EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: A review of the RCRA-LQG list, as provided by EDR, and dated 03/22/2021 has revealed that there are 3 RCRA-LQG sites within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

HAMER AVE AND 58TH STREET
HAMER AVE AND 58TH STREET
CORONA, CA 92880

TARGET PROPERTY COORDINATES

Latitude (North):	33.979185 - 33° 58' 45.07''
Longitude (West):	117.562932 - 117° 33' 46.56''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	448000.3
UTM Y (Meters):	3759796.5
Elevation:	669 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5640930 CORONA NORTH, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

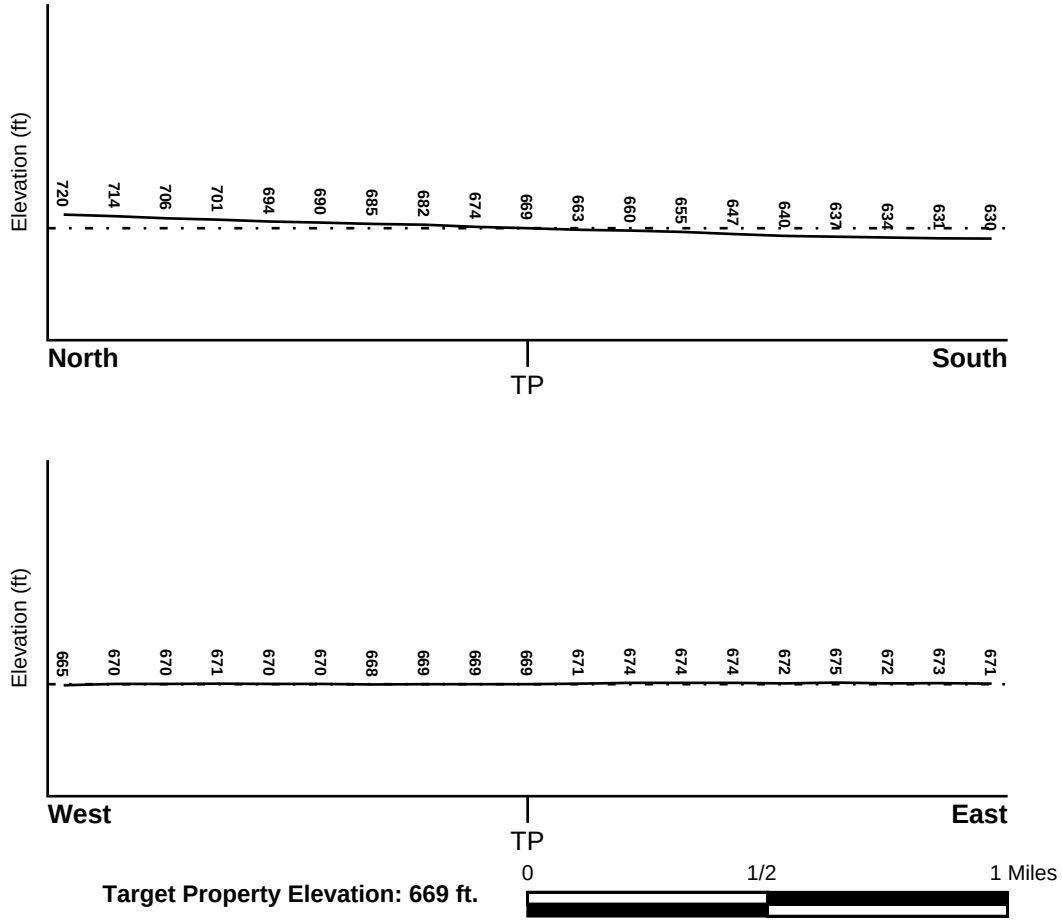
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06071C9375H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06065C0681G	FEMA FIRM Flood data
06065C0683G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CORONA NORTH	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: HILMAR

Soil Surface Texture: loamy fine sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	loamy fine sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 6.6
2	16 inches	72 inches	loamy fine sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 6.6

Soil Map ID: 2

Soil Component Name: HILMAR

Soil Surface Texture: loamy sand

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 1.4 Min: 0.42	Max: 9.6 Min: 8.4
2	16 inches	22 inches	stratified very fine sandy loam to silt loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 1.4 Min: 0.42	Max: 9.6 Min: 8.4
3	22 inches	72 inches	stratified very fine sandy loam to silt loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 1.4 Min: 0.42	Max: 9.6 Min: 8.4

Soil Map ID: 3

Soil Component Name: DELHI

Soil Surface Texture: loamy fine sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	loamy fine sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 6.1
2	9 inches	48 inches	sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 6.1
3	48 inches	59 inches	fine sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 6.1

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

INSTRUCTIONS FOR REQUESTING RECORDS

(California Public Records Act, Govt. Code Sections 6250-6276.48)

1. In order to expedite your request, please fill out the form completely. Requests may also be submitted by phone at (909) 396-3700, by facsimile to (909) 396-3330, or by email to PublicRecordsRequests@aqmd.gov.

2. Requests must be for records prepared, owned, used, or retained by the District (Gov. Code Sec. 6252(e)). Requests should be for clearly identifiable records. The District is not required to create a new record in response to a request. The District will assist the requestor in making a request that describes reasonably identifiable records (Gov. Code Sec. 6253.1). Documents will not be provided if disclosure would infringe upon a copyright, trade secret, or is otherwise exempt in accordance with state law.

3. A search for facility records can only be conducted by one or all of the following:

-- a) Facility Name, Address, or Identification Number

-- b) Facility Application Number, or Permit to Operate Number; or

-- c) Facility Notice of Violation/Notice to Comply Number.

4. You will be notified within ten (10) days whether your request seeks copies of disclosable public records prepared, owned, used, or retained by this agency. In some cases, the District may need an additional 14 days to respond. If so, you will be notified in writing. You will also be provided an estimated date of when the records will be made available.

5. Communications regarding your request, and any records, will be provided by email, unless specified otherwise.

6. If the search for records finds the records voluminous, you will be notified of the approximate number of pages and/or length of time it will take to process your request.

7. If the records you requested have been marked confidential by the source of the record, you will be notified and given the option of continuing with the District's Trade Secret process.

8. If your request is to review records, rather than receive copies, the District will notify you once the records are gathered, and arrangements will be made for your review.

9. The charge for the direct cost of duplication is as follows: Paper Copies, $0.15/page each over 10 pages (first 10 pages are free); Copied CD's or flash drives, no charge; and Copied Audio Tapes, $5.00 each. After a preliminary estimate, advance payment may be required.

10. If the request is for information in an electronic format, the requestor shall bear the cost of producing a copy of the record, including the cost to construct the record and the cost of programming and computer services necessary to produce a copy of the record, when either of the following applies: (1) the District would be required to produce a copy of an electronic record and the record is one that is produced only at otherwise regularly scheduled intervals, or (2) the request would require data compilation, extraction, or programming to produce the record. (Gov. Code Sec. 6253.9(b)). The transfer of gathered electronic records onto CD, DVD or flash drive typically costs $10.00 each. An invoice will accompany your records when completed.

Note: For further information, please refer to the District's Guidelines for Implementing the California Public Records Act. The Guidelines are available in the lobby of the District Headquarters or on the District's web site at www.aqmd.gov.

Note: If you have questions pertaining to the submittal of a Public Records Act request, you may contact the Public Records Unit, (909) 396-3700, Tuesday through Friday, 7:00 a.m. to 5:30 p.m. Our Fax number is (909) 396-3330. Our email address is PublicRecordsRequests@aqmd.gov.

Community

EJSCREEN EJ Indexes

Eleven primary environmental justice (EJ) indexes of EJSCREEN, EPA's screening tool for EJ concerns. EPA uses these indexes to identify geographic areas that may warrant further consideration or analysis for potential EJ concerns. The index values below are for the Census block group in which the facility is located. Note that use of these indexes does not designate an area as an "EJ community" or "EJ facility." EJSCREEN provides screening level indicators, not a determination of the existence or absence of EJ concerns. For more information, see the EJSCREEN home page.

Census Block Group EJ Indexes (percentile)	
Particulate Matter (PM 2.5)	99
Ozone	99.2
NATA Diesel PM	98.6
NATA Air Toxics Cancer Risk	97.9

Number of EJ Indexes Above 80th Percentile
9

View EJSCREEN Report

Census Block Group EJ Indexes (percentile)	
NATA Respiratory Hazard Index (HI)	98.3
Traffic Proximity	76.4
Lead Paint Indicator	62.8
Superfund Proximity	93
Risk Management Plan (RMP) Proximity	82.4
Hazardous Waste Proximity	88.3
Wastewater Discharge Proximity	82.1

Demographic Profile of Surrounding Area (3 Miles)

This section provides demographic information regarding the community surrounding the facility. ECHO compliance data alone are not sufficient to determine whether violations at a particular facility had negative impacts on public health or the environment. Statistics are based upon the 2010 U.S. Census and 2006-2010 American Community Survey 5-Year Summary and are accurate to the extent that the facility latitude and longitude listed below are correct. EPA's spatial processing methodology considers the overlap between the selected radii and the census blocks (for U.S. Census demographics) and census block groups (for ACS demographics) in determining the demographics surrounding the facility. For more detail about this methodology, see the DFR Data Dictionary.

Public Records Request Number: 1-061621-10
Location(s): 12740, 12741, 12745 Limonite Ave, Corona, CA 92880

Dear Requestor:

On June 16, 2021 the Department of Toxic Substances Control (DTSC) received your email of the same date requesting records under the Public Records Act. After a thorough review of our files, no site records were found pertaining to the sites/facilities referenced above.

A large number of our records are available on EnviroStor, an online database that provides non-confidential, public access to DTSCs data management system. It tracks our cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known or suspected contamination issues. EnviroStor is available 24/7, 365 days a year. The data reflects the latest updates as they are entered in the system. Access it from your computer or smartphone, the local library – anywhere Internet access is available. Just go to www.envirostor.dtsc.ca.gov. You'll find a step-by-step tour of EnviroStor under the "How to Use EnviroStor" menu on the website.

If you have any questions or would like further information regarding your request, please contact me at 916-255-4159 or via email at PubReqAct@dtsc.ca.gov.

Sincerely,
Choua Her

PROJECT PERSONNEL QUALIFICATIONS

HILLMANN CONSULTING

Gabriela Cyrulik

Environmental Technician
gcyrulik@hillmannconsulting.com

EDUCATION:

B.S. Geography and Minor in Environmental Science, Montclair State University, Montclair, NJ

CERTIFICATIONS:

OSHA 10-hr Construction Safety & Health

CA DPH Lead Sampling Technician

Certified in Fire & Smoke Restoration

YEARS OF EXPERIENCE:

With Hillmann: 2 years

Total: 2 years

PROFESSIONAL EXPERIENCE:

Ms. Cyrulik is an Environmental Technician for our Southern California Office. Ms. Cyrulik has supervised work practices and controls in accordance with job specifications, current EPA, OSHA, and state regulations for asbestos abatement projects in schools, as well as commercial, industrial, public, and multi-family residential buildings.

As an Environmental Technician, Ms. Cyrulik performs quality assurance air sampling for asbestos, lead, and mold abatement projects. She is also responsible for performing air and surface hazard materials testing, and potable and non-potable water sampling. She regularly performs Indoor Air Quality Assessments as well for several high-profile clients.

Additionally, Ms. Cyrulik is skilled at performing Phase I environmental site assessments and transaction screens to meet environmental due diligence requirements under CERCLA.

Representative Experience Includes:

Tishman Speyer Properties, nationwide: Hillmann has been providing the complete environmental program for Tishman Speyer's properties since 1987. Our services include: phase I environmental site assessments, asbestos surveys, air monitoring, bid administration, O&M programs, industrial hygiene, and indoor air quality programs. Ms. Cyrulik functions as an Industrial Hygienist on this contract, which is ongoing, and performs Indoor Air Quality Assessments.

Brookfield Properties, various locations: Since 1987, Hillmann has performed industrial hygiene, microbial, indoor air quality, asbestos surveys, project design investigations, project management, bulk sampling and analysis, and geotechnical services in numerous buildings in the New York and Los Angeles metropolitan areas. Ms. Cyrulik is an Industrial Hygienist on this contract.

HILLMANN CONSULTING

J. Ryan Terwilliger

Operational Manager, West Coast

EDUCATION:

B.S. Environmental Science, University of Southern California, Los Angeles, CA

CERTIFICATION:

Cal-OSHA Certified Asbestos Consultant
CDPH Accredited Lead Inspector/Assessor/ Project Monitor

CA Certified Site Surveillance Technician

OSHA 40 - Hr HAZWOPER

YEARS OF EXPERIENCE:

With Hillmann: 4 years

Total: 8 years

PROFESSIONAL EXPERIENCE:

Mr. Terwilliger is responsible for business operations, fiscal management and field staff management for Hillmann's California Office. He also performs asbestos surveys and investigations to identify asbestos and lead materials associated with occupational hazards. He supervises work practices and controls in accordance with job specifications, current EPA, OSHA and State Regulations for Asbestos remediation projects in commercial, industrial and multi-family residential buildings. Mr. Terwilliger performs IAQ, mold and moisture investigations in commercial, industrial and residential facilities nationwide. He also performs awareness training for asbestos, lead and microbial agents. Mr. Terwilliger provides litigation support consultation.

Representative Experience Includes:

Tishman Speyer Properties, Various locations: Hillmann has provided the complete environmental program for Tishman Speyer's properties since 1987. Our services include environmental health and safety, industrial hygiene, phase I environmental site assessments, asbestos surveys, air monitoring, bid administration, O&M programs and indoor air quality programs on various commercial, industrial and multi-family residential properties. Mr. Terwilliger is an Environmental Scientist on this contract, conducting on-site environmental services including phase I site assessments and NPDES water quality testing.

Westfield – Environmental Program, Various locations: Since 2000, Hillmann has been providing an environmental program encompassing environmental health and safety, Phase I environmental site assessments, asbestos and lead surveys, air monitoring, bid administration and O&M programs, industrial hygiene and indoor air quality programs, and hazardous materials assessments on their mall properties throughout the county. Mr. Terwilliger is an Environmental Scientist on this contract performing industrial hygiene services that include indoor air quality monitoring, Phase I environmental site assessments, asbestos and lead surveys.

Brookfield Office Properties, Various sites, CA: Hillmann has been providing hazardous materials surveys, development abatement specifications, and managing the oversight activities during the abatement at various Brookfield owned sites throughout California. Mr. Terwilliger functions as a Project Manager for this contract.

California Department of Transportation, Central Valley and Northern CA: Hillmann has been performing asbestos and Lead-based Paint Surveys for the California Department of Transportation. Performed comprehensive asbestos containing materials and lead-based paint surveys of residential and commercial buildings that were slated for demolition and generated report of findings in order to aid the Department of Transportation (DOT) in facilitating the road improvement programs and building renovations throughout the

Central Valley area. Also during the abatement of asbestos from DOT owned buildings, provided contractor oversight and air monitoring services for regulatory compliance.

Verizon, Various Sites, CA. Hillmann conducted hazardous materials surveys, development abatement specifications, and project monitoring during abatement at various Verizon owned sites throughout California. Mr. Terwilliger functioned as the Project Manager.

Public Storage, Los Angeles, CA: Hillman preformed comprehensive asbestos, lead-based paint and universal waste materials survey of commercial and industrial buildings throughout Southern California. Hazardous materials surveys were conducted prior to renovation for the storage units. Mr. Terwilliger developed abatement specifications and managed the abatement activities during the renovations of the buildings. He functioned as the Project Manager on this contract.

1.0 INTRODUCTION / BACKGROUND

Hillmann Consulting, LLC (Hillmann) conducted a Limited Phase II Subsurface Investigation at Leal Ranch, Eastvale, California. The Property encompasses six contiguous parcels addressed as 12741 and 12745 Limonite Avenue and 12740 58th Street in Eastvale, California and occupies 153.3 acres. The Property is bounded by Limonite Avenue to the south, 58th Street to the north, Scholar Way to the west and Hamner Avenue to the east. The Property is located in an area being developed with new homes and is being considered for redevelopment from its most recent use as agricultural land and a dairy farm to residential. The site location and its vicinity is indicated on **Figure 1**. The Property is currently developed with five residential structures in the northern portion of the Property, and with various dairy barns or out structures. The southern portion of the Property that was formerly orchard-bearing has no structures. The layout of the site is depicted on **Figure 2**.

In June 2021, Hillmann conducted a Phase I Environmental Site Assessment at the site. Records indicate the Property was utilized as orchard growing land dating to the 1930s. The northern portion of the site was utilized for dairy operations from the 1970s until 2019. Large portions of the north portion of the Property were used for dairy ranching and several areas are laden with deposits of animal waste. In addition, the north-central portion of the site includes a maintenance area where repair of farm equipment and vehicles was conducted. This area has multiple areas with small surficial spills and storage of hazardous materials. Records also indicate that an underground storage tank (UST) was used at the site and was removed from the ground in the late 1980s, No closure records for the former UST were available. The large zones with animal waste were identified as a potential environmental concern due to possible methane off-gassing, especially given the proposed residential use. In addition, the maintenance area and UST areas were identified as potential environmental concerns that justified preliminary subsurface investigation.. Results of the Phase I investigation are presented in Hillmann's *"Phase I Environmental Site Assessment Report"* dated June 25, 2021.

In July 2021, Hillmann completed a Limited Phase II Subsurface Investigation at the Property that included soil and soil gas sampling. The objective was to provide a preliminary indication of the amount of animal waste that would need to be removed, determining if there was a significant subsurface methane issue in the waste deposit areas, investigate potential subsurface contamination in the former agricultural areas from historic applications of pesticides, determine whether the historic UST had been removed, and defining potential contamination concerns in the maintenance and UST areas. The current investigation is an independent assessment of the site that was constrained by time and cost factors as part of a self-directed effort. The investigation included installation of 15 soil borings and soil gas sampling probes in targeted locations, soil sampling for pesticides which included the collection of ninety-six (96) individual samples, which were then composited into twenty-four (24) composite samples, and analyzed for Organochlorine Pesticides (OCPs) and Title 22 Metals from ninety-six (96) quadrants throughout the Property, and a GPR investigation in the reported former UST area. This investigation was not intended to meet the more stringent requirements of a regulatory driven assessment.

2.0 GEOLOGY/HYDROGEOLOGY

Based on the drilling logs, the sediments beneath the site consist primarily of silty sand and sandy silt with occasional layers of silty clay and sand from near surface to at least 14 feet below grade, the maximum depth of exploration. The animal waste zones typically have 1-2 feet of material on the surface before native sediment was encountered. However, local areas have piles of the waste and the thickness of those occasional piles can reach 4-5 feet. Groundwater was not encountered during drilling. Descriptions of the sediments encountered are presented in the drilling logs (**Appendix C**).

Based on records available on the GeoTracker website, groundwater is present at about 72 feet below grade at a site located 2 miles east of the Property (76 Station 5204, 6190 Etiwanda Avenue, Mira Loma, CA-Global ID-T0606581722).

3.0 SITE INVESTIGATION

On July 12-19, 2021, Hillmann installed fifteen (15) soil borings (B1-B15) across the northern portion of the site to total depths ranging from 5 to 14 feet below grade. The borings were installed in targeted locations including in the surficial animal waste zones, in the former UST area and in targeted areas of the maintenance area. The borings were installed using hand auger tools. The locations of the borings are indicated on **Figure 2**.

During drilling, a California Professional Geologist described the soil using the Unified Soil Classification System. Soil samples were obtained at select depths in some borings and were preserved for analysis in stainless steel rings, sealed with Teflon tape and plastic end caps. Select samples were analyzed for carbon chain hydrocarbons corresponding to gasoline, diesel fuel, and oil weights (C4-C12, C13-C22, and C23-C40 ranges, respectively) by EPA Method 8015M for Volatile Organic Compounds (VOCs) by EPA Method 8260B, and for heavy metals by EPA Method 6010B. The soil samples were analyzed by A&R Laboratories of Ontario, California.

Each boring was completed as a soil gas sampling probe (SG1-SG15) with sampling tips installed at maximum depth (5-14 feet below grade). The soil gas sampling probes consist of plastic micro-porous vapor implants that are approximately 2 inches long with a 0.5-inch outside diameter, connected to 0.25-inch outside diameter Nylaflow tubing that extended above the surface. The annulus around each vapor implant was backfilled with approximately 1 foot of screen-washed #3 sand. Six inches of dry bentonite was placed immediately above the sand pack, followed by one-foot of bentonite that was hydrated during placement. The bentonite was further sealed with more hydrated bentonite to grade to provide a secure borehole seal. The probes were finished with gas-tight fittings at the surface pending vapor purging and sampling.

The soil gas sampling probes were allowed to equilibrate for at least 48 hours before collecting vapor samples. Prior to vapor sampling, shut-in and leak tests were conducted on the probes. The probe head was attached to the sampling train assembly of Nylaflow tubing, valves, and fittings and connected to a purge pump. The pump was used to evacuate the sealed system using an applied vacuum of 100 inches of water column (in. WC). The vacuum on each probe was monitored for 90 seconds with the sampling train system sealed. After the shut-in test was

validated, the sampling train was leak tested. Liquid isopropyl alcohol was applied around all connections in the sampling train to evaluate whether the system was sealed from ambient air leaks. A detection of 10 times the reporting limit of this compound might suggest that ambient air leakage had occurred.

The purpose of purging is to remove stagnant air from the vapor sampling train to ensure representative samples are obtained. The probes were purged using an adjustable vacuum pump set at 200 mL/minute. During purging, the soil gas was monitored for VOC, oxygen, carbon dioxide, and methane content using a Mini-Rae 2000 multi gas detector to ensure that non-atmospheric formation air was being sampled (**Appendix D**).

Probes SG1-SG5 were installed in targeted areas in the maintenance and former UST areas. These probes were sampled for VOC content. Probes SG6-SG15 were intended to provide data on possible subsurface methane issues and were screened for methane content in the field. The methane monitoring probes were intended to be screened using a Micro-Tip FID instrument calibrated for methane; however, the device malfunctioned in the field. Instead each probe was screened using the methane function on the Mini-Rae 2000 multi-gas detector. Results indicated most probes (12 of 15 total) had no detectable methane content (<1% LEL), however, probe SG11 had greater than 100% LEL (approximately 50,000 ppmV). To provide confirmation of the maximum result, a sample was obtained from SG11 for laboratory analysis of methane content.

After purging three soil gas volumes through the system, vapor samples were collected from the VOC probes (SG1-SG5), and from methane probe SG11 on July 21, 2021. During sampling, the purge pump was operated at 200 mL/minute, and the vacuum was monitored to ensure it was below 100 in. WC. Vacuum applied below this level helps ensure chemical partitioning from pore water to soil gas and the stress on the air seals are both minimized. The samples were containerized in Tedlar bags which were delivered to the laboratory for analysis. Fresh tubing was used on each sampling train between holes. Soil gas samples SG1-SG3 were analyzed for VOC using EPA Method 8260B. Soil gas samples SG4 and SG5, obtained from the UST area, and were analyzed for VOC using the more sensitive TO-15 analysis and for gasoline range hydrocarbons by EPA Method 8015. The soil gas sample from SG11 was analyzed for methane only by EPA Method 8015M by A&R Laboratories of Ontario, California.

On July 16 and 19, 2021 Hillmann collected ninety-six (96) shallow soil samples from agricultural fields on the Property, which were composited into twenty-four (24) samples representative of a sampling area/quadrant. The samples were collected using a hand auger tool or soil sampling spatula, and were completed from 0.5 to 1.5 feet below grade, according to the June 2008 Revision of the California Department of Toxic Substance Control (DTSC) guidelines "Interim Guidance for Sampling Agricultural Soils". Soil samples collected were preserved for analysis in laboratory jars, sealed with Teflon tape and plastic end caps, wrapped in aluminum foil and stored on ice. A total of twenty-four (24) composited soil samples were submitted for laboratory analysis for organo-chlorine pesticides (OCP) by EPA Method 8081A and Title 22 Metals by EPA Method 6010B. A&R Laboratories of Ontario, California analyzed the samples. The soil sample locations are indicated on **Figure 1A.**

Finally, on July 16, a limited Ground Penetrating Radar (GPR) investigation was conducted in the area reported to Hillmann as being the location of the former UST.

3.1 Laboratory Results

Results from soil sampling indicated none of the samples had detectable concentrations of Volatile Organic Compounds (VOCs) or petroleum hydrocarbons, or heavy metal concentrations that exceed residential screening levels. These results are summarized in **Table 1 and Table 1A**. The laboratory reports from soil sampling are included in **Appendix B**.

Results from soil gas sampling indicated samples SG4 and SG5 had low concentrations of petroleum–related VOC including benzene, toluene, ethylbenzene, xylenes, and trimethylbenzene, and the common solvent tetrachloroethene (PCE). The detected concentrations were compared to the Regional Screening Levels (RSLs) for soil gas which are based on human health risk factors for residential and commercial settings and are commonly used as screening tools. The screening criteria uses defined indoor air concentrations based on human health risk factors that are modified using attenuation factors provided by the Environmental Protection Agency (EPA) (0.03) and California Department of Toxic Substance Control (DTSC) (0.002). DTSC policy on which attenuation factor to use is currently under review, but our understanding is that the current accepted screening levels for residential applications for the most environmentally sensitive of the detected compounds (benzene and PCE) are 0.0485 ug/L and 0.23 ug/L, respectively. The more stringent screening levels (if applied) would be 0.003 ug/L and 0.015 ug/L, respectively. Results indicated none of the detected concentrations approaches the current residential screening levels. However, the benzene detection in sample SG5 (0.0043 ug/L) slightly exceeds the proposed screening level of 0.003 ug/L. The laboratory-measured methane concentration in sample SG11 was 45,800 ppmV and exceeds the minimum methane concentration that typically requires construction mitigation measures (1,000 ppmV). These results are summarized in **Table 2**. The laboratory report from soil gas sampling is included in **Appendix B**.

Results of Organochlorine Pesticide (OCP) analysis indicated low levels of dichloro-diphenyl-dichloroethylene (4, 4'-DDE) detected in samples B-2, 6, 9, 10, 11, 12, 13, 15, 16, 17, 18, 19, 21, 23, 24 as well as low levels of dichloro-diphenyl-trichloroethane (4, 4'-DDT) detected in samples B-11. Results of heavy metal analysis indicated the samples had low background levels of barium, chromium, cobalt, copper, lead, nickel, vanadium, and zinc.

The detected compounds were compared to Regional Screening Levels (RSLs) developed by EPA which are based on human health toxicity factors for residential and commercial settings. Results of the OCP analysis low levels of 4, 4'-DDE and 4, 4'-DDT which did not exceed the applicable RSLs for residential applications. These results are summarized in **Table 3**. The results from heavy metal analysis indicate the samples had low, background levels of metals, which did not exceed the applicable RSLs for residential applications. These results are summarized in **Table 4**. The laboratory report is included as **Appendix B**.

4.0 CONCLUSIONS AND RECOMMENDATIONS

The site occupies approximately 153.3-acres, approximately 80 acres of which is former agricultural land that is being considered for a residential development. Records indicate the site is currently and historically utilized as agricultural land, which could pose possible environmental impacts if pesticides were used. Based on these factors Hillmann recommended that a soil sampling investigation that included sampling of near surface native soil for pesticides, and Title 22 Metals. Hillmann collected ninety-six (96) individual samples, which were then composited into twenty-four (24) composite samples, and analyzed for OCPs and Title 22 Metals. Results of the OCP analysis low levels of 4,4'-DDE and 4,4'-DDT which did not exceed the applicable RSLs for residential applications. The results from heavy metal analysis indicate the samples had low, background levels of metals, which did not exceed the applicable RSLs for residential applications.

The northern portion of the site maintained the dairy farm and areas of potential environmental concern including a former UST site, a vehicle maintenance area, and areas covered by animal waste. These concerns justified preliminary subsurface investigation. In July 2021, Hillmann conducted soil and soil gas sampling in targeted areas of the site. Results from soil sampling in the UST and maintenance areas indicated no detectable concentrations of petroleum hydrocarbons or VOC, and no heavy metal concentrations exceeding residential screening levels. The results from soil gas sampling in these areas (SG1-SG5) indicated no VOC concentrations exceeding current residential screening levels. One sample (SG5-14) had benzene concentrations that slightly exceed proposed residential screening levels (if they were to be adopted), but given the depth of the sample (14 feet) and consideration for attenuation provided by new construction, these very low concentrations likely do not pose a significant environmental or human health concern for the proposed residential use.

The results from methane testing in animal waste areas indicate most samples had insignificant concentrations of subsurface methane. Field screening indicated just three samples (of 15) had detectable concentrations of methane. The sample with the highest concentrations of methane (gauged in the field) was laboratory analyzed and had 45,800 ppmV methane which exceeds the typical screening level for determining if mitigation measures are required for new structures. However, it is important to note that the methane distribution is not wide spread and that the areas investigated are still covered with animal waste. This material will have to be removed and disposed prior to grading and construction. A follow-up methane survey should be performed when this is completed, possibly targeting sample SG11 as one of the primary future sampling sites. To provide a preliminary indication on the extent of animal waste, Hillmann recorded the depth of manure at each suspect location. The waste layer extended to 1-2 feet below grade in most areas investigated within the target zones. **Figure 3** shows the rough distribution of waste that would need to be removed and disposed to a depth of 1-2 feet below current surface grade. Based on this rough approximation, a minimum of about 60,000 cubic yards of waste would need to be removed and disposed.

A GPR investigation of the area reported to Hillmann as being the location of the former UST did not indicate any evidence of a UST still present. A copy of the GPR report is located in **Appendix E**.

5.0 LIMITATIONS

This Subsurface Investigation was performed in accordance with generally and currently accepted engineering practices and principles; however, the procedures and methodologies used in this investigation are not intended to meet all specific regulatory guidelines as this work was completed as a self-directed effort. Although the data in this report is indicative of subsurface conditions in areas investigated, no further conclusions regarding the absence or presence of subsurface contamination in other areas of the site should be construed or inferred other than those expressly stated in this report. The conclusions made are based on information obtained from field observations, independent laboratory analytical results, and from current and relevant Federal, State, regional, and local agencies.

DTSC Background	***12****									

Notes: ND - Not Detected. EPA Regional Screening Levels (RSLs) are human health risk-based screening levels used by EPA and DTSC in residential and commercial settings. DTSC Background Concentration is based on statistical study of sites throughout southern California. This concentration may be used as a screening level for anthropogenic and naturally occurring levels of arsenic in soil in southern California.* - Values modified by DTSC HHRA Note 3. Please refer to lab report for complete results.

Ken Zheng - Lab Director

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.

For any feedback concerning our services, please contact Jenny Jiang, Project Manager at 951.779.0310. You may also contact Ken Zheng, President at office@arlaboratories.com.

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.

Were all samples sealed in plastic bags?			X
Did all bottle labels agree with COC? (ID, dates and times)	X		
Were correct containers used for the tests required?	X		
Was a sufficient amount of samples sent for tests indicated?	X		
Was there headspace in VOA vials?			X
Were the containers labeled with correct preservatives?			X

Explanations/Comments:

Notification:

For discrepancies, how was the Project Manager notified? Verbal

Verbal: PM Initials: _____ Data/Time: _____

Email: Send to: _____ Data/Time: _____

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.

For any feedback concerning our services, please contact Jenny Jiang, Project Manager at 951.779.0310. You may also contact Ken Zheng, President at office@arlaboratories.com.

SECTION 1
INTRODUCTION

A. PROJECT LOCATION

The project site for the proposed New Home Company development (Leal Ranch - Tentative Tract 38290) is currently a vacant and undeveloped land in the City of Eastvale, Riverside County. The site has a total area of approximately 159.2 acres. It is bounded to the north by 58th Street and existing residential homes beyond; to the east by Hamner Avenue and existing residential homes and a commercial shopping center (Eastvale Gateway); to the south by Limonite Avenue and existing residential homes and a commercial shopping center beyond; and to the west by Scholar Way and existing residential homes beyond; See Vicinity Map for details.

B. STUDY PURPOSE

The purpose of this study is to provide a hydrology analysis for the flow rates produced from the proposed site and assure the proposed flow rates would not exceed the existing storm drain design flow rates in the surrounding streets.

It also serves as the basis for analyzing and designing proposed and required storm drain drainage facilities. The study also demonstrates the proposed detention basin to reduce the increased storm runoffs due to the project development to the existing storm drain design flows. In addition, water quality treatment measures are proposed to ensure the developed flows to be treated prior to releasing to downstream watercourses.

C. METHODOLOGY

This hydrology study was prepared in accordance with the Riverside County Flood Control and Water Conservation District (RCFC&WCD) criteria and Hydrology Manual (Manual) dated April 1978. All pertinent information is included in this report.

The hydrologic calculations were prepared using the CivilD Rational Method computer program. The results of the hydrologic calculations were used to design the required storm drain facilities.

D. DISCUSSION

Existing Condition:

Current development in the project site is comprised of one of the city's last operating dairies, the Leal family home, and a horse farm.

The project site is part of the Eastvale Master Drainage Plan (MPD) improvements. There are existing storm drain systems in the surrounding streets – Limonite Avenue, Scholar Way, Hamner Avenue and 58th Street. The as-built storm drain plans can be

found in Reference Section 5. The storm drains in the surrounding streets discharge into Cleveland Avenue Detention Basin per Eastvale Master Drainage Plan.

The project site sheet flows from north to south and to the existing storm drains along Limonite Avenue. The project site is part of Limonite Avenue storm drain (Line D-5) per Eastvale Master Drainage Plan. There are existing storm drain stubs provided for the future developments

Proposed Condition:

The New Home Company is proposing to develop the project into 14 Planning Areas (Lots 1-14) and 19 lettered lots (A-S) to accommodate a mixed use development consisting of multi-family residential, general retail (shopping center), general offices, medical offices, hotels, civic center, parks and supporting infrastructure improvements.

Storm drain systems are provided to convey the project site runoffs to the existing storm drain systems. Majority of the project site flows will join the existing storm drain systems along Limonite Avenue, following the Eastvale Master Drainage Plan. There are catch basins provided for the street improvements along 58th Street, Hamner Avenue, Limonite Avenue and Scholar Way. The catch basin laterals will be proposed to join the existing storm drains along the streets.

In addition to on-site drainage improvements, the proposed project will provide 2 water quality basins and one combined water quality/detention Basin for water quality treatments and mitigation of flow increases due to the project developments.

Hydrology Calculation Results:

There are three Drainage Areas in the proposed condition hydrology study, only the 100-year storm hydrology analysis were performed.

Drainage Area “A” consists half street improvements along Hamner Avenue and the storm drain laterals are provided to join the existing 66” RCP per Eastvale Master Drainage Plan Line “E”. It is anticipated that the proposed catch basins and laterals would follow the Eastvale MPD and would not have adverse impacts to the existing storm drain systems.

Drainage Area “B” consists majority of the project developments and the proposed storm drains are proposed to join the existing storm drains along Limonite Avenue (MDP Line “D-5”). The total 100-year storm peak flow rate is about 316.4 cfs with 149.1 acres of tributary areas. The design flow rate per the as-built plans is about 160 cfs. The project flows are more than the design flows for the existing storm drain systems.

Drainage Area “C” consists half street improvements along 58th Street and Scholar Way and the storm drain laterals are provided to join the existing 60” RCP and 72” RCP per

Eastvale Master Drainage Plan Line "D-3". It is anticipated that the proposed catch basins and laterals would follow the Eastvale MPD and would not have adverse impacts to the existing storm drain systems.

E. UNIT HYDROGRAPH AND BASIN ROUTING ANALYSIS

Per the 100-year hydrology analysis, the proposed peak flow rates are above the existing storm drain design flow rates for Limonite Storm drain. The proposed 100-year flow rate is about 316.4 cfs and the design flow rate is about 160 cfs.

Detention Basin

The underground Detention Basin with the sizes of approximately 360-ft long, 120-ft wide and 6-ft deep was provided at the southwest corner of the project site to reduce the peak flow rates to the existing storm drain design flows. The water quality basin is proposed at the south of the proposed underground detention basin for water quality basin. Please note the proposed detention basin and water quality basin locations and sizes are preliminary and subject to change during the final design.

Unit hydrograph and basin routing analysis were performed for the 100-year storm. The detailed unit hydrograph and basin routing calculations including stage-storage-outflow information can be found in the Section 4 and the basin routing summary can be found in Table 1. As shown from Table 1, the proposed detention facilities can mitigate the flow increases and reduce the flows to 252.1 cfs (inflow to the basin) to 82.0 cfs (outflow from the basin) with a flow reduction of 170.1 cfs. The total 100-year peak flow rate for Limonite Avenue storm drain is about 151.9 cfs with the proposed detention basin; refer to Table 2 for detailed explanations.

Table 1 Basin Routing Summary for Tentative Map No. 38290
in City of Eastvale

Storm	Inflow	outflow	flow reduction
	(cfs)	(cfs)	(cfs)
100-year	252.1	82.0	170.1

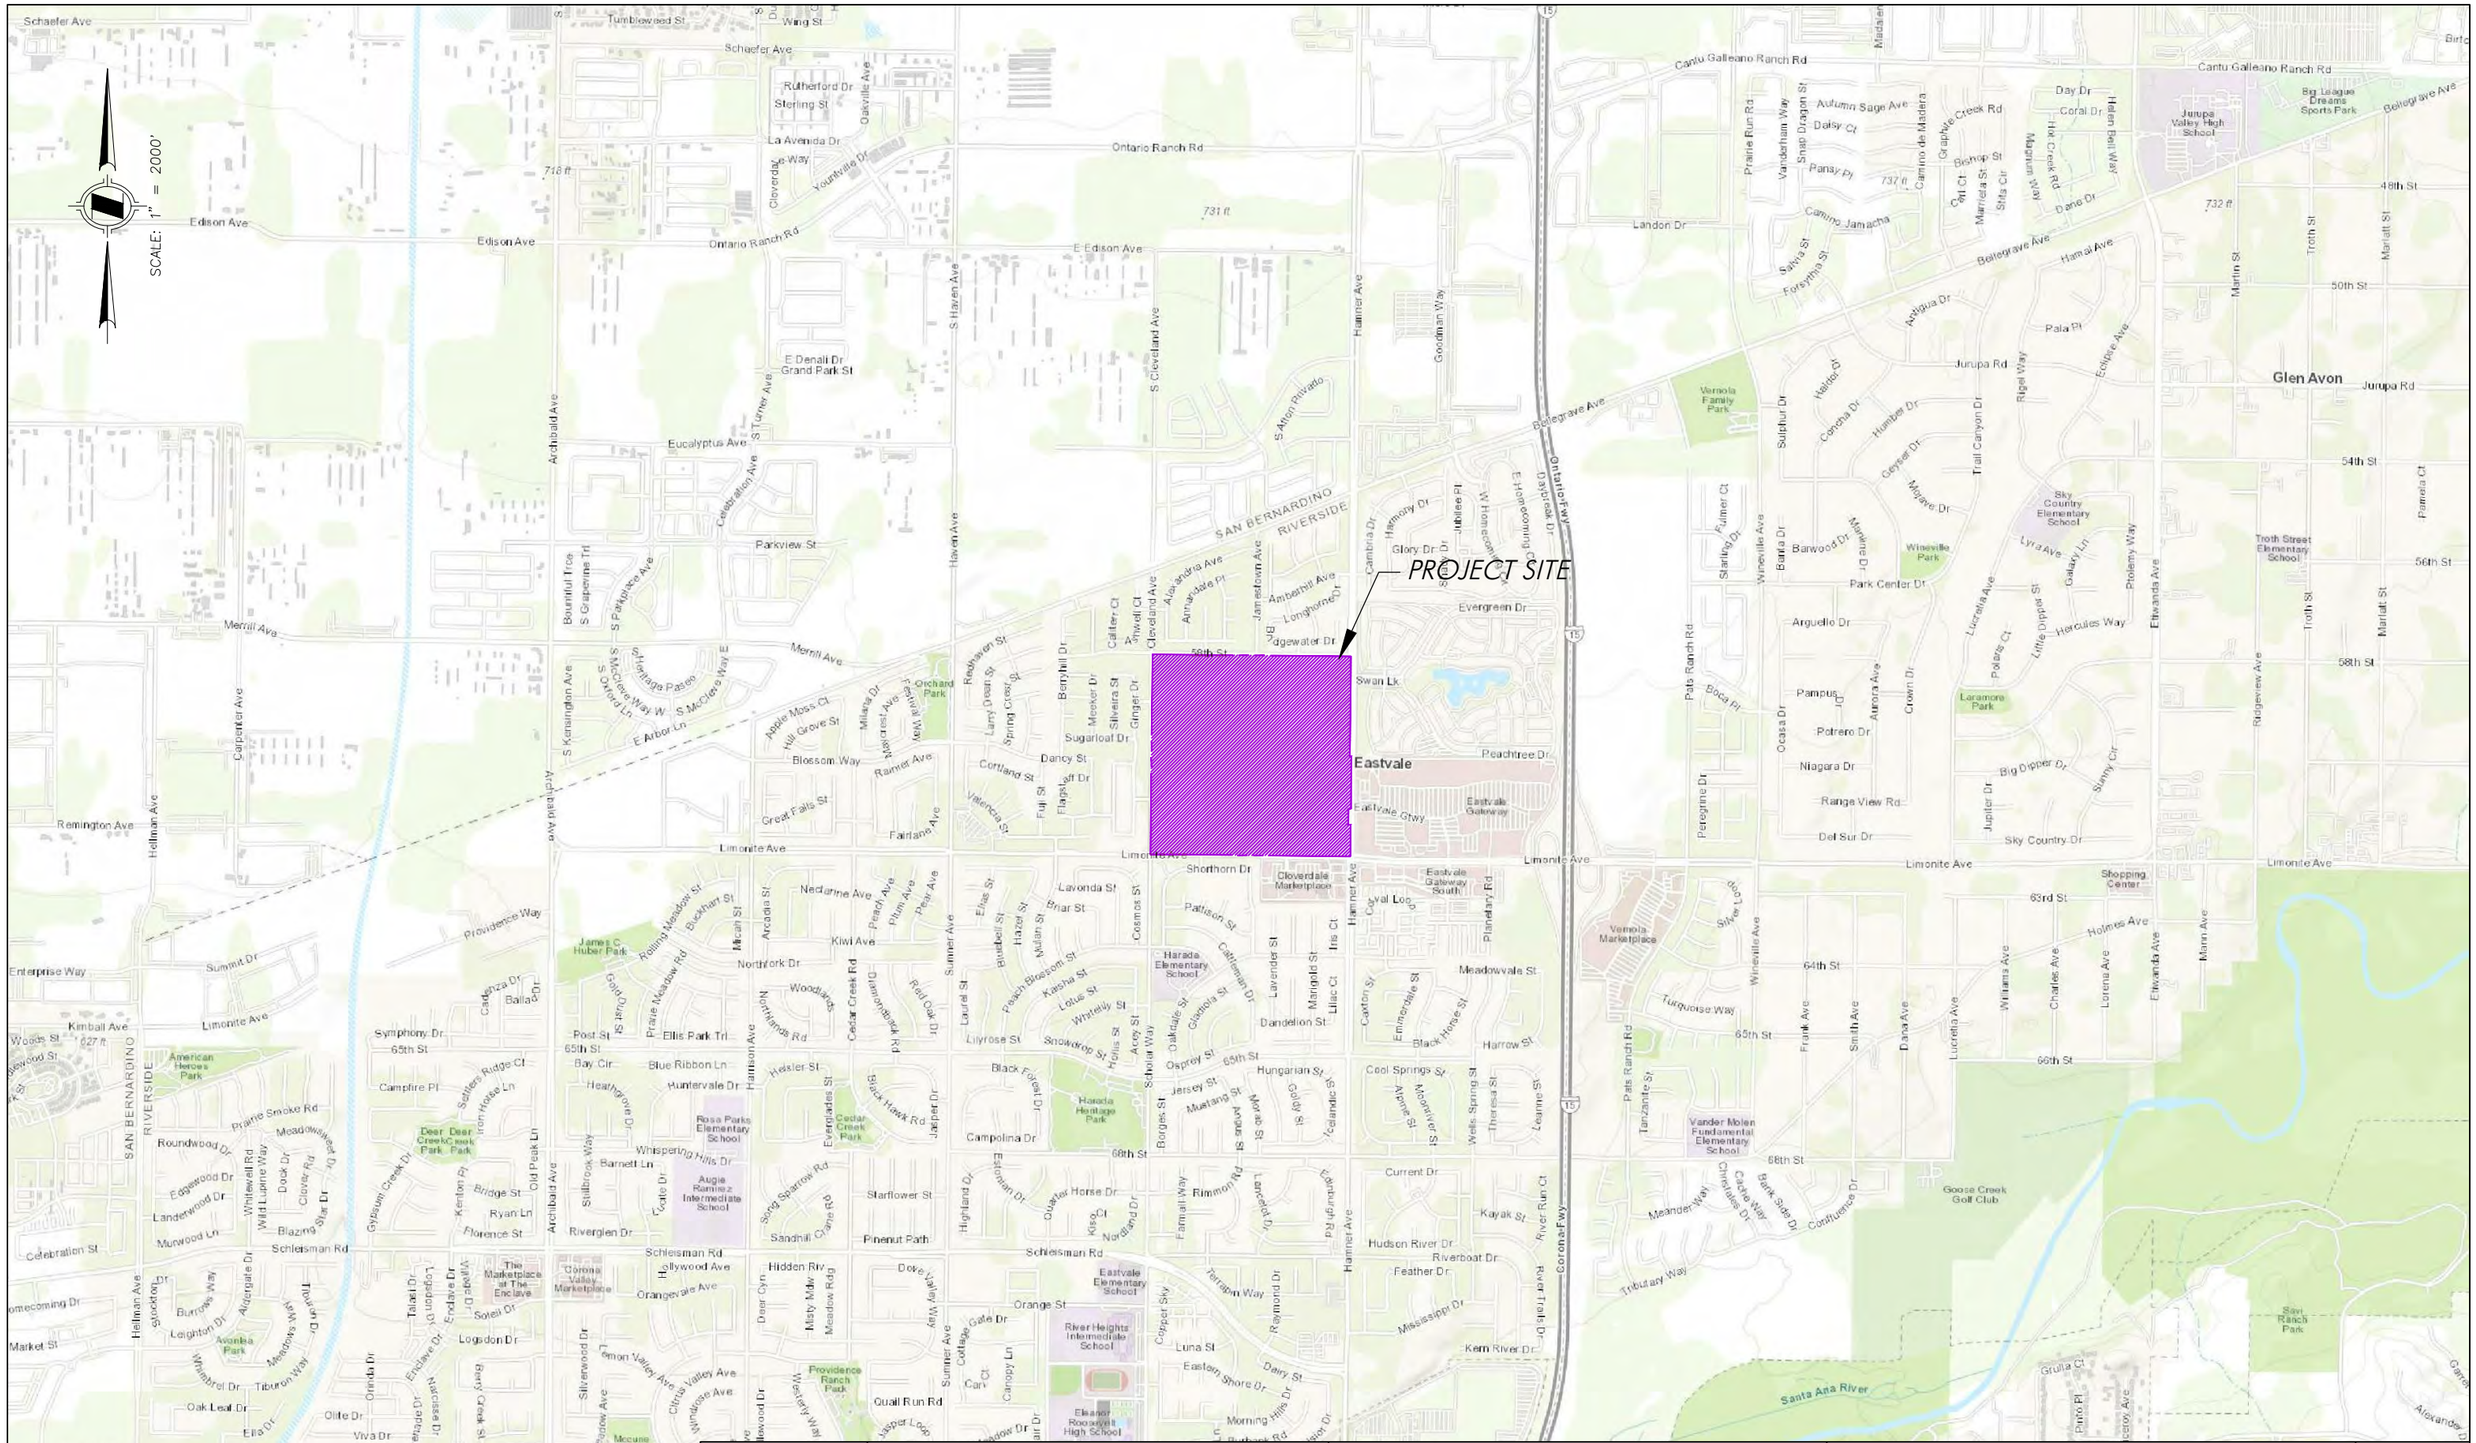
Note: the inflow used in the basin routing analysis was from Node 71

Table 2 100-year Flow Summary for Limonite Avenue Storm Drain after the flow mitigation provided by detention basin

in City of Eastvale

Node	Flow without Mitigation	Flow reduction per Table 1	Flow after Mitigation	Ex. Storm Drain Design Flow Rate	Flow after Mitigation less than the ex. SD Design Flow?
	(cfs)	(cfs)	(cfs)	(cfs)	yes
75	322.0	170.1	151.9	160.0	

As shown from Table 2, the proposed flows (151.9 cfs) is less than the existing storm drain design flow rate (160 cfs) with the proposed basin and would have no adverse impacts to the existing downstream storm drain systems.



Water Quality:

A complete Water Quality Report is present under a separate cover.

F. CONCLUSION

The New Home Company is proposing to develop the project into 14 Planning Areas (Lots 1-14) and 19 lettered lots (A-S) to accommodate a mixed use development consisting of multi-family residential, general retail (shopping center), general offices, medical offices, hotels, civic center, parks and supporting infrastructure improvements. The proposed project would result in the storm runoff volume and peak flow rate increases due to the project developments at certain discharge points. The project proposes the water quality and detention basins to provide water quality treatments and flow increase mitigations. The flow rates after accounting for the proposed basins are below the design flow rates along Limonite Avenue. Catch basins and laterals are provided for the half street improvements along Scholar Way, 58th Street and Hamner Avenue.

As a result of the project development, it is our opinion that the project would follow Eastvale Master Drainage Plan and would have no adverse impacts to the downstream drainage systems.

**** CONFLUENCE OF MINOR STREAMS ****
______________________________________________________________________________
Along Main Stream number: 2 in normal stream number 2
Stream flow area =     20.800(Ac.)
Runoff from this stream =     51.271(CFS)
Time of concentration =   11.89 min.
Rainfall intensity =     2.923(In/Hr)
Summary of stream data:

Stream   Flow rate      TC            Rainfall Intensity
 No.       (CFS)       (min)                (In/Hr)

1       29.013     14.34                2.637
2       51.271     11.89                2.923
Largest stream flow has longer or shorter time of concentration
Qp =     51.271 + sum of
         Qa          Tb/Ta
         29.013 *    0.829 =     24.066
Qp =     75.337

Total of 2 streams to confluence:
Flow rates before confluence point:
      29.013      51.271
Area of streams before confluence:
       12.800       20.800
Results of confluence:
Total flow rate =     75.337(CFS)
Time of concentration =    11.892 min.
Effective stream area after confluence =     33.600(Ac.)

↑ [Σ FLOWS (HOLES+RISER)]

(OUTFLOW THROUGH HOLES)

↑ (FLOW OVER TOP OF RISER PIPE)

Note:

1. Orifice outflow is based on:
   $Q=CA(2gH)^{0.5}$
   where:
   C = Coefficient, 0.6 used here
   A = Orifice Area
   H = Headwater

2. Top of riser overflow is based on:
   $Q=CLH^{1.5}$
   where:
   C = Coefficient, 2.8 used here based on sharp crested weir
   L = Weir Length
   H = Headwater

MAINTENANCE NOTES

THE FOLLOWING ITEMS ARE TO BE INSPECTED AND MAINTAINED BY THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT.

1. 78" RCP FROM STATION 62+03.37 TO STATION 62+11.37 AS SHOWN ON SHEET 3.
2. 72" RCP FROM STATION 62+30.24 TO STATION 62+36.24 AS SHOWN ON SHEET 3.
3. 60" RCP FROM STATION 10+06.67 TO STATION 23+34.00 AS SHOWN ON SHEETS 4 & 5.
4. 54" RCP FROM STATION 23+37.93 TO STATION 28+97.93 AS SHOWN ON SHEETS 5 & 6.
5. ALL MANHOLES AND OTHER STRUCTURES REQUIRED TO COMPLETE THE CONSTRUCTION OF THE ABOVE MENTIOND MAINLINE PIPES, EXCLUDING CATCH BASINS AND COLLECTOR PIPES WITHIN STREET R/W.
6. 72" BUBBLER FACILITY AT STATION 61+99.37 AND 48" DROP INLET FACILITY AT STATION 28+97.93 AS SHOWN ON SHEETS 3, 6, & 8.
7. 24" HDPE/PVC FROM STATION 49+93.05 TO STATION 61+94.37 AS SHOWN ON SHEETS 2 & 3.

GENERAL NOTES

1. THE CONTRACTOR SHALL CONSTRUCT THE FLOOD CONTROL IMPROVEMENTS SHOWN ON THE DRAWINGS IN CONFORMANCE WITH THE REQUIREMENTS OF THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT'S MEMORANDUM OF UNDERSTANDING STANDARD SPECIFICATIONS, DATED SEPTEMBER 1984, AND DESIGN MANUAL STANDARD DRAWINGS, RECENT EDITION DATED MAY 1971.
2. THE CONTRACTOR IS REQUIRED TO CONTACT ALL UTILITY AGENCIES REGARDING TEMPORARY SUPPORT AND SHORING REQUIREMENTS FOR THE VARIOUS UTILITIES SHOWN IN THE PLAN.
3. CONSTRUCTION INSPECTION WILL BE PERFORMED BY RIVERSIDE COUNTY FLOOD CONTROL. CONTACT DALE ANDERSON AT (909) 955-1288. THE DISTRICT MUST BE NOTIFIED TWENTY DAYS PRIOR TO CONSTRUCTION.
4. ALL STATIONING REFERS TO THE CENTERLINE OF CONSTRUCTION UNLESS OTHERWISE NOTED.
5. STATIONING FOR LATERALS AND CONNECTOR PIPE REFER TO THE CENTERLINE-CENTERLINE INTERSECTION STATION.
6. FORTY-EIGHT HOURS BEFORE EXCAVATION, CALL UNDERGROUND SERVICE ALERT (800) 227-2600.
7. ALL ELEVATIONS SHOWN ARE IN FEET AND DECIMALS THEREOF BASED ON U.S.C. & G.S. DATUM.
8. ALL CROSS SECTIONS ARE TAKEN LOOKING DOWNSTREAM.
9. ELEVATIONS AND LOCATIONS OF UTILITIES SHOWN ARE APPROXIMATE UNLESS OTHERWISE NOTED. ALL UTILITIES ARE TO BE PROTECTED IN PLACE UNLESS OTHERWISE NOTED.
10. OPENINGS RESULTING FROM THE CUTTING OR PARTIAL REMOVAL OF EXISTING CULVERTS, PIPES OR SIMILAR STRUCTURES TO BE ABANDONED SHALL BE SEALED WITH 6 INCHES OF CLASS "B" CONCRETE.
11. PIPE CONNECTED TO THE MAINLINE PIPE SHALL CONFORM TO JUNCTION STRUCTURE NO. 4 (JS 229) UNLESS OTHERWISE NOTED.
12. "V" IS THE DEPTH OF INLET AND CATCH BASINS MEASURED FROM THE TOP OF CURB TO INVERT OF CONNECTOR PIPE.
13. ALL CURBS, GUTTERS, SIDEWALKS, DRIVEWAYS AND OTHER EXISTING IMPROVEMENTS TO BE RECONSTRUCTED IN KIND AND AT THE SAME ELEVATION AND LOCATION AS THE EXISTING IMPROVEMENTS UNLESS OTHERWISE NOTED.
14. HYDRAULIC GRADE LINES SHOWN IN PROFILES ARE FOR 100 YEAR FREQUENCY FLOWS, UNLESS OTHERWISE NOTED.
15. THE CONTRACTOR SHALL COMPLY WITH THE STATE AND LOCAL SAFETY CODES DURING THE PROGRESS OF WORK.
16. THE DEVELOPER SHALL MAINTAIN ADJACENT STREETS IN A NEAT, SAFE, CLEAN AND SANITARY CONDITION AT ALL TIMES AND TO THE SATISFACTION OF THE COUNTY OF RIVERSIDE'S OR DISTRICT'S INSPECTOR. THE ADJACENT STREETS SHALL BE KEPT CLEAN OF DEBRIS, WITH DUST AND OTHER NUISANCE BEING CONTROLLED AT ALL TIMES. THE DEVELOPER SHALL BE RESPONSIBLE FOR ANY CLEAN-UP ON ADJACENT STREETS AFFECTED BY HIS CONSTRUCTION. METHOD OF STREET CLEANING SHALL BE BY DRY SWEEPING OF ALL PAVED AREAS.

GENERAL NOTES CONT.

17. THE CONTRACTOR AGREES THAT HE SHALL ASSUME SOLE AND COMPLETE RESPONSIBILITY FOR THE JOB SITE CONDITIONS DURING THE COURSE OF CONSTRUCTION OF THIS PROJECT, INCLUDING SAFETY OF ALL PERSONS AND PROPERTY, THAT THIS REQUIREMENT SHALL APPLY CONTINUOUSLY AND NOT BE LIMITED TO NORMAL WORKING HOURS; AND THAT THE CONTRACTOR SHALL DEFEND, INDEMNIFY AND HOLD THE OWNER, R.C.F.C.D., COUNTY ROAD DEPARTMENT, AND THE DEVELOPER'S ENGINEER HARLMESS FROM ANY AND ALL LIABILITY, REAL OR ALLEGED, IN CONNECTION WITH THE PERFORMANCE OF WORK ON THIS PROJECT, EXCEPTING FOR LIABILITY ARISING FROM THE SOLE NEGLIGENCE OF THE OWNERS, OR THE DEVELOPER'S ENGINEER.
18. ADJUST ALL STORM DRAIN AND SEWER MANHOLES, AND WATER VALVES TO GRADE.
19. ALL PIPE LENGTHS ARE HORIZONTAL PROJECTIONS (NOT TRUE LENGTHS OF PIPE) AND ARE THE BASIS OF THE ESTIMATES OF QUANTITIES. THE CONTRACTOR SHALL DETERMINE THE TRUE QUANTITY OF PIPE REQUIRED FOR THIS PROJECT PRIOR TO PLACING THE ORDER.
20. ELEVATIONS SHOWN ARE TO THE INVERT OF PIPE, EXCEPT WHERE OTHERWISE NOTED.
21. AT THE DISCRETION OF THE ENGINEER, THE CONTRACTOR MAY BE REQUIRED TO VERIFY BY POTHOLING THE LOCATION OF POTENTIALLY AFFECTED UTILITIES.
22. CONTRACTOR SHALL DISPOSE OF ALL EXCESS EXCAVATED MATERIAL AT MANDATORY DISPOSAL SITE. MUST BE NOTIFIED ONE WEEK PRIOR TO CONSTRUCTION.
23. ALL BACKFILL AND BEDDING AROUND STRUCTURES AND PIPES SHALL BE COMPACTED TO NOT LESS THAN 90 PERCENT RELATIVE COMPACTION EXCEPT WHERE SUCH MATERIAL IS PLACED UNDER EXISTING PAVED ROADWAYS, THE TOP 3 FEET, MEASURED FROM THE FINISHED PAVING, SHALL BE COMPACTED TO 95 PERCENT RELATIVE COMPACTION.
24. PIPE BEDDING SHALL CONFORM TO RCFC&WCD STD. DWG. NO. M815 EXCEPT FOR COVER <2 FEET. FOR COVER <2 FEET, CONCRETE SLURRY (2000 PSI - 2 SACK) SHALL BE USED. THE ENTIRE TRENCH SHALL BE SLURRY EXTENDING 4 INCHES MINIMUM AND 12 INCHES MAXIMUM ABOVE THE TOP OF THE PIPE.
25. APPROVAL OF THESE PLANS BY THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT DOES NOT RELIEVE THE DEVELOPER'S ENGINEER OF RESPONSIBILITY FOR THE ENGINEERING DESIGN. IF FIELD CHANGES ARE REQUIRED, IT WILL BE THE RESPONSIBILITY OF THE DESIGN ENGINEER TO MAKE THE NECESSARY CORRECTIONS.
26. THE CONTRACTOR OR DEVELOPER SHALL SECURE ALL REQUIRED ENCROACHMENT AND/OR STATE AND FEDERAL REGULATORY PERMITS PRIOR TO THE COMMENCEMENT OF ANY WORK.
27. STANDARD DRAWINGS CALLED FOR ON THE PLANS AND PROFILES SHALL CONFORM TO DISTRICT STANDARD DRAWINGS UNLESS NOTED OTHERWISE.
28. DURING ROUGH GRADING OPERATIONS AND PRIOR TO CONSTRUCTION OF PERMANENT DRAINAGE STRUCTURES, TEMPORARY DRAINAGE CONTROL SHOULD BE PROVIDED TO PREVENT PONDING WATER AND DRAINAGE TO ADJACENT PROPERTIES.

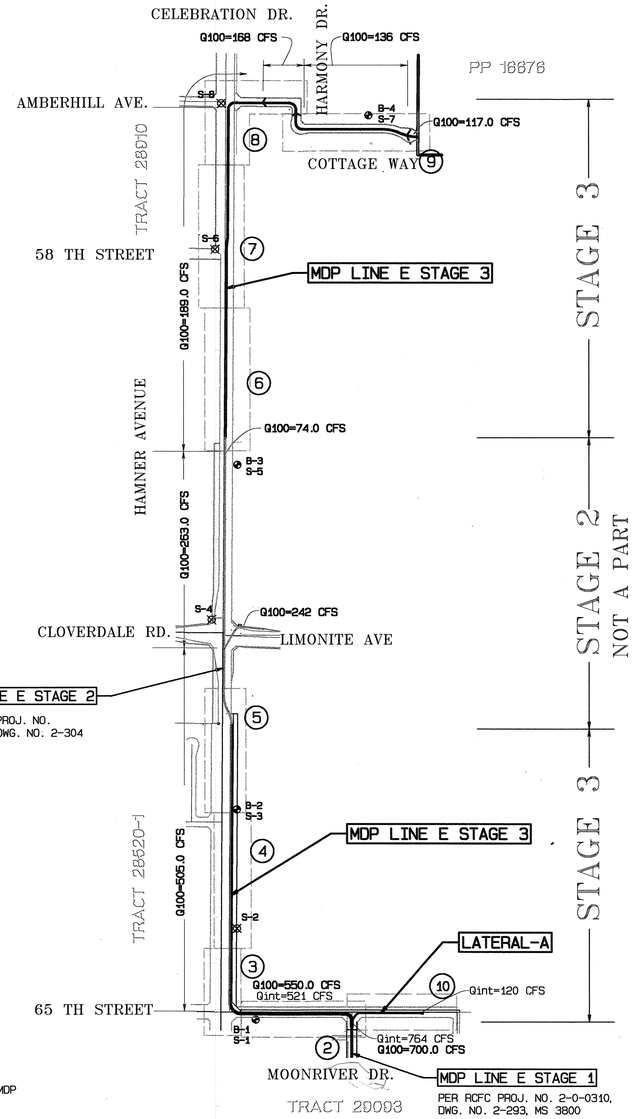
EASTVALE MASTER DRAINAGE PLAN LINE E

GENERAL NOTES



1. ALL STATIONING REFERS TO CENTERLINE OF CONSTRUCTION.
2. ALL CROSS SECTIONS ARE TAKEN LOOKING DOWNSTREAM.
3. TOPOGRAPHY BY DIGITAL PHOTOGRAMMETRIC METHODS. AERIAL PHOTOGRAPHS TAKEN AT AN ALTITUDE NOT TO EXCEED A FLYING HEIGHT TO CONTOUR INTERVAL RATIO OF 1800. PHOTOGRAPHY DATED 10-25-00, BY INLAND AERIAL SURVEYS, INC.
4. THE VERTICAL DATUM IS DERIVED FROM NGVD 29. THE HORIZONTAL DATUM IS DERIVED FROM NAD 83.
5. STANDARD DRAWINGS CALLED FOR ON THE PLAN & PROFILE SHALL CONFORM TO R.C.F.C. & W.C.D. STD. DRAWINGS, CALTRANS OR COUNTY STANDARD PLANS.
6. ELEVATIONS AND LOCATIONS OF UTILITIES WERE OBTAINED FROM AVAILABLE INFORMATION AND ARE SHOWN APPROXIMATELY ON THESE PLANS. 48 HOURS BEFORE EXCAVATION CALL UNDERGROUND SERVICE ALERT AT 1-800-227-2600. ALL UTILITIES SHALL BE PROTECTED IN PLACE EXCEPT AS NOTED ON PLANS AND SPECIFICATIONS.
7. THE CONTRACTOR IS REQUIRED TO CONTACT ALL UTILITY AGENCIES REGARDING TEMPORARY SUPPORT AND SHORING REQUIREMENTS FOR THE VARIOUS UTILITY LINES SHOWN ON THESE PLANS.
8. ALL OPENINGS RESULTING FROM CUTTING OR PARTIAL REMOVAL OF EXISTING CULVERTS, PIPES, OR SIMILAR STRUCTURES TO BE ABANDONED, SHALL BE SEALED AT BOTH ENDS WITH 6" MIN. CLASS "B" CONCRETE.
9. STREET RECONSTRUCTION SHALL BE AS SHOWN ON TYPICAL STREET PAVEMENT DETAILS. IF THERE IS NO TYPICAL DETAIL, THE RECONSTRUCTION SHALL BE 0.65' AC OVER 0.60' AB OR IN KIND, WHICHEVER IS GREATER, INCLUDING STRIPING AND MARKING.
10. ALL RECONSTRUCTION, RESURFACING AND PAVEMENT DELINEATION, CURBS, SIDEWALKS AND OTHER IMPROVEMENTS ARE TO BE RECONSTRUCTED IN KIND AT THE SAME LOCATIONS AND ELEVATIONS AS THE EXISTING IMPROVEMENTS, UNLESS OTHERWISE NOTED.
11. ⊕ INDICATES APPROX. SOIL BORING LOCATION PER SOILS REPORT DATED 6/11/2001.
12. FOR COMPLETE RIGHT-OF-WAY AND TEMPORARY CONSTRUCTION EASEMENT REFER TO GRANT OF EASEMENTS & OFFER OF DEDICATIONS RECORDED AS SHOWN ON PLAN
13. ALL TRENCH EDGES SHALL BE SAWCUT NEAT OR AS DIRECTED BY THE ENGINEER.
14. APPROVAL FOR THESE PLANS BY THE RIVERSIDE COUNTY FLOOD CONTROL & WATER CONSERVATION DISTRICT DOES NOT RELIEVE THE DEVELOPER'S ENGINEER OF RESPONSIBILITY FOR THE ENGINEERING DESIGN. IF FIELD CHANGES ARE REQUIRED, IT WILL BE THE RESPONSIBILITY OF THE DESIGN ENGINEER TO MAKE THE NECESSARY CHANGES.
15. ALL WORK WITHIN THE RIVERSIDE COUNTY TRANSPORTATION DEPARTMENT R/W WILL REQUIRE AN ENCROACHMENT PERMIT.
16. ITEMS WITHIN THE TEMPORARY CONSTRUCTION EASEMENT NOT IDENTIFIED ON THE PLANS SHALL BE PROTECTED IN PLACE OR RESTORED TO THE ORIGINAL CONDITIONS
17. CONTRACTOR SHALL INSTALL TEMPORARY CHAIN-LINK FENCE ALONG TEMPORARY CONSTRUCTION EASEMENT, OR RELOCATE EXIST. FENCE TO TEMPORARY CONSTRUCTION EASEMENT. TEMPORARY FENCE SHALL BE REMOVED AFTER CONSTRUCTION COMPLETED

NOTICE TO CONTRACTOR

THE EXISTENCE AND LOCATIONS OF ALL UNDERGROUND UTILITIES (UTILITY PIPES, STRUCTURES, ETC.) SHOWN ON THESE PLANS (MAIN LINES ONLY - NO SERVICE LATERALS) WERE ASCERTAINED BY A REVIEW OF RECORDS PROVIDED BY THESE MEMBER AGENCIES AND ARE APPROXIMATE. NEITHER THE OWNER NOR THE ENGINEER ASSUMES ANY RESPONSIBILITY FOR UTILITIES NOT SHOWN OR NOT IN THE LOCATION SHOWN.

THE CONTRACTOR IS REQUIRED TO TAKE DUE PRECAUTIONARY MEASURES TO PROTECT THE UTILITY LINES SHOWN AND ANY OTHER LINES NOT OF RECORD OR NOT SHOWN ON THESE PLANS. LOCATIONS OF UTILITIES SHALL BE VERIFIED BY THE CONTRACTOR PRIOR TO COMMENCEMENT OF CONSTRUCTION.

CALL UNDERGROUND SERVICE ALERT (U.S.A.) 1-800-227-2600 AT LEAST 2 WORKING DAYS PRIOR TO EXCAVATION.

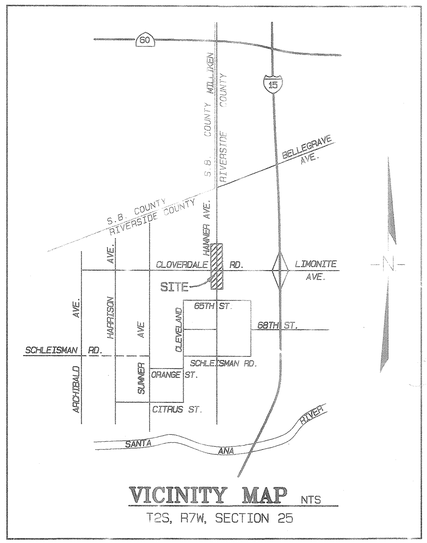
EASTVALE MASTER DRAINAGE PLAN LINE E

GENERAL NOTES

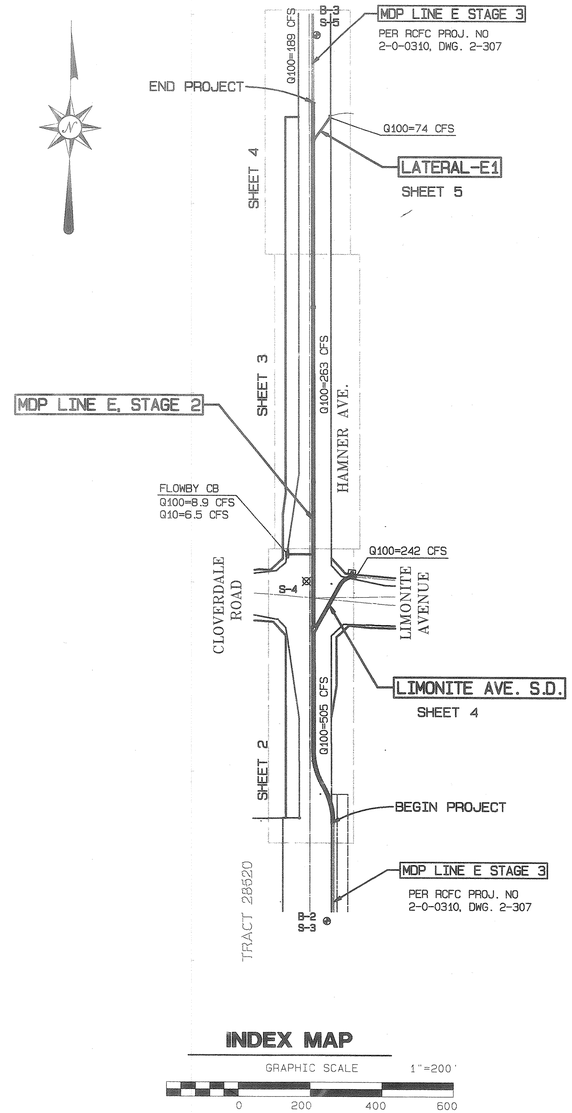


1. ALL STATIONING REFERS TO CENTERLINE OF CONSTRUCTION.
2. ALL CROSS SECTIONS ARE TAKEN LOOKING DOWNSTREAM
3. TOPOGRAPHY BY DIGITAL PHOTOGRAMMETRIC METHODS. AERIAL PHOTOGRAPHS TAKEN AT AN ALTITUDE NO TO EXCEED A FLYING HEIGHT TO CONTOUR INTERVAL RATIO OF 1800. PHOTOGRAPHY DATED 2-13-1999, BY INLAND AERIAL SURVEYS, INC.
4. THE VERTICAL DATUM IS DERIVED FROM NGVD 29. THE HORIZONTAL DATUM IS DERIVED FROM NAD 83.
5. STANDARD DRAWINGS CALLED FOR ON THE PLAN & PROFILE SHALL CONFORM TO R.C.F.C. & W.C.D. STD. DRAWINGS, CALTRANS OR COUNTY STANDARD PLANS.
6. ELEVATIONS AND LOCATIONS OF UTILITIES WERE OBTAINED FROM AVAILABLE INFORMATION AND ARE SHOWN APPROXIMATELY ON THESE PLANS. 48 HOURS BEFORE EXCAVATION CALL UNDERGROUND SERVICE ALERT AT 1-800-227-2600. ALL UTILITIES SHALL BE PROTECTED I
7. THE CONTRACTOR IS REQUIRED TO CONTACT ALL UTILITY AGENCIES REGARDING TEMPORARY SUPPORT AND SHORING REQUIREMENTS FOR THE VARIOUS UTILITY LINES SHOWN ON THESE PLANS.
8. ALL OPENINGS RESULTING FROM CUTTING OR PARTIAL REMOVAL OF EXISTING CULVERTS, PIPES, OR SIMILAR STRUCTURES TO BE ABANDONED, SHALL BE SEALED AT BOTH ENDS WITH 6" MIN. CLASS "B" CONCRETE.
9. STREET RECONSTRUCTION SHALL BE AS SHOWN ON TYPICAL STREET PAVEMENT DETAILS. IF THERE IS NO TYPICAL DETAIL, THE RECONSTRUCTION SHALL BE IN KIND.
10. ALL RECONSTRUCTION, RESURFACING AND PAVEMENT DELINEATION, CURBS, SIDEWALKS AND OTHER IMPROVEMENTS ARE TO BE RECONSTRUCTED IN KIND AT THE SAME LOCATIONS AND ELEVATIONS AS THE EXISTING IMPROVEMENTS, UNLESS OTHERWISE NOTED.
11. ⊗ INDICATES APPROX. SOIL BORING LOCATION PER SOILS REPORT BY RMA GROUP DATED 6/11/2001
12. CONSTRUCTION INSPECTION OF STORM DRAIN WILL BE PERFORMED BY RIVERSIDE COUNTY FLOOD CONTROL. CONTACT DALE ANDERSON AT (909) 275-1288. THE DISTRICT MUST BE NOTIFIED TWO WEEKS PRIOR TO CONSTRUCTION. CONSTRUCTION INSPECTION OF ROADWAY RELATED ITEMS WILL BE PERFORMED BY RIVERSIDE COUNTY TRANSPORTATION DEPARTMENT.
13. ALL TRENCH EDGES SHALL BE SAWCUT NEAT OR AS DIRECTED BY THE ENGINEER
14. ALL ROAD WORK SHALL CONFORM TO COUNTY ROAD IMPROVEMENT STANDARDS AND SPECIFICATIONS PER ORDINANCE 461.
15. APPROVAL FOR THESE PLANS BY THE RIVERSIDE COUNTY FLOOD CONTROL & WATER CONSERVATION DISTRICT DOES NOT RELIEVE THE DEVELOPER'S ENGINEER OF RESPONSIBILITY FOR THE ENGINEERING DESIGN. IF FIELD CHANGES ARE REQUIRED, IT WILL BE THE RESPONSIBILITY OF THE DESIGN ENGINEER TO MAKE THE NECESSARY CHANGES.
16. ALL WORK WITHIN THE RIVERSIDE COUNTY TRANSPORTATION DEPARTMENT R/W WILL REQUIRE AN ENCROACHMENT PERMIT.
17. ITEMS WITHIN THE TEMPORARY CONSTRUCTION EASEMENT NOT IDENTIFIED ON THE PLANS SHALL BE PROTECTED IN PLACE OR RESTORED IN KIND
18. STANDARD LOCATION OF STORM DRAIN (RIV. CO. STD 817) IS WAIVED DUE TO EXISTING UTILITY CONFLICTS.
19. THE OPENINGS OF CATCH BASIN AND CONCRETE DROP INLETS SHALL BE SEALED COMPLETELY WITH SAND BAGS OR OTHER METHOD APPROVED BY INSPECTOR UNTIL THE DOWN STREAM PORTION OF THE LINE E STAGE 3 CONSTRUCTED.

NOTICE TO CONTRACTOR

THE EXISTENCE AND LOCATIONS OF ALL UNDERGROUND UTILITIES (UTILITY PIPES, STRUCTURES, ETC.) SHOWN ON THESE PLANS (MAIN LINES ONLY – NO SERVICE LATERALS) WERE ASCERTAINED BY A REVIEW OF RECORDS PROVIDED BY THESE MEMBER AGENCIES AND ARE APPROXIMATE. NEITHER THE OWNER NOR THE ENGINEER ASSUMES ANY RESPONSIBILITY FOR UTILITIES NOT SHOWN OR NOT IN THE LOCATION SHOWN.

THE CONTRACTOR IS REQUIRED TO TAKE DUE PRECAUTIONARY MEASURES TO PROTECT THE UTILITY LINES SHOWN AND ANY OTHER LINES NOT OF RECORD OR NOT SHOWN ON THESE PLANS. LOCATIONS OF UTILITIES SHALL BE VERIFIED BY THE CONTRACTOR PRIOR TO COMMENCEMENT OF CONSTRUCTION.



CALL UNDERGROUND SERVICE ALERT (U.S.A.) 1-800-227-2600 AT LEAST 2 WORKING DAYS PRIOR TO EXCAVATION.

OWNER'S CERTIFICATION

This Project-Specific Water Quality Management Plan (WQMP) has been prepared for The New Home Company by Hunsaker & Associates Irvine, Inc. for the "Leal Ranch" Project.

This WQMP is intended to comply with the requirements of The City of Eastvale requirements for the preparation and implementation of a Project-Specific WQMP.

The undersigned, while owning the property/project described in the preceding paragraph, shall be responsible for the implementation and funding of this WQMP and will ensure that this WQMP is amended as appropriate to reflect up-to-date conditions on the site. In addition, the property owner accepts responsibility for interim operation and maintenance of Stormwater BMPs until such time as this responsibility is formally transferred to a subsequent owner. This WQMP will be reviewed with the facility operator, facility supervisors, employees, tenants, maintenance and service contractors, or any other party (or parties) having responsibility for implementing portions of this WQMP. At least one copy of this WQMP will be maintained at the project site or project office in perpetuity. The undersigned is authorized to certify and to approve implementation of this WQMP. The undersigned is aware that implementation of this WQMP is enforceable under the City of Eastvale Water Quality Ordinance.

"I, the undersigned, certify under penalty of law that the provisions of this WQMP have been reviewed and accepted and that the WQMP will be transferred to future successors in interest."

Section A: Project and Site Information

The New Home Company proposes the development of "Leal Ranch", Tentative Tract Map No. 38290, located just northwest of the intersection of Limonite Avenue and Hamner Avenue, in the City of Eastvale, California. Specifically, the project site is bound to the north by 58th Street and existing residential homes beyond; to the east by Hamner Avenue and existing residential homes and a commercial shopping center (Eastvale Gateway); to the south by Limonite Avenue and existing residential homes and a commercial shopping center beyond; and to the west by Scholar Way and existing residential homes beyond.

The Project Site consists of approximately 159.2 acres (6,934,278 SF) and will be subdivided into 14 Planning Areas (Lots 1-14) and 19 lettered lots (A-S) to accommodate a mixed use development consisting of multi-family residential, general retail (shopping center), general offices, medical offices, hotels, civic center, parks and supporting infrastructure improvements. Proposed lot summary is as follows:

NUMBERED LOTS			
Lot #	USAGE	S.F.	Acres
1	RESIDENTIAL	315,892.10	7.252
2	MIXED USE	550,731.85	12.643
3	COMMERCIAL CIVIC	426,869.17	9.800
4	MIXED USE	279,624.41	6.419
5	MIXED USE	198,540.25	4.558
6	RESIDENTIAL	244,324.99	5.609
7	RESIDENTIAL	613,599.82	14.086
8	RESIDENTIAL	171,451.45	3.936
9	RESIDENTIAL	191,384.23	4.394
10	MIXED USE	195,395.18	4.486
11	RESIDENTIAL	724,736.51	16.638
12	RESIDENTIAL	754,749.47	17.327
13	RESIDENTIAL	574,268.61	13.183
14	FIRE STATION	53,083.07	1.219
Total		5,294,651.10	121.5485

Total		1,613,549.69	37.0420

Impervious and paved areas for the site include each building structures, streets and parkways, walkways, parking lots and other miscellaneous hardscape areas. Total impervious area is anticipated to consist of approximately 127.36 acres, or 80% of the gross project area.

Pervious areas of the project include open space and designated landscaping areas located in designated park areas, street parkways and parking lots (planters), and private homeowner maintained landscaping areas. Project landscaping and revegetation areas will consist of native and/or drought tolerant plant species. Total pervious area is anticipated to consist of approximately 31.84 acres, or 20% of the gross project area.

Parking is anticipated to be provided via garage parking, driveway parking, open parking lots, parking structures and off-street parking. Total parking shall be consistent with City requirements per each development area's land use.

Normal trash typical of residential and commercial facilities can be anticipated to be produced daily from the project. These include food wastes (wrappers, bottles, etc.) plastics and paper wastes. Such trash is anticipated to be disposed of by residents, staff, and facility users in designated trash storage, to be hauled off for disposal on a weekly basis (minimum) by the contracting waste disposal company.

PROJECT INFORMATION	
Type of Project:	Mixed-Use (Residential, commercial, office, park, hotel, civic center)
Planning Area:	Eastvale Area Plan
Community Name:	"Leal Ranch"
Development Name:	"Leal Ranch"
PROJECT LOCATION	
Latitude & Longitude (DD): 33.978862414978266, -117.56268204581465	
Project Watershed and Sub-Watershed: Santa Ana River Watershed and Lower Cucamonga Creek	
APN(s): 164-030-010, 164-030-025, 164-030-012	
Map Book and Page No.: TBD	
PROJECT CHARACTERISTICS	
Proposed or Potential Land Use(s)	Commercial, office, medical office, hotel, residential, park
Proposed or Potential SIC Code(s)	TBD
Area of Impervious Project Footprint (SF)	5,547,422 SF
Total Area of proposed Impervious Surfaces within the Project Limits (SF)/or Replacement	5,547,422 SF
Does the project consist of offsite road improvements?	☐ Y ☒ N
Does the project propose to construct unpaved roads?	☐ Y ☒ N
Is the project part of a larger common plan of development (phased project)?	☐ Y ☒ N
EXISTING SITE CHARACTERISTICS	
Total area of Existing Impervious Surfaces within the project limits (SF)	693,428 SF
Is the project located within any MSHCP Criteria Cell?	☐ Y ☒ N
If so, identify the Cell number:	N/A
Are there any natural hydrologic features on the project site?	☐ Y ☒ N
Is a Geotechnical Report attached?	☒ Y ☐ N
If no Geotech. Report, list the NRCS soils type(s) present on the site (A, B, C and/or D)	Project resides in A and C areas
What is the Water Quality Design Storm Depth for the project?	0.86"

A.1 Maps and Site Plans

The project's Vicinity Map and Site Plan is provided in Appendix 1 of this WQMP. The maps show the following elements, as required by the WQMP Guidance Document.

- Drainage Management Areas
- Proposed Structural BMPs
- Drainage Path
- Drainage Infrastructure, Inlets, Overflows
- Source Control BMPs
- Buildings, Roof Lines, Downspouts
- Impervious Surfaces
- Standard Labeling

A.2 Receiving Waters

The project's receiving waters are as follows:

Table A.1 Identification of Receiving Waters

Receiving Waters	303(d) List Impairments[1]	Designated Beneficial Uses	Proximity to RARE Beneficial Use
Cucamonga Creek (Reach 1) 801.21	Cadmium, Copper, Lead, Zinc	GWR, REC2, LWRM, WILD	No RARE designation
Prado Basin Management Zone Hydrologic Unit 801.21	pH	REC1, REC2, WARM, WILD, RARE	6 miles
Santa Ana River (Reach 3) Hydrologic Unit 801.21	Copper, Lead *(Indicator Bacteria, Nitrate)*	AGR, GWR, REC1, REC2, WARM, WILD, RARE,SPWN	7 miles
Santa Ana River (Reach 2) Hydrologic Unit 801.11	None	REC2, WARM, WILD,	30 miles
Santa Ana River (Reach 1) Hydrologic Unit 801.11	None	REC2, WARM, WILD, RARE	35 miles
Tidal Prism of Santa Ana River and Newport Slough Hydrologic Unit 801.11	None	REC1, REC2, COMM, WILD, RARE, MAR	36.5 miles
Pacific Ocean Offshore Zone Hydrologic Unit 801.11	None	IND, NAV, REC1, REC2, COMM, WILD, RARE, SPWN, MAR	36.5 miles

[1] TMDLs denoted in italics and parenthesis.

A.3 Additional Permits/Approvals required for the Project:

Table A.2 Other Applicable Permits

Agency	Permit Required	
State Department of Fish and Game, 1602 Streambed Alteration Agreement	☐ Y	☒ N
State Water Resources Control Board, Clean Water Act (CWA) Section 401 Water Quality Cert.	☐ Y	☒ N
US Army Corps of Engineers, CWA Section 404 Permit	☐ Y	☒ N
US Fish and Wildlife, Endangered Species Act Section 7 Biological Opinion	☐ Y	☒ N
Statewide Construction General Permit Coverage	☒ Y	☐ N
Statewide Industrial General Permit Coverage	☐ Y	☒ N
Western Riverside MSHCP Consistency Approval (e.g., JPR, DBESP)	☐ Y	☒ N
Other *(please list in the space below as required)* City of Eastvale Development and Grading Permits	☒ Y	☐ N

Section B: Optimize Site Utilization (LID Principles)

Site Optimization

Does the project identify and preserve existing drainage patterns? If so, how? If not, why?

Yes. Pre-project site drains southerly to the existing storm rain in Limonite. Proposed condition will preserve flow patterns of project site.

Does the project identify and protect existing vegetation? If so, how? If not, why?

No. Pre-project site does not consist of any natural or native vegetation to be preserved. All vegetation will be removed and replaced with native and/or drought tolerant landscaping.

Does the project identify and preserve natural infiltration capacity? If so, how? If not, why?

Yes. Project will allow incidental infiltration of BMPs in the northern and central project areas, and only in areas where suitable soils are known to be present. Although the project tested favorable infiltration rates at a single location and per County data, is located with HSG Type A soils, per the geotechnical professional's recommendation, infiltration rates at the tested location is not typical of the project site due to the presence of large quantities of silt/compacted silt in project's subsurface soils. Due to unsuitable soils and low tested infiltration rates in the southern portion of the project site, infiltration will not be employed.

Does the project identify and minimize impervious area? If so, how? If not, why?

Yes. Wherever feasible, open space and landscaping areas have been proposed to minimize the amount of directly connected impervious area.

Does the project identify and disperse runoff to adjacent pervious areas? If so, how? If not, why? No. The project will not disperse runoff to adjacent pervious areas at this time. However, runoff dispersion will be considered as project design approaches final.

Section C: Delineate Drainage Management Areas (DMAs)

Table C.1 DMA Classifications

DMA Name or ID	Surface Type(s)[1]	Area (Sq. Ft.)	DMA Type
DMA 1 (Sub-Areas A – F)	Mixed Surface Type (landscaping, concrete/asphalt, roof)	5,563,173	Type D
DMA 2	Mixed Surface Type (landscaping, concrete/asphalt)	571,177	Type D
DMA 3	Mixed Surface Type (landscaping, concrete/asphalt)	20,004	Type D
DMA 4	Mixed Surface Type (landscaping, concrete/asphalt)	27,082	Type D
DMA 5	Mixed Surface Type (landscaping, concrete/asphalt)	37,514	Type D
DMA 6	Mixed Surface Type (landscaping, concrete/asphalt)	32,384	Type D
DMA 7	Mixed Surface Type (landscaping, concrete/asphalt)	91,523	Type D

DMA 15	Biotreatment/Bioretention BMP 15
DMA 16	Biotreatment/Bioretention BMP 16
DMA 17	Biotreatment/Bioretention BMP 17

Note: More than one drainage management area can drain to a single LID BMP; however, one drainage management area may not drain to more than one BMP.

Section D: Implement LID BMPs

D.1 Infiltration Applicability

Is there an approved downstream 'Highest and Best Use' for stormwater runoff (Reference Chapter 2.4.4 of the WQMP Guidance Document for further details)? ☐ Y ☒ N

Geotechnical Report

A Geotechnical Report is required by the City of Eastvale to confirm present and past site characteristics that may affect the use of Infiltration BMPs, see Appendix 3.

Is this project classified as a small project consistent with the requirements of Chapter 2 of the WQMP Guidance Document? ☐ Y ☒ N

Infiltration Feasibility

Table D.1 Infiltration Feasibility

Does the project site…	YES	NO
…have any DMAs with a seasonal high groundwater mark shallower than 10 feet?		X
If Yes, list affected DMAs:		
…have any DMAs located within 100 feet of a water supply well?		X
If Yes, list affected DMAs:		
…have any areas identified by the geotechnical report as posing a public safety risk where infiltration of stormwater could have a negative impact?		X
If Yes, list affected DMAs:		
…have measured in-situ infiltration rates of less than 1.6 inches / hour?	X	
If Yes, list affected DMAs:		
…have significant cut and/or fill conditions that would preclude in-situ testing of infiltration rates at the final infiltration surface?		X
If Yes, list affected DMAs:		
…geotechnical report identifies other site-specific factors that would preclude effective and safe infiltration?		X
Describe here: *Based on preliminary infiltration testing conducted onsite, infiltration of the site is feasible for norther and central areas of the project site. Southern areas is not feasible.*		

D.2 Harvest and Use Assessment

The following conditions apply*:*

☐ Reclaimed water will be used for the non-potable water demands for the project.

☐ Downstream water rights may be impacted by Harvest and Use as approved by the Regional Board (verify with the Copermittee).

☒ The Design Capture Volume will be addressed using Infiltration Only BMPs. In such a case, Harvest and Use BMPs are still encouraged, but are not required as the Design Capture Volume will be infiltrated or evapotranspired.

Irrigation Use Feasibility

Step 1: *Total Area of Irrigated Landscape*: *N/A*

Type of Landscaping (Conservation Design or Active Turf): *N/A*

Step 2: *Total Area of Impervious Surfaces: N/A*

Step 3: *The project EIATIA factor*: *N/A*

Step 4: *Minimum required irrigated area*:

Step 5:

Minimum required irrigated area (Step 4)	Available Irrigated Landscape (Step 1)
N/A	*N/A*

Toilet Use Feasibility

Step 1: *Projected Number of Daily Toilet Users: N/A*

Project Type: N/A

Step 2: *Total Area of Impervious Surfaces: N/A*

Step 3: *Enter your TUTIA factor: N/A*

Step 4: *Minimum number of toilet users: N/A*

Step 5:

Minimum required Toilet Users (Step 4)	Projected number of toilet users (Step 1)
N/A	*N/A*

Other Non-Potable Use Feasibility

Are there other non-potable uses for stormwater runoff on the site (e.g. industrial use)? There are no other non-potable uses for stormwater runoff of site.

Step 1: *Average Daily Demand: N/A*

Step 2: *Total Area of Impervious Surfaces: N/A*

Step 3: *Enter the factor from Table 2-3: N/A*

Step 4: *Minimum required use: N/A*

Step 5:

Minimum required non-potable use (Step 4)	Projected average daily use (Step 1)
N/A	*N/A*

D.3 Bioretention and Biotreatment Assessment

Other LID Bioretention and Biotreatment BMPs as described in Chapter 2.4.7 of the WQMP Guidance Document are feasible on nearly all development sites with sufficient advance planning.

For the project neither of the following applies:

☒ LID Bioretention/Biotreatment BMPs will be used for some or all DMAs of the project as noted below in Section D.4

☐ A site-specific analysis demonstrating the technical infeasibility of all LID BMPs has been performed and is included in Appendix 5.

The project proposes to use a combination of Bioretention BMPs (non-infiltration type) and Proprietary Biotreatment BMPs to address project runoff.

D.4 Feasibility Assessment Summaries

DMA 17	☐	☐	☒	☒	☐

Runoff from DMA 1 will be conveyed to a proprietary biotreatment BMP facility located in the southwestern portion of the project site (exact location to be determined) for treatment prior to discharging to the existing storm drain system in Limonite Avenue.

DMAs 2 (onsite backbone streets) and 2 through 17 (offsite perimeter street improvements) will be conveyed to parkway bioretention BMPs and/or proprietary biotreatment BMPs prior to discharging to the existing storm drain system along the project's perimeter streets.

Since the project is in the preliminary stage of design (TTM level), the exact locations and actual BMPs to be implemented are tentative and subject to change. Therefore, only feasible BMP alternatives and preliminary locations are provided at this time.

The required Design Capture Volume (V_{BMP}) and Design Flow Rate (Q_{BMP}) for each BMP are provided in the following tables. Although sizing of the proposed BMPs have not been determined at this time, it is anticipated that the project will be able to achieve minimum V_{BMP} and Q_{BMP} requirements for each DMA.

D.5 LID BMP Sizing

Table D.3 DCV Calculations for LID BMPs

DMA Type/ID	DMA Area (square feet)	Post-Project Surface Type	Effective Impervious Fraction, I_f	DMA Runoff Factor	DMA Areas x Runoff Factor[1]	*Design Storm Depth (In)*	*Design Capture Volume, Vbmp (cubic feet)*[2]	*Proposed Volume on Plans (cubic feet)*

Alternative Compliance (LID Waiver Program)

LID BMPs are expected to be feasible on virtually all projects. Where LID BMPs have been demonstrated to be infeasible as documented in Section D, other Treatment Control BMPs must be used (subject to LID waiver approval by the Regional Board). For the project, the following applies:

☒ LID Principles and LID BMPs have been incorporated into the site design to fully address all Drainage Management Areas. No alternative compliance measures are required for this project and thus this Section is not required to be completed.

- Or -

☐ The following Drainage Management Areas are unable to be addressed using LID BMPs. A site-specific analysis demonstrating technical infeasibility of LID BMPs has been approved by the Regional Board and included in Appendix 5. Additionally, no downstream regional and/or sub-regional LID BMPs exist or are available for use by the project. The alternative compliance measures on the following pages are being implemented to ensure that any pollutant loads expected to be discharged by not incorporating LID BMPs, are fully mitigated.

D.6 Identify Pollutants of Concern

Utilizing Table A.1 from Section A above which noted your project's receiving waters and their associated EPA approved 303(d) listed impairments, cross reference this information with that of your selected Priority Development Project Category in Table E.1 below. If the identified General Pollutant Categories are the same as those listed for your receiving waters, then these will be your Pollutants of Concern and the appropriate box or boxes will be checked on the last row. The purpose of this is to document compliance and to help you appropriately plan for mitigating your Pollutants of Concern in lieu of implementing LID BMPs.

Table D.5 Potential Pollutants by Land Use Type

Priority Development Project Categories and/or Project Features (check those that apply)	General Pollutant Categories							
	Bacterial Indicators	Metals	Nutrients	Pesticides	Toxic Organic Compounds	Sediments	Trash & Debris	Oil & Grease
☒ Detached Residential Development	P	N	P	P	N	P	P	P
☒ Attached Residential Development	P	N	P	P	N	P	P	P[2]
☒ Commercial/Industrial Development	P[3]	P	P[1]	P[1]	P[5]	P[1]	P	P

☐ Restaurants (>5,000 ft^2)	P	N	N	N	N	N	P	P
☐ Hillside Development (>5,000 ft^2)	P	N	P	P	N	P	P	P
☒ Parking Lots (>5,000 ft^2)	P[6]	P	P[1]	P[1]	P[4]	P[1]	P	P
☐ Retail Gasoline Outlets	N	P	N	N	P	N	P	P
Project Priority Pollutant(s) of Concern	☒	☒	☒	☐	☐	☐	☐	☐

P = Potential
N = Not Potential
[1] A potential Pollutant if non-native landscaping exists or is proposed onsite; otherwise not expected
[2] A potential Pollutant if the project includes uncovered parking areas; otherwise not expected
[3] A potential Pollutant is land use involving animal waste
[4] Specifically petroleum hydrocarbons
[5] Specifically solvents
[6] Bacterial indicators are routinely detected in pavement runoff

D.7 Stormwater Credits

Projects that cannot implement LID BMPs but implement smart growth principles are potentially eligible for Stormwater Credits. Utilize Table 3-8 within the WQMP Guidance Document to identify your Project Category and its associated Water Quality Credit.

Table D.6 Water Quality Credits

Qualifying Project Categories	Credit Percentage[2]
Not applicable to project. Project will implement LID BMPs to address runoff.	
Total Credit Percentage[1]	

[1] *Cannot Exceed 50%*
[2] *Obtain corresponding data from Table 3-8 in the WQMP Guidance Document*

D.8 Sizing Criteria

After you appropriately considered Stormwater Credits for your project, utilize Table E.3 below to appropriately size them to the DCV, or Design Flow Rate, as applicable. Please reference Chapter 3.5.2 of the WQMP Guidance Document for further information. ***This section is not applicable to project. Project will use LID BMPs to address project runoff.***

Table D.7 Treatment Control BMP Sizing

DMA Type/ID	DMA Area (square feet)	Post-Project Surface Type	Effective Impervious Fraction, I_f	DMA Runoff Factor	DMA Area x Runoff Factor		*Enter BMP Name / Identifier Here*		
	[A]		[B]	[C]	[A] x [C]				
						Design Storm Depth (in)	*Minimum Design Capture Volume or Design Flow Rate (cubic feet or cfs)*	*Total Storm Water Credit % Reduction*	*Proposed Volume or Flow on Plans (cubic feet or cfs)*
	A_T = Σ[A]				Σ= [D]	[E]	$[F] = \frac{[D]x[E]}{[G]}$	[F] X (1-[H])	[I]

[B], [C] is obtained as described in Section 2.3.1 from the WQMP Guidance Document
[E] is obtained from Exhibit A in the WQMP Guidance Document
[G] is for Flow-Based Treatment Control BMPs [G] = 43,560, for Volume-Based Control Treatment BMPs, [G] = 12
[H] is from the Total Credit Percentage as Calculated from Table E.2 above
[I] as obtained from a design procedure sheet from the BMP manufacturer and should be included in Appendix 6

D.9 Treatment Control BMP Selection

Treatment Control BMPs typically provide proprietary treatment mechanisms to treat potential pollutants in runoff, but do not sustain significant biological processes. Treatment Control BMPs must have a removal efficiency of a medium or high effectiveness as quantified below:

- **High**: equal to or greater than 80% removal efficiency
- **Medium**: between 40% and 80% removal efficiency

Such removal efficiency documentation (e.g., studies, reports, etc.) as further discussed in Chapter 3.5.2 of the WQMP Guidance Document, must be included in Appendix 6. In addition, ensure that proposed Treatment Control BMPs are properly identified on the WQMP Site Plan in Appendix 1.

This section is not applicable to project. Project will employ LID BMPs to address runoff.

Table D.8 Treatment Control BMP Selection

Selected Treatment Control BMP Name or ID[1]	Priority Pollutant(s) of Concern to Mitigate[2]	Removal Efficiency Percentage[3]

[1] Treatment Control BMPs must not be constructed within Receiving Waters. In addition, a proposed Treatment Control BMP may be listed more than once if they possess more than one qualifying pollutant removal efficiency.
[2] Cross Reference Table E.1 above to populate this column.
[3] As documented in a Co-Permittee Approved Study and provided in Appendix 6.

Section E: Hydromodification

F.1 Hydrologic Conditions of Concern (HCOC) Analysis

HCOC EXEMPTION 1: The Priority Development Project disturbs less than one acre. The City of Eastvale has the discretion to require a Project-Specific WQMP to address HCOCs on projects less than one acre on a case by case basis. The disturbed area calculation should include all disturbances associated with larger common plans of development.

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

The project does not qualify.

HCOC EXEMPTION 2: The volume and time of concentration[1] of storm water runoff for the post-development condition is not significantly different from the pre-development condition for a 2-year return frequency storm (a difference of 5% or less is considered insignificant) using one of the following methods to calculate:

- Riverside County Hydrology Manual
- Technical Release 55 (TR-55): Urban Hydrology for Small Watersheds (NRCS 1986), or derivatives thereof, such as the Santa Barbara Urban Hydrograph Method
- Other methods acceptable to the City of Eastvale

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

The project does not qualify.

Table E.1 Hydrologic Conditions of Concern Summary

	2 year – 24 hour		
	Pre-condition	Post-condition	% Difference

[1] Time of concentration is defined as the time after the beginning of the rainfall when all portions of the drainage basin are contributing to flow at the outlet.

HCOC EXEMPTION 3: All downstream conveyance channels to an adequate sump (for example, Prado Dam, Lake Elsinore, Canyon Lake, Santa Ana River, or other lake, reservoir or naturally erosion resistant feature) that will receive runoff from the project are engineered and regularly maintained to ensure design flow capacity; no sensitive stream habitat areas will be adversely affected; or are not identified on the Co-Permittees Hydromodification Sensitivity Maps.

Does the project qualify for this HCOC Exemption? ☒ Y ☐ N

Per most recent hydromodification susceptibility data, project is located within a hydromodification exempt area. See Appendix 7.

F.2 HCOC Mitigation

As an alternative to the HCOC Exemption Criteria above, HCOC criteria is considered mitigated if the project meets one of the following conditions, as indicated:

☐ Additional LID BMPS are implemented onsite or offsite to mitigate potential erosion or habitat impacts as a result of HCOCs. This can be conducted by an evaluation of site-specific conditions utilizing accepted professional methodologies published by entities such as the California Stormwater Quality Association (CASQA), the Southern California Coastal Water Research Project (SCCRWP), or other Co-Permittee approved methodologies for site-specific HCOC analysis.

☐ The project is developed consistent with an approved Watershed Action Plan that addresses HCOC in Receiving Waters.

☐ Mimicking the pre-development hydrograph with the post-development hydrograph, for a 2-year return frequency storm. Generally, the hydrologic conditions of concern are not significant, if the post-development hydrograph is no more than 10% greater than pre-development hydrograph. In cases where excess volume cannot be infiltrated or captured and reused, discharge from the site must be limited to a flow rate no greater than 110% of the pre-development 2-year peak flow.

☒ None of the above.

Section G: Source Control BMPs

Source control BMPs include permanent, structural features that may be required in project plans — such as roofs over and berms around trash and recycling areas — and Operational BMPs, such as regular sweeping and "housekeeping", that must be implemented by the site's occupant or user. The MEP standard typically requires both types of BMPs. In general, Operational BMPs cannot be substituted for a feasible and effective permanent BMP. Using the Pollutant Sources/Source Control Checklist in Appendix 8, the following Source Control BMPs are applicable to this project:

Table G.1 Permanent and Operations Source Control Measures

Potential Sources of Runoff pollutants	Permanent Structural Source Control BMPs	Operational Source Control BMPs
A. On-site storm drain inlets	Mark all inlets with the words "Only Rain Down the Storm Drain" or similar. Catch Basin Makers may be available from the Riverside County Flood Control and Water Conservation District, call 951.955.1200 to verify.	Maintain and periodically repaint or replace inlet markings. Provide stormwater pollution prevention information to new site owners, lessees, or operators. See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains."
B. Interior floor drains and elevator shaft sump pumps	Any interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer.	Inspect and maintain drains to prevent blockages and overflow.
C. Interior parking garages	Parking garage floor drains will be plumbed to the sanitary sewer.	Inspect and maintain drains to prevent blockages and overflow.
D1. Need for future indoor and structural pest control	Design building features that discourage entry of pests	Provide Integrated Pest Management information to owners, lessees and operators.

Potential Sources of Runoff pollutants	Permanent Structural Source Control BMPs	Operational Source Control BMPs
D2. Landscape/Outdoor Pesticide Use	Preserve, existing native trees, shrubs, and ground cover to the maximum extent possible. Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution. Where landscaping areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions. Consider using pest-resistant plants, especially to hardscape. To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.	Maintain landscaping using minimum or no pesticides. See applicable operation BMPs in "What you show know for…..Landscaping and Gardening" Provide IPM information to new owners, lessees and operators.
E. Pools, spas, ponds, decorative fountains, and other water features.	Ensure pools are plumbed to the sanitary sewer, place notes on plans that connection will be made according to local requirements.	See applicable operational BMPs in "Guidelines for Maintaining Your Swimming Pool, Jacuzzi and Garden Fountain"
F. Food service	Provide description of cleaning area locations and features. Provide description of items to be cleaned in facility and sizing to ensure largest items can be accommodated.	See brochure "The Food Service Industry Best Management Practices for: Restaurants, Grocery Stores, Delicatessens and Bakeries". Provide brochure to new site owners, lessees and operators.
G. Refuse areas	Trash enclosure areas shall be paved, covered with a solid canopy-type roof and precluded from rain, run-on and runoff. Drainage from any adjoining roofs and pavements shall be diverted around facility. Perimeter walls shall be installed and dumpster lid provided to prevent offsite transport of trash. Surrounding area shall be kept	Ensure adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials

Potential Sources of Runoff pollutants	Permanent Structural Source Control BMPs	Operational Source Control BMPs
	clean, with all leaks and over-spilled materials clean up as soon as possible. Trash shall be emptied on a weekly basis (at minimum) and as needed.	available on-site. See Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
N. Fire sprinkler test water	Provide a means to drain fire sprinkler test water to the sanitary sewer.	See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www. Cabmphandbooks.com
P. Plazas, sidewalks and parking lots	Sweep regularly	Sweep plazas, sidewalks, and parking lots regularly to prevent accumulation of litter and debris. Collect debris from pressure washing to prevent entry into the storm drain system. Collect wash water containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain.

Section H: Construction Plan Checklist

Table H.1 Construction Plan Cross-reference

BMP No. or ID	BMP Identifier and Description	Corresponding Plan Sheet(s)
N/A	Project is currently in the TTM approval process.	

Section I: Operation, Maintenance and Funding

As required by the City of Eastvale, the following Operation, Maintenance and Funding details are provided as summarized:

1. A means to finance and implement facility maintenance in perpetuity, including replacement cost.
2. Acceptance of responsibility for maintenance from the time the BMPs are constructed until responsibility for operation and maintenance is legally transferred.
3. An outline of general maintenance requirements for the Stormwater BMPs selected.
4. Figures delineating and designating pervious and impervious areas, location, and type of Stormwater BMP, and tables of pervious and impervious areas served by each facility..
5. A separate list and location of self-retaining areas or areas addressed by LID Principles that do not require specialized O&M or inspections but will require typical landscape maintenance as noted in Chapter 5, pages 85-86, in the WQMP Guidance.

See Appendix 9 for a detailed Stormwater BMP Operation and Maintenance Plan that sets forth a maintenance schedule for each of the Stormwater BMPs built on site, and an agreement assigning responsibility for maintenance and providing for inspections and certification.

Maintenance Mechanism: Property Owner (The New Home Company) prior to takeover by HOA.

Will the proposed BMPs be maintained by a Home Owners' Association (HOA) or Property Owners Association (POA)?

☒ Y ☐ N

Operation and Maintenance Plan and Maintenance Mechanism are included in Appendix 9. Educational materials for those personnel that will be maintaining the proposed BMPs within this Project-Specific WQMP are included in Appendix 10. Maintenance

Subject: ***Preliminary Geotechnical Evaluation Including Near Surface Organic Content for the Proposed Approximately 160-Acre "Leal" Property, City of Eastvale, California***

In accordance with your request, LGC Geotechnical, Inc. has performed a geotechnical evaluation including near surface organic content for the proposed approximate 160-acre "Leal" property located southwest of the intersection of Hamner Avenue and 58th Street in the City of Eastvale, California. This report summarizes the results of our background review, subsurface exploration, and geotechnical analyses of the data collected, and presents our findings, conclusions, and preliminary recommendations for the proposed residential project.

If you should have any questions regarding this report, please do not hesitate to contact our office. We appreciate this opportunity to be of service.

Respectfully,

LGC Geotechnical, Inc.

1.0 INTRODUCTION

1.1 Purpose and Scope of Services

This report presents the results of our geotechnical evaluation including near surface organic content for the proposed approximately 160-acre "Leal" property in the City of Eastvale, California (see Site Location Map, Figure 1). The purpose of our work was to collect subsurface data in order to prepare a geotechnical report providing recommendations for design and construction of the proposed project. Our scope of services included:

- Review of pertinent readily available geotechnical information and geologic maps (Appendix A).
- Subsurface investigation including excavation, sampling, and logging of ten small-diameter hollow stem borings.
- Excavation of 10 exploratory geotechnical trenches throughout the site to aid in estimating the depth of required removals during grading and assist in characterizing the near surface soils.
- Excavation of 25 shallow trenches to assess the organic content of near surface "soils".
- Laboratory testing of representative samples obtained during our subsurface investigation (Appendix C).
- Geotechnical analysis and evaluation of the data obtained, including:
  - Suitability of the site for the proposed development from a geotechnical standpoint;
  - Description of the site geology, and subsurface soil and groundwater conditions;
  - Assessment of the organic content of near surface "soils" including recommendations for offsite organic export and/or mixing;
  - Evaluation of the seismic conditions at the site, including seismic design criteria based on the 2019 California Building Code (CBC); and
  - Recommendations for remedial grading operations and site preparation.
- Preparation of this report presenting our findings, conclusions and recommendations with respect to the proposed site development.

1.2 Existing Site Conditions and Proposed Improvements

The square shaped site is approximately 160 acres in size with minor relief. The site is composed of four adjacent 40-acre parcels, and is bounded to the north by 58th street, the south by Limonite Avenue, the west by Scholar Way, and to the East by Hamner Avenue. The northern portion of the site is a former dairy that has been inactive for several years, while the south has remained as open pasture for decades. A review of historic aerial photographs suggests the site has been used as a dairy or agricultural farm dating back to the earliest available photos in 1938.

As of the date of this report, neither a conceptual plan nor grading plan was available. It is our understanding that the site will most likely consist of residential units, parks and associated street improvements and underground utilities. We expect the proposed residential development will be at-grade with relatively light building loads (column and wall loads assumed to be a maximum of approximately 30 kips and 3 kips per lineal foot, respectively). A preliminary grading plan was not available at this time either.

The recommendations provided herein are based upon the estimated structural loading and expected layout information above. We understand that the project plans are currently being developed at this time; LGC Geotechnical should be provided with updated project plans and any changes to the assumed structural loads when they become available, in order to either confirm or modify the recommendations provided herein.

1.3 Subsurface Evaluation

LGC Geotechnical performed a subsurface geotechnical evaluation of the site consisting of the excavation of 10 hollow-stem auger borings, 2 infiltration borings, 10 exploratory geotechnical trenches with organic testing, and 25 near surface organic trenches.

10 hollow-stem borings (HS-1 through HS-10) were drilled to depths ranging from approximately 25 to 50 feet below existing grade. An LGC Geotechnical representative observed the drilling operations, logged the borings, and collected soil samples for laboratory testing. The borings were excavated using a track-mounted drill rig equipped with 8-inch-diameter hollow-stem augers. Driven soil samples were collected by means of the Standard Penetration Test (SPT) and Modified California Drive (MCD) sampler generally obtained at 2.5 to 5-foot vertical increments. The MCD is a split-barrel sampler with a tapered cutting tip and lined with a series of 1-inch-tall brass rings. The SPT sampler and MCD sampler were driven using a 140-pound automatic hammer falling 30 inches to advance the sampler a total depth of 18 inches. The raw blow counts for each 6-inch increment of penetration were recorded on the boring logs. Bulk samples were also collected and logged at select depths for laboratory testing. At the completion of drilling, the borings were backfilled with the native soil cuttings and tamped. Some settlement of the backfill soils may occur over time.

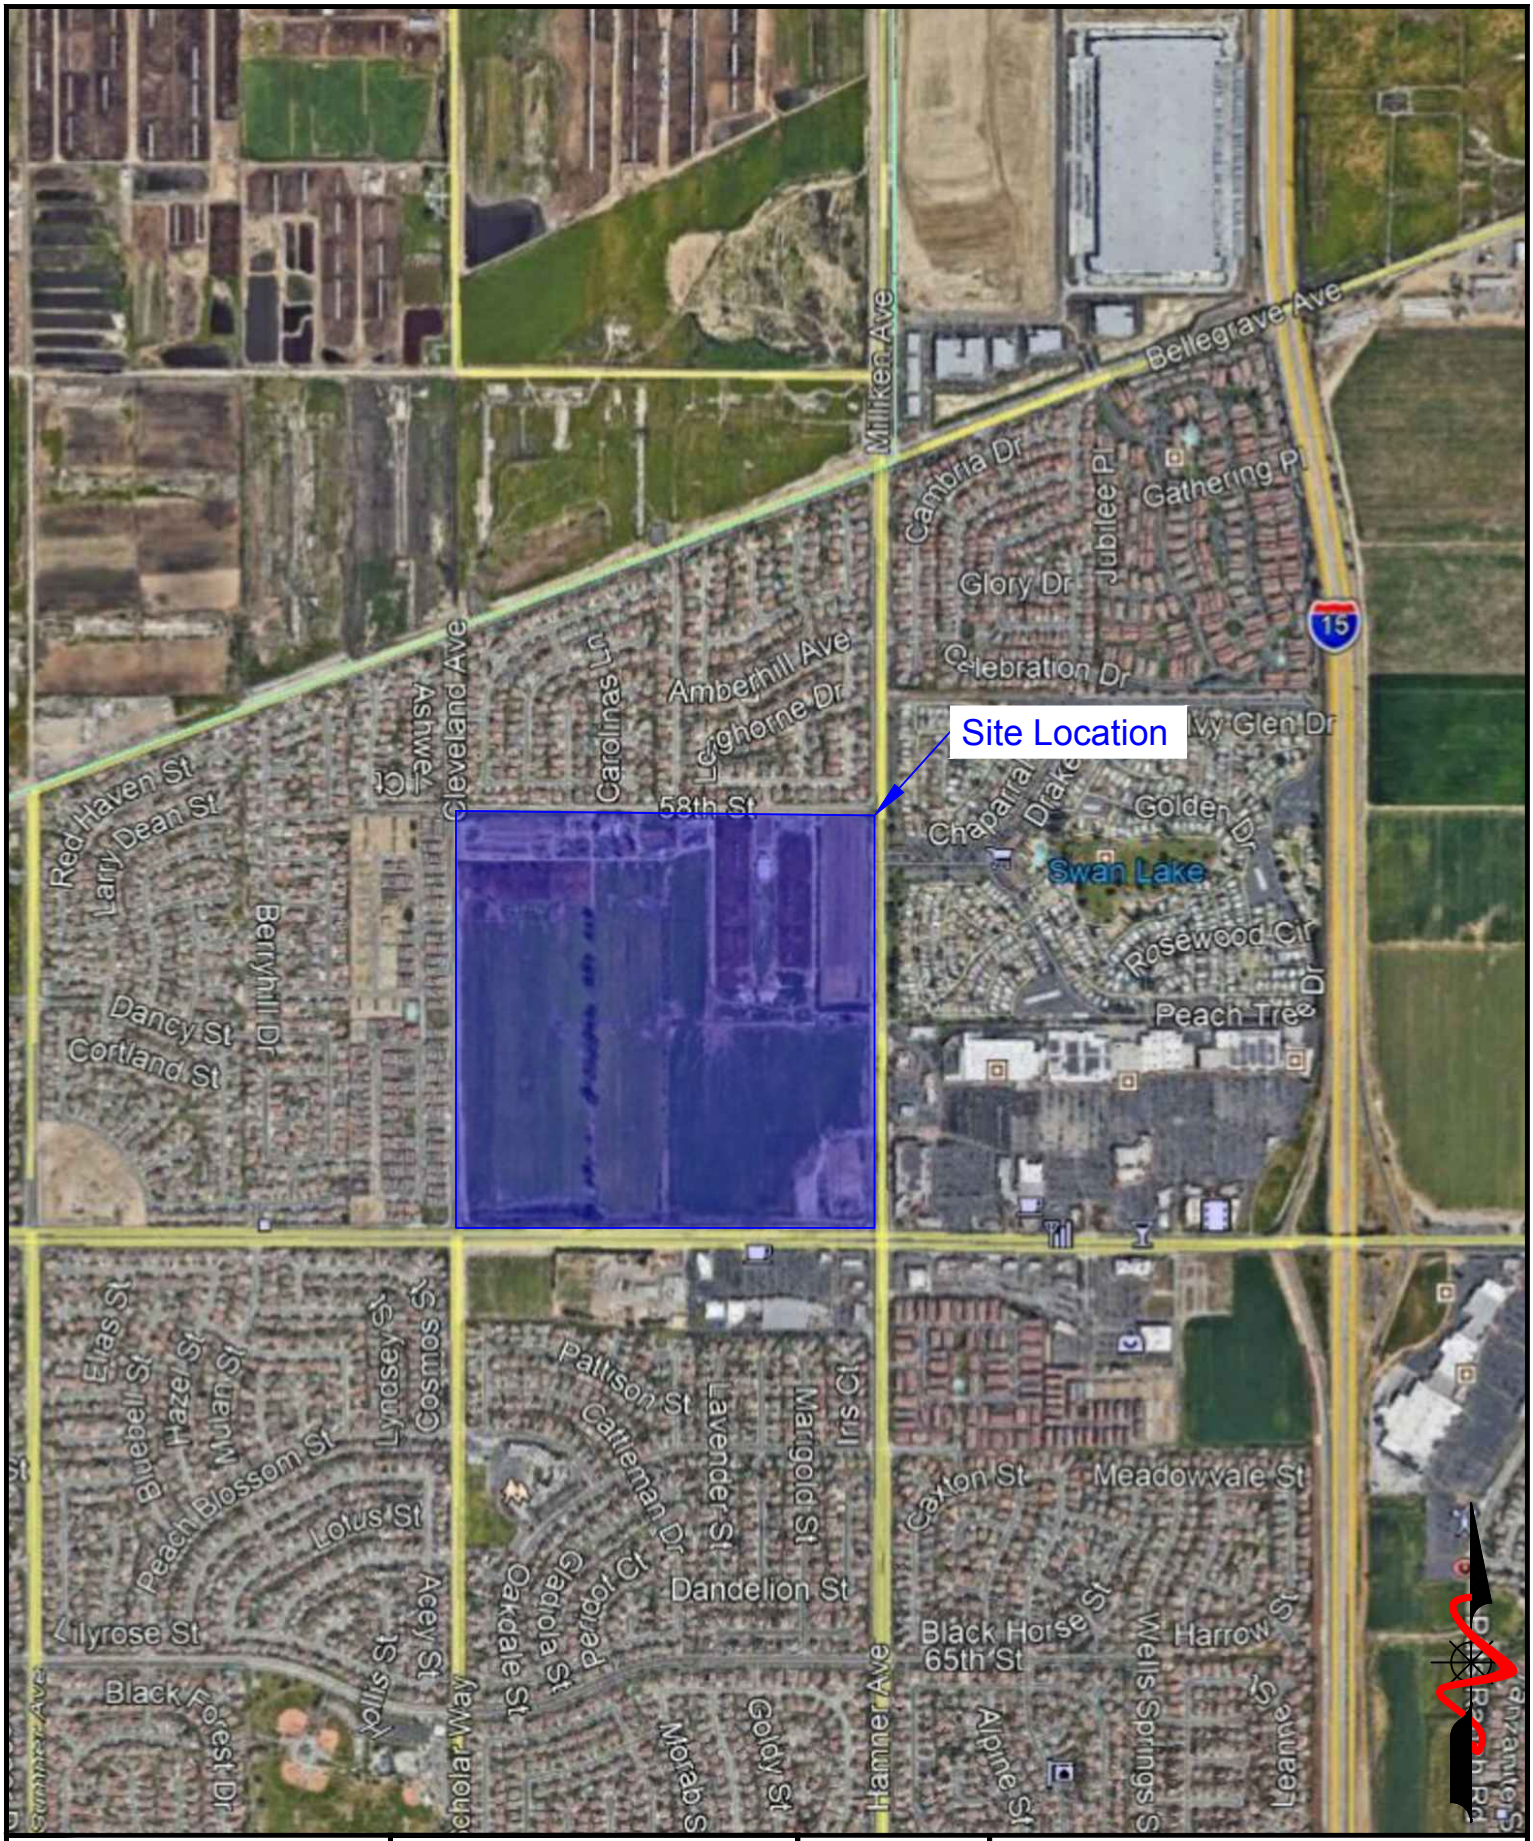
Ten exploratory geotechnical trenches (TP-1 through TP-10) were excavated utilizing a standard backhoe in order to estimate removal depths and obtain samples for laboratory testing. A staff geologist observed the operation, logged the geotechnical trenches and collected the soil samples. Each exploratory geotechnical trench was also logged and sampled for the organic content of the near surface "soils." The exploratory geotechnical trenches were subsequently backfilled with tamped native soils.

Twenty-five additional shallow trenches (T-1 through T-25) were excavated utilizing a standard backhoe in order to assess the organic content of near surface "soils". Samples were collected at various depths within each trench. In general, based on visual observations, 2 layers of soil were identified including 1) near surface heavily tainted organic "soils" and 2) "clean" (organic free) soils. In some areas there was a "transitional" layer in between these two. The shallow trenches were subsequently backfilled and tamped with native soils. There are 4 areas identified as having thick zones of buried or stockpiled high-organic material. These 4 areas have been outlined on our Geotechnical Map (Figure 2).

LGC Geotechnical, Inc. was asked to avoid the northwest corner of the property during our evaluation as this area is currently occupied by a local farmer. This area was not explored during our evaluation. The boundary for this area is shown on the Geotechnical Map (Figure 2).

The approximate locations of borings and trenches are shown on the Geotechnical Map (Figure

2). Boring and geotechnical trench logs are presented in Appendix B. The Encumbrance Map prepared by Hunsaker & Associates (H&A, 2021) was utilized as a base map for our Geotechnical Map.



1.4 Laboratory Testing

Laboratory testing was performed on representative soil samples obtained from our subsurface evaluation. Laboratory testing included in-situ moisture and density tests, fines content/sieve analysis, Atterberg Limits (liquid limit and plastic limits), consolidation, collapse/swell potential, expansion index, laboratory compaction and corrosion (sulfate and chloride). Additionally, the near surface organic content trench samples were tested for characterization of the organic content (ASTM 2974).

The following is a summary of the laboratory test results.

- Dry density of the samples collected ranged from approximately 90 pounds per cubic foot (pcf) to 122 pcf, with an average of approximately 109 pcf. Field moisture contents ranged from approximately 1.1 percent to 32.0 percent, with an average of approximately 12 percent.
- One sample tested for fines content indicated a fines content (passing No. 200 sieve) of 83 percent. According to the Unified Soils Classification System (USCS), the tested sample is classified as "fine grained" soil.
- One Atterberg Limit (liquid limit and plastic limit) test was performed. The result indicated a Plasticity Index value of 11.
- One consolidation test was performed. The deformation versus vertical stress plot is provided in Appendix C.
- One swell/collapse test was performed. The plots are provided in Appendix C.
- One Expansion Index (EI) test was performed. The result indicates an EI value of 11, corresponding to "Very Low" expansion potential.
- One laboratory compaction test of a near surface sample indicated maximum dry density of 125.0 pcf with an optimum moisture content of 8.5 percent.
- Corrosion testing indicated soluble sulfate content of 78 parts per million (ppm) and chloride content of 100 ppm.
- The organic content of the samples ranged from approximately 0.1 to 33.2 percent.

A summary of the results is presented in Appendix C. The moisture and dry density test results are presented on the boring logs in Appendix B.

FIGURE 1
Site Location Map

2.0 GEOTECHNICAL CONDITIONS

2.1 Regional Geology

The subject site is located south of the San Gabriel Mountains within the broad alluvial plain of the Santa Ana River Basin, within the Peninsular Ranges Geomorphic Province. Specifically, the site is located within the northern portion of the Perris Block, a geologic zone consisting of granitics overlain by sedimentary deposits that are bounded by active faults including the northwest-trending Whittier-Elsinore Fault Zone at the southwest and the northwest-trending San Jacinto Fault Zone at the northeast (USGS, 2002). The roughly rectangular Perris Block is transected by the southwest-trending Santa Ana River that passes approximately 2 miles south of the subject site.

Regional geologic mapping and local topographic expressions do not indicate the presence of large-scale landslides within or adjacent to the project area.

2.2 Site Geology and Generalized Subsurface Conditions

Based on regional mapping (USGS, 2002 & 2003), the subject site is underlain by Holocene- to Pleistocene-age alluvial fan deposits (Qyf), minor amounts of similar age eolian (wind-blown) deposits (Qye), and older early Pleistocene age alluvial channel deposits at depth. For this report however, alluvial and eolian deposits have been undifferentiated as general Quaternary deposits. As indicated in our field explorations, soils generally consisted of medium dense to dense sands and silty sands with thinner layers of stiff to very stiff fine-grained soils (i.e., silts and clays) to the maximum explored depth of approximately 50 feet below existing grade. Descriptions of the subsurface conditions are presented on the boring and geotechnical trench logs located in Appendix B. A brief description of the site geologic units can be found below.

2.3 Groundwater

Groundwater was not encountered in any of our borings. Groundwater levels recorded in the area by California Department of Water Resources are at depths greater than 100 feet below the ground surface (CDWR, 2021).

In general, groundwater levels fluctuate with the seasons and local zones of perched groundwater may be present within the near-surface deposits due to local seepage or during rainy seasons. Groundwater conditions below the site may be variable, depending on numerous factors including seasonal rainfall, local irrigation and groundwater pumping, among others.

2.4 Field Infiltration Testing

Two field percolation tests were performed on Borings I-1 and I-2 to approximate depths of 10 feet below existing grade, respectively. Estimation of infiltration rates was performed in general accordance with guidelines set forth by the Riverside County Flood Control (2011). In general, a 3-inch diameter perforated PVC pipe was placed in each borehole to be tested and

the annulus was backfilled with gravel, including placement of about 2 inches of gravel at the bottom of the borehole. The infiltration wells were pre-soaked prior to testing. Based on the County of Riverside methodology, the calculated (observed) infiltration rates are provided in Table 1 below. These infiltration rates do not include any factor of safety (to be determined by the project Civil Engineer); however, they have been normalized to correct the 3-D flow that occurs within the field test to 1-D flow out of the bottom of the boring only. The locations and depths of the infiltration tests were coordinated with the civil engineer. The approximate infiltration test locations are shown on the Geotechnical Map (Figure 2) and the infiltration test data is included in Appendix D and summarized below.

TABLE 1

Summary of Infiltration Testing

Infiltration Test Location	Infiltration Test Depth Below Existing Grade (ft)	Observed Infiltration Rate* (Inch/Hr.)
I-1	10	3.8
I-2	10	0.6

*Normalized to One-Dimensional Flow, does not include any Factor of Safety.

It should be emphasized that infiltration test results are only representative of the location and depth where they are performed. Varying subsurface conditions may exist outside of the test locations which could alter the calculated infiltration rates indicated above. Infiltration tests are performed using relatively clean water free of particulates, silt, etc. Refer to Section 4.8 for subsurface water infiltration recommendations.

2.5 Faulting and Seismic Hazards

Prompted by damaging earthquakes in California, State legislation and policies concerning the classification and land-use criteria associated with faults have been developed. Their purpose was to prevent the construction of urban developments across the trace of active faults, resulting in the Alquist-Priolo Earthquake Fault Zoning Act. Earthquake Fault Zones have been delineated along the traces of active faults within California. Where developments for human occupation are proposed within these zones, the State requires detailed fault evaluations be performed so that engineering geologists can mitigate the hazards associated with active faulting by identifying the location of active faults and allowing for a setback from zones of previous ground rupture.

The subject site is not located within an Alquist-Priolo Earthquake Fault Zone and no faults were identified on the site during our site evaluation. The possibility of damage due to ground rupture is considered low since no active faults are known to cross the site.

Secondary effects of seismic shaking resulting from large earthquakes on the major faults in the Southern California region, which may affect the site, include ground lurching, shallow ground rupture, soil liquefaction and dynamic settlement. These secondary effects of seismic shaking

are a possibility throughout the Southern California region and are dependent on the distance between the site and causative fault and the onsite geology. Some of the major active nearby faults that could produce these secondary effects include the Chino-Central, Elsinore, Cucamonga and San Andreas Faults, among others (CGS, 2018). A discussion of these secondary effects is provided in the following sections.

2.5.1 Liquefaction and Dynamic Settlement

Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high-intensity ground shaking. Liquefaction occurs when three general conditions coexist: 1) shallow groundwater; 2) low density non-cohesive (granular) soils; and 3) high-intensity ground motion. Studies indicate that loose, saturated, near-surface, cohesionless soils exhibit the highest liquefaction potential, while dry, dense, cohesionless soils, and cohesive soils exhibit low to negligible liquefaction potential. In general, cohesive soils are not considered susceptible to liquefaction. Effects of liquefaction on level ground include settlement, sand boils, and bearing capacity failures below structures. Furthermore, dynamic settlement of dry sands can occur as the sand particles tend to settle and densify as a result of a seismic event.

Based on our review of the City of Eastvale General Plan (CE, 2012), the subject site is located in an area of "High" liquefaction susceptibility based only on soil type (sediments being less than 10,000 years old and unconsolidated). Site soils are not generally susceptible to liquefaction due to a lack of groundwater in the upper 50 feet. However, isolated layers may be susceptible to dry sand seismic settlement. Seismically induced dry sand settlements were estimated by the procedures outlined by Pradel (Pradel, 1998) using the PGA_M per the 2019 CBC and a moment magnitude of 6.71 (USGS, 2014). Based on the data obtained from our field evaluation, seismic settlement due to dry sands is estimated to be on the order of about 0.5-inch or less. Differential settlement may be estimated as half of the total settlement over a horizontal span of 40 feet.

2.5.2 Lateral Spreading

Lateral spreading is a type of liquefaction induced ground failure associated with the lateral displacement of surficial blocks of sediment resulting from liquefaction in a subsurface layer. Once liquefaction transforms the subsurface layer into a fluid mass, gravity plus the earthquake inertial forces may cause the mass to move downslope towards a free face (such as a river channel or an embankment). Lateral spreading may cause large horizontal displacements and such movement typically damages pipelines, utilities, bridges, and structures.

Due to the depth to groundwater, low potential for liquefaction and lack of nearby "free face" conditions, the potential for lateral spreading is considered extremely low.

2.6 Seismic Design Criteria

The site seismic characteristics were evaluated per the guidelines set forth in Chapter 16, Section 1613 of the 2019 California Building Code (CBC) and applicable portions of ASCE 7-16 which has been adopted by the CBC. **Please note that the following seismic parameters are only applicable for code-based acceleration response spectra and are not applicable for where site-specific ground motion procedures are required by ASCE 7-16.** Representative site coordinates of latitude 33.975696 degrees north and longitude -117.566832 degrees west were utilized in our analyses. The maximum considered earthquake (MCE) spectral response accelerations (S_{MS} and S_{M1}) and adjusted design spectral response acceleration parameters (S_{DS} and S_{D1}) for Site Class D are provided in Table 1 on the following page. Since site soils are Site Class D, additional adjustments are required to code acceleration response spectrums as outlined below and provided in ASCE 7-16. The structural designer should contact the geotechnical consultant if structural conditions (e.g., number of stories, seismically isolated structures, etc.) require site-specific ground motions.

A deaggregation of the PGA based on a 2,475-year average return period (MCE) indicates that an earthquake magnitude of 6.71 at a distance of approximately 14.03 km from the site would contribute the most to this ground motion. A deaggregation of the PGA based on a 475-year average return period (Design Earthquake) indicates that an earthquake magnitude of 6.7 at a distance of approximately 17.24 km from the site would contribute the most to this ground motion (USGS, 2014).

Section 1803.5.12 of the 2019 CBC (per Section 11.8.3 of ASCE 7) states that the maximum considered earthquake geometric mean (MCE_G) Peak Ground Acceleration (PGA) should be used for liquefaction potential. The PGA_M for the site is equal to 0.74g (SEAOC, 2021).

TABLE 2

Seismic Design Parameters

Selected Parameters from 2019 CBC, Section 1613 - Earthquake Loads	Seismic Design Values	Notes/Exceptions
Distance to applicable faults classifies the site as a "Near-Fault" site.		Section 11.4.1 of ASCE 7
Site Class	D*	Chapter 20 of ASCE 7
Ss (Risk-Targeted Spectral Acceleration for Short Periods)	1.63g	From SEAOC, 2021
S_1 (Risk-Targeted Spectral Accelerations for 1-Second Periods)	0.586g	From SEAOC, 2021
F_a (per Table 1613.2.3(1))	1.0	For Simplified Design Procedure of Section 12.14 of ASCE 7, F_a shall be taken as 1.4 (Section 12.14.8.1)
F_v (per Table 1613.2.3(2))	1.714	Value is only applicable per requirements/exceptions per Section 11.4.8 of ASCE 7
S_{MS} for Site Class D [Note: $S_{MS} = F_aS_S$]	1.63g	-
S_{M1} for Site Class D [Note: $S_{M1} = F_vS_1$]	1.004g	Value is only applicable per requirements/exceptions per Section 11.4.8 of ASCE 7
S_{DS} for Site Class D [Note: $S_{DS} = (^2/_3)S_{MS}$]	1.087g	-
S_{D1} for Site Class D [Note: $S_{D1} = (^2/_3)S_{M1}$]	0.669g	Value is only applicable per requirements/exceptions per Section 11.4.8 of ASCE 7
C_{RS} (Mapped Risk Coefficient at 0.2 sec)	0.941	ASCE 7 Chapter 22
C_{R1} (Mapped Risk Coefficient at 1 sec)	0.918	ASCE 7 Chapter 22
*Since site soils are Site Class D and S_1 is greater than or equal to 0.2, the seismic response coefficient Cs is determined by Eq. 12.8-2 for values of $T \leq 1.5T_s$ and taken equal to 1.5 times the value calculated in accordance with either Eq. 12.8-3 for $T_L \geq T > T_s$, or Eq. 12.8-4 for $T > T_L$. Refer to ASCE 7-16.		

2.7 Organic Rich Soils

Approximately 60 bag soil samples were collected to determine their organic content (based on ASTM 2974). The organic content of the samples ranged from approximately 0.1 to 33.2 percent. In general, the organic content is higher near existing grade and decreases with depth. Table 6 (Appendix C) summarizes the measured organic content and also notes where the

organic content was estimated to be greater than 10% based on observation.

For most of the site there is a distinct contact between high organic content (greater than 5%) and low organic content (less than 2%) at the 1-foot depth. This upper 1-foot of soil across the site requires removal and disposal off-site due to high organic content (greater than 5.0 percent). In a few areas, there is a "transition zone" from 1-foot below the ground surface to approximately 2 feet below the ground surface where the organic content is greater than 2%. Below approximately 2 feet on average is generally free of organics.

There are 4 locations noted on our geotechnical map where appreciable amounts of high organic material is known to be stockpiled above the adjacent ground surface or buried below the ground surface. The depths of high organic material within these areas are noted on the Geotechnical Map (Figure 2). The material noted in these areas will need to be disposed of off-site.

Recommendations for off-site disposal and/or mixing to dilute organics to geotechnically acceptable organic levels (less than 2 percent) are provided in the following "Organic Rich Soil Recommendations" Section 4.1.2.

3.0 CONCLUSIONS

Based on the results of our subsurface geotechnical evaluation, it is our opinion that the proposed improvements are feasible from a geotechnical standpoint, provided that the recommendations contained in the following sections are incorporated during site grading and development. A summary of our geotechnical conclusions are as follows:

- The near-surface loose and compressible soils are not suitable for the planned improvements in their present condition (refer to Section 4.1). Organic rich soils (total organic carbon content generally greater than 2 percent) are not suitable for compacted fill soils from a geotechnical perspective.
- From a geotechnical perspective, onsite soils are anticipated to be suitable for use as general compacted fill provided the high organic content soils (soils with organic content greater than 5 percent) are removed from the site and the remaining soils with organic content between 2 and 5 percent are blended and mixed with "clean" soils and screened of construction debris and any oversized material (8 inches in greatest dimension).
- Records indicate groundwater levels recorded in the area are at depths greater than 100 feet below the ground surface.
- The subject study area is not located within a mapped State of California Earthquake Fault Zone, and based upon our review of published geologic mapping, no known active or potentially active faults are known to exist within or in the immediate vicinity of the site. Therefore, the potential for ground rupture as a result of faulting is considered very low.
- The main seismic hazard that may affect the site is ground shaking from one of the active regional faults. The subject site will likely experience strong seismic ground shaking during its design life.
- Site soils are not generally susceptible to liquefaction due to a lack of groundwater in the upper 50 feet. However, isolated layers are susceptible to dry sand seismic settlement. Total dynamic settlement is estimated to be on the order 0.5-inch or less. Differential settlement may be estimated as half of the total settlement over a horizontal span of 40 feet.
- Based on the results of preliminary laboratory testing, site soils are anticipated to have "Very Low" expansion potential. Final design expansion potential must be determined at the completion of grading.
- Based on the corrosion test results, soils are not considered corrosive per the Caltrans criteria (Caltrans, 2015).
- Excavations into the existing site soils should be feasible with heavy construction equipment in good working order. We anticipate that the sandy and silty earth materials generated from the excavations will be generally suitable for re-use as compacted fill, provided they are relatively free of rocks larger than 8 inches in dimension, construction debris, and significant organic material.
- Some portion of the onsite soils have high fines content; therefore, are not suitable for backfill of site retaining walls. Therefore, import of sandy soils meeting project recommendation is required.
- Field testing resulted in observed infiltration rates ranging from 0.6 to 3.8 inches per hour. The observed infiltration rates do not include a factor of safety. Discussion regarding infiltration is provided in Section 4.8.

4.0 RECOMMENDATIONS

The following recommendations are to be considered preliminary and should be confirmed upon completion of grading and earthwork operations. In addition, they should be considered minimal from a geotechnical viewpoint, as there may be more restrictive requirements from the architect, structural engineer, building codes, governing agencies, or the owner.

It should be noted that the following geotechnical recommendations are intended to provide sufficient information to develop the site in general accordance with the 2019 CBC requirements. With regard to the possible occurrence of potentially catastrophic geotechnical hazards such as fault rupture, earthquake-induced landslides, liquefaction, etc. the following geotechnical recommendations should provide adequate protection for the proposed development to the extent required to reduce seismic risk to an "acceptable level." The "acceptable level" of risk is defined by the California Code of Regulations as "that level that provides reasonable protection of the public safety, though it does not necessarily ensure continued structural integrity and functionality of the project" [Section 3721(a)]. Therefore, repair and remedial work of the proposed improvement may be required after a significant seismic event. With regards to the potential for less significant geologic hazards to the proposed development, the recommendations contained herein are intended as a reasonable protection against the potential damaging effects of geotechnical phenomena such as expansive soils, fill settlement, groundwater seepage, etc. It should be understood, however, that our recommendations are intended to maintain the structural integrity of the proposed development and structures given the site geotechnical conditions but cannot preclude the potential for some cosmetic distress or nuisance issues to develop as a result of the site geotechnical conditions.

The geotechnical recommendations contained herein must be confirmed to be suitable or modified based on the actual as-graded conditions.

4.1 Site Earthwork

Rough grading shall include removal of high organic content soils, remedial earthwork grading and placement of engineered compacted fill to design grades. Geotechnical recommendations for precise grading and construction of the proposed new improvements will be provided, as necessary.

We recommend that earthwork onsite be performed in accordance with the following recommendations, future grading plan review report(s), the 2019 CBC/City of Eastvale requirements, and the General Earthwork and Grading Specifications for Rough Grading included in Appendix D. In case of conflict, the following recommendations shall supersede those included in Appendix D. The following recommendations may be revised within future grading plan review reports or based on the actual conditions encountered during site grading.

4.1.1 Site Preparation

Prior to grading, areas to be developed should undergo the stripping and clearing of vegetation, high organic content soil removal/export and clearing of surface obstructions, pavements, foundation and slab elements from the site. Vegetation, debris and excessive organic material from livestock holding areas should be removed and properly disposed of offsite. Recommendations for removal of organic rich soils are provided in the following section. Holes resulting from removals of buried obstructions, which extend below proposed remedial and/or finish grades, should be replaced with suitable compacted fill material.

If cesspools or septic systems are encountered, they should be removed in their entirety. The resulting excavation should be backfilled with properly compacted fill soils. As an alternative, cesspools can be backfilled with lean sand-cement slurry. Any encountered wells should be properly abandoned in accordance with regulatory requirements.

4.1.2 Organic Rich Soil Recommendations

We recommend soils with an organic content greater than 5 percent be removed and exported from the site. For most of the site this is the top 1 foot. Figure 2 outlines areas that contains high organic content with more than 1-foot in thickness. Our recommendations are based on the following assumptions; 1) all soils with "high" organic contents greater than 5 percent shall be removed and disposed of off-site, 2) "transitional" soils (soils with organic content ranging from 2 to 5 percent) shall be adequately mixed or blended with the "clean" soils (soils with organic content less than 2.0 percent), and 3) There will be sufficient "clean" soils to dilute the limited "transitional" soils during the grading operation. From a geotechnical perspective, organic content of compacted fill soils should not exceed 2 percent.

After export of the top 1 foot of material, remedial grading as described in the following section should result in organic content of the fill materials to be approximately 1 percent. To satisfy the City's requirement of documenting the organic content in the fill, samples should be collected during grading and tested for organic content.

We recommend the geotechnical consultant be present during grading to observe the mixing of the onsite soils and perform periodic testing of the compacted fill. Organic materials shall be thoroughly mixed such that no nesting of organic materials occurs. Removal of organic materials is to satisfy geotechnical concerns and does not mitigate the potential for methane gas. Some methane gas should be expected after grading especially in former wastewater areas. Methane potential shall be evaluated by others.

4.1.3 Removal Depths and Limits

In order to provide a relatively uniform bearing condition for the planned improvements, we recommend the site soils be removed and recompacted. We recommend that soils within building pads be removed and recompacted to a minimum depth of 5 feet below

existing grade (not below base of organic removal). The envelope for removal and recompaction should extend laterally a minimum distance of 5 feet beyond the edges of the proposed improvements. In areas of design cut, over-excavation shall extend a minimum of 5 feet below existing grade or a minimum of 3 feet below finished grade, whichever is deeper. In the design cut areas, this depth may be reduced if in-place alluvial materials are tested and found to have an in-situ dry density equal or greater than 90 percent relative compaction (based on American Standard of Testing and Materials [ASTM] Test Method D1557) and exhibit uniform conditions. The Remedial Grading Diagram (Figure 5) provides a simplified example of the building pad remedial recommendations.

As shown on the attached Geotechnical Map (Figure 2), there is one isolated area of the site on the eastern edge of the property where removals will extend a minimum of 15 feet to remove a buried stockpile of manure. A representative from LGC geotechnical should be on site to approve the removal bottom to ensure it is acceptable from a geotechnical standpoint, and free of organic content.

For minor site structures such as free-standing and screen walls, the removals should extend at least 3 feet beneath the existing grade or 2 feet beneath the base of foundations, whichever is deeper. Within pavement and hardscape areas, removals should extend to a depth of at least 2 feet below the existing grade. The over-excavation in any design cut areas of the pavement may be reduced by the depth of the design cut but should not be less than 1-foot below the finished subgrade (i.e., below planned aggregate base/asphalt concrete). In general, the envelope for over-excavation should extend laterally a minimum distance of 2 feet beyond the edges of the proposed improvements mentioned above.

Local conditions may be encountered during excavation that could require additional over-excavation beyond the above-noted minimum in order to obtain an acceptable subgrade. The actual depths and lateral extents of grading will be determined by the geotechnical consultant, based on subsurface conditions encountered during grading. Removal areas and areas to be over-excavated should be accurately staked in the field by the Project Surveyor.

4.1.4 Temporary Excavations

Temporary excavations should be performed in accordance with project plans, specifications, and applicable Occupational Safety and Health Administration (OSHA) requirements. Excavations should be laid back or shored in accordance with OSHA requirements before personnel or equipment are allowed to enter. Based on our field investigation, the majority of site soils are anticipated to be OSHA Type "C" soils (refer to the attached boring logs). Sandy soils are present and should be considered susceptible to caving. Soil conditions should be regularly evaluated during construction to verify conditions are as anticipated. The contractor shall be responsible for providing the "competent person" required by OSHA standards to evaluate soil conditions. Close coordination with the geotechnical consultant should be maintained to facilitate construction while providing safe excavations. Excavation safety is the sole responsibility

of the contractor.

Vehicular traffic, stockpiles, and equipment storage should be set back from the perimeter of excavations a minimum distance equivalent to a 1:1(horizontal to vertical) projection from the bottom of the excavation or 5 feet, whichever is greater. Once an excavation has been initiated, it should be backfilled as soon as practical. Prolonged exposure of temporary excavations may result in some localized instability. Excavations should be planned so that they are not initiated without sufficient time to shore/fill them prior to weekends, holidays, or forecasted rain.

It should be noted that any excavation that extends below a 1:1 (horizontal to vertical) projection of an existing foundation will remove existing support of the structure foundation. If requested, temporary shoring parameters will be provided.

4.1.5 Subgrade Preparation

In general, areas to receive compacted fill should be scarified to a minimum depth of 6 inches, brought to a near-optimum moisture condition (generally within optimum and 2 percent above optimum moisture content), and re-compacted per project requirements. Removal bottoms and areas to receive fill should be observed and accepted by the geotechnical consultant prior to subsequent fill placement.

4.1.6 Material for Fill

From a geotechnical perspective, the onsite soils are generally considered suitable for use as general compacted fill, provided they are screened of organic materials, construction debris and any oversized material (8 inches in greatest dimension). From a geotechnical perspective, soils with an organic content of less than 2 percent are generally considered suitable for re-use as compacted fill.

From a geotechnical viewpoint, import soils for general fill (i.e., non-retaining wall backfill) should consist of clean, granular soils of Very Low expansion potential (expansion index 20 or less based on ASTM D4829). Import for retaining wall backfill should meet the criteria outlined in the paragraph below. Source samples should be provided to the geotechnical consultant for laboratory testing a minimum of three working days prior to any planned importation.

Retaining wall backfill should consist of granular free draining soils (sand equivalent of 30 or greater as determined by ASTM D2419 or CTM 217). Soils should also be screened of organic materials, construction debris, and any material greater than 3 inches in maximum dimension. The onsite soils are not considered suitable for retaining wall backfill due to their fines content (i.e., silt and clay content). Therefore, import of suitable soils meeting the criteria outlined above will be required.

Aggregate base should conform to the requirements of Section 200-2 of the most recent version of the Standard Specifications for Public Works Construction ("Greenbook") for

untreated base materials and/or City of Ontario requirements. It is our understanding that the City of Ontario only allows crushed aggregate base (CAB) and crushed miscellaneous base (CMB) is not allowed.

4.1.7 Placement and Compaction of Fills

Material to be placed as fill should be brought to near-optimum moisture content (generally within optimum and 2 percent above optimum moisture content) and recompacted to at least 90 percent relative compaction (per ASTM D1557). Moisture conditioning of site soils will be required in order to achieve adequate compaction. Drying and/or mixing the very moist soils will be required prior to reusing the materials in compacted fills. Soils are also present that will require additional moisture in order to achieve the required compaction.

The optimum lift thickness to produce a uniformly compacted fill will depend on the type and size of compaction equipment used. In general, fill should be placed in uniform lifts not exceeding 8 inches in compacted thickness. Each lift should be thoroughly compacted and accepted prior to subsequent lifts. Generally, placement and compaction of fill should be performed in accordance with local grading ordinances and with observation and testing by LGC Geotechnical. Oversized material as previously defined should be removed from site fills.

During backfill of excavations, the fill should be properly benched into firm and competent soils of temporary backcut slopes as it is placed in lifts.

Aggregate base material should be compacted to a minimum of 95 percent relative compaction at or slightly above optimum moisture content per ASTM D1557. Subgrade below aggregate base should be compacted to a minimum of 90 percent relative compaction per ASTM D1557 at near-optimum moisture content (generally within optimum and 2 percent above optimum moisture content).

4.1.8 Trench and Retaining Wall Backfill and Compaction

The onsite soils may generally be suitable as trench backfill, provided the soils are screened of rocks and other material greater than 6 inches in diameter and organic matter. If trenches are shallow or the use of conventional equipment may result in damage to the utilities, sand having a sand equivalent (SE) of 30 or greater (per California Test Method [CTM] 217) may be used to bed and shade the pipes. Sand backfill within the pipe bedding zone may be densified by jetting or flooding and then tamping to ensure adequate compaction. Subsequent trench backfill should be compacted in uniform thin lifts by mechanical means to at least the recommended minimum relative compaction (per ASTM D1557).

Retaining wall backfill should consist of sandy soils as outlined in preceding Section 4.1.6. The contractor should anticipate the importing of soils for the required retaining wall backfill. The limits of select sandy backfill should extend a minimum ½ the height of the

retaining wall or the width of the heel (if applicable), whichever is greater, refer to Figures 3 and 4 (rear of text). Retaining wall backfill soils should be compacted in relatively uniform thin lifts to at least 90 percent relative compaction (per ASTM D1557). Jetting or flooding of retaining wall backfill materials should not be permitted.

A representative from LGC Geotechnical should observe, probe, and test the backfill to verify compliance with the project recommendations.

4.1.9 Shrinkage and Subsidence

Allowance in the earthwork volumes budget should be made for an estimated 0 to 5 percent reduction in volume of near-surface (upper approximate 5 feet) soils. It should be stressed that these values are only estimates and that an actual shrinkage factor would be extremely difficult to predetermine. Subsidence due to earthwork equipment is expected to be up to 0.1 feet. These values are estimates only and exclude losses due to removal of vegetation or debris. The effective change in volume of onsite soils will depend primarily on the type of compaction equipment, method of compaction used onsite by the contractor, and accuracy of the topographic survey.

Due to the combined variability in topographic surveys, inability to precisely model the removals and variability of on-site near-surface conditions, it is our opinion that the site will not balance at the end of grading. If importing/exporting a large volume of soils is not considered feasible or economical, we recommend a balance area be designated onsite that can fluctuate up or down based on the actual volume of soil. We recommend a "balance" area that can accommodate on the order of 5 percent (plus or minus) of the total grading volume be considered.

4.2 Preliminary Foundation Recommendations

Provided that the remedial grading recommendations provided herein are implemented, the site may be considered suitable for the support of the residential structures using a conventional or post-tensioned foundation system. Site soils are anticipated to be "Very Low" expansion potential (EI of 20 or less per ASTM D4829) and special design considerations from a geotechnical perspective is not required, however, this must be verified based on as-graded conditions. Please note that the following foundation recommendations are preliminary and must be confirmed by LGC Geotechnical.

Preliminary foundation recommendations are provided in the following sections. Recommended soil bearing and estimated settlement due to structural loads are provided in Section 4.3.

4.2.1 Provisional Conventional Foundation Design

Due to the very low expansion potential of the onsite soils, the foundation/structural engineer may design a conventional foundation system that is tied together based upon the anticipated dead and live loads (wind, seismic) that will be imparted by the

structure. The recommendations provided in the "Soil Bearing and Lateral Resistance" section may be utilized in the design of a rigid slab-on-grade conventional foundation designed in accordance with Section 1808 of the 2019 C.B.C.

4.2.2 Provisional Post-Tensioned Foundation Design Parameters

The foundation designer may use a modulus of vertical subgrade reaction (k) of 200 pounds per cubic inch (pounds per square inch per inch of deflection). This value is for a 1-foot by 1-foot square loaded area and should be adjusted by the structural designer for the area of the proposed footing using the following formula:

$k = 200 \times [(B+1)/2B]^2$
k = modulus of vertical subgrade reaction, pounds per cubic inch (pci)
B = foundation width (feet)

The moisture content of near surface fill soils should be maintained at the level it was placed up to the time of concrete placement.

4.2.3 Shallow Foundation Maintenance

The geotechnical parameters provided herein assume that if the areas adjacent to the foundation are planted and irrigated, these areas will be designed with proper drainage and adequately maintained so that ponding, which causes significant moisture changes below the foundation, does not occur. Our recommendations do not account for excessive irrigation and/or incorrect landscape design. Plants should only be provided with sufficient irrigation for life and not overwatered to saturate subgrade soils. Sunken planters placed adjacent to the foundation, should either be designed with an efficient drainage system or liners to prevent moisture infiltration below the foundation. Some lifting of the perimeter foundation beam should be expected even with properly constructed planters.

In addition to the factors mentioned above, future owners/property management personnel should be made aware of the potential negative influences of trees and/or other large vegetation. Roots that extend near the vicinity of foundations can cause distress to foundations. Future owners (and the owner's landscape architect) should not plant trees/large shrubs closer to the foundations than a distance equal to half the mature height of the tree or 20 feet, whichever is more conservative unless specifically provided with root barriers to prevent root growth below the building foundation.

It is the owner's responsibility to perform periodic maintenance during hot and dry periods to ensure that adequate watering has been provided to keep soil from separating or pulling back from the foundation. Future owners and property management personnel should be informed and educated regarding the importance of maintaining a constant level of soil-moisture. The owners should be made aware of the potential negative consequences of both excessive watering, as well as allowing potentially expansive soils to become too dry. Expansive soils can undergo shrinkage

during drying, and swelling during the rainy winter season, or when irrigation is resumed. This can result in distress to building structures and hardscape improvements. The builder should provide these recommendations to future owners and property management personnel.

4.2.4 Slab Underlayment Guidelines

The following is for informational purposes only since slab underlayment (e.g., moisture retarder, sand or gravel layers for concrete curing and/or capillary break) is unrelated to the geotechnical performance of the foundation and thereby not the purview of the geotechnical consultant. Post-construction moisture migration should be expected below the foundation. The foundation engineer/architect should determine whether the use of a capillary break (sand or gravel layer), in conjunction with the vapor retarder, is necessary or required by code. Sand layer thickness and location (above and/or below vapor retarder) should also be determined by the foundation engineer/architect.

4.3 Soil Bearing and Lateral Resistance

Provided our earthwork recommendations are implemented, an allowable soil bearing pressure of 2,000 pounds per square foot (psf) may be used for the design of footings having a minimum width of 12 inches and minimum embedment of 15 inches below lowest adjacent ground surface. This value may be increased by 400 psf for each additional foot of embedment and 200 psf for each additional foot of foundation width to a maximum value of 3,000 psf. A mat foundation a minimum of 6 inches below lowest adjacent grade may be designed for an allowable soil bearing pressure of 1,200 psf. These allowable bearing pressures are applicable for level (ground slope equal to or flatter than 5H:1V) conditions only. Bearing values indicated are for total dead loads and frequently applied live loads and may be increased by ⅓ for short duration loading (i.e., wind or seismic loads).

Soil settlement is a function of footing dimensions and applied soil bearing pressure. In utilizing the above-mentioned allowable bearing capacity, assumed structural loads, and provided our earthwork recommendations are implemented, foundation settlement due to structural loads is anticipated to be on the order of 1-inch or less and ½-inch over a horizontal span of 40 feet for total and differential settlement, respectively. Differential settlement should be anticipated between nearby columns or walls where a large differential loading condition exists Furthermore, seismic settlement due to dry-sand settlement is anticipated to be 0.5 inches or less. Differential seismic settlement may be taken as half of the seismic settlement (i.e., ¼-inch over a horizontal span of 40 feet).

Resistance to lateral loads can be provided by friction acting at the base of foundations and by passive earth pressure. For concrete/soil frictional resistance, an allowable coefficient of friction of 0.35 may be assumed with dead-load forces. An allowable passive lateral earth pressure of 270 psf per foot of depth (or pcf) to a maximum of 2,700 psf may be used for the sides of footings poured against properly compacted fill. Allowable passive pressure may be increased to 360 pcf (maximum of 3,600 psf) for short duration seismic loading. This passive pressure is applicable for level (ground slope equal to or flatter than 5H:1V) conditions only. Frictional resistance and

passive pressure may be used in combination without reduction. We recommend that the upper foot of passive resistance be neglected if finished grade will not be covered with concrete or asphalt. The provided allowable passive pressures are based on a factor of safety of 1.5 and 1.1 for static and seismic loading conditions, respectively. The structural designer should incorporate appropriate factors of safety and/or load factors in their design.

4.4 Lateral Earth Pressures and Retaining Wall Design Considerations

Lateral earth pressures are provided as equivalent fluid unit weights, in pound per square foot (psf) per foot of depth or pcf. The values for the active condition do not contain an appreciable factor of safety, so the retaining wall designer should apply the applicable factors of safety and/or load factors during design. A soil unit weight of 120 pcf may be assumed for calculating the actual weight of soil over the wall footing.

Lateral earth pressures are presented in Table 2. Table 2 contains values for approved select sandy backfill for both drained and undrained conditions. Typically, retaining walls are designed for a drained condition with select sandy soils used as backfill. Should retaining walls have constraints limiting the ability to install or drain or appropriately outlet a drain, the values for undrained conditions should be used. Approved select sandy soils should have a sand equivalent of 30 or greater as determined by ASTM D2419.

The retaining wall designer should clearly indicate on the retaining wall plans if drains are required.

TABLE 3

Lateral Earth Pressures – Select Sand Backfill

Condition	**Equivalent Fluid Weight (pcf)**	
	Level Backfill	
	Approved Sandy Backfill Material - Drained	**Approved Sandy Backfill Material - Undrained**
Active	35	80

The drained equivalent fluid pressure values assume free-draining conditions and a drainage system will be installed and maintained to prevent the build-up of hydrostatic pressures. A relatively sandy backfill along with a subdrain pipe wrapped in drainage aggregate and filter fabric (e.g., “burrito” subdrain) properly outletted to a suitable discharge point is typically used for conventional retaining walls. Retaining wall structures should be provided with appropriate drainage and appropriately waterproofed. Typical conventional (i.e., backfilled) retaining wall drainage is shown in Figure 3. At similar sites, wall drainage through the face has been a preferred option. For this condition wall drainage is shown in Figure 4. If conditions other than

those assumed above are anticipated, the equivalent fluid pressure values should be provided on an individual-case basis by the geotechnical consultant.

Surcharge loading effects from any adjacent structures should be evaluated by the retaining wall designer. In general, structural loads within a 1:1 (horizontal to vertical) upward projection from the bottom of the proposed retaining wall footing will surcharge the proposed retaining structure. Uniform surcharges may be estimated using the applicable coefficient of lateral earth pressure using a rectangular distribution. A factor of 0.5 and 0.33 may be used for at-rest and active conditions, respectively. The retaining wall designer should contact the geotechnical engineer for any required geotechnical input in estimating any applicable surcharge loads.

If required, the retaining wall designer may use a seismic lateral earth pressure increment of 5 pcf for retaining walls up to a maximum of 10 feet in height with level backfill. This increment should be applied in addition to the applicable static lateral earth pressure using a triangular distribution with the resultant acting at H/3 in relation to the base of the retaining structure (where H is the retained height). For the restrained, at-rest condition, the seismic increment may be added to the applicable active lateral earth pressure (in lieu of the at-rest lateral earth pressure) when analyzing short duration seismic loading. Per Section 1803.5.12 of the 2019 CBC, the seismic lateral earth pressure is applicable to structures assigned to Seismic Design Category D through F for retaining wall structures supporting more than 6 feet of backfill height. This seismic lateral earth pressure is estimated using the procedure outlined by the Structural Engineers Association of California (Lew, et al, 2010). The provided seismic lateral earth pressure is for a level backfill condition and a maximum of 10 feet in height; a sloping backfill condition and greater retaining wall heights are not anticipated. However, if a sloping backfill condition or retaining walls greater than 10 feet in height are proposed, the retaining wall designer should contact the geotechnical engineer for specific seismic lateral earth pressure increments based on the configuration of the planned retaining wall structures.

For soil bearing and lateral resistance (friction coefficient and passive resistance) is provided in Section 4.3 “Soil Bearing and Lateral Resistance”. Earthwork considerations (temporary backcuts, backfill, compaction, etc.) for retaining walls are provided in Section 4.1 “Site Earthwork” and the subsequent earthwork related sub-sections.

4.5 Corrosivity to Concrete and Metal

Although not corrosion engineers (LGC Geotechnical is not a corrosion consultant), several governing agencies in Southern California require the geotechnical consultant to determine the corrosion potential of soils to buried concrete and metal facilities. We therefore present the results of our testing with regard to corrosion for the use of the client and other consultants, as they determine necessary.

Corrosion testing of near-surface bulk samples indicated a soluble sulfate content value of 78 ppm (less than 0.02 percent) and a chloride content of 100 ppm. Based on Caltrans Corrosion Guidelines (2015), soils are considered corrosive if the chloride concentration is 500 ppm or greater, or the sulfate concentration is 2,000 ppm (0.2 percent) or greater. Based on the test results, soils are not considered corrosive using Caltrans criteria.

Based on our laboratory test results of representative site soil samples, onsite soils should be considered as having a severity categorization of "not applicable" and are designated class "S0" per ACI 318, Table 19.3.1.1, sulfate. As a result, the minimum compressive strength of the concrete shall be 2,500 psi.

Laboratory testing may need to be performed at the completion of grading by the project corrosion engineer to further evaluate the as-graded soil corrosivity characteristics. Accordingly, revision of the corrosion potential may be needed, should future test results differ substantially from the conditions reported herein. The client and/or other members of the development team should consider this during the design and planning phase of the project and formulate an appropriate course of action.

4.6 Preliminary Asphalt Concrete Pavement Sections

For the purposes of these preliminary recommendations, we have selected a preliminary design R-value of 40 and calculated pavement sections for Traffic Indices of 5.5, 6.0 and 6.5. R-value testing of the street subgrade will need to be performed to confirm our preliminary testing results/assumptions once the streets have been graded to finish subgrade elevations and the final Traffic Index is determined by the Civil Engineer. It is our understanding that the City of Ontario requires that local streets have a minimum pavement section consisting of 4 inches of asphalt over 6 inches of crushed aggregate base (CAB).

TABLE 4

Preliminary Pavement Sections

Assumed Traffic Index	5.5	6.0	6.5
R -Value Subgrade	40	40	40
AC Thickness	4.0 inches	4.0 inches	4.0 inches
CAB Thickness	6.0 inches	6.0 inches	6.0 inches

Increasing the thickness of asphalt or adding additional base material will reduce the likelihood of the pavement experiencing distress during its service life. The above recommendations are based on the assumption that proper maintenance and irrigation of the areas adjacent to the roadway will occur through the design life of the pavement. Failure to maintain a proper maintenance and/or irrigation program may jeopardize the integrity of the pavement.

Earthwork recommendations regarding aggregate base and subgrade are provided in the previous Section "Site Earthwork" and the related sub-sections of this report.

4.7 Nonstructural Concrete Flatwork

Nonstructural concrete (such as flatwork, sidewalks, patios, etc.) has a potential for cracking due to changes in soil volume related to soil-moisture fluctuations. To reduce the potential for excessive cracking and lifting, concrete should be designed in accordance with the minimum guidelines outlined in Table 5 below. These guidelines will reduce the potential for irregular cracking and promote cracking along construction joints but will not eliminate all cracking or lifting. Thickening the concrete and/or adding additional reinforcement will further reduce cosmetic distress.

TABLE 5

Preliminary Geotechnical Parameters for Nonstructural Concrete Flatwork Placed on Very Low to Low Expansion Potential Subgrade

	Homeowner Sidewalks	**Private Drives**	**Patios/Entryways**	**City Sidewalk Curb and Gutters**
Minimum Thickness (in.)	4 (nominal)	4 (full)	4 (full)	City/Agency Standard
Presoaking	Wet down prior to placing	Wet down prior to placing	Wet down prior to placing	City/Agency Standard
Reinforcement	—	No. 3 at 24 inches on centers	No. 3 at 24 inches on centers	City/Agency Standard
Thickened Edge (in.)	—	8 x 8	—	City/Agency Standard
Crack Control Joints	Saw cut or deep open tool joint to a minimum of $^1/_3$ the concrete thickness	Saw cut or deep open tool joint to a minimum of $^1/_3$ the concrete thickness	Saw cut or deep open tool joint to a minimum of $^1/_3$ the concrete thickness	City/Agency Standard
Maximum Joint Spacing	5 feet	10 feet or quarter cut whichever is closer	6 feet	City/Agency Standard
Aggregate Base Thickness (in.)	—	—	—	City/Agency Standard

To reduce the potential for driveways to separate from the garage slab, the builder may elect to install dowels to tie these two elements together. Similarly, future homeowners should

consider the use of dowels to connect flatwork to the foundation.

4.8 Subsurface Water Infiltration

Recent regulatory changes have occurred that mandate storm water be infiltrated below grade rather than collected in a conventional storm drain system. Typically, a combination of methods are implemented to reduce surface water runoff and increase infiltration including; permeable pavements/pavers for roadways and walkways, directing surface water runoff to grass-lined swales, retention areas, and/or drywells, etc. It should be noted that collecting and concentrating surface water for the purpose of intentionally infiltrating below grade, conflicts with the geotechnical engineering objective of directing surface water away from slopes, structures and other improvements. The geotechnical stability and integrity of a site is reliant upon appropriately handling surface water. In general, we do not recommend that surface water be intentionally infiltrated into the subsurface soils.

Considering the results of the infiltration testing, if required, stormwater may be infiltrated into the subsurface soils at the depths tested below existing grade, using the values presented in Table 1 and the appropriate County of Riverside Flood Control (2011) safety factors. The Civil Engineer should determine the appropriate safety factor applicable to the proposed infiltration system. Results of field infiltration testing are provided in Appendix D.

The following should be considered for design of any required infiltration system:

- Water discharge from any infiltration systems should not occur within the zone of influence of foundation footings (column and load bearing wall locations). For preliminary purposes we recommend a minimum setback of 15 feet from the structural improvements, or the County recommended minimum setback, whichever is more conservative.
- An adequate setback distance between any infiltration facility and adjacent private property should be maintained.
- It may be prudent to provide an overflow system directly connected to the storm drain system in order to prevent failure of the infiltration system, either as a result of lower than anticipated infiltration and/or very high flow volumes. It should be noted that if pretreatment of runoff to remove debris, soil particles, etc., cannot be performed, design infiltration rates may need to be further reduced. Over time, siltation and plugging may reduce the infiltration rate and subsequent effectiveness of the infiltration system.
- Any designed infiltration system will require routine periodic maintenance.
- As with any systems that are designed to concentrate the surface flow and direct the water into the subsurface soils, some type of nuisance water and/or other water-related issues should be expected.

LGC Geotechnical should be provided with details for any planned required infiltration system early in the design process for geotechnical input.

4.9 Control of Surface Water and Drainage Control

From a geotechnical perspective, we recommend that compacted finished grade soils adjacent to proposed structures be sloped away from the proposed structures and towards an approved drainage device or unobstructed swale. Drainage swales, wherever feasible, should not be constructed within 5 feet of buildings. Where lot and building geometry necessitates that drainage swales be routed closer than 5 feet to structural foundations, we recommend the use of area drains together with drainage swales. Drainage swales used in conjunction with area drains should be designed by the project civil engineer so that a properly constructed and maintained system will prevent ponding within 5 feet of the foundation. Code compliance of grades is not the purview of the geotechnical consultant.

Planters with open bottoms adjacent to buildings should be avoided. Planters should not be designed adjacent to buildings unless provisions for drainage, such as catch basins, liners, and/or area drains, are made. Overwatering must be avoided.

4.10 Supplemental Field Explorations

It should be noted that a portion in the northwestern corner of the site was not accessible at the time of our field evaluation (see Figure 2). This area was not explored and did not receive testing for near surface organic rich soils. We recommend performing a future evaluation addressing the organic content of the area prior to the export of high organic "soils" from the site.

4.11 Geotechnical Plan Review

Project plans (grading, foundation, etc.) should be reviewed by this office prior to construction to verify that our geotechnical recommendations have been incorporated. Additional or modified geotechnical recommendations may be required based on the proposed layout.

4.12 Geotechnical Observation and Testing

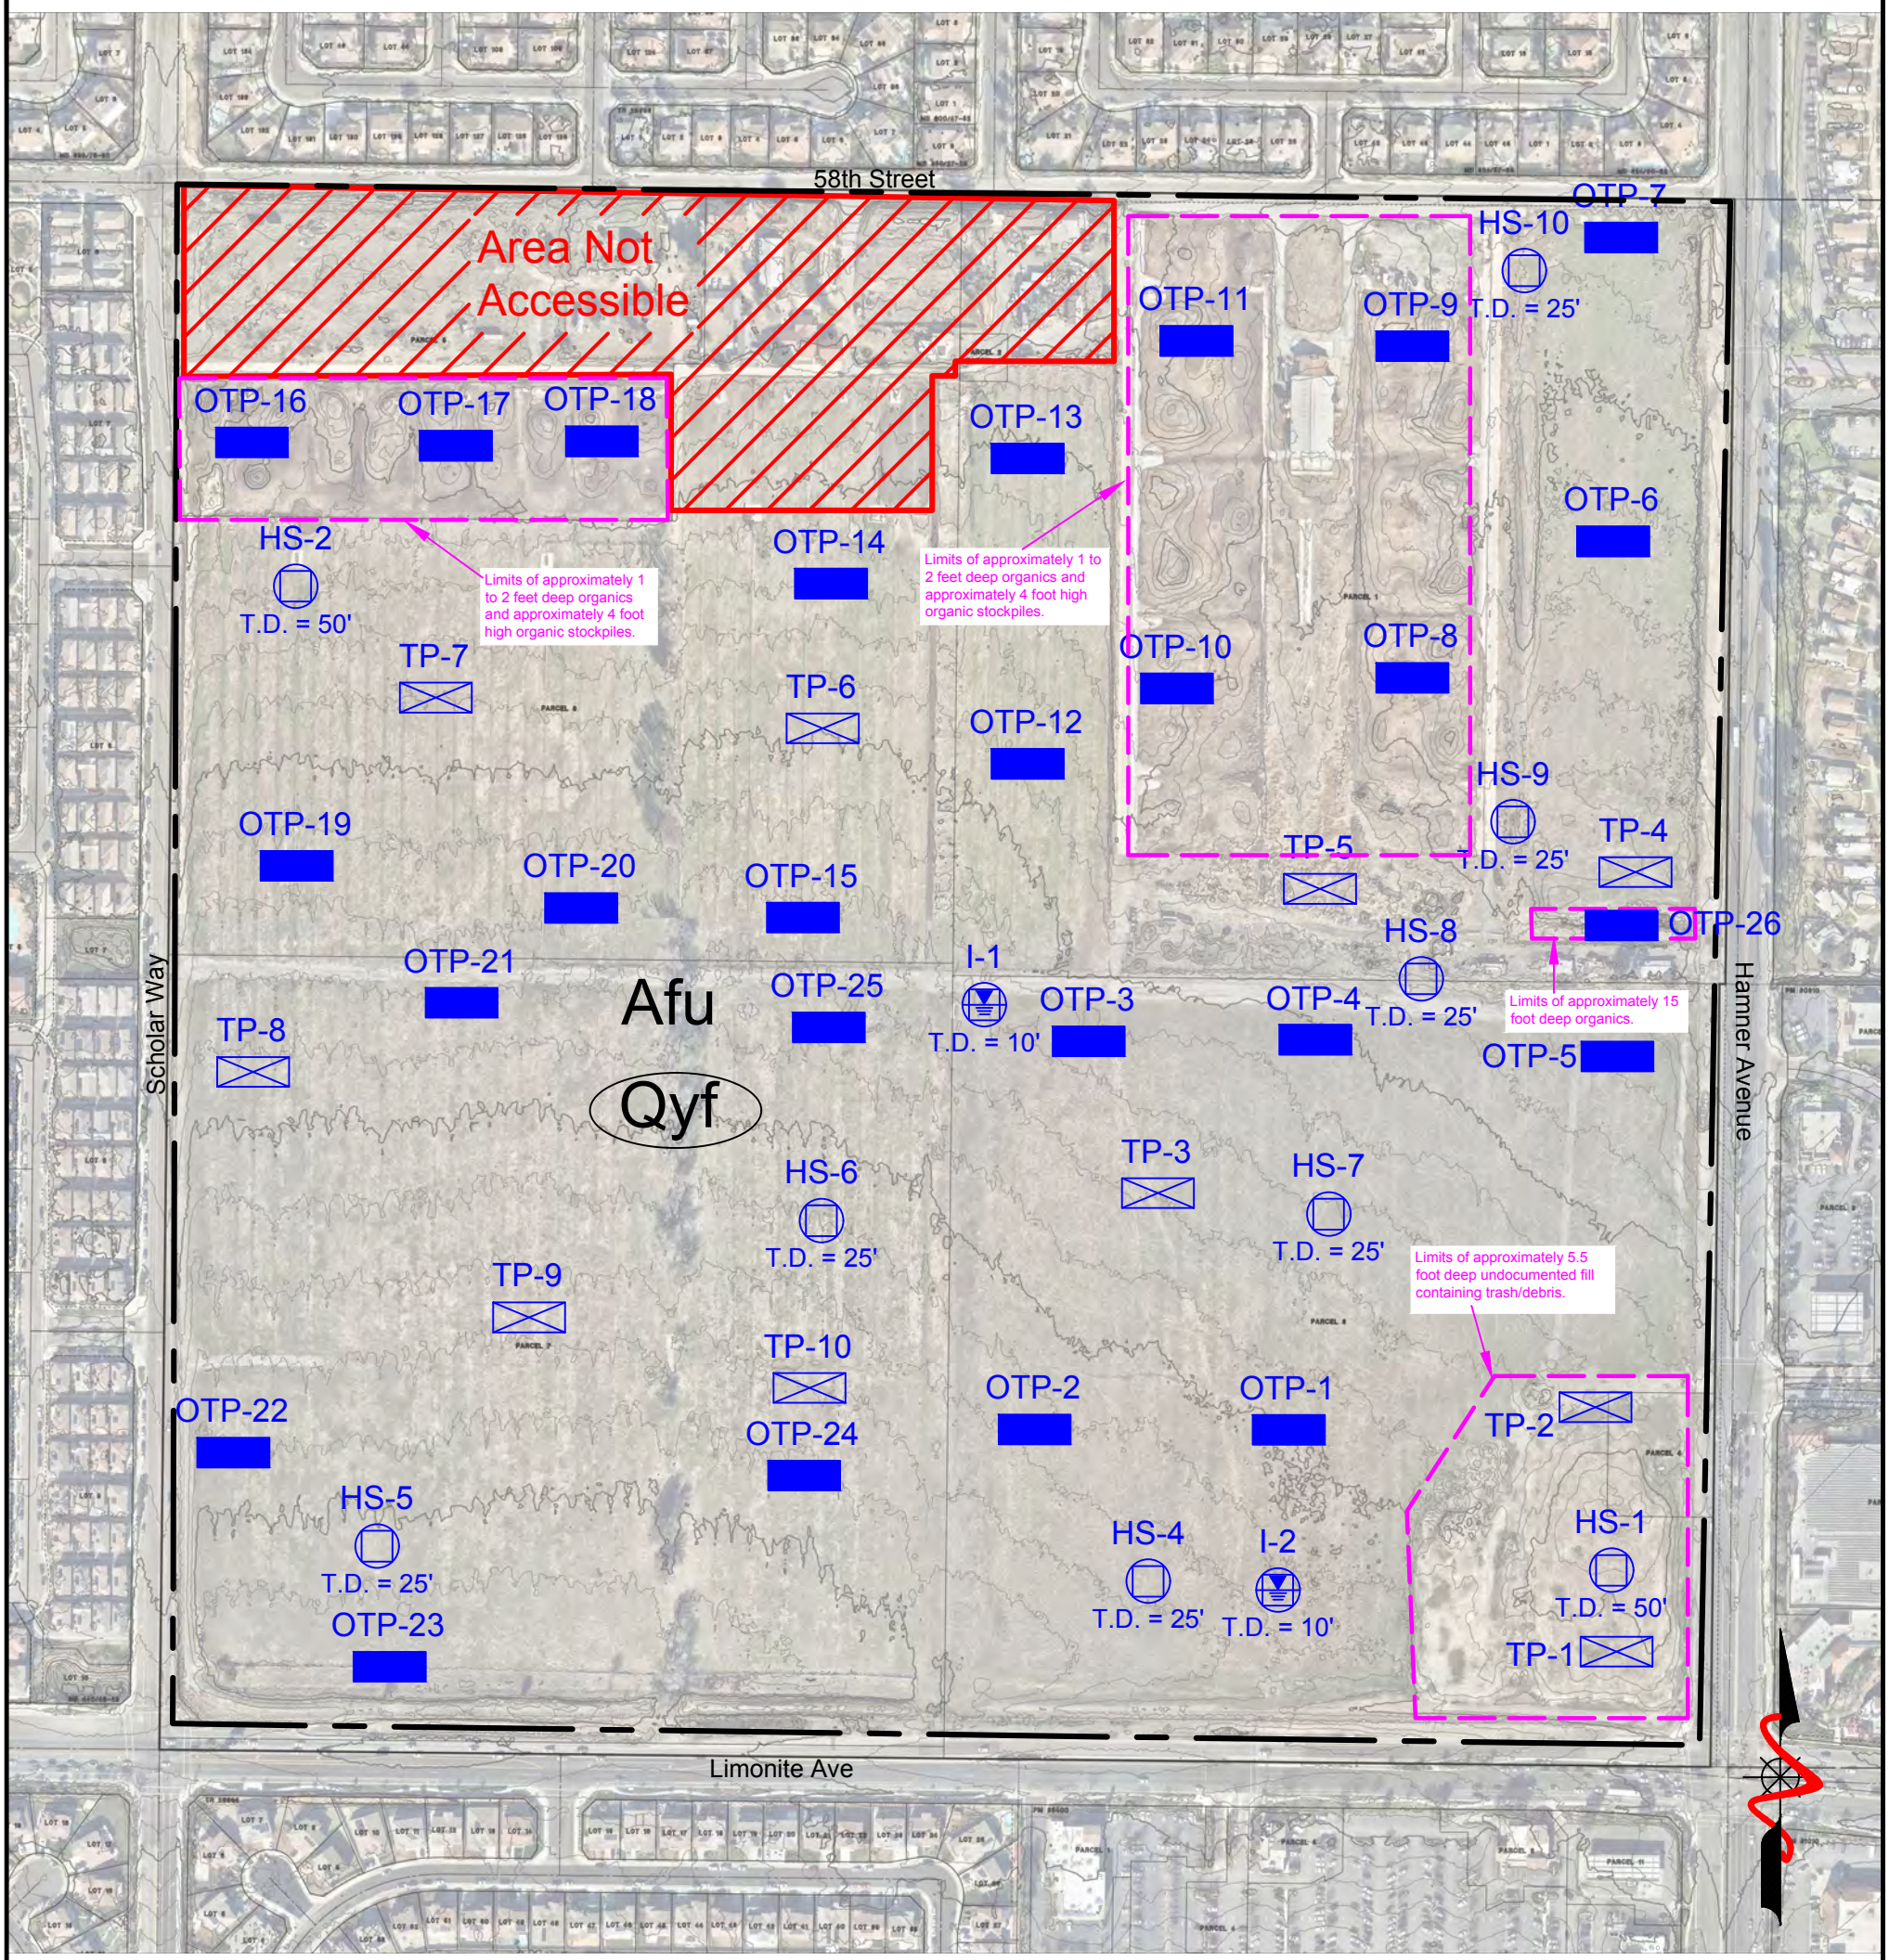
The recommendations provided in this report are based on limited subsurface observations and geotechnical analysis. The interpolated subsurface conditions should be checked in the field during construction by a representative of LGC Geotechnical. Geotechnical observation and testing is required per Section 1705 of the 2019 California Building Code (CBC).

Geotechnical observation and/or testing should be performed by LGC Geotechnical at the following stages:

- During grading (removal bottoms, fill placement, etc.);
- During retaining wall backfill and compaction;
- During utility trench backfill and compaction;

- After presoaking building pad and other concrete-flatwork subgrades, and prior to placement of aggregate base or concrete;
- Preparation of pavement subgrade and placement of aggregate base;
- After building and wall footing excavation and prior to placement of steel reinforcement and/or concrete; and
- When any unusual soil conditions are encountered during any construction operation subsequent to issuance of this report.

5.0 LIMITATIONS



Our services were performed using the degree of care and skill ordinarily exercised, under similar circumstances, by reputable soils engineers and geologists practicing in this or similar localities. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report.

This report is based on data obtained from limited observations of the site, which have been extrapolated to characterize the site. While the scope of services performed is considered suitable to adequately characterize the site geotechnical conditions relative to the proposed development, no practical evaluation can completely eliminate uncertainty regarding the anticipated geotechnical conditions in connection with a subject site. Variations may exist and conditions not observed or described in this report may be encountered during grading and construction.

This report is issued with the understanding that it is the responsibility of the owner, or of his/her representative, to ensure that the information and recommendations contained herein are brought to the attention of the other consultants (at a minimum the civil engineer, structural engineer, landscape architect) and incorporated into their plans. The contractor should properly implement the recommendations during construction and notify the owner if they consider any of the recommendations presented herein to be unsafe, or unsuitable.

The findings of this report are valid as of the present date. However, changes in the conditions of a site can and do occur with the passage of time, whether they be due to natural processes or the works of man on this or adjacent properties. The findings, conclusions, and recommendations presented in this report can be relied upon only if LGC Geotechnical has the opportunity to observe the subsurface conditions during grading and construction of the project, in order to confirm that our preliminary findings are representative for the site. This report is intended exclusively for use by the client, any use of or reliance on this report by a third party shall be at such party's sole risk.

In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and modification.

Appendix C
Laboratory Test Results

APPENDIX C

Laboratory Test Results

The laboratory testing program was directed towards providing quantitative data relating to the relevant engineering properties of the site soils. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on driven samples obtained from the test borings. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Grain Size Distribution/Fines Content: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140). Where applicable, the portion retained on the No. 200 sieve was dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D6913 (sieve).

Sample Location	Description	% Passing # 200 Sieve
I-2	Clay with Sand	83

Atterberg Limits: The liquid and plastic limits ("Atterberg Limits") were determined per ASTM D4318 for engineering classification of fine-grained material and presented in the table below. The USCS soil classification indicated in the table below is based on the portion of sample passing the No. 40 sieve and may not necessarily be representative of the entire sample. The plot is provided in this Appendix.

Sample Location	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index (%)	USCS Soil Classification
HS-8 @ 7.5 ft	32	21	11	CL

Consolidation: One consolidation test was performed per ASTM D2435. A sample (2.4 inches in diameter and 1-inch in height) was placed in a consolidometer and increasing loads were applied. The sample was allowed to consolidate under "double drainage" and total deformation for each loading step were recorded. The percent consolidation for each load step was recorded as the ratio of the amount of vertical compression to the original sample height. The consolidation pressure curve is provided in this Appendix.

Collapse/Swell Potential: One collapse test was performed per ASTM D4546. A sample (2.4 inches in diameter and 1-inch in height) was placed in a consolidometer and loaded to the approximate in-situ effective stress. The curve is presented in this Appendix.

Maximum Density Tests: The maximum dry density and optimum moisture content of a typical material was determined in accordance with ASTM D1557. The result of this test is presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-3 @ 0-5 ft	Brown Silty Sand	125.0	8.5

Expansion Index: The expansion potential of selected representative samples was evaluated by the Expansion Index Test per ASTM D4829.

Sample Location	Expansion Index	Expansion Potential*
HS-2 @ 0-5 ft	11	Very Low

* Per ASTM D4829

Soluble Sulfates: The soluble sulfate content of a select sample was determined by standard geochemical methods (CTM 417). The test result is presented in the table below.

Sample Location	Sulfate Content, ppm
HS-1 @ 0-5 ft	78

Chloride Content: Chloride content was tested per CTM 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-1 @ 0-5 ft	100

Organic Matter Content of Soils: Organic matter content tests were performed in general accordance with ASTM D 2974 (Test Methods A & C). The results are presented in this Table 6.

Infiltration Test Data Sheet

LGC Geotechnical, Inc
131 Calle Iglesia Suite 200, San Clemente, CA 92672 tel. (949) 369-6141

Project Name: Eastvale
Project Number: 21116-01
Date: 5/25/2021
Boring Number: I-2

Test hole dimensions (if circular)	
Boring Depth (feet)*:	10
Boring Diameter (inches):	8
Pipe Diameter (inches):	3

*measured at time of test

Test pit dimensions (if rectangular)	
Pit Depth (feet):	
Pit Length (feet):	
Pit Breadth (feet):	

*Pre-Test (Sandy Soil Criteria)**

Trial No.	Start Time (24:HR)	Stop Time (24:HR)	Time Interval (min)	Initial Depth to Water (feet)	Final Depth to Water (feet)	Total Change in Water Level (feet)	Greater Than or Equal to 0.5 feet (yes/no)
1	7:03	7:28	25.0	7.56	7.82	0.26	No
2	7:29	7:54	25.0	7.63	7.89	0.26	No

*If two consecutive measurements show that six inches of water seeps away in less than 25 minutes, the test shall be run for an additional hour with measurements taken every 10 minutes. Otherwise, pre-soak (fill) overnight, and then obtain at least twelve measurements per hole over at least six hours (approximately 30 minute intervals) with a precision of at least 0.25 inches

Main Test Data

Trial No.	Start Time (24:HR)	Stop Time (24:HR)	Time Interval, Δt (min)	Initial Depth to Water, D_o (feet)	Final Depth to Water, D_f (feet)	Change in Water Level, ΔD (feet)	Observed Infiltration Rate(in/hr)

Appendix E
General Earthwork and Grading Specifications for Rough Grading

General Earthwork and Grading Specifications for Rough Grading

1.0 General

1.1 Intent

These General Earthwork and Grading Specifications are for the grading and earthwork shown on the approved grading plan(s) and/or indicated in the geotechnical report(s). These Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the specific recommendations in the geotechnical report shall supersede these more general Specifications. Observations of the earthwork by the project Geotechnical Consultant during the course of grading may result in new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

1.2 The Geotechnical Consultant of Record

Prior to commencement of work, the owner shall employ a qualified Geotechnical Consultant of Record (Geotechnical Consultant). The Geotechnical Consultant shall be responsible for reviewing the approved geotechnical report(s) and accepting the adequacy of the preliminary geotechnical findings, conclusions, and recommendations prior to the commencement of the grading.

Prior to commencement of grading, the Geotechnical Consultant shall review the "work plan" prepared by the Earthwork Contractor (Contractor) and schedule sufficient personnel to perform the appropriate level of observation, mapping, and compaction testing.

During the grading and earthwork operations, the Geotechnical Consultant shall observe, map, and document the subsurface exposures to verify the geotechnical design assumptions. If the observed conditions are found to be significantly different than the interpreted assumptions during the design phase, the Geotechnical Consultant shall inform the owner, recommend appropriate changes in design to accommodate the observed conditions, and notify the review agency where required.

The Geotechnical Consultant shall observe the moisture-conditioning and processing of the subgrade and fill materials and perform relative compaction testing of fill to confirm that the attained level of compaction is being accomplished as specified. The Geotechnical Consultant shall provide the test results to the owner and the Contractor on a routine and frequent basis.

1.3 The Earthwork Contractor

The Earthwork Contractor (Contractor) shall be qualified, experienced, and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing the grading in accordance with the project plans and specifications. The Contractor shall prepare and submit to the owner and the Geotechnical Consultant a work plan that indicates the sequence of earthwork grading, the number of “equipment” of work and the estimated quantities of daily earthwork

contemplated for the site prior to commencement of grading. The Contractor shall inform the owner and the
Geotechnical Consultant of changes in work schedules and updates to the work plan at least 24 hours in advance of such changes so that appropriate personnel will be available for observation and testing. The Contractor shall not assume that the Geotechnical Consultant is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish the earthwork in accordance with the applicable grading codes and agency ordinances, these Specifications, and the recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of the Geotechnical Consultant, unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, insufficient buttress key size, adverse weather, etc., are resulting in a quality of work less than required in these specifications, the Geotechnical Consultant shall reject the work and may recommend to the owner that construction be stopped until the conditions are rectified. It is the contractor's sole responsibility to provide proper fill compaction.

2.0 Preparation of Areas to be Filled

2.1 Clearing and Grubbing

Vegetation, such as brush, grass, roots, and other deleterious material shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies, and the Geotechnical Consultant.

The Geotechnical Consultant shall evaluate the extent of these removals depending on specific site conditions. Earth fill material shall not contain more than 1 percent of organic materials (by volume). Nesting of the organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area.

As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, coolant, etc.) have chemical constituents that are considered to be hazardous waste. As such, the indiscriminate dumping or spillage of these fluids onto the ground may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed. The contractor is responsible for all hazardous waste relating to his work. The Geotechnical Consultant does not have expertise in this area. If hazardous waste is a concern, then the Client should acquire the services of a qualified environmental assessor.

2.2 Processing

Existing ground that has been declared satisfactory for support of fill by the Geotechnical Consultant shall be scarified to a minimum depth of 6 inches. Existing ground that is not satisfactory shall be over-excavated as specified in the following section. Scarification shall continue until soils are broken down and free of oversize material and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction.

2.3 Over-excavation

In addition to removals and over-excavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured or otherwise unsuitable ground shall be over-excavated to competent ground as evaluated by the Geotechnical Consultant during grading.

2.4 Benching

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical units), the ground shall be stepped or benched. Please see the Standard Details for a graphic illustration. The lowest bench or key shall be a minimum of 15 feet wide and at least 2 feet deep, into competent material as evaluated by the Geotechnical Consultant. Other benches shall be excavated a minimum height of 4 feet into competent material or as otherwise recommended by the Geotechnical Consultant. Fill placed on ground sloping flatter than 5:1 shall also be benched or otherwise over-excavated to provide a flat subgrade for the fill.

2.5 Evaluation/Acceptance of Fill Areas

All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by the Geotechnical Consultant as suitable to receive fill. The Contractor shall obtain a written acceptance from the Geotechnical Consultant prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys, and benches.

3.0 Fill Material

3.1 General

Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by the Geotechnical Consultant prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to the Geotechnical Consultant or mixed with other soils to achieve satisfactory fill material.

3.2 Oversize

Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 8 inches, shall not be buried or placed in fill unless location, materials, and placement methods are specifically accepted by the Geotechnical Consultant. Placement operations shall be such that nesting of oversized material does not occur and such that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 vertical feet of finish grade or within 2 feet of future utilities or underground construction.

3.3 Import

If importing of fill material is required for grading, proposed import material shall meet the requirements of the geotechnical consultant. The potential import source shall be given to the Geotechnical Consultant at least 48 hours (2 working days) before importing begins so that its suitability can be determined and appropriate tests performed.

4.0 Fill Placement and Compaction

4.1 Fill Layers

Approved fill material shall be placed in areas prepared to receive fill (per Section 3.0) in near-horizontal layers not exceeding 8 inches in loose thickness. The Geotechnical Consultant may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

4.2 Fill Moisture Conditioning

Fill soils shall be watered, dried back, blended, and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture content tests shall be performed in accordance with the American Society of Testing and Materials (ASTM Test Method D1557).

4.3 Compaction of Fill

After each layer has been moisture-conditioned, mixed, and evenly spread, it shall be uniformly compacted to not less than 90 percent of maximum dry density (ASTM Test Method D1557). Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction with uniformity.

4.4 Compaction of Fill Slopes

In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by backrolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet in fill elevation, or by other methods producing satisfactory results acceptable to the Geotechnical Consultant. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of maximum density per ASTM Test Method D1557.

4.5 Compaction Testing

Field tests for moisture content and relative compaction of the fill soils shall be performed by the Geotechnical Consultant. Location and frequency of tests shall be at the Consultant's discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

4.6 Frequency of Compaction Testing

Tests shall be taken at intervals not exceeding 2 feet in vertical rise and/or 1,000 cubic yards of compacted fill soils embankment. In addition, as a guideline, at least one test shall be taken on slope faces for each 5,000 square feet of slope face and/or each 10 feet of vertical height of slope. The Contractor shall assure that fill construction is such that the testing schedule can be accomplished by the Geotechnical Consultant. The Contractor shall stop or slow down the earthwork construction if these minimum standards are not met.

4.7 Compaction Test Locations

The Geotechnical Consultant shall document the approximate elevation and horizontal coordinates of each test location. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so that the Geotechnical Consultant can determine the test locations with sufficient accuracy. At a minimum, two grade stakes within a horizontal distance of 100 feet and vertically less than
5 feet apart from potential test locations shall be provided.

5.0 Subdrain Installation

Subdrain systems shall be installed in accordance with the approved geotechnical report(s), the grading plan, and the Standard Details. The Geotechnical Consultant may recommend additional subdrains and/or changes in subdrain extent, location, grade, or material depending on conditions encountered during grading. All subdrains shall be surveyed by a land surveyor/civil engineer for line and grade after installation and prior to burial. Sufficient time should be allowed by the Contractor for these surveys.

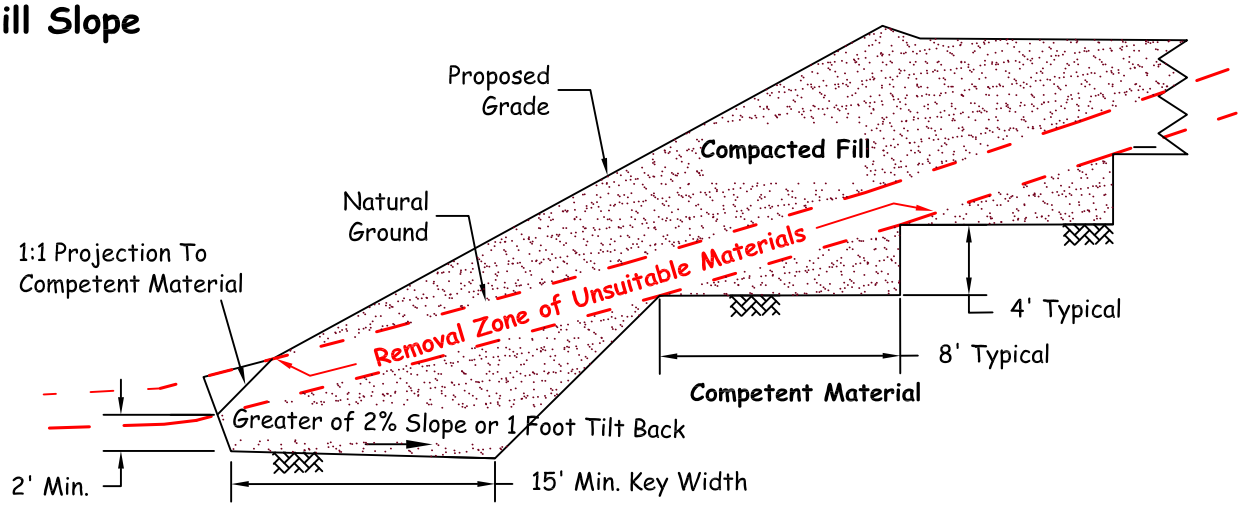
6.0 Excavation

Excavations, as well as over-excavation for remedial purposes, shall be evaluated by the Geotechnical Consultant during grading. Remedial removal depths shown on geotechnical plans are estimates only. The actual extent of removal shall be determined by the Geotechnical Consultant based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, evaluated, and accepted by the Geotechnical Consultant prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by the Geotechnical Consultant.

7.0 Trench Backfills

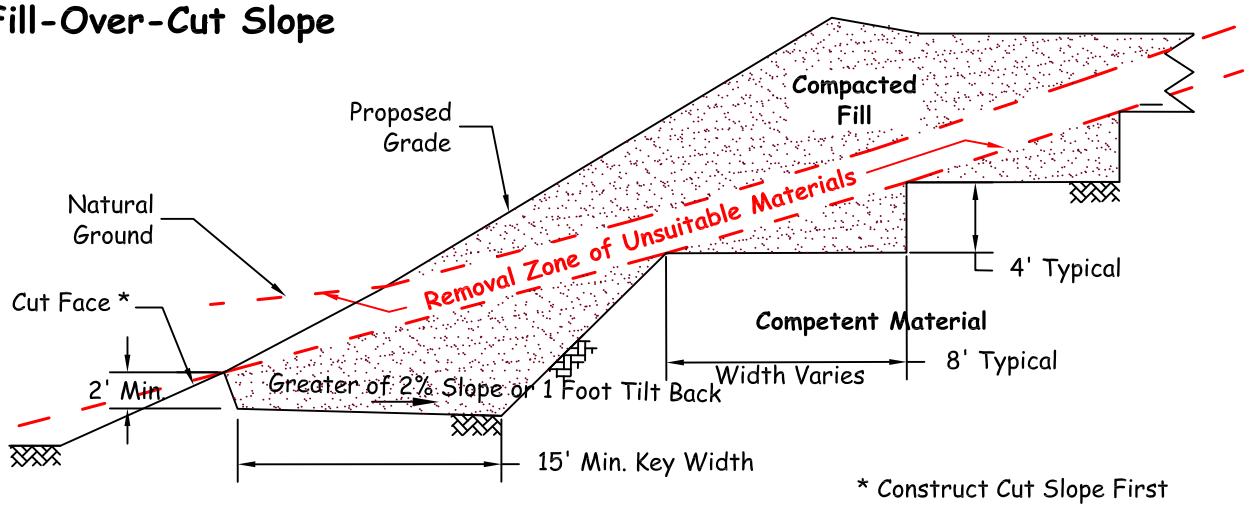
7.1 The Contractor shall follow all OHSA and Cal/OSHA requirements for safety of trench excavations.

7.2 All bedding and backfill of utility trenches shall be done in accordance with the applicable provisions of Standard Specifications of Public Works Construction. Bedding material shall have a Sand Equivalent greater than 30 (SE>30). The bedding shall be placed to 1 foot over



the top of the conduit and densified by jetting. Backfill shall be placed and densified to a minimum of 90 percent of maximum from 1 foot above the top of the conduit to the surface.

7.3 The jetting of the bedding around the conduits shall be observed by the Geotechnical Consultant.



7.4 The Geotechnical Consultant shall test the trench backfill for relative compaction. At least one test should be made for every 300 feet of trench and 2 feet of fill.

7.5 Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to the Geotechnical Consultant that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method.

Notes:

3.5 Bioretention Facility

Type of BMP	LID – Bioretention
Treatment Mechanisms	Infiltration, Evapotranspiration, Evaporation, Biofiltration
Maximum Drainage Area	This BMP is intended to be integrated into a project's landscaped area in a distributed manner. Typically, contributing drainage areas to Bioretention Facilities range from less than 1 acre to a maximum of around 10 acres.
Other Names	Rain Garden, Bioretention Cell, Bioretention Basin, Biofiltration Basin, Landscaped Filter Basin, Porous Landscape Detention

Description

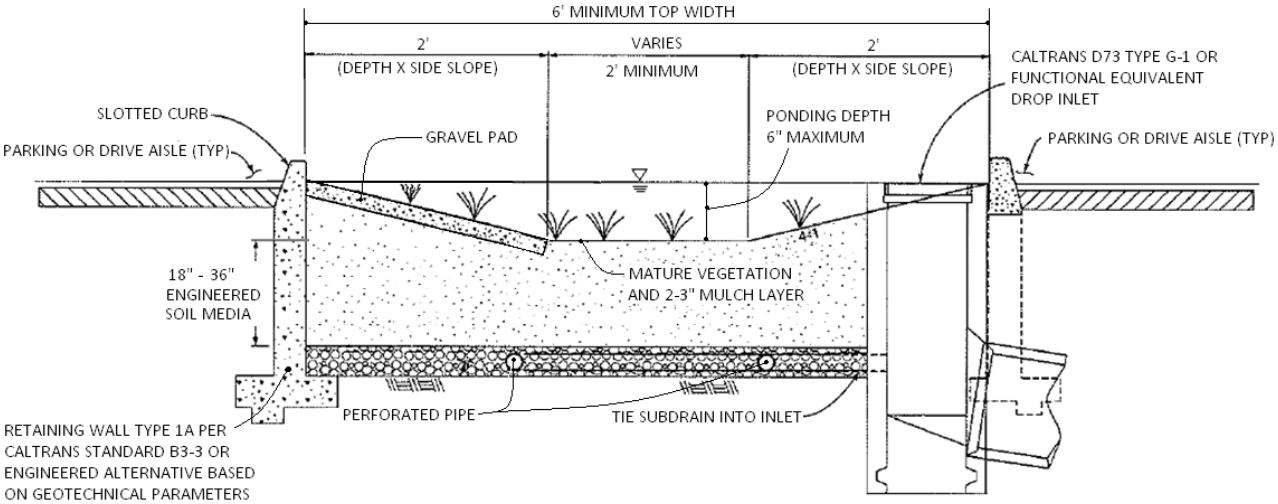
Bioretention Facilities are shallow, vegetated basins underlain by an engineered soil media. Healthy plant and biological activity in the root zone maintain and renew the macro-pore space in the soil and maximize plant uptake of pollutants and runoff. This keeps the Best Management Practice (BMP) from becoming clogged and allows more of the soil column to function as both a sponge (retaining water) and a highly effective and self-maintaining biofilter. In most cases, the bottom of a Bioretention Facility is unlined, which also provides an opportunity for infiltration to the extent the underlying onsite soil can accommodate. When the infiltration rate of the underlying soil is exceeded, fully biotreated flows are discharged via underdrains. Bioretention Facilities therefore will inherently achieve the maximum feasible level of infiltration and evapotranspiration and achieve the minimum feasible (but highly biotreated) discharge to the storm drain system.

Siting Considerations

These facilities work best when they are designed in a relatively level area. Unlike other BMPs, Bioretention Facilities can be used in smaller landscaped spaces on the site, such as:

- ✓ Parking islands
- ✓ Medians
- ✓ Site entrances

Landscaped areas on the site (such as may otherwise be required through minimum landscaping ordinances), can often be designed as Bioretention Facilities. This can be accomplished by:



- *Depressing* landscaped areas below adjacent impervious surfaces, rather than elevating those areas
- Grading the site to direct runoff from those impervious surfaces *into* the Bioretention Facility, rather than away from the landscaping
- Sizing and designing the depressed landscaped area as a Bioretention Facility as described in this Fact Sheet

Bioretention Facilities should however not be used downstream of areas where large amounts of sediment can clog the system. Placing a Bioretention Facility at the toe of a steep slope should also be avoided due to the potential for clogging the engineered soil media with erosion from the slope, as well as the potential for damaging the vegetation.

Design and Sizing Criteria

The recommended cross section necessary for a Bioretention Facility includes:

- Vegetated area
- 18' minimum depth of engineered soil media
- 12' minimum gravel layer depth with 6' perforated pipes (added flow control features such as orifice plates may be required to mitigate for HCOC conditions)

While the 18-inch minimum engineered soil media depth can be used in some cases, it is recommended to use 24 inches or a preferred 36 inches to provide an adequate root zone for the chosen plant palate. Such a design also provides for improved removal effectiveness for nutrients. The recommended ponding depth inside of a Bioretention Facility is 6 inches; measured from the flat bottom surface to the top of the water surface as shown in Figure 1.

Because this BMP is filled with an engineered soil media, pore space in the soil and gravel layer is assumed to provide storage volume. However, several considerations must be noted:

- Surcharge storage above the soil surface (6 inches) is important to assure that design flows do not bypass the BMP when runoff exceeds the soil's absorption rate.
- In cases where the Bioretention Facility contains engineered soil media deeper than 36 inches, the pore space within the engineered soil media can only be counted to the 36-inch depth.
- A maximum of 30 percent pore space can be used for the soil media whereas a maximum of 40 percent pore space can be use for the gravel layer.

Figure 1: Standard Layout for a Bioretention Facility

Engineered Soil Media Requirements

The engineered soil media shall be comprised of 85 percent mineral component and 15 percent organic component, by volume, drum mixed prior to placement. The mineral component shall be a Class A sandy loam topsoil that meets the range specified in Table 1 below. The organic component shall be nitrogen stabilized compost[1], such that nitrogen does not leach from the media.

Table 1: Mineral Component Range Requirements

Percent Range	Component
70-80	Sand
15-20	Silt
5-10	Clay

The trip ticket, or certificate of compliance, shall be made available to the inspector to prove the engineered mix meets this specification.

Vegetation Requirements

Vegetative cover is important to minimize erosion and ensure that treatment occurs in the Bioretention Facility. The area should be designed for at least 70 percent mature coverage throughout the Bioretention Facility. To prevent the BMP from being used as walkways, Bioretention Facilities shall be planted with a combination of small trees, densely planted shrubs, and natural grasses. Grasses shall be native or ornamental; preferably ones that do not need to be mowed. The application of fertilizers and pesticides should be minimal. To maintain oxygen levels for the vegetation and promote biodegradation, it is important that vegetation not be completely submerged for any extended period of time. Therefore, a maximum of 6 inches of ponded water shall be used in the design to ensure that plants within the Bioretention Facility remain healthy.

A 2 to 3-inch layer of standard shredded aged hardwood mulch shall be placed as the top layer inside the Bioretention Facility. The 6-inch ponding depth shown in Figure 1 above shall be measured from the top surface of the 2 to 3-inch mulch layer.

Curb Cuts

To allow water to flow into the Bioretention Facility, 1-foot-wide (minimum) curb cuts should be placed approximately every 10 feet around the perimeter of the Bioretention Facility. Figure 2 shows a curb cut in a Bioretention Facility. Curb cut flow lines must be at or above the V_{BMP} water surface level.

[1] For more information on compost, visit the US Composting Council website at: http://compostingcouncil.org/

Figure 2: Curb Cut located in a Bioretention Facility

To reduce erosion, a gravel pad shall be placed at each inlet point to the Bioretention Facility. The gravel should be 1- to 1.5-inch diameter in size. The gravel should overlap the curb cut opening a minimum of 6 inches. The gravel pad inside the Bioretention Facility should be flush with the finished surface at the curb cut and extend to the bottom of the slope.

In addition, place an apron of stone or concrete, a foot square or larger, inside each inlet to prevent vegetation from growing up and blocking the inlet. See Figure 3.

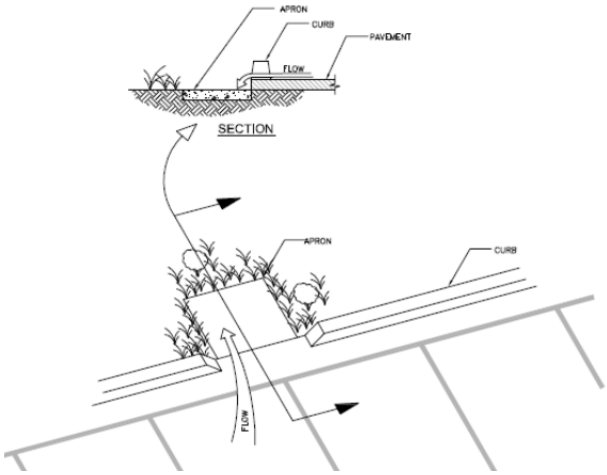


Figure 3: Apron located in a Bioretention Facility

Terracing the Landscaped Filter Basin

It is recommended that Bioretention Facilities be level. In the event the facility site slopes and lacks proper design, water would fill the lowest point of the BMP and then discharge from the basin without being treated. To ensure that the water will be held within the Bioretention Facility on sloped sites, the BMP must be terraced with nonporous check dams to provide the required storage and treatment capacity.

The terraced version of this BMP shall be used on non-flat sites with no more than a 3 percent slope. The surcharge depth cannot exceed 0.5 feet, and side slopes shall not exceed 4:1. Table 2 below shows the spacing of the check dams, and slopes shall be rounded up (i.e., 2.5 percent slope shall use 10' spacing for check dams).

Table 2: Check Dam Spacing

6" Check Dam Spacing	
Slope	**Spacing**
1%	*25'*
2%	*15'*
3%	*10'*

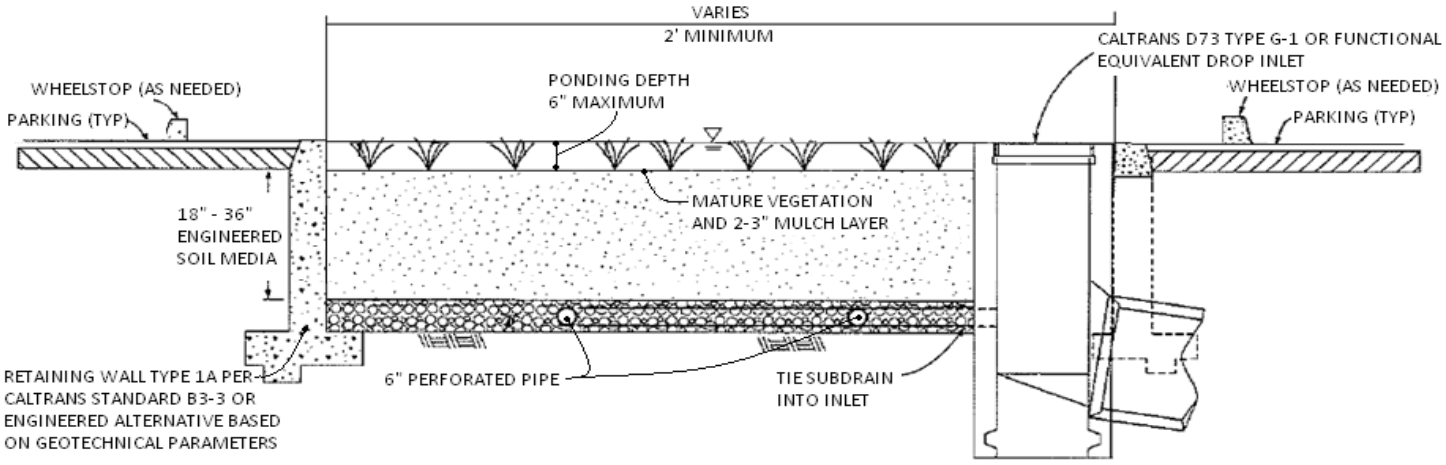
Roof Runoff

Roof downspouts may be directed towards Bioretention Facilities. However, the downspouts must discharge onto a concrete splash block to protect the Bioretention Facility from erosion.

Retaining Walls

It is recommended that Retaining Wall Type 1A, per Caltrans Standard B3-3 or equivalent, be constructed around the entire perimeter of the Bioretention Facility. This practice will protect the sides of the Bioretention Facility from collapsing during construction and maintenance or from high service loads adjacent to the BMP. Where such service loads would not exist adjacent to the BMP, an engineered alternative may be used if signed by a licensed civil engineer.

Side Slope Requirements



Bioretention Facilities Requiring Side Slopes

The design should assure that the Bioretention Facility does not present a tripping hazard. Bioretention Facilities proposed near pedestrian areas, such as areas parallel to parking spaces or along a walkway, must have a gentle slope to the bottom of the facility. Side slopes inside of a Bioretention Facility shall be 4:1. A typical cross section for the Bioretention Facility is shown in Figure 1.

Bioretention Facilities Not Requiring Side Slopes

Where cars park perpendicular to the Bioretention Facility, side slopes are not required. A 6-inch maximum drop may be used, and the Bioretention Facility must be planted with trees and shrubs to prevent pedestrian access. In this case, a curb is not placed around the Bioretention Facility,

but wheel stops shall be used to prevent vehicles from entering the Bioretention Facility, as shown in Figure 4.

Planter Boxes

Bioretention Facilities can also be placed above ground as planter boxes. Planter boxes must have a minimum width of 2 feet, a maximum surcharge depth of 6 inches, and no side slopes are necessary. Planter boxes must be constructed so as to ensure that the top surface of the engineered soil media will remain level. This option may be constructed of concrete, brick, stone or other stable materials that will not warp or bend. Chemically treated wood or galvanized steel, which has the ability to contaminate stormwater, should not be used. Planter boxes must be lined with an impermeable liner on all sides, including the bottom. Due to the impermeable liner, the inside bottom of the planter box shall be designed and constructed with a cross fall, directing treated flows within the subdrain layer toward the point where subdrain exits the planter box, and subdrains shall be oriented with drain holes oriented down. These provisions will help avoid excessive stagnant water within the gravel underdrain layer. Similar to the in-ground Bioretention Facility versions, this BMP benefits from healthy plants and biological activity in the root zone. Planter boxes should be planted with appropriately selected vegetation.

Figure 5: Planter Box
Source: LA Team Effort

Overflow

An overflow route is needed in the Bioretention Facility design to bypass stored runoff from storm events larger than V_{BMP} or in the event of facility or subdrain clogging. Overflow systems must connect to an acceptable discharge point, such as a downstream conveyance system as shown in Figure 1 and Figure 4. The inlet to the overflow structure shall be elevated inside the Bioretention Facility to be flush with the ponding surface for the design capture volume (V_{BMP}) as shown in Figure 4. This will allow the design capture volume to be fully treated by the Bioretention Facility, and for larger events to safely be conveyed to downstream systems. The overflow inlet shall **not** be located in the entrance of a Bioretention Facility, as shown in Figure 6.

Underdrain Gravel and Pipes

An underdrain gravel layer and pipes shall be provided in accordance with Appendix B – Underdrains.

Figure 6: Incorrect Placement of an Overflow Inlet.

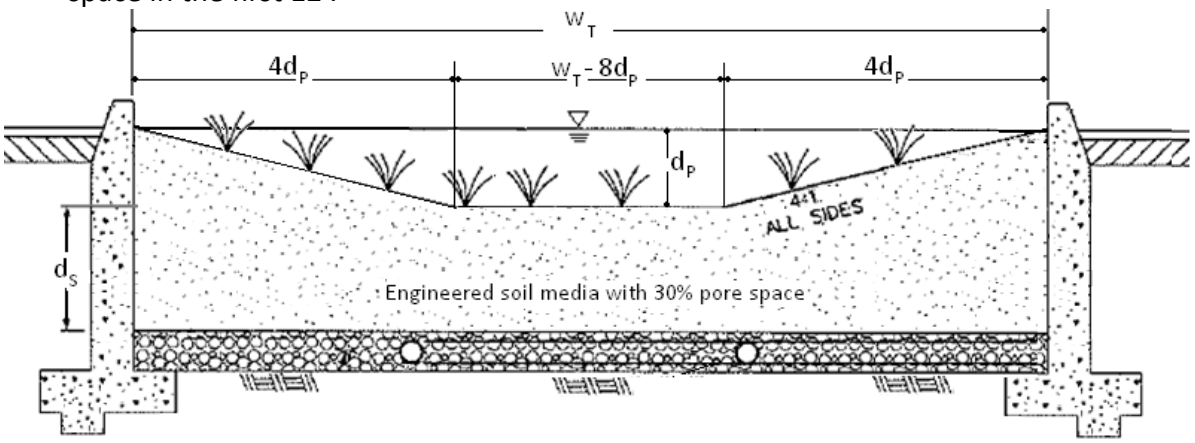
Inspection and Maintenance Schedule

The Bioretention Facility area shall be inspected for erosion, dead vegetation, soggy soils, or standing water. The use of fertilizers and pesticides on the plants inside the Bioretention Facility should be minimized.

Schedule	Activity
Ongoing	• Keep adjacent landscape areas maintained. Remove clippings from landscape maintenance activities. • Remove trash and debris • Replace damaged grass and/or plants • Replace surface mulch layer as needed to maintain a 2-3 inch soil cover.
After storm events	• Inspect areas for ponding
Annually	• Inspect/clean inlets and outlets

Bioretention Facility Design Procedure

1) Enter the area tributary, A_T, to the Bioretention Facility.



2) Enter the Design Volume, V_{BMP}, determined from Section 2.1 of this Handbook.

3) Select the type of design used. There are two types of Bioretention Facility designs: the standard design used for most project sites that include side slopes, and the modified design used when the BMP is located perpendicular to the parking spaces or with planter boxes that do not use side slopes.

4) Enter the depth of the engineered soil media, d_S. The minimum depth for the engineered soil media can be 18' in limited cases, but it is recommended to use 24' or a preferred 36' to provide an adequate root zone for the chosen plant palette. Engineered soil media deeper than 36' will only get credit for the pore space in the first 36'.

5) Enter the top width of the Bioretention Facility.

6) Calculate the total effective depth, d_E, within the Bioretention Facility. The maximum allowable pore space of the soil media is 30% while the maximum allowable pore space for the gravel layer is 40%. Gravel layer deeper than 12' will only get credit for the pore space in the first 12'.

a. For the design with side slopes the following equation shall be used to determine the total effective depth. Where, d_P is the depth of ponding within the basin.

$$d_E(\text{ft}) = \frac{0.3 \times \left[\left(w_T(\text{ft}) \times d_S(\text{ft})\right) + 4\left(d_P(\text{ft})\right)^2\right] + 0.4 \times 1(\text{ft}) + d_P(\text{ft})\left[4d_P(\text{ft}) + \left(w_T(\text{ft}) - 8d_P(\text{ft})\right)\right]}{w_T(\text{ft})}$$

This above equation can be simplified if the maximum ponding depth of 0.5' is used. The equation below is used on the worksheet to find the minimum area required for the Bioretention Facility:

$$d_E(\text{ft}) = (0.3 \times d_S(\text{ft}) + 0.4 \text{ x } 1(\text{ft})) - \left(\frac{0.7\ (\text{ft}^2)}{w_T(\text{ft})}\right) + 0.5(\text{ft})$$

b. For the design without side slopes the following equation shall be used to determine the total effective depth:

$$d_E(\text{ft}) = d_P(\text{ft}) + [(0.3) \times d_S(\text{ft}) + (0.4) \times 1(\text{ft})]$$

The equation below, using the maximum ponding depth of 0.5', is used on the worksheet to find the minimum area required for the Bioretention Facility:

$$d_E(\text{ft}) = 0.5\ (\text{ft}) + [(0.3) \times d_S(\text{ft}) + (0.4) \times 1(\text{ft})]$$

7) Calculate the minimum surface area, A_M, required for the Bioretention Facility. This does not include the curb surrounding the Bioretention Facility or side slopes.

$$A_M(\text{ft}^2) = \frac{V_{BMP}(\text{ft}^3)}{d_E\ (\text{ft})}$$

8) Enter the proposed surface area. This area shall not be less than the minimum required surface area.

9) Verify that side slopes are no steeper than 4:1 in the standard design, and are not required in the modified design.

10) Provide the diameter, minimum 6 inches, of the perforated underdrain used in the Bioretention Facility. See Appendix B for specific information regarding perforated pipes.

11) Provide the slope of the site around the Bioretention Facility, if used. The maximum slope is 3 percent for a standard design.

12) Provide the check dam spacing, if the site around the Bioretention Facility is sloped.

13) Describe the vegetation used within the Bioretention Facility.

Appendix 8: Source Control

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

How to use this worksheet (also see instructions in Section G of the WQMP Template):

1. Review Column 1 and identify which of these potential sources of stormwater pollutants apply to your site. Check each box that applies.
2. Review Column 2 and incorporate all of the corresponding applicable BMPs in your WQMP Exhibit.
3. Review Columns 3 and 4 and incorporate all of the corresponding applicable permanent controls and operational BMPs in your WQMP. Use the format shown in Table G.1on page 23 of this WQMP Template. Describe your specific BMPs in an accompanying narrative, and explain any special conditions or situations that required omitting BMPs or substituting alternative BMPs for those shown here.

IF THESE SOURCES WILL BE ON THE PROJECT SITE …	… THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on WQMP Drawings**	**3** **Permanent Controls—List in WQMP Table and Narrative**	**4** **Operational BMPs—Include in WQMP Table and Narrative**
☑ **A.** On-site storm drain inlets	☐ Locations of inlets.	☐ Mark all inlets with the words "Only Rain Down the Storm Drain" or similar. Catch Basin Markers may be available from the Riverside County Flood Control and Water Conservation District, call 951.955.1200 to verify.	☐ Maintain and periodically repaint or replace inlet markings. ☐ Provide stormwater pollution prevention information to new site owners, lessees, or operators. ☐ See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com ☐ Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains."
☑ **B.** Interior floor drains and elevator shaft sump pumps		☐ State that interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer.	☐ Inspect and maintain drains to prevent blockages and overflow.
☑ **C.** Interior parking garages		☐ State that parking garage floor drains will be plumbed to the sanitary sewer.	☐ Inspect and maintain drains to prevent blockages and overflow.

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

IF THESE SOURCES WILL BE ON THE PROJECT SITE …	… THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on WQMP Drawings**	3 **Permanent Controls—List in WQMP Table and Narrative**	4 **Operational BMPs—Include in WQMP Table and Narrative**
☑ **D1.** Need for future indoor & structural pest control		☐ Note building design features that discourage entry of pests.	☐ Provide Integrated Pest Management information to owners, lessees, and operators.
☑ **D2.** Landscape/ Outdoor Pesticide Use	☐ Show locations of native trees or areas of shrubs and ground cover to be undisturbed and retained. ☐ Show self-retaining landscape areas, if any. ☐ Show stormwater treatment and hydrograph modification management BMPs. (See instructions in Chapter 3, Step 5 and guidance in Chapter 5.)	State that final landscape plans will accomplish all of the following. ☐ Preserve existing native trees, shrubs, and ground cover to the maximum extent possible. ☐ Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution. ☐ Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions. ☐ Consider using pest-resistant plants, especially adjacent to hardscape. To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.	☐ Maintain landscaping using minimum or no pesticides. ☐ See applicable operational BMPs in **"What you should know for…..Landscape and Gardening"** at http://rcflood.org/stormwater/**Error! Hyperlink reference not valid.** ☐ Provide IPM information to new owners, lessees and operators.

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

IF THESE SOURCES WILL BE ON THE PROJECT SITE …	… THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on WQMP Drawings**	**3** **Permanent Controls—List in WQMP Table and Narrative**	**4** **Operational BMPs—Include in WQMP Table and Narrative**
☑ **E.** Pools, spas, ponds, decorative fountains, and other water features.	☐ Show location of water feature and a sanitary sewer cleanout in an accessible area within 10 feet. (Exception: Public pools must be plumbed according to County Department of Environmental Health Guidelines.)	If the Co-Permittee requires pools to be plumbed to the sanitary sewer, place a note on the plans and state in the narrative that this connection will be made according to local requirements.	☐ See applicable operational BMPs in "Guidelines for Maintaining Your Swimming Pool, Jacuzzi and Garden Fountain" at http://rcflood.org/stormwater/
☑ **F.** Food service	☐ For restaurants, grocery stores, and other food service operations, show location (indoors or in a covered area outdoors) of a floor sink or other area for cleaning floor mats, containers, and equipment. ☐ On the drawing, show a note that this drain will be connected to a grease interceptor before discharging to the sanitary sewer.	☐ Describe the location and features of the designated cleaning area. ☐ Describe the items to be cleaned in this facility and how it has been sized to insure that the largest items can be accommodated.	☐ See the brochure, "The Food Service Industry Best Management Practices for: Restaurants, Grocery Stores, Delicatessens and Bakeries" at http://rcflood.org/stormwater/ Provide this brochure to new site owners, lessees, and operators.
☑ **G.** Refuse areas	☐ Show where site refuse and recycled materials will be handled and stored for pickup. See local municipal requirements for sizes and other details of refuse areas. ☐ If dumpsters or other receptacles are outdoors, show how the designated area will be covered, graded, and paved to prevent run-on and show locations of berms to prevent runoff from the area. ☐ Any drains from dumpsters, compactors, and tallow bin areas shall be connected to a grease removal device before discharge to sanitary sewer.	☐ State how site refuse will be handled and provide supporting detail to what is shown on plans. ☐ State that signs will be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar.	☐ State how the following will be implemented: Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on WQMP Drawings**	3 **Permanent Controls—List in WQMP Table and Narrative**	4 **Operational BMPs—Include in WQMP Table and Narrative**
❑ **H.** Industrial processes.	❑ Show process area.	❑ **If industrial processes are to be located on site, state: "All process activities to be performed indoors. No processes to drain to exterior or to storm drain system."**	❑ **See Fact Sheet SC-10, "Non-Stormwater Discharges" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com** See the brochure "Industrial & Commercial Facilities Best Management Practices for: Industrial, Commercial Facilities" at http://rcflood.org/stormwater/

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

IF THESE SOURCES WILL BE ON THE PROJECT SITE …	… THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on WQMP Drawings**	3 **Permanent Controls—List in WQMP Table and Narrative**	4 **Operational BMPs—Include in WQMP Table and Narrative**
❑ **I.** Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.)	❑ Show any outdoor storage areas, including how materials will be covered. Show how areas will be graded and bermed to prevent run-on or run-off from area. ❑ Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults. ❑ Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site.	Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains. Where appropriate, reference documentation of compliance with the requirements of Hazardous Materials Programs for: ▪ Hazardous Waste Generation ▪ Hazardous Materials Release Response and Inventory ▪ California Accidental Release (CalARP) ▪ Aboveground Storage Tank ▪ Uniform Fire Code Article 80 Section 103(b) & (c) 1991 ▪ Underground Storage Tank www.cchealth.org/groups/hazmat/	❑ See the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC-33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on WQMP Drawings**	3 **Permanent Controls—List in WQMP Table and Narrative**	4 **Operational BMPs—Include in WQMP Table and Narrative**
❑ **J.** Vehicle and Equipment Cleaning	❑ Show on drawings as appropriate: **(1) Commercial/industrial facilities having vehicle/equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses.** **(2) Multi-dwelling complexes shall have a paved, bermed, and covered car wash area (unless car washing is prohibited on-site and hoses are provided with an automatic shut-off to discourage such use).** **(3) Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer.** **(4) Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed.**	❑ **If a car wash area is not provided, describe any measures taken to discourage on-site car washing and explain how these will be enforced.**	**Describe operational measures to implement the following (if applicable):** ❑ **Washwater from vehicle and equipment washing operations shall not be discharged to the storm drain system.** Refer to "Outdoor Cleaning Activities and Professional Mobile Service Providers" for many of the Potential Sources of Runoff Pollutants categories below. Brochure can be found at http://rcflood.org/stormwater/ ❑**Car dealerships and similar may rinse cars with water only.**

IF THESE SOURCES WILL BE ON THE PROJECT SITE …	… THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on WQMP Drawings**	3 **Permanent Controls—List in WQMP Table and Narrative**	4 **Operational BMPs—Include in WQMP Table and Narrative**
❑ **K.** Vehicle/Equipment Repair and Maintenance	❑ **Accommodate all vehicle equipment repair and maintenance indoors. Or designate an outdoor work area and design the area to prevent run-on and runoff of stormwater.** ❑ **Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas.** ❑ **Add a note on the plans that states either (1) there are no floor drains, or (2) floor drains are connected to wastewater pretreatment systems prior to discharge to the sanitary sewer and an industrial waste discharge permit will be obtained.**	❑ **State that no vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area.** ❑ **State that there are no floor drains or if there are floor drains, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.** ❑ **State that there are no tanks, containers or sinks to be used for parts cleaning or rinsing or, if there are, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.**	**In the Stormwater Control Plan, note that all of the following restrictions apply to use the site:** ❑ **No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinsewater from parts cleaning into storm drains.** ❑ **No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately.** ❑ **No person shall leave unattended drip parts or other open containers containing vehicle fluid, unless such containers are in use or in an area of secondary containment.** Refer to "Automotive Maintenance & Car Care Best Management Practices for Auto Body Shops, Auto Repair Shops, Car Dealerships, Gas Stations and Fleet Service Operations". Brochure can be found at http://rcflood.org/stormwater/ Refer to Outdoor Cleaning Activities and Professional Mobile Service Providers for many of the Potential Sources of Runoff Pollutants categories below. Brochure can be found at http://rcflood.org/stormwater/

IF THESE SOURCES WILL BE ON THE PROJECT SITE …	… THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on WQMP Drawings**	3 **Permanent Controls—List in WQMP Table and Narrative**	4 **Operational BMPs—Include in WQMP Table and Narrative**
❑ **L.** Fuel Dispensing Areas	❑ Fueling areas[6] shall have impermeable floors (i.e., portland cement concrete or equivalent smooth impervious surface) that are: a) graded at the minimum slope necessary to prevent ponding; and b) separated from the rest of the site by a grade break that prevents run-on of stormwater to the maximum extent practicable. ❑ Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover's minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area[1].] The canopy [or cover] shall not drain onto the fueling area.		❑ The property owner shall dry sweep the fueling area routinely. ❑ See the Fact Sheet SD-30 , "Fueling Areas" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

[6] The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ **M.** Loading Docks	❑ Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct stormwater away from the loading area. Water from loading dock areas shall be drained to the sanitary sewer, or diverted and collected for ultimate discharge to the sanitary sewer. ❑ Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation. ❑ Provide a roof overhang over the loading area or install door skirts (cowling) at each bay that enclose the end of the trailer.		❑ Move loaded and unloaded items indoors as soon as possible. ❑ See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

IF THESE SOURCES WILL BE ON THE PROJECT SITE …	… THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on WQMP Drawings**	3 **Permanent Controls—List in WQMP Table and Narrative**	4 **Operational BMPs—Include in WQMP Table and Narrative**
☑ **N.** Fire Sprinkler Test Water		☐ Provide a means to drain fire sprinkler test water to the sanitary sewer.	☐ See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
O. Miscellaneous Drain or Wash Water or Other Sources ☐ Boiler drain lines ☐ Condensate drain lines ☐ Rooftop equipment ☐ Drainage sumps ☐ Roofing, gutters, and trim. ☐ Other sources		☐ Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system. ☐ Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system. ☐ Rooftop equipment with potential to produce pollutants shall be roofed and/or have secondary containment. ☐ Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water. ☐ Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff. Include controls for other sources as specified by local reviewer.	

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on WQMP Drawings**	3 **Permanent Controls—List in WQMP Table and Narrative**	4 **Operational BMPs—Include in WQMP Table and Narrative**
☑ **P.** Plazas, sidewalks, and parking lots.			☐ Sweep plazas, sidewalks, and parking lots regularly to prevent accumulation of litter and debris. Collect debris from pressure washing to prevent entry into the storm drain system. Collect washwater containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain.

1.0 Introduction

1.1 Purpose of Analysis and Study Objectives

The purpose of this report is to evaluate the potential noise impacts from the proposed LEAL Master Plan Amendment (project) and provide recommendations, if necessary, to minimize any project noise impacts. The assessment was conducted within the context of the California Environmental Quality Act (CEQA) and utilizes the noise standards set forth by the applicable Federal, State, and local agencies.

The following is provided in this report:

- A description of the study area and the proposed project
- Information regarding the fundamentals of noise
- Identification of the regulatory setting and applicable noise standards
- Analysis of the existing noise environment
- Analysis of the project's operational noise impact to adjacent receptors
- Analysis of the project's construction noise and vibration impact to adjacent receptors
- Summary of recommended project design features to reduce noise level impacts.

This analysis also reviews changes in noise levels that would occur as a result of the proposed project in comparison to the previously approved project described in the Leal Master Plan Draft Environmental Impact Report, prepared by Michael Baker International, July 2015 (hereinafter referred to as 2015 EIR).

1.2 Site Location

The proposed project site is located near the northwest corner (NWC) of Hamner Avenue and Limonite Avenue, in the City of Eastvale. The project site is bound by 58th Street to the north, Limonite Avenue to the south, Hamner Avenue to the east, and Scholar Avenue to the west. The project site is located approximately 666 feet above sea level and generally slopes from north to south.

The project site location map is provided in Exhibit A.

The project site is currently vacant and zoned for Leal Master Plan in the City of Eastvale Zoning Map. The City of Eastvale General Plan land use map designates the project site as Leal Policy Area.

Several noise sensitive land use areas are present surrounding the project site, including;

- Existing residential uses located to the north, approximately 50 feet from the project site, across 58th Street.

- Existing residential uses located to the south, approximately 120 feet from the project site, across Limonite Avenue.

- Existing residential uses located to the east, approximately 170 feet from the project site, across Hamner Avenue.

- Existing residential uses located to the west, approximately 75 feet from the project site, across Scholar Way.

1.3 Project Description

The project consists of amending the Leal Master Plan to allow for the construction and operation of a total of 2,500 residential dwelling units, a 1.6 acre community recreational center, 12.5 acres of community park, and 28.17 acres of mixed use development (including a new civic center, retail/commercial and residential uses).

The total gross site area is approximately 158.6 acres.

The buildout of the project will also include approximately 22.9 acres of roadway improvement to 58th Street, Limonite Avenue, Hamner Avenue and Scholar Way, along with new internal street improvements.

The site plan used for this analysis, provided by the HUNSAKER & ASSOCIATES, is illustrated in Exhibit B. Table 1 summarizes the land use assumptions used for this analysis.

Table 1
Land Use Summary

Land Use	CalEEMod Use	Quantity	Metric[1]	Acre
Single Family Residential	Single Family Detached	400	DU	47.148
Multifamily Residential	Townhomes/Condos	1,000	DU	35.277
	Apartments	1,100	DU	28.169
Retail	Regional Shopping Center	390.0	TSF	
General Office	General Office	65.0	TSF

Total				**158.592**

[1] D.U. – Dwelling units; T.S.F. – Thousand Square Feet

This report analyzes short-term noise impacts associated with construction activities and long-term noise impacts associated with the day-to-day operation of the project. The primary sources of long-term noise impacts would increase in vehicular traffic along surrounding roadways, on-site circulation and parking lot noise, HVAC units, and outdoor recreational noise.

1.4 Summary of Analysis Results

Based on the result of this analysis, the project is not expected to result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

The amendment project is expected to generate 27,764 fewer trips compared to the previously approved 2015 EIR. As a result, the project's traffic noise contribution to the surrounding roadways would be less than previously estimated in the 2015 EIR, and the project would not cause a significant increase in the ambient roadway noise levels in the vicinity of the site. The amendment project has reduced the amount of commercial land use in favor of a greater amount of residential use; which is generally considered a more compatible land use with the surrounding community from a noise standpoint.

Several standard construction best practices and project design features have been recommended to help ensure noise levels do not significantly impact the surrounding community.

1.5 Recommended Project Design Features

The following recommended project design features include standard rules and requirements, best practices and recognized design guidelines for reducing noise levels. Design features are assumed to be part of the conditions of the project and integrated into its design. Design features are not typically considered mitigation under CEQA.

Operational Design Features

DF-1 Prior to the issuance of building permits, the project shall demonstrate that building construction will achieve the minimum interior noise standard of 45 dBA CNEL for all residential units located along arterial roadways and/or adjacent to commercial uses, per the California Building Standards Code. The following noise control measures may be required for dwelling units located near adjacent roadways:

- Install sound barriers (masonry walls or walls with earth berms) between residences and noise sources.
- Install double-paned or upgraded STC sound rated windows.
- Provide sound insulating exterior walls and roofing systems.
- Locate and/or design attic vents to minimize sound propagation into each home.

- Provide forced-air ventilation systems.

- Provide the necessary setbacks for dwelling units fronting along major roadways.

DF-2 The project shall comply with California Title 24 building insulation requirements for exterior walls, roofs and common separating assemblies (e.g. floor/ceiling assemblies and demising walls).

DF-3 For proper acoustical performance, all exterior windows, doors, and sliding glass doors should have a positive seal and leaks/cracks must be kept to a minimum.

DF-4 The final building plans shall ensure that HVAC units are not located within an area of the project site that would contribute to a noise level exceedance at any adjacent property line, per the City of Eastvale Municipal Code requirements. To meet the City's noise standards the following measures should be followed:

- All HVAC equipment shall be shielded or enclosed from the line of sight of adjacent residential uses.

- The combined noise level of all units operating simultaneously shall not exceed the City of Eastvale daytime and nighttime exterior standards at the nearest surrounding property lines.

DF-5 Future residents, property management personnel, and commercial tenants will be required to comply with the City of Eastvale Municipal Code Noise Regulations, Chapter 8.52, which specify that no person shall create loud, unnecessary, or unusual noise that disturbs the peace or quiet of any neighborhood, or that causes discomfort or annoyance to any person of normal sensitiveness.

To help ensure compliance with the City's Noise Regulations, the following recommendations are provided:

- Deliveries, loading and unloading activities, and trash pick-up hours should be limited to daytime hours only (8 a.m. – 10 p.m.).

- Limit engine idling time for all delivery vehicles and moving trucks to 5 minutes or less.

Construction Design Features

DF-6 Prepare a construction management plan and obtain a construction work permit from the City of Eastvale prior to starting construction. The construction management plan shall ensure all contractors implement construction best management practices to reduce construction noise levels. Examples of best management practices may include the following:

- All construction equipment shall be equipped with muffles and other suitable noise attenuation devices (e.g., engine shields).

- Grading and construction contractors shall use quieter equipment as opposed to noisier equipment (such as rubber-tired equipment rather than track equipment), to the maximum extent feasible.

- If feasible, electric hook-ups shall be provided to avoid the use of generators. If electric service is determined to be infeasible for the site, only whisper-quiet generators shall be used (i.e., inverter generators capable of providing variable load.

- Use electric air compressors and similar power tools rather than diesel equipment, where feasible.

- Locate staging area, generators and stationary construction equipment as far from the adjacent residential homes as feasible.

- Construction-related equipment, including heavy-duty equipment, motor vehicles, and portable equipment, shall be turned off when not in use for more than 5 minutes.

- Provide notifications and signage in readily visible locations along the perimeter of construction sites that indicate the dates and duration of construction activities, as well as provide a telephone number where neighbors can enquire about the construction process and register complaints to a designated construction noise disturbance coordinator.

- Construction activities shall not take place between the hours of 6:00 p.m. and 6:00 a.m. during the months of June through September and 6:00 p.m. to 7:00 a.m. during the months of October through May.

DF-7 No impact pile driving or blasting activities shall be permitted on the project site during construction. If impact pile driving or blasting is required, a follow-up noise and vibration impact assessment shall be conducted prior to start of any activity.

2.0 Fundamentals of Noise

This section of the report provides basic information about noise and vibration and presents some of the terms used in the report.

2.1 Sound, Noise, and Acoustics

The sound is a disturbance created by a moving or vibrating source and is capable of being detected by the hearing organs. The sound may be thought of as mechanical energy of a moving object transmitted by pressure waves through a medium to a human ear. For traffic or stationary noise, the medium of concern is air. *Noise* is defined as sound that is loud, unpleasant, unexpected, or unwanted.

2.2 Frequency and Hertz

A continuous sound is described by its *frequency* (pitch) and its *amplitude* (loudness). Frequency relates to the number of pressure oscillations per second. Low-frequency sounds are low in pitch (bass sounding) and high-frequency sounds are high in pitch (squeak). These oscillations per second (cycles) are commonly referred to as Hertz (Hz). The human ear can hear from the bass pitch starting out at 20 Hz all the way to the high pitch of 20,000 Hz.

2.3 Sound Pressure Levels and Decibels

The *amplitude* of a sound determines its loudness. The loudness of sound increases or decreases, as the amplitude increases or decreases. Sound pressure amplitude is measured in units of micro-Newton per square inch meter (N/m2), also called micro-Pascal (μPa). One μPa is approximately one hundred billionths (0.00000000001) of normal atmospheric pressure. Sound pressure level (SPL or L_p) is used to describe in logarithmic units the ratio of actual sound pressures to a reference pressure squared. These units are called decibels and abbreviated as dB.

2.4 Addition of Decibels

Because decibels are on a logarithmic scale, sound pressure levels cannot be added or subtracted by simple plus or minus addition. When two (2) sounds of equal SPL are combined, they will produce an SPL 3 dB greater than the original single SPL. In other words, sound energy must be doubled to produce a 3dB increase.

If two (2) sounds differ by approximately 10 dB the higher sound level is the predominant sound.

2.5 Human Response to Changes in Noise Levels[1]

In general, the healthy human ear is most sensitive to sounds between 1,000 Hz and 5,000 Hz, (A-weighted scale) and it perceives a sound within that range as being more intense than a sound with a higher or lower frequency with the same magnitude. For purposes of this report as well as with most environmental documents, the A-scale weighing is typically reported in terms of A-weighted decibel (dBA). Typically, the human ear can barely perceive the change in the noise level of 3 dB. A change in 5 dB is readily perceptible, and a change in 10 dB is perceived as being twice or half as loud. As previously discussed, a doubling of sound energy results in a 3 dB increase in sound, which means that a doubling of sound energy (e.g. doubling the volume of traffic on a highway), would result in a barely perceptible change in sound level.

2.6 Noise Descriptors

Noise in our daily environment fluctuates over time. Some noise levels occur in regular patterns, others are random. Some noise levels are constant, while others are sporadic. Noise descriptors were created to describe the different time-varying noise levels. Following are the most commonly used noise descriptors along with brief definitions.

A-Weighted Sound Level

The sound pressure level in decibels as measured on a sound level meter using the A-weighted filter network. The A-weighting filter de-emphasizes the very low and very high-frequency components of the sound in a manner similar to the response of the human ear. A numerical method of rating human judgment of loudness.

Ambient Noise Level

The composite of noise from all sources, near and far. In this context, the ambient noise level constitutes the normal or existing level of environmental noise at a given location.

[1] Technical Noise Supplement to the Traffic Noise Analysis Protocol, September 2013.

Community Noise Equivalent Level (CNEL)

The average equivalent A-weighted sound level during a 24-hour day, obtained after addition of five (5) decibels to sound levels in the evening from 7:00 to 10:00 PM and after addition of ten (10) decibels to sound levels in the night before 7:00 AM and after 10:00 PM.

Decibel (dB)

A unit for measuring the amplitude of a sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micro-pascals.

dB(A)

A-weighted sound level (see definition above).

Equivalent Sound Level (LEQ)

The sound level corresponding to a steady noise level over a given sample period with the same amount of acoustic energy as the actual time-varying noise level. The energy average noise level during the sample period.

Habitable Room

Any room meeting the requirements of the Uniform Building Code or other applicable regulations which is intended to be used for sleeping, living, cooking or dining purposes, excluding such enclosed spaces as closets, pantries, bath or toilet rooms, service rooms, connecting corridors, laundries, unfinished attics, foyers, storage spaces, cellars, utility rooms, and similar spaces.

L(n)

The A-weighted sound level exceeded during a certain percentage of the sample time. For example, L10 in the sound level exceeded 10 percent of the sample time. Similarly, L50, L90, and L99, etc.

Noise

Any unwanted sound or sound which is undesirable because it interferes with speech and hearing, or is intense enough to damage hearing, or is otherwise annoying. The State Noise Control Act defines noise as "...excessive undesirable sound...".

Percent Noise Levels

See L(n).

Sound Level (Noise Level)

The weighted sound pressure level obtained by use of a sound level meter having a standard frequency-filter for attenuating part of the sound spectrum.

Sound Level Meter

An instrument, including a microphone, an amplifier, an output meter, and frequency weighting networks for the measurement and determination of noise and sound levels.

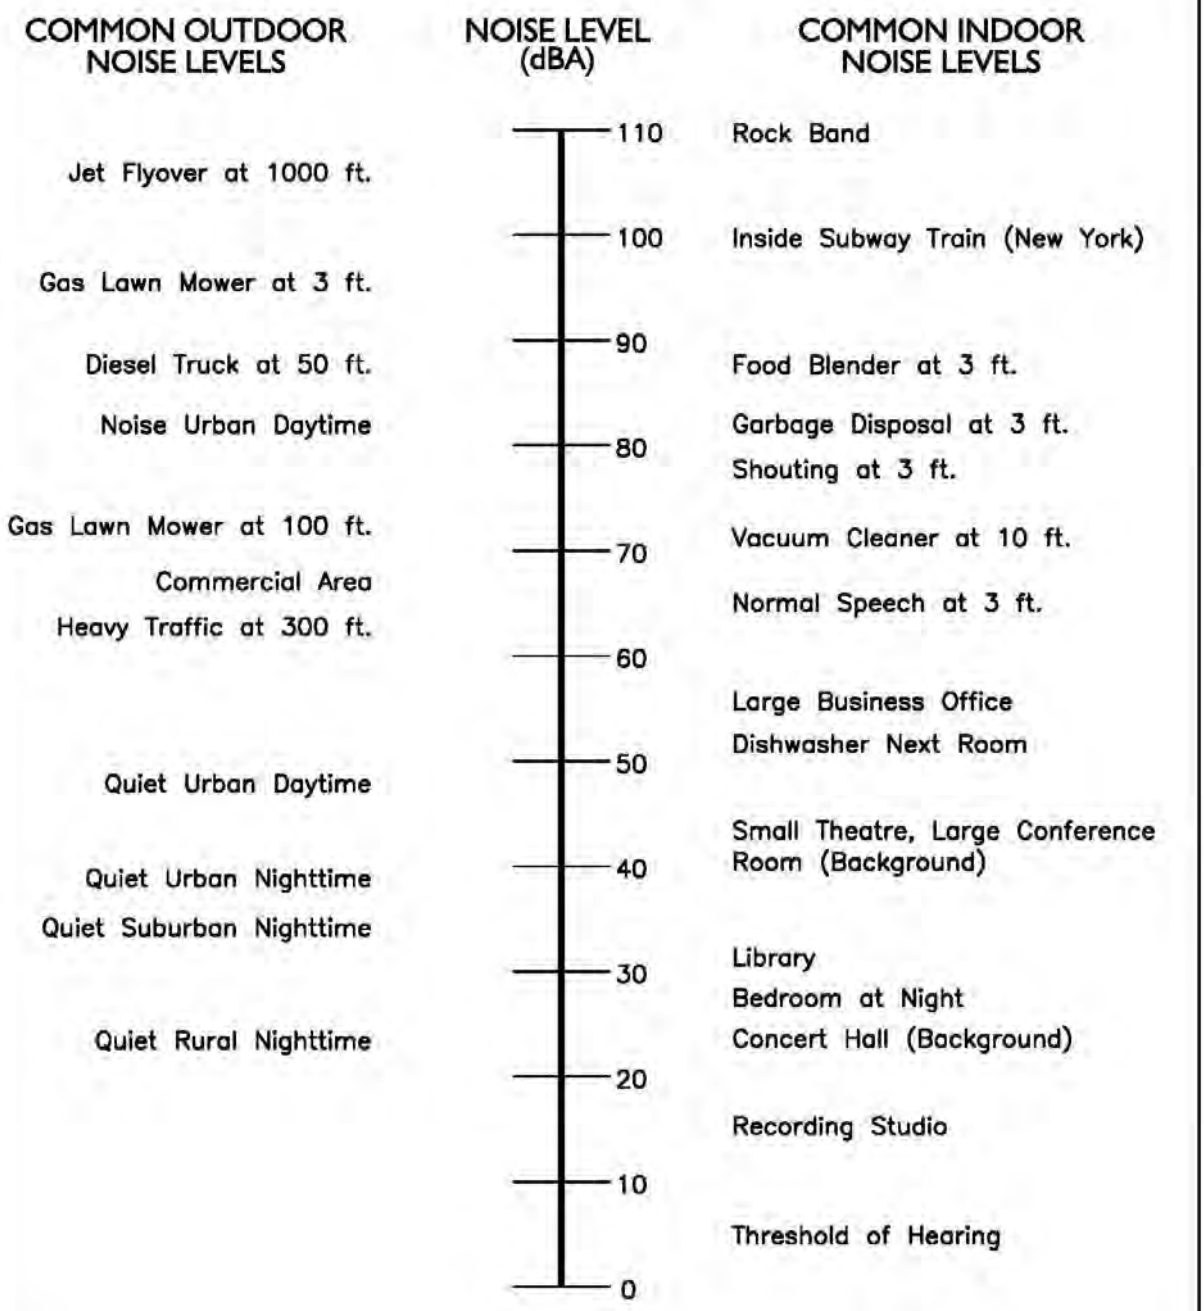
Single Event Noise Exposure Level (SENEL)

The dBA level which, if it lasted for one (1) second, would produce the same A-weighted sound energy as the actual event.

2.7 Sound Propagation[2]

As sound propagates from a source it spreads geometrically. The sound from a small, localized source (i.e., a point source) radiates uniformly outward as it travels away from the source in a spherical pattern. The sound level attenuates at a rate of 6 dB per doubling of distance. The movement of vehicles down a roadway makes the source of the sound appear to propagate from a line (i.e., line source) rather than a point source. This line source results in the noise propagating from a roadway in a cylindrical spreading versus a spherical spreading that results from a point source. The sound level attenuates for a line source at a rate of 3 dB per doubling of distance.

[2] Technical Noise Supplement to the Traffic Noise Analysis Protocol, September 2013.



As noise propagates from the source, it is affected by the ground and atmosphere. Noise models use the hard site (reflective surfaces) and soft site (absorptive surfaces) to help calculate predicted noise levels. Hard site conditions assume no excessive ground absorption between the noise source and the receiver. Soft site conditions such as grass, soft dirt or landscaping attenuate noise at an additional rate of 1.5 dB per doubling of distance. When added to the geometric spreading, the excess ground attenuation results in an overall noise attenuation of 4.5 dB per doubling of distance for a line source and 6.0 dB per doubling of distance for a point source.

Research has demonstrated that atmospheric conditions can have a significant effect on noise levels when noise receivers are located 200 feet and greater from a noise source. Wind, temperature, air humidity, and turbulence can further impact how far sound can travel.

Figure 1 shows typical sound levels from indoor and outdoor noise sources.

Figure 1[3]

TYPICAL SOUND LEVELS FROM
INDOOR AND OUTDOOR NOISE SOURCES

RK engineering group, inc.
rkengineer.com

2.8 Vibration Descriptors

Ground-borne vibrations consist of rapidly fluctuating motions within the ground that have an average motion of zero. The effects of ground-borne vibrations typically only cause a nuisance to people, but at extreme vibration levels, damage to buildings may occur. Although ground-borne vibration can be felt outdoors, it is typically only an annoyance to people indoors where the associated effects of the shaking of a building can be notable. Ground-borne noise is an effect of ground-borne vibration and only exists indoors since it is produced from noise radiated from the motion of the walls and floors of a room and may also consist of the rattling of windows or dishes on shelves.

Several different methods are used to quantify vibration amplitude.

PPV

Known as the peak particle velocity (PPV) which is the maximum instantaneous peak in vibration velocity, typically given in inches per second.

RMS

Known as the root mean squared (RMS) can be used to denote vibration amplitude.

VdB

A commonly used abbreviation to describe the vibration level (VdB) for a vibration source.

2.9 Vibration Perception

Typically, developed areas are continuously affected by vibration velocities of 50 VdB or lower. These continuous vibrations are not noticeable to humans whose threshold of perception is around 65 VdB. Outdoor sources that may produce perceptible vibrations are usually caused by construction equipment, steel-wheeled trains, and traffic on rough roads, while smooth roads rarely produce perceptible ground-borne noise or vibration. To counter the effects of ground-borne vibration, the Federal Transit Administration (FTA) has published guidance relative to vibration impacts.

2.10 Vibration Propagation

There are three main types of vibration propagation: surface, compression, and shear waves. Surface waves, or Rayleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wavefront, similar to ripples produced by throwing a rock into a pool of water. P-waves, or compression waves, are body waves that carry their energy along an expanding spherical wavefront. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. S-waves, or shear waves, are also body waves that carry energy along an expanding spherical wavefront. However, unlike P-waves, the particle motion is transverse, or side-to-side and perpendicular to the direction of propagation.

As vibration waves propagate from a source, the vibration energy decreases in a logarithmic nature and the vibration levels typically decrease by 6 VdB per doubling of the distance from the vibration source. As stated above, this drop-off rate can vary greatly depending on the soil but has been shown to be effective enough for screening purposes, in order to identify potential vibration impacts that may need to be studied through actual field tests.

3.0 Regulatory Setting

The proposed project is located in the City of Eastvale and noise regulations are addressed through the various federal, state, and local government agencies. The agencies responsible for regulating noise are discussed below.

3.1 Federal Regulations

The adverse impact of noise was officially recognized by the federal government in the Noise Control Act of 1972, which serves three (3) purposes:

- Publicize noise emission standards for interstate commerce
- Assist state and local abatement efforts
- Promote noise education and research

The Federal Office of Noise Abatement and Control (ONAC) was originally tasked with implementing the Noise Control Act. However, it was eventually eliminated leaving other federal agencies and committees to develop noise policies and programs. Some examples of these agencies are as follows: The Department of Transportation (DOT) assumed a significant role in noise control through its various agencies. The Federal Aviation Agency (FAA) is responsible to regulate noise from aircraft and airports. The Federal Highway Administration (FHWA) is responsible to regulate noise from the interstate highway system. The Occupational Safety and Health Administration (OSHA) is responsible for the prohibition of excessive noise exposure to workers.

The Federal government and the State advocate that local jurisdiction use their land use regulatory authority to arrange new development in such a way that "noise sensitive" uses are either prohibited from being constructed adjacent to a highway or, or alternatively that the developments are planned and constructed in such a manner that potential noise impacts are minimized.

Since the Federal government and the State have preempted the setting of standards for noise levels that can be emitted by the transportation source, the City is restricted to regulating the noise generated by the transportation system through nuisance abatement ordinances and land use planning.

3.2 State Regulations

Established in 1973, the California Department of Health Services Office of Noise Control (ONC) was instrumental in developing regularity tools to control and abate noise for use by local agencies. One significant model is the "Land Use Compatibility for Community Noise Environments Matrix." The matrix allows the local jurisdiction to clearly delineate compatibility of sensitive uses with various incremental levels of noise.

The State of California has established noise insulation standards as outlined in Title 24 of the Building Standards Code which in some cases requires acoustical analyses to outline exterior noise levels and to ensure interior noise levels do not exceed the interior threshold. The State mandates that the legislative body of each county and city adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines published by the State Department of Health Services. The guidelines rank noise land use compatibility in terms of normally acceptable, conditionally acceptable, normally unacceptable, and clearly unacceptable.

Noise insulation design standards for residences are identified in Section 1206 Sound Transmission of the 2019 California Building Standards Code. The City is required by the State Housing Law to adopt these State codes as minimum performance standards. The City may enact stricter noise standards throughout the city or on a case-by-case basis if deemed necessary. In brief, the Title 24 noise standards require the following for multi-family dwellings:

1. Party wall and floor-ceiling assembly designs must provide a minimum STC of 50, based on lab tests. Field tested assemblies must provide a minimum noise isolation class (NIC) of 45.

2. Floor-ceiling assembly designs must provide for a minimum impact insulation class (IIC) of 50, based on lab tests. Field tested assemblies must provide a minimum FIIC of 45.

3. Entry doors from interior corridors must provide an STC of 26 or more.

4. Penetrations or openings in sound rated assemblies must be treated to maintain required ratings.

5. Interior noise levels due to exterior sources must not exceed a community noise equivalent level (CNEL) or a day-night level (LDN) of 45 dBA, in any habitable room.

Thus, the interior limit is 45 dBA CNEL between dwelling units and from exterior noise sources to interior living spaces.

3.3 City of Eastvale Noise Regulations

The project is required to comply with the noise standards and thresholds established within the City of Eastvale Municipal Code Chapter 8.52 Noise Regulation. The noise standards from the Municipal code and the General Plan are provided in Appendix A.

3.3.1 City of Eastvale Municipal Code Noise Standards

The City of Eastvale Municipal Code Chapter 8.52 Noise Regulation, requires that a project shall not create loud, unnecessary, or unusual noise that disturbs the peace or quiet of any neighborhood, or that causes discomfort or annoyance to any person of normal sensitiveness. Noise standards are defined in Table 1 of the Chapter 8.52 Noise Regulation of the Municipal Code and are applicable to the project site and surrounding noise sensitive uses.

Table 2 shows the exterior noise standards from the City of Eastvale Municipal Code Chapter 8.52 Noise Regulation Exterior Noise Standards for the project site and surrounding residential land uses.

Table 2
City of Eastvale Municipal Code
Exterior Noise Level Standards

Land Use	Time Period	Maximum Decibel Level (dBA)
Specific Plan – Residential	7:00 AM – 10:00 PM	55
	10:00 PM – 7:00 AM	45
Specific Plan – Commercial	7:00 AM – 10:00 PM	65
	10:00 PM – 7:00 AM	55
Open Space (Recreational Use)	7:00 AM – 10:00 PM	45
	10:00 PM – 7:00 AM	45

[1] Source: City of Eastvale Municipal Code, Chapter 8.52 – Noise Regulation.

Construction Noise Regulations

Chapter 8.52 Noise Regulations, Section 8.52.020 Exemptions of the City's municipal code exempts the construction noise activities, provided;

- Private construction projects located one-quarter of a mile or more from an inhabited dwelling;
- Private construction projects located within one-quarter of a mile from an inhabited dwelling, provided that construction does not occur between the hours of:

  i. 6:00 p.m. and 6:00 a.m. during the months of June through September;

  ii. 6:00 p.m. and 7:00 a.m. during the months of October through May;

3.3.2 City of Eastvale General Plan Noise Standards

The City of Eastvale General Plan Noise Element addresses noise goals and policies, implementation programs, compatibility guidelines and roadway noise levels. Goals and policies that apply to the proposed project include:

POLICY N-1: Protect noise-sensitive land uses from high levels of noise by restricting noise producing land uses from these areas.

POLICY N-3: Consider the following uses to be sensitive to noise and vibration, and discourage these uses in areas where existing or projected future noise levels would be in excess of 65 CNEL and/or vibration would be more than 0.0787 Peak Particle Velocity (inches/second):

- Schools;
- Hospitals;
- Rest Homes;
- Long Term Care Facilities;
- Mental Care Facilities;
- Residential Uses;
- Libraries;
- Passive Recreation Uses; and
- Places of worship

POLICY N-4: Require noise sensitive land uses proposed in areas where existing or projected future noise levels would be in excess of 65 CNEL to have an acoustical specialist prepare a study of the noise problems and recommend structural and site design features that will adequately mitigate the noise problem.

POLICY N-5: Require that exterior noise forecasts use the appropriate Level of Service for the adjacent roadways, or a 20-year projection of traffic volumes (whichever is greater) for future noise forecasts.

4.0 Study Method and Procedures

The following section describes the noise modeling procedures and assumptions used in the noise analysis.

4.1 Traffic Noise Modeling

Traffic noise from vehicular traffic was projected using a version of the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108). The FHWA model arrives at the predicted noise level through a series of adjustments to the key input parameters. The following outlines the key adjustments made to the computer model for the roadway inputs:

- Roadway classification – (e.g. freeway, major arterial, arterial, secondary, collector, etc),
- Roadway Active Width – (distance between the center of the outer most travel lanes on each side of the roadway)
- Average Daily Traffic (ADT) Volumes, Travel Speeds, Percentages of automobiles, medium trucks, and heavy trucks
- Roadway grade and angle of view
- Site Conditions (e.g. soft vs. hard)
- Percentage of total ADT which flows each hour throughout a 24-hour period

The following outlines key adjustments to the computer model for the project site parameter inputs:

- Vertical and horizontal distances (Sensitive receptor distance from noise source)
- Noise barrier vertical and horizontal distances (Noise barrier distance from sound source and receptor).
- Traffic noise source spectra
- Topography

Table 3 and Table 4 indicates the roadway parameters utilized for this study.

Table 3
Roadway Parameters[1]

Roadway	Segment	Class.	Lanes	Speed Limit	Site
Limonite Avenue	Archibald Avenue to Harrison Avenue	Urban Arterial	6	50	Hard
Limonite Avenue	Harrison Avenue to Scholar Way	Urban Arterial	6	50	Hard
Limonite Avenue	Scholar Way to Hamner Avenue	Urban Arterial	5	45	Hard
Limonite Avenue	Hamner Avenue to I-15 Ramps	Urban Arterial	6	45	Hard
Limonite Avenue	I-15 Ramps to Wineville Avenue	Urban Arterial	6	50	Hard
Hamner Avenue	Citrus Street to Schleisman Road	Urban Arterial	6	50	Hard
Hamner Avenue	Schleisman Road to 68th Street	Urban Arterial	6	45	Hard

Table 6
Vehicle Distribution (Truck Mix) for Collector Roadways[1]

Motor-Vehicle Type	Daytime % (7 AM - 7 PM)	Evening % (7 PM - 10 PM)	Night % (10 PM - 7 AM)	Total % of Traffic Flow
Automobiles	73.6	13.6	10.22	97.42
Medium Trucks	0.9	0.04	0.9	1.84
Heavy Trucks	0.35	0.04	0.35	0.74

[1] Vehicle percentages are based on County of Riverside Department of Environmental Health.

4.2 Construction Noise Modeling

The construction noise analysis utilizes the Federal Highway Administration (FHWA) Roadway Construction Noise Model, together with several key construction parameters. Key inputs include distance to the sensitive receiver, equipment usage, and baseline parameters for the project site. This study evaluates the potential exterior noise impacts during each phase of construction.

Demolition activities are expected to occur at approximately 50 feet from the nearest existing residential uses to the north. Therefore, noise levels from demolition activities are analyzed at 50 feet. Noise levels from all other construction activities are conservatively estimated from 200 feet, whereas, in reality, the degree of construction noise will vary depending on the type of construction activity taking place and the location of the activity relative to the surrounding properties. Noise levels were projected for equipment operating over an 1-hour period from to the nearest sensitive receptor property line.

- Construction phasing and equipment usage assumptions are referenced from the LEAL Master Plan AQ & GHG and Energy Impact Study, by RK Engineering, November 2021.

4.3 Construction Vibration Modeling

The construction vibration assessment is based on the methodology set-forth within the Caltrans Transportation and Construction Vibration Guidance Manual, April 2020. The vibration impacts from vibratory rollers and compactors, heavy truck loading and bulldozer activity is analyzed. All vibratory activity is analyzed as a continuous and/or frequent event and is required to comply with the applicable guidance thresholds criteria. It is expected

that vibration levels will be highest during paving phase. No impact pile driving is expected as part of this project.

Vibratory impacts were calculated from the site area property line to the closest sensitive receptors and structures using the reference vibration levels, soil conditions and the reference equation *PPV= PPV ref (25/D)^n (in/sec)* (from Caltrans Manual) where:

PPV = reference measurement at 25 feet from vibration source
D = distance from equipment to property line
n= vibration attenuation rate through ground (n=1.1 was utilized for this study)

5.0 Existing Noise Environment

The existing noise environment for the project site and surrounding area has been established based on the modeled existing traffic noise levels by RK.

5.1 Existing Traffic Noise Levels

Table 7 shows the modeled existing traffic noise levels calculated at 100 feet from the centerline of roadway segments surrounding the site. The distances to the 55, 60, 65, and 70 dBA CNEL noise contours are also shown. The noise levels were calculated using traffic volumes from the *LEAL Masterplan Amendment Traffic Impact Study, RK Engineering Group, November 2021.*

The traffic noise levels does not takes into account of the effect of any noise barriers or topography that may reduce traffic noise levels.

The roadway noise calculation worksheets are provided in Appendix B.

Table 7
Existing Traffic Noise Levels

Roadway[1]	Segment	CNEL at 100ft. (dBA)	Distance to Contour (Ft)[2]			
			70 dBA CNEL	65 dBA CNEL	60 dBA CNEL	55 dBA CNEL
Limonite Avenue	Archibald Ave to Harrison Ave	68.2	66	210	664	2,100
Limonite Avenue	Harrison Avenue to Scholar Way	69.7	94	297	940	2,973
Limonite Avenue	Scholar Way to Hamner Avenue	69.0	80	254	803	2,538
Limonite Avenue	Hamner Avenue to I-15 Ramps	70.8	120	381	1,204	3,806
Limonite Avenue	I-15 Ramps to Wineville Avenue	70.8	122	384	1,215	3,843
Hamner Avenue	Citrus Street to Schleisman Road	68.7	74	234	740	2,341
Hamner Avenue	Schleisman Road to 68th Street	65.1	32	102	321	1,016
Hamner Avenue	68th Street to 58th Street	67.4	55	173	548	1,734
Hamner Avenue	Limonite Avenue to 58th Street	66.3	43	134	425	1,344
Hamner Avenue	58th Street to Bellgrave Avenue	66.3	43	134	425	1,344
Scholar Way	Limonite Avenue to 68th Street	57.8	6	19	60	191
Scholar Way	Bellgrave Ave to Limonite Ave	54.4	3	9	28	87

[1] Noise levels calculated at 100 feet from the centerline of subject roadway.

[2] Refer to Appendix B for projected noise level calculations.

6.0 Operational Noise Impacts

This assessment analyzes the anticipated noise levels generated by the project and impacts caused by changes to the ambient environment. The main sources of noise generated by the project would include vehicular traffic noise along the adjacent roadways. Noise level impacts are compared to the City of Eastvale noise standards.

The project must demonstrate that noise levels generated by the project site would not result in a permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

6.1 Traffic Source Noise

The potential off-site noise impacts caused by the increase in vehicular traffic from the operation of the proposed project on the nearby roadways were calculated for direct and cumulative project conditions.

6.1.1 Existing Conditions

The direct impact of project traffic added to the surrounding roadway network is shown in Table 8 for the existing year conditions. Roadway noise calculation worksheets are provided in Appendix B.

The FHWA Highway Traffic Noise Analysis and Abatement Policy and Guidance indicates that a change in noise level of 3 dBA is considered barely perceptible and a change in noise level of 5 dBA is considered readily perceptible to the human ear. Therefore, for purposes of this analysis, and consistent with common practice in the County of Riverside, an increase of 5 dBA or more above ambient conditions would be considered the threshold of significance for causing a substantial permanent increase in noise.

Table 8
Roadway Noise Impact Analysis (dBA CNEL)[1]
Existing Year Conditions

Roadway[2]	Segment	CNEL at the Nearest Façade			Significant Impact?[3]
		Existing Without Project	Existing with Project	Change as a Result of Project	
Limonite Avenue	Archibald Ave to Harrison Ave	68.2	69.0	0.8	NO
Limonite Avenue	Harrison Avenue to Scholar Way	69.7	70.3	0.6	NO
Limonite Avenue	Scholar Way to Hamner Avenue	69.0	71.3	2.3	NO
Limonite Avenue	Hamner Avenue to I-15 Ramps	70.8	72.2	1.4	NO
Limonite Avenue	I-15 Ramps to Wineville Avenue	70.8	71.3	0.5	NO
Hamner Avenue	Citrus Street to Schleisman Rd	68.7	69.4	0.7	NO
Hamner Avenue	Schleisman Road to 68th Street	65.1	66.2	1.1	NO
Hamner Avenue	68th Street to 58th Street	67.4	67.8	0.4	NO
Hamner Avenue	Limonite Avenue to 58th Street	66.3	69.4	3.1	NO
Hamner Avenue	58th Street to Bellgrave Avenue	66.3	69.4	3.1	NO
Scholar Way	Limonite Avenue to 58th Street	57.8	59.2	1.4	NO
Scholar Way[5]	58th Street to Bellgrave Avenue	54.4	57.0	2.6	NO

[1] Exterior noise levels are calculated at 5 feet above ground level.
[2] Noise levels are calculated approximately 100 feet from the centerline of the subject roadway.
[3] A significant noise impact would occur when project operational activities cause an increase in ambient noise levels of 5 dBA or more and the resulting noise level exceeds 60 dBA CNEL/Ldn.

Table 8 shows that the project would not result in a significant traffic noise level increase for all study area roadway segments.

6.1.2 Long Range Year Conditions

The cumulative impact of project traffic added to the surrounding roadway network with the addition of other potential cumulative development projects and area-wide growth is shown in Table 9 for Long Range Year conditions.

The FHWA Highway Traffic Noise Analysis and Abatement Policy and Guidance indicates that a change in noise level of 3 dBA is considered barely perceptible and a change in noise

level of 5 dBA is considered readily perceptible to the human ear. Therefore, for purposes of this analysis, and consistent with common practice in the County of Riverside, an increase of 5 dBA or more above ambient conditions would be considered the threshold of significance for causing a substantial permanent increase in noise.

Table 9
Roadway Noise Impact Analysis (dBA CNEL)[1]
Long Range Conditions

Roadway[2]	Segment	CNEL at the Nearest Façade			Significant Impact? [3]
		Long Range Without Project	Long Range with Project	Change as a Result of Project	
Limonite Avenue	Archibald Ave to Harrison Ave	72.0	72.3	0.3	NO
Limonite Avenue	Harrison Avenue to Scholar Way	72.6	72.9	0.3	NO
Limonite Avenue	Scholar Way to Hamner Avenue	71.2	72.6	1.4	NO
Limonite Avenue	Hamner Avenue to I-15 Ramps	72.7	73.7	1.0	NO
Limonite Avenue	I-15 Ramps to Wineville Avenue	73.7	73.9	0.2	NO
Hamner Avenue	Citrus Street to Schleisman Rd	69.6	70.2	0.6	NO
Hamner Avenue	Schleisman Road to 68th Street	66.1	67.1	1.0	NO
Hamner Avenue	68th Street to 58th Street	67.9	68.2	0.3	NO
Hamner Avenue	Limonite Avenue to 58th Street	69.4	71.2	1.8	NO
Hamner Avenue	58th Street to Bellgrave Avenue	69.4	71.2	1.8	NO
Scholar Way	Limonite Avenue to 58th Street	59.3	60.3	1.0	NO
Scholar Way[5]	58th Street to Bellgrave Avenue	55.4	57.6	2.2	NO

[1] Exterior noise levels are calculated at 5 feet above ground level.
[2] Noise levels are calculated approximately 100 feet from the centerline of the subject roadway.
[3] A significant noise impact would occur when project operational activities cause an increase in ambient noise levels of 5 dBA or more and the resulting noise level exceeds 60 dBA CNEL/Ldn.

Tables 9 shows that the project would not result in a significant traffic noise level increase for all study area roadway segments. The roadway noise calculation worksheets are provided in Appendix B.

6.2 Stationary Source Noise Impacts

Potential noise increases associated with each of the potential land uses in the proposed project are discussed below. Noise impacts were qualitatively assessed based on the potential land uses within the Master Plan area.

6.2.1 Residential Land Use

The proposed project allows for the future development of various residential land uses including medium- and high-density residential development and mixed-use development. The typical sources of stationary noise from residential land uses would include on-site circulation and parking lot noise, mechanical pool/spa equipment, HVAC units, and outdoor recreational noise.

Noise from residential land uses are typically considered compatible with other adjacent residential uses and would not typically be categorized as loud, unnecessary, or unusual noise that disturbs the peace or quiet of any neighborhood, or that causes discomfort or annoyance to any person of normal sensitiveness. In particular, social activities and vehicular related noise are generally substantially less during the noise sensitive nighttime hours.

Several project design features are provided to help ensure stationary noise from the residential land uses do not adversely affect the surrounding community.

6.2.2 Parks, Trails, and Open Space Land Uses

The proposed project allows for the development of several community features including gathering places, parks, open spaces, and trails.

The main sources of potential stationary noise impacts from the proposed land uses would include noise from children's play areas and playgrounds, outdoor gathering and events, and/or vehicle parking areas.

Parks and open space are typically considered compatible land uses with other adjacent residential uses and would not typically generate loud, unnecessary, or unusual noise that disturbs the peace or quiet of any neighborhood, or that causes discomfort or annoyance to any person of normal sensitiveness. Additionally, the parks will be closed during nighttime hours to help further reduce any potential noise impacts.

6.2.3 Commercial and Civic Land Uses

The proposed project allows for the future development of various nonresidential land uses, including standard and mixed-use retail, commercial office, and civic center uses. The main sources of potential stationary noise impacts from the proposed commercial and civic center use would mainly include on-site circulation and parking lot noise, HVAC units, on-site truck operations, vehicle/equipment backup alarms, decompression of trailer truck brakes, and loading dock operations.

Based on the current Masterplan layout, commercial and civic land uses are generally expected to be located on the southeast corner of the project site, with the exception of the fire station which is proposed to be located at the northwest corner of the site. Fire and emergency services are exempt from the noise standards in the Eastvale Municipal Code; however, several design features will help reduce noise levels as much as possible.

Land uses surrounding the proposed commercial and civic land uses near the southwest portion of the site include, commercial uses to the east and south. The proposed land uses would typically be compatible with other adjacent off-site surrounding land uses. Several project design features and construction practices are provided to help ensure operational noise levels from the commercial and civic center uses do not adversely affect the surrounding community.

6.3 Preliminary Interior Noise Analysis

Traffic noise levels along the adjacent roadways are the primary source of ambient noise impacting the project site. This section of the analysis does not necessarily apply to CEQA, as recent court rulings have indicated that CEQA is primarily concerned with the project's impact of the environment, not the environment's impact on a project.

Future traffic noise levels along the roadway segments surrounding the project site represents the noise levels at 100 feet from the centerline of each roadway segment and do not consider future noise barrier walls along the project property lines. The future roadway noise levels along the surrounding roadways are expected to range from 72.2 dBA CNEL along Limonite Avenue, 70.7 dBA CNEL along Hamner Avenue and 59.9 dBA CNEL along Scholarly Way.

Prior to issuance of building permits, the project proponent should demonstrate to the City building department that the proposed building shell and window assemblies will achieve

exterior to interior noise reduction necessary to meet the State of California and City of Eastvale requirements.

Furthermore, the project shall comply with California Title 24 insulation building requirements for commercial, multi-family dwelling units for common separating assemblies (e.g., floor/ceiling assemblies and demising walls).

6.4 Recommended Operational Design Features

The following recommended project design features include standard rules and requirements, best practices and recognized design guidelines for reducing noise levels. Design features are assumed to be part of the conditions of the project and integrated into its design. Design features are not typically considered mitigation under CEQA.

DF-1 Prior to the issuance of building permits, the project shall demonstrate that building construction will achieve the minimum interior noise standard of 45 dBA CNEL for all residential units located along arterial roadways and/or adjacent to commercial uses, per the California Building Standards Code. The following noise control measures may be required for dwelling units located near adjacent roadways:

- Install sound barriers (masonry walls or walls with earth berms) between residences and noise sources.
- Install double-paned or upgraded STC sound rated windows.
- Provide sound insulating exterior walls and roofing systems.
- Locate and/or design attic vents to minimize sound propagation into each home.
- Provide forced-air ventilation systems.
- Provide the necessary setbacks for dwelling units fronting along major roadways.

DF-2 The project shall comply with California Title 24 building insulation requirements for exterior walls, roofs and common separating assemblies (e.g. floor/ceiling assemblies and demising walls).

DF-3 For proper acoustical performance, all exterior windows, doors, and sliding glass doors should have a positive seal and leaks/cracks must be kept to a minimum.

DF-4 The final building plans shall ensure that HVAC units are not located within an area of the project site that would contribute to a noise level exceedance at any adjacent property line, per the City of Eastvale Municipal Code requirements. To meet the City's noise standards the following measures should be followed:

- All HVAC equipment shall be shielded or enclosed from the line of sight of adjacent residential uses.

- The combined noise level of all units operating simultaneously shall not exceed the City of Eastvale daytime and nighttime exterior standards at the nearest surrounding property lines.

DF-5 Future residents, property management personnel, and commercial tenants will be required to comply with the City of Eastvale Municipal Code Noise Regulations, Chapter 8.52, which specify that no person shall create loud, unnecessary, or unusual noise that disturbs the peace or quiet of any neighborhood, or that causes discomfort or annoyance to any person of normal sensitiveness.

To help ensure compliance with the City's Noise Regulations, the following recommendations are provided:

- Deliveries, loading and unloading activities, and trash pick-up hours should be limited to daytime hours only (8 a.m. – 10 p.m.).

- Limit engine idling time for all delivery vehicles and moving trucks to 5 minutes or less.

7.0 Construction Noise and Vibration Impacts

Temporary construction noise and vibration impacts have been assessed from the project site to the surrounding adjacent land uses.

Chapter 8.52 Noise Regulations, Section 8.52.020 – Exemptions, of the City's municipal code exempts the construction noise activities, provided;

- Private construction projects located one-quarter of a mile or more from an inhabited dwelling;
- Private construction projects located within one-quarter of a mile from an inhabited dwelling, provided that construction does not occur between the hours of:
  - i. 6:00 p.m. and 6:00 a.m. during the months of June through September;
  - ii. 6:00 p.m. and 7:00 a.m. during the months of October through May;

Although construction activity may be exempt from the noise standards in the City's Municipal Code, CEQA requires that potential noise impacts still be evaluated for significance. The City of Eastvale CEQA Significance Thresholds Guide does not have established criteria for construction noise impacts. Therefore, for purposes of this analysis, the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual (2018) criteria is referenced as an informational guide for the construction noise impact analysis[4]. The FTA provides reasonable criteria for assessing construction noise impacts based on the potential for adverse community reaction.

Construction phasing and equipment usage assumptions are referenced from:

- *LEAL Master Plan Amendment Project AQ & GHG and Energy Impact Study, by RK Engineering Group, November 2021.*

7.1 Typical Construction Noise Levels

Table 10 shows typical construction noise levels compiled by the Environmental Protection Agency (EPA) for common type construction equipment. Typical construction noise levels are used to estimate potential project construction noise levels at the adjacent sensitive receptors.

[4] Federal Transit Administration. Transit Noise and Vibration Impact Assessment Manual. Section 7. September 2018.

Table 10
Typical Construction Noise Levels[1]

Type	Noise Levels (dBA) at 50 Feet
Earth Moving	
Compactors (Rollers)	73 - 76
Front Loaders	73 - 84
Backhoes	73 - 92
Tractors	75 - 95
Scrapers, Graders	78 - 92

Vibrators	68 - 82
Saws	71 - 82

[1] Referenced Noise Levels from the Environmental Protection Agency (EPA)

7.2 Construction Noise Impact Analysis

This assessment analyzes potential noise impacts during all expected phases of construction, including; demolition, site preparation, grading, building construction, paving, and architectural coating. Noise levels are calculated based on an average distance of equipment over an 1-hour period to the nearest adjacent property. The project's estimated construction noise levels have been calculated using the Federal Highway Administration Roadway Construction Noise Model Version 1.1.

Demolition activities are expected to occur at approximately 50 feet from the nearest existing residential uses to the north. Therefore, noise levels from demolition activities are analyzed at 50 feet. Noise levels from all other construction activities are conservatively estimated from 200 feet, whereas, in reality, the degree of construction noise will vary depending on the type of construction activity taking place and the location of the activity relative to the surrounding properties.

Tables 11 shows the noise level impacts to the residential property lines to the east and south. Construction noise calculation worksheets are provided in Appendix C.

Table 11
Project Construction Noise Levels

Phase	Equipment	Quantity	Equipment Noise Level (dBA Leq)	Combined Noise Level (dBA Leq)
Demolition[2]	Concrete/Industrial Saw	1	74.8	84.6
	Excavators	3	76.7	
	Rubber Tired Dozers	2	77.7	
Site Preparation[1]	Rubber Tired Dozers	3	65.6	75.6
	Tractors/Loaders/Backhoes	4	68.0	
Grading[1]	Excavators	2	64.7	76.2
	Graders	1	69.0	
	Rubber Tired Dozers	1	65.6	
	Scrapers	2	67.6	
	Tractors/Loaders/Backhoes	2	68.0	
Building Construction[1]	Cranes	1	60.6	74.2
	Forklifts	3	59.0	
	Generator Sets	1	65.6	
	Tractors/Loaders/Backhoes	3	68.0	
	Welders	1	58.0	
Paving[1]	Pavers	1	62.2	67.3
	Paving Equipment	1	61.0	
	Rollers	2	61.0	
Architectural Coating[1]	Air Compressors	1	61.6	61.6
Worst Case Construction Phase Noise Level – Leq (dBA)				84.6
FTA Construction Noise Criteria (General Assessment)				90.0
Noise level exceeds FTA criteria?				**NO**

[1] Construction Noise Levels are analyzed at 200 feet

[2] Demolition noise levels are conservatively analyzed at 50 feet. Noise level does not take into account of existing six (6) foot wall along residential uses to the north.

As shown in Table 11, project construction noise levels are expected to be below the recommended 1-hour general assessment construction noise threshold provided by the FTA for adverse community reaction at the adjacent residential uses.

7.3 Construction Vibration

To determine the vibratory impacts during construction, reference construction equipment vibration levels were utilized and then extrapolated to the façade of the nearest adjacent structures. All structures surrounding the project site are "new residential structures". No historical or fragile buildings are known to be located within the vicinity of the site.

The construction of the proposed project is not expected to require the use of substantial vibration inducing equipment or activities, such as pile drivers or blasting. The main sources of vibration impacts during construction of the project would be the operation of equipment such as bulldozer activity during demolition, loading trucks during grading and excavation, and vibratory rollers during paving.

The construction vibration assessment utilizes the referenced vibration levels and methodology set-forth within the Caltrans Transportation and Construction Vibration Guidance Manual, April 2020. Table 12 shows the referenced vibration levels.

Table 12
Typical Construction Vibration Levels[1]

Equipment	Peak Particle Velocity (PPV) (inches/second) at 25 feet	Approximate Vibration Level (LV) at 25 feet
Piledriver (impact)	1.518 (upper range)	112
	0.644 (typical)	104
Piledriver (sonic)	0.734 upper range	105
	0.170 typical	93
Clam shovel drop (slurry wall)	0.202	94
Hydromill	0.008 in soil	66
(slurry wall)	0.017 in rock	75
Vibratory Roller	0.210	94
Hoe Ram	0.089	87
Large bulldozer	0.089	87
Caisson drill	0.089	87
Loaded trucks	0.076	86
Jackhammer	0.035	79
Small bulldozer	0.003	58

[1] Transit Noise and Vibration Impact Assessment, Federal Transit Administration, May 2006.

Table 13 shows the project's construction-related vibration analysis at the nearest structures to the project construction area. Construction impacts are assessed from the general closest area on the project site to the nearest adjacent structure.

Table 13
Construction Vibration Impact Analysis

Construction Activity	Distance to Nearest Structure (ft)	Duration	Calculated Vibration Level - PPV (in/sec)	City of Eastvale Vibration Threshold- PPV (in/sec)	Significant Impact
Large Bulldozer	100	Continuous/Frequent	0.019	0.0787	NO
Vibratory Roller	100	Continuous/Frequent	0.046		NO
Loaded Trucks	100	Continuous/Frequent	0.017		NO
Caisson Drilling	100	Continuous/Frequent	0.019		NO

As shown in Table 13, project related construction activity is not expected to cause any potential damage to the nearest structures and is expected to be below the City of Eastvale 0.0787 PPV (in/sec) threshold.

Construction vibration calculation worksheets are shown in Appendix C.

7.4 Construction Design Features

The following recommended mitigation measures are provided to help ensure the project's noise levels do not adversely impact the adjacent noise sensitive land uses:

DF-6 Prepare a construction management plan and obtain a construction work permit from the City of Eastvale prior to starting construction. The construction management plan shall ensure all contractors implement construction best management practices to reduce construction noise levels. Examples of best management practices may include the following:

- All construction equipment shall be equipped with muffles and other suitable noise attenuation devices (e.g., engine shields).

- Grading and construction contractors shall use quieter equipment as opposed to noisier equipment (such as rubber-tired equipment rather than track equipment), to the maximum extent feasible.

- If feasible, electric hook-ups shall be provided to avoid the use of generators. If electric service is determined to be infeasible for the site, only whisper-quiet generators shall be used (i.e., inverter generators capable of providing variable load.

- Use electric air compressors and similar power tools rather than diesel equipment, where feasible.

- Locate staging area, generators and stationary construction equipment as far from the adjacent residential homes as feasible.

- Construction-related equipment, including heavy-duty equipment, motor vehicles, and portable equipment, shall be turned off when not in use for more than 5 minutes.

- Provide notifications and signage in readily visible locations along the perimeter of construction sites that indicate the dates and duration of construction activities, as well as provide a telephone number where neighbors can enquire about the construction process and register complaints to a designated construction noise disturbance coordinator.

- Construction activities shall not take place between the hours of 6:00 p.m. and 6:00 a.m. during the months of June through September and 6:00 p.m. to 7:00 a.m. during the months of October through May.

DF-7 No impact pile driving or blasting activities shall be permitted on the project site during construction. If impact pile driving or blasting is required, a follow-up noise and vibration impact assessment shall be conducted prior to start of any activity.

City of Eastvale
Noise Standard

CHAPTER 8.52. - NOISE REGULATION

Sec. 8.52.010. - Reserved.

Sec. 8.52.020. - Exemptions.

Sound emanating from the following sources is exempt from the provisions of this chapter:

(1) Facilities owned or operated by or for a governmental agency;

(2) Capital improvement projects of a governmental agency;

(3) The maintenance or repair of public properties;

(4) Public safety personnel in the course of executing their official duties, including, but not limited to, sworn peace officers, emergency personnel and public utility personnel. This exemption includes, without limitation, sound emanating from all equipment used by such personnel, whether stationary or mobile;

(5) Public or private schools and school-sponsored activities;

(6) Agricultural operations on land designated agriculture in the city general plan, or land zoned A-l (light agriculture), A-P (light agriculture with poultry), A-2 (heavy agriculture), A-D (agriculture-dairy) or C/V (citrus/vineyard), provided such operations are carried out in a manner consistent with accepted industry standards. This exemption includes, without limitation, sound emanating from all equipment used during such operations, whether stationary or mobile;

(7) Wind energy conversion systems (WECS), provided such systems comply with the WECS noise provisions of county Ordinance No. 348;

(8) Private construction projects located one-quarter of a mile or more from an inhabited dwelling;

(9) Private construction projects located within one-quarter of a mile from an inhabited dwelling, provided that construction does not occur between the hours of:

a. 6:00 p.m. and 6:00 a.m. during the months of June through September; and

b. 6:00 p.m. and 7:00 a.m. during the months of October through May;

(10) Property maintenance, including, but not limited to, the operation of lawnmowers, leaf blowers, etc., provided such maintenance occurs between the hours of 7:00 a.m. and 8:00 p.m.;

(11) Motor vehicles, other than off-highway vehicles. This exemption does not include sound emanating from motor vehicle sound systems;

(12) Heating and air conditioning equipment;

(13) Safety, warning and alarm devices, including, but not limited to, house and car alarms, and other warning devices that are designed to protect the public health, safety and welfare;

(14) The discharge of firearms consistent with all state laws.

(Ord. No. 2011-04, §§ 1, 2, 1-26-2011)

Sec. 8.52.030. - Definitions.

The following words, terms and phrases, when used in this chapter, shall have the meanings ascribed to them in this section, except where the context clearly indicates a different meaning:

Audio equipment means a television, stereo, radio, tape player, compact disc player, mp3 player, I-POD or other similar device.

Decibel (dB) means a unit for measuring the relative amplitude of a sound equal approximately to the smallest difference normally detectable by the human ear, the range of which includes approximately 130 decibels on a scale beginning with zero decibels for the faintest detectable sound. Decibels are measured with a sound level meter using different methodologies defined as follows:

(1) The term, "A-weighting (dBA)" means the standard A-weighted frequency response of a sound level meter, which de-emphasizes low and high frequencies of sound in a manner similar to the human ear for moderate sounds.

(2) The term "maximum sound level (Lmax)" means the maximum sound level measured on a sound level meter.

Governmental agency means the United States, the state, the county, any city within the county, any special district within the county or any combination of these agencies.

Land use permit means a discretionary permit issued by the city pursuant to title 120 (planning and zoning) of this Code.

Motor vehicle means a vehicle that is self-propelled.

Motor vehicle sound system means a stereo, radio, tape player, compact disc player, mp3 player, I-POD or other similar device in a motor vehicle.

Noise means any loud, discordant or disagreeable sound.

Occupied property means property upon which is located a residence, business or industrial or manufacturing use.

Off-highway vehicle means a motor vehicle designed to travel over any terrain.

Public or private school means an institution conducting academic instruction at the preschool, elementary school, junior high school, high school or college level.

Public property means property owned by a governmental agency or held open to the public, including, but not limited to, parks, streets, sidewalks, and alleys.

Sensitive receptor means a land use that is identified as sensitive to noise in the noise element of the city general plan, including, but not limited to, residences, schools, hospitals, churches, rest homes, cemeteries or public libraries.

Sound-amplifying equipment means a loudspeaker, microphone, megaphone or other similar device.

Sound level meter means an instrument meeting the standards of the American National Standards Institute for type 1 or type 2 sound level meters or an instrument that provides equivalent data.

(Ord. No. 2011-04, §§ 1, 2, 1-26-2011)

Sec. 8.52.040. - General sound level standards.

No person shall create any sound, or allow the creation of any sound, on any property that causes the exterior sound level on any other occupied property to exceed the sound level standards set forth in the following table:

TABLE 1. SOUND LEVEL STANDARDS (dB Lmax)

General Plan Foundation Component				Maximum Decibel Level	
Land Use Designation General Plan		Land Use Designation Name	Density	7:00 a.m. — 10:00 p.m.	10:00 p.m.— 7:00 a.m.
Community development					
	EDR	Estate density residential	2 acres	55	45
	VLDR	Very low-density residential	1 acre	55	45
	LDR	Low-density residential	½ acre	55	45
	MDR	Medium-density residential	2—5	55	45

	MHDR	Medium high-density residential	5—8	55	45

(Ord. No. 2011-04, §§ 1, 2, 1-26-2011)

Sec. 8.52.050. - Sound level measurement methodology.

Sound level measurements may be made anywhere within the boundaries of an occupied property. The actual location of a sound level measurement shall be at the discretion of the enforcement officials identified in section 8.52.080. Sound level measurements shall be made with a sound level meter. Immediately before a measurement is made, the sound level meter shall be calibrated utilizing an acoustical calibrator meeting the standards of the American National Standards Institute. Following a sound level measurement, the calibration of the sound level meter shall be reverified. Sound level meters and calibration equipment shall be certified annually.

(Ord. No. 2011-04, §§ 1, 2, 1-26-2011)

Sec. 8.52.060. - Special sound sources standards.

The general sound level standards set forth in section 8.52.040 apply to sound emanating from all sources, including the special sound sources set forth in this section, and the person creating, or allowing the creation of, the sound is subject to the requirements of that section. The following special sound sources are also subject to the following additional standards, the failure to comply with which constitutes separate violations of this chapter:

(1) *Motor vehicles.*

a. *Off-highway vehicles.*

1. No person shall operate an off-highway vehicle unless it is equipped with a USDA-qualified spark arrester and a constantly operating and properly maintained muffler. A muffler is not considered constantly operating and properly maintained if it is equipped with a cutout, bypass or similar device.
2. No person shall operate an off-highway vehicle unless the noise emitted by the vehicle is not more than 96 dBA if the vehicle was manufactured on or after January 1, 1986, or is not more than 101 dBA if the vehicle was manufactured before January 1, 1986. For purposes of this subsection, emitted noise shall be measured a distance of 20 inches from the vehicle tailpipe using test procedures established by the Society of Automotive Engineers under Standard J-1287.

b. *Sound systems.* No person shall operate a motor vehicle sound system, whether affixed to the vehicle or not, between the hours of 10:00 p.m. and 8:00 a.m., such that the sound system is audible to the human ear inside any inhabited dwelling. No person shall operate a motor vehicle sound system, whether affixed to the vehicle or not, at any other time such that the sound system is audible to the human ear at a distance greater than 100 feet from the vehicle.

(2) *Power tools and equipment.* No person shall operate any power tools or equipment between the hours of 10:00 p.m. and 8:00 a.m. such that the power tools or equipment are audible to

the human ear inside an inhabited dwelling other than a dwelling in which the power tools or equipment may be located. No person shall operate any power tools or equipment at any other time such that the power tools or equipment are audible to the human ear at a distance greater than 100 feet from the power tools or equipment.

(3) *Audio equipment.* No person shall operate any audio equipment, whether portable or not, between the hours of 10:00 p.m. and 8:00 a.m. such that the equipment is audible to the human ear inside an inhabited dwelling other than a dwelling in which the equipment may be located. No person shall operate any audio equipment, whether portable or not, at any other time such that the equipment is audible to the human ear at a distance greater than 100 feet from the equipment.

(4) *Sound-amplifying equipment and live music.* No person shall install, use or operate sound-amplifying equipment, or perform, or allow to be performed, live music unless such activities comply with the following requirements. To the extent that these requirements conflict with any conditions of approval attached to an underlying land use permit, these requirements shall control:

a. Sound-amplifying equipment or live music is prohibited between the hours of 10:00 p.m. and 8:00 a.m.

b. Sound emanating from sound-amplifying equipment or live music at any other time shall not be audible to the human ear at a distance greater than 200 feet from the equipment or music.

(Ord. No. 2011-04, §§ 1, 2, 1-26-2011)

Sec. 8.52.070. - Exceptions.

Exceptions may be requested from the standards set forth in section 8.52.040 or 8.52.060 and may be characterized as construction-related, single-event or continuous event exceptions.

(1) *Application and processing.*

a. *Construction-related exceptions.* An application for a construction-related exception shall be made to and considered by the city on forms provided by the city and shall be accompanied by the appropriate filing fee. No public hearing is required.

b. *Single-event exceptions.* An application for a single-event exception shall be made to and considered by the city on forms provided by the planning department and shall be accompanied by the appropriate filing fee. No public hearing is required.

c. *Continuous-event exceptions.* An application for a continuous-event exception shall be made to the city on forms provided by the planning department and shall be accompanied by the appropriate filing fee. Upon receipt of an application for a

continuous-event exception, the city shall set the matter for public hearing before the planning commission, notice of which shall be given as provided in the Eastvale Municipal Code. Notwithstanding the exceptions set forth in this section, an application for a continuous-event exception that is associated with an application for a land use permit shall be processed concurrently with the land use permit in the same manner that the land use permit is required to be processed.

(2) *Requirements for approval.* The appropriate decision making body or officer shall not approve an exception application unless the applicant demonstrates that the activities described in the application would not be detrimental to the health, safety or general welfare of the community. In determining whether activities are detrimental to the health, safety or general welfare of the community, the appropriate decision-making body or officer shall consider such factors as the proposed duration of the activities and their location in relation to sensitive receptors. If an exception application is approved, reasonable conditions may be imposed to minimize the public detriment, including, but not limited to, restrictions on sound level, sound duration and operating hours.

(3) *Appeals.* The city's decision on an application for a construction-related exception is considered final. The city's decision on an application for a single-event exception is considered final. After making a decision on an application for a continuous-event exception, the appropriate decision-making body or officer shall mail notice of the decision to the applicant. Within ten calendar days after the mailing of such notice, the applicant or an interested person may appeal the decision to the city council. Upon receipt of an appeal and payment of the appropriate appeal fee, the city clerk shall set the matter for hearing not less than five days nor more than 30 days thereafter and shall give written notice of the hearing in the same manner as notice of the hearing was given by the appropriate hearing officer or body. The city council shall render its decision within 30 days after the appeal hearing is closed.

(4) *Effect of a pending continuous-event exception application.* For a period of 180 days from the effective date of the ordinance from which this chapter is derived, no person creating any sound prohibited by this chapter shall be considered in violation of this chapter if the sound is related to a use that is operating pursuant to an approved land use permit, if an application for a continuous-event exception has been filed to sanction the sound and if a decision on the application is pending.

(Ord. No. 2011-04, §§ 1, 2, 1-26-2011)

Sec. 8.52.080. - Enforcement.

The chief of police and planning director shall have the primary responsibility for enforcing this chapter; provided, however, the chief of police and planning director may be assisted by the public health department. Violations shall be prosecuted as described in section 8.52.100, but nothing in this chapter shall prevent the chief of police, planning director or the department of public health from engaging in efforts to obtain voluntary compliance by means of warnings, notices or educational programs.

(Ord. No. 2011-04, §§ 1, 2, 1-26-2011)

Sec. 8.52.090. - Duty to cooperate.

No person shall refuse to cooperate with, or obstruct, the enforcement officials identified in section 8.52.080 when they are engaged in the process of enforcing the provisions of this chapter. This duty to cooperate may require a person to extinguish a sound source so that it can be determined whether sound emanating from the source violates the provisions of this chapter.

(Ord. No. 2011-04, §§ 1, 2, 1-26-2011)

Sec. 8.52.100. - Violations and penalties.

Any person who violates any provision of this chapter once or twice within a 180-day period shall be guilty of an infraction. Any person who violates any provision of this chapter more than twice within a 180-day period shall be guilty of a misdemeanor. Each day a violation is committed or permitted to continue shall constitute a separate offense and shall be punishable as such. Penalties shall not exceed the following amounts:

(1) For the first violation within a 180-day period, the minimum mandatory fine shall be $500.00.

(2) For the second violation within a 180-day period, the minimum mandatory fine shall be $750.00.

(3) For any further violations within a 180-day period, the minimum mandatory fine shall be $1,000.00 or imprisonment in the county jail for a period not exceeding six months, or both.

(Ord. No. 2011-04, §§ 1, 2, 1-26-2011)

INTRODUCTION

"Noise" is unwanted sound. Sound can be measured in a variety of ways, but the determination of whether the *sound* is in fact *noise* is subjective. For example children playing may be wonderful sound to some, but not to others. And of course the sounds of playing during the early afternoon may be perceived differently than late in the evening. Laughter at 2 PM is charming; the same laughter at 2 AM can be annoying and disruptive to sleep.

Managing noise is both a quality of life issue and an important means of encouraging commerce. If noise standards are too stringent, businesses may have a difficult time locating in Eastvale, and mitigation from traffic noise or other sources may make it difficult to build new homes. If the noise standards are too lenient, the quality of life in the community may suffer. This chapter of the General Plan attempts to balance these issues and separate sound from noise in the context of the City of Eastvale.

SETTING

Eastvale has a relatively quiet noise environment. The primary sources of noise in the city are transportation-related. Interstate 15 and the other major transportation corridors in the community accommodate local and regional traffic; that creates noise. Sound generated by vehicle traffic along roadways can be expressed in terms of sound levels at a given distance from the roadway. Other noise sources in the City include outdoor speakers and alarms, air-conditioning, heating, generators, sirens, car and home stereos, etc. In the industrial area of Eastvale, outdoor equipment may create noise, although this is expected in an industrial setting and does not affect residential areas.

TERMS AND DEFINITIONS

The science of noise analysis has its own terminology that makes a straightforward discussion difficult. The terms shown in the definition block (*see text* box) are used to measure sound. The various sound levels are then used to develop or establish policy that affects noise generation and attenuation.

Ambient Noise: The normal or existing level of environmental noise at a given location.

CNEL (Community Noise Equivalent Level): The average equivalent A-weighted sound level during a 24-hour day, obtained after addition of five decibels to sound levels in the evening (from 7:00 p.m. to 10:00 p.m.) and after the addition of 10 decibels to sound levels in the night (from 10:00 p.m. to 7:00 a.m.).

dBA (A-weighted decibel): The A-weighted decibel scale discriminates upper and lower frequencies in a manner approximating the sensitivity of the human ear. The scale is based on a reference pressure level of 20 micropascals.

Leq (Equivalent energy level): The average acoustic energy content of noise during the time it lasts. The City uses a 10- minute Leq measurement.

Ldn (Day-Night Average Level): The average equivalent A-weighted sound level during a 24-hour day, obtained after addition of 10 decibels to sound levels in the night (from 10:00 p.m. to 7:00 a.m.).

NOISE SENSITIVE LAND USES

A series of land uses have been deemed "sensitive" by the State of California. These land uses require an attention to noise to ensure that they can operate as designed. Sensitive uses typically include schools, hospitals, rest homes, long term care facilities, mental care facilities, homes, places of worship, libraries, and passive recreation areas. Activities conducted in proximity to these sensitive uses must consider their sound output, and ensure that they don't create unacceptable noise levels.

Similarly, noise generating uses need to be protected from encroachment by noise sensitive uses. Existing agricultural operations, industrial and commercial activity that generates noise should not be required to curtail their activity because of a newly constructed housing project or other noise-sensitive use.

Most communities handle noise issues by taking care to put compatible uses near each other and avoid placing noisy uses next to homes and other noise-sensitive uses.

The table and maps on the following pages illustrate future noise conditions that will need to be addressed as the City makes land use decisions.

Table N-1 provides information on projected noise levels along major roadways in the City—specifically, what the future noise level could be at a given distance from the centerline of the roadway. This information is useful to residents seeking information on neighborhoods and to planners who want to ensure that noise impacts are properly addressed when new development proposals are reviewed. The noise information is expressed in A-weighted decibels (dBA) and divided into bands or contours ranging from 55 to 70 dBA in 5 dBA increments. The contours are used in ordinances and policy statements.

Noise created by stationary sources (i.e., outdoor mechanical equipment) is difficult to predict, and will need to be addressed on a case-by-case basis.

TABLE N-1: DISTANCE TO NOISE LEVELS BY MAJOR ROADWAY DESIGNATION[1]

Roadway Classification	70 dBA	65 dBA	60 dBA	55 dBA
Urban Arterial – 6 Lanes	141	297	638	1,373
Urban Arterial – 4 Lanes	106	227	487	1,048
Major Highway	91	190	407	879
Secondary Highway	65	135	288	620
Collector Street	27	59	126	272

Source: Appendix I: Noise Element Data, Riverside County General Plan

How Loud Is It?

Sound Levels for Common Noise Sources

Activity	Noise Level in Decibels
Limit of Hearing	0 dB
Normal Breathing	10 dB
Soft Whisper	30 dB
Library	40 dB
Refrigerator	50 dB
Rainfall	50 dB
Washing Machine	50-75 dB
Normal Conversation	60 dB
Hair Dryer	60-95 dB
Alarm Clock	65-80 dB
Power Mower	65-95 dB
Dumpster Pickup (@ 50')	80 dB
Garbage Disposal	80-95 dB
Noisy Restaurant	85 dB
Train Approaching (Engines)	85-90 dB
Tractor	90 dB
Shouting in Ear	110 dB
Loud Rock Concert	120 dB
Jet Engine at Takeoff	150 dB

These are typical noise levels. Distance from the source will reduce the noise level. A 10 dB increase doubles perceived loudness. Continued exposure to noise above 85 dB can cause hearing loss; the maximum exposure to 85 dB noise in the workplace is eight hours. A single exposure to 140 dB noise can cause some hearing loss. Source: National Institute for Occupational Safety and Health.

[1] *Distance is measured from the centerline.*

NOISE MITIGATION STRATEGIES

When an existing or proposed land use emits sound that exceeds the City determined acceptable level, the sound is characterized as noise and subject to regulation. There are a number of methods of reducing noise from both the source and at the sensitive use. When design or regulatory methods are used to reduce noise, the methods attenuate or mitigate the noise. There are both indoor and outdoor standards for this type of mitigation. Policies included in this chapter provide a number of methods for mitigation; however, with changing technology and advances in design, this list is not comprehensive, and new methods should be considered. Note too that the responsibility for mitigation is dependent upon the planned land use and existing uses on and near a site.

Table N-3 provides several categories for noise compatibility that equate to standard development processing. As noted in the table, *completely compatible* uses are typically those that would be allowed by right in the zoning code. Tentatively compatible uses are those that would be conditional uses. The remaining two columns, *normally incompatible* and *completely incompatible,* represent land uses where intensive study or even project denial might occur because of existing or projected noise levels.

NOISE SOURCES

AGRICULTURE

The City has adopted the Riverside County Right-to-Farm Ordinance which conserves, protects, and encourages the development, improvement, and continued viability of agricultural land and industries for the long-term production of food and other agricultural products, and for the economic well-being of the County's residents. The Right-to-Farm Ordinance also attempts to balance the rights of farmers to produce food and other agricultural products with the rights of non-farmers who own, occupy, or use land within or adjacent to agricultural areas. The City continues to support agriculture by limiting the circumstances under which agricultural operations may be deemed a nuisance.

STATIONARY NOISE

A stationary noise source is any entity in a fixed location that emits noise. Stationary noise sources are common in many noise-sensitive areas. Motors, appliances, air conditioners, lawn and garden equipment, power tools, and generators are often found in residential neighborhoods, as well as on or near the properties of schools, hospitals, and parks. These structures are often a permanent fixture and are required for the particular land use. Industrial and manufacturing facilities are also stationary noise producers that may affect adjacent sensitive land uses. The emitted noise from the noise source can be mitigated to acceptable levels either at the source or on the adjacent property through the use of proper planning, setbacks, noise walls, acoustic-rated windows, dense landscaping, or by other noise control measures.

TRANSPORTATION

The most common mobile noise sources in the City are transportation-related. Motor vehicle noise is characterized by the number of vehicles generating engine and tire noise on local roads and freeways, which often creates a higher sustained noise level in proximity to areas sensitive to noise exposure. Rail and aircraft operations, though less frequent, may generate extremely high noise levels that can be disruptive to daily activities in residential areas and noise sensitive uses. Transit associated with bus service in the City is part of the transportation noise consideration.

Airports

Aircraft flyovers are audible in Eastvale, as a result of aircraft approaching and departing from Chino Airport and Ontario International Airport. A substantial portion of the City underlies the general traffic patter envelope of Chino as clearly depicted in the most recently adopted version of the Chino land Use Compatibility Plan, available at www.rclaus.org. However, the noise is transient and not considered a major noise source unless they occur during the late evening and morning hours. According to the 2008 Airport Land Use Compatibility Plan, only about 10% of flights at Chino Airport occur between 7:00 p.m. and 7:00 a.m. Helicopters and heliports are also potential sources of noise, but due to the relatively low frequency and short duration of their operation in most circumstances, these operations do not significantly affect average noise levels within the City.

NOISE ATTENUATION

One of the most effective means of reducing noise in a sensitive area is to construct and design buildings in such a way that the noise is deflected, absorbed or mitigated so as not to affect the occupants. If the building has already been constructed, then landscaping, physical barriers, sound dampening technology and other design techniques can be used to absorb the noise. These building and design techniques should serve two purposes; to mitigate noise to acceptable indoor and outdoor levels, and to enhance the community character rather than detract from its surroundings.

VIBRATION

Another community annoyance related to noise is vibration. Vibration can be described by both its amplitude and frequency, where amplitude is characterized by displacement, velocity, and/or acceleration. Typically, particle velocity (measured in inches or millimeters per second) and/or acceleration (measured in gravities) are used to describe vibration.

Vibration can be felt outdoors, but the perceived intensity of vibration impacts are greater indoors, due to the shaking of the structure. Some of the most common sources of vibration come from trains and/or transit vehicles, construction

equipment, airplanes, and large vehicles. Several land uses are especially sensitive to vibration, and, therefore, have a lower vibration threshold. These uses include, but are not limited to, concert halls, hospitals, libraries, vibration-sensitive research operations, residential areas, schools, and offices.

Table N-2, Human Reaction to Typical Vibration Levels, presents the human reaction to various levels of peak particle velocity. Typical construction vibrations fall in the 10 to 30 Hertz (Hz) range and usually occur around 15 Hz. Traffic vibrations exhibit a similar range of frequencies. However, due to their suspension systems, buses often generate frequencies around 30 Hz at high speeds. It is more uncommon, but possible, to measure traffic frequencies above 30 Hz.

TABLE N-2: HUMAN REACTION TO TYPICAL VIBRATION LEVELS

Peak Particle Velocity (inches/second)	Human Reaction
0.0059-0.0188	Threshold of perception, possibility of intrusion
0.0787	Vibrations readily perceptible
0.0984	Continuous vibration begins to annoy people
0.1968	Vibrations annoying to people in buildings
0.3937-0.5905	Vibrations considered unpleasant when continuously subjected and unacceptable by some walking on bridges.

Source: Caltrans, 1992

ISSUES FOR FUTURE PLANNING

As population and development increase in Eastvale, the noise levels in the community will likely also increase. Methods of addressing the increase in noise can be evaluated before noise levels reach an annoyance level. Noise attenuation will be important for noise sensitive uses located along major roadways or in the vicinity of industrial or heavy commercial activities. The City may also need to address noise during the planning of special events such as street fairs and concerts.

NOISE GOALS AND POLICIES

GOAL N-1: Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors, and noise-sensitive uses of Eastvale.

GOAL N-2: Locate noise-tolerant land uses within areas irrevocably committed to land uses that are noise-producing, such as transportation corridors.

GOAL N-3: Ensure that noise sensitive uses do not encroach into areas needed by noise generating uses.

GOAL N-4: Locate noise sources away from existing noise sensitive land uses unless appropriate noise control measures are provided.

POLICIES

Policies are provided below in the following topical areas:

- General Noise Policies (page 10-7)
- Noise Mitigation Strategies (page 10-8)
- Noise Sources (page 10-12)
- Building and Design (page 10-13)
- Building and Design Techniques (page 10-14)

GENERAL NOISE POLICIES

POLICY N-1: **Protect noise-sensitive land uses from high levels of noise by restricting noise-producing land uses from these areas.**

POLICY N-2: **Continue to work with other agencies such as Caltrans and school districts to ensure that newly proposed facilities do not negatively affect existing noise sensitive land uses.**

POLICY N-3: **Consider the following uses to be sensitive to noise and vibration, and discourage these uses in areas where existing or projected future noise levels would be in excess of 65 CNEL and/or vibration would be more than 0.0787 Peak Particle Velocity (inches/second):**

- **Schools;**
- **Hospitals;**
- **Rest Homes;**
- **Long Term Care Facilities;**
- **Mental Care Facilities;**
- **Residential Uses;**
- **Libraries;**
- **Passive Recreation Uses; and**
- **Places of worship**

POLICY N-4: **Require noise sensitive land uses proposed in areas where existing or projected future noise levels would be in excess of 65 CNEL to have an acoustical specialist prepare a study of the noise problems and recommend structural and site design features that will adequately mitigate the noise problem.**

POLICY N-5: **Require that exterior noise forecasts use the appropriate Level of Service for the adjacent roadways, or a 20-year projection of traffic volumes (whichever is greater) for future noise forecasts.**

NOISE MITIGATION STRATEGIES

POLICY N-6: **Mitigate exterior noise to the levels shown in Table N-3 to the extent feasible.**

TABLE N-3: NOISE COMPATIBILITY BY LAND USE DESIGNATION[1]

Land Use Designations	Completely Compatible	Tentatively Compatible	Normally Incompatible	Completely Incompatible
All Residential (Single- and Multi-Family)	Less than 60 dBA	60-70 dBA	70-75 dBA	Greater than 75 dBA
All Non-Residential (Commercial, Industrial & Institutional)	Less than 70 dBA	70-75 dBA	Greater than 75 dBA	(2)
Public Parks (Lands on which public parks are located or planned)	Less than 65 dBA	65-70 dBA	70-75 dBA	Greater than 75 dBA

(1) All noise levels shown in this table are designated CNEL.
(2) To be determined as part of the project review process.

POLICY N-7: **Table N-4 provides the City's standards for maximum exterior non-transportation noise levels to which land designated for residential land uses may be exposed for any 30-minute period on any day. Where existing ambient noise levels exceed these standards, the ambient noise level shall be highest allowable noise level as measured in dBA Leq (30 minutes).**

Note to the Reader: Public schools are not regulated by the City; therefore, no noise standards for public schools are included in this Chapter.

ACTION N-7.1: Establish acceptable standards for residential noise sources such as, but not limited to, leaf blowers, mobile vendors, mobile stereos and stationary noise sources such as home appliances, air conditioners, and swimming pool equipment.

ACTION N-7.2: Evaluate noise producers for the possibility of pure-tone producing noises. Mitigate any pure tones that may be emitted from a noise source.

TABLE N-4: EXTERIOR NOISE LEVEL STANDARDS FOR NON-TRANSPORTATION NOISE, MEASURED AS DBA LEQ (30 MINUTES)[2]

Land Use Type	Time Period	Maximum Noise Level (dBA)
Single-Family Homes and Duplexes	10 p.m. to 7 a.m.	50
	7 a.m. to 10 p.m.	60
Multiple Residential 3 or More Units Per Building (Triplex +)	10 p.m. to 7 a.m.	55
	7 a.m. to 10 p.m.	60

POLICY N-8: **The noise levels specified in Policy N-7 shall be lowered by 5 dB for simple tonal noises (such as humming sounds), noises consisting primarily of speech or music, or for recurring impulsive noises (such as pile drivers, punch presses, and similar machinery). Example: the Single Family/Duplex standard from 10 p.m. to 7 a.m. for these types of noises is 45 dBA.**

POLICY N-9: **The City may impose exterior noise standards which are less restrictive than those specified in Table N-4, provided that:**

1) **The noise impact on the residential or other noise-sensitive use is addressed in an environmental analysis and at least one outdoor area meets the standard; and**

2) **A finding is made by the approving body specifying why the exception would not be detrimental to the public health, safety and general welfare; and**

3) **The exception would not adversely affect the character of the surrounding development.**

4) **The exception would not be injurious to adjacent uses, property and improvements; and,**

5) **Alternatives have been considered but none are technologically feasible for the proposal; and,**

[2] *Leq (Equivalent Sound Level) is the average noise level during the time period of the sample.*

6) **Interior noise levels resulting from an external source will be no more than 45dBA CNEL from 7 a.m. to 10 p.m.; and,**

7) **Residents of noise sensitive uses are informed of the proposal during the review stage and prior to approval.**

POLICY N-10: **Table N-5: Maximum Acceptable Interior Noise Levels Created by Exterior Noise Sources provides the City's standards for acceptable indoor noise levels for various types of land uses. These standards should receive special attention when projects are considered in "Tentatively Compatible" or "Normally Incompatible" areas.**

- **Noise created inside a use listed below shall not count toward the acceptable noise levels to be maintained in accordance with this policy.**

TABLE N-5: MAXIMUM ACCEPTABLE INTERIOR NOISE LEVELS CREATED BY EXTERIOR NOISE SOURCES

Land Use Type	Acceptable Noise Level (dBA CNEL)
Residential Living and Sleeping Areas	45 dBA
Residential Living and Sleeping Areas where the dwelling unit is subject to noise from railroad tracks, aircraft overflights, or similar sources which produce clearly identifiable, discrete noise events (such as the passing of a train as opposed to relatively steady or constant noise sources such as roadways)	40 dBA
Private & Semi Private School Classrooms(1)	55 dBA
All Places of Work Other than School Classrooms	Conform with applicable state and federal workplace safety standards

(1) Standards for public schools are set and enforced by the State of California and are not regulated by the City of Eastvale.

POLICY N-11: **Developers of new residential or other noise-sensitive uses which are placed in environments subject to existing or projected noise that exceeds the "completely compatible" guidelines in Table N-3: Noise Compatibility by Land Use Designation shall be responsible for ensuring that acceptable exterior and interior noise levels will be achieved.**

POLICY N-12: **The City's preferences for providing noise mitigation are, in order of preference (#1 is most preferred; #5 is the least):**

1) **Reduce noise at the source.**
2) **If #1 is not practical, designate land uses which are compatible with projected noise levels.**
3) **If #1 or #2 are not practical, use distance from the source to reduce noise to acceptable levels.**
4) **If #1, #2, or #3 are not practical, use buildings, berms, or landscaping or a combination of these to reduce exterior noise to acceptable levels. Use construction techniques (sound-reducing windows, insulation, etc.) to reduce interior noise to acceptable levels.**
5) **The last measure which should be considered is the use of a sound wall to reduce noise to acceptable levels.**

NOISE SOURCES

POLICY N-13: **Protect existing agricultural resources from noise complaints that may result from routine farming practices, through continued support of the Right-to-Farm Ordinance.**

POLICY N-14: **Ensure compatibility between industrial and commercial development and adjacent land uses. To achieve compatibility, industrial and commercial development projects may be required to include noise mitigation measures to avoid or minimize project impacts on adjacent uses.**

POLICY N-15: **Encourage noise-tolerant land uses such as commercial or industrial development, to locate in areas already committed to land uses that are noise-producing.**

POLICY N-16: **Require that parking structures, terminals, and loading docks of commercial or industrial land uses be designed to minimize potential noise impacts on adjacent noise sensitive land uses.**

POLICY N-17: **If noise levels in Table N-4 exceed, or are projected to be exceeded as a result of the proposed commercial or industrial loading dock or delivery area, require delivery hours be limited when adjacent to noise-sensitive land uses.**

ACTION N-17.1: Enforce all noise sections of the State Motor Vehicle Code.

POLICY N-18: **Natural buffers, setbacks or other noise attenuation shall be established between freeways and urban arterial roadways and adjoining noise-sensitive areas.**

ACTION N-18.1: Employ noise mitigation practices when designing all future streets and highways, and when improvements occur along existing highway segments.

POLICY N-19: **Encourage local and regional public transit providers to ensure that the equipment they operate and purchase is state-of-the-art and does not generate excessive noise impacts on the community.**

POLICY N-20: **Encourage the development and use of alternative transportation modes, including bicycle paths and pedestrian walkways, to minimize vehicular noise in residential and other noise-sensitive areas.**

POLICY N-21: **Actively participate in the development of noise abatement plans for freeways.**

BUILDING AND DESIGN

POLICY N-22: **Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.**

POLICY N-23: **Condition subdivision and other land development approval adjacent to developed/occupied noise-sensitive land uses to require the developer to submit a construction-related noise mitigation plan to the City for review and approval prior to issuance of a grading permit. The plan must depict the location of construction equipment and specify how the noise from this equipment will be mitigated during construction of this project, through the use of such methods as:**

a) Temporary noise attenuation fences;

b) Preferential location of equipment;

c) Length of equipment use and idling time; and,

d) Use of current noise suppression technology and equipment.

POLICY N-24: Require that all construction equipment be kept properly tuned and use noise reduction features (e.g. mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

BUILDING AND DESIGN TECHNIQUES

POLICY N-25: Development should use natural barriers such as berms, setbacks and/or dense vegetation to assist in noise reduction.

POLICY N-26: Continue to develop effective strategies and mitigation measures for the abatement of noise reflecting effective site design approaches and state-of-the-art building technologies.

POLICY N-27: Noise reduction measures shall be included in the design of new development through measures which may include:

- Separation of noise-sensitive buildings from noise-generating sources;
- Use of natural topography and intervening structures to shield noise-sensitive land uses; and
- Adequate sound proofing of noise sources or receptor structures to maintain desired interior noise levels.

POLICY N-28: Require that commercial and residential mixed-use structures minimize the transfer or transmission of noise and vibration from the commercial land use to the residential land use through appropriate building technologies.

Appendix B

Roadway Noise Analysis Results

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL (CALVENO)

Leal Specific Plan Traffic Impact Analysis (TIA), Fehr & Peers, May 2015) ..... B

1.0 Introduction

1.1 Purpose of Report and Study Objectives

The purpose of this traffic impact analysis is to evaluate The Leal Masterplan Amendment Project (hereinafter referred to as "modified project") from a traffic and circulation standpoint.

The *Leal Master Plan Draft Environmental Impact Report (DEIR), Michael Baker International, July 2015*, and the *Leal Specific Plan Traffic Impact Analysis (TIA), Fehr & Peers, May 2015)* have been previously prepared for the original project. Since then, modifications to the development plan have been proposed. RK has been requested to review the modified project and identify whether any new impacts or increase in severity of impacts may occur as a result of the modified project.

This analysis has been prepared to be consistent with the previous 2015 TIA and the 2015 DEIR prepared for the project. A copy of the *Leal Specific Plan Traffic Impact Analysis (TIA), Fehr & Peers, May 2015)* is contained as an attachment to this report.

The modified project is forecast to generate 27,764 fewer daily trips than what was previously estimated in the 2015 TIA and DEIR.[1] This is a substantial reduction in traffic, and as a result, the modified project would not result in additional transportation impacts other than those previously identified in the 2015 DEIR.

To help further demonstrate the reduced impact from the modified project, this report provides a detailed assessment of level of service impacts from the modified project to the local transportation system. In an effort to be consistent with the 2015 TIA and DEIR, and to provide a fair comparison of potential changes to previously identified project impacts, most of the same analysis assumptions and traffic forecasting scenarios from the 2015 TIA are used in this report.

1.2 Site Location

The proposed modified project site is bound by 58th Street to the north, Limonite Avenue to the south, Hamner Avenue to the east, and Scholar Way to the west, in the City of

[1] See Section 4.0 for more details regarding changes to project trip generation.

Eastvale. The project site is currently vacant and undeveloped. The project site location map is shown on Exhibit A. The project site plan is shown in Exhibit B.

1.3 Project Description

The previously approved 2015 TIA evaluated the following land uses for the original project:

- 660 dwelling units of multi-family residential;
- 1,525,000 square feet of retail;
- 460,000 square feet of general office;
- 460,000 square feet of medical office;
- 100,000 square feet of civic center; and
- 450 rooms of hotel.

The modified land use assumptions are summarized below.

- 400 dwelling units of single family detached residential;
- 2,100 dwelling units of multi-family residential;
- 390,000 square feet of commercial and retail;
- 65,000 square feet of general office;
- 65,000 square feet of medical office;
- 40,000 square feet of civic center use;
- 25,000 square feet of library use;
- 10,000 square feet of police station use; and
- 12,200 square feet of fire station use.

Table 1-1 summarizes the land uses evaluated in the previously approved 2015 TIA and the Modified Project land use assumptions.

Table 1-1
Project Land Uses

Land Use	Units	Previously Approved 2015 Project & traffic Study	Modified Project
Single Family Detached Residential	Dwelling Units	0	400
Multi-family Residential	Dwelling Units	660	2,100
Retail	Square Feet	1,525,000	390,000
General Office	Square Feet	460,000	65,000
Medical Office	Square Feet	460,000	65,000
Civic Center	Square Feet	100,000	40,000
Library	Square Feet	0	25,000
Police	Square Feet	0	10,000
Fire Station	Square Feet	0	12,200
Hotel	Rooms	450	0

2.0 Study Area & Analysis Methodology

This section of the report presents the analysis study area and the methodologies used to perform the traffic analyses summarized in this report in accordance with the City of Eastvale requirements. This section also discusses the agency-established applicable performance criteria and thresholds for the study facilities.

Although VMT is now the appropriate metric for determining transportation impacts, General Plan Policy C-10 of the Eastvale General Plan requires that the City maintain a LOS C on all City maintained roadways, and a LOS D in employment and commercial areas. Therefore, a discussion relative to project consistency with Policy C-10 has been included.

2.1 Study Area

The study area included in this analysis has been determined based upon the previously prepared and approved traffic study for the proposed modified project.

Consistent with the previously approved 2015 traffic study for the proposed project, this analysis evaluates the daily capacity and level of service (LOS) at the following eighteen (18) study roadway segments:

1. **Limonite Avenue:** Archibald Avenue to Harrison Avenue;
2. **Limonite Avenue:** Harrison Avenue to Scholar Way;
3. **Limonite Avenue:** Scholar Way to Hamner Avenue;
4. **Limonite Avenue:** Hamner Avenue to I-15 Ramps;
5. **Limonite Avenue:** I-15 Ramps to Wineville Avenue;
6. **Hamner Avenue:** Citrus Street to Schleisman Road;
7. **Hamner Avenue:** Schleisman Road to 68th Street;
8. **Hamner Avenue:** 68th Street to Limonite Avenue;

9. **Hamner Avenue:** Limonite Avenue to 58th Street;

10. **Hamner Avenue:** 58th Street to Bellegrave Avenue;

11. **Scholar Way:** Limonite Avenue to 68th Street;

12. **I-15 Freeway:** South of Limonite Avenue;

13. **I-15 Freeway:** Limonite Avenue to Cantu-Galleano Ranch Road;

14. **I-15 Freeway:** North of SR-60 Freeway;

15. **Scholar Way:** Bellegrave Avenue to Limonite Avenue;

16. **SR-60 Freeway:** West of I-15 Freeway;

17. **SR-60 Freeway:** East of I-15 Freeway; and

18. **Cantu-Galleano Ranch Road:** I-15 Ramps to Hamner Avenue.

Consistent with the previously approved 2015 traffic study for the proposed project, this analysis evaluates traffic conditions for the following study scenarios:

- Existing Conditions;
- Existing Plus Project Conditions;
- Cumulative (Long-Range) No Project Conditions; and
- Cumulative (Long-Range) Plus Project Conditions.

2.2 Volume to Capacity (V/C)) Methodology

The volume to capacity (V/C) ratio methodology is commonly utilized as the appropriate methodology for analyzing level of service (LOS) of roadway segments. This methodology is consistent with the methodology utilized in the previously prepared and approved 2015 traffic study for the proposed project.

To calculate the level of service, the daily volume of traffic using the roadway segment is compared with the daily capacity of the roadway segment; this is referred to as the volume-to-capacity (V/C) ratio. The V/C ratio represents the portion of the total daily capacity of the roadway being utilized by the daily volume of traffic.

Table 2-1 below shows the LOS criteria based on the V/C ratio of the roadway segment.

Table 2-1
Roadway Segment LOS - Volume to Capacity (V/C)

Level of Service (LOS)	Critical V/C Ratio
A	0.00 - 0.60
B	0.61 - 0.70
C	0.71 - 0.80
D	0.81 - 0.90
E	0.91 - 1.00
F	>1.00

The daily capacity of the roadway segment is determined based on the roadway classification and the number of travel lanes as shown in Table 2-2.

Table 2-2
Roadway Segment Daily Volume Capacity based on Classification

Roadway Classification	Number of Lanes (Both Directions of Travel)	Daily Capacity for LOS E (V/C = 1.00)
Freeway	10	200,600
Freeway	8	160,500
Freeway	6	117,500
Urban Arterial	6	53,900
Urban Arterial	4	35,900
Secondary Collector	2	13,000

Source: City of Eastvale General Plan

2.3 Study Roadway Segment Performance Criteria

The acceptable LOS (target LOS) for roadway segments in the City of Eastvale is LOS C or better. A roadway segment operating at LOS D, E or F is considered deficient.

3.0 Existing Traffic Volumes & Circulation System

This section provides a discussion of existing study area conditions and traffic volumes.

3.1 Existing Study Roadway Segment Classifications & Daily Capacity

Table 3-1 identifies the existing roadway segment classifications and daily capacity for the study area.

Table 3-1
Study Roadway Segments
Existing Daily Volume Capacity & Classification

#	Study Roadway Segment	Limits	Classification	No. of Lanes	Daily Capacity for LOS E (V/C = 1.00)
1	Limonite Ave	Archibald Ave to Harrison Ave	Urban Arterial	4	35,900
2	Limonite Ave	Harrison Ave to Scholar Way	Urban Arterial	4	35,900
3	Limonite Ave	Scholar Way to Hamner Ave	Urban Arterial	5	44,875
4	Limonite Ave	Hamner Ave to I-15 Ramps	Urban Arterial	6	53,900
5	Limonite Ave	I-15 Ramps to Wineville Ave	Urban Arterial	4	35,900
6	Hamner Ave	Citrus St to Schleisman Rd	Urban Arterial	4	35,900
7	Hamner Ave	Schleisman Rd to 68th St	Urban Arterial	6	53,900
8	Hamner Ave	68th St to Limonite Ave	Urban Arterial	6	53,900
9	Hamner Ave	Limonite Ave to 58th St	Urban Arterial	5	44,875
10	Hamner Ave	58th St to Bellegrave Ave	Urban Arterial	6	53,900
11	Scholar Way	Limonite Ave to 68th St	Secondary Collector	2	13,000
12	I-15 Freeway	South of Limonite Ave	Freeway	6	117,500
13	I-15 Freeway	Limonite Ave to Cantu-Galleano Ranch Rd	Freeway	6	117,500
14	I-15 Freeway	North of State Route 60	Freeway	8	160,500
15	Scholar Way	Bellgrave Ave to Limonite Ave	Secondary Collector	4	13,000
16	State Route 60	West of I-15 Freeway	Freeway	10	200,600
17	State Route 60	East of I-15 Freeway	Freeway	8	160,500
18	Cantu-Galleano Ranch Rd	I-15 Ramps to Hamner Ave	Urban Arterial	4	35,900

3.2 Existing Traffic Volumes

Existing traffic volumes at the study intersections are based upon the existing traffic volumes utilized in the previously prepared and approved *Leal Specific Plan Traffic Impact Analysis (TIA), Fehr & Peers, May 2015).*

Existing (2021) traffic volumes for the study area are derived by applying an annual growth rate of one percent (1%) per year to the 2015 traffic volumes over a six (6) year period. Existing (2021) traffic volumes within the study area are shown on Exhibit C and summarized in Table 3-2.

Table 3-2
Existing (2021) Traffic Volumes

#	Study Roadway Segment	Limits	Existing Daily Traffic Volume
1	Limonite Ave	Archibald Ave to Harrison Ave	18,497
2	Limonite Ave	Harrison Ave to Scholar Way	26,192
3	Limonite Ave	Scholar Way to Hamner Ave	29,548
4	Limonite Ave	Hamner Ave to I-15 Ramps	44,312
5	Limonite Ave	I-15 Ramps to Wineville Ave	33,855
6	Hamner Ave	Citrus St to Schleisman Rd	20,619
7	Hamner Ave	Schleisman Rd to 68th St	11,831
8	Hamner Ave	68th St to Limonite Ave	20,186
9	Hamner Ave	Limonite Ave to 58th St	15,649
10	Hamner Ave	58th St to Bellegrave Ave	15,649
11	Scholar Way	Limonite Ave to 68th St	4,912
12	I-15 Freeway	South of Limonite Ave	80,622
13	I-15 Freeway	Limonite Ave to Cantu-Galleano Ranch Rd	83,345
14	I-15 Freeway	North of State Route 60	115,671
15	Scholar Way	Bellgrave Ave to Limonite Ave	2,240
16	State Route 60	West of I-15 Freeway	69,076
17	State Route 60	East of I-15 Freeway	81,438
18	Cantu-Galleano Ranch Rd	I-15 Ramps to Hamner Ave	13,094

4.0 Projected & Future Traffic Volumes

This section of the report provides a discussion on methodologies utilized to derive future traffic volumes for the study area.

4.1 Project Traffic Conditions

Trip generation represents the amount of traffic that is attracted and produced by a development. The trip generation for the project is based upon the specific land uses that have been planned for this development.

Trip generation is typically estimated based on the trip generation rates from the latest *Institute of Transportation Engineers (ITE) Trip Generation Manual*. This publication provides a comprehensive evaluation of trip generation rates for a variety of land uses.

4.1.1 Trip Generation of Previously Approved Project

Table 4-1A shows the ITE (9th Edition, 2012) trip generation rates utilized for the trip generation analysis of the previously approved project and its land uses.

Table 4-1A
ITE 9th Edition (2012) Trip Generation Rates
Utilized in the Previously Approved Traffic Study
from Leal Specific Plan TIA (Fehr & Peers, May 12, 2015)

#	Land Use	ITE Code	Units	AM			PM			Daily
				In	Out	Total	In	Out	Total	
1	Apartment	220	DU	0.10	0.41	0.51	0.40	0.22	0.62	6.65
2	Hotel	310	Rooms	0.31	0.22	0.53	0.31	0.29	0.60	8.17
3	General Office	710	TSF	Ln(T)=0.8 x LN(X) + 1.57			0.25	1.24	1.49	Ln(T)=0.76 x LN(X) + 3.68
4	Medical / Dental Office	720	TSF	1.89	0.50	2.39	1.00	2.57	3.57	36.13
5	Government Office Complex	733	TSF	1.97	0.24	2.21	0.88	1.97	2.85	27.92
6	Shopping Center	820	TSF	Ln(T)=0.61 x LN(X) + 2.24			Ln(T)=0.67 x LN(X) + 3.31			Ln(T)=0.65 x LN(X) + 5.83

Source: 2012 ITE Trip Generation Manual (9th Edition)

DU = Dwelling Units

TSF = Thousand Square Feet

Utilizing the trip generation rates from Table 4-1A, Table 4-1B summarizes the daily and peak hour trip generation for the previously approved project.

Table 4-1B
Trip Generation of Previously Approved Project & Traffic Study from Leal Specific Plan TIA (Fehr & Peers, May 12, 2015)

#	Land Use	ITE Code	Units	Quantity	AM			PM			Daily
					In	Out	Total	In	Out	Total	
1	Apartment	220	DU	660	67	269	336	266	143	409	4,389
2	Hotel	310	Rooms	450	141	98	239	138	132	270	3,677
3	General Office	710	TSF	460.000	571	78	649	117	569	686	4,187
4	Medical / Dental Office	720	TSF	460.000	869	231	1,100	460	1,182	1,642	16,620
5	Government Office Complex	733	TSF	100.000	197	24	221	88	197	285	2,792
6	Shopping Center	820	TSF	1,525.000	510	312	822	1,785	1,933	3,718	39,908
Internal Capture (10%)					*-236*	*-101*	*-337*	*-285*	*-416*	*-701*	*-7,157*
Total Trip Generation					**2,120**	**911**	**3,030**	**2,569**	**3,740**	**6,309**	**64,416**

Source: 2012 ITE Trip Generation Manual (9th Edition); Leal Specific Plan TIA (Fehr & Peers, May 12, 2015).

DU = Dwelling Units

TSF = Thousand Square Feet

As shown in Table 4-1B, assuming a 10 percent internal capture consistent with the previously approved traffic study, based on the ITE trip generation rates, the previously approved project was forecast to generate approximately 64,416 daily trips which include approximately 3,030 AM peak hour trips and approximately 6,309 PM peak hour trips.

4.1.2 Trip Generation of Modified Project

Table 4-2 shows the ITE (10th Edition, 2017) trip generation rates utilized for the trip generation analysis of the modified project and its land uses.

Table 4-2A
ITE 10th Edition (2017) Trip Generation Rates
Utilized for Modified Project

#	Land Use	ITE Code	Units	AM			PM			Daily
				In	Out	Total	In	Out	Total

Total Trip Generation					**765**	**1,066**	**1,831**	**1,726**	**1,605**	**3,331**	**36,652**

Source: 2017 ITE Trip Generation Manual (10th Edition).

DU = Dwelling Units

TSF = Thousand Square Feet

As shown in Table 4-2B, assuming a 10 percent internal capture consistent with the previously approved traffic study, based on the ITE trip generation rates, the modified project is forecast to generate approximately 36,652 daily trips which include approximately 1,831 AM peak hour trips and approximately 3,331 PM peak hour trips.

4.1.3 Trip Generation Comparison of Previously Approved Project & Modified Project

Table 4-3 shows the trip generation comparison between the previously approved project and the modified project.

Table 4-3
Modified Project Net Trip Generation
Compared to Leal Specific Plan TIA (Fehr & Peers, May 12, 2015)

Land Use	AM			PM			Daily
	In	Out	Total	In	Out	Total	
Modified Project	765	1,066	1,831	1,726	1,605	3,331	36,652
Leal Specific Plan TIA (Fehr & Peers, May 12, 2015)	2,120	911	3,030	2,569	3,740	6,309	64,416
Net Difference	**-1,355**	**155**	**-1,200**	**-842**	**-2,136**	**-2,978**	**-27,764**

As shown in Table 4-3, when compared to the previously approved project, the modified project is forecast to generate approximately 27,764 net fewer daily trips which include approximately 1,200 net fewer AM peak hour trips and approximately 2,978 net fewer PM peak hour trips compared to the original project.

Based upon the preliminary trip generation analysis, the modified project is expected to generate fewer trips than were analyzed in the 2015 TIA and DEIR. Hence, additional traffic impacts are not expected.

4.2 Trip Distribution

Trip distribution represents the directional orientation of traffic to and from the project site. Trip distribution is heavily influenced by the geographical location of the site, the location of retail, employment, and recreational opportunities, and the proximity to the regional freeway system. The directional orientation of traffic was determined by evaluating existing and land uses and highways within the study area.

The project trip distribution is assumed to be the same as what was evaluated in the previously approved traffic study and the *Leal Specific Plan Traffic Impact Analysis (TIA), Fehr & Peers, May 2015).*

Table 4-4 shows the project trip distribution and traffic assignment on the study roadway segments. Project traffic volumes are also shown in Exhibit D.

Table 4-4
Project Trip Distribution & Trip Assignment on Study Roadway Segments

#	Study Roadway Segment	Limits	Distribution (Percent of Project Total Trips)	Project Total Daily Trip Generation	Project Daily Trip Assignment
1	Limonite Ave	Archibald Ave to Harrison Ave	10%	36,652	3,665
2	Limonite Ave	Harrison Ave to Scholar Way	10%	36,652	3,665
3	Limonite Ave	Scholar Way to Hamner Ave	50%	36,652	18,326
4	Limonite Ave	Hamner Ave to I-15 Ramps	45%	36,652	16,493
5	Limonite Ave	I-15 Ramps to Wineville Ave	10%	36,652	3,665
6	Hamner Ave	Citrus St to Schleisman Rd	10%	36,652	3,665
7	Hamner Ave	Schleisman Rd to 68th St	10%	36,652	3,665
8	Hamner Ave	68th St to Limonite Ave	5%	36,652	1,833
9	Hamner Ave	Limonite Ave to 58th St	45%	36,652	16,493
10	Hamner Ave	58th St to Bellegrave Ave	45%	36,652	16,493
11	Scholar Way	Limonite Ave to 68th St	5%	36,652	1,833
12	I-15 Freeway	South of Limonite Ave	20%	36,652	7,330
13	I-15 Freeway	Limonite Ave to Cantu-Galleano Ranch Rd	15%	36,652	5,498
14	I-15 Freeway	North of State Route 60	15%	36,652	5,498
15	Scholar Way	Bellgrave Ave to Limonite Ave	5%	36,652	1,833
16	State Route 60	West of I-15 Freeway	15%	36,652	5,498
17	State Route 60	East of I-15 Freeway	15%	36,652	5,498
18	Cantu-Galleano Ranch Rd	I-15 Ramps to Hamner Ave	10%	36,652	3,665

4.3 Existing Plus Project Conditions Traffic Volumes

Existing Plus Project Conditions traffic volumes consist of the summation of the existing traffic volumes and the project traffic volumes.

Existing Plus Project Conditions traffic volumes are shown on Exhibit E and summarized in Table 4-5.

Table 4-5
Existing Plus Project Conditions Traffic Volumes

#	Study Roadway Segment	Limits	Existing Daily Traffic Volume	Project Daily Traffic Volume	Existing Plus Project Conditions Daily Traffic Volume
1	Limonite Ave	Archibald Ave to Harrison Ave	18,497	3,665	**22,162**
2	Limonite Ave	Harrison Ave to Scholar Way	26,192	3,665	**29,857**
3	Limonite Ave	Scholar Way to Hamner Ave	29,548	18,326	**47,874**
4	Limonite Ave	Hamner Ave to I-15 Ramps	44,312	16,493	**60,805**
5	Limonite Ave	I-15 Ramps to Wineville Ave	33,855	3,665	**37,520**
6	Hamner Ave	Citrus St to Schleisman Rd	20,619	3,665	**24,284**
7	Hamner Ave	Schleisman Rd to 68th St	11,831	3,665	**15,496**
8	Hamner Ave	68th St to Limonite Ave	20,186	1,833	**22,019**

10	Hamner Ave	58th St to Bellegrave Ave	15,649	16,493	**32,142**
11	Scholar Way	Limonite Ave to 68th St	4,912	1,833	**6,745**
12	I-15 Freeway	South of Limonite Ave	80,622	7,330	**87,952**
13	I-15 Freeway	Limonite Ave to Cantu-Galleano Ranch Rd	83,345	5,498	**88,843**
14	I-15 Freeway	North of State Route 60	115,671	5,498	**121,169**
15	Scholar Way	Bellgrave Ave to Limonite Ave	2,240	1,833	**4,073**
16	State Route 60	West of I-15 Freeway	69,076	5,498	**74,574**
17	State Route 60	East of I-15 Freeway	81,438	5,498	**86,936**
18	Cantu-Galleano Ranch Rd	I-15 Ramps to Hamner Ave	13,094	3,665	**16,759**

4.4 Cumulative (Long-Range) Without Project Conditions Traffic Volumes

Cumulative (Long-Range) Without Project Conditions traffic volumes have been obtained from the previously approved traffic study as contained in the *Leal Specific Plan Traffic Impact Analysis (TIA), Fehr & Peers, May 2015).*

Long-Range Without Project Conditions traffic volumes as shown in Exhibit F and summarized in Table 4-6.

Table 4-6
Cumulative (Long-Range) Without Project Conditions
Traffic Volumes

#	Study Roadway Segment	Limits	Cumulative Without Project Daily Traffic Volume
1	Limonite Ave	Archibald Ave to Harrison Ave	44,000
2	Limonite Ave	Harrison Ave to Scholar Way	50,780
3	Limonite Ave	Scholar Way to Hamner Ave	48,960
4	Limonite Ave	Hamner Ave to I-15 Ramps	69,110
5	Limonite Ave	I-15 Ramps to Wineville Ave	65,010
6	Hamner Ave	Citrus St to Schleisman Rd	25,400
7	Hamner Ave	Schleisman Rd to 68th St	15,030
8	Hamner Ave	68th St to Limonite Ave	22,730
9	Hamner Ave	Limonite Ave to 58th St	31,890
10	Hamner Ave	58th St to Bellegrave Ave	31,890
11	Scholar Way	Limonite Ave to 68th St	6,860
12	I-15 Freeway	South of Limonite Ave	81,750
13	I-15 Freeway	Limonite Ave to Cantu-Galleano Ranch Rd	86,170
14	I-15 Freeway	North of State Route 60	127,570
15	Scholar Way	Bellgrave Ave to Limonite Ave	2,810
16	State Route 60	West of I-15 Freeway	78,910
17	State Route 60	East of I-15 Freeway	83,360
18	Cantu-Galleano Ranch Rd	I-15 Ramps to Hamner Ave	23,980

Source: Leal Specific Plan TIA (Fehr & Peers, May 12, 2015).

4.5 Cumulative (Long-Range) With Project Conditions Traffic Volumes

Cumulative (Long-Range) With Project Conditions traffic volumes are derived by adding the project-generated traffic to the Cumulative (Long-Range) With Project Conditions traffic volumes.

Long-Range Without Project traffic volumes as shown in Exhibit G and summarized in Table 4-7.

Table 4-7
Cumulative (Long-Range) With Project Conditions Traffic Volumes

#	Study Roadway Segment	Limits	Cumulative Without Project Daily Traffic Volume	Project Daily Traffic Volume	Cumulative With Project Daily Traffic Volume
1	Limonite Ave	Archibald Ave to Harrison Ave	44,000	3,665	**47,665**
2	Limonite Ave	Harrison Ave to Scholar Way	50,780	3,665	**54,445**

5.0 Study Roadway Segment LOS Analysis

This section of the report provides a discussion on the study roadway segment LOS analysis and findings.

5.1 Existing Conditions LOS

Existing Conditions LOS calculations for the study roadway segment are shown in Table 5-1 and are based upon the existing (2021) traffic volumes shown on Exhibit C and Table 3-2, and the existing roadway geometry and classifications shown in Table 3-1.

Table 5-1
Existing Conditions
Study Roadway Segment LOS Analysis Summary

#	Study Roadway Segment	Limits	Classification	No. of Lanes	Daily Capacity for LOS E (V/C = 1.00)	Traffic Volume	V/C Ratio	LOS
1	Limonite Ave	Archibald Ave to Harrison Ave	Urban Arterial	4	35,900	18,497	0.52	A
2	Limonite Ave	Harrison Ave to Scholar Way	Urban Arterial	4	35,900	26,192	0.73	C
3	Limonite Ave	Scholar Way to Hamner Ave	Urban Arterial	5	44,875	29,548	0.66	B
4	Limonite Ave	Hamner Ave to I-15 Ramps	Urban Arterial	6	53,900	44,312	**0.82**	**D**
5	Limonite Ave	I-15 Ramps to Wineville Ave	Urban Arterial	4	35,900	33,855	**0.94**	**E**
6	Hamner Ave	Citrus St to Schleisman Rd	Urban Arterial	4	35,900	20,619	0.57	A
7	Hamner Ave	Schleisman Rd to 68th St	Urban Arterial	6	53,900	11,831	0.22	A
8	Hamner Ave	68th St to Limonite Ave	Urban Arterial	6	53,900	20,186	0.37	A
9	Hamner Ave	Limonite Ave to 58th St	Urban Arterial	5	44,875	15,649	0.35	A
10	Hamner Ave	58th St to Bellgrave Ave	Urban Arterial	6	53,900	15,649	0.29	A
11	Scholar Way	Limonite Ave to 68th St	Secondary Collector	2	13,000	4,912	0.38	A
12	I-15 Freeway	South of Limonite Ave	Freeway	6	117,500	80,622	0.69	B
13	I-15 Freeway	Limonite Ave to Cantu-Galleano Ranch Rd	Freeway	6	117,500	83,345	0.71	C
14	I-15 Freeway	North of State Route 60	Freeway	8	160,500	115,671	0.72	C
15	Scholar Way	Bellgrave Ave to Limonite Ave	Secondary Collector	4	13,000	2,240	0.17	A
16	State Route 60	West of I-15 Freeway	Freeway	10	200,600	69,076	0.34	A
17	State Route 60	East of I-15 Freeway	Freeway	8	160,500	81,438	0.51	A
18	Cantu-Galleano Ranch Rd	I-15 Ramps to Hamner Ave	Urban Arterial	4	35,900	13,094	0.36	A

Deficient operation shown in **bold**.

As shown in Table 5-1, all study roadway segment are currently operating at an acceptable LOS (LOS C or better) for Existing Conditions with the exception of the following roadway segments which are currently operating at a deficient LOS (LOS D, E, or F):

4. **Limonite Avenue:** Hamner Avenue to I-15 Ramps; and

5. **Limonite Avenue:** I-15 Ramps to Wineville Avenue.

5.2 Existing Plus Project Conditions LOS

Existing Plus Project Conditions LOS calculations for the study roadway segment are shown in Table 5-2 and are based upon the Existing Plus Project traffic volumes shown on Exhibit E and Table 4-5, and the existing roadway geometry and classifications shown in Table 3-1.

Table 5-2
Existing Plus Project Conditions - Study Roadway Segment LOS Analysis Summary

#	Study Roadway Segment	Limits	Classification	No. of Lanes	Daily Capacity for LOS E (V/C = 1.00)	Existing Conditions			Existing Plus Project Conditions		
						Traffic Volume	V/C Ratio	LOS	Traffic Volume	V/C Ratio	LOS
1	Limonite Ave	Archibald Ave to Harrison Ave	Urban Arterial	4	35,900	18,497	0.52	A	22,162	0.62	B
2	Limonite Ave	Harrison Ave to Scholar Way	Urban Arterial	4	35,900	26,192	0.73	C	29,857	**0.83**	**D**
3	Limonite Ave	Scholar Way to Hamner Ave	Urban Arterial	5	44,875	29,548	0.66	B	47,874	**1.07**	**F**

Deficient operation shown in **bold**.

As shown in Table 5-2, all study roadway segment are forecast to operate at an acceptable LOS (LOS C or better) for Existing Plus Project Conditions with the exception of the following roadway segments which are forecast to operate at a deficient LOS (LOS D, E, or F):

2. **Limonite Avenue:** Harrison Avenue to Scholar Way;

3. **Limonite Avenue:** Scholar Way to Hamner Avenue;

4. **Limonite Avenue:** Hamner Avenue to I-15 Ramps; and

5. **Limonite Avenue:** I-15 Ramps to Wineville Avenue.

5.3 Cumulative (Long-Range) Without Project Conditions LOS

Cumulative (Long-Range) Without Project Conditions LOS calculations for the study roadway segment are shown in Table 5-3 and are based upon the Cumulative (Long-Range) Without Project traffic volumes shown on Exhibit F and Table 4-6, and the geometry and classifications as proposed by the project for Cumulative (Long-Range) conditions.

Table 5-3
Cumulative (Long-range) Without Project Conditions
Study Roadway Segment LOS Analysis Summary

#	Study Roadway Segment	Limits	Classification	No. of Lanes	Daily Capacity for LOS E (V/C = 1.00)	Traffic Volume	V/C Ratio	LOS
1	Limonite Ave	Archibald Ave to Harrison Ave	Urban Arterial	6	53,900	44,000	**0.82**	**D**
2	Limonite Ave	Harrison Ave to Scholar Way	Urban Arterial	6	53,900	50,780	**0.94**	**E**
3	Limonite Ave	Scholar Way to Hamner Ave	Urban Arterial *	5 + 1	45,366	48,960	**1.08**	**F**
4	Limonite Ave	Hamner Ave to I-15 Ramps	Urban Arterial	6	53,900	69,110	**1.28**	**F**
5	Limonite Ave	I-15 Ramps to Wineville Ave	Urban Arterial	6	53,900	65,010	**1.21**	**F**
6	Hamner Ave	Citrus St to Schleisman Rd	Urban Arterial	6	53,900	25,400	0.47	A
7	Hamner Ave	Schleisman Rd to 68th St	Urban Arterial	6	53,900	15,030	0.28	A
8	Hamner Ave	68th St to Limonite Ave	Urban Arterial	6	53,900	22,730	0.42	A
9	Hamner Ave	Limonite Ave to 58th St	Urban Arterial *	5 +1	45,366	31,890	0.70	B
10	Hamner Ave	58th St to Bellegrave Ave	Urban Arterial	6	53,900	31,890	0.59	A
11	Scholar Way	Limonite Ave to 68th St	Secondary Collector	2	13,000	6,860	0.53	A
12	I-15 Freeway	South of Limonite Ave	Freeway	6	117,500	81,750	0.70	B
13	I-15 Freeway	Limonite Ave to Cantu-Galleano Ranch Rd	Freeway	6	117,500	86,170	0.73	C
14	I-15 Freeway	North of State Route 60	Freeway	8	160,500	127,570	0.79	C
15	Scholar Way	Bellgrave Ave to Limonite Ave	Secondary Collector	4	13,000	2,810	0.22	A
16	State Route 60	West of I-15 Freeway	Freeway	10	200,600	78,910	0.39	A
17	State Route 60	East of I-15 Freeway	Freeway	8	160,500	83,360	0.52	A
18	Cantu-Galleano Ranch Rd	I-15 Ramps to Hamner Ave	Urban Arterial	4	35,900	23,980	0.67	B

Deficient operation shown in **bold**.

* = Consists of five lanes plus one frontage lane. This analysis assumes the segment has a daily capacity equivalent to five full lanes plus a sixth (frontage) lane with 5 percent of the capacity of a single lane.

As shown in Table 5-3, all study roadway segment are forecast to operate at an acceptable LOS (LOS C or better) for Cumulative (Long-Range) Without Project Conditions with the exception of the following roadway segments which are forecast to operate at a deficient LOS (LOS D, E, or F):

1. **Limonite Avenue:** Archibald Avenue to Harrison Avenue;

2. **Limonite Avenue:** Harrison Avenue to Scholar Way;

3. **Limonite Avenue:** Scholar Way to Hamner Avenue;

4. **Limonite Avenue:** Hamner Avenue to I-15 Ramps; and

5. **Limonite Avenue:** I-15 Ramps to Wineville Avenue.

5.4 Cumulative (Long-Range) With Project Conditions LOS Existing Plus Project Conditions LOS

Cumulative (Long-Range) With Project Conditions LOS calculations for the study roadway segment are shown in Table 5-4 and are based upon the Cumulative (Long-Range) With Project traffic volumes shown on Exhibit G and Table 4-7, and the geometry and classifications as proposed by the project for Cumulative (Long-Range) conditions.

Table 5-4
Cumulative (Long-range) With Project Conditions – Study Roadway Segment LOS Analysis Summary

#	Study Roadway Segment	Limits	Classification	No. of Lanes	Daily Capacity for LOS E (V/C = 1.00)	Cumulative (Long-Range) Without Project Conditions			Cumulative (Long-Range) With Project Conditions		
						Traffic Volume	V/C Ratio	LOS	Traffic Volume	V/C Ratio	LOS
1	Limonite Ave	Archibald Ave to Harrison Ave	Urban Arterial	6	53,900	44,000	**0.82**	**D**	47,665	**0.88**	**D**

16	State Route 60	West of I-15 Freeway	Freeway	10	200,600	78,910	0.39	A	84,408	0.42	A
17	State Route 60	East of I-15 Freeway	Freeway	8	160,500	83,360	0.52	A	88,858	0.55	A
18	Cantu-Galleano Ranch Rd	I-15 Ramps to Hamner Ave	Urban Arterial	4	35,900	23,980	0.67	B	27,645	0.77	C

Deficient operation shown in **bold**.

* = Consists of five lanes plus one frontage lane. This analysis assumes the segment has a daily capacity equivalent to five full lanes plus a sixth (frontage) lane with 5 percent of the capacity of a single lane.

As shown in Table 5-4, all study roadway segment are forecast to operate at an acceptable LOS (LOS C or better) for Cumulative (Long-Range) With Project Conditions with the exception of the following roadway segments which are forecast to operate at a deficient LOS (LOS D, E, or F):

As shown in Table 5-2, all study roadway segment are forecast to operate at an acceptable LOS (LOS C or better) for Existing Plus Project Conditions with the exception of the following roadway segments which are forecast to operate at a deficient LOS (LOS D, E, or F):

1. **Limonite Avenue:** Archibald Avenue to Harrison Avenue;

2. **Limonite Avenue:** Harrison Avenue to Scholar Way;

3. **Limonite Avenue:** Scholar Way to Hamner Avenue;

4. **Limonite Avenue:** Hamner Avenue to I-15 Ramps;

5. **Limonite Avenue:** I-15 Ramps to Wineville Avenue;

9. **Hamner Avenue:** Limonite Avenue to 58th Street;

10. **Hamner Avenue:** 58th Street to Bellegrave Avenue; and

14. **I-15 Freeway:** North of SR-60 Freeway.

6.0 Previously Approved Project & Modified Project LOS Comparison

A comparison of the level of service operations and deficiencies has been prepared between the previously approved project as document in the *Leal Specific Plan Traffic Impact Analysis (TIA), Fehr & Peers, May 2015* and the Modified project as currently proposed.

Table 6-1 shows the LOS and deficiency comparison for Existing Plus Project Conditions.

Table 6-2 shows the LOS and deficiency comparison for Cumulative (Long-Range) With Project Conditions.

As shown in Table 6-1 and 6-2, the Modified project results in the same or less LOS deficiencies and impacts when compared to the previously approved project for the analysis scenarios evaluated as part of this report.

Table 6-1
Previously Approved Project vs. Modified Project
Existing Plus Project Conditions
Study Roadway Segment LOS Analysis Comparison

#	Study Roadway Segment	Limits	Previously Approved Project *			Modified Project			Difference	
			Traffic Volume	V/C Ratio	LOS	Traffic Volume	V/C Ratio	LOS	Traffic Volume	V/C Ratio

7.0 Vehicle Miles Traveled (VMT) Evaluation

In response to Senate Bill (SB) 743, the California Natural Resource Agency certified and adopted new CEQA Guidelines in December 2018 which now identify Vehicle Miles Traveled (VMT) as the most appropriate metric to evaluate a project's transportation impact under CEQA (§ 15064.3).

Effective July 1, 2020, the previous CEQA metric of LOS, typically measured in terms of automobile delay, roadway capacity and congestion, generally will no longer constitute a significant environmental impact.

On June 24, 2020, the City of Eastvale adopted Resolution No. 20-44, which establishes VMT impact thresholds for assessing consistency with CEQA Guidelines Section 15064.3, subdivision (b).

Land use projects located within a low VMT-generating area may be presumed to have a less than significant impact absent substantial evidence to the contrary.

Utilizing the latest Riverside County Transportation Model (RIVCOM) and the Western Riverside County Council of Governments (WRCOG) Web Screening Tool, it has been determined that the project site is located within a low-VMT generating zone based on residential home-based VMT and home-based work VMT for both base model year (2018) and future model year (2045).

Utilizing the base model data for VMT screening is appropriate. RIVCOM assumes there will be 2,501 households and 2,107 employees in the project's traffic analysis zone (TAZ) under year 2045 conditions. The project would consist of similar land uses and demographics as estimated in the base model and is expected to exhibit similar VMT patterns.

As a result, the proposed Modified project is exempt from further VMT assessment and may be presumed to have a less than significant impact absent substantial evidence to the contrary.

The WRCOG tool output for the proposed project is provided Attachment A.

8.0 Findings & Conclusions

The purpose of this traffic impact analysis is to evaluate The Leal Masterplan Amendment Project (hereinafter referred to as "modified project") from a traffic and circulation standpoint.

The *Leal Master Plan Draft Environmental Impact Report (DEIR), Michael Baker International, July 2015*, and the *Leal Specific Plan Traffic Impact Analysis (TIA), Fehr & Peers, May 2015)* have been previously prepared for the original project. Since then, modifications to the development plan have been proposed. RK has been requested to review the modified project and identify whether any new impacts or increase in severity of impacts may occur as a result of the modified project.

This analysis has been prepared to be consistent with the previous 2015 TIA and the 2015 DEIR prepared for the project. A copy of the *Leal Specific Plan Traffic Impact Analysis (TIA), Fehr & Peers, May 2015)* is contained as an attachment to this report.

The proposed modified project site is bound by 58th Street to the north, Limonite Avenue to the south, Hamner Avenue to the east, and Scholar Way to the west, in the City of Eastvale. The project site is currently vacant and undeveloped. The project site location map is shown on Exhibit A. The project site plan is shown in Exhibit B.

The previously approved 2015 TIA evaluated the following land uses for the original project:

- 660 dwelling units of multi-family residential;
- 1,525,000 square feet of retail;
- 460,000 square feet of general office;
- 460,000 square feet of medical office;
- 100,000 square feet of civic center; and
- 450 rooms of hotel.

The modified land use assumptions are summarized below.

- 400 dwelling units of single family detached residential;

- 2,100 dwelling units of multi-family residential;
- 390,000 square feet of commercial and retail;
- 65,000 square feet of general office;
- 65,000 square feet of medical office;
- 40,000 square feet of civic center use;
- 25,000 square feet of library use;
- 10,000 square feet of police station use; and
- 12,200 square feet of fire station use.

The Table below summarizes the land uses evaluated in the previously approved 2015 TIA and the Modified Project land use assumptions.

Project Land Uses

Land Use	Units	Previously Approved 2015 Project & traffic Study	Modified Project
Single Family Detached Residential	Dwelling Units	0	400
Multi-family Residential	Dwelling Units	660	2,100
Retail	Square Feet	1,525,000	390,000
General Office	Square Feet	460,000	65,000
Medical Office	Square Feet	460,000	65,000
Civic Center	Square Feet	100,000	40,000
Library	Square Feet	0	25,000
Police	Square Feet	0	10,000
Fire Station	Square Feet	0	12,200
Hotel	Rooms	450	0

Study Area & Analysis Scenarios:

Consistent with the previously approved 2015 traffic study for the proposed project, this analysis evaluates the daily capacity and level of service (LOS) at the following eighteen (18) study roadway segments:

1. **Limonite Avenue:** Archibald Avenue to Harrison Avenue;
2. **Limonite Avenue:** Harrison Avenue to Scholar Way;
3. **Limonite Avenue:** Scholar Way to Hamner Avenue;
4. **Limonite Avenue:** Hamner Avenue to I-15 Ramps;
5. **Limonite Avenue:** I-15 Ramps to Wineville Avenue;
6. **Hamner Avenue:** Citrus Street to Schleisman Road;
7. **Hamner Avenue:** Schleisman Road to 68th Street;
8. **Hamner Avenue:** 68th Street to Limonite Avenue;
9. **Hamner Avenue:** Limonite Avenue to 58th Street;
10. **Hamner Avenue:** 58th Street to Bellegrave Avenue;
11. **Scholar Way:** Limonite Avenue to 68th Street;
12. **I-15 Freeway:** South of Limonite Avenue;
13. **I-15 Freeway:** Limonite Avenue to Cantu-Galleano Ranch Road;
14. **I-15 Freeway:** North of SR-60 Freeway;
15. **Scholar Way:** Bellegrave Avenue to Limonite Avenue;
16. **SR-60 Freeway:** West of I-15 Freeway;

17. **SR-60 Freeway:** East of I-15 Freeway; and

18. **Cantu-Galleano Ranch Road:** I-15 Ramps to Hamner Avenue.

Consistent with the previously approved 2015 traffic study for the proposed project, this analysis evaluates traffic conditions for the following study scenarios:

- Existing Conditions;
- Existing Plus Project Conditions;
- Cumulative (Long-Range) No Project Conditions; and
- Cumulative (Long-Range) Plus Project Conditions.

Project Trip Generation:

The previously approved project was forecast to generate approximately 64,416 daily trips which include approximately 3,030 AM peak hour trips and approximately 6,309 PM peak hour trips.

Based on the ITE trip generation rates, the modified project is forecast to generate approximately 36,652 daily trips which include approximately 1,831 AM peak hour trips and approximately 3,331 PM peak hour trips

When compared to the previously approved project, the modified project is forecast to generate approximately 27,764 net fewer daily trips which include approximately 1,200 net fewer AM peak hour trips and approximately 2,978 net fewer PM peak hour trips compared to the original project.

Based upon the preliminary trip generation analysis, the modified project is expected to generate fewer trips than were analyzed in the 2015 TIA and DEIR. Hence, additional traffic impacts are not expected.

LOS Analysis Findings:

Based on the LOS analysis conducted, the Modified project results in the same or less LOS deficiencies and impacts when compared to the previously approved project for the analysis scenarios evaluated as part of this report.

VMT Analysis Findings:

Utilizing the Western Riverside County Council of Governments (WRCOG) Screening Tool, the modified project site is located within a low-VMT generating zone based on residential home-based VMT and home-based work VMT.

As a result, the proposed Modified project is exempt from further VMT assessment and may be presumed to have a less than significant impact absent substantial evidence to the contrary.

The WRCOG tool output for the proposed project is provided Attachment A.

1.0 SUMMARY OF IMPACTS AND MITIGATION MEASURES

The purpose of this report is to analyze the projected impact of traffic generated by the proposed Leal Specific Plan on the area surrounding the project site. This report will begin with a summary of impacts in the area due to the proposed project. Mitigation measures for these impacts will then be discussed. This information is presented first to provide decision makers with an up-front summary of the impacts and mitigation measures for the project.

The following chapters summarize the remaining components of this assessment, including the methodology used for the analysis in this project and a detailed description of the environmental setting.

TRANSPORTATION IMPACT ASSESSMENT

According to the California Environmental Quality Act (CEQA) guidelines, a project results in a significant impact from a transportation perspective if the project:

- Conflicts with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit
    - In the City of Eastvale, the performance standards that are identified in the City's General Plan and in this specific plan include:
        - Maintaining Level of Service (LOS) C on local roadways.
            - This specific plan does identify the need to modify the "acceptable" LOS threshold in the study area, particularly on Limonite Avenue, as it will operate at LOS F into the future
            - For Caltrans facilities, LOS C was identified as the minimum acceptable operating level per their guidelines, which state that the threshold between LOS C and LOS D should apply
- Conflicts with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways.
- Substantially increases hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)
- Results in inadequate emergency access

- Conflicts with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities

CEQA also requires the project to be evaluated for its impacts to the existing setting and the cumulative impacts of the project. As such, this transportation assessment evaluates the following scenarios from a transportation perspective:

1. Existing Conditions
2. Existing plus Project Conditions
3. Cumulative No Project Conditions
4. Cumulative plus Project Conditions

IMPACTS

The proposed project and the analysis results were compared to the significance criteria described above to identify project impacts. The results are summarized below.

a) Does the proposed project conflict with an applicable plan, ordinance or policy?

Determination: Significant impacts with mitigation measures

The proposed project is consistent with adopted plans and policies related to non-motorized travel in the area. In fact, the project includes facilities to support bicycles and pedestrians on site. Additionally, the land use plan allows for a mix of uses that will increase project trip internalization and potential land use densities on the project site will support transit use in the study area.

To evaluate motorized facilities, the significance criteria from applicable jurisdictions summarized above were applied to the analysis results to identify significant impacts. The results are summarized in Table 1-1.

All locations where significant project impacts occur are subject to mitigation, if feasible, which is described later in this chapter.

Existing Plus Project impacts are projected to be:

- Limonite Avenue: Between Harrison Avenue & Scholar Way - The addition of project traffic degrades traffic operations from LOS C to LOS D
- Limonite Avenue: Between Scholar Way & Hamner Avenue- The addition of project traffic degrades operations from LOS C to LOS F
- Limonite Avenue: Between Hamner Avenue & I-15 SB Ramp - The addition of project traffic degrades operations from LOS C to LOS F

Notes:

Shading indicates unacceptable operations.

1. Volume to capacity ratio (V/C) measures the actual volume of vehicles observed or counted on any street segment in relation to the throughput capacity of the facility. Any measure higher than about 0.80 indicates some level of congestion. The number can exceed 1.00, indicating an overloaded situation with stop and go traffic.
2. The proposed I-15 Toll Lanes are assumed but are not incorporated in this volume-to-capacity assessment (e.g. the assessment only evaluates the general purpose lanes).

Source: Fehr & Peers, 2015

- Limonite Avenue: Between NB I-15 Ramp & Wineville Avenue - The addition of project traffic degrades operations from LOS D to LOS F
- Hamner Avenue: Between Limonite Avenue & Bellgrave Avenue- The addition of project traffic degrades operations from LOS C to LOS F

Cumulative impacts are projected to be:

- Limonite Anenue: Between Archibald Avenue and Harrison Avenue – The addition of project traffic degrades operations from LOS D to LOS E
- Limonite Avenue: Between Harrison Avenue & Scholar Way – The addition of project traffic degrades operations from LOS E to LOS F
- Limonite Avenue: Between Scholar Way & Hamner Avenue – The addition of project traffic degrades operations from LOS E to LOS F
- Limonite Avenue: Between Hamner Avenue & I-15 SB Ramp – The project adds traffic to a segment already operating at LOS F
- Limonite Avenue: Between I-15 Northbound Ramps & Wineville Avenue – The project adds traffic to a segment already operating at LOS F
- Hamner Avenue: Between Limonite Avenue & Bellgrave Avenue- The addition of project traffic degrades operations from LOS C to LOS F
- I-15 South of Limonite – The addition of project traffic degrades operations from LOS C to LOS D
- Cantu-Galleano Ranch Road: Between I-15 Ramps & Hamner Avenue – The addition of project traffic degrades operations from LOS C to LOS D.

b) Would the project conflict with an applicable congestion management program (CMP), including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Determination: Less than significant

The Riverside County CMP does not require any specific analysis methodology or analysis requirements be addressed in a transportation impact analysis for a development project. Therefore, Part B of the significance thresholds does not apply to analysis of the project.

c) Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Determination: Less than significant

The project does not include any characteristics that would change air traffic in the study area nor is the site within an airport land use influence area. Therefore, the impacts of the project are considered less-than-significant.

d) Would the project substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Determination: Less than significant with mitigation

Given that specific tract maps have not been completed for the project, it is unknown whether project driveways and internal circulation would have specific design features that would potentially increase hazards in the study area. Given the potential that increased hazards could occur due to a design feature, this impact is considered potentially significant.

e) Would the project result in inadequate emergency access?

Determination: Less than significant with mitigation

The project includes a series of connectivity that will provide for servicing emergency personnel. However, since tentative tract maps have not been completed yet, not every development building could be assessed, nor could internal neighborhood roadways be reviewed to assess emergency accessibility. Therefore, this impact is considered ***potentially significant***.

f) Would the project conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

Determination: Less than significant

The mixed use nature of the Specific Plan supports use of alternative modes of travel. As such, this impact is considered ***less-than-significant***.

MITIGATION MEASURES

For potentially significant impacts described above, the project is responsible for implementing feasible mitigation measures as described below.

Mitigation 1 – Improvements to Roadway Segments

Improvements to the roadway segments identified below would provide acceptable operations. Additionally, the project will be required to contribute its fair share funding for many regional impacts

through the County's Transportation Uniform Mitigation Fee (TUMF) program, which is the regional funding source for many facilities in Riverside County, and any local transportation fees.

Additionally, future development within the project shall be required to prepare a focused traffic study that will assess the following to ensure consistency with the assessment prepared for this project:

- Parking assessment
- Site access and on-site circulation assessment
- Interaction of driveways with adjacent intersections (if appropriate)
- Impact assessment of local intersections
- Impacts to pedestrian, transit, and bicycle facilities
- Trip generation monitoring study to ensure that, as land develops in the Leal specific plan area, the total development generates traffic at or below those assumed in this EIR

The locational improvements described below were developed to mitigate potentially significant impacts of the project at the study locations. Fehr & Peers also identified the amount of development that can occur from the project prior to triggering the identified impact. This is anticipated to assist the City in identifying levels of development that can occur prior to the impact occurring.

Existing plus Project Mitigation Measures

Limonite Avenue: Between Harrison Avenue & Scholar Way

The addition of project traffic degrades operations from LOS C to LOS D under Existing plus Project Conditions. To mitigate this impact, the roadway would need to be widened to six lanes. Since the regional TUMF program will widen this segment to six lanes, the project shall be responsible to pay its fair share of this improvement through the TUMF program. With this mitigation and implementation of the planned TUMF improvements, the impact would be mitigated to a ***less-than-significant level.***

Limonite Avenue: Between Scholar Way & Hamner Avenue

The addition of project traffic degrades operations from LOS C to LOS F under Existing plus Project Conditions. To mitigate this impact, the roadway would need to be widened to eight lanes. It should be noted that the project shall be responsible for a fair share payment toward the TUMF program, which is responsible for widening this facility to six lanes. However, widening beyond six lanes is inconsistent with the City's General Plan.

Given that the project identifies the need to widen this segment beyond six lanes, the City shall be responsible implementing the proposed general plan policy amendment to change the level of service threshold for acceptability from LOS C to LOS F on Limonite Avenue. With this policy change, although there will be congestion on this segment with the project, it would operate acceptably and the impact would be ***less-than-significant.***

Limonite Avenue: Between Hamner Avenue & I-15 Ramps

The addition of project traffic degrades operations from LOS C to LOS F under Existing plus Project Conditions. To mitigate this impact, the roadway would need to be widened beyond eight lanes which would be inconsistent with the City's General Plan.

Given that the roadway would need to be widened beyond six lanes, the City shall be responsible implementing the proposed general plan policy amendment to change the level of service threshold for acceptability from LOS C to LOS F on Limonite Avenue. With this policy change, although there will be congestion on this segment with the project, it would operate acceptably and the impact would be ***less-than-significant.***

Limonite Avenue: Between I-15 Ramps & Wineville Avenue

The addition of project traffic degrades operations from LOS D to LOS F under Existing plus Project Conditions. To mitigate this impact, the roadway would need to be widened to six lanes. The project shall be responsible to implement this improvement. It should be noted that this segment is a TUMF-designated facility; however, the TUMF program will only widen the roadway to its current cross-section. Additionally, this segment is outside the City of Eastvale and, as such, neither the City nor any developer can guarantee implementation of the mitigation measure. As such, this impact is considered ***significant-and-unavoidable.***

Hamner Avenue: Between Limonite Avenue & Bellgrave Avenue

The addition of project traffic degrades operations from LOS C to LOS F under Existing plus Project Conditions. To mitigate this impact, the roadway would need to be widened to six lanes. The project shall be responsible to implement this improvement. With implementation of the mitigation measure, the impact would be mitigated to a ***less-than-significant level.***

Cumulative plus Project Impacts

Limonite Avenue: Between Archibald Avenue & Harrison Avenue

The addition of project traffic degrades cumulative operations from LOS D to LOS E under Cumulative plus Project Conditions. To mitigate this impact, the roadway would need to be widened beyond six lanes. With this improvement, the roadway segment would operate at an acceptable level of service. However, this widening would be inconsistent with the City's General Plan roadway designation for this facility and the ultimate planned improvements through the regional TUMF program.

Given that the roadway would need to be widened beyond six lanes, the City shall be responsible implementing the proposed general plan policy amendment to change the level of service threshold for acceptability from LOS C to LOS F on Limonite Avenue. With this policy change, although there will be congestion on this segment with the project, it would operate acceptably and the impact would be ***less-than-significant.***

Limonite Avenue: Between Harrison Avenue & Scholar Way

The addition of project traffic degrades cumulative operations from LOS E to LOS F under Cumulative plus Project Conditions. To mitigate this impact, the roadway would need to be widened beyond six lanes. With this improvement, the roadway segment would operate at an acceptable level of service. However, this widening would be inconsistent with the City's General Plan roadway designation for this facility and the ultimate planned improvements through the regional TUMF program.

Given that the roadway would need to be widened beyond six lanes, the City shall be responsible implementing the proposed general plan policy amendment to change the level of service threshold for acceptability from LOS C to LOS F on Limonite Avenue. With this policy change, although there will be congestion on this segment with the project, it would operate acceptably and the impact would be ***less-than-significant.***

Limonite Avenue: Between Scholar Way & Hamner Avenue

The addition of project traffic degrades cumulative operations from LOS E to LOS F under Cumulative plus Project Conditions. To mitigate this impact, the roadway would need to be widened beyond six lanes. With this improvement, the roadway segment would operate at an acceptable level of service. However, this widening would be inconsistent with the City's General Plan roadway designation for this facility and the ultimate planned improvements through the regional TUMF program.

Given that the roadway would need to be widened beyond six lanes, the City shall be responsible implementing the proposed general plan policy amendment to change the level of service threshold for acceptability from LOS C to LOS F on Limonite Avenue. With this policy change, although there will be congestion on this segment with the project, it would operate acceptably and the impact would be ***less-than-significant.***

Limonite Avenue: Between Hamner Avenue & I-15

The project adds traffic to a segment already operating at LOS F under Cumulative plus Project Conditions. To mitigate this impact, the roadway would need to be widened beyond six lanes. However, this widening would be inconsistent with the City's General Plan roadway designation for this facility and the ultimate planned improvements through the regional TUMF program.

Given that the roadway would need to be widened beyond six lanes, the City shall be responsible implementing the proposed general plan policy amendment to change the level of service threshold for acceptability from LOS C to LOS F on Limonite Avenue. With this policy change, although there will be congestion on this segment with the project, it would operate acceptably and the impact would be ***less-than-significant.***

Limonite Avenue: Between I-15 Ramps & Wineville Avenue

The project adds traffic to a roadway segment already projected to operate at LOS F. To mitigate this impact, the roadway would need to be widened beyond six lanes and the project would be responsible to contribute a fair share payment through the TUMF program as it is a TUMF designated facility. It should be noted that the TUMF program will only widen the roadway to its current cross-section. Additionally,

this segment is outside the City of Eastvale and, as such, neither the City nor any developer can guarantee implementation of the mitigation measure. As such, this impact is considered ***significant-and-unavoidable.***

Hamner Avenue: Between Limonite Avenue & Bellgrave Avenue

The addition of project traffic degrades operations from LOS C to LOS F under Cumulative plus Project Conditions. To mitigate this impact, the roadway would need to be widened beyond the six lanes that are planned for in the City's General Plan. The project shall be responsible to for a fair share contribution toward this improvement.

Given that the roadway would need to be widened beyond six lanes (which would be inconsistent with the City's General Plan) the City shall be responsible implementing a proposed general plan policy amendment to change the level of service threshold for acceptability from LOS C to LOS F on this roadway segment. With this policy change, although there will be congestion on this segment with the project, it would operate acceptably and the impact would be ***less-than-significant.***

I-15: South of Limonite

The project is expected to degrade operations on this roadway segment from LOS C to LOS D. To mitigate this impact, the project would be responsible for a fair share contribution toward additional freeway capacity beyond that already planned for along the segment. Additionally, this segment is outside the City of Eastvale and, as such, neither the City nor any developer can guarantee implementation of the mitigation measure. As such, this impact is considered ***significant-and-unavoidable.***

I-15: North of SR-60

The project is expected to degrade operations on this roadway segment from LOS C to LOS D. To mitigate this impact, the project would be responsible for a fair share contribution toward additional freeway capacity beyond that already planned for along the segment. Additionally, this segment is outside the City of Eastvale and, as such, neither the City nor any developer can guarantee implementation of the mitigation measure. As such, this impact is considered ***significant-and-unavoidable.***

Cantu-Galleano Ranch Road: Between the I-15 Ramps & Hamner Avenue

The project is expected to degrade operations on this roadway segment from LOS C to LOS D. To mitigate this impact, the project would be responsible for a fair share contribution toward widening this segment from four lanes to six lanes through the City's development impact fee program. With this improvement, the impacts would be mitigated and the impact would be less-than-significant.

Transportation Impact 2 - Potential Increase in Hazards Due to a Design Feature

The following policy/mitigation measure shall be added to the Leal specific plan to address the impact identified above:

All future improvements in the Leal area shall be consistent with design standards set forth by the City or Leal Specific Plan. All designs, including site access points, shall be reviewed to determine that designs are consistent with appropriate design standards. Implementation of this policy/mitigation measure will reduce this impact to a ***less-than-significant*** level and no further mitigation is required.

Transportation Impact 3 - Potential Inadequate Emergency Access

The following policy/mitigation measure shall be added to the leal specific plan to address the impact identified above:

- All proposed development in the Leal area shall be reviewed by appropriate emergency services personnel to ensure adequate emergency access is provided. Implementation of this policy/mitigation measure will reduce this impact to a ***less-than-significant*** level and no further mitigation is required.

2.0 METHODOLOGY

This section of the report describes the methodologies used to complete this programmatic assessment.

TRAFFIC OPERATIONS

The analysis methodology used to analyze roadway segments is described below. The operations of roadway facilities are described with the term *level of service*. Level of service (LOS) is a qualitative description of traffic flow from the perspective of motorists based on factors such as speed, travel time, delay, freedom to maneuver, traffic volume, and the capacity of the roadway. Six levels are defined from LOS A, as the least congested operating conditions, to LOS F, or the most congested operating conditions. LOS E represents "at-capacity" operations. When volumes exceed capacity, stop-and-go conditions result and operations are designated as LOS F.

Roadway segments were analyzed by comparing the average daily traffic (ADT) volume to daily volume thresholds. Table 2-1, Roadway Segment Daily Volume Thresholds**,** displays the daily volume thresholds for various facility types. These thresholds are used as guidelines to identify the need for new or upgraded facilities.

TABLE 2-1

ROADWAY SEGMENT DAILY VOLUME THRESHOLDS[1]

Facility Type	Max Two-Way Traffic Volume		
	LOS C	LOS D	LOS E
Secondary Collector	10,400	11,700	13,000
Urban Arterial (4 Lanes)	28,700	32,300	35,900
Urban Arterial (6 Lanes)	43,100	48,500	53,900
Freeway (6 Lanes)	9,4000	105,800	117,500
Freeway (8 Lanes)	128,400	144,500	160,500
Freeway (10 Lanes)	160,500	180,500	200,600

Notes:

1. All volume thresholds are approximate and assume ideal roadway characteristics. Actual thresholds for each LOS listed above may vary depending on a variety of factors including (but not limited to) roadway curvature and grade, intersection or interchange spacing, driveway spacing, percentage of trucks and other heavy vehicles, lane widths, signal timing, on-street parking, volume of cross traffic and pedestrians, etc.

Source: Highway Capacity Manual, Transportation Research Board, 2000. & City of Eastvale General Plan

TRIP GENERATION AND INTERNALIZATION

This study utilized the 9th Edition of the Institute *of Transportation Engineers* (ITE) Trip Generation rates to determine daily trips generated by the proposed land use. Internalization rates were determined based on Mixed Use Development trip generation methodology (MXD). This methodology evaluates numerous components of a project and identifies the projects' potential to internalize traffic. The MXD model's methodology was developed based on 239 mixed-use sites across the United States, including sites in San Diego and Sacramento. Because of this the MXD model provides the most statistically valid and reliable way to estimate trip internalization for mixed-use development.

Because the specific plan allows for a range of development potential, a "worst case" assumption was made for the specific plan land uses. Our assumptions are summarized below:

- 660 multi-family homes (apartments)
- 1,525,000 sq. ft. of general retail (shopping center)
- 460,000 sq. ft. of general office
- 460,000 sq. ft. of medical office
- 450 hotel rooms
- 100,000 sq. ft. civic center

Utilizing the ITE trip generation and MXD trip internalization estimates, the project is expected to result in the following trip generation:

- 69,900 Gross Daily Trips
- 10% Trip Internalization (e.g. trips that stay within the specific plan area based on the land use information provided above (plus the project's proximity to transit, assumed intersection density, and other factors that affect trip internalization)
- 63,000 Net Daily Trips after accounting for trip internalization

The project trips were distributed to the surrounding roadway system using existing travel patterns in the area and the locations of complementary land uses in the area. The trip distribution information is summarized below:

- Limonite Avenue between Archibald Avenue & Scholar Way will see 10% of the total project trips.
- Limonite Avenue between Scholar Way & Hamner Avenue will see 50% of the total project trips.
- Limonite Avenue between Hamner Avenue & Southbound I-15 Ramps will see 45% of the total project trips.

- Limonite Avenue between the Northbound I-15 Ramps & Wineville Avenue will see 10% of the total project trips.
- Hamner Avenue between Citrus Avenue and 68th Street will see 10% of the total project trips.
- Hamner Avenue between 68th Street & Limonite Avenue, as well as Scholar Way between 68th Street & Limonite Avenue will see 5% of the total project trips.
- Hamner Avenue between Limonite Avenue & Bellgrave Avenue will see 45% of the total project trips.
- Hamner Avenue north of SR-60 will see 5% of total project trips.
- Cleveland Avenue between 58th Street & Limonite Avenue will see 5% of the total project trips.
- I-15 south of Limonite Avenue will see 20% of the total project trips.
- I-15 between Limonite Avenue & Cantu-Galleano Ranch Road will see 15% of the total project trips.
- I-15 north of SR-60 will see 15% of the total project trips.
- Cantu-Galleano Ranch Road will see 10% of the total project trips.
- SR-60 west of I-15 will see 15% of the total project trips.
- SR-60 east of I-15 will see 15% of the total project trips.

TRAVEL DEMAND FORECASTING

The Riverside Traffic Analysis Model (RIVTAM) was used for developing cumulative forecasts in the study area. This model incorporates land use information and roadway network characteristics (roadway alignments, roadway capacities, speeds) to forecast existing and future volumes on area roadways in Riverside County. This model also accounts for projected growth and land use changes within the county allowing for a more accurate forecast of future conditions.

Before the model could be used for this study, the land use and socio-economic components of the model were modified. These modifications are refinements to the model, and are intended to enable the model to more accurately reflect the proposed land use in the Leal Specific Plan study area.

One modification that was made was an update to the socio-economic data within the model to incorporate approved and pending projects in the study area. The approved and pending projects were converted from square feet of development to numbers of employees using conversion factors from the County of Riverside General Plan and were incorporated into the travel demand model. The model was also modified to delete any assumed land use in the Leal specific plan area as that land use was manually added to the "no project" forecasts.

APPROVED/PENDING PROJECTS

The resulting RIVTAM model incorporates several large scale developments in the City of Eastvale. Major land use projects included in the forecasts are listed in Table 2-2 below.

TABLE 2-2

APPROVED/PENDING PROJECTS

Project Name	Location	Description	Year	Source
Estancia by Lennar Homes	Citrus Avenue. between Sumner Avenue & Scholar Way	197 Single Family Homes	2013	City of Eastvale
The Trails at Eastvale	Corner of Archibald Avenue . & 65th Street	224 Single Family Homes	2013	City of Eastvale
Copper Sky	Schleisman Road & Scholar Way	224 Condominium Units	2007	City of Eastvale
Cleveland Square	Scholar Way & Limonite Avenue	350 Condominium Units	2009	City of Eastvale
Eastvale Business Park	North of 65th Street, East of Cucamonga Creek & West of Archibald Avenue	694,770 SF Industrial, 33,600 SF Office, 10,600 SF Retail	2014	City of Eastvale
Eastvale San Antonio Medical Plaza	Eastvale Gateway South	69,562 SF Medical Buildings	2013	City of Eastvale
Arco Gas Station	SE Corner of Hamner Avenue & Riverside Dr.	5,670 SF Gas Station	2014	City of Eastvale
Marketplace at The Enclave	SW Corner of Archibald Avenue & Schleisman Rd	Additional Retail Space	2014	City of Eastvale
Eastvale Gateway I & II	NE Corner of Hamner Avenue & Limonite Avenue	6,000 SF Retail	2014	City of Eastvale
Eastvale Gateway South	SE Corner of Hamner Avenue & Limonite Avenue	11,000 SF Retail	2014	City of Eastvale

3.0 REGULATORY CONTEXT

Existing transportation policies, laws, and regulations that would apply to the proposed project are summarized below. This information provides a context for the input discussion related to the project's consistency with applicable regulatory conditions.

CALIFORNIA DEPARTMENT OF TRANSPORTATION (CALTRANS)

Caltrans policies are applicable to I-15, and SR-60 are summarized in the Caltrans' *Guide for the Preparation of Traffic Impact* Studies (State of California Department of Transportation, December 2002). These guidelines identify when a traffic impact study is required, what should be included in the study, analysis scenarios, and guidance on acceptable analysis methodologies.

Caltrans endeavors to maintain a target service level of LOS C on State highway facilities. However, this may not always be feasible and it is recommended that the lead agency consult with Caltrans to determine the appropriate target LOS. For the purposes of this study, LOS C is considered the minimum acceptable operating level for Caltrans' controlled facilities (SR-60 roadway segments, I-15 roadway segments).

CITY OF EASTVALE GENERAL PLAN

The City of Eastvale provides the following policies regarding traffic and circulation issues such as LOS Standards, roadway funding, growth impacts, road standards, transit, and access:

- **Policy C-3:** The cumulative and indirect traffic impacts of development may be mitigated through the payment of impact mitigation fees.

- **Policy C-10:** Seek to maintain the following target levels of service: "C" along all City-maintained roads. A peak hour level of service of "D" may be allowed in commercial and employment areas, and at intersections of any combination of major highways, urban arterials, secondary highways, or freeway ramp intersections.

- **Policy C-11:** Alternative levels of service may be allowed on intersections in planned development or similar identified mixed-use areas that demonstrate links to transit, trails, and alternative transportation and comfortable walking distance to goods and services.

- **Policy C-13:** Construct and improve traffic signals at appropriate intersections. Traffic signals should be spaced and operated as part of coordinated systems to optimize traffic operation.

RIVERSIDE COUNTY CONGESTION MANAGEMENT PROGRAM

The Riverside County Congestion Management Program provides the following policies regarding LOS and Transportation Demand Management for SR-60, I-15, and Limonite Avenue:

- Minimum LOS threshold is LOS "E". Therefore when a CMP street or highway falls to "F" a deficiency plan is required.

It should be noted that the CMP does not require any specific assessment for development projects. As such, no specific analysis is required to show consistency with the CMP.

4.0 ENVIRONMENTAL SETTING

EXISTING TRANSPORTATION SYSTEM

The proposed Leal Specific Plan project is located in the City of Eastvale in the northeast portion of Riverside County. The site is located east of Cleveland Avenue, west of Hamner Avenue, and north of Limonite Avenue. The site is located approximately 0.5 miles west of Interstate 15 (I-15) which provides the major north-south regional access to the area.

Primary access to the project site is provided by Limonite Avenue, Hamner Avenue, and Cleveland Avenue.

The area surrounding the site is primarily residential. There is retail existing to the east and south of the project site. Automobiles are the primary mode of travel. Limited bus transit service and bicycle and pedestrian facilities exist in the immediate vicinity of the project site. The existing transportation facilities are described in detail below.

ROADWAY NETWORK

Regional access to the project site is provided by I-15 and State Route 60 (SR-60) in the area. Access to the project site from I-15 is provided by the interchange with Cantu-Galleano Ranch Road, and by the interchange at Limonite Avenue. SR-60 provides access to the project site through the I-15 interchange and Hamner Avenue. Local access to the project site is provided by Cleveland Avenue/Scholar Way to the west of the project site, Limonite Avenue to the south, and Hamner Avenue to the east. See Figure 4-1, Project Location for the existing roadway network within the project area. A brief description of the key roadway facilities in the vicinity of the proposed project is provided below.

- Interstate 15 (I-15) is the main north-south facility through Riverside County. It extends the entire length of Riverside County, from its southern border with San Diego County to its northern border with San Bernardino County. I-15 is a six-lane divided freeway from the San Diego County line to the San Bernardino County line. Near the project site, it is a six-lane freeway with interchanges at 6th Street, Cantu-Galleano Ranch Road, and SR-60.
- State Route 60 (SR-60) is a major east-west ten-lane divided freeway, which intersects I-15 in the City of Eastvale. Interchanges near the project site include Archibald Avenue, Haven Avenue to the east, and the I-15 interchange, and Mission Boulevard to the west.

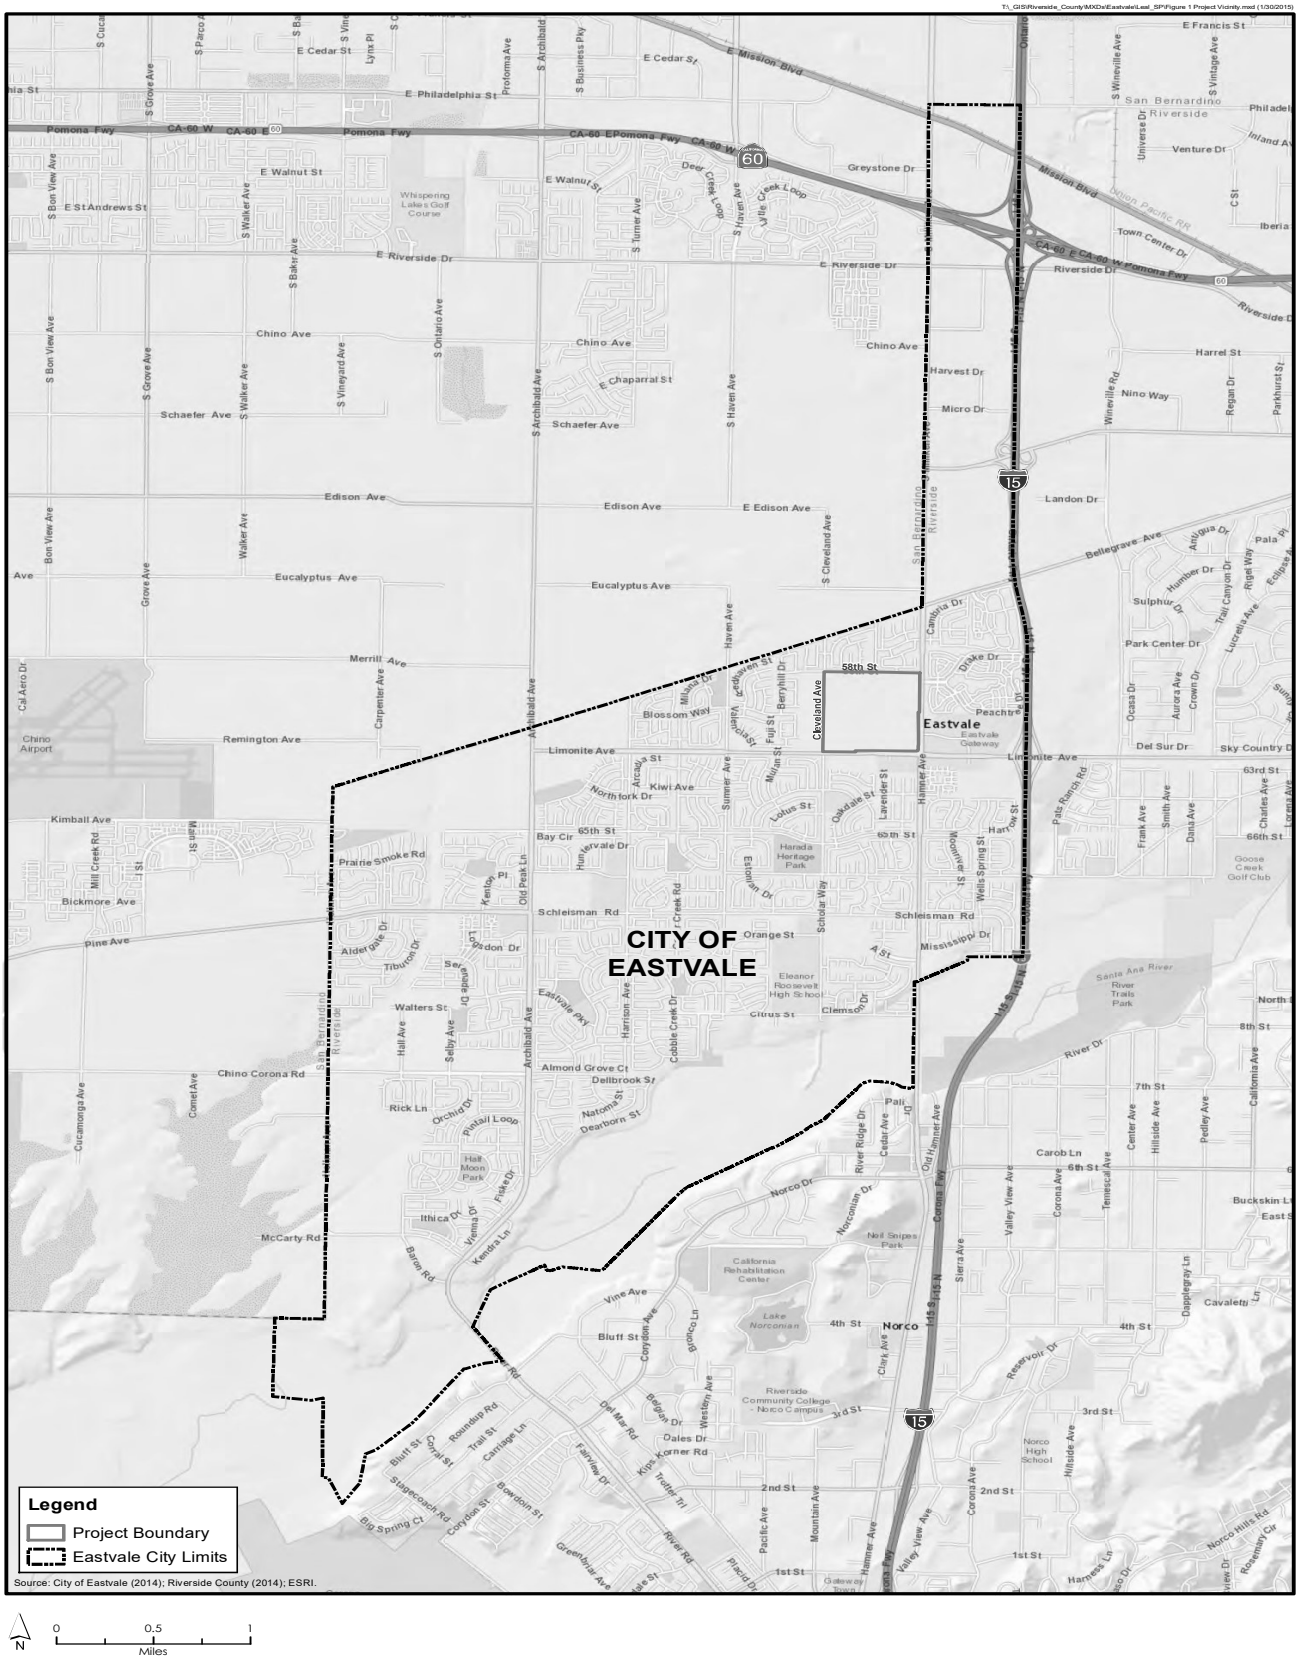

Figure 4-1
Project Location

- Hamner Avenue is a major thoroughfare running north-south through the City of Eastavle. Hamner operates as a four-lane roadway throughout most of the City with two-lanes in some areas, and as many as six lanes in some parts of the city. Hamner provides direct access to the project site from the west, and has two lanes of northbound traffic, and one lane of southbound traffic.
- Cleveland Avenue/Scholar Way is a four-lane roadway running from Citrus Street to Bellgrave Avenue. The roadway is designated as Cleveland Avenue north of Limonite, and Scholar Way south of Limonite in the city. It provides direct access to the project site from the east.
- Limonite Avenue is a major thoroughfare in the City of Eastvale running in the east-west direction. Limonite allows for two-lanes of traffic in each direction, and up to three-lanes in each direction in parts of the city. Limonite provides direct access to the project site from the south.

TRANSIT SYSTEM

Public transportation within Riverside County is provided by Riverside Transit Agency (RTA), which offers both fixed route and Dial-A-Ride service to the City of Eastvale. RTA currently operates two fixed routes to the City, Route 3 and Route 29. Route 3 operates seven days a week with weekday headways of thirty minutes, and weekend headways of one hour. Route 29 operates seven days a week with one hour headways. Route 3 provides access to the project site with stops at Hamner and Swan Lake Estates, and at Limonite and Hamner. Route 29 provides access to the project site with a stop at Limonite and Hamner.

RAIL SYSTEM

Riverside County is served by the Metrolink Riverside Line, which transports commuters from Riverside County to Union Station in Downton Los Angeles. The City of Eastvale has no stations providing service to this line but nearby Jurupa Valley provides riders access to the line.

BIKEWAY SYSTEM

The City of Eastvale does not currently provide an extensive bikeway system. The City identifies three classes of bikeways as:

- Class I: Provides a completely separated right-of-way for the exclusive use of bicycles and pedestrians
- Class II: Provides a striped lane for one-way bike travel on a street or highway
- Class III: Provides for shared use with pedestrian or motor vehicle traffic
- Class IV: This is a new classification that has just been created. Class IV bike facilities are called protected bike lanes or cycle tracks – these facilities are a hybrid between a Class I bicycle facility

and a Class II bicycle facility. They can be either on-street or off-street and are protected by some type of barrier from the adjacent travel lanes.

There are currently no bikeways serving the project site, but the City has an on-going Bicycle Master Plan.

TRAFFIC STUDY AREA

The following study locations were included in our assessment.

Roadway Segments (daily operations)

1. Limonite Avenue: Archibald Avenue to Harrison Avenue
2. Limonite Avenue: Harrison Avenue to Scholar Way
3. Limonite Avenue: Scholar Way to Hamner Avenue
4. Limonite Avenue: Hamner Avenue to I-15 Ramps
5. Limonite Avenue: I-15 Ramps to Wineville Avenue
6. Hamner Avenue: Citrus Street to Schleisman Road
7. Hamner Avenue: Schleisman Road to 68th Street
8. Hamner Avenue: 68th Street to Limonite Avenue
9. Hamner Avenue: Limonite Avenue to Bellgrave Avenue
10. Scholar Way: Limonite Avenue to 68th Street
11. Interstate 15: South of Limonite Avenue
12. Interstate 15: Limonite Avenue to Cantu-Galleano
13. Interstate 15: North of State Route 60
14. Cleveland Avenue: Bellgrave Avenueto Limonite Avenue
15. State Route 60: West of Interstate 15
16. State Route 60: East of Interstate 15
17. Cantu-Galleano Ranch Rd: Interstate 15 Ramps to Hamner Avenue

EXISTING TRAFFIC VOLUMES

Fehr & Peers obtained existing daily traffic counts from the Caltrans District 8 Caltrans Performance Measurement System database for the freeway system and traffic counts conducted by Fehr & Peers on April 14th through April 16th 2015 for local roadways. The average of these three days was used to determine existing volumes. These volumes can be found in Table 4-1.

TABLE 4-1

ROADWAY LEVEL OF SERVICE (LOS) – EXISTING CONDITIONS

ROADWAY SEGMENT	EXISTING CONDITIONS			
	LANES	VOLUME1	V/C2	LOS
LIMONITE AVENUE: ARCHIBALD AVENUE TO HARRISON AVENUE	4	17,425	0.49	C
LIMONITE AVENUE: HARRISON AVENUE TO SCHOLAR WAY	4	24,674	0.69	C

CANTU-GALLEANO RANCH ROAD: I-15 RAMPS TO HAMNER AVENUE	4	12,335	0.34	C

NOTES:

1.EXISITING 2015 TRAFFIC COUNTS

2. VOLUME TO CAPACITY RATIO (V/C) MEASURES THE ACTUAL VOLUME OF VEHICLES OBSERVED OR COUNTED ON ANY STREET SEGMENT IN RELATION TO THE THROUGHPUT CAPACITY OF THE FACILITY. ANY MEASURE HIGHER THAN ABOUT 0.80 INDICATES CONGESTION. THE NUMBER CAN EXCEED 1.00, INDICATING AN OVERLOADED SITUATION WITH STOP AND GO TRAFFIC.

SOURCE: FEHR & PEERS, 2015

EXISTING TRAFFIC CONDITIONS

Fehr & Peers conducted a detailed analysis of the study roadway segments. Areas identified as operating unacceptably are based on the level of service (LOS) policies published in the jurisdictions planning documents. For purposes of this study, the "acceptable" operating level is identified as LOS C, consistent with those thresholds identified in the Riverside County General Plan (which the City of Jurupa Valley operates under), the City of Eastvale General Plan, and the Caltrans Guidelines for Traffic Impact Assessment.

Table 4-1, Roadway Level of Service-Existing Conditions, presents the existing conditions analysis for roadway segments. Currently only one segment, Limonite Avenue from the I-15 Northbound Ramp to Wineville Avenue is operating below the acceptable LOS C.

5.0 EXISTING PLUS PROJECT CONDITIONS

Fehr & Peers added the "with project" forecasts developed for the project to the existing traffic counts to develop Existing Plus Project Traffic Volumes. These volumes are summarized on Figure 5-1 and are presented in Table 5-1.

As shown in Table 5-1, the project is expected to result in a significant impact to the following locations:

- Limonite Avenue: Harrison Avenue to Scholar Way
- Limonite Avenue: Scholar Way to Hamner Avenue
- Limonite Avenue: Hamner Avenue to I-15 Ramps
- Limonite Avenue: I-15 Ramps to Wineville Avenue
- Hamner Avenue: Limonite Avenue to Bellgrave Avenue

Measures to mitigate project impacts are summarized in Chapter 1.

TABLE 5-1

ROADWAY LEVEL OF SERVICE – EXISTING VS. EXISTING PLUS PROJECT CONDITIONS

Cantu Galleano Ranch Road: I-15 Ramps to Hamner Avenue	4	12,335	0.34	C	18,635	0.52	C

Notes:

1.Exisiting 2015 Traffic Counts

2. Volume to capacity ratio (V/C) measures the actual volume of vehicles observed or counted on any street segment in relation to the throughput capacity of the facility. Any measure higher than about 0.80 indicates congestion. The number can exceed 1.00, indicating an overloaded situation with stop and go traffic.

Existing (2015) Plus Project Conditions

Daily Volumes

6.0 CUMULATIVE CONDITIONS

As noted previously, cumulative traffic volumes were developed using the RIVTAM travel demand forecasting model after updating the land use information to incorporate approved and pending projects in the study area that were not included in the travel demand model assumptions.

In addition to the modeling modifications, it is assumed that the following roadways improvements would occur by year 2035 and these improvements are included in the forecasting and analysis assumptions:

- Limonite will be widened to six lanes
- Two express lanes each direction will be implemented on I-15 (please note that the reported traffic volumes on I-15 and the assumed capacity in the technical analysis is for the general purpose lanes only)
- Hamner Avenue will be widened to six lanes

Table 6-1 summarizes the results of the Cumulative No Project assessment. The Cumulative No Project traffic volumes are summarized on Figure 6-1.

As shown in Table 6-1, the following roadway segments are expected to operate unacceptably under the Cumulative No Project Condition:

- Limonite Avenue: Archibald Avenue to Harrison Avenue
- Limonite Avenue: Harrison Avenue to Scholar Way
- Limonite Avenue: Scholar Way to Hamner Avenue
- Limonite Avenue: Hamner Avenue to I-15 Ramps
- Limonite Avenue: I-15 Ramps to Wineville Avenue

TABLE 6-1

CANTU GALLEANO RANCH ROAD: I-15 RAMPS TO HAMNER AVENUE	4	23,980	0.67	C

SHADING INDICATES UNACCEPTABLE OPERATIONS.

1. VOLUME TO CAPACITY RATIO (V/C) MEASURES THE ACTUAL VOLUME OF VEHICLES OBSERVED OR COUNTED ON ANY STREET SEGMENT IN RELATION TO THE THROUGHPUT CAPACITY OF THE FACILITY. ANY MEASURE HIGHER THAN ABOUT 0.80 INDICATES CONGESTION. THE NUMBER CAN EXCEED 1.00, INDICATING AN OVERLOADED SITUATION WITH STOP AND GO TRAFFIC.

Cumulative (2035) No Project Conditions

Daily Volumes

7.0 CUMULATIVE PLUS PROJECT CONDITIONS

Project trips were added to the Cumulative No Project traffic volumes to develop Cumulative Plus Project traffic volumes. These volumes are summarized in Table 7-1 and are shown on Figure 7-1.

As shown in Table 7-1, the following locations are projected to operate at an unacceptable level under the Cumulative Plus Project Condition:

- Limonite Avenue: Archibald Avenue to Harrison Avenue
- Limonite Avenue: Harrison Avenue to Scholar Way
- Limonite Avenue: Scholar Way to Hamner Avenue
- Limonite Avenue: Hamner Avenue to I-15 Ramps
- Limonite Avenue: I-15 Ramps to Wineville Avenue
- Hamner Avenue: Limonite Avenue to Bellgrave Avenue
- I-15: South of Limonite Avenue
- I-15: North of SR-60
- Cantu Galleano Ranch Road: I-15 Ramps to Hamner Avenue

Measures to mitigate cumulative impacts are summarized in Chapter 1.

TABLE 7-1

Sewer System Development Analysis

Date: December 6, 2021

For: Peter Carlson
Carlson Strategic Land Solutions

By: Katie O'Connor, P.E.
Hunsaker & Associates Irvine, Inc.

Project: **Leal Ranch Development Area**

Hunsaker & Associates Irvine, Inc. (H&A) is pleased to submit the Sewer System Development Analysis for the Leal Ranch Development Area. This analysis has been prepared to describe the proposed sewer points of connections for the aforementioned development project in the City of Eastvale. The project lies within the jurisdiction of the Jurupa Community Services District (JCSD) and their standards have been used for this report.

FOUNDING PARTNERS:
RICHARD HUNSAKER
TOM R. McGANNON
JOHN A. MICHLER
DOUGLAS G. SNYDER

This evaluation is based on existing and known conditions and should be re-evaluated if these conditions change or new information becomes available. Any interpretation of the information presented in this report should be referred to H&A to ensure the integrity of the results.

Project Location

The Leal Ranch Development Area is located in the City of Eastvale west of Hamner Avenue, north of Limonite Avenue, east of Scholar Way and south of 58th Street.

PRINCIPALS:
FRED GRAYLEE
BRADLEY HAY
PAUL HUDDLESTON
KAMAL H. KARAM
DOUGLAS L. STALEY
KRIS WEBER
JOSEPH E. WIGHTMAN

Project Description

The Leal Ranch Development Area is master planned development that will include residential, mixed use commercial, recreation, and community facilities.

Summary of Findings

SANITARY SEWER

JCSD provided preliminary hydraulic analysis (performed by Webb and Associates, August 2021) of the existing sewer system that would be impacted by the proposed Leal Ranch Development Area. The purpose of this analysis was to determine the maximum average daily sewer generation from Leal Ranch Development without causing downstream sewer capacity issues in the existing system. JCSD determined that the maximum allowed average daily flows from the Leal Ranch development would be 555,000 GPD. Attached is the exhibit provided by JCSD depicting the sewer loading points for the project and the impact that flow has on the existing system.

The project is designed in such a way that the sewer points of connection will all be provided from the existing sewer in Limonite. There will be no points of connection to the existing sewer in Hamner Ave. The current Leal Ranch development land

Three Hughes

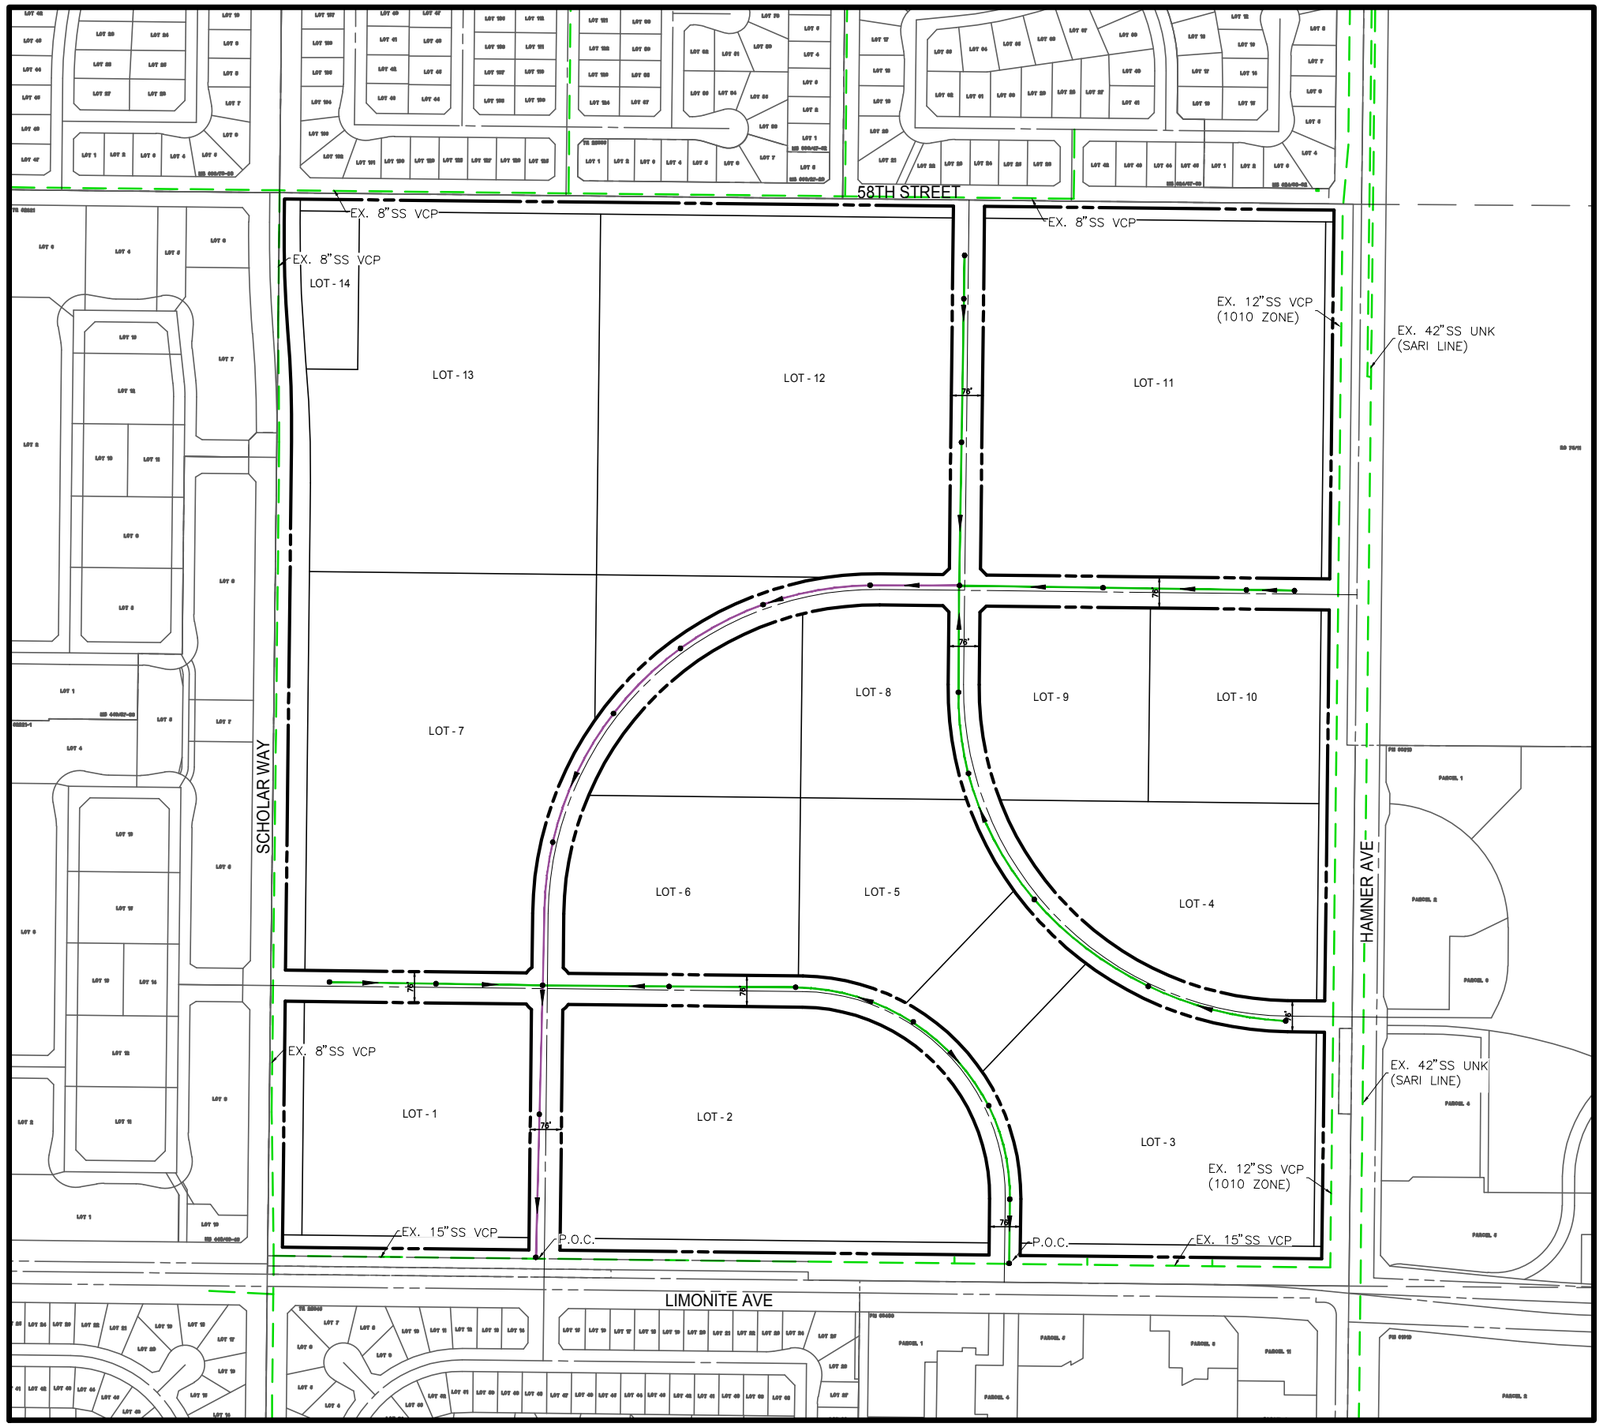
(949) 583-1010 PH
(949) 583-0759 FX
www.hunsaker.com



uses and densities produce average sewer flows of 544,710 GPD. The proposed project is 1.85% less than the maximum allowed average sewer flows from the site. Please see the attached summary comparing current design sewer generation flows with maximum acceptable sewer generation flows.

We sincerely trust these calculations will provide sufficient insight to the proposed and existing facilities that will serve the Leal Ranch Development Area. Please contact me at (949) 458-5437 with any questions.

Section 1. Introduction

Purpose

This document prepared for the New Home Company is a Water Supply Assessment (WSA) intended to meet the requirements of Senate Bill (SB) 610. The water demand for the Eastvale Leal Property ("proposed project") is calculated and the adequacy of water supplies to meet the proposed project is evaluated.

SB 610 established the primary legal standards for assessing the sufficiency of water supplies for new development projects. These statutes require as part of the environmental review conducted for a qualifying project pursuant to the California Environmental Quality Act (CEQA), the public water supplier or land use agency – in this case Jurupa Community Services District – must prepare a "water supply assessment" of the reliability of water supplies for the project, considering normal, single dry, and multiple dry years over a 20-year horizon. The basic requirement is that a WSA must "include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the water system's existing and planned future uses, including agricultural and manufacturing uses."[1]

References used in preparing this document include the following:

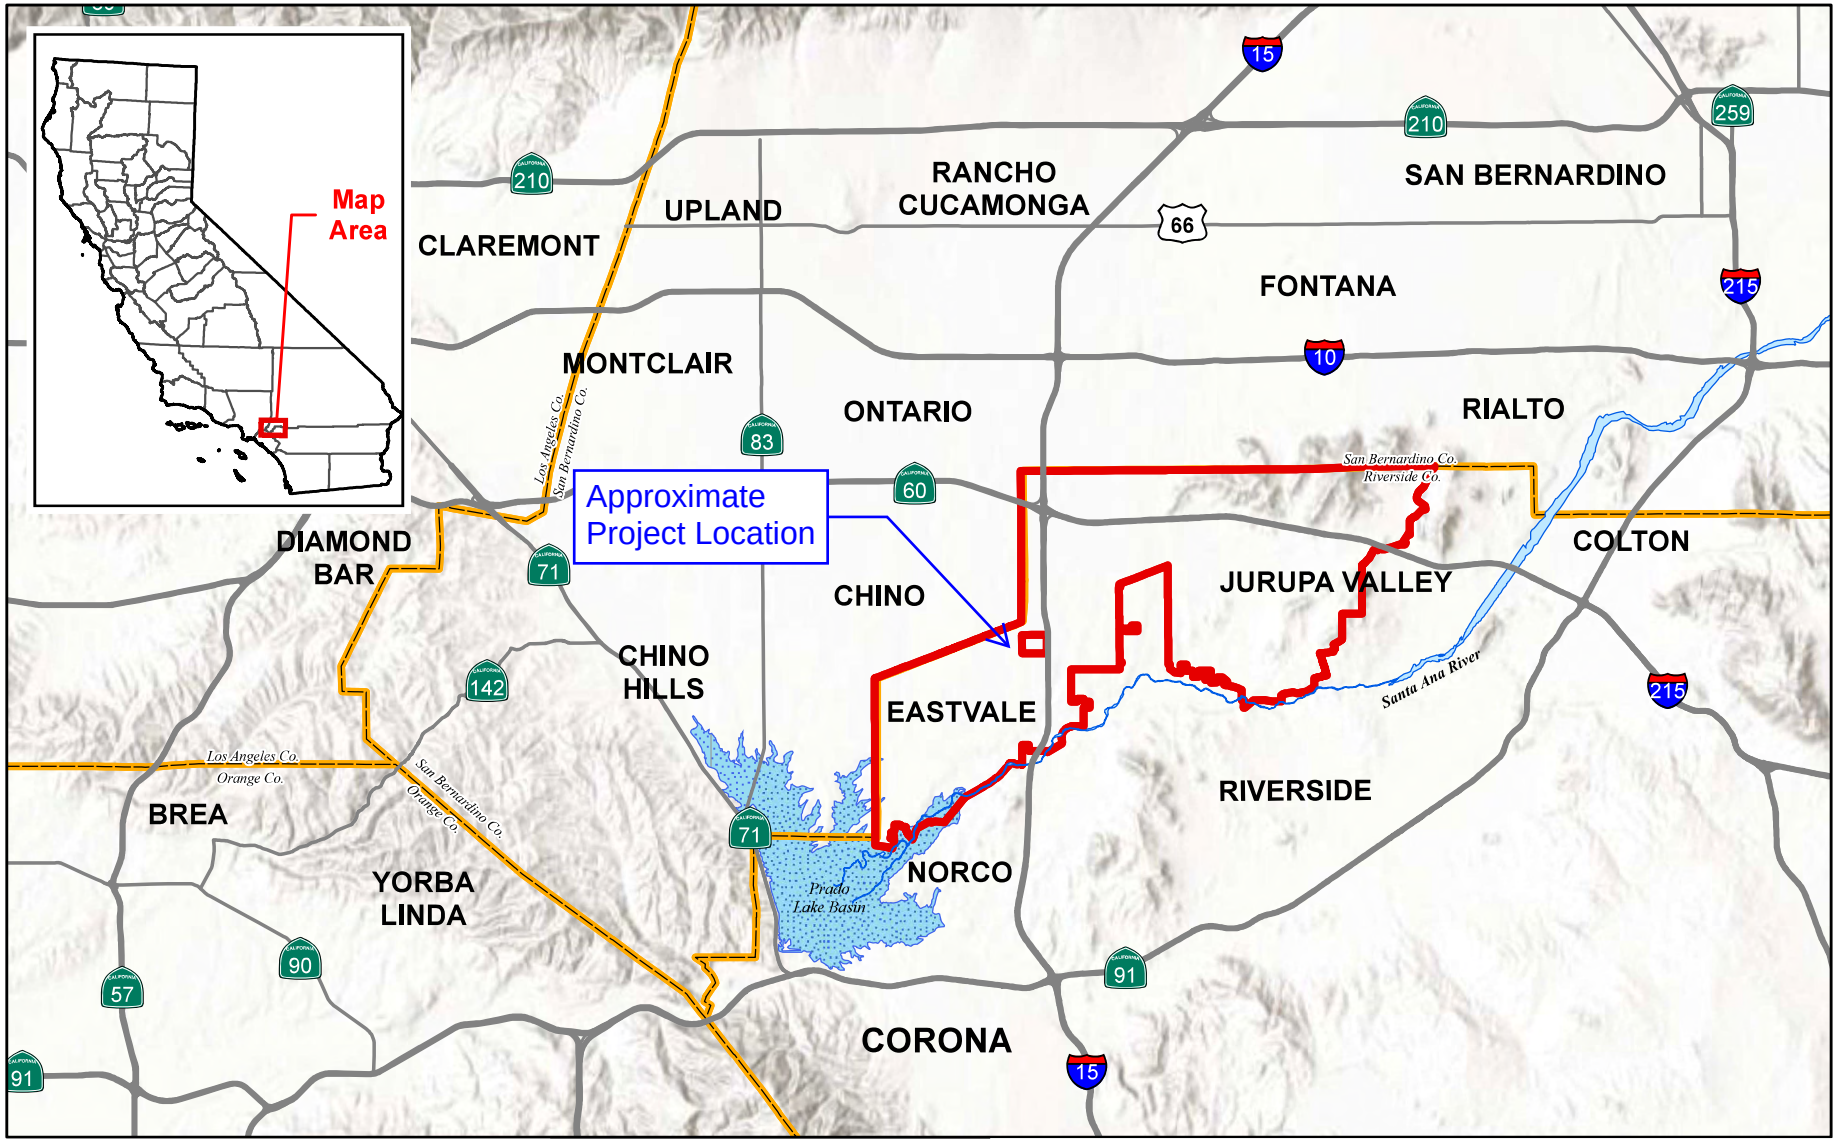
- JCSD 2020 Urban Water Management Plan (UWMP)
- JCSD Draft 2020 Water Master Plan
- Chino Basin Desalter Authority 2015 UWMP

This Assessment follows the report outline suggested by the DWR Guidebook for Implementation of Senate Bill 610 and Senate Bill 221 of 2001.

Project Description

The Eastvale Leal Property project is located within the City of Eastvale, California. The site is known as the Leal property located at 58th Street, Hamner Avenue, Limonite Avenue and Scholar Way and is approximately 160 acres. The proposed project will include mixed uses including mixed-use retail, office, housing, and civic development including police and fire stations and community center as well as a hotel and community spaces. Jurupa Community Services District (JCSD) is the water supplier for the Project site. Site location is shown in **Figure 1-1**, and a land use plan is provided in **Figure 1-2**.

For the purposes of this WSA, it is assumed that only potable water will be available to meet the project's water demand.



Project Relation to Urban Water Management Plan

JCSD is the water supplier for the Project and has prepared a 2020 UWMP, a copy of which is provided in **Appendix A**. The 2020 UWMP was adopted by JCSD Board of Directors on June 28, 2021 and reviewed by the state Department of Water Resources (DWR). The 2020 UWMP assumptions on growth projections within the service area were derived from an analysis of the additional water demand from the land uses assigned to vacant parcels by City-approved General Plans that could be developed in the future. As part

[1] California Water Code Section 10910(c)(3).

of this Assessment, it is assumed that there have been no substantial changes to the water supply portfolio as described in the 2020 UWMP.

As discussed further in Section 3 – Water Supply Analysis, JCSD is a member agency of the Chino Basin Desalter Authority (CDA), a Joint Exercise of Powers Agency from which JCSD purchases treated groundwater from the Chino Groundwater Basin. CDA has prepared a 2015 UWMP which is provided in **Appendix B**.

Section 2. Water Demand Analysis

The purpose of this section is to evaluate whether the proposed project was considered in the water supplier's planning for water demand. This section will: 1) show the calculated water demand of the proposed Project, 2) identify the various water use sectors, 3) identify water demand by those sectors for the next twenty years, and 4) compare the calculated water demand of the proposed Project to the water demand assumed in the most recent Urban Water Management Plan (UWMP) for the same property.

Project Water Demand

In the 2020 UWMP, the Project site was assumed to be half high-density residential (HDR) and half commercial-retail (CR). Water demand projections in the UWMP were based on developed properties and their underlying General Plan designations.

To calculate individual project water demands, JCSD currently uses the "Unit Values of Applied Water" from **Table 5-1 of JCSD's 2020 Draft Master Water Plan** (dated March 2021). Based on this table, JCSD uses a unit water demand factor of 3,600 gpd/ac for high density residential and 2,000 gpd/ac for commercial-retail and parks. As determined by the land use summary of the 158-acres for the proposed Project (**Table 2-1**), the Project water demand is estimated to be 461 AFY, as shown in **Table 2-2**.

Table 2-1. Project Land Use Summary

Lot	Land Use Category	Area (ac)
1	Residential	7.33
2	Mixed Use[a]	12.79
3	Commercial	9.80
4	Mixed Use[a]	6.45
5	Mixed Use[a]	4.66
6	Residential	5.61
7	Residential	14.13
8	Residential	3.94
9	Residential	4.39
10	Mixed Use[a]	4.52
11	Residential	16.49
12	Residential	17.20
13	Residential	13.15
14	Commercial[b]	1.22
A – I	Roadway	25.61
J – L	Open Space Recreation	7.16
M - V	Roadway	4.15
	Total Area	**158.58**

(a) Mixed use area was split 50-50 between residential and commercial
(b) Lot 14 is designated for a fire station, but was considered commercial land usage

Table 2-2. Project Water Demand

Land Use Category	Duty Factor (gpd/ac)	Area (ac)	Demand (gpd)	Demand (AFY)
Residential	3,600	82.23	296,021	331.59
Mixed Use (Residential)	3,600	14.21	51,151	57.30
Mixed Use (Commercial)	2,000	14.21	51,151	57.30
Commercial Retail	2,000	11.02	22,040	24.69
Open Space Recreation	2,000	7.16	14,312	16.03
Roadway	0	29.76	0	0
Total	**--**	**158.58**	**411,940**	**461.43**

In the 2020 UWMP, the Eastvale Leal Property was assumed to be 50% high density residential and 50% commercial retail, for a total demand of 450,800 gpd or 505 AFY.

Demographic Factors

A variety of demographic factors may affect water use. The Urban Water Management Planning Act lists several demographic factors to be detailed in UWMP's including climate, current and projected population, density, and the mix of customer types. As suggested by DWR, these data are provided herein and are taken generally from the Jurupa Community Services District's latest UWMP.

Climate

JCSD's service area is located within the greater Chino Basin valley, which is generally semi-arid and warm. Summers are dry with average temperatures as high as 95ºF and maximum daily temperatures that sometimes exceed 100ºF. Winters are cool with average temperatures as low as 40ºF. As shown in the UWMP, average annual rainfall between 2001-2019 was approximately 8 inches per year, whereas the historical average rainfall from 1908-1988 was approximately 13 inches per year. Recent rainfall measured from 2016 to 2019 at U.C. Riverside had an annual average of 9 inches per year. The elevations within the service area range from 560 feet to 2,230 feet above mean sea level.

Population

The City of Eastvale and approximately 65 percent of the City of Jurupa Valley make up the JCSD service area. Each year the JCSD Board of Directors adopts a population estimate for the District service area; in 2020, the estimated population is 130,546 persons, which includes the Swan Lake Mobile Home Park (not yet within the service area) in Eastvale. Population projections from the UWMP are shown in **Table 2-3**. Based on each City's General Plans and anticipated development patterns, JCSD service area population at buildout in 2040 is estimated at 171,300 persons.

Table 2-3. Service Area Population, 2020-2045

	2020	2025	2030	2035	2040[a]	2045
Service Area Population	130,546	140,735	150,923	161,112	171,300	171,300

Source: 2020 UWMP, Table 3-1, p. 3-19.
(a) Service area buildout is estimated to happen by 2040.

JCSD actively tracks the status of properties within their service area as they develop (e.g. whether residential or non-residential; vacant, proceeding through development process, or under construction; undeveloped or inactive) for the primary purpose of forecasting future water demand.

JCSD Water Demand

JCSD's most recently reported water demand data was for calendar year (CY) 2020. As of 2020, JCSD delivered to its customers approximately 28,505 acre-feet (AF) of potable water and 767 AF of non-potable water for a total of approximately 29,272 AF. The recorded and projected water demands by customer type for the JCSD service area are provided in **Table 2-4**. The recorded data is for 2016-2019, and the data from 2020 to 2040 is from the 2020 Urban Water Management Plan.

Table 2-4. Recorded and Future Water Demand (AFY)

Description	2016	2017	2018	2019	2020	2025	2030	2035	2040

Source: 2020 UWMP
(a) Includes water-only customers that do not have sewer service with JCSD.
(b) Includes governmental/institutional and non-billing meters for commercial landscape irrigation.
(d) Includes fire hydrants for fire suppression, dust control, and construction. Includes line breaks.
(e) From 2020-2040, includes non-potable losses with potable losses.
AFY = acre-feet per year

The water demand projections in the UWMP are based on site development information tracked by the District that includes the underlying or known land use designations and the where the project (if any) is in the development process with the respective city. Specifically, the assigned land use designations of undeveloped properties. These assumptions projected an increase of 9,460 AFY of potable water consumption for the service area by buildout (i.e. 2040).

The City of Eastvale makes up 30 percent of the JCSD service area and Eastvale is nearly built-out. JCSD anticipates buildout of the City of Eastvale within the next 10 years, and buildout of JCSD's service area within the City of Jurupa Valley is projected to be between 2040 and the year 2060.

JCSD is currently working on developing a recycled water plan for its customers within selected areas of the City Tang Amendment 4. JCSD has applied for grants and loans from the State Water Resources Control Board and other public agencies for the non-potable water system. The 2020 UWMP plans for 500 AFY of recycled water being available for landscape irrigation (excluding golf courses) from 2025 to 2040.

This WSA is required by the Water Code to address demand from existing and planned future uses, including agricultural and manufacturing uses. Agricultural activities have decreased in the JCSD service area as a result of planned urbanization according to approved city land use plans. JCSD expects water use for agricultural activities to continue declining and potentially replaced with non-potable sources. As shown in **Table 2-4**, JCSD expects an increase in the water demands from commercial and industrial properties combined, consistent with known projects and approved city land use plans.

Summary

The land use types for the Project site that were used in the 2020 UWMP water demand projections are similar to the land use types which are proposed by the subject Project. The 2020 UWMP projected a water demand of 505 AFY for the Eastvale Leal Property. Based on the District's current unit water demand factors, the Project will generate a potable water demand of approximately 461 AFY (**Table 2-3**). Therefore, the Project's water demands were accounted for in the most recent UWMP.

Section 3. Water Supply Analysis

This section identifies the sources of potable water utilized and available to Jurupa Community Services District (JCSD or District), which is the water supplier for the proposed Eastvale Leal Property (Project), The purpose of this section is to evaluate the water supplies that could be utilized by the proposed Project during normal, single-dry and multiple-dry water years during a 20-year projection.

Wholesale Water Supplies

Many retail water suppliers in California, including JCSD, receive supplies from one or more water wholesalers. SB 610 requires this Assessment to document wholesale supplies received, by: i) describing the quantities of water received from each wholesaler in prior years; ii) identifying existing entitlements, water rights, and/or water service contracts held by the District for the wholesale supply; iii) provide proof of entitlements, water rights, service contracts, relevant capital outlay programs, and construction permits for necessary infrastructure to deliver wholesale supplies, if any; and iv) regulatory approvals required to convey or deliver the wholesale supply.

Wholesale Supplies Received

JCSD is a member of the Chino Basin Desalter Authority (CDA), a Joint Exercise of Powers Agency, along with Santa Ana River Water Company, Inland Empire Utilities Agency (wholesaler), and the Cities of Chino, Chino Hills, Ontario, and Norco (UWMP, p. 6-2). CDA is a wholesale water supplier and its 2015 UWMP is provided in **Appendix B**. Each of the retail members of CDA have contractual "take or pay" commitments to purchase water produced by CDA (CDA, p. ES-2).

JCSD is currently entitled to 11,733 AFY of potable water from CDA. As of calendar year 2020, JCSD received 11,414 AF from CDA and the District projected CDA supplies is 11,733 AFY. Quantities of water received by JCSD in prior years from CDA are provided in **Table 3-1**.

Table 3-1. Recorded CDA Wholesale Deliveries

	2016	2017	2018	2019	2020
Volume (AF)	8,073	8,164	8,971	9,574	11,414

Note: From JCSD 2020 UWMP, Table 6A, p. 6-2.
AF = acre-feet

CDA provides high-quality drinking water from two desalters (salt removers) that was anticipated to treat approximately 35,200 AFY of Chino Basin groundwater in 2020 and thereafter. The Chino I Desalter, located at 6905 Kimball Avenue in Chino, was completed in 2000 and expanded in August 2005 to its current rated capacity of 15,906 AFY (14.2 mgd). However, the Chino I Desalter cannot provide this rated capacity due to the high total dissolved solids in the raw water supply. The Chino II Desalter was completed in 2006 and is located at 11202 Harrel Street in the City of Jurupa Valley. The current rated capacity is 11,201 AFY (10 mgd) and permitted capacity is 16,802 AFY (15 mgd), including 5,600 AFY (5 mgd) raw water bypass. As of March 2021, Plant 1 produced 11.97 MGD. Although Chino Desalter I capacity will not be increased, additional raw water capacity will be provided by five new wells in the Chino Creek Well Field. All five wells have been drilled and equipped. The Chino II Desalter is in the process of achieving their permitted capacity as a result of the construction of the South Archibald Plume Cleanup project. CDA is currently expanding the Chino II Desalter to a rated capacity of 25,427 AFY (22.7 mgd). As of March 2021, Plant 2 produced 20.3 mgd.

As stated in CDA's 2015 UWMP:

> Its primary authority is to desalinate brackish groundwater for its member agencies. The supply is 100 percent reliable under all water year types because pumping is in response to the OBMP [Optimum Basin Management Plan] to remove salts and nitrates from the basin and prevent highly saline groundwater from reaching the Santa Ana River. No water shortages are anticipated due to the mandate to continually pump 40,000 AFY from the basin. (CDA 2016, p. ES-2)

During calendar year 2020, JCSD negotiated the purchase of WMWD's CDA supply totaling 3,445 AF. JCSD is currently in negotiations with WMWD to purchase Mills Gravity Pipeline water supply in addition to WMWD's CDA supply. In addition, JCSD is in negotiations with Cucamonga Valley Water District to purchase imported and groundwater from them. A Preliminary Design Report has been prepared for JCSD's proposed Etiwanda Pipeline to CVWD.

Dry Year Yield Storage Program

The Dry Year Yield (DYY) storage program is a cooperative Conjunctive Use Program Agreement (No. 49960) between The Metropolitan Water District of Southern California (MWD), Inland Empire Utilities Agency (IEUA), Chino Basin Watermaster, Three Valleys Municipal Water District, and the Chino Basin groundwater producers (**Appendix D**). Under the DYY Program, MWD can store up to 100,000 AFY of imported water in the Chino Basin during wet years when surplus water is available, and to reduce imported water deliveries up to 33,000 AFY in dry, drought, or emergency periods, but not to exceed the amount of water in the MWD storage account. The DYY program provides MWD the right to store groundwater in the basin, in exchange for paying the costs of developing the facilities that deliver that water.

DYY funds were used by JCSD for the construction of the Roger D. Teagarden Ion-Exchange Facility. When MWD makes a call for its stored water, JCSD can operate this facility and utilize water from the CDA to meet the District's water supply obligation.

Through a Local Agency Agreement with the City of Ontario, JCSD can purchase Ontario's portion of CDA water during years when MWD is not making a call for the stored water (i.e. "wet" or "non-call" years) (**Appendix E**). Up to 2,000 AF over 12 months is anticipated. During dry or "call" years, JCSD will stop receiving Ontario's portion of CDA water and return to District well supply. (UWMP, p. 6-31)

Water deliveries received from the DYY Program from calendar year (CY) 2015 to 2020 are provided in **Table 3-2**.

Table 3-2. Recorded DYY Program Deliveries

	2015	2016	2017	2018	2019	2020
Volume (AF)	1,667	2,031	2,002	1,805	0	1,446
Note: From JCSD Staff, Water Supply History. AF = acre-feet						

Water Supplies

Water within the JCSD service area is entirely from groundwater production. The majority of that comes from the Chino Basin, which is supplemented with groundwater produced from the Riverside-Arlington Basin (aka Riverside South Basin). Water is obtained by way of District-owned wells and agreements with

neighboring agencies. JCSD does not directly rely on imported water, surface water, stormwater, or recycled water to supplement the water supply. However, these sources can, and are, being used by other agencies in the Chino Basin to recharge the basin supply. (UWMP, p. 6-1)

Wholesale water from CDA and DYY Program deliveries are described previously in Section 3.1. The following is a description of the supplies produced and projected supplies reasonably available to JCSD.

JCSD Wells in Chino Basin

The Chino Basin covers approximately 240 square miles and is one of the largest groundwater basins in Southern California. There is an estimated five million AF of water in storage, and an unused storage capacity of approximately one million AF (UWMP, p. 6-8). The Chino Basin has been adjudicated, and pumping activities are closely monitored by the court-appointed Chino Basin Watermaster. A copy of the 1978 Chino Basin Judgment is provided in **Appendix F**. This is discussed in detail in Section 4.0 – Groundwater Analysis.

JCSD currently operates 18 potable water wells in the Chino Basin that have a theoretical maximum production rate of 33,090 gallons per minute (gpm). However, JCSD does not operate its wells at maximum capacity, but rather they fluctuate on and off as demand changes (UWMP, p. 6-7). The ultimate well production capacity is estimated at 43,315 gpm (JCSD 2020). JCSD's current production (2019-2020) right to this source is 19,547.9 AF, as recorded in the Watermaster's (2019/2020) annual report. During 2020, JCSD produced 11,051.8 AF from its potable wells in the Chino Basin (JCSD 2020). JCSD has assumed in the UWMP that the future pumped volumes from its potable well field, within JCSD service area in the Chino Basin, will peak at 14,000 AFY, beginning in 2030. This level of production aims to minimize a decline in the groundwater table in the vicinity of JCSD's well field.

Two new potable wells are expected to be operational within the next five years (Wells 29 and 30). They will each contribute an additional 2,500 AFY. With the additional two wells, the total maximum day groundwater production capacity will be approximately 54.8 MGD (38,000 GPM). (UWMP, p. 6-7)

JCSD operates five non-potable wells within the Chino Basin. In 2020, the District produced 275.881 AF from this supply source to serve local park landscape irrigation-only accounts, and future production is estimated at 310 AFY (UWMP, p. 6-33).

The District operates two ion-exchange plants to denitrify water from several wells. The first is the Roger D. Teagarden Ion Exchange Facility which removes nitrates from seven potable wells. The other plant is the Well 17/18 Ion Exchange Facility that removes nitrates from JCSD Well Nos. 17 and 18. (UWMP, p. 6-7)

JCSD Wells in Riverside South Basin

The Riverside South Basin is the Riverside County portion of the larger Riverside-Arlington Basin. This basin has been adjudicated by the 1969 Orange County Judgment located in **Appendix G**, and basin pumping rights are further defined in the 1969 Western-San Bernardino Judgment located in **Appendix H**. JCSD operates two non-potable wells within the Riverside South Basin. Water from these wells is used to irrigate Oak Quarry Golf Club located at 7151 Sierra Avenue in Jurupa Valley. During CY 2020, JCSD pumped 490.774 AF from this source. JCSD expects future production from this source will be approximately 450 AFY. (UWMP, p. 6-8)

Rubidoux Community Services District

Since 2000, JCSD has purchased water extracted from the Riverside South Basin from Rubidoux Community Services District (RCSD). Through an agreement established in 2014, JCSD can pump potable water from RCSD's system into the District's 1,110 Pressure Zone through the Jewel Street Booster Station (**Appendix I**). As shown in **Table 3-3**, no supply was received by JCSD from this source since CY 2018 (JCSD Staff). JCSD anticipates future annual purchases of approximately 2,000 AF from RCSD. (UWMP, p. 6-2)

Table 3-3. Recorded Rubidoux Community Services District Deliveries

	2016	2017	2018	2019	2020
Volume (AF)	2,029	2,322	0	0	0
Note: From JCSD 2020 UWMP, Table 6B, p. 6-3. AF = acre-feet					

The current water supplies reasonably available to JCSD are summarized in **Table 3-4**, including the mechanism by which the District can use the water (e.g. water supply entitlement, water right, or water service contract), pursuant to SB 610 guidance.

Table 3-4. Current Water Supplies

Supply Type	Supply Method	Water Quality	Form of Right	Supply (AFY)
Groundwater	JCSD Wells[a]	Potable	Right	19,550
Wholesaler	CDA	potable	Contract	11,733
Groundwater	RCSD	Potable	Contract	2,000
Groundwater	DYY Program	Potable	Contract	2,000
Groundwater	JCSD Wells[b]	Non-potable	Right	450
			Total	**35,733**
Note: From District staff, Jan. 17, 2020. (a) Annual production rights in the Chino Basin (Production Year 2019-2020). (b) Within Riverside South Basin. AFY = acre-feet per year				

The water supply used by the District is only that which is required to meet actual demand. JCSD can extract, from the Chino Groundwater Basin, above their annual production rights, which is permitted with payment of appropriate fees to the Chino Watermaster.

According to information reasonably available to JCSD during preparation of the 2020 UWMP, **Table 3-5** provides the recorded and projected water supply sources for the District. This includes three sources that have not yet been used by JCSD: imported water from WMWD, Cucamonga Valley Water District, and recycled water from the WRCRWA Plant through a pending grant project authorization from the State Water Resources Control Board.

Table 3-5. Actual and Projected Water Supplies

Supply Type	Source	Water Quality	Ever Used?	Past (AF)						Current (AF)	Reasonably Available Future Volume (AF)			
				2011	2012	2013	2014	2015	2018	2020	2025	2030	2035	2040

			Total[1]	**24,903**	**22,195**	**26,963**	**26,963**	**22,381**	**26,426**	**28,124**	**42,093**	**44,093**	**44,093**	**42,093**

Note: From JCSD 2020 UWMP, p. 6-28, p. 6-29.
(a) Located within Chino Basin.
(b) Wholesale agency. No project has been determined; wholesaler supplier subject to change.
(c) Located within Riverside South Basin.
AF = acre-feet
(1) Due to rounding, sum of the individual items may not equal the total value.

As shown in **Table 3-5**, recycled water from WRCRWA has not been used by JCSD but grants and loans are currently being pursued by JCSD. Pursuant to SB 610 guidance, availability must be demonstrated for supply sources that have never been used by the water supplier. This can be done by identifying other water suppliers or contract holders that receive and have rights, entitlements, or contracts to the same source.

Western Municipal Water District

JCSD is one of 14 local retail agencies within the WMWD service area, and as such, JCSD can receive water from WMWD. WMWD is a member agency of MWD with responsibility to provide wholesale imported water to the retail agencies within its service area (CDA 2016, p. ES-1). This includes imported water supplies from the State Water Project obtained through WMWD's membership with MWD. WMWD provides supplemental water and/or water resources management to the cities of Norco, Corona, and Riverside and the water agencies of JCSD, SARWC, Box Springs Mutual, Eagle Valley Mutual, Elsinore Valley, Lee Lake, and Rancho California, and unincorporated areas of El Sobrante, Eagle Valley, Temescal Creek, Woodcrest, Lake Mathews, and March Air Reserve Base (CDA 2016, p. 2-2).

WMWD noted in their 2015 UWMP that JCSD may purchase water from them in the future (WMWD, p. 3-6). Further, WMWD's demand projections in the 2015 UWMP include 5,000 AFY to JCSD starting in 2020, increasing to 7,500 in 2025, then 10,000 from 2030 to 2040, which is consistent with the District's projection in **Table 3-5** (ibid, p. 4-7). Future water supply projects between JCSD and WMWD would directly connect imported supplies to JCSD; however, no project has yet been determined (UWMP, p. 6-32). Because of the assurance from MWD to its member agencies, WMWD's accounting for potential future demand from JCSD in their UWMP, and WMWD's ability to meet the demands of its other member agencies, the availability of future supply from WMWD is demonstrated.

Western Riverside County Regional Wastewater Authority

WRCRWA is a Joint Powers Authority consisting of the cities of Norco, Corona, JCSD, Home Gardens Sanitary District, and WMWD. The WRCRWA treatment plant is a tertiary treatment facility with an ultimate capacity of 32 mgd (WMWD, p. 6-11). JCSD is entitled to the recycled water generated from the District's share of sewage flow into the treatment plant. In 2020, approximately 5,120 AF of wastewater from the JCSD service area was sent to the WRCRWA Plant for treatment2. Currently, the effluent from the WRCRWA facility is discharged directly to the Santa Ana River immediately upstream of Prado Dam (IEUA, p. 6).

WRCRWA is in the final planning stages of providing recycled water to the City of Norco. As of 2015, seven miles of recycled water pipeline, a small reservoir, and a pump station have been installed. Norco is anticipated to take delivery of up to 895 AFY of recycled water. Western Riverside County Regional Wastewater Authority obtained an order approving a change of use permit (February 5, 2018) that would allow the WRCRWA member agencies to use recycled water from the treatment plant. (WMWD, p. 6-12).

JCSD is in the process of developing a recycled water system that will deliver irrigation water to parks and playgrounds utilizing a portion of the recycled water that they are entitled to from the WRCRWA facility. To further conserve local water supplies, JCSD would like to deliver the remaining portion of its recycled water entitlement to IEUA for reuse and replenishment of the Chino Basin (IEUA, p. 1). Therefore, IEUA and JCSD have partnered on a grant application to the State Water Resources Control Board under Prop. 1 and the Clean Water State Revolving Fund (CWSRF) Loan program for a joint regional recycled water intertie project (CWSRF No. 8167-110). The availability of this water supply source is demonstrated through the District's right to its share of sewer flow, the successful distribution of recycled water to the

City of Norco and ongoing efforts to distribute recycled water to other member agencies, and the District's ongoing efforts to create a distribution network.

Etiwanda Intervalley Pipeline

Jurupa Community Services District (JCSD) and Cucamonga Valley Water District (CVWD) are collaborating to develop a domestic water supply and conveyance project that will benefit both Districts by increasing water supply, improving water quality, enhancing infrastructure resiliency, and promoting sustainability. By working together, both Districts will benefit financially and operationally due to facilities that can be utilized by either or both Districts depending on needs and availability of the various water supplies. The total Etiwanda Water Quality and Water Resiliency Project is a model for how independent water purveyors can work together to benefit their stakeholders and provide increased reliability regarding water quality, availability, and sustainability.

JCSD's ultimate average daily demand for potable water is projected to be approximately 36,340 acre-feet per year (AF/YR) by about the year 2040. This demand will be supplied from a portfolio of sources including existing groundwater wells, Chino Basin Desalter Authority, and imported supply.

In order to meet ultimate demand of 36,340 AF/YR, JCSD needs to secure additional water supply of approximately 10,800 AF/YR. The Etiwanda lntervalley Water Quality and Water Resiliency Project will be the water supply and conveyance mechanism to satisfy the long-term water supply deficit. Water will be supplied from one of CVWD's surface water treatment plants and new wells to be drilled in the upper portion of the Chino Basin. CVWD owns and operates two surface water treatment plants that are fed water from the Rialto Feeder. The Rialto Feeder is a large diameter pipeline owned by The Metropolitan Water District of Southern California (MWD) that delivers raw water from the State Water Project (SWP) to local water purveyors who treat and deliver SWP water to their customers. CVWD currently operates the Lloyd Michael Water Treatment Plant (LMWTP), which has a permitted capacity of 30 MGD. CVWD also owns the Royer Nesbit Water Treatment Plant (RNWTP), which was permitted at 11.5 MGD but has been taken out of service and not currently operational. It has not been determined yet whether the LMWTP or the RNWTP will be the point of connection on the north end of the project but the southern connection will be at JCSD's 1110 and 980 pressure zone facilities near the Jurupa Hills along Country Village Road. The backbone conveyance portion of this project is called the Etiwanda Pipeline and it will be utilized to move water south into JCSD's service area and/or north into CVWD's service area. This project will be able to deliver the required imported water and allow JCSD to complete its water portfolio.

CVWD's long-term water supply will be provided through a combination of SWP water coming though the Rialto Feeder, local surface water captured in the local watershed, and groundwater wells in the Chino and Cucamonga Basins. It is anticipated that these sources are adequate to satisfy CVWD's demands. CVWD will benefit from this project through the development of additional groundwater wells, recharge of the aquifer during times of excess water on the SWP, additional storage facilities, enhanced ability to transfer water to multiple pressure zones, and to generate electricity to offset operating costs.

In general, the Etiwanda Intervalley Water Quality and Water Resiliency Project includes the following components:

- Etiwanda Pipeline (63,070 LF in 3 Phases)
- Storage reservoir(s) totaling approximately 10 million gallons
- Pressure reducing / flow control station(s)

- Upgrade existing pumping facilities to deliver water from CVWD's Reservoir 2C to their upper pressure zones
- Five (5) new wells, to be constructed in the northern portion of the Chino Groundwater Basin, including aquifer storage recharge (ASR) capabilities on two of the wells
- Upgrade/Expansion of either the LMWTP or the RNWTP
- Groundwater treatment of existing JCSD groundwater wells
- Hydroelectric generating facilities on the diversion from the Rialto Feeder to the LMWTP and Etiwanda Pipeline near the JCSD 1110 and 980 pressure zone tanks

Descriptions of All Water Supply Projects

JCSD has budgeted $10,875,000 for water source development in fiscal year (FY) 2021-2022, and a total of $192,616,900 from FY 21/22 to beyond 2024-25, as shown in **Table 3-6**.

Normal, Single-Dry, and Multiple-Dry Year Conditions

JCSD has various sources of water supplies available to meet demands during, normal, single-dry, and multiple-dry years. In the 2010 and 2015 UWMPs, JCSD assumed 2004 as its Normal Year and 1977 as the Single Dry Year. The Multiple-Dry Year period was established at 2012-2015 for the recent UWMP.

JCSD expects 100 percent of its supply to be available in all year types because the District's supply source is groundwater, and in particular the Chino Basin has five million AF in storage. Therefore, production of water would be a function of cost and not a lack of supply. Because JCSD does not operate its wells at full capacity, it can be assumed that groundwater pumping could increase to meet demand if drought conditions persisted or worsened.

A normal water year is a year, or an average of years, that most closely represents the average water supply available to the agency. The normal year water supplies available to JCSD and the normal year water demand projections are compared in **Table 3-7**. The District has determined with the addition of an imported water source, it will have sufficient supply and groundwater pumping capacity to meet maximum day water demands through 2040 (UWMP, p. 7-5)

As shown previously in **Table 3-5**, the projected supply from an imported water source is 7,500 AFY in 2025, and 10,000 AFY beginning in 2030. Also, the projected recycled water supply from WRCRWA is 500 AFY beginning in 2020. If both supply sources were subtracted from the total supply in **Table 3-7**, then a potential shortfall would not appear until sometime between 2025 and 2030.

The single dry year is the year that represents the lowest water supply available to the District. JCSD established in the 2010 UWMP that this is best represented by the dry year in 1977 (UWMP, p. 7-3). As shown in **Table 3-8**, JCSD has assumed the same water supply and demand as the Normal Year scenario shown in **Table 3-7**.

JCSD expects by 2025 that recycled water will meet some of the irrigation water demand, thus making available several hundred acre-feet of potable groundwater potentially available for urban use.

JCSD has observed in recent years reductions in water demand due to significant water conservation efforts on behalf of customers. Current and future drought regulations could further decrease water demands and ensure that existing supplies meet future demands during single or multiple dry years. (UWMP, p. 7-3)

The multiple dry year period is the range of years representing the lowest average water supply available to the District for a consecutive multiple year period (three years or more). This was established as 2012 to 2015 in the UWMP. Notably, JCSD had sufficient supplies to meet demands during the drought period from 2011-2017.

Because the District's supply source is groundwater, and specifically the Chino Basin has five million AF of water in storage, the District's ability to provide water during drought conditions would result in increased pumping costs but not the ability to produce water.

The multiple dry year supply and demand comparisons are shown in **Table 3-9**. Demand is expected to gradually decrease in response to drought regulations and water conservation. During the first dry year, JCSD assumes no change in projected water demand. During the second, third, and fourth dry years, JCSD assumes a decrease in water use of 5, 10, and 20 percent, respectively (as measured from the first-year baseline). This demonstrates the expected time-lag between the first dry year until water conservation efforts start to show an impact in water use. A multiple dry year decrease in demand of 20 percent has been demonstrated by JCSD, which reduced water production by 23 percent from 2013 to 2015. (UWMP, p. 7-5)

Note: From JCSD 2020 UWMP, Table 7-4.
AFY = acre-feet per year

As shown in Tables 3-6, 3-7, and 3-8 above, JCSD expects to have adequate water supplies to meet future planned water demands during normal, single-dry, and multiple-dry years through the 20-year planning period.

Summary

As described in Section 2, the projected annual potable water demand for the proposed Eastvale Leal Property is estimated at 461 AFY. Based on the information provided in the 2020 UWMP, the District has sufficient water supplies to meet the water demands of the Project by purchasing water from CDA that is within their contractual rights and by using existing groundwater supplies and pumping capacities that are more than adequate to meet the additional water demand of the proposed Project during normal, single-dry, and multiple-dry water years. With the ongoing water conservation efforts, JCSD will further ensure its ability to provide sufficient supply for the proposed Project. Section 4 will discuss the District's water rights in light of this water supply and capacity analysis.

Section 4. Groundwater Analysis

SB 610 requires specific groundwater information to be included in the WSA if groundwater will be a source of water for the proposed project. As discussed in Section 3, groundwater is a source of supply for the proposed Eastvale Leal Property Project.

Review of Urban Water Management Plan

The 2020 Urban Water Management Plan (UWMP), prepared by Albert A. Webb Associates (WEBB) on behalf of the Jurupa Community Services District (JCSD or District) was adopted by the Board of Directors on June 28, 2021 (**Appendix A**). The UWMP includes information relevant to the identified water supply for the proposed Project and is incorporated herein. Relevant information includes: 1) current and projected water demands through year 2040; 2) a description of the Chino Groundwater Basin; 3) the reliability of the water supply, projected supply and demand comparisons, and water shortage contingency plans; and 4) water demand management efforts.

Groundwater Basin Descriptions

As discussed in Section 3, the Chino Groundwater Basin (Chino Basin) is the direct source of groundwater for JCSD. The use of groundwater from the Riverside South Basin is limited to non-potable wells used for irrigation purposes. **Figure 4-1**, Groundwater Basin Map shows the JCSD service area in relation to underlying groundwater basins.

Chino Basin Description

The Chino Basin covers approximately 240 square miles in the upper Santa Ana River Watershed, and underlies parts of Los Angeles, San Bernardino, and Riverside Counties. The state Department of Water Resources (DWR) identifies the Chino Basin as No. 8-002.01, a sub-basin of the Upper Santa Ana Valley (Bulletin 118). While still considered a single basin for hydrologic purposes, the Chino Basin is divided into five management zones based on similar hydrologic conditions, and shown in **Figure 4-2**, Groundwater Management Zones.

It is estimated the Chino Basin has approximately 5 million acre-feet (AF) of water in storage, and an estimated 1 million AF of additional unused storage capacity (UWMP, p. 6-8). Geographically speaking, JCSD's service area covers the southeast corner of the Chino Basin.

Legal Right to Pump from the Chino Basin

Water rights to the Chino Basin were adjudicated by the Superior Court of the State of California for the County of San Bernardino in 1978 (a copy of the Judgment is provided in **Appendix F**). The Judgment created the Chino Basin Watermaster (Watermaster) which is comprised of three stakeholder committees (or "pools"): Overlying Agricultural Pool Committee (representing dairymen, farmers, and the State of California); Overlying Non-Agricultural Pool Committee (representing businesses and industries); and Appropriative Pool Committee (representing local cities, public water districts and private water companies). The Watermaster carries out the provisions of the Judgment including monitoring of the basin and files an annual report on pumping and replenishment.

JCSD is a member of the Appropriative Pool and therefore has adjudicated production rights to the basin. The Judgment established the total Appropriative Right for the Appropriative Pool at 78,763.82 AF. The District's portion of the Appropriative Right is 2,960.60 AF, which does not change from year to year.

The court's original Judgment declared the safe yield of the Chino Basin at 140,000 AFY. The Watermaster may determine that the operating safe yield (OSY) can be higher from year-to-year depending on factors including favorable precipitation and management efforts that maximize the beneficial use of the groundwater Basin. On July 31, 2020, the Court ordered that the safe yield be set at 131,000 AFY for the period of July 1, 2020 to June 30, 2030. The Judgment does not limit a Party's groundwater production to its share of safe yield.

As of June 30, 2020, the Judgment allocated an OSY of 44,834 AFY to the Appropriative Pool. Because JCSD has rights to 3.759 percent of the OSY, the District's current share of the OSY is 1,685.31 AF. This amount will change from year to year as directed by the Watermaster.

JCSD also gains water rights through agricultural land use conversions. Since 2000, JCSD has been credited two AF per acre per year of water rights for every acre converted to non-agricultural use within the JCSD service area. As of fiscal year 2019/2020, total land use conversion rights claimed by JCSD is 15,051 AF. Annual adjustments to this right may be made by the Watermaster as part of their "Reallocation of Agricultural Pool Safe Yield" calculations.

The Judgment allocates safe yield of the Chino Basin according to the three pools. There is a clear expectation that parties, including JCSD, would produce water in excess of their adjudicated production rights. The injunction in Paragraph 13 of the Judgment should thus be interpreted to mean that parties are enjoined from producing water in excess of their adjudicated rights except to the extent that they will pay a replenishment assessment.

The ability to produce water from the Chino Basin is accordingly not a matter of availability, as contemplated and sanctioned by the Judgment for the reasons discussed above, but rather a matter of cost. Water produced in excess of production rights will cost more than water produced within a party's production rights. Thus, the quantity and reliability of groundwater supplies under the Judgment for purposes of this Assessment is a matter of cost of the water produced from the Basin rather than limitations on production which may otherwise operate to reduce the sufficiency of the groundwater supply.

In addition to the Appropriative Pool water rights, the contract obligations in the Dry Year Yield (DYY) Program, purchases from RCSD and CDA as described in Section 3, the District has groundwater rights held in the Chino Basin as described below:

> **Annual Early Transfers**. The Watermaster can approve an "Early Transfer" of water to the Appropriative Pool equal to the quantity of water not produced by the Overlying Agricultural Pool that is remaining after all land use conversions are satisfied, pursuant to the Peace Agreement. The Early Transfer Water is annually allocated among the Appropriative Pool members in accordance with their pro-rata share of the initial Safe Yield. For JCSD, this is 3.759 percent of the amount transferred and therefore changes from year to year. In FY 2019/2020, JCSD was allocated 938.3 AF as its share of the Early Transfer.
>
> **Groundwater Storage Accounts**. JCSD has rights to store water in the Chino Basin. Currently (Production Year 2019-2020), there is a total of 31,861.3 AF in storage as recorded by the Watermaster (**Table 4-1**). As such, this is enough water in the District's storage accounts to meet at least one year of total demands, should its other water supply sources be unavailable.

Table 4-1. Groundwater Rights Summary

Description	Fiscal Year 2019/2020
Appropriative Right	2,960.60 AFY
Percent of OSY	3.759%
Carryover Beginning Balance	1,685.3 AFY
Assigned Share of OSY	1,685.3 AFY
Net Ag Pool Reallocation[a]	16,177.2 AFY
Total Annual Production Right in Acre-Feet Per Year	19,547.9
Groundwater Storage Accounts[b]	27,795 AF (Beginning Balance)
	(19.5) (Storage Loss)
	(1,535.2) (Transfer To/From)
	5,621 (From Under Production)
Storage Account Subtotal In Acre-Feet	31,861.3

Note: From CBWM 2020.
(a) For Production Year 2019-2020 (CBWM pp. N-12)
(b) Ending balances for production year 2019-2020 (CBWM, pp. N-13, N-14, N-15).
OSY = operating safe yield, AFY = acre-feet per year.

Recorded Use of Groundwater

JCSD currently operates 18 potable water wells in the Chino Basin that have a current production rate of 33,090 gallons per minute (gpm), and ultimate capacity is estimated at 43,315 gpm (JCSD 2020). JCSD does not operate its wells at maximum capacity, but rather they fluctuate on and off as demand changes. JCSD also operates seven non-potable wells in the Chino and Riverside South basins. Recorded groundwater production of potable and non-potable JCSD wells are listed in **Table 4-2**.

Table 4-2. Recorded Groundwater Production

Year	Potable (AFY)	Non-Potable (AFY)
2020	16,695	51
2005	18,913	--
2010	13,688	591
2015	8,993	845
2016	10,716	712
2017	12,906	795
2018	14,829	750
2020	11,052	767

Note:
2000, 2005, 2010 from DWR Public Water Systems Statistics (PWSS) reports.
2015 from UWMP, p. 6-4.
2016-2018 from JCSD Staff, Water Supply History.
Values are rounded to nearest whole number.

Projected Use of Groundwater

Projected groundwater use by JCSD is dependent upon the cost of extracting, treating, and transporting the water to customers. Groundwater from the Chino Basin will be utilized by JCSD either directly by pumping into its distribution system or by obtaining groundwater through the CDA, RCSD, and/or through the DYY program.

Table 4-3. Projected Use of Groundwater

Supply Type	Source	Water Quality	Projected Use (AFY)				
			2020	2025	2030	2035	2040
Groundwater	JCSD Wells[a]	Potable	11,029	14,000	18,000	18,000	18,000
Purchased	CDA[b]	Potable	11,414	11,733	11,733	11,733	11,733
Purchased	RCSD	Potable	--	2,000	2,000	2,000	2,000
Other	DYY Program	Potable	1,446	2,000	--	--	--
Transfers	CDA (for SARWC)	Potable	1,170	1,200	1,200	1,200	1,200
Potable Sub-Total			**25,059**	**30,933**	**32,933**	**32,933**	**32,933**
Recycled Water	WRCRWA Plant	Non-Potable	--	660	660	660	660
Groundwater	JCSD Wells[c]	Non-Potable	491	500	500	500	500
Groundwater	JCSD Wells[a]	Non-Potable	276	--	--	--	--
Non-Potable Sub-Total			**767**	**1,160**	**1,160**	**1,160**	**1,160**
Total			**25,826**	**32,093**	**34,093**	**34,093**	**34,093**

Note: See Table 3-5 of this report. From JCSD 2020 UWMP, p. 6-28, p. 6-29.
(a) Located within Chino Basin.
(b) Wholesale agency. No project has been determined; wholesaler supplier subject to change.
(c) Located within Riverside South Basin.
AF = acre-feet
(1) Due to rounding, sum of the individual items may not equal the total value.

The amount of water that JCSD plans to produce from the Chino Basin as shown in **Table 4-3** is well within their rights pursuant to the Chino Basin Judgment (**Appendix F**). Further, projections of groundwater obtained by JCSD from the other sources listed in **Table 4-3** are also within the District's rights and agreements. Therefore, the projected supplies needed to meet future demands are met from the various sources discussed in this report.

Sufficiency of Groundwater Basin

JCSD's legal right to pump water in an amount necessary to meet all demands as sanctioned and protected by the Judgment as discussed above, is buttressed by several programs and projects directed at ensuring the sufficiency of groundwater supplies from the Basin, particularly during dry years. An adjudicated water right has perhaps the most substantial indicia of reliability of any water right that currently exists in California. An adjudicated right is based upon long-term studies whose purpose it is to protect the long-term functionality of the water source. These rights are coordinated in an established and binding manner with all the other users of the Basin and are overseen by Watermaster which has the authority to mandate and proscribe activities whose purpose is to protect the water source and maximize its long-term beneficial use.

All Watermaster processes are governed by Rules and Regulations and receive active oversight from the Court which, as noted above, retains continuing jurisdiction over the administration of the Judgment. Consequently, the sufficiency of the groundwater is not only directed by rigorous Watermaster management processes but validated and ensured by continuing Court oversight.

The Optimum Basin Management Program (OBMP) for the Chino Basin has guided the Chino Basin Watermaster's activities since its adoption in 1998. Watermaster-led basin management activities to ensure the maximization of safe yield and OSY of the Chino Basin include objectives, projects, and programs identified in the Peace Agreement and the OBMP. Progress is reported in annual reports, biennial and triennial reports.

As stated, the referenced elements of the OBMP collectively comprise a comprehensive regimen directed to ensuring and maximizing the long-term beneficial use of water in the Chino Basin. In particular, and specific to the location of current and future groundwater production facilities upon which JCSD relies or will rely to provide water to meet water demands within its service area, OBMP Program Element No. 3, "Develop and Implement Water Supply Plan for the Impaired Areas of the Basin" and Program Element No. 5, "Develop and Implement Regional Supplemental Water Program", address the sufficiency of groundwater from the Basin. Fundamentally, the goal of Program Elements 3 and 5 is to develop a regional, long range, cost-effective, equitable, water supply plan for producers in the Chino Basin that incorporates sound basin management.

The JCSD service area overlies groundwater supplies in the southern part of the Chino Basin which must be pumped for purposes of meeting new demands, maintaining safe yield, and to protect water quality in the Santa Ana River. The JCSD service area overlies groundwater supplies in the southern part of the Chino Basin which must be pumped for purposes of meeting new demands, maintaining safe yield, and to protect water quality in the Santa Ana River. As agricultural production in the southern part of the Chino Basin declines, it will be necessary for these reasons to increase production for municipal uses. This is being achieved through the Chino I and Chino II Desalters, of which the JCSD has a contractual right to purchase 8,200 AFY pursuant to the original agreement, and 11,733 AFY as a result of subsequent amendments and expanded treatment facilities (**Appendix C**). Thus, not only was increased Chino Basin water production by JCSD foreseen in the OBMP but sanctioned and encouraged for purposes of achieving OBMP objectives.

The sufficiency of the groundwater supply that is available to JCSD is assured due to the abundance of groundwater in the central and southern portion of the Chino Basin, OBMP objectives that prioritize and assure production from the southern Chino Basin coupled with desalting and ion-exchange treatment facilities that enable the use of this abundant supply for municipal (potable) purposes. As indicated in the quoted text of the OBMP, southern basin production, where JCSD is partially located, is the linchpin of several critical OBMP objectives. Thus, the sufficiency of groundwater is heightened and prioritized by the necessity of continued pumping from the southern Chino Basin under the OBMP which is administered by the Watermaster and ultimately enforced by continuing Court jurisdiction over the Judgment.

The other referenced OBMP Program Elements are collectively directed to ensuring the sufficiency of Chino Basin groundwater supplies, particularly during dry years, and comprehensively address water quality and quantity, thus maximizing beneficial use over the long-term. Sufficiency of groundwater from the Chino Basin is further assured for the following reasons:

- Inland Empire Utilities Agency (IEUA) is a member agency of MWD, which provides imported water from the State Water Project for direct use by parties to the Judgment in the Chino Basin

and for Chino Basin recharge purposes (when supplies are available). IEUA has also reviewed the sufficiency of supplies for its service territory that includes the Chino Basin in connection with its 2015 UWMP (**Appendix J**).

- IEUA's UWMP is consistent with, and reiterative of, OBMP projects and programs (see Section 7.4 of **Appendix J**). IEUA anticipates increased limitations for imported water for direct and recharge use while noting reductions during dry years (due to increased reliance on groundwater from the Basin) and in the higher amount otherwise required in the absence of OBMP projects and programs. The UWMP also analyzes the sufficiency of water supplies for single and multiple year drought scenarios and concludes the region is expected to meet 100 percent of its dry year demand under every scenario. Key assumptions included:

    - Reliance on assurances provided by MWD in its 2015 UWMP (**Appendix K**) that it could meet 100 percent of projected supplemental full-service water supply demands through 2040;

    - Implementation of MWD's Chino Basin DYY Storage Program consistent with the contractual shift obligations of the participating agencies of up to 33,000 AF in a twelve-month period; and

    - Sustain per capita water use reductions of 10 percent by 2015 and 20 percent by 2020.

IEUA concluded in its 2015 UWMP that the projected available water supply will meet projected water demand due to diversified water supply and water conservation measures. Based on IEUA water supply projections, there are sufficient water supplies to meet normal year water demands and single dry year demands. However, in the multiple dry year scenario a local supply gap of 283 AF is projected for 2040. IEUA and retail agencies plan to close the supply gap through utilizing local supplemental water supply opportunities and securing additional imported water as needed to accommodate for the variability in supply from the State Water Project (**Appendix J**, p. 3-16).

CWC section 10631(j) provides that urban water suppliers, that rely upon a wholesale agency for a source of water may rely upon water supply information provided by the wholesale agency in fulfilling UWMP informational requirements.

IEUA's independent analysis of contemporary regional water conditions in conjunction with MWD's most recent report, provide additional and reliable assurances concerning the sufficiency of imported water supplies that comprise a portion of overall Chino Basin supply sufficiency. As stated in the above-quoted OBMP text, however, "expanded use of imported water in the northern part of the Chino Basin will have a lower priority than maintaining groundwater production in the southern part of the Chino Basin."

JCSD's participation in the DYY Storage Program described in Section 3, along with future water storage and recovery projects will drought-proof the Chino Basin and all other appropriative pool members from imported water shortages. This program is consistent with OBMP Program Element No. 9, "Develop and Implement Storage and Recovery Program." Benefits to the Chino Basin associated with this program include the construction of facilities to enhance imported water deliveries and the production of water from the Chino Basin. Further demonstrating the sufficiency of Chino Basin groundwater is MWD's program to use the Chino Basin for dry year supply purposes, thus underscoring that sufficient Chino Basin groundwater is available during dry years not only for local use by agencies like JCSD but also in connection with MWD's regional reliability programs.

In conclusion, the sufficiency of groundwater supplies available to JCSD is assured because of the OBMP programs overseen by the Chino Basin Watermaster and conducted under the auspices of continuing Court jurisdiction that specifically direct and assure the long-term production of water pursuant to the District's legal rights to produce such water necessary to meet ultimate water demands.

Summary

As discussed in Section 2, the proposed Project's annual water demand is estimated at 461 AFY. The proposed land use types are similar to the 2020 UWMP, which estimated an annual demand of 505 AFY. For the purposes of this analysis potable water is assumed. District-wide potable water consumption in CY 2020 was 27,357 AF (JCSD 2020). With passage of recent statewide water conservation standards, unit water consumption of potable water is anticipated to decline.

As discussed in Section 3, the water supply portfolio available to serve the Project includes local potable water from District wells, CDA, RCSD, and the DYY Program. The District also maintains water storage accounts through the Chino Basin Watermaster. As of 2020, the potable water supplies utilized by JCSD totaled approximately 27,357 AF, which is commensurate with the District-wide potable demand during the same time period (JCSD 2020).

As of CY 2020, the potable groundwater production by JCSD was approximately 11,502 AF, which is less than the District's projected peak groundwater production of potable ground water (**Table 4-2**). Further, the District currently uses their total rights to potable water available from the CDA (**Table 4-3**).

Currently, JCSD's annual production right in the Chino Basin as calculated by the Watermaster totals 19,547.9 AF, with an additional 31,861.3 AF in storage (**Table 4-1**).

Although annual fluctuations to rights and storage accounts will occur, the District's rights are projected to increase over the next 20 years due to more land use conversions.

In conclusion, the water supplies available to JCSD currently meet and exceed water demands. Groundwater production by JCSD is currently less than their existing rights and within their groundwater well production capacity. Regardless, JCSD has the means and right to exceed their groundwater allocation in the Chino Basin when required to meet demand pursuant to the Judgment. Further, JCSD has rights to water held in storage that would supply customer demands for more than one year. On the other hand, JCSD also can supply water to the Project purchased from CDA that is within their existing entitlements and capacities. Therefore, the District can meet the planned water demand of the proposed Project by utilizing JCSD's existing water supply.

As discussed in Section 2, the proposed Project's annual water demand is estimated at 461 AFY. For the purposes of this analysis potable water is assumed. District-wide potable water consumption in CY 2020 was 27,357 AF (JCSD 2020). With passage of recent statewide water conservation standards, unit water consumption of potable water is anticipated to decline.

As discussed in Section 3, the water supply portfolio available to serve the Project includes local potable water from District wells, CDA, RCSD, and the DYY Program. The District also maintains water storage accounts through the Chino Basin Watermaster. As of 2020, the potable water supplies utilized by JCSD totaled approximately 27,357 AF, which is commensurate with the District-wide potable demand during the same time period (JCSD 2020).

As of CY 2020, the potable groundwater production by JCSD was approximately 11,502 AF, which is less than the District's projected peak groundwater production of potable ground water (**Table 4-2**). Further, the District currently uses their total rights to potable water available from the CDA (**Table 4-3**).

Currently, JCSD's annual production right in the Chino Basin as calculated by the Watermaster totals 19,547.9 AF, with an additional 31,861.3 AF in storage (**Table 4-1**).

Although annual fluctuations to rights and storage accounts will occur, the District's rights are projected to increase over the next 20 years due to more land use conversions.

In conclusion, the water supplies available to JCSD currently meet and exceed water demands. Groundwater production by JCSD is currently less than their existing rights and within their groundwater well production capacity. Regardless, JCSD has the means and right to exceed their groundwater allocation in the Chino Basin when required to meet demand pursuant to the Judgment. Further, JCSD has rights to water held in storage that would supply customer demands for more than one year. On the other hand, JCSD also can supply water to the Project purchased from CDA that is within their existing entitlements and capacities. Therefore, the District can meet the planned water demand of the proposed Project by utilizing JCSD's existing water supply.

Figure 4-1. Groundwater Basin Map

Figure 4-2. Chino Basin Management Zones

Section 5. Conclusions

Jurupa Community Services District (JCSD) has been identified as the water supplier for the proposed Eastvale Leal Property ("Project"). JCSD prepared an Urban Water Management Plan (UWMP) in 2020.

The Project is in the City of Eastvale and consists of 158 acres of proposed development. The proposed project will include mixed uses including mixed-use retail, office, housing, and civic development including police and fire stations and community center as well as a hotel and community spaces.

The estimated potable water demand for the Project is 461 acre-feet per year (AFY) (**Table 2-3**). No recycled water is assumed available to serve this Project at this time. The Project site was accounted for in the 2020 UWMP, which estimated a demand of 505 AFY for the Project site. Thus the Project was accounted for in the water demand projections of the most recent UWMP.

JCSD produced 11,051.8 AF of groundwater for potable use in CY 2020. JCSD has water production rights in the Chino Groundwater Basin that currently total 19,547.9 AF, as well as groundwater storage accounts that total 31,861.3 AF (**Table 4-1**).

JCSD holds a contractual commitment as a member of the Chino Basin Desalter Authority (CDA) for potable supplies in the amount of 11,733 AFY, and an agreement to purchase potable water from Rubidoux Community Services District (RCSD) in the amount of approximately 2,000 AFY. During dry years, JCSD can also purchase the City of Ontario's share of CDA water in the amount of approximately 2,000 AF through the DYY Program. In CY 2020, JCSD received 11,414 AF from CDA and 1,446 AF through the DYY Program. No supply was received from RCSD in CY 2020 (**Table 3-5**). In addition, JCSD obtained WMWD's CDA's supply of 3,445.5 AF of WMWD's CDA supply in CY 2020.

JCSD has forecasted excess water supplies will be available to meet customer demand during single-dry and multiple dry water years over the next 20 years (**Tables 3-8** and **3-9**), assuming a new water supply source is brought online around 2025. Current projects and supply sources include Western Municipal Water District and Cucamonga Valley Water District (**Table 3-6**). The District currently has an application before the State Water Resources Control Board to obtain grant funding and a low interest rate loan for a recycled water system.

Potable water demand in the JCSD service area was 27,357.3 AF as of CY 2020. By 2040, ultimate potable water demands are estimated at 36,289 AFY (**Table 2-2**). The current groundwater pumping capacity (33,090 gpm) will be increased ultimately to 43,315 gpm to meet customer demands under buildout conditions.

Based on the evidence provided herein, the total projected water supplies available to JCSD during normal, single dry, and multiple dry water years over a 20-year projection will be sufficient to meet the projected water demand associated with the proposed Project in addition to the water supplier's existing and planned future uses, including agricultural and manufacturing uses. State mandated conservation efforts will reduce demand in the future.

EXISTING EASEMENTS

(4) EASEMENT(S) FOR THE PURPOSE(S) SHOWN BELOW AND RIGHTS INCIDENTAL THERETO, AS GRANTED IN A DOCUMENT:

GRANTED TO: SOUTHERN CALIFORNIA EDISON COMPANY
PURPOSE: PUBLIC UTILITIES
RECORDING DATE: APRIL 9, 1953
RECORDING NO.: 17029, BOOK 1459, PAGE 442, OF OFFICIAL RECORDS
AFFECTS: A PORTION OF PARCELS 1, 2 AND 6 AS MORE PARTICULARLY DESCRIBED IN SAID DOCUMENT.
TO BE QUITCLAIMED

EASEMENT(S) FOR THE PURPOSE(S) SHOWN BELOW AND RIGHTS INCIDENTAL THERETO, AS GRANTED IN A DOCUMENT:

(6) GRANTED TO: ARTHUR L. HANSON AND BESSIE L. HANSON
PURPOSE: UTILITIES
RECORDING DATE: JUNE 5, 1953
RECORDING NO.: 27507, BOOK 1479, PAGE 275, OF OFFICIAL RECORDS
AFFECTS: A PORTION OF SAID LAND AS MORE PARTICULARLY DESCRIBED IN SAID DOCUMENT
A PORTION TO BE QUITCLAIMED

(9) EASEMENT(S) FOR THE PURPOSE(S) SHOWN BELOW AND RIGHTS INCIDENTALS THERETO, AS GRANTED IN A DOCUMENT:

GRANTED TO: SOUTHERN CALIFORNIA EDISON COMPANY
PURPOSE: UTILITIES
RECORDING DATE: OCTOBER 25, 1968
RECORDING NO. 71591, OF OFFICIAL RECORDS
AFFECTS: A PORTION OF PARCEL 7 AND 8 AS MORE PARTICULARLY DESCRIBED IN SAID DOCUMENT.
A PORTION TO BE QUITCLAIMED

(12) EASEMENT(S) FOR THE PURPOSE(S) SHOWN BELOW AND RIGHTS INCIDENTALS THERETO, AS GRANTED IN A DOCUMENT:

GRANTED TO: COUNTY OF RIVERSIDE
PURPOSE: PUBLIC ROAD AND DRAINAGE, INCLUDING PUBLIC UTILITY AND PUBLIC SERVICES
RECORDING DATE: DECEMBER 21, 1998
RECORDING NO. 552204, OF OFFICIAL RECORDS
AFFECTS: A PORTION OF PARCELS 3 AND 4 AS MORE PARTICULARLY DESCRIBED IN SAID DOCUMENT

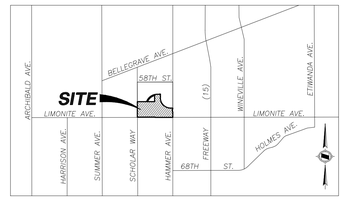
(20) EASEMENT(S) FOR THE PURPOSE(S) SHOWN BELOW AND RIGHTS INCIDENTALS THERETO, AS GRANTED IN A DOCUMENT:

GRANTED TO: COUNTY OF RIVERSIDE
PURPOSE: PUBLIC ROAD AND DRAINAGE, INCLUDING PUBLIC UTILITY AND PUBLIC SERVICES
RECORDING DATE: JANUARY 15, 2002
RECORDING NO. 2000-025215, OF OFFICIAL RECORDS
AFFECTS: A PORTION OF SAID LAND AS MORE PARTICULARLY DESCRIBED IN SAID DOCUMENT

(21) EASEMENT(S) FOR THE PURPOSE(S) SHOWN BELOW AND RIGHTS INCIDENTALS THERETO, AS GRANTED IN A DOCUMENT:

GRANTED TO: COUNTY OF RIVERSIDE
PURPOSE: PUBLIC ROAD AND DRAINAGE, INCLUDING PUBLIC UTILITY AND PUBLIC SERVICES
RECORDING DATE: JANUARY 15, 2002
RECORDING NO. 2000-025216, OF OFFICIAL RECORDS
AFFECTS: A PORTION OF SAID LAND AS MORE PARTICULARLY DESCRIBED IN SAID DOCUMENT

(22) EASEMENT(S) FOR THE PURPOSE(S) SHOWN BELOW AND RIGHTS INCIDENTALS THERETO, AS GRANTED IN A DOCUMENT:



GRANTED TO: JURUPA COMMUNITY SERVICES DISTRICT
PURPOSE: PIPELINES, UTILITIES AND ACCESS
RECORDING DATE: OCTOBER 1, 2003
RECORDING NO. 2000-770719, OF OFFICIAL RECORDS
AFFECTS: A PORTION OF SAID PARCEL 7 AS MORE PARTICULARLY DESCRIBED IN SAID DOCUMENT
PORTION TO BE QUITCLAIMED

(24) EASEMENT(S) FOR THE PURPOSE(S) SHOWN BELOW AND RIGHTS INCIDENTALS THERETO, AS GRANTED IN A DOCUMENT:

GRANTED TO: COUNTY OF RIVERSIDE
PURPOSE: DRAINAGE
RECORDING DATE: JULY 20, 2007
RECORDING NO. 2000-0474701, OF OFFICIAL RECORDS
AFFECTS: A PORTION OF PARCELS 7 AS MORE PARTICULARLY DESCRIBED IN SAID DOCUMENT

(27) EASEMENT(S) FOR THE PURPOSE(S) SHOWN BELOW AND RIGHTS INCIDENTALS THERETO, AS GRANTED IN A DOCUMENT:

GRANTED TO: CITY OF EASTVALE
PURPOSE: PUBLIC ROAD AND UTILITY
RECORDING DATE: OCTOBER 10, 2013
RECORDING NO. 2013-0488886, OF OFFICIAL RECORDS
AFFECTS: A PORTION OF SAID LAND AS MORE PARTICULARLY DESCRIBED IN SAID DOCUMENT

Apartments/Flats

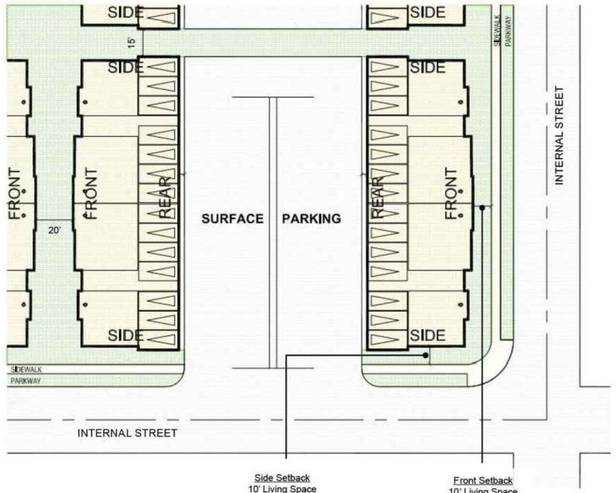

Table 4-7 establishes the development standards for residential apartments/flats. A conceptual plotting example illustrating the setback requirements is shown in Figure 4.8.

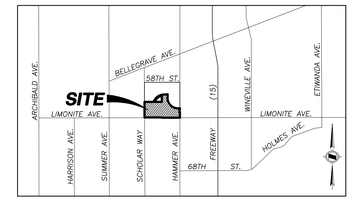

Table 4-7: Apartments/Flats Development Standards

	Apartments/Flats
Maximum Site Coverage	75%
Maximum Building Height	65' (4 stories)
Minimum Front Setback (from Internal Street Right-of-Way)	
Front Living Space	10'
Porch, Courtyard or Balcony	3'
Minimum Side Setback (from Internal Street Right-of-Way)	
Living Space	10'
Porch, Courtyard or Balcony	5'
Minimum Building Separation	
Front to Front (entries) - at open space	20'
Side to Side (no entries) - at open space	15'

PA-1 THREE STORY 10-PLEX &11-PLEX

MEDITERRANEAN STYLE (10-PLEX)

The Mediterranean style is a prime example of an old-world traditional style adapted to the Southern California climate and aesthetic. This traditional style has been refined, transformed, and embellished into a truly eclectic classic style. The shallow pitched hipped roof and simple wall aesthetic identifies this style. This style elicits a rustic character, expressed in warm colors, textures, materials and simple massing. Major elements are vertically oriented with shallow, wrought iron balconies. Use of classically shaped decorative trim elements, columns, shutters and cornice details is characteristic but not mandatory, along with lighter colors, to complement the warm climate.

VINEYARD STYLE (10-PLEX)

The Vineyard style captures the spirit of California agrarian family living. Homes reflect an airy connection to the outdoors with simple forms, vertical windows, and outdoor living spaces. The style is earthy and horizontal in nature based on farmhouse shapes and materials that suggest the home grew with the vineyard. Gable and cross gable roof forms are accented by shed roofs. Use of materials connect the style to the agricultural past with stucco, stone, board wall materials. Balconies are supported by simple railings reminiscent of traditional porch railings.

TRANSITIONAL MEDITERRANEAN (11-PLEX)

Inspired by architecture from the coastal regions of Spain and Italy where intense sunlight bathes every corner, the Mediterranean style emerged as a response to an ideal climate. Transitional Mediterranean reinterprets the style in a fresh way with modern materials and simplified forms and massing for todays sophisticated buyer. Sculpted stucco massing in fresh, more angular shapes embraces the timeless appeal of modern architecture, while still retaining a warmth from its traditional roots. The light colored walls are contrasted with rich dark or grayed woods to create the classic blend of light and dark features to define the forms. Large windows can be grouped or wrapped around a corner to carry the style around the sides. Other defining characteristics include a simple or parabolic arch at a window or entry, courtyards and minimal use of accent materials to accentuate key components or walls.

TRANSITIONAL CRAFTSMAN (11-PLEX)

The Craftsman originated from the early 1900s in Southern California where most prime early examples are concentrated and quickly spread throughout the country until the 1930's. Craftsman homes were inspired by the work of Charles and Henry Greene which drew their influences from the English Arts and Crafts movement, and an interest in wooden architecture from Eastern regions. These buildings are architecturally distinguished by their low-pitched, projecting eaves with rafter tails; clapboards, expansive porches with decorative or tapered columns, decorative braces underneath gables. The Eastwalk interpretation of the Transitional Craftsman incorporates many of these details with modern construction techniques and materials.

10-Plex Detail Elements - Mediterranean and Vineyard

Planning Area 1 features eight 10-plex multi-family condominium buildings. This housing type provides the highest density and the largest buildings, which create a dynamic urban streetscape. Every front door faces a community street or pedestrian paseo to reinforce this neighborhood as pedestrian oriented. The buildings feature Mediterranean and Vineyard architecture with a variety of enhanced materials including wood siding, stone veneer and stucco detailing. The buildings have well-organized facades with repeated forms to define a classic urban style that will stand the test of time.

Despite their compact arrangement, each residence is provided with important amenities to make it livable and memorable such as private entries at grade, private decks on the second floor, and two-car garage.

Architectural Features:

- Private entries.
- Diverse accent materials including wood siding, stone veneer, stucco corbels, stucco trim and contrasting color blocking.
- Private covered decks.
- Alignment to paseos and streets.

Conceptual Elevation

Private Entries

Diverse Accent Materials

Covered Decks

Front Doors Oriented Towards Paseos and Streets

Note: Artist's Conception: Colors, Materials and Application may Vary.

NOTES:

1. SHRUB DENSITY SHALL ADHERE TO THE FOLLOWING MINIMUM
   - 15 GALLON 10%
   - 5 GALLON 30%
   -1 GALLON 60%

GENERAL NOTES:

1. TREES SHALL BE LOCATED OUTSIDE OF UTILITY SETBACKS OR EASEMENTS AND SHALL BE LOCATED
   10' FROM ANY WATER OR SEWER LINE
   30' FROM ANY INTERSECTION
   10' FROM STREET LIGHT
   10' FROM FIRE HYDRANT OR STREET SIGN
   10' FROM DRIVEWAY APPROACH
   MATURE HEIGHT TO BE NO TALLER THAN 20' IF PLANTED UNDER UTILITY WIRES
2. STREET TREE SPECIES AND SPACING SHALL CONFORM TO ADJACENT TRACTS.
3. SIGHT DISTANCE TRIANGLES AT INTERSECTIONS AND DRIVEWAYS SHALL BE IN ACCORDANCE WITH COUNTY STANDARD NO. 821. VEGETATION WILL BE 30" MAXIMUM HEIGHT IN LIMITED USE AREAS.
4. ALL LANDSCAPE IMPROVEMENTS DEPICTED HEREIN OUTSIDE OF PUBLIC RIGHT OF WAY TO BE MAINTAINED BY PRIVATE PROPERTY ASSOCIATION(S) OR HOMEOWNERS ASSOCIATION(S).
5. SLOPE PLANTING SHALL INCLUDE PERMANENT GROUND COVER ADEQUATELY PLANTED WITH SHRUBS AND/OR TREES. PLANT MATERIAL AND MULCH TO BE SUITABLE FOR SLOPE USE AND PREVENTION OF SURFACE EROSION. PLANT SELECTION SHALL ENSURE FULL SLOPE COVERAGE WITHIN 12 MONTHS OF PLANTING.
6. 3" MINIMUM DEPTH OF SHREDDED BARK MULCH IN ALL PLANTER AREAS EXCLUDING HYDROSEED AREAS.
7. AGRONOMIC SOILS REPORT WILL BE PROVIDED DURING FINAL DESIGN.
8. 50% OF ALL TREES SHALL BE 24" BOX, 30% OF ALL TREES SHALL BE 36" BOX, AND 20% OF ALL TREES SHALL BE 48" BOX.

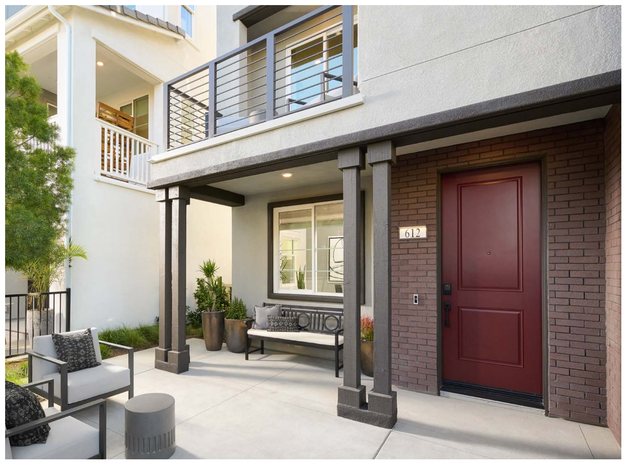
Planning Area 6 features 96 Row Townhomes within 32 separate Triplex buildings. The buildings provide a variety of building types and building scales throughout the community. Townhome dwellings offer a lifestyle that bridges the gap between single family homes and multi-family developments by providing all of the spaces found in a single family dwelling but with a stronger emphasis on neighbor and community. Every unit has a private front door facing a community street or pedestrian paseo. Individual dwellings are articulated on the building façade with enhanced materials and features to provide enduring community diversity and pleasing visual interest.



Three unique floor plans are offered. Some have living spaces on the first floor to activate the ground level while others offer living spaces on the upper floors with private covered decks. The buildings feature progressive interpretations of Spanish, Vineyard, and Farmhouse architecture.

Architectural Features:

- Private entries.
- Diverse accent materials.
- Private covered decks.
- Alignment to paseos and streets.

NOTES:

1. SHRUB DENSITY SHALL ADHERE TO THE FOLLOWING MINIMUM
   - 15 GALLON 10%
   - 5 GALLON 30%
   - 1 GALLON 60%

GENERAL NOTES:

1. TREES SHALL BE LOCATED OUTSIDE OF UTILITY SETBACKS OR EASEMENTS AND SHALL BE LOCATED
   10' FROM ANY WATER OR SEWER LINE
   30' FROM ANY INTERSECTION
   10' FROM STREET LIGHT
   10' FROM FIRE HYDRANT OR STREET SIGN
   10' FROM DRIVEWAY APPROACH
   MATURE HEIGHT TO BE NO TALLER THAN 20' IF PLANTED UNDER UTILITY WIRES
2. STREET TREE SPECIES AND SPACING SHALL CONFORM TO ADJACENT TRACTS.
3. SIGHT DISTANCE TRIANGLES AT INTERSECTIONS AND DRIVEWAYS SHALL BE IN ACCORDANCE WITH COUNTY STANDARD NO. 821. VEGETATION WILL BE 30" MAXIMUM HEIGHT IN LIMITED USE AREAS.
4. ALL LANDSCAPE IMPROVEMENTS DEPICTED HEREIN OUTSIDE OF PUBLIC RIGHT OF WAY TO BE MAINTAINED BY PRIVATE PROPERTY ASSOCIATION(S) OR HOMEOWNERS ASSOCIATION(S).
5. SLOPE PLANTING SHALL INCLUDE PERMANENT GROUND COVER ADEQUATELY PLANTED WITH SHRUBS AND/OR TREES. PLANT MATERIAL AND MULCH TO BE SUITABLE FOR SLOPE USE AND PREVENTION OF SURFACE EROSION. PLANT SELECTION SHALL ENSURE FULL SLOPE COVERAGE WITHIN 12 MONTHS OF PLANTING.
6. 3" MINIMUM DEPTH OF SHREDDED BARK MULCH IN ALL PLANTER AREAS EXCLUDING HYDROSEED AREAS.
7. AGRONOMIC SOILS REPORT WILL BE PROVIDED DURING FINAL DESIGN.
8. 50% OF ALL TREES SHALL BE 24" BOX, 30% OF ALL TREES SHALL BE 36" BOX, AND 20% OF ALL TREES SHALL BE 48" BOX.

4.1.2.2. Zero-Lot Line and Rear Loaded SFD Residential

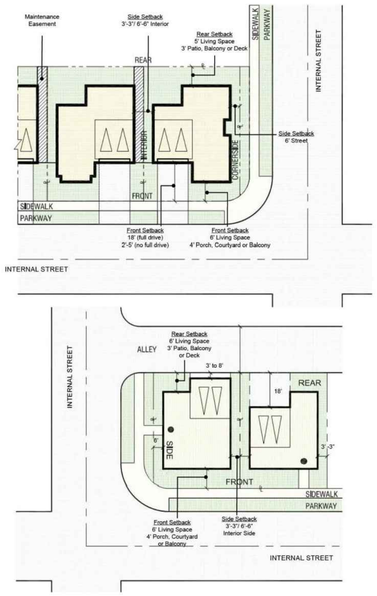

Table 4-3 establishes the development standards for front loaded zero-lot line and rear loaded SFD residential development. A conceptual plotting example illustrating the setback requirements is shown in Figure 4.4. Note: Zero-Lot Line Homes may be front or rear loaded. In the event that a rear-loaded Zero-Lot Line Home is proposed, the Rear-Loaded Homes standards shall apply (with a maintenance easement for the side yard).

Table 4-3:Zero-Lot & Rear Loaded SFD Residential Development Standards

	Zero-Lot Line Homes	Rear Loaded Homes
Minimum Lot Size	2,500 sq. ft.	2,000 sq. ft.
Maximum Building Height	50' (3 stories)	50' (3 stories)
Maximum Building Coverage	70%	70%
Minimum Front Setback (from Property Line)		
Living Space	6'	6'
Porch, Courtyard or Balcony	4'	4'
Front Entry Garage	18' (full driveway/2'- 5')	N/A
Minimum Side Setback (from Property Line)		
Interior Side (one side/between buildings)	3'/6'	3'/6'
Internal Street Right-of-Way Side	6'	6'
Minimum Rear Setback (from Property Line)		
Living Space	5'	5'
Patio Cover, Balcony or Deck	3'	3'
Rear Entry Garage Setback (from Access Drive)	N/A	3' to 8' or 18' min.

PA-7 THREE STORY SFD

TRANSITIONAL MEDITERRANEAN

Inspired by architecture from the coastal regions of Spain and Italy where intense sunlight bathes every corner, the Mediterranean style emerged as a response to an ideal climate. Transitional Mediterranean reinterprets the style in a fresh way with modern materials and simplified forms and massing for todays sophisticated buyer. Sculpted stucco massing in fresh, more angular shapes embraces the timeless appeal of modern architecture, while still retaining a warmth from its traditional roots. The light colored walls are contrasted with rich dark or grayed woods to create the classic blend of light and dark features to define the forms. Large windows can be grouped or wrapped around a corner to carry the style around the sides. Other defining characteristics include a simple or parabolic arch at a window or entry, courtyards and minimal use of accent materials to accentuate key components or walls.

TRANSITIONAL FARMHOUSE

Originating in the Midwest in the mid-1800s, the Farmhouse style ranges from small, simple structures to more elaborate homes featuring elements borrowed from other styles, particularly Victorian. This style gives a general feeling of nostalgia -- of a simpler time, with a sentimental connection to the land surrounding it and our country's rich architectural history. Front gables, porches and extended roof eaves are all style trademarks regardless of the home's size. The style evolved from the characteristics of the place, people, climate and materials available. Today's Transitional Farmhouse borrows design elements from its predecessors, while presenting a leaner profile composed of thoroughly modern materials. More refined details and simplified massing with an emphasis on vertical proportions define a more contemporary version of our traditional Farmhouse. Contrasting materials in a crisp range of whites and greys add a fresh look to an old favorite.

TRANSITIONAL CRAFTSMAN

The Craftsman originated from the early 1900s in Southern California where most prime early examples are concentrated and quickly spread throughout the country until the 1930's. Craftsman homes were inspired by the work of Charles and Henry Greene which drew their influences from the English Arts and Crafts movement, and an interest in wooden architecture from Eastern regions. These buildings are architecturally distinguished by their low-pitched, projecting eaves with rafter tails; clapboards, expansive porches with decorative or tapered columns, decorative braces underneath gables. The Eastwalk interpretation of the Transitional Craftsman incorporates many of these details with modern construction techniques and materials.

NOTES:

1. SHRUB DENSITY SHALL ADHERE TO THE FOLLOWING MINIMUM
   - 15 GALLON 10%
   - 5 GALLON 30%
   -1 GALLON 60%

GENERAL NOTES:

1. TREES SHALL BE LOCATED OUTSIDE OF UTILITY SETBACKS OR EASEMENTS AND SHALL BE LOCATED
   10' FROM ANY WATER OR SEWER LINE
   30' FROM ANY INTERSECTION
   10' FROM STREET LIGHT
   10' FROM FIRE HYDRANT OR STREET SIGN
   10' FROM DRIVEWAY APPROACH
   MATURE HEIGHT TO BE NO TALLER THAN 20' IF PLANTED UNDER UTILITY WIRES
2. STREET TREE SPECIES AND SPACING SHALL CONFORM TO ADJACENT TRACTS.
3. SIGHT DISTANCE TRIANGLES AT INTERSECTIONS AND DRIVEWAYS SHALL BE IN ACCORDANCE WITH COUNTY STANDARD NO. 821. VEGETATION WILL BE 30" MAXIMUM HEIGHT IN LIMITED USE AREAS.
4. ALL LANDSCAPE IMPROVEMENTS DEPICTED HEREIN OUTSIDE OF PUBLIC RIGHT OF WAY TO BE MAINTAINED BY PRIVATE PROPERTY ASSOCIATION(S) OR HOMEOWNERS ASSOCIATION(S).
5. SLOPE PLANTING SHALL INCLUDE PERMANENT GROUND COVER ADEQUATELY PLANTED WITH SHRUBS AND/OR TREES. PLANT MATERIAL AND MULCH TO BE SUITABLE FOR SLOPE USE AND PREVENTION OF SURFACE EROSION. PLANT SELECTION SHALL ENSURE FULL SLOPE COVERAGE WITHIN 12 MONTHS OF PLANTING.
6. 3" MINIMUM DEPTH OF SHREDDED BARK MULCH IN ALL PLANTER AREAS EXCLUDING HYDROSEED AREAS.
7. AGRONOMIC SOILS REPORT WILL BE PROVIDED DURING FINAL DESIGN.
8. 50% OF ALL TREES SHALL BE 24" BOX, 30% OF ALL TREES SHALL BE 36" BOX, AND 20% OF ALL TREES SHALL BE 48" BOX.

4.1.2.4. Row Townhomes

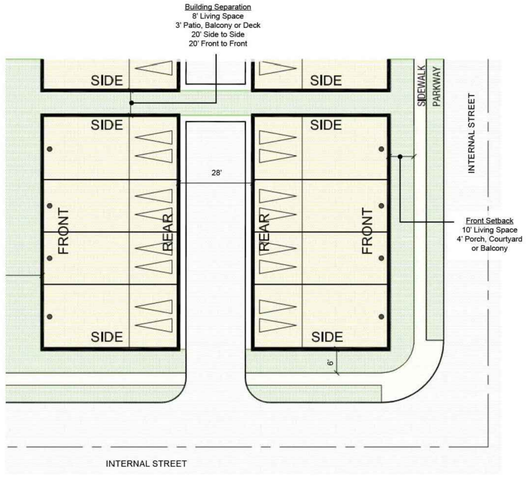

Table 4-5 establishes the development standards for row townhomes. A conceptual plotting example illustrating the setback requirements is shown in Figure 4.6.

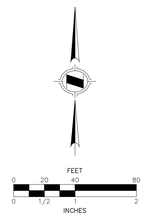

Table 4-5:Row Townhome Development Standards

	Row Townhomes
Minimum Parcel Size	1 ac
Maximum Site Coverage	N/A
Maximum Building Height	50' (3 stories)
Minimum Front Setback (from Internal Street Right-of-Way)	
Front Living Space	10'
Porch, Courtyard or Balcony	4'
Minimum Side Setback (from Internal Street Right-of-Way)	
Street Side	6'
Minimum Building Separation	
Living Space	8'
Patio Cover, Balcony or Deck	3'
Front to Front (entries) - at open space	20'
Side to Side with entries	20'
Garage Door to Garage Door at Alley	28'

Planning Area 8 features 78 dwelling units configured as duplex buildings. This housing type offers the same lifestyles typically associated with single-family residences, but in a more compact arrangement with attention to community design. Each residence features a private yard in addition to a large deck at the second floor to maximize outdoor living opportunities. Front door are oriented towards street or paseos, enhancing the pedestrian experience and neighborhood aesthetic.

Three different floor plans are offered, each expressed in three architectural styles: Spanish, Vineyard, and Farmhouse. Visual variety is further provided through six color schemes unique to this neighborhood.

Architectural Features:

- Wood and metal awnings at front doors.
- Diverse accent materials, including wood siding, stone veneer, stucco corbels, stucco trim and contrasting color blocking.
- Front patios.
- Private covered decks.
- Front door orientation toward street or paseo.

NOTES:

1. SHRUB DENSITY SHALL ADHERE TO THE FOLLOWING MINIMUM
   - 15 GALLON 10%
   - 5 GALLON 30%
   -1 GALLON 60%

GENERAL NOTES:

1. TREES SHALL BE LOCATED OUTSIDE OF UTILITY SETBACKS OR EASEMENTS AND SHALL BE LOCATED
   10' FROM ANY WATER OR SEWER LINE
   30' FROM ANY INTERSECTION
   10' FROM STREET LIGHT
   10' FROM FIRE HYDRANT OR STREET SIGN
   10' FROM DRIVEWAY APPROACH
   MATURE HEIGHT TO BE NO TALLER THAN 20' IF PLANTED UNDER UTILITY WIRES
2. STREET TREE SPECIES AND SPACING SHALL CONFORM TO ADJACENT TRACTS.
3. SIGHT DISTANCE TRIANGLES AT INTERSECTIONS AND DRIVEWAYS SHALL BE IN ACCORDANCE WITH COUNTY STANDARD NO. 821. VEGETATION WILL BE 30" MAXIMUM HEIGHT IN LIMITED USE AREAS.
4. ALL LANDSCAPE IMPROVEMENTS DEPICTED HEREIN OUTSIDE OF PUBLIC RIGHT OF WAY TO BE MAINTAINED BY PRIVATE PROPERTY ASSOCIATION(S) OR HOMEOWNERS ASSOCIATION(S).
5. SLOPE PLANTING SHALL INCLUDE PERMANENT GROUND COVER ADEQUATELY PLANTED WITH SHRUBS AND/OR TREES. PLANT MATERIAL AND MULCH TO BE SUITABLE FOR SLOPE USE AND PREVENTION OF SURFACE EROSION. PLANT SELECTION SHALL ENSURE FULL SLOPE COVERAGE WITHIN 12 MONTHS OF PLANTING.
6. 3" MINIMUM DEPTH OF SHREDDED BARK MULCH IN ALL PLANTER AREAS EXCLUDING HYDROSEED AREAS.
7. AGRONOMIC SOILS REPORT WILL BE PROVIDED DURING FINAL DESIGN.
8. 50% OF ALL TREES SHALL BE 24" BOX, 30% OF ALL TREES SHALL BE 36" BOX, AND 20% OF ALL TREES SHALL BE 48" BOX.
