USF) staff. The sampled locations within the reporting unit were selected using a one-time stratified-random approach as described above. Dates of sampling are chosen to correspond with the occurrence of night-time flood tides. Night-time zooplankton catches are known to be generally larger than daytime catches. This phenomenon was confirmed during preliminary sampling of the lower Alafia River. Similarly, existing data indicate that, during flood tides, the estuarine water column tends to contain more organisms that are moving upstream or are trying to maintain position within the estuary, whereas ebb tidal waters tend to contain more organisms that are in the process of leaving the estuary. Night-time flood tides were therefore chosen as the standard conditions for zooplankton sampling. A water column profile is performed at the end of each tow.

4.6.3. Fish

Fish sampling is conducted once monthly by Fish and Wildlife Research Institute (FWRI) staff. The sampling effort in each stratum typically consists of utilizing two 21-m seines and one 6.1-m otter trawl. The upper and lower-most strata of the Alafia River are not sampled using trawls. Additional Alafia River associated fish sampling occurs in Hillsborough Bay at the mouth of the Alafia River. This additional sampling effort was initiated in Water Year 2005 to assess fish populations that leave the Alafia River during periods of high flow (see Appendix A). Most of the animals traditionally sampled by the FWRI Fisheries Independent Monitoring Program are included in this effort. These include all fishes, blue crabs, stone crabs, horseshoe crabs, grass shrimp and penaeid shrimp. A water column profile and Secchi depth measurements are performed at each station.

4.7. Habitat / Vegetation

Current data collection activities for the habitat/vegetation element of the Alafia River HBMP are described briefly below. Specific procedures for sample collection and analysis are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

Riverine vegetation is mapped once every three years during the Fall index period (September through December). The boundaries of floodplain vegetation associations delineated during previous HBMP mapping events are plotted on false-color infrared aerial photographs provided by Tampa Bay Water. Paper and/or electronic versions of the photographs and boundaries are used in the field to map changes in floodplain vegetation. These photographs are supplemented with other aerial photographs if necessary. Vegetation is usually mapped by field staff in boats. The observed vegetation-association boundaries are compared with the previous event's boundary to determine shifts. Changes in vegetation boundaries are made by creating a copy of the previous event's coverage and editing only those polygons with changed boundaries or shapes. This procedure is designed to minimize observer bias.

If changes are made on paper maps, the resulting polygons are digitized to create a GIS coverage for each reporting unit. Inter-annual changes in the area and extent of major vegetation associations in the reporting units are calculated by comparing the association boundaries and areas over time. These vegetation association polygons are also used to calculate linear estimates of vegetation shoreline extents. Estimation of the first and last occurrence of vegetation community indicator species (e.g., black needlerush (*Juncus roemerianus*)) for each monitoring event is based on the population occurrence of each species rather than the occurrence of individual plants of each species.

Submerged aquatic vegetation (SAV) is surveyed once every five years. Sampling is conducted once during the SAV growing season. SAV is surveyed in two reporting units defined as the marine/brackish transitional area, and the brackish/fresh transitional area. These reporting units were identified by documenting the existing first and last occurrence of black needlerush (*Juncus roemerianus*). The mid-points of the marine/brackish and the brackish/fresh reporting units are defined as the observed downstream and upstream last occurrence of *Juncus*, respectively. The respective reporting units extend 2 km upstream and 2 km downstream from these two mid-points, therefore, both the marine/brackish and the brackish/fresh reporting units are 4 river km in length. Each reporting is divided into four spatial strata, each 1 km in length.

Under the original SAV sampling protocol, SAV was assessed at randomly-selected sampling locations in each stratum, on both the left and right sides of the river channel centerline. A revised sampling protocol has been implemented using underwater cameras. Under the revised protocol, a two transects (one on each side of the river) are surveyed for SAV along the entire 8-kilometer combined extent of the marine/brackish and brackish/fresh reporting units. The transects are surveyed by towing an underwater camera transmitting to a surface video screen. The transects are defined as the area between the side of the river channel and the water depth of two meters or less. Staff performing the survey documents the latitude and longitude of each SAV occurrence. These latitude and longitudes are converted to decimal river kilometers for reporting purposes.

In the event the video camera protocol cannot be implemented, SAV is sampling according to the original protocol. Under the original sampling protocol, a total of 36 randomly selected samples per reporting unit are collected using divers. These consist of eight samples per stratum (four samples on each side of the river). The relative percent cover of SAV plant species within a 1 m^2 quadrat is assessed at each sample location. The SAV sample locations are randomly selected for each event.

[2] Conducted once every five years (WY 2011, WY2016, etc.).

5.0 HBMP Data Quality and Management

Data quality and effective data management are critical components of all monitoring programs. Given the complexity of the HBMP, meeting data quality and management objectives is crucial for effective and accurate data collection and interpretation. HBMP data management activities including data collection, handling, evaluation, verification, validation, and reporting are described briefly in this section. The HBMP organizational chart is shown in Figure 5.1.1.

Additional information and specific procedures for sample collection and analysis are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

5.1. Data Quality Objectives

An important goal of the HBMP is the development of data quality objectives (DQOs) that are integrated with environmental data collection activities. Data quality objectives are statements that describe in precise quantitative terms the level of uncertainty that can be associated with collected environmental data, and as such provide insight into the level of certainty that can be applied without compromising the intended use of the data. Use of data quality objectives also provides statistical criteria that can aid the design of sampling strategy elements, balancing costs, and/or resource constraints.

Typically, DQOs are best developed by those identified as potential users of the data. In the absence of specific decision criteria, and the wide variety of potential uses to which the HMBP data may eventually be applied, the initial set of target DQOs are based on professional judgment, and are intended only to provide a starting point for a long-term, iterative DQO process. Consequently, these preliminary DQOs do not necessarily constitute definitive rules for accepting or rejecting results, but rather provide guidelines for continued improvement. Several iterations of the DQO process may be required as potential HBMP data users further define their specific needs.

During the collection of data under the HBMP, it is extremely important to both control and determine measurement error to the greatest extent possible. Measurement quality objectives (MQOs) are established for each sampling field method and laboratory analysis procedure. MQOs essentially represent data quality objectives based on internal and external controls (variability) associated with each type of data measurement. As such, they can be used to establish criteria for data acceptability until reliable error bounds are established for each measured response variable. As data are accumulated during the HBMP, error rates associated with each measurement are established and refinement of the initial target DQOs can be accomplished to determine the need for modifications to the sampling design and/or quality assurance/quality control (QA/QC) plan.

Initial measurements of data quality objectives for each of the various parameters can be expressed in terms of goals for accuracy, precision and completeness. These preliminary MQOs are based on estimates of the anticipated data quality, including the instrument manufacturer's specifications, sampler experience, and/or data collected during other similar studies. In general,

DQOs or MQOs are used to establish five aspects of data quality: representativeness, completeness, comparability, accuracy and precision. The MQOs are used along with both field and laboratory measurements to develop quality control criteria and to set the bounds of acceptable measurement error.

5.1.1. Representativeness

Representativeness is defined as "the degree to which the data accurately and precisely represent a characteristic of a population parameter, variation of a property, a process characteristic, or an operational condition" (Stanley and Verner, 1985). The concept of representativeness within the context of the biological monitoring program refers to the ability of the sampling effort to accurately and precisely characterize the selected environmental indicators effectively both temporally and spatially.

The design of the sampling program and the location of sampling sites provide the primary focus for defining the "representativeness" of population estimates for each reporting unit and strata. The HBMP employs a probability sampling approach that samples resources in proportion to their abundance and distribution to obtain unbiased estimates of resource characteristics and variability. The probability sampling approach applies systematic sampling to facilitate characterizations of spatial patterns and to encourage geographic coverage.

Once unbiased quantitative information on the kinds, extent, condition and distribution of resources and associated estimates of uncertainty are known, a baseline of the status of existing conditions is established. This baseline information is used to develop criteria for identifying "representativeness", the processes and magnitude of change associated with natural variation, and changes observed over time.

The data quality attribute of "representativeness" applies not only to the overall sampling design, but also to individual measurements and samples obtained during all temporal and spatial aspects of the monitoring effort. Holding time requirements for different types of samples ensure that analytical results are representative of conditions at the time of sampling; these requirements are specified for individual indicators. In addition, the use of QA/QC samples, which are similar in composition to samples being measured, provides estimates of precision and bias that are representative of sample measurements. Therefore, as a general program objective, the types of QA samples (i.e., performance evaluation material) used to assess the quality of analytical data will be as representative as possible of the natural samples collected during the project with respect to both composition and concentration.

5.1.2. Completeness

Completeness is defined as "a measure of the amount of data collected from a measurement process compared to the amount that was expected to be obtained under the conditions of measurement" (Stanley and Verner, 1985). All study elements within the HBMP have established completeness goals of 100% for each of the various indicators being measured. However, given the probability-based sampling design being employed, failure to achieve this

goal will not preclude the within-year or between-year assessment of ecosystem condition. The major consequence of having less than 100% complete data from all expected stations is a relatively minor loss of statistical power in the areal estimate of condition. The 100% completeness goal is established in an attempt to derive the maximum statistical power from the present sampling design. Based on the experience of other monitoring programs, failure to achieve this goal usually results from the field staff's inability to sample at some stations due to logistical barriers such as insufficient depth, impenetrable substrate, or adverse weather conditions. In the limited number of instances where these conditions may be encountered, extensive efforts will be made to re-locate the station or re-sample the station at a later date. In this way, the field personnel must always strive to achieve the 100% completeness goal. In addition, established protocols for tracking samples during shipment and laboratory processing will be followed to minimize data loss following successful sample collection.

5.1.3. Comparability

Comparability is defined as "the confidence with which one data set can be compared to another" (Stanley and Verner, 1985). Comparability of reporting units and calculations, database management processes, and interpretative procedures must be assured if the overall goals of the HBMP monitoring program are to be realized. A goal of the HBMP program is to generate extensive documentation to ensure that all future efforts can be made comparable. All field and laboratory methods are described in detail and available to all field personnel and analytical laboratory staff. In addition, the comparability of laboratory measurements will be established and monitored through duplicates and/or the use of field split and duplicate performance evaluation samples. The sampling design for each of the HBMP study elements has been made flexible enough to allow for analytical adjustments, if necessary, to ensure data comparability.

5.1.4. Accuracy and Precision

The term "accuracy", is used synonymously with the term bias within this QA/QC plan, and is defined as the difference between a measured value and the true or expected value.

Precision, by comparison, is defined as the degree of mutual agreement among individual repeated measurements. Collectively, accuracy and precision can provide an estimate of the total error or uncertainty associated with any individual measured value (Kirchner, 1983; Hunt and Wilson, 1986; Taylor, 1987). Measurement quality objectives for the various indicators are expressed separately as goals for both accuracy and precision. Accuracy and precision goals may not be definable for all parameters due to the nature of the measurement type. In order to evaluate the MQOs for accuracy and precision, various QA/QC samples will be collected and analyzed for most data collection activities.

5.2. Data Precision and Accuracy

General considerations for ensuring the precision and accuracy of field measurements and analytical laboratory results are described briefly below. Specific procedures are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

5.2.1. Field Measurements

Duplicate sets of field measurements are to be taken once per reporting unit per sampling day. These values (i.e., temperature, pH, DO, conductivity) will be documented as duplicates in the field notebooks and specifically used for determinations of instrument/sampling precision.

Measurements of accuracy will be based on QA/QC checks of standards at the end of each sampling event.

The precision of field measurements will be determined using the statistic "Relative Percent Difference" (RPD).

$$RPD = \{(|R1-R2|)/[(R1+R2)/2]\} \times 100$$

Where:

R1 = value of sample

R2 = value of sample duplicate

The RPD will be calculated for each duplicated pair of observations. The average or mean RPD is calculated by the formula:

$$\text{Mean}_{RPD} = \text{Sum (RPDs)} / n$$

where n = number of duplicate pairs

The standard deviation of the mean will be used to quantify precision measurements. The standard deviation of the mean is calculated by:

$$s^2_{RPD} = [\text{Sum}(X_i^2) - (\text{Sum}(X_i)^2/n)] / (n-1)$$

Where:

X_i = each calculated RPD

n = number of duplicate pairs

Hence:

$$s_{RPD} = (S^2_{RPD})^{1/2}$$

The s_{RPD} will be calculated for the previous 20 duplicates for each *in situ* field parameter. Based on such duplicate pairs, control and warning limits for precision will be calculated. Standard protocol is to define the "Control Limit" as 2 times the s_{RPD}, with the "Warning Limit" as 3 times the s_{RPD}. Using these procedures, control and warning charts can be generated to flag observations that exceed either Warning and/or Control Limits.

5.2.2. Method Detection Limits

For Method Detection Limits (MDLs), reagent-grade water is used to prepare a laboratory standard in a concentration range 1 to 5 times the estimated MDL of the specific compound of interest. If the estimated MDL is found to be correct, then seven aliquots of the standard are analyzed using the complete analytical method. The following calculations are then used to determine the MDL, and the Practical Quantification Limit (PQL).

In accordance with EPA procedures listed in 40 CFR 136 Appendix B, the MDL and PQL are determined by the following:

where: SD = standard deviation of 7 replicate measurements
MDL = 3.14 times the SD
PQL = 12 times the SD

MDLs are required to be recalculated when there are substantial changes in either the instrumentation or technique used.

5.3. HBMP Data Management

General considerations for HBMP data management (data sources, database management, and data verification) are described briefly below. Specific procedures are provided in the HBMP Quality Assurance and Quality Control Plan-Version 2.1 (PBS&J, 2008).

5.3.1. Data Sources

The HBMP is comprised of a number of separate and unique sampling efforts being conducted by each of the various members of the Project Team (see Figure 5.1.1). Certain members of the Project Team have ongoing, standardized data handling processes and verification and data storage methodologies (Florida Fish and Wildlife Research Institute, Terra Environmental, and the University of South Florida). For this reason, the initial steps: 1) logging of field and laboratory records, 2) data checking steps, 3) data review; and 4) internal QA/QC documentation, will follow the existing established protocols and will address the particularly unique criteria of each of these study elements. Raw hard copy data will be permanently maintained, and after being visually form checked for errors, will be entered into electronic format using appropriate protocols and multiple levels (both visual and automated) of checks to assure that all data quality goals are satisfied.

Some of the data used by the HBMP are provided by external sources. Examples include daily river flows, withdrawal rates, rainfall, other meteorological data, aerial photos and GIS data that are obtained on a relatively routine basis. In addition, the majority of the data to be used in assessing the status of Hillsborough Bay will come from external sources, such as EPCHC, FWRI, and SWFWMD. The schedule for retrieval of data from other sources varies based on data availability from the data provider.

Data transfer formats will be defined in consultation with the data providers. Care will be taken to ensure that all data received will be appropriately documented, to the greatest extent possible. This documentation will include definitions of variables and variable codes, units of measure, methods, and spatial definition of samples (e.g., latitude and longitude of sampling point). When possible, cross-comparisons of these data and the data collected by the HBMP will be made as an additional quality assurance check.

Historical data from other sources will also be used in the analysis of the HBMP data. The HBMP data management process will support data retrieval and documentation from all of these

other sources to ensure the data from these sources are correctly linked with the primary HBMP data sources.

5.3.2. Database Management

The HBMP data are housed within a relational Microsoft Access database. Data for each reporting element (water quality, fish, plankton, etc.) are stored in a series of tables that are relational to each other and separate from the other reporting elements. Export of data from Access to other software applications such as Excel (or other spreadsheets), SAS, and HTML for Internet applications will be facilitated through the use of this standardized data application. The use of a relational database ensures that many different data types can be effectively linked using common variable names and values.

Data from each HBMP study element, as well as other outside sources (SWFWMD, USGS, EPCHC, etc.), will have appropriately organized primary keys in order to properly link the data tables and retain the relational integrity of the data. Examples of primary key variables include, but are not be limited to: sampling group, date, time, reporting unit, stratum/substratum, and station location (such as river kilometer). Typically, the data for a given HBMP program element will be aggregated by year and month within the data set.

The "condition field" of all HBMP data which has been entered, checked through at least two steps for errors, and received the application of any necessary reduction methodologies (dilutions, calculations of species numbers, etc.) will remain designated as "raw" until undergoing further steps in the data validation protocol.

5.3.3. Data Verification

Following the entry, logging, and checking of all "raw" data, error and range checking procedures for data verification purposes will be performed. During the verification process, specific data conditions will be noted using appropriate "data qualifier" designations. Standard DEP/EPA data qualifier codes will be used, as needed, in the appropriately identified database field. Only after all such appropriate levels of data validation have been completed, will the "condition field" within each specific data record be changed from "raw" to "verified". Only the database manager and his/her designees will have read/write abilities at this level. All other database users will be provided with read-only access to data that has been listed as "raw" and is in the verification process. Any errors and/or other changes of data made between the "raw" and "verified" status must be fully explained in the appropriate "note field," and a permanent written record of any such changes will be maintained by the QA/QC Officer.

Cross comparison of "verified" data from the different HBMP elements allows further, subsequent, "validation" of each specific data entry. Final review of the data in this Verified Data Set will also include any other cross comparisons, for example, between field and laboratory data, or between taxonomic experts. Only after final QA/QC review of each specific subset of data (monthly for water quality, quarterly for most other project study elements) will the QA/QC Officer update the "verified" status of the data to "validated". Only under unusual circumstances will data not designated as "validated" be made available for general

dissemination. The QA/QC Officer, after final review with the appropriate specific project leaders, will be responsible for applying the final "data qualifier" and "data flags" within the database. These will be used to inform the end-users of the data of any problems that may have been found to exist in the data that could not be reconciled during the verification and validation checks of the data. In addition to the standard "data qualifiers", three levels of "data flags" will be used in a separate data field. These include:

- **accepted** - this type of designation will be used to designate data that has successfully met all established QA/QC protocols, procedures and standards. ***End users should encounter few, if any, difficulties utilizing data with this designation.***

- **rejected** - this designation will be used to indicate data that did not meet a significant element of the established QA/QC protocols, procedures or standards. Specific notes within the database will explain all such designations (i.e., chlorophyll *a* filters were not appropriately frozen and arrived at the Laboratory in an unacceptable condition). ***End users should never use any data with such a designation.***

- **provisional** - such data was collected, passed almost all of the required QA/QC protocols, but failed some minor QA/QC procedure or standard. Such problems will be noted in the database (i.e., the water chemistry sample for color was analyzed 1 hour outside its required hold time). ***Even though such values have a high probability of being representative of actual conditions, such data should probably be used with caution.***

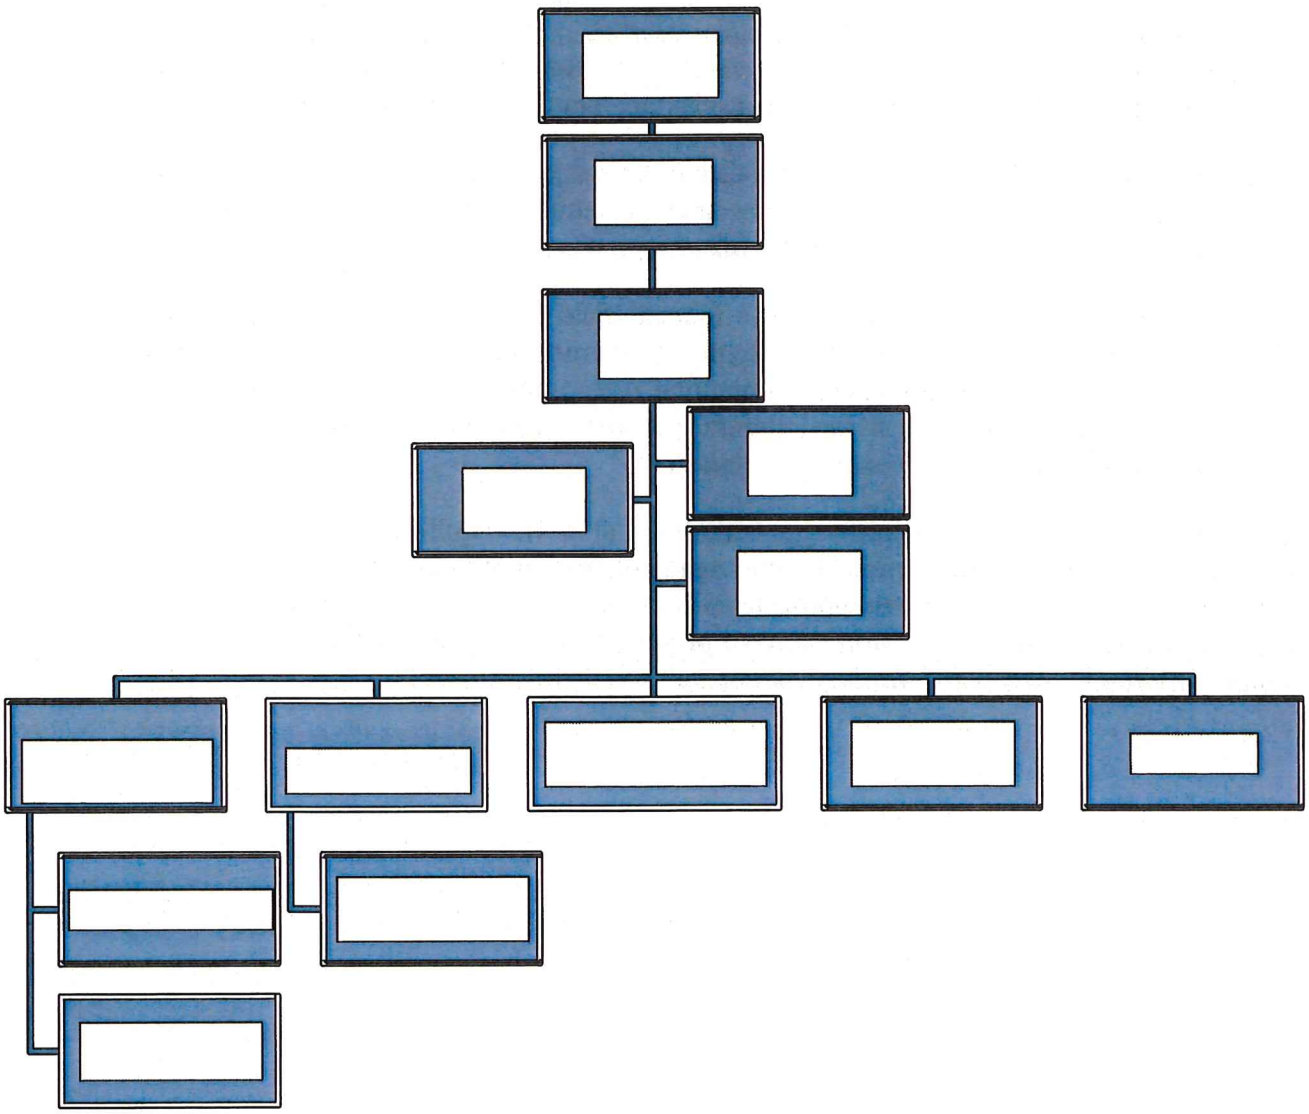

Figure 5.1.1. HBMP Organizational Chart

6.0 HBMP Reporting and Future Program Modifications

This section provides a brief summary of the HBMP reporting process and potential refinements to the program. The HBMP was intended to be routinely modified based on field conditions and the ongoing evaluation of HBMP data; recommendations are provided in HBMP reports and discussed at Annual Meetings. Previous modifications based on requests by the District and other stakeholders, logistical issues during implementation, and HBMP data evaluations are provided in Appendix A. All modifications approved by the District through July 2010 and incorporated into the program are provided in this section. It is anticipated that additional modifications will be made in the future to ensure cost-effective and appropriate monitoring relative to the objectives of the HBMP.

6.1. Reporting

The Southwest Florida Water Management District water use permits require that the HBMP results be submitted to SWFWMD in one of two report types: Annual Data Reports, and multi-year Interpretive Reports currently required once every five years for the TBC/Hillsborough River and once every three years for the Alafia River. General report requirements and methods used for data analysis are described briefly below.

6.1.1. TBC/Hillsborough River HBMP

Southwest Florida Water Management District (SWFWMD) Water Use Permit 2011796.002 for the Tampa Bypass Canal (TBC) and Hillsborough River requires that the HBMP results be submitted to SWFWMD annually in one of two types of reports. During most years, Tampa Bay Water is required to submit a HBMP Annual Report which includes all raw data collected by the HBMP for the preceding October 1st through September 30th water year. The permit requires an HBMP Annual Report in tabular form with text limited to an explanation of variable names and a description of any problems encountered or important observations made during the monitoring year. Once every five years (in July 2010, July 2015, July 2020, and July 2025), Tampa Bay Water is required submit a multi-year HBMP Interpretive Report.

The permit states the interpretive report will include comprehensive analyses of data collected by the HBMP and relevant data collected by other entities. These analyses are to be qualitative and/or quantitative and meant to evaluate the interactions of hydrologic conditions and withdrawals on streamflow, nutrient loading, salinity distributions, and the response of related water quality and biological variables in the lower Hillsborough River below the Tampa Dam, TBC, Palm River, and McKay Bay. The HBMP Interpretive Reports also include an appendix that provides tables of raw data collected by the HBMP during the previous water year thus fulfilling the requirement of the annual report for that year.

6.1.2. Alafia River HBMP

SWFWMD Water Use Permit 2011794.01 for the Alafia River states that HBMP reports will be submitted to the District according to the time frame established in the final approved HBMP plan. The periodic cycle for these reports will include yearly data reports and periodic

interpretive reports. The 1999 HBMP design (PBS&J, 2000) established a schedule for interpretive reports after Water Year 2003 and Water Year 2005 (July 2004 and 2006 respectively). A three year interval for interpretive reports (July 2009, July 2012, July 2015, etc.) was proposed during the Water Year 2006 annual meeting and subsequently approved by SWFWMD.

The Alafia River water use permit requires the submission of an annual data report of all raw data collected during the past water year. These reports are to be in tabular form with text limited to an explanation of variable names and a description of any problems encountered or important observations made during the monitoring year. The water use permit describes the required interpretive reports as including comprehensive analyses of all data collected to date that specifically address the objectives of the HBMP. It also states that qualitative and quantitative analyses shall be presented to evaluate the interactions of hydrologic conditions and withdrawals on streamflow, inundation of the river channel and its floodplain, nutrient loading, salinity distributions in the estuary, and the response of related water quality and biological variables. Like the Hillsborough/TBC interpretive reports, the Alafia River interpretive reports must also include an appendix that provides raw data collected by the HBMP during the previous water year in order to fulfill the requirement for the annual data report for that year.

6.2. Data Analysis

HBMP annual data reports and interpretive reports have used a number of methods to report and analyze data. Several of the most common are described briefly below.

6.2.1. Descriptive Statistics and Time Series

The HBMP has used descriptive statistics and descriptive time series to characterize all rainfall, hydrological, water quality and biological data. These data have also been compared to same day and lagged flow terms to ascertain relationships between these parameters and flow. Standard diversity measurements have been used to characterize and compare biological data. In addition, the first and last occurrences of organisms by distance up the river have been calculated and analyzed for particular groupings and other patterns.

6.2.2. HBMP Elements / Indicators

Since 2001, the HBMP has reviewed the characteristics and patterns of numerous physical, chemical, and biological parameters collected and/or analyzed by the HBMP, Minimum Flows Determination efforts, or similar programs in the HBMP study area. These programs have identified a subset of parameters/indicators that appear to be most useful in describing conditions and potential changes within the study area. These parameters shared certain characteristics. One of the most important characteristics was that the parameter/indicator was present and can be measured with sufficient frequency and/or in sufficient numbers to be statistically significant. The rivers and bays in the study area experience natural seasonal variations, so season absences of useful parameters are to be expected. However, parameters/indicators that are not present in sufficient frequency or numbers during at least part of the year have typically not been useful in

assessing status or trends within the rivers and bays of interest. HBMP parameters by monitoring element, potential effects of withdrawals, and SWFWMD MFL resources of concern are shown in Table 6.2.1.

Table 6.2.1 HBMP Elements/Indicators and SWFWMD MFL Resources of Concern

Element / Indicator	Potential Withdrawal Effects	MFL Resource of Concern/ Management Goals	Approved Design Modification[1]
Hydrology/Water Quality			
Salinity	↑ salinity	Maintain river bottom areas within appropriate salinity zones for the protection of benthic macro-invertebrate communities. Maintain suitable salinity regime for oysters	Added recorders/ fixed stations (2001)
Dissolved Oxygen	↑ or ↓ dissolved oxygen	Determine changes in low DO concentrations	Discontinued recorders (2004)
Chlorophyll-a	↑ or ↓ chlorophyll-a	Determine changes in distribution and probability of high chlorophyll-a	--
Specific Conductance	↑ specific conductance	--	--
Temperature	↑ or ↓ temperatures	--	--
pH	↑ pH values	--	--
Secchi Disk Depth	↑ or ↓ Secchi disk depth	--	--
Light Transmission	↑ or ↓ light transmission	--	--
Stream Flow	↓ streamflows	--	--
Water Level	↓ water elevations (upper river)	--	--
Color	↓ color	--	--
Total and Dissolved Organic Carbon	↓ TOC, ↓ DOC	--	Discontinued (2004)
Total Suspended Solids	↑ or ↓ TSS	--	--
Biotic Indicators			
Benthic Macroinvertebrates	Δ species composition, abundance, distribution; seasonal, archive, Alafia inset stratum	Maintain river bottom areas within appropriate salinity zones for the protection of benthic macroinvertebrate communities. Maintain suitable salinity regime for oysters	Redistributed sampling (2008)
Ichthyoplankton/ Zooplankton	Δ species composition, abundance, distribution	Protect nursery function by maintaining distribution and abundance of important fish and invertebrate taxa	Redistributed sampling (2008)
Adult/Juvenile Fishes	Δ species composition, abundance, distribution	Protect nursery function by maintaining distribution and abundance of important fish and invertebrate taxa	Added stratum Alafia River Delta (2005); redistributed sampling (2008)

Water-Dependent Birds	Δ species composition, abundance, distribution		Discontinued McKay Bay (2004); added Alafia Banks (2005-2008)
Habitat			
Emergent Vegetation	Δ species composition, abundance, distribution	Maintain surface isohaline locations within ranges that protect distribution of low-salinity shoreline vegetation communities	Eliminated Alafia fixed station (2008); reduced frequency (2004)
Submerged Vegetation	Δ species composition, abundance, distribution		Decreased frequency (2001)
Sediment Grain Size and Organic Matter			--
Note 1. Approved change from initial HBMP design (see Appendix A).			

6.2.3. HBMP Biotic Parameters of Interest

A large number of fish and invertebrate species in various life stages have been collected during the duration of the HBMP. Only a small number of these occur with sufficient frequency and abundance to allow for meaningful analyses. Even smaller subsets appear to have potential direct or indirect relationships to river flow. The species and groups that have been most informative in HBMP analyses to-date for the TBC/McKay Bay, the lower Hillsborough River and the lower Alafia River are listed in Tables 6.2.2-6.2.4.

Table 6.2.2 HBMP Key Biotic Indicators: TBC and McKay Bay

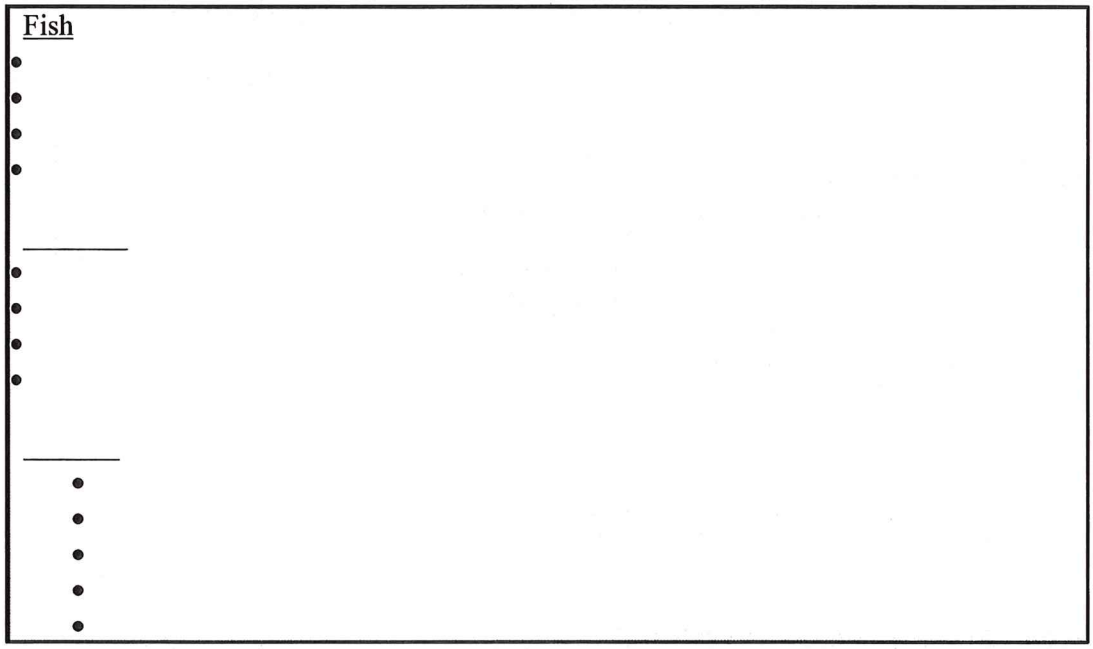

Table 6.2.3 HBMP Key Biotic Indicators: Lower Hillsborough River

Table 6.2.4 HBMP Key Biotic Indicators: Lower Alafia River

Fish • • • • • • • • • • • • • • • • • • • • • • • • • •	
Vegetation	Mangrove Swamp Needlerush Needlerush/Leather Fern Wetland Hardwood Forest Mixed Herbaceous Wetland Cattail

6.2.4. Center of Abundance

Center of abundance (COA) statistics describe the average position of occurrence for a given taxon over the sampling time period. For the linear riverine reporting units that are divided into spatial strata along a gradient, the COA can be described in terms of river kilometer (Rkm). Center of abundance was calculated by weighting the location of occurrence by the number of organisms of the given species collected at that location.

6.2.5. Abundance Weighted Salinity

Abundance weighted salinity (AWS) is a statistic that describes the salinity range in which a given taxon is found to be most abundant. Abundance weighted salinity weights the salinity at each sample collection site by the number or density of organisms of the given species collected at that location.

6.2.6. Dissolved Oxygen and Chlorophyll-a Thresholds and Exceedances

Water quality data collected by the HBMP to date have been used to develop logistic regression models to evaluate the potential effects of Tampa Bay Water withdrawals on water quality (dissolved oxygen and chlorophyll-a) within the HBMP reporting units. These models predict the probability of a sample being in exceedance of a threshold value. The exceedance thresholds used were obtained from independent scientific studies by the SWFWMD, the University of South Florida, and the Tampa Bay Estuary Program (TBEP). These studies were based on data from HBMP rivers and other tidal streams in southwest Florida. These models have been validated with additional data for successive interpretive reports.

6.2.7. Hydrodynamic Models

The HBMP has applied hydrodynamic models developed by the District for minimum flows analyses and other assessments of flow-related changes in estuarine systems. For HBMP analyses, these models have been applied to compare baseline and withdrawal scenarios. The first scenario uses actual, observed river flows that occurred downstream of the withdrawal locations to model daily conditions along the entire length of the reporting units during the periods in question. The second scenario adds the daily volumes of water diverted by Tampa Bay water to the observed river flows to "reconstruct" the flows that would have occurred in the absence of Tampa Bay Water operations. Modeled salinity conditions using observed flows have been compared to modeled salinity conditions using reconstructed flows to estimate the daily effect of Tampa Bay Water operations on water quality conditions and salinity regimes in the reporting units.

6.3. Potential Future Program Modifications

In an effort to improve the utility of information generated by the HBMP to detect potential effects of changes in flow on the five reporting units, several minor modifications to HBMP elements have been proposed. These were described in the Alafia River 2009 Year 10

Interpretive Report and the TBC/Hillsborough River 2010 Year 10 HBMP Interpretive Report, and discussed at the 2009 and 2010 HBMP Annual Meetings. The recommended modifications are summarized in the following sections.

6.3.1. Annual Reporting

As discussed at the 2010 HBMP Annual Meeting, current routine annual data reporting requires significant resources that may be better utilized. There was consensus that current HBMP reporting requirements be reviewed with the District and revised as appropriate.

6.3.2. Hydrology/Water Quality

The continuous salinity recording station below Buckhorn Springs on the Alafia River is located on a former speed zone sign piling that is becoming increasingly unstable. In Water Year 2008, the District gave approval to relocate this station just upstream or downstream of the current location. Suitable speed zone pilings are present just upstream of the Buckhorn Springs location. A long-term, EPCHC maintained continuous recorder location is also located just downstream of Buckhorn Springs. In the near future, this station may be relocated to the upstream location or data from the ECPHC station may be used for this HBMP data collection effort.

6.3.3. Benthic Macroinvertebrate Sampling (Special Studies)

Based on HBMP data collected to-date and numerous evaluations completed by Tampa Bay Water, the Southwest Florida Water Management District, the University of South Florida and others, the utility of the benthic program for detecting potential changes associated with Tampa Bay Water's permitted withdrawals has been limited. HBMP modifications that maintain or increase the ability of the benthic monitoring element to detect changes related to withdrawals for public supply while maintaining or reducing costs would be a valuable modification to the current program.

Suggested possible changes to the benthic invertebrate sampling element of the HBMP include:

- Concentrating benthic sampling effort in the Alafia River to improve statistical power
- Using seasonal index periods to characterize the benthos community as an alternative sampling strategy to the current design which requires year-round sampling
- Utilizing benthic taxa collected during sampling for the plankton element to characterize potential withdrawal-related changes in benthic indicators.

Each of these changes and supporting analyses are described briefly below. It is anticipated that the results of studies described below will be used in a re-evaluation of the entire benthos sampling program design that will be completed and presented at the 2011 or 2012 HBMP Annual Meeting.

6.3.3.1. Redirected Alafia River Sampling

As a result of statistical power analyses conducted in 2008, the Alafia River fish sampling program was modified after Water Year 2008. The power analyses concluded that the number of trawl samples in the upper river strata containing only one species or no individuals at all was making it difficult for the sampling program to detect statistically significant changes of a 15% magnitude. As a result, trawl sampling was concentrated in the mid to lower river strata where models predicted the most salinity fluctuations as a result of withdrawals. This was accomplished by discontinuing upstream trawl samples and increasing mid and lower strata trawl samples accordingly.

The power analyses also concluded that Alafia River samples with only a single species present or no benthic macroinvertebrates were reducing the benthic sampling program's ability to measure a statistically significant 15% change, suggesting that the Alafia River benthic program might be improved by concentrating sampling effort. Samples could be concentrated by shifting them out of the upper and lower strata into the middle strata where the greatest salinity changes are predicted. Samples could also be concentrated by shifting samples to certain "index period" months when withdrawals might have the greatest potential effect on benthic macroinvertebrates. The probability of collecting a benthic sample with just one species or with no organisms is greater in some months. This characteristic of the Alafia River will need to be taken into account if samples are concentrated in time and/or space.

6.3.3.2. Benthos Sampling Design Re-Evaluation

The results of preliminary analyses (Janicki Environmental, 2009) suggest that if the HBMP goal is to optimize the benthic element for statistical power to detect inter-annual differences in means for common community metrics, a sampling window incorporating months between December and May would yield the highest power in general. This time period tended to have higher CPUE, higher diversity and a lower frequency of null catches. This time period also coincides with recruitment windows for many estuarine dependent fish species of commercial and recreational value that prey on benthic taxa.

6.3.3.3. Compare Benthic and Zooplankton Samples

As discussed at the 2010 HBMP Annual Meeting, several macroinvertebrate groups collected in the plankton sampling effort are reported as grouped taxa and not identified to lower taxonomic levels. Many of these taxa also occur in the benthic samples.

It is possible that plankton sampling alone might be sufficient to provide information on that portion of the benthic community that is most susceptible to changes in flow and withdrawal. Alternatively, analyses may reveal that certain benthic taxa could be identified to a higher taxonomic level than currently utilized. These analyses could also determine if a coordinated plankton and benthic sampling program should be utilized.

For this special study, archived samples collected under the ichthyoplankton element would be selected, specific lumped taxa would be analyzed to lower taxonomic levels, and the occurrence

of macroinvertebrate taxa in the plankton and benthic samples would be evaluated relative to the objectives of the HBMP.

Field sampling of benthic populations would continue as specified under the current HBMP. However, these samples would be archived in alcohol for potential future sorting and taxonomic identification pending the results of additional analyses on archived plankton samples. It is anticipated that the results of these additional taxonomic analyses can be completed in time for presentation at the 2011 HBMP annual meeting.

6.3.4. Fish and Freshwater Inflows (SWFWMD Study)

The District has discussed re-evaluating existing fish versus river flow and salinity regressions using HBMP data collected since the original regressions were created five or more years ago. The District has recently initiated a new project to examine the applicability of using fish abundance and diversity to establish minimum flows and levels for southwest Florida coastal rivers. This study is meant to identify the strengths and weaknesses of the current approaches to establishing "fish-flow" relationships, identify confounding effects that may affect the relationships between fish and freshwater inflows, explore new techniques to identify effects of freshwater flows on fish populations, and identify new analytical tools.

This study will examine fish responses to changes in flow near the ranges typically observed during Tampa Bay Water operations. While the effects of changes in river flow on estuarine fish have been studied by a number of researchers, many of these efforts examined changes in flow much greater than those possible under the Tampa Bay Water operating regimes. Therefore, although not specifically performed for the HBMP, the results of this study may be important for re-evaluation of the HBMP fish and/or plankton sampling elements.

6.3.5. Habitat / Vegetation

Analysis of vegetation mapping data from Water Years 2003, 2006 and 2009 found very small changes in vegetation coverage. These changes could not be related to the relatively large natural changes in flow and salinity that occurred during this 6-year period. Changes in flow and salinity as a result of Tampa Bay Water operations are much smaller than those that occur as a result of natural variation in rainfall. If vegetation mapping cannot detect a change as a result of natural variations in flow, vegetation mapping is highly unlikely to be able to detect changes as a result of Tampa Bay Water operations. The next vegetation mapping event is not scheduled to occur until 2012, but the monitoring program may be better served by redirecting this effort towards additional direct measures of impact such as continuous water quality recorders. At a minimum, extending the vegetation mapping to a once per 6-year cycle is recommended.

7.0 HBMP Programmatic Criteria

As discussed in previous sections of this document, the overall purpose and scope of the HBMP extend beyond just data acquisition, analysis and reporting. The HBMP also incorporates programmatic criteria that have been included to ensure that the permitted withdrawals are consistent with District rules throughout the lifetime of the permits.

In the context of the HBMP, the term programmatic criteria refers to: 1) the criteria by which unacceptable environmental impacts are determined; and 2) the process by which appropriate management responses to detected conditions that constitute or could potentially lead to adverse environmental impact are determined and implemented. Important components of these criteria include established minimum flows and levels for lower Hillsborough River, Tampa Bypass Canal and Alafia River; specific HBMP objectives for each waterbody included as special conditions in WUPs for the Tampa Bypass Canal/Hillsborough River and Alafia River Water Supply Projects; and ongoing assessment of HBMP data to identify and evaluate any detected hydrobiological changes attributable to the permitted withdrawals, and appropriate management actions.

7.1. Background

In addition to other requirements, Water Use Permit (WUP) applicants must demonstrate that the proposed withdrawals meet the following Southwest Florida Water Management District (District or SWFWMD) conditions for issuance related to potential environmental impacts (40D-2.301, F.A.C.):

> *(b) Will not cause quantity or quality changes that adversely impact the water resources, including both surface and groundwater*
> *(c) Will not cause adverse environmental impacts to wetlands, lakes, streams, estuaries, fish and wildlife or other natural resources*
> *(g) Will not significantly induce saline water intrusion.*

The District's Basis of Review for WUPs for withdrawals from natural streams (Section 4.2.c) also requires that the following specific performance standards be met:

> *a. Flow rates shall not deviate from the normal rate and range of fluctuation to the extent that water quality, vegetation, and animal populations are adversely impacted in streams and estuaries.*
> *b. Flow rates shall not be reduced from the existing level of flow to the extent that salinity distributions in tidal streams and estuaries are significantly altered as a result of withdrawals.*
> *c. Flow rates shall not deviate from the normal rate and range of fluctuation to the extent that recreational use or aesthetic qualities of the water resource are adversely impacted.*

To provide ongoing reasonable assurance that District performance standards would be met, special conditions of the TBC/Hillsborough River and Alafia River project WUPs required the development and implementation of the HBMP as described in previous chapters of this document. General HBMP objectives are to collect data on the spatial and temporal

characteristics of environmental indicators including salinity regimes, water quality and biotic integrity (PBSJ, 2000).

Inherent in District rules is the recognition that surface water withdrawals are linked to potential changes in: 1) salinity patterns; 2) associated water quality constituents; and 3) biological communities. This potential linkage can be summarized conceptually as follows:

Freshwater Inflows
⇩
Salinity and Associated Water Quality Indicators
⇩
Biotic and Habitat Indicators

It should be noted, however, that while freshwater withdrawals may have a direct and instantaneous physical effect on salinity patterns, the effects of freshwater withdrawals on other water quality constituents and biological communities in particular, are typically indirect and complex. Such indirect impacts are mediated by physical and chemical changes or processes, and are typically manifested on longer time scales (e.g., days, months, seasons or years).

For example, a reduction in freshwater inflows may result in increased salinities within the geographic range of a population of a particular benthic organism; but if the changed salinity still remains within the salinity tolerance range of the organism, the abundance and distribution of the organism will likely not be affected. However, if that same change in salinity results in increased density stratification, which in turn leads to hypoxic conditions on the bottom, the abundance and distribution of the organism could be affected.

In addition to linkage between freshwater withdrawals and biological communities, the District performance standards also link adverse impact to:

- A significant deviation from natural or historic conditions
- A significant degradation of conditions necessary to support economically important activities such sport and commercial fishing, and water-dependent recreation and aesthetics.

7.2. Minimum Flows and Levels

At the time of initial HBMP development, limited standards or specific criteria were available for evaluating freshwater withdrawal-related changes to estuarine systems, or determining significant impacts to these systems. Since implementation of the HBMP in 2000, the District has developed and adopted Minimum Flows and Levels (MFLs) for the lower Hillsborough River, Tampa Bypass Canal and Alafia River as required by the Florida Legislature (SWFWMD 2004, 2006 and 2008). MFLs are based on technical evaluations that determine critical flows and the amount of water that can be withdrawn without causing unacceptable impacts to the ecology

of natural systems, recreational use or aesthetic qualities of these waterbodies (SWFWMD, 2008).

MFL documents prepared for each waterbody describe the purpose and background of the MFL, and provide descriptions of the physical and hydrologic characteristics of the waterbody and watershed, including river and spring flows, withdrawals, and river/channel morphology, sediments, and habitats. These documents also provide extensive analyses of freshwater inflows and relationships to important parameters and characteristics that were used to establish the MFLs, including:

- Tides and freshwater inflows and water levels and residence time, and results of hydrodynamic models developed for these estuarine systems
- Freshwater inflows and water quality constituents including salinity, dissolved oxygen, nutrients and chlorophyll-a
- Freshwater inflow and biological characteristics, including phytoplankton, benthic macroinvertebrates, mollusks, oysters, zooplankton and fishes.

MFL documents describe how these relationships were determined and used to examine the effects of reduced freshwater inflows on the hydrological and biological components of each system. For each system, baseline periods were identified and methods for evaluating flow reduction scenarios were selected. To determine minimum flow thresholds, resources of concern were identified along with appropriate identification of acceptable levels of change that do not result in unacceptable impacts to the ecology or other resources. Important considerations for the resources of concern included the following:

- Maintaining appropriate salinity zones for benthic macroinvertebrate communities, oysters, shoreline vegetation, and fish and invertebrates
- Minimizing the probability of hypoxia (dissolved oxygen concentrations <2.5 mg/L); specifically, examining the distribution and probability of low dissolved oxygen concentrations resulting from changes in flow
- Minimizing the probability of excessive chlorophyll-a concentrations, specifically examining the distribution and probability of high chlorophyll-a resulting from changes in flow.

Using the relationships between freshwater inflows and metrics for various resources of concern, the District identified water quality and biological resources of each waterbody that were particularly sensitive to flow reductions during periods of low flow. In addition to salinity changes during these periods, residence times typically increase in these waterbodies, potentially leading to large phytoplankton blooms, dissolved oxygen impacts and/or increases in abundance of non-desirable predators.

MFLs for the lower Hillsborough River, the Tampa Bypass Canal and the Alafia River were developed by the District based on the considerations described above over a multi-year process and have been adopted in District rules (40D-8, F.A.C.). Each of these is described briefly in the following sections.

7.2.1. TBC MFL

The Minimum Flow (MFL) for the Tampa Bypass Canal (TBC) was adopted in 2006. For the TBC, the District determined that establishment of an MFL was not appropriate due to designated flood control purpose and use of the TBC (SWFWMD, 2004), and an MFL of 0 cfs at Structure 160 was ultimately adopted. MFL analyses completed by the District evaluated relationships between flow and salinity, DO, and biota and concluded that no defensible technical basis exists for an MFL (SWFWMD, 2005). District technical analyses and conclusions for TBC MFL studies were confirmed by independent scientific per review (Powell et al., 2005).

In general, stratification is common in the TBC, but salinity was relatively insensitive to flow. Hypoxia was prevalent, but statistical analyses suggested that flow accounted for less than 50% of the variation in hypoxia. Overall, high flows in the TBC result in greater ecological effects than insufficient flows. High flows caused prolonged low salinity conditions, vertical stratification and hypoxia.

In addition to flood control and regional drinking water supply, the TBC is used to augment the Hillsborough River reservoir for the City of Tampa water supply and to meet requirements of the lower Hillsborough River MFL as discussed below.

7.2.2. Lower Hillsborough River MFL

The revised Minimum Flow (MFL) for the Lower Hillsborough River was established in November 2007. This MFL requires a 20 cfs (~13 mgd) flow at the base of the City of Tampa dam during the July 1 - March 31 time period and 24 cfs (~15.5 mgd) from April 1 - June 30, with an adjustment if there are lower than normal flows in the upper river.

In order to meet MFL requirements when water is not available to flow over the dam, a Recovery Strategy was adopted by the District along with the MFL identifying activities and milestones to be achieved in accordance with the time schedule specified (40D-80.073(8), F.A.C.). Sources of water to be used to meet the MFL include:

- Sulfur Springs discharge: 10 cfs (~6.46 mgd) to the base of the City of Tampa dam
- TBC pool: up to 7.1 mgd (~11 cfs) from the middle pool discharged to the Hillsborough River through S-161 and pumped to the base of the dam; up to 7.1 mgd from the middle pool to the dam through a pipeline to be constructed by 2013.
- Morris Bridge Sink Project: up to 3.9 mgd (~6.03 cfs) from Morris Bridge Sink to the TBC middle pool or 3.9 mgd from the TBC lower pool to the middle pool if available, then discharge to the Hillsborough River through S-161 and pumped to the base of the dam.

- The TBC middle pool and Morris Bridge Sink/TBC lower pool sources have specific operational and performance criteria identified as well as transmission pipeline construction components (40D-80.073(8), F.A.C.).

Additional potential MFL augmentation sources include Blue Sink based on cost/benefit and feasibility analyses to be completed, and other sources as identified in the future. Monitoring and evaluation for the MFL and Recovery Strategy are performed by the City of Tampa and the District with an annual implementation evaluation and report completed by the District.

The Lower Hillsborough River MFL was based on analyses presented in Lower Hillsborough River Low Flow Study Results and Minimum Flow Recommendation (SWFWMD, 2006). District technical analyses and conclusions for Lower Hillsborough River MFL studies were confirmed by independent scientific per review (Montagna, et al., 2007).

The primary water quality and ecological condition affected by freshwater inflows at the base of the dam is salinity, although tides and other factors (e.g., stormwater, winds, and salinity in Tampa Bay) complicate this relationship. In addition to analyses of existing data and modeling, Lower Hillsborough River and related Sulphur Springs MFL studies included a series of experimental water releases conducted to evaluate the effect of changes in flow on water quality parameters. These studies concluded that the effect of flow changes (in the low flow range) on salinity generally decrease as a function of increasing distance from the dam and depth in the water column.

Principal components analysis (PCA) performed on biological sampling results identified four salinity ranges utilized by invertebrates. The findings for benthic macroinvertebrate community structure showed that a distinct group of these organisms occur in river habitats with salinity in the range of <5 ppt. However, there was a high degree of species overlap among adjacent salinity zones and few estuarine species were identified as requiring a single salinity zone. Because some invertebrate species are restricted to the lower salinity range, maintaining an essentially permanent area of the lower river with a salinity of <5 psu would provide habitat for those predominantly oligohaline and fresh water species, assuming other habitat requirements are also present.

The creation of a < 5 psu salinity zone was chosen as the principal ecological criterion on which to establish minimum flows for the LHR. Juvenile stages of important estuarine dependent fish species concentrate in oligohaline waters. Benefits (in terms of provision of low salinity habitat) accruing from fresh (or nearly fresh) water inputs at the dam are most pronounced near the dam, with the magnitude of the effect diminishing downstream. For a given discharge rate, the strongest effects are realized nearest the dam and decrease incrementally downstream.

7.2.3. Lower Alafia River MFL

The minimum flow (MFL) rule for the lower Alafia River was established in 2009. This MFL was defined as not more than a 19% reduction of daily flows with a low-flow threshold of 120

cfs. Similar to other MFLs in southwest Florida, the District used the percent-of-flow method for the Lower Alafia River to determine the amount of water that can be withdrawn without causing

unacceptable impacts to the ecology or other water resources (SWFWMD, 2008). District technical analyses and conclusions for Lower Alafia River MFL studies were confirmed by independent scientific per review (Powell et al., 2008).

The Alafia River MFL document provides extensive analyses of freshwater inflows and relationships to important parameters and characteristics that were used to establish the MFL, including:

- Tides and freshwater inflows and water levels and residence time, including results of a hydrodynamic model developed for the lower river
- Freshwater inflows and water quality constituents including salinity, dissolved oxygen, nutrients, and chlorophyll-a
- Freshwater inflow and biological characteristics, specifically phytoplankton, benthic macroinvertebrates, mollusks, oysters, zooplankton, and fishes.

The MFL document describes how these relationships were determined and used to examine the effects of reduced freshwater inflows on the hydrological and biological components of the Lower Alafia River. First, a baseline period was identified and a method for developing flow reduction scenarios was selected. Second, resources of concern were identified along with appropriate identification of acceptable levels of change that do not result in unacceptable ecological impacts to habitat metrics.

The important considerations for the resources of concern included the following:

- Maintaining appropriate salinity zones for benthic macroinvertebrate communities, oysters, shoreline vegetation, and fish and invertebrates
- Minimizing the probability of hypoxia (dissolved oxygen concentrations <2.5 mg/L); specifically, the distribution and probability of low dissolved oxygen concentrations resulting from changes in flow
- Minimizing the probability of excessive chlorophyll-a concentrations; specifically, the distribution and probability of high chlorophyll-a resulting from changes in flow.

Using the relationships between freshwater inflows and the habitat metrics of the various resources of concern, the District found that the water quality and biological resources of the lower river were particularly sensitive to flow reductions during periods of low flow. During these periods, residence times increase within the lower river, potentially leading to large phytoplankton blooms and increases in abundance of non-desirable predators.

The effects of the MFL on metrics identified for the resources of concern were examined using hydrodynamic modeling and regression relationships between freshwater inflows and biological metrics. Regression models were used to predict changes in abundances of different life stages and size classes of fish and invertebrate species due to reduced freshwater inflows to the lower river. The results of these analyses indicated that the 19% reduction and the low-flow threshold would not result in unacceptable reductions in abundance, and most notably would not reduce the median abundance of juvenile red drum more than the 15% threshold identified.

Hydrodynamic modeling was used to examine changes in bottom areas of salinity zones important to benthic macroinvertebrates. Regression models were used to examine changes in surface isohalines that would affect wetland shorelines, and to predict shifts in geographic centers of abundance for key fish and invertebrate species. The combined results indicated that the minimum flows based on the abundance of key fish and invertebrate species would also prevent significant harm to the other resource characteristics. Logistic regression analyses were performed to predict the increased probability of low dissolved oxygen and high chlorophyll-a concentrations in response to reduced flows, indicating that the recommended minimum flows would not result in significant harm to the lower river, with only very small changes in probability of the occurrence of undesirable conditions.

7.3. WUP Requirements

To provide ongoing reasonable assurance that District performance standards would be met, special conditions of the TBC/Hillsborough River and Alafia River project WUPs required the development and implementation of the HBMP as described in previous chapters of this document. The general objectives of the HBMP are to collect data on the spatial and temporal characteristics of environmental indicators including salinity regimes, water quality and biotic integrity (PBSJ, 2000). Specific HBMP objectives related to ongoing compliance with District performance criteria are also provided in each WUP as listed in the following sections.

7.3.1. Tampa Bypass Canal Water Supply Project

Water Use Permit 20011796.002 for the Tampa Bypass Canal (TBC)/Hillsborough River Water Supply Project authorizes Tampa Bay Water to divert water from the Hillsborough River and withdraw water from Tampa Bypass Canal according to the schedule provided in the permit. This permit requires that Tampa Bay Water continue to implement the approved TBC/Hillsborough River HBMP in order to address the following objectives:

- Use baseline conditions to compare the effects of the permitted water use upon streamflow rates, salinity distributions, and selected water quality and biologic variables within the lower Hillsborough River below the Tampa Dam, TBC, Palm River and McKay Bay.

- Monitor diversions from the Hillsborough River and withdrawals from the TBC at the withdrawal points and evaluate streamflow data for the lower Hillsborough River at the Tampa Dam, and the TBC at the District's flood control Structures 160 and 162.

- Evaluate the ecological relationships of the lower Hillsborough River below the Tampa Dam, TBC, Palm River and McKay Bay to freshwater flows.

- Monitor selected water quality and biologic variables related to freshwater flow in order to determine if the ecological characteristics of the lower Hillsborough River below the Tampa Dam, TBC, Palm River and McKay Bay change over time.

- Determine the relative effect of permitted diversions and withdrawals on any ecologic changes that may occur in the lower Hillsborough River below the Tampa Dam, TBC, Palm River and McKay Bay.

- Determine if these withdrawals cause or significantly contribute to any unacceptable adverse environmental impacts to the natural resources of the lower Hillsborough River below the Tampa Dam, TBC, Palm River and McKay Bay due to changes in freshwater flows. The HBMP shall identify criteria that will be used to determine unacceptable adverse environmental impacts to the resources.

- Coordinate with appropriate agencies that have or are currently collecting data that can be incorporated into the HBMP to avoid duplication of effort and to facilitate the most efficient use of resources.

HBMP data collection activities that meet these objectives are described in Section 3.

7.3.2. Alafia River Water Supply Project

Water Use Permit 2011794.01 for the Alafia River authorizes Tampa Bay Water to withdraw water from the Alafia River at Bell Shoals Road according to the schedule provided in the permit. The original water use permit (Permit 2011794.00) required Tampa Bay Water to develop and implement an HBMP for the Alafia River. The permit specified that the HBMP address the following objectives:

- Establish baseline conditions prior to permitted use for streamflow rates, salinity distributions, and selected water quality and biological variables within the Alafia River and its estuary.

- Monitor withdrawals from the Alafia River at the withdrawal point and evaluate streamflow data for the river at all applicable locations.

- Evaluate the ecological relationships of the Alafia River and its estuary to freshwater flows.

- Monitor selected water quality and biological variables related to freshwater flow in order to determine if the ecological characteristics of the river and its estuary change over time.

- Determine the relative effect of permitted withdrawals from the Alafia River on any ecologic changes that may occur in the river and its estuary.

- Determine if these withdrawals cause or significantly contribute to any unacceptable environmental impacts that the river and its estuary exhibit as a result of changes in freshwater flows.

- Coordinate with appropriate agencies that have or are currently collecting data that can be incorporated into the HBMP to avoid duplication of effort and to facilitate the most efficient use of resources.

HBMP data collection activities to meet these objectives are described in Section 4.

7.4. HBMP Programmatic Criteria

Participants in the original HBMP design reached consensus that the HBMP would provide adequate data to detect potentially adverse hydrobiological changes in the HBMP reporting units. Participants also noted that the HBMP would need to determine if any observed hydrobiological changes were the result of natural variation or the permitted freshwater withdrawals. To address this need, it was concluded that HBMP data could also be used to support the enhancement of various predictive models that could be used to determine the incremental effects of the permitted withdrawals on any changes in freshwater inflows.

As required by specific conditions of the Water Use Permits, one of the goals of the HBMP design process was to identify criteria that will be used to determine unacceptable environmental impacts to the resources of concern. Given the above described considerations, the HBMP design group attempted to identify these criteria, as they specifically relate to the Tampa Bypass Canal and Alafia River Water Supply Projects. These criteria were described as follows:

> *A detected change, supported by statistical inference or a preponderance of evidence, from the pre-operational abundance, distribution, species composition, or species richness of biological communities of concern in the Lower Hillsborough River, Lower Palm River/TBC, McKay Bay, or Lower Alafia River reporting units that can be attributed to reductions in freshwater inflows caused by the permitted surface water withdrawals.*

The above described criteria were recommended by the HBMP design group for use in determining what conditions might constitute an unacceptable environmental impact with respect to the permitted withdrawals. The HBMP design group noted that conditions meeting the above recommended criteria for unacceptable environmental impact could be detected, measured and described in many different ways. A few examples are discussed below:

- Significant dislocation of an ecologically significant species distribution - a "center of population" (either abundance or frequency) statistic has been used in the HBMP to

assess the distribution of adult and young fish, and benthos relative to river location. Other related measures of distribution dislocations may also be applicable for the HBMP.

- Elimination or reduced abundance of a "desirable" species - the elimination, or a significant reduction in the abundance, of a "desirable" (e.g., economically or ecologically important) species within a reporting unit would likely be considered an unacceptable environmental impact. Measures of species composition and abundance for critical biological indicators are included in the HBMP.

- Significant change in species richness or similar measure of community balance.

- Significantly increased abundance of an "undesirable" species that could consume or out-compete desirable species - the converse of the above described scenario. Measures of species composition and abundance for biological indicators are included in the HBMP. As introduced exotic or nuisance species often occur in ecosystems due to factors unrelated to stress caused by fresh water withdrawals, any significant increases in exotic or nuisance species would require additional evaluation.

Given the potentially infinite measures of unacceptable environmental impact, it was the general consensus of the HBMP design group that specific programmatic criteria or thresholds not be developed for every indicator. Rather, the HBMP design group recommended the application of a consensus-based process to evaluate whether unacceptable environmental impact has occurred, or is in the process of occurring (PBS&J, 2000).

The second HBMP interpretive analyses (PBS&J, 2006) summarized the assessment of unacceptable environmental impact as a series of ten progressive questions. These questions are:

1. What were the daily flows in each reporting unit during the study period, and how did these flows compare to the historical flow record?

2. What were the daily Tampa Bay Water withdrawals from each reporting unit during the study period, and how did these withdrawals affect daily flows?

3. What was the observed intra- and inter-annual variation in salinity in each reporting unit during the study period?

4. What portion of the observed intra- and inter-annual variation in salinity was attributable to Tampa Bay Water withdrawals?

5. How did observed changes in salinity attributable to changes in flow compare to the predicted salinity vs. flow relationships used during the WUP process?

6. What was the observed intra- and inter-annual variation in chlorophyll-a and dissolved oxygen in each reporting unit during the study period?

7. What portion of the observed intra- and inter-annual variation in chlorophyll-a and dissolved oxygen was attributable to Tampa Bay Water withdrawals?

8. What was the observed intra- and inter-annual variation in the species composition, abundance and spatial/temporal distribution of key biotic indicators in each reporting unit during the study period?

9. To what extent did variation in flow or flow-related variables (e.g., salinity) affect the intra- and inter-annual variation in the species composition, abundance and spatial/temporal distribution of key biotic indicators?

10. To what extent did the variation in flow or flow-related variables attributable to Tampa Bay Water withdrawals affect the intra- and inter-annual variation in the species composition, abundance and spatial/temporal distribution of key biotic indicators?

If observed changes in the intra- and inter-annual variation in the species composition, abundance and spatial/temporal distribution of key biotic indicators are identified as clearly attributable to Tampa Bay Water withdrawals, the next analytical step would be to determine if these changes constituted an unacceptable environmental impact.

7.5. HBMP Management Responses

The final step for reasonable assurance in meeting District standards involves the identification of appropriate management actions or remedial measures to be taken if adverse environmental impacts are detected, although no particular management actions are specifically identified. However, waiting until an adverse environmental impact has occurred to initiate appropriate management actions or remedial measures reduces the opportunity to adequately protect resources that may be at risk. Therefore, proactive resource management is needed to protect the resources of concern in the potentially affected water bodies.

The initial HBMP design included an appropriate sequence of management actions that should be initiated if conditions are observed that could potentially lead to, or are consistent with, the above described criteria for unacceptable environmental impact. The following management actions, listed sequentially in order of increasing intensity, are recommended for consideration under the HBMP:

- Data QA/QC Audit - This action would involve the performance of a concentrated QA/QC audit to determine if the detected change was the result of laboratory problems, data entry errors, violation of sampling protocols, etc.

- Data Comparison (Correlates) - This action would involve a review of data correlates (e.g., specific conductance is a correlate to salinity) to determine if there is more than one line of evidence reflecting the detected change.

- Determination of the magnitude and ecological importance of the detected change.

- Assessment of the degree of statistical certainty for an observed change to determine the likelihood that the observed change was due to chance alone (e.g., *alpha* error).

- Assessment based on combined results for magnitude of change and probability that the change is due to chance alone. If both the detected change and the degree of certainty are low, then a less intense management response would be appropriate including increased or directed sampling efforts. If the detected change is considered to be moderate or large and the degree of certainty is high (e.g., low alpha), then a more intense management response may be indicated. If the detected change is relatively large, but the degree of certainty is low (e.g., high alpha), then a less intense management response may be appropriate.

- HBMP Special Meeting - If the data review and comparison indicates that a detected change is not due to quality control problems and is reflected in multiple lines of evidence, the next step would involve convening a special HBMP meeting. The purpose of the meeting would be to discuss the data review and comparison findings with all HBMP participants to determine additional steps to refine the understanding of the magnitude and extent of the detected change. Additional data analyses or a redirected and focused sampling effort to better define the detected change would be recommended as appropriate.

- Redirected Sampling Effort - This action would involve conducting more focused supplemental sampling and/or additional studies (e.g., controlled withdrawal/flow experiments) in the affected reporting units with the objective of gaining a better understanding of the detected change. The additional data collected from this effort could then be subjected to previous steps as appropriate. This action would determine if detection of the change is repeatable under a more focused sampling program. Although this step could be valuable, it may not be necessary for a redirected sampling effort to be conducted for all hydrobiological changes detected by the HBMP.

- Modified Withdrawal Schedules - Modified freshwater withdrawal schedules could include provisional or temporary reductions in withdrawal rates, or modifications to the schedules such that greater withdrawals would occur during high flows, but lesser withdrawals would occur during low flows. Another alternative would be the development of an optimization schedule whereby the highest withdrawal rates would occur in the river source with the greatest harvestable flows at any given time. Given the regional need for additional water supplies, a permanent reduction in the total permitted withdrawal volumes would likely be viewed as the most intense response to detected adverse impact.

As noted, consideration and application of these recommended management actions would vary with the specific hydrobiological changes and statistical measures of certainty involved.

However, this approach meets the need for reasonable assurance as well as the overall objectives of the HBMP.

Appendices

HBMP 2010 Update

APPENDIX A
Previously Authorized HBMP Design and Programmatic Modifications

Design of the Alafia River/Tampa Bypass Canal HBMP began in May 1999. The HBMP was designed in a series of workshops and subcommittee meetings attended by regulatory agency and local government representatives, and other stakeholders. A final HBMP design document was completed in late 1999 (PBS&J, 2000).

HBMP field sampling was initiated in April 2000, and continued implementation of the HBMP has been required under special conditions for the renewed and modified water use permits for these regional public water supply projects. The HBMP was intended to be routinely modified based on field conditions and the ongoing evaluation of HBMP data.

In the ten years since the acceptance of the final HBMP design by both the design group and the Tampa Bay Water Board, several minor modifications have been made to the HBMP. These modifications were in response to requests by the District and other stakeholders, logistical problems encountered during early implementation, and the sampling modifications identified based on evaluations of HBMP data.

Potential modifications to improve the monitoring program have been provided in HBMP annual and multi-year interpretative reports, and discussed at Annual HBMP Meetings. All modifications approved by the District through July 2010 and incorporated into the program are listed below.

1. Spatial Strata

Discontinued Sampling in Alafia River Stratum AR8

In 2000, Alafia River stratum AR8 was found to be inaccessible on nearly all tides. This portion of the river is also physically different than the lower river and would have required different benthic, fish, and plankton sampling methods than the lower river. As a result, stratum AR8 was deleted from the monitoring program with District approval after the first few months of program implementation. The sampling effort scheduled for AR8 was transferred to the other freshwater stratum (AR7), also with District approval.

2. Hydrology/Water Quality

Added Fixed-Location Water Quality Sample Stations

In Water Year 2001, three additional fixed-location water quality monitoring stations were added at the request of the District. One additional fixed-location water quality sampling station was added at the mouth of the Alafia River and one at the mouth of the Hillsborough River at existing EPCHC sampling sites. A third fixed station was added at the upstream side of the S160 dam. This station is only sampled when there is flow over S160. These stations were meant to describe upstream and downstream boundary inputs (by downstream flow or incoming tide) to the reporting units.

Discontinued Total Organic Carbon and Dissolved Organic Carbon

Total organic carbon and dissolved organic carbon sampling was discontinued in the Alafia River, TBC and McKay Bay at the end of Water Year 2004 (September 2004). There was consensus at the 2004 Annual Meeting to discontinue the sampling and analysis of TOC and DOC as part of the HBMP because the HBMP had generated a considerable amount of data for dissolved and total organic carbon in these systems and additional data was not necessary.

Discontinued Continuous Dissolved Oxygen Sensors

Dissolved oxygen (DO) probes on the Sligh Avenue and Columbus Avenue continuous recorder stations in the Hillsborough River reporting unit were deactivated during Water Year 2004. There was consensus at the 2004 Annual Meeting that DO measurements at these stations could be discontinued. This consensus was based on the belief that the data collected under long-term deployments of membrane-based, dissolved oxygen measurement equipment did not have the precision to detect the small changes predicted as a result of withdrawals.

3. Biota

Completed McKay Bay and TBC Oyster and Mollusk Surveys

Oyster and mollusk surveys were conducted in McKay Bay and the TBC as special studies completed in 2005 and 2008. These studies included a bathymetric and oyster bar survey (PBS&J, 2005), and mapped the distribution and assessed the health of oysters and other mollusks (Janicki Environmental, 2008).

Discontinued Avian Surveys near McKay, Added Avian Study near Alafia

There were significant variations in natural flow from 2000 to 2004 including some of the highest and lowest flow on record. However, there was no relationship between flow and bird observations collected during this period. Based on data collected from 2000 to 2004, HBMP annual meeting participants concluded that the ability to link changes in bird communities to flow and salinity changes associated with the surface water projects was tenuous at best. As a result, bird sampling in the ponds area was eliminated in Water Year 2005, and a redesigned Alafia area sampling was implemented.

Completed Avian Special Study at Alafia Banks

In Water Year 2005, surveys included quantification of foraging effort by select benthic feeding indicator species as part of an approved HBMP special study. No relationship between flow and bird populations were observed during this sampling, and all bird sampling in the Alafia Banks was discontinued at the end of Water Year 2008 with District approval. Since relationships between the large natural variations in Alafia River flow and bird populations could not be detected, it was determined that it would be difficult or impossible to detect variations in bird populations as a result of withdrawals.

Added Expanded Fish Sampling in Hillsborough Bay Adjacent to the Alafia River

The HBMP was designed to characterize baseline conditions, and detect hydrobiological changes, in the river estuaries of the Alafia, Hillsborough and Palm Rivers, and McKay Bay. Although Hillsborough Bay was a defined reporting unit in the HBMP, it was the consensus of the Focus Group that hydrobiological changes associated with the permitted withdrawals would first be detected in the rivers long before any potential cumulative impacts in Hillsborough Bay were realized. Therefore, the HBMP Focus Group did not recommend additional sampling of Hillsborough Bay. Rather, they concluded that data currently being routinely collected by others (e.g., EPCHC and FWRI) would likely be adequate to assess changes in water quality, benthos and fish communities in Hillsborough Bay.

At the 2004 Annual Meeting, FWRI staff pointed out that the FIM sampling effort was not intended to make annual inferences regarding fish population changes in Hillsborough Bay, and suggested that if it is desirable to make annual inferences regarding potential cumulative impacts on fish communities, the

sampling intensity of the FIM program would need to be increased. There was agreement among the meeting participants that the original assumptions regarding the initial detection of changes related to surface water withdrawals in the river estuaries still held true, but that the adequacy of sampling activities in Hillsborough Bay should be evaluated further. As a result of re-evaluating the adequacy of existing monitoring programs to address the issues of concern in Hillsborough Bay, additional fish sampling stations were added as a special study to the HBMP in Water Year 2005. The stations are located near the mouth of the Alafia River (referred to as the Alafia River Delta stratum).

After several years of data collection in the delta area, power analyses conducted by Janicki Environmental found that this sampling did not have sufficient power to detect a 25% change in community indices in the Alafia River Delta stratum. This sampling is divided into two spatial strata, an inner stratum at the mouth of the river, and an outer stratum more distant from the river. FWRI staff suggested that the power of this sampling could be improved by concentrating sampling in the inner stratum. This sampling program was redesigned to consist of seven samples per year, all of which are taken in the inner stratum. This recommendation was approved by the District and implemented at the beginning of Water Year 2009.

Redistributed Benthic and Fish Sampling Effort in the Alafia River, Hillsborough River, and Tampa Bypass Canal

Power analysis conducted by Janicki Environmental found that the relatively high number of catches with no organisms greatly reduced the analytical power of trawls in the upper Alafia River and Hillsborough River strata and the majority of the TBC. In order to address this issue, FWRI staff recommended that all fish trawl samples originally conducted in Alafia and Hillsborough Rivers strata 4 and 5 be shifted to downstream to strata 1, 2, and 3 (see Tables 3.7.1 and 4.7.1). FWRI staff believed shifting trawls to the downstream strata would improve the analytical power of sampling in the downstream strata. Seine sampling would remain unchanged and would still be conducted the upstream strata. This recommendation was approved by SWFWMD and implemented at the beginning of Water Year 2009.

The majority of the TBC is comprised of areas where large numbers of zero fish and benthic catches occur. As a result, fish sampling was stopped in the TBC beginning in Water Year 2009. Benthic sampling upstream of the US 41 bridge was stopped at the same time. The District believed that benthic habitat conditions in the short stretch of the TBC downstream of the US41 Bridge might be more indicative of McKay Bay than the TBC and requested that benthic sampling be continued below US41.

4. Habitat/Vegetation

Reduced Frequency of Alafia SAV Surveys

In October 2001, the District approved an additional program modification based on data collected during Water Year 2001. This modification changed the frequency of submerged aquatic vegetation surveys in the Alafia River from once per year to once every five years. This change was initiated after SAV was found in only one location (the mouth of a spring discharge) in the Alafia River during the first SAV sampling event. It was felt that annual monitoring was not warranted given the lack of SAV in baseline conditions.

Reduced Frequency of Vegetation Mapping

At the 2004 Annual Meeting, SWFWMD staff agreed that the required interval for vegetation polygon mapping could be lengthened and suggested that once every three years in concert with the submittal of

comprehensive interpretive reports would be appropriate. This change was initiated because no significant changes had been observed in the 2000, 2001, 2002, and 2003 mapping events even though there had been large natural variation in flow. The last mapping occurred in Water Year 2009. The next mapping is scheduled to occur in the Fall of Water Year 2012.

Discontinued Alafia Fixed-Station Vegetation Sampling

Fixed-station vegetation sampling on the Alafia River was discontinued at the end of Water Year 2008 with District approval. Analyses of data collected from 2001 to 2007 were unable to detect changes in vegetation as a result of the large variation of inter-annual flows during this period. As a result, it was unlikely that this monitoring could have detected changes as a result of Tampa Bay Water operations. This monitoring effort was confounded by the fact that vegetation in areas most likely to be influenced by salinity changes as a result of withdrawals consisted of narrow fringe marshes adjoining residential properties. These areas contained large amounts of invasive exotic and nuisance vegetation and were subject to many forms of disturbance aside from those that might be caused by Tampa Bay Water operations.

5. Reporting

Modified Interpretive Report Schedule/Frequency

The frequency of interpretive report submittals was discussed at the May 2003 HBMP Annual Meeting. Interpretive reports were originally required to be submitted every five years. This 5-year interval included a mid-term, interpretive report submitted in year 3 of each five-year evaluation period, and a comprehensive interpretive report submitted in year 5 of each five-year evaluation period. At the May 2003 Annual Meeting, Tampa Bay Water proposed that the interpretive report submittal schedule be modified such that comprehensive interpretive reports are submitted every three years. Each comprehensive interpretive report would summarize HBMP findings of the previous two years, as well as compare these findings to the HBMP and baseline periods of record. Representatives from the SWFWMD and other meeting participants agreed with this proposed schedule. The first HBMP Interpretive Report was submitted to the District on July 2003 and the second in July 2006. The HBMP reporting the Alafia River and other reporting units was split with the most recent TBC/Hillsborough water use permit. The TBC/Hillsborough interpretive reports are now submitted at five-year interval. The last report was submitted in 2010 and the next report is due in July 2015. The Alafia Interpretive Report remains on a three-year interval. The last report was submitted in 2009. Under the current schedule, the fourth Alafia Interpretive Report will be submitted in July 2012.

Notice of Rights

ADMINISTRATIVE HEARING

1. You or any person whose substantial interests are or may be affected by the District 's intended or proposed action may request an administrative hearing on that action by filing a written petition in accordance with Sections 120.569 and 120.57, Florida Statutes (F.S.), Uniform Rules of Procedure Chapter 28-106, Florida Administrative Code (F.A.C.) and District Rule 40D-1.1010, F.A.C. Unless otherwise provided by law, a petition for administrative hearing must be filed with (received by) the District within 21 days of receipt of written notice of agency action. "Written notice" means either actual written notice, or newspaper publication of notice, that the District has taken or intends to take agency action. "Receipt of written notice" is deemed to be the fifth day after the date on which actual notice is deposited in the United States mail, if notice is mailed to you, or the date that actual notice is issued, if sent to you by electronic mail or delivered to you, or the date that notice is published in a newspaper, for those persons to whom the District does not provide actual notice.

2. Pursuant to Subsection 373.427(2)(c), F.S., for notices of intended or proposed agency action on a consolidated application for an environmental resource permit and use of sovereignty submerged lands concurrently reviewed by the District, a petition for administrative hearing must be filed with (received by) the District within 14 days of receipt of written notice.

3. Pursuant to Rule 62-532.430, F.A.C., for notices of intent to deny a well construction permit, a petition for administrative hearing must be filed with (received by) the District within 30 days of receipt of written notice of intent to deny.

4. Any person who receives written notice of an agency decision and who fails to file a written request for a hearing within 21 days of receipt or other period as required by law waives the right to request a hearing on such matters.

5. Mediation pursuant to Section 120.573, F.S., to settle an administrative dispute regarding District intended or proposed action is not available prior to the filing of a petition for hearing.

6. A request or petition for administrative hearing must comply with the requirements set forth in Chapter 28.106, F.A.C. A request or petition for a hearing must: (1) explain how the substantial interests of each person requesting the hearing will be affected by the District's intended action or proposed action, (2) state all material facts disputed by the person requesting the hearing or state that there are no material facts in dispute, and (3) otherwise comply with Rules 28-106.201 and 28-106.301, F.A.C. Chapter 28-106, F.A.C. can be viewed at www.flrules.org or at the District's website at www.WaterMatters.org/permits/rules.

7. A petition for administrative hearing is deemed filed upon receipt of the complete petition by the District Agency Clerk at the District's Tampa Service Office during normal business hours, which are 8:00 a.m. to 5:00 p.m., Monday through Friday, excluding District holidays. Filings with the District Agency Clerk may be made by mail, hand-delivery or facsimile transfer (fax). The District does not accept petitions for administrative hearing by electronic mail. Mailed filings must be addressed to, and hand-delivered filings must be delivered to, the Agency Clerk, Southwest Florida Water Management District, 7601 Highway 301 North, Tampa, FL 33637-6759. Faxed filings must be transmitted to the District Agency Clerk at (813) 367-9776. Any petition not received during normal business hours shall be filed as of 8:00 a.m. on the next business day. The District's acceptance of faxed petitions for filing is subject to certain conditions set forth in the District's Statement of Agency Organization and Operation, available for viewing at www.WaterMatters.org/about.

JUDICIAL REVIEW

1. Pursuant to Sections 120.60(3) and 120.68, F.S., a party who is adversely affected by District action may seek judicial review of the District's action. Judicial review shall be sought in the Fifth District Court of Appeal or in the appellate district where a party resides or as otherwise provided by law.

2. All proceedings shall be instituted by filing an original notice of appeal with the District Agency Clerk within 30 days after the rendition of the order being appealed, and a copy of the notice of appeal, accompanied by any filing fees prescribed by law, with the clerk of the court, in accordance with Rules 9.110 and 9.190 of the Florida Rules of Appellate Procedure (Fla. R. App. P.). Pursuant to Fla. R. App. P. 9.020(h), an order is rendered when a signed written order is filed with the clerk of the lower tribunal.
