In order to comply with the Beaumont Basin Maximum Benefit Objectives to supply Sun Lakes Country Club with recycled water, a portion of the MBR permeate will be fed to a reverse-osmosis (RO) facility. There are two options for the RO facility. Option 1 is to install an RO facility at the WWTP. Brine will be disposed of in salt evaporation ponds to be constructed at the WWTP site. Option 2 is to install the RO facility at the point-of-use, the Sun Lakes Country Club. Under Option 2, brine can be disposed of into the sewer, which would ultimately return to the WWTP, or through a brine line to be built from the RO facility to the Beaumont Wastewater Treatment Plant.

The minimum requirements of the new RO facility are summarized in Table 13.

Table 17 RO facility design criteria

Parameter	Value
Effluent Total Dissolved Solids (TDS), mg/L	<330
Effluent Total Nitrogen (TN), mg/L	<5.0
Minimum Total Blended Flow, MGD	0.76

Additional design guidelines can be found in Table 49 in Section 6.1.8.

6. Engineering Design Guidelines

6.1 Mechanical

The following tables contain the Engineering Design Guidelines for mechanical criteria. The DBE is responsible to review and finalize these requirements for complete functioning facilities.

Table 18 General mechanical requirements

Item	Parameter	Criteria	Notes
0	Scope	This document applies to General Mechanical Requirements	
1	Stainless Steel Treatment	All fabricated stainless steel shall be pickle and passivated (P&P) to ASTM380 to remove free iron, heat tint oxides, weld scale, and other impurities. P&P shall be done by full emersion of fabricated parts.	
		SST items include: piping, structural elements, supports, fabricated items. cut items, and other parts. Field cutting and drilling of holes in SST boxes or fabricated items shall be field cleaned and P&P. Field cutting shall be approved on a case by case basis.	
2	PVC Flanges and Plastic Flanges	Vanstone flanges are NOT allowed	
3	Factory Acceptance Testing (FAT)	Contractor shall certify, a minimum of 48 hours before the date of the FAT witness by the City, that all manufacturer QC activities and the approved factory test plan have been successfully completed without failures/deficiencies/damage/incompleteness /not passing. Contractor shall submit successfully completed, signed off factory test(s) by the manufacturer to the City. If not provided, City can cancel the FAT witness and DBE shall be responsible for all costs and impacts associated with rescheduling the FAT witness.	This is applicable if the City plans to perform the FAT witness.
4	Mechanical Equipment Installation Tolerances	Tolerances for all installations by DBE of mechanical equipment (valves, gates, flowmeters, pumps, blowers, etc.) shall be within allowable manufacturers' requirements.	

6.1.1 Valves

Table 19 Valves, general

Item	Parameter	Criteria	Notes
0	Scope	This document applies to all valves.	
1	Valve Location	Valves shall be accessible (i.e., not buried, with chain operator or valve box), unless otherwise necessary and noted. Valves shall be installed in locations with enough room for maintenance personnel to maintain valves with the proper equipment. Minimize locating valves with actuators in classified areas, when possible.	

Item	Parameter	Criteria	Notes
2	Valve and Gate Automation	Apply automation on critical pipes and channels to enhance equipment O&M.	Automation and connection to SCADA is preferred.
3	Valve Maintenance	Incorporate dismantling joints into design layout to ease removal of valves.	
		Consider access hatches, rollup doors, and lifting devices for large and critical valves.	
4	Actuator Type	Incorporate pneumatic/electric actuators for proportional control (modulating) valves and gates, unless otherwise noted or not available.	Provide chain operator for valves over 6-ft high.
		Buried valves shall have extension stems to grade with square nuts and cast iron or steel pipe extensions. Stem supports shall prevent shearing of the stem.	
5	Actuator Sizing	Oversize actuator to allow for aging/corrosion/scaling/ clogging of equipment.	
6	Surge Control	Specify speed of opening and closing to avoid significant increase in pressures.	
7	Factory Testing Data	Submit Factory Acceptance Test data before shipment of the valve. The data shall also include certification of quality and test results for factory-applied coatings.	
8	Labeling and Valve Tags	Label all valves with manufacturer's name and working pressure cast in raised letters on valve body.	
		A Type 316 SS tag that includes the valve Reference Number shall be mounted to the valve with Type 316 SS attachments.	
9	Painting and Coating (General)	Required for the exterior surfaces of valves.	
		Required for the wet interior surfaces of ferrous valves.	
	Painting and Coating (Buried Valves)	Epoxy coated and wrapped with polyethylene encasement.	
	Painting and Coating (Above-ground Valves)	Ferrous interior surfaces: Epoxy.	
		Ferrous exterior surfaces: Epoxy.	
		Non-ferrous surfaces: Coat machined, polished, and non-ferrous surfaces (including gears, bearing surfaces and similar unpainted surfaces) with corrosion prevention compound which shall be maintained during storage and until equipment begins operation.	
10	Pressure Testing, Field	Conduct on closed valves.	
		Test system at pressure equal to 1.5 of design pressure. Maximum system pressure test shall not exceed valve manufacturer's maximum pressure limit.	
11	Bolts, Nuts, Studs, Washers, Gaskets	All bolts, nuts, studs and washers shall be of Type 316 stainless steel. Buried service shall be stainless-steel 316 with bituminous coating.	
		Gaskets shall be full-face type. Gasket material shall conform to manufacturer's recommendations.	
12	End Connections	2.5-inch and smaller may be provided with threaded or flanged end connections	
		3-inches and larger require flanged end connections	
		Unless otherwise shown or otherwise specified, all flanged valves shall have ends conforming to AWWA C115, 125 lb. flange.	

Item	Parameter	Criteria	Notes
13	Manufacturer	A single manufacturer shall be made responsible for coordination of design, testing, and furnishing each valve.	
		Where 2 or more valves of the same type and size are required, the valves shall be furnished by the same manufacturer.	
		Shall have a successful record of not less than 5 years in the manufacture of the valves indicated	
		Require manufacturer to provide Certificate of Proper Installation.	

Table 20 Gate valves

Item	Parameter	Criteria	Notes
0	Scope	This document applies to gate valves.	
1	Type	Types: -Resilient-seated (conform to AWWA C509). -Metal-seated double disk	
2	Manufactures	Manufacturers: Mueller -Or equal	
3	Pressure	Rated 250 PSI.	Minimum.
4	Materials	Body: -Ductile iron. Trim: 316 SS	
5	End Connections	Type: -Exposed: flanged ends conforming to ANSI B16.1, Class 125. -Buried: mechanical joint ends conforming to ANSI A21.11. Bell and spigot end connections by City approval only.	
6	Size	Maximum 16”.	

Table 21 Check valves

Item	Parameter	Criteria	Notes
0	Scope	This document applies to swing check, slanting disc, chemical check, and air service check valves.	
1	Swing Check	Type: -Full opening passages. -Flanged cover piece (for access to disc). -Outside lever and spring. -Air cushioned or hydraulic cushioned, controlled closing.	
		Size: 3-inches and larger.	
		Pressure: Rated 250 PSI working pressure.	
		Manufacturers: APCO/DeZurik. -Or equal	
		Body: Heavy Cast or Ductile Iron.	
2	Slanting Disc	Type: -55 degree seating angle. -Guaranteed not to stick in closed position. -Flanged connections for Dashpot or Hydraulic Snubber. -Position indicator.	
		Pressure: Rated 250 PSI working pressure.	
		Manufacturers: APCO/DeZurik. -Or equal	

Item	Parameter	Criteria	Notes
		Body: Ductile Iron, Carbon Steel, and Stainless Steel.	
3	Chemical (Type Check Valve)	Type: -Self-contained, straight-through design. -Used for all liquid chemical feed systems.	
		Material: Chlorinated poly(vinyl chloride (CPVC), conforming to ASTM8F441.	
		Manufacturers: Ryan Herco. -GF Plastic Systems. -Asahi/America. -Or equal	
4	Air Service (Type Check Valve)	Type: -Double Door Check Valve. - Wafer or Lugged Style -Operate without hammer or shock. -Spring loaded. -Normally closed.	
		Body: 316 Stainless Steel.	
		Manufacturers: APCO/DeZurik. -Or equal	
		Hinge and stop pins 316 SS.	
5	End Connections (all check valve types)	Flanged (conforming to ANSI/ASME B16.1), Class 125.	
6	Position Switches (all check valve types)	Housing: 316 Stainless Steel.	
		Manufacturers: -Westlock Silver Bullet Model 316. -Or equal.	

Table 22 Double offset butterfly valves

Item	Parameter	Criteria	Notes
0	Scope	This section applies to all types of double offset butterfly valves for reclaimed water applications	Double Offset, AWWA
1	Materials	Ductile Iron Body (A536 65-41-12)	
		Flanged End Connection (AWWA)	
		Shaft Seal: Dry Shaft or Wet Seal	EPDM O-rings or Chevron V-Type Packing (pressure energized seal only)
		Trim: 316 SS	
2	Size	8” and above	6” and under refer to Gate Valve Guidelines
3	Maximum Flow Velocity	16 fps (Bi-Directional Sizing Required)	
4	Manufacturers	DHC (BTD), VAG (EKN AWWA), or City pre-approved equal	
5	Pressure Class	Class 250B and Class 150B Class 250 with ANSI 125 flanges (Back Spotting of Flanges Required)	
6	Disc	Ductile iron ASTM A536 65-45-12, 316 Stainless Steel	
		Double offset disc design for all valves	

Item	Parameter	Criteria	Notes
		Prior to application of required coating install stainless steel seat edge (where applicable).	
		Mechanically secured to shaft with Type 304 stainless steel, straight through taper pins and locking nuts (where applicable).	Material selection for pins shall be based on pressure class
		No travel stops for disc on interior of body	
		Bubble tight with rated pressure applied from either side of valve.	
		Bi-directional for control of flow from either direction.	
7	Rubber Seats	Rubber seats shall be in-body or disc and the retainer shall be a (1-piece) 316 stainless steel seat retainer.	
8	Disc Seating Edge	Type 316 Stainless Steel or Nickel Aluminum Bronze.	
		Seat shall completely cover and envelope the entire leading edge of the disc.	
		Valves disc that do not completely cover the disc edge or that have coated disc edges are not acceptable.	
9	Shaft Seals	Shaft seals shall be EPDM O-ring or Chevron V-type pressurized seals only.	
10	Coating	Fusion Bonded Epoxy	
		Epoxy shall be a minimum of 10 mils DFT	
11	Operators	Sized for bi-directional flow	
		AWWA Worm Gear: 300 ft-lb input torque to stop	
12	Input Torque	Required input torque with maximum hand wheel pull of 80lbs and 150 ft. lbs. for 2” operating nuts. Per AWWA C504	
13	Gear Reducers	Totally enclosed, permanently lubricated and sealed gear reducers.	
		Self-locking with open and close stops provided to limit valve disc travel.	
		Worm Gear (SAMBO AWWA or City pre-approved equal).	
		Buried service gears shall be minimally 90% grease packed with a generous slathering of all interior surfaces.	
		Submit calculations for valve torque requirements to Engineer as part of Shop Drawing submittal package. Velocity for dynamic torque must be 16 fps.	Mill Test Reports Shall Be Required for Plain Stem Valve Metallic Components (Operators Excluded)
14	Compliance	Compliant with AIS requirements (for SRF AIS Funding) - Manufactured using Iron and Steel products produces in the United States.	
		In Accordance with AWWA C504.	

Table 23 Pressure reducing/pressure relief valves

Item	Parameter	Criteria	Notes
0	Scope	This document applies to pressure reducing, pressure sustaining, flow control, level control, and pressure relief valves.	
1	Type	Single diaphragm globe or angle valve.	
		Hydraulically operated, adjustable, pilot controlled.	
2	Materials	Body Materials: Ductile Iron (ASTM A 536).	
		Trim: 316 SS.	
3	Pressure	Rated: 250 PSI.	

4	Manufacturers	Manufacturers: Cla-Val Company. -Or equal	

Table 24 Diaphragm valves

Item	Parameter	Criteria	Notes
0	Scope	This document applies to diaphragm valves.	
1	Service Types	Service Types: -Chemical. -Water.	
2	Body	Materials: PVC; CPVC; PVDF; and 316SS where appropriate.	
3	Diaphragm	Materials: -EPDM. -TFE	
4	Manufacturers	Manufactures: -ITT Grinnel. -Asahi/America. -Hayward -RG Sloane -Chemtrol	

Table 25 Air release and vacuum valves

Item	Parameter	Criteria	Notes
0	Scope	This document applies to air release, air and vacuum, and combination air valves.	
1	Air Release Valve (ARV)	Type: Float operated, compound lever.	
		Include isolation valve to allow removal of valve without shutting down the equipment.	
2	Air and Vacuum Valves (AVV)	Float has no direct contact with air and water.	
		Float is centered or peripheral guided for positive shutoff into seat.	
		Seat shall be fastened into the valve cover.	
3	Combination Air Valves (CAV)	Type: Single-body construction designed to provide all functions within one housing.	
4	Air Valve for Vertical Turbine Pumps	Types: -3-inches and smaller: AVV with throttling device. -4-inches and larger: Dual body CAV mounted on top of surge check.	
5	Pressure	See Air Valve Sizing Table in 2.1.8	
6	Materials	Body: Cast Iron, Ductile Iron, Stainless steel or composite materials.	
		Trim: 316 SS.	
7	Manufacturers	Manufacturers : -APCO/DeZurik. -A.R.I. Flow Control Accessories. -Or equal	

Table 26 Air valve sizing

Air Valve Sizing				
Service	**Valve Type**	**Pressure Range**	**Manufacturer and Model**	**Notes**
Potable / Reclaimed Water	ARV	≤ 150 PSI	-A.R.I. S-050 or Equal.	
		> 150 PSI	-A.R.I. S-015 or Equal.	
		> 500 PSI	-A.R.I. S-016 or Equal.	

Air Valve Sizing				
Service	**Valve Type**	**Pressure Range**	**Manufacturer and Model**	**Notes**
	AVV	≤ 150 PSI	-A.R.I. K-060 or Equal.	
		> 150 PSI	-A.R.I. K-060 or Equal.	
		> 500 PSI	-A.R.I. K-064 or Equal.	
	CAV	≤ 150 PSI	-A.R.I. D-040 or Equal.	
		> 150 PSI	-A.R.I. D-060-C HF or Equal.	
		> 500 PSI	-A.R.I. D-064-C HF or Equal.	
Sewer / Wastewater Treatment Plants	ARV	≤ 150 PSI	-A.R.I. S-050 or Equal.	
	AVV	≤ 150 PSI	-A.R.I. K-020 or Equal.	
	CAV	≤ 150 PSI	-A.R.I. D-023 or Equal.	

Table 27 Sluice/slide gates

Item	Parameter	Criteria	Notes
0	Scope	This document applies to sluice or slide gates.	
1	Design Requirement	The design requirements for the slide, frame and guides shall be either “Standard” or “Heavy Duty”.	
		The “Standard” or “Heavy Duty” gate design shall be determined by the “gate factor”	
		The “gate factor” is the product of the width times the design head	
		If the “gate factor” exceeds 120, the “Heavy Duty” design shall be used.	
		The “Heavy Duty” gate may also be selected regardless of the “gate factor” number, if it is designated in the Gate Schedule	
2	Manufacturers	Manufacturers: -Rodney-Hunt. -Waterman. -Whipps. -Golden Harvest. - Fontaine-Aquanox -Or approved equal.	
3	Materials	Body: Stainless Steel, Type 316.	Type of material should be reviewed for suitability for environment. 316 L should be used for all welded components
		Gate: Stainless Steel, Type 316.	
		Trim: 316 SS.	
		Slide gates, seals: - UHMWPE for sides and top - Neoprene or EPDM for bottom	
4	Standard Frame	In addition to the minimum requirements of AWWA C561, latest edition, the guide fabrication with UHMWPE shall support the slide fully in open position.	
		Design for the maximum design head specified, with a minimum safety factor of 4 with regard to ultimate tensile, compressive and shear strengths published in referenced ASTM Material standards.	
		Where frames extend above the operating floor, the frame design is to be self-supporting so that no further reinforcing or support is required. For cases where extreme height requires additional bracing, such bracing shall be provided by the gate manufacturer, and shall be submitted for approval by the Engineer.	
		From Stainless Steel plate and/or structural members to provide a rigid, one piece frame and guide. Minimum thickness of all members 1/4 –inch. Bolt together frame and guide designs are not acceptable.	

Item	Parameter	Criteria	Notes
		Design shall allow for embedded mounting directly to a wall with stainless steel anchor bolts and grout or mounting to a wall thimble with stainless mounting studs and a mastic gasket material. Mounting style shall be as shown on the contract drawings and gate schedule.	
		The structural portion of the frame and guide that incorporated the seat/seals shall be framed or welded into a one-piece shape for rigidity. Frame and guide designs that consist of two or more bolted.	
		Structural members for water loads transferred through the assembly bolts are specifically not acceptable.	
		Gussets shall be “wraparound” gussets. The gussets shall extend over the guide section to ensure the guide surfaces are at 90 degrees. The wraparound gussets shall be welded to guide groove as well as welded to and extend fully to the outside width of the wall base plate. Gussets to be on vertical guide members and bottom invert guide member to stabilize guide groove dimensions, prevent twisting of guide groove transfer force to wall mounting plate at each anchor location besides the wall opening.	
		Invert seal shall be mounted in the frame with mechanical fasteners. As an alternate, the invert seal may be mounted to the slide with mechanical fasteners.	
		Allow replacement of the frame’s top, bottom and side seals without dismantling or removing the frame from the concrete or wall thimble.	
		Mounting surface of the frame to be flat and provide leak-tight closure between the frame and the mounting surface.	
		Face mounted, wall thimble mounted or embedded frame, as shown on the contract drawings or in the Gate Schedule.	
		Ultra-high molecular weight polyethylene (UHMWPE) per ASTM D4020 to be inserted into guide for contact with slide.	
		Minimum UHMWPE contact width of 1 inch.	
		A rigid stainless invert member shall be provided across the bottom of the opening. The invert member shall have a face continuous with the sides of the frame on downward opening weir gates.	
		A rigid stainless steel top seal member shall be provided across the top of the opening on gates designed to cover submerge openings.	
		Anchor bolts shall not pass through the sealing surface of the frame or guides.	
5	Heavy Duty Frame	Formed Stainless Steel Plate and/or structural members to provide rigid, one-piece frame. Note: multi-piece frame will only be considered when shipping restriction does not allow one-piece. If a multi-piece frame is proposed, submit this deviation for approval by the ENGINEER.	
		The structural portion of the frame that incorporates the seat/seals shall be formed or welded into one-piece shape for rigidity. Frame and guide designs that consist of two or more bolted structural members for	

Item	Parameter	Criteria	Notes
		water loads transferred through the assembly bolts are specifically not acceptable.	
		Minimum section thickness of all members shall be 1/4-inch. When the “gate factor” exceeds 240, minimum section thickness of all members shall be 3/8-inch.	
		Engagement dimensions must be increased to accommodate Heavy Duty Slide.	
6	Gates: Standard Slide	In addition to the minimum requirements of AWWA C561	
		All materials shall be stainless steel as called for in the gate schedule.	
		Rectangular or square.	
		Fabricated with a flat plate reinforced with structural members and/or formed plate stiffeners to form a rigid, one-piece slide. Minimum section thickness of all members, except seal retainers, shall be 1/4-inch	
		Reinforcing stiffeners shall be welded to the slide and mounted horizontally. Vertical stiffeners shall be welded on the outside of the horizontal stiffeners and gate surface for additional reinforcement and stress distribution.	
		Deflection shall not exceed 1/720 of the span of the gate or 1/16” whichever is less, when under the maximum design head	
		Design for the maximum design head specified, with a minimum safety factor of 4 with regard to ultimate tensile, compressive and shear strengths published in the referenced ASTM material standards	
		The stem connector shall be constructed of two angles or plates and shall be welded to the slide and to at least one horizontal stiffener. A minimum of two bolts shall connect the stem to the stem connector	
7	Gates: Heavy Duty Slide Design	Stainless steel plate with structural members and/or formed plate stiffeners to form rigid, one-piece slide. Note: multi-piece slide will only be considered when shipping restriction does not allow one-piece. If a multi-piece slide is proposed, submit this deviation for approval by the ENGINEER.	
		Minimum section thickness of all members, except seal retainers, shall be 1/4-inch. When “gate factor” exceeds 240, the minimum section thickness of all members, except seal retainers, shall be 3/8-inch.	
		Heavy Duty slide shall include an increased section at insertion into the guides (thick-edge design). When the “gate factor” exceeds 120, the minimum gate edge thickness inserting into the guide groove shall be a 1 ½” plate, or a boxed fabrication, suitably designed, to achieve for each foot of slide height a minimum section modulus of 3.50 $inch^3$ as well as at sections through the horizontal ribs. When the “gate factor” exceeds 240, the minimum gate edge thickness inserting into the guide groove shall be a minimum 2” thick plate, or a boxed fabrication, suitably designed, to achieve for each foot of slide height, a minimum section modulus of 7.00 $inch^3$ as well as at all sections through the horizontal reinforcement ribs.	
8	Seals	Seal shall be self-adjusting.	

Item	Parameter	Criteria	Notes
		- UHMWPE for side and top seals - Shall be neoprene or EPDM for bottom seals.	
		All gates shall be provided with a self-adjusting, low coefficient of friction, UHMW polyethylene seat/seal system with a continuous compression cord to ensure contact between the seals/seats and the slide, and to restrict leakage in accordance with the performance requirements listed in this specification. Self-Adjusting seals shall be on the sides and top of upward opening gates and shall be on the sides and bottom of downward opening gates.	
		The seal system shall have been factory tested to confirm negligible wear (less than 0.01”) and proper sealing. The factory testing shall consist of an accelerated wear test comprised of a minimum of 25,000 open-close cycles using a well-agitated sand/water mixture to simulate fluidized grit, and a re-test of leakage to confirm compliance with this specification’s leakage limits.	
		Resilient J-seals, P-seals or crown seals shall not be acceptable.	
		Pressure pads, or any other arrangement requiring adjustment to maintain seal compression shall not be acceptable.	
		All seals must be bolted or otherwise mechanically fastened. Arrangements with seals that are force fit or held in place with adhesives are unacceptable.	
		The seals shall be mounted so as not to obstruct the waterway opening.	
		All upward opening gates shall be provided with a resilient seal to seal the bottom portion of the gate. The seal shall be attached to the invert member of the frame. As an alternate, the invert seal may be mounted to the bottom of the slide. Invert seal shall be held in place with stainless steel attachment hardware	
		The seal system shall be durable and shall be designed to accommodate high velocities and frequent cycling without loosening or suffering damage.	
		All seats/seals shall be field replaceable without removing the frame from the wall or wall thimble.	
9	Stems	Shall be full depth ACME threads with a 16-microinch finish.	
		Stainless steel	
		The stem shall be constructed of solid stainless steel bar for the entire length. Extension pipes are not acceptable.	
		The stem shall be threaded to allow full travel of the slide unless the travel distance is otherwise shown on the Contract Drawings or Gate Schedule.	
		Minimum outside diameter at the stem thread shall be 1.50	
		Stems shall have rolled threads or machine-cut-and-polished threads of the American Standard full depth ACME type with a surface finish on the thread flanks of 16 micro-inch or better. Stub ACME threads or metric DIN 103 threads are not acceptable.	

Item	Parameter	Criteria	Notes
		The selected stem configuration shall provide the most efficient combination of stem diameter/pitch/lead and keep the operating temperature at the stem nut to a minimum during operation. If the proposed stem configuration will result in any deviation from the specified speed range, the proposed deviation must be submitted for approval by the ENGINEER.	
		Stem diameter, stem guide quantity and stem guide spacing shall provide a slenderness ratio (l/r) not exceeding 200.	
		Tensile strength shall be suitable to withstand the stem design force, as defined in AWWA C561, with a safety factor of 5 on the ultimate tensile strength published in the referenced ASTM material standards.	
		Compressive strength shall be suitable to resist buckling at two times the stem design force, as defined in AWWA C561. Determine critical buckling load using Euler Column formula defined in AWWA C561, where C=2.	
		Stems of more than one section shall be joined with silicon bronze (ASTM B584 C87200 or C87300) or stainless steel couplings which shall be threaded and keyed to the stem or threaded and bolted to the stem. Fasteners shall include an anti-loosening feature such as thread locking compound or nylon-insert nuts. Fasteners shall be stainless steel and shall be lubricated at assembly.	
		Stems, on manually operated gates, shall be provided with adjustable manganese bronze (ASTM B584 C86300 or C86500 or the wrought equivalent) stop collars to prevent over closing of the slide.	
		Gates having width greater than 2 times the height shall be provided with 2 stems and 2 lifting mechanisms connected by a tandem shaft.	
		Cross drill and connect the stem to the slide structural sections. Fasteners shall include an anti-loosening feature such as thread locking compound or nylon-insert nuts. Fasteners shall be stainless steel and shall be lubricated at assembly.	

Table 28 Miscellaneous valves

Item	Parameter	Criteria	Notes
0	Scope	This document applies to ball valves; solenoid valves; and pet cocks.	
1	Ball Valves	General: Line size ball valve and union shall be installed upstream of each solenoid valve, in-line flow switch, or other in-line electrical device for isolation during maintenance.	
	PVC Ball Valves (Sizes 1/2-inch to 4-inches)	Materials: Body, ball, stem and connector - Schedule 80 PVC or CPVC.	
		Type: Double block (or full block) designed to prevent seal carrier blow-out.	
		<u>Pressure:</u> -Rated to 150 PSI at 70°F. -90° ON/OFF actuation.	

Item	Parameter	Criteria	Notes
		Manufacturers: -Hayward (Sizes 1/2-inch to 4-inches). -Spears. -M&T Plastic Inc. (Sizes 1/2-inch to 6-inches) -The Harrington Corp. (Sizes 1/2-inch to 4-inches). -Ryan Herco Products Corp. (Sizes 1/2-inch to 4-inches). -or approved equal.	
	Bronze or SS Ball Valves (Sizes 1/2-inch to 4-inches)	Type: -For general water and air service. -Top entry type. -Screwed ends. -Full bore ports. -Hand lever operators.	
		Materials: -All-bronze or SS. -Teflon seats.	
		Pressure: Minimum rating of 250 PSI for Bronze or 1,000 PSI WOG (cold, non-shock).	
		Manufacturers: -Apollo Ball Valve Division. -Or equal.	
2	Solenoid Valves	Type: -Two-way, normally closed (i.e., closes when de-energized). -Packless construction. -Threaded ends. -Threaded conduit connection. -Strainer to be installed upstream of each valve.	
		Materials: -Seat: Resilient Buna "N" and Teflon. -Body: Forged brass or stainless steel body and ball where appropriate -Internal parts (in contact with fluid): Series 300 and 400 stainless steel.	
		Manufacturers: ASCO/DeZurik. -Or equal	
3	Pet Cocks (2.5-inch and smaller)	Provide lever or tee handle operator.	
		Materials: All brass (ASTM B 16).	
		Manufacturers: Lunkenheimer Figure 478 or 479. -Or equal	

Table 29 Valve actuators

Item	Parameter	Criteria	Notes
0	Scope	This document applies to all valve actuating equipment. This includes manual and automated electric and pneumatic actuators.	
1	Chain actuators	Required for manual shut-off valves mounted higher than 6-feet above working level.	
2	Spur Gear and Hand wheel	Required for: -Gate valves 8-inches and larger. -Where chain actuator is required.	
3	Automated Electric Actuators	Manufacturers: AUMA. -Or equal	Must meet area classification requirements.

Item	Parameter	Criteria	Notes
4	Automated Pneumatic Actuators	Manufacturers: Fisher. -Or equal	
5	Manual Operator (exposed)	Types: -Worm gear drive and nut. -Hand wheel or chain.	
		Chain wheel, sprocket, and aluminum chain required if mounted more than 6 feet above the operating floor.	
6	Manual Operator (buried valves)	Provide valve box, 2-inch square operating nut, and position indicator.	
		Extension: required if top of valve nut is greater than 12-inches below top of valve box.	
7	Valve Boxes (buried valves)	Material: -Cast iron. -Concrete. -Or similar.	
		Cover Size: allow operation of valve actuators.	
		Cover Marking: -Potable Water: Water. -Recycled Water: RW. -Sanitary Sewer: Sewer.	

Table 30 Pipe and valve schedule

Item	Pipe Material	Preferred Type of Valve	Preferred Manufacturers
Process (> 3")			
FORCEMAIN	HDPE, Steel, Ductile Iron, ANSI A21, 51 (AWWA C151) AWWA C900	Plug	DeZurik
INFLUENT / EFFLUENT	Steel, AWWA C200, Welded.	Plug (in vault),	DeZurik, Clow
		Gates	Waterman, Fontaine-Aquanox
SECONDARY EFFLUENT		Plug (in vault)	DeZurik, Clow

CIRCULATED SLUDGE		Plug	DeZurik, Clow
RAW SLUDGE		Plug	DeZurik, Clow
THICKENED SLUDGE		Plug	DeZurik, Clow
MIXED LIQUOR		Plug	DeZurik, Clow

Item	Pipe Material	Preferred Type of Valve	Preferred Manufacturers
RAS / WAS / SUPERNATANT	Ductile Iron, ANSI A21, 51 (AWWA C151), Glass-lined, HDPE (below ground only).	Plug	DeZurik, Clow
THICKENER PRESSURIZED RECYCLE		Plug	DeZurik, Clow
THICKENER SUBNATANT		Plug	DeZurik, Clow
DIGESTER SUPERNATANT		Plug	DeZurik, Clow
DIGESTED SLUDGE	Ductile Iron, ANSI A21, 51 (AWWA C151), Glass-lined or PVC, ASTM D2241, HDPE (below ground only).	Plug	DeZurik, Clow
DRAIN	Ductile Iron, ANSI A21, 51 (AWWA C151).	Plug	DeZurik, Clow
STORM DRAIN	RCP, AWWA C302.	Plug	DeZurik, Clow
STRUCTURE UNDERDRAIN	Ductile Iron, ANSI A21, 51 (AWWA C151).	Plug	DeZurik, Clow
SANITARY SEWER	Extra Strength. PVC or HDPE	Plug	DeZurik, Clow
STRUCTURE UNDERDRAIN COLLECTOR	Ductile Iron, ANSI A21, 51 (AWWA C151).		
PLANT INFLUENT	Glass-Lined Ductile Iron, ANSI A21, 51 (AWWA C151), HDPE (below ground only).	Plug (in vault).	DeZurik, Clow
			Waterman, Fontaine
GRIT SLURRY	Ductile Iron AWWA C151, HDPE (below ground only).	Plug	DeZurik, Clow
Misc. Piping, all sizes			
FUEL OIL RETURN	Steel, ASTM A120; Sch. 40, Black, Welded.	Ball	Watts, Apollo
FUEL OIL SUPPLY		Ball	Watts, Apollo
LUBE OIL		Ball	Watts, Apollo
WASTE LUBE OIL		Ball	Watts, Apollo
HOT WATER RETURN	Steel, ASTM A120, Sch. 40, Black, Welded. Ductile Iron, ANSI A21, 51 (AWWA C151), HDPE (below ground only).	Ball	Watts, Apollo
HOT WATER SUPPLY	Steel, ASTM A120, Sch. 40, Black, Welded. Ductile Iron, ANSI A21, 51 (AWWA C151), HDPE (below ground only).	Ball	Watts, Apollo Maximum temperature is 200 degrees F
INSTRUMENT AIR	Stainless Steel 316SS, ASTM A312, Sch. 80.	Ball	Swagelok
DIGESTER GAS (Low Pressure)	Stainless Steel 316SS, ASTM A312, Sch. 10.	Butterfly, Eccentric Plug	DeZurik
VACUUM	Stainless Steel 316SS, ASTM A312, Sch. 80.	Ball	Swagelok
PLANT AIR	Stainless Steel 316SS, ASTM A312, Sch. 80	Ball	Swagelok
FIRE PROTECTION SPRINKLER SYSTEM	Steel, ASTM A120, Sch. 40, Black.	By Code	By Code

Item	Pipe Material	Preferred Type of Valve	Preferred Manufacturers
ENGINE COOLING WATER RETURN	Steel, Ductile Iron, ANSI A21, 51 (AWWA C151).		
SUMP PUMP DISCHARGE	Ductile Iron, ANSI A21, 51 (AWWA C151).	Plug	DeZurik, Clow
ENGINE EXHAUST	Steel, ASTM A120, Sch. 40, Black, Welded. Stainless Steel 316SS, ASTM A312, Sch. 40S.	N/A	Caterpillar
	Follow Caterpillar recommendations.		
LIQUIFIED AERATION	Stainless Steel 316SS, ASTM A312, Sch. 40S.	Butterfly, eccentric butterfly	DeZurik, Fisher
LIQUID PETROLEUM GAS	Steel, ASTM A106 or A53, Sch. 80, Seamless, Black.	By code	
RAIN WATER LEADER	Steel, ASTM A120, Sch. 40, Black, Welded.		
DEFOAMING CHEMICAL SOLUTION	PVC, Sch. 80.	Ball	Asahi/America, Spears
PLANT DRAIN	PVC, Sch. 80 or Ductile Iron, ANSI A21, 51 (AWWA C151).	Plug	DeZurik
POTABLE WATER	Distraction / Transmission: - PVC (AWWA C900 or C905, CPVC (ASTMF 441), Sch. 80 - Ductile Iron, ANSI A21, 51 (AWWA C151) - Welded Steel Plumbing: - Sch. 80 PVC		
LANDSCAPING SPRINKLER SYSTEM	PVC, Sch. 80 or Copper, ASTM B88, Type K.		
DEMINERALIZED WATER	PVC, Sch. 80 or FRP.	Ball	Asahi/America, Spears
PLANT OVERFLOW	Steel, AWWA C200, Welded or RCP, AWWA C302.	Gates	Waterman, Clow
RAW WATER	Steel, AWWA C200, Welded or RCP, AWWA C302.		
SANITARY DRAINS AND VENTS	Steel, ASTM A120, Sch. 40, Black, Welded.		
SAMPLE LINES (SEE LIST AT RIGHT)	Ductile Iron, ANSI A21, 51 (AWWA C151) or PVC, Sch. 80.	Ball	Swagelok
CHEMICAL DRAIN AND VENT	Polypropylene, ASTM D2146, Sch. 40, Heat Fused Joints or Tempered Class Pipe.	Ball	Asahi/America, Spears

Item	Pipe Material	Preferred Type of Valve	Preferred Manufacturers
UTILITY WATER (NON-POTABLE WATER)	Copper, ASTM B88, Type K or Ductile Iron, ANSI A21, 51 (AWWA C151); Distraction / Transmission: - PVC (AWWA C900 or C905, CPVC (ASTMF 441), Sch. 80 - Ductile Iron, ANSI A21, 51 (AWWA C151) - Welded Steel Plumbing: - Sch. 80 PVC		
FROTH SPRAY	PVC, Stainless Steel 316SS, ASTM A312, Sch. 40S.		
FOUL AIR	FRP.		
Chemical Storage and Feed Facilities			
HYPOCHLORITE	Sch. 80 CPVC. Double contained in buried and unburied locations	Ball	Asahi/America, Spears
LIQUID ALUM		Ball	Asahi/America, Spears
POLYMER - ANIONIC		Ball	Asahi/America, Spears
POLYMER - CATIONIC		Ball	Asahi/America, Spears
POLYMER - NONIONIC			
CAUSTIC SODA	Steel, ASTM A106 or A53, Sch. 40, Seamless, Black	Ball	Asahi/America, Spears
SULFUR DIOXIDE (GAS OR LIQUID STATE)	Steel, ASTM A106 or A53, Sch. 80, Seamless, Black.		
SULFURIC ACID	Stainless Steel 316SS if <10% concentration, ASTM A312, Sch. 40S. Pipe joints to be welded.	PVDF ball or diaphragm valves, or TFE lined steel plugs for >10% acid concentration.	
LIME SLURRY	Flexible Rubber Hose.		
Channel Control/Isolation			
HEADWORKS	N/A	Sluice	Fontaine, Hydrogate, Whipps

6.1.2 Pumps

Table 31 Pumps, general

Item	Parameter	Criteria	Notes
0	Scope	This document provides guidelines for general pump requirements, which shall be applicable to pump installations.	
1	Configuration	The pumps and pumping appurtenances shall be by a single manufacturer responsible for furnishing and functional operation of complete pump system.	

Item	Parameter	Criteria	Notes
2	General	No cavitation shall be allowed in pumps operating within the stable operating range for the specified operating conditions. For the purposes of this provision, cavitation shall be recognized and accepted as being present in a pumping unit if cavitation noise can be perceived either by the human ear or by acoustic instruments or devices. The presence or absence of cavitation noise shall be verified by the City and/or its consultant during both the factory/field performance tests of the pumps and during operation of the pumps up to the end of the warranty period. To assist in revealing potential cavitation during the factory/field performance tests, in addition to all other required tests, the Manufacturer shall force the pumps to operate at the specified minimum net positive suction head available for each of the following conditions: minimum flow rate, design flow rate and head, and maximum flow rate.	
3	Testing	Engineer to ensure pumps and motors are tested at factory. Minimum of 7 certified sets of test data shall be submitted. Acceptance criteria shall be in accordance with ANSI/HI 14.6" Grade 1U	Verity the testing range falls within operational performance range: Flow +10%, Head +6%
4	Design	Specify pump type and identify process. Specify performance curve and pump data. Specify electrical requirements and controls. Assemble drawings showing location and process. Specify pump drive and motor. Shall require Contractor to produce bearing calculations, indicate points on H/Q curves, pump detailed description, installation drawings.	
5	Mechanical Seal	Where indicated for the pump seal, they shall be of the best quality, using the Manufacturer's suggested materials best suited for the specific application. For drainage and liquids containing sediments, the seals shall be fresh-water flushed, using lantern rings.	Mechanical Seals If using mechanical seals, use Couplers or Split Seal if in a location that is difficult to access.
		Mechanical Seals: rotating balanced O-ring type. Water lubrication - cooling. Materials: Metal parts except springs: 316 stainless steel. Springs: Hastelloy C. Seal faces: Tungsten carbide, except where required for chemical resistance or in the presence of oxidants. In such cases, follow pump manufacturer's recommendation. Elastomers: Viton.	
6	Flanges (suction and discharge)	Cast Iron (ANSI/ASME B16.1), Class 25, 125, 250, and 800. Or ANSI/ASME B16.5. Or ASTM A-36 steel plate with a minimum wall thickness of ¼ inch.	
7	Lubrication	Vertical pump shafts (clean water) - Product water lubricated; Deep-well/dry barrels - Water or oil lubricated bearings, seals, and enclosed line shafts. Vertical propeller, mixed-flow, and turbine pumps or bowl sizes 10-inches and larger (other than deep well pumps) - Stainless steel tube attached to the column for grease lubrication of the bottom bearing	
8	Vortex Suppressors	Provide for vertical pumps with marginal submergence.	
		In accordance with Hydraulic Institute requirements	

Item	Parameter	Criteria	Notes
9	Pump Casing	Ductile Iron, Austenitic (ASTM A 439).	
		Cast iron, Stainless steel or Bronze.	
		Stainless Steel, Type 416 or 316, SAE63 Bronze.	
		Hot-dipped galvanized (not buried or submerged), stainless steel (buried or submerged).	
10	Pump Guards	All rotating surfaces must be guarded.	
		Pump guards are to be provided by the manufacturer.	

Table 32 Horizontal centrifugal pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to horizontal, variable-speed, non-clog or non-clog mixed flow centrifugal pumps.	
1	Operation	1200* rpm, maximum, ventilated spaces.	*Maximum shaft speed dependent on casing/ impeller diameter
		Waste Activated Sludge or Return Activated Sludge, up to 15,000 mg/l suspended sludge, 6.5-8.5 pH, 65-85 degrees F.	
2	Liquids	Unscreened municipal wastewater solids.	
		Unscreened industrial wastewater solids.	
3	Materials	Casing - Cast iron.	
		Suction and discharge flanges - provide by pressure class.	
		Volute lining - Fusion bonded epoxy.	
		Impeller - Silicon bronze.	
		Shaft - Stainless steel type 316.	
		Bearings - minimum 100,000 hours, grease lubricated.	
4	Drive	Horizontal inverter-duty.	
5	Manufacturers	See Pump Schedule.	

Table 33 Submersible Sump Pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to submersible sump pumps.	
1	Operation	Intermittent and continuous, submerged.	
2	Liquids	Process water.	
		Surface runoff.	
		Washdown.	
3	Materials	Shaft: Stainless Steel 316.	
		Impeller: cast iron or SAE63 bronze.	
		Seal: mechanical, single or double, in an oil reservoir.	
		Hardware: exposed shall be stainless steel 316.	
		Connection: flange or screw with neoprene pressure hose.	
4	Drive	Submersible electric.	
5	Manufacturers	See Pump Schedule.	

Table 34 Submersible wastewater pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to submersible wastewater pumps.	
1	Operation	Constant speed, on/off cycling, submerged partially submerged or dry condition up to 65' depth.	

2	Liquids	Process drainage from cleaning and maintenance activities, up to 15,000 mg/l suspended sludge, 50-95 degrees F.	
		Unscreened wastewater solids, RAS, WAS.	
	Materials	Casing: Cast iron Class 30.	
		Pump lining - Fusion bonded epoxy.	
		Shaft: Stainless steel 316.	
		Impeller: Cast stainless steel.	
		Seal: tandem double mechanical, in an oil reservoir.	
		Hardware: exposed shall be stainless steel 316.	
		Bearings: bronze.	
		Maximum efficiency, minimum, percent: 65.	
3	Manufacturers	See Pump Schedule.	

Table 35 Sludge dewatering piston pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to dewatering sludge piston pumps.	
1	Operation	Continuous duty, reciprocating, dual piston, single discharge.	
		Sludge cake, 20-30% solid concentrations.	
2	Liquids	Digested dewatered municipal wastewater sludge.	
		Inorganic solids with moderate abrasive characters.	
3	Type	Pistons: Steel or stainless steel face and core.	
		Piston head: Buna-N (Nitrile) rubber bonded to steel core.	
		Rods: High strength steel, hard chrome plated; or chrome steel.	
4	Drive	TBA	
5	Manufacturers	See Pump Schedule.	

Table 36 Positive displacement rotary lobe pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to positive displacement rotary lobe pumps.	
1	Operation	Permeate/Backwash.	
2	Mounting	On concrete pad in weather exposed location. Baseplate shall be galvanized.	
3	Materials	Casing: Stainless steel, Type 316.	
		Shaft: stainless steel 316.	
		Shaft Sleeve: Stainless steel, Type 316.	
		Pump: Minimum of two tri-lobe rotors driven through positive timing gears, bearing assembly direct.	
		Hardware: Stainless steel, Type 316.	
		Feed Pump: Inverter-duty, NEMA 4X control panel with VFD, 480 Vac.	
4	Manufacturers	See Pump Schedule.	

Table 37 Progressive cavity pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to progressive cavity pumps for sludge feed service.	
1	Operation	Digested moderately abrasive sludge, organic solids and small inorganic particles, 6-9 pH, 60-105 degrees F.	

2	Materials	Pump body: Cast iron. Shaft: 416 chrome steel or AISI 4120 chromium nitride coating. Rotor and Stator: Two-stage convoluted rotor, convoluted stator. Hardware: Stainless steel, Type 316. Rotor Drive Configuration: Gear joints: Alloy steel, grease lubricated crowned, with ridge spline design. Pivot joints: alloy steel, cartridge design cross journal connected by connecting rod. Pin joints: High temperature grease lubricated, positively sealed and lubricated. Shaft seals and bearings: bearings shall be 100,000 hour minimum, grease lubricated.	
3	Drive	Closed coupled block: direct coupled motor and gear reducer or gear motor Bearing assembly -V-belt: V-belt drive.	
4	Manufacturers	See Pump Schedule.	

Table 38 Vertical turbine pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to vertical turbine pumps.	
1	Operation	Recycled water, 6-8 pH, 50-75 degrees F.	
2	Materials	Pump body: Epoxy-coated cast iron. Shaft: 316 stainless steel. Hardware: Stainless steel, Type 316. Rotor Drive Configuration: Gear joints: Alloy steel, grease lubricated crowned, with ridge spline design. Pivot joints: alloy steel, cartridge design cross journal connected by connecting rod. Pin joints: High temperature grease lubricated, positively sealed and lubricated. Shaft seals and bearings: bearings shall be 100,000 hour minimum, grease lubricated.	
3	Drive	Vertical, solid/hollow shaft, high efficiency & thrust, variable speed.	
4	Manufacturers	See Pump Schedule.	

Table 39 Axial & mixed flow pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to centrifugal axial and mixed flow pumps.	
1	Operation	Suction speed shall be calculated IAW ANSO/HI 1.3. Suction specific speed shall not exceed 12,500.	
		Return activated sludge, up to 15,000 mg/l suspended sludge, 6.5-8.5 pH, 65-85 degrees F.	
2	Liquids	Unscreened municipal wastewater solids.	
		Unscreened industrial wastewater solids.	
3	Type	Rigid sphere, 3" min passing through the pump from inlet to discharge.	
4	Drive	Electric motors only.	
5	Manufacturers	See Pump Schedule.	

Table 40 End-suction centrifugal pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to horizontal, end- suction centrifugal pumps.	
1	Operation	Utility water - potable, recycled.	
		Boiler, heat loops, brine solutions.	
2	Materials	Casing - Cast iron.	
		Suction and discharge flanges - provide by pressure class.	
		Volute lining - Fusion bonded epoxy.	
		Impeller - Silicon bronze.	
		Shaft - Stainless steel type 316.	
		Seals - mechanical.	
		Bearings - minimum 100,000 hours, grease lubricated.	
3	Manufacturers	See Pump Schedule.	

Table 41 Pump schedule

Item	Pump Type	Preferred Manufacturers	Notes
Process Stream			
Influent Pumping-Dry Pit	Vertical, non-clog centrifugal.	Flygt non-clog, Vaughan	
Influent Pumping-Wet Well	Submersible.	Flygt, Vaughan, ABS-Sulzer	
Primary Sludge	Progressive cavity.	Seepex, Moyno	
	Centrifugal.	WEMCO Hidrostal non-clog impeller, Vaughan	
Scum	Submersible chopper centrifugal.	Flygt non-clog, Vaughan Recirculation, ABS-Sultzer	
		WEMCO Hidrostal.	
Secondary Scum	Submersible chopper centrifugal.	Flygt non-clog, Vaughan, ABS-Sulzer	
	Centrifugal.	Allis Chalmers, Vaughan	
	Vertical Turbine Solid Handling.	Fairbanks Morse	
	Low head propeller (axial/mixed flow)		
RAS/WAS Sump	Submersible sump.	ABS-Sulzer, Flygt	
Waste Activated Sludge (WAS)	Centrifugal screw pumps.		
	Centrifugal.	Worthington / Fairbanks Morse.	
Thickened Waste Activated Sludge (TWAS)	Progressive Cavity.	Allweiler, Seepex, Moyno.	
Digester Feed Blended Primary/TWAS	Progressive Cavity.		
Digester Mixing	Chopper centrifugal.	WEMCO Hidrostal, Vaughan.	
Digester Secondary Heat Loop	ANSI Horizontal end suction.	Aurora.	
Digester Sludge Heating Recirculation	Chopper or screw centrifugal.	WEMCO Hidrostal, Vaughan.	

Item	Pump Type	Preferred Manufacturers	Notes
Digested Sludge Transfer	Progressive cavity.	Allweiler (NEMO, Seepex are both good alternatives), Moyno.	
Dewatering Feed	Progressive cavity. Rotary Lobe.	Allweiler. Vogelsang.	
Dewatered Sludge	Dewater sludge piston.	Schwing Bioset, Putzmiester.	
Aeration Basin	Submersible.	ABS-Sulzer	
Return Water	Submersible.	Flygt, Vaughan, ABS-Sulzer	
Primary Heat Loop	ANSI Horizontal end suction.		
Utility Water	ANSI Horizontal end suction.		
Boiler Recirculation	ANSI Horizontal end suction.		
Recycled Water	Vertical Turbine.		

6.1.3 Chemical Storage and Feed Facilities

Table 42 Chemical storage and feed facilities, general

Item	Parameter	Criteria	Notes
0	Scope	This document applies to Chemical Storage and Feed Facilities.	
1	Design Approach	Select proper material for chemical compatibility.	
		Define specific safety requirements for chemical handling.	
2	Access	Identify all requirements for maintenance and operations.	

Table 43 Chemical metering pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to Chemical Metering Pumps.	
1	Containment	All pumps shall be contained to prevent chemical spills.	Chemicals to be located in the same containment area shall not pose potential hazards.
		Pump platforms shall be at least as high as containment wall.	
		Use reinforced concrete base or applicable as provided by manufacturer.	
2	Suction	Set tank height so metering pump suction line is full when only a few inches of liquid remain in tank.	
3	Duty / Standby	For 1 to 4 duty pumps per injection point, include 1 standby pump.	
		Standby pump should utilize a common discharge header.	
4	Type	Peristaltic Pump Types (Ferric Chloride, Hypochlorite, Bisulfite, Peroxide, Caustic, Polymer, Other Acids).	
		Equipped with compression rollers that are retractable for tube loading. One roller shall be fully engaged with the tubing at all times to prevent backflow or siphoning.	

Item	Parameter	Criteria	Notes
		Use no check valves or diaphragms and shall require no dynamic seals in contact with the pumpage.	
		Dry self-priming, capable of being run dry without damaging effects to pump or tube, with a maximum suction lift of 15 feet wc.	
		Chemical metering pumps shall have Ethernet interface with control capability and support for CIP communications with Control Logix.	
	Tubing	Provide a tubing element with molded fittings, which shall be self-locating when fitted into the pump head.	
		Replaceable with no disassembly of the pump head.	
		Select material and size for the chemical being metered.	
		Supply four tube elements of the specified size per pump.	
5	Manufacturers	Watson Marlow.	
		Flex-Pro by Blue-White Ind.	
		Or equal.	
6	Accessories	Quick disconnect flush connection, Pressure Relief Valve, Pressure Indicator/Pressure Switch High, Calibration Column, Leak Detection.	
	SCADA Indicators	SCADA Guidelines (see Appendices), Leak Detection.	
		Provide per OSHA requirements.	

Table 44 Chemical storage facilities

Item	Parameter	Criteria	Notes
0	Scope	This document applies to Chemical Storage Facilities.	
1	Days of Storage	7 days minimum.	15 days max preferred.
		Consider degradation characteristics for chemicals such as Hypochlorite in establishing solution strength and storage requirements.	
2	Accessories	Ultrasonic or radar level sensor.	
3	SCADA Indicators	SCADA Guidelines (see Appendices).	
4	SCADA Alarms	High Level--90 percent. Low Level--15 percent. Low-Low Level--10 percent.	
5	Awning	Provide awning for chemical storage and feed facilities.	
		Consider future solar panels in awning design.	
6	Access	Allow proper truck or forklift entry and exit.	
7	Loading Area	Utilize common loading facilities with secondary containment.	
8	Screening/Shade	Consider screening and shade to maintain chemical integrity. This is significant for Hypochlorite solution.	
9	Coating/Painting	Consider chemical compatibility with specified coating and paint.	
		Consider staining property of the chemical when specifying coating and paint	
10	Ladder with Gage	Tanks exceeding 10 feet in height shall be provided with an exterior ladder equipped with a safety cage meeting current OSHA requirements. The ladder shall be Fabricated of fiberglass reinforced plastic shapes.	
		A clear width of at least 18 inches, with rungs at least ¾ inch diameter and spaced not more than 12 inch	

Item	Parameter	Criteria	Notes
		apart, and a clearance of at least 7 inches between the back of the ladder and the tank wall.	
11	Safety Handrails and Kickplates	Safety Handrails and Kickplates meeting current OSHA requirements shall be provided around the top of each tank.	
		The handrail shall be attached to the ladder side rails and anchored to the tank head. A self-closing safety gate shall be provided at the ladder access opening.	
12	Safety Shower/ Eye Wash	Provide per OSHA requirements.	

6.1.4 Primary Clarifier

Table 45 Primary clarifier, general

Item	Parameter	Criteria	Notes
0	Primary Clarifier	This document applies to Primary Clarifiers.	
1	Primary Sludge Grinders	Inline sludge shredders and grinders	
2	Primary Sludge Pumps	Progressive Cavity	
3	Primary Scum Pumps	Recessed Impeller or Open Vane	
4	Primary Center Drive	Shaft Drive or Cage Drive	

6.1.5 Secondary Treatment System

Table 46 Secondary treatment system, general

Item	Parameter	Criteria	Notes
0	Secondary Treatment	This document applies to Secondary Treatment Systems.	
1	Fine Screens with Washer-Compactor	2000 Micron Opening, Center-feed	
2	Mixing Channel	To Ensure Proper Blending of PE and RAS Prior to Splitting to Aeration Basins	
3	Mixing Chimney	One per Aeration Basin to Ensure Proper Blending of pre-blended PE & RAS with MLR	
4	Mixing System (Anoxic and Swing Zones)	Large Bubble Mixing System Powered by Compressors	
5	Aeration Blowers	Turbo or Hybrid Blower System with 50% Turndown	
6	Butterfly Control Valves and Actuators	One per Aerated and Swing Zone with <0.25% Actuator Resolution	
7	Diffusers (Aerobic zones)	Discs or Tubes; to Match Entire Range of Blower Airflow	
8	Mixed Liquor Pumps	Centrifugal/Mixed Flow Pump	
9	MLR Pumps (Inside Each AB)	Axial/Mixed Flow Pump	
10	Membrane Cassettes(1)	Hollow Fiber/Flat Sheet	
11	Permeate/Backpulse Pumps(1)	Reversible Positive Displacement/Lobe Pump	

Item	Parameter	Criteria	Notes
12	Scour Blowers(1)	Turbo or Hybrid Blower	
13	WAS Pumps	Centrifugal Pump	

(1) Provided as part of MBR vendor scope of supply.

6.1.6 Chlorine Contact Tank

Table 47 Chlorine contact tank, general

Item	Parameter	Criteria	Notes
0	Chlorine Contact Tank (CCT)	This document applies to Chlorine Contact Tanks.	
1	Chlorine Dissolution System	Connect to Existing System	
2	Chlorine Solution Pumps	Dosing	
3	CCT Effluent Pumps	Centrifugal	

6.1.7 Solids Handling

Table 48 Solids handling, general

Item	Parameter	Criteria	Notes
0	Solids Handling	This document applies to Solids Handling Facilities.	
1	Rotary Drum/Screw Thickeners	Compact and entirely enclosed. Thickened sludge 4-8%	
2	Digester Recycle Pumps	Progressive Cavity	
3	Heat Exchangers	Spiral	

6.1.8 Reverse-Osmosis Facilities

Table 49 Reverse-osmosis facilities, general

Item	Parameter	Criteria	Notes
0	Reverse Osmosis (RO) Facilities	This document applies to Reverse Osmosis Facilities.	
1	RO Units	>93% Recovery	

6.2 Civil

6.2.1 Civil Narrative

The site is located at 2242 Charles Street in an unimproved portion of the parcel. The area of improvement is relatively flat and will require grading and drainage improvements to accommodate the new structures. According to the Riverside County flood map effective 08/28/2008, the site is characterized as an area of minimal flood hazard and does not lie within a floodplain characterized by a 100-year flood. Although flooding is not anticipated, proper grading and drainage of the site are required to minimize foundation settlement and overall building performance.

The proposed structures will be surrounded by hardscape and/or native landscape and shall be designed per the California Building Code. Therefore, site improvements shall be sloped away at a minimum of 2% for impervious areas or a minimum of 5% for pervious areas away from building foundations for a minimum of 10 feet in both scenarios. In addition to the grading considerations, these improvements are expected to exceed the 5,000 square feet impervious improvements threshold and will initiate a Water Quality Management Plan. On-site permanent Best

Management Practices (BMPs) are required to capture and treat the anticipated runoff calculated using the rational method. Geotechnical investigations will identify if infiltration is feasible.

All utility services required for the proposed improvements are expected to be provided through underground services. It is anticipated that existing potable water, wastewater, power, and gas services will be extended to the proposed structures, and additional permitting or approvals will not be required.

6.2.2 General Civil Requirements

The following table contains the Engineering Design Guidelines for civil criteria. The DBE is responsible to review and finalize these requirements for complete functioning facilities.

Table 50 General civil requirements

Item	Parameter	Criteria	Notes
0	Scope	This document applies to Civil Design at the treatment plants and collection/distribution systems.	
1	Site Layout	Allow for future logical expansion, safety, maintenance, and process flow.	
2	Preliminary Site Plan	Survey to be referenced to the Plant Coordinate System and to other separate surveys for pipelines, plant sites, and related facilities. Use survey for grading and drainage designs.	
		Perform geotechnical investigations to determine soil design parameters and existing conditions, corrosivity, boulders, cobbles, etc.	
		Provide corrosion control design testing and recommendations in a report.	
		Provide landscape buffer space along public roads for noise abatement and screening of facilities from public view.	
		Incorporate site specific requirements for special conditions.	
		Accommodate visitor, personnel, and truck traffic.	
		Provide access to the perimeter of all facilities.	
		Provide ample space for those facilities requiring secondary containment.	
		Include all transformers, substations and water supply facilities.	
		Provide space for emergency generators where required.	
		Identify work area, storage area and allowable site access.	
3	Facility Arrangement	Maintain separation of operations and administration buildings from process areas.	
		Arrange process components to minimize unusual equipment arrangements.	
		Provide adequate space for piping required between process units for future expansion.	
		Provide space for cranes and maintenance vehicles without impairing normal operation.	
		Valves should be in such a way as to maximize ease of operation	

Item	Parameter	Criteria	Notes
		Keep the number of confined spaces to a minimum.	
4	Access Roads	Use minimum width of 24 feet for Two-way traffic.	Include Striping.
		Provide ample space and route for chemical deliveries.	
		Design buildings to be accessible to Fire Department apparatus by roads with a minimum unobstructed width of 20 feet, and vertical clearance of 15 feet. Extend roads to within 150 feet of all building walls and entrances.	
		Discuss road design criteria and layout with local Fire Department.	
		Provide directional and traffic signs and markings for all one-way roads and direct traffic to key buildings.	
		All building accesses to comply with ADA requirements.	
5	Parking Area Design	Parking for employees and visitors to be located near operations and administration buildings.	
		Early during design, confirm the need for truck parking and types of trucks.	
6	Horizontal and Vertical Control	Establish basis before surveying.	
7	Coordinates	Locate structures with a minimum of two coordinates on the outside face of the wall or on column lines. Show on structural foundation plan.	
		Locate circular structures by a coordinate for the center point and by the radius.	
		Locate centerline of roads with coordinates on points of intersection and with adequate curve information.	
		Provide profiles for roads where control of grade is critical and/or vertical curves are required. Show stations, existing grade, vertical curves, horizontal curves and final grade.	
		Provide coordinates and/or dimensions for grading control points, top or bottom of slope to provide sufficient staking to control contractor's tolerances for grading.	
		Provide coordinates or distances from existing structures for appurtenances to fix their location. Locate coordinates on appurtenance's centerline.	
		Provide coordinates or distances from existing structures for yard fixtures.	
8	Grading	Comply with latest edition of the California Building Code, Appendix J. Any conflict with geotechnical report shall be signed and provided in a written report.	
		Entire site to allow future construction to meet minimum design slopes. Flowlines in landscape areas = 1%; Paved areas = 1%; Concrete gutters = 0.5%.	

Item	Parameter	Criteria	Notes
		Minimize use of cross gutters or ribbon gutters.	
		Maximum road grades for heavy truck traffic on a routine basis = 7%; short reaches of 10% to 12% allowed under special circumstances.	
		Where grass is mowed, maximum slope = 5:1 horizontal to vertical.	
		Provide access ramps per ADA requirements.	
		Finished grade around structures, slabs and buildings shall be at least 6-inches below floor or slab elevation.	
		Comply with all state and federal safety codes.	
		Show contours with control points established to provide for intersecting planes on the Plans.	
9	Drainage Systems	Drainage piping shall be at least 6-inch nominal size.	
		Incorporate drainage design during initial design phases.	
		Direct sheet flow and flowlines away from walkways, buildings, cut and fill slopes, and yard activities. Provide culverts where collected drainage must cross walkways.	
		Design inlet structures where it will not hinder facility operation.	
		Provide a design to eliminate soil or debris from entering storm drain system for large areas.	
		Storm drains and catch basin laterals are a minimum of 18-inch diameter. Inlet openings are a minimum 2 feet in length.	
		Daylight storm drains to ditches or connect to an off-site drain system. Avoid on-site detention basins where soils are poor. Do not retain storm water more than a few days.	
		Design to be maintenance free, if possible.	
		Calculate drainage runoff using a minimum of a 100-year storm. For storm calculations, use 24-hour duration. For conveyance, use 6-hour intensity. Where intense rainfall could result in runoff leaving property, use 2-hour intensity.	
		Use rainfall intensity/frequency graphs from the County of Riverside.	
10	Yard Piping	Design sanitary sewer, interceptors, mains, and interplant mains of a material that is resistant to hydrogen sulfide corrosion. Apply PVC liner or appropriate coating plate linings to structures.	Use CPVC, if exposed to sunlight.
		Design steel pipe in accordance with American Water Works Association Manual M11.	
		Design ductile iron pipe in accordance with Chapter 7, Sewers, Siphons and Force Mains.	

Item	Parameter	Criteria	Notes
		For pressure distribution pipes, use restrained joints. For non-restrained joints, use harness assemblies across joints. Must withstand the maximum pressure anticipated for the system.	
		Design to have access for maintenance and inspection and have manholes to grade. Provide flanged or restrained/screwed end plug cleanouts for all building drains and sewers and all force mains.	
		Try not to bury valves. Locate all valves in tunnels or buildings or construct vaults around necessary yard valves.	
		Gravity pipelines to be a minimum 6-inch in diameter and have manhole to grade. Locate manholes at all changes in direction. Maximum distance = 300 feet between manholes.	
		Design smaller pressure lines with pressure cleanouts at grade.	
		Provide air and vacuum relief valves at high points on pressure pipes. Provide drains or blowoffs at low points.	
		Lay piping in corridors and provide space for future piping as well as access for pipe repairs.	
		Provide pipe capacity calculations in conjunction with the plant hydraulic profile.	
		Design all pipe for positive embankment conditions. 95% max dry density compaction of pipe zone bedding and backfill.	
		Combine the drain system for return to the treatment system.	
		Minimize abandoned unused piping, removing as much existing piping as possible. If left in place, fill abandoned pipe with grout plug and seal ends.	
11	Piping at Structures	Encase piping in concrete whenever under a structure and to a distance structure determined by a 45° angle from the outside of the footing to the pipe.	
		Outside structure or encasement, provide flexible joints on pipes. Where pressure lines are involved, include flexible joints with a mechanical restraint. Where gravity lines are involved, flexible joints may be normal push-on joints. Use the first flexible joint 2 feet from the structure. Use two (2) two-foot long joints at a junction with a structure.	
12	Water Piping	Design as a loop. Provide three (3) isolation valves at all tee fittings (one on each tee outlet).	

Item	Parameter	Criteria	Notes
		Minimum horizontal separation requirements for the parallel construction of potable water pipelines: • 10-feet: Sewer, Secondary Treated Recycled Water and hazardous fluids • 4-feet: Disinfected Tertiary Recycled Water and Storm Drainage.	Maintain 1-foot vertical separation also.
		Crossings shall be constructed no less than 45-degrees and no joints are allowed within 8-feet horizontal distance.	
		Whenever a pipeline crossing must occur where required clearances cannot be met, special construction that minimizes the potential for contamination will be required as specified by CDPH.	
		Provide an air-gap for potable water supply to the site. Where potable water is used for landscape irrigation or process usage, provide a reduced pressure principle backflow assembly system, complete with test cock and isolation valves.	
		Develop galvanic protection plan for pipelines placed directly in soil. Plan shall explain system used, detailing type, required maintenance, and construction requirements.	
		Contractor shall CCTV RW lines following completion of construction	
13	Fire Protection	Comply with National Fire Protection Association and local fire codes.	
		Provided by a potable water supply.	
		Form a piping loop around the plant perimeter.	
		Submit fire hydrant spacing for review by local fire departments.	
		Place fire hydrants near cross streets and roads with fire truck access and where they are readily visible.	
		Provide break-off check valves for fire hydrants that are vulnerable to vehicular damage.	
14	Security	Security fencing to be 8-foot-high chain link fence, with 3 strands of barbed wire slanting outward around property line.	
		Construct posts per APWA-AGC Standard Plan 600-0. Design fabric and posts to PVC-coated galvanized fabric and Class 1A steel per standard specification for public works construction 206-6 and Districts Master Specification.	
		Identify all security requirements for the proposed project including fencing, access, lighting, CCTV, and alarms.	
		Utilize the non-jump type to prevent vandalism.	
15	Paving	Use latest Green Book requirements. Comply with California Department of Transportation Highway Design Manual Chapter 600.	

Item	Parameter	Criteria	Notes
		Determine R value for subgrade soils under pavement using a State of California Registered Geo-technical Engineer.	
		Design access roads with a maximum traffic index of 7.0. For parking areas use AR-8000 asphalt.	
		Concrete pavement may be used in lieu of asphalt pavement. Use concrete paving where truck parking is anticipated and where asphalt paving is incompatible with the materials handling requirements for the area.	
		Construct pedestrian walkways between structures and buildings of concrete with a minimum width of 4 feet and minimum thickness of 4 inches.	
16	Spill Prevention, Control and Countermeasure Plan	Identify all manholes on main lines and drains on laterals that may overflow.	
		Identify all storm drains that may be vulnerable to an overflow.	
		Identify all potential emergency diversions that may be made to prevent an overflow.	
		Identify storm drains that may be suitable for containment of an overflow, where the storm drain may be plugged in time to prevent discharge to surface waters.	
		Specify which storm drains should be covered with mat and sandbags and which should be used for containment if necessary.	
		Specify all equipment at hand during all bypass operations.	
		Specify when emergency bypass equipment shall be ready.	
		Specify training of contractor staff in District procedures and IEUA specified procedures.	
		Include in Contract Documents the spill response plan and required configurations. Indicate on drawings the installed locations of storm sewer mats, sandbags and pipe plugs for containment.	
17	Manhole Covers in Streets	Use Traffic Rated (H-20) manhole covers.	
	Hatches/Manholes covers	Always try to use a circular section. If rectangular is the only configuration, use double hatch (Belco)	
	Guard Posts	Always add around equipment if there is any chance of traffic exposure.	

6.3 Structural

6.3.1 Structural Narrative

The structural scope for the expansion of the City's WWTP involves the addition of new components and the expansion/alteration of existing components within the existing WWTP. The identified new components include:

Pre-Engineered Metal Building (PEMB) may house various equipment, such as MBRs, RO systems, pumps, blower, tanks, office building, and their corresponding concrete pads/pedestals and building foundations.

- Cast in-place concrete for all required equipment.
- Concrete pads for all required equipment.

Additionally, alterations to existing components are proposed, including:

- Conversion of the existing secondary digester into a primary digester.

6.3.2 Design Loads

Load combinations for analysis and design will be in accordance with ASCE 7-16, Chapter 2, as referenced in CBC 2022.

The loads for analysis and design will be in accordance with CBC 2022, Chapter 35.

As outlined in the CBC 2022, the environmental loads will be determined per ASCE 7. The wind loads will be calculated per Chapter 27 using the Directional Procedure, and the Seismic loads per Chapter 12 using the Equivalent Lateral Force Procedure.

The design loads for the Project are as follows:

- Risk Category: IV
- Wind Design Data
    - Basic Wind Speed, V: 96 mph
    - Exposure Category: C
- Earthquake Design Data
    - Site Soil Class: D-Default
    - Seismic Design Category: E
    - SDS: 1.57 g & SD1: 0.932 g
    - SS: 1.962 g & S1: 0.822 g
    - Seismic Importance factor, I_e: 1.5

6.3.3 General Structural Requirements

The following table contains the Engineering Design Guidelines for structural criteria. The DBE is responsible to review and finalize these requirements for complete functioning facilities.

Table 51 General structural requirements

Item	Parameter	Criteria	Notes
0	Scope	This document applies to Structural Design.	
1	General Code Requirements	Comply with the latest editions of the CBC, ACI, AISC, ASCE, AWS, AWWA, AASHTO and CMAA. Detailed code requirements shall be per the latest edition of the following codes: • General Design: per CBC Chapter 16 and ASCE 7 • Concrete: per CBC Chapter 19, ACI 318, ACI 350, and ACI 350.3 • Masonry: per CBC Chapter 21, and ACI 530/ASCE 5/TMS 402 • Steel: per CBC Chapter 22 and AISC 360, AISC 341, AISC 358	

DRAFT

Item	Parameter	Criteria	Notes
		• Wood: per CBC Chapter 23 and NDS-2015	
2	Geotechnical Investigations	Required prior to structural design.	
		Establish location of water table and identify types of soil layers.	
		For structures located below grade and foundations supported by piles, soil-structure interaction analysis under seismic loading may need to be performed, unless it can be demonstrated by other methods that the structure is not subject to damage that renders the essential facilities inoperable after an earthquake.	
		Geotechnical Baseline Report (GBR) may be warranted for some critical structures.	
3	Dead Loads	An allowance for routed mechanical, piping, heating, ventilating and air conditioning (HVAC) and electrical equipment of 20 pounds per square foot will be included.	
4	Live Loads	Design floor area for the loads from specific equipment used or the 125 psf uniform load and 2,000 concentrated load minimums whichever is greater.	
		Design process equipment and pump rooms for minimum live load of 200 psf or maximum fork lift wheel loads, whichever is higher.	
		Electrical and control rooms shall be designed minimum live load of 300 psf.	
		Do not use CBC live load reduction.	
		Use AASHTO HS 20-44 loading where access is provided for trucks.	
5	Wind Loads	Basic Wind Speed (3 second Gust) = 110 mph (with consideration for special wind regions).	
		Exposure Category = "D"	
		Risk Category shall be per CBC Table 1604.5.	
6	Seismic Loads	All structures shall be designed according to the ASCE and CBC.	
		Analysis and modeling criteria for seismic design of buildings shall be in accordance with ASCE 7-10 Section 12.6.	
7	Lateral Earth and Liquid Loads	Consider all operating conditions within design criteria.	
8	Earth Pressure Loads - Below Grade Structures	Design for active soil pressure for all yielding walls.	
		Design for at-rest soil pressure for all non-yielding walls.	
		Surcharge soil pressure including AASHTO vehicle wheel loads if applicable (minimum surcharge equal to an additional 2 feet of soil).	
		Design for passive soil pressure.	
		Design for soil dynamic loads due to earthquake.	
9	Crane & Monorail Loads	Select design loads based on the heaviest item to be removed, with a safety factor. Use safety factor of at least one third, and higher if weights are not all available.	
		Design of crane girder, monorail beam and beam hangers and supports in accordance with CMAA.	

Item	Parameter	Criteria	Notes
		Allow for future addition of cranes in areas of heavy equipment in structural design.	
		Impact and lateral loads shall be in accordance with CBC. Vertical deflection shall not exceed L/800 and horizontal deflection shall not exceed L/400.	
10	Crane Girders	Use adjustable bolted connections for fastening crane rail to girder. Welded connections are not permitted.	
		Continuous crane girders are not permitted. Simply supported crane girders shall have end connections capable of rotation under vertical loads.	
11	Thermal Loads	Consider in the design. Such forces will include, but not limited to those caused by piping expansion or contraction.	
12	Erection Loads	Consider in the design.	
13	Load Combinations, Drift and Deflection Limitations	In accordance with ASCE and CBC.	
14	Uplift Loads	Design structures for a minimum factor of safety against uplift and sliding of 1.25 when the structure is empty and there are maximum ground water levels.	
		Uplift forces with empty structure and maximum ground water levels shall be one of the load cases evaluated for designing the structure's base slab.	
15	Seismic Upgrade to Existing Structure	Eliminate missing links in lateral force resisting systems, correct gross deficiencies in seismic systems and strengthen non-ductile "weak links" in such systems.	
		Consistently upgrade entire structure for code prescribed requirements.	
		Weigh the exact performance required and the cost of various levels of retrofit for specific structures on a case-by-case basis.	
		When criteria for strengthening existing essential and other structures and elements for which such relaxation is proposed is to be presented together with a description of the justification.	
16	Materials - Steel and Miscellaneous	Structural Steel: ASTM A36.	
		Structural Shapes (W Shapes): ASTM A992.	
		Structural Steel Pipe: A53, Type E or S, Grade B.	
		Structural Tubing: ASTM A500, Grade B.	
		Carbon Steel Bolts (for minor structural connections not exposed to corrosive environment): ASTM A307.	
		Connection Bolts (subject to vibration, cyclic, or fatigue loading): ASTM A325 SC, galvanized per ASTM B695.	
		Connection Bolts (not subject to vibration, cyclic, or fatigue loading): ASTM A325 N, galvanized per ASTM B695.	
		Anchor Bolts, studs, inserts, and fasteners (exposed to water, groundwater, sewage, sewer gas, or areas above sewage) sleeved and unsleeved: Type 316 stainless steel.	

Item	Parameter	Criteria	Notes
		Anchor Bolts, studs, inserts, and fasteners (not exposed to water, groundwater, sewage, sewer gas, or areas above sewage) sleeved and unsleeved: ASTM F1554, galvanized per ASTM B695.	
		Concrete anchors and adhesive capsule anchors: Type 316 stainless steel.	
		Anchor bolts and concrete anchors (in contact with aluminum): Type 304 or 316 stainless steel.	
		Welding Electrodes: E70XX Low hydrogen type or as approved.	
		Perform all welding to approved and certified AWS procedures.	
17	Materials - Concrete	Cement: ASTM C150 Type II or Type V.	
		Reinforcement: ASTM A615 Grade 60.	
		Cast in place concrete: 4000-psi minimum, 28 day compressive strength.	
		Lean concrete for mud mats: 2500-psi minimum, 28 day compressive strength.	
		Concrete for duct banks: 2500-psi minimum, 28 day compressive strength.	
		Design the expansion, contraction, and construction joints to adequately tolerate differential movements due to settlement, temperature, and shrinkage effects.	
		Provide all types of joints in structures with waterstop and UV resistant system where water tightness is required.	
18	Materials - Aluminum	All aluminum: 6061-T6 and ASTM B221 and ASTM B308.	
		Bolts and components (connecting aluminum): Type 304 or 316 stainless steel.	
		Aluminum guardrails and handrails (rails, posts, and fitting-assembly spacers): 6063 or T6 extruded aluminum pipe of 1-1/2-inch outer diameter and 0.145 inch wall thickness.	
		Aluminum guardrails and handrails (other parts not listed above): 6063 extruded aluminum or 214-F aluminum casting.	
		Aluminum ladders: 6063-T6 or 6061-T6.	
		Design the finished diameter of holes for unfinished bolts to be not more than 1/16 inch larger than the nominal bolt diameter.	
		Perform all welding to approved and certified AWS procedures.	
19	Materials - Masonry	Concrete block; concrete masonry unit: Standard medium weight, (unless specified to use lightweight: maximum 105 pcf), ASTM C90, Grade NI.	
		Brick: ASTM C62, Grade MW.	
		Mortar minimum compressive strength: 1,800 psi ASTM C270 Type S.	
		Cement: ASTM C150, Type II.	
		Grout minimum compressive strength: 2,000 psi ASTM C476	
		Reinforcement Yield Strength: 60,000 psi ASTM A615.	

Item	Parameter	Criteria	Notes
		CMU is not acceptable for below grade facilities and structures.	
20	Facilities	Essential facilities are those which are required to maintain the flow of wastewater through the plants.	
21	Water Holding Structures	Do not back fill until the basin passes a leak test. During leak testing, the liquid level in the tank shall be at maximum operating levels.	
	Protection of Concrete in Corrosive Areas	Use imbedded HDPE liner for protection of new cast in place concrete in corrosive areas such as preliminary treatment, headworks, primary clarifiers, digesters, etc. The HDPE liner shall be by AGRU Sure-Grip as manufactured by Agru America, or equal.	
	Concrete Structure Finish	Concrete structure finish requirements shall include “sack and patch” on of all exposed and submerged structures.	
22	Crack Control	In accordance with ACI 350, shall apply to all water holding structures.	
		Buildings with high humidity.	
		All structures exposed to repeated wash down or chemical or process spills.	
		All structures below groundwater.	
		All structures built in or placed in the water.	
		Structures below grade and above groundwater where dry interior is critical, including: basements pump stations, electrical vaults and valve houses.	
		Z factor shall be less than 95 kps per inch for service load cases for all structures exposed to raw wastewater, primary or secondary flows and sludge. In all other cases Z shall not exceed 115 kips per inch.	
23	Concrete Repair and Replacement	Inspection/assessment procedures and repair and/or replacement recommendations shall be in accordance with American Concrete Institute Standards.	
24	Foundations	Where conflict exists between Geotechnical reports and information, the most stringent requirement shall govern.	
		Explore alternatives to traditional pile driving for foundation designs.	
		Evaluate designs based on the nature of the soils and geological substrate and the proximity to sensitive noise receptors including human activities and sensitive wildlife species.	
		Alternatives include avoiding the need for piles, use of cast-in-place piling constructed in bored holes and low noise type pile drivers and extractors.	
		If pile driving is recommended, an acoustic engineer shall evaluate mitigation measures.	
25	Vibrating Equipment	The ratio of the natural frequency of the structure to the exciting frequency of the equipment shall be greater than 1.5.	
26	Equipment Anchorage	Anchor all equipment, tanks, piping, etc. in accordance with CBC requirements to resist wind or seismic loads.	
		Anchorage of equipment, piping etc. that is submerged in water or wastewater shall be	

Item	Parameter	Criteria	Notes
		designed for seismic induced water sloshed loads in addition to the other loadings.	
27	Floor Drainage	Ensure the drainage plan does not prevent proper pipe or conduit routing and does not result in impractical footing requirements.	
		Where practical, the floors of electrical rooms shall be sloped 1/4-inch per foot or more to flush door sills.	
		Other rooms that have smoothly coated floors and are not subject to washdown shall be sloped at least 1/4-inch per foot to floor drains.	
		Except for floors in office spaces, all other room floors shall be sloped at 3/8-inch per foot or more to floor drains.	
		The provision of a side slope to a drainage trench along the side of a room can allow more aggressive slopes and is sometimes preferred. Drainage trenches may be sloped with at least 1/4-inch per foot slope. Trenches should be 12 inches wide.	
28	Potential Loads from Solar Panels and other power generation equipment	Include loads from potential future solar panels for relevant structures as well as loads from any other power generation equipment.	

6.4 Architectural

The following table contains the Engineering Design Guidelines for architectural criteria. The DBE is responsible to review and finalize these requirements for complete functioning facilities.

Table 52 General architectural requirements

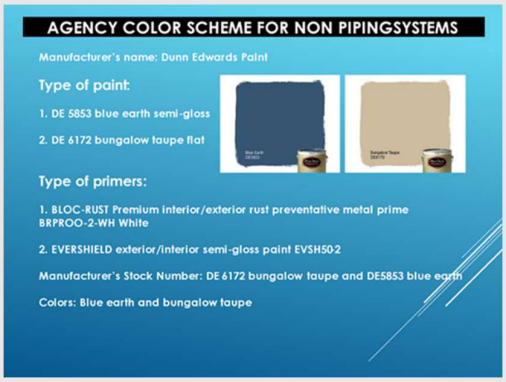
Item	Parameter	Criteria	Notes
0	Scope	This document applies to Architectural Design.	
1	Building Insulation	Comply with fire-resistance and flammability ratings.	
		Comply with code interpretations by governing authorities.	
2	Sound Attenuation Mineral Fiber Blanket Insulation	Provide insulations formed from inorganic mineral fibers complying with ASTM C 665 and ASTM C 764.	
3	Sound Attenuation Fire Blanket Insulation	Provide insulation containing non-asbestos, non-combustible compounds of spun mineral fiber felt formed into flexible and resilient blankets: 1) Thermal Conductivity (k), ASTM C 518: 0.27 Btu/in./hr/sf/degrees F. 2) Density, Manufacturer's Certified Test: 2.5 pcf. 3) Flame Spread, ASTM E 84: 25 maximum. 4) Smoke Developed, ASTM E 84: 50 maximum. 5) Fuel Contributed, ASTM E 84: 50 maximum.	
		Thickness: 3-inches.	
		Width: 16-inches.	
		Thermafiber SAFB by USG Interiors, or equal.	

Item	Parameter	Criteria	Notes
4	Fire Safing Insulation	Semi-rigid non-asbestos compounds of spun mineral fiber felt, meeting FS HH-I-521F, Type I, Class A and FS HH-I-558B, Form A, Classes 1 and 2. Nominal density of 4 pounds per cubic foot and a thermal conductivity (k) of 0.24: a. Flame Spread Rating, ASTM E 84: 15 maximum. b. Fuel Contributed, ASTM E 84: 1 maximum. c. Smoke Development, ASTM E 84: 0 maximum. d. Fire Resistance Rating, ASTM E 119: 3 hours minimum.	
		Thermafiber Fire-Safing Insulation by USG Interiors, or equal.	
5	Rigid Interior Wall Insulation	Provide insulations formed from extruded polystyrene foam, tight closed cell structure with no voids between the cells, high compressive strength, resistance to water penetration, and formed into rigid sheet complying with ASTM D 2842, ASTM C 518, ASTM C 177, and ASTM C 578, Type X: 1) Thermal Resistance Aged R-Valve per inch at 75 degrees F mean temp, ASTM C 518: 5.0. 2) Compressive Strength (lb/in) min., ASTM D 1621: 15. 3) Flexural Strength (lb/in) min., ASTM C 203: 40. 4) Water Absorption (% by volume) max., ASTM C 272: 0.1. 5) Water Vapor Permeance (perm), ASTM E 96: 1.1. 6) Flame Spread, ASTM E 84: 5. 7) Smoke Developed, ASTM E 84: 165.	
		Thickness: 1-1/2 inches.	
		Width: 23-7/8 inches.	
		Styrofoam Z-mate Interior Rigid Wall Insulation by Dow Chemical, or equal.	
6	Roof Insulation	Rigid foam insulation, ANSI/ASTM C-1289 Type II, polyiscocyanurate board with fiberous glass facer: a. Compressive Strength: 20 psi, nominal b. Board Density: 2.0 lbs. Per cubic foot, nominal c. Thickness and R-value: 2-inch, R 12.0 d. Provide minimum slope to drain of 1/4-inch per foot. e. Provide Pre-cut factory-formed corners, crickets, tapered edge strips, hipsand valleys.	
		ISO Insulation System by: GAF EverGuard Roofing Systems, or equal.	
7	Adhesive For Bonding Insulation	The type recommended by the insulation manufacturer and complying with fire-resistance requirements.	
8	Mechanical Anchors	Type and size shown or, if not shown, as recommended by the insulation manufacturer for the type of application shown and condition of substrate.	

Item	Parameter	Criteria	Notes
9	Impaling Clips	Provide galvanized steel impaling clips complying with requirements of governing code authorities and as recommended by the insulation manufacturer for full system responsibility.	
10	Adhesive Tapes	Complete selection of insulation manufacturer's recommended taping materials.	
11	Fire-Stop Sealants And Other Fire-Stop System Components	Complete selection of fire stop manufacturer's recommended vinyl-type non-asbestos fire stop systems. Provide complete systems complying with UL 1479 and ASTM E814 with a two- or three-hour fire rating. Provide equal fire protection as provided by fire-rating of construction penetrated. Fire stop systems shall also be gas and watertight. Fire Stop Systems by Dow Corning Corporation, or equal.	
12	Single-Ply Roofing	Comply with the Factory Mutual Publication 1-29 Technical Advisory Bulletin for wind resistance. Provide uniform ballast weight distribution over entire roof surface. Comply with FM wind uplift criteria at corners and perimeters. Provide combined ballast and single ply roofing manufacturer's recommended screw and plate fasteners located in accordance with FM 1-29 TAB 1. Comply with applicable insurance rating bureau requirements as required by the California Building Code, latest edition and International Building Code, latest edition, unless more restrictive requirements are specified or required. a. Out-of-Plane: 1/8-inch maximum in 10 foot-0 inches and 1/16-inch maximum in any 12-inches measured along the plane. b. Maximum Offset in Plane Alignment: 1/16-inch. c. Variation From Slope: 1/8-inch maximum in 10 foot - 0 inches. A smooth type, polyester scrim reinforced thermoplastic polyolefin based membrane for use as a single ply roofing membrane and flashing material	
		Membrane by GAF Materials Corporation, Or equal.	
13	Single-Ply Roofing Ballast	Smooth, rounded, river washed stone from 3/4-inch to 1-1/2-inch in diameter applied at a rate of 1,000 pounds per square, spread evenly over the surface without adhesive.	
		Provide granite or other stone capable of withstanding exposure without deterioration.	
14	Polyvinyl Chloride (PVC) Roofing	Comply with Factory Mutual Publication Class 1-90 (Wind Uplift Attachment Criteria). Class A fire rated assembly in accordance with UL-790 or ASTM E 108. Roof system shall comply with all applicable building codes and California Building Code Title 24, Section 118. 1. PVC roofing: Fabric reinforced PVC sheet, ASTM D4434 for Type II PVC membranes. Fiberglass reinforcing material, 80 mils minimum polymer thickness, 40 mils thickness above	

Item	Parameter	Criteria	Notes
		scrim, 110 lbf/in minimum breaking strength, white color 2. Membrane Manufacturer's membrane shall be of consistent base formulation for a minimum of 50 years. Manufacturer and membrane shall be listed in Cool Roof Rating Council product listing and roofing membranes shall be tested by CRRC-1. 3. Warranty: Manufacturer's 30-year system warranty (20 year material and labor with 10 year extension on material), Contractor's two (2) year warranty. Early Bird warranties are not acceptable. 4. Components including roofing insulation, fasteners, and walkways for roofing system from same manufacturer as membrane roofing. 5. Sika Sarnafil (Membrane: Sarnafil S327 EnergySmart 60-mil), Carlisle Syntec (Membrane: 60-Mil Sure-Flex PVC KEE), Johns Manville (60-Mil PVC KEE by Cooley Group), or equal. 6. Pre-Installation meeting between IEUA, Design Engineer, Applicator/Contractor, Roofing Manufacturer's Representative, and related Subcontractors shall be held at least two(2) weeks prior to installation.	
15	PVC Roofing Auxiliary Materials	1. Sheet Flashing: standard reinforced PVC sheet flashing of same thickness and color as PVC sheet. 2. Flashing Membrane Adhesive: solvent-based reactivating-type adhesive used to attach PVC flashing membrane to vertical (flashing) substrate. 3. Membrane Attachment Bar: one(1) inch wide, pre-punched aluminum bar used to attach PVC field membrane at all perimeter and base-angle transitions. 4. Membrane bonding adhesive: Manufacturer's standard, water based, Low VOC bonding adhesive 5. Metal Termination Bars: Manufacturer's standard predrilled stainless steel or aluminum, with anchors 6. Fasteners: factory-coated steel fasteners and metal plates complying with corrosion-resistance provisions in FM Global 4470 and acceptable to roof manufacturer. 7. Cover Board: by Georgia-Pacific DensDeck, or approved equal. ASTM C 1177, glass-mat faced, water resistant gypsum. Smoke developed and flame spread (ASTM E-84): 0, Mold resistance (ASTM D3273): 10, Compressive strength (ASTM C 473): 900psi, Board size: ½"x4'x8'. 8. Cover Board Adhesive: urethane based, low-rise foam adhesive shall be used to attach cover board to top layer of insulation. 9. Roof Insulation: Polyisocyanurate board insulation, ASTM C 1289-11, Type II, Class 2,	

Item	Parameter	Criteria	Notes
		Grade 2 (20 psi). Zero Ozone Depletion Potential from blowing agent (HCFC-free), Long-Term Thermal Resistance R-Value based on ASTM 1303-11 and/or C AN/ULC S770-09.Facer type: coated glass face, board size: 2.6”x4’X8’ (R-15.0), Total Thermal Resistance Value: R-30.0 min. 10: Tapered Insulation: provide factory tapered insulation boards 11: Insulation and Cover Board Fasteners: corrosion-resistant, minimum #15 fastener with attachment plate to attach insulation to structural metal deck. 12: Flexible Walkways: factory-formed, non-porous, heavy0-duty, slip-resisting, surface-textured walkways pads or rolls	
16	Membrane Protection Concrete Pavers	Interlocking Ballast Pavers by Westile, an Oldcastle Company, Or equal.	
17	Vapor Barrier	Rufco 4000B by Raven Industries, Incorporated, Or equal.	
18	TPO Preformed Vent Boots	0.075" thick molded TPO membrane, heat welded directly to roofing membrane, supplied with stainless steel clamping rings, (1" to 6" diameter pipes)diameter pipes).	
		GAF EverGuard TPO Preformed Vent Boots by GAF Materials Corporation.	
19	TPO Preformed Corners	Universal style accommodates both inside and outside corners of base and curb flashing, 0.065" thick molded TPO membrane, heat welded directly to roofing membrane, 4" X 4" with 4" flange.	
		GAF EverGuard TPO Preformed Corners by GAF Materials Corporation.	
20	TPO Drain Inserts	Rigid molded TPO membrane flashing complete with clamping ring and strainer basket, membrane heat welds directly to drain insert flange, sealant ring at base of insert tube.	
		GAF EverGuard TPO Preformed Corners by GAF Materials Corporation.	
21	TPO Coated Metal	25 gauge steel with 0.020" thick TPO based film required for fabricated metal gravel stops and drip edge profiles, metal base and curb flashings and sealant pans.	
		GAF EverGuard TPO Coated Metal by GAF Materials Corporation.	
22	Lip Termination Bar	Extruded aluminum termination bar with angled lip caulk receiver and lower leg bulb stiffener. Pre-punched slotted holes at 6" on center, 3/4" x 10’ with 0.090" cross section.	
		GAF EverGuard Liptermination Bar by GAF Materials Corporation, Or equal.	
23	Miscellaneous Materials	1. Bonding Adhesive: As recommended by the roofing manufacturer. 2. Splicing Cement: As recommended by the roofing manufacturer. 3. Lap Sealant: As recommended by the roofing manufacturer.	



Item	Parameter	Criteria	Notes
		4. Deck Primer: As recommended by roofing manufacturer. 5. Caulking and Sealants: As recommended by the roofing manufacturer. 6. Protection Board: As recommended by the roofing manufacturer for use beneath membrane protection pavers. 7. Mechanical Fasteners and Plates: Stainless steel and plates as recommended by the roofing manufacturer.	
24	Single-Ply Roofing Manufacturer	1. Fully adhered single-ply TPO TSR roofing system, by GAF EverGuard by GAF Materials Corporation. (Uses: concrete decks). 2. Mechanically attached single-ply TPO TSR roofing system by GAF EverGuard.	
		by GAF Materials Corporation. (Uses: metal decks), Or equal.	
25	Flashing And Trim	Flashing and trim shall be permanently watertight, and not deteriorate in excess of manufacturer's published limitations.	
		Flashing and trim to be fabricated and installed to meet the requirements of FM 1-90 and applicable requirements of the California Building Code, latest edition and the International Building Code, latest edition.	
		Comply with fabrication details recommended by SMACNA.	
26	Stainless Steel Flashing and Trim	Provide sheet stainless steel, Type 304 complying with ASTM A 176, with No. 2D dead soft, fully annealed finish, unless otherwise specified.	
27	Cast-In-Place Roofing Reglets and Counterflashing	Provide stainless steel, Type 304, (.020-inch) built-in-place reglets with wind lock clips.	
		Type CO Reglet for cast-in-place application by Fry Reglet Corporation, Or equal.	
28	Fiberglass Reinforced Plastic (FRP) Doors and Frames	General: a. Fiberglass Mat: Minimum 1.5 ounces per square foot. b. Resins: Manufacturer’s formulation for fabricating units to meet specified requirements.	
		Manufactured Units:	
		1. Fiberglass Reinforced Plastic (FRP) Doors: a. Thickness: 1-3/4 inches. b. Thermal Insulating Value: ‘R’ Factor 11. c. Construction: 1) Core: End-grain balsa wood, resin-impregnated. 2) Door Plates: Molded in one continuous piece, resin reinforced with hand-laid glass fiber mat, nominal 1/8-inch thick, minimum 15 mil gelcoated surface. 3) Door Edges: Minimum three (3) layers resin-reinforced glass fiber mat, nominal 3/8-inch thick, machine tooled. d. Finish: Smooth gloss surface, minimum Value 88 in accordance with ASTM D 523.	

Item	Parameter	Criteria	Notes
		2. Fire-rated Fiberglass Reinforced Plastic (FRP) Doors: UL approved, and as follows: a. Thickness: 1-3/4 inches. b. Thermal Insulating Value: 'R' Factor 11. c. Construction: 1) Core: Fire-resistant mineral core. 2) Door Plates: Molded in one continuous piece resin, reinforced with hand-laid glass fiber mat nominal 1/8-inch thick, minimum 25 mil gelcoated surface. 3) Door Edges: Minimum two (2) layers resin-reinforced glass fiber mat, nominal 1/4-inch thick, machine tooled. d. Finish: Smooth gloss surface, minimum Value 88 in accordance with ASTM D 523.	
		3. Fiberglass Reinforced Plastic (FRP) Frames: a. Construction: One-piece pultruded fiberglass reinforced plastic, minimum 1/4-inch wall thickness, jamb-to-head joints mitered and reinforced with (FRP) clips and stainless steel fasteners conforming to SDI requirements for performance equivalent to 16 gage steel frames. b. Frame Profile: 5-3/4 inches deep, 2 inches wide face; double rabbeted with 5/8-inch high stop. c. Finish: Satin finish, with true and consistent color throughout frame thickness.	
		4. Fire-rated Frames: UL approved, and as follows: a. Construction: Type 304 stainless steel, or steel gel-coated to match doors.	
		5. Lites and Louvers: a. Lites: 1) Stops: Pultruded fiberglass reinforced plastic construction. 2) Fasteners: Stainless steel screws as recommended by manufacturer. 3) Fire-rated: Stainless steel, Type 304 UL rated frames. b. Louvers: 1) Construction: Molded solid vanes; pultruded fiberglass reinforced construction. 2) Finish: Satin finish, with true and consistent color throughout frame thickness.	
		6. Fiberglass Reinforced Plastic (FRP) Removable Transoms: a. Construction: Transoms shall match door frame construction and color.	
		Fiberglass doors and frames by FIB-R-DOR Division of Advance Fiberglass, Inc., Or equal.	
29	Non-Rated Wall Access Doors	Stainless Steel KRP-DSC-214M by Karp Associates, Or equal.	
30	Overhead Rolling Doors (High Speed Roll-Up Door)	Speed-Master Series-Model 1500 by Hörmann Flexon LLC. Phone: 1-800-365-3667, website: www. HORMANN-FLEXON.com, Or equal.B.	
31	Painting	A. Shop clean and prime all ferrous metal and galvanized surfaces, exposed and	

Item	Parameter	Criteria	Notes
		unexposed, except lubricated surfaces, with door manufacturer's standard rust inhibitive primer drying to a flat sheen.	
32	Aluminum Storefront Windows and Framing	Trifab VG 451T (Thermal) Storefront System by Kawneer Company, Incorporated, Or equal.	
33	Exposed Aluminum Polyvinylidene Fluoride Based Coating	Duranar Metallic XL Specialty Color 4-Coat System by PPG Industries Coatings and Resins Division, or equal.	
34	Skylights	Model DDCAP1 3636, by Wasco Products Incorporated, Or equal.	
35	Fall Protection Safety Screens	Provide 1-inch square mesh consisting of 12 gage galvanized steel wire. Fasten mesh to the extruded aluminum retainer assembly.	
36	Aluminum Finishes	A. General: Comply with NAAMM “Metal Finishes Manual” recommendations for application and designations of finishes. B. Finish designations prefixed by AA conform to the system for designations of aluminum finishes established by the Aluminum Association. C. Class I or Class II, Clear-Anodized Finish: AA-C22A41 (Chemical Finish: etched, medium matte; Anodic Coating: Class I Architectural, clear film thicker than 0.7 mil complying with AAMA 607.1. Class II Architectural 0.7 mil.	
37	Finish Hardware - Hinges	Provide all doors with mortise hinges, unless specifically scheduled otherwise.	
		FBB 199 and FBB 191 by Stanley Commercial Hardware, Or approved equal.	
38	Finish Hardware- Mortise Locks Sets	Extra Heavy Duty Mortise Lockset L9000 Series with Lever Handles by Schlage Part of Worldwide Ingersoll-Rand Corporation, Or equal.	
39	Finish Hardware- Panic Exit Devices	Von Duprin Part of Worldwide, Or equal.	
40	Finish Hardware- Cylinders And Keying System	Cylinders and Keying by Schlage Part of Worldwide Ingersoll-Rand Corporation. No equals allowed.	
41	Finish Hardware- Fire Department Key Lock Box	Knox Company, Model 3200R Knox-Box, Or equal.	
42	Finish Hardware- Door Closers	4040 XP Heavy Duty Closer by LCN Part of Worldwide Ingersoll-Rand Corporation, Or approved equal.	
43	Finish Hardware- Floor Stops	FB13/14R, FB17 by Glynn-Johnson Part of Worldwide Ingersoll-Rand Corporation, Or approved equal.	
44	Finish Hardware- Stripping And Seals	No. 4301CRL by Pemko Manufacturing Company, Or equal.	
45	Finish Hardware- Thresholds	172A, 176A by Pemko Manufacturing Company, Or equal.	
46	Finish Hardware- Astragals	No. 357SS by Pemko Manufacturing Company, Or equal.	
47	Finish Hardware- Sealants	Provide butyl rubber sealant complying with FS TT-S-001657 for use with thresholds.	
48	Finish Hardware- Flush Bolts	GJ FB6 Extension Flush Bolts by Glynn-Johnson Part of Worldwide Ingersoll-Rand, Or equal.	

Item	Parameter	Criteria	Notes
49	Finish Hardware-Coordinators	COR 1, 2 and 3 Series with FB Series by Glynn-Johnson Part of Worldwide Ingersoll-Rand, Or equal.	
50	Glass And Glazing-Clear Wire Glass (Interior Door/Transom Lites	Polished Plate Wire Glass by PPG Industries, Incorporated, Or equal.	
51	Glass And Glazing-Insulating Glass	Caribia Tinted Tempered Commercial Insulating Glass Units by PPG Industries, Inc., Or equal.	
52	Glass And Glazing-Clear Tempered Insulating Glass	Clear Tempered Commercial Insulating Glass Units by PPG Industries, Inc., Or equal.	
53	Glass And Glazing-Clear Tempered Monolithic Glass (Interior Door/Transom Lites	Clear Tempered Monolithic Commercial Glass Units by PPG Industries, Inc., Or equal.	
54	Glass And Glazing-Tinted Tempered Monolithic Glass (Exterior Door/Transom Lites	Caribia Tinted Tempered Monolithic Commercial Glass Units by PPG Industries, Inc., Or equal.	
55	Glazing Sealants And Tapes- Structural Silicone Sealant	Dow Corning 995 Silicone Structural Adhesive by Dow Corning Corporation, Or equal.	
56	Glazing Sealants And Tapes- Exterior One-Part Silicone Rubber Sealant	Spectrum I by Tremco, Incorporated. Or equal.	
57	Glazing Sealants And Tapes- Preformed Butyl Rubber Glazing Sealant	Polyshim II Glazing Tape by Tremco, Incorporated. Or equal.	
58	Glazing Sealants And Tapes- Dense Compression Wedge Gaskets	Dense Silicone Wedge Gaskets SCR-900 by Tremco, Incorporated. Or equal.	
59	Miscellaneous Glazing Materials	A. Setting Blocks: Neoprene, 70-90 durometer hardness, with proven compatibility with sealants used as recommended by the glass manufacturer. B. Spacers: Neoprene, 40-50 durometer hardness, with proven compatibility with sealants used as recommended by the glass manufacturer. C. Compressible Filler Rod: Closed-cell or waterproof-jacketed rod stock of synthetic rubber or plastic foam, proven to be compatible with sealants used, flexible and resilient, with 5-10 pounds per square inch compression strength for 25 percent deflection.	
60	Translucent Fiberglass Sandwich Panels	Translucent fiberglass sandwich panels by Kalwall Corporation, www.kalwall.com. Or equal,	
61	Gypsum Wallboard	United States Gypsum Company, Dietrich Metal Framing, Or equal.	

Item	Parameter	Criteria	Notes
62	Gypsum Wallboard - Wall/Partition Support Materials	400 USTE 20 DW EQ UltraSTEEL framing with complementary accessories by Dietrich Metal Framing. Or equal.	
63	Gypsum Wallboard - Furring Members	Z-furring (ZF-Series) by Dietrich Metal Framing	
64	Acoustical Ceilings- Acoustical Panels	Sanserra 573 Tegular by Armstrong. Or equal.	
65	Ceiling Suspension Materials- Exposed Suspension System	Prelude XL 15/16” Exposed Tee Systems by Armstrong. Or equal.	
66	Acoustical Panels- Perforated Metal Acoustical Panels	Eckoustic Functional Panels by Eckel Industries, Incorporated. Or equal.	
67	Resilient Tile- Rubber Tile	Noraplan Stone al by Nora Flooring Incorporated.	
68	Painting	Tnemec Company, Incorporated, Devoe High Performance Coatings, Or equal.	
69	Louvers And Vents	A. Aluminum Sheet: ASTM B 209, 5005 with temper as required for forming, or as otherwise recommended by the metal producer to provide the required finish. B. Aluminum Extrusions: ASTM B 221, Alloy 6063-T52. C. Anchors and Inserts: Use Type 316 stainless steel expansion bolt devices or drill and epoxy Type 316 stainless steel anchors. D. Bituminous Paint: SSPC-Paint 12 (cold-applied asphalt mastic). E. Blank-Off Panels: Provide 16 gage aluminum sheet with A42 Dark Bronze anodized finish. Provide Type 316 stainless steel fasteners, 12 inches on centers.	
70	Fixed Louvers	No. A6155 by Construction Specialties, Incorporated. Or equal.	
71	Finishes- Exposed Aluminum Polyvinylidene Fluoride Based Coating	Kynar 500 TRI-X by DeSoto Incorporated. Duranar XL by PPG Industries, Incorporated. Or equal.	
72	Louver Screens	A. Provide removable screens for all louvers. B. Fabricate screen frames of the same metal and finish as the louver units to which secured. Provide frames consisting of extra heavy duty extruded 0.090-inch aluminum for permanently securing screen mesh. Frames shall be rewirable. C. Use insect screen of 18 by 14 mesh, 0.0123-inch diameter stainless steel intercrimp wire. D. Locate screens on inside face of louvers. Secure screens to louver frames with machine screws, spaced at each corner and at 12 inches on centers. E. Provide minimum No. 8 stainless steel metal screws unless larger screws are required by screen size. F. Provide cross bar screen reinforcement of same material and finish as louver which	

Item	Parameter	Criteria	Notes
		subdivides screens into maximum area of 50 square feet.	
73	Sill Extension	Gage and Finish: Same as louver.	
74	Self-Luminous Exit Signs	Everglo Signs by Self Powered Lighting Incorporated. Isolite Model 2040-01 Signs by Safety Light Corporation. Or equal.	
75	Fire Extinguisher Location Signs, Interior Room Identification Signs, And Chemical Area Safety Signs	A. Material: Subsurface silkscreened graphics on a transparent acrylic sheet, 0.08-inches thick with Helvetica Medium alphabet and matching arrows type face. Provide 2-inch high upper case letters and 1-inch high lower case letters. B. Fire Extinguisher Identification Sign: Provide 15-inch by 15-inch with square corners, unframed. Provide one for each surface mounted fire extinguisher. Background color red with white lettering. Sign shall incorporate a directional arrow	
76	Room Identification Signs	Provide 15-inch by 15-inch with square corners, unframed. Colored background with white lettering. Provide one sign for each of the followings rooms in the Centrifuge Building: Locate on wall adjacent to entry door into room. 1. Unisex Restroom. 2. Control Room. 3. Electrical Room (two signs). 4. Truck Loading Observation Room (at stairway #3).	
77	Chemical And Process Area Safety Signs	Safety signs shall be formed from rigid polystyrene or polyethylene plastic. Letters shall be 2-inch high upper case letters and 1-inch high lower case letters.	
78	Architectural Finishes	Architectural finishes of concrete prior to painting shall be uniform profile by blasting and or other methods. Consider the use of Wunderfixx (or equal), a concrete smoothing compound for exterior concrete walls.	
79	Paint Color of Architectural Features	Paint color of architectural features (facias, doors, exterior features systems, roof drains, awnings) shall conform to IEUA color standard2 	

Item	Parameter	Criteria	Notes
		Contractor is responsible to color matching and/or field coating to match, other manufacturers' standards are not acceptable.	

6.5 HVAC

The following tables contain the Engineering Design Guidelines for HVAC criteria. The DBE is responsible to review and finalize these requirements for complete functioning facilities.

Table 53 HVAC general

Item	Parameter	Criteria	Notes
0	Scope	This document applies to all heating, ventilation, and air conditioning equipment and design.	
1	System Configuration Options	-Unitary equipment -Centralized heating and cooling system -Composite (combined) system	
		AC systems shall be consolidated where possible.	
		Redundancy is required in electrical rooms, server rooms, control rooms, and in other critical locations.	
2	Unitary Equipment Application	Use for small and remote buildings or system that require stand-alone or redundant cooling equipment.	
		Do not use where maintenance is difficult or access is limited.	
		Outdoor equipment, such as air-cooled condenser coils, corrode quickly if exposed to vapor/condensate of a sewage treatment process.	
		Not suitable for 100% outside air systems.	
3	Central System Application	Use for localized heating and cooling of groups of buildings.	
		Use hot water heating boilers and steam boilers.	
4	Composite System Application	Use if a central system can handle a group of buildings, but unitary system(s) are needed for remote or distant buildings.	
5	Weather Conditions	Summer conditions: select 0.5% design dry-bulb and coincident wet-bulb temperatures.	
		Winter conditions: select 0.6% design temperatures.	
		Use latest ASHRAE climatic data for the region.	
6	Equipment Access	Minimum 30-inches around all equipment.	
		When located on roof, proper accessibility and maintenance clearances are required. This includes stairs/ladders, platform, catwalk, handrails, etc.	
7	Equipment Location	Where possible, minimize long duct runs.	
		Unless necessary, do not mount equipment on roofs (adds expense of access ladders/catwalks and cranes are required to install/remove equipment).	

Item	Parameter	Criteria	Notes
8	Intake/Exhaust Locations	Locate intakes considering prevailing wind direction and potential sources of odorous, toxic, or corrosive gases, and environmental conditions.	
		Do not route exhausts where they can feed air intakes.	
		Do not route exhausts toward the entry points of confined spaces.	
9	Ventilation	Ventilation is required for all buildings, equipment rooms, galleries, and storage areas.	
10	Odorous, Hazardous, and Special Environments	FRP fans, housings, and assemblies are required in corrosive environments (i.e., hydrogen sulfide).	
		Minimize potential for fire and explosion.	
		Maintain concentrations of hazardous gases to levels below those considered dangerous to personnel.	
		Computer / Control Rooms: -Do not use more than 10% outside air for cooling.-Provide special equipment with dehumidification capabilities and three-stage air filtration system.-Maintain positive pressure.	
		Locate exhaust points as close as possible to potential sources of odors or hazardous gases.	
		In chemical gas areas, locate supply points near the ceiling and exhaust points near the floor.	
		Provide dust removal systems for areas that produce dust (e.g., air filter, electrostatic precipitators).	
		Provide oxygen sensors where pure oxygen is used for aeration.	
11	Insulation	Insulate ductwork for mechanically cooled spaces to prevent condensation.	
		Use piping and equipment insulation where the following items are needed: -Heat loss/energy conservation. -Personnel protection. -Condensation control. -Jacketed insulation on exterior refrigerant lines.	
12	Vibration / Noise Control	Provide vibration control on all floor-mounted or large ceiling-hung air moving equipment.	
		Incorporate seismic bracing and restraints into large HVAC vibration isolation equipment and all suspended equipment.	
		Use duct silencers in conjunction with exhaust fans at areas containing equipment which generates substantial noise.	
		Control noise to meet local codes and regulations.	
		In administration areas, insulate the interior of fans, air-handling units, and critical ducts.	
13	Fans and Air Handling Units	Use centrifugal, wall-mounted fans to exhaust the air.	
		The unit housing and coils shall be constructed on non-corrosive materials.	

Item	Parameter	Criteria	Notes
14	Materials	Components: -non-ferrous -bronze anodized aluminum -FRP -stainless steel -galvanized steel (only in locations not exposed to water, ground water, or sewer gas)	
		FRP shall have a flame spread of < 25 and smoke propagation < 400.	
		Consider fire-resistant FFRP ductwork in all hazardous and highly corrosive areas.	
15	Energy Efficiency	Design on steady-state heat transfer conditions with buildings and processes us use 24 hours per day.	
		Do not count thermal storage in the building mass to reduce the design loads.	
		Base calculation on ASHRAE Fundamentals.	
16	Boilers	Types: hot water heating and steam.	
		Fuels: natural gas, sludge digester gas, or both.	
		Do not use electric heating coils, unless at remote site without gas supply or small heating demands.	
		Follow applicable codes and SCAQMD regulations.	
		Include provisions for thermal expansion.	
		Provide heat for these central systems by natural gas fired high efficiency low temperature hot water boilers operating at over 90 percent low heating value (LHV) fuel to hot water efficiency.	
		Provide modulating control on 100 percent outside air systems.	
17	Ductwork	Insulation: -Double wall for outside. -Single wall for inside.	
		Material: -Typical: galvanized steel -Buried: HDPE -Aeration areas: 316 SS -Foul air: FRP	
18	Refrigerant	Shall not be on EPA Phase-out List 2 years after announcement.	
19	Coils	Type: Copper Tubing with Aluminum Fins.	
		Coating: Use coated coil, unless otherwise noted.	
		Cleaning: Provide utility water tap with quick disconnect and hose.	
20	Manufacturers	See Section 3.2 (AC Units)	
21	Dampers	Use dampers on every header.	
		Use motorized dampers for 1+1 unit arrangement.	
		Use backdraft dampers if two units are feeding into same line	
22	Condensate Line Material	Copper.	

Item	Parameter	Criteria	Notes
23	Alarms/Controls	Provide SCADA alarms for critical HVAC items. Provide room temperature monitoring at SCADA for critical areas.	
24	Slope and Drain	Provide slope with drain capture. 1% slope with flow and 2 % slope against flow.	
25	Floor Drain for Equipment	Use Josam E2 Series or equal for significant drain flows.	
27	EMS Controls	JCI, Carrier IVU or Tridium.	
28	Minimum SEER	2 more than California minimum.	
29	Thermostat	Debonair if available.	
30	Access to AC Control Panel	Use hinged door rather than screws.	
31	Controls	Critical HVAC systems (e.g., in electrical rooms, SCADA rooms, server rooms, etc.) require remote monitoring and/or alarming	

Table 54 Air conditioning units

Item	Parameter	Criteria	Notes
0	Scope	This document applies to air conditioning units.	
1	Warranty	All AC Units require 1-year manufacturer's warranty.	
2	Acceptable Manufacturers	-Carrier. -Trane. -Liebert. -Mitsubishi (split systems)	
3	Cabinet and Frame	Materials: -Base frame: phosphatized, zinc coated 18 gage steel. -Doors and Access panels: 18 gage steel. -Cabinet Insulation: Fireproof material or foil faced glass fiber. -Exterior finish: Textured vinyl enamel to match computer equipment. -Roof mounted: 12 gage zinc coated steel with weatherproof seal.	
		Thermally and acoustically line cabinet interior equal to one inch thick of 1.5 lb./cf. density duct liner material, meeting requirements of NFPA 90A.	
		Panels shall be gasketed, with quick release hinged with latches and handles.	
4	Condensate Pan	Provide an insulated condensate pan under the evaporator coil. Provide copper condensate drainpipe complete with union, trap and open tee at discharge of trap, connect drain to condensate sump pump as specified hereinafter.	
5	Compressors	Type: -Hermetic. -Semi-hermetic.	
		Provide crankcase heaters, discharge muffler, and related components for proper operation.	
		Use dual compressors for units larger than 5 tons.	Check availability.
		Compressor shall be serviceable without dismantling other components.	

Item	Parameter	Criteria	Notes
6	Condensers	Provide air cooled units with matched air cooled condenser consisting of corrosion resistant cabinet, incorporating copper tube aluminum fin condenser coils arranged for minimum of two circuits and multiple direct drive condenser fans with inherently protected motors. Operating controls shall permit fan cycling for head pressure control.	
7	Filters	Provide removable, disposable pleated cartridge type filters with efficiency of 60 percent by NBS atmospheric dust spot method. Mount filters in top of cabinet in a track or holding device designed to preclude air bypass.	
8	Evaporator Coils	Type: Horizontally split face coils.	
		Material: Seamless copper tubes expanded into aluminum fins.	
9	Evaporator Fans and Motors	Fans shall be arranged to draw air through the cooling coils.	
		Type: multi-blade up flow propeller.	
		Fans shall be provided with vibration isolation from the unit casing.	
		Each fan shall be independently driven by heavy duty drip proof permanently or grease lubricated ball bearing motor with built-in current and overload protection.	
		Motors shall be installed on an adjustable base.	
10	Controls	All temperature sensors shall be mounted within the unit in the return air stream.	
		Temperature control shall be set to maintain 75 degrees F DB.	
		High pressure fan control or economizer to be installed for low ambient temperature conditions.	
		The control and readout panel shall indicate the following: cooling operating stages, loss of air flow, dirty filters, high and low.	
11	Condenser and Evaporator Coils	3/8-inch OD seamless copper tube mechanically bonded to aluminum fins.	
12	Air Filters	Indoor: Continuous filament, pleated, 2-inch thick, viscosine coated removable media with filter cell.	
		Outside: Camfil Farr, with rainguard and PVC coated bird screen.	
		Flow rate: 200 cubic feet per minute with less than 0.25 water column drop.	
		Locate in dry areas.	
13	MCC Rooms	AC Package unit pad mounted with supply and return ductwork.	
14	Cabinet AC	Ice Qube or Mclean stainless steel for outdoor use.	

Table 55 Heat pumps

Item	Parameter	Criteria	Notes
0	Scope	This document applies to heat pump units.	

1	Approved Manufacturers	Carrier.	
2	Ambient Conditions	Capable of operating at rated capacities at 120 degrees F.	
3	Materials	-Casing: 18 gage zinc coated steel. -Exterior surface: phosphatized, painted with epoxy primer, and finished with baked enamel. -Motor / Fan mounts: heavy zinc coating. -Coil frame: Minimum 12 gage zone coated steel.	
4	Condenser Fan and Drive	Type: axial flow propeller fan.	
		Material: Zinc plated or aluminum.	
5	Refrigerant Compressor	Type: hermetic reciprocating or scroll compressor.	
6	Condensing Coil	Seamless copper tubing and heavy-duty aluminum fins.	
7	Application	Office Space only.	

Table 56 Exhaust fans

Item	Parameter	Criteria	Notes
0	Scope	This document applies to exhaust fans.	
1	Materials	-Fans: Fiberglass reinforced plastic, fire retardant. -Housing: Fiberglass reinforced vinyl-ester. -Metal components: coated with corrosion proof UV inhibited gel. -Fan shaft seal: Teflon seal between shaft and housing.	
2	Manufacturers	-Hartzell Fan, Inc. -Swarthout, Inc. -Greenheck.	
3	Type	Extruded flanged mounted louver with an integral draft damper.	
4	Housing	Provide corrosion resistant solid fiberglass reinforced plastic design with construction classification suitable for pressure range.	
5	Shaft bearings	Heavy-duty, grease lubricated, sealed, self-aligning, frictionless ball bearings, L-10 minimum life ratings of 50,000 hours.	
6	Hood and Bird Screen	FRP hood complete with guard securely anchored to hood inlets.	

Table 57 Ductwork and accessories

Item	Parameter	Criteria	Notes
0	Scope	This document applies to HVAC ductwork and accessories.	
1	Materials	Select corrosive resistant material compatible with environment.	
2	Hanging Ductwork	Do not use straps for hanging ductwork, instead use angled rods constructed from the same material as the duct.	
		Hanger rods: Duct half perimeter up to 72 inch: 3/8 inch at 8 feet spacing. Duct half perimeter greater than 72 inch: 1/2 inch at 6 feet spacing.	

Item	Parameter	Criteria	Notes
3	Sleeves	20 gage galvanized steel sleeve, caulked airtight with fire resistant sealant required when duct passes through masonry wall, partitions, or floors.	
4	Weatherproof Duct	16 gage galvanized steel.	
5	Air Volume Extractors	Manufacturers: -Hart and Cooley. -Titus.	
		Material: Aluminum.	
		Blades: Gang-operated curved adjustable blades controlled through a manual adjusting lever.	
6	Splitter Dampers	Manufacturers: -Hart and Cooley. -Titus.	
		Material: Aluminum.	
		Adjustment: Manual adjusting lever with locking device.	
7	Volume Dampers	Manufacturers: -Honeywell. -Arrow United Industries, Inc.	
		Material: Match Duct.	
		Blades: opposed blades, key operated with vinyl edge seals.	
		Provide outside handle, quadrant, approved position indicator, locking device and linkage for manual operation or motorized operation.	
		Performance:-Damper Leakage: Not more than 16 cfm per square foot at 4-inch W.G.-Certification: Manufacturer shall provide certified test data.	
8	Belt Guards	Expanded hinged steel or hinged sheet steel for weather protection where required.	
		Fabricate guards to receive 2-inch larger pulleys without alteration to the guard.	
9	Flexible Connections: (For air handling units)	Material: -3/16-inch thick, 6-inch wide fabric reinforced neoprene. -0.080 gauge, 3-inch wide aluminum strip.	
10	Turning Vanes	Same material as ducts. Vanes shall be 2-inch blades for ducts up to 18 inches in either dimension and shall be 4-1/2 inch blades for larger ducts.	
		Vanes: Double thickness for supply and exhaust/return ductwork. Finished with an air-dried phenolic corrosion resistant coating prior to installation.	
11	Screens	1/2-inch mesh, stainless steel metal screen with stainless steel frame.	
12	Registers, Grilles, and Diffusers	Manufacturers: -Carnes -Hart and Cooley -Titus	
13	Supply Registers	Type: Individually adjustable	
		Frame and Blades: Aluminum in aluminum and galvanized steel ducts. SS in SS or FRP ducts.	

Item	Parameter	Criteria	Notes
14	Smoke Dampers	Comply with fire and mechanical Codes.	
15	Supply Diffusers	Type: Square, step-down outlet with round neck.	
		Frame and Core: Aluminum in aluminum and galvanized steel ducts.	
		Provide combination volume control and equalizing deflector construction of same material as frame above.	

Table 58 Ventilation schedule

Area	Ventilation Requirements	Room Condition Heat-Cool, °F	Duct Materials
Administration/ Operation Building			
-Offices	15 to 20 cfm/person (4)	70/78	Aluminum, G.S.
-Meeting & Conference Rooms	15 to 20 cfm/person (4)	70/78	Aluminum, G.S.
-Toilet/Locker Rooms	100% exhaust	70/78	Aluminum
-Control/Computer Rooms	10% Outside air	72/72	Aluminum, G.S.
-Stairwells (enclosed)	100% Outside air (5)	50/85	Aluminum, G.S.
-Laboratories	100% exhaust (5)	70/75	FRP/SS
Maintenance Building			
-General		40/90	Aluminum, G.S.
-Shops and Offices		68/75	G.S.
Control Rooms/Centers			
-Attended	6 Air changes/hr.	68/75	Aluminum, G.S.
	10% Outside air.		
-Unattended or combined-with MCC	6 Air changes/hr.	55/85 (max.)	Aluminum, G.S.
	10% Outside air.		
Motor Control Center Rooms/ Buildings	6 Air changes/hr.	55/90	Aluminum, G.S.
	10% Outside air.		
HVAC Equipment Rooms	6 Air changes/hr.	No requirement	G.S.
Storage Rooms		No requirement	G.S.
Thickening Control Building	12 continuous air changes/ hour 100% outside air.	55/85	FRP
Digester Area			
-Gas Compressor Room (explosive, toxic)	12 continuous air changes/ hour 100% outside air, 30 changes/hour intermittent (1)	55/85	Anodized Aluminum, Type 316 SS, or RFP
Dewatering Building	12 continuous air changes/ hour 100% outside air	55/90	FRP

Area	Ventilation Requirements	Room Condition Heat-Cool, °F	Duct Materials
Dewatered Biosolids Storage Building	12 continuous air changes/ hour 100% outside air	No requirement	Anodized Aluminum, Type 316 SS, or FRP
Chemical Areas			
-Chlorine (toxic, corrosive)	10-20 air changes/hour 100% outside air (3) (1)	60/90	FRP(3)
-Chemical Storage Rooms	10-20 air changes/hour 100% outside air (1)	60/90	
Peroxide Storage & Handling Areas	10-20 air changes/hour 100% outside air (1)	60/90	FRP
Chemical Handling	6 air changes/ hour 100% outside air (1)	55/85	FRP
Tunnels/Underground Gallery	Table 8.3, see NAPA 820	No requirement	G.S.
-w/o gas piping	6 air changes/ hour 100% outside air (1)		Aluminum, G.S., FRP
-w/gas piping (potentially explosive)	12 continuous air changes/ hour 100% outside air		Aluminum, G.S., FRP
Stairwells to Tunnels or Basement/Underground Structures			
Preliminary Treatment/ Headwork's Building	20-30 air changes/hour 100% outside air. Chemical scrubber	40-90	Aluminum, G.S., FRP
-Wet wells (explosive, toxic, corrosive, high humidity)	30 continuous ventilation air changes/hour 100% outside air	No requirement	Aluminum, G.S., FRP
-Screening (explosive, toxic, corrosive, high humidity)	20(8)-30(1) continuous ventilation air changes/hour 100% outside air	50/90	Aluminum, G.S., FRP
-Grit removal (high humidity, corrosive) room (above tank covers)	20(8)-30(1) continuous ventilation air changes/hour 100% outside air	50/90	Type 316 SS, or FRP
Process Equipment Rooms	6(8)-12(1) Ventilation air changes/hour 100% outside air	50/85	FRP
Cogeneration Building	12 continuous air changes/ hour 100% outside air	40/90	Aluminum, G.S.
-General (explosive)	Ventilation air changes 100% outside air	50/95	FRP for process areas
-Offices (physically separated)	15 to 20 cfm/person (4)	70/78	Aluminum, G.S.
-General (explosive and flammable) (20-foot minimum envelope around equipment)	12 continuous air changes/ hour 100% outside air	N/A	FRP for process areas
Process Area Offices	15 to 20 cfm/person (4)	70/78	Aluminum, G.S.

(1) Higher ventilation rate when people are present
(2) Review NFPA 820 for specific process.
(3) Special ventilation requirements for chemical spills (refer to applicable NFPA standards).
(4) Review Title 24 and ASHRAE Standard 62-1989 for requirements
(5) Follow Title 24, BOCA, ASHRAE, and local codes for requirements.
(6) Refer to Title 24 for ventilation rate if refrigeration machines are housed indoors
(7) More restrictive than WEF MOP No. 8, Table 7-6

(8) Intermittent when people are not present

6.6 Electrical

6.6.1 Existing Electrical Installation

The existing electrical installation comprises an onsite utility transformer, a main Service Switchboard rated at 3000amp, and a main circuit breaker rated at 3000AF/2400AT.

The switchboard was installed in the year 2000 with three spaces for future feeders, as shown in Figure 5.

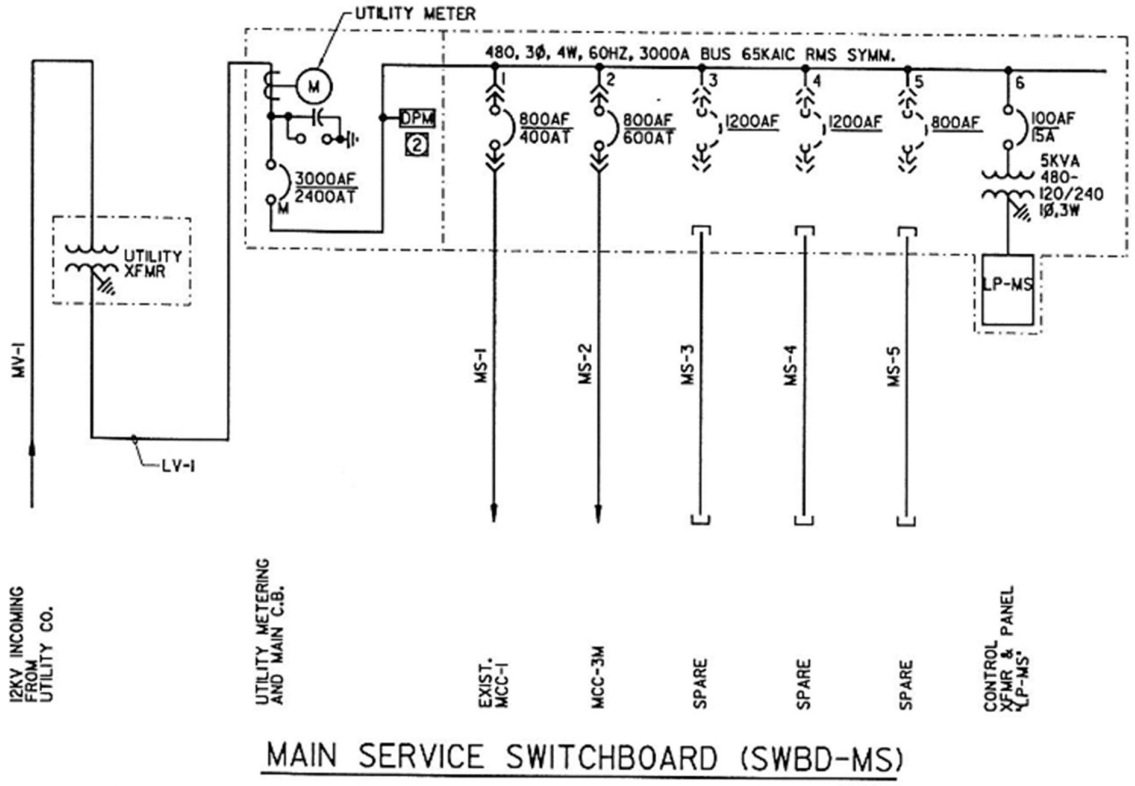


Figure 5 Existing switchboard

6.6.2 Electrical Scope of Work

The electrical scope of work for this Project is to provide electrical design for providing power to all the electrical equipment related to the expansion of Banning's Wastewater Treatment Plant, as shown on the Conceptual PFD (Attachment A).

- Installing new feeders at the existing service switchboard
- Installing new MCCs
- Installing new duct banks
- Providing site lighting and building lighting
- Providing power for new HVAC and ancillary loads

6.6.3 Preliminary of Electrical Installation Plan

The existing location of electrical equipment, the preliminary location of new electrical equipment, and the power plant are shown in Figure 6. All conceptual drawings are subject to change by the DBE.

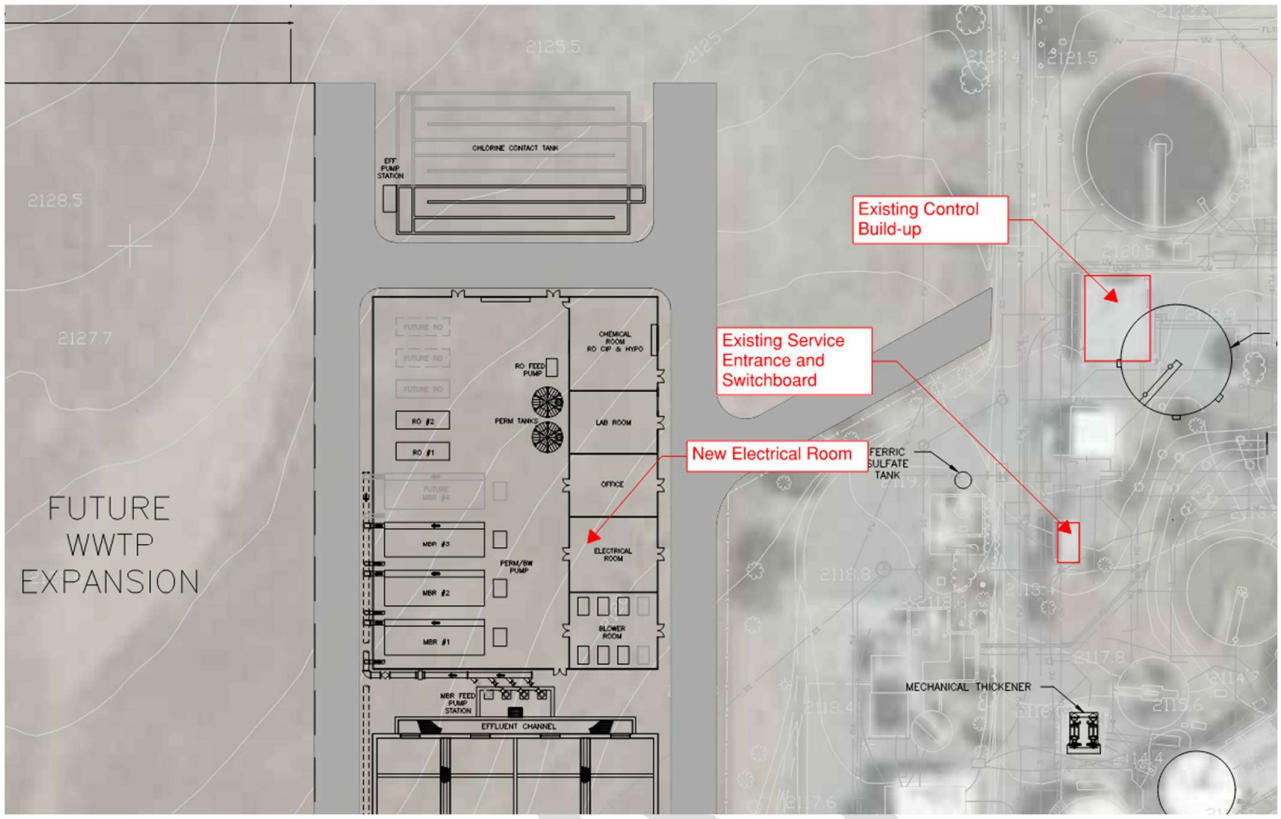

Figure 6 Layout of new electrical equipment

6.6.4 Estimated Load Calculation

Existing Load:

The existing connected load at the site is about 970 Amp, as shown in Figure 7.

	SOURCE	LOAD	VOLTAGE	KW	HP	A	DESCRIPTION
1	SWBD-MS	MS-1	480			503	
2	SWBD-MS	MS-2	480			467	
					TOTAL	**970**	

Figure 7 Existing connected load

However, if the demand load is less than this number, the meter reading or facility electrical bill should be checked.

New Load:

The estimated new loads list and calculated power demand are shown in Figure 8. This load is subject to change pending on the DBE's design.

DRAFT

Power Usage	Version	Date			Project Number			
	Number of Equipment				Installation			
Description	Duty	Standby	Voltage	VFD/ Softstarter	Duty Unit Power (HP)	Standby Unit Power (HP)	Total Duty Power Usage (HP)	Total Power Usage (HP)
Primary Clarifier Equipment								
Primary Clarifier Mechanism	1		480		1.5		1.5	1.5
Sludge Grinder	1		480		3.0		3.0	3.0
Primary Sludge Pumps	1		480		3.0		3.0	3.0
Primary Scum pumps	1		480		3.0		3.0	3.0
Equalization Basin								
Pump	2	1	480	VFD	100.0	100.0	200.0	300.0
Aeration Basin								
Fine Screen	2	1	480		2.5	2.5	5.0	7.5
Washer Compactor	2	1	480		2.5	5.0	5.0	10.0
MLR Pump	4		480	VFD	1.0		4.0	4.0
Mixed Liquor Pump	3	1	480	VFD	75.0	75.0	225.0	300.0
Anoxic Tank Large Bubble Mixing System	1	1	480	VFD	5.0	5.0	5.0	10.0
Aeration Blowers	3	1	480	VFD	100.0	100.0	300.0	400.0
Overall Gates	10		480	VFD	2.0		20.0	20.0
Membrane Tanks								
Scour Blowers	3	1	480	VFD	40.0	40.0	120.0	160.0
Motorized Valves - Aeration Blowers Pipes	20		480		1.5		30.0	30.0
Permeate/Backpulse Pump	4		480	VFD	25.0		100.0	100.0
WAS Pump	1	1	480	VFD	3.0	3.0	3.0	6.0
Chemical Pumps	4		480		3.0		12.0	12.0
Bridge Crane membrane	1		480		20.0		20.0	20.0
Effluent System								
RO Feed Pump, 1st stage	1	1	480	VFD	125.0	125.0	125.0	250.0
RO Feed Pump, 2nd stage	1	1	480	VFD	40.0	40.0	40.0	80.0
Evaporator	5		480		27.0		135.0	135.0

Sludge Facility						0.0		
RDTs	1	1	480	VFD	3.0	3.0	3.0	6.0
Sludge Mixing Pump	1	1	480	VFD	15.0	15.0	15.0	30.0
Totals							**1,397.50**	**1,921.00**

Figure 8 Estimated new Load list and calculated power

The additional demand load is about 1397 HP, which is about 1650 Amp. The new loading of the Main Switchboard is shown in Figure 9.

	SOURCE	LOAD	VOLTAGE	KW	HP	A	DESCRIPTION
1	SWBD-MS	MS-1	480			503	Existing
2	SWBD-MS	MS-2	480			467	Existing
3	SWBD-MS	MS-3	480			1640	New
4							
					TOTAL	**2610**	

Figure 9 New loading of the main switchboard

This is over the capacity of the existing main circuit breaker setting (2400A). However, the circuit breaker setting could be adjusted, and as mentioned above, it is expected that the running current of the existing load (Demand load) would be much less than what is shown in Figure 7, the existing connected load.

6.6.5 General Electrical Requirements

The following tables contain the Engineering Design Guidelines for Electrical criteria. The DBE is responsible to review and finalize these requirements for complete functioning facilities.

6.6.5.1 Electrical Supply and Distribution

Table 59 Power Supply to Site

Item	Parameter	Criteria	Notes
1	Load Estimate	Determine anticipated loads.	

Item	Parameter	Criteria	Notes
2	Supply Voltage	480 Volt, 3 phase, 4 wire	
3	Scope	Evaluate the total running load of the WWTP. Verify if the existing transformer and switchboard have enough capacity to run the new and existing loads. If required, provide additional transformer and switchboard capacity to run the new and existing loads. Coordinate with SCE for replacing existing Transformer if required.	Provide 20% spare transformer nameplate rated capacity, if additional transformer is needed.

Table 60 Arc Flash

Item	Parameter	Criteria	Notes
1	Arc Flash Study	Evaluate if Arc Flash Study is required by code. If required by code, coordinate Short Circuit, Arc Flash, and Harmonic Studies to be performed using ETAP Software.	
2	Arc Flash Labels	If Arc Flash Study is required by code, provide Arc Flash Labels for all affected equipment based on Arc Flash Study results.	

6.6.5.2 Technical Requirements

Table 61 Lightning Protection & Grounding

Item	Parameter	Criteria	Notes
1	Lightning Protection	DBE shall perform risk assessment in accordance with NFPA 780 to determine requirements.	
2	Grounding	Ground grid shall consist of embedded concrete rebar in the new building and pump station slabs, connected to grounding rods.	

Table 62 Switchgear

Item	Parameter	Criteria	Notes
1	Material/Enclosure	Heavy gauge steel with NEMA 1 or NEMA 3R ratings as required.	
2	Preferred Manufacturers	Allen Bradley.	No equal.
3	Communications	Main circuit breakers will include relays which can communicate via Ethernet to SCADA.	
4	Remote Operation	Remote racking and un-racking of main incoming breakers to avoid arc flash incidents.	
5	Circuit Breakers	Separately mounted construction; insulated case circuit breakers.	
		Units shall include solid state trip units with ground fault protection for all breakers larger than 400 Amperes.	
6	Bus Bars	Tin- or silver-plated copper bus bars.	
7	Access	Front and rear access to each cubicle as required.	
8	Power Monitoring	Power monitoring of voltage (over/under), phase imbalance, ground, kilowatts, and kilowatt/hours.	
		Power monitor connected via communications network.	
		Instantaneous Power shall be available for trending in SCADA.	
		Total kilowatt/hours shall be available in SCADA.	
9	Bus Bracing	Bus bracing will be a minimum of 65kAIC or as	

Item	Parameter	Criteria	Notes
		determined by power study.	

Table 63 Motor Control Centers (MCCs)

Item	Parameter	Criteria	Notes
1	Materials/Enclosure	Heavy gauge steel with NEMA 1 or NEMA 3R ratings as required.	
2	Preferred Manufacturers	Preference shall be for equipment that is consistent with the PLC vendor such that communications between the intelligent motor starters and the PLC can be seamlessly integrated.	Refer to SCADA Design Deliverables
3	Ratings	NEMA (not IEC) rated relays and starters.	
4	Intelligent MCC	Provide intelligent MCC consisting of intelligent motor starters and networked components for simplified installation and improved diagnostics.	
		Intelligent motor starters include integrated current or power monitoring, overload relays and programmable protection functions and diagnostics (trip history, trip status, time since last trip, etc.), which are all accessible via an integrated communications interface.	
5	Wiring	Communications and power wiring shall be separated from one another.	Include conduit for future plant expansion (i.e., future Trident Units and Influent/ Effluent Pumps)
		Provide non-metallic duct where communication cables are exposed to other wiring systems (i.e., Innerduct, Smurf tube, Schedule 40 PVC)	
6	Communication	Starters shall include the ability to communicate with the SCADA system via Ethernet, or field bus nominated for instrument networking.	Consider Fiber Optic Cable where appropriate.
7	Reduced Voltage Starters	Reduced voltage starters shall be solid-state type.	
8	Power Monitoring	Power monitoring of each MCC voltage (over/under), phase imbalance, ground, kilowatts, and kilowatt/hours.	
		Power monitor connected via communications network.	
		Instantaneous Power shall be available for trending in SCADA.	
		Total kilowatt/hours shall be available in SCADA.	
9	Bus Bars	Tin- or silver-plated copper bus bars.	
10	Bus Bracing	Bus bracing will be a minimum of 65KAIC or as determined by the power study.	

Table 64 Variable Frequency Drives (VFDs)

Item	Parameter	Criteria	Notes
1	Location	Install in MCC lineup (not standalone)	Except GAC pumps.
2	Preferred Manufacturers	Toshiba P9	Preference shall be for equipment that is consistent with the PLC vendor such that communications between the equipment can be seamlessly integrated.
3	Type	Pulse-Width-Modulated (PWM).	

Item	Parameter	Criteria	Notes
		6-pulse VFDs for low voltage (600V) motors less than 100 HP.	
		18-pulse VFDs for low voltage (600V) motors 100 HP or higher.	
4	Bus Bracing	Minimum of 65kA for low voltage (LV) VFDs.	
5	Control Power	120V internal or external control power transformers.	
6	Communications	Integral communication to central SCADA system via Ethernet/IP.	
7	Protection Functions	Temperature and vibration module for motor protection.	
8	Cable	Cable between VFD and the motor shall be VFD cable which is specifically designed to reduce noise and cross-talk in VFD applications.	
9	Filters	Input filter requirements shall be specified as necessary to reduce harmonics on the system to the limits nominated in IEEE 519.	
		Output filter requirements shall be specified as necessary to address noise, crosstalk, motor dV/dt and insulation requirements (NEMA MG 1-31-40.4.2), etc.	
		Additional output filters may need to be considered for long motor cable lengths.	

Table 65 Motors

Item	Parameter	Criteria	Notes
1	Cooling	Totally enclosed fan cooled (TEFC).	
2	Preferred Manufacturers	US Motors	
3	Service Factor	1.15	
4	Efficiency	Super or premium efficiency ratings.	
5	Thermal Protection (Motors > 500 HP)	PT100 RTDs, two per phase, separately brought out.	
6	Thermal Protection (Conventional Motors ≤ 500 HP, > 15 HP)	Embedded PTC 1000 Thermistors	
7	Thermal Protection (Submersible > 30 HP or any VFD motors)	Embedded PTC 1000 Thermistors	
8	Vibration monitoring	Vibration monitoring required on air blower motors or other motors determined to be critical/high-cost assets.	
9	Inverter Duty	VFD driven motors shall be designed to operate within the speed range required without overheating and shall have insulation suitable for inverter duty.	
10	Jam Protection	For motors driving loads prone to jamming provide electronic shear pin protection.	
11	Starting	Soft starter or VFD rated duty for all motors 60HP and larger.	

Table 66 Transformers

Item	Parameter	Criteria	Notes
1	Non-Linear Loads	"K" rated units for anticipated low voltage non-linear loads (e.g., solid state ballasts, Uninterruptible Power Supplies [UPS], etc.).	

Table 67 Uninterruptible Power Supply (UPS)

Item	Parameter	Criteria	Notes
1	General	Provide UPS at all PLC locations and network switch locations	
2	Communication	Ethernet I/P.	
		It shall be able to communicate to SCADA the condition and the condition of the system power input.	
3	Maintenance Bypass	UPSs shall be provided with maintenance bypass switches for service during operation.	
4	Power Conditioning	The UPS shall also provide power conditioning for sensitive control equipment and instruments.	
5	Backup Time	2 hours (min)	

Table 68 Interior Lighting

Item	Parameter	Criteria	Notes
1	Type	LED	
2	Compliance/ Controls	Comply with California Title 24 energy conservation regulations, including occupancy sensing and daylight controls.	
		Applicable ADA requirements for emergency exit lighting	
		Additional security requirements outlined below.	
3	Corrosive Areas	Sealed fixtures in process areas where corrosion may be a problem	
4	Emergency Lighting	Incorporate emergency battery backup lighting fixtures for life safety and ingress/egress during power outages.	
5	Lighting	Provide adequate lighting for routine O&M activities.	

Table 69 Exterior Lighting

Item	Parameter	Criteria	Notes
1	Type	LED	
2	Controls/ Compliance	Comply with California Title 24 energy conservation regulations.	
		Comply with International Dark Sky Association requirements.	
		Generally, control shall be via photocell and time clock with manual override.	
		Applicable ADA requirements for access and egress lighting	
		Additional security requirements outlined below.	
3	Requirement	Switch-on lights shall be provided under each canopy to work on the major process equipment.	
		Exterior fixtures to provide a lighting level suitable for process area maintenance, safety and security.	

Table 70 Conduit

Item	Parameter	Criteria	Notes
1	General Use	Galvanized rigid steel (GRS)	
2	Duct Bank	Non-metallic PVC.	
		Concrete encased with reinforcing steel.	
		Incorporate 20 percent spare conduits dedicated for use with this phase of installation.	
		Allow conduit for future expansion	
3	Future Expansion	Provide all required underground conduit for future expansion (e.g., Trident Units, Influent/Effluent Pumps)	

Table 71 Conductors

Item	Parameter	Criteria	Notes
1	Material	Copper.	
		Aluminium conductors not acceptable.	
2	Conductor Type (Power)	Low voltage (600 Volt), type THHN or XHHW	
3	Signal Wiring	Twisted Shielded Pairs.	
		300 V will be acceptable except where 600 V is required per NEC.	
4	Network Cabling	Cat 5E	

Table 72 Harmonic Filter

Item	Parameter	Criteria	Notes
1	Requirement	Mitigate electrical harmonics generated from solid state/non-linear devices such as UPS, computer power supplies, solid state lighting ballasts, and VFDs.	
2	Harmonic Limits	Institute of Electrical and Electronics Engineers (IEEE) Standard 519 for general systems.	

Table 73 Receptacles and Ancillary Equipment

Item	Parameter	Criteria	Notes
1	Location	Dual 120V receptacles shall be installed with suitable spacing to provide access to power within 100 ft of any location of any new above ground facility, and at any major equipment locations or control panels.	
		3 phase, 480 V welding outlets shall be installed at major equipment locations.	
		Location and type of receptacles within the Office/SCADA/Lab shall be per the California Building Code, Title 24, and NEC requirements.	
2	Type	Receptacles in main plant area (exposed to wash-down etc.) or outdoors shall be UL listed weatherproof, industrial type.	
3	Disconnect for Chemical Dosing, Metering and Sump Pumps	A control and power quick-disconnect plug and receptacle shall be provided for chemical dosing and metering pumps and sump pumps.	Allows for ease of replacement and relocation without the need for an electrician.
		The receptacle and plug must have an IP68 rating with the attachment plug cap inserted or removed.	

Table 74 Backup Generator

Item	Parameter	Criteria	Notes
1	Manufacturers	Caterpillar	No equal
		Generator shall be on the SCAQMD list of approved generators	
2	Protection	Engine shutdown on high water temperature, low oil pressure, overspeed, and engine overcrank.	
		Limits as selected by manufacturer.	
3	Controls	Local control panel with MANUAL-OFF-REMOTE selector switch on engine- generator control panel.	
4	Accessories	Fuel pressure gage, water temperature gage, lube oil pressure gage on engine/generator control panel.	
5	Enclosure	NEMA MG1, Open, Drip Proof.	
6	Fuel Storage	Mount on skid base with integral fuel storage.	
		Double wall fuel tank.	
		48 hours storage for full load operation.	
7	Alternator	Line to Neutral Voltage THD ≤ 5 %	
		Line to Natural Individual Harmonic THvD: ≤ 3%	
		3rd Harmonics: practically zero	
		Subtransient Reactance: ≤ 12%	
8	Voltage Regulator	Volts/Hertz exciter-regulator: to match engine and generator characteristics.	
		Voltage regulation: plus or minus 1% from no load to full load.	
		Manual controls: ability to adjust voltage droop, voltage level (plus or minus 5%) and voltage gain via control panel.	
9	Governor	Electronic governor to maintain engine speed within 0.5%, steady state, and 5%, no load to full load, with recovery to steady state within 2 seconds following sudden load changes. Equip governor with means for manual operation and adjustment.	
10	Load Bank	Required for standby generator sets where the full load is not available for regular maintenance testing or start-up services.	If load banks are to be hired for testing instead of permanently installed, design shall include suitable facility for connecting temporary load bank
11	Communications	Ethernet	
		Acceptable Protocols: Industrial IP, Modbus TCP	
12	Signals	Hard-wired signals (form c, dry contacts): Fault, Running, Available (Remote & not faulted), Battery Low.	All signals shall go back to SCADA – fail/run/error, etc. Signal for the fuel indicator at the generator

Item	Parameter	Criteria	Notes
13	Local Alarm and Status Monitoring	Low oil pressure (alarm & shutdown) Oil pressure sender failure (alarm) Low coolant temperature (alarm) High coolant temperature (alarm & shutdown). Engine temperature sender failure (alarm). Low coolant level (alarm or shutdown selectable) Fail to crank (shutdown). Fail to start/overcrank (shutdown) Overspeed (shutdown) Low/high DC voltage (alarms) Weak battery (alarm). Low fuel day tank (alarm) Low/high AC voltage (shutdowns) Under frequency (shutdown). Over current (alarm & shutdown) Short circuit (shutdown). Ground fault (alarm) Overload (alarm). Emergency stop (shutdown) Engine oil pressure (psi or kPA) Engine coolant temperature (degrees F or C) Engine oil temperature (degrees F or C) Engine speed (rpm) Number of hours of operation (hours) Number of start attempts Battery voltage (DC volts)	

Table 75 Automatic Transfer Switch (ATS)

Item	Parameter	Criteria	Notes
1	Manufacturers	Eaton	No equal.
2	Description	NEMA ICS 10.	Provide two options: • Close-Transition • Open-Transition For client selection
		Suitable for use in standby systems in NFPA 70.	
		Conform to NFPA 110.	
		Manual operation conforms to UL 1008 Safe operation under full load conditions.	
3	Configuration	Electrically operated.	
		Mechanically held in both operating positions.	
4	Rating	Continuous duty.	
		Three (3) poles with solid neutral.	
5	Interrupting Capacity	100% continuous rating.	
6	Withstand Current Rating	14,000 RMS symmetrical amperes when used with molded case circuit breaker.	
		Non-welding contact when used upstream feeder overcurrent device available fault current specified.	
7	Service Conditions	NEMA ICS10	
		Temperature: -40 to +50 degrees C Relative	
		Humidity: up to 95%	
8	Enclosure	Open switch in electrical equipment cabinet.	
		Visible main transfer switch.	
		Indicating lights: Normal Source, alternate Source, connected to normal and connected to emergency are accepted.	
9	Enclosure Auxiliary Contacts	Rated no ≤ 10 amps at 120 volts, 60 Hz Loss of Utility Power.	
		Preferred Source Active.	

Item	Parameter	Criteria	Notes
		Alternate Source Active.	
10	Preferred Source Monitor	Monitor normal source voltage and frequency.	
		Initiate transfer when voltage drops below 85% or frequency varies more than 3% from rated nominal value.	
11	Alternate Source Monitor	Monitor alternate source voltage and frequency.	
		Inhibit transfer when voltage is below 85% or frequency varies more than 3% from rated nominal value.	
12	In-Phase Monitor	Inhibit transfer until source.	
		Load is within 10 electrical degrees.	
13	Sequence of Operation	Initiate Time Delay to Start Alternate Source Engine Generator: Upon initiation by normal source monitor. Time Delay to Start Alternate Source Engine Generator: 0 to 30 seconds, adjustable and factory set at 30 seconds. Initiate Transfer Load to Alternate Source: Upon initiation by normal source monitor and permission by alternate source monitor. Time Delay before Transfer to Alternate Power Source: 0 to 300 seconds, adjustable, and factory set at 3 seconds.	
		Initiate Retransfer Load to Normal Source: Upon permission by normal source monitor. Time Delay before Transfer to Normal Power: 0 to 30 minutes, adjustable; and factory set at 5 minutes. Time delay shall be automatically defeated in the event of alternate source failure, provide normal source is available. Time Delay before Engine Shutdown: 0 to 30 minutes, adjustable, of unloaded operation factory set at 10 minutes.	
14	Engine Exerciser	Generator exerciser timer User programmable run times selectable between load transfer and engine run only fail-safe feature that will retransfer the switch to preferred source during exercise period.	
		Bypass exerciser control when normal source fails during exercising.	
15	Alternate System Exerciser	Transfer load to alternate source during engine exercising period.	
16	Startup and Testing	ATS and Generator testing shall be performed to demonstrate functionality and operation of new and existing equipment in an emergency.	If Startup and Testing is performed prior to installation of all equipment, then Startup and Testing shall be repeated after all equipment have been installed. Performance of backup generator shall be demonstrated continuously for 48 hours.
		Local and Remote testing shall be performed at full load.	

6.7 Instrumentation and Controls

6.7.1 Process Control Narrative

Process controls will be set up according to industry standards and be connected to the new SCADA system. Controls should allow automatic operation to the industry standard and the extent possible. The following section summarizes a conceptual process control narrative for DBE consideration.

Aeration control will allow dissolved oxygen (DO) concentration control in each aerated zone and swing zone. DO setpoints will be operator adjustable and operators will be able to schedule DO concentrations in 30-minute intervals for a diurnal or weekly schedule. The control system will be able to maintain DO setpoints at concentrations as low as 0.2 mg/L and as high as 2.5 mg/L. The DO control system would use cascade control with airflow control for the primary loop and DO control for the secondary loop. Blower control will be based on pressure control, including the option of operating in most-open-valve mode. Minimum airflows to each zone will be operator adjustable and initially set to an airflow equivalent to 0.1 scfm/sf or the minimum airflow required to meet the minimum diffuser airflow as recommended by the diffuser supplier, whichever is higher. Blower controls will include protections against blower damage due to low airflow and overpressure.

If needed, blower controls can also be based on flow or ammonia control in addition to DO and pressure control.

MLR pumps will include VFDs which will be set up to operate at an operator adjustable ratio to the primary effluent equalization pumps divided by the number of Aeration Basins in service, i.e. the feed flow to the aeration basins, per basin. The ratio will be adjustable between 2.0 and 5.0.

Solids retention time (SRT) is the most important parameter to be controlled at any activated sludge plant, including MBR plants. Ideally, SRT control should be set up to achieve a steady waste activated sludge (WAS) flow rate that is only adjusted when either the SRT setpoint changes (which may be done seasonally) or when a train or a basin is taken out of service. t is possible to achieve this condition when the return activated sludge (RAS) ratio (RAS flow/Influent flow, where influent flow to the MBR system is the flow provided by the equalization pumps) is maintained at a constant value. At the WWTP, the RAS ratio will be controlled by the ratio between the flow provided by the mixed liquor transfer pumps, transferring mixed liquor from the aeration basins to the membrane tanks. The target for this flow ratio will be 5.0, meaning the RAS ratio will be 4.0. The required WAS mass flow is equal to the biomass inventory divided by the target SRT. In the MBR system, the MLSS concentration in the aeration basin can be calculated as a fraction of the MLSS concentration in the membrane tank, where the fraction is 80% (= R/[R + 1]) when the typical RAS ratio of 4.0 is used. The solids inventory is the sum of the solids inventory in the aeration basins and the membrane tanks. If the WAS is taken from the RAS stream, which has a slightly higher MLSS concentration, the WAS flow is:

$Q_{WAS} = (0.8.V_{AB} + V_{MT})/SRT$

Where Q_{WAS} = WAS flow rate, gpd
V_{AB} = Volume of the aeration basin in service, gal
V_{MT} = Volume of the membrane tank in service, gal
SRT = Target SRT, days

If the ML pumps cannot maintain the target RAS ratio of 4.0 for any reason, the 0.8 factor in the equation can be adjusted as required.

Using a stable WAS flow would help the MBR system to produce a consistent effluent quality and maintain the biomass at a stable point for optimal performance.

To minimize the accumulation of scum in the system, the WAS should be drawn from the surface of the RAS channel once scum would have had a chance to float, so that scum is wasted preferentially and the so-called scum SRT is less than the system SRT. This approach is also described as a classifying selector by some consultants.

6.7.2 Level of Automation

The Project shall include a high level of automation. The plant operators will manually initiate the wastewater treatment plant's start-up from the Project's control system. After operator initiation, the control system will manage the plant startup sequences, normal operation, and shutdown sequence fully automatically.

Every skid will have its own PLC control system and Human Machine Interface (HMI) and shall be Supervisory Control and Data Acquisition system (SCADA) transparent, i.e., seamlessly integrated into the site SCADA system.

Plant operations will be monitored and controlled via a local operator station using an owner- and engineer-approved SCADA Platform. A development workstation will have the PLC programming software installed, as well as the SCADA platform Integrated Development Environment (IDE) to develop and maintain the project Human Machine Interfaces (HMIs).

Plant monitoring and control will be predominantly carried out from the Central Control Room on Operator Workstations located in the plant administration building. Further control will be available through HMIs located at critical areas of the plant, locations to be confirmed during project design.

The design will enable remote off-site access for operator monitoring, technician diagnostics, and control modifications under agreed security measures. If requested, allowance will be made for the transfer of historical data from the local historian to a central monitoring location.

The capability will be provided to connect laptop HMI units through a local secure, encrypted wireless network throughout the site to facilitate commissioning and maintenance activities over the life of the plant.

6.7.3 Plant Control Architecture

The following section summarizes a conceptual plant control architectural plan for DBE consideration.

The Plant LAN will be a secure Control Center Network within a single control area. The upper-level supervisory control network connects Control Center servers, application servers, and HMIs over Ethernet. The control servers and application object servers are installed in a server rack, and each is configured in redundant pairs with secondary network interfaces. The servers host the Wonderware System Platform. The owner and engineer shall approve the number of HMI workstations to be provided for operators and supervisors and at the security gate for monitoring and control.

Supplied Architecture shall:

- Be scalable, as shown in Figure 10.
- Be flexible from a connectivity standpoint, as shown in Figure 11.
- Employ virtualization, as shown in Figure 11.
- Provide redundancy at the control and supervisory levels, as shown in Figure 13.

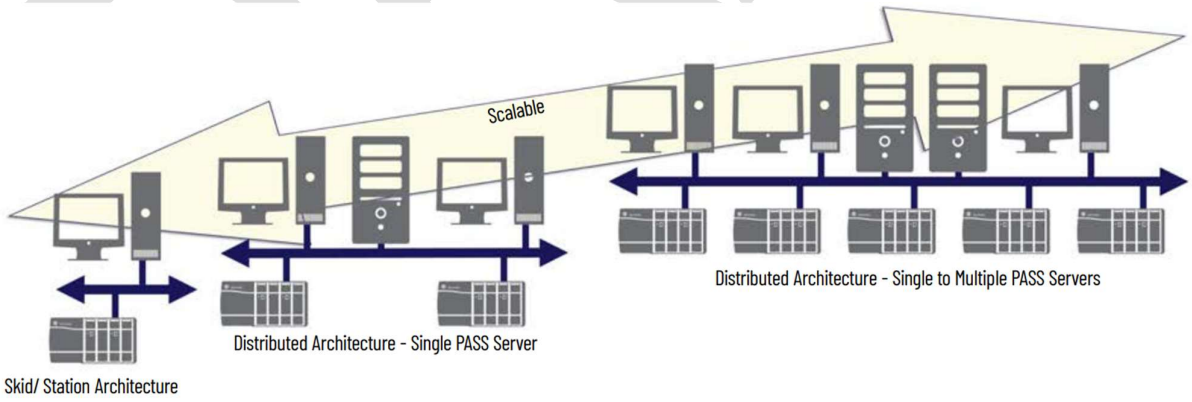

Figure 10 An example of a scalable plant architecture

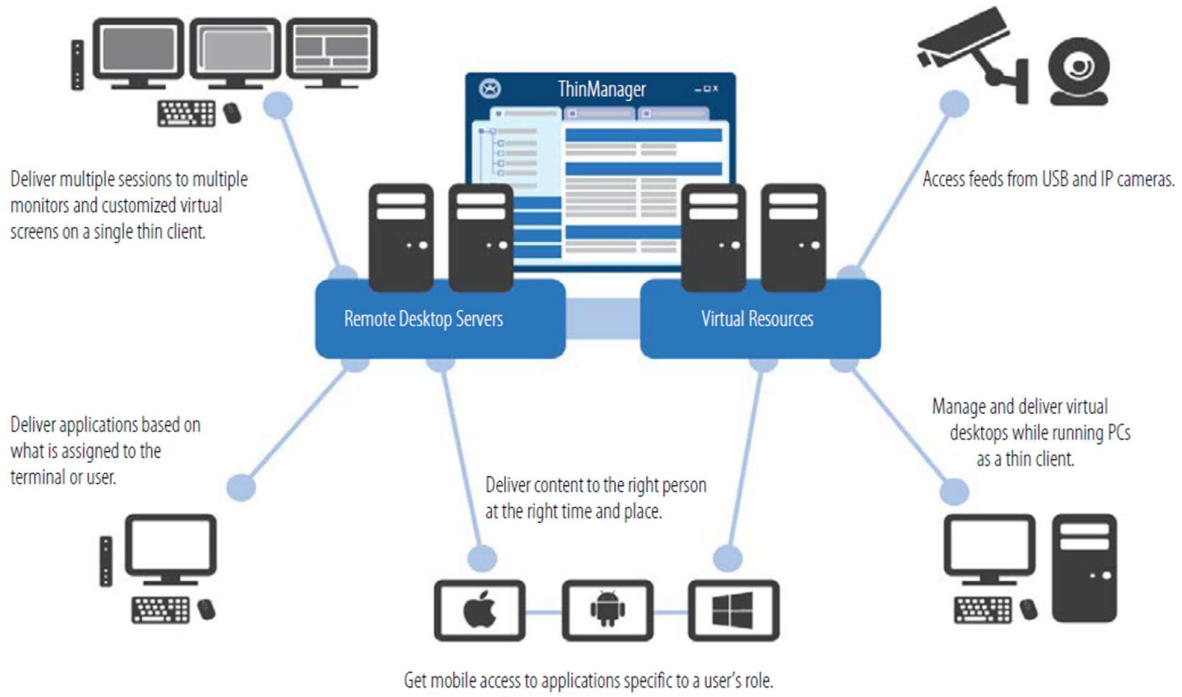

Figure 11 The solution shall have the flexibility of connectivity and manageability using thin clients.

Table 76 SCADA system elements descriptions

System Element	Description
Process Automation System Server (PASS)	The PASS is a required system element that can host displays, alarms, and data connections to controllers. Multiple PASS servers can be used to provide additional system capacity or to create logical segregation of application content that is based on the process. For smaller systems, the PASS - C (consolidated PASS server) supports functions that otherwise would be hosted on application servers.
Operator workstation (OWS) and Application server (AppServ-OWS)	The OWS and AppServ-OWS provides an interactive graphical interface to monitor and control the process. The AppServ-OWS uses Microsoft® Remote Desktop Services (RDS) technology to serve multiple instances of the OWS as thin clients from one server. The technology provides for FactoryTalk® View SE thin clients that run applications and process data on a remote computer.
Engineering workstation (EWS) and Application server (AppServ-EWS)	The EWS and AppServ-EWS provide a central location for configuring the system and monitoring/maintaining system operation. The AppServ-EWS uses Microsoft Remote Desktop Services (RDS) technology to serve multiple instances of the EWS as thin clients from one server. The technology provides for SCADA HMI thin clients that run applications and process data on a remote computer.
AppServ-Asset management	The asset management server is a centralized tool for managing automation-related asset information (Rockwell Automation and third-party assets). The asset management application server includes capabilities for asset inventory, source control, audits, change notifications, reporting, and security.
AppServ-Info	Data management storage can include a Historian or Microsoft SQL server.
Controllers/PLCs	The Programmable Logic Controllers (PLCs) support continuous process and batch applications. These controllers also support discrete and motion applications.

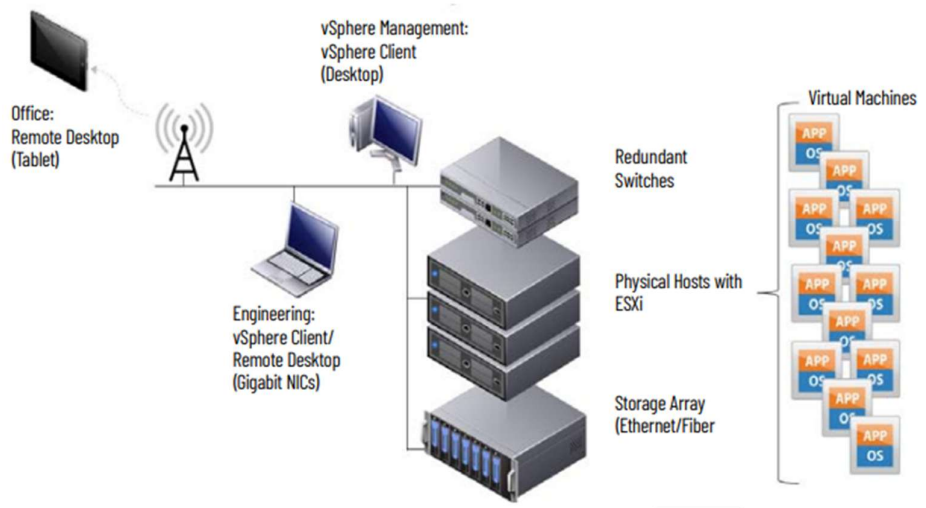

Figure 12 Architecture elements virtualization

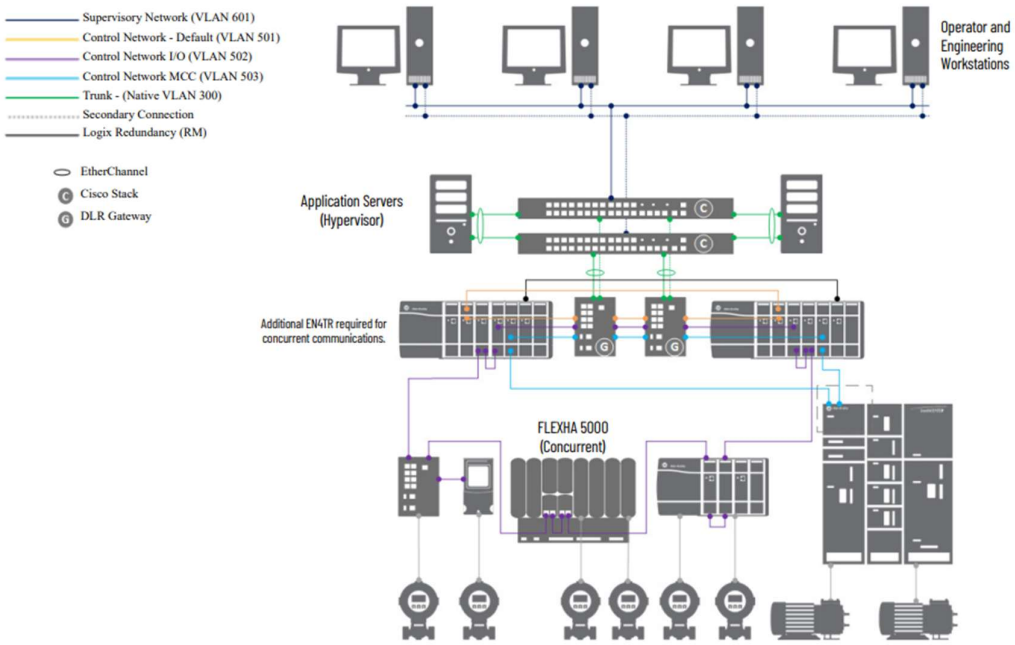

Figure 13 Typical resilient DLR topology

The lower-level process control network connects the servers to the PLCs over Ethernet. The PLCs communicate via approved Ethernet protocols with compatible actuators, motors, instruments, analyzers, and other control elements at the field level. Approved Ethernet-based protocols are Ethernet/IP, Modbus/TCP, or other Engineer-approved protocols.

Secure wireless access points will connect operators' mobile tablets to access HMI and SCADA systems.

6.7.4 Motor Control Centers (MCCs)

Smart MCCs shall be used throughout the project. All MCCs will be connected to PLCs; all motors are controlled in Local (hand)/Remote (Auto) modes with proper signaling and indication for all normal and alarm conditions locally and remotely. Local PLCs control the operation of motors and provide data for the SCADA system. PLCs and VFDs will be securely connected to the network.

6.7.5 Instrumentation and Field Devices

The following equipment shall be standardized to reduce the inventory of spares and minimize the time for replacement:

- Instruments
- Installation Materials
- Tube and Tube Fittings
- Manifolds

6.7.5.1 Instrument Specific Requirements

Local Control Panels-Local control switches and indicators shall be used where required to address specific safety or maintenance concerns. Otherwise, all manual control will be available via SCADA only (locally via wireless tablets).

6.7.5.2 Instrument Mounting and Access

- All process instruments in wet areas will be housed in IP68, NEMA 4 enclosures (NEMA4x in chemical areas), or vendor requirements, whichever is more stringent.
- Access will be considered in the selection of instrumentation.
- Instruments will be mounted at a working level between three and five feet above the operating floor.
- Process indicators and indicating transmitters will be mounted in a position that is readable by an operator without requiring the use of a ladder or the building of platforms.
- Temperature sensors will be installed and clamped in tube racks. The excess capillary tube will be coiled and clamped to the mounting stand below the instrument.
- Instruments located near each other will be grouped to the maximum extent possible on a common mounting stand, wall bracket, or instrument rack.
- Instrument impulse lines will incorporate a blowdown leg or contamination accumulation leg for the removal of dirt and moisture.
- Instrumentation taps to process lines will be isolated by a root valve at the connection.
- Isolation valves for taps to process lines will be ¼-turn ball valves of materials compatible with the process fluid.
- Isolation valves for chemical service will match isolation valves used in other portions of that chemical piping.
- Analyzers for primary process lines will be installed in bypass assemblies external to the main process headers to allow routine maintenance.
- Analyzer assemblies will include an isolation valve at each process connection tap, pressure regulator, and manual sample valve, rotameter flow element with integral flow metering valve, check valve, miscellaneous piping, and fittings.
- Analyzers will be generally panel mounted and located in close proximity to the relevant sample point in a designated analyzer room (where possible) for improved access to common operational and maintenance activities on these units.
- The analyzer waste streams will be discharged into and drained to a common collection point for either pumped return to a specified point along the process or drained to waste.
- All analyzers will have “no flow" detection and pressure and flow control valves on the inlet to ensure a constant rate of feed through the analyzer.

DRAFT

- Manual sample points will be provided for sampling water at various points throughout the main process, typically with each change in process unit and upstream and downstream of chemical dosage points for manual checks of water quality and chemistry.
- Assemblies for analyzer sensors that must remain wetted at all times (e.g., pH sensors) will incorporate a vacuum breaker in the drain piping.
- Sample drain will be routed to a hub drain.

6.7.6 Controllers and Input/Output (I/O) Modules

- Programmable Logic Controllers (PLCs) to be Allen-Bradley, Siemens, or Modicon PLCs in that order of preference.
- Current Versions - Each PLC CPU, I/O module, specialty module, and communication module will be the latest version, supported by the manufacturer for the life of the system.
- Programming Software, PLC, and SCADA IDEs shall use object-oriented programming based on function blocks for all typical equipment and functions in accordance with IEC- 61131-3.
- All CPUs will be equipped with non-volatile memory cards to preserve programs.
- Installed I/O capacity will include 25% spare I/O points. PLC rack power supplies will have the capacity to support at least 25% I/O expansion. The above requirements should also apply to vendor-supplied PLCs.
- I/O Modules Discrete input modules will be 24VDC only. Discrete output modules will be used to trigger interposing relays (unless an isolated output module is used.)
- Analog modules will be 4-20 mA 24VDC isolated input and output channel design. Analog input isolators will be used. All analog inputs will be scaled to specified engineering units at the PLC programming level. High and low alarm trip points will be provided at 90% and 10% of the span for all analog points unless otherwise specified in P&ID and on IO lists. All analog signals exiting the buildings to or from devices or instruments will have transient voltage surge suppression (TVSS).
- RTD modules will be used for RTD inputs.

6.7.6.1 Spare Hardware

20% spares for I/O modules, CPUs, backplanes, and power supplies in addition to any other OEM recommended hardware.

6.7.6.2 Backups

A flexible backup system shall be implemented into the proposed system. Backup copies will be collected at minimum every six months of the transitional operation period.

6.7.7 General Instrumentation and Controls Requirements

The following tables contain the Engineering Design Guidelines for I&C criteria. The DBE is responsible to review and finalize these requirements for complete functioning facilities.

6.7.7.1 Instrumentation and Field Devices

Table 77 General

Item	Parameter	Criteria	Notes
1	Standardization	Standardize on the following equipment throughout the Project to reduce spare supply inventories and minimize rework time for replacement: • Instruments • Installation materials	

DRAFT

Item	Parameter	Criteria	Notes
		• Tube and tube fittings • Manifolds Variations from this requirement shall only be allowed by specific approval of City of Banning. Manufacturer or DBE preference shall not be justification for failure to comply with this requirement. Only sound, engineering supported justifications will be considered.	
2	Communications	Field bus to be nominated by the DBE to suit PLC.	
3	Grounding and Bonding	In accordance with manufacturer's requirements and as specified elsewhere.	
4	Control System Integrator	Control System Integrators Association (CSIA) Certified Integrator; OR Ignition Certified System Integrator; OR demonstrate similar recent experience using the same PLC hardware, SCADA software and networked instruments and MCCs	
5	Duplicate Instruments for Different Purposes	As a general rule, measuring points and measuring equipment for interlocking and protection purposes shall be separate and not combined with measuring equipment for monitoring or automatic control equipment.	
		For flow measurement one common primary element can be used. Signals to be processed in several systems shall be suitably repeated and mutually decoupled to avoid interaction.	
6	Location	All instrument materials and construction shall be suitable for the location in which they are installed. Consider wet, corrosive, and hazardous areas in the selection of instrumentation.	

6.7.7.2 Instrument Specific Requirements

Table 78 General

Item	Parameter	Criteria	Application
1	Level - Radar	Manufacturer: Endress & Hauser, or equal. Measurement Range: 0 % through 100 % level. Measurement Resolution: 0.1 inch or less. Measurement Accuracy: +/- 0.25 % of measured distance for distances greater than 3.3 feet.	Consider where foaming may be an issue (in cases where ultrasonic LT may not be suitable).
2	Level - Ultrasonic	Manufacturer: Endress & Hauser, or equal Measurement Range: 0 % through 100 % level. Measurement Resolution: 0.1 inch or less. Measurement Accuracy: +/- 0.25 % of measured distance for distances greater than 3.3 feet.	Non-contact level monitoring.
3	Level - Pressure	Manufacturers: Endress & Hauser, or equal. Measurement Accuracy: +/- 0.1 % of range.	Where non-contact level monitoring is not required and ease of access to the transmitter is desired (e.g. water tanks).
4	Level - Submersible Hydrostatic	Manufacturers: Endress & Hauser, or equal. Measurement Accuracy: +/- 0.25 %	Covered basins.
5	Level - Conductivity Probe	Manufacturers: Warrick, or equal.	
6	Level - Float Switch	Manufacturers: Magnetrol, Kari, Flygt, equal.	Level alarm detection.

Item	Parameter	Criteria	Application
		Mercury shall not be acceptable in float switch devices.	Not used for primary process control applications.
7	Pressure - Absolute (Diaphragm Type)	Manufacturers: Endress & Hauser, or equal Accuracy: +/- 0.1 % of range Chemical Installation: Isolation Diaphragm Seal Calibration/Testing: 3-way valve manifold for calibration/testing and tapping point for pressure gauge.	Pipe pressure, pump discharge/suction, general process pressure.
8	Pressure - Differential	Manufacturers: Endress & Hauser, equal Accuracy: +/- 0.1 % of range Chemical Installation: Isolation Diaphragm Seal 3-way valve manifold for calibration/testing and tapping point for pressure gauge.	Pressure drop across filters, etc.
9	Pressure - Switch	Manufacturers: Ashcroft or similar approved	
10	Flow - Electromagnetic (Full pipe)	Manufacturers: Endress & Hauser, No equal Installation: Vault or above ground. Shall not be directly buried. Maintenance: Provide maintenance bypass for critical applications where a bypass or standby does not exist. Accuracy: Max 1 % of measured, for flow velocities between 10 % and 100 % of full scale. Grounding: Grounding rings or protective shield when installed in non-conductive pipe. Repeatability: Max 0.25 % of full scale.	All primary and secondary process flows. DBE shall provide engineering justification for any alternative proposed.
11	Flow - Open Channel	Manufacturers: Endress & Hauser, no equal Accuracy: Product shall be chosen for maximum accuracy based on the dimensions and flow pattern of the channel.	
12	Flow- Air	Manufacturers: FCI Insertion, or similar approved	
13	Flow - Liquid Switch	Manufacturers (thermal flow switch): Dwyer, IFM, or similar approved	Pump no flow, sample line no flow, etc.
14	Flow - Air Switch	Manufacturers: FCI, or similar approved	Ventilation/Extraction fan no flow, etc.
15	Limit - Switch	Manufacturer: Square D, Class 9007 Type C, or similar approved	
16	Temperature - Transmitter	Manufacturer: Endress & Hauser, or equal	Process temperature
17	Temperature - Switch	Manufacturer: Ashcroft, Allen Bradley, or similar approved.	
18	Vibration - Transmitter	Manufacturer: Bently Nevada, or similar approved.	Vibration monitoring for large pumps, motors, blowers, etc.
19	Residual Chlorine Analyzer	Manufacturer: Hach CLF10sc, with sc200 controller no equal Type: Free chlorine type. Accuracy: Max + 0.5% of reading Repeatability: Max 0.2% of reading.	
20	Turbidity Analyzer	Manufacturer: Hach, no equal Accuracy: Max 2% of NTU reading Repeatability: Max 1% of NTU reading.	
21	TOC Analyzer	Manufacturer: Suez Sievers M5310C, no equal Accuracy/reliability: Max + 3% of reading or 0.3 mgC/l. Compensation: Automatic compensation for atmospheric pressure changes Other Requirements: In addition to the above	Regulatory monitoring for plant product water.

Item	Parameter	Criteria	Application
		requirements, DBE specification shall include requirements for self-testing and self- cleaning requirements, sample system and pumps, service frequency, cycle time, etc.	
22	pH Analyzer	Manufacturer: Hach, no equal Accuracy: Max + 0.5% of reading Repeatability: Max 0.2% of reading.	
23	Conductivity Analyzer	Manufacturer: Hach, no equal Accuracy: Max 3% of reading Repeatability: Max 0.2% of reading	
24	TDS	Manufacturer: Hach, UT5300, no equal Accuracy: - ±2% or 0.01 NTU from 0 - 40 NTU - ±10% of reading from 40 - 1000 NTU based on Formazin primary standard	

Table 79 Junction Boxes

Item	Parameter	Criteria	Preferred Equipment
1	Mounting	Mounted accessible from floor or platforms.	
2	Doors	Doors will be able to open without interference.	

Table 80 Local Control Panels

Item	Parameter	Criteria	Preferred Equipment
1	Location	Located close to the equipment. Local control switches and indicators only where required to address specific safety or maintenance concerns, otherwise all manual control shall be available via SCADA only (accessible locally via wireless tablet computers)	
2	Local-Off-Remote Switch and Control Devices, indicator lights and Pushbuttons	Where required, LOR switch shall allow an operator to take manual control of a device or piece of equipment and operate it from that panel manually.	
		LCPs should be protected from the weather and/or be appropriate for the environment that they are operated in. Local Control Panels (LCP) exposed to direct sunlight shall include sunshade protection for any exposed electronic displays or instrument displays.	
		SCADA network side shall be all hard connections. Wireless and Bluetooth shall be turned off.	

Table 81 Instrument Mounting and Access

Item	Parameter	Criteria	Preferred Equipment
1	Housing	All process instruments in wet areas shall be housed in IP68, NEMA 4 enclosures (NEMA 4X in chemical areas), or vendor requirements, whichever is more stringent.	
2	Access	Access shall be considered in the selection of instrumentation. For example, tanks shall be measured using pressure at the base of the tank	

Item	Parameter	Criteria	Preferred Equipment
		wherever practical, to remove the need for maintenance access to the top of tanks.	
3	Instrument Height	Instruments mounted at a working level between 3 and 5 feet above the operating floor.	
4	Indicator Height	Process indicators and indicating transmitters mounted in a position that is readable by an operator without requiring the use of a ladder or the building of platforms.	
5	Capillary Tube Installation	Temperature and pressure instruments capillary sensors will be installed and clamped in tube racks. Excess capillary tube will be coiled and clamped to the mounting stand below the instrument.	
6	Grouping	Instruments located near each other will be grouped to the maximum extent possible on a common mounting stand, wall bracket or instrument rack.	
7	Dirt/ Moisture Removal	Instrument impulse lines will incorporate a blowdown leg or contamination accumulation leg for the removal of dirt and moisture.	
8	Isolation Valves	Instrumentation taps to process lines will be isolated by a root valve at the connection.	
		Isolation valves for taps to process lines will be 1/4-turn ball valves of materials compatible with the process fluid.	
		Isolation valves for chemical service will match isolation valves used in other portions of that chemical piping.	
9	Analyzers	Analyzers for primary process lines will be installed in bypass assemblies external to the main process headers to allow routine maintenance.	
		Analyzer assemblies will include an isolation valve at each process connection tap, pressure regulator, manual sample valve, rotameter flow element with integral flow metering valve, check valve, miscellaneous piping and fittings.	
		Generally, panel mounted and located in close proximity to the relevant sample point in a designated analyzer room (where possible) for improved access for common operational and maintenance activities on these units.	
		The analyzer waste streams will be discharged into a tundish and drained to a common collection point for either pumped return to a specified point along the process or drained to waste.	
		All analyzers will have no flow detection and pressure and flow control valves on the inlet to ensure a constant rate of feed through the analyzer. Manual sample points will be provided for sampling water at various points through the main process, typically with each change in process unit and upstream and downstream of chemical dose points for manual checks of water quality and chemistry.	
		Assemblies for analyzer sensors which must remain wetted at all times (e.g., pH sensors) will incorporate a vacuum breaker in the drain piping.	
		Sample drain will be routed to a hub drain.	

6.8 Supervisory Control and Data Acquisition System (SCADA)

6.8.1 Approved SCADA platforms

- SCADA systems shall include all components needed to:
    - connect to the PLCs, field devices, and databases,
    - include Historians, reporting platforms, and flexibility to generate reports as needed by the Owner and Operators,
    - provide secure ways to connect and utilize the system with the latest and greatest security mechanisms,
    - provide multi-level HMIs compatible with tablets and smartphones, and
    - provide structured alarming and annunciation, and alarms servers for multi-media alarming (emails, text messages …) compatible with tablets and smart phones.
- Approved SCADA system platforms are as follows:
    - A control system integrated SCADA platform (e.g. if the control system is Rockwell Automation (PlantPAx or similar) FactoryTalk View SE system to be used; however if the control system is Siemens, the TIA should be used.
    - Wonderware System Platform (latest version).
    - An Owner and Engineer-approved platform.
- Perpetual licenses will be used unless otherwise approved by the Owner and the Engineer.
- The selected system integrator will incorporate all the vendor screens in the final SCADA screens and will develop screens for all other equipment, for integration at the control room.
- New screens will be developed following the Owner and the Engineer's SCADA standards.
- All analog and discrete inputs to the PLC will be displayed on the SCADA screens.
- Real-time and historical trending for all analog inputs to the PLC will be available from the local servers.
- Screen displays will be arranged using a hierarchy:
- Show only information that needs to be immediately available for operations (system overview)
- Poke points for more details on a particular process or piece of equipment.
- Further poke points for control stations for devices such as pumps and valves.
- A hierarchy of alarms shall be specified, which will be adjustable by the operators.
- Each alarm shall be classified with a corresponding value representing criticality. The system will present the alarms in different ways based on the criticality, per the District's SCADA standards.
- All alarm functions shall be carried out at the PLC level.
- All alarms shall display on a common alarm screen.
- All alarms must be acknowledged by the plant operating staff before they can be cleared.
- Some alarms may be cleared from the SCADA. Others will need a local reset. The philosophy will be based on safety and equipment protection.
- No alarm will clear automatically until it has been properly acknowledged.

DRAFT

- Equipment safety interlocks specified to shutdown equipment "independent of control mode" or other similar descriptions will be active regardless of PLC (MANUAL/AUTO) or field control station (ON, LOCAL/REMOTE) operating status.
- Other software generated alarms will remain active independent of operating mode, but only affect specified control actions in AUTO (PLC) and REMOTE (field) operating modes.
- For all equipment controlled by the PLC, the equipment will receive and display applicable statuses and alarm signals, such as operating mode (LOCAL, REMOTE, etc.), operating status (ON, OPEN, CLOSED, etc.), and alarm status (FAIL, LOCKED-OUT, etc.).
- For multistate devices where actual digital input is not provided, provide PLC logic-based on the status of the other inputs to develop the remaining status. For example, for LOR switches use the status of the LOCAL and REMOTE inputs to develop and display the status of the OFF position.
- For all equipment controlled by the PLC, our DBE team will provide separate displays and poke points for the selection of AUTO/MANUAL operating modes. In AUTO mode, the device will be controlled by the PLC. In MANUAL mode, the device will be operated by START/STOP and OPEN/CLOSE poke points, as appropriate. The workstation will display the current operating status of each device and an alarm if the equipment fails to respond to a command signal after an operator-adjustable time period.
- PID control functions will be performed at the PLC with controller faceplate displays at the workstation.
- Standard PID control operator interface will be provided, including AUTO/MANUAL mode selection:
    - In AUTO, the controller output will be based on the PID control function at the PLC.
    - In MANUAL, the output of the controller will be based on an operator set value.
    - Transfer between MANUAL and AUTO will be bumpless.
    - At the workstation, DBE will provide AUTO/MANUAL selection poke points for PID-controlled equipment, with graphic loading displays for manual control.
- PID loop tuning parameters shall be available via SCADA but will require engineering login to make adjustments.

6.8.2 Typical Monitoring and Control

The following are some of the typical I/O signals that shall be monitored and used to control equipment by SCADA:

- All Analog Transmitters - Transmitter Fail Alarm
- Constant Speed Drive - Drive start/stop command, Drive running indication, Drive in auto or remote indication, Drive faulted, PLC calculated drive run time, Fail to Start/Stop, and Diagnostics (confirm specific parameters)
- Variable Speed Drive - Drive start/stop command, Drive running indication, Drive in auto indication, Drive faulted, VFD speed set point, VFD speed feedback, PLC calculated drive run time, and Diagnostics (confirm specific parameters)
- Chemical Dosing Feed System - Chemical volume quantity used calculated values.

6.8.3 Control Philosophy

- The control system will be fully automated so that, as far as practical, all day-to-day operational adjustments and reporting can be conducted from the SCADA screens. The level of automation will be consistent with the staffing requirements for the plant.
- Skid vendor screens will be incorporated on the SCADA HMI, such that all parameters can be monitored and controlled except where safety concerns dictate local control only or where controls are related to maintenance tasks that can only be carried out locally anyway.

DRAFT

- Alarms for control network failures will be incorporated including Ethernet switches, PLCs, or any network communication where available.
- Local manual override will be accomplished with a hard-wired switch except where personnel, equipment, or the process are protected by equipment software interlocks that need to be maintained at all times.
- The system will not be able to create a safety issue for the local operator. For example, remote operation should not be allowed if a local manual override is selected.
- Shutdown of the plant units will be fully automated.
- Recovery after a power outage or shutdown will be mostly automatic but will require operator intervention for the process to begin and may require additional operator intervention through the startup sequence as determined during the plant design in order to ensure safely and compliance requirements are met.
- Automatic and manual operation of the system will be done from the Operator Workstations (OWS) and from wireless tablet devices. Additional remote-control access may be incorporated during the transitional operation period using RDP and VPN access built into the SCADA Virtual Servers and Virtual Machines systems.

6.8.4 System Integration & Testing

The selected system integrator shall incorporate all the vendor screens in the final SCADA screens and shall develop screens for all other equipment, for integration at the control room.

Factory acceptance testing and site acceptance testing (FAT and SAT) shall be performed and witnessed at minimum by The Engineer's representative.

6.8.5 General SCADA Requirements

The following tables contain the Engineering Design Guidelines for SCADA criteria. The DBE is responsible to review and finalize these requirements for complete functioning facilities.

The table below describes the proposed plant network, from the Servers and Workstations to the PLC network. Any hardware or software requirements specified here may be modified with approval from City of Banning.

Table 82 System Specifications

Item	Parameter	Criteria	Notes
SERVERS			
1	Server Rack	One (1) server rack to be installed in the new server room. Server rack slots will need to be accessible from the front (for slot racks) and the rear (for cable management).	
2	Servers	Minimum three (3) converged rack servers each with the following specifications: • Two (2) CPUs • Eighteen (18) CPU cores • Eight (8) Network Interface Cards (NIC's) Hypervisor Servers are recommended to utilize virtual machines to handle the server processes. Servers will be redundant. If one server needs to be taken offline for maintenance, two redundant servers will still be active.	Ensure redundant power supplies for this hardware.
3	Network Switches	Minimum two (2) port-managed Layer 3 ethernet switches. One ethernet switch will be configured for the devices on the PLC/SCADA network.	Ensure redundant power supplies (UPS) for this hardware.

Item	Parameter	Criteria	Notes
		The other ethernet switch will be configured for the devices on the City of Banning LAN.	
4	Server Peripherals	Other server rack hardware should include local KVM switch with keyboard and monitor for access to the server and Network Time Server appliance with four (4) isolated Network Interface Cards (NIC's) and GPS receiver	
5	Server Capabilities	Server software capabilities, at a minimum, should include: • Microsoft Windows Server 2019 OS, with Hyper-V • SQL Server 2019 Standard version • System Event Monitoring • Host Intrusion Detection and Antivirus agents for each installed operating system with central management and reporting • Host Intrusion and Detection Management platform • System Data Log Management • Virtual Machines • Wonderware (Aveva) Server for configuring graphics and HMI communication drivers • SCADA Active Directory • Servers must have capacity for redundant storage of historical data (including old data transferred from existing Historian).	
6	Historical Data	DBE will need to design server storage space to account for, at a minimum, the following Historical data: • All analog I/O points at the WWTP, logged every 30 seconds • All motor run statuses at the WWTP plant, logged on every change in status • All existing historical data, currently stored on the existing servers at the City of Banning Wastewater Treatment Plant Administrative Building	
7	Software Licensing and Versions	All licensing required for the server software, workstation software, Wonderware software, and Rockwell Automation Studio5000 software shall be furnished by the DBE.	Support level for the software licensing should be specified and agreed upon by both the DBE and City of Banning.
		Furnish four (4) years extended Rockwell support for the installed software.	
		Furnish five (5) years extended support for installed Host Intrusion Detection and antivirus software.	
		The DBE shall cover the update costs for the local equipment as new versions of the software are released, prior to Final Acceptance.	
		The DBE shall be responsible for costs associated with any upgrade required to the software licenses arising from incorrect specification, or changes initiated by the DBE during the Performance Acceptance period.	
		At the end of the Performance Acceptance period all software shall be fully updated to the latest versions provided by the manufacturer.	

Item	Parameter	Criteria	Notes
OPERATOR WORKSTATIONS			
1	SCADA Room Workstations	Minimum two (2) workstations (WS) in the SCADA Room with video card capable of supporting a minimum of twelve (12) independent high-resolution monitors.	
		One workstation is for SCADA software only and running on the PLC network. Minimum two (2) LED monitors, 28" to 32" diameter. One must be wall mount and one desk mount. Must have the Wonderware (Aveva) Runtime application and the Rockwell Automation Studio5000 application fully licensed. No internet access.	
		Other workstation is for the CCTV system and running on the City of Banning corporate LAN. Minimum two (2) wall-mounted LED monitors. One monitor for the CCTV system, 36" to 40" screen diameter. Other monitor will be for operator administrative tasks, 24" to 28" diameter. This workstation will have internet access to allow operators to check emails and attend VoIP calls.	
		Any additional workstations	
2	Office Workstations	Refer to Final Drawing for location and number of workstations to be furnished.	
3	Workstation Specifications	Workstations must have minimum 16GB of RAM, 1TB Solid-State Hard Drive, and come with keyboard, mouse, and speakers.	
		The workstations are required to have the Windows 10 Professional OS, Adobe Acrobat standard standalone version and perpetual license, and Microsoft 365 standalone applications installed (Outlook, Word, Excel, etc.) with perpetual license.	
4	Panel HMI's	Each HMI shall be panel-mounted and have a runtime version to allow operators to monitor and control the WWTP process. Panel-mounted HMI's will be connected to the PLC network. HMI specifications shall satisfy the minimum software requirements. HMI shall be PanelView, Ignition Edge, or engineer-approved equal.	HMI specifications to be agreed upon between DBE and City of Banning.
PLC PANEL HARDWARE			
1	Existing PLC Replacement	Existing PLCs will be replaced with Allen-Bradley CompactLogix 5370, CompactLogix 5380, or engineer-approved equal PLCs. Replacement PLCs shall have at minimum 2MB of spare memory available after commissioning.	
2	New PLCs	New PLC Panels will be Allen-Bradley CompactLogix 5370, CompactLogix 5380, or engineer-approved equal PLCs. New PLCs shall have at minimum 2MB of spare memory available after commissioning.	
3	Panel I/O	For all existing PLC panels, the panel enclosure will remain. DBE will design a complete upgrade/ replacement of the panel hardware while utilizing the space inside of existing panel enclosures. PLC Total I/O count will need to account for 25% spare I/O at each panel (new and existing). Where integrating Modbus TCP IO, provide PLC	

Item	Parameter	Criteria	Notes
		rack-mouinted Modbus TCP cards that are compatible with the furnished PLC.	
4	Panel-to-Panel Communications	All PLC panels and network hardware will communicate via ethernet. Any existing network protocols that are not ethernet will need to be converted. All new panel ethernet switches will have a minimum of 8 ports and be listed as Managed and Layer 2 by the manufacturer.	
5	Fiber Testing	The DBE will coordinate testing of all existing fiber runs for connectivity. Any fiber runs that are not operational will need to be repaired/replaced.	
NETWORK COMMUNICATIONS			
1	Ethernet Protocol	Any network devices in the SCADA network that are not communicating through Ethernet will need to be converted to Ethernet protocol. This includes any vendor package controllers that need to communicate with the SCADA system. Develop and implement a network segmentation plan that uses firewalls and VLAN segmentation to segregate network traffic.	
2	Existing Fiber Communications	The DBE will coordinate testing of all existing fiber runs for connectivity. Any fiber runs that are not operational will need to be repaired/replaced.	
3	Wireless	All Wi-Fi connections shall be disabled, unless absolutely required. If so, specific Wi-Fi connections must be secured, monitored, and logged.	
CYBERSECURITY CONSIDERATIONS			
1	Accessibility	The Wonderware (Aveva) Server and Historian log files should be accessible from the SCADA Workstation. The SCADA system shall be accessible remotely by SCADA operations staff.	Control capabilities for remote access shall be agreed upon between DBE and City of Banning.
2	SCADA Login and Passwords	Require user specific operator login credentials for access at all computerized host access points with a minimum of seven (7) operator groups. Prescribed automatic logout functionality (i.e. logout upon 300 seconds of inactivity). Login credentials to be managed in a similar way to the City of Banning's existing IT system login credential. Remote logins will be required to include two-factor authentication to allow access.	
3	Default Passwords	Delete all default login credentials, and store passwords in a secure location once commissioning is completed.	
4	Corporate LAN	There shall be no direct interface between the Plant SCADA network and the Corporate LAN. Secure transfer of data between the SCADA system and Corporate LAN shall be managed by City of Banning and shall not be compromised when the DBE is integrating asset register data or SCADA screens at the SCADA system. A segmented Demilitarized Zone (DMZ) shall be provided that blocks and restricts traffic from/to SCADA LAN and Corporate LAN.	
5	Cybersecurity	Utilize industry best practice and design in	

Item	Parameter	Criteria	Notes
	Design	accordance with ISA/IEC- 62443 Industrial Network and System Security standards. Implement a defense in-depth approach to cybersecurity. Implement a zero-trust design. Provide system operator notification indicating system and device status, with controls that permit manual and automatic blocking of network access points and ethernet switch ports.	
6	Cybersecurity Workshops	The full extent of the cybersecurity requirements will need to be discussed during workshops that include the City of Banning, its representatives, and the DBE. There will be a minimum of six (6) workshops with a minimum allotted time of (20) hours. This time can be allotted in any manner agreeable to both City of Banning and the DBE. Design decisions shall include input and final direction given by City of Banning and its representatives.	These workshops are for discussing cybersecurity implementation options and for deciding on the final security design requirements for the WWTP.
7	SCADA Workshops	Four (4) training sessions (4-hours each). Two (2) workshops for each group of City of Banning. Training on controls, alarm settings, modifying settings, etc.	In addition to functional testing and I/O verifications
SCADA MIGRATION			
1	SCADA Migration	DBE shall prepare a SCADA Migration Plan that outlines the steps that will be taken to install new hardware and software as well as complete upgrades to existing equipment and software while maintaining operations at the WWTP. SCADA Migration Plan shall list any required shutdowns (quantity, timing, duration, systems affected, etc.). Any shutdowns shall be in accordance with overall project shutdown allowances.	
		DBE shall submit Draft SCADA Migration Plan to City of Banning for review. DBE shall hold one (1) 4-hour workshop with City of Banning and incorporate any comments into updated SCADA Migration Plan. DBE shall submit Final SCADA Migration Plan to City of Banning for review and approval.	

6.8.5.1 Design Deliverables

The I&C design deliverables will provide the framework for the system integrator to develop the PLC programs and configure the HMI system. While the PLC panels, PLC programming, and HMI configuration shall be furnished by the system integrator, the DBE shall be responsible for providing the necessary design deliverables to guide the programming and panel construction.

Details about the design deliverables and programming guidelines are described in the tables below. Any specifications below can be modified with approval from the City of Banning.

Table 83 Design Deliverables

Item	Parameter	Criteria	Notes
DESIGN DELIVERABLES			
1	I/O List	List of all hard-wired I/O at each PLC panel (including any remote I/O), including I/O channel mapping	
2	Register Map	List of all signals to be communicated between PLCs, including register address mapping	
3	Alarm List	List of every alarm and shutdown condition that will require operator attention. Include any automatic actions or required operator actions for alarm conditions.	
4	Process Control Narratives	Create document to describe WWTP process in detail, beginning with the automated process to be programmed in the PLCs and including any operator monitoring or control actions. This document should be organized to describe each PLC's individual control processes and control loops as well as the PLC's interaction with other PLCs. Normal vs. Abnormal process conditions at the plant should also be detailed.	A draft control narrative, which is included in Section 6.7.1 of this DCR, has been prepared by City of Banning to kick start this effort.
		A cybersecurity control narrative shall be developed that includes all server instances, workstation instances, and detailed network functional descriptions.	
		DBE shall conduct a preliminary workshop to validate the scope and a minimum of two (2) workshop before finalizing the Process Control Narrative, each workshop shall be 2-4 hours in duration.	
5	HMI Screens List	Develop list of HMI screens for the system integrator to build.	Verify with City of Banning Operations
6	Network List	List of all network devices, physical locations, IP addresses, VLAN configurations, and gateway information.	
7	Equipment List	List of all hardware, physical locations, manufacturer information, model numbers, etc.	

Table 84 PLC Programming Specifications

Item	Parameter	Criteria	Notes
1	Programming Upgraded PLCs	For each PLC program that is replacing an existing PLC, program scope should encompass all I/O mapping, controls, alarms, and logic from the existing PLC. This program scope should be clearly defined in the control narratives description for that PLC.	
2	PLC Programming Standards	Ensure PLC programming practices in accordance with IEC 61131-3 and comply with City of Banning SCADA standards	
3	Vendor Package Systems	Vendor PLCs shall be the same type as the rest of the site.	
		Vendor PLCs shall have processor program and vital configuration information backed up in a similar manner to the other site PLCs.	

Item	Parameter	Criteria	Notes
4	Program Modifications	A copy of the latest PLC program shall be saved to the SCADA Workstation and backed up to the Servers. Studio5000 shall be installed at the SCADA Workstation to allow program modifications as needed.	
		Latest version of Aveva (WonderWare) software, 1 developer license, 2 thick clients, and a pair of RDS thin clients.	

Table 85 HMI Configuration

Item	Parameter	Criteria	Notes
1	HMI Screens List	HMI Screens list will include existing Wonderware (Aveva) screens that the plant operators require for the local SCADA and any screens or process information from existing panel-mounted HMIs or other packaged systems that have not been incorporated into the existing Wonderware screens.	Review with City of banning Operations to ensure all monitoring and control data points are accessible from the SCADA Workstation and all SCADA Tablets.
2	Vendor Package Systems	The system integrator shall incorporate all the necessary vendor data in the final SCADA screens.	
3	Navigation/Alarm Pane	Include a header or footer screen that is sized and configured to always be displayed with any process screen. This screen will contain navigation links, an alarm banner, and critical process information to the operator at all times.	
4	Hard-wired Signal Monitoring	All hard-wired analog and discrete inputs to the PLC will be displayed on the SCADA screens. Real-time and historical trending for all analog inputs and run statuses to the PLC will be available from the HMI screens.	
5	Screen Display Hierarchy	Displays will be arranged using a hierarchy: • Show only information that needs to be immediately available for operations (system overview). • Poke points for more details on a particular process or piece of equipment. • Further poke points for control stations for devices such as pumps and valves, etc.	
6	Alarm Hierarchy	A hierarchy of alarms shall be specified, which will be adjustable by the operators.	
		Each alarm shall be classified with a corresponding value representing criticality. The system will present the alarms in different ways based on the criticality, per City of Banning SCADA standards.	
7	Alarms	All alarm functions will be carried out at the PLC level.	
		All alarms will display on a common alarm screen.	
		All alarms must be acknowledged by the Plant operating staff before they can be cleared.	
		Some alarms may be cleared from SCADA. Others will need local reset. Philosophy shall be based on safety and equipment protection.	
		No alarm will clear automatically until it has been	

Item	Parameter	Criteria	Notes
		properly acknowledged.	
8	Proportional, Integral, Derivative (PID) Control	PID control functions will be performed at the PLC with controller faceplate displays at the workstation. Standard PID control operator interface will be provided, including AUTO/ MANUAL mode selection: • In AUTO, the controller output will be based on the PID control function at the PLC. • In MANUAL, the output of the controller will be based on an operator set value. • Transfer between MANUAL and AUTO will be pumpless. • At the workstation, DBE will provide AUTO/MANUAL selection poke points for PID controlled equipment, with graphic loading displays for manual control. PID loop tuning parameters shall be available via SCADA but will require engineering login to make adjustments.	
9	Standards	New HMI screens shall be developed following City of Banning SCADA standards.	

The following table includes some of the typical I/O signals that shall be monitored and used to control equipment or systems by SCADA.

Table 86 Typical Monitoring and Control

Item	Parameter	Monitoring & Control Signals	Notes
1	All Analog Transmitters	Transmitter Fail Alarm	
2	Level Transmitters	Continuous level monitoring PLC calculated high/low level alarm PLC calculated high-high/low-low level alarm	
3	Level Switches	high/ low level alarms high-high/low-low level alarms	
4	Flow Transmitters	Continuous flow monitoring PLC calculated flow totals PLC calculated high/low flow alarms	
5	Flow Switches	Flow alarms where applicable	
6	Pressure Transmitters	Continuous pressure monitoring PLC calculated high/low pressure alarms	
7	Analyzers (pH/LEL/H2S/CL2/ DO etc.)	Continuous signal monitoring Dry contact high/low level alarm PLC calculated high-high/low-low level alarm	
8	Temperature Transmitters	Continuous temperature indication PLC calculated high/low temperature alarm	
9	Temperature Switches	High temperature alarm Low temperature alarm	
10	Open/Close Valve or Gate	Valve open/close command. Valve open/close position indication Valve in Auto or Remote indication Valve fault indication.	
11	Modulating Flow Control Valve	Valve position set point Valve position feedback. Valve open/close position indication if applicable. Valve fault indication.	
12	Constant Speed Drive	Drive start/stop command Drive running indication Drive in auto or remote indication Drive faulted (General Fault or Multiple Fault Indicators, etc.) PLC calculated drive run time	

Item	Parameter	Monitoring & Control Signals	Notes
		Failure to respond to command or change of status when not commanded. Diagnostics (DBE to confirm specific parameters)	
13	Variable Speed Drive	VFD start/stop command VFD running indication VFD in auto indication VFD faulted VFD speed set point VFD speed feedback PLC calculated VFD run time Diagnostics (DBE to confirm specific parameters)	
14	Chemical Dosing/ Feed System	Chemical Dosing/Feed Systems Chemical volume/quantity used calculated values	
15	SCADA Cybersecurity	Captured host intrusion and antivirus events to be centrally logged within the SQL database located in the DMZ with status displayed at the HMI and alarmed on pickup of a high-level security event.	
		Network diagnostics and device communication status shall be logged and displayed at the HMI.	
		Log network status to Historian.	
		System log files shall be logged to the SQL database located in the DMZ.	
		Configure each HMI to log Factory Talk FT Diagnostic data to SQL database located in the DMZ.	
		Configure ethernet switches to be monitored and status displayed at the HMI. Log status changes for ethernet switch and each port to Historian. On pickup of unauthorized port access or ethernet switch fault, display alarm at HMI.	

Table 87 Security

Item	Parameter	Criteria	Notes
1	Construction / Work Area	Make adequate provision for the protection of the work area against fire, theft, and vandalism, and for the protection of the public against exposure to injury.	
2	General Design Principles	Security improvements shall integrate with existing site security infrastructure.	
		Discrete security measures shall be planned into the facility without creating a fortress-like appearance.	
		Site design will address security issues related to access control; electronic protection; and the “hardening” of the site against man-made and natural disasters.	
		Security measures shall be in line with 2008 America's Water Infrastructure Act.	
3	Vulnerability Assessment	DBE will conduct a vulnerability assessment and provide all other security measures required pursuant to Applicable Law	Report deliverable
4	Locking	All electrical panels exterior to the building structures shall be lockable	
5	Dual Authentication	Key Fob	

6.9 Miscellaneous

The following table contains the Engineering Design Guidelines for miscellaneous criteria.

Table 88 General miscellaneous requirements

Clause	Parameter	Criteria
0	Scope	This document applies to General/Misc.
1	Project Schedule	Primavera Version 7.0 unless otherwise approved by the PM.
2	Design Submittals for City Reviews	All design documents in support of establishing cost estimates and/or GMPs.
3	Permits	Consider all applicable permits. Examples include California Environmental Quality Act (CEQA), South Coast Air Quality Management District (SCAQMD), and/or Regional Water Quality Control Board (RWQCB) permits.
4	Site Visit, Survey, Geophysical Investigation, and Potholing	Review alignments for visible utility conflicts, constructability, and ease of operations and maintenance of the facilities. Conduct geophysical investigation to determine presence of subsurface features. Perform potholing to determine depths of subsurface features.
5	Technical Specifications	CSI Format, "Green Book" Standard Specifications for Public Works Construction can be referenced in lieu.
6	Right-of-Way/Easements	Consider all applicable Right-of-Way/Easements requirements and limitations and how they are communicated with the Contractor.
7	Asset Register	Create Asset Register and include for each new asset, size, capacity, year of construction, cost, tolerances, measured vibration, etc.
8	Landscape	Review project landscape requirements with City staff.
9	Forklifts	Use electric units and propane.
10	Equipment's Needing Backwash	Use recycled water in lieu of potable water where possible.
11	Spare Parts	Evaluate spare parts requirements for all critical mechanical equipment being designed and discuss with City O&M Staff.
12	Equipment Utility Pads	Provide for all equipment. Use reinforced concrete. Bollards are necessary to protect utilities, where applicable.
13	Equipment Sole Sourcing	Public Contract Code § 3400(b) allows sole sourcing under four reasons: (1) to conduct a field test or experiment of the product, (2) to match existing products in use on the particular public work, (3) to obtain a product that is only available from one source, and (4) to respond to an emergency.
14	O&M/ SOPs/ UPCPs	• Prepare treatment facility Operations and Maintenance (O&M) Manuals to a standardized electronic format and level of content • Establishment of standardized formats and content for Standard Operating Procedures (SOPs) and Unit Process Control Procedures (UPCPs)
15	Identification Devices	Develop a technical specification section to require Contractor to furnish and install all identification devices as shown and specified in the Contract Documents. This would include a section for "Smart Tags" and related tag guidelines including but not limited to Piping ID, Exit Signs, Safety Signs, Right-to-know labels and tags.
16	Submittal Packaging	• Package submittals to facilitate quick reviews. • Consider a list of unique submittal packages required (e.g., material data, seismic calcs, testing plan, test results, Certificate of Proper Installation (COPI), warranty cert, O&M, etc. • Consider grouping submittals by facility, if multiple facilities.

Clause	Parameter	Criteria
		• Requirements should state that submittals should be "submitted and approved" prior to scheduling of shipping, testing, etc.
17	Prevent Damage to Metal surfaces during Unloading	Contractor shall use nylon straps for handling of all stainless steel, aluminum, and coated equipment and construction elements as to not damage the finish.
18	SDTI	WWTP shall remain in operation at all times. The CONTRACTOR shall compile a detailed list of all items of work involving tie-ins and all their work elements.

PROCESS FLOW ABBREVIATION

AA	AERATION AIR
AGA	AGITATION AIR
BD	BOTTOM DRAIN
BW	BACKWASH
CA	COMPRESSOR AIR
CD	CHEMICAL DRAIN AND VENT
CLS	CIRCULATED SLUDGE
CS	CAUSTIC SODA
D/DRN	DRAIN
DG	DIGESTER GAS
DS/DSL	DIGESTED SLUDGE
DSL (AB)	DIGESTED SLUDGE (ABANDONED)
EA	EXHAUST AIR
EFF	EFFLUENT
ELEC	ELECTRICAL
EX	ENGINE EXHAUST
FA	FOUL AIR
FC	FERRIC CHLORIDE
FD	FLOOR DRAIN
FM	FORCE MAIN (SEWER)
FW	FIRE WATER
G	GAS LINES
GR	GRIT
GRE	GREASE
HPDG	HIGH PRESSURE DIGESTER GAS
HS	HEATED SLUDGE
HW	HOT WATER
HWR	HOT WATER RETURN
HWS	HOT WATER SUPPLY
IA	INSTRUMENT AIR
INF	INFLUENT
LAT	LATERAL (SEWER)
LO	ENGINE LUBE OIL
LPG	LIQUIFIED PETROLEUM GAS
ML	MIXED LIQUOR
MLR	MIXED LIQUOR RETURN
MLSS	MIXED LIQUOR SUSPENDED SOLIDS
OF	OVERFLOW
PD	PUMPED DRAIN, PLANT DRAIN
PE	PRIMARY EFFLUENT, PLANT EFFLUENT
PG	PROPANE GAS
PI	PRIMARY INFLUENT, PLANT INFLUENT
PMT	PERMEATE
POL	POLYMER
PPW	PLANT PROCESS WATER
PS	PRIMARY SLUDGE
PSC	PRIMARY SCUM
PW	POTABLE WATER
RAS	RETURN ACTIVATED SLUDGE
RSL	RAW SLUDGE
SBD	SLUDGE BED DECANT
SBN	SUBNATANT
SC	SCUM
SCN	SCREENINGS
SE	SECONDARY EFFLUENT
SH	SODIUM HYPOCHLORITE
SLC	SLUDGE CAKE
SN	SUPERNATANT
SPD	SUMP PUMP DISCHARGE
SSC	SECONDARY SCUM
SW	SEAL WATER
TD	TANK DRAIN
TFE	TRICKLING FILTER EFFLUENT
TO	THICKENER OVERFLOW
TSL	THICKENED SLUDGE
TWAS	THICKENED WASTE ACTIVATED SLUDGE
UW	UTILITY WATER
VAC	VACUUM
VT	VENT
W	WATER
WAS	WASTE ACTIVATED SLUDGE
WG	WASTE GAS
WW	WASTE WATER

EQUIPMENT DESIGNATIONS

DESIGNATION	EQUIPMENT	DESIGNATION	EQUIPMENT
AAB	AERATION AIR BLOWER	MBR	MEMBRANE BIOREACTOR
AB	AGITATION AIR BLOWER	MBS	MECHANICALLY CLEANED BAR SCREEN
AMX	ANOXIC MIXER	MLRP	MIXED LIQUOR RECYCLE PUMP
BF	BIOFILTER	MX	MECHANICAL MIXER
BLR	BOILER	PAC	PRESSURIZATION AIR COMPRESSOR
BRP	BOILER RECIRCULATION PUMP	PCP	POLYMER CIRCULATION PUMP
BSC	BAR SCREEN	PF	PROCESS FAN
CCT	CHLORINE CONTACT TANK	PFP	POLYMER FEED PUMP
CP	AIR COMPRESSOR	PFT	POLYMER FEED TANK
DAFT	DISSOLVED AIR FLOATION THICKENER	PTK	PRESSURIZATION TANK
DGB	DIGESTER WASTE GAS BURNER (FLARE)	PWP	PLANT WATER PUMP
DIG	DIGESTER	RSP	RAS PUMP
DRP	DAF RECYCLE PUMP	SCC	SCREENINGS COMPACTOR
DSP	DRAINAGE SUMP PUMP	SDG	STANDBY DIESEL POWER GENERATOR
GP	GRIT PUMP	SG	SLUICE GATE
GRP	GREASE PUMP	SGR	SLUDGE GRINDER
GRT	GRIT REMOVAL TANK	SLG	SLIDE GATE
HEX	HEAT EXCHANGER	SMX	STATIC MIXER
HPT	HYDRO-PNEUMATIC TANK	SSP	SECONDARY SCUM PUMP
HWP	HOT WATER PUMP	TSP	TWAS PUMP
IGR	IN-LINE GRINDER	UCP	UNIT CONTROL PANEL
IP	INFLUENT PUMP	WSP	WAS PUMP

DESIGN INFLUENT WASTEWATER FLOW

ITEM	UNIT	EXISTING	UPGRADE
AVERAGE DAILY FLOW	MGD	3.6	
MAX DAY FLOW	MGD	7.2	
INFLUENT WASTEWATER CHARACTERISTICS			
BOD	MG/L	317	
TSS	MG/L	318	
TOTAL NITROGEN	MG/L	>60	

DESIGN EFFLUENT QUALITY

ITEM			
BOD	MG/L	30	<5
TOTAL INORGANIC NITROGEN	MG/L	22	<7.5
TSS	MG/L	30	<5

PRIMARY TREATMENT

ITEM			
HEADWORKS			
MECHANICAL BAR SCREEN	NUMBER	1	
CAPACITY	MGD	5	
OPENING SIZE	IN.	0.25	
MANUAL BAR SCREEN	NUMBER	1	
OPENING SIZE	IN.	1.5	
COMPACTOR	NUMBER	1	
CAPACITY	CU. FT/HR	133	
GRIT BASIN	NUMBER	1	
DIAMETER	FT	18	
GRIT WASHER/CYCLONE	NUMBER	1	
CAPACITY, EACH	MGD	3.6	
FERRIC SULFATE FEED PUMP	NUMBER	2	
CAPACITY, EACH	GPH	28	
MOTOR, EACH	HP	0.5	
HEAD, EACH	PSI	150	
STORAGE CAPACITY	GAL	2000	
PRIMARY CLARIFIERS	NUMBER	2	1 (OPTIONAL)
WEST TANK			
DESIGN FLOW RATE	MGD	1.6	
DIAMETER	FT	45	
SIDE WATER DEPTH	FT	6.5	
EAST TANK			
DESIGN FLOW RATE	MGD	2	
DIAMETER	FT	50	
SIDE WATER DEPTH	FT	7	
NEW TANK			
DESIGN FLOW RATE	MGD		2
DIAMETER	FT		50
SIDE WATER DEPTH	FT		7
EQ BASIN STATION PUMPS (BY OTHERS)	NUMBER		3
CAPACITY, EACH	MGD		3.6
MOTOR, EACH	HP		70
EQ BASIN VOLUME	MG		2.1

NOTE:
(1) TO BE USED FOR MBR SYSTEM AND CHLORINE CONTACT TANK
(2) CONVERT EXISTING SECONDARY DIGESTER TO PRIMARY DIGESTER
(3) ALL DRAWINGS ARE CONCEPTUAL AND SUBJECT TO CHANGE BY THE DESIGN BUILD ENTITY.

SECONDARY TREATMENT

ITEM	UNIT	EXISTING	EXPANSION
MECHANICAL FINE SCREEN	NUMBER		2+1
CAPACITY, EACH	MGD		3.6
OPENING SIZE	MM		2
MEMBRANE BIOREACTOR (MBR) UNIT			
AERATION BASIN, EACH (L, W, D)	FT		120, 30, 18
NO. OF BASINS	NUMBER		4 (3+1)
MEMBRANE TANK, EACH (L, W, H)	FT		45, 13, 10
NO. OF TRAINS	NUMBER		4
DESIGN MLSS	MG/L		6,000 – 8,000
DESIGN SYSTEM SRT	DAY		20
MBR FEED PUMPS	NUMBER		3+1
CAPACITY, EACH	GPM		4,200
MOTOR, EACH	HP		40
PERMEATE/BACKPULSE PUMPS	NUMBER		3+1
CAPACITY, EACH	GPM		840
MOTOR, EACH	HP		10
WAS PUMPS	NUMBER		1+1
CAPACITY, EACH	GPM		50
MOTOR, EACH	HP		5

Scope Clarifications, Assumptions, and Exclusions 16

Introduction

As requested by the City of Banning (City), AECOM/W. M. LYLES JOINT VENTURE (AECOM/WML) has developed a scope of services and preliminary schedule for Phase 1 of the progressive design-build services for the Wastewater Treatment Plant and Recycled Water Upgrades Project (Project).

Background

The City of Banning is responsible for the collection, conveyance, treatment, and disposal of wastewater generated within its service area. The local collector sewers discharge into larger sewer trunk mains, then to the Banning WWTP, located in the southeast corner of the City.

The existing WWTP has a current capacity of 3.6 million gallons per day (MGD) and is designed to treat wastewater to secondary standards. The WWTP consists of preliminary treatment, primary treatment, secondary treatment, solids handling, disinfection (currently not in use), and evaporation/percolation ponds. The preliminary treatment system consists of a mechanical bar screen, compactor, grit removal system, and cyclone separator. Effluent from the preliminary treatment system is gravity fed to two primary clarifiers. Primary effluent is pumped to two Trickling Filters, each rated for 1.8 MGD. The Trickling Filter effluent is sent to two secondary clarifiers.

Secondary effluent flows through a chlorine contact chamber and is then discharged to 10 unlined evaporation/percolation ponds which recharges the Cabazon Groundwater Basin. This recharge is provided only through surface percolation, and no injection wells are used by the City.

Primary and secondary sludge is processed via two primary anaerobic digesters. A second-stage digester is currently used as a sludge holding tank before thickened sludge is sent to the sludge drying beds. Sludge is allowed to dry and then is hauled offsite for final disposal. A gravity thickener was used to thicken secondary sludge but is currently not in service.

At this time, effluent from the WWTP is in compliance with effluent water quality discharge requirements. However, the WWTP will not be able to meet the impending discharge limits proposed by the Colorado River Basin Regional Water Quality Control Boad (RWQCB). In addition, many treatment facilities at the plant, including the two Trickling Filters, have reached the end of their useful life.

Project Description

The Project involves upgrading the Banning WWTP to Title 22 standards for recycled water use.

The existing Trickling Filters and secondary clarifiers will be abandoned, and a new MBR facility and UV disinfection system will be installed to meet Title 22 recycled water standards. Other miscellaneous upgrades of the WWTP, including fine screening upstream of the aeration tanks, modifications to digester facilities, dewatering, chemical systems, and ancillary facilities (office, electrical and control systems including new SCADA, plant water, potable water, stormwater, etc.) will also be implemented as part of the project. An RO system and associated evaporations ponds may be needed as well and is included in this scope of services, if confirmed.

Progressive Design Build Approach Implementation

In accordance with the RFP, AECOM/WML proposes to implement the project on a progressive design-build basis. This approach involves bringing design and construction resources together in an integrated team to

manage the project in a competitive manner but with a single source of responsibility and accountability. This approach is broken down into two distinct phases:

Phase 1 Services – Planning, Design Development, Permitting and Preparation of the Design-Build Price. This phase includes all the planning, engineering, and permitting to prepare a complete design to develop a Guaranteed Maximum Price (GMP) and schedule for Phase 2.

Phase 2 Services– Project Execution. Upon agreement on the GMP for the project and the release of required approvals, AECOM/WML will proceed with Phase 2 for equipment and material procurement, construction, engineering design support during construction, construction management, start-up, and acceptance testing.

Phase 1 – Scope of Work

AECOM/WML will provide Phase 1 engineering services including the preparation of a Preliminary Design Report (PDR) and a complete design to develop the Phase 2 Proposal, including a GMP for the construction of the Project.

The scope of work for Phase 1 has been organized into four interrelated tasks as follows:

- Task 1- Design
- Task 2- Cost Estimating
- Task 3- Meetings & Reports
- Task 4 – Investigations / Support

A detailed description of these tasks is provided in the following subsections.

Task 1 - Design

Sub Task 1.1 – Preliminary Design Report

Objective: Further develop design concepts and formally document project scope and rationale in a Preliminary Design Report (PDR).

AECOM/WML Activities: Prepare a PDR incorporating the results of kick-off and progress meetings, technical collaboration sessions, and workshops with the City conducted to date. A draft PDR will document these results and describe the proposed scope of work for new facilities. The final PDR will document the rationale for all design decisions and will present the initial scope of work for design and GMP development.

The PDR for the WWTP will define the overall project goals and design intent and the detailed design criteria for all project components, systems and subsystems such as:

- Design criteria for flows and loads.
- Anticipated unit process flow rates and chemical use and storage requirements.
- Wastewater treatment process design, including mass balances, equipment capacities and related design criteria.
- Geotechnical data and design criteria (Geotechnical Report).
- Base Map from topographic survey.
- Civil concepts and design criteria. Including facilities planning in regard to location and orientation of proposed facilities and relation to existing facilities and hydraulic profile.

- Foundation, structural and architectural concepts and design criteria.
- Architectural concepts and design criteria.
- Process mechanical concepts and design criteria.
- HVAC concepts and design criteria.
- Plumbing concepts and design criteria.
- Fire protection design criteria.
- SCADA system architecture and outline process control descriptions for critical unit operations and draft P&IDs.
- Physical and electronic security/surveillance systems.
- Electrical power supply and distribution strategy.
- Permitting requirements.
- Potholing/utility searches

Deliverables:

- Draft PDR including Geotechnical Report and Base map.
- Updated List of drawings and specifications
- Preliminary drawings including process flow diagrams, hydraulic profile, mass balances, conceptual site plans; major process general arrangement plans and sections (fine screens, MBR, UV disinfection, dewatering);
- Final PDR incorporating City comments.
- Deliverables will be provided in electronic format (PDF)

Key Understanding: The main purpose of preparing the draft PDR is to further develop the design while formally documenting project scope and rationale. This document will provide the basis for the Initial Cost Baseline.

Drawings for all design phases will be prepared with AutoCAD or Revit, and in accordance with the United States National CAD Standard® (NCS). Design plans will be developed utilizing industry standard scales, in English (not metric) engineering units. Attachment A (Draft Index of Drawings and Specifications) shows a list of drawings and specifications anticipated for the Project and at what stage they will be provided.

Specifications for all design phases will be prepared in Microsoft Word using the industry standard. AECOM/WML's budget for this task assumes no Division 0 and Division 1 specifications will be required to be prepared by AECOM/WML, and that AECOM/WML's Design-Build specifications (16 Divisions format) will be used as a basis for the technical provisions.

Meetings/Travel: Refer to Task 3 – Meetings and Reports for planned meetings and workshops. Ad-hoc calls may be needed to coordinate and discuss emerging technical issues.

Information and Services Provided by Others: As-builts of existing facilities, available geotechnical reports and data, City's input on the design concepts and alternatives. City to provide comments in spreadsheet for tracking and disposition purposes.

City's operations staff to provide additional sampling and sample analysis as part of routine monthly efforts and as may be needed by MBR and RO equipment manufacturers to size their equipment and provide performance warranties.

Sub Task 1.2 – 30 Percent Design Phase

Objective: Preparation of 30 Percent Design.

AECOM/WML Activities: Develop initial discipline design drawings and specifications for City review. A preliminary list of the anticipated drawings and specifications included in this submittal is detailed in the Draft

Index of Drawing List and Specifications included in Appendix A. The proposed number of drawings and level of details in each drawing are consistent with a 30 percent design level.

Deliverables:

- 30 percent Design drawings and major equipment specifications and draft hydraulic profile
- Deliverables will be provided in electronic format (PDF)

Key Understanding: The main purpose of the 30 percent design package is to incorporate design requirements and develop the design sufficiently so that a cost estimate can be prepared. The 30 percent design will set the stage for subsequent design phases and development of the GMP and will be the basis for the Cost Update No. 1. The overall scope for the Project will be fixed after the City comments on the 30 percent design are addressed.

Meetings/Travel: Refer to Task 3 – Meetings and Reports for planned meetings and workshops.

Information and Services Provided by Others: City's input on PDR and technical collaboration sessions. City to provide comments in spreadsheet for tracking and disposition purposes.

Sub Task 1.3 – 60 Percent Design Phase

Objective: Preparation of 60 Percent Design.

AECOM/WML Activities:

Advance individual disciplines design for City review. A preliminary list of the anticipated drawings and specifications is included in this submittal is detailed in the Draft List of Drawing List and Specifications included in Appendix A. The proposed number of drawings and level of details in each drawing are consistent with a 60 percent design level.

Finalize 60 percent design package and update cost estimate based on City comments.

Deliverables:

- 60 percent Design drawings and specifications and final hydraulic profile calculations.
- Deliverables will be provided in electronic format (PDF)

Key Understanding: The main purpose of the 60 percent design package is to progress the develop the design from the 30 percent design package sufficiently to develop the Draft GMP and ultimately the Final GMP as well as setting the stage for the final design package.

Included in the 60 percent design will be markups of as-built drawings and specifications developed for in-kind replacement of the equipment listed below to include in the GMP. No drawings will be developed for the replacement of equipment and construction will be performed from the shop drawings supplied by the equipment suppliers:

- Upgrade Ferric Sulfate Feed/Storage System
- Digester Coating
- Replace Piping in Grit Chamber
- Replace East Primary Clarifier Center Drive
- Replace Existing PVC Digester Gas Piping

- Replace Digester Hot Water Boiler
- Replace Grit/Cyclone Unit
- Replace Two Old Grit Pumps

Title 24 analysis to comply with CalGreen regulations is included and will be provided after the 60 percent design review is provided by the City.

Meetings/Travel: Refer to Task 3 – Meetings and Reports for planned meetings and workshops.

Information and Services Provided by Others: City's input from review of the 30 Percent Design and technical collaboration sessions. City to provide comments in spreadsheet for tracking and disposition purposes.

Sub Task 1.4 – Hydraulic Profile Modeling

Objective: For the selected process configuration, develop and revise hydraulic profile for the proposed facility expansion.

AECOM/WML Activities: Use existing drawings and conceptual design information on the proposed expansion to develop a hydraulic model of the new and existing infrastructure. Model to be developed in AECOM's plant hydraulic profile (PHP) program.

Deliverables: None. All information collected in this task will be incorporated into the PDR and design drawings.

Key Understanding: The goal of the modeling will be to minimize inter-process pumping after, as well as set elevations of major new facilities.

Meetings/Travel: None.

Information and Services Provided by Others: City to provide any hydraulic profile information for the existing plant including the condition of existing pipelines or facility modifications. City to provide comments in spreadsheet for tracking and disposition purposes.

Sub Task 1.5 – Final Design Phase

Objective: Preparation of Final Design to issue for Construction pending Phase 2 notice to proceed.

AECOM/WML Activities:

Address the City comments on the complete design provided in the 60 Percent Design Submittal and provide a Final Design for the Project. A preliminary list of the anticipated drawings and specifications included in this submittal is detailed in the Draft List of Drawing List and Specifications in Appendix A. Proposed number of drawings and level of details in each drawing are consistent with a Final Design ready to be issued for construction.

Deliverables:

- Final Design (Sealed and Signed by Engineer-of- Record for each discipline) drawings and specifications.
- Deliverables will be provided in electronic format (PDF).

Key Understanding: The Final Design will be the basis for the final cost update (Cost Update No. 4). The Final Design package will set the stage for the preparation of the GMP submittal and the overall scope for Phase 2 of this Project. Any modifications by the City to this design will be handled as design change notices in Phase 2.

Meetings/Travel: Refer to Task 3 – Meetings and Reports for planned meetings and workshops.

Information and Services Provided by Others: City's input on 60 percent design packages. City to provide comments in spreadsheet for tracking and disposition purposes.

Task 2 - Cost Estimating

Sub Task 2.1. – Initial Baseline Cost Model and Updates

Objective: Preparation of initial baseline cost model and one cost update and draft and final GMP.

AECOM/WML Activities: Provide cost estimates tracking different stages of design as follows:

- Initial Baseline Cost Estimate – After submittal of Draft PDR Report
- Cost Update No. 1 – After 30% Design Submittal
- Draft GMP – After 60% Design Submittal
- Final GMP – After Draft GMP Submittal and reconciliation of 60% Design Submittal comments

Deliverables:

- Initial Baseline Cost Estimate, Cost Update, Draft GMP, and Final GMP.
- Initial Draft Phase 2 CPM Schedule, Schedule Update, Draft Phase 2 Baseline Schedule, and Final Phase 2 Baseline Schedule
- Deliverables will be provided in electronic format (PDF).

Key Understanding: The main purpose of the baseline cost estimate is to incorporate confirmation of concept design and establish the format and base for cost updates through design development. The baseline cost estimate and subsequent cost updates will set the stage for development of the GMP. This will allow the City and AECOM/WML to ensure the Project is being designed to budget.

Meetings/Travel: Virtual meetings will be held to present the Initial Baseline Cost Estimate and up to four Cost Updates. These meetings will be held as part of the technical collaboration portion of the Project Progress Meetings.

Information and Services Provided by Others: City's input on design concepts and input on potential value engineering ideas.

Sub Task 2.2. – GMP Development

Objective: Complete a Phase 2 proposal including development of a guaranteed maximum price (GMP) based on a combination of competitive bidding and self-performing construction work based on final design documents.

AECOM/WML Activities: Using the Phase 1 work products, the AECOM/WML team will obtain pricing for equipment and materials and solicit bids for construction of the proposed project. The AECOM/WML will then prepare and submit a detailed Phase 2 proposal for City review. The Phase 2 Proposal will detail all the necessary services for permitting, equipment and materials procurement, physical construction of the Project, engineering design support during construction, construction management, quality control activities, start-up, commissioning and acceptance testing, O&M manual and record drawings, training and any additional contracted

services for the duration of the Project. It shall contain a construction schedule, Substantial and Final Completion dates, and a Startup, Commissioning and Acceptance Testing Plan.

Alternative approaches and materials of construction will be evaluated using bidding or through in-house cost estimates and final recommendations will be made to the City. After completion of bidding and pricing efforts, the Phase 2 proposal will be updated to summarize a description of the recommended project approach and the details of the GMP estimate.

Deliverables: Phase 2 proposal (Draft and Final) documenting the design-build project scope of work, design drawings and detailed cost estimate including the following:

- Contract amendment (general conditions)
- Final design including drawings and specifications.
- GMP, including recommended Design-Builder contingency, process guarantee, assumptions, clarifications, and exceptions.
- Org Chart for Phase 2
- Phase 2 schedule
- Draft Quality Management Plan
- Draft Startup, Commissioning and Training Plan (Final needs to be done in Phase 2 in coordination with vendors)
- Risk Register

Key Understanding: The AECOM/WML team will provide GMP for the project using an open book bidding process. Certain portions of the work such as concrete work, installation of process equipment and process piping will be self-performed by the AECOM/WML team. Items such as unforeseen site conditions and scope additions are not to be carried in the Design-Builder contingency and should be managed as change orders.

AECOM/WML will provide a Draft Phase 2 Proposal followed by a Final Phase 2 Proposal incorporating the results and agreements of the negotiations with the City.

Meetings/Travel: One full day meeting to review draft Phase 2 Proposal

Information and Services Provided by Others: Input from City on draft Phase 2 Proposal.

Task 3 - Meetings & Reports

Sub Task 3.1 – Kick-off Meeting/Workshop

Objective*:* Discuss project expectations with the City including project scope and execution, roles and responsibilities, quality control, progress reporting, schedule, and deliverables. Review concept design and discuss major unit process treatment that will meet the project performance goals.

AECOM/WML Activities: Prior to the workshop, AECOM/WML will prepare an agenda and PowerPoint presentation all the items described in the objective. Also, AECOM/WML will prepare a data request to gather all information available that can assist in the development of the activities scoped in Phase 1.

Deliverables: Workshop agenda and data request will be issued at least three days before the meeting. A summary of workshop findings will be issued after the meeting. A Project Quality Plan and Project Execution Plan will be developed for discussion in the kick-off meeting.

Key Understanding: The main purpose of the Kick-off / Workshop is to set project expectations and facilitate effective collaboration between the City and AECOM/WML and to plan the specifics of the next steps for Phase 1.

Meetings/Travel: A 4-hour workshop will be held to kick-off the Project at a location chosen by the City. The PM, DM, Process Lead, and Preconstruction Manager will attend in person.

Information and Services Provided by Others: City to attend workshop with key staff and provide a venue.

Sub Task 3.2 – Progress Meetings and Reports

Objective: The overall objective of this task is to ensure on-time and on-budget project progression according to the scope, fluid and coordinated communication with City staff, adequate project controls and quality of all deliverables. Included in this task are 16 Progress Meetings. Progress Meetings will be broken down into a Project Management Segment, to discuss overall project progression and issues, followed by a Technical Collaboration Segment. Technical Collaboration Segments will be used to discuss specific technical items, such as process options or preferences, or to review design submittals for the different design phases after the City has provided their comments.

The following Technical Collaboration Segments are included:

- MBR and Disinfection Technical Collaboration
- Site Layout Technical Collaboration
- Permitting Technical Collaboration
- Other Emerging Topics for Technical Collaboration
- Draft PDR Review
- 30 Percent Design / VE Review
- 60 Percent Design Review
- 100 Percent Design Review

Progress Meetings and Reports

AECOM/WML Activities: Schedule and conduct 16 Progress Meetings with City and City's representatives at City offices or by video conference calls.

Deliverables: Meeting agendas prior to each meeting date. Other relevant documents requiring City review prior to the meeting will be submitted in advance.

Key Understanding: Half-day Progress Meetings will be held. It is envisioned that, typically, the Project Management portion of the Progress Meetings will last one hour and will be attended by the DB project manager, design manager and process lead. The Technical Collaboration Portion of the Progress Meeting will be attended by the same team members plus additional discipline leads as needed to cover the selected technical item.

Meetings/Travel: Meetings will be held with a combination of in person and video conference calls as needed.

Information and Services Provided by Others: City to attend meetings with key staff to provide input on overall Project progress and performance as well as ensuring that appropriate key technical staff participates in the Technical Collaboration segments.

Sub Task 3.3 – Project Status Reports & Monthly Invoices

AECOM/WML Activities: Prepare monthly invoices in accordance with actual progress and a monthly progress report to accompany each invoice for the previous month's work. Progress reports will review major work activities and budget and schedule status by task, summarizing work hours by task and job title and person assigned for the invoice period, and document progress made during the past month, accomplishments, and a look-ahead to the next month's progress goals. Update Phase 1 schedule periodically, comparing actual progress to the originally proposed schedule and identifying any necessary corrective measures.

Deliverables: PDF of monthly invoices and monthly progress reports.

Meetings/Travel: None.

Information and Services Provided by Others: None.

Sub Task 3.4 – Risk Management Workshop

AECOM/WML Activities: AECOM/WML will develop and maintain a risk log. The risk log is the key document used in managing risk. The log records risks identified during proposal and work plan development; workshops, technical reviews, and monthly project meetings; and through other events that occur during the project. Initially the log will be populated with generic risks and those captured through past experience on similar projects. Each identified event is assigned a score based on one of three probability ratings and one of five impact (cost or schedule) severity ratings. This allows a semi-quantitative approach for prioritizing the various risks and to calculate and assign values for the important risks.

A workshop will be used to discuss this risk register and build consensus among stakeholders and as a means to bring the Project together to identify and evaluate potential risks.

The workshop will be held after the 30 Percent Design Submittal and will focus on design and procurement risks, especially those areas indicated in the proposal analysis. After the risk register is developed, it will be maintained through the end of Phase 1 and submitted as part of the Phase 2 Proposal.

Deliverables: Develop and maintain risk log. For workshop, PDF of workshop agenda and risk register will be issued before the workshop. A summary of workshop findings issued after the meeting.

Meetings/Travel: None.

Information and Services Provided by Others: City's input on additional risks and valuation of identified risks.

Sub Task 3.5 – Constructability Review Workshops

Objective: Conduct constructability reviews as a tool to plan and sequence the construction and identify potential capital cost savings for the Project

AECOM/WML Activities:
AECOM/WML technical, construction, and operations specialists will perform constructability reviews to evaluate constructability and potential for less-costly means of achieving City's project value objectives. The constructability review team will conduct reviews of the 30 Percent and 60 Percent Designs. Findings will be presented in a workshop format to promote collaboration between the Design-build team and City staff. Two workshops are planned.

Deliverables:

- PowerPoint presentation for each workshop with agenda and constructability analysis and results. Meeting minutes after each workshop.

Key Understanding: City to provide input during workshop on constructability preferences and constrains.

Meetings/Travel: Constructability Workshops will be conducted in person or virtually. It is anticipated that each workshop will last 2-3 hours.

Information and Services Provided by Others: City's input on the constructability information provided.

Sub Task 3.6 –SCADA Development and Scoping Workshops

Objective: Interact with City staff to analyze and collaborate on electrical, instrumentation, and SCADA needs for the Project

AECOM/WML Activities: Four workshops are planned to discuss electrical, instrumentation, and SCADA needs for the Project.

Prior to the initial Workshop (SCADA Workshop No. 1), prepare a summary of proposed electrical, instrumentation, and SCADA components (including SCADA architecture) of the Project to be presented during the initial workshop to receive input and exchange ideas with City staff and validate project scope and preferences. This will include input from the City on equipment preferences, controls, including automated and fail-safe control, and any SCADA system hardware, software, and programming requirements, including quantity and location of SCADA Human Machine Interfaces (HMIs).

SCADA Workshops No. 2 and 3 will focus on reviewing the conceptual control narratives (control philosophies) developed as part of the design to *ensure obtain* the City*'s* agrees with *input on* the control philosoph*ies* being proposed for the different processes.

SCADA Workshop No. 4 will focus on how the input received in the previous workshops were addressed as well as other topics such as *site-wide* communications, security, cybersecurity, SCADA screens planning for Phase 2, etc.

Deliverables: PowerPoint presentation for each workshop with agenda and technical content. Meeting minutes after each workshop.

Key Understanding: These workshops will provide the basis for the electrical, instrumentation, and SCADA concepts for design and cost estimate. The conceptual control narratives developed in the design phase are preliminary in nature and will have to be adjusted during Phase 2 after the submittals for the equipment are available. However, they will have enough information to provide an understanding to the City how the equipment will be controlled and their level of automation. Equipment and Instrumentation tagging nomenclature will be established in the first workshop and will adhere by all parties.

Meetings/Travel: Four SCADA Workshops will be conducted in person or virtually. It is anticipated that each workshop will last 4 hours. AECOM/WML team members, including design manager, preconstruction manager, *programming lead,* process lead, electrical lead, and I&C lead, will attend in person or virtually.

Information and Services Provided by Others: City to attend workshops with key facility staff to provide input on electrical, instrumentation, and SCADA.

Task 4 – Preliminary Investigations & Support

Sub Task 4.1 – Potholing

AECOM/WML Activities: Potholing activities will be conducted if necessary to locate buried infrastructure, verify as-built locations, and determine utility locations throughout the project site.

Deliverables: None. All information collected in this task will be incorporated into the PDR or design drawings

Key Understanding: A budget of $15k is being carried for potholing and ground radar penetration (GPR) for utility investigation. It is our understanding that the existing plant and the area allocated for the new plant does not have any cultural significance and no special cultural monitoring provisions are required.

Meetings/Travel: It is assumed that the field activities associated with this task will be conducted in a period of two days.

Sub Task 4.2 – Topographic Survey

Objective: Provide a Boundary and Topographic Survey for the WWTP to supplement existing available information and fill information gaps to assist on further development of concept layout, detail design activities, and construction cost estimates.

AECOM/WML Activities: Perform boundary and topographic survey including the existing WWTP and areas of the proposed expanded plant to the west of the existing plant as shown in red in the figure below.

Surveying activities include the following:

<u>Aerial Topographic Survey</u>

- Field locate and recover an existing benchmark and establish survey datum for the project. Vertical datum shall be based on the North America Vertical Datum of 1988 (NAVD88), and Horizontal control will be North American Datum of 1983 (NAD83) State Plan Coordinates, Zone VI.
- Set ground control and aerial targets for aerial topographic mapping of the project limits by aerial subconsultant.
- Fly overall site and process aerial imagery and control.

- Map existing ground surface elevations and identify surface features within the project limits, including curb, gutter, pavement areas, sidewalk, utility appurtenances, structures, fence lines, and other existing visible features for the West and East limits of the project, depicted in Figure 1.
- Provide a 1" = 40' scale digital aerial topographic survey of property with one-foot contour, for the project limits.

Title Report

- Obtain and furnish one Title Report from a title company for APNs: 532-180-008, -009. The Title report will be used to verify legal ownership, legal description of the property, along with easements/encumbrances on the property that may impact the project design and/or property rights.

Boundary Survey

- Utilizing the obtained title report, together with available public records tools, research and compile all appropriate reference materials pertaining to the property, including reference Record Maps, Corner Records, Tie Sheets, Vesting Deeds, Right-of-Way Deeds and Easement Documents.
- Perform field survey to locate and recover existing survey monuments and establish survey control for the project. Horizontal control datum and basis of bearings shall be based on the California State Plane Coordinate System, North American Datum of 1983 (NAD83), Zone VI.
- Map existing property lines, easements, right-of-way, and street centerlines, based on public records research data and items noted in the obtained title report.
- Prepare a boundary survey to show the existing property lines, easements, right-of-way, and street centerlines, for APNs: 532-180-008, -009.

Deliverables:
Digital color orthorectified photo (1” = 40’ scale).

Electronic PDF & CAD of Aerial Topographic Survey from Aerial.

Title Report for APNs: 532-180-008, -009

Electronic PDF of Boundary Survey, signed & stamped by a Licensed Land Surveyor.

AutoCAD file with 2D linework for the existing property lines, easements, right-of-way, and

street centerlines to be used and referenced for design.

Information and Services Provided by Others: City to provide any past survey data, location of historical benchmarks, property survey of newly acquired land to the north of the main plant area, right of ways, easements, etc.

Sub Task 4.3 – Environmental Support

Objective: Identify necessary environmental support and scope of work to be provided as an allowance of $30,000.

AECOM/WML Activities: AECOM/WML will support the update of the previous IS-MND (included as an attachment to the RFP). The City is in the process of updating this IS-MND to include new CEQA and NEPA requirements; the completion of the update is anticipated in Q1 of 2025.

Deliverables: As required to support the update of the IS-MND. It is anticipated that this may include narratives, figures, and other supporting documentation to describe the Project.

Key Understanding: The City will lead this effort and request support to AECOM/WML as needed.

Meetings/Travel: None. Except phone calls as needed as part of the normal communication for the Project.

Information and Services Provided by Others: Preparation of IS-MND

Sub Task 4.4 – Geotechnical Investigation

Objective: Collect subsurface information to determine soil and groundwater conditions as well as corrosivity potential to assist on the development of alternative analyses, detail design activities, and construction cost estimates.

AECOM/WML Activities: The AECOM/WML team will conduct subsurface investigations to supplement the existing information from the previous investigations at the site. The geotechnical investigation includes approximately 4-acres in the area of the proposed WWTP expansion west of the existing WWTP. This task includes the following:

Document Review and Field Preparation

- Review available geotechnical maps and documents to evaluate the subsurface conditions prior to performing field investigation.
- Obtain boring permits.
- Site reconnaissance
- Call Dig Alert and mark out borings.

Geotechnical Investigation

- 8 borings (1 to 100 feet, 5 to 30 feet and 2 to 50')
- Install groundwater monitoring well in the 100' boring (This may be changed to a shorter boring depending on where groundwater is encountered
- Mud rotary drilling methods for two 50' borings and the 100' boring.
- Hollow stem auger drilling methods for other borings
- Drum and dispose of cuttings for mud rotary borings, including analytical testing.
- Assumed thin spread other soil cuttings on site.

Laboratory Testing

- Based on soil conditions encountered, perform collapse potential as well as other lab tests, including moisture and density, grain size distribution, Atterberg limits, corrosion potential, and direct shear tests.

Analyses

- Perform engineering analyses to evaluate the foundation bearing and settlement for the structures, lateral loading conditions, foundation types, groundwater and uplift conditions, as applicable.
- Evaluate the seismic conditions based on the California Building Code.

Report

- Geotechnical report with results of the field investigation and laboratory testing.
- Geotechnical engineering recommendations for the seismic design (code-based parameters), foundations, slope stability, and earthwork for the project.

Deliverables: A draft Geotechnical Report, including corrosion analysis and mitigations, will be included as appendices in the PDR.

Key Understanding: The location and extent of the field investigations will be further refined based on revisions to the proposed site plan and associated facilities.

Meetings/Travel: A representative from AECOM/WML's will travel to the site to supervise the geotechnical investigations.

Information and Services Provided by Others: City to provide any available past geotechnical data, including subsurface investigations and analyses conducted at the site prior to the beginning of the field investigations.

Sub Task 4.5 – Permitting Support

Objective: Provide support for permit review and issuance, as well as compliance and verification, coordinating with regulatory agencies. Develop a plan to be implemented to timely obtain all permits necessary to build and operate the proposed improvements at the WWTP.

AECOM/WML Activities:

The following agencies have jurisdiction over the Banning WWTP in relation to the proposed Project improvements, and the City of Banning will need to coordinate with multiple agencies regarding the review and approval of permit applications to construct and commission the proposed improvements. Permitting support will include regional, state, and federal levels include approvals from and coordination with the following:

- City of Banning (CEQA Lead Agency)
    - Community Development
        - Building Permit
    - Public Works
        - Encroachment Permit
- County of Riverside
    - Department of Environmental Health
        - Solid Waste Facility Requirements
    - Fire Department – Hazardous Materials Division
        - Hazardous Material Business Plan
- California State Waterboard Region 7: Colorado River
    - Stormwater Pollution Prevention Plan (SWPPP) Updates - Proposed changes to the facility that may affect the existing National Pollution Discharge Elimination System (NPDES) General Permit (for stormwater discharges associated with industrial activities) requirements and/or stormwater monitoring, the existing SWPPP must be updated.
    - Salinity and Nitrogen Technical Memorandum
    - Title 22 Engineering Report for the Production, Distribution, and Use of Recycled Water
    - Title 27 Permit
- South Coast Air Quality Management District
    - Authority to Construct Permit
    - Permit to Operate

Key Understanding: AECOM/WML will provide preliminary preparation of all necessary permit applications and facilitation of regulatory agency approval of all permits that are Contractor's responsibility. City will maintain a lead role with the permitting agencies. It is understood that applying and securing these permits will be part of Phase 2 of this Project. Includes permitting new backup generator.

Meetings/Travel: AECOM/WML permitting lead to attend up to 4 meetings and conference calls as needed.

Information and Services Provided by Others: City will sign permit applications, furnish permit application fees, and attend permitting coordination and review meetings with regulatory agencies as necessary. City to provide copies of all relevant existing permits, plus relevant communications with permitting agencies. City staff or consultant will assist in timely contacting regulatory agencies to gather information to prepare schedule and action plan for permitting.

Deliverables: Permitting Plan and submissions will include a draft for City review and final for submittal to agencies.

Sub Task 4.6 – Energy Tax Credits / Incentives

Objective: Explore Federal and State tax credits for energy generating and storage facilities and other incentives related to facilities such as energy savings equipment and electrical vehicles charging stations.

AECOM/WML Activities: AECOM/WML will explore the feasibility of the City obtaining funding from the following:

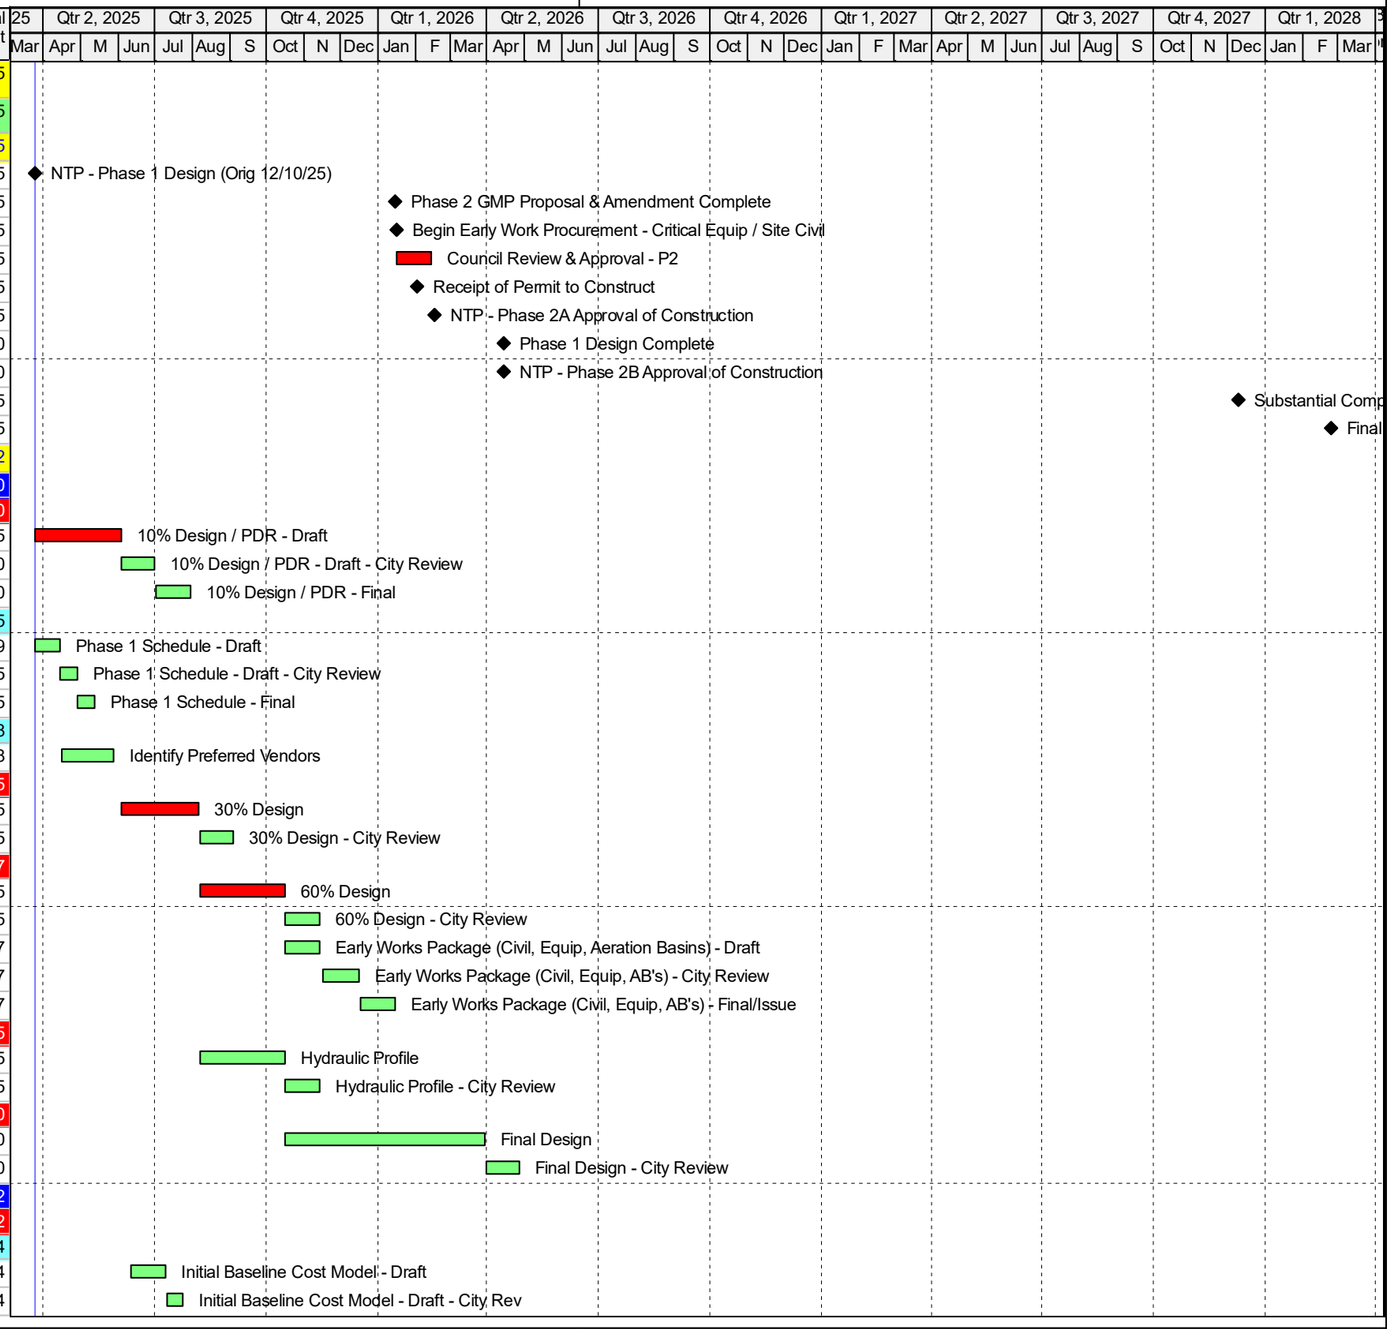
Solar Incentives (Federal ITC):
The Federal Investment Tax Credit (ITC) allows the water treatment facility to claim 30% of the total cost of their solar installation. This includes solar panels, inverters, labor, and other associated costs like permitting fees. The ITC applies to projects completed between now and 2032, providing significant tax savings. For instance, a $100,000 solar installation would result in a $30,000 tax credit, reducing upfront expenses. If the facility's tax liability is less than the credit, the remaining amount can be carried over into future years. This makes solar installation more affordable and offers a quicker return on investment.

Battery Energy Storage Incentives (SGIP):
The California Self-Generation Incentive Program (SGIP) provides rebates for battery energy storage systems (BESS). The rebate starts at $150 per kilowatt-hour (kWh) of installed battery capacity. After the SGIP rebate is applied, the federal Investment Tax Credit (ITC) allows you to claim 30% of the remaining project cost. For example, if a battery system costs $100,000 and qualifies for a $15,000 SGIP rebate, the ITC would then apply to the remaining $85,000. This combined approach can significantly reduce the overall cost.

Direct Pay Provision:
For tax-exempt entities like nonprofits or government-run facilities, Direct Pay allows them to receive the full value of the ITC as a direct payment instead of a tax credit. This ensures that even entities without tax liabilities can fully benefit from both the ITC and any bonus credits.

Deliverables: PowerPoint presentation for workshop with agenda and technical content. Meeting minutes after workshop.

Key Understanding: This effort is limited to the identification of the programs that the City qualifies for and does not include planning and designing a renewable energy facilities.



Meetings/Travel: PowerPoint presentation will be delivered virtually.

Information and Services Provided by Others: City to provide type of energy generating and storage facilities is targeting.

Scope Clarifications, Assumptions, and Exclusions

- Our Phase 1 Services are based on the technical approach and concepts presented in our Technical Proposal (Section 3).
- No CCTV or other video surveillance systems are included in the Phase 1 Services.
- We have assumed a 2-week City review time for each submittal.
- The facility sizing is based on information provided in the concept documents and discussions with the City. Key assumptions include a Maximum Month Flow rate of 3.6 mgd, BOD of 317 mg/l, TSS of 318 mg/l and total Nitrogen of 58 mg/l.
- The extent of SCADA integration of existing facilities will be determined during Phase 1.
- Our Phase 1 scope of services does not include any services related to asbestos or hazardous or toxic materials, paint, etc.
- Costs for unplanned upgrades to existing structures or buildings to comply with National Fire Protection Agency, ADA, or building code requirements triggered by electrical or renovation work in existing facilities is not included.
- The requested and provided Bid Bond (20% of the Phase 1 Cost) will be deemed satisfied and no longer in effect upon the execution of a Phase 1 contract. It will not be carried forward to Phase 2.
- Performance and Payment Bonds for the PDB Basis of Design Services are not included in the Pricing Information Form PDB Basis of Design Services. Cost of Payment and Performance bonds for the full value of the contract will be provided upon execution of the GMP and Phase 2 contract amendment.
- The Phase 1 Baseline Preliminary services follow the schedule and timeline presented as part of this proposal submission.
- We assume progress meetings will be conducted via video conference using Microsoft Teams.
- Cost for phase 1 will be managed as a whole and not by individual tasks requested to be provided in the cost forms on a time and material basis. The Design Build team will have the ability to move funds as needed between tasks to complete the Phase 1 activities without exceeding the total contract value. The price breakdown presented in the Proposal Forms is provided for reference only and does not represent the cost to perform individual items of work separately.
- Electrical design will be limited to all new facilities and not inclusive of the design of a facility-wide upgrade and/or replacement of the existing electrical infrastructure.

APPENDIX A
PROPOSED PHASE 1 DESIGN & PHASE 2 CONSTRUCTION SCHEDULE

18-Feb-25 11:02
Datadate 25-Mar-25

Activity ID	Activity Name	Original Duration	Start	Finish	Total Float
P1D.1740	Permit to Operate (After Construction)	120	31-Mar-26	17-Sep-26	322
Energy Tax Credits / Incentives		20	04-Jun-25	01-Jul-25	40
P1D.1800	Energy Tax Credits / Incentives Support	20	04-Jun-25	01-Jul-25	40
CONSTRUCTION		527	16-Jan-26	23-Feb-28	35
Construction Phase 2A - Early Work		400	16-Jan-26	18-Aug-27	62
Early Procurement		140	16-Jan-26	05-Aug-26	306
Early Administative Tasks		140	16-Jan-26	05-Aug-26	306
C2A.1000	Procure Early Works Subcontractors & Suppliers	60	16-Jan-26	13-Apr-26	37
C2A.1010	Coordinate w/ Banning Elect Utility / SCPPA)	120	17-Feb-26	05-Aug-26	306
Prepare Early Submittals & Submit		120	17-Feb-26	05-Aug-26	182
C2A.1020	P/S Concrete Reinforcing (Rebar) - Aeration Basin / UV SOG	10	17-Feb-26	02-Mar-26	41
C2A.1050	P/S Electrical Materials - General	10	17-Feb-26	02-Mar-26	36

INITIAL STUDY/MITIGATED NEGATIVE DECLARATION

CITY OF BANNING WASTEWATER TREATMENT PLANT EXPANSION AND PHASE I RECYCLED WATER SYSTEM

The City of Banning Public Utilities Department proposes to construct and operate the first phase of its recycled water system in Banning. The Proposed Project would include expansion of the existing 3.6 million gallons per day (mgd) wastewater treatment plant (WWTP), new pipelines to transport recycled water, a pump station, and a storage reservoir for recycled water.

The California Environmental Quality Act (CEQA), as established by the statute (Public Resources Code §§ 21000 *et seq.)*, requires that the environmental implications of an action by a local agency be estimated and evaluated before project approval. This Initial Study has been prepared in accordance with Section 15365 of CEQA Guidelines (14 Cal. Code Reg. 1500 *et seq.*). This Initial Study provides the assessment for a determination of whether the project may have a significant effect on the environment.

SECTION 1. PROJECT INFORMATION

1.1	**Project Title**	Wastewater Treatment Plant Expansion and Phase I Recycled Water System
1.2	**Lead Agency Name and Address**	City of Banning Water/Wastewater Utilities Department 176 E. Lincoln Street Banning, California 92220
1.3	**Contact Person and Phone Number**	Mr. Paul Toor, Director (951) 922-3283
1.4	**Project Location**	The City of Banning is located in Riverside County approximately 20 miles west of Palm Springs along the Interstate 10 (I-10) corridor. The City of Banning wastewater treatment plant (WWTP) is located at 2242 East Charles Street, south of the I-10 and south of the Banning Municipal Airport (Figure 1). The existing Banning WWTP is located on approximately 126 acres and includes treatment plant process units, an operations building, percolation ponds, sludge drying beds, and a vacant field west of the process units. Approximately 16 of these acres are vacant, and would be used for the proposed WWTP expansion. Adjacent land uses are rural residential and industrial. The City's animal shelter and Smith Creek are located south of the Banning WWTP. The proposed recycled water pipeline would be constructed from the Banning WWTP west along Charles Street, north on Hathaway Street, continuing west on Lincoln Street to South Sunset Avenue where it turns south on Sunset Avenue to the unpaved City access road (extension of Westward Avenue) that crosses unimproved land terminating at the Sun Lakes housing development on the west.
1.5	**Project Sponsor's Name and Address**	City of Banning Water/Wastewater Utilities Department 176 E. Lincoln Street Banning, California 92220

Figure 1. Location of the Proposed Project

1.6 General Plan Designation

The City of Banning General Plan designation for the Banning WWTP is Public Facilities and Industrial. Although the proposed recycled water pipeline would be placed primarily in existing or planned streets and the city of Banning rights-of-way, the alignment would cross over the following General Plan designations: Industrial, Airport Industrial, Public Facilities, General Commercial, Business Park, Very Low Density Residential, Low Density Residential, Medium Density Residential, Open Space Park, and Open Space Resources (City of Banning, 2007a).

1.7 Zoning

The location of the proposed project is zoned consistent with the Banning General Plan. The Banning WWTP is zoned Industrial. The proposed corridor for the recycled water pipeline is zoned for industrial, commercial and residential uses.

1.8 Description of the Proposed Project

The City of Banning proposes to expand its 3.6 mgd wastewater treatment plant and construct facilities to support its planned recycled water storage and distribution capability in accordance with the Banning Recycled Water Master Plan. The capacity of the existing WWTP, on approximately 126 acres of land, would expand from 3.6 mgd to 5.1 mgd. The additional 1.5 mgd capacity would include an advanced treatment process using a Membrane Bioreactor (MBR) to produce recycled water. The MBR treatment process would satisfy State of California Department of Health Services (DHS) Title 22 water quality requirements without filtration.

Construction of the proposed recycled water system will provide needed recycled water to the Sun Lakes housing development in

1181

southwest Banning. Recycled water would also be used for irrigation of parks, golf courses, street medians and greenbelts in the Phase I service area as shown on Figure 2. As shown on Figure 2, the Proposed Project would require construction at three locations:

- Approximately 16 of the 126 total acres of property at the Banning WWTP are undeveloped land, and would be used for the proposed WWTP expansion. This undeveloped land is west of the existing WWTP and south of Charles Street. This 16-acre site does not have any structures and is currently not in use. This undeveloped land would be used for the proposed WWTP expansion; a new controls building and laboratory, a 100-ft diameter water storage reservoir tank, chlorine contact basins, fine screening facility, recycled water pad and sump, and the MBR bioreactors would be constructed on the 16-acre site (Figure 3).
- Existing Well R1, east of the WWTP and its percolation ponds, would be retrofitted in order to extract and convey groundwater into the treatment process. Approximately 3,500 feet of buried pipeline would be constructed from the wellhead to the access road and along Charles Street to the WWTP expansion site.
- Approximately 5 miles of recycled water pipeline would be constructed from the existing WWTP to the Sun Lakes housing development to the west. The pipeline alignment would be primarily along existing roadways and within the City's right-of-way. The pipeline would run from the WWTP along Charles Street, north on Hathaway Street, continuing west on Lincoln Street to Sunset Avenue where it would turn south on Sunset Avenue to the unpaved City access road that crosses unimproved land to the Sun Lakes housing development on the west side (the unpaved access road is an extension of Westward Avenue). The recycled water line would continue west on this access road along with the existing water, sewer and gas line to reach the Sun Lakes housing development.

1.9 Background

The City of Banning Water/Wastewater Utilities Department is responsible for providing water and for the collection of wastewater from homes and businesses, including approximately 12,800 dwellings. The City has been providing high quality drinking water to the residents since 1967. More than 30,000 residents in Banning depend on the Department to provide water service to their homes and businesses. By supplying local groundwater pumped from City-owned wells, the Department is able to meet the daily demands of its customers.

The Banning WWTP was originally constructed in 1968. The plant is operated and maintained by United Water Service, a public-private partnership. Recent upgrades have resulted in an increase of secondary treatment capacity to 3.6 mgd. The headworks, completed in 1999, were designed for an ultimate capacity of 7.8 mgd. As of January 2005, the plant received an average flow of approximately 2.4 mgd (City of Banning, 2005). The WWTP is designed for an influent biological oxygen demand (BOD) of 250 milligrams per liter (mg/L). The WWTP is currently receiving flow with an average BOD concentration of 300 mg/L.

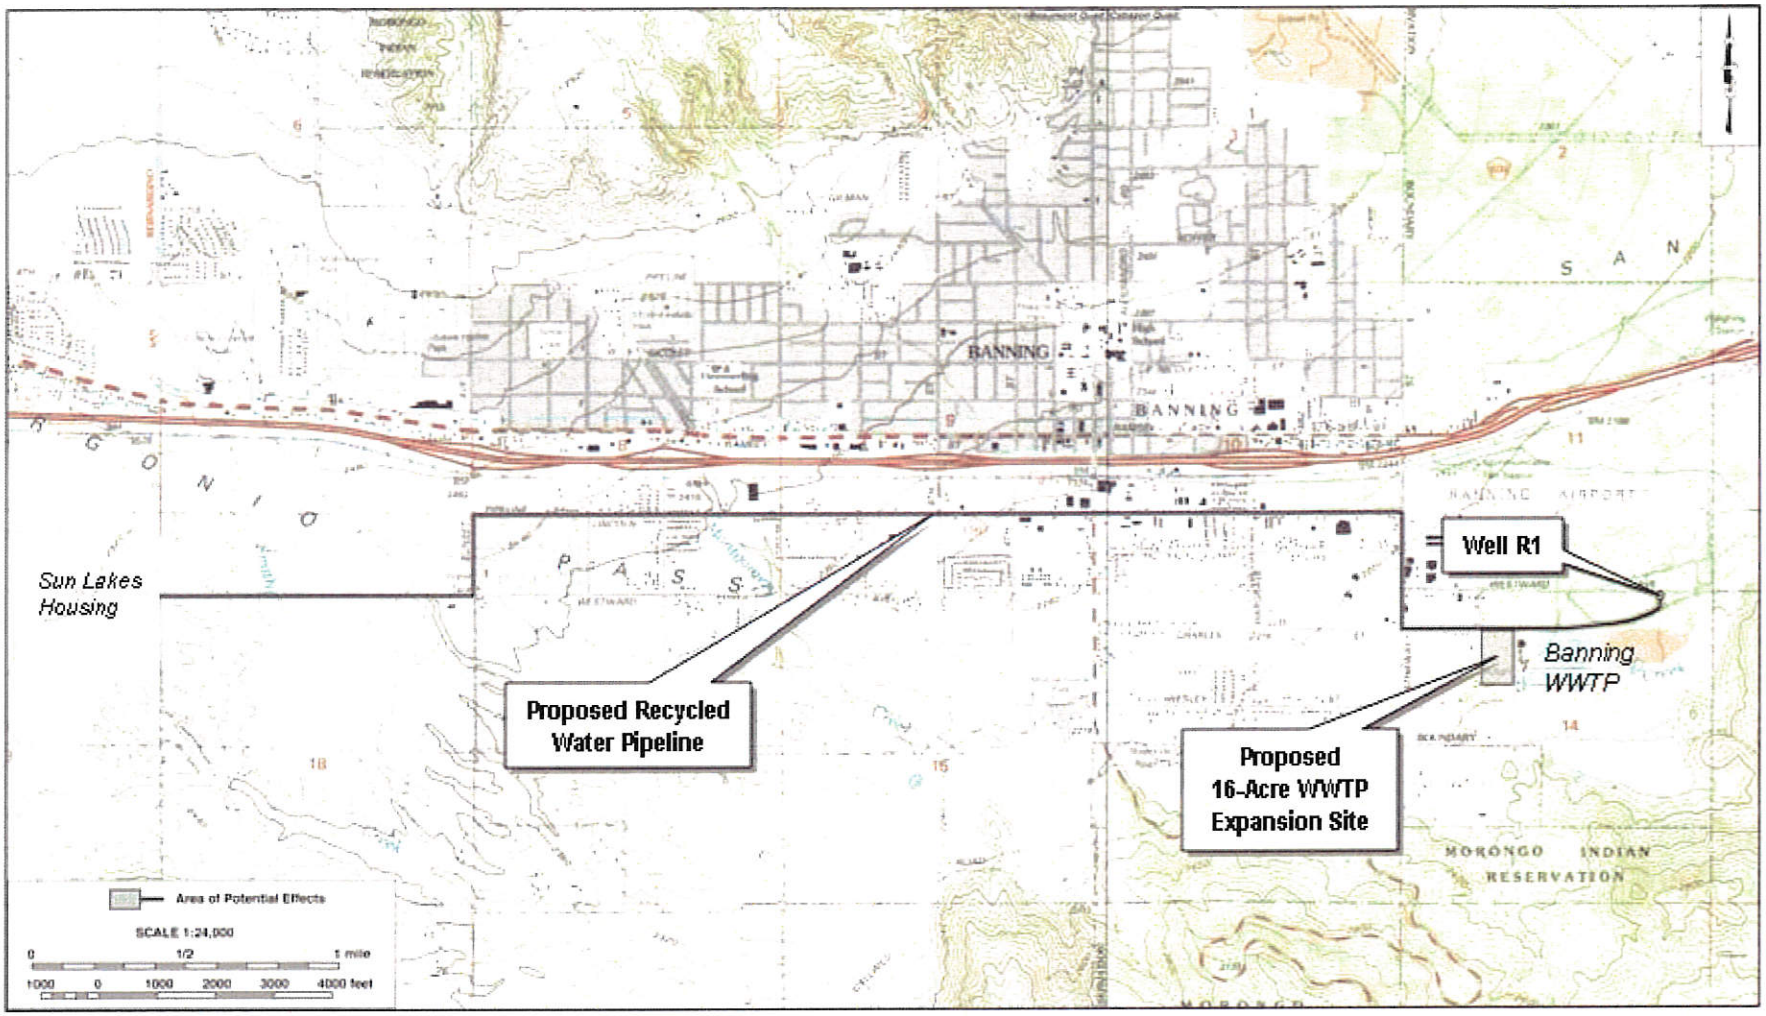

Figure 2. Proposed Expansion of the Banning WWTP and Phase I Recycled Water Distribution System

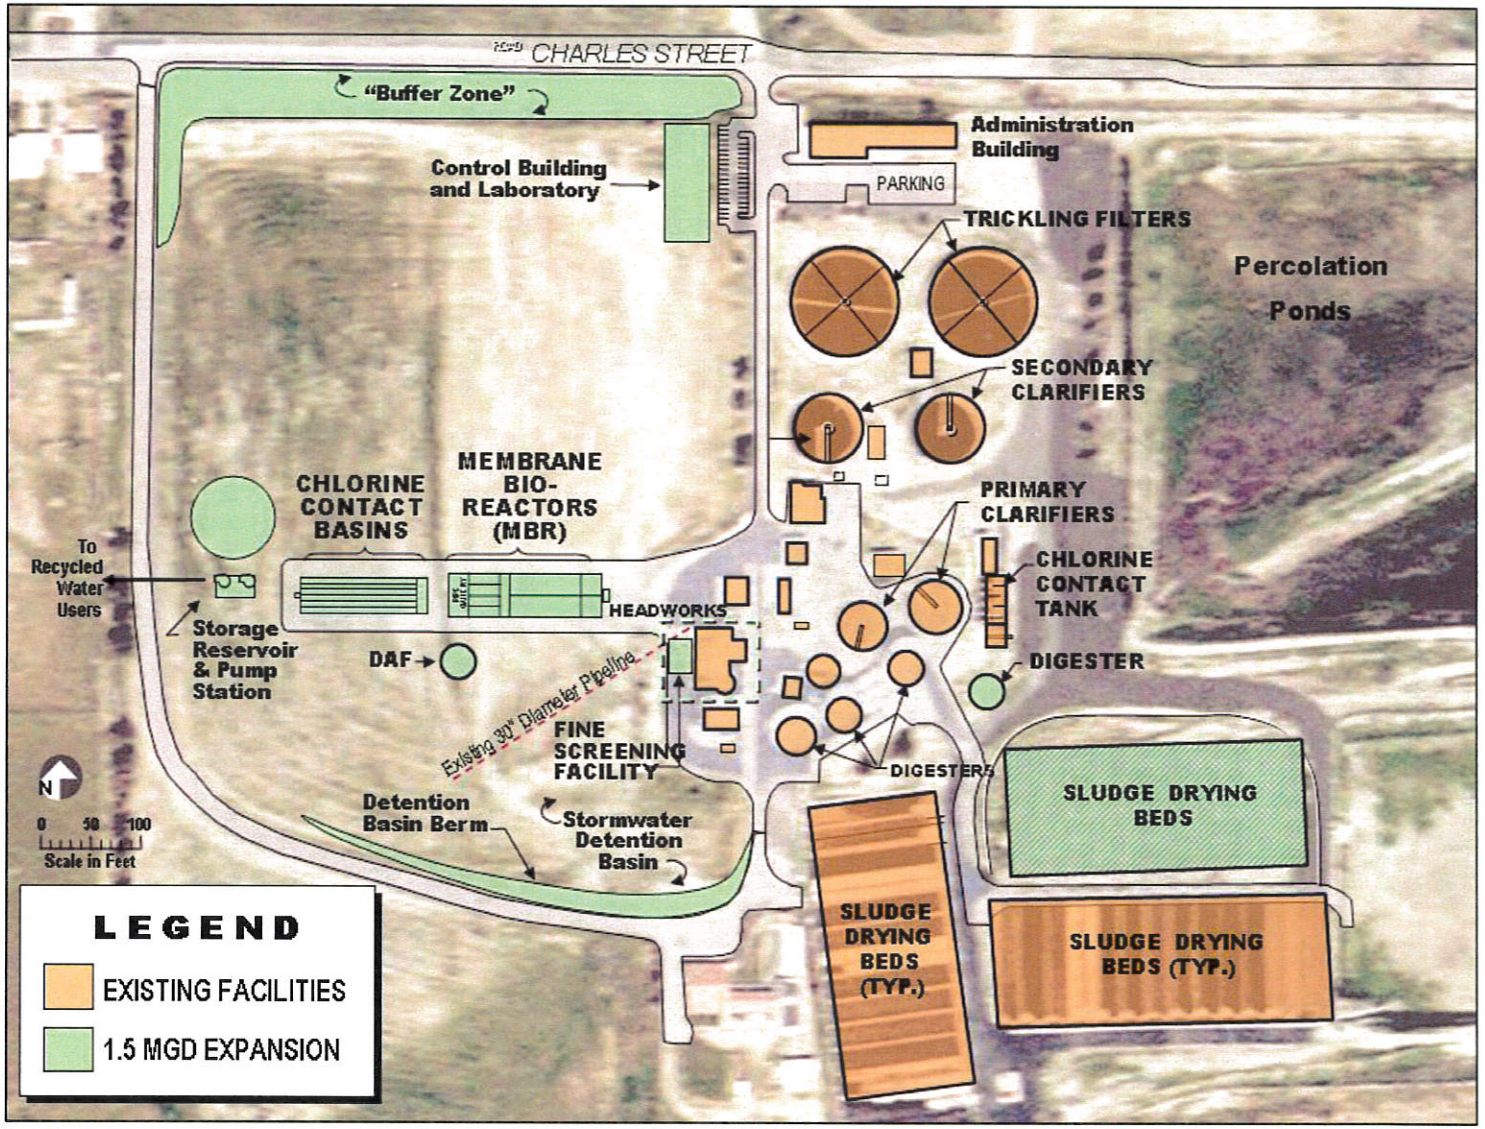

Figure 3. Proposed Expansion of the Banning WWTP on 16-Acre Site

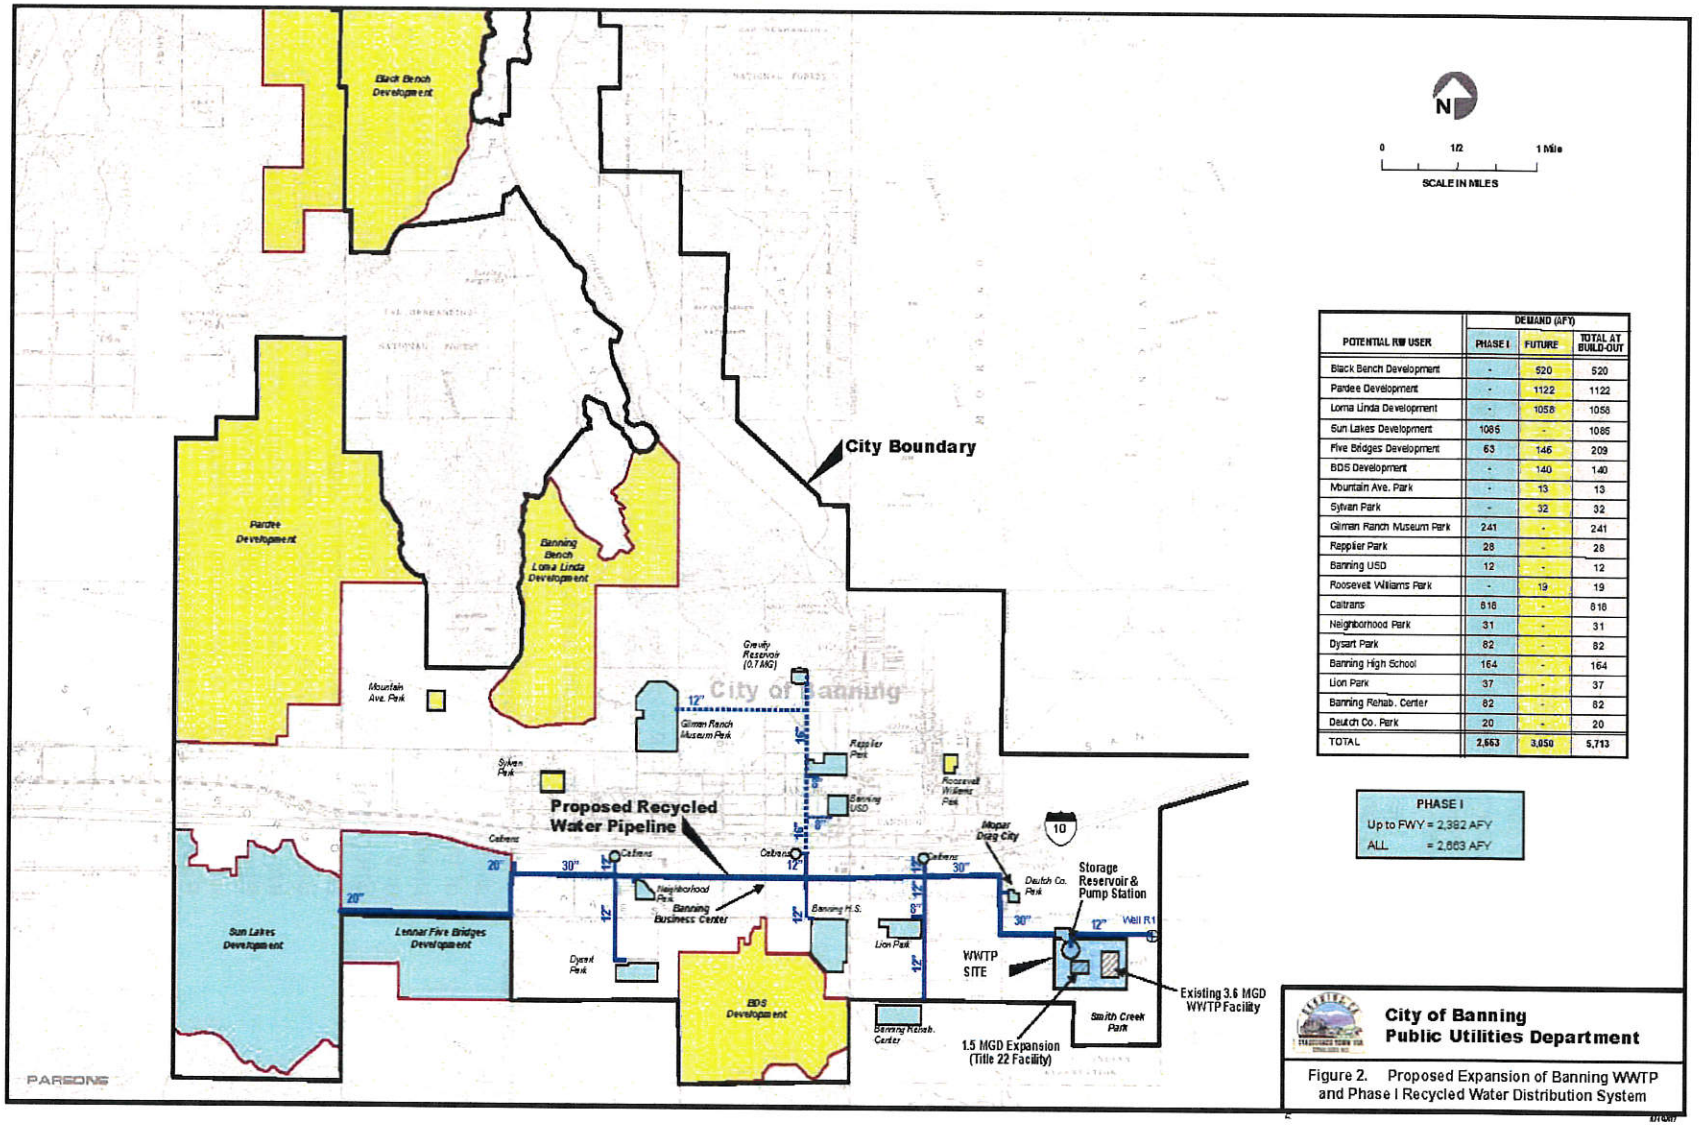
Sewer services are provided to the entire city limits and to the unincorporated areas of Riverside County that surround the southeast section of the City. Collected wastewater is transported by 8-, 10-, 15- and 18-inch diameter sewer main lines connected to trunk lines. Wastewater received at the Banning WWTP undergoes treatment consisting of screening, grit removal, primary clarification, trickling filters, and secondary clarifiers. Anaerobic digesters and sludge drying beds are used for sludge stabilization and dewatering. The existing WWTP does not meet Title 22 treatment requirements[1].

Treated effluent from the existing WWTP is discharged to percolation ponds located west and northeast of the WWTP. This effluent subsequently recharges the East Banning storage unit (City of Banning, 2005). The City has future plans to evaluate the effect of the current effluent discharge on the groundwater quality and develop a mitigation plan, if necessary. As part of the evaluation, the City intends to submit the monitoring plan within three years following the approval of the Waste Discharge Permit for the existing 3.6 mgd WWTP and 1.5 mgd Water Reclamation Facility by the Regional Board. Once the monitoring plan is approved, the City will then install monitoring wells to establish a baseline for the groundwater quality. Depending on the outcome of the evaluation, the City will adopt a mitigation plan which could include, lining the percolation ponds, retrofitting the existing WWTP with nutrient removal treatment processes, or diluting the effluent from the existing WWTP with the higher quality effluent from the proposed MBR plant.



The City of Banning does not produce or use recycled water at this time. Treated wastewater is not being used to offset potable water demands. Golf courses, parks and other medians are currently being irrigated with potable water. The demand for recycled water continues to grow in the area.

In order to provide recycled water for irrigation, the WWTP would have to be upgraded to meet Title 22 tertiary standards. This would require activated sludge, microfiltration, and disinfection (City of Banning, 2005).

The demand for recycled water in the Banning area is projected at over 2,600 acre-feet per year (see Figure 4). Recycled water can be used to meet future irrigation demand and, subsequently, offset a portion of the potable water demand. Recycled water production is projected to increase at a much higher rate than recycled water demand. By the year 2030, it is projected that the City would have approximately 7,500 acre-feet per year of surplus recycled water.

[1] Title 22 is the State of California's code for health and safety standards for drinking water. Division 4 of this code requires an adequately oxidized, coagulated, clarified, filtered, and disinfected wastewater.

Figure 2. Proposed Expansion of Banning WWTP and Phase I Recycled Water Distribution System

Figure 4. Projected Demand for Recycled Water in the Banning Area

The City of Banning will be submitting an application for a State Revolving Fund (SRF) loan to the State Water Resources Control Board. The SRF Loan Program is partially funded by the U.S. Environmental Protection Agency (USEPA) and subject to federal environmental regulations including the Endangered Species Act, the National Historic Preservation Act (NHPA) and the General Conformity Rule for the Clean Air Act. The USEPA has chosen to use the California Environmental Quality Act (CEQA) as the compliance base for California's SRF Loan Program, in addition to compliance with the ESA, NHPA and CAA. Collectively, the State Water Resources Control Board calls these requirements CEQA-Plus.

The State Water Resources Control Board, Division of Financial Assistance, is a Responsible Agency that will act on behalf of the USEPA to review and consider the CEQA document before approving the project's funding. The Board will make findings as to the adequacy of the CEQA document and distribute the applicant's CEQA document to selected federal agencies for review and comments before making a determination on adequacy. The CEQA document is also transmitted to the State Clearinghouse for state agency review as part of the CEQA process.

Additional environmental analyses are required for federal compliance associated with the CEQA-Plus process for the SRF loan application for the proposed Banning wastewater treatment plant expansion and Phase I recycling water system: Endangered Species Act; General Conformity Rule of the Clean Air Act; National Historic Preservation Act; Sections 401 and 404 of the Clean Water Act (Wetland Protection); Coastal Zone Management Act; Farmland Protection Policy Act; Floodplain Management; and, Wild and Scenic Rivers Act. The environmental analyses for applicable federal consultation processes are underway and will be included in the CEQA-Plus documentation that will accompany the SRF loan application. Supporting information for federal requirements is included in, or appended to, this Initial Study.

1.10 Purpose of the Project

The purpose of the project is to provide the existing Banning WWTP with capability to produce recycled water in accordance with Title 22 of the California Code of Regulations. The proposed project would provide a recycled water distribution system to meet the ongoing and projected water supply needs for the Sun Lakes and Five Bridges housing areas. The proposed project would enable availability and use of recycled water, which is not available in Banning at this time. Recycled water would be used primarily for irrigation of street medians, greenbelts, parks and golf courses. Surplus recycled water available during certain times of the year would be stored in reservoirs for future use or percolated into the East Banning groundwater aquifer.

1.11 Construction

Pipeline construction would typically include trenching to a depth of approximately five feet in a corridor approximately five feet wide, placing of bedding material, laying of pipe, backfilling the trench and repaving the street or restoring landscaping. While construction of up to a 2,000-foot segment of pipeline would be anticipated at any

1187

one time, approximately 1,000 linear feet of open trench is expected to occur at any time. While some temporary lane closures may be required, closures of entire roads would not be expected during the construction period. Construction vehicles and equipment would be staged onsite and would not require street closures. Installation of the recycled water pipeline would be required to be separated from the potable water pipeline by a distance of 10 feet, as required by the California Department of Health Services (DHS), unless special materials and construction methods are used.

Construction of the tanks would require site clearing grading and excavation. No demolition of any structures is anticipated. Construction of the water storage tank would require excavation of up to approximately ten feet of earth from the surface to construct the foundation and prepare the subsurface soil for the new facilities. An 1,800-gallon sodium hypochlorite tank would be constructed. Although temporary road closures would not be expected during the construction period, temporary lane closures may be required for pipeline installation. Construction vehicles and equipment would be staged onsite and would not require street closures.

The construction period for the Proposed Project would be approximately two years. Expansion of the Banning WWTP would require approximately eight months, and may occur concurrently with pipeline construction.

1.12 Operation

As shown on Figure 5, the treatment train for the MBR process includes liquid and solids as follows:

- Liquid handling units would incorporate headworks, fine screens, anoxic and aerobic tanks, chlorine contact tank and percolation ponds.
- The solids handling units are dissolved air flotation (DAF), anaerobic digesters and sludge drying beds.

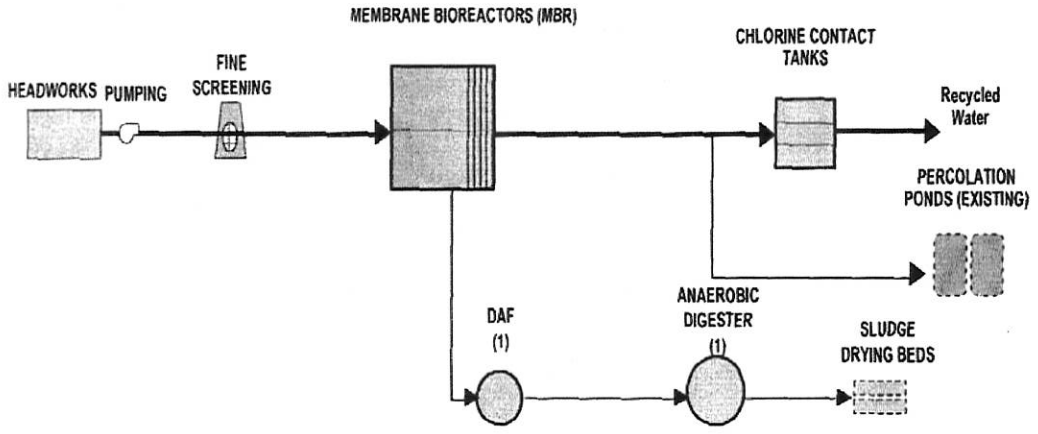

Figure 5. MBR Process Train

The influent pump, DAF circulation, sludge pumps and skimmer and digester mixing, and sludge circulation pumps would operate 24 hours per day. Operation of the expanded Banning WWTP and the proposed recycled water pipelines and reservoirs would be managed by the City of Banning Public Utilities Department.

1.13 Related Projects

A variety of housing, institutional and retail development projects are ongoing and planned in the vicinity of the Proposed Project. Table 1 identifies related projects that are planned, approved, or under construction in the project area. Figure 4 shows the locations of related projects in the area of the Proposed Project.

Table 1. Related Projects in the Vicinity of the Proposed Project

Property Owner	Dwelling Units (du)	Acre(s)	Year of Construction
Pardee Homes Butterfield	5,400	1,522	TBD
Black Bench Ranch	1,500	1,488	TBD
Lennar Five Bridges	2,160	548	2008
Banning Bench Loma Linda	944	600	TBD
Mopar Drag City	--	60	2008
Sun Lakes (Commercial)	--	47	2008
Banning Business Center	--	9	2006
Smith Creek Park	--	150	TBD

TBD to be determined

The Proposed Project is designed to provide recycled water storage and transmission piping to accommodate future growth in the Banning area. Several housing development projects in the area (i.e., Sun Lakes and Five Bridges) have been identified as potential beneficiaries of the Proposed Project.

The City of Banning is in various stages of approving four specific plans for new residential communities that will add almost 10,000 new dwelling units to the City. These new subdivisions also incorporate land for parks and open space, golf courses, medical offices, schools, commercial centers, and quasi-public uses such as churches and fire stations. In addition to these four major development discussed below, a number of small subdivisions ranging in size from 10 lots to 484 lots are in various stages of planning approval and/or construction.

Pardee Homes Butterfield Development

Pardee Homes has an approved specific plan, development agreement, and environmental impact report to build a major new community within the City of Banning on 1,552 acres of land east of Highland Springs Road and north of Wilson Avenue. This approved development includes 5,400 dwelling units. However, Pardee Homes is currently reexamining this plan and considering revisions that will change all housing within the development to single-family dwellings. The new community is approved for a 193-acre golf course, 20 acres of commercial development, 5 acres of medical offices, 75 acres of park land, a new school, and fire station.

1189

Black Bench Ranch Development

A specific plan for the development of Black Bench Ranch has been approved along with the environmental impact report for the development. That EIR is currently under legal challenge. As designed, the ranch's 1,488 acres will be developed with a maximum of 1,500 homes at a density of about 3 units per acre. The remainder of the ranch will include a new school site, 81 acres of parks and trails, and 869 acres of open space. A new roadway system will provide access and circulation for the ranch located on the mountain bench at Banning's northern boundary.

Lennar Five Bridges Development

Lennar has proposed a new community on 548 acres of land located west of Sunset Avenue south of the Interstate 10 and the Union Pacific Railroad right-of-way. The draft specific plan and draft EIR are under public review. Included in the development are 2,160 residences, mostly comprised of single-family dwellings with densities ranging from 3 units an acre to 8 units per acre. There are about 95 patio homes and 273 townhouses at a higher density, along with 51.6 acres of commercial retail space, 106.2 acres of parks and open space, and a site for a new fire station. A major improvement included as part of this development is the construction of a grade separation between the Union Pacific Railroad tracks and Sunset Avenue. The grade separation is being designed and is scheduled to begin construction in 2008.

Banning Bench Loma Linda Property Development

Approximately 600 acres of land on the north mountain bench east of Sunset Avenue has been approved for construction of 844 single-family homes and 100 cluster homes, a 16.2-acre village center with commercial and quasi-public uses, and 325 acres of recreation and open space, including a new golf course with clubhouse and driving range.

Mopar Drag City

Drag City, under construction just south of the Banning Municipal Airport runway, will be Southern California's first professional drag strip to be built in over 40 years. This venue will include a track surface, lights for night racing, and a depressed design to limit the impact of noise on adjacent areas. Drag City will include a quarter-mile regulation drag strip and bleacher seating for up to 10,000 people on about 60 acres.

Sun Lakes Commercial Project

The Sun Lakes Specific Plan includes 47 acres of vacant land north of the Sun Lakes residential subdivision and south of Interstate 10. This acreage, east of the Albertson's/K-Mart Shopping Plaza on Highland Springs Avenue, would be developed for commercial uses. Plans for this acreage would include an auto mall along the freeway and medical offices along Sun Lakes Boulevard.

Banning Business Center

The Banning Business Center is a new business park that will offer condominium space to office, light manufacturing and service retail users. Located on 9 acres at the northwest corner of 4th Street and Lincoln Street, the business park has access to Interstate 10 from the 8th Street exit, which is grade-separated from the Union Pacific Railroad tracks (City of Banning, 2007c).

Smith Creek Park

The City of Banning has developed a Master Plan for passive and active space at the 150-acre Smith Creek Park site located at the eastern terminus of Porter Road, north and south of Smith Creek southeast of the Banning WWTP. The regional park would include equestrian facilities, trails, stables, trailer parking, a grandstand, a riding ring, storage pen, locker facilities, fishing lake, dock, community center, picnic and recreational vehicle camping facilities, amphitheater, tennis and basketball courts, driving range, swimming pool, commercial retail center, restaurants and a hotel. A schedule for this development has not been established (City of Banning, 2007a).

1.14	**Surrounding Land Uses and Setting**	Airport, rural residential, vacant land, and mixed industrial, institutional, commercial uses.
1.15	**Other agencies whose approval is required**	State Water Resources Control Board, County of Riverside Transportation and Land Management Agency and Planning Department, Riverside County Flood Control and Water Conservation District, City of Banning.

1191

Environmental Factors Potentially Affected:

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following page.

☐ Aesthetics	☐ Agricultural Resources	☐ Air Quality
☐ Biological Resources	☐ Cultural Resources	☐ Geology /Soils
☐ Hazards & Hazardous Materials	☐ Hydrology /Water Quality	☐ Land Use /Planning
☐ Mineral Resources	☐ Noise	☐ Population /Housing
☐ Public Services	☐ Recreation	☐ Transportation /Traffic
☐ Utilities /Service Systems	☐ Mandatory Findings of Significance	

Determination: (To be completed by the Lead Agency)

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☑ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Water/Wastewater Utilities Dept.
For

EVALUATION OF ENVIRONMENTAL IMPACTS:

1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

3) Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analyses," as described in (5) below, may be cross-referenced).

5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
   a) Earlier Analysis Used. Identify and state where they are available for review.
   b) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
   c) Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.

8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.

9) The explanation of each issue should identify:
   a) the significance criteria or threshold, if any, used to evaluate each question; and
   b) the mitigation measure identified, if any, to reduce the impact to less than significance

SECTION 2. CEQA ENVIRONMENTAL CHECKLIST

The Environmental Checklist and discussion of potential environmental effects were completed in accordance with Section 15063(d)3 of the California Environmental Quality Act Guidelines, 1998, to determine if the proposed project may have any significant impacts on the environment.

A brief explanation is provided for all determinations. A "No Impact" or "Less Than Significant Impact" determination is made when the project would not have any impact or would not have a significant effect on the environment for that issue area, respectively, based on a project-specific analysis

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
I. Aesthetics. Would the project:				
a) Have a substantial adverse effect on a scenic vista?			X	
While the City of Banning General Plan does not evaluate aesthetics as a planning element, the City's land use policies encourage the preservation of ridgelines, watercourses, washes and greenbelts. Implementation of the General Plan, Zoning Ordinance and other regulatory mechanisms will help to promote conservation within the City of Banning. There are no designated scenic vistas in the City of Banning. The Proposed Project area south of the I-10 freeway is relatively flat, with the San Bernardino Mountains serving as a scenic backdrop. The project setting is generally industrial with rural residential and agricultural uses. There are no scenic vistas in the project area. The proposed expansion of the Banning WWTP and construction of recycled water pipelines would not obstruct general views of the mountains or other scenic aspects of the area. All recycled water pipelines would be located underground and would not adversely affect any scenic views. The effect of the Proposed Project on scenic vistas would be considered less than significant.				
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?			X	
There are no State- or County-designated scenic highways within the project area. Although expansion of the Banning WWTP will be visible to some degree in the local area, this visual impact would not be considered a substantial degradation of the visual quality of the area. Therefore, impacts to scenic resources from the Proposed Project would be considered less than significant.				
c) Substantially degrade the existing visual character or quality of the site and its surroundings?			X	
The project setting within the City of Banning is primarily industrial with rural residential and agricultural land uses in the vicinity. The proposed expansion of the Banning WWTP would be visible in the local area, but would not result in a substantial degradation of the visual quality of the area. All pipelines would be purple (painted purple, constructed of purple pipe or with purple bagging), located underground and would not adversely affect the existing visual quality of the project area. Construction of the recycled water pipeline may degrade the visual quality of the project area during construction activities, but this situation would be temporary and considered less than significant.				

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
The Proposed Project would not result in any conflicts with plans and policies for preservation of open space, and would not adversely impact the visual character and quality of the project area. The Proposed Project would not substantially degrade the visual character of the site and its surroundings.				
d) Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?			X	
The developed portions of Banning exhibit typical urban sources of light and glare. Construction activities would occur primarily during daylight hours; therefore, no new sources of artificial lighting would be necessary during construction at the WWTP or along the pipeline route. The proposed WWTP expansion area would be equipped with artificial lighting for security purposes. This new lighting would be directed inward and not adversely affect day or nighttime views in the area. Therefore, impacts from light and glare would be considered less than significant.				
II. Agriculture Resources. In determining whether impacts to agriculture resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?			X	
The State of California Department of Conservation Division of Land Resources has surveyed land as part of its Farmland Mapping and Monitoring Program. Most of the City of Banning south of the I-10 is classified as Developed or Built-up Land. The proposed recycled water line would cross land that is classified as Williamson Act – Non-Prime Agricultural Land from Sunset Avenue to Sun Lakes housing. Other areas of the Proposed Project are not in the Williamson Act Program. The Proposed Project would not result in conversion of farmland. Impacts to farmland would be considered less than significant.				
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?				X
There are no Williamson Act contracts in place for the affected project area. Therefore, the Proposed Project would not result in any conflicts to existing zoning or Williamson Act contracts.				
c) Involve other changes in the existing environment that, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?				X
The Proposed Project would not result in the conversion of farmland into non-agricultural uses. The impact of the Proposed Project on farmland would be considered less than significant.				
III. Air Quality: Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				

1195

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Conflict with or obstruct implementation of the applicable air quality plan?			X	

The Proposed Project would result in temporary air pollutant emissions during construction of the expanded WWTP and pipelines, as shown on Table 2. The construction-related air pollutant emissions would not result in any conflict or obstruction with the objectives or implementation of the South Coast Air Quality Management District (SCAQMD) Air Quality Management Plan. Impacts to air quality are considered less than significant.

Table 2. Estimated Air Pollutant Emissions from the Proposed Expansion of the Banning WWTP and Construction of Phase I Recycled Water Pipelines

Source	Emissions (lb/day)				
	CO	ROG	NOX	SOX	PM10
Expansion of Banning WWTP	5.74	1.13	14.00	1.48	31.65
Installation of Pipeline from Well R1	0.00	0.00	0.09	0.00	4.87
Installation of Pipeline to Sun Lakes	0.09	0.00	0.17	0.00	72.78
Total	**5.83**	**1.13**	**14.26**	**1.48**	**109.30**
SCAQMD Threshold (lb/day)	550	75	100	150	150

CO = carbon monoxide
ROG = reactive organic gases
NOX = nitrogen oxides
SOX = sulfur oxides
PM10 = particulate matter less than or equal to 10 microns in diameter

Particulate matter emissions shown on Table 2 do not reflect watering for dust control. Although impacts to air quality are considered less than significant, emissions of particulate matter can be reduced by approximately 50 percent with watering for dust control (a standard construction practice).

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?			X	

The Proposed Project would result in the generation of air contaminant emissions that would result from the use of construction equipment and construction worker vehicles (Table 2). These emissions would not exceed SCAQMD significance thresholds. Construction activities would be temporary and would not be expected to result in any adverse, long-term effects on air quality because the generation of air pollutants primarily associated with temporary construction activities would be limited to pipeline installation. Impacts to air quality from construction of the Proposed Project would be considered less than significant. Once the project has been completed, it is estimated that there would be no net change in operational vehicles that would travel within the service area. The impacts to air quality from exhaust emissions from these vehicles would be considered less than significant.

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)?			X	

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
The project area is located in Salton Sea Air Basin and managed by the South Coast Air Quality Management District. The nearest monitoring station is the Banning Air Quality Monitoring Station. The area is classified as a non-attainment area for ozone precursors (reactive organic compounds and nitrogen oxides) and particulate matter. The net increase in emissions of these pollutants that would be attributed to construction of the Proposed Project would not be expected to exceed federal or state standards, nor would they be considered cumulatively considerable.				
d) Expose sensitive receptors to substantial pollutant concentrations?			X	
The nearest sensitive receptors to the site are rural residences immediately west of the 16-acre expansion site west of the Banning WWTP (there are no schools or hospitals within 0.5 mile of the WWTP). None of the residents are expected to be exposed to substantial construction-related pollutants as a result of the Proposed Project. Impacts to sensitive receptors would be considered less than significant.				
e) Create objectionable odors affecting a substantial number of people?				X
No activities would occur, and no materials or chemicals would be stored on-site, that would have the potential to cause odor impacts during project activities at the site. Sodium hypochlorite would be stored on site for use in the treatment process. This material would be stored in a closed system and would not be expected to cause odors. Therefore, adverse odor impacts affecting a substantial number of people would not be expected to occur.				
IV. Biological Resources. Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?		X		
The project area within the Banning city limits is characterized by industrial and rural residential uses. The project area was surveyed by a qualified biologist in April 2007. The Proposed Project would include construction (e.g., ground disturbance) at four locations, as described herein. • The Well R1 site and its associated pipeline to the 16-acre expansion site are inside the Banning WWTP property fenceline and have been partially cleared. An existing dirt road provides access to the percolation ponds and Well R1, which is located upon flat ground. Although the dirt road is heavily traveled, this area is characterized by presence of buckwheat (*Eriogonom fasciculatum*), filaree (*Erodium* sp.) and mustard (*Brassica* sp.). Lark sparrow (*Chondestes grammacus*), western kingbird (*Tyrannus verticalis*), killdeer (*Charadrius vociferous*) and jack rabbit (*Lepus californicus*) were observed on April 4, 2007. Small burrows west of the well may be used by pocket mouse species. The area may potentially serve as habitat for four species considered sensitive by the California Natural Diversity Data Base (CNDDB): San Diego black-tailed jack rabbit (*Lepus californicus bennettii*); pallid San Diego pocket mouse (*Chaetodipus fallax pallidus*); Los Angeles pocket mouse (*Perognathus longimembris brevinasus*); and, coast San Diego horned lizard (*Phrynosoma coronatum blainvillei*). None of these four California Species of Special Concern (CSC) were observed on April 4, 2007.				

1197

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact

- The 16-acre expansion site west of the existing Banning WWTP is generally flat with domestic olive trees (*Olea europaea*) that have been planted along two sides of the field as hedgerows. The property is mowed twice yearly. Vehicular traffic along a perimeter road into the Banning Animal Shelter crosses the parcel near its southern boundary. Plants found on the site include California croton (*Croton californicus*), mustard, yellow fiddleneck (*Amsinckia* sp.), sun cup (*Camissonia* sp.) and annual grasses. Common raven (*Corvus corax*), American crow (*Corvus brachyrhynchos*) and burrows of California ground squirrel (*Spermophilus beecheyi*) were observed on the site on April 4, 2007. No burrowing owls (*Athene cunicularia*) were seen flying or posting on dirt mounds on April 4, 2007, and no ground squirrel burrow had indirect evidence of burrowing owls inhabiting this site.
- The proposed recycled water pipeline corridor from the Banning WWTP to Sunset Avenue would be constructed entirely on paved surfaces, primarily in residential areas. A natural gas pipeline and water supply line are located beneath Lincoln Street (and other streets along this route). Biological resources are limited to annual, introduced species common to urban areas.
- The proposed recycled water pipeline corridor from Sunset Avenue to the Sun Lakes housing area would be constructed on a gravel surface comprising the extension of Westward Avenue. This access road experiences frequent vehicular traffic and bisects the proposed Five Bridges housing property. Although a corridor south of the roadway is fenced, this property is used for cattle grazing. Utility lines (gas and fiber optics) are located on the north side of Westward Avenue, with an aboveground, suspended sewage pipe crossing to the south side of the roadway near the wash of Smith Creek. A series of bridges provide the roadway over the large wash. Wildlife observed on April 4, 2007 included Say's phoebe (*Sayornis saya*), mourning dove (*Zenaida macroura*), European starling (*Sturnis vulgaris*), Brewer's blackbird (*Euphagus cyanocephalus*), crow, raven, and turkey vulture (*Cathartes aura*). Although evidence of pocket gopher (*Thomomys bottae*) was observed, the dirt shoulders of the road contain no biological resources of concern.

The USFWS identified 15 federally protected species known to inhabit locales in the general region of the City of Banning. With the exception of Stephen's kangaroo rat and mountain yellow-legged frog, none of these species occur any closer than 3 miles from the project site (most are known only from very considerably farther away than 3 miles from the project site).

- Stephen's kangaroo rat *(Dipodomys stephensi),* a federal-listed endangered and state-listed threatened species, generally occurs in annual and perennial grasslands, but has also been found to inhabit sparse coastal sage scrub or sagebrush plant assemblages. This small mammal requires areas with well-drained, gravelly or sandy soil for digging their burrows. Stephen's kangaroo rat has been recorded on the Five Bridges housing site. CNDDB records show one entry, from April 1939, representing one animal now in the collections at the Museum of Vertebrate Zoology at Berkeley. No further information about the location or burrows at this location was recorded in 1939. During the site reconnaissance conducted in April 2007, burrows were found which probably were dug by kangaroo rats. The location of each burrow is shown in Appendix D (Biological Resources Survey Report). None of the burrows are closer than 950 ft to the proposed alignment on Westward Avenue. These burrows are at a sufficient distance from the proposed trench on Westward Avenue and would not be affected by the Proposed Project. Suitable habitat for Stephens' kangaroo rat does not occur along the heavily utilized access roadway between Sunset Avenue and the Sun Lakes housing area. The Proposed Project would not result in loss of habitat for this species because the pipeline would be installed in existing roadways.

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
• Yellow-legged frog (*Rana mucosa*), a true frog (Family Ranidae) listed by the USFWS as endangered, but without formal listing by the State. This species always occurs very near water. A single occurrence of this species within 0.25 mile of the project site is from a collection made in 1925 at a vaguely described locale. The species possibly has been extirpated from this locale. The mapped occurrence (shown as 1.0 mile in radius) would intersect the project area only along Lincoln Street at about San Gorgonio Avenue. The Proposed Project would not result in loss of habitat for this species because the pipeline would be installed in existing roadways. No evidence of any special status species was observed along the proposed alignment of the pipeline (west on Lincoln Street to Sunset Avenue, south on Sunset to Westward Avenue, west on the north shoulder of Westward Avenue). The vibration from trenching does not propagate very far through alluvial sediments such as occur along Westward Avenue. Therefore, there would be no concern for kangaroo rats that may inhabit burrows several hundred meters north of Westward Avenue. Vibrations propagated through the ground would not influence birds. Noise generated by diesel engines of tracked excavators, front loaders, and other construction vehicles would likely drive birds away from the immediate vicinity, but not otherwise cause effects. The City would ensure that the following mitigation measures to avoid or minimize habitat disturbance would be incorporated into project design and planning: • *Pipeline design will be limited to the disturbed shoulders of the existing roadway along Westward Avenue. Placement of recycled water pipeline in any washes or creeks will be avoided.* • *A qualified biologist will be present during trenching to monitor ground disturbance to ensure that construction vehicles do not stray, or materials placed, north of Westward Avenue into grasslands of marginal quality but where kangaroo rat burrows might occur north of the project site.* • *Pipeline installation along Westward Avenue from Sunset Avenue to the Sun Lakes housing area would be conducted by minimizing the width of the trench corridor to less than 5 feet, wherever possible.* • *Construction laydown and staging areas would be sited along nearby paved road surfaces and would not be located upon any undisturbed, natural areas.* • *To avoid potential impacts, construction work limits would be clearly designated on construction plans and specifications.* • *To retain native plant material, any topsoil removed from the site would be stockpiled, covered and replaced on-site, as much as possible. During pipeline construction, any non-paved areas that are trenched would be returned to their original condition following pipeline installation.* Implementation of these mitigation measures would avoid impacts to listed species. With implementation of these mitigation measures, the proposed project would not adversely affect listed and sensitive species known to occur in the vicinity.				
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations, or by the California Department of Fish and Game or the U.S. Fish and Wildlife Service?			X	
The project sites do not contain riparian habitat. Pipelines would be constructed within existing roadways and not within drainage areas. Impacts to riparian habitat or other sensitive natural communities would be considered less than significant.				

1199

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?				X
A jurisdictional delineation of resources defined by Section 404 of the Clean Water Act was conducted in 2004. This delineation identified drainages associated with Pershing and Smith Creeks which run through the proposed Five Bridges property. The proposed recycled water pipeline corridor would be placed within the existing access road (Westward Avenue). None of the proposed pipeline segments or other proposed facilities would be sited within U.S. Army Corps of Engineers-defined wetlands. The Proposed Project would not result in physical modifications or placement of facilities in, or adjacent to, streams, flood control channels or wetlands.				
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?		X		
The Proposed Project would not be expected to interfere with movement of small mammals. The proposed recycled water pipeline would be constructed within the existing roadways. With incorporation of the mitigation measures described in Section IV.a, impacts to wildlife movement would be considered less than significant.				
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?				X
The Proposed Project would not result in the need to remove any trees that are subject to local policies or ordinances. The Proposed Project would not result in the removal of any coast live oak trees. No conflicts with local policies or ordinances would be expected.				
f) Conflict with the provision of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?				X
The Proposed Project is not located in a Cell, Cell Group, or Subunit of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). Developed by the Riverside County Transportation and Land Management Agency in order to map out potential reserve areas for habitat conservation, the MSHCP is a comprehensive, multi-jurisdictional effort that focuses on the conservation of 146 species. The MSHCP consists of a reserve system of approximately 500,000 acres of which approximately 347,000 acres are currently within public ownership and 153,000 acres are currently in private ownership. The MSHCP includes 250,000 acres of privately owned land proposed as potential criteria area, including the project site, and will ultimately be reduced to 157,000 acres designated as habitat conservation land.				

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
The Proposed Project would not significantly alter the existing setting, or remove any significant habitat or biological resources. At this time, the project area is not within an area designated for conservation or management under the MSHCP. The Five Bridges site is not considered to be an integral part of any regional or otherwise identified wildlife corridor (Impact Sciences, Inc., 2006). The proposed recycled water pipeline corridor is not located within habitat or fee area for any listed species. Therefore, the Proposed Project would not conflict with the MSHCP or any other existing conservation plan.				
V. Cultural Resources. Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?				X
A cultural resources investigation was conducted for the project area (CRM Tech, 2007). This investigation included a records search to determine the extent of previous cultural resource investigations in the area. Archaeological site records, historic maps, listing of resources on the National Register of Historic Places (NRHP), California Register of Historic Resources (CRHR), California Points of Historical Interest, California Landmarks, and National Historic Landmarks were reviewed to determine whether any archaeological sites or architectural resources exist in the project area. Results of the records search revealed that no historic properties (resources listed on or determined eligible for listing on the NRHP or CRHR) are located within or adjacent to the project area. However, during the field survey, one previously unrecorded historic-period site, 33-16207 was identified within the APE. Site 33-16207 is located on land once owned by Walter Hathaway; however, some of the historic landscape features are likely to post-date Hathaway's association with the property. Therefore, Site 33-16207 does not qualify as a historic property. The Proposed Project would not result in any adverse change to historical resources.				
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?		X		
The cultural resources investigation conducted for the project area (CRM Tech, 2007) identified one previously unrecorded historic-period site with potential archaeological significance, Site 33-16208 (CA-Riv-8364), within the APE. Site 33-16208, a refuse deposit containing temporally and morphologically diagnostic consumer items from the 1920s-1930s, has the potential to yield important archaeological data. The proposed pipeline alignment would be located to avoid Site 33-16208. Two mitigation measures have been identified: • *The pipeline from Well R1 to the Banning WWTP would be aligned to avoid Site 33-16208. The City would ensure that a qualified archaeological monitor flags the boundaries of this site prior to any groundwork, and that the monitor is present during pipeline trenching at this location.* • *In the event any archaeological materials or subsurface deposits are unearthed during earthmoving activities, the construction contractor would cease activity in the affected area (e.g., redirect activities into another area) until the discovery can be evaluated by a qualified archaeologist or historic resources specialist, as required, and appropriate treatment measures implemented.* With incorporation of these mitigation measures into the project, impacts to archaeological resources would be considered less than significant.				

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
c) Directly or indirectly destroy a unique paleontological resource or site of unique geologic feature?		X		

Based on previous and current investigations, no paleontological resources are known in the project area. No fossil vertebrate localities have been identified to date within or near the project area. Although no paleontological resources have been recorded, the proposed recycled water corridor along the extension of Westward Avenue (from Sunset Avenue to the Sun Lakes housing development) is located in Pleistocene older alluvium. Similar Pleistocene sediments located in the region have been found to have a high potential for paleontologic resources and, therefore, the paleontological sensitivity of the site is considered to be high. The occurrence of fossil sites in Pleistocene older alluvium suggests that there is a potential for additional similar, scientifically important fossil remains to be encountered in the project area. Excavations into older Pleistocene alluvium found near washes and flood control easements have previously encountered vertebrate fossils.

Earthmoving activities associated with project construction, as well as the unauthorized collection of fossil remains by construction personnel, could result in the loss of previously unrecorded fossil sites and the remains of extinct land mammal species. This loss would be a significant adverse environmental impact to paleontological resources. To avoid potential impacts to paleontological resources, the District would ensure that the mitigation measures described in Section IV.a are incorporated into project planning (these measures would restrict ground disturbance to specified work areas). In addition, the following mitigation would be implemented during construction:

- *In the event paleontological resources are encountered during earthwork, the construction contractor would cease activity in the affected area (e.g., redirect activities into another area) until a qualified paleontologist can evaluate the discovery, and implement appropriate treatment measures. The paleontologist would determine if the paleontological material should be salvaged, identified and permanently preserved. Curation of specimens into an accredited museum repository would be conducted by a qualified paleontologist, who would also prepare a report of findings for the City of Banning.*

With incorporation of this mitigation measure, impacts to nonrenewable paleontologic resources would be considered less than significant.

d) Disturb any human remains, including those interred outside of formal cemeteries?		X		

The Proposed Project is not expected to encounter any human remains as a result of earthmoving activities. A search of the Sacred Lands File by the NAHC did not indicate the presence of Native American cultural resources in or near the project area, and the project area is not otherwise known to be a previous cemetery or burial site. Therefore, the probability of encountering human remains during project construction is unlikely. To avoid potential impacts to human remains that may be buried beneath the surface in the work area, the City would ensure that the following mitigation measure is implemented:

- *In the event human remains are encountered during project construction, the Riverside County Coroner shall be contacted to determine whether or not investigation of the cause of death is required. In the event the remains are Native American in origin, the Native American Heritage Commission shall be contacted to determine necessary procedures for protection and preservation of remains, including reburial, as provided in the CEQA Guidelines, Section 15064.5(e).*

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
With incorporation of this mitigation measure, impacts to human remains would be considered less than significant.				
VI. Geology and Soils. Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.			X	
There are no known active faults with evidence of surface rupture extending across the proposed site for the expansion of the Banning WWTP. Active faults with surface rupture in the region of the project site include the San Bernardino and Southern extensions of the San Andreas Fault located 9 kilometers from the site at its closest point. The project site is not located within a currently established Alquist-Priolo special studies zone (State of California Fault Rupture Hazard Zone) (Converse Consultants, 2007). Therefore, the potential for surface fault rupture occurring at the project site is considered to be low. The proposed WWTP expansion would be designed to resist damage from an earthquake conforming to the requirements of the 1997 Uniform Building Code of International Conference of Building Officials. The potential impact from rupture of an earthquake fault is considered less than significant.				
ii) Strong seismic ground shaking?			X	
Although no known active faults are found in the area, ground shaking from earthquakes associated with nearby and distant faults may occur during the lifetime of the project (Converse Consultants, 2007). Although no known active faults are found in the area, ground shaking from earthquakes associated with nearby and distant faults may occur during the lifetime of the project (Converse Consultants, 2007). Because earthquake-related hazards cannot be avoided in the southern California region, the project site could be subjected to seismic ground shaking. Therefore, the potential impact from seismic ground shaking would be considered less than significant.				
iii) Seismic-related ground failure, including liquefaction?			X	
The potential for seismic hazards due to the secondary effects of earthquakes, including liquefaction, in the project area is considered low (Converse Consultants, 2007). Therefore, the impact from seismic-related ground failure, including liquefaction, would be considered less than significant.				
iv) Landslides?			X	
The potential for seismic hazards due to the secondary effects of earthquakes, including landslides, in the project area is considered low (Converse Consultants, 2007). Therefore, the impact from seismic-related ground failure, including landslides, would be considered less than significant.				

1203

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Result in substantial soil erosion or the loss of topsoil?			X	
The Proposed Project would result in limited removal of topsoil for construction of the expansion of the Banning WWTP and associated recycled water pipelines. Any topsoil removed from the site would be placed in the immediate area and used for re-compaction purposes. The Proposed Project would not result in development of any structures on sloped areas or within any area of potential slope failure. Therefore, slope stabilization would not be required. The potential for soil erosion and loss of topsoil would be considered minimal. Impacts from erosion and loss of topsoil would be considered less than significant.				
c) Be located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?			X	
The Proposed Project would be designed and constructed in accordance with the recommendations of the site-specific geotechnical investigation which requires that approval by the Geotechnical Engineer for placement and compaction of fill, backfilling of trenches and testing of soils. Based on the geotechnical investigation, it is not anticipated that project construction would result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse. Impacts from unstable soils would be considered less than significant.				
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?			X	
The site is situated on Quaternary-age alluvium and alluvial fan deposits derived from the erosion of earth materials in the San Bernardino mountains to the north and transportation by streams and sheet flow to the site area. These alluvial deposits generally consist of various mixtures of sand, silt and gravel. The expansion potential for soils on the site is expected to be very low based on the soil classification (Converse Consultants, 2007). Therefore, impacts from expansive soils would be considered less than significant.				
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?				X
The Proposed Project would not include the requirement to support the use of septic tanks or alternative wastewater disposal systems.				
VII. Hazards and Hazardous Materials. Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			X	

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
The Proposed Project would involve the transport, storage, use and disposal of sodium hypochlorite, a hazardous substance that is a highly reactive and has exposure effects from inhalation, ingestion and skin contact. Sodium hypochlorite would be used in the MBR treatment process and controlled under secondary containment structures. The expanded WWTP would require the storage of a two-week supply, or approximately 1,800 gallons, of sodium hypochlorite. Sodium hypochlorite would be transported, stored, used and disposed of in accordance with applicable USEPA, RCRA, OSHA and Uniform Fire Code regulations. Operation of the expanded wastewater treatment plant would not be expected to create a significant hazard to the public. The impact of the Proposed Project from hazardous materials would be considered less than significant.				
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?			X	
The Proposed Project would require the storage and use of sodium hypochlorite, a hazardous material. This material would be stored and used with secondary containment that would collect sodium hypochlorite in the event of an unforeseen upset or accident. The impact from release of sodium hypochlorite into the environment would be considered less than significant. The rupture of a recycled water pipeline could result in release of water either onto the street or in the subsurface. Recycled water in the pipeline would be treated to Title 22 standards and would not create a significant hazard to the public (Title 22 treated water is suitable for human contact). Development and operation of the Proposed Project would not result in a significant hazard to the public and no accidental explosion or release of toxic or hazardous substances would be expected to occur. Impacts from hazardous materials would be considered less than significant.				
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?				X
There are no existing or proposed schools within one-quarter mile of the Banning WWTP. The Proposed Project would not use or store hazardous substances in quantities that could result in a significant hazard to the public. Disinfection of recycled water would be accomplished at the Banning WWTF. Disinfection of pipelines would not be conducted, all chlorine injection would be accomplished at the Banning WWTP only. Therefore, no accidental explosion or release of toxic or hazardous substances as a result of the Proposed Project would be expected to occur near an existing or proposed school.				
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?				X

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
A search of available environmental records was conducted in December 2006 by Track Info Services, LLC, an independent database review company. The records search includes a review of available federal, state, and local environmental databases. These databases identify properties or locations that have had known releases of regulated substances, or which have had histories involving the use, storage, treatment, generation, disposal, or handling of hazardous substances. The records search meets search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. No listed facilities within one mile of the project site were present on the National Priority List (NPL), Corrective Action Reports, Treatment Storage and Disposal Facility List, or State Priority List. The site for the proposed WWTP expansion and recycled water pipelines would not create any significant hazard to the public or the environment.				
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?				X
The project area is located approximately 0.4 miles south of the Banning Municipal Airport. The site is within the Banning Municipal Airport Master Plan area, and within the Zone E compatibility area for the airport. Zone E includes additional lands under important airspace around the airport. Aircraft overflight of these areas are typically at altitudes of less than 3,000 feet above the airport elevation. In portions of the area, tall structures are height limited. The proposed expansion of the Banning WWTP would not require construction of structures that would exceed approximately 30 feet in height (height limitations would not be exceeded). Therefore, there would be no airport safety related impacts.				
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?				X
The project area is not located adjacent to any private airstrips. Therefore, there would be no airport safety related impacts.				
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			X	
The Proposed Project would not result in any interference with existing emergency response or emergency evacuation plans for local, state or federal agencies. While temporary lane closures may occur, complete street closures would not be required during project construction. All emergency procedures would be implemented within local, state, and federal guidelines. Therefore, impacts to emergency response or evacuation plans would be considered less than significant.				
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?				X

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
The project site is located in a "moderate" to "no fuel" Fire Threat Zone (City of Banning, 2007a). The construction and operation of the Proposed Project would not result in any increase in the fire hazard at or near the project site. The Proposed Project would not result in any increase in exposure of people or structures to risk from wildland fires. Therefore, impacts from wildland fires would be considered less than significant.				
VIII. Hydrology and Water Quality. Would the project:				
a) Violate any water quality standards or waste discharge requirements?				X
The development of project facilities would increase recycled water distribution within the City of Banning service area. Groundwater from Well R1 would be extracted and piped to the expanded WWTP for processing. No groundwater would be released. Impacts to water quality standards or waste discharge requirements would not be expected.				
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?			X	
The City of Banning WWTP is underlain by the East Banning Storage Unit, which encompasses approximately 4.4 square miles and serves the area at the base of the Banning Bench and the southern portion of the City. In 2004, depth to groundwater within this storage unit was 380 feet below ground surface (fbgs). The Proposed Project would not result in depletion of groundwater supplies because the volume of groundwater withdrawn at Well R1 would be exceeded by the amount being percolated in the series of ponds east of the WWTP. In addition, the production of recycled water would alleviate some of the water demand and provide beneficial uses. The City of Banning is experiencing a temporary surplus of water in the Beaumont Basin, and is allowed to pump sufficient water from this basin in order to meet its water demand (City of Banning, 2005). The earthwork associated with construction of the proposed WWTP expansion and recycled water pipelines would not interfere with any known aquifers. Therefore, impacts to groundwater supplies would be considered less than significant.				
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?			X	
Construction of the proposed recycled water pipeline would not require any alteration of drainage patterns or waterways. Erosion control measures would be implemented during construction to minimize the potential for sediment to be picked up and transported off-site, or by runoff. Construction equipment would not be rinsed off on-site in such a manner to affect nearby drainageways. Construction materials would be covered and stored in contained areas away from Smith Creek. Therefore, impacts to drainage patterns from the Proposed Project would be considered less than significant.				

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
d) Substantially alter the existing drainage pattern of the site or area, including the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off- site?			X	

The Proposed Project would not result in any alteration of the existing drainages. Pipelines would be placed in existing roadways or within public right-of-ways along Charles Street, Hathaway Street, Lincoln Street, and Sunset Avenue. At the extension of Westward Avenue, the proposed recycled water line would be suspended on an existing pipe bridge similar to existing utilities (the pipeline would not be constructed in the washes associated with Pershing or Smith Creeks). This is the only location where the pipeline would be suspended. Design of pipelines at these crossings would include restraint joints to prevent joint separation and possible leakage.

The proposed pipelines would be placed underground and would not result in increased impervious surfaces. The resulting surface runoff would not be expected to change from existing conditions, or result in any increase in flooding. The Federal Emergency Management Agency (FEMA) has identified areas subject to 100-year flood hazards along the northern reaches of Smith Creek and the channels of Pershing Creek (Impact Sciences, Inc., 2006). Floodplains associated with Smith Creek are present south of the Banning WWTP and encompass a portion of the southern ponds at the facility. The proposed expansion of the Banning WWTP would not be located in any area designated as a floodplain. The proposed recycled water line along Lincoln Street would cross over several former (unnamed) washes that had originated on the Banning bench.

Erosion control measures would be implemented during construction of project facilities to minimize the potential for sediment to be picked up and transported off-site by runoff. Standard erosion control measures would include stockpiling and covering topsoil, as well as best management practices to prevent water quality impacts. These measures would be accomplished by the construction contractor and monitored by the City of Banning. Construction equipment would not be rinsed off on-site, or in such a manner as to adversely impact Smith Creek along the southern boundary of the project site. Construction materials would be covered and stored in contained areas away from any drainage areas. Standard erosion control measures would effectively prevent and minimize adverse impacts from runoff. Impacts to drainage would be considered less than significant.

e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?			X	

The Proposed Project would contribute to storm runoff due to an increase in impervious surface area. While approximately 9.5 acres of land would be disturbed, only approximately one acre of land would become impervious. This equates to an increase in impervious land of approximately less than one percent of the total 126 acres of land on which the Banning WWTP is located. Expansion facilities would be designed with adequate site drainage. The capacity of the existing stormwater drainage system is expected to accommodate any increase from impervious areas. Significant adverse operational impacts to surface water quality are not expected to occur. Impacts to stormwater drainage systems would be considered less than significant.

f) Otherwise substantially degrade water quality?				X

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
The Proposed Project would not result in any other effects that could substantially degrade water quality. The Proposed Project would meet all applicable Title 22 requirements, and would not violate any water quality standards or waste discharge requirements. Any discharges would be conducted in accordance with the City's Waste Discharge Requirements (Order No. 01-022) which would be amended for processing of recycled water. The City plans to develop and implement a comprehensive water quality monitoring program to assess the average concentration of total dissolved solids, nitrates and chlorides in the Banning and Cabazon groundwater basins to ensure that percolation ponds are not significantly degrading groundwater quality. No significant impacts to water quality are expected to occur as a result of the Proposed Project.				
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?				X
The Proposed Project would not result in the placement of housing in the 100-year flood hazard area.				
h) Place within a 100-year flood hazard area structures that would impede or redirect flood flows?			X	
Both 100-year and 500-year floodplains have been mapped on the site and in the project area. Although the wash is no longer visible due to development, the historic 100-year floodplain west of the Banning WWTP originates from an unnamed creek originating on the Banning Bench at elevation 3,000 ft above sea level (this unnamed creek is not a tributary of the San Gorgonio River). The 100-year floodplain associated with Smith Creek south of the Banning WWTP extends over a portion of the aeration ponds at the plant. The Proposed Project would be located upon four flood zones designated by FEMA[1] as follows: the WWTP expansion site, Well R1 and the pipeline from Well R1 to the WWTP would be located on Zone C; the recycled water pipeline would be located primarily on Zones B and C; one segment of the pipeline along Lincoln Street at 4th Street would be within Zone A; and, one segment of the pipeline along West Lincoln Street east of Adams Avenue would be located in Zone A4. A portion of the proposed recycled water pipeline along Hathaway and Lincoln Streets, as well as along the unnamed City access road, would be located within the historic 100-year floodplain associated with Smith and Pershing Creeks, Highland Wash and two unnamed creeks originating in the mountains north of Banning. The pipeline would be buried underground at a depth of approximately 5 feet and would not be directly exposed to flood hazards. The Proposed Project would not impede or redirect flow within any creeks or drainage areas. Therefore, impacts to the 100-year flood hazard area would be considered less than significant.				

[1] FEMA has identified and mapped areas that are at risk due to periodic flooding. Flood Insurance Rating Maps (FIRM) includes flood zone designations for areas subject to flooding based on engineering and hydrologic studies. The following flood zone designations are found on the FIRM maps produced for the area of the Proposed Project:
Zones A and A4: Areas with a 1 percent annual chance of flooding over the life of a 30-year mortgage, and considered to be a high risk area (flood insurance is mandatory).
Zones B and C: Areas outside the 1-percent annual chance floodplain and considered to be a moderate to low risk area (flood insurance is not mandatory).

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?				X
The Proposed Project would not expose people or property to flood-related hazards. The net drainage from the area would not be changed with the implementation of the Proposed Project. Therefore, no significant impacts would be expected to occur.				
j) Inundation by seiche, tsunami, or mudflow?				X
Flooding associated with seiches (wave-like oscillations of water in an enclosed basin caused by earthquakes, high winds or other atmospheric conditions) is not anticipated at the project site due to its distance from enclosed bodies of water. The project site is located approximately 50 miles northeast of the coast. The potential for inundation by a tsunami is expected to be a rare occurrence. The Proposed Project would not result in any increased risk for inundation by mudflow. Impacts from seiche, tsunami or mudflow would not be expected.				
IX. Land Use and Planning. Would the project:				
a) Physically divide an established community?				X
The Proposed Project would consist of construction of pipelines within existing or planned roadways. Nearby residential properties would not be adversely impacted by proposed facilities or operations. The Proposed Project would be located on land owned by the City or land that the City has utility easements. Construction of the project facilities would not result in any division of the community.				
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?			X	
The City of Banning designates land use for Banning WWTP as Public Facilities and Industrial. The proposed recycled water pipeline would be placed primarily in existing or planned streets and the city of Banning rights-of-way. The pipeline corridor would cross over the following General Plan designations: Industrial, Airport Industrial, Public Facilities, General Commercial, Business Park, Very Low Density Residential, Low Density Residential, Medium Density Residential, Open Space Park, and Open Space Resources (City of Banning, 2007a). Zoning designations in the City of Banning are consistent with the General Plan. **Coastal Zone Management Act.** The coastal zone for the State of California is defined as the land and water area of the state from the Oregon border to the border of the Republic of Mexico, extending seaward to the state's outer limit of jurisdiction, including all offshore islands, and extending inland generally 1000 yards from the mean high tide line of the sea. In significant coastal estuarine, habitat, and recreational areas it extends inland to the first major ridgeline paralleling the sea or five miles from the mean high tide line of the sea, whichever is less, and in developed urban areas the zone generally extends inland less than 1,000 yards. There have been some minor modifications to the boundary since the program was approved. Riverside County is not within the Coastal Zone. The proposed project is not located within the Coastal Zone.				

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Wild and Scenic Rivers. There are no designated Wild and Scenic Rivers that would be impacted by the proposed project. The closest river with this designation is Sespe Creek in Ventura County, which is approximately 120 miles from the City of Banning. Conflicts with land use designations and zoning ordinance would not be expected. Impacts to local land use and zoning would be considered less than significant.				
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?			X	
There are no conservation plans or natural community conservation plans that overlay the Proposed Project. The proposed expansion of the Banning WWTP and Phase I recycled water distribution line would be located in the developed urban portion of the City of Banning. Conservation areas of Western Riverside County are located south of the project area. The proposed project is not located within the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) area. Therefore, there the Proposed Project would not conflict with the MSHCP or any other existing conservation plan.				
X. Mineral Resources. Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				X
The project area is located in Mineral Resource Zone 3, an area where available geologic information indicates that mineral deposits are likely to exist, however, the significance of the deposit cannot be evaluated from available data. No loss of availability of known mineral resources would result from implementation of the Proposed Project. The impact of construction of the proposed project facilities at this location on mineral resources is considered to be less than significant.				
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?			X	
The Banning Quarry, operated by Robertson's Ready Mix, is the only aggregate producer in the City of Banning. The Banning Quarry is mined for rock, sand and base materials used for concrete and construction. This quarry is located north of I-10 in an MRZ-2 area. The Proposed Project would not be located on any locally important mineral resource recovery site, nor would it result in any interference with existing mining operations at the Banning Quarry. Therefore, impacts to mineral resources would be considered less than significant.				
XI. Noise. Would the project result in:				
a) Exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?			X	

1211

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
The primary noise source in the City of Banning is motor vehicle traffic. In addition, the Banning Municipal Airport generates intermittent noise from daily takeoffs and landings. Noise impacts from project activities are a function of the noise generated by construction equipment, the location and sensitivity of nearby land uses, and the duration of the noise-generating activities. The construction of proposed pipelines would include pavement breaking and excavation. Construction equipment that could be used during expansion of the WWTP includes graders, bulldozers, dump trucks and front end loaders. Construction equipment that could be used during pipeline installation includes jackhammers, pavement breakers and trenching machines. During construction, single-family residences in the immediate area would be subjected to temporary increases in noise levels. Operation of construction equipment may generate intermittent noise levels up to 80 dBA at approximately 150 feet from the source. An average day-night sound level of 65 dBA is generally accepted as a standard for residential communities. Riverside County does not have a specific ordinance addressing noise limits for construction. The County restricts construction noise limits on a nuisance basis. The Building and Safety Department of Riverside County limits construction hours to between the hours of 7 AM to 6 PM. The City of Banning has adopted noise control and abatement ordinances (Nos. 1138 and 1243) in accordance with Section 46026 of the Health and Safety Code (Model Community Noise Ordinance). While temporary increases in noise in the surrounding area may result in annoyance to local residents, adverse effects such as speech interference, sleep disturbance, and hearing loss would not be expected to result. Construction activities for the proposed project would not be expected to exceed the average day-night sound level of 65 dBA. Construction activities would be limited to daytime hours. No post construction noise-generating activities would result from the Proposed Project. The principal source of noise during operations would be from limited vehicular noise from maintenance personnel working at the site. The Proposed Project would not result in any change to the number of personnel. Therefore, impacts to noise from operations would be considered less than significant.				
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?			X	
Construction activities may result in vibration from compacting and grading equipment, including pavement breakers, jack hammers, and a trench machine. Groundborne vibration is measured using the typical annoyance threshold of 72 VdBA (vibrational A-weighted decibel level). Excessive amounts of groundborne vibration or noise levels would not be expected from construction equipment to be used. For these reasons, impacts from groundborne vibration would be considered less than significant.				
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?			X	
No post construction noise-generating activities would result from the Proposed Project. The Proposed Project would result in short-term increases in noise levels during construction, but would not result in any permanent change to the existing ambient noise level once construction of the WWTP expansion and pipelines are complete. Impacts to ambient noise levels in the project vicinity would be considered less than significant.				

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?			X	
The Proposed Project would result in a temporary increase in ambient noise levels during construction activities. The impact of the temporary increase in noise would be considered less than significant.				
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?			X	
The Proposed Project is located within the Banning Municipal Airport Master Plan area, but would not expose people who reside or work in the area to excessive noise levels. The expected noise level from the Proposed Project would not differ substantially from the existing noise environment at the Banning WWTP. Impacts to noise would be considered less than significant.				
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?				X
The Proposed Project is not located in the vicinity of any private airstrips.				
XII. Population and Housing. Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?			X	
The Proposed Project would not have direct growth inducing effects, although it would support the ongoing and planned development in the Banning wastewater treatment service area. The Proposed Project would not result in the need for additional infrastructure. Impacts to population growth would be considered less than significant.				
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?				X
The Proposed Project would not displace any housing. All proposed project facilities would be constructed within existing streets and right-of-ways. Therefore, the project would not result in any impacts to housing.				
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?				X
The Proposed Project would not displace any people, or result in the need for replacement housing elsewhere. Therefore, the Proposed Project would not result in any impacts to housing.				

1213

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
XIII. Public Services. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
a) Fire protection?				X
The Riverside County Fire Department, in cooperation with the California Department of Forestry and Fire Protection, provides fire protection services to the project area. The Proposed Project would not result in any increase in the demand for fire protection services. The Proposed Project would not generate a need for new fire stations in the area or cause any significant impacts to existing fire protection services. Therefore, impacts to fire protection services are not expected.				
b) Police protection?				X
The Banning Police Department and the Riverside County Sheriff's Department provide police protection in the project area. The Proposed Project would allow adequate circulation for pedestrians, vehicles, and police patrols. It is not anticipated that the Proposed Project would result in the need for new police stations in the area, or otherwise impact existing police services.				
c) Schools?				X
The Proposed Project would not generate any additional population in the area, and therefore would not impact local school enrollments. The Proposed Project would not otherwise adversely impact existing and planned schools in the area. Therefore, no adverse impacts to schools would result from the Proposed Project.				
d) Parks?				X
The proposed project facilities would not result in any impacts to local parks. There would be no change to the planned 150-acre Smith Creek Park that would be developed south of the Banning WWTP. The Proposed Project would not result in adverse impacts to existing or planned parks in the region.				
e) Other public facilities?				X
The proposed project facilities would be operated and maintained by the City of Banning or its designated operator, and would not result in any impacts to other public facilities.				
XIV. Recreation				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?			X	
The Proposed Project would not result in any increase in use of any parks or other recreational facilities. Therefore, impacts to existing or planned neighborhood and regional parks would be less than significant.				

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?				X
The Proposed Project would not include any recreational facilities. No impacts to the environment from expansion of recreational facilities would be expected to occur.				
XV. Transportation/Traffic. Would the project:				
a) Cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?			X	
During the construction period, construction workers would access the WWTP expansion site on a daily basis. Assuming that all the workers travel in single occupant vehicles, this would result in additional inbound and outbound vehicle trips. These trips would occur before morning and evening peak hour traffic. Movement of the construction vehicles would not be expected to result in any change to the volume-to-capacity ratio of roadways or congestion at intersections in the local area. Construction-related traffic would be a temporary, short-term condition and is not expected to result in any substantial effects on traffic. Operation of the Proposed Project is estimated to result in no net change in the number of personnel vehicles. For these reasons, impacts to traffic would be considered less than significant.				
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?			X	
Vehicular traffic would be expected to increase temporarily during the construction period as a result of the daily project-related vehicle trips. Traffic may be temporarily delayed during the installation of recycled water pipelines along existing streets (Charles Street, Hathaway Street, Lincoln Street and Sunset Avenue). Temporary lane closures may be required, however, closure of complete roads is not expected. These temporary and localized impacts would not be expected to result in a substantial change to the current level of service for affected roadways. For these reasons, construction impacts to traffic would be considered less than significant. During operations, the Proposed Project would not be expected to result in any change to the existing level of service on any roads or highways in the project area. Impacts to traffic levels of service on roads and highways would be considered less than significant.				
c) Results in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?				X
The Proposed Project would not result in any changes to air traffic patterns that could result in any increases in safety risks.				

1215

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
d) Substantially increase hazards due to a design feature (e.g. sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?				X
No alterations to area roadways are proposed. No substantial increase in hazards or incompatible uses would be anticipated as a result of the Proposed Project.				
e) Result in inadequate emergency access?				X
No changes in access to emergency facilities or nearby land uses are expected to occur as a result of implementation of the project.				
f) Result in inadequate parking capacity?			X	
The proposed WWTP expansion would not require additional employees or maintenance vehicles. The additional proposed project facilities would be maintained by City personnel who currently park within the existing WWTP boundaries. The impact of the Proposed Project on parking is considered to be less than significant.				
g) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?				X
No modifications to the area roadways or bikeways are proposed. There would be no effects on existing facilities and structures (i.e., bus turnouts and bicycle racks) that support alternative transportation. Therefore, the Proposed Project would not result in any conflicts with policies that support alternative transportation.				
XVI. Utilities and Service Systems. Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?				X
The Proposed Project would not result in any discharges of wastewater that exceed treatment requirements regulated by the California Regional Water Quality Control Board (CRWQCB). Any discharges would be conducted in accordance with the City's Waste Discharge Requirements (Order No. 01-022) which would be amended for processing of recycled water. Therefore, there would be no impacts.				
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?				X
The Proposed Project would result in construction and operation of new recycled water distribution facilities intended to meet the growing demand for water in the area. Expansion of the existing Banning WWTP would result in order to meet the demand of planned growth and provide a new capability for recycled water production. Impacts to water or wastewater treatment facilities from the Proposed Project would not be expected.				

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?				X
The Proposed Project would provide recycled water production and distribution facilities for residents in the City of Banning. This would enable irrigation of parks, golf courses and other buffer areas with recycled water, which would replace the use of potable water. No increase in water use would be expected. The Proposed Project would have no effect on storm water drainage in the area.				
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?			X	
Water used at the Banning WWTP is supplied by the City of Banning Water/Wastewater Utilities Department. The Proposed Project would use additional water for the MBR treatment process. This water would be extracted from Well R1 located on City property. The City has entitlement to this water supply in accordance with its 2004 adjudication judgment for groundwater pumping and storage rights in the Beaumont Basin (City of Banning, 2005). Therefore, impacts to water supply would be considered less than significant.				
e) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?				X
The Proposed Project would not result in any increase in wastewater generation or otherwise adversely impact the existing regional sewer system and local wastewater treatment plant. Operation of the Proposed Project would result in no net change in the number of employees or residents in the project area. The project would not result in a need for additional wastewater treatment capacity in the project area. The additional treatment capacity is being added in order to accommodate planned growth in the community and to provide the capability to produce recycled water. No impacts to wastewater treatment systems are expected.				
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?			X	
Construction activities would generate solid waste, however the amount generated would be minimal and is not expected to significantly impact landfill capacities. Solid waste from the project would be disposed of in landfills that have sufficient permitted capacity (Lamb Canyon Sanitary Landfill, El Sobrante Landfill and the Badlands Landfill). Operation of the Proposed Project would not generate solid waste. Impacts to solid waste disposal would be considered to be less than significant.				
g) Comply with federal, state, and local statutes and regulations related to solid waste?			X	
All solid waste disposal would be managed in accordance with applicable federal, state and local statutes and regulations. Impacts to solid waste would be considered less than significant.				

1217

Potential Impacts	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
XVII. Mandatory Findings of Significance				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?			X	
The analysis conducted in this Initial Study results in a determination that the project could result in a less than significant effect on the local environment. The construction activities associated with the Proposed Project would not be expected to substantially degrade fish, wildlife, and/or plant populations. Intrusion on any previously undiscovered cultural or historic resources would not be anticipated (mitigation for inadvertent discovery of cultural materials has been included in this analysis).				
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)			X	
The Proposed Project would result in loss of up to approximately 9.5 acres of marginal habitat as a result of construction of the expansion of the Banning WWTP. Because the habitat that would be lost is marginal in value, impacts from the Proposed Project would not be cumulatively considerable. The analysis in this Initial Study has determined that the project impacts would be considered less than significant.				
c) Does the project have environmental effects that will cause substantial adverse effects on human beings, either directly or indirectly?				X
Direct and indirect adverse effects on human beings would not be expected as a result of the project. The Proposed Project would result in a new capability to produce and distribute Title 22 recycled water to the Banning community, which is considered a beneficial impact.

SECTION 1
CLEAN AIR ACT CONFORMITY

1.1 INTRODUCTION

The Clean Air Act (CAA) requires the U.S. Environmental Protection Agency (USEPA) to promulgate rules that ensure that federal actions conform to the appropriate State Implementation Plan (SIP). These rules are codified in 40 Code of Federal Regulations (CFR) Parts 6, 51, and 93. The SIP is a plan that provides for the implementation, maintenance, and enforcement of the National Ambient Air Quality Standards (NAAQS). This plan provides emission limitations and control measures to attain and maintain the NAAQS. Conformity to a SIP is defined as being consistent with the SIP's purpose of eliminating or reducing the severity and number of violations of the NAAQS and achieving expeditious attainment of such standards.

A federal agency responsible for a proposed action is required to determine if its actions conform to the applicable SIP. If the action involves the Federal Highway Administration or Federal Transit Authority, it falls under Transportation Conformity Rules. All other Proposed Actions fall under General Conformity Rules. The Wastewater Treatment Plant Expansion and Phase I Recycled Water System in Banning, California is applying for funding from the State Revolving Fund (SRF) Loan Program. The SRF Loan Program is partially funded by the USEPA and subject to federal environmental regulations, including the General Conformity Rule for the Clean Air Act. Therefore, the proposed Wastewater Treatment Plant Expansion and Phase I Recycled Water System in Banning, California is a federally-funded action subject to the USEPA General Conformity rules and must conform to the SIP for the State of California.

1.2 CONFORMITY BACKGROUND INFORMATION

Section 176(c) of the CAA prohibits federal entities from taking actions in nonattainment or maintenance areas that do not conform to the SIP for the attainment and maintenance of the NAAQS. Therefore, the purpose of conformity is to:

- Ensure federal activities do not interfere with the emission budgets in the SIPs;
- Ensure federal actions do not cause or contribute to new violations; and,
- Ensure attainment and maintenance of the NAAQS.

In December 1993, USEPA promulgated two sets of regulations to implement Section 176(c) of the CAA. First, on December 24, the USEPA promulgated the Transportation Conformity Regulations (applicable to highways and mass transit) to establish the criteria and procedure for determining that transportation plans, programs, and projects funded under Title 23 U.S.C. or the Federal Transit Act conform with the SIP (58 FR 62188). On December 30, the USEPA promulgated regulations, known as the General Conformity Regulations (applicable to all other projects), to ensure that other federal actions also conform to the SIPs (58 FR 63214).

With respect to General Conformity, all Proposed Actions, such as the proposed Wastewater Treatment Plant Expansion and Phase I Recycled Water System project, are covered unless otherwise exempt. Actions considered exempt from General Conformity include:

- Actions covered by Transportation Conformity;
- Action with clearly *de minimis* emissions;
- Exempt actions listed in the rule; and,
- Actions covered by a "Presumed to Conform" demonstration (an approved list).

Conformity can be demonstrated by:

- Showing emission increases are included in the SIP;

- The affected state agreeing to include increases in the SIP;
- No new violations of NAAQS and/or no increase in the frequency/severity of violations for areas without SIPs;
- Offsets; and,
- Mitigation.

1.3 GENERAL CONFORMITY DETERMINATION PROCESS

The General Conformity Rule consists of three major parts: applicability, analysis, and procedure. These three parts are described in the following sections.

1.3.1 Applicability

Attainment Areas

The General Conformity Rule applies to Proposed Actions occurring in air basins designated as nonattainment for criteria pollutants or areas designated as maintenance areas. Proposed Actions occurring in air basins that are in attainment of the NAAQS are not subject to the Conformity Rule.

A criteria pollutant is defined as a pollutant for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations in order to protect public health and public welfare. A nonattainment area is any area that does not meet (or that contributes to ambient air quality in a nearby area that does not meet) the national primary or secondary ambient air quality standard for the pollutant. A maintenance area is a redesignated nonattainment area for any air pollutant that has attained the national primary ambient air quality standard for that air pollutant. Criteria pollutants and designation of attainment status are further discussed in Section 3.2.

De Minimis Emissions Levels

Threshold (*de minimis*) rates of emissions were established in the Final Rule to focus conformity requirements on those Proposed Actions with the potential to have significant air quality impacts. With the exception of lead, the *de minimis* levels are based on the CAA's major stationary source definitions for the criteria pollutants (and precursor criteria pollutants) and vary by the severity of the nonattainment area. A conformity determination is required when the annual total of direct and indirect emissions from a Proposed Action occurring in a nonattainment or maintenance area equals or exceeds the annual *de minimis* levels.

Table 1-1 lists the *de minimis* levels by pollutant applicable for Proposed Actions in nonattainment areas. The *de minimis* level for ozone applies to each precursor, volatile organic compounds (VOC) and nitrogen oxides (NO_X). The *de minimis* level for $PM_{2.5}$ applies to each precursor (as deemed significant), sulfur dioxide (SO_2), NO_X, and VOC or ammonia. Those levels specific to Air Quality Control Region (AQCR) 24, the region in which the project is located, are shown in bold type. The project activities will occur in an area designated as serious nonattainment for CO and PM_{10}; severe-17 nonattainment for 8-hour ozone; and nonattainment for $PM_{2.5}$.

Regional Significance

A Proposed Action that does not exceed the threshold rates of criteria pollutants may still be subject to a General Conformity determination. General Conformity applies if a Proposed Action is considered to be "regionally significant", meaning the direct and indirect emissions of any pollutant represent ten (10) percent or more of a nonattainment or maintenance area's emissions inventory for that pollutant.

Exemptions and Presumptions

The final rule contains exemptions from the General Conformity process. Certain Proposed Actions are deemed by the USEPA to conform because of the thorough air quality analysis

1227

required to comply with other statutory requirements. Examples of these actions include those subject to the New Source Review program, and remedial activities under the Comprehensive Environmental Response, Compensation and Liability Act.

Table 1-1 *De Minimis* Levels for Criteria Pollutants in Nonattainment Areas

Pollutant	Designation	Tons/Year
Ozone*	Serious Nonattainment	50
	Severe Nonattainment	**25**
	Extreme Nonattainment	10
	Other nonattainment areas outside of ozone transport region	100
	Marginal and moderate nonattainment areas inside ozone transport region	50/100
Carbon Monoxide	**All nonattainment areas**	**100**
Sulfur Dioxide	All nonattainment areas	100
Lead	All nonattainment areas	25
Nitrogen Dioxide	All nonattainment areas	100
Particulate Matter	Moderate nonattainment (PM_{10})	100
	Serious Nonattainment (PM_{10})	**70**
	Nonattainment ($PM_{2.5}$)	**100**

* includes precursors: VOC or NO_X
Bold values indicate pollutant levels specific to AQCR 24
Source: 40 CFR 51.853

Other Proposed Actions that are exempt from the conformity process include those actions that would result in no increase in emissions, or an increase in emissions that is clearly *de minimis*. Examples include continuing or recurring activities, routine maintenance and repair, administrative and planning actions, land transfers, and routine movement of mobile assets.

A federal agency can establish its own presumptions of conformity through separate rulemaking actions. Section 176(c) of the CAA does not specifically exempt any activity, thus a separate analysis would need to show that the activity presumed to conform has no impacts to air quality. Based on this analysis, a federal agency can document that certain types of future actions would be *de minimis*.

1.3.2 Analysis

A conformity analysis for the Proposed Action examines the impacts of the direct and indirect emissions from mobile and stationary sources, and emissions from any reasonably foreseeable Proposed Action. Indirect emissions are those emissions of a criteria pollutant or its precursors that are caused by the Proposed Action but may occur later in time and/or may be farther removed in distance from the action itself but are still reasonably foreseeable; and the federal agency can control and will maintain control over the indirect action due to a continuing program responsibility of the federal agency. Reasonably foreseeable emissions are projected future indirect emissions that are identified at the time the conformity determination is made; the location of such emissions is known and the emissions are quantifiable, as described and documented by the federal agency based on its own information and after reviewing any information presented to the federal agency.

The conformity determination procedure is detailed in 40 CFR 51.589. The analysis is based upon the latest planning assumptions, the latest emission estimation techniques, applicable air quality models, databases, and other requirements of the "Guideline on Air Quality Models (Revised)" (USEPA Publication No. 450/2-78-027R, 1986), and on the total of direct and indirect emissions from the action. Finally, actions required to issue a conformity determination must list mitigation measures and go through the public notice process. Exempt actions are not required to go through this process.

1.3.3 Procedure

Procedural requirements of the conformity rule allow for public review of the federal agency's conformity determination. Although the conformity determination is a federal responsibility, state and local air agencies are provided notification and their expertise is consulted. No

documentation or public participation is required for applicability analyses that result in *de minimis* determinations.

The federal agency must provide a 30-day notice of the Proposed Action and draft conformity determination to the appropriate USEPA Region, and state and local air control agencies. The federal agency must also make the draft determination available to the public to allow opportunity for review and comment.

1229

SECTION 2
DESCRIPTION OF THE PROPOSED ACTION

The City of Banning proposes to expand its existing 3.6 mgd wastewater treatment plant and construct additional supporting structures to support the City's planned recycled water storage and distribution capability in accordance with the Banning Recycled Water Master Plan.

2.1 LOCATION OF THE PROPOSED ACTION

The City of Banning is located in Riverside County approximately 20 miles west of Palm Springs along the Interstate 10 (I-10) corridor. Figure 2-1 shows the general location of the project area. The Proposed Action is located within AQCR 24.

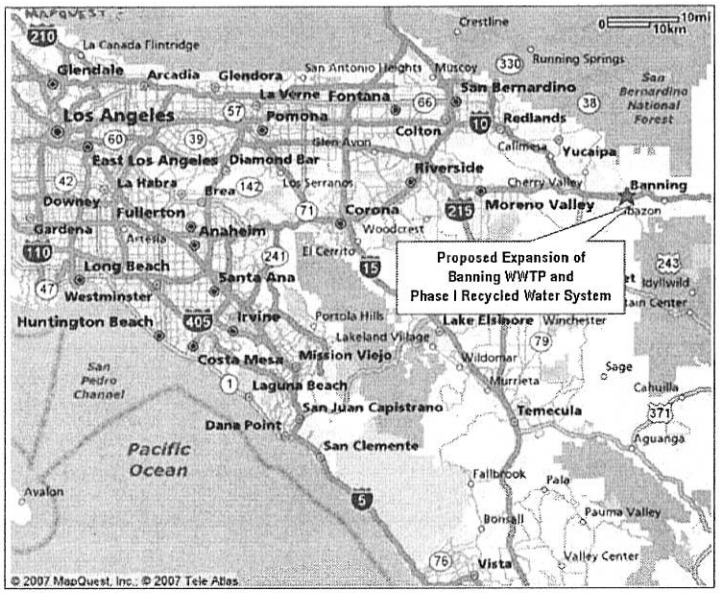

Figure 2-1 Location of the Proposed Action

2.2 PURPOSE OF THE PROPOSED ACTION

The purpose of the project is to provide the existing Banning WWTP with upgrades necessary to process high strength wastewater generated in the service area and produce Title 22 recycled water. The Proposed Action would provide a recycled water distribution system to meet the ongoing and projected water supply needs for the Sun Lakes and Five Bridges housing areas. Recycled water would be used primarily for irrigation of street medians, greenbelts, parks and golf courses. Surplus recycled water available during certain times of the year would be stored in reservoirs for future use or percolated into the East Banning groundwater aquifer.

2.3 ELEMENTS OF THE PROPOSED ACTION

2.3.1 Project Construction

As shown on Table 2-1, several areas of construction will be associated with the Proposed Action:

- **Expansion of Existing WWTP. This project would include construction of the expansion on approximately 16 of the 126 total acres of property at the Banning WWTP. The expansion includes an aboveground water storage reservoir, electrical controls/laboratory building, a chlorine contact tank, and the facility for the MBR process.**
- **Installation of 3,500 feet of pipeline. Existing Well R1, east of the WWTP and its percolation ponds, would be retrofitted in order to extract and convey groundwater into the treatment process. Approximately 3,500 feet of buried pipeline would be constructed from the wellhead to the access road and along Charles Street to the WWTP expansion site. Pipeline construction would typically include trenching to a depth of approximately five feet in a corridor approximately five feet wide, placing of bedding material, laying of pipe, backfilling the trench and repaving the street or restoring landscaping.**

•

1231

Table 2-1 Construction Project Information

Project	Project Area (sq ft)	Demolition (sq ft)	Start Date (FY)	Duration (months)
Expansion of existing WWTP	418,176	NA	08	8 months
Installation of 3,500 feet of pipeline	35,000	NA	08	3 months
Installation of 5 miles of pipeline	264,000	NA	08	24 months
Total	717,176	NA	NA	NA

* Based on trenching to a depth of approximately five feet in a corridor approximately five feet wide

- **Installation of 5 miles of pipeline. Approximately 5 miles of recycled water pipeline would be constructed from the existing WWTP to the Sun Lakes housing development to the west. Pipeline construction would typically include trenching to a depth of approximately five feet in a corridor approximately five feet wide, placing of bedding material, laying of pipe, backfilling the trench and repaving the street or restoring landscaping**

Four other past and reasonably foreseeable projects could occur during the same time period as the Proposed Action. Table 2-2 lists the construction projects.

Table 2-2 Construction Project Information, Cumulative Condition

Project	Project Area (Square Feet)	Demolition (Square Feet)	Start Date (FY)	Duration (months)
Lennar Five Bridges	23,870,880	0	08	72
Mopar Drag City	2,613,600	0	08	12
Sun Lakes (Commercial)	2,047,320	0	08	36
Banning Business Center	392,040	0	06	12
Total:	28,923,840	0	NA	NA

- **Lennar Five Bridges Development. Lennar has proposed a new community on 548 acres of land located west of Sunset Avenue south of the Interstate 10 and the Union Pacific Railroad right-of-way. The Draft Specific Plan EIR is in public review. Included in the development are 2,160 residences, mostly comprised of single-family dwellings with densities ranging from 3 units to 8 units per acre. There are about 95 patio homes and 273 townhouses at a higher density, with 51.6 acres of commercial retail space, 106.2 acres of parks and open space, and a site for a new fire station. A major improvement would be a grade separation between the Union Pacific Railroad tracks and Sunset Avenue, which is scheduled to begin construction in 2008.**
- **Mopar Drag City. Drag City, under construction just south of the Banning Municipal Airport runway, will include a track surface, lights for night racing, and a depressed design to limit the impact of noise on adjacent areas. Drag City will include a quarter-mile regulation drag strip and bleacher seating for up to 10,000 people on approximately 60 acres.**
- **Sun Lakes Commercial Project. The Sun Lakes Specific Plan includes 47 acres of vacant commercial land north of the Sun Lakes residential subdivision and south of Interstate 10. This commercial acreage is east of the Albertson's/K-Mart Shopping Plaza on Highland Springs Avenue. Plans for this project would include a new auto mall and medical offices along Sun Lakes Boulevard.**
- **Banning Business Center. The Banning Business Center is a planned business park that would offer condominium space to office, light manufacturing and service retail users. Located on nine acres at the northwest corner of 4th Street and Lincoln Street, the**

business park would have access to Interstate 10 from the 8th Street exit, which is grade-separated from the Union Pacific Railroad tracks.

1233

SECTION 3
EXISTING AIR QUALITY

Air quality is characterized by the existing concentrations of various air pollutants, and the climatic and meteorological conditions within an area. Precipitation, wind direction and speed (horizontal airflow), and atmospheric stability (vertical airflow) are factors that determine the extent of pollutant dispersion.

3.1 METEORLOGICAL CONDITIONS

The Banning area experiences consistent wind conditions. The average annual wind speed is 5.0 knots. The wind averages 4.5 knots during the winter months and 5.5 knots during the summer months. During June through August, the predominant wind directions are from the west-northwest and typically have the highest average wind speed of 5.5 knots (WRCC, 2007).

The Banning area experiences mild temperatures with an average annual temperature of 76 degrees Fahrenheit (°F). The warmest months are July and August with a mean monthly temperature of 94°F and January is the coldest month with a mean monthly temperature of 37°F (WRCC, 2007).

The Banning area experiences moderate precipitation. Most of the precipitation falls during the winter months of December through March. The average precipitation during this time period is 3.0 inches per month. Throughout the rest of the year, the average precipitation is only 0.7 inches per month. The average annual precipitation is 18 inches (WRCC, 2007).

3.2 CRITERIA POLLUTANTS AND STANDARDS

The NAAQS were established by the USEPA for six pollutants. Criteria pollutants are defined as those pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations in order to protect public health. Criteria pollutants cause or contribute to air pollution which could endanger the public health or welfare. The USEPA has described the potential health and welfare effects of these pollutants. It is on the basis of these criteria and the health and welfare objectives that the standards are set or revised.

The six criteria pollutants are ozone (O_3), particulate matter ($PM_{2.5}$ and PM_{10}), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), and lead (Pb). Even though ozone is a regulated criteria pollutant, it is not directly emitted from sources. Ozone forms as a result of VOC and NO_x reacting with sunlight in the atmosphere.

The General Conformity Rule addresses the impact of the Proposed Action on the area's attainment of the NAAQS. The NAAQS for the criteria pollutants are shown in Table 3-1.

Air quality is determined by comparing ambient air levels with the appropriate primary or secondary NAAQS for each criteria pollutant. National primary standards establish the level of air quality necessary to allow an adequate margin of safety to protect the public heath. National secondary standards establish the level of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

Table 3-1 National Ambient Air Quality Standards

Pollutant	Averaging Time	Federal Standards	
		Primary	Secondary
Ozone (O_3)	1 Hour	No Standard	Same as Primary Standard
	8 Hour	0.08 ppm (157 µg/m^3)	
Respirable Particulate Matter (PM_{10})	24 Hour	150 µg/m^3	Same as Primary Standard
	Annual Arithmetic Mean	---	
Fine Particulate Matter ($PM_{2.5}$)	24 Hour	65 µg/m^3	Same as Primary Standard
	Annual Arithmetic Mean	15 µg/m^3	
Carbon Monoxide (CO)	8 Hour	9 ppm (10 mg/m^3)	None
	1 Hour	35 ppm (40 mg/m^3)	
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	0.053 ppm (100 µg/m^3)	Same as Primary Standard
Lead	Average Calendar Quarter	1.5 µg/m^3	Same as Primary Standard
Sulfur Dioxide (SO_2)	Annual Arithmetic Mean	0.030 ppm (80 µg/m^3)	---
	24 Hour	0.14 ppm (365 µg/m^3)	---
	3 Hour	---	0.5 ppm (1300 µg/m^3)

Due to a lack of evidence linking health problems to long-term exposure to coarse particle pollution, the U.S. Environmental Protection Agency revoked the former annual PM_{10} standard of 50 µg/m^3 in 2006 (effective December 17, 2006). Source: http://epa.gov/air/criteria.html#2

Areas not meeting ambient air quality standards are designated as being in nonattainment for the specific pollutant causing the violation. The CAA Amendments of 1990 (CAAA) further classified O_3, CO, and PM nonattainment areas based on the magnitude of the problem. Depending on the classification (e.g., ozone: marginal, moderate, serious, severe, or extreme), an area must adopt certain air pollution reduction measures. The classification also determines when the area must achieve attainment.

3.2.1 Ozone

Ozone is not emitted directly into the air but is formed through chemical reactions between natural and man-made emissions of VOC and NO_x in the presence of sunlight. Thus, VOC and NO_x are referred to as "precursors" of ozone. The level of ozone in the air depends on the outdoor levels of these organic gases, the radiant energy of the sun, and other weather conditions. The biggest concern with high ozone concentrations is the damage it causes to human health, vegetation and many common materials used everyday. High ozone concentrations can cause shortness of breath, coughing, wheezing, headaches, nausea, eye and throat irritations and lung damage.

3.2.2 Carbon Monoxide

Carbon monoxide is a colorless, odorless and tasteless toxic gas found naturally in trace quantities in the atmosphere and emitted from any form of combustion. At low concentrations,

1235

the central nervous system is affected. At higher concentrations, irritability, headaches, rapid breathing, blurred vision, lack of coordination, nausea and dizziness can all occur. It is especially dangerous indoors when ventilation is inadequate; unconsciousness or death can occur.

3.2.3 Nitrogen Dioxide

Nitrogen dioxide is a reddish-brown to dark brown poisonous gas that produces an irritating odor. It is a byproduct of high combustion sources. Health effects include damage to lungs, bronchial and respiratory system irritation, headaches, nausea, coughing, choking and chest pains.

3.2.4 Sulfur Dioxide

Sulfur dioxide is a colorless gas with a strong suffocating odor. It is a gas resulting from the burning of sulfur-containing fuels. Exposure to SO_2 can irritate the respiratory system including lung and throat irritations and nasal bleeding. In the presence of moisture, SO_2 can form sulfuric acid that can cause damage to vegetation.

3.2.5 Suspended Particulate Matter

There are two categories of particulate matter: particles with diameters less than 10 microns (PM_{10}) and particles with diameters less than 2.5 microns ($PM_{2.5}$). The sources of PM_{10} emissions include industrial and agricultural operations, automobile exhaust, and construction. Sources of fine particles include all types of combustion activities (i.e., motor vehicles, power plants, wood burning) and certain industrial processes. PM_{10} poses a health concern because it can be inhaled into, and accumulate in, the respiratory system. $PM_{2.5}$ is referred to as "fine" particles and is believed to pose the greatest health risks. Because of their small size (approximately 1/30th the average width of a human hair), fine particles can lodge deeply into the lungs.

3.2.6 Lead

Lead is a bluish-white to silvery gray solid. Lead particles can originate from motor vehicle exhaust, industrial smelters and battery plants. Health effects include decreased motor function, reflexes and learning as well as damage to the central nervous system, kidneys and brain. At high levels of exposure, seizures, coma or death may occur.

3.3 AIR QUALITY CONTROL REGION

The State of California is divided into a number of areas designated as air basins. The Proposed Action is located in the Metropolitan Los Angeles Air Quality Control Region, which includes parts of the counties of Los Angeles, San Bernardino, Riverside, Ventura and Santa Barbara. This area is known as Air Quality Control Region 24 (AQCR 24). The air basin is under the jurisdiction of South Coast Air Quality Management District, Ventura County Air Pollution Control District and the Santa Barbara County Air Pollution Control District. Table 3-2 lists the air emissions for the AQCR 24 for 2005.

Table 3-2 2005 Emissions Inventory for AQCR 24 (tons)

CO	VOC	NO_X	SO_X	PM_{10}	$PM_{2.5}$
1,636,843	327,405	411,757	35,478	129,539	52,524

Source: CARB, 2007

3.3.1 Attainment Status

Areas not meeting ambient air quality standards are designated as being in nonattainment for the specific pollutant causing the violation. National standards other than for ozone, particulates and those based on annual averages are not to be exceeded more than once a year. The 8-hour ozone standard is attained when the 3-year average of the 4th highest daily

concentrations is 0.08 ppm or less. The 24-hour PM_{10} standard is attained when the 3-year average of the 99th percentile of monitored concentrations is less than 150 $\mu g/m^3$. The 24-hour $PM_{2.5}$ standard is attained when the 3-year average of 98th percentiles is less than 65 $\mu g/m^3$. Except for the national particulate standards, annual standards are met if the annual average falls below the standard at every site. The national annual particulate standard for PM_{10} is met if the 3-year average falls below the standard at every site. The annual $PM_{2.5}$ standard is met if the 3-year average of annual averages spatially-averaged across officially designed clusters of sites falls below the standard.

3.3.1.1 Ozone

In 1997, the USEPA promulgated the 8-hour ozone standard. On April 15, 2004, USEPA issued the first 8-hour ozone designations. Before that date, ozone attainment designations were determined by the 1-hour ozone standard of 0.12 ppm. The new 8-hour standard became effective 60 days after promulgation (June 15, 2004), while the existing 1-hour standard, for most purposes, remains in effect until USEPA determines an area has air quality meeting the 1-hour standard.

In relation to General Conformity, the proper *de minimis* threshold to use to determine conformity depends upon when the Proposed Action begins. Actions beginning before June 15, 2005 must meet the 1-hour ozone *de minimis* threshold. Actions beginning on or after June 15, 2005 must meet the 8-hour ozone *de minimis* threshold (Personal Communication, 2004). Since the Proposed Action is scheduled to start after June 15, 2005, the 8-hour ozone threshold applies.

According to 40 CFR 81.305, AQCR 24 has been designated as severe-17 nonattainment for the 8-hour ozone standard.

3.3.1.2 Particulate Matter

On January 5, 2005, USEPA issued the first $PM_{2.5}$ designations. Before that date, PM attainment designations were determined by the PM_{10} standard of 150 ug/m^3. The new $PM_{2.5}$ standard became effective 90 days after promulgation on April 5, 2005, while the existing PM_{10} standard, for most purposes, remains in effect until USEPA determines an area has air quality meeting the PM_{10} standard.

In relation to General Conformity, the proper *de minimis* threshold to use to determine conformity depends upon when the Proposed Action Finding of No Significant Impact (FONSI) or Record of Decision (ROD) is signed. Documents signed before April 5, 2006 must meet the PM_{10} *de minimis* threshold. Documents signed on or after April 5, 2006 must meet the $PM_{2.5}$ *de minimis* threshold (Personal Communication, 2005). This criteria does not apply to the proposed Wastewater Treatment Plant Expansion and Phase I Recycled Water System in Banning, which is subject to General Conformity requirements as part of its SRF loan application process.

According to 40 CFR 81.305, AQCR 24 has been designated as nonattainment for $PM_{2.5}$ and as serious nonattainment for PM_{10}.

3.3.1.3 Nitrogen Dioxide

According to 40 CFR 81.305, AQCR 24 has been designated as cannot be classified or better than national standards for NO_2.

3.3.1.4 Sulfur Dioxide

According to 40 CFR 81.305, AQCR 24 has been designated as better than national standards for SO_2.

1237

3.3.1.5 Carbon Monoxide

According to 40 CFR 81.305, AQCR 24 has been designated serious nonattainment for CO.

3.3.1.6 Lead

There is no information concerning lead in 40 CFR 81.305 for any part of California; therefore, the area has been designated as "cannot be classified" for lead.

SECTION 4
ANALYSIS AND RESULTS

This section includes a comprehensive analysis of the resultant emissions from the Proposed Action. The purpose of this analysis is to determine whether the Proposed Action will conform to the SIP as specified in Section 176(c) of the CAA. A positive conformity determination can be demonstrated by determining that the Proposed Action does not increase emissions with respect to the current emissions. A discussion of the overall analytical methodology, emission changes by sources and a conclusion of General Conformity are presented in this chapter. Appendix A contains supporting air pollutant emission calculations.

4.1 CONFORMITY DETERMINATION METHODOLOGY

4.1.1 Analytical Methods

The methodology for the General Conformity analysis for the Proposed Action consisted of the following steps: (1) determine the pollutants of concern based on the attainment status of the air basin; (2) define the scope of the Proposed Action; (3) calculate emissions based on the scope; (4) review net emission changes for *de minimis* threshold levels and regional significance; (5) determine conformity for applicable criteria pollutants.

The emission factors applied in the analysis are based on USEPA guidance. Fugitive dust would be generated from activities associated with site clearing, grading, cut and fill operations, and from vehicular traffic moving over the disturbed site. These emissions would be greatest during the initial site preparation activities and would vary from day to day depending on the construction phase, level of activity, and prevailing weather conditions.

The quantity of uncontrolled fugitive dust emissions from a construction site is proportional to the area of land being worked and the level of construction activity. The USEPA estimates that uncontrolled fugitive dust emissions from ground-disturbing activities would be emitted at a rate of 80 lbs of total suspended particulate (TSP) per acre per day of disturbance (USEPA, 1995). In a USEPA study of air sampling data at a distance of 50 meters downwind from construction activities, PM_{10} emissions from various open dust sources were determined based on the ratio of PM_{10} to TSP sampling data. The average PM_{10} to TSP ratios for top soil removal, aggregate hauling, and cut and fill operations are reported as 0.27, 0.23, and 0.22, respectively (USEPA, 1988). Using 0.24 as the average ratio for purposes of analysis, the emission factor for PM_{10} dust emissions becomes 19.2 lbs per acre per day of disturbance.

The USEPA also assumes that 230 working days are available per year for construction (accounting for weekends, weather, and holidays), and that only half of these working days would result in uncontrolled fugitive dust emissions at the emitted rate described above (USEPA, 1995). The USEPA estimates that the effects of fugitive dust from construction activities would be reduced significantly with an effective watering program. Watering the disturbed area of the construction site twice per day with approximately 3,500 gallons per acre per day would reduce TSP emissions as much as 50 percent (USEPA, 1995).

Specific information describing the types of construction equipment required for a specific task, the hours the equipment is operated, and the operating conditions vary widely from project to project. For purposes of analysis, these parameters were estimated using established cost estimating methodologies for construction and experience with similar types of construction projects (Means, 1996). Combustive emissions from construction equipment exhausts were estimated from USEPA approved emissions factors for heavy duty diesel powered construction equipment (USEPA 1985).

Additional PM emission factors are from the California Air Resources Board (CARB) PM Profile (CARB, 2002) and USEPA estimates for $PM_{2.5}$ (USEPA, 2005).

1239

4.1.2 Pollutants of Concern

The area affected by the Proposed Action is in severe-17 nonattainment for 8-hour ozone as described in Section 3.3.1.1; serious nonattainment for PM_{10} and nonattainment for $PM_{2.5}$ as described in Section 3.3.1.2; and, serious nonattainment for carbon monoxide as described in Section 3.3.1.5. Consequently, direct and indirect emissions of VOC and NO_X (precursors to ozone), as well as CO, PM_{10}, and $PM_{2.5}$, resulting from the Proposed Action are subject to a conformity determination. Thus, the conformity analysis will focus on only these pollutants.

4.1.3 Applicability

As discussed in Section 1.3.1, the Proposed Action conforms for a criteria pollutant if the emissions for that pollutant do not exceed the *de minimis* thresholds specified in the Final Conformity Rule (see Table 1-1). Conversely, if the total direct and indirect emissions of a pollutant exceed its *de minimis* threshold, a formal General Conformity Determination is required for that pollutant.

4.2 CHANGES IN EMISSIONS FROM THE PROPOSED ACTION

The Proposed Action will affect the total amount of emissions from several categories of sources. The analysis includes all sources subject to the change in emission rates, exclusive of any stationary sources that are subject to review and that may require a permit under the New Source Review (NSR) or Prevention of Significant Deterioration (PSD) programs. The emissions associated with the Proposed Action are included in the analysis.

4.2.1 Construction

Emissions from construction activity are considered area emissions, although short-term, while emissions from vehicles supporting construction are considered mobile sources.

4.2.1.1 Methodology

Emission factors from the USEPA were used to estimate construction-related air pollutant emissions. These factors include on-site construction equipment and workers' travel.

Several construction areas are anticipated in support of the Proposed Action. The Banning area has four other past and reasonably foreseeable actions that could occur during the same period as the Proposed Action. The fiscal year (FY) with the greatest emissions was used to present the extreme condition in this analysis.

4.2.1.2 Results

Table 4-1 summarizes the net emission changes anticipated from construction activities. An increase in emissions is logical. The USEPA watering factor for reducing particulate matter emissions has been applied in these calculations.

4.2.2 Summary of Results

Table 4-2 compares the net change in emissions associated with the Proposed Action with de minimis thresholds for AQCR 24 and states whether or not the emissions exceed de minimis or would be regionally significant.

Table 4-1 Change in Construction Emissions Associated with the Proposed Action

	Pollutants Emitted (tons/year)					
	CO	VOC	NO_X	SO_X	PM_{10}	$PM_{2.5}$
Proposed Action Construction

Net Change in Emissions from Cumulative Condition Projects	**177.59**	**23.33**	**180.28**	**4.65**	**51.52**	**8.76**

* Unmitigated emissions estimate taken from Table 4.3-8 of the Draft EIR for the Five Bridges Specific Plan (Nov 2006). These emissions are subject to change, and the construction start date for this project is not known at this time.

Table 4-2 Regional Significance Analysis and Comparison to Conformity *De Minimis* Thresholds in AQCR 24

Category	Pollutants Emitted (tons/year)					
	CO	VOC	NO_X	SO_X	PM_{10}	$PM_{2.5}$
Emissions Inventory	1,636,843	327,405	411,757	35,478	129,539	52,524
Project Emissions	**0.67**	**0.13**	**1.65**	**0.18**	**12.28**	**2.09**
Percent Change	**negligible**	**negligible**	**negligible**	**negligible**	**negligible**	**negligible**
de minimis Threshold	100	25	25	NA	70	100
Exceed *de minimis* Threshold?	**No**	**No**	**No**	NA	**No**	**No**
Regionally Significant? (>10%)	**No**	**No**	**No**	NA	**No**	**No**

NA =Not applicable because *de minimis* does not apply since this AQCR is in attainment for this particular pollutant.

Bold indicates pollutants of concern for Conformity Determination.

4.3 CONFORMITY DETERMINATION RESULTS

As explained in Section 4.1.3, a conformity determination is required if the total direct and indirect emissions of a pollutant from the Proposed Action exceed the *de minimis* threshold established in the Final Rule. The emissions must be compared to the air quality emissions

1241

inventory of the air basin to determine regional significance of the Proposed Action when the total nonattainment criteria pollutant emissions do not exceed the *de minimis* thresholds. The Proposed Action is considered regionally significant for a particular pollutant if the amount of emissions is greater than 10 percent of the emissions inventory. Regionally significant actions must be further reviewed to determine conformity.

4.3.1 Proposed Action

De Minimis Levels

Table 4-2 summarizes the Proposed Action emissions in AQCR 24 and compares them to the *de minimis* thresholds. As a result of the Proposed Action, there would be an increase in emissions for CO, PM_{10}, $PM_{2.5}$, SO_X, VOC and NO_X. A Proposed Action conforms to the applicable SIP when criteria pollutants do not exceed their respective *de minimis* thresholds of: 100 tons per year (tpy) for CO and $PM_{2.5}$; 70 tpy for PM_{10}; and, 25 tpy for VOC and NO_X. CO, NO_X and PM_{10} emissions do not exceed their respective *de minimis* threshold. A Proposed Action does not conform to the applicable SIP when criteria pollutants exceed their respective *de minimis* thresholds.

Regional Significance

The Proposed Action is not considered to be regionally significant because the CO, PM_{10}, $PM_{2.5}$, SO_X, VOC and NO_X emissions are less than 10 percent of the emissions inventory (see Table 4-2).

4.4 CONCLUSION

The Proposed Action will occur in an area designated as severe-17 nonattainment for 8-hour ozone; serious nonattainment for PM_{10} and nonattainment for $PM_{2.5}$; serious nonattainment for carbon monoxide. Thus, this conformity determination focuses on only the criteria pollutants of CO, PM_{10}, $PM_{2.5}$, VOC and NO_X.

The analysis of direct and indirect emission changes from mobile and stationary sources and reasonably foreseeable and controllable actions for the Proposed Action supports a positive conformity determination.

The total of direct and indirect CO, PM_{10}, and NO_X emissions are below the *de minimis* threshold established for these pollutants (see Table 4-2). Additionally, the emissions of CO, VOC, SO_X, PM_{10}, $PM_{2.5}$ and NO_X would be less than 10 percent of the emissions inventory and, therefore, the action would not be considered regionally significant (see Table 4-2). It has been determined that the Proposed Action positively conforms to the applicable SIP. The City is supporting an activity that has been demonstrated by USEPA standards not to cause or contribute to new violations of any national ambient air quality standard in the affected area, nor would this action increase the frequency or severity of an existing violation. Implementation of the Proposed Action will not delay timely attainment of any standards in AQCR 24, and the action is in compliance or is consistent with all relevant requirements and milestones contained in the applicable SIP. This conclusion of positive General Conformity for the Proposed Action fulfills the City's obligation and responsibility under 40 CFR Part 93, Subpart B.

Project Size: Approximately 16 acres and 28,500 linear feet

Keywords: City of Banning, Riverside County; historical/archaeological resources survey; Site 33-16207 (rural historical landscape); Site 33-16208/CA-RIV-8364 (early 20th century refuse deposit); testing recommended at Site 33-16208

MANAGEMENT SUMMARY

In June and July 2007, CRM TECH performed a cultural resources study on the Area of Potential Effects (APE) of a proposed wastewater treatment plant expansion and recycled water distribution system in the City of Banning, Riverside County, California. The undertaking involves the construction of additional wastewater treatment facilities on a 16-acre tract of undeveloped land and approximately 28,500 linear feet of water conveyance pipelines. The APE lies to the south of the city's downtown area, in Sections 7-10, 14, 15, and 18 of T3S R1E, San Bernardino Base Meridian. The study is a part of the environmental review process for the proposed undertaking, as required by the City of Banning in compliance with Section 106 of the National Historic Preservation Act and the California Environmental Quality Act (CEQA).

The purpose of the study is to provide the City of Banning with the necessary information and analysis to determine whether the proposed undertaking would have any effects on historical/archaeological resources that may exist in or near the APE, as mandated by Section 106 and CEQA. In order to accomplish the objective of the study, CRM TECH conducted a historical/archaeological resources records search, pursued historical background research, contacted Native American representatives, and carried out a systematic field survey.

As a result of these research procedures, two previously unrecorded historic-period sites, 33-16207 and 33-16208 (CA-RIV-8364), were identified within the APE. Site 33-16207 consists of a group of rural historic landscape features of unknown age, such as olive trees, a fence, and remnants of an irrigation system. Although the site is located on land once owned by Walter Hathaway, a prominent local merchant around the turn of the 20th century and the first mayor of Banning, there is no evidence that these features are closely associated with Hathaway and the prominent role he played in the early history of Banning, nor do they demonstrate any other notable historical/archaeological merits. In fact, historical sources suggest that at least some of the features likely post-date Hathaway's association with the property. Therefore, Site 33-16207 does not appear to qualify as a "historic property," as defined by Section 106, or a "historical resource," as defined by CEQA.

Site 33-16208 is a refuse deposit containing an abundance of temporally and morphologically diagnostic consumer items from the 1920s-1930s, which may provide valuable information on the consumer practices of local households at the time. There may be a subsurface component to the site, as it was observed that many of the artifacts found on the surface were partly buried. While the 1920s-1930s may not be considered a particularly early period in local history, it was a time of accelerated growth and dramatic change in Banning and the entire United States. To date, very few similar sites, with a good level of integrity and a variety of household consumer refuse items dating to the early 20th century, have been recorded in the City of Banning.

Based on these considerations, Site 33-16208 may have the potential to yield important archaeological data for the study of local history with regard to consumerism and the lifestyle of early-20th century agriculturalists in this portion of inland southern California, but that potential cannot be ascertained without further archaeological investigation. In order to determine the significance of the site and its qualification as a "historic property"/"historical resource," CRM TECH recommends that an archaeological testing and evaluation program be implemented on the site. Further recommendations regarding the final treatment of the site will be formulated and presented on the basis of the results of the testing and evaluation program.

No further cultural resources investigation is recommended for the balance of the APE unless project plans undergo such changes as to include areas not covered by this study. However, if buried cultural materials are encountered during construction anywhere within the APE, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

INTRODUCTION

In June and July 2007, CRM TECH performed a cultural resources study on the Area of Potential Effects (APE) of a proposed wastewater treatment plant expansion and recycled water distribution system in the City of Banning, Riverside County, California (Fig. 1). The undertaking involves the construction of additional wastewater treatment facilities on a 16-acre tract of undeveloped land and approximately 28,500 linear feet of water conveyance pipelines. The APE lies to the south of the city's downtown area, in Sections 7-10, 14, 15, and 18 of T3S R1E, San Bernardino Base Meridian (Fig. 2). The study is a part of the environmental review process for the proposed undertaking as required by the City of Banning in compliance with Section 106 of the National Historic Preservation Act and the California Environmental Quality Act (CEQA).

CRM TECH performed the current study to provide the City of Banning with the necessary information and analysis to determine whether the proposed undertaking would have any effects on historical/archaeological resources that may exist in or near the APE, as mandated by Section 106 and CEQA. In order to accomplish the objective of the study, CRM TECH conducted a historical/ archaeological resources records search, pursued historical background research on the APE, contacted representatives of local Native American groups, and carried out a systematic field survey. The following report is a complete account of the methods and results of the various avenues of research, and the final conclusion of the study.

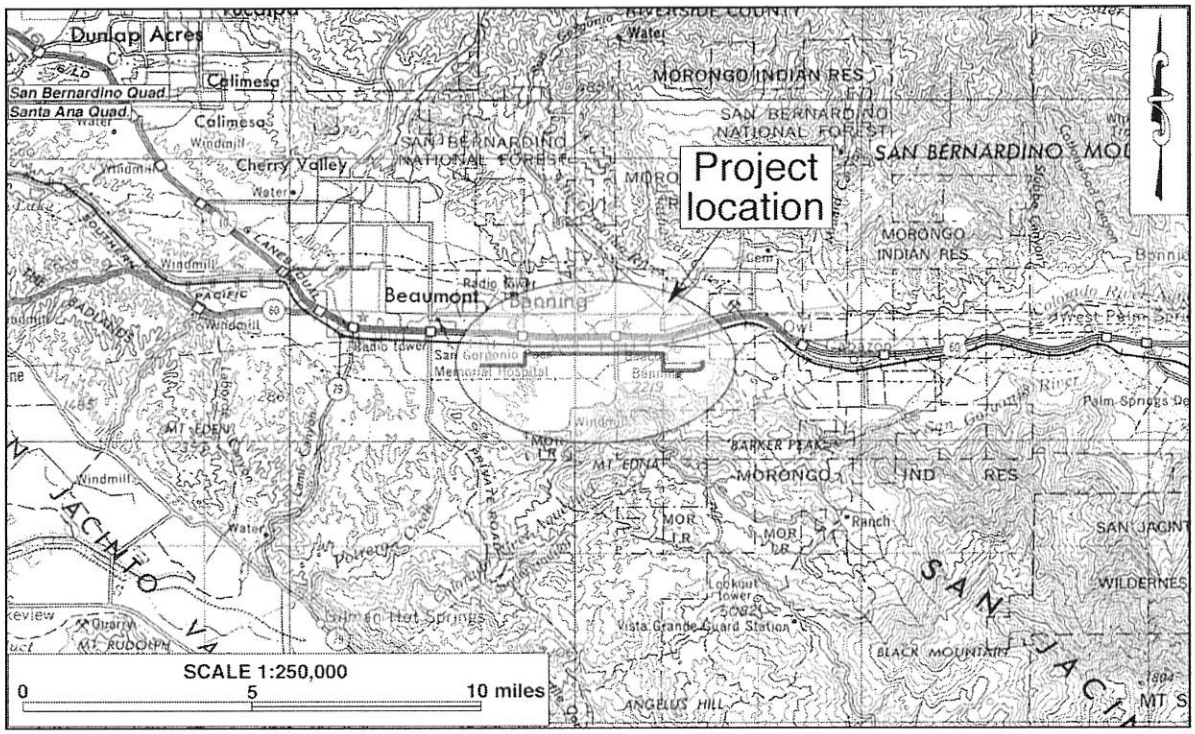

Figure 1. Project vicinity. (Based on USGS San Bernardino and Santa Ana, Calif., 1:250,000 quadrangles [USGS 1969; 1979])

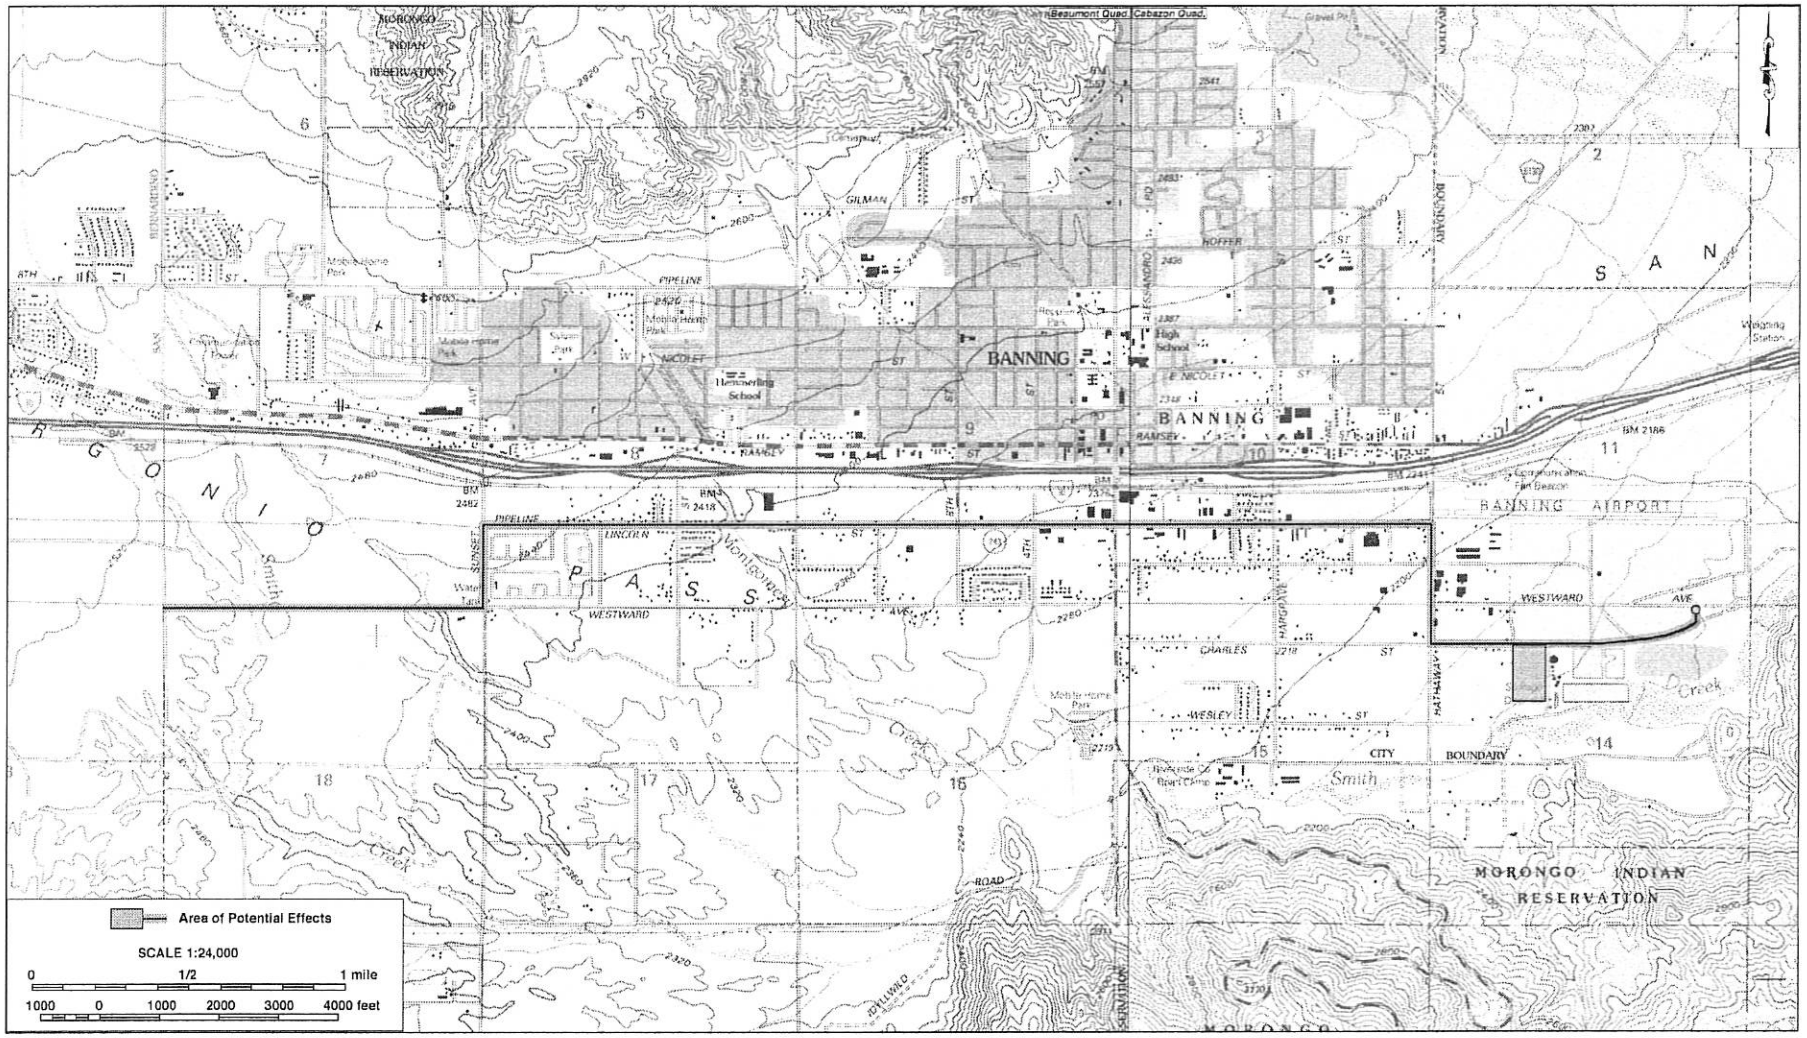

Figure 2. Area of Potential Effects. (Based on USGS Beaumont and Cabazon, Calif., 1:24,000 quadrangles [USGS 1996a; 1996b])

AREA OF POTENTIAL EFFECTS

According to 36 CFR 800.2(d), the Area of Potential Effects is "the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist." For the current undertaking, the APE consists of a 16-acre tract of undeveloped land designated for the expansion of the Banning Wastewater Treatment Plant (WWTP) and approximately 28,500 linear feet of pipeline rights-of-way, which measures approximately five feet in width. Table 1 provides further description of the various components of the undertaking and their locations (cf. Fig. 2).

Table 1. Description of the Undertaking

Project Component	Description
Wastewater treatment plant expansion	Construction of additional wastewater treatment facilities on an approximately 16-acre tract of undeveloped land located to the west of the existing Banning WWTP and south of Charles Street.
Pipeline to Well R1	Retrofitting the existing Well R1 located to the east of the WWTP and installing approximately 3,500 linear feet of pipeline from Well R1 to the WWTP expansion site
Recycled water pipeline	Installation of approximately 25,000 linear feet of recycled water pipeline beginning at the existing WWTP, west along Charles Street, north along Hathaway Street, west along Lincoln Street, south along Sunset Avenue, west along an unpaved City access road (an extension of Westward Avenue), to a point of connection at the Sun Lakes housing development.

SETTING

CURRENT NATURAL SETTING

The City of Banning is situated just west of the San Gorgonio Pass, and near the southern foothills of the San Jacinto and San Bernardino Mountains. The San Gorgonio Pass, an east-west trending corridor between the two mountain ranges, is an important connection between southern California's coastal regions and the vast Colorado Desert, with Interstate 10 serving as the main transportation route through the pass. The APE is located to the south of Interstate 10 and extends east-west across both undeveloped and developed areas in the southern portion of the Banning city limits. Elevations along the project route range between approximately 2,080 feet to 2,500 feet above mean sea level. Descriptions of each portion of the APE are presented below.

- **Recycled water pipeline:** Most of the APE lies along the route of the proposed recycled water pipeline, and much of the pipeline route is situated within the existing rights-of-way of various public roads. The route passes through residential, commercial, and light industrial use zones found along Sunset Avenue and Lincoln, Hathaway, and Charles Streets (Fig. 3). The western end of the pipeline route follows an existing gravel-topped access road across undeveloped land to the Sun Lakes housing development (Fig. 3). This portion of the APE is a utility corridor that has been graded smooth along most of its course, and used for both above- and below-ground utilities, including a petroleum pipeline, a fiber optic cable, sewer, and a power transmission line.

- **Banning WWTP expansion:** The 16-acre tract proposed for the expansion of the Banning WWTP is undeveloped and relatively level (Fig. 3). A paved road traverses near its western boundary and serves as the driveway to the Banning Animal Shelter located to the south of the existing WWTP. The 16-acre tract is a portion of Assessor's Parcel No. 532-180-038. Vegetation on the property appears to be controlled by periodic grubbing or mowing, as most of the surface is bare (Fig. 3). A row of olive trees and concrete standpipes line a fence along the western edge of the property.
- **Pipeline to Well R1:** Well R1 is located at the eastern end of the APE and is accessed through an extension of Charles Street from the existing Banning WWTP. The westernmost 600 feet of the proposed pipeline route is along paved road, while the balance is along a dirt service road that leads to the well (Fig. 3).

CULTURAL SETTING

Ethnohistoric Context

The San Gorgonio Pass area has long been a major crossing and intersecting point for Native American tribes in the surrounding regions. It is generally considered to be the

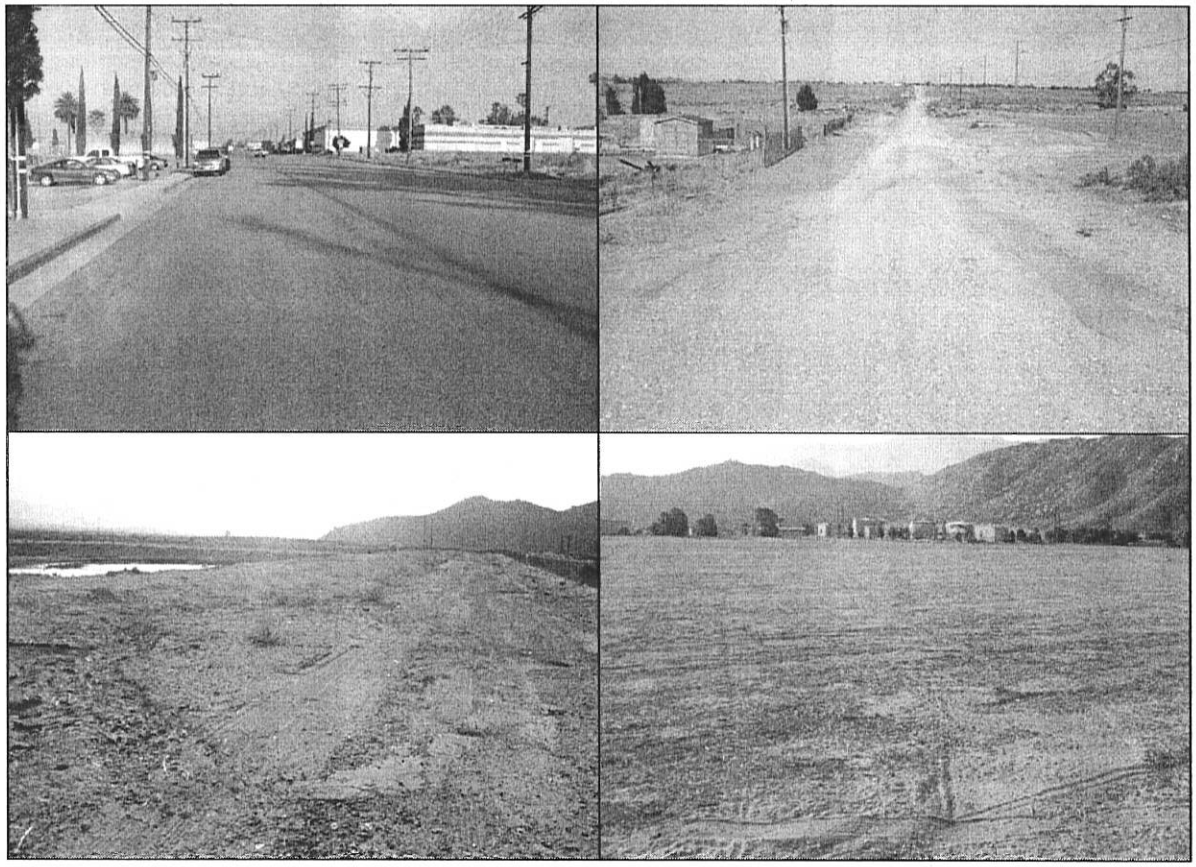

Figure 3. Overview of the current natural setting of the APE. *Clockwise from upper left*: view east along Lincoln Street; view west along utility corridor; view southeast across the 16-acre lot toward existing WWTP facility; view east along dirt access road to Well R1. (Photos taken on July 6 and 9, 2007)

1270

traditional territory of the Pass Cahuilla Indians, but was probably visited and used by members of the Serrano Indians as well. The Pass Cahuilla are one of the three subgroups—as defined by modern anthropologists—of the Cahuilla, who have occupied the central portion of what is now Riverside County for many centuries. The homeland of the Serrano is centered at the San Bernardino Mountains, but also includes the southern rim of the Mojave Desert, extending from today's Victorville eastward to Twentynine Palms, and may include areas as far south as the present-day March Air Reserve Base.

Modern anthropological literature suggests that the Cahuilla and Serrano societies were similar in many respects. Both groups were primarily gatherers and hunters, and occasional fishers. Both were organized by lineages and clans that were affiliated with one of two exogamous moieties. These different lineages, clans, and moieties interacted with the others through trade, ceremonies and intermarriage.

Although contact with Europeans may have occurred as early as 1771 or 1772, Spanish influence on the Cahuilla and Serrano societies was negligible until the 1800s. Beginning in the early 19th century, the increased Spanish—and later Euroamerican—presence and active involvement in the area brought significant impacts to Indian populations and their lifeways. In particular, the native population was decimated during the 19th century as a result of the exposure to European diseases, most notably smallpox, for which the Native peoples had no immunity. Today, the nearest Native American group to the project location is the Morongo Band of Mission Indians, which includes members of both Cahuilla and Serrano descent.

Historic Context

Dating back to ancient times, the San Gorgonio Pass area was always known as the nexus for cross-desert travels. Most notable among early roads through the pass was the Cocomaricopa Trail, a Native American trading route connecting coastal southern California to areas along the Colorado River. In 1862, the Cocomaricopa Trail was "discovered" by William David Bradshaw, and became known as the Bradshaw Trail. For the next decade and a half, it served as the main thoroughfare between the Los Angeles area and gold mines near present-day Ehrenberg, Arizona, until the completion of the Southern Pacific Railway in 1876-1877 brought an end to its heyday.

During much of the Spanish and Mexican periods in California history, the project vicinity was generally considered a part of Rancho San Gorgonio, the most remote of the 24 principal cattle ranches under the control of Mission San Gabriel (Gunther 1984:458). Around 1845, after secularization of the mission system, Powell "Paulino" Weaver and Isaac "Julian" Williams petitioned the Mexican authorities for a land grant of the 48,400-acre rancho, which stretched from Yucaipa to the eastern edge of the San Gorgonio Pass (Security-First National Bank of Los Angeles 1955; Eyer 1984:4). Although the grant was never issued, Weaver and Williams took possession of the land under assumed ownership (Gunther 1984:459).

Within the present-day City of Banning, the earliest non-Native settlements were the adobe houses built by Isaac W. Smith and José Pope in 1854, after both had secured partial interests in Rancho San Gorgonio (Eyer 1984:5; Jennings et al. 1993:46-47). Pope's house, at what is now the Gilman Ranch, served as a stage station on the Bradshaw Trail under the

later owners of the property, Newton Noble and James M. Gilman (Jennings et al. 1993:46). Smith's ranch, also known to have been a stage stop, later became the site of the Highland Springs Resort (*ibid.*:47).

The railroad came through in 1876, as mentioned above, facilitating population growth and the need for services and amenities. At the time, Banning was called Moore City, after the town's principal landowner, Ransom B. Moore (*Press-Enterprise* 1968; Gunther 1984:40). The area was renamed after Phineas Banning, a Los Angeles-based freight wagon operator and San Gorgonio Pass area sheep rancher around 1877 and a townsite was officially established in 1884 (Gunther 1984:41).

Even with increased development, land ownership was tenuous. Railroad land grants issued to the Southern Pacific and the creation of the Portrero Indian Reservation left the area a checkerboard of claims by the railroad, Native Americans, and early settlers. The matter was finally resolved with federal approval in 1891. Indian land was consolidated as the Morongo Reservation, the railroads received an east-west swath, and displaced settlers were retitled with other parcels (Hughes 1938:29).

Construction in town near the turn of the century included the Bryant House in 1885, later called the San Gorgonio Inn (Eyer 1984:13), and St. Boniface Indian School, built in 1889 on 80 acres purchased by the Bureau of Catholic Indian Missions (Hughes 1938:6). In 1911, two years before the city's incorporation, the Banning Sanitarium opened, marking the beginning of the city's efforts to market the health benefits of the region's dry climate. The campaign extended well into the 1940s with claims that "the nation's best physicians annually send scores of people here to get relief from asthma, bronchial and lung trouble [while] others have learned of the health advantages and charm of Banning through letters from people who have moved here" (Banning Chamber of Commerce 1948; Eyer 1984:13).

The Metropolitan Water District provided a considerable economic and population boost when, in 1930, it chose Banning to set up headquarters for the tunneling operations through the San Jacinto Mountains, a part of the massive Colorado River Aqueduct project. Growth in the city slowed considerably during World War II, but rebounded afterward.

In the meantime, more and more resort and tourist traffic found its way to the Palm Springs area, further to the east. Coupled with the completion of the State Highway 60 bypass in 1962, Banning underwent significant changes in its economic base and population makeup, with a large increase in "unskilled labor, mostly minorities," residents who could find work in hotels and resorts of the Palm Springs area, but could not afford to live there (*Press-Enterprise* 1977). The city, like nearby Beaumont, also supported a large retirement community (*ibid.*).

Banning's economy today is largely geared to travelers on Interstate 10, with many residents finding employment in retail and other consumer services. Although considerably expanded, the city's commercial center remains the same as in the 1920s, along the blocks running east-west on Ramsey Street (City of Banning 1978:4). To a large extent, it is a reflection of the community's strong desire to preserve its traditional town center and prevent the fate that befell numerous other downtown commercial districts throughout the U.S. during the era of rapid urban expansion and suburbanization in the decades immediately following World War II.

1272

RESEARCH METHODS

RECORDS SEARCH

On June 11, 2007, CRM TECH archaeologist Nina Gallardo (see App. 1 for qualifications) completed the records search at the Eastern Information Center (EIC), located at the University of California, Riverside. During the records search, Gallardo examined maps and records on file at the EIC for previously identified cultural resources within or near the APE, and existing cultural resources reports pertaining to the project vicinity. Previously identified cultural resources include properties designated as California Historical Landmarks, Points of Historical Interest, or Riverside County Landmarks, as well as those listed in the National Register of Historic Places, the California Register of Historical Resources, or the California Historical Resource Information System. The results of the records search are presented below.

HISTORICAL BACKGROUND RESEARCH

Terri Jacquemain, CRM TECH historian (see App. 1 for qualifications), conducted the historical background research on the basis of published literature in local history, archival records of the County of Riverside, and historic maps of the Banning area. Among maps consulted for this study were the U.S. General Land Office's (GLO) land survey plat maps dated 1856-1880, and the U.S. Geological Survey's (USGS) topographic maps dated 1901-1956. These maps are collected at the Science Library of the University of California, Riverside, and the California Desert District of the U.S. Bureau of Land Management, located in Moreno Valley.

NATIVE AMERICAN PARTICIPATION

As part of the research procedures, CRM TECH contacted the State of California's Native American Heritage Commission on June 11, 2007, to request a records search in the commission's sacred lands file. Following the commission's recommendations, CRM TECH further contacted eight Native American representatives in the region in writing on June 13 to solicit local Native American input regarding any possible cultural resources concerns over the proposed project. The correspondences between CRM TECH and the Native American representatives are attached to this report in Appendix 2.

FIELD SURVEY

On July 6 and 9, 2007, CRM TECH archaeologists Josh Smallwood and Nina Gallardo (see App. 1 for qualifications) carried out the field survey of the APE. Smallwood and Gallardo conducted an intensive-level, on-foot inspection of the WWTP expansion site by walking parallel transects spaced 15 meters (approx. 50 feet) apart. The pipeline route to the existing Well R1 and the western portion of the recycled water pipeline route, which traverse across undeveloped land, were also surveyed at an intensive level. The survey of these two areas covered a maximum width of 30 meters (approx. 90 feet), 15 meters on each side of the centerline of the access roads.

The remainder of the APE, lying within the rights-of-way of paved streets, was surveyed at a reconnaissance level mainly by driving along the project route. In this way, the entire

APE was examined systematically for any evidence of human activities dating to the prehistoric or historic periods (i.e., 50 years ago or older). Visibility of the native ground surface ranged between poor (0-20%) along paved or gravel roads and excellent (80-100%) in recently graded, grubbed, or mowed areas.

RESULTS AND FINDINGS

RECORDS SEARCH

According to records on file at the EIC, portions of the APE had been previously surveyed for cultural resources (Figs. 4a, 4b), and two historic-period sites, CA-RIV-7544H and 33-13778, were identified partially across the APE. The boundaries of Site CA-RIV-7544H covers a large area, nearly one mile long and a half-mile wide, encompassing a total of 34 erosion control and water catchment features. These features were located along drainages and erosion channels, and probably served to divert and catch rainwater and prevent erosion of the pasturelands (Messick and Dice 2004). Site 33-13778 was recorded as a large farm/ranching complex comprising five structural foundations and three existing buildings that may have once been part of an early 20th century ranch (Taniguchi and Dice 2004).

During a 2004 study, both of these sites were evaluated against the criteria for listing in the National Register of Historic Places and the California Register of Historical Resources, as established under the provisions of Section 106 and CEQA. Both were found not to be eligible as they failed to meet any of the criteria, and for the lack of historic integrity (Taniguchi and Dice 2004:1-3; Messick and Dice 2004:2-4).

Within a one-mile radius of the APE, as many as 19 cultural resources studies have been carried out on various parcels of land and linear features (Figs. 4a, 4b). As a result of these and other studies, a total of 222 sites and three isolated finds were identified within the scope of the records search (Table 1). These included 11 prehistoric—i.e., Native American—sites, three of which also had historic-period components, 12 historic-period sites, and 199 historic-era buildings, groups of buildings, or other built-environment features. The isolates were fragments of glass from historic-period bottles.

The prehistoric resources were recorded as sites containing bedrock milling features, groundstone pieces, and chipped stone tools and debitage. The historic-period sites included scattered refuse, structural ruins, water conveyance and divergence systems, remains of a mining operation, two electrical substations, a segment of the former Southern Pacific Railway (now a part of the Union Pacific system), and the Gilman Ranch. As for the historic-era buildings, dates of construction ranged between ca. 1884 and 1961. A number of the buildings and structural ruins found within the scope of the records search were recorded along the north and south sides of Lincoln Street, the main route of the recycled water pipeline.

NATIVE AMERICAN PARTICIPATION

In response to CRM TECH's inquiry, the Native American Heritage Commission reported that the sacred lands record search identified no Native American cultural resources in the

1274

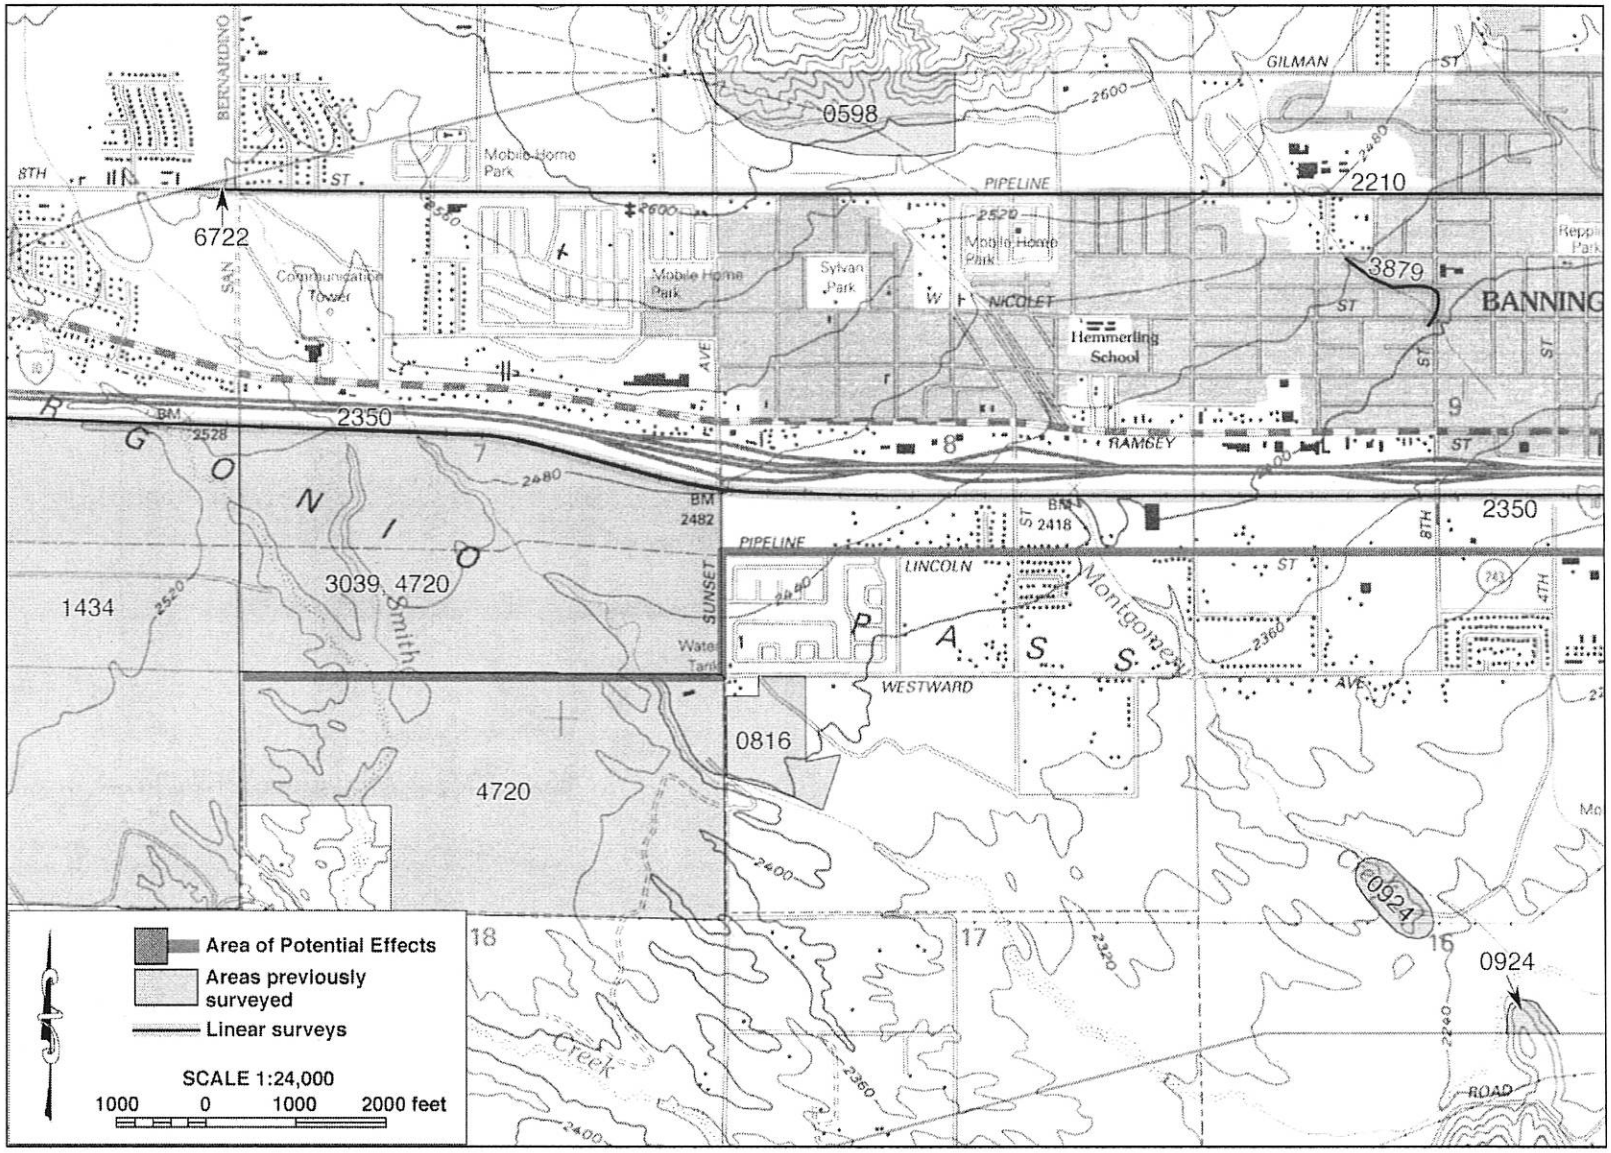

Figure 4a. Previous cultural resources surveys in the vicinity of the APE (western portion), listed by EIC file number. Locations of historical/archaeological sites are not shown as a protective measure.

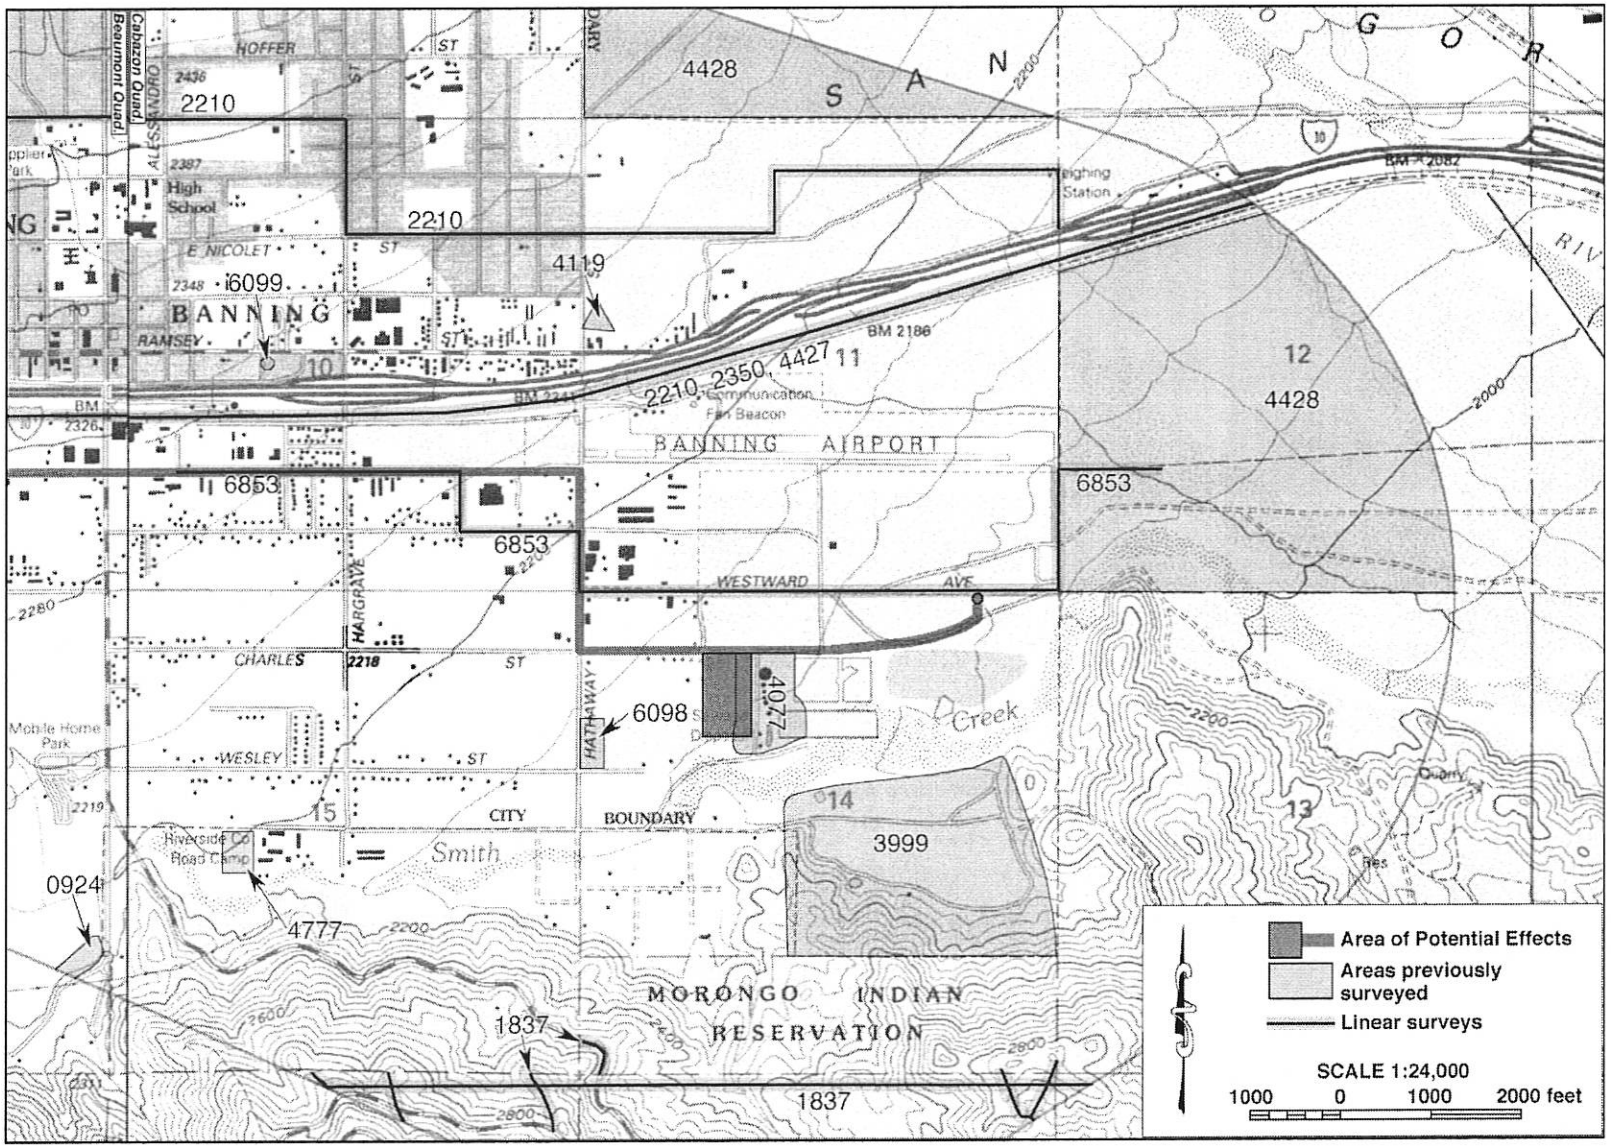

Figure 4b. Previous cultural resources surveys in the vicinity of the APE (eastern portion), listed by EIC file number. Locations of historical/archaeological sites are not shown as a protective measure.

33-15846	Zanja Substation, 34763 Juniper Avenue, ca. 1951

immediate project vicinity. However, noting that "the absence of specific site information in the Sacred Lands File does not guarantee the absence of cultural resources in any 'area of potential effect'," the commission suggested that local Native American representatives be contacted, and provided a list of potential contacts in the region (see App. 2).

Upon receiving the Native American Heritage Commission's response, CRM TECH contacted all six individuals on the list and the organizations they represent. In addition, John Gomez, Jr., Cultural Resources Coordinator for the Ramona Band of Cahuilla Indians, was also contacted at the recommendation of tribal Vice-Chairman Joseph Hamilton. Andrea Candellaria, Tribal Receptionist for the Santa Rosa Band of Mission Indians, was later contacted by telephone. As of this time, two written responses and one verbal response have been received (see App. 2).

An e-mail was received from Britt Wilson, Cultural Resources Coordinator, for the Morongo Band of Mission Indians, on June 13, 2007. In the e-mail Mr. Wilson states that due to the close proximity of the Red Hands Village Site (CA-RIV-57) and a rock art site (CA-RIV-5847) to the undertaking, the Tribe believes that there is a high probability that Native American cultural resources could be discovered in the APE. Therefore, the Morongo Band recommends archaeological monitoring for the undertaking, with at least one monitor being a Native American from the Morongo Band of Mission Indians. The Tribe also wishes to be present during any preconstruction meetings.

John Gomez, Jr., of the Ramona Band of Cahuilla Indians, replied in a letter dated July 5, 2007. Mr. Gomez states that the Tribe has no information regarding cultural resources within the APE, but reserves the right to provide comments upon review of the findings. A copy of the report was requested. Andrea Candellaria, Tribal Receptionist for the Santa

Rosa Band of Mission Indians, stated by phone on June 22, 2007, that the tribe had no specific concerns at this time regarding the APE, but would reserve the right to be notified of any cultural resources discovered during ground-disturbing activities.

FIELD SURVEY

During the field survey, none of the previously recorded water diversion/conveyance features of Site CA-RIV-7544 or structural ruins/buildings of Site 33-13778 was encountered within or immediately adjacent to the APE. CA-RIV-7544 consists of more than 30 structural features scattered over a rather large area, delineated by an all-encompassing site boundary that extends across the proposed pipeline alignment. However, none of the features of Site CA-RIV-7544 was previously recorded within the APE. Although the boundaries of Site 33-13778 encompass a portion of the APE along Sunset and Westward Avenues, all of the components of the site are located outside the road rights-of-way, and outside the APE boundaries. Since the proposed undertaking has no potential to affect either of these sites, they do not require any further consideration.

Two previously unrecorded sites were encountered within the APE boundaries during the field survey, one near existing Well R1, and the other located on the 16-acre WWTP expansion site. Both of these sites, since designated as 33-16207 and 33-16208 (CA-RIV-8364), are from the historic period. Site 33-16207 consists of a group of rural historic landscape features, including a row of olive trees, a fence, concrete irrigation standpipes, a cistern, and a small, rectangular structural footing, all located along the western edge of the WWTP expansion site.

Site 33-16208 is situated to the southwest of Well R1 and northeast of Southern California Edison power pole #1989008E. It consists of historic-period refuse found in low-density concentrations on both sides of Charles Street and scattered to the northeast near Well R1. The site measures approximately 70 x 50 meters and contains fragmented glass bottles, ceramic kitchen wares, metal cans, and other household refuse items. Many of the artifacts found at Site 33-16208, though fragmented, are temporally and morphologically diagnostic. Consumer products represented in the deposit include salve, medicine, milk, carbonated beverages, bleach, preserves, tobacco, perfume, and canned meat, to name a few.

Manganese glass manufactured between 1880-1920s was present at the site and has turned amethyst in color from sun exposure. Maker's marks on some of the bottle bases found at the site include (based on Toulouse 1971): Southern Glass Company, Vernon, CA (1917-1931); Owens Bottle Company, Toledo, OH (1911-1929); Pacific Coast Glass Works, San Francisco, CA (1902-1924; Pacific Coast Glass Company, San Francisco, CA (1925-1930); and Illinois Pacific Glass Company, San Francisco, CA (1902-1925).

Ceramic marks included (based on Lehner 1988): Pacific Clay Products Company, Los Angeles, CA (1922-1946); Carr China Company, Grafton, WV (1916-1952); and D.E. McNicol Pottery, Clarksburg, WV (1920s-1960s). A few church-key opened steel-top beverage cans date to 1935-1960, and hinged-lid tobacco tins, popular throughout the early and mid-20th century, were also found (IMACS 1992:471). The presence of these datable artifacts suggests the refuse was deposited at this location sometime around the 1920s-1930s.

1282

HISTORICAL BACKGROUND RESEARCH

Historic maps consulted for this study indicate that the vicinity of the APE showed ample evidence of human activities as early as the mid-19th century, thanks in part to its location on the Cocomaricopa-Bradshaw Trail. In the 1850s, when the U.S. government conducted the first systematic land survey in the region, the surveyors noted a number of roads and Indian trails crisscrossing the largely barren landscape, including a wagon road that was undoubtedly a part of the Cocomaricopa-Bradshaw Trail (Fig. 5). Some of the lesser-known Indian trails evidently crossed various portions of the APE (*ibid.*).

During the second half of the 19th century, homesteading and other settlement/land development activities gradually spread through the San Gorgonio Pass area, and in the mid-1870s, the Southern Pacific Railway joined the Cocomaricopa-Bradshaw Trail along roughly the same course. The completion of the Southern Pacific Railway and the subsequent establishment of the town of Banning in 1884 ushered in a major growth spurt in the project vicinity during the late 19th and early 20th centuries. By 1897-1898, the town of Banning had essentially taken shape north of the APE, with a few streets extending into the APE (Fig. 6).

Between then and the 1950s, the area around the town of Banning gradually developed a cultural landscape that was typical of rural southern California at the time, featuring a regular grid of crisscrossing roads lined with stretches of orchards and scattered buildings, most of them presumably farmhouses (Figs. 7, 8). That development pattern evidently persisted in the area until the late 20th century, when southern California's thirst for affordable housing brought about accelerated urbanization in the communities in the San Gorgonio Pass region.

Most of the APE was located along these various roads, and the rest of it, primarily the WWTP expansion site, evidently remained vacant throughout the historic period (Figs. 5-8). Formerly Lot 13 of the Waverly Tract, the WWTP expansion site, including the area of Site 33-16207, was acquired by the City of Banning from Walter S. Hathaway around 1935, three years before his death (County Assessor 1933-1938). A prominent local merchant around the turn of the 20th century, Walter Hathaway served as the first mayor of Banning after the city was incorporated in 1913 (Holtzclaw 2005:23).

Since at least 1913, no assessments had been levied for improvements on Lot 13 (County Assessor 1913-1938), suggesting that neither a building nor any trees and vines were present on the property when it was acquired by the City. Meanwhile, no buildings or other built-environment features were apparent at or near the location of Well R1 during the historic period, where the refuse deposit at Site 33-16208 was found. That area was, and still is, used for cattle ranching, as evidenced by free-range cattle that were observed during the field survey.

DISCUSSION

Based on the research results discussed above, the following sections present the CRM TECH's conclusion on whether any "historic properties" or "historical resources," as defined

Figure 5. The APE and vicinity in 1852-1856. (Source: GLO 1856; 1857)

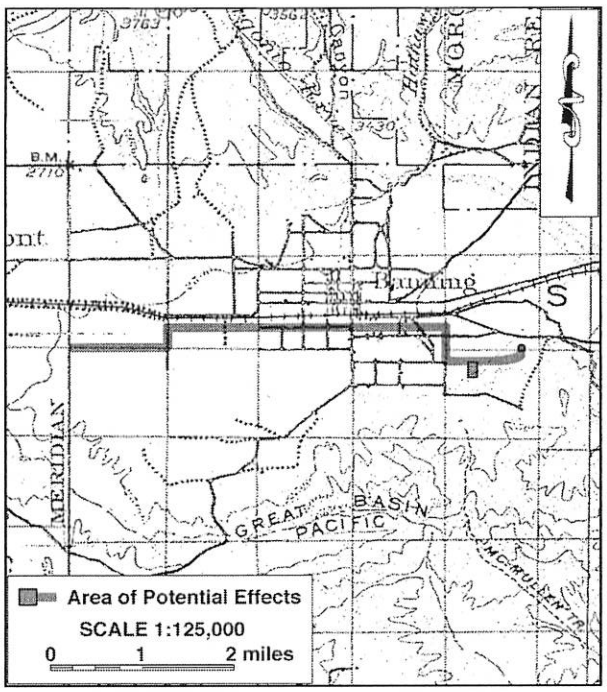

Figure 6. The APE and vicinity in 1897-1898. (Source: USGS 1901)

by Section 106 and CEQA regulations, are present within or immediately adjacent to the APE and may be affected by the proposed undertaking.

DEFINITION

"Historic properties," as defined by the Advisory Council on Historic Preservation, include "prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior" (36 CFR 800.16(l)). The eligibility for inclusion in the National Register is determined by applying the following criteria, developed by the National Park Service as per provision of the National Historic Preservation Act:

> The quality of significance in American history, architecture, archaeology, engineering, and culture

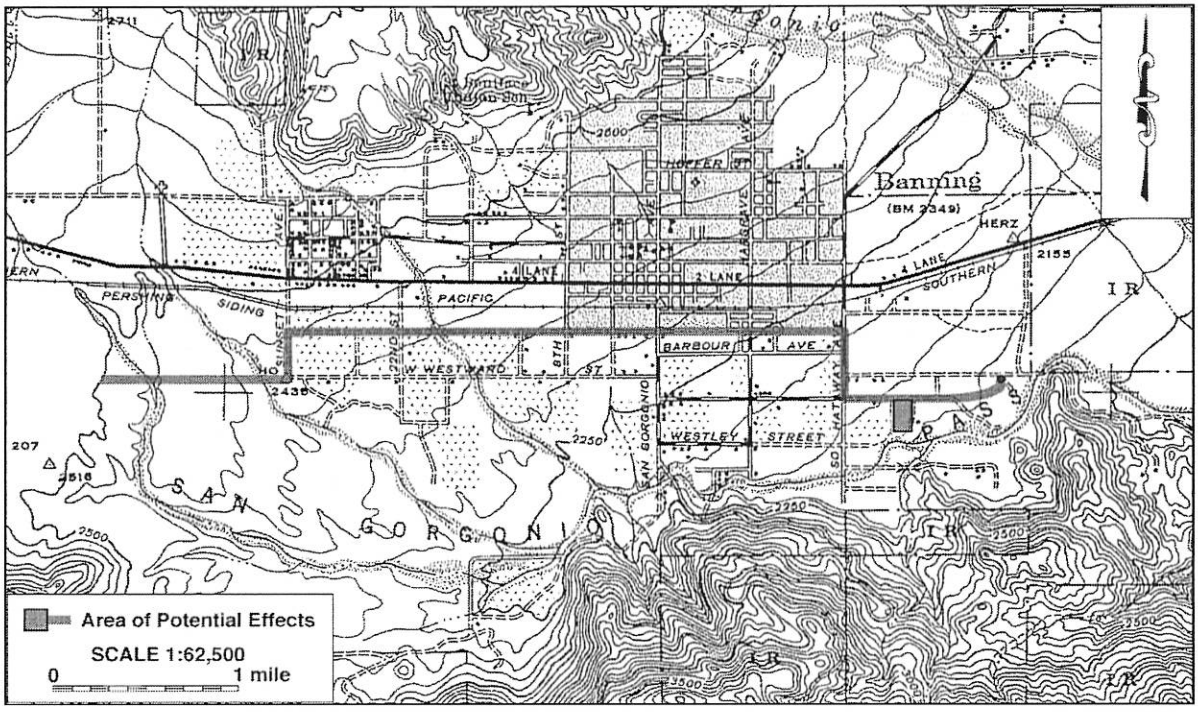

Figure 7. The APE and vicinity in 1939-1941. (Source: USGS 1942)

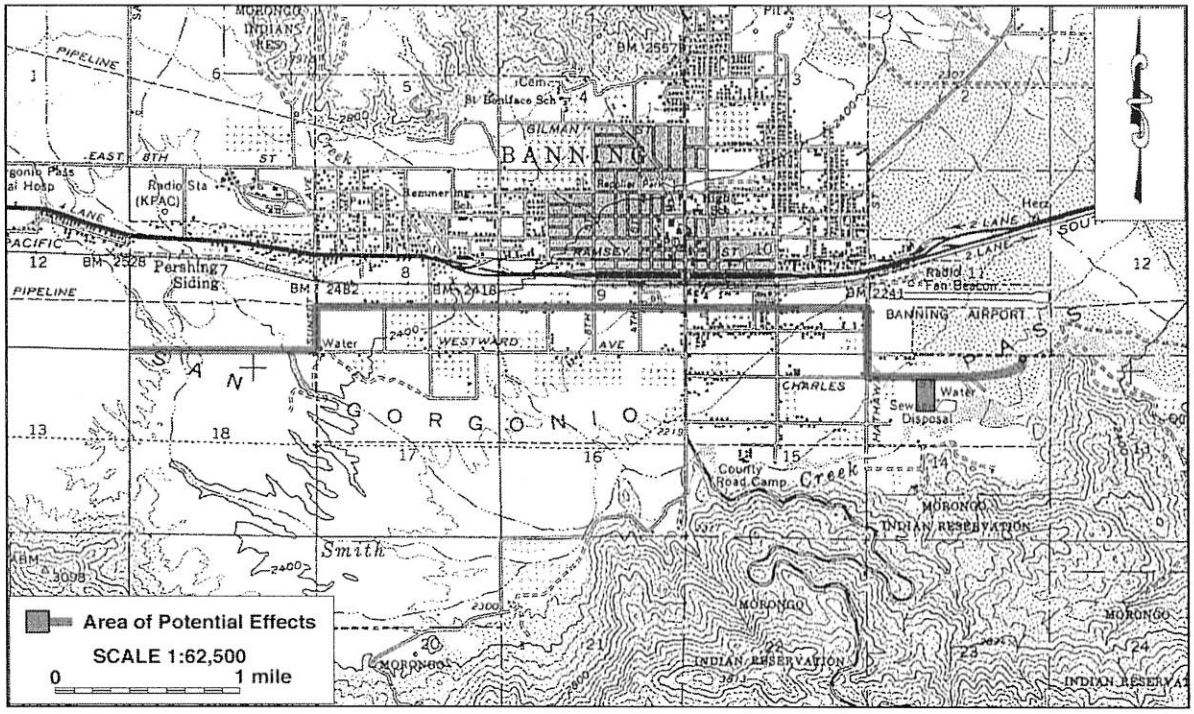

Figure 8. The APE and vicinity in 1949-1951. (Source: USGS 1956)

is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and

(a) that are associated with events that have made a significant contribution to the broad patterns of our history; or
(b) that are associated with the lives of persons significant in our past; or
(c) that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
(d) that have yielded, or may be likely to yield, information important in prehistory or history. (36 CFR 60.4)

For CEQA-compliance considerations, the State of California's Public Resources Code (PRC) establishes the definitions and criteria for "historical resources," which require similar protection to what NHPA Section 106 mandates for historic properties. "Historical resources," according to PRC §5020.1(j), "includes, but is not limited to, any object, building, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California." More specifically, CEQA guidelines state that the term "historical resources" applies to any such resources listed in or determined to be eligible for listing in the California Register of Historical Resources, included in a local register of historical resources, or determined to be historically significant by the Lead Agency (Title 14 CCR §15064.5(a)(1)-(3)).

1286

Regarding the proper criteria of historical significance, CEQA guidelines mandate that "a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources" (Title 14 CCR §15064.5(a)(3)). A resource may be listed in the California Register if it meets any of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history. (PRC §5024.1(c))

As mentioned above, two previously recorded sites, CA-RIV-7544H and 33-13778, were reportedly located partially across the proposed pipeline route, but the field survey reveals that none of the features of these two sites is located within or immediately adjacent to the APE. In addition, both of these sites were previously determined not to be eligible for listing in either the National Register or the California Register (Taniguchi and Dice 2004:1-3; Messick and Dice 2004:2-4). Therefore, the only potential "historic properties"/"historical resources" present within the APE are Site 33-16207 and 33-16208 (CA-RIV-8364). Pursuant to these statutory and regulatory guidelines, Sites 33-16207 and -16208 are evaluated under the criteria for the National Register and the California Register, and the results of the evaluation are discussed below.

SITE EVALUATION

Site 33-16207

Site 33-16207 consists of a group of rural historic landscape features of unknown age, such as olive trees, a fence, and remnants of an irrigation system. Although the site is located on land once owned by Walter Hathaway, a notable local merchant and community leader around the turn of the 20th century, there is no evidence that these features are closely associated with Hathaway and the prominent role he played in the early history of Banning. In fact, historical sources suggest that at least some of the features, such as the olive trees, likely post-date Hathaway's association with the property. In addition, none of the features demonstrates a close association with any historical event, special aesthetic values, or any other historical/archaeological merits. Therefore, Site 33-16207 does not appear to be eligible for listing in the National Register or the California Register, and does not appear to qualify as a "historic property" or a "historical resource."

Site 33-16208 (CA-RIV-8364)

The refuse deposit found and recorded as Site 33-16208 contains an abundance of temporally and morphologically diagnostic artifacts that may provide valuable information on the consumer practices of local households around the 1920s-1930s, even though the refuse itself does not appear to be associated with any particular household, a specific person, or a historical event. The site may contain a subsurface component, as it was

observed that many of the artifacts found on the surface were partly buried. While the 1920s-1930s may not be considered a particularly early period in local history, it was a time of accelerated growth and dramatic change in Banning and the entire United States after the end of World War I, during a decade of unprecedented prosperity and the ensuing Great Depression, and before the U.S. involvement in World War II.

In light of the location of the site, it may be associated with residents who lived to the southeast of downtown Banning and were primarily agriculturalists, as evidenced by the numerous orchards and farmhouses observed in historic maps. This area has since been developed and many of the former farms and ranches have become the scene of residential and commercial developments, most of which occurred during the post-WWII boom. Remnants of the agricultural landscapes and free-range cattle observed in the site vicinity during the field survey attest to the area's historical use, which is quickly vanishing due to the effects of urban sprawl.

As of 2004, only four other historic-period refuse scatters have been recorded in the City of Banning and its sphere of influence, as reported by the Eastern Information Center (Tang et al. 2004:8). In comparison to most sites of this type that have been recorded in the southern California desert region, Site 33-16208 is remarkable in that it retains a good level of integrity and contains a variety of household consumer refuse items that date to the early 20th century. As such, Site 33-16208 may have the potential to yield important archaeological data for the study of local history with regard to consumerism and the lifestyle of early-20th century agriculturalists in this portion of inland southern California.

However, the data potential—and thus the significance—of the site cannot be ascertained without additional archaeological investigations, including a surface collection of the diagnostic artifacts, subsurface testing to explore the quantity and quality of the artifact deposit, and analysis of the recovered materials. In order to determine the significance of Site 33-16208 and its qualification as a "historic property"/"historical resource," a testing phase study will be necessary at the site, as outlined below.

CONCLUSION AND RECOMMENDATIONS

Section 106 of the National Historic Preservation Act mandates that federal agencies take into account the effects of their undertakings on historic properties and seek ways to avoid, minimize, or mitigate any adverse effects on such properties (36 CFR 800.1(a)). Similarly, CEQA establishes that "a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (PRC §21084.1). "Substantial adverse change," according to PRC §5020.1(q), "means demolition, destruction, relocation, or alteration such that the significance of an historical resource would be impaired."

The present study has concluded that Site 33-16207 does not appear to qualify as a "historic property" or a "historical resource," but that the significance of Site 33-16208 cannot be determined without further studies. Based on these findings, CRM TECH recommends that an archaeological testing and evaluation program be implemented on Site 33-16208 prior to the commencement of the project. The testing and evaluation program should consist of, at a minimum, the following procedures:

1288

- Preparation of a research design;
- Surface collection of diagnostic artifacts;
- Excavation of archaeological test units to determine the subsurface content of the site;
- Laboratory analysis of artifacts recovered through the archaeological field procedures;
- Cataloguing and permanent curation, at an appropriate facility, of all artifacts recovered from the site;
- Preparation of a final report to summarize the findings of the procedures outlined above and to interpret such findings within the context of a regional research design.

Further recommendations regarding the final treatment of Site 33-16208 will be formulated and presented on the basis of the results of the testing and evaluation program. No additional cultural resources investigation is recommended for the balance of the APE unless project plans undergo such changes as to include areas not covered by this study. However, if buried cultural materials are encountered during construction anywhere within the APE, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

RE: Banning WWTP
In the City of Banning, Riverside County
CRM TECH Contract #2083

Dear Mr. Andreas:

CRM TECH is conducting a cultural resources study for the project referenced above. In the meantime, I am writing to request your input on potential Native American cultural resources in or near the project area. Please respond at your earliest convenience if you have any specific knowledge of sacred/religious sites or other sites of Native American traditional cultural value within or near the project area that we should be aware of. The lead agency for this project is the City of Banning for CEQA compliance purposes.

The project is located in the City of Beaumont, Riverside County. The accompanying map, based on the USGS Beaumont and Cabazon, Calif., quadrangles, depicts the location of the APE in Sections 8-11 and 14-18, T3S R1E, SBBM.

Any information, concerns or recommendations regarding cultural resources in the vicinity of the project area may be forwarded to CRM TECH by telephone, e-mail, facsimile or standard mail. Thank you for the time and effort in addressing this important matter.

Respectfully,

Laura Hensley Shaker

Re: Proposed Banning WWTP CRM TECH #2083t, Riverside County

Dear Ms. Hensley Shaker:

The Native American Heritage Commission was able to perform a record search of its Sacred Lands File (SLF) for the affected project area. The SLF failed to indicate the presence of Native American cultural resources in the immediate project area. The absence of specific site information in the Sacred Lands File does not guarantee the absence of cultural resources in any 'area of potential effect (APE).'

Early consultation with Native American tribes in your area is the best way to avoid unanticipated discoveries once a project is underway. Enclosed are the nearest tribes that may have knowledge of cultural resources in the project area. A List of Native American contacts are attached to assist you. The Commission makes no recommendation of a single individual or group over another. It is advisable to contact the person listed; if they cannot supply you with specific information about the impact on cultural resources, they may be able to refer you to another tribe or person knowledgeable of the cultural resources in or near the affected project area (APE).

Lack of surface evidence of archeological resources does not preclude the existence of archeological resources. Lead agencies should consider avoidance, as defined in Section 15370 of the California Environmental Quality Act (CEQA) when significant cultural resources could be affected by a project. Also, Public Resources Code Section 5097.98 and Health & Safety Code Section 7050.5 provide for provisions for accidentally discovered archeological resources during construction and mandate the processes to be followed in the event of an accidental discovery of any human remains in a project location other than a 'dedicated cemetery. Discussion of these should be included in your environmental documents, as appropriate.

If you have any questions about this response to your request, please do not hesitate to contact me at (916) 653-6251.

Sincerely,

Dave Singleton
Program Analyst

Conversation: City of Banning WWTP

Laura,

Thank you for contacting the Morongo Band of Mission Indians concerning the City of Banning's proposed WWTP project.

Due to the proximity of the site to the extensive Red Hands Village Site (RIV-57) and rock art (RIV-5847) and adjacent Smith Creek, the Tribe believes the site of the actual plant is in a high-probability area for cultural resources and we recommend an archaeological site monitoring plan for the plant area. At least one monitor should be Native American provided by Morongo under contract to the City/contractor. The Tribe also asks that it be invited to any pre-construction meeting.

Thank you for considering our comments.

Sincerely,

Britt W. Wilson

Re: Banning WTTP; CRM Tech Contract #2083

Dear Ms. Shaker:

The Ramona Band of Cahuilla Indians appreciates the opportunity to consult with you regarding the proposed project listed above and mentioned in your June 13, 2007 letter.

The Ramona Band of Cahuilla Indians is concerned about the protection of unique and irreplaceable cultural resources, such as Cahuilla village and burial sites and archaeological items that may be displaced by ground-disturbing work associated with any project within the aboriginal homelands of the Cahuilla people.

The Ramona Band of Cahuilla Indians is also concerned about the proper and lawful treatment of any cultural or ceremonial items, Native American human remains, or sacred items discovered during planning and/or construction of the project.

At this time, the Ramona Band of Cahuilla Indians has no information to provide regarding cultural resources that may be located within the project area. However, the Ramona Band of Cahuilla Indians reserves the right to provide comments regarding the Project upon review of the findings of the cultural resources assessment for the subject property. Please forward a copy of the cultural resources study/investigation of the above referenced property to the address listed above.

The Ramona Band of Cahuilla Indians appreciates the opportunity to consult regarding the proposed project.

Sincerely,

John A. Gomez, Jr.
Cultural Resources Coordinator
Ramona Band of Cahuilla Indians

Biological Resources Survey Report

Biological Survey Report: City of Banning Wastewater Treatment Plant Expansion and Phase I Recycled Water System

The City of Banning proposes to expand its 3.6 mgd wastewater treatment plant (WWTP) and construct a recycled water storage and distribution system in accordance with the Banning Recycled Water Master Plan. The capacity of the existing WWTP, on approximately 126 acres of land, would expand from 3.6 mgd to 5.1 mgd. The additional 1.5 mgd capacity would include an advanced treatment process using a Membrane Bioreactor (MBR) to produce recycled water. The MBR treatment process would satisfy State of California Department of Health Services (DHS) Title 22 water quality requirements without filtration. Expansion of the treatment plant would occur primarily on approximately 16 acres of undeveloped land west of the existing WWTP. Expansion of the WWTP and installation of a recycled water system would necessitate ground disturbance at three locations:

- From an existing, capped water well (Well R1) northeast of the WWTP to the existing WWTP;
- A 9.5-acre undeveloped field immediately west of the existing WWTP; and,
- Along paved streets between the WWTP on the eastern side of town and Sunset Avenue on the west side of Banning, and between Sunset Avenue and the eastern side of the Sun Lakes residential development.

Survey Techniques

On April 4, 2007, Mr. John Moeur, Terrestrial Ecologist and Principal Scientist (Parsons), examined the proposed sites for the various components of the WWTP expansion and recycled water system. A broad characterization of the project biological study area was deemed sufficient initially, rather than quantitative descriptions derived from systematic sampling techniques. For these reasons, a pedestrian survey was combined with windshield observations, as appropriate.

The site of Well R1, the undeveloped field, and a diagonal route between Sunset Avenue and Westward Avenue were walked. Other project components could be seen adequately from a slow-moving vehicle. The study area includes approximately 1.3 acres (0.54 hectares [h]) around the site of Well R1, 9.5 acres (3.83 h) of vacant field just west of the treatment plant, about 14.3 acres (5.78 h) along the diagonal between Sunset Avenue and Westward Avenue. The proposed alignment for the recycled water pipeline is composed of various paved streets with minimal to no biological value, as any plants were growing through asphalt pavement.

Formally Protected Species

Records kept by California Department of Fish and Game (CDFG) as the California Natural Diversity Database (CNDDB) (2003) reflect previous biological collections and observations that display collection locales. Such information can indicate land areas possibly still inhabited by protected species.

The United States Fish and Wildlife Service (USFWS) identified 16 federally protected species known to inhabit locales in the general region of the City of Banning (see attached letter dated September 14, 2007). With the exception of Stephen's kangaroo rat and mountain yellow-legged frog, none of these species occur any closer than 3 miles from the project site (most are known only from very considerably farther away than 3 miles from the project site).

Stephen's kangaroo rat (*Dipodomys stephensi*), of the rodent (Family Heteromyidae) is listed as endangered by the USFWS and threatened by the CDFG. Stephen's kangaroo rat generally occurs in annual and perennial grasslands dominated by brome grasses and filaree, but has also been found to inhabit sparse coastal sage scrub, scrub mixed with chamise, or sagebrush plant assemblages. This

small mammal prefers areas with well-drained, gravelly or sandy soil for digging their burrows, but will also burrow in firm soils. Stephen's kangaroo rat has been recorded on the Five Bridges housing site.

Yellow-legged frog (*Rana mucosa*), a true frog (Family Ranidae) is listed by the USFWS as endangered, but does not have formal listing by the CDFG. This species always occurs very near water. The instance (CNDDB EOIndex № 42456) which maps within 0.25 mile of the study area is from a collection made in 1925 at a vaguely described locale. The species possibly has been extirpated from this locale. The mapped occurrence (shown as 1.0 mile in radius) would intersect the project study area only along Lincoln Street at about San Gorgonio Avenue.

Sensitive Species

In the extent of the project study area between well R1 on the eastern side of Banning and the Sun Lakes residential development on the west, CNDDB records show locales of seven other species thought to be declining in their abundance or being restricted from their historic range. While most have been termed California Species of Concern, none has formal status under either the federal or the state Endangered Species Act. These seven species are: Yucaipa onion (*Allium marvinii*), Plummer's mariposa lily (*Calochortus plummerae*), northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*), mesa horkelia (*Horkelia cuneata puberula*), Los Angeles pocket mouse (*Perognathus longimembris brevinasus*), western spadefoot toad (*Spea hammondii*), and the American badger (*Taxidea taxus*).

Twelve additional sensitive species were reported (Impact Sciences, 2006) from the western portion of the present study area during biological surveys conducted for the Five Bridges residential development. CNDDB archives do not record these species in this geographic area (not an uncommon circumstance). Most are birds of special concern: Cooper's hawk (*Accipiter cooperii*), sharp-shinned hawk (*Accipiter striatus*), Bell's sage sparrow (*Amphispiza belli*), golden eagle (*Aquila chrysaetos*), burrowing owl (*Athene cunicularia*), California horned lark (*Eremophila alpestris actia*), northern harrier (*Circus cyaneus*), and loggerhead shrike (*Lanius ludovicianus*). Two mammals and two reptiles were also identified: the pallid San Diego pocket mouse (*Chaetodipus fallax pallidus*), San Diego black-tailed jack rabbit (*Lepus californicus bennettii*), coastal western whiptail (*Aspidoscelis tigris stejnegeri*), and coast San Diego horned lizard (*Phrynosoma coronatum blainvillei*), respectively.

Site for Well R1

The Well R1 site, approximately 1.3 acres in size within the Banning WWTP property fence line, has been partially cleared. The ground around Well R1 has been scraped flat. An existing dirt road provides access to percolation ponds and Well R1. The well's casing protrudes from the ground at coordinates 11S 0514386E 3753048N (UTM NAD 1983). Although the dirt road is heavily traveled, this area is characterized by presence of buckwheat (*Eriogonom fasciculatum*), filaree (*Erodium* sp.), and mustard (*Brassica* sp.). Lark sparrow (*Chondestes grammacus*), western kingbird (*Tyrannus verticalis*), killdeer (*Charadrius vociferous*), and jack rabbit (*Lepus californicus*) were observed on April 4, 2007. These jack rabbits may belong to the sensitive subspecies (*L. californicus bennettii*) given this location and occurrences just a few miles west as recorded by CNDDB. Small burrows west of the well may be used by pocket mouse species. The area may potentially serve as habitat for three other species considered sensitive by the California Natural Diversity Data Base (CNDDB): pallid San Diego pocket mouse, Los Angeles pocket mouse and coast San Diego horned lizard. None of these three California Species of Special Concern (CSC) were observed on April 4, 2007.

Undeveloped Field West of WWTF

The proposed expansion site west of the existing Banning WWTP is generally flat, about 9.5 acres in size, and was planted with domestic olive trees as hedgerows (*Olea europaea*) along two sides of the field. The property is mowed twice yearly. Vehicular traffic along a perimeter road into the Banning Animal Shelter crosses the parcel near its southern boundary. Plants found on the site include California croton (*Croton californicus*), mustard, yellow fiddleneck (*Amsinckia* sp.), sun cup (*Camissonia* sp.) and annual grasses. Common raven (*Corvus corax*), American crow (*Corvus brachyrhynchos*),

and numerous burrows dug by California ground squirrel (*Spermophilus beecheyi*) were observed on the site on April 4, 2007. No burrowing owls were seen flying or posting on dirt mounds on April 4, 2007, and no ground squirrel burrow had indirect evidence of burrowing owls that may inhabit this site.

Pipeline Route Along Paved Residential Streets

The proposed recycled water pipeline corridor from the Banning WWTP to Sunset Avenue would be constructed entirely on paved surfaces, primarily in residential areas. A natural gas pipeline and water supply line are located beneath Lincoln Street (and other streets along this route). Annual, introduced grasses were visible in vacant areas between houses, as were ground squirrel burrows. No species but those common to urban areas were noted.

Alignment Along Westward Avenue

The proposed recycled water pipeline corridor from Sunset Avenue to the Sun Lakes housing area would be constructed on a gravel surface comprising the extension of Westward Avenue. This access road experiences frequent vehicular traffic and bisects the proposed Five Bridges housing property. Although a corridor south of the roadway is fenced, this property is used for cattle grazing. Utility lines (gas and fiber optics) are located on the north side of Westward Avenue, with an aboveground, suspended sewage pipe crossing to the south side of the roadway near Smith Creek. A series of bridges provide the roadway over the large wash. Wildlife observed on April 4, 2007 included Say's phoebe (*Sayornis saya*), mourning dove (*Zenaida macroura*), European starling (*Sturnis vulgaris*), Brewer's blackbird (*Euphagus cyanocephalus*), crow, raven, and turkey vulture (*Cathartes aura*). Although evidence of pocket gopher (*Thomomys bottae*) was observed, the dirt shoulders of the road contain no biological resources of concern.

Undeveloped land north of Westward Avenue was surveyed for the Five Bridges residential development, and evidence of Stephens' kangaroo rat were observed there. CNDDB records also show areas mapped as inhabited by *D. stephensi* (Fig. 1). A possible route across this currently undeveloped acreage was examined on April 4, 2007 looking particularly for burrows probably dug by heteromyid rodents. Four such burrows were found. All are in the general vicinity of mapped local distribution of Stephen's kangaroo rat (Fig. 1). No sign of burrowing owls was found anywhere along the diagonal alignment. A cluster of large gums trees (*Eucalyptus* sp.), mature willows (*Salix goodingii*), and mule fat (*Baccharis salisifolia*) grows where this diagonal route would cross Pershing Creek. The grove of trees constitutes an island of arboreal habitat in an otherwise spare tract. A number of bird species were present and active there at mid-day. Tracks of several native mammals species were also seen there.

Fig. 1. Location of four burrows (yellow Xs) close to a diagonal route (blue) across undeveloped land north of Westward Avenue. Irregular polygon (orange) shows land occupied by Stephen's kangaroo rat, as recorded by CNDDB. Magenta oval denotes large trees populated by a variety of bird species.

This diagonal route should be avoided in favor of the north shoulder of Westward Avenue between Sunset Avenue and the Sun Lakes Development. The diagonal route is not being considered for the recycled water pipeline at this time.

Conclusion

Two federally listed species and eighteen sensitive species have been recorded historically in the general vicinity of the proposed recycled water pipeline and water treatment facilities as proposed by the City of Banning. No listed species were evident in the project study area where proposed trenches would be excavated. The site of the water treatment facility west of the existing plant has no signs of any species of concern.

Installation of pipelines along existing roads would have no adverse consequence to any listed species or California species of special concern.

No need for formal coordination with agencies would arise as all effects of ground disturbance would occur in either existing paved streets through residential neighborhoods of Banning, along the manufactured and maintained shoulders of compacted gravel roads used regularly for operational purposes, or on a vacant tract of land adjacent to the exiting treatment facility. As no foreseeable adverse affects would be anticipated, no mitigation would be required to compensate for project effects to biological resources.

Pasadena, California 91124

Subj: Species List for the Proposed Waste Water Treatment Plant Expansion and Phase I Recycled Water System, City of Banning, Riverside County, California.

Dear Ms. Crisologo:

This letter is in response to your written request, received on September 05, 2007, for information on federally endangered, threatened, proposed, and candidate species that occur in the vicinity of the proposed wastewater treatment expansion and recycled water system that includes pipelines, pumps, a skimmer, and storage reservoirs. The proposed project is located in the City of Banning at 2242 East Charles Street and includes a pipeline that would be constructed west along Charles Street, north on Hathaway Street, west on Lincoln Street, south to an unpaved access road terminating at the Sun Lakes housing development. To assist you in evaluating the potential occurrence of federally listed endangered, threatened, proposed, and candidate species that may occur in the vicinity of the area identified, we are providing the enclosed list.

The proposed project is located within the plan area for the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The MSHCP provides for the long-term conservation and management of habitat for many federally listed and sensitive species in the region while authorizing certain impacts to these species. The City of Banning is signatory to the MSHCP, and therefore, will need to conduct this project consistent with the provisions of the MSHCP.

If the proposed project is authorized, funded, or carried out by a Federal agency and may affect a listed species, then the Federal agency must consult with us, pursuant to section 7 of the Endangered Species Act of 1973 (Act), as amended (16 U.S.C 1531 *et seq*).

Although we have provided a list of federally listed endangered, threatened, proposed, and candidate species that may occur in the vicinity of the proposed action, we do not have site-specific information for the project area. Therefore, we recommend that project proponents seek assistance from a biologist familiar with the habitat conditions and associated species in and around the proposed project site to assess the actual potential for direct, indirect and cumulative impacts likely to result from the proposed activity.

TAKE PRIDE IN AMERICA

If you have any questions regarding this letter, please contact Kathleen Pollett of this office at (760) 431-9440, extension 357.

Sincerely,

for Karen A. Goebel
Assistant Field Supervisor

APPENDIX E

Mitigation Monitoring and Reporting Program

MITIGATION MONITORING AND REPORTING PROGRAM: CITY OF BANNING WASTEWATER TREATMENT PLANT EXPANSION AND PHASE I RECYCLED WATER SYSTEM

Section 21081.6 of the Public Resources Code, enacted by passage of AB 3180 (Cortese Bill), requires public agencies approving projects with significant environmental impacts to adopt a Mitigation Monitoring and Reporting Program. This objective of the program is to ensure that mitigation measures adopted to avoid or mitigate potentially significant environmental impacts are implemented. Section 21081.6 of the Public Resources Code requires all state and local agencies to establish monitoring and reporting programs whenever approval of a project relies upon a mitigated negative declaration or an environmental impact report (EIR). In accordance with these requirements, this mitigation monitoring and reporting program has been prepared to ensure that mitigation measures identified in the Initial Study/Mitigated Negative Declaration for the Wastewater Treatment Plant Expansion and Phase I Recycled Water System (or subsequent revisions thereto), are implemented in an effective and timely manner, and that identified impacts are avoided or mitigated to a level of insignificance. This program provides a discussion of parties responsible for the mitigation program, and a detailed discussion of monitoring and reporting procedures for the mitigation.

I. RESPONSIBLE PARTY

The City of Banning Water/Wastewater Utilities Department (City) will be responsible for implementing and reporting of the mitigation measures in this mitigation program. This agency will be responsible for construction management and oversight, and will ensure that mitigation measures are properly carried out by designated and qualified personnel, which may include specialty contractors.

II. MITIGATION REQUIREMENTS

The Proposed Project includes construction to expand the existing wastewater treatment plant (WWTP) by 3.6 million gallons per day, install new pipeline to transport recycled water, construct a pump station and a storage reservoir for recycled water. Based on the findings of the Initial Study, a total of ten (10) mitigation measures are required for biological and cultural resources, while four (4) construction best management practices are recommended for air quality and hydrology/water quality. Potentially significant impacts and specific mitigation measures are described on Table 1.

III. SCHEDULE AND REPORTING FREQUENCY

Monitoring of mitigation activities will be documented on a Mitigation Monitoring Report form (see Exhibit A). This form will be filled out by the appropriate individual in the event an inadvertent discovery of archaeological materials, paleontological materials, or human remains are found. Monitoring reports will be submitted to the City, retained in the City's project files, and be available for inspection upon request. Completion of these forms will demonstrate and document compliance with Public Resources Code 21081.6.

Table 1. Summary of Environmental Impacts and Mitigation Measures

Resource Area	Potentially Significant Impact	Mit. No.	Mitigation Measure	Frequency of Reporting	Significance After Mitigation
Aesthetics	None.	---	None required.	---	---
Agricultural Resources	None.	---	None required.	---	---
Air Quality	None.	1	The best management practice of watering for dust control is recommended.	---	---
Biological Resources	Potential to interfere with movement of small animals	2	The following mitigation measures will be incorporated into project design and planning to avoid or minimize habitat disturbance: • *Pipeline design will be limited to the disturbed shoulders of the existing roadway along Westward Avenue. Placement of recycled water pipeline in any washes or creeks will be avoided.*	Upon 100% design completion and during construction	Less than significant
		3	• *A qualified biologist will be present during trenching to monitor ground disturbance to ensure that construction vehicles do not stray north of Westward Avenue into grasslands of marginal quality but where kangaroo rat burrows might occur north of the project site.*	During construction	Less than significant
		4	• *Pipeline installation along Westward Avenue from Sunset Avenue to the Sun Lakes housing area would be conducted by minimizing the width of the trench corridor to less than 5 feet, wherever possible.*	Upon 100% design completion and during construction	Less than significant
		5	• *Construction laydown and staging areas would be sited along nearby paved road surfaces and would not be located upon any undisturbed, natural areas.*	Upon 100% design completion and during construction	Less than significant
		6	• *To avoid potential impacts, construction work limits would be clearly designated on construction plans and specifications.*	Upon 100% design completion and during construction	Less than significant
		7	• *To retain native plant material, any topsoil removed from the site would be stockpiled, covered and replaced on-site, as much as possible. During pipeline construction, any non-paved areas that are trenched would be returned to their original condition following pipeline installation.*	Upon 100% design completion and during construction	Less than significant

Table 1. Summary of Environmental Impacts and Mitigation Measures (Cont'd)

Resource Area	Potentially Significant Impact	Mit. No.	Mitigation Measure	Frequency of Reporting	Significance After Mitigation
Cultural Resources	Construction activities may encounter previously undiscovered archaeological resources	8	• *The pipeline from Well R1 to the Banning WWTP would be aligned to avoid Site 33-16208. The City would ensure that a qualified archaeological monitor flags the boundaries of the site prior to any groundwork, and that the monitor is present during pipeline trenching at this location. In lieu of avoiding the site, the City may also conduct an archaeological testing and evaluation program for Site 22-16208 as described in the Cultural Resources Survey Report (July 20, 2007) for this project.*	Upon 100% design completion and during construction	Less than significant
		9	• *In the event any archaeological materials or subsurface deposits are unearthed during earthmoving activities, the construction contractor would cease activity in the affected area (e.g., redirect activities into another area) until the discovery can be evaluated by a qualified archaeologist or historic resources specialist, as required, and appropriate treatment measures implemented.*	Upon 100% design completion and during construction	Less than significant
	Construction earthmoving activities and unauthorized collection of fossil remains by construction personnel	10	To avoid potential impacts to paleontological resources, the District would ensure that the two mitigation measures described above are incorporated into project planning (these measures would restrict ground disturbance to specified work areas), and the following mitigation would be implemented during construction: • *In the event paleontological resources are encountered during earthwork, the construction contractor would cease activity in the affected area (e.g., redirect activities into another area) until a qualified paleontologist can evaluate the discovery, and implement appropriate treatment measures. The paleontologist would determine if the paleontological material should be salvaged, identified and permanently preserved. Curation of specimens into an accredited museum repository would be conducted by a qualified paleontologist, who would also prepare a report of findings for the City of Banning.*	Immediately upon discovery	Less than significant

Table 1. Summary of Environmental Impacts and Mitigation Measures (Cont'd)

Resource Area	Potentially Significant Impact	Mit. No.	Mitigation Measure	Frequency of Reporting	Significance After Mitigation
Cultural Resources (Cont'd)	Construction activities encountering human remains	11	To avoid potential impacts to human remains that may be buried beneath the surface in the work area, the City would ensure that the following mitigation measure is implemented: • *In the event human remains are encountered during project construction, the Riverside County Coroner shall be contacted to determine whether or not investigation of the cause of death is required. In the event the remains are Native American in origin, the Native American Heritage Commission shall be contacted to determine necessary procedures for protection and preservation of remains, including reburial, as provided in the CEQA Guidelines, Section 15064.5(e).*	Immediately upon discovery	Less than significant
Geology and Soils	None.	---	None required.	---	---
Hazards and Hazardous Materials	None.	---	None required.	---	---
Hydrology and Water Quality	None.	12	Three construction best management practices for erosion control would be implemented during construction of project facilities to minimize the potential for sediment to be picked up and transported off-site by runoff. • *Standard erosion control measures would include stockpiling and covering topsoil, as well as best management practices to prevent water quality impacts.*	Upon 100% design completion and during construction	Less than significant
		13	• *Construction equipment would not be rinsed off on-site or in such a manner as to adversely impact Smith Creek along the southern boundary of the project site.*	Upon 100% design completion and during construction	Less than significant
		14	• *Construction materials would be covered and stored in contained areas away from any drainage areas. Construction materials would be covered and stored in contained areas away from any drainage areas.*	Upon 100% design completion and during construction	Less than significant

WDRs – waste discharge requirements
WIFIA – Water Infrastructure Finance Innovation Act
WWTP – City of Banning Wastewater Treatment Plant

EXECUTIVE SUMMARY

The City of Banning (City) has prepared this feasibility study to support a grant application for WaterSMART: Title XVI WIIN Act Water Reclamation and Reuse Projects for Fiscal Years 2023 and 2024 per Funding Opportunity Announcement No. R23AS00464. This study evaluates the feasibility of upgrading the City's Wastewater Treatment Plant (WWTP) to tertiary disinfected recycled water standards for non-potable reuse under the terms of the U.S. Bureau of Reclamation (USBR) Water Reclamation and Reuse (Title XVI) program. This study is structured to follow the Bureau of Reclamation Manual, Directives and Standards, "WTR 11-01."

The existing WWTP consists of preliminary treatment, primary treatment, secondary treatment, solids handling, disinfection (currently not in use), and evaporation/percolation ponds. The WWTP effluent is currently in compliance with discharge requirements, but it requires significant upgrades to comply with impending water quality discharge limits by the Regional Water Quality Control Board (RWQCB). In addition, the Trickling Filters, which perform secondary treatment, have reached their end of life. WWTP effluent discharges to percolation ponds that recharge into the Cabazon Groundwater Basin but is not entirely extracted by Banning - the percolated water flows to other water agencies located downgradient.

The proposed Wastewater Treatment Plant and Recycled Water Upgrades Project (Project) evaluated by this study consists of three phases: I) upgrading the existing WWTP to recycled water standards and building pipelines to connect the WWTP to customers currently using ground water from non-potable wells, II) building pipelines to connect the WWTP to the future recycled water customers, and III) building pipelines to connect the WWTP to a groundwater recharge basin upgradient of the Cabazon storage unit. Phase I will be implemented in the near term, and Phases II and III will be implemented in the long-term. Phases II and III are not included in this Feasibility Study for clarity. The City has only requested funding for Phase I in the WaterSMART funding application but will seek additional funding for Phases II and III in the future and will provide an updated Feasibility Study at that time.

Currently, there are no non-potable recycled water uses that have been implemented in the City. By implementing both project components, non-potable reuse and indirect potable reuse, the supply and usage of locally sourced non-potable water supply will increase by an estimated 4,035 AFY (3.6 MGD) of recycled water.

The City relies upon purchasing water from the San Gorgonio Pass Water Agency (SGPWA) for groundwater recharge. The increased supply of local non-potable water supplies produced from this Project would decrease demands on the SGPWA, and on its supplier, the California State Water Project, thereby reducing diversions from natural watercourses in the Sacramento-San Joaquin Delta. The Project also provides non-quantifiable benefits including improving non-potable water supply reliability and drought resiliency.

1. INTRODUCTION

1.1 Prelude

The proposed Wastewater Treatment Plant and Recycled Water Upgrades Project (Project) is the subject of this feasibility study, which supports a grant application for WaterSMART: Title XVI WIIN Act Water Reclamation and Reuse Projects for Fiscal Years 2023 and 2024 per Funding Opportunity Announcement No. R23AS00464. This study is structured to follow the Bureau of Reclamation Manual, Directives and Standards, "WTR11-01," which was intended for reclamation projects. The purpose is to evaluate Project feasibility under the terms of the U.S. Bureau of Reclamation (USBR) Water Reclamation and Reuse (Title XVI) program.

The Project evaluated by this study involves upgrading the existing Wastewater Treatment Plant (WWTP) at the City of Banning (City) to Title 22 standards for recycled water use.

At this time, effluent from the WWTP meets the effluent water quality discharge requirements. However, the WWTP will not be able to meet the impending discharge limits proposed by the Colorado River Basin Regional Water Quality Control Boad (RWQCB). In addition, many treatment facilities at the plant have reached the end of their useful life. WWTP effluent is currently discharged to percolation ponds that recharge into the Cabazon Groundwater Basin but is not entirely extracted by Banning - the percolated water flows to other water agencies located downgradient.

By replacing existing equipment with new facilities that can treat the water to tertiary disinfected recycled water standards, the WWTP effluent can be used to meet current and future non-potable water demands in the City. This allows the City to both meet the impending RWQCB requirements as well as benefit from their WWTP effluent. These benefits include reducing the City's reliance on imported water and improving the reliability of groundwater for drinking water purposes. Since the City is considered a Disadvantaged Community, a reliable local supply of water will also support City growth and economic development, which are dependent on the availability of water supplies.

1.2 Non-Federal Project Sponsor

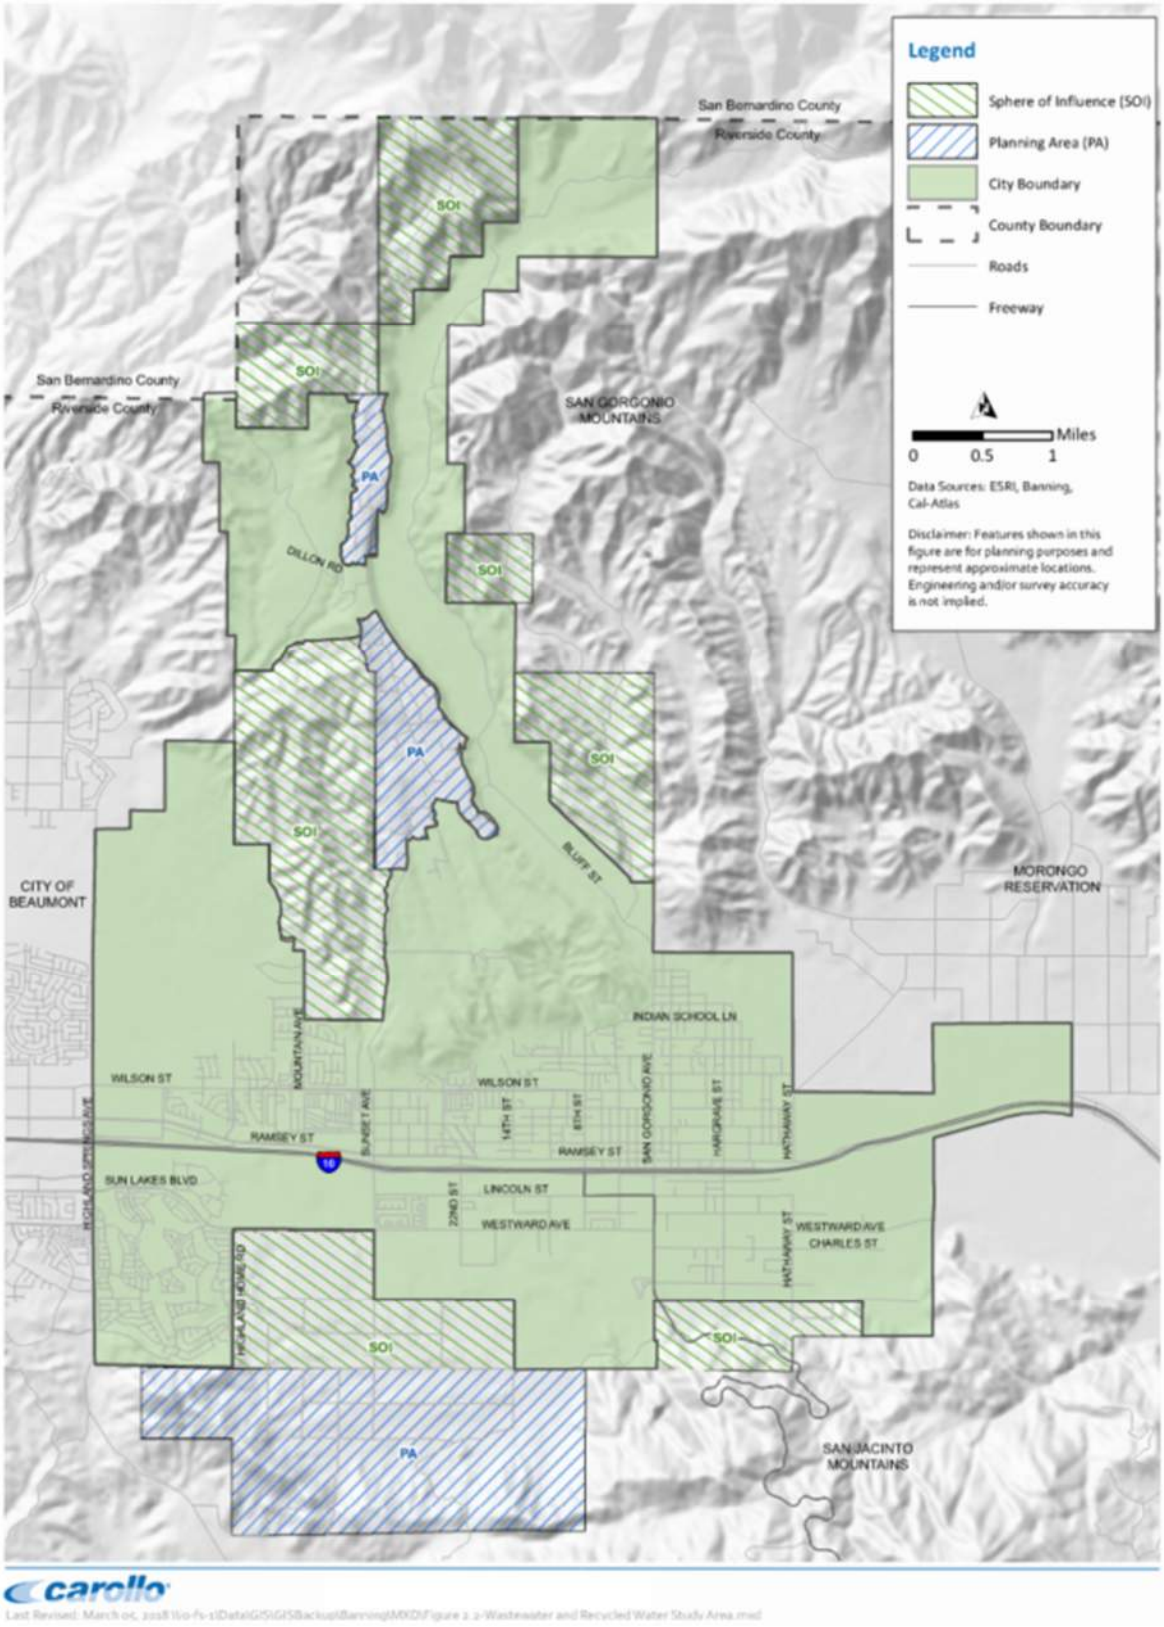
The City of Banning is serving as the non-federal project sponsor. The City was incorporated as a Charter City in 1913, pursuant to the California Constitution Article XI and the California Government Code and is governed by an elected five-member council. It is a full-service city, providing water and wastewater services through its Water and Wastewater Utilities Department, under the purview of the City Council.

1.3 Study Area and Project Map

The City of Banning is in the northwestern portion of Riverside County, approximately 25 miles east of downtown Riverside and approximately 30 miles west of the City of Palm Springs. The City

is bounded by the San Bernardino Mountains to the north; Cherry Valley to the northwest; the City of Beaumont to the west and southwest; unincorporated County area to the south; the San Jacinto Mountains to the southeast; and the Morongo Band of Mission Indians and unincorporated community of Cabazon to the east. The City's total land area is 14,848 acres or 23.2 square miles. See Figure 1 on the following page for a map of the City boundaries.

The City's water service area comprises 100 percent of the population residing within the City limits, and a small unincorporated area of Riverside County. The City's Water Service Area comprises about 16,908 acres or 26.4 square miles.



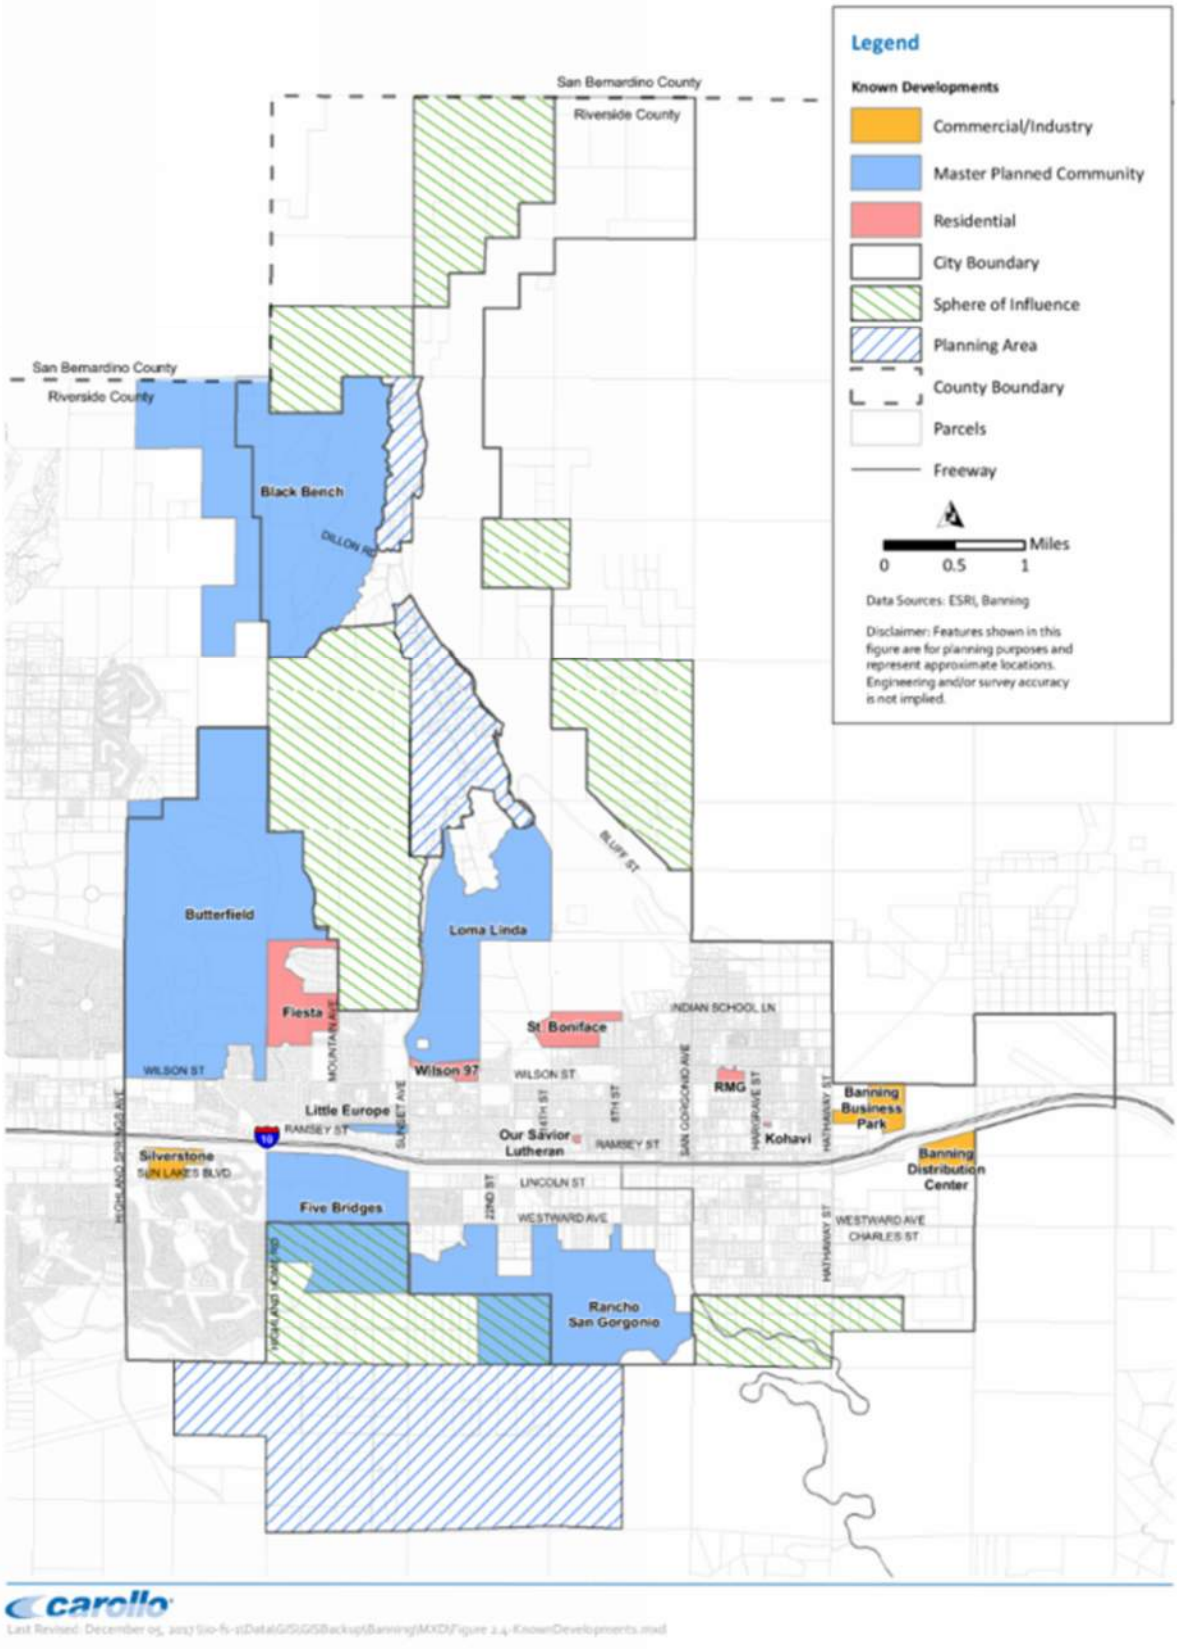
The City is a retail agency and within the San Gorgonio Pass Subbasin portion of the Coachella Valley Groundwater Basin. The City is a member of the San Gorgonio Pass Regional Water Alliance (Alliance). The Alliance was created to identify challenges in water supply and water quality in the region and to improve coordination and communication among local, state, and federal governments and water purveyors and other water resource stakeholders in the San Gorgonio Pass region.

Since 2015, the City has participated in the following two additional agreements:

1. San Gorgonio Integrated Regional Water Management Group, which includes: City of Banning, Banning Heights Mutual Water Company, Cabazon Water District, High Valleys Water District, Riverside County Flood Control and Water Conservation District (CFCWCD), and the San Gorgonio Pass Water Agency.
2. San Gorgonio Pass Subbasin Groundwater Sustainability Agency, which includes: the Desert Water Agency, Banning Heights Mutual Water District, Cabazon Water District, Mission Springs Water District, San Gorgonio Pass Water Agency and the City of Banning.
3. San Timoteo Groundwater Sustainability Agency, which includes: City of Banning, Beaumont-Cherry Valley Water District, City of Redlands, Yucaipa Valley Water District, San Gorgonio Pass Water Agency.

The City participates in the Beaumont Management Zone (BMZ) Maximum Benefits Program, which is under the oversight of the RWQCB and is intended to ensure the long-term sustainability of water quality in the BMZ. Yucaipa Valley Water District, Beaumont Cherry Valley Water District, and City of Beaumont also participate in the program.

Figure 1. City of Banning Project Map (courtesy of 2018 Integrated Master Plan (2018 IMP))



1.3.1 Land Use

The City includes a mixture of residential uses and equestrian estates, combined with more recently planned residential housing developments. The community focal point is an extended commercial downtown stretching along Ramsey Street. Ramsey Street largely parallels Interstate 10; consequently, one can find almost any type of restaurant, bank, or service station here - a wider variety than one would expect in a city of this size. Table 1 provides some basic statistics on current land use and economy for the County of Riverside and the City. Figure 2 on the following page shows the City's known developments, which includes the agricultural, open space, and community areas.

Table 1. Current Land Use & Economic Statistics for Riverside County and City of Banning Land

Item	Riverside County	Banning
Land Area (sq. miles)	7,206 sq. miles	23 sq. miles
Land Area (acres)	4,611,840 acres	14,720 acres
Agricultural Land	263,796 acres	1,200 acres
Developed Land	165,151 acres	428 acres
Population	2,470,546	31,125
Housing Units	857,148	10,991
Median Home Price	$350,100	$234,900
Owner Occupancy Rate	66.3%	65.9%
Employed (16yrs +)	59.7%	44.5%
Median Household Income	$67,005	$42,274
Percent in Poverty	11.3%	20.6%
Manufacturing	$15.1 Billion	$72.8 Million
Agriculture/Crops	$3.9 Billion	N/A
Retail & Wholesale Sales	$43.8 Billion	$248.7 Million

Figure 2. City of Banning – Known Developments (courtesy of 2018 IMP)

1.3.2 Climate

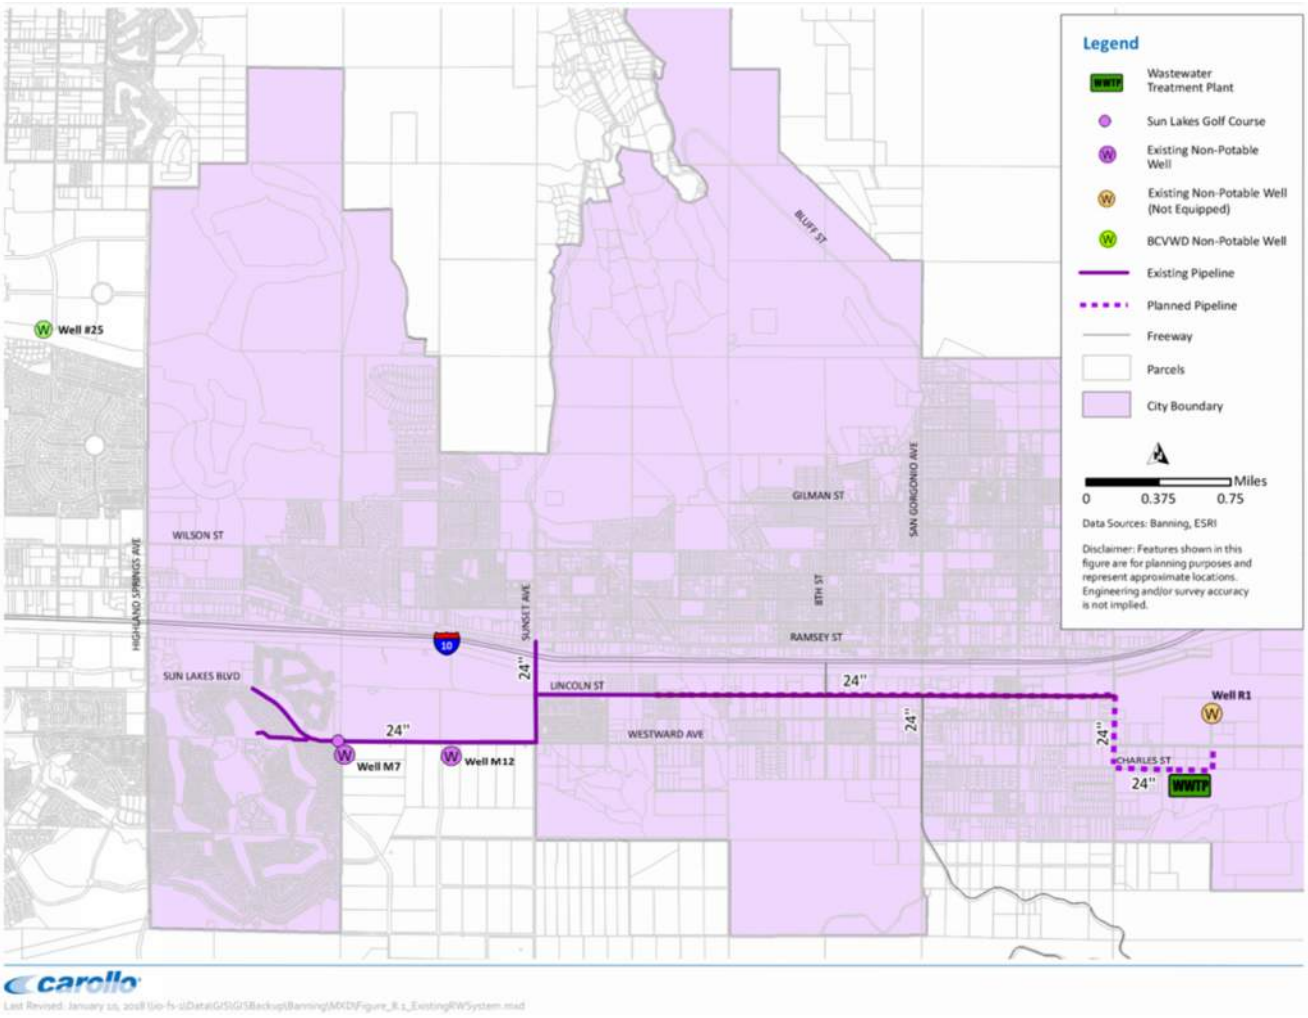
The City is located within the San Gorgonio Pass, which is a transitional zone where coastal climates transition to desert, resulting in significantly differing landscape and geology. The climate can best be characterized by hot, dry summers and short, mild winters. The region receives an average annual rainfall of approximately 19.7 inches, most of which takes place between December and March. Evapotranspiration (ETo) in the area ranges from 7.88 inches in July to 1.94 inches in December.

As the State of California and the Riverside County region has undergone a several-year drought, rainfall has been much lower in the City. Recent ETo and rainfall for the City is listed in Table 2.

Table 2. Recent Climate Characteristics (2022 – 2023)
CIMIS Station 239 (Hemet)
(cimis.water.ca.gov)

Month	Rainfall (in.)	Eto (in.)
Mar (2022)	0.69	2.30
Apr (2022)	0.27	3.15
May (2022)	0.00	4.21
Jun (2022)	0.02	6.14
Jul (2022)	0.00	7.89
Aug (2022)	0.00	7.70
Sep (2022)	0.17	9.16
Oct (2022)	0.25	8.34
Nov (2022)	1.77	6.47
Dec (2022)	1.18	4.65
Jan (2023)	0.91	2.87
Feb (2023)	0.69	2.13
Totals	**5.95**	**65.01**

1.3.3 Population



According to the 2020 Census Data, the resident population of the City is 29,528, and estimated to be 30,273 as of July 1, 2021. Since the City's water service area comprises 100 percent of the population residing within the City limits, the total current resident population served by the City's water system is approximately 31,125 persons, including those outside City limits. The City is currently experiencing a peak population, based on State of California Department of Finance estimates. Since the City is a commercial and government-services center for the region, daytime population increases demand for potable water beyond the City's resident population.

1.4 Reclaimed Water Area

There are no non-potable reclaimed water uses that have been implemented in Banning.

Currently, the City's existing non-potable water system delivers water from a non-potable groundwater well, Well M7, to Sun Lakes Country Club for irrigation use. The City has begun constructing a 24-inch diameter pipeline to connect the existing non-potable water pipe to the WWTP. The backbone pipeline is expected to be completed, tested, and accepted by the end of 2023. Once reclaimed water becomes available from the upgraded WWTP, the WWTP will replace Well M7 to serve Sun Lakes Country Club and other irrigation customers as part of this Project. The existing non-potable water system and planned backbone pipeline are shown in Figure 3 below.

Figure 3. City of Banning Reclaimed Water Area (courtesy of 2018 IMP)

2. STATEMENT OF PROBLEM AND NEEDS

2.1 Introduction

This section reviews the City's need for water reclamation, as well as short- and long-term recycled water demands and supplies. This section also includes discussions of sources of additional supplies and water quality concerns.

2.2 Need for Water Reclamation

With climate change bringing on more unpredictable and severe variations in weather which have recently been more frequent, and longer duration droughts in California and the entire Western United States, it is crucial for water agencies to engage in comprehensive planning to develop and implement sustainable sources of water. The effects of drought are clearly demonstrated with the Governor of California declaring a statewide State of Emergency due to drought. The Governor's State of Emergency declaration is accompanied by a call for all state residents to cut down on water use by 15%.

The last severe drought to affect the State occurred only a few years ago between 2012-2017 with 2013-2014 having extraordinarily dry conditions. The current drought may even be on a more dire path as the 2020 water year was the third driest water year on record in the last 127 years. With climate change resulting in hotter, drier summers and reduced precipitation, severe and prolonged droughts are forecast to be a normal part of California's future.

This water reclamation Project will generate sustainable supplies to the City's water supply portfolio that will help Banning better prepare for future water supply challenges.

In addition to drought preparation, water reclamation will help reduce the City's reliance on imported water. Currently, the City has access to imported water from the Sacramento-San Jaquin River Delta in Northern California through the San Gorgonio Pass Water Agency (SGPWA). The Bay Delta water system provides Southern California agencies with over 1 million acre-feet of water annually. According to the City's 2020 Urban Water Management Plan (2020 UWMP), the City purchased an average of 847 acre-feet per year (AFY) per year between 2010 – 2015, and an average of 752 AFY per year between 2015 – 2020 for groundwater recharge. By providing recycled non-potable water from the WWTP to irrigation customers, this will allow the City to rely less on imported water and depend on its local water supply to meet non-potable water demands.

2.3 Current Water Supplies

2.3.1 Water Sources and Supplies

The City currently uses potable water and non-potable water to meet the water needs of its service area. The City's water is obtained entirely from groundwater through nineteen (19) potable groundwater wells, one (1) non-potable groundwater well, and three (3) co-owned wells

with the Beaumont-Cherry Valley Water District (BCVWD). The City also has access to imported water from the Sacramento-San Joaquin River Delta in Northern California through the SGWPA and surface water from the Whitewater River. Both imported and surface water are used to recharge the groundwater aquifers.

Imported Water Sources

The SGPWA is one of 29 agencies in the State that have a State Water Project (SWP) Water Supply Contract with the Department of Water Resources (DWR). These agencies receive an allocation from the SWP each year. SGPWA also acquires water supplies through contracts with other agencies and annual water transfers and exchanges. Currently, as a wholesale agency, SGPWA distributes imported SWP water to three (3) member agencies: the City of Banning, BCVWD, and Yucaipa Valley Water District.

Table 3 shows the City's recent imported water purchases from 2015 to 2020 and compares them to the years 2010 to 2015. As shown in the table, the City purchased an average of 752 AYF per year from 2015 to 2020.

Table 3. Imported Water Purchases, courtesy of the 2020 Urban Water Management Plan (2020 UWMP)

Year	Purchases (AFY)
2015	686
2016	1,477
2017	1,350
2018	500
2019	250
2020	250
2015-2020 Avg.	**752**
2010-2015 Avg. (2015 UWMP)	847

Groundwater Sources

The City is within the boundaries of the Coachella Valley Hydrologic Unit, which encompasses several groundwater basins, including the Coachella Valley Groundwater Basin (Basin), within which the City is located. The Basin extends from Banning to the Salton Sea.

The City is underlain by the San Gorgonio Pass Subbasin (SGP Subbasin) portion of the Basin. The SGP Subbasin is divided into water storage units. The City extracts groundwater from the Banning

Storage Unit, the Banning Bench Storage Unit, the Cabazon Storage, the Beaumont Storage Unit, and the Banning Water Canyon Storage Unit.

Over the past five years of operation, groundwater extraction has averaged 7,513 AFY. Table 4 displays the City's groundwater supplies from 2015 to 2020.

Table 4. Imported Water Purchases, courtesy of the 2020 UWMP

Year	Production (AFY)
2015	6,723
2016	7,035
2017	7,576
2018	7,924
2019	7,226
2020	8,596
Average	**7,513**
2010 – 2015 Avg. (2015 UWMP)	8,246

Currently, the City does not utilize the entire capacity of all of its storage units. The maximum annual amount pumped by the City in the past 10 years is just under 9,000 AFY. Due to the projected developments, the City expects pumping to increase by 25% within 10 years and over 50% by the end of 2045. Table 5 below shows the City's projected water supplies and available volumes.

Table 5. Projected Water Supply Availability in AFY, courtesy of the 2020 UWMP

Year	2025	2030	2035	2040	2045
Basin	Projected (Available)	Projected (Available)	Projected (Available)	Projected (Available)	Projected (Available)
Beaumont Basin[1]	1,491 (1,491)	1,267 (1,267)	1,077 (1,077)	916 (916)	778 (778)
West Banning Basin	1,430 (1,430)	1,430 (1,430)	1,430 (1,430)	1,430 (1,430)	1,430 (1,430)
Cabazon Basin	853 (N/A)	960 (N/A)	1,054 (N/A)	1,136 (N/A)	1,208 (N/A)
Banning Bench	1,055 (1,330)	1,187 (1,330)	1,304 (1,330)	1,330 (1,330)	1,330 (1,330)
Banning Water Canyon	3,679 (3,730)	3,730 (3,730)	3,730 (3,730)	3,730 (3,730)	3,730 (3,730)
Imported Recharge into Beaumont Basin	250	500	1,000	1,750	2,500
Water Supply Deficit[2]	999	2,126	3,156	4,128	4,991

Total Available Local Groundwater Supply	**8,508**	**8,574**	**8,595**	**8,542**	**8,476**
Storage Banked in the Beaumont Basin	**42,169**	**38,422**	**30,291**	**19,510**	**7,622**

Notes:
(1) The City's appropriated water rights will continue to decrease over time due to overlying water rights or demand increases.
(2) The water supply deficit is currently covered by Beaumont storage.

Surface Water

The Whitewater Flume was built to provide water and power to the City and Banning Heights Mutual Water Company (BHWMC). BHWMC utilizes approximately 1,000 AFY of the Whitewater River diversions in the Flume, and the remainder of the diverted water flows into the San Gorgonio River below the Banning Heights Mutual Water Company (BHMWC) extraction point. A portion of the natural runoff and the Whitewater River diversions are diverted into spreading ponds located approximately one mile north of the Banning Bench in order to increase groundwater recharge.

Since 1913, surface water from the Whitewater River has been diverted into the Banning Water Canyon Storage Unit, with an average of 1,500 AFY diverted into Banning Water Canyon since 1961.

Rights to Groundwater

The City's rights to annual groundwater extraction are shown in Table 5. The City will pull the differential amounts between the "Projected" and "Available" from the Beaumont Basin Storage Account. Water recharged (i.e., imported water) in the Beaumont Basin will also be credited in the City's storage account, allowing the "Projected" volume to increase. The City also anticipates that it would recharge more during wet years so that water supply can be available during drought periods when local groundwater levels are impacted.

The amount of "Available" yield not produced in the Beaumont Basin by the Overlying Water Right holders is issued to the retail agencies, with the City of Banning receiving 31.43% of the "Available" yield. The amount of Unused Overlying Water from the Beaumont Basin that will be allocated to the City of Banning is projected to decrease by 15% every five years from 2024 on.

Planned Supply Projects

The City continually reviews practices that will provide its customers with adequate and reliable supplies. Trained staff continue to ensure the water quality is safe and the water supply will meet present and future needs in an environmentally and economically responsible manner. The City coordinates its long-term water shortage planning with SGPWA and other local agencies through the development of their respective UWMPs. The City also meets bi-monthly with the San

Gorgonio Pass Regional Water Alliance, which is comprised of thirteen (13) local water purveyors, to discuss local issues with different agencies.

Any new City water supply projects will be to add, replace, or upgrade wells to support population growth and new development. The projects that have been identified to improve the City's water supply reliability and enhance the operations of the City's facilities include replacement of water meters, fire hydrants, valves, and pipelines and construction of new storage reservoirs.

2.3.2 Wastewater Treatment Plant Flows

The City provides sewer service to the area within City limits and to unincorporated areas of Riverside County that surround the southeast portion of the City. The City of Banning is responsible for the collection, conveyance, treatment, and disposal of wastewater generated within its service area. Municipal wastewater in the City's service area is generated from residential, commercial, and institutional sewer discharges. The City does not currently have any major industrial sewer discharges (i.e., brine). However, there are some cannabis cultivation facilities that will be operational soon, which will need to be monitored and regulated.

The City's wastewater collection system drains primarily from west to east. The wastewater discharged from the City is collected from a network of 112 miles of gravity sewer mains. The local collector sewers discharge into larger sewer trunk mains, then to the Banning WWTP, located in the southeast corner of the City (see Figure 4 on Page 14).

The WWTP has a current capacity of 3.6 million gallons per day (MGD) and is designed to treat wastewater to secondary standards. The WWTP consists of preliminary treatment, primary treatment, secondary treatment, solids handling, disinfection (currently not in use), and evaporation/percolation ponds. The preliminary treatment system consists of a mechanical bar screen, compactor, grit removal system, and cyclone separator. Effluent from the preliminary treatment system is gravity fed to two primary clarifiers. Primary effluent is pumped to two Trickling Filters, each rated for 1.8 MGD. The Trickling Filter effluent is sent to two secondary clarifiers. Secondary effluent flows through a chlorine contact chamber and is then discharged to 10 unlined evaporation/percolation ponds which recharges the Cabazon Groundwater Basin. This recharge is provided only through surface percolation, and no injection wells are used by the City.

Primary and secondary sludge is processed via two primary anaerobic digesters. A second-stage digester is currently used as a sludge holding tank before thickened sludge is sent to the sludge drying beds. Sludge is allowed to dry and then is hauled offsite for final disposal. A gravity thickener was used to thicken secondary sludge but is currently not in service. An overall process schematic of the existing WWTP is shown in Figure 5 on Page 15.

The quantities of wastewater generated are proportional to the City' population and the water used by its residents. The wastewater flows are metered at the influent point to the WWTP. Total wastewater collected in the City between 2018 and 2022 is shown in Table 6.

Table 6. Wastewater Flows Collected in City

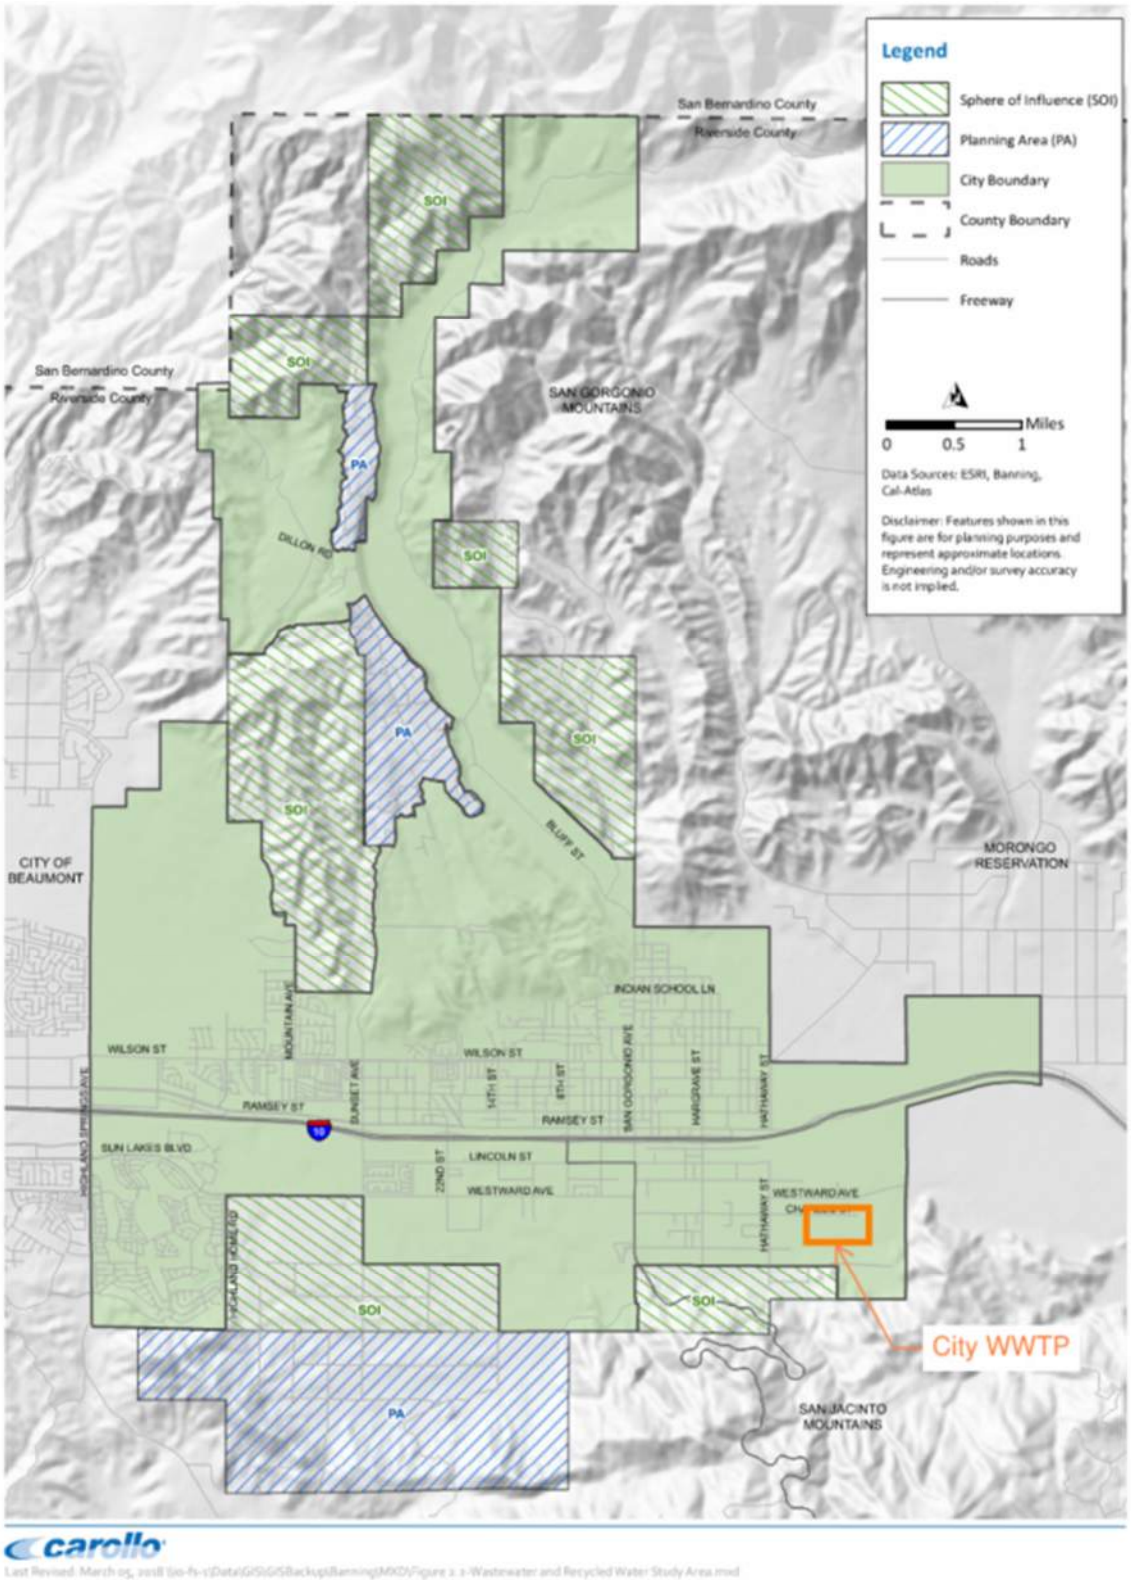
Year	Wastewater (AFY)	Wastewater (MGD)
2018	2,259	2.02
2019	2,234	2.00
2020	2,185	1.95
2021	2,226	1.99
2022	2,307	2.06
Average	**2,242**	**2.00**

Due to projected housing developments within the City's service area, wastewater flows are expected to significantly change. Based on review of available data, it was determined that the most accurate forecasting methodology for projected sewer flow included a combination of population and land use flow factors. Table 7 below shows the projected wastewater flows from the years 2023 through 2027:

Table 7. Projected Wastewater Flows Collected in City

Year	Flows (AFY)	Flows (MGD)
2023	2,352	2.10
2024	2,430	2.17
2025	2,520	2.25
2026	2,610	2.33
2027	2,700	2.41

Figure 4. City of Banning Reclaimed Wastewater Treatment Plant Location (courtesy of 2018 IMP)



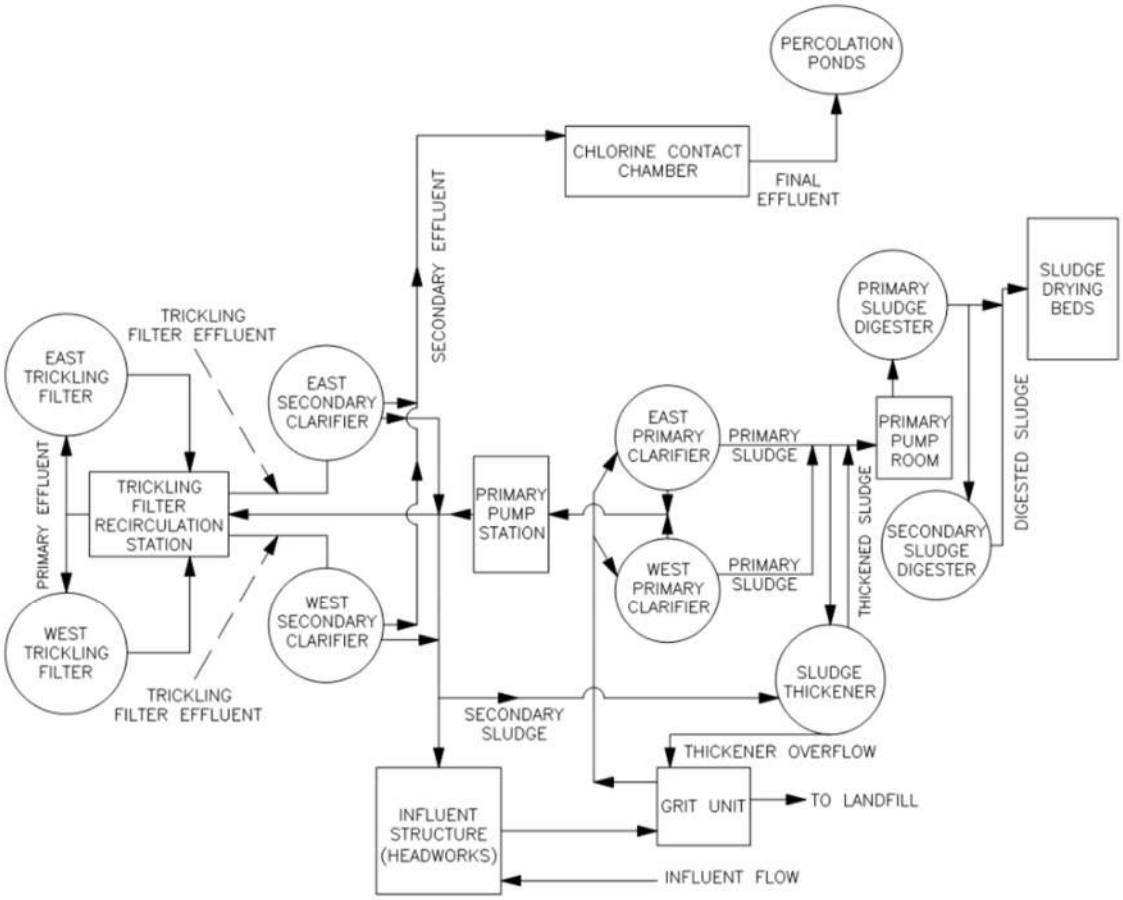


Figure 5. Process Schematic for Existing WWTP

2.3.3 Non-Potable Groundwater Well Capacities

The City has been operating one well (Well M7) and estimates that this well produces an average capacity of approximately 350 gpm. In addition, the City also started to operate a second well (Well M12) in mid-year 2017 with an estimated capacity of approximately 1,000 gpm. A third well (Well NP-1) is located near the WWTP, which was recently equipped. The status and capacities of the wells are summarized in Table 8.

Table 8. Existing City Non-Potable Groundwater Well Capacities

Well Number	Current Status	Future Status	Estimated Capacity (AFY)	Estimated Capacity (MGD)
Well M7	Operational	Potable	560	0.5
Well M12	Operational	Potable	1,568	1.4
Well NP-1	Recently Equipped	Non-Potable	1,344	1.2
Total			**3,472**	**3.1**

As listed in Table 8, the total estimated capacity of the three wells with the addition of Well NP-1 is approximately 3,472 AFY (3.1 MGD) of non-potable water. Although Wells M7 and M12 are both equipped, City staff plans to eventually convert Well M7 and Well M12 over to the potable water system by the end of year 2025 and year 2040, respectively, to supplement the potable water supply. Along with this conversion, it is assumed that Well NP-1 will supplement the recycled water system supply. With only Well NP-1 and Well M12 online by the end of year 2025, the groundwater well supply is estimated to provide up to 2,912 AFY (2.6 MGD) of non-potable water. By the end of year 2040, only Well NP-1 is assumed to be online, which results in a groundwater well supply of 1,344 AF (1.2 MGD). The capacities listed in MGD reflect the assumption that wells would be pumping 24 hours per day.

2.3.4 Recycled Water Production

As mentioned in Section 2.3.1, the Banning WWTP is the only wastewater treatment facility for the City. The WWTP currently provides only secondary treatment, and the treated wastewater does not meet Title 22 Standards. Further, the City does not use any recycled water produced by any other neighboring agencies. Thus, no wastewater has been "recycled" (re-used) within the City's service area from 2019 to 2023, as Table 9 indicates.

Table 9. Recycled Water Produced and/or Used in City

Year	Recycled Water Produced or Used (AFY)
2019	0
2020	0
2021	0
2022	0
2023	0

The amounts indicated in Table 9 above coincide with the projections in the City's 2020 UWMP. That is, the 2020 UWMP did not project any recycled water use through the year 2020.

2.4 Current and Projected Water Demands

2.4.1 Current Water Demands

Annual water consumption from 2016 to 2020 listed in Table 10 range from a high of 8,325 AF in 2020 to a low of 6,712 AF in 2016, with an average of 7,648 AF.

Table 10. City Recent Water Use

Year	Total Consumption (AFY)	Per Capita (GPCD)
2016	6,997	203
2017	7,381	213
2018	7,927	228
2019	7,297	209
2020	8,369	240
Average from 2016 to 2020		**219**

2.4.2 Projected Water Demands

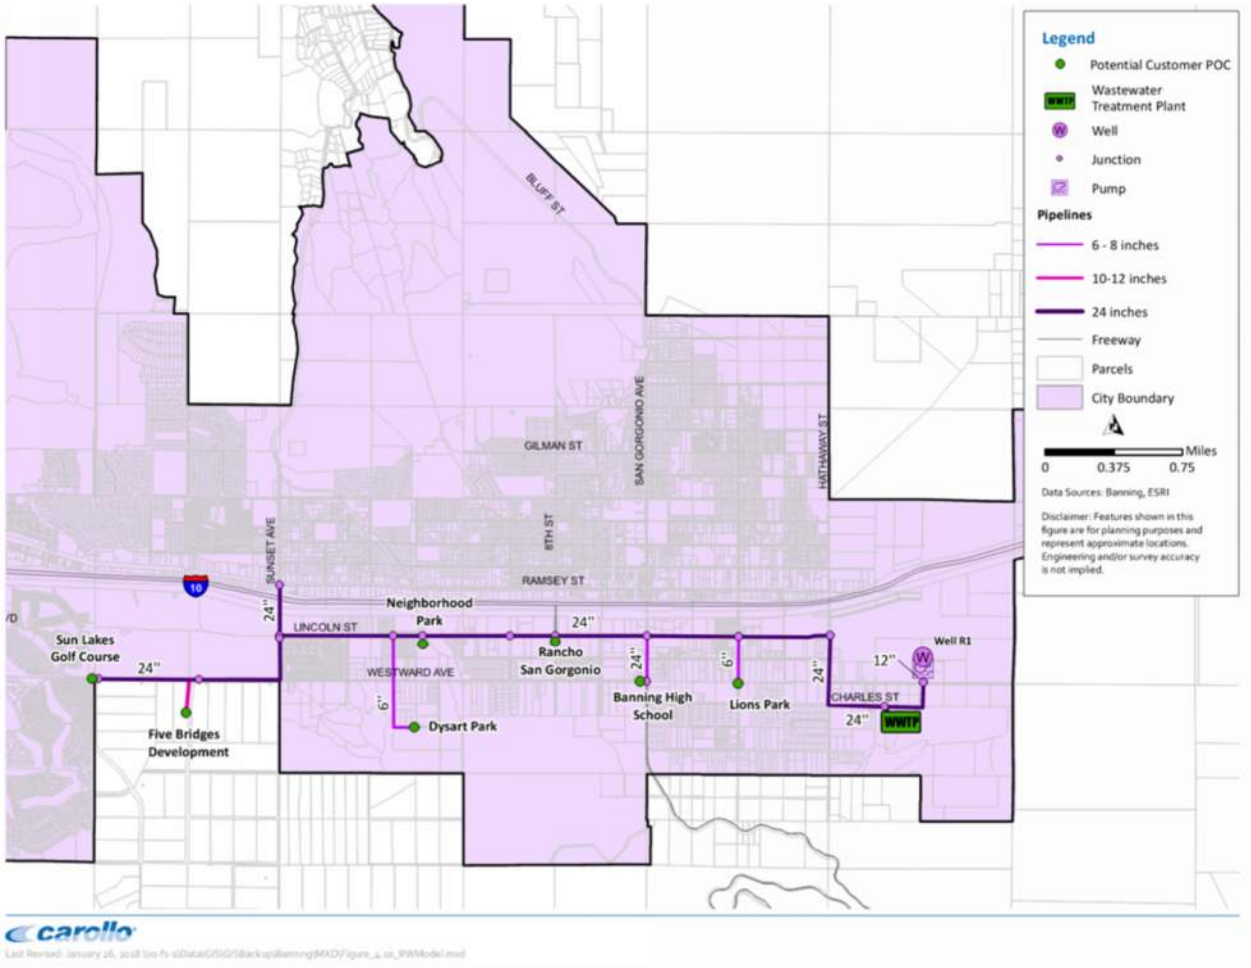
Future water use projections must consider significant factors on water demand, such as development and/or redevelopment, and climate patterns, among other less significant factors that affect water demand. Climate conditions will continue to be a major influence on demand as drought conditions will increase demand at a time when these supplies are limited.

The City's projected water use for 2025-2045 is broken down by sector in Table 11 below.

Table 11. Projected Water Demand by Sector in AFY, courtesy of the 2020 UWMP

Sector	2025	2030	2035	2040	2045
Water Service Area Population	38,180	45,235	52,290	59,345	66,400
Consumption Rate (GPCD) *Including 1.0% Annual Passive Savings*	222	211	201	191	181
Demands					
Single Family Residential	4,505	5,071	5,569	6,004	6,382
Multi-Family Residential	92	103	114	123	130
Commercial	2,263	2,548	2,798	3,016	3,206
Industrial	195	220	241	260	276
Institutional/Governmental	26	29	32	35	37
Landscape Irrigation	977	1100	1208	1,302	1,384
Total Water Sales	**8,059**	**9,070**	**9,961**	**10,739**	**11,415**
Unaccounted for Water	1,448	1,630	1,790	1,930	2,052
Total Water Consumption (Total Supply into System)	**9,507**	**10,701**	**11,751**	**12,670**	**13,467**

2.4.3 Projected Recycled Water Demands



The City currently serves one customer, Sun Lakes Country Club, with non-potable water from Well M7 and Well M12. Typical annual demand for the Sun Lakes Country Club is 850 AFY (0.76 MGD). Since the Sun Lakes Country Club is located on the westerly end of the City, once the City constructs the recycled water backbone pipeline to reach the Sun Lakes Country Club, other potential customers would be within proximity to receive recycled water. Therefore, construction of recycled water facilities would prove feasible if the funding for recycled water improvements and pipeline infrastructure was covered, at least in-part, by developers, and an agreement was in place for the use of recycled water. The City would then be able to provide recycled water to its customers. The City's previous 2006 Recycled Water Master Plan (2006 RWMP) identified potential customers across the Interstate 10 Freeway. The methodology to determine these customers and their demands is described in Section 3.3. However, the 2018 Integrated Master Plan indicated that these potential customers were not feasible, due to the challenges to cross the 10 Freeway. The potential recycled water customers are listed in Table 12 below and shown in Figure 6 on the following page.

Table 12. Potential Recycled Water Users

Customer	Recycled Water Demand (AFY)	Recycled Water Demand (MGD)
Existing Customers Currently Using Potable Water or Ground Water from Non-Potable Wells		
Sun Lakes Country Club	850	0.76
Banning High School	175	0.16
Dysart Park	87	0.08
Lions Park	79	0.07
Subtotal	1,191[(1)]	1.07
Projected Future Developments		
Rancho San Gorgonio Development	217	0.19
Five Bridges Development	223	0.20
Neighborhood Park	35	0.03
Subtotal	475[(2)]	0.42
Total	**1,666**	**1.49**

Notes:
(1) Will serve in Phase I of the Project.
(2) Will serve in Phase II (future phase) of the Project.

Figure 6. City of Banning Potential Recycled Water Customers (courtesy of 2018 IMP)

2.4.4 Projected Water Supply and Demand Imbalances

Table 13 shows the imbalances between the projected water supplies and demands of the City. As shown in the table, demand continues to increase as supplies decrease. This indicates the need for a new, drought-proof local supply of water to meet the demands of the City.

Table 13. Projected Water Supply and Demand Imbalances

	2025	2030	2035	2040	2045
Total Available Local Groundwater Supply in AFY (see Table 5)	8,508	8,574	8,595	8,542	8,476
Total Water Consumption in AFY (Total Supply into System) (see Table 11)	9,507	10,701	11,751	12,670	13,467

Local Groundwater Supply Shortage in AFY Supplied by Storage Banked in Beaumont Basin	-999	-2,127	-3,156	-4,128	-4,991
Storage Banked in the Beaumont Basin in AFY (see Table 5)	47,169	43,422	35,291	24,510	12,622

2.5 Future Recycled Water Supplies

The City plans to upgrade the existing WWTP treatment to meet tertiary treatment standards and facilitate infrastructure to supply recycled water. This proposed expansion described in the 2018 IMP is also in accordance with the City's 2006 RWMP. The proposed WWTP upgrade will include enhancing biological treatment and constructing recycled water laterals along the backbone pipeline. Facilities to be constructed would include recycled water pipelines to transport recycled water to the recycled water customers.

Upon completion of the upgrades, approximately 4,035 AFY (3.6 MGD) – the total projected WWTP effluent – of recycled water will be available to recycled water customers. Assuming that the improvements would be completed by the year 2027, projected recycled water use would be as shown in Table 14 below.

Table 14. Projected Recycled Water Production and/or Use

Year	Phase	Recycled Water Produced / Used (AFY)	Recycled Water Produced / Used (MGD)
2025	N/A	0	0
2027	I	4,035/1,191	3.6/1.07

The projected quantities shown in Table 14 above show the recycled water produced and used in Phase I of the project (described further in Section 4.2). Once the WWTP upgrades are completed, 4,035 AFY (3.6 MGD) will be available for recycled water use. Phase I will serve the existing customers currently using potable water or ground water from non-potable wells (Sun Lakes Country Club, Banning High School, Dysart Park, and Lions Park) with a total demand of 1,191 AFY.

2.6 Water Quality Concerns

The main water quality concerns are the standards and regulations that the potential recycled water sources currently do not meet. These include the Regional Water Quality Board Order, Title 22 Requirements, and Beaumont Basin Plan requirements.

2.6.1 Regional Water Quality Control Board Order

On June 30, 2016, the RWQCB adopted Board Order R7-2016-0015 (Board Order), which describes the Waste Discharge Requirements (WDRs) and other terms and conditions of operation for the WWTP. The Board Order requires the WWTP to remove constituents that present the greatest risk to groundwater quality such as nitrogen, coliforms, and total dissolved solid (TDS). According to the United States Environmental Protection Agency (US EPA), the maximum contaminant level (MCL) for Nitrate as Nitrogen is 10 mg/L. Per the Board Order, it is assumed all nitrogen available converts to nitrate/nitrite so Total Nitrogen (TN) is used as the measurement of concern. The wastewater effluent limitations per the Board Order are outlined in Table 15.

Table 15. Banning WWTP Effluent Concentrations and Limitations

Parameter	Units	Impending Effluent Limits	
		30-Day Mean	7-Day Mean
Flow	MGD	3.6	N/A
20C BOD5	mg/L	30 mg/L	45 mg/L
TSS	mg/L	30 mg/L	45 mg/L
pH	--	6.0 – 9.0	
TDS	mg/L	Not to Exceed 300 mg/L of the Water Supply	
TN(1)	mg/L	10 mg N/L	

Notes:
(1) City does not need to comply with this limit at this time.

The WDRs identified TN and TDS as constituents of concern. Currently, the average TN concentration in the WWTP's effluent is 27 mg-N/L, well above the future TN limit of 10 mg-N/L specified in the Board Order. The two existing Trickling Filters used for secondary treatment at the WWTP are therefore not able to meet the impending water quality limits by the Board Order. Based on a recent structural condition assessment, both Trickling Filters are also nearing the end of their lifecycle. This Project therefore involves implementing a new biological treatment system with nitrification/denitrification (NDN) to ensure nitrogen levels in the WWTP's effluent meet the impending Board Order TN requirement. The selected system to replace the existing Trickling Filters is Membrane Bioreactor (MBR). Section 4.6 describes the analysis that was done to select MBR as the recommended biological treatment option for the City.

The WDRs also state that effluent TDS is not to exceed a level of 300 mg/L above the potable water supply "reasonably protects present and anticipated beneficial uses of groundwater in the area," (typical incremental addition of dissolved salts from domestic water usage is 150 to 380 mg/L.) The level of TDS in Banning's potable water supply is approximately 200 mg/L, which would result in an effluent TDS limit of approximately 500 mg/L. Currently, the average TDS in the treated wastewater is about 390 mg/L, so future TDS limits in an updated WDR would not require additional treatment.

2.6.2 Title 22 Requirements

In order for the WWTP effluent to be used as recycled water to meet the current and project non-potable irrigation water demands, it must meet tertiary disinfected recycled water standards. The current WWTP effluent does not comply with State Water Resources Control Board, Division of Drinking Water (DDW) water recycling criteria outlined in the California Code of Regulations Title 22 requirements. To comply with Title 22, the effluent must meet the following requirements for "Disinfected Tertiary Recycled Water":

- Average daily turbidity less than 2 nephelometric turbidity unit (NTU); approximately 3 – 5 mg/L TSS.
- Effluent cannot exceed 5 NTU more than 5% of the time.
- Effluent cannot exceed 10 NTU at any time.
- Coagulant must be added if the influent to the filter exceeds 5 NTU for more than 15 minutes, or 10 NTU at any time.
- The disinfection process must provide a chlorine residual that provides 450 milligram minutes per liter (mg-min/L) under minimal modal contact time (CT) of 90 minutes.
    - This corresponds to a residual of 5 mg/L or less, or any process that achieves 5-log virus removal.
- Total coliform cannot exceed the average most probable number (MPN) of 2.2 per 100 milliliters (mL).
- No more than one sample per month can exceed an MPN of 23 per 100 mL.

In order to supply recycled water, the City will be required to improve the removal efficiency of the existing WWTP to comply with the TN, turbidity, and disinfection requirements. The Project involves implementing MBR and chlorine disinfection at the WWTP. These proposed treatment systems ensure that the WWTP will comply with Title 22 requirements for disinfected tertiary recycled water.

2.6.3 Beaumont Basin Plan Requirements

In order to serve Sun Lakes Country Club, which is located above the Beaumont Basin, the WWTP and Well NP-1 must meet the Beaumont Basin maximum benefit objectives of 330 mg/L for TDS. Currently, the WWTP effluent and Well NP-1 have an average TDS of 390 mg/L and 430 mg/L, respectively. Therefore, neither source currently meets this limit. Due to this restriction, and potential stricter TDS limits for the San Gorgonio region in the future, a TDS treatment is required. The proposed TDS treatment for this Project is a two-stage reverse osmosis (RO) system to be implemented as the last step in the WWTP treatment process. Details about the RO requirements for the WWTP and Well NP-1 can be found in the RO Analysis Technical Memo in Appendix A**.**

3. WATER RECLAMATION, RECYCLING OPPORTUNITIES

3.1 Introduction

This section provides a discussion of the City's water reclamation and reuse opportunities including:

- Potential uses for reclaimed water and sources to be reclaimed
- Markets available to use the water produced
- Considerations that may prevent implementation of a water reuse project
- Water and wastewater agencies with jurisdiction and their facilities
- Current water reuse
- Water reclamation and reuse technology currently in use and opportunities for improvement

3.2 Uses for Reclaimed Water

The available market is the non-potable demand from the existing customers currently using potable water or ground water from non-potable wells as well as the future recycled water customers listed in Section 2.4 Table 12. These customers consist of parks, schools, and other landscape irrigation users. The market for water produced by Phase I of this Project (described further in Section 4.2) is expected to be 1,191 AFY (1.07 MGD).

Appendix B includes the Rancho San Gorgonio Water Supply Assessment, which states that the Rancho San Gorgonio Development must utilize recycled water for all common area irrigation demands (see Appendix B, Section 5 "Recycled Water System," pages 37-41 of the document, page 38-42 of the PDF). For the other customers, discussions have been initiated to obtain letters of intent.

3.3 Water Market Available to Utilize Reclaimed Water

The future recycled water demand projections listed in Section 2.4 Table 12 are based on a review of the identified potential customers in the 2006 RWMP. This section describes the methodology used to project the future demand potential.

It should be noted that the future demands described herein do not necessarily represent the actual future demands. This section is limited to identifying the future demand potential.

3.3.1 Methodology

As described in Section 2.4, the 2006 RWMP identified potential 18 recycled water customers based on the following three criteria:

1. Location shall be near a recycled water distribution pipeline or in proximity of other potential customers.
2. ADD exceeds 10,000 gpd. Potential customers with ADD less than 10,000 gpd may be eligible if their location is near a recycled water pipeline.

3. Location within City limits.

The list of potential recycled water customers was reviewed to determine the current irrigation status of each customer and the feasibility of tying into the recycled water system, resulting in an updated list of 15 customers.

3.3.2 Potential Customers

Since the 2006 RWMP, several customers, including Caltrans, Repplier Park, and Gilman Ranch Museum, have reduced demands due to changes such as drought tolerant landscaping. Based on an initial review of the recycled water system layout, connecting these customers was not considered cost effective. In addition, customers north of the Interstate 10 would require a second pressure zone, resulting in an additional pump, large lengths of pipeline, and additional storage to serve these customers. Since those customers were not large users, City staff decided to keep the recycled water system south of the Interstate 10. The customers that are included in this analysis and their demands are summarized in Section 2.4, and the location of the recycled water customers is shown in Figure 6.

3.4 Considerations That Will Prevent Implementing Water Reclamation

One consideration of concern is water quality, particularly TN and TDS levels of the WWTP. As mentioned previously in Section 2.5, the WWTP must comply with the Board Order, Title 22, and Beaumont Basin Plan requirements to supply recycled water. One of the main objectives of this Project is therefore to overcome these water quality limitations by implementing treatment systems that will effectively lower TN and TDS to allowable levels.

Another consideration is community push back for tertiary recycled water. With this in mind, the community will be involved with this Project through public meetings to voice their concerns. It is, however, expected that the reliability and high water quality of recycled water will help to stimulate recycled water demand and mitigate the public's concerns.

3.5 Agencies with Jurisdiction Over Sources of Reclaimed Water

The WWTP and groundwater wells are solely owned by the City.

3.6 Potential Sources to be Reclaimed

Effluent from the City of Banning WWTP and Well NP-1 are two potential sources to be reclaimed. Descriptions of the two sources are described in Section 2.3.

3.7 Description and Location of Source Water Facilities

Effluent from the City of Banning WWTP and Well NP-1 are two potential sources to be reclaimed. Descriptions of the two sources are described in Section 2.3.

3.8 Current Water Reclamation Taking Place in Study Area

As discussed in Section 1.4, there is no water reclamation taking place in the City of Banning.

3.9 Other Current and Projected Wastewaters and Disposal Options

If the WWTP does not get upgraded to Title 22 standards, the current disposal option will remain; the effluent from the WWTP will continue to percolate into the 10 unlined percolation ponds within the Cabazon Groundwater Basin, with no benefits to the City.

In order to meet the Board Order TN restriction, however, the biological treatment process at the WWTP would need to be upgraded regardless of whether the WWTP effluent was used for reclaimed water purposes.

3.10 Water Reclamation Technology Use in Study Area

As discussed in Section 1.4, there is no water reclamation taking place in the City of Banning.

4. DESCRIPTION OF ALTERNATIVES

4.1 Non-Federal Funding Condition

If Federal funding were not provided for the Project, the City would delay the project and continue to apply for funding under other opportunities as described in Section 9.5.

4.2 Specific Objectives Alternatives Are Designed to Address

The objectives of the proposed Project are to:

- Increase water supply availability, reliability, and drought resiliency by supplementing a local water supply, and
- Improve local water supply reliability by proactively planning for facilities needed to meet future demand.

There are three proposed potential recycled water project alternatives to achieve these objectives. These alternatives include:

- Alternative 1: Do Nothing
- Alternative 3: Non-Potable Reuse
- Alternative 4: Hybrid Non-Potable Reuse and Indirect Potable Reuse

4.2.1 Alternative 1 - Do Nothing

This alternative involves no recycled water upgrades of the WWTP. The existing facilities would remain at the WWTP, and effluent from the WWTP would continue to discharge to the percolation ponds near the WWTP site. Under this alternative, due to the WWTP's current high TN levels, the plant would not meet the impending Board Order requirements. In addition, the existing non-potable water customers would continue to be served by potable water or ground water from non-potable wells, and therefore Wells M7 and M12 would not be converted to the potable water system. In order to recharge the groundwater to serve these customers, the City would continue to purchase imported water from the Sacramento-San Joaquin Delta through SGPWA. However, with worsening climate change conditions, State water supplies are becoming scarcer. Because of this, competition for water allocations to water retailers will increase, making it more challenging for the City to receive imported water. Therefore, imported water should not be solely relied on to meet future demands that exceed the City's local supply.

The O&M costs for the "Do Nothing" alternative include the purchase of imported water and pumping costs to serve the existing non-potable water customers. The current estimated annual O&M cost to deliver imported water is estimated at $463,848 per year. This includes an average (based on 2015-2020) purchase of 752 AF of imported water at $399/AF, or $300,048, plus $163,800 for pumping, or $463,848 per year. The projected O&M cost for imported water in 2045 is $2,779,000 for purchase and $1,517,090 for pumping for a total of $4,296,090. This is based on a purchase of 2,500 AF of imported water (see Table 5 in Section 2.4) and a 5% price escalation rate of imported water purchases and pumping per year.

4.2.2 Alternative 2 - Non-Potable Reuse

Alternative 2 involves three phases. Phase I will begin early 2025 to meet the current demands of Sun Lakes Country Club. Phase II will begin by 2029 to meet the demands of the future remaining recycled water customers.

Phase I

Since Well M7 is planned to be converted to the potable water system by the end of 2025, Phase I involves using Well NP-1 to supply 850 AFY (0.76 MGD) to Sun Lakes Country Club in place of Well M7.

A recent Well NP-1 pump test shows an 800-gpm capacity, which exceeds the demand of the Sun Lakes Country Club. As a result, Well NP-1 will operate intermittently to satisfy the current recycled water demand.

Construction of the backbone pipeline along Lincoln Street to connect Well NP-1 to the Sun Lakes Country Club will be completed by the end of 2023. The design of the two reservoirs/forebays and booster stations needed to store the Well NP-1 supply and pump the water to the backbone pipeline, respectively, will be completed during the first quarter of 2024. The City is currently developing environmental documentation and will begin construction of the reservoirs/forebays and booster stations within the second quarter of 2024.

To meet Beaumont Basin requirements for TDS and TN, a 1 MGD RO system will be implemented at Well NP-1, and evaporation beds will be constructed for the RO brine. The RO permeate will travel through the backbone pipeline to Sun Lakes Country Club, with the forebay storing Well NP-1 supply and the booster station pumping the water from the forebay to the backbone pipeline.

Well NP-1 will continue to serve Sun Lakes Country Club until the WWTP upgrades are completed at the end of 2027.

The next step of Phase I is to upgrade the WWTP. The existing Trickling Filters and secondary clarifiers will be decommissioned, and a new 3.6 MGD MBR facility and chlorine disinfection tank will be installed to meet Title 22 recycled water standards. Other miscellaneous upgrades of the WWTP, including headworks, primary clarifier, and digester facilities, will also be implemented in this phase.

Laterals with pipeline diameters ranging from 6-12 inches will be constructed to connect the remaining customers currently using potable water or ground water from non-potable wells listed in Section 2.4 (Banning High School, Dysart Park, and Lions Park).

Once the construction of the WWTP upgrades is complete, the RO system and brine evaporation ponds used for Well NP-1 will be repurposed for WWTP effluent use. 1,191 AFY (1.07 MGD) of the WWTP effluent will serve the demands for Sun Lakes Country Club, Banning High School, Dysart Park, and Lions Park, and the rest will continue to discharge to the percolation ponds.

Since the WWTP effluent will be used to meet the recycled water demands, Well NP-1 will be used as a backup source.

Phase II

In Phase II, laterals will be constructed to connect the future recycled water customers, including Rancho San Gorgonio Development, Five Bridges Development, and Neighborhood Park to the main recycled water system.

In order to meet the Beaumont Basin requirements to serve these remaining customers, an additional RO module will be installed at the WWTP. The permeate from the RO modules will blend for a total of 1,666 AFY (1.49 MGD) of WWTP effluent to serve the recycled water customers. The remaining WWTP effluent will continue to discharge to the percolation ponds. Figure 6 in Section 2.4 shows the proposed layout of Alternative 2.

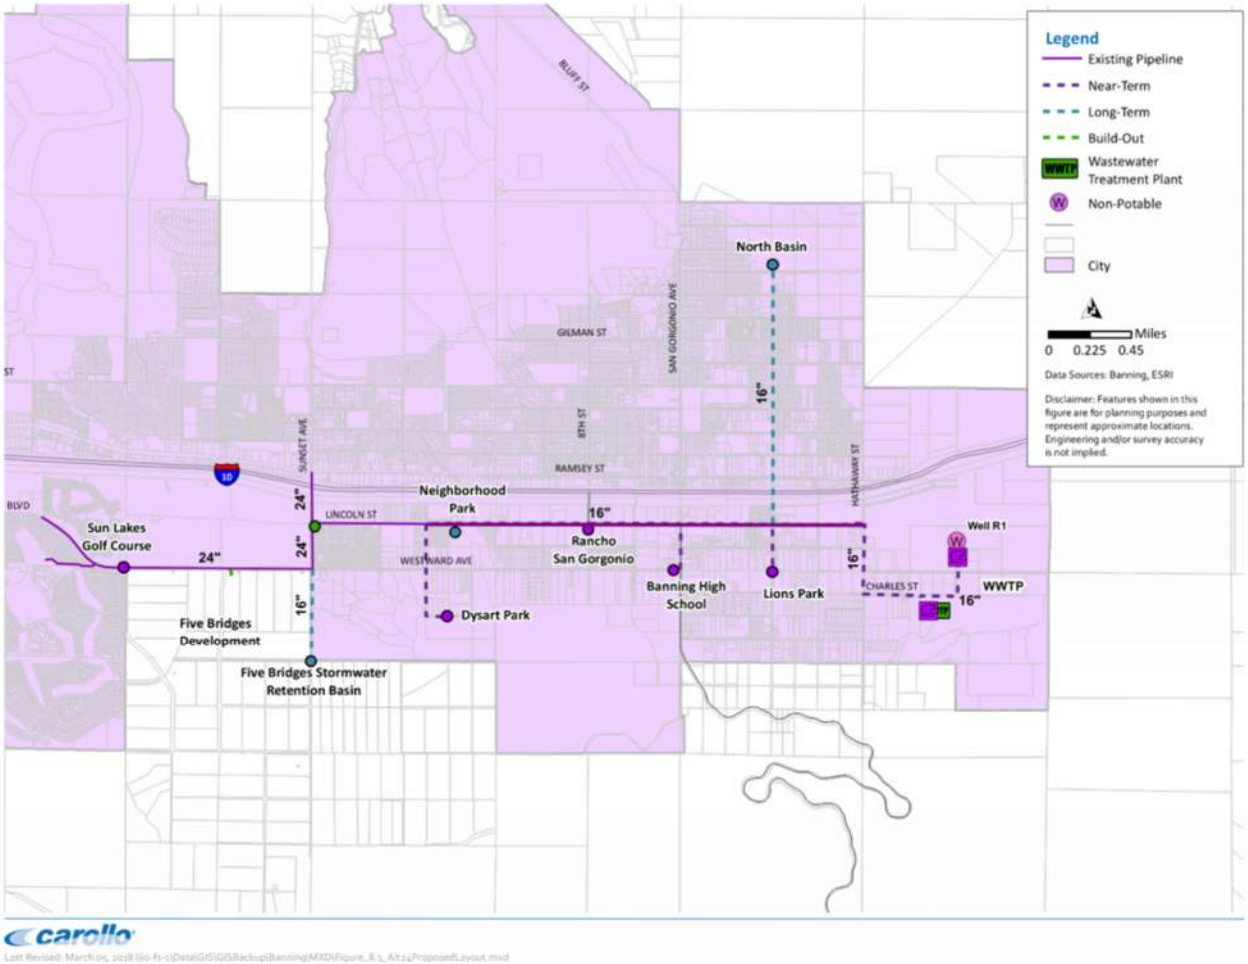
4.2.3 Alternative 3 – Hybrid Non-Potable Reuse and Indirect Potable Reuse

Alternative 3 is similar to Alternative 2 but incorporates an additional phase for indirect potable reuse. Instead of the WWTP effluent that is not used to meet recycled water demands discharging to the percolation ponds, in Alternative 3, the remaining effluent will flow to one of two groundwater aquifers for indirect potable reuse. By percolating to new basins upgradient of the Banning groundwater storage unit, this will keep groundwater recharge within the City's wells.

Options for recharge of groundwater aquifers via recharge basins include North Basin and Five Bridges. The requirements to recharge to North Basin and Five Bridges Basin are described in the sections below. Figure 7 on the next page shows the proposed layout of Alternative 3.

Due to the limited surface recharge capacity of the proposed groundwater basins, injection wells may be required to recharge groundwater in the targeted area. In order to allow for indirect potable reuse through injection wells, ultraviolet advanced oxidation (UVAOP) will be required. The current facility plan would include needed infrastructures (e.g., transformer size, space allocation, etc.) to facilitate this addition in the future when needed. The surface recharge at these basins will take into account ground water travel time to the nearest potable groundwater wells and appropriate monitoring wells for full compliance with Title 22 regulations.

North Basin



North Basin is in the northeastern part of the City boundary. This site is not owned by the City. Since the site has been mined and a large pit exists, it is assumed that minimal earthwork will be required. The site improvements included as part of this analysis include a berm on all four sides of the basin, a berm to create two cells for operational flexibility, basin piping, maintenance ramps, security, and monitoring equipment. Since the potential recharge basin is at a higher elevation than the WWTP, an 800 hp pump and 15,000 feet of 16-inch diameter pipeline will be

required to convey water from the WWTP to the recharge basin. The City will also need to add monitoring wells and lysimeters.

Five Bridges Basin

This option involves groundwater recharge at the future Five Bridges Recharge Basin, which is located at the southwest part of the City within the Five Bridges Development. The site will likely be owned by the City. Although the Five Bridges development is not anticipated to occur until the build-out phase, City staff believe that the basin can be constructed beforehand. It is anticipated that site improvements will include earthwork, berms on all four sides of the basin, a berm to create two cells for operational flexibility, maintenance ramps, security, and monitoring equipment. This alternative will require an approximately 2,000 feet of 16-inch diameter pipeline to convey water from the WWTP to the recharge basin. The City will also need to add monitoring wells and lysimeters.

Figure 7. Preliminary Site Layout for Alternative 3 (courtesy of 2018 IMP)

4.3 Description of the Proposed Water Reclamation Project

The selected alternative is Alternative 3. This alternative includes non-potable reuse with a total demand of 1,666 AFY (1.49 MGD). The remaining recycled water supply from the WWTP will be used for indirect potable reuse at either North Basin or Five Bridges. With the combination of both non-potable reuse and indirect potable reuse, the City will have seasonal flexibility and will be able to maximize the use of recycled water throughout the year. Since the City will be able to maximize the recycled water supply from the WWTP, the estimated net yield is 4,035 AFY (3.6 MGD).

This Project (i.e. Alternative 3) will be done in 3 Phases, however, only Phase I will be implemented at this time. Phases II and III are future phases that will be implemented in the long-term. The City has only requested funding for Phase I in the WaterSMART funding application but will seek additional funding for Phases II and III in the future at which time the City will develop updated feasibility studies to includes Phases II and III.

As mentioned in Section 4.2, Phase I involves constructing an RO system and brine evaporation ponds for Well NP-1, which will later be repurposed for WWTP use. A new 3.6 MGD MBR facility and chlorine disinfection tank will be installed to meet Title 22 recycled water standards, and other miscellaneous upgrades of the WWTP will also be implemented in this phase. Laterals will be built along the backbone pipeline to connect the WWTP to the existing customers currently using potable water or ground water from non-potable wells that can utilize recycled water to meet irrigation demands.

The preliminary cost estimates for Phase I of the proposed Project are summarized in Table 16 below. A breakdown of the capital costs and replacement costs (over a 50-year period – the expected lifecycle of the Project) associated with Phase I of the Project are shown in Tables 17 and 18, respectively. Lifecycle costs over the 50-year span of the Project can be found in Appendix C, and a preliminary detailed site plan and process flow diagram for the Project can be found in Appendix D.

Table 16. Preliminary Cost Estimate

	Estimated Annual Yield (AFY)	Capital Cost[(1)]	O&M Cost	Annual Cost ($/year)	Unit Cost ($/AF)
Phase I	1,191	$93,487,328	$3,500,000	$3,890,000	$3,668

Notes:
(1) Capital costs include a construction contingency of 25% and additional markups for mobilization (5%), general conditions (5%), contractor profit (5%), and escalation to-point of construction (5%). Cost estimates and cost assumptions are provided in detail in Appendix E.

Table 17. Cost Summary of Phase I of the Proposed Project, in 2023 dollars

Item	Cost
CEQA	
CEQA (Biological, Cultural, Air Quality, and IS/MND)	$180,000
Permitting	$120,000
Subtotal	**$300,000**
Design	
Preliminary Design	$1,409,808
Final Design	$5,639,232
Subtotal	**$7,049,040**
Construction	
RO system	$3,497,500
Brine Drying Beds and Evaporators	$5,256,100
MBR Facility (3.6 MGD)	$52,887,000
Primary Clarifier	$1,944,100
Chlorine Tank	$2,377,700
Upgrade Ferric Sulfate Feed/Storage System	$298,100
Digester Coating	$463,500
Replace Piping in Grit Chamber	$58,300
Replace TF Center Drives	$499,300
Replace East Primary Clarifier Center Drive	$99,900
Replace Existing PVC Digester Gas Piping	$16,700
Replace Digester Hot Water Boiler	$176,400
Replace TF Effluent Distribution Valves (4)	$174,800
Replace TF Recirculation Pumps (2)	$124,900
Replace Grit/Cyclone Unit	$299,600
Replace Two Old Grit Pumps	$174,800
Recycled Water Laterals	$2,141,700
Subtotal	**$70,490,400**
Construction Administration	
Construction Management and Inspection	$7,049,040
Environmental Monitoring and Support During Construction	$100,000
Subtotal	**$7,149,040**
Other	
Contingency	$8,498,848
Subtotal	**$8,498,848**
TOTAL ESTIMATED PROJECT COSTS	**$93,487,328**

Table 18. Replacement Costs, in 2023 dollars

Description of Replacement Requirement	Replacement Frequency	Year(s)	Cost
Civil/Structural, Mechanical, Electrical/Controls Replacements	Every year	Every Year from 2028 to 2077	$868,658.82
RO Membrane Replacement and MBR Membrane Replacement	Every 5 years	2032, 2037, 2042, 2047, 2052, 2057, 2062, 2067, 2072, 2077	$2,200,000.00

4.4 Estimated Costs of Alternatives

Estimated capital and annualized costs were developed for each of the project options and are summarized in Table 19.

Table 19. Monetary Analysis

	Estimated Annual Yield (AFY)	Capital Cost	O&M Cost	Annual Cost ($/year)	Unit Cost ($/AF)
Alternative 1	752 (from groundwater)	$0	$463,848	$493,848	$657
Alternative 3 (Phase I only)	1,191	$93,487,328	$3,500,000	$3,890,000	$3,668

As seen in Table 19, the proposed Project (Alternative 3 Phase I) has higher capital and annual costs than the "Do Nothing" Alternative. However, most of the benefits resulting from the implementation are difficult to quantify, as they include climate change and environmental impacts, as well as improved water supply quality and reliability.

4.5 Waste-Stream Discharge Treatment

The following waste streams will be involved in the Project: screenings, grit, primary sludge, secondary sludge and RO brine.

The WWTP currently has a mechanical bar screen and a grit chamber to remove debris and solid materials from the wastewater. These screenings and grit are then hauled offsite to a landfill.

Downstream of the headworks, there are two primary clarifiers that separate settleable solids from wastewater. After primary treatment, the effluent flows to the Trickling Filters then the secondary clarifiers, which separate biological floc from the treated wastewater. Sludge from the primary and secondary clarifiers is processed by two primary anaerobic digesters. A second-stage digester is used as a sludge holding tank before dewatered sludge is sent to the sludge drying beds. Sludge is allowed to dewater in these beds and is then hauled offsite for final disposal.

For Phase I of the Project, an additional primary clarifier will be added to the treatment process for redundancy in the system and to allow for peak flows in the WWTP influent. Additionally, the Trickling Filters will be replaced by MBR treatment, and the secondary clarifiers will be decommissioned. Therefore, the sludge from the primary clarifiers will combine with the waste activated sludge from the MBR system, rather than from the secondary clarifiers, to be processed by the digesters.

An additional waste stream that will be included in the Project is RO brine from the RO system. There is expected to be around 0.035 MGD of RO brine that will require approximately 15 acres of salt evaporation ponds and 10 evaporators. This amount will increase as recycled water demand increases and more RO modules are needed. The brine evaporation ponds will be constructed on the WWTP property near the existing percolation ponds.

4.6 Alternative Technologies

Four viable biological treatment options were selected for evaluation to treat the anticipated average daily flow of 3.6 MGD. The treatment alternatives include:

1. Return Flow from Trickling Filter Effluent to Primary Clarifier
2. Conventional Activated Sludge
3. Moving Bed Biofilm Reactor
4. Membrane Bioreactor

See Appendix F for the Nitrogen Removal and Plant Reliability Technical Memo comparing the four alternatives. Due to its high effluent water quality, operational ease, flexibility to meet more stringent permit regulations, and scalability, a Membrane Bioreactor was recommended in the Technical Memo to be considered for future implementation.

5. ECONOMIC ANALYSIS

5.1 Introduction

The following sections provide an economic analysis of the Project compared to other alternatives.

5.2 Economic Analysis

Currently, no non-potable water reuse is being practiced in the City, and the effluent from the City's WWTP is discharging to percolation ponds that Banning gains no benefits from. Producing reclaimed water would significantly enhance the City's drinking water reliability and increase its economic advantage because of the sustainable growth and profit from selling the WWTP effluent to irrigation customers. The City has taken significant steps in establishing a water recycling program in the City including:

- Identifying existing and future customers that can utilize recycled water
- Serving existing customers from non-potable groundwater wells
- Constructing 24-inch backbone pipelines that extend across the City with easy access to existing customers that can utilize recycled water and future recycle water customers

When the proposed facilities are complete (Phase I is constructed), the City will be able to convert all non-potable wells to potable, thus benefiting from the investments made in drilling and equipping these wells.

At this time, the City uses imported water for groundwater replenishment. By supplying these irrigation customers with a reclaimed local water supply instead of pumped groundwater (as is currently done), this will reduce the amount of required imported water for the City, thereby reducing the City's overall water costs.

Another economic benefit of the Project is its impact on City growth. City growth is dependent on the availability of water supplies to meet various demands for new City population. Increasing the reliability of drinking water will therefore allow the City to meet its needs for growth.

As mentioned in Section 2.6, there is a compliance order from RWQCB that limits the TN from the WWTP. MBR, the selected treatment system, will be a reliable process that would meet these requirements. Among the alternatives proposed in Section 4.6, MBR would produce the best water quality. With the addition of RO, effluent from the WWTP would consistently meet the Beaumont Basin Plan requirements as well, allowing the City to supply recycled water to Sun Lakes Country Club and the remaining customers with significant irrigation demand.

5.3 Cost Comparison of Alternatives that Would Satisfy Demand of Proposed Project

See **Section 4.4** for a cost comparison of the proposed alternatives.

5.4 Description and Benefits of Water Supply Alternatives

Table 20 below compares the non-monetary criteria of the three Alternatives.

Table 20. Non-Monetary Criteria

	Alternative 1	Alternative 3 (Phase I only)
Regulatory Compliance	1	5
Reliability/Process Robustness	2	5
Enhancement of Indirect Potable Reuse	1	2
Groundwater Quality Enhancement	1	5
Flexibility for Future Water Reuse	1	5
Operational Simplicity	5	4
Ease of Implementation/Funding	5	5
Total	**16**	**31**

As seen in Table 20, the proposed Project (Alternative 3 Phase I) has a higher ranking in terms of non-monetary criteria than the "Do Nothing" alternative (Alternative 1). Alternative 1 will keep the current WWTP system as is, keeping facilities that have reached their end of life, and therefore remaining non-compliant with the impending Board Order restrictions. Therefore, Alternative 1 is ranked the lowest in terms of regulatory compliance, enhancement of indirect potable reuse, groundwater quality enhancement, and flexibility for future water reuse. Alternative 3 (Phase I only) is ranked the highest for regulatory compliance, reliability/process robustness, groundwater quality enhancement, and flexibility for future water reuse, as this alternative involves upgrading the treatment from the existing Trickling Filters to MBR to meet Board Order requirements and Title 22 standards (with the addition of chlorine disinfection).

5.5 Alternative Most Likely to be Implemented in Absence of Project

The Alternative that would most likely be implemented in the absence of the Project is Alternative 1 – do nothing.

However, In order to meet the impending Board Order TN restriction which will exceed the WWTP treatment capacity, the biological treatment process at the WWTP would need to be upgraded regardless of whether the WWTP effluent was used for reclaimed water purposes.

5.6 Qualitative Benefits and Justification of Water Reclamation

The non-quantifiable benefits are numerous. The sustainable recycled water supply will be tolerant to drought and will benefit the City's customers through improved water supply reliability.

Another benefit is the reduction of reliance on imported water and the implementation of regional management of water supplies and groundwater quality.

Reclaiming treated wastewater also has environmental impacts. By using a local supply of water, energy is saved by not pumping imported water from the Bay Delta. By not using water resources imported from other regions, more water is available for environmental uses in those areas. Additionally, since onsite treatment systems and the existing WWTP do not effectively remove nitrate from wastewater, another benefit of this Project would be the reduction of the amount of nitrate that percolates into the groundwater. This would not only help the City meet the Board Order requirements, but also alleviate the rising nitrate levels observed in some wells in the Region.

6. SELECTION OF THE PROPOSED WATER RECLAMATION PROJECT

6.1 Introduction

This section describes the benefits of water reclamation for the City.

6.2 Justification of Water Reclamation as Selected Alternative

The Project meets the objective of providing a cost-effective non-potable water supply. The Project has numerous qualitative and environmental benefits. These benefits are as follows:

- Increases local supply of non-potable water,
- Improves non-potable water supply reliability,
- Environmental benefits,
    - Reduction of nitrate in the groundwater,
    - Energy savings from less imported water from the Sacramento-San Joaquin Delta,
    - Decreases demand on the regional wholesale water agency, SGPWA, which makes more water available for environmental uses from imported supply areas,
    - Reduces the use of existing diversions from natural watercourses. By implementing the Project, the City will reduce dependence on imported water supplies which are diverted from natural watercourses in the Sacramento-San Joaquin Delta

The proposed facilities do not pose significant impacts to the environment and the City does not anticipate opposition to the Project. No obstacles have been identified that would prevent implementation of the project.

6.3 Analysis of Water Reclamation

6.3.1 Reduction, Postponement, or Elimination of Development of New or Expanded Water Supplies and Reduction of Diversions of Natural Water Courses

To the extent that agencies like the City of Banning can develop local supplies, the wholesale agencies forego the need to expand their own supply sources or can reduce their reliance on other sources. Most of the imported supplies are obtained from diversions from natural water courses, including the Sacramento and San Joaquin Rivers. Local supply projects like this Project result in reduced development efforts by the wholesalers.

6.3.2 Reduction of Demand on Existing Federal Water Supply Facilities

The California State Water Project (SWP) and the federal Central Valley Project share the Sacramento-San Joaquin Delta as a water supply. The imported water supply utilized by the SGPWA and the City comes from the SWP facilities. Although the Project would not reduce demand on the federal facilities, it could indirectly reduce the demand on the shared state and federal supply.

6.3.3 Reduction, Postponement, or Elimination of new or Expanded Wastewater Facilities

This Project involves expansion of limited processes, including a new primary clarifier. Although the two existing primary clarifiers at the plant accommodate an average flow of 3.6 MGD, they do not allow for peak flow of redundancy. Therefore, a new primary clarifier will be installed to handle daily peak flow rate. The rest of the facilities at the plant are sized for the expected influent flow of 3.6 MGD and will not require expansion.

Expanding the primary treatment system and upgrading other systems at the WWTP, including headworks, secondary treatment, and digester facilities, will eliminate the need for a new wastewater facility.

7. ENVIRONMENTAL CONSIDERATIONS AND POTENTIAL EFFECTS

7.1 Introduction

This section describes the potential environmental impacts and effects of the proposed Project, the environmental analysis and documentation prepared to date, how the project will affect water supply and water quality, and a discussion of public outreach and regional cooperation. The governing laws are the State of California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA).

7.2 Potential Environmental Impacts and Effects

The City does not anticipate that the Project will have significant impacts on endangered or threatened species, public health or safety, hydrology and water quality, regulated waters of the United States, or cultural resources. The City does not anticipate that the Project will have significant environmental effects as defined by State and federal environmental laws. As such, the City will prepare a Negative Declaration to obtain CEQA coverage and expects that USBR will adopt a Finding of No Significant Impacts (FONSI) to obtain NEPA coverage for the Project. The City completed an Initial Study-Mitigated Negative Declaration (IS-MND) in October 2007. The IS-MND covered significant elements of the current proposed project. The findings of the October 2007 IS-MND were either "Less Than Significant Impact" or "No Impact". The City has identified the potential environmental impacts described in Table 21, along with best management practices (BMPs) and potential mitigation measures.

Table 21. Potential Environmental Impacts and Mitigation Measures

Potential Impact	Potential Mitigation
Air quality and greenhouse gases	An air quality analysis will be completed as part of the CEQA analysis. Project construction will comply with local air quality requirements. Typical dust control measures, such as watering and reducing off-road vehicle speeds, will be employed. Project operations will be evaluated for consistency with the State GHG reduction targets found in AB 32 and SB 32. Emissions from operation of the proposed facilities are not expected to exceed applicable significance thresholds.
Biological resources	Construction of the project facilities is not expected to impact biological resources. Biological resources will be surveyed prior to design and sensitive species and their habitats will be avoided in the project design. The Project is not expected to impact wetlands or waters of the U.S. as regulated by U.S. Army Corps of Engineers, RWQCB, and California Department of Fish and Wildlife. The Project will comply with adopted Habitat Conservation Plans and Natural Community Conservation Plans.

	Operation of the Project is not anticipated to affect biological resources as all O&M activities will be constrained to the WWTP and associated brine minimization and drying beds, Operation will be sustainable and will have no impact on riparian and aquatic habitats.
Cultural resources	No Cultural resources are known to exist on the Project site. Cultural resources will be surveyed prior to design and the Project will be designed to avoid any identified cultural sites. Onsite construction monitoring mitigation may be necessary to ensure that discovery of any previously unidentified archeological resources is handled appropriately. The City will comply with California Assembly Bill 52 regarding formal consultation with Native American tribes about the proposed Project.
Hydrology and water quality	The City will characterize the RO brine (concentrate) discharge to the evaporation (drying) beds to verify quality of the solids before final disposal. The proposed Project is not within the 100-year floodplain. During the design This conclusion will be confirmed. Hydrologic impacts, including erosion and siltation during construction of the proposed facilities would be minimized through compliance with existing regulations, including enrollment in an NPDES construction general permit, completion of a storm water pollution prevention plan, and implementation of required BMPs.
Groundwater levels, supplies, and recharge during operation	The Project will result in directing a portion of the WWTP effluent for non-potable water reuse. This will reduce the amount of WWTP effluent currently discharged to the percolation ponds. The Project will not impact any drinking wells.
Transport, use, and disposal of hazardous materials during construction and operation	The RO system will use a variety of chemicals typically used in water treatment, possibly including scale inhibitors, membrane cleaning solutions, chlorine, ammonia, and caustic soda. Some of the chemicals will be delivered to the plant while others may be generated on-site. Chemical storage will have full containment structures to prevent spills along with alarms. Proper handling of these chemicals will be incorporated into the Standard Operating Procedures. Compliance with existing regulations is expected to minimize impacts to a less than significant level.

Noise	Construction noise is considered a nuisance and is regulated by the City's Noise Ordinance. The majority of construction activities for the Project will be in the vicinity of the WWTP which is located in an isolated part of the City. Construction equipment will be fitted with approved mufflers and other measures may be utilized to comply with the existing regulations.
Traffic impacts during construction	Construction traffic associated with the proposed facilities construction will be temporary, and the impacts will be insignificant. Construction traffic controls will be employed to reduce public hazards.

7.3 Public Outreach

The majority of the proposed facilities will be within the footprint of the existing WWTP. As such the City does not anticipate any public opposition to this Project. Also, the City will add significantly needed upgrades to its WWTP, which would enhance its reliability. The City plans to implement more public outreach and enhance publicity for the proposed Project. The upgraded WWTP and non-potable reuse are expected to promote growth in this disadvantaged community.

The City has constructed a significant portion of the non-potable reuse conveyance system, and this Project would complement the completed facilities.

7.4 Effect of Historic Properties

The City does not anticipate that the project will have any adverse effects on historic properties. The majority of construction will be within the WWTP footprint.

7.5 Avoiding Public Health and Environmental Quality Issues Associated with Use of Reclaimed Water

The proposed treatment facilities for the WWTP upgrades including MBR and partial RO will result in a reliable high-quality effluent suitable for non-potable reuse for irrigation purposes. The effluent water quality will consistently meet all State Title 22 requirements.

The City will apply the treatment technologies described in Section 4.2 so that the product water will meet state and federal non-potable reuse water quality requirements for irrigation purposes. The primary requirements are outlined in the State Title 22 requirements. The City will work closely with the SWRCB the State's enforcement agency, in developing and permitting the Project. Typical steps include:

- Meetings and coordination,
- Submittal of the Project application,

- Review and approval of the preliminary design,
- Review and approval of the project plans and specifications, and operating plan,
- Inspection of plant construction and witness of start-up testing, and
- Amendment of the City's discharge permits.

Future phases of the Project include groundwater recharge of the Banning groundwater storage unit. The planned upgrades at the WWTP will incorporate space and hydraulic head for additional advanced treatments to be added in the future.

8. LEGAL AND INSTITUTIONAL REQUIREMENTS

8.1 Introduction

This section focuses on the legal and institutional requirements which must be considered prior to implementation of the Project. The following is a discussion of water and wastewater rights, legal and institutional requirements, interagency agreements, permitting requirements, unresolved issues, and wastewater discharge requirements.

8.2 Analysis of Water Rights Issues

There are no anticipated water rights issues potentially resulting from implementation of the proposed project. Through various adjudications and overlying water rights, the City owns and operates the sources of water supply (WWTP and groundwater wells).

8.3 Discussion of Legal and Institutional Requirements with Potential to Affect Implementation of Project

8.3.1 Department of Water Resources – Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act (SGMA) was passed by the California State Legislature in September 2014, establishing new requirements for groundwater management in medium and high priority groundwater basins. The act requires the development and implementation of Groundwater Sustainability Plans (GSPs) for each groundwater basin and subbasin. The GSP must contain objectives and actions to achieve and maintain groundwater sustainability and to avoid the undesirable results of overdraft. SGMA also requires the establishment of Groundwater Sustainability Agencies (GSAs) to oversee development and implementation of GSPs and provides authority to GSAs to sustainably manage groundwater. Local water authorities and counties have primary responsibility and authority for the development and implementation of GSPs and GSAs; however, the State has been given authority to intervene if specific requirements are not met.

8.3.2 Groundwater Sustainability Agencies

SGMA requires that high and medium priority groundwater basins, as designated by the California Department of Water Resources (DWR), create groundwater sustainability agencies by June 30, 2017. The bill authorizes any local agency or combination of agencies to become a GSA with the purpose of developing and implementing GSPs in order to meet the goals and standards of sustainable management of groundwater basins as described in SGMA. Multiple GSAs and GSPs in a single basin are allowed under the law; however, multiple GSPs within a basin must be coordinated and meet all requirements for achieving sustainable groundwater management within the entire groundwater basin or be subject to state intervention. A combination of agencies creating a GSA can be formed by a joint powers agreement, a memorandum of agreement, or other legal agreement.

8.3.3 Groundwater Sustainability Plans

SGMA requires that GSAs develop and implement groundwater sustainability plans. GSPs must be completed by January 31, 2020 for basins deemed by DWR to be in critical overdraft. For all remaining medium and high priority basins, GSPs must be completed by January 31, 2022. Implementation of the GSPs must result in groundwater quantity and quality sustainability within 20 years (by 2040 or 2042 based on the basin overdraft situation). DWR may grant up to two extensions of an additional five years to GSAs to achieve sustainability upon a showing of good cause. If the GSPs are not completed within the above timeframe, or if the SWRCB, in consultation with DWR, determines that groundwater sustainability is not being achieved in the time given, authority for developing and implementing a GSP will be designated to the RWQCB.

8.3.4 San Gorgonio Pass Subbasin

The SGP Subbasin (DWR Basin 7-021.04) is located in Southern California between the San Bernardino Mountains to the north, the San Jacinto Mountains to the south, Coachella Valley to the east and San Bernardino Valley to the west. The SGP Subbasin adjoins the San Timoteo Groundwater Subbasin to the west and the Indio Subbasin to the east. The SGP Subbasin boundaries generally correspond to the DWR's California's Groundwater Bulletin 118.

The San Gorgonio Pass (SGP) Subbasin (7-021.04) is one of several alluvial basins and subbasins identified by the California Department of Water Resources (DWR) as being in a medium-priority subbasin in Bulletin 118 (2003). Beginning in 2015, GSAs within the SGP Subbasin formed to address the long-term reliability of groundwater through the development a single GSP. The SGP Subbasin GSP (SGP GSP) was developed in a coordinated fashion by the Desert Water Agency GSA, San Gorgonio Pass GSA, and Verbenia GSA with the goal of achieving sustainability for the SGP Subbasin as a whole. The SGP GSP was adopted by the respective GSAs and submitted to DWR on January 25, 2022, ahead of the January 31, 2022, deadline.

The SGP GSP jurisdiction includes the Desert Water Agency GSA, San Gorgonio Pass GSA, and Verbenia GSA. Desert Water Agency GSA consists of the Desert Water Agency. San Gorgonio Pass GSA consists of Banning Heights Mutual Water Company (MWC), the City of Banning, Cabazon Water District (WD) and San Gorgonio Pass Water Agency (SGPWA). Verbenia GSA consists of Mission Springs WD and SGPWA. The SGP Subbasin GSAs are not required to develop a Coordination Agreement. Despite this, the GSAs entered into a cooperative Memorandum of Agreement for development of the GSP and grant funding. The three GSAs have cooperatively worked together to coordinate SGP GSP development. The SGP Subbasin includes a portion of an adjudicated area, known as the Beaumont Basin, that resides outside the Plan Area. Since it was previously adjudicated, the portion of the Beaumont Basin located in the SGP Subbasin is not subject to SGMA regulations.

8.3.5 Santa Ana River Basin Plan

An updated Water Quality Control Plan for the Santa Ana River Basin (Basin Plan) was adopted by the Regional Board on March 11, 1994, approved by the State Water Resources Control Board (SWRCB) on July 21, 1994, and approved by the Office of Administrative Law (OAL) on January 24, 1995. The Basin Plan identifies the Region's ground and surface waters, designates beneficial uses for those waters, establishes water quality objectives for the protection of those uses, prescribes implementation plans and establishes monitoring and surveillance programs to assess implementation efforts. Amendments to the Basin Plan to incorporate a revised Total Dissolved Solids and Nitrogen Management Plan (Salt Management Plan) into the 1995 Basin Plan were approved by the Regional Board on January 22, 2004, by the State Water Resources Control Board on October 1, 2004 and by the Office of Administrative Law on December 23, 2004. The surface water standards provisions of the amendments were approved by the U.S. Environmental Protection Agency on January 20, 2007. This amendment included revised groundwater subbasin boundaries (now called management zones), revised TDS and nitrate-nitrogen (nitrate-N) groundwater quality objectives, revised TDS and nitrogen waste load allocations, revised reach designations, and revised TDS and nitrogen objectives and beneficial uses for specific surface waters.

Antidegradation water quality objectives set forth by the Basin Plan amendment restricted the use of recycled water for irrigation and groundwater recharge for certain groundwater management zones, including the Beaumont Management Zone (BMZ) and the San Timoteo Management Zone (STMZ). In particular, the ambient TDS concentrations of these management zones exceeded the antidegradation objectives, meaning that no assimilative capacity existed for which the Regional Board could allocate the use of the City's recycled water within the BMZ or STMZ. Under the antidegradation objectives, the use of recycled water would require mitigation even though the reuse would not materially impact future TDS concentrations or impair beneficial uses. Thus, alternative maximum-benefit objectives were specified for the BMZ and the STMZ. The maximum-benefit objectives were established based on demonstrations by the involved agencies that antidegradation policies were satisfied.

Discharge of recycled water over the BMZ by the City of Banning as a result of the project will be in full adherence to the requirements set forth in the Basin Plan.

8.4 Discussion of Need for Multi-Jurisdictional or Interagency Agreements

As the sole retail supplier of water in the service area, and the agency responsible for wastewater processing, the City of Banning is able to produce recycled water for distribution within its service area without agreements with any other agency.

8.5 Discussion of Permitting Procedures Required

The following permits will be required for the Project:

1. DDW Title 22 Permit

2. California State Water Resources Control Board General Permit (combining Non-Discharge National Pollutant Discharge Elimination System [NPDES], Waste Discharge Requirement [WDR], and Waste Recharge Requirements [WRR])
3. AQMD
4. CEQA (IS-MND)

A Title 22 Engineering Report is required to be submitted for approval by DDW for meeting water quality requirements of the treated recycled water and groundwater recharge requirements. After the WWTP's design documents are finalized, the City will submit the necessary reports, analyses, and applications to obtain required permits from both DDW and the RWQCB.

As described in Section 7, the City will prepare a Negative Declaration to obtain CEQA coverage for the Project in parallel with Project design.

8.6 Discussion of Unresolved Issues Associated with Implementing Proposed Project

There are no unresolved issues associated with implementing the proposed project.

8.7 Identification of Current and Proposed Discharge Requirements

The current discharge requirements for the WWTP are laid out in the RWQCB Board Order, which describes the WDRs and other terms and conditions of operation for the WWTP.

The Board Order can be found in Appendix G.

8.8 Rights to Wastewater Discharges

The City's rights to groundwater extraction are in Table 5 in Section 2.3.

9. FINANCIAL CAPABILITY OF SPONSOR

9.1 Introduction

The City has developed an implementation schedule and general funding plan that demonstrates that at the Feasibility Study stage, the City has the financial capability if the project moves to construction.

9.2 Schedule

The proposed schedule for the Project includes three phases, however only Phase I will be implemented in the near term. In Phase I, the RO system for Well NP-1 and WWTP upgrades will be installed, as well as the recycled water laterals for Banning High School, Dysart Park, and Lions Park.

The preliminary and final design of Phase I is expected to be completed by the 2nd quarter of 2026. Design includes initiating the necessary permits, completing CEQA/NEPA documentation, completing design, going out to bid, obtaining the authority to award the construction contracts, awarding contracts, and issuing notices to proceed.

The first step of construction for Phase I will be installing the Well NP-1 upgrades, including the RO system and brine evaporation ponds, and WWTP upgrades, including the new MBR facility, primary clarifier, chlorine tank, and lab and control building. Once easements have been obtained for the recycled water laterals, construction of the laterals will occur in parallel with construction of the WWTP upgrades. Development and testing of the new facilities will follow. Phase I is estimated to be completed in 3 years by the 4th Quarter of 2027, as shown in Table 22 on the following page.

Table 22. Project Schedule – Phase 1

Project Component	Duration	2024				2025				2026				2027			
		Q1	**Q2**	**Q3**	**Q4**	**Q1**	**Q2**	**Q3**	**Q4**	**Q1**	**Q2**	**Q3**	**Q4**	**Q1**	**Q2**	**Q3**	**Q4**

Testing	3 months																

9.3 Willingness and Capability of the City of Banning to Fund the Project

The Project will be funded through the City's capital replacement and operating budgets, as well as development activity revenues via the City's local development impact fee program. The City also has the capability to fund projects through debt issuance.

9.4 Project Funding Plan

9.4.1 Operating Budgets

The City owns and manages both a water utility and wastewater utility as individual self-supporting enterprises. Therefore, the utilities must develop financial plans that provide sufficient revenues to meet all operation and maintenance expenses, water purchases, wastewater treatment, debt service requirements, capital improvements funded from current revenues, and other expenditures.

In 2022, the City Council of the City of Banning approved a Water and Wastewater Rate Study (Rate Study). The Rate Study developed financial plans that projected operating revenue, expenses, and capital financing costs for the utilities over a five-year planning period beginning July 1, 2022 and ending June 30, 2027. The financial plans projected future rate revenues under existing rates, operation and maintenance (O&M) expenses, principal and interest expense on debt, transfers, and capital improvement program (CIP) requirements.

For the water utility, the Rate Study identified:

- **Operation and Maintenance Expenses:** The O&M expenses increase from $7.9M in FY 2023 to $10.0M in FY 2027.
- **Debt Service:** There is an existing revenue bond with an annual payment of $2.0M. There is no future debt planned.
- **Capital Improvements**: The CIP identified an average of $6.2M per year in capital projects from FY 2023 to FY 2027.
- **Reserves:** Continue to maintain the operating fund reserve level. The operating fund reserve is designed to help cover fluctuations in day-to-day expenses. The new target, consistent with industry reserve guidelines, will be 90 days of O&M expenses, a change from the existing 10% of O&M expenses and debt service payments.

For the wastewater utility, the Rate Study identified:

- **Operation and Maintenance Expenses:** The O&M expenses increase from $3.7M in FY 2023 to $4.6M in FY 2027; increases in cost to operate and maintain the proposed Wastewater Treatment Plant and Recycled Water Upgrades Project are included as part of the Rate Study projections.

- **Debt Service:** There is an existing revenue bond with an annual payment of $290k associated from a 2019 Refunding Revenue Bond. The City anticipates a net debt issuance of $25.0M in FY 2025, which will add an annual payment of $1.9M starting in FY 2025. The primary expense for the new debt issuance is for the Wastewater Treatment Plant and Recycled Water Upgrades Project. The Rate Study ensures the appropriate level of debt service coverage.
- **Capital Improvements**: The CIP identified an average of $12.1M per year in capital projects from FY 2023 to FY 2027.
- **Reserves:** Continue to maintain the operating fund reserve level. The operating fund reserve is to help cover fluctuations in day-to-day expenses. The scheduled target will be 90 days of O&M expenses, a change from the existing 10% of O&M expenses and debt service payment.

The revenue requirements listed above for the water and wastewater utilities set the basis for the development of suitable rate schedules to produce revenues adequate to meet financial needs while recognizing customer costs of service. In November of 2022, City Council held a public hearing resulting the approval of the rate increases for a period of five years as shown in Table 23.

Table 23. Rate Increases

Fiscal Year	Effective Month	Water Utility	Wastewater Utility
FY 2022-2023	January	10.75%	40.00%
FY 2023-2024	July	0.00%	25.00%
FY 2023-2024	January	10.75%	25.00%
FY 2024-2025	January	10.75%	3.00%
FY 2025-2026	January	10.75%	3.00%
FY 2026-2027	January	10.75%	3.00%

There is a current fund balance in the Water Operations Fund of $17.5M and a fund balance in the Wastewater Operations Fund of $3.7M.

In addition to operating and capital revenues related to rates, the City has continued to charge a monthly Tertiary Surcharge of $2.72/month per account to fund capital improvements at the wastewater treatment plant. The Wastewater Tertiary Fund has a fund balance of $7.7M of which $7M would be allocated to the Proposed Project.

Additionally, the City has the capability to fund projects through either cash payment or debt issuance.

9.4.2 Development Impact Fees

In 2018 the City Council of the City of Banning completed and approved an Integrated Master

Plan (2018 IMP) that evaluated the performance and condition of the City's potable water, wastewater and recycled water system (future) systems under current and future conditions through year 2040. The 2018 IMP includes a capital improvement plan (CIP) to guide the City in the planning and development of facilities required to meet system performance for existing and future customers.

In September 2019, the City Council approved new and updated the development impact fees, including impacts fees to cover the costs for water, recycled water, and wastewater facilities.

The Water Impact Fee fund balance is approximately $3.3M of which $1.5M would be allocated to the Proposed Project.

The Wastewater Impact Fee fund balance is approximately $10.8M of which $7.5M would be allocated to the Proposed Project.

The City of Banning is currently witnessing a significant amount of growth in the residential sector. It is expected the available funding in the utility impact fee funds will continue to increase allowing for additional allocations to the Proposed Project.

The City has the capability to fund projects through either cash payment or debt issuance.

Over time, staff will present updated rate studies to City Council in order to ensure that rate revenues are sufficient to cover ongoing operations, maintenance, replacement costs and debt service coverage obligations.

9.5 Other Funding Sources

The City is also considering, as possible funding sources, the Water Infrastructure Finance Innovation Act (WIFIA) and Clean Water State Revolving Fund (CWSRF).

10. RESEARCH NEEDS

The proposed water reclamation Project includes basic research needs and will solely use proven technologies and conventional system components. Further research to implement the proposed water reclamation project will not be necessary.

EXECUTIVE SUMMARY

There are two potential sources of recycled water for the City of Banning, the Banning Wastewater Treatment Plant (WWTP) and a non-potable well (NP-1), however neither currently meets the Beaumont Basin Plan requirements for TDS and TN. In order to lower the TDS and TN at either source, a reverse osmosis (RO) treatment will need to be implemented. To recover around 1 MGD of available reuse water and obtain TDS and TN concentrations lower than the Beaumont Basin Plan requirements, the WWTP would require a 0.5 MGD RO system and the non-potable well would require a 0.8 MGD RO system.

The recommended approach is to treat NP-1 with RO now, since construction of the WWTP upgrades is not expected to finish for another 3 years. Once the WWTP is upgraded to tertiary standards, the RO system can be converted to treat the WWTP effluent, or a second RO system can be built and the RO-treated NP-1 and WWTP effluent can blend to serve recycled water customers.

1. BACKGROUND AND PURPOSE

The City's existing non-potable water system delivers recycled water from Well M7 to the Sun Lakes Country Club. The City has served an average of 0.76 MGD from Well M7 to the Sun Lakes Country Club in the years 2012 through 2014. However, the City eventually plans to convert Well M7 and Well M12 (another operational non-potable well) over to the potable water system by the end of year 2025 and year 2040, respectively, to supplement the potable water supply.

According to the 2018 San Gorgonio Integrated Master Plan, the existing potential recycled water demand for the City of Banning is around 1.49 MGD: 0.76 MGD average day demand (ADD) from Sun Lakes Country Club, 0.20 MGD ADD from Five Bridges Development, 0.03 MGD ADD from Neighborhood Park, 0.08 MGD ADD from Dysart Park, 0.19 MGD ADD from Rancho San Gorgonio, 0.16 MGD ADD from Banning High School, and 0.07 MGD ADD from Lions Park. Based on recent discussions with the City, the aim will be to serve Sun Lakes Country Club first, and Banning High School, Dysart Park, Lions Park, Rancho San Gorgonio, Neighborhood Park and Five Bridges Development in the near-future.

In order to meet these recycled water demands, the City has plans to upgrade the existing wastewater treatment plant (WWTP) to meet tertiary standards. The City has already begun constructing an additional 3.4 miles of pipeline to connect the existing recycled water pipes to the wastewater treatment plant (WWTP) and to NP-1 located adjacent to the WWTP.

In addition to these standards, in order to serve Sun Lakes Country Club, which is located over the Beaumont Basin, the WWTP effluent must also meet the Beaumont Basin maximum benefit objectives of 330 mg/L for TDS and 5 mg/L for TN. With a current average TDS of 390 mg/L and an expected TN of 7.74 mg/L, once secondary treatment at the plant is upgraded to MBR, the WWTP effluent does not meet either of these objectives.

Near the WWTP is a non-potable well, NP-1, that may be able to supply water to these irrigation customers in place of the WWTP until the plant is upgraded to tertiary standards. The capacity of the well is 800 gal/min, or 1.15 MGD, and is expected to be fully operational within the next few months. Like the WWTP, the water quality of the well does not meet the Beaumont Basin maximum benefit objectives. Based on an analytical report from August of 2023, the average TDS and TN of NP-1 is 430 mg/L and 17 mg/L, respectively.

The purpose of this technical memo is to determine the best strategy for supplying recycled water to the City of Banning.

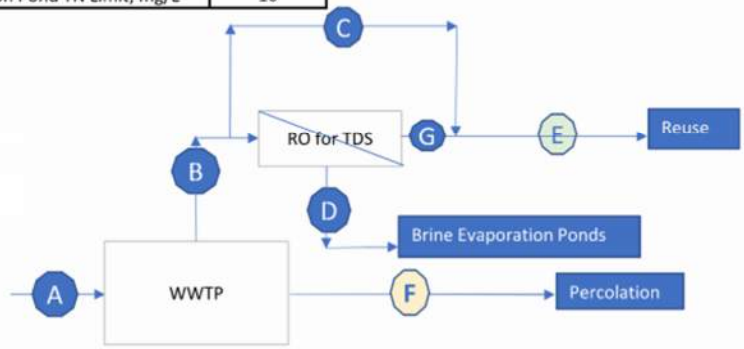
2. TDS AND TN MASS BALANCES

In order to reduce TDS and TN levels at either the WWTP or NP-1, the most effective treatment method is reverse osmosis (RO). This section describes the RO treatment systems and final effluent quality at each location. In order to meet the current recycled water demand for Sun Lakes Country Club, the assumed output goal for available reuse water for both the WWTP and NP-1 is around 1 MGD.

Various recovery rates were analyzed for the proposed RO treatment system, including 75%, 80%, and 93%. Based on expected costs of brine treatment for each of the recovery rates, it was determined that maximizing RO recovery is the most cost beneficial. At this time, 93% recovery for a two-stage RO system is feasible based on the source water quality, and therefore TDS and TN mass balances in the following section assume a 93% recovery rate.

For both options, the proposed RO systems were sized to treat the final combined effluent to just below the Beaumont Basin Plan requirement (i.e., Beaumont Basin maximum benefit objective) for TN. For lower final combined effluent TN concentrations, additional RO treatment capacity can be added to the systems.

2.1 Option 1



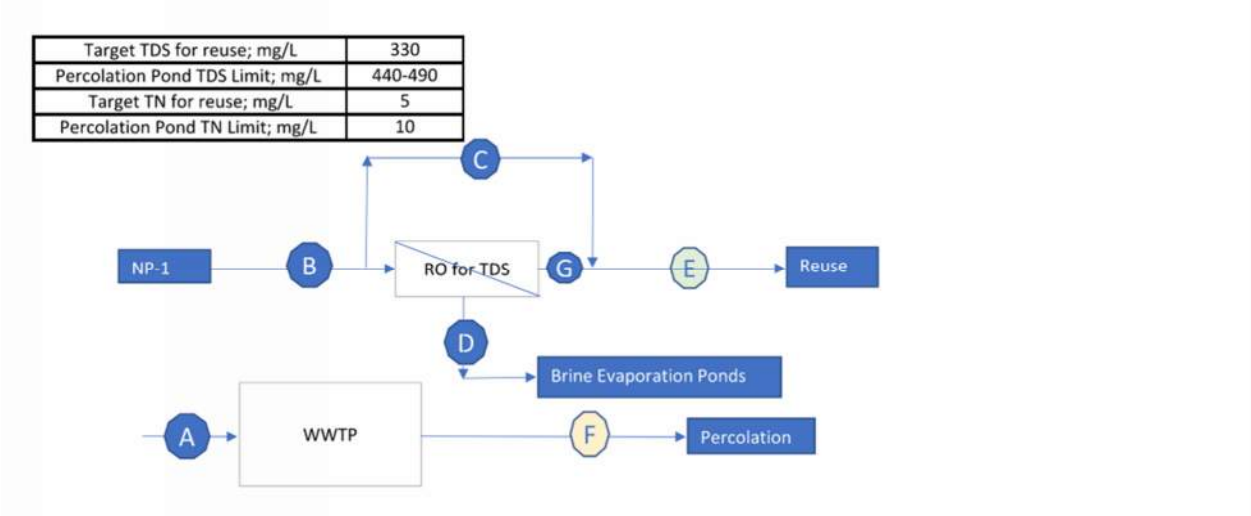
This first option involves treating a percentage of the WWTP effluent with RO for recycled water irrigation use. Since the WWTP must meet tertiary standards in order to be recycled, an MBR, chlorination tank, and RO system would all need to be implemented for this alternative. Therefore, this process involves sending 1 MGD of the approximately 3.6 MGD WWTP influent through the MBR from the primary clarifiers, then to the chlorination tank; the remaining 2.6 MGD will continue discharging to the percolation ponds.

After disinfection, 0.5 MGD of this 1 MGD flow will be sent to the two-stage RO system and the remaining 0.5 MGD will blend with the RO permeate. Assuming 93% recovery, around 0.035 MGD of the RO treated 0.5 MGD will be converted into brine. This brine will be sent to mechanical evaporators and salt evaporation ponds that will be located near the RO facility. These salt evaporation ponds will require around 8 acres of surface area and will be designed to meet the Title 27 requirements described in Section 2.4. The 0.47 MGD RO permeate will combine with the 0.5 MGD WWTP effluent for a total of 0.97 MGD available for reuse.

The TDS and TN of the 0.97 MGD reuse water will be about 207 mg/L and 4.4 mg/L, respectively, meeting the Beaumont Basin Plan requirements of 330 mg/L for TDS and 5 mg/L for TN. The water quality of the remaining WWTP effluent that will discharge to the percolation ponds will remain unchanged, with a TDS of 390 mg/L TDS and TN of 7.5 mg/L. These concentrations are both below the California Regional Water Quality Control Board, Colorado River Basin Region's (RWQCB) Board Order R7-2016-0015 (Board Order) percolation limits of 440-490 mg/L for TDS and 10 mg/L for TN. See Figure 1 for the detailed mass balance of this option, including the evaluated available reuse water for 93%, 80% and 75% RO recovery.

Figure 1. WWTP TDS Mass Balance

Target TDS for reuse; mg/L	330
Percolation Pond TDS Limit; mg/L	440-490
Target TN for reuse; mg/L	5
Percolation Pond TN Limit; mg/L	10



RO Recovery			A	B	C	D	E	F	G
93		Flow, mgd	3.6	1	0.5	0.04	0.97	2.60	0.47
		TDS, mg/L	390	390	390	5438.57	207	390	10
		TN, mg/L	7.5	7.74	7.74	99.78	4.4	7.5	1
80		Flow, mgd	3.6	1	0.50	0.10	0.90	2.60	0.40
		TDS, mg/L	390	390	390	1910	221	390	10
		TN, mg/L	7.5	7.74	7.74	35.45	4.7	7.5	1
75		Flow, mgd	3.6	1	0.50	0.13	0.88	2.60	0.38
		TDS, mg/L	390	390	390	1530	227	390	10
		TN, mg/L	7.5	7.74	7.74	28.52	4.8	7.5	1

2.2 Option 2

The second alternative involves treating NP-1 with RO for recycled water irrigation use. For this option, 1 MGD will be pumped from NP-1. Of this 1 MGD, 0.8 MGD will flow to the two-stage RO system, and 0.2 MGD will blend with the RO permeate. Assuming 93% recovery, there will be approximately 0.056 MGD of RO brine, which will be sent to mechanical evaporators and salt evaporation ponds located near the RO facility. These salt evaporation ponds will require around 15 acres of surface area and will be designed to meet the Title 27 requirements described in Section 2.4. The 0.74 MGD RO permeate will blend with the 0.2 MGD non-treated water from the well for a total of 0.94 MGD available for reuse.

The final TDS and TN of the 0.94 MGD recycled water will be about 99 mg/L and 4.0 mg/L, respectively, below the Beaumont Basin Plan requirements. The water quality of the WWTP effluent that discharges to the percolation ponds will remain unchanged, with a TDS of 390 mg/L TDS and TN of 7.5 mg/L, both below the RWQCB Board Order percolation limits. See Figure 2 for the detailed mass balance of this option, including the evaluated available reuse water for 93%, 80%, and 75% RO recovery.

Figure 2. NP-1 TDS Mass Balance

RO Recovery			A	B	C	D	E	F	G
93		Flow, mgd	3.6	1	0.2	0.06	0.94	3.6	0.74
		TDS, mg/L	390	430	430	6010	99	390	10
		TN, mg/L	7.5	16	16	217.78	4.0	7.5	1
80		Flow, mgd	7.5	1	0.20	0.16	0.84	3.6	0.64
		TDS, mg/L	390	430	430	2110	110	390	10
		TN, mg/L	7.74	16	16	76.75	4.4	7.5	1
75		Flow, mgd	3.6	1	0.20	0.20	0.8	3.6	0.60
		TDS, mg/L	390	430	430	1690	115	390	10
		TN, mg/L	7.74	16	16	61.56	4.6	7.5	1

2.3 RO Facility Siting

Among the potential recycled water demands, the Sun Lakes Country Club with a demand of 0.76 MGD is the only one located over the Beaumont Basin. As such, an RO facility can be sized for the demand by the Sun Lakes Country Club and be located near the service connection. Brine from the RO facility would be discharged back into the sewer and treated at the WWTP.

The capital costs for this option would be smaller than siting the RO facility near the WWTP and NP-1 well. However, locating the RO facility at the service connection has significant drawbacks including:

1. The remote O&M will result in higher operations costs.
2. The brine flow will be discharged to the sewer and treated again at the WWTP. If treatment Option 1 is pursued, the return brine will result in gradual increase in the WWTP TDS level.
3. If lower TDS levels become important for the other potential users, it would be much harder to implement in the future.
4. Having the location by the WWTP allows for future brine management such as evaporation ponds.

Because of these drawbacks, it is recommended that the RO facility be located near the WWTP.

2.4 Title 27 Requirements

The discharge of the RO to the brine evaporation ponds is subject to regulation under the California Code of Regulations, Title 27 Environmental Protection (27 CCR), Division 2 Solid Waste. This liquid-designated waste must be contained in a Class II surface impoundment constructed with a double liner and a leachate collection and removal system (LCRS) per CCR, Title 27. As part of the CCR, Title 27 requirements, the Discharger is also required to monitor the surface impoundments, including the vadose zone and groundwater beneath the site.

In order to comply with this regulation, the design of the evaporation ponds will include several layers of protection and monitoring capabilities. The uppermost layer will consist of a 60-mil textured HDPE primary liner, which will prevent leachate from migrating below the ponds. A second 60-mil HDPE drain liner will make up the bottom of the LCRS. The bottom liner is defined as the free-draining vadose zone monitoring system (VZMS).

This LCRS system will be designed to detect any leaks and collect any moisture that may develop in the LCRS. The bottom liner will capture any liquid that leaks through the upper primary liner, with the liquid being collected in a sump area for collection and removal. The sump will be continuously monitored using a level switch that will be installed in the monitoring tube of the LCRS sump.

3. COST ESTIMATE

3.1 Option 1

The order of magnitude costs for Option 1 are detailed below. The capital costs required for the WWTP effluent to meet tertiary standards include MBR, disinfection, an RO system, as well as brine evaporation ponds and mechanical evaporators.

WWTP	
MBR – 3.6 MGD	$52,887,000
Chlorination Tank – 3.6 MGD	$2,377,700
RO System – 0.5 MGD	$1,619,000
Brine Evaporation Ponds and Mechanical Evaporators	$5,256,100
TOTAL	**$62,139,800**

3.2 Option 2

The order of magnitude cost for Option 2 is detailed below. The capital costs required for NP-1 to meet non-potable standards are an RO system as well as brine evaporations ponds and mechanical evaporators.

NP-1	
RO System – 0.8 MGD	$3,497,500
Brine Evaporation Ponds and Mechanical Evaporators	$2,948,000
TOTAL	**$6,445,500**

4. RECOMMENDATIONS

It is recommended to implement Option 2 now and Option 1 once the upgrade of the WWTP is complete. The time of construction to upgrade the WWTP, including building the new MBR and chlorination tank, is estimated to take approximately 3 years. Therefore, in order to serve the current recycled water demands from Sun Lakes Country Club within these 3 years, a 1 MGD RO system for NP-1 can be built now. Once the construction for the upgrades of the WWTP is finished, depending on the recycled water demand at this time, either the RO system used for NP-1 can be converted for WWTP effluent use or a second 1 MGD RO system can be built for the WWTP effluent. If a second RO system is installed, the NP-1 and WWTP effluent, post RO-treatment, will blend to satisfy the recycled water demands, thereby keeping NP-1 in commission.

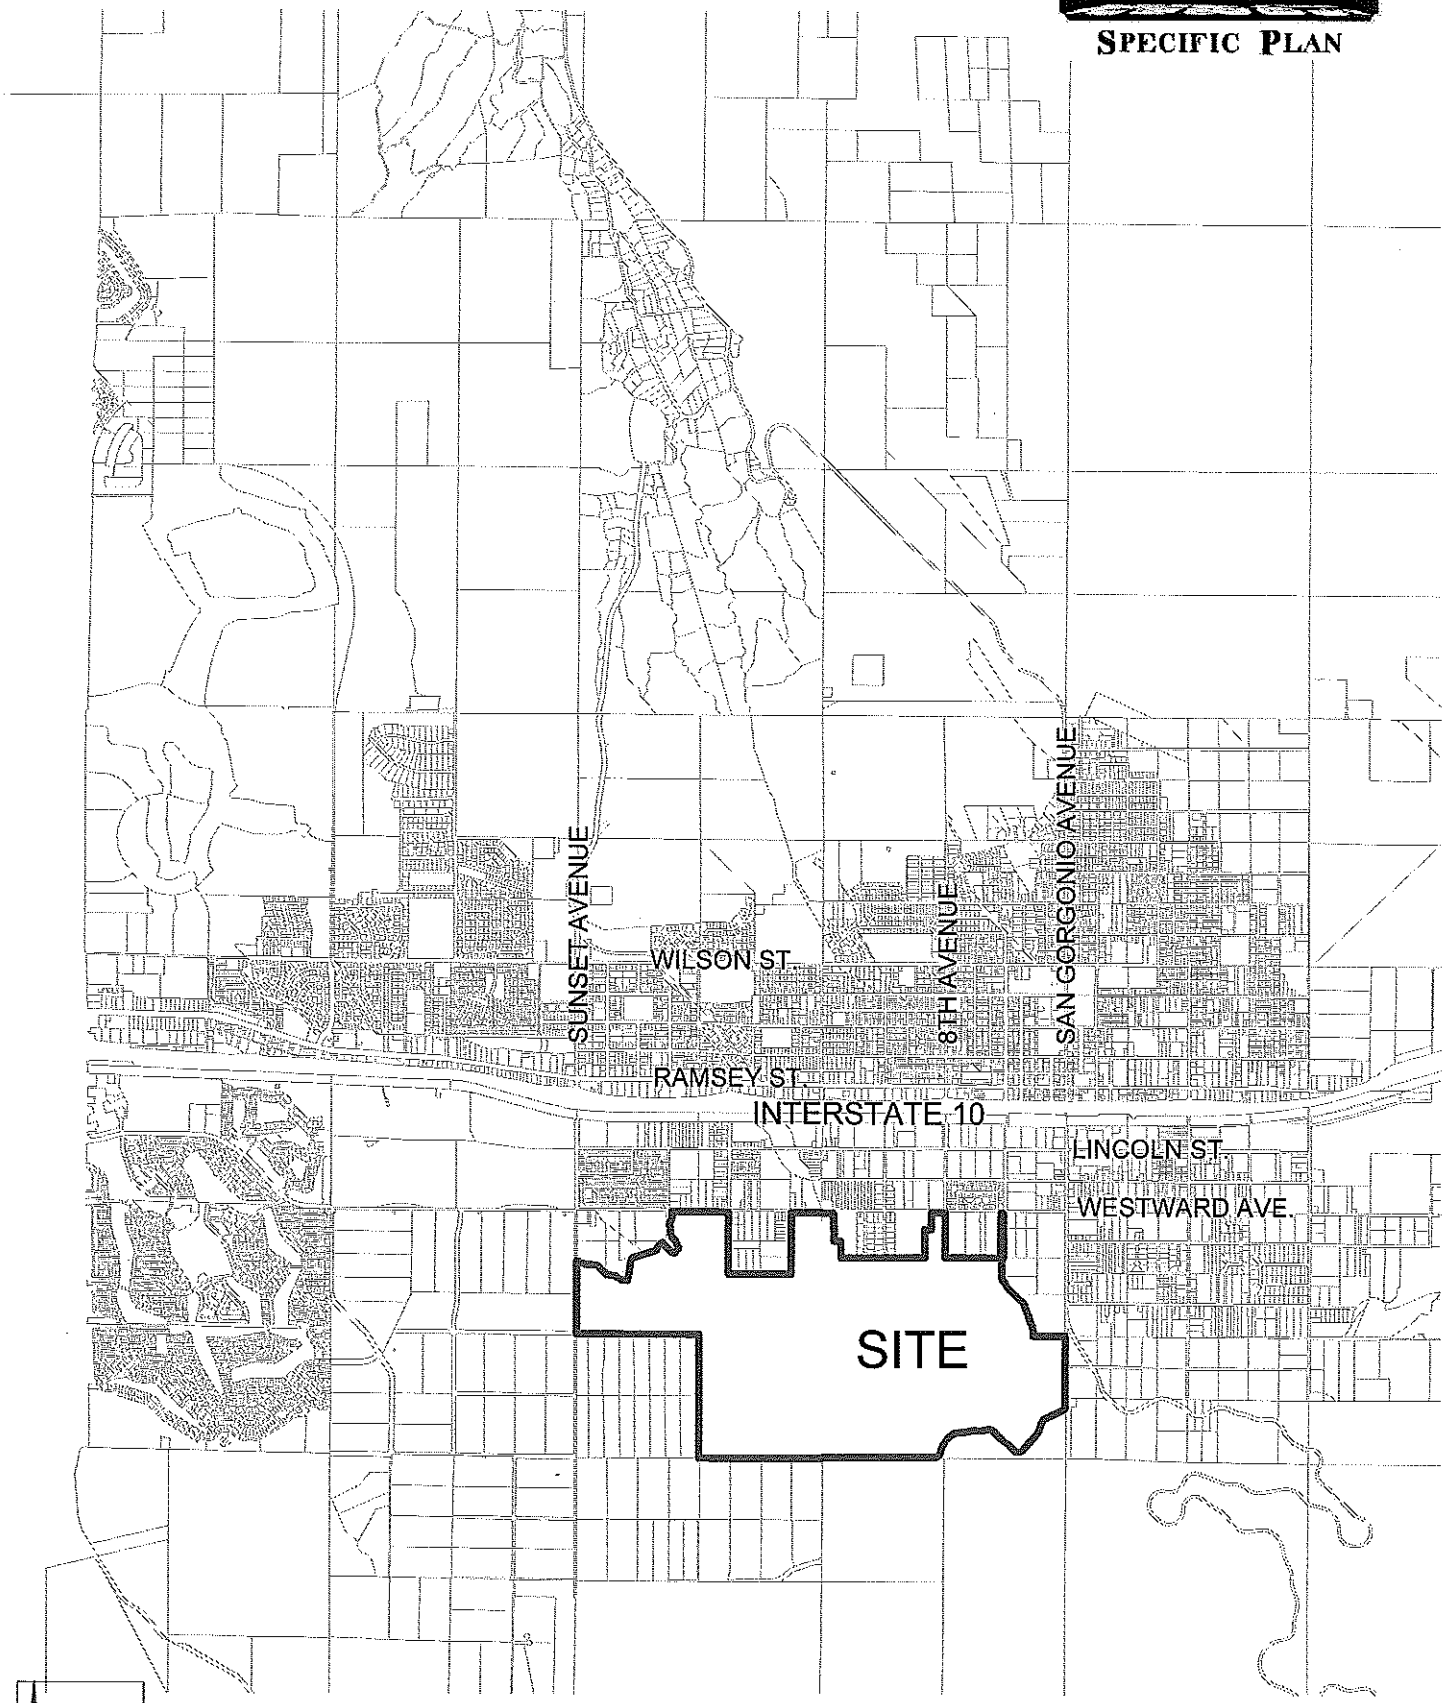
1. Executive Summary



Rancho San Gorgonio is a master planned community proposed in the city of Banning, Riverside County, California. Located on approximately 831 acres on the south side of the city, including approximately160 acres to be annexed from the county, up to 3385 residences are anticipated, among other uses and amenities.

Due to the size of the project, state law requires a Water Supply Assessment be prepared to ensure there will be an adequate supply of water for the project and the city over the next twenty years.

The city had an Urban Water Management Plan prepared, last updated in 2010, that describes in detail the various sources of water, the confidence in long-term reliability of those sources, the quality of those sources, and the projected demand for water within the city from now until buildout of the city.

The UWMP was the primary resource and was used as a basis for this WSA. Based on information provided in the UWMP, an assessment is made herein of the change this project will have on what was anticipated with the UWMP. Planning ahead to a built-out condition, there will be an estimated increase in population of 5243 due to this project, resulting in an increase in demand for water of 1,583 acre-feet/year.

As outlined in the UWMP and supporting reports, the city has a solid source of water, and due to a growing water account balance within the underground water basin, it is determined by this WSA that there will be an adequate supply of water to serve the project and city based on existing and projected supply and demand calculations.

Vicinity Map

2. Water Supply Assessment

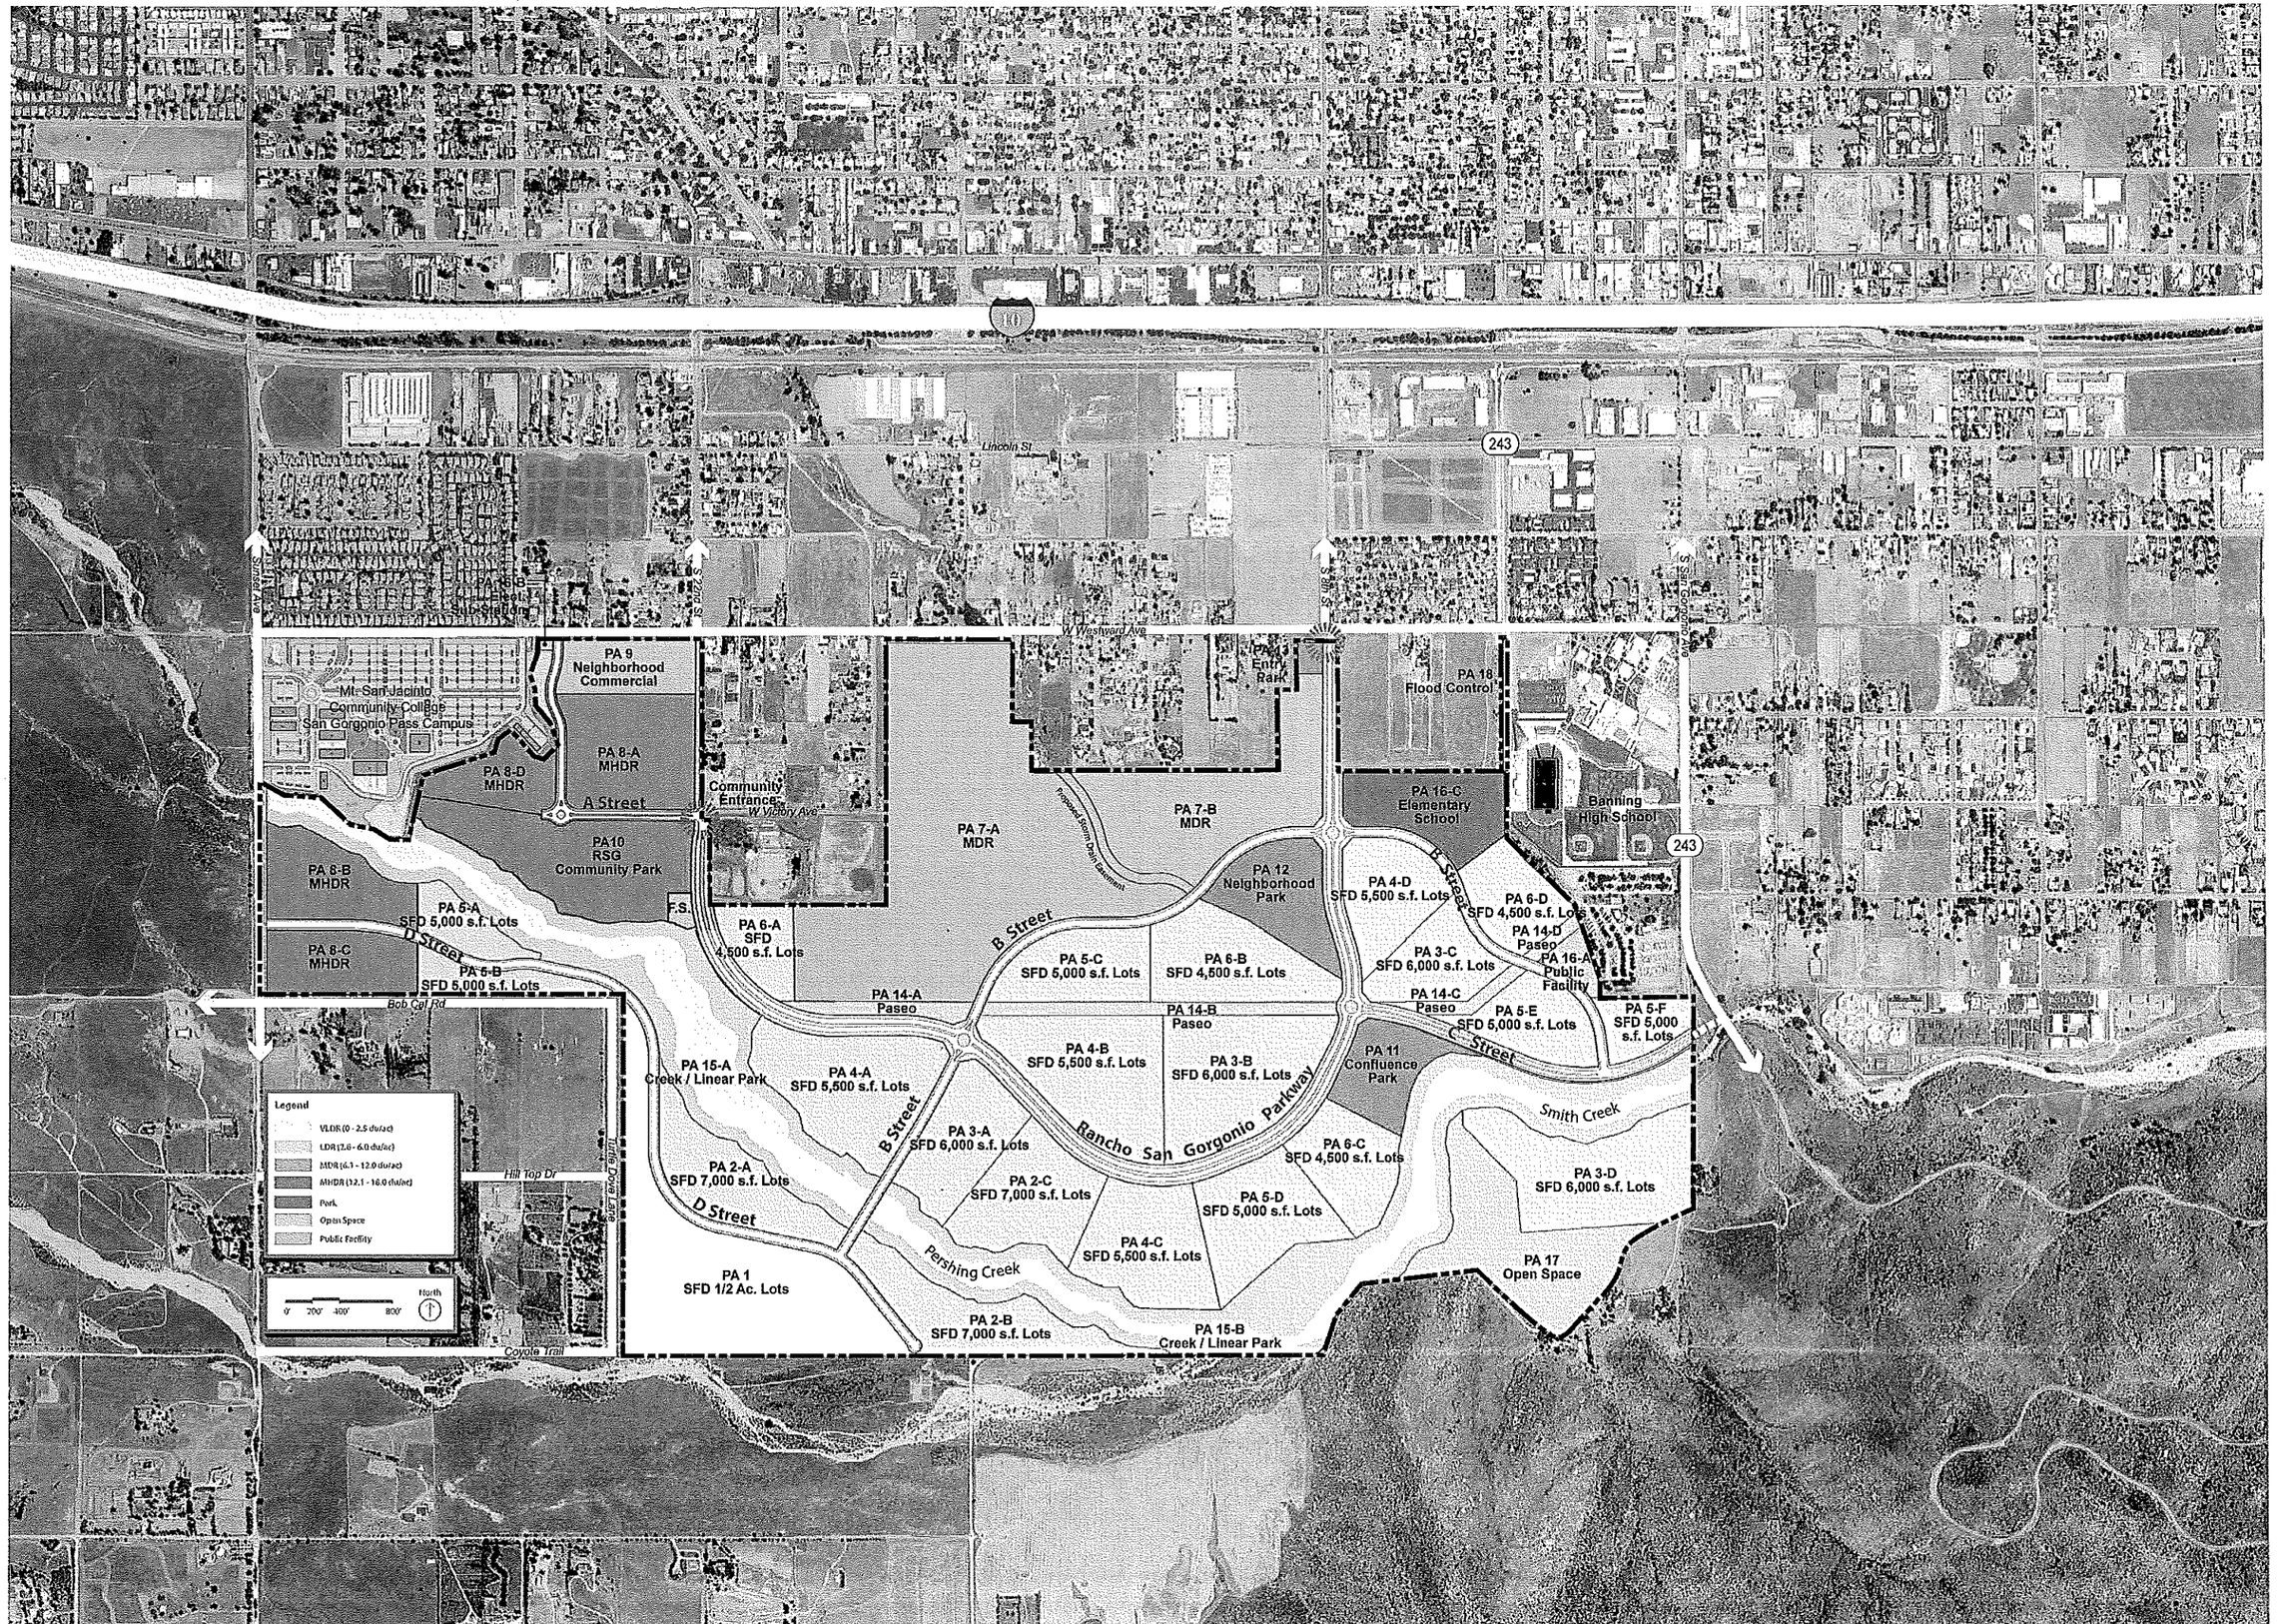
2.1. Introduction

A Water Supply Assessment (WSA) is mandated by state law, SB 610, in general for any project proposing 500 or more new residences. SB 610 stipulates when and how WSA's are needed and completed. As the city of Banning is both the land use agency and the water supplier for the proposed Rancho San Gorgonio Master Planned Community, and accompanying Specific Plan, the city is responsible for ensuring the WSA is prepared in accordance with SB 610. Madole & Associates, Inc., and Encompass Associates, Inc., were contracted to prepare the WSA by Rancho San Gorgonio, LLC, for the benefit of the city of Banning.

This WSA is based upon the City of Banning Urban Water Management Plan (UWMP), which is anticipated to have final approval this year. Data pertaining to historical supply and demand is taken from the UWMP. Projections can then be made for the increase in demand from the proposed Rancho San Gorgonio development.

Per SB 610, this WSA "must address whether the projected supply for the next 20 years - based on normal, single dry, and multiple dry years - will meet the demand projected for the project plus existing and planned future use..." The following three issues must be addressed:

1. Assess water received in prior years from (and provide supporting documentation):
    a. Water supply entitlements
    b. Water rights
    c. Water service contracts
2. If no water received in prior years, identify other water suppliers
3. If the source includes groundwater, follow the related guidelines as applicable.



From these three inquiries, the city of Banning can determine if there is sufficient water supply for the proposed project. If there is insufficient supply, the WSA must set forth plans to acquire the necessary supply, including the estimated cost thereof, the permits required, and the estimated timeframe for supply acquisition.

2.2. Proposed Project Description

Rancho San Gorgonio is a master planned community proposed in the city of Banning, California, comprising approximately 830.8 acres. The site is south of Interstate 10, generally situated between Sunset Avenue and San Gorgonio Avenue, south of Westward Avenue. A portion of the property is in unincorporated Riverside County, and will be annexed into the city limits as part of the development process.

The proposed project will consist of up to 3385 dwelling units, almost 49 acres of neighborhood and community parks, over 160 acres of paseos and open space, and 81 acres of right-of-way and utility easements. (Exhibit 2-1)

A mix of residential properties is proposed, including single-family detached in a variety of lot sizes up to half-acre lots, as well as multi-family residences. Numerous parks are planned throughout, with amenities anticipated to include a community center, picnic areas, pedestrian, bicycle and equestrian trails, and athletic fields. See Table 2-1 for a breakdown of land uses, dwelling units, and acreages.

3. Existing Water System and Supply

3.1. City of Banning Water System

The city of Banning is the utility provider of water and sewer services throughout the city, including areas outside city limits, within the sphere of influence (see Exhibit 3-1). All water is pumped from the various underground water basins via a network of wells. The pipeline system connects these wells and tank reservoirs together, broken up naturally by actual elevation differences and with pressure regulating devices into four pressure zones in order to serve all parts of the city (see Exhibit 3-2)

3.2. Current Sources of Water

All water enters the city system via pumping operations from the underground basins. All groundwater basins are geologic formations that, in one way or another, collect and retain water that percolates into the ground. There are different means of replenishing the underground water basin storage. Surface water naturally percolates into the ground during rainfall events, snow melt from the surrounding mountains and higher elevations, and from urban sources, "return flows", such as excess irrigation runoff. The city also purchases State Water Project (SWP) water through the San Gorgonio Pass Water Agency (SGPWA). Finally, the city has plans to utilize recycled water for nonpotable, irrigation demands, and by doing so, will free up the water supply for additional potable needs.

Table 4-1 from the UWMP summarizes current and future water supplies, and that table is replicated here. The various sources will be discussed further below, as summarized from Section 4 of the UWMP.

Table 3-1 - Current and Projected Water Supplies (Table 4-1 from the 2010 UWMP) [acre-ft]						
Water Supply Source	2010*	2015	2020	2025	2030	2035
Banning Storage Unit[1]	1218	1130	1130	1130	1130	1130
Banning Bench Storage Unit[1]	1472	1960	1960	1960	1960	1960

Cabazon Storage Unit[3]	565	1185	1405	1648	1916	2212
Recycled Water Supply[4]	0	1680	1680	1680	1680	1680
Return Flows from Recycled Water Irrigation[5]		420	420	420	420	420
Return Flows from Potable Residential Irrigation[6]	0	9	18	28	38	48
SWP Table A Entitlement[7]	1200	2595	2595	2595	2595	2595
Total	9552	15563	15792	16045	16323	16628

* 2010 values are actual supplies utilized by the City in 2010. The DWR Guidebook requires inclusion of 2010, however as the deadline for submittal of the UWMP has been extended to 2011, all 2010 values are not projections or estimates, but are actual values.

1) Maximum Perennial Yield Estimates for the Banning and Cabazon Storage Units, and Available Water Supply from the Beaumont Basin,Geoscience 2011.

2 City of Banning average annual production from City of Banning Wells within the Beaumont Storage Unit since the basin was adjudicated in 2004

3) Cabazon production supply includes approximately 710 acre-ft/yr, which has been the average annual production from the City of Banning Well C-6, and additional water which may be utilized by the City as described in Maximum Perennial Yield Estimates Report, Geoscience, 2011 (see Appendix F). See Section 4.2.7 for explanation of estimates. These values assume that Phase I of the WWTP Expansion will be completed by 2014, and 1,680 acre-ft/yr will be treated to Tertiary standards and used to offset potable demand, therefore the 1,680 acre-ft/yr is excluded from these estimates.

4) Values from Initial Study/Mitigated Negative Declaration, Wastewater Treatment Plant Expansion and Phase I Recycled Water System, May2008 prepared by the City of Banning Water/Wastewater Utilities Department. Assumes WWTP Phase I will be completed by 2015. It is assumed that supply will increase by 1.5 MGD/ 1,680 AFY every ten years.

5) Values include 25% return flow from all irrigation purposes inside and outside the BMZ for Phase I and Phase II WWTP expansion project assumes Phase I will be completed in 2014.

6) Values include 25% return flow from all irrigation purposes where potable water is used (50% of residential water use is used for landscape irrigation). Returns flows for Beaumont Storage Unit are not counted, as the City has an allotment of the Safe Yield. All return flows within the Beaumont Basin from imported water are dedicated for overdraft mitigation. Return flows in the Banning Storage Units are considered for developments projected for construction which will add new recharge to the storage units (total of 1,044 EDUs at build out - assumed to be 2061) along with 20X2020 conservation.

7) Assumes 60% SGPWA SWP average reliability per DWR's Final Reliability Report 9/27/10; Assumes Banning's allocation of available SWP water is 25% of SGPWA Allotment, assumes EBX-II is on line by 2014.

3.2.1. Groundwater

The project and the city of Banning, among other cities in the area, are situated over the San Gorgonio Pass Ground Water Basin. The basin is broken down into five sub-units, which are not totally independent from each other (see Exhibit 3-3).

3.2.1.1. Banning Storage Unit

The Banning Storage Unit is located substantially within the city limits, comprising the downtown area and beyond on both sides of Interstate 10. It is about 3.9 square miles in size, with an average thickness of 600 feet and up to 240,000 acre-feet of capacity (Geoscience 2011).

The city of Banning has exclusive pumping rights to the Banning Storage Unit. With the four wells currently installed within this unit, the city has pumping capacity up to 3,500 gpm, or 5,646 acre-ft/year. The Geoscience study (2011) determined the safe yield to be 1,130 acre-ft/year, which is what the UWMP includes for future production projections.

3.2.1.2. Banning Bench Storage Unit

The Banning Bench Storage Unit is located north of the Banning Storage Unit, mostly within the city limits, up to Banning Canyon. It is approximately 5.9 square miles in size, with an average thickness of 30 feet and up to 1500 acre-feet of capacity (Geoscience 2011).

The city of Banning also has exclusive pumping rights to the Banning Bench Storage Unit. Three wells within this unit produce 3,650 gpm, or 5,888 acre-ft/year. The safe yield was determined to be 1,960 acre-ft/year.

3.2.1.3. Banning Canyon Storage Unit

Extending a few miles north from Banning Bench, the Banning Canyon Storage Unit comprises the canyon area of the city. About 1.6 square miles, it has an average thickness of 161 feet and can store up to about 13,500 acre-feet (Geoscience 2011).

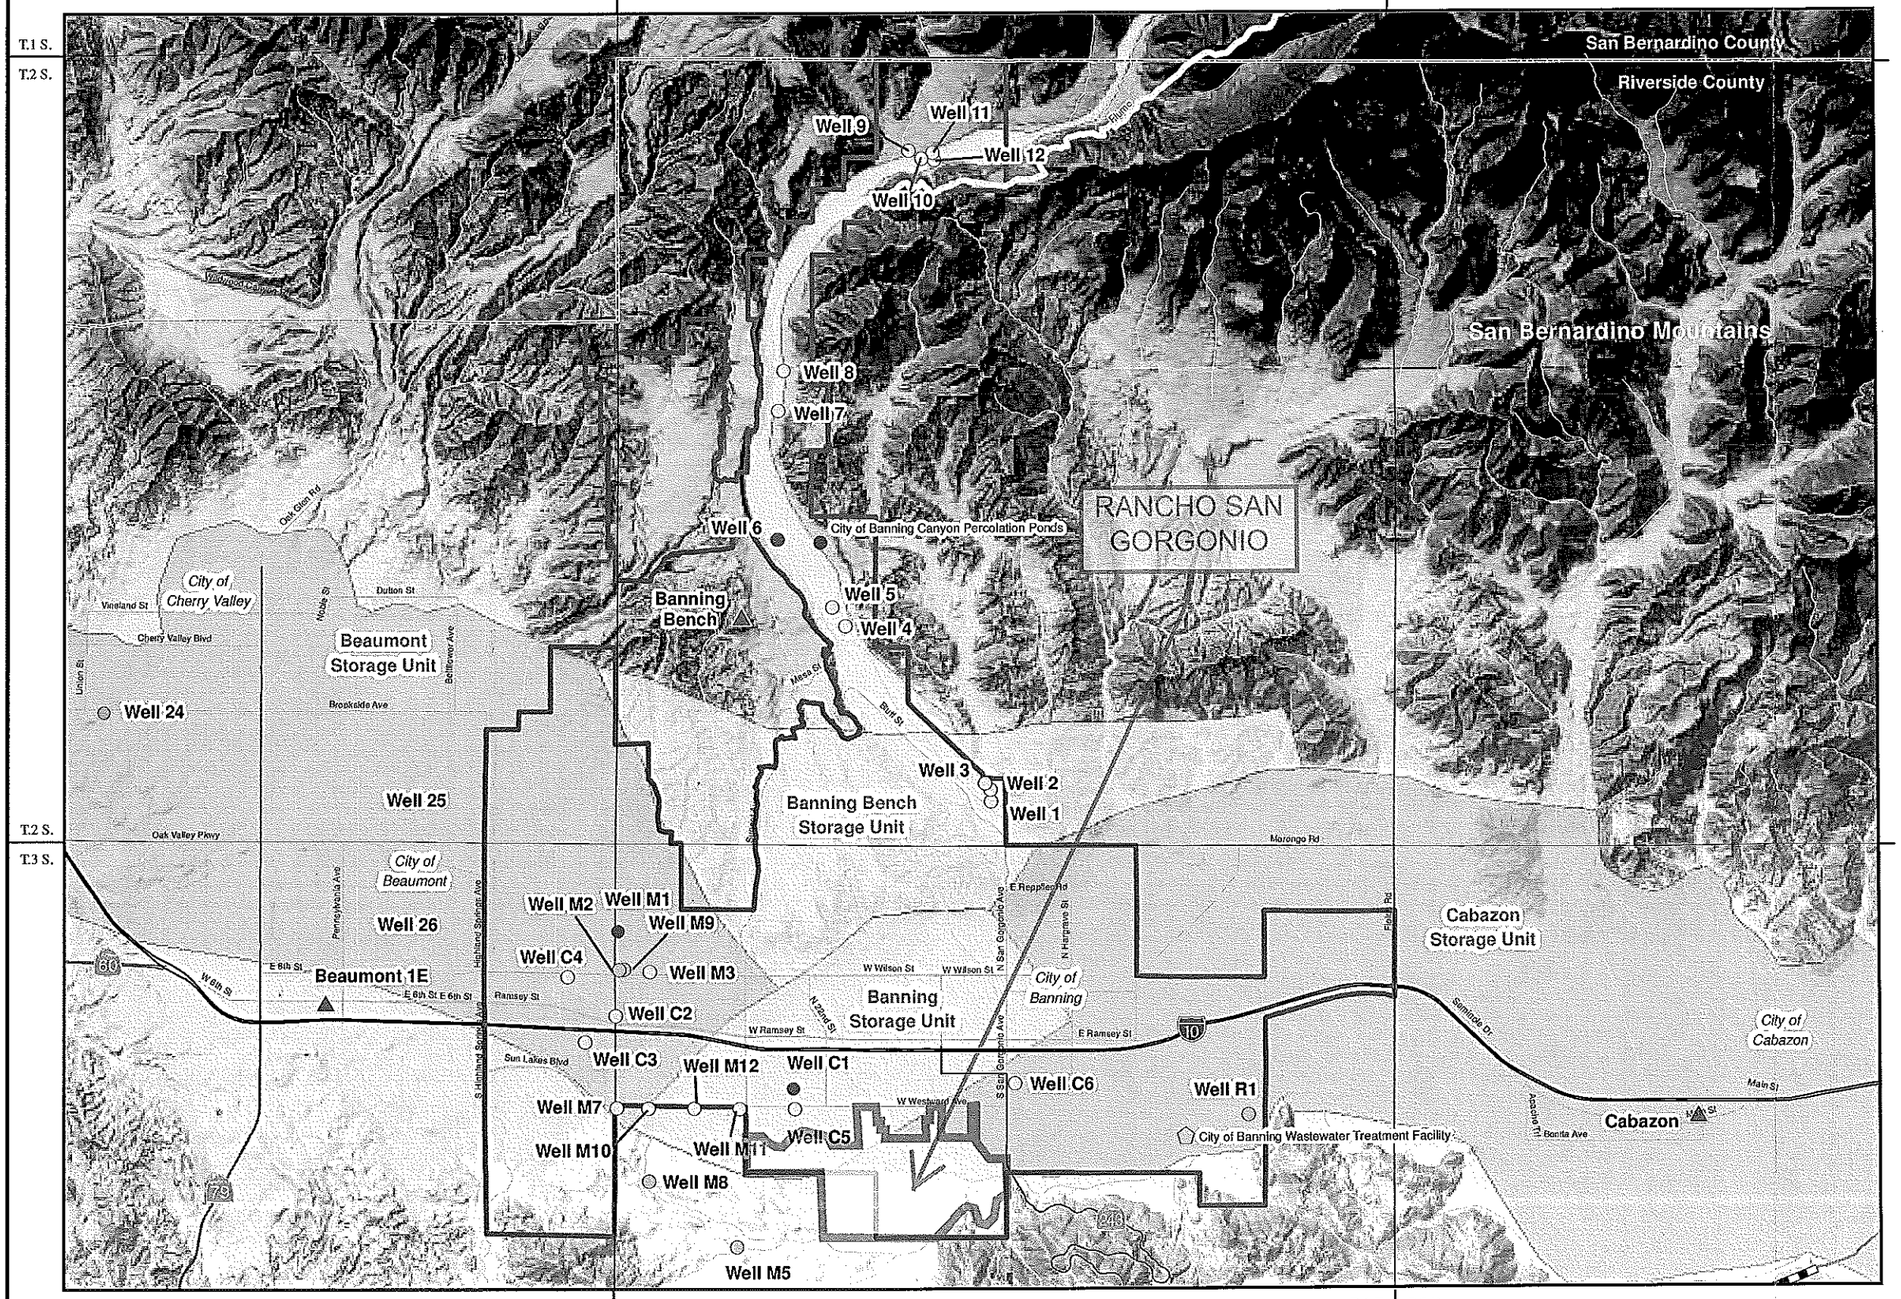
The Banning Canyon Storage Unit is the largest source of water for the city. The San Gorgonio River, and a diversion system from the Whitewater River, provide recharge for Banning Canyon. Eight wells within this unit produce 8,600 gpm, or 13,873 acre-ft/year. The safe yield has been determined to be 4,070 acre-ft/year.

3.2.1.4. Cabazon Storage Unit

Underlying the eastern portion of the city, the Cabazon Storage Unit extends easterly to the city of Cabazon. The Cabazon Storage Unit is about 27 square miles in size, has an average thickness of 350 feet, and can store up to 1,000,000 acre-feet.

The city does not have exclusive pumping rights for the Cabazon Storage Unit. One well within this unit can produce 900 gpm, or 1,452 acre-ft/year. However, the city is not producing from this well, as the WWTP currently discharges wastewater treated to a secondary standard, which does not meet domestic, potable water quality requirements. The city is anticipating utilizing the Cabazon Storage Unit to supplement the recycled water production capacity of the WWTP.

3.2.1.5. Beaumont Storage Unit



Located in mostly in the city of Beaumont, part of the Beaumont Storage Unit underlies the western portion of the city of Banning. It is approximately 20 square miles in size (2010 UWMP).

Extraction of water from the Beaumont Storage Unit has been adjudicated (see Section 6), with rights shared amongst the city of Banning, the Beaumont Cherry Valley Water District, the South Mesa Water District, and the Yucaipa Valley Water District.

Five wells within this unit, plus the city's share of three additional wells, produce 7,650 gpm, or 12,340 acre-ft/year. The judgment has given the city the right to pump 5,910 acre-feet annually through the year 2014. The basin Watermaster is required by law to re-evaluate the safe yield from the storage unit every ten years, and is due for a re-evaluation in 2014.

A summary of the historical well production, broken down by year and by Storage Unit, is included in Section 4.2.2 and Table 4-3 of the UWMP.

Currently, the city does not pump all of what is allotted, and therefore maintains a water account balance. Table 4-4 in the UWMP summarizes this account, and that table is included below.

*It should be noted that there is a discrepancy between the reported City of Banning unused overlying water right allocation in 2009 as reported by the Sixth Annual Beaumont Basin Watermaster Report (1,405 acre-ft) and the value of 1,492 acre-ft as listed in the Draft Beaumont Management Zone Maximum Benefits Program Modeling Scenarios, 2011 Appendix A-3.

[1] Projected allocation of pumping rights per Appendix A-3 ("Projected Allocation of Pumping Rights for the 2004 Beaumont Basin Judgment") of the Draft Beaumont Management Zone Maximum Benefits Program Modeling Scenarios, prepared by Wildemuth Environmental, Inc. dated
March 18, 2011.

[2] Controlled overdraft assigned by the Beaumont Basin Judgment for the ten year period 2004 through 2012 (see Appendix G).

[3] State Water Project purchases reported by Watermaster for 2009 year. Values for purchases for 2010 year provided by the City of Banning. Projected Purchases (2011-2035) assumed to be 25% of annual delivery to SGPWA anticipated by the SWP Reliability Report (60% of the
maximum annual delivery of 8,650 acre-ft per year until 2013, when EBXII is assumed be online, SGPWA full Table A entitlement of 17,300 will be accessible).

[4] City of Banning production as reported by the City of Banning for years 2004-2010, production includes water received from BCVWD. For years 2011 through 2020, City of Banning pumping is assumed at the average annual pumping value of 2,514 acre-ft/yr.

[5] Transfer reported by Watermaster in the Sixth Annual Report of the Beaumont Basin Watermaster dated 2010, by the City from South Mesa

Mutual Water Company.
[6] Sum of columns 1, 2, 3 and 5 minus column 4, the product is added to the previous year Estimated Total Water in Storage. It should be noted that water in storage values differ from that of the 6th Annual Watermaster report due to fiscal vs. calander yeah reporting (i.e. 2009 values in the 6th Annual Report are as of September 30th 2009 and 2009 values shown in this table are as of December 31, 2009).

This account balance is included in the supply projections for the proposed project in Section4 below.

The project lies over the Banning and Cabazon Storage Units. The project is planning to implement various techniques that will increase percolation and recharge opportunities within the project area, which at a minimum will limit the decrease in percolation due to development. Conversely, the proposed infiltration basins, pervious pavement and other storm water quality best management practices could very well constitute an increase in recharge, as storm runoff will be captured and retained.

Natural percolation from large storm events is not generally very high in relation to the volume of runoff, however when a significant portion of that runoff is captured and retained, recharge will be enhanced. An estimate of the average volume of runoff that could be recharged is included in Section 3.2.2 below.

It should be noted that the excess pumping capacity in all five storage units provides the city with safeguards in case of emergencies and system maintenance.

3.2.2. Surface Water

As stated previously, surface water naturally recharges the underground water basin across the region, and most directly by the San Gorgonio River and the Whitewater River diversion. The Rancho San Gorgonio master planned community will further augment surface water recharge, through the network of infiltration and detention basins, that will capture not only small and large storm runoff, but "return flows" from irrigation overspray and other urban uses.

An estimate of the volume of stormwater recharge is included in Tables 3.2.2-1 and 3.2.2-2 below. The amount of infiltration that naturally occurs prior to the development of Rancho San Gorgonio is first estimated from the hydrology calculations included in the project Master Plan of Drainage (see calculation summary sheet at the rear of this report). The result of the analysis shown in Table 3.2.2-1 represents an average percentage of rainfall that will be infiltrated.

Table 3.2.2-1: 100-year 6-hour Storm within the limits of Rancho San Gorgonio		
Area	849.6	ac
Total rainfall (6-hr)	3.200	in
Peak rainfall volume (6-hr)	2,719	ac-in
Existing Condition		
Peak (volume) runoff (6-hr), from hydrology	103	ac-ft
	1,241	ac-in
Infiltration (total rainfall volume - runoff volume)	1,478	ac-in
Total Infiltration per in of rainfall, 1478 / 3.2 =	462	ac-in per in
Infiltration Yield per in of rainfall, 462 / 849.6 =	54%	

Next, it is assumed that the full average annual rainfall will either infiltrate as part of typical runoff or be captured by the infiltration basins proposed throughout the project. The infiltration basins are designed to contain the full 100-year 3-hour storm, which is a significant event and represents runoff in excess of typical, "average" storm events.

An average annual rainfall of 17.77 inches was used in this analysis, per the 2010 UWMP (page 12). As discussed above, this average rainfall quantity will be fully captured in the developed condition, however the increase in recharge due to the project is reduced by that which would occur naturally prior to development. The estimated increase in recharge is therefore 579 acre-feet per year per the table below.

Table 3.2.2-2: Estimation of Stormwater Recharge		
Annual Rainfall		
Average annual rainfall = total developed infiltration and capture = See 2010 UWMP (page 12)	17.770	in
Existing condition infiltration based on Annual Rainfall		
Existing condition infiltration, 0.54 x 17.77 =	9.596	in
Estimation of additional infiltration due to development		
Net additional infiltration due to development, 17.77 - 9.596 =	8.174	in
	579	ac-ft (per yr)

Surface water is not listed as a separate source in Table 3-1 above because it merely recharges basin storage unit pumping production.

3.2.3. State Water Project Water

The SGPWA currently purchases water from the SWP, and sells it to the cities in the region as needed. The city purchases water for the sole purpose of recharging the basin storage units.

The SGPWA has a contract for 17,300 acre-ft/year, but currently only has facilities that can deliver 8,650 acre-ft/year. Table 3-1 above includes the amount of SWP water the city expects to purchase from SGPWA in the future, based in part on long-term delivery reliability estimates, established by the Department of Water Resources.

3.2.4. Recycled Water

The city of Banning currently has no facilities to provide recycled water, however such facilities are under construction and anticipated to be in service in the next couple of years. The city anticipated a phased approach to providing recycled water, with the first phase providing 1,650 acre-ft/year, with similar capacities being added roughly every ten years thereafter, as demand increases.

Use of recycled water displaces what would have been domestic, potable water demand, and therefore is treated as a supply, up to the limit of the demand displacement.

3.3. Water Quality

Section 5.9 of the UWMP summarizes historical water quality data, and makes the conclusion that current water quality is excellent, and that there are no known reasons to expect future water quality to be any less so.

3.4. Water shortage/emergency contingencies

The city has adopted a Water Storage Contingency Plan in order to address emergency and disaster planning as related to water supply and fire suppression. Details are discussed in Sections 5.4 through 5.6 of the UWMP.

3.5. Current and Projected Demand

The methodology used to determine city-wide water demand in the UWMP was followed in this WSA. Table 3-8 in the UWMP defines the projected water use through 2035, broken down by land use type, as was determined based upon historical data.

Projected demand in UWMP is based on population growth and estimated per capita water use. The current city General Plan projects buildout in 2061, with a population of 80,226. This reflects a 2% population growth rate.

Current (2010) city water usage is calculated to be 229 gallons per capita per day. The projections follow state guidelines, which calculates to 315 gallons per capita per day (UWMP, page 37). However, state law currently in effect will require a 20% reduction in water use by the year 2020. Therefore, projected water use is reduced by 10% for 2015, and by 20% by 2020 and thereafter.

Table 3-2 Current Projected City-wide Water Demand - Based on Land Use Factors (Table 3-8, 2010 UWMP, with 20x2020 factored)

Water Use Sectors	Average % Use of Water Supply 2005-2010	2010	2015	2020	2025	2030	2035
Population		29603	32684	36086	39842	43989	48567
Per Capita Water Use [gpcd]		229	283	252	252	252	252
Single Family Residential	56.2%	4412	5833	5724	6320	6978	7704
Multi-family Residential	2.3%	120	240	236	260	288	317
Commercial/Institutional	26.2%	1908	2720	2669	2947	3254	3593
Industrial	1.2%	95	121	119	131	145	160
Irrigation	11.9%	939	1233	1211	1337	1476	1629
Other	1.1%	31	113	111	122	135	149
Sales to other Agencies	1.1%	82	116	113	125	138	153
Total [acre-ft/yr]		7586	10376	10183	11243	12413	13705

3.6. Assessment of Current Supply and Demand

Table 3-3 below is a summary of Tables 3-1, 3-2 and UWMP Table 4-4, providing an analysis of the city's projected surplus, as determined in the UWMP. Based on the current plan and projections, the city can meet future water needs.

Table3-3: Supply and Demand (20x2020) Comparisons - Current City UWMP with Water Basin Account Balance

	Average Water Years					
	2010	2015	2020	2025	2030	2035
Total Supply*	34,192	60,518	70,006	78,460	86,160	93,154
Total Demand**	7,586	10,376	10,183	11,243	12,413	13,705
Supply Surplus	**26,606**	**50,142**	**59,823**	**67,217**	**73,747**	**79,449**

*Total Supply equals the account balance from the Beaumont Basin (per Table 4-4 in the UWMP, as provided in Section 3.2.1.5 above) plus the Supply from Table 4-1 of the UWMP (Table 3-1 above).

**Total Demand is from Table 3-8 of the UWMP (Table 3-2 above).

4. Proposed Project

4.1. Proposed Project Buildout Estimate

Given current market conditions, which are subject to change, project buildout is anticipated to occur in 6 phases, one phase every three years, for a total duration of 18 years. With construction estimated to commence in 2016, buildout would occur by 2034. Table 4-1 below reflects a linear buildout trend, with an average of 2.64 persons per dwelling, as per the city General Plan.

Table 4-1 - Forecasted Project Buildout

Year	Dwelling Units	Population
2016	0	0
2017	188	496
2018	376	993
2019	564	1489
2020	752	1985
2021	940	2482
2022	1128	2978
2023	1316	3474
2024	1504	3971
2025	1692	4467
2026	1880	4963
2027	2068	5460
2028	2256	5956
2029	2444	6452
2030	2632	6948
2031	2820	7445
2032	3008	7941
2033	3196	8437
2034	3385	8936

4.2. Current UWMP Demand Comprising Project Area

The land comprising this proposed community is included in the current UWMP, including the 160 acres to be annexing into the city from the county (see Exhibit 3-1), however at lower densities than are proposed. Therefore, per Section 5 of SB 610, it must first be determined if the existing 20-year projections can meet the proposed increased demands. This WSA relies upon the UWMP and will only address the changes proposed with this master planned community.

Listed in Table 4-2 below is a summary of the land use zones that currently constitute the property being developed, from the city General Plan (see Exhibit 4-1). The total number of projected dwelling units will then be compared with what is proposed, and the increase in dwelling units is what will be used to assess the ability of the water supply, with future projections, to serve the proposed development. Note that as the City's General Plan assumes actual development will occur at about 75% of the maximum density, so too are the projected densities adjusted accordingly.

Table 4-2 - Existing Land Use with Projected Buildout Density

Type	Zoning Density	Dwelling Units per Acre	Acres	Maximum Dwelling Units	75% of Max. Density*
Ranch/Agriculture**	10 ac min.	0.10	149.49	8	6
Rural SFR	0-1 du/ac	1	26.78	26	20
Very Low SFR***	0-2 du/ac	2	545.57	1067	800
Low SFR	0-5 du/ac	5	0	0	0
Medium SFR	0-10 du/ac	10	14	140	105
Very High MFR	19-24 du/ac	24	26	624	468
Park	0 du/ac	0	0	0	0
Open Space (Resources)	0 du/ac	0	69	0	0
			848	1865	**1399**

*The City General Plan assumes 75% of maximum density for buildout conditions

**This Type is comprised of 8 parcels, all less than 20 acres, therefore only 8 units max

***Maximum units calculated by parcel, not by gross acreage

In order to determine the change in projected water demand due to the proposed project, an estimate of the change in dwelling units, or population, is first required. Table 4-3 below shows an evaluation of the change in dwelling units.

Table 4-3: Proposed Land Use with Maximum Buildout Density				
Type	Zoning Density	Target Dwelling Units per Acre	Acres	Maximum Dwelling Units
Single-Family Residential**	0.5-6	2-6	362.8	1533
Multi-Family Residential	12.1-18.0	18	51.7	930
Age-Qualified Residential	6.1-12.0	6.5	115.94	754
Mixed Use *	12.1-18.0	18	9.33	168
Parks & Open Space	n/a	n/a	209.18	0
Right-of-way	n/a	n/a	77.17	0
Public Facility	n/a	n/a	3.62	0
Storm Drain Easement	n/a	n/a	1.1	0
Single-Family Residential**	0.5-6	2-6	362.8	1533
			830.84	**3385**
			Increase over current zoning:	**1986**
(see Table 4-2 above: 75% of currently projected buildout)				

*Neighborhood Commercial with Residential Overlay
(9.33 ac dedicated to MFR)

Table 4-4 below provides a comparison of current versus proposed population, broken down in 5 year increments for inclusion in the calculations below.

Table 4-4 - Change in Population						
Year	2015	2020	2025	2030	2035	2061
Current	0	328	739	1149	1559	3693
Proposed	0	752	1692	2632	8936	8936
Increase	0	424	953	1483	7377	5243

4.3. Proposed Water Demand Factors

The UWMP establishes 315 gallons per day per capita as the baseline water demand for dwelling units. The baseline figure is prior to the impacts of the "20x2020" requirement.

Therefore, the project will be required to comply accordingly, and so a 10% reduction is included for 2015 (283 gpd), and the full 20% reduction by 2020 and thereafter (252 gpd).

These targets will be achieved in part through landscape and irrigation design standards included in the project Specific Plan. Furthermore, landscaping, irrigation, and building plumbing requirements will be enforced by the city at building permit issuance. As stated in the UWMP, the city has determined that current city ordinances, along with the building codes, will achieve a 20% reduction in water use.

The project also proposes to utilize recycled water for landscape irrigation in common areas throughout the project. As shown in Section 5.7 below, there is a projected irrigation demand of 218 acre-feet per year at buildout, which will be supplied by nonpotable water. Further, it is anticipated that the project will generate 470 acre-feet per year (Section 5.5 below) in sewage, with the excess capacity of 252 acre-feet per year either contributing to recycled water demand throughout the city or being recharged back into the groundwater basins for reuse.

4.4. Proposed Project Demands

From Table 4-3 above, the estimated increase in dwelling units is 1986. Per the city of Banning Water Master Plan (WMP, 1994), persons per dwelling is estimated at 2.64 across all residential density types. Therefore, the projected population increase at buildout will be 5243, changing the city-wide estimated buildout population to 85,513, or 2.1% growth rate.

However, as the project is anticipated to be built out in 18 years, this population increase, as shown in Table 4-1 above, is utilized in the calculations.

Table 4-5 shows the estimated project demand. The same Land Use Factors and Buildout rate are used as per the UWMP.

Table 4-5 - Project Water Demand - Based on Land Use Factors (with 20x2020 factored)

Water Use Sectors	Average % Use of Water Supply 2005-2010	2015	2020	2025	2030	2035
Population		0	752	1692	2632	8936
Per Capita Water Use [gpcd]		283	252	252	252	252
Single Family Residential	56.2%	0	119	269	418	1417
Multi-family Residential	2.3%	0	5	11	17	58
Commercial/Institutional	26.2%	0	56	125	195	661
Industrial	1.2%	0	3	6	9	30
Irrigation	11.9%	0	25	57	88	300
Other	1.1%	0	2	5	8	28
Sales to other Agencies	1.1%	0	2	5	8	28
Total [acre-ft/yr]		0	212	478	743	2522

Table 4-6 shows proposed, city-wide water demand, based on Table 3-8 from the UWMP, and shown above in Table 3-2, adjusted for the projected increase in population due to the proposed project. Land use factors, as determined in the UWMP, are not to be confused with the proposed project land uses. Historical city-wide demand has been appropriated by land use based on actual usage data which has been maintained by the city, which provides a means of determining the impact new development will have on city-wide water demand.

Table 4-6 - Proposed Projected City-wide Water Demand - Based on Land Use Factors (with 20x2020 factored)							
Water Use Sectors	Average % Use of Water Supply 2005-2010	2010	2015	2020	2025	2030	2035
Population		29603	32684	36510	40795	45472	55944
Per Capita Water Use [gpcd]		229	283	252	252	252	252
Single Family Residential	56.2%	4412	5833	119	269	418	1417
Multi-family Residential	2.3%	120	240	5	11	17	58
Commercial/Institutional	26.2%	1908	2720	56	125	195	661
Industrial	1.2%	95	121	3	6	9	30
Irrigation	11.9%	939	1233	25	57	88	300
Other	1.1%	31	113	2	5	8	28
Sales to other Agencies	1.1%	82	116	2	5	8	28
Total [acre-ft/yr]		7586	10376	10306	11515	12836	15792

*Total demand is calculated by multiplying Population with Per Capita Water Use, and applying a unit conversion factor to translate from gpcd to acre-ft/yr.

Note that projections in this WSA will follow the time horizon used in the UWMP for consistency. The UWMP projects supply and demand beyond the required 20-year period required for this project.

4.5. Evaluation of UWMP to meet Project Demand

Current supply projections are included in the UWMP (Table 5-9), based on past record data, with projections based on the trends established by that actual data. Those projects have been modified to include the Water Basin Account Balance, as per the table on page 42 of "Maximum Perennial Yield Estimates for the Banning and Cabazon Storage Units, and Available Water Supply from the Beaumont Basin", Geoscience Support Services, Inc., 2011.

The basin account balance represents surplus water, annually, that the city does not draw but which it has the right to pump. The city has not been drawing its full allotment, therefore the water account balance has been increasing, and is projected to increase over time.

Table 4-7: Supply and Demand (20x2020) Comparisons - Current City UWMP - Without Project (UWMP Table 5-9)						
Average Water Years						
	2010	2015	2020	2025	2030	2035
Total Supply	9,552	15,563	15,792	16,045	16,323	16,628
Total Demand	7,586	10,376	10,183	11,243	12,413	13,705
Supply Surplus	**1,966**	**5,187**	**5,609**	**4,802**	**3,910**	**2,923**
Single-dry Water Years						
Total Supply	N/A	12,043	12,314	12,608	12,928	13,235
Total Demand	N/A	9,821	9,638	10,642	11,749	12,972
Supply Surplus	**N/A**	**2,222**	**2,676**	**1,966**	**1,179**	**263**
Multiple-dry Water Years						
Total Supply	N/A	12,784	13,038	13,316	13,619	13,926

Total Supply	N/A	12,784	13,038	13,316	13,619	13,926
Total Demand	N/A	8,184	8,129	9,083	10,125	12,456
Supply Surplus	**N/A**	**4,600**	**4,909**	**4,233**	**3,494**	**1,470**

Table 4-8 demonstrates that there will be sufficient supply to support the proposed project in all cases except for Single-dry Water Years starting in 2035. Table 4-9 provides a comparison of the projected water account balance with the Single-dry Water Year shortfalls, indicating that there is a substantial surplus of water.

Table 4-9: Single-dry Water Year Surplus or Shortfall and Water Account Balance - With Project

	Single-dry Water Years					
	2010	2015	2020	2025	2030	2035
Supply Surplus	N/A	2,222	2,560	1,709	779	(1,712)
Water Account Balance	24,640	44,955	54,214	62,415	69,837	76,526
Sufficient Water Account Balance	**N/A**	**N/A**	**N/A**	**N/A**	**N/A**	**Yes**

This analysis reflects projected supplies that the city has physical access to and the legal right to acquire and provide.

An additional assessment is required to determine if the city has the current capacity, in terms of well production, to meet these demands on a daily basis. Table 4-2 of the UWMP summarizes the current system well capacity. The historical low capacity of 28,754 acre-feet per year exceeds the total city demand of 14,215 acre-feet per year in 2035. Therefore, there is current system pumping capacity.

4.6. Proposed Source of New Supply

As shown in Section 4.5 above, new sources of supply are not required to support the project. This is in due largely to the following:

(1) As stated above, the city has taken measures to comply with the state-mandated "20 by 2020" water reduction program. The various water conservation measures taken by the city come into effect and are enforced during the building construction process. This is included in the projections made in this WSA.

(2) The pending completion of the State Department of Water Resources' (along with SGPWA) East Branch Expansion Phase II project, which will bring additional capacity for State Water Project water to the area. This capacity is included in the projections made in this WSA.

(3) The proposed use of recycled water for common area irrigation for the project. As shown above, the project will be able to generate more recycled water than will be utilized for irrigation. The fact that potable water will not be used for common area irrigation is included in the projections made in this WSA, however the benefit provided due to the surplus recycled water, whether it is used elsewhere in the city, or by being recharged into the groundwater basin, is not included in the projections herein, and thereby adds a level of conservation to the supply calculations.

(4) Integrated Storm Water Quality provisions are proposed throughout the Rancho San Gorgonio master planned community. The primary concept is for all storm runoff to be conveyed to a system of infiltration basins prior to discharge to the creek system. These infiltration basins not only capture storm runoff, but every day nuisance water as well, and in turn recharge the underlying groundwater basins. Per the project Preliminary (Storm) Water Quality Management Plan, the basin system has been designed for a volume of 316,681 cubic feet, or 7.3 acre-feet.

4.7. Permits Required for New Supply

As shown in Section 4.5 above, new sources of supply are not required to support the project.

4.8. Estimate of the Cost and Schedule for New Supply

As shown in Section 4.5 above, new sources of supply are not required to support the project.

4.9. Proposed Project Water System

A system of water main pipelines will be installed throughout the project, with larger lines serving as the backbone infrastructure, which in turn will serve smaller local waterlines distributed throughout the various planning areas.

There will be at a minimum two points of connection to the existing city water system. It is anticipated that the project will connect to the city's "Main" pressure zone in Sunset or Westward, at the westerly or northwesterly portion of the project. A second main connection will likely be on San Gorgonio Avenue, which is in the city's "Lower" pressure zone. It is anticipated that a pressure reducing valve will be required with at least the connection to the "Main" pressure zone in order to safely and efficiently serve the project. At this time, this new zone is titled "Rancho San Gorgonio".

The project "Master Plan of Water" report estimates the size of the various pipelines, and assesses the need for emergency storage and fire suppression capacities.

An independent recycled water system is a proposed alternative to traditional irrigation from potable water sources for this master planned community. See Section 5 for a description of the recycled water system.

Conceptual Potable Water Master Plan

EXHIBIT 4.9

5. Recycled Water System

5.1. Introduction

The city is requiring that the Rancho San Gorgonio project utilize recycled water for all common area irrigation demands. This includes median and parkway landscape areas along the major streets within the project, as well as at the various parks and community centers throughout the master planned community. Landscaping on private property at residences will still be irrigated with domestic, potable water.

A recycled water system would reduce the amount of potable water required to serve the proposed project, while at the same time reducing the impact to the existing sewer system and waste water treatment facility. There would be an added expense due to the additional facilities required to support a recycled water system.

5.2. Proposed (City) Recycled Water System

At present, the city is constructing a centralized recycled water system. Pipelines are being installed in Westward Avenue west of Sunset, northerly on Sunset Avenue, and then easterly in Lincoln Avenue, eventually reaching the wastewater treatment plant. Expansion of the WWTP is anticipated, but work has not yet begun.

carollo engineers

5.3. Recycled Water Delivery Options

A likely option is for a satellite package plant to be constructed, either somewhere within the limits of the community, such as PA 16-A, or at a strategic location nearby. One of the primary end-users of recycled water within the city is the Sun Lakes Golf Course.

Alternatively, a connection could be made to the pipeline the city is currently constructing. The recycled water would be produced at the upgraded city WWTP. Connections could be made at Westward and Sunset Avenues, or up to Lincoln Avenue via 8th or 22nd Streets.

Regardless of the ultimate source of recycled water, a system of pipelines will be required throughout the project. See Exhibit 5-2 for the proposed location of the on-site recycled water system, as well as the location of the points of connection anticipated at this time.

5.4. Projected Collection of Sewage available for Recycled Water

Based on figures outlined in the city's Sewer Master Plan (2006), the project is estimated to generate 0.839 MGD of sewage, or a peak amount of 1.4 MGD.

Table 5.4-3: Estimated Increase In Required Sewer Capacity

Land Use	Factor	Unit	Existing "Buildout" DU	MGD	Proposed DU or AC	MGD
Residential	194	Gal/Capita/Day	1399	0.271406	3385	0.65669
Commercial	1500	Gal/Acre/Day				
Industrial	1000	Gal/Acre/Day				
Airport	250	Gal/Acre/Day				
Public Park	182448	Gal/day based on Fixture Units			1	0.18245
Prison (Rehab. Center)	2000	Gal/Acre/Day				
		Total Average Flow		0.271406		0.83914
		Total Peak Flow*		0.46139		1.42653
		Increase			0.96514	

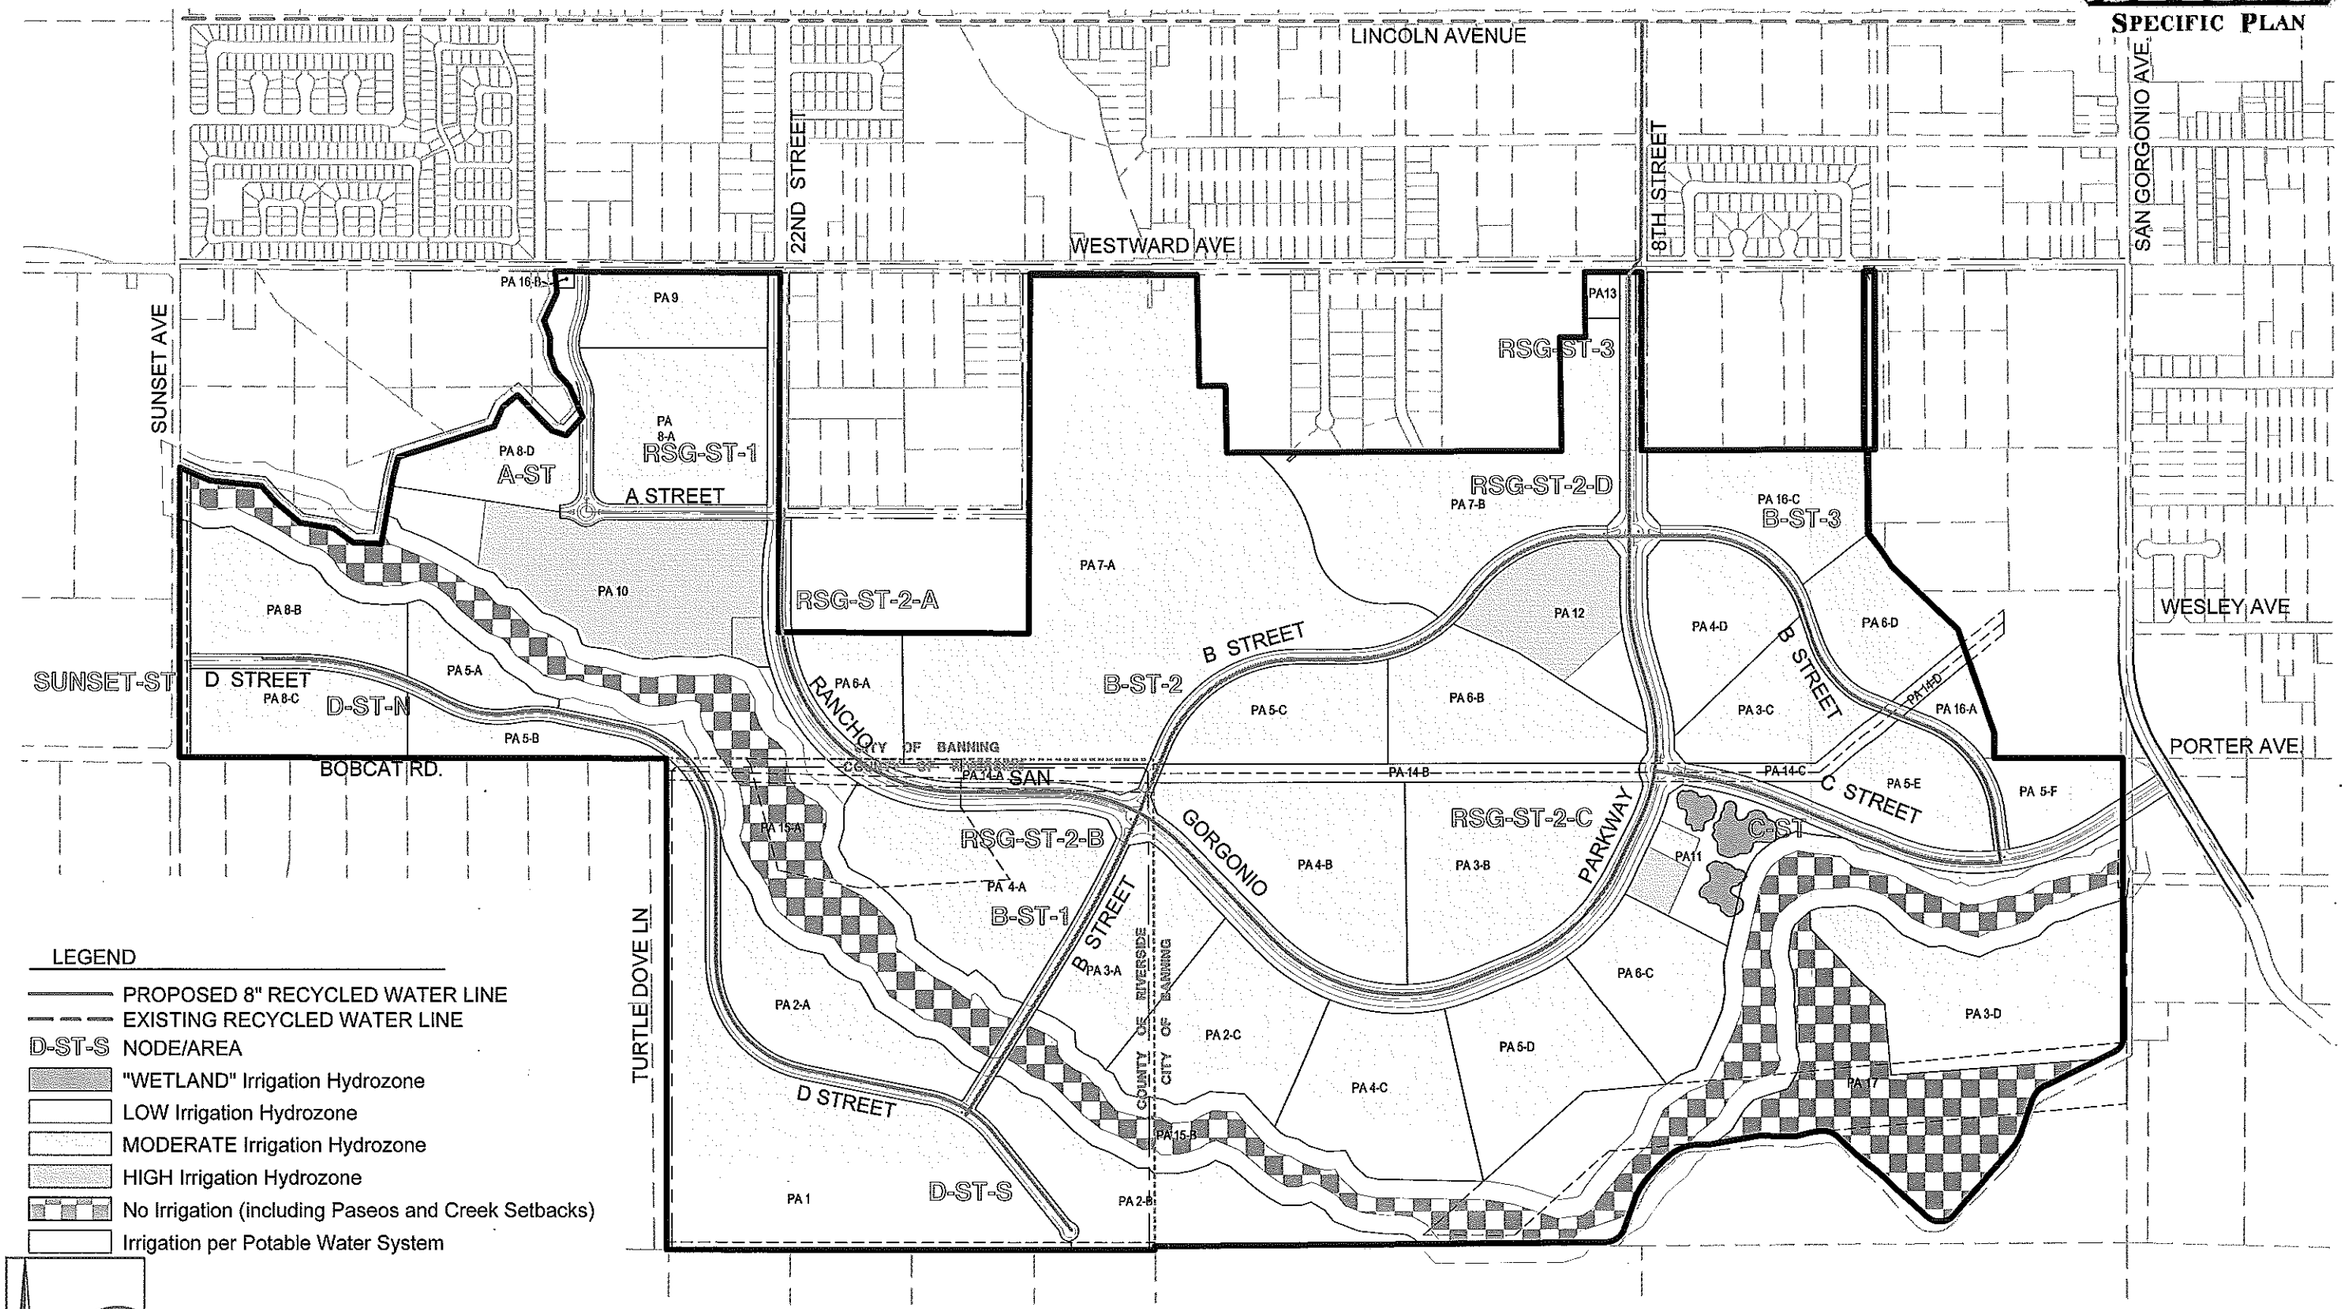
Note: Park area includes PA 10, PA 11 and 12 only.
*Peaking factor is from SSS (see Section 3.1 of the MPS for the formula, dry weather)

5.5. Estimated amount of Recycled Water available for Landscape Irrigation

Per Section 5.4 above, the project could provide 0.839 MGD of sewage for treatment and conversion to recycled water. A membrane bioreactor (MBR) wastewater treatment plant is proposed and discussed in detail in the project MPS. With a conservative yield of 50%, the plant could generate at least 470 acre-feet per year (50% of 0.839 MGD converted to acre-feet per year) of recycled water for common area landscape irrigation use.

As the peak demand for irrigation does not generally coincide with the peak generation of sewage, storage capacity would likely be required to accommodate peak irrigation needs. Alternatives to storage would be to supplement with domestic water as needed, tie into an off-site source of recycled water, or tie into an off-site sewerline to draw wastewater as needed.

5.6. Estimated demand for Recycled Water



Based on preliminary calculations in the project Master Plan of Water, there are approximately 218 acres of common area landscaping for which recycled water is anticipated to be utilized for irrigation. Those areas include street parkways and medians, Paseos and creek setback areas, and significant portions of the large proposed parks. There will be a mix of turf and drought-tolerant landscaping watered with recycled water. Per the MPW, an average demand of 194,356 gallons per day is estimated, or 218 acre-feet per year.

5.7. Projected Reduction in Potable Water Demand

A detailed study would be required to determine if all of the available wastewater could be used for irrigation purposes, depending on how the recycled water system is configured ultimately. It is assumed herein that all of the wastewater generated could be recycled into water for irrigation use (with a yield of 50%), therefore there would be a reduction of 470 acre-feet year in potable water demand for the city, and approximately 218 acre-feet year from the project, at buildout.

II. RECITALS

WHEREAS, plaintiff is a joint powers public agency, formed in 2001 for the purpose, among others, of preparing and implementing a Water Resources Management Plan for the San Timoteo Watershed and the waters tributary thereto, including the Beaumont Basin, in order to conserve local water supplies, improve surface and subsurface water quality and quantity, and to protect and enhance groundwater storage, for the benefit of the public;

WHEREAS, the Beaumont Basin, also known as the Beaumont Storage Unit, is the common source of water supply for appropriative water uses within the communities of Banning, Beaumont, Cherry Valley and Calimesa, and for various overlying uses including, but not limited to, golf courses and related facilities and agricultural production, including egg production and related agricultural irrigation uses;

WHEREAS, the maximum quantity of water which can be produced from the Beaumont Basin, at safe yield, is currently estimated to be 8650 acre feet per year, and the total groundwater production from the Beaumont Basin has exceeded and continues to exceed its safe yield;

WHEREAS, much of the land area within and adjacent to the Beaumont Basin is proposed to be intensively developed with residential, commercial and industrial uses, which will place additional demands on local water resources;

WHEREAS, it is estimated that the Beaumont Basin has the capability of storing more than 200,000 acre feet of water for overlying and appropriative use by water users within and

adjacent to the Beaumont Basin;

WHEREAS, the plaintiff proposes to invest substantial public funds to construct facilities that will enable the storage of water within the Beaumont Basin, in addition to the storage that occurs naturally;

WHEREAS, the Overlying and Appropriating Defendants wish to secure the provision and availability of a reliable, affordable, long-term water supply for the area within plaintiff's jurisdiction, making reasonable and beneficial use of the native groundwater in the Beaumont Basin, and other local water resources, promoting the importation of water into the area, and storage of such water, and local surface waters, in the Beaumont Basin;

WHEREAS, the Overlying Defendants believe that it is in their best interest to enter into this Stipulation and be subject to the attached Judgment, rather than continue to litigate the safe yield of the Beaumont Basin, the quantity of their overlying rights, both historical and unexercised, the rights they may have to use the storage volume existing beneath their respective lands, and other issues;

WHEREAS, in order to protect existing overlying and appropriative uses and to justify and protect the public investment necessary to utilize the available groundwater storage capacity in the Beaumont Basin, it is necessary to adjudicate the Beaumont Basin and to define the respective water rights of the overlying and appropriative producers of groundwater.

NOW, THEREFORE, the undersigned parties, and each of them, hereby agree to the following Stipulated Terms.

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5490

III. STIPULATED TERMS

1. Form of Judgment: Judgment may be filed and entered in the form attached hereto as Exhibit "1" and made a part hereof.

2. Fees and Costs: Each party shall bear its own costs, attorneys fees and litigation expenses arising out of this adjudication.

3. Waiver: Notice of entry of judgment, the right to trial, stay of execution and appeal, is hereby waived, except as expressly set forth in the Judgment.

4. Binding Effect: This Stipulation and all obligations herein, shall be binding on and shall inure to the benefit of the heirs, executors, administrators, successors and assigns of the parties hereto.

5. Construction and Interpretation: No adverse construction or interpretation of this Stipulation shall be made under the Civil Code simply because the parties drafted or participated in the drafting of this Stipulation. The terms of the Judgment shall be interpreted to further the purposes of this Stipulation.

6. Jurisdiction and Venue: The Superior Court of California in and for the County of Riverside shall have jurisdiction of this matter. In the event of any litigation arising out of this Stipulation, venue shall conclusively be deemed to lie in the County of Riverside.

7. Advice of Counsel: The undersigned each have had the opportunity to consult with or have consulted with their own legal counsel regarding this Stipulation and all matters set forth herein, or have knowingly waived the right to do so.

CASE NO. RIC 389197

JUDGMENT PURSUANT TO STIPULATION ADJUDICATING GROUNDWATER RIGHTS IN THE BEAUMONT BASIN

AKLUFI AND WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

a California corporation; MERLIN PROPERTIES, LLC; LEONARD M. STEARNS and DOROTHY D. STEARNS, individually and as Trustees of the LEONARD M. STEARNS FAMILY TRUST OF 1991; and DOES 1 through 500, inclusive,

Defendants.

I. INTRODUCTION

1. Pleadings, Parties and Jurisdiction

The complaint herein was filed on February 20, 2003, seeking an adjudication of water rights, injunctive relief and the imposition of a physical solution. The defaults of certain defendants have been entered, and certain other defendants dismissed. Other than defendants who have been dismissed or whose defaults have been entered, all defendants have appeared herein. This Court has jurisdiction of the subject matter of this action and of the parties herein.

2. Stipulation for Judgment

Stipulation for Entry of Judgment has been filed by and on behalf of all defendants who have appeared herein.

3. Definitions

As used in this Judgment, these terms shall have the following meanings:

A. Appropriator or Appropriator Parties: the pumpers identified in Exhibit "C" attached hereto.

B. Appropriator's Production Right: consists of an Appropriator's share of Operating Yield, plus (1) any water acquired by an Appropriator from an Overlying Producer or other Appropriator pursuant to this Judgment, (2) any water

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

withdrawn from the Appropriator's storage account, (3) and New Yield created by the Appropriator.

C. Appropriative Water: the amount of Safe Yield remaining after satisfaction of Overlying Water Rights.

D. Appropriative Water Right: each Appropriator's share of Appropriative Water, such share expressed as a percentage as shown on Exhibit "C".

E. Beaumont Basin or Beaumont Storage Unit: the area situated within the boundaries shown on Exhibit "A" attached hereto.

F. Conjunctive Use: the storage of water in a Groundwater Basin for use at a later time.

G. Groundwater: water beneath the surface of the ground within the zone below the water table in which soil is saturated with water.

H. Groundwater Basin: an area underlain by one or more permeable formations capable of furnishing a substantial water supply.

I. Groundwater Storage Agreement: a standard form of written agreement between the Watermaster and any Person requesting the storage of Supplemental Water.

J. Groundwater Storage Capacity: the space available in a Groundwater Basin that is not utilized for storage or regulation of Safe Yield and is reasonably available for Stored Water and Conjunctive Use.

K. Minimal Producer: any Producer who pumps 10 or fewer acre feet of Groundwater from the Beaumont Basin per year.

LUF WY CI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

L. New Yield: increases in yield in quantities greater than historical amounts from sources of supply including, but not limited to, capture of available storm flow, by means of projects constructed after February 20, 2003, as determined by the Watermaster.

M. Operating Yield: the maximum quantity of water which can be produced annually by the Appropriators from the Beaumont Basin, which quantity consists of Appropriative Water plus Temporary Surplus.

N. Overdraft: a condition wherein the total annual production from a Groundwater Basin exceeds the Safe Yield thereof.

O. Overlying Parties: the Persons listed on Exhibit "B", who are owners of land which overlies the Beaumont Basin and have exercised Overlying Water Rights to pump therefrom. Overlying Parties include successors in interest and assignees.

P. Overlying Water Rights: the quantities decreed to Overlying Parties in Column 4 of Exhibit "B" to this Judgment.

Q. Overproduction: by an Appropriator, measured by an amount equal to the Appropriator's actual annual production minus the Appropriator's Production Right. By a new overlying producer, an amount equal to what the overlying producer pumped during the year.

R. Party (Parties): any Person(s) named in this action, or who has intervened, or has become subject to this Judgment either through stipulation, trial or otherwise

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

S. Person: any individual, partnership, association, corporation, governmental entity or agency, or other organization.

T. Physical Solution: the physical solution set forth in Part V of this Judgment.

U. Produce, Producing, Production, Pump or Pumping: the extraction of groundwater.

V. Producer or Pumper: any Person who extracts groundwater.

W. Recycled Water: has the meaning provided in Water Code Section 13050(n) and includes other nonpotable water for purposes of this Judgment.

X. Safe Yield: the maximum quantity of water which can be produced annually from a Groundwater Basin under a given set of conditions without causing a gradual lowering of the groundwater level leading eventually to depletion of the supply in storage. The Safe Yield of the Beaumont Basin is 8650 acre feet per year in each of the ten (10) years following entry of this Judgment.

Y. San Timoteo Watershed Management Authority: a joint powers public agency whose members are the Beaumont-Cherry Valley Water District, the City of Beaumont, the South Mesa Mutual Water Company and the Yucaipa Valley Water District.

Z. Stored Water: Supplemental Water stored in the Beaumont Basin pursuant to a Groundwater Storage Agreement with the Watermaster.

AA. Supplemental Water: water imported into the

LUF[illegible] WYS[illegible]
3403 TENTH [illegible]ET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

Beaumont Basin from outside the Beaumont Basin including, without limitation, water diverted from creeks upstream and tributary to Beaumont Basin and water which is recycled and useable within the Beaumont Basin.

BB. Temporary Surplus: the amount of groundwater that can be pumped annually in excess of Safe Yield from a Groundwater Basin necessary to create enough additional storage capacity to prevent the waste of water.

CC. Watermaster: the Person appointed by the Court to administer and enforce the Physical Solution.

4. List of Exhibits

The following exhibits are attached to this Judgment and made a part hereof:

Exhibit "A" -- "Location Map of Beaumont Basin"
Exhibit "B" -- "Overlying Owners and Their Water Rights"
Exhibit "C" -- "Appropriators and Their Water Rights"
Exhibit "D" -- "Legal Description of Lands of the Overlying Parties"
Exhibit "E" -- "Location of Overlying Producer Parcels and Boundary of the Beaumont Basin"

II. INJUNCTIONS

1. Injunction Against Unauthorized Production of Beaumont Basin Water

Each party herein is enjoined, as follows:

A. Overlying Parties: Each defendant who is an Overlying Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any five-year period hereafter in excess of five times the share of the Safe Yield assigned to the Overlying Parties as set

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

forth in Column 4 of Exhibit "B", as more fully described in the Physical Solution.

B. Appropriator Parties: Each defendant who is an Appropriator Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any year hereafter in excess of such party's Appropriator's Production Right, except as additional annual Production may be authorized by the provisions of the Physical Solution.

2. Injunction Against Unauthorized Storage or Withdrawal of Stored Water

Each and every Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from storing Supplemental Water in the Beaumont Basin for withdrawal, or causing withdrawal of water stored by that Party, except pursuant to the terms of a written Groundwater Storage Agreement with the Watermaster and in accordance with Watermaster Rules and Regulations. Any Supplemental Water stored in the Beaumont Basin, except pursuant to a Groundwater Storage Agreement, shall be deemed abandoned and not classified as Stored Water.

III. DECLARATION AND ADJUSTMENT OF RIGHTS

1. Overlying Rights

The Overlying Parties are currently exercising Overlying Water Rights in the Beaumont Basin. As shown on Exhibit "B", the aggregate Projected Maximum Production of water from the Beaumont Basin pursuant to Overlying Water Rights is 8610 acre feet and the Overlying Water Rights are individually decreed, in Column 4 of Exhibit "B", for each Overlying Party. The Overlying Parties

8650

UFI WYS
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

shall continue to have the right to exercise their respective Overlying Water Right as set forth in Column 4 of Exhibit "B" except to the extent their respective properties receive water service from an Appropriator Party, as contemplated by Paragraph III.3 of this Judgment.

2. Appropriator's Share of Operating Yield

Each Appropriator Party's share of Operating Yield is shown on Exhibit "C". Notwithstanding any other provision of this Judgment, each Appropriator Party may use its Appropriator's Production Right anywhere within its service area.

3. Adjustment of Rights

A. The Overlying Parties shall have the right to exercise their respective Overlying Water Rights except as provided in this Paragraph 3.

B. To the extent any Overlying Party requests, and uses its Exhibit "B", Column 4 water to obtain water service from an Appropriator Party, an equivalent volume of potable groundwater shall be earmarked by the Appropriator Party which will serve the Overlying Party, up to the volume of the Overlying Water Right as reflected in Column 4 of Exhibit "B" attached hereto, for the purpose of serving the Overlying Party. The intent of this provision is to ensure that the Overlying Party is given credit towards satisfying the water availability assessment provisions of Government Code, Section 66473.7 et seq. and Water Code, Section 10910 et seq. or other similar provisions of law, equal to the amount of groundwater earmarked hereunder.

C. When an Overlying Party receives water service as

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

provided for in subparagraph III.3.B the Overlying Party shall forebear the use of that volume of the Overlying Water Right earmarked by the Appropriator Party. The Appropriator Party providing such service shall have the right to produce the volume of water foregone by the Overlying Party, in addition to other rights otherwise allocated to the Appropriator Party.

D. Should the volume of the Overlying Water Right equal or exceed the volume of potable groundwater earmarked as provided in subparagraph 3.B, the Appropriator Party which will serve the Overlying Party shall (i) impose potable water charges and assessments upon the Overlying Party and its successors in interest at the rates charged to the then-existing regular customers of the Appropriator Party, and (ii) not collect from such Overlying Party any development charge that may be related to the importation of water into the Beaumont Basin. The Appropriator Party which will serve the Overlying Party pursuant to Subparagraph III.3.B shall also consider, and negotiate in good faith regarding, the provision of a meaningful credit for any pipelines, pump stations, wells or other facilities that may exist on the property to be served.

E. In the event an Overlying Party receives Recycled Water from an Appropriator Party to serve an overlying use served with groundwater, the Overlying Water Right of the Overlying Party shall not be diminished by the receipt and use of such Recycled Water. Recycled Water provided by an Appropriator Party to an Overlying Party shall satisfy the

...UFI ... WYS ...
...3403 TENTH ... ET, SUITE 610
RIVERSIDE, C...FORNIA 92501
(909) 682-5480

criteria set forth in the California Water Code including, without limitation, the criteria set forth in Water Code Sections 13550 and 13551. The Appropriator Party which will serve the Recycled Water shall have the right to use that portion of the Overlying Water Right of the Overlying Party offset by the provision of Recycled Water service pursuant to the terms of this subparagraph; provided, however, that such right of use by the Appropriator Party shall no longer be valid if the Recycled Water, provided by the Appropriator Party to the Overlying Party, does not satisfy the requirements of Sections 13550 and 13551 and the Overlying Party ceases taking delivery of such Recycled Water.

F. Nothing in this Judgment is intended to impair or adversely affect the ability of an Overlying Party to enter into annexation or development agreements with any Appropriator Party.

G. Oak Valley Partners LP ("Oak Valley") is developing its property pursuant to Specific Plans 216 and 216A adopted by the County of Riverside ("County") in May 1990, and Specific Plan 318 adopted by the County in August, 2001, (Specific Plans 216, 216A and 318 are collectively referred to as the "Specific Plans"). The future water supply needs at build-out of the Specific Plans will greatly exceed Oak Valley's Projected Maximum Production, as reflected in Exhibit "B" to the Judgment, and may be as much as 12,811 acre feet per year. Oak Valley has annexed the portion of its property now within the City of Beaumont into the Beaumont-Cherry Valley Water District ("BCVWD"), and is in

the process of annexing the remainder portion of its property into the Yucaipa Valley Water District ("YVWD"), in order to obtain retail water service for the development of the Oak Valley property pursuant to the Specific Plans (for purposes of this subparagraph BCVWD and YVWD are collectively referred to as the "Water Districts", and individually as a "Water District"). YVWD covenants to use its best efforts to finalize the annexation of the Oak Valley property within the Calimesa City limits. Oak Valley, for itself and its successors and assigns, hereby agrees, by this stipulation and upon final annexation of its property by YVWD, to forbear from claiming any future, unexercised, overlying rights in excess of the Projected Maximum Production of Exhibit "B" of 1806 acre feet per year. As consideration for the forbearance, the Water Districts agree to amend their respective Urban Water Management Plans ("UWMP") in 2005 as follows: BCVWD agrees that 2,400 acre feet per year of projected water demand shall be included for the portion of Oak Valley to be served by BCVWD in its UWMP, and YVWD agrees to include 8,000 acre feet per year of projected water demand as a projected demand for the portion of Oak Valley to be served by YVWD in its UWMP by 2025. The Water Districts agree to use their best judgment to accurately revise this estimate to reflect the projected water demands for the UWMP prepared in 2010. Furthermore, the Water Districts further agree that, in providing water availability assessments prior to 2010, as required by Water Code §10910 and water supply verifications as required by Government Code §§66455.3 and

LUF WY! 1
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

66473.7, or any similar statute, and in maintaining their respective UWMP, each shall consider the foregoing respective projected water demand figures for Oak Valley as proposed water demands. The intent of the foregoing requirements is to ensure that Oak Valley is credited for the forbearance of its overlying water rights and is fully accounted for in each Water District's UWMP and overall water planning. The Water Districts' actions in performance of the foregoing planning obligations shall not create any right or entitlement to, or priority or allocation in, any particular water supply source, capacity or facility, or any right to receive water service other than by satisfying the applicable Water District's reasonable requirements relating to application for service. Nothing in this subparagraph G is intended to affect or impair the provision of earmarked water to Overlying Parties who request and obtain water service from Appropriator Parties, as set forth in subparagraph III.3.B, above.

H. Persons who would otherwise qualify as Overlying Producers based on an interest in land lying within the City of Banning's service area shall not have the rights described in this Paragraph III.3.

4. Exemption for Minimal Producers

Unless otherwise ordered by the Court, Minimal Producers are exempt from the provisions of this Judgment.

IV. CONTINUING JURISDICTION

Full jurisdiction, power and authority is retained and reserved to the Court for purposes of enabling the Court, upon

application of any Party, by a motion noticed for at least a 30-day period (or consistent with the review procedures of Paragraph VII.6 herein, if applicable), to make such further or supplemental order or directions as may be necessary or appropriate for interim operation of the Beaumont Basin before the Physical Solution is fully operative, or for interpretation, or enforcement or carrying out of this Judgment, and to modify, amend or amplify any of the provisions of this Judgment or to add to the provisions hereof consistent with the rights herein decreed; except that the Court's jurisdiction does not extend to the redetermination of (a) Safe Yield during the first ten years of operation of the Physical Solution, and (b) the fraction of the share of Appropriative Water of each Appropriator.

V. THE PHYSICAL SOLUTION

1. Purpose and Objective

In accordance with the mandate of Section 2 of Article X of the California Constitution, the Court hereby adopts, and orders the parties to comply with, a Physical Solution. The purpose of the Physical Solution is to establish a legal and practical means for making the maximum reasonable beneficial use of the waters of Beaumont Basin, to facilitate conjunctive utilization of surface, ground and Supplemental Waters, and to satisfy the requirements of water users having rights in, or who are dependent upon, the Beaumont Basin. Such Physical Solution requires the definition of the individual rights of all Parties within the Beaumont Basin in a manner which will fairly allocate the native water supplies and which will provide for equitable sharing of costs of Supplemental Water.

RIVERSIDE, CALIFORNIA 92501
(909) 682-9480

2. Need for Flexibility

The Physical Solution must provide maximum flexibility and adaptability in order that the Watermaster and the Court may be free to use existing and future technological, social, institutional and economic options. To that end, the Court's retained jurisdiction shall be utilized, where appropriate, to supplement the discretion granted herein to the Watermaster.

3. Production and Storage in Accordance With Judgment

This Judgment, and the Physical Solution decreed herein, address all Production and Storage within the Beaumont Basin. Because the Beaumont Basin is at or near a condition of Overdraft, any Production outside the framework of this Judgment and Physical Solution will potentially damage the Beaumont Basin, injure the rights of all Parties, result in the waste of water and interfere with the Physical Solution. The Watermaster shall bring an action or a motion to enjoin any Production that is not in accordance with the terms of this Judgment.

4. General Pattern of Operation

One fundamental premise of the adjudication is that all Producers shall be allowed to pump sufficient water from the Beaumont Basin to meet their respective requirements. Another fundamental premise of the adjudication is that Overlying Parties who pump no more than the amount of their Overlying Water Right as shown on Column 4 of Exhibit "B" hereto, shall not be charged for the replenishment of the Beaumont Basin. To the extent that pumping exceeds five (5) times the share of the Safe Yield assigned to an Overlying Party (Column 4 of Exhibit "B") in any five (5) consecutive years, or the share of Operating Yield

Right of each Appropriator Party, each such Party shall provide funds to enable the Watermaster to replace such Overproduction.

5. Use of Available Groundwater Storage Capacity

A. There exists in the Beaumont Basin a substantial amount of available Groundwater Storage Capacity. Such Capacity can be reasonably used for Stored Water and Conjunctive Use and may be used subject to Watermaster regulation to prevent injury to existing Overlying and Appropriative water rights, to prevent the waste of water, and to protect the right to the use of Supplemental Water in storage and Safe Yield of the Beaumont Basin.

B. There shall be reserved for Conjunctive Use a minimum of 200,000 acre feet of Groundwater Storage Capacity in the Beaumont Basin provided that such amount may be reduced as necessary to prevent injury to existing water rights or existing uses of water within the Basin, and to prevent the waste of water. Any Person may make reasonable beneficial use of the Groundwater Storage Capacity for storage of Supplemental Water; provided, however, that no such use shall be made except pursuant to a written Groundwater Storage Agreement with the Watermaster. The allocation and use of Groundwater Storage Capacity shall have priority and preference for Producers within the Beaumont Basin over storage for export. The Watermaster may, from time-to-time, redetermine the available Groundwater Storage Capacity.

///

///

3403 TENTH ET, SUITE 610
RIVERSIDE, C. IFORNIA 92501
(909) 682-5480

VI. ADMINISTRATION

1. Administration and Enforcement by Watermaster

The Watermaster shall administer and enforce the provisions of this Judgment and any subsequent order or instructions of the Court.

2. Watermaster Control

The Watermaster is hereby granted discretionary powers to develop and implement a groundwater management plan and program for the Beaumont Basin, which plan shall be filed with and shall be subject to review and approval by, the Court, and which may include water quantity and quality considerations and shall reflect the provisions of this Judgment. Except for the exercise by Overlying Parties of their respective Rights described in Column 4 of Exhibit "B" hereto in accordance with the provisions of the Physical Solution, groundwater extractions and the replenishment thereof, and the storage of Supplemental Water, shall be subject to procedures established and administered by the Watermaster. Such procedures shall be subject to review by the Court upon motion by any Party.

3. Watermaster Standard of Performance

The Watermaster shall, in carrying out its duties and responsibilities herein, act in an impartial manner without favor or prejudice to any Party or purpose of use.

4. Watermaster Appointment

The Watermaster shall consist of a committee composed of persons nominated by the City of Banning, the City of Beaumont, the Beaumont-Cherry Valley Water District, the South Mesa Mutual Water Company and the Yucaipa Valley Water District, each of

RIVERSIDE, CA. ORNIA 92501
(909) 682-5480

which shall have the right to nominate one representative to the Watermaster committee who shall be an employee of or consultant to the nominating agency. Each such nomination shall be made in writing, served upon the other parties to this Judgment and filed with the Court, which shall approve or reject such nomination. Each Watermaster representative shall serve until a replacement nominee is approved by the Court. The nominating agency shall have the right to nominate that representative's successor.

5. Powers and Duties of the Watermaster

Subject to the continuing supervision and control of the Court, the Watermaster shall have and may exercise the following express powers, and shall perform the following duties, together with any specific powers, authority, and duties granted or imposed elsewhere in this Judgment or hereafter ordered or authorized by the Court in the exercise of its continuing jurisdiction:

A. Rules and Regulations: The adoption of appropriate rules and regulations for the conduct of Watermaster affairs, copies of which shall be provided to all interested parties.

B. Wellhead Protection and Recharge: The identification and management of wellhead protection areas and recharge areas.

C. Well Abandonment: The administration of a well abandonment and well destruction program.

D. Well Construction: The development of minimum well construction specifications and the permitting of new wells.

...LUF... WY...
...Tenth St, Suite 610
RIVERSIDE, C...FORNIA 92501
(909) 682-5480

E. Mitigation of Overdraft: The mitigation of conditions of uncontrolled overdraft.

F. Replenishment: The acquisition and recharge of Supplemental Water.

G. Monitoring: The monitoring of groundwater levels, ground levels, storage, and water quality.

H. Conjunctive Use: The development and management of conjunctive-use programs.

I. Local Projects: The coordination of construction and operation, by local agencies, of recharge, storage, conservation, water recycling, extraction projects and any water resource management activity within or impacting the Beaumont Basin.

J. Land Use Plans: The review of land use plans and coordination with land use planning agencies to mitigate or eliminate activities that create a reasonable risk of groundwater contamination.

K. Acquisition of Facilities: The purchase, lease and acquisition of all necessary real and personal property, including facilities and equipment.

L. Employment of Experts and Agents: The employment or retention of such technical, clerical, administrative, engineering, accounting, legal or other specialized personnel and consultants as may be deemed appropriate. The Watermaster shall maintain records allocating the cost of such services as well as all other expenses of Watermaster administration.

M. Measuring Devices: Except as otherwise provided

3403 TENTH ST., SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-3480

by agreement the Watermaster shall install and maintain in good operating condition, at the cost of the Watermaster, such necessary measuring devices or meters as Watermaster may deem appropriate. Such devices shall be inspected and tested as deemed necessary by the Watermaster and the cost thereof borne by the Watermaster. Meter repair and retesting will be a Producer expense.

N. Assessments: The Watermaster is empowered to levy and collect the following assessments:

(1) Annual Replenishment Assessments

The Watermaster shall levy and collect assessments in each year, in amounts sufficient to purchase replenishment water to replace Overproduction by any Party.

(2) Annual Administrative Assessments

a. Watermaster Expenses: The expenses of administration of the Physical Solution shall be categorized as either "General Watermaster Administration Expenses", or "Special Project Expenses".

i. General Watermaster Administration Expenses: shall include office rent, labor, supplies, office equipment, incidental expenses and general overhead. General Watermaster Administration Expenses shall be assessed by the Watermaster equally against the Appropriators who have appointed representatives to the Watermaster.

LUF[illegible]
3403 TENTH S[illegible], SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

ii. Special Project Expenses: shall include special engineering, economic or other studies, litigation expenses, meter testing or other major operating expenses. Each such project shall be assigned a task order number and shall be separately budgeted and accounted for. Special Project Expenses shall be allocated to the Appropriators, or portion thereof, on the basis of benefit.

O. Investment of Funds; Borrowing: The Watermaster may hold and invest Watermaster funds as authorized by law, and may borrow, from time-to-time, amounts not exceeding annual receipts.

P. Contracts: The Watermaster may enter into contracts for the performance of any of its powers.

Q. Cooperation With Other Agencies: The Watermaster may act jointly or cooperate with other local, state and federal agencies.

R. Studies: The Watermaster may undertake relevant studies of hydrologic conditions and operating aspects of the management program for the Beaumont Basin.

S. Groundwater Storage Agreements: The Watermaster shall adopt uniform rules and a standard form of agreement for the storage of Supplemental Water, provided that the activities undertaken pursuant to such agreements do not injure any Party.

T. Administration of Groundwater Storage Capacity: Except for the exercise by the Overlying Parties of their

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

respective Overlying Water Rights described in Part III, above, in accordance with the provisions of the Physical Solution, all Groundwater Storage Capacity in the Beaumont Basin shall be subject to the Watermaster's rules and regulations, which regulations shall ensure that sufficient storage capacity shall be reserved for local projects. Any Person or entity may apply to the Watermaster to store water in the Beaumont Basin.

U. Accounting for Stored Water: The Watermaster shall calculate additions, extractions and losses and maintain an annual account of all stored water in the Beaumont Basin, and any losses of water supplies or Safe Yield resulting from such stored water.

V. Accounting for New Yield: Recharge of the Beaumont Basin with New Yield water shall be credited to the Party that creates the New Yield. The Watermaster shall make an independent scientific assessment of the estimated New Yield created by each proposed project. New Yield will be allocated on an annual basis, based upon monitoring data and review by the Watermaster.

W. Accounting for Acquisitions of Water Rights: The Watermaster shall maintain an accounting of acquisitions by Appropriators of water otherwise subject to Overlying Water Rights as the result of the provision of water service thereto by an Appropriator.

X. Annual Administrative Budget: The Watermaster shall prepare an annual administrative budget for public review, and shall hold a public hearing on each such budget

LUF[illegible] WY[illegible]
3403 Tenth [illegible]t, Suite 610
Riverside, C[illegible]fornia 92501
(909) 682-5480

prior to adoption. The budget shall be prepared in sufficient detail so as to make a proper allocation of the expenses and receipts. Expenditures within budgeted items may thereafter be made by the Watermaster as a matter of course.

Y. Redetermining the Safe Yield: The Safe Yield of the Beaumont Basin shall be redetermined at least every 10 years beginning 10 years after the date of entry of this Judgment.

6. Reports and Accounting

(a) Production Reports: Each Pumper shall periodically file, pursuant to Watermaster rules and regulations, a report showing the total production of such Pumper from each well during the preceding report period, and such additional information as the Watermaster may reasonably require.

(b) Watermaster Report and Accounting: The Watermaster shall prepare an annual report of the preceding year's operations, which shall include an audit of all assessments and Watermaster expenditures.

7. Replenishment

Supplemental Water may be obtained by the Watermaster from any source. The Watermaster shall seek the best available quality of Supplemental Water at the most reasonable cost for recharge in the Basin. Sources may include, but are not limited to:

(a) Recycled Water;

(b) State Water Project Water;

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

(c) Other imported water.

Replenishment may be accomplished by any reasonable method including:

(a) Spreading and percolation, or injection of water in existing or new facilities; and/or

(b) In-lieu deliveries for direct surface use, in lieu of groundwater extraction.

VII. MISCELLANEOUS PROVISIONS

1. Designation of Address for Notice and Service

Each Party shall designate, in writing to the plaintiff, the name and address to be used for purposes of all subsequent notices and service herein, such designation to be delivered to the plaintiff within 30 days after the Judgment has been entered. The plaintiff shall, within 45 days after judgment has been entered, file the list of designees with the Court and serve the same on the Watermaster and all Parties. Such designation may be changed from time-to-time by filing a written notice of such change with the Watermaster. Any Party desiring to be relieved of receiving notices of Watermaster activity may file a waiver of notice on a form to be provided by the Watermaster. The Watermaster shall maintain, at all times, a current list of Parties to whom notices are to be sent and their addresses for purposes of service. The Watermaster shall also maintain a full current list of names and addresses of all Parties or their successors, as filed herein. Copies of such lists shall be available to any Person. If no designation is made, a Party's designee shall be deemed to be, in order of priority: (i) the Party's attorney of record; or (ii) if the Party does not have an

RIVERSIDE, C...FORNIA 92501
(909) 682-5480

attorney of record, the Party itself at the address on the Watermaster list.

2. Intervention After Judgment

Any Person who is neither a Party to this Judgment nor a successor or assignee of a Party to this Judgment may seek to become a party to this Judgment by filing a petition in intervention.

3. Interference with Pumping

Nothing in this judgment shall be deemed to prevent any party from seeking judicial relief against any other party whose pumping activities constitute an unreasonable interference with the complaining party's ability to extract groundwater.

4. Successors and Assigns

This Judgment and all provisions herein shall be binding on and shall inure to the benefit of the heirs, executors, administrators, successors and assigns of the parties hereto.

5. Severability

The provisions of this Judgment are severable. If any provision of this Judgment is held by the Court to be illegal, invalid or unenforceable, that provision shall be excised from the Judgment. The remainder of the terms of the Judgment shall remain in full force and effect and shall in no way be affected, impaired or invalidated by such excision. This Judgment shall be reformed to add, in lieu of the excised provision, a provision as similar in terms to the excised provision as may be possible and be legal, valid and enforceable.

6. Review Procedures

Any action, decision, rule or procedure of the Watermaster

pursuant to this Judgment shall be subject to review by the Court on its own motion or on timely motion by any Party, as follows:

A. Effective Date of Watermaster Action: Any order, decision or action of the Watermaster pursuant to this Judgment on noticed specific agenda items shall be deemed to have occurred on the date of the order, decision or action.

B. Notice of Motion: Any Party may, by a regularly-noticed motion, petition the Court for review of the Watermaster's action or decision pursuant to this Judgment. The motion shall be deemed to be filed when a copy, conformed as filed with the Court, has been delivered to the Watermaster, together with the service fee established by the Watermaster sufficient to cover the cost to photocopy and mail the motion to each Party. The Watermaster shall prepare copies and mail a copy of the motion to each Party or its designee according to the official service list which shall be maintained by the Watermaster according to Part VII, paragraph 1, above. A Party's obligation to serve the notice of a motion upon the Parties is deemed to be satisfied by filing the motion as provided herein. Unless ordered by the Court, any petition shall not operate to stay the effect of any Watermaster action or decision which is challenged.

C. Time for Motion: A motion to review any Watermaster action or decision shall be filed within 90 days after such Watermaster action or decision, except that motions to review Watermaster assessments hereunder shall be filed within 30 days of mailing of notice of the assessment.

D. De Novo Nature of Proceeding: Upon filing of a petition to review a Watermaster action, the Watermaster shall notify the Parties of a date when the Court will take evidence and hear argument. The Court's review shall be de novo and the Watermaster decision or action shall have no evidentiary weight in such proceeding.

E. Decision: The decision of the Court in such proceedings shall be an appealable Supplemental Order in this case. When the same is final, it shall be binding upon the Watermaster and the Parties.

EXECUTIVE SUMMARY

The purpose of this memo is to evaluate biological treatment alternatives for nitrogen removal and the production of recycled water for the City of Banning Wastewater Treatment Plant. Wastewater treatment stages considered for this evaluation included biological, tertiary, and solids treatments. Several process options were assessed within each treatment stage to develop a list of wastewater treatment alternatives for further evaluation. The treatment alternatives are evaluated based on estimated construction and operating costs, operational issues, site constraints, and the ability to comply with current and future regulatory requirements. Additionally, this evaluation considered existing treatment process operations, and the ability to upgrade or reuse facilities for future use. The viable wastewater treatment alternatives developed from the evaluation are listed below:

Alternative 1 - Return Flow from Trickling Filter Effluent to Primary Clarifier
Alternative 2 - Conventional Activated Sludge
Alternative 3 - Moving Bed Biofilm Reactor
Alternative 4 - Membrane Bioreactor

The recommended alternative is the Membrane Bioreactor based on its expandability, operational reliability, effluent quality, and flexibility to meet future permit and reuse requirements.

1 BACKGROUND

The City of Banning (City) owns and operates a wastewater treatment plant (WWTP) located at 2242 East Charles Street, Banning, California 92220. The WWTP has a design treatment capacity of 3.6 million gallons per day (MGD) and currently discharges an average of 2.07 MGD into 10 unlined evaporation/percolation ponds. Future (Year 2035) average flow is expected to increase to 3.6 MGD. The treated effluent then percolates into the groundwater of the San Gorgonio Hydraulic Unit. Groundwater from this basin is used for municipal, industrial, and agricultural applications.

1.1 Regional Water Quality Control Board Order

On June 30, 2016, the California Regional Water Quality Control Board adopted Board Order R7-2016-0015, which describes the Waste Discharge Requirements (WDRs) and other terms and conditions of operation for the WWTP. The Board Order requires the WWTP to remove constituents that present the greatest risk to groundwater quality such as nitrogen, coliforms, and total dissolved solid (TDS). According to the United States Environmental Protection Agency (US EPA), the maximum contaminant level (MCL) for Nitrate as Nitrogen is 10 mg/L. Per the Board Order, it is assumed all nitrogen available converts to nitrate/nitrite so Total Nitrogen (TN) is used as the measurement of concern. The wastewater effluent limitations per the Board Order are outlined in Table 1.

Table 1. WWTP effluent limitations per Board Order R7-2016-0015

Parameter	30-Day Average	7-Day Average
20°C BOD_5	30 mg/L	45 mg/L
TSS	30 mg/L	45 mg/L
pH	6.0 - 9.0	
30-Day Daily Dry Weather Discharge	< 3.6 MGD	
DO	Upper Zone of the Ponds > 1.0 mg/L	
TDS	Not to Exceed 300 mg/L above the Water Supply	
TN*	10 mg-N/L	

*City does not need to comply with this limit at this time

Currently, the average TN concentration in the WWTP's effluent is 27 mg-N/L, well above the future TN limit of 10 mg-N/L specified in Board Order R7-2016-0015. As a result, the City will need to upgrade the biological treatment process at the WWTP to lower the TN below 10 mg-N/L.

1.2 Title 22 Requirements

The City is interested in utilizing WWTP effluent for beneficial non-potable reuse applications such as landscape, public parks, and golf course irrigation. However, the WWTP effluent, based

on the Annual Operations Monitoring Report for 2022, does not comply with California's water recycling criteria outlined in Title 22, Code of Regulations. To comply with Title 22 requirements, the effluent must meet the following requirements:

- Average daily turbidity less than 2 nephelometric turbidity unit (NTU); approximately 3 – 5 mg/L TSS.
- Effluent cannot exceed 5 NTU more than 5% of the time.
- Effluent cannot exceed 10 NTU at any time.
- Coagulant must be added if the influent to the filter exceeds 5 NTU for more than 15 minutes, or 10 NTU at any time.
- The disinfection process must provide a chlorine residual that provides 450 milligram-minutes per liter (mg-min/L) under minimal modal contact time (CT) of 90 minutes.
    - This corresponds to a residual of 5 mg/L or less, or any process that achieves 5-log virus removal.
- Total coliform cannot exceed the average most probable number (MPN) of 2.2 per 100 milliliters (mL).
- No more than one sample per month can exceed an MPN of 23 per 100 mL.

The WWTP currently discharges 27 mg/L TN and 20 mg/L TSS. In order to meet tertiary requirements, the City will be required to improve the removal efficiency of the existing WWTP to comply with the TN, turbidity, and disinfection requirements.

1.3 Beaumont Basin Plan Requirements

The largest potential recycled water user for the City of Banning is Sun Lakes Country Club, a golf course located above the Beaumont Basin Management Zone. In order to serve recycled water to Sun Lakes, the WWTP effluent must meet the Beaumont Basin maximum benefit objectives for TDS and TN of 330 mg/L and 5 mg/L, respectively. With a current average TDS of 390 mg/L and TN of 27 mg/L, the WWTP effluent does not meet either of these limits. Due to these restrictions, and potential stricter limits for the San Gorgonio region in the future, the City will need to implement a reverse osmosis train post-secondary treatment to further reduce the WWTP's TDS and TN levels.

The purpose of this technical memo is to evaluate potential treatment alternatives for the WWTP that comply with the Regional Water Quality Board Order as well as Title 22 and Beaumont Basin Management Zone requirements for tertiary water, and recommend the most suitable system for the City.

2 BIOLOGICAL TREATMENT ALTERNATIVES

Four viable biological treatment options were selected for evaluation to treat the anticipated average daily flow of 3.6 MGD. The treatment alternatives include:

1. Return Flow from Trickling Filter Effluent to Primary Clarifier
2. Conventional Activated Sludge
3. Moving Bed Biofilm Reactor
4. Membrane Bioreactor

For Alternatives 2-4, BioWin modeling results from the 2020 Banning Nitrogen Removal Feasibility Study (2020 Study) were used to compare effluent water quality. For Alternative 1, a new BioWin simulation was conducted to determine a different strategy that would allow the existing trickling filters to comply with the Board Order TN requirements. The previous design from the 2020 Study of increasing the recirculation of the trickling filters to 350% was ruled out, as this only lowered the final TN to 9.92 mg/L, just below the Board Order requirement of 10 mg/L. Alternative 1, as currently being considered, would send recirculation flow from the trickling filters back to primary influent.

2.1 Alternative No. 1: Return Flow from Trickling Filter Effluent to Primary Clarifier

2.1.1 Overview

Trickling Filters (TF) are currently utilized by the City at the WWTP. TF, shown in Figure 1, is an aerobic attached growth process used for secondary treatment. It consists of a tank filled with different types of media such as crushed stone, rocks, or plastic materials ranging in size from 2 – 4 inches. Wastewater is distributed by a rotary distributor arm over the top area of a vessel containing non-submerged packing material. As the wastewater trickles through the bed, microbial growth on the media forms a biofilm. The organic material in the wastewater is degraded by microorganisms attached to the biofilm. Some of the ammonia nitrogen in the wastewater is oxidized by nitrifying bacteria to nitrate or nitrite to nitrogen. An essential element of the trickling filter design and operation is the recirculation of effluent to the filter media for process optimization and increased treatment performance.

There are four basic trickling filter types: low-rate, intermediate-rate, high-rate, and roughing filters. Low-rate filters are loaded at less than 40 kg BOD_5 per day. The residual solids are usually well digested, producing a higher quality secondary effluent. Intermediate-rate filters are loaded up to 64 kg BOD_5 per day. This system requires wastewater recirculation to ensure sufficient effluent quality. High-rate filters have a maximum organic load, ranging from 64 – 160 kg BOD_5 per day. In this system, a secondary filtration stage is required to achieve effluent standards. Roughing filters are typically loaded from 160 – 480 kg BOD_5 per day. Overall, low-rate and high-rate trickling filters achieve the highest organic removal rates.

Figure 1. Trickling filters at the City WWTP

Advantages	Disadvantages
• Simplicity in biological operation • Low energy requirements • Low maintenance requirements • Low sludge production • Appropriate for small and medium sized communities • No problems of sludge bulking in secondary clarifiers • Improved sludge thickening abilities • Durable process elements	• Low loading rate requirements depending on media • Diffusion limitations and possibility of mass transfer • Higher BOD_5 and solid concentrations in the effluent • Issues with biofilm maintenance due to excess sloughing • Odor problems • Low efficiency at cold temperatures

2.1.2 Implementation at the WWTP

The existing operation of the trickling filters does not allow for sufficient N/DN to occur. One way to reduce trickling filter nitrate is to recycle trickling filter effluent to the headworks. Any denitrification achieved in the headworks and primary clarifiers would not only reduce the BOD in the primary effluent but also reduce the nitrate in the secondary effluent.

A recirculation pump, with a capacity of 1,400 gpm, will be installed at the Trickling Filter Recirculation Station. The pump will take trickling filter effluent and deliver it to the headworks at the Grit Chamber Splitter Box. Based on BioWin modeling results, the expected secondary effluent for the constituents of concern is provided in Table 2. As seen in Table 2, the operation of the trickling filters will comply with BOD_5 and TN effluent goals. However, to confirm that this approach will effectively lower TN levels, a 2-month pilot test will be conducted at the Plant.

Table 2. Secondary effluent water quality for Alternative 1

Parameter	Secondary Effluent Water Quality
BOD_5	24.74 mg/L
TSS	6.31 mg/L
TN	7.50 mg-N/L

A summary of the capital, annual O&M, and 20-year life cycle costs for Alternative 1 to comply with Board Order and Title 22 requirements is shown in Table 3. Annual O&M costs include pump power consumption, chemicals (NaOCl and polymers), and labor and maintenance of equipment. Due to the age and condition of the existing TFs, the remaining service life of both TFs is expected to be 10 years maximum. Therefore, although the capital cost only involves the addition of the recirculation flow, the 20-year life cycle cost includes the replacement of both TFs in 2035.

A tertiary filter is required to comply with Title 22 turbidity requirements, and ultrafiltration is needed to meet the Beaumont Basin maximum benefit objectives. If the pilot test is unsuccessful, a denitrification filter will need to be implemented rather than the proposed recirculation flow to the primary clarifier.

Table 3. Capital, O&M, and life cycle cost summary for Alternative 1

Cost Component	Cost
Capital	
Recirculation to Primary Clarifier	$705,500
Tertiary Filter	$2,721,000
Ultrafiltration	$5,900,000
Anaerobic Digester	$2,100,000
Total Capital Cost	**$11,426,500**
Annual O&M	
Power	$196,574
Chemical	$18,750
Labor and Maintenance	$1,080,000
Total O&M Cost	**$1,098,750**
20-Year Life Cycle Cost	
$44,768,000	

2.2 Alternative No. 2: Conventional Activated Sludge

2.2.1 Overview

The conventional activated sludge (CAS) process, shown in Figure 2, is a biological wastewater treatment system where various microorganisms growing as suspended flocs, called mixed liquor, degrade organic matter in the wastewater. The mixed liquor settles in the secondary clarifiers, effluent is discharged for further treatment, and the microorganisms are recirculated back to the bioreactor as return activated sludge (RAS). Oxygen is provided by blowers and diffusers to facilitate the growth of microorganisms. Excess sludge is wasted so that the system can be operated at a target solids retention time.

The conventional activated sludge process can be modified for biological nitrogen removal. This is accomplished by dividing the bioreactor into the aerobic zone and anoxic zone (where no oxygen is provided). Ammonia in the wastewater is oxidized to nitrite and nitrate in the aerobic zone, whereas nitrate and nitrite are denitrified to nitrogen gas in the anoxic zone. In the modified Ludzack-Ettinger (MLE) configuration, the anoxic zone is placed upstream of the aerobic zone. Nitrate and nitrite are recirculated back to from the end of the aerobic zone to the anoxic zone for denitrification. Other configurations, such as the step-feed activated sludge process, have also been used successfully for nitrogen removal.

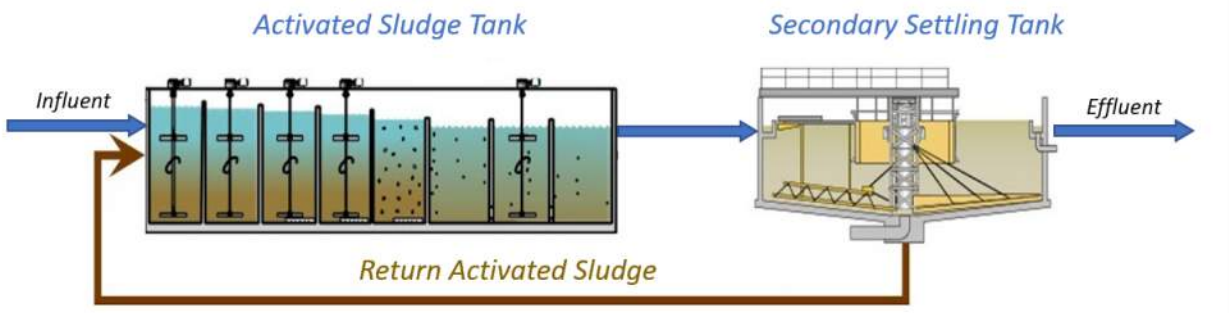

Figure 2. Conventional activated sludge flow diagram

Advantages

- Plenty of operating experience
- Uniform mixing in aeration tanks
- High oxygen transfer efficiency
- Solid and liquid stream separation
- High quality effluent

Disadvantages

- High operational cost
- Sludge disposal requirement
- Diffusers require regular cleaning

2.2.2 Implementation at the WWTP

Conventional activated sludge is one of the most common biological nutrient removal systems in the United States. New bioreactors with anoxic and aerobic zones will need to be constructed for

this system. The City owns the property immediately to the west of the WWTP where the proposed CAS system could be located. The existing trickling filters will be decommissioned, while the existing primary clarifiers and primary effluent pump station will remain in operation. The existing secondary clarifiers will not be suitable for the increased flow as the underflow drain is only 6" in diameter. The new RAS line needs to be at least 12" in diameter to handle the increased RAS flows. New rectangular clarifiers will need to be constructed north of the bioreactors to handle half (1.8 MGD) of the average daily flow. An external carbon source is not necessary for this option. Modeled secondary effluent water quality from the 2020 Study is provided in Table 4.

Table 4. Secondary effluent water quality for Alternative 2

Parameter	Secondary Effluent Water Quality
BOD_5	4.78 mg/L
TSS	10.96 mg/L
TN	7.49 mg-N/L

A summary of the capital, annual O&M, and 20-year life cycle costs for Alternative 2 is shown in Table 5. A tertiary filter is required to comply with Title 22 turbidity requirements, and ultrafiltration is needed to meet the Beaumont Basin maximum benefit objectives. Annual O&M costs are based on power, chemical (NaOCl and polymer), and labor and maintenance.

Table 5. Capital, O&M, and life cycle cost summary for Alternative 2

Cost Component	Cost
Capital	
Activated Sludge System	$48,910,800
Tertiary Filter	$2,721,000
Ultrafiltration	$5,900,000
Anaerobic Digester	-
Total Capital Cost	**$57,531,800**
Annual O&M	
Power	$1,310,496
Chemical	$18,750
Labor and Maintenance	$1,080,000
Total O&M Cost	**$2,409,246**
20-Year Life Cycle Cost	
$119,328,000	

2.3 Alternative No. 3: Moving Bed Biofilm Reactor

2.3.1 Overview

The moving bed biofilm reactor (MBBR) process, shown in Figure 3, is a biological treatment process that was developed by combining the conventional activated sludge system and suspended biofilm carrier media. This process incorporates polyethylene or other material media that provides surface area for the growth of heterotrophic and autotrophic bacteria biofilm in uniformly mixed tanks. The MBBR contains media with a surface area ranging from 400 – 600 m^2/m^3. A final clarifier is used to remove suspended solids and to produce a clarified effluent. Settled sludge can be returned to the bioreactor if necessary.

MBBRs may be used for aerobic, anoxic, or anaerobic processes. The system can handle high organic loads and high substrate concentrations. Nitrification rates are influenced by the organic load, dissolved oxygen (DO) concentration, ammonium nitrogen concentration, temperature, pH, and alkalinity in the reactor.

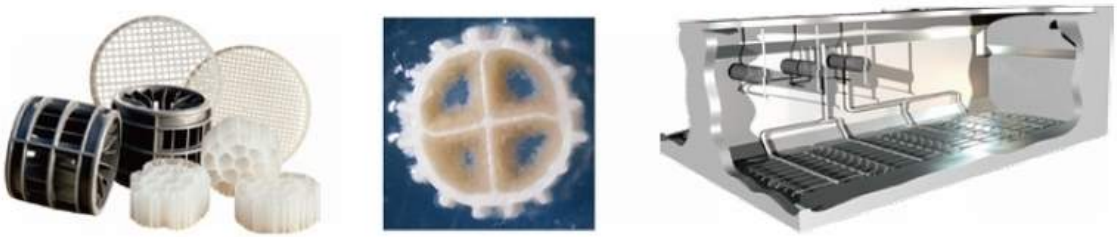

Figure 3. MBBR system components (courtesy of Veolia)

Advantages	Disadvantages
• Backwash is not necessary • A high specific biofilm surface area • Continuous operation of the reactor without clogging • Ability to increase the plant capacity without expansion of existing reactor volume • Easy to operate • Stable operation at low temperature • Long life expectancy of biofilm media carriers	• Media can wash out over time; regular cleaning of effluent screens • Longer start up time requirement • Bacterial activity has to be monitored periodically • Cost of the media

2.3.2 Implementation at the WWTP

For the MBBR system, plastic biocarriers are suspended in the aerobic and anoxic tanks to allow for microorganism growth. The primary effluent enters a common influent channel where flow is evenly distributed into the four tanks. The first tank is aerobic where heterotrophs are predominant and organic removal primarily occurs. The next tank is also aerobic, but the conditions are enhanced for the growth of nitrifiers for ammonia removal. From here, wastewater enters the anoxic tank where denitrification occurs. With this process configuration,

an external carbon source such as methanol or glycerol is added to promote denitrification. Alternatively, the City can reverse this process by having an anoxic tank upstream of the aeration tanks and utilize an internal recycle to maintain the carbon requirements for denitrification. This would decrease chemical costs but increase power costs due to additional pumping requirements. A final, small polishing reaeration step is included to re-add oxygen back into the wastewater for the purpose of downstream processes that require oxygen in the system. The secondary effluent is conveyed to the existing secondary clarifiers where a small portion of the sludge is returned to the reaeration tanks. The reactors will be equipped with media retention screens to keep the media elements from leaving the MBBR basins. Modeled secondary effluent water quality from the 2020 Study is provided in Table 6.

Table 6. Secondary effluent water quality for Alternative 3

Parameter	Secondary Effluent Water Quality
BOD_5	4.34 mg/L
TSS	6.64 mg/L
TN	8.00 mg-N/L

A summary of the capital, annual O&M, and 20-year life cycle costs for Alternative 3 is shown in Table 7. A tertiary filter is required to comply with Title 22 turbidity requirements, and ultrafiltration is needed to meet the Beaumont Basin maximum benefit objectives. Annual O&M costs are based on power, chemical (NaOCl, methanol, and polymer), and labor and maintenance.

Table 7. Capital, O&M, and life cycle cost summary for Alternative 3

Cost Component	Cost
Capital	
MBBR	$39,346,500
Denitrification Filter	-
Tertiary Filter	$2,721,000
Ultrafiltration	$5,900,000
Anaerobic Digester	$2,100,000
Total Capital Cost	**$50,067,500**
Annual O&M	
Power	$1,474,308
Chemical	$18,750
Labor and Maintenance	$1,080,000
Total O&M Cost	**$2,573,058**
20-Year Life Cycle Cost	
$116,048,000	

2.4 Alternative No. 4: Membrane Bioreactor

2.4.1 Overview

Membrane Bioreactors (MBRs), shown in Figure 4, consist of a biological reactor with suspended biomass and solids separation by microfiltration or ultrafiltration membranes with the nominal pore size ranging from 0.07 – 2.0 µm and 0.008 – 0.2 µm, respectively. MBRs can be operated at higher MLSS concentrations (8,000 – 12,000 mg/L), as a result, the reactor size is reduced. Solids liquid separation is accomplished with membranes instead of clarifiers. There are two fundamental arrangements of MBRs: (1) integrated systems that have membranes immersed in an activated sludge reactor and (2) separate systems that have a membrane module placed outside the reactor. Immersed MBRs typically use hollow fiber membranes that operate at lower pressures, accommodate various types of biosolids, concentrate biosolids without settling concerns, and have lower life-cycle costs. Separate systems are typically pressure driven and the membranes are in a stand-alone tank. Properly configured, the MBR process removes nitrogen similar to the activated sludge process.

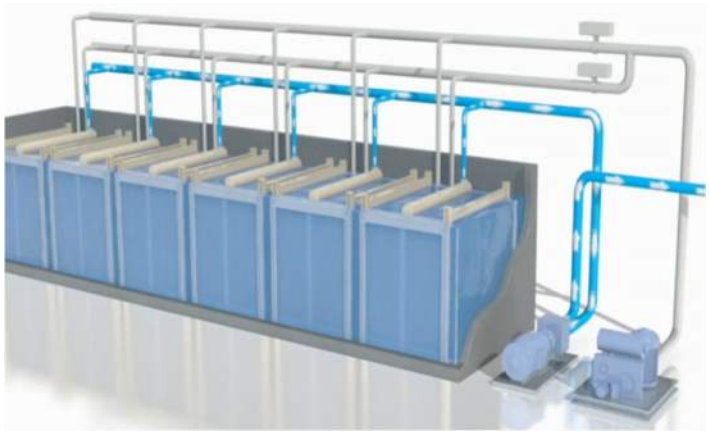

Figure 4. MBR Facility (courtesy of KY OCP)

Advantages

- Higher MLSS concentrations therefore a small footprint
- Less sludge production due to longer SRT design
- High effluent quality
- No secondary clarifier is needed
- Better site planning for City WWTP
- No UF pretreatment for future RO

Disadvantages

- High capital costs (membranes)
- High energy costs compared to the conventional process due to membrane scouring
- Limited time on membrane life
- High cost membrane replacement

2.4.1.1 Packaged vs Non-Packaged System

There are two options to consider for an MBR system: a packaged or non-packaged system. The main differences between the two options are cost, schedule, and aesthetics. Unlike packaged MBR systems which comprise of pre-engineered, prefabricated structures, non-packaged MBR systems require the contractor to source all related equipment, resulting in higher costs and longer construction schedules. Typically, packaged MBR systems involve stainless-steel tanks while non-packaged systems involve concrete tanks; the significant site work and material cost required for the construction of concrete costs also contribute to the higher overall cost of non-packaged systems. As for aesthetics, concrete structures are more common at existing municipal treatment plants. However, a prefabricated building can be built around a packaged MBR system for appearance purposes.

2.4.2 Implementation at the WWTP

The MBR system combines conventional biological nutrient removal with the use of membranes for the separation of solids and treated effluent. The MBR process train is similar to Alternative 2 except that membranes replace the secondary clarifiers and tertiary filters. The design MLSS of the MBR system is also much higher than Alternatives 2, which allows for greater treatment capacity per unit volume of the aeration basin. One design note is that the high recycle from the membrane aeration zone impacts the denitrification ability and the carbon demand. Consequently, a tank will be provided to allow the DO to decrease by endogenous respiration before the recycle stream is returned to the anoxic zone.

Membrane fouling is controlled by several methods of cleaning which includes the chemical clean in place (CIP) system, relaxation, and air scouring. Chemical CIP cleaning is also referred to as maintenance cleaning used to address irreversible fouling. This type of cleaning usually occurs at least 10 times a year and is completely automated; however, it can also be manually operated as needed. The membrane units are cleaned in place quickly by injecting a dilute solution of bleach into the permeate line which remains in the membranes for 1 to 3 hours and then the normal operation is resumed. During the cleaning of one basin, the other basins are left online and operated at a slightly higher flux rate as required to meet plant demand. Although this type of cleaning is efficient, the addition of chemicals will degrade any membrane material over time. Therefore, replacement of the membranes will be required.

There are two types of membranes available for wastewater applications: hollow fiber and flat sheet. Hollow fiber membranes are constructed of a microporous structure and are densely packed into tubes to create the membrane module. These tightly packed modules allow for high membrane surface areas and high outside pressure tolerance. Typically, flow is applied to the outside of the membranes and permeate is removed via the inner tube of the module. However, some manufacturers offer the opposite (in-out) flow pattern. The typical vacuum pressure applied to the hollow fiber membranes is around 10 pounds per square inch (psi). Flat sheet membranes are constructed of paper-like backing material with a membrane cast on the surface of the paper. These plates are submerged into the membrane tank, and permeate pass through

the membrane from the outside in. The membranes allow the biofilm to attach and are continuously aerated to prevent solids buildup.

Modeled secondary effluent water quality from the 2020 Study is provided in Table 8.

Table 8. Secondary effluent water quality for Alternative 4

Parameter	Secondary Effluent Water Quality
BOD_5	0.86 mg/L
TSS	0.00 mg/L
TN	7.74 mg-N/L

A summary of the capital, annual O&M, and 20-year life cycle costs for Alternative 4 is shown in Table 9. Annual O&M costs are based on power, chemical, and labor and maintenance. Chemical costs include NaOCl, polymer, citric acid, sodium bisulfite, and sodium hydroxide. Costs are based on the hollow fiber membrane type and include a range of costs from a non-packaged to a packaged system.

Table 9. Capital, O&M, and life cycle cost summary for Alternative 4

Cost Component	Cost
Capital	
MBR	$52,887,000 - $68,996,868
Tertiary Filter	-
Ultrafiltration	-
Anaerobic Digester	-
Total Capital Cost	**$52,887,000 - $68,996,868**
Annual O&M	
Power	$1,638,120
Chemical	$37,500
Labor and Maintenance	$1,200,000
Total O&M Cost	**$2,875,620**
20-Year Life Cycle Cost	
$126,344,000 - $142,454,000	

3 COMPARISON OF TREATMENT ALTERNATIVES

A comprehensive summary of the capital, annual O&M, and 20-year life cycle costs for the wastewater treatment alternatives developed for the City of Banning is shown in Table 10. The 20-year life cycle cost shows that Alternative 1 is the least expensive alternative. This alternative is essentially the baseline scenario to comply with Board Order and Title 22 requirements at 3.6 MGD and utilizes the existing treatment process as much as possible. However, this alternative provides the least flexibility regarding expected effluent water quality, particularly for BOD_5 and TN. If future discharge permit limits become more stringent, or other constituents, such as phosphorus, become regulated, upgrades to Alternative 1 would be challenging and costly.

Table 10. Cost comparison summary for the treatment alternatives

Treatment Alternative	Capital	Annual O&M	20-Year Life Cycle
Alternative 1 Trickling Filter	$11,426,500	$1,098,750	$44,768,000
Alternative 2 Activated Sludge	$57,531,800	$2,409,246	$119,328,000
Alternative 3 MBBR	$50,067,500	$2,573,058	$116,048,000
Alternative 4 MBR	$52,887,000 - $68,996,868	$2,875,620	$126,344,000 - $142,454,000

The cost comparison summary identifies three groupings of the treatment alternatives. Alternative 1 is the cheapest all-around option. Life cycle costs for Alternatives 2 and 3 are within $3,000,000 of one another and utilize the same treatment process with slightly varied components that alter the overall process operation. Between Alternatives 2 and 3, Alternative 3 provides the lower capital cost option due to the reduction in required tank size as compared to conventional activated sludge. Alternative 4 has an expensive capital cost, since the MBR system produces the highest effluent water quality. The capital cost for Alternatives 2 and 4 are relatively close to one another. However, the annual O&M costs show that Alternative 4 becomes more costly over a 20-year life cycle.

A breakdown of the required WWTP upgrades to meet Board Order requirements and Title 22 regulations for each alternative is provided in Table 11. The tertiary filter and ultrafiltration costs are the same for Alternatives 1 – 3, and not required for Alternative 4. Alternatives 2 and 4 do not require any additional anaerobic digesters, while Alternatives 1 and 3 will require a new anaerobic digester.

Table 11. Unit operation cost comparison for the treatment alternatives

Unit	Alternative 1 Trickling Filter	Alternative 2 Activated Sludge	Alternative 3 MBBR	Alternative 4 MBR
Recirculation to Primary Clarifier	$705,500	-	-	-
Activated Sludge	-	$48,910,800	-	-
MBBR	-	-	$39,346,500	-
MBR	-	-	-	$52,887,000 - $68,996,868
Tertiary Filter	$2,721,000	$2,721,000	$2,721,000	-
Ultrafiltration	$5,900,000	$5,900,000	$5,900,000	-
Anaerobic Digester	$2,100,000	-	$2,100,000	-
Total	**$11,426,500**	**$57,531,800**	**$50,067,500**	**$52,887,000 - $68,996,868**

A comparison of the expected secondary effluent water quality for all alternatives is provided in Table 12. The concentrations presented do not reflect tertiary filter effluent to show the comparison between biological treatment systems. All the alternatives comply with the Board Order requirements with respect to nitrogen. Compared to Alternative 1, Alternatives 2 – 4 produce better water quality, can meet possible more stringent discharge limits, and have better flexibility to stay in compliance if treatment efficiency degrades. Alternative 4 produces the best all-around effluent water quality, and an additional tertiary filter is not required to comply with Title 22 requirements unlike Alternatives 1 – 3.

Table 12. Secondary effluent water quality comparison for the treatment alternatives

Parameter	Secondary Treatment Effluent Concentration (mg/L)			
	Alternative 1 Trickling Filter	Alternative 2 Activated Sludge	Alternative 3 MBBR	Alternative 4 MBR
BOD_5	24.74	4.78	4.34	0.86
TSS	6.31	10.96	6.64	0
TN	7.50	7.49	8.00	7.74

Non-monetary criteria for the alternatives are compared in Table 13. The criteria for each alternative were given a ranking from 1 to 5; 5 being the best (and in terms of footprint, smallest), and 1 being the worst (and in terms of footprint, largest). Alternative 1 is the least scalable, operationally reliable, and flexible to meet permit requirements when compared to Alternatives 2-4. Alternatives 2 and 3 are similar in terms of operational reliability, ease of operation, flexibility

to meet permit requirements, footprint, and Title 22 reuse capability, but Alternative 3 is the more scalable of the two. Alternative 4 is the most scalable and operationally reliable of all alternatives, and because an MBR system does not require a secondary clarifier, it has the smallest overall footprint. Alternative 4 is also the only alternative that does not require additional filtration for Title 22 reuse. For overall rankings, Alternative 4 has the best score, followed by Alternative 3, Alternative 2, then Alternative 1.

Table 13. Non-monetary comparison summary for the treatment alternatives

Treatment Alternative	Scalability	Operational Reliability	Ease of Operation	Flexibility to Meet Permit Requirements	Footprint	Title 22 Reuse	Total Score
Alternative 1 Trickling Filter	1	2	5	1	1	1	**11**
Alternative 2 Activated Sludge	3	4	3	3	3	4	**20**
Alternative 3 MBBR	4	4	3	3	3	4	**21**
Alternative 4 MBR	5	5	2	5	5	5	**27**

4 SUMMARY OF ANALYSIS AND RECOMMENDATIONS

The cost evaluation suggests that Alternative 1 is the cheapest option available to comply with Board Order and Title 22 requirements. However, based on the capacity of the existing infrastructure, this option has the least flexibility to maintain effluent TN treatment goals, and the existing trickling filter components are old and will require replacement within the next 10 years. Therefore, this alternative is not recommended for future implementation.

Alternatives 2 – 3 are similar in cost and operation. Among them,

1. Alternative 2 (CAS) are ubiquitous throughout the United States, are reliable to meet discharge limits, easy to operate, and have the ability to be upgraded with IFAS or MBBR in the future if required. However, these systems require a larger footprint as compared to Alternative 4 to meet effluent requirements.
2. Alternative 3 (MBBR) produces the best secondary effluent water quality out of these two alternatives and is the lowest capital and life cycle cost option. However, Alternative 3 is more complex to operate, requires an external carbon input, and the number of municipal installations in the United States is significantly less than Alternative 2.

Alternative 4 (MBR) can be the most expensive alternative, depending on whether a packaged or non-packaged system is selected, but it produces the best water quality. With advances in technology, the MBR system can also be operated fairly autonomously and does not require much operator input. Additionally, the City is familiar with the design of MBRs based on the 90% design of an MBR facility in 2007.

Alternative 4 also sets the City up for any changes to discharge or reuse requirements in the future. Unlike Alternatives 1 – 3, MBR systems have built-in filtration, and therefore they can produce recycled water without the use of tertiary filters as well as meet the Beaumont Basin Plan TDS and TN requirements without ultrafiltration.

Furthermore, since MBR is modular, it allows the system to be phased into the Plant. In the first phase of upgrades, one approach is to keep the two TFs in operation and install an additional 1.5 MGD MBR at the Plant. This option involves sending 1.5 MGD to the MBR for recycled water irrigation use. For the remaining 2.1 MGD, the Alternative 1 strategy of sending a return flow from the TF effluent to the headworks would be implemented to allow the 2.1 MGD to flow through the TFs then discharge into the percolation ponds. As recycled water demands increase and the TFs reach the end of their service lives, more MBR modules can be phased in for increased capacity until the total 3.6 MGD future average flow is treated by MBR.

Therefore, due to its high effluent water quality, operational ease, flexibility to meet more stringent permit regulations, and scalability, a Membrane Bioreactor is recommended to be considered for future implementation.

Appendix G
WDR Board Order R7-2016-0015

July 5, 2016

Art Vela
Acting Public Works Director
City of Banning
99 East Ramsey Street
Banning, CA 92220

Lorenzo Amis
Project Manager
Suez Environmental Services, Inc.
2242 E. Charles Street
Banning, CA 92220

Dear Mr. Vela and Mr. Amis,

SUBJECT: WASTE DISCHARGE REQUIREMENTS (WDRs) BOARD ORDER R7-2016-0015, FOR CITY OF BANNING, WASTEWATER TREATMENT PLANT, BANNING, RIVERSIDE COUNTY

Enclosed is a copy of Board Order R7-2016-0015 adopted by the California Regional Water Quality Control Board, Colorado River Basin Region on June 30, 2016, during its public meeting in the Palm Desert, California.

Should you have any questions concerning this Board Order, please contact Jose Cortez, P.E., Water Resources Control Engineer, at jose.cortez@waterboards.ca.gov or (760) 776-8963.

Sincerely,

Jose L. Angel

Jose L. Angel, P.E.
Executive Officer
Colorado River Basin
Regional Water Quality Control Board

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
COLORADO RIVER BASIN REGION

BOARD ORDER R7-2016-0015

WASTE DISCHARGE REQUIREMENTS
FOR
CITY OF BANNING, OWNER
SUEZ WATER ENVIRONMENTAL SERVICES, OPERATOR
BANNING WASTEWATER TREATMENT PLANT
Banning – Riverside County

The California Regional Water Quality Control Board, Colorado River Basin Region (Colorado River Basin Water Board) finds that:

1. The City of Banning (Owner), 99 East Ramsey Street, Banning, California 92220, and Suez Water Environmental Services, Inc., a Delaware-based business entity (Operator), (collectively or individually referred to as Discharger) submitted an application to update the Waste Discharge Requirements (WDRs) for the Banning Wastewater Treatment Plant (WWTP or Facility). The WWTP is located at 2242 East Charles Street, Banning, California 92220, as shown in Attachment A (Vicinity Map), made part of this Board Order by this reference. Suez Water Environmental Services, Inc. maintains an office at the Facility.

2. The City of Banning owns a wastewater collection, treatment and disposal system which provides sewerage service to the city. The WWTP has a design treatment capacity of 3.6 million gallons-per-day (MGD) and currently discharges approximately 2.07 MGD into 10 unlined evaporation/percolation ponds (ponds). The Facility is located in Section 14, Township 3 South, Range 1 East, San Bernardino Baseline and Meridian. The Facility's Assessor's Parcel Numbers are 532 180 038/532 180 036; and its latitude and longitude coordinates are 33.915194/33.912134 and 116.852411/116.84164, respectively. The Facility is assigned California Integrated Water Quality System (CIWQS) number CW-208668; Waste Discharger Identification (WDID) number 7A330100015, and GeoTracker Global ID number WDR100027202.

3. The wastewater treatment plant currently receives industrial wastewater from several businesses within the City of Banning. The Discharger's Industrial Waste Program issues Industrial User Discharge Permits to verify that these businesses meet the City of Banning's local ordinance discharge limits, which were determined to ensure that the wastewater treatment plant is protected and can meet effluent standards.

4. The discharge is currently regulated by Board Order (WDRs) 01-022, adopted on May 9, 2001.

5. Board Order 01-022, required the Discharger to construct a groundwater monitoring system in the vicinity of the unlined ponds. The Board Order also required effluent monitoring for Sulfate, Chloride, Fluoride, Aluminum, and Iron until the groundwater monitoring system was installed and groundwater monitoring was initiated. Board Order 01-022, Monitoring and Reporting Program, states that "As soon as Ground Water monitoring commences, these constituents will not be required in Effluent monitoring."

The groundwater monitoring system was completed in August 2007, and effluent monitoring for Sulfate, Chloride, Fluoride, Aluminum, and Iron were discontinued at that time. These constituents have been removed from the monitoring and reporting program for this Board Order as well as the effluent limitations for Chloride, Aluminum, and Iron.

6. The WDRs are being updated to implement the most current laws and regulations applicable to the discharge.

Wastewater Treatment Facility and Discharge

7. The WWTP consists of preliminary treatment, primary treatment, secondary treatment, solids handling, and disinfection (currently not in use), and the disposal ponds. Untreated wastewater flows to the preliminary treatment system, which consists of a mechanical bar screen, compactor, grit removal system, classifier and cyclone separator. Wastewater from the preliminary treatment system flows to two primary clarifiers and is then pumped to two trickling filters. The effluent from the trickling filters flows to the two secondary clarifiers and then to the chlorine contact chamber, which is currently used as a holding tank for the final effluent water sampling and discharge to the percolation ponds. The disinfection units have not been in use since April 2000.

8. Primary sludge from the two primary clarifiers is pumped to the anaerobic digester for further treatment. Secondary sludge from the secondary clarifiers is pumped to the gravity thickener for thickening and then pumped to three anaerobic digesters for further treatment. Sludge wasting from the digester is pumped to the sludge drying beds. The Discharger produces Class B biosolids, and a private contractor hauls the biosolids offsite to a permitted facility for disposal.

9. The Discharger's Self-Monitoring Reports (SMRs) from January 2011 through December 2015 characterize the WWTP effluent as follows:

Constituent	Units	Average	Maximum	Minimum
Flow	MGD	2.071	2.238	1.897
20° C BOD_5[1]	mg/L[2]	23	27	19
TSS[3]	mg/L	21	28	16
pH	s.u.[4]	7.3	7.6	7.1
TDS[5]	mg/L	426	464	380
Nitrate as N	mg/L	22	32	12
Total Nitrogen	mg/L	29	49	14

[1] 5-day biochemical oxygen demand at 20 degrees Celsius.
[2] milligrams per Liter
[3] Total Suspended Solids
[4] Standard pH units
[5] Total Dissolved Solids

Hydrogeological Conditions

10. Precipitation in the Banning area averages about 12 inches per year. Annual evapotranspiration rate is approximately 56 inches.

11. A drainage course identified as Smith Creek Flood Control Channel is located along the south side of WWTP.

12. There are no domestic wells within 500 feet of the on-site evaporation/percolation ponds.

13. The evaporation/percolation ponds overlay an aquifer of high quality groundwater. The Discharger's SMRs show that the depth to groundwater in the vicinity of the WWTF ranges from about 330 feet (MW1) to 630 feet below ground surface (bgs) (MW3).

14. Water supply to the community is from groundwater production wells located in the San Gorgonio Hydrologic Unit, Banning Hydrologic Subunit. TDS in the water supply averages about 204 mg/L, based on data reported in the City of Banning's SMRs from January 2011 through December 2015.

15. Regional groundwater flow in the area is generally from the west to the east.

16. The Discharger uses a network of three groundwater monitoring wells, one upgradient and two downgradient, to monitor the impact of wastewater discharge to groundwater in the area of the ponds. The locations of the groundwater monitoring wells identified as R-1 (MW1), MP-1 (MW2) and C-6 (MW3) are shown in Attachment C (Monitoring Well Locations), made part of this Board Order by reference. The Discharger's monitoring reports from January 2011 through December 2015 show the following average water quality data for the groundwater monitoring wells:

	Units	MW1 (downgradient)	MW2 (downgradient)	MW3 (upgradient)
Depth to Groundwater	feet below ground surface	361	410	629
Total Dissolved Solids	mg/L	332	252	219
Total Nitrogen	mg/L	4	2	1.1
Nitrate as N	mg/L	2	2	1.5
Iron	mg/L	34	ND	ND
Sulfate	mg/L	32	18	15
Chloride	mg/L	42	35	13
Aluminum	mg/L	20	ND	ND
Fluoride	mg/L	0.4	0.4	0.6

17. The Discharger reports that the soil in the vicinity of the WWTP, from ground surface to 300 bgs, is sand and gravelly sand containing small rocks and boulders. From a depth of 300 to 600 feet bgs, the soil is mostly sand and gravel with spots of brown clay and layers of fine sand and clay.

Basin Plan, Beneficial Uses, and Regulatory Considerations

18. The Water Quality Control Plan for the Colorado River Basin Region of California (Basin Plan), which was adopted on November 17, 1993 and amended on November 13, 2012, designates the beneficial uses of ground and surface waters in this Region, and contains implementation programs and policies to achieve water quality objectives, including narrative objectives for ground water quality, in Chapter 3, section IV, Ground Water Objectives.

19. The discharge is within the San Gorgonio Hydrologic Unit, Banning Subunit. The beneficial uses of groundwater in the San Gorgonio Hydrologic Unit include:

    a. Municipal supply (MUN),

    b. Industrial supply (IND), and

    c. Agricultural supply (AGR).

20. This Order implements numeric and narrative water quality objectives for ground and surface waters established by the Basin Plan. The numeric objectives for groundwater designated for municipal and domestic supply are the maximum contaminant levels (MCLs) specified in sections 64431, 64444, and 64678 of Title 22 of the California Code of Regulations (CCR), and the bacteriological limits specified in section 64426.1 of Title 22, CCR.

21. It is the policy of the State of California that every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. This order promotes that policy by requiring discharges to meet maximum contaminant levels designed to protect human health and ensure that water is safe for domestic use.

22. Section 13267 of the California Water Code (CWC) authorizes the Colorado River Basin Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP) establishes monitoring and reporting requirements to implement federal and state requirements.

23. This Order establishes WDRs pursuant to Division 7, Chapter 4, Article 4, of the CWC for discharges that are not subject to regulation under Clean Water Act (CWA) section 402 (33 U.S.C. section 1342).

24. Pursuant to CWC section 13263(g), the discharge of waste is a privilege, not a right, and adoption of this Order does not create a vested right to continue the discharge.

25. The discharge authorized by this Board Order, and treatment and storage facilities associated with discharges of treated municipal wastewater, except for discharges of residual sludge and solid waste, are exempt from the requirements of the Consolidated Regulations for Treatment, Storage, Processing, or Disposal of Solid Waste, as set forth in Title 27, CCR, Division 2, Subdivision 1. This exemption is based on section 20090(a)

of Title 27, which states in relevant part that discharges of domestic sewage or treated effluent are exempt provided that such discharges are regulated by WDRs, or for which WDRs have been waived, and which are consistent with applicable water quality objectives, and treatment or storage facilities associated with municipal WWTP's, provided that residual sludges or solid waste from WWTP's shall be discharged only in accordance with the applicable Title 27 provisions. All of these Title 27 exemption conditions have been met with these WDRs.

Groundwater Degradation

26. State Water Board Resolution 68-16, "Policy with Respect to Maintaining High Quality Waters of the State"(Resolution 68-16) states:

"Whenever the existing quality of water is better than the quality established in policies as of the date on which such policies become effective, such existing high quality will be maintained until it has been demonstrated to the State that any change will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial use of such water and will not result in water quality less than that prescribed in the policies."

Resolution 68-16 further states:

"Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in the best practicable treatment or control [BPTC] of the discharge necessary to assure that (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained."

27. Some degradation of groundwater from the discharge to the ponds is consistent with Resolution 68-16, provided that the degradation:
    a. Is confined to a reasonable area;
    b. Is minimized by means of full implementation, regular maintenance, and optimal operation of BPTC measures;
    c. Is limited to waste constituents typically encountered in domestic wastewater; and
    d. Does not result in the loss of any beneficial use as prescribed in the applicable basin plan, or violation of any water quality objective.

28. The discharge of wastewater from the WWTP, as permitted herein, reflects BPTC. The controls assure the discharge does not create a condition of pollution or nuisance, and that the highest water quality consistent with maximum benefit to the people of the State will be maintained, which is consistent with the anti-degradation provisions of Resolution 68-16. The WWTP incorporates:
    a. Technology for secondary treated domestic wastewater;
    b. Solids handling facilities;
    c. An operation and maintenance manual;
    d. A City ordinance that is comprised of a comprehensive set of rules and regulations

governing the design, construction, maintenance and use of public and private sewer facilities within City jurisdictional limits;

e. Staffing to assure proper operation and maintenance;

f. A network of groundwater monitoring wells; and

g. A standby emergency power generator of sufficient size to operate the treatment plant and ancillary equipment during periods of loss of commercial power.

Accordingly, the discharge as authorized is consistent with the anti-degradation provisions of Resolution 68-16 and the applicable water quality objectives.

Constituents of Concern

29. Constituents of concern in domestic wastewater effluent that present the greatest risk to groundwater quality are nitrogen, coliforms (pathogen-indicator organisms), and TDS. The WWTP provides substantial removal of soluble organic matter, solids, and some nitrogen treatment.

30. Title 22, CCR section 64431, Maximum Contaminant Level (MCL) for Nitrate plus Nitrite as Nitrogen is 10 mg/L. To account for the fate of transport for the various components of Total Nitrogen, as a conservative value it is assumed that all nitrogen present converts to nitrate/nitrite. The City of Banning's SMRs report an average of 29 mg/L for Total Nitrogen between January 2011 and December 2015. Because the concentration of total nitrogen in the effluent is elevated, it is probable that nitrates may reach groundwater in concentrations that exceed the MCL prescribed in Title 22, CCR, section 64431. This Board Order will require that the Discharger conduct a nitrogen removal analysis and provide its findings in a technical report that provides a workplan and time schedule for the installation and implementation of nitrogen removal alternatives.

31. While secondary treatment reduces fecal coliform densities by 90 to 99%, the remaining organisms in effluent are still 10^5 to 10^6 MPN/100 ml (United States Environmental Protection Agency, Design Manual, Municipal Wastewater Disinfection; October 1986). Given the depth to groundwater, it is not likely that pathogen-indicator bacteria will reach groundwater at densities exceeding those prescribed in Title 22, CCR. Thus, it is not anticipated that groundwater will be degraded by pathogen-indicator bacteria. Furthermore, any degradation by pathogens that might occur will be limited to the area in the vicinity of the ponds and degradation by pathogens should not be significant.

32. The typical incremental addition of dissolved salts from domestic water usage is 150 to 380 mg/L. Domestic water supply to the City of Banning showed an average of about 200 mg/L during the period of January 2011 to December 2015. From January 2011 to December 2015 treated wastewater discharged by the City of Banning had an average TDS concentration of approximately 420 mg/L. Thus, the average TDS increase over the domestic water supply for this facility during the same time period was about 220 mg/L. Treated wastewater discharged by the WWTP has a TDS limit of a maximum of 400 mg/L above the domestic source water as regulated by Board Order 01-022. The Colorado River Water Board is responsible for implementing the State Water Resources Control Board's Salt and Nutrient Management Plan (SNMP). To that end, the TDS effluent limit in this Board Order will be reduced to 300 mg/L above the domestic water supply. A regulatory limit of 300 mg/L above the domestic source water reasonably protects present and anticipated beneficial uses of groundwater in the area; therefore, it is

not likely that groundwater will exhibit significant degradation by TDS.

Stormwater

33. Federal regulations for storm water discharges were promulgated by the U.S. Environmental Protection Agency on November 16, 1990, (40 CFR Parts 122, 123, and 124) to implement the Clean Water Act's storm water program set forth in Clean Water Act section 402(p) (33 U.S.C. section 1342(p).). In relevant part, the regulations require specific categories of facilities that discharge storm water associated with industrial activity to "waters of the United States" to obtain NPDES permits and to require control of such pollutant discharges using Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT) to prevent and reduce pollutants and any more stringent controls necessary to meet water quality standards. Facilities used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are within the confines of the facility with a design flow of one million gallons a day or more, or required to have an approved pretreatment program under 40 CFR Part 403, are considered to be engaging in "industrial activity" for purposes of the Clean Water Act's storm water program. The facility has a design treatment capacity of 3.6 MGD, and is thus subject to the federal regulations for discharges of stormwater associated with industrial activity.

CEQA and Public Participation

34. In accordance with section 15301, Chapter 3, Title 14, CCR, the issuance of these WDRs, which govern the operation of an existing facility involving negligible or no expansion of use beyond that previously existing, is exempt from the provisions of the California Environmental Quality Act (Pub. Resources Code, section 21000 et seq.).

35. The Colorado River Basin Water Board has notified the Discharger and all known interested agencies and persons of its intent to draft WDRs for this discharge, and has provided them with an opportunity for a public meeting and an opportunity to submit comments.

36. The Colorado River Basin Water Board, in a public meeting, heard and considered all comments pertaining to this discharge.

IT IS HEREBY ORDERED, that Board Order 01-022 is rescinded upon the effective date of this Order, except for enforcement purposes, and, in order to meet the provisions contained in Division 7 of the California Water Code, and regulations adopted thereunder, the Discharger shall comply with the following:

A. Effluent Limitations

1. Effluent discharged into the ponds for disposal shall not exceed the following effluent limits:

Constituent	Units	30-Day Arithmetic Mean	7-Day Arithmetic Mean	Maximum
20° C BOD_5	mg/L	30	45	-----

Constituent	Units	30-Day Arithmetic Mean	7-Day Arithmetic Mean	Maximum
Total Suspended Solids	mg/L	30	45	-----

2. The 30-day average daily dry weather discharge from the WWTP shall not exceed 3.6 MGD.

3. Effluent from the WWTP into the ponds shall not have a pH below 6.0 or above 9.0.

4. The increase in concentration of TDS in the wastewater discharged to the ponds over that contained in the water supply to the community shall not exceed 300 mg/L.

5. The ponds shall be maintained so they will continuously operate in aerobic conditions. The dissolved oxygen content in the upper zone (one foot) of the ponds shall not be less than 1.0 mg/L at all times.

B. Discharge Prohibitions

1. Discharge of waste classified as "hazardous", as defined in Title 23, CCR, section 2521(a), or "designated", as defined in California Water Code section 13173, is prohibited.

2. Discharge of treated wastewater at a location other than the designated disposal areas is prohibited.

3. The discharge of any wastewater from the Facility to any surface waters or surface drainage courses is prohibited.

4. Discharge of waste to land not owned or authorized for such use by the Discharger is prohibited.

5. Surfacing or ponding of wastewater outside of the designated disposal locations is prohibited.

6. Bypass, overflow, discharge, or spill of untreated or partially treated waste is prohibited.

C. Discharge Specifications

1. The treatment or disposal of wastes from the WWTP shall not cause pollution or nuisance as defined in sections 13050(l) and 13050(m) of Division 7 of the California Water Code, respectively.

2. A minimum freeboard depth of two feet shall be maintained at all times in each pond.

3. All treatment, storage, and disposal areas shall be designed, constructed, operated, and maintained to prevent inundation or washout due to floods with a 100-year return frequency.

4. Ponds shall have sufficient capacity to accommodate allowable wastewater flow, design seasonal precipitation, ancillary inflow, and infiltration during the non-irrigation season. Design seasonal precipitation shall be based on total annual precipitation using a return

period of 100 years, distributed monthly in accordance with historical rainfall patterns.

5. The ponds shall be managed to prevent breeding of mosquitoes. In particular:
   a. An erosion control program should assure that small coves and irregularities are not created around the perimeter of the water surface.
   b. Weeds shall be minimized through control of water depth, harvesting, or herbicides.
   c. Dead algae, vegetation, and debris shall not accumulate on the water surface.
6. Public contact with wastewater shall be precluded through such means as fences, signs, and other acceptable alternatives.
7. Objectionable odors originating at this facility shall not be perceivable beyond the limits of the wastewater treatment and disposal area.
8. The ponds shall be maintained and operated so as to maximize infiltration and minimize the increase of salinity in the groundwater.
9. The Discharger shall not accept wastewater in excess of the treatment capacity of the Facility.

D. Groundwater Limitations

1. Discharge from the WWTP shall not cause groundwater to:
   a. Contain constituents in excess of California MCLs, as set forth in the California Code of Regulations, Title 22, section 64426.1 for bacteriological constituents; section 64431 for inorganic chemicals; section 64444 for organic chemicals; and section 64678 for determination of exceedances of lead and copper action levels.
   b. Contain taste or odor-producing substances in concentrations that adversely affect beneficial uses as a result of human activity.

E. Pretreatment

1. In the event that the facility has an average dry weather flow or treatment capacity of 5 MGD or more and Industrial Users [40 CFR 403.3(h)] are discharging pollutants which could Pass Through [40 CFR 403.3(n)] or Interfere [40 CFR 403.3(i)] with the operation of the wastewater treatment facility or are otherwise subject to National Pretreatment Standards [40 CFR 403.3(j)], (ii) California Code of Regulations, Title 23, section 2233 requires the facility to have and enforce an adequate pretreatment program, or (iii) the Colorado River Basin Water Board or its Executive Officer determines that other circumstances warrant, then:
   a. The Discharger shall notify the Colorado River Basin Water Board within 30 days after there are discharges that trigger the pretreatment requirements.
   b. The Discharger shall submit a revised Report of Waste Discharge and the pretreatment program for the Board review and approval as soon as possible but not later than one year of the notice of pretreatment requirements.
   c. The Discharger shall enforce the federal categorical pretreatment standards on all Categorical Industrial Users (CIUs).

d. The Discharger shall notify the CIU of its discharge effluent limits. The limits must be as stringent as the pretreatment standards contained in the applicable federal category (40 CFR Part 400-699). The Discharger may develop more stringent, technically based local limit if it can show cause.

e. The Discharger shall notify the RWQCB if the CIU violates its discharge effluent limits.

2. The Colorado River Basin Water Board retains the right to take legal action against an industrial user and/or the Discharger where a user fails to meet the approved applicable pretreatment standards.

F. Special Provisions

1. Within **12 months** of the adoption of this Order, the Discharger shall submit to the Colorado River Basin Water Board office a technical report that includes a copy of the Maintenance and Operations Manual for the WWTP.

2. Within **18 months** of the adoption date of this Board Order, the Discharger shall submit for approval by the Colorado River Basin Water Board's Executive Officer, a technical report that is a work plan and time schedule to conduct a study that addresses the practicability of a 10 mg/L total nitrogen effluent limitation and the impact the discharge has on the beneficial uses of the receiving groundwater. The time schedule for the study shall not be longer than four (4) years. A California Professional Engineer (PE), Registered Geologist (RG), Certified Engineering Geologist (CEG), or a Certified Hydro Geologist (CHG) must sign and stamp the technical report. The report shall, at a minimum, include the following:

   a. Evaluation by the Discharger must include information on the following factors relating to the discharge:

      i. Description of the municipal entity and facilities.

      ii. Description of the quantity and nitrogen concentration of domestic water sources contributing to discharge.

      iii. Description of significant nitrogen sources of the municipal wastewater collection system, and identification of entities responsible for each source, if available.

      iv. Description of the wastewater discharge, receiving waters, quantity, and nitrogen load.

      v. Alternative plans for minimizing nitrogen contribution from the municipal sources. Alternative plans should include:

         1) Description of nitrogen sources and alternative means of control; and

         2) Cost of alternative plans in dollars per ton, of nitrogen removed from discharge.

      vi. Description and analyses of potential conventional nitrogen removal treatment technologies for implementation at the WWTP. Analyses shall include cost of implementation in dollars per ton, of nitrogen removed from discharge.

      vii. Such other information pertinent to the study as the permitting authority may deem necessary.

   b. In determining what permit conditions shall be required, the permit issuing authority shall consider the following criteria including, but not limited to:

i. The practicability of achieving a 10 mg/L total nitrogen effluent limit.

ii. Where a 10 mg/L effluent limit is not determined to be practicable, the Discharger shall provide the following:

1) The impact of the proposed nitrogen input of each alternative on the beneficial uses of the groundwater in terms of tons per year and concentration;

2) Costs per ton of nitrogen removed from discharge of each alternative plan;

3) Capability of minimizing nitrogen discharge;

4) A proposed value for the practical incremental increase; and

5) A justification for the proposed practical incremental increased value.

a. By **June 30, 2020**, the Discharger shall submit a final technical report that includes the Discharger's recommendations and conclusions, including a tentative work plan and time schedule for facility plant improvements required to accomplish nitrogen removal and comply with the effluent water quality limit. The report shall be certified with the signature and stamp of a California licensed professional PE, PG, CEG, or a CHG.

3. Within **24 months** of the adoption of this Order, the Discharger shall submit to the Colorado River Basin Water Board a technical report that includes a copy of the City of Banning ordinance that provides a comprehensive set of rules and regulations governing the design, construction, maintenance and use of public and private sewer facilities within the city's jurisdictional limits.

4. Within **24 months** of the adoption of this Order, the Discharger shall submit a technical report that contains:

a. Documents demonstrating the City of Banning's authority to issue permits for individual and community onsite septic systems;

b. The City of Banning's affirmative statement with regard to submitting a Local Agency Management Program plan in accordance with the State Water Board's *Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems*; and,

c. Identification of all areas within the jurisdiction of the City of Banning's sewer authority that are currently on existing onsite septic systems, and those undeveloped areas planned for septic systems.

G. Standard Provisions

1. The Discharger shall comply with all of the conditions of this Board Order. Noncompliance is a violation of the Porter-Cologne Water Quality Control Act (CWC, section 13000 et seq.), and is grounds for enforcement action.

2. The Discharger shall comply with the Electronic Submittal of Information (ESI) requirements by submitting all correspondence and reports required under Monitoring and Reporting Program (MRP) R7-2016-0015, and future revisions thereto, including

groundwater monitoring data and discharge location data (latitude and longitude), correspondence, and pdf monitoring reports to the State Water Resources Control Board GeoTracker https://geotracker.waterboards.ca.gov/ database. Documents that are 2.0 MB or larger should be broken down into smaller electronic files, labelled properly and uploaded into GeoTracker.

3. All technical reports required in conjunction with this Order are required pursuant to Section 13267 of the CWC, and shall include a statement by the Discharger, or an authorized representative of the Discharger, certifying under penalty of perjury under the laws of the State of California, that the report is true, complete, and accurate.

4. In accordance with California Business and Professions Code Sections 6735, 7835, and 7835.1, engineering and geologic evaluations and judgments shall be performed by or under the direction of California registered professionals (i.e., civil engineer, engineering geologist, geologist, etc.) competent and proficient in the fields pertinent to the required activities. All technical reports specified herein that contain work plans, that describe the conduct of investigations and studies, or that contain technical conclusions and recommendations concerning engineering and geology shall be prepared by or under the direction of appropriately qualified professionals, even if not explicitly stated. Each technical report submitted by the Discharger shall contain a statement of qualifications of the responsible licensed professionals as well as the professional's signature and/or stamp of the seal. Additionally, to the extent that preparation of a required technical report involves field activities, field activities shall be conducted under the direct supervision of one or more of these professionals.

5. The Discharger shall not cause degradation of any water supply in accordance with State Water Board Resolution 68-16.

6. Standby power generating facilities shall be available to operate the plant during a commercial power failure.

7. Adequate measures shall be taken to assure that flood or surface drainage waters do not erode or otherwise render portions of the discharge facilities inoperable.

8. The WWTP shall be supervised and operated by persons possessing certification of appropriate grade pursuant to section 3680, Chapter 26, Division 3, Title 23 of the California Code of Regulations.

9. The Discharger shall at all times properly operate and maintain all systems and components of collection, treatment and control, installed or used by the Discharger to achieve compliance with this Board Order. Proper operation and maintenance includes effective performance, adequate process controls, and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities/systems when necessary to achieve compliance with this Board Order. All systems in service or reserved shall be inspected and maintained on a regular basis. Records of inspections and maintenance shall be retained, and made available to the Colorado River Basin Water Board's Executive Officer on request.

10. The Discharger shall ensure that all site-operating personnel are familiar with the content of this Board Order, and shall maintain a copy of this Board Order at the site.

11. The Discharger shall allow the Colorado River Basin Water Board, or an authorized representative, upon presentation of credentials and other documents as may be required by law, to:

    a. Enter the premises regulated by this Board Order, or the place where records are kept under the conditions of this Board Order;

    b. Have access to and copy, at reasonable times, records kept under the conditions of this Board Order;

    c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Board Order; and

    d. Sample or monitor at reasonable times, for the purpose of assuring compliance with this Board Order or as otherwise authorized by the California Water Code, any substances or parameters at this location.

12. Disposal of oil and grease, biosolids, screenings, and other solids collected from liquid wastes shall be pursuant to Title 27, and the review and approval of the Colorado River Basin Water Board Executive Officer.

13. Any proposed change in use or disposal of biosolids requires the approval of the Colorado River Basin Water Board Executive Officer, and U.S. Environmental Protection Agency Regional Administrator, who must be notified at least 90 days in advance of the change.

14. Sludge use and disposal shall comply with Federal and State laws and regulations, including permitting requirements, and technical standards in 40 CFR Part 503. If the State and Colorado River Basin Water Boards are delegated the authority to implement 40 CFR Part 503 regulations, this Order may be revised to incorporate appropriate time schedules and technical standards. The Discharger shall comply with the standards and time schedules in 40 CFR part 503, whether or not part of this Order.

15. The Discharger shall provide a plan as to the method, treatment, handling and disposal of sludge that is consistent with all State and Federal laws and regulations and obtain prior written approval from the Colorado River Basin Water Board specifying location and method of disposal, before disposing of treated or untreated sludge, or similar solid waste.

16. The Discharger shall maintain a permanent log of all solids hauled away from the treatment facility for use/disposal elsewhere and shall provide a summary of the volume, type (screenings, grit, raw sludge, digested sludge), use (agricultural, composting, etc.), and the destination in accordance with the MRP of this Board Order. Sludge that is stockpiled at the treatment facility shall be sampled and analyzed for those constituents listed in the sludge monitoring section of the MRP of this Board Order and as required by Title 40, Code of Federal Regulations, Part 503. The results of the analyses shall be submitted to the Colorado River Basin Water Board as part of the MRP.

17. The Discharger shall provide a report to the Colorado River Basin Water Board when it determines that the plant's average dry-weather flow rate for any month exceeds 80 percent of the design capacity. The report should indicate what steps, if any, the Discharger intends to take to provide for the expected wastewater treatment capacity necessary when the plant reaches design capacity.

18. Prior to implementing a modification that results in a material change in the quality or quantity of wastewater treated or discharged, or a material change in the location of discharge, the Discharger shall report all pertinent information in writing to the Colorado River Basin Water Board, and obtain revised requirements.

19. Prior to a change in ownership or management of WWTP, the Discharger shall transmit a copy of this Board Order to the succeeding owner/operator, and forward a copy of the transmittal letter to the Colorado River Basin Water Board.

20. The Discharger shall provide adequate notice to the Colorado River Basin Water Board Executive Officer of the following:

    a. The introduction of pollutants into any treatment facility described in the Findings of this Board Order from an indirect Discharger which would be subject to section 301 or 306 of the Clean Water Act, if the pollutants were discharged directly;

    b. Any substantial change in the volume or character of pollutants introduced into any treatment facility described in the Findings of this Board Order, by an existing or new source; and

    c. Any planned physical alteration or addition to the facilities described in this Board Order, or change planned in the Discharger's sludge use or disposal practice, where such alterations, additions, or changes may justify the application of Board Order conditions that are different from or absent in the existing Board Order, including notification of additional disposal sites not reported during the Board Order application process, or not reported pursuant to an approved land application plan.

21. The Discharger shall report orally, any noncompliance that may endanger human health or the environment. The noncompliance shall be reported immediately to the Colorado River Basin Water Board's Executive Officer at (760) 346-7491, and the California Office of Emergency Services at (800) 852-7550 as soon as:

    a. The Discharger has knowledge of the discharge,

    b. Notification is possible, and

    c. Notification will not substantially impede cleanup or other emergency measures.

    During non-business hours, the Discharger shall leave a message on the Colorado River Basin Water Board's office voice recorder at the above listed number. Incident information shall be provided orally as soon as possible and within 24 hours from the time the Discharger becomes aware of the incident. A written report shall also be provided within five (5) business days of the time the Discharger becomes aware of the incident. The written report shall contain a description of the noncompliance and its cause, the period of noncompliance, the anticipated time to achieve full compliance, and the steps taken or planned, to reduce, eliminate, and prevent recurrence of the noncompliance. The Discharger shall report all intentional or unintentional spills in excess of one thousand (1,000) gallons occurring within the WWTP or collection system to the Colorado River Basin Water Board office in accordance with the above time limits.

22. The Discharger shall report all instances of noncompliance. Reports of noncompliance shall be submitted with the Discharger's next scheduled SMRs or earlier if requested by the Colorado River Basin Water Board's Executive Officer, or if required by an applicable standard for sludge use and disposal.

23. By-pass (i.e., the intentional diversion of waste streams from any portion of the treatment facilities, except diversions designed to meet variable effluent limits) is prohibited. The Colorado River Basin Water Board may take enforcement action against the Discharger for by-pass unless:

    a. By-pass was unavoidable to prevent loss of life, personal injury, or severe property damage. Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to be inoperable, or substantial and permanent loss of natural resources reasonably expected to occur in the absence of a by-pass. Severe property damage does not mean economic loss caused by delays in production; and

       There were no feasible alternatives to by-pass, such as the use of auxiliary treatment facilities or retention of untreated waste. This condition is not satisfied if adequate back-up equipment was not installed to prevent by-pass occurring during equipment downtime, or preventive maintenance.

    b. By-pass is:

       i. Required for essential maintenance to assure efficient operation; and

       ii. Neither effluent nor receiving water limitations are exceeded; and

       iii. The Discharger notifies the Colorado River Basin Water Board ten (10) days in advance.

24. In the event of an unanticipated by-pass, the Discharger shall immediately report the incident to the Colorado River Basin Water Board. During non-business hours, the Discharger shall leave a message on the Colorado River Basin Water Board office voice recorder. A written report shall be provided within five business days the Discharger is aware of the incident. The written report shall include a description of the by-pass, any noncompliance, the cause, period of noncompliance, anticipated time to achieve full compliance, and steps taken or planned, to reduce, eliminate, and prevent recurrence of the noncompliance.

25. Federal regulations for storm water discharges require specific categories of facilities which discharge storm water associated with industrial activity (storm water) to obtain National Pollutant Discharge Elimination System (NPDES) permits and to implement Best Conventional Pollutant Technology (BCPT) and Best Available Technology Economically Achievable (BAT) to reduce or eliminate industrial storm water pollution.

26. All storm water discharges from this facility must comply with the lawful requirements of municipalities, counties, drainage districts, and other local agencies, regarding discharges of storm water to storm water drain systems or other courses under their jurisdiction.

27. Storm water discharges from the facility shall not cause or threaten to cause pollution or contamination.

28. Storm water discharges from the facility shall not contain hazardous substances equal to or in excess of a reportable quantity listed in 40 CFR Part 117 and/or 40 CFR Part 302.

29. The Discharger is the responsible party for the waste discharge requirements and the monitoring and reporting program for the facility. The Discharger shall comply with all

conditions of these waste discharge requirements. Violations may result in enforcement actions, including Colorado River Basin Water Board Orders or court orders, requiring corrective action or imposing civil monetary liability, or in modification or revocation of these waste discharge requirements by the Colorado River Basin Water Board.

30. This Board Order does not authorize violation of any federal, state, or local laws or regulations.

31. This Board Order does not convey property rights of any sort, or exclusive privileges, nor does it authorize injury to private property or invasion of personal rights, or infringement of federal, state, or local laws or regulations.

32. This Board Order may be modified, rescinded, or reissued, for cause. The filing of a request by the Discharger for a Board Order modification, rescission or reissuance, or notification of planned changes or anticipated noncompliance, does not stay any Board Order condition. Causes for modification include a change in land application plans, or sludge use or disposal practices, and adoption of new regulations by the State or Colorado River Basin Water Board (including revisions to the Basin Plan), or Federal government.

I, Jose L. Angel, Executive Officer, do hereby certify the foregoing is a full, true and correct copy of an Order adopted by the California Regional Water Quality Control Board, Colorado River Basin Region, on June 30, 2016.

Jose L. Angel

JOSE L. ANGEL, P.E.
Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
COLORADO RIVER BASIN REGION

MONITORING AND REPORTING PROGRAM R7-2016-0015
FOR
CITY OF BANNING, OWNER
SUEZ WATER ENVIRONMENTAL SERVICES, INC., OPERATOR
BANNING WASTEWATER TREATMENT PLANT
Banning - Riverside County

Location of Discharge:
Section 14, T3S, R1E, SBB&M

A. Monitoring

1. This Monitoring and Reporting Program (MRP) describes requirements for monitoring a wastewater system and groundwater quality (when needed). This MRP is issued pursuant to California Water Code (CWC) section 13267. The Discharger shall not implement any changes to this MRP unless and until a revised MRP is issued by the Executive Officer.

2. Water Code section 13267 states, in part:

   "In conducting an investigation specified in subdivision (a), the Colorado River Basin Water Board may require that any person who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste within its region, or any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the Colorado River Basin Water Board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the Colorado River Basin Water Board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports."

3. Water Code section 13268 states, in part:

   "(a) (1) Any person failing or refusing to furnish technical or monitoring program reports as required by subdivision (b) of section 13267, or failing or refusing to furnish a statement of compliance as required by subdivision (b) of section 13399.2, or falsifying any information provided therein, is guilty of a misdemeanor, and may be liable civilly in accordance with subdivision (b). (b) (1) Civil liability may be administratively imposed by a Colorado River Basin Water Board in accordance with Article 2.5 (commencing with section 13323) of Chapter 5 for a violation of subdivision (a) in an amount which shall not exceed one thousand dollars ($1,000) for each day in which the violation occurs."

4. The Discharger owns and operates the wastewater system that is subject to Board Order R7-2016-0015. The reports are necessary to ensure that the Discharger complies with the Order. Pursuant to Water Code section 13267, the Discharger shall implement the MRP and shall submit the monitoring reports described herein.

5. All samples shall be representative of the volume and nature of the discharge or matrix of material sampled. The time, date, and location of each grab sample shall be recorded on the sample chain of custody form. If composite samples are collected, the basis for sampling (time or flow weighted) shall be approved by Colorado River Basin Water Board staff.

6. Field test instruments (such as those used to test pH, dissolved oxygen, and electrical conductivity) may be used provided that:

   a. The user is trained in proper use and maintenance of the instruments;

   b. The instruments are field calibrated prior to monitoring events at the frequency recommended by the manufacturer;

   c. Instruments are serviced and/or calibrated by the manufacturer at the recommended frequency; and

   d. Field calibration reports are submitted as described in the "Reporting" section of this MRP.

7. The collection, preservation and holding times of all samples shall be in accordance with U. S. Environmental Protection Agency (USEPA) approved procedures. Unless otherwise approved by the Colorado River Basin Water Board's Executive Officer, all analyses shall be conducted by a laboratory certified by the State Water Resources Control Board Division of Drinking Water. All analyses shall be conducted in accordance with the latest edition of the "Guidelines Establishing Test Procedures for Analysis of Pollutants" (40 CFR Part 136), promulgated by the USEPA.

8. All monitoring instruments and devices used by the Discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy. In the event that continuous monitoring equipment is out of service for period greater than 24-hours, the Discharger shall obtain representative grab samples each day the equipment is out of service. The Discharger shall correct the cause(s) of failure of the continuous monitoring equipment as soon as practicable. The Discharger shall report the period(s) during which the equipment was out of service and if the problem has not been corrected, shall identify the steps which the Discharger is taking or proposes to take to bring the equipment back into service and the schedule for these actions.

9. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Board Order, and records of all data used to complete the application for this Board Order, for a period of at least five (5) years from the date of the sample, measurement, report or application. This period may be extended by request of the Colorado River Basin Water Board's Executive Officer at any time. Records of monitoring information shall include:

   a. The date, exact place, and time of sampling or measurement(s);

   b. The individual(s) who performed the sampling or measurement(s);

   c. The date(s) analyses were performed;

   d. The individual(s) who performed the analyses;

e. The analytical techniques or method used; and

f. The results of such analyses.

10. Samples shall be collected at the location specified in the WDRs. If no location is specified, sampling shall be conducted at the most representative sampling point available.

11. Given the monitoring frequency prescribed by MRP R7-2016-0015, if only one sample is available for a given reporting period, compliance with monthly average, or weekly average Discharge Specifications, will be determined from that sample.

12. If the facility is not in operation, or there is no discharge during a required reporting period, the Discharger shall forward a letter to the Colorado River Basin Water Board indicating that there has been no activity during the required reporting period.

Influent Monitoring

13. Influent to the WWTP shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
20°C BOD_5[1]	mg/L[2]	24-Hr. Composite	2x/Month	Monthly
Total Suspended Solids	mg/L	24-Hr. Composite	2x/Month	Monthly
Nitrate as N	mg/L	24-Hr. Composite	Quarterly	Quarterly
Nitrite as N	mg/L	24-Hr. Composite	Quarterly	Quarterly
Total Nitrogen	mg/L	24-Hr. Composite	Quarterly	Quarterly

WWTP Effluent Monitoring

14. Effluent from the WWTP into the Evaporation/Percolation Ponds shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Flow; Total Plant Effluent into Ponds	MGD[3]	Flow Meter Reading	Daily	Monthly
20°C BOD_5	mg/L	24 Hr. Composite	Weekly	Monthly
Total Suspended Solids	mg/L	24 Hr. Composite	Weekly	Monthly
Nitrate as N	mg/L	24 Hr. Composite	2x/Month	Monthly

[1] 5-day Biochemical Oxygen Demand at 20 degrees Celsius.
[2] milligrams per Liter
[3] Million Gallons per Day

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Nitrite as N	mg/L	24 Hr. Composite	2x/Month	Monthly
Total Nitrogen	mg/L	24 Hr. Composite	2x/Month	Monthly
Total Dissolved Solids	mg/L	Grab	Monthly	Monthly
VOCs[4]	µg/L[5]	24 Hr. Composite	Annually	Annually

Pond Monitoring

15. The ponds shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Dissolved Oxygen[6]	mg/L	Composite	Weekly	Monthly
pH	s.u.[7]	Grab	Weekly	Monthly
Freeboard	Ft	Measurement	Weekly	Monthly

The ponds shall be observed for vegetation growth, erosion and irregularities to prevent the breeding of mosquitoes. Observations shall be reported with the monthly SMR.

Domestic Water Supply

16. The domestic water supply shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Total Dissolved Solids	mg/L	Composite	Monthly	Monthly

Groundwater Monitoring

17. Groundwater shall be sampled in the uppermost 20 feet of the shallow aquifer from the monitoring wells according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Depth to Groundwater	ft (bgs)[8]	measurement	Quarterly	Quarterly

[4] Analysis of Volatile Organic Compounds is to be accomplished using the USEPA test methods 601 and 602 or 624
[5] micrograms per liter
[6] Dissolved Oxygen shall be monitored at the upper one foot layer of the evaporation/percolation ponds.
[7] standard pH units
[8] feet below ground surface.

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Total Dissolved Solids	mg/L	Grab	Quarterly	Quarterly
Total Nitrogen	mg/L	Grab	Quarterly	Quarterly
Nitrate as N	mg/L	Grab	Quarterly	Quarterly
Nitrite as N	mg/L	Grab	Quarterly	Quarterly
Sulfate	mg/L	Grab	Quarterly	Quarterly
Chloride	mg/L	Grab	Quarterly	Quarterly
Fecal Coliform	MPN/100mL	Grab	Quarterly	Quarterly
VOCs	µg/L	Grab	Annually	Annually

Sludge Monitoring

18. Prior to disposal, sludge that is generated at the WWTP shall be sampled and analyzed for the following:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Arsenic	mg/kg[9]	Composite	Annually	Annually
Cadmium	mg/kg	Composite	Annually	Annually
Chromium	mg/kg	Composite	Annually	Annually
Copper	mg/kg	Composite	Annually	Annually
Lead	mg/kg	Composite	Annually	Annually
Mercury	mg/kg	Composite	Annually	Annually
Molybdenum	mg/kg	Composite	Annually	Annually
Nickel	mg/kg	Composite	Annually	Annually
Selenium	mg/kg	Composite	Annually	Annually
Zinc	mg/kg	Composite	Annually	Annually
Fecal Coliform	MPN/gram[10]	Composite	Prior to Disposal	Annually

B. Reporting

1. The Discharger shall inspect and document any operation/maintenance problems by inspecting each unit process. In addition, calibration of flow meters and equipment shall be performed in a timely manner and documented. Operation and Maintenance reports shall be submitted to the Colorado River Basin Water Board Office annually.

[9] milligrams per kilogram
[10] Most Probable Number per gram.

2. The annual Operation and Maintenance report shall include the following:

   a. Documentation showing the calibration of flow meters and equipment as performed in a timely manner annually;

   b. Modifications and updates to the Operation and Maintenance Manual;

   c. Operator certification status update including number of staff and grade certification.

   d. Modifications and updates to the City's waste water ordinance or rules and regulations.

3. The Discharger shall report annually on the quantity, location and method of disposal of all sludge and similar solid materials being produced at the WWTP. If no sludge is disposed of during the year being reported, the Discharger shall state "No Sludge Removed" in the annual monitoring report.

4. The Discharger shall provide the Colorado River Basin Water Board with an annual report describing the pretreatment program activities over the previous twelve-month period. The report shall be transmitted to the Colorado River Basin Water Board office no later than January 31 of each year and include:

   a. A summary of actions taken by the Discharger which ensures industrial-user compliance;

   b. An updated list of industrial users (by SIC categories) which were issued permits, and/or enforcement orders, and a status of compliance for each user; and

   c. The name and address of each user that received a revised discharge limit.

5. SMRs shall be certified under penalty of perjury to be true and correct, and shall contain the required information at the frequency designated in this MRP.

6. Each Report must contain an affirmation in writing that states:

   "All analyses were conducted at a laboratory certified for such analyses by and in accordance with current USEPA procedures or as specified in this Monitoring and Reporting Program."

7. Each Report shall contain the following completed declaration:

   "I certify under the penalty of law that this document, including all attachments and supplemental information, was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of a fine and imprisonment.

   Executed on the _____day of _____ at _____

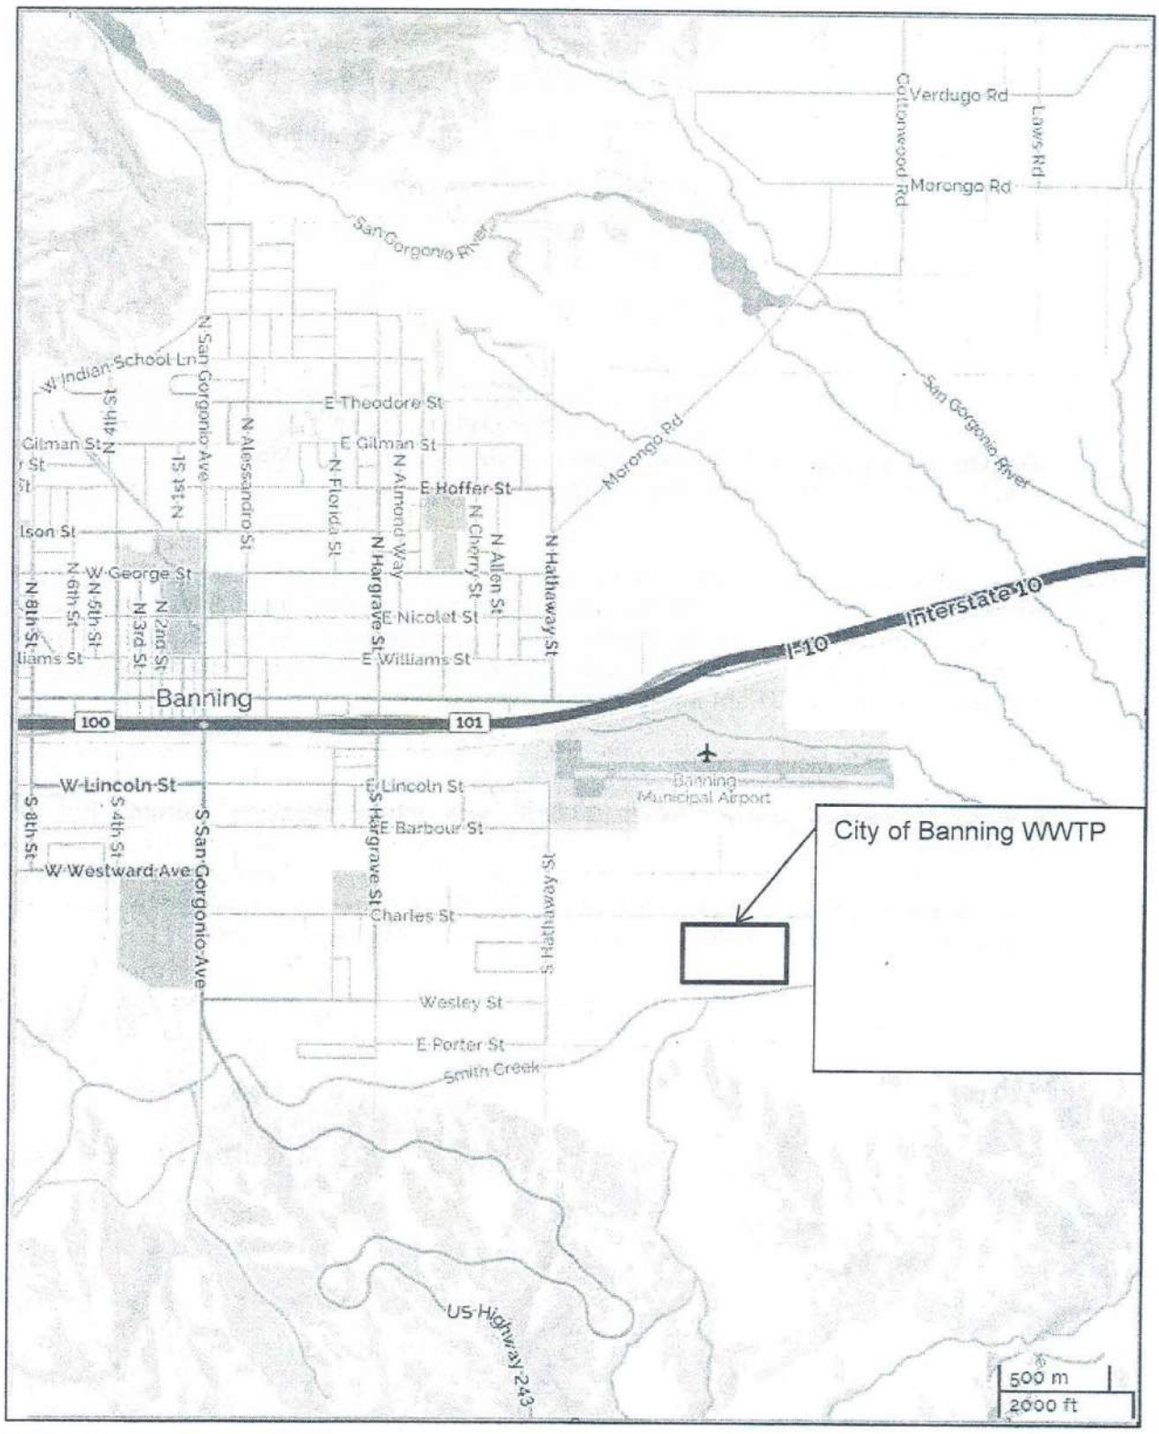
   _____(Signature)

   _____(Title)"

8. The SMRs, and other information requested by the Colorado River Basin Water Board, shall be signed by a principal executive officer or ranking elected official.

9. A duly authorized representative of the Discharger may sign the documents if:
   a. The authorization is made in writing by the person described above;
   b. The authorization specified an individual or person having responsibility for the overall operation of the regulated disposal system; and
   c. The written authorization is submitted to the Colorado River Basin Water Board's Executive Officer.

10. The Discharger shall attach a cover letter to the SMRs. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned and the proposed time schedule of corrective actions. Identified violations should include a description of the requirement that was violated and a description of the violation.



11. Daily, weekly, and monthly monitoring shall be included in the monthly monitoring report. Monthly monitoring reports shall be submitted to the Colorado River Basin Water Board by the 15th day of the following month. Quarterly monitoring reports shall be submitted by January 15th, April 15th, July 15th and October 15th. Annual monitoring reports shall be submitted by January 31st of the following year.

12. The Discharger shall comply with the Electronic Submittal of Information (ESI) requirements by submitting all correspondence and reports required under Monitoring and Reporting Program (MRP) R7-2016-0015, and future revisions thereto, including groundwater monitoring data and discharge location data (latitude and longitude), correspondence, and pdf monitoring reports to the State Water Resources Control Board GeoTracker database. Documents that are 2.0 MB or larger should be broken down into smaller electronic files, labelled properly and uploaded into GeoTracker.

APPENDICES

APPENDIX A – PRELIMINARY DESIGN (60%) DRAWINGS
APPENDIX B – SAMPLE FLOW CHART

1. INTRODUCTION

The City of Banning desires to construct equalization basins at the existing Wastewater Treatment Plant (WWTP) to mitigate the daily and wet weather flow variations received at the plant. Specifically, the City would like to construct two distinct basins at the existing plant site. The first basin will be used to equalize the daily diurnal flows received by the plant. The second basin will primarily be utilized during large "wet weather flow" events to store the additional plant flow.

The key objective of this Preliminary Engineering Report (PER) is to discuss the approach and identify principal design criteria associated with the City of Banning WWTP Equalization Basin construction project. Specifically, this report addresses and describes the following:

- Conceptual project approach
- Relevant existing facilities
- Determination of required equalization volumes
- Description and preliminary layouts of proposed equalization basins, auxiliary facilities, and potential modifications to existing facility
- Preliminary opinion of cost.

1.1. PROJECT APPROACH

The project approach assumes the proposed basins will receive plant influent flows following the primary treatment processes (screening, grit removal and primary clarification). This means the primary treatment processes will continue to experience diurnal and wet weather flow variations. However, the maintenance and operation of the proposed equalization basins will be simplified. The main reason for this is that a significant quantity of rags, grit, and larger debris will be removed from the influent flow prior to entering the equalization and storage basins. Thus, the equalization and storage basins will accumulate less debris, requiring less cleaning and maintenance by operations staff.

Flow from the primary clarifiers will be gravity conveyed to the equalization basin, as illustrated in the preliminary hydraulic profile and process flow schematic drawings included in Appendix A. Specifically, the existing primary effluent piping will be intercepted with a new 20-inch pipe (PVC, C-900) which will convey the flow to the new diurnal equalization basin, as shown in attached drawings. Available record drawings indicate that a portion of an existing 18-inch bypass line could be used for this purpose. However, due to age and unknown condition of this pipe, this preliminary effort assumes that a new pipe will be constructed.

As noted previously, two basins are proposed to be constructed. The smaller diurnal equalization basin will attenuate variation of typical daily flows. During infrequent wet weather flows, or other conditions where the capacity of the diurnal equalization basin is exceeded, liquid will overflow into the larger wet weather flow storage basin. Typically, the plant average day flow (ADF) will be discharged from the equalization basin(s) to the downstream secondary treatment processes using an equalization basin pump station. The diurnal equalization basin will be sized to allow daily emptying at the plant design flows. Based on the operational preference, the wet weather storage basin may require several days to empty. Alternatively, increased discharge (higher than ADF) from the equalization pump station may also be used to control the time required to empty this basin.

The flow from the diurnal equalization basin will be pumped directly to the existing 20-inch piping feeding the existing humus recirculation pump station. As a result, the existing primary effluent pump station will be abandoned.

2. EXISTING FACILITIES

2.1. DESCRIPTION OF EXISTING FACILITIES

Information presented below has been extracted from record drawings made available by the City, limited site visits conducted to date, and specific survey and geotechnical studies completed for this effort. Due to the age of record drawings and potential for changed field conditions it is anticipated that additional site visits will be required to verify existing conditions and further develop the design.

The current wastewater treatment plant was designed to treat an average day flow of 3.6 million gallons per day (MGD) and a peak flow of 7.2 MGD (MWH Plan Set 1999). The existing WWTP is a trickling filter plant with the following principal process/treatment components:

- Headworks (screening and grit removal)
- Primary Clarification
- Primary Effluent Pump Station
- Trickling Filters
- Humus Recirculation Pump Station
- Secondary Clarifiers
- Chlorine Disinfection
- Solids Handling Facilities
- Auxiliary facilities such as MCC buildings, chemical storage areas, detention pond(s), sludge drying beds, and others

A brief description of pertinent existing facilities is provided in the following paragraphs. These facilities are also identified in the facility site and yard piping drawings included in Appendix A.

2.1.1. Detention Pond

This earthen pond, constructed in 1999-2000, is principally used to accept storm water collected on site. Multiple pipes deliver storm water to the basin currently. The area currently occupied by this pond has been identified as the site of the proposed equalization basins.

Figure A. Existing Detention Pond

2.1.2. Primary Clarifiers

Two concrete circular primary clarifiers are operated in the plant. Primary effluent from each clarifier is currently conveyed to the primary effluent pump station via 18-inch piping. In addition, original plans indicate that primary clarifier effluent boxes also allow for discharge of the primary effluent directly into an 18-inch bypass line. However, based on site visit observations, the current condition of the primary clarifier effluent boxes is such that will require modifications to ensure continued operability.

2.1.3. Primary Effluent Pump Station

The main function of this pump station is to deliver primary effluent to the recirculation pump station and ultimately trickling filters for additional treatment. This pump station currently receives primary effluent from the primary clarifiers and a 4-inch drain line from the trickling filter recirculation pump station. The pump station shows significant signs of age and its continued use would require substantial improvements.

Figure B. Existing Primary Effluent Pump Station

2.1.4. Humus Recirculation Pump Station

The existing Humus Recirculation Pump Station delivers a combined flow of primary effluent and humus return flows to trickling filters. Review of available record drawings show the current pump station consisting of a wet well with submersible pumps and a pump gallery with valves and piping combining the return and primary effluent flows. Figure C below shows a pump station schematic. In addition, capacity of existing pumps is shown in Table 1.

Table 1. Existing Recirculation Pumps

Pump	Flow (gpm)	Head (feet)	HP
Pump #1 (P-7)	1,800	N/A	15.0
Pump #2 (P-8)	1,800	N/A	15.0

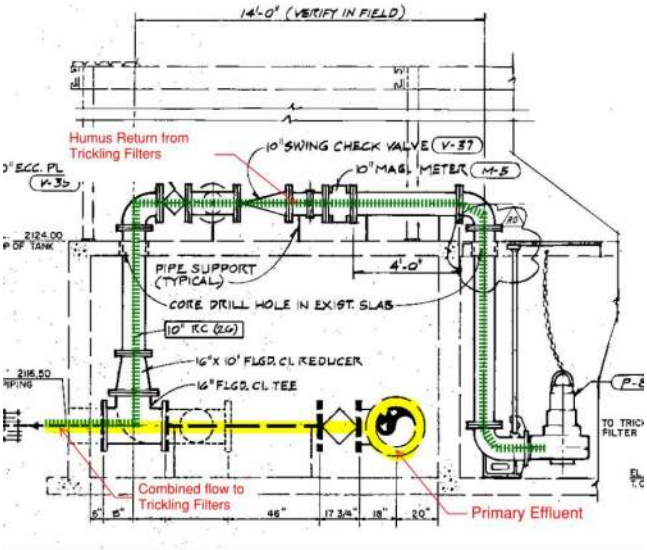

Figure C. Recirculation Pump Station Schematic

This effort did not include an evaluation of the condition of the recirculation pump station. It is assumed that the current piping and recirculation pumps are adequate to accommodate the plant design flows.

3. PROPOSED FACILITIES AND MODIFICATIONS

The main objective of this project is to design and construct flow equalization facilities which will provide daily flow equalization and emergency storage for larger "wet flow" events sporadically experienced by the plant and typically associated with larger storm events and inflow and infiltration (I&I) in the collection system. The City has identified a suitable location on the existing plant site currently occupied by a storm water detention pond as the desired location of the future equalization facilities (See drawing 01C201 in Appendix A).

Following paragraphs describe the approach to sizing the two basins and establish the minimum volume and principal design criteria required for both applications.

3.1. EQUALIZATION BASIN SIZING

Equalization basin sizing for wastewater treatment plants is ideally based on measured plant influent flow data. Historic flow data provided by the City and used in this analysis is summarized below:

- Daily flow data for years 2011 through 2016 – This data was generally used to identify general flow patterns and identify impacts of rainfall events to daily inflow into the plant
- Hourly flow data (Flowcharts – see example in Appendix B) for years 2010 through 2013*
    - (*some daily records missing)
    - Spreadsheets with hourly flow data corresponding to significant wet weather flow events outside the 2010 to 2013 time period

  This data was used to develop the diurnal curves as described in subsequent paragraphs.
- Miscellaneous flow and rainfall (precipitation depth) data associated with wet weather events.

3.1.1. DIURNAL EQUALIZATION BASIN SIZING

Typical approach to sizing equalization basins involves a development of a diurnal curve. In general, diurnal curves are somewhat specific to a given collection system or treatment facility, although some variation based on seasons and specific events is usually observed. To develop a diurnal curve for this facility a representative sample of available hourly flow data was generated and processed. As a result, and as shown in Figure D, a representative "typical" diurnal curve (in red) was developed. For illustration purposes, a sample of diurnal curves used to develop the typical curve are also shown in gray.

Once the typical diurnal curve was defined, it was normalized based on the annual average plant flows to obtain a unit diurnal curve, which is a curve based on an average flow of 1 MGD. A unit diurnal curve allows us to apply the plant design flow rate (or any flow rate for that matter) for subsequent use in sizing of equalization facilities.

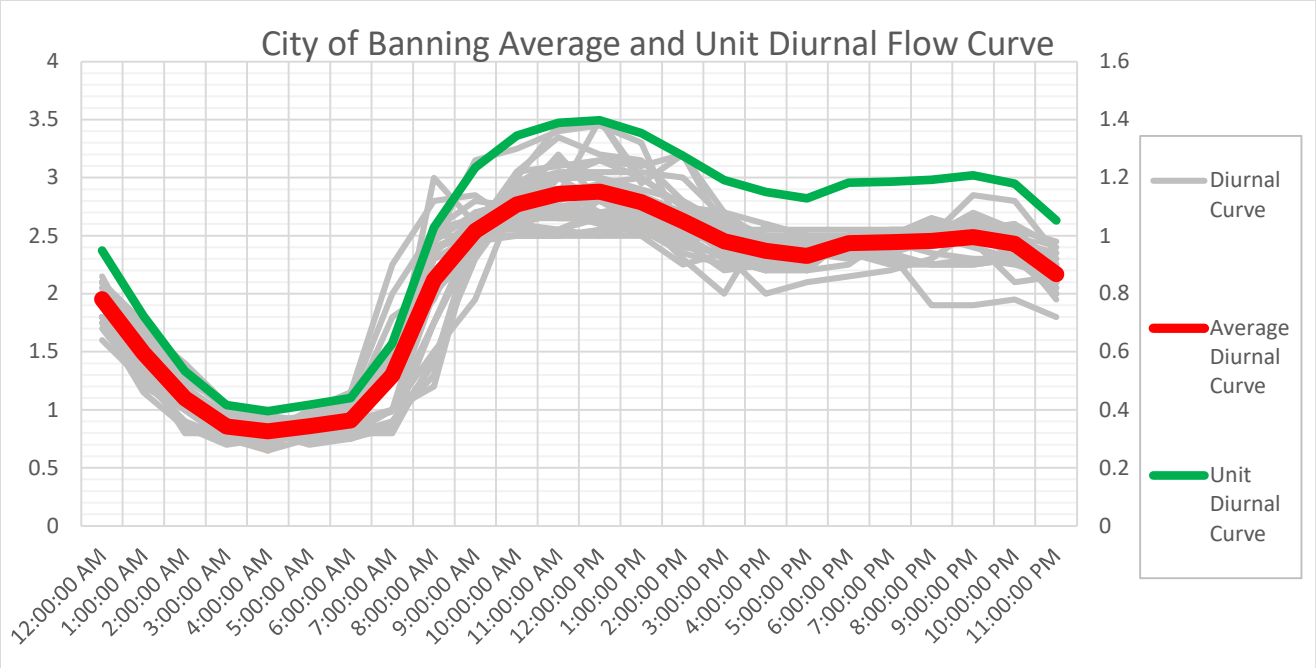

Figure D. City of Banning WWTP Historic Average and Unit Diurnal Flow Curve

With the unit diurnal curve established, the plant design flow of 3.6 MGD (ADF) was applied and a design diurnal curve was developed for actual sizing of the diurnal equalization basin. The sizing of the basin assumes that while the inflow into the equalization basin is represented by the diurnal curve flows, the equalization basin outflow is equal to the average plant design flow of 3.6 MGD. In other words, while the incoming flow varies significantly based on the time of the day, the outflow is constant (equalized) throughout the 24-hour period. An important aspect of equalization basin operation is the ability to empty the equalization basin daily and this is also a factor that impacts the sizing of the equalization basin.

Based on the design diurnal curve, outflow rate of 3.6 MGD, and the requirement to empty the equalization basin daily, a minimum equalization basin volume of 550,000 gallons is established. However, standard industry practice recommends a 10% to 20% volume contingency to account for unforeseen changes in diurnal flows. In this case, it is suggested to increase this volume by 10% to 600,000 gallons due to the additional overflow volume that will be available in the wet weather flow storage basin.

Figure E illustrates the diurnal influent flows, ADF, and storage volume during a 72-hour period operation of the proposed equalization basin. The red line represents the plant influent flow. The green line represents the effluent flow from the diurnal equalization basin and the blue line represents the volume of storage at a given time.

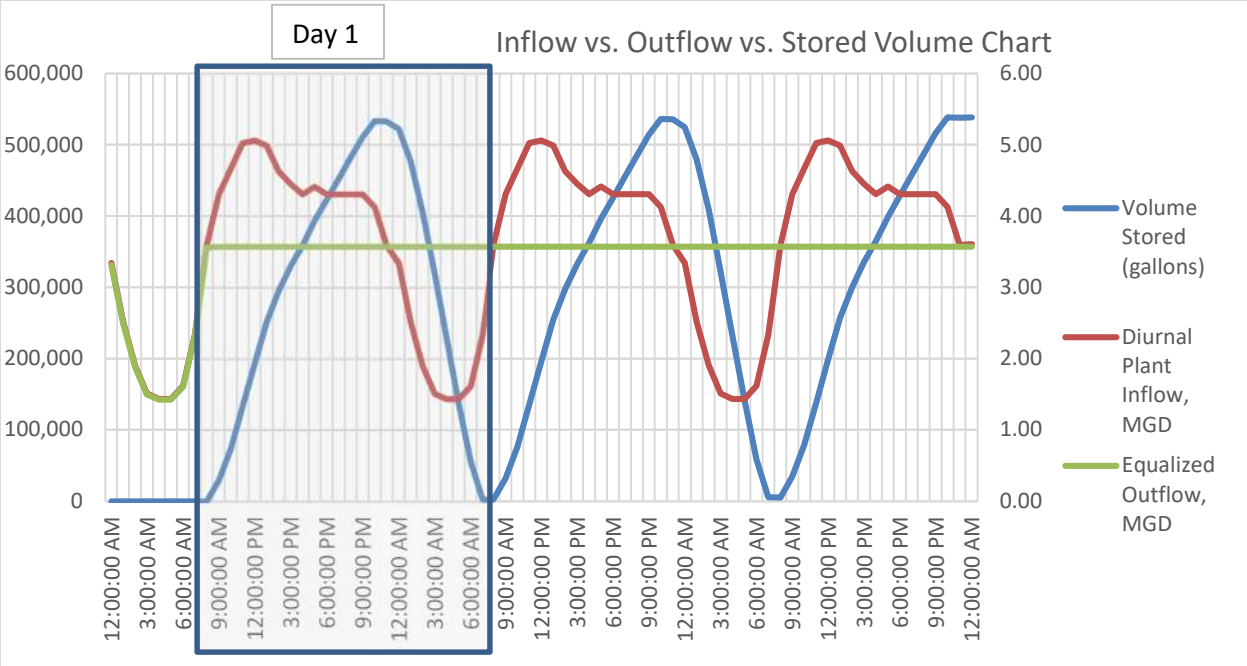

Figure E. Flow vs Equalization Basin Storage Curve

3.2. DIURNAL EQUALIZATION BASIN STRUCTURE

The diurnal equalization basin will be a cast-in place concrete structure. The main reason for this is to minimize footprint and enhance maintenance and operability. Preliminary design parameters for the diurnal equalization basin structure are listed below:

Minimum volume of 600,000 gallons is required.

Operational liquid depth: Based on the overall plant hydraulics and desire to minimize earthwork (excavation and backfill) during construction, a maximum liquid depth of 18 feet is proposed for the diurnal equalization basin. As a result, a minimum area of 4,500 square feet (sf) is required.

Preliminary Diurnal Basin Configuration:

- Shape – Rectangular - with Two Sub-Basins
- Maximum liquid depth = 18 feet
- Wall height = 20 feet (2-foot min. freeboard)
- Nominal length = 100 feet
- Nominal width = 45 feet
- Preliminary wall width = 30 inches
- Preliminary slab thickness = 30 inches
- Typical min. floor slope = 0.5%
- Additional structural requirements:
    - Low flow channel sloped at 1% min.
    - Pump Intake Sump

A cursory review of an alternative circular-shaped equalization basin was completed as part of this effort. Based on the preliminary structural analysis and required volume, an estimated 150 cubic yards (CY) difference in concrete quantity required is approximated. While this difference in material quantity is significant, the labor requirements associated with circular tanks construction are typically higher thus minimizing potential cost savings. As a result, this potential option was not considered

further.

3.3. DIURNAL EQUALIZATION BASIN OPERATION

3.3.1. Flow Control

The equalization basin will work in concert with the equalization basin pump station. Simple and robust operation is desired for equalization basin due to the nature of liquid handled and their continuous use. Drawings attached in Appendix A provide a preliminary basin layout and identify some of the proposed flow control features described below:

The primary effluent will be conveyed from the primary clarifier directly into the equalization pump station. Continuous plant influent flow metering will be provided, and a 15-day average plant influent flow rate will be used to determine the ADF for the period. This normalized flow rate which will control the operation of the equalization basin pumps. In some circumstances (based on liquid levels in the equalization basin) the pumps will have the ability to pump lower or higher rates.

The equalization basin pump station will be hydraulically connected to the diurnal equalization basin. As a result, any influent flow that exceeds the established ADF will be stored in the diurnal equalization basin. Once the influent flow rate is less than the ADF, the equalization basin will start to empty.

In the scenario when the plant is experiencing wet weather flows and the diurnal equalization basin cannot provide the required attenuation and storage, an overflow will be provided that will convey liquid from the diurnal equalization basin into the wet weather storage basin. The overflow will be set at an elevation that is a few inches higher than the maximum operational liquid elevation for the diurnal equalization basin. This configuration ensures that the two basins are not hydraulically connected and that the wet weather storage basin only receives flows when the diurnal equalization basin is out of capacity.

The mechanism to empty the wet weather storage basin will consist of a single or multiple pipe intake(s) at a low spot constructed in the basin and a pipe(s) which will discharge back into the diurnal equalization basin. Flap gates or duckbill check valves (see Figure F below) will be installed at the end of the pipe (inside of the diurnal equalization basin). This configuration will simplify the flow controls (no operator input required) and ensure that the liquid in the diurnal equalization basin is removed prior to removal of liquid from the wet weather storage basin.

Figure F. Duckbill and Flap gates (Courtesy of Red Valve and Hydro-Gate)

3.3.2. Equalization Basin Maintenance

Maintenance of equalization basins is important. If proper maintenance is not performed odor and nuisance solids may be present. Design of the equalization basin and auxiliary facilities, and a number of passive and active features may greatly improve the operability and minimize maintenance

requirements. For this project, several features may be implemented:

- Passive measures:
  - Primary effluent flow will be directed into the pump station wet well (sump) – this will minimize the utilization of the equalization basing during low flows. In other words, if the influent flow is equal or less than the ADF, the main equalization basin volume will not be utilized.
  - Use of sloped floor and low flow channels – this will ensure a level of self-cleaning as the level in the equalization basin is lowered.
  - Corrosion resistant Fiberglass Reinforced Plastic (FRP) access ladders will be provided allowing for easier access into the basin.
  - Protective coatings and non-corrosive materials of construction– ensure longevity and easier cleaning of concrete surfaces.

- Active measures:
  - Automatic tipping buckets (Refer to Figure G) - provide an automated cleaning system based on relatively simple operational strategy. Once the equalization basin is empty or very close to empty solenoid valves located at utility water feed lines to each tipping bucket are opened and start filling the buckets. Once the liquid level in the buckets reaches a certain stage, buckets are "tipped" and the entire volume is discharged onto the sloped basin floor. The quantity and energy of the discharged liquid washes off the basin floor and portion of walls. The principal advantage of this system is that it does not require operator input. However, some disadvantages of the system are noted below:
    - Relatively high capital cost
    - Specific structural requirements
    - Require electrical and controls
    - Relatively high utility water demand.

Figure G. Automatic Tipping Buckets (Courtesy of Ovivo)

  - Wash-down Monitor Hydrants are relatively simple systems typically consisting of

a 2 to 4-inch hydrant with a spray nozzle. The spray nozzle usually can travel 360 degrees horizontally and 90 degrees vertically allowing for wide coverage.

Figure H. Typical Washdown Monitor Hydrant

Main advantage of this system is simplicity and relatively low capital cost. However, manual operation associated with this system increases the long-term operational costs.

Ability to implement any of the active measures is contingent on availability of utility water on site which will be further investigated during detailed design. Review of the available record drawings suggest that the utility water system at the plant has a capacity to deliver 300 gpm at a pressure of 185 feet. Additional review of the current utility water demand at the plant is required to establish if the current system capacity is sufficient for implementation of all or any of the active measures proposed.

3.3.3. Odor Control

No dedicated odor control is proposed for the initial construction project. The structural design of the equalization basin will assume and include provisions for a future aluminum cover and active odor control system.

3.4. EQUALIZATION BASIN PUMP STATION

Main purpose of the equalization basin pump station is to provide a consistent flow to secondary treatment processes (recirculation pump station and trickling filters). As previously noted, the pumped flow will be equivalent to an average day plant influent flow normalized through a 15-day period. To provide operational flexibility and account for potential scenarios when the equalization basins are offline the pump station will also have a capacity to pump peak design flows.

The proposed equalization basin pump station will consist of three self-priming pumps (see Figure I). The pump station wet well (sump) will be incorporated into the main diurnal equalization basin structure. The pumps and majority of suction and discharge piping will be constructed on a concrete pad adjacent to the diurnal equalization basin structure. It is recommended to provide a small metal awning right above the pumps for weather protection.

Figure I. Self-Priming Pump (Courtesy of Gormann-Rupp)

Assuming the pumps will connect into the existing primary effluent pump station discharge piping (See attached drawings in Appendix A for approximate location), a total dynamic head (TDH) of 50 feet is estimated. Table 2 shows the basic design criteria for the equalization basin pumps:

Table 2. Preliminary Equalization Pump Station Design Parameters

Design parameter:	
No. of Pumps	3 (2 Duty +1 Standby)
Flow capacity	2,600 gpm (each)
Estimated TDH	50 feet
Suction Lift	20 feet (+/-)
Drive Size	50 HP (VFD)
Solids handling capacity	3-inch diameter solids

Main pump discharge header will have a magmeter installed allowing for flow measurement and control of pumps.

Submersible pumps may be installed as an alternative to utilizing self-priming pumps in this application. Budgetary costs received for both types of pumps suggest that the capital cost difference is within 10% and cannot be considered significant at this stage of design. However, unless there is a strong preference, or if the detailed design favors or requires the use of submersible pumps, self-priming pumps are recommended for this application. The main reason for this is that the self-priming pumps are a "dry" installation and allow for easy visual inspection and relatively easier maintenance.

3.5. WET WEATHER FLOW STORAGE BASIN

A secondary, wet weather flow storage basin (storage basin) will be constructed adjacent to the diurnal equalization basin structure. The main purpose of this storage basin is to provide an overflow storage (from diurnal equalization basin) for wet weather flows.

3.6. WET WEATHER FLOW STORAGE BASIN SIZING

In general, process of estimating the size of the wet weather storage basin included the following steps:

- Identification of wet weather days from available rainfall data
- Correlation of "rain days" with available hourly flow data (for period of 2010 through 2013 and additional wet weather day hourly flow data provided)
- Development of individual diurnal curves for wet weather days.
- Comparison of wet weather days to design diurnal curve
- Development of the design wet weather flow curve (see Figure J below) – increased by 20% (to account for variability in wet weather flow distribution).

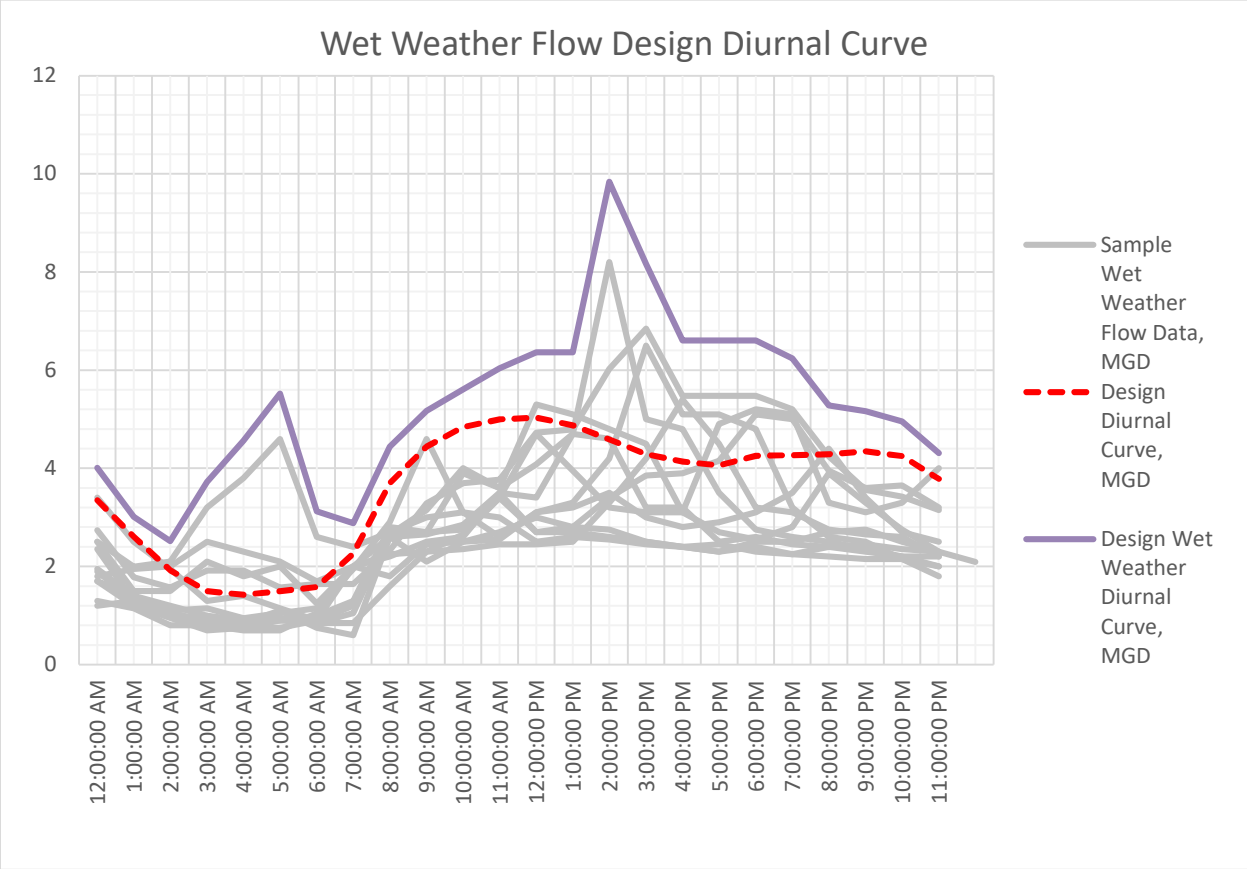

Figure J. Wet Weather Flow Design Diurnal Curve

Once the design wet weather curve was established, it was "routed" through both the diurnal and wet weather flow basins. It is noted that a maximum 72-hour period was assumed to drain the storm drain basin. As a result, the routing was completed based on the assumptions that the wet weather flows (equivalent to design curve) have a 24-hour duration and that the equalization pump station will discharge at a slightly increased rate of 4.0 MGD (+/_) to secondary treatment processes during this time. As a result, a total equalization volume of 1.8 Million Gallons (MG) was determined as the minimum required volume for the wet weather storage flow basin. Figure K below illustrates the routing of wet weather flows through the storage basin and time required to empty the basin.

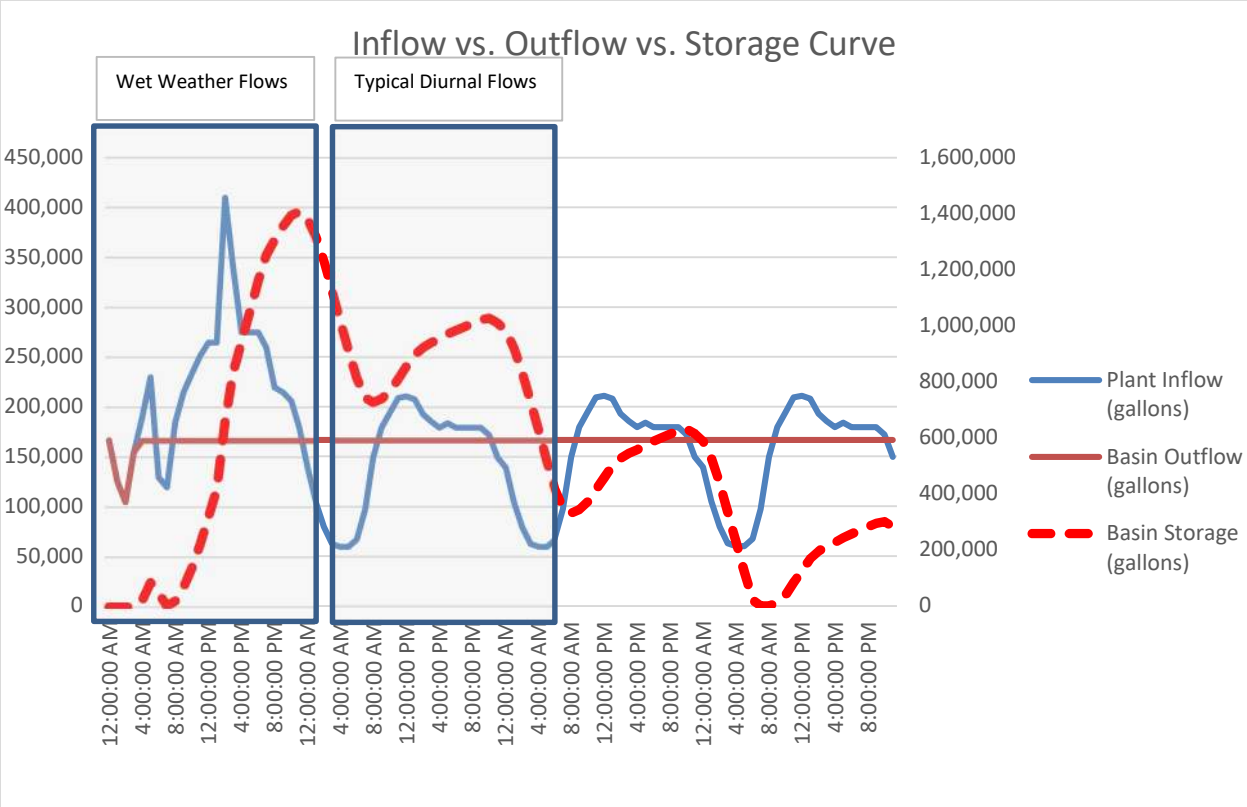

Figure K. Flow vs. Storage Curve for Combined Equalization and Wet Weather Storage Basin

3.7. WET WEATHER FLOW STORAGE BASIN STRUCTURE

Due to the frequency of wet weather events, it is anticipated that the wet weather storage basin will not be used daily. Therefore, the approach to designing this structure is slightly different compared to the diurnal equalization basin. Several options were evaluated:

Option1: Concrete tank – This option assumes that the entire wet weather storage basin structure is a cast-in-place concrete structure. Preliminary, the structure would have the following dimensions:

- Nominal Length = 100 feet
- Nominal Width = 130 feet
- Liquid Depth = 18 feet
- Wall Height = 20 feet

This option offers following advantages:

- Smaller footprint – higher liquid depth possible
- Potential for shared wall construction with diurnal equalization basin
- Easier maintenance.

The main disadvantage of this option is the relatively high capital cost (Refer to Table 3 below).

Option 2: Lined basin (60 mil HDPE) with concrete floor - With this option, a 60 mil HDPE liner would be installed on the sides of the storage basin and a concrete cast-in place floor would be constructed. Following footprint is estimated for this option:

- Bottom Nominal Length = 70 feet
- Bottom Nominal Width = 180 feet
- Side Slopes = 2.5H:1V
- Liquid Depth = 11 feet
- Minimum Freeboard = 3 feet

- Concrete floor thickness = 6 inches

The main advantages and disadvantages associated with this option are listed below:

- Advantages:
  - Lower capital cost relative to Option 1
  - Easier maintenance
- Disadvantages:
  - Larger footprint
  - Higher capital cost associated with concrete floor construction
  - High temperature and UV exposure impacts on liner – may require use of high temperature liner.

Option 3: Lined basin (60 mil HDPE) – Similar to Option 2 with the main difference being the use of a 60-mil HDPE liner for the basin floor. This option would have the same footprint and geometry as Option 2. While this option does not include a concrete basin floor, at a minimum a concrete sump for collection of return flows will be constructed. A summary of advantages and disadvantages associated with this option is provided below:

- Advantages:
  - Least expensive capital cost option
- Disadvantages:
  - Larger footprint
  - Maintenance of the lined floor may be more difficult compared to concrete floor
  - High temperature and UV exposure impacts on liner – may require use of high temperature liner.

Table 3. Storage Basin Options Relative Costs

Option	Relative Construction Cost (Concrete and/or Liner Cost only)
Option 1	**$ 1.8 Million**
Option 2	**$300,000**
Option 3	**$180,000**

Given the relatively infrequent use of the wet weather storage basin and the high cost of Option 1 it is recommended that the detailed design proceeds with Option #3. Layout of the storage basin is shown in the attached drawings in Appendix A.

3.8. WET WEATHER STORAGE BASIN OPERATION

3.8.1. Flow Control

The storage basin is expected to receive flows only in case when the flows into the plant exceed the capacity of the equalization basin. Overflow piping from the equalization basin will convey these additional flows directly into the storage basin. As previously noted, the return piping to equalization basin will be equipped with a flap gate that will prevent the return of flows (emptying of the storage basin) until the liquid level in the equalization basin is a few inches lower than the level in the storage basin. Ultimately, the entire operation is controlled by the equalization pumps and no operator input is required during this process.

3.8.2. Storage Basin Maintenance

Due to the size of the storage basin, when it comes to maintenance, the emphasis will be to design the basins with additional considerations to enhance the maintenance which may include:

- Larger sloped concrete area to direct return flows and enhance maintenance.
- Concrete ramp allowing for access to the basin floor
- Large opening bar screen at the return flow sump to prevent any large debris entering return piping

In addition, yard hydrants will be installed in the vicinity of the return flow sump to facilitate periodic washdown and cleaning.

3.8.3. Odor Control

No dedicated odor control is proposed for the initial construction project. Timely evacuation of liquid from the storage basin along with prompt cleaning after use will need to be implemented to minimize the potential to generate odors.

3.9. SITE WORK AND YARD PIPING

Site work will be limited to construction of proposed basins and installation of required process piping. In general, the location and shape of the existing detention pond along with the proposed design will minimize excavation and backfill requirements. Based on the information presented in the Geotechnical report, the in-situ soils are suitable for use in construction of the proposed structures. Consequently, minimum quantities of import fill material will be required. Paved areas disturbed by excavation and other construction activities will be replaced in kind. Specifically, paved areas disturbed by excavation required to install yard piping will be replaced. Gravel (road base) will be placed around the new equalization basin pump station diurnal equalization basin structure.

The proposed project will require installation of relatively large diameter process piping (18 to 24-inch diameter). The Geotechnical report indicates a severe potential for metal loss due to soil resistivity characteristics. As a result, the design will incorporate plastic piping (PVC, C-900) with coated and polyethylene wrapped ductile iron fittings.

3.10. ELECTRICAL

3.10.1. Proposed Electrical Design

As described in preceding sections, this project will incorporate an equalization and wet weather storage basins and three 50 HP VFD controlled equalization basin pumps to attenuate flow variations into the plant's secondary treatment processes. Two of the pumps will be used as duty pumps and one will remain on standby.

Following the review of available record drawings, potential existing system deficiencies are identified and listed below:

- The motor control center (MCC) 3M located in the existing Boiler/MCC building has spare breakers that could potentially feed the equalization basin pumps VFDs. There are concerns however, that the MCC would be overloaded with additional loads generated by two duty 50HP pumps.
- The MCC utilizes a standby 200KW generator with a 350A breaker. The breaker size is nearly half of the trip rating of the MCC which is concerning if much of the existing plant equipment is needed during a power outage. It is required to evaluate the current MCC loads and verify size of the existing or recommend a new generator size.
- There are also some concerns regarding availability of physical space needed for three (3) 50HP VFDs. A site visit is required to verify availability of space in this location.

Considering the overall design approach and potential deficiencies of the existing system, three

preliminary electrical design options are identified. Each option offers its own advantages and disadvantages as described in section below. To properly evaluate these options, additional site visit(s) will be completed to evaluate and confirm the condition of the existing electrical system.

Option 1 – Provide a power feed from existing MCC 3M located in the MCC/Boiler building to pump VFD's installed in a metal or pre-cast electrical enclosure (Refer to Figure L) adjacent to the equalization pumps. The small electrical enclosure will be air conditioned to maintain satisfactory conditions for VFD operation. The VFD's would be fed from a single 300A breaker located in the MCC 3M. Ideally, existing electrical pullboxes located in the yard will be used to route the required conduits. The main advantage of this option is that a single feeder from the MCC would reduce cost and mitigate problems of voltage drop associated with VFDs being located remotely from the pumps.

Figure L. Electrical Enclosure Options (precast concrete or metal panels)

Option 2 – This option assumes that the new pump VFDs will be installed in or near MCC 3M and fed from the motor control center spare breakers. The main advantage of this option is that it would not require the construction of a new electrical enclosure near the equalization basin pumps. However, additional investigation is required to determine if sufficient space is available for the installation of VFDs. Furthermore, due to distance to pumps (more than 400 feet), frequency irregularities and voltage drops would require use of larger and more expensive cables that would offset some of the cost associated with the electrical enclosure.

Option 3 - This option is similar to option 1 as it requires VFD's to be installed in a pre-cast electrical enclosure adjacent to the EQ Pumps. This option is presented with the assumption that there is insufficient electrical or physical space in MCC 3M for the new equipment. An existing and available breaker space in SWBD-MS would feed MCC-EQ from a 400A breaker. This would reduce the electrical load and harmonics on MCC-3M generated by the VFDs. Existing pullboxes and conduits in between SWBD-MS and the EQ electrical room would be utilized to route power. Further investigation of routing and conduit availability may be required with this option.

Regardless of the option selected, the existing standby generator will need to be evaluated. Preliminary analysis indicates that a new, larger generator (300 KW) may be required for options 1 and 2. With option 3, a new (150KW) generator and ATS will likely need to be installed near the equalization basin Electrical room.

All three options are feasible however, option 3 appears to be the most economical, efficient and robust. Therefore, the current engineering design is based on option.

3.10.2. Controls and Instrumentation

PLC locations and hardware manufacturers are unknown at this time and will need to incorporate the proposed VFD I/O and controls for tipping buckets if utilized. VFDs will need discrete and analog inputs and outputs which may require new hardware to be installed if existing I/O cards are at or near capacity. Control conduits will run alongside power conduits from the existing PLC to the equalization pump station. Instrumentation, such as level and flow indicators will be used in the equalization basins and pump station and incorporated into the SCADA system to monitor and control performance and operation.

3.10.3. NFPA Classifications

Equalization basins storing raw or partially treated wastewater fall into one of the following categories:

- Open to Atmosphere (design condition):
  - Class 1, Division 2 (within a 10-foot envelope)
- Enclosed (potential future condition) –
  - No ventilation or less than 12 air exchanges per hour (ACH) – Class 1, Division 1
  - Continuously ventilated at 12 ACH - Class 1, Division 2

3.11. SEQUENCE OF CONSTRUCTION

Majority of new facilities may be constructed with no or very little interruptions to existing plant operations. The basins, pump station, and the electrical enclosure may be constructed without disruptions to plant operations. Construction of yard piping and connections to existing process piping may require bypass pumping and relatively short disruptions. Electrical system modifications and potential standby generator change will require short duration disruptions. Alternative standby power sources will be provided during these activities to ensure continued operation of existing plant.

3.12. VALUE ENGINEERING CONSIDERATIONS

Based on the input form the City staff and engineering evaluation of potential cost reduction measures an alternative project scope approach as outlined below may be implemented.

- Construct one half of the diurnal equalization basin – one half (300,000 gallons of storage volume) of the concrete diurnal equalization basin would be constructed. While this volume is borderline adequate at current plant flows, any potential excess liquid would be transferred to the wet weather storage basin. Alternatively, the excess flows could be handled by increasing the flow rate of the equalization basin pumps.
- Remove active cleaning system (tipping buckets) – Tipping buckets would be replaced with monitor washdown hydrants. This approach will result in relatively significant capital cost savings.
- Remove concrete coating – While not ideal installation of protective coatings may be omitted or postponed until the construction of the second half of the diurnal equalization basin.

The cumulative effect on the project capital cost of these scope modifications is illustrated in Table 5. It is noted that not all items listed above need to be removed from the scope. Each item listed above may be removed individually from the scope to decrease the capital cost if needed.

4. OPINION OF COST

Table 4 below presents the opinion of cost for the project as described in this report and outlined in the attached drawings. Table 5 illustrates the potential cost savings associated with the reduced project scope. As appropriate for this level of design development a 15% contingency is used.

DRAWING NO.

G004

SHEET OF

GENERAL NOTES:

1. THE PROJECT SPECIFICATIONS SHALL BE PART OF THE CONTRACT DOCUMENTS.

2. THE STRUCTURAL DRAWINGS ARE TO BE USED IN CONJUNCTION WITH CIVIL, MECHANICAL, AND ELECTRICAL DRAWINGS. NO PORTION OF STRUCTURAL RELATED WORK, INCLUDING SHOP DRAWING DEVELOPMENT, SHALL BE PERFORMED WITHOUT CONSIDERING REQUIREMENTS OF CONTRACT DOCUMENTS IN THEIR ENTIRETY.

3. DETAILS AND SCHEDULES INDICATED AS "TYPICAL" MAY NOT BE SPECIFICALLY REFERENCED ON DRAWINGS. DETERMINE WHERE EACH TYPICAL DETAIL OR SCHEDULE APPLIES BEFORE PROCEEDING WITH WORK. IF CONDITIONS ARE FOUND WHICH ARE NOT SPECIFICALLY DETAILED AND NO TYPICAL DETAIL OR SCHEDULE APPLIES, PROMPTLY NOTIFY THE STRUCTURAL ENGINEER.

4. OPENINGS, POCKETS, CORE DRILLING, ETC. SHALL NOT BE PLACED IN STRUCTURAL WALLS, SLABS, AND MEMBERS UNLESS SPECIFICALLY DETAILED ON THE STRUCTURAL DRAWINGS. NOTIFY THE STRUCTURAL ENGINEER OF RECORD WHEN DRAWINGS BY OTHERS INDICATE OPENINGS, POCKETS, CORE DRILLING, ETC., NOT INDICATED ON THE STRUCTURAL DRAWINGS, BUT WHICH ARE LOCATED IN STRUCTURAL MEMBERS.

5. THE CONTRACTOR SHALL REVIEW EXISTING CONDITIONS ON THE SITE DURING THE BIDDING. THE CONTRACTOR SHALL VERIFY ALL DIMENSIONS PRIOR TO STARTING WORK. THE ENGINEER SHALL BE NOTIFIED OF ANY DISCREPANCIES OR INCONSISTENCIES PRIOR TO PROCEEDING.

6. UNLESS NOTED OR SHOWN OTHERWISE, ALL PHASES OF WORK ARE TO CONFORM TO THE MINIMUM STANDARDS OF THE CALIFORNIA BUILDING CODE (LATEST EDITION), AND ANY ASTM SPECIFICATIONS ON WHICH THESE STANDARDS ARE BASED. WHERE CONFLICT BETWEEN BUILDING CODES AND SPECIFICATIONS OCCUR, THE MOST STRINGENT REQUIREMENTS SHALL GOVERN.

7. ALL ASTM DESIGNATIONS REFERRED TO ON THESE DRAWINGS SHALL BE THE LATEST ADOPTED OR REVISED SPECIFICATION, AS OF THE DATE OF THESE DRAWINGS.

8. ALL DIMENSIONS SHALL TAKE PRECEDENCE OVER SCALE SHOWN ON PLANS, SECTIONS AND DETAILS. DRAWINGS SHALL NOT BE SCALED FOR CONSTRUCTION PURPOSES.

9. NOTES AND DETAILS ON THE DRAWINGS SHALL TAKE PRECEDENCE OVER GENERAL NOTES AND TYPICAL DETAILS.

10. THE STRUCTURAL DRAWINGS SHOW ONLY THE BASIC STRUCTURAL REQUIREMENTS. REFER TO CIVIL, MECHANICAL, AND ELECTRICAL DRAWINGS FOR NON-STRUCTURAL ITEMS, SUCH AS:

    A. SIZE AND LOCATION OF ALL OPENINGS.
    B. SIZE AND LOCATION OF ALL CONCRETE CURBS, WALKS, ROOF AND FLOOR DRAINS, SLOPES, DEPRESSED SLAB AREAS, ETC.
    C. FLOOR, ROOF, AND WALL FINISHES.
    D. DIMENSIONS WHICH ARE NOT SHOWN ON STRUCTURAL DRAWINGS.

11. THE STRUCTURAL CONTRACT DOCUMENTS AND SPECIFICATIONS REPRESENT THE FINISHED STRUCTURE. UNLESS OTHERWISE NOTED, THEY DO NOT INDICATE THE METHOD OF CONSTRUCTION.

12. NEITHER THE OWNER NOR THE STRUCTURAL ENGINEER WILL ENFORCE SAFETY MEASURES OR REGULATIONS. THE CONTRACTOR SHALL, AT HIS OWN EXPENSE, DESIGN, CONSTRUCT, AND MAINTAIN ALL SAFETY DEVICES, INCLUDING SHORING AND BRACING AND SHALL BE SOLELY RESPONSIBLE FOR CONFORMING TO ALL LOCAL, STATE, AND FEDERAL SAFETY AND HEALTH STANDARDS, LAWS AND REGULATIONS. SITE OBSERVATION VISITS BY THE STRUCTURAL ENGINEER SHALL NOT INCLUDE INSPECTION OF THE ABOVE SAFETY ITEMS.

13. SATISFACTORY EXECUTION OF CONSTRUCTION IS DEPENDENT UPON CONFORMANCE WITH THE INTENT OF THESE DRAWINGS. THE OWNER OR CONTRACTOR SHALL RETAIN A CALIFORNIA LICENSED CIVIL OR STRUCTURAL ENGINEER DURING CONSTRUCTION TO OBSERVE THE CONSTRUCTION AND STATE THAT THE STRUCTURE HAS BEEN BUILT IN GENERAL CONFORMANCE WITH THE INTENT OF THESE DRAWINGS.

14. CONSTRUCTION MATERIALS SHALL BE SPREAD OUT IF PLACED ON FRAMED FLOORS OR ROOF. LOAD SHALL NOT EXCEED DESIGN LIVE LOAD FOR EACH PARTICULAR LEVEL. WHEN WEIGHT OF MATERIALS OR EQUIPMENT MAY EXCEED DESIGN LOAD, STRUCTURAL SYSTEMS SHALL BE SHORED.

15. WHERE NO CONSTRUCTION DETAILS ARE SHOWN OR NOTED FOR ANY PART OF THE WORK, THE DETAILS SHALL BE THE SAME AS FOR OTHER SIMILAR WORK.

16. FOR BELOW GRADE STRUCTURES BACKFILL SHALL NOT BE PLACED UNTIL ALL FLOOR AND ROOF FRAMING IS COMPLETE.

FOUNDATION:

1. ATTACH ONE COPY OF SOILS REPORT TO THE APPROVED SET OF CONSTRUCTION DOCUMENTS. SOILS REPORT SHALL BE PART OF THESE NOTES. PRIOR TO THE POURING OF CONCRETE AND PRIOR TO THE CONTRACTOR REQUESTING A BUILDING DEPARTMENT FOUNDATION INSPECTION, THE GEOTECHNICAL ENGINEER SHALL INSPECT AND APPROVE THE FOOTING EXCAVATIONS. THE GEOTECHNICAL ENGINEER SHALL POST NOTICE ON THE JOB SITE AND ADVISE THE BUILDING INSPECTOR IN WRITING THAT THE WORK SO INSPECTED MEETS THE CONDITIONS OF THE REPORT. THE GEOTECHNICAL ENGINEER WRITTEN CERTIFICATION SHALL VERIFY THE FOLLOWING:

    A. THE BUILDING PAD WAS PREPARED IN ACCORDANCE WITH THE SOILS REPORT.
    B. THE UTILITY TRENCHES HAVE BEEN PROPERLY BACKFILLED AND COMPACTED.
    C. THE FOUNDATION EXCAVATIONS COMPLY WITH THE INTENT OF THE SOILS REPORT.

2. SOILS REPORT PREPARED BY: LANDMARK GEO-ENGINEERS AND GEOLOGISTS GEOTECHNICAL REPORT PROPOSED BANNING WWTP UPGRADES BANNING, CALIFORNIA LCI REPORT NO. LP20157 DATED OCTOBER 28, 2020

3. SOIL REMOVAL, BACKFILLING, AND RECOMPACTION SHALL BE PERFORMED PER SOILS REPORT RECOMMENDATIONS UNDER GEOTECHNICAL ENGINEER'S SUPERVISION AND INSPECTION.

4. SPECIAL INSPECTION AND TESTING IS REQUIRED IN ACCORDANCE WITH SECTIONS 1704 AND 1705 OF THE CALIFORNIA BUILDING CODE AND THE "STATEMENT OF SPECIAL INSPECTIONS" ON THESE CONSTRUCTION DOCUMENTS.

5. TYPE OF FOOTING:
    A. SHALLOW FOOTING SYSTEM-MINIMUM EMBEDMENT 18" BELOW LOWEST ADJACENT GRADE.

    DESIGN SOIL PRESSURE:

FOOTING TYPE	STATIC BEARING PRESSURE
SPREAD FOOTING	2,000 PSF
CONTINUOUS FOOTING	2,000 PSF

    ALLOWABLE BEARING CAPACITIES MAY BE INCREASED TO 2,500 PSF WHEN FOUNDATION IS LOCATED A MINIMUM OF 3'-6" BELOW GRADE AND BY ONE-THIRD WHEN CONSIDERING LOADS OF SHORT DURATION SUCH AS WIND OR SEISMIC FORCES.

6. FOOTING ELEVATIONS SHALL BE LOCATED SUCH THAT THEIR BEARING IS A MINIMUM HORIZONTAL DISTANCE OF 7 FEET FROM THE DAYLIGHT OF AN ADJACENT SLOPE OR AS RECOMMENDED WITHIN THE SOILS REPORT.

7. FOUNDATION EXCAVATIONS, FILLING, AND COMPACTION ARE TO BE OBSERVED BY AND DEEMED ACCEPTABLE TO THE GEOTECHNICAL ENGINEER OR THEIR REPRESENTATIVE PRIOR TO PLACEMENT OF REINFORCING STEEL OR CONCRETE.

8. A MOISTURE BARRIER MEMBRANE SHALL BE PLACED PER THE RECOMMENDATIONS OF THE GEOTECHNICAL ENGINEER.

9. ALL EXCAVATIONS SHALL BE PROPERLY BACKFILLED. DO NOT PLACE BACKFILL BEHIND RETAINING WALLS BEFORE WALLS HAVE ATTAINED FULL DESIGN STRENGTH. CONTRACTOR SHALL BRACE OR PROTECT ALL BUILDING AND PIT WALLS BELOW GRADE FROM LATERAL LOADS UNTIL ATTACHING FLOORS ARE COMPLETELY IN PLACE AND HAVE ATTAINED FULL STRENGTH. CONTRACTOR SHALL PROVIDE FOR DESIGN, PERMITS, AND INSTALLATION OF SUCH BRACING.

10. SLAB BASE AND COMPACTION ARE TO BE IN ACCORDANCE WITH SOILS REPORT.

11. NO PIPES OR DUCTS SHALL BE PLACED IN SLABS OR WALLS UNLESS SPECIFICALLY DETAILED OR APPROVED BY THE ENGINEER.

12. FOR ALL DIMENSIONS, CURBS, SLAB DEPRESSIONS, STEPS, FLOOR DRAINS, FLOOR SINKS, TRENCHES, UNDER FLOOR DUCTS, AND CONDUITS, SEE ARCHITECTURAL, MECHANICAL, REFRIGERATION, AIR CONDITIONING, PLUMBING, ELECTRICAL, AND FOOD SERVICES DRAWINGS. TRENCH BACK FILL AS PER SOILS REPORT REQUIREMENTS.

13. ALL WALLS RETAINING EARTH SHALL DRAIN TO DAYLIGHT OR OTHER DRAINAGE.

14. ALL ABANDONED FOOTINGS, UTILITIES, ETC., THAT INTERFERE WITH NEW CONSTRUCTION SHALL BE REMOVED

15. THE CONTRACTOR SHALL DETERMINE THE LOCATION OF UTILITY SERVICE IN AREAS TO BE EXCAVATED BEFORE BEGINNING EXCAVATION. EXERCISE EXTREME CAUTION IN EXCAVATING AND TRENCHING. DAMAGE CAUSED AS A RESULT OF FAILING TO EXACTLY LOCATE AND PRESERVE ALL EXISTING UNDERGROUND UTILITIES ARE THE RESPONSIBILITY OF THE CONTRACTOR.

16. THE CONTRACTOR SHALL PROVIDE FOR DESIGN, APPROVALS, PERMITS, INSTALLATION, AND MONITORING OF ALL CRIBBING, SHEATHING, AND SHORING REQUIRED TO SAFELY RETAIN TEMPORARY EXCAVATIONS.

17. ALL PLANTERS IN CLOSE PROXIMITY TO THE STRUCTURE SHALL HAVE ADEQUATE DRAINAGE OF SURFACE WATER TO PREVENT SATURATION OF SOIL UNDER FOUNDATION.

DESIGN BASIS:

CODE: 2019 CBC (CALIFORNIA BUILDING CODE) CCR, TITLE 24, PART 2.

GRAVITY LOADS:

1. FLAT ROOF LIVE LOAD : 20 PSF (REDUCIBLE)
2. FLOOR LIVE LOAD : 100 PSF
3. PLATFORM/WALKWAY LIVE LOAD : 100 PDF

LATERAL LOADS:

1. EARTHQUAKE DESIGN DATA :
    RISK CATEGORY = III
    SEISMIC DESIGN CATEGORY = D
    SITE CLASS = C
    S_s = 1.885g
    S_1 = 0.782g
    F_a = 1.20
    F_v = 1.40
    S_{MS} = 2.262g
    S_{M1} = 1.095g
    S_{DS} = 1.508g
    S_{D1} = 0.730g
    I_e = 1.25
    STRUCTURE:
    CONCRETE BASINS:
    RESPONSE MODIFICATION FACTORS PER ACI 350.3 FOR FIXED OR HINGE BASE TANKS
    R_i = 2.0
    R_c = 1.0

2. WIND DESIGN DATA:
    BASIC WIND SPEED = 105MPH
    EXPOSURE C
    ANALYSIS PROCEDURE USED: ASCE 7 METHOD 2 MWFRS DIRECTION PROCEDURES - ALL HEIGHTS

SOIL LOADS:

1. BRACED RETAINING/FOUNDATION WALLS:
    AT-REST PRESSURE = 60H PSF/FT
    CANTILEVER RETAINING WALLS:
    ACTIVE PRESSURE = 45H PSF/FT
    SOIL SEISMIC (ULTIMATE) = 40H PSF/FT (UNIFORM PRESSURE)
    PASSIVE PRESSURE = 300 PSF
2. TRAFFIC SURCHARGE = 120 PSF
3. COEFFICIENT OF FRICTION = 0.35

DEFERRED SUBMITTALS

1. THE FOLLOWING PORTIONS OF THE PROJECT ARE DEFERRED SUBMITTAL ITEMS AND HAVE NOT BEEN DESIGNED BY THE ENGINEER OF RECORD.

    A. STAIRS
    B. GRATING, PLANKING, WALKWAYS, AND SUPPORTS
    C. HANDRAILS AND GUARDRAILS
    D. MECHANICAL UNITS/COMPONENTS/PIPE SUPPORTS AND ANCHORAGE (EXCEPT AS INDICATED ON PLANS)
    E. PRE-ENGINEERED METAL BUILDING
    F. PRE-ENGINEERED SELF-FRAMED BUILDING

2. DEFERRED SUBMITTAL ITEMS SHALL BE DESIGNED BY A CIVIL OR STRUCTURAL ENGINEER REGISTERED IN THE STATE OF CALIFORNIA. STRUCTURAL CALCULATIONS AND SHOP DRAWINGS SHALL BE SUBMITTED TO THE ENGINEER OF RECORD FOR REVIEW.

3. DEFERRED SUBMITTAL ITEMS SHALL NOT BE INSTALLED UNTIL THE ENGINEER OF RECORD HAS REVIEWED THE SUBMITTAL DOCUMENTS AND INDICATED THAT THEY HAVE BEEN REVIEWED AND THAT THEY HAVE BEEN FOUND TO BE IN GENERAL CONFORMANCE WITH THE DESIGN DOCUMENTS.

CONCRETE:

1. CONCRETE CONSTRUCTION SHALL CONFORM TO CHAPTER 19 OF THE CALIFORNIA BUILDING CODE, ACI 318 "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" AND ACI 350 "CODE REQUIREMENT FOR ENVIRONMENTAL CONCRETE STRUCTURES" (LATEST EDITIONS), EXCEPT AS MODIFIED BY THE SUPPLEMENTAL REQUIREMENTS CONTAINED HEREIN OR SHOWN ON THE DRAWINGS.
2. SPECIAL INSPECTION AND TESTING IS REQUIRED IN ACCORDANCE WITH SECTIONS 1704 AND 1705 OF THE CALIFORNIA BUILDING CODE AND THE "STATEMENT OF SPECIAL INSPECTIONS" ON THESE CONSTRUCTION DOCUMENTS.
3. ALL CONCRETE SHALL BE 150 PCF HARDROCK, AND SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH OF 5,000 PSI AT 28 DAYS.
4. THE MAXIMUM SIZE AGGREGATE IN FOUNDATION AND MASS CONCRETE WORK SHALL BE 1 INCH. THE MAXIMUM SIZE AGGREGATE IN SLABS ON GRADE, WALLS, AND ALL OTHER CONCRETE SHALL BE 3/4 INCH. PEA GRAVEL SHALL NOT BE USED FOR STRUCTURAL CONCRETE, UON.
5. CEMENT SHALL CONFORM TO ASTM C150, TYPE II/V, LOW ALKALI. AGGREGATES FOR NORMAL WEIGHT SHALL CONFORM TO ASTM C33.
6. ADMIXTURES AND COLORS (EXCEPT AS NOTED HEREIN) SHALL NOT BE USED UNLESS SUBSTANTIATING DATA IS SUBMITTED TO AND REVIEWED BY THE ENGINEER AND ARCHITECT OF RECORD.
7. CONCRETE MIXES SHALL BE DESIGNED BY A QUALIFIED TESTING LABORATORY. THE MIX DESIGNS SHALL CONFORM TO CBC CHAPTER 19 UNLESS OTHERWISE NOTED.
8. NON-STRUCTURAL STEEL EMBEDDED IN CONCRETE SHALL BE GALVANIZED OR PAINTED. ALL DAMAGED GALVANIZED AREAS SHALL BE REPAIRED PRIOR TO EMBEDMENT.
9. PROVIDE 2- #5 DIAGONAL BARS AT CORNERS OF WALL, FLOOR, AND ROOF OPENINGS AND INSIDE CORNERS OF FLOORS.
10. PROVIDE WATERSTOPS IN ALL BELOW GRADE FOUNDATION WALL CONSTRUCTION JOINTS.
11. READY MIXED CONCRETE SHALL CONFORM TO ASTM C94.
12. PLACEMENT OF CONCRETE SHALL CONFORM TO ACI 304. CLEAN AND ROUGHEN TO 1/4" AMPLITUDE FOR ALL CONCRETE SURFACES AGAINST WHICH CONCRETE IS TO BE PLACED.
13. ALL EXPOSED CONCRETE SHALL HAVE A SMOOTH FORM FINISH USING B-B PLYFORM, CLASS I, EXT-APA PLYWOOD.
14. ALL SLABS SHALL HAVE A TROWEL FINISH EXCEPT AS NOTED ON THE DRAWINGS.
15. ALL REINFORCING STEEL, ANCHOR BOLTS, DOWELS, AND INSERTS SHALL BE WELL SECURED IN POSITION PRIOR TO PLACING CONCRETE.
16. IF THE CONTRACTOR REQUESTS TO MAKE ANY CONSTRUCTION JOINTS OTHER THAN THOSE SHOWN ON THESE DRAWINGS, THEY SHALL SUBMIT DETAILS OF CHANGES TO THE ENGINEER OF RECORD FOR REVIEW BEFORE STARTING WORK.
17. NO BRICK OR POROUS MATERIAL SHALL BE USED TO SUPPORT FOUNDATION STEEL OFF THE GROUND.
18. PROVIDE 3/4 INCH CHAMFER ON ALL EXPOSED CONCRETE CORNERS, UON.
19. SLEEVE PLUMBING OPENINGS IN SLABS WITH NON-CORROSIVE SLEEVE BEFORE PLACING CONCRETE AND BEND REINFORCING AROUND SLEEVES.
20. ALL REINFORCING BARS SHALL BE PROVIDED WITH THE FOLLOWING CONCRETE MINIMUM COVER:

FOOTINGS CAST AGAINST EARTH	3"
FORMED CONCRETE EXPOSED TO EARTH, WEATHER, OR LIQUID	2"
BEAMS AND GIRDERS	2"
WALLS	2"
COLUMN TIES	2"
SLABS (#11 AND SMALLER)	2"

21. CONCRETE CURING: TYPICALLY REQUIRED A MINIMUM OF 7 DAYS.

REINFORCING STEEL:

1. ALL REINFORCING STEEL SHALL BE PLACED IN CONFORMANCE WITH THE CBC, AND THE "MANUAL OF STANDARD PRACTICE" BY THE CRSI OR AS MODIFIED BY THE CONSTRUCTION DOCUMENTS.
2. SPECIAL INSPECTION AND TESTING IS REQUIRED IN ACCORDANCE WITH SECTIONS 1704 AND 1705 OF THE CALIFORNIA BUILDING CODE AND THE "STATEMENT OF SPECIAL INSPECTIONS" ON THESE CONSTRUCTION DOCUMENTS.
3. REINFORCING BARS SHALL CONFORM TO ASTM A615, DEFORMED GRADE 60. REINFORCING BARS THAT ARE TO BE WELDED SHALL CONFORM TO ASTM A706, DEFORMED GRADE 60.
4. DETAILS OF REINFORCEMENT SHALL COMPLY WITH ACI 318 (LATEST EDITION).
5. WELDING OF REINFORCEMENT SHALL BE IN ACCORDANCE WITH ASTM A706 WITH LOW HYDROGEN ELECTRODES AND STRUCTURAL WELDING CODE REINFORCING STEEL SHALL CONFORM TO ANSI / AWS D1.4. MINIMUM TENSILE STRENGTH OF WELD METAL SHALL BE 90 KSI. ALL WELDING SHALL BE PERFORMED BY CERTIFIED WELDERS.
6. REINFORCING BARS FOR COLUMNS AND REINFORCING IN SEISMIC ELEMENTS INCLUDING SHEAR WALL VERTICAL REINFORCING STEEL, MOMENT FRAME BEAMS AND COLUMNS, AND DIAPHRAGM CHORD BARS SHALL CONFORM TO ASTM A706, GRADE 60, U.O.N.
7. ALL REINFORCING BAR BENDS SHALL BE MADE COLD, UNLESS OTHERWISE PERMITTED BY THE BUILDING OFFICIAL.
8. WELDED WIRE FABRIC SHALL CONFORM TO ASTM A185, AND SHALL BE LAPPED 1 SPACE AND 12" MINIMUM.
9. DOWELS BETWEEN FOOTINGS AND WALLS OR COLUMNS SHALL BE LAPPED WITH THE SAME GRADE, SIZE, SPACING, AND NUMBER AS THE VERTICAL REINFORCEMENT.
10. REINFORCING SPLICES SHALL BE MADE AS INDICATED ON THE DRAWINGS.
11. ALL VERTICAL REINFORCING SHALL BE CONTINUOUS BETWEEN TWO LEVELS, UNLESS OTHERWISE NOTED.
12. SLAB ON GRADE REINFORCING SHALL BE POSITIONED AT MID-DEPTH, UNLESS OTHERWISE NOTED.
13. PROVIDE #3 SPACER TIES AT 2'-6" ON CENTER IN ALL BEAMS AND FOOTINGS TO SECURE REINFORCING BARS IN PLACE, UNLESS OTHERWISE NOTED.
14. PIPING AND CONDUIT SHALL BE SO FABRICATED AND INSTALLED THAT CUTTING, BENDING, OR DISPLACEMENT OF REINFORCEMENT FROM ITS PROPER LOCATION WILL NOT BE REQUIRED.
15. REINFORCING BAR LAP SPLICES SHALL NOT BE PERMITTED IN MOMENT FRAMES OR SHEAR WALLS UNLESS SPECIFICALLY DETAILED ON THE STRUCTURAL DRAWINGS OR APPROVED BY THE ENGINEER IN WRITING.
16. MINIMUM CLEAR DISTANCES BETWEEN REINFORCING STEEL, INCLUDING SPLICED REINFORCEMENT, SHALL BE 1" OR 1 BAR DIAMETER, WHICHEVER IS GREATER. MINIMUM CLEAR DISTANCE AT COLUMNS SHALL BE 1 1/2" OR 1 1/2 BAR DIAMETERS, WHICHEVER IS GREATER.
17. ALL REINFORCEMENT SHALL BE CENTERED ON MEMBER UNLESS OTHERWISE INDICATED.

STRUCTURAL OBSERVATION:

1. PER CBC CHAPTER 17 SECTION 1704, THE OWNER SHALL EMPLOY A LICENSED ENGINEER RESPONSIBLE FOR THE STRUCTURAL DESIGN, OR HIS DESIGNATED ENGINEER TO MAKE SITE VISITS TO OBSERVE GENERAL COMPLIANCE WITH THE APPROVED STRUCTURAL PLANS, SPECIFICATIONS AND CHANGE ORDERS. THE ENGINEER SHALL SUBMIT A STATEMENT IN WRITING TO THE BUILDING OFFICIAL STATING THAT THE SITE VISIT HAS BEEN MADE AND THAT ANY DEFICIENCIES NOTED HAVE BEEN CORRECTED. STRUCTURAL OBSERVATION DOES NOT INCLUDE OR WAIVE THE INSPECTIONS REQUIRED BY SECTIONS 110, 1704, 1705 OR OTHER SECTIONS OF THE CODE. THE CONTRACTOR SHALL NOTIFY THE ENGINEER 72 HOURS PRIOR TO THE COMPLETION OF ANY WORK THAT REQUIRES OBSERVATIONS. STRUCTURAL OBSERVATIONS ARE REQUIRED FOR THE FOLLOWING WORK PERFORMED BY THE CONTRACTOR:
   a. 90% OF FOUNDATION REINFORCEMENT PRIOR TO FIRST CONCRETE PLACEMENT FOR EACH STRUCTURE.
   b. 90% OF WALL REINFORCEMENT PRIOR TO FIRST CONCRETE PLACEMENT FOR EACH STRUCTURE.
   c. 90% OF ANY INTERMEDIATE FLOOR REINFORCEMENT PRIOR TO FIRST CONCRETE PLACEMENT/50% OF ANY INTERMEDIATE FRAMING FOR EACH STRUCTURE.
   d. 90% OF ROOF REINFORCEMENT PRIOR TO FIRST CONCRETE PLACEMENT/50% OF ROOF FRAMING FOR EACH STRUCTURE.

STATEMENT OF SPECIAL INSPECTIONS

REQUIRED VERIFICATION AND INSPECTION OF SOILS		
VERIFICATION AND INSPECTION	CONTINUOUS INSPECTION	PERIODIC INSPECTION
1. VERIFY MATERIALS BELOW SHALLOW FOUNDATIONS ARE ADEQUATE TO ACHIEVE THE DESIGN BEARING CAPACITY.	–	X
2. VERIFY EXCAVATIONS ARE EXTENDED TO PROPER DEPTH AND HAVE REACHED PROPER MATERIAL.	–	X
3. PERFORM CLASSIFICATION AND TESTING OF COMPACTED FILL MATERIALS.	–	X
4. VERIFY USE OF PROPER MATERIALS, DENSITIES, AND LIFT THICKNESS DURING PLACEMENT AND COMPACTION OF COMPACTED FILL.	X	–
5. PRIOR TO PLACEMENT OF COMPACTED FILL, OBSERVE SUBGRADE AND VERIFY THAT SITE HAS BEEN PREPARED PROPERLY.	–	X

REQUIRED VERIFICATION AND INSPECTION OF CONCRETE CONSTRUCTION		
VERIFICATION AND INSPECTION	CONTINUOUS INSPECTION	PERIODIC INSPECTION
1. INSPECTION OF REINFORCING STEEL, AND PLACEMENT.	–	X
2. REINFORCING BAR WELDING:		
a. VERIFY WELDABILITY OF REINFORCING BARS OTHER THAN ASTM A706;	–	X
b. INSPECT SINGLE-PASS FILLET WELDS, MAXIMUM 5/16"; AND	–	X
c. INSPECT ALL OTHER WELDS.	X	–
3. INSPECTION ANCHORS CAST IN CONCRETE.	X	–
4. INSPECTION ANCHORS POST-INSTALLED IN HARDENED CONCRETE MEMBER.		
a. ADHESIVE ANCHORS INSTALLED IN HORIZONTALLY OR UPWARDLY INCLINED ORIENTATIONS TO RESIST SUSTAINED TENSION LOADS.	X	–
b. MECHANICAL ANCHORS AND ADHESIVE ANCHORS NOT DEFINED IN 4.a.	–	X
5. VERIFYING USE OF REQUIRED DESIGN MIX.	–	X
6. AT THE TIME FRESH CONCRETE IS SAMPLED TO FABRICATE SPECIMENS FOR STRENGTH TESTS, PERFORM SLUMP AND AIR CONTENT TESTS, AND DETERMINE THE TEMPERATURE OF THE CONCRETE.	X	–
7. INSPECTION OF CONCRETE PLACEMENT FOR PROPER APPLICATION TECHNIQUES.	X	–
8. INSPECTION FOR MAINTENANCE OF SPECIFIED CURING TEMPERATURE AND TECHNIQUES.	–	X
9. VERIFICATION OF IN-SITU CONCRETE STRENGTH PRIOR TO REMOVAL OF SHORES AND FORMS FROM BEAMS AND STRUCTURAL SLABS.	–	X
10. INSPECT FORMWORK FOR SHAPE, LOCATION, AND DIMENSIONS OF THE CONCRETE MEMBER BEING FORMED.	–	X

SPECIAL INSPECTION PROGRAM – APPLIES TO ALL TABLES

THE SPECIAL INSPECTIONS LISTED ARE IN ADDITION TO THE CALLED INSPECTIONS REQUIRED BY LATEST EDITION OF THE CBC CHAPTER 1 SECTION 110. THE SPECIAL INSPECTIONS IDENTIFIED ON PLANS ARE, IN ADDITION TO, AND NOT SUBSTITUTE FOR, THOSE INSPECTIONS REQUIRED TO BE PERFORMED BY THE GOVERNING JURISDICTION'S BUILDING INSPECTOR. THE GOVERNING JURISDICTION IS DEFINED AS THE CITY, COUNTY, OR GOVERNMENTAL UNIT THAT IS RESPONSIBLE FOR THE INSPECTIONS OF CONSTRUCTION OR WORK AS SPECIFIED IN THE CONTRACT DOCUMENTS.

A. PROVIDE SPECIAL INSPECTION AND TESTING FOR SEISMIC AND WIND RESISTANCE AS REQUIRED BY CBC SECTIONS 1704, AND 1705.

B. THE SPECIAL INSPECTORS MUST BE CERTIFIED BY THE GOVERNING JURISDICTION, TO PERFORM THE TYPE OF INSPECTION SPECIFIED.

EXCEPTIONS:
1. SOILS INSPECTIONS BY THE GEOTECHNICAL SOILS ENGINEER OF RECORD.
2. SMOKE CONTROL SYSTEM, BY THE MECHANICAL ENGINEER OF RECORD.
3. WHEN WAIVED BY THE BUILDING OFFICIAL.

C. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO NOTIFY THE SPECIAL INSPECTOR OR INSPECTION AGENCY AT LEAST ONE WORKING DAY PRIOR TO PERFORMING ANY WORK THAT REQUIRES SPECIAL INSPECTION.

D. SPECIALLY INSPECTED WORK THAT IS INSTALLED OR COVERED WITHOUT THE APPROVAL OF THE INSPECTOR IS SUBJECT TO REMOVAL OR EXPOSURE.

E. THE CONSTRUCTION MATERIALS TESTING LABORATORY MUST BE APPROVED BY THE GOVERNING JURISDICTION, FOR TESTING OF MATERIALS, SYSTEMS, COMPONENTS AND EQUIPMENTS.

F. A PROPERTY OWNER'S FINAL REPORT OF WORK REQUIRING SPECIAL INSPECTION MUST BE COMPLETED BY THE PROPERTY OWNER, PROPERTY OWNER'S AGENT OF RECORD, ARCHITECT OF RECORD, OR ENGINEER OF RECORD AND SUBMITTED TO THE INSPECTION SERVICES DIVISION.

G. AN APPLICATION TO PERFORM OFF-SITE FABRICATION MUST BE SUBMITTED TO THE INSPECTION SERVICES DIVISION FOR APPROVAL PRIOR TO FABRICATION.

H. A CERTIFICATE OF COMPLIANCE OF OFF-SITE FABRICATION MUST BE COMPLETED AND SUBMITTED TO THE INSPECTION SERVICES DIVISION PRIOR TO ERECTION OF PREFABRICATED COMPONENTS.

I. FABRICATOR MUST BE REGISTERED AND APPROVED BY THE GOVERNING JURISDICTION FOR THE FABRICATION OF MEMBERS AND ASSEMBLIES ON THE PREMISES OF THE FABRICATOR'S SHOP.

J. THE SPECIAL INSPECTOR MUST BE CERTIFIED BY THE GOVERNING JURISDICTION IN THE CATEGORY OF WORK REQUIRED TO HAVE SPECIAL INSPECTION.

K. FABRICATION OF MEMBERS AND ASSEMBLIES DONE IN A FABRICATOR'S SHOP APPROVED BY INSPECTION SERVICES NEED NOT HAVE CONTINUOUS OR PERIODIC SPECIAL INSPECTION. AT COMPLETION OF FABRICATION, THE APPROVED FABRICATOR SHALL SUBMIT THE CERTIFICATE OF COMPLIANCE FORM TO INSPECTION SERVICES.

L. CONTRACTOR RESPONSIBILITY PER CBC SECTION 1704.4 :
EACH CONTRACTOR RESPONSIBLE FOR THE CONSTRUCTION OF A MAIN WIND- OR SEISMIC-FORCE-RESISTING SYSTEM, DESIGNATED SEISMIC SYSTEM OR A WIND- OR SEISMIC-RESISTING COMPONENT LISTED IN THE STATEMENT OF SPECIAL INSPECTIONS SHALL SUBMIT A WRITTEN STATEMENT OF RESPONSIBILITY TO THE BUILDING OFFICIAL AND THE OWNER PRIOR TO THE COMMENCEMENT OF WORK ON THE SYSTEM OR COMPONENT. THE CONTRACTOR'S STATEMENT OF RESPONSIBILITY SHALL CONTAIN ACKNOWLEDGEMENT OF AWARENESS OF THE SPECIAL REQUIREMENTS CONTAINED IN THE STATEMENT OF SPECIAL INSPECTIONS IN CBC SECTION 1704.

REQUIRED REPORTS:

1. THE SPECIAL INSPECTOR SHALL FURNISH INSPECTION REPORTS TO THE BUILDING OFFICIAL AND TO THE REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE.

2. SPECIAL INSPECTION REPORTS SHALL INDICATE THAT THE WORK INSPECTED WAS PERFORMED IN CONFORMANCE WITH THE APPROVED CONSTRUCTION DOCUMENTS.

3. DISCREPANCIES SHALL BE BROUGHT TO THE IMMEDIATE ATTENTION OF THE CONTRACTOR FOR CORRECTION.

4. IF DISCREPANCIES ARE NOT CORRECTED, THE DISCREPANCIES SHALL BE BROUGHT TO THE ATTENTION OF THE BUILDING OFFICIAL AND TO THE REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE PRIOR TO COMPLETION OF THAT PHASE OF WORK.

5. A FINAL REPORT DOCUMENTING THE REQUIRED SPECIAL INSPECTIONS AND CORRECTION OF ANY DISCREPANCIES NOTED IN THE INSPECTIONS SHALL BE SUBMITTED AT A POINT IN TIME AGREED UPON BY THE PERMIT APPLICANT AND THE BUILDING OFFICIAL PRIOR TO THE START OF WORK.

CONTINUOUS AND PERIODIC INSPECTIONS:

1. WHERE CONTINUOUS SPECIAL INSPECTION IS REQUIRED, THE SPECIAL INSPECTOR SHALL CONTINUOUSLY PROVIDE FULL-TIME VERIFICATION OF THE WORK.

2. WHERE PERIODIC SPECIAL INSPECTION IS REQUIRED, THE SPECIAL INSPECTOR SHALL PROVIDE VERIFICATION THAT THE PERIODIC INSPECTION WAS PERFORMED.

PD	PLANT DRAIN
NPW	NON-POTABLE WATER
SD	STORM DRAIN

NOTES:

1- INSTALLATION TYPES:
- BUR - BURIED PIPE
- OUT - OUTSIDE EXPOSED
- IN - INSIDE EXPOSED

2- PIPE RESTRAINT REQUIREMENTS:
- BURIED DIP:
  - FITTINGS - MEGALUG SERIES 1100, OR EQUAL
  - JOINTS - MEGALUG SERIES 1700, OR EQUAL
  - COUPLINGS - MEGALUG SERIES 3800, OR EQUAL
- BURIED PVC (C-900, 905):
  - FITTINGS - MEGALUG SERIES 2000 OR 2200, OR EQUAL
  - JOINTS - MEGALUG SERIES 1900 OR 2800, OR EQUAL
- WELDED STEEL PIPE:
  - FULLY WELDED JOINTS OR FLANGED WHERE SHOWN
- EXPOSED DIP AND PVC (C-900, 905):
  - FLANGED

3- ALL PIPING TESTS SHALL BE IN ACCORDANCE WITH SPECIFICATION SECTION 330505.
- AL - AIR LOW HEAD
- AH - AIR HIGH HEAD
- HH - HYDROSTATIC HIGH HEAD
- HL - HYDROSTATIC LOW HEAD
- G - GRAVITY

4- EXPOSED DIP SHALL BE COATED AND LABELED IN ACCORDANCE WITH SPECIFICATION SECTIONS 098000 AND 220553.

5- UNLESS NOTED OTHERWISE, ALL POTABLE AND NON-POTABLE WATER LINES SHALL BE BURIED MINIMUM 36" BELOW FINISHED GROUND.

6- FOR YARD PIPING NOT SPECIFICALLY LISTED IN THIS SCHEDULE, USE SIMILAR PIPE MATERIALS AND TESTING STANDARDS TO MATCH PIPES OF SIMILAR SERVICE THAT ARE LISTED IN THIS SCHEDULE.

NOTES:

1. SEE ARCHITECTURAL, MECHANICAL AND ELECTRICAL DRAWINGS FOR ADDITIONAL INFORMATION.
2. SEE MECHANICAL DRAWINGS FOR LOCATION, SIZE, AND ADDITIONAL INFORMATION REGARDING EQUIPMENT.
3. ALL STRUCTURAL MEMBERS OF THE PRE-ENGINEERED METAL BUILDING SHALL BE HOT-DIPPED GALVANIZED.
4. PRE-ENGINEERED METAL BUILDING COLUMN FOOTING DESIGN IS BASED ON PRELIMINARY LOADS. FINAL COLUMN FOOTING SIZES WILL BE VERIFIED BY THE SEOR AFTER THE RECEIPT OF OTHER PRE-ENGINEERED METAL BUILDING DEFERRED SUBMITTAL. FOOTING REVISIONS (IF ANY WILL BE ADDRESSED BY ADDENDUM OR REVISION).
5. NO COLUMNS FOR THE PRE-ENGINEERED METAL BUILDING SHALL BE MANUFACTURED OR INSTALLED PRIOR TO SEOR REVIEW AND APPROVAL OF PRE-ENGINEERED BUILDING DEFERRED SUBMITTAL.
6. CONTRACTOR SHALL VERIFY ALL EQUIPMENT PAD SIZE, LOCATIONS, AND ANCHORING REQUIREMENTS WITH THE MANUFACTURER OR SUPPLIER
7. ANCHOR BOLTS FOR PRE-ENGINEERED BUILDING AND EQUIPMENT SHALL BE:
   A. POST-INSTALLED ANCHORS.
   B. DESIGNED, SEALED, AND SIGNED BY A CALIFORNIA LICENSED CIVIL OR STRUCTURAL ENGINEER. DESIGN SHALL BE SUBMITTED TO SEOR FOR REVIEW AND APPROVAL PRIOR TO INSTALLATION.
   C. PROVIDED BY THE CONTRACTOR.
   D. DESIGNER SHALL COORDINATE ANCHOR BOLT SIZE, SPACING, AND EMBEDMENT DEPTH WITH SUPPLIER REQUIREMENTS AND BASE MATERIAL & CONFIGURATION PER THESE DRAWINGS.
8. SEE SPECIFICATION SECTION 133400 FOR PRE-ENGINEERED METAL BUILDING REQUIREMENTS.
9. FOR SUBGRADE PREPARATION REQUIREMENTS SEE SPECIFICATION SECTION 312000.
10. PRE-ENGINEERED METAL BUILDING SHALL BE DESIGNED TO HAVE ALL OPEN BAYS, I.E. NO CROSS-BRACING ALLOWED.

NOTES

1. THE COMPLETED INSTALLATION SHALL COMPLY WITH APPLICABLE FEDERAL, STATE, AND LOCAL CODES, ORDINANCES, AND REGULATIONS. ALL WORK SHALL BE COMPLETED IN A NEAT, WORKMANLIKE MANNER IN ACCORDANCE WITH THE LATEST NEC STANDARDS OF INSTALLATION UNDER COMPETENT SUPERVISION. INSTALL GROUNDING PER NEC.
2. ALL MATERIALS SHALL BE NEW AND OF THE BEST QUALITY, MANUFACTURED IN ACCORDANCE WITH NEMA, ANSI, UL, OR OTHER APPLICABLE STANDARDS. THE USE OF MANUFACTURERS' NAMES, MODELS, AND NUMBERS IS INTENDED TO ESTABLISH STYLE, QUALITY, APPEARANCE, USEFULNESS, AND BID PRICE.
3. PROTECT ALL ELECTRICAL MATERIAL AND EQUIPMENT INSTALLED AGAINST DAMAGE BY OTHER TRADES, WEATHER CONDITIONS, OR ANY OTHER PREVENTABLE CAUSES. EQUIPMENT DAMAGED DURING SHIPPING OR CONSTRUCTION, PRIOR TO ACCEPTANCE BY THE ENGINEER OR OWNER, WILL BE REJECTED AS DEFECTIVE.
4. ALL COMPONENTS SHALL BE FREE OF DUST, GRIT, AND FOREIGN MATERIALS, AND LEFT AS NEW BEFORE FINAL ACCEPTANCE OF WORK. DAMAGED PAINT AND FINISHES SHALL BE TOUCHED UP OR PAINTED WITH MATCHING COLOR PAINT AND FINISH.
5. CIRCUIT CONDUCTORS #6 AWG OR SMALLER SHALL BE THWN STRANDED COPPER. #4 TO #2 AWG SHALL BE XHHW STRANDED COPPER. #1 AWG OR LARGER SHALL BE XHHW-2 STRANDED COPPER. MINIMUM POWER CONDUCTOR SIZE SHALL BE #12 AWG WITH #12 GROUND. ALL WIRE TO BE SIZED PER NEC TABLE 316-10, 75ºC BASED ON 30ºC AMBIENT.
6. SAFETY SWITCHES, ELECTRICAL DISTRIBUTION EQUIPMENT, CONTROL PANELS AND OTHER ELECTRICAL DEVICES SHALL BE UL LISTED, AND RATED FOR HEAVY DUTY SERVICE.
7. DEVICE WIRING SHALL BE SPECIFICATION GRADE.
8. TYPICAL DETAILS SHALL APPLY IN ALL CASES, WHETHER SPECIFICALLY REFERRED TO OR NOT.

NOTES

1. THE COMPLETED INSTALLATION SHALL COMPLY WITH APPLICABLE FEDERAL, STATE, AND LOCAL CODES, ORDINANCES, AND REGULATIONS. THE CONTRACTOR SHALL OBTAIN NECESSARY PERMITS AND INSPECTIONS REQUIRED BY THE AUTHORITIES HAVING JURISDICTION. ALL WORK SHALL BE COMPLETED IN A NEAT, WORKMANLIKE MANNER IN ACCORDANCE WITH THE LATEST NEC STANDARDS OF INSTALLATION UNDER COMPETENT SUPERVISION. INSTALL GROUNDING PER NEC.
2. VISIT THE SITE PRIOR TO BIDDING TO BECOME FAMILIAR WITH EXISTING CONDITIONS AND OTHER FACTORS, WHICH MAY AFFECT THE EXECUTION OF THE WORK. INCLUDE ALL RELATED COSTS IN THE INITIAL BID PROPOSAL.
3. THE CONTRACTOR SHALL COORDINATE WORK WITH THE UTILITIES PROVIDING SERVICES ON THIS PROJECT, AND SHALL COMPLY WITH ALL THEIR INSTALLATION REQUIREMENTS.
4. ALL MATERIALS SHALL BE NEW AND OF THE BEST QUALITY, MANUFACTURED IN ACCORDANCE WITH NEMA, ANSI, UL, OR OTHER APPLICABLE STANDARDS. THE USE OF MANUFACTURERS' NAMES, MODELS, AND NUMBERS IS INTENDED TO ESTABLISH STYLE, QUALITY, APPEARANCE, USEFULNESS, AND BID PRICE.
5. PROTECT ALL ELECTRICAL MATERIAL AND EQUIPMENT INSTALLED AGAINST DAMAGE BY OTHER TRADES, WEATHER CONDITIONS, OR ANY OTHER PREVENTABLE CAUSES. EQUIPMENT DAMAGED DURING SHIPPING OR CONSTRUCTION, PRIOR TO ACCEPTANCE BY THE ENGINEER OR THE OWNER, WILL BE REJECTED AS DEFECTIVE.
6. LEAVE THE SITE CLEAN. REMOVE ALL DEBRIS, EMPTY CARTONS, TOOLS, CONDUIT, WIRE SCRAPS AND ALL MISCELLANEOUS SPARE EQUIPMENT AND MATERIALS USED IN THE WORK DURING CONSTRUCTION. ALL COMPONENTS SHALL BE FREE OF DUST, GRIT AND FOREIGN MATERIALS, LEFT AS NEW BEFORE FINAL ACCEPTANCE OF WORK. DAMAGED PAINT AND FINISHES SHALL BE TOUCHED UP OR REPAINTED WITH MATCHING COLOR PAINT AND FINISH.
7. CIRCUIT CONDUCTORS #6 AWG OR SMALLER SHALL BE THWN STRANDED COPPER. #4 AWG THROUGH #2 AWG SHALL BE XHHW STRANDED COPPER. #1 AWG OR LARGER SHALL BE XHHW-2 STRANDED COPPER. MINIMUM POWER CONDUCTOR SIZE SHALL BE #12 AWG WITH #12 AWG GROUND. ALL WIRE TO BE SIZED PER NEC TABLE 316-10, 75° C BASED ON A 30° C AMBIENT.
8. UNDERGROUND CONDUITS SHALL BE SCHEDULE 40 PVC. MINIMUM CONDUIT DEPTH SHALL BE 24 INCHES. MINIMUM UNDERGROUND CONDUIT SIZE SHALL BE 1 INCH.
   MINIMUM CONDUIT DEPTH UNDER SLAB SHALL BE 1 INCH.
9. CONDUITS SHALL BE MARKED AT EACH END WITH MATCHING NUMBERED BRASS OR NYLON TAGS. SPARE CONDUITS SHALL HAVE A PULL STRING INSTALLED AND SECURED.
10. EXPOSED CONDUITS SHALL BE GALVANIZED RIGID STEEL (GRS). MINIMUM SIZE 3/4 INCH, UNLESS OTHERWISE NOTED ON THE PLANS.
11. SAFETY SWITCHES, ELECTRICAL DISTRIBUTION EQUIPMENT, CONTROL PANELS, AND OTHER ELECTRICAL DEVICES SHALL BE UL LISTED, AND RATED FOR HEAVY DUTY SERVICE.
12. WIRING DEVICES SHALL BE SPECIFICATION GRADE.
13. THE CONTRACTOR IS RESPONSIBLE FOR MANAGING, SCHEDULING, DOCUMENTING, AND PERFORMING THE WORK SO THAT A COMPLETE ELECTRICAL, INSTRUMENTATION AND CONTROL SYSTEM FOR THE FACILITY IS PROVIDED. ACCURATE SHOP AND RECORD DRAWINGS, AND OEM MANUALS SHALL BE SUBMITTED PRIOR TO FINAL ACCEPTANCE OF THE WORK.
14. TYPICAL DETAILS SHALL APPLY IN ALL CASES, WHETHER SPECIFICALLY REFERRED TO OR NOT.
15. REFER TO SPECIFICATION 260533 "RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS" FOR CONDUIT SPACING AND ROUTING REQUIREMENTS.

0 4 8

Scale in Feet

NOTES

1. THE INTERIOR OF THE EQ BASIN AND EXTENDING OUT 10 FEET HORIZONTALLY AND 1.5 FEET VERTICALLY IS RATED CLASS I, DIV2 (SEE NFPA 820 FIGURE A.5.2). IN THIS CLASSIFIED AREA, ALL ELECTRICAL COMPONENTS SHALL BE RATED CLASS I, DIV 2. SEAL OFFS SHALL BE UTILIZED PER THE REQUIREMENTS OF NEC. FOR THE UNCLASSIFIED SPACE SURROUNDING THIS AREA, ALL COMPONENTS SHALL BE CORROSION RESISTANT AND PANELS SHALL BE 316SS NEMA 4X. ALL EXPOSED CONDUITS AND FITTINGS SHALL BE PVC COATED GRS. ALL CHANNEL, ANCHORS, FASTENERS AND ASSOCIATED HARDWARE SHALL BE 316SS. CONDUIT SHALL ONLY RUN EXPOSED WHERE NECESSARY.
2. CONTRACTOR SHALL BE RESPONSIBLE FOR SUBMITTING CONDUIT DETAILS AND A CONDUIT ROUTING PLAN TO THE ELECTRICAL ENGINEER FOR APPROVAL.
3. LIMIT EXPOSED CONDUITS, 90° BENDS, AND WALL PENETRATIONS. MAINTAIN SEPARATION BETWEEN SIGNAL AND POWER-CARRYING CONDUITS.

VFD CONTROL DESCRIPTION

WHEN THE HOR SWITCH IS IN THE HAND POSITION, THE MOTOR SHOULD RUN, WHEN THE HOR SWITCH IS IN THE OFF POSITION, THE MOTOR SHOULD STOP AND WHEN THE HOR SWITCH IS IN THE REMOTE POSITION, THE MOTOR IS CONTROLLED BY THE PLC. THE PLC WILL BE ABLE TO MONITOR WHETHER THE HOR IS IN THE HAND OR REMOTE POSITION.

WHEN THE HOR SWITCH IS IN THE HAND POSITION, THE SPEED COMMAND COMES FROM THE POTENTIOMETER. WHEN IN THE REMOTE POSITION, THE SPEED COMMAND COMES FROM THE PLC.

VFD CONTROL SCHEMATIC

TYPICAL FOR: P-11201, P-11202, P-11203

NOTES:

1. TYPICAL SCHEMATIC DIAGRAMS ARE INTENDED TO REFLECT THE GENERAL CONTROL STRATEGY. ACTUAL CIRCUITRY MAY VARY FOR SPECIFIC EQUIPMENT SUPPLIED. THE NUMBER AND TYPE OF DEVICES SHALL BE FURNISHED AS REQUIRED FOR PROPER OPERATION OF THE EQUIPMENT.
2. CONTROL POWER TRANSFORMERS (CPT) SHALL BE ADEQUATELY SIZED AND SHALL BE PROVIDED WITH PROPERLY SIZED FUSES FOR BOTH THE PRIMARY AND SECONDARY WINDINGS.
3. FUSES SHALL BE ADEQUATELY SIZED PER THE EQUIPMENT MANUFACTURER'S RECOMMENDATIONS.
4. ADJUST TIME DELAY RELAYS PRIOR TO STARTUP. STAGGER TIMER SETTINGS FOR POWER ON-DELAY RELAYS.
5. CONTROL SWITCHES SHALL BE DOOR MOUNTED ON THEIR RESPECTIVE PANELS. DEVICES SHALL BE RATED FOR LINE VOLTAGE AND 125% OF LOAD CURRENT.
6. LOCAL CONTROLS SHALL BE INSTALLED ACCORDING TO P&ID'S AND NOT NECESSARILY AS SHOWN ON SCHEMATICS. SEE LCP SCHEMATICS AND CONDUIT SCHEDULE FOR EXACT WIRING.

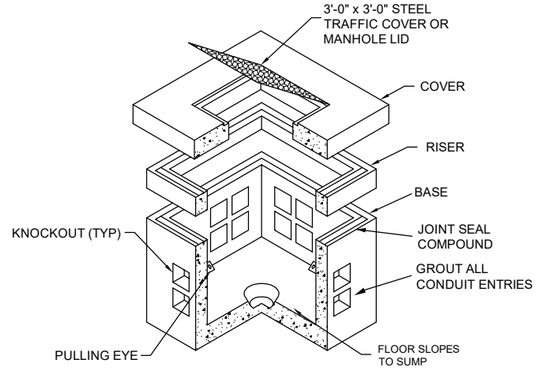
001 TYP **ELECTRICAL PANEL MOUNTING DETAIL**

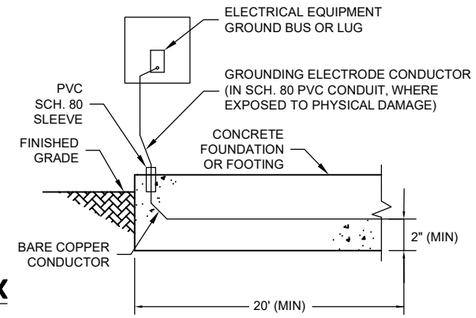


SCALE: NONE

1. STAINLESS STEEL 1-5/8" X 1-5/8" UNISTRUT CHANNEL.
2. ½" X 3" S.S. ANCHOR BOLT OR LAG BOLT WITH WASHER, ANCHORED TO WALL (EVERY 18", 2 MIN.)
3. MAXIMUM PANEL HEIGHT NOT TO EXCEED 72".
4. CENTER OF INSTRUMENT DISPLAYS SHALL BE 62".
5. CENTER OF LOCAL CONTROL STATIONS SHALL BE 48".

WALL MOUNTED JBOX/PANEL DETAIL

002 TYP SCALE: NONE

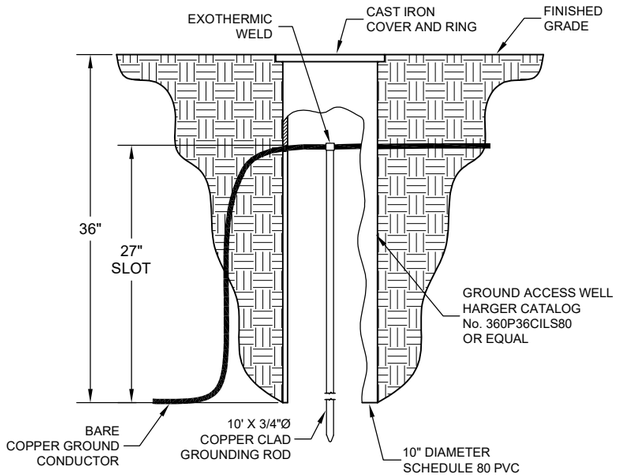


NOTE:

3'-11" x 3'-11" x 4'-1" MINIMUM INSIDE DIMENSIONS.
INSTALL A GROUND ROD AND CONNECT TO DUCT BANK GROUND.
TRAIN CABLES AROUND INTERIOR PERIMETER ON CABLE RACKS.

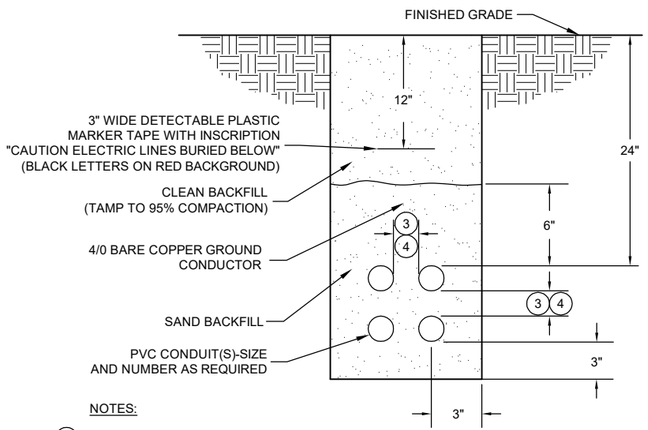
021 TYP **UNDERGROUND CONCRETE PULLBOX**

SCALE: NONE



NOTE:

ALL WORK SHALL BE PER NATIONAL ELECTRICAL CODE AND LOCAL GOVERNING AUTHORITY.

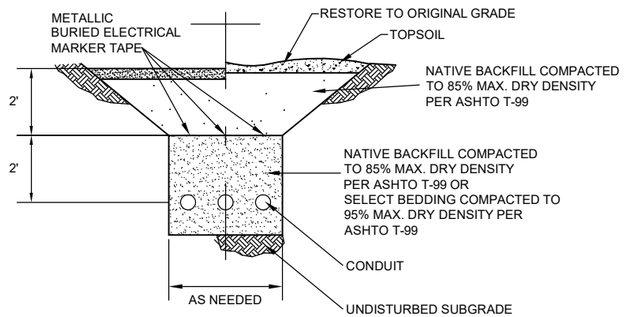


140 TYP **UFER GROUNDING DETAIL**

SCALE: NONE

100 TYP **GROUND ROD WITH ACCESS WELL**

SCALE: NONE



NOTES:

1. DIMENSIONS ARE MINIMUM.
2. THE GROUND CONDUCTOR SHALL RUN CONTINUOUSLY THROUGH MANHOLES AND PULL BOXES AND SHALL CONTINUE FROM THE DUCTBANK INTO THE ELECTRICAL EQUIPMENT OR BUILDING GROUNDING SYSTEM AND SHALL BE BONDED TO EACH RIDGID METAL CONDUIT. BOND CONDUCTORS TO BE SOLID COPPER #10 AWG OR LARGER AS REQUIRED BY THE NEC.
3. ALL DUCTS OF THE SAME DUTY (480V POWER, 120V POWER, 120V CONTROLS, AND SIGNAL/FIBER) SHALL BE SEPARATED BY A MINIMUM OF 2".
4. SIGNAL AND FIBER DUCTS SHALL BE SEPARATED FROM 480V POWER BY A MIN. OF 12", FROM 120V POWER BY A MIN. OF 6" AND FROM 120V CONTROL BY MIN. OF 4" UNLESS NOTED OTHERWISE ON THE DRAWINGS. 120V POWER AND 120V CONTROL DUCTS SHALL BE SEPARATED FROM 480V POWER BY A MIN. OF 4" UNLESS NOTED OTHERWISE ON THE DRAWINGS.

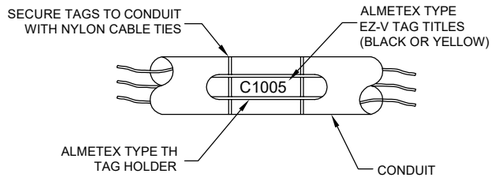
202 TYP MULTIPLE DUCT DUCTBANK DETAIL

SCALE: N.T.S.

NOTES:

1. ALL DIMENSIONS SHOWN ARE MINIMUM DIMENSIONS. UNLESS NOTED OTHERWISE ON THE DRAWINGS.
2. ALL REBAR SHALL BE #4 BAR AND HAVE A MINIMUM CONCRETE EMBEDMENT OF 2" (EDGE OF REBAR TO OUTSIDE SURFACE OF CONCRETE).
3. REBAR HOOPS SHALL OVERLAP 9" MINIMUM AND SHALL BE PROVIDED EVERY 4 FEET HORIZONTALLY. HOOPS SHALL NOT BE REQUIRED ON SINGLE ROW DUCTBANKS.
4. HORIZONTAL REBAR SHALL BE PLACED @ A MAXIMUM OF 18" ON CENTER ALL AROUND THE DUCTBANK ENVELOPE AND SHALL BE SUPPORTED EVERY 4 FEET LONGITUDINALLY. SINGLE ROW DUCTBANKS LESS THAN 24" WIDE SHALL HAVE A MIN. OF 2 HORIZONTAL BARS.
5. DUCT SPACERS (SADDLES) SHALL BE PROVIDED FOR PROPER SUPPORT OF CONDUIT DUCTS. SPACERS SHALL BE PROVIDED HORIZONTALLY AS RECOMMENDED BY THE MANUFACTURER AND TO PREVENT ANY SAGGING OF THE DUCTS (LOW SPOTS WILL NOT BE ALLOWED).
6. DUCTS SHALL BE SECURED TO PREVENT FLOATING DURING THE CONCRETE ENCASEMENT.
7. PROVIDE A 4/0 BARE CONTINUOUS COPPER GROUND. SEE GROUNDING SPECIFICATION SECTION 16170.
8. DUCTBANK CONCRETE SHALL BE COLOR DYED RED BY MIXING 3 LBS. IRON OXIDE PER CUBIC YARD OF CONCRETE.
9. ALL DUCTBANKS SHALL BE SLOPED @ 1/4" PER 10 FEET TO ALLOW DRAINAGE.
10. A 3" WIDE DETECTABLE PLASTIC MARKER TAPE WITH INSCRIPTION "CAUTION ELECTRICAL LINES BURIED BELOW" (BLACK LETTERS ON RED BACKGROUND) SHALL BE INSTALLED 12" ABOVE THE TOP OF ALL CONCRETE ENCASED DUCTBANKS.
11. REFER TO CONDUIT SCHEDULE FOR WIRE FILL OF ALL DUCTS.
12. ALL DUCTS OF THE SAME DUTY (480V POWER, 120V POWER, 120V CONTROLS, AND SIGNAL) SHALL BE SEPARATED BY A MINIMUM OF 2".
13. SIGNAL DUCTS SHALL BE SEPARATED FROM 480V POWER BY A MIN. OF 12". SIGNAL DUCTS SHALL BE SEPARATED FROM 120V POWER DUCTS BY 6" MIN. AND FROM 120V CONTROL BY MIN. OF 4" UNLESS NOTED OTHERWISE ON THE DRAWINGS.



1. UNISTRUT P1000 CHANNEL
2. UNISTRUT CONDUIT STRAP
3. 3/8"x3-1/2" ANCHOR BOLT GROUTED INTO CONCRETE (1 PER FOOT 2 MINIMUM)

FOUNDATION PLAN

SCALE 1/8"=1'-0"

FOUNDATION and CONCRETE NOTES

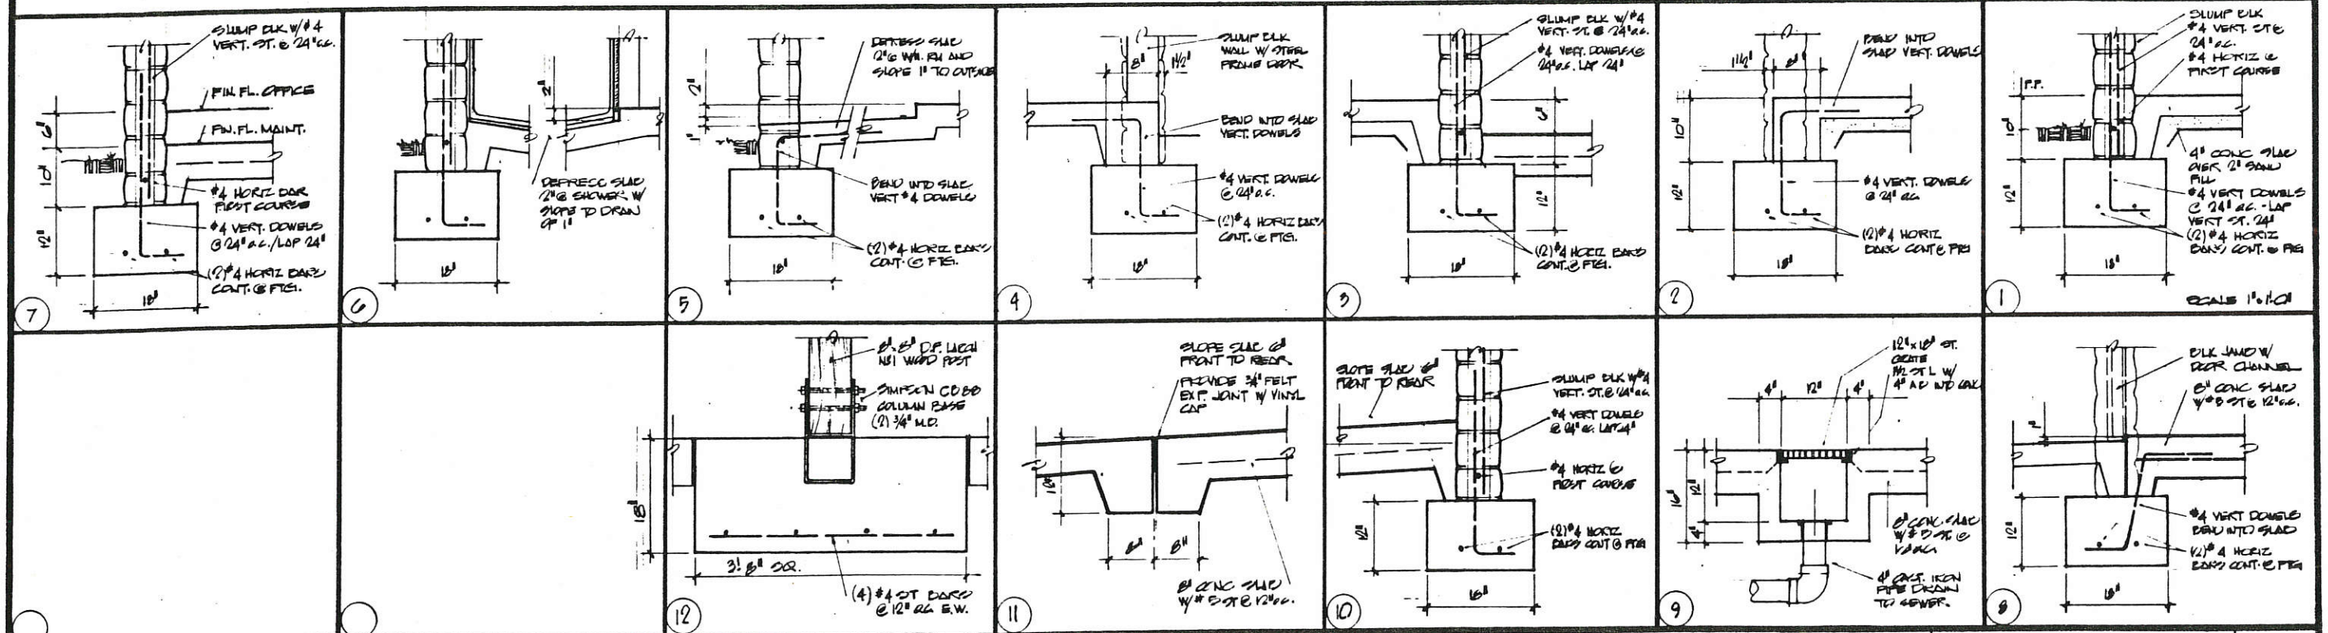
A. FOUNDATIONS

- ASSUMED BEARING VALUE - SEE NOTE 'A'
- ALL BACKFILL SHALL BE COMPACTED TO MINIMUM OF 90% MAXIMUM DENSITY.
- ALL FOOTINGS SHALL BE EMBEDDED A MINIMUM OF 12" BELOW NATURAL GRADE.
- ALL WATER SHALL BE REMOVED FROM FOUNDATION EXCAVATIONS PRIOR TO PLACING ANY CONCRETE.

B. REINFORCING STEEL

- ALL STEEL SHALL BE INTERMEDIATE GRADE CONFORMING TO A.S.T.M. A-615 GR 40.
- ALL STEEL DWG. BRCHT'D BARS SHALL BE DEFORMED PER A.S.T.M. A 305.
- WELDED WIRE MESH SHALL CONFORM TO A.S.T.M. A-185 OR A-497.
- ALL STEEL SHALL BE PLACED AND TIED PROPERLY PRIOR TO POURING CONC.

C. CONCRETE



- CONCRETE USE IN THIS WORK SHALL HAVE THE FOLLOWING 28 DAY COMPRESSIVE STRENGTH WITH A 4" MAXIMUM SLUMP, SLABS ON GRADE AND FOOTINGS - 3,000 P.S.I.
- CONCRETE OVER STEEL SHALL BE PER AC I 318-83 REQUIREMENTS
- BEFORE PLACING ANY CONCRETE, CHECK WITH ALL TRADES TO INSURE PROPER PLACEMENT OF ALL OPENINGS, SLEEVES, CURBS, CONDUITS DRAINS, ANCHORS, ETC. RELATING TO THIS BLDG.
- ALL TRADES THAT ARE REQUIRED ACCESS THRU CONC. SHALL BE REQUIRED TO PLACE EQUIPMENT, MATERIAL OR MAKE ARRANGEMENT FOR PLACEMENT PRIOR TO POURING CONCRETE.

D. BLOCK MASONRY

- MASONRY BLOCK UNITS SHALL BE GRADE N-1 f'm = 1500 PSI, SLUMP BLOCK BY FIRST-LITE BLK. MFG. OR ORCO BLOCK MFG., MASONRY UNITS SHALL BE CLEAN AND FREE OF ALL SUBSTANCE THAT MAY INHIBIT BOND.
- MORTAR MIX SHALL CONFORM TO A.S.T.M. C-270 & TYPE S

NOTE 'A' - SEE REPORT OF PRELIMINARY FOUNDATION INVESTIGATION, PROPOSED ADDITIONS TO CITY OF BANNING SEWER AND TREATMENT PLANT 1985 AND 1986 BY ASSOCIATED SOILS ENGINEERING INC.

GENERAL NOTES:

GENERAL CONSTRUCTION

1. IT SHALL BE THE CONTRACTOR'S RESPONSIBILITY TO VERIFY ALL DIMENSIONS AND CONDITIONS AT THE SITE AND TO CROSS CHECK DETAILS AND DIMENSIONS SHOWN ON THE CIVIL, MECHANICAL AND ELECTRICAL DRAWINGS. FLOOR AND WALL OPENINGS, SLEEVES, VARIATIONS IN THE STRUCTURAL SLAB ELEVATIONS AND OTHER CIVIL, MECHANICAL OR ELECTRICAL REQUIREMENTS MUST BE COORDINATED BEFORE THE CONTRACTOR PROCEEDS WITH CONSTRUCTION.

2. IN ALL CASES WHERE A CONFLICT MAY OCCUR SUCH AS ITEMS COVERED BY SPECIFICATIONS OR NOTES ON THE DRAWINGS OR BETWEEN GENERAL NOTES AND SPECIFIC DETAILS, THE CIVIL ENGINEER SHALL BE NOTIFIED AND HE WILL INTERPRET THE INTENT OF THE CONTRACT DOCUMENTS.

3. IN NO CASE SHALL WORKING DIMENSIONS BE SCALED FROM PLANS, SECTIONS OR DETAILS ON STRUCTURAL DRAWINGS.

4. THE DETAILS ON DRAWING S-1 AND S-2 SHALL APPLY IN ALL CASES UNLESS SPECIFICALLY DETAILED OR NOTED OTHERWISE. WHERE NO SPECIFIC DETAIL IS SHOWN, THE FRAMING OR CONSTRUCTION SHALL BE IDENTIFIED OR SIMILAR TO THAT INDICATED FOR LIKE CASES OF CONSTRUCTION ON THIS PROJECT.

5. WALL AND FLOOR OPENINGS AS REQUIRED BY CIVIL, MECHANICAL, ELECTRICAL OR SIMILAR REQUIREMENTS AS WELL AS EQUIPMENT INSTALLATION SHALL BE VERIFIED BY SHOP DRAWINGS, EQUIPMENT DATA, ETC. AS REQUIRED.

6. STRUCTURES HAVE BEEN DESIGNED FOR OPERATIONAL LOADS ON THE COMPLETED STRUCTURES. DURING CONSTRUCTION, THE STRUCTURES SHALL BE PROTECTED BY BRACING AND BALANCING WHEREVER EXCESSIVE CONSTRUCTION LOADS MAY OCCUR.

7. WORKMANSHIP AND MATERIALS SHALL CONFORM TO THE REQUIREMENTS OF THE LATEST EDITION OF THE UNIFORM BUILDING CODE AND THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION AND ADDENDA.

8. WHEN FILLING THE STRUCTURES WITH WATER, AS REQUIRED IN THE SPECIFICATIONS, ALL BASINS (IF ANY) LOCATED IN THE SAME STRUCTURE SHALL BE FILLED SIMULTANEOUSLY AT THE SAME RATE IN ORDER TO KEEP THE WATER LEVEL CONSTANT THROUGHOUT.

REINFORCING STEEL

1. ALL REINFORCING STEEL SHALL BE GRADE 40 FOR #4 AND SMALLER; GRADE 60 FOR #5 AND LARGER REINFORCING STEEL SHALL CONFORM TO ASTM A-615. DEFORMATION SHALL BE IN ACCORDANCE WITH ASTM A-305.

2. ALL DETAILING, FABRICATION AND PLACING OF REINFORCING BARS, UNLESS OTHERWISE NOTED, SHALL BE IN ACCORDANCE WITH THE "MANUAL OF STANDARD PRACTICE OR DETAILING REINFORCED CONCRETE STRUCTURES" ACI-315, LATEST EDITION.

3. REINFORCING MARKED "CONTINUOUS" AND TEMPERATURE REINFORCING OF WHICH THE LAP LENGTH HAS NOT BEEN SPECIFIED MAY BE SPLICED WITH A LAP AS INDICATED ON NOTE 3 OF DETAIL 8, PAGE S-2. ALL OTHER LAPS REQUIRED SHALL BE AS SHOWN ON THE DRAWINGS OR AS APPROVED BY THE ENGINEER.

4. UNLESS OTHERWISE SHOWN, ASIDE FROM NORMAL ACCESSORIES USED TO HOLD REINFORCING BARS FIRMLY IN POSITION, THE FOLLOWING SHALL BE ADDED:

   A. IN SLAB: #4 MIN RISER BARS AT 48 INCHES O.C. MAX. TO SUPPORT TOP REINFORCING BARS.

   B. IN WALLS: WITH 2 CURTAINS #3 U OR I SHAPE SPACERS AT 6 FEET O.C. EACH WAY.

5. METAL CLIPS OR SUPPORTS SHALL NOT BE PLACED IN CONTACT WITH THE FORMS OR THE SUBGRADE. CONCRETE BLOCKS (OR DOBBIES) SUPPORTING BARS ON SUBGRADE SHALL BE IN SUFFICIENT NUMBERS TO SUPPORT THE BARS WITHOUT SETTLEMENT, BUT IN NO CASE SUCH SUPPORT SHALL BE CONTINUOUS.

6. DOWELS SHALL BE WIRED OR OTHERWISE HELD IN POSITION. THEY SHALL NOT BE PLACED INTO FRESHLY POURED CONCRETE.

7. REINFORCING BARS AND ACCESSORIES SHALL NOT BE PLACED IN CONTACT WITH ANY PIPE, PIPE FLANGE OR METAL PARTS EMBEDDED IN CONCRETE. A MINIMUM OF 2 INCHES CLEARANCE SHALL BE PROVIDED AT ALL TIMES.

8. CERTIFICATION AND TESTING OF REINFORCED STEEL SHALL BE IN ACCORDANCE WITH THE PROVISIONS OF ASTM STANDARDS. THE CONTRACTOR SHALL SUPPLY SUCH CERTIFICATION TO THE ENGINEER PRIOR TO PLACEMENT OF ANY REINFORCEMENT.

9. UNLESS OTHERWISE SHOWN ON DRAWINGS, ALL REINFORCING SHALL HAVE THE FOLLOWING CONCRETE COVERAGE.

   A. SLABS OR WALLS (SURFACES EXPOSED TO THE WEATHER OR IN CONTACT WITH EARTH OR WATER).....2"

   B. WALL (UNEXPOSED, INTERIOR).....1-1/2"

   C. BEAMS AND COLUMNS (MAIN REINF.).....2"

   D. SLABS (UNEXPOSED, INTERIOR).....1-1/2"

   E. SURFACES DEPOSITED DIRECTLY AGAINST EARTH.....3"

   F. SURFACES DEPOSITED DIRECTLY AGAINST EARTH (FORMED).....2"

STRUCTURAL STEEL

1. STEEL CONSTRUCTION SHALL CONFORM TO THE SPECIFICATIONS AND STANDARDS AS CONTAINED IN THE LATEST EDITION OF THE AISC STEEL CONSTRUCTION MANUAL.

2. ALL STRUCTURAL SHAPES, BARS, PLATES AND SHEETS SHALL MEET ASTM A-36 SPECIFICATIONS.

3. ALL WELDING SHALL BE BY THE SHIELDED ARC METHOD AND SHALL CONFORM TO AWS CODE FOR ARC AND GAS WELDING. QUALIFICATION OF WELDERS SHALL BE IN ACCORDANCE WITH THE SPECIFICATIONS FOR STANDARD QUALIFICATION PROCEDURE OF AWS.

MASONRY

1. CONCRETE BLOCK MASONRY SHALL BE NORMAL WEIGHT, HOLLOW UNITS CONFORMING TO ASTM C-90, GRADE "N" SIZE OF UNITS, COLOR AND TEXTURE SHALL BE AS PER SPECIFICATIONS.

2. ALL CELLS OF MASONRY CONCRETE BLOCK SHALL BE GROUTED UNLESS OTHERWISE NOTED ON DRAWINGS.

3. BAR SPLICES SHALL BE 40 BAR DIAMETER UNLESS OTHERWISE NOTED.

4. MORTAR SHALL BE IN ACCORDANCE WITH TABLE 24-A OF U.B.C. TYPE M AND SHALL HAVE MINIMUM COMPRESSIVE STRENGTH AT 28 DAYS OF 2500 PSI. GROUT SHALL BE IN ACCORDANCE WITH PARA. 2403(8) OF U.B.C. AND SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH OF 2000 PSI.

WOOD

1. ALL HORIZONTAL LOAD CARRYING MEMBERS AND POSTS SHALL BE NO. 1 GRADE DOUGLAS FIR OR LARCH (EXCEPT AS NOTED).

2. STUDS, PLATES, SILLS AND BLOCKING TO BE CONSTRUCTION GRADE DOUGLAS FIR OR BETTER.

3. SILLS UNDER BEARING AND NON-BEARING STUD PARTITIONS SHALL BE PRESSURE TREATED DOUGLAS FIR BOLTED TO CONCRETE WITH 5/8" DIA X 10" ANCHOR BOLTS SPACED NOT MORE THAN 4'-0" O.C. UNLESS NOTED OTHERWISE, THERE SHALL BE ONE BOLT WITHIN 9" OF EACH END OF ALL SILL PLATE, MINIMUM 2 BOLTS PER PIECE.

4. BRIDGING SHALL BE PROVIDED AS PER CODE.

5. FRAMING MEMBERS SHALL NOT BE NOTCHED IN ANY MANNER EXCEPT WHERE SPECIFICALLY DETAILED OR APPROVED BY THE ENGINEER.

6. MINIMUM NAILING FOR ALL WOOD MEMBERS SHALL BE PER CODE UNLESS SPECIFICALLY NOTED.

7. STRUCTURAL PLYWOOD SHALL BE C-DX (32/16) IN CONFORMANCE WITH UBC STANDARD NO. 25-9 AND OF THICKNESS AS NOTED ON PLANS.

8. EDGES OF ALL OPENINGS THROUGH THE ROOF SHALL BE NAILED PER BOUNDARY OF PLYWOOD DIAPHRAGM NAILING REQUIREMENTS.

9. JOIST HANGERS AND OTHER CONNECTORS SHALL BE SIMPSON TYPE OR EQUAL.

FOUNDATIONS

1. FOUNDATION DESIGN BASED UPON CRITERIA PRESENTED IN "REPORT OF PRELIMINARY FOUNDATION INVESTIGATION PROPOSED ADDITIONS TO CITY OF BANNING SEWER TREATMENT PLAN CHARLES STREET, BANNING, CALIFORNIA".

2. ALL FOOTINGS SHALL EXTEND 12" MINIMUM INTO FIRM NATURAL MATERIAL

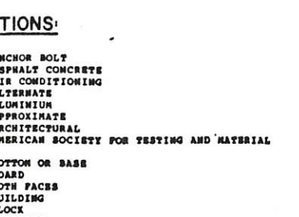
CONCRETE

1. ALL STRUCTURAL CONCRETE SHALL DEVELOP A MINIMUM COMPRESSIVE STRENGTH OF 3000 PSI IN 28 DAYS.

2. ALL KEYWAYS IN CONSTRUCTION JOINTS SHALL BE THOROUGHLY CLEANED TO OBTAIN MAXIMUM BONDING.

3. THE LOCATION OF ALL CONSTRUCTION JOINTS NOT SPECIFICALLY NOTED OR SHOWN SHALL BE APPROVED BY THE CIVIL OR STRUCTURAL ENGINEER.

4. ALL WATER HOLDING STRUCTURES SHALL REQUIRE WATERSTOPS AT ALL CONSTRUCTION AND EXPANSION JOINTS, EXCEPT AT JOINTS ONLY COMMON TO WATER HOLDING STRUCTURES.



5. DOWELS, PIPES, WATERSTOPS AND OTHER INSTALLED MATERIALS OR ACCESSORIES SHALL BE HELD SECURELY IN POSITION WHILE CONCRETE IS BEING PLACED.

6. ALL EXPOSED CORNERS AND EDGES OF SLABS, WALLS AND COLUMNS SHALL HAVE TOOLED EDGES OR 3/4" CHAMFER.

GENERAL NOTES:

1. (#) DESIGNATES A DIMENSION, SIZE OR CONFIGURATION, ETC. WHICH SHALL BE VERIFIED BY THE MANUFACTURER OF THE ACTUAL EQUIPMENT FURNISHED.
2. EXACT LOCATION OF EQUIPMENT, PIPING AND ELECTRICAL EQUIPMENT TO BE VERIFIED BY MANUFACTURER'S APPROVED DRAWINGS PRIOR TO CONSTRUCTION. EQUIPMENT SHALL BE LOCATED FOR EASY MAINTENANCE AND REPAIR.
3. ANCHOR BOLTS, BOLTS, FLAT & LOCK WASHERS AND NUTS WHICH SHALL BE UTILIZED FOR ADJUSTABLE WEIRS SHALL BE STAINLESS STEEL. ALL OTHER ANCHOR BOLTS SHALL BE GALVANIZED.
4. ALL EQUIPMENT FLOOR MOUNTED SHALL BE INSTALLED PER DETAILS ON SHEET M-9
5. REFER TO SHEET 9# FOR PIPE THROUGH WALL DETAIL. PIPE SLEEVE TYPE REQUIRED ONLY WHERE INDICATED.
6. THE LOCATION OF ELECTRICAL SERVICE JUNCTION BOX SHALL BE LOCATED NEAR EQUIPMENT MOTOR TERMINAL BOXES. THE CONTRACTOR SHALL BE RESPONSIBLE TO VERIFY WITH MANUFACTURER.
7. MINIMUM PIPE COVER SHALL BE 3' - 0" UNLESS SPECIFICALLY INDICATED OTHERWISE.
8. THRUST BLOCKS SHALL BE PROVIDED PER STANDARD DRAWING FOR ALL PIPE BENDS GREATER THAN V32 BEND.
9. WEEP RING SHALL BE PROVIDED AT ALL PIPING THROUGH WATER CONTAINING STRUCTURE WALLS. ALL PIPE INLET/OUTLET SHALL HAVE ROUND EDGE PER DETAIL ON SHEET S-2.
10. ALL HANDRAILS SHALL BE 1-1/2" DIAMETER PIPE AND SHALL BE POST SLEEVE MOUNTED PER DETAIL M-9
11. ALL METAL SURFACE TO BE BOLTED TO CONCRETE SHALL RECEIVE COATING PER SPECIFICATION SECTION 4.10 PRIOR TO INSTALLATION. ALL METAL TO BE CAST-IN-CONCRETE SHALL BE GALVANIZED UNLESS SPECIFICALLY INDICATED.
12. ALL VALVES SHALL BE PROVIDED WITH AN INDEXING TAG PER STANDARD DRAWING VALVES AS LISTED SHALL BE REVISED BY THE CONTRACTOR TO REFLECT EXACT AS INSTALLED CONDITIONS. THE CONTRACTOR SHALL LIST AND INDEX ALL VALVES INCLUDING THOSE VALVES NOT LISTED HEREON.
13. GATE VALVES SHALL BE AWWA TYPE UNLESS INDICATED ON THE VALVE SCHEDULE AS LOW PRESSURE TYPE (GATE L.P.)
14. PLUG VALVES SHALL BE NON-LUBRICATED TYPE UNLESS OTHERWISE INDICATED ON THE VALVE SCHEDULE.
15. BURIED VALVES SHALL BE DESIGNED SPECIALLY FOR BURIED SERVICE AND PROVIDED WITH STEM EXTENSION, VALVE BOX, AND COVER. GEAR OPERATORS SHALL BE PROVIDED AS REQUIRED. TWO TEE HANDLES SHALL BE FURNISHED. REFER TO STANDARD DRAWING FOR VALVE BOXES.

NOTE:

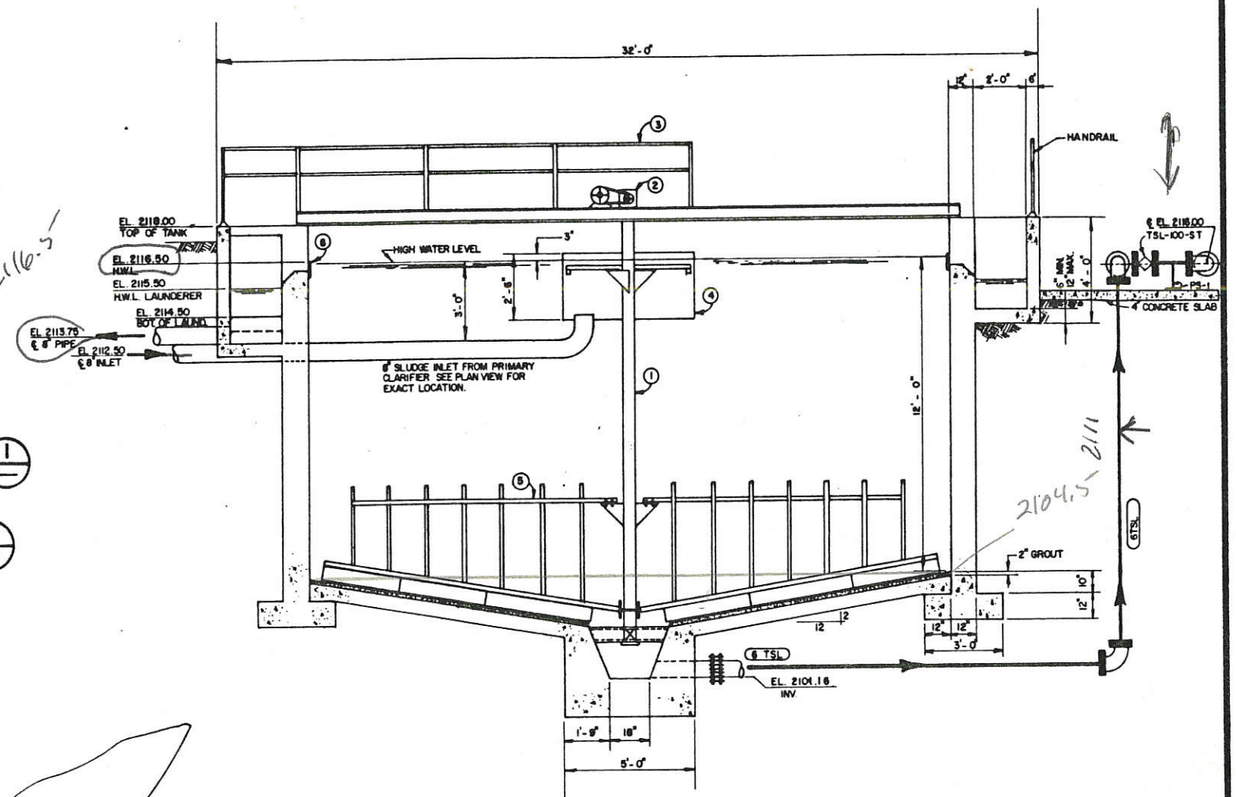
1. LAYOUT BASED ON ENVIREX COMBINED HEATER AND HEAT EXCHANGER MODEL 756R. MINIMUM BOILER OUTPUT RATING SHALL BE 900,000 BTU/HR. MINIMUM SLUDGE HEATING CAPACITY SHALL BE 750,000 BTU/HR. INSTALLATION OF THE UNIT AND APPURTENANCES SHALL BE PER MANUFACTURER'S RECOMMENDATIONS.
2. ALL ELECTRICAL ITEMS FURNISHED AND INSTALLED SHALL BE SUITABLE FOR HAZARDOUS LOCATIONS.
3. EXISTING PIPING AND APPURTENANCES HAVE BEEN LOCATED BY UTILIZING PREVIOUS CONSTRUCTION DRAWINGS. MISCELLANEOUS VALVES AND FITTINGS HAVE NOT BEEN SHOWN. CONTRACTOR SHALL VERIFY PIPING LOCATIONS IN THE FIELD.
4. CONTRACTOR SHALL VERIFY THE ADEQUACY OF THE EXISTING ELECTRICAL SYSTEM AND FURNISH AND INSTALL THE NECESSARY ITEMS FOR THE PROPER OPERATION OF THE RELOCATED SLUDGE PUMP, OPERATION AND CONTROL OF THE BOILER UNIT AND THE SUMP PUMP.
5. ALL GAS PIPING SHALL BE SCHEDULE 80, PVC PIPE.
6. ALL LIQUID PIPING SHALL BE AS LISTED ON SHEET M-1.
7. 'W'. DIMENSIONS WILL VARY DEPENDING ON ACTUAL HEATER UNIT SUPPLIED. MINIMUM 3 FEET CLEARANCE SHALL BE MAINTAINED BETWEEN OBSTRUCTIONS AND GAS PIPING, CONTROLS, VIEWPORTS AND MAINTENANCE ACCESS OF THE UNIT.



NOTE: INDICATES BLOCKWALL

SYMBOL LIST

SYMBOL	DESCRIPTION
	1/2" conduit run with 2 #12 conductors unless shown otherwise.
	1/2" conduit underground with 2 #12 conductors unless shown otherwise.
C.O.	Conduit run only, no wires within.
#10	Cross lines on conduit runs indicate number of #12 awg wires contained therein. 2 #12 are to be ran when cross lines are not shown. Numeral beside cross lines indicate size other than #12. Longer cross lines indicate neutral wire.
CE2	Conduit run to panelboard "CE", circuit no. 2.
C.O.	Conduit only.
	Fluorescent light fixture.
	Pole or wall mounted light fixture.
	Motor running light indication in control panel.
B DO	Lighting fixture identification symbol. Letter indicates type of fixture; numeral in lower half of hexagon indicates lamp wattage; excluding ballast where applicable.
PB	Pullbox.
	Branch circuit panel.
S	Single pole light switch.
J	Junction box.
W.P.	Weatherproof
+6'-6"	Indicates equipment mounting height above finished floor, grade, stairs, or platform unless otherwise noted.
(2)	Integral or fractional horsepower motor, numeral indicates horsepower rating.
150A, 2P	Molded case circuit breaker, ampere trip rating of poles as indicated.
	Transformer, description as noted.
2	Combination magnetic motor starter with molded case circuit breaker. Numeral indicates size.
	Ground
G	Generator
	Conductors connected.
U.G.	Underground
A.I.C.	Ampere interrupting capacity, symmetrical.
F	Disconnect switch, F indicates fused.
M	Circuit number in Control House switchgear room distribution equipment.
	Transfer switch.
M	Electricmeter
	Duplex grounding type receptacle (mount at +12" unless otherwise noted)

PULLBOXES

VIEWS LOOKING INTO BOXES SIDES LAID DOWN

EQUIPMENT REQUIREMENTS & WIRE AND CONDUIT RUNNING LIST FOR PULL BOX WORK

WORK ITEM	ACTION REQUIRED	DESCRIPTION	FROM	VIA	TO	REMARKS
A.	REMOVE	8 #4 SPARE CONDUCTORS	ELECT. ROOM CKT 13, MCC-3	1 1/2" C 'ZH1 0" TO PB'Z' & THEN 2" C 'ZY4' TO PB'Y' & THEN 1 1/2" C 'YN3'	ABOVE GROUND 24"W X 12"H X 7"D PULLBOX AT PRIMARY EFFLUENT LOCATION	THESE CONDUITS TO BE REUSED FOR FEEDER TO NEW VARIABLE FREQUENCY DRIVE SYSTEM. REPLACE 100A BREAKER MCC-3, CKT 13 WITH 250 AF, 175A TRIP WALL MOUNTED BREAKER.
B.	REMOVE	3 #4 SPARE CONDUCTORS	PB'Y'	2" C 'YN2'	ABOVE GROUND 24"W X 12"H X 7"D PULLBOX AT PRIMARY EFFLUENT LOCATION	THIS ITEM CAN BE PERFORMED CONCURRENTLY WITH ITEM C.
C.	REMOVE PULL BACK-DO NOT CUT)	3 #4 WORKING CONDUCTORS	PB'Y'	2" C 'YN2'	PRIMARY EFFLUENT MOTOR STARTERS NOS. 1 & 2 IN 20"W X 26"H X 8"D ENCLOSURE FOR PRI. EFFL. PUMPS NOS. 1 & 2	RELOCATE CONTROL PANEL TO A CONVENIENT NEARBY LOCATION AND TEMPORARILY RESTORE PUMPS TO OPERATION WITH THIS FEEDER UNTIL CUTOVER TO THE NEW VFD SYSTEM. REWORK LOAD ENDS OF CONDUITS 'YN2' AND 'YN3' AS REQUIRED TO TERMINATE THEM IN VFD EQUIPMENT.
D.	ADD	3 #2/0 CU, THWN (NEW) FOR VFD SYSTEM (NEW)	CKT 30, ELECT. ROOM	1 1/2" C 'ZH1 0" TO PB'Z' & THEN 2" C 'ZY4' TO PB'Y' & THEN 1 1/2" C 'YN3'	VARIABLE FREQUENCY DRIVE SYSTEM MAIN BUS	BOND ALL CONDUITS IN PULLBOXES FOR THIS CIRCUIT WITH A #6 CU. CONDUCTOR PER NEC. TABLE 250-95.
E.	ADD	3 SETS-3 #8 CU, THWN (NEW) FOR PEP #1 & 2 (E) PEP #3 (NEW)	VARIA. FREQ. DRIVE SYSTEM	3 - 3/4" C	PRIMARY EFFLUENT PUMPS NOS. 1,2 & 3	PUMPS 1 & 2 ARE EXISTING. PUMP NO. 3 IS NEW. THIS WORK ITEM DISCONTINUES THE OPERATION OF THE PRIMARY EFFLUENT PUMPS ON A TEMPORARY BASIS PER ITEM C.
F.	REMOVE	6 #4 SPARE CONDUCTORS (3 SPARE & 3 NOW DISCONNECTED FROM PRI. EFFL. PUMPS 1 & 2 STARTERS)	ELECT. ROOM MCC-3, 3 #4, CKT 12& 3&4 SPARE	1 1/2" C 'ZH6' TO PB'Z' & THEN 2" C 'ZY5' TO PB'Y' & THEN 1" C 'YT4' TO PB 'T' & THEN 'TE4'	TEMPORARY SET-UP OF PRIMARY EFFLUENT PUMPS 1 & 2 PER. ITEM C.	REUSE THIS CONDUIT PATH FOR ITEM G BELOW.
G.	ADD	2 #8 THWN & 15 AMP, 2P BREAKER (NEW) FOR CHLOR. BLDG. UNPROTECTED SUPPLY (NEW)	ELECT. ROOM MCC-3, CKT 18	1 1/2" C 'ZH6' TO PB'Z' & THEN 2" C 'ZY5' TO PB'Y' & THEN 1" C 'YT4' TO PB 'T' & THEN 'TE4'	J - BOX OUTSIDE CHLORINE EQUIPMENT BUILDING	BOND CONDUITS IN PULLBOXES. THIS CKT IS FOR CHLORINE BUILDING UNPROTECTED SUPPLY. SEE CHLORINE EQUIP 'T' BUILDING - SHEET E-4. PULL IN THESE CONDUCTORS THRU 'ZH5' AT THE SAME TIME WITH CONDUCTORS ADDED IN ITEMS H, M & N BELOW. PULL IN THESE CONDUCTORS THRU 'ZY5' AT THE SAME TIME WITH CONDUCTORS ADDED IN ITEM M BELOW.
H.	ADD	3 #8 THWN & 30 AMP, 2P BREAKER (NEW) FOR CHLORINE BLDG. PROTECTED SUPPLY (NEW)	ELECT. ROOM PANEL A CKT 8, 10	1 1/2" C 'ZH6' TO PB'Z' & THEN 2" C 'ZY1' TO PB'Y' & THEN 1" C 'YT5' TO PB 'T' & THEN 'TE5'	J - BOX OUTSIDE CHLORINE EQUIPMENT BUILDING	THIS CKT FOR CHLORINE BUILDING PROTECTED SUPPLY. BOND CONDUITS IN PULLBOXES. PULL IN THESE CONDUCTORS THRU 'ZH5' AT THE SAME TIME WITH CONDUCTORS ADDED IN ITEMS G, M & N. PULL IN THESE CONDUCTORS THRU 'ZY1' AT THE SAME TIME WITH CONDUCTORS ADDED IN ITEM N.
L	ADD	6 #12 THWN FOR 5 HP RECIRCULATION PUMPS NOS. 1 & 2 (NEW)	ELECT. ROOM CKT 2, MCC-1 & CKT 9, MCC-2 USE ONE SPARE & ONE NEW BREAKER, TWO SPR. STARTERS	1 1/2" C 'XH1' TO PB'X' & THEN 1" C 'XV1' TO PB'V' & THEN 1" C 'VN1'	5HP, 480V, 3P DISCONNECTS IN SIGHT OF RECIRCULATION PUMPS NOS. 1 & 2	1 1/2" CONDUIT 'XH2' NOW OCCUPIED BY CONDUCTORS FOR 10 HP WASHWATER PUMP NO. 2 & UNUSED CONDUCTORS FOR ABANDONED WASHWATER PUMP NO. 1 & THESE CONDUCTORS TO REMAIN IN CONDUIT 'XH2' SEE ITEM J BELOW. BOND CONDUITS IN PULLBOXES.
J.	ADD	3 #12 THWN FOR 3/4 HP FINAL CLARIFIER PUMP (NEW)	ELECT. ROOM CKT 16 & MCC-3 (ADD NEW 15A, 3P BREAKER)	1 1/2" C 'XH3' TO PB'X' & THEN 1" C 'XV1' TO PB'V' & THEN 1" C 'VE1'	COMBINATION STARTER, SIZE 0, 3P, 480V, IN SIGHT OF FINAL CLARIFIER DRIVE	PULL IN THESE CONDUCTORS SIMULTANEOUSLY WITH CONDUCTORS BEING ADDED IN ITEM I ABOVE.
K.	ADD	2 #12 THWN & 1 #12 GRD (NEW) FOR AREA LT. FIXT. (NEW)	ELECT. ROOM PANEL 'A', CKT 15	1 1/2" C 'ZH5' TO PB'X' & THEN 1" C 'XV1' TO PB'V' & THEN 1" C 'VE1'	AREA LIGHT FIXTURE AT FINAL CLARIFIER BRIDGE.	PULL IN THESE CONDUCTORS SIMULTANEOUSLY WITH CONDUCTORS BEING ADDED IN ITEMS I & J ABOVE.
L	ADD	1" CONDUIT ONLY DESIGNATED 'XV1' (NEW)	PB'X'	PARALLEL TO 1" C 'XV1'	PB'V'	FOR FUTURE
M.	ADD	6 #4 THWN (NEW) FOR FINAL EFFLUENT PUMPS (NEW)	ELECT. RM. CKT 3 12 & 15 MCC-3, 100A. BRKRS	1 1/2"C. 'ZH5' TO PB'Z' & THEN 2"C 'ZY5' TO PB'Y' & THEN 1 1/2"C. 'YT5' TO PB 'T' & THEN 1 1/2"C. 'TE3'	PULLBOX BELOW FINAL EFFLUENT PUMP STARTERS	PULL IN THESE CONDUCTORS THRU CONDUIT 'ZH5' AT THE SAME TIME WITH CONDUCTORS ADDED IN ITEMS G, H & N. PULL IN THESE CONDUCTORS THRU CONDUIT 'ZY5' AT THE SAME TIME WITH CONDUCTORS ADDED IN ITEM G ABOVE.
N.	ADD	3 #12 THWN (NEW) FOR CHLOR. WATER SUPPLY PUMP (NEW)	ELECT. RM. CKT. 21, MCC-4	1 1/2"C. 'ZH5' TO PB'Z' & THEN 2"C 'ZY1' TO PB 'Y' & THEN 1"C. 'YT3' TO PB 'T' & THEN 'TE5'	J-BOX OUTSIDE CHLORINE EQUIPMENT BUILDING	PULL IN THESE CONDUCTORS THRU CONDUIT 'ZH5' AT THE SAME TIME WITH CONDUCTORS ADDED IN ITEMS G, H & M ABOVE. PULL IN THESE CONDUCTORS THRU CONDUIT 'ZY1, YT5' & 'TE5' WITH ITEM H ABOVE.
P.	ADD	3 #6 THWN (NEW) FOR MCC-6 PANEL (NEW)	ELECT. RM. CKT. 31, MCC-2	1 1/2"C. 'ZH1' TO PB'Z' & THEN 1 1/2"C. 'ZW4' TO PB'W' & THEN 'WS1'	MOTOR CONTROL PNL MCC-6 FOR SLUDGE PUMP, GRINDER & THICKENER.	NOTE THAT ALL CONDUITS BETWEEN PB'Z' & PB'W' ARE TO BE REMOVED & NEW CONDUITS REROUTED TO ALLOW INSTALLATION OF A NEW SLUDGE THICKENER STRUCTURE. SEE SITE PLAN & PULL BOX VIEWS ON THIS SHEET. CONDUITS 'ZH1' & 'ZW4' ARE NOW OCCUPIED BY 9 #10 CONDUCTORS (6 WORKING & 3 SPARE). PULL BACK THESE CONDUCTORS & RETURN THEM WITH THE 3 #8'S FOR THIS CIRCUIT.
Q	ADD	1" CONDUIT ONLY, DESIGNATED 'WE2'	PB'W'	PARALLEL TO 1" C. 'WS1'	MCC-6	FOR FUTURE

NOTES:
1. UNPROTECTED CIRCUITS SUPPLIED FROM PRIME SOURCE ONLY.

Proposal for Progressive Design-Build Services for the City of Banning Wastewater Treatment Plant and Recycled Water Upgrades Project - RFP-24-074

We are excited by the opportunity to become a trusted partner of the City in developing the most cost-effective solution for your wastewater treatment plant upgrades that will minimize impacts to your rate payers while at the same time, provide a long-term solution to support community growth. Our team has worked hard to find **design-to-budget ideas for your project and we are confident that the solutions we present in our proposal can save the City$10M+** compared to the original concept. Highlights of our proposal include:

- **Experts skilled in progressive design-build and MBR systems.** AECOM/Lyles have worked together on numerous progressive design-build treatment plant upgrade projects totaling over $1B, as well as many MBR systems. These past experiences allow us to work together seamlessly to deliver your project and hone in on the biggest cost items, optimizing the budget for the City.
- **Experience with San Gorgonio Pass and desert communities.** From our wealth of experience delivering similar projects in surrounding communities (including Beaumont), we have a strong appreciation for pragmatic solutions that work for you.
- **A proven progressive design-build management approach.** We know how to streamline the crucial Phase 1 activities so that collaboration is fostered while still making timely decisions to maintain the overall project schedule. We are committed to a transparent Guaranteed Maximum Price (GMP) presentation and converting this project from Phase 1 to Phase 2.
- **Design to Budget Ideas that offer real savings.** We have left no stone unturned in looking at ways to save the City money while still achieving your project goals. From optimizing basin sizing, to finding a creative way to forego the reverse osmosis (RO) system, we offer the City ways to lessen the impact to your rate payers, while maintaining the resiliency to accommodate local population growth and future permit expectations.
- **A dedication to a quality project.** Our design to budget ideas do not come at a cost of quality or impacting the City's options in the future. We are committed to using proven vendors and quality suppliers and our design provides for easy future expansion with low capital expenditure.
- **Our corporate commitment to make this a success for the City.** We are committing the team provided herein for the duration of the project. We have learned that team continuity throughout the duration is critical to the overall project success and delivering the lowest total project cost.

Single Point of Contact for AECOM/Lyles – Project Manager Joe Lawrence is the single point of contact for the team, ensuring clear communication and streamlined project management.

Joe Lawrence
Design-Build Project Manager
26501 Madison Avenue
Murrieta, CA 92562
T: 916.644.9487 | E: jlawrence@wmlylesco.com

We appreciate the City using an industry standard template as the basis for the sample agreement, and we are confident that we can negotiate a contract with the City for this project. We also confirm that we have read and understood all elements of the RFP. Furthermore, in our cost proposal, we have provided a detailed scope of work of our services.

Bonding and Sureties – The AECOM/Lyles team confirms we will meet the bonding requirements outlined in the Request for Proposal (RFP). We have included in our proposal a Surety Letter of Intent and the *Proposal Bid Bond* as required in RFP section IV.E.

Financial Capacity – Both AECOM and Lyles confirm there are no changes in our firms' financial capacities and bonding capabilities. The financial statements included in our SOQ are the most current and there are no changes in our standings.

CEQA, Funding, and PLA Compliance – The AECOM/Lyles JV confirms we have reviewed the *CEQA, Funding, and PLA Compliance* requirements, signed and included the form in our proposal uploads in your procurement system, and agree to comply with the terms and conditions.

Per the instructions in the Request for Proposal, our Part V Phase 1 Cost Proposal has been submitted as a separate file. Part VI Required Forms have been completed and uploaded into the OpenGov procurement system.

We have assembled a truly collaborative and integrated team. We look forward to sharing more details on our proposal during the interview. AECOM/Lyles appreciates the time and commitment the City has invested in this procurement process and appreciate you meeting with our team during our proposal development. **Our goal as the City's of Banning's trusted partner is to implement a "no surprises" and "design to budget" commitment throughout the project. This can only happen through effective, open and transparent communication and we look forward to working side-by side with the City in delivering this project.** Thank you for your consideration.

Respectfully submitted,

AECOM/Lyles Joint Venture

PART II

Project Team, Experience, and Approach

The AECOM/Lyles Team presented in our SOQ is 100% committed to the success of the City's WWTP and Recycled Water Upgrade project—from day one to day done.

"I am fully committed to collaborating with the City for the next several years to continue the implementation and construction of Banning's WWTP project, ensuring a safe and sustainable wastewater and recycled water system for decades to come.

– Joe Lawrence
Design-Build Project Manager

"I'm looking forward to this exciting partnership with the City of Banning where we explore cost-effective solutions, keeping the rate payers in mind at every step as we design to budget for this important project.

– Gabriel Perigault
Design Manager

"I pledge to open lines of communication with all stakeholders, including operations staff, to keep construction moving on the project and deliver first-class facilities of the highest quality, on budget and schedule – with no surprises.

– Marcos Reyes
Construction Manager

Key Project Personnel

As presented in our SOQ, the AECOM/Lyles key personnel have delivered together on design-build treatment projects in California with significant upgrade and maintenance of plant operations considerations, bringing demonstrated efficiency and collaboration to the City. Our management team—along with Treatment Process Design Lead Alex Franchi, Preconstruction Manager Vince Guillama, Construction Superintendent Anthony Pilato, Commissioning Lead Vijay Kumar, and other team members—remain fully committed to meeting all of the project objectives detailed in the City's RFP.

Team Enhancement

We are presenting one key team member enhancement in **Joe Lawrence as our Design-Build Project Manager**. Joe has a distinguished career in the water/wastewater industry, with 22 years of experience managing design-build projects for public and private water and wastewater treatment facilities. Throughout his career, Joe has been involved in all aspects of project delivery including project management, preconstruction services, cost control and budgeting, construction implementation, and start-up and commissioning on numerous alternative delivery projects, including design-build and progressive design-build projects. Many of these projects involved collaboration with the same AECOM/Lyles JV team we are proposing for this project.

While we have **NO CHANGE to the rest of our team or any of the key staff presented in our SOQ**, our team will be further enhanced during contracting efforts with disadvantaged subconsultants from our Good Faith Outreach efforts. We pledge to meet any goals required by the City and/or different funding sources and grants.

On the next page is an update to our organizational chart (Figure II-1) highlighting the enhancements to our team. We have also included a brief biography for our project manager Joe Lawrence that summarizes his qualifications. We would be happy to provide resumes for all of our team members at the City's request. **All other components of our team and SOQ remain unchanged.**

Benefits of the AECOM/Lyles Team

- ✓ **Extensive resources** that are fully committed to this project
- ✓ **Simultaneous and direct access to design and construction resources** at all times through our integrated joint venture
- ✓ **A team that has successfully worked together** to deliver other projects in the region
- ✓ **Proven ability to partner with owners through their first progressive design-build and get to Phase 2** without exercising the "off-ramp"
- ✓ **Collaborative design process:** price, constructability, operability are considered holistically
- ✓ **Innovative concepts** to minimize total project cost such as right-sizing tankage
- ✓ **Staff continuity** through all project phases
- ✓ **Maintain ongoing plant operations** with detailed construction sequencing
- ✓ **Comprehensive start-up and commissioning plan** to ensure operations staff is trained to operated the new facility

Enhancing our Team... *"W.M. Lyles Co., led by the exceptional project management of Mr. Joe Lawrence, delivered outstanding quality and expertise on the Galt WWTP Tertiary Filtration, UV Disinfection and Biosolids Improvements Project. Joe's leadership ensured timely completion within the 206-day timeline and minimal change orders. We're eager to collaborate with Joe and the W. M. Lyles Co. team again on future projects."* - James Boarer, P.E., Construction Manager, PSOMAS

Joe Lawrence

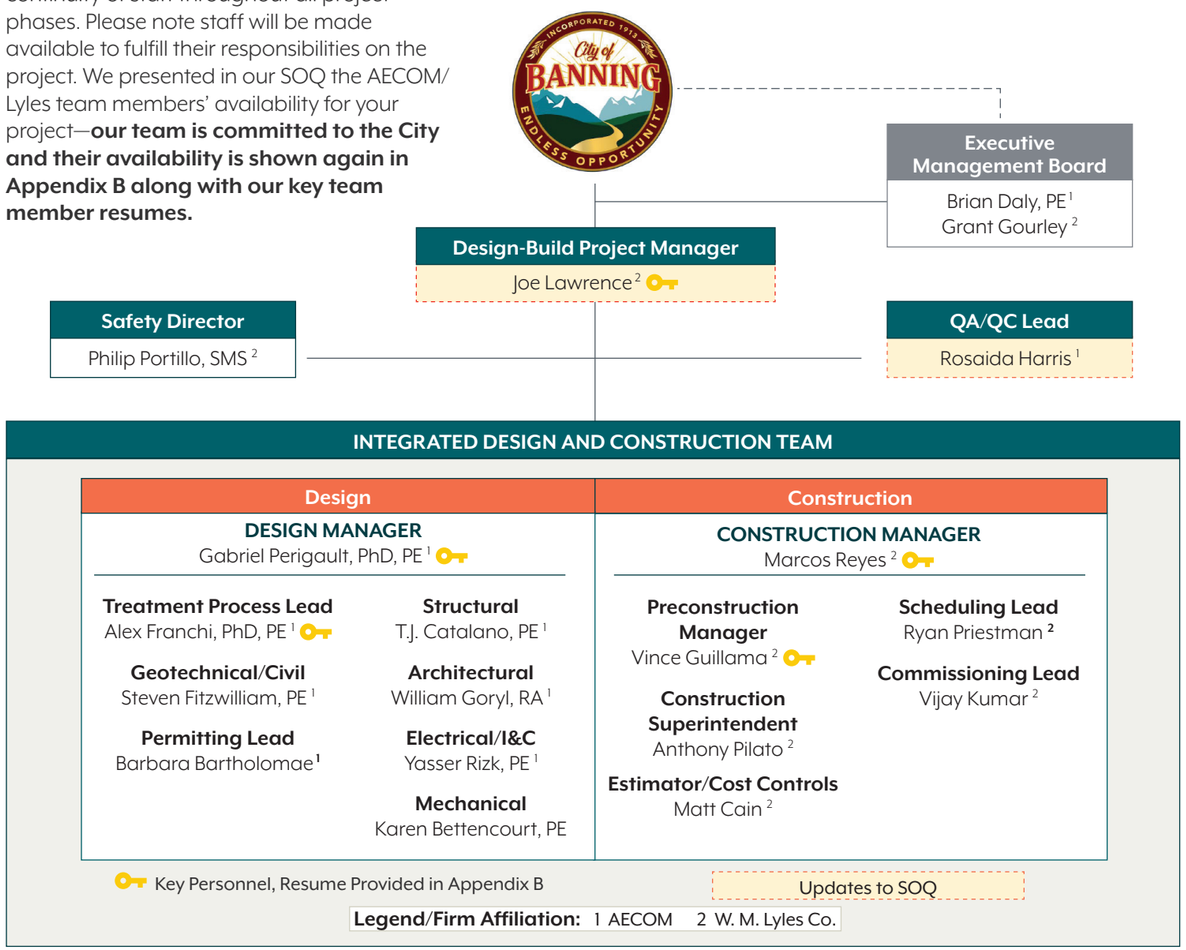
Design-Build Project Manager

Joe is a Senior Vice President at W. M. Lyles and Collaborative Delivery Manager with over 22 years of experience in managing and delivering large-scale water and wastewater treatment projects. He has a proven track record in pre-construction planning, project management, pre-construction services, cost control and budgeting, construction implementation, and start-up and commissioning on numerous design-build and progressive design-build projects. Joe is committed to delivering high-quality infrastructure while leading teams and managing complex project requirements.

Why Joe?

- ✓ Involved in every design-build project completed by AECOM WML in the last 15 years
- ✓ Brings expertise in **collaboration** and working with the team to **design to budget** for project success
- ✓ Met multiple times with the City of Banning and **understands the solutions** to upgrading the existing wastewater treatment plant
- ✓ Advanced understanding of various delivery methods, including design-build and progressive design-build
- ✓ Deep technical expertise, particularly in SCADA upgrades, biological treatment, tertiary filtration, and disinfection processes

Highly experienced progressive design-build project manager working on WWTP upgrades similar to the City of Banning



Joe brings 20+ years of experience in managing wastewater treatment plant upgrades with a primary focus on collaborative delivery. He brings detailed preconstruction phase and estimating experience combined with years of heavy civil construction and start-up and commissioning for water/wastewater infrastructure. He understands each step of the project lifecycle and how to lead a high-functioning team. **Joe has been working closely with AECOM for the past 15 years on design-build projects such as:**

- East County Advanced Water Purification (ECAWP) Packages 1 and 3 Progressive Design-Build
- City of Stockton Regional Wastewater Control Facility Progressive Design-Build Upgrades
- City of Davis Wastewater Treatment Plant Secondary and Tertiary Improvements, Design-Build
- City of Santa Cruz Graham Hill Water Treatment Plant Upgrades Progressive Design-Build

AECOM/Lyles project personnel are available to start work immediately and are committed to the City of Banning for the duration of your project

Figure 2-1: Organization Chart

Our combined organization promotes the continuity of staff throughout all project phases. Please note staff will be made available to fulfill their responsibilities on the project. We presented in our SOQ the AECOM/Lyles team members' availability for your project—**our team is committed to the City and their availability is shown again in Appendix B along with our key team member resumes.**

Good Faith Efforts

At AECOM/Lyles, we are dedicated to fostering diversity and inclusion through active engagement with Disadvantaged Business Enterprises (DBEs). Our comprehensive outreach strategy, including advertised public events, ensures economic growth and equal opportunity. We host public outreach events to share information on collaborative projects, maximizing participation from both local and competitive environments. For example, at Hi-Desert Water District, our open house with local unions, businesses, subcontractors, and the public resulted in multiple bids and met all SRF grant requirements. **For this project, we placed legal notice ads announcing the DBE opportunity in the Banning Record Gazette and performed searches on four websites (CA.GOV, DOT.CA, SBA, and CalTrans), resulting in solicitation of 1,223 DBEs. From that outreach effort, 21 DBEs have expressed interest in bidding.**

Team Experience

The AECOM/Lyles team has NO CHANGE to our project experience. The information presented in our Statement of Qualifications (SOQ) demonstrates a long history of working on design-build projects together as well as unmatched local experience working on similar projects for similar clients in Southern California. Table II-1 below summarizes the client reference projects previously presented. **Additional recent successful projects include the CR&R Riverside County Environmental Center in Perris, the Victor Valley Waste to Energy project in Victorville, Morongo WWTP in Cabazon, Beaumont, Hi-Desert, Yucaipa, Palm Springs and Lytle Creek WWTPs, all of which showcase our team's deep-rooted understanding of the local area.**

BEST for **BANNING**

Our team has prioritized this project over other opportunities in the marketplace. We have been tracking this project for 3+ years because the City is the type of client we want to work for—a pragmatic desert community looking to make every dollar count.

Table 2-1. Summary of Project Experience presented in our Statement of Qualifications

Project Name/Location	Scope of Services	Relevance	Self Performance Level	Similar Performance Criteria
East County Advanced Water Purification Progressive Design-Build, Santee, CA AECOM/Lyles JV	Progressive Design-Build for WWTP and AWT	Reuse, RO, New Plant, PDB, T22 compliance	78%	☑
S1 WWTP Improvements Progressive Design-Build Rialto, CA AECOM/Lyles JV	Progressive Design-Build of WWTP improvements	Design to Budget, significant cost savings realized	75%	☑
Regional WPCF Upgrades Progressive Design-Build Stockton, CA AECOM/Lyles JV	Progressive Design-Build of WWTP improvements	Design to Budget, adjusted GMP to meet Client's goals	78%	☑
WWTP Salt Mitigation Upgrade Project Beaumont, CA W. M. Lyles	Construction of treatment plant upgrades including MBR	Neighboring community facing similar challenges	78%	☑
HDWD Wastewater Reclamation Facility Progressive Design-Build Yucca Valley, CA W. M. Lyles	Progressive Design-Build of treatment plant including MBR and UV	Design to Budget, $2M in cost VE cost savings	75%	☑

Imperial Wastewater Treatment Plant Upgrade

Additional Project Experience

This comprehensive project for the City of Imperial, completed in 2021 by Lyles, involved significant upgrades to the existing WWTP:

- Upgrades to the existing influent pump station and the construction of several new facilities
- New facilities included a grit structure, aeration basins, **MBR facility**, and dewatering facility
- Designed to efficiently process an average daily flow of 2.4 million gallons of wastewater
- Initial stages involved demolition of an existing aeration basin, setting up a shoring and dewatering system, and excavating 15,000 cubic yards of earthwork
- The team then installed approximately 5,500 lineal feet of below-grade piping and constructed the aeration basins, membrane bioreactor basins, and the slab for the dewatering facility building
- The final stages involved the completion of the membrane bioreactor facility and installation of the above-grade process mechanical piping and equipment

Approach

Key staff have delivered together on progressive design-build wastewater projects and projects in the San Gorgonio Pass and desert areas, bringing lessons learned and collaboration to the City

Management of the Project Team

The AECOM/Lyles team has no other companies as part of our core team at this time. We have advertised this project for 30 days in the Press Empire and, if selected, we intend to add small business firms, such as surveyors, drillers and geotechnical firms, during Phase One to meet City goals and grant/funding source requirements.

As presented in our SOQ and reaffirmed in the previous subsection, the AECOM/Lyles key personnel have delivered together on design-build treatment projects in California. The team has **successfully employed designing-to-budget** on other projects and will work in close collaboration with City staff and its advisory team to implement this proven approach.

How Key Staff will Interact in a Collaborative Manner

The AECOM/Lyles team will be led by **Design-Build Project Manager Joe Lawrence.** Joe will bring his 22+ years of experience with water/wastewater treatment plant construction in California. Joe will have overall accountability and day to day contact with the City and your advisors through the entire project.

Design Manager Gabriel Perigault will lead the overall design of the project. He will work closely with the preconstruction and construction teams and your staff to deliver a design that meets your budget. He will lead the technical workshops that are associate with our collaborative approach. Gabriel has managed the design for numerous water and wastewater facilities, including the recent Davis, Rialto and Stockton WWTP design-build projects delivered with Lyles. With 30+ years of experience and a leader in innovative treatment technologies including MBR systems, he will guide the team and provide the City with a project that provides reliable performance while optimizing capital and operational expenses.

BEST for **BANNING**

Being a highly experienced, integrated 50/50 JV team functioning as one entity, our business operating culture is truly collaborative with all parties dedicated to the same goal of designing to a budget. This is in stark contrast to other DB entities who will have designers subcontracted to a general contractor.

Treatment Process Lead Alex Franchi will lead the treatment process train scheme and the technical details related to the MBR and disinfection systems. He will coordinate with Gabriel, Vince and the rest of the team to make sure the most cost-effective technical solutions are brought forward and he will be on point for discussions with critical technology vendors to ensure our design and the scope of supply align.

Preconstruction Manager Vince Guillama will work closely with Mike, Gabriel and the City's team to establish the initial project estimate and update it regularly as design decisions are made and the scope is finalized. He will also work closely with Construction Manager Marcos Reyes in developing and maintaining the project schedule. Vince is a proven collaborator in this role, having provided preconstruction services for a multitude of DB projects, notably the City of Davis, City of Santa Cruz, East County AWP (1&3), and City of Stockton Projects, all undertaken as part of the AECOM/Lyles JV.

Construction Manager Marcos Reyes will participate in constructability and VE reviews during Phase One. He will work with Vince in maintaining the project schedule. During Phase Two, he will oversee the construction of the upgrades. Marcos has over 15 years of experience managing construction of wastewater facilities. He is currently serving as WRF Construction Manager for the ECAWP Project, following his successful role as Construction Manager on the $25M Rialto WWTP Project (also operated by Veolia), both in collaboration with AECOM.

Constructability, Operability, Maintainability, Durability, Sustainability, VE, and Efficiency of Design and Construction

Applying the best aspects of progressive design-build. Our approach builds upon the work completed by the City and our concept is a starting point for discussions with the City's team (see Part 3). We applaud the City's approach to use the progressive design-build (PDB) model and we know that collaborative, cost-centric discussions will drive best solutions. We are no strangers to this process with PDB projects completed and underway in Rialto, Stockton, and the ECAWP program in Santee. Phase One management elements will be focused on workshops, design development, price certainty and construction sequencing. Preconstruction Manager Vince Guillama and Construction Manager Marcos Reyes will participate in the VE sessions and constructability reviews to provide their input.

Our JV will use Primavera P6 to track the schedule and adjust as needed. The meetings and workshops schedule will be critical in driving technical decisions to maintain overall project schedule and designing to budget as the primary goal through direct presentation of cost impacts as they relate to specific options. Details on our approach to both Phase One and Two are presented in the following subsections.

Phase One Approach

Our design to budget approach starts with a detailed agreement of the process train and **we will leverage vendor provided designs when they provide capital and operational benefits**.

Our scope and initial estimate will establish the City's the must have scope items. We will also make separate list of wish list items that can be added into the project during Phase One, as the budget allows.

Building on the baseline cost and critical guardrails established from the programming workshop, we will step through the workshop process. The baseline cost model will be used to measure alternatives or modifications against the initial layout to compare costs associated with alternative concepts, equipment or approaches that may be contemplated during the workshop process. Decision Log maintains positive momentum and serves as a go-to reference point so that decisions aren't constantly revisited.

We will use a clear process that documents agreed upon elements in the Decision Log to maintain positive project momentum. Elements that need adjustments or a different alternative will be vetted, refined and brought back to the City at a future meeting. We have learned that having a baseline upon which to compare "real-time" options allows the entire team to make educated, value-based decisions with the total project cost in mind. A critical Lesson Learned by our team is the importance of having sufficient engineering and planning budget. The additional effort placed on Phase 1 will result in significantly lower total project costs through sound decision making and review of total project lifecycle costs

BEST for BANNING

Our proven approach for PDB projects starts with an initial estimate that is based on real numbers from similar projects plus market outreach. The estimate is updated regularly, allowing the City to make value based decisions so there is no surprises at the GMP.

Disciplined cost accounting controls are the essential responsibility of the Project Manager in Phase One as engineering progresses to 100%. Weekly Estimates to Complete (ETC) are tracked by the Project Manager with weekly design cost reporting prepared by the JV controls team. Design to budget efforts is continual with regular construction cost and schedule adjustments reflected in the outcomes of design workshops, equipment/materials market interaction and early subcontractor inclusion.

As described later in this Section under the Collaboration heading, **we envision a workshop process to involve the City and its advisors to make the above decisions. The workshops will also be a key way we obtain operations team input and get feedback when finalizing equipment selection**.

PROVEN INNOVATION TO DRIVE DOWN PROJECT COSTS

Our VE and optioneering efforts on other design-build projects has resulted in an average savings to clients of 21% when comparing our solution to the owner's original concept

BEST for BANNING

OPTIMIZING DESIGN-TO-BUDGET THROUGH CREATIVE CONCEPTS

We recognize that all projects face some level of financial pressure. To this end we have already begun looking at potential alternatives to to meet the City's desired project budget. While these alternative will be developed more comprehensively during the phase 1 activities, we present a number of these in detail in Part III as a sign of commitment to the City that we take this responsibility seriously:

- ✓ **Right-sizing tankage and basins to save cost.** Our modeling and analysis shows that the sizing the aeration and mbr basins can be reduced, saving construction costs, while still providing the appropriate redundancy.
- ✓ **Three tank configuration of bioreactors.** Will provide required redundancy while providing cost savings.
- ✓ **Eliminate the initial need for the RO system and evaporation ponds.** We believe that blending MBR effluent and potable water can meet the nitrogen and TDS limits at a lower cost.
- ✓ **Hydraulics.** Maximize the use of gravity flow through the plant to lower pumping costs
- ✓ **Eliminate the third primary clarifier.** Savings can provided by not constructing the third primary clarifier without impacting the performance of the MBR system
- ✓ **Site layout.** The site's large area with limited interface points allows for spacious logistics, staging, and stormwater management. Early procurement and just-in-time delivery will streamline the project timeline and prevent delays.
- ✓ **Chlorination basin vs. UV disinfection.** Eliminate the construction of a large chlorination basin with a more cost-efficient and environmentally friendly UV disinfection.

Design

During Phase One, as part of the Progress Meetings, we will conduct design reviews on selected topics with the purpose of disseminating information, promoting discussion and obtaining feedback so that City staff understands the design and has enough information to approve the design. More resembling a workshop than a meeting, this approach to review meetings has been developed and honed on similar large and complex projects. We will manage design review meetings using the following best practices:

- ✓ Dedicated leader to facilitate
- ✓ Up-front technical discussion materials
- ✓ Clear agendas that specify: (1) purpose and decisions expected, (2) overview topics and issues, (3) discussion and review, (4) summary decisions made, and (5) approvals
- ✓ Clear, action-oriented minutes
- ✓ Follow-up action items and distribution of issue resolution

Schedule Management and City Reviews. We will use Primavera P6 to track progress and adjust course, as needed. The meetings, submittals, and review schedule will be critical in driving decisions to maintain overall project schedule. As described more fully in Part IV, we will use a cost loaded schedule and provide 3 week look aheads as appropriate.

Our Integrated JV Addresses City Concerns

Providing continuity in leadership between Project phases. A hallmark of how the AECOM/Lyles JV does design-build work is that we promote staff continuity throughout all project phases. This virtually eliminates any risk of discontinuity in leadership and any issues with information transfer. For instance, the project manager will stay engaged for all phases of the project. The design manager and all discipline leads will continue to be involved in the project after the design is complete, providing interpretation and responding to any questions in the field to make sure the design intent is carried out in

We will use 3D models during detailed design. We have experienced the benefits of using this tool in other projects as it provides a better perspective facilitating the understating among the design-build team, City staff, and other stakeholders, and, in the end, the decision-making process. It also helps break down the compartmentalization between design and construction, and avoid clashes between disciplines during construction, to see the project visualized early on.

what is being built. Similarly, the construction manager will engage in the project during phase 1 to understand the design, and provide constructability and VE input.

Compartmentalization between design and construction. As an integrated JV our delivery model breaks down the barriers that could compartmentalize design and construction activities. Our key staff have worked together before on progressive design-build treatment plant projects have a rapport and an efficient communication style that promotes collaboration. For example, our team does page flip reviews at critical milestones to make sure that the design and construction implementation members are all aligned in what is being presented and priced.

Contractor or equipment supplier interests overriding engineering-based decisions. All equipment and materials for the project will be reviewed and approved by the Engineer of Record that designed and specified these items, including any vendor provided designs. For critical equipment, including all mechanical equipment, AECOM/Lyles, in close coordination with the City, will also be in charge of recommending to the City suppliers, selecting the equipment and approving all shop submittals prior to release for fabrication. Alex Franchi will be involved with critical process equipment to make sure vendor supplied equipment align with overall design decisions and anticipated performance requirements. This approach provides an unbiased process that ensures that the City's preferences are considered and the best value with respect to cost, functionality, and durability are part of the selection process.

Phase Two Approach

Experience Developing/Managing the GMP

As an experienced design-builder, AECOM/Lyles has a unique advantage of developing realistic costs during the GMP development phase of the project. Our DB project manager, design and procurement team and subcontractor partners understand technical and quality requirements and are skilled at developing detailed, bottoms up cost estimates. They have long-lasting relationships with reputable equipment suppliers which reduces the risk of scope creep during the design and, ultimately, construction.

Additionally, our team will work closely with the City to implement decisions on equipment, materials of construction, and overall site considerations that will positively impact the GMP. Techniques will include using a decision log to document each decision made along with any associated cost impacts, so that a running tally of the current project cost is maintained and can be easily measured against a baseline. Our team will also make sure that multiple bids are received for not only the equipment but also subcontractors to achieve the lowest project cost possible. Internal contractor prequalification procedures will also verify that vendors and subcontractors selected for the project are financially stable and will provide the workmanship and ethics commensurate with the AECOM/Lyles JV philosophy. Beginning with our rigorous prequalification process, we will communicate with subcontractors the importance of quality, safety and performance, in addition to best value provided.

BEST for BANNING

We design and build to budget on all our design-build projects to ensure client satisfaction: the proof – no client has ever taken the off ramp at the GMP stage on any of our projects.

Our team recommends the GMP process occurs after the 60% design milestone in order to maintain the project schedule.

Estimating and Cost Monitoring

AECOM and Lyles have very successful histories managing costs on both lump sum and progressive design-build projects. Vince and Marcos will provide the City and its advisory team frequent cost estimate updates during design leading not surprise at the GMP. Our partnership with key subconsultants during the design phase will allow our team to further develop a reliable cost estimate for the GMP, that accurately captures the electrical components of this project. Highlights of AECOM/Lyles team estimating, and cost monitoring procedures include:

- ✓ An initial cost estimate will be performed before the kickoff workshop and updated on an ongoing basis.
- ✓ One difference maker for AECOM/Lyles is that we start with a detailed estimate from day one, drawing upon a wealth of similar past construction projects to establish a baseline estimate. We are much more accurate and transparent than our competition.
- ✓ VE and constructibility reviews are performed throughout the design phase.
- ✓ Another difference maker is the flexibility of contractual approach from conversion to a lump sum or cost plus with a GMP with a shared savings, depending on the City's preferences.

Biggest Lessons Learned Developing GMPs

AECOM/Lyles will meet the challenges of establishing the GMP price for the City's project, by staying flexible during the design process and keeping a strong focus on designing to budget. The three key issues we have encountered when designing to the GMP include:

1. **Defining project "must haves" to establish early cost certainty.** AECOM and Lyles use an early partnering approach through common sharing of project budgets, which allows both the owner and design-builder to establish "must-have" items as well as "wish list" items and make value-based decisions against a mutually agreeable baseline.
2. **Clear scope expectations/scope-creep.** Early agreement between the owner and the design-builder regarding the core project design criteria and scope is critical to cost, schedule, and project certainty.
3. **Escalation of materials.** Recent market volatility and global economics have affected material costs and could have a significant impact on overall project costs. Our constant bidding of wastewater projects in California allows us to stay in touch with market pricing and minimizes surprises at the GMP deliverable.

Other Mitigation Measures. AECOM/Lyles suggests holding regular meetings to openly discuss and evaluate engineering options, while providing a continual accurate update of the agreed upon budget and schedule, and jointly maintaining control of detailed scope. This approach has worked well on other projects and will serve as another way to facilitate design to budget.

Approach to Construction

AECOM/Lyles has a proven track record of successfully delivering complex treatment plant projects, particularly with desert communities. We have developed a robust approach to site layout, logistics, and construction sequencing that prioritizes efficiency, safety, and environmental stewardship. Details of construction approach are presented in Part IV of this proposal.

Site Layout and Logistics

We approached the site layout and logistical plan with a focus on maximizing efficiency and minimizing disruption. As part of this analysis we are also focused how decisions we make relative to the layout and logistics of build the new plant and how that could affect the day-to-day operations of your existing plant. Our approach has been developed to have minimal impact to current vehicular and pedestrian access and maintaining as little impact to your current facility.

The project site provides a large area with limited interface and tie-in points for the main portion of the work with the existing facility, affording a spacious area for site logistics, staging, and stormwater management both during and following construction. We understand that this project demands meticulous planning and execution to balance the need for efficient construction

Figure 2-2. Site Plan Logistics

with the necessity of minimizing environmental impacts. The uncomplicated nature of the site enables a straightforward approach to layout, logistics, and resource management, ensuring that all construction activities are confined within the designated boundaries while adhering to strict regulatory requirements. We do not foresee any resource limitations that would affect project progress. With the ability to self-perform 75% of the work, we can control costs, create efficiencies, enhance coordination, mitigate risks, and improve safety while enabling resource flexibility and ensuring quality. Our early procurement strategies and just-in-time delivery streamline project timelines by securing critical materials and equipment in advance, minimizing storage costs, reducing the risk of damage, and preventing delays in construction progress.

Location and Layout of Key Elements. Construction Laydown Areas: Strategically positioned within the site to allow easy access to materials while minimizing the footprint on undisturbed areas.

Laydown and Staging Areas. Located near the main construction zones to facilitate the efficient movement of equipment and materials, reducing downtime and delays. This will be constructed immediately adjacent to the work site to avoid double or triple handling of materials.

Access Roads and Traffic Management will be clear and concise, carefully planned to ensure safe and efficient movement of vehicles and machinery while minimizing impacts on surrounding areas. This will also allow easy access to all the different key element areas and keep truck haul roads away from trailers and parking areas for a straight, easy in and out. Traffic flow will be managed to prevent bottlenecks and maintain site safety. We expect a primary access point off Charles street past the existing entrance of the existing facility.

Parking. Designated parking areas will be established within the site boundaries to prevent off-site disruptions and ensure easy access for workers. Two designated areas will be created: one for CM/Project personnel and another for craft labor and subs.

Site Security Measures. A comprehensive security plan will be implemented, including fencing, surveillance, and controlled access points, to protect the site and ensure compliance with safety protocols. We will include a guard shack at the front gate and a separate entrance to avoid disturbing the existing plant entrance. Site fencing and security gates will be locked after hours. Web-based security cameras will also be installed.

Utilities Placement. Utilities will be strategically placed to support construction activities while minimizing interference with the natural environment and existing infrastructure.

Waste Management Facilities. Designated areas will be established for waste collection and sorting, ensuring that all waste is handled in an environmentally responsible manner. These areas will be strategically positioned near the main construction/staging area, as well as near the trailers and exit, for ease of access.

Containment within Boundaries. All elements, including laydown areas, staging zones, and access roads, will be fully contained within the specified site boundaries and established easements. This ensures that our activities do not encroach on protected areas or disrupt neighboring properties.

Mitigation Measures to Minimize Environmental Impacts. To further minimize environmental impacts, we will implement a range of mitigation measures, including sediment control, dust suppression, and noise reduction strategies. These measures will be continuously monitored and adjusted as needed to ensure compliance with environmental regulations and best practices.

Startup and Commissioning

Our startup and commissioning approach is presented in Part IV of this proposal. We acknowledge the procurement requirements regarding startup and commissioning, including the requirement for 30 days for startup and testing and pre-commissioning meeting to discuss plan with the City 3 to 6 months before startup and testing is scheduled to begin.

Permitting

BEST for BANNING

Our long-term relationships with California permitting agencies and regulators will provide the City with a streamlined process to meet the project schedule.

Anticipated Permits and Schedule. Please see our full project schedule included in Appendix A for a breakdown of the timeframe to apply for and obtain permits. Below is a list of anticipated permits:

City of Banning

- Community Development
- Building Permit
- Public Works Coordination
- Encroachment Permit Coordination

County of Riverside

- Dept. of Environmental Health
- Solid Waste Facility Requirements
- Fire Dept. - Hazardous Materials Div.
- Hazardous Materials Business Plan
- Transportation and Land Mgmt Agency and Planning
- Flood Control and WaterConservation District

CA State Waterboard R7: Colorado River

- Stormwater
- Industrial User Waste Discharge Reqmnts
- SWPPP Updates associated w/Industrial Activities
- Construction General Permit (w/SWPPP by contractor)
- Recycled Water
- Title 22 Eng. Report for Prod., Dist., & Use of Recycled Water

South Coast Air Quality Management District

- Authority to Construct Permit
- Permit to Operate (after Construction)

Understanding of Permit Process and Support for the City. For permitting and governmental approvals we will create a Permit Work Plan that will identify each specific permit required, the permitting agency contacts, submittal requirements, prerequisite conditions, processing times, and schedule for submittals. Key success factors for our plan include:

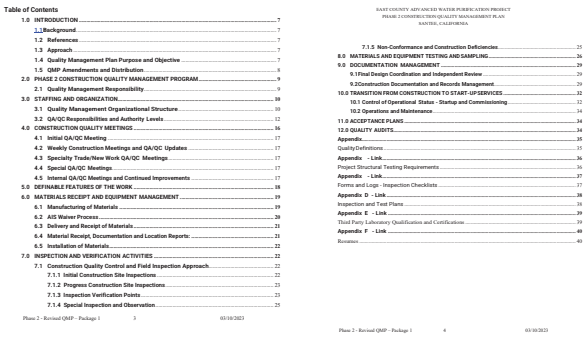
- ✓ Implementing up-front coordination with the City and permit agencies to facilitate the approval process. This will help minimize the risk of delays.
- ✓ Coordinating design activities with permit submittals
- ✓ Preparing discrete permit submittal packages
- ✓ Follow-up shortly after submittal to confirm information compliance and/or additional information required

Title 22 and RWQCB permits. The AECOM/Lyles Team will provide the necessary technical information to support development of the Title 22 Engineering Report permit approval process. We will provide the elements that are related to our scope of work, i.e., descriptions of the WWTP , pathogenic microorganism control, reliability of features for the new facilities, contingency plan, monitoring system, recycled reverse osmosis performance, advanced oxidation performance, operational optimization plan, and an operations and maintenance readiness plan.

CEQA Compliance. We will review the CEQA documentation and the design team will incorporate the specific requirements into the early design concepts. Specific measures will be taken to ensure applicable mitigation, monitoring and reporting measures will be included on design plans to foster compliance. At the onset of the project, a master list of Mitigation, Monitoring, and Reporting Program (MMRP) requirements that are applicable to each design element will be created and distributed to the project team.

Grant/Loan Compliance. AECOM/Lyles is very comfortable working on projects with SRF and WIFIA requirements; both the ECAWP, Davis and Stockton design-build projects received SRF funding. We will review existing grant and loan requirements, including documentation and reporting requirements, with the City at the onset and incorporate those procedures into our project management and execution plan to ensure schedule and funding compliance. Task and schedule reporting milestones will be added into our master project schedule.

Design Build Quality Control Plan



One of the benefits of AECOM/Lyles' extensive history of working together previously on PDB projects is that we have a well-established joined QA/QC program that provides robust oversight at every stage of the project. Building on the successful QA/QC programs we have executed together on the Rialto WWTP, Stockton WWTP, and Santa Cruz WTP PDB projects, we will implement the following program.

Our Certified Quality Management System

AECOM/Lyles will provide the City with a Quality Management Plan (QMP) that will define the procedures and protocols that we will utilize to provide QA/QC throughout the project, from design through construction, start-up and commissioning. The policies

and procedures provided within AECOM's Quality Management System (QMS) will be utilized as AECOM/ Lyles' procedures to execute the QMP. The AECOM Water offices in the U.S. are an ISO 9001:2015 certified organization. ISO 9000 standards are globally recognized as the foundation of establishing quality management systems. Our QMP will include established procedures governing overall quality management and specific procedures for each phase of this project. The QA/QC program is enhanced when the City and the AECOM/Lyles Team works collaboratively on a daily basis to monitor progress. The AECOM/Lyles Team self-performing civil, concrete and mechanical aspects of the work provides optimum control of quality workmanship.

Construction work progress will be monitored and documented using the Site Field Resident's (SFR's) Daily Report which will document the progress of the work by recording the time development of the work, weather conditions, the crew sizes, equipment, etc. The SFR will review the reports to verify their accuracy. Work progress will also be documented in the CPM Schedule. This documentation includes operating logs, source and field testing/sampling log, records of inspections and tests with daily logs and site photographs, written reports and engineering data of material testing, audit reports (from third parties to the JV), certifications, proper equipment installation confirmed by manufacturer representatives, system test results, personnel qualifications and certifications records, procedures and document review records. QA/QC records will be uploaded to the agreed upon project portal on a routine basis for review by the City.

Phase 2 - Revised QMP - Package 1 4 03/10/2023

Through our numerous projects done together, we have developed a strong QA/QC program that blends design and construction activities.

Document Control and Records Management

We will launch and maintain an internet-based electronic Document Management System (DMS) to provide efficient loading and retrieval of project-related documents, provide links and search functions indicating where the documents are located within the DMS, and provide training for key City personnel that will have access to the DMS. All documents and records will be uploaded to the City's system on a routine basis to ensure your staff has access to current data at any given time.

The QA/QC staff is empowered to enforce all quality objectives and will maintain all the necessary recorded documents to provide the City with proper implementation of a QA/QC Program.

Key Personnel responsible for QA/QC

QA/QC Lead Rosaida Harris, will have overall responsibility for the Quality Management Plan (QMP). Rosaida is a QA/QC leader for AECOM Water projects. In close coordination with design and construction team,

Table 2-2. Our quality control process provides oversight at every step from concept to completion

Design-Build Quality Management	This plan will outline the quality assurance and quality control requirements for design, permitting, construction, commissioning, and testing phases of the project. The plan will detail procedures that we will apply to ensure that each element of the project is delivered with quality in accordance with the contract documents and industry standards. We will use standardized forms and checklists to document all procedures have been followed according to the plan.
Technical Reviews	Our ISO 9001 standards require review and sign-off by a Technical Quality Advisor for all key disciplines. This offers the project team timely reviews. Each submittal will be reviewed for engineering decisions and correctness of calculations, code compliance, as well as content, clarity and presentation, incorporation of standards, consistency with the City's project budget and schedule. Quality control reviews will be documented through our project website and each corrective action noted in our QA/QC log.
Construction Management and Inspection	The AECOM/Lyles team will provide full-time construction management services reporting directly to City staff to oversee construction activities and coordinate materials testing to confirm compliance with the design and approved shop drawings.
Acceptance Test Plan	This plan will outline the process and procedures for verifying all commissioning activities are coordinated, executed, and documented to demonstrate that the project performs satisfactorily in all manners, and meets all water quality objectives for final effluent reuse and disposal required by the Regional Board, including the Beaumont Basin Plan limits for TN and TDS.

she will be responsible for monitoring the QA/QC aspects of the project, coordinating with the appropriate lead engineers, construction management and site superintendents and technical discipline needs.

AECOM/Lyles Team has extensive QA/QC experience routinely performing full oversight of essentially self-inspection on many public projects. This experience will provide the City with a high level of transparency.

Team Partnership Environment

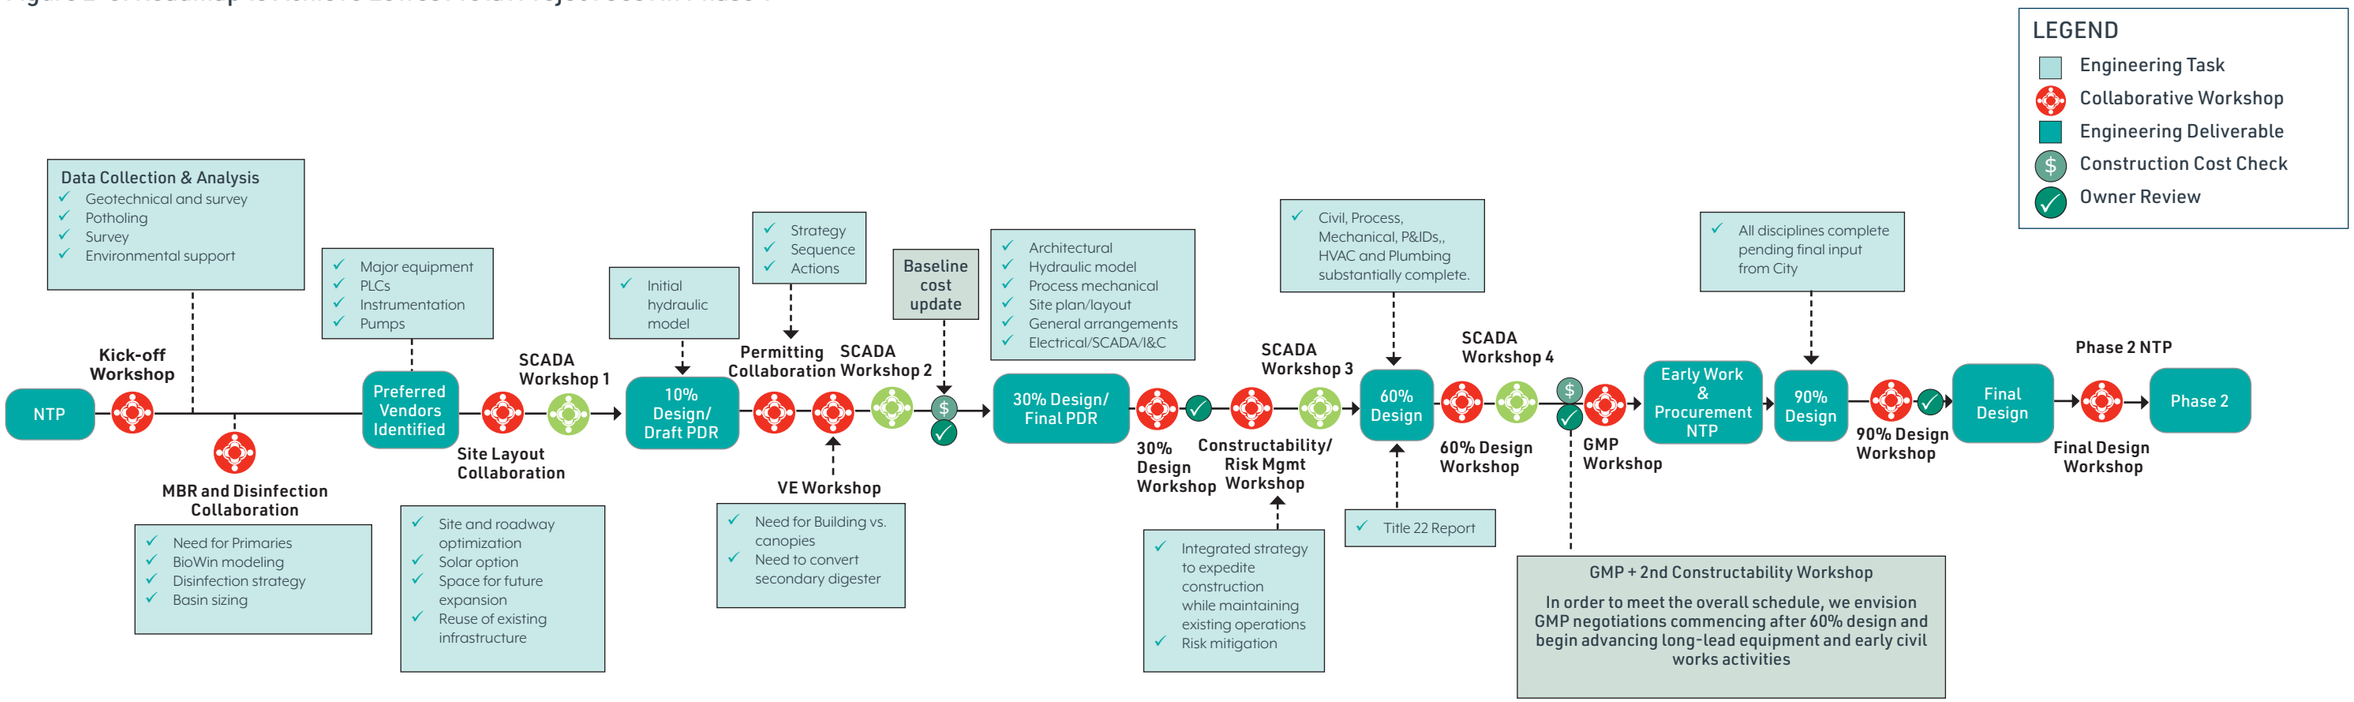
The AECOM/Lyles JV promotes collaboration across all elements of the project life-cycle and with all stakeholders—it is more than a philosophy, it is a core value. It demands proactive involvement, respectful dialogue, challenges to the status quo, and transparency by all parties. We have used our JV collaboration approach successfully on several of California's largest PDB projects. Internally, our design and construction personnel are fully integrated. This means that our designers are not designing in isolation; rather, they are in constant communication with construction personnel and your team to validate that key design decisions such as the location of construction joints, or the type of pipe restraint is consistent with what has been priced. This focused dialogue allows us to stand behind our commitment of "no surprises" at the GMP or at any interim pricing update. We commit to optimizing the City's goals and vision, and to best assure a successful project journey. This is illustrated on the next page in Figure II-2, which provides a roadmap that shows how we will develop and finalize the design during phase 1, maintaining the schedule while also incorporating crucial feedback from the City.

City Involvement and Communication

Key aspects of our collaborative approach that facilitate City involvement include:

- ✓ **Collaborative, detailed approach to ensure the right data is carried forward as design criteria.** The goal is to get all preferences and constraints on the table so the best options are advanced for implementation in the design.
- ✓ **Engineering meetings that seamlessly coordinate construction and operations elements.** Our design team holds internal weekly progress meetings. Every few weeks, production drawings are uploaded to MS Teams so that the estimating and construction teams can review. Joe, Gabe and Vince will efficiently manage constructability challenges to confirm the design drawings reflect the most cost-efficient approach to construct the project. As VE ideas arise they will evaluate the cost and schedule impacts and provide an overview to facilitate proactive dialogue with the City's project team. We will gain consensus with your team through bi-weekly coordination meetings that track overall status, and perform continuous constructability review and reach consensus on time sensitive issues.
- ✓ **Major milestone meetings to improve quality.** Our team meets ahead of major submittal milestones to QC the design plans, reports and specifications that accompany the submittal. This additional level of scrutiny holds all parties accountable on our team and further promotes our united, project-centric approach.
- ✓ **Real time pricing updates improve decision-making.** Starting with a solid initial estimate, we will isolate discrete alternatives with conceptual layouts; then provide real-time updates to show where the money is being allocated to facilitate value-based decision-making by the City.
- ✓ **Leadership meetings will increase collaboration and will occur throughout the project.** The City's team (including operations staff), owner's advisor and other stakeholders participation will be key to the project success. Meetings will be frequent early in the process, as Phase One decisions have the biggest impact on total project cost and operational considerations.
- ✓ **Executive meetings demonstrate our corporate commitment.** Monthly meetings between the City and our JV executive team (Grant Gourley and Brian Daly) can bring early corrective action. They also routinely reviews project status, adherence to the City's budget, staffing, and project challenges. Brian and Grant are design-build practitioners on numerous water/ wastewater design-build projects and will be actively engaged in the details of this project.

Project Manager Role



The project manager on this Project, Joe Lawrence, is responsible for overseeing the entire project team, including all firms and individuals involved in both pre-construction and construction phases. Joe has the authority to make critical decisions related to project management, resource allocation, and ensuring the project meets its goals and objectives. He plays a key role in integrating design and construction organizations, managing cost and schedule, and coordinating with key personnel and entities involved in the Project.

"I am fully committed to collaborating with the City and providing leadership to find the most cost-effective project that meets the City's objectives and provides for future growth and expansion.

– Joe Lawrence
Design-Build Project Manager

Figure 2-3. Roadmap to Achieve Lowest Total Project Cost in Phase 1

Our comprehensive approach to planning, collaboration and design development will result in clear decisions, streamlined procurement and construction and the Lowest total project cost delivered for your project

- A portion of the Project Progress Meetings will be allocated for Technical collaboration sessions. Only a few anticipated technical collaboration sessions are shown in this diagram.

- Value engineering will occur organically as part of our "Design-to-budget Approach". Value engineering will be specifically covered during the design workshops for the different design milestones as well as the cost update workshops.

- Dates and duration of activities, including anticipated permit sequence are included in the schedule, included in Appendix A.

BEST for BANNING

Our team will be well-prepared for each meeting, bringing the required detailed information to allow the City to understand the options and make the best choices to meet your budget

Below we present representative details to show how robust the preparation and documentation for each key meeting will be with the City so you can be confident in each decision made:

- ✓ **Kickoff meeting.** Discuss project expectations with the City including project execution, quality control, progress reporting, and deliverables. Review concept design and evaluate major unit process treatment that will meet the project performance goals. Make a preliminary selection of preferred major unit process options and vendors. A Project Quality Plan and Project Execution Plan will be developed for discussion in the kick-off meeting.
- ✓ **Technical Progress meetings.** The main purpose of the Technical Progress Meetings is to facilitate effective collaboration between the City and AECOM/Lyles to allow the selection of preferred unit process options that will be verified by subsequent design development. Evaluate and analyze the major unit process treatment alternatives that will meet the project performance goals and make a preliminary selection of preferred major unit process options.
- ✓ **Risk Management Workshop.** AECOM/Lyles will develop and maintain a risk log. The risk log is the key document used in managing risk. The log records risks identified during proposal and work plan development; workshops, technical reviews, and monthly project meetings; and through other events that occur during the project. An initial risk workshop will be used to build consensus among stakeholders and as a means to bring the Project together to identify and evaluate potential risks

PART III

Technical Approach

Delivering a quality project while driving down cost

Introduction

We appreciate the challenges the City faces in balancing numerous items associated with the expansion of its WWTP, including:

- ✓ Minimizing the cost to your rate payers
- ✓ Meeting future water quality requirements
- ✓ Promoting the use of recycled water
- ✓ Providing for long-term community growth

We will work closely with you to explore value based solutions and will be constantly challenging ourselves to make sure a design to budget approach is employed.

AECOM/Lyles has taken a close look at the City's initial concept and have noted several opportunities and challenges with this concept on Figure 3-1 on the following page. Later in this section, we present our concept that builds on the one presented in the DCR to optimize the project costs even further. We view this concept as the starting point on our collective journey to cost savings– throughout this section we present additional ideas, that if incorporated into the final scope, will provide the City additional cost savings while still meeting all of your core goals of this environmentally sensitive project.

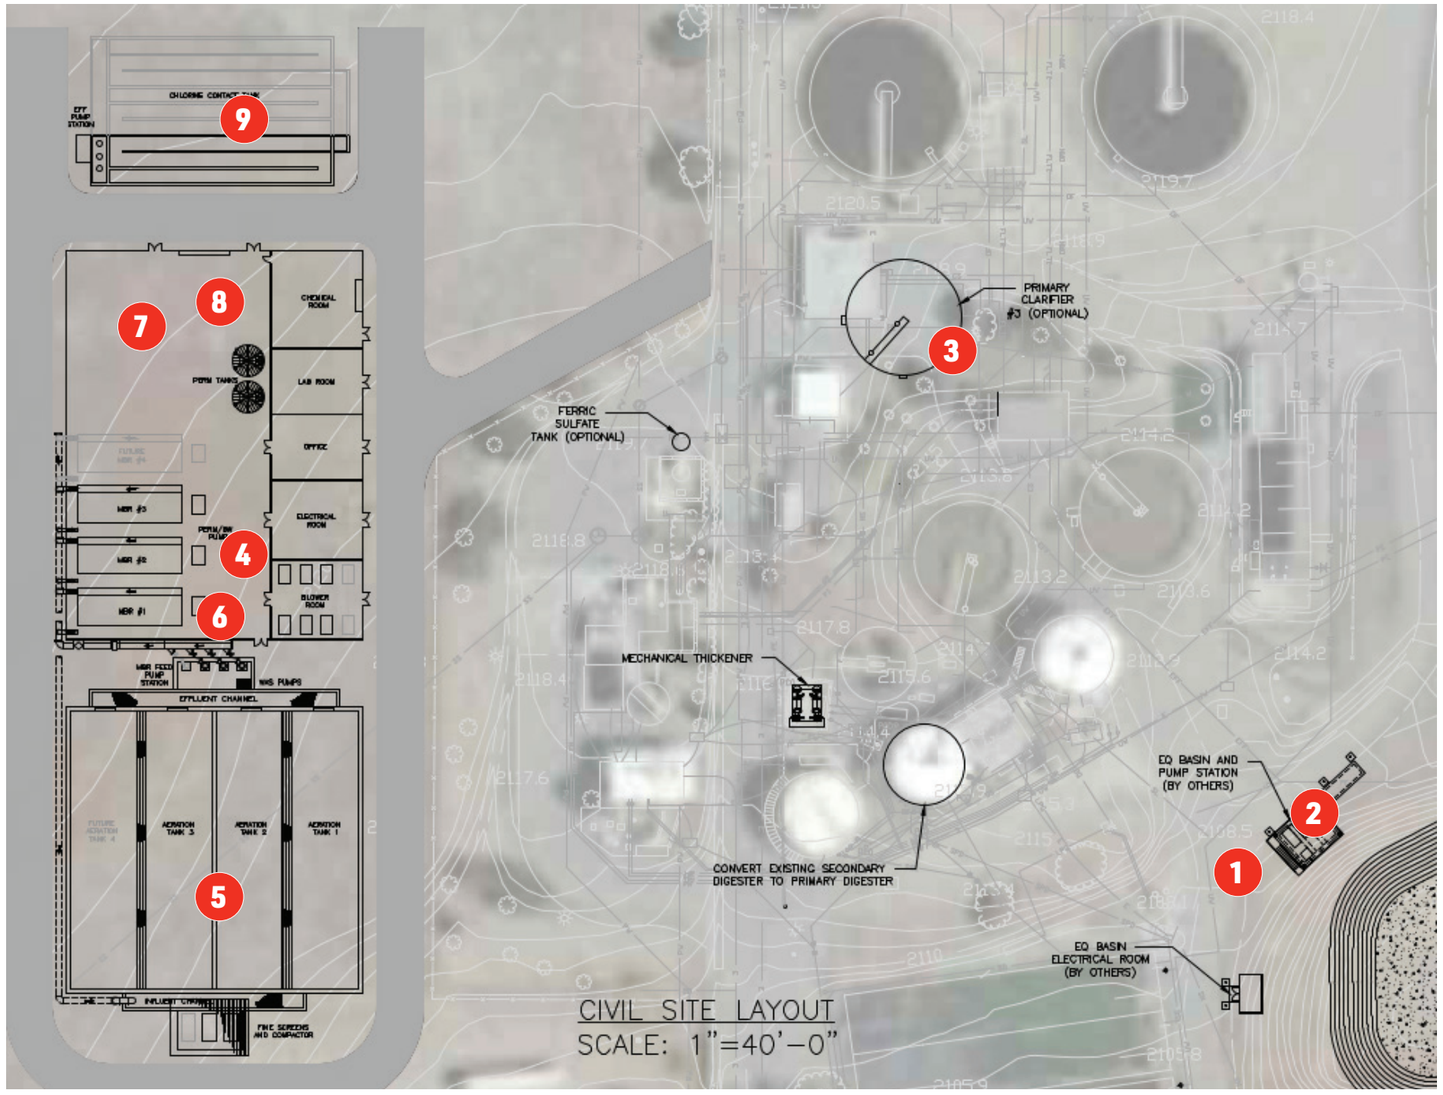
BEST for BANNING

Throughout this Section we highlight how are team is committed to doing what is best for Banning. We will bring forward the most cost-effective solutions—but not at the cost of quality. We will not cut corners or propose items that are not in your best interest.

Our cost saving ideas can save the City more than $10M

Hydraulic Capacity

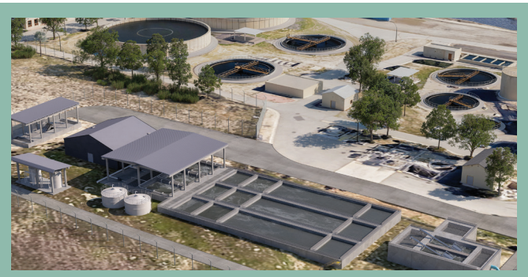
We understand the importance of efficient hydraulics and accurate flow splitting between unit processes. Our team will optimize the head loss through the plant to **reduce the energy costs associated with increased pumping, significantly reducing the initial capital and lifelong operating costs of the facility**.



We will confirm existing profiles (as related to our new work) to ensure compatibility with existing plant tie-ins and prepare a comprehensive hydraulic profiles that considers minimum, average, and maximum flow rates and considers anticipated critical units out of service.

Figure 3-2 on page 3-3 show our initial hydraulic profile and a drawing is included in Appendix A. **Our proposed scheme will minimize pumping as the wastewater will only be pumped once from equalization through the MBR process**.

BEST for BANNING *Hydraulic Highlights- Building in Reliability & Flexibility for the future*

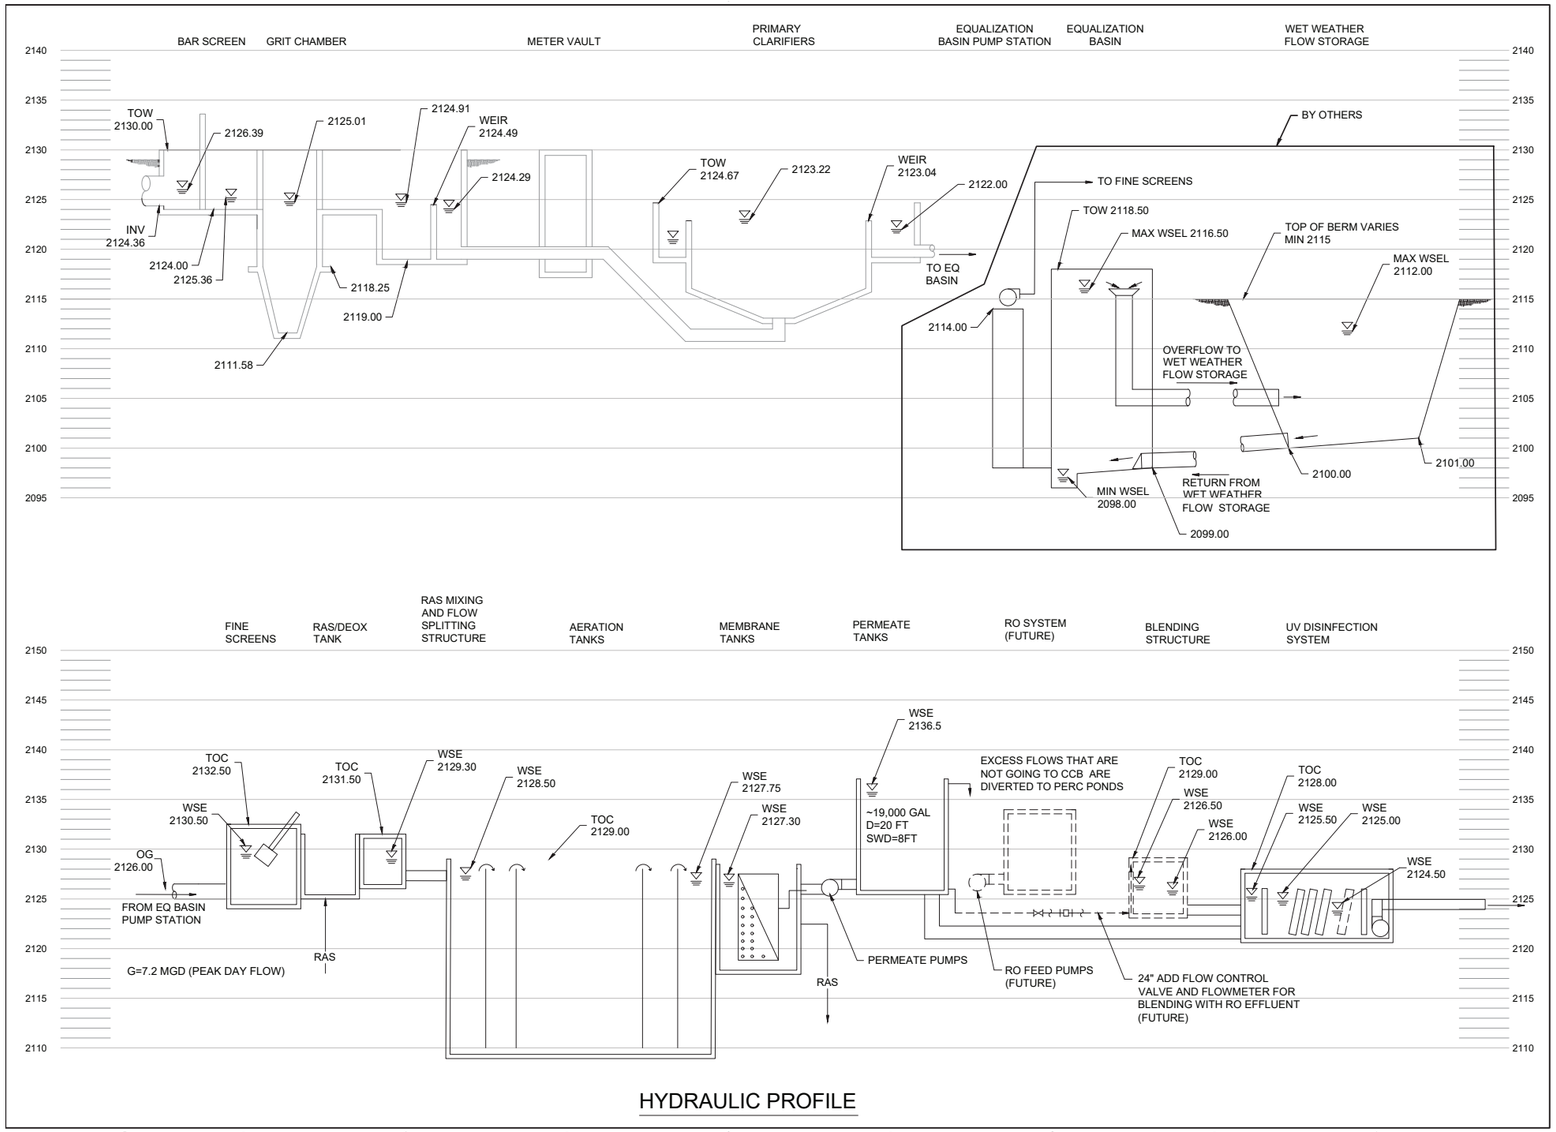


- ✓ **Redundant pumping (one redundant pump in all trains that convey the rated hydraulic capacity)**
- ✓ **In normal operation, one duty fine screen and one backup. Future third channel.**
- ✓ **Three aeration basins, two duty and one standby**
- ✓ **Three Membrane Tanks, two duty and one standby**
- ✓ **UV disinfection channel duty (~.5 MGD) and remaining flow directed to percolation ponds or UV disinfection channel off-line and all flows directed to percolation ponds**

Figure 3-1. Challenges and Opportunities with the City's Base Design presented in the DCR

When we looked at your DCR documents and drawings, we identified several key areas that were potentially adding cost, were technically complex or had implications for long-term operations or future expansion. These key items are summarized below and on page 18, we present our recommended solutions to improve the project budget and overall plant performance.

1. **Plant wide comprehensive hydraulic approach** – Due to flat topography of the site careful consideration must be given to minimize long term operations costs associated with pumping flow multiple times vs use of gravity conditions where possible.
2. **Water quality and flow data availability** – use of historical data can be supplemented with text book evaluations for overall plant design considerations
3. **Balancing the use of existing assets verses constructing new systems** - utilization of existing plant primary clarifiers versus need for an additional primary as it relates to the overall ability of the plant to meet future effluent guidelines.
4. **Identification of critical equipment and preselected vendors** – this strategy will allow all parties to gain early certainty in performance, project schedule and total project cost early in the project .
5. **Beaumont Basin water quality requirements (specifically for Total Nitrogen)** present a unique challenge for reuse and overall design of the facility. Consideration and inclusion of a supplemental carbon source will be required to meet RWQB requirements.
6. **Identifying design elements and construction approach to take advantage of adjacent structures** will shrink the overall footprint on site, reduce subsurface utilities and lower the total project cost.
7. **Getting the sizing correct**- Right sizing building and units to accommodate immediate needs and potential future regulatory or facility expansion
8. **Costly RO system adds significant complexity** to the plant layout and more important operator interface, monitoring and maintenance .
9. **Industry accepted CCT approach using Sodium Hypochlorite works against the Beaumont Basin TDS requirements** and challenges long term treatment goals. Using a technologically accepted alternative will lower overall operations cost, promote reuse, and align with long term TDS goals



OUR INNOVATIVE CONCEPTS WILL SAVE THE CITY MONEY

- ✓ Shrink the size of the basins while still providing sufficient redundancy
- ✓ Using existing assets instead of new construction where practical
- ✓ Strategy to eliminate the need for the costly RO system will still meeting reuse goals
- ✓ Placing MBR under canopy instead

Details of our cost saving solutions are presented on Figure 3-3 and throughout this section

Figure 3-2. Our Hydraulic Profile Minimizes Pumping Costs

Our initial assessment is that the new primary effluent equalization basin pump station can convey the primary effluent from the equalization pump station to the proposed 2-mm mechanical screens. Effluent will be combined with return activated sludge (RAS) from the membrane tanks and then flow by gravity to a splitter box for even distribution through each aeration tanks and ultimately to the membrane tanks. Treated effluent (permeate) will be pumped out of the membranes to fill permeate tanks that will feed the UV disinfection process and or discharge to the percolation ponds (via the existing chlorination tank).

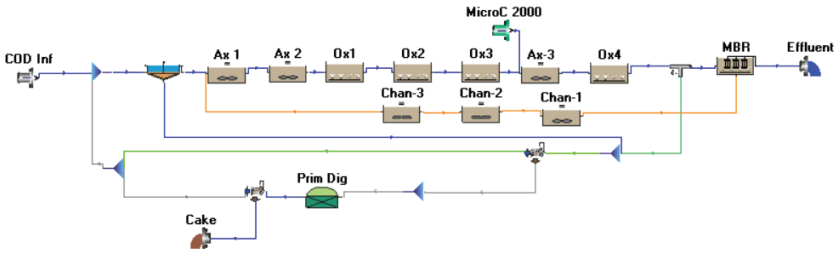
Based on flow data presented in the Carollo study (2018) and the primary effluent equalization design documents, we believe the maximum day flow of 7.2 MGD shown in the conceptual design documents correlates to a peak hour wet weather flow. Based on the most current equalization basin and pump station design provided we believe the stated peak hourly flows can be managed by the equalization basin volume and the maximum daily flow rate should be in the range of 5 to 5.5 MGD which could also be mostly absorbed by the EQ basin. We recommend that early in the design setting a reasonable maximum day flow to secondary treatment that balances design hydraulic throughput with the cost of implementation.

We will confer with the City prior to finalizing design decisions cost and operational implications. **This collaborative effort will provide the City with all the technical and non-technical information necessary to make value-based, design to budget decisions that meet the City's current needs while also creating a plan for the future.**

BEST for BANNING

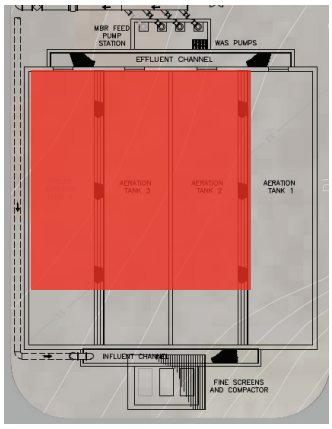
Future-proofing the WWTP for future flows and loads

- ✓ Piping sizing and layout for fourth aeration basin
- ✓ An expandable flow splitter box
- ✓ Space in membrane tanks for additional membranes to accommodate flows for a fourth aeration basin
- ✓ Space in the UV channel to accommodate additional UV banks for additional disinfection capacity
- ✓ Tie ins and layout for a future RO system and space for evaporation ponds
- ✓ Electrical systems expandable to accommodate the expanded facilities described above
- ✓ Spare I/Os in PLCs
- ✓ Spare conduits for electrical and instrumentation.



Treatment Processes, Equipment Selection & Capacity

Our team has invested significant effort over the last several months to develop concepts that demonstrate our project understanding, innovation and commitment to partnering with the City to deliver fiscally responsible solutions that consider both up-front capital and long-term operations cost savings, as summarized on **Figure 3-3** on next page.



Determining the volume requirements for the major new process areas and establishing mass balances and critical process requirements for mechanical equipment is dependent on flows and wastewater constituent loads. The recommendations we are presenting herein are a result of our of review the water quality data provided coupled with industry accepted guidelines and representative data from other plants in the area. Our concept is to provide a facility that is right-sized without over-designing and causing challenges to the operations staff and having facilities that may not be needed for many years.

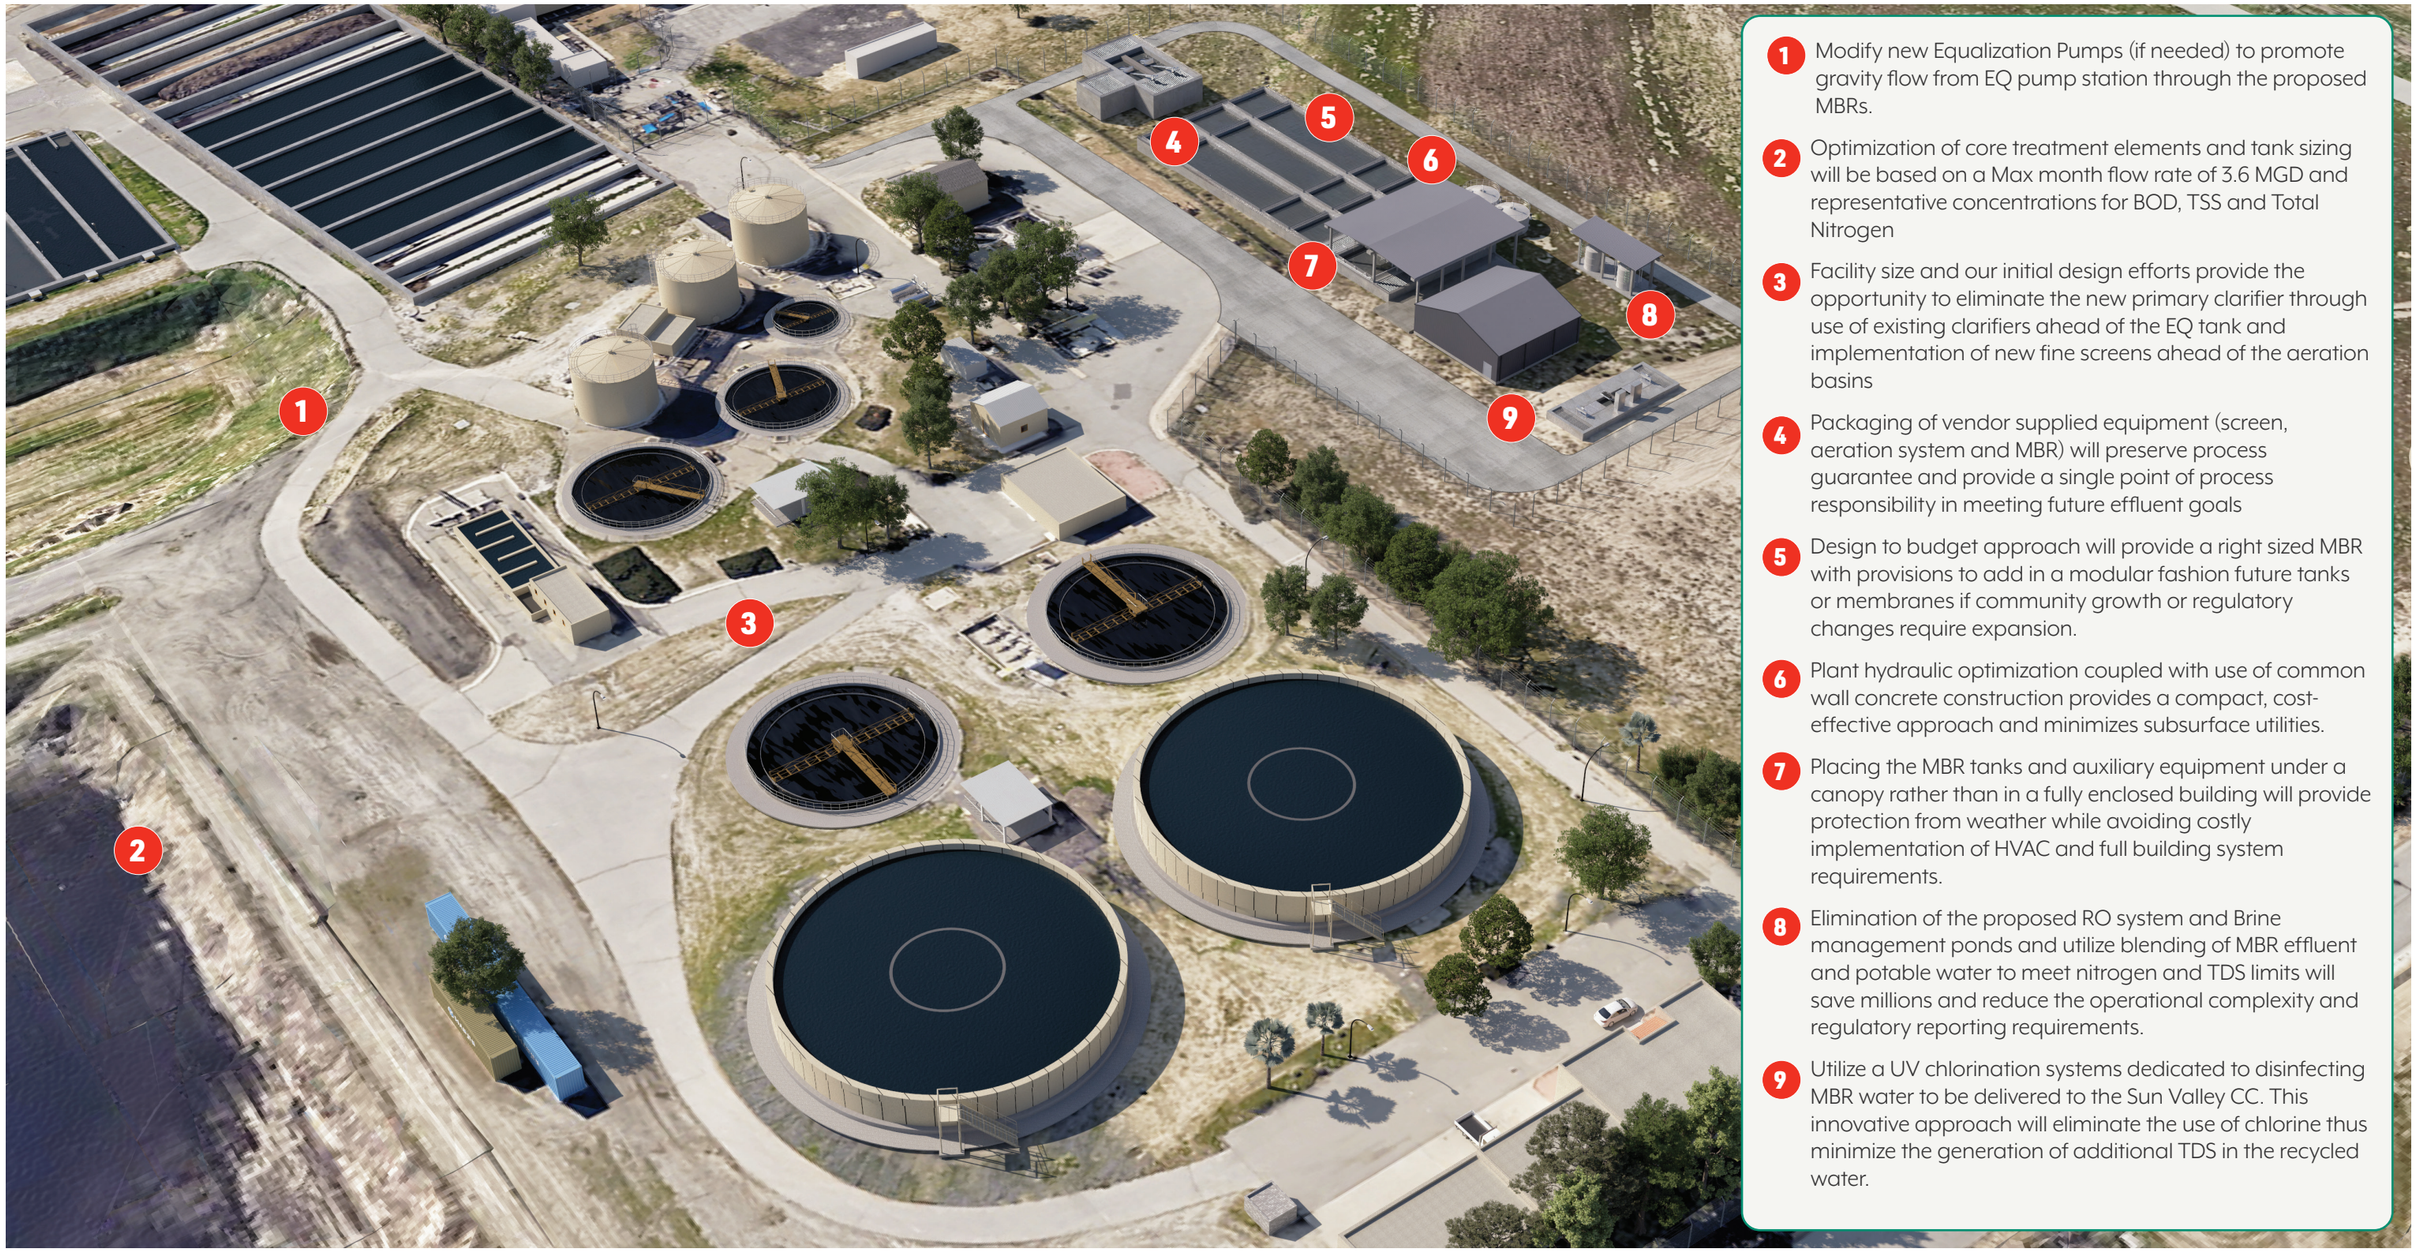
We successfully used a similar approach for City of Stockton, for the upgrade and expansion of their WWTP. Thus, as discussed in our confidential meeting with you, our base approach for your facility is to design the MBR facility to treat the 30-day maximum monthly of 3.6 mgd with BOD, TSS and TN concentrations as specified in the July 2024 CDR presented with the RFP.

In support of our approach, we developed an initial plant-wide process model in Biowin. We estimated primary clarifier TSS removal efficiencies using historical correlations between hydraulic retention times and TSS. The anticipated removal efficiency ranged from 55-60% for 2mgd to 45-50% for a peak of 3.6mgd.

Our modeling shows 1.2 MG is available within a three aeration tank configuration

Our modeling indicates that the City would have sufficient capacity with our proposed three aeration tank approach with a combined volume of 1.2 million gallons. **This approach provides sufficient redundancy to allow a tank to be removed from service and is about 17% smaller than the volume shown in the draft drawings in RFP.** This design to budget mindset is the cornerstone of our approach to assist the City with stretching is dollars to get the most out of the facility.

We had a VE session and spoke to hollow fiber membrane vendors about best practices and O&M considerations. This helped us achieve a layout that streamlines construction, considers future expansion and reduces the total project cost.



Key concepts for the development of the design of the new treatment facilities are here discussed following the flow of water from primary settling, through equalization and pumping, fine screening, biological treatment with a MBR system (aeration tanks and membrane tanks), and disinfection.

BEST for BANNING

Proven Experience implementing our Proposed Solutions

- ✓ **Beaumont.** MBR system installation at neighboring desert community
- ✓ **Stockton:** we analyzed the flows and loads, and future flow projections to implement a strategy that deferred some expansion to a future date, if and when it was needed.
- ✓ **Multiple MBR installations:** we have developed designs for similar-sized facilities such as Sand Island WWTP (Hawaii), City of Brandon (Canada), North Gate (Arizona), Provo (Utah).
- ✓ **Rialto.** Progressive Design-build where AECOM/Lyles did significant design to budget VEs to find a project scope that solved Rialto's WWTP issues while staying within their budget.
- ✓ **High Desert.** Progressive Design-Build of treatment plant including MBR and UV

Figure 3-3. Our Design Concept Provides Numerous Cost Saving Options

1. Modify new Equalization Pumps (if needed) to promote gravity flow from EQ pump station through the proposed MBRs.
2. Optimization of core treatment elements and tank sizing will be based on a Max month flow rate of 3.6 MGD and representative concentrations for BOD, TSS and Total Nitrogen
3. Facility size and our initial design efforts provide the opportunity to eliminate the new primary clarifier through use of existing clarifiers ahead of the EQ tank and implementation of new fine screens ahead of the aeration basins
4. Packaging of vendor supplied equipment (screen, aeration system and MBR) will preserve process guarantee and provide a single point of process responsibility in meeting future effluent goals
5. Design to budget approach will provide a right sized MBR with provisions to add in a modular fashion future tanks or membranes if community growth or regulatory changes require expansion.
6. Plant hydraulic optimization coupled with use of common wall concrete construction provides a compact, cost-effective approach and minimizes subsurface utilities.
7. Placing the MBR tanks and auxiliary equipment under a canopy rather than in a fully enclosed building will provide protection from weather while avoiding costly implementation of HVAC and full building system requirements.
8. Elimination of the proposed RO system and Brine management ponds and utilize blending of MBR effluent and potable water to meet nitrogen and TDS limits will save millions and reduce the operational complexity and regulatory reporting requirements.
9. Utilize a UV chlorination systems dedicated to disinfecting MBR water to be delivered to the Sun Valley CC. This innovative approach will eliminate the use of chlorine thus minimize the generation of additional TDS in the recycled water.

Vendors Selection for Large and Critical Processes and Electrical Components

During the early stages of Phase I, a critical step will be the identification, pre-selection of vendors for competitive solicitation efforts of critical equipment including an MBR package (potentially inclusive of fine screens, aeration system (blowers and diffusers), permeate pumps, and membrane equipment) and UV disinfection system. We have found this approach to be effective as it provides MBR vendors sufficient control over the scope of supply to allow provision of a reliable performance guarantee while still maintaining a competitive procurement process. We will also consider other long lead equipment such as transformers and electrical switchgear. This step will be completed in collaboration with the City and your advisory team to ensure that the pre-selection includes the City's preferences and ability to provide reliable service following post construction.

Early solicitation and selection allows the design to confidently identify footprint, piping and electrical and instrumentation requirements to provide an accurate final design that avoids design revisions and other costly surprises during the construction phase. This effort will also mitigate schedule constraints, secure early pricing certainty and help to reduce the total project cost.

From our past experience with MBRs and other technologies, we have developed a strong understanding of what works and what doesn't work. We align with industry leading vendors that provide process and performance guarantees for their equipment. Our approach further encourages flexibility from the suppliers to contribute their know-how to ensure innovation is incorporated, that is budget-conscious.

Our procurement approach has been successfully implemented on numerous past progressive design build projects for public agency Owners that have secured both SRF and WIFIA project funding. We will develop and finalize a cost evaluation for use in evaluating the equipment proposals. With the City's input, we will carefully document our evaluation so that once it is complete, the decision-making process will be thorough and clear. On previous projects, Owners have chosen to proceed with advancing the procurement process through and early GMP and lock critical equipment vendors into guaranteed pricing for the project. We would look to explore this option with the City (typically around the 30% design phase). A key benefit is obtaining shop drawings during the design phase which will expedite the design and delivery of the equipment and over all reduce the risk of design and construction challenges later in the project.

BEST for BANNING

When we procure the MBR system we will specify to the vendor key parameters for them to base their proposal on–Specifying what works rather just accepting whatever arrangement the vendor typically provides.

BEST for BANNING

We will take a close look if primary clarifiers are actually needed as part of the new treatment system—eliminating them would provide cost savings to the City

Discuss the anticipated useful life of the proposed systems

A key element to ensure value for the City is to ensure the quality of the construction and a long useful life for the equipment selected. In general concrete structures and buried civil infrastructure will last over 50 years. Equipment useful life will depend on materials used as well as proper installation, and O&M: however, Table 3-1 presents planning level useful life expectancies.

Table 3-1. Anticipated Useful Life

Infrastructure	Anticipated Life
Concrete structures	50 years
Permeate tank	30 years
Membranes	10-15 years
UV System	20 years
Blowers	20 years
Pumps	15-20 years
Fine Screens	20 years
Buildings & Canopies	20-25 years
Rotary Drum Thickener	15-20 years

Primary Clarifiers

The design team assessed the two existing primary clarifiers. Based on our previously mentioned removal rates for TSS and BOD and the use of 2 mm fine screens, we believe a third primary clarifier can be deferred to the future and not be provided as part of this project. There are many MBR plants of a size similar to this one that operate without any primary clarification. Our review of past condition assessments revealed that the primaries are in good condition, and could be left in operation to provide continued removal of solids upstream of the fine screens. The size of the aeration tanks, aeration system (blowers, diffusers) we have modeled (for a 1.2 MG overall tank volume) accounts for the elimination of the third clarifier. A secondary benefit of this approach is its support for achieving Total Nitrogen reduction goals in the plant. **An additional primary tank could remove too much carbon from influent and require a costly additional chemical dosing system ahead of the membrane tanks to achieve this water quality goal**.

Equalization Pump Station and Off-line Equalization

Although this process is currently being added under a different project it is important to confirm during design that the equalization pumps provide sufficient head and flow to meet the elevation requirements for the new fine screens to optimize the water level in the aeration and membrane tanks. Early in the design, an assessment should be made of the optimal elevation for siting the new MBR facility. There is typically significant cost and operability differences between locating the aeration tanks aboveground, below ground or partially in the ground, based on geotechnical conditions, construction costs and operability. Once this is established, the operating conditions for the EQ pumps can be finalized.

Fine Screens

The build-up of debris within the membrane tanks is operationally unacceptable and an ongoing challenge for MBR operations. MBR manufacturers properly require the installation of fine screens upstream of the MBR to remove inorganic material, fibers, and hair present in the wastewater stream before they get into the membrane tank. Manufacturers of hollow fiber membranes, typically, require 2 mm or smaller openings to protect the membranes while flat sheet MBR systems allow larger openings as their cassettes are less affected by the accumulation of solids.

Our approach considers in-channel gravity rotary drums equipped with perforated plates as they provide proper protection for the membranes, are easy to maintain and provide efficient solids collection and handling.

Figure 3.4 illustrates a layout for in-channel gravity rotary drum screens at your new plant. Primary effluent after diurnal equalization will be pumped from the new primary effluent pump station into the fine screening influent channel. Two screens, each sized for 100% capacity will designed. Space for a third screen will be reserved for future expansion. The solids collection and management system can be equipped with an integral bagging system that will both assist with solids consolidation into the solids container with the additional benefit of odor mitigation.

Aeration Tanks

Hydraulic and biological modeling of the new aeration and MBR facilities will be important in optimizing the design of the anoxic/aerobic zones and RAS de-oxygenation zone to meet the anticipated permit requirements for nitrogen.

We have conducted a preliminary plant-wide treatment model based on the data available with the RFP, supplemented and enhanced with plant influent data (COD, N and P) collected by this team on wastewaters of similar strength and community demographics in southern California. We also considered anticipated loads generated by your solids processing and digestion (three primary digesters) systems—particularly the stream containing the high ammonia concentration from the drying beds and future dewatering. Some of the key considerations are described on the two pages.

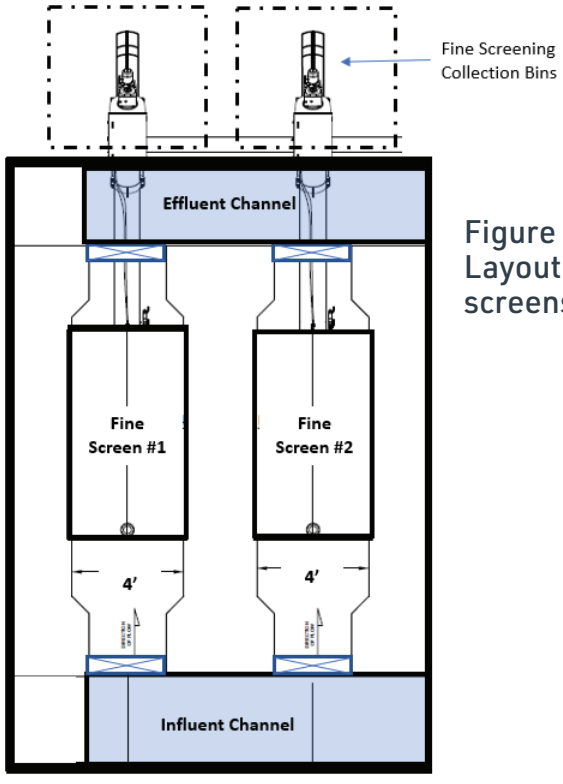


Figure 3-4. Layout for fine screens

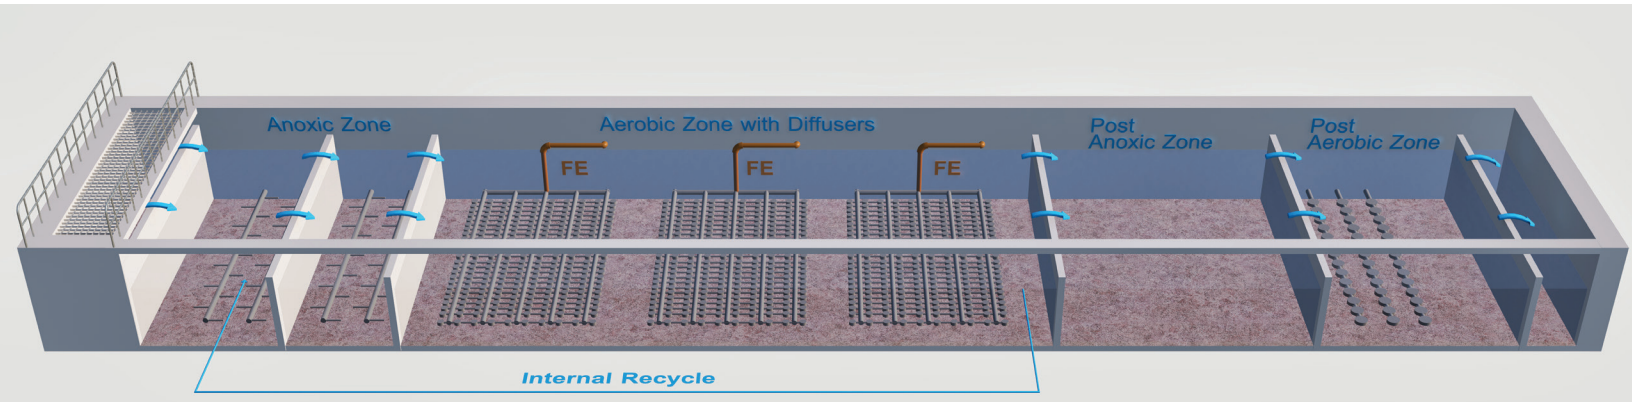
After review of three and four-tank configurations, a three-tank configuration for the aeration tanks is recommended to minimize overall cost. Based on the conceptual-level process modeling results, a total volume of 1.2 million gallons. An aerobic Solids Retention Time (SRT) of 8 days was assumed under winter conditions and a maximum Mixed Liquor Suspended Solids (MLSS) concentration of 8,000 mg/L was used. This is well below what most MBR facilities can operate (10,000 mg/l). The aerated zones in the three aeration tanks will be supplied air from a common air header system and three blowers in a two duty/one standby configuration. Space will be allocated for a fourth MBR of identical dimensions and additional blowers to allow the City to build additional treatment capacity in the future.



A 4-stage Bardenpho process will allow the City to reliably meet the plant effluent Total Nitrogen (TN) limit of 10 mg/L (see Figure 3.5). The "Pre-Anoxic" zone will receive nitrate from the Return Activated Sludge (RAS) from the downstream membrane tanks (see following section on the membrane tanks) and Internal Mixed Liquor Return (IMLR) as shown below. Following the Pre-Anoxic zone will be a single aerated zone with dissolved oxygen control. The "Post-Anoxic" zone in each reactor will provide endogenous denitrification. In the final "Post-Aerobic" stage, the mixed liquor will be aerated to oxidize remaining ammonia prior to the mixed liquor flowing into effluent channel. With the RAS and IMLR pumps, the operators will have an opportunity to optimize nitrogen removal through the different seasons.

A mixed RAS Deoxygenation Zone with 5 minutes of contact time at the 3.6 MGD design condition will allow the dissolved oxygen to be depleted prior to the RAS being mixed with primary effluent. Depleting the dissolved oxygen in the RAS ahead of the primary effluent will allow more readily degradable carbon to be available for denitrification in the Pre-Anoxic zones without the need for an expensive additional carbon chemical system.

Blower Selection – High-speed turbo blowers and hybrid (rotary screw) blowers will be considered for process aeration. Blowers are also required for scouring the membrane cassettes to manage membrane fouling. For the size of this facility, a positive displacement blower is most common. Final selection will not be based solely on membrane supplier preferences or the lowest equipment cost, but will also consider operating cost and maintenance requirements, with the City's input to ensure this key process mechanical equipment meets the City's needs. As noted above, space will be provided in the blower room for installation of an additional blower(s) in the future.

Diffuser Type Selection – There are a wide variety of diffusers available in today's markets in many different shapes and materials. Each performs differently in a site-specific environment in terms of fouling and long-term oxygen transfer efficiency. Our team has performed diffuser analysis for other facilities in California and will bring that experience to the City. Fine bubble disc and tube diffusers will be considered since they are most commonly used and multiple manufacturers are available for competitive bidding. Selection will be based on the option that meets the oxygen transfer requirements and efficiency at the lowest cost.

Figure 3-5. The aerated zone that follows the Pre-Anoxic zone would be comprised of three separate diffuser grids

Diffuser Layout – Aeration diffusers provide air for both oxygen transfer and mixing energy in the aerated zones in each aeration basin. They must be laid out in patterns that allow the changing oxygen demand along the length of the aerated zone to be efficiently met. Diffusers are typically laid out in a tapered density pattern as the first level of control of airflow rates. Higher oxygen transfer is required in the upstream section of the aerated zone where oxygen demand is highest, resulting in a need for a higher diffuser density, and lowest at the end of the aerated zone prior to the Post-Anoxic zone. Diffusers will be designed in specific grids sized to allow localized control. The aerated zone that follows the Pre-Anoxic zone will be comprised of three separate diffuser grids, each with a Dissolved Oxygen (DO) probe, an air flow control valve with high precision actuator and air flow meter. The aerated zone downstream of the Post- Anoxic zone will have a single diffuser grid. The ultimate diffuser layout will be proposed by the diffuser supplier in concert with the MBR supplier and in close coordination with AECOM/Lyles.

Airflow Control System –Our experience has shown that primary effluent constituent loads to the aeration tanks will change throughout the day due to diurnal changes in their concentrations (cBOD5, TKN). In-line analyzers (DO probes) and automated control systems (most open valve/blower output) providing an instantaneous response to these changing conditions will be implemented.

The design will be based on tapered DO setpoints for the three diffuser grids in the aerated zone that follows the Pre-Anoxic zone such as 2, 1.5 and 1 mg/L. The aeration system will have sufficient turndown to allow lower setpoints to be used to optimize performance and minimize energy consumption. The DO concentration at the end of the aerated zone will be designed to be no higher than 1 mg/L since the IMLR pumps send mixed liquor from this location to the Pre-Anoxic zone.

The DO in the aerobic zone following the Post-Anoxic zone will be designed for greater than 1 mg/L to ensure residual ammonia is thoroughly oxidized.

Optional Aeration Improvement. There has been an increasing trend in the industry in the use of Ammonia Based Aeration Control (ABAC) to control airflow while using DO probes to establish both maximum and minimum set points. In our experience from implementing ABAC in other facilities, this is a reliable control philosophy that further minimizes blower power consumption while optimizing process performance. However, ABAC requires ammonia probes and associated maintenance and calibration. Information on

BEST for **BANNING**

A small, low cost supplemental carbon addition system will allow the plant to meet treatment objectives without a costly RO system

ABAC can be provided to the City to determine if its implementation is justified and best meets the City's needs. This will be one of the topics planned for one of our technical collaboration segments.

Large bubble mixing is proposed for use in the RAS de-oxygenation zone, bioreactor mixed liquor effluent channel and the anoxic zones as this mixing approach has the lowest energy costs. Note the proposed **use of a PE/RAS flow splitter box eliminates the need for a flow distribution channel and its associated mixing requirement**.

Supplemental Organic Carbon Addition – While advanced WWTPs commonly achieve an effluent TN of less than 10 mg/L without any carbon supplementation, our approach for deferring the RO will require an effluent nitrogen of approximately 6 mg/L for meeting blended water quality requirements for reuse at Sun Lakes. Since this lower level of effluent nitrogen may not be achievable, we recommend including a supplemental carbon feed system. By providing carbon storage, pumping, piping, and distribution diffusers in the Post-Anoxic zones in the three aeration tanks, supplemental carbon can be added as needed. Micro-C 2000, a non-hazardous glycerin-based product produced and marketed by Environmental Operating Solutions, Inc. are commonly used for facilities of this size and is recommended by AECOM/Lyles. Dosage rates can be controlled by a nitrate-N probe in each Post-Anoxic zone. This approach will reduce TN to a level low enough to minimize the amount of potable water used for blending to defer the RO system construction.

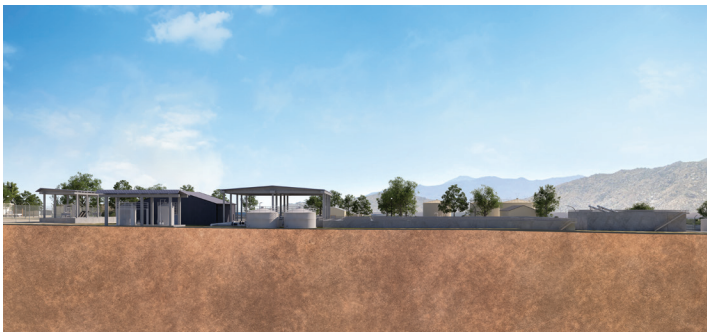


Figure 3-6. A 3-tank configuration is cost effective and allows for easy expansion in the future

Membrane Tanks

Based on our experience from developing designs for similar-sized facilities, and following discussions with several prominent MBR suppliers, our team has developed a preliminary layout with several innovative/ alternative ideas that enhance the system layout, performance and operator interface. The design is based on typical dimensions using hollow fiber cassettes. Flat plate technology can also be used in a similar configuration.

Figure 3.6 illustrates a 3-tank configuration and how we propose to integrate the membrane tanks within the new biological system.

The concept layout shown utilizes the Veolia Leap MBR cassettes. This approach will require four cassettes (500EV modules), and with one membrane tank out of service will meet the City's peak flow (3.6 mgd) and load requirement. The proposed two-row cassette layout is advantageous since it reduces the length of the tanks and provides a more compact common-wall design and provides a conservative flux rate of 14 gfd under average day flow conditions. During the detailed design we will explore with the City the option to add an additional six feet of length to accommodate additional cassettes consistent with a fourth (future) aeration basin.

In this layout, the footprint includes an average sidewater depth of 20 feet (which we deem to be optimal for aeration design) and will be gravity-fed through a common channel that collects flow from all aeration tanks in service. Lastly, two duty RAS pumps will be required to pump up to 15 MGD (400% of the primary effluent flow rate) to limit the membrane tank MLSS to 10,000 mg/L at the design condition. At plant influent flows and loads in the near-term, the RAS pumping rate is anticipated to be 100 to 150% of the primary effluent flow rate. Waste Activated Sludge (WAS) pumps (one duty/one standby) will also pump sludge from this channel to the mechanical thickener.

Our initial cost assessment of this layout suggests that **a concrete structure with common walls for the entire MBR system is the lowest cost option**, in comparison to concrete aeration tanks followed by elevated individual stainless steel membrane tanks that will require additional piping, controls and electrical elements.

Other key design-to-budget aspects of our robust and flexible membrane tanks approach include:

- ✓ Total membrane filtration area and range of design fluxes minimize fouling for the following flow conditions: 30-day ADWF of 3.6 MGD; peak 24-hour average flow up to 5 MGD.
- ✓ Provide spaces to accommodate additional membranes for future flows without capital expansion
- ✓ Provide redundancy to allow one membrane tank to be removed from service for the clean-in-place procedure required
- ✓ Minimize pumping energy by pumping only RAS back to the aeration basin rather than pumping ML (PE + RAS flows) to the membrane tanks
- ✓ Safe delivery and storage areas for membrane cleaning chemicals (i.e, sodium hypochlorite and citric acid)

Scum Management. Scum formation is anticipated to occur at some undefined frequency in the three aeration tanks and MBR tanks. A manual weir gate is proposed at the end of each tank that allows the operators to lower the weir to remove scum from the tanks. A similar manual weir gate will be provided in the RAS channel at the end of the membrane tanks. In both cases scum will be conveyed to a scum wet well and pumped to the digester inlet.

Final Disinfection

A portion of the MBR effluent will be used for unrestricted water reuse (irrigation) and will require Title 22 disinfection. The remaining MBR effluent diverted to percolation ponds does not require disinfection and will reduce the size of this systems thus right sizing the overall application lower both the capital and long-term operating costs of the facility.

The DCR base approach project includes chlorine disinfection using a three-pass 110,000-gallon chlorine contact basin (LxWxD of 60x20x12 feet, respectively) to provide a chlorine residual that provides 450-milligram minutes per liter (mg-min/L) under a minimal modal contact time (CT) of 90 minutes. The chemical for disinfection is NaOCl. Per the 2022 Feasibility Report, the cost of this contact basin and chemical storage and feed system is ~ $2.4 M. This is a solid approach that follows industry accepted practice and guidelines.

Our team examined this approach and applied some additional critical thinking including operability, meeting future water quality requirements, and providing recycled flow to the Sun Lake Country Club. We concluded that a UV system would best serve the City's goals for this project while meeting disinfection requirements. We believe **UV is a more cost-effective solution that is readily expandable to accommodate future demands.**

One of the key considerations of our proposed modification is that chlorine disinfection utilizes sodium hypochlorite (NaOCl), which increases the Total Dissolved Solids of the effluent. We estimate the additional TDS added to the MBR effluent within the 12-15 mg/l. This outcome is contrary to the City goals associated with the anticipated RWQB requirements and need to reduce TDS overall to provide a suitable water source to the Sun Lake Country Club. The additional costs associated with an RO system, brine management and disposal approach make our approach highly attractive. We have also considered a cost effective unique approach to the recycled water production for the country club described in greater detail below. **Eliminating the hypochlorite disinfection approach will save up to $75k to $95k annually.**

In recent years and on several projects (Rialto, Stockton) AECOM/WML have compared the life cycle cost of UV and chlorine disinfection (both chloramination and free chlorine) and UV disinfection has turned out to be the most economical alternative. For Banning, because of the improved UV transmittance of membrane effluent (>65%), UV disinfection is particularly attractive.

We have done a preliminary design for a UV facility for 1.07 mgd (the combined amount used by Sun Lake CC and by the new plant)and this will require a single channel (LxWxD of 35x5x8 feet, respectively) with three UV banks (two duty and one standby, each bank with 4 modules with 8 250 W lamps per module). Our preliminary estimate of the construction cost for this system is approximately $ 0.75 M

The approximate annual power usage and cost to treat 1.07 mgd are 140,160 kW and $14,160, respectively. An additional bank can be added to increase the firm capacity for this system to 1.6 mgd, if additional capacity is needed in the future.

Primary Sludge and Waste Activated Sludge Processing

While co-thickening primary sludge and waste activated sludge (WAS) is shown in the RFP documents, our experience is that the primary sludge will likely not be consistent enough to give a stable operating point for the mechanical thickener. This could result in the need to construct, operate, and maintain a large combined sludge storage tank with feed pumping ahead of the thickener to provide a more consistent solids composition by mixing and equalization. With respect to gas production it is beneficial to avoid spikes can result from intermittent feed pumping and instead have a mostly continuous feed of sludge (especially primary) to the digester which can provide constant gas production and more stable digester operation. Therefore, the team proposes to keep the two sludges separate and the primary sludge will be fed to the digesters as it is done in the current operation while thickening the WAS. Since primary sludge readily thickens, we suggest adding a density meter to the combined discharge of the primary sludge pumps to provide feedback to the operators for achieving the desired primary sludge feed concentration to the digesters.

Our recommendation is to provide two rotary drum thickeners (one operating, one spare) to thicken WAS with space for expansion in the future. We agree with the RFP selection of rotary drum thickening (RDT) as the most cost-competitive thickening technology for this application and installation size. Furthermore, there is demonstrated experience with the unattended operation of RDTs with WAS feed, which provides the City with greater flexibility for 24-hour WAS processing and constant feed to the digester while saving on capital cost by installing a smaller unit.

Mechanical thickening will be provided with the associated polymer feed system. We recommend that the skid system using liquid polymer totes. Both thickening and polymer system will be installed outside under the canopy structure.

Recuperative Thickening Alternative. A main driver for the mechanical thickening is the optimization of digestion capacity. As an alternative to thickening WAS prior to digestion or separately thickening primary sludge in the future, the City could consider recuperative thickening of digested sludge. Recuperative thickening consists of pumping some sludge from the digester, thickening it and returning thickened sludge into the digester. This could be cost-competitive and provides several operational benefits. First, it keeps the digester feed operation the same as it is currently. It can be operated on demand, when there is a need for more digester capacity. The feed to thickening is more uniform since it is digested solids, making it easier to control the thickening performance. Recuperative thickening does not require tanks upstream or downstream, and the thickening process can happen for each digester in sequential order. The limit of thickening is typically based on the type of digester mixing system. Although replacing the digester mixing system is not part of this project, it may be possible to change the digester mixing system in the future to further increase overall capacity. For example, this could be done using low speed, high torque mechanical mixers similar ones our team is implementing on the East County AWP project in Santee.

Conversion of the Secondary Digester to a Primary Digester. As stated in the RFP scope, the secondary digester needs to be upgraded to a primary digester to ensure the City can continue producing Class B biosolids. We will provide new digester heating system similar to the heating systems of the other digesters for the familiarity of operation and controls. Digester gas handling and use for the upgraded digester will be connected to the existing boiler and the digester gas flare. Although the upgrade of the digester gas system is not in the scope of this project, once the thickening system is selected and designed, the potential peaking factors in digester gas production in the future upgraded system be evaluated. If the digesters feeding happens over short periods of time at higher rates, the digester gas peak flows may potentially be higher than the existing system capacity and may require an upgrade.

Our Solution alleviates the need for RO

A key element of this project is to produce recycled water suitable for irrigation within the boundaries of the Beaumont Basin, specifically the Sun Lakes Country Club.

The DCR includes an RO system to reliably meet the water quality objectives for this basin, specifically TN ≤ 5 mg/l and TDS ≤ 330 mg/L. All other uses have less restrictive water quality objectives. We anticipate that the water quality generated by the MBR system will have a TN < 6.3 mg/l and TDS of ~380.

The proposed RO solution has substantial capital and annual operational costs to the City. Additionally, the handling of multiple chemicals for scaling minimization and periodic cleaning of the membranes will place additional stress on the operations staff and possibly require additional personnel support. Lastly the option requires a large amount of land allocated for brine disposal evaporation ponds (potentially up to 15 acres or more depending on the treated flow).

Per the 2022 Feasibility Study, the construction cost of these facilities is estimated at $8.75M. The cost for power and chemicals for a 0.4 mgd system is estimated at ~$260k per year. Additional O&M costs to be considered include labor for operations and maintenance for the RO system and brine evaporation ponds, spare parts, and environmental monitoring for the evaporation ponds and ultimate disposal of the brine salt which will likely need to be treated as a regulated or hazardous waste depending on the concentration of certain metals.

Having completed several recent RO systems associated with water reuse project, we are very aware of items that lead to the successful design and operation of these complex systems. Water characterization that includes silica and phosphates concentrations are essential to understanding membrane fouling, chemical recovery and performance warranty offered by the vendors. Many communities have invested in extensive water quality sampling and pilot studies to determine the ultimate efficacy of using a proposed RO system. We appreciate the challenges the City is facing with providing a sustainable water source for Sun Lakes and other recycled uses and believe that it is the City's best interest to consider another option.

Deferment and potential elimination of the RO system reduces the overall risk exposure to both the City and its operators. Our team has a solution that is sustainable and cost effective (both capital and operations). Our

BEST for **BANNING**

Eliminating the need for the RO system will save the City nearly $9M in construction expenditures.

option will eliminate the capital expenditure of $8.75M associated with the RO and brine management ponds and the annual operating costs of $260K/year would be offset by a similar cost, however with significantly less stress placed on the operations staff. There is also the elimination of the brine salt disposal which may requires specialized handling and disposal requirements due to heavy metal concentrations.

To accomplish the project goals without the use of an RO system, AECOM/Lyles suggests the blending of MBR effluent with potable water. The key elements of this approach are:

Optimize total nitrogen removal in the biological process from 7.5 mg/l to 6.3 mg/l to reduce the amount of potable water needed for blending.

Blend MBR effluent and potable water for irrigation at Sun Lakes Country Club only. Per the 2023 water quality reports the potable water of the City of Banning, TN is ~1.5 mg/l and TDS is ~200 mg/l.

Using this scheme, 0.55 mgd of UV-disinfected MBR effluent will be blended with 0.21 mgd (143 gpm) of potable water at the Sun Lakes Country Club. The resulting blend will provide 0.76 mgd of irrigation water and meet the TDS and TN requirements for the Beaumont Basin.

The estimated yearly cost of the potable water is ~ $390k using $3.88 per HCF (2024-2025 retail rate). This expected to be even lower, that the O&M cost for the RO and evaporation ponds facilities when adding in the additional labor and brine salt disposal costs.

Considering that blending with potable water is only required for the flow pumped to the Sun Lakes Country Club, this approach will meet ALL irrigation demands (1.07 mgd), using 0.86 mgd of recycled water produced at the WWTP and 0.21 mgd of potable water, while deferring or totally eliminating the capital and O&M costs associated with an RO system and evaporation ponds.

As part of our blending concept we will prepare a technical memorandum focused on salinity and nitrogen management and we will endeavor to meet with the Regional Board to get obtain their concurrence with this cost effective solution.

Non-Process Design and Auxiliary Facilities

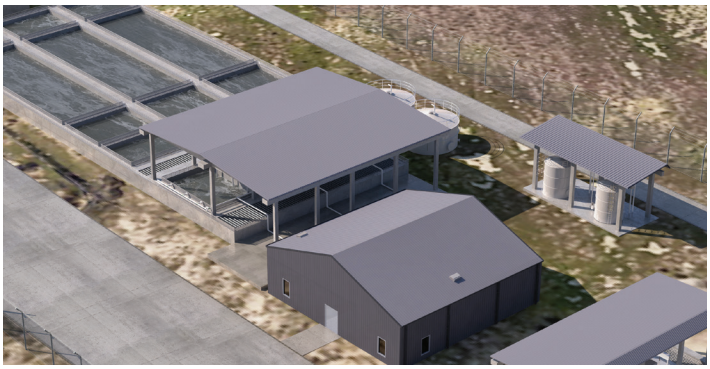
Once the key decisions are made regarding the major process facilities then the remainder of the project elements can be developed. These non-process related features of the project will be documented in the PDR, additional meetings with the City staff will be conducted to further flesh out existing operational needs and practices at the WWTP. Some initial thoughts about the approach and challenges are presented below for civil/site work, geotechnical, and building services. All of these engineering and architectural design disciplines are located together in one place – the AECOM design center.

Civil/Site Work

Key features include:

- ✓ New force main to transfer flow from the equalization basin to the to the new MBR facility.
- ✓ New force main to transfer treated effluent from the UV system to the the reservoir tank.
- ✓ New pipe to transfer excess flow from the permeate tank to the evaporation ponds
- ✓ New roadways and parking to support the new MBR treatment facility.
- ✓ Management and establishment of site specific stormwater measures
- ✓ Onsite vehicular access and roadway systems that accommodates chemical deliveries and emergency vehicles
- ✓ Site grading that promotes positive run-off away from buildings and structures

We plan to follow existing pipeline alignments where possible to best avoid any conflicts with existing structures and subsurface obstacles. Site grading will be developed around new facilities such that there is a natural transition from new to existing facilities.



Geotechnical Field Investigations

We will perform subsurface geotechnical investigation in the vicinity of proposed new structures to determine soil conditions to assist in the development of detailed design and construction cost estimates. Investigations will include review of available geotechnical maps and documents along with site reconnaissance and obtaining appropriate permits. Soil borings will be conducted with hollow stem auger methods. Borings will be advanced to an appropriate depth determined during preliminary investigations and soils will be collected for laboratory testing and analysis including moisture and density, grain size distribution, Atterberg limits, corrosion potential, and direct shear testing. A geotechnical report will be developed including results of field investigation and laboratory testing and will provide geotechnical engineering recommendations for seismic design, foundations, slope stability and earthwork. Based on preliminary review of site conditions and provided subsurface information we anticipate that foundations

for the main proposed structure development will primarily consist of shallow foundations (spread and continuous footings, mat foundations).

Process Building

Our concept for the new process building includes a new pre-engineered metal building on a reinforced concrete slab floor with individual equipment support pads. The process building will house the main electrical room that will support the upgrades, blowers, chemical metering, as well as a new laboratory and office space. Initial collaborative discussions will include identifying the needs of the City and WWTP staff to right size this building and provide value based design to budget. Building will be designed to 2022 Building Code. All finishes (both interior and exterior) will be developed and selected collaboratively between our team and your staff. Building layout will consider ADA requirements in appropriate areas. Windows and Doors will meet the intended use of the areas (i.e. finishes, size, area requirements, area classification).

Power Supply & Electrical Equipment

Evaluation of the existing electrical distribution will be critical in developing the electrical design on the new treatment facility. One of our team's initial efforts in support of the electrical design will be to evaluate the total operating demand of the existing WWTP loads and review 12-month peak demand KW from the utility. Then with an inventory of existing equipment to remain and proposed equipment our electrical design team will verify that the existing transformer and switchboard have enough capacity to run the new and existing loads.

It is anticipated that the existing electrical system is in good condition and will be expanded upon as part of the facility upgrades. The upgrade will include 480VAC feeders installed from the existing spare breakers at the existing main switchboard SWBD-MS. The following presents our approach to the electrical design of the upgrades.

- ✓ The new electrical system equipment will be housed in air conditioned, environmentally controlled electrical rooms.
- ✓ During the design phase, a detailed and comprehensive electrical load analysis to evaluate plant service loading at the main switchboard as well as each MCC, distribution and lighting panels. The load study will be used to support the plant upgrade and to confirm each electrical system loading.
- ✓ The motor control centers, variable frequency drives (VFDs)switchboards, distribution panels and lighting panels shall be provided with integral surge protection devices (SPDs) for increased electrical system reliability and for safe operation.
- ✓ Overall short circuit withstand and interrupt rating of the equipment will be determined as required.
- ✓ To optimize plant power operation and to monitor electrical energy and electrical protection functions, the electrical distribution equipment shall be provided with a plant wide power monitoring system connected in a network to a dedicated power monitoring workstation.

Standby Power

- ✓ Evaluate capacity required to provide standby power for both new and existing facility loads and provide a standby diesel engine generator set.
- ✓ Standby generator to be provided with double wall, sub-base fuel tank sized as required for 48 hours of full load operation.
- ✓ Automatic Transfer Switch (ATS) to be provided to transfer from utility power to standby generator power if utility power is unavailable. Transfer switch to be open-transition type

Instrumentation & Controls

The distributed PLC-based SCADA system will include a client server environment, highly integrated Human Interface (HMI), and process control distributed to the unit process. Workshops will be held to develop the specific design approach for the new system, including requirements for redundancy and reliability. Balance of Plant PLCs will be distributed throughout the site and connected via a fiber optic communication backbone. Vendor-provided PLCs will control packaged systems and connect to the local balance of plant PLCs. The SCADA system will be flexible and expandable to allow for future process enhancements and hardware changes.

The system will provide information to the Operators and other users from any system access point. Operator control commands generated from an HMI shall be executed in the respective PLC. Access and information may be expanded and available based on needs, technology, and cost of ownership.

The commonality of control will extend throughout the facilities control hierarchy from the discrete devices in the field, to the PLCs, and the HMI. Specified instruments will monitor plant process parameters to optimize plant operation. Operator and machine safety will be integrated into the monitoring and control of the facilities. The alarm management system will provide a uniform and easily understood operator alarm notification presented at the HMI. Software and control system integration will monitor and control the process and provide text-based reports for operations and regulatory reporting needs.

Energy Incentives

There are several energy incentive options that will help adding solar energy to the project a substantially more affordable proposition. Adding solar energy to the project will pay by itself in a few a years and help offset the added energy consumption from the added treatment processes.

Solar Incentives (Federal ITC)

The Federal Investment Tax Credit (ITC) allows the water treatment facility to claim 30% of the total cost of their solar installation. This includes solar panels, inverters, labor, and other associated costs like permitting fees. The ITC applies to projects completed between now and 2032, providing significant tax savings. For instance, a $100,000 solar installation would result in a $30,000 tax credit, reducing upfront expenses. If the facility's tax liability is less than the credit, the remaining amount can be carried over into future years. This makes solar installation more affordable and offers a quicker return on investment.

Battery Energy Storage Incentives (SGIP)

The California Self-Generation Incentive Program (SGIP) provides rebates for battery energy storage systems (BESS). The rebate starts at $150 per kilowatt-hour (kWh) of installed battery capacity. After the SGIP rebate is applied, the federal Investment Tax Credit (ITC) allows you to claim 30% of the remaining project cost. For example, if a battery system costs $100,000 and qualifies for a $15,000 SGIP rebate, the ITC would then apply to the remaining $85,000. This combined approach can significantly reduce the overall cost.

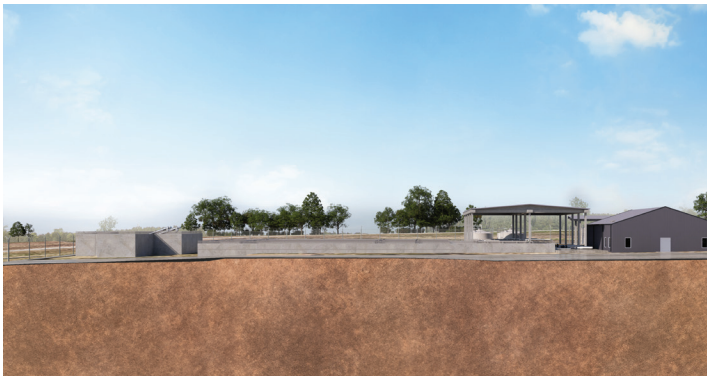
Direct Pay Provision

For tax-exempt entities like nonprofits or government-run facilities, Direct Pay allows them to receive the full value of the ITC as a direct payment instead of a tax credit. This ensures that even entities without tax liabilities can fully benefit from both the ITC and any bonus credits.

Innovation & Design Optimization

Please refer to Figure 3-3 for a graphical summary of our innovation and optimization concepts. Below, we summarize them.

Design Criteria. Base the process volumes on 3.6 MGD 30-day average flow rate with average influent concentration data to avoid over-building tank volume in comparison to assuming maximum month load peaking factors. Revisit peak-day flows as it is likely will be lower than 7.2 mgd.



Overall Site Layout and Piping and Pumping. Efficient layout and adequate sizing of yard piping will ensure the project set the stage for the future capacity expansions beyond this project. Our approach minimizes pumping by providing gravity flow for most of liquid train, with only two pumping stages (permeate pumps and disinfected effluent pumps) from the fine screens discharge to the recycled water storage tank.

Headworks and Primary Treatment. Defer construction of a third primary clarifier. Performance of the two existing clarifiers is anticipated to be adequate for flows up to the deswign flow of 3.6 MGD.

Biological Treatment. A four-stage Bardenpho configuration will allow optimization of nitrogen removal and flexibility to reduce the effluent TN as desired to eliminate the need for RO.

Disinfection. UV offers cost savings and provides additional flexibility for future expansion.

Eliminate Costly RO. Use Potable Water or Raw Water for Blending RW to SL Golf Course to Eliminate the Need for RO.

PART IV

Construction & Startup Process

Understanding the balance required between efficient construction, maintaining plant operations and preserving environmental conditions, we have devised a comprehensive plan that addresses all aspects. With our proven track record and strategic planning, we are poised to deliver a project that exceeds your expectations.

Introduction

We've developed a comprehensive sequence plan, layout, and schedule addressing site logistics, safety, and compliance to balance efficient construction with environmental preservation. AECOM/Lyles has extensive experience working in dry and windy landscapes like the City of Banning, having successfully completed projects in neighboring communities, including a similar project in nearby Beaumont. This regional expertise, combined with our local craft labor resources and access to local subcontractors, ensures we can secure the right partners to deliver your project successfully. **Our team lives and works in Riverside and the surrounding area and have strong relationships with local subcontractors/ suppliers** through our dedicated outreach efforts and repeat business on completed and ongoing projects. This network allows us to quickly secure qualified subcontractors familiar with the local conditions. Our regional projects include the Hi-Desert Wastewater Reclamation Facility, CR&R Riverside County Environmental Center, VVWRA Hesperia Subregional MBR Plant, VVWRA Apple Valley Subregional MBR Plant, Morongo WWTP, Palm Springs WWTP, Yucaipa WWTP, Yucaipa Water Treatment Plant and Lytle Creek WWTP. These successfully completed projects demonstrate our ability to leverage our resources and local reputation to deliver positive results.

Construction Planning and Sequencing

With years of experience in managing large-scale infrastructure projects, we have developed a robust approach that prioritizes efficiency, safety, environmental stewardship, and the operation of existing facilities.

Your project site is ideally situated, with many of the proposed new facilities located on the adjacent lot. This allows a straightforward approach to site layout, logistics, and resource management. Notably, the bulk of the proposed facilities are greenfield in nature, confined between the existing plant entrance road, Charles St, and the Animal Shelter facility. Reference Part II: Site Layout for further discussion. Other than the smaller-scale RDT, Digester improvements and a few miscellaneous improvements at the existing plant, this limits the impact on the existing facilities and personnel. Shutdowns of the plant are also limited, allowing for the completion of the main MBR facilities to be constructed almost in whole, off to the side, and without straining existing space and resources. When work involves interaction with existing facilities, AECOM/Lyles will submit a detailed shutdown request that includes a field coordination meeting and a comprehensive plan submission, for City approval at least two weeks prior to the scheduled activity.

Our early procurement strategies and just-in-time delivery streamline project timelines by ensuring that critical materials and equipment are secured in advance and arrive when needed. Our QA/QC team will implement a QR code tracking system to verify that all process equipment is checked in upon delivery, ensuring it arrives undamaged and meets project specifications. This provides an early opportunity to confirm that the equipment is in proper condition before installation. Additionally, the City can use the QR code system for real-time, on-the-spot compliance verification in the field. This proven approach will minimize storage costs, reduce the risk of damage, and prevent delays in construction. Our specific strategy for your project, including the advancement of a 60% GMP in line with early procurement and work packages, allows us to achieve your construction schedule and proactively address current long lead durations on critical

BEST for BANNING

We have assigned **Philip Portillo**, who has nearly 12 years of safety experience, to serve as our Safety Director. He will work closely with the local safety manager to ensure our site safety representatives are all well qualified and expertly trained. Our safety team will passionately pursue compliance with safe practices dictated by locations, conditions, and circumstances unique to this project.

equipment and materials. We advocate for early Phase 2 NTP following GMP, and ahead of the Final Design. This is specifically discussed in the Schedule section.

Approach to Self-Performance

AECOM/Lyles has the capability to self-perform approximately 75% of the construction work on this project, including all earthwork, concrete, structural steel and metals, mechanical piping, equipment installation and instrumentation integration for the project. This allows us to control project costs, maintain efficiency, enhance coordination, mitigate risks, improve safety, enable resource flexibility, control schedules, and ensure quality. **The benefit to the Ciy is the lowest total project cost due to reduced schedule and elimination of double markup on subcontractors.**

As a JV, this self-performance responsibility is shared by both parties and is supported by the capabilities of both AECOM and Lyles. This approach provides the City joint and several accountabilities while providing confidence in the availability of resources. Also, the integration of design scope with primarily self-performed construction scope and a limited number of dedicated subcontractors reduces the layers and amount of markup embedded in the price. What sets us apart for the Banning project is our unmatched self-performance experience with MBR. **We have installed, modified, removed, and replaced more MBR cassettes than any other contractor in Southern California**, giving us deep insight into both effective and flawed designs. For Banning, this means AECOM/Lyles will not only execute the MBR installation with precision but will also bring invaluable expertise to guide the design for optimal operations and long-term maintenance. Our team will design the MBR tanks, bridge crane, permeate piping, and air piping connections to ensure the safe and efficient removal and replacement of the MBR cassettes—prioritizing the safety of the operations team long after our work is complete.

While Lyles self-performs a majority of the work, we typically subcontract specialty trades such as concrete reinforcing steel (rebar), masonry, painting and coating, interior finishes, and electrical. This allows AECOM/Lyles to leverage the expertise and experience of industry leaders who can provide input in schedule, budget, and constructability, expanding the benefit of trade partners beyond installation only. Our goal is to align with subcontractors and vendors who share our "project-first" mindset, are local to the project thus keeping the money spent in the community, fostering a collaborative work atmosphere that delivers high-quality results for the overall benefit of the project.

Securing Competitive Bids

AECOM/Lyles will collaborate closely with the City to tailor our procurement strategies to the project specifics to ensure that adequate vendors and subcontractors are identified, facilitating maximum competitive bidding from qualified firms. Before beginning procurement, anticipated purchase agreements and subcontracts will be prioritized based on complexity, manufacturing lead time, historical performance of the vendors/ subcontractors, impact on schedule and sequencing, overall value, and long-term O&M. Using this methodology, our team will identify critical scopes and recommend that some be competitively procured early, aiding the GMP development, and allowing the design to be tailored accordingly. This approach maximizes design efficiency and ensures that the City and other stakeholders are fully satisfied with the critical elements. The procurement of the remaining work will be timed to provide maximum pricing competition, particularly for commodities such as concrete, piping, and metals. We will reach out to trusted partners to ensure participation as well as solicit the overall market through Good Faith Efforts (GFE). The team will use Building Connect or other solicitation software to ensure GFE documentation and related requirements are adhered to along with maximum distribution.

Our team will use both one-step best value and low lump sum procurement approaches across the various scopes.

- ✓ Best value selection will be used for complex scopes or where subcontractor input during the design would benefit the project. These are typically initiated through RFP that is tailored to the scope specifics and will conform to minimum 30-day solicitation requirements. RFP scoring will be based on criteria established with the City and include experience, safety record, bonding capacity, and other proof of financial stability requirements followed by technical requirements and pricing. Following panel review, the highest scoring proposer will be recommended to the City for confirmation and subsequent award. Interviews and/or reference validation may be required.
- ✓ Low lump sum selection is typically used for more straightforward scopes where the benefit of subcontractor input in the design is minimal (i.e. painting & coating) or for commodity or equipment purchases that are specification-based (piping, valves, etc.). Lump sum selected proposers will still be prequalified to ensure responsible and responsive bids before selection.

Our final selections will be made with City input and consensus, following thorough bid validation. We will clearly define roles, responsibilities, and expectations with all selected subcontractors to ensure seamless collaboration and alignment with our project goals.

Communication Strategies

Our approach to self-performance, sub-selection management, and communication is designed to maximize efficiency, quality, and collaboration with you and your Owner's Advisor throughout the project.

We will establish a dedicated SharePoint site to share updates, schedules, technical information, and other relevant documents in real-time. This centralized platform will ensure transparency and facilitate efficient information exchange among all participants and will be accessible to all stakeholders. This site will also store and allow access to the Submittal, RFI, and PCO/Change Logs, as well as Daily Construction Reports, Testing Reports, etc.

Our project team will hold regular progress meetings with the City and other stakeholders, supplemented by as-needed ad-hoc meetings to address specific issues or opportunities. We encourage open dialogue, actively listen to feedback, and being responsive to any concerns or questions that arise from the team, implementing or revising best practice strategies where applicable. Project decisions made during these meetings will be documented in a Decision Log and stored on the project SharePoint site as well.

The construction team will meet weekly with superintendents and foremen and as needed to review the 3-week schedules and ensure that all preceding work and resources are onsite or in transit. Premobilization or Kick-off meetings for any new subcontractors on site will be conducted to ensure that all new personnel are aware of the project details, safety requirements, site access, and hauling routes, etc. Noncompliance is unacceptable and may result in the replacement of nonconforming personnel. To address client interface, we will maintain open and consistent communication with the City and other stakeholders throughout the project. This will also involve regular progress updates, transparent reporting through our dedicated SharePoint site, and scheduled meetings to discuss any emerging issues or opportunities. Our goal is to foster a collaborative environment where client feedback is actively sought and integrated into project decision-making.

Through our focus on self-performance, rigorous sub-selection, and proactive communication, AECOM/Lyles will ensure a well-managed, collaborative project environment that delivers outstanding results.

Revision 8/30/2017

Shown above is an example of a Table of Contents that we include in all of our Safety Manuals. This enables easy navigation and quick reference to specific safety topics. It also clearly demonstrates the comprehensive nature of our safety planning, covering all critical aspects for a safe and successful project.

Approach to Safety

With AECOM/Lyles, safety isn't just a priority; it's our most important core value, ingrained in every aspect of our operations. We are dedicated to implementing an effective safety program on your project that emphasizes best practices, rigorous safety protocols, workforce training, and fostering a culture centered around safety. Our commitment extends to providing a safe and healthy working environment during all phases of the project for all employees (both our and yours),

subcontractors, project stakeholders, and the community. Our most important resource is our people and our priority is to ensure their wellbeing.

Our commitment to safety begins with the designation of a full-time, on-site Safety Coordinator who is responsible for overseeing all safety protocols throughout the project. This ensures that safety remains a top priority every day, on every part of the site.

We have established a comprehensive safety review process that includes regular safety meetings, where issues are proactively addressed, and any concerns are resolved quickly and efficiently. Our safety framework also includes thorough documentation of all safety procedures, ensuring full compliance with regulations and that all team members have access.

Central to our approach is the meticulous evaluation of risks associated with the project. We recognize that every project comes with its own set of challenges and potential hazards. Therefore, we conduct thorough risk assessments to fully identify and understand these potential hazards. This allows us to devise strategies for equitable risk identification and distribution, ensuring that safety concerns are addressed proactively throughout the project lifecycle. Job Site Safety Analyses (JSAs) are developed for each task on a daily basis, followed, monitored, and revised as necessary. Every employee has the authority to stop work at the first sign of an issue. This allows the team to come together and reassess a situation and provide alternate safer approaches.

We emphasize workforce training to promote safety excellence. Our team receives extensive training and resources to navigate diverse construction environments safely. This training is both general to our industry as well as specific to the project site and the tasks at hand and would look to integrate your staff into this training protocol as well. This empowers our workforce to recognize and respond to hazards, fostering a culture of vigilance and accountability.

We prioritize site safety and security through specialized training in construction traffic management and equipment handling. All personnel receive material safety training to ensure proper chemical handling and storage. Strict access controls and personnel tracking systems maintain a secure job site, allowing us to deliver high-quality results on schedule while safeguarding everyone involved. A guard shack and security guard will be utilized for the site entrance off Charles St. to direct both construction traffic and check-in visitors and direct them accordingly or deter unnecessary personnel. All construction facilities around your project site will be fenced.

By aligning with your O&M goals, we reinforce our commitment to these safety initiatives. This dedication to safety is demonstrated by both AECOM and Lyles, which have a Worker's Compensation Insurance Interstate Experience Modification Rate (EMR) well below industry averages statewide and nationally.

Table 4-1. AECOM/Lyles EMR Numbers

AECOM and Lyles prioritize safety, as shown by our low EMRs. This shared commitment minimizes risks and supports the City's goals for a successful project..

EMR	2024	2023	2022
AECOM	0.57	0.62	0.58
Lyles	1.0	0.93	0.74

Design-Build Schedule

AECOM/Lyles understands that the City expects to issue the Notice to Proceed in December 2024, with the goal of achieving Final Acceptance in the 4th Quarter of 2027. To meet this objective, we have developed a comprehensive Critical Path Method (CPM) schedule outlining all major activities and milestones from the Contract Date to Final Completion. As shown in **Appendix A,** our schedule includes approximately 375 activities with a critical path that extends from NTP through PDR/10% Design, 30% Design, 60% Design, GMP and Construction Amendment Approvals, early equipment and subcontractor procurement, Aeration Basin construction, MBR facility construction, start-up, and into Plant Commissioning and Acceptance activities. Using the December 10, 2024 tentative NTP date listed in the RFP, our team anticipates Substantial Completion on August 16, 2027, followed by Final Completion and Acceptance on November 9, 2027. This provides for approximately 33 working days of total float against the City's Final Completion goal.

We understand the City's schedule requirements for key milestones, approvals, construction, shutdown and tie-ins, procurement, start-up and testing and our schedule clearly outlines the necessary design, construction, and start-up phases. We will collaborate with the City and plant O&M staff to proactively address project requirements, define responsibilities, and maintain momentum while maintaining existing operations.

Our dedicated scheduler will work closely with Joe Lawrence, Gabe Perigault, Vince Guillama, key subcontractors, trusted suppliers, and the City to iteratively refine the schedule throughout the design phase. We will provide regular monthly schedule updates as well as at each design milestone (30%, 60%, etc.) and at any major change or update in scope or duration. Three-week schedule updates will be provided at each Progress Meeting to help provide more detailed information on ongoing or anticipated activities to enhance coordination with the existing plant operations.

Project Schedule

The project schedule includes 33 working days of float, which provides some flexibility, but requires careful management to avoid delays. Proactive monitoring of progress against the schedule is essential, with immediate action taken at the first signs of potential delays. Identifying opportunities to recapture lost float is crucial to maintaining the project timeline. Delays in procurement, civil works, design, or other aspects can quickly erode this buffer due to the schedule's tightness. Therefore, vigilant planning and monitoring are necessary to keep the project on track and avoid consuming the float.

This strategy will require associated amendments to allocate the necessary funds. However, it will significantly reduce the need for extensions and ensure a more streamlined project timeline.

Early Procurement of Equipment and Materials

Recognizing the City's willingness to request modifications to funding deadlines to accommodate extended construction durations, while desiring a 2027 completion, our team recommends the early procurement of major and/or long-lead-time equipment pieces. This approach offers several advantages:

Design Efficiencies: Early procurement expedites the receipt of shop drawings for key equipment allowing designs to be tailored around the specific equipment for the project, avoiding generic representations and potential costly revisions during the submittal and construction phases. **This further ensures a precise fit and optimal system configuration from the outset**.

Price Certainty: Early contracting locks in prices for high-value equipment, reducing uncertainty and conservatism in the GMP or related contingencies and effectively shielding the project from unpredictable market fluctuations and potential supplier escalation. Global conflict often strains supply and drives up costs. Early price certainty provides a solid financial foundation for the project moving into construction.

Supply Chain Mitigation: Procuring equipment early can avoid vulnerable points in the supply chain, such as potential production lulls during Phase 2. Coming out of COVID and the resulting ramp-up to meet high demands exposed the economic and supply chain vulnerability to work stoppages such as the recent East and Gulf Coast longshoreman and harbor disputes. Climate change and major natural disasters in and around major manufacturing facilities can also prove to be an issue. We are already hearing of extended delays related to certain electrical equipment manufacturers in and around North Carolina and have already seen deliveries for PLCs and VFDs on current projects increasing up to 56 weeks after submittal approval, still affected by the lingering pandemic effects. By obtaining submittals and releasing as far in advance as reasonable, we can minimize the risk of overall project delays and ensure a steady progression of work.

Schedule Condensing: By strategically shifting components of the procurement forward, overlapping with Phase 1, we can condense the overall project

Lyles' recent success with the Hi-Desert Water District (HDWD) exemplifies the value we can bring to the City of Banning. When HDWD needed to select equipment for their MBR units, we guided them through a complex procurement process that demanded a deep understanding of technical specifications and budget constraints. Our collaborative approach, transparent analysis, and constant communication empowered HDWD to make informed decisions that aligned with their goals and priorities. By involving HDWD throughout the process, we ensured the selected solution met their unique needs and expectations, delivering a cost-effective, high-quality result that met all technical requirements. Given the similar scope and terrain of the City of Banning project, we are confident in our ability to replicate this success. Through our collaborative, transparent, and data-driven approach, we will deliver a project that exceeds expectations and sets a new standard for municipal water infrastructure in the region.

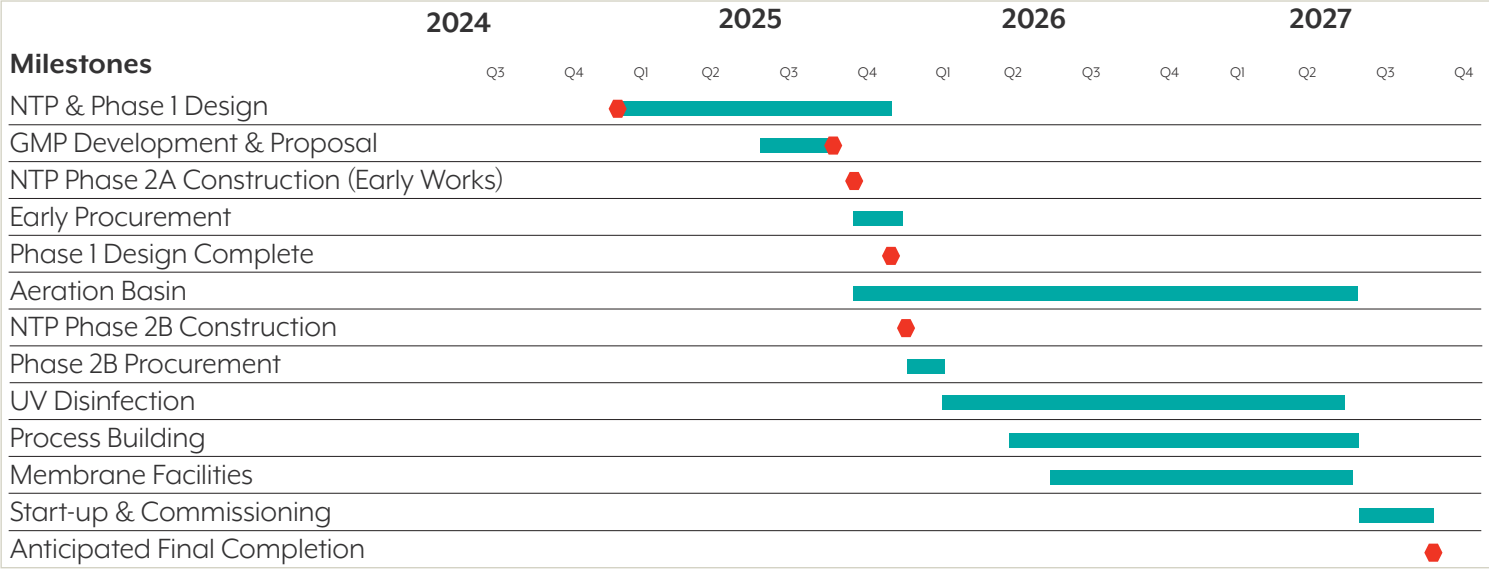
schedule. This streamlined approach optimizes the construction timeline for greater efficiency.

To take advantage, we anticipate early procurement of the following major equipment pieces in order to advance early design and ensure on-time delivery;

- ✓ Electrical Gear (PLCs, VFDs, MCCs, Transformers, etc.)
- ✓ Fine & Course Bubble Diffuser Systems
- ✓ Aeration Blower Equipment
- ✓ Membrane Bioreactor Equipment

Early Procurement of Subcontractors

Similar to the critical equipment and materials strategies noted above, our team recommends the early procurement of select subcontractors. Specifically, this would include electrical and instrumentation (EI&C), pre-engineered metal buildings (PEMB), and concrete reinforcing. While requiring design details to advance sufficiently at earlier stages with a higher upfront effort, this approach offers several advantages:



Increased Constructability: Bringing a subcontractor on prior to the completion of Final Design, in this case between the 60% and 90% stages, allows us to take advantage of the specialty expertise, ensuring that the design as shown can be built and used efficiently as well as providing the ability to take and use real-time and real-world alternate approaches that have the potential to save time, cost, and/or reduce risk for the subcontractor and the project overall.

Budgeting and Price Certainty: Early subcontracting also helps lock in pricing for critical specialty scopes not performed by the AECOM/Lyles team. We rely on our partners to review and back-up our original budget assumptions advanced from early design and estimate iterations as well as provide their current understanding of the market conditions in their specific sectors for a more precise GMP. The subcontractor input on design ensures that the design details necessary for pricing are available and accurate, reducing conservatism and contingency.

Supply Chain Mitigation: Just like general contractors, subcontractors are exposed to the same vulnerabilities in the supply chain related to limited supply, work stoppages, conflict, etc. Deliveries for PLCs and VFDs on current projects are increasing up to 56 weeks after submittal approval, still affected by the lingering pandemic effects. Getting early development, shop drawings, and into the fabrication queue for these types of items is imperative for on-time project completion. We then rely on and support our subcontractors to coordinate with their known contacts as well as maintain dates and track deliveries to minimize the risk of delays and ensure a steady progression of work for them and the project overall. Electrical gear on this project has limited float and has the potential to push start-up beyond the intended completion dates if not properly managed.

Schedule Condensing: Early subcontracting also allows our subcontractor to procure equipment and materials during Phase 1 that would traditionally not be available until first executing a subcontract and then second-tier purchase agreements after a Phase 2 NTP, extending project duration. For this project, acquiring a concrete reinforcement (Rebar) subcontractor in lockstep with the 60% Design and GMP is imperative. This allows for the necessary time for the rebar design, submittal, approvals, and fabrication to advance specifically for the Aeration

Figure 4-2. Milestone Schedule

Basin well ahead of the Final Design. This ensures that rebar can be onsite at the earliest possible date to maintain construction on one of the most critical structures due to its depth and the proximity of other structures within its excavation footprint.

Early Work Packages

In order to take advantage of early procurement, design for specific aspects of the work must be substantially advanced to allow vendors and subcontractors to accurately price the work, and with minimal revisions. Several of these packages will be developed as part of the 60% Design and will be provided to the City for review and comment before being revised and stamped for construction use. This will require our design team to advance selection of and design around critical equipment pieces ahead of the Final Design. This will allow the submittal, review, and release of long lead items. Additionally, advancement of this design will allow the construction team to excavate, install underground utilities, and move into foundation construction while preparing for equipment installation during the fabrication period. To ensure on-time completion, we anticipate the development of an early work package for the Aeration Basins allowing for civil work (including mass excavation) and structure foundations. Completion of this deep structure is critical to advancement of the MBR Tank and all other structures within the AB excavation footprint. **Early procurement is a key strategy for ensuring a more streamlined project timeline, staying within budget, and ultimately delivering a superior final product for the City.**

The Phase 1 Design period is anticipated to be 390 calendar or 275 working days through December 15, 2026. We anticipate GMP development beginning in July 2025, following completion of the 60% Design, moving into a City approval of an early works GMP. Approval of Construction or NTP 2A by October 30, 2026 ahead of Phase 1 completion. The early works GMP NTP marks the go-point to procurement of major equipment and critical material, taking advantage of the strategies noted. Phase 2B NTP is anticipated to occur shortly thereafter, marking the issue of the full construction documents and the start of the balance of the construction and remaining procurement.. This approach saves the project approximately four months and avoids a down period allowing design completion for negotiations, amendment drafting, and agreements. The design and construction teams are able to roll seamlessly from design into construction and engineering support during construction, maintaining team focus and momentum.

Cash Flow

AECOM/Lyles recognizes that one of the most important monthly deliverables is providing an accurate cash flow forecast for the City's use and for coordination with funding agency requirements. We will provide an initial Cash Flow curve related to the anticipated schedule, equipment and material deliveries, and construction operations for the City's use. Any changes or updates in either the schedule or expected dollar distribution will be communicated with the greater team. Note that all costs incurred are summarized weekly, and tracked against the initial budget. Additionally, an "estimate to complete" is performed routinely to track the status of the project against the remaining budget. Any deviations from the expected or forward-looking budget concerns are brought to the overall project team during Progress Meetings. These estimates will also be compared against the baseline drawdown schedule to ensure that the City can proactively manage its financial needs. This will be made available as part of our open-book process to ensure no surprises throughout the project delivery.

Functional Testing, Startup, Acceptance Testing and Transfer of Operations

Proper implementation of these activities is a key element in achieving ultimate success for this project. These steps will be the culmination of nearly a decade of hard work invested by the city into this project. Recognizing the significance, we have already started planning for start-up in our design, as designing with the end performance goals in mind is a key tenet of the AECOM/WML Team's approach to design-build.

Prior to any commissioning, startup, training, or performance testing activities, our team will develop testing and training plans that align with City staff schedules to demonstrate the efficiency of the new facility. Many key items have already been considered in developing our conceptual design and proposal offering. Some key elements of plan are presented in the following subsections.

The plan will be documented in our Startup and Commissioning Plan. This approach has been implemented successfully on other projects involving complex startup and sequencing efforts, including California WWTP design-build projects for the cities of Davis, Rialto, and Stockton.

Equipment Documentation and Testing

Many of the requirements for equipment and system testing can be found in the Final Design Specifications and will be implemented during construction. These activities include:

- ✓ Leak testing of tanks and pipes
- ✓ Electrical and instrumentation tests (aka dry testing)
- ✓ Vendor certification (where applicable) of installed process equipment

Other activities will be addressed in a draft startup and commissioning plan developed and submitted to the City and its Advisor for review during the early stages of construction. Examples of planned activities include:

- ✓ Confirmation that all process equipment supplier O&M manuals have been received
- ✓ Inspection of the electrical power system completed by the local power authority
- ✓ Vendor startup and checkout of process equipment

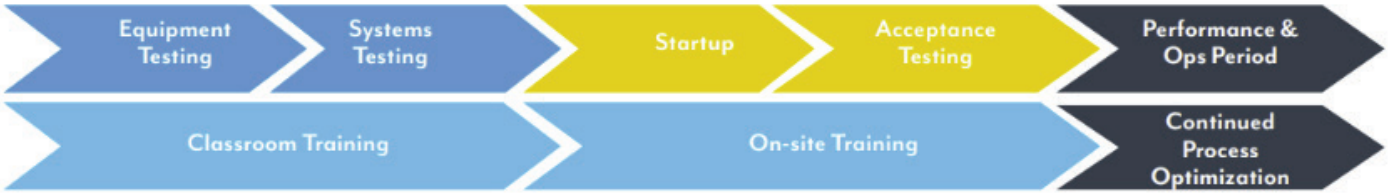
The plan will include ample time for manufacturers' representatives to be on site and to allow time for potential revisits and adjustments. Results of the equipment testing, including vendor startup and checkout reports, will be compiled and submitted as documentation of the testing program. Certificates of Proper Installation (COPI) will be prepared and signed by equipment manufacturer representatives.

System/Clean Water testing

After the individual process components are functionally tested, a series of systems tests will follow. Whereas the equipment testing will have focused on individual units, these tests will be structured to confirm that inter-related components will work correctly. Typically, this testing is done with clean water. For example, one aeration tank, membrane tank, and permeate tank would be filled with water. A temporary pump would be installed at the permeate tank to recycle a water stream back to the fine screens where one screen would be in service and treated flow would travel by gravity to the in-service aeration basin and membrane tank. Here, a permeate pump would transfer flow back to the permeate tank. This would result in a constant flow of water thought the fine screen/MBR system and testing of all associated equipment (blowers, diffusers, pumps etc.) Once testing is complete, the water would be transferred to the next screen/aeration/MBR tank for the next round of testing and so on until and all facilities are satisfactory. Examples of systems that will be tested include:

- ✓ Aeration/biological systems including membranes, pumps, blowers, diffusers, and instrumentation
- ✓ UV disinfection systems
- ✓ Dewatering equipment, pumps, VFDs, pipelines, valves and control logic
- ✓ Standby and emergency systems, including generators and UPS systems
- ✓ Power distributions and MCC equipment

Additional vendor documentation including additional COPI forms will be submitted at the completion of the systems testing process documenting the successful results of the functional testing.



Wastewater Startup

Startup of the new facilities on wastewater will follow completion of all pre-startup checks. This will be performed in accordance with a written startup plan and under the direction of our team's startup manager.

For the most operational flexibility, startup of the new MBR facility can be done in a stepwise manner: first the biological treatment process will be started up with the objective of discharging fully treated but undisinfected effluent to the onsite disposal beds. Because biological treatment systems need to grow sufficient mass of bacteria to treat the incoming wastewater, the start-up must be done in gradual increments to slowly ramp up treatment capacity. This will require close coordination between the existing WWTP and the startup of the MBRs as the bulk of treatment will still need be provided by the existing trickling filters.

Following systems testing with clean water, off-site biological material (waste activated sludge or seed) will be collected and transported to the site and introduced to the biological (SBR or MBR) system. This critical step will require a well thought-out plan of introducing raw wastewater to the new plant in a controlled manner.

Figure 4-3. The AECOM/Lyles team will develop a well thought-out Startup Plan

Small batches of wastewater will initially be received, with the treatment process closely monitored to ensure complete treatment. These batch increments will be slowly increased (typically 5 to 10% per day) until one treatment train is full and treated flow is of a high enough quality to discharge to the effluent beds. The next step is to bring the second aeration tank online and continue to slowing ramp up the wastewater flow while monitoring mixed liquor concentration levels and permeate quality. These steps will allow a viable biological community to be established that will be capable of treating the full plant flow. This process typically takes four to six weeks to complete.

Following the establishment of a strong biological community, the plant will be run for a few weeks to ensure all systems are working and fine-tuned prior to formal acceptance testing. At some point prior to acceptance testing but after full plant flow is achieved, UV disinfection will be placed in service for its Title 22 treatment. UV testing as required by DDW will be accomplished.

All equipment will be operated in accordance with the operational needs of the plant at flow/process loading rates as determined by the AECOM/Lyles Team. The purpose of the startup testing will be to demonstrate the operational readiness of the equipment and the functionality of associated instrumentation.

Acceptance testing

Following functional testing, we propose to operate the new facilities during a two-week acceptance test to demonstrate satisfactory performance and compliance with Title 22 reuse regulations and effluent bed discharge requirements.

In general, the liquid processes will be operated to treat the influent flow and loads that enter the treatment facility over the 14-day test period, with reuse water treated in quantities as needed and the remainder of the flow discharged to the effluent disposal beds.

During the acceptance test we anticipate that sampling and testing will be in accordance with the discharge permit requirements. Composite samples of the influent and final effluent will be collected and analyzed at the required permit frequency. In addition, sampling of the primary influent and effluent will be included for targeted water quality parameters.

Once the acceptance testing has been completed, normal industry practice is to transfer full operational responsibility back to the Owner.

BEST for **BANNING**

Vijay Kumar, a seasoned Startup and Commissioning Manager, brings 27+ years of hands-on experience in water/wastewater treatment system installation, commissioning, and optimization. A notable example is his Commissioning Engineer role on the $54.4M City of Beaumont WWTP Salt Mitigation Upgrade Project. This extensive project demanded the demolition, modification, and construction of various system components. Vijay's technical expertise and problem-solving skills ensured a successful, on-schedule commissioning process. His comprehensive knowledge and experience make him an ideal partner for efficient and reliable water/wastewater treatment projects.

APPENDIX

B

Resumes

Joe Lawrence

Project Manager

Joe is a Senior Vice President at W. M. Lyles and Collaborative Delivery Manager with over 22 years of experience in managing and delivering large-scale water and wastewater treatment projects. He has a proven track record in pre-construction planning, cost controls, and project execution. He has extensive experience with progressive design-build and design-bid-build delivery methods, overseeing advanced water purification, wastewater treatment plant expansions, and SCADA upgrades. Joe is committed to delivering high-quality infrastructure while leading teams and managing complex project requirements.

Firm
W. M. Lyles. Co

Education/Academic Qualifications
BBS, Construction Management
California State University Fresno, 2001

Professional Registrations
Contractor's License – Class A
General Engineering – State of Hawaii

Community Involvement
ACE Mentoring Program of Central California

Tenure with AECOM: 22
Total Years in Industry: 22

Why Joe?

- ✓ Extensive background in advanced water purification systems and recycled water projects, such as the ECAWP
- ✓ Advanced understanding of various delivery methods, including PDB and DBB
- ✓ Deep technical expertise, particularly in SCADA upgrades, biological treatment, tertiary filtration, and disinfection processes

Owner/Client References

① East County Advanced Water Purification (ECAWP) Packages 1 and 3, Progressive Design-Build, Santee, CA

Client: ECAWP/Padre Dam Municipal Water District
Alfred Pedroza, PE
AWP Engineer (Owner's Project Manager)
T: 619.540.9313 | E: apedroza@padre.org

Role: Pre-Construction and cost controls/budgeting.

To reduce the East County Water District's reliance on water from outside sources, the East County Advanced Purification Project (ECAWP) will treat East County's wastewater locally for potable reuse. Joe managed pre-construction, cost control and budgeting for Package 1, which involves design and construction of a water recycling facility, advanced water purification facility, visitor center, product water pump station, solids handling facility, and system integration across Packages 1-4 of the ECAWP.

② Stockton Regional Wastewater Control Facility, Progressive Design-Build Modifications, Stockton, CA

Client: City of Stockton
Art O'Brien
T: 209.937.8787 | E: aobrien@robertson-bryan.com

Role: Construction Manager.

Joe was the primary lead for this progressive design-build project that involved the construction of new influent pumping, screening, and grit removal systems; new secondary biological treatment systems; new tertiary filtration and disinfection systems; and new solids handling facilities to replace an existing oxidation pond and overland flow treatment system. Major process equipment included large vertical turbine solids handling pumps, perforated fine screens, conical tray grit removal systems, primary and secondary clarifier mechanisms, aeration blowers and diffusers, submersible mixers, tertiary disc filters, UV disinfection system, sludge centrifuge, and associated electrical, control, and SCADA upgrades.

Joe Lawrence

Project Manager

③ Davis - WWTP Secondary and Tertiary Improvements, Design-Build, Davis, CA

Client: City of Davis
Michael Lindquist
T: 530.747.8287 | E: lindquist4water@gmail.com

Role: Role: Construction Manager.

Design-Build construction of new secondary biological treatment systems, new tertiary filtration and disinfection systems, and new solids handling facilities to replace an existing oxidation pond and overland flow treatment system. The secondary treatment processes consist of four new extended aeration basins and four new 85' diameter secondary clarifiers. Tertiary filtration and disinfection facilities consist of four new 6 MGD disc filters, two new chlorine contact tanks, and a new sodium hypochlorite and sodium bisulfite storage and pumping facility. Sludge handling facilities consist of two new rotary drum thickeners, two new screw presses, chemical storage facilities, and a 48,000 SF sludge storage facility. Also included were a new cogeneration plant, a new emergency power generator, and numerous other electrical, control, and SCADA upgrades.

Additional Experience

Graham Hill Water Treatment Plant Upgrades, Progressive Design-Build, Santa Cruz, CA. Pre-Construction Manager. The WTP was built in 1960s and had not been significantly upgraded since the 1980s. The City recognized that in order to secure their water future, significant upgrades to the WTP had to be undertaken. Joe is the vital link between the design, project owner, and construction teams, ensuring that the project is well-planned, cost-effective, and set up for successful execution once construction begins. The project scope includes: high-rate clarification through the use of space-efficient plate settlers, ozone system, granular activated carbon (GAC), reclaimed water clarifiers, provisions for future UV disinfection, and new chemical feed systems; new administration and maintenance buildings, and new ozone building; upgraded operations building and upgraded filter gallery building; electrical upgrades; demolition of some existing buildings and site improvements including landscaping and vehicular access improvements. Construction is anticipated to begin in late 2024, and substantial completion is expected by Spring 2028.

Wastewater Treatment Plant Upgrade & Expansion, Design Bid Build, Linda County Water District, Marysville CA. Executive Sponsor for construction of a new 5 MGD wastewater treatment plant on a 27 acre site adjacent to an existing treatment plant. New facilities include a headworks, two primary clarifiers, four activated sludge basins, two secondary clarifiers, filter pump station, six effluent filters, sludge thickening system, sludge drying beds, sludge lagoons, site grading, and associated piping, electrical, and instrumentation systems. Upgrades to the existing plant include the demolition of existing facilities and modifications to the existing effluent pump station.

WWTP Tertiary Filtration, UV Disinfection and Biosolids Improvements, City of Galt, CA. Project Manager for expansion of 3 MGD wastewater treatment system to 6 MGD, including tertiary filtration and ultraviolet disinfection capabilities, biosolids dewatering facility, biosolids storage and transfer facilities, operations and electrical building, pump stations, backup power generation, and additional infrastructure. Expedited delivery: 12 month contract time. **American Public Works Association (APWA) Project of the Year 2010.**

5 MGD WWTP Expansion and Upgrade, Design Bid Build, City of Reedley, CA. Project Manager/Estimator for expansion and upgrade to 5 MGD, including influent pump station, headworks, anoxic basin recycle pump station, oxidation ditch, RAS pump station, sludge storage facility, effluent pump station, and secondary clarifiers. Construction also included structural concrete, equipment delivery and installation, underground utilities, above-ground piping, and total project administration.

Copper River Wastewater Reclamation, Design-Build, Copper River Development Co. Project Manager/Estimator for 0.75 MGD wastewater reclamation facility, including SBR structure, chlorine contact structure, effluent distribution structure and pump station, metal buildings, administration/laboratory building, associated equipment, and process piping.

Fresno County Juvenile Justice Facility Wastewater Treatment Plant, Fresno County, CA. Project Engineer/Estimator for 0.12 MGD wastewater treatment plant to service the new Fresno County Juvenile Facility, including new concrete structures, lined storage ponds, yard piping (26' deep), associated equipment, and process piping.

Gabriel Perigault, PHD, PE

Engineering Manager

Gabriel brings experience on more than 25 water/wastewater treatment plants, including process selection, piloting, detailed design, construction, start-up and commissioning, and performance validation and optimization. He will lead the design, working closely with our Project Manager Joe Lawrence and Process Technical Lead Alex Franchi and specialty design disciplines similar to our other PDB projects in California. Gabriel has a project first and client centric mindset. He is an organized, responsive and committed multi-discipline design manager with extensive experience overseeing complex water and wastewater projects. He is an excellent communicator and is fluent in all the major disciplines with special focus on process mechanical and instrumentation.

Firm
AECOM

Education/Academic Qualifications
PhD, Environmental Engineering, Stanford University, 2001

MS, Environmental Engineering, Stanford University, 1995

BS, Mechanical Engineering, University of Chile, 1990

Professional Registrations
Professional Engineer, Civil, CA #68471

Tenure with AECOM: 8
Total Years in Industry: 25

Why Gabriel?

- ✓ Will lead our multi-discipline design team through lessons learned from collaboration on recent and current design-build projects with AECOM/ Lyles JV – East County AWP, Davis, Stockton, Rialto plus many other design-build utility projects in California
- ✓ Extensive experience managing the design of MBR and RO facilities

Owner/Client References

① Stockton Regional Wastewater Control Facility Progressive Design-Build Modifications, Stockton, CA

Client: City of Stockton
Art O'Brien, Project Manager
T: 916-790-0218 | E: aobrien@robertson-bryan.com

Role: As Design Manager, led the design of multiple improvements to treat 40 mgd (average dry weather flow, 105 mgd peak) and meet more stringent nitrogen limits, reduce effluent salinity, and improve overall energy efficiency and operational reliability using a progressive design-build delivery approach.

Design is complete and construction is due to be complete in 2024. Improvements include: new influent pumping station and headworks; replacing the existing biotowers, facultative ponds and wetlands with new activated sludge secondary treatment process with nitrogen removal; replacing the existing nitrifying biotowers, DAF thickeners, gravity filters, and chlorine contact canal with new tertiary disk filters and UV disinfection; providing new dewatering facilities using centrifuge technology; new buildings for administration, engineering, laboratory, safety, operations and maintenance functions; and optimizing overall plant hydraulics to reduce the multiple pumping steps (currently 7) across the plant to only two pumping steps and rely on gravity flow for most conveyance through the treatment train.

② East County Advanced Water Purification (ECAWP) Packages 1 and 3 Progressive Design-Build, Santee, CA

Client: ECAWP/Padre Dam Municipal Water District
Alfred Pedroza, PE
AWP Engineer (Owner's Project Manager)
T: 619.540.9313 | E: apedroza@padre.org

Role: As Design Manager for Package 3 and Engineering Advisor for Package 1, Gabe has been involved throughout the project.

Gabriel Perigault, PHD, PE

Engineering Manager

The AECOM/Lyles JV is providing PDB services for the heart of the program, which includes the design and construction of a water reclamation facility and an advanced water purification facility (Package 1), and conveyance infrastructure (Package 3).

- **Package 1** involves the design and construction of a 16-mgd WRF, 13.5-mgd wastewater and advanced water purification facility, visitor center, product water pump station, and solids handling facility. Gabe is working closely with the treatment systems design team in a technical advisory role.
- **Package 3** includes the rehabilitation and upgrading of the Influent Pump Station and the East Mission Gorge Pump Station (new pumps, odor control systems, ferric feed system, several metering and flow control vaults, backup power), new WRF force main (14,000 ft open cut, 3,500 ft horizontal directional drilling), and new residuals bypass system (pumping station and conveyance system). Gabe served as the overall design manager as well as the AECOM project manager for the entire package.

③ **Santa Cruz WTP Progressive Design-Build, Santa Cruz CA**

Client: City of Santa Cruz
Matt Zeman, Engineering Associate
T: 629.540.9313 | E: apedroza@padre.org

Role: Design Manager.

The AECOM/Lyles JV is providing PDB services for $100M+ upgrade to the Graham Hill WTP. The WTP was built in 1960s and had not been significantly upgraded since the 1980s. The City recognized that in order to secure their water future, significant upgrades to the WTP had to be undertaken. Joe is the vital link between the design, project owner, and construction teams, ensuring that the project is well-planned, cost-effective, and set up for successful execution once construction begins. The project scope includes: high-rate clarification through the use of space-efficient plate settlers, ozone system, granular activated carbon (GAC), reclaimed water clarifiers, provisions for future UV disinfection, and new chemical feed systems; new administration and maintenance buildings, and new ozone building; upgraded operations building and upgraded filter gallery building; electrical upgrades; demolition of some existing buildings and site improvements including landscaping and vehicular access improvements.

Additional Experience

Wastewater Treatment Plant Progressive Design-Build Improvements, City of Rialto, CA. Design Manager. Led the production of the Basis of Design Report, including 50 percent design drawings, and GMP for expanded headworks and secondary treatment facilities, new disk filters and UV system, as well as several retrofits to the existing thickening and solids handling facilities to provide treatment capacity for 12 mgd average annual flow. This was the first phase of the progressive design-build delivery approach selected to procure this project. Cost $26M. (2020)

Wastewater Treatment Plant Secondary and Tertiary Improvement Design-Build, City of Davis, CA. Served as the Engineer-of-Record for the performance acceptance report, which included the following process: modified Ludzack-Ettinger Nitrogen Removal Process, tertiary filtration with disk filters, chlorine disinfection, WAS thickening with rotatory drum thickeners, sludge dewatering with screw presses, and miscellaneous pumping, storage and conveyance facilities within the existing WWTP. Cost: $72M. (2018)

Montevina Water Treatment Plant Progressive Design-Build, Los Gatos, San Jose Water Company, CA. As Design Lead, coordinated design activities at project's design center and served as process and mechanical designer for solids handling facilities. Project included upgrading 43-year-old plant to convert the existing 30 mgd direct filtration process to a 30 mgd membrane filtration process. This plant is the primary supplier of drinking water for the Town of Los Gatos and surrounding west Silicon Valley communities. Specific duties for this progressive design-build project included coordination of design duties for the overall design effort and detail design of thickening and dewatering facilities and associated ancillary facilities (miscellaneous pumping and polymer storage and feed systems). Thickening and dewatering included two gravity thickeners and two screw presses, respectively. Cost: $58M (2015)

Sun City Tehama Water Reclamation Facility – Pulte Homes, Tehama, CA. Prepared a facility plan, a Title 22 engineering report, and regulatory compliance studies and reports to secure Waste Discharge Requirements to permit effluent disposal for agricultural irrigation for a new community in Tehama County. ***Conducted 30 percent design for a package MBR treatment plant*** and chlorine disinfection system as well as aerated solids stabilization pond. $300,000 (2006)

Alessandro (Alex) Franchi, PHD, PE

Process Technical Lead

Alex's technical experience encompasses conventional and advanced processes in wastewater, water reuse and potable treatment including oxidation, chemical and ultraviolet disinfection (UV), membrane technologies, advanced oxidation, activated sludge, membrane biological reactors, media filtration, coagulation, headworks, and pump stations. Alex will lead the process design team in preparing deliverables and recommending technology solutions. His most recent MBR design was for the Inland Empire Utilities Agency Regional Plant 5, where he developed the layout, preliminary design, and final design of the fine screens facilities. Alex was intimately involved with the design of two additional MBR in Southern California. Alex is currently providing services for the East County Advanced Water Purification (PDB project which includes a 4-stage bardenpho, MF, RO, and UV/AOP.

Firm
AECOM

Education/Academic Qualifications
PhD, Environmental Engineering, Johns Hopkins University, 2000

MS, Environmental Engineering, Johns Hopkins University, 1995

BS, Civil/Chemical Engineering, University of Maryland - College Park, 1992

Professional Registrations
Professional Engineer, Civil, CA #75225

Tenure with AECOM: 6
Total Years in Industry: 30

Why Alex?

- ✓ MBR and RO design
- ✓ Led successful designs of Title 22 projects across California
- ✓ Lead designer for large (>$150M) progressive design-build projects
- ✓ Wastewater, drinking water and water reuse facilities process design

Owner/Client References

① Silicon Valley Clean Water, RESCU Front of Plant Progressive Design-Build Project, Redwood, CA

Client: Silicon Valley Clean Water
Teresa Herrera, P.E. – Manager
T: 650.591.7121 | E: therrera@svcw.org

Role: As Design Lead, Alex completed design to construction package level.

Progressive design-build project involving the design and construction of a new 80-mgd front of the plant facilities, including deep-lift pump station (90 feet), new headworks with screenings, grit removal, solids loadout, chemicals storage, electrical room, and connection pipeline to existing plant.

② East County Advanced Water Purification Program (ECAWP) Package 1 Progressive Design-Build, Santee, CA

Client: ECAWP JPA/Padre Dam Municipal Water District
Seval Sen, PE - AWP Engineering Manager
T: 619.258.4631 | E: ssen@padre.org

Role: Lead Process Engineer for 11.5 advanced treatment facility including MF, RO and UV/AOP.

This progressive design-build project is one of the first in the country for the augmentation of a surface water supply with treated wastewater for potable reuse. Components of Package 1 include: a 16-mgd Water Recycling Facility, an 11.5-mgd Advanced Water Purification Facility including MF, RO and UV/AOP, a solids handling facility, a product water pump station and a new visitor's center.

③ PFAS treatment System at Well OPA-1

Client: Orange County Water District
Ryan Bouley, Principal Engineer
(714) 378-8207 Email: rbouley@ocwd.com

Role: Project Manager and Lead Process Engineer for OPA-1 PFAS removal system.

Alessandro (Alex) Franchi, PHD, PE

Process Technical Lead

Preliminary design, final design services, bid phase, and engineering during construction services for a PFAS treatment system at Well OPA-1. The treatment system includes lead/lag ion exchange treatment system capable of treating a flow rate of approximately 3 mgd, including appurtenant facilities. The design incorporates provisions to accommodate intermittent operations of the well. The ion exchange vessels are located in a depressed structural concrete pit to minimize the visual impact of the vessels on the adjacent residential community.

Additional Experience

Regional Wastewater Control Facility Progressive Design- Build Modifications, City of Stockton Municipal Utilities, Stockton, CA. Senior reviewer of UV facilities and leading the design of multiple improvements to treat 40-mgd (average dry weather flow, 105-mgd peak hour flow) and meet more stringent nitrogen limits, reduce effluent salinity, and improve overall energy efficiency and operational reliability using a progressive design- build delivery approach. Improvements include: new influent pumping station and headworks; new activated sludge secondary treatment for biological nutrient removal, including aeration system (nitrification/denitrification); new tertiary disk filters and UV disinfection; new dewatering facilities with centrifuges; new buildings for administration, engineering, laboratory, safety, operations and maintenance; new lime system; and optimizing overall plant hydraulics. $194M (2024)

RP5 and RP1 Upgrades, Advanced Treatment, UV/ Chlorine Disinfection, and Cost Estimates, Inland Empire Utility Agency, Chino, CA. Task lead for a multi-phase project involved the design and economic analysis for expansion and upgrades at four water recycling facilities ranging between 10 and 60 mgd. Tasks included general site planning, design, and economic analysis of wastewater treatment processes to produce California Title 22 water. The RP-5 upgrade included the preliminary design of a 45-mgd UV facility. The groundwater injection component of the project included the predesign of a 3-mgd facility with MBR, microfiltration, reverse osmosis (RO), UV, AOP, and stabilization. Cost $11M (2019)

Regional Water Reclamation Facility Expansion and Upgrade, Elsinore Valley Municipal Water District, Lake Elsinore, CA. UV disinfection and hydraulics task Lead for the rehabilitation and expansion from 16- up to 26-mgd of an existing wastewater treatment plant, including headworks upgrades, the addition of a new 8-mgd MBR treatment train, new UV system, equalization basin for secondary effluent, off-spec water management, and upgrades of solids processing facility. The plant effluent is discharged into Lake Elsinore and must meet strict standards for low phosphorous and California Title 22 reclaimed water for recreational uses. The project included a new aeration basin and membrane bioreactor for the expansion. Worked extensively with EVWMD staff to evaluate and select blower and diffuser equipment to meet the needs and preferences of the staff. Cost $8.7M (2019)

South Coast Water Reclamation, Barbados Water Authority, Barbados. The Barbados Water Authority (BWA) evaluated the feasibility of upgrading its South Coast Sewage Treatment Plant to a tertiary/advanced treatment plant capable of producing water suitable for groundwater recharge in a potable aquifer and/or a non-potable aquifer, or suitable for edible food crop irrigation. The goals of the Project include: augmenting existing groundwater water supplies, mitigating climate change effects, addressing seawater intrusion and sea level rise, diversifying potable water sources, enhancing water supply resiliency, and reducing the impact of treated effluent on marine life and the environment. Alex led the conceptual design of a 1.6 MGD advanced water treatment facility including disk filters, UV disinfection, ultrafiltration (UF), reverse osmosis (RO), stabilization of pH and alkalinity control, and final disinfection. Cost $140,000 (2022)

Airport Satellite Water Reclamation Plant Feasibility Study, City of Fresno, CA. Advanced treatment process lead for a feasibility study for a 5-mgd water reclamation facility that included MBR, RO, UV, and AOP and industrial source treatment. Water from this facility will be used for groundwater injection to recharge a depleted aquifer and public or agricultural irrigation. The intake points from the sewer system, located near a winery, discharge 800,000 gallons per day to 2.7-mgd of partially treated wastewater to the sewer system. The feasibility study evaluated the possibility of converting partially treated discharge into high-quality recycled water using membrane bioreactor treatment, followed by UV light disinfection; and using the recycled water for irrigation of the airport golf course, groundwater recharge, and industrial uses. Alex conducted a senior review of the membrane bioreactor system and the advanced treatment facility. Cost $0.5M (2019)

Marcos Reyes

Construction Manager

Marcos is a dynamic professional with a strong foundation in engineering principles, he has progressively advanced within the wastewater treatment plant construction industry, starting as a Superintendent in 2009 and transitioning through roles as Project Engineer/ Assistant Project Manager before assuming his current position as Project Manager. Through his career journey, he has demonstrated adeptness in project management, engineering, and leadership, consistently delivering successful outcomes on various projects. His background includes experience working alongside AECOM on the ECAWP Advanced Water Purification Project and Rialto WWTP Improvements project. He brings a combination of technical expertise and managerial skills to drive projects to completion efficiently and effectively.

Firm
W. M. Lyles Co.

Education/Academic Qualifications
BS, Civil Engineering,
San Diego State University, 2008

Tenure with Lyles: 7
Total Years in Industry: 15

Why Marcos?

- ✓ Worked with AECOM staff on design-build projects including East County Advanced Water Purification $260M joint venture project
- ✓ Worked with AECOM staff on design-build projects including Rialto $25M WWTP improvements project including site upgrades and piping
- ✓ San Diego County experience includes pipeline project consisting of upgrading of 27,000 feet of existing 72- and 75-inch pipe
- ✓ Extensive underground utility and pump station experience

Owner/Client References

① East County Advanced Water Purification Program (ECAWP) Package 1 Progressive Design-Build, Santee, CA

Client: ECAWP/Padre Dam Municipal Water District
Kyle Swanson
T: 619.528.4766 | E: kswanson@padre.org

Role: Marcos is the Sr. Construction Manger for the East County Advanced Purification Project (ECAWP)

This progressive design-build project is one of the first in the country for the augmentation of a surface water supply with treated wastewater for potable reuse. Components of Package 1 include: a 16-mgd Water Recycling Facility, an 11.5-mgd Advanced Water Purification Facility including MF, RO and UV/AOP, a solids handling facility, a product water pump station and a new visitor's center.

② Inland Empire Utilities Agency – Regional WRP No. 5 Liquids Expansion to 22.5 MGD, DDB, Chino, CA

Client: Inland Empire Utilities Agency
Jason Marseilles
T: 909.993.1600 | E: jmarseilles@ieua.org

Role: As Construction Manager, Marcos worked on the construction of the upgrade and expansion of the Agency's existing RP-5 plant from a conventional activated sludge wastewater treatment plant to a 22.5 MGD water recycling treatment plant, and with the capability of being further expanded to 30 MGD in the future. The major items of work to be performed include the liquids treatment processes, solids treatment processes, common facilities, and off-site facilities. Construction Cost $329M.

Marcos Reyes

Construction Manager

③ Rialto Wastewater Treatment Plant Improvements, Design-Build, Rialto, CA

Client: City of Rialto
Thomas Crowley, Utilities Manager
T: 909.421.7210 | E: tcrowley@rialtoca.gov

Role: As the Construction Manger, Macros worked on the $25M Design-Build expansion project, is a Joint Venture between W. M. Lyles Co. and AECOM.

Construction activities include the expansion to an existing conventional WWTP, increasing the treatment capacity from 7.3 MGD current average to 11.7 MGD future average. Work also includes headwork's expansion with new bar screens, washer compacter, one primary clarifiers, equalization basin improvements, one secondary clarifier, cloth disc tertiary filters, chlorine contact basin, RAS Pump Station, electrical buildings and associated site electrical upgrades, instrumentation, piping, paving, and fencing. Construction Cost $25M.

Additional Experience

Headworks and Primary Clarifier Upgrade, DBB, City of Palm Springs, CA. Project Manager. Construction of a new headworks facility, including new barscreens equipment, washer compacter, grit classifiers, two 100' diameter primary clarifiers, two scum pump stations, one sludge degritting facility, a prefabricated electrical building and an odor control system. The new upgrades to the existing wastewater treatment plant will increase the treatment capacity from 10.9 MGD to 21.8 MGD. Cost $20M. (2018)

Western Riverside County Regional WW Authority 14 MGD Plant Expansion, DBB, Riverside, CA. Project Engineer. Construction of a 6.0 MGD expansion to an existing conventional WWTP that increases the treatment capacity up to 14.0 MGD. Construction activities include headwork's expansion with new bar screens, washer compacter, grit classifier, two primary clarifiers, equalization basin, bioreactor, bio filter, secondary clarifier, cloth disc tertiary filters, chlorine contact basin, recycle water pump station, masonry digester building, solar drying beds and odor control system, five electrical buildings and associated site electrical, instrumentation, piping, paving, and fencing. Upgrades to the existing plant include new centrifuges, fixed steel digester covers, odor control facilities, masonry thickener building and chemical building upgrades. Cost $26M. (2016)

What Marcos' Clients Say

"Marcos Reyes served as the on-site construction managerfor the $25M Rialto Progressive Design Build WWTP with AECOM. ***His project first mentality, coupled with extensive construction knowledge, expertise and experience provided the project with numerous well reasoned, cost effective and workable solutions to overcome the interface challenges on a retrofit project.*** *Timely and cost effective solutions to tie-ins, resolving conflicts with existing utilities, and working out design issues associated with an upgrade while maintaining continuous operation of the existing plant were invaluable."*

Bill Hanley, PE, Veolia North America

Nob Hill Improvements Project for SDCWA, DBB, San Diego, CA. Project Engineer. Construction of approximately 900ft of two sections of existing pipelines with one pipeline at a lower elevation. The new pipelines were constructed by tunneling and excavation. This allowed the water authority the ability to operate and maintain its pipelines and structures, eliminating the likelihood of future uncontrolled release of water in the area. The project added a new access road to Nob Hill, and as a result, SDCWA vehicles will no longer need to use the private roads for access to SDCWA facilities. Cost $10M. (2017)

Pipeline 3 Desal Relining San Marcos to Twin Oaks Project for SDCWA, DBB, San Diego, CA. Project Engineer. The Pipeline 3 Desalination Relining project included upgrading 27,000 feet of existing 72- and 75-inch diameter pipe with new welded steel liners; fabricating and installing 494 feet of 69-inch outside diameter welded steel pipe at seven access portals; fabricating and installing 448 feet of 67 ¾-inch outside diameter welded steel pipe at eight access portals; and replacing 47 feet of 72-inch steel pipe with new 67 ¾-inch outside diameter welded steel pipe. As a result of this project, this accommodated pressurized flows from the new Carlsbad 50MG Seawater Desalination RO Treatment Plant. Cost $25M. (2015)

I-405 Sepulveda Pass Widening, DB, Los Angeles, CA. Superintendent. This $721 million design-build project involved constructing one 10-mile high-occupancy vehicle (HOV) lane northbound on Interstate 405 from Interstate 10 to U.S.-101. The project realigned existing on and off ramps, reconstruct or modify 23 bridge and ramp structures, build approximately 18 miles of retaining walls, and perform road improvements on the adjacent city streets. Cost $721M. (2014)

Vince Guillama

Preconstruction Services Manager

Vince brings more than 20 years of experience in the water / wastewater industry. During this time, he has overseen and provided preconstruction services for numerous design-build projects, including the $200M Stockton RWCF project, a joint venture with AECOM. His focus on communication and collaboration encourages innovation to create cost savings and gain schedule. Vince brings a unique perspective having managed design-build projects from pre-construction through completion.

MS, Construction Management, Arizona State University, 2006

BS, Civil Engineering, University of California Davis, 2004

Professional Registrations
Engineer-in-Training, CA #117946

Tenure with Lyles: 16
Total Years in Industry: 20

Why Vince?

- ✓ Current and previous experience working on AECOM/Lyles JV design-build projects including Stockton Regional Wastewater Control Facility Modifications
- ✓ Experienced in innovative preconstruction to save time and money
- ✓ Proven Value Engineering results
- ✓ Preconstruction and construction phase oversight for multiple water and wastewater treatment facilities throughout California

Owner/Client References

① East County Advanced Water Purification Program (ECAWP) Package 1 Progressive Design-Build, Santee, CA

Client: ECAWP/Padre Dam Municipal Water District
Kyle Swanson
T: 619.528.4766 | E: kswanson@padre.org

Role: Vince was the Pre-construction Manger providing first-hand constructability through the design process.

This progressive design-build project is one of the first in the country for the augmentation of a surface water supply with treated wastewater for potable reuse. **Components of Package 1 include**: a 16-mgd Water Recycling Facility, an 11.5-mgd Advanced Water Purification Facility including MF, RO and UV/AOP, a solids handling facility, a product water pump station and a new visitor's center.

② Stockton Regional Wastewater Control Facility Modifications, Progressive Design-Build, Stockton, CA

Client: City of Stockton
Deedee Antypas, Deputy Director of Wastewater Operations
T: 209.937.7425 | E: deedee.antypas@stocktonca.gov

Role: As the Pre-Construction Manager, Vince led the development of the GMP, capitalizing on his background in construction to provide first-hand constructability consulting throughout the design process.

Progressive design-build of new influent pumping, screening, and grit removal systems; new secondary biological treatment systems; tertiary filtration and disinfection systems; and solids handling facilities to replace an existing oxidation pond and overland flow treatment system. Includes installation of major process equipment such as vertical turbine pumps, perforated fine screens, conical tray grit removal systems, circular and rectangular primary and secondary clarifier mechanisms, aeration blowers and diffusers, submersible mixers, tertiary disc filters, UV disinfection system, sludge centrifuge, and associated electrical, control, and SCADA upgrades. Construction Cost $209M.

Vince Guillama

Preconstruction Services Manager

③ Graham Hill Water Treatment Plant Upgrades, Progressive Design-Build, Santa Cruz, CA

Client: City of Santa Cruz
Matt Zeman, Project Manager
T: 858.610.7478 | mzeman@cityofsantacruz.com

Role: In the role of Pre-Construction Manager, Vince is leading the development of the GMP, capitalizing on his background in construction to provide first hand constructability constulting throughout the design process.

The WTP was built in 1960s and had not been significantly upgraded since the 1980s. **The City recognized that in order to secure their water future, significant upgrades to the WTP had to be undertaken. Vince is leading the AECOM/Lyles construction team, worked closely with the client and its advisor through many iterations of layouts and process trains to arrive at the right solution for the City. Over 20 workshops were held on a wide range of topics that cover unit processes and constructability, among many others. The project scope includes**: high-rate clarification through the use of space-efficient plate settlers, ozone system, granular activated carbon (GAC), reclaimed water clarifiers, provisions for future UV disinfection, and new chemical feed systems; new administration and maintenance buildings, and new ozone building; upgraded operations building and upgraded filter gallery building; electrical upgrades; demolition of some existing buildings and site improvements including landscaping and vehicular access improvements. Construction is anticipated to begin in late 2024, and substantial completion is expected by Spring 2028.

Additional Experience

WWTP Secondary and Tertiary Improvements Design-Build, City of Davis, CA. Estimator/Project Manager. Design-build construction of new secondary biological treatment systems, new tertiary filtration and disinfection systems, and new solids handling facilities to replace an existing oxidation pond and overland flow treatment system. The secondary treatment processes consist of four new extended aeration basins and four new 85' diameter secondary clarifiers. Tertiary filtration and disinfection facilities consist of four new 6 MGD disc filters, two new chlorine contact tanks, and new a sodium hypochlorite and sodium bisulfite storage and pumping facility. Sludge handling facilities consist of two new rotary drum thickeners, two new screw presses, chemical storage facilities, and a 48,000 square foot sludge storage facility. Also included are a new cogeneration plant, a new emergency power generator, and numerous other electrical, control, and SCADA upgrades. Project Cost: $71M. (2018)

Orange County Sanitation District – P1-101 Sludge Dewatering and Odor Control Project, Orange County, CA. Project Manager - Mechanical. Construction of a new 32,000 SF thickening and dewatering structure on CIDH piles, including equipment, odor control, mechanical, fire, plumbing, electrical and instrumentation and control systems. Addition of two new concrete pipe tunnels along with a 1200 LF precast screen wall and fabricated above grade pipe rack, modifications to existing tunnel piping, rehabilitation of exiting silos and Truck Load Out Facility, as well as new underground piping, paving, demolition, and all other site improvements required to replace the existing sludge handling systems. Construction Cost: $127M. (2019)

Regional Water Reclamation Plant Upgrade, City of Moreno Valley, CA. Upgrade of existing 15.8 MGD water reclamation plant to 18.5 MGD, including yard structures, headworks, influent pump station, grit basins, power and blower buildings, chemical scrubber odor control facility, secondary effluent pump station, tertiary effluent/utility water pump station, tertiary effluent meter vault, acid-phase digester and fare, methane-phase digester, digested sludge storage tanks, low pressure digester gas holder, 15 kW generator, boiler facility, electrical buildings, and related appurtenances. Construction Cost: $29.7M. (2012)

Water Treatment Facility Improvements, City of El Centro, CA. Expansion of existing 10.5 MGD facility to 21 MGD, including clarifier units, gravity filters, waste wash-water recovery basin, raw water structure, operations and chemical buildings, dividing berm and connecting piping of two 25 MG earthen storage reservoirs, clearwell and backwash recovery pump stations, and site improvements including site piping, grading, paving, electrical instrumentation, and controls. Construction Cost: $26.6M. (2009)

Staffing Availability for Banning

Staffing Availability

Prior to selection of specific staff for our team, we examined the existing and projected workload of each person and confirmed their availability for this assignment. We have determined they have no obligations, either current or projected, that would prevent them from performing with excellence to meet the requirements and schedule for this project.

Staff/Role	Availabity	Responsibilities	Benefit to Banning
Joe Lawrence **Design-Build Project Manager**	Phase 1 - 75% Phase 2 - 100%	Single point of responsibility	Successful track record in DB project management, including multiple projects with AECOM (ECAWP, Stockton, Santa Cruz)
Gabriel Perigault, PhD, PE **Design Manager**	Phase 1 - 60% Phase 2 - 30%	Manage design development	Led the design of 25 water and wastewater treatment plants; proven track record delivering successful DB projects with Lyles (ECAWP, Santa Cruz)
Marcos Reyes **Construction Manager**	Phase 1 - 25% Phase 2 - 100%	Onsite construction management	Lives within 25 miles of the project; proven track record delivering successful DBs with AECOM (Rialto, ECAWP)
Vince Guillama **Preconstruction Manager**	Phase 1 - 100% Phase 2 - 20%	Manage early works packages, ensures budget adherence during design	Lessons-learned managing early works packages; proven track record delivering successful DB projects with AECOM (Stockton, ECAWP, Davis, Santa Cruz)
Alex Franchi, PhD, PE **Treatment Process Lead**	Phase 1 - 60% Phase 2 - 25%	Treatment technology selection/design	Led successful designs of Title 22 projects across California; Proven track record delivering successful DB projects with Lyles (ECAWP)
Rosaida Harris **QA/QCLead**	Phase 1 - 40% Phase 2 - 40%	QA/QC management and discipline coordination	Extensive experience in QC for both design and construction on DB projects
Anthony Pilato **Superintendent**	Phase 1 - 5% Phase 2 - 100%	Manage onsite activities during construction	Seasoned superintendent with extensive experience coordinating multiple trades and managing large-scale projects, such as the $57M City of Beaumont
Matt Cain **Estimator/Cost Controls**	Phase 1 - 80% Phase 2 - 15%	Budget control and management	Design-to-budget experience from Beaumont and Rialto projects, backed by a successful track record with AECOM on the Rialto and ECAWP projects
Ryan Priestman **Lead Scheduler**	Phase 1 - 40% Phase 2 - 40%	Project Scheduling	Proven ability to work with AECOM to solve scheduling hurdles on the ECAWP DB project
Vijay Kumar **Commissioning Lead**	Phase 1 - 20% Phase 2 - 60%	Startup and commissioning plans and coordination	Proven ability to work with AECOM on commissioning and startup activities
Tyler Payne, SMS, CHST, CIT, STS, CUSP - Safety Director	Phase 1 - 15% Phase 2 -80%	Safety Management	Proven ability to provide Safety Management on successful local DB projects with AECOM (ECAWP)
T.J. Catalano, PE **Structural**	Phase 1 - 50% Phase 2 - 20%	Structural engineering lead	Brings experience upgrading WWTPs all aspects of structural engineering design and construction services on DBP projects such as ECAWP.
Steven Fitzwilliam, PE **Geotechnical/Civil**	Phase 1 - 50% Phase 2 - 20%	Geotechnical and Site/Civil Engineering	28 years of geotechnical experience, including design-build treatment plant projects
Barbara Bartholomae **Permitting Lead**	Phase 1 - 50% Phase 2 - 30%	Permit Management	Proven track record delivering permitting services on successful DB projects with Lyles (ECAWP, Santa Cruz)
William Goryl, RA **Architectural**	Phase 1 - 50% Phase 2 - 20%	Architectural design	30 years of architectural experience, including Design-build WWTPs such as Davis, CA and Rialto,A
Yasser Rizk, PE **Electrical/I&C**	Phase 1 - 50% Phase 2 - 20%	Electrical and SCADA/I&C Design	Extensive DB experience, highly skilled in electrical design, coordination of HVAC, mechanical process, and control systems for innovative, effective design
Karen Bettencourt, PE **Mechanical**	Phase 1 - 50% Phase 2 - 20%	Mechanical Process Design	20+ years of treatment plant mechnical process engineering, including the Stockton WWTP DB
Executive Management Board			
Grant Gourley **Executive Management Board**	Phase 1 - 10% Phase 2 - 10%	Executive Oversight	Decades of lessons-learned providing executive oversight on DB projects throughout CA and with AECOM (ECAWP, Stockton, Santa Cruz, Davis
Brian Daly, PE **Executive Management Board**	Phase 1 - 10% Phase 2 - 10%	Executive Oversight	National DB Leader with 30 years of DB experience, serves on all AECOM/Lyles JV Management Boards

Insurance Terms

Insurance Terms

1. General Liability - Commercial General Liability (CGL) - Insurance Services Office (ISO) Commercial General Liability Coverage (Occurrence Form CG 00 01) including products and completed operations, property damage, bodily injury, personal and advertising injury with limit of at least twenty million dollars ($20,000,000) per occurrence or the full per occurrence limits of the policies available, whichever is greater. If a general aggregate limit applies, either the general aggregate limit shall apply separately to this project/location (coverage as broad as the ISO CG 25 03, or ISO CG 25 04 endorsement provided to City of Banning or the general aggregate limit shall be twice the required occurrence limit.
2. Automobile Liability - Insurance Services Office (ISO) Business Auto Coverage (Form CA 00 01), covering Symbol 1 (any auto) with limit of one million dollars ($1,000,000) for bodily injury and property damage each accident.
3. Workers' Compensation Insurance - The Contractor shall provide workers' compensation coverage as required by the State of California, with Statutory Limits, and Employer's Liability Insurance with limit of no less than $1,000,000 per accident for bodily injury or disease. Waiver of Subrogation (also known as Transfer of Rights of Recovery Against Others to Us): The Contractor hereby agrees to waive rights of subrogation to obtain endorsement necessary to affect this waiver of subrogation in favor of the City of Banning, its directors, officers, employees, and authorized volunteers, for losses paid under the terms of this coverage which arise from work performed by the Named Insured for the City of Banning; this provision applies regardless of whether or not the City of Banning has received a waiver of subrogation from the insurer.
4. Builder's Risk - (Course of Construction) if necessary- insurance utilizing an "All Risk" (Special Perils) coverage form with limits equal to the completed value of the project and no coinsurance penalty provision.
5. Professional Liability - with limits no less than $5,000,000 per occurrence or claim, and $5,000,000 policy aggregate.
6. Professional Liability Claims Made Policies – include the following provisions. The Retroactive Date must be shown and must be before the date of the contract or the beginning of contract work.
7. Insurance must be maintained and evidence of insurance must be provided for at least five (5) years after completion of the contract of work.
8. If coverage is canceled or non-renewed, and not replaced with another claims-made policy form with a Retroactive Date prior to the contract effective date, the Consultant must purchase "extended reporting" coverage for a minimum of ten (10) years after completion of contract work.
9. Contractors' Pollution Liability and/or Asbestos Liability and/or Errors and Omissions (if project involves environmental hazards) - with limits no less than $2,000,000 per occurrence or claim, and $2,000,000 policy aggregate. If the Contractor maintains broader coverage and or/higher limits than the minimums shown above, the City of Banning requires and shall be entitled to the broader coverage and/or higher limits maintained by the Contractor. Any available insurance proceeds in excess of the specified minimum of insurance and coverage shall be available to the City of Banning.

Form of Performance Bond

Bond No. _____

PERFORMANCE BOND

KNOW ALL PERSONS BY THESE PRESENTS that:

WHEREAS the City of Banning ("City"), has awarded to _____

_____ ("Principal")

(Name and address of Contractor)

a contract (the "Contract") for the Work described as follows:

_____

(Project name)

WHEREAS, Principal is required under the terms of the Contract to furnish a Bond for the faithful performance of the Contract.

NOW, THEREFORE, we, the undersigned Principal, and _____

_____,

(Name and address of Surety)

("Surety") a duly admitted surety insurer under the laws of the State of California, as Surety, are held and firmly bound unto the City in the penal sum of _____

Dollars ($_____), this amount being not less than the total Contract Price, in lawful money of the United States of America, for the payment of which sum well and truly to be made, we bind ourselves, our heirs, successors executors and administrators, jointly and severally, firmly by these presents.

THE CONDITION OF THIS OBLIGATION IS SUCH THAT, if the hereby bounded Principal, his, her or its heirs, executors, administrators, successors or assigns, shall in all things stand to and abide by, and well and truly keep and perform the covenants, conditions and provisions in the Contract and any alteration thereof made as therein provided, on the Principal's part, to be kept and performed at the time and in the manner therein specified, and in all respects according to their true intent and meaning, and shall indemnify and save harmless the City, its officers, agents and employees, as therein stipulated, then this obligation shall become null and void; otherwise, it shall be and remain in full force and effect.

As a part of the obligation secured hereby and in addition to the face amount specified therefor, there shall be included costs and reasonable expenses and fees, including reasonable attorneys' fees, incurred by City in successfully enforcing such obligation, all to be taxed as costs and included in any judgment rendered. Surety hereby waives any statute of limitations as it applies to an action on this Bond.

The Surety hereby stipulates and agrees that no change, extension of time, alteration or addition to the terms of the Contract or of the Work to be performed thereunder or the specifications accompanying the same shall in anywise affect its obligations under this Bond, and it does hereby waive notice of any such change, extension of time, alteration or addition to the terms of the Contract or to the Work or to the specifications. Surety hereby waives the provisions of California

Civil Code Sections 2845 and 2849. The City is the principal beneficiary of this Bond and has all rights of a party hereto.

IN WITNESS WHEREOF, two (2) identical counterparts of this instrument, each of which shall for all purposes be deemed an original hereof, have been duly executed by Principal and Surety, on the date set forth below, the name of each corporate party being hereto affixed and these presents duly signed by its undersigned representative(s) pursuant to authority of its governing body.

Form of Payment Bond

Bond No. _____

PAYMENT BOND
(LABOR AND MATERIALS)

KNOW ALL PERSONS BY THESE PRESENTS that:

WHEREAS the City of Banning ("City"), State of California, has awarded to _____

_____ ("Principal")

(Name and address of Contractor)

a contract (the "Contract") for the Work described as follows:

_____

(Project name)

WHEREAS, under the terms of the Contract, the Principal is required before entering upon the performance of the Work, to file a good and sufficient payment Bond with the City to secure the claims to which reference is made in Title 3 (commencing with Section 9000) of Part 6 of Division 4 of the Civil Code.

NOW, THEREFORE, we, the undersigned Principal, and _____

_____

(Name and address of Surety)

("Surety") a duly admitted surety insurer under the laws of the State of California, as Surety, are held and firmly bound unto the City and all contractors, subcontractors, laborers, material suppliers, and other persons employed in the performance of the Contract and referred to in Title 3 (commencing with Section 9000) of Part 6 of Division 4 of the Civil Code in the penal sum of _

_____

Dollars ($_____), for materials furnished or labor thereon of any kind, or for amounts due under the Unemployment Insurance Act with respect to this Work or labor, that the Surety will pay the same in an amount not exceeding the amount hereinabove set forth, and also in case suit is brought upon this Bond, will pay, in addition to the face amount thereof, costs and reasonable expenses and fees, including reasonable attorneys' fees, incurred by City in successfully enforcing this obligation, to be awarded and fixed by the court, and to be taxed as costs and to be included in the judgment therein rendered.

It is hereby expressly stipulated and agreed that this Bond shall inure to the benefit of any and all persons, companies, and corporations entitled to file claims under Title 3 (commencing with Section 9000) of Part 6 of Division 4 of the Civil Code, so as to give a right of action to them or their assigns in any suit brought upon this Bond.

Upon expiration of the time within which the California Labor Commissioner may serve a civil wage and penalty assessment against the principal, any of its subcontractors, or both the principal and its subcontractors pursuant to Labor Code Section 1741, and upon expiration of the time within which a joint labor management committee may commence an action against the principal, any of its subcontractors, or both the principal and its subcontractors pursuant to Labor Code Section 1771.2, if the condition of this Bond be fully performed, then this obligation shall become null and void; otherwise, it shall be and remain in full force and effect.

The Surety hereby stipulates and agrees that no change, extension of time, alteration, or addition to the terms of the Contract or the Specifications accompanying the same shall in any manner affect its obligations on this Bond, and it does hereby waive notice of any such change, extension, alteration, or addition.

IN WITNESS WHEREOF, two (2) identical counterparts of this instrument, each of which shall for all purposes be deemed an original hereof, have been duly executed by Principal and Surety, on the date set forth below, the name of each corporate party being hereto affixed and these presents duly signed by its undersigned representative(s) pursuant to authority of its governing body.

Exhibit M

Wage Determination Schedules

"General Decision Number: CA20240025 12/06/2024

Superseded General Decision Number: CA20230025

State: California

Construction Types: Building, Heavy (Heavy and Dredging) and Highway

County: Riverside County in California.

BUILDING CONSTRUCTION PROJECTS; DREDGING PROJECTS (does not include hopper dredge work); HEAVY CONSTRUCTION PROJECTS (does not include water well drilling); HIGHWAY CONSTRUCTION PROJECTS

Note: Contracts subject to the Davis-Bacon Act are generally required to pay at least the applicable minimum wage rate required under Executive Order 14026 or Executive Order 13658. Please note that these Executive Orders apply to covered contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but do not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(1).

If the contract is entered into on or after January 30, 2022, or the contract is renewed or extended (e.g., an option is exercised) on or after January 30, 2022:	. Executive Order 14026 generally applies to the contract. . The contractor must pay all covered workers at least $17.20 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on the contract in 2024.
If the contract was awarded on or between January 1, 2015 and January 29, 2022, and the contract is not renewed or extended on or after January 30, 2022:	. Executive Order 13658 generally applies to the contract. . The contractor must pay all covered workers at least $12.90 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on that contract in 2024.

|_____|_____|

The applicable Executive Order minimum wage rate will be adjusted annually. If this contract is covered by one of the Executive Orders and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must still submit a conformance request.

Additional information on contractor requirements and worker protections under the Executive Orders is available at http://www.dol.gov/whd/govcontracts.

Workers required to suit up and work in a hazardous material

environment: $2.00 per hour additional. Combination mixer and compressor operator on gunite work shall be classified as a concrete mobile mixer operator.

SEE ZONE DEFINITIONS AFTER CLASSIFICATIONS

POWER EQUIPMENT OPERATORS CLASSIFICATIONS

GROUP 1: Bargeman; Brakeman; Compressor operator; Ditch Witch, with seat or similar type equipment; Elevator operator-inside; Engineer Oiler; Forklift operator (includes loed, lull or similar types under 5 tons; Generator operator; Generator, pump or compressor plant operator; Pump operator; Signalman; Switchman

GROUP 2: Asphalt-rubber plant operator (nurse tank operator);Coil Tubing Rig Operator, Concrete mixer operator-skip type; Conveyor operator; Fireman; Forklift operator (includes loed, lull or similar types over 5 tons; Hydrostatic pump operator; oiler crusher (asphalt or concrete plant); Petromat laydown machine; PJU side dum jack; Screening and conveyor machine operator (or similar types); Skiploader (wheel type up to 3/4 yd. without attachment); Tar pot fireman; Temporary heating plant operator; Trenching machine oiler

GROUP 3: Asphalt-rubber blend operator; Bobcat or similar type (Skid steer); Equipment greaser (rack); Ford Ferguson (with dragtype attachments); Helicopter radioman (ground); Stationary pipe wrapping and cleaning machine operator

GROUP 4: Asphalt plant fireman; Backhoe operator (mini-max or similar type); Boring machine operator; Boxman or mixerman (asphalt or concrete); Chip spreading machine operator; Concrete cleaning decontamination machine operator; Concrete Pump Operator (small portable);Direct Push Operator (Geoprobe or similar types) Drilling machine operator, small auger types (Texoma super economatic or similar types - Hughes 100 or 200 or similar types - drilling depth of 30' maximum); Equipment greaser (grease truck); Guard rail post driver operator; Highline cableway signalman; Hydra-hammer-aero stomper; Micro Tunneling (above ground tunnel); Power concrete curing machine operator; Power concrete saw operator; Power-driven jumbo form setter operator; Power sweeper operator; Rock Wheel Saw/Trencher; Roller operator (compacting); Screed operator (asphalt or concrete); Trenching machine operator (up to 6 ft.); Vacuum or much truck

GROUP 6: Articulating material hauler; Asphalt plant engineer; Batch plant operator; Bit sharpener; Concrete joint machine operator (canal and similar type); Concrete planer operator; Dandy digger; Deck engine operator; Derrickman (oilfield type); Drilling machine operator, bucket or auger types (Calweld 100 bucket or similar types - Watson 1000 auger or similar types - Texoma 330, 500 or 600 auger or similar types - drilling depth of 45' maximum); Drilling machine operator; Hydrographic seeder machine operator (straw, pulp or seed), Jackson track maintainer, or similar type; Kalamazoo Switch tamper, or similar type; Machine tool operator; Maginnis internal full slab vibrator, Mechanical berm, curb or gutter(concrete or asphalt); Mechanical finisher operator (concrete, Clary-Johnson-Bidwell or similar); Micro tunnel system (below ground); Pavement breaker operator (truck mounted); Road oil mixing machine operator; Roller operator (asphalt or finish), rubber-tired earth moving equipment (single engine, up to and including 25 yds. struck); Self-propelled tar pipelining machine operator; Skiploader operator (crawler and wheel type, over 3/4 yd. and up to and including 1-1/2 yds.); Slip form pump operator (power driven hydraulic lifting device for concrete forms); Tractor operator-bulldozer, tamper-scraper (single engine, up to 100 h.p. flywheel and similar types, up to and including D-5 and similar types); Tugger hoist operator (1 drum); Ultra high pressure waterjet cutting tool system operator; Vacuum blasting machine operator

GROUP 8: Asphalt or concrete spreading operator (tamping or finishing); Asphalt paving machine operator (Barber Greene or similar type); Asphalt-rubber distribution operator; Backhoe operator (up to and including 3/4 yd.), small ford, Case or similar types; Cable Bundling Machine Operator (excluding handheld); Cable Trenching Machine Operator (Spider Plow or similar types) Cast-in-place pipe laying machine operator; Combination mixer and compressor operator (gunite work); Compactor operator (self-propelled); Concrete mixer operator (paving); Crushing plant operator; Drill Doctor; Drilling machine operator, Bucket or auger types (Calweld 150 bucket or similar types - Watson 1500, 2000 2500 auger or similar types - Texoma 700, 800 auger or similar types - drilling depth of 60' maximum); Elevating grader operator; Grade checker; Gradall operator; Grouting machine operator; Heavy-duty repairman; Heavy equipment robotics operator; Kalamazoo balliste regulator or similar type; Kolman belt loader and similar type; Le Tourneau blob compactor or similar type; Loader operator (Athey, Euclid, Sierra and similar types); Mobark Chipper or similar; Ozzie padder or similar types; P.C. slot saw; Pneumatic concrete

placing machine operator (Hackley-Presswell or similar type); Pumpcrete gun operator; RCM Cementing Unit Operator, Rail/Switch Grinder Operator (Harsco or similar types) Rock Drill or similar types; Rotary drill operator (excluding caisson type); Rubber-tired earth-moving equipment operator (single engine, caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds. up to and including 50 cu. yds. struck); Rubber-tired earth-moving equipment operator (multiple engine up to and including 25 yds. struck); Rubber-tired scraper operator (self-loading paddle wheel type-John Deere, 1040 and similar single unit); Self- propelled curb and gutter machine operator; Shuttle buggy; Skiploader operator (crawler and wheel type over 1-1/2 yds. up to and including 6-1/2 yds.); Soil remediation plant operator; Surface heaters and planer operator; Tractor compressor drill combination operator; Tractor operator (any type larger than D-5 - 100 flywheel h.p. and over, or similar-bulldozer, tamper, scraper and push tractor single engine); Tractor operator (boom attachments), Traveling pipe wrapping, cleaning and bendng machine operator; Trenching machine operator (over 6 ft. depth capacity, manufacturer's rating); trenching Machine with Road Miner attachment (over 6 ft depth capacity): Ultra high pressure waterjet cutting tool system mechanic; Water pull (compaction) operator

GROUP 10: Drilling machine operator, Bucket or auger types (Calweld 200 B bucket or similar types-Watson 3000 or 5000 auger or similar types-Texoma 900 auger or similar types-drilling depth of 105' maximum); Dual drum mixer, dynamic compactor LDC350 (or similar types); Monorail locomotive operator (diesel, gas or electric); Motor patrol-blade operator (single engine); Multiple engine tractor operator (Euclid and similar type-except Quad 9 cat.); Rubber-tired earth-moving equipment operator (single engine, over 50 yds. struck); Pneumatic pipe ramming tool and similar types; Prestressed wrapping machine operator; Rubber-tired earth-moving equipment operator (single engine, over 50 yds. struck); Rubber tired earth moving equipment operator (multiple engine, Euclid, caterpillar and similar over 25 yds. and up to 50 yds. struck), Tower crane repairman; Tractor loader operator (crawler and wheel type over 6-1/2 yds.); Woods mixer operator (and similar Pugmill equipment)

GROUP 12: Auto grader operator; Automatic slip form operator; Drilling machine operator, bucket or auger types (Calweld, auger 200 CA or similar types - Watson, auger 6000 or similar types - Hughes Super Duty, auger 200 or similar

types - drilling depth of 175' maximum); Hoe ram or similar with compressor; Mass excavator operator less tha 750 cu. yards; Mechanical finishing machine operator; Mobile form traveler operator; Motor patrol operator (multi-engine); Pipe mobile machine operator; Rubber-tired earth- moving equipment operator (multiple engine, Euclid, Caterpillar and similar type, over 50 cu. yds. struck); Rubber-tired self- loading scraper operator (paddle-wheel-auger type self-loading - two (2) or more units)

GROUP 13: Rubber-tired earth-moving equipment operator operating equipment with push-pull system (single engine, up to and including 25 yds. struck)

GROUP 14: Canal liner operator; Canal trimmer operator; Remote- control earth-moving equipment operator (operating a second piece of equipment: $1.00 per hour additional); Wheel excavator operator (over 750 cu. yds.)

GROUP 15: Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (single engine, Caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds. and up to and including 50 yds. struck); Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (multiple engine-up to and including 25 yds. struck)

GROUP 16: Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (single engine, over 50 yds. struck); Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (multiple engine, Euclid, Caterpillar and similar, over 25 yds. and up to 50 yds. struck)

GROUP 17: Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (multiple engine, Euclid, Caterpillar and similar, over 50 cu. yds. struck); Tandem tractor operator (operating crawler type tractors in tandem - Quad 9 and similar type)

GROUP 18: Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - single engine, up to and including 25 yds. struck)

GROUP 19: Rotex concrete belt operator (or similar types); Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - single engine, Caterpillar, Euclid, Athey Wagon and similar types with any

and all attachments over 25 yds.and up to and including 50 cu. yds. struck); Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - multiple engine, up to and including 25 yds. struck)

GROUP 20: Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - single engine, over 50 yds. struck); Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps, and similar types in any combination, excluding compaction units - multiple engine, Euclid, Caterpillar and similar, over 25 yds. and up to 50 yds. struck)

GROUP 21: Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - multiple engine, Euclid, Caterpillar and similar type, over 50 cu. yds. struck)

GROUP 22: Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (single engine, up to and including 25 yds. struck)

GROUP 23: Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (single engine, Caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds. and up to and including 50 yds. struck); Rubber-tired earth-moving equipment operator, operating with the tandem push-pull system (multiple engine, up to and including 25 yds. struck)

GROUP 24: Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (single engine, over 50 yds. struck); Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (multiple engine, Euclid, Caterpillar and similar, over 25 yds. and up to 50 yds. struck)

GROUP 25: Concrete pump operator-truck mounted; Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (multiple engine, Euclid, Caterpillar and similar type, over 50 cu. yds. struck); Spyder Excavator Operator, with all attachments

CRANES, PILEDRIVING AND HOISTING EQUIPMENT CLASSIFICATIONS

GROUP 1: Engineer oiler; Fork lift operator (includes loed, lull or similar types)

GROUP 2: Truck crane oiler

GROUP 3: A-frame or winch truck operator; Ross carrier operator (jobsite)

GROUP 4: Bridge-type unloader and turntable operator; Helicopter hoist operator

GROUP 5: Hydraulic boom truck; Stinger crane (Austin-Western or similar type); Tugger hoist operator (1 drum)

GROUP 6: Bridge crane operator; Cretor crane operator; Hoist operator (Chicago boom and similar type); Lift mobile operator; Lift slab machine operator (Vagtborg and similar types); Material hoist and/or manlift operator; Polar gantry crane operator; Self Climbing scaffold (or similar type); Shovel, backhoe, dragline, clamshell operator (over 3/4 yd. and up to 5 cu. yds. mrc); Tugger hoist operator

GROUP 7: Pedestal crane operator; Shovel, backhoe, dragline, clamshell operator (over 5 cu. yds. mrc); Tower crane repair; Tugger hoist operator (3 drum)

GROUP 8: Crane operator (up to and including 25 ton capacity); Crawler transporter operator; Derrick barge operator (up to and including 25 ton capacity); Hoist operator, stiff legs, Guy derrick or similar type (up to and including 25 ton capacity); Shovel, backhoe, dragline, clamshell operator (over 7 cu. yds., M.R.C.)

GROUP 9: Crane operator (over 25 tons and up to and including 50 tons mrc); Derrick barge operator (over 25 tons up to and including 50 tons mrc); Highline cableway operator; Hoist operator, stiff legs, Guy derrick or similar type (over 25 tons up to and including 50 tons mrc); K-crane operator; Polar crane operator; Self erecting tower crane operator maximum lifting capacity ten tons

GROUP 10: Crane operator (over 50 tons and up to and including 100 tons mrc); Derrick barge operator (over 50 tons up to and including 100 tons mrc); Hoist operator, stiff legs, Guy derrick or similar type (over 50 tons up to and including 100 tons mrc), Mobile tower crane operator (over 50 tons, up to and including 100 tons M.R.C.);

GROUP 11: Crane operator (over 100 tons and up to and

including 200 tons mrc); Derrick barge operator (over 100 tons up to and including 200 tons mrc); Hoist operator, stiff legs, Guy derrick or similar type (over 100 tons up to and including 200 tons mrc); Mobile tower crane operator (over 100 tons up to and including 200 tons mrc) ; Tower crane operator and tower gantry

GROUP 12: Crane operator (over 200 tons up to and including 300 tons mrc); Derrick barge operator (over 200 tons up to and including 300 tons mrc); Hoist operator, stiff legs, Guy derrick or similar type (over 200 tons, up to and including 300 tons mrc); Mobile tower crane operator (over 200 tons, up to and including 300 tons mrc)

GROUP 13: Crane operator (over 300 tons); Derrick barge operator (over 300 tons); Helicopter pilot; Hoist operator, stiff legs, Guy derrick or similar type (over 300 tons); Mobile tower crane operator (over 300 tons)

TUNNEL CLASSIFICATIONS

GROUP 1: Skiploader (wheel type up to 3/4 yd. without attachment)

GROUP 2: Power-driven jumbo form setter operator

GROUP 3: Dinkey locomotive or motorperson (up to and including 10 tons)

GROUP 4: Bit sharpener; Equipment greaser (grease truck); Slip form pump operator (power-driven hydraulic lifting device for concrete forms); Tugger hoist operator (1 drum); Tunnel locomotive operator (over 10 and up to and including 30 tons)

GROUP 5: Backhoe operator (up to and including 3/4 yd.); Small Ford, Case or similar; Drill doctor; Grouting machine operator; Heading shield operator; Heavy-duty repairperson; Loader operator (Athey, Euclid, Sierra and similar types); Mucking machine operator (1/4 yd., rubber-tired, rail or track type); Pneumatic concrete placing machine operator (Hackley-Presswell or similar type); Pneumatic heading shield (tunnel); Pumpcrete gun operator; Tractor compressor drill combination operator; Tugger hoist operator (2 drum); Tunnel locomotive operator (over 30 tons)

GROUP 6: Heavy Duty Repairman

GROUP 7: Tunnel mole boring machine operator

ENGINEERS ZONES

$1.00 additional per hour for all of IMPERIAL County and the portions of KERN, RIVERSIDE & SAN BERNARDINO Counties as defined below:

That area within the following Boundary: Begin in San Bernardino County, approximately 3 miles NE of the intersection of I-15 and the California State line at that point which is the NW corner of Section 1, T17N,m R14E, San Bernardino Meridian. Continue W in a straight line to that point which is the SW corner of the northwest quarter of Section 6, T27S, R42E, Mt. Diablo Meridian. Continue North to the intersection with the Inyo County Boundary at that point which is the NE corner of the western half of the northern quarter of Section 6, T25S, R42E, MDM. Continue W along the Inyo and San Bernardino County boundary until the intersection with Kern County, as that point which is the SE corner of Section 34, T24S, R40E, MDM. Continue W along the Inyo and Kern County boundary until the intersection with Tulare County, at that point which is the SW corner of the SE quarter of Section 32, T24S, R37E, MDM. Continue W along the Kern and Tulare County boundary, until that point which is the NW corner of T25S, R32E, MDM. Continue S following R32E lines to the NW corner of T31S, R32E, MDM. Continue W to the NW corner of T31S, R31E, MDM. Continue S to the SW corner of T32S, R31E, MDM. Continue W to SW corner of SE quarter of Section 34, T32S, R30E, MDM. Continue S to SW corner of T11N, R17W, SBM. Continue E along south boundary of T11N, SBM to SW corner of T11N, R7W, SBM. Continue S to SW corner of T9N, R7W, SBM. Continue E along south boundary of T9N, SBM to SW corner of T9N, R1E, SBM. Continue S along west boundary of R1E, SMB to Riverside County line at the SW corner of T1S, R1E, SBM. Continue E along south boundary of T1s, SBM (Riverside County Line) to SW corner of T1S, R10E, SBM. Continue S along west boundary of R10E, SBM to Imperial County line at the SW corner of T8S, R10E, SBM. Continue W along Imperial and Riverside county line to NW corner of T9S, R9E, SBM. Continue S along the boundary between Imperial and San Diego Counties, along the west edge of R9E, SBM to the south boundary of Imperial County/California state line. Follow the California state line west to Arizona state line, then north to Nevada state line, then continuing NW back to start at the point which is the NW corner of Section 1, T17N, R14E, SBM

$1.00 additional per hour for portions of SAN LUIS OBISPO, KERN, SANTA BARBARA & VENTURA as defined below:

That area within the following Boundary: Begin approximately 5 miles north of the community of Cholame, on the Monterey County

and San Luis Obispo County boundary at the NW corner of T25S, R16E, Mt. Diablo Meridian. Continue south along the west side of R16E to the SW corner of T30S, R16E, MDM. Continue E to SW corner of T30S, R17E, MDM. Continue S to SW corner of T31S, R17E, MDM. Continue E to SW corner of T31S, R18E, MDM. Continue S along West side of R18E, MDM as it crosses into San Bernardino Meridian numbering area and becomes R30W. Follow the west side of R30W, SBM to the SW corner of T9N, R30W, SBM. Continue E along the south edge of T9N, SBM to the Santa Barbara County and Ventura County boundary at that point whch is the SW corner of Section 34.T9N, R24W, SBM, continue S along the Ventura County line to that point which is the SW corner of the SE quarter of Section 32, T7N, R24W, SBM. Continue E along the south edge of T7N, SBM to the SE corner to T7N, R21W, SBM. Continue N along East side of R21W, SBM to Ventura County and Kern County boundary at the NE corner of T8N, R21W. Continue W along the Ventura County and Kern County boundary to the SE corner of T9N, R21W. Continue North along the East edge of R21W, SBM to the NE corner of T12N, R21W, SBM. Continue West along the north edge of T12N, SBM to the SE corner of T32S, R21E, MDM. [T12N SBM is a think strip between T11N SBM and T32S MDM]. Continue North along the East side of R21E, MDM to the Kings County and Kern County border at the NE corner of T25S, R21E, MDM, continue West along the Kings County and Kern County Boundary until the intersection of San Luis Obispo County. Continue west along the Kings County and San Luis Obispo County boundary until the intersection with Monterey County. Continue West along the Monterey County and San Luis Obispo County boundary to the beginning point at the NW corner of T25S, R16E, MDM.

$2.00 additional per hour for INYO and MONO Counties and the Northern portion of SAN BERNARDINO County as defined below:

That area within the following Boundary: Begin at the intersection of the northern boundary of Mono County and the California state line at the point which is the center of Section 17, T10N, R22E, Mt. Diablo Meridian. Continue S then SE along the entire western boundary of Mono County, until it reaches Inyo County at the point which is the NE corner of the Western half of the NW quarter of Section 2, T8S, R29E, MDM. Continue SSE along the entire western boundary of Inyo County, until the intersection with Kern County at the point which is the SW corner of the SE 1/4 of Section 32, T24S, R37E, MDM. Continue E along the Inyo and Kern County boundary until the intersection with San Bernardino County at that point which is the SE corner of section 34, T24S, R40E, MDM. Continue E along the Inyo and San Bernardino County boundary until the point which is the NE corner of the Western half of the NW quarter of

Section 6, T25S, R42E, MDM. Continue S to that point which is the SW corner of the NW quarter of Section 6, T27S, R42E, MDM. Continue E in a straight line to the California and Nevada state border at the point which is the NW corner of Section 1, T17N, R14E, San Bernardino Meridian. Then continue NW along the state line to the starting point, which is the center of Section 18, T10N, R22E, MDM.

GROUP 10: Dump truck - 50 yds. or more water level; Water pull - single engine with attachment

GROUP 11: Water pull - twin engine; Water pull - twin engine with attachments; Winch truck driver - $1.25 additional when operating winch or similar special attachments

GROUP 12: Boom Truck 17K and above

WELDERS - Receive rate prescribed for craft performing operation to which welding is incidental.

==========

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including

preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at https://www.dol.gov/agencies/whd/government-contracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (iii)).

The body of each wage determination lists the classification and wage rates that have been found to be prevailing for the cited type(s) of construction in the area covered by the wage determination. The classifications are listed in alphabetical order of ""identifiers"" that indicate whether the particular rate is a union rate (current union negotiated rate for local), a survey rate (weighted average rate) or a union average rate (weighted union average rate).

Union Rate Identifiers

A four letter classification abbreviation identifier enclosed in dotted lines beginning with characters other than ""SU"" or ""UAVG"" denotes that the union classification and rate were prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2014. PLUM is an abbreviation identifier of the union which prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. 07/01/2014 is the effective date of the most current negotiated rate, which in this example is July 1, 2014.

Union prevailing wage rates are updated to reflect all rate changes in the collective bargaining agreement (CBA) governing this classification and rate.

Survey Rate Identifiers

Classifications listed under the ""SU"" identifier indicate that no one rate prevailed for this classification in the survey and the published rate is derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As this weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SULA2012-007 5/13/2014. SU indicates the rates are survey rates based on a weighted average calculation of rates and are not majority rates. LA indicates the State of Louisiana. 2012 is the year of survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 5/13/2014 indicates the survey completion date for the classifications and rates under that identifier.

Survey wage rates are not updated and remain in effect until a new survey is conducted.

Union Average Rate Identifiers

Classification(s) listed under the UAVG identifier indicate that no single majority rate prevailed for those classifications; however, 100% of the data reported for the classifications was union data. EXAMPLE: UAVG-OH-0010 08/29/2014. UAVG indicates that the rate is a weighted union average rate. OH indicates the state. The next number, 0010 in the example, is an internal number used in producing the wage determination. 08/29/2014 indicates the survey completion date for the classifications and rates under that identifier.

A UAVG rate will be updated once a year, usually in January of each year, to reflect a weighted average of the current negotiated/CBA rate of the union locals from which the rate is based.

State Adopted Rate Identifiers

Classifications listed under the ""SA"" identifier indicate that the prevailing wage rate set by a state (or local) government was adopted under 29 C.F.R   1.3(g)-(h). Example: SAME2023-007 01/03/2024. SA reflects that the rates are state adopted. ME refers to the State of Maine. 2023 is the year during which the state completed the survey on which the listed classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 01/03/2024 reflects the date on which the classifications and rates under the ?SA? identifier took effect under state law in the state from which the rates were adopted.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

* an existing published wage determination
* a survey underlying a wage determination
* a Wage and Hour Division letter setting forth a position on a wage determination matter
* a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour National Office because National Office has responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor

200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

==========

END OF GENERAL DECISION"

RESOLUTION NO. 2021-50

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF BANNING, CALIFORNIA ADOPTING THE 2020 URBAN WATER MANAGEMENT PLAN

WHEREAS, the California Legislature enacted Assembly Bill 797 (Water Code Section 10610 et seq.), known as the Urban Water Management Planning Act, during the 1983-1984 Regular Session, and as amended subsequently, which mandates that every supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, prepare an Urban Water Management Plan (UWMP), the primary objective of which is to plan for the conservation and efficient use of water; and

WHEREAS, the City of Banning (City) is an urban supplier of water providing water; and

WHEREAS, the UWMP shall be periodically reviewed at least once every five years, and that the City shall make any amendments or changes to its plan which are indicated by the review; and

WHEREAS, the UWMP must be adopted after public review and hearing, and filed with the California Department of Water Resources within thirty days of adoption; and

WHEREAS, the City has therefore, prepared and circulated for public review a draft UWMP, and a properly noticed public hearing regarding said UWMP was held by the City Council on June 8, 2021; and

WHEREAS, the City Council shall have filed said UWMP with the California Department of Water Resources within 30 days of adoption.

NOW, THEREFORE, BE IT RESOLVED by the City Council of the City of Banning as follows:

SECTION 1. The City of Banning is in conformance with all applicable requirements of the Urban Water Management Planning Act.

SECTION 2. The 2020 UWMP is hereby adopted and ordered filed with the City Clerk.

SECTION 3. This resolution shall be in full force and effect immediately upon its passage and adoption thereof.

SECTION 4. The Public Works Director is hereby authorized and directed to file the 2020 UWMP with the California Department of Water Resources within 30 days after adoption of this resolution.

PASSED, APPROVED AND ADOPTED this 8th day of June 2021.

Colleen Wallace, Mayor
City of Banning

ATTEST:

Caroline Patton, Deputy City Clerk
City of Banning

APPROVED AS TO FORM AND LEGAL CONTENT:

Kevin G. Ennis, City Attorney
Richards, Watson & Gershon

CERTIFICATION:

I, Caroline Patton, Deputy City Clerk of the City Council, do hereby certify that the foregoing Resolution 2021-50, was duly adopted by the City Council of the City of Banning, California, at a regular meeting thereof held on the 8th day of June 2021 by the following vote, to wit:

AYES: Council Members Hamlin, Happe, Pingree, Sanchez, and Mayor Wallace

NOES:

ABSENT:

ABSTAIN:

Caroline Patton, Deputy City Clerk
City of Banning

RESOLUTION 2022-14 UA

A RESOLUTION OF THE UTILITY AUTHORITY OF THE CITY OF BANNING, CALIFORNIA AWARDING A PROFESSIONAL SERVICES AGREEMENT TO N2W ENGINEERING TO PROVIDE OWNER ADVISOR SERVICES AND PRELIMINARY ENGINEERING FOR THE WASTEWATER TREATMENT PLANT IMPROVEMENT PROJECT IN A NOT-TO-EXCEED AMOUNT OF $1,576,430

WHEREAS, the City of Banning owns and operates a wastewater treatment plant (WWTP) also knows as the Water Reclamation Facility which includes a current treatment process consisting of preliminary, primary, secondary, disinfection and sludge disposal; and

WHEREAS, the WWTP has a design treatment capacity of 3.6 million gallons per day (MGD) and typical average daily discharges ranging from 2.0 MGD to 2.1 MGD into 10 unlined evaporation/percolation ponds; and

WHEREAS, the City has recognized a need to construct major improvements to the WWTP in order to comply with California Regional Water Quality Control Board, Colorado River Basin Region (RWQCB) Board Order R7-2016-0015; to increase treatment capacity to support increasing demands; and to enhance the City's water supply portfolio by developing a recycled water supply; and

WHEREAS, due to staff resources the City desires to hire an Owner Advisor to manage the WWTP improvement project as it progresses through the various phases (i.e. planning, environmental, design and construction); and

WHEREAS, on July 21, 2022 the City released a request for qualifications (RFQ) and received one submittal from N2W Engineering. Based on the qualifications of N2W Engineering and the results of an interview conducted by City staff, it has been determined that N2W Engineering has the qualifications and experience to successfully complete the scope of services as the City's Owner Advisor on the WWTP improvement project; and

WHEREAS, the Professional Services Agreement with N2W Engineering to provide Owner Advisor services for the WWTP Improvement project is in an amount of "not-to-exceed" $1,576,430; and

WHEREAS, appropriations in the amount of $460,000 from Fund 680 (Wastewater Operations) and $756,430 from Fund 681 (Wastewater Capital Facility) are required to fund the Professional Services Agreement.

NOW, THEREFORE, BE IT RESOLVED by the Banning Utility Authority of the City of Banning as follows:

SECTION 1. Resolution 2022-14 UA is hereby adopted awarding a Professional Services Agreement to N2W Engineering to provide Owner Advisor services for the Wastewater Treatment Plant Improvement project in the "not-to-exceed" amount of $1,576,430.

SECTION 2. The City Manager or his designee is hereby authorized and directed to execute the Professional Services Agreement with N2W Engineering of Irvine, CA and to make all necessary budget adjustments, appropriations and transfers related to the Professional Services Agreement.

PASSED, APPROVED AND ADOPTED this 13th day of December 2022.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
COLORADO RIVER BASIN REGION

ORDER R7-2016-0015

WASTE DISCHARGE REQUIREMENTS
FOR
CITY OF BANNING, OWNER
SUEZ WATER ENVIRONMENTAL SERVICES, OPERATOR
BANNING WASTEWATER TREATMENT PLANT
BANNING-RIVERSIDE COUNTY

The California Regional Water Quality Control Board, Colorado River Basin Region (Colorado River Basin Water Board), finds that:

1. The City of Banning (Owner), 99 East Ramsey Street, Banning, California 92220, and Suez Water Environmental Services, Inc., a Delaware-based business entity (Operator), (collectively or individually referred to as Discharger) submitted an application to update the Waste Discharge Requirements (WDRs) for the Banning Wastewater Treatment Plant (WWTP or Facility). The WWTP is located at 2242 East Charles Street, Banning, California 92220, as shown in Attachment A (Vicinity Map), made part of this Board Order by this reference. Suez Water Environmental Services, Inc. maintains an office at the Facility.

2. The City of Banning owns a wastewater collection, treatment and disposal system which provides sewerage service to the city. The WWTP has a design treatment capacity of 3.6 million gallons-per-day (MGD) and currently discharges approximately 2.07 MGD into 10 unlined evaporation/percolation ponds (ponds). The Facility is located in Section 14, Township 3 South, Range 1 East, San Bernardino Baseline and Meridian. The Facility's Assessor's Parcel Numbers are 532 180 038/532 180 036; and its latitude and longitude coordinates are 33.915194/33.912134 and 116.852411/116.84164, respectively. The Facility is assigned California Integrated Water Quality System (CIWQS) number CW-208668; Waste Discharger Identification (WDID) number 7A330100015, and GeoTracker Global ID number WDR100027202.

3. The wastewater treatment plant currently receives industrial wastewater from several businesses within the City of Banning. The Discharger's Industrial Waste Program issues Industrial User Discharge Permits to verify that these businesses meet the City of Banning's local ordinance discharge limits, which were determined to ensure that the wastewater treatment plant is protected and can meet effluent standards.

4. The discharge is currently regulated by Board Order (WDRs) 01-022, adopted on May 9, 2001.

5. Board Order 01-022, required the Discharger to construct a groundwater monitoring system in the vicinity of the unlined ponds. The Board Order also required effluent monitoring for Sulfate, Chloride, Fluoride, Aluminum, and Iron until the groundwater monitoring system was installed and groundwater monitoring was initiated. Board Order 01-022, Monitoring and Reporting Program, states that "As soon as Ground Water monitoring commences, these constituents will not be required in Effluent monitoring." The groundwater monitoring system was completed in August 2007, and effluent monitoring for Sulfate, Chloride, Fluoride, Aluminum, and Iron were discontinued at that time. These constituents have been removed from the monitoring and reporting program for this Board Order as well as the effluent limitations for Chloride, Aluminum, and Iron.

6. The WDRs are being updated to implement the most current laws and regulations applicable to the discharge.

Wastewater Treatment Facility and Discharge

7. The WWTP consists of preliminary treatment, primary treatment, secondary treatment, solids handling, and disinfection (currently not in use), and the disposal ponds. Untreated wastewater flows to the preliminary treatment system, which consists of a mechanical bar screen, compactor, grit removal system, classifier and cyclone separator. Wastewater from the preliminary treatment system flows to two primary clarifiers and is then pumped to two trickling filters. The effluent from the trickling filters flows to the two secondary clarifiers and then to the chlorine contact chamber, which is currently used as a holding tank for the final effluent water sampling and discharge to the percolation ponds. The disinfection units have not been in use since April 2000.

8. Primary sludge from the two primary clarifiers is pumped to the anaerobic digester for further treatment. Secondary sludge from the secondary clarifiers is pumped to the gravity thickener for thickening and then pumped to three anaerobic digesters for further treatment. Sludge wasting from the digester is pumped to the sludge drying beds. The Discharger produces Class B biosolids, and a private contractor hauls the biosolids offsite to a permitted facility for disposal.

9. The Discharger's Self-Monitoring Reports (SMRs) from January 2011 through December 2015 characterize the WWTP effluent as follows:

Constituent	Units	Average	Maximum	Minimum
Flow	MGD	2.071	2.238	1.897
20° C BOD_5[1]	mg/L[2]	23	27	19

[1] 5-day biochemical oxygen demand at 20 degrees Celsius.

Constituent	Units	Average	Maximum	Minimum
TSS[3]	mg/L	21	28	16
pH	s.u.[4]	7.3	7.6	7.1
TDS[5]	mg/L	426	464	380
Nitrate as N	mg/L	22	32	12
Total Nitrogen	mg/L	29	49	14

Hydrogeologic Conditions

10. Precipitation in the Banning area averages about 12 inches per year. Annual evapotranspiration rate is approximately 56 inches.

11. A drainage course identified as Smith Creek Flood Control Channel is located along the south side of WWTP.

12. There are no domestic wells within 500 feet of the on-site evaporation/percolation ponds.

13. The evaporation/percolation ponds overlay an aquifer of high quality groundwater. The Discharger's SMRs show that the depth to groundwater in the vicinity of the WWTF ranges from about 330 feet (MW1) to 630 feet below ground surface (bgs) (MW3).

14. Water supply to the community is from groundwater production wells located in the San Gorgonio Hydrologic Unit, Banning Hydrologic Subunit. TDS in the water supply averages about 204 mg/L, based on data reported in the City of Banning's SMRs from January 2011 through December 2015.

15. Regional groundwater flow in the area is generally from the west to the east.

16. The Discharger uses a network of three groundwater monitoring wells, one upgradient and two downgradient, to monitor the impact of wastewater discharge to groundwater in the area of the ponds. The locations of the groundwater monitoring

---

[2] Miligrams per Liter

[3] Total Suspended Solids

[4] Standard pH units

[5] Total Dissolved Solids

wells identified as R-1 (MW1), MP-1 (MW2) and C-6 (MW3) are shown in Attachment C (Monitoring Well Locations), made part of this Board Order by reference. The Discharger's monitoring reports from January 2011 through December 2015 show the following average water quality data for the groundwater monitoring wells:

Column header omitted in original	Units	MW1 (downgradient)	MW2 (downgradient)	MW3 (upgradient)
Depth to Groundwater	feet below ground surface	361	410	629
Total Dissolved Solids	mg/L	332	252	219
Total Nitrogen	mg/L	4	2	1.1
Nitrate as N	mg/L	2	2	1.5
Iron	mg/L	34	ND	ND
Sulfate	mg/L	32	18	15
Chloride	mg/L	42	35	13
Aluminum	mg/L	20	ND	ND
Fluoride	mg/L	0.4	0.4	0.6

17. The Discharger reports that the soil in the vicinity of the WWTP, from ground surface to 300 bgs, is sand and gravelly sand containing small rocks and boulders. From a depth of 300 to 600 feet bgs, the soil is mostly sand and gravel with spots of brown clay and layers of fine sand and clay.

Basin Plan, Beneficial Uses, and Regulatory Considerations

18. The Water Quality Control Plan for the Colorado River Basin Region of California (Basin Plan), which was adopted on November 17, 1993 and amended on November 13, 2012, designates the beneficial uses of ground and surface waters in this Region, and contains implementation programs and policies to achieve water quality objectives, including narrative objectives for ground water quality, in Chapter 3, section IV, Ground Water Objectives.

19. The discharge is within the San Gorgonio Hydrologic Unit, Banning Subunit. The beneficial uses of groundwater in the San Gorgonio Hydrologic Unit include:

    a. Municipal Supply (MUN),
    b. Industrial Supply (IND), and
    c. Agricultural Supply (AGR).

20. This Order implements numeric and narrative water quality objectives for ground and surface waters established by the Basin Plan. The numeric objectives for groundwater designated for municipal and domestic supply are the maximum contaminant levels (MCLs) specified in sections 64431, 64444, and 64678 of Title 22 of the California Code of Regulations (CCR), and the bacteriological limits specified in section 64426.1 of Title 22, CCR.

21. It is the policy of the State of California that every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. This order promotes that policy by requiring discharges to meet maximum contaminant levels designed to protect human health and ensure that water is safe for domestic use.

22. Section 13267 of the California Water Code (CWC) authorizes the Colorado River Basin Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP) establishes monitoring and reporting requirements to implement federal and state requirements.

23. This Order establishes WDRs pursuant to Division 7, Chapter 4, Article 4, of the CWC for discharges that are not subject to regulation under Clean Water Act (CWA) section 402 (33 U.S.C. section 1342).

24. Pursuant to CWC section 13263(g), the discharge of waste is a privilege, not a right, and adoption of this Order does not create a vested right to continue the discharge.

25. The discharge authorized by this Board Order, and treatment and storage facilities associated with discharges of treated municipal wastewater, except for discharges of residual sludge and solid waste, are exempt from the requirements of the Consolidated Regulations for Treatment, Storage, Processing, or Disposal of Solid Waste, as set forth in Title 27, CCR, Division 2, Subdivision 1. This exemption is based on section 20090(a) of Title 27, which states in relevant part that discharges of domestic sewage or treated effluent are exempt provided that such discharges are regulated by WDRs, or for which WDRs have been waived, and which are consistent with applicable water quality objectives, and treatment or storage facilities associated with municipal WWTP's, provided that residual sludges or solid waste from WWTP’s shall be discharged only in accordance with the applicable Title 27 provisions. All of these Title 27 exemption conditions have been met with these WDRs.

Groundwater Degradation

26. State Water Board Resolution 68-16, "Policy with Respect to Maintaining High Quality Waters of the State"(Resolution 68-16) states:

    "Whenever the existing quality of water is better than the quality established in policies as of the date on which such policies become effective, such existing high quality will be maintained until it has been demonstrated to the State that any change will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial use of such water and will not result in water quality less than that prescribed in the policies."

    Resolution 68-16 further states:

    "Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in the best practicable treatment or control [BPTC] of the discharge necessary to assure that (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained."

27. Some degradation of groundwater from the discharge to the ponds is consistent with Resolution 68-16, provided that the degradation:

    a. Is confined to a reasonable area;

    b. Is minimized by means of full implementation, regular maintenance, and optimal operation of BPTC measures;

    c. Is limited to waste constituents typically encountered in domestic wastewater; and

    d. Does not result in the loss of any beneficial use as prescribed in the applicable basin plan, or violation of any water quality objective.

28. The discharge of wastewater from the WWTP, as permitted herein, reflects BPTC. The controls assure the discharge does not create a condition of pollution or nuisance, and that the highest water quality consistent with maximum benefit to the people of the State will be maintained, which is consistent with the anti-degradation provisions of Resolution 68-16. The WWTP incorporates:

    a. Technology for secondary treated domestic wastewater;

    b. Solids handling facilities;

    c. An operation and maintenance manual;

d. A City ordinance that is comprised of a comprehensive set of rules and regulations governing the design, construction, maintenance and use of public and private sewer facilities within City jurisdictional limits;

e. Staffing to assure proper operation and maintenance;

f. A network of groundwater monitoring wells; and

g. A standby emergency power generator of sufficient size to operate the treatment plant and ancillary equipment during periods of loss of commercial power.

Accordingly, the discharge as authorized is consistent with the anti-degradation provisions of Resolution 68-16 and the applicable water quality objectives.

Constituents of Concern

29. Constituents of concern in domestic wastewater effluent that present the greatest risk to groundwater quality are nitrogen, coliforms (pathogen-indicator organisms), and TDS. The WWTP provides substantial removal of soluble organic matter, solids, and some nitrogen treatment.

30. Title 22, CCR section 64431, Maximum Contaminant Level (MCL) for Nitrate plus Nitrite as Nitrogen is 10 mg/L. To account for the fate of transport for the various components of Total Nitrogen, as a conservative value it is assumed that all nitrogen present converts to nitrate/nitrite. The City of Banning's SMRs report an average of 29 mg/L for Total Nitrogen between January 2011 and December 2015. Because the concentration of total nitrogen in the effluent is elevated, it is probable that nitrates may reach groundwater in concentrations that exceed the MCL prescribed in Title 22, CCR, section 64431. This Board Order will require that the Discharger conduct a nitrogen removal analysis and provide its findings in a technical report that provides a workplan and time schedule for the installation and implementation of nitrogen removal alternatives.

31. While secondary treatment reduces fecal coliform densities by 90 to 99%, the remaining organisms in effluent are still 10^5 to 10^6 MPN/100 ml (United States Environmental Protection Agency, Design Manual, Municipal Wastewater Disinfection; October 1986). Given the depth to groundwater, it is not likely that pathogen-indicator bacteria will reach groundwater at densities exceeding those prescribed in Title 22, CCR. Thus, it is not anticipated that groundwater will be degraded by pathogen-indicator bacteria. Furthermore, any degradation by pathogens that might occur will be limited to the area in the vicinity of the ponds and degradation by pathogens should not be significant.

32. The typical incremental addition of dissolved salts from domestic water usage is 150 to 380 mg/L. Domestic water supply to the City of Banning showed an

average of about 200 mg/L during the period of January 2011 to December 2015. From January 2011 to December 2015 treated wastewater discharged by the City of Banning had an average TDS concentration of approximately 420 mg/L. Thus, the average TDS increase over the domestic water supply for this facility during the same time period was about 220 mg/L. Treated wastewater discharged by the WWTP has a TDS limit of a maximum of 400 mg/L above the domestic source water as regulated by Board Order 01-022. The Colorado River Water Board is responsible for implementing the State Water Resources Control Board's Salt and Nutrient Management Plan (SNMP). To that end, the TDS effluent limit in this Board Order will be reduced to 300 mg/L above the domestic water supply. A regulatory limit of 300 mg/L above the domestic source water reasonably protects present and anticipated beneficial uses of groundwater in the area; therefore, it is not likely that groundwater will exhibit significant degradation by TDS.

Stormwater

33. Federal regulations for storm water discharges were promulgated by the U.S. Environmental Protection Agency on November 16, 1990, (40 CFR Parts 122, 123, and 124) to implement the Clean Water Act's storm water program set forth in Clean Water Act section 402(p) (33 U.S.C. section 1342(p).). In relevant part, the regulations require specific categories of facilities that discharge storm water associated with industrial activity to "waters of the United States" to obtain NPDES permits and to require control of such pollutant discharges using Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT) to prevent and reduce pollutants and any more stringent controls necessary to meet water quality standards. Facilities used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are within the confines of the facility with a design flow of one million gallons a day or more, or required to have an approved pretreatment program under 40 CFR Part 403, are considered to be engaging in "industrial activity" for purposes of the Clean Water Act's storm water program. The facility has a design treatment capacity of 3.6 MGD, and is thus subject to the federal regulations for discharges of stormwater associated with industrial activity.

CEQA and Public Participation

34. In accordance with section 15301, Chapter 3, Title 14, CCR, the issuance of these WDRs, which govern the operation of an existing facility involving negligible or no expansion of use beyond that previously existing, is exempt from the provisions of the California Environmental Quality Act (Pub. Resources Code, section 21000 et seq.).

35. The Colorado River Basin Water Board has notified the Discharger and all known interested agencies and persons of its intent to draft WDRs for this discharge, and

has provided them with an opportunity for a public meeting and an opportunity to submit comments.

36. The Colorado River Basin Water Board, in a public meeting, heard and considered all comments pertaining to this discharge.

IT IS HEREBY ORDERED, that Board Order 01-022 is rescinded upon the effective date of this Order, except for enforcement purposes, and, in order to meet the provisions contained in Division 7 of the California Water Code, and regulations adopted thereunder, the Discharger shall comply with the following:

A. Effluent Limitations

1. Effluent discharged into the ponds for disposal shall not exceed the following effluent limits:

Constituent	Units	30-Day Arithmetic Mean	7-Day Arithmetic Mean	Maximum
20^{o} C BOD_5	mg/L	30	45	-----
Total Suspended Solids	mg/L	30	45	-----

2. The 30-day average daily dry weather discharge from the WWTP shall not exceed 3.6 MGD.

3. Effluent from the WWTP into the ponds shall not have a pH below 6.0 or above 9.0.

4. The increase in concentration of TDS in the wastewater discharged to the ponds over that contained in the water supply to the community shall not exceed 300 mg/L.

5. The ponds shall be maintained so they will continuously operate in aerobic conditions. The dissolved oxygen content in the upper zone (one foot) of the ponds shall not be less than 1.0 mg/L at all times.

B. Discharge Prohibitions

1. Discharge of waste classified as “hazardous”, as defined in Title 23, CCR, section 2521(a), or “designated”, as defined in California Water Code section 13173, is prohibited.

2. Discharge of treated wastewater at a location other than the designated disposal areas is prohibited.

3. The discharge of any wastewater from the Facility to any surface waters or surface drainage courses is prohibited.

4. Discharge of waste to land not owned or authorized for such use by the Discharger is prohibited.

5. Surfacing or ponding of wastewater outside of the designated disposal locations is prohibited.

6. Bypass, overflow, discharge, or spill of untreated or partially treated waste is prohibited.

C. Discharge Specifications

1. The treatment or disposal of wastes from the WWTP shall not cause pollution or nuisance as defined in sections 13050(l) and 13050(m) of Division 7 of the California Water Code, respectively.

2. A minimum freeboard depth of two feet shall be maintained at all times in each pond.

3. All treatment, storage, and disposal areas shall be designed, constructed, operated, and maintained to prevent inundation or washout due to floods with a 100-year return frequency.

4. Ponds shall have sufficient capacity to accommodate allowable wastewater flow, design seasonal precipitation, ancillary inflow, and infiltration during the non-irrigation season. Design seasonal precipitation shall be based on total annual precipitation using a return period of 100 years, distributed monthly in accordance with historical rainfall patterns.

5. The ponds shall be managed to prevent breeding of mosquitoes. In particular:

    a. An erosion control program should assure that small coves and irregularities are not created around the perimeter of the water surface.

    b. Weeds shall be minimized through control of water depth, harvesting, or herbicides.

    c. Dead algae, vegetation, and debris shall not accumulate on the water surface.

6. Public contact with wastewater shall be precluded through such means as fences, signs, and other acceptable alternatives.

7. Objectionable odors originating at this facility shall not be perceivable beyond the limits of the wastewater treatment and disposal area.

8. The ponds shall be maintained and operated so as to maximize infiltration and minimize the increase of salinity in the groundwater.

9. The Discharger shall not accept wastewater in excess of the treatment capacity of the Facility.

D. Specifications

1. Discharge from the WWTP shall not cause groundwater to:

   a. Contain constituents in excess of California MCLs, as set forth in the California Code of Regulations, Title 22, section 64426.1 for bacteriological constituents; section 64431 for inorganic chemicals; section 64444 for organic chemicals; and section 64678 for determination of exceedances of lead and copper action levels.

   b. Contain taste or odor-producing substances in concentrations that adversely affect beneficial uses as a result of human activity.

E. Pretreatment

1. In the event that the facility has an average dry weather flow or treatment capacity of 5 MGD or more and Industrial Users [40 CFR 403.3(h)] are discharging pollutants which could Pass Through [40 CFR 403.3(n)] or Interfere [40 CFR 403.3(i)] with the operation of the wastewater treatment facility or are otherwise subject to National Pretreatment Standards [40 CFR 403.3(j)], (ii) California Code of Regulations, Title 23, section 2233 requires the facility to have and enforce an adequate pretreatment program, or (iii) the Colorado River Basin Water Board or its Executive Officer determines that other circumstances warrant, then:

   a. The Discharger shall notify the Colorado River Basin Water Board within 30 days after there are discharges that trigger the pretreatment requirements.

   b. The Discharger shall submit a revised Report of Waste Discharge and the pretreatment program for the Board review and approval as soon as possible but not later than one year of the notice of pretreatment requirements.

c. The Discharger shall enforce the federal categorical pretreatment standards on all Categorical Industrial Users (CIUs).

d. The Discharger shall notify the CIU of its discharge effluent limits. The limits must be as stringent as the pretreatment standards contained in the applicable federal category (40 CFR Part 400-699). The Discharger may develop more stringent, technically based local limit if it can show cause.

e. The Discharger shall notify the RWQCB if the CIU violates its discharge effluent limits.

2. The Colorado River Basin Water Board retains the right to take legal action against an industrial user and/or the Discharger where a user fails to meet the approved applicable pretreatment standards.

F. Special Provisions

1. Within **12 months** of the adoption of this Order, the Discharger shall submit to the Colorado River Basin Water Board office a technical report that includes a copy of the Maintenance and Operations Manual for the WWTP.

2. Within **18 months** of the adoption date of this Board Order, the Discharger shall submit for approval by the Colorado River Basin Water Board's Executive Officer, a technical report that is a work plan and time schedule to conduct a study that addresses the practicability of a 10 mg/L total nitrogen effluent limitation and the impact the discharge has on the beneficial uses of the receiving groundwater. The time schedule for the study shall not be longer than four (4) years. A California Professional Engineer (PE), Registered Geologist (RG), Certified Engineering Geologist (CEG), or a Certified Hydro Geologist (CHG) must sign and stamp the technical report. The report shall, at a minimum, include the following:

   a. Evaluation by the Discharger must include information on the following factors relating to the discharge:

      i. Description of the municipal entity and facilities.

      ii. Description of the quantity and nitrogen concentration of domestic water sources contributing to discharge.

      iii. Description of significant nitrogen sources of the municipal wastewater collection system, and identification of entities responsible for each source, if available.

      iv. Description of the wastewater discharge, receiving waters, quantity, and nitrogen load.

v. Alternative plans for minimizing nitrogen contribution from the municipal sources. Alternative plans should include:

(A) Description of nitrogen sources and alternative means of control; and

(B) Cost of alternative plans in dollars per ton, of nitrogen removed from discharge.

vi. Description and analyses of potential conventional nitrogen removal treatment technologies for implementation at the WWTP. Analyses shall include cost of implementation in dollars per ton, of nitrogen removed from discharge.

vii. Such other information pertinent to the study as the permitting authority may deem necessary.

b. In determining what permit conditions shall be required, the permit issuing authority shall consider the following criteria including, but not limited to:

i. The practicability of achieving a 10 mg/L total nitrogen effluent limit.

ii. Where a 10 mg/L effluent limit is not determined to be practicable, the Discharger shall provide the following:

(A) The impact of the proposed nitrogen input of each alternative on the beneficial uses of the groundwater in terms of tons per year and concentration;

(B) Costs per ton of nitrogen removed from discharge of each alternative plan;

(C) Capability of minimizing nitrogen discharge;

(D) A proposed value for the practical incremental increase; and

(E) A justification for the proposed practical incremental increased value.

c. By **June 30, 2020**, the Discharger shall submit a final technical report that includes the Discharger's recommendations and conclusions, including a tentative work plan and time schedule for facility plant improvements required to accomplish nitrogen removal and comply with the effluent water quality limit. The report shall be

certified with the signature and stamp of a California licensed professional PE, PG, CEG, or a CHG.

3. Within **24 months** of the adoption of this Order, the Discharger shall submit to the Colorado River Basin Water Board a technical report that includes a copy of the City of Banning ordinance that provides a comprehensive set of rules and regulations governing the design, construction, maintenance and use of public and private sewer facilities within the city's jurisdictional limits.

4. Within **24 months** of the adoption of this Order, the Discharger shall submit a technical report that contains:

   a. Documents demonstrating the City of Banning's authority to issue permits for individual and community onsite septic systems;

   b. The City of Banning's affirmative statement with regard to submitting a Local Agency Management Program plan in accordance with the State Water Board's *Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems*; and,

   c. Identification of all areas within the jurisdiction of the City of Banning's sewer authority that are currently on existing onsite septic systems, and those undeveloped areas planned for septic systems.

G. Standard Provisions

1. The Discharger shall comply with all of the conditions of this Board Order. Noncompliance is a violation of the Porter-Cologne Water Quality Control Act (CWC, section 13000 et seq.), and is grounds for enforcement action.

2. The Discharger shall comply with the Electronic Submittal of Information (ESI) requirements by submitting all correspondence and reports required under Monitoring and Reporting Program (MRP) R7-2016-0015, and future revisions thereto, including groundwater monitoring data and discharge location data (latitude and longitude), correspondence, and pdf monitoring reports to the State Water Resources Control Board GeoTracker https://geotracker.waterboards.ca.gov/ database. Documents that are 2.0 MB or larger should be broken down into smaller electronic files, labelled properly and uploaded into GeoTracker.

3. All technical reports required in conjunction with this Order are required pursuant to Section 13267 of the CWC, and shall include a statement by the Discharger, or an authorized representative of the Discharger, certifying

under penalty of perjury under the laws of the State of California, that the report is true, complete, and accurate.

4. In accordance with California Business and Professions Code Sections 6735, 7835, and 7835.1, engineering and geologic evaluations and judgments shall be performed by or under the direction of California registered professionals (i.e., civil engineer, engineering geologist, geologist, etc.) competent and proficient in the fields pertinent to the required activities. All technical reports specified herein that contain work plans, that describe the conduct of investigations and studies, or that contain technical conclusions and recommendations concerning engineering and geology shall be prepared by or under the direction of appropriately qualified professionals, even if not explicitly stated. Each technical report submitted by the Discharger shall contain a statement of qualifications of the responsible licensed professionals as well as the professional's signature and/or stamp of the seal. Additionally, to the extent that preparation of a required technical report involves field activities, field activities shall be conducted under the direct supervision of one or more of these professionals.

5. The Discharger shall not cause degradation of any water supply in accordance with State Water Board Resolution 68-16.

6. Standby power generating facilities shall be available to operate the plant during a commercial power failure.

7. Adequate measures shall be taken to assure that flood or surface drainage waters do not erode or otherwise render portions of the discharge facilities inoperable.

8. The WWTP shall be supervised and operated by persons possessing certification of appropriate grade pursuant to section 3680, Chapter 26, Division 3, Title 23 of the California Code of Regulations.

9. The Discharger shall at all times properly operate and maintain all systems and components of collection, treatment and control, installed or used by the Discharger to achieve compliance with this Board Order. Proper operation and maintenance includes effective performance, adequate process controls, and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities/systems when necessary to achieve compliance with this Board Order. All systems in service or reserved shall be inspected and maintained on a regular basis. Records of inspections and maintenance shall be retained, and made available to the Colorado River Basin Water Board's Executive Officer on request.

10. The Discharger shall ensure that all site-operating personnel are familiar with the content of this Board Order, and shall maintain a copy of this Board Order at the site.

11. The Discharger shall allow the Colorado River Basin Water Board, or an authorized representative, upon presentation of credentials and other documents as may be required by law, to:

    a. Enter the premises regulated by this Order, or the place where records are kept under the conditions of this Board Order;

    b. Have access to and copy, at reasonable times, records kept under the conditions of this Board Order;

    c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and

    d. Sample or monitor at reasonable times, for the purpose of assuring compliance with this Order or as otherwise authorized by the Water Code, any substances or parameters at this location.

12. Disposal of oil and grease, biosolids, screenings, and other solids collected from liquid wastes shall be pursuant to Title 27, and the review and approval of the Colorado River Basin Water Board Executive Officer.

13. Any proposed change in use or disposal of biosolids requires the approval of the Colorado River Basin Water Board Executive Officer, and U.S. Environmental Protection Agency Regional Administrator, who must be notified at least 90 days in advance of the change.

14. Sludge use and disposal shall comply with Federal and State laws and regulations, including permitting requirements, and technical standards in 40 CFR Part 503. If the State and Colorado River Basin Water Boards are delegated the authority to implement 40 CFR Part 503 regulations, this Order may be revised to incorporate appropriate time schedules and technical standards. The Discharger shall comply with the standards and time schedules in 40 CFR part 503, whether or not part of this Order.

15. The Discharger shall provide a plan as to the method, treatment, handling and disposal of sludge that is consistent with all State and Federal laws and regulations and obtain prior written approval from the Colorado River Basin Water Board specifying location and method of disposal, before disposing of treated or untreated sludge, or similar solid waste.

16. The Discharger shall maintain a permanent log of all solids hauled away from the treatment facility for use/disposal elsewhere and shall provide a

summary of the volume, type (screenings, grit, raw sludge, digested sludge), use (agricultural, composting, etc.), and the destination in accordance with the MRP of this Board Order. Sludge that is stockpiled at the treatment facility shall be sampled and analyzed for those constituents listed in the sludge monitoring section of the MRP of this Board Order and as required by Title 40, Code of Federal Regulations, Part 503. The results of the analyses shall be submitted to the Colorado River Basin Water Board as part of the MRP.

17. The Discharger shall provide a report to the Colorado River Basin Water Board when it determines that the plant's average dry-weather flow rate for any month exceeds 80 percent of the design capacity. The report should indicate what steps, if any, the Discharger intends to take to provide for the expected wastewater treatment capacity necessary when the plant reaches design capacity.

18. Prior to implementing a modification that results in a material change in the quality or quantity of wastewater treated or discharged, or a material change in the location of discharge, the Discharger shall report all pertinent information in writing to the Colorado River Basin Water Board, and obtain revised requirements.

19. Prior to a change in ownership or management of WWTP, the Discharger shall transmit a copy of this Board Order to the succeeding owner/operator, and forward a copy of the transmittal letter to the Colorado River Basin Water Board.

20. The Discharger shall provide adequate notice to the Colorado River Basin Water Board Executive Officer of the following:

    a. The introduction of pollutants into any treatment facility described in the Findings of this Board Order from an indirect Discharger which would be subject to section 301 or 306 of the Clean Water Act, if the pollutants were discharged directly;

    b. Any substantial change in the volume or character of pollutants introduced into any treatment facility described in the Findings of this Board Order, by an existing or new source; and

    c. Any planned physical alteration or addition to the facilities described in this Board Order, or change planned in the Discharger's sludge use or disposal practice, where such alterations, additions, or changes may justify the application of Board Order conditions that are different from or absent in the existing Board Order, including notification of additional disposal

sites not reported during the Board Order application process, or not reported pursuant to an approved land application plan.

21. The Discharger shall report orally, any noncompliance that may endanger human health or the environment. The noncompliance shall be reported immediately to the Colorado River Basin Water Board's Executive Officer at (760) 346-7491, and the California Office of Emergency Services at (800) 852-7550 as soon as:

    a. The Discharger has knowledge of the discharge;

    b. Notification is possible, and

    c. Notification will not substantially impede cleanup or other emergency measures.

    During non-business hours, the Discharger shall leave a message on the Colorado River Basin Water Board's office voice recorder at the above listed number. Incident information shall be provided orally as soon as possible and within 24 hours from the time the Discharger becomes aware of the incident. A written report shall also be provided within five (5) business days of the time the Discharger becomes aware of the incident. The written report shall contain a description of the noncompliance and its cause, the period of noncompliance, the anticipated time to achieve full compliance, and the steps taken or planned, to reduce, eliminate, and prevent recurrence of the noncompliance. The Discharger shall report all intentional or unintentional spills in excess of one thousand (1,000) gallons occurring within the WWTP or collection system to the Colorado River Basin Water Board office in accordance with the above time limits.

22. The Discharger shall report all instances of noncompliance. Reports of noncompliance shall be submitted with the Discharger's next scheduled SMRs or earlier if requested by the Colorado River Basin Water Board's Executive Officer, or if required by an applicable standard for sludge use and disposal.

23. By-pass (i.e., the intentional diversion of waste streams from any portion of the treatment facilities, except diversions designed to meet variable effluent limits) is prohibited. The Colorado River Basin Water Board may take enforcement action against the Discharger for by-pass unless:

    a. By-pass was unavoidable to prevent loss of life, personal injury, or severe property damage. Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to be inoperable, or substantial and permanent loss of natural resources reasonably expected to occur in

the absence of a by-pass. Severe property damage does not mean economic loss caused by delays in production; and

There were no feasible alternatives to by-pass, such as the use of auxiliary treatment facilities or retention of untreated waste. This condition is not satisfied if adequate back-up equipment was not installed to prevent by-pass occurring during equipment downtime, or preventive maintenance.

b. By-pass is:

i. Required for essential maintenance to assure efficient operation; and

ii. Neither effluent nor receiving water limitations are exceeded; and

iii. The Discharger notifies the Colorado River Basin Water Board ten (10) days in advance.

24. In the event of an unanticipated by-pass, the Discharger shall immediately report the incident to the Colorado River Basin Water Board. During non-business hours, the Discharger shall leave a message on the Colorado River Basin Water Board office voice recorder. A written report shall be provided within five business days the Discharger is aware of the incident. The written report shall include a description of the by-pass, any noncompliance, the cause, period of noncompliance, anticipated time to achieve full compliance, and steps taken or planned, to reduce, eliminate, and prevent recurrence of the noncompliance.

25. Federal regulations for storm water discharges require specific categories of facilities which discharge storm water associated with industrial activity (storm water) to obtain National Pollutant Discharge Elimination System (NPDES) permits and to implement Best Conventional Pollutant Technology (BCPT) and Best Available Technology Economically Achievable (BAT) to reduce or eliminate industrial storm water pollution.

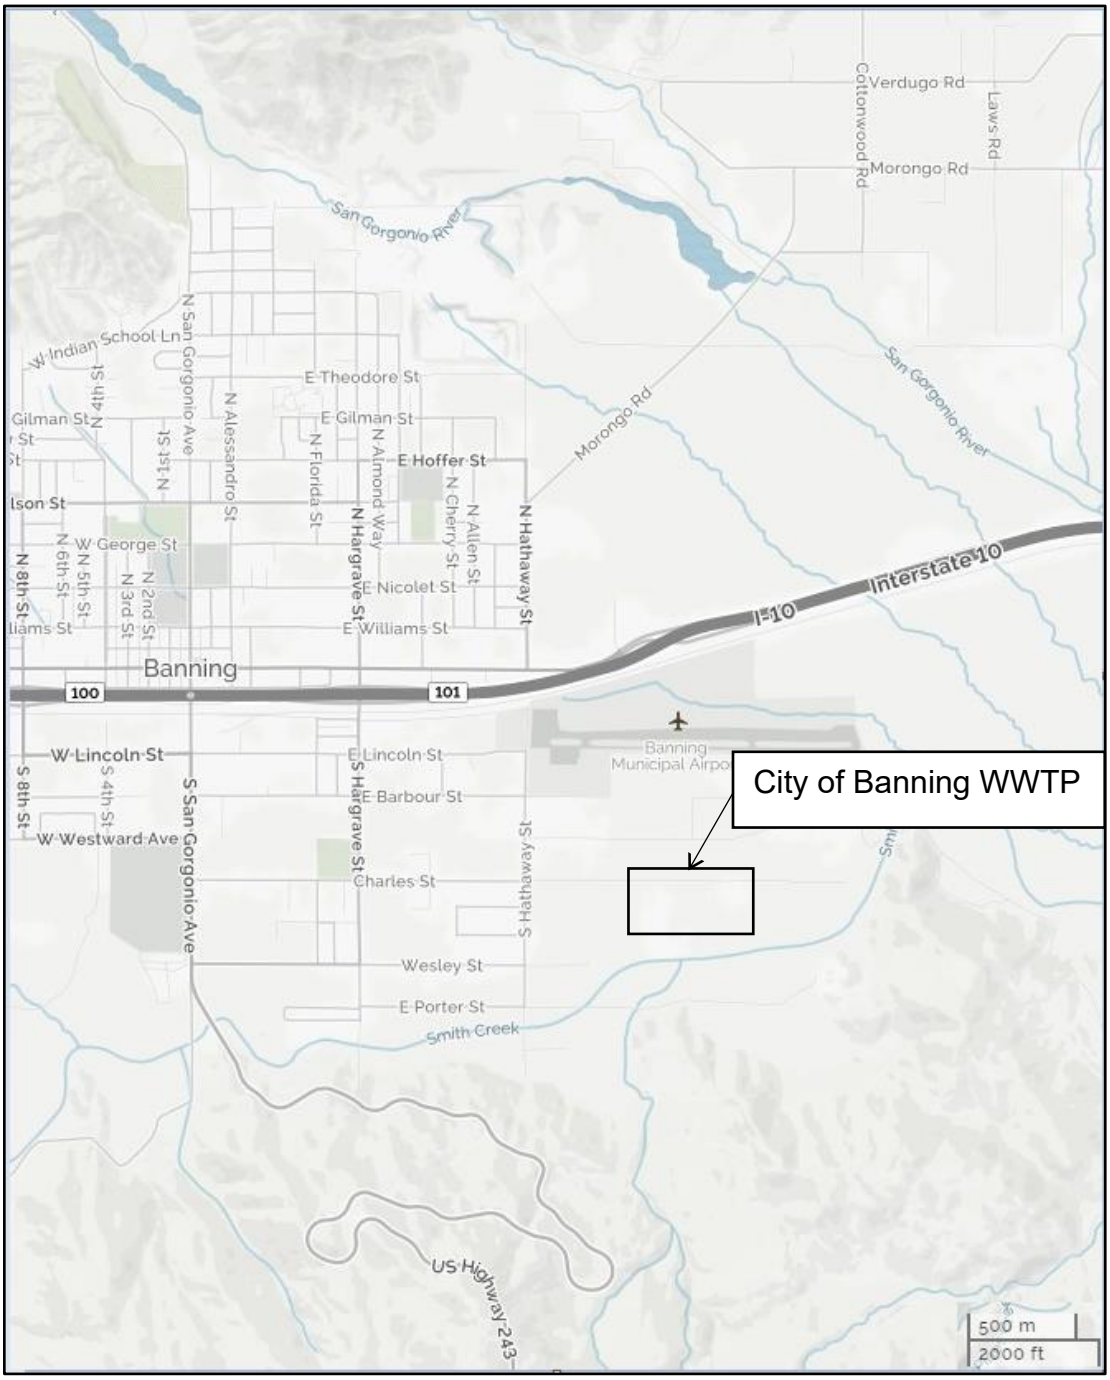
26. All storm water discharges from this facility must comply with the lawful requirements of municipalities, counties, drainage districts, and other local agencies, regarding discharges of storm water to storm water drain systems or other courses under their jurisdiction.

27. Storm water discharges from the facility shall not cause or threaten to cause pollution or contamination.

28. Storm water discharges from the facility shall not contain hazardous substances equal to or in excess of a reportable quantity listed in 40 CFR Part 117 and/or 40 CFR Part 302.

29. The Discharger is the responsible party for the waste discharge requirements and the monitoring and reporting program for the facility. The Discharger shall comply with all conditions of these waste discharge requirements. Violations may result in enforcement actions, including Colorado River Basin Water Board Orders or court orders, requiring corrective action or imposing civil monetary liability, or in modification or revocation of these waste discharge requirements by the Colorado River Basin Water Board.

30. This Board Order does not authorize violation of any federal, state, or local laws or regulations.



31. This Board Order does not convey property rights of any sort, or exclusive privileges, nor does it authorize injury to private property or invasion of personal rights, or infringement of federal, state, or local laws or regulations.

32. This Board Order may be modified, rescinded, or reissued, for cause. The filing of a request by the Discharger for a Board Order modification, rescission or reissuance, or notification of planned changes or anticipated noncompliance, does not stay any Board Order condition. Causes for modification include a change in land application plans, or sludge use or disposal practices, and adoption of new regulations by the State or Colorado River Basin Water Board (including revisions to the Basin Plan), or Federal government.

I, Jose L. Angel, Executive Officer, do hereby certify the foregoing is a full, true and correct copy of an Order adopted by the California Regional Water Quality Control Board, Colorado River Basin Region, on June 30, 2016.

MONITORING AND REPORTING PROGRAM R7-2016-0015
FOR
CITY OF BANNING, OWNER
SUEZ WATER ENVIRONMENTAL SERVICES, OPERATOR
BANNING WASTEWATER TREATMENT PLANT
BANNING-RIVERSIDE County:
LOCATION OF DISCHARGE:
Section 14, T3S, R1E, SBB&M

A. Monitoring

1. This Monitoring and Reporting Program (MRP) describes requirements for monitoring a wastewater system and groundwater quality (when needed). This MRP is issued pursuant to California Water Code (CWC) section 13267. The Discharger shall not implement any changes to this MRP unless and until a revised MRP is issued by the Executive Officer.

2. Water Code section 13267 states, in part:

   "In conducting an investigation specified in subdivision (a), the Colorado River Basin Water Board may require that any person who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste within its region, or any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the Colorado River Basin Water Board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the Colorado River Basin Water Board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports."

3. Water Code section 13268 states, in part:

   "(a) (1) Any person failing or refusing to furnish technical or monitoring program reports as required by subdivision (b) of section 13267, or failing or refusing to furnish a statement of compliance as required by subdivision (b) of section 13399.2, or falsifying any information provided therein, is guilty of a misdemeanor, and may be liable civilly in accordance with subdivision (b). (b) (1) Civil liability may be administratively imposed by a Colorado River Basin Water Board in accordance with Article 2.5 (commencing with section

13323) of Chapter 5 for a violation of subdivision (a) in an amount which shall not exceed one thousand dollars ($1,000) for each day in which the violation occurs."

4. The Discharger owns and operates the wastewater system that is subject to Board Order R7-2016-0015. The reports are necessary to ensure that the Discharger complies with the Order. Pursuant to Water Code section 13267, the Discharger shall implement the MRP and shall submit the monitoring reports described herein.

5. All samples shall be representative of the volume and nature of the discharge or matrix of material sampled. The time, date, and location of each grab sample shall be recorded on the sample chain of custody form. If composite samples are collected, the basis for sampling (time or flow weighted) shall be approved by Colorado River Basin Water Board staff.

6. Field test instruments (such as those used to test pH, dissolved oxygen, and conductivity) may be used provided that:

    a. The user is trained in proper use and maintenance of the instruments;

    b. The instruments are field calibrated prior to monitoring events at the frequency recommended by the manufacturer;

    c. Instruments are serviced and/or calibrated by the manufacturer at the recommended frequency; and

    d. Field calibration reports are submitted as described in the "Reporting" section of this MRP.

7. The collection, preservation and holding times of all samples shall be in accordance with U. S. Environmental Protection Agency (USEPA) approved procedures. Unless otherwise approved by the Colorado River Basin Water Board's Executive Officer, all analyses shall be conducted by a laboratory certified by the State Water Resources Control Board Division of Drinking Water. All analyses shall be conducted in accordance with the latest edition of the "Guidelines Establishing Test Procedures for Analysis of Pollutants" (40 CFR Part 136), promulgated by the USEPA.

8. All monitoring instruments and devices used by the Discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy. In the event that continuous monitoring equipment is out of service for period greater than 24-hours, the Discharger shall obtain representative grab samples each day the equipment is out of service. The Discharger shall correct the cause(s) of failure of the continuous monitoring equipment as soon as practicable.

The Discharger shall report the period(s) during which the equipment was out of service and if the problem has not been corrected, shall identify the steps which the Discharger is taking or proposes to take to bring the equipment back into service and the schedule for these actions.

9. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Board Order, and records of all data used to complete the application for this Board Order, for a period of at least five (5) years from the date of the sample, measurement, report or application. This period may be extended by request of the Colorado River Basin Water Board's Executive Officer at any time. Records of monitoring information shall include:

    a. The date, exact place, and time of sampling or measurement(s);

    b. The individual(s) who performed the sampling or measurement(s);

    c. The date(s) analyses were performed;

    d. The individual(s) who performed the analyses;

    e. The analytical techniques or method used; and

    f. The results of such analyses.

10. Samples shall be collected at the location specified in the WDRs. If no location is specified, sampling shall be conducted at the most representative sampling point available.

11. Given the monitoring frequency prescribed by MRP R7-2016-0015, if only one sample is available for a given reporting period, compliance with monthly average, or weekly average Discharge Specifications, will be determined from that sample.

12. If the facility is not in operation, or there is no discharge during a required reporting period, the Discharger shall forward a letter to the Colorado River Basin Water Board indicating that there has been no activity during the required reporting period.

Influent Monitoring

13. Influent to the WWTP shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
20°C BOD_5[1]	mg/L[2]	24-Hr. Composite	2x/Month	Monthly
Total Suspended Solids	mg/L	24-Hr. Composite	2x/Month	Monthly
Nitrate as N	mg/L	24-Hr. Composite	Quarterly	Quarterly
Nitrite as N	mg/L	24-Hr. Composite	Quarterly	Quarterly
Total Nitrogen	mg/L	24-Hr. Composite	Quarterly	Quarterly

WWTP Effluent Monitoring

14. Effluent from the WWTP into the Evaporation/Percolation Ponds shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Flow; Total Plant Effluent into Ponds	MGD[3]	Flow Meter Reading	Daily	Monthly
20°C BOD_5	mg/L	24 Hr. Composite	Weekly	Monthly
Total Suspended Solids	mg/L	24 Hr. Composite	Weekly	Monthly
Nitrate as N	mg/L	24 Hr. Composite	2x/Month	Monthly
Nitrite as N	mg/L	24 Hr. Composite	2x/Month	Monthly

[1] 5-day Biochemical Oxygen Demand at 20 degrees Celsius.

[2] milligrams per Liter

[3] Million Gallons per Day

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Total Nitrogen	mg/L	24 Hr. Composite	2x/Month	Monthly
Total Dissolved Solids	mg/L	Grab	Monthly	Monthly
VOCs[4]	µg/L[5]	24 Hr. Composite	Annually	Annually

Pond Monitoring

15. The ponds shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Sampling Frequency	Reporting Frequency
Dissolved Oxygen[6]	mg/L	Composite	Weekly	Monthly
pH	s.u.[7]	Grab	Weekly	Monthly
Freeboard	Ft	Measurement	Weekly	Monthly

The ponds shall be observed for vegetation growth, erosion and irregularities to prevent the breeding of mosquitoes. Observations shall be reported with the monthly SMR.

Domestic Water Supply

16. The domestic water supply shall be monitored according to the following schedule:

[4] Analysis of Volatile Organic Compounds is to be accomplished using the USEPA test methods 601 and 602 or 624

[5] micrograms per liter

[6] Dissolved Oxygen shall be monitored at the upper one foot layer of the evaporation/percolation ponds.

[7] standard pH units

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Total Dissolved Solids	mg/L	Composite	Monthly	Monthly

Groundwater Monitoring

17. Groundwater shall be sampled in the uppermost 20 feet of the shallow aquifer from the monitoring wells according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Depth to Groundwater	ft (bgs)[8]	measurement	Quarterly	Quarterly
Total Dissolved Solids	mg/L	Grab	Quarterly	Quarterly
Total Nitrogen	mg/L	Grab	Quarterly	Quarterly
Nitrate as N	mg/L	Grab	Quarterly	Quarterly
Nitrite as N	mg/L	Grab	Quarterly	Quarterly
Sulfate	mg/L	Grab	Quarterly	Quarterly
Chloride	mg/L	Grab	Quarterly	Quarterly
Fecal Coliform	MPN/100mL	Grab	Quarterly	Quarterly
VOCs	μg/L	Grab	Annually	Annually

Sludge Monitoring

18. Prior to disposal, sludge that is generated at the WWTP shall be sampled and analyzed for the following:

[8] feet below ground surface.

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Arsenic	mg/kg[9]	Composite	Annually	Annually
Cadmium	mg/kg	Composite	Annually	Annually
Chromium	mg/kg	Composite	Annually	Annually
Copper	mg/kg	Composite	Annually	Annually
Lead	mg/kg	Composite	Annually	Annually
Mercury	mg/kg	Composite	Annually	Annually
Molybdenum	mg/kg	Composite	Annually	Annually
Nickel	mg/kg	Composite	Annually	Annually
Selenium	mg/kg	Composite	Annually	Annually
Zinc	mg/kg	Composite	Annually	Annually
Fecal Coliform	MPN/gram[10]	Composite	Prior to Disposal	Annually

B. Reporting

1. The Discharger shall inspect and document any operation/maintenance problems by inspecting each unit process. In addition, calibration of flow meters and equipment shall be performed in a timely manner and documented. Operation and Maintenance reports shall be submitted to the Colorado River Basin Water Board Office annually.

2. The annual Operation and Maintenance report shall include the following:

    a. Documentation showing the calibration of flow meters and equipment as performed in a timely manner annually;

    b. Modifications and updates to the Operation and Maintenance Manual;

[9] milligrams per kilogram

[10] Most Probable Number per gram.

c. Operator certification status update including number of staff and grade certification.

d. Modifications and updates to the City's waste water ordinance or rules and regulations.

3. The Discharger shall report annually on the quantity, location and method of disposal of all sludge and similar solid materials being produced at the WWTP. If no sludge is disposed of during the year being reported, the Discharger shall state "No Sludge Removed" in the annual monitoring report.

4. The Discharger shall provide the Colorado River Basin Water Board with an annual report describing the pretreatment program activities over the previous twelve-month period. The report shall be transmitted to the Colorado River Basin Water Board office no later than January 31 of each year and include:

   a. A summary of actions taken by the Discharger which ensures industrial-user compliance;

   b. An updated list of industrial users (by SIC categories) which were issued permits, and/or enforcement orders, and a status of compliance for each user; and

   c. The name and address of each user that received a revised discharge limit.

5. SMRs shall be certified under penalty of perjury to be true and correct, and shall contain the required information at the frequency designated in this MRP.

6. Each Report must contain an affirmation in writing that states:

   "All analyses were conducted at a laboratory certified for such analyses by and in accordance with current USEPA procedures or as specified in this Monitoring and Reporting Program."

7. Each report shall contain the following completed declaration:

   "I certify under the penalty of law that this document, including all attachments and supplemental information, was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for

submitting false information, including the possibility of a fine and imprisonment.

Executed on the _____day of _____ at _____

_____(Signature)

_____(Title)"

8. The SMRs, and other information requested by the Colorado River Basin Water Board, shall be signed by a principal executive officer or ranking elected official.

9. A duly authorized representative of the Discharger may sign the documents if:

   a. The authorization is made in writing by the person described above;

   b. The authorization specified an individual or person having responsibility for the overall operation of the regulated disposal system; and

   c. The written authorization is submitted to the Colorado River Basin Water Board's Executive Officer.

10. The Discharger shall attach a cover letter to the SMRs. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned and the proposed time schedule of corrective actions. Identified violations should include a description of the requirement that was violated and a description of the violation.

11. Daily, weekly, and monthly monitoring shall be included in the monthly monitoring report. Monthly monitoring reports shall be submitted to the Colorado River Basin Water Board by the 15th day of the following month. Quarterly monitoring reports shall be submitted by January 15th, April 15th, July 15th and October 15th. Annual monitoring reports shall be submitted by January 31st of the following year.

12. The Discharger shall comply with the Electronic Submittal of Information (ESI) requirements by submitting all correspondence and reports required under Monitoring and Reporting Program (MRP) R7-2016-0015, and future revisions thereto, including groundwater monitoring data and discharge location data (latitude and longitude), correspondence, and pdf monitoring reports to the State Water Resources Control Board GeoTracker database. Documents that are 2.0 MB or larger should be broken down into smaller electronic files, labelled properly and uploaded into GeoTracker.

ACKNOWLEDGEMENTS

Engineering Team: This report was prepared and edited by the following engineering staff:

Joon Min, PhD, Principal in Charge, Montrose

James Wang, PE, Senior Design Manager, Montrose

Chi-Chung Tang, PhD, PE, Technical Advisor and QA/QC Officer, Montrose

Young Eum, PhD, Senior Process Engineer, Montrose

Kyle Nelson, PE, Project Engineer, Montrose

Dustin Stickney, PE, Project Engineer, Montrose

Agata Bugala, Staff Engineer, Montrose

City Staff: The engineering team was assisted by the following City of Banning and Suez Environmental staff. Their assistance is greatly appreciated:

Art Vela, PE, Director of Public Works, City of Banning

Luis Cardenas, PE, Senior Engineer, City of Banning

Perry Gerdes, Public Utilities Superintendent, City of Banning

Lorenzo Amis, Chief Plant Operator, Suez Environmental/United Water

John Holub, Plant Operator, Suez Environmental/United Water

1. INTRODUCTION

The purpose of this study is to evaluate wastewater treatment alternatives for nitrogen removal and the production of recycled water for the City of Banning (City) wastewater treatment plant (WWTP). Wastewater treatment stages considered for this evaluation included biological, tertiary, and disinfection. Several process options were assessed within each treatment stage to develop a list of wastewater treatment alternatives for further evaluation. The treatment alternatives are evaluated based on estimated construction and operating costs, operational issues, site constraints, and the ability to comply with current and future regulatory requirements. Additionally, this evaluation considered existing treatment process operations, and the ability to upgrade or reuse facilities for future use. The viable wastewater treatment alternatives developed from the evaluation are listed below:

Alternative 1 - Increase Trickling Filter Recirculation Rate
Alternative 2 - Conventional Activated Sludge
Alternative 3 - Integrated Fixed-Film Activated Sludge
Alternative 4 - Moving Bed Biofilm Reactor
Alternative 5 - Membrane Bioreactor

2. BACKGROUND

Groundwater is one of the main drinking water sources for the City. One of the serious problems that affect the quality of the region's groundwater is nutrients leaching through from the soil. Nitrogen easily percolates into the groundwater via rainwater recharge, irrigation water carrying excess fertilizers, and untreated sewage or septic leaching. Nitrate and nitrite nitrogen at levels above the drinking water standards have the potential to cause serious human health effects, particularly for infants below the age of six months. Additionally, ammonia nitrogen in the wastewater can form harmful disinfection byproducts when chlorine is used for disinfection. To protect the quality of the City's water supply, it is critical that the nitrogen in the City's wastewater be properly managed.

2.1. Plant Overview

The City owns and operates a WWTP located at 2242 East Charles Street, Banning, California 92220. The WWTP has a design treatment capacity of 3.6 million gallons per day (MGD) and currently discharges approximately 2.07 MGD into 10 unlined evaporation/percolation ponds. The treated effluent then percolates into the groundwater of the San Gorgonio Hydraulic Unit. Groundwater from this basin is used for municipal, industrial, and agricultural applications.

The WWTP consists of preliminary treatment, primary treatment, secondary treatment, solids handling, disinfection (currently not in use), and evaporation/percolation ponds. The preliminary treatment system consists of a mechanical bar screen, compactor, grit removal system, and cyclone separator. Effluent from the preliminary treatment system is gravity fed to two primary clarifiers. Primary effluent is pumped to two trickling filters, each rated for 1.8 MGD. The trickling filter effluent is sent to two secondary clarifiers. Secondary effluent flows through a chlorine contact chamber and is then discharged to the evaporation/percolation ponds. Primary and secondary sludge is processed via two primary anaerobic digesters. A second-stage digester is currently used as a sludge holding tank before dewatered sludge is sent to the sludge drying beds. Sludge is allowed to dewater and then is hauled offsite for final disposal. A gravity thickener was used to thicken secondary sludge but is currently not in service. An overall process schematic of the existing WWTP is shown in Figure 1.

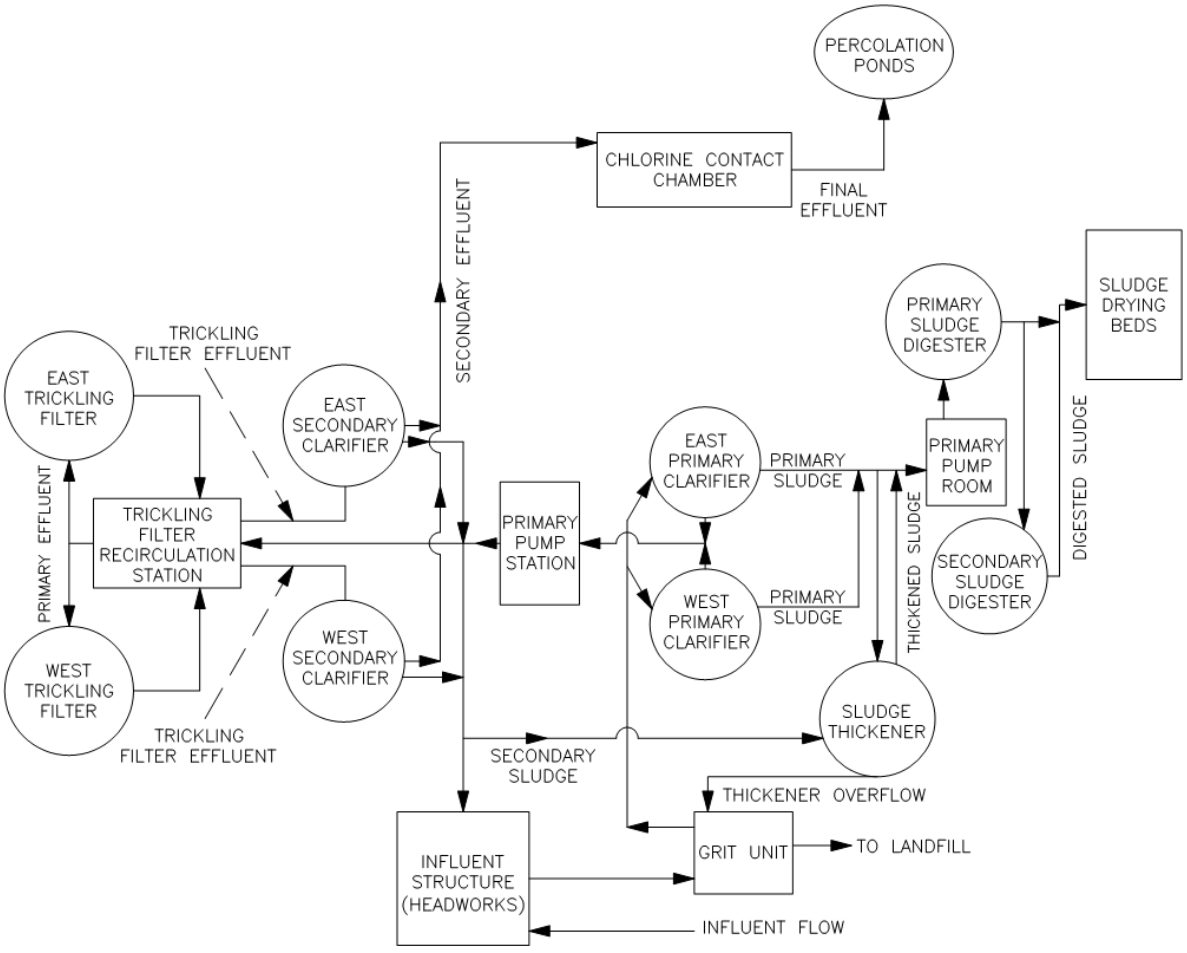

Figure 1. Process schematic for existing WWTP

2.2. Previous Efforts

In 2007, the City contracted Parsons to evaluate treatment technologies for a 1.5 MGD water reclamation facility (WRF) for the production of recycled water. Treatment alternatives investigated included oxidation ditch (OD), conventional activated sludge (CAS), and membrane bioreactor (MBR). The purpose of the evaluation was to determine the best option to comply with future Title 22 requirements for the beneficial reuse of recycled water. Parsons determined an MBR system was the best treatment option and completed a 90% design package of the WRF. However, the final design and construction of the WRF were terminated due to other pressing City needs and the desire to prepare for future population growth in the area.

In 2013, ZW3, Inc. performed a condition assessment evaluation of the unit operations, equipment, structural, and electrical components of the WWTP. The assessment estimated the

remaining lifetime of the existing unit treatment processes before preforming any major upgrades. It was determined that while several components of the WWTP are nearly 50 years old, process and structural components are performing adequately and are expected to remain operational for several more decades. Additionally, the facility and treatment system produce effluent that complied with permit limits.

In 2015, Carollo Engineers assessed the viability of producing recycled water by expanding the existing WWTP or constructing a satellite plant at or near the Rancho San Gorgonio Development. Carollo considered treatment alternatives, including upgrading the facility to a 3.6 MGD tertiary filter treatment system and constructing a 1.5 MGD MBR facility and a 1 MGD satellite treatment facility. The estimated capital and operation and maintenance (O&M) costs only considered the planning stage, and did not include nitrogen removal by the treatment processes.

Since both the 2007 Parson and 2015 Carollo studies evaluated the use of an MBR treatment system, the City would like to update the cost estimates based on new design considerations and improvements to the MBR technology. A comparison of the capital, annual O&M, and life cycle costs from the Parson and Carollo reports is shown in Table 1.

Table 1. Cost comparison of previous MBR studies to treat 1.5 MGD

2007 Parson Study			**2015 Carollo Study**
Cost Type	**Hollow Fiber MBR**	**Flat Sheet MBR**	**MBR**
Construction Cost	**$14,628,000**	**$14,395,000**	**$9,200,000**
Annual O&M Costs			
Power	$250,000	$230,000	-
Chemical	$59,000	$59,000	-
Maintenance and Replacement	$165,000	$145,000	-
Total O&M Cost	**$474,000**	**$434,000**	**$760,000**
Life Cycle Cost	**$21,678,000**[1]	**$20,837,000**[1]	**$28,614,000**[1]

[1] Life Cycle cost was calculated based on a 3% interest rate and 20 years of the return period.

2.3. Regional Water Quality Control Board Order

On June 30, 2016, the California Regional Water Quality Control Board adopted Board Order R7-2016-0015, which describes the Waste Discharge Requirements (WDRs) and other terms and conditions of operation for the WWTP. The Board Order requires the WWTP to remove constituents that present the greatest risk to groundwater quality such as nitrogen, coliforms, and total dissolved solid (TDS). According to the United States Environmental Protection Agency (US EPA), the maximum contaminant level (MCL) for Nitrate as Nitrogen is 10 mg/L. Per the Board

Order, it is assumed all nitrogen available converts to nitrate/nitrite so Total Nitrogen (TN) is used as the measurement of concern. The wastewater effluent limitations per the Board Order are outlined in Table 2.

Table 2. WWTP effluent limitations per Board Order R7-2016-0015

Parameter	30-Day Average	7-Day Average
20°C BOD_5	30 mg/L	45 mg/L
TSS	30 mg/L	45 mg/L
pH	6.0 - 9.0	
30-Day Daily Dry Weather Discharge	< 3.6 MGD	
DO	Upper Zone of the Ponds > 1.0 mg/L	
TDS	Not to Exceed 300 mg/L of the Water Supply	
TN*	10 mg-N/L	

*City does not need to comply with this limit at this time

Currently, the average TN concentration in the WWTP's effluent is 29 mg-N/L, well above the future TN limit of 10 mg-N/L specified in Board Order R7-2016-0015. As a result, the Board Order requires the City to conduct a nitrogen removal analysis and summarize the findings in a technical report that includes a tentative work plan and time schedule for the installation and implementation of nitrogen removal treatment alternatives. The final technical report is required to be submitted to the Regional Control Board by June 30, 2020.

2.4. Title 22 Requirements

Water recycling has been proven to be effective and successful in creating a new and reliable water supply without compromising public health. Non-potable reuse is a widely accepted practice and is used to accommodate the needs of the growing water supply demand. Although the initial investment for the construction of water recycling systems can be significant, water recycling and reuse is a sustainable, cost-effective approach for long term applications.

The City is interested in utilizing WWTP effluent for beneficial non-potable reuse applications such as agriculture, landscape, public parks, and golf course irrigation. However, the WWTP effluent, based on the Self-Monitoring Report data from 2011 – 2015, does not comply with California's water recycling criteria outlined in Title 22, Code of Regulations. To comply with Title 22 requirements, the effluent must meet the following requirements:

- Average daily turbidity less than 2 nephelometric turbidity unit (NTU); approximately 3 – 5 mg/L TSS.

- Effluent cannot exceed 5 NTU more than 5% of the time.
- Effluent cannot exceed 10 NTU at any time.
- Coagulant must be added if the influent to the filter exceeds 5 NTU for more than 15 minutes, or 10 NTU at any time.
- The disinfection process must provide a chlorine residual that provides 450 milligram-minutes per liter (mg-min/L) under minimal modal contact time (CT) of 90 minutes.
    - This corresponds to a residual of 5 mg/L or less, or any process that achieves 5-log virus removal.
- Total coliform cannot exceed the average most probable number (MPN) of 2.2 per 100 milliliters (mL).
- No more than one sample per month can exceed an MPN of 23 per 100 mL.

The WWTP currently discharges 29 mg/L TN and 21 mg/L TSS. In order to use recycled water, the City will be required to improve the removal efficiency of the existing WWTP to comply with the TN, turbidity, and disinfection requirements. The project will ensure the proposed treatment system comply with Title 22 requirements for disinfected tertiary recycled water, while optimizing the treatment process to minimize capital and operating expenses, environmental impacts, and community impacts.

3. WASTEWATER CHARACTERIZATION

The wastewater characteristics, including biochemical oxygen demand (BOD_5), total suspended solids (TSS), TDS, pH, and temperature, are based on the Annual Operations Monitoring Reports from January 2015 – September 2018 and are summarized in Table 3. Raw wastewater quality data for TN, total kjeldahl nitrogen (TKN), and ammonia nitrogen (NH_3-N) were measured separately in March 2019. These wastewater characteristics were used in sizing the treatment units during the evaluation of nitrogen removal alternatives and the estimation of sludge productions.

Table 3. Wastewater characteristics

Parameter	Unit	Raw Wastewater	Primary Effluent		Plant Effluent
			% Removal	Concentration	
BOD_5[1]	mg/L	320	30	224	24
TSS[1]	mg/L	288	50	144	20
TDS[1]	mg/L	420	-	420	437
pH[1]	-	7.5	-	7.5	7.5
Temperature[1]	°F	76	-	76	70
TN[2]	mg/L	45	6	42.3	29
TKN[2]	mg/L	45	6	42.3	19
NH_3-N[2]	mg/L	38	0	38	8.4

[1] Data per 2015 – 2018 Annual Operations Reports.
[2] Data per March 2019. It is currently not regularly measured.

3.1. Sources of Nitrogen

The sources of wastewater discharged to collection systems are typically from residential areas, commercial, institutional, recreational, and industrial facilities. Nitrogen in the wastewater entering the WWTP is primarily domestic in nature, and from a few industrial facilities within the City. Although WWTPs cannot completely remove all nutrients or other constituents from the influent wastewater, their final concentration can be decreased by reducing pollution that comes from these sources. To estimate the nitrogen load contributed from domestic and industrial sources, the total flow must be estimated for each source.

For residential areas, the wastewater flow rate is primarily a function of the population. According to the California Department of Finance report released in May 2019, the City of Banning has a population of 31,044 people. Using the Metcalf and Eddy Wastewater Treatment

and Reuse Guidance Book, standard demand factors are used to estimate the average wastewater flow rate contributed from residential sources. The estimated average wastewater flow rate, expressed in gallons per day (gpd), from the City assuming most of the homes in the City are older homes is presented in Table 4.

Table 4. Estimated wastewater flow from City population

Residential Wastewater Flow				
Description	**Quantity**	**Units**	**Flow/Unit**	**Base Flow (gpd)**
Population	31,044	people	50	1,552,200
Miscellaneous	15%	-	-	232,900
			Subtotal	**1,785,100**

Industrial discharge is monitored at various locations and submitted to the City in accordance with local and federal requirements. Currently, industrial discharge requirements do not have wastewater nitrogen limitations. Presently, the City regulates industrial discharge from two businesses within City limits.

- **San Gorgonio Memorial Hospital (SGMH)** – Located on the westside of Banning. The hospital complies with the Non-Significant Industrial User Discharge Permit. SGMH has two clinics: behavioral health services, as well as an outpatient cardiac rehabilitation clinic located within the hospital, and is licensed for a total of 79 inpatient beds.
- **Larry D. Smith Correctional Facility** – Located in South Banning is classified as a Class I Non-Categorical Significant Industrial User. The Facility's Riverside County staff report issued on June 2011, states that the Correctional Facility has more than 1,500 beds and also contains a laundry facility.

Wastewater flow rates from each facility are determined based on the industrial discharge type and the design daily flow rates. Table 5 and Table 6 are the estimated wastewater baseflow for SGMH and the correctional facility, respectively. The quantity of each facilities' flow-generating components is estimated according to facility size, type, and typical wastewater flowrates for various industrial activities. Allen Industrial Facility was excluded from the calculations due to the non-significant discharge volume.

Table 5. Estimated wastewater flows for San Gorgonio Memorial Hospital

San Gorgonio Memorial Hospital				
Description	**Quantity**	**Units**	**Flow/Unit**	**Base Flow (gpd)**
Hospital, medical	61	Bed	300	18,300
	31	Employee	10	400
Hospital, mental	18	Bed	150	2,700
	9	Employee	10	100
Miscellaneous	15%	-	-	3,300
			Subtotal	**24,800**

Table 6. Estimated wastewater flow for Larry D. Smith Correctional Facility

Correctional Facility				
Description	**Quantity**	**Units**	**Flow/Unit**	**Base Flow (gpd)**
Correctional facility	1,500	Inmate	120	180,000
	100	Employee	10	1,000
Miscellaneous	15%	-	-	27,200
			Subtotal	**208,200**

The estimated nitrogen mass contribution from domestic wastewater is typically found by multiplying the average wastewater flow rate by a factor of 13 – 14.3 grams of nitrogen per capita per day. The estimated nitrogen load contributed from domestic and industrial sources, and the nitrogen load calculated from the current average flow rate and nitrogen water quality data is shown in Table 7. The difference between the estimated versus actual data can be contributed to flow/load variance, natural losses, and dilution in the collection system.

Table 7. Estimated nitrogen contribution from wastewater sources

Parameter	Residential	SGMH	Correctional Facility	Total Estimated	*Current Data*
Wastewater Flow (gpd)	1,785,100	24,800	208,200	2,018,100	*2,070,000*
TN Load (lb/day)	934	3.31	48	986	*777*
TN Concentration (mg/L)	63	16	28	59	*45*

4. PRELIMINARY SCREENING OF OPTIONS

In this technical memorandum, a systematic naming convention is used to label the process/unit operation categories that make up the different liquid treatment systems. The use of "Alternatives" represents the complete wastewater treatment system and is comprised of a combination of "Stages" that maintain individual "Options". The wastewater treatment system was divided into the following three stages for evaluation:

- Biological
- Tertiary Filters
- Disinfection

A preliminary list of viable treatment options that comply with Title 22 requirements was developed for this evaluation. General information and illustrations for each option are given below. Internal brainstorm sessions were conducted to analyze the feasibility of various options, and to develop treatment alternatives for preliminary design.

4.1. Biological Treatment

Biological systems refer to the secondary treatment stage of wastewater unit processes. The focus of this evaluation was to determine the performance of each treatment option on the removal of BOD_5, TN, and TSS. The eleven biological treatment options are presented in Table 8.

Table 8. Biological treatment process options

Biological Treatment Option	Abbreviation
Trickling Filter	TF
Denitrification Filter	DF
Oxidation Ditch	OD
Conventional Activated Sludge	CAS
Integrated Fixed-Film Activated Sludge	IFAS
Moving Bed Biofilm Reactor	MBBR
Membrane Bioreactor	MBR
Sidestream Treatment	ST
Biologically Active Filtration	BAF
Natural Treatment Systems	NT
Passive Aeration Rock Filters	PARF

4.1.1. Trickling Filter

Trickling Filters are currently utilized by the City at the WWTP. TF, shown in Figure 2, is an aerobic attached growth process used for secondary treatment. It consists of a tank filled with different types of media such as crushed stone, rocks, or plastic materials ranging in size from 2 – 4 inches. Wastewater is distributed by a rotary distributor arm over the top area of a vessel containing non-submerged packing material. As the wastewater trickles through the bed, microbial growth on the media forms a biofilm. The organic material in the wastewater is degraded by microorganisms attached to the biofilm. Some of the ammonia nitrogen in the wastewater is oxidized by nitrifying bacteria to nitrate or nitrite nitrogen. An essential element of the trickling filter design and operation is the recirculation of effluent to the filter media for process optimization and increased treatment performance.

There are four basic trickling filter types: low-rate, intermediate-rate, high-rate, and roughing filters. Low-rate filters are loaded at less than 40 kg BOD_5 per day. The residual solids are usually well digested, producing a higher quality secondary effluent. Intermediate-rate filters are loaded up to 64 kg BOD_5 per day. This system requires wastewater recirculation to ensure sufficient effluent quality. High-rate filters have a maximum organic load, ranging from 64 – 160 kg BOD_5 per day. In this system, a secondary filtration stage is required to achieve effluent standards. Roughing filters are typically loaded from 160 – 480 kg BOD_5 per day. Overall, low-rate and high-rate trickling filters achieve the highest organic removal rates.

Figure 2. Trickling filters at the City WWTP

Advantages	Disadvantages
• Simplicity in biological operation • Low energy requirements • Low maintenance requirements • Low sludge production • Appropriate for small and medium sized communities • No problems of sludge bulking in secondary clarifiers • Improved sludge thickening abilities • Durable process elements	• Low loading rate requirements depending on media • Diffusion limitations and possibility of mass transfer • Higher BOD_5 and solid concentrations in the effluent • Issues with biofilm maintenance due to excess sloughing • Odor problems • Low efficiency at cold temperatures

4.1.2. Denitrification Filter

Denitrification filtration, shown in Figure 3, is a commonly employed method to reduce the TN and suspended solids via attached growth processes. The attached biofilm converts nitrite and nitrate (NO_x) to nitrogen gas with the addition of a carbon source, such as glycerol or methanol, to stimulate the denitrification process. There are two main configurations of denitrification filters: downflow and upflow packed-bed reactors. Downflow denitrification filters operate in a conventional filtration mode. Wastewater flows through a downflow filter over weirs along the length of the filter bed on both sides. During this process, nitrate is converted to nitrogen gas under anoxic and anaerobic conditions by autotrophic bacteria that are attached to the filter media. Backwashing is required at regular intervals. In upflow denitrification filters, influent flows upward through the filter media and is slowly drawn into an airlift pipe in the center of the filter. Compressed air is added to the filter to draw media up and scour the biofilm off. Continuous backwash or reject is required. Typical medias used for denitrification filters include mono-media granular sand, gravel, or silica. An external carbon sourced is typically dosed in the denitrification filter influent.

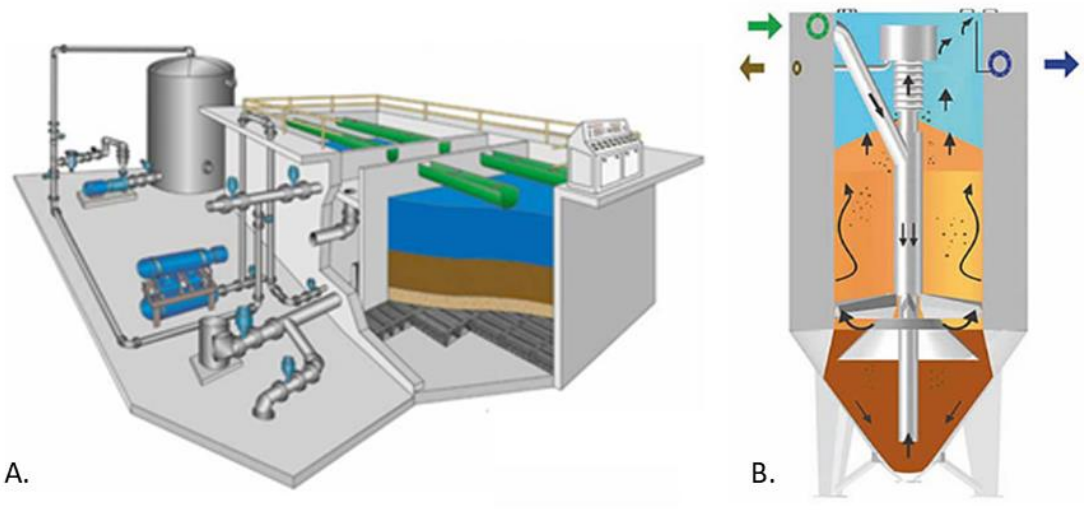

Figure 3. (a)Downflow and (b)Upflow Denitrification Filter (courtesy of ITT Leopard and Dynasand

Advantages	Disadvantages
• Effective total nitrogen, solids, phosphorus, and BOD_5 removal • Operational flexibility • Small footprint	• High chemical addition costs • Additional pump station • Upflow denitrification filters have high energy costs due to continuous backwashing

4.1.3. Oxidation Ditch

Oxidation Ditches, shown in Figure 4, is a type of modified activated sludge process that utilizes long solid retention times (SRT) to accomplish organic and nitrogen removal. Oxidation ditches are configured in a single or multi-ring, oval, or horseshoe-shaped basin. Aerators are equipped to provide circulation, oxygen transfer, and aeration in the basin. Wastewater flows continuously in one direction to create a mixed system.

Screened influent enters the oxidation ditch, is aerated and mixed with the return activated sludge, and effluent is settled in a secondary clarifier. The system can operate in an extended or conventional aeration mode. Tertiary filters may be required when discharge requirements are more stringent. This process is suitable for use in small and medium communities with large land areas. The oxidation ditch is typically designed to achieve both BOD_5 and nitrogen removal via nitrification/denitrification (N/DN). Primary settling is not required.

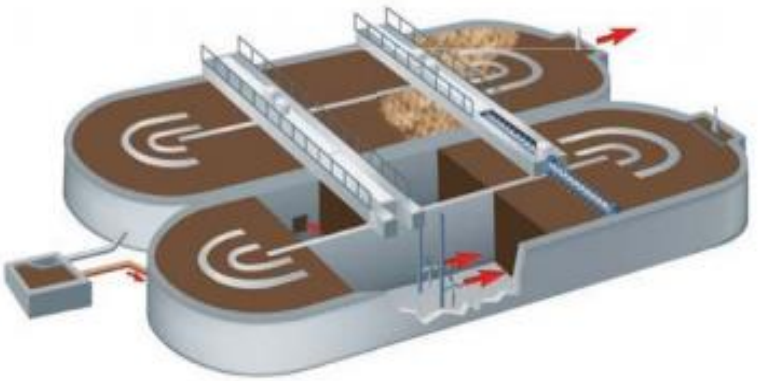

Figure 4. Oxidation Ditch (courtesy of Veolia)

Advantages

- Highly reliable and operational simplicity
- Low maintenance costs
- Well-stabilized sludge
- Capable of treating shock/toxic loads without affecting effluent quality due to long SRT time and complete mixing
- Adaptable for N/DN

Disadvantages

- Larger footprint requirements compared to other activated sludge treatment options
- Higher effluent suspended solids
- Unable to treat sustained highly toxic waste streams
- Requires more energy consumption than conventional treatment

4.1.4. Conventional Activated Sludge

The conventional activated sludge process, shown in Figure 5, is a biological wastewater treatment system where various microorganisms growing as suspended flocs, called mixed liquor, degrade organic matter in the wastewater. The mixed liquor settles in the secondary clarifiers, effluent is discharged for further treatment, and the microorganisms are recirculated back to the bioreactor as return activated sludge (RAS). Oxygen is provided by blowers and diffusers to facilitate the growth of microorganisms. Excess sludge is wasted so that the system can be operated at a target solids retention time.

The conventional activated sludge process can be modified for biological nitrogen removal. This is accomplished by dividing the bioreactor into the aerobic zone and anoxic zone (where no oxygen is provided). Ammonia in the wastewater is oxidized to nitrite and nitrate in the aerobic zone, whereas nitrate and nitrite are denitrified to nitrogen gas in the anoxic zone. In the modified Ludzack-Ettinger (MLE) configuration, the anoxic zone is placed upstream of the aerobic zone. Nitrate and nitrite are recirculated back to from the end of the aerobic zone to the anoxic zone for denitrification. Other configurations, such as the step-feed activated sludge process, have also been used successfully for nitrogen removal.

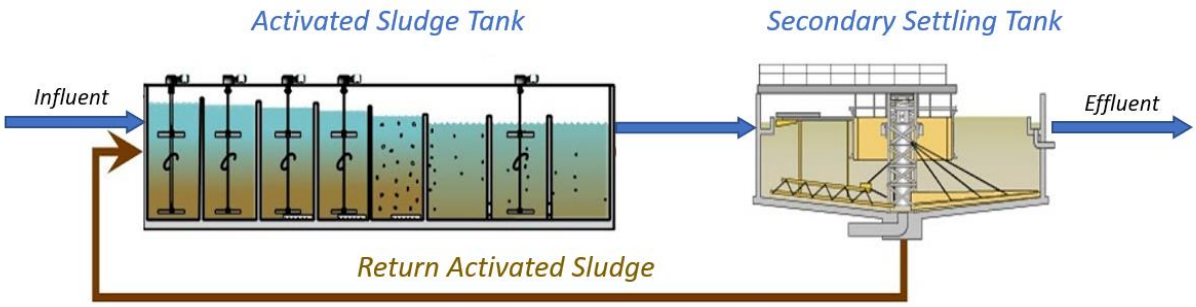

Figure 5. Conventional activated sludge flow diagram

Advantages

- Plenty of operating experience
- Uniform mixing in aeration tanks
- High oxygen transfer efficiency
- Solid and liquid stream separation
- High quality effluent

Disadvantages

- High operational cost
- Sludge disposal requirement
- Diffusers require regular cleaning

4.1.5. Integrated Fixed-Film Activated Sludge (IFAS)

An Integrated Fixed-Film Activated Sludge (IFAS) system, shown in Figure 6, contains fixed media that promote biofilm growth within conventional activated sludge systems. It operates in the same manner as the conventional activated sludge system. The primary difference between IFAS and conventional activated sludge is that IFAS systems allow for a greater density of bacteria populations to grow on the surface area of the media. The greater amount of biomass increases the treatment capacity of a basin. The fixed media's surface areas usually range from 50 – 300 m^2/m^3. IFAS achieves an increase in process reliability under conditions of variable mixed liquor, solids retention, and organic loading rates. IFAS systems require secondary clarifiers and sludge recycle, as in the conventional activated sludge process. However, because the mixed liquor suspended solids (MLSS) levels are lower in the bioreactor than those in the conventional activated sludge process, the size of the secondary clarifiers can be reduced.

While a conventional activated sludge process is typically designed and operated at SRTs ranging from 12 to 18 days to achieve nitrification with water temperatures between 10 and 15 °C, an IFAS system achieves nitrification typically with SRTs of 4 – 5 days, even with the temperature at approximately 10 °C.

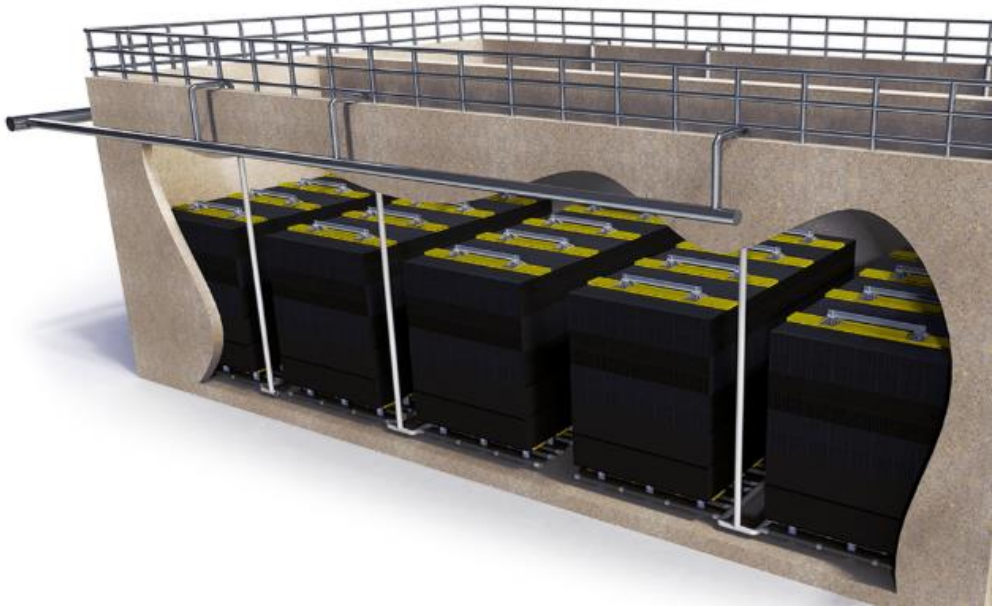

Figure 6. IFAS (courtesy of Brentwood)

Advantages	Disadvantages
• Increased capacity of the activated sludge without increasing tank volume • Increased process stability • Reduced clarifier loading • Low construction costs	• High oxygen demand requirements • Accumulation of debris in IFAS cells • Foaming issues • Cost of the media

4.1.6. Moving Bed Biofilm Reactor (MBBR)

The moving bed biofilm reactor (MBBR) process, shown in Figure 7, is a biological treatment process that was developed by combining the conventional activated sludge system and suspended biofilm carrier media. This process incorporates polyethylene or other material media that provides surface area for the growth of heterotrophic and autotrophic bacteria biofilm in uniformly mixed tanks. The MBBR contains media with the surface area of ranging from 400 – 600 m^2/m^3. A final clarifier is used to remove suspended solids and to produce a clarified effluent. Settled sludge can be returned to the bioreactor if necessary.

MBBRs may be used for aerobic, anoxic, or anaerobic processes. The system can handle high organic loads and high substrate concentrations. Nitrification rates are influenced by the organic load, dissolved oxygen (DO) concentration, ammonium nitrogen concentration, temperature, pH, and alkalinity in the reactor.

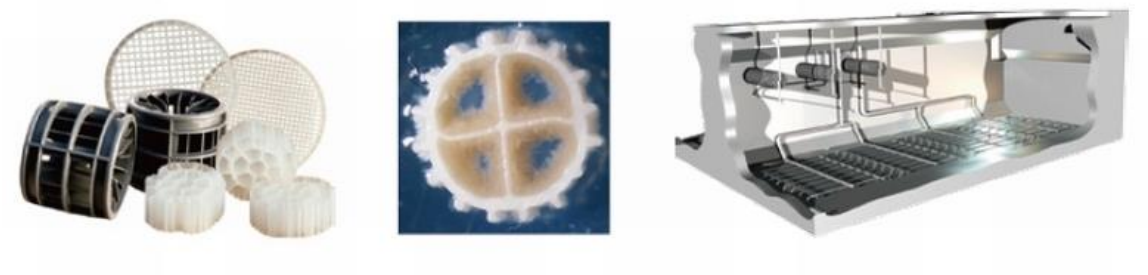

Figure 7. MBBR system components (courtesy of Veolia)

Advantages	Disadvantages
• Backwash is not necessary • A high specific biofilm surface area • Continuous operation of the reactor without clogging • Ability to increase the plant capacity without expansion of existing reactor volume • Easy to operate • Stable operation at low temperature • Long life expectancy of biofilm media carriers	• Media can wash out over time; regular cleaning of effluent screens • Longer start up time requirement • Bacterial activity has to be monitored periodically • Cost of the media

4.1.7. Membrane Bioreactor (MBR)

Membrane Bioreactors (MBRs), shown in Figure 8, consist of a biological reactor with suspended biomass and solids separation by microfiltration or ultrafiltration membranes with the nominal pore size ranging from 0.07 – 2.0 µm and 0.008 – 0.2 µm, respectively. MBRs can be operated at higher MLSS concentrations (8,000 – 12,000 mg/L), as a result, the reactor size is reduced. Solids liquid separation is accomplished with membranes instead of clarifiers. There are two fundamental arrangements of MBRs: (1) integrated systems that have membranes immersed in an activated sludge reactor and (2) separate systems that have a membrane module placed outside the reactor. Immersed MBRs typically use hollow fiber membranes that operate at lower pressures, accommodate various types of biosolids, concentrate biosolids without settling concerns, and have lower life-cycle costs. Separate systems are typically pressure driven and the membranes are in a stand-alone tank. Properly configured, the MBR process removes nitrogen similar to the activated sludge process.

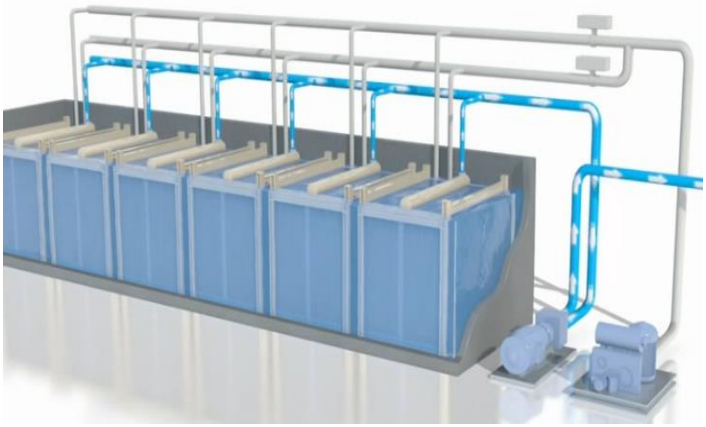

Figure 8. MBR Facility (courtesy of KY OCP)

Advantages	Disadvantages
• Higher MLSS concentrations therefore a small footprint • Less sludge production due to longer SRT design • High effluent quality • No secondary sedimentation is needed	• High capital costs (membranes) • High energy costs compared to the conventional process due to membrane scouring • Limited time on membrane life • High cost membrane replacement

4.1.8. Sidestream Treatment

Most WWTPs return sludge dewatered liquid (filtrate of centrate) generated from the sludge treatment processes to the headwork of the plant. This sidestream can contain elevated levels of ammonia nitrogen if sludge is anaerobically digested. The ammonia mass loading of the sidestream can account for 15 to 25 percent of the total nitrogen load that has to be treated by the biological process. In recent years, advances have been made to effectively remove nitrogen from the sludge dewatering sidestream using the ammonia oxidizing bacteria (AOB) and the anaerobic ammonia oxidizing (Anammox) bacteria. In this process, some of the ammonia nitrogen is partially oxidized to nitrite nitrogen by the AOB, the Anammox bacteria then use the nitrite nitrogen as electron acceptor and the remaining ammonia nitrogen as electron donor to form nitrogen gas. No carbon source is necessary for the process. Because Anammox bacteria grow slowly, there is no significant sludge produced from the process that needs to be managed. Additionally, oxygen required is significantly lower than the conventional nitrification process.

There are three major technology providers for the process: Kruger/Veolia (ANITA™Mox), Ovivo (AnammoPAQ™), and World Water Works (DEMON®). These systems operate in either batch or continuous flow configurations, with anammox bacteria attaching to a surface or floating freely

as granules. The process operates similarly to the MBBR and IFAS processes. An example of the anammox treatment system is shown in Figure 9.

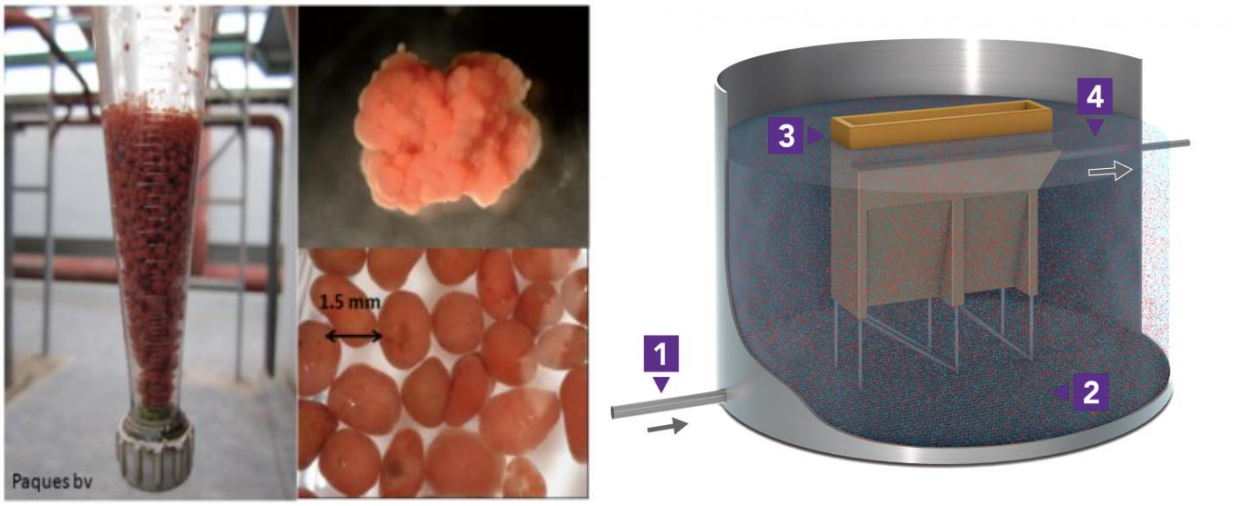

Figure 9. Sidestream anammox treatment systems (courtesy of Veolia and Ovivo)

Advantages

- No external carbon addition
- Reduced energy for aeration
- Less sludge production
- Lower alkalinity demands
- Cost effective compared to conventional biological nutrient removal systems

Disadvantages

- Slow growth of Anammox bacteria
- Sensitive to nitrite, oxygen, and ammonia concentration and other environmental conditions (temperature, pH)
- Tight process controls
- High cost of anammox bacteria

4.1.9. Biologically Active Filter

Biologically Active Filter (BAF) systems, shown in Figure 10, remove contaminants by three main mechanisms: biodegradation, adsorption, and filtration. They can combine ammonia, carbonaceous matter, and solids removals in a single unit. Microorganisms attach to the filter media creating a biofilm that consumes organic matter and nitrifies ammonia nitrogen. BAFs utilized for denitrification are fed a form of carbon (i.e. acetic acid, methanol) and use nitrate as an electron acceptor in place of oxygen.

In a BAF, influent flows either upwards or downwards through tanks that are filled with media. Granular activated carbon is often used as the media to promote biofilm growth. The size of the granular media affects the efficiency of wastewater treatment in terms of solids and nutrient removal. For example, medias with large diameters (6 mm) reduce available space for biofilm growth, while small diameter medias facilitate higher filtration efficiency, but require more

frequent backwashing. BAF units are typically used as a polishing step after conventional treatment and are utilized to remove micropollutants and suspended solids. Clarifiers are not required in the BAF system.

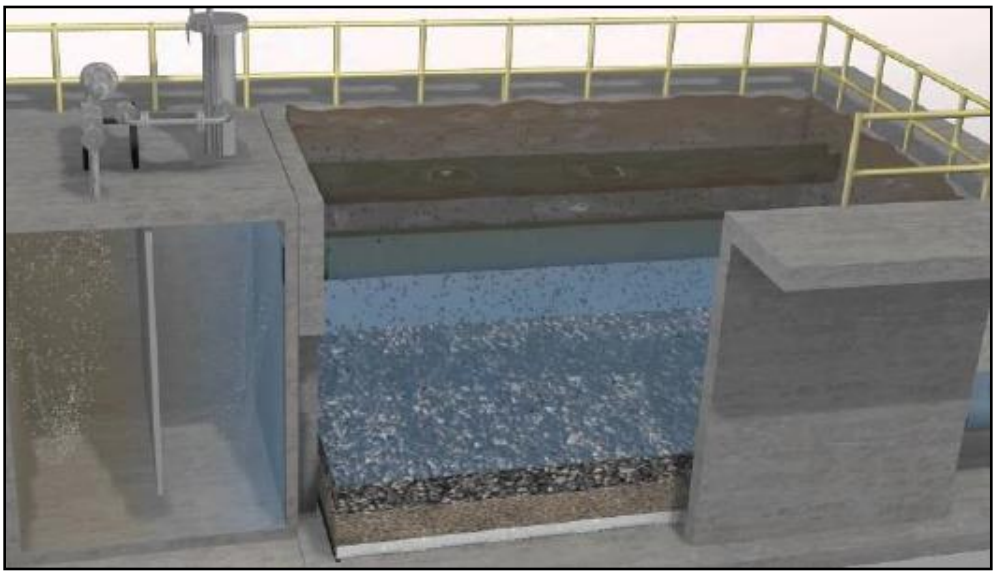

Figure 10. BAF layout (courtesy of Leopard)

Advantages	Disadvantages
• Fully automated operation • Capable of handling varied flow and temperature fluctuations • Cost effective due to the elimination of secondary clarifiers • Ability to control odor • Better contaminant removal than conventional filtration • Reduction of residual solid production	• Optimization for media type is required • Higher costs due to automated valves and on-line instrumentation • Higher operational costs due to external carbon source for denitrification

4.1.10. Natural Treatment Systems

Natural treatment systems such as constructed wetlands, shown in Figure 11, promote the breakdown of contaminants via natural processes such as photodegradation, biological and chemical transformation, and physical removal mechanisms. Plant species, media types, and optimal operating parameters (water depth, hydraulic load, and retention time) are all crucial influencing factors to the removal performance of constructed wetlands. The removal mechanisms for nitrogenous compounds in constructed wetlands are sedimentation, adsorption,

volatilization, microbial uptake and transformation, and plant uptake. Nitrate will either be absorbed by plants and microbes and converted to biomass through assimilation, or it will undergo denitrification in the anaerobic zone at the bottom of the wetland. The highest rate of nitrogen removal is observed during the growing season where up to 3.3 g-N/m^2-yr have been estimated for uptake by emergent wetland plants. Other case studies have shown up to 70% TN removal.

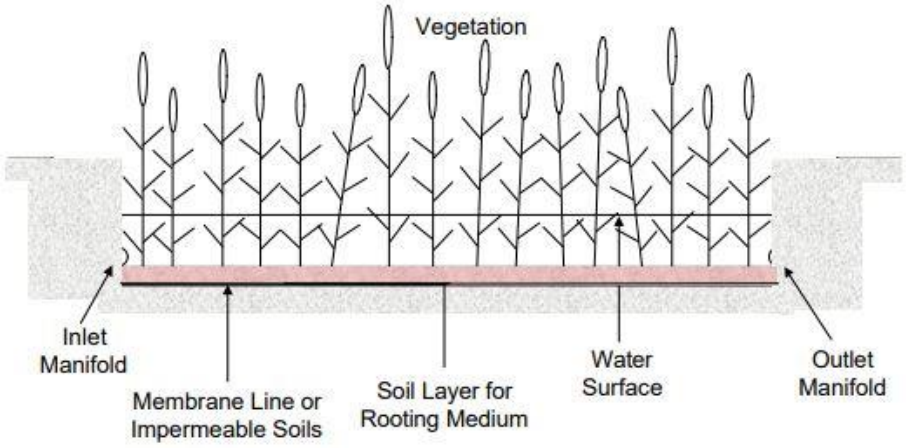

Figure 11. Schematic of a natural treatment system

The City can retrofit unused percolation/evaporation ponds for constructed wetlands. The bulk of the capital costs needed would be to perform earthwork and grading in order to create wetland cells, purchase of wetland vegetation, and install flow control structures. Effluent can be discharged via the remaining percolation ponds or connected to distribution lines for water reuse. Additionally, wetlands are less expensive to operate and maintain since mechanical equipment, energy, and skilled operator requirements are reduced compared to conventional treatment systems.

Advantages

- Ease of construction
- Low O&M costs
- Habitat for wildlife
- Reliable treatment under fluctuating loading rates

Disadvantages

- Requires preliminary treatment
- Large footprint area
- Long retention time
- Pests and vector control

4.1.11. Passive Aeration Rock Filters

Passive aeration rock filters, shown in Figure 12, is a relatively new method using passive aeration attached growth for biological degradation. Wastewater is filled and drained through subsurface flow basins to achieve passive aeration. The system is comprised of two flow basins with gravel

media that alternate between fill and drain cycles. This process allows for uniform mixing and has the ability to treat high nitrogen loads to tertiary effluent quality levels. The unique pumping configuration in the basin can allow for simultaneous N/DN. Prescreening and primary settling are recommended to prevent clogging and odor issues in the basins.

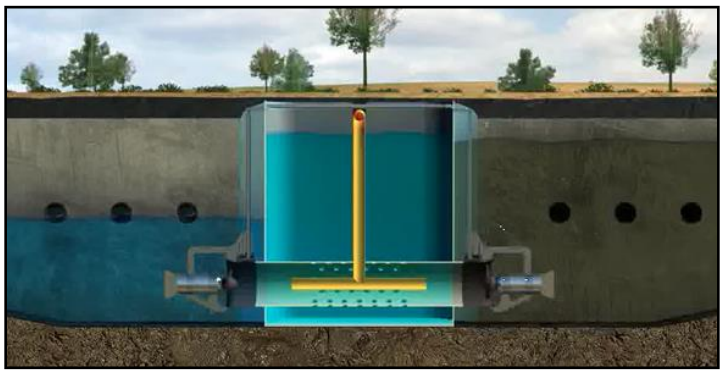

Figure 12. The flow control structure of passive aeration rock filter (courtesy of Triple-T)

Advantages	Disadvantages
• High degree of nitrogen removal	• Relatively new technology
• Low energy consumption	• Large footprint area
• Low O&M costs	• Smaller flow installations
• Low sludge production	

4.1.12. Treatment Process Selection Criteria

Capital and O&M costs, regulatory compliance, and treatment performance are the main design parameters to evaluate potential treatment options. However, there are several other factors that may affect the City's decision in selecting a treatment process, such as permitting, construction schedule, process robustness, footprint, ease of operation, monitoring requirements, and consumables. All of these factors are considered in evaluating which treatment process will yield most benefit for the City.

Process evaluation and selection have been performed by using a paired comparison analysis to weigh the relative importance of each selection criterion. During this analysis, one criterion is judged to be more important than, of equal importance to, or less important than one other criterion. Comparing only two criteria at a time simplifies the evaluation and minimizes ambiguity in the weighting process. For example, if criterion A (applications) is compared with criterion B (startup time), and B is more important than A, B is then listed in the weighting table.

A mathematical formula was used to convert the paired comparison selections to a relative weight factor for each criterion, rather than randomly assigning values. Table 9 illustrates the

comparison analysis and the relative weights of twelve criteria that our team developed for the biological treatment options.

Table 9. Process selection criteria and weighting factors for biological treatment options

	Criteria	Priority												Weight
		A	B	C	D	E	F	G	H	I	J	K	L	
A	Demonstrated in Previous Applications		A	C	D	A	F	A	H	I	A	K	L	6%
B	Start Up Time			C	D	B	F	G	H	I	J	K	L	2%
C	Constructability				D	C	F	C	H	I	C	K	C	9%
D	Operational Complexity					D	F	D	H	D	D	K	D	12%
E	Treatment Complexity						F	G	H	I	E	K	L	2%
F	Regulatory Compliance							F	F	F	F	F	F	17%
G	Process Robustness								H	I	G	K	L	5%
H	Capital Cost									H	H	H	H	15%
I	O&M Cost										I	K	I	11%
J	Environmental Impacts											K	L	2%
K	Effluent Water Quality												K	14%
L	Footprint													8%

Each option was assigned an absolute score of 1 to 5 per criterion. These scores were multiplied by the relative weight of a given criterion and then summed for each process. Scores and weighting factors were determined by the project team and City staff. Table 10 presents the relative weights of the criteria along with the individual and total scores for the options based on a 1 – 5 scale.

Table 10. Biological treatment options weighted scores

Weighted Scores

4.1.13. Options Eliminated

Based on the results of the paired comparison analysis, the following six options were eliminated from further analysis: Denitrification Filter (DF), Oxidation Ditch (OD), Sidestream Treatment (ST), Biologically Active Filtration (BAF), Natural Treatment Systems (NT), and Passive Aeration Rock Filters (PARF). Brief reasons for the elimination of these options are provided in Table 11.

Table 11. Biological treatment option elimination reasoning

Eliminated Option	Reason for Elimination
Denitrification Filter	▶ Capital cost is higher than MBBR or IFAS systems while not providing much better effluent water quality. Requires additional carbon source for nitrogen removal which increases O&M costs.
Oxidation Ditch	▶ Operates similar to conventional activated sludge systems, but does not provide significant treatment improvements or cost savings.
Sidestream Treatment	▶ Sidestream treatment may not achieve nitrogen discharge limits; therefore, improving the mainstream system is needed. Sidestream treatment is optimal for larger municipal facilities where space is limited and O&M costs are prohibitive.
Biologically Active Filter	▶ It requires upstream treatment units to prevent clogging. Typically used as a polishing step or for smaller wastewater systems.
Natural Treatment Systems	▶ To comply with the effluent TN goal of 10 mg/L, the system must be at least 90 acres. The City does not have enough land space to accommodate this large footprint.
Passive Aeration Rock Filters	▶ The typical largest installation is around 1.5 MGD. Very few installations in the United States. It does not provide significant improvement in effluent water quality compared to conventional treatment systems.

4.2. Tertiary Filters

Tertiary treatment options are used as a polishing step for wastewater to remove suspended, colloidal, and dissolved constituents. Advanced filtration is required when wastewater is discharged into receiving water bodies with stringent suspended solids effluent requirements or

reuse applications. The most common processes for tertiary filters are cloth media disk filters, pressurized sand filters, and gravity sand filters.

4.2.1. Cloth Media Disk Filters

Cloth media disk filters, as shown in Figure 13, utilize nylon, acrylic, and polyester pile fabric as the media to reduce TSS concentrations to below 5 mg/L. Additionally, disk filters have been used for membrane pretreatment and phosphorus removal. They are typically made of a series of disks mounted horizontally or vertically. Disk filters are completely submerged in tanks, and flow direction is dependent upon the method of solids removal. Disk filter footprints are very small compared to gravity sand filters; typically, 2 – 12 filters can be placed in one basin.

When disk filters are in operation, water enters the feed tank and flows through the filter cloth and a central collection tube. The filtered effluent is collected in a central tube and is discharged to the effluent channel. The solids accumulate on the medium, resulting in an increase of head-loss. After reaching a predetermined head loss level, disks are backwashed and the filter is put back into operation.

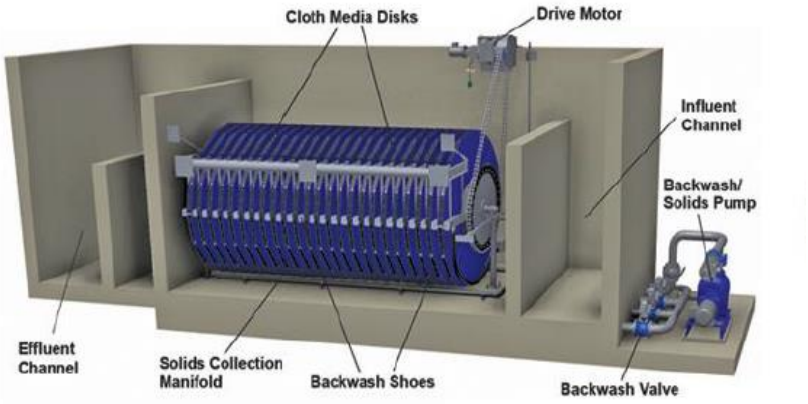

Figure 13. Disk Filter (courtesy of Aqua-Aerobics)

Advantages

- Simple operation
- High quality effluent
- Minimal head loss
- Fully automated operation
- Low backwash waste generation
- Low energy costs

Disadvantages

- Filters have a limited life span
- Filters can be designed to operate at slightly higher loading rates than sand/dual media filters.
- Fouling problem may occur due to chemical pretreatment processes used upstream such as polymer addition

4.2.2. Pressurized Sand Filters

Pressurized Sand Filters, shown in Figure 14, are an effective system to remove TSS and reduce turbidity in wastewater. Pressurized sand filters are deployed in vertical or horizontal pressurized steel tanks, and consist of multiple layers of sand, gravel, or anthracite in a variety of sizes and specific gravities. These systems have been proven to produce effluent water quality below 0.5 NTU. The amount of pressurized sand filters in series is dependent upon the flow of the system.

When pressurized sand filters are placed in operation, water flows through the filter bed where polymer is added to enhance removal mechanisms. Constituents in the wastewater are retained in and around the sand grains. Due to the accumulation of solids on the sand, head-loss increases and flow is reduced once an excess in pressure drop occurs across the filter. Pressurized sand filters are required to be backwashed or air scoured to prevent clogging and to maintain treatment performance.

Figure 14. Pressurized sand filters (courtesy of EPD USA Inc.)

Advantages	Disadvantages
• High efficiency in turbidity and TSS removal • Easy in O&M • Higher energy requirement than gravity filters	• Clogging issues due to fine sand • High backwash volumes

4.2.3. Gravity Sand Filters

Gravity Sand Filters, as shown in Figure 15, are an effective filtration method to remove pathogens and meet stringent effluent discharge permit requirements. Gravity sand filters are driven entirely under gravity force without any outside energy supply. The water level above the media forces the water through the sand filter media. The rate at which water passes through the gravity filters depends on the hydraulic loading rate and the medium used. Based on the loading rate, the gravity filters can be classified as slow sand filters, rapid sand filters, or high rate sand filters. Frequent backwashing is required at regular intervals.

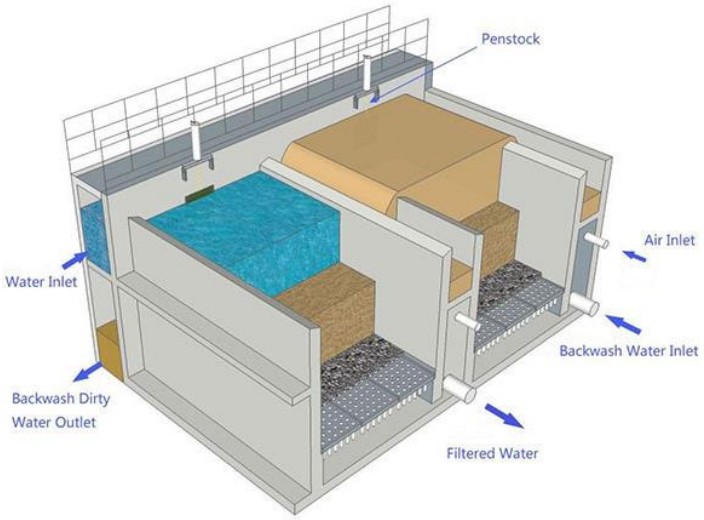

Figure 15. Gravity sand filters (courtesy of Khan Water Treatment Co., Ltd.)

Advantages

- High efficiency in turbidity and TSS removal
- Short cleaning time

Disadvantages

- High capital and operational costs
- Frequent cleaning (every 24 – 72 hours)
- Clogging and odor problems

4.2.4. Treatment Process Selection Criteria

The same methodology as discussed in Section 4.1.12 was utilized to compare the three tertiary filtration options. Table 12 illustrates the comparison analysis and the relative weights of five criteria that the project team and City staff developed for the tertiary filters. Table 13 presents the relative weights of the criteria along with the individual and total scores for the options based on a 1 – 3 scale.

Table 12. Process selection criteria and weighting factors for tertiary filter

	Criteria	Priority					Weight
		A	B	C	D	E	
A	Backwash Quantity		B	A	A	E	20%
B	Capital Cost			C	B	E	20%
C	O&M Cost				C	C	30%
D	Operational Complexity					D	10%
E	Space Requirements						20%

Table 13. Tertiary filter options weighted scores

Weighted Scores			
Selection Criteria	**Cloth Media Disk Filter**	**Pressurized Sand Filter**	**Gravity Sand Filter**
Safety	0.6	0.6	0.2
Capital Cost	0.4	0.4	0.4
O&M Cost	0.9	0.6	0.6
Operational Complexity	0.2	0.2	0.2
Effluent Water Quality	0.6	0.4	0.2
Total Weighted Score	**2.7**	**2.2**	**1.6**

4.2.5. Options Eliminated

Based on the results of the paired comparison analysis, the pressurized sand filter and gravity sand filter were eliminated from further analysis. Brief reasons for the elimination of these options are provided in Table 14.

Table 14. Tertiary filter options elimination reasoning

Eliminated Method	Reason for Elimination
Pressurized Sand Filters	▶ The system requires high backwash volumes.
Gravity Sand Filters	▶ The system requires a lower recovery than cloth media filter due to higher backwashing. a large footprint and additional pretreatment due to clogging affected by water impurities. Additionally, it has high capital and operational costs due to frequent backwashing.

4.3. Disinfection

Disinfection is the process of inactivating pathogens in water and wastewater. Title 22 specifies the required level of disinfection prior to reuse applications. Based on the existing configuration of the WWTP and proven disinfection technology for wastewater applications, the use of Sodium Hypochlorite, Chlorine Gas, and Ultraviolet were considered.

4.3.1. Sodium Hypochlorite

Sodium hypochlorite (NaOCl) is the most commonly used source of chlorine for the disinfection of municipal wastewater treatment plant effluent. NaOCl is available in liquid form with concentrations of 12.5% to 15% of available chlorine. The solution can be degraded when

exposed to sunlight and heat. Therefore, the sodium hypochlorite solution has to be stored in a corrosive resistant tank in a cool, dark place, as shown in Figure 16.

The required chlorine dose depends on water characteristics, contact time, and discharge requirements. Water temperature, alkalinity, and nitrogen content also affect chlorine disinfection efficacy. Ammonia reacts with chlorine to form chloramines which are less effective disinfectant than free chlorine. Any nitrite nitrogen as well as other reduced chemicals in the water will be oxidized by chlorine. Chlorine may also react with organic matter in the water to produce harmful disinfection by-products. The unit cost of sodium hypochlorite solution is about 30% higher than the unit cost of gaseous chlorine.

Figure 16. Sodium Hypochlorite System (courtesy of Bergen County)

Advantages

- Provides residual protection in the effluent
- Effective disinfectant
- Low capital costs than UV and gaseous chlorine
- Safer to handle than gaseous chlorine

Disadvantages

- Not effective against *Cryptosporidium*
- Highly corrosive
- Produces disinfection byproducts
- Limited shelf life

4.3.2. Chlorine Gas

Chlorine gas (Cl_2), as shown in Figure 17, utilizes a similar disinfection mechanism as NaOCl. It is injected into wastewater through chlorinators to reduce the pressure so that gas becomes liquid. Only qualified personnel, under the supervision of certified personnel and in accordance with the

Occupational Safety and Health Administration (OSHA) regulatory requirements, are allowed to handle chlorine gas at wastewater treatment plants due to safety concerns. Safety concerns include chlorine gas leaks that could have been caused during the shipment process, storage on site, and/or changing of the gas cylinders. Therefore, many wastewater plants have switched from chlorine gas to sodium/calcium hypochlorite sources for chlorine disinfection.

Figure 17. Chlorine gas (courtesy of JCS Industries)

Advantages

- Effective against most pathogens
- Provides residual protection in the effluent
- Low operating and capital costs

Disadvantages

- Disinfection byproduct formation
- Increased safety risk and special training required for operators
- Not effective against *Cryptosporidium*
- Additional regulatory requirements

4.3.3. UV

Ultraviolet (UV) disinfection, shown in Figure 18, utilizes UV electromagnetic energy to damage microbial DNA and RNA, thereby retarding microbial reproduction. The optimum UV wavelengths are from 250 to 270 nm. The main components of a UV system include UV lamps, quartz sleeves that house the lamps, the supporting structure, and the power supply. UV systems are classified according to the lamp types and whether the flow occurs in an open or closed channel.

UV capital costs depend on the capacity of the plant, wastewater characteristics, and the manufacturer. The total capital and operating costs for UV disinfection are much higher than chlorination. However, in cases where both chlorination and dichlorination are required and fire codes are met, UV becomes cost competitive. Additionally, no harmful disinfection byproducts are formed during operation.

Figure 18. UV System (courtesy of Flow-Technics, Inc.)

Advantages

- More effective disinfectant than chlorine for protozoa
- No byproducts formation
- No residual effect harmful to human or aquatic life
- Eliminates the need to generate, handle, transport, or store hazardous chemicals
- Shorter contact times

Disadvantages

- High energy requirements
- Low dosages may not effectively inactivate bacteria and viruses
- Turbidity and TSS can render UV ineffective
- Fouling of tubes
- No measurable residual in the effluent to indicate the efficacy of disinfection
- UV lamps have limited life and need to be replaced regularly
- No residual; reactivation of microorganisms has been reported

4.3.4. Treatment Process Selection Criteria

The same methodology discussed in Section 4.1.12 was utilized to compare the three disinfection options. Table 15 illustrates the comparison analysis and the relative weights of five criteria that the project team and City staff developed for the disinfection systems. Table 16 presents the relative weights of the criteria along with the individual and total scores for the options based on a 1 – 3 scale.

Table 15. Process selection criteria and weighting factors for the disinfection system

	Criteria	Priority					Weight
		A	B	C	D	E	
A	Safety		A	A	A	A	40%
B	Capital Cost			C	B	E	10%
C	O&M Cost				C	C	30%
D	Operational Complexity					D	10%
E	Effluent Water Quality						10%

Table 16. Disinfection options weighted scores

Weighted Scores			
Selection Criteria	**NaOCl**	**Cl_2**	**UV**
Safety	1.2	0.4	1.2
Capital Cost	0.2	0.3	0.1
O&M Cost	0.9	0.9	0.3
Operational Complexity	0.3	0.3	0.2
Effluent Water Quality	0.2	0.2	0.3
Total Weighted Score	**2.8**	**2.1**	**2.1**

4.3.5. Options Eliminated

Based on the results of the paired comparison analysis, chlorine gas and UV disinfection were eliminated from further analysis. Brief reasons for the elimination of these options are provided in Table 17.

Table 17. Disinfection option elimination reasoning

Eliminated Method	Reason for Elimination
Chlorine Gas	▶ Chlorine gas is a serious safety concern. Operations of a gaseous chlorine disinfection system are complicated and require meeting stringent federal and state safety requirements.
Ultraviolet Disinfection	▶ UV has higher capital costs and significantly higher O&M costs due to high power consumption compared to sodium hypochlorite; UV lamps need to be replaced regularly

5. ALTERNATIVES ANALYSIS

After the initial screening of secondary, tertiary, and disinfection options, five wastewater treatment alternatives were developed for process design and sizing of tanks and equipment. Capital and O&M costs were estimated and compared. Analyses of each alternative included defining the design criteria, biological process modeling, plant hydraulics calculations, and cost estimation. The subsections below provide a more detailed description of the analytical procedures.

5.1. Design Criteria

The wastewater treatment alternatives were evaluated by developing preliminary design criteria. The components and site layouts associated with each alternative were defined by size and quantity while applying the design criteria listed in Section 6 and Section 7. The size and quantity of the components associated with the wastewater treatment alternative were then used to develop capital and O&M costs. When appropriate, assumptions for design criteria were made for sizing the treatment systems.

5.2. BioWin Modeling

The BioWin 5.3 software (EnviroSim Associates Ltd.) for wastewater treatment plant simulation was utilized to estimate key performance indicators (KPI) including effluent water quality, DO, MLSS, SRT, and hydraulic retention time (HRT) for selected biological process configurations. The processes were designed to achieve a 10 mg/L TN effluent, and further optimized to achieve 8 mg/L TN to offer a safety factor for operation.

The model was configured and calibrated with plant physical data, operation data, influent loading data, influent wastewater characteristics, and kinetic and stoichiometric model parameters. Once the model was calibrated for each process, constraint parameters related to operation and water quality are addressed through trial and error method based on the general approach. KPIs based on secondary effluent water quality and operation conditions in the bioreactors have been established to analyze and provide comparisons between each alternative. An example of the BioWin process modeling is shown in Figure 19.

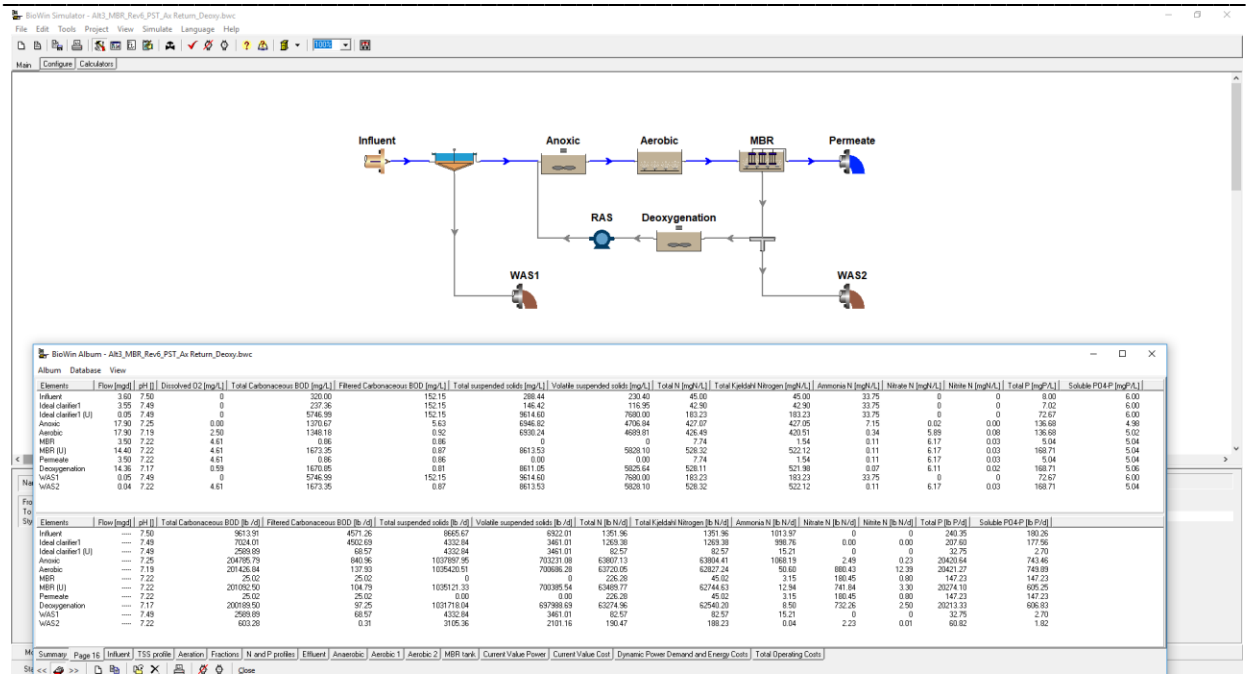

Figure 19. BioWin modeling

5.3. Visual Hydraulics 4.2

Visual Hydraulics is a software primarily used for modeling the hydraulic characteristics of water and wastewater treatment plants. The software is capable of analyzing hydraulic profiles for the entire treatment plant, and follows the traditional method for analyzing water surface profiles. A downstream control point (chlorine contact chamber discharge point) was selected for each alternative, and the hydraulics of each treatment alternative was checked. The use of Visual Hydraulics 4.2 determined if new and existing pumps and pipelines would be suitable for each proposed treatment alternative.

5.4. Cost Assumptions

A list of assumptions used for capital and O&M cost estimates for each wastewater treatment alternative is provided in Table 18. Capital costs were developed using the 17 division of constructions as defined by the Construction Specifications Institute (CSI)'s MasterFormat. Life cycle costs prepared for this report assumed an annual interest rate of 2.5 percent. Any cost assumptions that deviate from this table are identified in the wastewater treatment alternative subsections.

Table 18. Cost assumptions for the development of capital and O&M costs

Cost Item	Value
Capital Costs	
Equipment Installation	25% of equipment cost
Pipe Installation	300% of pipe material cost
Diffuser Installation	$125/diffuser
Electrical	20% of Div 1 -15
Instrumentation	10% of Div 1 - 16
Contingency	15% of Construction Subtotal
Mobilization and Insurance	5% of Construction Subtotal with Contingency
General Conditions	9% of Construction Subtotal with Contingency, and Mobilization and Insurance
Contractor Profit	15% of Construction Subtotal with Contingency, Mobilization and Insurance, and General Conditions
Concrete	$1,200/CY
Annual O&M Costs	
Electrical	$0.10/kWh
Labor, Maintenance, and Spare Parts	2% of equipment cost
12.5% Sodium Hypochlorite	$2.12/gallon
Polymer	$0.94/gallon
Citric Acid	$7.50/gallon
Sodium Bisulfite	$2.42/gallon
Sodium Hydroxide	$0.95/gallon

6. WASTEWATER PLANT UPGRADES

Upgrades to the WWTP to appropriately handle the future 3.6 MGD average flow and to comply with Board Order and Title 22 requirements are discussed in this section. The costs for these components to comply with Title 22 requirements are included in the capital, O&M, and life cycle costs discussed in Sections 7 and 8.

The existing plant unit processes were reused as much as possible based on the condition assessment evaluation. Reuse of the existing trickling filter tanks for the biological treatment options was evaluated to save on capital construction costs. However, based on WWTP site investigations from October 30, 2018 and April 16, 2019, and recommendations per the condition assessment evaluation, the structure of the trickling filters is not recommended for retrofit without major repairs.

6.1. Equalization Basin

Currently, the City has no method to regulate variations in flow. Additionally, many of the existing treatment processes downstream of the headworks are not designed to handle 3.6 MGD. The existing treatment components have the following treatment capacity: Primary West Clarifier (1.6 MGD), Primary East Clarifier (2.0 MGD), West Tricking Filter (1.8 MGD), East Trickling Filter (1.8 MGD), Secondary-clarifier West (1.8 MGD), Secondary-clarifier East (1.8 MGD), and Anaerobic Digester (2.3 MGD).

The construction of an equalization (EQ) basin is recommended to regulate flow and organic and nitrogen loading to ensure the biological treatment processes are not under- or over-sized. It is important to equalize the nitrogen loading to optimize the removal performance of the biological systems. Other benefits of the EQ basin include lower capital and O&M costs for systems requiring to be designed for peak flow conditions, and the ability to store wastewater in case of emergency or treatment process downtime.

The City records daily flow fluctuations using a flow meter located upstream of the unused chlorine contact tank. Daily flow is recorded continuously on flow record disks. Data from January 2017 – September 2018 were analyzed to determine hourly flow fluctuations. The average flow recorded over this time period was approximately 2.0 MGD. Presently, it is unknown if the daily flow variation will change with an increase in average flow. Therefore, it is assumed the daily flow variation will remain the same. The flow fluctuations at 3.6 MGD is scaled up from the 2.0 MGD flow rate. Figure 20 shows the existing (blue) and projected future (red) diurnal flow patterns.

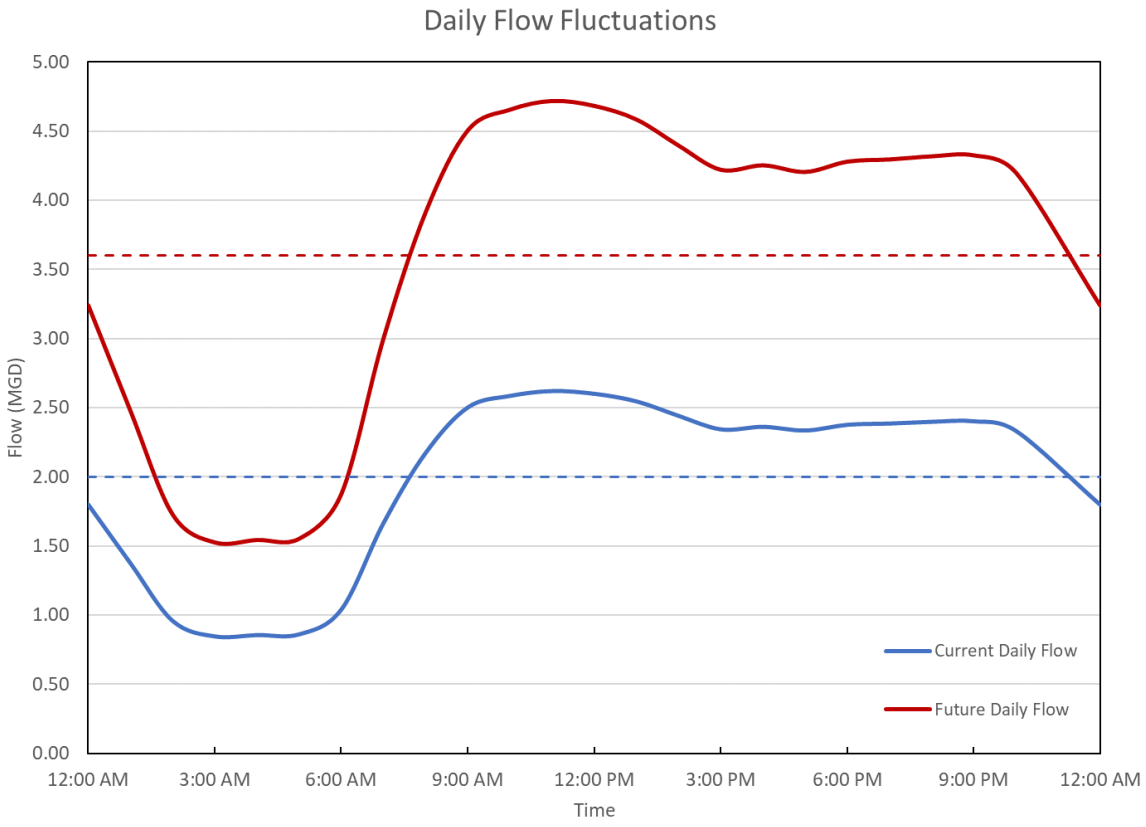

Figure 20. Daily flow fluctuation for existing (2.0 MGD) and future (3.6 MGD) flow conditions

The City operates nine evaporation/percolation ponds and one stormwater detention pond. The existing stormwater pond is recommended to be converted into a new EQ basin based on the size of the pond and the topography of the site. Based on the existing utility layout of the WWTP, the primary clarifier effluent will be directed to the new EQ basin. A liner such as concrete or high-density polyethylene (HDPE) is required to prevent percolation of untreated wastewater into the groundwater aquifer. The EQ basin will be able to hold approximately 3,500,000 gallons. A new pump station will need to be constructed to return flow to WWTP during low flow periods. The design criteria for the new EQ basin and pump station are shown in Table 19.

Table 19. Summary of design characteristics for EQ basin

Parameter	Unit	Value
EQ Basin		
Top Length	ft	360
Top Width	ft	151
Bottom Length	ft	282
Bottom Width	ft	73
Side Slopes	-	3:1
Height	ft	13
Volume	gal	3,500,000
Type of Liner	-	Concrete
Thickness	inches	8
EQ Basin Pump Station		
Number of Pumps	-	2+1
Flow/pump	MGD	1.8
Pump Power	HP	25

6.2. Primary Clarifier

The two existing primary clarifiers can accommodate an average flow of up to 3.6 MGD. Although this meets our requirement for the new wastewater treatment plant, the existing layout does not allow for peak daily flow or redundancy. Based on the layout of existing utilities and wastewater pipeline, it would be more cost effective and easier to build a third primary clarifier to handle the daily peak flowrate. The third primary clarifier will be 50 feet in diameter and sized for 2 MGD flow. The total capacity of the primary clarifiers including the proposed clarifier will be 5.6 MGD, sufficient to handle daily peak flow and wet weather flow. The primary clarifier effluent will be directed to the EQ basin using the existing piping. Design criteria and sizing of the existing and new primary clarifiers are summarized in Table 20.

Table 20. Summary of design characteristics for existing and new primary clarifiers

Parameter	Unit	Primary Clarifier 1 (West)	Primary Clarifier 2 (East)	Primary Clarifier 3 (New)
Design Flow Rate	MGD	1.6	2	2
Clarifier Diameter	ft	45	50	50
Clarifier Surface Area	ft^2	1,600	1,965	1.965
Sidewall Depth	ft	6.5	7	7
Volume Capacity	ft^3	10,330	13,750	13,750
Hydraulic Retention Time	hr	1.2(1)	1.2(1)	1.2(1)
Hydraulic Surface Loading Rate	gpm/ft^2	0.7(1)	0.7(1)	0.7(1)

Note: Referred to the report of "City of Banning Water Reclamation Plant Overview"
(1) WEF and ASCE, Design of Municipal Wastewater Treatment Plants (DMWTP), 1998

6.3. Tertiary Filter

A tertiary filter is required to meet the Title 22 turbidity requirements for recycled water. Based on the results of the preliminary screening of options, cloth media disk filters were used for sizing, layout, and costs. The disk filter tank is recommended to be installed at grade between the secondary clarifiers and chlorine contact tank. The system will tie into the existing secondary effluent pipeline and will be gravity fed to the disinfection system. A secondary effluent pump station is required upstream of the disk filters to accommodate the head loss associated with the filters and maintain gravity flow to the chlorine contact tank. Design criteria for the tertiary filters and secondary effluent pump station are shown in Table 21.

Table 21. Summary of design characteristics for tertiary filter components

Parameter	Unit	Value
Cloth Media Filters		
Number of Disks	-	6
Filter Area	ft^2	432
Flow	MGD	3.73
Tank Length	ft	15.5
Tank Width	ft	8
Tank Height	ft	10.5
Maximum Head loss	inch	12
Secondary Effluent Pump Station		
Number of Pumps	-	2+1
Flow/pump	MGD	1.8
Pump Power	HP	15

The State Water Resources Control Board has developed a list of Conditionally Accepted Alternative Filtration Technologies (CAAFT) that are suitable for Title 22 applications. These technologies have been recognized via thorough testing and continuous monitoring for Title 22 compliance. A current list of CAAFT as of the September 2014 "Alternative Treatment Technology Report for Recycled Water" is provided in Table 22. An alternative analysis of these equipment suppliers should be conducted to determine the cost-effective solution without sacrificing performance.

Table 22. List of CAAFT for filtration systems

Cloth Filters	Non-Granular Media Filters	Other Filters and Non-Polymeric Membrane Filters
1) Alfa Laval Ashbrook Simon-Hartley – Iso-Disc 2) Aqua-Aerobic System - MMK2-13 acrylic pile fabric 3) Aqua-Aerobic System – NF-102 needle felt fabric 4) Aqua-Aerobic System - PA-13 nylon pile fabric 5) Aqua-Aerobic System - PES-13 woven polyester fabric 6) Aqua-Aerobic System – PES-14 woven polyester fabric 7) Entex Technologies – FlowTex Disc Filter 8) Five Star Cloth – Cloth 1A-Yellow Jersey Knit Fabric 9) Five Star Cloth – Cloth 2A-Yellow Jersey Knit Fabric 10) I. Kruger - Hydrotech 11) Nordic Water - Nordic Water Disc Filter 12) Sanitaire a Xylem Brand – Drumfilter 13) Siemens Water Technologies – Forty X	1) Amiad - AMF Wastewater Filter 2) Nova Water Technologies - Nova Ultrascreen Filter® 3) Schreiber - Fuzzy Filter 4) Schreiber – Compressible Media Filter	1) Metawater – Ceramic Membrane

6.4. Chlorine Contact Tank

According to Title 22 regulations, systems that wish to use wastewater effluent for irrigation purposes must meet disinfection requirements. Title 22 requires 90 minutes of modal contact time at peak daily flowrate and CT of 450 mg-min/L at all times if chlorine is used for disinfection. An existing chlorine contact chamber is located onsite, but the use of a disinfectant was discontinued. The existing tank is sized for 2.4 MGD and 60 minutes of contact time. Due to the recommendation of the construction of an EQ basin, flows will stay constant at approximately 3.6 MGD throughout the day. Compliance with Title 22 disinfection requirements will require the

construction of a second, identical chlorine contact tank, which will achieve 90 minutes contact time at 3.6 MGD. Additionally, a cover or canopy over the contact tanks is recommended to prevent photo and thermal degradation of free chlorine.

Based on the results of the preliminary screening of options, free chlorine in the form of 12.5% sodium hypochlorite will be used for disinfection. There are two methods for sodium hypochlorite disinfection: bulk delivery and onsite generation. Bulk delivery is the cheapest capital cost option and is considered for the purposes of this evaluation. Onsite generation can be explored during detailed design and the system can be installed in the existing decommissioned chlorine gas storage room adjacent to the chlorine contact tank. The bulk delivery option will require two double walled sodium hypochlorite storage tanks installed to the east of the decommissioned chlorine storage building. Double walled storage tanks are the preferred tank option since secondary containment is already built into the tank. A concrete secondary containment area can also be installed to provide additional safety and containment of leaks from piping or fittings. The tanks are sized to handle approximately two weeks of sodium hypochlorite usage. Title 22 requires 5 mg/L of combined chlorine residual. The total chlorine dose will vary between wastewater treatment alternatives, but a maximum of two 1,500-gallon sodium hypochlorite storage tanks is required. Design criteria for the chlorine contact tanks and sodium hypochlorite storage tanks are shown in Table 23.

Table 23. Summary of design characteristics for chlorine contact tanks

Parameter	Unit	Value
Flow	MGD	3.6
Contact Time	minutes	90
Number of Tanks	-	2
Tank Length	ft	60
Tank Width	ft	20
Tank Height	ft	12
Tank Volume	gal	110,000
CT	mg-min/L	450
Disinfectant	-	Sodium Hypochlorite
Free Chlorine	%	12.5
Required Residual	mg/L	5
Number of Storage Tanks	-	2
Total Storage Tank Volume	gal	3,000

6.5. Sludge Treatment

Sludge generated at the WWTP is anaerobically digested. The existing digestion system includes two primary digesters and one secondary digester. All three digesters are 35' in diameter, the primary digesters have a side wall depth (SWD) of 26' and water surface elevation (WSEL) of 24' and the secondary digester SWD of 21' and WSEL of 19'. Currently, only the primary digesters are mixed, heated, and used for digestion, while the secondary digester is unmixed and unheated and is only used for sludge holding and some thickening. Assuming 20 days SRT and 4% solids concentration, the existing primary digesters can accommodate sludge generated from a wastewater flow of 2.3 MGD under the current trickling filter treatment system. A summary of the dimensions of the existing three digesters is shown in Table 24. A gravity sludge thickener is onsite, but is not operated based on past operating experience. Treated sludge is gravity fed to the facility's drying beds where it remains until approximately 85% of the moisture is removed. Dried sludge is then hauled off for beneficial reuse as a fertilizer and soil amendment.

Table 24. Existing anaerobic digesters dimensions and capacity

Parameter	Unit	East Primary	West Primary	Secondary
Diameter	ft	35	35	35
SWD	ft	26	26	21
WSEL	ft	24	24	19
Total Volume	ft^3	23,091	23,091	18,280
	gal	172,718	172,718	136,735
Design SRT	days	20	20	20
Design Sludge Flow Capacity	gal/day	8,636	8,636	6,837

To accommodate the increased average daily flow, the existing digesters will need to be reconfigured and potentially new digesters will need to be constructed. The existing secondary digester can be converted to a primary digester by adding recirculation pumps and heating elements to the system. This will provide a total capacity of 482,000-gallons and 24,000 gpd of wasted sludge if the three existing digesters are operated in parallel.

Additionally, it is recommended a new mechanical sludge thickener to be installed to improve the total solids content in the digester influent thus reducing the size requirements of the new digesters. A mechanical thickener such as a rotary screw thickener, shown in Figure 21, can receive sludge at approximately 0.4% solids and thicken it to 4 – 6% solids content. Mechanical thickeners are compact, can be totally enclosed, and require minimal operator attendance. For the purposes of this evaluation, a new mechanical thickener system will be installed adjacent to

the existing gravity thickener. Piping for the thickened sludge will tie into the existing and new digesters.

Figure 21. Mechanical sludge thickener (courtesy of Huber)

The size of the new digesters will differ for each wastewater treatment alternative based on the projected amounts of primary sludge and waste activated sludge (WAS). The design of the new digesters used an assumed SRT of 20 days and 26' tank SWD. By converting the existing secondary digester to a primary digester, only the trickling filter and MBBR treatment alternative will require a new digester to be constructed to accommodate the increased flow capacity. A summary of the sludge design parameters of all the treatment alternatives is provided in Table 25. Costs for sludge treatment for each treatment alternative is based on the new mechanical thickener, anaerobic digesters, and associated sludge piping and pumps from the secondary clarifiers.

Table 25. Summary of anaerobic digester design requirements

Parameter	Unit	TF	CAS	IFAS	MBBR	MBR

6.6. Lab and Control Building

After analyzing the condition and location of the current lab and control building, it was determined that the existing lab building needs to either be upgraded or demolished and built new. A new lab and control building would be constructed adjacent to the proposed aeration tanks. This update would provide a new state of the art equipment to help ensure successful and smooth system operations.

A new control room and lab will increase treatment plant reliability and safety. The building will supply adequate office, storage, and laboratory space. The control room workstation will be centralized to support plant supervision, functionality, and efficiency via supervisory control and data acquisition (SCADA). Further, operators' needs, such as easy access to the process, internal and external communication, and alarm response, will all be considered in designing the workstation layout. The workstation computers will be connected to servers, allowing for trending and archiving, memory backup, and signal processing.

7. WASTEWATER TREATMENT ALTERNATIVES

After the initial screening of secondary, tertiary filters, and disinfection treatment options, five biological treatment options were selected for further evaluation to treat an average daily flow of 3.6 MGD. To comply with the Board Order and Title 22 requirements, the biological processes were combined with all of the components discussed in Section 6 unless otherwise noted. BioWin modeling results for each alternative were completed to compare effluent water quality and to determine necessary unit processes. Detailed capital, O&M, and 20-year life cycle costs were developed for each alternative for comparison. Viable treatment alternatives included:

Alternative 1 - Increase Trickling Filter Recirculation Rate
Alternative 2 - Conventional Activated Sludge
Alternative 3 - Integrated Fixed-Film Activated Sludge
Alternative 4 - Moving Bed Biofilm Reactor
Alternative 5 - Membrane Bioreactor

7.1. Alternative 1 Increase Trickling Filter Recirculation Rate

The existing operation of the trickling filters does not allow for sufficient N/DN to occur. Each trickling filter is operated at a recirculation ratio of 100% under the current conditions (or 1.0 MGD recirculation rate per trickling filter). In order to reduce the TN concentration in the effluent, nitrate has to be denitrified after ammonia is nitrified to nitrate. In trickling filters, denitrification occurs during anoxic conditions which happen at the top of the filter. The BOD_5 and ammonia nitrogen in the influent consume oxygen and create anoxic conditions for denitrification. Aerobic conditions occur downward through the trickling filter, which allows for nitrification. By increasing the recirculation rate, higher denitrification rates can occur thus lowering the effluent TN.

In order to comply with the Board Order requirements, the trickling filter recirculation ratio must be increased to at least 350% (or 12.6 MGD) for the future design flow conditions. The existing diameter of the trickling filter influent pipe is 20”, which can just barely accommodate the proposed recirculation rate, but not flow beyond this level. A summary of the design characteristics for Alternative 1 is shown in Table 26.

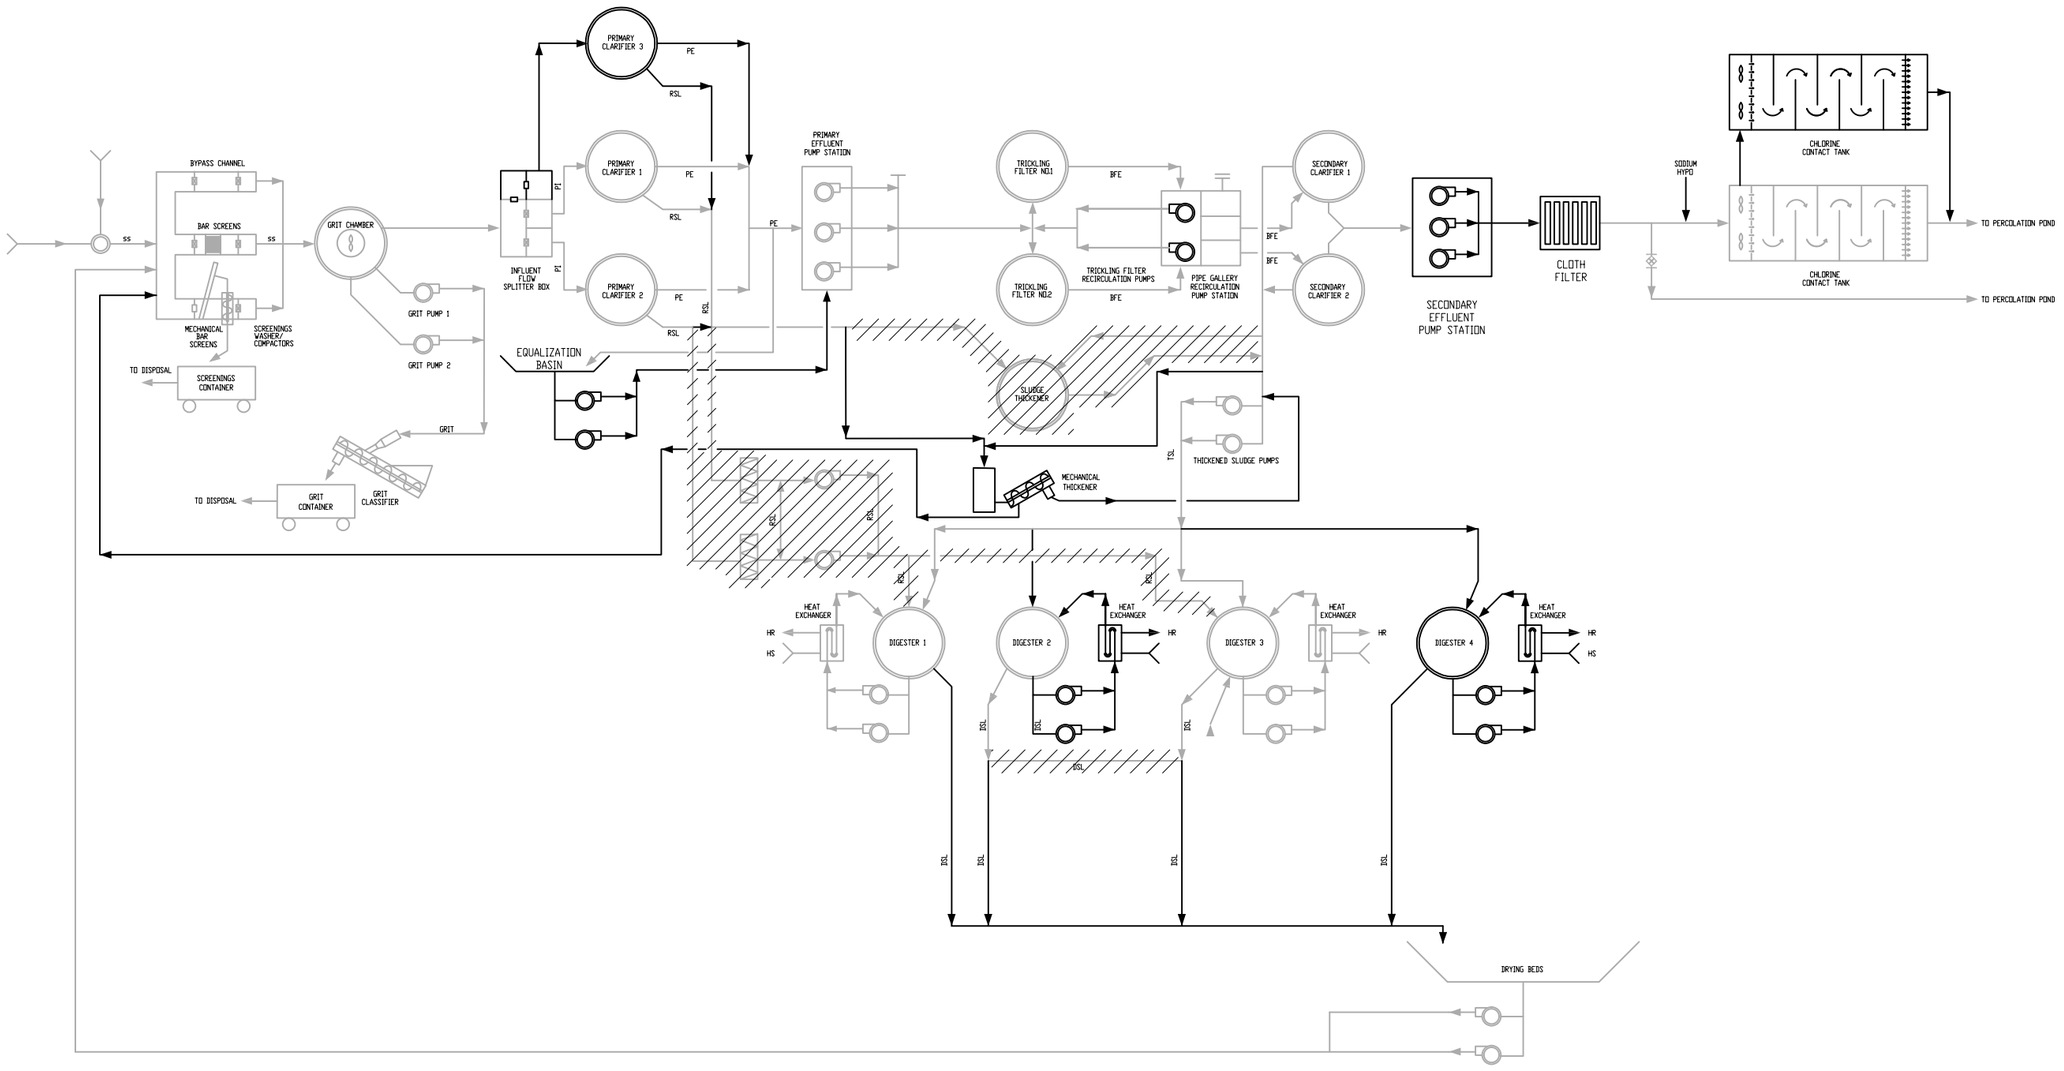

Table 26. Summary of design characteristics for Alternative 1

Parameter	Unit	Value
Design Flow Rate	MGD	3.6
Design Flow per TF	MGD	1.8
Design Temperature	°F	70
Filter Diameter	ft	110
Filter Surface Area	ft^2	9,500
Media Depth	ft	8
Media Volume	ft^3	76,000
Empty Bed Contact Time	hr	7.6
Maximum Flow Rate	MGD	West 6.48 / East 8.352
Nitrate Return Flow	%	350
Hydraulic Surface Loading Rate	gpm/ft^2	0.59
BOD_5 Surface Loading Rate	$lb/1000\ ft^2/day$	353
Volumetric BOD_5 Loading Rate	$lb/1000\ ft^3/day$	48.1
New Recirculation Pumps	-	2
Pump Power	HP	50

Based on BioWin modeling results, the expected secondary effluent for the constituents of concern is provided in Table 27. The operation of the trickling filter will comply with BOD_5 and TN effluent goals, but a tertiary filter will be required to comply with Title 22 turbidity requirements. Additionally, based on the capacity of the existing infrastructure, there is minimal process flexibility to maintain effluent TN treatment goals. A proposed process flow diagram and site layout to comply with the Board Order and Title 22 requirements are shown in Figure 22 and Figure 23, respectively.

Table 27. Secondary effluent water quality for Alternative 1

Parameter	Secondary Effluent Water Quality
BOD_5	24.74 mg/L
TSS	6.31 mg/L
TN	9.92 mg-N/L

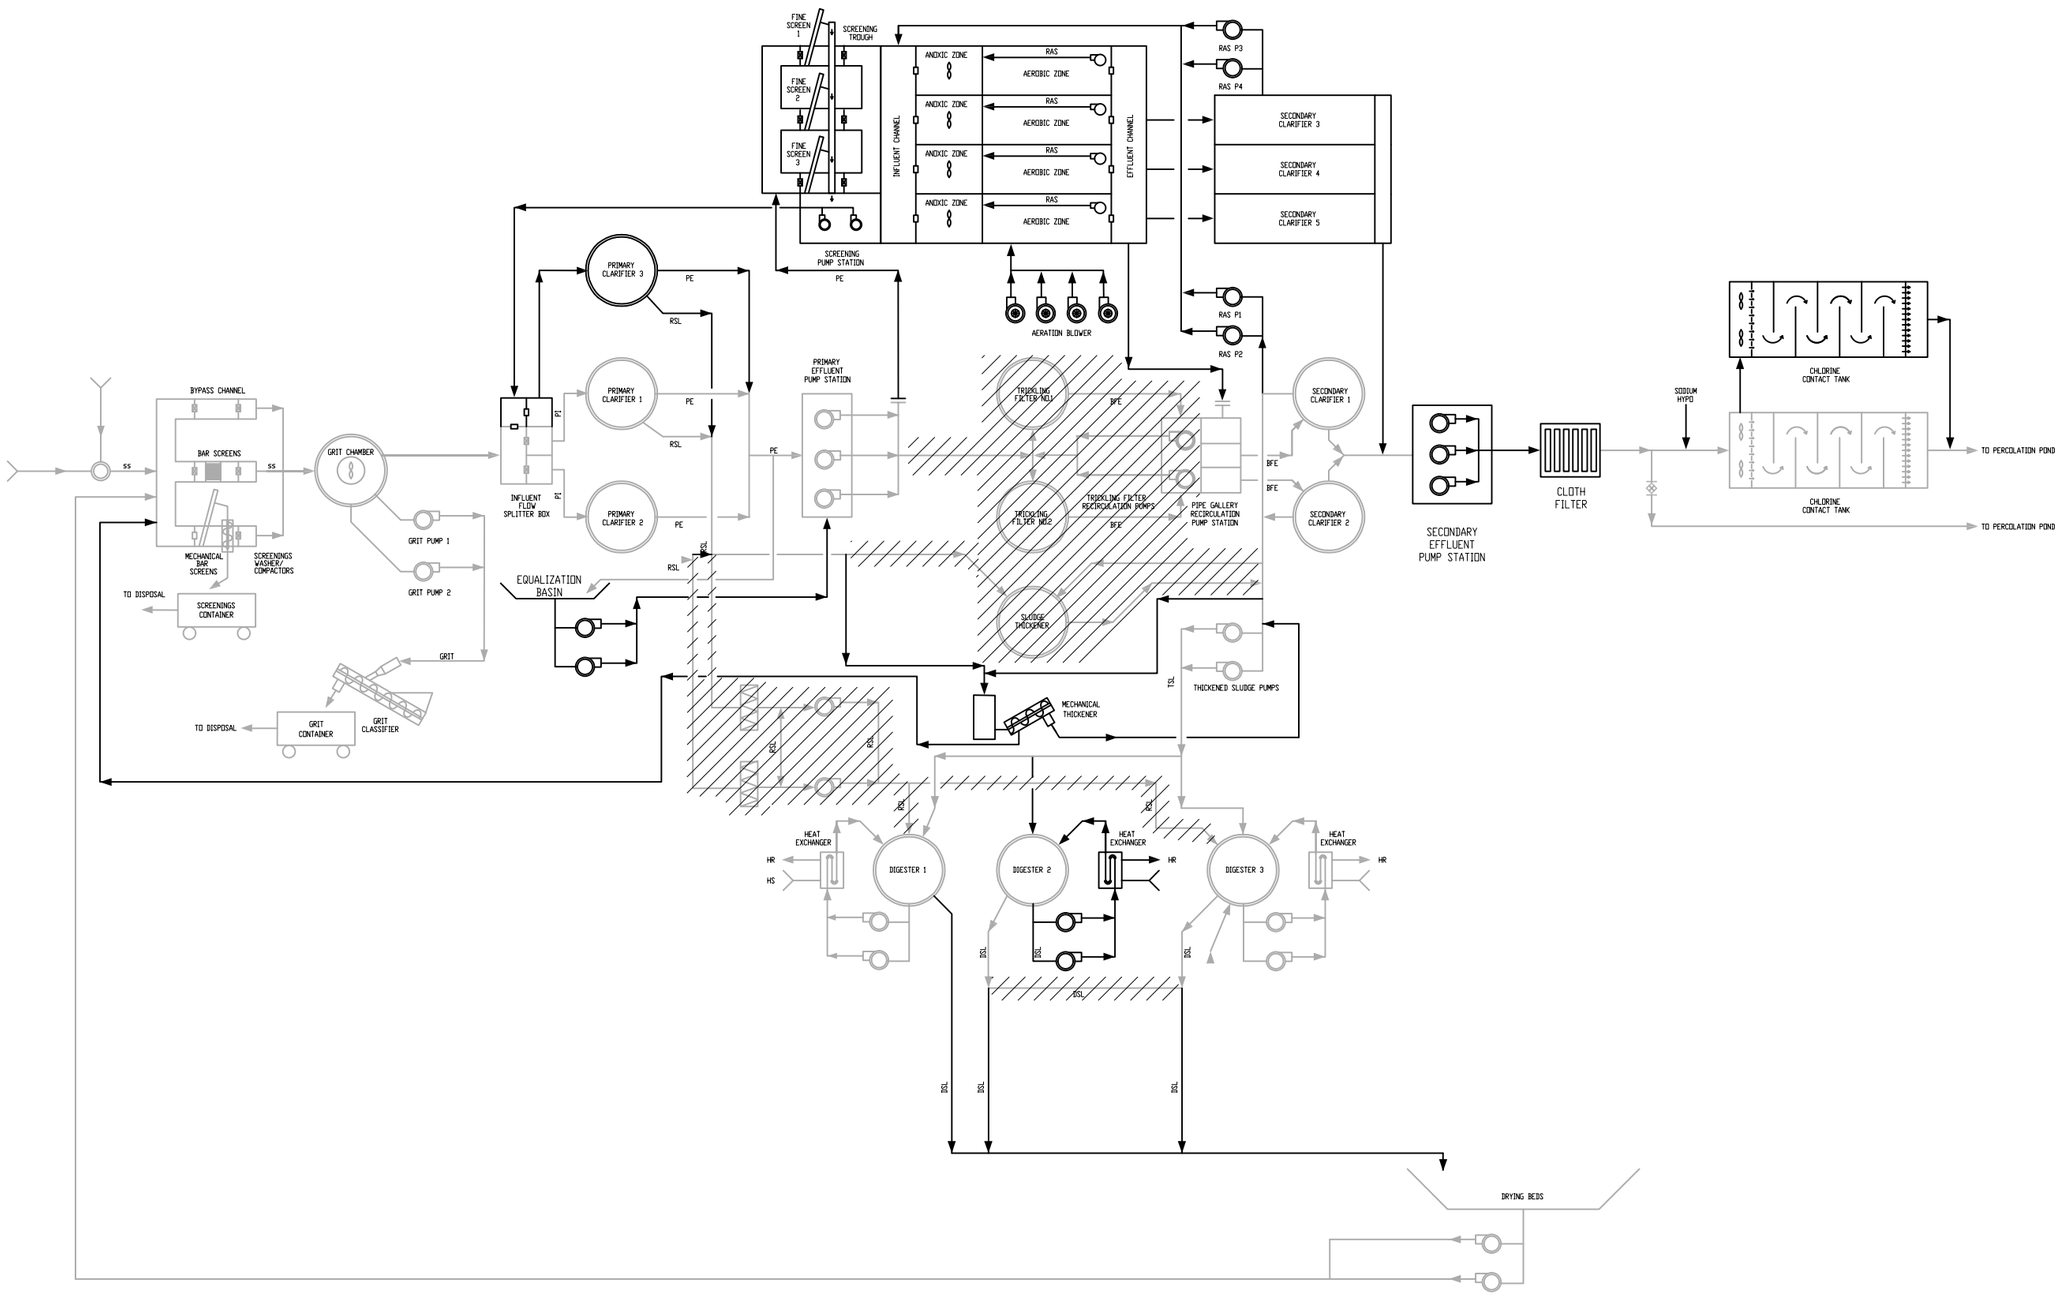
7.2. Alternative 2 Conventional Activated Sludge

Conventional activated sludge is one of the most common biological nutrient removal systems in the United States. New bioreactors with anoxic and aerobic zones will need to be constructed for this system. The City owns the property immediately to the west of the WWTP where the proposed CAS system could be located. The existing trickling filters will be decommissioned, while the existing primary clarifiers and primary effluent pump station will remain in operation. The existing secondary clarifiers will not be suitable for the increased flow as the underflow drain is only 6” in diameter. The new RAS line needs to be at least 12” in diameter to handle the increased RAS flows. New rectangular clarifiers will need to be constructed north of the bioreactors to handle half (1.8 MGD) of the average daily flow. An external carbon source is not necessary for this option. A summary of the design characteristics for Alternative 2 is shown in Table 29. Modeled secondary effluent water quality is provided in Table 30. A tertiary filter is required to



comply with Title 22 turbidity requirements. The proposed process flow diagram and site layout for Alternative 2 are shown in Figure 24 and Figure 25, respectively.

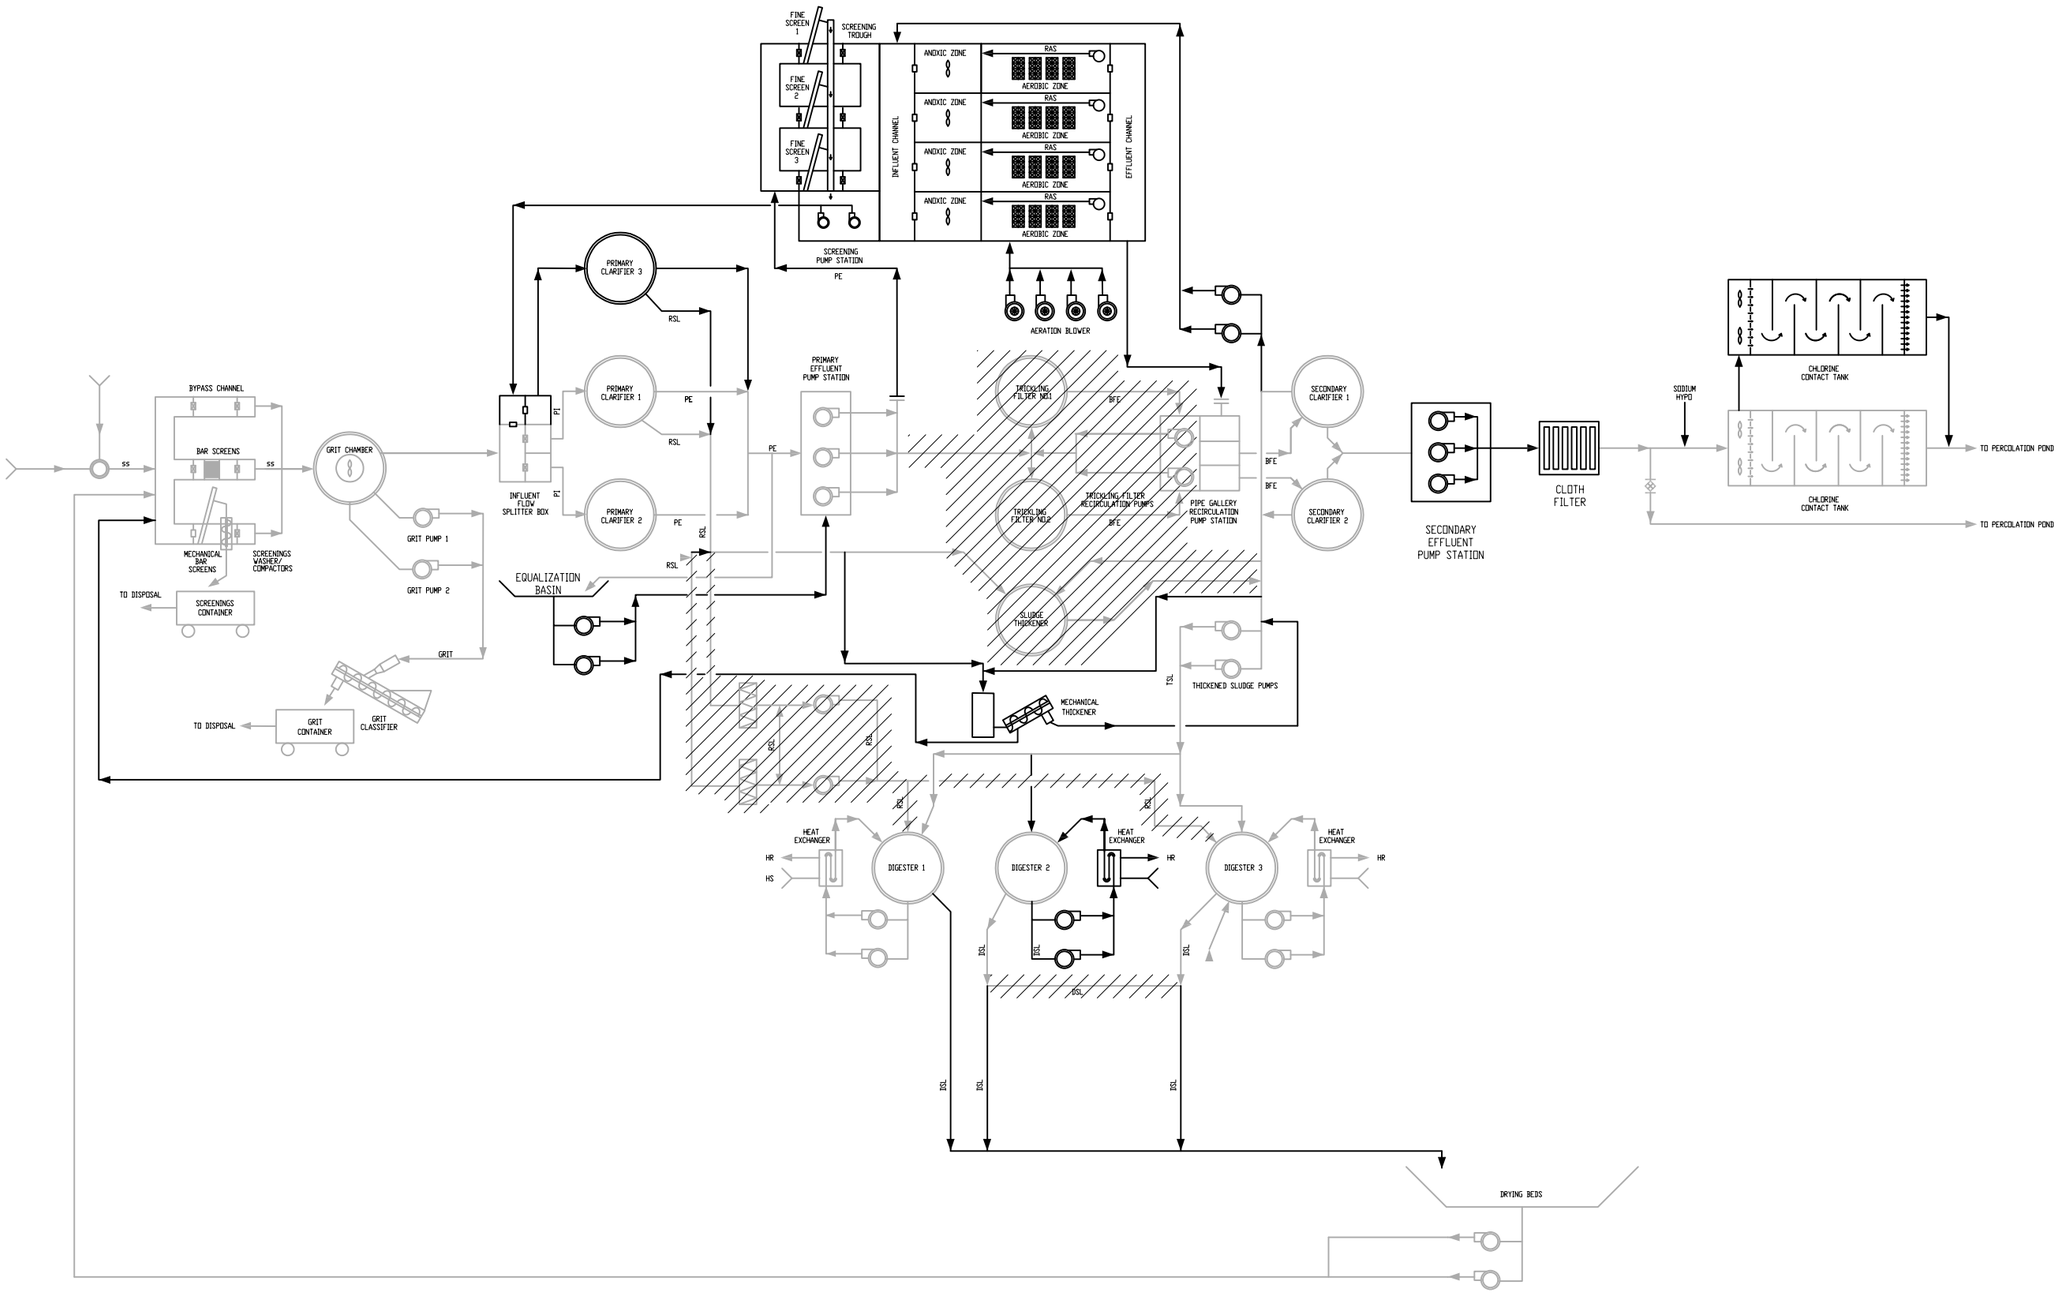
A summary of the capital, annual O&M, and 20-year life cycle costs for Alternative 2 is shown in Table 31. Annual O&M costs are based on power, chemical (NaOCl and polymer), and labor and maintenance.

Table 31. Capital, O&M, and life cycle cost summary for Alternative 2

Cost Component	Cost
Capital	
EQ Basin	$2,008,000
Primary Clarifier	$1,701,000
Tertiary Filter	$1,814,000
Chlorination Tank	$1,097,000
Sludge Treatment	-
Lab and Control Building	$978,000
Activated Sludge System	$22,501,000
Total Capital Cost	**$30,099,000**
Annual O&M	
Power	$302,000
Chemical	$182,000
Maintenance and Spare Parts	$48,000
Total O&M Cost	**$532,000**
20-Year Life Cycle Cost	
$43,941,000	

7.3. Alternative 3 Integrated Fixed-Film Activated Sludge



The IFAS system is nearly identical to Alternative 2, except the media is placed in the aerobic tank to allow for biofilm growth. The increased density of heterotrophs allows for increased treatment capacity in the same sized tank as the conventional activated sludge tank. Additionally, Alternative 3 has the same issue with the existing secondary clarifier RAS line, so new rectangular clarifiers will need to be constructed to the north of the secondary treatment tank. A summary of the design characteristics for Alternative 3 is shown in Table 32. Modeled secondary effluent water quality is provided in Table 33. A tertiary filter is required to comply with Title 22 turbidity requirements The proposed process flow diagram and site layout for Alternative 3 are shown in Figure 26 and Figure 27, respectively.

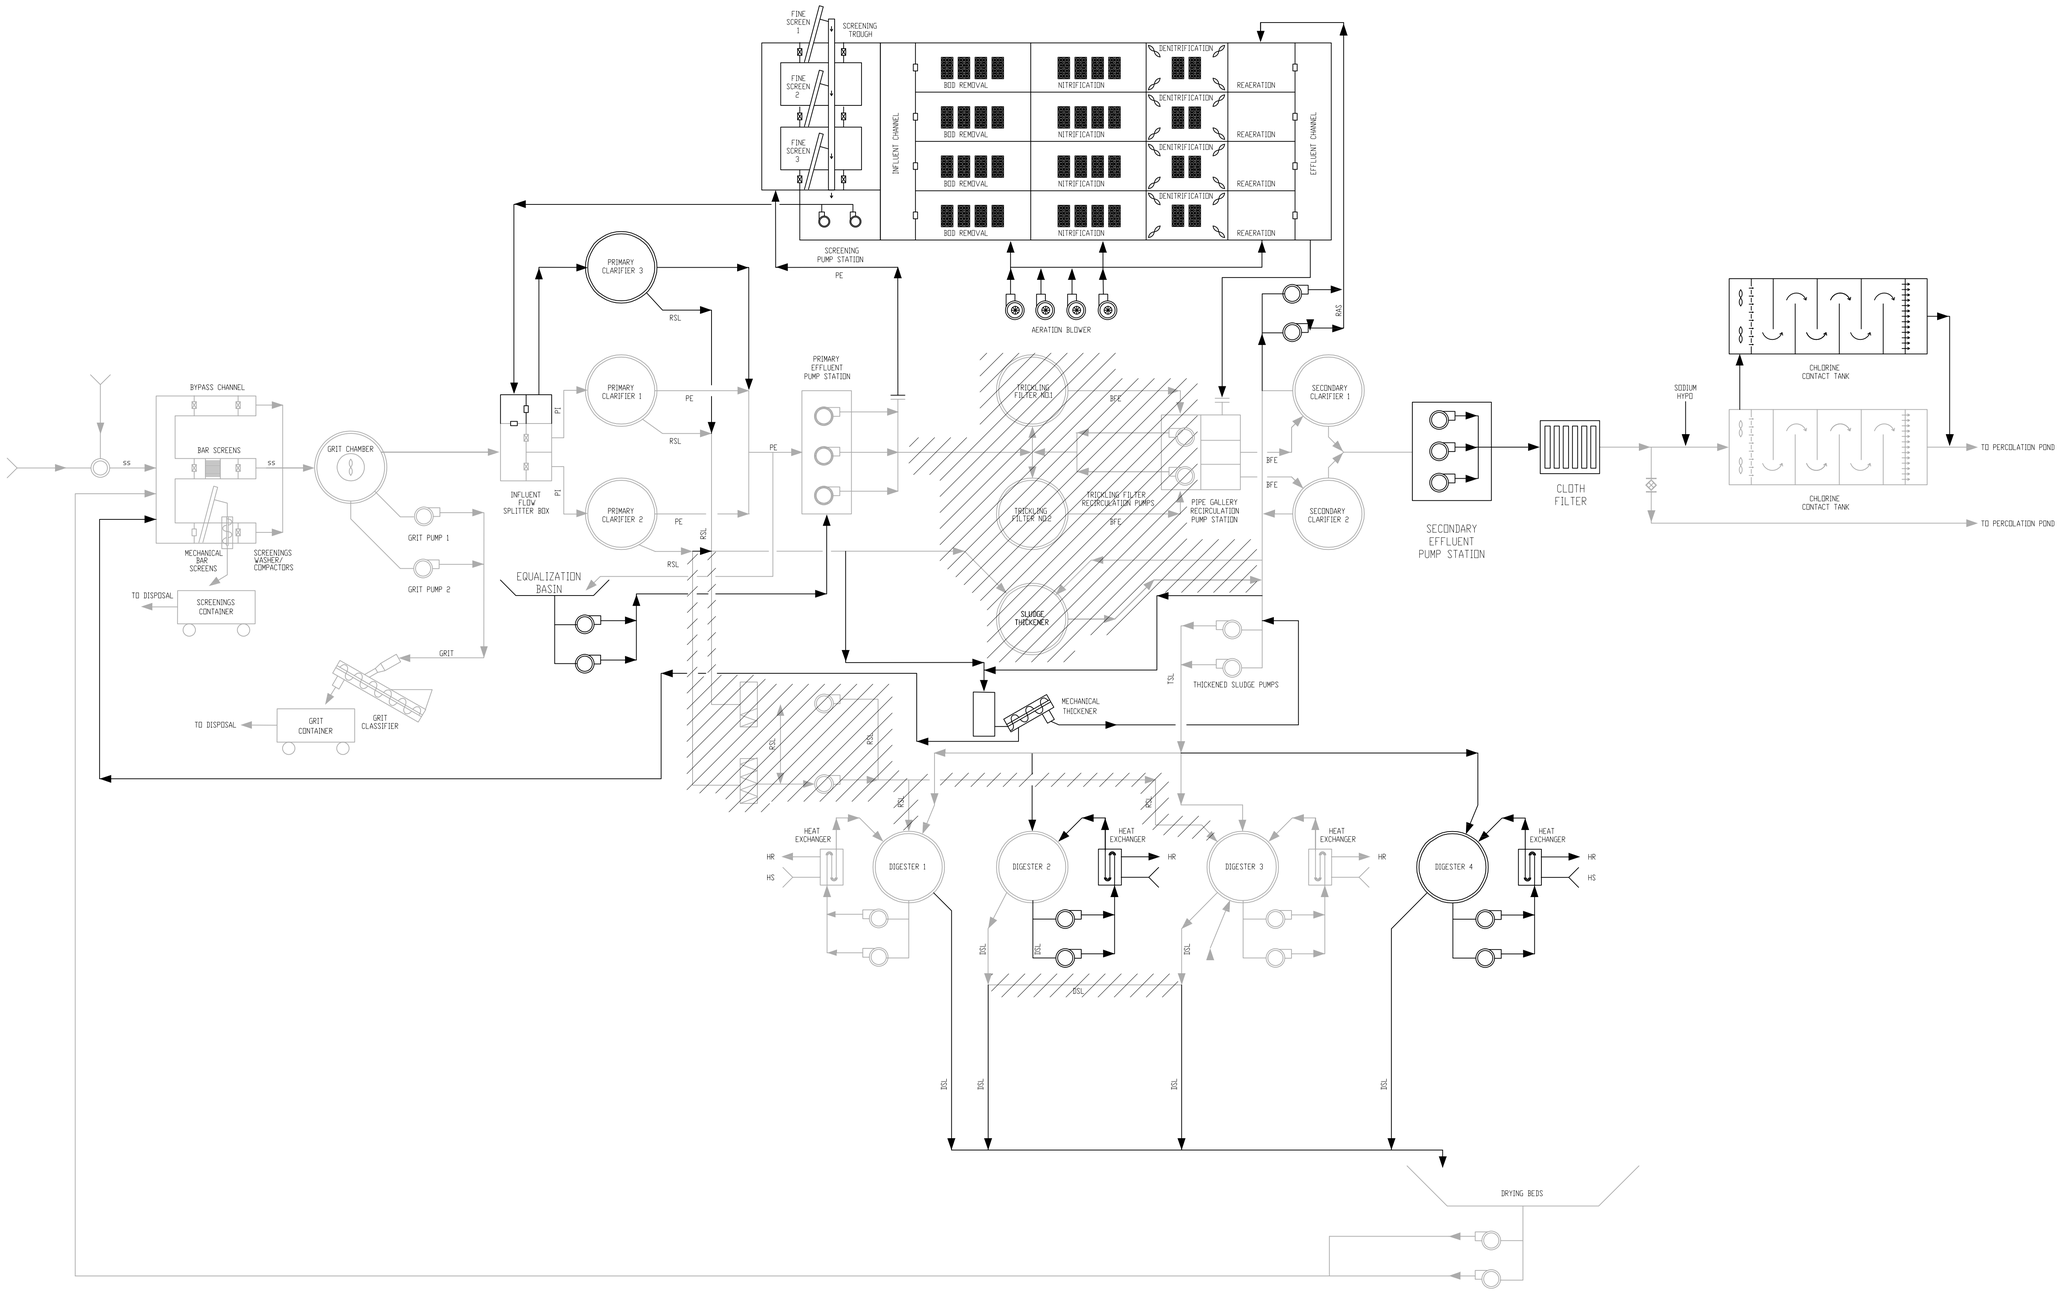
7.4. Alternative 4 Moving Bed Biofilm Reactor

The MBBR system is similar to the IFAS option, but the process configuration is slightly different. Plastic biocarriers are suspended in the aerobic and anoxic tanks to allow for microorganism growth. The primary effluent enters a common influent channel where flow is evenly distributed into the four tanks. The first tank is aerobic where heterotrophs are predominant and organic removal primarily occurs. The next tank is also aerobic but the conditions are enhanced for the growth of nitrifiers for ammonia removal. From here, wastewater enters the anoxic tank where denitrification occurs. With this process configuration, an external carbon source such as methanol or glycerol is added to promote denitrification. Alternatively, the City can reverse this process by having an anoxic tank upstream of the aeration tanks and utilize an internal recycle to maintain the carbon requirements for denitrification. This would decrease chemical costs, but increase power cost due to additional pumping requirements. A final, small polishing reaeration step is included to re-add oxygen back into the wastewater for the purpose of downstream



processes that require oxygen in the system. The secondary effluent is conveyed to the existing secondary clarifiers where a small portion of the sludge is returned to the reaeration tanks. The reactors will be equipped with media retention screens to keep the media elements from leaving the MBBR basins. A summary of the design characteristics for Alternative 4 is shown in Table 35. Modeled secondary effluent water quality is provided in Table 36. A tertiary filter is required to comply with Title 22 turbidity requirements. The proposed process flow diagram and site layout for Alternative 4 are shown in Figure 28 and Figure 29, respectively.

7.5. Alternative 5 Membrane Bioreactor

The MBR system combines conventional biological nutrient removal with the use of membranes for the separation of solids and treated effluent. The MBR process train is similar to Alternative 2 except that membranes replace the secondary clarifiers and tertiary filters. The design MLSS of the MBR system is much higher than Alternatives 2 – 4, which allows for greater treatment capacity per unit volume of the aeration basin. The EQ basin is an important upstream unit to create a steady flow, providing a relatively steady flux for membrane operation. One design note is that the high recycle from the membrane aeration zone impacts the denitrification ability and the carbon demand. Consequently, a tank will be provided to allow the DO to decrease by endogenous respiration before the recycle stream is returned to the anoxic zone.

Membrane fouling is controlled by several methods of cleaning which includes the chemical clean in place (CIP) system, relaxation, and air scouring. Chemical CIP cleaning is also referred to as

maintenance cleaning used to address irreversible fouling. This type of cleaning usually occurs at least 10 times a year and is completely automated; however, it can also be manually operated as needed. The membrane units are cleaned in place quickly by injecting a dilute solution of bleach into the permeate line which remains in the membranes for 1 to 3 hours and then the normal operation is resumed. During the cleaning of one basin, the other basins are left online and operated at a slightly higher flux rate as required to meet plant demand. Although this type of cleaning is efficient, the addition of chemicals will degrade any membrane material over time. Therefore, replacement of the membranes will be required.

There are two types of membranes available for wastewater applications: hollow fiber and flat sheet. Hollow fiber membranes are constructed of a microporous structure and are densely packed into tubes to create the membrane module. These tightly packed modules allow for high membrane surface areas and high outside pressure tolerance. Typically, flow is applied to the outside of the membranes and permeate is removed via the inner tube of the module. However, some manufacturers offer the opposite (in-out) flow pattern. The typical vacuum pressure applied to the hollow fiber membranes is around 10 pounds per square inch (psi). Flat sheet membranes are constructed of a paper like backing material with a membrane cast on the surface of the paper. These plates are submerged into the membrane tank, and permeate pass through the membrane from the outside in. The membranes allow the biofilm to attach and are continuously aerated to prevent solids buildup. A comparison of the predominant MBR equipment suppliers is provided in Table 38.

Table 38. MBR equipment supplier specification comparison

A summary of the capital, annual O&M, and 20-year life cycle costs for Alternative 5 is shown in Table 41. Annual O&M costs are based on power, chemical, and labor and maintenance. Chemical costs include NaOCl, polymer, citric acid, sodium bisulfite, and sodium hydroxide. Costs are based on the hollow fiber membrane type.

Table 41. Capital, O&M, and life cycle cost summary for Alternative 5

Cost Component	Cost
Capital	
EQ Basin	$2,008,000
Primary Clarifier	$1,701,000
Chlorination Tank	$1,097,000
Sludge Treatment	-
Lab and Control Building	$978,000
MBR	$28,415,000
Total Capital Cost	**$34,199,000**
Annual O&M	
Power	$527,000
Chemical	$221,000
Maintenance and Spare Parts	$138,000
Total O&M Cost	**$878,000**
20-Year Life Cycle Cost	
$67,206,000	

8. COMPARISON OF WASTEWATER TREATMENT ALTERNATIVES

A comprehensive summary of the capital, annual O&M, and 20-year life cycle costs for the wastewater treatment alternatives developed for the City of Banning is shown in Table 42. The 20-year life cycle cost shows that Alternative 1 is the least expensive alternative. This alternative is essentially the baseline scenario to comply with Board Order and Title 22 requirements at 3.6 MGD, and utilizes the existing treatment process as much as possible. However, this alternative provides the least flexibility regarding expected effluent water quality, particularly for BOD_5 and TN. If future discharge permit limits become more stringent, or other constituents, such as phosphorus, become regulated, upgrades to Alternative 1 would be challenging and costly.

Table 42. Cost comparison summary for the treatment alternatives

Treatment Alternative	Capital	Annual O&M	20-Year Life Cycle
Alternative 1 Trickling Filter	$10,394,000	$393,000	$20,623,000
Alternative 2 Activated Sludge	$30,099,000	$532,000	$43,941,000
Alternative 3 IFAS	$33,333,000	$631,000	$49,704,000
Alternative 4 MBBR	$23,317,000	$737,000	$42,395,000
Alternative 5 MBR	$34,199,000	$878,000	$67,206,000

The cost comparison summary identifies three groupings of the treatment alternatives. Alternative 1 is significantly the cheapest all-around option and is in its own grouping. Life cycle costs for alternatives 2 – 4 are within $7,000,000 of one another and utilize the same treatment process with slightly varied components that alter the overall process operation. As expected, Alternative 5 is the most expensive alternative since the MBR system produces the highest effluent water quality. Out of the second grouping, Alternative 4 provides the lowest capital and life cycle cost option due to the reduction in required tank size as compared to conventional activated sludge. The capital cost for Alternatives 2, 3, and 5 are relatively close to one another, but the annual O&M costs dictate which alternatives become more costly over a 20-year life cycle. In order to compare these groupings, a summary of the expected secondary effluent water quality is provided in Table 43. The concentrations presented do not reflect tertiary filter effluent to show the comparison between biological treatment systems.

Table 43. Secondary effluent water quality comparison for the treatment alternatives

Parameter	Secondary Treatment Effluent Concentration (mg/L)				
	Alternative 1 Trickling Filter	Alternative 2 Activated Sludge	Alternative 3 IFAS	Alternative 4 MBBR	Alternative 5 MBR
BOD_5	24.74	4.78	4.58	4.34	0.86
TSS	6.31	10.96	10.43	6.64	0
TN	9.92	7.49	7.40	8.00	7.74

All of the Alternatives comply with the Board Order requirements with respect to nitrogen. Alternatives 2 – 5 produce better water quality than Alternative 1, can meet possible more stringent discharge limits, and have better flexibility to stay in compliance if treatment efficiency degrades. Alternatives 2 – 4 produce very similar water quality in regards to BOD_5 and TN, but Alternative 4 has the lowest expected effluent TSS which will enhance the performance of tertiary filters. Alternative 5 produces the best all-around effluent water quality, and an additional tertiary filter is not required to comply with Title 22 requirements unlike Alternatives 1 – 4.

A breakdown of the required WWTP upgrades for each alternative is provided in Table 44. The EQ basin, primary clarifier, chlorination tank, and lab and control building costs are the same among the treatment alternatives. The tertiary filter cost is the same for Alternatives 1 – 4, and no tertiary filter is required for Alternative 5. The cost of the sludge treatment upgrades varies among all treatment alternatives. Alternatives 2, 3, and 5 do not require any additional anaerobic digesters while Alternatives 1 and 4 will require a new anaerobic digester as discussed in Section 6.5. Although Alternatives 2, 3, and 5 do not show any costs associated with sludge treatment, modifications to existing digester operation will need to be made and a new sludge thickener will be required.

Table 44. Unit operation cost comparison for the treatment alternatives

Unit	Alternative 1 Trickling Filter	Alternative 2 Activated Sludge	Alternative 3 IFAS	Alternative 4 MBBR	Alternative 5 MBR
EQ Basin	$2,008,000	$2,008,000	$2,008,000	$2,008,000	$2,008,000
Primary Clarifier	$1,701,000	$1,701,000	$1,701,000	$1,701,000	$1,701,000
Tertiary Filter	$1,814,000	$1,814,000	$1,814,000	$1,814,000	-
Chlorination Tank	$1,097,000	$1,097,000	$1,097,000	$1,097,000	$1,097,000
Sludge Treatment	$1,400,000	-	-	$1,203,000	-

Unit	Alternative 1 Trickling Filter	Alternative 2 Activated Sludge	Alternative 3 IFAS	Alternative 4 MBBR	Alternative 5 MBR
Lab Building	$978,000	$978,000	$978,000	$978,000	$978,000
TF Modifications	$1,396,000	-	-	-	-
Activated Sludge	-	$22,501,000	-	-	-
IFAS	-	-	$25,735,000	-	-
MBBR	-	-	-	$14,516,000	-
MBR	-	-	-	-	$28,415,000
Total	**$10,394,000**	**$30,099,000**	**$33,333,000**	**$23,317,000**	**$34,199,000**

All of the proposed treatment alternatives are designed to meet the Board Order proposed limit of 10 mg/L TN. However, the total construction costs per tons of nitrogen removed varies between each option, and will give the City data to determine what is the most cost-effective alternative for nitrogen removal. Table 45 shows the comparison of total project construction cost and total cost of the biological system only per ton of nitrogen removed per year. Since the infrastructure of Alternative 1 is already in place, the $/tons/year is significantly less than Alternatives 2 – 5. However, based on the total cost per ton of nitrogen removal, Alternative 4 offers the best value to comply with the Board Order and to produce recycled water.

Table 45. Comparison of total cost per ton of nitrogen removed

Alternative	Mass TN Removed	Total Cost per Nitrogen Removed	Biological Process Cost per Nitrogen Removed
	tons/year	$/tons/yr	$/tons/yr
Alternative 1 Trickling Filter	192	$54,118	$7,268
Alternative 2 Activated Sludge	205	$146,562	$109,565
Alternative 3 IFAS	206	$161,921	$125,012
Alternative 4 MBBR	203	$115,103	$71,657
Alternative 5 MBR	204	$167,643	$139,290

9. SUMMARY OF ANALYSIS

On February 12, 2019, City and Montrose staff presented the preliminary results of the nitrogen removal evaluation to the City Council. A summary of the key points drawn from the nitrogen removal alternatives analysis, City staff input, and City Council input is provided below.

- Any decision to implement the selected treatment alternative must take into consideration not only costs, but also the following:
    1. When will the City actually see an average flow of 3.6 MGD? Based on the 2018 City Integrated Master Plan, the average daily flow is forecasted to be 2.80 MGD in 2025 and 4.29 MGD by 2040. Based on these projections, 3.6 MGD would not happen until 2032.
    2. When will the Regional Water Quality Control Board require the City WWTP to comply with the total nitrogen limit?
    3. When does the City plan to start using recycled water for irrigation or recharge purposes? The Beaumont Basin has a 330 mg/L TDS and 5 mg/L nitrate limit in the groundwater. To achieve the 330 mg/L TDS limit, WWTP effluent may require treatment by reverse osmosis.
    4. Would the City ever consider direct potable reuse for water supply augmentation?
    5. Do we expect to observe more stringent water quality requirements in the future? Alternatively, will the Regional Board consider raising the TN limits if there are no adverse impacts to groundwater quality?
    6. How will the beneficial reuse of recycled water affect the underlying groundwater in the basin? What levels of water quality are required to remain in compliance with the non-degradation standards of the region?
- The WWTP will require the following upgrades to treat an average daily flow of 3.6 MGD:
    1. Installation of a new equalization basin to handle daily flow fluctuations.
    2. Construct one new primary clarifier to provide redundancy.
    3. Increase sludge treatment capacity by installing a new mechanical thickener and new anaerobic digesters.
    4. The existing lab building is old and needs upgrades, and the control building will become obsolete once the WWTP SCADA system is upgraded. A new lab and control building are included in the cost evaluation.
- The cost evaluation suggests that Alternative 1 (increase trickling filter recirculation rate) is the cheapest option available to comply with Board Order and Title 22 requirements. However, this option has the least flexibility meeting discharge limits, and the existing trickling filter components are old and will require structure upgrades within 20 years. Therefore, this alternative is not recommended for future implementation.

- Alternatives 2 – 4 are similar in cost and operation. Among them,
    1. Alternative 3 (IFAS) is the costliest alternative without providing significant advantages in the effluent water quality or operational simplicity, so it should be eliminated from consideration.
    2. Alternative 2 (CAS) are ubiquitous throughout the United States, are reliable to meet discharge limits, easy to operate, and have the ability to be upgraded with IFAS or MBBR in the future if required. However, these systems require a larger footprint as compared to Alternative 4 to meet effluent requirements.
    3. Alternative 4 (MBBR) produces the best secondary effluent water quality out of these three alternatives and is the lowest capital and life cycle cost option. Alternative 4 is slightly more complex to operate, requires an external carbon input, and the number of municipal installations in the United States is significantly less than Alternative 2. However, due to the significantly lower capital cost of the MBBR system and the resiliency and reliability to meet discharge limits, Alternative 4 is recommended to be considered for future implementation.
- Alternative 5 (MBR) is the most expensive alternative, but it produces the best water quality. With advances in technology, the MBR system can be operated fairly autonomously and does not require much operator input. Alternative 5 sets the City up for any changes to discharge or reuse requirements in the future, and can produce recycled water without the use of tertiary filters. Additionally, if the City requires TDS removal, a reverse osmosis treatment train can be implemented post MBR. Alternative 5 offers the City the most flexibility regarding end uses, but comes at a significantly higher cost than the other treatment alternatives. The City is familiar with the design of MBRs based on the 90% design of an MBR facility in 2007.

10. IMPLEMENTATION PLAN

There are several matters the City needs to consider when selecting the most suitable option, such as nitrogen compliance, production of recycled water, fees associated with development in the City, population growth, future regulatory requirements, and the ability to increase water and sewer rates to customers to pay for the WWTP upgrades. Several progress meetings have been held with the City during which the design team and the City discussed the wastewater treatment alternatives evaluated in this Nitrogen Removal Feasibility Study. Based on the outcome of these discussions and the proposed regulatory requirements, Alternative 4, Moving Bed Biofilm Reactor is recommended for implementation at the City WWTP.

Alternative 4 not only successfully achieves Board Order nitrogen limits, but also is the most reasonably priced, reliable treatment alternative. This option will result in immediate Board Order and Title 22 compliance while offering a low-cost solution relative to other alternatives. Furthermore, this approach accounts for more stringent discharge limits in the future since more media can be added to the aerobic and anoxic tanks to increase treatment capacity, and the process can be modified to meet specified discharge limits. If the City determines immediate Board Order compliance is required and production of recycled water can be delayed, the construction of the cloth media filters and the chlorination tank upgrades could be deferred. While this phased approach option can save the City several million dollars in upfront capital costs, in the long run the overall project cost would be significantly higher.

Although there are few MBBR municipal installations in California, there are plenty of installations in the northern parts of the United States and in Canada where cold weather significantly affects organic and nitrogen removal performance of wastewater treatment systems. Municipal MBBR installations are starting to increase in the southern parts of the United States where organic discharge limits are tightened, and nutrient effluent requirements are implemented. Additionally, MBBR systems are widely used in the industrial wastewater treatment sector as these systems have the ability to accommodate high-strength wastewater loads in small footprints.

Alternatively, if more stringent regulations are expected and/or future indirect potable reuse is desired, Alternative 5, MBR, should be considered. As mentioned, MBR is the most advanced and reliable technology available, producing the best water quality for future reuse or groundwater recharge. If TDS removal is required in the future, the WWTP can be readily upgraded as pretreatment for reverse osmosis membranes. Since the City is considered a disadvantaged community, it may be difficult for it to receive funding for this alternative. It should also be noted that Alternative 5 is the costliest, and grants from the State of California will likely be required for its implementation.

Once the project is ready to commence, several implementation options are available. If the City uses a traditional Design-Bid-Build (DBB) method, it is estimated that the final design will be completed in ten months, permitting nine months, and construction and start-up be completed within sixteen months. By using the DBB method the estimated overall project schedule would be approximately 3 years including time to prepare and award the engineering design and construction contracts. Upgrades to the wastewater treatment plant would begin after the Regional Board reviews this feasibility study, and the proposed nitrogen and TDS limits are finalized. A preliminary implementation schedule utilizing the DBB method is provided in Figure 32. Alternative delivery methods, such as a Design-Build (DB) approach, can reduce the overall project timeline by one year, saving project costs by 10 – 20%. Overall, the DB method would minimize project costs by reducing the design and construction timeline, equipment costs by giving buying power to the contractor, and the number of change orders. Further, by using a DB method the involvement of a third party is not required for construction management.

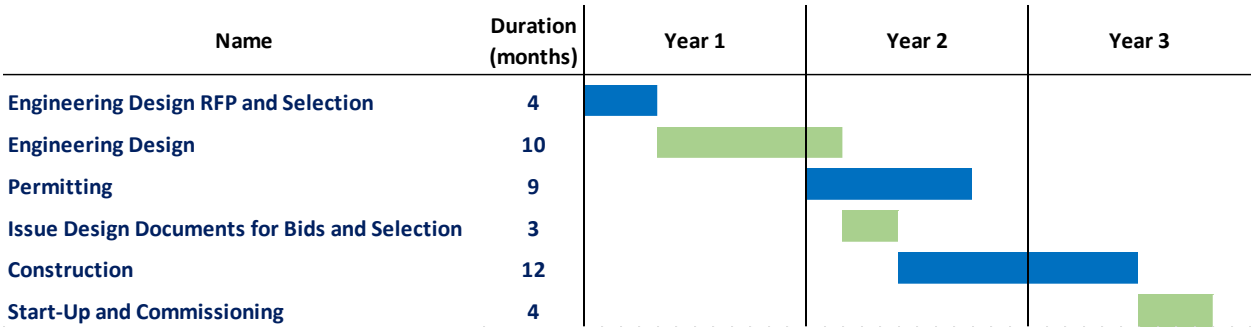

Figure 32. Preliminary implementation schedule utilizing the traditional Design-Bid-Build method

Banning, CA 92220

Subject: Notice of Funding Opportunity No. R23AS00464 – WaterSMART: Title XVI Water Infrastructure Improvements for the Nation (WIIN) Act Water Reclamation and Reuse Projects – Your Application Titled, "Critical Wastewater Treatment Recycled Water Upgrades"

Dear Mr. Art Vela:

The Bureau of Reclamation (Reclamation) is pleased to inform you that your application, submitted by the second application due date of September 30, 2024, for the WaterSMART: Title XVI WIIN Act Water Reclamation and Reuse Projects Funding Opportunity was among those receiving the highest ratings and is now being considered for award with funding available under the Bipartisan Infrastructure Law (BIL), P.L. 117-58. Reclamation anticipates awarding Federal funds in the amount of $16,194,576 for your project.

In working with you to develop your financial assistance agreement, Reclamation will closely review the activities outlined in your proposal to ensure that activities eligible for funding are identified and that the proposed costs are allowable under financial assistance regulations and the Notice of Funding Opportunity (NOFO). If some costs or activities are determined to be ineligible or unallowable, Reclamation will work with you to refine the scope of work and budget for the project. In addition, Reclamation must have sufficient evidence prior to award that non-Federal cost share will be available. The final funding amount may be adjusted if necessary. Please note that a small portion of this amount may be set aside for Reclamation to ensure the project's Federal regulatory and statutory compliance, and to otherwise oversee the implementation of the project.

All new financial assistance awards for infrastructure projects must meet Buy America requirements. Office of Management and Budget (OMB) implementing guidance states that the Buy America provisions apply to projects carried out through Bipartisan Infrastructure Law (BIL) funding and annual appropriations. See OMB Memorandum M-22-11 for further details. Section 41101 of the BIL requires that all laborers and mechanics employed by contractors or subcontractor in the performance of construction, alteration, or repair work on a project assisted in whole or in part by funding made available under the BIL shall be paid wages at rates not less than those prevailing on similar projects in

the locality, as determined by the Secretary of Labor in accordance with Subchapter IV of Chapter 31 of Title 40, United States Code (commonly referred to as the Davis-Bacon Act).

All projects being considered for award of funding are required to comply with all Federal environmental and cultural resource requirements, including the National Environmental Policy Act, Endangered Species Act, Clean Water Act, and the National Historic Preservation Act. Ground-disturbing activities of any type, including fieldwork, monitoring or other activities may not occur until Reclamation has determined that all environmental and cultural resource compliance is complete.

In addition, funding for construction activities will not be released until Reclamation makes a determination of financial capability for the project.

The Reclamation regional or area office that will be responsible for awarding and administering your agreement will contact you in the coming months to finalize your award. In the meantime, if you have any questions regarding the process or your agreement, please contact Viranousack (Alex) Soubannarath, Lower Colorado Basin Regional Title XVI Coordinator, at (951) 695-5310 or vsoubannarath@usbr.gov.

Thank you for your interest and participation in the WaterSMART: Water Recycling and Desalination Programs. The success of the Title XVI Program depends on collaboration with partners to improve the reliability of water supplies.

Sincerely,

/s/ Diana Blake
Grants Officer

PROPOSAL

Design and Construction of the City of Banning Wastewater Treatment Plant and Recycled Water Project

Prepared by:
AECOM/W. M. LYLES CO.,

Proposal for Progressive Design-Build Services for the City of Banning Wastewater Treatment Plant and Recycled Water Upgrades Project - RFP-24-074

We are excited by the opportunity to become a trusted partner of the City in developing the most cost-effective solution for your wastewater treatment plant upgrades that will minimize impacts to your rate payers while at the same time, provide a long-term solution to support community growth. Our team has worked hard to find **design-to-budget ideas for your project and we are confident that the solutions we present in our proposal can save the City$10M+** compared to the original concept. Highlights of our proposal include:

- **Experts skilled in progressive design-build and MBR systems.** AECOM/Lyles have worked together on numerous progressive design-build treatment plant upgrade projects totaling over $1B, as well as many MBR systems. These past experiences allow us to work together seamlessly to deliver your project and hone in on the biggest cost items, optimizing the budget for the City.
- **Experience with San Gorgonio Pass and desert communities.** From our wealth of experience delivering similar projects in surrounding communities (including Beaumont), we have a strong appreciation for pragmatic solutions that work for you.
- **A proven progressive design-build management approach.** We know how to streamline the crucial Phase 1 activities so that collaboration is fostered while still making timely decisions to maintain the overall project schedule. We are committed to a transparent Guaranteed Maximum Price (GMP) presentation and converting this project from Phase 1 to Phase 2.
- **Design to Budget Ideas that offer real savings.** We have left no stone unturned in looking at ways to save the City money while still achieving your project goals. From optimizing basin sizing, to finding a creative way to forego the reverse osmosis (RO) system, we offer the City ways to lessen the impact to your rate payers, while maintaining the resiliency to accommodate local population growth and future permit expectations.
- **A dedication to a quality project.** Our design to budget ideas do not come at a cost of quality or impacting the City's options in the future. We are committed to using proven vendors and quality suppliers and our design provides for easy future expansion with low capital expenditure.
- **Our corporate commitment to make this a success for the City.** We are committing the team provided herein for the duration of the project. We have learned that team continuity throughout the duration is critical to the overall project success and delivering the lowest total project cost.

Single Point of Contact for AECOM/Lyles – Project Manager Joe Lawrence is the single point of contact for the team, ensuring clear communication and streamlined project management.

Joe Lawrence
Design-Build Project Manager
26501 Madison Avenue
Murrieta, CA 92562
T: 916.644.9487 | E: jlawrence@wmlylesco.com

We appreciate the City using an industry standard template as the basis for the sample agreement, and we are confident that we can negotiate a contract with the City for this project. We also confirm that we have read and understood all elements of the RFP. Furthermore, in our cost proposal, we have provided a detailed scope of work of our services.

Bonding and Sureties – The AECOM/Lyles team confirms we will meet the bonding requirements outlined in the Request for Proposal (RFP). We have included in our proposal a Surety Letter of Intent and the *Proposal Bid Bond* as required in RFP section IV.E.

Financial Capacity – Both AECOM and Lyles confirm there are no changes in our firms' financial capacities and bonding capabilities. The financial statements included in our SOQ are the most current and there are no changes in our standings.

CEQA, Funding, and PLA Compliance – The AECOM/Lyles JV confirms we have reviewed the *CEQA, Funding, and PLA Compliance* requirements, signed and included the form in our proposal uploads in your procurement system, and agree to comply with the terms and conditions.

Per the instructions in the Request for Proposal, our Part V Phase 1 Cost Proposal has been submitted as a separate file. Part VI Required Forms have been completed and uploaded into the OpenGov procurement system.

We have assembled a truly collaborative and integrated team. We look forward to sharing more details on our proposal during the interview. AECOM/Lyles appreciates the time and commitment the City has invested in this procurement process and appreciate you meeting with our team during our proposal development. **Our goal as the City's of Banning's trusted partner is to implement a "no surprises" and "design to budget" commitment throughout the project. This can only happen through effective, open and transparent communication and we look forward to working side-by side with the City in delivering this project.** Thank you for your consideration.

Respectfully submitted,

AECOM/Lyles Joint Venture

PART II

Project Team, Experience, and Approach

The AECOM/Lyles Team presented in our SOQ is 100% committed to the success of the City's WWTP and Recycled Water Upgrade project—from day one to day done.

"I am fully committed to collaborating with the City for the next several years to continue the implementation and construction of Banning's WWTP project, ensuring a safe and sustainable wastewater and recycled water system for decades to come.

– Joe Lawrence
Design-Build Project Manager

"I'm looking forward to this exciting partnership with the City of Banning where we explore cost-effective solutions, keeping the rate payers in mind at every step as we design to budget for this important project.

– Gabriel Perigault
Design Manager

"I pledge to open lines of communication with all stakeholders, including operations staff, to keep construction moving on the project and deliver first-class facilities of the highest quality, on budget and schedule – with no surprises.

– Marcos Reyes
Construction Manager

Key Project Personnel

As presented in our SOQ, the AECOM/Lyles key personnel have delivered together on design-build treatment projects in California with significant upgrade and maintenance of plant operations considerations, bringing demonstrated efficiency and collaboration to the City. Our management team—along with Treatment Process Design Lead Alex Franchi, Preconstruction Manager Vince Guillama, Construction Superintendent Anthony Pilato, Commissioning Lead Vijay Kumar, and other team members—remain fully committed to meeting all of the project objectives detailed in the City's RFP.

Team Enhancement

We are presenting one key team member enhancement in **Joe Lawrence as our Design-Build Project Manager**. Joe has a distinguished career in the water/wastewater industry, with 22 years of experience managing design-build projects for public and private water and wastewater treatment facilities. Throughout his career, Joe has been involved in all aspects of project delivery including project management, preconstruction services, cost control and budgeting, construction implementation, and start-up and commissioning on numerous alternative delivery projects, including design-build and progressive design-build projects. Many of these projects involved collaboration with the same AECOM/Lyles JV team we are proposing for this project.

While we have **NO CHANGE to the rest of our team or any of the key staff presented in our SOQ**, our team will be further enhanced during contracting efforts with disadvantaged subconsultants from our Good Faith Outreach efforts. We pledge to meet any goals required by the City and/or different funding sources and grants.

On the next page is an update to our organizational chart (Figure II-1) highlighting the enhancements to our team. We have also included a brief biography for our project manager Joe Lawrence that summarizes his qualifications. We would be happy to provide resumes for all of our team members at the City's request. **All other components of our team and SOQ remain unchanged.**

Benefits of the AECOM/Lyles Team

- ✓ **Extensive resources** that are fully committed to this project
- ✓ **Simultaneous and direct access to design and construction resources** at all times through our integrated joint venture
- ✓ **A team that has successfully worked together** to deliver other projects in the region
- ✓ **Proven ability to partner with owners through their first progressive design-build and get to Phase 2** without exercising the "off-ramp"
- ✓ **Collaborative design process:** price, constructability, operability are considered holistically
- ✓ **Innovative concepts** to minimize total project cost such as right-sizing tankage
- ✓ **Staff continuity** through all project phases
- ✓ **Maintain ongoing plant operations** with detailed construction sequencing
- ✓ **Comprehensive start-up and commissioning plan** to ensure operations staff is trained to operated the new facility

Enhancing our Team... *"W.M. Lyles Co., led by the exceptional project management of Mr. Joe Lawrence, delivered outstanding quality and expertise on the Galt WWTP Tertiary Filtration, UV Disinfection and Biosolids Improvements Project. Joe's leadership ensured timely completion within the 206-day timeline and minimal change orders. We're eager to collaborate with Joe and the W. M. Lyles Co. team again on future projects."* - James Boarer, P.E., Construction Manager, PSOMAS

Joe Lawrence

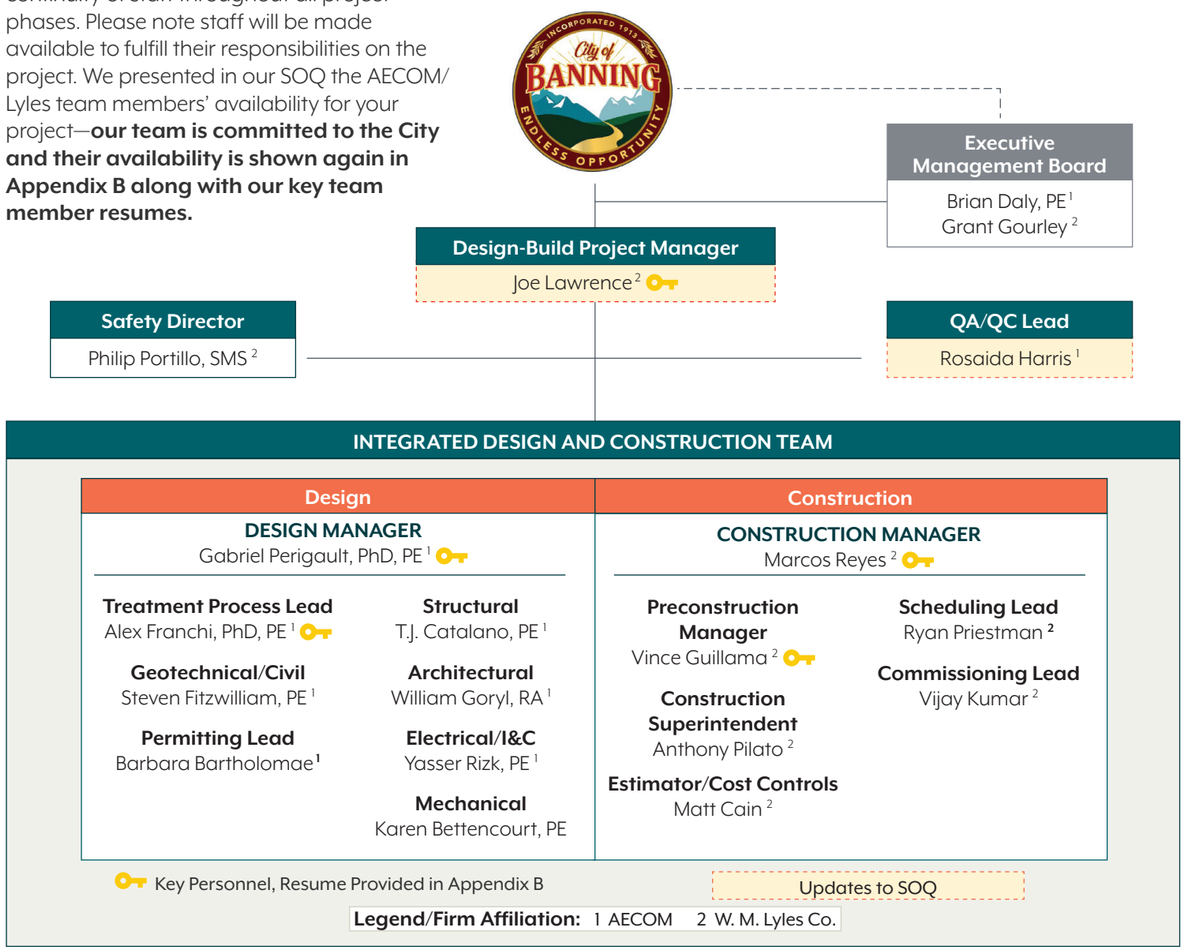
Design-Build Project Manager

Joe is a Senior Vice President at W. M. Lyles and Collaborative Delivery Manager with over 22 years of experience in managing and delivering large-scale water and wastewater treatment projects. He has a proven track record in pre-construction planning, project management, pre-construction services, cost control and budgeting, construction implementation, and start-up and commissioning on numerous design-build and progressive design-build projects. Joe is committed to delivering high-quality infrastructure while leading teams and managing complex project requirements.

Why Joe?

- ✓ Involved in every design-build project completed by AECOM WML in the last 15 years
- ✓ Brings expertise in **collaboration** and working with the team to **design to budget** for project success
- ✓ Met multiple times with the City of Banning and **understands the solutions** to upgrading the existing wastewater treatment plant
- ✓ Advanced understanding of various delivery methods, including design-build and progressive design-build
- ✓ Deep technical expertise, particularly in SCADA upgrades, biological treatment, tertiary filtration, and disinfection processes

Highly experienced progressive design-build project manager working on WWTP upgrades similar to the City of Banning



Joe brings 20+ years of experience in managing wastewater treatment plant upgrades with a primary focus on collaborative delivery. He brings detailed preconstruction phase and estimating experience combined with years of heavy civil construction and start-up and commissioning for water/wastewater infrastructure. He understands each step of the project lifecycle and how to lead a high-functioning team. **Joe has been working closely with AECOM for the past 15 years on design-build projects such as:**

- East County Advanced Water Purification (ECAWP) Packages 1 and 3 Progressive Design-Build
- City of Stockton Regional Wastewater Control Facility Progressive Design-Build Upgrades
- City of Davis Wastewater Treatment Plant Secondary and Tertiary Improvements, Design-Build
- City of Santa Cruz Graham Hill Water Treatment Plant Upgrades Progressive Design-Build

AECOM/Lyles project personnel are available to start work immediately and are committed to the City of Banning for the duration of your project

Figure 2-1: Organization Chart

Our combined organization promotes the continuity of staff throughout all project phases. Please note staff will be made available to fulfill their responsibilities on the project. We presented in our SOQ the AECOM/Lyles team members' availability for your project—**our team is committed to the City and their availability is shown again in Appendix B along with our key team member resumes.**

Good Faith Efforts

At AECOM/Lyles, we are dedicated to fostering diversity and inclusion through active engagement with Disadvantaged Business Enterprises (DBEs). Our comprehensive outreach strategy, including advertised public events, ensures economic growth and equal opportunity. We host public outreach events to share information on collaborative projects, maximizing participation from both local and competitive environments. For example, at Hi-Desert Water District, our open house with local unions, businesses, subcontractors, and the public resulted in multiple bids and met all SRF grant requirements. **For this project, we placed legal notice ads announcing the DBE opportunity in the Banning Record Gazette and performed searches on four websites (CA.GOV, DOT.CA, SBA, and CalTrans), resulting in solicitation of 1,223 DBEs. From that outreach effort, 21 DBEs have expressed interest in bidding.**

Team Experience

The AECOM/Lyles team has NO CHANGE to our project experience. The information presented in our Statement of Qualifications (SOQ) demonstrates a long history of working on design-build projects together as well as unmatched local experience working on similar projects for similar clients in Southern California. Table II-1 below summarizes the client reference projects previously presented. **Additional recent successful projects include the CR&R Riverside County Environmental Center in Perris, the Victor Valley Waste to Energy project in Victorville, Morongo WWTP in Cabazon, Beaumont, Hi-Desert, Yucaipa, Palm Springs and Lytle Creek WWTPs, all of which showcase our team's deep-rooted understanding of the local area.**

BEST for BANNING

Our team has prioritized this project over other opportunities in the marketplace. We have been tracking this project for 3+ years because the City is the type of client we want to work for—a pragmatic desert community looking to make every dollar count.

Table 2-1. Summary of Project Experience presented in our Statement of Qualifications

Project Name/Location	Scope of Services	Relevance	Self Performance Level	Similar Performance Criteria
East County Advanced Water Purification Progressive Design-Build, Santee, CA AECOM/Lyles JV	Progressive Design-Build for WWTP and AWT	Reuse, RO, New Plant, PDB, T22 compliance	78%	☑
S1 WWTP Improvements Progressive Design-Build Rialto, CA AECOM/Lyles JV	Progressive Design-Build of WWTP improvements	Design to Budget, significant cost savings realized	75%	☑
Regional WPCF Upgrades Progressive Design-Build Stockton, CA AECOM/Lyles JV	Progressive Design-Build of WWTP improvements	Design to Budget, adjusted GMP to meet Client's goals	78%	☑
WWTP Salt Mitigation Upgrade Project Beaumont, CA W. M. Lyles	Construction of treatment plant upgrades including MBR	Neighboring community facing similar challenges	78%	☑
HDWD Wastewater Reclamation Facility Progressive Design-Build Yucca Valley, CA W. M. Lyles	Progressive Design-Build of treatment plant including MBR and UV	Design to Budget, $2M in cost VE cost savings	75%	☑

Imperial Wastewater Treatment Plant Upgrade

Additional Project Experience

This comprehensive project for the City of Imperial, completed in 2021 by Lyles, involved significant upgrades to the existing WWTP:

- Upgrades to the existing influent pump station and the construction of several new facilities
- New facilities included a grit structure, aeration basins, **MBR facility**, and dewatering facility
- Designed to efficiently process an average daily flow of 2.4 million gallons of wastewater
- Initial stages involved demolition of an existing aeration basin, setting up a shoring and dewatering system, and excavating 15,000 cubic yards of earthwork
- The team then installed approximately 5,500 lineal feet of below-grade piping and constructed the aeration basins, membrane bioreactor basins, and the slab for the dewatering facility building
- The final stages involved the completion of the membrane bioreactor facility and installation of the above-grade process mechanical piping and equipment

Approach

Key staff have delivered together on progressive design-build wastewater projects and projects in the San Gorgonio Pass and desert areas, bringing lessons learned and collaboration to the City

Management of the Project Team

The AECOM/Lyles team has no other companies as part of our core team at this time. We have advertised this project for 30 days in the Press Empire and, if selected, we intend to add small business firms, such as surveyors, drillers and geotechnical firms, during Phase One to meet City goals and grant/funding source requirements.

As presented in our SOQ and reaffirmed in the previous subsection, the AECOM/Lyles key personnel have delivered together on design-build treatment projects in California. The team has **successfully employed designing-to-budget** on other projects and will work in close collaboration with City staff and its advisory team to implement this proven approach.

How Key Staff will Interact in a Collaborative Manner

The AECOM/Lyles team will be led by **Design-Build Project Manager Joe Lawrence.** Joe will bring his 22+ years of experience with water/wastewater treatment plant construction in California. Joe will have overall accountability and day to day contact with the City and your advisors through the entire project.

Design Manager Gabriel Perigault will lead the overall design of the project. He will work closely with the preconstruction and construction teams and your staff to deliver a design that meets your budget. He will lead the technical workshops that are associate with our collaborative approach. Gabriel has managed the design for numerous water and wastewater facilities, including the recent Davis, Rialto and Stockton WWTP design-build projects delivered with Lyles. With 30+ years of experience and a leader in innovative treatment technologies including MBR systems, he will guide the team and provide the City with a project that provides reliable performance while optimizing capital and operational expenses.

BEST for **BANNING**

Being a highly experienced, integrated 50/50 JV team functioning as one entity, our business operating culture is truly collaborative with all parties dedicated to the same goal of designing to a budget. This is in stark contrast to other DB entities who will have designers subcontracted to a general contractor.

Treatment Process Lead Alex Franchi will lead the treatment process train scheme and the technical details related to the MBR and disinfection systems. He will coordinate with Gabriel, Vince and the rest of the team to make sure the most cost-effective technical solutions are brought forward and he will be on point for discussions with critical technology vendors to ensure our design and the scope of supply align.

Preconstruction Manager Vince Guillama will work closely with Mike, Gabriel and the City's team to establish the initial project estimate and update it regularly as design decisions are made and the scope is finalized. He will also work closely with Construction Manager Marcos Reyes in developing and maintaining the project schedule. Vince is a proven collaborator in this role, having provided preconstruction services for a multitude of DB projects, notably the City of Davis, City of Santa Cruz, East County AWP (1&3), and City of Stockton Projects, all undertaken as part of the AECOM/Lyles JV.

Construction Manager Marcos Reyes will participate in constructability and VE reviews during Phase One. He will work with Vince in maintaining the project schedule. During Phase Two, he will oversee the construction of the upgrades. Marcos has over 15 years of experience managing construction of wastewater facilities. He is currently serving as WRF Construction Manager for the ECAWP Project, following his successful role as Construction Manager on the $25M Rialto WWTP Project (also operated by Veolia), both in collaboration with AECOM.

Constructability, Operability, Maintainability, Durability, Sustainability, VE, and Efficiency of Design and Construction

Applying the best aspects of progressive design-build. Our approach builds upon the work completed by the City and our concept is a starting point for discussions with the City's team (see Part 3). We applaud the City's approach to use the progressive design-build (PDB) model and we know that collaborative, cost-centric discussions will drive best solutions. We are no strangers to this process with PDB projects completed and underway in Rialto, Stockton, and the ECAWP program in Santee. Phase One management elements will be focused on workshops, design development, price certainty and construction sequencing. Preconstruction Manager Vince Guillama and Construction Manager Marcos Reyes will participate in the VE sessions and constructability reviews to provide their input.

Our JV will use Primavera P6 to track the schedule and adjust as needed. The meetings and workshops schedule will be critical in driving technical decisions to maintain overall project schedule and designing to budget as the primary goal through direct presentation of cost impacts as they relate to specific options. Details on our approach to both Phase One and Two are presented in the following subsections.

Phase One Approach

Our design to budget approach starts with a detailed agreement of the process train and **we will leverage vendor provided designs when they provide capital and operational benefits**.

Our scope and initial estimate will establish the City's the must have scope items. We will also make separate list of wish list items that can be added into the project during Phase One, as the budget allows.

Building on the baseline cost and critical guardrails established from the programming workshop, we will step through the workshop process. The baseline cost model will be used to measure alternatives or modifications against the initial layout to compare costs associated with alternative concepts, equipment or approaches that may be contemplated during the workshop process. Decision Log maintains positive momentum and serves as a go-to reference point so that decisions aren't constantly revisited.

We will use a clear process that documents agreed upon elements in the Decision Log to maintain positive project momentum. Elements that need adjustments or a different alternative will be vetted, refined and brought back to the City at a future meeting. We have learned that having a baseline upon which to compare "real-time" options allows the entire team to make educated, value-based decisions with the total project cost in mind. A critical Lesson Learned by our team is the importance of having sufficient engineering and planning budget. The additional effort placed on Phase 1 will result in significantly lower total project costs through sound decision making and review of total project lifecycle costs

BEST for BANNING

Our proven approach for PDB projects starts with an initial estimate that is based on real numbers from similar projects plus market outreach. The estimate is updated regularly, allowing the City to make value based decisions so there is no surprises at the GMP.

Disciplined cost accounting controls are the essential responsibility of the Project Manager in Phase One as engineering progresses to 100%. Weekly Estimates to Complete (ETC) are tracked by the Project Manager with weekly design cost reporting prepared by the JV controls team. Design to budget efforts is continual with regular construction cost and schedule adjustments reflected in the outcomes of design workshops, equipment/materials market interaction and early subcontractor inclusion.

As described later in this Section under the Collaboration heading, **we envision a workshop process to involve the City and its advisors to make the above decisions. The workshops will also be a key way we obtain operations team input and get feedback when finalizing equipment selection**.

PROVEN INNOVATION TO DRIVE DOWN PROJECT COSTS

Our VE and optioneering efforts on other design-build projects has resulted in an average savings to clients of 21% when comparing our solution to the owner's original concept

BEST for BANNING

OPTIMIZING DESIGN-TO-BUDGET THROUGH CREATIVE CONCEPTS

We recognize that all projects face some level of financial pressure. To this end we have already begun looking at potential alternatives to to meet the City's desired project budget. While these alternative will be developed more comprehensively during the phase 1 activities, we present a number of these in detail in Part III as a sign of commitment to the City that we take this responsibility seriously:

- ✓ **Right-sizing tankage and basins to save cost.** Our modeling and analysis shows that the sizing the aeration and mbr basins can be reduced, saving construction costs, while still providing the appropriate redundancy.
- ✓ **Three tank configuration of bioreactors.** Will provide required redundancy while providing cost savings.
- ✓ **Eliminate the initial need for the RO system and evaporation ponds.** We believe that blending MBR effluent and potable water can meet the nitrogen and TDS limits at a lower cost.
- ✓ **Hydraulics.** Maximize the use of gravity flow through the plant to lower pumping costs
- ✓ **Eliminate the third primary clarifier.** Savings can provided by not constructing the third primary clarifier without impacting the performance of the MBR system
- ✓ **Site layout.** The site's large area with limited interface points allows for spacious logistics, staging, and stormwater management. Early procurement and just-in-time delivery will streamline the project timeline and prevent delays.
- ✓ **Chlorination basin vs. UV disinfection.** Eliminate the construction of a large chlorination basin with a more cost-efficient and environmentally friendly UV disinfection.

Design

During Phase One, as part of the Progress Meetings, we will conduct design reviews on selected topics with the purpose of disseminating information, promoting discussion and obtaining feedback so that City staff understands the design and has enough information to approve the design. More resembling a workshop than a meeting, this approach to review meetings has been developed and honed on similar large and complex projects. We will manage design review meetings using the following best practices:

- ✓ Dedicated leader to facilitate
- ✓ Up-front technical discussion materials
- ✓ Clear agendas that specify: (1) purpose and decisions expected, (2) overview topics and issues, (3) discussion and review, (4) summary decisions made, and (5) approvals
- ✓ Clear, action-oriented minutes
- ✓ Follow-up action items and distribution of issue resolution

Schedule Management and City Reviews. We will use Primavera P6 to track progress and adjust course, as needed. The meetings, submittals, and review schedule will be critical in driving decisions to maintain overall project schedule. As described more fully in Part IV, we will use a cost loaded schedule and provide 3 week look aheads as appropriate.

Our Integrated JV Addresses City Concerns

Providing continuity in leadership between Project phases. A hallmark of how the AECOM/Lyles JV does design-build work is that we promote staff continuity throughout all project phases. This virtually eliminates any risk of discontinuity in leadership and any issues with information transfer. For instance, the project manager will stay engaged for all phases of the project. The design manager and all discipline leads will continue to be involved in the project after the design is complete, providing interpretation and responding to any questions in the field to make sure the design intent is carried out in

We will use 3D models during detailed design. We have experienced the benefits of using this tool in other projects as it provides a better perspective facilitating the understating among the design-build team, City staff, and other stakeholders, and, in the end, the decision-making process. It also helps break down the compartmentalization between design and construction, and avoid clashes between disciplines during construction, to see the project visualized early on.

what is being built. Similarly, the construction manager will engage in the project during phase 1 to understand the design, and provide constructability and VE input.

Compartmentalization between design and construction. As an integrated JV our delivery model breaks down the barriers that could compartmentalize design and construction activities. Our key staff have worked together before on progressive design-build treatment plant projects have a rapport and an efficient communication style that promotes collaboration. For example, our team does page flip reviews at critical milestones to make sure that the design and construction implementation members are all aligned in what is being presented and priced.

Contractor or equipment supplier interests overriding engineering-based decisions. All equipment and materials for the project will be reviewed and approved by the Engineer of Record that designed and specified these items, including any vendor provided designs. For critical equipment, including all mechanical equipment, AECOM/Lyles, in close coordination with the City, will also be in charge of recommending to the City suppliers, selecting the equipment and approving all shop submittals prior to release for fabrication. Alex Franchi will be involved with critical process equipment to make sure vendor supplied equipment align with overall design decisions and anticipated performance requirements. This approach provides an unbiased process that ensures that the City's preferences are considered and the best value with respect to cost, functionality, and durability are part of the selection process.

Phase Two Approach

Experience Developing/Managing the GMP

As an experienced design-builder, AECOM/Lyles has a unique advantage of developing realistic costs during the GMP development phase of the project. Our DB project manager, design and procurement team and subcontractor partners understand technical and quality requirements and are skilled at developing detailed, bottoms up cost estimates. They have long-lasting relationships with reputable equipment suppliers which reduces the risk of scope creep during the design and, ultimately, construction.

Additionally, our team will work closely with the City to implement decisions on equipment, materials of construction, and overall site considerations that will positively impact the GMP. Techniques will include using a decision log to document each decision made along with any associated cost impacts, so that a running tally of the current project cost is maintained and can be easily measured against a baseline. Our team will also make sure that multiple bids are received for not only the equipment but also subcontractors to achieve the lowest project cost possible. Internal contractor prequalification procedures will also verify that vendors and subcontractors selected for the project are financially stable and will provide the workmanship and ethics commensurate with the AECOM/Lyles JV philosophy. Beginning with our rigorous prequalification process, we will communicate with subcontractors the importance of quality, safety and performance, in addition to best value provided.

BEST for BANNING

We design and build to budget on all our design-build projects to ensure client satisfaction: the proof – no client has ever taken the off ramp at the GMP stage on any of our projects.

Our team recommends the GMP process occurs after the 60% design milestone in order to maintain the project schedule.

Estimating and Cost Monitoring

AECOM and Lyles have very successful histories managing costs on both lump sum and progressive design-build projects. Vince and Marcos will provide the City and its advisory team frequent cost estimate updates during design leading not surprise at the GMP. Our partnership with key subconsultants during the design phase will allow our team to further develop a reliable cost estimate for the GMP, that accurately captures the electrical components of this project. Highlights of AECOM/Lyles team estimating, and cost monitoring procedures include:

- ✓ An initial cost estimate will be performed before the kickoff workshop and updated on an ongoing basis.
- ✓ One difference maker for AECOM/Lyles is that we start with a detailed estimate from day one, drawing upon a wealth of similar past construction projects to establish a baseline estimate. We are much more accurate and transparent than our competition.
- ✓ VE and constructibility reviews are performed throughout the design phase.
- ✓ Another difference maker is the flexibility of contractual approach from conversion to a lump sum or cost plus with a GMP with a shared savings, depending on the City's preferences.

Biggest Lessons Learned Developing GMPs

AECOM/Lyles will meet the challenges of establishing the GMP price for the City's project, by staying flexible during the design process and keeping a strong focus on designing to budget. The three key issues we have encountered when designing to the GMP include:

1. **Defining project "must haves" to establish early cost certainty.** AECOM and Lyles use an early partnering approach through common sharing of project budgets, which allows both the owner and design-builder to establish "must-have" items as well as "wish list" items and make value-based decisions against a mutually agreeable baseline.
2. **Clear scope expectations/scope-creep.** Early agreement between the owner and the design-builder regarding the core project design criteria and scope is critical to cost, schedule, and project certainty.
3. **Escalation of materials.** Recent market volatility and global economics have affected material costs and could have a significant impact on overall project costs. Our constant bidding of wastewater projects in California allows us to stay in touch with market pricing and minimizes surprises at the GMP deliverable.

Other Mitigation Measures. AECOM/Lyles suggests holding regular meetings to openly discuss and evaluate engineering options, while providing a continual accurate update of the agreed upon budget and schedule, and jointly maintaining control of detailed scope. This approach has worked well on other projects and will serve as another way to facilitate design to budget.

Approach to Construction

AECOM/Lyles has a proven track record of successfully delivering complex treatment plant projects, particularly with desert communities. We have developed a robust approach to site layout, logistics, and construction sequencing that prioritizes efficiency, safety, and environmental stewardship. Details of construction approach are presented in Part IV of this proposal.

Site Layout and Logistics

We approached the site layout and logistical plan with a focus on maximizing efficiency and minimizing disruption. As part of this analysis we are also focused how decisions we make relative to the layout and logistics of build the new plant and how that could affect the day-to-day operations of your existing plant. Our approach has been developed to have minimal impact to current vehicular and pedestrian access and maintaining as little impact to your current facility.

The project site provides a large area with limited interface and tie-in points for the main portion of the work with the existing facility, affording a spacious area for site logistics, staging, and stormwater management both during and following construction. We understand that this project demands meticulous planning and execution to balance the need for efficient construction

Figure 2-2. Site Plan Logistics

with the necessity of minimizing environmental impacts. The uncomplicated nature of the site enables a straightforward approach to layout, logistics, and resource management, ensuring that all construction activities are confined within the designated boundaries while adhering to strict regulatory requirements. We do not foresee any resource limitations that would affect project progress. With the ability to self-perform 75% of the work, we can control costs, create efficiencies, enhance coordination, mitigate risks, and improve safety while enabling resource flexibility and ensuring quality. Our early procurement strategies and just-in-time delivery streamline project timelines by securing critical materials and equipment in advance, minimizing storage costs, reducing the risk of damage, and preventing delays in construction progress.

Location and Layout of Key Elements. Construction Laydown Areas: Strategically positioned within the site to allow easy access to materials while minimizing the footprint on undisturbed areas.

Laydown and Staging Areas. Located near the main construction zones to facilitate the efficient movement of equipment and materials, reducing downtime and delays. This will be constructed immediately adjacent to the work site to avoid double or triple handling of materials.

Access Roads and Traffic Management will be clear and concise, carefully planned to ensure safe and efficient movement of vehicles and machinery while minimizing impacts on surrounding areas. This will also allow easy access to all the different key element areas and keep truck haul roads away from trailers and parking areas for a straight, easy in and out. Traffic flow will be managed to prevent bottlenecks and maintain site safety. We expect a primary access point off Charles street past the existing entrance of the existing facility.

Parking. Designated parking areas will be established within the site boundaries to prevent off-site disruptions and ensure easy access for workers. Two designated areas will be created: one for CM/Project personnel and another for craft labor and subs.

Site Security Measures. A comprehensive security plan will be implemented, including fencing, surveillance, and controlled access points, to protect the site and ensure compliance with safety protocols. We will include a guard shack at the front gate and a separate entrance to avoid disturbing the existing plant entrance. Site fencing and security gates will be locked after hours. Web-based security cameras will also be installed.

Utilities Placement. Utilities will be strategically placed to support construction activities while minimizing interference with the natural environment and existing infrastructure.

Waste Management Facilities. Designated areas will be established for waste collection and sorting, ensuring that all waste is handled in an environmentally responsible manner. These areas will be strategically positioned near the main construction/staging area, as well as near the trailers and exit, for ease of access.

Containment within Boundaries. All elements, including laydown areas, staging zones, and access roads, will be fully contained within the specified site boundaries and established easements. This ensures that our activities do not encroach on protected areas or disrupt neighboring properties.

Mitigation Measures to Minimize Environmental Impacts. To further minimize environmental impacts, we will implement a range of mitigation measures, including sediment control, dust suppression, and noise reduction strategies. These measures will be continuously monitored and adjusted as needed to ensure compliance with environmental regulations and best practices.

Startup and Commissioning

Our startup and commissioning approach is presented in Part IV of this proposal. We acknowledge the procurement requirements regarding startup and commissioning, including the requirement for 30 days for startup and testing and pre-commissioning meeting to discuss plan with the City 3 to 6 months before startup and testing is scheduled to begin.

Permitting

BEST for BANNING

Our long-term relationships with California permitting agencies and regulators will provide the City with a streamlined process to meet the project schedule.

Anticipated Permits and Schedule. Please see our full project schedule included in Appendix A for a breakdown of the timeframe to apply for and obtain permits. Below is a list of anticipated permits:

City of Banning

- Community Development
- Building Permit
- Public Works Coordination
- Encroachment Permit Coordination

County of Riverside

- Dept. of Environmental Health
- Solid Waste Facility Requirements
- Fire Dept. - Hazardous Materials Div.
- Hazardous Materials Business Plan
- Transportation and Land Mgmt Agency and Planning
- Flood Control and WaterConservation District

CA State Waterboard R7: Colorado River

- Stormwater
- Industrial User Waste Discharge Reqmnts
- SWPPP Updates associated w/Industrial Activities
- Construction General Permit (w/SWPPP by contractor)
- Recycled Water
- Title 22 Eng. Report for Prod., Dist., & Use of Recycled Water

South Coast Air Quality Management District

- Authority to Construct Permit
- Permit to Operate (after Construction)

Understanding of Permit Process and Support for the City. For permitting and governmental approvals we will create a Permit Work Plan that will identify each specific permit required, the permitting agency contacts, submittal requirements, prerequisite conditions, processing times, and schedule for submittals. Key success factors for our plan include:

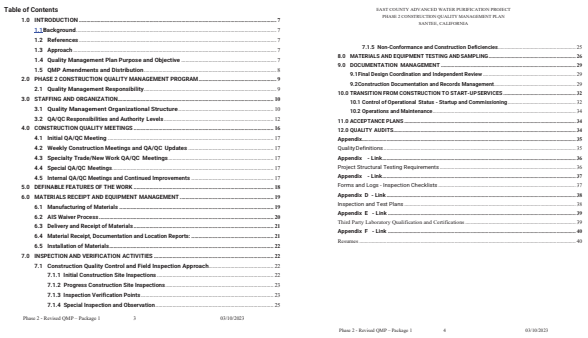
- ✓ Implementing up-front coordination with the City and permit agencies to facilitate the approval process. This will help minimize the risk of delays.
- ✓ Coordinating design activities with permit submittals
- ✓ Preparing discrete permit submittal packages
- ✓ Follow-up shortly after submittal to confirm information compliance and/or additional information required

Title 22 and RWQCB permits. The AECOM/Lyles Team will provide the necessary technical information to support development of the Title 22 Engineering Report permit approval process. We will provide the elements that are related to our scope of work, i.e., descriptions of the WWTP , pathogenic microorganism control, reliability of features for the new facilities, contingency plan, monitoring system, recycled reverse osmosis performance, advanced oxidation performance, operational optimization plan, and an operations and maintenance readiness plan.

CEQA Compliance. We will review the CEQA documentation and the design team will incorporate the specific requirements into the early design concepts. Specific measures will be taken to ensure applicable mitigation, monitoring and reporting measures will be included on design plans to foster compliance. At the onset of the project, a master list of Mitigation, Monitoring, and Reporting Program (MMRP) requirements that are applicable to each design element will be created and distributed to the project team.

Grant/Loan Compliance. AECOM/Lyles is very comfortable working on projects with SRF and WIFIA requirements; both the ECAWP, Davis and Stockton design-build projects received SRF funding. We will review existing grant and loan requirements, including documentation and reporting requirements, with the City at the onset and incorporate those procedures into our project management and execution plan to ensure schedule and funding compliance. Task and schedule reporting milestones will be added into our master project schedule.

Design Build Quality Control Plan



One of the benefits of AECOM/Lyles' extensive history of working together previously on PDB projects is that we have a well-established joined QA/QC program that provides robust oversight at every stage of the project. Building on the successful QA/QC programs we have executed together on the Rialto WWTP, Stockton WWTP, and Santa Cruz WTP PDB projects, we will implement the following program.

Our Certified Quality Management System

AECOM/Lyles will provide the City with a Quality Management Plan (QMP) that will define the procedures and protocols that we will utilize to provide QA/QC throughout the project, from design through construction, start-up and commissioning. The policies

and procedures provided within AECOM's Quality Management System (QMS) will be utilized as AECOM/Lyles' procedures to execute the QMP. The AECOM Water offices in the U.S. are an ISO 9001:2015 certified organization. ISO 9000 standards are globally recognized as the foundation of establishing quality management systems. Our QMP will include established procedures governing overall quality management and specific procedures for each phase of this project. The QA/QC program is enhanced when the City and the AECOM/Lyles Team works collaboratively on a daily basis to monitor progress. The AECOM/Lyles Team self-performing civil, concrete and mechanical aspects of the work provides optimum control of quality workmanship.

Construction work progress will be monitored and documented using the Site Field Resident's (SFR's) Daily Report which will document the progress of the work by recording the time development of the work, weather conditions, the crew sizes, equipment, etc. The SFR will review the reports to verify their accuracy. Work progress will also be documented in the CPM Schedule. This documentation includes operating logs, source and field testing/sampling log, records of inspections and tests with daily logs and site photographs, written reports and engineering data of material testing, audit reports (from third parties to the JV), certifications, proper equipment installation confirmed by manufacturer representatives, system test results, personnel qualifications and certifications records, procedures and document review records. QA/QC records will be uploaded to the agreed upon project portal on a routine basis for review by the City.

Through our numerous projects done together, we have developed a strong QA/QC program that blends design and construction activities.

Document Control and Records Management

We will launch and maintain an internet-based electronic Document Management System (DMS) to provide efficient loading and retrieval of project-related documents, provide links and search functions indicating where the documents are located within the DMS, and provide training for key City personnel that will have access to the DMS. All documents and records will be uploaded to the City's system on a routine basis to ensure your staff has access to current data at any given time.

The QA/QC staff is empowered to enforce all quality objectives and will maintain all the necessary recorded documents to provide the City with proper implementation of a QA/QC Program.

Key Personnel responsible for QA/QC

QA/QC Lead Rosaida Harris, will have overall responsibility for the Quality Management Plan (QMP). Rosaida is a QA/QC leader for AECOM Water projects. In close coordination with design and construction team,

Table 2-2. Our quality control process provides oversight at every step from concept to completion

Design-Build Quality Management	This plan will outline the quality assurance and quality control requirements for design, permitting, construction, commissioning, and testing phases of the project. The plan will detail procedures that we will apply to ensure that each element of the project is delivered with quality in accordance with the contract documents and industry standards. We will use standardized forms and checklists to document all procedures have been followed according to the plan.
Technical Reviews	Our ISO 9001 standards require review and sign-off by a Technical Quality Advisor for all key disciplines. This offers the project team timely reviews. Each submittal will be reviewed for engineering decisions and correctness of calculations, code compliance, as well as content, clarity and presentation, incorporation of standards, consistency with the City's project budget and schedule. Quality control reviews will be documented through our project website and each corrective action noted in our QA/QC log.
Construction Management and Inspection	The AECOM/Lyles team will provide full-time construction management services reporting directly to City staff to oversee construction activities and coordinate materials testing to confirm compliance with the design and approved shop drawings.
Acceptance Test Plan	This plan will outline the process and procedures for verifying all commissioning activities are coordinated, executed, and documented to demonstrate that the project performs satisfactorily in all manners, and meets all water quality objectives for final effluent reuse and disposal required by the Regional Board, including the Beaumont Basin Plan limits for TN and TDS.

she will be responsible for monitoring the QA/QC aspects of the project, coordinating with the appropriate lead engineers, construction management and site superintendents and technical discipline needs.

AECOM/Lyles Team has extensive QA/QC experience routinely performing full oversight of essentially self-inspection on many public projects. This experience will provide the City with a high level of transparency.

Team Partnership Environment

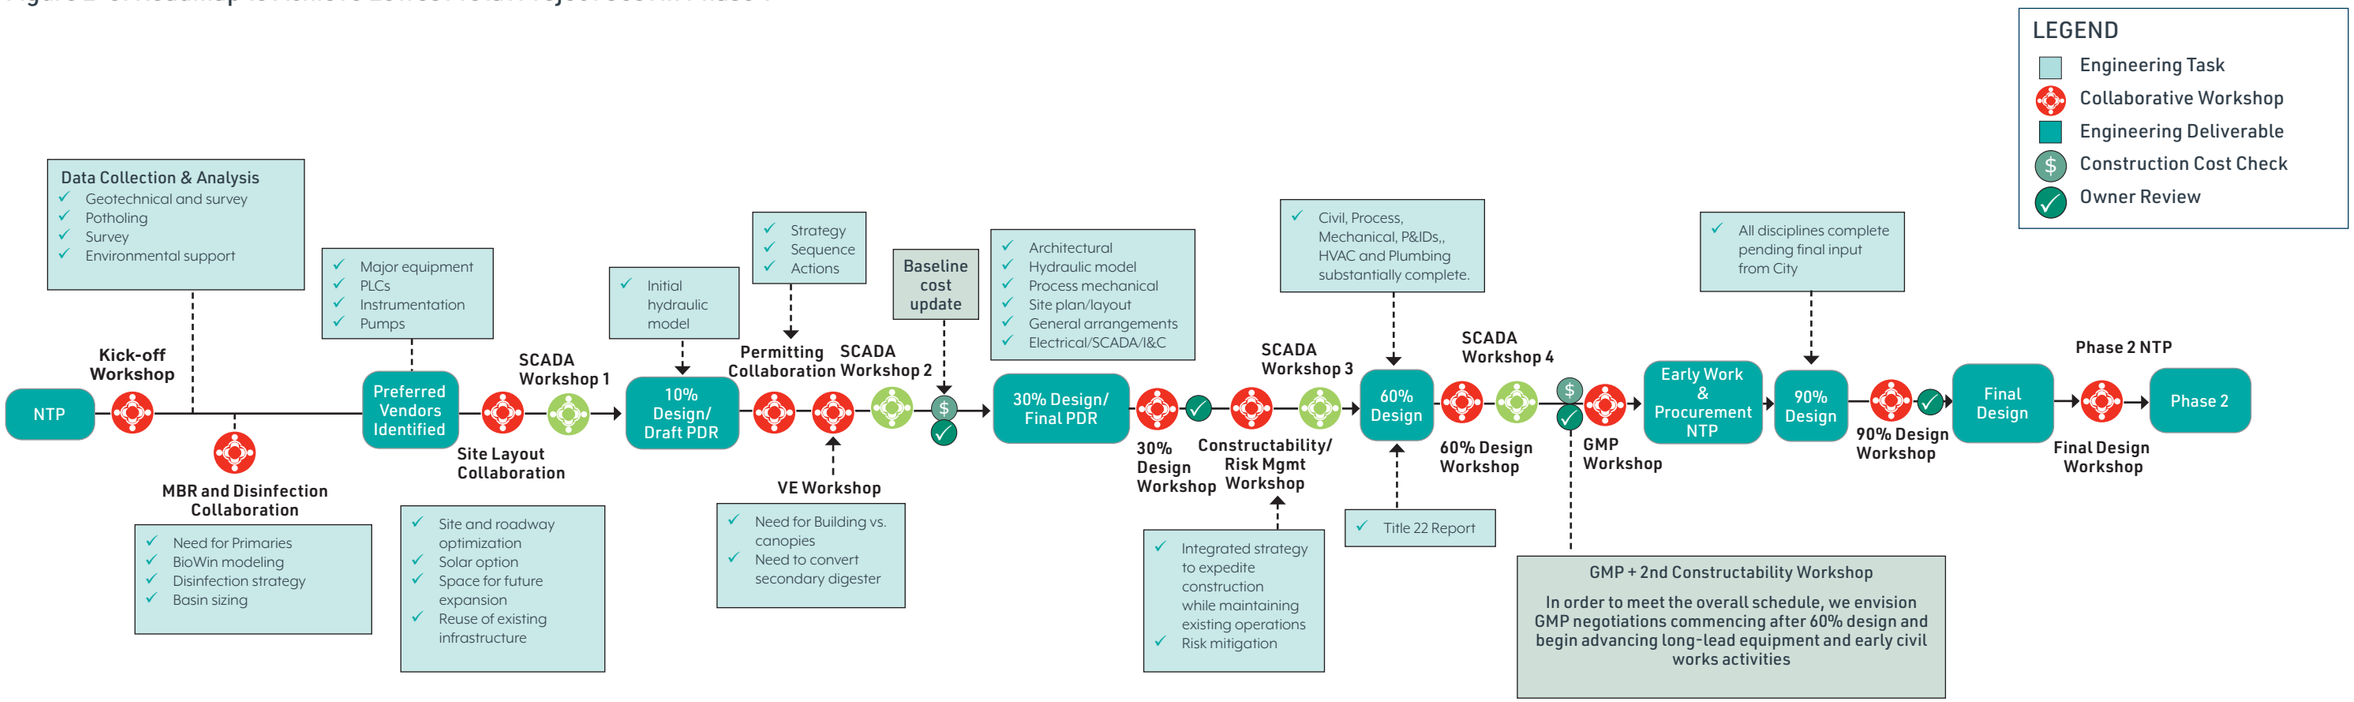
The AECOM/Lyles JV promotes collaboration across all elements of the project life-cycle and with all stakeholders—it is more than a philosophy, it is a core value. It demands proactive involvement, respectful dialogue, challenges to the status quo, and transparency by all parties. We have used our JV collaboration approach successfully on several of California's largest PDB projects. Internally, our design and construction personnel are fully integrated. This means that our designers are not designing in isolation; rather, they are in constant communication with construction personnel and your team to validate that key design decisions such as the location of construction joints, or the type of pipe restraint is consistent with what has been priced. This focused dialogue allows us to stand behind our commitment of "no surprises" at the GMP or at any interim pricing update. We commit to optimizing the City's goals and vision, and to best assure a successful project journey. This is illustrated on the next page in Figure II-2, which provides a roadmap that shows how we will develop and finalize the design during phase 1, maintaining the schedule while also incorporating crucial feedback from the City.

City Involvement and Communication

Key aspects of our collaborative approach that facilitate City involvement include:

- ✓ **Collaborative, detailed approach to ensure the right data is carried forward as design criteria.** The goal is to get all preferences and constraints on the table so the best options are advanced for implementation in the design.
- ✓ **Engineering meetings that seamlessly coordinate construction and operations elements.** Our design team holds internal weekly progress meetings. Every few weeks, production drawings are uploaded to MS Teams so that the estimating and construction teams can review. Joe, Gabe and Vince will efficiently manage constructability challenges to confirm the design drawings reflect the most cost-efficient approach to construct the project. As VE ideas arise they will evaluate the cost and schedule impacts and provide an overview to facilitate proactive dialogue with the City's project team. We will gain consensus with your team through bi-weekly coordination meetings that track overall status, and perform continuous constructability review and reach consensus on time sensitive issues.
- ✓ **Major milestone meetings to improve quality.** Our team meets ahead of major submittal milestones to QC the design plans, reports and specifications that accompany the submittal. This additional level of scrutiny holds all parties accountable on our team and further promotes our united, project-centric approach.
- ✓ **Real time pricing updates improve decision-making.** Starting with a solid initial estimate, we will isolate discrete alternatives with conceptual layouts; then provide real-time updates to show where the money is being allocated to facilitate value-based decision-making by the City.
- ✓ **Leadership meetings will increase collaboration and will occur throughout the project.** The City's team (including operations staff), owner's advisor and other stakeholders participation will be key to the project success. Meetings will be frequent early in the process, as Phase One decisions have the biggest impact on total project cost and operational considerations.
- ✓ **Executive meetings demonstrate our corporate commitment.** Monthly meetings between the City and our JV executive team (Grant Gourley and Brian Daly) can bring early corrective action. They also routinely reviews project status, adherence to the City's budget, staffing, and project challenges. Brian and Grant are design-build practitioners on numerous water/ wastewater design-build projects and will be actively engaged in the details of this project.

Project Manager Role



The project manager on this Project, Joe Lawrence, is responsible for overseeing the entire project team, including all firms and individuals involved in both pre-construction and construction phases. Joe has the authority to make critical decisions related to project management, resource allocation, and ensuring the project meets its goals and objectives. He plays a key role in integrating design and construction organizations, managing cost and schedule, and coordinating with key personnel and entities involved in the Project.

"I am fully committed to collaborating with the City and providing leadership to find the most cost-effective project that meets the City's objectives and provides for future growth and expansion.

– Joe Lawrence
Design-Build Project Manager

Figure 2-3. Roadmap to Achieve Lowest Total Project Cost in Phase 1

Our comprehensive approach to planning, collaboration and design development will result in clear decisions, streamlined procurement and construction and the Lowest total project cost delivered for your project

- A portion of the Project Progress Meetings will be allocated for Technical collaboration sessions. Only a few anticipated technical collaboration sessions are shown in this diagram.

- Value engineering will occur organically as part of our "Design-to-budget Approach". Value engineering will be specifically covered during the design workshops for the different design milestones as well as the cost update workshops.

- Dates and duration of activities, including anticipated permit sequence are included in the schedule, included in Appendix A.

BEST for BANNING

Our team will be well-prepared for each meeting, bringing the required detailed information to allow the City to understand the options and make the best choices to meet your budget

Below we present representative details to show how robust the preparation and documentation for each key meeting will be with the City so you can be confident in each decision made:

- ✓ **Kickoff meeting.** Discuss project expectations with the City including project execution, quality control, progress reporting, and deliverables. Review concept design and evaluate major unit process treatment that will meet the project performance goals. Make a preliminary selection of preferred major unit process options and vendors. A Project Quality Plan and Project Execution Plan will be developed for discussion in the kick-off meeting.
- ✓ **Technical Progress meetings.** The main purpose of the Technical Progress Meetings is to facilitate effective collaboration between the City and AECOM/Lyles to allow the selection of preferred unit process options that will be verified by subsequent design development. Evaluate and analyze the major unit process treatment alternatives that will meet the project performance goals and make a preliminary selection of preferred major unit process options.
- ✓ **Risk Management Workshop.** AECOM/Lyles will develop and maintain a risk log. The risk log is the key document used in managing risk. The log records risks identified during proposal and work plan development; workshops, technical reviews, and monthly project meetings; and through other events that occur during the project. An initial risk workshop will be used to build consensus among stakeholders and as a means to bring the Project together to identify and evaluate potential risks

PART III

Technical Approach

Delivering a quality project while driving down cost

Introduction

We appreciate the challenges the City faces in balancing numerous items associated with the expansion of its WWTP, including:

- ✓ Minimizing the cost to your rate payers
- ✓ Meeting future water quality requirements
- ✓ Promoting the use of recycled water
- ✓ Providing for long-term community growth

We will work closely with you to explore value based solutions and will be constantly challenging ourselves to make sure a design to budget approach is employed.

AECOM/Lyles has taken a close look at the City's initial concept and have noted several opportunities and challenges with this concept on Figure 3-1 on the following page. Later in this section, we present our concept that builds on the one presented in the DCR to optimize the project costs even further. We view this concept as the starting point on our collective journey to cost savings– throughout this section we present additional ideas, that if incorporated into the final scope, will provide the City additional cost savings while still meeting all of your core goals of this environmentally sensitive project.

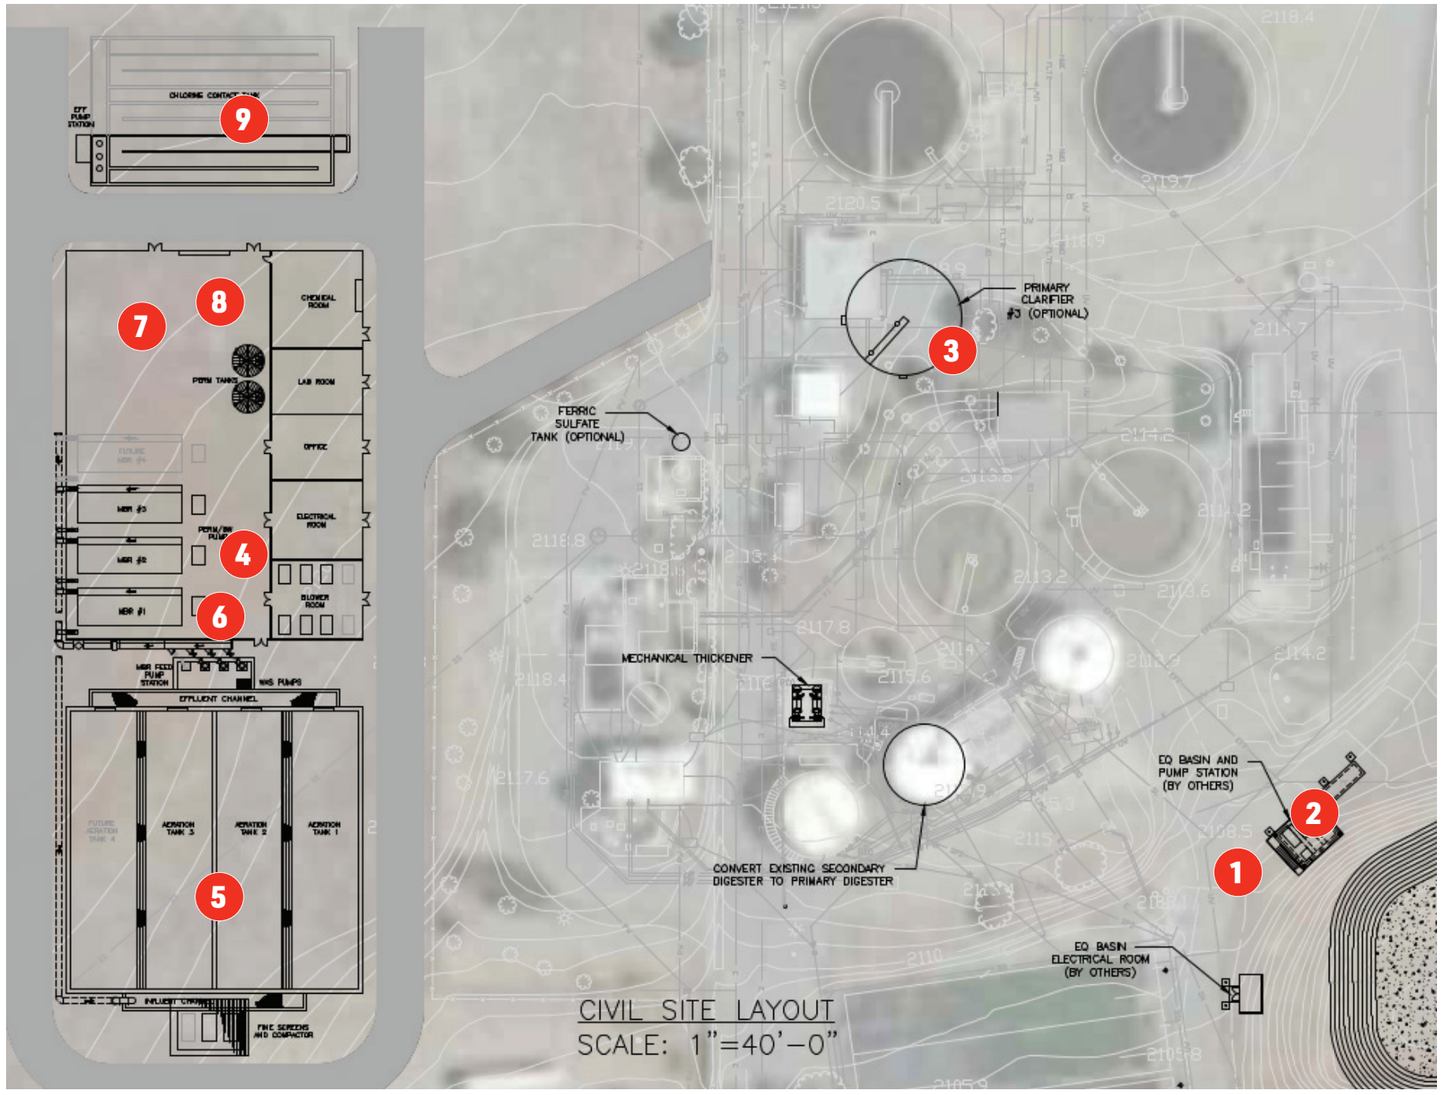
BEST for BANNING

Throughout this Section we highlight how are team is committed to doing what is best for Banning. We will bring forward the most cost-effective solutions—but not at the cost of quality. We will not cut corners or propose items that are not in your best interest.

Our cost saving ideas can save the City more than $10M

Hydraulic Capacity

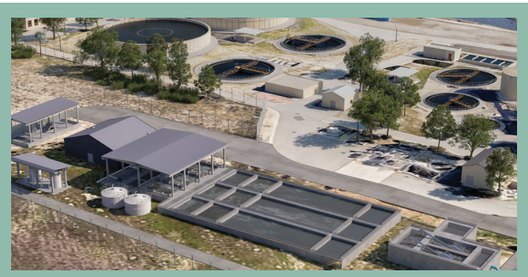
We understand the importance of efficient hydraulics and accurate flow splitting between unit processes. Our team will optimize the head loss through the plant to **reduce the energy costs associated with increased pumping, significantly reducing the initial capital and lifelong operating costs of the facility**.



We will confirm existing profiles (as related to our new work) to ensure compatibility with existing plant tie-ins and prepare a comprehensive hydraulic profiles that considers minimum, average, and maximum flow rates and considers anticipated critical units out of service.

Figure 3-2 on page 3-3 show our initial hydraulic profile and a drawing is included in Appendix A. **Our proposed scheme will minimize pumping as the wastewater will only be pumped once from equalization through the MBR process**.

BEST for BANNING *Hydraulic Highlights- Building in Reliability & Flexibility for the future*

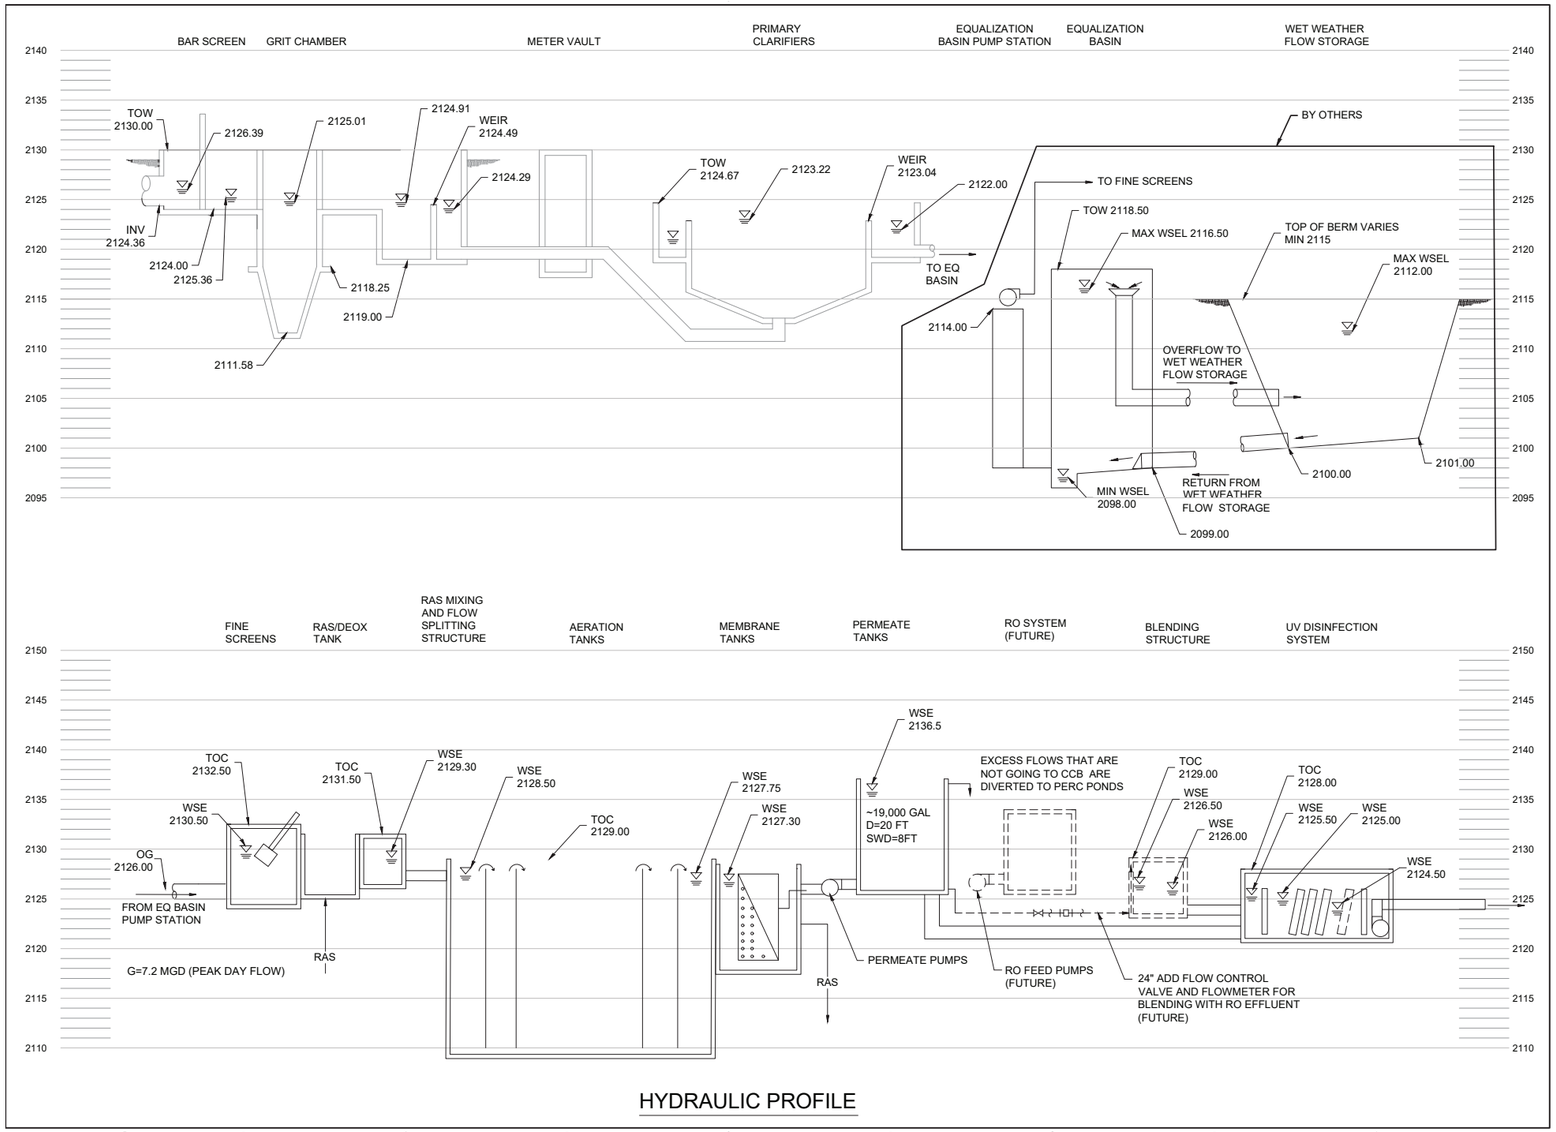


- ✓ **Redundant pumping (one redundant pump in all trains that convey the rated hydraulic capacity)**
- ✓ **In normal operation, one duty fine screen and one backup. Future third channel.**
- ✓ **Three aeration basins, two duty and one standby**
- ✓ **Three Membrane Tanks, two duty and one standby**
- ✓ **UV disinfection channel duty (~.5 MGD) and remaining flow directed to percolation ponds or UV disinfection channel off-line and all flows directed to percolation ponds**

Figure 3-1. Challenges and Opportunities with the City's Base Design presented in the DCR

When we looked at your DCR documents and drawings, we identified several key areas that were potentially adding cost, were technically complex or had implications for long-term operations or future expansion. These key items are summarized below and on page 18, we present our recommended solutions to improve the project budget and overall plant performance.

1. **Plant wide comprehensive hydraulic approach** – Due to flat topography of the site careful consideration must be given to minimize long term operations costs associated with pumping flow multiple times vs use of gravity conditions where possible.
2. **Water quality and flow data availability** – use of historical data can be supplemented with text book evaluations for overall plant design considerations
3. **Balancing the use of existing assets verses constructing new systems** - utilization of existing plant primary clarifiers versus need for an additional primary as it relates to the overall ability of the plant to meet future effluent guidelines.
4. **Identification of critical equipment and preselected vendors** – this strategy will allow all parties to gain early certainty in performance, project schedule and total project cost early in the project .
5. **Beaumont Basin water quality requirements (specifically for Total Nitrogen)** present a unique challenge for reuse and overall design of the facility. Consideration and inclusion of a supplemental carbon source will be required to meet RWQB requirements.
6. **Identifying design elements and construction approach to take advantage of adjacent structures** will shrink the overall footprint on site, reduce subsurface utilities and lower the total project cost.
7. **Getting the sizing correct**- Right sizing building and units to accommodate immediate needs and potential future regulatory or facility expansion
8. **Costly RO system adds significant complexity** to the plant layout and more important operator interface, monitoring and maintenance .
9. **Industry accepted CCT approach using Sodium Hypochlorite works against the Beaumont Basin TDS requirements** and challenges long term treatment goals. Using a technologically accepted alternative will lower overall operations cost, promote reuse, and align with long term TDS goals



OUR INNOVATIVE CONCEPTS WILL SAVE THE CITY MONEY

- ✓ Shrink the size of the basins while still providing sufficient redundancy
- ✓ Using existing assets instead of new construction where practical
- ✓ Strategy to eliminate the need for the costly RO system will still meeting reuse goals
- ✓ Placing MBR under canopy instead

Details of our cost saving solutions are presented on Figure 3-3 and throughout this section

Figure 3-2. Our Hydraulic Profile Minimizes Pumping Costs

Our initial assessment is that the new primary effluent equalization basin pump station can convey the primary effluent from the equalization pump station to the proposed 2-mm mechanical screens. Effluent will be combined with return activated sludge (RAS) from the membrane tanks and then flow by gravity to a splitter box for even distribution through each aeration tanks and ultimately to the membrane tanks. Treated effluent (permeate) will be pumped out of the membranes to fill permeate tanks that will feed the UV disinfection process and or discharge to the percolation ponds (via the existing chlorination tank).

00 G-006

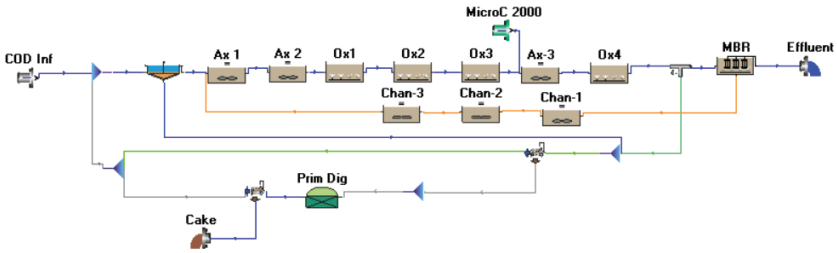
Based on flow data presented in the Carollo study (2018) and the primary effluent equalization design documents, we believe the maximum day flow of 7.2 MGD shown in the conceptual design documents correlates to a peak hour wet weather flow. Based on the most current equalization basin and pump station design provided we believe the stated peak hourly flows can be managed by the equalization basin volume and the maximum daily flow rate should be in the range of 5 to 5.5 MGD which could also be mostly absorbed by the EQ basin. We recommend that early in the design setting a reasonable maximum day flow to secondary treatment that balances design hydraulic throughput with the cost of implementation.

We will confer with the City prior to finalizing design decisions cost and operational implications. **This collaborative effort will provide the City with all the technical and non-technical information necessary to make value-based, design to budget decisions that meet the City's current needs while also creating a plan for the future.**

BEST for BANNING

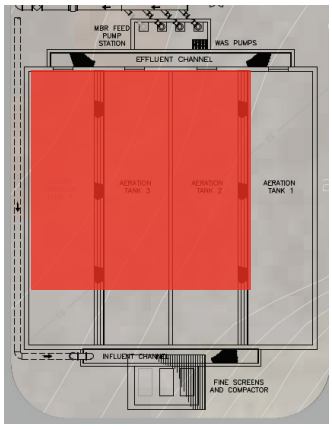
Future-proofing the WWTP for future flows and loads

- ✓ Piping sizing and layout for fourth aeration basin
- ✓ An expandable flow splitter box
- ✓ Space in membrane tanks for additional membranes to accommodate flows for a fourth aeration basin
- ✓ Space in the UV channel to accommodate additional UV banks for additional disinfection capacity
- ✓ Tie ins and layout for a future RO system and space for evaporation ponds
- ✓ Electrical systems expandable to accommodate the expanded facilities described above
- ✓ Spare I/Os in PLCs
- ✓ Spare conduits for electrical and instrumentation.



Treatment Processes, Equipment Selection & Capacity

Our team has invested significant effort over the last several months to develop concepts that demonstrate our project understanding, innovation and commitment to partnering with the City to deliver fiscally responsible solutions that consider both up-front capital and long-term operations cost savings, as summarized on **Figure 3-3** on next page.



Determining the volume requirements for the major new process areas and establishing mass balances and critical process requirements for mechanical equipment is dependent on flows and wastewater constituent loads. The recommendations we are presenting herein are a result of our of review the water quality data provided coupled with industry accepted guidelines and representative data from other plants in the area. Our concept is to provide a facility that is right-sized without over-designing and causing challenges to the operations staff and having facilities that may not be needed for many years.

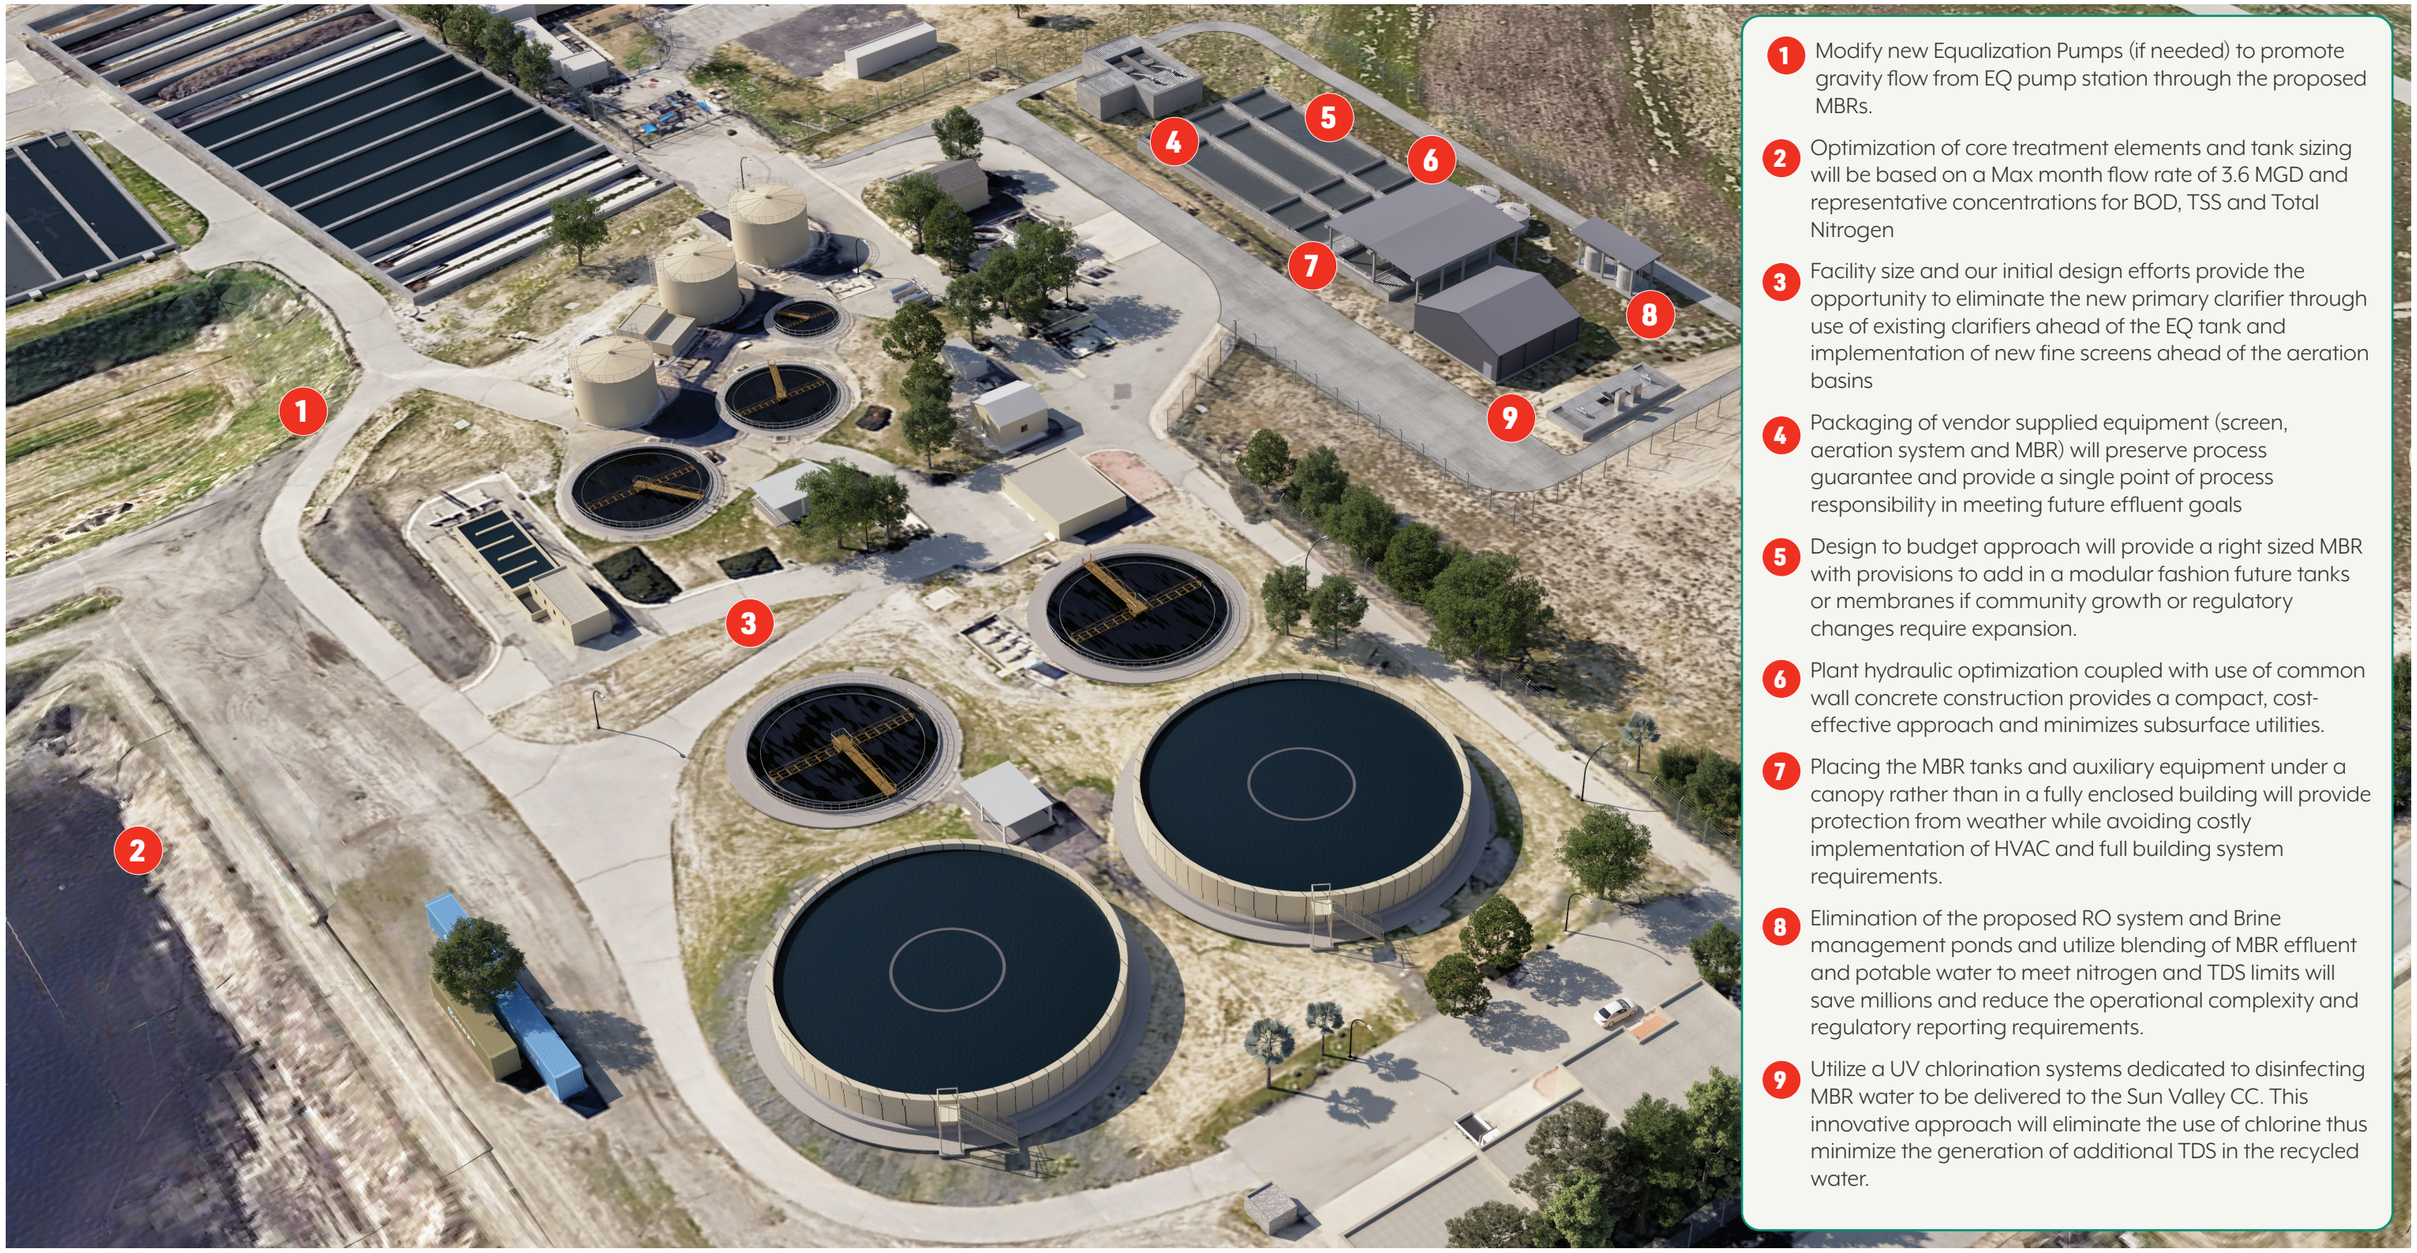
We successfully used a similar approach for City of Stockton, for the upgrade and expansion of their WWTP. Thus, as discussed in our confidential meeting with you, our base approach for your facility is to design the MBR facility to treat the 30-day maximum monthly of 3.6 mgd with BOD, TSS and TN concentrations as specified in the July 2024 CDR presented with the RFP.

In support of our approach, we developed an initial plant-wide process model in Biowin. We estimated primary clarifier TSS removal efficiencies using historical correlations between hydraulic retention times and TSS. The anticipated removal efficiency ranged from 55-60% for 2mgd to 45-50% for a peak of 3.6mgd.

Our modeling shows 1.2 MG is available within a three aeration tank configuration

Our modeling indicates that the City would have sufficient capacity with our proposed three aeration tank approach with a combined volume of 1.2 million gallons. **This approach provides sufficient redundancy to allow a tank to be removed from service and is about 17% smaller than the volume shown in the draft drawings in RFP.** This design to budget mindset is the cornerstone of our approach to assist the City with stretching is dollars to get the most out of the facility.

We had a VE session and spoke to hollow fiber membrane vendors about best practices and O&M considerations. This helped us achieve a layout that streamlines construction, considers future expansion and reduces the total project cost.



Key concepts for the development of the design of the new treatment facilities are here discussed following the flow of water from primary settling, through equalization and pumping, fine screening, biological treatment with a MBR system (aeration tanks and membrane tanks), and disinfection.

BEST for BANNING

Proven Experience implementing our Proposed Solutions

- ✓ **Beaumont.** MBR system installation at neighboring desert community
- ✓ **Stockton:** we analyzed the flows and loads, and future flow projections to implement a strategy that deferred some expansion to a future date, if and when it was needed.
- ✓ **Multiple MBR installations:** we have developed designs for similar-sized facilities such as Sand Island WWTP (Hawaii), City of Brandon (Canada), North Gate (Arizona), Provo (Utah).
- ✓ **Rialto.** Progressive Design-build where AECOM/Lyles did significant design to budget VEs to find a project scope that solved Rialto's WWTP issues while staying within their budget.
- ✓ **High Desert.** Progressive Design-Build of treatment plant including MBR and UV

Figure 3-3. Our Design Concept Provides Numerous Cost Saving Options

1. Modify new Equalization Pumps (if needed) to promote gravity flow from EQ pump station through the proposed MBRs.
2. Optimization of core treatment elements and tank sizing will be based on a Max month flow rate of 3.6 MGD and representative concentrations for BOD, TSS and Total Nitrogen
3. Facility size and our initial design efforts provide the opportunity to eliminate the new primary clarifier through use of existing clarifiers ahead of the EQ tank and implementation of new fine screens ahead of the aeration basins
4. Packaging of vendor supplied equipment (screen, aeration system and MBR) will preserve process guarantee and provide a single point of process responsibility in meeting future effluent goals
5. Design to budget approach will provide a right sized MBR with provisions to add in a modular fashion future tanks or membranes if community growth or regulatory changes require expansion.
6. Plant hydraulic optimization coupled with use of common wall concrete construction provides a compact, cost-effective approach and minimizes subsurface utilities.
7. Placing the MBR tanks and auxiliary equipment under a canopy rather than in a fully enclosed building will provide protection from weather while avoiding costly implementation of HVAC and full building system requirements.
8. Elimination of the proposed RO system and Brine management ponds and utilize blending of MBR effluent and potable water to meet nitrogen and TDS limits will save millions and reduce the operational complexity and regulatory reporting requirements.
9. Utilize a UV chlorination systems dedicated to disinfecting MBR water to be delivered to the Sun Valley CC. This innovative approach will eliminate the use of chlorine thus minimize the generation of additional TDS in the recycled water.

Vendors Selection for Large and Critical Processes and Electrical Components

During the early stages of Phase I, a critical step will be the identification, pre-selection of vendors for competitive solicitation efforts of critical equipment including an MBR package (potentially inclusive of fine screens, aeration system (blowers and diffusers), permeate pumps, and membrane equipment) and UV disinfection system. We have found this approach to be effective as it provides MBR vendors sufficient control over the scope of supply to allow provision of a reliable performance guarantee while still maintaining a competitive procurement process. We will also consider other long lead equipment such as transformers and electrical switchgear. This step will be completed in collaboration with the City and your advisory team to ensure that the pre-selection includes the City's preferences and ability to provide reliable service following post construction.

Early solicitation and selection allows the design to confidently identify footprint, piping and electrical and instrumentation requirements to provide an accurate final design that avoids design revisions and other costly surprises during the construction phase. This effort will also mitigate schedule constraints, secure early pricing certainty and help to reduce the total project cost.

From our past experience with MBRs and other technologies, we have developed a strong understanding of what works and what doesn't work. We align with industry leading vendors that provide process and performance guarantees for their equipment. Our approach further encourages flexibility from the suppliers to contribute their know-how to ensure innovation is incorporated, that is budget-conscious.

Our procurement approach has been successfully implemented on numerous past progressive design build projects for public agency Owners that have secured both SRF and WIFIA project funding. We will develop and finalize a cost evaluation for use in evaluating the equipment proposals. With the City's input, we will carefully document our evaluation so that once it is complete, the decision-making process will be thorough and clear. On previous projects, Owners have chosen to proceed with advancing the procurement process through and early GMP and lock critical equipment vendors into guaranteed pricing for the project. We would look to explore this option with the City (typically around the 30% design phase). A key benefit is obtaining shop drawings during the design phase which will expedite the design and delivery of the equipment and over all reduce the risk of design and construction challenges later in the project.

BEST for BANNING

When we procure the MBR system we will specify to the vendor key parameters for them to base their proposal on–Specifying what works rather just accepting whatever arrangement the vendor typically provides.

BEST for BANNING

We will take a close look if primary clarifiers are actually needed as part of the new treatment system—eliminating them would provide cost savings to the City

Discuss the anticipated useful life of the proposed systems

A key element to ensure value for the City is to ensure the quality of the construction and a long useful life for the equipment selected. In general concrete structures and buried civil infrastructure will last over 50 years. Equipment useful life will depend on materials used as well as proper installation, and O&M: however, Table 3-1 presents planning level useful life expectancies.

Table 3-1. Anticipated Useful Life

Infrastructure	Anticipated Life
Concrete structures	50 years
Permeate tank	30 years
Membranes	10-15 years
UV System	20 years
Blowers	20 years
Pumps	15-20 years
Fine Screens	20 years
Buildings & Canopies	20-25 years
Rotary Drum Thickener	15-20 years

Primary Clarifiers

The design team assessed the two existing primary clarifiers. Based on our previously mentioned removal rates for TSS and BOD and the use of 2 mm fine screens, we believe a third primary clarifier can be deferred to the future and not be provided as part of this project. There are many MBR plants of a size similar to this one that operate without any primary clarification. Our review of past condition assessments revealed that the primaries are in good condition, and could be left in operation to provide continued removal of solids upstream of the fine screens. The size of the aeration tanks, aeration system (blowers, diffusers) we have modeled (for a 1.2 MG overall tank volume) accounts for the elimination of the third clarifier. A secondary benefit of this approach is its support for achieving Total Nitrogen reduction goals in the plant. **An additional primary tank could remove too much carbon from influent and require a costly additional chemical dosing system ahead of the membrane tanks to achieve this water quality goal**.

Equalization Pump Station and Off-line Equalization

Although this process is currently being added under a different project it is important to confirm during design that the equalization pumps provide sufficient head and flow to meet the elevation requirements for the new fine screens to optimize the water level in the aeration and membrane tanks. Early in the design, an assessment should be made of the optimal elevation for siting the new MBR facility. There is typically significant cost and operability differences between locating the aeration tanks aboveground, below ground or partially in the ground, based on geotechnical conditions, construction costs and operability. Once this is established, the operating conditions for the EQ pumps can be finalized.

Fine Screens

The build-up of debris within the membrane tanks is operationally unacceptable and an ongoing challenge for MBR operations. MBR manufacturers properly require the installation of fine screens upstream of the MBR to remove inorganic material, fibers, and hair present in the wastewater stream before they get into the membrane tank. Manufacturers of hollow fiber membranes, typically, require 2 mm or smaller openings to protect the membranes while flat sheet MBR systems allow larger openings as their cassettes are less affected by the accumulation of solids.

Our approach considers in-channel gravity rotary drums equipped with perforated plates as they provide proper protection for the membranes, are easy to maintain and provide efficient solids collection and handling.

Figure 3.4 illustrates a layout for in-channel gravity rotary drum screens at your new plant. Primary effluent after diurnal equalization will be pumped from the new primary effluent pump station into the fine screening influent channel. Two screens, each sized for 100% capacity will designed. Space for a third screen will be reserved for future expansion. The solids collection and management system can be equipped with an integral bagging system that will both assist with solids consolidation into the solids container with the additional benefit of odor mitigation.

Aeration Tanks

Hydraulic and biological modeling of the new aeration and MBR facilities will be important in optimizing the design of the anoxic/aerobic zones and RAS de-oxygenation zone to meet the anticipated permit requirements for nitrogen.

We have conducted a preliminary plant-wide treatment model based on the data available with the RFP, supplemented and enhanced with plant influent data (COD, N and P) collected by this team on wastewaters of similar strength and community demographics in southern California. We also considered anticipated loads generated by your solids processing and digestion (three primary digesters) systems—particularly the stream containing the high ammonia concentration from the drying beds and future dewatering. Some of the key considerations are described on the two pages.

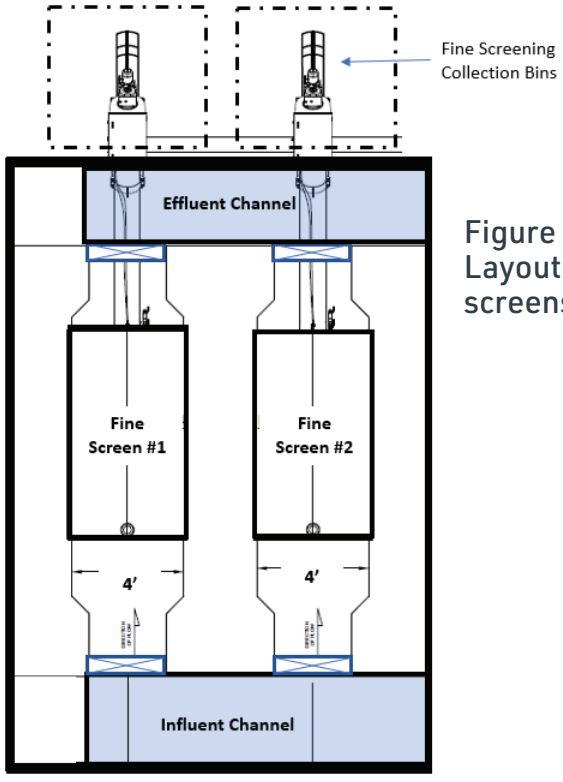


Figure 3-4. Layout for fine screens

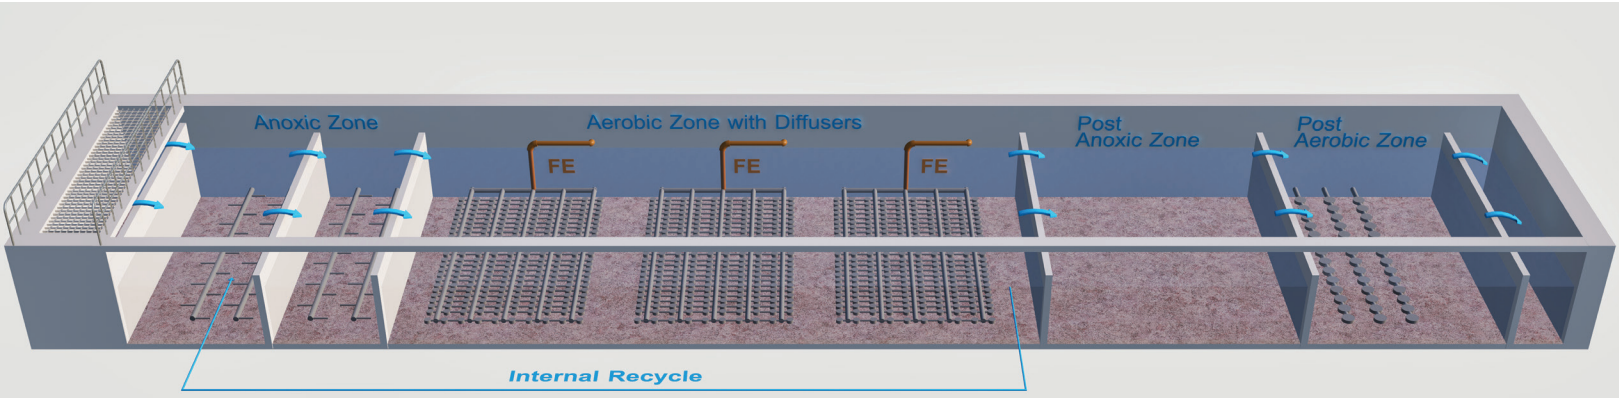
After review of three and four-tank configurations, a three-tank configuration for the aeration tanks is recommended to minimize overall cost. Based on the conceptual-level process modeling results, a total volume of 1.2 million gallons. An aerobic Solids Retention Time (SRT) of 8 days was assumed under winter conditions and a maximum Mixed Liquor Suspended Solids (MLSS) concentration of 8,000 mg/L was used. This is well below what most MBR facilities can operate (10,000 mg/l). The aerated zones in the three aeration tanks will be supplied air from a common air header system and three blowers in a two duty/one standby configuration. Space will be allocated for a fourth MBR of identical dimensions and additional blowers to allow the City to build additional treatment capacity in the future.



A 4-stage Bardenpho process will allow the City to reliably meet the plant effluent Total Nitrogen (TN) limit of 10 mg/L (see Figure 3.5). The "Pre-Anoxic" zone will receive nitrate from the Return Activated Sludge (RAS) from the downstream membrane tanks (see following section on the membrane tanks) and Internal Mixed Liquor Return (IMLR) as shown below. Following the Pre-Anoxic zone will be a single aerated zone with dissolved oxygen control. The "Post-Anoxic" zone in each reactor will provide endogenous denitrification. In the final "Post-Aerobic" stage, the mixed liquor will be aerated to oxidize remaining ammonia prior to the mixed liquor flowing into effluent channel. With the RAS and IMLR pumps, the operators will have an opportunity to optimize nitrogen removal through the different seasons.

A mixed RAS Deoxygenation Zone with 5 minutes of contact time at the 3.6 MGD design condition will allow the dissolved oxygen to be depleted prior to the RAS being mixed with primary effluent. Depleting the dissolved oxygen in the RAS ahead of the primary effluent will allow more readily degradable carbon to be available for denitrification in the Pre-Anoxic zones without the need for an expensive additional carbon chemical system.

Blower Selection – High-speed turbo blowers and hybrid (rotary screw) blowers will be considered for process aeration. Blowers are also required for scouring the membrane cassettes to manage membrane fouling. For the size of this facility, a positive displacement blower is most common. Final selection will not be based solely on membrane supplier preferences or the lowest equipment cost, but will also consider operating cost and maintenance requirements, with the City's input to ensure this key process mechanical equipment meets the City's needs. As noted above, space will be provided in the blower room for installation of an additional blower(s) in the future.

Diffuser Type Selection – There are a wide variety of diffusers available in today's markets in many different shapes and materials. Each performs differently in a site-specific environment in terms of fouling and long-term oxygen transfer efficiency. Our team has performed diffuser analysis for other facilities in California and will bring that experience to the City. Fine bubble disc and tube diffusers will be considered since they are most commonly used and multiple manufacturers are available for competitive bidding. Selection will be based on the option that meets the oxygen transfer requirements and efficiency at the lowest cost.

Figure 3-5. The aerated zone that follows the Pre-Anoxic zone would be comprised of three separate diffuser grids

Diffuser Layout – Aeration diffusers provide air for both oxygen transfer and mixing energy in the aerated zones in each aeration basin. They must be laid out in patterns that allow the changing oxygen demand along the length of the aerated zone to be efficiently met. Diffusers are typically laid out in a tapered density pattern as the first level of control of airflow rates. Higher oxygen transfer is required in the upstream section of the aerated zone where oxygen demand is highest, resulting in a need for a higher diffuser density, and lowest at the end of the aerated zone prior to the Post-Anoxic zone. Diffusers will be designed in specific grids sized to allow localized control. The aerated zone that follows the Pre-Anoxic zone will be comprised of three separate diffuser grids, each with a Dissolved Oxygen (DO) probe, an air flow control valve with high precision actuator and air flow meter. The aerated zone downstream of the Post- Anoxic zone will have a single diffuser grid. The ultimate diffuser layout will be proposed by the diffuser supplier in concert with the MBR supplier and in close coordination with AECOM/Lyles.

Airflow Control System –Our experience has shown that primary effluent constituent loads to the aeration tanks will change throughout the day due to diurnal changes in their concentrations (cBOD5, TKN). In-line analyzers (DO probes) and automated control systems (most open valve/blower output) providing an instantaneous response to these changing conditions will be implemented.

The design will be based on tapered DO setpoints for the three diffuser grids in the aerated zone that follows the Pre-Anoxic zone such as 2, 1.5 and 1 mg/L. The aeration system will have sufficient turndown to allow lower setpoints to be used to optimize performance and minimize energy consumption. The DO concentration at the end of the aerated zone will be designed to be no higher than 1 mg/L since the IMLR pumps send mixed liquor from this location to the Pre-Anoxic zone.

The DO in the aerobic zone following the Post-Anoxic zone will be designed for greater than 1 mg/L to ensure residual ammonia is thoroughly oxidized.

Optional Aeration Improvement. There has been an increasing trend in the industry in the use of Ammonia Based Aeration Control (ABAC) to control airflow while using DO probes to establish both maximum and minimum set points. In our experience from implementing ABAC in other facilities, this is a reliable control philosophy that further minimizes blower power consumption while optimizing process performance. However, ABAC requires ammonia probes and associated maintenance and calibration. Information on

BEST for **BANNING**

A small, low cost supplemental carbon addition system will allow the plant to meet treatment objectives without a costly RO system

ABAC can be provided to the City to determine if its implementation is justified and best meets the City's needs. This will be one of the topics planned for one of our technical collaboration segments.

Large bubble mixing is proposed for use in the RAS de-oxygenation zone, bioreactor mixed liquor effluent channel and the anoxic zones as this mixing approach has the lowest energy costs. Note the proposed **use of a PE/RAS flow splitter box eliminates the need for a flow distribution channel and its associated mixing requirement**.

Supplemental Organic Carbon Addition – While advanced WWTPs commonly achieve an effluent TN of less than 10 mg/L without any carbon supplementation, our approach for deferring the RO will require an effluent nitrogen of approximately 6 mg/L for meeting blended water quality requirements for reuse at Sun Lakes. Since this lower level of effluent nitrogen may not be achievable, we recommend including a supplemental carbon feed system. By providing carbon storage, pumping, piping, and distribution diffusers in the Post-Anoxic zones in the three aeration tanks, supplemental carbon can be added as needed. Micro-C 2000, a non-hazardous glycerin-based product produced and marketed by Environmental Operating Solutions, Inc. are commonly used for facilities of this size and is recommended by AECOM/Lyles. Dosage rates can be controlled by a nitrate-N probe in each Post-Anoxic zone. This approach will reduce TN to a level low enough to minimize the amount of potable water used for blending to defer the RO system construction.

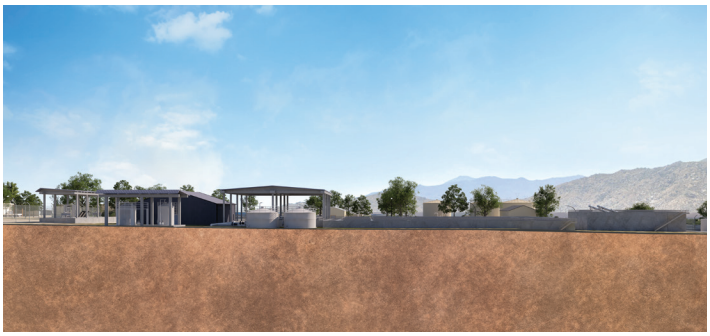


Figure 3-6. A 3-tank configuration is cost effective and allows for easy expansion in the future

Membrane Tanks

Based on our experience from developing designs for similar-sized facilities, and following discussions with several prominent MBR suppliers, our team has developed a preliminary layout with several innovative/ alternative ideas that enhance the system layout, performance and operator interface. The design is based on typical dimensions using hollow fiber cassettes. Flat plate technology can also be used in a similar configuration.

Figure 3.6 illustrates a 3-tank configuration and how we propose to integrate the membrane tanks within the new biological system.

The concept layout shown utilizes the Veolia Leap MBR cassettes. This approach will require four cassettes (500EV modules), and with one membrane tank out of service will meet the City's peak flow (3.6 mgd) and load requirement. The proposed two-row cassette layout is advantageous since it reduces the length of the tanks and provides a more compact common-wall design and provides a conservative flux rate of 14 gfd under average day flow conditions. During the detailed design we will explore with the City the option to add an additional six feet of length to accommodate additional cassettes consistent with a fourth (future) aeration basin.

In this layout, the footprint includes an average sidewater depth of 20 feet (which we deem to be optimal for aeration design) and will be gravity-fed through a common channel that collects flow from all aeration tanks in service. Lastly, two duty RAS pumps will be required to pump up to 15 MGD (400% of the primary effluent flow rate) to limit the membrane tank MLSS to 10,000 mg/L at the design condition. At plant influent flows and loads in the near-term, the RAS pumping rate is anticipated to be 100 to 150% of the primary effluent flow rate. Waste Activated Sludge (WAS) pumps (one duty/one standby) will also pump sludge from this channel to the mechanical thickener.

Our initial cost assessment of this layout suggests that **a concrete structure with common walls for the entire MBR system is the lowest cost option**, in comparison to concrete aeration tanks followed by elevated individual stainless steel membrane tanks that will require additional piping, controls and electrical elements.

Other key design-to-budget aspects of our robust and flexible membrane tanks approach include:

- ✓ Total membrane filtration area and range of design fluxes minimize fouling for the following flow conditions: 30-day ADWF of 3.6 MGD; peak 24-hour average flow up to 5 MGD.
- ✓ Provide spaces to accommodate additional membranes for future flows without capital expansion
- ✓ Provide redundancy to allow one membrane tank to be removed from service for the clean-in-place procedure required
- ✓ Minimize pumping energy by pumping only RAS back to the aeration basin rather than pumping ML (PE + RAS flows) to the membrane tanks
- ✓ Safe delivery and storage areas for membrane cleaning chemicals (i.e, sodium hypochlorite and citric acid)

Scum Management. Scum formation is anticipated to occur at some undefined frequency in the three aeration tanks and MBR tanks. A manual weir gate is proposed at the end of each tank that allows the operators to lower the weir to remove scum from the tanks. A similar manual weir gate will be provided in the RAS channel at the end of the membrane tanks. In both cases scum will be conveyed to a scum wet well and pumped to the digester inlet.

Final Disinfection

A portion of the MBR effluent will be used for unrestricted water reuse (irrigation) and will require Title 22 disinfection. The remaining MBR effluent diverted to percolation ponds does not require disinfection and will reduce the size of this systems thus right sizing the overall application lower both the capital and long-term operating costs of the facility.

The DCR base approach project includes chlorine disinfection using a three-pass 110,000-gallon chlorine contact basin (LxWxD of 60x20x12 feet, respectively) to provide a chlorine residual that provides 450-milligram minutes per liter (mg-min/L) under a minimal modal contact time (CT) of 90 minutes. The chemical for disinfection is NaOCl. Per the 2022 Feasibility Report, the cost of this contact basin and chemical storage and feed system is ~ $2.4 M. This is a solid approach that follows industry accepted practice and guidelines.

Our team examined this approach and applied some additional critical thinking including operability, meeting future water quality requirements, and providing recycled flow to the Sun Lake Country Club. We concluded that a UV system would best serve the City's goals for this project while meeting disinfection requirements. We believe **UV is a more cost-effective solution that is readily expandable to accommodate future demands.**

One of the key considerations of our proposed modification is that chlorine disinfection utilizes sodium hypochlorite (NaOCl), which increases the Total Dissolved Solids of the effluent. We estimate the additional TDS added to the MBR effluent within the 12-15 mg/l. This outcome is contrary to the City goals associated with the anticipated RWQB requirements and need to reduce TDS overall to provide a suitable water source to the Sun Lake Country Club. The additional costs associated with an RO system, brine management and disposal approach make our approach highly attractive. We have also considered a cost effective unique approach to the recycled water production for the country club described in greater detail below. **Eliminating the hypochlorite disinfection approach will save up to $75k to $95k annually.**

In recent years and on several projects (Rialto, Stockton) AECOM/WML have compared the life cycle cost of UV and chlorine disinfection (both chloramination and free chlorine) and UV disinfection has turned out to be the most economical alternative. For Banning, because of the improved UV transmittance of membrane effluent (>65%), UV disinfection is particularly attractive.

We have done a preliminary design for a UV facility for 1.07 mgd (the combined amount used by Sun Lake CC and by the new plant)and this will require a single channel (LxWxD of 35x5x8 feet, respectively) with three UV banks (two duty and one standby, each bank with 4 modules with 8 250 W lamps per module). Our preliminary estimate of the construction cost for this system is approximately $ 0.75 M

The approximate annual power usage and cost to treat 1.07 mgd are 140,160 kW and $14,160, respectively. An additional bank can be added to increase the firm capacity for this system to 1.6 mgd, if additional capacity is needed in the future.

Primary Sludge and Waste Activated Sludge Processing

While co-thickening primary sludge and waste activated sludge (WAS) is shown in the RFP documents, our experience is that the primary sludge will likely not be consistent enough to give a stable operating point for the mechanical thickener. This could result in the need to construct, operate, and maintain a large combined sludge storage tank with feed pumping ahead of the thickener to provide a more consistent solids composition by mixing and equalization. With respect to gas production it is beneficial to avoid spikes can result from intermittent feed pumping and instead have a mostly continuous feed of sludge (especially primary) to the digester which can provide constant gas production and more stable digester operation. Therefore, the team proposes to keep the two sludges separate and the primary sludge will be fed to the digesters as it is done in the current operation while thickening the WAS. Since primary sludge readily thickens, we suggest adding a density meter to the combined discharge of the primary sludge pumps to provide feedback to the operators for achieving the desired primary sludge feed concentration to the digesters.

Our recommendation is to provide two rotary drum thickeners (one operating, one spare) to thicken WAS with space for expansion in the future. We agree with the RFP selection of rotary drum thickening (RDT) as the most cost-competitive thickening technology for this application and installation size. Furthermore, there is demonstrated experience with the unattended operation of RDTs with WAS feed, which provides the City with greater flexibility for 24-hour WAS processing and constant feed to the digester while saving on capital cost by installing a smaller unit.

Mechanical thickening will be provided with the associated polymer feed system. We recommend that the skid system using liquid polymer totes. Both thickening and polymer system will be installed outside under the canopy structure.

Recuperative Thickening Alternative. A main driver for the mechanical thickening is the optimization of digestion capacity. As an alternative to thickening WAS prior to digestion or separately thickening primary sludge in the future, the City could consider recuperative thickening of digested sludge. Recuperative thickening consists of pumping some sludge from the digester, thickening it and returning thickened sludge into the digester. This could be cost-competitive and provides several operational benefits. First, it keeps the digester feed operation the same as it is currently. It can be operated on demand, when there is a need for more digester capacity. The feed to thickening is more uniform since it is digested solids, making it easier to control the thickening performance. Recuperative thickening does not require tanks upstream or downstream, and the thickening process can happen for each digester in sequential order. The limit of thickening is typically based on the type of digester mixing system. Although replacing the digester mixing system is not part of this project, it may be possible to change the digester mixing system in the future to further increase overall capacity. For example, this could be done using low speed, high torque mechanical mixers similar ones our team is implementing on the East County AWP project in Santee.

Conversion of the Secondary Digester to a Primary Digester. As stated in the RFP scope, the secondary digester needs to be upgraded to a primary digester to ensure the City can continue producing Class B biosolids. We will provide new digester heating system similar to the heating systems of the other digesters for the familiarity of operation and controls. Digester gas handling and use for the upgraded digester will be connected to the existing boiler and the digester gas flare. Although the upgrade of the digester gas system is not in the scope of this project, once the thickening system is selected and designed, the potential peaking factors in digester gas production in the future upgraded system be evaluated. If the digesters feeding happens over short periods of time at higher rates, the digester gas peak flows may potentially be higher than the existing system capacity and may require an upgrade.

Our Solution alleviates the need for RO

A key element of this project is to produce recycled water suitable for irrigation within the boundaries of the Beaumont Basin, specifically the Sun Lakes Country Club.

The DCR includes an RO system to reliably meet the water quality objectives for this basin, specifically TN ≤ 5 mg/l and TDS ≤ 330 mg/L. All other uses have less restrictive water quality objectives. We anticipate that the water quality generated by the MBR system will have a TN < 6.3 mg/l and TDS of ~380.

The proposed RO solution has substantial capital and annual operational costs to the City. Additionally, the handling of multiple chemicals for scaling minimization and periodic cleaning of the membranes will place additional stress on the operations staff and possibly require additional personnel support. Lastly the option requires a large amount of land allocated for brine disposal evaporation ponds (potentially up to 15 acres or more depending on the treated flow).

Per the 2022 Feasibility Study, the construction cost of these facilities is estimated at $8.75M. The cost for power and chemicals for a 0.4 mgd system is estimated at ~$260k per year. Additional O&M costs to be considered include labor for operations and maintenance for the RO system and brine evaporation ponds, spare parts, and environmental monitoring for the evaporation ponds and ultimate disposal of the brine salt which will likely need to be treated as a regulated or hazardous waste depending on the concentration of certain metals.

Having completed several recent RO systems associated with water reuse project, we are very aware of items that lead to the successful design and operation of these complex systems. Water characterization that includes silica and phosphates concentrations are essential to understanding membrane fouling, chemical recovery and performance warranty offered by the vendors. Many communities have invested in extensive water quality sampling and pilot studies to determine the ultimate efficacy of using a proposed RO system. We appreciate the challenges the City is facing with providing a sustainable water source for Sun Lakes and other recycled uses and believe that it is the City's best interest to consider another option.

Deferment and potential elimination of the RO system reduces the overall risk exposure to both the City and its operators. Our team has a solution that is sustainable and cost effective (both capital and operations). Our

BEST for **BANNING**

Eliminating the need for the RO system will save the City nearly $9M in construction expenditures.

option will eliminate the capital expenditure of $8.75M associated with the RO and brine management ponds and the annual operating costs of $260K/year would be offset by a similar cost, however with significantly less stress placed on the operations staff. There is also the elimination of the brine salt disposal which may requires specialized handling and disposal requirements due to heavy metal concentrations.

To accomplish the project goals without the use of an RO system, AECOM/Lyles suggests the blending of MBR effluent with potable water. The key elements of this approach are:

Optimize total nitrogen removal in the biological process from 7.5 mg/l to 6.3 mg/l to reduce the amount of potable water needed for blending.

Blend MBR effluent and potable water for irrigation at Sun Lakes Country Club only. Per the 2023 water quality reports the potable water of the City of Banning, TN is ~1.5 mg/l and TDS is ~200 mg/l.

Using this scheme, 0.55 mgd of UV-disinfected MBR effluent will be blended with 0.21 mgd (143 gpm) of potable water at the Sun Lakes Country Club. The resulting blend will provide 0.76 mgd of irrigation water and meet the TDS and TN requirements for the Beaumont Basin.

The estimated yearly cost of the potable water is ~ $390k using $3.88 per HCF (2024-2025 retail rate). This expected to be even lower, that the O&M cost for the RO and evaporation ponds facilities when adding in the additional labor and brine salt disposal costs.

Considering that blending with potable water is only required for the flow pumped to the Sun Lakes Country Club, this approach will meet ALL irrigation demands (1.07 mgd), using 0.86 mgd of recycled water produced at the WWTP and 0.21 mgd of potable water, while deferring or totally eliminating the capital and O&M costs associated with an RO system and evaporation ponds.

As part of our blending concept we will prepare a technical memorandum focused on salinity and nitrogen management and we will endeavor to meet with the Regional Board to get obtain their concurrence with this cost effective solution.

Non-Process Design and Auxiliary Facilities

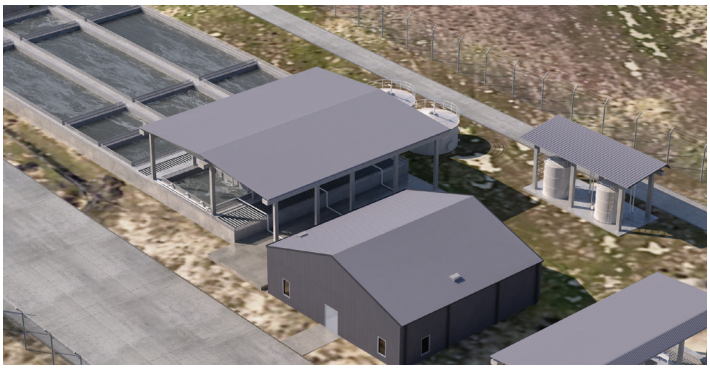
Once the key decisions are made regarding the major process facilities then the remainder of the project elements can be developed. These non-process related features of the project will be documented in the PDR, additional meetings with the City staff will be conducted to further flesh out existing operational needs and practices at the WWTP. Some initial thoughts about the approach and challenges are presented below for civil/site work, geotechnical, and building services. All of these engineering and architectural design disciplines are located together in one place – the AECOM design center.

Civil/Site Work

Key features include:

- ✓ New force main to transfer flow from the equalization basin to the to the new MBR facility.
- ✓ New force main to transfer treated effluent from the UV system to the the reservoir tank.
- ✓ New pipe to transfer excess flow from the permeate tank to the evaporation ponds
- ✓ New roadways and parking to support the new MBR treatment facility.
- ✓ Management and establishment of site specific stormwater measures
- ✓ Onsite vehicular access and roadway systems that accommodates chemical deliveries and emergency vehicles
- ✓ Site grading that promotes positive run-off away from buildings and structures

We plan to follow existing pipeline alignments where possible to best avoid any conflicts with existing structures and subsurface obstacles. Site grading will be developed around new facilities such that there is a natural transition from new to existing facilities.



Geotechnical Field Investigations

We will perform subsurface geotechnical investigation in the vicinity of proposed new structures to determine soil conditions to assist in the development of detailed design and construction cost estimates. Investigations will include review of available geotechnical maps and documents along with site reconnaissance and obtaining appropriate permits. Soil borings will be conducted with hollow stem auger methods. Borings will be advanced to an appropriate depth determined during preliminary investigations and soils will be collected for laboratory testing and analysis including moisture and density, grain size distribution, Atterberg limits, corrosion potential, and direct shear testing. A geotechnical report will be developed including results of field investigation and laboratory testing and will provide geotechnical engineering recommendations for seismic design, foundations, slope stability and earthwork. Based on preliminary review of site conditions and provided subsurface information we anticipate that foundations

for the main proposed structure development will primarily consist of shallow foundations (spread and continuous footings, mat foundations).

Process Building

Our concept for the new process building includes a new pre-engineered metal building on a reinforced concrete slab floor with individual equipment support pads. The process building will house the main electrical room that will support the upgrades, blowers, chemical metering, as well as a new laboratory and office space. Initial collaborative discussions will include identifying the needs of the City and WWTP staff to right size this building and provide value based design to budget. Building will be designed to 2022 Building Code. All finishes (both interior and exterior) will be developed and selected collaboratively between our team and your staff. Building layout will consider ADA requirements in appropriate areas. Windows and Doors will meet the intended use of the areas (i.e. finishes, size, area requirements, area classification).

Power Supply & Electrical Equipment

Evaluation of the existing electrical distribution will be critical in developing the electrical design on the new treatment facility. One of our team's initial efforts in support of the electrical design will be to evaluate the total operating demand of the existing WWTP loads and review 12-month peak demand KW from the utility. Then with an inventory of existing equipment to remain and proposed equipment our electrical design team will verify that the existing transformer and switchboard have enough capacity to run the new and existing loads.

It is anticipated that the existing electrical system is in good condition and will be expanded upon as part of the facility upgrades. The upgrade will include 480VAC feeders installed from the existing spare breakers at the existing main switchboard SWBD-MS. The following presents our approach to the electrical design of the upgrades.

- ✓ The new electrical system equipment will be housed in air conditioned, environmentally controlled electrical rooms.
- ✓ During the design phase, a detailed and comprehensive electrical load analysis to evaluate plant service loading at the main switchboard as well as each MCC, distribution and lighting panels. The load study will be used to support the plant upgrade and to confirm each electrical system loading.
- ✓ The motor control centers, variable frequency drives (VFDs)switchboards, distribution panels and lighting panels shall be provided with integral surge protection devices (SPDs) for increased electrical system reliability and for safe operation.
- ✓ Overall short circuit withstand and interrupt rating of the equipment will be determined as required.
- ✓ To optimize plant power operation and to monitor electrical energy and electrical protection functions, the electrical distribution equipment shall be provided with a plant wide power monitoring system connected in a network to a dedicated power monitoring workstation.

Standby Power

- ✓ Evaluate capacity required to provide standby power for both new and existing facility loads and provide a standby diesel engine generator set.
- ✓ Standby generator to be provided with double wall, sub-base fuel tank sized as required for 48 hours of full load operation.
- ✓ Automatic Transfer Switch (ATS) to be provided to transfer from utility power to standby generator power if utility power is unavailable. Transfer switch to be open-transition type

Instrumentation & Controls

The distributed PLC-based SCADA system will include a client server environment, highly integrated Human Interface (HMI), and process control distributed to the unit process. Workshops will be held to develop the specific design approach for the new system, including requirements for redundancy and reliability. Balance of Plant PLCs will be distributed throughout the site and connected via a fiber optic communication backbone. Vendor-provided PLCs will control packaged systems and connect to the local balance of plant PLCs. The SCADA system will be flexible and expandable to allow for future process enhancements and hardware changes.

The system will provide information to the Operators and other users from any system access point. Operator control commands generated from an HMI shall be executed in the respective PLC. Access and information may be expanded and available based on needs, technology, and cost of ownership.

The commonality of control will extend throughout the facilities control hierarchy from the discrete devices in the field, to the PLCs, and the HMI. Specified instruments will monitor plant process parameters to optimize plant operation. Operator and machine safety will be integrated into the monitoring and control of the facilities. The alarm management system will provide a uniform and easily understood operator alarm notification presented at the HMI. Software and control system integration will monitor and control the process and provide text-based reports for operations and regulatory reporting needs.

Energy Incentives

There are several energy incentive options that will help adding solar energy to the project a substantially more affordable proposition. Adding solar energy to the project will pay by itself in a few a years and help offset the added energy consumption from the added treatment processes.

Solar Incentives (Federal ITC)

The Federal Investment Tax Credit (ITC) allows the water treatment facility to claim 30% of the total cost of their solar installation. This includes solar panels, inverters, labor, and other associated costs like permitting fees. The ITC applies to projects completed between now and 2032, providing significant tax savings. For instance, a $100,000 solar installation would result in a $30,000 tax credit, reducing upfront expenses. If the facility's tax liability is less than the credit, the remaining amount can be carried over into future years. This makes solar installation more affordable and offers a quicker return on investment.

Battery Energy Storage Incentives (SGIP)

The California Self-Generation Incentive Program (SGIP) provides rebates for battery energy storage systems (BESS). The rebate starts at $150 per kilowatt-hour (kWh) of installed battery capacity. After the SGIP rebate is applied, the federal Investment Tax Credit (ITC) allows you to claim 30% of the remaining project cost. For example, if a battery system costs $100,000 and qualifies for a $15,000 SGIP rebate, the ITC would then apply to the remaining $85,000. This combined approach can significantly reduce the overall cost.

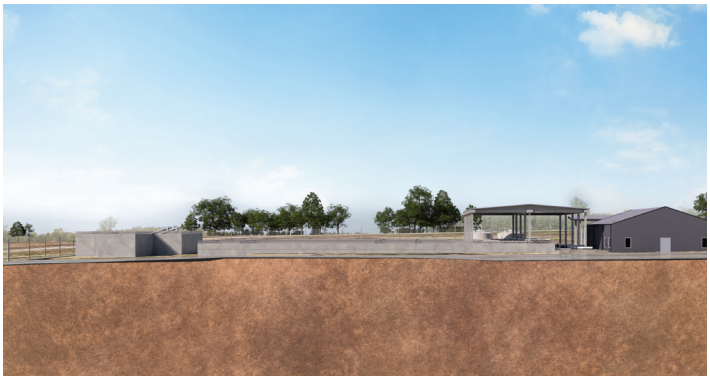
Direct Pay Provision

For tax-exempt entities like nonprofits or government-run facilities, Direct Pay allows them to receive the full value of the ITC as a direct payment instead of a tax credit. This ensures that even entities without tax liabilities can fully benefit from both the ITC and any bonus credits.

Innovation & Design Optimization

Please refer to Figure 3-3 for a graphical summary of our innovation and optimization concepts. Below, we summarize them.

Design Criteria. Base the process volumes on 3.6 MGD 30-day average flow rate with average influent concentration data to avoid over-building tank volume in comparison to assuming maximum month load peaking factors. Revisit peak-day flows as it is likely will be lower than 7.2 mgd.



Overall Site Layout and Piping and Pumping. Efficient layout and adequate sizing of yard piping will ensure the project set the stage for the future capacity expansions beyond this project. Our approach minimizes pumping by providing gravity flow for most of liquid train, with only two pumping stages (permeate pumps and disinfected effluent pumps) from the fine screens discharge to the recycled water storage tank.

Headworks and Primary Treatment. Defer construction of a third primary clarifier. Performance of the two existing clarifiers is anticipated to be adequate for flows up to the deswign flow of 3.6 MGD.

Biological Treatment. A four-stage Bardenpho configuration will allow optimization of nitrogen removal and flexibility to reduce the effluent TN as desired to eliminate the need for RO.

Disinfection. UV offers cost savings and provides additional flexibility for future expansion.

Eliminate Costly RO. Use Potable Water or Raw Water for Blending RW to SL Golf Course to Eliminate the Need for RO.

PART IV

Construction & Startup Process

Understanding the balance required between efficient construction, maintaining plant operations and preserving environmental conditions, we have devised a comprehensive plan that addresses all aspects. With our proven track record and strategic planning, we are poised to deliver a project that exceeds your expectations.

Introduction

We've developed a comprehensive sequence plan, layout, and schedule addressing site logistics, safety, and compliance to balance efficient construction with environmental preservation. AECOM/Lyles has extensive experience working in dry and windy landscapes like the City of Banning, having successfully completed projects in neighboring communities, including a similar project in nearby Beaumont. This regional expertise, combined with our local craft labor resources and access to local subcontractors, ensures we can secure the right partners to deliver your project successfully. **Our team lives and works in Riverside and the surrounding area and have strong relationships with local subcontractors/ suppliers** through our dedicated outreach efforts and repeat business on completed and ongoing projects. This network allows us to quickly secure qualified subcontractors familiar with the local conditions. Our regional projects include the Hi-Desert Wastewater Reclamation Facility, CR&R Riverside County Environmental Center, VVWRA Hesperia Subregional MBR Plant, VVWRA Apple Valley Subregional MBR Plant, Morongo WWTP, Palm Springs WWTP, Yucaipa WWTP, Yucaipa Water Treatment Plant and Lytle Creek WWTP. These successfully completed projects demonstrate our ability to leverage our resources and local reputation to deliver positive results.

Construction Planning and Sequencing

With years of experience in managing large-scale infrastructure projects, we have developed a robust approach that prioritizes efficiency, safety, environmental stewardship, and the operation of existing facilities.

Your project site is ideally situated, with many of the proposed new facilities located on the adjacent lot. This allows a straightforward approach to site layout, logistics, and resource management. Notably, the bulk of the proposed facilities are greenfield in nature, confined between the existing plant entrance road, Charles St, and the Animal Shelter facility. Reference Part II: Site Layout for further discussion. Other than the smaller-scale RDT, Digester improvements and a few miscellaneous improvements at the existing plant, this limits the impact on the existing facilities and personnel. Shutdowns of the plant are also limited, allowing for the completion of the main MBR facilities to be constructed almost in whole, off to the side, and without straining existing space and resources. When work involves interaction with existing facilities, AECOM/Lyles will submit a detailed shutdown request that includes a field coordination meeting and a comprehensive plan submission, for City approval at least two weeks prior to the scheduled activity.

Our early procurement strategies and just-in-time delivery streamline project timelines by ensuring that critical materials and equipment are secured in advance and arrive when needed. Our QA/QC team will implement a QR code tracking system to verify that all process equipment is checked in upon delivery, ensuring it arrives undamaged and meets project specifications. This provides an early opportunity to confirm that the equipment is in proper condition before installation. Additionally, the City can use the QR code system for real-time, on-the-spot compliance verification in the field. This proven approach will minimize storage costs, reduce the risk of damage, and prevent delays in construction. Our specific strategy for your project, including the advancement of a 60% GMP in line with early procurement and work packages, allows us to achieve your construction schedule and proactively address current long lead durations on critical

BEST for BANNING

We have assigned **Philip Portillo**, who has nearly 12 years of safety experience, to serve as our Safety Director. He will work closely with the local safety manager to ensure our site safety representatives are all well qualified and expertly trained. Our safety team will passionately pursue compliance with safe practices dictated by locations, conditions, and circumstances unique to this project.

equipment and materials. We advocate for early Phase 2 NTP following GMP, and ahead of the Final Design. This is specifically discussed in the Schedule section.

Approach to Self-Performance

AECOM/Lyles has the capability to self-perform approximately 75% of the construction work on this project, including all earthwork, concrete, structural steel and metals, mechanical piping, equipment installation and instrumentation integration for the project. This allows us to control project costs, maintain efficiency, enhance coordination, mitigate risks, improve safety, enable resource flexibility, control schedules, and ensure quality. **The benefit to the Ciy is the lowest total project cost due to reduced schedule and elimination of double markup on subcontractors.**

As a JV, this self-performance responsibility is shared by both parties and is supported by the capabilities of both AECOM and Lyles. This approach provides the City joint and several accountabilities while providing confidence in the availability of resources. Also, the integration of design scope with primarily self-performed construction scope and a limited number of dedicated subcontractors reduces the layers and amount of markup embedded in the price. What sets us apart for the Banning project is our unmatched self-performance experience with MBR. **We have installed, modified, removed, and replaced more MBR cassettes than any other contractor in Southern California**, giving us deep insight into both effective and flawed designs. For Banning, this means AECOM/Lyles will not only execute the MBR installation with precision but will also bring invaluable expertise to guide the design for optimal operations and long-term maintenance. Our team will design the MBR tanks, bridge crane, permeate piping, and air piping connections to ensure the safe and efficient removal and replacement of the MBR cassettes—prioritizing the safety of the operations team long after our work is complete.

While Lyles self-performs a majority of the work, we typically subcontract specialty trades such as concrete reinforcing steel (rebar), masonry, painting and coating, interior finishes, and electrical. This allows AECOM/Lyles to leverage the expertise and experience of industry leaders who can provide input in schedule, budget, and constructability, expanding the benefit of trade partners beyond installation only. Our goal is to align with subcontractors and vendors who share our "project-first" mindset, are local to the project thus keeping the money spent in the community, fostering a collaborative work atmosphere that delivers high-quality results for the overall benefit of the project.

Securing Competitive Bids

AECOM/Lyles will collaborate closely with the City to tailor our procurement strategies to the project specifics to ensure that adequate vendors and subcontractors are identified, facilitating maximum competitive bidding from qualified firms. Before beginning procurement, anticipated purchase agreements and subcontracts will be prioritized based on complexity, manufacturing lead time, historical performance of the vendors/ subcontractors, impact on schedule and sequencing, overall value, and long-term O&M. Using this methodology, our team will identify critical scopes and recommend that some be competitively procured early, aiding the GMP development, and allowing the design to be tailored accordingly. This approach maximizes design efficiency and ensures that the City and other stakeholders are fully satisfied with the critical elements. The procurement of the remaining work will be timed to provide maximum pricing competition, particularly for commodities such as concrete, piping, and metals. We will reach out to trusted partners to ensure participation as well as solicit the overall market through Good Faith Efforts (GFE). The team will use Building Connect or other solicitation software to ensure GFE documentation and related requirements are adhered to along with maximum distribution.

Our team will use both one-step best value and low lump sum procurement approaches across the various scopes.

- ✓ Best value selection will be used for complex scopes or where subcontractor input during the design would benefit the project. These are typically initiated through RFP that is tailored to the scope specifics and will conform to minimum 30-day solicitation requirements. RFP scoring will be based on criteria established with the City and include experience, safety record, bonding capacity, and other proof of financial stability requirements followed by technical requirements and pricing. Following panel review, the highest scoring proposer will be recommended to the City for confirmation and subsequent award. Interviews and/or reference validation may be required.
- ✓ Low lump sum selection is typically used for more straightforward scopes where the benefit of subcontractor input in the design is minimal (i.e. painting & coating) or for commodity or equipment purchases that are specification-based (piping, valves, etc.). Lump sum selected proposers will still be prequalified to ensure responsible and responsive bids before selection.

Our final selections will be made with City input and consensus, following thorough bid validation. We will clearly define roles, responsibilities, and expectations with all selected subcontractors to ensure seamless collaboration and alignment with our project goals.

Communication Strategies

Our approach to self-performance, sub-selection management, and communication is designed to maximize efficiency, quality, and collaboration with you and your Owner's Advisor throughout the project.

We will establish a dedicated SharePoint site to share updates, schedules, technical information, and other relevant documents in real-time. This centralized platform will ensure transparency and facilitate efficient information exchange among all participants and will be accessible to all stakeholders. This site will also store and allow access to the Submittal, RFI, and PCO/Change Logs, as well as Daily Construction Reports, Testing Reports, etc.

Our project team will hold regular progress meetings with the City and other stakeholders, supplemented by as-needed ad-hoc meetings to address specific issues or opportunities. We encourage open dialogue, actively listen to feedback, and being responsive to any concerns or questions that arise from the team, implementing or revising best practice strategies where applicable. Project decisions made during these meetings will be documented in a Decision Log and stored on the project SharePoint site as well.

The construction team will meet weekly with superintendents and foremen and as needed to review the 3-week schedules and ensure that all preceding work and resources are onsite or in transit. Premobilization or Kick-off meetings for any new subcontractors on site will be conducted to ensure that all new personnel are aware of the project details, safety requirements, site access, and hauling routes, etc. Noncompliance is unacceptable and may result in the replacement of nonconforming personnel. To address client interface, we will maintain open and consistent communication with the City and other stakeholders throughout the project. This will also involve regular progress updates, transparent reporting through our dedicated SharePoint site, and scheduled meetings to discuss any emerging issues or opportunities. Our goal is to foster a collaborative environment where client feedback is actively sought and integrated into project decision-making.

Through our focus on self-performance, rigorous sub-selection, and proactive communication, AECOM/Lyles will ensure a well-managed, collaborative project environment that delivers outstanding results.

Revision 8/30/2017

Shown above is an example of a Table of Contents that we include in all of our Safety Manuals. This enables easy navigation and quick reference to specific safety topics. It also clearly demonstrates the comprehensive nature of our safety planning, covering all critical aspects for a safe and successful project.

Approach to Safety

With AECOM/Lyles, safety isn't just a priority; it's our most important core value, ingrained in every aspect of our operations. We are dedicated to implementing an effective safety program on your project that emphasizes best practices, rigorous safety protocols, workforce training, and fostering a culture centered around safety. Our commitment extends to providing a safe and healthy working environment during all phases of the project for all employees (both our and yours),

subcontractors, project stakeholders, and the community. Our most important resource is our people and our priority is to ensure their wellbeing.

Our commitment to safety begins with the designation of a full-time, on-site Safety Coordinator who is responsible for overseeing all safety protocols throughout the project. This ensures that safety remains a top priority every day, on every part of the site.

We have established a comprehensive safety review process that includes regular safety meetings, where issues are proactively addressed, and any concerns are resolved quickly and efficiently. Our safety framework also includes thorough documentation of all safety procedures, ensuring full compliance with regulations and that all team members have access.

Central to our approach is the meticulous evaluation of risks associated with the project. We recognize that every project comes with its own set of challenges and potential hazards. Therefore, we conduct thorough risk assessments to fully identify and understand these potential hazards. This allows us to devise strategies for equitable risk identification and distribution, ensuring that safety concerns are addressed proactively throughout the project lifecycle. Job Site Safety Analyses (JSAs) are developed for each task on a daily basis, followed, monitored, and revised as necessary. Every employee has the authority to stop work at the first sign of an issue. This allows the team to come together and reassess a situation and provide alternate safer approaches.

We emphasize workforce training to promote safety excellence. Our team receives extensive training and resources to navigate diverse construction environments safely. This training is both general to our industry as well as specific to the project site and the tasks at hand and would look to integrate your staff into this training protocol as well. This empowers our workforce to recognize and respond to hazards, fostering a culture of vigilance and accountability.

We prioritize site safety and security through specialized training in construction traffic management and equipment handling. All personnel receive material safety training to ensure proper chemical handling and storage. Strict access controls and personnel tracking systems maintain a secure job site, allowing us to deliver high-quality results on schedule while safeguarding everyone involved. A guard shack and security guard will be utilized for the site entrance off Charles St. to direct both construction traffic and check-in visitors and direct them accordingly or deter unnecessary personnel. All construction facilities around your project site will be fenced.

By aligning with your O&M goals, we reinforce our commitment to these safety initiatives. This dedication to safety is demonstrated by both AECOM and Lyles, which have a Worker's Compensation Insurance Interstate Experience Modification Rate (EMR) well below industry averages statewide and nationally.

Table 4-1. AECOM/Lyles EMR Numbers

AECOM and Lyles prioritize safety, as shown by our low EMRs. This shared commitment minimizes risks and supports the City's goals for a successful project..

EMR	2024	2023	2022
AECOM	0.57	0.62	0.58
Lyles	1.0	0.93	0.74

Design-Build Schedule

AECOM/Lyles understands that the City expects to issue the Notice to Proceed in December 2024, with the goal of achieving Final Acceptance in the 4th Quarter of 2027. To meet this objective, we have developed a comprehensive Critical Path Method (CPM) schedule outlining all major activities and milestones from the Contract Date to Final Completion. As shown in **Appendix A,** our schedule includes approximately 375 activities with a critical path that extends from NTP through PDR/10% Design, 30% Design, 60% Design, GMP and Construction Amendment Approvals, early equipment and subcontractor procurement, Aeration Basin construction, MBR facility construction, start-up, and into Plant Commissioning and Acceptance activities. Using the December 10, 2024 tentative NTP date listed in the RFP, our team anticipates Substantial Completion on August 16, 2027, followed by Final Completion and Acceptance on November 9, 2027. This provides for approximately 33 working days of total float against the City's Final Completion goal.

We understand the City's schedule requirements for key milestones, approvals, construction, shutdown and tie-ins, procurement, start-up and testing and our schedule clearly outlines the necessary design, construction, and start-up phases. We will collaborate with the City and plant O&M staff to proactively address project requirements, define responsibilities, and maintain momentum while maintaining existing operations.

Our dedicated scheduler will work closely with Joe Lawrence, Gabe Perigault, Vince Guillama, key subcontractors, trusted suppliers, and the City to iteratively refine the schedule throughout the design phase. We will provide regular monthly schedule updates as well as at each design milestone (30%, 60%, etc.) and at any major change or update in scope or duration. Three-week schedule updates will be provided at each Progress Meeting to help provide more detailed information on ongoing or anticipated activities to enhance coordination with the existing plant operations.

Project Schedule

The project schedule includes 33 working days of float, which provides some flexibility, but requires careful management to avoid delays. Proactive monitoring of progress against the schedule is essential, with immediate action taken at the first signs of potential delays. Identifying opportunities to recapture lost float is crucial to maintaining the project timeline. Delays in procurement, civil works, design, or other aspects can quickly erode this buffer due to the schedule's tightness. Therefore, vigilant planning and monitoring are necessary to keep the project on track and avoid consuming the float.

This strategy will require associated amendments to allocate the necessary funds. However, it will significantly reduce the need for extensions and ensure a more streamlined project timeline.

Early Procurement of Equipment and Materials

Recognizing the City's willingness to request modifications to funding deadlines to accommodate extended construction durations, while desiring a 2027 completion, our team recommends the early procurement of major and/or long-lead-time equipment pieces. This approach offers several advantages:

Design Efficiencies: Early procurement expedites the receipt of shop drawings for key equipment allowing designs to be tailored around the specific equipment for the project, avoiding generic representations and potential costly revisions during the submittal and construction phases. **This further ensures a precise fit and optimal system configuration from the outset**.

Price Certainty: Early contracting locks in prices for high-value equipment, reducing uncertainty and conservatism in the GMP or related contingencies and effectively shielding the project from unpredictable market fluctuations and potential supplier escalation. Global conflict often strains supply and drives up costs. Early price certainty provides a solid financial foundation for the project moving into construction.

Supply Chain Mitigation: Procuring equipment early can avoid vulnerable points in the supply chain, such as potential production lulls during Phase 2. Coming out of COVID and the resulting ramp-up to meet high demands exposed the economic and supply chain vulnerability to work stoppages such as the recent East and Gulf Coast longshoreman and harbor disputes. Climate change and major natural disasters in and around major manufacturing facilities can also prove to be an issue. We are already hearing of extended delays related to certain electrical equipment manufacturers in and around North Carolina and have already seen deliveries for PLCs and VFDs on current projects increasing up to 56 weeks after submittal approval, still affected by the lingering pandemic effects. By obtaining submittals and releasing as far in advance as reasonable, we can minimize the risk of overall project delays and ensure a steady progression of work.

Schedule Condensing: By strategically shifting components of the procurement forward, overlapping with Phase 1, we can condense the overall project

Lyles' recent success with the Hi-Desert Water District (HDWD) exemplifies the value we can bring to the City of Banning. When HDWD needed to select equipment for their MBR units, we guided them through a complex procurement process that demanded a deep understanding of technical specifications and budget constraints. Our collaborative approach, transparent analysis, and constant communication empowered HDWD to make informed decisions that aligned with their goals and priorities. By involving HDWD throughout the process, we ensured the selected solution met their unique needs and expectations, delivering a cost-effective, high-quality result that met all technical requirements. Given the similar scope and terrain of the City of Banning project, we are confident in our ability to replicate this success. Through our collaborative, transparent, and data-driven approach, we will deliver a project that exceeds expectations and sets a new standard for municipal water infrastructure in the region.

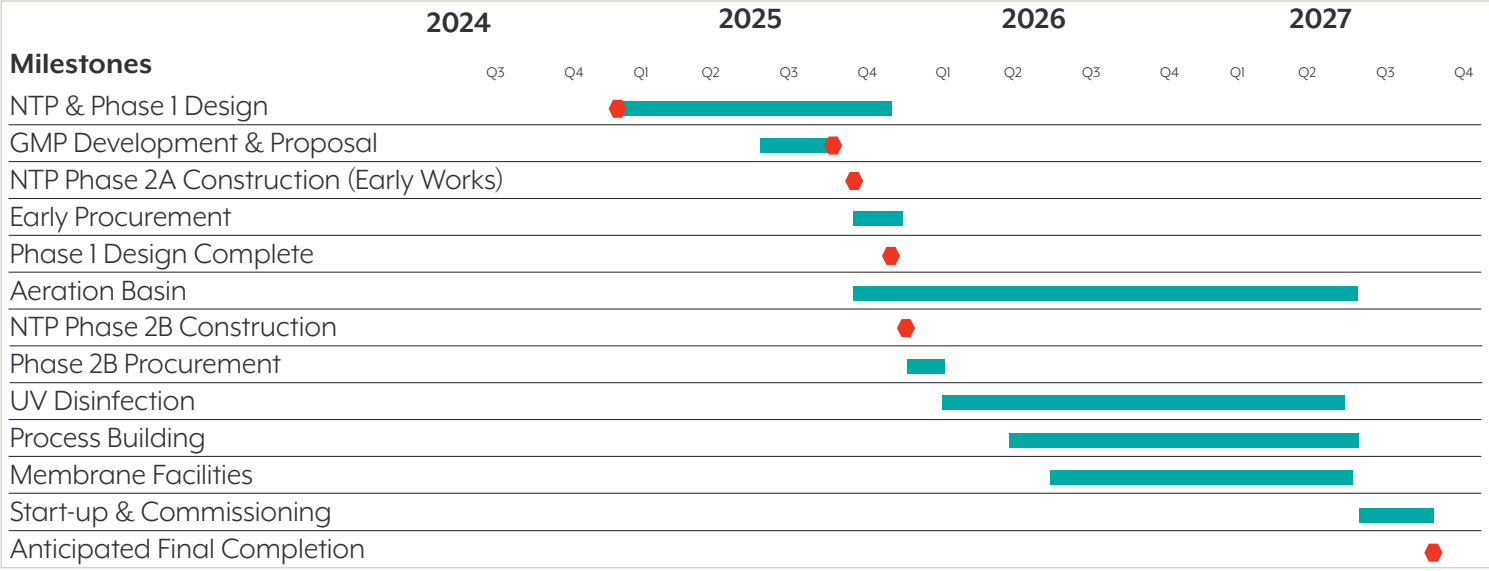
schedule. This streamlined approach optimizes the construction timeline for greater efficiency.

To take advantage, we anticipate early procurement of the following major equipment pieces in order to advance early design and ensure on-time delivery;

- ✓ Electrical Gear (PLCs, VFDs, MCCs, Transformers, etc.)
- ✓ Fine & Course Bubble Diffuser Systems
- ✓ Aeration Blower Equipment
- ✓ Membrane Bioreactor Equipment

Early Procurement of Subcontractors

Similar to the critical equipment and materials strategies noted above, our team recommends the early procurement of select subcontractors. Specifically, this would include electrical and instrumentation (EI&C), pre-engineered metal buildings (PEMB), and concrete reinforcing. While requiring design details to advance sufficiently at earlier stages with a higher upfront effort, this approach offers several advantages:



Increased Constructability: Bringing a subcontractor on prior to the completion of Final Design, in this case between the 60% and 90% stages, allows us to take advantage of the specialty expertise, ensuring that the design as shown can be built and used efficiently as well as providing the ability to take and use real-time and real-world alternate approaches that have the potential to save time, cost, and/or reduce risk for the subcontractor and the project overall.

Budgeting and Price Certainty: Early subcontracting also helps lock in pricing for critical specialty scopes not performed by the AECOM/Lyles team. We rely on our partners to review and back-up our original budget assumptions advanced from early design and estimate iterations as well as provide their current understanding of the market conditions in their specific sectors for a more precise GMP. The subcontractor input on design ensures that the design details necessary for pricing are available and accurate, reducing conservatism and contingency.

Supply Chain Mitigation: Just like general contractors, subcontractors are exposed to the same vulnerabilities in the supply chain related to limited supply, work stoppages, conflict, etc. Deliveries for PLCs and VFDs on current projects are increasing up to 56 weeks after submittal approval, still affected by the lingering pandemic effects. Getting early development, shop drawings, and into the fabrication queue for these types of items is imperative for on-time project completion. We then rely on and support our subcontractors to coordinate with their known contacts as well as maintain dates and track deliveries to minimize the risk of delays and ensure a steady progression of work for them and the project overall. Electrical gear on this project has limited float and has the potential to push start-up beyond the intended completion dates if not properly managed.

Schedule Condensing: Early subcontracting also allows our subcontractor to procure equipment and materials during Phase 1 that would traditionally not be available until first executing a subcontract and then second-tier purchase agreements after a Phase 2 NTP, extending project duration. For this project, acquiring a concrete reinforcement (Rebar) subcontractor in lockstep with the 60% Design and GMP is imperative. This allows for the necessary time for the rebar design, submittal, approvals, and fabrication to advance specifically for the Aeration

Figure 4-2. Milestone Schedule

Basin well ahead of the Final Design. This ensures that rebar can be onsite at the earliest possible date to maintain construction on one of the most critical structures due to its depth and the proximity of other structures within its excavation footprint.

Early Work Packages

In order to take advantage of early procurement, design for specific aspects of the work must be substantially advanced to allow vendors and subcontractors to accurately price the work, and with minimal revisions. Several of these packages will be developed as part of the 60% Design and will be provided to the City for review and comment before being revised and stamped for construction use. This will require our design team to advance selection of and design around critical equipment pieces ahead of the Final Design. This will allow the submittal, review, and release of long lead items. Additionally, advancement of this design will allow the construction team to excavate, install underground utilities, and move into foundation construction while preparing for equipment installation during the fabrication period. To ensure on-time completion, we anticipate the development of an early work package for the Aeration Basins allowing for civil work (including mass excavation) and structure foundations. Completion of this deep structure is critical to advancement of the MBR Tank and all other structures within the AB excavation footprint. **Early procurement is a key strategy for ensuring a more streamlined project timeline, staying within budget, and ultimately delivering a superior final product for the City.**

The Phase 1 Design period is anticipated to be 390 calendar or 275 working days through December 15, 2026. We anticipate GMP development beginning in July 2025, following completion of the 60% Design, moving into a City approval of an early works GMP. Approval of Construction or NTP 2A by October 30, 2026 ahead of Phase 1 completion. The early works GMP NTP marks the go-point to procurement of major equipment and critical material, taking advantage of the strategies noted. Phase 2B NTP is anticipated to occur shortly thereafter, marking the issue of the full construction documents and the start of the balance of the construction and remaining procurement.. This approach saves the project approximately four months and avoids a down period allowing design completion for negotiations, amendment drafting, and agreements. The design and construction teams are able to roll seamlessly from design into construction and engineering support during construction, maintaining team focus and momentum.

Cash Flow

AECOM/Lyles recognizes that one of the most important monthly deliverables is providing an accurate cash flow forecast for the City's use and for coordination with funding agency requirements. We will provide an initial Cash Flow curve related to the anticipated schedule, equipment and material deliveries, and construction operations for the City's use. Any changes or updates in either the schedule or expected dollar distribution will be communicated with the greater team. Note that all costs incurred are summarized weekly, and tracked against the initial budget. Additionally, an "estimate to complete" is performed routinely to track the status of the project against the remaining budget. Any deviations from the expected or forward-looking budget concerns are brought to the overall project team during Progress Meetings. These estimates will also be compared against the baseline drawdown schedule to ensure that the City can proactively manage its financial needs. This will be made available as part of our open-book process to ensure no surprises throughout the project delivery.

Functional Testing, Startup, Acceptance Testing and Transfer of Operations

Proper implementation of these activities is a key element in achieving ultimate success for this project. These steps will be the culmination of nearly a decade of hard work invested by the city into this project. Recognizing the significance, we have already started planning for start-up in our design, as designing with the end performance goals in mind is a key tenet of the AECOM/WML Team's approach to design-build.

Prior to any commissioning, startup, training, or performance testing activities, our team will develop testing and training plans that align with City staff schedules to demonstrate the efficiency of the new facility. Many key items have already been considered in developing our conceptual design and proposal offering. Some key elements of plan are presented in the following subsections.

The plan will be documented in our Startup and Commissioning Plan. This approach has been implemented successfully on other projects involving complex startup and sequencing efforts, including California WWTP design-build projects for the cities of Davis, Rialto, and Stockton.

Equipment Documentation and Testing

Many of the requirements for equipment and system testing can be found in the Final Design Specifications and will be implemented during construction. These activities include:

- ✓ Leak testing of tanks and pipes
- ✓ Electrical and instrumentation tests (aka dry testing)
- ✓ Vendor certification (where applicable) of installed process equipment

Other activities will be addressed in a draft startup and commissioning plan developed and submitted to the City and its Advisor for review during the early stages of construction. Examples of planned activities include:

- ✓ Confirmation that all process equipment supplier O&M manuals have been received
- ✓ Inspection of the electrical power system completed by the local power authority
- ✓ Vendor startup and checkout of process equipment

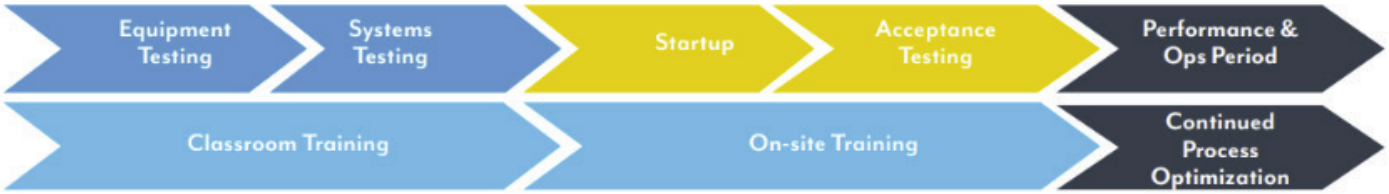
The plan will include ample time for manufacturers' representatives to be on site and to allow time for potential revisits and adjustments. Results of the equipment testing, including vendor startup and checkout reports, will be compiled and submitted as documentation of the testing program. Certificates of Proper Installation (COPI) will be prepared and signed by equipment manufacturer representatives.

System/Clean Water testing

After the individual process components are functionally tested, a series of systems tests will follow. Whereas the equipment testing will have focused on individual units, these tests will be structured to confirm that inter-related components will work correctly. Typically, this testing is done with clean water. For example, one aeration tank, membrane tank, and permeate tank would be filled with water. A temporary pump would be installed at the permeate tank to recycle a water stream back to the fine screens where one screen would be in service and treated flow would travel by gravity to the in-service aeration basin and membrane tank. Here, a permeate pump would transfer flow back to the permeate tank. This would result in a constant flow of water thought the fine screen/MBR system and testing of all associated equipment (blowers, diffusers, pumps etc.) Once testing is complete, the water would be transferred to the next screen/aeration/MBR tank for the next round of testing and so on until and all facilities are satisfactory. Examples of systems that will be tested include:

- ✓ Aeration/biological systems including membranes, pumps, blowers, diffusers, and instrumentation
- ✓ UV disinfection systems
- ✓ Dewatering equipment, pumps, VFDs, pipelines, valves and control logic
- ✓ Standby and emergency systems, including generators and UPS systems
- ✓ Power distributions and MCC equipment

Additional vendor documentation including additional COPI forms will be submitted at the completion of the systems testing process documenting the successful results of the functional testing.



Wastewater Startup

Startup of the new facilities on wastewater will follow completion of all pre-startup checks. This will be performed in accordance with a written startup plan and under the direction of our team's startup manager.

For the most operational flexibility, startup of the new MBR facility can be done in a stepwise manner: first the biological treatment process will be started up with the objective of discharging fully treated but undisinfected effluent to the onsite disposal beds. Because biological treatment systems need to grow sufficient mass of bacteria to treat the incoming wastewater, the start-up must be done in gradual increments to slowly ramp up treatment capacity. This will require close coordination between the existing WWTP and the startup of the MBRs as the bulk of treatment will still need be provided by the existing trickling filters.

Following systems testing with clean water, off-site biological material (waste activated sludge or seed) will be collected and transported to the site and introduced to the biological (SBR or MBR) system. This critical step will require a well thought-out plan of introducing raw wastewater to the new plant in a controlled manner.

Figure 4-3. The AECOM/Lyles team will develop a well thought-out Startup Plan

Small batches of wastewater will initially be received, with the treatment process closely monitored to ensure complete treatment. These batch increments will be slowly increased (typically 5 to 10% per day) until one treatment train is full and treated flow is of a high enough quality to discharge to the effluent beds. The next step is to bring the second aeration tank online and continue to slowing ramp up the wastewater flow while monitoring mixed liquor concentration levels and permeate quality. These steps will allow a viable biological community to be established that will be capable of treating the full plant flow. This process typically takes four to six weeks to complete.

Following the establishment of a strong biological community, the plant will be run for a few weeks to ensure all systems are working and fine-tuned prior to formal acceptance testing. At some point prior to acceptance testing but after full plant flow is achieved, UV disinfection will be placed in service for its Title 22 treatment. UV testing as required by DDW will be accomplished.

All equipment will be operated in accordance with the operational needs of the plant at flow/process loading rates as determined by the AECOM/Lyles Team. The purpose of the startup testing will be to demonstrate the operational readiness of the equipment and the functionality of associated instrumentation.

Acceptance testing

Following functional testing, we propose to operate the new facilities during a two-week acceptance test to demonstrate satisfactory performance and compliance with Title 22 reuse regulations and effluent bed discharge requirements.

In general, the liquid processes will be operated to treat the influent flow and loads that enter the treatment facility over the 14-day test period, with reuse water treated in quantities as needed and the remainder of the flow discharged to the effluent disposal beds.

During the acceptance test we anticipate that sampling and testing will be in accordance with the discharge permit requirements. Composite samples of the influent and final effluent will be collected and analyzed at the required permit frequency. In addition, sampling of the primary influent and effluent will be included for targeted water quality parameters.

Once the acceptance testing has been completed, normal industry practice is to transfer full operational responsibility back to the Owner.

BEST for **BANNING**

Vijay Kumar, a seasoned Startup and Commissioning Manager, brings 27+ years of hands-on experience in water/wastewater treatment system installation, commissioning, and optimization. A notable example is his Commissioning Engineer role on the $54.4M City of Beaumont WWTP Salt Mitigation Upgrade Project. This extensive project demanded the demolition, modification, and construction of various system components. Vijay's technical expertise and problem-solving skills ensured a successful, on-schedule commissioning process. His comprehensive knowledge and experience make him an ideal partner for efficient and reliable water/wastewater treatment projects.

Resumes

Joe Lawrence

Project Manager

Joe is a Senior Vice President at W. M. Lyles and Collaborative Delivery Manager with over 22 years of experience in managing and delivering large-scale water and wastewater treatment projects. He has a proven track record in pre-construction planning, cost controls, and project execution. He has extensive experience with progressive design-build and design-bid-build delivery methods, overseeing advanced water purification, wastewater treatment plant expansions, and SCADA upgrades. Joe is committed to delivering high-quality infrastructure while leading teams and managing complex project requirements.

Firm
W. M. Lyles. Co

Education/Academic Qualifications
BBS, Construction Management
California State University Fresno, 2001

Professional Registrations
Contractor's License – Class A
General Engineering – State of Hawaii

Community Involvement
ACE Mentoring Program of Central California

Tenure with AECOM: 22
Total Years in Industry: 22

Why Joe?

- ✓ Extensive background in advanced water purification systems and recycled water projects, such as the ECAWP
- ✓ Advanced understanding of various delivery methods, including PDB and DBB
- ✓ Deep technical expertise, particularly in SCADA upgrades, biological treatment, tertiary filtration, and disinfection processes

Owner/Client References

① East County Advanced Water Purification (ECAWP) Packages 1 and 3, Progressive Design-Build, Santee, CA

Client: ECAWP/Padre Dam Municipal Water District
Alfred Pedroza, PE
AWP Engineer (Owner's Project Manager)
T: 619.540.9313 | E: apedroza@padre.org

Role: Pre-Construction and cost controls/budgeting.

To reduce the East County Water District's reliance on water from outside sources, the East County Advanced Purification Project (ECAWP) will treat East County's wastewater locally for potable reuse. Joe managed pre-construction, cost control and budgeting for Package 1, which involves design and construction of a water recycling facility, advanced water purification facility, visitor center, product water pump station, solids handling facility, and system integration across Packages 1-4 of the ECAWP.

② Stockton Regional Wastewater Control Facility, Progressive Design-Build Modifications, Stockton, CA

Client: City of Stockton
Art O'Brien
T: 209.937.8787 | E: aobrien@robertson-bryan.com

Role: Construction Manager.

Joe was the primary lead for this progressive design-build project that involved the construction of new influent pumping, screening, and grit removal systems; new secondary biological treatment systems; new tertiary filtration and disinfection systems; and new solids handling facilities to replace an existing oxidation pond and overland flow treatment system. Major process equipment included large vertical turbine solids handling pumps, perforated fine screens, conical tray grit removal systems, primary and secondary clarifier mechanisms, aeration blowers and diffusers, submersible mixers, tertiary disc filters, UV disinfection system, sludge centrifuge, and associated electrical, control, and SCADA upgrades.

Joe Lawrence

Project Manager

③ Davis - WWTP Secondary and Tertiary Improvements, Design-Build, Davis, CA

Client: City of Davis
Michael Lindquist
T: 530.747.8287 | E: lindquist4water@gmail.com

Role: Role: Construction Manager.

Design-Build construction of new secondary biological treatment systems, new tertiary filtration and disinfection systems, and new solids handling facilities to replace an existing oxidation pond and overland flow treatment system. The secondary treatment processes consist of four new extended aeration basins and four new 85' diameter secondary clarifiers. Tertiary filtration and disinfection facilities consist of four new 6 MGD disc filters, two new chlorine contact tanks, and a new sodium hypochlorite and sodium bisulfite storage and pumping facility. Sludge handling facilities consist of two new rotary drum thickeners, two new screw presses, chemical storage facilities, and a 48,000 SF sludge storage facility. Also included were a new cogeneration plant, a new emergency power generator, and numerous other electrical, control, and SCADA upgrades.

Additional Experience

Graham Hill Water Treatment Plant Upgrades, Progressive Design-Build, Santa Cruz, CA. Pre-Construction Manager. The WTP was built in 1960s and had not been significantly upgraded since the 1980s. The City recognized that in order to secure their water future, significant upgrades to the WTP had to be undertaken. Joe is the vital link between the design, project owner, and construction teams, ensuring that the project is well-planned, cost-effective, and set up for successful execution once construction begins. The project scope includes: high-rate clarification through the use of space-efficient plate settlers, ozone system, granular activated carbon (GAC), reclaimed water clarifiers, provisions for future UV disinfection, and new chemical feed systems; new administration and maintenance buildings, and new ozone building; upgraded operations building and upgraded filter gallery building; electrical upgrades; demolition of some existing buildings and site improvements including landscaping and vehicular access improvements. Construction is anticipated to begin in late 2024, and substantial completion is expected by Spring 2028.

Wastewater Treatment Plant Upgrade & Expansion, Design Bid Build, Linda County Water District, Marysville CA. Executive Sponsor for construction of a new 5 MGD wastewater treatment plant on a 27 acre site adjacent to an existing treatment plant. New facilities include a headworks, two primary clarifiers, four activated sludge basins, two secondary clarifiers, filter pump station, six effluent filters, sludge thickening system, sludge drying beds, sludge lagoons, site grading, and associated piping, electrical, and instrumentation systems. Upgrades to the existing plant include the demolition of existing facilities and modifications to the existing effluent pump station.

WWTP Tertiary Filtration, UV Disinfection and Biosolids Improvements, City of Galt, CA. Project Manager for expansion of 3 MGD wastewater treatment system to 6 MGD, including tertiary filtration and ultraviolet disinfection capabilities, biosolids dewatering facility, biosolids storage and transfer facilities, operations and electrical building, pump stations, backup power generation, and additional infrastructure. Expedited delivery: 12 month contract time. **American Public Works Association (APWA) Project of the Year 2010.**

5 MGD WWTP Expansion and Upgrade, Design Bid Build, City of Reedley, CA. Project Manager/Estimator for expansion and upgrade to 5 MGD, including influent pump station, headworks, anoxic basin recycle pump station, oxidation ditch, RAS pump station, sludge storage facility, effluent pump station, and secondary clarifiers. Construction also included structural concrete, equipment delivery and installation, underground utilities, above-ground piping, and total project administration.

Copper River Wastewater Reclamation, Design-Build, Copper River Development Co. Project Manager/Estimator for 0.75 MGD wastewater reclamation facility, including SBR structure, chlorine contact structure, effluent distribution structure and pump station, metal buildings, administration/laboratory building, associated equipment, and process piping.

Fresno County Juvenile Justice Facility Wastewater Treatment Plant, Fresno County, CA. Project Engineer/Estimator for 0.12 MGD wastewater treatment plant to service the new Fresno County Juvenile Facility, including new concrete structures, lined storage ponds, yard piping (26' deep), associated equipment, and process piping.

Gabriel Perigault, PHD, PE

Engineering Manager

Gabriel brings experience on more than 25 water/wastewater treatment plants, including process selection, piloting, detailed design, construction, start-up and commissioning, and performance validation and optimization. He will lead the design, working closely with our Project Manager Joe Lawrence and Process Technical Lead Alex Franchi and specialty design disciplines similar to our other PDB projects in California. Gabriel has a project first and client centric mindset. He is an organized, responsive and committed multi-discipline design manager with extensive experience overseeing complex water and wastewater projects. He is an excellent communicator and is fluent in all the major disciplines with special focus on process mechanical and instrumentation.

Firm
AECOM

Education/Academic Qualifications
PhD, Environmental Engineering, Stanford University, 2001

MS, Environmental Engineering, Stanford University, 1995

BS, Mechanical Engineering, University of Chile, 1990

Professional Registrations
Professional Engineer, Civil, CA #68471

Tenure with AECOM: 8
Total Years in Industry: 25

Why Gabriel?

- ✓ Will lead our multi-discipline design team through lessons learned from collaboration on recent and current design-build projects with AECOM/ Lyles JV – East County AWP, Davis, Stockton, Rialto plus many other design-build utility projects in California
- ✓ Extensive experience managing the design of MBR and RO facilities

Owner/Client References

① Stockton Regional Wastewater Control Facility Progressive Design-Build Modifications, Stockton, CA

Client: City of Stockton
Art O'Brien, Project Manager
T: 916-790-0218 | E: aobrien@robertson-bryan.com

Role: As Design Manager, led the design of multiple improvements to treat 40 mgd (average dry weather flow, 105 mgd peak) and meet more stringent nitrogen limits, reduce effluent salinity, and improve overall energy efficiency and operational reliability using a progressive design-build delivery approach.

Design is complete and construction is due to be complete in 2024. Improvements include: new influent pumping station and headworks; replacing the existing biotowers, facultative ponds and wetlands with new activated sludge secondary treatment process with nitrogen removal; replacing the existing nitrifying biotowers, DAF thickeners, gravity filters, and chlorine contact canal with new tertiary disk filters and UV disinfection; providing new dewatering facilities using centrifuge technology; new buildings for administration, engineering, laboratory, safety, operations and maintenance functions; and optimizing overall plant hydraulics to reduce the multiple pumping steps (currently 7) across the plant to only two pumping steps and rely on gravity flow for most conveyance through the treatment train.

② East County Advanced Water Purification (ECAWP) Packages 1 and 3 Progressive Design-Build, Santee, CA

Client: ECAWP/Padre Dam Municipal Water District
Alfred Pedroza, PE
AWP Engineer (Owner's Project Manager)
T: 619.540.9313 | E: apedroza@padre.org

Role: As Design Manager for Package 3 and Engineering Advisor for Package 1, Gabe has been involved throughout the project.

Gabriel Perigault, PHD, PE

Engineering Manager

The AECOM/Lyles JV is providing PDB services for the heart of the program, which includes the design and construction of a water reclamation facility and an advanced water purification facility (Package 1), and conveyance infrastructure (Package 3).

- **Package 1** involves the design and construction of a 16-mgd WRF, 13.5-mgd wastewater and advanced water purification facility, visitor center, product water pump station, and solids handling facility. Gabe is working closely with the treatment systems design team in a technical advisory role.
- **Package 3** includes the rehabilitation and upgrading of the Influent Pump Station and the East Mission Gorge Pump Station (new pumps, odor control systems, ferric feed system, several metering and flow control vaults, backup power), new WRF force main (14,000 ft open cut, 3,500 ft horizontal directional drilling), and new residuals bypass system (pumping station and conveyance system). Gabe served as the overall design manager as well as the AECOM project manager for the entire package.

③ Santa Cruz WTP Progressive Design-Build, Santa Cruz CA

Client: City of Santa Cruz
Matt Zeman, Engineering Associate
T: 629.540.9313 | E: apedroza@padre.org

Role: Design Manager.

The AECOM/Lyles JV is providing PDB services for $100M+ upgrade to the Graham Hill WTP. The WTP was built in 1960s and had not been significantly upgraded since the 1980s. The City recognized that in order to secure their water future, significant upgrades to the WTP had to be undertaken. Joe is the vital link between the design, project owner, and construction teams, ensuring that the project is well-planned, cost-effective, and set up for successful execution once construction begins. The project scope includes: high-rate clarification through the use of space-efficient plate settlers, ozone system, granular activated carbon (GAC), reclaimed water clarifiers, provisions for future UV disinfection, and new chemical feed systems; new administration and maintenance buildings, and new ozone building; upgraded operations building and upgraded filter gallery building; electrical upgrades; demolition of some existing buildings and site improvements including landscaping and vehicular access improvements.

Additional Experience

Wastewater Treatment Plant Progressive Design-Build Improvements, City of Rialto, CA. Design Manager. Led the production of the Basis of Design Report, including 50 percent design drawings, and GMP for expanded headworks and secondary treatment facilities, new disk filters and UV system, as well as several retrofits to the existing thickening and solids handling facilities to provide treatment capacity for 12 mgd average annual flow. This was the first phase of the progressive design-build delivery approach selected to procure this project. Cost $26M. (2020)

Wastewater Treatment Plant Secondary and Tertiary Improvement Design-Build, City of Davis, CA. Served as the Engineer-of-Record for the performance acceptance report, which included the following process: modified Ludzack-Ettinger Nitrogen Removal Process, tertiary filtration with disk filters, chlorine disinfection, WAS thickening with rotatory drum thickeners, sludge dewatering with screw presses, and miscellaneous pumping, storage and conveyance facilities within the existing WWTP. Cost: $72M. (2018)

Montevina Water Treatment Plant Progressive Design-Build, Los Gatos, San Jose Water Company, CA. As Design Lead, coordinated design activities at project's design center and served as process and mechanical designer for solids handling facilities. Project included upgrading 43-year-old plant to convert the existing 30 mgd direct filtration process to a 30 mgd membrane filtration process. This plant is the primary supplier of drinking water for the Town of Los Gatos and surrounding west Silicon Valley communities. Specific duties for this progressive design-build project included coordination of design duties for the overall design effort and detail design of thickening and dewatering facilities and associated ancillary facilities (miscellaneous pumping and polymer storage and feed systems). Thickening and dewatering included two gravity thickeners and two screw presses, respectively. Cost: $58M (2015)

Sun City Tehama Water Reclamation Facility – Pulte Homes, Tehama, CA. Prepared a facility plan, a Title 22 engineering report, and regulatory compliance studies and reports to secure Waste Discharge Requirements to permit effluent disposal for agricultural irrigation for a new community in Tehama County. ***Conducted 30 percent design for a package MBR treatment plant*** and chlorine disinfection system as well as aerated solids stabilization pond. $300,000 (2006)

Alessandro (Alex) Franchi, PHD, PE

Process Technical Lead

Alex's technical experience encompasses conventional and advanced processes in wastewater, water reuse and potable treatment including oxidation, chemical and ultraviolet disinfection (UV), membrane technologies, advanced oxidation, activated sludge, membrane biological reactors, media filtration, coagulation, headworks, and pump stations. Alex will lead the process design team in preparing deliverables and recommending technology solutions. His most recent MBR design was for the Inland Empire Utilities Agency Regional Plant 5, where he developed the layout, preliminary design, and final design of the fine screens facilities. Alex was intimately involved with the design of two additional MBR in Southern California. Alex is currently providing services for the East County Advanced Water Purification (PDB project which includes a 4-stage bardenpho, MF, RO, and UV/AOP.

AECOM

Education/Academic Qualifications
PhD, Environmental Engineering, Johns Hopkins University, 2000

MS, Environmental Engineering, Johns Hopkins University, 1995

BS, Civil/Chemical Engineering, University of Maryland - College Park, 1992

Professional Registrations
Professional Engineer, Civil, CA #75225

Tenure with AECOM: 6
Total Years in Industry: 30

Why Alex?

- ✓ MBR and RO design
- ✓ Led successful designs of Title 22 projects across California
- ✓ Lead designer for large (>$150M) progressive design-build projects
- ✓ Wastewater, drinking water and water reuse facilities process design

Owner/Client References

① Silicon Valley Clean Water, RESCU Front of Plant Progressive Design-Build Project, Redwood, CA

Client: Silicon Valley Clean Water
Teresa Herrera, P.E. – Manager
T: 650.591.7121 | E: therrera@svcw.org

Role: As Design Lead, Alex completed design to construction package level.

Progressive design-build project involving the design and construction of a new 80-mgd front of the plant facilities, including deep-lift pump station (90 feet), new headworks with screenings, grit removal, solids loadout, chemicals storage, electrical room, and connection pipeline to existing plant.

② East County Advanced Water Purification Program (ECAWP) Package 1 Progressive Design-Build, Santee, CA

Client: ECAWP JPA/Padre Dam Municipal Water District
Seval Sen, PE - AWP Engineering Manager
T: 619.258.4631 | E: ssen@padre.org

Role: Lead Process Engineer for 11.5 advanced treatment facility including MF, RO and UV/AOP.

This progressive design-build project is one of the first in the country for the augmentation of a surface water supply with treated wastewater for potable reuse. Components of Package 1 include: a 16-mgd Water Recycling Facility, an 11.5-mgd Advanced Water Purification Facility including MF, RO and UV/AOP, a solids handling facility, a product water pump station and a new visitor's center.

③ PFAS treatment System at Well OPA-1

Client: Orange County Water District
Ryan Bouley, Principal Engineer
(714) 378-8207 Email: rbouley@ocwd.com

Role: Project Manager and Lead Process Engineer for OPA-1 PFAS removal system.

Alessandro (Alex) Franchi, PHD, PE

Process Technical Lead

Preliminary design, final design services, bid phase, and engineering during construction services for a PFAS treatment system at Well OPA-1. The treatment system includes lead/lag ion exchange treatment system capable of treating a flow rate of approximately 3 mgd, including appurtenant facilities. The design incorporates provisions to accommodate intermittent operations of the well. The ion exchange vessels are located in a depressed structural concrete pit to minimize the visual impact of the vessels on the adjacent residential community.

Additional Experience

Regional Wastewater Control Facility Progressive Design- Build Modifications, City of Stockton Municipal Utilities, Stockton, CA. Senior reviewer of UV facilities and leading the design of multiple improvements to treat 40-mgd (average dry weather flow, 105-mgd peak hour flow) and meet more stringent nitrogen limits, reduce effluent salinity, and improve overall energy efficiency and operational reliability using a progressive design- build delivery approach. Improvements include: new influent pumping station and headworks; new activated sludge secondary treatment for biological nutrient removal, including aeration system (nitrification/denitrification); new tertiary disk filters and UV disinfection; new dewatering facilities with centrifuges; new buildings for administration, engineering, laboratory, safety, operations and maintenance; new lime system; and optimizing overall plant hydraulics. $194M (2024)

RP5 and RP1 Upgrades, Advanced Treatment, UV/ Chlorine Disinfection, and Cost Estimates, Inland Empire Utility Agency, Chino, CA. Task lead for a multi-phase project involved the design and economic analysis for expansion and upgrades at four water recycling facilities ranging between 10 and 60 mgd. Tasks included general site planning, design, and economic analysis of wastewater treatment processes to produce California Title 22 water. The RP-5 upgrade included the preliminary design of a 45-mgd UV facility. The groundwater injection component of the project included the predesign of a 3-mgd facility with MBR, microfiltration, reverse osmosis (RO), UV, AOP, and stabilization. Cost $11M (2019)

Regional Water Reclamation Facility Expansion and Upgrade, Elsinore Valley Municipal Water District, Lake Elsinore, CA. UV disinfection and hydraulics task Lead for the rehabilitation and expansion from 16- up to 26-mgd of an existing wastewater treatment plant, including headworks upgrades, the addition of a new 8-mgd MBR treatment train, new UV system, equalization basin for secondary effluent, off-spec water management, and upgrades of solids processing facility. The plant effluent is discharged into Lake Elsinore and must meet strict standards for low phosphorous and California Title 22 reclaimed water for recreational uses. The project included a new aeration basin and membrane bioreactor for the expansion. Worked extensively with EVWMD staff to evaluate and select blower and diffuser equipment to meet the needs and preferences of the staff. Cost $8.7M (2019)

South Coast Water Reclamation, Barbados Water Authority, Barbados. The Barbados Water Authority (BWA) evaluated the feasibility of upgrading its South Coast Sewage Treatment Plant to a tertiary/advanced treatment plant capable of producing water suitable for groundwater recharge in a potable aquifer and/or a non-potable aquifer, or suitable for edible food crop irrigation. The goals of the Project include: augmenting existing groundwater water supplies, mitigating climate change effects, addressing seawater intrusion and sea level rise, diversifying potable water sources, enhancing water supply resiliency, and reducing the impact of treated effluent on marine life and the environment. Alex led the conceptual design of a 1.6 MGD advanced water treatment facility including disk filters, UV disinfection, ultrafiltration (UF), reverse osmosis (RO), stabilization of pH and alkalinity control, and final disinfection. Cost $140,000 (2022)

Airport Satellite Water Reclamation Plant Feasibility Study, City of Fresno, CA. Advanced treatment process lead for a feasibility study for a 5-mgd water reclamation facility that included MBR, RO, UV, and AOP and industrial source treatment. Water from this facility will be used for groundwater injection to recharge a depleted aquifer and public or agricultural irrigation. The intake points from the sewer system, located near a winery, discharge 800,000 gallons per day to 2.7-mgd of partially treated wastewater to the sewer system. The feasibility study evaluated the possibility of converting partially treated discharge into high-quality recycled water using membrane bioreactor treatment, followed by UV light disinfection; and using the recycled water for irrigation of the airport golf course, groundwater recharge, and industrial uses. Alex conducted a senior review of the membrane bioreactor system and the advanced treatment facility. Cost $0.5M (2019)

Marcos Reyes

Construction Manager

Marcos is a dynamic professional with a strong foundation in engineering principles, he has progressively advanced within the wastewater treatment plant construction industry, starting as a Superintendent in 2009 and transitioning through roles as Project Engineer/ Assistant Project Manager before assuming his current position as Project Manager. Through his career journey, he has demonstrated adeptness in project management, engineering, and leadership, consistently delivering successful outcomes on various projects. His background includes experience working alongside AECOM on the ECAWP Advanced Water Purification Project and Rialto WWTP Improvements project. He brings a combination of technical expertise and managerial skills to drive projects to completion efficiently and effectively.

Firm
W. M. Lyles Co.

Education/Academic Qualifications
BS, Civil Engineering,
San Diego State University, 2008

Tenure with Lyles: 7
Total Years in Industry: 15

Why Marcos?

- ✓ Worked with AECOM staff on design-build projects including East County Advanced Water Purification $260M joint venture project
- ✓ Worked with AECOM staff on design-build projects including Rialto $25M WWTP improvements project including site upgrades and piping
- ✓ San Diego County experience includes pipeline project consisting of upgrading of 27,000 feet of existing 72- and 75-inch pipe
- ✓ Extensive underground utility and pump station experience

Owner/Client References

① East County Advanced Water Purification Program (ECAWP) Package 1 Progressive Design-Build, Santee, CA

Client: ECAWP/Padre Dam Municipal Water District
Kyle Swanson
T: 619.528.4766 | E: kswanson@padre.org

Role: Marcos is the Sr. Construction Manger for the East County Advanced Purification Project (ECAWP)

This progressive design-build project is one of the first in the country for the augmentation of a surface water supply with treated wastewater for potable reuse. Components of Package 1 include: a 16-mgd Water Recycling Facility, an 11.5-mgd Advanced Water Purification Facility including MF, RO and UV/AOP, a solids handling facility, a product water pump station and a new visitor's center.

② Inland Empire Utilities Agency – Regional WRP No. 5 Liquids Expansion to 22.5 MGD, DDB, Chino, CA

Client: Inland Empire Utilities Agency
Jason Marseilles
T: 909.993.1600 | E: jmarseilles@ieua.org

Role: As Construction Manager, Marcos worked on the construction of the upgrade and expansion of the Agency's existing RP-5 plant from a conventional activated sludge wastewater treatment plant to a 22.5 MGD water recycling treatment plant, and with the capability of being further expanded to 30 MGD in the future. The major items of work to be performed include the liquids treatment processes, solids treatment processes, common facilities, and off-site facilities. Construction Cost $329M.

Marcos Reyes

Construction Manager

③ Rialto Wastewater Treatment Plant Improvements, Design-Build, Rialto, CA

Client: City of Rialto
Thomas Crowley, Utilities Manager
T: 909.421.7210 | E: tcrowley@rialtoca.gov

Role: As the Construction Manger, Macros worked on the $25M Design-Build expansion project, is a Joint Venture between W. M. Lyles Co. and AECOM.

Construction activities include the expansion to an existing conventional WWTP, increasing the treatment capacity from 7.3 MGD current average to 11.7 MGD future average. Work also includes headwork's expansion with new bar screens, washer compacter, one primary clarifiers, equalization basin improvements, one secondary clarifier, cloth disc tertiary filters, chlorine contact basin, RAS Pump Station, electrical buildings and associated site electrical upgrades, instrumentation, piping, paving, and fencing. Construction Cost $25M.

Additional Experience

Headworks and Primary Clarifier Upgrade, DBB, City of Palm Springs, CA. Project Manager. Construction of a new headworks facility, including new barscreens equipment, washer compacter, grit classifiers, two 100' diameter primary clarifiers, two scum pump stations, one sludge degritting facility, a prefabricated electrical building and an odor control system. The new upgrades to the existing wastewater treatment plant will increase the treatment capacity from 10.9 MGD to 21.8 MGD. Cost $20M. (2018)

Western Riverside County Regional WW Authority 14 MGD Plant Expansion, DBB, Riverside, CA. Project Engineer. Construction of a 6.0 MGD expansion to an existing conventional WWTP that increases the treatment capacity up to 14.0 MGD. Construction activities include headwork's expansion with new bar screens, washer compacter, grit classifier, two primary clarifiers, equalization basin, bioreactor, bio filter, secondary clarifier, cloth disc tertiary filters, chlorine contact basin, recycle water pump station, masonry digester building, solar drying beds and odor control system, five electrical buildings and associated site electrical, instrumentation, piping, paving, and fencing. Upgrades to the existing plant include new centrifuges, fixed steel digester covers, odor control facilities, masonry thickener building and chemical building upgrades. Cost $26M. (2016)

What Marcos' Clients Say

"Marcos Reyes served as the on-site construction managerfor the $25M Rialto Progressive Design Build WWTP with AECOM. ***His project first mentality, coupled with extensive construction knowledge, expertise and experience provided the project with numerous well reasoned, cost effective and workable solutions to overcome the interface challenges on a retrofit project.*** *Timely and cost effective solutions to tie-ins, resolving conflicts with existing utilities, and working out design issues associated with an upgrade while maintaining continuous operation of the existing plant were invaluable."*

Bill Hanley, PE, Veolia North America

Nob Hill Improvements Project for SDCWA, DBB, San Diego, CA. Project Engineer. Construction of approximately 900ft of two sections of existing pipelines with one pipeline at a lower elevation. The new pipelines were constructed by tunneling and excavation. This allowed the water authority the ability to operate and maintain its pipelines and structures, eliminating the likelihood of future uncontrolled release of water in the area. The project added a new access road to Nob Hill, and as a result, SDCWA vehicles will no longer need to use the private roads for access to SDCWA facilities. Cost $10M. (2017)

Pipeline 3 Desal Relining San Marcos to Twin Oaks Project for SDCWA, DBB, San Diego, CA. Project Engineer. The Pipeline 3 Desalination Relining project included upgrading 27,000 feet of existing 72- and 75-inch diameter pipe with new welded steel liners; fabricating and installing 494 feet of 69-inch outside diameter welded steel pipe at seven access portals; fabricating and installing 448 feet of 67 ¾-inch outside diameter welded steel pipe at eight access portals; and replacing 47 feet of 72-inch steel pipe with new 67 ¾-inch outside diameter welded steel pipe. As a result of this project, this accommodated pressurized flows from the new Carlsbad 50MG Seawater Desalination RO Treatment Plant. Cost $25M. (2015)

I-405 Sepulveda Pass Widening, DB, Los Angeles, CA. Superintendent. This $721 million design-build project involved constructing one 10-mile high-occupancy vehicle (HOV) lane northbound on Interstate 405 from Interstate 10 to U.S.-101. The project realigned existing on and off ramps, reconstruct or modify 23 bridge and ramp structures, build approximately 18 miles of retaining walls, and perform road improvements on the adjacent city streets. Cost $721M. (2014)

Vince Guillama

Preconstruction Services Manager

Vince brings more than 20 years of experience in the water / wastewater industry. During this time, he has overseen and provided preconstruction services for numerous design-build projects, including the $200M Stockton RWCF project, a joint venture with AECOM. His focus on communication and collaboration encourages innovation to create cost savings and gain schedule. Vince brings a unique perspective having managed design-build projects from pre-construction through completion.

Firm
W. M. Lyles Co.

Education/Academic Qualifications
MS, Construction Management, Arizona State University, 2006

BS, Civil Engineering, University of California Davis, 2004

Professional Registrations
Engineer-in-Training, CA #117946

Tenure with Lyles: 16
Total Years in Industry: 20

Why Vince?

- ✓ Current and previous experience working on AECOM/Lyles JV design-build projects including Stockton Regional Wastewater Control Facility Modifications
- ✓ Experienced in innovative preconstruction to save time and money
- ✓ Proven Value Engineering results
- ✓ Preconstruction and construction phase oversight for multiple water and wastewater treatment facilities throughout California

Owner/Client References

① East County Advanced Water Purification Program (ECAWP) Package 1 Progressive Design-Build, Santee, CA

Client: ECAWP/Padre Dam Municipal Water District
Kyle Swanson
T: 619.528.4766 | E: kswanson@padre.org

Role: Vince was the Pre-construction Manger providing first-hand constructability through the design process.

This progressive design-build project is one of the first in the country for the augmentation of a surface water supply with treated wastewater for potable reuse. **Components of Package 1 include**: a 16-mgd Water Recycling Facility, an 11.5-mgd Advanced Water Purification Facility including MF, RO and UV/AOP, a solids handling facility, a product water pump station and a new visitor's center.

② Stockton Regional Wastewater Control Facility Modifications, Progressive Design-Build, Stockton, CA

Client: City of Stockton
Deedee Antypas, Deputy Director of Wastewater Operations
T: 209.937.7425 | E: deedee.antypas@stocktonca.gov

Role: As the Pre-Construction Manager, Vince led the development of the GMP, capitalizing on his background in construction to provide first-hand constructability consulting throughout the design process.

Progressive design-build of new influent pumping, screening, and grit removal systems; new secondary biological treatment systems; tertiary filtration and disinfection systems; and solids handling facilities to replace an existing oxidation pond and overland flow treatment system. Includes installation of major process equipment such as vertical turbine pumps, perforated fine screens, conical tray grit removal systems, circular and rectangular primary and secondary clarifier mechanisms, aeration blowers and diffusers, submersible mixers, tertiary disc filters, UV disinfection system, sludge centrifuge, and associated electrical, control, and SCADA upgrades. Construction Cost $209M.

Vince Guillama

Preconstruction Services Manager

③ Graham Hill Water Treatment Plant Upgrades, Progressive Design-Build, Santa Cruz, CA

Client: City of Santa Cruz
Matt Zeman, Project Manager
T: 858.610.7478 | mzeman@cityofsantacruz.com

Role: In the role of Pre-Construction Manager, Vince is leading the development of the GMP, capitalizing on his background in construction to provide first hand constructability constulting throughout the design process.

The WTP was built in 1960s and had not been significantly upgraded since the 1980s. **The City recognized that in order to secure their water future, significant upgrades to the WTP had to be undertaken. Vince is leading the AECOM/Lyles construction team, worked closely with the client and its advisor through many iterations of layouts and process trains to arrive at the right solution for the City. Over 20 workshops were held on a wide range of topics that cover unit processes and constructability, among many others. The project scope includes**: high-rate clarification through the use of space-efficient plate settlers, ozone system, granular activated carbon (GAC), reclaimed water clarifiers, provisions for future UV disinfection, and new chemical feed systems; new administration and maintenance buildings, and new ozone building; upgraded operations building and upgraded filter gallery building; electrical upgrades; demolition of some existing buildings and site improvements including landscaping and vehicular access improvements. Construction is anticipated to begin in late 2024, and substantial completion is expected by Spring 2028.

Additional Experience

WWTP Secondary and Tertiary Improvements Design-Build, City of Davis, CA. Estimator/Project Manager. Design-build construction of new secondary biological treatment systems, new tertiary filtration and disinfection systems, and new solids handling facilities to replace an existing oxidation pond and overland flow treatment system. The secondary treatment processes consist of four new extended aeration basins and four new 85' diameter secondary clarifiers. Tertiary filtration and disinfection facilities consist of four new 6 MGD disc filters, two new chlorine contact tanks, and new a sodium hypochlorite and sodium bisulfite storage and pumping facility. Sludge handling facilities consist of two new rotary drum thickeners, two new screw presses, chemical storage facilities, and a 48,000 square foot sludge storage facility. Also included are a new cogeneration plant, a new emergency power generator, and numerous other electrical, control, and SCADA upgrades. Project Cost: $71M. (2018)

Orange County Sanitation District – P1-101 Sludge Dewatering and Odor Control Project, Orange County, CA. Project Manager - Mechanical. Construction of a new 32,000 SF thickening and dewatering structure on CIDH piles, including equipment, odor control, mechanical, fire, plumbing, electrical and instrumentation and control systems. Addition of two new concrete pipe tunnels along with a 1200 LF precast screen wall and fabricated above grade pipe rack, modifications to existing tunnel piping, rehabilitation of exiting silos and Truck Load Out Facility, as well as new underground piping, paving, demolition, and all other site improvements required to replace the existing sludge handling systems. Construction Cost: $127M. (2019)

Regional Water Reclamation Plant Upgrade, City of Moreno Valley, CA. Upgrade of existing 15.8 MGD water reclamation plant to 18.5 MGD, including yard structures, headworks, influent pump station, grit basins, power and blower buildings, chemical scrubber odor control facility, secondary effluent pump station, tertiary effluent/utility water pump station, tertiary effluent meter vault, acid-phase digester and fare, methane-phase digester, digested sludge storage tanks, low pressure digester gas holder, 15 kW generator, boiler facility, electrical buildings, and related appurtenances. Construction Cost: $29.7M. (2012)

Water Treatment Facility Improvements, City of El Centro, CA. Expansion of existing 10.5 MGD facility to 21 MGD, including clarifier units, gravity filters, waste wash-water recovery basin, raw water structure, operations and chemical buildings, dividing berm and connecting piping of two 25 MG earthen storage reservoirs, clearwell and backwash recovery pump stations, and site improvements including site piping, grading, paving, electrical instrumentation, and controls. Construction Cost: $26.6M. (2009)

Staffing Availability for Banning

2015

Staffing Availability

Prior to selection of specific staff for our team, we examined the existing and projected workload of each person and confirmed their availability for this assignment. We have determined they have no obligations, either current or projected, that would prevent them from performing with excellence to meet the requirements and schedule for this project.

Staff/Role	Availabity	Responsibilities	Benefit to Banning
Joe Lawrence **Design-Build Project Manager**	Phase 1 - 75% Phase 2 - 100%	Single point of responsibility	Successful track record in DB project management, including multiple projects with AECOM (ECAWP, Stockton, Santa Cruz)
Gabriel Perigault, PhD, PE **Design Manager**	Phase 1 - 60% Phase 2 - 30%	Manage design development	Led the design of 25 water and wastewater treatment plants; proven track record delivering successful DB projects with Lyles (ECAWP, Santa Cruz)
Marcos Reyes **Construction Manager**	Phase 1 - 25% Phase 2 - 100%	Onsite construction management	Lives within 25 miles of the project; proven track record delivering successful DBs with AECOM (Rialto, ECAWP)
Vince Guillama **Preconstruction Manager**	Phase 1 - 100% Phase 2 - 20%	Manage early works packages, ensures budget adherence during design	Lessons-learned managing early works packages; proven track record delivering successful DB projects with AECOM (Stockton, ECAWP, Davis, Santa Cruz)
Alex Franchi, PhD, PE **Treatment Process Lead**	Phase 1 - 60% Phase 2 - 25%	Treatment technology selection/design	Led successful designs of Title 22 projects across California; Proven track record delivering successful DB projects with Lyles (ECAWP)
Rosaida Harris **QA/QCLead**	Phase 1 - 40% Phase 2 - 40%	QA/QC management and discipline coordination	Extensive experience in QC for both design and construction on DB projects
Anthony Pilato **Superintendent**	Phase 1 - 5% Phase 2 - 100%	Manage onsite activities during construction	Seasoned superintendent with extensive experience coordinating multiple trades and managing large-scale projects, such as the $57M City of Beaumont
Matt Cain **Estimator/Cost Controls**	Phase 1 - 80% Phase 2 - 15%	Budget control and management	Design-to-budget experience from Beaumont and Rialto projects, backed by a successful track record with AECOM on the Rialto and ECAWP projects
Ryan Priestman **Lead Scheduler**	Phase 1 - 40% Phase 2 - 40%	Project Scheduling	Proven ability to work with AECOM to solve scheduling hurdles on the ECAWP DB project
Vijay Kumar **Commissioning Lead**	Phase 1 - 20% Phase 2 - 60%	Startup and commissioning plans and coordination	Proven ability to work with AECOM on commissioning and startup activities
Tyler Payne, SMS, CHST, CIT, STS, CUSP - Safety Director	Phase 1 - 15% Phase 2 -80%	Safety Management	Proven ability to provide Safety Management on successful local DB projects with AECOM (ECAWP)
T.J. Catalano, PE **Structural**	Phase 1 - 50% Phase 2 - 20%	Structural engineering lead	Brings experience upgrading WWTPs all aspects of structural engineering design and construction services on DBP projects such as ECAWP.
Steven Fitzwilliam, PE **Geotechnical/Civil**	Phase 1 - 50% Phase 2 - 20%	Geotechnical and Site/Civil Engineering	28 years of geotechnical experience, including design-build treatment plant projects
Barbara Bartholomae **Permitting Lead**	Phase 1 - 50% Phase 2 - 30%	Permit Management	Proven track record delivering permitting services on successful DB projects with Lyles (ECAWP, Santa Cruz)
William Goryl, RA **Architectural**	Phase 1 - 50% Phase 2 - 20%	Architectural design	30 years of architectural experience, including Design-build WWTPs such as Davis, CA and Rialto,A
Yasser Rizk, PE **Electrical/I&C**	Phase 1 - 50% Phase 2 - 20%	Electrical and SCADA/I&C Design	Extensive DB experience, highly skilled in electrical design, coordination of HVAC, mechanical process, and control systems for innovative, effective design
Karen Bettencourt, PE **Mechanical**	Phase 1 - 50% Phase 2 - 20%	Mechanical Process Design	20+ years of treatment plant mechnical process engineering, including the Stockton WWTP DB
Executive Management Board			
Grant Gourley **Executive Management Board**	Phase 1 - 10% Phase 2 - 10%	Executive Oversight	Decades of lessons-learned providing executive oversight on DB projects throughout CA and with AECOM (ECAWP, Stockton, Santa Cruz, Davis
Brian Daly, PE **Executive Management Board**	Phase 1 - 10% Phase 2 - 10%	Executive Oversight	National DB Leader with 30 years of DB experience, serves on all AECOM/Lyles JV Management Boards

Owners Rep. Comments	AECOM RESPONSE
Assuming that RO design and evaporation ponds are not included in the costs listed in Column D. Please include cost of RO/Evap Design as separate line item.	The design cost for the RO system, including supporting systems (additional chems, etc.) as well as 15-20 acres of evaporation ponds with mechanical aerators is estimated at $309k. The total amount of engineering hours to produce this design is estimated at 1,742 for all disciplines. This includes 53 addional drawings and 4 additional specs, as well as modification to other drawings and specs.The revised list of drawings and specs with the new drawings and specs is enclosed and changes highlighted in yellow. This also include the BODR adder and production of all the reports associated with the permitting of the evaporation ponds per Title 27.
After all decisions have been made in the BDR, moving the design to 30 percent should not take this much effort. Given that the RO and brine management facilities are not included will result in further savings, this effort may be reduced. A minimum saving is indicated.	Reduced to the extent possible. There is a major effort for the mechanical and instrumentation disciplines for this submittal.
Moving the design to 60 percent given the simple treatment train should not take this much effort. A minimum saving is indicated.	Reduced to the extent possible. This effort also includes the scope for replacement in kind for: •Digester Coating •Replace Piping in Grit Chamber •Replace East Primary Clarifier Center Drive •Replace Existing PVC Digester Gas Piping •Replace Digester Hot Water Boiler •Replace Grit/Cyclone Unit •Replace Two Old Grit Pumps

Moving the design to 90 percent given the simple treatment train should not take this much effort. A minimum saving is indicated.	We are proposing to eliminate the 90% Submittal to streamline the desing process and save cost.
The level of effort on a design including mainly packaged treatment systems seems high. A minimum saving is indicated.	The cost of this submittal increased because the 90% submittal was eliminated. The complete design will include sealed and signed drawings and this is last opportunity for thorough QC and reducing the possibility of conflicts/issues for Phase 2. This effort also includes the scope for replacement in kind for: •Digester Coating •Replace Piping in Grit Chamber •Replace East Primary Clarifier Center Drive •Replace Existing PVC Digester Gas Piping •Replace Digester Hot Water Boiler •Replace Grit/Cyclone Unit •Replace Two Old Grit Pumps
There seems to be a duplication of effort here with the initial baseline cost model. A minimum saving is indicated.	Reduced to the extent possible. However, baseline cost model is only one component of the GMP. We need to adjust contract, front end specs, Commissioning Plan, QMP for construction, etc.
We assume a virtual meeting. Minimum saving is indicated	Cost has been reduced but not to the extent requested. Cost has been reduced. However, this task includes preparing a Project Quality Plan and Project Execution Plan (a requirement of the RFP and included in our scope) for discussion in the kick-off meeting. This

These meeting are to discuss progress and plan activities. Simple reporting to document action items and design decisions is envisioned. 12 hours total can be assumed per meeting. Added contingency for addional 6 other meetings. These meeting are all virtual. A minimum saving is indicated.	Cost has been reduced but not to the extent requested. These are not only status meetings (see scope for this task). The second part of all the meetings is technical discussions of technical choices as well as review/discussion of comments/responses to deliverables. This is a very essential component of progressive DB. Please refer to scope provided.
Assumed 12 reports/invoices. A minimum saving is indicated.	Reduced to the extent possible. This effort not only includes invoicing on behalf of AECOM/WML but all project controls activities as requested in the RFP. In addition to invoicing and progress reports, writing contracts and managing payments to subs, schedule
We assume a virtual meeting. Minimum saving is indicated	Reduced to the extent possible. This not only includes the workshop but the preparation and maintenance of a risk register that will be essential to determine the necesssary contingency to carry in the GMP.
Although higher than other proposals, we left this effort intact.

Article 1

General

1.1 Mutual Obligations.

1.1.1 *Owner and Design-Builder* commit at all times to cooperate fully with each other and proceed on the basis of trust and good faith, to permit each party to realize the benefits afforded under the Contract Documents.

1.2 Basic Definitions.

1.2.1 ***Agreement* or *Contract*** refers to the executed contract between Owner and Design-Builder and includes DBIA Document No. 535, *Standard Form of General Conditions of Contract Between Owner and Design-Builder* (2022 Edition) and DBIA Document No. 545, *Design-Build Agreement for Water and Wastewater Projects* (2024 Edition), and all Exhibits and documents incorporated therein.

1.2.2 ***Basis of Design Documents*** are as follows: DBIA Document No. 535, *Standard Form of General Conditions of Contract Between Owner and Design-Builder* (2022 Edition) and DBIA Document No. 545, *Design-Build Agreement for Water and Wastewater Projects* (2024 Edition), Exhibit A "Design Criteria Report and Preliminary Design Drawings*",* and those documents specifically listed in, as applicable, in Exhibit D "*List of Reference Documents"*.

1.2.3 ***Change Directive*** is a directive issued by the Owner, at the Owner's sole discretion, to the Design-Builder to recognize that there is a potential Change Order to the Contract and provide the Design-Builder with direction on a path forward on the potential changed work.

1.2.4 ***Change Order*** is a contractually binding amendment to the Contract, which shall comply with the Change Order provisions of the Contract Documents.

1.2.5 ***Construction Documents*** are the documents, consisting of Drawings and Specifications, to be prepared or assembled by Design-Builder consistent with the the Design-Builder's accepted proposal and the Basis of Design Documents unless a deviation from the Basis of Design Documents is specifically set forth in a Change Order executed by both Owner and Design-Builder, as part of the design review process contemplated by Section 2.4 of these General Conditions of Contract.

1.2.6 ***Construction Services*** include construction, testing, commissioning, and acceptance for the Project, and all other work as needed to complete the Work as provided for in the Construction Documents.

1.2.7 ***Contract Documents*** are those documents identified in the DBIA Document No. 545.

1.2.8 ***Contract Price or Design-Build Price*** refers to the amounts set forth in the DBIA Document No. 545.

1.2.9 ***Contract Time*** refers to the time periods set forth in Article 5 of the DBIA Document No. 545.

1.2.10 ***Contractor's Construction Schedule*** is the Design-Builder's schedule for the Construction Services scope of work that complies with the scheduling requirements of the Contract Documents and clearly identifies the Critical Path of the Work.

1.2.11 ***Date of Commencement*** – As defined in the DBIA Document No. 545.

1.2.12 ***Day*** **or** ***Days*** shall mean calendar days unless otherwise specifically noted in the Contract Documents.

1.2.13 ***Design-Builder*** is the party to the Contract that is responsible for design, construction, commissioning and acceptance testing, and training and other services as defined by the Contract Documents. Any and all references to Contractor and Contractor's obligations are applicable to the Design-Builder.

1.2.14 ***Design-Build Team*** is comprised of Design-Builder, Design Consultant, and key Subcontractors identified by Design-Builder.

1.2.15 ***Design Consultant*** is a qualified, licensed design professional who is not an employee of Design-Builder, but is retained by Design-Builder, or employed or retained by anyone under contract with Design-Builder, to furnish design services required under the Contract Documents. A Design Sub-Consultant is a qualified, licensed design professional who is not an employee of Design Consultant but is retained by Design Consultant or employed or retained by anyone under contract to Design Consultant, to furnish design services required under the Contract Documents.

1.2.16 ***Design Services*** are those services as defined in Article 2 of the General Conditions and in the Contract Documents.

1.2.17 ***Design Submission*** means any and all documents, packaged treatment submittals, electronic information, including computer programs and computer generated materials, data, plans, drawings, sketches, illustrations, specifications, descriptions, models, and other information developed, prepared, furnished, delivered or required to be delivered by, or for, Design-Builder.

1.2.18 ***Engineer of Record*** is the qualified licensed in the State of California design professional responsible for the Design Services.

1.2.19 ***Final Acceptance*** occurs once all requirements of Final Completion have occurred and the Owner issues a Letter of Final Acceptance.

1.2.20 ***Final Application for Payment*** is the Design-Builder's request for final payment after Final Acceptance has occurred and a Letter of Final Acceptance has been issued by the Owner.

1.2.21 ***Final Completion*** is the date on which all Work is complete in accordance with the Contract Documents, including but not limited to, any items identified in the punch list prepared under Section 6.6.1.

1.2.22 ***Force Majeure Events*** are those events that are beyond the control of both Design-Builder and Owner, including the events of war, floods, labor disputes, earthquakes, epidemics, adverse weather conditions not reasonably anticipated, and other acts of God. Listed more fully in Section 8.3.

1.2.23 ***General Conditions of Contract*** refer to this DBIA Document No. 535, *Standard Form of General Conditions of Contract Between Owner and Design-Builder* (2022 Edition).

1.2.24 *GMP Proposal* or *Proposal* means that proposal developed by Design-Builder*, Cost Plus Fee With an Option for a Guaranteed Maximum* Price, *Progressive Design-Build Agreement,* or DBIA Document No. 545, *Progressive Design-Build Agreement for Water and Wastewater Projects.* The GMP will become the basis for the Contract Price.

1.2.25 ***Hazardous Conditions*** are any materials, wastes, substances and chemicals deemed to be hazardous under applicable Legal Requirements, or the handling, storage, remediation, or disposal of which are regulated by applicable Legal Requirements.

1.2.26 ***Holiday(s)*** - The day upon which the Owner is closed during normal business hours in observance of one of its holidays. City's observed holidays are:

a. New Year's Day,
b. President's Day,
c. Memorial Day,
d. Independence Day,
e. Labor Day,
f. Thanksgiving Day & Day after and
g. Christmas Day and Day after

In addition, the Design-Builder shall not perform any work during a period starting December 24th and ending January 1st. Design-Builder shall return to perform work on January 2nd. The days between December 24th and ending January 1 shall not be working days for City.

1.2.27 ***Legal Requirements*** are all applicable federal, state and local laws, codes, ordinances, rules, regulations, orders and decrees of any government or quasi-government entity having jurisdiction over the Project or Site, the practices involved in the Project or Site, or any Work.

1.2.28 ***Notice to Proceed*** is the written notice from the Owner to the Design-Builder establishing the dates for Design Services and/or Construction Services, and which authorizes the Design-Builder to commence with Design Services

and/or Construction Services. The effective date of the Notice to Proceed shall be no later than the date the Kick-Off meeting is held.

1.2.29 ***Other Contractors*** shall mean any contractors, service providers, suppliers or vendors performing construction, maintenance, operations, or repairs in and around the Project Site.

1.2.30 ***Owner (or City)*** shall mean the City of Banning, acting through its City Council. Owner may include Owner's Representative, where appropriate delegation has occurred.

1.2.31 ***Owner's Project Criteria or Design Criteria*** are developed by or for Owner to describe Owner's program requirements and objectives for the Project, including use, space, price, time, site and expandability requirements, as well as submittal requirements and other requirements governing Design-Builder's performance of the Work. Owner's Project Criteria may include conceptual documents, design criteria, design performance specifications, design specifications, and LEED® or other sustainable design criteria and other Project-specific technical materials and requirements.

1.2.32 ***Owner's Representative*** shall mean person, persons, or entity to whom the Owner may delegate responsibilities to, to fulfill the duties of Owner as identified in Contract Documents.

1.2.33 ***Project*** shall mean the City of Banning Wastewater Treatment Plant and Recycled Water Upgrades Project, and includes the total design, construction, and testing and commissioning of the Work under the Contract and all other work, labor, equipment, and materials necessary to accomplish the Project.

1.2.34 ***Proposal*** is the Design-Builder's submittal in response to the Owner's Request for Proposal, which includes the Design-Builder's progressive design submittal and upon which the Design-Builder based its Design-Build Price.

1.2.35 ***Site*** **or** ***Project Site*** is the land or premises on which the Project is located, and includes all areas designated for staging, storage, parking and temporary offices as indicated in the Contract Documents.

1.2.36 ***Subcontractor*** is any person or entity retained by Design-Builder as an independent contractor to perform a portion of the Work and shall include materialmen and suppliers.

1.2.37 ***Sub-Subcontractor*** is any person or entity retained by a Subcontractor as an independent contractor to perform any portion of a Subcontractor's Work and shall include materialmen and suppliers.

1.2.38 ***Substantial Completion*** **or** ***Substantially Complete*** means the date on which Design-Builder has satisfied all of the requirements for Substantial Completion under the Contract Documents, and the Work, or an agreed upon portion of the Work, is sufficiently complete in accordance with the Contract

Documents so that Owner can occupy and use the Project for its intended purposes.

1.2.39 ***Work*** is comprised of all Design-Builder's design, construction and other services required by the Contract Documents, including procuring and furnishing all materials, equipment, services and labor reasonably inferable from the Contract Documents.

1.2.40 ***Work Products*** are all works, tangible or not, created under the Contract for the Owner, as defined under Article 4 of the DBIA Document No. 545.

Article 2

Design-Builder's Services and Responsibilities

2.1 General Services.

2.1.1 The Design-Builder will designate in writing a contact person ("Design-Builder's Representative") for coordination and communication with Owner. The Design-Builder's Representative shall have the authority to make decisions for the Design-Builder firm and shall have binding signatory power for changes in work. The Design-Builder's Representative and/or his or her designee shall be on the Project Site at all times during work activity. Design-Builder's Representative shall be reasonably available to Owner and shall have the necessary expertise and experience required to supervise the Work. Design-Builder's Representative shall communicate regularly with Owner and shall be vested with the authority to act on behalf of Design-Builder. Design-Builder's Representative may be replaced only with the mutual agreement of Owner and Design-Builder.

2.1.2 An orderly system for communication between Owner and the Design-Builder is essential to the satisfactory completion of the Work. Owner will transmit, directly or through others, written instructions, responses or other communications to the Design-Builder's Representative or other persons identified in writing by the Design-Builder to receive such communications. The Design-Builder shall, by a letter to Owner, designate (by name) one or more staff members to receive oral and written field communications when the Design-Builder's Representative is away from the Project Site and to act as the designated representative. During the times that the Design-Builder's Representative may be temporarily absent, a staff member shall be authorized to act immediately on orders or instructions issued by Owner. If Owner finds it necessary to communicate with the Design-Builder Personnel authorized to receive such communications and none are available to receive such communications, Owner may suspend all of the Design-Builder's operations at the Project Site until such communications can be accomplished. Formal communications from the Design-Builder to Owner that are necessary for the performance of the Contract, including documents described in the Contract Documents, and any other written communications, will be addressed to Owner, unless otherwise specified in the Contract Documents. All written communications or submittals shall be signed by the Design-Builder's Representative or designee

in serialized format, and Design-Builder shall maintain logs available to Owner for review and reconciliation upon request.

2.1.3 The Design-Builder represents it has the proper business and professional background, knowledge, experience and expertise necessary to provide all Design Services and Construction Services for the Project. Design-Builder further represents that it and all Design-Builder's subcontractors possess all required professional licenses in the State of California to provide all Design Services and Construction Services necessary for the Project. At all times herein, Design-Builder shall possess a California Contractor's license, Class A. Design-Builder's California Contractor's license number is 1133137.

2.1.4 Design-Builder makes certain representations in the Contract Documents, including without limitation, the representations in this clause. Design-Builder is deemed to make these representations by and as a condition of submission of Design-Builder's proposal. Design-Builder agrees that it has single point responsibility for the design and construction of this Project. Following award and execution of the Contract, these representations are deemed republished throughout the performance of the Work of the Contract and shall also be treated as express warranties.

2.1.5 Design-Builder has at the time of Proposal, and will throughout performance, carefully and adequately reviewed the Contract Documents and acknowledges that these Contract Documents establish the scope, level of quality, construction intent and the procedures for the Design-Builder's design and construction of the Work to a state of 100% completion. Design-Builder shall carefully study and compare each of the Contract Documents with the others and with information furnished by Owner, and shall report in writing to Owner any errors, inconsistencies, or omissions in the Contract Documents or inconsistencies with program performance requirements or applicable Code requirements observed by Design-Builder.

2.1.6 Design-Builder has at the time of Proposal, and will throughout performance, carefully examine the Project Site and the adjacent areas, has adequately investigated the nature and location of the Work to be performed and has satisfied itself and will continue to satisfy itself as to the general and local conditions which will be applicable, including but not limited to:

2.1.6.1 Conditions related to Project Site access and topography, and to the transportation, disposal, handling and storage of materials;

2.1.6.2 The availability of labor, water, power and roads;

2.1.6.3 Observable physical conditions at the Project Site and existing Project Site conditions, including seasons and climate;

2.1.6.4 Size, utility capacities and connection options of external utilities;

2.1.6.5 The surface conditions of the ground, including normal and usual soil conditions;

2.1.6.6 The character and availability of the equipment and facilities which will be needed prior to and during the performance of the construction work; and

2.1.6.7 All other conditions which may be material to the Design-Builder's performance of its obligations under this Contract.

2.1.7 Design-Builder has at the time of Proposal, and will throughout performance, have the experience and capability to efficiently and expeditiously accomplish the Work required under this Contract in a timely and satisfactory manner and at the standard of practice of a Design-Builder with substantial experience in the Work of the Contract.

2.1.8 Design-Builder shall supervise, coordinate, and direct the Work using Design-Builder's best skill and attention. Design-Builder shall be solely responsible for, and have control over the entire design effort, construction means, methods, techniques, sequences, procedures, and the coordination of all portions of the Work, including, but without limitation, site work, utilities, and building process systems.

2.1.9 The Design-Builder shall coordinate, sequence, and organize its work so as to minimize the inconvenience and disruption to the general public to the greatest extent reasonable. Such coordination and mitigation shall include dissemination of information and meeting with or notification to the parties who will be affected by the Work, as appropriate, and shall be undertaken in cooperation with Owner, and in accordance with any specific Contract Document provisions or direction from Owner. Prior to commencement of the Work, the Design-Builder shall hold pre-installation coordination meetings and prepare coordination drawings that document the pre-planning of the Work. This process shall ensure the installation of the Work is undertaken in an efficient and professional manner in accordance with the Contract Documents. In the event that the Owner in good faith determines that the Design-Builder has not complied with this provision, or has failed to properly address the inconvenience and/or a disruption to the general public, the Owner shall have the right to change the sequence of the Work by providing the Design-Builder with 48 hours' notice, and the Design-Builder will not be entitled to any additional time or compensation resulting from the change in the sequence of the Work. The Design-Builder's coordination shall include, but not be limited to, the following:

2.1.9.1 Coordinate use of Project space and sequence of installation of equipment or other work that is indicated on the Contract Documents. Utilize space efficiently to eliminate conflicts in the installation of the Work and to maximize accessibility for maintenance and repairs.

2.1.9.2 When necessary, prepare memoranda for distribution to each party involved in the Work outlining special procedures required for

coordination and construction. Include such items as required notices, reports, construction restraints and attendance at meetings.

2.1.9.3 Coordinate schedule and timing of required administrative procedures with other construction activities to avoid conflicts and ensure orderly progress of the Work.

2.1.9.4 The Design-Builder shall obtain the approval of Owner and notify all other affected persons or "Other Contractors" at least forty-eight (48) hours before starting work which may block access or otherwise cause undue difficulty to occupants or users of property affected, and shall restore such access to a usable condition or, with Owner's permission, provide replacement access as soon as possible.

2.1.9.5 The Design-Builder shall obtain necessary information and identify equipment locations and other layouts, as available, to avoid interface conflicts and shall be familiar with applicable codes and requirements and perform its work in compliance therewith.

2.1.9.6 Coordinate execution of the Work with those public utilities, governmental bodies, private utilities and Other Contractors performing work on and adjacent to the worksites. Eliminate or minimize delays in the Work and conflicts with those utilities, bodies and Other Contractors.

2.1.10 Design-Builder shall be responsible for inspection of all portions of the Work, including those portions already performed under this Contract, to determine that such portions conform to the requirements of the Contract Documents and are ready to receive subsequent Work.

2.1.11 The Design-Builder shall be solely responsible for any and all design errors including, but without limitation, errors, inconsistencies or omissions in the Construction Documents. Design-Builder shall take field measurements, verify field conditions, and carefully compare with the Contract Documents such field measurements, conditions, and other information known to Design-Builder before commencing the Work. Errors, inconsistencies, or omissions discovered at any time shall be promptly reported in writing to Owner.

2.1.12 Design-Builder further represents and warrants it will continuously furnish the necessary personnel to complete the Project on a timely basis as required in this Contract and that such personnel have the experience and expertise levels to adequately perform the work. Design-Builder’s representations and warranties stated herein, shall also apply to Design-Builder’s subcontractors.

2.1.13 The Design-Builder shall provide Owner with a monthly status report detailing the progress of the Work, including (i) whether the Work is proceeding according to schedule; (ii) whether discrepancies, conflicts, or ambiguities exist in the Contract Documents that require resolution; (iii) whether health and safety issues exist in connection with the Work; (iv) status of the contingency account to the extent provided for in the DBIA Document No. 545, *Progressive Design-Build*

Agreement for Water and Wastewater Projects; and (v) other items that require resolution so as not to jeopardize Design-Builder's ability to complete the Work for the Contract Price and within the Contract Time(s). Status reports shall be submitted with Design-Builder's draft Payment Applications as a pre-requisite to payment.

2.1.14 Prior to commencement of the Work, Design-Builder shall prepare and submit a schedule in compliance with the scheduling requirements contained in Article 2 of the General Conditions. The schedule shall be revised as required by conditions and progress of the Work, but such revisions shall not relieve Design-Builder of its obligations to complete the Work within the Contract Time(s), as such dates may be adjusted in accordance with the Contract Documents. Owner's review of, and response to, the schedule shall not be construed as relieving Design-Builder of its complete and exclusive control over the means, methods, sequences and techniques for executing the Work.

2.1.15 The Design-Builder is required to meet with the Owner within seven (7) days after execution of the Agreement to discuss issues affecting the administration of the Work and to implement the necessary procedures, including those relating to schedule, submittals and payment, to facilitate the ability of the parties to perform their obligations under the Contract Documents.

2.1.16 The Design-Builder shall conduct progress meetings in compliance with the Contract Documents, unless otherwise agreed in writing. The Design-Builder shall schedule a Preconstruction Conference following receipt of the Notice to Proceed for Construction Services to discuss the Design-Builder's construction and scheduling requirements in Section 2.12 of the General Conditions. For all meetings, the Design-Builder shall make arrangements for meetings and prepare agendas with copies for participants. For meetings between Owner and the Design-Builder, Owner will record minutes and distribute. The Design-Builder shall be advised of and shall attend Contract meetings as deemed necessary by Owner and at no additional cost. The Design-Builder shall inform Owner at least forty-eight (48) hours in advance of any Project-related meeting(s) where Design-Builder intends to have a lawyer present.

2.2 Design Professional Services.

2.2.1 Design-Builder shall, consistent with applicable state licensing laws, provide through qualified, licensed design professionals employed by Design-Builder, or procured from qualified, independent licensed Design Consultants, the necessary design services, including architectural, engineering and other design professional services, for the preparation of the required drawings, specifications and other design submittals to permit Design-Builder to complete the Work consistent with the Contract Documents. Nothing in the Contract Documents is intended or deemed to create any legal or contractual relationship between Owner and any Design Consultant.

2.2.2 Design-Builder shall employ only Design Consultants and/or Design Subconsultants who are duly licensed and qualified to perform the Work consistent

with the Contract Documents. Prior to the date that Design Consultants and/or Design Subconsultants perform Work on the Project, Design-Builder shall identify in writing to Owner all Design Consultants and Design Subconsultants. To the extent that Design-Builder has not selected a Design Consultant or Design Subconsultant prior to performing the Work, Design-Builder shall provide Owner in writing a list of any subsequently added Design Consultants and/or Design Subconsultants and their scope of Work prior to their performing Work on the Project. Owner may reasonably object to Design-Builder's selection of any Design Consultant or Design Subconsultant, provided that the Contract Price and/or Contract Time(s) shall be adjusted to the extent that Owner's decision impacts Design-Builder's cost and/or time of performance. Design-Builder shall not substitute a listed Design Consultant or Subconsultant without obtaining Owner's prior written consent; such consent shall not be unreasonably withheld. Nothing in the Contract Documents is intended or deemed to create any legal or contractual relationship between Owner and any Design Consultant or Design Subconsultant, including but not limited to any third-party beneficiary rights.

2.3 Standard of Care for Design Professional Services.

2.3.1 All work performed in connection with this Contract shall be performed in a manner consistent with the standard of care ordinarily exercised by those who provide architectural, engineering, planning and design services for projects of similar size, scope and complexity for water treatment facilities in the United States, and consistent with the standard of care ordinarily exercised by those who specialize in such specialty services. In addition, all work is to be performed within the standard of care for California architects, engineers, planners and designers. Neither review nor approval of Design-Builder's work by Owner, any employee, any agent/consultant of Owner, or any other person shall in any way relieve Design-Builder from its duty to utilize this standard of care in the performance of its duties. Design-Builder agrees to provide its professional services in a manner that is in the Owner's economic and governmental best interests, consistent with this standard of care and the Design-Builder's professional obligations. 2.4 Design Development Services.

2.4.1 Upon receipt of the Notice to Proceed for Design Services, the Design-Builder shall commence the design and the preparation of the Construction Documents per the terms of the Contract and as provided in Exhibit B "Scope of Work." The Construction Documents shall provide information customarily necessary in documents for projects of similar size, complexity, and quality. The Construction Documents shall include all information required to complete the construction of the Project, other than such details customarily developed by others during construction.

2.4.2 Contract Schedule shall indicate the times for Owner to review the completion of each such portion of the Construction Documents and a reasonable time for review of same. The Schedule shall indicate a minimum of 21 calendar days for review by Owner. Design-Builder and Owner shall, consistent with any applicable provision of the Contract Documents, agree upon any interim Design Submissions that Owner may wish to review, which interim Design Submissions

may include design criteria, drawings, diagrams and specifications setting forth the Project requirements.

2.4.2.1 Design Submissions shall be consistent with the Owner's Project Criteria as well as the Basis of Design Documents, as the Basis of Design Documents may have been changed or supplemented through the design process set forth in this Section. By submitting Design Submissions, Design-Builder represents to the Owner that the Work depicted and otherwise shown, contained, or reflected in Design Submissions may be constructed in compliance with the then current Contract Price and Contract Time. Notwithstanding the above, Design-Builder may propose Design Submissions that may alter the Basis of Design Documents, the Contract Price and/or Contract Time; however, Design-Builder must provide notice thereof in accordance with Article 9 of the General Conditions and obtain a Change Order before such proposed Design Submissions are incorporated into the Construction Documents.

2.4.2.2 On or about the time of the Design Submissions, Design-Builder and Owner shall meet and confer about the Design Submissions, with Design-Builder identifying during such meetings, among other things, the evolution of the design and any changes to the Basis of Design Documents, or, if applicable, previously submitted Design Submissions. Changes to the Basis of Design Documents, including those that are deemed minor changes under Section 9.3.1, shall be processed in accordance with Article 9. Minutes of the meetings, including a full listing of all changes, will be maintained by Design-Builder and provided to all attendees for review. Following the design review meeting, Owner shall review and approve the interim Design Submissions and meeting minutes in a time that is consistent with the turnaround times set forth in Design-Builder's schedule.

2.4.2.3 Owner shall review and respond to Design Submissions, providing any comments and/or concerns about the Design Submissions. Owner shall provide all comments on the Design Submissions within the time provided by the Contract Documents. Design-Builder shall revise the Design Submissions (and any other deliverables) in response to Owner's comments and incorporate said responses into the next submission of Design Submissions.

2.4.2.4 If incorporation of Owner's comments results in a design that is inconsistent with or otherwise gives rise to a change in Owner's Project Criteria, the Basis of Design Documents, the Contract Price and/or the Contract Time, Design-Builder shall provide notice thereof in accordance with Articles 9 and 10 of the General Conditions. Changes to the Basis of Design Documents, the Contract Price and/or the Contract Time, including those that are deemed minor changes, shall be processed in accordance with Article 9 of the General Conditions.

2.4.3 Design-Builder shall submit Construction Documents to Owner setting forth in detail drawings and specifications describing the requirements for construction of the Work. The Construction Documents shall be consistent with the latest set of interim Design Submissions, as such submissions may have been modified in a design review meeting and recorded in the meeting minutes. The parties shall have a design review meeting to discuss, and Owner shall review and approve, the Construction Documents in accordance with the procedures set forth in Section 2.4.1 above. Design-Builder shall proceed with construction in accordance with the approved Construction Documents and shall submit one set of approved Construction Documents to Owner prior to commencement of construction.

2.4.4 Owner's review and approval of interim Design Submissions, meeting minutes, and the Construction Documents is for the purpose of mutually establishing a conformed set of Contract Documents compatible with the requirements of the Work. Neither Owner's review nor approval of any interim Design Submissions, meeting minutes, and Construction Documents shall be deemed to transfer any design liability from Design-Builder to Owner, nor shall it relieve the Design-Builder from its duty to utilize this standard of care in the performance of its duties. Design-Builder shall provide Owner with sufficient time in the Project Schedule to review and approve the Design Submissions.

2.4.5 To the extent not prohibited by the Contract Documents or Legal Requirements, Design-Builder may prepare interim Design Submissions and Construction Documents for a portion of the Work to permit construction to proceed on that portion of the Work prior to completion of the Construction Documents for the entire Work. Interim design submissions shall be consistent with the Basis of Design Documents, as the Basis of Design Documents may have been changed through the design process set forth in this Section. On or about the time of the scheduled submissions, Design-Builder and Owner shall meet and confer about the submissions, with Design-Builder identifying during such meetings, among other things, the evolution of the design and any changes to the Basis of Design Documents, or, if applicable, previously submitted design submissions. Following the design review meeting, Owner shall review and approve the interim design submissions and meeting minutes in a time that is consistent with the turnaround times set forth in Design-Builder's schedule.

2.5 Legal Requirements.

2.5.1 Design-Builder shall perform the Work in accordance with all Legal Requirements and shall provide all notices applicable to the Work as required by the Legal Requirements.

2.5.2 Subject to notice and scheduling provisions, where revisions are required to be made to the Construction Documents resulting in a change in the construction because of changes in Legal Requirements, the Contract Price and/or Contract Time(s) may be adjusted to compensate Design-Builder for the effects of any changes in the Legal Requirements enacted after the date of the Agreement. This Article 2.5.2 shall not apply where there is a Force Majeure event resulting in changes to the Legal Requirements, in which case, Section 8.3 will apply.

2.5.3 California Air Resources Board (CARB): The Design-Builder shall comply with the all California Air Resources Board (CARB) In-Use Off-Road Diesel-Fueled Fleet Regulation [Title 13 CCR, Division 3, Chapter 9, Article 4.8, as amended, effective 10/1/23] and is responsible for maintaining compliance with said regulations for the duration of Project and for verifying compliance certificates for any subcontractors used throughout the contract term.. The Design-Builder shall acknowledge these requirements and provide compliance certificates with their Proposal.

1. The Design-Builder must obtain copies of the valid Certificates of Reported Compliance for the fleet selected for the contract and their listed subcontractors, if applicable, prior to entering into a new or renewed contract with that fleet.
2. The Design-Builder shall not enter into a contract with a fleet for which it does not have a valid Certificates of Reported Compliance for the fleet and its listed subcontractors, if applicable, prior to entering into a new or renewed contract with that fleet.
3. The Design-Builder shall collect new valid Certificates of Reported Compliance for the current compliance year, between March 1 and June 1 of each year, from all fleets that have an ongoing contract with the Design-Builder as of March 1 of that year.

2.5.4 ASSET MANAGEMENT

Asset Management Data: The Contractor shall provide all Asset Management Data services per Design Criteria Report.

2.6 Government Approvals and Permits.

2.6.1 Design-Builder shall obtain and pay for all necessary permits, approvals, licenses, government charges and inspection fees required for the prosecution of the Work by any government or quasi-government entity having jurisdiction over the Project as identified in Exhibit F to the Agreement, (*Permits and Approvals*), .

2.6.2 Design-Builder shall provide reasonable assistance to Owner in obtaining those permits, approvals and licenses that are Owner's responsibility.

2.7 Design-Builder's Construction Services.

2.7.1 Unless otherwise provided in the Contract Documents to be the responsibility of Owner or a separate contractor, Design-Builder shall provide through itself or Subcontractors the necessary supervision, labor, inspection, testing, start-up, material, equipment, machinery, temporary utilities and other temporary facilities to permit Design-Builder to complete construction of the Project consistent with the Contract Documents.

2.7.2 Design-Builder shall perform all construction activities efficiently and with the requisite expertise, skill and competence to satisfy the requirements of the Contract Documents. Design-Builder shall at all times exercise complete and exclusive control over the means, methods, sequences and techniques of

construction.

2.7.3 Design-Builder shall employ only Subcontractors who are responsible, duly licensed and qualified to perform the Work consistent with the Contract Documents. Design-Builder shall at all times comply with the requirements of Public Contract Code Section 22166 regarding the use of Subcontractors. Prior to the date that Subcontractors perform Work on the Project, Design-Builder shall identify in writing to Owner all Subcontractors. To the extent that Design-Builder has not selected a Subcontractor prior to performing the Work, Design-Builder shall provide Owner in writing a list of any subsequently added Subcontractors prior to their performing Work on the Project. Owner may reasonably object to Design-Builder's selection of any Subcontractor. Design-Builder may not substitute listed Subcontractors without Owner's prior written consent; such consent shall not be unreasonably withheld. The Design-Builder shall select or replace the subcontractor in compliance with the Contract requirement, at no cost or time impact to the Owner.

2.7.4 Design-Builder assumes responsibility to Owner for the proper performance of the Work of Subcontractors and any acts and omissions in connection with such performance. Nothing in the Contract Documents is intended or deemed to create any legal or contractual relationship between Owner and any Subcontractor or Sub-Subcontractor, including but not limited to any third-party beneficiary rights.

2.7.5 Design-Builder shall coordinate the activities of all Subcontractors. If Owner performs other work on the Project or at the Site with separate contractors under Owner's control, Design-Builder agrees to reasonably cooperate and coordinate its activities with those of such separate contractors so that the Project can be completed in an orderly and coordinated manner without unreasonable disruption.

2.7.6 Design-Builder shall keep the Site reasonably free from debris, trash and construction wastes to permit Design-Builder to perform its construction services efficiently, safely and without interfering with the use of adjacent land areas. Upon Substantial Completion of the Work, or a portion of the Work, Design-Builder shall remove all debris, trash, construction wastes, materials, equipment, machinery and tools arising from the Work or applicable portions thereof to permit Owner to occupy the Project or a portion of the Project for its intended use.

2.8 Design-Builder Subcontracts

2.8.1 Design-Builder shall use only Responsible (as defined by Public Contract Code section 1103) and qualified Subcontractors and material suppliers. Unless previously identified in Design-Builder's Proposal, before making an award to a Subcontractor or material supplier, the Design-Builder shall identify in writing to the Owner the name, qualifications, experience, contact and licensing information, and scope of work for each proposed Subcontractor or material supplier. The Design-Builder shall provide the Owner with a letter which provides all necessary information demonstrating that the proposed subcontractor or material supplier satisfies the Contract requirements, including but not limited to, insurance provisions. If requested, Design-Builder will promptly provide additional

information requested by Owner pending concurrence from Owner. The Owner reserves the right, which shall be exercised in good faith, to reasonably deny or remove a Subcontractor, Sub-subcontractor, or material supplier in the event the Owner determines that the Subcontractor, Sub-subcontractor, or material supplier is not Responsible, or that the subcontractor or material supplier fails to satisfy or violates the requirements under the Contract Documents. Nothing herein shall be construed to relieve the Design-Builder from its obligations to properly manage, supervise, schedule, or coordinate its Subcontractors and material suppliers.

2.8.2 All subcontracts will be between the Design-Builder and the Subcontractors. Subcontracts shall be in writing to protect Owner from impacts and claims arising from the Work. A copy of every subcontract shall be furnished to Owner upon request. The Design-Builder shall be responsible to Owner for the acts and omissions of its agents and employees, suppliers, Subcontractors, and Sub-subcontractors performing work under a contract with the Design-Builder, and of its lower tier subcontractors, agents or employees. The Design-Builder shall require each Subcontractor to be bound to the Design-Builder by the terms of the Contract Documents, and to assume toward the Design-Builder all applicable obligations and responsibilities which the Design-Builder, by these Contract Documents, assumes toward Owner. Said Contract shall preserve and protect the rights of Owner under the Contract Documents with respect to the Work to be performed by the Subcontractors that the subcontracting thereof will not prejudice such rights. Where appropriate, the Design-Builder shall require each Subcontractor to enter into similar Contracts with the Sub-subcontractors. The Design-Builder shall make available to each proposed Subcontractor, prior to the execution of the subcontract, copies of the Contract Documents and the Contractor's Construction Schedule, to which the Subcontractor shall similarly make copies of such Contract Documents available to their Sub-subcontractors. Each Subcontractor will be bound by this Article. Subcontractors also shall be provided access to all Requests for Information (RFI's), Schedule Updates, and any other information that arises during the performance of the Work. No subcontract or purchase order shall bind or purport to bind Owner. Each subcontract or purchase order shall provide, without requiring the prior consent of the relevant Subcontractor or supplier, for assignment and delegation of such subcontract or purchase order by Design-Builder to Owner in the event of a default by the Design-Builder. If Owner elects to assume by assignment any subcontract or purchase order as described in this Article, then Design-Builder shall enter into reasonable assignment documentation requested by Owner which may be required to effect such assignment.

2.8.3 Subject to Public Contract Code Section 22166, the Design-Builder shall make no substitution for any Subcontractor, person or entity previously selected without the prior written concurrence of Owner which will not be unreasonably withheld.

2.9 Design-Builder's Responsibility for Project Safety.

2.9.1 Design-Builder recognizes the importance of performing the Work in a safe manner so as to prevent damage, injury or loss to (i) all individuals at the Site,

whether working or visiting; (ii) the Work, including materials and equipment incorporated into the Work or stored on-Site or off-Site; and (iii) all other property at the Site or adjacent thereto. Design-Builder assumes responsibility for implementing and monitoring all safety precautions and programs related to the performance of the Work. Design-Builder shall, prior to commencing construction, designate a Safety Representative with the necessary qualifications and experience to supervise the implementation and monitoring of all safety precautions and programs related to the Work. Unless otherwise required by the Contract Documents, Design-Builder's Safety Representative shall be an individual stationed at the Site who may have responsibilities on the Project in addition to safety. The Safety Representative shall make routine daily inspections of the Site and shall hold weekly safety meetings with Design-Builder's personnel, Subcontractors and others as applicable.

2.9.2 Design-Builder and Subcontractors shall comply with all Legal Requirements relating to safety, including but not limited to, all pertinent safety laws and regulations and orders of the State of California, Department of Industrial Relations, Division of Industrial Safety, and U.S. Department of Labor, OSHA, as well as any Owner-specific safety requirements set forth in the Contract Documents, provided that such Owner-specific requirements do not violate any applicable Legal Requirement. Design-Builder will immediately report in writing any safety-related injury, loss, damage or accident arising from the Work to Owner's Representative and, to the extent mandated by Legal Requirements, to all government or quasi-government authorities having jurisdiction over safety-related matters involving the Project or the Work.

2.9.3 Design-Builder's responsibility for safety under this Section is not intended in any way to relieve Subcontractors and Sub-Subcontractors of their own contractual and legal obligations and responsibility for (i) complying with all Legal Requirements, including those related to health and safety matters; and (ii) taking all necessary measures to implement and monitor all safety precautions and programs to guard against injuries, losses, damages or accidents resulting from their performance of the Work.

2.9.4 The Design-Builder shall conduct all operations in a manner that will cause no interference with normal operations of the Owner. In all operations, the Design-Builder shall be governed by the regulations and rules of Owner and shall cooperate fully with Owner. All temporary blockages for the movement of construction materials or equipment shall be coordinated with and approved by Owner at least forty-eight (48) working hours in advance of any closure. The Design-Builder shall provide and maintain temporary and permanent fences, barriers, lights, bridges, and signs and provide such flaggers and guards as necessary to give adequate warning to the public and all individuals on or using the premises.

2.9.5 Within ten (10) Days after the date of the Notice to Proceed and before moving vehicles onto the Project Site, the Design-Builder shall submit to Owner the proposed Plan for vehicular and pedestrian traffic circulation, including the

location and types of signs to be used. Thereafter, and not later than fifteen (15) Days prior to subsequent changes required by Owner for said circulation, sign locations and types, the Design-Builder shall submit revised plans to Owner.

2.9.6 The Design-Builder shall conduct the operations in a manner that avoids injury or damage to adjacent property and improvements. Property such as, but not limited to, buildings, trees, shrubbery, lawns, pole lines, fences, guard rails, guide posts, culvert and Project markers, signs, structures, and other objects on or adjacent to the Project Site, that are not designated for removal, shall be protected from injury or damage. If damaged or removed due to Design-Builder's operations, they shall be restored or replaced in as nearly the original condition and location as is reasonably possible. When ordered by Owner, the Design-Builder shall provide and install suitable safeguards to protect any object from injury or damage.

2.10 Design-Builder's Warranty.

2.10.1 Design-Builder warrants to Owner that the construction, including all materials and equipment furnished as part of the construction, shall be new unless otherwise specified in the Contract Documents, of good quality, in conformance with the Contract Documents and free of defects in materials and workmanship.

2.10.2 All Work shall be warranted by the Design-Builder against defective workmanship and materials for the warranty period specified elsewhere in the Contract or one (1) year after the date of the Final Acceptance of the Work by Owner, whichever is later. Neither Final Acceptance nor the final payment nor any provision in the Contract Documents shall relieve the Design-Builder of responsibility for faulty material or quality of Work. The Design-Builder shall replace or repair any such defective Work in a manner satisfactory to Owner, after notice to do so from Owner and within the time specified in the notice.

2.10.3 Disclaimers and Limitations: Manufacturer's disclaimers and limitations on product warranties do not relieve Design-Builder of warranty on work that incorporates products. Manufacturer's disclaimers and limitations on product warranties do not relieve suppliers, manufacturers, and subcontractors required to countersign special warranties with Design-Builder.

2.10.4 Related Damages and Losses: When correcting failed or damaged warranted construction, remove and replace construction that has been damaged as a result of such failure or must be removed and replaced to provide access for correction of warranted construction.

2.10.5 Reinstatement of Warranty: When work covered by warranty has failed and been corrected by replacement or rebuilding, reinstate warranty by written endorsement. Reinstated warranty shall be equal to original warranty with equitable adjustment for depreciation.

2.10.6 Replacement Cost: Upon determination that work covered by warranty has failed, replace or rebuild work to acceptable condition complying with requirements

of Contract Documents. Design-Builder is responsible for cost of replacing or rebuilding defective work regardless of whether Owner has benefited from use of work through portion of its anticipated useful service life.

2.10.7 Warranty for labor and materials required by the Contract Documents shall have their warranty period begin on the date of Final Acceptance or beneficial use by Owner for a period of one (1) year or as covered by special warranties, whichever is longer. As to any portion of the Project that has been constructed, or had required equipment installed, "Beneficial use" means that such constructed portion, or installed equipment, is ready for its intended use, even though completion of minor "punch-list" items that do not affect the intended use, may be pending. Design-Builder's performance and payment bonds shall remain in effect throughout the warranty periods set forth in this Article. The Design-Builder shall provide any and all technical support necessary to provide oversight, training and coordination of Owner personnel who perform the maintenance for installations performed under these specifications such that the Warranty durations specified in those sections and elsewhere in the Contract Documents will not begin until Final Acceptance of all work required by the Contract. All arrangements required to be made with any supplier shall be made by the Design-Builder.

2.10.8 The Design-Builder shall replace or repair any such defective work in a manner satisfactory to Owner, after notice to do so from Owner and within the time specified in the notice.

2.10.9 Expressed warranties made to Owner are in addition to implied warranties and shall not limit duties, obligations, rights, and remedies otherwise available under law. Expressed warranty periods shall not be interpreted as limitations on time in which Owner can enforce such other duties, obligations, rights, or remedies.

2.10.10 Expressed warranties made to Owner shall not deprive Owner of other rights Owner may have under other provisions of Contract Documents and are in addition to and run concurrent with other warranties made by Design-Builder under requirements of Contract Documents.

2.10.11 Rejection of Warranties: Owner reserves right to reject warranties and to limit selection to products with warranties not in conflict with requirements of Contract Documents.

2.10.12 Where Contract Documents require special warranty, or similar commitment on work or part of work, Owner reserves right to refuse to accept work, until Design-Builder presents written evidence that entities required to countersign such commitments have done so or are willing to do so.

2.10.13 Warranty Submittals: Submit written warranties to Owner prior to date certified for Substantial Completion.

2.10.14 When a designated portion of work is completed and occupied or used by Owner, by separate agreement with Design-Builder during construction

period, submit properly executed warranties to Owner within fifteen (15) days of completion of that designated portion of work.

2.10.15 When Contract Documents require Design-Builder, or Design-Builder and subcontractor, supplier or manufacturer to execute special warranty, prepare written document that contains appropriate terms and identification, ready for execution by required parties. Submit draft to Owner, for approval prior to final execution.

2.10.16 Form of Submittal: At Final Completion compile two (2) copies of each required warranty properly organized and executed by Design-Builder, or by Design-Builder, subcontractor, supplier, or manufacturer.

2.11 Correction of Defective Work.

2.11.1 Design-Builder agrees to correct any Work that is found to not be in conformance with the Contract Documents, including that part of the Work subject to Section 2.9 hereof, within a period of one year from the date of Final Acceptance of the Work, or within such longer period to the extent required by any specific warranty included in the Contract Documents.

2.11.2 Design-Builder shall, within seven (7) days of receipt of written notice from Owner that the Work is not in conformance with the Contract Documents, take meaningful steps to commence correction of such nonconforming Work, including the correction, removal or replacement of the nonconforming Work and any damage caused to other parts of the Work affected by the nonconforming Work. If Design-Builder fails to commence the necessary steps within such seven (7) day period, Owner, in addition to any other remedies provided under the Contract Documents, may provide Design-Builder with written notice that Owner will commence correction of such nonconforming Work with its own forces. If Owner does perform such corrective Work, Design-Builder shall be responsible for all reasonable costs incurred by Owner in performing such correction. If the nonconforming Work creates an emergency requiring an immediate response, the seven (7) day period identified herein shall be deemed inapplicable.

2.11.3 The one-year period referenced in Section 2.10.1 above applies only to Design-Builder's obligation to correct nonconforming Work and is not intended to constitute a period of limitations for any other rights or remedies Owner may have regarding Design-Builder's other obligations under the Contract Documents.

2.12 Construction Coordination and Schedule

2.12.1 General

A. Administrative and procedural requirements for planning, monitoring, and documenting the progress of construction during performance of the Work, including the following:

1. 60-day startup construction schedule;

2. Contractor's Construction Schedule; and

3. Construction Progress Schedule reports.

2.12.2 Definitions

A. Activity: A discrete part of a project that can be identified for planning, scheduling, monitoring, and controlling the construction project. Activities included in a construction schedule consume time and resources.

1. Critical Activity: An activity on the critical path that must start and finish on the planned early start and finish times.

2. Predecessor Activity: An activity that precedes another activity in the network.

3. Successor Activity: An activity that follows another activity in the network.

B. Cost Loading: The allocation of the schedule of values for the completion of an activity as scheduled. The sum of costs for all activities must equal the total Contract Sum unless otherwise accepted by the Owner.

C. CPM: Critical path method, which is a method of planning and scheduling a construction project where activities are arranged based on activity relationships. Network calculations determine when activities can be performed and the critical path of Project.

D. Critical Path: The longest connected chain of interdependent activities through the network schedule that establishes the minimum overall Project duration and contains no float.

E. Day: Calendar Day unless specifically noted as Work Day.

F. Event: The starting or ending point of an activity.

G. Float: The measure of leeway in starting and completing an activity.

1. Float time is not for the exclusive use or benefit of either City or Contractor, but is a jointly owned, expiring Project resource available to both parties as needed to meet schedule milestones and Contract completion date.

2. Free float is the amount of time an activity can be delayed without adversely affecting the early start of the successor activity.

3. Total float is the measure of leeway in starting or completing an activity without adversely affecting the planned Project completion date.

4. Use of float suppression techniques such as software constraints, preferential sequencing, special lead/lag logic restraints, extended activity times, or imposed dates, other than as required by the Contract, shall be cause for the rejection of any schedule submitted by the Contractor.

H. Resource Loading: The allocation of manpower and equipment necessary for the completion of an activity as scheduled.

2.12.3 Submittals

A. Submittals shall include shop drawings and a schedule for delivery, including fabrication time.

B. Format for Submittals: Submit required submittals in the following format:

1. PDF electronic schedule file.

2. Working electronic copy of schedule file.

3. PDF file of narrative reports.

C. Submit a startup construction schedule within 15 days after receipt of the Owner's Notice to Proceed for Phase 2 Services, submit a preliminary schedule indicating planned operations during first 60 days of Phase 2.

1. Include cost of activities expected to be completed before submission and acceptance of the complete schedule.

2. Acceptance of cost-loaded, construction startup schedule will not constitute acceptance of schedule of values for cost-loaded activities.

3. The startup schedule shall include a schedule for the procurement of materials and equipment and a schedule for Submittals.

D. Submit a complete Contractor’s Construction Schedule (Baseline) in compliance with Section 2.12.6 with a network diagram within 30 days after receipt of the Owner's Notice to Proceed for Phase 2 Services. Show the complete network analysis system with logic ties for all major activities.

1. Size: as required to display entire network for entire construction period.

2. This schedule submittal will be reviewed by the Owner and returned to the Design-Builder within thirty (30) Days after submission. After receipt of review comments, Design-Builder shall resubmit a mutually acceptable system.

E. Submit a working electronic copy Contractor's Construction Schedule using software indicated in this Section, and labeled to comply with requirements for submittals. Provide hard copy in size able to display entire schedule for entire construction period.

F. Submit each of the reports listed following concurrent with CPM schedule. For each activity in reports include activity number, activity description, cost, original duration, remaining duration, early start date, early finish date, late start date, late finish date, and total float in calendar days.

1. Activity Report: List of all activities sorted by activity number and then early start date, or actual start date if known.

2. Logic Report: List of preceding and succeeding activities for all activities, sorted in ascending order by activity number and then early start date, or actual start date if known.

3. Total Float Report: List of all activities sorted in ascending order of total float.

4. Earnings Report: Compilation of Contractor's total earnings from the Notice to Proceed until most recent Application for Payment.

5. Critical path layout and report.

G. Submit a Narrative Report with each schedule submittal describing the following:

1. Project duration and variation from schedule;

2. Schedule status;

3. Milestone summary;

4. Critical Path Analysis;

6. Schedule progress;

7. Started, in-progress, and completed activities;

8. Change Notices and RFI's;

9. Delays and Impacts;

10. Weather conditions;

11. Progress photos.

H. Submit Construction Progress Schedule with each Application for Payment indicating progress on all activities and implications on overall schedule. Construction Progress Schedule (monthly schedule update) is meant to only monitor the actual progress of work relative to the approved Baseline Schedule. It is not a substitute to the approved Baseline Schedule. Any schedule update that changes logic and duration or Contract Completion Date of the approved Baseline Schedule is not acceptable. Approved Baseline Schedule shall only be revised or superseded by a dully executed Revised Baseline Schedule Change Order.

I. Submit Recovery Schedule when periodic update indicates the Work is 21or more calendar days behind the current accepted schedule, indicating means by which Contractor intends to regain compliance with the schedule.

1. The Contractor shall take all necessary measures to make up for such delay either by increasing staff, plant or facilities, or by amending its Work methods, whichever is applicable, with no change to the Contract Price.

2. Indicate changes to working hours, working days, crew sizes, and equipment required to achieve compliance, and date by which recovery will be accomplished.

2.12.4 Quality Control and Quality Assurance:

A. Comply with the requirements specified in the Contract Documents for Quality Assurance and Quality Control Requirements.

B. Scheduler Qualifications: An experienced scheduler in CPM scheduling and reporting, with capability of producing CPM reports and diagrams within 24 hours of Owner's request.

C. Preconstruction Conference: Refer to Section 2.1.16. Review methods and procedures related to the preliminary construction schedule and Contractor's construction schedule, including the following:

1. Review software limitations and content and format for reports.

2. Verify availability of qualified personnel needed to develop and update schedule.

3. Discuss constraints, including phasing, interim milestones and maintaining WWTP operation.

4. Review delivery dates for City-furnished products.

5. Review schedule for work of City's separate contracts.

6. Review submittal requirements and procedures.

7. Review time required for review of submittals and resubmittals.

8. Review requirements for tests and inspections by independent testing and inspecting agencies.

9. Review time required for Project closeout and City startup and commissioning activities.

10. Review and finalize list of construction activities to be included in schedule.

11. Review procedures for updating schedule.

12. Review site safety, security, site access, operation hours, environmental monitoring, permits and requirements.

2.12.5 Coordination:

A. The Contractor has the obligation and responsibility at all times to plan and monitor all of its activities, anticipating and scheduling its staff, subcontractors at all tiers, materials, plant and Work methods in a manner that is likely to ensure completion of the Work in accordance with the terms and conditions of the Contract.

B. Contractor will coordinate preparation and processing of schedules and reports with performance of construction activities and with scheduling and reporting of separate contractors. Contractor must notify Owner when equipment of components arrive, or are expected to arrive; their assistance may be needed in uncrating or exposing materials for inspection.

C. Coordinate Contractor's Construction Schedule with the Schedule of Values, submittal schedule, progress reports, payment requests, and other required schedules and reports.

1. Secure time commitments for performing critical elements of the Work from entities involved.

2. Coordinate each construction activity in the network with other activities and schedule them in proper sequence.

D. The Contractor must have the scheduler onsite regularly or in collaboration with someone onsite. The Project Manager or Project Engineer can serve this role for the Contractor.

2.12.6 Contractor’s Construction Schedule:

A. Time Frame: Extend schedule from date established for Notice to Proceed for Phase 2 to date of Substantial Completion.

1. Contract completion date shall not be changed by submission of a schedule that shows an early completion date, unless specifically authorized by Change Order.

B. Activities: Establish a separate numbered activity for each main element of the Work. Comply with the following:

1. Activity Duration: Define activities so no activity is longer than 20 days, unless specifically allowed by Owner. The durations shall be determined based upon resource planning under contractually-defined on-site work conditions. The Owner may require that the duration of major activities be calculated by the scheduling software based on of the planned rate of daily production. In calculating activity durations, normal inclement weather shall be considered.

2. Critical Path Activities: Include procurement process activities for long lead

items and major items, requiring a cycle of more than 60 days, as separate activities in schedule. Critical path cycle activities include, but are not limited to, submittals, acceptance, purchasing, fabrication, and delivery.

3. Submittal Review Time: Include review and resubmittal times indicated in Submittal Requirements, in schedule. Coordinate submittal review times in Contractor's construction schedule with submittal schedule. Contractor must submit all submittals 90 days prior to startup to allow for review and approval by the Owner, unless another time frame is specified elsewhere in the Contract Documents.

4. Startup and Testing Time: Include no fewer than 30 days for startup and testing. Include a pre-commissioning meeting to discuss plan with the Owner 3 to 6 months before startup and testing is scheduled to begin.

5. Substantial Completion: Indicate completion in advance of date established for Substantial Completion, and allow no fewer than 30 days for Owner's administrative procedures necessary for certification of Substantial Completion.

6. Punch List and Final Completion: Include not more than 45 days for completion of punch list items and final completion.

C. Constraints: Include constraints and work restrictions indicated in the Contract Documents and as follows in schedule, and show how the sequence of the Work is affected.

1. Phasing: Arrange list of activities on schedule by phase.

2. Products Ordered in Advance: Include a separate activity for each product, including delivery dates. Delivery dates should stipulate the earliest possible delivery date.

3. Work Restrictions: Show the effect of the following items on the schedule:

    (a) Coordination with existing construction;

    (b) Limitations of continued occupancies;

    (c) Uninterruptible services;

    (d) Partial occupancy before Substantial Completion;

    (e) Use of premises restrictions;

    (f) Provisions for future construction;

    (g) Seasonal variations and inclement weather;

    (h) Environmental control/ permitting;

(i) Specified work sequences and constraints; and

(j) Site access, security, and rights of adjacent neighbors.

4. Work Stages: Indicate important stages of construction for each major portion of the Work, including, but not limited to, the following:

   (a) Subcontract awards;

   (b) Submittals;

   (c) Purchases;

   (d) Mockups;

   (e) Fabrication;

   (f) Sample testing;

   (g) Deliveries;

   (h) Installation;

   (i) Functional testing;

   (j) Start-up;

   (k) Commissioning;

   (l) Performance testing;

   (m) Training;

   (n) Tests and inspections;

   (o) Adjusting;

   (p) Curing;

   (q) Startup and placement into final use and operation;

   (r) Project closeout and final cleaning; and

   (s) Demobilization.

5. Construction Areas: Identify each major area of construction for each major portion of the Work. Indicate where each construction activity within a major area must be sequenced or integrated with other construction activities to provide for the following:

   (a) Earthworks and excavation;

(b) Structural completion;

(c) Completion of mechanical installation;

(d) Completion of electrical and instrumentation installation;

(e) Completion of SCADA integration;

(f) Functional testing;

(g) Start-up;

(h) Commissioning;

(i) Performance testing;

(j) Training; and

(k) Substantial Completion.

6. Other constraints and Work Restrictions.

D. Milestones: Include milestones indicated in the Contract Documents in schedule, including, but not limited to, the Notice to Proceed, proposed Shutdowns, Substantial Completion, and Final Completion, and the appropriate interim milestones.

E. Computer Scheduling Software: Prepare schedules using current version of a program that has been developed specifically to manage construction schedules.

7. Use Primavera P6.

8. Settings: The Contractor is required to provide to the Owner all of the software settings it has used in the baseline schedules and updates. Examples of the information required are: Calendar settings, User Preferences, Administrative Preferences, Schedule Settings, etc.

9. Contractor must incorporate separate calendars as appropriate to identify all tasks subject to permits and work restrictions described in the specifications.

F. Contract Modifications:

1. For each proposed contract modification that may impact the overall schedule, prepare a time-impact analysis using a network fragnet to demonstrate the effect of the proposed change on the overall project schedule. Logically connect approved Contract changes into the CPM schedule. Each change will be identified by number and description, and activities/milestones will be added to record the following:

(a) Date the change was identified;

(b) Date the change was priced (if applicable); and

(c) Start and finish dates of the changed Work.

2. Extensions of the Contract Times must be substantiated by a complete schedule demonstration showing the cause and effect of the relevant issue on the then-current critical path.

3. Contract modification proposals must be submitted by the contractor within 5 working days or the next weekly meeting. Contract modification proposals must be submitted in writing and documented via email or letter.

G. Initial Issue of Schedule: Prepare initial network diagram from a sorted activity list indicating straight "early start-total float." Identify critical activities. Prepare tabulated reports showing the following:

1. Contractor or subcontractor and the Work or activity;

2. Description of activity;

3. Main events of activity;

4. Immediately preceding and succeeding activities;

5. Early and late start dates;

6. Early and late finish dates;

7. Activity duration in workdays;

8. Total float or slack time;

9. Average size of workforce; and

10. Dollar value of activity (coordinated with the schedule of pay items).

H. Schedule Updating: The CPM Progress Schedule shall show the projected completion date of the Work based on the progress information inserted into it, without changes to the schedule logic or the original duration of any activity. The Contractor shall use the retained logic option when executing schedule calculation. The Contractor should update the schedule monthly to reflect changes and show accurate timelines. Concurrent with making revisions to schedule, prepare tabulated reports showing the following:

1. Identification of activities that have changed;

2. Changes in early and late start dates;

3. Changes in early and late finish dates;

4. Changes in activity durations in workdays;

5. Changes in the critical path;

6. Changes in total float or slack time; and

7. Changes in the Contract Time.

I. Value Summaries: Prepare two cumulative value lists, sorted by finish dates.

1. In first list, tabulate activity number, early finish date, dollar value, and cumulative dollar value.

2. In second list, tabulate activity number, late finish date, dollar value, and cumulative dollar value.

3. In subsequent issues of both lists, substitute actual finish dates for activities completed as of list date.

4. Prepare list for ease of comparison with payment requests; coordinate timing with progress meetings.

    (a) In both value summary lists, tabulate "actual percent complete" and "cumulative value completed" with total at bottom.

2.12.7 Contractor's Look-Ahead Schedules:

A. Contractor will develop and maintain a detailed look-ahead schedule and follow the following procedures:

1. Contractor shall list all completed, in progress, and upcoming activities for previous week, the current week, and the next two weeks upcoming;

2. Contractor shall show significant activities with actual start and completion dates;

3. Contractor shall present the look-ahead schedule at the weekly progress meetings as described in Project Meetings.

2.12.8 Acceptance of Schedules:

1. Owner review and acceptance of schedules does not waive any contract requirements and does not relieve the Design-Builder of any obligation or responsibility for submitting complete and accurate information.

2. If the Design-Builder fails to submit any of the schedule submittals, or to meet the scheduling requirements, including but not limited to update

requirements, for a period of thirty (30) Days or more beyond the required submittal date, progress payments may be withheld until such time as the Design-Builder submits the required scheduling submittals in compliance with the Contract Documents.

Article 3

Owner's Services and Responsibilities

3.1 Duty to Cooperate.

3.1.1 Owner shall, throughout the performance of the Work, cooperate with Design-Builder and perform its responsibilities, obligations and services in a timely manner to facilitate Design-Builder's timely and efficient performance of the Work and so as not to delay or interfere with Design-Builder's performance of its obligations under the Contract Documents.

3.1.2 Owner shall provide timely reviews and approvals of interim Design Submissions and Construction Documents consistent with the turnaround times set forth in Design-Builder's schedule.

3.1.3 Owner shall give Design-Builder timely notice of any Work that Owner notices to be defective or not in compliance with the Contract Documents.

3.2 Furnishing of Services and Information.

3.2.1 Notwithstanding the provision of certain documents from the Owner, the Design-Builder shall investigate the Project Site to ascertain conditions affecting necessary procedure and sequence of work operations for execution of the Contract, and to ascertain Project Site conditions, character, quality and quantity of surface and subsurface materials that will be encountered. The Design-Builder shall verify all dimensions in the field and shall check field conditions continuously during construction. Owner assumes no responsibility whatsoever in respect to the Design-Builder's interpretation of subsurface investigations. There is no guarantee or warranty, either expressed or implied, that conditions indicated in the Contract Documents, are representative of those existing throughout the Work, or any part of it, or that unexpected developments may not occur.

3.2.2 All soil and test hole data, groundwater elevations, and soil analyses shown on the Plans or included in the Contract Documents apply only at the location of the test holes and to the depths indicated. Soil test reports for test holes which have been drilled are available for inspection at the office of Owner. Additional subsurface exploration may be performed by the Design-Builder at its own expense.

3.2.3 The indicated groundwater elevation is that which existed on the date specified in the data. It is the Design-Builder's responsibility to determine and allow for the groundwater elevation on the date the Work is performed. A difference in

groundwater elevation between what is shown in the soil boring logs and what is actually encountered during construction will not be considered as a basis for extra work.

3.2.4 If discovery is made of items of archaeological or paleontological interest, the Design-Builder shall immediately cease excavation in the area of discovery and shall not continue until ordered by Owner. When resumed, excavation operations within the area of discovery shall be as directed by Owner. Discoveries which may be encountered may include, but not be limited to, dwelling sites, stone implementations or other artifacts, animal bones, human bones, and fossils.

3.2.5 Rights of entry for the Work will be provided by Owner pursuant to the Contract Documents. Unless otherwise provided in the Contract Documents, the Design-Builder shall make arrangements, pay for, and assume all responsibility for acquiring, using, and disposing of additional work areas and facilities that may be temporarily required to perform the Work. The Design-Builder shall indemnify and hold Owner harmless from all claims for damages caused by such actions.

3.3 Financial Information.

3.3.2 Design-Builder shall cooperate with the reasonable requirements of Owner's lenders or other financial sources. Notwithstanding the preceding sentence, after execution of the Agreement Design-Builder shall have no obligation to execute for Owner or Owner's lenders or other financial sources any documents or agreements that require Design-Builder to assume obligations or responsibilities greater than those existing obligations Design-Builder has under the Contract Documents.

3.4 Owner's Representative.

3.4.1 Owner's Representative shall be responsible for providing Owner-supplied information and approvals in a timely manner to permit Design-Builder to fulfill its obligations under the Contract Documents. Owner's Representative shall also provide Design-Builder with prompt notice if it observes any failure on the part of Design-Builder to fulfill its contractual obligations, including any errors, omissions or defects in the performance of the Work. Owner's Representative shall communicate regularly with Design-Builder and shall be vested with the authority to act on behalf of Owner.

3.5 Government Approvals and Permits.

3.5.1 Owner shall obtain and pay for all necessary permits, approvals, licenses, government charges and inspection fees set forth in the *Permits and Approvals,* attached as Exhibit E to the Agreement.

3.5.2 Owner shall provide reasonable assistance to Design-Builder in obtaining those permits, approvals and licenses that are Design-Builder's responsibility.

3.6 Owner's Other Contractors.

3.6.1 Subject to the Design-Builder's coordination responsibilities of Other

Contractors pursuant to Article 2.1.9, Owner is responsible for all work performed on the Project or at the Site by Other Contractors under Owner's control. In addition to Design-Builder's coordination obligations, Owner shall assist the Design-Builder and request that Other Contractors cooperate with, and coordinate their activities so as to enable Design-Builder to timely complete the Work consistent with the Contract Documents.

Article 4

Hazardous Conditions and Differing Site Conditions

4.1 Hazardous Conditions.

4.1.1 Except as otherwise permitted in the Contract Documents, the Design-Builder agrees to accept sole responsibility for full compliance with any and all applicable present and future rules, regulations, restrictions, ordinances, statutes, laws and/or other orders of any governmental entity regarding the use, storage, handling, distribution, processing and/or disposal of hazardous wastes, extremely hazardous wastes, hazardous substances, hazardous materials, hazardous chemicals, toxic chemicals, toxic substances, pollutants, contaminants, or other similarly regulated substances (hereinafter referred to as "hazardous substances") regardless of whether the obligation for such compliance or responsibility is placed on the Owner of the land, on the Owner of any improvements on the premises, on the user of the land, or on the user of the improvements. Said hazardous substances shall include, but shall not be limited to gasoline, diesel and other fuels, lubricating oils and solvents.

4.1.2 Except for claims arising from Owner's sole or active negligence or willful misconduct, the Design-Builder agrees that any damages, penalties or fines levied against Owner and/or the Design-Builder as a result of noncompliance with any of the above shall be the sole responsibility of the Design-Builder and, further, that the Design-Builder shall indemnify and pay and/or reimburse Owner for any damages, penalties or fines that Owner incurs, or pays, as a result of Design-Builder's noncompliance with this General Condition.

4.1.3 In the case of any hazardous substance spill, leak, discharge or improper storage on the premises, or contamination of same, by action or inaction of the Design-Builder, or anyone directly or indirectly employed or under contract to the Design-Builder, the Design-Builder agrees to make, or cause to be made, any necessary repairs or corrective actions, as well as to clean up and remove any leakage, contamination or contaminated ground. In the case of any hazardous substance spill, leak, discharge or contamination caused in whole or part by the Design-Builder, or by any of its subcontractors, employees, or agents, which affects Owner's property, or property (ies) of Owner's tenant(s), the Design-Builder agrees to make, or cause to be made, any necessary repairs, or take corrective actions, to clean-up and remove any such spill, leakage or contamination to the extent required by applicable law or regulation.

4.1.4 If, after reasonable notice, the Design-Builder fails to repair, clean-up, properly dispose of, or take any other corrective action(s) as required by the Contract Documents, Owner may (but shall not be required to) take all steps it deems reasonably necessary to properly repair, clean-up or otherwise correct the condition(s) resulting from the spill, leak or contamination. Any such repair, clean-up or corrective action(s) taken by Owner shall be at Design-Builder's sole cost and expense, including any and all costs (including any administrative costs) which Owner incurs, or pays, as a result of any repair, clean-up or corrective action it takes.

4.1.5 If the Design-Builder installs or uses already installed underground storage tanks, pipelines or other improvements on the specified premises for the storage, distribution, use, treatment or disposal of any hazardous substances, the Design-Builder agrees, upon the expiration and/or termination of this Contract, to remove and/or clean up, at the sole option of Owner, the above-referred to improvements. Said removal and/or clean-up shall be at Design-Builder's sole cost and expense, and shall be undertaken and completed in full compliance with all federal, state and local laws and regulations, as well as in compliance with the reasonable directions of Owner. Design-Builder shall promptly supply Owner with copies of all notices, reports, correspondence and submissions made by the Design-Builder to any governmental entity regarding any hazardous substance spill, leak, discharge or clean-up, including all tests results.

4.1.6 Notwithstanding the foregoing sections of this General Condition:

4.1.6.1 Design-Builder shall not be held responsible for the presence or remediation of asbestos, asbestos-related materials, or any other hazardous substance, in any form whatsoever, as such materials and substances are defined by the Environmental Protection Agency or any other public authority, found on any property or structure that is the subject of services performed by Design-Builder under the Contract.

4.1.6.2 The Design-Builder’s obligation to remediate hazardous substances is limited to the Work identified in the Contract Documents. The Design-Builder has no obligation to identify, abate and/or remediate hazardous substances not directly affected by the Work; however, the Design-Builder will identify, abate and/or remediate hazardous substances not included in the scope of work as directed in writing by Owner.

4.1.6.3 The Design-Builder will be compensated for approved additional costs resulting from changes in regulations, restrictions, ordinances, statutes, laws and/or other orders of any governmental entity regarding the use, storage, handling, distribution, processing and/or disposal of hazardous wastes, extremely hazardous wastes, hazardous substances, hazardous materials, hazardous chemicals, toxic chemicals, toxic substances, pollutants, contaminants, or other similarly regulated substances.

4.1.6.4 Owner will retain title to all pre-existing hazardous substances

removed as part of the Design-Builder's work, and title shall not transfer to the Design-Builder. Owner agrees to sign all manifests as Owner of all such pre-existing hazardous substances. Hazardous substances introduced onto the Project Site by the Design-Builder shall remain titled to the Design-Builder.

4.1.7 This General Condition and the obligation(s) contained therein, shall survive the expiration or earlier termination of this Contract.

4.2 Differing Site Conditions.

4.2.1 Concealed or latent physical conditions or subsurface conditions at the Site that (i) materially differ from the conditions indicated in the Contract Documents or (ii) are of an unknown and unusual nature, differing materially from the conditions ordinarily encountered and generally recognized as inherent in the Work, are collectively referred to herein as "Differing Site Conditions." The Design-Builder shall immediately, and before any of the following conditions are disturbed, notify Owner, first verbally and later within seven (7) days of the verbal notification, with a properly documented notice.

4.2.2 Upon encountering a Differing Site Condition, Design-Builder shall provide prompt written notice to Owner of such condition, which notice shall not be later than 21 calendar days after such condition has been encountered. Design-Builder shall, to the extent reasonably possible, provide such notice before the Differing Site Condition has been substantially disturbed or altered. Upon confirmation of a Differing Site Condition the Design Builder shall provide detailed technical and cost information to the Owner.

4.2.2 Owner shall investigate such conditions, and if it finds that such conditions do materially differ and could not have been discovered, or reasonably inferred, from the Contract Documents or a thorough inspection of the Project Site by the Design-Builder, and such conditions cause an impact to the Contract pricing, or Work Completion Time, Owner may issue a Change Directive.

4.2.3 If the Design-Builder has not fully complied with the documentation and submittal requirements of the Contractor Potential Change Notice in accordance with the Contract, the Design-Builder shall be deemed to have waived its right to assert a claim for any adjustment to the Contract pricing, or Work Completion Time arising out of such differing Project Site conditions.

4.2.4 Should an agreement not be reached on a Change Order, pursuant to Article 9, the Owner may issue a Change Directive to have the Work performed. Such an Order is unilateral and the Work will be performed on a Time and Material basis. The Design-Builder shall be required to keep detailed records of all costs related to performing the Work and compensation for said work will be reconciled in a Change Order upon agreement of a lump sum price or completion of the Work, whichever occurs first.

Article 5

Insurance and Bonds

5.1 Design-Builder's Insurance Requirements.

5.1.1 Design-Builder is responsible for procuring and maintaining the insurance for the coverage amounts all as set forth in the Insurance Exhibit H to the Agreement. Coverage shall be secured from insurance companies authorized to do business in the state in which the Project is located, and with a minimum rating set forth in the Insurance Exhibit H.

5.1.2 Design-Builder's insurance policies shall specifically delete any design-build or similar exclusions that could compromise coverage's because of the design-build delivery of the Project.

5.1.3 Prior to commencing any design and construction services hereunder, Design-Builder shall provide Owner with certificates and pertinent additional insured and other endorsements evidencing that (i) all insurance obligations required by the Contract Documents are in full force and in effect and will remain in effect for the duration required by the Contract Documents; and (ii) no insurance coverage will be canceled, renewal refused, or materially changed unless at least thirty (30) days' prior written notice is given to Owner and all other insureds. If any of the foregoing insurance coverage's is required to remain in force after final payment additional certificate(s) and endorsement(s) evidencing continuation of such coverage shall be submitted with the Final Application for Payment.

5.3.5 Owner and Design-Builder waive against each other and Owner's separate contractors, Design Consultants, Subcontractors, agents and employees of each and all of them, all damages covered by property insurance provided herein, except such rights as they may have to the proceeds of such insurance. Design-Builder and Owner shall, where appropriate, require similar waivers of subrogation from Owner's separate contractors, Design Consultants and Subcontractors and shall require each of them to include similar waivers in their contracts. These waivers of subrogation shall not contain any restriction or limitation that will impair the full and complete extent of its applicability to any person or entity unless agreed to in writing prior to the execution of this Agreement.

5.2 Bonds and Other Performance Security.

5.2.1 If Owner requires Design-Builder to obtain performance and labor and material payment bonds, or other forms of performance security, the amount, form and other conditions of such security shall be as set forth in the Agreement.

5.2.2 The Design-Builder shall file surety bonds with Owner to be approved by the City and/or its counsel in the amount and for the purposes noted below. Bonds issued by a surety who is listed in the latest version of U.S. Department of Treasury

Circular 570, who is authorized to issue bonds in California, and whose bonding limitation shown in said circular is sufficient to provide bonds in the amount required by the Contract. Bonds from all other sureties shall be accompanied by all of the documents enumerated in Code of Civil Procedure 995.660(a). The Design-Builder shall pay all bond premiums, costs, and incidentals.

5.2.3 The Design-Builder shall provide Payment and Performance bonds on forms provided by Owner. The "Payment Bond" (Material and Labor bond) shall be for 100 percent (100%) of the Contract price, as amended from time to time, to satisfy claims of material suppliers and mechanics and laborers employed by it on the Work.

5.2.4 The Performance Bond shall be for one hundred percent (100%) of the Contract price as amended from time to time. The Design-Builder shall submit all bonds within fifteen (15) calendar days of the award of Contract.

5.2.5 Should any bond become insufficient, the Design-Builder shall renew the bond within 10 days after receiving notice from Owner.

5.2.6 Should any surety at any time be unsatisfactory to the Owner, notice will be given the Design-Builder to that effect. No further payment shall be deemed due or will be made under the Contract until a new surety shall qualify and be accepted by the Owner.

5.2.7 Changes in the Work or extensions of time made pursuant to the Contract shall in no way release the Design-Builder or surety from its obligations. Notice of such changes or extensions shall be waived by the surety.

Article 6

Payment

6.1 Schedule of Values.

6.1.1 Unless required by Owner upon execution of this Agreement, within ten (10) days of execution of the Agreement, Design-Builder shall submit for Owner's review and approval a schedule of values for all of the Work. The Schedule of Values will (i) subdivide the Work into its respective parts; (ii) include values for all items comprising the Work; and (iii) serve as the basis for monthly progress payments made to Design-Builder throughout the Work.

6.1.2 Owner will timely review and approve the schedule of values so as not to delay the submission of Design-Builder's first application for payment. Owner and Design-Builder shall timely resolve any differences so as not to delay Design-Builder's submission of its first application for payment.

6.2 Monthly Progress Payments.

6.2.1 On or before the date established in the Agreement, Design-Builder shall submit for Owner's review and approval its Application for Payment requesting

payment for all Work performed as of the date of the Application for Payment. The Application for Payment shall be accompanied by all supporting documentation required by the Contract Documents , including but not limited to:

6.2.1.1 Unconditional releases of lien in the statutory form for all subcontractors and suppliers, through the prior payment application.

6.2.1.2 Actual invoices for materials and equipment must be submitted with the Application for Payment (for cost reimbursable contracts).

i. Unless otherwise provided in the Contract Documents, up to eighty percent (80%) of the invoiced amount may be paid on account of materials and equipment delivered and suitably stored at the Project Site for subsequent incorporation in the Work.

ii. Payment will not be made for any materials or equipment unless each individual piece of the material or equipment becomes a permanent part of the Work or the material or equipment is required by the Contract Documents and is specifically manufactured for the Project and could not be readily utilized or diverted to another job. Actual invoices for materials and equipment must be submitted with the Application for Payment

6.2.2 Owner may withhold a payment in whole or in part to the extent reasonably necessary to protect Owner due to Owner's determination that the Work has not progressed to the point indicated in the Application for Payment or that the quality of work is not in accordance with the Contract Documents. Owner may also withhold a payment because of subsequently discovered evidence which may nullify the whole or a part of an Application for Payment previously issued to such extent as may be necessary to protect Owner from loss for which the Design-Builder is responsible.

6.2.3 Where Allowances have been used, the Design-Builder may be paid for Allowance items on either a cost reimbursable or lump sum basis. The Design-Builders mark-up shall be all-inclusive of supervision and coordination and no additional compensation shall be allowed. An Allowance shall not be considered a change for the purposes of granting time extensions. Unused portions of a stipulated Allowance will not be paid to the Design-Builder and shall be deducted from the contract value at the completion of the Project via a deductive change order.

6.2.4 Upon prior written approval from the Owner, the Application for Payment may request payment for equipment and materials not yet incorporated into the Project, provided that (i) Owner is satisfied that the equipment and materials are suitably stored at either the Site or another acceptable location; (ii) the equipment and materials are protected by suitable insurance; and (iii) upon payment, Owner will receive the equipment and materials free and clear of all liens and

encumbrances.

6.2.5 The Application for Payment shall constitute Design-Builder's representation that the Work described therein has been performed consistent with the Contract Documents, has progressed to the point indicated in the Application for Payment, and that title to all Work will pass to Owner free and clear of all claims, liens, encumbrances, and security interests upon the incorporation of the Work into the Project, or upon Design-Builder's receipt of payment, whichever occurs earlier.

6.3 Withholding of Payments.

6.3.1 On or before the date established in the Agreement, subject to the Retention provisions, Owner shall pay Design-Builder all amounts properly due. If Owner determines that Design-Builder is not entitled to all or part of an Application for Payment as a result of Design-Builder's failure to meet its obligations hereunder, it will notify Design-Builder in writing at least five (5) days prior to the date payment is due. The notice shall indicate the specific amounts Owner intends to withhold, the reasons and contractual basis for the withholding, and the specific measures Design-Builder must take to rectify Owner's concerns. Design-Builder and Owner will attempt to resolve Owner's concerns prior to the date payment is due

6.3.2 Notwithstanding anything to the contrary in the Contract Documents, Owner shall pay Design-Builder all undisputed amounts in an Application for Payment within the times required by the Agreement.

6.4 Design-Builder's Payment Obligations.

6.4.1 Design-Builder will pay Design Consultants and Subcontractors, in accordance with its contractual obligations to such parties, all the amounts Design-Builder has received from Owner on account of their work. Design-Builder will impose similar requirements on Design Consultants and Subcontractors to pay those parties with whom they have contracted. Design-Builder will indemnify and defend Owner against any claims for payment, stop payment notices, and mechanic's liens as set forth in Section 7.3 hereof.

6.5 Substantial Completion.

6.5.1 Design-Builder shall notify Owner when it believes the Work, or to the extent permitted in the Contract Documents, a portion of the Work, is Substantially Complete. Within five (5) days of Owner's receipt of Design-Builder's notice, Owner and Design-Builder will jointly inspect such Work to verify that it is Substantially Complete in accordance with the requirements of the Contract Documents. If such Work is Substantially Complete, Owner shall prepare and issue a Certificate of Substantial Completion that will set forth (i) the date of Substantial Completion of the Work or portion thereof; (ii) the remaining items of Work that have to be completed before final payment; (iii) provisions (to the extent not already provided in the Contract Documents) establishing Owner's and Design-Builder's responsibility for the Project's security, maintenance, utilities and insurance pending final payment; and (iv) an acknowledgment that warranties

commence to run on the date of Substantial Completion, except as may otherwise be noted in the Certificate of Substantial Completion. The Certificate of Substantial Completion shall not relieve the Design-Builder of the responsibility to complete all work in accordance with the Contract Documents. Failure to include any items on the punch list shall not alter the responsibility of the Design-Builder to complete all Work in accordance with the Contract Documents.

6.5.2 Substantial Completion occurs when all of the following conditions have been met:

6.5.2.1 The Design-Builder has submitted and Owner has approved in writing, such approval not to be unreasonably withheld, a certification by the Design-Builder and the lead Design Firm that construction of the Project, excepting the items on the Final Punch List, is complete and in all respects is in compliance with this Agreement.

6.5.2.2 A preliminary or temporary certificate of occupancy has been issued for the Project, where required by applicable law

6.5.2.3 The Design-Builder has delivered to Owner a red-lined set of "as-built" construction record drawings as required by the Contract Documents

6.5.2.4 All Utilities specified or required under this Agreement to be arranged for by the Design-Builder are connected and functioning properly

6.5.2.5 The Design-Builder and Owner have agreed in writing upon the Final Punch List (or, if they are unable to agree, Owner shall have prepared and issued the Final Punch List to the Design-Builder within 15 business days of the Design-Builder having submitted its proposed Final Punch List to Owner)

6.5.2.6 The Design-Builder has delivered to Owner written certification from the equipment manufacturers (including information technology systems and instrumentation and controls) that all major items of machinery and equipment included in the Project have been properly installed, performance tested, and commissioned in accordance with the manufacturers' recommendations, warranties, and requirements

6.5.2.7 The Design-Builder has submitted written certification that all of the foregoing conditions have been satisfied and Owner has approved the Design-Builder's certification, which approval shall be effective as of the date of the Design-Builder's certification.

6.5.3 Upon Substantial Completion of the entire Work or, if applicable, any portion of the Work, Owner may at its sole discretion per DBIA Agreement No. 545, Article 7, release to Design-Builder portions of the retained amounts relating, as applicable, to the entire Work or completed portion of the Work, less an amount equal to the reasonable value of all remaining or incomplete items of Work as noted in the Certificate of Substantial Completion.

6.5.4 Owner, at its option, may use a portion of the Work which has been determined to be Substantially Complete, provided, however, that (i) a Certificate of Substantial Completion has been issued for the portion of Work addressing the items set forth in Section 6.5.1 above; (ii) Design-Builder and Owner have obtained the consent of their sureties and insurers, and to the extent applicable, the appropriate government authorities having jurisdiction over the Project; and (iii) Owner and Design-Builder agree that Owner's use or occupancy will not interfere with Design-Builder's completion of the remaining Work.

6.6 Final Completion and Final Payment.

6.6.1 When the Design-Builder considers that the Work is complete and ready for final inspection, it shall submit a Notice of Final Completion to Owner for inspection with certification that:

6.6.1.1 Work has been completed in accordance with Contract Documents and Certificate of Occupancy issued.

6.6.1.2 Work has been inspected by the Design-Builder for compliance with Contract Documents and all Punch List work has been completed.

6.6.1.3 All damaged or destroyed real, personal**,** public or private property has been repaired or replaced**.**

6.6.1.4 All required as-builts and close out documents have been submitted and accepted.

6.6.1.5 All operation and maintenance manuals and warranties have been submitted and accepted and all training and commissioning has been completed.

6.6.1.6 Work is ready for final inspection by Owner.

6.6.2 Owner will inspect to verify the status of completion with reasonable promptness after receipt of such certifications. The inspection of the Work will be done in accordance with the Contract provisions.

6.6.3 If Owner finds incomplete or defective work:

6.6.3.1 Owner may, at Owner's sole discretion, either terminate the inspection or prepare a punch list and notify the Design-Builder in writing, listing incomplete or defective work.

6.6.3.2 The Design-Builder shall take immediate steps to remedy stated deficiencies. Upon completion and correction of all stated deficiencies, the Design-Builder shall send a second written certification to Owner that work is complete.

6.6.3.3 Owner will then re-inspect the Work.

6.6.3.4 Owner may, at Owner's sole discretion, have a separate contractor make corrections and deduct the cost of the corrections from the Design-Builder's final payment if the work is not promptly corrected.

6.6.4 Final Acceptance

6.6.4.1 Within 120 days after Substantial Completion, and after Owner has made the final inspection and is satisfied that the Work has been completed in accordance with the Agreement, and is satisfied that all submittals have been made and accepted, all as-builts and record documents have been completed and accepted, all Change Orders executed, all final quantities agreed to, and all other Contract requirements, except for possible future warranty and guarantee work have been accomplished, Owner shall issue a document evidencing Final Acceptance.

6.6.4.2 If Owner finds the Work to be complete, Owner will issue a letter of Final Acceptance to the Design-Builder.

6.6.4.3 The Work shall be under the charge and care of the Design-Builder until Owner issues the letter of Final Acceptance unless otherwise approved by Owner. The Design-Builder shall take every precaution against injury or damage to the Work from the action of the elements or any other cause, whether arising from the execution or non-execution of the Work. The Design-Builder shall rebuild, repair, restore, and make good, at the Design-Builder's expense, all injuries or damage to the Work occurring before acceptance of the Work.

6.6.5 Upon issuance of a letter of Final Acceptance, the Design-Builder shall submit a Final Application for Payment, and Owner shall make final payment by the time required in the Agreement, provided that Design-Builder has achieved Final Completion.

6.6.6 At the time of submission of its Final Application for Payment, Design-Builder shall provide the following information:

6.6.6.1 An affidavit that there are no claims, obligations or liens outstanding or unsatisfied for labor, services, material, equipment, taxes or other items performed, furnished or incurred for or in connection with the Work which will in any way affect Owner's interests;

6.6.6.2 A general release executed by Design-Builder waiving, upon receipt of final payment by Design-Builder, all claims, except those claims previously made in writing to Owner and remaining unsettled at the time of final payment;

6.6.6.3 Consent of Design-Builder's surety, if any, to final payment;

6.6.6.4 All operating manuals, warranties and other deliverables required by the Contract Documents; and

6.6.6.5 Certificates of insurance confirming that required coverage's will remain in effect consistent with the requirements of the Contract Documents.

6.6.7 Upon making final payment, Owner waives all claims against Design-Builder except claims relating to (i) Design-Builder's failure to satisfy its payment obligations, if such failure affects Owner's interests; (ii) Design-Builder's failure to complete the Work consistent with the Contract Documents, including defects appearing after Substantial Completion; (iii) the terms of any special warranties required by the Contract Documents; and claims for indemnification arising hereunder. After the date of Final Acceptance of the Work by Owner, no additional claims or change requests may be submitted by Design-Builder.

6.6.8 Deficiencies in the Work discovered after Substantial Completion, whether or not such deficiencies would have been included on the punch list if discovered earlier, shall be deemed warranty Work. Such deficiencies shall be corrected by Design-Builder under Sections 2.9 and 2.10 herein and shall not be a reason to withhold final payment from Design-Builder, provided, however, that Owner shall be entitled to withhold from the Final Payment the reasonable value of completion of such deficient work until such work is completed.

Article 7

Indemnification

7.1 Patent and Copyright Infringement.

7.1.1 Design-Builder shall defend any action or proceeding brought against Owner based on any claim that the Work, or any part thereof, or the operation or use of the Work or any part thereof, constitutes infringement of any United States patent or copyright, now or hereafter issued. Owner shall give prompt written notice to Design-Builder of any such action or proceeding and will reasonably provide authority, information and assistance in the defense of same. Design-Builder shall indemnify and hold harmless Owner from and against all damages and costs, including but not limited to attorneys' fees and expenses awarded against Owner or Design-Builder in any such action or proceeding. Design-Builder agrees to keep Owner informed of all developments in the defense of such actions.

7.1.2 If Owner is enjoined from the operation or use of the Work, or any part thereof, as the result of any patent or copyright suit, claim, or proceeding, Design-Builder shall at its sole expense take reasonable steps to procure the right to operate or use the Work. If Design-Builder cannot so procure such right within a reasonable time, Design-Builder shall promptly, at Design-Builder's option and at Design-Builder's expense, (i) modify the Work so as to avoid infringement of any such patent or copyright; or (ii) replace said Work with Work that does not infringe or violate any such patent or copyright.

7.1.3 Sections 7.1.1 and 7.1.2 above shall not be applicable to any suit, claim or

proceeding based on infringement or violation of a patent or copyright (i) relating solely to a particular process or product of a particular manufacturer specified by Owner and not offered or recommended by Design-Builder to Owner; or (ii) arising from modifications to the Work by Owner or its agents after acceptance of the Work. If the suit, claim or proceeding is based upon events set forth in the preceding sentence, Owner shall defend, indemnify and hold harmless Design-Builder to the same extent Design-Builder is obligated to defend, indemnify and hold harmless Owner in Section 7.1.1 above.

7.1.4 The obligations set forth in this Section 7.1 shall constitute the sole agreement between the parties relating to liability for infringement of violation of any patent or copyright.

7.2 Tax Claim Indemnification.

7.2.1 If, in accordance with Owner's direction, an exemption for all or part of the Work is claimed for taxes, Owner shall indemnify, defend and hold harmless Design-Builder from and against any liability, penalty, interest, fine, tax assessment, attorneys' fees or other expenses or costs incurred by Design-Builder as a result of any action taken by Design-Builder in accordance with Owner's directive. Owner shall furnish Design-Builder with any applicable tax exemption certificates necessary to obtain such exemption, upon which Design-Builder may rely.

7.3 Payment Claim Indemnification.

7.3.1 Provided that Owner is not in breach of its contractual obligation to make payments to Design-Builder for the Work, Design-Builder shall indemnify, defend and hold harmless Owner from any claims or mechanic's liens brought against Owner or against the Project as a result of the failure of Design-Builder, or those for whose acts it is responsible, to pay for any services, materials, labor, equipment, taxes or other items or obligations furnished or incurred for or in connection with the Work. Within three (3) days of receiving written notice from Owner that such a claim or mechanic's lien has been filed, Design-Builder shall commence to take the steps necessary to discharge said claim or lien, including, if necessary, the furnishing of a mechanic's lien bond. If Design-Builder fails to do so, Owner will have the right to discharge the claim or lien and hold Design-Builder liable for costs and expenses incurred, including attorneys' fees.

7.4 Design-Builder's General Indemnification.

7.4.1 To the fullest extent permitted by law, Design-Builder shall defend, indemnify and hold harmless Owner and any and all of Owner's Council, Boards, officers, agents, employees, assigns and successors in interest from and against any and all suits, claims, causes of action, liability, losses, damages, demands or expenses (including, but not limited to, attorney's fees and costs of litigation), (collectively, "Loss") claimed by anyone (including Design-Builder and/or Design-Builder's agents or employees) by reason of injury to, or death of, any person(s) (including Design-Builder and/or Design-Builder's agents or employees), or for damage to, or destruction of, any property (including property of Design-Builder

and/or Design-Builder's agents or employees) or for any and all other losses, founded upon or alleged to arise out of, pertain to, or relate to the Design-Builder's and/or subcontractor's performance of the Work on the Project, whether or not contributed to by any act or omission of Owner, or of any of Owner's Council, Boards, officers, agents or employees; Provided, however, that where such suits, claims, causes of action, liability, losses, damages, demands or expenses arise from or relate to Design-Builder's performance of a "Construction Contract" as defined by California Civil Code section 2783, this paragraph shall not be construed to require Design-Builder to indemnify or hold Owner harmless to the extent such suits, causes of action, claims, losses, demands and expenses are caused by the Owner's sole negligence, willful misconduct or active negligence; Provided further that where such suits, claims, causes of action, liability, losses, damages, demands or expenses arise from Design-Builder's design professional services as defined by California Civil Code section 2782.8, Design-Builder's indemnity obligations shall be limited to allegations, suits, claims, causes of action, liability, losses, damages, demands or expenses arising out of, pertaining to, or relating to the Design-Builder's negligence, recklessness or willful misconduct in the performance of the Agreement.

7.4.2 For indemnity obligations that arise from professional errors and omissions, Design-Builder, to the fullest extent permitted by law, shall indemnify Owner, its officers, directors, and employees from and against claims, losses, damages, liabilities, including attorneys' fees and expenses, for non-party bodily injury, sickness, or death and non-party property damage or destruction (other than to the Work itself) but only to the extent resulting from the negligent acts or omissions of Design-Builder, Design Consultants, Subcontractors, anyone employed directly or indirectly by any of them or anyone for whose acts any of them may be liable.

7.4.3 If an employee of Design-Builder, Design Consultants, Subcontractors, anyone employed directly or indirectly by any of them or anyone for whose acts any of them may be liable has a claim against Owner, its officers, directors, employees, or agents, Design-Builder's indemnity obligations set forth in Sections 7.4.1 and 7.4.2 above shall not be limited by any limitation on the amount of damages, compensation or benefits payable by or for Design-Builder, Design Consultants, Subcontractors, or other entity under any employee benefit acts, including workers' compensation or disability acts.

7.4.3 Design-Builder's obligation to defend the Owner and the other referenced indemnitees arises at the time such Loss is tendered to Design-Builder by the Owner and continues at all times until finally resolved, and/or decided by an adjudicatory body or a court of competent jurisdiction.

7.5 Owner's General Indemnification.

7.5.1 For claims and liabilities arising during Design-Builder's Phase 1 services, Owner, to the fullest extent permitted by law, shall indemnify, hold harmless and defend Design-Builder and any of Design-Builder's officers, directors, and employees, from and against claims, losses, damages, liabilities, including attorneys' fees and expenses, for bodily injury, or death, and property damage or

destruction (other than to the Work itself) but only in proportion to and to the extent resulting from the negligent acts or omissions of Owner, or Owner's employees or agents who are directly under Owner's authority or control (separate and distinct from Design-Builder or others under Design-Builder's authority or control) and for whose acts Owner may be liable.

7.6 Survival of Indemnities

7.6.1 The provisions of this Article 7 shall remain operative following a termination of all other performance under this Agreement unless specifically extinguished in a writing signed as approved by the Design-Builder, the Owner and its attorney.

7.7 Limited Recourse.

7.7.1 None of the obligations set forth in this Agreement (on behalf of any party) constitute personal obligations of any natural persons who are the officers, shareholders, members, partners, employees, or agents of any party unless the natural person is expressly identified as a contracting party. All Parties to this Agreement shall not seek recourse against any natural person described herein. This provision, however, shall not protect such natural persons from liability for willful misconduct, illegal acts or intentional violation of any duty of corporate loyalty.

Article 8

Time

8.1 Obligation to Achieve the Contract Times.

8.1.1 Design-Builder agrees that it will commence performance of the Work and achieve the Contract Time(s) in accordance with Article 5 of the Agreement.

8.1.2 The Design-Builder shall be permitted reasonable, uninterrupted access to the Project Site subject to the operational protocols in place and as revised from time to time. The Design-Builder shall cooperate with Owner to reasonably accommodate Owner's other work on the Project Site. Design-Builder shall actively schedule plan and coordinate the sequence of the Work and shall not delegate such responsibility for coordination to subcontractors but rather shall actively and proactively schedule and lead subcontractor coordination.

8.1.3 The Design-Builder shall diligently prosecute the Work to completion. If Owner determines that the Design-Builder is failing to prosecute the Work in accordance with its approved schedule or the Project milestones, the Design-Builder shall, upon orders from Owner, immediately take steps to remedy the situation

8.1.4 All work performed and services provided hereunder by the Design-Builder shall conform to the highest professional standards for the construction industry in the State of California as applicable to a Design-Builder with prior

successful experience in work similar in size and scope and complexity as the Work of the Contract Documents.

8.1.5 The Design-Builder shall give Owner full information in advance as to its plans for performing each part of its work. If at any time, Design-Builder's actual progress is inadequate to meet the requirements of this Agreement, Owner may so notify Design-Builder who shall thereupon take such steps as may be necessary to improve its progress. A Recovery Schedule is required along with the submission of a monthly Progress Schedule Update if the monthly Progress Schedule Update shows a delay of more than 21 calendar days to the Contract Milestones. If within a reasonable period as determined by Owner, the Design-Builder does not improve performance to meet the currently approved Construction Schedule; Owner may require an increase in the Design-Builder's labor force, the number of shifts, overtime operations, and additional days of work per week, all without additional cost to Owner. Neither such notice by Owner nor Owner's failure to issue such notice shall relieve Design-Builder of its obligation to achieve the quality of work and rate of progress required by this Agreement.

8.2 Delays to the Work.

8.2.1 If Design-Builder is delayed on the critical path in the performance of the Work due to acts, omissions, conditions, events, or circumstances beyond its control and due to no fault of its own or those for whom Design-Builder is responsible, subject to compliance with Section 2.12, the Contract Time(s) for performance may be reasonably extended by Change Order. An excusable delay is a delay to the critical path of the Project and meets all of the following requirements:

8.2.1.1 It was not the responsibility of the Design-Builder under the Contract Documents and was beyond the control of Design-Builder;

8.2.1.2 It could not have been foreseen or avoided by Design-Builder;

8.2.1.3 It could not have been mitigated by Design-Builder;

8.2.1.4 It was not caused in whole or in part by Design-Builder, its subcontractors or agents;

8.2.1.5 Design-Builder has provided written notice to Owner of the delay act or event within seven (7) calendar days of being made aware of its occurrence and thereafter satisfies all requirements in the Contract Documents for making a request for extension to the Project Schedules and Contract milestones. Pursuant to California Civil Code section 1511, the Parties agree that any failure to submit a timely and properly documented notice of delay or a request for extension of to the Project Schedules and Contract Milestones shall constitute a waiver by Design-Builder of any claim for additional compensation, time or impact costs from Owner.

8.2.2 In addition to Design-Builder's right to a time extension for those events set forth in Section 8.2.1 above, Design-Builder may be entitled to an appropriate adjustment of the Contract Price. A delay which is excusable must also meet the requirements for a compensable delay in order to be compensable. A Force Majeure delay is an excusable non-compensable delay. Owner shall make the final determination of Force Majeure delays. A delay due to financial issues of Design-Builder or any of its subcontractors or suppliers, including bankruptcy or insolvency, is not an excusable delay. A non-excusable delay is also non-compensable. A compensable delay must be excusable and meet all of the following requirements:

8.2.2.1 The costs of delay requested could not be mitigated;

8.2.2.2 It was a result of a change directed by Owner, a material breach of the Agreement by Owner or resulting from the active negligence of Owner;

8.2.2.3 The Contract Documents do not preclude the claim for compensation;

8.2.2.4 The delay is not concurrent with a delay caused in whole or part by Design-Builder;

8.2.2.5 Design-Builder has satisfied all requirements in the Contract Documents for making a claim for compensation pursuant to a compensable delay in a timely manner.

8.2.3 If the Contractor Change Request is based in whole or in part on a delay of any kind or nature, the complete itemized proposal shall include the following information in addition to all other required information:

8.2.3.1 The date, nature and circumstances of each event regarded as a cause of the delay;

8.2.3.2 If the Design-Builder claims acceleration costs of scheduled performance or delivery, the basis upon which acceleration arose;

8.2.3.3 The identification of any documents and the substance of any oral communication known to the Design-Builder which substantiate, refute or concern such delay;

8.2.3.4 A Critical Path Method (CPM) schedule, including design, construction and commissioning corrected to reflect actual performance, showing delay impacts as separate tasks and Design-Builder's mitigation of such impacts; and

8.2.3.5 The specific elements of Contract performance for which the Design-Builder may seek an equitable adjustment, including:

i. Identification of each Contract or schedule line item which has been or may be affected by such delay;

ii. To the extent practicable, identification of the delay and disruption in the manner and sequence of performance, and the effect on continued performance, which have been or may be caused by such delay;

iii. Identification of labor, materials, or both, or other cost items including overhead and subcontractor costs, which have been or may be added, deleted or wasted by such delay, and a statement that the Design-Builder is maintaining records by some generally accepted accounting procedure which allows the separately identifiable direct costs due to the delay, and those not incurred as a result of the delay, to be readily identified and segregated; and

iv. Estimates of the necessary adjustments to Contract Amount, Contract Time and any other Contract provisions affected by the delay.

8.2.4 Claims for a compensable delay shall not be allowed for any costs incurred if the Design-Builder fails to notify Owner in writing within seven (7) calendar days of being made aware of the act or event causing the delay. The Design-Builder will have the burden of proving that the delay is both an excusable delay and a compensable delay. If an excusable delay is found to be a compensable delay, Owner will by Change Order extend the Work Completion Time for the increase in the time of performance and will adjust the total Contract Price. The Change Order will be the Design-Builder's sole remedy arising out of the compensable delay. Pursuant to California Civil Code section 1511, the Parties agree that any failure to submit a timely and properly documented notice of excusable or compensable delay shall constitute a waiver by Design-Builder of any claim for additional compensation, time or impact costs from Owner.

8.3 Force Majeure

8.3.1 The term "Force Majeure" as employed herein shall mean an excusable, non-compensable delay which is one of the below listed types, to the extent that the event(s) delays the progress of critical path activities, are beyond the Design-Builder's control, were not anticipatable by Design-Builder and could not be mitigated by Design-Builder, regardless of the cost of mitigation: acts of God (except as excluded herein), strikes (except those determined by Owner to be within the control of the Design-Builder), lockouts, or other industrial disturbances, acts of public enemies, terrorist acts, wars, blockades, insurrections, riots, epidemics, pandemics, earthquakes, hurricanes, tornadoes, orders by any court, board, department, commission or city or county of the United States or of any

State, civil disturbances, explosions, rain or other adverse weather conditions, including fire (except fire which was the responsibility of the Design-Builder).

8.3.2 The Design-Builder's observance of non-sanctioned picket lines or other similar labor actions shall be considered a non-excusable delay under this Contract and, as such, is not a Force Majeure event.

8.3.3 Should either party be rendered unable, either wholly or in part, by an event of Force Majeure to fulfill its obligations under the Contract, the obligation(s) affected by such event of Force Majeure shall be suspended only during the continuance of the Force Majeure event. Suspension of Work is not required for a Force Majeure event. The party so affected shall give notice of the existence, extent and nature of such Force Majeure in writing to the other party within seven (7) calendar days after the commencement of the Force Majeure event. The party so affected shall remedy such inability with all reasonable dispatch and shall use due diligence in this regard. Failure to give such notice shall result in the continuance of such party's obligation regardless of the extent of any existing Force Majeure event. Pursuant to California Civil Code section 1511, the Parties agree that any failure to submit a timely and properly documented notice and description of a Force Majeure event shall constitute a waiver by Design-Builder of any claim for additional compensation, time or impact costs from Owner.

8.3.4 Nothing within this Article shall restrict the Owner's rights to pursue a termination or suspension pursuant to the Contract Documents.

8.4 Liquidated Damages

8.4.1 Liquidated Damages are the specified dollar amount the Design-Builder shall pay to the Owner due to the Design-Builder's failure to complete the Work within the Work Completion Time. Unless provided otherwise in the Contract Documents. Liquidated Damages are intended to cover Owner's administrative, inspection, project management, and professional services costs in the period of extended construction and shall not be construed to cover or apply to costs of completion of the Work, costs or delays resulting from defective work, property damage or any costs or damages covered by insurance of any type.

8.4.2 The parties recognize and agree that time is of the essence for this Contract. If Substantial Completion has not occurred on or before the scheduled Substantial Completion date, Owner will assess Liquidated Damages, as it is and will be impractical and extremely difficult to ascertain the actual damages which Owner will sustain in the event of and by reason of such delay. Owner shall have the right to deduct said Liquidated Damages from any amount due or that may become due the Design-Builder, or to collect such Liquidated Damages from the Design-Builder or its surety. These Liquidated Damages shall not be construed as a penalty.

8.4.3 Execution of the Contract shall constitute agreement by Owner and Design-

Builder that the amount specified in the Contract Documents is the minimum value of the costs and actual damage caused by the failure of the Design-Builder to complete the Work within the allotted time. Such sum is Liquidated Damages and may be deducted from payments due the Design-Builder if such delay occurs.

8.4.4 Owner expressly denies that any progress payments made after the scheduled completion date constitute a waiver of Liquidated Damages.

8.4.5 These provisions shall not prevent Owner, in the case of the Design-Builder's default under this Contract, from terminating the right of the Design-Builder to proceed as provided in the Contract Documents and seeking all damages and other remedies available to Owner under this Contract or by Law.

Article 9

Changes to the Contract Price and Time

9.1 Change Orders.

9.1.1 A Change Order is a written instrument issued after execution of the Agreement signed by Owner and Design-Builder, stating their agreement upon all of the following:

9.1.1.1 The scope of the change in the Work;

9.1.1.2 The amount of the adjustment to the Contract Price; and

9.1.1.3 The extent of the adjustment to the Contract Time(s).

9.1.2 All changes in the Work authorized by applicable Change Order shall be performed under the applicable conditions of the Contract Documents. Owner and Design-Builder shall negotiate in good faith and as expeditiously as possible the appropriate adjustments for such changes.

9.1.3 The Contract Pricing and Work Completion Time may only be changed by executed Change Order. Change Orders are generally bilateral signed by the Design-Builder and by Owner. Owner may also issue unilateral Change Orders, should there be an impasse on executing a bilateral agreement or time does not permit further negotiations.

9.1.4 No extra work or change in the Contract Documents shall be made unless by a written Change Order approved by Owner. No claim for any change to the Contract Pricing or Work Completion Time shall be valid unless so ordered. A Change Order signed by the Design-Builder conclusively establishes the Design-Builder's agreement therewith, including the adjustment in the Contract Pricing and the Work Completion Time. Owner reserves the right to contract with any person or firm other than the Design-Builder for any or all changed work.

9.1.5 Accord and Satisfaction. It is the intent of Owner to settle each Change Order full and final at the time the Change Order is issued. Therefore, the following language will be deemed incorporated into all Change Orders:

"The undersigned hereby proposes and agrees to furnish any and all labor, material and equipment, including all overhead and profit, in strict accordance with the requirements of the original Contract Documents except as specifically above noted otherwise for the sum stated above, and that are *required in connection with the above proposed change.*

By signing the Change Order, the Design-Builder acknowledges and agrees, on behalf of himself, all subcontractors, and all suppliers, that the stipulated compensation includes payment for all work contained in the Change Order, plus all payment for the interruption of schedules, extended overhead costs, delay, all impacts, and ripple effect of cumulative impact on all other work under this Contract. The signing of the Change Order indicates that the Change Order constitutes the compensation (time and cost) set forth in the Change Order and comprises the total compensation due the Design-Builder, all subcontractors, and all suppliers, for the Work or change defined in the Change Order, including impact on unchanged work. The Design-Builder is in full mutual accord and satisfaction with the change, and that the time and /or cost under the Change Order constitute the total equitable adjustment owed the Design-Builder, all subcontractors, and all suppliers, as a result of the changes. The Design-Builder. on behalf of the Design-Builder, all subcontractors, and all suppliers, agrees to waive all right, without exception or reservation of any kind whatsoever, to file any further Claim related to this Change Order *No further Claim or request for equitable adjustment of any type shall arise out of or as a result of this Change Order or the impact of this Change Order on the remainder of the Work under the Contract. The Design-Builder further agrees to indemnify and hold the Owner and its agents harmless from any further Claims, requests for equitable adjustment, or damages raised by subcontractors or suppliers at any tier, as a result of the Work under this Contract. The Design-Builder, on behalf of the Design-Builder, all subcontractors, and all suppliers, expressly waives the benefits of the provisions of Section 1542 of the Civil Code, which reads as follows: "A GENERAL RELEASE DOES NOT EXTEND* TO *CLAIMS WHICH THE CREDITOR DOES NOT KNOW* OR *SUSPECT* TO *EXIST IN HIS OR HER FAVOR AT THE TIME OF EXECUTING THE RELEASE, WHICH IF KNOWN BY HIM OR HER MUST HAVE MATERIALLY AFFECTED HIS OR HER SETTLEMENT WITH THE DEBTOR." The Owner and the Design-Builder hereby agree that this Change Order constitutes full mutual accord and satisfaction for all time, all costs, and all impacts related directly to this Change Order."*

9.1.6 Unilateral Change Order. In case of failure on the part of Owner and the Design-Builder to arrive at an agreement on the amount of a credit or an extra cost for a proposed change to the Contract Documents, a unilateral Change Order will be processed in the amount believed by Owner to be reasonable and the Design-Builder shall proceed with the Work. If the Design-Builder believes that the amount set forth in the unilateral Change Order is not a reasonable payment for the Work required the Design-Builder may file a Claim and request for review in accordance

with Article 10.

9.1.7 No oral statement of any person including the Design-Builder's personnel shall in any manner or degree, modify or otherwise affect the terms of this Contract.

9.1.8 Design-Builder's Overhead and Profit Limitation - For all negotiated Change Orders the allowance for overhead and profit and all other items of expense or cost not included in the Cost of the Work, to the extent they are applicable to the conditions created by the Change Order. The allowance for overhead and profit shall not exceed the following schedule:

Total Combined Overhead and Profit

Labor = 15 percent
Materials = 15 percent
Equipment = 15 percent
Subcontractor = 10 percent

9.1.9 Not Used

9.1.10 Equipment Rental Rates – Rental equipment required specifically for the Additional Work. Whenever possible, changed work will be accomplished using equipment available on-site or owned by the Design-Builder. If no on-site equipment can be used and a specific piece of equipment must be rented to be used exclusively for the changed work, the rental rate that will apply will be the rate shown on the supplier's invoice.

9.1.11 Design-Builder's Extra Work Report - In order to be paid for extra work based on time and materials, the Design-Builder must submit a daily Extra Work Report on a form provided by the Owner's Representative. The form must be completely filled out based on the provisions of this Article and signed by the Design-Builder and Owner's Representative at the end of each work day. Failure to complete the form and obtain appropriate signatures by the next working day after the Work was completed will result in Design-Builder's costs for extra work being disallowed until such form is completed and agreed to by the Owner's Representative. Delay in submitting the form beyond seven (7) days will result in the Owner's records becoming the official record for payment purposes.

9.1.12 No Additional Compensation for Overtime - Except as otherwise provided in this Article, the **Design-Builder** shall receive no additional compensation for overtime Work (i.e., work in excess of 8 hours in any one calendar day or 40 hours in any one calendar week), even though such overtime Work may be required under emergency conditions and may be ordered by the Owner in writing. Owner will pay additional compensation to the **Design-Builder** for overtime Work only in the event extra Work is ordered by the Owner, and the Change Order specifically authorizes the use of overtime Work and then only to such extent as overtime

wages are regularly being paid by the **Design-Builder** for overtime Work of a similar nature in the same locality.

9.2 Work Change Directives.

9.2.1 A Work Change Directive is a written order prepared and signed by Owner directing a change in the Work prior to agreement on an adjustment in the Contract Price and/or the Contract Time(s).

9.2.2 Owner and Design-Builder shall negotiate in good faith and as expeditiously as possible the appropriate adjustments for the Work Change Directive. Upon reaching an agreement, the parties shall prepare and execute an appropriate Change Order reflecting the terms of the agreement.

9.3 Minor Changes in the Work.

9.3.1 Minor changes in the Work do not involve an adjustment in the Contract Price and/or Contract Time(s) and do not materially and adversely affect the Work, including the design, quality, performance and workmanship required by the Contract Documents. Design-Builder may make minor changes in the Work consistent with the intent of the Contract Documents, provided, however, that Design-Builder shall promptly inform Owner, in writing, of any such changes and record such changes on the documents maintained by Design-Builder.

9.4 Contract Price Adjustments.

9.4.1 The increase or decrease in Contract Price resulting from a change in the Work shall be determined by one or more of the following methods:

9.4.1.1 Unit prices set forth in the Agreement or as subsequently agreed to between the parties;

9.4.1.2 A mutually accepted lump sum, properly itemized and supported by sufficient substantiating data to permit evaluation by Owner;

9.4.1.3 Costs, fees and any other markups set forth in the Agreement; or

9.4.1.4 If an increase or decrease cannot be agreed to as set forth in items 9.4.1.1 through 9.4.1.3 above and Owner issues a Work Change Directive, the cost of the change of the Work shall be determined by the reasonable expense and savings in the performance of the Work resulting from the change, including a reasonable overhead and profit, as may be set forth in the Agreement.

9.4.2 If unit prices are set forth in the Contract Documents or are subsequently agreed to by the parties, but application of such unit prices will cause substantial inequity to Owner or Design-Builder because of differences in the character or quantity of such unit items as originally contemplated, such unit prices shall be

equitably adjusted.

9.5 Escalation of Cost

9.5.1 Potential Time and Price-Impacted Material. As of the date of this Agreement, certain markets providing essential materials to the Project are experiencing or are expected to experience significant, industry-wide economic fluctuation during the performance of this Agreement that may impact price, availability and deliver time frames ("Potential Time and Price-Impacted Material"). This Agreement provides for a fair allocation of the risk of such market conditions between the Owner and the Design-Builder and shall only apply to the Potential Time and Price-Impacted material(s) listed in Schedule (To be included in the Phase 2 Amendment) to this Agreement.

9.5.2 Baseline Price and Time. Owner and Design-Builder shall agree upon a method for establishing the market price as of the date of this Agreement ("Baseline Price"), and the method for calculating an adjustment in the pricing for a Potential Time and Price-Impacted Material listed in Schedule (To be included in the Phase 2 Amendment) to this Agreement.

9.5.2.1 Compensation for any Potential Time and Price-Impacted Material shall not be duplicated in any contingency amounts established under the terms of the Agreement.

9.5.3 Adjustment In Baseline Price. If during the course of the Project a Potential Time and Price-Impacted Material item experiences an increase or decrease in its Baseline Price of 25% over 180 days as a result of unanticipated and significant industry wide price fluctuation, either party may notify the other in writing within thirty (30) days from the date the basis for equitable adjustment arises and shall provide appropriate documentation. Material shall not include any amount for overhead and profit.

9.5.3.1 In the event of a decrease in a Baseline Price, the Contract Price shall be equitably adjusted to reflect such decrease, subject to Article 9 of this Agreement, but only for those Potential Time and Price-Impacted Materials delivered on or after the date on which written notice of the adjustment in Baseline Price is given.

9.5.3.2 In the event of an increase in a Baseline Price, the Contract Price shall be equitably adjusted to reflect such decrease, subject to Article 9 of this Agreement, but only for those Potentially Time and Price-Impacted Materials delivered on or after the date on which notice of the adjustment in Baseline Price is given.

9.5.3.3 The Contract Price shall not be adjusted by more than _____ ((To be included in the Phase 2 Amendment) %) percent of the original Contract Price for the aggregate of

the decreases in Baseline Price for Potentially Time and Price-Impacted Materials.

9.5.3.4 No adjustment shall be made for quantities of Potentially Time and Price-Impacted Materials scheduled for delivery under the terms of this Agreement prior to the date on which written notice of the adjustment in Baseline Price is given, unless the failure to deliver such quantities before that date is beyond the control of and without the fault of the Contractor, its Subcontractors and Material Suppliers.

9.5.3.5 Payment, if any, for an adjustment shall be made in accordance with the terms of the Agreement.

9.5.4 Time Impact and Availability. If the Contract is delayed at any time in the commencement or progress of the Work due to a delay in the delivery of, or unavailability of, a Potentially Time and Price-Impacted Material, beyond the control of and without the fault of the Contractor, its Subcontractors and Material Suppliers, the Contractor shall be entitled to an excusable, non-compensable delay subject to the requirements of Article 2.12 of the General Conditions. The Owner and Design-Builder shall undertake reasonable steps to mitigate the effect of such delays.

9.5 Emergencies.

9.5.1 In any emergency affecting the safety of persons and/or property, Design-Builder shall act, at its discretion, to prevent threatened damage, injury or loss. Any change in the Contract Price and/or Contract Time(s) on account of emergency work shall be determined as provided in this Article 9.

Article 10

Contract Adjustments and Disputes

10.1 Requests for Contract Adjustments and Relief.

10.1.1 Claims. For purposes of this Article, "Claim" means a separate demand by the Design-Builder for one of more of the following: (A) a time extension, (B) payment of money or damages arising from Work done by or on behalf of the Design-Builder pursuant to the Contract, or (C) an amount the payment of which is disputed by the Owner. In accordance with California Public Contract Code Section 20104.2 and Public Contract Code Section 9204, presuming Design-Builder has diligently pursued and exhausted the administrative procedures of the Contract, the procedures in this Article apply to claims between the Design-Builder and the Owner.

10.1.2 If the Design-Builder believes that it is entitled to relief against the Owner for any event arising out of or related to the Work or Project, Design-Builder shall provide written notice to the Owner of the basis for its claim for relief, as provided

for in Articles 8 and 9. In the event that the Design-Builder does not accept the Owner's decision on a Change Order Request, the Design-Builder must within 30 calendar days of a written rejection submit in writing and in electronic form to the Owner with all documentation which it believes relate to the issues it is raising ("Dispute Submittal"). All disputes and negotiations shall be documented by each Party in writing in accordance with the Agreement and shall state each claim specifically, show the calculation and basis for each claim for compensation and the schedule (including fragnet) analysis for each schedule demand. Any claim that lacks specific calculation or documentary support will not be considered, and will be a waiver of that claim so that no further administrative or judicial action may be taken. Pursuant to California Civil Code section 1511, the Parties agree that any failure to submit a timely and properly documented Contractor Change Request or Dispute Submittal shall constitute a waiver by Design-Builder of any claim for additional compensation, time or impact costs from Owner.

10.1.3 Certification of Dispute Submittal. Any claim, including without limitation any claim filed on behalf of or having its source in a claim by subcontractor, sub-subcontractor, or supplier, at any tier, which the Design-Builder chooses to make to Owner, shall be accompanied by the certification language set forth below signed by a responsible managing officer of the Design-Builder's organization, who has the authority to sign subcontracts or Purchase Orders on behalf of the Design-Builder, and who has personally investigated and confirmed the truth and accuracy of the matters set forth in such certification. Submission of certification in accordance herewith is a condition precedent to Owner's consideration of or decision on the claim and to the filing and maintenance of any legal action or proceeding to enforce or recover monies under such claim. Failure to submit such a certification along with the claim shall result in the claim being returned to the Design-Builder without any decision, and shall waive the Design-Builder's right to pursue the claim either on its own behalf or on behalf of such subcontractor or supplier.

10.1.4 The certification shall state: "I hereby certify under penalty of perjury that I am a managing officer of (Design-Builder's name) and that I have reviewed the Claim presented herewith on Design-Builder's behalf and/or on behalf of (subcontractor's/supplier's name(s)) and that the following statements are true and correct:

10.1.4.1 The facts alleged in or that form the basis for the Claim are true and accurate; and, Design-Builder does not know of any facts or circumstances, not alleged in the Claim, that by reason of their not being alleged render any fact or statement alleged in the Claim materially misleading; and,

10.1.4.2 Design-Builder has, with respect to any request for money or damages alleged in or that forms the basis for the Claim, reviewed the job cost records (including those maintained by Design-Builder and by any subcontractor or supplier, of any tier, that is asserting all or any portion of the Claim) and confirmed with mathematical certainty that the losses or

damages suffered by Design-Builder and /or such subcontractor or supplier were in fact suffered in the amounts and for the reasons alleged in the Claim; and,

10.1.4.3 Design-Builder has, with respect to any request for extension of time or claim of delay, disruption, hindrance or interference alleged in or that forms the basis for the Claim, reviewed the job schedules(including those maintained by Design-Builder and by any subcontractor or supplier, of any tier, that is asserting all or any portion of the Claim) and confirmed on an event-by-event basis that the delays or disruption suffered by Design-Builder and /or such subcontractor or supplier were in fact experienced for the durations, in the manner, and with the consequent effects on the time and/or sequence of performance of the Work, as alleged in the Claim; and,

10.1.4.4 Design-Builder has not received payment from Owner for, nor has Design-Builder previously released Owner from any portion of the Claim."

10.1.4.5 Design-Builder Signature Line_____

10.1.5 Owner's Response. Upon receipt of a claim pursuant to this Article, the Owner shall conduct a reasonable review of the claim and provide a written response to the Design-Builder within 45 days of the date of the claim, identifying the portion of the claim that is disputed and the portion that is undisputed. Upon receipt of a claim, the Owner and the Design-Builder may, by mutual agreement, extend the time period provided in this subdivision.

10.1.5.1 All amounts that the Owner identifies in its response as undisputed must be processed and paid within 60 days of the Owner's response. Pursuant to Public Contract Code section 9204(d)(4), if the Owner fails to pay within 60 days, undisputed amounts not paid will bear interest at 7 percent per annum.

10.1.5.2 If the Owner needs approval from its governing body to provide the Design-Builder a written statement identifying the disputed portion and the undisputed portion of the claim, and the Owner's governing body does not meet within the 45 days or within the mutually agreed to extension of time following receipt of a claim sent by registered mail or certified mail, return receipt requested, the Owner shall have up to (3) three days following the next duly publicly noticed meeting of the Owner's governing body after the 45-day period, or extension, expires to provide the Design-Builder a written statement identifying the disputed portion and the undisputed portion.

10.1.6 Meet and Confer. If the Design-Builder disputes the Owner's written response, or the Owner fails to respond within the time prescribed, the Design-Builder may so notify the Owner, in writing, either within 15 days of receipt of the Owner's response or within 15 days of the Owner's failure to respond within the time prescribed, respectively, and demand an informal conference to meet and confer for settlement of the issues in dispute. Upon receipt of a demand, the

Owner shall schedule a meet and confer conference within 30 days for settlement of the dispute.

10.1.7 Mediation. Within 10 business days following the conclusion of the meet and confer conference, if the claim or any portion of the claim remains in dispute, the Owner shall provide the Design-Builder a written statement identifying the portion of the claim that remains in dispute and the portion that is undisputed. Any payment due on an undisputed portion of the claim shall be processed and made within 60 days after the Owner issues its written statement. If the Owner fails to pay within 60 days, undisputed amounts not paid will bear interest at 7 percent per annum. Any disputed portion of the claim, as identified by the Design-Builder in writing, shall be submitted to nonbinding mediation, with the Owner and the Design-Builder sharing the associated costs equally. The Owner and Design-Builder shall mutually agree to a mediator within 10 business days after the disputed portion of the claim has been identified in writing, unless the parties agree to select a mediator at a later time.

10.1.7.1 If the parties cannot agree upon a mediator, each party shall select a mediator and those mediators shall select a qualified neutral third party to mediate with regard to the disputed portion of the claim. Each party shall bear the fees and costs charged by its respective mediator in connection with the selection of the neutral mediator.

10.1.7.2 For purposes of this section, mediation includes any nonbinding process, including, but not limited to, neutral evaluation or a dispute review board, in which an independent third party or board assists the parties in dispute resolution through negotiation or by issuance of an evaluation. Any mediation utilized shall conform to the timeframes in this section.

10.1.7.3 Unless otherwise agreed to by the Owner and the Design-Builder in writing, the mediation conducted pursuant to this section shall excuse any further obligation under Public Contract Code Section 20104.4 to mediate after litigation has been commenced.

10.1.7.4 This section does not preclude the Owner from requiring arbitration of disputes under private arbitration or the Public Works Contract Arbitration Program, if mediation under this section does not resolve the parties' dispute.

10.1.7.5 The mediation shall be held no earlier than the date the Design-Builder completes the Work or the date that the Design-Builder last performs Work, whichever is earlier. All unresolved claims shall be considered jointly in a single mediation, unless a new unrelated claim arises after mediation is complete.

10.1.8 Arbitration. Upon receipt of a claim, the Owner and the Design-Builder may mutually agree to waive, in writing, mediation and proceed directly to the commencement of a civil action or binding arbitration.

10.2 Legal Proceedings

10.2.1 Civil Actions. Procedures for civil actions to resolve claims of $375,000 or less between the City and the Design-Builder are governed pursuant to Public Contract Code Section 20104.4.

10.2.2 Government Code Claims. In addition to any and all contract requirements pertaining to notices of and requests for compensation or payment for extra Work, disputed Work, construction claims and/or changed conditions, the Design-Builder must comply with the claim procedures set forth in Government Code Section 900, et seq. prior to filing any lawsuit against the Owner. Such Government Code claims and any subsequent lawsuit based upon the Government Code claims shall be limited to those matters that remain unresolved after all procedures pertaining to the extra Work, disputed Work, construction claims, and/or changed conditions have been followed by the Design-Builder. If no such Government Code claim is submitted, or if the prerequisite contractual requirements are not satisfied, no action against the Owner may be filed. A Government Code claim must be filed no earlier than the date the Work is completed or the date the Design-Builder last performs Work on the Project, whichever occurs first. A Government Code claim shall be inclusive of all unresolved claims unless a new unrelated claim arises after the Government Code claim is submitted.

10.2.3 Non-Waiver. The Owner's failure to respond to a claim from the Design-Builder within the time periods described in this Article or to otherwise meet the time requirements of this Article shall result in the claim being deemed rejected in its entirety. A claim that is denied by reason of the Owner's failure to have responded to a claim, or its failure to otherwise meet the time requirements of this section, shall not constitute an adverse finding with regard to the merits of the claim or the responsibility or qualifications of the Design-Builder.

10.2.4 Forum for Dispute Resolution. It is the express intention of the parties that all legal proceedings related to this Agreement or to the Project or to any rights or any relationship between the parties arising therefrom shall be governed by the laws of the State of California, without regard for conflicts of laws principles, and shall be solely and exclusively initiated and maintained in Riverside County Superior Court. The Design-Builder and Owner each irrevocably consents to the jurisdiction of such courts in any such legal proceeding and waives any objection it may have to the laying of the jurisdiction of any such legal proceeding.

10.3 Duty to Continue Performance.

10.3.1 Unless provided to the contrary in the Contract Documents, Design-Builder shall continue to perform the Work and Owner shall continue to satisfy its payment obligations for undisputed amounts to Design-Builder as well as any further amounts pursuant to Section 9.4, pending the final resolution of any dispute or disagreement between Design-Builder and Owner.

Article 11

Suspension and Termination for Cause

11.1 Owner's Right to Suspend Work.

11.1.1 Owner may suspend all or any part of the Work by written order signed by Owner ("Suspension Order"), without invalidating the Agreement, for such period or periods as it may deem necessary due to:

11.1.1.1 Any reason for the convenience of the Owner, with or without cause;

11.1.1.2 An order from a state or federal court or a government administrative agency; or

11.1.1.3 The Design-Builder's failure to perform any provision of the Contract Documents.

11.1.2 Upon receipt from Owner of a Suspension Order, the Design-Builder shall, unless the notice requires otherwise:

11.1.2.1 Immediately discontinue work on the date and to the extent specified in the notice;

11.1.2.2 Place no further orders or subcontracts for material, services, or facilities with respect to suspended work other than to the extent required in the notice;,

11.1.2.3 Promptly make every reasonable effort to obtain suspension in terms satisfactory to Owner of all orders, subcontracts and rental agreements to the extent they relate to performance of suspended work;

11.1.2.4 Continue to protect and maintain the Work including those portions on which work has been suspended; if the Design-Builder fails to properly provide for public safety, traffic, and protection of the Work during periods of suspension, Owner may elect to do so and back charge or deduct the cost thereof from monies due the Design-Builder. Such actions will not relieve the Design-Builder from liability.

11.1.2.5 Within three (3) days of the receipt of the Suspension Order, submit a suspension plan to Owner for acceptance. The plan shall describe how the Design-Builder will store all materials in a manner so that the materials will not become an obstruction or become damaged in any way, what cost effective methods it will employ to prevent damage to or deterioration of the Work and otherwise protect the Work, how suitable drainage will be provided, what temporary structures will be necessary, and how the Design-Builder will prepare for resuming the Work for the

least possible remobilization cost. After the plan is accepted, the Design-Builder shall implement it in accordance with instructions received from Owner; and

11.1.2.6 Take any and all measures to minimize costs associated with such suspension.

11.1.3 Under no circumstance shall a suspension absolve the Design-Builder or the Design-Builder's sureties of the duties and responsibilities guaranteed under the performance and payment bond(s). The Design-Builder shall again proceed with the Work when it is ordered to do so in writing by Owner.

11.1.4 Design-Builder is entitled to seek an adjustment of the Contract Price and/or Contract Time(s) if its cost or time to perform the Work has been adversely impacted by any suspension of stoppage of the Work by Owner. If the Design-Builder intends to assert a claim for compensation or time extension under this Article, it must, and not withstanding any time limitations specified elsewhere in the Contract Documents, within seven (7) calendar days after receipt of notice to resume work, submit to Owner a Contractor Change Request setting forth the schedule impact and monetary impact of the suspension in sufficient detail to permit thorough analysis. Adjustment of work Completion Time, if appropriate, will be made pursuant to the provisions of the Contract Documents. Adjustment of the not to exceed contract amount, if any, will be within the Owner’s sole discretion and shall not in any event, exceed the cost of the extra work resulting from such suspension. Such cost, if any, shall be determined in accordance with the Contract Documents. Pursuant to California Civil Code section 1511, the Parties agree that any failure to submit a timely and properly documented Contractor Change Request shall constitute a waiver by Design-Builder of any claim for additional compensation, time or impact costs from Owner.

11.1.5 Suspension due to a ruling of City, State or Federal Court -- The Suspension Order will identify the court or agency ruling which caused the suspension, and subject to Owner approval, may extend the Work Completion Time by the stated amount of time specified by the court or agency order. If the ruling causes suspension for an indefinite period of time and as a result a time extension cannot be established, the Suspension Order may also be for an indefinite period of time, subject to Owner approval. If the Suspension Order is issued because of acts or omissions of the Design-Builder, the Design-Builder shall not be entitled to a time extension or payment for any additional costs it incurs.

11.1.6 Suspension Resulting from Design-Builder’s Failure to Perform -- If a Suspension Order results from the Design-Builder's failure to satisfactorily perform any of the provisions of the Agreement, including but not limited to faulty workmanship, safety concerns, improper or inadequate manpower, equipment, supplies or supervision, or failure to perform the Work or pay employees, subcontractors or suppliers in a timely manner, the Suspension Order will identify

the reason, or reasons, for the order. In this circumstance, no time extension will be authorized for the Design-Builder and any costs to the Design-Builder resulting from such Suspension Order will not be reimbursed by Owner. A Suspension Order issued under these circumstances will remain in effect until the Design-Builder has removed or corrected the grounds for the suspension, or the Suspension Order expires by its terms.

11.2 Owner's Right to Perform and Terminate for Cause.

11.2.1 If Design-Builder persistently fails to (i) provide a sufficient number of skilled workers, (ii) supply the materials required by the Contract Documents, (iii) comply with applicable Legal Requirements, (iv) timely pay, without cause, Design Consultants or Subcontractors, (v) prosecute the Work with promptness and diligence to ensure that the Work is completed by the Contract Time(s), as such times may be adjusted, or (vi) perform material obligations under the Contract Documents, then Owner, in addition to any other rights and remedies provided in the Contract Documents or by law, shall have the rights set forth in Sections 11.2.2 and 11.2.3 below.

11.2.2 Upon the occurrence of an event set forth in Section 11.2.1 above, Owner may provide written notice to Design-Builder that it intends to terminate the Agreement unless the problem cited is cured, or commenced to be cured, within seven (7) days of Design-Builder's receipt of such notice. If Design-Builder fails to cure, or reasonably commence to cure, such problem, then Owner may give a second written notice to Design-Builder of its intent to terminate within an additional seven (7) day period. If Design-Builder, within such second seven (7) day period, fails to cure, or reasonably commence to cure, such problem, then Owner may declare the Agreement terminated for default by providing written notice to Design-Builder of such declaration.

11.2.3 Upon declaring the Agreement terminated pursuant to Section 11.2.2 above, Owner may elect to:

11.2.3.1 Enter upon the premises and take possession, for the purpose of completing the Work, of all materials, equipment, scaffolds, tools, appliances and other items thereon, which have been purchased or provided for the performance of the Work, all of which Design-Builder hereby transfers, assigns and sets over to Owner for such purpose, and to employ any person or persons to complete the Work and provide all of the required labor, services, materials, equipment and other items. In the event of such termination, Design-Builder shall not be entitled to receive any further payments under the Contract Documents until the Work shall be finally completed in accordance with the Contract Documents. At such time, if the unpaid balance of the Contract Price exceeds the cost and expense incurred by Owner in completing the Work, such excess shall be paid by Owner to Design-Builder. Notwithstanding the preceding sentence, if the Agreement establishes a Guaranteed Maximum Price, Design-Builder will only be entitled to be paid for Work performed prior to its default. If Owner's cost and expense of completing the Work exceeds the unpaid balance of

the Contract Price, then Design-Builder shall be obligated to pay the difference to Owner. Such costs and expense shall include not only the cost of completing the Work, but also losses, damages, costs and expense, including attorneys' fees and expenses, incurred by Owner in connection with the re-procurement and defense of claims arising from Design-Builder's default, subject to the waiver of consequential damages set forth in Article 13 in the 545 Design Build Agreement hereof; or

11.2.3.2 Serve written notice upon the Design-Builder and its surety on its performance bond demanding satisfactory compliance with the Contract.

i. If the surety assumes the Contract, all money which may become due the Design-Builder shall be payable to the surety as the Work progresses, subject to the terms of the Contract.

ii. If the surety does not assume the Contract and commence performance of the Work within twenty-one (21) days after receiving the Public Works Director's notice and demand, or fails to continue to comply, the Public Works Director may remove the surety from the premises. If the surety bond has provisions contrary to this right, then the 60 day time limit stated elsewhere in this Contract shall apply.

iii. Upon any Surety default, Owner may then take possession of all material and equipment and complete the Work by use of its own forces, by letting the unfinished work to another Design-Builder, or by a combination of such methods. In any event, the cost of completing the Work shall be charged against the Design-Builder and its surety and may be deducted from any money due or becoming due from the Design-Builder. If the amount unpaid under the Agreement is insufficient for completion, the Design-Builder or surety shall pay to Owner within five (5) days after the completion and an itemized demand for payment from Owner, all costs and damages incurred by Owner in excess of the amount unpaid under the Agreement.

11.2.4 If Owner improperly terminates the Agreement for cause, the termination for cause will be converted to a termination for convenience in accordance with the provisions of Section 11.4 hereof.

11.3 Bankruptcy of Owner or Design-Builder.

11.3.1 If either Owner or Design-Builder institutes or has instituted against it a case under the United States Bankruptcy Code (such party being referred to as the "Bankrupt Party"), such event may impair or frustrate the Bankrupt Party's ability

to perform its obligations under the Contract Documents. Accordingly, should such event occur:

11.3.1.1 The Bankrupt Party, its trustee or other successor, shall furnish, upon request of the non-Bankrupt Party, adequate assurance of the ability of the Bankrupt Party to perform all future material obligations under the Contract Documents, which assurances shall be provided within ten (10) days after receiving notice of the request; and

11.3.1.2 The Bankrupt Party shall file an appropriate action within the bankruptcy court to seek assumption or rejection of the Agreement within sixty (60) days of the institution of the bankruptcy filing and shall diligently prosecute such action.

If the Bankrupt Party fails to comply with its foregoing obligations, the non-Bankrupt Party shall be entitled to request the bankruptcy court to reject the Agreement, declare the Agreement terminated and pursue any other recourse available to the non-Bankrupt Party under this Article 11.

11.3.2 The rights and remedies under Section 11.3.1 above shall not be deemed to limit the ability of the non-Bankrupt Party to seek any other rights and remedies provided by the Contract Documents or by law, including its ability to seek relief from any automatic stays under the United States Bankruptcy Code or the right of Design-Builder to stop Work under any applicable provision of these General Conditions.

11.4 Termination for Convenience.

11.4.1 Upon ten (10) days' written notice to Design-Builder, Owner may, for its convenience and without cause, elect to terminate this Agreement. In such event, Owner shall pay Design-Builder for the following:

11.4.1.1 All Work executed and for proven loss, cost or expense in connection with the Work;

11.4.1.2 The reasonable costs and expenses attributable to such termination, including demobilization costs and amounts due in settlement of terminated contracts with Subcontractors and Design Consultants; and

11.4.1.3 The amount set forth in Article 6 of the Agreement.

11.4.2 If Owner terminates this Agreement pursuant to Section 11.4.1 above and proceeds to design and construct the Project through its employees, agents or third parties, Owner's rights to use the Work Product shall be as set forth in Article 4 of the Agreement. Such rights may not be transferred or assigned to others without Design-Builder's express written consent and such third parties' agreement to the terms of Article 4 of the Agreement.

Article 12

Electronic Data

12.1 Electronic Data.

12.1.1 The parties recognize that Contract Documents, including drawings, specifications and three-dimensional modeling (such as Building Information Models) and other Work Product may be transmitted among Owner, Design-Builder and others in electronic media as an alternative to paper hard copies (collectively "Electronic Data").

12.2 Transmission of Electronic Data.

12.2.1 Owner and Design-Builder shall agree upon the software and the format for the transmission of Electronic Data. Each party shall be responsible for securing the legal rights to access the agreed-upon format, including, if necessary, obtaining appropriately licensed copies of the applicable software or electronic program to display, interpret and/or generate the Electronic Data.

12.2.2 Neither party makes any representations or warranties to the other with respect to the functionality of the software or computer program associated with the electronic transmission of Work Product. Unless specifically set forth in the Agreement, ownership of the Electronic Data does not include ownership of the software or computer program with which it is associated, transmitted, generated or interpreted.

12.2.3 By transmitting Work Product in electronic form, the transmitting party does not transfer or assign its rights in the Work Product. The rights in the Electronic Data shall be as set forth in Article 4 of the Agreement. Under no circumstances shall the transfer of ownership of Electronic Data be deemed to be a sale by the transmitting party of tangible goods.

12.3 Electronic Data Protocol.

12.3.1 The parties acknowledge that Electronic Data may be altered or corrupted, intentionally or otherwise, due to occurrences beyond their reasonable control or knowledge, including but not limited to compatibility issues with user software, manipulation by the recipient, errors in transcription or transmission, machine error, environmental factors, and operator error. Consequently, the parties understand that there is some level of increased risk in the use of Electronic Data for the communication of design and construction information and, in consideration of this, agree, and shall require their independent contractors, Subcontractors and Design Consultants to agree, to the following protocols, terms and conditions set forth in this Section 12.3.

12.3.2 Electronic Data will be transmitted in the format agreed upon in Section 12.2.1 above, including file conventions and document properties, unless otherwise agreed upon in advance in writing.

12.3.3 The Electronic Data represents the information at a particular point in time and is subject to change. Therefore, the parties shall agree upon protocols for notification by the author to the recipient of any changes which may thereafter be made to the Electronic Data, which protocol shall also address the duty, if any, to update such information, data or other information contained in the electronic media if such information changes prior to Final Completion of the Project.

12.3.4 The transmitting party specifically disclaims all warranties, expressed or implied, including, but not limited to, implied warranties of merchantability and fitness for a particular purpose, with respect to the media transmitting the Electronic Data. However, transmission of the Electronic Data via electronic means shall not invalidate or negate any duties pursuant to the applicable standard of care with respect to the creation of the Electronic Data, unless such data is materially changed or altered after it is transmitted to the receiving party, and the transmitting party did not participate in such change or alteration.

Article 13

Miscellaneous

13.1 Confidential Information.

13.1.1 Confidential Information is defined as information which is determined by the transmitting party to be of a confidential or proprietary nature and: (i) the transmitting party identifies as either confidential or proprietary; (ii) the transmitting party takes steps to maintain the confidential or proprietary nature of the information; and (iii) the document is not otherwise available in or considered to be in the public domain. The receiving party agrees to maintain the confidentiality of the Confidential Information and agrees to use the Confidential Information solely in connection with the Project. For avoidance of doubt, all data and information provided or made accessible to Design-Builder by Owner, shall be deemed to be confidential information and may only be disclosed as required to perform the Work, or as required by by law.

13.1.2 The parties understand that all the material provided or produced under this Agreement may be subject to the California Public Records Act, Cal. Government Code section 7920.000, et seq., and that in the event of a request to the Owner for disclosure of such information, the Owner shall advise the Design-Builder of such request in order to give the Design-Builder the opportunity to object to the disclosure of any of its proprietary or confidential material. In the event of the filing of a lawsuit to compel such disclosure, the Owner will tender all such material to the court for judicial determination of the issue of disclosure and the Design-Builder

agrees to intervene in such lawsuit to protect and assert its claims of privilege against disclosure of such material. The Design-Builder further agrees to defend, indemnify and save and hold harmless the Owner, its council, officers, agents and employees, from any claim, damages, expense, loss or costs arising out of the Design-Builder's intervention to protect and assert its claims of privilege against disclosure under this Article including, but not limited to, prompt reimbursement to the Owner of all reasonable attorney fees, costs and damages that the Owner may incur directly or may be ordered to pay by such court.

13.2 Assignment.

13.2.1 Neither Design-Builder nor Owner shall, without the written consent of the other, assign, transfer or sublet any portion or part of the Work or the obligations created by the Contract Documents.

13.2.2 For purposes of this Contract, the terms "transfer" and "assign" shall include, but not be limited to, the following:

13.2.2.1 If the Design-Builder is a joint venture, a limited liability company, or a partnership, the transfer of fifty percent (50%) or more of the interest or membership in the joint venture, the limited liability company, or the partnership;

13.2.2.2 If the Design-Builder is a corporation, any cumulative or aggregate sale, transfer, merger, assignment, or hypothecation of fifty percent (50%) or more of the voting shares of the Design/Builder;

13.2.2.3 The dissolution by any means of Design-Builder; and

13.2.2.4 A change in business or corporate structure. Any such transfer, assignment, mortgaging, pledging, or encumbering of Design/Builder without the written consent of the Owner is a violation of this Contract and shall be voidable at Owner's option and shall confer no right, title, or interest in or to this Contract upon the assignee, mortgagee, pledgee, encumbrance, or other lien holder, successor, or purchaser.

13.3 Successorship.

13.3.1 Design-Builder and Owner intend that the provisions of the Contract Documents are binding upon the parties, their employees, agents, heirs, successors and assigns.

13.4 Governing Law.

13.4.1 The Agreement and all Contract Documents shall be governed by the laws of the State of California, without giving effect to its conflict of law principles.

13.5 Severability.

13.5.1 If any provision or any part of a provision of the Contract Documents shall

be finally determined to be superseded, invalid, illegal, or otherwise unenforceable pursuant to any applicable Legal Requirements, such determination shall not impair or otherwise affect the validity, legality, or enforceability of the remaining provision or parts of the provision of the Contract Documents, which shall remain in full force and effect as if the unenforceable provision or part were deleted.

13.6 No Waiver.

13.6.1 The failure of either Design-Builder or Owner to insist, in any one or more instances, on the performance of any of the obligations required by the other under the Contract Documents shall not be construed as a waiver or relinquishment of such obligation or right with respect to future performance.

13.7 Headings.

13.7.1 The headings used in these General Conditions of Contract, or any other Contract Document, are for ease of reference only and shall not in any way be construed to limit or alter the meaning of any provision.

13.8 Notice.

13.8.1 Whenever the Contract Documents require that legal notice be provided to the other party, notice will be deemed to have been validly given (i) if delivered in person to the individual intended to receive such notice; (ii) four (4) days after being sent by registered or certified mail, postage prepaid to the address indicated in the Agreement; or (iii) if transmitted by facsimile, by the time stated in a machine-generated confirmation that notice was received at the facsimile number of the intended recipient. All other communications requiring non-legal notice will be deemed to have been validly given if delivered by the aforementioned methods or by electronic mail.

13.9 Amendments.

13.9.1 The Contract Documents may not be changed, altered, or amended in any way except in writing signed by a duly authorized representative of each party.

13.10 No Third Party Beneficiary

13.10.1 It is expressly understood and agreed that the enforcement of the terms and conditions of the Contract, and all rights of action relating to such enforcement, shall be strictly reserved to the Owner and the Design-Builder, and that nothing contained in the Contract shall give or allow any claim or right of action by any other or third person under the Contract. It is the express intention of the Owner and the Design-Builder that any member of the public, subcontractor, supplier, material man, tradesman, vendor or other person or entity other than the Owner or the Design-Builder receiving services or benefits under the Contract shall be deemed to be an incidental beneficiary only. The foregoing shall not, however, impair Owner's status as a third party beneficiary of subcontracts of any tier for the performance of work or delivery of services, material or equipment to the Project.

13.11 Labor and Prevailing Wages

13.11.1 California Labor Code Compliance

13.11.1.1 Public Work

The Design-Builder acknowledges that the Project is a "public work" as defined in Labor Code Section 1720 *et seq*. ("Chapter 1"), and that this Project is subject to (a) Chapter 1, including without limitation Labor Code Section 1771 and (b) the rules and regulations established by the Director of Industrial Relations ("DIR") implementing such statutes. The Design-Builder shall perform all Work on the Project as a public work. The Design-Builder shall comply with and be bound by all the terms, rules and regulations described in (a) and (b) as though set forth in full herein.

13.11.1.2 Copies of Wage Rates

Pursuant to Labor Code Section 1773.2, copies of the prevailing rate of per diem wages for each craft, classification, or type of worker needed to perform the Project are on file at City Hall and will be made available to any interested party on request. By initiating any Work, the Design-Builder acknowledges receipt of a copy of the DIR determination of such prevailing rate of per diem wages, and the Design-Builder shall post such rates at each job site covered by these Contract Documents.

The Design-Builder shall comply with and be bound by the provisions of Labor Code Sections 1774 and 1775 concerning the payment of prevailing rates of wages to workers and the penalties for failure to pay prevailing wages. The Design-Builder shall, as a penalty paid to the City, forfeit two hundred dollars ($200) for each calendar day, or portion thereof, for each worker paid less than the prevailing rates as determined by the DIR for the work or craft in which the worker is employed for any public work done pursuant to these Contract Documents by the Design-Builder or by any Subcontractor.

13.11.1.3 Payroll Records

The Design-Builder shall comply with and be bound by the provisions of Labor Code Section 1776, which requires the Design-Builder and each Subcontractor to (1) keep accurate payroll records and verify such records in writing under penalty of perjury, as specified in Section 1776, (2) certify and make such payroll records available for inspection as provided by Section 1776, and (3) inform the City of the location of the records. The Design-Builder has ten (10) days in which to comply subsequent to receipt of a written notice requesting these records, or as a penalty to the City, the Design-Builder shall forfeit one hundred dollars ($100) for each Day, or portion thereof, for each worker, until strict compliance is effectuated. Upon the request of the Division of Labor Standards Enforcement, these penalties shall be withheld from progress payments then due.

The Design-Builder and each Subcontractor shall comply with and be bound by the provisions of Labor Code Section 1771.4(a)(3), which requires that each Design-Builder and each Subcontractor shall furnish the records specified in Section 1776 directly to the Labor Commissioner at least monthly, in a format prescribed by the Labor Commissioner.

13.11.1.4 Hours of Labor

The Design-Builder acknowledges that eight (8) hours labor constitutes a legal day's work. The Design-Builder shall comply with and be bound by Labor Code Section 1810. The Design-Builder shall comply with and be bound by the provisions of Labor Code Section 1813 concerning penalties for workers who work excess hours. The Design-Builder shall, as a penalty paid to the City, forfeit twenty-five dollars ($25) for each worker employed in the performance of this Project by the Design-Builder or by any Subcontractor for each calendar day during which such worker is required or permitted to work more than eight (8) hours in any one (1) calendar day and forty (40) hours in any one calendar week in violation of the provisions of Division 2, Part 7, Chapter 1, Article 3 of the Labor Code. Pursuant to Labor Code Section 1815, work performed by employees of the Design-Builder in excess of eight (8) hours per day, and forty (40) hours during any one week shall be permitted upon public work upon compensation for all hours worked in excess of eight (8) hours per day at not less than one and one-half (1-1/2) times the basic rate of pay.

13.11.1.5 Apprentices

The Design-Builder shall comply with and be bound by the provisions of Labor Code Sections 1777.5, 1777.6 and 1777.7 and California Code of Regulations Title 8, Section 200 *et seq*. concerning the employment of apprentices on public works projects. The Design-Builder shall be responsible for compliance with these Sections for all apprenticeable occupations. Before commencing Work on this Project, the Design-Builder shall provide the City with a copy of the information submitted to any applicable apprenticeship program. Within sixty (60) Days after concluding Work, Design-Builder and each of its Subcontractors shall submit to the City a verified statement of the journeyman and apprentice hours performed under this Contract. Design-Builder is also required to comply with the requirements of Public Contract Code Section 22164(c)(1) requiring the use of a skilled and trained workforce as defined in Public Contract Code Section 2600, et seq. See Section 13.12, below.

13.11.1.6 Debarment or Suspension

The Design-Builder shall not perform Work with any Subcontractor that has been debarred or suspended pursuant to California Labor Code Section 1777.1 or any other federal or State law providing for the debarment of contractors from public works. The Design-Builder and Subcontractors

shall not be debarred or suspended throughout the duration of this Contract pursuant to Labor Code Section 1777.1 or any other federal or State law providing for the debarment of contractors from public works. If the Design-Builder or any Subcontractor becomes debarred or suspended during the duration of the Project, the Design-Builder shall immediately notify the City.

13.11.1.7 Registration with the DIR

In accordance with Labor Code Sections 1725.5 and 1771.1, no contractor or subcontractor shall be qualified to bid on, be listed in a bid proposal, subject to the requirements of Section 4104 of the Public Contract Code, or engage in the performance of any contract for public work, unless currently registered and qualified to perform public work pursuant to Section 1725.5.

13.11.1.8 Compliance Monitoring and Posting Job Sites

This Project is subject to compliance monitoring and enforcement by the DIR. The Design-Builder shall post job site notices, as prescribed by regulation.

13.11.1.9 Subcontractors

For every Subcontractor who will perform Work on the Project, the Design-Builder shall be responsible for such Subcontractor's compliance with the requirements set forth above, and Labor Code Sections 1860 and 3700, and the Design-Builder shall include in the written Contract between it and each Subcontractor a copy of these provisions and a requirement that each Subcontractor shall comply with those provisions. The Design-Builder shall be required to take all actions necessary to enforce such contractual provisions and ensure Subcontractor's compliance, including without limitation, conducting a periodic review of the certified payroll records of the Subcontractor and upon becoming aware of the failure of the Subcontractor to pay its workers the specified prevailing rate of wages, the Design-Builder shall diligently take corrective action to halt or rectify any failure.

13.12 Use of Skilled and Trained Workforce Required

13.12.1 At all times herein, Design-Builder shall comply with the provisions of Public Contract Code Section 22164(c)(1), which requires Design-Builder and its subcontractors at every tier to use a skilled and trained workforce to perform all work on this Project that falls within an apprenticeable occupation in the building and construction trades, in accordance with Public Contract Code Section 2600, et seq.

13.13 Mandatory Terms

13.13.1 Public Contract Code. Pursuant to Public Contract Code Section 7103.5, Design-Builder offers and agrees to assign to Owner all rights, title, and interest in and to all causes of action it may have under Section 4 of the Clayton Act (15 U.S.C.

Sec. 15) or under the Cartwright Act (Chapter 2 (commencing with Section 16700) of Part 2 of Division 7 of the California Business and Professions Code) arising from purchases of goods, services, or materials pursuant to the Contract. This assignment shall be made and become effective at the time the Owner tenders final payment to Design-Builder without further acknowledgment by the parties.

Pursuant to Public Contract Code Section 7104, if the project involves trenching more than four (4) feet deep, Design-Builder shall promptly and before the following conditions are disturbed notify the Owner in writing of any:

a. Material that Design-Builder believes may be material that is hazardous waste, as defined in California Health and Safety Code Section 25117, that is required to be removed to a Class I, Class II, or Class III disposal site in accordance with provisions of existing law; and/or

b. Subsurface or latent physical conditions at the site differing from those indicated; and/or

c. Unknown physical conditions at the site of any unusual nature, different materially from those ordinarily encountered and generally recognized as inherent in work of the character provided for in the Contract.

The Owner shall promptly investigate the conditions, and if the Owner finds that the conditions do materially differ or do involve hazardous waste and cause a decrease or increase in Design-Builder's cost of or the time required for performance of any part of the work the Owner shall issue a change order.

Pursuant to Public Contract Code Section 9201, the Owner has full authority to compromise or otherwise settle any claim relating to this Contract at any time. The Owner shall timely notify Design-Builder of the receipt of any third-party claim relating to the Contract. The Owner shall be entitled to recover its reasonable costs incurred in providing the notification required by Public Contract Code Section 9201(b).

Additionally, pursuant to Government Code Section 8546.7, since this Contract involves the expenditure of public funds in excess of ten thousand dollars ($10,000), Design-Builder shall be subject to State Auditor examination and audit at the request of the Owner or as part of any audit of the Owner, for a period of three (3) years after final payment under this Contract.

13.13.2 Other Statutorily Required Terms.

As required by Labor Code Section 6705, and in addition thereto, whenever work under the Contract that involves an estimated expenditure in excess of twenty-five thousand dollars ($25,000) for the excavation of any trench or trenches five (5) feet or more in depth, Design-Builder shall submit for acceptance by Owner in advance of excavation, a detailed plan showing the design of shoring, bracing, sloping, or other provisions to be

made for worker protection from the hazard of caving ground during the excavation, of such trench or trenches. If such plan varies from the shoring system standards established by the Construction Safety Orders of the Division of Industrial Safety, the plan shall be prepared by a registered civil or structural engineer employed by Design-Builder, and all costs therefor shall be included in the price of the Contract. Nothing in this provision shall be deemed to allow the use of a shoring, sloping, or other protective system less effective than that required by the Construction Safety Orders. Nothing in this provision shall be construed to impose tort liability on the Owner or on any Owner officer, agent, consultant, representative, or employee. All plans, processing and shoring costs are Design-Builder's responsibility.

The methods used and costs involved to locate existing elements, points of connection and all construction methods are Design-Builder's sole responsibility. Accuracy of information furnished, as to existing conditions, is not guaranteed. Design-Builder, at its sole expense, must make all investigations necessary to determine locations of existing elements, which requires compliance with Government Code Section 4216, et seq., and includes, without limitation, contacting regional notification center(s) such as DigAlert, and other private underground locating firm(s), and/or utilizing potholes, specialized locating equipment and/or hand trenching. Pursuant to Government Code Section 4215, the Owner acknowledges its responsibilities with respect to locating, relocating, removing or protecting utility facilities on the site of the Project, if it entails construction and such utilities are not identified by the Owner in writing prior to commencement of construction.

Design-Builder agrees not to accept any employment or representation during the term of this Contract or within twelve (12) months after completion of the work under this Contract which is or may likely make Design-Builder "financially interested," as provided in Government Code Section 1090 and 87100, in any decisions made by Owner on any matter in connection with which Design-Builder has been retained pursuant to this Contract.

CITY OF BANNING
STAFF REPORT

TO:	**CITY COUNCIL**
FROM:	**Robert Fisher, Acting City Manager**
PREPARED BY:	**Lincoln Bogard, Administrative Services Director**
MEETING DATE:	**February 25, 2025**
SUBJECT:	**Zencity Contract Presentation, Discussion and Direction**

RECOMMENDATION:

Provide direction to City Manager regarding Zencity contract.

BACKGROUND:

Mayor Flynn consideration of the Zencity contract as a future agenda item. The Zencity platform is a central element of the City's community engagement program because it provides ongoing surveying, project dialogue, and lesser used feature called organic. The current contract requires a 90-day notice of termination, which means notice must be provided no later than September 1, 2025, if the City chooses to terminate the agreement.

Zencity Community Survey is a rolling 3-month survey of community members. The survey is a tool that is used to measure community satisfaction levels with City services and characteristics. In addition, the survey results can be tracked to compare the current survey results with prior periods so trends can be measured. The information is useful because it provides insight into community satisfaction, which can be used to focus resources in areas needing improvement.

Zencity Engage/Projects is the feature used to provide information to the community about current and upcoming projects (public and private). This feature is embedded in the City website and has been invaluable for staff and community members.

Zencity Organic is a feature that monitors and summarizes social media feeds to track conversations. This feature is helpful because it provides staff with information to help us better understand issues that are important to the community. This feature also gives staff a better understanding of the sentiment of social media conversations so we can provide information that is relevant and helpful to the community.

JUSTIFICATION:

A City Council adopted priority for the past 8 years has been to enhance community engagement efforts. The implementation of Zencity is one of several actions intended to enhance community engagement.

FISCAL IMPACT:

The total cost for all features of Zencity is $42,000 annually.

ALTERNATIVES:

Provide direction to City Manager.

BUDGETED?:

Yes

CONTRACT/AGREEMENT:

Yes

Banning, CA

Community Survey

April - June 2024

Powered by Zencity

The Zencity Community Survey

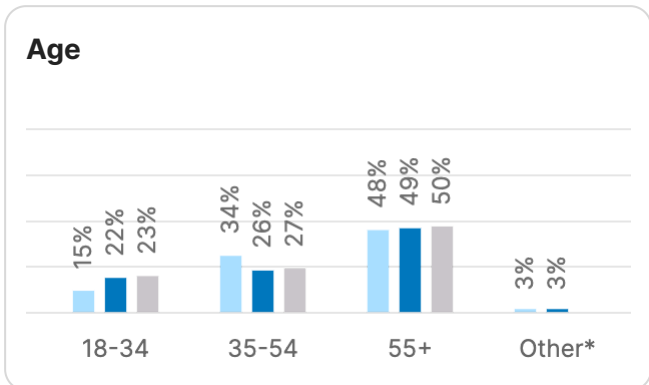
A recurring survey that never stops running, the Zencity Community Survey measures how satisfied residents are with their community and with local government-provided services and allows officials to compare these scores over time and against a cohort of similar communities.

Survey Methodology

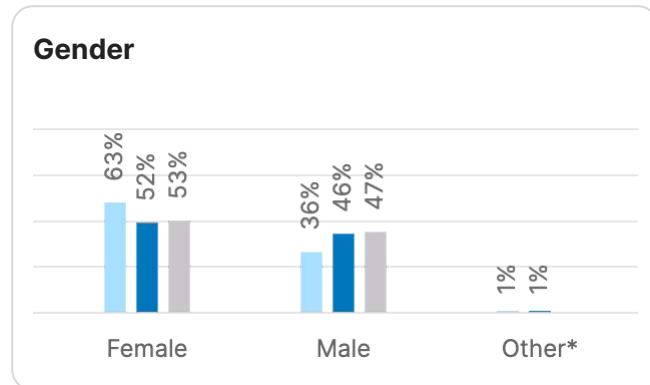
529 respondents were digitally recruited (e.g. over social media, mobile apps, local websites, and survey panels) between April - June 2024. Zencity built a representative sample by matching respondent data to the U.S. Census Bureau's race, ethnicity, age, and gender distributions in Banning, CA. Finally, rake-weighting was applied as a statistical safeguard to balance out any remaining discrepancies in distribution, so no demographic group is overrepresented or underrepresented in the final score.

Score Calculation

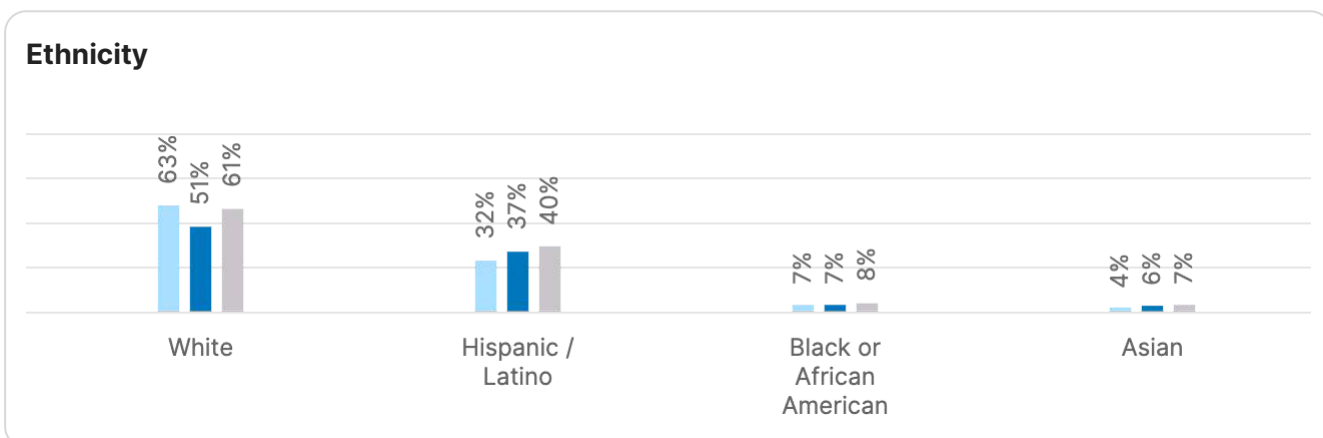
The overall satisfaction score is calculated by averaging how each resident rated quality of life and community characteristics on a numeric scale (1-5), and classifying this average as satisfied, neutral, or not satisfied. The resulting score, then, is the weighted percentage of residents who gave an overall satisfied rating.



Sample Composition



529 **valid respondents**



Key

- **Unweighted demographics** - What we collected, without adjustments
- **Weighted demographics** - Our sample, adjusted to be representative of the population
- **Population demographics** - The demographics of the 18+ population

* The "Other" category includes missing data, people who selected "prefer not to say", and other groups not defined in the census.

Overall Satisfaction

The overall satisfaction score is calculated from the questions in the two main sections of the survey: general quality of life and satisfaction with different characteristics of life in your community.

We take the average of these questions, then classify the score as positive (3+), neutral (1.5 to <3), or negative (≤1.5). The percentages represent the percent of respondents in each category.

If you have a previous cycle, the up (↑) and down (↓) arrows will show the change in percentage points.

Community Benchmark

How we compare Banning, CA to other similar communities

Residents from more than 1,000 communities across the United States have participated in Zencity's Community Surveys. We use the combined results from these surveys to produce our benchmark estimates. By averaging across respondents from dozens or hundreds of different communities, it's possible to arrive at a picture of what the results for a "typical" community in that cohort look like. This offers a way to compare your results- particularly strengths and areas for improvement- within a greater context. Each community running a Community Survey with Zencity receives a customized community benchmark cohort that reflects its unique characteristics.

First, the cities, towns, and counties in the United States are allocated into cohorts using variables such as population size, geography, density, and demographics to group similar communities together. Then, each cohort's benchmarks are calculated using the same scoring methodology outlined in the Survey Methodology section. Finally, since recruitment methods can differ slightly according to the needs of each community, cohort benchmarks are adjusted accordingly to match the exact distribution of recruitment methods.

These are some of the communities represented in your cohort

Density is calculated by people per square mile of land area.
Diversity is measured by percentage of people who are not in the largest race or ethnicity group.
Median income is the median annual dollars of income per household.

COMMUNITY NAME	TOTAL POP	DENSITY	DIVERSITY	MEDIAN INCOME ($)
Banning, California	29,929	1,288	34.85%	$54,083

CITY OF BANNING
STAFF REPORT

TO:	**CITY COUNCIL**
FROM:	**Robert Fisher, Acting City Manager**
PREPARED BY:	**Art Vela, Public Works Director** **Lincoln Bogard, Administrative Finance Director**
MEETING DATE:	**February 25, 2025**
SUBJECT:	**Discussion of Next Steps in the Banning Electric Utility Financial Recovery Plan**

RECOMMENDATION:

City Council previously approved a strategy for recovering the Banning Electric Utility's (BEU) cash balance including a 13.9% rate increase each November 2024 and 2025, and $6 million debt issuance to replenish cash balance ("BEU Financial Recovery Plan"). Staff requests a discussion and confirmation of the next step (debt issuance) or alternative Council direction.

BACKGROUND:

Prior to November 2024, the Banning Electric Utility (BEU) last increased rates overall in 2013. During the intervening years, the BEU saw increased pressure from operating expense inflation, increasing power purchase costs (increasing 31% from 2019-2023), and increased capital expenditures. During this time, BEU's average monthly single family residential bill was significantly lower than neighboring cities served by Southern California Edison.

During the three-year period from fiscal years 2020-21 through 2022-23, BEU expended approximately $10 million per year on capital projects (compared to a prior 6-year average of $3.5 million per year). Prior to fiscal year 2020-21, the BEU's reserves remained above $15 million (higher than the ~$11 million policy). However, with the increased capital expenditures beginning in Fiscal year 2020-21, BEU's reserves and cash balance saw dramatic decreases during the subsequent three-year period. In fiscal year 2023-24, BEU did not generate sufficient revenues to cover its operating costs, debt service, and capital expenditures (though capital expenditures were reduced to the minimum amount possible in fiscal year 2023-24). As a result, BEU had a bond debt service coverage covenant default (debt service coverage was well under the 120% required in the bond documents). Additionally, BEU ended fiscal 2023-24 with a negative $6.5 million cash balance. BEU operating expenses and debt service payments were made through borrowing from other City Funds, putting pressure on those funds – including the City's General Fund.

As a result of this deteriorating financial position, S&P Global Ratings took several actions to decrease the BEU's rating from "A-" (June 2022) to "BB-" (November 2024). They met with City staff twice in 2024 to discuss the financial condition and the City's plan to improve the condition of its finances over the next two years. The most recent downgrade to "BB-" in November 2024 also had a negative outlook – which means that S&P plans to further downgrade the credit rating if BEU's financial position does not increase materially over the next year or two.

At the August 27, 2024, City Council meeting, Council received a report from staff and discussed four

options for a potential BEU Emergency Rate Increase, staff report attached hereto. Those four options ranged from “do nothing” to implementing a one-time 64% emergency rate increase to replenish the BEU’s cash position and remedy its coverage covenant default. After discussion, Councilmembers selected an initial option which included two 22% emergency rate increases (one in November 2024 and the second in November 2025). Council also requested that staff evaluate some additional scenarios and present an updated analysis at a subsequent meeting.

At the September 24, 2024, City Council meeting, Council reviewed updated analysis of options available to bring the Electric Utility’s cash balance from negative to positive by the end of fiscal year 2026, staff report attached hereto. Staff presented three scenarios at that meeting – a scenario (3B) that reflected 22.7% rate increases each November 2024 and November 2025, a second scenario (3C) that spread those rate increases over a 3-year period (14.7% per year, each November 2024-2026), and a third scenario (4B) that targeted a 13.9% rate increase each November 2024 and 2025, and $6 million debt issuance to replenish cash balance (“BEU Financial Recovery Plan”). City Council indicated a preference for the third (4B) scenario, with the assumption that the debt financing component would be evaluated at a subsequent meeting.

At the October 22, 2024 City Council Meeting, City Council took action to adopt Resolution 2024-169 that authorized an emergency 13.9% rate increase, effective November 1, 2024 and authorize a second 13.9% emergency rate increase, effective November 1, 2025. The understanding is that the actual rate increase on November 1, 2025, will be subject to the findings of an electric rate study. That electric rate study is underway and Staff expect that it will be completed in Fall 2025.

Based on this background and the adopted 13.9% rate increases, staff wish to discuss the financing component of the BEU Financial Recovery Plan to get further direction from City Council.

JUSTIFICATION:

The City Council took action in October 2024 to authorize two 13.9% emergency rate increase each November 2024 and November 2025. These rate increases are deemed necessary to maintain the solvency of BEU and ensure that there are sufficient revenues to pay for operating expenses, power purchase costs, and minimal, but essential capital projects.

The current BEU Financial Recovery Plan assumes 13.9% annual rate increases each November 2024 and November 2025. Additionally, it assumes that the City issues a $6.1 million bond, split into two series: a $2.3 million tax exempt series to be used to address capital needs through fiscal year 2026 and a $3.8 million taxable series to be used to repay a portion of what BEU owes to other City Funds and bring BEU cash balance positive by the end of fiscal year 2025-26.

Because of BEU’s current credit rating (“BB-“), a debt financing would likely be issued without a credit rating. Additionally, given the size and anticipated term (20 years or less), the bonds would be sold through private placement process to a single investor (typically a regional or national bank). Given the BEU’s financial position, we would expect that an investor would require a significant risk premium in the interest rate. Additionally, since a portion of the financing would be issued on a taxable basis, we would anticipate that portion to have an interest rate in the 6-7% range. In addition, NHA Advisors informed staff that there may be additional options available to more comprehensively address the liquidity needs through a larger restructuring of the existing debt of BEU. These options require further research to validate, but would still require City Council’s approval to issue new money debt for the purposes outlined in the original plan.

Upon direction from City Council, staff will work with NHA Advisors (the City’s "Municipal Advisor") and other financing professionals (legal counsel, placement agent) to solicit financing proposals from regional and national banks. City staff will work with NHA Advisors to evaluate the proposals, select the best proposal, and bring a financing agreement before council at a subsequent meeting for consideration. It’s important to note that soliciting financing proposals does not obligate the City to enter into a financing

agreement.

If BEU does not issue debt, the timeline for BEU's cash balance to return to a positive position (and repay all inter-fund loans to other City funds) is extended two more years – fiscal year 2027-28. As an alternative option to debt financing, the City could explore higher rate increases in fiscal year 2025-26 (higher than the 13.9% approved by Council in October 2024) to bring BEU's cash balance positive by the end of fiscal year 2025-26. City staff can work with its rate consultant and municipal advisor to determine the magnitude of rate increases needed under this alternative.

FISCAL IMPACT:

There is no fiscal year 2024-25 budgetary impact from Council directing staff to solicit financing proposals from banks. The City would be under no obligation to enter into a financing agreement after soliciting proposals. Said financing proposal would be brought to Council at a future meeting for consideration. The issuance costs of financing (likely ~2% of principal) are paid on a contingent basis (contingent upon successful completion of the financing) and would be paid out of the financing and amortized over the life of the loan. First debt service payments would not commence until fiscal year 2025-26.

If BEU does not bring its cash balance positive by the end of fiscal year 2026, it is possible that S&P would further downgrade BEU's 2015 Bonds. Since the 2015 Bonds were sold with a fixed interest rate, changes in the credit rating (up or down) do not impact the annual debt service on those bonds. Rather, the current credit rating impacts the future cost of issuing bonds or debt financing future capital projects. All else being equal, higher credit ratings translate into lower cost of borrowing.

In addition to the credit rating considerations, BEU's negative cash balance is only possible through extensive inter-fund borrowing. This borrowing puts stress on other City funds, namely the General Fund. Failure to improve BEU's cash balance and bring it into the positive territory would continue to have a negative impact on the General Fund's available cash balance and could impact City services.

ALTERNATIVES:

1. Direct City staff to work with its Municipal Advisor to assemble a finance team to solicit bank bids for a private placement of approximately $6.1 million in BEU debt and evaluate a potential restructuring of existing debt.
2. Direct City staff to work with its rate consultant to provide a comparison of rate impacts with and without debt financing. This alternative will essentially eliminate or defer the debt financing step include as part of the BEU Financial Recovery Plan, lead to a potential downgrade of BEUs credit rating and defer capital investments (i.e. infrastructure and equipment).
3. Provide alternative direction to staff

CITY OF BANNING
STAFF REPORT

TO:	**CITY COUNCIL**
FROM:	**Douglas Schulze, City Manager**
PREPARED BY:	**Art Vela, Public Works Director** **Lincoln Bogard, Administrative Finance Director**
MEETING DATE:	**August 27, 2024**
SUBJECT:	**Discussion of the Banning Electric Utility Emergency Rate Increase Scenarios**

RECOMMENDATION:

Discuss the different alternatives for a possible emergency electrical rate increase and provide direction to staff.

BACKGROUND:

On May 14, 2024 City Council approved Resolution 2024-71, approving a contract with NHA Advisors, LLC (NHA). NHA's scope of work included financial planning, debt management and financial implementation, ballot initiatives and other related services. Recognizing the financial challenges faced by the Banning Electric Utility (BEU), Resolution 2024-71 included a $100,000 task order to evaluate and assess financing and other options for BEU.

On June 25, 2024, staff presented a report regarding the lowering of the Banning Finance Authority's Outstanding Electric System Revenue Bond rating and requested that City Council consider an interim Electric Rate Adjustment. City Council provided direction to staff to return at a future meeting with options for City Council to consider regarding an Emergency Electric Rate Increase.

City staff worked with NHA, to analyze four preliminary options for an emergency electric rate increase in the to improve operating revenues and replenish cash balances. It is important to note that the analysis presented in this staff report are best estimates available at this time based on a dynamic model, but this modeling is not a cost of service study and NHA is not acting as the City's rate consultant. The City will soon be issuing a request for proposals for a consultant to perform a cost of service study, and is also proceeding with this high level analysis in the interest of time.

Option 1

This option is a "do nothing" scenario and evaluates the impact to BEU of not implementing emergency rate increases. This scenario assumes the first electric utility rate increases happen after the City completes a full cost of service study in conjunction with the electric master plan. Under this scenario, the cash balance is expected to be more negative by FY 2025 end, which will further pressure other City funds and could result in an additional credit rating downgrade. Additionally, it is likely that the BEU will have a covenant default related to the 120% debt service coverage requirement on the 2015 Bonds.

Option 2

Option 2 models the amount of emergency rate increase in FY 2025 needed to simply cover operations and essential expenditures. Using FY 2025 budgeted operating revenues and expenses as the baseline,

it calculates that a 13% one-time rate increase (effective October 1, 2024) would generate sufficient revenues in FY 2025 to allow BEU to fund essential CIP, meet the 120% debt service coverage requirement, and cover operating expenses. The fund balance remains negative and does not see any meaningful improvement under this scenario – which means that other City funds will not be paid back for funds loaned to BEU.

Option 3

Option 3 explores the amount of emergency rate increases needed in FY 2025 and FY 2026 to bring the fund balance back into the black – allowing the Electric Utility to repay what it owes to other City Funds. Analysis of this option calculated that a 64% one-time rate increase in FY 2025, effective October 1, 2024, should generate sufficient revenues to bring BEU cash balance to a positive number after paying back the other City Funds. Under this scenario of Option 3, future years could see a reduction in rates, depending on the findings of the upcoming cost of service study. If stretching that recovery timeline out to two years, two 22% annual rate increases would be needed to bring the fund balance to the same place by the end of FY 2026. Under both scenarios for Option 3, BEU meets its 120% debt service coverage requirement for both fiscal years. Additionally, the BEU replenishes its fund balance within the two-year window given to it by the credit rating agency.

Option 4

Option 4 analyzes the amount of emergency rate increase needed in FY 2025 to cover operations and essential expenditures (similar to Option 2) but expands upon Option 2 to include approximately $10 million bond financing to bring BEU's cash balance back into the positive (allowing it to repay what it owes to other City Funds). The debt service requires a 13% emergency rate increase in FY 2025, which is similar to Option 2. The trade-off to the benefit of the rapid improvement in cash balance is that this Option 4 also has the interest cost of a financing and long-term annual debt service payments.

Debt service on a bond financing would be structured to have minimal to no payments in the first two years to allow the Electric Utility to build up its reserves and adopt a longer-term rate increase plan. Compared to Option 2, this option would require higher long-term rate increases to support the annual debt service on a bond.

Because of the Electric Utility's current "BB" credit rating, it is likely that a bond financing would be unrated. Additionally, it would be issued on a taxable basis because of IRS limitations on the use of tax exempt debt to reimburse an issuer for prior capital expenditures.

Staff is seeking direction from City Council on which option it would like to proceed with. Staff would return to City Council in September with a resolution for either Option 2, 3 or 4, if one of those are selected.

JUSTIFICATION:

The Electric Utility's cash balance has decreased significantly in recent years due to a combination of capital spending and inflationary pressures. Over the past three years, the Electric Utility has spent $10 million per year on average toward capital projects. Additionally, while the Electric Utility has historically been able to generate sufficient operating revenues to cover operating expenses, in each of the last three fiscal years – 2022, 2023 and 2024 – operating expenses have been greater than operating revenues. One driver behind this is power purchase costs, which increased 31% from 2019 to 2023.

As a result, the Electric Utility's unrestricted cash and investments balance decreased significantly from over $18 million in FY 2019 to negative $9.5 million in FY 2024. Because operating expenses have been greater than revenues in the last three years and cash balances are negative, Electric Utility has needed to borrow from other City funds, which has put significant strain on those funds.

The General Fund's cash balance in FYE 2023 was $4.5 million after including a $3.5M amount due from other funds. This is a marked decrease from the General Fund's pooled cash balances over $13 million in fiscal year 2018. Continued borrowing from the General Fund is not an option to support the Electric Utility. Additionally, the Banning Utility Authority's Water and Wastewater Funds are subject to California's Proposition 218 related to utility rates and charges and having those funds' send cash to the Electric Utility could expose the City to the risk of a legal challenge.

The options listed above, with the exception of Option 1, would provide relief to the current fiscal challenges faced by BEU.

FISCAL IMPACT:

Options 1 thru 4 have different degrees of fiscal impact to BEU.

ALTERNATIVES:

1. Option 1
2. Option 2
3. Option 3
4. Option 4
5. Provide alternative direction to staff.

BUDGETED?:

No

CONTRACT/AGREEMENT:

CITY OF BANNING
STAFF REPORT

TO: **CITY COUNCIL**

FROM: **Douglas Schulze, City Manager**

PREPARED BY: **Art Vela, Public Works Director**
Lincoln Bogard, Administrative Services Director

MEETING DATE: **September 24, 2024**

SUBJECT: **Discussion of the Banning Electric Utility Emergency Rate Increase Scenarios**

RECOMMENDATION:

Discussion of the Banning Electric Utility Emergency Rate Increase Scenarios and provide staff with direction with which scenario to move forward with.

BACKGROUND:

On August 27, 2024, City Council received a report from staff and discussed four options for a potential Banning Electric Utility Emergency Rate In Increase, staff report attached hereto. The four options were are follows:

	Option 1	Option 2	Option 3A/3B	Option 4
Description	No Action	Maintains Services	Maintains Services and Replenishes Cash with Rate Revenues	Maintains Services and Replenishes Cash $10M Bond
Rate Increase	None	13% in FY 2025	64% in FY 2025 or 22% in FY 2025 and 22% in FY 2026	13% in FY 2025

After discussing the options above, Councilmembers selected their preferred option as follows:

- Mayor Sanchez: Option 4
- Mayor Pro Tem Minjares: Option 3B
- Councilmember Wallace: Option 3B
- Councilmember Flynn: Option 3B
- Councilmember Happe: Option 3B

As part of the discussion, Mayor Pro Tem Minjares and Councilmember Flynn requested that staff also provide a revised Option 3 to spread the increases over three years rather than two years.

Staff has evaluated and prepared the following scenarios for Council's consideration:

Scenario 3B

This scenario is very similar to the scenario shown to City Council in August and models what kind of rate increase would be required to bring the Electric Utility's cash from negative to positive by the end of fiscal year 2026. This modeling assumes two rate increases – one in November 2024 and one in November 2025. Each of these rate increases is 22.7%. This is slightly higher than the 22% increases shown to Council in August because the analysis in August assumed that the first rate increase would be effective October 1 compared to the November 1 assumption in this update. This analysis assumes that rate increases apply equally to both the energy charge (per kWh) and the Basic Service Charge.

Of the scenarios evaluated for this report, this scenario has the greatest near-term increases.

Scenario 3C

Based on a request at the August 27th City Council meeting, this scenario evaluates the annual rate increases needed to bring the Electric Utility's cash from negative to positive by the end of fiscal year 2027. Because this scenario assumes a longer recovery, it requires approximately 14.7% annual rate increases – one in November 2024, one in November 2025, and one in November 2026. Under this scenario, the cash balance stays negative until FY 2027. Similar to scenario 3B above, the modeling for this scenario assumes the energy charge (per kWh) and the Basic Service Charge increase with the rate increases.

Because this scenario has the slowest recovery of the Electric Utility's cash, there is greater risk that unforeseen expenses or cost increases prevent that recovery. Additionally, there is greater risk of further downgrades in the Electric Utility's credit rating because of this slower recovery.

Finally, due to the anticipated timing of a Cost of Service Study, it is likely that the November 2026 rate increase under this scenario will be changed to something other than 14% based on the findings of that study.

Scenario 4B

This scenario explores the strategic use of bond funding to facilitate the recovery of Electric Utility's cash position by the end of fiscal year 2026. Unlike the bonds scenario presented to the Council in August (Scenario 4), this Scenario 4B assumes a significantly smaller amount of bond funding raised: $6 million total. That amount is split into $2.2 million raised from a tax-exempt financing and $3.8 million raised from a taxable financing. While the taxable portion is used to replenish fund balance, the tax-exempt portion of the financing is used to address the budgeted capital expenditures in FYE 2025 and 2026. While the entire financing will likely be unrated given the current "BB" credit rating, unlike a taxable interest rate (assumed to be 7%) this analysis assumes a tax-exempt interest rate of 5.5% for a 20-year financing.

Under this scenario, two 13.9% annual rate increases are needed in FY 2025 and FY 2026, followed by additional rate increases in future years to support the debt service. Preliminary modeling suggests that those rate increases beyond FY 2026 are in the 4-6% range.

Unlike Scenarios 3B and 3C above, this Scenario 4B spreads the costs of the capital expenditures and fund balance recovery over a longer period of time. However, because this scenario uses bond financing, there is the cost of long-term bond repayments – though those costs are spread out over 18-20 years.

The table below summarizes of the key comparisons of the three scenarios for the Residential Service Rate. Please note that the projections for FY 2027 will likely change based the findings of the Cost of Service Study:

	FY 2025	FY 2026	FY 2027
Date Rate Increases Effective	*November 1*	*November 1*	*November 1*
Scenario 3B			
Rate Increase (Energy Charge Only)	22.7%	22.7%	0%
Cost per kWh	$0.174	$0.214	$0.214
Basic Service Charge	$37	$45	$45
Avg SFR Monthly Bill*	$136	$165	$165
Scenario 3C			
Rate Increase (Energy Charge Only)	14.7%	14.7%	14.7%
Cost per kWh	$0.163	$0.187	$0.214
Basic Service Charge	$34	$39	$45
Avg SFR Monthly Bill*	$127	$145	$166
Scenario 4B			
Rate Increase (Energy Charge Only)	13.9%	13.9%	5%
Cost per kWh	$0.162	$0.184	$0.194
Basic Service Charge	$34	$39	$41
Avg SFR Monthly Bill*	$126	$143	$150

JUSTIFICATION:

The Electric Utility's cash balance has decreased significantly in recent years due to a combination of capital spending and inflationary pressures. Over Fiscal Years 2020-21 through 2022-23, the Electric Utility spent $10 million per year on average toward capital projects. Additionally, while the Electric Utility has historically been able to generate sufficient operating revenues to cover operating expenses, in each of the last three fiscal years – 2022, 2023 and 2024 – operating expenses have been greater than operating revenues. One driver behind this is power purchase costs, which increased 31% from 2019 to 2023.

As a result, the Electric Utility's unrestricted cash and investments balance decreased significantly from over $18 million in FY 2019 to negative $9.5 million in FY 2024. Because operating expenses have been greater than revenues in the last three years and cash balances are negative, Electric Utility has needed to borrow from other City funds, which has put significant strain on those funds.

The General Fund's cash balance in FYE 2023 was $4.5 million after including a $3.5M amount due from other funds. This is a marked decrease from the General Fund's pooled cash balances over $13 million in fiscal year 2018. Continued borrowing from the General Fund is not an option to support the Electric Utility. Additionally, the Banning Utility Authority's Water and Wastewater Funds are subject to California's Proposition 218 related to utility rates and charges and having those funds' send cash to the Electric Utility could expose the City to the risk of a legal challenge.

The options listed above would provide relief to the current fiscal challenges faced by BEU.

FISCAL IMPACT:

Options 3B, 3C and 4B have different degrees of fiscal impact to the Banning Electric Utility.

ALTERNATIVES:

1. Option 3B
2. Option 3C
3. Option 4B
4. Provide alternative direction to staff.

CITY OF BANNING
STAFF REPORT

TO:	**CITY COUNCIL**
FROM:	**Douglas Schulze, City Manager**
PREPARED BY:	**Art Vela, Public Works Director**
MEETING DATE:	**October 22, 2024**
SUBJECT:	**Consideration of Resolution 2024-169, Approving Electric Rate Increases and Revisions to Certain Electric Rates and Tariffs**

RECOMMENDATION:

Adopt Resolution 2024-169.

BACKGROUND:

On June 25, 2024, staff reported on the lowering of the Banning Finance Authority's Outstanding Electric System Revenue Bond rating, see staff report attached hereto. In summary, the City's outstanding Electric System 2015 Refunding Revenue Bonds (current outstanding balance: $20,880,000) underlying rating was downgraded from A- to BB due to two primary factors:

1. Lack of proactive rate setting: while the electric rates underwent various restructures, the rates have not been increased for the purpose of generating additional revenue since 2013.
2. The use of interfund borrowing to meet financial obligations: due to increases in power purchase costs, operating expenses and accelerated investments in capital improvements, the Banning Electric Utility's cash balance fell below reserve policy and has been supplemented by other City funds.

During the June 25, 2024 discussion, City Council provided direction for staff to prepare different rate increase options. On August 27, 2024, staff returned (see attached staff report) with four options:

1. Option 1: No rate increase; do nothing.
2. Option 2: A 13% rate increase in FY 2025 to cover the annual deficit only.
3. Option 3: A 64% rate increase in FY 2025 (Option 3A) or a 22% rate increase in FY 2025 and FY 2026 (Option 3B) to cover the annual deficit, brings cash balance to positive and avoids debt coverage covenant default.
4. Option 4: A 13% rate increase in FY 2025 to cover the annual deficit, bring cash balance to positive and avoids debt coverage covenant default. This option replenishes cash with $10M bond revenue.

Although the majority of City Council supported Option 3B, two City Councilmembers (Flynn and Minjares) requested to see a modified Option 3B, that would include increases spread over three years rather than two years.

On September 24, 2024, staff presented three electric rate increase options for City Council's consideration:

1. Option 3B: Same as described above, although updated to reflect an increase of 22.7% each year in FY 2025 and FY 2026.
2. Option 3C: 14.7% rate increase each year in FY 2025, FY 2026 and FY 2027 to cover the annual deficit, bring cash balance to positive and avoids debt coverage covenant default.
3. Option 4B: 13.9% rate increase per year in FY 2025 and FY 2026 to cover the annual deficit, bring cash balance to positive and avoids debt coverage covenant default. This options is similar to Option 4 described above, although revised to rely on $6M in bond revenue made up of $3.8M in taxable financing and $2.2m in tax exempt financing.

In concluding the discussion, Council majority supported Option 4B.

If approved, the following rates and tariffs will be adjusted as follows (see Exhibit "A" for revised rate and tariff pages in their entirety; all others remain unchanged):

Residential Service (RS-1)

	Current	11/1/2024	11/1/2025
Basic Service Charge – per meter	$30	$34	$39
Energy Charge – per kWh	$0.1421	$0.1619	$0.1843

General Service Single Phase (GS-1)

	Current	11/1/2024	11/1/2025
Basic Service Charge – per meter	$58.50	$67	$76
Energy Charge – per kWh	$0.1202	$0.1369	$0.1559

Small Commercial Multi-Phase (SC-1)

	Current	11/1/2024	11/1/2025
Basic Service Charge – per meter	$58.50	$67	$76
Energy Charge – per kWh	$0.1202	$0.1369	$0.1559
Multi-Phase Service Meter Charge	$3.97	$4.52	$5.15

Interruptible Well Service (IW-1)

	Current	11/1/2024	11/1/2025
Basic Service Charge – per meter	$300	$342	$389
Energy Charge – per kWh	$0.1052	$0.1198	$0.1365
Demand Charge – per kWh	$13.50	$15.38	$17.51

Medium Commercial Service (MC-1)

	Current	11/1/2024	11/1/2025
Basic Service Charge – per meter	$200	$228	$259
Energy Charge – per kWh	$0.1105	$0.1259	$0.1434
Demand Charge – per kWh	$17.05	$19.42	$22.12

Industrial Service (IS-1)

	Current	11/1/2024	11/1/2025
Basic Service Charge – per meter	$400	$456	$519
Energy Charge – per kWh	$0.1010	$0.1150	$0.1310
Demand Charge – per kWh	$14.50	$16.52	$18.81

Street Lighting Service (SL-1)

	Current	11/1/2024	11/1/2025
Per Street Light	$8.45	$9.62	$10.96

Security Lighting Service (SL-2)

	Current	11/1/2024	11/1/2025
100 Watt Equivalent LED	$9.72	$11.07	$12.61
250 Watt Equivalent LED	$24.30	$27.68	$31.52
100 Watt Sodium Vapor	$19.43	$22.13	$25.21
150 Watt Sodium Vapor	$29.15	$33.20	$37.82
175 Watt Sodium Vapor	$34.00	$38.73	$44.11
200 Watt Sodium Vapor	$38.87	$44.27	$50.43
250 Watt Sodium Vapor	$48.58	$55.33	$63.02
400 Watt Sodium Vapor	$77.73	$88.53	$100.84
20 Foot or 35 Foot Wood Pole (City owned)	$4.01	$4.57	$5.20

JUSTIFICATION:

Banning Electric Utility's ("BEU") cash balance has decreased significantly in recent years due to a combination of capital spending and inflationary pressures. Over Fiscal Years 2020-21 through 2022-23, BEU spent $10 million per year on average toward capital projects. Additionally, while BEU has historically been able to generate sufficient operating revenues to cover operating expenses, in each of the last three fiscal years – 2022, 2023 and 2024 – operating expenses have been greater than operating revenues. One driver behind the increase in operating expenses is power purchase costs, which increased 31% from 2019 to 2023.

As a result, BEU's unrestricted cash and investment balance decreased significantly from over $18 million in FY 2019 to negative $9.5 million in FY 2024. Because operating expenses have been greater than revenues in the last three years and cash balances are negative, BEU has needed to borrow from

other City funds.

BEU's capital improvement plan has been drastically reduced with the intent of reducing expenditures and impacts the required electric rate increase, evident that the rate increases are not in excess of the revenue requirements reasonably necessary to operate the City's electric utility.

FISCAL IMPACT:

If approved, the first rate increase of 13.9% would become effective on November 1, 2024 and the second rate increase of 13.9% would become effective on November 1, 2025. The rate increase will generate sufficient revenue to cover all of Banning Electric Utility expenses including: general administrative services; services rendered by other city departments in support of the Banning Electric Utility; additions and betterments to the electric utility system; the amortization or depreciation of obsolete facilities within the electric utility system; any and all bonded indebtedness incurred in the construction or extension of the electrical utility system, including principal and interest thereof; and a reasonable reserve fund to provide for unforeseen contingencies.

The proposed electric rate increases will result in approximately $2.5M in additional revenue in FY 2025 and $4.1M in additional revenue in FY 2026.

ALTERNATIVES:

1. City Council could elect to reject staff's recommendation and no pursue an electric rate increase. This alternative would result in further degradation of BEUs cash balance as well as impact the City overall cash position. This alternative may also lead to further lowering of BEU's bond rating.
2. City Council could elect to reconsider the previous electric rate increase options or request another be explored. This alternative will result in further degradation of BEU's cash balance until rate increases are approved. This alternative may also lead to further lowering of BEU's bond rating.

BUDGETED?:

No

CONTRACT/AGREEMENT:

Banning Electric Utility Financial Recovery Plan Summary

Background on the Current Situation

- Prior to November 2024, BEU last increased rates overall in 2013
- BEU saw increasing pressure from operating expense inflation, power purchase costs, and increased capital expenditures
- BEU electric rates historically have been significantly less than neighboring cities served by SCE
- BEU expended $10 million per year on capital projects in FYEs 2021-2023 (vs $3.5M annual average for the prior 6 years)
- BEU reserves remained above $15M (vs $11M policy) from 2016-2020, but saw dramatic decreases into negative territory
- Negative $6.5M BEU cash as of June 2024
- Debt Service Coverage was under the 120% requirement in FYE 2024 ("technical default")
- S&P took several actions to decrease the credit rating from "A-" (June 2022) to "BB-" (November 2024) with a negative outlook for
- City Council took action to authorize an emergency rate increase of 13.9% on November 1, 2024, and 13.9% on 11/1/2025

The Current Question

- City is currently in the process of a long-term BEU rate study with multiple years of rate increases; that study is expected to be completed Fall 2025
- Increased revenues following 13.9% emergency rate increase on 11/1/24 are expected to generate sufficient revenue to meet the 120% Debt Service for FYE 2025
- Scenario 4B selected by City Council outlined the use of ~$6M bond financing in FYE 2025, with $3.8M going to replenish fund balance (remainder to be used for capital projects over the next 2-3 years)
- Under Scenario 4B the BEU cash balance is expected to be positive by end of FYE 2026
- In the absence of a bond financing, the BEU cash balance is expected to remain negative until FYE 2028

Should the City proceed at this time with <u>exploring</u> the issuance of approximately $6 million in bonds to replenish BEU cash balance and fund a portion of CIP for the next 2 years?

Financing Considerations

- S&P's November 2024 rating report indicated that rating downgrades were possible if liquidity does not materially improve on a sustained basis; waiting until FYE 2028 for BEU cash to recover to positive balance risks a further downgrade
- Current BEU credit rating is "junk" status, so a financing in 2025 would be issued without a credit rating, likely sold to one purchaser (e.g., a regional or national bank, aka "private placement")
- Term of the financing can vary – typically 10-15 years with a limit at 20 years for a private placement
- Interest rate on the unrated, private placement financing is could be in the 6-7% range
- Costs of issuing $6M in bonds are likely in the $100-120K range (~2% of principal) and would be paid out of the financing with no FYE 2025 budgetary impact to BEU
- Future annual debt service on a $6M financing would need to be factored into long-term financial and rate plans

NHA | ADVISORS
Financial & Policy Strategies. Delivered.

Next Steps: If directed, the City's financing team will contact banks for bids/term sheets on a $6M financing and will come back to Council in 1-2 months with a financing proposal and financing agreement for Council vote; financing team's work would be done on a contingent basis and the City will under no obligation to issue debt if bank bids are not acceptable

CITY OF BANNING
STAFF REPORT

TO:	**CITY COUNCIL**
FROM:	**Robert Fisher, Acting City Manager**
PREPARED BY:	**Art Vela, Public Works Director**
MEETING DATE:	**February 25, 2025**
SUBJECT:	**Discussion of a City of Banning Fire Hydrant Maintenance Program**

RECOMMENDATION:

Discuss the City's current fire hydrant maintenance activities and the development of a formal Fire Hydrant Maintenance Program.

BACKGROUND:

Due to the recent fires in Los Angeles County, the public has had general criticism about California's water management and specific concerns about fire hydrant readiness to serve. It's noted that the complications during the recent fires in Southern California primarily revolved around the severity and span of the fires along with a lack of water supply for various reasons (e.g. significant increase in fire suppression demand, unavailable equipment such as storage reservoirs and wells, etc.). Nonetheless, the magnitude of the devastation created by the recent fires is reason enough to reevaluate current practices and identify areas for improvement.

While the City of Banning, Water Division of the Public Works Department, does not currently have a formal written fire hydrant maintenance policy, current practices include the inspection and maintenance of fire hydrants of most, but not all, fire hydrants throughout the City. Typically, the City's Water Division staff inspect and operate fire hydrants during various activities such as: water main flushing, draining related to leak repairs, fire flow testing, installation of construction water meters, pressure testing/monitoring and visual inspections. While these activities regularly allow staff to ensure fire hydrants are maintained, it's possible that not all fire hydrants are visited and operated by staff.

In order to continue with the City's goal of providing safe, affordable and reliable water service, it would be prudent for the Public Works Department to develop a formal Fire Hydrant Maintenance Program which includes:

- Maintenance of approximately 1,820 Fire Hydrants (FH)
- Inspect and exercise each FH once every two years at minimum
- Maintain GIS mapping of FH
- Utilize Asset Management Software as system of record to ensure all FH are inspected and exercised
- Inspection checklist (e.g. rust, bolts, breakaways, paint, lubrication, weeds, traffic marker, nozzle caps, etc.)
- Repair and/or replace FH when needed
- Review and identification of areas in the City that may lack FH

If acceptable to City Council, staff will begin working on a formal written FH Maintenance Program and

present it to City Council at a later date.

JUSTIFICATION:

The development of a formal written Fire Hydrant Maintenance Program will ensure that FH are readily available and in operable condition.

FISCAL IMPACT:

It is anticipated that the Water Division would minimally need to add one Water Service Maintenance Worker position to be dedicated to the FH Maintenance Program.

Other unknown costs would be associated with water loss (non-revenue water) during FH flushing, FH repairs/replacements, miscellaneous materials.

ALTERNATIVES:

Do not move forward with a formal written FH Maintenance Program and continue with current practices.

BUDGETED?:

No

CONTRACT/AGREEMENT:

No

AGREEMENT FOR PROFESSIONAL SERVICES (C00931) FOR DESIGN OF RAMSEY STREET WATER MAIN BY AND BETWEEN CITY OF BANNING AND GLENN A. RICK ENGINEERING & DEVELOPMENT CO. DBA RICK ENGINEERING COMPANY

THIS AGREEMENT FOR PROFESSIONAL SERVICES (herein "Agreement") is made and entered into this day: November 14, 2023, ("Effective Date") by and between the **CITY OF BANNING,** a California municipal corporation ("City") and Glenn A. Rick Engineering & Development Co., a California Corporation, dba Rick Engineering Company. ("Consultant"). City and Consultant are sometimes hereinafter individually referred to as "Party" and hereinafter collectively referred to as the "Parties."

RECITALS

A. City has sought by issuance of a Request for Proposals (RFP No. 23-036) from the bench of prequalified Engineers (RFQ-22-007), the performance of the services for the Design of Ramsey Street Water Main and as further defined and described particularly in Article 1 of this Agreement.

B. Consultant, following submission of a proposal for the performance of the services defined and described particularly in Article 1 of this Agreement, was selected by City to perform those services.

C. The Parties desire to formalize the selection of Consultant for performance of those services defined and described particularly in Article 1 of this Agreement and desire that the terms of that performance be as particularly defined and described herein.

D. Pursuant to the City of Banning's Municipal Code, City has authority to enter into this Agreement.

NOW, THEREFORE, in consideration of the mutual promises and covenants made by the Parties and contained herein and other consideration, the value and adequacy of which are hereby acknowledged, the Parties agree as follows:

ARTICLE 1. SERVICES OF CONSULTANT

1.1 Scope of Services.

In compliance with all terms and conditions of this Agreement, Consultant shall provide those services specified in the "Scope of Services" attached hereto as **Exhibit A** and incorporated herein by this reference, which services may be referred to herein as the "Services" hereunder. As a material inducement to City entering into this Agreement, Consultant represents and warrants that it has the qualifications, experience, and facilities necessary to properly perform the Services required under this Agreement in a thorough, competent, and professional manner, and is experienced in performing the Services contemplated herein. Consultant shall at all times faithfully, competently and to the best of its ability, experience and talent, perform all Services described herein. Consultant covenants that it shall follow the highest professional standards in

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

performing the Services required hereunder and that all materials will be of good quality, and fit for the purpose intended. For purposes of this Agreement, the phrase "highest professional standards" shall mean those standards of practice recognized by one or more first-class firms performing similar work under similar circumstances. This Agreement calls for services that, in whole or in part, constitute "public works" as defined in the California Labor Code. Therefore, as to those services that are "public works," Consultant shall comply in all respects with all applicable provisions of the California Labor Code, including those set forth in Exhibit B hereto.

1.2 Contract Documents and Exhibits.

This Agreement includes the Request for Proposal and Consultant's accepted proposal ("Contract Documents"), both of which are on file with the City and incorporated herein by this general reference as though fully set forth herein. **Exhibit A** (Scope of Services), **Exhibit B** (Special Requirements), **Exhibit C** (Schedule of Compensation), and **Exhibit D** (Schedule of Performance) also constitute a part of this Agreement and are incorporated into this Agreement by this reference. Except as set forth in Section 1.10 regarding **Exhibit B**, this Agreement controls over the Contract Documents and the provisions in **Exhibits A, B** and **C**.

1.3 Compliance with Law.

Consultant shall keep itself informed concerning all ordinances, resolutions, statutes, rules, and regulations of City and any Federal, State or local governmental entity having jurisdiction in effect at the time service is rendered, and shall render all Services hereunder in accordance therewith.

1.4 Licenses, Permits, Fees and Assessments.

Consultant shall obtain and maintain during the term of this Agreement, at its sole cost and expense, all necessary licenses, permits, certificates and approvals required by law for the performance of Services under this Agreement, including a City business license. Consultant shall have the sole obligation to pay for all fees, assessments and taxes, plus applicable penalties and interest, which may be imposed by law and which arise from or are necessary for Consultant's performance of the Services required by this Agreement. Consultant shall indemnify, defend and hold harmless City, its officers, employees or agents, against all such fees, assessments, taxes, penalties or interest levied, assessed or imposed against City hereunder.

1.5 Familiarity with Services.

By executing this Agreement, Consultant warrants that Consultant: (i) has thoroughly investigated and considered the Scope of Services to be performed, (ii) has carefully considered how the Services should be performed, and (iii) fully understands the facilities and any difficulties and restrictions attending performance of the Services under this Agreement. If the Services involve work upon any site, Consultant warrants that Consultant has or will investigate the site and is or will be fully acquainted with the conditions existing therein, prior to commencement of Services hereunder. Should Consultant discover any latent or unknown conditions, which will materially affect the performance of the Services hereunder, Consultant shall immediately inform City of such fact and shall not proceed except at Consultant's risk until written instructions are received from the Contract Officer (defined in Section 1.12. A).

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

1.6 Prevention of Loss and Damages.

Consultant shall adopt reasonable methods during the Term (defined in Section 3.4) to furnish continuous protection to the work product, and the equipment, materials, papers, documents, plans, studies and/or other components thereof to prevent losses or damages, and shall be responsible for all such damages, to persons or property, until acceptance of the Services by City, except such losses or damages as may be caused by City's own negligence.

1.7 Further Responsibilities of Parties.

Both Parties agree to use reasonable care and diligence to perform their respective obligations under this Agreement. Both Parties agree to act in good faith to execute all instruments, prepare all documents and take all actions as may be reasonable necessary to carry out the purposes of this Agreement. Unless hereafter specified, neither Party shall be responsible to perform the Services of the other.

1.8 Additional Services.

City shall have the right at any time during the performance of the Services, without invalidating this Agreement, to order extra services beyond that specified in the Scope of Services or to make changes by altering, adding to or deducting from the Services. No such extra services may be undertaken unless a written order is first given by the Contract Officer to Consultant, which written order incorporates therein an adjustment in (i) the Contract Sum (as defined in Section 2.1), and/or (ii) the Schedule of Performance, (as defined in Section 3.2), and which written order is approved in writing by Consultant. Any increase in compensation of up to ten percent (10%) of the Contract Sum, or $25,000, whichever is less; or in the Schedule of Performance of up to one hundred eighty (180) days may be approved by the Contract Officer. Any greater increases, taken either separately or cumulatively, must be approved by City Council. It is expressly understood by Consultant that the provisions of this Section shall not apply to Services which are specifically set forth in the Scope of Services or which are reasonably contemplated therein. Consultant hereby acknowledges that it accepts the risk that the Services to be provided pursuant to the Scope of Services may be more costly or time consuming than Consultant anticipates and that Consultant shall not be entitled to additional compensation therefor.

1.9 Facilities and Equipment.

Except as otherwise provided, Consultant shall, at its own cost and expense, provide all facilities and equipment necessary to perform the Services required by this Agreement. City shall make available to Consultant only physical facilities such as desks, filing cabinets, and conference space ("City Facilities"), as City deems, in its sole discretion, to be reasonably necessary for Consultant's use while consulting with City employees and reviewing records and the information in possession of City. The location, quality, and time of furnishing City Facilities shall be in the sole discretion of City. In no event shall City be required to furnish any facilities that may involve incurring any direct expense, including but not limited to a computer, long distance telephone, network data, internet or other communication charges, vehicles and reproduction facilities.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

1.10 Special Requirements.

Additional terms and conditions of this Agreement, if any, which are made a part hereof are set forth in the "Special Requirements" attached hereto as **Exhibit B** and incorporated herein by this reference. In the event of a conflict between the provisions of **Exhibit B** and any other provisions of this Agreement, the provisions of **Exhibit B** shall govern.

1.11 Corrections.

In addition to the indemnification obligations set forth in Article 4, and Sections 1.4, 1.13, 5.3, 5.4, and 6.3, Consultant shall correct, at its expense, all errors in the Services which may be disclosed during City's review of Consultant's report or plans. Should Consultant fail to make such correction(s) in a reasonably timely manner, such correction(s) may be made by City, and the cost thereof shall be charged to Consultant. In addition to all other available remedies, City may deduct the cost of such correction(s) from any retention amount held by City, or may withhold payment otherwise owed Consultant under this Agreement up to the amount of the cost of correction(s), as provided in Section 6.3.

1.12 Party Representatives.

A. Contract Officer: For the purposes of this Agreement, the Contract Officer shall be the City Manager, or such other person designated in writing by the City Manager ("Contract Officer"). Unless otherwise specified herein, any approval of City required hereunder shall mean the approval of the Contract Officer. The Contract Officer shall have authority, if specified in writing by the City Manager, to sign all documents on behalf of City required hereunder to carry out the terms of this Agreement.

B. Principals and Personnel of Consultant.

1) Consultant Representative: The following principal of Consultant is hereby designated as being the Consultant Representative authorized to act on Consultant's behalf regarding the Services specified herein and make all decisions in connection therewith:

Name	Title
Richard O'Neill	Associate Principal

It is expressly understood that the experience, knowledge, capability and reputation of the foregoing Consultant Representative were a substantial inducement for City to enter into this Agreement. Therefore, the foregoing Consultant Representative shall be responsible during the term of this Agreement for directing all activities of Consultant and devoting sufficient time to personally supervise the Services hereunder. All personnel of Consultant, and any authorized agents, shall at all times be under the exclusive direction and control of the Consultant Representative. For purposes of this Agreement, the foregoing Consultant Representative may not be replaced nor may their responsibilities be substantially reduced or reassigned by Consultant without the express written approval of City. It shall be Consultant's responsibility to assure that the Contract Officer is kept informed of the progress of the performance of the Services, and Consultant shall refer any decisions which must be made by City to the Contract Officer.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

2) Consultant's Personnel: Consultant has, or will secure at its own expense, all personnel required to perform the Services required under this Agreement. All of the Services required under this Agreement shall be performed by Consultant or under its supervision, and all personnel engaged in the Services shall be qualified to perform such Services. Consultant shall make every reasonable effort to maintain the stability and continuity of Consultant's staff and sub-contractors, if any, assigned to perform the Services required under this Agreement. Consultant shall notify City of all changes in Consultant's staff and sub-contractors, if any, assigned to perform the Services required under this Agreement, prior to and during any such performance. In the event that City, in its sole discretion, at any time during the term of this Agreement, desires to reassign any staff or sub-contractor of Consultant, City shall give notice as set forth in Section 8.1. Consultant shall, immediately upon the receipt of the notice to re-assign staff from City, reassign such person or persons.

1.13 Independent Contractor.

A. Consultant is an independent contractor and not an employee of City. Consultant shall have no power to incur any debt, obligation, or liability on behalf of City. All Services provided pursuant to this Agreement shall be performed by Consultant or under its supervision. Consultant will determine the means, methods, and details of performing the Services. Any additional personnel performing Services under this Agreement on behalf of Consultant shall also not be employees of City and shall at all times be under Consultant's exclusive direction and control. Consultant shall pay all wages, salaries, and other amounts due such personnel in connection with their performance of Services under this Agreement and as required by law. Consultant shall be responsible for all reports and obligations respecting such additional personnel, including, but not limited to: social security taxes, income tax withholding, unemployment insurance, disability insurance, and workers' compensation insurance.

B. Consultant shall indemnify and hold harmless City and its elected officials, officers, employees, servants, designated volunteers, and agents serving as independent contractors in the role of City officials, from any and all liability, damages, claims, costs and expenses of any nature to the extent arising from Consultant's personnel practices. City shall have the right to offset against the amount of any fees due to Consultant under this Agreement any amount due to City from Consultant as a result of Consultant's failure to promptly pay to City any reimbursement or indemnification arising under this Section.

1.14 Prohibition Against Subcontracting or Assignment.

The experience, knowledge, capability and reputation of Consultant, the Consultant Representative and employees were a substantial inducement for City to enter into this Agreement. Therefore, Consultant shall not contract with any other entity to perform in whole or in part the Services required hereunder without the express written approval of City. In addition, neither this Agreement nor any interest herein may be transferred, assigned, conveyed, hypothecated or encumbered voluntarily or by operation of law, whether for the benefit of creditors or otherwise, without the prior written approval of City. Transfers restricted hereunder shall include the transfer to any person or group of persons acting in concert of more than twenty-five percent (25%) of the present ownership and/or control of Consultant, taking all transfers into account on a cumulative basis. In the event of any such unapproved transfer, including any bankruptcy proceeding, this

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

Agreement shall be void. No approved transfer shall release Consultant or any surety of Consultant of any liability hereunder without the express consent of City.

ARTICLE 2. COMPENSATION AND METHOD OF PAYMENT.

2.1 Contract Sum.

Subject to any limitations set forth in this Agreement, as full compensation for Services satisfactorily rendered, City shall pay Consultant at the hourly rates set forth in **Exhibit C-1** and the not-to-exceed sub-budget rates set forth in the "Schedule of Compensation" attached hereto as **Exhibit C** and incorporated herein by this reference. In no event shall Consultant be paid more than Three Hundred Eighty-Six Thousand Eight Hundred Ninety-Five ($386,895.00) (the "Contract Sum"). The Contract Sum shall include the attendance of Consultant at all project meetings reasonably deemed necessary by City. Coordination of the performance of the Services with City is a critical component of the Services. If Consultant is required to attend additional meetings to facilitate such coordination, Consultant shall not be entitled to any additional compensation for attending those meetings.

2.2 Method of Compensation.

The method of compensation may include: (i) a lump sum payment upon completion of the Services, (ii) payment in accordance with specified tasks or the percentage of completion of the Services, (iii) payment for time and materials based upon Consultant's rates as specified in the Schedule of Compensation, provided that time estimates are provided for the performance of sub tasks, but not exceeding the Contract Sum or (iv) such other methods as may be specified in the Schedule of Compensation.

2.3 Reimbursable Expenses.

City shall only reimburse Consultant for those actual and necessary expenses expressly set forth in **Exhibit C**. Reimbursable expenses may include reimbursement for actual and necessary expenditures for reproduction costs, telephone expenses, and travel expenses approved by the Contract Officer in advance, or actual sub-contractor expenses of an approved sub-contractor pursuant to Section 1.14, and only if specified in the Schedule of Compensation.

2.4 Unauthorized Services and Expenses.

City will not pay for any Services or reimburse for any expenses incurred which are not specified in the Scope of Services, unless authorized in writing as set forth in Section 1.8 of this Agreement. City shall make payment for such authorized additional Services and expenses in accordance with Article 2 of this Agreement.

2.5 Invoices.

Each month Consultant shall furnish to City an original invoice for all Services performed and expenses incurred during the preceding month. Each such invoice shall contain all of the information set forth in Section III of **Exhibit C** to this Agreement. By submitting an invoice for payment under this Agreement, Consultant is certifying compliance with all provisions of the

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

Agreement. Consultant shall not invoice City for any duplicate Services performed by more than one person.

City shall independently review each invoice submitted by Consultant to determine whether the Services performed and expenses incurred are in compliance with the provisions of this Agreement. City will use its best efforts to cause Consultant to be paid within thirty (30) days of receipt of Consultant's correct and undisputed invoice, except as to any charges for Services performed or expenses incurred by Consultant which are disputed by City, or as provided in Section 6.3. In the event any charges or expenses are disputed by City, the original invoice shall be returned by City to Consultant for correction and resubmission. Review and payment by City of any invoice provided by Consultant shall not constitute waiver of any rights or remedies provided herein or any applicable law.

2.6 Waiver.

Payment to Consultant for Services performed pursuant to this Agreement shall not be deemed to waive any defects in Services performed by Consultant.

ARTICLE 3. PERFORMANCE SCHEDULE

3.1 Time of Essence.

Time is of the essence in the performance of this Agreement; provided, however, that the foregoing shall not be construed to limit or deprive a Party of the benefits of any grace or use period allowed in this Agreement.

3.2 Schedule of Performance.

Consultant shall commence the Services pursuant to this Agreement upon receipt of a written notice to proceed and shall perform all Services within the time period(s) established in the "Schedule of Performance" attached hereto as **Exhibit D** and incorporated herein by this reference.

3.3 Force Majeure.

The time period(s) specified in the Schedule of Performance for performance of the Services rendered pursuant to this Agreement may be extended because of any delays due to unforeseeable causes beyond the control and without the fault or negligence of Consultant. Such unforeseeable consequences include, but are not restricted to, acts of God or public enemy, unusually severe weather, fires, earthquakes, floods, epidemics, quarantine restrictions, riots, strikes, freight embargoes, wars, litigation, and/or acts of any governmental agency, including City, if Consultant shall within ten (10) days of the commencement of such delay notify the Contract Officer in writing of the causes of the delay. The Contract Officer shall ascertain the facts and the extent of delay, and extend the time for performing the Services for the period of the enforced delay when and if in the judgment of the Contract Officer such delay is justified, subject to the provisions of Section 1.8. The Contract Officer's determination (or the City Council's determination, in the event the period of enforced delay exceeds the period specified in Section 1.8) shall be final and conclusive upon the Parties to this Agreement. In no event shall Consultant

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

be entitled to recover damages against City for any delay in the performance of this Agreement, however caused; Consultant's sole remedy shall be the extension of the Agreement pursuant to this Section.

3.4 Term.

The Term of this Agreement shall be from the Effective Date through June 30, 2024, unless sooner terminated as provided in Article 6 of this Agreement or extended as provided in Sections 1.8 and 3.3 of this Agreement. Maximum term and any subsequent amendment or modification shall not exceed five (5) years.

ARTICLE 4. INSURANCE AND INDEMNIFICATION

4.1 Minimum Scope and Limits of Insurance.

Consultant shall procure and at all times during the term of this Agreement carry, maintain, and keep in full force and effect, insurance as follows:

A. Commercial General Liability Insurance with a minimum limit of $1,000,000.00 per occurrence for bodily injury, personal injury and property damage and a general aggregate limit of $2,000,000.00 per project or location. If Consultant is a limited liability company, the commercial general liability coverage shall be amended so that Consultant and its managers, members, affiliates, employees, agents and other persons necessary or incidental to its operation are insureds.

B. Automobile Liability Insurance for any owned, non-owned or hired vehicle used in connection with the performance of this Agreement with a combined single limit of $1,000,000.00 per accident for bodily injury and property damage. If Consultant does not use any owned, non-owned or hired vehicles in the performance of Services under this Agreement, Consultant shall obtain a non-owned auto endorsement to the Commercial General Liability policy.

C. Workers' Compensation Insurance as required by the State of California and Employer's Liability Insurance with a minimum limit of $1,000,000.00 per accident for bodily injury or disease. If Consultant has no employees while performing Services under this Agreement, workers' compensation policy is not required; however, Consultant shall execute a declaration that it has no employees.

D. Professional Liability/Errors and Omissions Insurance with minimum limits of $1,000,000.00 per claim and in the aggregate.

4.2 Acceptability of Insurers.

The insurance policies required under this Article shall be issued by an insurer admitted to write insurance in the State of California with a rating of A:VII or better in the latest

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

edition of the A.M. Best Insurance Rating Guide. Self-insurance shall not be considered to comply with the insurance requirements under this Article.

4.3 Additional Insured.

The commercial general and automobile liability policies shall contain an endorsement naming City, its officers, employees, agents and volunteers as additional insureds.

4.4 Primary and Non-Contributing.

The insurance policies required under this Article shall apply on a primary non-contributing basis in relation to any other insurance or self-insurance available to City. Any insurance or self-insurance maintained by City, its officers, employees, agents or volunteers, shall be in excess of Consultant's insurance and shall not contribute with it.

4.5 Consultant's Waiver of Subrogation.

The insurance policies required under this Article shall not prohibit Consultant and Consultant's employees, agents or sub-contractors from waiving the right of subrogation prior to a loss. Consultant hereby waives all rights of subrogation against City.

4.6 Deductibles and Self-Insured Retentions.

Any deductibles or self-insured retentions must be declared to and approved by City. At City's option, Consultant shall either reduce or eliminate the deductibles or self-insured retentions with respect to City; or Consultant shall procure a bond guaranteeing payment of losses and expenses.

4.7 Cancellations or Modifications to Coverage.

Consultant shall not cancel, reduce or otherwise modify the insurance policies required by this Article during the term of this Agreement. The commercial general and automobile liability policies required under this Agreement shall be endorsed to state that should the issuing insurer cancel the policy before the expiration date, the issuing insurer will endeavor to mail 30 days' prior written notice to City. If any insurance policy required under this Article is canceled or reduced in coverage or limits, Consultant shall, within two (2) Business Days (as defined in Section 8.12) of notice from the insurer, phone, fax or notify City via certified mail, return receipt requested, of the cancellation of or changes to the policy.

4.8 City Remedy for Noncompliance.

If Consultant does not maintain the policies of insurance required under this Article in full force and effect during the term of this Agreement, or in the event any of Consultant's policies do not comply with the requirements under this Article, City may either immediately terminate this Agreement or, if insurance is available at a reasonable cost, City may, but has no duty to, take out the necessary insurance and pay, at Consultant's expense, the premium thereon. Consultant shall promptly reimburse City for any premium paid by City, or City may withhold amounts sufficient to pay the premiums from payments due to Consultant.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

4.9 Evidence of Insurance.

Prior to the performance of Services under this Agreement, Consultant shall furnish the City Clerk with a certificate or certificates of insurance and all original endorsements evidencing and effecting the coverages required under this Article. The endorsements are subject to City's approval. Consultant may provide complete, certified copies of all required insurance policies to City. Consultant shall maintain current endorsements on file with the City Clerk. Consultant shall provide proof to the City Clerk that insurance policies expiring during the term of this Agreement have been renewed or replaced with other policies providing at least the same coverage. Consultant shall furnish such proof at least two (2) weeks prior to the expiration of the coverages.

4.10 Indemnity Requirements not Limiting.

Procurement of insurance by Consultant shall not be construed as a limitation of Consultant's liability or as full performance of Consultant's duty to indemnify City under this Agreement.

4.11 Sub-contractor Insurance Requirements.

Consultant shall require each of its sub-contractors that perform Services under this Agreement to maintain insurance coverage that meets all of the requirements of this Article.

4.12 Indemnification, Hold Harmless, and Duty to Defend.

A. Indemnification of City.

1) Indemnity for Design Professional Services. To the fullest extent permitted by law, Consultant shall, at its sole cost and expense, protect, indemnify, and hold harmless City and its elected officials, officers, attorneys, agents, employees, designated volunteers, successors, assigns and those City agents serving as independent contractors in the role of City officials (collectively "Indemnitees"), from and against any and all damages, costs, expenses, liabilities, claims, demands, causes of action, proceedings, judgments, penalties, liens, and losses of any nature whatsoever, including fees of accountants, attorneys, or other professionals and all costs associated therewith, and reimbursement of attorney's fees and costs of defense (collectively "Liabilities"), whether actual, alleged or threatened, which arise out of, are claimed to arise out of, pertain to, or relate to, in whole or in part, the negligence, recklessness or willful misconduct of Consultant, its officers, agents, servants, employees, subcontractors, material men, contractors or their officers, agents, servants or employees (or any entity or individual that Consultant shall bear the legal liability thereof) in the performance of design professional services under this Agreement by a "design professional," as the term is defined under California Civil Code Section 2782.8(c).

2) Other Indemnities. Other than in the performance of design professional services, and to the fullest extent permitted by law, Consultant shall, at its sole cost and expense, defend, hold harmless and indemnify Indemnitees from and against any and all damages, costs, expenses, liabilities, claims, demands, causes of action, proceedings, expenses, judgments, penalties, liens, and losses of any nature whatsoever, including fees of accountants, attorneys, or other professionals and all costs associated therewith and the payment of all consequential

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

damages (collectively "Claims"), at law or in equity, whether actual, alleged or threatened, which arise out of, are claimed to arise out of, pertain to, or relate to the acts or omissions of Consultant, its officers, agents, servants, employees, sub-contractors, materialmen, consultants or their officers, agents, servants or employees (or any entity or individual that Consultant shall bear the legal liability thereof) in the performance of this Agreement, including the Indemnitees' active or passive negligence, except for Claims arising from the sole negligence or willful misconduct of the Indemnitees as determined by court decision or by the agreement of the Parties. Consultant shall defend the Indemnitees in any action or actions filed in connection with any Claims with counsel of the Indemnitees' choice, and shall pay all costs and expenses, including all attorneys' fees and experts' costs actually incurred in connection with such defense. Consultant shall reimburse the Indemnitees for any and all legal expenses and costs incurred by Indemnitees in connection therewith.

3) Consultant shall pay all required taxes on amounts paid to Consultant under this Agreement, and indemnify and hold City harmless from any and all taxes, assessments, penalties, and interest asserted against City by reason of the independent contractor relationship created by this Agreement. Consultant shall fully comply with the workers' compensation law regarding Consultant and Consultant's employees. Consultant shall indemnify and hold City harmless from any failure of Consultant to comply with applicable workers' compensation laws. City may offset against the amount of any fees due to Consultant under this Agreement any amount due to City from Consultant as a result of Consultant's failure to promptly pay to City any reimbursement or indemnification arising under this subparagraph A.3.

4) Consultant shall obtain executed indemnity agreements with provisions identical to those in this Article from each and every sub-contractor or any other person or entity involved by, for, with or on behalf of Consultant in the performance of this Agreement. If Consultant fails to obtain such indemnities, Consultant shall be fully responsible and indemnify, hold harmless and defend the Indemnitees from and against any and all Liabilities and Claims, in law or in equity, whether actual, alleged or threatened, which arise out of, are claimed to arise out of, pertain to, or relate to the acts or omissions of Consultant's sub-contractor, its officers, agents, servants, employees, sub-contractors, materialmen, contractors or their officers, agents, servants or employees (or any entity or individual that Consultant's sub-contractor shall bear the legal liability thereof) in the performance of this Agreement, including the Indemnitees' active or passive negligence, except for Liabilities and Claims arising from the sole negligence or willful misconduct of the Indemnitees, as determined by court decision or by the agreement of the Parties.

B. Workers' Compensation Acts not Limiting. Consultant's indemnifications and obligations under this Article, or any other provision of this Agreement, shall not be limited by the provisions of any workers' compensation act or similar act. Consultant expressly waives its statutory immunity under such statutes or laws as to City, its officers, agents, employees and volunteers.

C. Insurance Requirements not Limiting. City does not, and shall not, waive any rights that it may possess against Consultant because of the acceptance by City, or the deposit with City, of any insurance policy or certificate required pursuant to this Agreement. The indemnities in this Article shall apply regardless of whether or not any insurance policies are determined to be applicable to the Liabilities, tax, assessment, penalty or interest asserted against City.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

D. Survival of Terms. Consultant's indemnifications and obligations under this Article shall survive the expiration or termination of this Agreement.

ARTICLE 5. RECORDS, REPORTS, AND RELEASE OF INFORMATION

5.1 Service Records.

Consultant shall keep, and require sub-contractors to keep, such ledgers, books of accounts, invoices, vouchers, canceled checks, reports, studies or other documents relating to the disbursements charged to City and Services performed hereunder (the "Service Records"), as shall be necessary to perform the Services required by this Agreement and enable the Contract Officer to evaluate the performance of such Services. Any and all such Service Records shall be maintained in accordance with generally accepted accounting principles and shall be complete and detailed. The Contract Officer shall have full and free access to such Service Records at all times during normal business hours of City, including the right to inspect, copy, audit and make copies and transcripts from such Service Records. Such Service Records shall be maintained for a period of three (3) years following completion of the Services hereunder, and City shall have access to such Service Records in the event any audit is required. In the event of dissolution of Consultant's business, custody of the Service Records may be given to City, and access shall be provided by Consultant's successor in interest ("Consultant's Successor"). If custody of the Service Records is given to Consultant's Successor, Consultant shall give written notice to City of the transfer of the Service Records to Consultant's Successor. The notice shall include contact information (address and telephone number) for Consultant's Successor, and access shall be provided to City by Consultant's Successor.

5.2 Reports.

Consultant shall periodically prepare and submit to the Contract Officer such reports concerning the performance of the Services required by this Agreement as the Contract Officer shall require. Consultant hereby acknowledges that City is greatly concerned about the cost of Services to be performed pursuant to this Agreement. For this reason, Consultant agrees that if Consultant becomes aware of any facts, circumstances, techniques, or events that may or will materially increase or decrease the cost of the Services contemplated herein, Consultant shall promptly notify the Contract Officer of that fact, circumstance, technique or event and the estimated increased or decreased cost related thereto.

5.3 Ownership of Documents.

All drawings, specifications, maps, designs, photographs, studies, surveys, data, notes, computer files, reports, records, documents and other materials (the "Consultant Documents") prepared by Consultant, its employees, sub-contractors and agents in the performance of this Agreement shall be the property of City and shall be delivered to City upon request of the Contract Officer or upon the termination of this Agreement. Consultant shall have no claim for further employment or additional compensation as a result of the exercise by City of its full rights of ownership use, reuse, or assignment of the Consultant Documents hereunder. Any use, reuse or assignment of such completed Consultant Documents for other projects and/or use of uncompleted Consultant Documents without specific written authorization by Consultant will be at City's sole

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

risk and without liability to Consultant, and Consultant's guarantee and warranties shall not extend to such use or assignment. Consultant may retain copies of such Consultant Documents for its own use. Consultant shall have an unrestricted right to use the concepts embodied therein. All sub-contractors shall provide for assignment to City of all Consultant Documents prepared by them; and in the event Consultant fails to secure such assignment, Consultant shall indemnify City for all damages resulting therefrom.

5.4 Confidentiality and Release of Information.

A. All information gained or work product produced by Consultant in performance of this Agreement shall be considered confidential, unless such information is in the public domain or already known to Consultant. Consultant shall not release or disclose any such information or work product to persons or entities other than City without prior written authorization from the Contract Officer.

B. Consultant, its officers, employees, agents or sub-contractors, shall not, without prior written authorization from the Contract Officer or unless requested by the City Attorney, voluntarily provide documents, declarations, letters of support, testimony at depositions, response to interrogatories or other information concerning the Services performed under this Agreement. Response to a subpoena or court order shall not be considered "voluntary" provided Consultant gives City notice of such court order or subpoena.

C. If Consultant, or any officer, employee, agent or sub-contractor of Consultant, provides any information or work product in violation of this Agreement, then City shall have the right to reimbursement and indemnity from Consultant for any damages, costs and fees, including attorneys' fees, caused by or incurred as a result of Consultant's conduct.

D. Consultant shall promptly notify City should Consultant, its officers, employees, agents or sub-contractors be served with any summons, complaint, subpoena, notice of deposition, request for documents, interrogatories, request for admissions or other discovery request, court order or subpoena from any Party regarding this Agreement and the Services performed thereunder. City retains the right, but has no obligation, to represent Consultant or be present at any deposition, hearing or similar proceeding. Consultant agrees to cooperate fully with City and to provide City with the opportunity to review any response to discovery requests provided by Consultant. However, this right to review any such response does not imply or mean the right by City to control, direct, or rewrite the response.

ARTICLE 6. ENFORCEMENT OF AGREEMENT AND TERMINATION

6.1 California Law.

This Agreement, and any dispute arising from the relationship between the Parties to this Agreement, shall be interpreted, construed and governed both as to validity and to performance of the Parties in accordance with the laws of the State of California. Legal actions concerning any dispute, claim or matter arising out of or in relation to this Agreement shall be instituted in the Superior Court of the County of Riverside, State of California, or any other appropriate court in such county, and Consultant covenants and agrees to submit to the personal jurisdiction of such

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

court in the event of such action. In the event of litigation in a U.S. District Court, venue shall lie exclusively in the Central District of California, in Riverside.

6.2 Disputes; Default.

A. In the event that City determines Consultant is in default under the terms of this Agreement, City shall have no obligation or duty to continue compensating Consultant for any Services performed after the date of default. In addition to the provisions of Section 4.8, and the right to terminate pursuant to Section 6.7, if the City Manager determines that Consultant is in default in the performance of any of the terms or conditions of this Agreement, City may serve Consultant with written notice of the default. Consultant shall have ten (10) calendar days after service upon it of the notice in which to cure the default by rendering a satisfactory performance. In the event that Consultant fails to cure its default within such period of time, City may, notwithstanding any other provision of this Agreement, terminate this Agreement without further notice and without prejudice to any other remedy to which it may be entitled at law, in equity or under this Agreement.

B. In the event of termination pursuant to this Section, City may take over the Services and prosecute the same to completion by contract or otherwise, and Consultant shall be liable to the extent that the total cost for completion of the Services required hereunder exceeds the compensation herein stipulated (provided that City shall use reasonable efforts to mitigate such damages), and City may withhold any payments to Consultant for the purpose of set-off or partial payment of the amounts owed City as provided in Section 6.3.

6.3 Retention of Funds.

Consultant hereby authorizes City to deduct from any amount payable to Consultant (whether or not arising out of this Agreement): (i) any payment amount of which may be in dispute hereunder or which is necessary to compensate City for any losses, costs, liabilities, or damages suffered by City, (ii) all amounts retained pursuant to the provisions of Section 4.8, (iii) all amounts for which City may be liable to third parties, by reason of Consultant's acts or omissions in performing or failing to perform Consultant's obligation under this Agreement, and (iv) all payments due or that become due to Consultant during the period that Consultant or any of its sub-contractors fail to maintain any required insurance in full force and effect, until notice is received by City that the required insurance has been restored to full force and effect and that the premiums therefore have been paid for a period satisfactory to City, as provided in Section 4.9, above. In the event that any claim is made by a third party, the amount or validity of which is disputed by Consultant, or any indebtedness shall exist which shall appear to be the basis for a claim of lien, City may withhold from any payment due, without liability for interest because of such withholding, an amount sufficient to cover such claim. The failure of City to exercise such right to deduct or to withhold shall not, however, affect the obligations of Consultant to insure, indemnify, and protect City as elsewhere provided herein.

6.4 Waiver.

Waiver by any Party to this Agreement of any term, condition, or covenant of this Agreement shall not constitute a waiver of any other term, condition, or covenant. Waiver by any

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

Party of any breach of the provisions of this Agreement shall not constitute a waiver of any other provision or a waiver of any subsequent breach or violation of any provision of this Agreement. Acceptance by City of any Services by Consultant shall not constitute a waiver of any of the provisions of this Agreement. No delay or omission in the exercise of any right or remedy by a non-defaulting Party on any default shall impair such right or remedy or be construed as a waiver. Any waiver by either Party of any default must be in writing, and shall not be a waiver of any other default concerning the same or any other provision of this Agreement.

6.5 Rights and Remedies are Cumulative.

Except with respect to rights and remedies expressly declared to be exclusive in this Agreement, the rights and remedies of the Parties are cumulative and the exercise by either Party of one or more of such rights or remedies shall not preclude the exercise by it, at the same or different times, of any other rights or remedies for the same default or any other default by the other Party.

6.6 Legal Action.

In addition to any other rights or remedies, either Party may take legal action, in law or in equity, to cure, correct or remedy any default, to recover damages for any default, to compel specific performance of this Agreement, to obtain declaratory or injunctive relief, or to obtain any other remedy consistent with the purposes of this Agreement. Notwithstanding any contrary provision herein, Consultant must file a statutory claim pursuant to Government Code Sections 905 et seq. and 910 et seq., in order to pursue a legal action against City under this Agreement.

6.7 Termination Prior to Expiration of Term.

This Article 6 shall govern any termination of this Agreement except as specifically provided in Section 6.2 for termination for default of Consultant. City reserves the right to terminate this Agreement at any time, with or without cause, upon thirty (30) days' written notice to Consultant, except that where termination is due to the fault of Consultant, the period of notice may be a shorter time as may be determined by the Contract Officer. In addition, Consultant reserves the right to terminate this Agreement at any time, with or without cause, upon sixty (60) days' written notice to City, except that where termination is due to the fault of City, the period of notice may be a shorter time as Consultant may determine. Upon receipt of any notice of termination, Consultant shall immediately cease all Services hereunder except such as may be specifically approved by the Contract Officer. Except where Consultant has initiated termination, Consultant shall be entitled to compensation for all Services rendered prior to the effective date of the notice of termination and for any Services authorized by the Contract Officer thereafter in accordance with the Schedule of Compensation or such as may be approved by the Contract Officer, except as provided in Section 6.3. In the event Consultant has initiated termination, Consultant shall be entitled to compensation only for the reasonable value of the work product actually produced hereunder. In the event of termination without cause pursuant to this Section, the terminating Party need not provide the non-terminating Party with the opportunity to cure pursuant to Section 6.2.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

6.8 Attorneys' Fees.

In any litigation or other proceeding by which a Party seeks to enforce its rights under this Agreement (whether in contract, tort or both) or seeks a declaration of any rights or obligations under this Agreement, the prevailing Party in such action or proceeding, in addition to any other relief which may be granted, whether legal or equitable, shall be entitled to reasonable attorneys' fees. Attorneys' fees shall include attorney's fees on any appeal, and in addition the Party entitled to attorneys' fees shall be entitled to all other reasonable costs for investigating such action, taking depositions and discovery and all other necessary costs the court allows which are incurred in such litigation. All such fees shall be deemed to have accrued on commencement of such action and shall be enforceable whether or not such action is prosecuted to judgment.

ARTICLE 7. CITY OFFICERS AND EMPLOYEES: NON-DISCRIMINATION

7.1 Non-liability of City Officers and Employees.

No officer or employee of City shall be personally liable to Consultant, or Consultant's Successor, in the event of any default or breach by City or for any amount which may become due to Consultant or Consultant's Successor, or for breach of any obligation of the terms of this Agreement.

7.2 Conflict of Interest.

Consultant covenants that neither it, nor any officer or principal of its firm, has or shall acquire any interest, directly or indirectly, which would conflict in any manner with the interests of City or which would in any way hinder Consultant's performance of Services under this Agreement. Consultant further covenants that in the performance of this Agreement, no person having any such interest shall be employed by it as an officer, employee, agent or sub-contractor without the express written consent of the Contract Officer. Consultant agrees to at all times avoid conflicts of interest or the appearance of any conflicts of interest with the interests of City in the performance of this Agreement.

No officer or employee of City shall have any direct or indirect financial interest in this Agreement within the scope of Government Code section 1090, nor shall any such officer or employee make, participate in making, or use his or her official position to influence, any City decision relating to the Agreement which has a material financial effect on his or her financial interests or the financial interests of any corporation, partnership or association in which he or she is, directly or indirectly, interested, in violation of any State statute or regulation. Consultant warrants that it has not paid or given, and will not pay or give any third party any money or other consideration for obtaining this Agreement.

Consultant and its officers, employees, associates and sub-contractors, if any, shall comply with all conflict of interest statutes of the State of California applicable to Consultant's Services under this Agreement, including the Political Reform Act (Gov. Code § 81000, et seq.) and Government Code Section 1090. During the term of this Agreement, Consultant may perform similar services for other clients; but Consultant and its officers, employees, associates and sub-contractors shall not, without the Contract Officer's prior written approval, perform services for another person or entity for whom Consultant is not currently performing services that would

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

require Consultant or one of its officers, employees, associates or sub-contractors to abstain from a decision under this Agreement pursuant to a conflict of interest statute. Consultant shall incorporate a clause substantially similar to this Section into any subcontract that Consultant executes in connection with the performance of this Agreement.

7.3 Covenant Against Discrimination.

Consultant covenants that, by and for itself, its heirs, executors, assigns, and all persons claiming under or through them, that there shall be no discrimination against or segregation of, any person or group of persons on account of race, color, creed, religion, sex, gender, sexual orientation, marital status, national origin, or ancestry in the performance of this Agreement. Consultant shall take affirmative action to insure that applicants are employed, and that employees are treated during employment, without regard to their race, color, creed, religion, sex, marital status, national origin, or ancestry, or other protected class.

7.4 Unauthorized Aliens.

Consultant hereby promises and agrees to comply with all of the provisions of the Federal Immigration and Nationality Act, 8 U.S.C.A. §§ 1101, et seq., as amended, and in connection therewith, shall not employ unauthorized aliens as defined therein. Should Consultant so employ such unauthorized aliens for the performance of Services covered by this Agreement, and should the any liability or sanctions be imposed against City for such use of unauthorized aliens, Consultant hereby agrees to and shall reimburse City for the cost of all such liabilities or sanctions imposed, together with any and all costs, including attorneys' fees, incurred by City.

ARTICLE 8. MISCELLANEOUS PROVISIONS

8.1 Notices.

Any notice, demand, request, document, consent, approval, bill, invoice, report or other communication required or permitted under this Agreement shall be in writing and conclusively deemed effective: (a) on confirmed delivery by courier service or overnight delivery service during Consultant's and City's regular business hours; or (b) three (3) Business Days after deposit in the United States mail, by certified or registered mail, and addressed to the Party to be notified as set forth below:

If to City

8.2 Interpretation.

The terms of this Agreement shall be construed in accordance with the meaning of the language used and shall not be construed for or against either Party by reason of the authorship of this Agreement or any other rule of construction which might otherwise apply.

8.3 Counterparts.

This Agreement may be executed in counterparts, each of which shall be deemed to be an original, and such counterparts shall constitute one and the same instrument.

8.4 Integration; Amendment.

This Agreement, and all exhibits referred to in this Agreement, constitute the final, complete and exclusive statement of the terms of the agreement between the Parties pertaining to the subject matter of this Agreement and supersede all other and cancels any and all previous negotiations, arrangements, agreements and understandings, if any, between the Parties, and none shall be used to interpret this Agreement. No Party has been induced to enter into this Agreement by, nor is any Party relying on, any representation or warranty except those expressly set forth in this Agreement. No amendment to or modification of this Agreement, nor any provision or breach hereof waived, shall be valid unless made in writing and approved by Consultant and by City Council. The Parties agree that this requirement for written modifications cannot be waived and that any attempted waiver shall be void.

8.5 Severability.

In the event that any one or more of the phrases, sentences, clauses, paragraphs, or sections contained in this Agreement shall be declared invalid or unenforceable by a valid judgment or decree of a court of competent jurisdiction, such invalidity or unenforceability shall not affect any of the remaining phrases, sentences, clauses, paragraphs, or sections of this Agreement which are hereby declared as severable and shall be interpreted to carry out the intent of the Parties hereunder unless the invalid provision is so material that its invalidity deprives either Party of the basic benefit of their bargain or renders this Agreement meaningless.

8.6 Mutual Cooperation.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

A. City's Cooperation. City shall provide Consultant with all pertinent data, documents and other requested information as is reasonably available for Consultant's proper performance of the Services required under this Agreement.

B. Consultant's Cooperation. In the event any claim or action is brought against City relating to Consultant's performance of Services rendered under this Agreement, Consultant shall render any reasonable assistance that City requires.

8.7 No Third Party Beneficiaries Intended.

This Agreement is made solely for the benefit of the Parties to this Agreement and their respective successors and assigns, and no other person or entity may have or acquire a right by virtue of this Agreement.

8.8 Final Payment Acceptance Constitutes Release.

The acceptance by Consultant of the final payment made under this Agreement shall operate as and be a release of City from all claims and liabilities for compensation to Consultant for anything done, furnished or relating to Consultant's Services. Acceptance of payment shall be any negotiation of City's check or the failure to make a written extra compensation claim within ten (10) calendar days of the receipt of that check. However, approval or payment by City shall not constitute, nor be deemed, a release of the responsibility and liability of Consultant, its employees, sub-contractors and agents for the accuracy and competency of the information provided and/or Services performed; nor shall such approval or payment be deemed to be an assumption of such responsibility or liability by City for any defect or error in the Services prepared by Consultant, its employees, sub-contractors and agents.

8.9 Non-Appropriation of Funds.

Payments to be made to Consultant by City for Services performed within the current fiscal year which are within the current fiscal budget and within an available, unexhausted fund. In the event that City does not appropriate sufficient funds for payment of Consultant's Services beyond the current fiscal year, this Agreement shall cover payment for Consultant's Services only to the conclusion of the last fiscal year in which City appropriates sufficient funds and shall automatically terminate at the conclusion of such fiscal year.

8.10 Headings.

The headings in this Agreement are included solely for convenience of reference and shall not affect the interpretation of any provision of this Agreement or any of the rights or obligations of the Parties to this Agreement.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

8.11 Word Usage.

Unless the context clearly requires otherwise, (a) the words "shall," "will" and "agrees" are mandatory and "may" is permissive; (b) "or" is not exclusive; and (c) "includes" or "including" are not limiting.

8.12 Business Days.

"Business Days" refers to days that the Banning City Hall is open for business.

8.13 Corporate Authority.

The persons executing this Agreement on behalf of the Parties hereto warrant that (i): such Party is duly organized and existing, (ii) they are duly authorized to execute and deliver this Agreement on behalf of that Party, (iii) by so executing this Agreement, such Party is formally bound to the provisions of this Agreement, and (iv) the entering into this Agreement does not violate any provision of any other Agreement to which that Party is bound. This Agreement shall be binding upon the heirs, executors, administrators, successors and assigns of the Parties.

8.14 Electronic Signatures.

Each Party may adopt as its signature an electronic identification consisting of a symbol or code that is affixed to or contained in each document transmitted by such Party ("electronic signature"). The Parties hereto herby agree that electronic signatures are acceptable, shall have the same force and effect under the law as original wet signatures, and shall be sufficient to verify that the Parties have executed this Agreement and such other documents transmitted by the Parties.

EXHIBIT "A"
SCOPE OF SERVICES

I. Consultant will perform the following Services in connection with providing Engineer Design Services prepared in connection therewith:

II. As part of the Services, Consultant will prepare and deliver the following tangible work products and services to City:

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

SCOPE OF WORK

Rick Engineering Company (RICK) will perform the following services in connection with providing the design of a new ductile iron pipe (size TBD by city) water main in Ramsey Street between Sunset Avenue and Highland Home Road based on the following scope of work.

Task 1. Project Management

1.1 Kick-off Meeting and Project Management

After execution of the contract, Rick Engineering Company (RICK) will schedule and attend a kick-off meeting with the City of Banning (City) to discuss the project scope, goals, preliminary findings and alignment selected by the City, finalize the project schedule, and identify available as-built plans and studies. RICK will prepare the meeting agenda and provide the team with meeting minutes following the meeting.

RICK will provide project management of the project that includes preparation and maintenance of a project specific Work Plan. The Work Plan will include details of methodology of design, sequence of tasks lists of deliverables, milestone submittal schedule, summary of organizational responsibilities, and a communication plan with contacts of all team members. Additionally, RICK will provide utility coordination with the utility providers that have utilities along the alignment, and perform quality assurance and quality control prior to each milestone submittal, and in conformance with federal, state, and city standards.

Deliverables – Meeting agenda and minutes, Work Plan

1.2 Progress Meetings

RICK will schedule monthly progress meetings with the City and project team, that will be face to face or virtual, and facilitate additional meetings with the City departments/stakeholders as needed for the project during the project duration. Scope assumes 8 monthly meetings, that includes milestone design review / comment resolution meetings and an additional 3 project meetings.
RICK will prepare agendas and minutes for the meetings, distribute the minutes, and will also provide a monthly progress report to be included with the monthly invoice.

Deliverables – Meeting agendas and minutes

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

1.3 Invoicing

RICK will develop and provide a monthly invoice to the City. The invoice will include RICK labor costs, subconsultant invoices and direct expenses. Direct expenses will be supported by a copy of the receipt if applicable. Invoices shall include details of billed and remaining budget for each task, and will include the monthly progress report of the tasks completed, identify any outstanding issues to be resolved, and upcoming work to be performed.

Deliverable – Monthly invoices and progress reports

Task 2. Project Development

2.1 Utility Research, Base Mapping, and Site Reconnaissance

RICK will conduct research with the City of Banning, County of Riverside, and other governing agencies and utility companies for existing plans and maps of the adjacent area to be used for the design of the project.

RICK will conduct a field visit to collect visible information of project site. Research will consist of the private water systems that will be reconnected to the new/proposed waterline in Ramsey Street and the affected private properties. RICK will verify existing site data in terms of surrounding street system, geometry, parking, signing and striping, and private improvements and private water system appurtenances on the properties.

RICK will prepare a CAD file based on the boundary survey described below showing the existing utilities discovered in the research.

Deliverables - Photo log for any photos taken, letters to utility companies, utility as-built maps, and an AutoCAD drawing of the existing utilities.

2.1.1 Property Research

RICK will research City of Banning and County of Riverside survey records and record mapping for property and right of way information. RICK will also conduct a field survey to establish street centerline and rights of way of Ramsey Street within the project limits (between Sunset Avenue and Highland Home Road), Omar Street (between Ramsey and W. Jacinto View Road), W. Jacinto View Road (between Omar Street and Winchester Drive), and the property lines of the adjacent private properties and private properties that are affected by the relocation of water services. Survey basis of bearings and coordinates will be California State Plane Coordinates. Survey data and records analysis will be prepared within a CAD file establishing project mapping for centerline and right of

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

way, including intersecting streets. Base mapping will include existing easements. Easements will be researched to identify their applicability/inapplicability with new waterline alignments.

Deliverables - Field Review notes, photo log for any photos taken, and an AutoCAD drawing of the rights of ways and centerline.

2.1.2 Site Topography and Surveying

RICK will provide a supplemental field topography along the existing water line points of connection and where needed and the effected private properties (where water systems will be reconnected in Ramsey Street). Consultant will locate and dip existing sewer and storm drain manholes. Topography will be vertically controlled by local published benchmarks.

Deliverables – Field Review notes, photo log for any photos taken, and CAD file with survey points.

2.1.3 Aerial Topography

RICK will provide an aerial topography of the project site consisting of surface utility appurtenances and improvements such as curb, edge of pavement, drainage inlets, valve cans, fences, driveways, mailboxes, utility vaults, power poles, signs, lights, traffic signals, sidewalks, pedestrian ramps, and notable grade features.

Deliverables – 40-scale at 1-foot contours

2.2 Potholing

RICK's subconsultant, C Below, will perform potholing for the project. C Below will perform forty (40) potholes as indicated in the RFP. A standard pothole is 12 in. x 12 in, performed to the top of pipe or encasement with sand backfill and a permanent surface patch. Potholes are assumed to be 5' in depth. Potholes include water line tie-in points and underground utility crossings. Potholes will also be used to locate the old Highway 99 concrete by setting alignment of potholes perpendicular to Ramsey Street, spaced 10' on center curb to curb. Alignments will be performed at mid-point of each project phase (3 alignments). C Below will provide a detailed potholing report at the conclusion of the investigation. Service includes Dig Alert Coordination and Delineation, Encroachment permit, vacuum excavation to top of utility, encasement, or stop depth, standard traffic control, 12-inches of hot patching (restored within 30-days of excavation activity), sand backfill, removal of debris, and pothole report. Services not included are slurry backfill, extensive traffic control, flagging for traffic control, sidewalk concrete

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

panel replacement, and removal of Dig Alert marks.

Standard traffic control includes one lane closure with minimal signage not spanning an intersection.

Prior to potholing, a potholing plan will be developed showing location of potholes for connection points, intermediate points, and location of other underground utilities.

Deliverables – Potholing plan and potholing report

2.3 Geotechnical Study

Geocon is proposing to drill six (6) geotechnical borings up to 15 feet in depth, along portions of the proposed water main alignment, where the subsurface explorations of our 2018 geotechnical investigation cannot supplement. The geotechnical borings will be performed to the observe subsurface soil conditions and collect samples for laboratory testing. We expect that traffic control signage/equipment will be sufficient and flag persons will not be required. Furthermore, we expect that the Banning encroachment permit will be a no fee permit for this project, and that patching of the borings with asphalt concrete cold-patch is acceptable.

RICK's subconsultant, Geocon West, Inc, will consist of:

- Mark the planned boring locations and notify Underground Surface Alert of Southern California to mark any subsurface utility locations near the exploration locations. Additionally, the client should provide plans depicting the locations of all utilities in the project area.
- Prepare no-fee encroachment permits with the City of Banning for our work. We have assumed a traffic control plan utilizing MUTCD or Watchbook details will be sufficient, and an engineered traffic control plan will not be required.
- Provide traffic control setup and breakdown at each boring location. We plan to source traffic control signage/equipment for our work and did not include flag persons in this budget.
- Drill six (6) geotechnical borings along the portion of the proposed water main alignment that our 2018 subsurface explorations cannot supplement. We will collect bulk and ring samples of the subgrade soil for laboratory testing. Borings will be backfilled with soil cuttings and clean sand, and capped with asphalt concrete cold-patch upon completion. We expect borings of up to 15 feet will be sufficient for design of the proposed water main. Borings will be located so that there is an approximate 500-foot interval maintained between the new borings and 2018 borings, along the proposed water main alignment, to ensure an appropriate standard of care. We have budgeted one day of drilling.
- Perform laboratory testing which is expected to include in-situ moisture content and dry density determinations, maximum dry density and optimum moisture

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

content, grain size analysis, corrosion screening, sand equivalent, and direct shear testing. The laboratory testing program will be based on the conditions encountered during the field investigation with respect to the proposed improvements. Our 2018 laboratory test results will be provided as supplemental information for the portion of the proposed water main alignment able to be covered by our 2018 geotechnical investigation.

- Prepare a geotechnical report presenting our findings in the field, boring logs, a map depicting the boring locations, a discussion of the geotechnical conditions at the site, and geotechnical parameters for storm drain design.

Assumptions:

- The borings can be safely performed in the vicinity of the proposed water main alignment, considering existing utilities are present and to facilitate traffic flow around our drilling operations. Where performing the borings poses a conflict with existing utilities, resulting in an unsafe working environment for property, personnel, and/or motorists/pedestrians, the planned borings will be relocated, as feasible.
- This proposal does not include any costs to re-grade, install hot-mix asphalt concrete patching, re-vegetate, landscape or otherwise repair disturbed areas.

Deliverables – Geotechnical report

Task 3. Preliminary Engineering Design

3.1 Preliminary Design Plans (30% design)

RICK will prepare waterline plans for approximately (7,200 LF) for a proposed Ductile Iron pipe in Ramsey Street between Sunset Avenue and Highland Home Road. Plans will be at 40-scale and include plan and profile. Plans will be setup for 3 construction phases:
Phase 1: The waterline between Sunset Avenue to near the property at 3929 W. Ramsey Street.
Phase 2: The continuation of Phase 1 to Omar Street, then continuing north on Omar to W. Jacinto View Road, and then east to the Winchester Drive intersection.
Phase 3: From Omar Street westerly on Ramsey Avenue to approximately Highland Home Road.

Additionally, RICK will:

a. Collect the data from the utility and property research from scope items above to use as part of the base file for the water plans. Existing utilities will be shown on the plans in locations verified by the potholing above and/or provided by the utility companies. As part of the plan preparation, RICK will contact affected

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

utility companies to obtain permits if needed (utility fees to be paid by the City of Banning).

b. RICK will arrange and participate in informal meetings as necessary with City staff to review the progress of the project and exchange ideas and information.
c. Meetings with the City of Banning will discuss the key design issues and develop general project criteria for construction, including schedule and possible ways of minimizing problems. RICK will prepare and submit meeting agendas prior to the meetings.
d. RICK will provide data received and assumptions utilized to the city for approval prior to integrating the data into the project's final design.
e. RICK will prepare preliminary water plans (30-percent design) using AutoCAD for approximately 7,200 LF of water line (8-inch to 14-inch) to establish an agreement with the City of Banning on project scope, alignment, easements, parameters, hydraulic requirements, maintenance concerns, constructability and construction phasing, traffic impacts, and general disruption to the area. The preliminary design is to be submitted to the City of Banning for review and approval. The preliminary design shall address the following:
    a. Pipeline alignment/facility locations
    b. Construction schedule and phasing recommendations
    c. Construction Cost Estimate of recommended improvements
    d. Conflicts with other utilities and adjacent facilities in the area
    e. Traffic and pedestrian control
    f. Erosion Control
    g. Preferred materials for construction
    h. Areas where construction work is limited or controlled.
    i. Impacts to City water system.
    j. Impacts to surrounding business and residential areas.
    k. Easements (existing and proposed)
    l. Corrosion protection (if necessary)
f. The preliminary design will be submitted in PDF format through the City's SmartGov platform for the City of Banning's review and concurrence. The design will be at a 30% level of effort. Changes in layout and location of facilities suggested by the city will be investigated. A final layout and location of facilities will then be established.
g. As part of the meetings with the city, discussions and submittals of material will be presented to the city through the preliminary design process to reduce comment time and effort by the city.

It is assumed that the City of Banning will provide the size of the proposed new waterline. A hydraulic analysis is not included with this scope. However, we have provided it as an additional/if needed service.

It is assumed that the majority of the existing waterline will be abandoned in place.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

As part of the 30% design, RICK will prepare a traffic control conceptual staging plan for Phase 1 only identifying the assumed stages for each of the phases as noted in the Request for Proposal. The project Phase 1 proposes to construct approximately 2,600' of a water main along Ramsey Street from Sunset Avenue to 3929 W. Ramsey Street. It is anticipated that the traffic control conceptual staging plan will be prepared at 40 scale and will identify the proposed linear footage per stage and a description of the work that will be completed.

Deliverables – (all via the city's SmartGov platform): PDF of the preliminary design plans and the preliminary opinion of probable costs.

3.2 Preliminary Design Plans (60% design)

Rick will prepare plans based on the 30% design and subsequent review comments by the City. Plans include a one (1) cover sheet, two (2) detail sheet, ten (10) plan and profile sheets, two (2) connection detail sheets for private landowners, and one (1) valve shut down sheet if needed, and will show the existing water services and fire hydrants to the new waterline. Due to the existing waterline being at the back of the effected parcels, water meters, backflow devised and related system components shall be moved to front Ramsey off the new proposed waterline. Detail sheets will detail the on-site design connecting to the new line to provide a water system at minimum equal to the existing condition.

RICK's subconsultant, Dexter Wilson Engineering, will assist in preparation of technical specifications, pipeline material design, pipeline deflection calculations, design of thrust restraining systems, details for phased connections, details for connection to the existing pipeline, peer review of replacement plans, and other pipeline design aspects.

Consultant will incorporate any comments received from the City of Banning on the traffic control conceptual staging plan into the 60% design plans. Consultant will prepare 40-scale traffic control plans for the work associated with the Ramsey Street Water Main for Phase 1 only. The traffic control plans will provide work zones that are staged for construction of the water main, appurtenances, laterals, and any required detours. The one stage of traffic control is assumed as follows:

Phase 1: Sunset Avenue to 3929 W. Ramsey Street. There are assumed 5 stages of traffic control; Stage 1A is to 600' west of Sunset Avenue; Stages 1B, 1C, 1D, and 1E will be up to 500' along Ramsey to 3929 W. Ramsey Street.

The traffic control plans will be prepared following the requirements of the California Manual on Uniform Traffic Control Devices (MUTCD) and the City of Banning. Three (3) submittals are assumed – 60%, 90%, and final. Five (5) sheets

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

of traffic control plans are assumed for Phase 1.

A progress meeting will be coordinated with the City of Banning to discuss the 60% design plans. The meeting will discuss the comments and markups and establish a timeline for the project moving forward.

Deliverables - (all via the city's SmartGov platform): PDF of the preliminary design plans and the preliminary opinion of probable costs.

3.3 Detailed Design Plans (90% Design)

Rick will prepare the 90% detailed design waterline plans and traffic control plans based on the 60% review comments received from the City of Banning and other entities. Plans shall follow the City of Banning standards and policies.

RICK will prepare project specifications following the Standard Specifications for Public Works Construction, SSPWC, "Greenbook", latest edition.

RICK will prepare an opinion of probable cost and bid schedule that has construction items of work, unit of measurement, unit cost, and cost based on the detailed design waterline plans.

Deliverables - (all via the city's SmartGov platform): PDF of the preliminary design plans, the preliminary opinion of probable costs, and the Standards and Specifications

Task 4. Final Design Plans

4.1 Final Water Plans

Upon authorization from the City, RICK will finalize the waterline plans and traffic control plans based on the final comments from the City and other entities. Plans will follow the City of Banning standards and policies. Plans will be signed by a licensed Civil Engineer and provided to the City of Banning on Mylar.

RICK will provide the City of Banning a Final set of Project specifications based on final comments from the City of Banning following the SPPWC. RICK will also provide a final opinion of probable cost and bid schedule based on the signed waterline plans.

Deliverables - (all via the city's SmartGov platform): PDF of the preliminary design plans, the preliminary opinion of probable costs, and the Standards and Specifications

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

Task 5. Easement Documents

5.1 Easement Documents

RICK will prepare a legal description and plat for each easement for three (3) permanent easements to be granted to the City of Banning and ten (10) temporary construction easements that are required for reconnection of existing private water systems to the new water main. RICK will obtain and review title reports for the thirteen (13) affected properties.

RICK assumes three (3) permanent easements to be granted to the City of Banning and ten (10) Temporary Construction Easements for reconnection of existing private water systems to the new water main.

Assumptions:

- Assumes up to 13 tax parcels owned by 13 unique entities are impacted by temporary construction easements (TCE's) and/or permanent easements.
- Scope does not include any discussions with property owners.
- No appraisal work or negotiations included.
- Consultant is providing legal description and plat for the 13 easements only.

Deliverables - (all via the city's SmartGov platform): Easement documents (legal description and plat) and up to 13 preliminary title reports.

Task 6. Stormwater Pollution Prevention Plan

6.1 Stormwater Pollution Prevention Plan

The Risk Type 1 LUP SWPPP will be prepared in accordance with the requirements of the Appendix E of the National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities Order WQ 2022-0057-DWQ NPDES No. CAS000002 (adopted September 8, 2022, effective September 1, 2023).

RICK will prepare a Risk Type 1 LUP SWPPP based on the project's assumed Risk Type.

This task will also include the preparation of a Notice of Intent (NOI) on the Storm Water Multi Application Report Tracking System (SMARTS) database. The Discharger must designate RICK as a Data Entry Person to prepare the NOI. The Discharger/LRP must electronically certify and submit the NOI on SMARTS.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

RICK will act as the initial Qualified SWPPP Developer (QSD) for the preparation of the SWPPP, however the Discharger must hire a QSD and a Qualified SWPPP Practitioner (QSP) for implementation of the SWPPP throughout the life of the project.

Based on the provided bid package this project is assumed to be a Risk Type 1 LUP based on the following assumptions:

1. More than 70% of the soil disturbance will occur on paved surfaces; and
2. Areas that are disturbed will be returned to pre-project conditions at the end of each day.

Deliverables - (all via the city's SmartGov platform): SWPPP (erosion control plan submitted via drawing submittals)

Task 7. Construction Surveying and Staking

7.1 Phase One Water Stakes

RICK will maintain horizontal and vertical control for the duration of the surveying work on this project. RICK will also provide required calculations to field crew for each survey request received.

RICK will provide one set of stakes at all primary points of control; beginning and ends of pipe and at not less than 50' on center along tangent sections and 25' on curves to facilitate the construction of approximately 2,600 LF of water mainline. RICK will also provide not more than two (2) stakes each; to facilitate the location of services, fire hydrants, and points of connection.

*Water stakes to be set in three (3) trips.

Deliverables – Construction Staking Cut Sheets

7.2 Phase Two Water Stakes

RICK will provide one set of stakes at all primary points of control; beginning and ends of pipe and at not less than 50' on center along tangent sections and 25' on curves to facilitate the construction of approximately 2,700 LF of water mainline. RICK will also provide not more than two (2) stakes each; to facilitate the location of services, fire hydrants, and points of connection.

*Water stakes to be set in three (3) trips.

Deliverables – Construction Staking Cut Sheets

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

7.3 Phase Three Water Stakes

RICK will provide one set of stakes at all primary points of control; beginning and ends of pipe and at not less than 50' on center along tangent sections and 25' on curves to facilitate the construction of approximately 1,900 LF of water mainline. RICK will also provide not more than two (2) stakes each; to facilitate the location of services, fire hydrants, and points of connection.

*Water stakes to be set in three (2) trips.

Deliverables – Construction Staking Cut Sheets

Task 8. Bidding/Construction Support – Phase 1 Only

8.1 Bidding

RICK will be available during the advertising and bidding of the project to assist the City of Banning in answering questions/RFI's and the preparation of plan addenda, if needed. RICK will attend one (1) pre-bid meeting for the bidding process.

Deliverables – Meeting attendance, responses to Bidder's RFI's

8.2 Construction Administration

RICK will be available during the construction of the project to answer RFI's and prepare plan addenda, if needed. RICK will attend one (1) pre-construction meeting and eight (8) site visits during construction of the project as requested by the city. RICK will review shop drawings and submittals from the contractor for conformance with the contract plans and specifications, and make recommendations for acceptance, denial or resubmittal.

Deliverables – Meeting attendance, response to Contractor's RFI's, design addenda, submittal reviews

8.3 As-Built Plans

RICK will prepare As-Built Plans and process with the City of Banning, as necessary. Scope assumes RICK will receive as-built letters from the contractors and the contractor's as-built plan markup's. Scope assumes no major changes have occurred and does not include any as-built survey time. As-built plans will be submitted to the City within one month of receiving as-built letters and markup's from the contractor.
Deliverables – As-built Plans

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

Additional Services (If Needed Services)

Corrosivity Assessment

Rick's subconsultant, RF Yeager will prepare a corrosivity assessment for the proposed waterline, that will include a field resistivity testing, a review of the Geotech/soil chemical analysis data, a review for the potential of stray current interference, and a Corrosivity Assessment Letter Report. This information will be used for the determination of the type of corrosion protection and if any cathodic protection for the pipeline would be required and the corrosion control approach that the City may want to implement.

Deliverable – Corrosivity Assessment Letter Report

Corrosion Control Design

As part of the 90% design plans, RICK's subconsultant, RF Yeager, will provide Corrosion Control Design as part of the plans if Client requires joint bonds, test stations, insulators, and other standard corrosion control facilities. It is recommended the Client to use joint bonds, test stations, and insulators (steel or DIP) such that the pipeline is made electrically continuous and test stations are installed at the side of the road. This allows for monitoring and for adding cathodic protection in the future (should soil conditions/pipeline environment change) and will be much less costly because the pipe is electrically continuous and test stations are already installed. Corrosion control detail sheets, specifications, and cost estimate is included.

Cathodic Protection Design Pipeline

If it is found that Cathodic Protection is required, RICK's subconsultant, RF Yeager, will review the waterline plans, provide comments, and corrosion control design analysis/calculations. Details and specifications will be included. A cathodic protection system cost estimate will be included. RF Yeager will then address the 90% plan comments and provide final 100% design documents. Once approved for final signature, RF Yeager will sign and stamp the final drawings. Cathodic protection detail sheets, specifications, and cost estimates are included.
Deliverables – Corrosion control design analysis/calculations, specifications, and cost estimate.

Hydraulic Analysis

RICK's subconsultant, Dexter Wilson Engineering, will perform hydraulic modeling for the waterline sizing for the project site, if City does not provide the waterline

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

sizing. It is assumed City will provide the necessary information to run the modeling.

Caltrans Encroachment Permit

RICK will prepare one (1) Caltrans encroachment permit application for the traffic control devices (i.e. advance signage) that are within the Caltrans right-of-way (ROW) along Sunset Avenue in the vicinity of I-10. For the Caltrans encroachment permit application, the traffic control plans are assumed to be submitted to Caltrans in City of Banning format and will include a Caltrans signature block on the plans.

Plan Processing and Coordination (Caltrans)

RICK will submit and process the traffic control plans with Caltrans District 8. It is assumed that up to two (2) sets of plan check review comments will be received, coordinated, and addressed.

Monument Preservation

Pursuant to Section 8771 of the Business and Professions Code, preconstruction corner records will be prepared and filed identifying recovered survey monuments within the proposed construction limits. Post construction corner records will also be filed reflecting replacement monuments.

Deliverables – Pre and Post construction corner records

Monument Replacement

RICK will replace destroyed survey monuments at the completion of the construction with the project limits.

Record of Survey

Pursuant to 8762 of the Business and Professions Code the filing of a Record of Survey shall be filed if the survey discloses “the establishment of one or more points or lines not shown on any subdivision map, official map, or record of survey, the positions of which are not ascertainable from the inspection of the subdivision map official map or record of survey.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

III. In addition to the requirements of Parts I and II of this Scope of Services, during the performance of the Services, Consultant will keep City appraised through periodic status reports regarding the performance of the Services under this Agreement as set forth below and in Section 5.2, by the following means:

a. In-person meetings and/or teleconferences.

b. Email updates/questions to applicant team and City while reviews are underway.

c. Conference calls.

IV. All work product is subject to review and acceptance by City, and must be revised by Consultant without additional charge to City until found satisfactory and accepted by City.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

EXHIBIT "B"
SPECIAL REQUIREMENTS

TERMS FOR COMPLIANCE WITH CALIFORNIA LABOR LAW REQUIREMENTS

1. This Agreement calls for services that, in whole or in part, constitute "public works" as defined in Division 2, Part 7, Chapter 1 (commencing with Section 1720) of the California Labor Code ("Chapter 1"). Further, Consultant acknowledges that this Agreement is subject to (a) Chapter 1 and (b) the rules and regulations established by the Department of Industrial Relations ("DIR") implementing such statutes. Therefore, as to those Services that are "public works," Consultant shall comply with and be bound by all the terms, rules and regulations described in 1(a) and 1(b) as though set forth in full herein.

2. California law requires the inclusion of specific Labor Code provisions in certain contracts. The inclusion of such specific provisions below, whether or not required by California law, does not alter the meaning or scope of Section 1 above.

3. Consultant shall be registered with the Department of Industrial Relations in accordance with California Labor Code Section 1725.5, and has provided proof of registration to City prior to the Effective Date of this Agreement. Consultant shall not perform work with any subcontractor that is not registered with DIR pursuant to Section 1725.5. Consultant and subcontractors shall maintain their registration with the DIR in effect throughout the duration of this Agreement. If the Consultant or any subcontractor ceases to be registered with DIR at any time during the duration of the project, Consultant shall immediately notify City.

4. Pursuant to Labor Code Section 1771.4, Consultant's Services are subject to compliance monitoring and enforcement by DIR. Consultant shall post job site notices, as prescribed by DIR regulations.

5. Pursuant to Labor Code Section 1773.2, copies of the prevailing rate of per diem wages for each craft, classification, or type of worker needed to perform the Agreement are on file at City Hall and will be made available to any interested party on request. Consultant acknowledges receipt of a copy of the DIR determination of such prevailing rate of per diem wages, and Consultant shall post such rates at each job site covered by this Agreement.

6. Consultant shall comply with and be bound by the provisions of Labor Code Sections 1774 and 1775 concerning the payment of prevailing rates of wages to workers and the penalties for failure to pay prevailing wages. The Consultant shall, as a penalty to City, forfeit $200.00 for each calendar day, or portion thereof, for each worker paid less than the prevailing rates as determined by the DIR for the work or craft in which the worker is employed for any public work done pursuant to this Agreement by Consultant or by any subcontractor.

7. Consultant shall comply with and be bound by the provisions of Labor Code Section 1776, which requires Consultant and each subcontractor to: keep accurate payroll records and verify such records in writing under penalty of perjury, as specified in Section 1776; certify and make such payroll records available for inspection as provided by Section 1776; and inform City of the location of the records.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

8. Consultant shall comply with and be bound by the provisions of Labor Code Sections 1777.5, 1777.6 and 1777.7 and California Administrative Code Title 8, Section 200 et seq. concerning the employment of apprentices on public works projects. Consultant shall be responsible for compliance with these aforementioned Sections for all apprenticeable occupations. Prior to commencing work under this Agreement, Consultant shall provide City with a copy of the information submitted to any applicable apprenticeship program. Within 60 days after concluding work pursuant to this Agreement, Consultant and each of its subcontractors shall submit to City a verified statement of the journeyman and apprentice hours performed under this Agreement.

9. The Consultant shall not perform Work with any Subcontractor that has been debarred or suspended pursuant to California Labor Code Section 1777.1 or any other federal or state law providing for the debarment of contractors from public works. The Consultant and Subcontractors shall not be debarred or suspended throughout the duration of this Agreement pursuant to Labor Code Section 1777.1 or any other federal or state law providing for the debarment of contractors from public works. If the Consultant or any subcontractor becomes debarred or suspended during the duration of the project, the Consultant shall immediately notify City.

10. Consultant acknowledges that eight hours labor constitutes a legal day's work. Consultant shall comply with and be bound by Labor Code Section 1810. Consultant shall comply with and be bound by the provisions of Labor Code Section 1813 concerning penalties for workers who work excess hours. The Consultant shall, as a penalty to City, forfeit $25.00 for each worker employed in the performance of this Agreement by the Consultant or by any subcontractor for each calendar day during which such worker is required or permitted to work more than eight hours in any one calendar day and 40 hours in any one calendar week in violation of the provisions of Division 2, Part 7, Chapter 1, Article 3 of the Labor Code. Pursuant to Labor Code section 1815, work performed by employees of Consultant in excess of eight hours per day, and 40 hours during any one week shall be permitted upon public work upon compensation for all hours worked in excess of eight hours per day at not less than one and one-half times the basic rate of pay.

11. California Labor Code Sections 1860 and 3700 provide that every employer will be required to secure the payment of compensation to its employees. In accordance with the provisions of California Labor Code Section 1861, Consultant hereby certifies as follows:

> "I am aware of the provisions of Section 3700 of the Labor Code which require every employer to be insured against liability for workers' compensation or to undertake self-insurance in accordance with the provisions of that code, and I will comply with such provisions before commencing the performance of the work of this contract."
>
> **Date**_____ **Signature**_____

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

12. For every subcontractor who will perform work on the project, Consultant shall be responsible for such subcontractor's compliance with Chapter 1 and Labor Code Sections 1860 and 3700, and Consultant shall include in the written contract between it and each subcontractor a copy of those statutory provisions and a requirement that each subcontractor shall comply with those statutory provisions. Consultant shall be required to take all actions necessary to enforce such contractual provisions and ensure subcontractor's compliance, including, without limitation, conducting a periodic review of the certified payroll records of the subcontractor and upon becoming aware of the failure of the subcontractor to pay his or her workers the specified prevailing rate of wages. Consultant shall diligently take corrective action to halt or rectify any failure.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

EXHIBIT "C"
SCHEDULE OF COMPENSATION

I. Consultant shall perform the following Scope of Services at the rates stated in Exhibit C-1.

II. Within the budgeted amounts for each Task, and with the approval of the Contract Officer, funds may be shifted from one Task sub-budget to another so long as the Contract Sum is not exceeded per Section 2.1, unless Additional Services are approved per Section 1.8.

III. City will compensate Consultant for the Services performed upon submission of a valid invoice. Each invoice is to include:

A. Line items for all personnel describing the Services performed, the number of hours worked, and the hourly rate.

B. Line items for all materials and equipment properly charged to the Services.

C. Line items for all other approved reimbursable expenses claimed, with supporting documentation.

D. Line items for all approved sub-contractor labor, supplies, equipment, materials, and travel properly charged to the Services.

IV. Consultant's billing rates for all personnel are attached as Exhibit C-1.

Associate Planner	140.00
Assistant Planner	120.00
Planning Technician	95.00
Principal Project Landscape Architect/Manager	$190.00
Associate Project Landscape Architect/Manager	170.00
Assistant Project Landscape Architect/Manager	150.00
Principal Landscape/Urban Designer	125.00
Associate Landscape/Urban Designer	120.00
Assistant Landscape/Urban Designer	115.00
Principal Environmental Project Manager	$200.00
Associate Environmental Project Manager	170.00
Assistant Environmental Project Manager	150.00
Principal Environmental Specialist	140.00
Associate Environmental Specialist	130.00
Assistant Environmental Specialist	120.00
Environmental Technician	100.00
Senior Water Quality Manager	$240.00
Principal Water Resources Designer	155.00
Associate Water Resources Designer	140.00
Assistant Water Resources Designer	130.00
GIS Manager	$190.00
Principal GIS Project Manager	180.00
Associate GIS Project Manager	165.00
Assistant GIS Project Manager	150.00
Principal GIS Analyst	145.00
Associate GIS Analyst	130.00
Assistant GIS Analyst	120.00
Principal Graphics Designer	130.00
Associate Graphics Designer	125.00
Assistant Graphics Designer	115.00
CAD Manager	180.00
Field Supervisor	$195.00
One-person Survey Party (Prevailing Wage)	270.00
One-person Survey Party w/ Robotics (Prevailing Wage)	270.00
Two-person Survey Party (Prevailing Wage)	350.00
Three-person Survey Party (Prevailing Wage)	390.00
3D Laser Scanning Crew (One-Person)	$235.00
3D Laser Scanning Crew (Two Person)	280.00
Principal 3D Laser Scanning Project Manager	$190.00
Associate 3D Laser Scanning Project Manager	175.00
Assistant 3D Laser Scanning Project Manager	160.00
Principal 3D Laser Scanning Specialist	140.00
Associate 3D Laser Scanning Specialist	130.00
Assistant 3D Laser Scanning Specialist	120.00
Principal 3D Laser Scanning Technician	115.00
Associate 3D Laser Scanning Technician	100.00
Assistant 3D Laser Scanning Technician	90.00
Photogrammetry Supervisor	$185.00
Principal Photogrammetrist	155.00
Associate Photogrammetrist	120.00
Assistant Photogrammetrist	110.00
Principal Survey Analyst	$185.00
Associate Survey Analyst	150.00
Assistant Survey Analyst	125.00
Associate Project Administrator	$80.00
Assistant Project Administrator	70.00
Administrative Assistant/Manager	75.00

Rates subject to change for prevailing wage contracts.
When authorized, overtime shall be charged at the listed rates times 1.5.
Unless otherwise agreed upon, we shall charge for printing, reproduction, deliveries, transportation, and other expenses.
A fifteen (15) percent fee for administration, coordination and handling will be added to all subcontracted services.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79

Structural Engineer
$185.00 Per Hour

SKS Engineering, Inc.

Position	Hourly Rates
Principal	$205-275
Senior Associate	$150-220
Associate	$110-170
Senior Analyst	$105-135
Analyst	$70-105
Assistant Analyst	$60-115
Administrative Support	$65-105

URBAN CROSSROADS

General

(1) Reimbursable direct costs, such as reproduction, supplies, and messenger service will be billed at cost.
(2) Hourly rates apply to work time, travel time, and time spent at public hearings and meetings. For overtime work, the above rates may be increased 50 percent.
(3) Monthly billing statements are due within thirty (30) days of receipt.

TURNING MOVEMENT COUNTS (TMC)
$226.00 – 2-hour Peak Period Counts – Pedestrian & Bicycles Included
$226.00 – 4-hour Peak Period Counts – Pedestrian & Bicycles Included
$339.00 – 6-hour Peak Period Counts – Pedestrian & Bicycles Included

BI-DIRECTIONAL VOLUME (ADT) – TUBE COUNTS
$100.00 – 24 hours (1-day)
$200.00 – 48 hours (2-day)
$300.00 – 72 hours (3-day)
$400.00 – 96 hours (4-day)
$500.00 – 120 hours (5-day)
$600.00 – 144 hours (6-day)
$700.00 – 168 hours (7-day)

BI-DIRECTIONAL SPEED OR CLASSIFICATION – TUBE COUNTS
$198.00 – 24 hours (1-day)
$396.00 – 48 hours (2-day)
$594.00 – 72 hours (3-day)
$792.00 – 96 hours (4-day)
$990.00 – 120 hours (5-day)
$1,188.00 – 144 hours (6-day)
$1,386.00 – 168 hours (7-day)

OTHER STUDIES – QUOTES BASED ON SCOPE
Pedestrian Gap Studies
Parking Duration Studies
Video Turning Movement Counts
Radar Studies – Non Intrusive
Travel Time Studies – GPS
Many more customized studies available

EXHIBIT "D"
SCHEDULE OF PERFORMANCE

I. Consultant shall perform all Services timely, and deliver the specified tangible work products to City in accordance with the schedule attached as Exhibit D-1.

II. The Contract Officer may approve extensions for performance of the Services in accordance with Sections 1.8 and 3.3.

DocuSign Envelope ID: BF8F66BC-485E-460D-B3E1-CCE525366D79
