This notice is posted pursuant to the Texas Open Meetings Act. Notice is hereby given that a **Regular Sustainability Commission Meeting** of the City of Buda, TX, will be held at which time the following subjects will be discussed and may be acted upon.

A. **CALL TO ORDER**

B. **INVOCATION**

C. **PLEDGE OF ALLEGIANCE TO THE FLAGS OF THE UNITED STATES AND TEXAS**
   
   PLEDGE OF ALLEGIANCE TO THE TEXAS FLAG: Honor the Texas flag; I pledge allegiance to thee, Texas, one state under God, one and indivisible.

D. **ROLL CALL**

E. **PUBLIC COMMENTS/PUBLIC TESTIMONY**

   Members of the public who wish to participate in Public Comment must complete a sign-in form and turn it into the City Clerk before the period provided for Public Comment is called for consideration by the presiding officer. Members of the public who wish to participate during the Public Testimony period provided for any item on the agenda must complete a sign-in form and turn it into the City Clerk before the item they wish to participate in is called for consideration by the presiding officer.

F. **CONSENT AGENDA**

   F.1. Approval of the minutes from the October 3, 2019 Sustainability Commission meeting

   *Sustainability Commission Minutes 10.3.19.docx*

G. **REGULAR AGENDA**

   G.1. Deliberation and possible action on offering holiday light recycling (Deputy City Manager Micah Grau)

   G.2. Presentation of the draft 2018 CAPCOG Air Quality Report and update on 2019 Ozone Action Days (Deputy City Manager Micah Grau)

   *CACAC Meeting 2019-10-31 item 4 - 2019 Ozone Season Monitoring and Outre...pdf*

   *CACAC Meeting 2019-10-31 item 5 - 2018 Annual Report and Data Analysis P...pdf*
H. REPORTS

H.1. Staff report on the Arbor Day activities held on November 1, 2019 (Deputy City Manager Micah Grau)

H.2. Update on Sustainability Commission sub-committees (Events/Education, Projects/Applications, Keep Buda Beautiful)

I. COMMISSION REQUEST FOR FUTURE AGENDA ITEMS

J. ADJOURNMENT

City Hall is wheelchair accessible and accessible parking spaces are available. Requests for accommodations must be made 48 hours prior to the meeting. Please contact City Hall at (512) 312-0084, or FAX (512) 312-1889 for information or assistance.

I, the undersigned authority, do hereby certify that the above Notice of Meeting of the Sustainability Commission of the City of Buda, was posted on the bulletin board in front of Buda City Hall, which is readily accessible to the public at all times, by 5:00 pm on November 4, 2019.

/s/__________________________________________
Staff Liaison
commission and/or committee, whose members may be in attendance, if such numbers constitute a quorum. The members of the boards, commissions and/or committees may be permitted to participate in discussions on the same items listed on the agenda, which occur at the meeting, but no action will be taken by such in attendance unless such item and action is specifically provided for on an agenda for that body, board, commission or committee subject to the Texas Open Meetings Act.
Sustainability Commission Agenda Item Report
Date: Thursday, November 7, 2019

Agenda Item No. 2019-678- #F.1
Contact: Micah Grau

Subject: Approval of the minutes from the October 3, 2019 Sustainability Commission meeting

1. Executive Summary
2. Background/History
3. Staff’s review and analysis
4. Financial Impact
5. Summary/Conclusion
6. Pros and Cons
7. Alternatives
8. Recommendation
A. CALL TO ORDER

Chairperson Rex Drake called the meeting to order at 7:00 pm.

B. INVOCATION

C. PLEDGE OF ALLEGIANCE TO THE FLAGS OF THE UNITED STATES AND TEXAS

PLEDGE OF ALLEGIANCE TO THE TEXAS FLAG: Honor the Texas flag; I pledge allegiance to thee, Texas, one state under God, one and indivisible.

D. ROLL CALL

Members Present:
Chairperson Rex Drake
Vice-Chair Marni Martinez
Commissioner Ashley Prendergast
Commissioner Blake Farrar
Commissioner Brittany Davis

Members Absent:
Commissioner Jacqueline Leo
Commissioner Staci Rives

E. PUBLIC COMMENTS

At this time, comments will be taken from the audience on non-agenda related topics for a length of time not to exceed three minutes per person. To address the Commission, please submit a Citizen’s Comment form to the Board Liaison prior to the start of the meeting. No action may be taken by the Commission during Public Comments.

Deputy City Manager Micah Grau informed the Commission about new rules required for public comment.

F. CONSENT AGENDA

F.1. Approval of the Sustainability Commission Meeting for September 5, 2019

Motion by Commissioner Martinez, seconded by Commissioner Davis. Motion passed 5-0.
G. REGULAR AGENDA

G.1. Deliberation and possible action on City of Buda water quality ordinances and management practices

Micah Grau introduced Water Resource Coordinator Blake Neffendorf and Senior Project Engineer Angela Kennedy to discuss this item. Neffendorf provided information on the Edwards Aquifer recharge formations located in and around Buda including the Antioch Cave. Kennedy briefed the Commission on the City's water quality ordinance, types of stormwater quality ponds, and innovative technologies that are being used to remove pollutants from the stormwater system. The presenters also spoke about the things homeowners can do to protect our groundwater by slowing and capturing stormwater run-off on their property and by using pesticides, herbicides, and fertilizers correctly. The Commissioners spoke of ways to inform the public about stormwater best practices including utilizing the Sustainability Commission blog, website, social media, and by developing a handout to distribute to the public. No action was taken.

G.2. Deliberation and possible action on a Sustainable Building Program for the City of Buda

Micah Grau presented this item. The purpose of the discussion was to gauge the Commission's interest in working on developing a Sustainable Building Program for Buda. Grau presented on possible components of the program including energy efficiency, water quality and conservation, use of recycled and sustainable materials, installation of dark sky compliant lighting, sustainable transportation initiatives, conservation and preservation of native spaces, and affordable housing. The Program would need to find suitable incentives and measures to be eligible for the Sustainable Building Program.

The Commission was interested in this project and viewed it as a medium to long-term priority. They wanted to see more information come back to the Commission. No action taken.

G.3. Deliberation and possible action on Buda’s 2019 Arbor Day festivities

Micah Grau presented information about the proposed Arbor Day events. A proclamation is scheduled for the October 15th Council Meeting recognizing November 1 as Arbor Day. Staff is coordinating a tree planting with Tom Green Elementary School at Green Meadows Park that morning. The Library will be hosting tree activities in the afternoon at the City Hall/Library lobby. Tree Folks from Austin will be providing free saplings to families. No action taken on this item.

H. STAFF REPORTS

Micah Grau presented this item to update the Commission on the recently purchased recycling trailer and carts. The Commission was pleased that the City was able to acquire the trailer and to begin offering recycling at community festivals. Staff intends to utilize it for the Booda Halloween event in late October. No action.

H.2. Update on Sustainability Commission sub-committees (Events/Education, Projects/Applications, Keep Buda Beautiful)

Events and Education did not meet this month. Project and Applications is scheduled to hold their first meeting on October 4th. Keep Buda Beautiful is still in the process of forming under the Buda Chamber. The Chamber has agreed to take this one.
I. COMMISSION REQUEST FOR FUTURE AGENDA ITEMS

None.

J. ADJOURNMENT

The Commission adjourned at 8:18 pm.
1. **Executive Summary**
   Staff will brief the Commission on the draft 2018 Air Quality Report compiled for the Austin-Round Rock MSA by the Capital Area Council of Governments and report on 2019 Ozone Action Days.

2. **Background/History**
   CAPCOG's Air Quality Program coordinates regional air quality planning and performs air quality technical research, especially focusing on ground-level ozone pollution. The program's planning efforts include coordinating development and implementation of voluntary regional air quality plans, providing technical assistance to organizations that participate in the air quality plans, administering regional pollution reduction grants and conducting air quality education and outreach to reduce emissions and exposure to air pollution. Technical research efforts include air quality monitoring, emissions inventory development, data analysis, modeling, and pollution control strategy evaluation. The program is funded through grants from the Texas Commission on Environmental Quality (TCEQ), the U.S. Environmental Protection Agency and local governments.

3. **Staff’s review and analysis**
   Buda has provided data for the 2018 report in compliance with the City’s pledge.

4. **Financial Impact**

5. **Summary/Conclusion**
   Not applicable.

6. **Pros and Cons**

7. **Alternatives**

8. **Recommendation**
   No action is needed.

- 1997 Standard
- 2008 Standard
- 2015 Standard
- Design Value

11/13/2019 Capital Area Council of Governments
2020 4<sup>th</sup> High Needed for NAAQS Violation

• In order for the 2018-2020 design value to exceed the NAAQS, the following 4<sup>th</sup> high values would need to be measured at one of TCEQ’s regulatory ozone monitors:
  • CAMS 3, Austin Northwest = 78 ppb
  • CAMS 38, Austin Audubon Society = 80 ppb
• This is highly unlikely for the region.
  • Due to a good ozone season this year, we should not expect a violation in 2020.
AQI Days, Jan. 1 – Oct. 20

- **Good**: 184 days (63%)
- **Moderate**: 106 days (36%)
- **Unhealthy for Sensitive Groups: Ozone**: 2 days (1%)
- **Unhealthy for Sensitive Groups: PM 2.5**: 1 day (0%)

Item 5: 2018 Annual Air Quality Report & Data Analysis Report

Central Texas Clean Air Coalition Advisory Committee
October 31, 2019
2018 Annual Air Quality Report
Highlights

• 10 days when ozone levels were “unhealthy for sensitive groups.”

• For the first time in a long time, PM$_{2.5}$ levels reached “unhealthy for sensitive groups” on a few days.

• 7 out of 8 TCEQ Ozone Action Day forecasts correctly predicted ozone levels > 70 ppb.

• While NO$_X$ continued to trend downward, emissions from regional power plants during the 2018 O$_3$ season were higher than in 2017.

• Research conducted by CAPCOG in spring 2019 indicates that on-road NO$_X$ emissions within the region at least 13% higher than current modeling due to high gasoline sulfur levels within the region.

• New legislation adopted in spring 2019 will significantly increase the amount of grant funding for reducing emissions from diesel on-road and non-road sources.
EPA’s Comments on Annual Report

• “CAPCOG’s continued efforts to bring local jurisdictions and stakeholders together to raise awareness about ozone trends and to encourage their investment in air quality maintenance/improvement (including commitments that will help reduce ozone precursors and their assumption of some of the financial burden formerly covered by Rider funds) is impressive. Great work!”

• “We’ve said it before, but it bears repeating – your table laying out all of the TERP grant programs and their impact over the past FY in the Austin area is extremely helpful. Thank you for pulling that information together in such a clear, concise way!”

• “Your hard work to seek a Volkswagen settlement allocation for the Austin area was clearly successful – congratulations! The NOx emissions avoided as a result of these eventual projects will definitely be worth capturing in your plan.”

• “Given that PM$_{2.5}$ levels have crept up a bit in your area, would you have an interest in participating in [EPA’s] Advance [Program] with respect to PM$_{2.5}$?”
CAC Reporting for 2018

- 26 CAC member organizations provided updates on emission reductions measures and operational data
- CAC Members who did not report are:
  - CAMPO
  - City of Bastrop
  - City of Georgetown
  - City of Leander
  - City of Luling
  - City of Pflugerville
  - CLEAN AIR Force
  - Hays County
2018 Air Monitoring Data Analysis

• Purpose
  – Analysis 2018 Ozone Data
    • Temporal Analysis
    • Meteorological Trends
    • Co-Pollutant Correlations
    • Ozone Transport Analysis
    • NO$_x$ Emission Profile Changes
  – Compare 2018 data to previous timeframes
    • 2017
    • 2016
    • 2010-2015 (conceptual model)
Temporal Analysis

Percentage of days with MDA8 values >70 ppb by month

- 2010-2015
- 2016
- 2017
- 2018

Temporal Analysis

Distribution of MDA8 O₃ above 70 by day of the week

- 2010-2015
- 2016
- 2017
- 2018
Temporal Analysis

Distribution of start hour for MDA8 ≥ 55 ppb by monitoring station, 2018
Meteorological Trends

Typical Wind Speed 12 pm – 4pm at CAMS 3 on Days with MDA8 O₃ <55 ppb, 55-70 ppb, and >70 ppb at CAMS 3, 2010-2015, 2016, 2017, and 2018

![Average Wind Speed Chart](chart.png)
Meteorological Trends

Typical Temperature 12 pm – 4pm at CAMS 3 on Days with MDA8 O₃ <55 ppb, 55-70 ppb, and >70 ppb at CAMS 3, 2010-2015, 2016, 2017, and 2018
Meteorological Trends

Typical Relative Humidity 12 pm – 4pm at Camp Mabry on Days with MDA8 O₃ <55 ppb, 55-70 ppb, and >70 ppb at CAMS 3, 2010-2015, 2016, 2017, and 2018

![Bar chart showing average relative humidity for different O₃ concentrations from 2010 to 2018.](chart.png)
Meteorological Trends

Number of Days Upwind in 2018 per County on Days with MDA8 O3 days >70 ppb at CAMS 3 at elevations of 100 m, 500 m, and 1,000 m
Comparison of Background Contribution to MDA8 O₃ on Days with MDA8 O₃ <55 ppb, 55-70 ppb, and >70 ppb at CAMS 3, 2010-2015, 2016, 2017, and 2018
Comparison of Local Contribution to MDA8 O3 on Days with MDA8 O3 <55 ppb, 55-70 ppb, and >70 ppb at CAMS 3, 2010-2015, 2016, 2017, and 2018
Key Findings

• The monthly distribution of high O$_3$ was unusual due to a very large number of high O$_3$ days in July and no days when MDA8 O$_3$ even reached “moderate” levels after August.

• While the 2018 levels were substantially higher than in 2017 or 2016, they would not be considered “outliers” based on year-to-year variation across the 2016 – 2018 period.

• Two local meteorological factors stand out as potential explanations for the higher O$_3$ observed in the MSA in 2018 compared to 2017 and 2016: more days high temperatures (>90 deg. F) and more days with lower RH (<40%).
Key Findings

- There were several other meteorological factors that the region’s Conceptual Model has previously shown were associated with high O₃ that were actually less prevalent in 2018, including low wind speed, high diurnal temperature changes, and high solar radiation.

- The “transport” analysis suggests that the local contribution on high O₃ days (>70 ppb) continued to be about 20 ppb.

- Aside from counties within the Austin-Round Rock-Georgetown MSA, Bexar, Comal, Gonzales, and Guadalupe Counties were the most common “upwind” counties of CAMS 3 when MDA8 O₃ levels were >70 ppb.

- Overall, 2018 meteorological data trends were consistent with the relationship between MDA8 O₃ and weather conditions observed in 2010-2015.
Thank You, Questions?

The preparation of this report was financed through funding provided by local governments participating in the Central Texas Clean Air Coalition. The content, findings, opinions, and conclusions are the work of the author(s) and do not necessarily represent findings, opinions, or conclusions of the individual members of the Coalition.
Executive Summary

This is the annual air quality report for the Austin-Round Rock-Georgetown Metropolitan Statistical Area (MSA) prepared by the Capital Area Council of Governments (CAPCOG) for the members of the Central Texas Clean Air Coalition (CAC), the Texas Commission on Environmental Quality (TCEQ), and the U.S. Environmental Protection Agency (EPA). This report serves as the region’s annual “check-in” with EPA as part of the CAC’s participation in the Ozone (O₃) Advance Program (OAP). The report covers January 1, 2018, through December 31, 2018. Under the most recent MSA definitions promulgated by the Office of Management and Budget (OMB) in September of 2018, the Austin-Round Rock-Georgetown MSA consists of Bastrop, Caldwell, Hays, Travis, and Williamson Counties, which are the same five counties that have been participating in regional air quality planning efforts since 2002.

The report is intended to do the following:

- Provide an update to EPA, TCEQ, and local stakeholders on the status of air quality in the Austin-Round Rock-Georgetown MSA through the end of 2018 (Section 1);
- Provide an update on the latest understanding of the contribution of the region’s emissions to high O₃ levels when they occur (Section 2);
- Summarize the status of emission reduction measures implemented in the region in 2018 (Section 3);
- Detail ongoing planning activities in the region (Section 4); and
- Identify new issues affecting air quality planning efforts in 2019 and beyond (Section 5).

Some of the highlights of the report are listed below:

- The region’s 2018 air pollution levels continued to meet all federal air quality standards, although O₃ levels were high enough to put the region at risk of violating the O₃ standard for 2017-2019 and 2018-2020 if O₃ levels are not lower in 2019 and 2020;
- There were a total of 13 days when monitored air pollution levels were considered “unhealthy for sensitive groups” and another 122 days when air pollution levels were considered “moderate,” according to EPA’s Air Quality Index (AQI);
- For the first time in a long time, PM₂.₅ levels measured within the region were high enough on a few days to be considered “unhealthy for sensitive groups;”
- While overall emissions of nitrogen oxides (NOₓ) continued to trend downward, emissions from regional power plants during the 2018 O₃ season were higher than they were in 2017;
- Emission reduction measures implemented by the state and local partners in 2018 continued to help significantly control regional O₃ levels;
- Research conducted by CAPCOG in spring 2019 indicates that on-road NOₓ emissions within the region are likely at least 13% higher than current modeling would indicate due to high gasoline sulfur levels within the region;
- New legislation adopted in spring 2019 should significantly increase the amount of grant funding available for reducing emissions from diesel on-road and non-road sources; and
The CAC completed the adoption of a new regional air quality plan for 2019-2023 to take the place of the expiring OAP Action Plan.

This report includes information from 26 different CAC member organizations. Another eight CAC member organizations did not provide reports this year. CAPCOG will provide an addendum to this report to CAC members, TCEQ, and EPA, if these organizations provide reports or we receive any updates from any other organization after this report has been submitted. Supplemental spreadsheets provide details of each organization’s reported activities.

1 Air Quality Status

The following bullet points summarize the status of the Austin-Round Rock-Georgetown MSA’s air quality status as of the end of 2018:

- Air pollution levels throughout the metro area remained in compliance with all National Ambient Air Quality Standards (NAAQS), although the region’s 2016-2018 O₃ levels were just 3% below the 2015 O₃ NAAQS.

- Through the end of 2018, City of Austin is the 2nd-largest in the U.S. with air pollution levels in compliance with all NAAQS, and is the largest city in the U.S. designated “attainment/unclassifiable” for all NAAQS (San Jose, which is the next-largest city, also attaining all NAAQS, but Santa Clara County where it is located, is part of the San Francisco Bay O₃ nonattainment area).

- All five of the counties in the Austin-Round Rock-Georgetown MSA remain designated as “attainment/unclassifiable” for the 2015 O₃ NAAQS and all other NAAQS.

- The region recorded ten days when O₃ levels were considered "unhealthy for sensitive groups," as well as an additional 139 days when either NO₂, O₃, or PM₂.₅ levels were considered "moderate," based on EPA’s AQI.

- The region’s cumulative seasonal O₃ levels were 55% below the levels that EPA considers harmful to vegetation.

- TCEQ has not completed a new review of air toxics data collected at CAMS 171 since 2017, which reflected 2016 data. That review, however, found that all air toxics levels measured were below the levels that would be expected to cause adverse health or environmental impacts.

- Seven out of eight TCEQ OAD forecasts correctly predicted O₃ levels > 70 ppb.

- Overall, TCEQ’s daily AQI forecasts correctly predicted “moderate” or worse air quality 70% of the time, but they only were able to predict 59% of all days when the AQI levels were “moderate” or worse within the region.

While the region was able to narrowly remain in compliance with the NAAQS through the end of 2018, there were a total of ten days when air pollution levels within the region was considered “unhealthy for sensitive groups” for ground-level O₃.

The following map shows the locations of all of the Continuous Air Monitoring Stations (CAMS) that collect air pollution and meteorological data in and near the Austin-Round Rock-Georgetown MSA, including the monitors operated by TCEQ, CAPCOG, St. Edward’s University, and the National Weather Service.
1.1 Compliance with the NAAQS

The Austin-Round Rock-Georgetown MSA’s 2018 design values for carbon monoxide (CO), nitrogen dioxide (NO₂), O₃, particulate matter with diameters of 2.5 micrometers or less (PM₂.₅), particulate matter with diameters of 10 micrometers or less (PM₁₀), and sulfur dioxide (SO₂) were all in compliance with the applicable NAAQS. Lead (Pb) is not monitored within the region. Table 1-1 shows all of the NAAQS currently in effect.

</table>
There are four “regulatory” monitoring stations in the Austin-Round Rock-Georgetown MSA, all located in Travis County, that reported data to EPA and were used for comparisons to the NAAQS. Table 1-2 summarizes the Federal Reference Method (FRM) monitors in the region and the years for which data are available from 2016-2018. CAMS 1068 is the region’s designated “near-road” monitor.

Figure 1-2 shows the metro area’s 2017 and 2018 design values compared to each primary NAAQS. The 2018 design value for 8-hour O₃ was slightly lower compared to 2017, whereas the design values for PM₂.₅ saw an increase in 2018 compared to 2017.¹

Figure 1-2. Austin-Round Rock-Georgetown MSA Design Values as a percentage of Primary NAAQS

While there is no formal threshold that delineates an area as “near-nonattainment,” Appendix D to 40 CFR Part 58 does specify that for certain pollutants, measurements above a certain % of the maximum

¹ Data for all pollutants other than PM₁₀ obtained from EPA design value reports posted at: [https://www.epa.gov/air-trends/air-quality-design-values](https://www.epa.gov/air-trends/air-quality-design-values). PM₁₀ figure calculated as 4th-highest recorded 24-hour PM10 concentration over a 3-year period from data from TCEQ’s website.
allowed under the NAAQS trigger additional monitoring requirements. For the O₃ and PM₂.₅ NAAQS, measurements at or above 85% of the NAAQS trigger additional monitoring requirements, while for PM₁₀.₅, “medium concentration” monitoring requirements apply to data exceeding 80% of the NAAQS. If the 85% threshold were used to define an area as “near-nonattainment,” then the Austin metro area would only be near-nonattainment for the 2015 O₃ NAAQS, while if the 80% threshold were used, the Austin area would also be near-nonattainment for the 2012 PM₂.₅ annual NAAQS.

1.2 O₃ Design Value Trend

Figure 1-3 below shows the trend in the Austin-Round Rock-Georgetown MSA’s 8-hour O₃ design values from 2010-2018 compared to the 2008 and 2015 8-hour O₃ NAAQS, along with the 4th-highest Maximum Daily 8-Hour Average (MDA8) O₃ at each regulatory O₃ station. MDA8 is the daily maximum 8-hour concentration for a given calendar day that is the highest of the 24 possible 8-hour average concentrations computed for that day. Over this time, the region’s design value has decreased an average of 0.75 ppb per year.

Figure 1-3. Austin-Round Rock-Georgetown MSA 8-Hour O₃ Design Value and 4th-Highest MDA O₃ Trend 2010-2018
After a 3 ppb increase from 2016 to 2017, the region experienced a 1 ppb decrease from 2017 to 2018. The variation in design values between 2016 and 2018 is due to the high O₃ measurements from 2015 dropping out of the three-year average. Due to the high O₃ levels in 2018, a 4th-highest MDA8 O₃ of 71 ppb or higher at CAMS 3 or 76 ppb or higher at CAMS 38 in 2019 would cause a violation of the 2015 O₃ design value for 2017-2019. As of July 31, 2019, the 4th-highest MDA8 O₃ values for 2019 at CAMS 3 and 38 were both 62 ppb, but the highest O₃ levels typically occur in August and September.

Figure 1-4 above shows the 4th highest MDA8 O₃ values at CAMS 3 since 2010 and compares these values to the trendline and the 95% confidence range². In 2018, the 4th highest value was at the high end of the expected 95% confidence range. The fact that it was on the high side of the range indicated that the region experienced a higher than expected 4th highest MDA8 O₃ values at CAMS 3.

1.3 Maximum Daily 8-Hour O₃ Averages in the Region

While compliance with the O₃ NAAQS is based on readings recorded at “regulatory” Federal Reference Method (FRM) or Federal Equivalent Method (FEM) O₃ samplers, there are also a number of non-regulatory O₃ monitoring stations in the region that can be used to understand regional O₃ levels.

In addition to the two regulatory O₃ monitors that TCEQ operates, CAPCOG collected O₃ data at eight monitoring stations and St. Edward’s University collected data at one additional O₃ monitoring station between 2016 and 2018. These monitoring stations use EPA-approved O₃ sampling methods and data collected during this period followed a Quality Assurance Project Plan (QAPP) approved by TCEQ, but were not operated as FRM or FEM monitors, and are not reported to EPA.

² 95% confidence interval range is based on the standard deviation for the 3-year design value period associated with that year. So, the standard deviation applicable to the 2018 data reflected 2016-2018 data.
Table 1-4 summarizes the fourth-highest MDA8 O₃ measurements collected at each monitoring station in the CAPCOG region in 2016, 2017, and 2018, as well as the three-year average for each station. CAMS 3 and 38 are the “regulatory” monitoring stations operated by TCEQ, while CAMS 601, 614, 684, 690, 1603, 1604, 1675, and 6602 are research monitoring stations operated by CAPCOG. CAMS 1605 is owned and operated by St. Edward’s University. Reports documenting the quality-checks performed at CAPCOG’s sites can be found on CAPCOG’s website at http://www.capcog.org/divisions/regional-services/aq-reports.

CAMS 1605 was installed by St. Edward’s University at their campus in Austin ahead of the 2016 O₃ season in order to support scientific research involving the launching of “ozonesondes” to collect vertical measurements of O₃ on predicted high O₃ days. Throughout the 2016 O₃ season, the monitor recorded lower than expected ambient O₃ measurements for the vicinity based on analysis of modeling data and comparisons to the nearby CAMS 1603 monitor. Following a series of quality-checks, St. Edward’s University researchers determined that the O₃ data at CAMS 1605 was accurate and precise, but believed that values were likely lower than expected due to some NOₓ titration issues on campus where the monitor is located (less than 1 kilometer from IH-35, U.S.-71, and Congress Avenue, causing a potentially high localized concentration of NOₓ on campus).³ As Table 1-4 shows, 2018 O₃ levels were similarly low compared to the other monitors in Travis County. The CAMS 1605 data are therefore reliable for ground-level verification of the ozonesonde measurements, but not a good indication of neighborhood-level exposure of O₃ in the vicinity of the monitor.

A Google earth map of CAMS 1605 illustrates the proximity to nearby roadways.

³ On days in 2016 when at either CAMS 1603 or CAMS 1605 had MDA8 values of 55 ppb or higher, CAMS 1605 had MDA8 values that were, on average, 10.6 ppb lower than CAMS 1603, with a range of 2-19 ppb below the values at CAMS 1603. Modeling results from release 2 of the June 2012 episode available from TCEQ, on the other hand, showed that CAMS 1605 was only 1.1 ppb lower, on average, than CAMS 1603 when either site had MDA8 values of 55 ppb or higher, ranking from 3.5 below to 10.6 ppb above.
These data generally show that the 2016-2018 three-year average of the fourth highest MDA8 values in the region ranged from 56 ppb – 68 ppb, with two monitors recording fourth-highest MDA8 values at the upper end of that range (C3 and C614).

1.4 Daily Pollution Levels Compared to EPA’s AQI

While regulatory compliance is an important indicator of a region’s air quality, it is possible for an area to experience numerous NAAQS exceedances multiple times in a given year and still have a compliant design value. A design value also does not directly indicate how frequently a region experienced high pollution levels. Another indicator that can be used to characterize a region’s air quality is the number of days a region experiences air pollution levels that fall within each of the AQI categories established by EPA. Table 1-5 shows the concentrations of NO$_2$, O$_3$, and PM$_{2.5}$ that correspond to each AQI level.
This report includes data from all of the air pollution monitoring stations in the region, not just the TCEQ regulatory monitors that are used for formal AQI reporting to TCEQ. Therefore, the number of days in the "moderate" and "unhealthy for sensitive groups" categories described below are higher than if only the TCEQ regulatory monitors were used.

1.4.1 High AQI Days by Pollutant

The following figures show the number of days in 2018 when PM$_{2.5}$, PM$_{10}$, or O$_3$ concentrations measured in the CAPCOG region were high enough to be considered "moderate" or "unhealthy for sensitive groups." Monitored pollution levels for CO, NO$_2$, and SO$_2$ all remained in the "good" range throughout the year. In total, the region experienced moderate or worse air quality on 37% of days in 2018, with 13 of those days reaching "unhealthy for sensitive groups" levels. Note that for PM$_{10}$, sampling only occurs once every six days. Therefore, while there were two recorded "moderate" PM$_{10}$ days in 2018, there could well have been more, especially during July when PM$_{2.5}$ levels were also high.
Figure 1-6. Number of "Moderate" or "Unhealthy for Sensitive Groups" Air Pollution Days in the CAPCOG Region in 2018 by Pollutant

High levels of O₃ were responsible for the majority of the days when the region experienced air pollution levels considered "unhealthy for sensitive groups". However, high levels of PM².₅ were responsible for a majority of the days when air pollution levels were considered "moderate" or worse. Figure 1-7 shows the distribution of days when air pollution was considered at least "moderate" by pollutant.

Figure 1-7. Days in 2018 When AQI Levels in the MSA Were "Moderate" or Worse
1.4.2 High O₃ AQI Days by Monitoring Station

The following figures show the number of days when O₃ levels were considered “moderate” or “unhealthy for sensitive groups” at each O₃ monitoring station in the region in 2018. CAMS 1603 at Gorzycki Middle School experienced the majority of the “unhealthy for sensitive groups” days in the region. Additionally, CAMS 3 and CAMS 1675 each had 6 days that were “unhealthy for sensitive groups,” where all other monitors in the region had 3 or fewer days that were “unhealthy for sensitive groups” due to O₃.

Figure 1-8. Number of Days when O₃ Pollution was "Moderate" or Worse by Monitoring Station and County, 2018

1.4.3 High PM AQI Days by Monitoring Station

Figure 1-9 shows the number of days when PM₂.₅ levels were considered “moderate” or “unhealthy for sensitive groups” at each PM₂.₅ monitoring station in the region in 2018. These data are based on daily average PM₂.₅ levels collected from continuous samplers at CAMS 3, 171, and 1068. In July 2018, the region experienced 3 days when PM₂.₅ levels reached “unhealthy for sensitive groups” due to elevated PM₂.₅ levels associated with Saharan dust.
PM$_{10}$ levels recorded at CAMS 3 and 171 reached "moderate" levels on July 1, 2018, when both monitoring stations also recorded high PM$_{2.5}$ levels ("moderate" at CAMS 38 and "unhealthy for sensitive groups" at CAMS 171). There was also one day (December 22, 2018) when PM$_{10}$ levels were “moderate” at CAMS 38, but AQI levels for all other pollutants were in the “good” range region-wide.

1.4.4 Distribution of “Moderate” or Worse AQI Days by Month

Air pollution levels vary significantly by month in the CAPCOG region. Figure 1-10 shows the number of days when air pollution levels were “moderate” or “unhealthy for sensitive groups” within the region by month.
The absence of any days with “moderate” or worse air pollution during September and October was highly unusual, as was the very high number of days when the region experienced poor air quality in July.

1.4.5 Seasonal \( \text{O}_3 \) Exposure

While EPA set the 2015 secondary \( \text{O}_3 \) standard identical to the 2015 primary \( \text{O}_3 \) standard, the preamble to the rulemaking states that, “the requisite protection will be provided by a standard that generally limits cumulative seasonal exposure to 17 ppm-hours (ppm-hrs) or lower, in terms of a 3-year W126 index.”\(^4\) EPA did not set a separate secondary standard to protect public welfare, as opposed to public health, because, “such control of cumulative seasonal exposure will be achieved with a standard set at a level of 0.070 ppm, and the same indicator, averaging time, and form as the current standard.”\(^5\)

The region’s peak seasonal \( \text{O}_3 \) exposure levels were 55-70% below the 17 ppm-hr levels EPA referenced in the final 2015 \( \text{O}_3 \) NAAQS rulemaking. Figure 1-11 shows the 3-month seasonal exposure levels at each monitoring station by month.

\(^4\) 80 FR 65294
\(^5\) Ibid.
1.5 Air Quality Forecasting

One of the factors that influences the risks associated with air pollution is the extent to which air pollution can be accurately and successfully predicted. For the Austin area, there are two types of forecasting tools that can be used to help reduce the exposure of sensitive populations to high air pollution levels – OADs and daily Air Quality Forecasts.

1.5.1 O₃ Action Days

TCEQ issues OADs the afternoon before a day when it believes that O₃ levels may exceed the level of the NAAQS.

There are two ways CAPCOG measures the performance of OAD forecasting for the region over the past several years – accuracy in correctly predicting an OAD, and success in predicting when actual monitored O₃ levels were high enough to be considered "unhealthy for sensitive groups."

Using the new AQI for O₃, CAPCOG calculates these metrics as follows:

\[
\text{Accuracy in Correctly Predicting an OAD} = \frac{\text{Number of days OAD was issued}}{\text{Number of days OAD was predicted}}
\]

\[
\text{Success in Predicting O₃ Levels} = \frac{\text{Number of days O₃ levels were actually high enough to be considered "unhealthy for sensitive groups."}}{\text{Number of days actual O₃ levels exceeded 70 ppb}}
\]

Using these metrics means that TCEQ’s OAD forecasting efforts for the region in 2018 were accurate 87.5% of the time, but OAD forecasting missed 30% of the days when MDA8 O₃ levels actually exceeded 70 ppb (three out of eight). These metrics are only accounting for days when either a forecast was for
>70 ppb or actual $O_3$ was >70 ppb, and does not account for the other days when TCEQ correctly did not issue an OAD and $O_3$ did not exceed 70 ppb.

From 2016-2018, TCEQ issued a total of 12 OAD alerts for the Austin-Round Rock-Georgetown area – two in 2016, two in 2017, and eight in 2018. During this time frame, there were a total of 18 days when $O_3$ levels exceeded the level of the relevant $O_3$ NAAQS: one in 2016, seven in 2017, and ten in 2018. Table 1-6 lists each of these dates.

</tbody>
</table>

Seven of the eight OAD forecasts correctly predicted $O_3$ levels over the applicable NAAQS – a 87.5% accuracy rate over the three-year period. Conversely, there was a 70% “success rate” in predicting actual MDA8 $O_3$ levels over the applicable NAAQS from 2016-2018.
1.5.2 **Daily Air Quality Forecasts**

Unlike OADs, which are only issued for days when TCEQ believes \( \text{O}_3 \) will reach levels considered “unhealthy for sensitive groups;” daily air quality forecasts include forecasts for "good" and "moderate" air pollution levels as well; it also includes forecasts for pollutants other than \( \text{O}_3 \). The performance of these forecasts can also be measured using the same type of metrics used above for OADs – accuracy and success. In this case, CAPCOG evaluated the accuracy and success rate in terms of the number of days when air quality was forecast to be "moderate" or worse. The equations below explain these terms in terms of the daily AQI forecast.

\[
\text{Forecast Correct} = \frac{\text{OAD Days}}{\text{Days when MDA8 > NAAQS}}
\]

\[
\text{Forecast Not Correct} = 1 - \frac{\text{OAD Days}}{\text{Days when MDA8 > NAAQS}}
\]

Since the daily AQI forecasts for the region included forecasts for both \( \text{O}_3 \) and \( \text{PM}_{2.5} \), it is possible to analyze these accuracy and success rates by pollutant, as well as for the overall AQI. Figure 1-13 shows the results of this analysis for 2018.
2018 Regional O₃ Season Weekday NOₓ Emissions Profile

NOₓ emissions react with volatile organic compounds (VOC) in the presence of sunlight to form ground-level O₃. Depending on local conditions, an area’s O₃ problems can be influenced more by NOₓ emissions or VOC emissions. In the Austin metro area, NOₓ emissions account for about 99% of all locally-generated O₃. Therefore, understanding the contribution of different sources of NOₓ emissions to the region’s typical daily NOₓ emissions during ozone season helps understand the relative importance of these sources to O₃ formation.

Overall, TCEQ’s forecasts for “moderate” or higher O₃ levels were 59% accurate and 81% successful. Whereas, forecasts for “moderate” or higher PM₂.₅ forecasting were 60% accurate and 35% successful. Overall AQI forecasts were 70% accurate and 52% successful.
The following pie chart shows the estimated average 2018 $O_3$ season weekday anthropogenic NO$_x$ emissions in the region by major source type – on-road mobile, non-road mobile, point source, and area source emissions.
2.1 NO\textsubscript{X} Emissions by Source Type by County

Table 2-1 shows the break-down of the region’s ozone season day (OSD) weekday NO\textsubscript{X} emissions by county and source type.

2.2 On-Road Sources

The on-road sector includes mobile sources that are registered to operate on public roads. On-road vehicles remain the largest source of NO\textsubscript{X} emissions within the region, accounting for 27.11 tons per day (tpd) of NO\textsubscript{X} emissions on a typical 2018 OSD weekday, based on TCEQ’s most recent “trends” emissions inventories.\textsuperscript{6} Table 2-2 shows the typical 2018 O\textsubscript{3} season weekday NO\textsubscript{X} emissions for the region by source use type.

</tr>
</tbody>
</table>

Passenger cars and passenger trucks combined to account for 13.41 tpd of NO\textsubscript{X} emissions, while commercial trucking accounted for 11.10 tpd NO\textsubscript{X} emissions, and the remaining sources accounted for 2.61 tpd NO\textsubscript{X} emissions, most of which come from light commercial trucks.

### 2.3 Non-Road Sources

The non-road sector consists of any mobile source that is not registered to be operated on a public road, including sources such as agricultural equipment, construction and mining equipment, locomotives, aircraft, and drill rigs. Non-road sources made up the 3\textsuperscript{rd}-largest source of NO\textsubscript{X} emissions within the region in 2018, accounting for 15.89 tpd of NO\textsubscript{X} emissions on a typical O\textsubscript{3} season weekday. There are four different types of non-road data sets: equipment modeled in the MOVES2014b and TexNv2 models, locomotives/rail equipment, aircraft (including ground support equipment), and drill rigs.

</table>

For MOVES2014b sources, CAPCOG used the 2017 OSD estimates prepared by TCEQ for the AERR,\textsuperscript{7} then adjusted the totals four each SCC and county based on the ratio for 2018/2017 ratio for the SCC and county in TCEQ’s “trends” emissions inventory.\textsuperscript{8}

\textsuperscript{7} Available online here: ftp://amdaftp.tceq.texas.gov/pub/El/nonroad/aerr/2017/for_EPA/
\textsuperscript{8} Available online here: ftp://amdaftp.tceq.texas.gov/pub/El/nonroad/trends/
For Aircraft, CAPCOG interpolated the 2018 data using ERG's estimated O₃ season daily 2017 and 2020.⁹

For locomotives and drill rigs, CAPCOG used the existing trends inventories.¹⁰

### 2.4 Point Sources

The point source sector consists of any stationary source that reports its emissions to TCEQ. The most recent point source data that is publicly available from TCEQ is for 2017. In that year, there were 28 facilities in the Austin-Round Rock-Georgetown MSA that reported emissions to TCEQ.¹¹ Data specific to 2018 are also available for each electric generating unit (EGU) that reports to EPA, the Hal Weaver Power Plant, Austin White Lime, and Texas Lehigh Cement Company. CAPCOG estimated an average of 17.90 tpd NOₓ emissions from point sources in the MSA in 2018:

- Except for the turbines at Decker Creek Power Plant, CAPCOG used the average daily NOₓ emissions reported to EPA for May 1, 2018 – September 30, 2018 for all EGUs that report emissions to EPA,¹² (7.86 tpd);
- For the eight turbine units at Decker Creek Power Plant, CAPCOG used the average daily NOₓ emissions reported to EPA for May 1, 2018 – September 30, 2018, adjusted to reflect the ratio between the average OSD NOₓ emissions reported in TCEQ's EIQ for 2017 to the average OSD (May 1 – September 30) NOₓ emissions reported to EPA for 2017¹³ (0.15 tpd);
- For Austin White Lime and Texas Lehigh Cement company, CAPCOG used the average 2018 OSD NOₓ emissions reported to CAPCOG for this report (7.19 tpd);
- For the Hal Weaver Power Plant, its 2017 EIQ did not include an OSD estimate, and monthly fuel consumption data is available from EIA for both 2017 and 2018,¹⁴ so CAPCOG estimated the 2018 OSD NOₓ emissions by using the May 1, 2017 – September 30, 2017, and May 1, 2018 – September 30, 2018 fuel consumption data relative to the annual 2017 fuel consumption total (0.81 tpd);
- For all other sources of NOₓ emissions, CAPCOG used the OSD NOₓ emissions reported in the facility's 2017 EIQ (1.90 tpd).

Table 2-4 shows the estimated OSD NOₓ emissions by county for EGU and non-EGU sources.

Since EPA data for EGUs are available at the daily level, CAPCOG also analyzed the NO\textsubscript{X} emissions on the top four O\textsubscript{3} days at CAMS 3, since these four days would affect NAAQS compliance. On these days, EGU NO\textsubscript{X} emissions averaged 12.78 tpd, which is 60% higher than the May 1 – September 30 daily average. This suggests that point sources generally, and EGUs specifically, contributed more to O\textsubscript{3} formation on those top four days than the OSD estimate would suggest.
2.5 Area Sources

CAPCOG estimated the 2018 area sources using TCEQ’s 2017 summer weekday NOX emissions from its 2017 National Emissions Inventory submission.\textsuperscript{15}

\textsuperscript{15} E-mailed from Matthew Southard, TCEQ, to Andrew Hoekzema, CAPCOG, on July 26, 2019.
3 Implementation of O₃ Advance Program Action Plan and Other Measures

This section provides details on emission reduction measures implemented within the Austin-Round Rock-Georgetown MSA in 2018. This includes both measures that had been included in the OAP Action Plan and other measures that were not explicitly committed to in that plan.

3.1 Regional and State-Supported Measures

Regional and state-supported measures involve multi-jurisdictional programs or state involvement in an emission reduction measure within the region. These include:

- The vehicle emissions inspection and maintenance (I/M) program;
- The Drive a Clean Machine program;
- Texas Emission Reduction Plan (TERP) grants;
- Volkswagen Environmental Mitigation Trust Beneficiary Mitigation Plan for Texas;
- The Commute Solutions Program;
- The Clean Air Partners Program;
- The Clean Cities Program;
- Outreach and Education Measures; and
- Property-Assessed Clean Energy (PACE).

3.1.1 Vehicle Emissions Inspection and Maintenance Program

The Austin-Round Rock-Georgetown MSA is home to Travis and Williamson Counties – the two largest “attainment” counties in the Country that have a vehicle emissions inspection and maintenance (I/M) program. The I/M program has been in place since September 1, 2005, and it was implemented as part of the region’s participation in the Early Action Compact (EAC) program. The program's rules are found in Title 30, Part 1, Texas Administrative Code (TAC) Chapter 114, Subchapter C, Division 3: Early Action Compact Counties. Under the program, all gasoline-powered vehicles (including heavy-duty vehicles but excluding motorcycles) that are 2-24 years old are required to undergo an annual emissions inspection along with their annual safety inspection. Vehicles model year 1995 and older are required to pass a “two-speed idle” (TSI) test, and vehicles model year 1996 and newer are required to pass an “on-board diagnostic” (OBD) test. Up until the end of state fiscal year 2018, the inspection cost $16 per test:

- The station may retain $11.50
- $4.50 is remitted to the state and deposited into the Clean Air Account (Fund 151):
  - $2.50 is for state administration of the I/M program
  - $2.00 is for DACM/LIRAP (no longer collected as of late 2018)

If a vehicle fails an emissions inspection, the owner is required to fix the vehicle as a condition of registration. As described in 37 TAC § 23.52(a), "an emissions testing waiver defers the need for full
compliance with vehicle emissions standards of the vehicle emissions inspection and maintenance (I/M) program for a specified period of time after a vehicle fails an emissions test.” The following waivers are available in certain circumstances:

- A "low-mileage" waiver if a motorist has paid at least $100 for emissions-related repairs and is driven less than 5,000 per year
- An "individual vehicle" waiver if a motorist has paid at least $600 in emissions-related repairs

Under 37 TAC § 23.53(a), time extensions are also available:

- A "low-income time extension" is available if the motorist has income at or below the federal poverty level and the motorist hadn't previously received a time extension in the same cycle
- A "parts-availability time extension" is available if an applicant can show problems in obtaining the needed parts for repair

Some of the key metrics for the I/M program year-to-year are the number of emissions inspections and the failure rates. Table 3-1 summarizes the number and disposition of emissions inspections in 2018:

Table 3-1. I-M Program Statistics for 2018

</tbody>
</table>

In general, there have been year-over-year increases in the number of emissions inspections tracking with population increases, except for 2015. The difference in 2015 was that, due to a transition period in the state's move from a two-sticker (registration and inspection) system to a one-sticker system, some vehicles were able to skip a cycle of inspections if they had a January 2015 or February 2015 registration renewal deadline. By March 1, 2016, however, all vehicles should have "caught up." In 2018, there were approximately 0.67 emissions inspections per capita in Travis and Williamson Counties, compared to 0.49 emissions per capita in 2006, meaning that growth in emissions inspections is outpacing population growth in these counties.

---

16 Data e-mailed from David Serrins, TCEQ, to Andrew Hoekzema, CAPCOG, 7/30/2019.
Figure 3-1. Trend in Emissions Inspections Compared to Population in Travis and Williamson Counties 2006-2018

2018 saw a slight decline in the initial failure rate from the previous year, decreasing to 4.9%.

Figure 3-2. Initial Emissions Inspection Failure Rate Trend 2006-2018

Figure 3-3 shows the emissions test failure rates of each model year based on tests conducted in 2017 and 2018. As the figure below shows, the chances of older model-year vehicles failing an emissions test...
are significantly higher than a newer model-year vehicle failing a test. In 2018 for example, 2016 model year vehicles had a rate of only about 1.8%, whereas the rate for model year 2001 vehicles was 13.8%, eight times higher. As the figure shows, the failure rates for each model year were very similar in 2017 and 2018.

Figure 3-3. Emissions Test Failure Rate by Model Year, 2017 and 2018

As described above, under certain circumstances, a vehicle subject to annual testing requirements is allowed to continue operating under an I/M program waiver. Table 3-2 summarizes the waivers issued in 2017 and 2018.

3.1.2 Drive a Clean Machine Program

One significant development in the region’s air quality plan that occurred in 2017 was the Governor’s line-item veto of appropriations for the Drive a Clean Machine (DACM) program for state fiscal years 2018 and 2019 (Sep. 1, 2017 – Aug. 31, 2019). As a result of this veto, the Travis County and Williamson
County Commissioners’ Courts voted in late 2017 to suspend collection of the $2 surcharge on vehicle inspections associated with the program. Travis County, which has been administering the program on behalf of both itself and Williamson County since 2016, continued administering the program up through May 2019 with unspent funds that had already been appropriated to the counties in FY 2016 and 2017. The Drive a Clean Machine (DACM) program helped support the I/M program in Travis and Williamson Counties by providing funding to moderate-income and low-income motorists for:

- Repairing emissions control systems on vehicles that fail an emissions test;
- Replacing a vehicle that fails an emissions test; and
- Replacing a vehicle that is at least 10 years old.

Motorists could receive up to $600 for repairs, $3,000 for a car up to 3 years old, $3,000 for a truck up to 2 years old, or $3,500 for a hybrid or alternative-fueled vehicle up to 3 years old. New vehicles were required to meet Tier 2 bin 5 or Tier 3 bin 160 or cleaner standard. Replacement vehicles could not have an odometer reading of more than 70,000 miles. Replacement vehicles could only be purchased through a participating dealer and repairs must be performed by a recognized emissions repair facility for Travis and Williamson Counties. DACM achieved emission reductions beyond those that would be achieved by implementing an I/M program in the following ways:

- It increased I/M program compliance by making it more likely that a motorist brought in their vehicle for a vehicle inspection based on the knowledge that financial assistance was available if they failed the test;
- It increased I/M program compliance by reducing the need for low-income time extensions for repairs;
- It increased I/M program compliance by replacing older vehicles that were more likely to fail an emissions test with newer vehicles that were more likely to pass; and
- It accelerated the benefits of newer vehicle emissions standards by replacing older vehicles with newer vehicles.

As Figure 3-4 shows, the number of vouchers redeemed slightly increased from FY 2017 to FY 2018, although participation was still much lower than it had been in 2009 and 2010, prior to large program budget cuts. These data suggest that the reduced participation in the program as a result of those cuts may have had long-lasting impacts even after funding was reinstated in 2013 and 2015.
3.1.3 **Texas Emission Reduction Plan Grants**

Texas Emission Reduction Plan (TERP) grants provide funding for a variety of types of projects designed to reduce emissions, particularly NO\textsubscript{X}. These include:

- The Diesel Emissions Reduction Incentive (DERI) program, designed to achieve emission reductions by incentivizing the early replacement or repowering of older diesel-powered engines with newer engines:
  - The Emission Reduction Incentive Grant (ERIG) program is a competitive grant program based on the cost/ton of NO\textsubscript{X} reduced;
  - The Rebate Grant program is a first-come, first-served grant program based on fixed rebate dollar amounts based on fixed cost/ton of NO\textsubscript{X} reduced assumptions;
- The Texas Natural Gas Vehicle Grant Program (TNGVGP) incentivizes the replacement of diesel-powered trucks with natural gas vehicle-powered trucks, with the newer engine needing to achieve at least a 25% reduction in emissions compared to the diesel power it is replacing;
- The Texas Clean Fleet Program (TCFP) incentivizes owners of large fleets to replace a significant portion of their conventionally-fueled vehicles with alternative-fueled vehicles, achieving emission reductions by replacing the older, dirtier engines with newer, cleaner engines;
- The Clean School Bus (CSB) program provides funding for the retrofit and replacement of older school buses;
- The Light Duty Motor Vehicle Purchase or Lease Incentive Program (LDPLIP) provides rebate incentives statewide to purchase or lease an eligible new light-duty motor vehicle powered by natural gas, propane, hydrogen fuel cell, or electric drive;
• The New Technology Implementation Grants (NTIG) program provides funding for new/innovative technology to reduce emissions from stationary sources; and
• The Alternative Fueling Facilities Program (AFFP) provides funding for the construction of a variety of types of alternative fuel infrastructure in nonattainment areas;
• The Seaport and Rail Yard Areas Emission Reduction (SPRY) Program provides funding for the early replacement of drayage trucks and equipment at eligible in ports and class I railyards in nonattainment areas (this program was formerly known as the Drayage Truck Incentive Program or DTIP). The Austin area is not eligible for this program.

Notable program changes mandated by the statutory changes adopted by the 2017 Texas legislative session included:

• Consolidation of the Clean Transportation Triangle (CTT) and AFFP programs;
• Allowing school bus replacements to be funded under the CSB;
• Reinstatement of the LDPLIP, and;
• New allocations of funding among the various programs.

TCEQ posted a series of reports on their program website in October 2018 that summarizes the estimated OSD weekday NO\textsubscript{X} emission reductions being achieved by each program for 2018 – 2021 based on grants awarded through August 31, 2018. Table 3-3 summarizes these data for the Austin area.\textsuperscript{17}

</tbody>
</table>

\textsuperscript{17} It is CAPCOG’s understanding that TCEQ develops OSD weekday NO\textsubscript{X} emission reduction estimates by dividing the annual NO\textsubscript{X} reductions by 260, which corresponds roughly to the number of weekdays in a year.
TCEQ does not provide NO\textsubscript{X} estimates for funding awarded for the NTIG, AFFP, or LDPLIP grant programs.

Table 3-4 shows the TERP funding awarded to the Austin-Round Rock-Georgetown MSA in FY 2018, along with any quantified NO\textsubscript{X} emissions reductions from those grants. The LDPLIP program is not included due to the lack of a project list available online that would enable identification of the amount awarded in grants in FY 2018 as opposed to prior years. A total of $771,665 was awarded statewide in FY 2018.\textsuperscript{22}

<td>12.19%</td>
<td>112.34</td>
<td>$37,541</td>
</tr>
</tbody>
</table>

The NOx reductions from grants awarded in the Austin in 2018 area translate to 0.05 tpd of additional NOx reductions for at least 2019-2022.

The $4,217,381 in funding awarded to the Austin area was significantly less than the $7,704,529 that TCEQ awarded to the Austin area the prior year. However, the FY 2018 totals do not include ERIG grants solicited at the end of FY 2018, which were not awarded until mid-FY 2019.

### 3.1.4 Texas Volkswagen Environmental Mitigation Program (TxVEMP)

While the TCEQ initially proposed not to award any funding from the Volkswagen settlement earmarked for vehicle and equipment replacement to the Austin area, the final version of their Beneficiary Mitigation Plan wound up identifying the Austin metro area as a "priority" area and allocated $16,297,602 of the $169,548,522 total available funds to the Austin-Round Rock-Georgetown MSA. The funds are for the replacement or repower of diesel vehicles and equipment to new diesel, alternative fuel (compressed natural gas, propane, or hybrid electric), or all-electric vehicles and equipment. TCEQ opened their first grant round for the Texas Volkswagen Environmental Mitigation Program in spring of 2019. The Beneficiary Mitigation Plan for Texas and information about the grants can be found at [www.TexasVWFund.org](http://www.TexasVWFund.org).

### 3.1.5 Commute Solutions Program

The Commute Solutions program is the region-wide Travel Demand Management (TDM) program that promotes activities to increase the efficiency and use of existing roadways by encouraging shifts from less efficient travel behaviors like, single occupant vehicle use, vehicle use during peak congestion hours, and travel on high-congestion roadways, to more efficient behaviors like, the use of public transit, carpools, vanpools, walking, biking, teleworking, alterative work schedules, and travel on less congested roadways. Due to the importance of these types of activities as part of the region’s air quality plan, CAPCOG leveraged the local air quality funding in order to support this activity. Apart from air quality, other benefits of the program and other TDM activities include:

- Improved regional mobility;

---

• Improved safety outcomes;
• Reduced fuel consumption;
• Reduced time wasted in traffic;
• Improved workforce and economic development outcomes;
• Improved public quality of life; and
• Reduced space needed to service the transportation system

In October 2018, Commute Solutions introduced a regional emergency ride home program to provide commuters who use a mode of commuting other than single-occupancy vehicles a free or reduced-cost ride home from work when an unexpected event occurs that necessitate the commuter to use another mode to get home. In addition, the program’s logo and branding were updated to provide a fresh and updated look.

The Commute Solutions website provides the public with information about central Texas mobility options and encourages the public to shift from single occupant vehicle use to a more efficient mode. In 2018, CAPCOG maintained and updated the Commute Solutions website; the following summarizes key statistics during this period.

*Figure 3-5. Commute Solutions Website Traffic, 2018*

Figure 3-8. Example Commute Solutions Newsletter Article from the March/April 2018 Newsletter

Commute Inspiration - Featured Commuter: Carrie D.

Learn how Carrie commutes smarter, helping our region reduce traffic congestion and vehicle emissions!

With no public transportation options between downtown and our home in western Travis County, my husband and I aim to carpool four days a week in an electric vehicle (Nissan Leaf), dropping off and picking up our kid at daycare together. Although my time in the car is slightly longer compared to driving myself, it gives us over an hour to discuss our week’s plans and priorities, so we never feel like time is wasted if we hit a traffic jam. If we run out of topics of conversation, I am lucky to be the only family member who doesn’t get carsick when reading, so as a passenger I can always use my phone to: get a head start on the work day by checking emails; download a book or magazine from the library for myself, or find interesting news items, and read them out loud for discussion. One of our challenges is also a benefit: we have to be much more organized in the morning to ensure none of us are late, a goal we are mostly successful at despite none of us being morning-people. I’m so glad we’ve pushed ourselves to do this more often, thanks in large part to the City of Austin’s rewards for more frequent alternative commutes. - Carrie D.

CAPCOG staff coordinated and collaborated from regional partners via the Regional TDM Coordinating Committee, formerly known as the Commute Solutions Steering Committee. This committee met twelve in 2018. In addition, CAPCOG staff has partnered with the City of Austin to provide an Emergency Ride Home Program, updated the program’s branding and marketing materials, and host a Commute
Solutions event; this work is expected to be completed in FY 2019. The table below shows the program participation from the myCommuteSolutions.com platform over the entire 2018 calendar year.

3.1.6 Clean Air Partners Program

CLEAN AIR Force’s Clean Air Partners Program includes reporting from a number of organizations outside of the CAC. These include:

- 3M;
- American Lung Association;
- Applied Materials;
- Austin Community College District;
- Austin Independent School District (AISD);
- Chemical Logic, Inc.;
- Emerson Process Management;
- EnviroMedia Social Marketing;
- Environmental Defense Fund;
- HNTB Corporation;
- Metropia;
- NXP;
- Oracle;

---

33 RideShark does have data on estimated fuel savings for driving alone if someone is using a vehicle with better-than average fuel consumption/emissions rates, but CAPCOG did not include those data in the totals for this table.

34 RideShark’s platform allows for entries for “days off,” but no fuel savings are included in the subtotal on this table.
• Pfizer;
• R&R Limousine and Bus;
• Samsung Austin Semiconductor;
• Seton Healthcare Family;
• Spectrum;
• St. David’s Healthcare;
• TECO-Westinghouse;
• Tokyo Electron;
• University of Texas at Austin; and
• Zephyr Environmental Corporation.

In addition, there are several CAC members who also participate in the Clean Air Partners Program:

1. CAPCOG;
2. City of Austin;
3. Central Texas Regional Mobility Authority (CTRMA);
4. CAMPO;
5. Lone Star Clean Fuels Alliance (LSCFA);
6. Lower Colorado River Authority (LCRA);
7. Travis County;
8. TxDOT Headquarters;
9. TxDOT Austin District; and
10. Williamson County

3.1.7 Outreach and Education Measures

Continued outreach and education is essential to achieving CAC goals. 2018 outreach and education activities are organized into six tasks:

1. Electronic Outreach;
2. In-person Outreach;
3. Development of Air Quality Educational Materials;
4. Air Quality Outreach and Education Coordination and Collaboration;
5. Air Quality Outreach Activities Milestones; and
6. Commute Solutions Outreach Program.
One of the primary ways CAPCOG staff accomplished outreach goals during this period was through electronic outreach. Electronic outreach allows the program to provide air quality information to a large audience with limited resources. Electronic outreach completed during this period was carried out through the Air Central Texas (ACT) website, social media accounts, and ACT newsletters.

The ACT website (www.aircentraltexas.org) provides the public with information about central Texas air quality, supports existing air quality programs, and promotes activities to protect local air quality, all to motivate everyone to make decisions that are "Air Aware." In 2018, CAPCOG continued to maintain and update the ACT website. Figure 3-9 shows the number of new unique visitors and page views for each month. The increase in website visits during the summer is likely a combination of an increased number of OADs and paid advertising from the City of Austin directing to the ACT website during the summer. 

*Figure 3-9. Air Central Texas Website Traffic, 2018*

![Graph showing the number of new unique visitors and page views for each month.](image)

Figure 3-10 shows where website visitors came from. Around two-thirds of all visitors either found the website from an organic search of terms in a search engine (Google, Bing) or used a direct web search in which the users typed in an ACT URL or were directed from an email or newsletter. Visitors also found the site through iHeartMedia paid advertising, social media links, and referrals from other websites – mainly the City of Austin and CAPCOG websites.

*Figure 3-10 shows where website visitors came from.*

![Graph showing where website visitors came from.](image)
The top 10 ACT Webpages viewed between in 2018, are listed below. The homepage is where digital ads clicks are being sent, so it is not surprising that it received the most page views. Other pages that received the highest number of views were also referenced in the City of Austin digital ads and newsletter links. It is notable that two of the top ten pages, #4 and #7, are in Spanish.

In addition to electronic outreach, CAPCOG staff continued to engage the public in-person at community events and hosted one event, the 2018 Air Central Texas Awards. As Table 3-12 shows, CAPCOG reached a total of 1,292 individuals at events in three of the five CAC counties in 2018. CAPCOG staff did not attend events in Caldwell and Hays counties as the events that we previously attended were either cancelled or downscaled to remove tabling vendors. A greater effort will be required to find new suitable events to attend in the future.

CAPCOG staff updated and developed air quality outreach materials for CAPCOG and the CAC to use to promote regional air quality. The materials updated or developed in 2018 include:

- Updated existing materials to newest available information and data
  - Children and Air Quality
  - Aging and Air Quality
  - EPA AQI for O₃ Guide
- New Educational Materials Developed
  - Air Central Texas Guide to the AQI
  - Air Central Texas Meteorologist Toolkit
  - NOₓ Emissions by Source infographic
  - Properly Inflated Tires graphic
  - 2-minutes Idling graphic

Examples of ACT materials are below.

Be Air Aware
3.1.8 **PACE Program**

The PACE program provides an innovative mechanism for financing renewable energy and energy-efficiency improvements to industrial, commercial, multi-family residential, and non-profit buildings in participating jurisdictions. In order to address pay-back periods for energy efficiency and renewable energy (EE/RE) projects that may not align properly with a private property owner, the PACE program enables jurisdictions to put a property tax lien on a piece of property where an EE/RE improvement is made using private financing until the loan for the project has been paid back. PACE is authorized under state law in Section 399 of the Texas Local Government Code Chapter 399.\(^{38}\) Projects include:

- HVAC modification or replacement;
- Light fixture modifications such as LED;
- Solar panels;
- High-efficiency windows or doors;
- Automated energy control systems;
- Insulation, caulking, weather-stripping or air sealing;
- Water-use efficiency improvements;
- Energy- or water-efficient manufacturing processes and/or equipment;
- Solar hot water;
- Gray water reuse; and
- Rainwater collection systems.

As of July 17, 2019, eight of the seventeen completed PACE projects in the state were in Bastrop, Hays, Travis, and Williamson Counties. Table 3-14 summarizes key data from the projects for each county.

(Table 3-14. PACE Project Summary for Austin-Round Rock-Georgetown MSA as of July 17, 2019)

### 3.2 Organization-Specific Measures and Updates

This section provides updates on measures implemented by CAC members. Supplemental electronic files provide detailed, measure-by-measure, organization-by-organization details, while this section of the report provides an overview of these measures, a stand-alone section for Texas Lehigh Cement Company’s NO\textsubscript{X} emission reduction program is detailed here. These measures are based on reports collected from CAC members in May and June 2018.

Organizations that provided a report to CAPCOG included:

1. Austin White Lime Company;
2. Bastrop County;
3. Caldwell County;
4. Capital Metropolitan Transportation Authority (CapMetro);
5. City of Austin;
6. City of Bee Cave;
7. City of Buda;
8. City of Cedar Park;
9. City of Hutto;
10. City of Kyle;
11. City of Lakeway;
12. City of Lockhart;
13. City of Round Rock;
14. City of San Marcos;
15. City of Sunset Valley;
16. City of Taylor;
17. Central Texas Regional Mobility Authority (CTRMA);
18. Lower Colorado River Authority (LCRA);
19. Lone Star Clean Fuels Alliance (LSCFA);
20. TCEQ;
21. Public Citizen;
22. Texas Department of Transportation (TxDOT);
23. Texas Lehigh Cement Company;
24. Texas Parks and Wildlife Department (TPWD);
25. Travis County; and
26. Williamson County.

Organizations that did not report as of the date of this report included:
1. CAMPO; 
2. City of Bastrop; 
3. City of Georgetown; 
4. City of Leander; 
5. City of Luling; 
6. City of Pflugerville; 
7. CLEAN AIR Force; and 
8. Hays County.

If these organizations provide data subsequent to this report, CAPCOG will provide an updated version of this report. Many jurisdictions provided detailed operational data. CAPCOG intends to use this in a subsequent technical report analyzing the emissions reduction impact of various OAP Action Plan measures. Organization-specific information is available in three accompanying spreadsheets.

### 3.2.1 Texas Lehigh Cement Company

The Texas Lehigh Cement Company in Buda (Hays County) voluntarily implements a NO\textsubscript{X} emission reduction program on days when TCEQ forecasts “moderate” or higher O\textsubscript{3} levels in the region. The facility, which is the largest point source of NO\textsubscript{X} emissions within the Austin-Round Rock-Georgetown MSA, is equipped with a selective non-catalytic reduction (SNCR) system that it operates as needed to maintain compliance with permit requirements. On days when TCEQ predicts that O\textsubscript{3} levels in the region will be “moderate” or higher, Texas Lehigh will increase the NO\textsubscript{X} reduction efficiency of the system between the key hours of 9 am – 3 pm, which prior modeling had shown were the most important hours for the facility to reduce NO\textsubscript{X} emissions in order to reduce its contribution to high O\textsubscript{3} levels within the region. Previous annual reports illustrate the NO\textsubscript{X} reductions that can be achieved on high forecasted O\textsubscript{3} days. Also, a 2015 report by CAPCOG showed that this measure could reduce peak 8-hour O\textsubscript{3} concentrations at regional O\textsubscript{3} monitors by as much as 0.7-0.8 ppb in some locations. While Texas Lehigh provided their hourly NO\textsubscript{X} data for 2018, they did not provide any notes on their implementation of this measure in 2018, but the data for OADs and O\textsubscript{3} exceedances indicates that this measure was clearly implemented on these key days. The average for the “other” days also includes days with “moderate” O\textsubscript{3} forecast, which explains why the average hourly emissions from 9 am – 3 pm for these days was lower than the other hours.
3.2.2 Commuter Programs

CAC members implemented a number of commuter programs in 2018. These include:

- Providing alternative commuting infrastructure: 4 organizations;
- Allowing employees to work compressed work weeks: 9 organizations;
- Allowing employees to work flexible work schedules: 13 organizations;
- Carpool or other alternative transportation programs: 7 organizations;
- Transit pass subsidized by employer: 3 organizations;
- Part-time teleworking: 9 organizations;
- Full-time teleworking: 3 organizations;
- Implementing internal employer commute reduction programs: 3 organizations;
- Incentivizing alternative commuting among organization’s own employees: 4 organizations; and
- Encouraging alternative commuting within the community: 5 organizations.

3.2.3 Development Measures

Development measures implemented in 2018 included:

- Access management: 2 organizations;
- Expedited permitting for mixed use, transit-oriented development, or in-fill development: 1 organization;
- Tree planting programs: 13 organizations;
- Tree maintenance programs: 6 organizations;
- Development policies to improve energy and resource efficiency in new buildings: 9 organizations; and
- Codes and ordinances that encourage a more pedestrian-friendly environment: 3 organizations.
3.2.4 **Energy and Resource Conservation**

Energy and Resource Conservation measures implemented in 2018 included:
- Resource conservation: 11 organizations;
- Energy efficiency programs: 8 organizations;
- Renewable energy programs: 5 organizations;
- Electric vehicle programs: 4 organizations;
- Water conservation programs: 9 organizations; and
- Resource recovery and recycling programs: 8 organizations.

3.2.5 **Fleet and Fuel Efficiency Measures**

Fleet and Fuel Efficiency Measures included:
- Alternative fuel vehicles: 7 organizations;
- Business evaluation of fleet usage, including operations and right-sizing: 11 organizations;
- Fueling of vehicles in the evening: 9 organizations;
- Low-emission vehicles: 8 organizations;
- Texas Low-Emission Diesel Equivalent for Fleets: 6 organizations;
- Vehicle maintenance by manufacturer specifications: 11 organizations;
- Prioritize purchasing of low-emission light-duty vehicles: 4 organizations;
- Prioritize purchasing of alternative-fueled vehicles and equipment: 3 organizations;
- Prioritize purchasing of hybrid vehicles: 2 organizations;
- Increase fuel efficiency: 5 organizations;
- Increase substitution of conventional fuels with alternative fuels: 3 organizations;
- Idling limits for vehicles and equipment: 8 organizations;
- Pursue replacement/repower/retrofit of old diesel-powered vehicles and equipment through TERP and/or DERA funding: 4 organizations;
- Employee training on alternative fuels and fuel efficiency: 2 organizations; and
- Vapor Recovery on Pumps: 1 organization.

3.2.6 **Outreach and Awareness**

Outreach and Awareness measures implemented by individual CAC members in 2018 included:
- Employee education program: 14 organizations;
- Public education: 13 organizations;
- OAD notification program: 12 organizations;
- OAD response programs: 8 organizations; and
- Programs to improve awareness of and compliance with air quality rules: 6 organizations.

3.2.7 **Regulation and Enforcement**

Regulation and enforcement measures implemented by individual CAC members in 2018 included:
- Open burning restrictions: 5 organizations; and
- Special event emission reduction policies: 2 organization

The following jurisdictions implement idling restrictions, either with a local ordinance, through a memorandum of agreement (MOA) with TCEQ, or both.
Table 3-15. Jurisdictions Implementing Idling Restrictions in the Austin-Round Rock-Georgetown MSA

These idling restrictions are “passive” controls in that the jurisdictions will respond to complaints when they are made, but they don’t devote dedicated resources to idling restriction enforcement.

3.2.8 Sustainable Procurement and Design

Sustainable procurement and design measures implemented by individual CAC members in 2018 included:

- Contractor Provisions for High O₃ Days: 1 organization;
- Direct deposit: 17 organizations;
- Restrictions on use of organization’s drive-through facilities on OAD: 0 organizations;
- E-government and/or remote locations: 9 organizations;
- Landscaping voluntary start at noon on OAD: 2 organizations;
- Low VOC asphalt: 5 organizations;
- Low VOC roadway striping material: 4 organizations;
- Shaded parking: 4 organizations;
- Clean landscaping contracting: 1 organization;
- Clean construction contracting: 1 organization; and
- Local sourcing of materials: 3 organizations.

3.2.9 Other Notable Distinctions for Local Communities

In response to the 2017 annual air quality report, EPA suggested referencing some of the other distinctions local communities have received, such as the "STAR Communities" program. This section identifies a number of these types of distinctions that local communities have received.

- STAR Communities:
  - The STAR Community Rating System provides a comprehensive framework and certification program for evaluating local sustainability, encompassing economic, environmental, and social performance measures since its release in 2012.

39 The City of Austin’s MOA with TCEQ expired on December 31, 2018. The City of Austin will not be renewing it at this time.
City of Austin is a 4-Star Certified Community, the highest rating of any city in Texas, receiving this designation in 2014: https://reporting.starcommunities.org/communities/5-austin-texas

- **SolSmart:**
  - Recognizes cities, counties, and regional organizations for making it faster, easier, and more affordable to go solar.
  - The City of Austin is designated as a "Gold"-level designee and the City of Smithville (in Bastrop County) is designated as a "Bronze"-level designate: http://www.solsmart.org/our-communities/designee-map/

- **Climate Mayors:**
  - A bipartisan, peer-to-peer network of U.S. mayors working to demonstrate leadership on climate change through meaningful actions in their communities.
  - City of Austin, City of San Marcos, and City of Smithville are all members: http://climatemayors.org/about/members/
  - City of Austin also participates in a collaborative electric vehicle purchasing initiative through the Climate Mayors: https://driveevfleets.org/what-is-the-collaborative/

### 4 Ongoing Planning Activities

This section documents notable air quality planning milestones and activities completed in 2018.

#### 4.1 Clean Air Coalition Meetings

During 2018, there were a total of four Clean Air Coalition meetings:
- February 14, 2018;
- May 9, 2018;
- August 8, 2018; and
- November 14, 2018.

Significant policy-related actions taken by the CAC in 2018 included:
- Endorsement of CAPCOG Air Quality Program for 2019-2023 and FY 2019 Funding Request;
- Endorsement of CAPCOG Air Monitoring Plan for 2019-2023;
- A Resolution in Support of CAPCOG’s Application to CAMPO for Transportation Development Credits (TDCs) for the Commute Solutions Program;
- Legislative Recommendations on Air Quality Planning Funding and Other Air Quality Issues;
- A comment letter to TCEQ regarding the draft VW Beneficiary Mitigation Plan for Texas;
- Approval of the 2019 – 2023 Austin-Round Rock-Georgetown MSA Regional Air Quality Plan; and
- Creation of a Subcommittee to Make Recommendations on Future CAPCOG Local Air Quality Funding Requests.

The Clean Air Coalition Advisory Committee (CACAC) met five times:
- February 2, 2018;
- April 26, 2018;
- July 26, 2018;
- November 1, 2018; and
- December 10, 2018.
The CACAC Outreach and Education Subcommittee met a total of 10 times in 2018:
- March 8, 2018;
- April 6, 2018;
- May 3, 2018;
- June 7, 2018;
- July 2, 2018;
- August 2, 2018; and
- September 9, 2018.

In addition, CAPCOG staff also collaborated with the City of Austin to hold an Air Quality Awareness Week Press Event, the CLEAN AIR Force of Central Texas to hold their Air Quality Awareness Week Kick-off Event, and the CACAC outreach and education committee to create the ACT Meteorologist Toolkit.

### 4.2 LSCFA

The LSCFA held a number of meetings and workshops throughout 2018.

**Board Meetings:**
- January 10, 2018;
- April 11, 2018;
- July 11, 2018; and
- December 12, 2018.

**Workshops:**
- Texas Clean Cities Planning: May 23, 2018
- Alternative Fuel School Bus Roundtable for Fleet Managers: June 18, 2018
- Clean Cities Heavy Duty Electric Vehicle Workshop for VW Mitigation Plan: June 21, 2018
- Transportation and Clean Air: June 21, 2018
- 100 Best Fleets Program at The University of Texas: July 18, 2018
- Education and Planning with the Texas Natural Gas Vehicle Alliance: September 25, 2018
- Propane School Buses: September 27, 2019

### 4.3 Regional Air Quality Technical Research Activities

CAPCOG completed a number of air quality technical research activities in 2018 including:

- **Monitoring projects:**
  - Continued $O_3$ and meteorological data collection at eight CAPCOG-owned monitoring stations in the region to supplement the two TCEQ $O_3$ monitors in the region;
  - 2018 Air Quality Monitoring Report;

- **Modeling and data analysis projects:**
  - An analysis of 2017 air quality and meteorological monitoring data;
  - Secondary Analysis of Photochemical Modeling Data Report;
Local and Voluntary Emission Reduction Quantification Report;

- Emissions inventory projects:
  - Emissions Inventory Spatial Surrogates Review and Updates; and
  - Non-Road Emissions Inventory Projections.

Reports and data from these projects can be found at [http://www.capcog.org/divisions/regional-services/aq-reports](http://www.capcog.org/divisions/regional-services/aq-reports).

### 4.4 Statewide Collaborative Initiatives

CAPCOG participates in several statewide air quality-related initiatives in 2018, which are listed below.

#### 4.4.1 Regional Air Quality Planning Group

CAPCOG participated in meetings with the other 11 regional air quality planning groups across the state on the following dates:

- February 21, 2018; and

#### 4.4.2 Texas Clean Air Working Group

CAPCOG participated in Texas Clean Air Working Group (TCAWG) meetings in 2018, as well as a number of TCAWG subcommittees on TERP, Idling, and the Volkswagen (VW) Settlement issues during this time.

- General TCAWG Meetings:
  - January 29, 2018; and
  - September 18, 2018.

- TERP, Idling, and VW Settlement Subcommittee Meetings and Conference Calls:
  - January 17, 2018;
  - January 29, 2018;
  - February 14, 2018;
  - June 21, 2018;
  - October 22, 2018; and
  - November 19, 2018.

#### 4.4.3 Technical Working Group for Mobile Source Emissions

CAPCOG participated in the Technical Working Group for Mobile Source Emissions (TWG) meetings in 2018. The TWG meets to discuss Texas transportation issues regarding on-road mobile source emission inventories and transportation policy. CAPCOG attended the meetings on the following dates:

- February 1, 2018;
- September 6, 2018; and
- December 6, 2018.
5  Planning for the Future

This section details some important issues to note for the region’s air quality plan moving forward, including new issues that have arisen between the end of 2018 and the completion of this report.

5.1  Texas Emission Reduction Plan

TCEQ had not yet awarded all of the TERP funding appropriated for the 2018-2019 biennium by the end of 2018. Most notably, TCEQ had not yet awarded funding for any of the ERIG grant applications that had been submitted in late summer 2018. The RFGA for the TCFP program also closed in February 2019, and TCEQ continued to accept applications for the TNGVGP and LDPLIP programs up through the end of May 2019.

</tbody>
</table>

- For the TCFP, a total of $20,010,413.78 was available, with funding requests from the Austin area accounting for $3,751,347 (18.75%). This included funding requests from CapMetro, Eanes ISD, and Georgetown ISD. Grant awards have not yet been publicly announced as of 7/30/2019.
- For the TNGVGP, while only $1,039,378 in funding had been awarded as of October 2018, by July 1, 2019, an additional $13,891,137 in funding had been awarded to reduce 189,2175 tons of NO\textsubscript{X} ($73,414 per ton) with an additional $498,084 in funding requests still under review. It is not clear from the data available online as of 7/30/2019 how much of this funding or the associated emission reductions are for the Austin area.
- TCEQ also made $5 million available for DERI rebate grants for small businesses but has not yet announced information about grant awards. A total of $7,895,796.89 was requested.

The 86\textsuperscript{th} Texas Legislature appropriated the same $155 million for the TERP program for 2020-2021 as it did for 2018-2019, although the allocation among the various authorized uses of TERP changed. Specifically, the amount appropriated for the DERI program decreased by $12 million (a 17% decrease) for the biennium, while funding for the AFFP increased by $6 million (a 100% increase) and the previously unfunded Government Alternative Fuel Fleet Program (GAFFP) was appropriated $6 million. This change in appropriations among programs results in the DERI program receiving 39% of the total funding appropriated for 2020-2021, down from 47%, while the share of funding appropriated for the various alternative fuel programs (AFFP, GAFFP, TCFP, NGVGP, and LDPLIP) increasing from 24% to 32%. Due to the relatively higher cost per ton ratios for the alternative fuel programs compared to DERI, this change in appropriations would be expected to diminish the amount of emission reductions that the programs could achieve in the Austin area from grants awarded in the next biennium compared to the current biennium.
The Legislature also passed landmark TERP legislation (HB 3745) that will address the continued growth of the TERP account due to under-appropriation of funds for grants ($155 million for 2020-2021) relative to the revenues collected (over $550 million for the 2020-2021 biennium), which has resulted in a fund balance approaching $2 billion that has accumulated since 2001. The legislation extended all TERP revenue provisions until all areas of the state are designated “attainment” for all O₃ NAAQS, coinciding with when the authorization for awarding grants would end, and would establish a new “TERP Fund” that would receive all TERP revenue collected after August 31, 2021, and enable TCEQ to award funds out of the fund without needing to go through the appropriations process. This will dramatically increase the amount of funding available for the TERP program starting in FY 2022.

5.2 TxVEMP

In May 2019, TCEQ began rolling out the first in a series of VW grant opportunities, starting with transit buses. TCEQ allocated a total of $5,704,161 for this grant round to the Austin area, and as of 7/25/2019, a total of $6,855,278 in funding from the Austin area had been requested. This included $4,297,580 from CapMetro for 20 electric buses as part of its fleet-wide effort to start transitioning from diesel to electric. TCEQ has announced that the next round of grants will open in fall 2019 for refuse trucks.

5.3 New Regional Air Quality Plan

The Austin-Round Rock-Georgetown MSA’s Advance Program Action Plan expired on December 31, 2018. Throughout 2018, CAPCOG worked with the CAC to develop a new plan. The 2019-2023 Austin-Round Rock-Georgetown MSA Regional Air Quality Plan was finalized on December 21, 2018. For the purposes of the region’s participation in EPA’s Advance Program, this new plan constitutes a new “Path Forward,” and covers more than just O₃. The plan is available at http://www.capcog.org/divisions/regional-services/regional-air-quality-plan.
This plan’s two key goals are:

1. Maximizing the probability of compliance with the National Ambient Air Quality Standards region-wide; and
2. Otherwise minimizing health and environmental impacts of regional air pollution.

In order to achieve these objectives, this plan calls for:

1. Implementation of controls on the emissions of NO\textsubscript{X};
2. Outreach, education, and technical support to enhance NO\textsubscript{X} emission reductions;
3. Outreach and education to reduce public exposure to ambient ground-level O\textsubscript{3}, PM, and NO\textsubscript{2} when high enough to be considered "moderate" or worse based on the EPA’s AQI;
4. Ambient air monitoring;
5. Other air quality research and planning activities; and
6. Policy advocacy.

5.4 Relocation of Monitoring Stations in 2019

In 2018, CAPCOG developed and received approval from the CAC for a 2019-2023 monitoring plan, which called for the closure of three of its eight monitoring stations (CAMS 601 in Fayette County, CAMS 684 in Bastrop County, and CAMS 1603 in Southwest Austin) and opening of three new monitoring stations within the region – one in Elgin, one in Bastrop, and one in East Austin.\textsuperscript{40} Ahead of the 2019 O\textsubscript{3} season, CAPCOG was able to complete the closure of CAMS 601 and 684 and the opening of new sites in Bastrop (CAMS 1612) and Elgin (CAMS 1613) but was not able to relocate CAMS 1603 yet. CAPCOG is in talks with City of Austin to find a suitable location in East Austin and hopes to complete the relocation of CAMS 1603 sometime in late 2020.

TCEQ’s 2019 Annual Monitoring Network Plan (AMNP) calls for the relocation of CAMS 3, the region’s key regulatory O\textsubscript{3} monitoring station, by May 2020 due to construction occurring at Murchison Middle School where the monitoring station is located.\textsuperscript{41} TCEQ is working with Austin Independent School District (AISD) to find another location at the campus to relocate the station to if possible, and will seek to find another site within 1 mile of the current location if possible in order to ensure data continuity.

5.5 Funding for Future TDM Efforts

In May 2018, the CAMPO board awarded about $500K to three TDM programs for FY 2019 and used another $300K to conduct a regional TDM study, which has not yet been finalized. It also set aside an additional $500K for additional TDM projects in the future, which it has indicated it plans to award in September 2019. CAMPO staff have announced that they do not plan to conduct a call for projects for the 2021-2024 TIP due to the Policy Board’s decision in May 2019 to commit of all uncommitted STBG

funds for 2020-2029 to three roadway projects. CAMPO expects the next project call to occur in late 2021 for the 2023-2026 TIP. This means that the $500K set aside by the Policy Board in May 2018 for TDM projects is the only federal funding that will likely be available for these projects for 2020-2022.

5.6 Reinstatement of Local Air Quality Planning Grant Funding

The 86th Texas Legislature reinstated local air quality planning funding for “near-nonattainment” areas for the 2020-2021 biennium, although their use will be restricted to monitoring and emissions inventory work. As of July 31, TCEQ staff is still deciding on how to proceed with this and expects to call a meeting with the various areas in the near future. TCEQ did indicate that it expected the Austin area to receive the minimum of $281,250 for the biennium, rather than the approximately $960,000 that would have been allocated to the Austin area if the seven “attainment” counties in the San Antonio metro area had been treated as a single “area” rather than seven separate “areas.”

Due to the restrictions on the use of the funding, the main impact of this funding would be to reduce the amount of funding needed from local governments to support CAPCOG’s air quality program for 2020-2021, but it would not be expected to actually increase the amount of funding spent on the program over this period. Since the funding can’t be used for outreach, and it’s unclear at this stage exactly what other activities would be eligible for funding, CAPCOG expects to still continue to need to rely on as much as $578,750 in local funds over the 2020-2021 biennium to support the program (an average of $289,375 per year).

5.7 CapMetro Bus Electrification Initiative

As part of its long-term planning efforts, CapMetro has begun the process of converting significant parts of its fleet from diesel to electric. On July 25, 2019, staff from CapMetro announced that it will be receiving funding from several different grant applications it submitted in recent months, including the Federal Transit Administration (FTA) Low and No Emission Bus Program, TCEQ’s Clean Fleet Program, and the Texas VW Environmental Mitigation Program.

5.8 DERA Grant Applications

In spring 2019, CAPCOG submitted three Diesel Emission Reduction Act (DERA) grant applications to EPA. One application included projects identified by CapMetro and Austin White Lime, while the other two would have provided for region-wide rebates or a region-specific competitive grant process. CAPCOG received notification from EPA recently that these projects were not funded, but CAPCOG plans to continue to pursue these grant opportunities in collaboration with the CAC in the future.

5.9 EPA Travel Efficiency Assessment Method Technical Assistance Project

In early 2019, CAPCOG applied to EPA for technical assistance through its Travel Efficiency Assessment Method (TEAM) initiative and was one of two organizations selected by EPA for this round of projects. CAPCOG has been working with local partners to select strategies that EPA’s contractor will evaluate and has recently completed the preparation of data for this effort. Strategies that will be modeled include:

1. Improved transit service along a key corridor in Austin;
2. Improved transit service region-wide;
3. Subsidized transit passes for government employees; and
4 Vehicle miles traveled (VMT) pricing.

Results should be available later in 2019.

5.10 Gasoline Sulfur Levels and Impacts on On-Road NO\textsubscript{X}

One area of uncertainty regarding the estimated on-road NO\textsubscript{X} emissions relates to gasoline sulfur levels.

Fuel sampling conducted by Eastern Research Group (ERG) for TCEQ in 2017\textsuperscript{42} showed that the Austin area continued to have the highest gasoline sulfur levels in the state – a weighted average of 30 ppm, compared to the statewide average of 19.85 ppm. These levels were both significantly higher than the 10 ppm modeling assumption for all counties for 2017 and beyond used in TCEQ’s “trends” inventory, which was based on Tier 3 fuel standards. These findings were consistent with ERG’s fuel sampling studies in 2014\textsuperscript{43} and 2011\textsuperscript{44}, which also showed that the Austin area’s gasoline levels were the highest in the state, coming in at 13.83 ppm and 16.17 ppm above the statewide averages, respectively.

In January 2019, CAPCOG analyzed on-road emissions modeling results that varied the gasoline fuel sulfur input from 10 ppm up to 90 ppm. 95 ppm is the down-stream per-gallon cap in the Tier 3 regulations, while 10 ppm is the annual average level that refineries are supposed to achieve for product at the “refinery gate.” These results suggested that regional NO\textsubscript{X} emissions from gasoline vehicles in 2017 were actually approximately 23% higher than what the TCEQ “trends” emissions inventories would have accounted for. Overall, this means that on-road emissions would be about 13% higher than what would have been expected when including diesel vehicles as well. The relative difference becomes larger in future years as the projected emissions rates for newer vehicles increasingly depend on the lower gasoline sulfur levels anticipated by the Tier 3 standards.

It is unknown whether gasoline sulfur levels in the Austin area continued to be elevated in 2018 compared to other parts of the state, and since TCEQ is unlikely to conduct any new fuel sampling studies until 2020, it is also unlikely that Austin levels in 2019 can be confidently assessed either.

6 Conclusion

Unfortunately, air pollution levels in the Austin metro area were worse in 2018 than in 2017, and $O_3$ levels were high enough to put the region at risk of recording a violation of the $O_3$ NAAQS for 2017-2019. The increased $O_3$ air pollution levels were within the range that could be expected based on year-to-year variation, but data reported from local power plants to EPA indicate that regional EGU NO\textsubscript{$X$} emissions were significantly higher on key high $O_3$ days in 2018 than they were in 2017, particularly the Decker Creek and Sim Gideon Power Plants. 2018 represented the first year when the Sandow Power Plant in southern Milam County was closed, and part the increase in NO\textsubscript{$X$} emissions from power plants in the MSA may be as a result of the load shift.

The region’s $O_3$ levels in 2017 and 2018 are high enough that the region is at significant risk of violating the 2015 $O_3$ NAAQS by the end of 2019, although it’s doubtful that EPA would initiate an “out-of-cycle” nonattainment designation for the region even if there was a violation for 2017-2019. Moving forward, a number of steps taken at the state and regional level in 2018 and 2019 will help control air pollution levels within the region over the next few years.

- The CAC continued to implement measures committed to in the $O_3$ Advance Program Action Plan in its final year;
- The CAC re-committed to continuing to pursue air quality improvements by adopted a new five-year air quality plan for 2019-2023;
- The CAMPO Policy Board awarded approximately $500K for regional TDM initiatives;
• TCEQ allocated over $16 million in VW mitigation funds specifically for the Austin area; and
• TCEQ awarded at least $4.2 million in TERP funds to the Austin area in 2018 and at least another $6.7 million in TERP ERIG funds to the Austin area in early 2019.
