There is an existing storm drain system in Orange Street across the sites frontage which begins as a 42” and transitions to a 48” part way through the site. This storm drain had a lateral A-2 which was bulk headed off at the front of our site for this development to tie into. Lateral A-2 was estimated to carry 24.7 CFS, which is greater than the 22.8 CFS the project generates. Therefore, this project is consistent with the anticipated flows of the existing City storm drain system, and will not affect the HGL found on the city reference drawings. These plans are included as reference.

INDEX

	SHEET NO.:
TITLE SHEET	1
PLAN & PROFILE	2-5

GENERAL NOTES

1. THE CONTRACTOR SHALL CONSTRUCT THE FLOOD CONTROL IMPROVEMENTS SHOWN ON THE DRAWINGS IN CONFORMANCE WITH THE REQUIREMENTS OF THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT'S M.O.U., STANDARD SPECIFICATIONS DATED SEPTEMBER 1984, AND DESIGN MANUAL STANDARD DRAWINGS DATED MAY 1971.
2. AN ENCROACHMENT PERMIT IS REQUIRED FROM RIVERSIDE COUNTY FLOOD CONTROL. CONTACT ED LOTZ AT 909/955-1266. AFTER THE PERMIT IS ISSUED THE DISTRICT MUST BE NOTIFIED ONE WEEK PRIOR TO CONSTRUCTION.
3. CONSTRUCTION INSPECTION WILL BE PERFORMED BY RIVERSIDE COUNTY FLOOD CONTROL. CONTACT DALE ANDERSON AT 909/955-1288. THE DISTRICT MUST BE NOTIFIED TWENTY DAYS (20) PRIOR TO CONSTRUCTION.
4. ALL STATIONING REFERS TO CENTERLINE OF CONSTRUCTION UNLESS OTHERWISE NOTED.
5. STATIONING FOR LATERALS AND CONNECTOR PIPE REFER TO THE CENTERLINE INTERSECTION STATIONS.
6. FORTY-EIGHT HOURS BEFORE EXCAVATION, CALL UNDERGROUND SERVICE ALERT 1-800-227-2600.
7. ALL ELEVATIONS SHOWN ARE IN FEET AND DECIMALS THEREOF BASED ON U.S.C. & G.S DATUM.
8. ALL CROSS SECTIONS ARE TAKEN LOOKING DOWNSTREAM.
9. ELEVATIONS OF UTILITIES ARE APPROXIMATE UNLESS OTHERWISE NOTED.
10. OPENINGS RESULTING FROM THE CUTTING OR PARTIAL REMOVAL OF EXISTING CULVERTS, PIPES OR SIMILAR STRUCTURES TO BE ABANDONED SHALL BE SEALED WITH 6" OF CLASS "B" CONCRETE.
11. PIPE CONNECTED TO THE MAINLINE PIPE SHALL CONFORM TO JUNCTION STRUCTURE NO. 4 (JS 229) UNLESS OTHERWISE NOTED.
12. PIPE BEDDING SHALL CONFORM TO RCFC&WCD STD. DWG. NO. M815 EXCEPT FOR COVER <2 FEET. FOR COVER <2 FEET, CONCRETE SLURRY (2000 PSI - 2 SACK) SHALL BE USED. THE ENTIRE TRENCH SHALL BE SLURRY EXTENDING 4 INCHES MINIMUM AND 12 INCHES MAXIMUM ABOVE THE TOP OF PIPE.
13. BH-1 INDICATES SOIL BORING LOCATIONS BASED ON THE SOILS REPORT DATED MARCH 13, 2001. LOCATIONS SHOWN ARE APPROXIMATE.
14. "V" IS THE DEPTH OF CATCH BASINS MEASURED FROM THE TOP OF CURB TO INVERT OF CONNECTOR PIPE.
15. CATCH BASINS SHALL BE LOCATED SO THAT LOCAL DEPRESSION SHALL BEGIN AT EXISTING CURB RETURN JOINT, UNLESS SPECIFIED.
16. ALL CURBS, GUTTERS, SIDEWALKS, DRIVEWAYS AND OTHER EXISTING IMPROVEMENTS TO BE RECONSTRUCTED IN KIND AND AT THE SAME ELEVATION AND LOCATION AS THE EXISTING IMPROVEMENTS UNLESS OTHERWISE NOTED.
17. STANDARD DRAWINGS CALLED FOR ON THE PLAN AND PROFILE SHALL CONFORM TO DISTRICT STANDARD DRAWINGS UNLESS NOTED OTHERWISE.
18. THE CONTRACTOR IS REQUIRED TO CALL ALL UTILITY AGENCIES REGARDING TEMPORARY SHORING AND SUPPORT REQUIREMENTS FOR THE VARIOUS UTILITY LINES SHOWN ON THESE PLANS.
19. DURING ROUGH GRADING OPERATIONS AND PRIOR TO CONSTRUCTION OF PERMANENT DRAINAGE STRUCTURES, TEMPORARY DRAINAGE CONTROL SHOULD BE PROVIDED TO PREVENT PONDING WATER AND DAMAGE TO ADJACENT PROPERTIES.
20. APPROVAL OF THESE PLANS BY THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT DOES NOT RELIEVE THE DEVELOPER'S ENGINEER OF RESPONSIBILITY FOR THE ENGINEERING DESIGN. IF FIELD CHANGES ARE REQUIRED, IT WILL BE THE RESPONSIBILITY OF THE DESIGN ENGINEER TO MAKE THE NECESSARY CORRECTIONS.
21. THE CONTRACTOR OR DEVELOPER SHALL SECURE ALL REQUIRED ENCROACHMENT AND/OR STATE AND FEDERAL REGULATORY PERMITS PRIOR TO THE COMMENCEMENT OF ANY WORK.

R.C.F.C. & W.C.D. STANDARD DRAWINGS

A Brief Introduction

This Project-Specific WQMP Template for the Santa Ana Region has been prepared to help guide you in documenting compliance for your project. Because this document has been designed to specifically document compliance, you will need to utilize the WQMP Guidance Document as your "how-to" manual to help guide you through this process. Both the Template and Guidance Document go hand-in-hand, and will help facilitate a well prepared Project-Specific WQMP. Below is a flowchart for the layout of this Template that will provide the steps required to document compliance.

OWNER'S CERTIFICATION

This Project-Specific Water Quality Management Plan (WQMP) has been prepared for Woodside 05S, LP by Allard Engineering for the APN: 152-040-003 (Orange Street SFR) project.

This WQMP is intended to comply with the requirements of The County of Riverside for R8-2010-0033 which includes the requirement for the preparation and implementation of a Project-Specific WQMP.

The undersigned, while owning the property/project described in the preceding paragraph, shall be responsible for the implementation and funding of this WQMP and will ensure that this WQMP is amended as appropriate to reflect up-to-date conditions on the site. In addition, the property owner accepts responsibility for interim operation and maintenance of Stormwater BMPs until such time as this responsibility is formally transferred to a subsequent owner. This WQMP will be reviewed with the facility operator, facility supervisors, employees, tenants, maintenance and service contractors, or any other party (or parties) having responsibility for implementing portions of this WQMP. At least one copy of this WQMP will be maintained at the project site or project office in perpetuity. The undersigned is authorized to certify and to approve implementation of this WQMP. The undersigned is aware that implementation of this WQMP is enforceable under County of Riverside Water Quality Ordinance (Municipal Code Section2010 SAR-MS4).

"I, the undersigned, certify under penalty of law that the provisions of this WQMP have been reviewed and accepted and that the WQMP will be transferred to future successors in interest."

Section A: Project and Site Information

PROJECT INFORMATION	
Type of Project:	Single Family Residential Homes
Planning Area:	
Community Name:	
Development Name:	Magnolia Ranch
PROJECT LOCATION	
Latitude & Longitude (DMS): 33.95987 N -117.57044 W	
Project Watershed and Sub-Watershed: Santa Ana Region.	
Gross Acres: 8.28	
APN(s): 152-04-0003	
Map Book and Page No.: BK 152, PG. 04	
PROJECT CHARACTERISTICS	
Proposed or Potential Land Use(s)	Single Family Residential Home
Proposed or Potential SIC Code(s)	1521
Area of Impervious Project Footprint (SF)	144,271
Total Area of proposed Impervious Surfaces within the Project Footprint (SF)/or Replacement	144,271
Does the project consist of offsite road improvements?	☒ Y ☐ N
Does the project propose to construct unpaved roads?	☐ Y ☒ N
Is the project part of a larger common plan of development (phased project)?	☐ Y ☒ N
EXISTING SITE CHARACTERISTICS	
Total area of existing Impervious Surfaces within the Project limits Footprint (SF)	78,200
Is the project located within any MSHCP Criteria Cell?	☐ Y ☒ N
If so, identify the Cell number:	Insert text here.
Are there any natural hydrologic features on the project site?	☐ Y ☒ N
Is a Geotechnical Report attached?	☒ Y ☐ N
If no Geotech. Report, list the NRCS soils type(s) present on the site (A, B, C and/or D)	Type B
What is the Water Quality Design Storm Depth for the project?	0.85 inch/day

A.1 Maps and Site Plans

When completing your Project-Specific WQMP, include a map of the local vicinity and existing site. In addition, include all grading, drainage, landscape/plant palette and other pertinent construction plans in Appendix 2. At a minimum, your WQMP Site Plan should include the following:

- Drainage Management Areas
- Proposed Structural BMPs
- Drainage Path
- Drainage Infrastructure, Inlets, Overflows
- Source Control BMPs
- Buildings, Roof Lines, Downspouts
- Impervious Surfaces
- Standard Labeling
- BMP Locations (Lat/Long)

Use your discretion on whether or not you may need to create multiple sheets or can appropriately accommodate these features on one or two sheets. Keep in mind that the Co-Permittee plan reviewer must be able to easily analyze your project utilizing this template and its associated site plans and maps.

A.2 Identify Receiving Waters

Using Table A.1 below, list in order of upstream to downstream, the receiving waters that the project site is tributary to. Continue to fill each row with the Receiving Water's 303(d) listed impairments (if any), designated beneficial uses, and proximity, if any, to a RARE beneficial use. Include a map of the receiving waters in Appendix 1.

Table A.1 Identification of Receiving Waters

Receiving Waters	EPA Approved 303(d) List Impairments	Designated Beneficial Uses	Proximity to RARE Beneficial Use
Cucamonga Creek Reach-1	Cadmium, Copper, Lead, Zinc	NONE	None, No RARE Beneficial use
Santa Ana River Reach - 3	Copper, Indicator Bacteria. Lead	RE1,2, BIOL, WILD, MAR, EST, RARE	RARE, 0.85 MILE
Prado Dam Reservour	PH, Indicator Bacteria	AGR, GWR, REC1,2, WARM, WILD, SPWN, RARE	RARE, 5.5 MILES
Santa Ana River Reach - 2	Indicator Bacteria	AGR, GWR, REC1,2, WARM, WILD, SPWN	RARE, 7.0 MILES
Santa Ana River Reach - 1	Indicator Bacteria	REC1,2, WARM, WILD	None, No RARE Beneficial use

A.3 Additional Permits/Approvals required for the Project:

Table A.2 Other Applicable Permits

Agency	Permit Required	
State Department of Fish and Game, 1602 Streambed Alteration Agreement	☐ Y	☒ N
State Water Resources Control Board, Clean Water Act (CWA) Section 401 Water Quality Cert.	☐ Y	☒ N
US Army Corps of Engineers, CWA Section 404 Permit	☐ Y	☒ N
US Fish and Wildlife, Endangered Species Act Section 7 Biological Opinion	☐ Y	☒ N
Statewide Construction General Permit Coverage	☐ Y	☒ N
Statewide Industrial General Permit Coverage	☐ Y	☒ N
Western Riverside MSHCP Consistency Approval (e.g., JPR, DBESP)	☐ Y	☒ N
Other *(please list in the space below as required)*	☐ Y	☒ N

If yes is answered to any of the questions above, the Co-Permittee may require proof of approval/coverage from those agencies as applicable including documentation of any associated requirements that may affect this Project-Specific WQMP.

Section B: Optimize Site Utilization (LID Principles)

Review of the information collected in Section 'A' will aid in identifying the principal constraints on site design and selection of LID BMPs as well as opportunities to reduce imperviousness and incorporate LID Principles into the site and landscape design. For example, constraints might include impermeable soils, high groundwater, groundwater pollution or contaminated soils, steep slopes, geotechnical instability, high-intensity land use, heavy pedestrian or vehicular traffic, utility locations or safety concerns. Opportunities might include existing natural areas, low areas, oddly configured or otherwise unbuildable parcels, easements and landscape amenities including open space and buffers (which can double as locations for bioretention BMPs), and differences in elevation (which can provide hydraulic head). Prepare a brief narrative for each of the site optimization strategies described below. This narrative will help you as you proceed with your LID design and explain your design decisions to others.

The 2010 Santa Ana MS4 Permit further requires that LID Retention BMPs (Infiltration Only or Harvest and Use) be used unless it can be shown that those BMPs are infeasible. Therefore, it is important that your narrative identify and justify if there are any constraints that would prevent the use of those categories of LID BMPs. Similarly, you should also note opportunities that exist which will be utilized during project design. Upon completion of identifying Constraints and Opportunities, include these on your WQMP Site plan in Appendix 1.

Consideration of "highest and best use" of the discharge should also be considered. For example, Lake Elsinore is evaporating faster than runoff from natural precipitation can recharge it. Requiring infiltration of 85% of runoff events for projects tributary to Lake Elsinore would only exacerbate current water quality problems associated with Pollutant concentration due to lake water evaporation. In cases where rainfall events have low potential to recharge Lake Elsinore (i.e. no hydraulic connection between groundwater to Lake Elsinore, or other factors), requiring infiltration of Urban Runoff from projects is counterproductive to the overall watershed goals. Project proponents, in these cases, would be allowed to discharge Urban Runoff, provided they used equally effective filtration-based BMPs.

Site Optimization

The following questions are based upon Section 3.2 of the WQMP Guidance Document. Review of the WQMP Guidance Document will help you determine how best to optimize your site and subsequently identify opportunities and/or constraints, and document compliance.

Did you identify and preserve existing drainage patterns? If so, how? If not, why?

The proposed site will drain to the proposed Contech Retention/Infiltration Chamber System-1,2 which will overflow when it reach capacity and the flow will conveys to the south via proposed storm drain and drain to the existing City Storm Drain System in Orange Street. We will retain/infiltrate the water volume generated in WQ Storm event (2-yr storm event). Only when the onsite Retention/infiltration Basin reach its capacity, water will drain to the proposed storm drain line and drain out to the existing storm drain system which conform to the existing drainage condition. Therefore, will preserve the existing drainage pattern.

Did you identify and protect existing vegetation? If so, how? If not, why?

This site is mostly barren and has moderate area of vegetation in its existing condition. The proposed site will remove existing vegetation and replace with the proposed planters and landscape areas which will be planted with climate adaptive plants/native vegetation/trees.

Did you identify and preserve natural infiltration capacity? If so, how? If not, why?

Yes, the site will have below surface infiltration/retention chamber system-1,2 where stormwater from water quality storm event will retain & infiltrate into the native sub-soil within the drawdown time.

Did you identify and minimize impervious area? If so, how? If not, why?

No. The existing site condition is mostly barren with a single existing structure and natural dirt cover. The proposed site will have planters, landscape area which will be approximately at least 15% of the site area.

Did you identify and disperse runoff to adjacent pervious areas? If so, how? If not, why?

Yes. Portion of paved area and the interior streets will drain to landscape area before conveyed to the drainage system.

Section C: Delineate Drainage Management Areas (DMAs)

Utilizing the procedure in Section 3.3 of the WQMP Guidance Document which discusses the methods of delineating and mapping your project site into individual DMAs, complete Table C.1 below to appropriately categorize the types of classification (e.g., Type A, Type B, etc.) per DMA for your project site. Upon completion of this table, this information will then be used to populate and tabulate the corresponding tables for their respective DMA classifications.

Table C.1 DMA Classifications

DMA Name or ID	Surface Type(s)[1][2]	Area (Sq. Ft.)	DMA Type
DMA-1	Landscape/Planters	97,226	A-1
DMA-1	Roof	29,168	D-1
DMA-1	Street/Paved Area	35,649	D-2
DMA-2	Landscape/Planters	119,180	A-1
DMA-2	Roof	30,754	D-1
DMA-2	Street/Paved Area	43,700	D-2

[1]Reference Table 2-1 in the WQMP Guidance Document to populate this column
[2]If multi-surface provide back-up

Table C.2 Type 'A', Self-Treating Areas

DMA Name or ID	Area (Sq. Ft.)	Stabilization Type	Irrigation Type (if any)
DMA-1	97,226	Mulching, Soding	Onsite Sprinkler with Rain Sensor
DMA-2	119,180	Mulching, Soding	Onsite Sprinkler with Rain Sensor

Table C.3 Type 'B', Self-Retaining Areas

Self-Retaining Area				Type 'C' DMAs that are draining to the Self-Retaining Area		
DMA Name/ ID	Post-project surface type	Area (square feet) [A]	Storm Depth (inches) [B]	DMA Name / ID	[C] from Table C.4 = [C]	Required Retention Depth (inches) [D]

$$[D] = [B] + \frac{[B] \cdot [C]}{[A]}$$

Table C.4 Type 'C', Areas that Drain to Self-Retaining Areas

DMA					Receiving Self-Retaining DMA		
DMA Name/ ID	Area (square feet) [A]	Post-project surface type	Impervious fraction [B]	Product [C] = [A] x [B]	DMA name /ID	Area (square feet) [D]	Ratio [C]/[D]

DMA Name or ID	BMP Name or ID
DMA-1 (D1, D2)	Below-surface Retention/Infiltration Chamber System-1. To be Installed in DMA-1.
DMA-2 (D1, D2)	Below-surface Retention/Infiltration Chamber System-2, To be Installed in DMA-2.

Note: More than one drainage management area can drain to a single LID BMP, however, one drainage management area may not drain to more than one BMP.

Section D: Implement LID BMPs

D.1 Infiltration Applicability

Is there an approved downstream 'Highest and Best Use' for stormwater runoff (see discussion in Chapter 2.4.4 of the WQMP Guidance Document for further details)? ☐ Y ☒ N

If yes has been checked, Infiltration BMPs shall not be used for the site; proceed to section D.3

If no, continue working through this section to implement your LID BMPs. It is recommended that you contact your Co-Permittee to verify whether or not your project discharges to an approved downstream 'Highest and Best Use' feature.

Geotechnical Report

A Geotechnical Report or Phase I Environmental Site Assessment may be required by the Co-permittee to confirm present and past site characteristics that may affect the use of Infiltration BMPs. In addition, the Co-Permittee, at their discretion, may not require a geotechnical report for small projects as described in Chapter 2 of the WQMP Guidance Document. If a geotechnical report has been prepared, include it in Appendix 3. In addition, if a Phase I Environmental Site Assessment has been prepared, include it in Appendix 4.

Is this project classified as a small project consistent with the requirements of Chapter 2 of the WQMP Guidance Document? ☐ Y ☒ N

Infiltration Feasibility

Table D.1 below is meant to provide a simple means of assessing which DMAs on your site support Infiltration BMPs and is discussed in the WQMP Guidance Document in Chapter 2.4.5. Check the appropriate box for each question and then list affected DMAs as applicable. If additional space is needed, add a row below the corresponding answer.

Table D.1 Infiltration Feasibility

Does the project site…	YES	NO
…have any DMAs with a seasonal high groundwater mark shallower than 10 feet?		X
If Yes, list affected DMAs:		
…have any DMAs located within 100 feet of a water supply well?		X
If Yes, list affected DMAs:		
…have any areas identified by the geotechnical report as posing a public safety risk where infiltration of stormwater could have a negative impact?		X
If Yes, list affected DMAs:		
…have measured in-situ infiltration rates of less than 1.6 inches / hour?		X
If Yes, list affected DMAs:		
…have significant cut and/or fill conditions that would preclude in-situ testing of infiltration rates at the final infiltration surface?		X
If Yes, list affected DMAs:		
…geotechnical report identify other site-specific factors that would preclude effective and safe infiltration?		X
Describe here:		

If you answered "Yes" to any of the questions above for any DMA, Infiltration BMPs should not be used for those DMAs and you should proceed to the assessment for Harvest and Use below.

*The Infiltration BMPs (*Below-surface Retention/Infiltration Chamber System-1,2) To be Installed in DMA-1 and DMA-2 *are to be used for mitigation of water quality volume from both DMA-1, DMA-2. We will take*

the storm water generates in DMA-1, DMA-2 to the proposed BMPs (Inf. Chamber System-1,2) located in DMA-1 & DMA-2.

D.2 Harvest and Use Assessment

Please check what applies*:*

☐ Reclaimed water will be used for the non-potable water demands for the project.

☐Downstream water rights may be impacted by Harvest and Use as approved by the Regional Board (verify with the Copermittee).

X☐The Design Capture Volume will be addressed using Retention/Infiltration Only BMPs. In such a case, Harvest and Use BMPs are still encouraged, but it would not be required if the Design Capture Volume will be infiltrated or evapotranspired.

If any of the above boxes have been checked, Harvest and Use BMPs need not be assessed for the site. If none of the above criteria applies, follow the steps below to assess the feasibility of irrigation use, toilet use and other non-potable uses (e.g., industrial use).

Irrigation Use Feasibility

Complete the following steps to determine the feasibility of harvesting stormwater runoff for Irrigation Use BMPs on your site:

Step 1: Identify the total area of irrigated landscape on the site, and the type of landscaping used.

Total Area of Irrigated Landscape: Insert Area (Acres)

Type of Landscaping (Conservation Design or Active Turf): List Landscaping Type

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for irrigation use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: Insert Area (Acres)

Step 3: Cross reference the Design Storm depth for the project site (see Exhibit A of the WQMP Guidance Document) with the left column of Table 2-3 in Chapter 2 to determine the minimum area of Effective Irrigated Area per Tributary Impervious Area (EIATIA).

Enter your EIATIA factor: EIATIA Factor

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum irrigated area that would be required.

Minimum required irrigated area: Insert Area (Acres)

Step 5: Determine if harvesting stormwater runoff for irrigation use is feasible for the project by comparing the total area of irrigated landscape (Step 1) to the minimum required irrigated area (Step 4).

Minimum required irrigated area (Step 4)	Available Irrigated Landscape (Step 1)
Insert Area (Acres)	Insert Area (Acres)

Toilet Use Feasibility

Complete the following steps to determine the feasibility of harvesting stormwater runoff for toilet flushing uses on your site:

Step 1: Identify the projected total number of daily toilet users during the wet season, and account for any periodic shut downs or other lapses in occupancy:

Projected Number of Daily Toilet Users: Number of daily Toilet Users

Project Type: Enter 'Residential', 'Commercial', 'Industrial' or 'Schools'

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for toilet use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: Insert Area (Acres)

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-2 in Chapter 2 to determine the minimum number or toilet users per tributary impervious acre (TUTIA).

Enter your TUTIA factor: TUTIA Factor

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum number of toilet users that would be required.

Minimum number of toilet users: Required number of toilet users

Step 5: Determine if harvesting stormwater runoff for toilet flushing use is feasible for the project by comparing the Number of Daily Toilet Users (Step 1) to the minimum required number of toilet users (Step 4).

Minimum required Toilet Users (Step 4)	Projected number of toilet users (Step 1)
Insert Area (Acres)	Insert Area (Acres)

Other Non-Potable Use Feasibility

Are there other non-potable uses for stormwater runoff on the site (e.g. industrial use)? See Chapter 2 of the Guidance for further information. If yes, describe below. If no, write N/A.

Insert narrative description here.

Step 1: Identify the projected average daily non-potable demand, in gallons per day, during the wet season and accounting for any periodic shut downs or other lapses in occupancy or operation.

Average Daily Demand: Projected Average Daily Use (gpd)

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for the identified non-potable use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: Insert Area (Acres)

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-4 in Chapter 2 to determine the minimum demand for non-potable uses per tributary impervious acre.

Enter the factor from Table 2-4: Enter Value

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum number of gallons per day of non-potable use that would be required.

Minimum required use: Minimum use required (gpd)

Step 5: Determine if harvesting stormwater runoff for other non-potable use is feasible for the project by comparing the projected average daily use (Step 1) to the minimum required non-potable use (Step 4).

Minimum required non-potable use (Step 4)	Projected average daily use (Step 1)
Minimum use required (gpd)	Projected Average Daily Use (gpd)

If Irrigation, Toilet and Other Use feasibility anticipated demands are less than the applicable minimum values, Harvest and Use BMPs are not required and you should proceed to utilize LID Bioretention and Biotreatment per Section 3.4.2 of the WQMP Guidance Document.

D.3 Bioretention and Biotreatment Assessment

Other LID Bioretention and Biotreatment BMPs as described in Chapter 2.4.7 of the WQMP Guidance Document are feasible on nearly all development sites with sufficient advance planning.

Select one of the following:

☐ LID Bioretention/Biotreatment BMPs will be used for some or all DMAs of the project as noted below in Section D.4 (note the requirements of Section 3.4.2 in the WQMP Guidance Document).

☐ A site-specific analysis demonstrating the technical infeasibility of all LID BMPs has been performed and is included in Appendix 5. If you plan to submit an analysis demonstrating the technical infeasibility of LID BMPs, request a pre-submittal meeting with the Copermittee to discuss this option. Proceed to Section E to document your alternative compliance measures.

D.4 Feasibility Assessment Summaries

From the Infiltration, Harvest and Use, Bioretention and Biotreatment Sections above, complete Table D.2 below to summarize which LID BMPs are technically feasible, and which are not, based upon the established hierarchy.

Table D.2 LID Prioritization Summary Matrix

DMA Name/ID	LID BMP Hierarchy				No LID (Alternative Compliance)
	1. Infiltration	2. Harvest and use	3. Bioretention	4. Biotreatment	
DMA-1	☒	☐	☐	☐	☐
DMA-2	☒	☐	☐	☐	☐

For those DMAs where LID BMPs are not feasible, provide a brief narrative below summarizing why they are not feasible, include your technical infeasibility criteria in Appendix 5, and proceed to Section E below to document Alternative Compliance measures for those DMAs. Recall that each proposed DMA must pass through the LID BMP hierarchy before alternative compliance measures may be considered.

Insert narrative description here.

Project is proposing to treat the required design capture volume generated from the entire project site (DMA-1 and DMA-2) and the offsite street improvement areas (Included in DMA-1,2) from the WQMP storm event (85th Percentile storm event) using two below-surface Infiltration/Retention Chamber System-1,2 BMPs. Infiltration/Retention Chamber System-1,2 BMPs are located in DMA-1 and DMA-2. In situ infiltration test in DMA-1,2 resulted in infiltration rate 2.67"/hr at Infiltration Test Pit I-1 which is more than the minimum requirement for the infiltration BMPs. Therefore, we are proposing to the Infiltration/Retention Chamber System-1,2 in DMA-1/DMA-2 where the tested infiltration rates exceed the minimum requirements.

Once the Infiltration/Retention Chamber System-1,2 reach their capacity, the overflow will drain out using storm drain pipe from the Chamber System-1,2 and will be conveys to the frontal street (Orange Street) via the proposed 30" storm drain lateral onsite and finally conveys to the existing City storm drain system (48" RCP) in Orange Street via 30" lateral.

D.5 LID BMP Sizing

Each LID BMP must be designed to ensure that the Design Capture Volume will be addressed by the selected BMPs. First, calculate the Design Capture Volume for each LID BMP using the V_{BMP} worksheet in Appendix F of the LID BMP Design Handbook. Second, design the LID BMP to meet the required V_{BMP} using a method approved by the Co-permittee. Utilize the worksheets found in the LID BMP Design Handbook or consult with your Co-permittee to assist you in correctly sizing your LID BMPs. Complete Table D.3 below to document the Design Capture Volume and the Proposed Volume for each LID BMP. Provide the completed design procedure sheets for each LID BMP in Appendix 6. You may add additional rows to the table below as needed.

For BMP Design Volume (Vbmp) calculation refer to Appendix 6.

Below Surface Ret/Inf Chamber System-1 Sizing:

DMA Type/ID	DMA Area (square feet)	Post-Project Surface Type	Effective Impervious Fraction, I_f	**DMA Runoff Factor**	DMA Areas x Runoff Factor	*Enter BMP Name / Identifier Here* *INF./RET CHAMBER SYSTEM-1*		
	[A]		[B]	[C]	[A] x [C]			
DMA-1 D1	*29,168*	*Roof*	*1.00*	*0.89*	*25,959.5*	*Design Storm Depth (in)*	*Design Capture Volume, V_{BMP} (cubic feet)*	*Proposed Volume on Plans (cubic feet)*
DMA-1 D2	*35,649*	*Street/Paved Area*	*1.00*	*0.89*	*31,727.6*			
DMA-1 A1	*97,226*	*Landscape*	*0.10*	*0.11*	*10,694.8*			
DMA-1	$A_T = \Sigma[A]$ 162,043				$\Sigma = [D]$ 68382	[E] 0.85	$[F] = \frac{[D]x[E]}{12}$ 4,844	[G] *4,873*

Below Surface Ret/Inf Chamber System-2 Sizing:

DMA Type/ID	DMA Area (square feet)	Post-Project Surface Type	Effective Impervious Fraction, I_f	**DMA Runoff Factor**	DMA Areas x Runoff Factor	*Enter BMP Name / Identifier Here* *INF./RET CHAMBER SYSTEM-2*		
	[A]		[B]	[C]	[A] x [C]			
DMA-2 D1	*30,754*	*Roof*	*1.00*	*0.89*	*27,371.1*	*Design Storm Depth (in)*	*Design Capture Volume, V_{BMP} (cubic feet)*	*Proposed Volume on Plans (cubic feet)*
DMA-2 D2	*43,700*	*Street/Paved Area*	*1.00*	*0.89*	*38,893*			
DMA-2 A1	*119,180*	*Landscape*	*0.10*	*0.11*	*13,109.8*			
DMA-2	$A_T = \Sigma[A]$ 198,634				$\Sigma = [D]$ 79,374	[E] 0.85	$[F] = \frac{[D]x[E]}{12}$ 5,623	[G] *5,729*

[B], [C] is obtained as described in Section 2.3.1 of the WQMP Guidance Document
[E] is obtained from Exhibit A in the WQMP Guidance Document
[G] is obtained from a design procedure sheet, such as in LID BMP Design Handbook and placed in Appendix 6

Total Design Capture Volume (Vbmp): 10,467 cu-ft (4,844 cf + 5,623 cf)

July 2011

Section E: Alternative Compliance (LID Waiver Program)

LID BMPs are expected to be feasible on virtually all projects. Where LID BMPs have been demonstrated to be infeasible as documented in Section D, other Treatment Control BMPs must be used (subject to LID waiver approval by the Co-permittee). Check one of the following Boxes:

✓ ☐ LID Principles and LID BMPs have been incorporated into the site design to fully address all Drainage Management Areas. No alternative compliance measures are required for this project and thus this Section is not required to be completed.

- Or -

☐ The following Drainage Management Areas are unable to be addressed using LID BMPs. A site-specific analysis demonstrating technical infeasibility of LID BMPs has been approved by the Co-Permittee and included in Appendix 5. Additionally, no downstream regional and/or sub-regional LID BMPs exist or are available for use by the project. The following alternative compliance measures on the following pages are being implemented to ensure that any pollutant loads expected to be discharged by not incorporating LID BMPs, are fully mitigated.

E.1 Identify Pollutants of Concern

Utilizing Table A.1 from Section A above which noted your project's receiving waters and their associated EPA approved 303(d) listed impairments, cross reference this information with that of your selected Priority Development Project Category in Table E.1 below. If the identified General Pollutant Categories are the same as those listed for your receiving waters, then these will be your Pollutants of Concern and the appropriate box or boxes will be checked on the last row. The purpose of this is to document compliance and to help you appropriately plan for mitigating your Pollutants of Concern in lieu of implementing LID BMPs.

Table E.1 Potential Pollutants by Land Use Type

Priority Development Project Categories and/or Project Features (check those that apply)	General Pollutant Categories							
	Bacterial Indicators	Metals	Nutrients	Pesticides	Toxic Organic Compounds	Sediments	Trash & Debris	Oil & Grease
☒ Detached Residential Development	P	N	P	P	N	P	P	P
☐ Attached Residential Development	P	N	P	P	N	P	P	P(2)
☐ Commercial/Industrial Development	P(3)	P	P(1)	P(1)	P(5)	P(1)	P	P
☐ Automotive Repair Shops	N	P	N	N	P(4, 5)	N	P	P
☐ Restaurants (>5,000 ft^2)	P	N	N	N	N	N	P	P
☐ Hillside Development (>5,000 ft^2)	P	N	P	P	N	P	P	P
☐ Parking Lots (>5,000 ft^2)	P(6)	P	P(1)	P(1)	P(4)	P(1)	P	P
☐ Retail Gasoline Outlets	N	P	N	N	P	N	P	P
Project Priority Pollutant(s) of Concern	☐	☐	☐	☐	☐	☐	☐	☐

P = Potential

N = Not Potential

(1) A potential Pollutant if non-native landscaping exists or is proposed onsite; otherwise not expected

(2) A potential Pollutant if the project includes uncovered parking areas; otherwise not expected

(3) A potential Pollutant is land use involving animal waste

(4) Specifically petroleum hydrocarbons

(5) Specifically solvents

(6) Bacterial indicators are routinely detected in pavement runoff

E.2 Stormwater Credits

Projects that cannot implement LID BMPs but nevertheless implement smart growth principles are potentially eligible for Stormwater Credits. Utilize Table 3-8 within the WQMP Guidance Document to identify your Project Category and its associated Water Quality Credit. If not applicable, write N/A.

Table E.2 Water Quality Credits

Qualifying Project Categories	Credit Percentage[2]
Total Credit Percentage[1]	

[1]Cannot Exceed 50%

[2]Obtain corresponding data from Table 3-8 in the WQMP Guidance Document

E.3 Sizing Criteria

After you appropriately considered Stormwater Credits for your project, utilize Table E.3 below to appropriately size them to the DCV, or Design Flow Rate, as applicable. Please reference Chapter 3.5.2 of the WQMP Guidance Document for further information.

Table E.3 Treatment Control BMP Sizing

DMA Type/ID	DMA Area (square feet)	Post-Project Surface Type	Effective Impervious Fraction, I_f	DMA Runoff Factor	DMA Area x Runoff Factor		*Enter BMP Name / Identifier Here*		
	[A]		[B]	[C]	[A] x [C]				
						Design Storm Depth (in)	*Minimum Design Capture Volume or Design Flow Rate (cubic feet or cfs)*	*Total Storm Water Credit % Reduction*	*Proposed Volume or Flow on Plans (cubic feet or cfs)*
	A_T = Σ[A]				Σ= [D]	[E]	[F] = $\frac{[D]x[E]}{[G]}$	[F] X (1-[H])	[I]

[B], [C] is obtained as described in Section 2.3.1 from the WQMP Guidance Document

[E] is for Flow-Based Treatment Control BMPs [E] = .2, for Volume-Based Control Treatment BMPs, [E] obtained from Exhibit A in the WQMP Guidance Document

[G] is for Flow-Based Treatment Control BMPs [G] = 43,560, for Volume-Based Control Treatment BMPs, [G] = 12

[H] is from the Total Credit Percentage as Calculated from Table E.2 above

[I] as obtained from a design procedure sheet from the BMP manufacturer and should be included in Appendix 6

E.4 Treatment Control BMP Selection

Treatment Control BMPs typically provide proprietary treatment mechanisms to treat potential pollutants in runoff, but do not sustain significant biological processes. Treatment Control BMPs must have a removal efficiency of a medium or high effectiveness as quantified below:

- High: equal to or greater than 80% removal efficiency
- Medium: between 40% and 80% removal efficiency

Such removal efficiency documentation (e.g., studies, reports, etc.) as further discussed in Chapter 3.5.2 of the WQMP Guidance Document, must be included in Appendix 6. In addition, ensure that proposed Treatment Control BMPs are properly identified on the WQMP Site Plan in Appendix 1.

Table E.4 Treatment Control BMP Selection

Selected Treatment Control BMP Name or ID[1]	Priority Pollutant(s) of Concern to Mitigate[2]	Removal Efficiency Percentage[3]

[1] Treatment Control BMPs must not be constructed within Receiving Waters. In addition, a proposed Treatment Control BMP may be listed more than once if they possess more than one qualifying pollutant removal efficiency.
[2] Cross Reference Table E.1 above to populate this column.
[3] As documented in a Co-Permittee Approved Study and provided in Appendix 6.

Section F: Hydromodification

F.1 Hydrologic Conditions of Concern (HCOC) Analysis

Once you have determined that the LID design is adequate to address water quality requirements, you will need to assess if the proposed LID Design may still create a HCOC. Review Chapters 2 and 3 (including Figure 3-7) of the WQMP Guidance Document to determine if your project must mitigate for Hydromodification impacts. If your project meets one of the following criteria which will be indicated by the check boxes below, you do not need to address Hydromodification at this time. However, if the project does not qualify for Exemptions 1, 2 or 3, then additional measures must be added to the design to comply with HCOC criteria. This is discussed in further detail below in Section F.2.

HCOC EXEMPTION 1: The Priority Development Project disturbs less than one acre. The Co-permittee has the discretion to require a Project-Specific WQMP to address HCOCs on projects less than one acre on a case by case basis. The disturbed area calculation should include all disturbances associated with larger common plans of development.

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, HCOC criteria do not apply.

HCOC EXEMPTION 2: The volume and time of concentration[1] of storm water runoff for the post-development condition is not significantly different from the pre-development condition for a 2-year return frequency storm (a difference of 5% or less is considered insignificant) using one of the following methods to calculate:

- Riverside County Hydrology Manual
- Technical Release 55 (TR-55): Urban Hydrology for Small Watersheds (NRCS 1986), or derivatives thereof, such as the Santa Barbara Urban Hydrograph Method
- Other methods acceptable to the Co-Permittee

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, report results in Table F.1 below and provide your substantiated hydrologic analysis in Appendix 7.

Table F.1 Hydrologic Conditions of Concern Summary

	2 year – 24 hour		
	Pre-condition	Post-condition	% Difference
Time of Concentration			
Volume (Cubic Feet)			

[1] Time of concentration is defined as the time after the beginning of the rainfall when all portions of the drainage basin are contributing to flow at the outlet.

Entered time of concentration and volumes are from Phase I & II combined.

HCOC EXEMPTION 3: All downstream conveyance channels to an adequate sump (for example, Prado Dam, Lake Elsinore, Canyon Lake, Santa Ana River, or other lake, reservoir or naturally erosion resistant feature) that will receive runoff from the project are engineered and regularly maintained to ensure design flow capacity; no sensitive stream habitat areas will be adversely affected; or are not identified on the Co-Permittees Hydromodification Susceptibility Maps.

Does the project qualify for this HCOC Exemption? ☒ Y ☐ N

If Yes, HCOC criteria do not apply and note below which adequate sump applies to this HCOC qualifier:

The site will drain to the existing City Strom Drain System in Orange Street (48" RCP) after mitigation of the water quality volume by infiltration BMPs (Inf/Ret. Basin-1). Ultimately the City Storm Drain System conveys water to Santa Ana River

F.2 HCOC Mitigation

If none of the above HCOC Exemption Criteria are applicable, HCOC criteria is considered mitigated if they meet one of the following conditions:

a. Additional LID BMPS are implemented onsite or offsite to mitigate potential erosion or habitat impacts as a result of HCOCs. This can be conducted by an evaluation of site-specific conditions utilizing accepted professional methodologies published by entities such as the California Stormwater Quality Association (CASQA), the Southern California Coastal Water Research Project (SCCRWP), or other Co-Permittee approved methodologies for site-specific HCOC analysis.

b. The project is developed consistent with an approved Watershed Action Plan that addresses HCOC in Receiving Waters.

c. Mimicking the pre-development hydrograph with the post-development hydrograph, for a 2-year return frequency storm. Generally, the hydrologic conditions of concern are not significant, if the post-development hydrograph is no more than 10% greater than pre-development hydrograph. In cases where excess volume cannot be infiltrated or captured and reused, discharge from the site must be limited to a flow rate no greater than 110% of the pre-development 2-year peak flow.

Be sure to include all pertinent documentation used in your analysis of the items a, b or c in Appendix 7.

HCOC Mitigation not required-HCOC Exemption satisfied.

Section G: Source Control BMPs

Source control BMPs include permanent, structural features that may be required in your project plans — such as roofs over and berms around trash and recycling areas — and Operational BMPs, such as regular sweeping and "housekeeping", that must be implemented by the site's occupant or user. The MEP standard typically requires both types of BMPs. In general, Operational BMPs cannot be substituted for a feasible and effective permanent BMP. Using the Pollutant Sources/Source Control Checklist in Appendix 8, review the following procedure to specify Source Control BMPs for your site:

1. *Identify Pollutant Sources*: Review Column 1 in the Pollutant Sources/Source Control Checklist. Check off the potential sources of Pollutants that apply to your site.

2. *Note Locations on Project-Specific WQMP Exhibit*: Note the corresponding requirements listed in Column 2 of the Pollutant Sources/Source Control Checklist. Show the location of each Pollutant source and each permanent Source Control BMP in your Project-Specific WQMP Exhibit located in Appendix 1.

3. *Prepare a Table and Narrative*: Check off the corresponding requirements listed in Column 3 in the Pollutant Sources/Source Control Checklist. In the left column of Table G.1 below, list each potential source of runoff Pollutants on your site (from those that you checked in the Pollutant Sources/Source Control Checklist). In the middle column, list the corresponding permanent, Structural Source Control BMPs (from Columns 2 and 3 of the Pollutant Sources/Source Control Checklist) used to prevent Pollutants from entering runoff. Add additional narrative in this column that explains any special features, materials or methods of construction that will be used to implement these permanent, Structural Source Control BMPs.

4. *Identify Operational Source Control BMPs:* To complete your table, refer once again to the Pollutant Sources/Source Control Checklist. List in the right column of your table the Operational BMPs that should be implemented as long as the anticipated activities continue at the site. Copermittee stormwater ordinances require that applicable Source Control BMPs be implemented; the same BMPs may also be required as a condition of a use permit or other revocable Discretionary Approval for use of the site.

Table G.1 Permanent and Operational Source Control Measures

Potential Sources of Runoff pollutants	Permanent Structural Source Control BMPs	Operational Source Control BMPs

Section H: Construction Plan Checklist

Populate Table H.1 below to assist the plan checker in an expeditious review of your project. The first two columns will contain information that was prepared in previous steps, while the last column will be populated with the corresponding plan sheets. This table is to be completed with the submittal of your final Project-Specific WQMP.

Table H.1 Construction Plan Cross-reference

BMP No. or ID	BMP Identifier and Description	Corresponding Plan Sheet(s)	BMP Location (Lat/Long)
BMP-1	Infiltration/Retention Chamber System-1	WQMP Exhibit	Lat. 33.9596° Long. -117.5712°
BMP-2	Infiltration/Retention Chamber System-2	WQMP Exhibit	Lat. 33.9596° Long. -117.5700°

Note that the updated table — or Construction Plan WQMP Checklist — is only a reference tool to facilitate an easy comparison of the construction plans to your Project-Specific WQMP. Co-Permittee staff can advise you regarding the process required to propose changes to the approved Project-Specific WQMP.

Section I: Operation, Maintenance and Funding

The Co-permittee will periodically verify that Stormwater BMPs on your site are maintained and continue to operate as designed. To make this possible, your Co-permittee will require that you include in Appendix 9 of this Project-Specific WQMP:

1. A means to finance and implement facility maintenance in perpetuity, including replacement cost.
2. Acceptance of responsibility for maintenance from the time the BMPs are constructed until responsibility for operation and maintenance is legally transferred. A warranty covering a period following construction may also be required.
3. An outline of general maintenance requirements for the Stormwater BMPs you have selected.
4. Figures delineating and designating pervious and impervious areas, location, and type of Stormwater BMP, and tables of pervious and impervious areas served by each facility. Geo-locating the BMPs using a coordinate system of latitude and longitude is recommended to help facilitate a future statewide database system.
5. A separate list and location of self-retaining areas or areas addressed by LID Principles that do not require specialized O&M or inspections but will require typical landscape maintenance as noted in Chapter 5, pages 85-86, in the WQMP Guidance. Include a brief description of typical landscape maintenance for these areas.

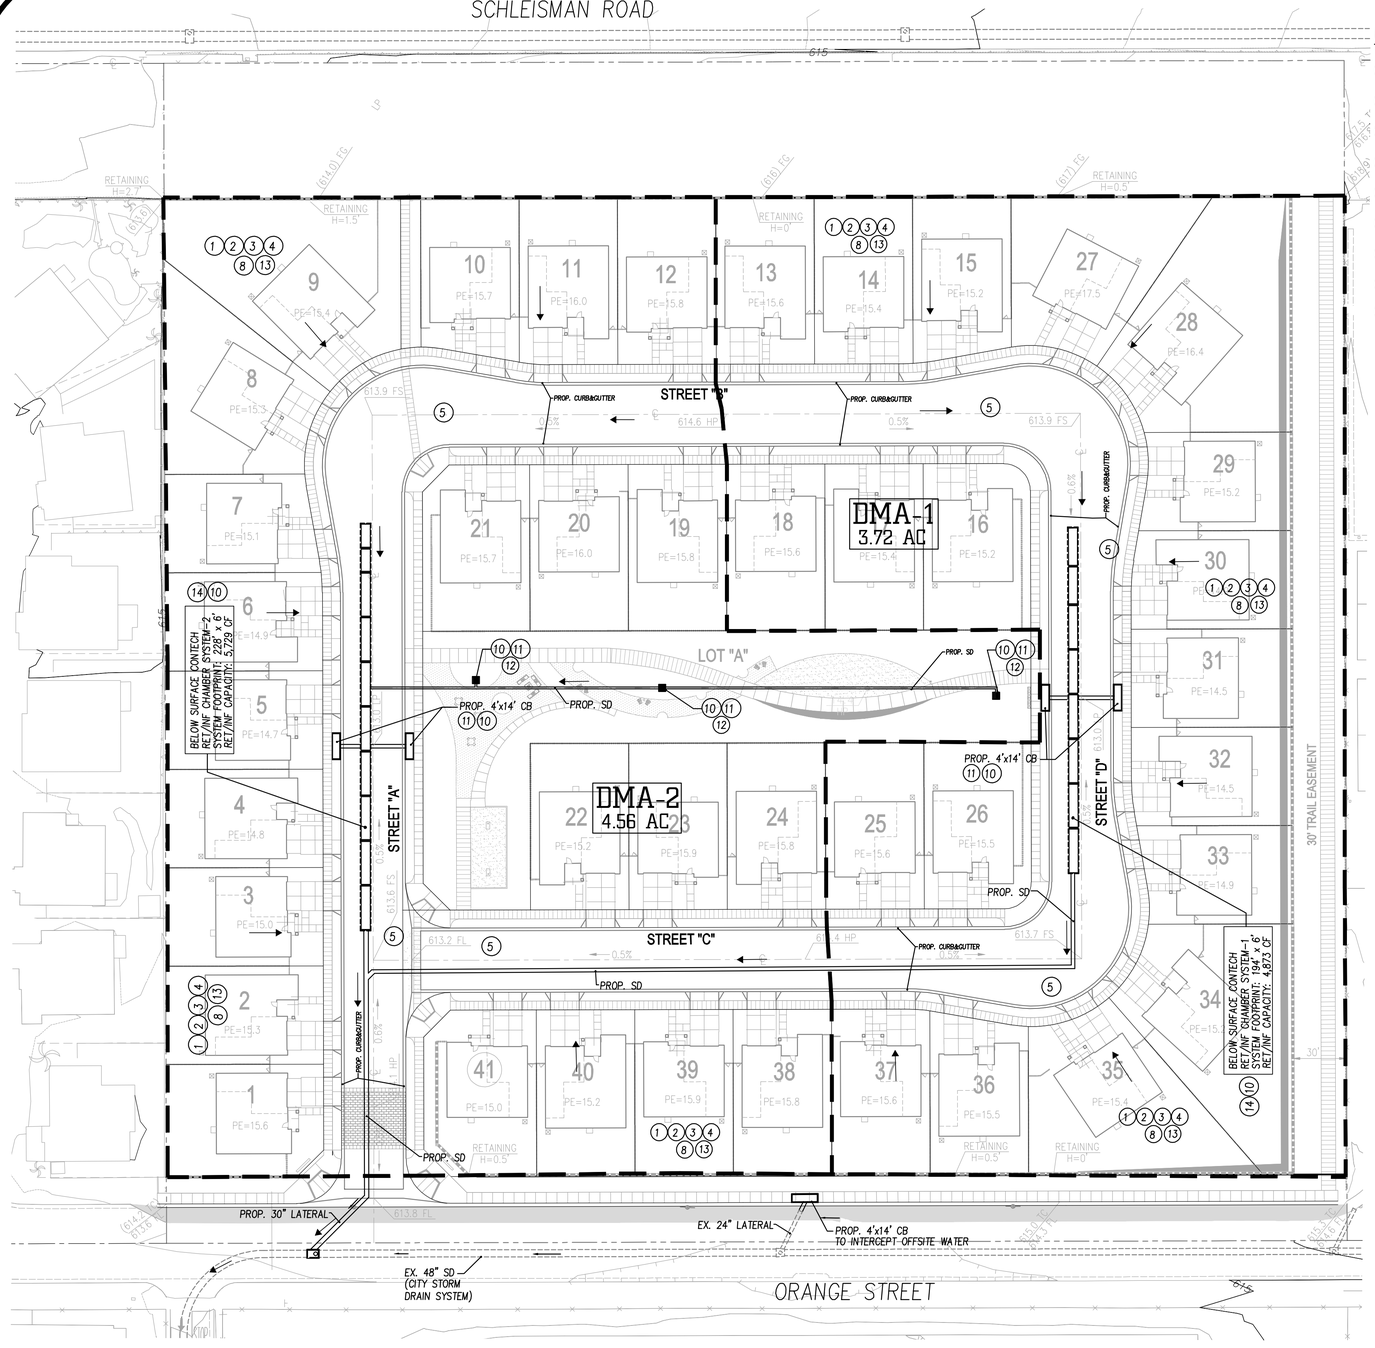
Your local Co-Permittee will also require that you prepare and submit a detailed Stormwater BMP Operation and Maintenance Plan that sets forth a maintenance schedule for each of the Stormwater BMPs built on your site. An agreement assigning responsibility for maintenance and providing for inspections and certification may also be required.

Details of these requirements and instructions for preparing a Stormwater BMP Operation and Maintenance Plan are in Chapter 5 of the WQMP Guidance Document.

Maintenance Mechanism: Insert text here.

Will the proposed BMPs be maintained by a Home Owners' Association (HOA) or Property Owners Association (POA)?

☒ Y ☐ N



Include your Operation and Maintenance Plan and Maintenance Mechanism in Appendix 9. Additionally, include all pertinent forms of educational materials for those personnel that will be maintaining the proposed BMPs within this Project-Specific WQMP in Appendix 10.

Subject: **Additional Infiltration Evaluation**
Proposed Single and Multi-Family Residential Development
Assessor's Parcel Number 152-040-003
13175 Orange Street
Eastvale, Riverside County, California

References: See Page 5

Dear Ms. Crooker:

As requested and authorized, GeoTek, Inc. (GeoTek) has performed an Additional Infiltration Evaluation associated with the proposed single- and multi-family residential development to be located in the City of Eastvale, Riverside County, California. The intent of this study is to evaluate the infiltration properties of the underlying soils within the proposed project storm water disposal areas. This report presents the results of the evaluation performed by GeoTek.

Site Description

The subject site is currently identified as Assessor's Parcel Number 152-040-003 and is located at 13175 Orange Street, in the City of Eastvale, Riverside County, California. The site is square-shaped and consists of approximately 10-acres of land. Topographically, the site slopes downward to the south with total relief of approximately four (4) feet.

Based on information provided by the project civil engineer, Allard Engineering, storm water is proposed to be disposed of via chambers at four (4) locations throughout the site.

Infiltration Testing

Four (4) percolation test borings were excavated with a truck-mounted hollow stem auger drill rig within the proposed infiltration areas to depths ranging from approximately nine (9) to 10 feet below the existing ground surface (bgs). The approximate locations of the percolation test borings are indicated on the attached Boring Location Map, Figure 1.

The borings were approximately 8-inches in diameter. Four-inch diameter slotted PVC pipes encapsulated in filter sock were inserted into the test holes. The annular space between the test hole sidewalls and PVC pipe was filled with gravel.

The soils encountered in all of the borings were alluvium, consisting of interbedded layers of silty sand, clayey sand, silt and clay (SM, SC, ML and CL soil types based upon the Unified Soil Classification System). The logs of the borings are presented in Appendix A.

Groundwater was not encountered nor observed in any of the borings for this evaluation or in GeoTek's previous evaluation (GeoTek, 2021) to a maximum depth of 50 feet. Based on a review of groundwater depths noted on the State Department of Water Resources Water Data Library website, it is estimated a historic high groundwater depth of about 50 feet below existing grade exists at the site.

Subsequent to pre-soaking the test holes in general conformance with the referenced document (County of Riverside, 2011), percolation testing was performed in the lower 20 inches in each of the percolation borings. The percolation testing was conducted in general conformance with the referenced document from the County of Riverside. The percolation rates were converted to an infiltration rate via the Porchet Method.

The infiltration rate for each of the borings is presented in the follow table after the water level had stabilized.

Inf test pit at the proposed Chamber-2

Boring No.	Infiltration Rate (inches per hour)	Depth of Boring (feet)
Boring B-1	2.67	9
Boring B-2	0.38	10
Boring B-3	3.0	9 ½
Boring B-4	0.38	10

Copies of the percolation data sheets and infiltration conversion sheets (Porchet Method) are included in Appendix B.

Inf test pit at the proposed Chamber-1

The reported infiltration rate is the measured rate without any factor of safety applied. Over the lifetime of the water quality facility, the infiltration rates may be affected by silt build up and biological activities, as well as local variations in near surface soil conditions. A suitable factor of safety should be applied to the field rates in design the infiltration systems.

It should be noted that the infiltration rates provided above were performed in relatively undisturbed native soils. Infiltration rates will vary and are mostly dependent on the underlying consistency of the site soils and relative density. Infiltration rates will be impacted by weight of equipment travelling over the soils, placement of engineered fill and other various factors. GeoTek, Inc. assumes no responsibility or liability for the ultimate design or performance of the storm water facilities.

LIMITATIONS

The materials observed on the project site appear to be representative of the tested areas; however, soil materials vary in character between excavations and natural outcrops or conditions exposed during site construction. Site conditions may vary due to seasonal changes or other factors. GeoTek, Inc. assumes no responsibility or liability for work, testing or recommendations performed or provided by others.

GeoTek's conclusions and recommendations are professional opinions that are limited to the extent of the available data. Observations during construction are important to allow for any change in recommendations found to be warranted. These opinions have been derived in accordance with current standards of practice and no warranty is expressed or implied. Standards of practice are subject to change with time.

The opportunity to be of continued service on this project is sincerely appreciated. If you should have any questions, please do not hesitate to contact GeoTek.

Respectfully submitted,
GeoTek, Inc.

Attention: Mr. Bret Ilich

Subject: Geotechnical and Infiltration Evaluation
Proposed Single- and Multi-Family Residential Development
Assessor's Parcel Number 152-040-003
Eastvale, Riverside County, California

Dear Mr. Ilich:

We are pleased to provide the results of our geotechnical and infiltration evaluation for the subject project located in Eastvale, Riverside County, California. This report presents the results of our evaluation and discussion of our findings.

Based on the results of our evaluation, development of the property appears feasible from a geotechnical viewpoint provided that the recommendations presented in this report and in future reports are incorporated into design and construction.

The opportunity to be of service is sincerely appreciated. If you should have any questions, please do not hesitate to call our office.

Respectfully submitted,
GeoTek, Inc.

1. PURPOSE AND SCOPE OF SERVICES

The purpose of this study was to evaluate the geotechnical conditions for the proposed development. Services provided for this study included the following:

- Research and review of available geologic and geotechnical data, and general information pertinent to the site,
- Excavation of six (6) geotechnical borings extended to depths ranging from approximately 20 to 51-½ feet below grade;
- Excavation of two (2) borings to a depth of about 5 feet each for infiltration testing;
- Collection of bulk and undisturbed samples from the test borings;
- Performance of laboratory testing on select soil samples;
- Review and evaluation of site seismicity, and
- Compilation of this geotechnical and infiltration evaluation report which presents our findings and a general summary of pertinent geotechnical conditions relevant for site development.

The intent of this report is to aid in the evaluation of the site for future development from a geotechnical perspective. The professional opinions and geotechnical information contained in this report will likely need to be updated based on our review of final site development plans. These should be provided to GeoTek for review when available.

2. SITE DESCRIPTION AND PROPOSED DEVELOPMENT

2.1 SITE DESCRIPTION

The project is a nearly square shaped approximate 10-acre site located north of Orange Street and easterly of Calina Lane in Eastvale, California. The site currently occupied by a single-family residence, flatwork, landscaping and animal pens. The site topography can be considered as relatively flat terrain with elevations ranging from approximately 618 to 622 feet above mean sea level. The general site location is presented on the attached Figure 1.

2.2 PROPOSED DEVELOPMENT

It is our understanding that site developments will consist of a total of 138 homesites consisting of two-story single-family residential structures and three-story multi-family residential structures and associated parking/drive areas, recreational improvements and lot improvements. Stormwater facilities are also proposed as part of the planned development. We anticipate that the residential structures will be supported by a shallow post-tensioned foundation system. Although structural loading information was not available at the time of this report preparation, we anticipate maximum column and wall loads on the order of 50 kips and 3 kips per foot, respectively. Once actual structural loads are known that information should be provided to GeoTek to determine if modifications to the recommendations contained in this report are warranted.

Based on the relatively flat topography at each site, we anticipate that the maximum depth of cut or fill will be less than about five (5) feet, not including any remedial grading.

As site development planning progresses and plans become available, the plans should be provided to GeoTek for review and comment. Additional engineering analyses may be necessary in order to provide specific earthwork recommendations and geotechnical design parameters for actual site development.

3. FIELD EXPLORATION & LABORATORY TESTING

3.1 FIELD EXPLORATION

GeoTek performed a field exploration at this site on January 6, 2021 which consisted of excavating six (6) exploratory borings to depths ranging from about 20 to 51-½ feet. In addition, two (2) percolation test borings about 5 feet deep were advanced. The borings were drilled with a hollow-stem auger drill rig and logged by a GeoTek geologist.

The approximate locations of our site explorations are shown on the Boring Location Map, Figure 2. Logs of the borings are provided in Appendix A.

3.2 LABORATORY TESTING

Laboratory testing was performed on selected relatively undisturbed and bulk soil samples collected during the field exploration. The purpose of the laboratory testing was to confirm the field classification of the soil materials encountered and to evaluate the soils physical

properties for use in the engineering design and analysis. Our test results along with a brief description and relevant information regarding testing procedures are included on the boring logs included in Appendix A or in Appendix B.

4. PERCOLATION TESTING

Percolation testing was performed at boring locations I-1 and I-2 to assess the infiltration characteristics of the site soils. The borings were excavated to approximately 5 feet below the existing grade. The boring diameter was approximately eight inches. Subsequent to pre-soaking, percolation testing was performed within the lower approximately 20 inches in the borings by a representative of our firm, in general conformance with the Boring Percolation Test Procedure (per Riverside County requirements). As required, the percolation rates were corrected to account for discharge of water from both the sides and bottom of the borings. This correction was performed using the Porchet Method, obtaining the infiltration rates tabulated below:

SUMMARY OF RESULTS		
Boring	Measured Field Percolation Rate (minutes per inch)	Calculated Infiltration Rate (inches per hour)
I-1	4.8	1.2
I-2	2.3	2.7

Copies of the field data sheets and infiltration conversion calculations (Porchet Method) are included in Appendix C. The reported infiltration rates are the measured rate without any factor of safety applied. Over the lifetime of the storm water facility, the infiltration rates may be affected by silt build up and biological activities, as well as local variations in near surface soil conditions. A suitable factor of safety should be applied to the field rates in design the infiltration system.

It should be noted that the infiltration rates provided above were performed in relatively undisturbed native soils. Infiltration rates will vary and are mostly dependent on the underlying consistency of the site soils and relative density. Infiltration rates will be impacted by weight of equipment travelling over the soils, placement of engineered fill and other various factors. GeoTek, Inc. assumes no responsibility or liability for the ultimate design or performance of the storm water facility.

5. GEOLOGIC AND SOILS CONDITIONS

5.1 REGIONAL SETTING

The subject property is situated in the Peninsular Ranges geomorphic province. The Peninsular Ranges province is one of the largest geomorphic units in western North America. Basically, it extends roughly 975 miles from the north and extends from the Transverse Ranges geomorphic province to the tip of Baja California, from north to south. This province varies in width from about 30 to 100 miles. It is bounded on the west by the Pacific Ocean, on the south by the Gulf of California and on the east by the Colorado Desert Province.

The Peninsular Ranges are essentially a series of northwest-southeast oriented fault blocks. Several major fault zones are found in this province. The Elsinore Fault zone and the San Jacinto Fault zone trend northwest-southeast and are found in the near the middle of the province. The San Andreas Fault zone borders the northeasterly margin of the province.

More specific to the subject property, the site is located in an area geologically mapped to be underlain by alluvium (Morton, D.M. and Miller, F.K., 2006).

5.2 EARTH MATERIALS

A brief description of the earth materials encountered during our subsurface exploration is presented in the following section. Based on the exploratory excavations and review of published geologic maps, the site is underlain by alluvium. Although not encountered, localized areas of undocumented fill may be present.

5.2.1 Alluvium

Alluvial soils were encountered within all borings and extended to the maximum depths explored ranging from 20 to 51-½ feet below grade. The alluvial soils encountered generally consisted of clayey sand, silt, clay and silty sand. The sandy soils were noted to possess a relative density ranging from dense to very dense and the silty/clayey soils generally possessed a stiff to hard consistency.

According to the results of the laboratory testing performed on two (2) samples of the near surface alluvial soils, the materials tested and observed have a "very low" ($0 \leq EI \leq 20$) and "low" ($21 \leq EI \leq 50$) expansion potential when tested and classified in accordance with ASTM D 4829. The test results are provided in Appendix B.

5.3 SURFACE WATER AND GROUNDWATER

5.3.1 Surface Water

If encountered during earthwork construction, surface water on this site is the result of precipitation or possibly some minor surface run-off from immediately surrounding properties. Overall site area drainage is generally in a southwesterly direction, as directed by site topography. Provisions for surface drainage will need to be accounted for by the project civil engineer.

5.3.2 Groundwater

Groundwater was not encountered within our exploratory borings performed for this evaluation. Based on the lack of water encountered in the borings and a review of the groundwater information contained on the State Department of Water Resources Water Data Library website, we estimate that the depth to high groundwater at the site is about 50 feet below grade. Based on this depth to water, groundwater-related problems are not expected during or after construction.

It is possible that seasonal variations (temperature, rainfall, etc.) will cause fluctuations in the groundwater level. Additionally, perched water may be encountered at shallow depths following extensive rain events. If shallow perched water is encountered, we anticipate that it can be managed with conventional sump pumps.

5.4 FAULTING AND SEISMICITY

The geologic structure of the entire southern California area is dominated mainly by northwest-trending faults associated with the San Andreas system. The sites are in a seismically active region. No active or potentially active fault is known to exist at these sites nor are the sites situated within a State of California designated *"Alquist-Priolo"* Earthquake Fault Zone. Additionally, the site is not situated within an Earthquake Fault Zone as noted on the Riverside County GIS "Map My County" website.

5.4.1 Seismic Design Parameters

This site is located at approximately 33.959950º Latitude and -117.570312º Longitude. Site spectral accelerations (S_a and S_1), for 0.2 and 1.0 second periods for a Class "D" site, was determined from the SEAOC/OSHPD web interface that utilizes the USGS web services and retrieves the seismic design data and presents that information in a report format. Using the ASCE 7-16 option on the SEAOC/OSHPD website results in the values for S_{M1} and S_{D1}

reported as "null-See Section 11.4.8" (of ASCE 7-16). As noted in ASCE 7-16, Section 11.4.8, a site-specific ground motion procedure is recommended for Site Class D when the value S_1 exceeds 0.2. The value S_1 for the subject site exceeds 0.2.

For a site Class D, an exception to performing a site-specific ground motion analysis is allowed in ASCE 7-16 where S_1 exceeds 0.2 provided the value of the seismic response coefficient, Cs, is conservatively calculated by Eq 12.8-2 of ASCE 7-16 for values of $T \leq 1.5T_s$ and taken as equal to 1.5 times the value computed in accordance with either Eq. 12.8-3 for $T_L \geq T > 1.5T_s$ or Eq. 12.8-4 for $T > T_L$.

The results, based on the 2015 NEHRP and the 2019 CBC, are presented in the following table and we have assumed that the exception as allowed in ASCE 7-16 is applicable. If the exception is deemed not appropriate, a site-specific ground motion analysis will be required.

SITE SEISMIC PARAMETERS	
Mapped 0.2 sec Period Spectral Acceleration, S_S	1.65g
Mapped 1.0 sec Period Spectral Acceleration, S_1	0.591g
Site Coefficient for Site Class "D," F_a	1.0
Site Coefficient for Site Class "D," F_v	1.709
Maximum Considered Earthquake Spectral Response Acceleration for 0.2 Second, S_{MS}	1.65g
Maximum Considered Earthquake Spectral Response Acceleration for 1.0 Second, S_{M1}	1.01g
5% Damped Design Spectral Response Acceleration Parameter at 0.2 Second, S_{DS}	1.1g
5% Damped Design Spectral Response Acceleration Parameter at 1 second, S_{D1}	0.673g
PGA_M	0.747g
Seismic Design Category	D

Final selection of the appropriate seismic design coefficients should be made by the project structural engineer based upon the local practices and ordinances, expected building response and desired level of conservatism.

5.4.2 Surface Fault Rupture

The site is in a seismically active region; however, no active or potentially active fault is known to exist at this site nor is the site situated within an *"Alquist-Priolo"* Earthquake Fault Zone. The nearest known active fault is the Elsinore fault zone situated about 8 miles to the southwest. Therefore, the potential for surface rupture at the site is considered to be nil.

5.4.3 Liquefaction & Dynamic Densification

Liquefaction describes a phenomenon in which cyclic stresses, produced by earthquake-induced ground motion, create excess pore pressures in relatively cohesionless and some low-plastic soils. These soils may thereby acquire a high degree of mobility, which can lead to lateral movement, sliding and settlement of loose sediments, sand boils and other damaging deformations. This phenomenon occurs only below the water table, but, after liquefaction has developed, the effects can propagate upward into overlying non-saturated soil as excess pore water dissipates.

The factors known to influence liquefaction potential include soil type and grain size, relative density, groundwater level, confining pressures, and both intensity and duration of ground shaking. In general, materials that are most susceptible to liquefaction are loose, saturated granular soils having low fines content under low confining pressures.

The Riverside County GIS "Map My County" website indicates that the site is located within a "high" liquefaction potential zone.

Based on the presence of alluvial soils, an estimated high groundwater depth of 50 feet and the "high" liquefaction potential for the site, an assessment of the liquefaction potential was performed. The computer software program LIQUEFYPRO was utilized for this assessment. For this analysis, we utilized the soil profile from Boring B-2, a ground acceleration (PGA_M) of 0.747g and a mean earthquake magnitude of 6.73. The ground acceleration and earthquake magnitude were obtained from the USGS websites. The results of this analysis indicates that the site soils are not susceptible to liquefaction upon application of the design earthquake.

The dry settlement potential of the site soil was also evaluated to assess the potential settlement of the unsaturated soils resulting from seismic activity. The results of this analysis indicates a seismic dry settlement of less than ½ inch is estimated. We recommend a seismic differential seismic settlement of ¼ inch over a 40-foot span be considered for design. Based on the estimated magnitude of seismic settlement, mitigation and/or special foundation design is not considered warranted. A copy of the liquefaction and seismic settlement analysis is presented in Appendix D.

5.4.4 Other Seismic Hazards

The potential for secondary seismic hazards such as seiche and tsunami is considered to be remote due to site elevation and distance from an open body of water. Due to the low liquefaction hazard, the potential for lateral spreading is considered to be nil.

6. CONCLUSIONS AND RECOMMENDATIONS

6.1 GENERAL

Development of the site appears feasible from a geotechnical viewpoint. Specific recommendations for site development provided in this report will need to be further evaluated when development plans are provided for our review. The following sections present general recommendations. More specific geotechnical recommendations for site development can be provided when more finalized site development plans are available for review.

6.2 EARTHWORK CONSIDERATIONS

6.2.1 General

Earthwork and grading should be performed in accordance with the applicable grading ordinances of the City of Eastvale, the 2019 California Building Code (CBC) and recommendations contained in this report. The General Grading Guidelines included in Appendix E outline general procedures and do not anticipate all site-specific situations. In the event of conflict, the recommendations presented in the text of this report should supersede those contained in Appendix E.

6.2.2 Site Clearing

Site preparation should start with removal of all deleterious materials and vegetation within the planned development areas of the site. All debris and deleterious materials should be properly disposed of off-site.

6.2.3 Remedial Grading

Due to the collapse potential of the near surface soils, we recommend that the existing soils beneath the planned buildings be over-excavated to a depth of at least 5 feet below existing or finished grade and at least 3 feet below the bottom of the planned foundations, whichever is deeper. If existing fill soils are encountered, the over-excavations should also be extended to removal of all undocumented fill. The lateral extent of this recommended over-excavation should extend at least 5 feet beyond the building perimeters and beneath all adjacent patio slabs. The soils exposed at the base of the soil over-excavations should be examined by a GeoTek representative to document that the exposed soils are suitable for support of the planned improvements and meet a minimum 85 percent relative compaction with little to no

visible porosity. If unsuitable soils are observed, the over-excavation should be extended in depth until suitable soils, as determined by GeoTek, are encountered.

Beneath concrete flatwork and street pavements, it our opinion that the over-excavations may be limited to 12 inches below existing or finished grade, whichever is deeper, and meet a minimum 85 percent relative compaction with little to no visible porosity, provided all existing undocumented fill is removed.

Following the recommended removals and observations by GeoTek, the exposed soils should be scarified to a depth of about 12 inches, be moisture conditioned to slightly above the soil's optimum moisture content and then be compacted to at least 90 percent of the soil's maximum dry density, per ASTM D 1557.

6.2.4 Engineered Fill

The on-site soils are generally considered suitable for reuse as engineered fill provided they are free from vegetation, debris and other deleterious material. Any over-sized material (greater than 3 inches in maximum dimension) should be removed from the soil prior to use as fill. The undercut areas should be brought to final subgrade elevations with fill materials that are placed and compacted in general accordance with minimum project standards. Engineered fill should be placed in six-inch to eight-inch loose lifts, moisture conditioned to about two percent above the optimum moisture content and compacted to a minimum relative compaction of 90 percent as determined by ASTM D 1557.

6.2.5 Excavation Characteristics

Excavations in the on-site alluvial materials should be readily accomplished with heavy-duty earthmoving or excavating equipment in good operating condition.

6.2.6 Trench Excavations and Backfill

Temporary trench excavations within the on-site materials should be stable at 1:1 inclination for short durations during construction and where cuts do not exceed 10 feet in height. We anticipate that temporary cuts to a maximum height of four feet can be excavated vertically.

Trench excavations should conform to Cal-OSHA regulations. The contractor should have a competent person, per OSHA requirements, on site during construction to observe conditions and to make the appropriate recommendations.

Utility trench backfill should be compacted to at least 90 percent relative compaction (as determined per ASTM D 1557). Under-slab trenches should also be compacted to project specifications. Where applicable, based on jurisdictional requirements, the top 12 inches of

backfill below subgrade for road pavements should be compacted to at least 95 percent relative compaction. On-site materials may not be suitable for use as bedding material but should be suitable as backfill provided particles larger than 6 inches are removed.

Compaction should be achieved with a mechanical compaction device. Ponding or jetting of trench backfill is not recommended. If backfill soils have dried out, they should be thoroughly moisture conditioned prior to placement in trenches.

6.2.7 Shrinkage and Subsidence

For planning purposes, a shrinkage factor of about 5 to 10 percent may be considered for materials that may need to be removed and replaced. A subsidence loss of about 0.1 foot should also be anticipated.

Site balance areas should be available in order to adjust project grades, depending on actual field conditions at the conclusion of earthwork construction.

6.3 DESIGN RECOMMENDATIONS

6.3.1 Foundation Design Criteria

We understand that a post-tension foundation system is planned for the site. Foundation design criteria for a post-tensioned foundation system in general conformance with the 2019 CBC, are presented herein. These are typical design criteria and are not intended to supersede the design by the structural engineer.

Expansion Index (EI) testing performed on representative samples collected from the site has indicated the site soils possess a "very low" to "low" expansion potential. The results of the EI testing are included in Appendix B. The foundation elements for the proposed structures should bear entirely in engineered fill soils and should be designed in accordance with the *2019 California Building Code (CBC).*

Presented below are post-tensioned foundation design parameters for the proposed residential structures at the site. These parameters are in general conformance with *Standard Requirements for Design and Analysis of Shallow Post-Tensioned Concrete Foundation on Expansive Soil* (PTI, 2012).

DESIGN PARAMETERS FOR POST-TENSIONED SLABS	
Foundation Design Parameter	**Design Value**
	Soil Characteristics: LL≤40; PI≤20; Passing #200 Sieve < 50%; Clay fines ≈ 40%; EI=22
Edge Moisture Variation Distance, e_m - Edge Lift (swelling) - Center Lift (shrinkage)	 4.9 ft 9.0 ft
Soil Differential Movement, y_m - Edge Lift (swelling) - Center Lift (shrinkage)	 ≈0.3 in ≈0.2 in
Ext. Perimeter Beam Embedment	One- or Two-Story – 12 inches* Three-Story – 18 inches*
Presaturation of Subgrade Soil (Percent of Optimum)	Minimum 100% to a depth of 12 inches

* Required depth of perimeter beam/stiffening rib per structural calculations may govern.

The following assumptions were used to generate e_m and y_m values: Thornthwaite Moisture Index = -20; constant suction value = 3.6pF; post-equilibrium case assumed with wet (swelling) cycle going from 3.9pF to 3.0pF and drying (shrinking) cycle going from 3.6pF to 4.5pF.

Post-tensioned slabs should be designed in accordance with the *2019 CBC* and PTI design methodology. The bottom of the perimeter edge beam/deepened footing should be designed to resist tension forces using either cable or conventional reinforcement, per the structural engineer. The table above provides design criteria for foundations resting on "low" expansive soils. Foundations on soils with "very low" expansion potential could be safely designed for "low" soil expansion.

The following criteria for design of foundations are preliminary and should be re-evaluated based on the results additional laboratory testing of samples obtained at/near finish pad grade.

An allowable bearing capacity of 2,000 pounds per square foot (psf) may be used for design of building and retaining wall footings. This allowable soil bearing capacity is based on a minimum foundation depth and width of 12 inches. The allowable bearing capacity may be increased by one-third when considering short-term wind and seismic loads.

The bottom of the perimeter edge beam/deepened footing for post tension systems should be deepened a minimum of 12 inches and designed to resist tension forces using either cable or conventional reinforcement, per the structural engineer.

It should be noted that the criteria provided are based on soil support characteristics only. The structural engineer should design the slab and beam reinforcement based on actual loading conditions. We estimate static settlement of foundations designed as recommended in this report to be less than 1-inch total and ½ inch differential over a 40-foot span.

The passive earth pressure may be computed as an equivalent fluid having a density of 250 psf per foot of depth, to a maximum earth pressure of 2,000 psf for footings founded on engineered fill. A coefficient of friction between soil and concrete of 0.35 may be used with dead load forces. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

A moisture and vapor retarding system should be placed below slabs-on-grade where moisture migration through the slab is undesirable. Guidelines for these are provided in the 2019 California Green Building Standards Code (CALGreen) Section 4.505.2, the 2019 CBC Section 1907.1 and ACI 360R-10. The vapor retarder design and construction should also meet the requirements of ASTM E 1643. A portion of the vapor retarder design should be the implementation of a moisture vapor retardant membrane.

It should be realized that the effectiveness of the vapor retarding membrane can be adversely impacted as a result of construction related punctures (e.g., stake penetrations, tears, punctures from walking on the vapor retarder placed atop the underlying aggregate layer, etc.). These occurrences should be limited as much as possible during construction. Thicker membranes are generally more resistant to accidental puncture than thinner ones. Products specifically designed for use as moisture/vapor retarders may also be more puncture resistant. Although the CBC specifies a 6-mil vapor retarder membrane, it is GeoTek's opinion that a minimum 10 mil thick membrane with joints properly overlapped and sealed should be considered, unless otherwise specified by the slab design professional. The membrane should consist of Stego wrap or the equivalent.

Moisture and vapor retarding systems are intended to provide a certain level of resistance to vapor and moisture transmission through the concrete, but do not eliminate it. The acceptable level of moisture transmission through the slab is to a large extent based on the type of flooring used and environmental conditions. Ultimately, the vapor retarding system should be comprised of suitable elements to limited migration of water and reduce transmission of water vapor through the slab to acceptable levels. The selected elements should have suitable properties (i.e. thickness, composition, strength, and permeability) to achieve the desired performance level.

Moisture retarders can reduce, but not eliminate, moisture vapor rise from the underlying soils up through the slab. Moisture retarder systems should be designed and constructed in accordance with applicable American Concrete Institute, Portland Cement Association, Post-Tensioning Concrete Institute, ASTM and California Building Code requirements and guidelines.

GeoTek recommends that a qualified person, such as the flooring contractor, structural engineer, architect, and/or other experts specializing in moisture control within the building be consulted to evaluate the general and specific moisture and vapor transmission paths and associated potential impact on the proposed construction. That person (or persons) should provide recommendations relative to the slab moisture and vapor retarder systems and for migration of potential adverse impact of moisture vapor transmission on various components of the structures, as deemed appropriate.

In addition, the recommendations in this report and our services in general are not intended to address mold prevention; since we, along with geotechnical consultants in general, do not practice in the area of mold prevention. If specific recommendations addressing potential mold issues are desired, then a professional mold prevention consultant should be contacted.

We recommend that control joints be placed in two directions spaced approximately 24 to 36 times the thickness of the slab in inches. These joints are a widely accepted means to control cracks and should be reviewed by the project structural engineer.

6.3.2 Miscellaneous Foundation Recommendations

6.3.2.1 To minimize moisture penetration beneath the slab-on-grade areas, utility trenches should be backfilled with engineered fill, lean concrete or concrete slurry where they intercept the perimeter footing or thickened slab edge.

6.3.2.2 Soils from the footing excavations should not be placed in the slab-on-grade areas unless properly compacted and tested. The excavations should be free of loose/sloughed materials and be neatly trimmed at the time of concrete placement.

6.3.3 Foundation Setbacks

Where applicable, the following setbacks should apply to all foundations. Any improvements not conforming to these setbacks may be subject to lateral movements and/or differential settlements:

- The outside bottom edge of all footings should be set back a minimum of H/3 (where H is the slope height) from the face of any descending slope. The setback should be at least 7 feet and need not exceed 40 feet.
- The bottom of all footings for structures near retaining walls should be deepened so as to extend below a 1:1 projection upward from the bottom inside edge of the wall stem. This applies to the existing retaining walls along the perimeter, if they are to remain.

- The bottom of any proposed foundations for structures should be deepened so as to extend below a 1:1 projection upward from the bottom of the nearest excavation.

6.4 RETAINING WALL DESIGN AND CONSTRUCTION

6.4.1 General Design Criteria

Recommendations presented herein may apply to typical masonry or concrete vertical retaining walls to a maximum height of six feet. Additional review and recommendations should be requested for higher walls.

Retaining wall foundations embedded a minimum of 12 inches into engineered fill should be designed using an allowable bearing capacity of 2,000 psf. An increase of one-third may be applied when considering short-term live loads (e.g. seismic and wind loads).

The passive earth pressure may be computed as an equivalent fluid having a density of 250 psf per foot of depth, to a maximum earth pressure of 2,500 psf. A coefficient of friction between soil and concrete of 0.35 may be used with dead load forces. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

An equivalent fluid pressure approach may be used to compute the horizontal active pressure against the wall. The appropriate fluid unit weights are given in the table below for specific slope gradients of retained materials.

Surface Slope of Retained Materials (H:V)	Equivalent Fluid Pressure (PCF) Select Backfill*
Level	40
2:1	60

*Backfill should consist of soil with an expansion index less than or equal to 50.

The above equivalent fluid weights do not include superimposed loading conditions such as expansive soils, vehicular traffic, structures, seismic conditions or adverse geologic conditions.

As required by code, additional lateral forces induced on retaining walls during an earthquake must be considered for wall design for sites with a Site Class D designation. For level backfill,

an incremental seismic equivalent fluid pressure of 23.1 pcf is recommended, where required. This pressure can be assumed to be a conventional triangular distribution.

6.4.2 Wall Backfill and Drainage

Wall backfill should consist of low expansive (EI<50) soil that should include a minimum one-foot wide section of ¾- to 1-inch clean crushed rock (or approved equivalent). The rock should be placed immediately adjacent to the back of the wall and extend up from the backdrain to within approximately 12 inches of finish grade. The upper 12 inches should consist of compacted on-site materials. The presence of other materials might necessitate revision to the parameters provided and modification of wall designs.

The backfill materials should be placed in lifts no greater than eight inches in thickness and compacted to a minimum of 90 percent relative compaction in accordance with ASTM Test Method D 1557. Proper surface drainage needs to be provided and maintained. Water should not be allowed to pond behind retaining walls. Waterproofing of site walls should be performed where moisture migration through the walls is undesirable.

Retaining walls should be provided with an adequate pipe and gravel back drain system to reduce the potential for hydrostatic pressures to develop. A 4-inch diameter perforated collector pipe (Schedule 40 PVC, or approved equivalent) in a minimum of one cubic foot per linear foot of ¾-inch or one-inch clean crushed rock or equivalent, wrapped in filter fabric should be placed near the bottom of the backfill and be directed (via a solid outlet pipe) to an appropriate disposal area.

Walls from two to four feet in height may be drained using localized gravel packs behind weep holes at 8 feet maximum spacing (e.g. approximately 1.5 cubic feet of gravel in a woven plastic bag). Weep holes should be provided or the head joints omitted in the first course of block extended above the ground surface. However, nuisance water may still collect in front of the wall.

Drain outlets should be maintained over the life of the project and should not be obstructed or plugged by adjacent improvements.

6.4.3 Restrained Retaining Walls

Any retaining wall that will be restrained prior to placing backfill or walls that have male or reentrant corners should be designed for at-rest soil conditions using an equivalent fluid pressure of 65 pcf (very low expansive backfill), plus any applicable surcharge loading. For areas having male or reentrant corners, the restrained wall design should extend a minimum distance

equal to twice the height of the wall laterally from the corner, or as otherwise determined by the structural engineer.

6.4.3.1 Other Design Considerations

- Retaining and garden wall foundation elements should be designed in accordance with building code setback requirements. A minimum horizontal setback distance of five feet as measured from the bottom outside edge of the footing to a sloped face is recommended.
- Wall design should consider the additional surcharge loads from superjacent slopes and/or footings, where appropriate.
- No backfill should be placed against concrete until minimum design strengths are evident by compression tests of cylinders.
- The retaining wall footing excavations, backcuts and backfill materials should be approved by the project geotechnical engineer or their authorized representative.
- Positive separations should be provided in garden walls at horizontal distances not exceeding 20 feet.

6.4.4 Soil Corrosivity

The soil resistivity at this site was tested in the laboratory on two (2) samples collected by our firm. The results of the testing indicate that the soil samples were considered *"mildly corrosive"* to "*moderately corrosive*" (6,097 to 13,400 ohm-cm) to buried ferrous metals in accordance with current standards commonly used by corrosion engineers. We recommend that a corrosion engineer be consulted to determine what corrosion protection may be warranted for the site. The laboratory test results are provided in Appendix B.

6.4.5 Soil Sulfate Content

The sulfate content was determined in the laboratory for two representative soil samples collected by our firm. The results indicate that the water-soluble sulfate for the tested sample was less than 0.1 percent by weight, which is considered "not applicable" (i.e. negligible) as per Table 4.2.1 of ACI 318. Based upon the test result, no special concrete mix design is required for sulfate attack resistance. The laboratory test result is provided in Appendix B.

6.4.6 Import Soils

Import soils should have expansion characteristics similar to the on-site soils. GeoTek also recommends that the proposed import soils be tested for expansion and sulfate potential.

GeoTek should be notified a minimum of 72 hours prior to importing so that appropriate sampling and laboratory testing can be performed.

6.5 PRELIMINARY PAVEMENT DESIGN

A preliminary pavement section has been developed based on assumed traffic loading and our estimate of the pavement subgrade soils following completion of site grading. Given the preliminary nature of the pavement sections presented below, final pavement design should be based on R-value testing of the as-graded soils and the known or assigned Traffic Indexes for the site roadways. Based on the near-surface soil types encountered in our test borings, we estimate that an as-graded R-value of 40 is appropriate for this preliminary design. For this preliminary design, we have assumed a Traffic Index of 5.5. Based on the above discussion, the following preliminary pavement design is presented.

Street	Assumed Traffic Index	Asphaltic Concrete/Aggregate Base (inches)
Interior Streets	5.5	3/6

The final pavement sections are subject to the review and approval by the local jurisdictional agency. Performance of the pavement sections will ultimately be based largely on construction methods, traffic loading and subgrade performance. All aggregate base and the upper 12 inches of subgrade should be compacted to at least 95 percent of the material's maximum dry density, per ASTM D-1557.

All pavement installation, including preparation and compaction of subgrade and base material and placement and rolling of asphaltic concrete, should be done in accordance with the City of Eastvale specifications, and under the observation and testing of GeoTek and a City or County inspector where required.

The aggregate base should consist of crushed rock with an R-Value and gradation in accordance with Crushed Aggregate Base (Section 200-2 of the "Greenbook"). Minimum compaction requirements should be 95 percent for both subgrade and aggregate base (ASTM D 1557). Jurisdictional minimum compaction requirements in excess of the aforementioned minimums may govern.

6.6 CONCRETE CONSTRUCTION

6.6.1 General

Concrete construction should follow the 2019 CBC and ACI guidelines regarding design, mix placement and curing of the concrete. If desired, we could provide quality control testing of the concrete during construction.

6.6.2 Concrete Flatwork

Exterior concrete slabs, sidewalks and driveways should be designed using a four-inch minimum thickness. No specific reinforcement is required from a geotechnical perspective. However, some shrinkage and cracking of the concrete should be anticipated as a result of typical mix designs and curing practices commonly utilized in industrial construction.

Sidewalks and driveways may be under the jurisdiction of the governing agency. If so, jurisdictional design and construction criteria would apply, if more restrictive than the recommendations presented in this report.

Subgrade soils should be pre-moistened prior to placing concrete. The subgrade soils below exterior slabs, sidewalks, driveways, etc. should be pre-saturated to a minimum of 100% of the optimum moisture content to a depth of 12 inches.

All concrete installation, including preparation and compaction of subgrade, should be done in accordance with the City of Eastvale specifications, and under the observation and testing of GeoTek and a City inspector, if necessary.

6.6.3 Concrete Performance

Concrete cracks should be expected. These cracks can vary from sizes that are essentially unnoticeable to more than 1/8 inch in width. Most cracks in concrete while unsightly do not significantly impact long-term performance. While it is possible to take measures (proper concrete mix, placement, curing, control joints, etc.) to reduce the extent and size of cracks that occur, some cracking will occur despite the best efforts to minimize it. Concrete undergoes chemical processes that are dependent on a wide range of variables, which are difficult, at best, to control. Concrete, while seemingly a stable material, is subject to internal expansion and contraction due to external changes over time.

One of the simplest means to control cracking is to provide weakened control joints for cracking to occur along. These do not prevent cracks from developing; they simply provide a relief point for the stresses that develop. These joints are a widely accepted means to control

cracks but are not always effective. Control joints are more effective the more closely spaced they are. GeoTek suggests that control joints be placed in two directions and located a distance apart approximately equal to 24 to 36 times the slab thickness.

Exterior concrete flatwork (patios, walkways, driveways, etc.) is often some of the most visible aspects of site development. They are typically given the least level of quality control, being considered "non-structural" components. We suggest that the same standards of care be applied to these features as to the structures themselves.

6.7 POST CONSTRUCTION CONSIDERATIONS

6.7.1 Landscape Maintenance and Planting

Water has been shown to weaken the inherent strength of soil, and slope stability is significantly reduced by overly wet conditions. Positive surface drainage away from graded slopes should be maintained and only the amount of irrigation necessary to sustain plant life should be provided for planted slopes. Controlling surface drainage and runoff and maintaining a suitable vegetation cover can minimize erosion. Plants selected for landscaping should be lightweight, deep-rooted types that require little water and are capable of surviving the prevailing climate.

Overwatering should be avoided. Care should be taken when adding soil amendments to avoid excessive watering. Leaching as a method of soil preparation prior to planting is not recommended. An abatement program to control ground-burrowing rodents should be implemented and maintained. This is critical as burrowing rodents can decreased the long-term performance of slopes.

It is common for planting to be placed adjacent to structures in planter or lawn areas. This will result in the introduction of water into the ground adjacent to the foundations. This type of landscaping should be avoided. Planters within 10 feet of the buildings should be above ground and underlain by a concrete slab. Waterproofing of the foundation and/or subdrains may be warranted and advisable. We could discuss these issues, if desired, when plans are made available.

6.7.2 Drainage

The need to maintain proper surface drainage and subsurface systems cannot be overly emphasized. Positive site drainage should be maintained at all times. Drainage should not flow uncontrolled down any descending slope. Water should be directed away from foundations

and not allowed to pond or seep into the ground adjacent to the footings and floor-slabs. Pad drainage should be directed toward approved areas and not be blocked by other improvements.

Roof gutters should be installed that will direct the collected water at least 20 feet from the buildings.

It is the owner's responsibility to maintain and clean drainage devices on or contiguous to their lot. In order to be effective, maintenance should be conducted on a regular and routine schedule and necessary corrections made prior to each rainy season.

6.8 PLAN REVIEW AND CONSTRUCTION OBSERVATIONS

We recommend that site grading, specifications, retaining wall/shoring plans and foundation plans be reviewed by this office prior to construction to check for conformance with the recommendations of this report. Additional recommendations may be necessary based on these reviews. We also recommend that GeoTek representatives be present during site grading and foundation construction to check for proper implementation of the geotechnical recommendations. The owner/developer should have GeoTek's representative perform at least the following duties:

- Observe site clearing and grubbing operations for proper removal of unsuitable materials.
- Observe and test bottom of removals prior to fill placement.
- Evaluate the suitability of on-site and import materials for fill placement and collect soil samples for laboratory testing when necessary.
- Observe the fill for uniformity during placement including utility trenches.
- Test the fill for field density and relative compaction.
- Test the near-surface soils to verify proper moisture content.
- Observe and probe foundation excavations to confirm suitability of bearing materials.

If requested, a construction observation and compaction report can be provided by GeoTek, which can comply with the requirements of the governmental agencies having jurisdiction over the project. We recommend that these agencies be notified prior to commencement of construction so that necessary grading permits can be obtained.

7. LIMITATIONS

This evaluation does not and should in no way be construed to encompass any areas beyond the specific area of proposed construction as indicated to us by the client. Further, no evaluation of any existing site improvements is included. The scope is based on our understanding of the project and the client's needs, our proposal (Proposal No. 0804120-CR) dated August 13, 2020 and geotechnical engineering standards normally used on similar projects in this region.

The materials observed on the project site appear to be representative of the area; however, soil and bedrock materials vary in character between excavations and natural outcrops or conditions exposed during site construction. Site conditions may vary due to seasonal changes or other factors. GeoTek, Inc. assumes no responsibility or liability for work, testing or recommendations performed or provided by others.

Since our recommendations are based on the site conditions observed and encountered, and laboratory testing, our conclusions and recommendations are professional opinions that are limited to the extent of the available data. Observations during construction are important to allow for any change in recommendations found to be warranted. These opinions have been derived in accordance with current standards of practice and no warranty is expressed or implied. Standards of practice are subject to change with time.

A - FIELD TESTING AND SAMPLING PROCEDURES

The Modified Split-Barrel Sampler (Ring)

The ring sampler is driven into the ground in accordance with ASTM Test Method D 3550. The sampler, with an external diameter of 3.0 inches, is lined with 1-inch long, thin brass rings with inside diameters of approximately 2.4 inches. The sampler is typically driven into the ground 12 or 18 inches with a 140-pound hammer free falling from a height of 30 inches. Blow counts are recorded for every 6 inches of penetration as indicated on the log of boring. The samples are removed from the sample barrel in the brass rings, sealed, and transported to the laboratory for testing.

Bulk Samples (Large)

These samples are normally large bags of earth materials over 20 pounds in weight collected from the field by means of hand digging or exploratory cuttings.

Bulk Samples (Small)

These are plastic bag samples which are normally airtight and contain less than 5 pounds in weight of earth materials collected from the field by means of hand digging or exploratory cuttings. These samples are primarily used for determining natural moisture content and classification indices.

B - BORING LOG LEGEND

The following abbreviations and symbols often appear in the classification and description of soil and rock on the log of borings:

SOILS

USCS	Unified Soil Classification System
f-c	Fine to coarse
f-m	Fine to medium

GEOLOGIC

B: Attitudes	Bedding: strike/dip
J: Attitudes	Joint: strike/dip
C: Contact line	
……..	Dashed line denotes USCS material change
———	Solid Line denotes unit / formational change
———	Thick solid line denotes end of the boring

(Additional denotations and symbols are provided on the log of boring)

APPENDIX B

LABORATORY TEST RESULTS

Single- and Multi-Family Residential Developments
Eastvale, Riverside County, California
Project No. 2603-CR

GEOTEK

SUMMARY OF LABORATORY TESTING

Classification

Soils were classified visually in general accordance with the Unified Soil Classification System (ASTM Test Method D 2487). The soil classifications are shown on the logs of exploratory borings in Appendix A.

Collapse

Collapse testing was performed on selected samples of the site soils according to ASTM Test Method D 4546. The results of this testing are presented in Appendix B.

Direct Shear

Shear testing was performed in a direct shear machine of the strain-control type in general accordance with ASTM Test Method D 3080. The rate of deformation is approximately 0.035 inch per minute. The samples were sheared under varying confining loads in order to determine the coulomb shear strength parameters, angle of internal friction and cohesion. The results of the testing are presented in Appendix B.

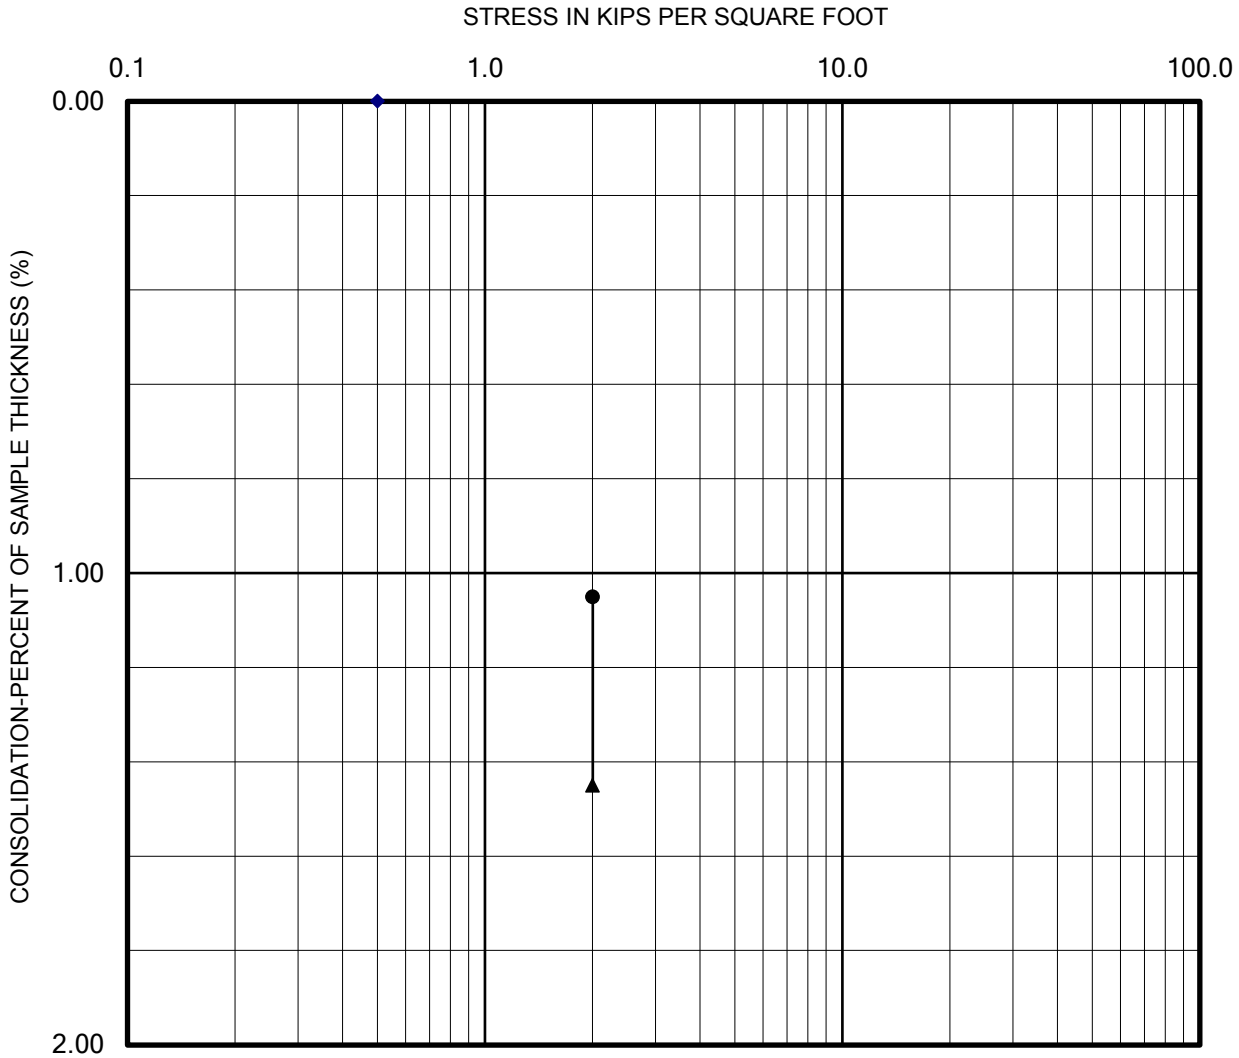
Expansion Index

Expansion Index testing was performed on two representative soil samples. Testing was performed in general accordance with ASTM Test Method D 4829. The results of the testing are provided below.

Boring No.	Depth (ft.)	Soil Type	Expansion Index	Classification
B-1	1-5	Clayey Sand	22	Low
B-4	1-5	Silty Sand	1	Very Low

Moisture-Density Relationship

Laboratory testing was performed on representative site samples collected during the recent subsurface exploration. The laboratory maximum dry density and optimum moisture content for the sample tested was determined in general accordance with test method ASTM Test Procedure D 1557. The results are included in Appendix B.



Percent of Soil Finer than No. 200 Sieve

Tests to determine the percent of soil finer than No. 200 sieve were performed on selected samples obtained from the properties. The tests were conducted in general accordance with ASTM D1140. The test results are shown on the logs of borings in Appendix A.

Sulfate Content, Resistivity and Chloride Content

Testing to determine the water-soluble sulfate content, resistivity testing and the chloride content was performed by others. The results of the testing are provided below and in Appendix B.

Boring No.	Depth (ft.)	pH ASTM G51	Chloride ASTM D4327 (ppm)	Sulfate ASTM D4327 (% by weight)	Resistivity ASTM G187 (ohm-cm)
B-1	1-5	8.6	9.4	0.0009	6,097
B-4	1-5	7.4	7.6	0.0015	13,400

Seating Cycle

DIRECT SHEAR TEST

Project Name:	MLC Holdings	***Sample Location:***	B1 @ 0-5 feet
Project Number:	2603-CR	***Date Tested:***	1/25/2021

Shear Strength: Φ = **29°** , **C = 139 psf**

Notes: 1 - The soil specimen used in the shear box was a ring sample remolded to approximately 90% relative compaction from a bulk sample collected during the field investigation.

2 - The above reflect direct shear strength at saturated conditions.

3 - The tests were run at a shear rate of 0.035 in/min.

GENERAL GRADING GUIDELINES

Single- and Multi-Family Residential Developments
Eastvale, Riverside County, California
Project No. 2603-CR

GEOTEK

GENERAL GRADING GUIDELINES

Guidelines presented herein are intended to address general construction procedures for earthwork construction. Specific situations and conditions often arise which cannot reasonably be discussed in general guidelines, when anticipated these are discussed in the text of the report. Often unanticipated conditions are encountered which may necessitate modification or changes to these guidelines. It is our hope that these will assist the contractor to more efficiently complete the project by providing a reasonable understanding of the procedures that would be expected during earthwork and the testing and observation used to evaluate those procedures.

General

Grading should be performed to at least the minimum requirements of governing agencies, Chapters 18 and 33 of the Uniform Building Code, CBC (2019) and the guidelines presented below.

Preconstruction Meeting

A preconstruction meeting should be held prior to site earthwork. Any questions the contractor has regarding our recommendations, general site conditions, apparent discrepancies between reported and actual conditions and/or differences in procedures the contractor intends to use should be brought up at that meeting. The contractor (including the main onsite representative) should review our report and these guidelines in advance of the meeting. Any comments the contractor may have regarding these guidelines should be brought up at that meeting.

Grading Observation and Testing

1. Observation of the fill placement should be provided by our representative during grading. Verbal communication during the course of each day will be used to inform the contractor of test results. The contractor should receive a copy of the "Daily Field Report" indicating results of field density tests that day. If our representative does not provide the contractor with these reports, our office should be notified.
2. Testing and observation procedures are, by their nature, specific to the work or area observed and location of the tests taken, variability may occur in other locations. The contractor is responsible for the uniformity of the grading operations; our observations and test results are intended to evaluate the contractor's overall level of efforts during grading. The contractor's personnel are the only individuals participating in all aspect of site work. Compaction testing and observation should not be considered as relieving the contractor's responsibility to properly compact the fill.
3. Cleanouts, processed ground to receive fill, key excavations, and subdrains should be observed by our representative prior to placing any fill. It will be the contractor's responsibility to notify our representative or office when such areas are ready for observation.

4. Density tests may be made on the surface material to receive fill, as considered warranted by this firm.
5. In general, density tests would be made at maximum intervals of two feet of fill height or every 1,000 cubic yards of fill placed. Criteria will vary depending on soil conditions and size of the fill. More frequent testing may be performed. In any case, an adequate number of field density tests should be made to evaluate the required compaction and moisture content is generally being obtained.
6. Laboratory testing to support field test procedures will be performed, as considered warranted, based on conditions encountered (e.g. change of material sources, types, etc.) Every effort will be made to process samples in the laboratory as quickly as possible and in progress construction projects are our first priority. However, laboratory workloads may cause in delays and some soils may require a **minimum of 48 to 72 hours to complete test procedures**. Whenever possible, our representative(s) should be informed in advance of operational changes that might result in different source areas for materials.
7. Procedures for testing of fill slopes are as follows:
    a) Density tests should be taken periodically during grading on the flat surface of the fill, three to five feet horizontally from the face of the slope.
    b) If a method other than over building and cutting back to the compacted core is to be employed, slope compaction testing during construction should include testing the outer six inches to three feet in the slope face to determine if the required compaction is being achieved.
8. Finish grade testing of slopes and pad surfaces should be performed after construction is complete.

Site Clearing

1. All vegetation, and other deleterious materials, should be removed from the site. If material is not immediately removed from the site it should be stockpiled in a designated area(s) well outside of all current work areas and delineated with flagging or other means. Site clearing should be performed in advance of any grading in a specific area.
2. Efforts should be made by the contractor to remove all organic or other deleterious material from the fill, as even the most diligent efforts may result in the incorporation of some materials. This is especially important when grading is occurring near the natural grade. All equipment operators should be aware of these efforts. Laborers may be required as root pickers.
3. Nonorganic debris or concrete may be placed in deeper fill areas provided the procedures used are observed and found acceptable by our representative.

Treatment of Existing Ground

1. Following site clearing, all surficial deposits of alluvium and colluvium as well as weathered or creep effected bedrock, should be removed unless otherwise specifically indicated in the text of this report.
2. In some cases, removal may be recommended to a specified depth (e.g. flat sites where partial alluvial removals may be sufficient). The contractor should not exceed these depths unless directed otherwise by our representative.
3. Groundwater existing in alluvial areas may make excavation difficult. Deeper removals than indicated in the text of the report may be necessary due to saturation during winter months.
4. Subsequent to removals, the natural ground should be processed to a depth of six inches, moistened to near optimum moisture conditions and compacted to fill standards.
5. Exploratory back hoe or dozer trenches still remaining after site removal should be excavated and filled with compacted fill if they can be located.

Fill Placement

1. Unless otherwise indicated, all site soil and bedrock may be reused for compacted fill; however, some special processing or handling may be required (see text of report).
2. Material used in the compacting process should be evenly spread, moisture conditioned, processed, and compacted in thin lifts six (6) to eight (8) inches in compacted thickness to obtain a uniformly dense layer. The fill should be placed and compacted on a nearly horizontal plane, unless otherwise found acceptable by our representative.
3. If the moisture content or relative density varies from that recommended by this firm, the contractor should rework the fill until it is in accordance with the following:
    a) Moisture content of the fill should be at or above optimum moisture. Moisture should be evenly distributed without wet and dry pockets. Pre-watering of cut or removal areas should be considered in addition to watering during fill placement, particularly in clay or dry surficial soils. The ability of the contractor to obtain the proper moisture content will control production rates.
    b) Each six-inch layer should be compacted to at least 90 percent of the maximum dry density in compliance with the testing method specified by the controlling governmental agency. In most cases, the testing method is ASTM Test Designation D 1557.
4. Rock fragments less than eight inches in diameter may be utilized in the fill, provided:
    a) They are not placed in concentrated pockets;
    b) There is a sufficient percentage of fine-grained material to surround the rocks;
    c) The distribution of the rocks is observed by, and acceptable to, our representative.

5. Rocks exceeding eight (8) inches in diameter should be taken off site, broken into smaller fragments, or placed in accordance with recommendations of this firm in areas designated suitable for rock disposal. On projects where significant large quantities of oversized materials are anticipated, alternate guidelines for placement may be included. If significant oversize materials are encountered during construction, these guidelines should be requested.
6. In clay soil, dry or large chunks or blocks are common. If in excess of eight (8) inches minimum dimension, then they are considered as oversized. Sheepsfoot compactors or other suitable methods should be used to break up blocks. When dry, they should be moisture conditioned to provide a uniform condition with the surrounding fill.

Slope Construction

1. The contractor should obtain a minimum relative compaction of 90 percent out to the finished slope face of fill slopes. This may be achieved by either overbuilding the slope and cutting back to the compacted core, or by direct compaction of the slope face with suitable equipment.
2. Slopes trimmed to the compacted core should be overbuilt by at least three (3) feet with compaction efforts out to the edge of the false slope. Failure to properly compact the outer edge results in trimming not exposing the compacted core and additional compaction after trimming may be necessary.
3. If fill slopes are built "at grade" using direct compaction methods, then the slope construction should be performed so that a constant gradient is maintained throughout construction. Soil should not be "spilled" over the slope face nor should slopes be "pushed out" to obtain grades. Compaction equipment should compact each lift along the immediate top of slope. Slopes should be back rolled or otherwise compacted at approximately every 4 feet vertically as the slope is built.
4. Corners and bends in slopes should have special attention during construction as these are the most difficult areas to obtain proper compaction.
5. Cut slopes should be cut to the finished surface. Excessive undercutting and smoothing of the face with fill may necessitate stabilization.

UTILITY TRENCH CONSTRUCTION AND BACKFILL

Utility trench excavation and backfill is the contractors responsibility. The geotechnical consultant typically provides periodic observation and testing of these operations. While efforts are made to make sufficient observations and tests to verify that the contractors' methods and procedures are adequate to achieve proper compaction, it is typically impractical to observe all backfill procedures. As such, it is critical that the contractor use consistent backfill procedures.

Compaction methods vary for trench compaction and experience indicates many methods can be successful. However, procedures that "worked" on previous projects may or may not prove effective on a given site. The contractor(s) should outline the procedures proposed, so that we may discuss them **prior** to construction. We will offer comments based on our knowledge of site conditions and experience.

1. Utility trench backfill in slopes, structural areas, in streets and beneath flat work or hardscape should be brought to at least optimum moisture and compacted to at least 90 percent of the laboratory standard. Soil should be moisture conditioned prior to placing in the trench.
2. Flooding and jetting are not typically recommended or acceptable for native soils. Flooding or jetting may be used with select sand having a Sand Equivalent (SE) of 30 or higher. This is typically limited to the following uses:
   a) shallow (12 + inches) under slab interior trenches and,
   b) as bedding in pipe zone.

   The water should be allowed to dissipate prior to pouring slabs or completing trench compaction.
3. Care should be taken not to place soils at high moisture content within the upper three feet of the trench backfill in street areas, as overly wet soils may impact subgrade preparation. Moisture may be reduced to 2% below optimum moisture in areas to be paved within the upper three feet below sub grade.
4. Sand backfill should not be allowed in exterior trenches adjacent to and within an area extending below a 1:1 projection from the outside bottom edge of a footing, unless it is similar to the surrounding soil.
5. Trench compaction testing is generally at the discretion of the geotechnical consultant. Testing frequency will be based on trench depth and the contractors procedures. A probing rod would be used to assess the consistency of compaction between tested areas and untested areas. If zones are found that are considered less compact than other areas, this would be brought to the contractors attention.

JOB SAFETY

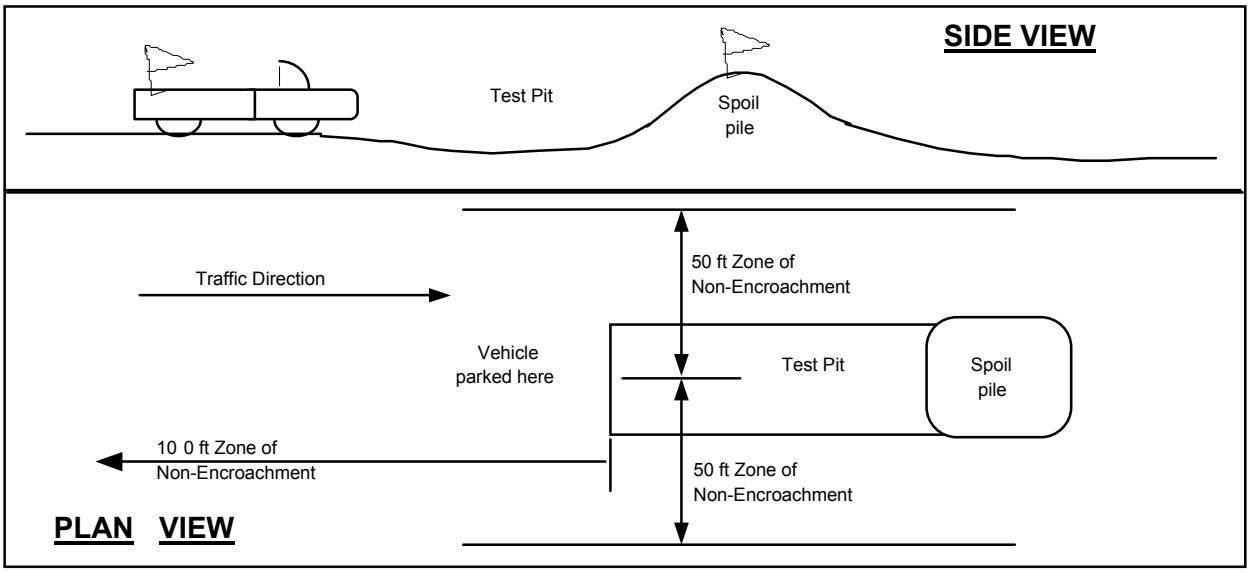
General

Personnel safety is a primary concern on all job sites. The following summaries are safety considerations for use by all our employees on multi-employer construction sites. On ground personnel are at highest risk of injury and possible fatality on grading construction projects. The company recognizes that construction activities will vary on each site and that job site safety is the contractor's responsibility. However, it is, imperative that all personnel be safety conscious to avoid accidents and potential injury.

In an effort to minimize risks associated with geotechnical testing and observation, the following precautions are to be implemented for the safety of our field personnel on grading and construction projects.

1. Safety Meetings: Our field personnel are directed to attend the contractor's regularly scheduled safety meetings.
2. Safety Vests: Safety vests are provided for and are to be worn by our personnel while on the job site.
3. Safety Flags: Safety flags are provided to our field technicians; one is to be affixed to the vehicle when on site, the other is to be placed atop the spoil pile on all test pits.

In the event that the contractor's representative observes any of our personnel not following the above, we request that it be brought to the attention of our office.



Test Pits Location, Orientation and Clearance

The technician is responsible for selecting test pit locations. The primary concern is the technician's safety. However, it is necessary to take sufficient tests at various locations to obtain a representative sampling of the fill. As such, efforts will be made to coordinate locations with the grading contractors authorized representatives (e.g. dump man, operator, supervisor, grade checker, etc.), and to select locations following or behind the established traffic pattern, preferably outside of current traffic. The contractors authorized representative should direct excavation of the pit and safety during the test period. Again, safety is the paramount concern.

Test pits should be excavated so that the spoil pile is placed away from oncoming traffic. The technician's vehicle is to be placed next to the test pit, opposite the spoil pile. This necessitates that the fill be maintained in a drivable condition. Alternatively, the contractor may opt to park a piece of equipment in front of test pits, particularly in small fill areas or those with limited access.

A zone of non-encroachment should be established for all test pits (see diagram below). No grading equipment should enter this zone during the test procedure. The zone should extend outward to the sides approximately 50 feet from the center of the test pit and 100 feet in the direction of traffic flow. This zone is established both for safety and to avoid excessive ground vibration, which typically decreases test results.

TEST PIT SAFETY PLAN

Slope Tests

When taking slope tests, the technician should park their vehicle directly above or below the test location on the slope. The contractor's representative should effectively keep all equipment at a safe operation distance (e.g. 50 feet) away from the slope during testing.

The technician is directed to withdraw from the active portion of the fill as soon as possible following testing. The technician's vehicle should be parked at the perimeter of the fill in a highly visible location.

Trench Safety

It is the contractor's responsibility to provide safe access into trenches where compaction testing is needed. Trenches for all utilities should be excavated in accordance with CAL-OSHA and any other applicable safety standards. Safe conditions will be required to enable compaction testing of the trench backfill.

All utility trench excavations in excess of 5 feet deep, which a person enters, are to be shored or laid back. Trench access should be provided in accordance with OSHA standards. Our personnel are directed not to enter any trench by being lowered or "riding down" on the equipment.

Our personnel are directed not to enter any excavation which;

1. is 5 feet or deeper unless shored or laid back,
2. exit points or ladders are not provided,
3. displays any evidence of instability, has any loose rock or other debris which could fall into the trench, or

4. displays any other evidence of any unsafe conditions regardless of depth.

If the contractor fails to provide safe access to trenches for compaction testing, our company policy requires that the soil technician withdraws and notifies their supervisor. The contractors representative will then be contacted in an effort to effect a solution. All backfill not tested due to safety concerns or other reasons is subject to reprocessing and/or removal.

Procedures

In the event that the technician's safety is jeopardized or compromised as a result of the contractor's failure to comply with any of the above, the technician is directed to inform both the developer's and contractor's representatives. If the condition is not rectified, the technician is required, by company policy, to immediately withdraw and notify their supervisor. The contractor's representative will then be contacted in an effort to effect a solution. No further testing will be performed until the situation is rectified. Any fill placed in the interim can be considered unacceptable and subject to reprocessing, recompaction or removal.

In the event that the soil technician does not comply with the above or other established safety guidelines, we request that the contractor bring this to technicians attention and notify our project manager or office. Effective communication and coordination between the contractors' representative and the field technician(s) is strongly encouraged in order to implement the above safety program and safety in general.

The safety procedures outlined above should be discussed at the contractor's safety meetings. This will serve to inform and remind equipment operators of these safety procedures particularly the zone of non-encroachment.

The safety procedures outlined above should be discussed at the contractor's safety meetings. This will serve to inform and remind equipment operators of these safety procedures particularly the zone of non-encroachment.

Appendix 6: BMP Design Details

BMP Sizing, Design Details and other Supporting Documentation

D.5 LID BMP Sizing

Each LID BMP must be designed to ensure that the Design Capture Volume will be addressed by the selected BMPs. First, calculate the Design Capture Volume for each LID BMP using the V_{BMP} worksheet in Appendix F of the LID BMP Design Handbook. Second, design the LID BMP to meet the required V_{BMP} using a method approved by the Co-permittee. Utilize the worksheets found in the LID BMP Design Handbook or consult with your Co-permittee to assist you in correctly sizing your LID BMPs. Complete Table D.3 below to document the Design Capture Volume and the Proposed Volume for each LID BMP. Provide the completed design procedure sheets for each LID BMP in Appendix 6. You may add additional rows to the table below as needed.

For BMP Design Volume (Vbmp) calculation refer to Appendix 6.

Below Surface Ret/Inf Chamber System-1 Sizing:

	38 hr		< 48 hr draw down time. OK

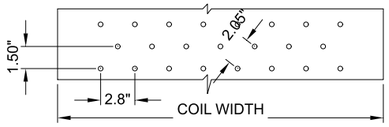
	Infiltration Systems - CMP Infiltration & CMP Perforated Drainage Pipe			
	Material Location	Description	Material Designation	Designation
8	Rigid or Flexible Pavement (if applicable)			
7	Road Base (if applicable			
A	Geotextile Layer	Non-Woven Geotextile	CONTECH C-40 or C-45	Engineer Decision for consideration to prevent soil migration into varying soil types. Wrap the trench only.
6	Backfill	Infiltration pipe systems have a pipe perforation sized of 3/8" diameter. An open graded, free draining stone, with a particle size of ½" – 2 ½" diameter is recommended.	AASHTO M 145-A-1 or AASHTO M 43 - 3, 4	Material shall be worked into the pipe haunches by means of shovel-slicing, rodding, air-tamper, vibratory rod, or other effective methods. Compaction of all placed fill material is necessary and shall be considered adequate when no further yielding of the material is observed under the compactor, or under foot, and the Project Engineer or his representative is satisfied with the level of compaction"
3	Bedding Stone	Well graded granular bedding material w/maximum particle size of 3"	AASHTO M43 - 3,357,4,467, 5, 56, 57	For soil aggregates larger than 3/8" a dedicated bedding layer is not required for CMP. Pipe may be placed on the trench bottom comprised of native suitable well graded & granular material. For Arch pipes it is recommended to be shaped to a relatively flat bottom or fine-grade the foundation to a slight v-shape. Soil aggregates less than 3/8" and unsuitable material should be over-excavated and re-placed with a 4"-6" layer of well graded & granular stone per the material designation.
A	Geotextile Layer	None	None	Contech does not recommend geotextiles be placed under the invert of Infiltration systems due to the propensity for geotextiles to clog over time.
*	Note: The listed AASHTO designations are for gradation only. The stone must also be angular and clean.			

1 MINIMUM WIDTH DEPENDS ON SITE CONDITIONS AND ENGINEERING JUDGEMENT.

FOUNDATION/BEDDING PREPARATION

2 PRIOR TO PLACING THE BEDDING, THE FOUNDATION MUST BE CONSTRUCTED TO A UNIFORM AND STABLE GRADE. IN THE EVENT THAT UNSUITABLE FOUNDATION MATERIALS ARE ENCOUNTERED DURING EXCAVATION, THEY SHALL BE REMOVED AND BROUGHT BACK TO THE GRADE WITH A FILL MATERIAL AS APPROVED BY THE ENGINEER.

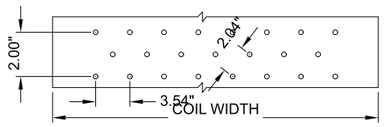
5 HAUNCH ZONE MATERIAL SHALL BE PLACED AND UNIFORMLY COMPACTED WITHOUT SOFT SPOTS.



BACKFILL

MATERIAL SHALL BE PLACED IN 8"-10" MAXIMUM LIFTS. INADEQUATE COMPACTION CAN LEAD TO EXCESSIVE DEFLECTIONS WITHIN THE SYSTEM AND SETTLEMENT OF THE SOILS OVER THE SYSTEM. BACKFILL SHALL BE PLACED SUCH THAT THERE IS NO MORE THAN A TWO-LIFT DIFFERENTIAL BETWEEN THE SIDES OF ANY PIPE IN THE SYSTEM AT ALL TIMES DURING THE BACKFILL PROCESS. BACKFILL SHALL BE ADVANCED ALONG THE LENGTH OF THE SYSTEM AT THE SAME RATE TO AVOID DIFFERENTIAL LOADING ON ANY PIPES IN THE SYSTEM.

EQUIPMENT USED TO PLACE AND COMPACT THE BACKFILL SHALL BE OF A SIZE AND TYPE SO AS NOT TO DISTORT, DAMAGE, OR DISPLACE THE PIPE. ATTENTION MUST BE GIVEN TO PROVIDING ADEQUATE MINIMUM COVER FOR SUCH EQUIPMENT. MAINTAIN BALANCED LOADING ON ALL PIPES IN THE SYSTEM DURING ALL SUCH OPERATIONS.



OTHER ALTERNATE BACKFILL MATERIAL MAY BE ALLOWED DEPENDING ON SITE SPECIFIC CONDITIONS. REFER TO TYPICAL BACKFILL DETAIL FOR MATERIAL REQUIRED.

2 2/3" x 1/2" CORRUGATION - STEEL AND ALUMINUM CMP EDGE SPACING EQUAL ON BOTH SIDES

CONSTRUCTION LOADS

FOR TEMPORARY CONSTRUCTION VEHICLE LOADS, AN EXTRA AMOUNT OF COMPACTED COVER MAY BE REQUIRED OVER THE TOP OF THE PIPE. THE HEIGHT-OF-COVER SHALL MEET THE MINIMUM REQUIREMENTS SHOWN IN THE TABLE BELOW. THE USE OF HEAVY CONSTRUCTION EQUIPMENT NECESSITATES GREATER PROTECTION FOR THE PIPE THAN FINISHED GRADE COVER MINIMUMS FOR NORMAL HIGHWAY TRAFFIC.

PIPE SPAN, INCHES	AXLE LOADS (kips)			
	18-50	50-75	75-110	110-150
	MINIMUM COVER (FT)			
12-42	2.0	2.5	3.0	3.0
48-72	3.0	3.0	3.5	4.0
78-120	3.0	3.5	4.0	4.0
126-144	3.5	4.0	4.5	4.5

*MINIMUM COVER MAY VARY, DEPENDING ON LOCAL CONDITIONS. THE CONTRACTOR MUST PROVIDE THE ADDITIONAL COVER REQUIRED TO AVOID DAMAGE TO THE PIPE. MINIMUM COVER IS MEASURED FROM THE TOP OF THE PIPE TO THE TOP OF THE MAINTAINED CONSTRUCTION ROADWAY SURFACE.

CONSTRUCTION LOADING DIAGRAM

SCALE: N.T.S.

SPECIFICATION FOR DESIGNED DETENTION SYSTEM:

SCOPE
THIS SPECIFICATION COVERS THE MANUFACTURE AND INSTALLATION OF THE DESIGNED DETENTION SYSTEM DETAILED IN THE PROJECT PLANS.

MATERIAL
THE MATERIAL SHALL CONFORM TO THE APPLICABLE REQUIREMENTS LISTED BELOW:

ALUMINIZED TYPE 2 STEEL COILS SHALL CONFORM TO THE REQUIREMENTS OF AASHTO M-274 OR ASTM A-92.

THE GALVANIZED STEEL COILS SHALL CONFORM TO THE REQUIREMENTS OF AASHTO M-218 OR ASTM A-929.

THE POLYMER COATED STEEL COILS SHALL CONFORM TO THE REQUIREMENTS OF AASHTO M-246 OR ASTM A-742.

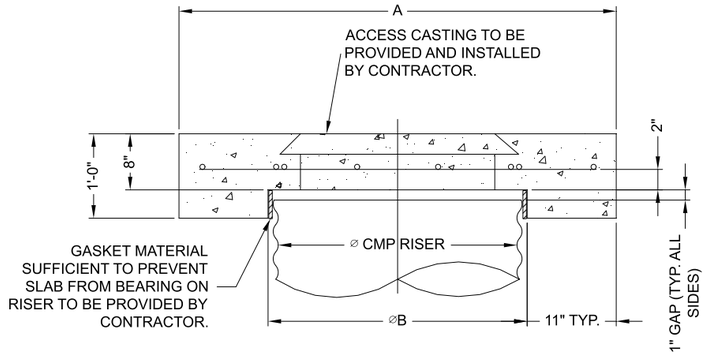
THE ALUMINUM COILS SHALL CONFORM TO THE APPLICABLE OF AASHTO M-197 OR ASTM B-744.

CONSTRUCTION LOADS
CONSTRUCTION LOADS MAY BE HIGHER THAN FINAL LOADS. FOLLOW THE MANUFACTURER'S OR NCSPA GUIDELINES.

PIPE
THE PIPE SHALL BE MANUFACTURED IN ACCORDANCE TO THE APPLICABLE REQUIREMENTS LISTED BELOW:

ALUMINIZED TYPE 2: AASHTO M-36 OR ASTM A-760

GALVANIZED: AASHTO M-36 OR ASTM A-760

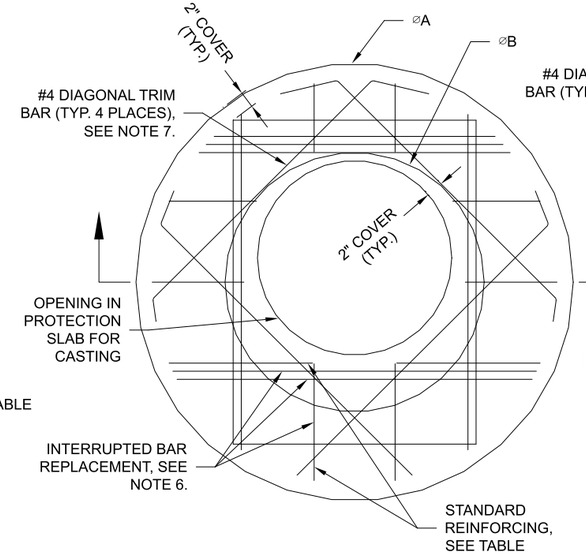


APPLICABLE POLYMER COATED: AASHTO M-245 OR ASTM A-762

ALUMINUM: AASHTO M-196 OR ASTM B-745

APPLICABLE
HANDLING AND ASSEMBLY
SHALL BE IN ACCORDANCE WITH NCSP'S (NATIONAL CORRUGATED STEEL PIPE ASSOCIATION) FOR ALUMINIZED TYPE 2, GALVANIZED OR POLYMER COATED STEEL. SHALL BE IN ACCORDANCE WITH THE MANUFACTURER'S RECOMMENDATIONS FOR ALUMINUM PIPE.
REQUIREMENTS
INSTALLATION
SHALL BE IN ACCORDANCE WITH AASHTO STANDARD SPECIFICATIONS FOR HIGHWAY BRIDGES, SECTION 26, DIVISION II DIVISION II OR ASTM A-798 (FOR ALUMINIZED TYPE 2, GALVANIZED OR POLYMER COATED STEEL) OR ASTM B-788 (FOR ALUMINUM PIPE) AND IN CONFORMANCE WITH THE PROJECT PLANS AND SPECIFICATIONS. IF THERE ARE ANY INCONSISTENCIES OR CONFLICTS THE CONTRACTOR SHOULD DISCUSS AND RESOLVE WITH THE SITE ENGINEER.

IT IS ALWAYS THE RESPONSIBILITY OF THE CONTRACTOR TO FOLLOW OSHA GUIDELINES FOR SAFE PRACTICES.



NOTE:
THESE DRAWINGS ARE FOR CONCEPTUAL PURPOSES AND DO NOT REFLECT ANY LOCAL PREFERENCES OR REGULATIONS. PLEASE CONTACT YOUR LOCAL CONTECH REP FOR MODIFICATIONS.

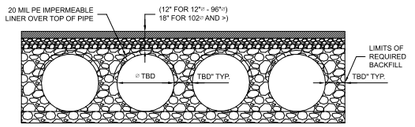
CMP DETENTION INSTALLATION GUIDE

PROPER INSTALLATION OF A FLEXIBLE UNDERGROUND DETENTION SYSTEM WILL ENSURE LONG-TERM PERFORMANCE. THE CONFIGURATION OF THESE SYSTEMS OFTEN REQUIRES SPECIAL CONSTRUCTION PRACTICES THAT DIFFER FROM CONVENTIONAL FLEXIBLE PIPE CONSTRUCTION. CONTECH ENGINEERED SOLUTIONS STRONGLY SUGGESTS SCHEDULING A PRE-CONSTRUCTION MEETING WITH YOUR LOCAL SALES ENGINEER TO DETERMINE IF ADDITIONAL MEASURES, NOT COVERED IN THIS GUIDE, ARE APPROPRIATE FOR YOUR SITE.

FOUNDATION

CONSTRUCT A FOUNDATION THAT CAN SUPPORT THE DESIGN LOADING APPLIED BY THE PIPE AND ADJACENT BACKFILL WEIGHT AS WELL AS MAINTAIN ITS INTEGRITY DURING CONSTRUCTION.

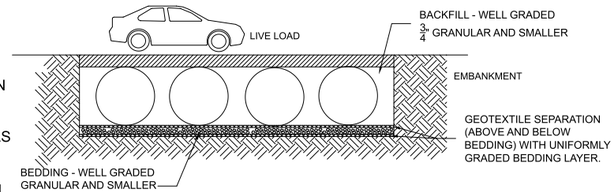
IF SOFT OR UNSUITABLE SOILS ARE ENCOUNTERED, REMOVE THE POOR SOILS DOWN TO A SUITABLE DEPTH AND THEN BUILD UP TO THE APPROPRIATE ELEVATION WITH A COMPETENT BACKFILL MATERIAL. THE STRUCTURAL FILL MATERIAL GRADATION SHOULD NOT ALLOW THE MIGRATION OF FINES, WHICH CAN CAUSE SETTLEMENT OF THE DETENTION SYSTEM OR PAVEMENT ABOVE. IF THE STRUCTURAL FILL MATERIAL IS NOT COMPATIBLE WITH THE UNDERLYING SOILS AN ENGINEERING FABRIC SHOULD BE USED AS A SEPARATOR. IN SOME CASES, USING A STIFF REINFORCING GEOGRID REDUCES OVER EXCAVATION AND REPLACEMENT FILL QUANTITIES.



GRADE THE FOUNDATION SUBGRADE TO A UNIFORM OR SLIGHTLY SLOPING GRADE. IF THE SUBGRADE IS CLAY OR RELATIVELY NON-POROUS AND THE CONSTRUCTION SEQUENCE WILL LAST FOR AN EXTENDED PERIOD OF TIME, IT IS BEST TO SLOPE THE GRADE TO ONE END OF THE SYSTEM. THIS WILL ALLOW EXCESS WATER TO DRAIN QUICKLY, PREVENTING SATURATION OF THE SUBGRADE.

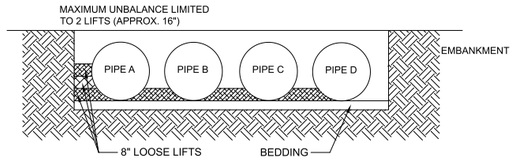
GEOMEMBRANE BARRIER

A SITE'S RESISTIVITY MAY CHANGE OVER TIME WHEN VARIOUS TYPES OF SALTING AGENTS ARE USED, SUCH AS ROAD SALTS FOR DEICING AGENTS. IF SALTING AGENTS ARE USED ON OR NEAR THE PROJECT SITE, A GEOMEMBRANE BARRIER IS RECOMMENDED WITH THE SYSTEM. THE GEOMEMBRANE LINER IS INTENDED TO HELP PROTECT THE SYSTEM FROM THE POTENTIAL ADVERSE EFFECTS THAT MAY RESULT FROM THE USE OF SUCH AGENTS INCLUDING PREMATURE CORROSION AND REDUCED ACTUAL SERVICE LIFE.



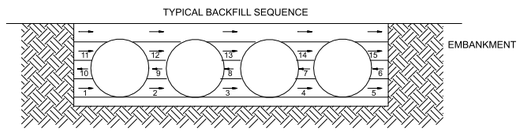
THE PROJECT'S ENGINEER OF RECORD IS TO EVALUATE WHETHER SALTING AGENTS WILL BE USED ON OR NEAR THE PROJECT SITE, AND USE HIS/HER BEST JUDGEMENT TO DETERMINE IF ANY ADDITIONAL PROTECTIVE MEASURES ARE REQUIRED. BELOW IS A TYPICAL DETAIL SHOWING THE PLACEMENT OF A GEOMEMBRANE BARRIER FOR PROJECTS WHERE SALTING AGENTS ARE USED ON OR NEAR THE PROJECT SITE.

IN-SITU TRENCH WALL



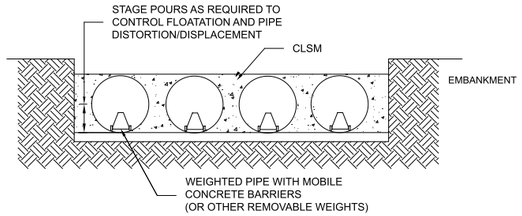
IF EXCAVATION IS REQUIRED, THE TRENCH WALL NEEDS TO BE CAPABLE OF SUPPORTING THE LOAD THAT THE PIPE SHEDS AS THE SYSTEM IS LOADED. IF SOILS ARE NOT CAPABLE OF SUPPORTING THESE LOADS, THE PIPE CAN DEFLECT. PERFORM A SIMPLE SOIL PRESSURE CHECK USING THE APPLIED LOADS TO DETERMINE THE LIMITS OF EXCAVATION BEYOND THE SPRING LINE OF THE OUTER MOST PIPES.

IN MOST CASES THE REQUIREMENTS FOR A SAFE WORK ENVIRONMENT AND PROPER BACKFILL PLACEMENT AND COMPACTION TAKE CARE OF THIS CONCERN.



BACKFILL PLACEMENT

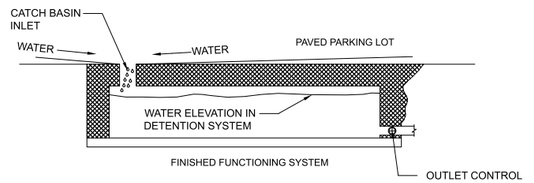
MATERIAL SHALL BE WORKED INTO THE PIPE HAUNCHES BY MEANS OF SHOVEL-SLICING, RODDING, AIR TAMPER, VIBRATORY ROD, OR OTHER EFFECTIVE METHODS.



IF AASHTO T99 PROCEDURES ARE DETERMINED INFEASIBLE BY THE GEOTECHNICAL ENGINEER OF RECORD, COMPACTION IS CONSIDERED ADEQUATE WHEN NO FURTHER YIELDING OF THE MATERIAL IS OBSERVED UNDER THE COMPACTOR, OR UNDER FOOT, AND THE GEOTECHNICAL ENGINEER OF RECORD (OR REPRESENTATIVE THEREOF) IS SATISFIED WITH THE LEVEL OF COMPACTION.

FOR LARGE SYSTEMS, CONVEYOR SYSTEMS, BACKHOES WITH LONG REACHES OR DRAGLINES WITH STONE BUCKETS MAY BE USED TO PLACE BACKFILL. ONCE MINIMUM COVER FOR CONSTRUCTION LOADING ACROSS THE ENTIRE WIDTH OF THE SYSTEM IS REACHED, ADVANCE THE EQUIPMENT TO THE END OF THE RECENTLY PLACED FILL, AND BEGIN THE SEQUENCE AGAIN UNTIL THE SYSTEM IS COMPLETELY BACKFILLED. THIS TYPE OF CONSTRUCTION SEQUENCE PROVIDES ROOM FOR STOCKPILED BACKFILL DIRECTLY BEHIND THE BACKHOE, AS WELL AS THE MOVEMENT OF CONSTRUCTION TRAFFIC. MATERIAL STOCKPILES ON TOP OF THE BACKFILLED DETENTION SYSTEM SHOULD BE LIMITED TO 8- TO 10-FEET HIGH AND MUST PROVIDE BALANCED LOADING ACROSS ALL BARRELS. TO DETERMINE THE PROPER COVER OVER THE PIPES TO ALLOW THE MOVEMENT OF CONSTRUCTION EQUIPMENT SEE TABLE 1, OR CONTACT YOUR LOCAL CONTECH SALES ENGINEER.

WHEN FLOWABLE FILL IS USED, YOU MUST PREVENT PIPE FLOATATION. TYPICALLY, SMALL LIFTS ARE PLACED BETWEEN THE PIPES AND THEN ALLOWED TO SET-UP PRIOR TO THE PLACEMENT OF THE NEXT LIFT. THE ALLOWABLE THICKNESS OF THE CLSM LIFT IS A FUNCTION OF A PROPER BALANCE BETWEEN THE UPLIFT FORCE OF THE CLSM, THE OPPOSING WEIGHT OF THE PIPE, AND THE EFFECT OF OTHER RESTRAINING MEASURES. THE PIPE CAN CARRY LIMITED FLUID PRESSURE WITHOUT PIPE DISTORTION OR DISPLACEMENT, WHICH ALSO AFFECTS THE CLSM LIFT THICKNESS. YOUR LOCAL CONTECH SALES ENGINEER CAN HELP DETERMINE THE PROPER LIFT THICKNESS.



CONSTRUCTION LOADING

TYPICALLY, THE MINIMUM COVER SPECIFIED FOR A PROJECT ASSUMES H-20 LIVE LOAD. BECAUSE CONSTRUCTION LOADS OFTEN EXCEED DESIGN LIVE LOADS, INCREASED TEMPORARY MINIMUM COVER REQUIREMENTS ARE NECESSARY. SINCE CONSTRUCTION EQUIPMENT VARIES FROM JOB TO JOB, IT IS BEST TO ADDRESS EQUIPMENT SPECIFIC MINIMUM COVER REQUIREMENTS WITH YOUR LOCAL CONTECH SALES ENGINEER DURING YOUR PRE-CONSTRUCTION MEETING.

ADDITIONAL CONSIDERATIONS

BECAUSE MOST SYSTEMS ARE CONSTRUCTED BELOW-GRADE, RAINFALL CAN RAPIDLY FILL THE EXCAVATION; POTENTIALLY CAUSING FLOATATION AND MOVEMENT OF THE PREVIOUSLY PLACED PIPES. TO HELP MITIGATE POTENTIAL PROBLEMS, IT IS BEST TO START THE INSTALLATION AT THE DOWNSTREAM END WITH THE OUTLET ALREADY CONSTRUCTED TO ALLOW A ROUTE FOR THE WATER TO ESCAPE. TEMPORARY DIVERSION MEASURES MAY BE REQUIRED FOR HIGH FLOWS DUE TO THE RESTRICTED NATURE OF THE OUTLET PIPE.

CMP DETENTION SYSTEM INSPECTION AND MAINTENANCE

UNDERGROUND STORMWATER DETENTION AND INFILTRATION SYSTEMS MUST BE INSPECTED AND MAINTAINED AT REGULAR INTERVALS FOR PURPOSES OF PERFORMANCE AND LONGEVITY.

INSPECTION

INSPECTION IS THE KEY TO EFFECTIVE MAINTENANCE OF CMP DETENTION SYSTEMS AND IS EASILY PERFORMED. CONTECH RECOMMENDS ONGOING, ANNUAL INSPECTIONS. SITES WITH HIGH TRASH LOAD OR SMALL OUTLET CONTROL ORIFICES MAY NEED MORE FREQUENT INSPECTIONS. THE RATE AT WHICH THE SYSTEM COLLECTS POLLUTANTS WILL DEPEND MORE ON SITE SPECIFIC ACTIVITIES RATHER THAN THE SIZE OR CONFIGURATION OF THE SYSTEM.

INSPECTIONS SHOULD BE PERFORMED MORE OFTEN IN EQUIPMENT WASHDOWN AREAS, IN CLIMATES WHERE SANDING AND/OR SALTING OPERATIONS TAKE PLACE, AND IN OTHER VARIOUS INSTANCES IN WHICH ONE WOULD EXPECT HIGHER ACCUMULATIONS OF SEDIMENT OR ABRASIVE/ CORROSIVE CONDITIONS. A RECORD OF EACH INSPECTION IS TO BE MAINTAINED FOR THE LIFE OF THE SYSTEM

MAINTENANCE

CMP DETENTION SYSTEMS SHOULD BE CLEANED WHEN AN INSPECTION REVEALS ACCUMULATED SEDIMENT OR TRASH IS CLOGGING THE DISCHARGE ORIFICE.

ACCUMULATED SEDIMENT AND TRASH CAN TYPICALLY BE EVACUATED THROUGH THE MANHOLE OVER THE OUTLET ORIFICE. IF MAINTENANCE IS NOT PERFORMED AS RECOMMENDED, SEDIMENT AND TRASH MAY ACCUMULATE IN FRONT OF THE OUTLET ORIFICE. MANHOLE COVERS SHOULD BE SECURELY SEATED FOLLOWING CLEANING ACTIVITIES. CONTECH SUGGESTS THAT ALL SYSTEMS BE DESIGNED WITH AN ACCESS/INSPECTION MANHOLE SITUATED AT OR NEAR THE INLET AND THE OUTLET ORIFICE. SHOULD IT BE NECESSARY TO GET INSIDE THE SYSTEM TO PERFORM MAINTENANCE ACTIVITIES, ALL APPROPRIATE PRECAUTIONS REGARDING CONFINED SPACE ENTRY AND OSHA REGULATIONS SHOULD BE FOLLOWED.

ANNUAL INSPECTIONS ARE BEST PRACTICE FOR ALL UNDERGROUND SYSTEMS. DURING THIS INSPECTION, IF EVIDENCE OF SALTING/DE-ICING AGENTS IS OBSERVED WITHIN THE SYSTEM, IT IS BEST PRACTICE FOR THE SYSTEM TO BE RINSED, INCLUDING ABOVE THE SPRING LINE SOON AFTER THE SPRING THAW AS PART OF THE MAINTENANCE PROGRAM FOR THE SYSTEM.

MAINTAINING AN UNDERGROUND DETENTION OR INFILTRATION SYSTEM IS EASIEST WHEN THERE IS NO FLOW ENTERING THE SYSTEM. FOR THIS REASON, IT IS A GOOD IDEA TO SCHEDULE THE CLEANOUT DURING DRY WEATHER.

THE FOREGOING INSPECTION AND MAINTENANCE EFFORTS HELP ENSURE UNDERGROUND PIPE SYSTEMS USED FOR STORMWATER STORAGE CONTINUE TO FUNCTION AS INTENDED BY IDENTIFYING RECOMMENDED REGULAR INSPECTION AND MAINTENANCE PRACTICES. INSPECTION AND MAINTENANCE RELATED TO THE STRUCTURAL INTEGRITY OF THE PIPE OR THE SOUNDNESS OF PIPE JOINT CONNECTIONS IS BEYOND THE SCOPE OF THIS GUIDE.

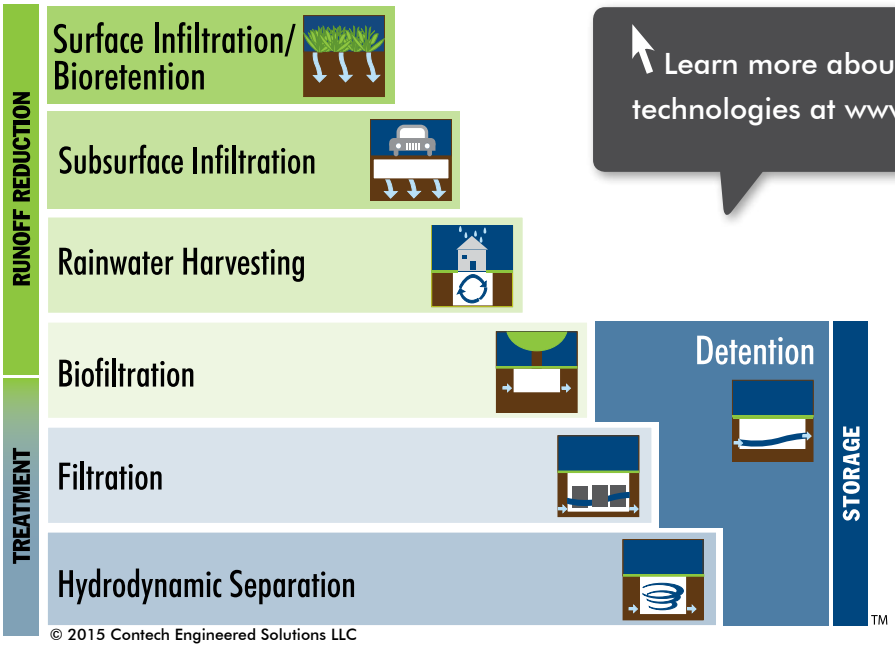
Corrugated Metal Pipe Infiltration System



Solutions Guide

Stormwater Solutions from Contech

Selecting the Right Stormwater Solution Just Got Easier...

It's simple to choose the right stormwater solution to achieve your goals with the Contech Stormwater Solutions Staircase. First, select the runoff reduction practices that are most appropriate for your site, paying particular attention to pretreatment needs. If the entire design storm cannot be retained, select a treatment best management practice (BMP) for the balance. Finally, select a detention system to address any outstanding downstream erosion.

DYODS

Design Your Own Detention or Infiltration System

The Contech Design Your Own Detention System (DYODS®) tool fully automates the layout process for stormwater detention and infiltration systems and produces CAD and PDF files that can be used for creating plans and specs, and for estimating total installed costs.

To use the *Design Your Own Detention or Infiltration System* tool, visit: www.ContechES.com/dyods

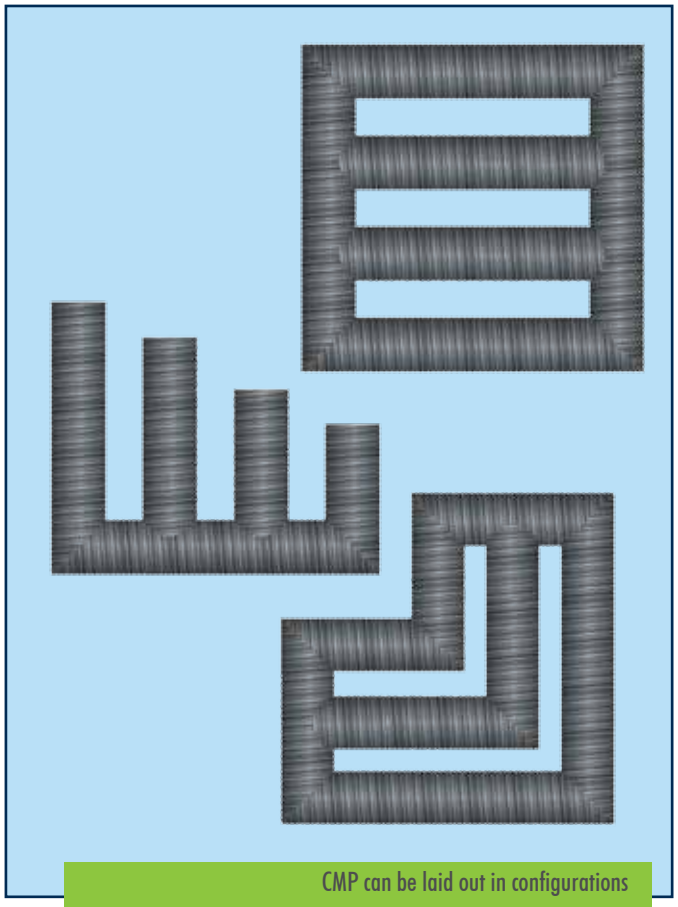
Subsurface Infiltration as a Stormwater Management Strategy

The only sure way to eliminate stormwater pollution is to eliminate stormwater runoff. In recognition of this fact, Green Infrastructure and Low Impact Development based stormwater management regulations prioritizing runoff reduction have proliferated throughout the United States.

Where site conditions allow, infiltration is typically the most cost effective and reliable runoff reduction approach. In urban environments where there are competing demands for land, subsurface infiltration can provide many of the benefits of landscape based systems but without requiring dedicated land area. Infiltration systems are commonly comprised of a pretreatment component designed to remove sediment, trash, and oil, followed by plastic, metal or concrete storage units surrounded by permeable stone creating a high voids storage gallery. Infiltration systems are typically designed to support vehicular loading and to withstand lateral pressures from surrounding soil that allows the overlying land to be used for virtually any non-building application.

Subsurface infiltration meets the objectives of LID by reducing runoff with the added benefit of saving land space in urban environments.

LID benefits include runoff volume reduction, peak flow control, ground water recharge, and water quality improvement.



CMP infiltration is used at Pitzer College in Claremont, California.

CMP – the "Go To" Material for Subsurface Infiltration

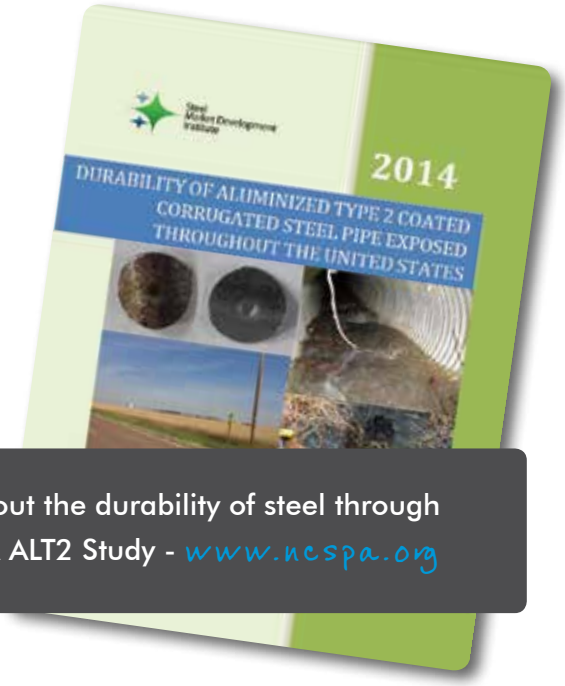
The purpose of the storage vessel is to hold stormwater runoff underground while allowing it to infiltrate the surrounding soil. For the majority of applications, corrugated metal pipe (CMP) is the "go to" material for subsurface infiltration.

- 75+ year service life guidance for certain materials/coatings in recommended environments.* Please refer to the Corrugated Metal Pipe Detention Design Guide for additional information.
- Various pipe coatings and materials are available to accommodate site-specific needs: Aluminized Steel Type 2 (ALT2), Galvanized, CORLIX® Aluminum, and Polymer Coated.
- Wide range of gages, corrugations, and shapes, in diameters 12" – 144".
- Pipe can be fully or partially perforated for infiltration, retention, or groundwater recharge applications.
- Custom access risers and manifolds provide direct access for maintenance.
- Outlet control devices can be incorporated within the system, eliminating the need for a separate structure.
- Customizable - a variety of fittings allow CMP to match most layout configurations.
- May be designed for heavy loading and high maximum cover.
- Contributes to LEED points.
- Available locally; quick turnaround time.
- The most economical installed solution.

With its low cost, a wide variety of diameters, layout configurations, and materials, no other material can match CMP's flexibility and versatility.

CMP can be laid out in configurations not achievable with other materials.

A wide range of CMP diameters and coatings are available to meet site specific needs.



* Service life guidance provided by National Corrugated Steel Pipe Association (NCSPA) and/or AK Steel Corporation. See NCSPA.org website or consult your engineer of record for additional information on service life, recommended environments and field studies on various materials and coatings. Corrosive environments, such as seawater and road/de-icing salt infiltration, and other environments with pH and resistivity outside of the recommended range may cause premature corrosion and reduce actual service life. Because site conditions vary, Contech does not guaranty or warrant service life guidance for materials and coatings.

Addressing the Question of Longevity

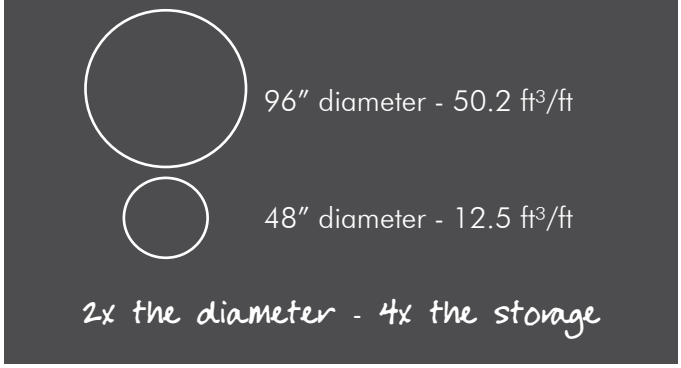
Some engineers are hesitant to use corrugated metal pipe (CMP) for infiltration because they have heard about CMP drainage culverts that have corroded due to abrasion. Factors affecting longevity differ between culvert and infiltration applications. Culverts experience high velocity flows carrying abrasive sediment, which can wear off galvanized coatings used in older CMP culverts. Infiltration systems are designed for storage rather than conveyance, so velocity and abrasive forces are minimized. In addition, improved CMP coatings, such as Aluminized Type 2 (ALT2), are more abrasion resistant and have demonstrated superior in-ground performance against abrasion in long-term durability studies. Field studies also have indicated that ALT2 coating may extend service life in wider pH and resistivity ranges than galvanized coatings. Confirming and maintaining recommended environmental conditions helps ensure system longevity projected by the long term studies. Finally, properly designed infiltration systems include pretreatment, flow control and a stone backfill envelope that can reduce exposure to abrasion.

CMP has a proven service life

Learn more about the durability of steel through the recent NCSPA ALT2 Study - www.ncspa.org

- National Corrugated Steel Pipe Association (NCSPA) service life guidance of 75+ years for certain materials/coatings in recommended environments.
- CMP infiltration systems can be designed to meet HS-20 or greater load requirements with proper depths of cover.
- With low flows, CMP infiltration systems have little susceptibility to abrasion inside the pipe that holds stormwater runoff.
- Various pipe coatings and materials are available to accommodate site-specific needs: Aluminized Steel Type 2 (ALT2), Galvanized, CORLIX® Aluminum, and Polymer Coated.
- CMP infiltration systems are to be surrounded by clean crushed rock to provide increased storage capacity and reduce contact with native soils. The entire system may be wrapped with fabric or liner on the sides and top to help further reduce contact with native soils.
- CMP infiltration systems may be used in wide range of recommended environments. AK Steel Corporation's field studies and technical guidance indicate 75 year service life guidance for 16 gage ALT2 for pH of 5-9 and resistivity greater than 1,500 ohm-cm and 100 year service life guidance for 16 gage ALT2 for pH of 6-8 and resistivity greater than 5,000 ohm-cm.
- Corrosive environments, such as seawater and road/de-icing salt infiltration, acidic minewater, and sanitary sewage, and other environments with pH and resistivity outside of the recommended range may cause premature corrosion and reduce actual service life.
- Infiltration systems are to be inspected and maintained in accordance with Contech's guidelines. See Corrugated Metal Pipe Detention Design Guide for additional information on CMP infiltration systems.

Learn more at www.ContechES.com/cmp-detention



Maximizing Vertical Space: Every Inch Counts

One of the most overlooked advantages of CMP is its ability to maximize vertical storage space.

Increasing the depth of a CMP infiltration system allows for more water storage in the same footprint. For example, doubling the diameter of pipe yields four times as much storage volume in the pipe. This provides a significant cost savings per cubic foot of storage. In addition, more vertical storage space means a smaller footprint, less excavation, and lower project costs.

Contech's Corrugated Metal Pipe Detention systems maximize vertical storage space.

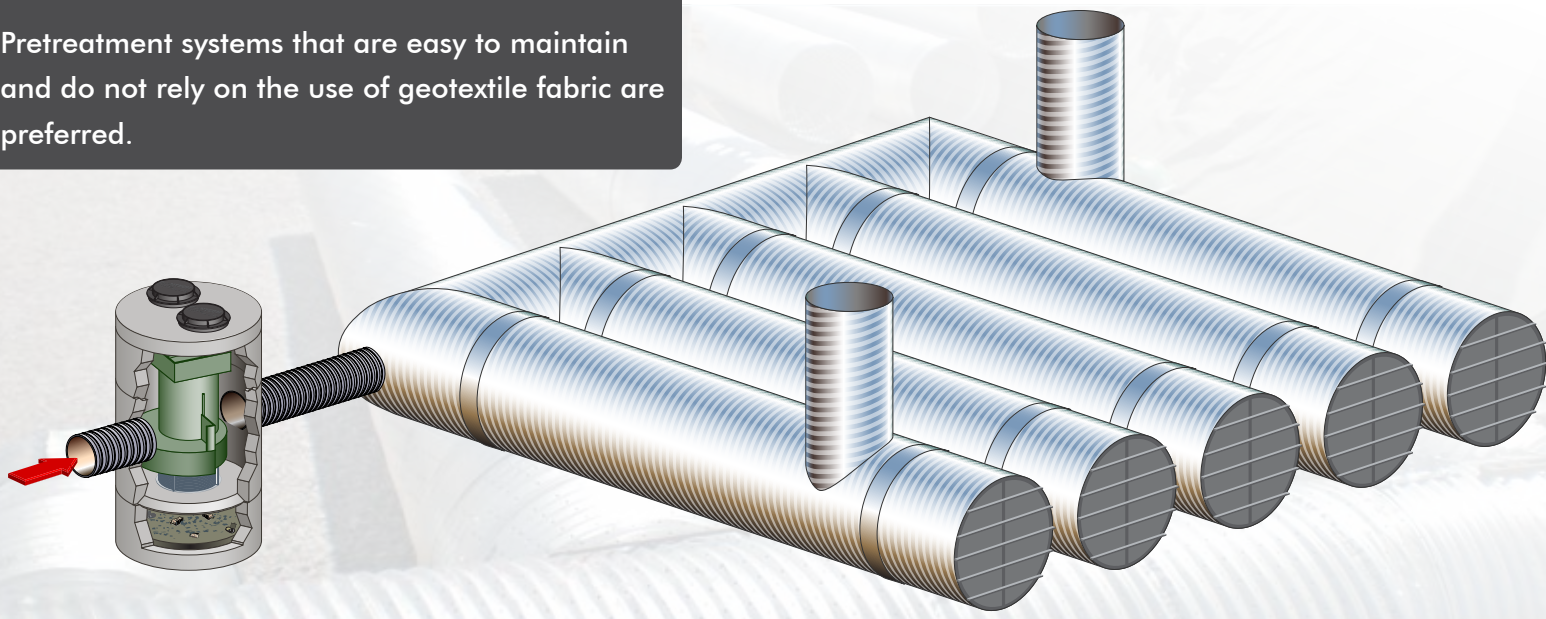
Sizing

Round Pipe – CMP → 6-in to 144-in

Diameter (inches)	Volume (ft³/ft)	Min. Cover Height	Diameter (inches)	Volume (ft³/ft)	Min. Cover Height
12	.78	12″	78	33.2	12″
15	1.22	12″	84	38.5	12″
18	1.76	12″	90	44.2	12″
21	2.40	12″	96	50.3	12″
24	3.14	12″	102	56.8	18″
30	4.9	12″	108	63.6	18″
36	7.1	12″	114	70.9	18″
42	9.6	12″	120	78.5	18″
48	12.6	12″	126	86.6	18″
54	15.9	12″	132	95.0	18″
60	19.6	12″	138	103.9	18″
66	23.8	12″	144	113.1	18″
72	28.3	12″			

The Need for Effective Pretreatment

Infiltration systems have multiple components, and one of the most important is pretreatment. The purpose of a pretreatment device is to prolong the life of the infiltration system by removing debris and sediment that can collect on the invert and within the stone backfill voids. Pretreatment will maintain the efficiency of an infiltration system as well as extend the life cycle, therefore preventing a premature replacement. Pretreatment also offers these additional benefits:



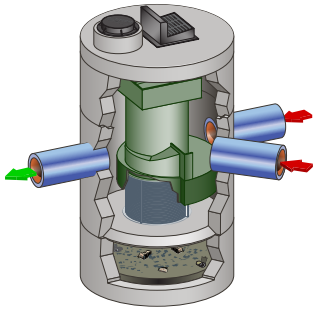
- Easier to clean and maintain compared to the infiltration system itself.
- Cost savings due to the extended service life of the system.
- Removing trash and debris protects downstream outlet control structures from clogging.

Pretreatment Design Considerations

When choosing a pretreatment system, it is important to consider the following:

- Downstream outlet control structures may require protection from a pretreatment device that screens trash and debris.
- Pretreatment system selection depends on pollutant targets. Trash, debris, and larger particles can be removed with hydrodynamic separators. Removing high percentages of fine particles and associated heavy metals and nutrients requires filtration.
- Reduced long term maintenance or replacement cost of the infiltration system can help justify pretreatment construction costs.
- Inlet and pipe layout will influence the number and type of pretreatment systems used. A combination of different systems may be appropriate for the various inlet locations and flows.

Pretreatment systems that are easy to maintain and do not rely on the use of geotextile fabric are preferred.



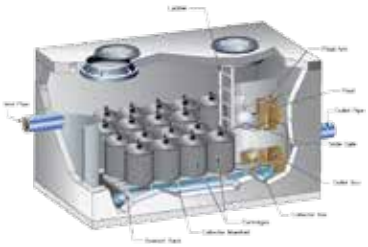
Learn more at www.ContechES.com/cmp-detention

7

Pretreatment Options

Contech offers a number of pretreatment options, all of which will extend the life of subsurface infiltration systems and improve water quality. The type of system chosen will depend on a number of factors including footprint, soil conditions, local regulations, and the desired level of pretreatment.

CDS provides direct access to cleaning, and the built-in high flow bypass weir eliminates the need for a separate bypass structure.



Hydrodynamic Separation

Hydrodynamic Separation (HDS) provides a basic level of pretreatment by capturing and retaining trash and debris, sediment, and oil from stormwater runoff.

CDS®

The CDS uses a combination of swirl concentration and indirect screening and is the only non-blocking screening technology available in an HDS system.

Filtration

Filtration provides a higher level of pretreatment and improved water quality by removing trash and debris, oil, fine solids, and dissolved pollutants such as metals, hydrocarbons, and nutrients.

Filterra® Bioretention System

Filterra is an engineered bioretention system that has been optimized for high volume/flow treatment and high pollutant removal.

The Stormwater Management StormFilter®

The StormFilter system is comprised of a structure that houses rechargeable, media-filled cartridges. The media can be customized to target site-specific pollutants.

Jellyfish® Filter

The Jellyfish filter uses membrane filtration in a compact footprint to remove a high level and a wide variety of stormwater pollutants such as fine particulates, oil, trash and debris, metals, and nutrients.

Alternative Materials for Subsurface Infiltration

There may be instances where alternative materials are needed for subsurface infiltration due to site specific needs.

Plastic Chambers

Plastic chambers are best suited to shallow depth applications; minimum cover is 18 inches, and maximum cover is 96 inches. Some benefits of chambers are:

- Chambers may be beneficial for sites with limited vertical storage.
- Lightweight and installed by hand.
- Heavy equipment is not required to set units into place.
- Centralized stocking locations for short lead times.

Concrete Structures/Vaults

Some concrete structures and vaults are best suited for high loading applications such as railroads or airports. Concrete units are also ideal in corrosive environments or areas with high salinity. Some benefits of concrete structures are:

- Wide range of spans and heights.
- Greater underground infiltration storage in a smaller footprint.
- Ample and easy maintenance access.
- Fast installation.

Project Profiles: CMP Infiltration Systems in Action

Edie and Lew Wasserman Building, UCLA

Westwood, California

- The new six-story, 100,000 square foot Edie and Lew Wasserman Building was built on a very dense site that needed to meet sustainability requirements.
- The design needed to maximize infiltration volume, match existing inverts, and work around existing utilities.
- The stormwater management systems included a CDS pretreatment system and a CMP infiltration system using 57′ of 72″ perforated CMP.
- Perforated CMP was selected to avoid utilities, minimize excavation, meet the City of LA LID requirements, contribute to the building's LEED certification, and to provide space for the buildings "outdoor room" and gardens.

Creative Office Space

El Segundo, California

- A stormwater infiltration solution was needed for a new group of office buildings.
- The owner wanted to maximize the use of the parking area in the urban setting.
- The site had a tight footprint and multiple utility constraints, requiring the design of five separate systems.
- A total of 860 LF of perforated CMP was installed providing of 25,265 CF of storage.
- Perforated CMP was selected for its design flexibility, cost effectiveness, and ease of installation.

City Center Regional Stormwater Facility

Mountlake Terrace, Washington

- The city of Mountlake Terrace, Washington needed a new stormwater retention facility to provide stormwater treatment and downstream flood control.
- There was limited footprint for 80,000 CF of runoff, and the system was required to be very deep, with about 15′ of cover.
- Engineers designed a system consisting of a CDS pretreatment system in front of 800 linear feet of 120″ diameter, perforated, aluminized type 2 CMP that allows the runoff to slowly infiltrate the surrounding soil.
- Perforated CMP was selected for its ability to accommodate the deep bury, the relatively small footprint, and cost effectiveness.

The Right Partner Can Make All the Difference

Regardless of your project's objectives and constraints, our team of stormwater design engineers, regulatory managers, and local stormwater consultants are here to provide you with expert advice and assistance. If your goal is to eliminate or detain runoff, you can rely on Contech for a wide range of subsurface infiltration, detention, and rainwater harvesting solutions. If treatment is needed, our landscape-based biofiltration or subsurface filtration designs can fit into virtually any site and can be tailored to address specific pollutants.

At every stage of your project, count on Contech to provide engineering services including:

- Regulatory guidance and permitting assistance
- Preliminary standard details and/or site specific final CAD drawings and specifications
- Low Impact Development design assistance
- Engineering calculations for hydraulics/hydrology, rainwater harvesting, and detention/retention
- Online "Design Your Own" tools
- Review of preliminary site design, feasibility screening, and layout assistance
- Value engineering – cost estimates and options analysis
- Pre-construction support, project scheduling, and contractor coordination
- Installation and construction support
- Maintenance support:
  - » Guidance manuals
  - » Demonstrations
  - » Qualified contractor identification

The result: an efficient design process, the right product, greater land space savings, and faster permitting. The entire Contech stormwater team welcomes the opportunity to work with you on your stormwater projects.

To get started, please visit www.conteches.com/localresources or call us at 800-338-1122.

Supporting Detail Relating to Hydrologic Conditions of Concern

Not Required, Site drains to the City Storm Drain System in Developed Condition

Appendix 8: Source Control

Pollutant Sources/Source Control Checklist

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Shown on WQMP Drawings**	3 **Permanent Controls—Listed in WQMP Table and Narrative**	4 **Operational BMPs—Included in WQMP Table and Narrative**
☑ **A.** On-site storm drain inlets	☑ Locations of inlets.	☑ Mark all inlets with the words "No Dumping! Flows to Bay" or similar.	☑ Maintain and periodically repaint or replace inlet markings. ☐ Provide stormwater pollution prevention information to new site owners, lessees, or operators. ☑ See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com ☑ Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains."
☐ **B.** Interior floor drains and elevator shaft sump pumps		☐ State that interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer.	☐ Inspect and maintain drains to prevent blockages and overflow.
☐ **C.** Interior parking garages		☐ State that parking garage floor drains will be plumbed to the sanitary sewer.	☐ Inspect and maintain drains to prevent blockages and overflow.
☐ **D1.** Need for future indoor & structural pest control		☐ Note building design features that discourage entry of pests.	☐ Provide Integrated Pest Management information to owners, lessees, and operators.

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Shown on WQMP Drawings	3 Permanent Controls—Listed in WQMP Table and Narrative	4 Operational BMPs—Included in WQMP Table and Narrative
☑ **D2.** Landscape/ Outdoor Pesticide Use	☐ Show locations of native trees or areas of shrubs and ground cover to be undisturbed and retained. ☐ Show self-retaining landscape areas, if any. ☑ Show stormwater treatment facilities.	State that final landscape plans will accomplish all of the following. ☐ Preserve existing native trees, shrubs, and ground cover to the maximum extent possible. ☑ Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution. ☑ Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions. ☑ Consider using pest-resistant plants, especially adjacent to hardscape. ☑ To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.	☑ Maintain landscaping using minimum or no pesticides. ☑ See applicable operational BMPs in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com ☐ Provide IPM information to new owners, lessees and operators.
☐ **E.** Pools, spas, ponds, decorative fountains, and other water features.	☐ Show location of water feature and a sanitary sewer cleanout in an accessible area within 10 feet.	☐ If the local municipality requires pools to be plumbed to the sanitary sewer, place a note on the plans and state in the narrative that this connection will be made according to local requirements.	☐ See applicable operational BMPs in Fact Sheet SC-72, "Fountain and Pool Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Shown on WQMP Drawings	3 Permanent Controls—Listed in WQMP Table and Narrative	4 Operational BMPs—Included in WQMP Table and Narrative
☐ **F.** Food service	☐ For restaurants, grocery stores, and other food service operations, show location (indoors or in a covered area outdoors) of a floor sink or other area for cleaning floor mats, containers, and equipment. ☐ On the drawing, show a note that this drain will be connected to a grease interceptor before discharging to the sanitary sewer.	☐ Describe the location and features of the designated cleaning area. ☐ Describe the items to be cleaned in this facility and how it has been sized to insure that the largest items can be accommodated.	☐
☑ **G.** Refuse areas	☑ Show where site refuse and recycled materials will be handled and stored for pickup. See local municipal requirements for sizes and other details of refuse areas. ☑ If dumpsters or other receptacles are outdoors, show how the designated area will be covered, graded, and paved to prevent run-on and show locations of berms to prevent runoff from the area. ☐ Any drains from dumpsters, compactors, and tallow bin areas shall be connected to a grease removal device before discharge to sanitary sewer.	☐ State how site refuse will be handled and provide supporting detail to what is shown on plans. ☐ State that signs will be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar.	☑ State how the following will be implemented: Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
☐ **H.** Industrial processes.	☐ Show process area.	☐ If industrial processes are to be located on site, state: "All process activities to be performed indoors. No processes to drain to exterior or to storm drain system."	☐ See Fact Sheet SC-10, "Non-Stormwater Discharges" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Shown on WQMP Drawings	3 Permanent Controls—Listed in WQMP Table and Narrative	4 Operational BMPs—Included in WQMP Table and Narrative
❑ **I.** Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.)	❑ Show any outdoor storage areas, including how materials will be covered. Show how areas will be graded and bermed to prevent run-on or run-off from area. ❑ Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults. ❑ Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site.	❑ Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains. Where appropriate, reference documentation of compliance with the requirements of local Hazardous Materials Programs for: ▪ Hazardous Waste Generation ▪ Hazardous Materials Release Response and Inventory ▪ California Accidental Release (CalARP) ▪ Aboveground Storage Tank ▪ Uniform Fire Code Article 80 Section 103(b) & (c) 1991 ▪ Underground Storage Tank	❑ See the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC-33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Shown on WQMP Drawings	3 Permanent Controls—Listed in WQMP Table and Narrative	4 Operational BMPs—Included in WQMP Table and Narrative
❑ **J.** Vehicle and Equipment Cleaning	❑ Show on drawings as appropriate: (1) Commercial/industrial facilities having vehicle /equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses. (2) Multi-dwelling complexes shall have a paved, bermed, and covered car wash area (unless car washing is prohibited on-site and hoses are provided with an automatic shut-off to discourage such use). (3) Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer. (4) Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed.	❑ If a car wash area is not provided, describe measures taken to discourage on-site car washing and explain how these will be enforced.	Describe operational measures to implement the following (if applicable): ❑ Wash water from vehicle and equipment washing operations shall not be discharged to the storm drain system. ❑ Car dealerships and similar may rinse cars with water only. ❑ See Fact Sheet SC-21, "Vehicle and Equipment Cleaning," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Shown on WQMP Drawings	3 Permanent Controls—Listed in WQMP Table and Narrative	4 Operational BMPs—Included in WQMP Table and Narrative
❑ **K.** Vehicle/Equipment Repair and Maintenance	❑ Accommodate all vehicle equipment repair and maintenance indoors. Or designate an outdoor work area and design the area to prevent run-on and runoff of stormwater. ❑ Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas. ❑ Add a note on the plans that states either (1) there are no floor drains, or (2) floor drains are connected to wastewater pretreatment systems prior to discharge to the sanitary sewer and an industrial waste discharge permit will be obtained.	❑ State that no vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area. ❑ State that there are no floor drains or if there are floor drains, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements. ❑ State that there are no tanks, containers or sinks to be used for parts cleaning or rinsing or, if there are, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.	In the SUSMP report, note that all of the following restrictions apply to use the site: ❑ No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinsewater from parts cleaning into storm drains. ❑ No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately. ❑ No person shall leave unattended drip parts or other open containers containing vehicle fluid, unless such containers are in use or in an area of secondary containment.

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Shown on WQMP Drawings	3 Permanent Controls—Listed in WQMP Table and Narrative	4 Operational BMPs—Included in WQMP Table and Narrative
❑ **L.** Fuel Dispensing Areas	❑ Fueling areas[1] shall have impermeable floors (i.e., portland cement concrete or equivalent smooth impervious surface) that are: a) graded at the minimum slope necessary to prevent ponding; and b) separated from the rest of the site by a grade break that prevents run-on of stormwater to the maximum extent practicable. ❑ Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover's minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area[1].] The canopy [or cover] shall not drain onto the fueling area.		❑ The property owner shall dry sweep the fueling area routinely. ❑ See the Business Guide Sheet, "Automotive Service—Service Stations" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

[1] The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Shown on WQMP Drawings	3 Permanent Controls—Listed in WQMP Table and Narrative	4 Operational BMPs—Included in WQMP Table and Narrative
❑ **M.** Loading Docks	❑ Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct stormwater away from the loading area. Water from loading dock areas should be drained to the sanitary sewer where feasible. Direct connections to storm drains from depressed loading docks are prohibited. ❑ Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation. ❑ Provide a roof overhang over the loading area or install door skirts (cowling) at each bay that enclose the end of the trailer.		❑ Move loaded and unloaded items indoors as soon as possible. ❑ See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
❑ **N.** Fire Sprinkler Test Water		❑ Provide a means to drain fire sprinkler test water to the sanitary sewer.	❑ See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Shown on WQMP Drawings	3 Permanent Controls—Listed in WQMP Table and Narrative	4 Operational BMPs—Included in WQMP Table and Narrative
O. Miscellaneous Drain or Wash Water ☐ Boiler drain lines ☐ Condensate drain lines ☐ Rooftop equipment ☐ Drainage sumps ☑ Roofing, gutters, and trim.		☐ Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system. ☐ Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system. ☐ Rooftop mounted equipment with potential to produce pollutants shall be roofed and/or have secondary containment. ☐ Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water. ☑ Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.	
☑ **P.** Plazas, sidewalks, and parking lots.			☑ Plazas, sidewalks, and parking lots shall be swept regularly to prevent the accumulation of litter and debris. Debris from pressure washing shall be collected to prevent entry into the storm drain system. Wash water containing any cleaning agent or degreaser shall be collected and discharged to the sanitary sewer and not discharged to a storm drain.

Appendix 9: O&M

Operation and Maintenance Plan and Documentation of Finance, Maintenance and Recording Mechanisms

Will provided upon Final Approval

Typical Requirements for Common Maintenance Mechanisms

Typical Requirements for Common Maintenance Mechanisms

1. **Public entity maintenance**: The Co-Permittee may approve a public or acceptable quasi-public entity (e.g., the Riverside County Flood Control District, or annex to an existing assessment district, an existing utility district, a state or federal resource agency, or a conservation conservancy) to assume responsibility for operation, maintenance, repair and replacement of the BMP. Unless otherwise acceptable to individual Co-Permittees, public entity maintenance agreements shall ensure estimated costs are front-funded or reliably guaranteed, (e.g., through a trust fund, assessment district fees, bond, letter of credit or similar means). In addition, the Co-Permittees may seek protection from liability by appropriate releases and indemnities.

   The Co-Permittee shall have the authority to approve Urban Runoff BMPs proposed for transfer to any other public entity within its jurisdiction before installation. The Co-Permittee shall be involved in the negotiation of maintenance requirements with any other public entities accepting maintenance responsibilities within their respective jurisdictions; and in negotiations with the resource agencies responsible for issuing permits for the construction and/or maintenance of the facilities. The Co-Permittee must be identified as a third party beneficiary empowered to enforce any such maintenance agreement within their respective jurisdictions.

2. **Project proponent agreement to maintain Urban Runoff BMPs:** The Co-Permittee may enter into a contract with the project proponent obliging the project proponent to maintain, repair and replace the Urban Runoff BMP as necessary into perpetuity. Security or a funding mechanism with a "no sunset" clause may be required.

3. **Assessment districts:** The Co-Permittee may approve an Assessment District or other funding mechanism created by the project proponent to provide funds for Urban Runoff BMP maintenance, repair and replacement on an ongoing basis. Any agreement with such a District shall be subject to the Public Entity Maintenance Provisions above.

4. **Lease provisions:** In those cases where the Co-Permittee holds title to the land in question, and the land is being leased to another party for private or public use, the Co-Permittee may assure Urban Runoff BMP maintenance, repair and replacement through conditions in the lease.

5. **Conditional use permits:** For discretionary projects only, the Co-Permittee may assure maintenance of Urban Runoff BMPs through the inclusion of maintenance conditions in the conditional use permit. Security may be required.

6. **Alternative mechanisms:** The Co-Permittee may accept alternative maintenance mechanisms if such mechanisms are as protective as those listed above.

Appendix 10: Educational Materials

10 **METHOD TO PREVENT STORM WATER POLLUTION**

1) INTRODUCTION

This section include copies of the educational materials that will be used in implementing the project specific Water Quality Management Plan.

2. NON-STORM WATER DISCHARGES

2.1 Description

Non-storm water discharges are those flows that do not consist entirely of storm water. Some non-storm water discharges do not include pollutants and may be discharged to the storm drain. These include u neon laminated groundwater and natural springs. There are also some non-storm water discharges that typically do not contain pollutants and may be discharged to the storm drain with conditions. These include car washing, air conditioner condensate, etc. However there are certain non-storm water discharges that pose environmental concern. These discharges may originate from illegal dumping or from internal floor drains, appliances, industrial processes, sinks, and toilets that are connected to the nearby storm drainage system. These discharges can carry substances such as paint, oil, fuel and other automotive fluids, chemicals and other pollutants into storm drains. They can generally be detected through a combination of detection and elimination. The ultimate goal is to effectively eliminate non-storm water discharges to the storm water drainage system through implementation of measures to detect, correct, and enforce against illicit connections and illegal discharges of pollutants on streets and into the storm drain system and creeks.

2.2 Approach

Initially the industry must make an assessment of non-storm water discharges to determine which types must be eliminated or addressed through BMPs. The focus of the following approach is in the elimination of non-storm water discharges.
Ensure that used oil, used antifreeze, and hazardous chemical recycling programs are being implemented.
Encourage litter control.
Develop clear protocols and lines of communication for effectively prohibiting non storm water discharges, especially those that are not classified as hazardous. These axe often not responded to as effectively as they need to be stencil or demarcate storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as Dump No Waste Drains to Stream stenciled or demarcate next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.
Isolate problem areas and plug illicit discharges points.
Inventory and inspect each discharges point during dry weather.
During dry weather the storm water collection system is filled with smoke and then traced to sources. The appearance of smoke at the base of a toilet indicates that there may be a connection between the sanitary and the storm water system.

2.3 Inspection & Reporting

Regularly inspect and clean up hot spots and other storm drainage areas where illegal dumping and disposal occurs.
Never hose down or bury dry material spills. Sweep up the material and dispose of Properly.
For larger spills, a private spill cleanup company or Hazmat team may be necessary.
Lighting or barriers may also be-needed to discourage future dumping.
Conduct field investigations of the industrial storm drain system for potential sources of non-storm water discharges.
Report prohibited non-storm water discharges observed during the course of normal daily activities so they can be investigated, contained, and cleaned up or eliminated.
Maintain documentation of illicit connection and illegal dumping incidents, including significant conditionally exempt discharges that are not properly managed.

2.4 Training

Training of technical staff in identifying and documenting illegal dumping incidents is required.Train employees to identify non-storm water discharges and report discharges to the appropriate departments.
Educate employees about spill prevention and cleanup. Well trained employees can reduce human errors that lead to accidental releases or spills.
The employees should have the tools and knowledge to immediately begin cleaning up a spill should one occur. Employees should be familiar with the Spill Prevention Control and Counter measure Plan.
Determine and implement appropriate outreach efforts to reduce non-permissible non-storm water discharges.
When a responsible party is identified, educate the party on the impacts of his or her actions.

Non-storm water discharges to the storm water collection system may include any water used directly in the manufacturing process, air conditioning condensate and coolant, non-contact cooling water, cooling equipment condensate, outdoor secondary containment water, vehicle and equipment wash water, sink and drinking fountain wastewater, sanitary wastes, or other wastewaters. One of the keys to success of reducing or eliminating illegal dumping is increasing the number of people at the facility who are aware of the. problem and who have the tools to at least identify the incident, if not correct it Therefore, train field staff to recognize and report the incidents.

3. SPILL PREVENTION, CONTROL & CLEANUP

3.1 Description

Many activities (that occur at an industrial or commercial site) have the potential to cause accidental *or* illegal spills. Preparation for accidental or illegal spills, with proper training and reporting systems implemented, can minimize the discharge of pollutants to the environment.

Spills and leaks are one of the largest contributors of storm water pollutants. Spill prevention and control plans are applicable to any site at which hazardous materials are stored or used. An effective plan should have spill prevention and response procedures that identify potential spill areas, specify material handling procedures, describe spill response procedures, and provide spill clean-up equipment. The plan should take steps to identify and characterize potential spills, eliminate and reduce spill potential, respond to spills when they occur in an effort to prevent pollutants from entering the storm water drainage system, and train personnel to prevent and control future spills.

3.2 Approach

Develop procedures to prevent/mitigate spills to storm drain systems. Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures.

Recycle, reclaim or reuse materials whenever possible. This will reduce the amount of process materials that are brought into the facility.

Store and contain liquid materials in such a manner that if the tank is ruptured, the contents will not discharge, flow, or be washed into the storm drainage system, surface waters, or groundwater.

Place drip pans or absorbent materials beneath al mounted taps, and at all potential drip and spill locations during filling and unloading of tanks. Any collected liquids or soiled absorbent materials must be reused/recycled or properly disposed.

Checks tanks daily for leaks and spills. Replace tanks that are leaking, corroded, or otherwise deteriorating with tanks in good condition. Collect all spilled liquids and properly dispose of them.

Label all containers according to their contents.

3.3 Spill Control and Cleanup Activities

Follow the Spill Prevention Control Countermeasure Plan.
Clean up leaks and spills immediately.
Place a stockpile of spill cleanup materials where it will be readily accessible.
Never hose down or bury dry material spills. Sweep up the material and dispose of Properly.
Chemical cleanups of material can be achieved with the use of adsorbents, gels, and forms.
Use adsorbent materials on small spills rather than hosing down the spill.
Remove the adsorbent materials promptly and dispose of properly.
For larger spills, a private spill cleanup company or Hazmat team may be necessary.

3.4 Reporting

Reporting spills that pose an immediate threat to human health or the environment to the Regional Water Quality Control Board.
Federal regulations require that any oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center(NRC) at 800-424-8802 (24 hours)
Report spills to local agencies, such as the fire department; they can assist in cleanup.
Designated areas should be impervious and paved with Portland cement concrete, free of cracks and gaps, in order to contain leaks and spills.
Maintenance is critical to preventing leaks and spills. Conduct routing inspections.
Perform all vehicle fluid removal or changing inside or under cover to prevent the run-on of storm water and the runoff of spills.

3.5 Training

Educate employees about spill prevention and cleanup.
The employee should have the tools and knowledge to immediately begin cleaning up as pill should one occurs. Employees should be familiar with the spill Prevention Control and Countermeasure Plan.
Employees should be educated about aboveground storage tank requirements.
Employees responsible for aboveground storage tanks and liquid transfers should be thoroughly familiar with the Spill Prevention Control Countermeasure Plan and the plan should be readily available.
Train employees to recognize and report illegal dumping incidents.
For the purposes of developing a spill prevention and response program to meet the storm water regulations, facility managers should use information provided in this fact sheet and the spill prevention/response portions of the fact sheet in this handbook, for specific activities.

4. OUTDOOR EQUIPMENT OPERATIONS

4.1 Description

Outside process equipment operations and maintenance can contaminate storm water runoff. Activities, such as grinding, painting, coating, sanding, degreasing or parts cleaning, landfills and waste piles, solid waste treatment and disposal, are examples of process operation that can lead to contamination of storm water runoff. Source controls for outdoor process equipment operations and maintenance include reducing the amount of waste created, enclosing or covering all or some of the equipment, installing secondary containment, and training employees.

4.2 Approach

Perform the activity during dry periods.
Use non-toxic chemicals for maintenance and minimize or eliminate the use of solvents.
Consider enclosing the activity in a building and connecting the floor drains to the sanitary sewer.
Minimize contact of storm water with outside process equipment operations through berming and drainage routing. If possible, connect process equipment area to public sewer or facility wastewater treatment system. Some municipalities require that secondary containment areas be connected to the sanitary sewer, prohibiting any hard connections to the storm drain.
Keep your Spill Prevention Control and Countermeasure Plan up-to-date. Place a stockpile of spill cleanup materials where it will be readily accessible.
Prevent operator errors by using engineering safe guards and thus reducing accidental releases of pollutant.
Inspect storage areas regularly for leaks or spills. Also check for structural failure, spills and overfills due to operator error, and/or failure of piping system.

4.3 Training

Train employees to perform the activity during dry periods only or substituting benign materials for more toxic ones.
Train employee and contractors in proper techniques for spill containment and cleanup. Employees should have the tools and knowledge to immediately begin cleaning up a spill should one occur.

4.4 Prevention

Keep Spill Prevention Control and Counter measure Plan up-to-date.
Have employees trained in emergency spill cleanup procedures present when dangerous waste, liquid chemicals, or other wastes are delivered.
Place a stockpile of spill cleanup materials where it will be readily accessible.

5. OUTDOOR LOADING / UNLOADING

5.1 Description

The loading/unloading of materials usually lakes place outside on docks or terminals; therefore materials spilled, leaked, or lost during loading/unloading may collect in the soil or on other surfaces and have the potential to be carried away by storm water runoff or when the area is cleaned. Additionally, rainfall may wash pollutant from machinery used to unload or move materials. Implementation of the following protocols will prevent or reduce the discharge of pollutants to storm water from outdoor loading/unloading of materials.

5.2 Approach

Reduce potential for pollution discharge through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

Keep accurate maintenance logs to evaluate materials removed and improvements made.
Parks tank trucks or delivery vehicles in designated areas so that spills or leaks can be contained.
Limit exposure of material to rainfall whenever possible.
Prevent storm water run-on.
Check equipment regularly for leaks
Develop an operations plan that describes procedures for loading and/or unloading.
Conduct loading and unloading in dry weather if possible.
Cover designated loading/unloading areas to reduce exposure of materials to rain
Have employees load and unload all materials and equipment in covered areas such as building overhangs at loading docks if feasible.
Load/unload only at designated loading areas.
Pave loading areas with concrete instead of asphalt.
Avoid placing storm drains in the area.
Keep your Spill Prevention Control and Countermeasure Plan up-to-date
Store and maintain appropriate spill cleanup materials in a location. that is readily accessible and known to all and ensure that employees are familiar with the site spill control plan and proper spill cleanup procedures.
Have an emergency spill cleanup plan readily available
Use drip pans or comparable devices when transferring oils, solvents, and paints.

5.3 Inspection

Check loading and unloading equipment regularly for leaks, including valves, pumps, flanges and connections.
Look for dust or fumes during loading or unloading operations.

5.4 Training

Train employees and contractors on proper spill containment and cleanup.
Have employees trained in spill containment and cleanup present during loading/unloading.
Train employees in proper handling techniques during liquid transfers to avoid spills
Make sure forklift operators are properly trained on loading and unloading procedures.

5.5 Prevention

Keep Spill Prevention Control Countermeasure Plan up-to-date.
Contain leaks during transfer.
Store and maintain appropriate spill cleanup materials in a location that is readily accessible and known to all and ensure that employees are familiar with the site spill control plan and proper spill cleanup procedures.
Have an emergency spill cleanup plan readily available.
Use drip pans or comparable devices when transferring oil, solvents, and paints.

6. WASTE HANDLING & DISPOSAL

6.1 Description

Improper storage and handling of solid wastes can allow toxic compounds, oils and greases, heavy metals, nutrients, suspended solids, and other pollutants to enter storm water runoff. The discharge of pollutants to storm water from waste handling and disposal can be prevented and reduced by tracking waste generation, storage, and disposal reducing waste generation and disposal through source reduction, reuse, and recycling; and preventing run-on and runoff. Approach

Accomplish reduction in the amount of waste generated using the following source controls:

Production planning and sequencing Process or equipment modification -
Raw material substitution or elimination Loss prevention and housekeeping Waste segregation and separation Close loop recycling

Establish a material tracking system to increase awareness about material usage.
This may reduce spills and minimize contamination, thus reducing the amount of waste produced.
Recycle materials whenever possible, Sweep and clean the storage area regularly. If it is paved, do not hose down the area to a storm drain.
Dispose of rinse and wash water from cleaning waste containers into a sanitary sewer if allowed by the local sewer authority. Do not discharge wash water to the street or storm drain.
Transfer waste from damaged containers into safe containers.
Take special care when loading or unloading wastes to minimize losses. Loading systems can be used to minimize spills and fugitive emission losses such as dust or mist.
Vacuum transfer systems can minimize waste loss.

Controlling Litter and Waste Collection
Post No Littering signs and enforce antilitter laws.
Provide a sufficient number of litter receptacles for the facility.
Clean out and cover Utter receptacles frequently to prevent spillage.
Inspect solid waste containers for structural damage regularly. Repair or replace damaged containers as necessary.
Do not mix wastes; this can cause chemical reactions, make recycling impossible, and complicate disposal.
Ensure that only appropriate solid wastes are added to the solid waste container. Certain wastes such as hazardous wastes, appliances, fluorescent lamps, pesticides, etc., may not be disposed of in solid waste containers.

6.2 Inspection

Inspect and replace faulty pumps or hoses regularly to minimize the potential of releases and spills.
Check waste management areas for leaking containers or spills.
Repair leasing equipment including valves, lines, seals, or pumps promptly.

6.3 Training

Train staff in pollution prevention measures and proper disposal methods.
Train employees and contractors in proper spill containment and cleanup.
The employee should have the tools and knowledge to immediately begin cleaning up a spill should one occur.
Train employees and subcontractors in proper hazardous waste management

6.4 Prevention

Keep Spill Prevention Control and Countermeasure Plan up-to-date.
Have an emergency plan, equipment and trained personnel ready at all times to deal immediately with major spills.
Collect all spilled liquids and properly dispose of them.
Store and maintain appropriate spill cleanup materials in a location known to all near the designated wash area.

7. OUTDOOR STORAGE OF RAW MATERIALS

7.1 Description

Raw materials, by-products, finished products, containers, and material storage areas exposed to rain and/or runoff can pollute storm water. Storm water can become contaminated when materials wash off or dissolve into water or are added to runoff by spills and leaks. Improper storage of these materials can result in accidental spills and the release of materials. To prevent or reduce the discharge of pollutants to storm water from material delivery and storage, pollution prevention and source control measures must be implemented, such as minimizing the storage of hazardous materials on-site$_3$ enclosing or covering materials, storing materials in a designated area, installing secondary containment, conducting regular inspections, preventing storm water run-on and runoff, and training employees and subcontractors.

7.2 Approach

Emphasize employee education for successful BMP implementation.
Keep an accurate, up-to-date inventory of the materials delivered and stored on-site.
Keep chemicals in their original containers and keep them well labeled.
Keep outdoor storage containers in good condition.
Minimize storm water run-on by enclosing the area or building a berm around it.
Secure drums stored in an area where unauthorized persons may gain access to prevent accidental spillage, pilferage, or any unauthorized use. Curbing should be placed along the perimeter of the area to prevent the run-on of uncontaminated storm water from adjacent areas as well as runoff of storm water from the stockpile areas.

7.3 Inspection

Conduct regular inspections of storage areas so that leaks and spills are detected as soon as possible.
Check berms, curbing, containment for repair and patching.

7.2 Training

Train employees well in proper material storage.
Train employees and contractors in proper techniques for spill containment and cleanup.

7.3 Prevention

Keep Spill Prevention Control and Countermeasure Plan up-to-date. Place a stockpile of spill cleanup materials, such as brooms, dustpans, and vacuum sweepers near the storage area where it will be ready accessible.
Have employees trained in spill containment and cleanup present during the loading/unloading of dangerous wastes, liquid chemicals, or other materials.

8. BUILDING & GROUNDS MAINTENANCE

8.1 Description

Storm water runoff from building and grounds maintenance activities can be contaminated with toxic hydrocarbons in solvents, fertilizers and pesticides, suspended solids, heavy metals, abnormal pH, and oils and greases. Utilizing the protocols in this fact sheet will prevent or reduce the discharge of pollutants to storm water from building and grounds maintenance activities by washing and cleaning up with as little water as possible, following good landscape management practices, preventing and cleaning up spills immediately, keeping debris from entering the storm drains, and maintaining the storm water collection system.

8.2 Approach

Reduce potential for pollutant discharge through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

Switch to non-toxic chemicals for maintenance when possible.

Choose cleaning agents that can be recycled.
Encourage proper lawn management and landscaping, including use of native vegetation.
Encourage use of Integrated Pest Management techniques for pest control.
Encourage proper onsite recycling of yard trimmings.
Recycle residual paints, solvents, lumber, and other material as much as possible.
If soaps or detergents are not used, and the surrounding area is paved, wash runoff does not have to be collected but must be screened. Pressure washers must use filer fabric or some other type of screen on the ground and/or in the catch basin to trap the particles in wash water runoff.
If pressured washing on a grassed area (with or without soap), runoff must be dispersed as sheet flow as much as possible, rather than as a concentrated stream. The wash runoff must remain on the grass and not drain to pavement

8.3 Landscaping Activities

Dispose of grass clippings, leaves, sticks, or other collected vegetation as garbage, or by composting. Do not dispose of collected vegetation into waterways or storm drainage system. Use mulch or other erosion control measures on exposed soils.

8.4 Building Repair, Remodeling and Construction

Do not dump any toxic substance or liquid waste on *the* paveme.nl, the ground, or toward a storm drain.

Use ground or drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of collected material daily.

Use a storm drain cover, filter fabric, or similarly effective runoff control mechanism if dust, grit$_s$ wash water, or other pollutants may escape the work area and enter a catch basin. This is particularly necessary on rainy days.

Store toxic material under cover during precipitation events and when not in use. A Cover would include tarps or other temporary cover material.

8.5 Inspection

Inspect irrigation system periodically to ensure that the right amount of water is being applied and that excessive runoff is not occurring. Minimize excess watering and repair leaks in the irrigation system as soon as they are observed.

8.6 Training

Educate and train employees on pesticide use and in pesticide application techniques to
prevent pollution.

Train employees and contractors in proper techniques for spill containment and cleanup Be sure the frequency of training takes into account the complexity of the operations and
the nature of the staff.

8.7 Prevention

Keep Spill Prevention Control and Countermeasure Plan up-to-date.

Place a stockpile of spill cleanup materials, such as brooms, dustpans, and vacuum sweepers near the storage area where it wall be readily accessible.

Have employees trained in spill containment and cleanup present during the, loading/unloading of dangerous wastes, liquid chemicals, or other materials. Clean up spills immediately.

9. PARKING / STORAGE AREA MAINTENANCE

9.1 Description

Parking lots and storage areas can contribute a number of substances, such as trash, suspended solids, hydrocarbons, oil and grease, and heavy metals that can enter receiving waters through storm water runoff or non-storm water discharges. The protocols in this fact sheet are intended to prevent or reduce the discharge of pollutants from parking/storage areas and include using good housekeeping practices, following appropriate cleaning BMP s and training employees.

9.2 Approach

The goal of this program is to ensure storm water pollution prevention practices are considered when conducting activities on or around parking areas and storage areas to reduce potential for pollutant discharge to receiving waters. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.
Encourage alternative designs and maintenance strategies for impervious parking lots.
Keep accurate maintenance logs to evaluate BMP implementation.
Keep the parking and storage areas clean and orderly. Remove debris in a timely fashion.
Discharge soapy water remaining in mop or wash buckets to the sanitary sewer through a sink, toilet, clean-out, or wash area with drain.

9.3 Controlling Litter, Surf ace Cleaning, and Repair

Post No Littering signs and enforce anti-litter laws.
Provide an adequate number of litter receptacles.
Routinely sweep, shovel, and dispose of litter in the trash.
Use dry cleaning methods to prevent the discharge of pollutants into the storm water conveyance system if possible.
Sweep all parking lots at least once before the onset of the wet season.
Apply concrete, asphalt, and seal coat during dry weather to prevent contamination from contacting storm water runoff.
Use only as much water as necessary for dust control, to avoid runoff.
Catch drips from paving equipment that is not in use with pans or absorbent material place under the machines. Dispose of collected material and absorbents property.

9.4 Inspection

Have designated personnel conduct inspections of parking facilities and storm water conveyance systems associated with parking facilities on a regular basis.

9.5 Training

Provide regular training to field employees and/or contractors regarding cleaning of paved areas and proper operation of equipment.
Train employees and contractors in proper techniques for spill containment and cleanup.

9.6 Prevention

Keep Spill Prevention Control Countermeasure Plan up-to-date.
Place stockpile of spill cleanup materials where it will be readily accessible or at a central location.
Clean up fluid spills immediately with absorbent rags or material. *JBS* Dispose or spilled material and absorbents properly.

10. METHOD TO PREVENT STORM WATER POLLUTION

Who is responsible for Storm Water Pollution Prevention?

10.1 In one sentence

Each individual working in the company is a responsible party. Of course there is one employee in charge of the program, but without your co-operation his/her job will be very difficult. We should keep our eyes open watching for any possible source of pollutants and either eliminate it or at least if you can't report the situation immediately to the management.

What is our company's propose to prevent storm water pollution?

(a) Facility Design

The site storm water run off is mainly directed to under ground filtration chambers. This means mat the storm water run off is going to the under ground reservoirs. To Reduce the under ground water pollution the storm water run off is going first to a "Filtration System" with high efficiency to capture the majority of sediments, oil and grease, suspended solid and will treat some of the dissolved solids and nutrients. Any equipment in the world has a limit in capacity. If we over load the filtration system with pollutants, the result are some of the pollutants will escape the system and go to the Filtration Chambers. We have to do what we agreed on; otherwise the "Filtration System" will be overwhelmed. It is not only some pollutants will escape the Filter but also it will be clogged with debris.

In the Original design of the facility there are two major Best Management Measures used:

(1) Filtration System (Show the slide of the filter drawing/picture)
(2) Filtration Chambers. (Show the drawing/picture of the filtration chamber)

Offer brief explanation of how these two BMP's function.

In the Water Quality Management Plan you can find the maintenance procedures and schedule for these two measures.

(b) Operation and Maintenance

Through the implementation of the Water Quality Management the company is taking all possible precautions to prevent the storm water run off pollution. Actually the training we have today is part of this plan.

Periodical inspection and maintenance of at the BMP's are required.
Copy of the "WQMP" is available for you to review.

[At this time the trainer will pick up a copy of the plan and show it to the trainees. Also the trainer shall highlight the main sections of the plan]

Once the trainer completes that he/she will guide the trainees through the facility to show them where are the "Filtration System" inlet and the location of the "Filtration Chambers". Then the trainer shall guide the group to show the landscape areas around the parameter of the site and how the sprinkler system is designed and controlled.

Then back to the class room to complete the training.

GOVERNMENT ORGANIZATIONS INVOLVED IN THE WQMP AND REGULATIONS:

Storm water pollution prevention started with Federal Regulations "Clean Water Act". States and Counties established detailed regulations in implementing the federal program. The program in the State of California is managed by The State Water Quality Control Board. Riverside County and City of Perris are responsible for enforcing the program and monitoring the compliance of all Commercial and Industrial Facilities in their jurisdiction.

The regulations allow the local authorities to impose penalties on violators. These penalties range from warning to fines and imprisonment depending on the kind of violation. Repeated violations or ignoring the required corrective actions can escalate the level of penalty even if it is a minor violation.

It is for every employee benefit to avoid any kind of violation. Penalties can threaten the continuation of the business operation. The bottom line is, when prevent storm water pollution we are:

(1) Protect our health and our children health
(2) Protect our job in Western Way Recycling

Let's make Pollution Prevention Part of our Daily Life

Class Room Training

The class room training shall cover the following:

1. What is the definition of storm water?
2. Where the storm water goes?
3. Why we are concerned about preventing the storm water pollution?
    4. What are the substances that may pollute the storm water in general and what are the specific site potential pollutants?
5. How we can prevent those pollutants from reaching the storm water?
6. Who is responsible for storm water pollution prevention?
    7. What our company (Western Way Recycling, Inc.) did and doing to prevent the storm water pollution?
    8. The government organization responsible for the storm water pollution prevention program.

The Trainer: A qualified company employee or outside qualified consultant

Class room environment and tools:
Shall be comfortable setting using overhead projector. Preferred to have pictures of the existing on site BMPs (The retention area, filtration system and Infiltration Chambers Maximum number of trainees per class is 10 employees.

Method of approach:
Dynamic interaction based on addressing questions to the trainees. It is very important t& tie the training to the trainee's real life daily practice. At the end of the class the trainer should give sufficient time for the trainees to ask questions and generate suggestions from the trainees. Any suggestion regardless if it may look not valid shall be considered for discussion and positive criticism by the group.
The final list of employee's suggestions shall be presented to the company management for consideration. This is the best way to get the employees to participate in the implementation of the program.

Class room training shall be on annual base. The training material shall be revised to include:

- Employees suggestions from the previous training
- Update in permit conditions
- Any new regulations
- Any change in the operations

1. What is the Storm Water?

It is in common term the Rain Water. The natural cycle of water on earth start from the evaporated water mainly off the world large water bodies (Oceans, Seas, and Lakes). The water vapor forms the clouds which under certain weather conditions fall on the ground water drops or snow.

2. Where the Storm Water Goes?

The Storm Water (Rain) is the life blood for all human beings, animals and plants. Looking at the world map there are large areas just plain desert Good example is the desert areas in California. If God forbid- we suffer drought for extended period of time-say 7 to 8 years- our whole state will turn gradually to be desert. Considerable amount of rain water penetrate the surface soil and ends up in the under ground naturally created reservoirs which we call aquifers. These aquifers are the source of water feeding the water wells. The Inland empire and San Gabriel Valley area depending on the under ground water for the majority of these areas residential, commercial and industrial water supply needs. The rest of the rainwater which fall on the paved street, buildings, parking lots or any other impervious surfaces are collected by a huge piping net work and flood control channels and directed to the ocean. In addition there is always runoff quantity of rain water the soil can not absorb -especially in times of heavy rain- also goes to the storm water piping and flood control channels. If you look carefully under the streets curbs you can see large openings which are the inlet to the flood control system.

3. Why we are concerned about preventing the Storm Water Pollution?

Considering what we discussed before, the rain water will end up either in the ocean or in the under ground water reservoirs. The ocean is the world of magnificent marine life supplied us with all kinds of seafood Also it is where we go with our children to enjoy swimming and playing. Any pollutants may end up in the bodies of the seafood we eat. In case of high pollution the ocean beaches will be dangerous for the adults and children. The under ground water is what we are using in our homes for drinking, cooking, cleaning and other purposes.
In very short answer, WE PREVENT THE RAIN WATER POLLUTION BECAUSE WE ARE PROTECTING OUR SELF.

4. Pollutants

Pollutants are any substance which can represent threat to human life, marine life and plants. They range from mild pollutants to extremely dangerous and toxic pollutants. No doubt that the modern civilization created hundreds of chemicals that were not in nature before or were not exposed to use. Examples are: Oil and Grease, mercury compounds, solvents, pesticides, chemical fertilizers, specific metals and metal compounds etc. In the attached publication by Federal EPA # 833-B-03-002 you can see how different pollutants can affect the marine life. These pollutants include: Debris, Sediments, Excess Nutrients, Bacteria and Household Hazardous In our operation here we receive tons of empty cans, glass bottles and printed paper. The rain water can wash down the recyclable materials which potentially carry several pollutants. These pollutants can end up either to storm water drainage system then to the ocean or in the underground water.

5. How can we prevent the pollutants from mixing with the storm water?

a) Housekeeping; we can not stress enough the importance of housekeeping. Clean yard and well organized storage of material is the first pollution prevention measure.
b) Containment of any spilled liquids. In case some of the containers may have left over fluids, the operator should not allow the spill to spread all over the place. Use absorbents to contain the spill. DO NOT WASH ANY SPILL BY HOSING IT DOWN THE STORM WATER DRAIN.
c) No car wash or truck wash on site
d) No oil change or any car repair shall be performed on site.
e) Customers and employees shall use the available trash cans and not to litter the trash any where.
f) It is forbidden to intentionally dispose of any fluids to the storm water drain specially waste oil, cleaners, soap, alcohol beverage, pesticides, weed Wing chemicals, acids and alkaline .
g) Watch for any excess plant and lawn watering. The excessive watering and cause run-off to the storm water drain. Most probably the run off will carry with it sediments, soil fertilizers and pesticide (If it was in the soil)
h) Now the trainer can ask the attendees to suggest more measures

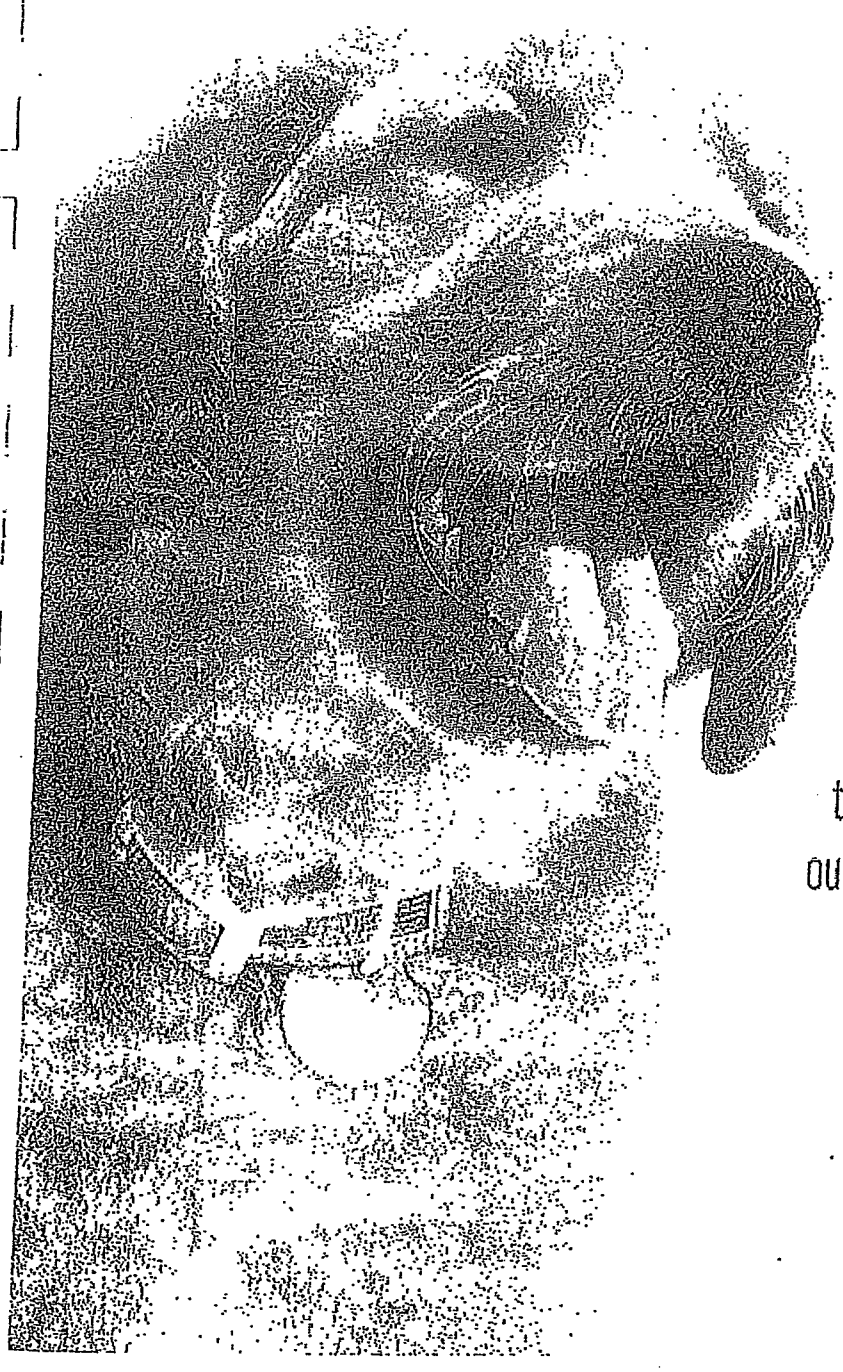
6. Who is Responsible for Storm Water Pollution Prevention?

In one sentence: Each individual working in the company is a responsible party.
Of course there is one employee in charge of the program, but without your co-operation his / her job will be very difficult. We should keep our eyes open watching for any possible source of pollutants and either eliminate it or at least if you can 7 report the situation immediately to the management.

7. What is our company is doing to prevent storm water pollution?

(a) Facility Design
The site storm water run off is mainly directed to under ground filtration chambers. This means that the storm water run off is going to the under ground water reservoirs. To reduce the under ground water pollution the storm water run off is going first to a
violation. Repeated violations or ignoring the required corrective actions can escalate the level of penalty even if it is a minor violation.

It is for every employee benefit to avoid any kind of violation. Penalties can threaten the continuation of the business operation. The bottom line is, when prevent storm water pollution we are:



1) Protect our health and our children health
2) Protect our job in Retail Building

3) Protect our health and our children health
4) Protect our job in Retail Building

Let make Pollution Prevention Part of our Daily

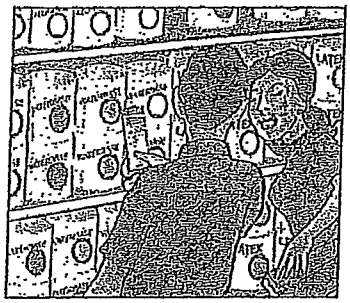
Questions and Answer

Pick up after your pooch to curb pollution.

Maybe you weren't aware, but dog waste left on the ground gets into storm drains, polluting rivers, lakes and beaches.

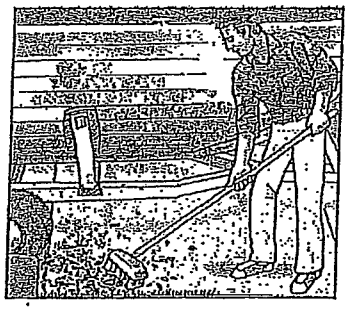
The bacteria and risk of disease threatens the health of our kids and communities. Wherever you live in San Bernardino County, this pollution is a problem. The answer? Pick up after your dog, to help prevent pollution and protect our health. It's in your hands.

CITY OF FONTANA



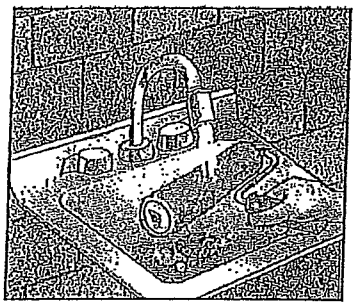
STORMWATER PROGRAM

♻ Printed on recycled paper



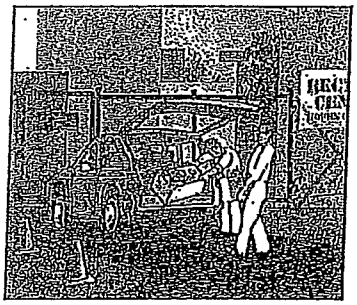
STORMWATER Pollution Prevention

PAINTING



Paints, solvents, adhesives and other toxic chemicals used in painting often make their way into the San Bernardino County storm drain system and do not get treated before reaching the Santa Ana River. This pollutes our drinking water and contaminates waterways, making them unsafe for people and wildlife. Follow these simple tips to prevent pollution and protect our health.

Water-Based Paints
Use water-based paints whenever possible. They are less toxic than oil-based paints and easier to clean up. Look for products labeled "latex" or "cleans with water."



Paint Removal
Sweep up paint stripping residue, chips and dust instead of hosing into the street and dispose of them safely at a household hazardous waste collection facility. Call (800) CLEANUP for the facility in your area.

Painting Cleanup
Never clean brushes or rinse paint containers in the street, gutter or near a storm drain. Clean water-based paints in the sink. Clean oil-based paints with thinner, which can be reused by putting it in a jar to settle out the paint particles and then pouring off the clear liquid for future use. Wrap dried paint residue in newspaper and dispose of it in the trash.

Exterior Paint Removal
When stripping or cleaning building exteriors with high-pressure water, block nearby storm drains and divert washwater onto a designated dirt area. Ask your local wastewater treatment authority if you can collect building cleaning water and discharge it to the sewer.

Recycling Paint
Recycle leftover paint at a household hazardous waste collection facility, save it for touch ups or give it to someone who can use it, like a theatre group, school, city or community organization.

To report illegal dumping or for more information on stormwater pollution prevention, call:

1 (800) CLEANUP

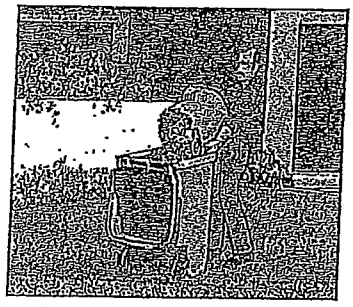
CITY OF FONTANA

Stormwater Pollution Prevention

HOME REPAIR & REMODELING

Paints, solvents, adhesives and other toxic substances used in home repair and remodeling often make their way into the San Bernardino County storm drain system and do not get treated before reaching the Santa Ana River. This pollutes our drinking water and contaminates waterways, making them unsafe for people and wildlife. Follow these simple tips to prevent pollution and protect your health.

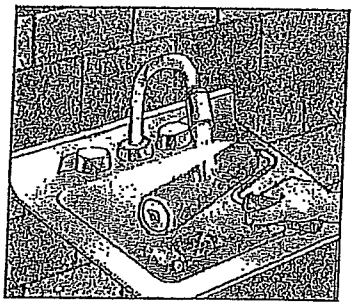


Construction Projects

Keep construction debris away from the street, gutter and storm drains. Schedule grading and excavation projects for dry weather. Cover excavated material and stockpiles of soil, sand or gravel, protected from rain, wind and runoff. Prevent erosion by planting fast-growing annual and perennial grass, which can shield and bind soil.

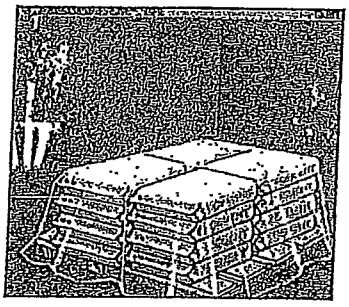
Recycle Household Hazardous Waste

Household cleaners, paint and other home improvement products like wallpaper and tile adhesives are too toxic to trash. Recycle them instead, at a convenient household hazardous waste collection facility. Call (800) CLEANUP for the facility in your area.



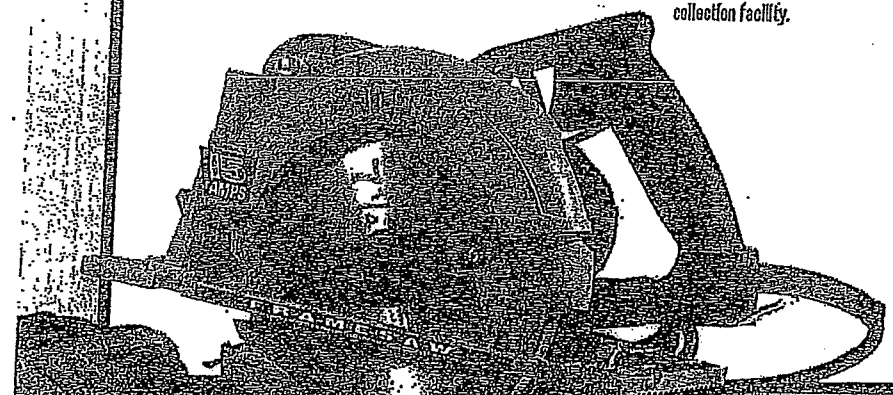
Landscaping & Gardening

Avoid applying fertilizers or pesticide near curbs and driveways, and store covered, protected from rain, wind and runoff. Try using organic or non-toxic alternatives. Reduce runoff and lower your water bill by using drip irrigation, soaker hoses or micro-spray systems. Recycle leaves instead of blowing, sweeping or raking them into the street, gutter or storm drain.



Paint Removal

Paint stripping residue, chips and dust from marine paints and paints containing lead or tributyl tin are hazardous wastes. Sweep them up instead of hosing into the street and dispose of them safely at a household hazardous waste collection facility.



Painting Cleanup

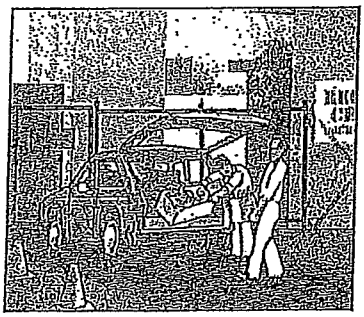
Avoid cleaning brushes or rinsing paint containers in the street, gutter or near a storm drain. Clean water-based paints in the sink. Clean oil-based paints with thinner, which you can filter and reuse. Recycle leftover paint at a household hazardous waste collection facility, save it for touch ups or give it to someone who can use it, like a theatre group, school, city or community organization.

Concrete and Masonry

Store bags of cement and plaster away from gutters and storm drains, and cover them to protect against rain, wind and runoff. Sweep or scoop up cement washout or concrete dust instead of hosing into driveways, streets, gutters or storm drains.

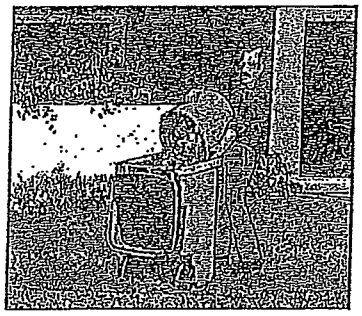
To report illegal dumping or for more information on stormwater pollution prevention, call:

1 (800) CLEANUP



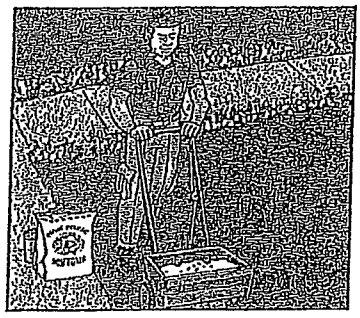
www.1800cleanup.org

CITY OF FONTANA

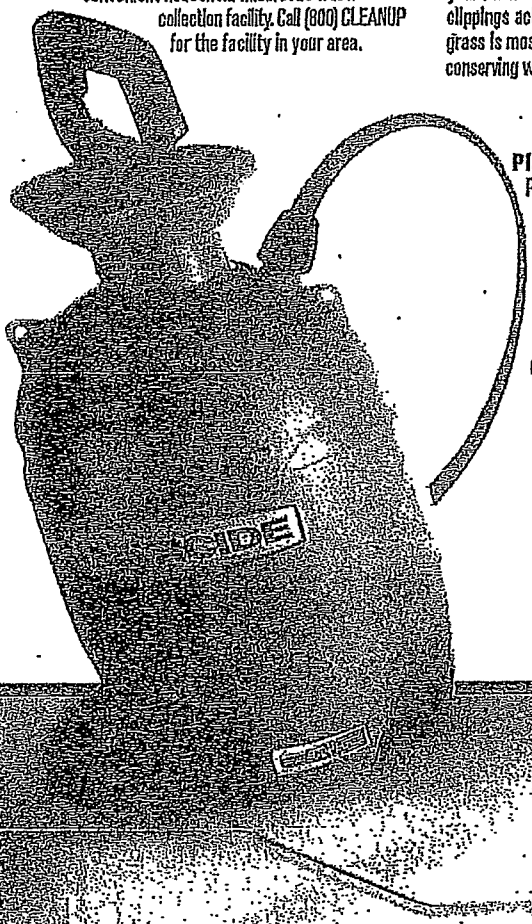


STORMWATER Pollution Prevention

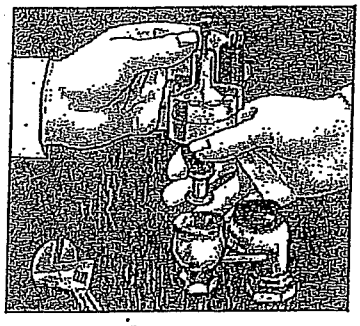
HOME & GARDEN



Yard waste and household toxics like paints and pesticides often make their way into the San Bernardino County storm drain system and do not get treated before reaching the Santa Ana River. This pollutes our drinking water and contaminates waterways, making them unsafe for people and wildlife. Follow these simple tips to prevent pollution and protect your health.



Recycle Household Hazardous Waste
Household products like paint, pesticides, solvents and cleaners are too dangerous to dump and too toxic to trash. Take them to be recycled at a convenient household hazardous waste collection facility. Call (800) CLEANUP for the facility in your area.



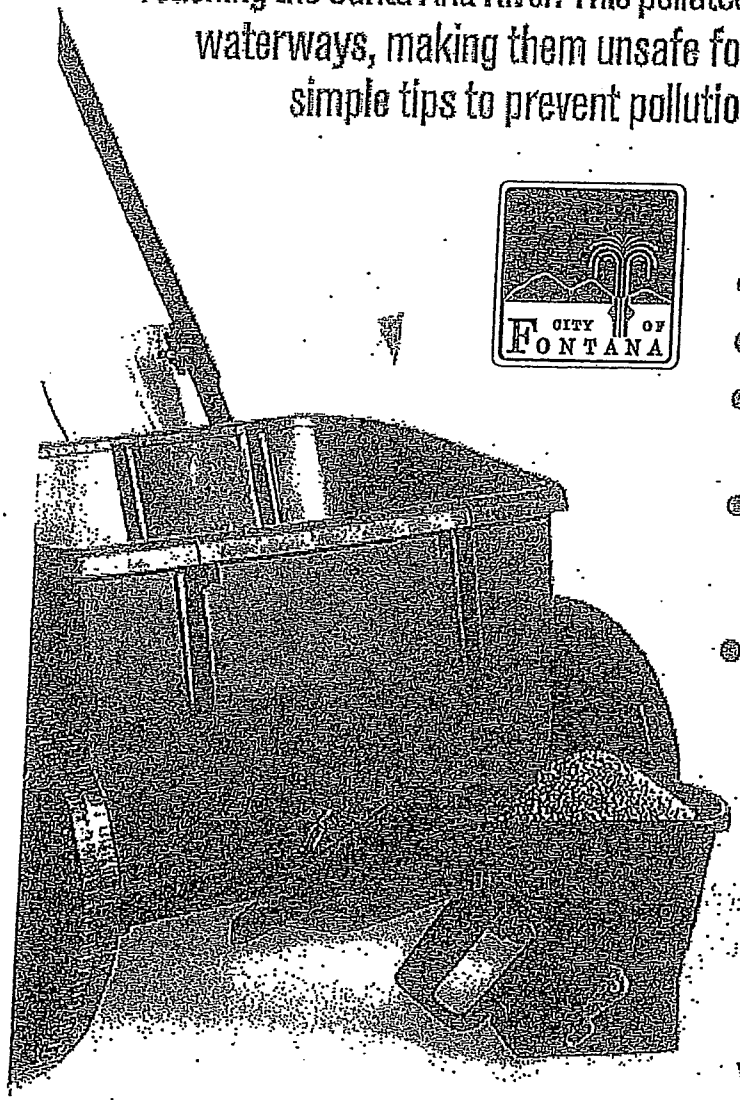
Disposing of Yard Waste
Recycle leaves, grass clippings and other yard waste. Instead of blowing, sweeping or hosing into the street. Try grasscycling, leaving grass clippings on your lawn instead of using a grass catcher. The clippings act as a natural fertilizer, and because grass is mostly water, it also irrigates your lawn, conserving water.

Use Fertilizers & Pesticides Safely
Fertilizers and pesticides are often carried into the storm drain system by sprinkler runoff. Try using organic or non-toxic alternatives. If you use chemical fertilizers or pesticides, avoid applying near curbs and driveways and never apply before a rain.

Planting in the Yard
Produce less yard waste and save water by planting low maintenance, drought-tolerant trees and shrubs. Using drip irrigation, soaker hoses or micro-spray systems for flower beds and vegetation can also help reduce your water bill and prevent runoff.

Use Water Wisely
Cut your water costs and prevent runoff by controlling the amount of water and direction of sprinklers. The average lawn needs about an inch of water a week, including rainfall, or 10 to 20 minutes of watering. A half-inch per week is enough for fall and spring. Sprinklers should be on long enough to allow water to soak into the ground but not so long as to cause runoff.

CITY OF FONTANA



To report illegal dumping or for more information on stormwater pollution prevention, call:

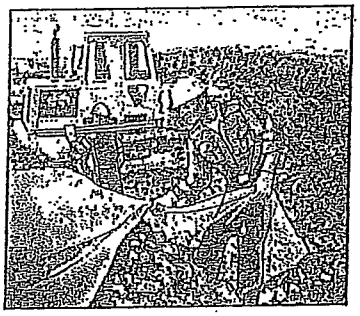
Fertilizer Tips to Prevent Pollution

Water that runs off your lawn and garden can carry excess fertilizer into the San Bernardino County storm drain system, and it does not get treated before reaching the Santa Ana River. This pollutes our drinking water and contaminates waterways, making them unsafe for people and wildlife. Follow these simple tips to prevent pollution and protect your health:

- Read the product label and follow the directions carefully, using only as directed.
- Avoid applying near driveways or gutters.
- Never apply fertilizer before a rain.
- Store fertilizers and chemicals in a covered area and in sealed, waterproof containers.
- Take unwanted lawn or garden chemicals to a household hazardous waste collection facility. Call (800) 253-2687.
- Use non-toxic products for your garden and lawn whenever possible.

To report illegal dumping or for more information on Stormwater pollution prevention, call:

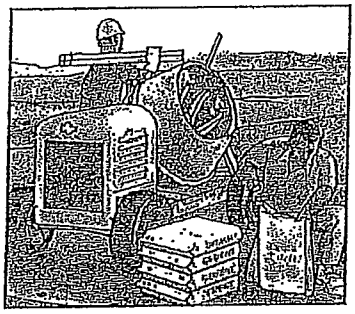


1 (800) CLEANUP

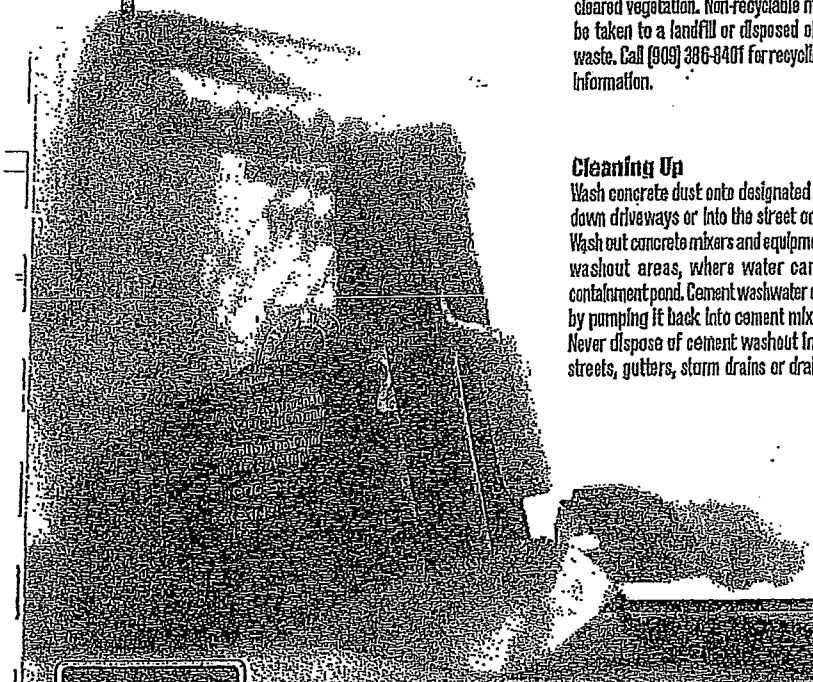
www.1800cleanup.org

Stormwater Pollution Prevention

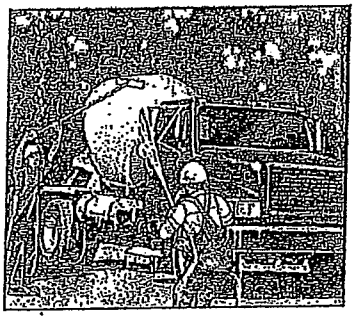
FRESH CONCRETE & MORTAR APPLICATION



Cement wash, sediment, vehicle fluids, dust and hazardous debris from construction sites often make their way into the San Bernardino County storm drain system and do not get treated before reaching the Santa Ana River. This pollutes our drinking water and contaminates waterways, making them unsafe for people and wildlife. Follow these best management practices to prevent pollution and protect public health.



Storing Materials
Keep construction materials and debris away from the street, gutter and storm drains. Secure open bags of cement and cover exposed stockpiles of soil, sand or gravel and excavated material with plastic sheeting, protected from rain, wind and runoff.



Ordering Materials & Recycling Waste
Reduce waste by ordering only the amounts of materials needed for the job. Use recycled or recyclable materials whenever possible. When breaking up paving, recycle the pieces at a crushing company. You can also recycle broken asphalt, concrete, wood, and cleared vegetation. Non-recyclable materials should be taken to a landfill or disposed of as hazardous waste. Call (909) 386-8401 for recycling and disposal information.

During Construction
Schedule excavation and grading during dry weather. Prevent mortar and cement from entering the street and storm drains by placing erosion controls. Setup small mixers on tarps or drop cloths, for easy cleanup of debris. Never bury waste material. Recycle or dispose of it as hazardous waste.

Cleaning Up
Wash concrete dust onto designated dirt areas, not down driveways or into the street or storm drains. Wash out concrete mixers and equipment in specified washout areas, where water can flow into a containment pond. Cement washwater can be recycled by pumping it back into cement mixers for reuse. Never dispose of cement washout into driveways, streets, gutters, storm drains or drainage ditches.

CITY OF FONTANA

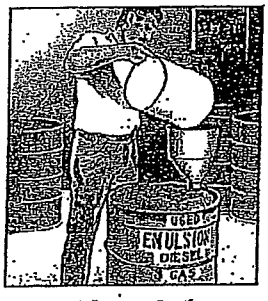
STORMWATER Pollution Prevention

AUTO MAINTENANCE

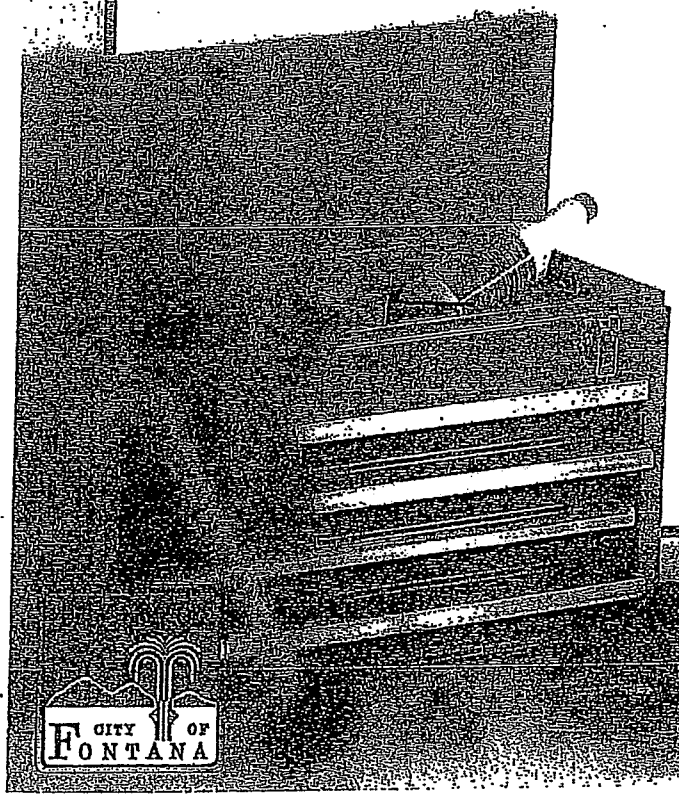
Oil, grease, anti-freeze and other toxic automotive fluids often make their way into the San Bernardino County storm drain system, and do not get treated before reaching the Santa Ana River. This pollutes our drinking water and contaminates waterways, making them unsafe for people and wildlife. Follow these best management practices to prevent pollution and protect public health.

Cleaning Auto Parts
Scrape parts with a wire brush or use a bake oven rather than liquid cleaners. Arrange drip pans, drying racks and drain boards so that fluids are directed back into the parts washer or the fluid holding tank. Do not wash parts or equipment in a shop sink, parking lot, driveway or street.

Storing Hazardous Waste
Keep your liquid waste segregated. Many fluids can be recycled via hazardous waste disposal companies if they are not mixed. Store all materials under cover with spill containment or inside to prevent contamination of rainwater runoff.



Metal Grinding and Polishing
Keep a bin under your lathe or grinder to capture metal fillings. Send uncontaminated fillings to a scrap metal recycler for reclamation. Store metal fillings in a covered container or indoors.



Preventing Leaks and Spills
Place drip pans underneath to capture fluids. Use absorbent cleaning agents instead of water to clean work areas.

Cleaning Spills
Use dry methods for spill cleanup (sweeping, absorbent materials). Follow your hazardous materials response plan, as filed with your local fire department or other hazardous materials authority. Be sure that all employees are aware of the plan and are capable of implementing each phase. To report serious toxic spills, call 911.

Proper Disposal of Hazardous Waste
Recycle used motor oil and oil filters, anti-freeze and other hazardous automotive fluids, batteries, tires and metal fillings collected from grinding or polishing auto parts. Contact a licensed hazardous waste hauler. For more recycling information, call (909) 386-8401.

To report illegal dumping or for more information on stormwater pollution prevention, call:

CITY OF FONTANA

Site Design & Landscape Planning SD-10

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- ☑ Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Each project site possesses unique topographic, hydrologic, and vegetative features, some of which are more suitable for development than others. Integrating and incorporating appropriate landscape planning methodologies into the project design is the most effective action that can be done to minimize surface and groundwater contamination from stormwater.

Approach

Landscape planning should couple consideration of land suitability for urban uses with consideration of community goals and projected growth. Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Design requirements for site design and landscapes planning should conform to applicable standards and specifications of agencies with jurisdiction and be consistent with applicable General Plan and Local Area Plan policies.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Designing New Installations

Begin the development of a plan for the landscape unit with attention to the following general principles:

- Formulate the plan on the basis of clearly articulated community goals. Carefully identify conflicts and choices between retaining and protecting desired resources and community growth.
- Map and assess land suitability for urban uses. Include the following landscape features in the assessment: wooded land, open unwooded land, steep slopes, erosion-prone soils, foundation suitability, soil suitability for waste disposal, aquifers, aquifer recharge areas, wetlands, floodplains, surface waters, agricultural lands, and various categories of urban land use. When appropriate, the assessment can highlight outstanding local or regional resources that the community determines should be protected (e.g., a scenic area, recreational area, threatened species habitat, farmland, fish run). Mapping and assessment should recognize not only these resources but also additional areas needed for their sustenance.

Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Conserve Natural Areas during Landscape Planning

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Cluster development on least-sensitive portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

Maximize Natural Water Storage and Infiltration Opportunities Within the Landscape Unit

- Promote the conservation of forest cover. Building on land that is already deforested affects basin hydrology to a lesser extent than converting forested land. Loss of forest cover reduces interception storage, detention in the organic forest floor layer, and water losses by evapotranspiration, resulting in large peak runoff increases and either their negative effects or the expense of countering them with structural solutions.
- Maintain natural storage reservoirs and drainage corridors, including depressions, areas of permeable soils, swales, and intermittent streams. Develop and implement policies and

regulations to discourage the clearing, filling, and channelization of these features. Utilize them in drainage networks in preference to pipes, culverts, and engineered ditches.

- Evaluating infiltration opportunities by referring to the stormwater management manual for the jurisdiction and pay particular attention to the selection criteria for avoiding groundwater contamination, poor soils, and hydrogeological conditions that cause these facilities to fail. If necessary, locate developments with large amounts of impervious surfaces or a potential to produce relatively contaminated runoff away from groundwater recharge areas.

Protection of Slopes and Channels during Landscape Design

- Convey runoff safely from the tops of slopes.
- Avoid disturbing steep or unstable slopes.
- Avoid disturbing natural channels.
- Stabilize disturbed slopes as quickly as possible.
- Vegetate slopes with native or drought tolerant vegetation.
- Control and treat flows in landscaping and/or other controls prior to reaching existing natural drainage systems.
- Stabilize temporary and permanent channel crossings as quickly as possible, and ensure that increases in run-off velocity and frequency caused by the project do not erode the channel.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion. Energy dissipaters shall be installed in such a way as to minimize impacts to receiving waters.
- Line on-site conveyance channels where appropriate, to reduce erosion caused by increased flow velocity due to increases in tributary impervious area. The first choice for linings should be grass or some other vegetative surface, since these materials not only reduce runoff velocities, but also provide water quality benefits from filtration and infiltration. If velocities in the channel are high enough to erode grass or other vegetative linings, riprap, concrete, soil cement, or geo-grid stabilization are other alternatives.
- Consider other design principles that are comparable and equally effective.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Redevelopment may present significant opportunity to add features which had not previously been implemented. Examples include incorporation of depressions, areas of permeable soils, and swales in newly redeveloped areas. While some site constraints may exist due to the status of already existing infrastructure, opportunities should not be missed to maximize infiltration, slow runoff, reduce impervious areas, disconnect directly connected impervious areas.

Roof Runoff Controls SD-11

Rain Garden

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Description

Various roof runoff controls are available to address stormwater that drains off rooftops. The objective is to reduce the total volume and rate of runoff from individual lots, and retain the pollutants on site that may be picked up from roofing materials and atmospheric deposition. Roof runoff controls consist of directing the roof runoff away from paved areas and mitigating flow to the storm drain system through one of several general approaches: cisterns or rain barrels; dry wells or infiltration trenches; pop-up emitters, and foundation planting. The first three approaches require the roof runoff to be contained in a gutter and downspout system. Foundation planting provides a vegetated strip under the drip line of the roof.

Approach

Design of individual lots for single-family homes as well as lots for higher density residential and commercial structures should consider site design provisions for containing and infiltrating roof runoff or directing roof runoff to vegetative swales or buffer areas. Retained water can be reused for watering gardens, lawns, and trees. Benefits to the environment include reduced demand for potable water used for irrigation, improved stormwater quality, increased groundwater recharge, decreased runoff volume and peak flows, and decreased flooding potential.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Designing New Installations

Cisterns or Rain Barrels

One method of addressing roof runoff is to direct roof downspouts to cisterns or rain barrels. A cistern is an above ground storage vessel with either a manually operated valve or a permanently open outlet. Roof runoff is temporarily stored and then released for irrigation or infiltration between storms. The number of rain

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

barrels needed is a function of the rooftop area. Some low impact developers recommend that every house have at least 2 rain barrels, with a minimum storage capacity of 1000 liters. Roof barrels serve several purposes including mitigating the first flush from the roof which has a high volume, amount of contaminants, and thermal load. Several types of rain barrels are commercially available. Consideration must be given to selecting rain barrels that are vector proof and childproof. In addition, some barrels are designed with a bypass valve that filters out grit and other contaminants and routes overflow to a soak-away pit or rain garden.

If the cistern has an operable valve, the valve can be closed to store stormwater for irrigation or infiltration between storms. This system requires continual monitoring by the resident or grounds crews, but provides greater flexibility in water storage and metering. If a cistern is provided with an operable valve and water is stored inside for long periods, the cistern must be covered to prevent mosquitoes from breeding.

A cistern system with a permanently open outlet can also provide for metering stormwater runoff. If the cistern outlet is significantly smaller than the size of the downspout inlet (say ¼ to ½ inch diameter), runoff will build up inside the cistern during storms, and will empty out slowly after peak intensities subside. This is a feasible way to mitigate the peak flow increases caused by rooftop impervious land coverage, especially for the frequent, small storms.

Dry wells and Infiltration Trenches

Roof downspouts can be directed to dry wells or infiltration trenches. A dry well is constructed by excavating a hole in the ground and filling it with an open graded aggregate, and allowing the water to fill the dry well and infiltrate after the storm event. An underground connection from the downspout conveys water into the dry well, allowing it to be stored in the voids. To minimize sedimentation from lateral soil movement, the sides and top of the stone storage matrix can be wrapped in a permeable filter fabric, though the bottom may remain open. A perforated observation pipe can be inserted vertically into the dry well to allow for inspection and maintenance.

In practice, dry wells receiving runoff from single roof downspouts have been successful over long periods because they contain very little sediment. They must be sized according to the amount of rooftop runoff received, but are typically 4 to 5 feet square, and 2 to 3 feet deep, with a minimum of 1-foot soil cover over the top (maximum depth of 10 feet).

To protect the foundation, dry wells must be set away from the building at least 10 feet. They must be installed in solids that accommodate infiltration. In poorly drained soils, dry wells have very limited feasibility.

Infiltration trenches function in a similar manner and would be particularly effective for larger roof areas. An infiltration trench is a long, narrow, rock-filled trench with no outlet that receives stormwater runoff. These are described under Treatment Controls.

Pop-up Drainage Emitter

Roof downspouts can be directed to an underground pipe that daylights some distance from the building foundation, releasing the roof runoff through a pop-up emitter. Similar to a pop-up irrigation head, the emitter only opens when there is flow from the roof. The emitter remains flush to the ground during dry periods, for ease of lawn or landscape maintenance.

Foundation Planting

Landscape planting can be provided around the base to allow increased opportunities for stormwater infiltration and protect the soil from erosion caused by concentrated sheet flow coming off the roof. Foundation plantings can reduce the physical impact of water on the soil and provide a subsurface matrix of roots that encourage infiltration. These plantings must be sturdy enough to tolerate the heavy runoff sheet flows, and periodic soil saturation.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Efficient Irrigation SD-12

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Irrigation water provided to landscaped areas may result in excess irrigation water being conveyed into stormwater drainage systems.

Approach

Project plan designs for development and redevelopment should include application methods of irrigation water that minimize runoff of excess irrigation water into the stormwater conveyance system.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Designing New Installations

The following methods to reduce excessive irrigation runoff should be considered, and incorporated and implemented where determined applicable and feasible by the Permittee:

- Employ rain-triggered shutoff devices to prevent irrigation after precipitation.
- Design irrigation systems to each landscape area's specific water requirements.
- Include design featuring flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.
- Implement landscape plans consistent with County or City water conservation resolutions, which may include provision of water sensors, programmable irrigation times (for short cycles), etc.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Design timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water drainage system.
- Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider design features such as:
  - Using mulches (such as wood chips or bar) in planter areas without ground cover to minimize sediment in runoff
  - Installing appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant materials where possible and/or as recommended by the landscape architect
  - Leaving a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible
  - Choosing plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth
- Employ other comparable, equally effective methods to reduce irrigation water runoff.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Storm Drain Signage SD-13

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☑ Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Waste materials dumped into storm drain inlets can have severe impacts on receiving and ground waters. Posting notices regarding discharge prohibitions at storm drain inlets can prevent waste dumping. Storm drain signs and stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets.

Approach

The stencil or affixed sign contains a brief statement that prohibits dumping of improper materials into the urban runoff conveyance system. Storm drain messages have become a popular method of alerting the public about the effects of and the prohibitions against waste disposal.

Suitable Applications

Stencils and signs alert the public to the destination of pollutants discharged to the storm drain. Signs are appropriate in residential, commercial, and industrial areas, as well as any other area where contributions or dumping to storm drains is likely.

Design Considerations

Storm drain message markers or placards are recommended at all storm drain inlets within the boundary of a development project. The marker should be placed in clear sight facing toward anyone approaching the inlet from either side. All storm drain inlet locations should be identified on the development site map.

Designing New Installations

The following methods should be considered for inclusion in the project design and show on project plans:

- Provide stenciling or labeling of all storm drain inlets and catch basins, constructed or modified, within the project area with prohibitive language. Examples include "NO DUMPING

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

– DRAINS TO OCEAN" and/or other graphical icons to discourage illegal dumping.

- Post signs with prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

Note - Some local agencies have approved specific signage and/or storm drain message placards for use. Consult local agency stormwater staff to determine specific requirements for placard types and methods of application.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. If the project meets the definition of "redevelopment", then the requirements stated under " designing new installations" above should be included in all project design plans.

Additional Information

Maintenance Considerations

- Legibility of markers and signs should be maintained. If required by the agency with jurisdiction over the project, the owner/operator or homeowner's association should enter into a maintenance agreement with the agency or record a deed restriction upon the property title to maintain the legibility of placards or signs.

Placement

- Signage on top of curbs tends to weather and fade.

- Signage on face of curbs tends to be worn by contact with vehicle tires and sweeper brooms.

Supplemental Information

Examples

- Most MS4 programs have storm drain signage programs. Some MS4 programs will provide stencils, or arrange for volunteers to stencil storm drains as part of their outreach program.

Other Resources

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Trash Storage Areas SD-32

Description

Trash storage areas are areas where a trash receptacle (s) are located for use as a repository for solid wastes. Stormwater runoff from areas where trash is stored or disposed of can be polluted. In addition, loose trash and debris can be easily transported by water or wind into nearby storm drain inlets, channels, and/or creeks. Waste handling operations that may be sources of stormwater pollution include dumpsters, litter control, and waste piles.

Approach

This fact sheet contains details on the specific measures required to prevent or reduce pollutants in stormwater runoff associated with trash storage and handling. Preventative measures including enclosures, containment structures, and impervious pavements to mitigate spills, should be used to reduce the likelihood of contamination.

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Design requirements for waste handling areas are governed by Building and Fire Codes, and by current local agency ordinances and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code and ordinance requirements. Hazardous waste should be handled in accordance with legal requirements established in Title 22, California Code of Regulation.

Wastes from commercial and industrial sites are typically hauled by either public or commercial carriers that may have design or access requirements for waste storage areas. The design criteria in this fact sheet are recommendations and are not intended to be in conflict with requirements established by the waste hauler. The waste hauler should be contacted prior to the design of your site trash collection areas. Conflicts or issues should be discussed with the local agency.

Designing New Installations

Trash storage areas should be designed to consider the following structural or treatment control BMPs:

- Design trash container areas so that drainage from adjoining roofs and pavement is diverted around the area(s) to avoid run-on. This might include berming or grading the waste handling area to prevent run-on of stormwater.
- Make sure trash container areas are screened or walled to prevent off-site transport of trash.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Use lined bins or dumpsters to reduce leaking of liquid waste.
- Provide roofs, awnings, or attached lids on all trash containers to minimize direct precipitation and prevent rainfall from entering containers.
- Pave trash storage areas with an impervious surface to mitigate spills.
- Do not locate storm drains in immediate vicinity of the trash storage area.
- Post signs on all dumpsters informing users that hazardous materials are not to be disposed of therein.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Maintenance Considerations

The integrity of structural elements that are subject to damage (i.e., screens, covers, and signs) must be maintained by the owner/operator. Maintenance agreements between the local agency and the owner/operator may be required. Some agencies will require maintenance deed restrictions to be recorded of the property title. If required by the local agency, maintenance agreements or deed restrictions must be executed by the owner/operator before improvement plans are approved.

Building & Grounds Maintenance SC-41

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	✓
Nutrients	✓
Trash	
Metals	✓
Bacteria	✓
Oil and Grease	
Organics	

Description

Stormwater runoff from building and grounds maintenance activities can be contaminated with toxic hydrocarbons in solvents, fertilizers and pesticides, suspended solids, heavy metals, abnormal pH, and oils and greases. Utilizing the protocols in this fact sheet will prevent or reduce the discharge of pollutants to stormwater from building and grounds maintenance activities by washing and cleaning up with as little water as possible, following good landscape management practices, preventing and cleaning up spills immediately, keeping debris from entering the storm drains, and maintaining the stormwater collection system.

Approach

Reduce potential for pollutant discharge through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

Pollution Prevention

- Switch to non-toxic chemicals for maintenance when possible.
- Choose cleaning agents that can be recycled.
- Encourage proper lawn management and landscaping, including use of native vegetation.

CASQA
California Stormwater Quality Association

- Encourage use of Integrated Pest Management techniques for pest control.
- Encourage proper onsite recycling of yard trimmings.
- Recycle residual paints, solvents, lumber, and other material as much as possible.

Suggested Protocols

Pressure Washing of Buildings, Rooftops, and Other Large Objects

- In situations where soaps or detergents are used and the surrounding area is paved, pressure washers must use a water collection device that enables collection of wash water and associated solids. A sump pump, wet vacuum or similarly effective device must be used to collect the runoff and loose materials. The collected runoff and solids must be disposed of properly.
- If soaps or detergents are not used, and the surrounding area is paved, wash runoff does not have to be collected but must be screened. Pressure washers must use filter fabric or some other type of screen on the ground and/or in the catch basin to trap the particles in wash water runoff.
- If you are pressure washing on a grassed area (with or without soap), runoff must be dispersed as sheet flow as much as possible, rather than as a concentrated stream. The wash runoff must remain on the grass and not drain to pavement.

Landscaping Activities

- Dispose of grass clippings, leaves, sticks, or other collected vegetation as garbage, or by composting. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Use mulch or other erosion control measures on exposed soils.

Building Repair, Remodeling, and Construction

- Do not dump any toxic substance or liquid waste on the pavement, the ground, or toward a storm drain.
- Use ground or drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of collected material daily.
- Use a ground cloth or oversized tub for activities such as paint mixing and tool cleaning.
- Clean paintbrushes and tools covered with water-based paints in sinks connected to sanitary sewers or in portable containers that can be dumped into a sanitary sewer drain. Brushes and tools covered with non-water-based paints, finishes, or other materials must be cleaned in a manner that enables collection of used solvents (e.g., paint thinner, turpentine, etc.) for recycling or proper disposal.
- Use a storm drain cover, filter fabric, or similarly effective runoff control mechanism if dust, grit, wash water, or other pollutants may escape the work area and enter a catch basin. This is particularly necessary on rainy days. The containment device(s) must be in place at the beginning of the work day, and accumulated dirty runoff and solids must be collected and disposed of before removing the containment device(s) at the end of the work day.

- If you need to de-water an excavation site, you may need to filter the water before discharging to a catch basin or off-site. If directed off-site, you should direct the water through hay bales and filter fabric or use other sediment filters or traps.
- Store toxic material under cover during precipitation events and when not in use. A cover would include tarps or other temporary cover material.

Mowing, Trimming, and Planting

- Dispose of leaves, sticks, or other collected vegetation as garbage, by composting or at a permitted landfill. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Use mulch or other erosion control measures when soils are exposed.
- Place temporarily stockpiled material away from watercourses and drain inlets, and berm or cover stockpiles to prevent material releases to the storm drain system.
- Consider an alternative approach when bailing out muddy water: do not put it in the storm drain; pour over landscaped areas.
- Use hand weeding where practical.

Fertilizer and Pesticide Management

- Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of fertilizers and pesticides and training of applicators and pest control advisors.
- Use less toxic pesticides that will do the job when applicable. Avoid use of copper-based pesticides if possible.
- Do not use pesticides if rain is expected.
- Do not mix or prepare pesticides for application near storm drains.
- Use the minimum amount needed for the job.
- Calibrate fertilizer distributors to avoid excessive application.
- Employ techniques to minimize off-target application (e.g., spray drift) of pesticides, including consideration of alternative application techniques.
- Apply pesticides only when wind speeds are low.
- Fertilizers should be worked into the soil rather than dumped or broadcast onto the surface.
- Irrigate slowly to prevent runoff and then only as much as is needed.
- Clean pavement and sidewalk if fertilizer is spilled on these surfaces before applying irrigation water.
- Dispose of empty pesticide containers according to the instructions on the container label.

- Use up the pesticides. Rinse containers, and use rinse water as product. Dispose of unused pesticide as hazardous waste.
- Implement storage requirements for pesticide products with guidance from the local fire department and County Agricultural Commissioner. Provide secondary containment for pesticides.

Inspection

- Inspect irrigation system periodically to ensure that the right amount of water is being applied and that excessive runoff is not occurring. Minimize excess watering and repair leaks in the irrigation system as soon as they are observed.

Training

- Educate and train employees on pesticide use and in pesticide application techniques to prevent pollution.
- Train employees and contractors in proper techniques for spill containment and cleanup.
- Be sure the frequency of training takes into account the complexity of the operations and the nature of the staff.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Place a stockpile of spill cleanup materials, such as brooms, dustpans, and vacuum sweepers (if desired) near the storage area where it will be readily accessible.
- Have employees trained in spill containment and cleanup present during the loading/unloading of dangerous wastes, liquid chemicals, or other materials.
- Familiarize employees with the Spill Prevention Control and Countermeasure Plan.
- Clean up spills immediately.

Other Considerations

Alternative pest/weed controls may not be available, suitable, or effective in many cases.

Requirements

Costs

- Cost will vary depending on the type and size of facility.
- Overall costs should be low in comparison to other BMPs.

Maintenance

Sweep paved areas regularly to collect loose particles. Wipe up spills with rags and other absorbent material immediately, do not hose down the area to a storm drain.

Supplemental Information

Further Detail of the BMP

Fire Sprinkler Line Flushing

Building fire sprinkler line flushing may be a source of non-stormwater runoff pollution. The water entering the system is usually potable water, though in some areas it may be non-potable reclaimed wastewater. There are subsequent factors that may drastically reduce the quality of the water in such systems. Black iron pipe is usually used since it is cheaper than potable piping, but it is subject to rusting and results in lower quality water. Initially, the black iron pipe has an oil coating to protect it from rusting between manufacture and installation; this will contaminate the water from the first flush but not from subsequent flushes. Nitrates, poly-phosphates and other corrosion inhibitors, as well as fire suppressants and antifreeze may be added to the sprinkler water system. Water generally remains in the sprinkler system a long time (typically a year) and between flushes may accumulate iron, manganese, lead, copper, nickel, and zinc. The water generally becomes anoxic and contains living and dead bacteria and breakdown products from chlorination. This may result in a significant BOD problem and the water often smells. Consequently dispose fire sprinkler line flush water into the sanitary sewer. Do not allow discharge to storm drain or infiltration due to potential high levels of pollutants in fire sprinkler line water.

Drainage System Maintenance SC-44

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize

Description

As a consequence of its function, the stormwater conveyance system collects and transports urban runoff and stormwater that may contain certain pollutants. The protocols in this fact sheet are intended to reduce pollutants reaching receiving waters through proper conveyance system operation and maintenance.

Targeted Constituents

Sediment	✓
Nutrients	
Trash	✓
Metals	
Bacteria	✓
Oil and Grease	
Organics	

Approach

Pollution Prevention

Maintain catch basins, stormwater inlets, and other stormwater conveyance structures on a regular basis to remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, restore catch basins' sediment trapping capacity, and ensure the system functions properly hydraulically to avoid flooding.

Suggested Protocols

Catch Basins/Inlet Structures

- Staff should regularly inspect facilities to ensure compliance with the following:
  - Immediate repair of any deterioration threatening structural integrity.
  - Cleaning before the sump is 40% full. Catch basins should be cleaned as frequently as needed to meet this standard.
  - Stenciling of catch basins and inlets (see SC34 Waste Handling and Disposal).

CASQA California Stormwater Quality Association

- Clean catch basins, storm drain inlets, and other conveyance structures before the wet season to remove sediments and debris accumulated during the summer.
- Conduct inspections more frequently during the wet season for problem areas where sediment or trash accumulates more often. Clean and repair as needed.
- Keep accurate logs of the number of catch basins cleaned.
- Store wastes collected from cleaning activities of the drainage system in appropriate containers or temporary storage sites in a manner that prevents discharge to the storm drain.
- Dewater the wastes if necessary with outflow into the sanitary sewer if permitted. Water should be treated with an appropriate filtering device prior to discharge to the sanitary sewer. If discharge to the sanitary sewer is not allowed, water should be pumped or vacuumed to a tank and properly disposed. Do not dewater near a storm drain or stream.

Storm Drain Conveyance System

- Locate reaches of storm drain with deposit problems and develop a flushing schedule that keeps the pipe clear of excessive buildup.
- Collect and pump flushed effluent to the sanitary sewer for treatment whenever possible.

Pump Stations

- Clean all storm drain pump stations prior to the wet season to remove silt and trash.
- Do not allow discharge to reach the storm drain system when cleaning a storm drain pump station or other facility.
- Conduct routine maintenance at each pump station.
- Inspect, clean, and repair as necessary all outlet structures prior to the wet season.

Open Channel

- Modify storm channel characteristics to improve channel hydraulics, increase pollutant removals, and enhance channel/creek aesthetic and habitat value.
- Conduct channel modification/improvement in accordance with existing laws. Any person, government agency, or public utility proposing an activity that will change the natural (emphasis added) state of any river, stream, or lake in California, must enter into a Steam or Lake Alteration Agreement with the Department of Fish and Game. The developer-applicant should also contact local governments (city, county, special districts), other state agencies (SWRCB, RWQCB, Department of Forestry, Department of Water Resources), and Federal Corps of Engineers and USFWS.

Illicit Connections and Discharges

- Look for evidence of illegal discharges or illicit connections during routine maintenance of conveyance system and drainage structures:
  - Is there evidence of spills such as paints, discoloring, etc?

- Are there any odors associated with the drainage system?
- Record locations of apparent illegal discharges/illicit connections?
- Track flows back to potential dischargers and conduct aboveground inspections. This can be done through visual inspection of upgradient manholes or alternate techniques including zinc chloride smoke testing, fluorometric dye testing, physical inspection testing, or television camera inspection.
- Eliminate the discharge once the origin of flow is established.

- Stencil or demarcate storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as "Dump No Waste Drains to Stream" stenciled next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

Illegal Dumping

- Inspect and clean up hot spots and other storm drainage areas regularly where illegal dumping and disposal occurs.
- Establish a system for tracking incidents. The system should be designed to identify the following:
  - Illegal dumping hot spots
  - Types and quantities (in some cases) of wastes
  - Patterns in time of occurrence (time of day/night, month, or year)
  - Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills)
  - Responsible parties
- Post "No Dumping" signs in problem areas with a phone number for reporting dumping and disposal. Signs should also indicate fines and penalties for illegal dumping.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

Training

- Train crews in proper maintenance activities, including record keeping and disposal.
- Allow only properly trained individuals to handle hazardous materials/wastes.
- Have staff involved in detection and removal of illicit connections trained in the following:
  - OSHA-required Health and Safety Training (29 CFR 1910.120) plus annual refresher training (as needed).

- OSHA Confined Space Entry training (Cal-OSHA Confined Space, Title 8 and Federal OSHA 29 CFR 1910.146).
- Procedural training (field screening, sampling, smoke/dye testing, TV inspection).

Spill Response and Prevention

- Investigate all reports of spills, leaks, and/or illegal dumping promptly.
- Clean up all spills and leaks using "dry" methods (with absorbent materials and/or rags) or dig up, remove, and properly dispose of contaminated soil.
- Refer to fact sheet SC-11 Spill Prevention, Control, and Cleanup.

Other Considerations (Limitations and Regulations)

- Clean-up activities may create a slight disturbance for local aquatic species. Access to items and material on private property may be limited. Trade-offs may exist between channel hydraulics and water quality/riparian habitat. If storm channels or basins are recognized as wetlands, many activities, including maintenance, may be subject to regulation and permitting.
- Storm drain flushing is most effective in small diameter pipes (36-inch diameter pipe or less, depending on water supply and sediment collection capacity). Other considerations associated with storm drain flushing may include the availability of a water source, finding a downstream area to collect sediments, liquid/sediment disposal, and prohibition against disposal of flushed effluent to sanitary sewer in some areas.
- Regulations may include adoption of substantial penalties for illegal dumping and disposal.
- Local municipal codes may include sections prohibiting discharge of soil, debris, refuse, hazardous wastes, and other pollutants into the storm drain system.

Requirements

Costs

- An aggressive catch basin cleaning program could require a significant capital and O&M budget.
- The elimination of illegal dumping is dependent on the availability, convenience, and cost of alternative means of disposal. The primary cost is for staff time. Cost depends on how aggressively a program is implemented. Other cost considerations for an illegal dumping program include:
  - Purchase and installation of signs.
  - Rental of vehicle(s) to haul illegally-disposed items and material to landfills.
  - Rental of heavy equipment to remove larger items (e.g., car bodies) from channels.
  - Purchase of landfill space to dispose of illegally-dumped items and material.

- Methods used for illicit connection detection (smoke testing, dye testing, visual inspection, and flow monitoring) can be costly and time-consuming. Site-specific factors, such as the level of impervious area, the density and ages of buildings, and type of land use will determine the level of investigation necessary.

Maintenance

- Two-person teams may be required to clean catch basins with vactor trucks.
- Teams of at least two people plus administrative personnel are required to identify illicit discharges, depending on the complexity of the storm sewer system.
- Arrangements must be made for proper disposal of collected wastes.
- Technical staff are required to detect and investigate illegal dumping violations.

Supplemental Information

Further Detail of the BMP

Storm Drain Flushing

Flushing is a common maintenance activity used to improve pipe hydraulics and to remove pollutants in storm drainage systems. Flushing may be designed to hydraulically convey accumulated material to strategic locations, such as an open channel, another point where flushing will be initiated, or the sanitary sewer and the treatment facilities, thus preventing resuspension and overflow of a portion of the solids during storm events. Flushing prevents "plug flow" discharges of concentrated pollutant loadings and sediments. Deposits can hinder the designed conveyance capacity of the storm drain system and potentially cause backwater conditions in severe cases of clogging.

Storm drain flushing usually takes place along segments of pipe with grades that are too flat to maintain adequate velocity to keep particles in suspension. An upstream manhole is selected to place an inflatable device that temporarily plugs the pipe. Further upstream, water is pumped into the line to create a flushing wave. When the upstream reach of pipe is sufficiently full to cause a flushing wave, the inflated device is rapidly deflated with the assistance of a vacuum pump, thereby releasing the backed up water and resulting in the cleaning of the storm drain segment.

To further reduce impacts of stormwater pollution, a second inflatable device placed well downstream may be used to recollect the water after the force of the flushing wave has dissipated. A pump may then be used to transfer the water and accumulated material to the sanitary sewer for treatment. In some cases, an interceptor structure may be more practical or required to recollect the flushed waters.

It has been found that cleansing efficiency of periodic flush waves is dependent upon flush volume, flush discharge rate, sewer slope, sewer length, sewer flow rate, sewer diameter, and population density. As a rule of thumb, the length of line to be flushed should not exceed 700 feet. At this maximum recommended length, the percent removal efficiency ranges between 65-75% for organics and 55-65% for dry weather grit/inorganic material. The percent removal efficiency drops rapidly beyond that. Water is commonly supplied by a water truck, but fire hydrants can also supply water. To make the best use of water, it is recommended that reclaimed water be used or that fire hydrant line flushing coincide with storm sewer flushing.

1.0 INTRODUCTION

1.1 Purpose of Analysis and Study Objectives

This Noise Impact Analysis has been prepared to determine the noise impacts associated with the proposed Magnolia Ranch Residential project (proposed project). The following is provided in this report:

- A description of the study area and the proposed project;
- Information regarding the fundamentals of noise;
- Information regarding the fundamentals of vibration;
- A description of the local noise guidelines and standards;
- An evaluation of the current noise environment;
- An analysis of the potential short-term construction-related noise impacts from the proposed project; and
- An analysis of long-term operations-related noise impacts from the proposed project.

1.2 Site Location and Study Area

The project site is located in the City of Eastvale (City). The approximately 10.0 gross acre project site is relatively flat and currently includes a ranch house with barn and associated fencing and facilities for livestock/horses. The project site is bounded by Schleisman Road to the north, Eastvale Elementary School to the east, Orange Street and River Heights Intermediate School to the south and single-family homes to the west. The project study area is shown in Figure 1.

Sensitive Receptors in Project Vicinity

The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

1.3 Proposed Project Description

The proposed project would consist of a residential development on 8.28 net acres that would include 41 detached single-family homes with approximately 22,000 square feet of common open space. New sidewalks will be provided along the north side of Orange Street, a walkway will run in a north-south direction adjacent to the east property line, and a walkway will run in an east-west direction through the common open space area. The proposed project would also include development of an internal road system and road improvements to the portion of Orange Street that is adjacent to the project site. It should be noted that the project applicant is proposing to pay TUMF fees in lieu of road improvements to the portion of Schleisman Road that is adjacent to the project site, however in order to provide a conservative analysis, it has been assumed that this area will be graded as part of the proposed project. The proposed site plan is shown in Figure 2.

1.4 Executive Summary

Standard Noise Regulatory Conditions

The proposed project will be required to comply with the following regulatory conditions from the City and State of California (State).

City of Eastvale Noise Regulations

The following lists the noise and vibration regulations from the City of Eastvale Development Code that are applicable, but not limited to the proposed project.

- Section 120.05.130(b) - Noise control standards
- Section 120.05.130(b) – Vibration standards

State of California Noise Regulations

The following lists the State of California noise regulations that are applicable, but not limited to the proposed project.

- California Vehicle Code Section 27200-27207 – On Road Vehicle Noise Limits
- California Vehicle Code Section 38365-38350 – Off-Road Vehicle Noise Limits

Summary of Analysis Results

The following is a summary of the proposed project's impacts with regard to the State CEQA Guidelines noise checklist questions.

Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less than significant impact.

Generation of excessive groundborne vibration or groundborne noise levels?

Less than significant impact.

For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Less than significant impact.

1.5 Project Design Features Incorporated into the Proposed Project

This analysis was based on implementation of the following project design features that are either already depicted on the proposed project site plan and architectural plans or are required from City and State Regulations.

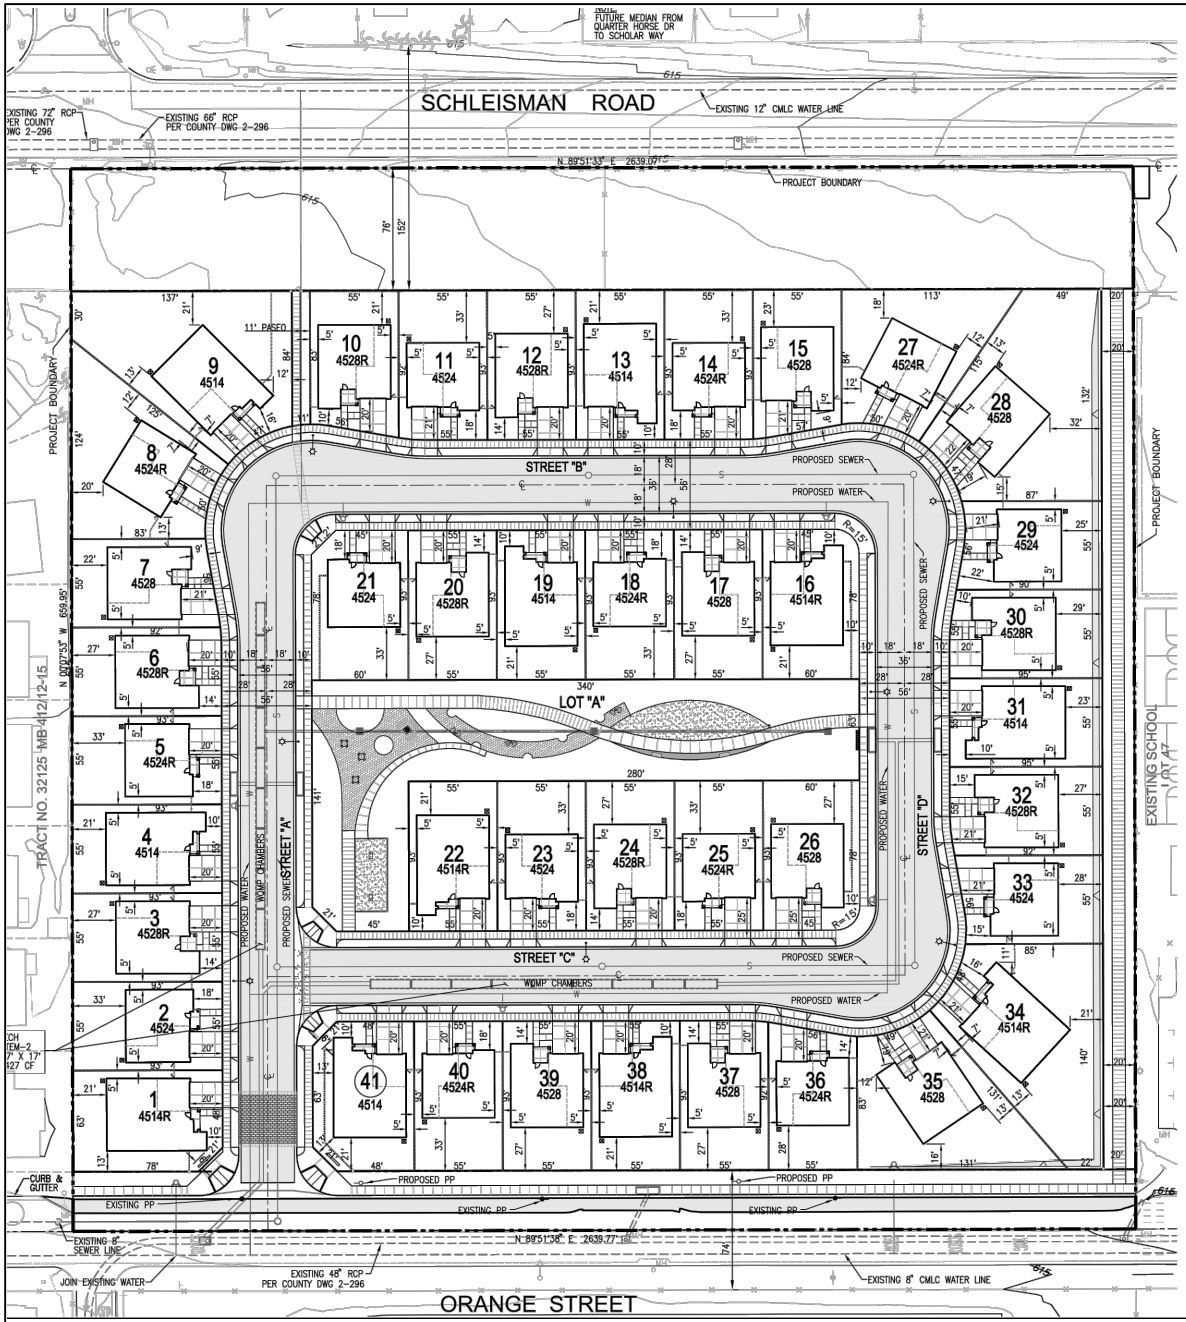
Project Design Feature 1:
Prior to the issuance of the grading permit, the project applicant shall submit a construction-related noise mitigation plan to the City for review and approval. The plan shall depict the

locations of where construction equipment will operate on the project site and how the noise from the construction equipment will be mitigated during construction of the project, through use of such methods as:

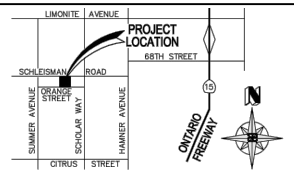
1. Temporary noise attenuation fences;
2. Preferential location of equipment
3. Length of equipment use and idling time; and,
4. Use of current noise suppression technology and equipment.

1.6 Mitigation Measures for the Proposed Project

This analysis found that through adherence to the noise and vibration regulations detailed in Section 1.4, through implementation of Project Design Feature 1 detailed in Section 1.5 above, and through implementation of the following mitigation all noise and vibration impacts would be reduced to less than significant levels.



Mitigation Measure 1:



The project applicant shall construct a minimum 6.5-foot high wall on the north side of Lots 9 through 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings.

Proposed Site Plan

2.0 NOISE FUNDAMENTALS

Noise is defined as unwanted sound. Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Sound is produced by the vibration of sound pressure waves in the air. Sound pressure levels are used to measure the intensity of sound and are described in terms of decibels. The decibel (dB) is a logarithmic unit which expresses the ratio of the sound pressure level being measured to a standard reference level. A-weighted decibels (dBA) approximate the subjective response of the human ear to a broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear.

2.1 Noise Descriptors

Noise Equivalent sound levels are not measured directly, but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (Leq) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. The worst-hour traffic Leq is the noise metric used by California Department of Transportation (Caltrans) for analyzing traffic noise impacts.

The Day-Night Average Level (Ldn or DNL) is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of ten decibels to sound levels at night between 10 p.m. and 7 a.m. While the Community Noise Equivalent Level (CNEL) is similar to the Ldn, except that it has another addition of 4.77 decibels to sound levels during the evening hours between 7 p.m. and 10 p.m. These additions are made to the sound levels at these time periods because during the evening and nighttime hours, when compared to daytime hours, there is a decrease in the ambient noise levels, which creates an increased sensitivity to sounds. For this reason, the sound appears louder in the evening and nighttime hours and is weighted accordingly. The City of Eastvale relies on the CNEL noise standard to assess transportation-related impacts on noise sensitive land uses.

2.2 Tone Noise

A pure tone noise is a noise produced at a single frequency and laboratory tests have shown that humans are more perceptible to changes in noise levels of a pure tone. For a noise source to contain a “pure tone,” there must be a significantly higher A-weighted sound energy in a given frequency band than in the neighboring bands, thereby causing the noise source to “stand out” against other noise sources. A pure tone occurs if the sound pressure level in the one-third octave band with the tone exceeds the average of the sound pressure levels of the two contiguous one-third octave bands by:

- 5 dB for center frequencies of 500 hertz (Hz) and above
- 8 dB for center frequencies between 160 and 400 Hz
- 15 dB for center frequencies of 125 Hz or less

2.3 Noise Propagation

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in level of noise as the distance from the source increases. The manner in which the noise level reduces with distance depends on whether the source is a point or line source as well as ground absorption, atmospheric effects and refraction, and shielding by natural and manmade features.

Sound from point sources, such as air conditioning condensers, radiate uniformly outward as it travels away from the source in a spherical pattern. The noise drop-off rate associated with this geometric spreading is 6 dBA per each doubling of the distance (dBA/DD) between source and receiver. Transportation noise sources such as roadways are typically analyzed as line sources, since at any given moment the receiver may be impacted by noise from multiple vehicles at various locations along the roadway. Because of the geometry of a line source, the noise drop-off rate associated with the geometric spreading of a line source is 3 dBA/DD.

2.4 Ground Absorption

The sound drop-off rate is highly dependent on the conditions of the land between the noise source and receiver. To account for this ground-effect attenuation (absorption), two types of site conditions are commonly used in traffic noise models, soft-site and hard-site conditions. Soft-site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation. For point sources, a drop-off rate of 7.5 dBA/DD is typically observed over soft ground with landscaping, as compared with a 6.0 dBA/DD drop-off rate over hard ground such as asphalt, concrete, stone and very hard packed earth. For line sources a 4.5 dBA/DD is typically observed for soft-site conditions compared to the 3.0 dBA/DD drop-off rate for hard-site conditions. Caltrans research has shown that the use of soft-site conditions is more appropriate for the application of the Federal Highway Administration (FHWA) traffic noise prediction model used in this analysis.

3.0 GROUND-BORNE VIBRATION FUNDAMENTALS

Ground-borne vibrations consist of rapidly fluctuating motions within the ground that have an average motion of zero. The effects of ground-borne vibrations typically only cause a nuisance to people, but at extreme vibration levels damage to buildings may occur. Although ground-borne vibration can be felt outdoors, it is typically only an annoyance to people indoors where the associated effects of the shaking of a building can be notable. Ground-borne noise is an effect of ground-borne vibration and only exists indoors, since it is produced from noise radiated from the motion of the walls and floors of a room and may also consist of the rattling of windows or dishes on shelves.

3.1 Vibration Descriptors

There are several different methods that are used to quantify vibration amplitude such as the maximum instantaneous peak in the vibrations velocity, which is known as the peak particle velocity (PPV) or the root mean square (rms) amplitude of the vibration velocity. Due to the typically small amplitudes of vibrations, vibration velocity is often expressed in decibels and is denoted as (L_v) and is based on the rms velocity amplitude. A commonly used abbreviation is "VdB", which in this text, is when L_v is based on the reference quantity of 1 micro inch per second.

3.2 Vibration Perception

Typically, developed areas are continuously affected by vibration velocities of 50 VdB or lower. These continuous vibrations are not noticeable to humans whose threshold of perception is around 65 VdB. Off-site sources that may produce perceptible vibrations are usually caused by construction equipment, steel-wheeled trains, and traffic on rough roads, while smooth roads rarely produce perceptible ground-borne noise or vibration.

3.3 Vibration Propagation

The propagation of ground-borne vibration is not as simple to model as airborne noise. This is due to the fact that noise in the air travels through a relatively uniform medium, while ground-borne vibrations travel through the earth which may contain significant geological differences. There are three main types of vibration propagation; surface, compression, and shear waves. Surface waves, or Rayleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wave front, similar to ripples produced by throwing a rock into a pool of water. P-waves, or compression waves, are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. S-waves, or shear waves, are also body waves that carry energy along an expanding spherical wave front. However, unlike P-waves, the particle motion is transverse or "side-to-side and perpendicular to the direction of propagation."

As vibration waves propagate from a source, the vibration energy decreases in a logarithmic nature and the vibration levels typically decrease by 6 VdB per doubling of the distance from the vibration source. As stated above, this drop-off rate can vary greatly depending on the soil but has been shown to be effective enough for screening purposes, in order to identify potential vibration impacts that may need to be studied through actual field tests.

4.0 REGULATORY SETTING

The project site is located in the City of Eastvale. Noise regulations are addressed through the efforts of various federal, state, and local government agencies. The agencies responsible for regulating noise are discussed below.

4.1 Federal Regulations

The adverse impact of noise was officially recognized by the federal government in the Noise Control Act of 1972, which serves three purposes:

- Promulgating noise emission standards for interstate commerce
- Assisting state and local abatement efforts
- Promoting noise education and research

The Federal Office of Noise Abatement and Control (ONAC) was initially tasked with implementing the Noise Control Act. However, the ONAC has since been eliminated, leaving the development of federal noise policies and programs to other federal agencies and interagency committees. For example, the Occupational Safety and Health Administration (OSHA) agency prohibits exposure of workers to excessive sound levels. The Department of Transportation (DOT) assumed a significant role in noise control through its various operating agencies. The Federal Aviation Administration (FAA) regulates noise of aircraft and airports. Surface transportation system noise is regulated by a host of agencies, including the Federal Transit Administration (FTA), which regulates transit noise, while freeways that are part of the interstate highway system are regulated by the Federal Highway Administration (FHWA). Finally, the federal government actively advocates that local jurisdictions use their land use regulatory authority to arrange new development in such a way that "noise sensitive" uses are either prohibited from being sited adjacent to a highway or, alternately that the developments are planned and constructed in such a manner that potential noise impacts are minimized.

Although the proposed project is not under the jurisdiction of the FTA, the *Transit Noise and Vibration Impact Assessment Manual* (FTA Manual), prepared by the FTA, September 2018, is the only guidance document from a government agency that has defined what constitutes a significant noise impact from implementing a project. The FTA standards are based on extensive studies by the FTA and other governmental agencies on the human effects and reaction to noise and a summary of the FTA findings are provided below in Table A.

Table A – FTA Project Effects on Cumulative Noise Exposure

Existing Noise Exposure (dBA Leq or Ldn)	Allowable Noise Impact Exposure dBA Leq or Ldn		
	Project Only	Combined	Noise Exposure Increase
45	51	52	+7
50	53	55	+5
55	55	58	+3
60	57	62	+2
65	60	66	+1
70	64	71	+1
75	65	75	0

Source: Federal Transit Administration, 2018.

The FTA also provides guidance on construction noise and recommends developing construction noise criteria on a project-specific basis that utilizes local noise ordinances if possible. However, local noise ordinances usually relates to nuisance and hours of allowed activity and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the noise impacts of a construction project. Project construction noise criteria should take into account the existing noise environment, the absolute noise levels during construction activities, the duration of the construction, and the adjacent land uses. The FTA standards are based on extensive studies by the FTA and other governmental agencies on the human effects and reaction to noise and a summary of the FTA findings for a detailed construction noise assessment are provided below in Table B.

Table B – FTA Construction Noise Criteria

Land Use	Day (dBA $Leq_{(8\text{-hour})}$)	Night (dBA $Leq_{(8\text{-hour})}$)	30-day Average (dBA Ldn)
Residential	80	70	75
Commercial	85	85	80[(1)]
Industrial	90	90	85[(1)]

Notes:
[(1)] Use a 24-hour $Leq_{(24\ hour)}$ instead of $Ldn_{(30\ day)}$.
Source: Federal Transit Administration, 2018.

Since the federal government has preempted the setting of standards for noise levels that can be emitted by the transportation sources, the City is restricted to regulating the noise generated by the transportation system through nuisance abatement ordinances and land use planning.

4.2 State Regulations

Noise Standards

California Department of Health Services Office of Noise Control

Established in 1973, the California Department of Health Services Office of Noise Control (ONC) was instrumental in developing regularity tools to control and abate noise for use by local agencies. One significant model is the "Land Use Compatibility for Community Noise Environments Matrix," which allows the local jurisdiction to clearly delineate compatibility of sensitive uses with various incremental levels of noise.

California Noise Insulation Standards

Title 24, Chapter 1, Article 4 of the California Administrative Code (California Noise Insulation Standards) requires noise insulation in new hotels, motels, apartment houses, and dwellings (other than single-family detached housing) that provides an annual average noise level of no more than 45 dBA CNEL. When such structures are located within a 60-dBA CNEL (or greater) noise contour, an acoustical analysis is required to ensure that interior levels do not exceed the 45-dBA CNEL annual threshold. In addition, Title 21, Chapter 6, Article 1 of the California Administrative Code requires that all habitable rooms, hospitals, convalescent homes, and places of worship shall have an interior CNEL of 45 dB or less due to aircraft noise.

Government Code Section 65302

Government Code Section 65302 mandates that the legislative body of each county and city in California adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines published by the State Department of Health Services. The guidelines rank noise land use compatibility in terms of normally acceptable, conditionally acceptable, normally unacceptable, and clearly unacceptable.

California Vehicle Code Section 27200-27207 – On-Road Vehicle Noise

California Vehicle Code Section 27200-27207 provides noise limits for vehicles operated in California. For vehicles over 10,000 pounds noise is limited to 88 dB for vehicles manufactured before 1973, 86 dB for vehicles manufactured before 1975, 83 dB for vehicles manufactured before 1988, and 80 dB for vehicles manufactured after 1987. All measurements are based at 50 feet from the vehicle.

California Vehicle Section 38365-38380 – Off-Road Vehicle Noise

California Vehicle Code Section 38365-38380 provides noise limits for off-highway motor vehicles operated in California. 92 dBA for vehicles manufactured before 1973, 88 dBA for vehicles manufactured before 1975, 86 dBA for vehicles manufactured before 1986, and 82 dBA for vehicles manufactured after December 31, 1985. All measurements are based at 50 feet from the vehicle.

Vibration Standards

Title 14 of the California Administrative Code Section 15000 requires that all state and local agencies implement the California Environmental Quality Act (CEQA) Guidelines, which requires the analysis of exposure of persons to excessive groundborne vibration. However, no statute has been adopted by the state that quantifies the level at which excessive groundborne vibration occurs.

The *Transportation- and Construction Vibration Guidance Manual*, prepared by Caltrans, April 2020, provides practical guidance to Caltrans engineers, planners, and consultants who must address vibration issues associated with the construction, operation, and maintenance of Caltrans projects. However, this manual is also used as a reference point by many lead agencies and CEQA practitioners throughout California, as it provides numeric thresholds for vibration impacts. Thresholds are established for continuous (construction-related) and transient (transportation-related) sources of vibration, which found that the human response becomes distinctly perceptible at 0.25 inch per second PPV for transient sources and 0.04 inch per second PPV for continuous sources.

4.3 Local Regulations – City of Eastvale

The *City of Eastvale General Plan* (General Plan), approved June 13, 2012, and the Eastvale, CA Code of Ordinances (Municipal Code), January 7, 2022, establishes the following applicable policies related to noise and vibration.

General Plan

The following applicable goals and policies to the proposed project are from the Noise Element of the General Plan.

Goal N-1: Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors, and noise-sensitive uses of Eastvale.

Goal N-3: Ensure that noise sensitive uses do not encroach into area needed by noise generating uses.

Goal N-4: Locate noise sources away from existing noise sensitive land uses unless appropriate noise control measures are provided.

Policy N-3: Consider the following uses to be sensitive to noise and vibration, and discourage these uses in areas where existing or projected future noise levels would be in excess of 65 CNEL and/or vibration would be more than 0.0787 Peak Particle Velocity (inches/second)

- Schools;
- Hospitals;
- Rest Homes;
- Long Term Care Facilities;
- Mental Care Facilities;
- Residential Uses;
- Libraries;
- Passive Recreation Uses; and
- Places of Worship

Policy N-4: Require noise sensitive land uses proposed in areas where existing or projected future noise levels would be in excess of 65 CNEL to have an acoustical specialist prepare a study of the noise problems and recommend structural and site design features that will adequately mitigate the noise problem.

Policy N-5: Require that exterior noise forecasts use the appropriate Level of Service for the adjacent roadways, or a 20-year projection of traffic volumes (whichever is greater) for future noise forecasts.

Policy N-6: Mitigate exterior noise levels to the levels shown in Table N-3 (Table C) to the extent feasible.

Table C – City of Eastvale Noise Compatibility by Land Use Designation[1]

Land Use Designations	Completely Compatible	Tentatively Compatible	Normally Incompatible	Completely Incompatible
All Residential (Single- and Multi-Family)	Less than 60 dBA	60 – 70 dBA	70 – 75 dBA	Greater than 75 dBA
All Non-Residential (Commercial, Industrial & Institutional)	Less than 70 dBA	70 – 75 dBA	Greater than 75 dBA	--[(2)]
Public Parks (Lands on which public parks are located or planned)	Less than 65 dBA	65 – 70 dBA	70 – 75 dBA	Greater than 75 dBA

Notes:
[1] All noise levels shown in this Table are designated CNEL.
[2] To be determined as part of the project review process.
Source: City of Eastvale, 2012.

Policy N-7: Table N-4 (Table D) provides the City's standards for maximum exterior non-transportation noise levels to which land designated for residential land uses may be exposed for any 30-minute period on any day. Where existing ambient noise levels

exceed these standards, the ambient noise level shall be the highest allowable noise level as measured in dBA Leq (30 minutes).

Note to Reader: Public schools are not regulated by the City; therefore, no noise standards for public schools are provided in this Chapter.

Table D – City of Eastvale Exterior Noise Level Standards for Non-Transportation Noise[1]

Land Use Type	Time Period	Maximum Noise Level (dBA)
Single-Family Homes and Duplexes	10 p.m. to 7 a.m.	50
	7 a.m. to 10 p.m.	60
Multiple Residential 3 or More Units per Building (Triplex +)	10 p.m. to 7 a.m.	55
	7 a.m. to 10 p.m.	60

Notes:
[1] Measured as dBA Leq (30 minutes).

Policy N-9: The City may impose exterior noise standards which are less restrictive than those specified in Table N-4, provided that:

1) The noise impact on the residential or other noise-sensitive use is addressed in an environmental analysis and at least one outdoor area meets the standards; and
2) A finding is made by the approving body specifying why the exception would not be detrimental to the public health, safety and general welfare; and
3) The exception would not adversely affect the character of the surrounding development.
4) The exception would not be injurious to adjacent uses, property and improvements; and,
5) Alternatives have been considered but none are technologically feasible for the proposal and,
6) Interior noise levels resulting from and external source will be no more than 45 dBA CNEL from 7 a.m. to 10 p.m.; and,
7) Residents of noise sensitive uses are informed of the proposal during the review stage and prior to approval.

Policy N-10: Table N-5 (Table E): Maximum Acceptable Interior Noise Levels Created by Exterior Noise Sources provides the City's standards for acceptable indoor noise levels for various types of land uses. These standards should receive special attention when projects are considered in "Tentatively Compatible" or "Normally Incompatible" areas.

- Noise created inside a use listed below shall not count toward the acceptable noise levels to be maintained in accordance with this policy.

Table E – Maximum Acceptable Interior Noise Levels Created by Exterior Noise Sources

Land Use Type	Acceptable Noise Level (dBA CNEL)
Residential Living and Sleeping Areas	45 dBA
Residential Living and Sleeping Areas where the dwelling unit is subject to noise from railroad tracks, aircraft overflights, or similar sources which produce clearly identifiable, discrete noise events (such as the passing of a trains as opposed to relatively steady or constant noise sources such as roadways)	40 dBA
Private & Semi Private Classrooms[(1)]	55 dBA
All Places of Work Other than School Classrooms	Conform with applicable state and federal workplace safety standards

Notes:
[1] Standards for public schools are set and enforced by the State of California and are not regulated by the City of Eastvale.
Source: City of Eastvale, 2012.

Policy N-11: Developers of new residential or other noise-sensitive uses which are placed in environments subject to existing or projected noise that exceeds the "completely compatible" guidelines in Table N-3 (see Table C) shall be responsible for ensuring that acceptable exterior and interior noise levels will be achieved.

Policy N-22: Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.

Policy N-23: Condition subdivision and other land development approval adjacent to developed/occupied noise-sensitive land uses to require the developer to submit a construction-related noise mitigation plan to the City for review and approval prior to issuance of a grading permit. The plan must depict the location of construction equipment and specify how the noise from this equipment will be mitigated during construction of this project, through the use of such methods as:

a) Temporary noise attenuation fences;

b) Preferential location of equipment

c) Length of equipment use and idling time; and,

d) Use of current noise suppression technology and equipment.

Policy N-24: Require that all construction equipment be kept properly tuned and use noise reduction features (e.g. mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

City of Eastvale Municipal Code

The City of Eastvale Municipal Code establishes the following applicable standards for new residential development related to noise and vibration.

Section 8.52.020 - Exemptions

Sound emanating from the following sources is exempt from the provisions of this chapter:

(9) Private construction projects located within one-quarter of a mile from an inhabited dwelling, provided that construction does not occur between the hours of:

a. 6:00 p.m. and 6:00 a.m. during the months of June through September; and

b. 6:00 p.m. and 7:00 a.m. during the months of October through May;

(10) Property maintenance, including, but not limited to, the operation of lawnmowers, leaf blowers, etc., provided such maintenance occurs between the hours of 7:00 a.m. and 8:00 p.m.;

(12) Heating and air conditioning equipment.

Section 8.52.040 – General sound level standards

No person shall create any sound, or allow the creation of any sound, on any property that causes the exterior sound level on any other occupied property to exceed the sound level standards set forth in the following table:

Table F – City of Eastvale Municipal Code Sound Level Standards

General Plan Foundation Component			Maximum Decibel Level	
Land Use Designation General Plan	Land Use Designation Name	Density (per acre)	7:00 a.m. – 10:00 p.m.	10:00 p.m. – 7:00 a.m.
MDR	Medium-Density Residential	2-5	55	45
MHDR	Medium High-Density Residential	5-8	55	45
HDR	High-Density Residential	8-14	55	45
PF	Public Facility		65	45
REC	Recreation		45	45

Source: City of Eastvale, 2015.

Section 120.05.130 – Noise, odor and vibration performance standards

a) *Applicability.* The standards of this section apply to all new and existing land uses within the city, unless otherwise exempted.

b) *Noise standards.* All uses shall comply with the noise standards set forth in the city's general plan and within the city's noise ordinance (see chapter 8.52).

d) *Vibration standards.* Uses shall be operated in compliance with the following provisions:

(1) Uses, activities and processes shall not generate vibrations that cause discomfort or annoyance to reasonable persons of normal sensitivity or which endanger the comfort, repose, health or peace of residents whose property abuts the property lines of the subject parcel.

(3) Vibrations from temporary construction/demolition and vehicles that leave the subject parcel (e.g., trucks, trains and aircraft) are exempt from the provisions of this section.

5.0 EXISTING NOISE CONDITIONS

To determine the existing noise levels, noise measurements have been taken in the vicinity of the project site. The field survey noted that noise within the proposed project area is generally characterized by vehicle traffic on Schleisman Road that is adjacent to the north side of the project site and from Orange Street that is adjacent to the south side of the project site. There is also noise created from Eastvale Elementary School, adjacent to the east side of the project site. The following describes the measurement procedures, measurement locations, noise measurement results, and the modeling of the existing noise environment.

5.1 Noise Measurement Equipment

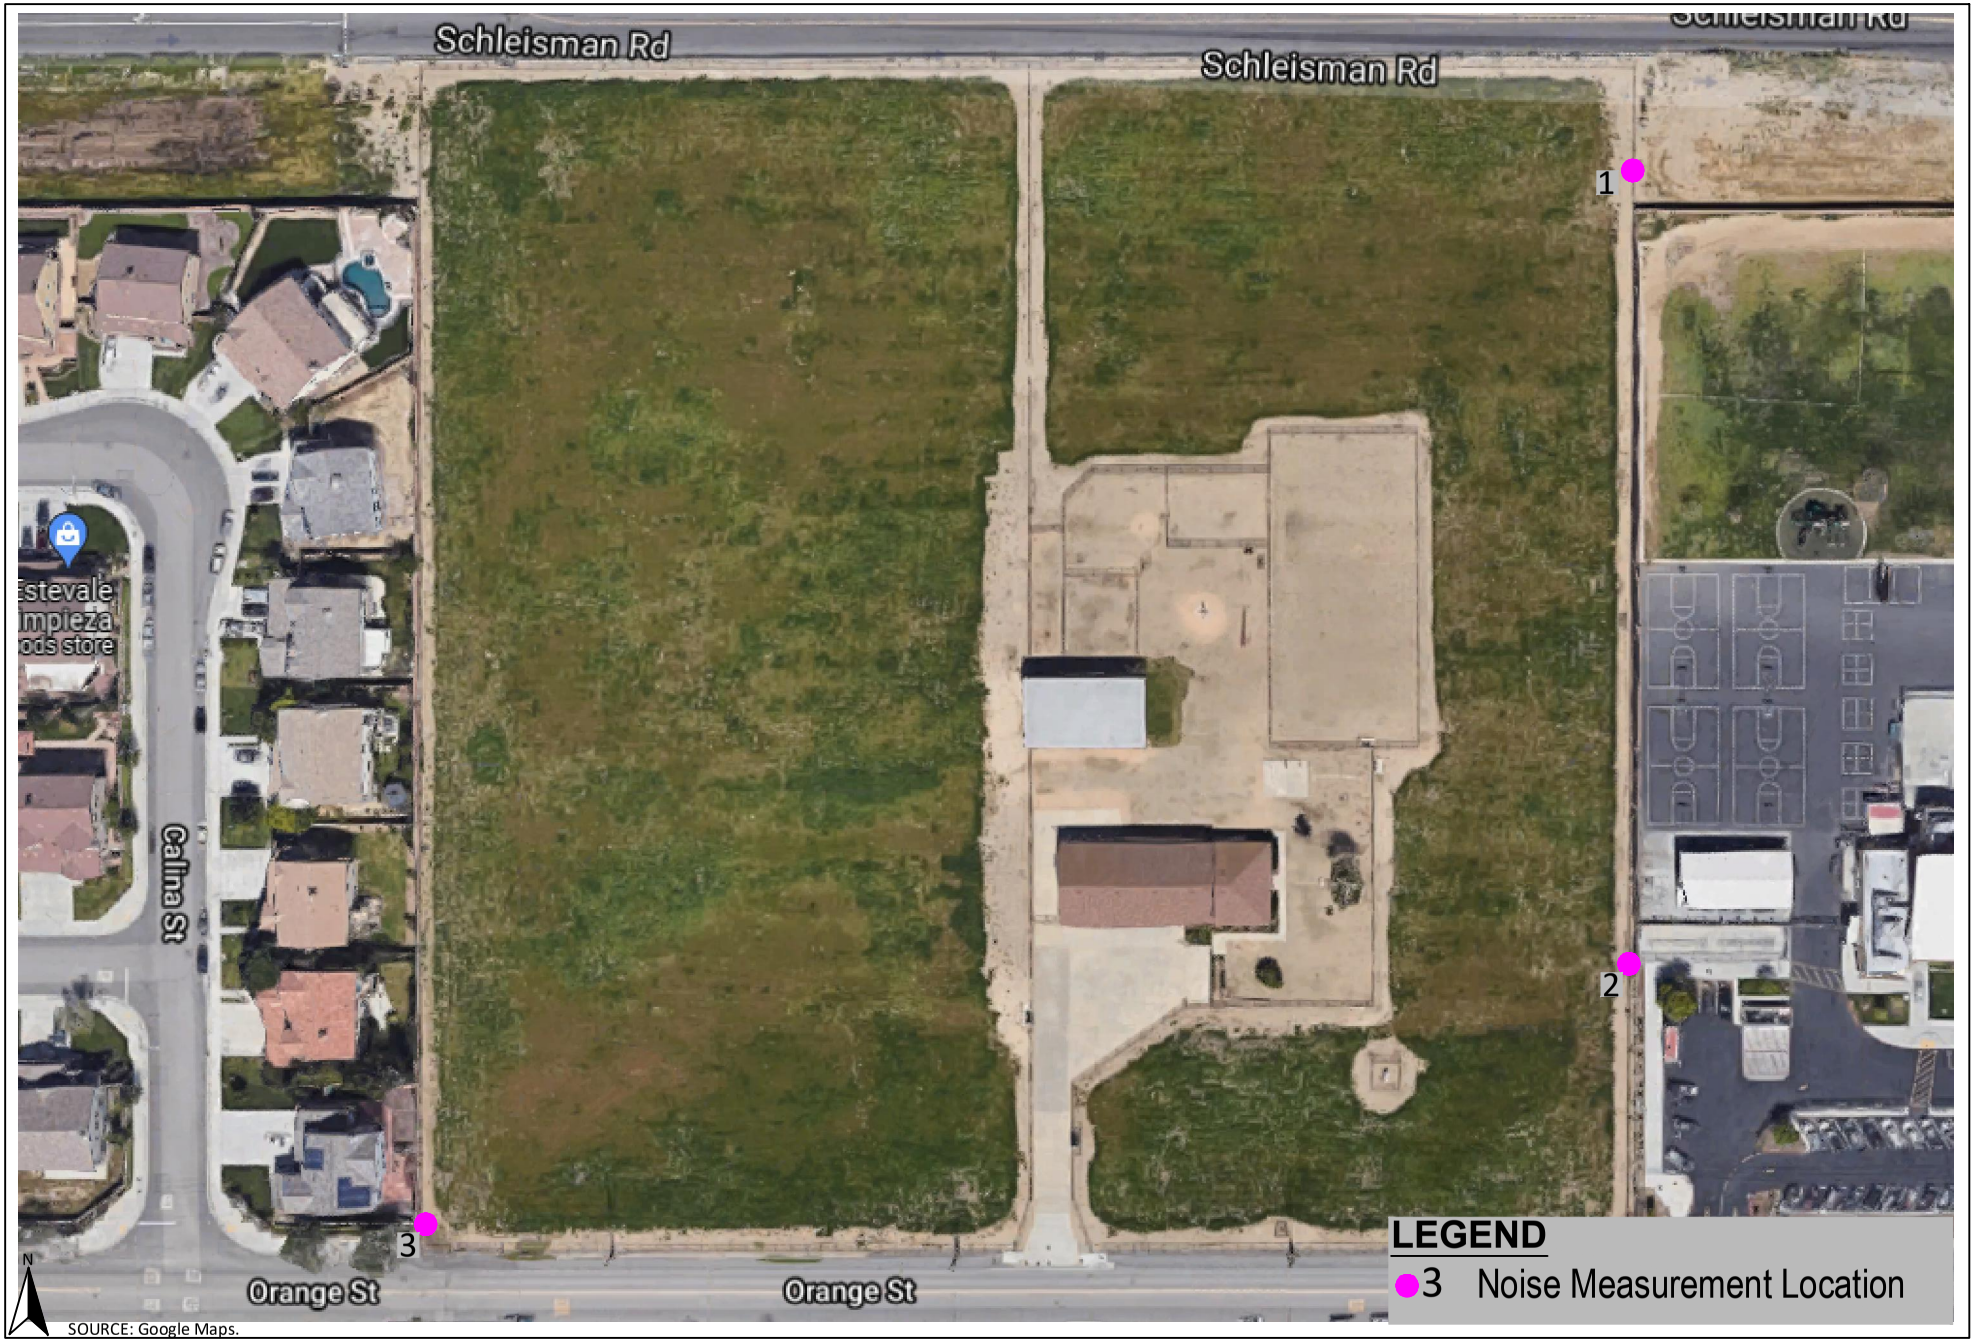
The noise measurements were taken using three Larson Davis Model LXT1 Class 1 sound level meters programmed in "slow" mode to record the sound pressure level at 1-second intervals for 24 hours in "A" weighted form. In addition, the L_{eq} averaged over the entire measuring time and L_{max} were recorded with the three sound level meters. The sound level meters and microphones were mounted on fences, were placed between four and six feet above the ground and were equipped with windscreens during all measurements. The noise meters were calibrated before and after the monitoring using a Larson Davis Cal200 calibrator. All noise level measurement equipment meets American National Standards Institute (ANSI) specifications for sound level meters (ANSI S1.4-2014 standard).

Noise Measurement Locations

The noise monitoring locations were selected in order to obtain noise levels on the project site and at the nearest residential uses located on the west side of the project site and at the school located on the east side of the project site. Descriptions of the noise monitoring sites are provided below in Table G and are shown in Figure 3. Appendix A includes a photo index of the study area and noise level measurement locations.

Noise Measurement Timing and Climate

The noise measurements were recorded between 4:09 p.m. on Thursday, December 9, 2021 and 4:21 p.m. on Friday, December 10, 2021. When the noise measurements were started the sky was cloudy, the temperature was 56 degrees Fahrenheit, the humidity was 71 percent, barometric pressure was 29.20 inches of mercury, and the wind was blowing around three miles per hour. Overnight, the temperature dropped to 43 degrees Fahrenheit and the humidity peaked at 95 percent. At the conclusion of the noise measurements, the sky was partly cloudy, the temperature was 61 degrees Fahrenheit, the humidity was 47 percent, barometric pressure was 29.44 inches of mercury, and there was no wind.



5.2 Noise Measurement Results

The results of the noise level measurements are presented in Table G. The measured sound pressure levels in dBA have been used to calculate the minimum and maximum L_{eq} averaged over 1-hour intervals. Table G also shows the L_{eq}, L_{max}, and CNEL, based on the entire measurement time. The CNEL was calculated through use of the hourly Leq that was entered into Equation 2-23 from *Technical Noise Supplement to the Traffic Noise Analysis Protocol* (TeNS), prepared by Caltrans, September 2013. The noise monitoring data printouts are included in Appendix B. Figure 4 shows a graph of the 24-hour noise measurements.

Table G – Existing (Ambient) Noise Level Measurements

Site No.	Site Description	Average (dBA L_{eq})		1-hr Average (dBA L_{eq}/Time)		24-hr dBA CNEL
		Daytime[1]	Nighttime[2]	Minimum	Maximum	
1	Located on a fence near the northeast corner of the project site, approximately 90 feet south of Schleisman Road centerline.	57.4	53.6	47.8 1:43 a.m.	60.4 6:59 a.m.	61.1
2	Located on a fence on the east side of the project site and adjacent to the bike parking area at Eastvale Elementary School and approximately 180 feet north of Orange Street centerline.	56.2	49.1	43.2 11:43 p.m.	63.4 11:39 a.m.	57.7
3	Located on a fence near the southwest corner of the project site and shared property line with the home at 7092 Calina Street, approximately 35 feet north of Orange Street centerline.	59.5	51.7	44.5 1:44 a.m.	64.2 7:33 a.m.	60.9

6.0 MODELING PARAMETERS AND ASSUMPTIONS

6.1 Construction Noise

The noise impacts from construction of the proposed project have been analyzed through use of the FHWA's Roadway Construction Noise Model (RCNM). The FHWA compiled noise measurement data regarding the noise generating characteristics of several different types of construction equipment used during the Central Artery/Tunnel project in Boston. Table H below provides a list of the construction equipment anticipated to be used for each phase of construction that was obtained from the *Air Quality, Energy, and Greenhouse Gas Impact Analysis Magnolia Ranch Residential Project* (Air Quality Analysis), prepared by Vista Environmental, July 26, 2022.

Table H – Construction Equipment Noise Emissions and Usage Factors

Equipment Description	Number of Equipment	Acoustical Use Factor[1] (percent)	Spec 721.560 Lmax at 50 feet[2] (dBA, slow[3])	Actual Measured Lmax at 50 feet[4] (dBA, slow[3])
Demolition				
Concrete/Industrial Saws	1	20	90	90
Excavators	3	40	85	81
Rubber Tired Dozers	2	40	85	82
Site Preparation

Roller	2	20	85	80
Architectural Coating				
Air Compressor	1	40	80	78

Notes:
[1] Acoustical use factor is the percentage of time each piece of equipment is operational during a typical workday.
[2] Spec 721.560 is the equipment noise level utilized by the RCNM program.
[3] The "slow" response averages sound levels over 1-second increments. A "fast" response averages sound levels over 0.125-second increments.

[4] Actual Measured is the average noise level measured of each piece of equipment during the Central Artery/Tunnel project in Boston, Massachusetts primarily during the 1990s.
Source: Federal Highway Administration, 2006 and CalEEMod default equipment mix.

Table H shows the associated measured noise emissions for each piece of equipment from the RCNM model and measured percentage of typical equipment use per day. Construction noise impacts to the nearby sensitive receptors have been calculated according to the equipment noise levels and usage factors listed Table H and through use of the RCNM. For each phase of construction, all construction equipment was analyzed based on being placed in the middle of the project site, which is based on the analysis methodology detailed in FTA Manual for a General Assessment. However, in order to provide a conservative analysis, all equipment was analyzed, instead of just the two nosiest pieces of equipment as detailed in the FTA Manual. The RCNM model printouts are provided in Appendix C.

6.2 Operations-Related Noise

FHWA Model Methodology

The proposed project would result in increases in traffic noise to the nearby roadways as well as introduce new sensitive receptors to the project site. The project impacts to the offsite roadways were analyzed through use of the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108 (FHWA Model). The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). Adjustments are then made to the reference energy mean emission level to account for: the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT) and the percentage of ADT which flows during the day, evening and night, the travel speed, the vehicle mix on the roadway, which is a percentage of the volume of automobiles, medium trucks and heavy trucks, the roadway grade, the angle of view of the observer exposed to the roadway and site conditions ("hard" or "soft" relates to the absorption of the ground, pavement or landscaping). The following section provides a discussion of the software and modeling input parameters used in this analysis and a discussion of the resultant existing noise model.

FHWA Model Traffic Noise Prediction Model Inputs

The roadway parameters used for this study are presented in Table I. The roadway classifications are based on the City's General Plan Circulation Element. The roadway speeds are based on the posted speed limits. The distance to the nearest sensitive receptor was determined by measuring the distance from the roadway centerline to the nearest residence. Since the study area is located in a suburban environment and landscaping or natural vegetation exists along the sides of the nearby roads, soft site conditions were modeled.

Table I – FHWA Model Roadway Parameters

Roadway	Segment	General Plan Classification	Vehicle Speed (MPH)	Distance to Nearest Receptor[1] (feet)
Sumner Avenue	North of Schleisman Road	Major	45	85
Sumner Avenue	South of Schleisman Road	Major	45	45
Sumner Avenue	South of Orange Street	Major	45	60
Scholar Way	North of Schleisman Road	Secondary	35	70
Scholar Way	South of Schleisman Road	Secondary	35	60

Roadway	Segment	General Plan Classification	Vehicle Speed (MPH)	Distance to Nearest Receptor[1] (feet)
Scholar Way	South of Orange Street	Secondary	35	60
Scholar Way	South of Baltimore Street	Secondary	35	75
Hamner Avenue	North of Schleisman Road	Urban Arterial	45	90
Hamner Avenue	South of Schleisman Road	Urban Arterial	45	100
Schleisman Road	West of Sumner Avenue	Major	45	70
Schleisman Road	East of Sumner Avenue	Urban Arterial	45	80
Schleisman Road	West of Scholar Way	Urban Arterial	45	80
Schleisman Road	East of Scholar Way	Urban Arterial	45	80
Orange Street	East of Sumner Avenue	Collector	30	40
Orange Street	West of Scholar Way	Collector	30	100

Notes:
[1] Distance measured from nearest offsite residential structure to centerline of roadway.
Source: City of Eastvale, 2012; Vista Environmental.

The average daily traffic (ADT) volumes were obtained from the *Project Scoping Agreement for Land Use Project – PLN22-20024* (Traffic Scoping Agreement), prepared by Urban Crossroads, June 27, 2022. The ADT volumes used in this analysis are shown in Table J.

Table J – Average Daily Traffic Volumes

		Average Daily Traffic Volumes					
Roadway	Segment	Existing	Existing + Project	2024 No Project	2024 + Project	2040 No Project	2040 + Project
Sumner Avenue	North of Schleisman Road	10,950	11,050	11,800	11,900	12,500	12,550
Sumner Avenue	South of Schleisman Road	9,600	9,750	10,600	10,750	11,750	11,900
Sumner Avenue	South of Orange Street	8,400	8,400	9,000	9,000	9,300	9,350
Scholar Way	North of Schleisman Road	7,450	7,550	8,050	8,150	8,150	8,300
Scholar Way	South of Schleisman Road	6,950	7,100	7,550	7,750	7,600	7,800
Scholar Way	South of Orange Street	7,200	7,200	7,800	7,850	8,200	8,250
Scholar Way	South of Baltimore Street	7,850	7,850	8,500	8,550	8,850	8,900
Hamner Avenue	North of Schleisman Road	24,600	24,650	28,800	28,800	29,800	29,850
Hamner Avenue	South of Schleisman Road	24,650	24,700	28,600	28,650	29,650	29,700
Schleisman Road	West of Sumner Avenue	18,400	18,500	20,100	20,150	30,900	31,000
Schleisman Road	East of Sumner Avenue	9,600	9,600	10,900	10,900	28,300	28,300
Schleisman Road	West of Scholar Way	9,400	9,400	10,750	10,750	33,000	33,000
Schleisman Road	East of Scholar Way	8,550	8,600	9,850	9,900	26,350	26,400
Orange Street	East of Sumner Avenue	1,100	1,250	1,350	1,500	1,650	1,850
Orange Street	West of Scholar Way	2,450	2,650	2,750	3,000	2,900	3,150

Source: City of Eastvale, 2012; Urban Crossroads, 2022.

The vehicle mixes used in the FHWA-RD-77-108 Model are shown in Table K and is based on the typical vehicle mixes observed in Riverside County. The vehicle mixes provides the hourly distribution percentages of automobiles, medium trucks, and heavy trucks for input into the FHWA model.

Table K – Roadway Vehicle Mixes

Vehicle Type	Traffic Flow Distributions			
	Day (7 a.m. to 7 p.m.)	Evening (7 p.m. to 10 p.m.)	Night (10 p.m. to 7 a.m.)	Overall
Secondary, Collector or Smaller				
Automobiles	73.60%	13.60%	10.22%	97.42%
Medium Trucks	0.90%	0.04%	0.9%	1.84%
Heavy Trucks	0.35%	0.04%	0.35%	0.74%
Major, Arterial Highways, and Expressways				
Automobiles	69.50%	12.90%	9.60%	92.00%
Medium Trucks	1.44%	0.06%	1.50%	3.00%
Heavy Trucks	2.40%	0.10%	2.50%	5.00%

Source: County of Riverside, 2015.

FHWA Model Source Assumptions

To assess the roadway noise generation in a uniform manner, all vehicles are analyzed at the single lane equivalent acoustic center of the roadway being analyzed. In order to determine the height above the road grade where the noise is being emitted from, each type of vehicle has been analyzed independently with autos at road grade, medium trucks at 2.3 feet above road grade, and heavy trucks at 8 feet above road grade. These elevations were determined through a noise-weighted average of the elevation of the exhaust pipe, tires and mechanical parts in the engine, which are the primary noise emitters from a vehicle.

6.3 Vibration

Construction activity can result in varying degrees of ground vibration, depending on the equipment used on the site. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings in the vicinity of the construction site respond to these vibrations with varying results ranging from no perceptible effects at the low levels to damage at the highest levels. Table L gives approximate vibration levels for particular construction activities. The data in Table L provides a reasonable estimate for a wide range of soil conditions.

Table L – Vibration Source Levels for Construction Equipment

Equipment		Peak Particle Velocity (inches/second)	Approximate Vibration Level (L_v)at 25 feet
Pile driver (impact)	Upper range	1.518	112
	typical	0.644	104
Pile driver (sonic)	Upper range	0.734	105
	typical	0.170	93
Clam shovel drop (slurry wall)		0.202	94
Vibratory Roller		0.210	94
Hoe Ram		0.089	87
Large bulldozer		0.089	87
Caisson drill		0.089	87
Loaded trucks		0.076	86
Jackhammer		0.035	79
Small bulldozer		0.003	58

Source: Federal Transit Administration, 2018.

The construction-related vibration impacts have been calculated through the vibration levels shown above in Table L and through typical vibration propagation rates. The equipment assumptions were based on the equipment lists provided above in Table H.

7.0 IMPACT ANALYSIS

7.1 CEQA Thresholds of Significance

Consistent with the California Environmental Quality Act (CEQA) and the State CEQA Guidelines, a significant impact related to noise would occur if a proposed project is determined to result in:

- Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Generation of excessive groundborne vibration or groundborne noise levels; or
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

7.2 Generation of Noise Levels in Excess of Standards

The proposed project would not generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. The following section calculates the potential noise emissions associated with the temporary construction activities and long-term operations of the proposed project and compares the noise levels to the City standards.

Construction-Related Noise

The construction activities for the proposed project are anticipated to include demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses, site preparation and grading of the 10.0 gross acre project site, building construction of the 41 single-family homes, paving of the onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site, and application of architectural coatings.

Noise impacts from construction activities associated with the proposed project would be a function of the noise generated by construction equipment, equipment location, sensitivity of nearby land uses, and the timing and duration of the construction activities. The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Section 8.52.020(9) of the City's Municipal Code exempts construction noise that occurs between 6:00 a.m. and 6:00 p.m. June thru September and between 7:00 a.m. and 6:00 p.m. October thru May. However, General Plan Policy N-23, requires that infill development projects to prepare a Construction Noise Mitigation Plan prior to obtaining a grading permit. The Plan will require the use temporary noise barriers, designated equipment staging areas, limits on idling and requirement of all equipment using mufflers. Project Design Feature 1 has been included in this analysis to ensure implementation of General Plan Policy N-23.

The City construction noise standards do not provide any limits to the noise levels that may be created from construction activities and even with adherence to the City standards, the resultant construction

noise levels may result in a significant substantial temporary noise increase to the nearby sensitive receptors. In order to determine if the proposed construction activities would create a significant substantial temporary noise increase, the FTA construction noise criteria thresholds detailed above in Section 4.1 have been utilized, which shows that a significant construction noise impact would occur if construction noise exceeds 80 dBA during the daytime at any of the nearby homes and school.

Construction noise impacts to the nearby sensitive receptors have been calculated through use of the RCNM and the parameters and assumptions detailed in Section 6.1 of this report including Table H that shows the anticipated construction equipment per phase. In order to account for the existing 6 to 7 foot high concrete masonry unit (cmu) wall on the west side of the project site, 5 dB of estimated shielding was added to the RCNM model for the homes to the west. The results are shown below in Table M and the RCNM printouts are provided in Appendix C.

Table M – Construction Noise Levels at the Nearest Sensitive Receptors

Construction Phase	Construction Noise Level (dBA Leq) at:	
	Nearest Homes to the West[1]	Nearest School to the East[2]
Demolition	65	70
Site Preparation	66	71
Grading	67	72
Building Construction	65	70
Paving	60	65
Painting	52	57
FTA Construction Noise Threshold[4]	**80**	**80**
Exceed Thresholds?	No	No

[1] The nearest homes to the west are located as near as 340 feet from the center of the project site. 5 dB of estimated shielding was included to account for the 6 to 7 foot high cmu wall on the west side of the project site.
[2] The nearest school structure to the east is located as near as 340 feet from the center of the project site.
[4] The FTA Construction noise thresholds are detailed above in Table B.
Source: RCNM, Federal Highway Administration, 2006

Table M shows that the greatest noise impacts would occur during the grading phase, with a noise level as high as 72 dBA Leq at the school to the east and 67 dBA Leq at the nearest homes to the west. Table M also shows that none of the construction phases would exceed the FTA noise standard of 80 dB at the nearby homes or school. Therefore, through adherence to the allowable construction times detailed in Section 8.52.020(9) of the Municipal Code and through implementation of Project Design Feature 1, that requires the preparation of a construction-related noise mitigation plan, prior to the issuance of the grading plan for the proposed project, the proposed project would not create a substantial temporary increase in ambient noise levels from construction of the proposed project. Impacts would be less than significant.

Operational-Related Noise

The proposed project would consist of a residential development with 41 single-family homes. Potential noise impacts associated with the operations of the proposed project would be from project-generated vehicular traffic on the nearby roadways. In addition, the proposed development would be adjacent to Schleisman Road and adjacent to Eastvale Elementary School, which may create exterior and interior noise levels in excess of City standards at the proposed homes. The noise impacts to the nearby existing homes and proposed homes have been analyzed separately below.

Roadway Vehicular Noise Impact to Nearby Homes

Vehicle noise is a combination of the noise produced by the engine, exhaust and tires. The level of traffic noise depends on three primary factors (1) the volume of traffic, (2) the speed of traffic, and (3) the number of trucks in the flow of traffic. The proposed project does not propose any uses that would require a substantial number of truck trips and the proposed project would not alter the speed limit on any existing roadway so the proposed project's potential offsite noise impacts have been focused on the noise impacts associated with the change of volume of traffic that would occur with development of the proposed project.

Neither the General Plan nor the Municipal Code defines what constitutes a "substantial permanent increase to ambient noise levels". As such, this impact analysis has utilized guidance from the Federal Transit Administration for a moderate impact that has been detailed above in Table A that shows that the project contribution to the noise environment can range between 0 and 7 dB, which is dependent on the existing roadway noise levels.

The potential offsite traffic noise impacts created by the on-going operations of the proposed project have been analyzed through utilization of the FHWA model and parameters described above in Section 6.2 and the FHWA model traffic noise calculation spreadsheets are provided in Appendix D. The proposed project's potential offsite traffic noise impacts have been analyzed for the existing year, opening year 2024, and future year 2040 scenarios that are discussed separately below.

Existing Year Conditions

The proposed project's potential offsite traffic noise impacts have been calculated through a comparison of the Existing scenario to the Existing With Project scenario. The results of this comparison are shown in Table N.

Table N – Existing Year Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]			
Roadway	Segment	Existing	Existing Plus Project	Project Contribution	Increase Threshold[2]
Sumner Avenue	North of Schleisman Road	63.0	63.1	0.1	+2 dBA
Sumner Avenue	South of Schleisman Road	67.4	67.5	0.1	+1 dBA
Sumner Avenue	South of Orange Street	64.4	64.4	0.0	+2 dBA
Scholar Way	North of Schleisman Road	59.3	59.4	0.1	+3 dBA
Scholar Way	South of Schleisman Road	60.1	60.2	0.1	+2 dBA
Scholar Way	South of Orange Street	60.3	60.3	0.0	+2 dBA
Scholar Way	South of Baltimore Street	59.1	59.1	0.0	+3 dBA
Hamner Avenue	North of Schleisman Road	66.6	66.6	0.0	+1 dBA
Hamner Avenue	South of Schleisman Road	65.8	65.8	0.0	+1 dBA
Schleisman Road	West of Sumner Avenue	66.7	66.7	0.0	+1 dBA
Schleisman Road	East of Sumner Avenue	63.5	63.5	0.0	+2 dBA
Schleisman Road	West of Scholar Way	63.4	63.4	0.0	+2 dBA
Schleisman Road	East of Scholar Way	63.0	63.0	0.0	+2 dBA
Orange Street	East of Sumner Avenue	52.7	53.3	0.6	+5 dBA
Orange Street	West of Scholar Way	50.1	50.4	0.3	+5 dBA

Notes:

[1] Distance to nearest residential use shown in Table I, does not take into account existing noise barriers.
[2] Increase Threshold obtained from the FTA's allowable noise impact exposures detailed above in Table A.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table N shows that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds detailed above. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels for the existing conditions. Impacts would be less than significant.

Opening Year 2024 Conditions

The proposed project's potential offsite traffic noise impacts have been calculated through a comparison of the opening year 2024 scenario to the opening year 2024 with project scenario. The results of this comparison are shown in Table O.

Table O – Opening Year 2024 Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]			
Roadway	Segment	Year 2024	Year 2024 Plus Project	Project Contribution	Increase Threshold[2]
Sumner Avenue	North of Schleisman Road	63.3	63.4	0.1	+2 dBA
Sumner Avenue	South of Schleisman Road	67.8	67.9	0.1	+1 dBA
Sumner Avenue	South of Orange Street	64.7	64.7	0.0	+1 dBA
Scholar Way	North of Schleisman Road	59.7	59.7	0.0	+2 dBA
Scholar Way	South of Schleisman Road	60.5	60.6	0.1	+2 dBA
Scholar Way	South of Orange Street	60.6	60.6	0.0	+2 dBA
Scholar Way	South of Baltimore Street	59.4	59.5	0.1	+3 dBA
Hamner Avenue	North of Schleisman Road	67.3	67.3	0.0	+1 dBA
Hamner Avenue	South of Schleisman Road	66.4	66.4	0.0	+1 dBA
Schleisman Road	West of Sumner Avenue	67.1	67.1	0.0	+1 dBA
Schleisman Road	East of Sumner Avenue	64.0	64.0	0.0	+2 dBA
Schleisman Road	West of Scholar Way	64.0	64.0	0.0	+2 dBA
Schleisman Road	East of Scholar Way	63.6	63.6	0.0	+2 dBA
Orange Street	East of Sumner Avenue	53.6	54.1	0.5	+5 dBA
Orange Street	West of Scholar Way	50.6	51.0	0.4	+5 dBA

Notes:
[1] Distance to nearest residential use shown in Table I, does not take into account existing noise barriers.
[2] Increase Threshold obtained from the FTA's allowable noise impact exposures detailed above in Table A.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table O shows that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds detailed above. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels for the opening year 2024 conditions. Impacts would be less than significant.

Future Year 2040 Conditions

The proposed project's potential offsite traffic noise impacts have been calculated through a comparison of the future year 2040 scenario to the future year 2040 with project scenario. The results of this comparison are shown in Table P.

Table P – Future Year 2040 Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]			
Roadway	Segment	Year 2040	Year 2040 Plus Project	Project Contribution	Increase Threshold[2]
Sumner Avenue	North of Schleisman Road	63.6	63.6	0.0	+2 dBA
Sumner Avenue	South of Schleisman Road	68.3	68.3	0.0	+1 dBA
Sumner Avenue	South of Orange Street	64.9	64.9	0.0	+1 dBA
Scholar Way	North of Schleisman Road	59.8	59.8	0.0	+2 dBA
Scholar Way	South of Schleisman Road	60.5	60.7	0.2	+2 dBA
Scholar Way	South of Orange Street	60.9	60.9	0.0	+2 dBA
Scholar Way	South of Baltimore Street	59.6	59.7	0.1	+2 dBA
Hamner Avenue	North of Schleisman Road	67.4	67.4	0.0	+1 dBA
Hamner Avenue	South of Schleisman Road	66.6	66.6	0.0	+1 dBA
Schleisman Road	West of Sumner Avenue	68.9	68.9	0.0	+1 dBA
Schleisman Road	East of Sumner Avenue	68.2	68.2	0.0	+1 dBA
Schleisman Road	West of Scholar Way	68.8	68.8	0.0	+1 dBA
Schleisman Road	East of Scholar Way	67.8	67.9	0.1	+1 dBA
Orange Street	East of Sumner Avenue	54.5	55.0	0.5	+5 dBA
Orange Street	West of Scholar Way	50.9	51.2	0.3	+5 dBA

Notes:
[1] Distance to nearest residential use shown in Table I, does not take into account existing noise barriers.
[2] Increase Threshold obtained from the FTA's allowable noise impact exposures detailed above in Table A.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table P shows that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds detailed above. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels for the future year 2040 conditions. Impacts would be less than significant.

Noise Impacts to the Proposed Homes

The proposed project would consist of a residential development with 41 single-family homes. The proposed development would be adjacent to Schleisman Road to the north and adjacent to Eastvale Elementary School to the east, which may create exterior and interior noise levels in excess of City standards at the proposed homes. The roadway noise impacts and non-transportation noise impacts have been analyzed separately below.

Non-Transportation Noise Impacts to Proposed Homes

The noise impacts from Eastvale Elementary School are controlled by General Plan Policy N-7 that provides the City's standards for maximum exterior non-transportation noise levels. For the proposed single-family homes, General Plan Policy N-7 provides a noise standard of 60 dBA between7 a.m. to 10 p.m. and 50 dBA between 10 p.m. to 7 a.m. at the exterior of the proposed single-family homes.

Noise Measurement 2 (see Table G above) is most representative of the noise created from the school, since it was located on the shared property line with the School, is in close proximity to the outdoor lunch area and playgrounds, and there are no roads in the immediate vicinity of Noise Measurement 2. Noise Measurement 2 recorded noise levels of 56.2 dBA Leq between 7 a.m. to 10 p.m. and 49.1 dBA Leq between 10 p.m. to 7 a.m.. As such, the noise created from the outdoor areas of the School are below the City's non-transportation exterior noise standards for single-family homes provided in General Plan Policy N-7. Therefore, the non-transportation noise impacts created from Eastvale Elementary School to the proposed homes would be within the City noise standards. Impacts would be less than significant.

Roadway Noise Impacts to Proposed Homes

The north side of the proposed development would be adjacent to Schleisman Road. General Plan Policy N-6 requires exterior noise levels for new residential uses to be mitigated to the levels shown above in Table C that shows the "Completely Compatible" noise standard of less than 60 dBA, "Tentatively Compatible" 60 to 70 dBA, "Normally Incompatible" 70 to 75 dBA, and "Completely Incompatible" greater than 75 dBA. General Plan Policy N-11 requires developers of new residential uses where the noise exceeds the "Completely Compatible" noise standard to ensure acceptable exterior and interior noise levels. General Plan Policy N-10 details that the maximum acceptable interior noise level from roadway noise sources is 45 dBA CNEL.

It is anticipated that the primary source of noise impacts to the project site will be traffic noise from Schleisman Road that is adjacent to the north side of the project site. The proposed homes will also experience some background traffic noise impacts from the proposed project's internal roadways and from Orange Street that is adjacent to the south side of the project site. As the traffic on these local streets would consist of low traffic volumes at slower speeds, the traffic noise from these roads would not make a significant contribution to the noise environment. As such, the noise levels from these roads were not analyzed. The FHWA traffic noise prediction model parameters used in this analysis are discussed above in detail in Section 6.2 and the FHWA model printouts are provided in Appendix G. The exterior and interior noise impacts to the proposed homes have been analyzed separately below.

Exterior Noise Impacts to Proposed Homes

The anticipated exterior noise levels have been calculated for the backyards of representative homes that are adjacent to Schleisman Road. For each backyard, the receptor was placed 10 feet behind the wall and 5 feet above the ground, which is based on the roadway noise analysis methodology provided in Appendix I-1 of the County of Riverside General Plan, December 8, 2015, since the City of Eastvale does not provide any roadway noise analysis standards to utilize. The calculated noise levels for backyards that are adjacent to Schleisman Road are shown below in Table R.

Table Q – Proposed Homes Exterior Noise Levels from Schleisman Road

Building Number	Exterior Noise Level Without Sound Walls (dBA CNEL)	Exceed City's 60 dBA CNEL Threshold?	Exterior Noise Level With 6.5 Foot High Sound Wall (dBA CNEL)	Exceed City's 60 dBA CNEL Threshold?
9	68.1	Yes	59.1	No
11	68.1	Yes	59.3	No
13	68.1	Yes	59.6	No
15	68.2	Yes	60.0	No
17	68.1	Yes	59.9	No

Notes:

City's residential 60 dBA CNEL residential exterior noise standard from General Plan Policy N-6.
Source: FHWA RD-77-108 Model.

Table R shows that without a sound wall, that the noise levels at all of the backyards adjacent to Schleisman Road would exceed the City's residential exterior noise standard of 60 dBA CNEL. This would be considered a significant impact.

Mitigation Measure 2 is provided that would require construction of a minimum 6.5 foot high cmu wall on the north side of all backyards that are adjacent to Schleisman Road. As shown in Table R, above, with implementation of Mitigation Measure 2, the proposed homes exterior noise levels would be within the City's 60 dBA CNEL residential exterior noise standard and would result in a less than significant impact.

Interior Noise Impacts to Proposed Homes

To assess the interior noise levels, the same proposed homes analyzed for the exterior private backyard analysis were also analyzed for their interior noise levels. The exterior noise level at the façade of the first and second floors were calculated through use of the same methodology detailed above for the outdoor noise calculations and the results are shown below in Table R. Table R also shows the interior noise levels calculated based on 25 dB of attenuation, which is the minimum exterior to interior noise reduction rate for new homes that are constructed to meet the required California Code of Regulations Title 24, Part 6 building energy-efficiency standards that require the installation of dual-paned windows as well as enhanced insulation requirements. The anticipated noise levels have been calculated at the facades of representative proposed homes to Schleisman Road and the results are shown below in Table R.

Table R – Proposed Homes Interior Noise Levels from Schleisman Road

Building Number	Floor	Road Noise Levels (dBA CNEL)		Exceed 45 dBA Interior Threshold?
		Exterior at Facade	Interior[1]	
9	First	58.9	33.9	No
	Second	66.9	40.4	No
11	First	58.2	33.2	No
	Second	65.4	40.4	No
13	First	58.8	33.8	No
	Second	65.7	40.7	No
15	First	60.0	35.0	No
	Second	66.9	41.9	No
17	First	58.3	33.3	No
	Second	64.3	39.3	No

Notes:
[1] Based on standard dual pane windows and doors with a 26 STC rating, which are required per Title 24 energy saving requirements.
Source: FHWA RD-77-108 Model.

Table R shows that the interior noise level of all homes adjacent to Schleisman Road would be within the City's 45 dBA CNEL interior noise standard. Impacts would be less than significant.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Mitigation Measure 1:

The project applicant shall construct a minimum 6.5-foot high wall on the north side of Lots 9 through 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings.

Level of Significance After Mitigation

Less than significant impact.

7.3 Generation of Excessive Groundborne Vibration

The proposed project would not expose persons to or generation of excessive groundborne vibration or groundborne noise levels. The following section analyzes the potential vibration impacts associated with the construction and operations of the proposed project.

Construction-Related Vibration Impacts

The construction activities for the proposed project are anticipated to include demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses, site preparation and grading of the 10.0 gross acre project site, building construction of the 41 single-family homes, paving of the onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site, and application of architectural coatings.

Vibration impacts from construction activities associated with the proposed project would typically be created from the operation of heavy off-road equipment. The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Section 120.05.130(e) of the Municipal Code provides a vibration standard for new development of any vibration that causes discomfort or annoyance to reasonable persons of normal sensitivity. However Section 120.05.130(e) of the Municipal Code exempts construction activities from this standard. Since neither the Municipal nor the General Plan provide a quantifiable vibration threshold for temporary construction activities, guidance from the *Transportation and Construction-Induced Vibration Guidance Manual*, prepared by Caltrans, April 2020, has been utilized, which defines the threshold of perception from transient sources such as off-road construction equipment at 0.25 inch per second peak particle velocity (PPV).

The primary source of vibration during construction would be from the operation of a bulldozer. From Table L above a large bulldozer would create a vibration level of 0.089 inch per second PPV at 25 feet. The vibration level at the nearest offsite homes (25 feet to west) and school structure (25 feet to east) would be below the 0.25 inch per second PPV threshold detailed above. Impacts would be less than significant.

Operations-Related Vibration Impacts

The proposed project would consist of the development of a residential community. The on-going operation of the proposed project would not include the operation of any known vibration sources other than typical onsite vehicle operations for a residential development. Therefore, a less than significant vibration impact is anticipated from operation of the proposed project.

Level of Significance

Less than significant impact.

7.4 Aircraft Noise

The proposed project may expose people residing in the project area to excessive noise levels from aircraft. The nearest airport is Chino Airport that is located as near as three miles west of the project site. The project site is located outside of the 60 dBA CNEL noise contours of this airport. Therefore, the proposed homes would not be exposed to excessive aircraft noise. Impacts would be less than significant.

Level of Significance

Less than significant impact.

FHWA Model Onsite Traffic Noise Calculation Printouts

FHWA-RD-77-108 HIGHWAY TRAFFIC NOISE PREDICTION MODEL

Road Name: Schleisman Road
Building: Building 9
Project Name: Magnolia Ranch
Job Number: 21003

NOISE MODEL INPUTS

Highway Data

Average Daily Traffic:	33,000 vehicles
Peak Hour Volume:	3,300 vehicles
Vehicle Speed:	45 mph
Near/Far Lane Distance:	78 feet

Vehicle Mix

	Day	Evening	Night	Daily
Autos:	69.5%	12.9%	9.6%	92.0%
Medium Trucks:	1.4%	0.1%	1.5%	3.0%
Heavy Trucks:	2.4%	0.1%	2.5%	5.0%

Site Data

Barrier Height:	**6.5 feet**
Barrier Type(Wall/Berm):	Wall
Site Conditions(Hard/Soft):	Soft
Centerline (C.L.) Dist. to Barrier:	76 feet
C.L. Dist. To Observer (Backyard):	86 feet
Barrier Dist. To Observer (Backyard):	10 feet
C.L. Dist. To Observer (Structure):	97 feet
Barrier Dist. To Observer (Structure):	21 feet
Road Grade:	0.00 %
Left View:	-90 degrees
Right View:	90 degrees

Elevations

Barrier Base Elevation:	615.4 feet
Road Elevation:	611.5 feet
Noise Source Elevation above Road	
Autos:	0 feet
Med Trucks:	2.3 feet
Hvy Trucks:	8 feet
Pad Elevation:	615.4 feet
Observer Heights Above Pad Elevation	
Exterior:	5 feet
First Floor:	5.5 feet
Second Floor:	14 feet

FHWA NOISE MODEL CALCULATIONS

Ldn	Day-night average noise level
Leq	Equivalent sound level
Lmax	Maximum noise level
OSHA	Occupational Safety and Health Administration
PPV	Peak particle velocity
RMS	Root mean square
SEL	Single Event Level or Sound Exposure Level
STC	Sound Transmission Class
VdB	Vibration velocity level in decibels

1.0 INTRODUCTION

1.1 Purpose of Analysis and Study Objectives

This Noise Impact Analysis has been prepared to determine the noise impacts associated with the proposed Magnolia Ranch Residential project (proposed project). The following is provided in this report:

- A description of the study area and the proposed project;
- Information regarding the fundamentals of noise;
- Information regarding the fundamentals of vibration;
- A description of the local noise guidelines and standards;
- An evaluation of the current noise environment;
- An analysis of the potential short-term construction-related noise impacts from the proposed project; and
- An analysis of long-term operations-related noise impacts from the proposed project.

1.2 Site Location and Study Area

The project site is located in the City of Eastvale (City). The approximately 10.0 gross acre project site is relatively flat and currently includes a ranch house with barn and associated fencing and facilities for livestock/horses. The project site is bounded by Schleisman Road to the north, Eastvale Elementary School to the east, Orange Street and River Heights Intermediate School to the south and single-family homes to the west. The project study area is shown in Figure 1.

Sensitive Receptors in Project Vicinity

The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

1.3 Proposed Project Description

The proposed project would consist of a residential development on 8.28 net acres that would include 41 detached single-family homes with approximately 22,000 square feet of common open space. New sidewalks will be provided along the north side of Orange Street, a walkway will run in a north-south direction adjacent to the east property line, and a walkway will run in an east-west direction through the common open space area. The proposed project would also include development of an internal road system and road improvements to the portion of Orange Street that is adjacent to the project site. It should be noted that the project applicant is proposing to pay TUMF fees in lieu of road improvements to the portion of Schleisman Road that is adjacent to the project site, however in order to provide a conservative analysis, it has been assumed that this area will be graded as part of the proposed project. The proposed site plan is shown in Figure 2.

1.4 Executive Summary

Standard Noise Regulatory Conditions

The proposed project will be required to comply with the following regulatory conditions from the City and State of California (State).

City of Eastvale Noise Regulations

The following lists the noise and vibration regulations from the City of Eastvale Development Code that are applicable, but not limited to the proposed project.

- Section 120.05.130(b) - Noise control standards
- Section 120.05.130(b) – Vibration standards

State of California Noise Regulations

The following lists the State of California noise regulations that are applicable, but not limited to the proposed project.

- California Vehicle Code Section 27200-27207 – On Road Vehicle Noise Limits
- California Vehicle Code Section 38365-38350 – Off-Road Vehicle Noise Limits

Summary of Analysis Results

The following is a summary of the proposed project's impacts with regard to the State CEQA Guidelines noise checklist questions.

Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less than significant impact.

Generation of excessive groundborne vibration or groundborne noise levels?

Less than significant impact.

For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Less than significant impact.

1.5 Project Design Features Incorporated into the Proposed Project

This analysis was based on implementation of the following project design features that are either already depicted on the proposed project site plan and architectural plans or are required from City and State Regulations.

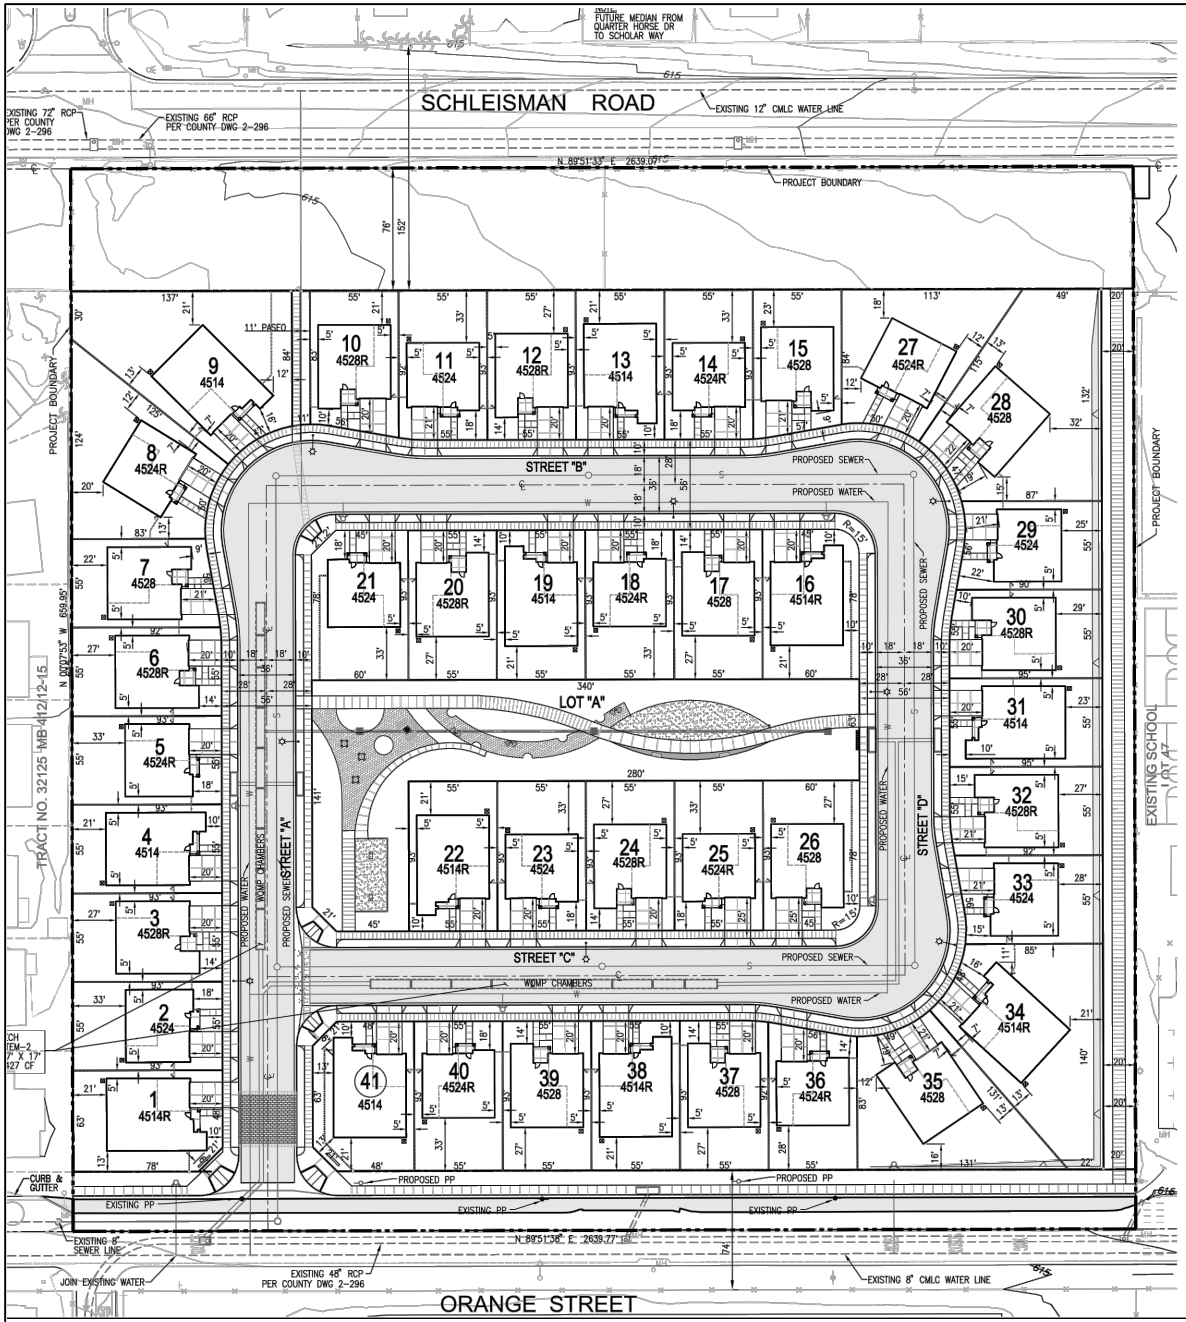
Project Design Feature 1:
Prior to the issuance of the grading permit, the project applicant shall submit a construction-related noise mitigation plan to the City for review and approval. The plan shall depict the

locations of where construction equipment will operate on the project site and how the noise from the construction equipment will be mitigated during construction of the project, through use of such methods as:

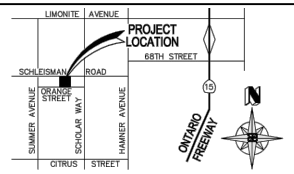
1. Temporary noise attenuation fences;
2. Preferential location of equipment
3. Length of equipment use and idling time; and,
4. Use of current noise suppression technology and equipment.

1.6 Mitigation Measures for the Proposed Project

This analysis found that through adherence to the noise and vibration regulations detailed in Section 1.4, through implementation of Project Design Feature 1 detailed in Section 1.5 above, and through implementation of the following mitigation all noise and vibration impacts would be reduced to less than significant levels.



Mitigation Measure 1:



The project applicant shall construct a minimum 6.5-foot high wall on the north side of Lots 9 through 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings.

2.0 NOISE FUNDAMENTALS

Noise is defined as unwanted sound. Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Sound is produced by the vibration of sound pressure waves in the air. Sound pressure levels are used to measure the intensity of sound and are described in terms of decibels. The decibel (dB) is a logarithmic unit which expresses the ratio of the sound pressure level being measured to a standard reference level. A-weighted decibels (dBA) approximate the subjective response of the human ear to a broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear.

2.1 Noise Descriptors

Noise Equivalent sound levels are not measured directly, but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (Leq) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. The worst-hour traffic Leq is the noise metric used by California Department of Transportation (Caltrans) for analyzing traffic noise impacts.

The Day-Night Average Level (Ldn or DNL) is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of ten decibels to sound levels at night between 10 p.m. and 7 a.m. While the Community Noise Equivalent Level (CNEL) is similar to the Ldn, except that it has another addition of 4.77 decibels to sound levels during the evening hours between 7 p.m. and 10 p.m. These additions are made to the sound levels at these time periods because during the evening and nighttime hours, when compared to daytime hours, there is a decrease in the ambient noise levels, which creates an increased sensitivity to sounds. For this reason, the sound appears louder in the evening and nighttime hours and is weighted accordingly. The City of Eastvale relies on the CNEL noise standard to assess transportation-related impacts on noise sensitive land uses.

2.2 Tone Noise

A pure tone noise is a noise produced at a single frequency and laboratory tests have shown that humans are more perceptible to changes in noise levels of a pure tone. For a noise source to contain a “pure tone,” there must be a significantly higher A-weighted sound energy in a given frequency band than in the neighboring bands, thereby causing the noise source to “stand out” against other noise sources. A pure tone occurs if the sound pressure level in the one-third octave band with the tone exceeds the average of the sound pressure levels of the two contiguous one-third octave bands by:

- 5 dB for center frequencies of 500 hertz (Hz) and above
- 8 dB for center frequencies between 160 and 400 Hz
- 15 dB for center frequencies of 125 Hz or less

2.3 Noise Propagation

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in level of noise as the distance from the source increases. The manner in which the noise level reduces with distance depends on whether the source is a point or line source as well as ground absorption, atmospheric effects and refraction, and shielding by natural and manmade features.

Sound from point sources, such as air conditioning condensers, radiate uniformly outward as it travels away from the source in a spherical pattern. The noise drop-off rate associated with this geometric spreading is 6 dBA per each doubling of the distance (dBA/DD) between source and receiver. Transportation noise sources such as roadways are typically analyzed as line sources, since at any given moment the receiver may be impacted by noise from multiple vehicles at various locations along the roadway. Because of the geometry of a line source, the noise drop-off rate associated with the geometric spreading of a line source is 3 dBA/DD.

2.4 Ground Absorption

The sound drop-off rate is highly dependent on the conditions of the land between the noise source and receiver. To account for this ground-effect attenuation (absorption), two types of site conditions are commonly used in traffic noise models, soft-site and hard-site conditions. Soft-site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation. For point sources, a drop-off rate of 7.5 dBA/DD is typically observed over soft ground with landscaping, as compared with a 6.0 dBA/DD drop-off rate over hard ground such as asphalt, concrete, stone and very hard packed earth. For line sources a 4.5 dBA/DD is typically observed for soft-site conditions compared to the 3.0 dBA/DD drop-off rate for hard-site conditions. Caltrans research has shown that the use of soft-site conditions is more appropriate for the application of the Federal Highway Administration (FHWA) traffic noise prediction model used in this analysis.

3.0 GROUND-BORNE VIBRATION FUNDAMENTALS

Ground-borne vibrations consist of rapidly fluctuating motions within the ground that have an average motion of zero. The effects of ground-borne vibrations typically only cause a nuisance to people, but at extreme vibration levels damage to buildings may occur. Although ground-borne vibration can be felt outdoors, it is typically only an annoyance to people indoors where the associated effects of the shaking of a building can be notable. Ground-borne noise is an effect of ground-borne vibration and only exists indoors, since it is produced from noise radiated from the motion of the walls and floors of a room and may also consist of the rattling of windows or dishes on shelves.

3.1 Vibration Descriptors

There are several different methods that are used to quantify vibration amplitude such as the maximum instantaneous peak in the vibrations velocity, which is known as the peak particle velocity (PPV) or the root mean square (rms) amplitude of the vibration velocity. Due to the typically small amplitudes of vibrations, vibration velocity is often expressed in decibels and is denoted as (L_v) and is based on the rms velocity amplitude. A commonly used abbreviation is "VdB", which in this text, is when L_v is based on the reference quantity of 1 micro inch per second.

3.2 Vibration Perception

Typically, developed areas are continuously affected by vibration velocities of 50 VdB or lower. These continuous vibrations are not noticeable to humans whose threshold of perception is around 65 VdB. Off-site sources that may produce perceptible vibrations are usually caused by construction equipment, steel-wheeled trains, and traffic on rough roads, while smooth roads rarely produce perceptible ground-borne noise or vibration.

3.3 Vibration Propagation

The propagation of ground-borne vibration is not as simple to model as airborne noise. This is due to the fact that noise in the air travels through a relatively uniform medium, while ground-borne vibrations travel through the earth which may contain significant geological differences. There are three main types of vibration propagation; surface, compression, and shear waves. Surface waves, or Rayleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wave front, similar to ripples produced by throwing a rock into a pool of water. P-waves, or compression waves, are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. S-waves, or shear waves, are also body waves that carry energy along an expanding spherical wave front. However, unlike P-waves, the particle motion is transverse or "side-to-side and perpendicular to the direction of propagation."

As vibration waves propagate from a source, the vibration energy decreases in a logarithmic nature and the vibration levels typically decrease by 6 VdB per doubling of the distance from the vibration source. As stated above, this drop-off rate can vary greatly depending on the soil but has been shown to be effective enough for screening purposes, in order to identify potential vibration impacts that may need to be studied through actual field tests.

4.0 REGULATORY SETTING

The project site is located in the City of Eastvale. Noise regulations are addressed through the efforts of various federal, state, and local government agencies. The agencies responsible for regulating noise are discussed below.

4.1 Federal Regulations

The adverse impact of noise was officially recognized by the federal government in the Noise Control Act of 1972, which serves three purposes:

- Promulgating noise emission standards for interstate commerce
- Assisting state and local abatement efforts
- Promoting noise education and research

The Federal Office of Noise Abatement and Control (ONAC) was initially tasked with implementing the Noise Control Act. However, the ONAC has since been eliminated, leaving the development of federal noise policies and programs to other federal agencies and interagency committees. For example, the Occupational Safety and Health Administration (OSHA) agency prohibits exposure of workers to excessive sound levels. The Department of Transportation (DOT) assumed a significant role in noise control through its various operating agencies. The Federal Aviation Administration (FAA) regulates noise of aircraft and airports. Surface transportation system noise is regulated by a host of agencies, including the Federal Transit Administration (FTA), which regulates transit noise, while freeways that are part of the interstate highway system are regulated by the Federal Highway Administration (FHWA). Finally, the federal government actively advocates that local jurisdictions use their land use regulatory authority to arrange new development in such a way that "noise sensitive" uses are either prohibited from being sited adjacent to a highway or, alternately that the developments are planned and constructed in such a manner that potential noise impacts are minimized.

Although the proposed project is not under the jurisdiction of the FTA, the *Transit Noise and Vibration Impact Assessment Manual* (FTA Manual), prepared by the FTA, September 2018, is the only guidance document from a government agency that has defined what constitutes a significant noise impact from implementing a project. The FTA standards are based on extensive studies by the FTA and other governmental agencies on the human effects and reaction to noise and a summary of the FTA findings are provided below in Table A.

Table A – FTA Project Effects on Cumulative Noise Exposure

Existing Noise Exposure (dBA Leq or Ldn)	Allowable Noise Impact Exposure dBA Leq or Ldn		
	Project Only	Combined	Noise Exposure Increase
45	51	52	+7
50	53	55	+5
55	55	58	+3
60	57	62	+2
65	60	66	+1
70	64	71	+1
75	65	75	0

Source: Federal Transit Administration, 2018.

The FTA also provides guidance on construction noise and recommends developing construction noise criteria on a project-specific basis that utilizes local noise ordinances if possible. However, local noise ordinances usually relates to nuisance and hours of allowed activity and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the noise impacts of a construction project. Project construction noise criteria should take into account the existing noise environment, the absolute noise levels during construction activities, the duration of the construction, and the adjacent land uses. The FTA standards are based on extensive studies by the FTA and other governmental agencies on the human effects and reaction to noise and a summary of the FTA findings for a detailed construction noise assessment are provided below in Table B.

Table B – FTA Construction Noise Criteria

Land Use	Day (dBA $Leq_{(8\text{-hour})}$)	Night (dBA $Leq_{(8\text{-hour})}$)	30-day Average (dBA Ldn)
Residential	80	70	75
Commercial	85	85	80[(1)]
Industrial	90	90	85[(1)]

Notes:
[(1)] Use a 24-hour $Leq_{(24\ hour)}$ instead of $Ldn_{(30\ day)}$.
Source: Federal Transit Administration, 2018.

Since the federal government has preempted the setting of standards for noise levels that can be emitted by the transportation sources, the City is restricted to regulating the noise generated by the transportation system through nuisance abatement ordinances and land use planning.

4.2 State Regulations

Noise Standards

California Department of Health Services Office of Noise Control

Established in 1973, the California Department of Health Services Office of Noise Control (ONC) was instrumental in developing regularity tools to control and abate noise for use by local agencies. One significant model is the "Land Use Compatibility for Community Noise Environments Matrix," which allows the local jurisdiction to clearly delineate compatibility of sensitive uses with various incremental levels of noise.

California Noise Insulation Standards

Title 24, Chapter 1, Article 4 of the California Administrative Code (California Noise Insulation Standards) requires noise insulation in new hotels, motels, apartment houses, and dwellings (other than single-family detached housing) that provides an annual average noise level of no more than 45 dBA CNEL. When such structures are located within a 60-dBA CNEL (or greater) noise contour, an acoustical analysis is required to ensure that interior levels do not exceed the 45-dBA CNEL annual threshold. In addition, Title 21, Chapter 6, Article 1 of the California Administrative Code requires that all habitable rooms, hospitals, convalescent homes, and places of worship shall have an interior CNEL of 45 dB or less due to aircraft noise.

Government Code Section 65302

Government Code Section 65302 mandates that the legislative body of each county and city in California adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines published by the State Department of Health Services. The guidelines rank noise land use compatibility in terms of normally acceptable, conditionally acceptable, normally unacceptable, and clearly unacceptable.

California Vehicle Code Section 27200-27207 – On-Road Vehicle Noise

California Vehicle Code Section 27200-27207 provides noise limits for vehicles operated in California. For vehicles over 10,000 pounds noise is limited to 88 dB for vehicles manufactured before 1973, 86 dB for vehicles manufactured before 1975, 83 dB for vehicles manufactured before 1988, and 80 dB for vehicles manufactured after 1987. All measurements are based at 50 feet from the vehicle.

California Vehicle Section 38365-38380 – Off-Road Vehicle Noise

California Vehicle Code Section 38365-38380 provides noise limits for off-highway motor vehicles operated in California. 92 dBA for vehicles manufactured before 1973, 88 dBA for vehicles manufactured before 1975, 86 dBA for vehicles manufactured before 1986, and 82 dBA for vehicles manufactured after December 31, 1985. All measurements are based at 50 feet from the vehicle.

Vibration Standards

Title 14 of the California Administrative Code Section 15000 requires that all state and local agencies implement the California Environmental Quality Act (CEQA) Guidelines, which requires the analysis of exposure of persons to excessive groundborne vibration. However, no statute has been adopted by the state that quantifies the level at which excessive groundborne vibration occurs.

The *Transportation- and Construction Vibration Guidance Manual*, prepared by Caltrans, April 2020, provides practical guidance to Caltrans engineers, planners, and consultants who must address vibration issues associated with the construction, operation, and maintenance of Caltrans projects. However, this manual is also used as a reference point by many lead agencies and CEQA practitioners throughout California, as it provides numeric thresholds for vibration impacts. Thresholds are established for continuous (construction-related) and transient (transportation-related) sources of vibration, which found that the human response becomes distinctly perceptible at 0.25 inch per second PPV for transient sources and 0.04 inch per second PPV for continuous sources.

4.3 Local Regulations – City of Eastvale

The *City of Eastvale General Plan* (General Plan), approved June 13, 2012, and the Eastvale, CA Code of Ordinances (Municipal Code), January 7, 2022, establishes the following applicable policies related to noise and vibration.

General Plan

The following applicable goals and policies to the proposed project are from the Noise Element of the General Plan.

Goal N-1: Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors, and noise-sensitive uses of Eastvale.

Goal N-3: Ensure that noise sensitive uses do not encroach into area needed by noise generating uses.

Goal N-4: Locate noise sources away from existing noise sensitive land uses unless appropriate noise control measures are provided.

Policy N-3: Consider the following uses to be sensitive to noise and vibration, and discourage these uses in areas where existing or projected future noise levels would be in excess of 65 CNEL and/or vibration would be more than 0.0787 Peak Particle Velocity (inches/second)

- Schools;
- Hospitals;
- Rest Homes;
- Long Term Care Facilities;
- Mental Care Facilities;
- Residential Uses;
- Libraries;
- Passive Recreation Uses; and
- Places of Worship

Policy N-4: Require noise sensitive land uses proposed in areas where existing or projected future noise levels would be in excess of 65 CNEL to have an acoustical specialist prepare a study of the noise problems and recommend structural and site design features that will adequately mitigate the noise problem.

Policy N-5: Require that exterior noise forecasts use the appropriate Level of Service for the adjacent roadways, or a 20-year projection of traffic volumes (whichever is greater) for future noise forecasts.

Policy N-6: Mitigate exterior noise levels to the levels shown in Table N-3 (Table C) to the extent feasible.

Table C – City of Eastvale Noise Compatibility by Land Use Designation[1]

Land Use Designations	Completely Compatible	Tentatively Compatible	Normally Incompatible	Completely Incompatible
All Residential (Single- and Multi-Family)	Less than 60 dBA	60 – 70 dBA	70 – 75 dBA	Greater than 75 dBA
All Non-Residential (Commercial, Industrial & Institutional)	Less than 70 dBA	70 – 75 dBA	Greater than 75 dBA	--[(2)]
Public Parks (Lands on which public parks are located or planned)	Less than 65 dBA	65 – 70 dBA	70 – 75 dBA	Greater than 75 dBA

Notes:
[1] All noise levels shown in this Table are designated CNEL.
[2] To be determined as part of the project review process.
Source: City of Eastvale, 2012.

Policy N-7: Table N-4 (Table D) provides the City's standards for maximum exterior non-transportation noise levels to which land designated for residential land uses may be exposed for any 30-minute period on any day. Where existing ambient noise levels

exceed these standards, the ambient noise level shall be the highest allowable noise level as measured in dBA Leq (30 minutes).

Note to Reader: Public schools are not regulated by the City; therefore, no noise standards for public schools are provided in this Chapter.

Table D – City of Eastvale Exterior Noise Level Standards for Non-Transportation Noise[1]

Land Use Type	Time Period	Maximum Noise Level (dBA)
Single-Family Homes and Duplexes	10 p.m. to 7 a.m.	50
	7 a.m. to 10 p.m.	60
Multiple Residential 3 or More Units per Building (Triplex +)	10 p.m. to 7 a.m.	55
	7 a.m. to 10 p.m.	60

Notes:
[1] Measured as dBA Leq (30 minutes).

Policy N-9: The City may impose exterior noise standards which are less restrictive than those specified in Table N-4, provided that:

1) The noise impact on the residential or other noise-sensitive use is addressed in an environmental analysis and at least one outdoor area meets the standards; and
2) A finding is made by the approving body specifying why the exception would not be detrimental to the public health, safety and general welfare; and
3) The exception would not adversely affect the character of the surrounding development.
4) The exception would not be injurious to adjacent uses, property and improvements; and,
5) Alternatives have been considered but none are technologically feasible for the proposal and,
6) Interior noise levels resulting from and external source will be no more than 45 dBA CNEL from 7 a.m. to 10 p.m.; and,
7) Residents of noise sensitive uses are informed of the proposal during the review stage and prior to approval.

Policy N-10: Table N-5 (Table E): Maximum Acceptable Interior Noise Levels Created by Exterior Noise Sources provides the City's standards for acceptable indoor noise levels for various types of land uses. These standards should receive special attention when projects are considered in "Tentatively Compatible" or "Normally Incompatible" areas.

- Noise created inside a use listed below shall not count toward the acceptable noise levels to be maintained in accordance with this policy.

Table E – Maximum Acceptable Interior Noise Levels Created by Exterior Noise Sources

Land Use Type	Acceptable Noise Level (dBA CNEL)
Residential Living and Sleeping Areas	45 dBA
Residential Living and Sleeping Areas where the dwelling unit is subject to noise from railroad tracks, aircraft overflights, or similar sources which produce clearly identifiable, discrete noise events (such as the passing of a trains as opposed to relatively steady or constant noise sources such as roadways)	40 dBA
Private & Semi Private Classrooms[(1)]	55 dBA
All Places of Work Other than School Classrooms	Conform with applicable state and federal workplace safety standards

Notes:
[1] Standards for public schools are set and enforced by the State of California and are not regulated by the City of Eastvale.
Source: City of Eastvale, 2012.

Policy N-11: Developers of new residential or other noise-sensitive uses which are placed in environments subject to existing or projected noise that exceeds the "completely compatible" guidelines in Table N-3 (see Table C) shall be responsible for ensuring that acceptable exterior and interior noise levels will be achieved.

Policy N-22: Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.

Policy N-23: Condition subdivision and other land development approval adjacent to developed/occupied noise-sensitive land uses to require the developer to submit a construction-related noise mitigation plan to the City for review and approval prior to issuance of a grading permit. The plan must depict the location of construction equipment and specify how the noise from this equipment will be mitigated during construction of this project, through the use of such methods as:

a) Temporary noise attenuation fences;

b) Preferential location of equipment

c) Length of equipment use and idling time; and,

d) Use of current noise suppression technology and equipment.

Policy N-24: Require that all construction equipment be kept properly tuned and use noise reduction features (e.g. mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

City of Eastvale Municipal Code

The City of Eastvale Municipal Code establishes the following applicable standards for new residential development related to noise and vibration.

Section 8.52.020 - Exemptions

Sound emanating from the following sources is exempt from the provisions of this chapter:

(9) Private construction projects located within one-quarter of a mile from an inhabited dwelling, provided that construction does not occur between the hours of:

a. 6:00 p.m. and 6:00 a.m. during the months of June through September; and

b. 6:00 p.m. and 7:00 a.m. during the months of October through May;

(10) Property maintenance, including, but not limited to, the operation of lawnmowers, leaf blowers, etc., provided such maintenance occurs between the hours of 7:00 a.m. and 8:00 p.m.;

(12) Heating and air conditioning equipment.

Section 8.52.040 – General sound level standards

No person shall create any sound, or allow the creation of any sound, on any property that causes the exterior sound level on any other occupied property to exceed the sound level standards set forth in the following table:

Table F – City of Eastvale Municipal Code Sound Level Standards

General Plan Foundation Component			Maximum Decibel Level	
Land Use Designation General Plan	Land Use Designation Name	Density (per acre)	7:00 a.m. – 10:00 p.m.	10:00 p.m. – 7:00 a.m.
MDR	Medium-Density Residential	2-5	55	45
MHDR	Medium High-Density Residential	5-8	55	45
HDR	High-Density Residential	8-14	55	45
PF	Public Facility		65	45
REC	Recreation		45	45

Source: City of Eastvale, 2015.

Section 120.05.130 – Noise, odor and vibration performance standards

a) *Applicability.* The standards of this section apply to all new and existing land uses within the city, unless otherwise exempted.

b) *Noise standards.* All uses shall comply with the noise standards set forth in the city's general plan and within the city's noise ordinance (see chapter 8.52).

d) *Vibration standards.* Uses shall be operated in compliance with the following provisions:

(1) Uses, activities and processes shall not generate vibrations that cause discomfort or annoyance to reasonable persons of normal sensitivity or which endanger the comfort, repose, health or peace of residents whose property abuts the property lines of the subject parcel.

(3) Vibrations from temporary construction/demolition and vehicles that leave the subject parcel (e.g., trucks, trains and aircraft) are exempt from the provisions of this section.

5.0 EXISTING NOISE CONDITIONS

To determine the existing noise levels, noise measurements have been taken in the vicinity of the project site. The field survey noted that noise within the proposed project area is generally characterized by vehicle traffic on Schleisman Road that is adjacent to the north side of the project site and from Orange Street that is adjacent to the south side of the project site. There is also noise created from Eastvale Elementary School, adjacent to the east side of the project site. The following describes the measurement procedures, measurement locations, noise measurement results, and the modeling of the existing noise environment.

5.1 Noise Measurement Equipment

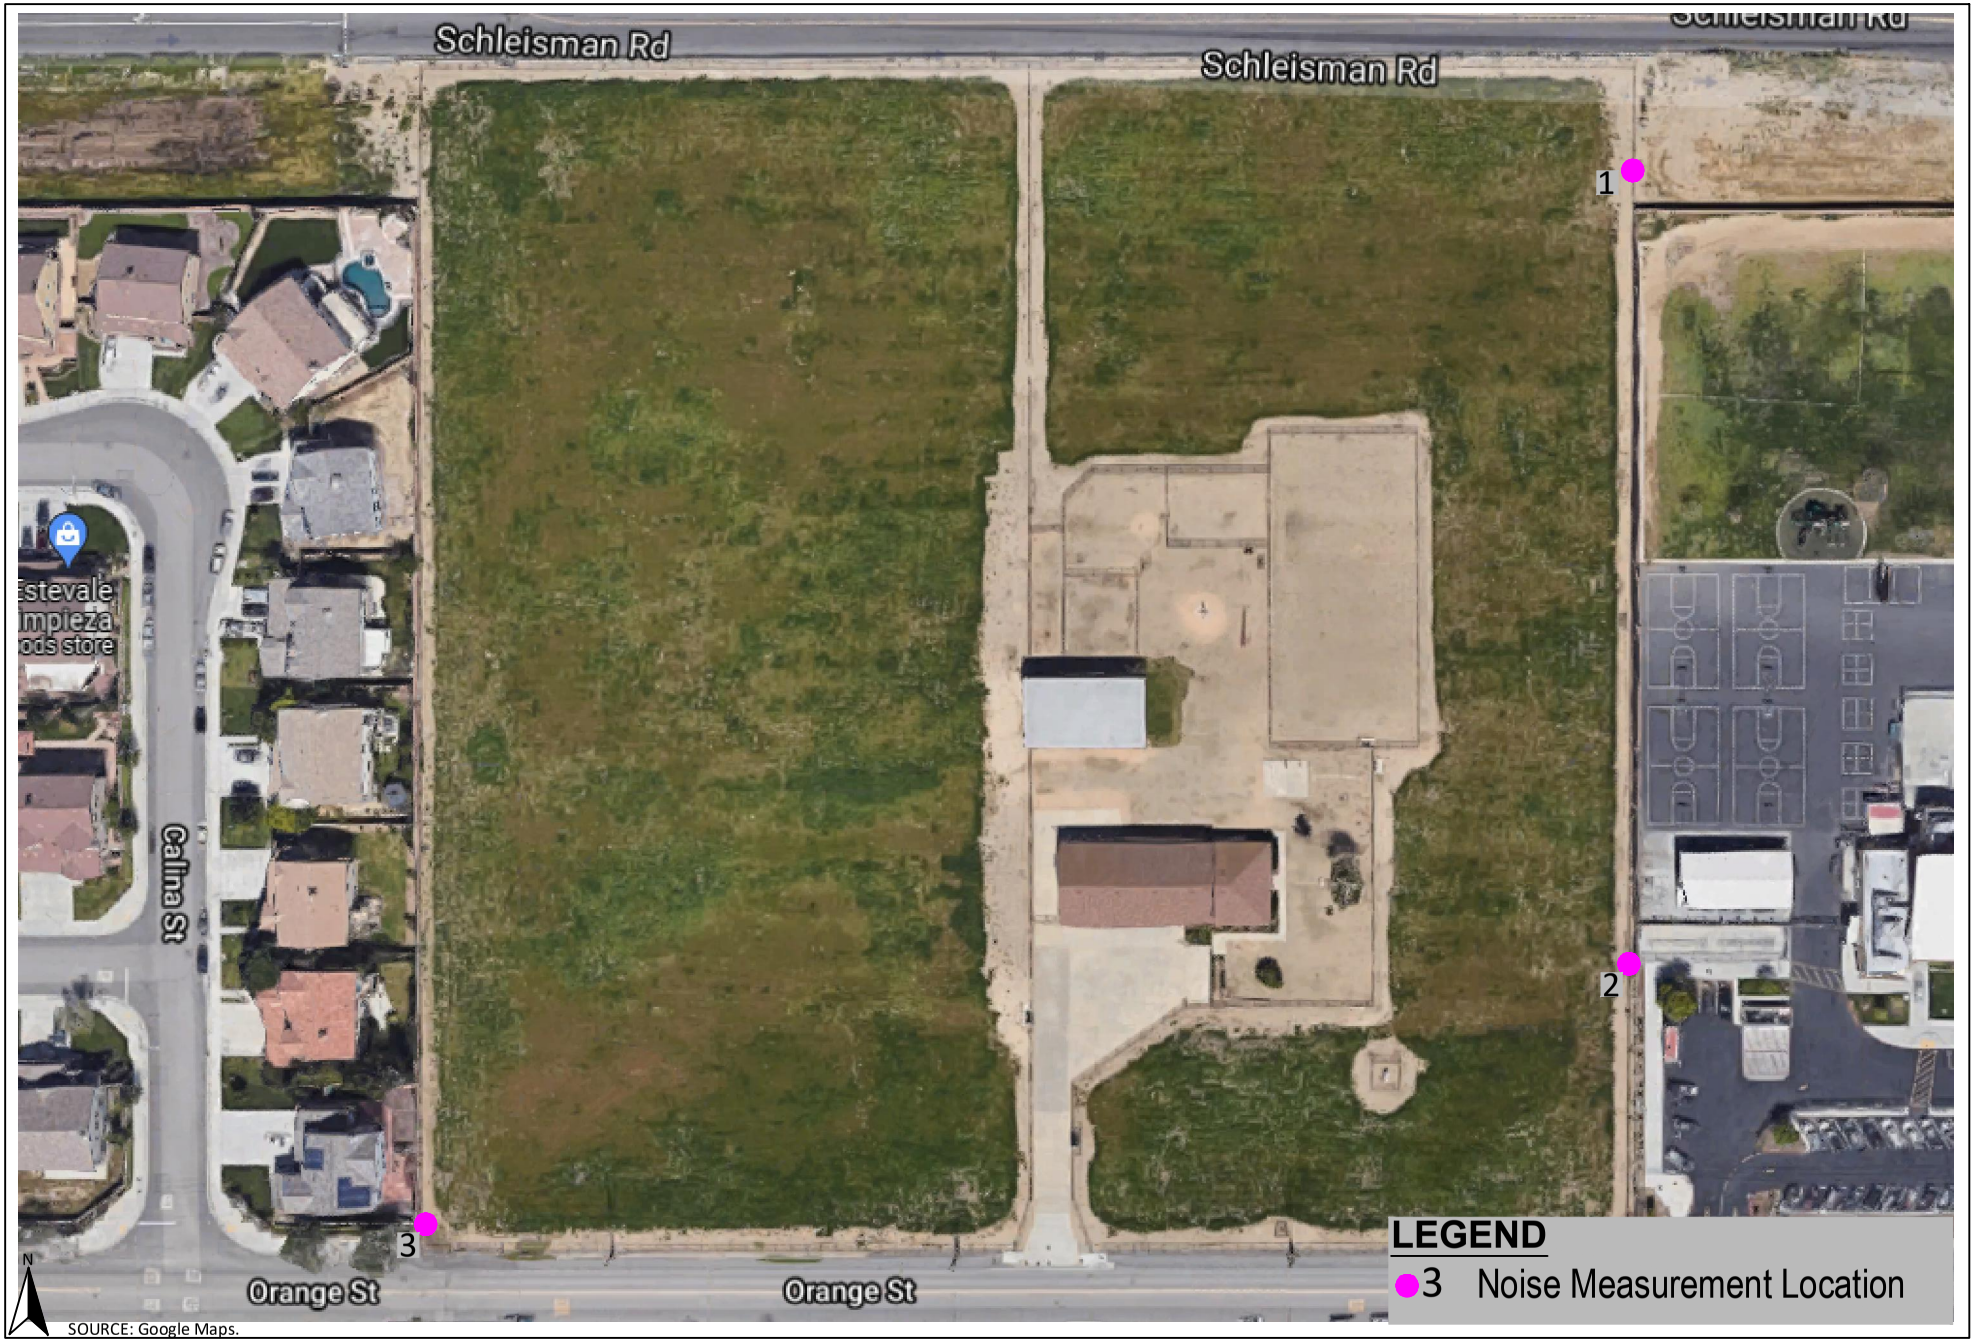
The noise measurements were taken using three Larson Davis Model LXT1 Class 1 sound level meters programmed in "slow" mode to record the sound pressure level at 1-second intervals for 24 hours in "A" weighted form. In addition, the L_{eq} averaged over the entire measuring time and L_{max} were recorded with the three sound level meters. The sound level meters and microphones were mounted on fences, were placed between four and six feet above the ground and were equipped with windscreens during all measurements. The noise meters were calibrated before and after the monitoring using a Larson Davis Cal200 calibrator. All noise level measurement equipment meets American National Standards Institute (ANSI) specifications for sound level meters (ANSI S1.4-2014 standard).

Noise Measurement Locations

The noise monitoring locations were selected in order to obtain noise levels on the project site and at the nearest residential uses located on the west side of the project site and at the school located on the east side of the project site. Descriptions of the noise monitoring sites are provided below in Table G and are shown in Figure 3. Appendix A includes a photo index of the study area and noise level measurement locations.

Noise Measurement Timing and Climate

The noise measurements were recorded between 4:09 p.m. on Thursday, December 9, 2021 and 4:21 p.m. on Friday, December 10, 2021. When the noise measurements were started the sky was cloudy, the temperature was 56 degrees Fahrenheit, the humidity was 71 percent, barometric pressure was 29.20 inches of mercury, and the wind was blowing around three miles per hour. Overnight, the temperature dropped to 43 degrees Fahrenheit and the humidity peaked at 95 percent. At the conclusion of the noise measurements, the sky was partly cloudy, the temperature was 61 degrees Fahrenheit, the humidity was 47 percent, barometric pressure was 29.44 inches of mercury, and there was no wind.



5.2 Noise Measurement Results

The results of the noise level measurements are presented in Table G. The measured sound pressure levels in dBA have been used to calculate the minimum and maximum L_{eq} averaged over 1-hour intervals. Table G also shows the L_{eq}, L_{max}, and CNEL, based on the entire measurement time. The CNEL was calculated through use of the hourly Leq that was entered into Equation 2-23 from *Technical Noise Supplement to the Traffic Noise Analysis Protocol* (TeNS), prepared by Caltrans, September 2013. The noise monitoring data printouts are included in Appendix B. Figure 4 shows a graph of the 24-hour noise measurements.

Table G – Existing (Ambient) Noise Level Measurements

Site No.	Site Description	Average (dBA L_{eq})		1-hr Average (dBA L_{eq}/Time)		24-hr dBA CNEL
		Daytime[1]	Nighttime[2]	Minimum	Maximum	
1	Located on a fence near the northeast corner of the project site, approximately 90 feet south of Schleisman Road centerline.	57.4	53.6	47.8 1:43 a.m.	60.4 6:59 a.m.	61.1
2	Located on a fence on the east side of the project site and adjacent to the bike parking area at Eastvale Elementary School and approximately 180 feet north of Orange Street centerline.	56.2	49.1	43.2 11:43 p.m.	63.4 11:39 a.m.	57.7
3	Located on a fence near the southwest corner of the project site and shared property line with the home at 7092 Calina Street, approximately 35 feet north of Orange Street centerline.	59.5	51.7	44.5 1:44 a.m.	64.2 7:33 a.m.	60.9

6.0 MODELING PARAMETERS AND ASSUMPTIONS

6.1 Construction Noise

The noise impacts from construction of the proposed project have been analyzed through use of the FHWA's Roadway Construction Noise Model (RCNM). The FHWA compiled noise measurement data regarding the noise generating characteristics of several different types of construction equipment used during the Central Artery/Tunnel project in Boston. Table H below provides a list of the construction equipment anticipated to be used for each phase of construction that was obtained from the *Air Quality, Energy, and Greenhouse Gas Impact Analysis Magnolia Ranch Residential Project* (Air Quality Analysis), prepared by Vista Environmental, July 26, 2022.

Table H – Construction Equipment Noise Emissions and Usage Factors

Equipment Description	Number of Equipment	Acoustical Use Factor[1] (percent)	Spec 721.560 Lmax at 50 feet[2] (dBA, slow[3])	Actual Measured Lmax at 50 feet[4] (dBA, slow[3])
Demolition				
Concrete/Industrial Saws	1	20	90	90
Excavators	3	40	85	81
Rubber Tired Dozers	2	40	85	82
Site Preparation				
Rubber Tired Dozers	3	40	85	82
Crawler Tractors	4	40	84	N/A
Grading				
Excavators	2	40	85	81
Grader	1	40	85	83
Rubber Tired Dozer	1	40	85	82
Scrapers	2	40	85	84
Crawler Tractors	2	40	84	N/A

Air Compressor	1	40	80	78

Notes:
[1] Acoustical use factor is the percentage of time each piece of equipment is operational during a typical workday.
[2] Spec 721.560 is the equipment noise level utilized by the RCNM program.
[3] The "slow" response averages sound levels over 1-second increments. A "fast" response averages sound levels over 0.125-second increments.

[4] Actual Measured is the average noise level measured of each piece of equipment during the Central Artery/Tunnel project in Boston, Massachusetts primarily during the 1990s.
Source: Federal Highway Administration, 2006 and CalEEMod default equipment mix.

Table H shows the associated measured noise emissions for each piece of equipment from the RCNM model and measured percentage of typical equipment use per day. Construction noise impacts to the nearby sensitive receptors have been calculated according to the equipment noise levels and usage factors listed Table H and through use of the RCNM. For each phase of construction, all construction equipment was analyzed based on being placed in the middle of the project site, which is based on the analysis methodology detailed in FTA Manual for a General Assessment. However, in order to provide a conservative analysis, all equipment was analyzed, instead of just the two nosiest pieces of equipment as detailed in the FTA Manual. The RCNM model printouts are provided in Appendix C.

6.2 Operations-Related Noise

FHWA Model Methodology

The proposed project would result in increases in traffic noise to the nearby roadways as well as introduce new sensitive receptors to the project site. The project impacts to the offsite roadways were analyzed through use of the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108 (FHWA Model). The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). Adjustments are then made to the reference energy mean emission level to account for: the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT) and the percentage of ADT which flows during the day, evening and night, the travel speed, the vehicle mix on the roadway, which is a percentage of the volume of automobiles, medium trucks and heavy trucks, the roadway grade, the angle of view of the observer exposed to the roadway and site conditions ("hard" or "soft" relates to the absorption of the ground, pavement or landscaping). The following section provides a discussion of the software and modeling input parameters used in this analysis and a discussion of the resultant existing noise model.

FHWA Model Traffic Noise Prediction Model Inputs

The roadway parameters used for this study are presented in Table I. The roadway classifications are based on the City's General Plan Circulation Element. The roadway speeds are based on the posted speed limits. The distance to the nearest sensitive receptor was determined by measuring the distance from the roadway centerline to the nearest residence. Since the study area is located in a suburban environment and landscaping or natural vegetation exists along the sides of the nearby roads, soft site conditions were modeled.

Table I – FHWA Model Roadway Parameters

Roadway	Segment	General Plan Classification	Vehicle Speed (MPH)	Distance to Nearest Receptor[1] (feet)
Sumner Avenue	North of Schleisman Road	Major	45	85
Sumner Avenue	South of Schleisman Road	Major	45	45
Sumner Avenue	South of Orange Street	Major	45	60
Scholar Way	North of Schleisman Road	Secondary	35	70
Scholar Way	South of Schleisman Road	Secondary	35	60

Roadway	Segment	General Plan Classification	Vehicle Speed (MPH)	Distance to Nearest Receptor[1] (feet)
Scholar Way	South of Orange Street	Secondary	35	60
Scholar Way	South of Baltimore Street	Secondary	35	75
Hamner Avenue	North of Schleisman Road	Urban Arterial	45	90
Hamner Avenue	South of Schleisman Road	Urban Arterial	45	100
Schleisman Road	West of Sumner Avenue	Major	45	70
Schleisman Road	East of Sumner Avenue	Urban Arterial	45	80
Schleisman Road	West of Scholar Way	Urban Arterial	45	80
Schleisman Road	East of Scholar Way	Urban Arterial	45	80
Orange Street	East of Sumner Avenue	Collector	30	40
Orange Street	West of Scholar Way	Collector	30	100

Notes:
[1] Distance measured from nearest offsite residential structure to centerline of roadway.

The average daily traffic (ADT) volumes were obtained from the *Project Scoping Agreement for Land Use Project – PLN22-20024* (Traffic Scoping Agreement), prepared by Urban Crossroads, June 27, 2022. The ADT volumes used in this analysis are shown in Table J.

Table J – Average Daily Traffic Volumes

		Average Daily Traffic Volumes					
Roadway	Segment	Existing	Existing + Project	2024 No Project	2024 + Project	2040 No Project	2040 + Project
Sumner Avenue	North of Schleisman Road	10,950	11,050	11,800	11,900	12,500	12,550
Sumner Avenue	South of Schleisman Road	9,600	9,750	10,600	10,750	11,750	11,900
Sumner Avenue	South of Orange Street	8,400	8,400	9,000	9,000	9,300	9,350
Scholar Way	North of Schleisman Road	7,450	7,550	8,050	8,150	8,150	8,300
Scholar Way	South of Schleisman Road	6,950	7,100	7,550	7,750	7,600	7,800
Scholar Way	South of Orange Street	7,200	7,200	7,800	7,850	8,200	8,250
Scholar Way	South of Baltimore Street	7,850	7,850	8,500	8,550	8,850	8,900
Hamner Avenue	North of Schleisman Road	24,600	24,650	28,800	28,800	29,800	29,850
Hamner Avenue	South of Schleisman Road	24,650	24,700	28,600	28,650	29,650	29,700
Schleisman Road	West of Sumner Avenue	18,400	18,500	20,100	20,150	30,900	31,000
Schleisman Road	East of Sumner Avenue	9,600	9,600	10,900	10,900	28,300	28,300
Schleisman Road	West of Scholar Way	9,400	9,400	10,750	10,750	33,000	33,000
Schleisman Road	East of Scholar Way	8,550	8,600	9,850	9,900	26,350	26,400
Orange Street	East of Sumner Avenue	1,100	1,250	1,350	1,500	1,650	1,850
Orange Street	West of Scholar Way	2,450	2,650	2,750	3,000	2,900	3,150

Source: City of Eastvale, 2012; Urban Crossroads, 2022.

The vehicle mixes used in the FHWA-RD-77-108 Model are shown in Table K and is based on the typical vehicle mixes observed in Riverside County. The vehicle mixes provides the hourly distribution percentages of automobiles, medium trucks, and heavy trucks for input into the FHWA model.

Table K – Roadway Vehicle Mixes

Vehicle Type	Traffic Flow Distributions			
	Day (7 a.m. to 7 p.m.)	Evening (7 p.m. to 10 p.m.)	Night (10 p.m. to 7 a.m.)	Overall
Secondary, Collector or Smaller				
Automobiles	73.60%	13.60%	10.22%	97.42%
Medium Trucks	0.90%	0.04%	0.9%	1.84%
Heavy Trucks	0.35%	0.04%	0.35%	0.74%
Major, Arterial Highways, and Expressways				
Automobiles	69.50%	12.90%	9.60%	92.00%
Medium Trucks	1.44%	0.06%	1.50%	3.00%
Heavy Trucks	2.40%	0.10%	2.50%	5.00%

Source: County of Riverside, 2015.

FHWA Model Source Assumptions

To assess the roadway noise generation in a uniform manner, all vehicles are analyzed at the single lane equivalent acoustic center of the roadway being analyzed. In order to determine the height above the road grade where the noise is being emitted from, each type of vehicle has been analyzed independently with autos at road grade, medium trucks at 2.3 feet above road grade, and heavy trucks at 8 feet above road grade. These elevations were determined through a noise-weighted average of the elevation of the exhaust pipe, tires and mechanical parts in the engine, which are the primary noise emitters from a vehicle.

6.3 Vibration

Construction activity can result in varying degrees of ground vibration, depending on the equipment used on the site. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings in the vicinity of the construction site respond to these vibrations with varying results ranging from no perceptible effects at the low levels to damage at the highest levels. Table L gives approximate vibration levels for particular construction activities. The data in Table L provides a reasonable estimate for a wide range of soil conditions.

Table L – Vibration Source Levels for Construction Equipment

Equipment		Peak Particle Velocity (inches/second)	Approximate Vibration Level (L_v)at 25 feet
Pile driver (impact)	Upper range	1.518	112
	typical	0.644	104
Pile driver (sonic)	Upper range	0.734	105
	typical	0.170	93
Clam shovel drop (slurry wall)		0.202	94
Vibratory Roller		0.210	94
Hoe Ram		0.089	87
Large bulldozer		0.089	87
Caisson drill		0.089	87
Loaded trucks		0.076	86
Jackhammer		0.035	79
Small bulldozer		0.003	58

Source: Federal Transit Administration, 2018.

The construction-related vibration impacts have been calculated through the vibration levels shown above in Table L and through typical vibration propagation rates. The equipment assumptions were based on the equipment lists provided above in Table H.

7.0 IMPACT ANALYSIS

7.1 CEQA Thresholds of Significance

Consistent with the California Environmental Quality Act (CEQA) and the State CEQA Guidelines, a significant impact related to noise would occur if a proposed project is determined to result in:

- Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Generation of excessive groundborne vibration or groundborne noise levels; or
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

7.2 Generation of Noise Levels in Excess of Standards

The proposed project would not generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. The following section calculates the potential noise emissions associated with the temporary construction activities and long-term operations of the proposed project and compares the noise levels to the City standards.

Construction-Related Noise

The construction activities for the proposed project are anticipated to include demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses, site preparation and grading of the 10.0 gross acre project site, building construction of the 41 single-family homes, paving of the onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site, and application of architectural coatings.

Noise impacts from construction activities associated with the proposed project would be a function of the noise generated by construction equipment, equipment location, sensitivity of nearby land uses, and the timing and duration of the construction activities. The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Section 8.52.020(9) of the City's Municipal Code exempts construction noise that occurs between 6:00 a.m. and 6:00 p.m. June thru September and between 7:00 a.m. and 6:00 p.m. October thru May. However, General Plan Policy N-23, requires that infill development projects to prepare a Construction Noise Mitigation Plan prior to obtaining a grading permit. The Plan will require the use temporary noise barriers, designated equipment staging areas, limits on idling and requirement of all equipment using mufflers. Project Design Feature 1 has been included in this analysis to ensure implementation of General Plan Policy N-23.

The City construction noise standards do not provide any limits to the noise levels that may be created from construction activities and even with adherence to the City standards, the resultant construction

noise levels may result in a significant substantial temporary noise increase to the nearby sensitive receptors. In order to determine if the proposed construction activities would create a significant substantial temporary noise increase, the FTA construction noise criteria thresholds detailed above in Section 4.1 have been utilized, which shows that a significant construction noise impact would occur if construction noise exceeds 80 dBA during the daytime at any of the nearby homes and school.

Construction noise impacts to the nearby sensitive receptors have been calculated through use of the RCNM and the parameters and assumptions detailed in Section 6.1 of this report including Table H that shows the anticipated construction equipment per phase. In order to account for the existing 6 to 7 foot high concrete masonry unit (cmu) wall on the west side of the project site, 5 dB of estimated shielding was added to the RCNM model for the homes to the west. The results are shown below in Table M and the RCNM printouts are provided in Appendix C.

Table M – Construction Noise Levels at the Nearest Sensitive Receptors

Construction Phase	Construction Noise Level (dBA Leq) at:	
	Nearest Homes to the West[1]	Nearest School to the East[2]
Demolition	65	70
Site Preparation	66	71
Grading	67	72
Building Construction	65	70
Paving	60	65
Painting	52	57
FTA Construction Noise Threshold[4]	**80**	**80**
Exceed Thresholds?	No	No

[1] The nearest homes to the west are located as near as 340 feet from the center of the project site. 5 dB of estimated shielding was included to account for the 6 to 7 foot high cmu wall on the west side of the project site.
[2] The nearest school structure to the east is located as near as 340 feet from the center of the project site.
[4] The FTA Construction noise thresholds are detailed above in Table B.
Source: RCNM, Federal Highway Administration, 2006

Table M shows that the greatest noise impacts would occur during the grading phase, with a noise level as high as 72 dBA Leq at the school to the east and 67 dBA Leq at the nearest homes to the west. Table M also shows that none of the construction phases would exceed the FTA noise standard of 80 dB at the nearby homes or school. Therefore, through adherence to the allowable construction times detailed in Section 8.52.020(9) of the Municipal Code and through implementation of Project Design Feature 1, that requires the preparation of a construction-related noise mitigation plan, prior to the issuance of the grading plan for the proposed project, the proposed project would not create a substantial temporary increase in ambient noise levels from construction of the proposed project. Impacts would be less than significant.

Operational-Related Noise

The proposed project would consist of a residential development with 41 single-family homes. Potential noise impacts associated with the operations of the proposed project would be from project-generated vehicular traffic on the nearby roadways. In addition, the proposed development would be adjacent to Schleisman Road and adjacent to Eastvale Elementary School, which may create exterior and interior noise levels in excess of City standards at the proposed homes. The noise impacts to the nearby existing homes and proposed homes have been analyzed separately below.

Roadway Vehicular Noise Impact to Nearby Homes

Vehicle noise is a combination of the noise produced by the engine, exhaust and tires. The level of traffic noise depends on three primary factors (1) the volume of traffic, (2) the speed of traffic, and (3) the number of trucks in the flow of traffic. The proposed project does not propose any uses that would require a substantial number of truck trips and the proposed project would not alter the speed limit on any existing roadway so the proposed project's potential offsite noise impacts have been focused on the noise impacts associated with the change of volume of traffic that would occur with development of the proposed project.

Neither the General Plan nor the Municipal Code defines what constitutes a "substantial permanent increase to ambient noise levels". As such, this impact analysis has utilized guidance from the Federal Transit Administration for a moderate impact that has been detailed above in Table A that shows that the project contribution to the noise environment can range between 0 and 7 dB, which is dependent on the existing roadway noise levels.

The potential offsite traffic noise impacts created by the on-going operations of the proposed project have been analyzed through utilization of the FHWA model and parameters described above in Section 6.2 and the FHWA model traffic noise calculation spreadsheets are provided in Appendix D. The proposed project's potential offsite traffic noise impacts have been analyzed for the existing year, opening year 2024, and future year 2040 scenarios that are discussed separately below.

Existing Year Conditions

The proposed project's potential offsite traffic noise impacts have been calculated through a comparison of the Existing scenario to the Existing With Project scenario. The results of this comparison are shown in Table N.

Table N – Existing Year Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]			
Roadway	Segment	Existing	Existing Plus Project	Project Contribution	Increase Threshold[2]
Sumner Avenue	North of Schleisman Road	63.0	63.1	0.1	+2 dBA
Sumner Avenue	South of Schleisman Road	67.4	67.5	0.1	+1 dBA
Sumner Avenue	South of Orange Street	64.4	64.4	0.0	+2 dBA
Scholar Way	North of Schleisman Road	59.3	59.4	0.1	+3 dBA
Scholar Way	South of Schleisman Road	60.1	60.2	0.1	+2 dBA
Scholar Way	South of Orange Street	60.3	60.3	0.0	+2 dBA
Scholar Way	South of Baltimore Street	59.1	59.1	0.0	+3 dBA
Hamner Avenue	North of Schleisman Road	66.6	66.6	0.0	+1 dBA
Hamner Avenue	South of Schleisman Road	65.8	65.8	0.0	+1 dBA
Schleisman Road	West of Sumner Avenue	66.7	66.7	0.0	+1 dBA
Schleisman Road	East of Sumner Avenue	63.5	63.5	0.0	+2 dBA
Schleisman Road	West of Scholar Way	63.4	63.4	0.0	+2 dBA
Schleisman Road	East of Scholar Way	63.0	63.0	0.0	+2 dBA
Orange Street	East of Sumner Avenue	52.7	53.3	0.6	+5 dBA
Orange Street	West of Scholar Way	50.1	50.4	0.3	+5 dBA

Notes:

[1] Distance to nearest residential use shown in Table I, does not take into account existing noise barriers.
[2] Increase Threshold obtained from the FTA's allowable noise impact exposures detailed above in Table A.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table N shows that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds detailed above. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels for the existing conditions. Impacts would be less than significant.

Opening Year 2024 Conditions

The proposed project's potential offsite traffic noise impacts have been calculated through a comparison of the opening year 2024 scenario to the opening year 2024 with project scenario. The results of this comparison are shown in Table O.

Table O – Opening Year 2024 Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]			
Roadway	Segment	Year 2024	Year 2024 Plus Project	Project Contribution	Increase Threshold[2]
Sumner Avenue	North of Schleisman Road	63.3	63.4	0.1	+2 dBA
Sumner Avenue	South of Schleisman Road	67.8	67.9	0.1	+1 dBA
Sumner Avenue	South of Orange Street	64.7	64.7	0.0	+1 dBA
Scholar Way	North of Schleisman Road	59.7	59.7	0.0	+2 dBA
Scholar Way	South of Schleisman Road	60.5	60.6	0.1	+2 dBA
Scholar Way	South of Orange Street	60.6	60.6	0.0	+2 dBA
Scholar Way	South of Baltimore Street	59.4	59.5	0.1	+3 dBA
Hamner Avenue	North of Schleisman Road	67.3	67.3	0.0	+1 dBA
Hamner Avenue	South of Schleisman Road	66.4	66.4	0.0	+1 dBA
Schleisman Road	West of Sumner Avenue	67.1	67.1	0.0	+1 dBA
Schleisman Road	East of Sumner Avenue	64.0	64.0	0.0	+2 dBA
Schleisman Road	West of Scholar Way	64.0	64.0	0.0	+2 dBA
Schleisman Road	East of Scholar Way	63.6	63.6	0.0	+2 dBA
Orange Street	East of Sumner Avenue	53.6	54.1	0.5	+5 dBA
Orange Street	West of Scholar Way	50.6	51.0	0.4	+5 dBA

Notes:
[1] Distance to nearest residential use shown in Table I, does not take into account existing noise barriers.
[2] Increase Threshold obtained from the FTA's allowable noise impact exposures detailed above in Table A.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table O shows that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds detailed above. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels for the opening year 2024 conditions. Impacts would be less than significant.

Future Year 2040 Conditions

The proposed project's potential offsite traffic noise impacts have been calculated through a comparison of the future year 2040 scenario to the future year 2040 with project scenario. The results of this comparison are shown in Table P.

Table P – Future Year 2040 Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]			
Roadway	Segment	Year 2040	Year 2040 Plus Project	Project Contribution	Increase Threshold[2]
Sumner Avenue	North of Schleisman Road	63.6	63.6	0.0	+2 dBA
Sumner Avenue	South of Schleisman Road	68.3	68.3	0.0	+1 dBA
Sumner Avenue	South of Orange Street	64.9	64.9	0.0	+1 dBA
Scholar Way	North of Schleisman Road	59.8	59.8	0.0	+2 dBA
Scholar Way	South of Schleisman Road	60.5	60.7	0.2	+2 dBA
Scholar Way	South of Orange Street	60.9	60.9	0.0	+2 dBA
Scholar Way	South of Baltimore Street	59.6	59.7	0.1	+2 dBA
Hamner Avenue	North of Schleisman Road	67.4	67.4	0.0	+1 dBA
Hamner Avenue	South of Schleisman Road	66.6	66.6	0.0	+1 dBA
Schleisman Road	West of Sumner Avenue	68.9	68.9	0.0	+1 dBA
Schleisman Road	East of Sumner Avenue	68.2	68.2	0.0	+1 dBA
Schleisman Road	West of Scholar Way	68.8	68.8	0.0	+1 dBA
Schleisman Road	East of Scholar Way	67.8	67.9	0.1	+1 dBA
Orange Street	East of Sumner Avenue	54.5	55.0	0.5	+5 dBA
Orange Street	West of Scholar Way	50.9	51.2	0.3	+5 dBA

Notes:
[1] Distance to nearest residential use shown in Table I, does not take into account existing noise barriers.
[2] Increase Threshold obtained from the FTA's allowable noise impact exposures detailed above in Table A.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table P shows that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds detailed above. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels for the future year 2040 conditions. Impacts would be less than significant.

Noise Impacts to the Proposed Homes

The proposed project would consist of a residential development with 41 single-family homes. The proposed development would be adjacent to Schleisman Road to the north and adjacent to Eastvale Elementary School to the east, which may create exterior and interior noise levels in excess of City standards at the proposed homes. The roadway noise impacts and non-transportation noise impacts have been analyzed separately below.

Non-Transportation Noise Impacts to Proposed Homes

The noise impacts from Eastvale Elementary School are controlled by General Plan Policy N-7 that provides the City's standards for maximum exterior non-transportation noise levels. For the proposed single-family homes, General Plan Policy N-7 provides a noise standard of 60 dBA between7 a.m. to 10 p.m. and 50 dBA between 10 p.m. to 7 a.m. at the exterior of the proposed single-family homes.

Noise Measurement 2 (see Table G above) is most representative of the noise created from the school, since it was located on the shared property line with the School, is in close proximity to the outdoor lunch area and playgrounds, and there are no roads in the immediate vicinity of Noise Measurement 2. Noise Measurement 2 recorded noise levels of 56.2 dBA Leq between 7 a.m. to 10 p.m. and 49.1 dBA Leq between 10 p.m. to 7 a.m.. As such, the noise created from the outdoor areas of the School are below the City's non-transportation exterior noise standards for single-family homes provided in General Plan Policy N-7. Therefore, the non-transportation noise impacts created from Eastvale Elementary School to the proposed homes would be within the City noise standards. Impacts would be less than significant.

Roadway Noise Impacts to Proposed Homes

The north side of the proposed development would be adjacent to Schleisman Road. General Plan Policy N-6 requires exterior noise levels for new residential uses to be mitigated to the levels shown above in Table C that shows the "Completely Compatible" noise standard of less than 60 dBA, "Tentatively Compatible" 60 to 70 dBA, "Normally Incompatible" 70 to 75 dBA, and "Completely Incompatible" greater than 75 dBA. General Plan Policy N-11 requires developers of new residential uses where the noise exceeds the "Completely Compatible" noise standard to ensure acceptable exterior and interior noise levels. General Plan Policy N-10 details that the maximum acceptable interior noise level from roadway noise sources is 45 dBA CNEL.

It is anticipated that the primary source of noise impacts to the project site will be traffic noise from Schleisman Road that is adjacent to the north side of the project site. The proposed homes will also experience some background traffic noise impacts from the proposed project's internal roadways and from Orange Street that is adjacent to the south side of the project site. As the traffic on these local streets would consist of low traffic volumes at slower speeds, the traffic noise from these roads would not make a significant contribution to the noise environment. As such, the noise levels from these roads were not analyzed. The FHWA traffic noise prediction model parameters used in this analysis are discussed above in detail in Section 6.2 and the FHWA model printouts are provided in Appendix G. The exterior and interior noise impacts to the proposed homes have been analyzed separately below.

Exterior Noise Impacts to Proposed Homes

The anticipated exterior noise levels have been calculated for the backyards of representative homes that are adjacent to Schleisman Road. For each backyard, the receptor was placed 10 feet behind the wall and 5 feet above the ground, which is based on the roadway noise analysis methodology provided in Appendix I-1 of the County of Riverside General Plan, December 8, 2015, since the City of Eastvale does not provide any roadway noise analysis standards to utilize. The calculated noise levels for backyards that are adjacent to Schleisman Road are shown below in Table R.

Table Q – Proposed Homes Exterior Noise Levels from Schleisman Road

Building Number	Exterior Noise Level Without Sound Walls (dBA CNEL)	Exceed City's 60 dBA CNEL Threshold?	Exterior Noise Level With 6.5 Foot High Sound Wall (dBA CNEL)	Exceed City's 60 dBA CNEL Threshold?
9	68.1	Yes	59.1	No
11	68.1	Yes	59.3	No
13	68.1	Yes	59.6	No
15	68.2	Yes	60.0	No
17	68.1	Yes	59.9	No

Notes:

City's residential 60 dBA CNEL residential exterior noise standard from General Plan Policy N-6.
Source: FHWA RD-77-108 Model.

Table R shows that without a sound wall, that the noise levels at all of the backyards adjacent to Schleisman Road would exceed the City's residential exterior noise standard of 60 dBA CNEL. This would be considered a significant impact.

Mitigation Measure 2 is provided that would require construction of a minimum 6.5 foot high cmu wall on the north side of all backyards that are adjacent to Schleisman Road. As shown in Table R, above, with implementation of Mitigation Measure 2, the proposed homes exterior noise levels would be within the City's 60 dBA CNEL residential exterior noise standard and would result in a less than significant impact.

Interior Noise Impacts to Proposed Homes

To assess the interior noise levels, the same proposed homes analyzed for the exterior private backyard analysis were also analyzed for their interior noise levels. The exterior noise level at the façade of the first and second floors were calculated through use of the same methodology detailed above for the outdoor noise calculations and the results are shown below in Table R. Table R also shows the interior noise levels calculated based on 25 dB of attenuation, which is the minimum exterior to interior noise reduction rate for new homes that are constructed to meet the required California Code of Regulations Title 24, Part 6 building energy-efficiency standards that require the installation of dual-paned windows as well as enhanced insulation requirements. The anticipated noise levels have been calculated at the facades of representative proposed homes to Schleisman Road and the results are shown below in Table R.

Table R – Proposed Homes Interior Noise Levels from Schleisman Road

Building Number	Floor	Road Noise Levels (dBA CNEL)		Exceed 45 dBA Interior Threshold?
		Exterior at Facade	Interior[1]	
9	First	58.9	33.9	No
	Second	66.9	40.4	No
11	First	58.2	33.2	No
	Second	65.4	40.4	No
13	First	58.8	33.8	No
	Second	65.7	40.7	No
15	First	60.0	35.0	No
	Second	66.9	41.9	No
17	First	58.3	33.3	No
	Second	64.3	39.3	No

Notes:
[1] Based on standard dual pane windows and doors with a 26 STC rating, which are required per Title 24 energy saving requirements.
Source: FHWA RD-77-108 Model.

Table R shows that the interior noise level of all homes adjacent to Schleisman Road would be within the City's 45 dBA CNEL interior noise standard. Impacts would be less than significant.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Mitigation Measure 1:

The project applicant shall construct a minimum 6.5-foot high wall on the north side of Lots 9 through 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings.

Level of Significance After Mitigation

Less than significant impact.

7.3 Generation of Excessive Groundborne Vibration

The proposed project would not expose persons to or generation of excessive groundborne vibration or groundborne noise levels. The following section analyzes the potential vibration impacts associated with the construction and operations of the proposed project.

Construction-Related Vibration Impacts

The construction activities for the proposed project are anticipated to include demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses, site preparation and grading of the 10.0 gross acre project site, building construction of the 41 single-family homes, paving of the onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site, and application of architectural coatings.

Vibration impacts from construction activities associated with the proposed project would typically be created from the operation of heavy off-road equipment. The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Section 120.05.130(e) of the Municipal Code provides a vibration standard for new development of any vibration that causes discomfort or annoyance to reasonable persons of normal sensitivity. However Section 120.05.130(e) of the Municipal Code exempts construction activities from this standard. Since neither the Municipal nor the General Plan provide a quantifiable vibration threshold for temporary construction activities, guidance from the *Transportation and Construction-Induced Vibration Guidance Manual*, prepared by Caltrans, April 2020, has been utilized, which defines the threshold of perception from transient sources such as off-road construction equipment at 0.25 inch per second peak particle velocity (PPV).

The primary source of vibration during construction would be from the operation of a bulldozer. From Table L above a large bulldozer would create a vibration level of 0.089 inch per second PPV at 25 feet. The vibration level at the nearest offsite homes (25 feet to west) and school structure (25 feet to east) would be below the 0.25 inch per second PPV threshold detailed above. Impacts would be less than significant.

Operations-Related Vibration Impacts

The proposed project would consist of the development of a residential community. The on-going operation of the proposed project would not include the operation of any known vibration sources other than typical onsite vehicle operations for a residential development. Therefore, a less than significant vibration impact is anticipated from operation of the proposed project.

Level of Significance

Less than significant impact.

7.4 Aircraft Noise

The proposed project may expose people residing in the project area to excessive noise levels from aircraft. The nearest airport is Chino Airport that is located as near as three miles west of the project site. The project site is located outside of the 60 dBA CNEL noise contours of this airport. Therefore, the proposed homes would not be exposed to excessive aircraft noise. Impacts would be less than significant.

Level of Significance

Less than significant impact.

APPENDIX C

RCNM Model Construction Noise Calculation Printouts

Roadway Construction Noise Model (RCNM),Version 1.1

Report date: 1/17/2022
Case Description: Magnolia Ranch - Demolition

---- Receptor #1 ----

Description	Land Use	Baselines (dBA) Daytime	Evening	Night
Nearest Homes to West	Residential	59.5	59.5	51.7

Description	Impact Device	Usage(%)	Equipment Spec Lmax (dBA)	Actual Lmax (dBA)	Receptor Distance (feet)	Estimated Shielding (dBA)
Concrete Saw	No	20		89.6	340	5
Excavator	No	40		80.7	340	5
Excavator	No	40		80.7	340	5
Excavator	No	40		80.7	340	5
Dozer	No	40		81.7	340	5
Dozer	No	40		81.7	340	5

Results

Equipment	Calculated (dBA) *Lmax	Leq	Day Lmax	Noise Limits (dBA) Leq	Evening Lmax	Leq
Concrete Saw	67.9	60.9	N/A	N/A	N/A	N/A
Excavator	59.1	55.1	N/A	N/A	N/A	N/A
Excavator	59.1	55.1	N/A	N/A	N/A	N/A
Excavator	59.1	55.1	N/A	N/A	N/A	N/A
Dozer	60.0	56.0	N/A	N/A	N/A	N/A
Dozer	60.0	56.0	N/A	N/A	N/A	N/A
Total	**68**	**65**	N/A	N/A	N/A	N/A

*Calculated Lmax is the Loudest value.

APPENDIX E

FHWA Model Onsite Traffic Noise Calculation Printouts

FHWA-RD-77-108 HIGHWAY TRAFFIC NOISE PREDICTION MODEL

Road Name: Schleisman Road
Building: Building 9
Project Name: Magnolia Ranch
Job Number: 21003

NOISE MODEL INPUTS

Highway Data

Average Daily Traffic:	33,000 vehicles
Peak Hour Volume:	3,300 vehicles
Vehicle Speed:	45 mph
Near/Far Lane Distance:	78 feet

Vehicle Mix

	Day	Evening	Night	Daily
Autos:	69.5%	12.9%	9.6%	92.0%
Medium Trucks:	1.4%	0.1%	1.5%	3.0%
Heavy Trucks:	2.4%	0.1%	2.5%	5.0%

Site Data

Barrier Height:	**6.5 feet**
Barrier Type(Wall/Berm):	Wall
Site Conditions(Hard/Soft):	Soft
Centerline (C.L.) Dist. to Barrier:	76 feet
C.L. Dist. To Observer (Backyard):	86 feet
Barrier Dist. To Observer (Backyard):	10 feet
C.L. Dist. To Observer (Structure):	97 feet
Barrier Dist. To Observer (Structure):	21 feet
Road Grade:	0.00 %
Left View:	-90 degrees
Right View:	90 degrees

Elevations

Barrier Base Elevation:	615.4 feet
Road Elevation:	611.5 feet
Noise Source Elevation above Road	
Autos:	0 feet
Med Trucks:	2.3 feet
Hvy Trucks:	8 feet
Pad Elevation:	615.4 feet
Observer Heights Above Pad Elevation	
Exterior:	5 feet
First Floor:	5.5 feet
Second Floor:	14 feet

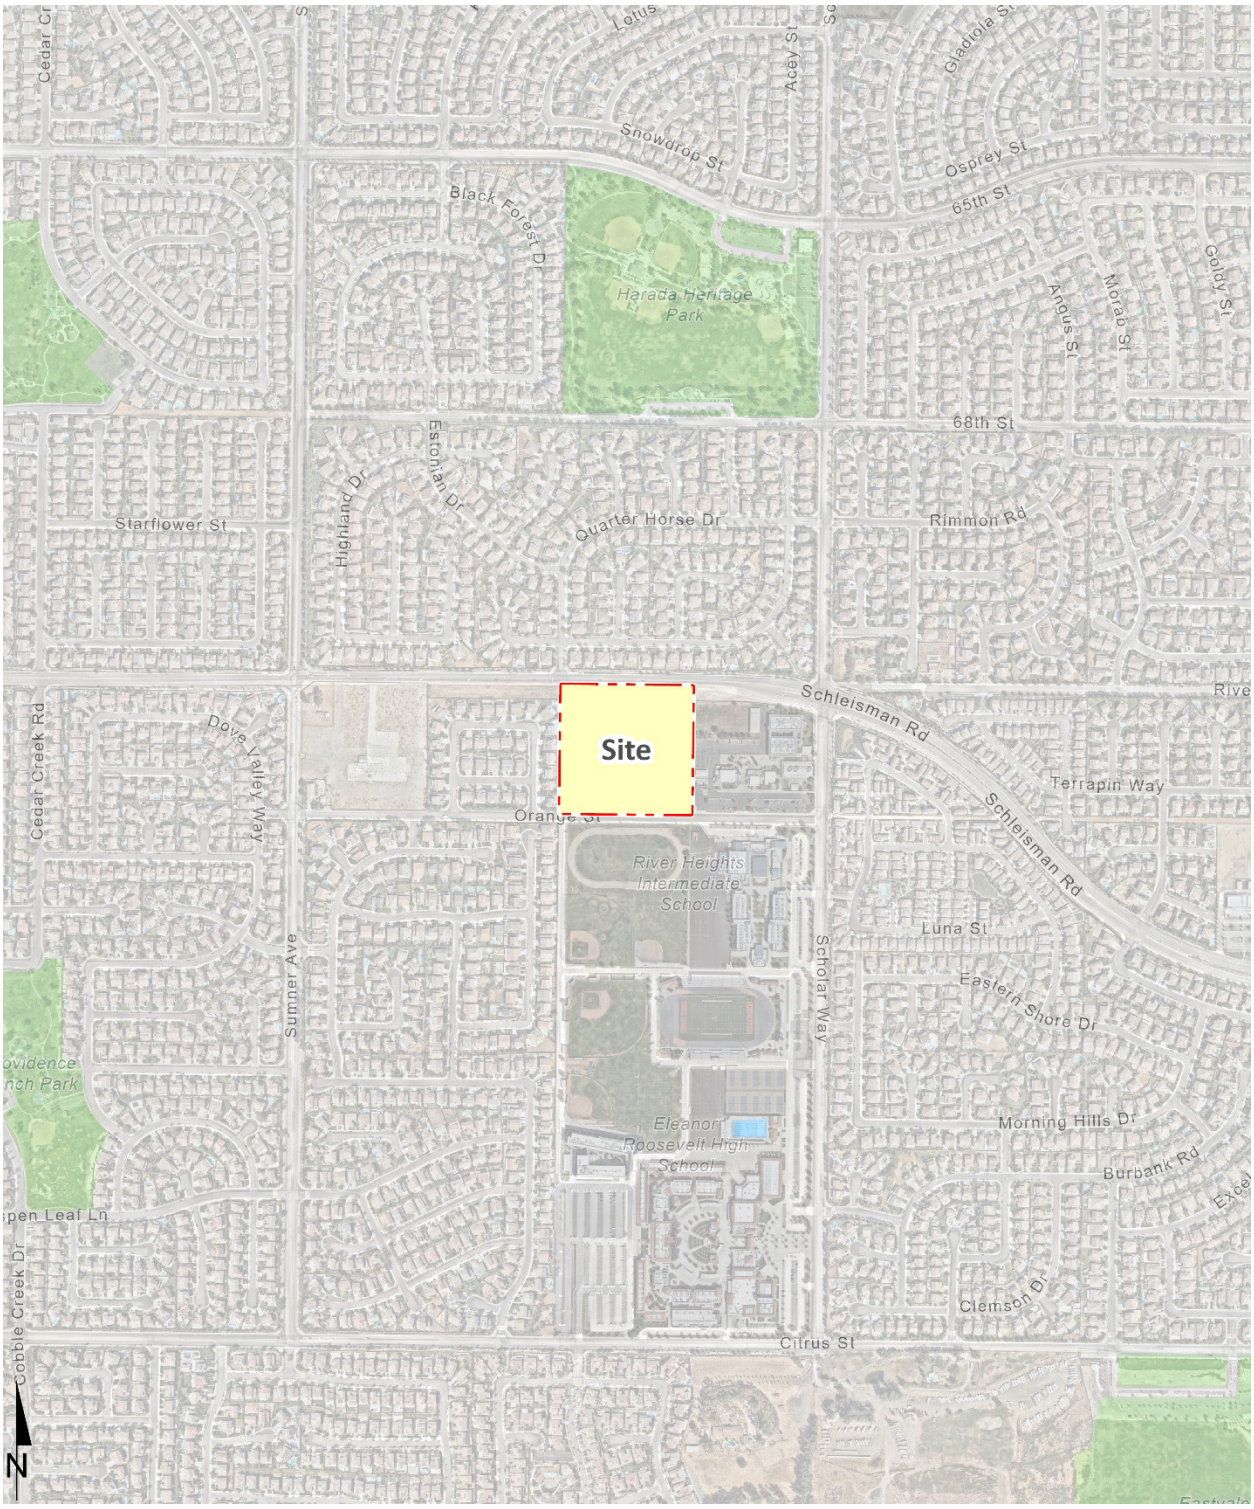
1 INTRODUCTION

This report presents the results of the traffic analysis (**TA**) for the proposed Magnolia Ranch development (**Project**), which is bounded by Schleisman Road to the north and Orange Street to the south in the City of Eastvale. The Project's location relative to the surrounding area is shown on Exhibit 1-1.

The purpose of this TA is to evaluate the potential circulation system deficiencies that may result from the development of the proposed Project, and to recommend improvements to achieve acceptable circulation system operational conditions. As directed by City of Eastvale staff, this traffic study has been prepared in accordance with the County of Riverside Transportation Analysis Guidelines for Level of Service Vehicle Miles Traveled, and consultation with City staff during the scoping process. (1) The approved Project Traffic Study Scoping agreement is provided in Appendix 1.1 of this TA.



1.1 SUMMARY OF FINDINGS

The Project is to construct the following improvements as design features in conjunction with development of the site:

- Project to install stop sign for egress traffic from the proposed Project at Driveway 1 on Orange Street, which is proposed for full access.
- The Project will construct Orange Street from the western Project boundary to the eastern Project boundary at its ultimate half-section width as a 2-lane Collector (ultimate 74-foot right-of-way) in compliance with the circulation recommendations found in the City of Eastvale's General Plan.

Additional details and intersection lane geometrics are provided in Section 1.7 *Recommendations* of this report. The addition of Project traffic is not anticipated to result in any operational deficiencies at the study area intersections under any of the future traffic conditions.

EXHIBIT 1-1: LOCATION MAP

1.2 PROJECT OVERVIEW

Exhibit 1-2 illustrates the preliminary site plan. As indicated on Exhibit 1-2, the Project is proposed to consist of up to 41 single family detached residential units. Regional access to the Project site is available via the I-15 Freeway at Limonite Avenue interchange. Vehicular traffic access will be provided via the following driveway:

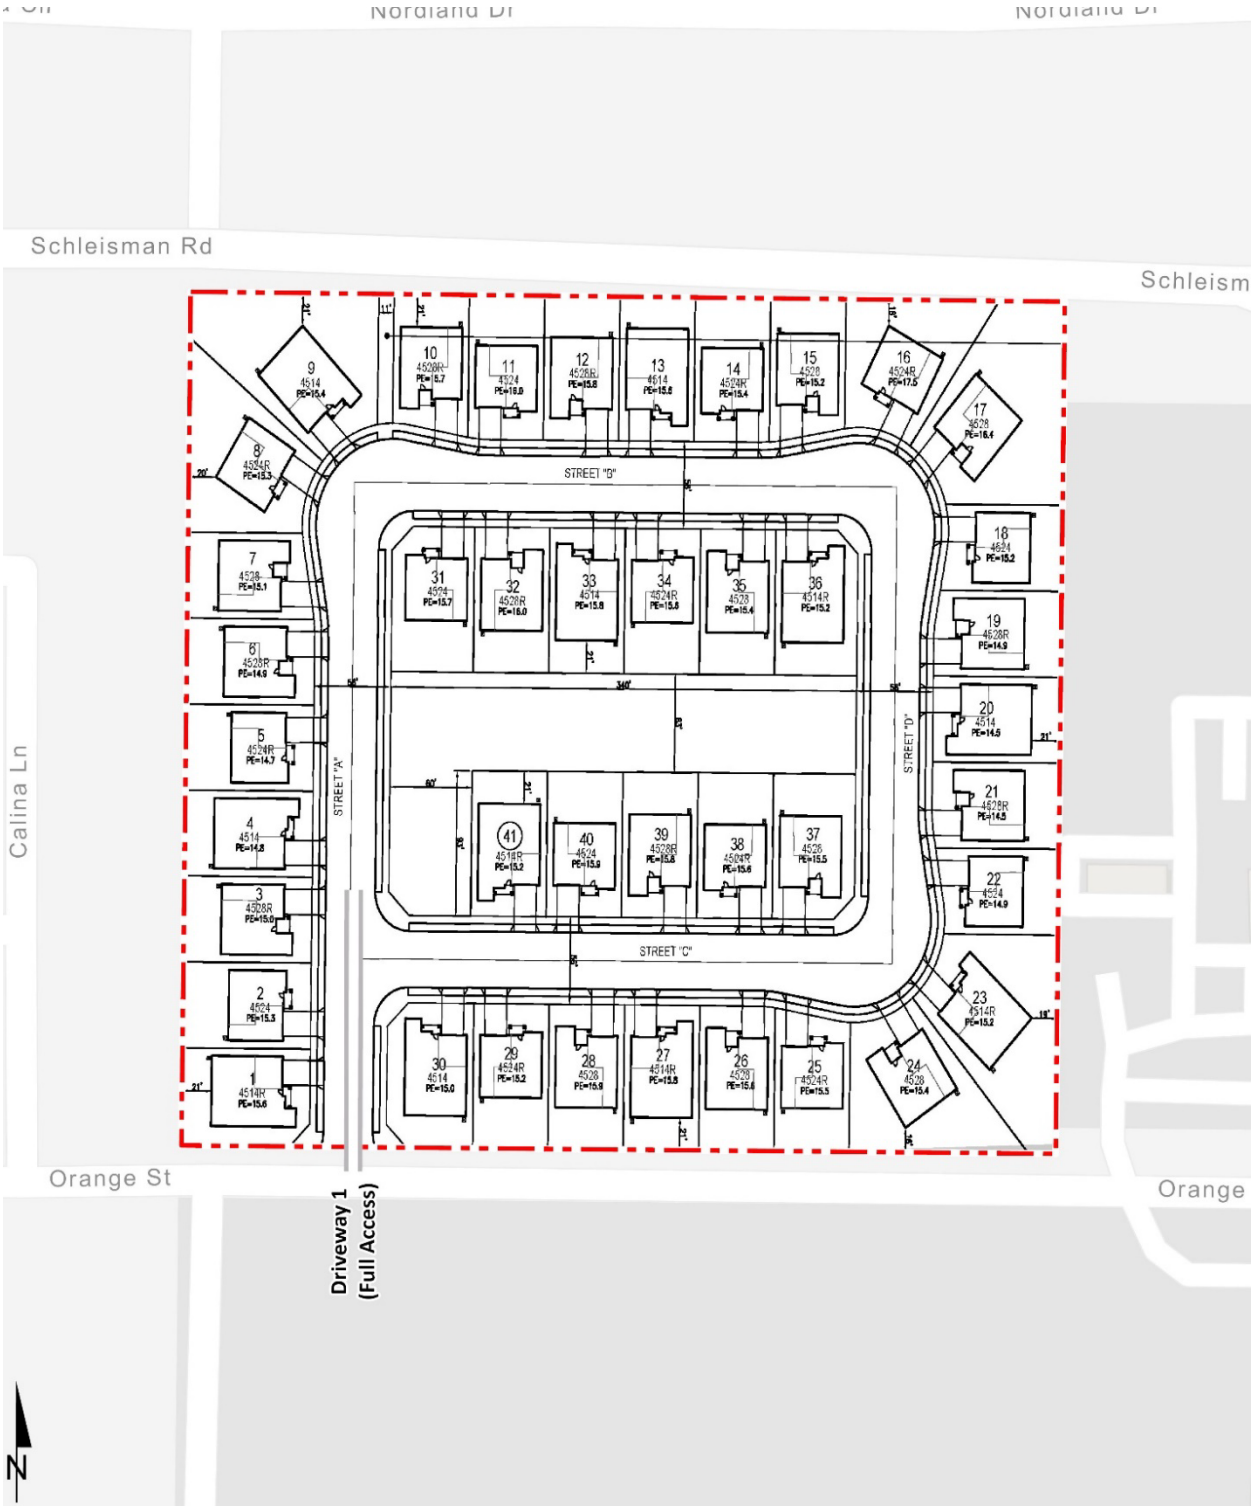
- Driveway 1 via Orange Street – Full access

Trips generated by the Project's proposed land uses have been estimated based on trip generation rates collected by the Institute of Transportation Engineers (**ITE**) Trip Generation Manual, 11th Edition, 2017. (2) The proposed Project is anticipated to generate a total of 388 vehicle trip-ends per day with 28 AM peak hour trips and 38 PM peak hour trips. The assumptions and methods used to estimate the Project's trip generation characteristics are discussed in greater detail in Section 4.1 *Project Trip Generation* of this report.

1.3 ANALYSIS SCENARIOS

For the purposes of this traffic study, potential deficiencies to traffic and circulation have been assessed for each of the following conditions:

- Existing (2021) Conditions
- Existing plus Project (**E+P**) Conditions
- Opening Year Cumulative (2025) Without Project Conditions
- Opening Year Cumulative (2025) With Project Conditions
- Horizon Year (2040) Without Project Conditions
- Horizon Year (2040) With Project Conditions



1.3.1 EXISTING (2021) CONDITIONS

Information for Existing (2021) conditions is disclosed to represent the baseline traffic conditions as they existed at the time this report was prepared. Due to the currently ongoing COVID-19 pandemic, the traffic counts utilized for the purposes of this analysis relied on both historic data and adjusted 2021 count data. Details on adjustments to the existing traffic counts are discussed in Section 3.5 *Existing (2021) Traffic Counts* of this TA.

1.3.2 EXISTING PLUS PROJECT CONDITIONS

The E+P analysis determines circulation system deficiencies that would occur on the existing roadway system in the scenario of the Project being placed upon Existing conditions. The E+P analysis is intended to identify the project-specific traffic deficiencies associated solely with the development of the proposed Project based on a comparison of the E+P traffic conditions to Existing (2021) conditions.

EXHIBIT 1-2: PRELIMINARY SITE PLAN

1.3.3 OPENING YEAR CUMULATIVE CONDITIONS

The Opening Year Cumulative traffic conditions analysis determines the potential near-term cumulative circulation system deficiencies. To account for background traffic growth, traffic associated with other known cumulative development projects in conjunction with an ambient growth factor from Existing conditions of 6.81 (for 2025 conditions – 1.6 percent per year compounded over 4 years) are included for Opening Year Cumulative traffic conditions. This list was compiled from information provided by the City of Eastvale.

1.3.4 HORIZON YEAR (2040) CONDITIONS

Traffic projections for Horizon Year Without Project conditions were derived from the Riverside Transportation Analysis Model (**RivTAM**) for study area intersections located in Riverside County. The Horizon Year conditions analysis will be utilized to determine if improvements funded through regional transportation mitigation fee programs, such as the Western Riverside Council of Governments Transportation Uniform Mitigation Fee (**TUMF**), City of Eastvale Development Impact Fee (**DIF**) programs, or other approved funding mechanism (e.g., Mira Loma Road and Bridge Benefit District (**RBBD**), etc.) can accommodate the long-range cumulative traffic at the target Level of Service (**LOS**) identified in the City of Eastvale (lead agency) General Plan. (3) Other improvements needed beyond the "funded" improvements (such as localized improvements to non-TUMF, non-DIF, or non-RBBD facilities) are identified as such.

1.4 STUDY AREA

To ensure that this TA satisfies the City of Eastvale's traffic study requirements, Urban Crossroads, Inc. prepared a project traffic study scoping package for review by City staff prior to the preparation of this report. The Agreement provides an outline of the Project study area, trip generation, trip distribution, and analysis methodology (see Appendix 1.1).

1.4.1 INTERSECTIONS

The following 8 study area intersections shown on Exhibit 1-3 and listed in Table 1-1 were selected for this TA based on consultation with City of Eastvale staff. The "50 peak hour trip" criterion utilized by the City of Eastvale is consistent with the methodology employed by the County of Riverside, and generally represents a minimum number of trips at which a typical intersection would have the potential to be substantively deficient by a given development proposal. Although each intersection may have unique operating characteristics, this traffic engineering rule of thumb is a widely utilized tool for estimating a potential area of analysis (i.e., study area).

EXHIBIT 1-3: STUDY AREA

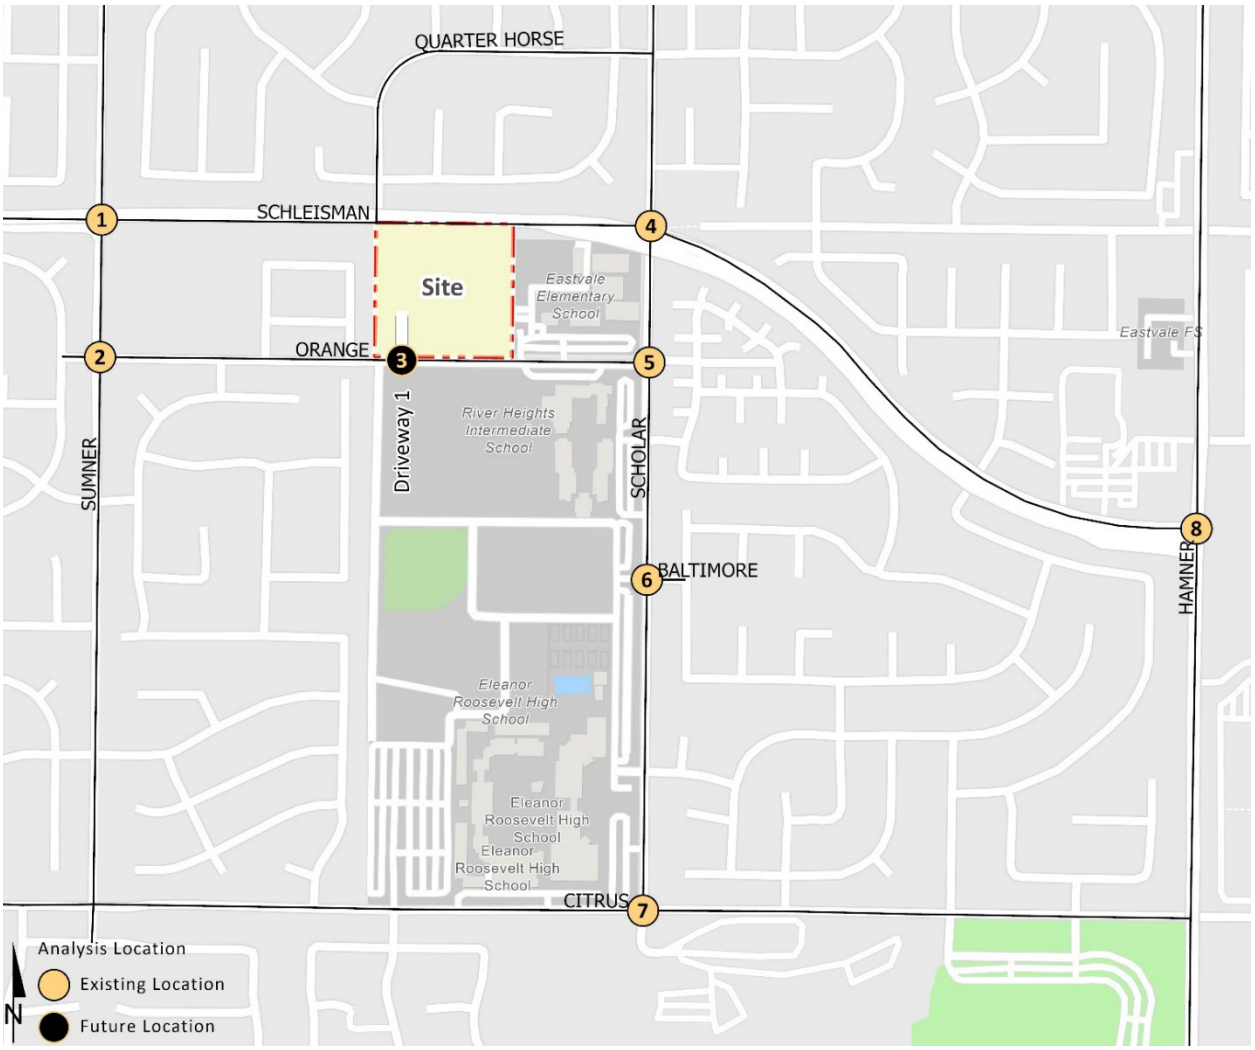


TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS

#	Intersection	Jurisdiction	CMP?
1	Sumner Av. & Schleisman Rd.	Eastvale	No
2	Sumner Av. & Orange St.	Eastvale	No
3	Driveway 1 & Orange St.	Eastvale	No
4	Scholar Wy. & Schleisman Rd.	Eastvale	No
5	Scholar Wy. & Orange St.	Eastvale	No
6	Scholar Wy. & Baltimore St.	Eastvale	No
7	Scholar Wy. & Citrus St.	Eastvale	No
8	Hamner Av. & Schleisman Rd.	Eastvale	No

The intent of a Congestion Management Program (**CMP**) is to more directly link land use, transportation, and air quality, thereby prompting reasonable growth management programs that will effectively utilize new transportation funds, alleviate traffic congestion and related deficiencies, and improve air quality. The County of Riverside CMP became effective with the passage of Proposition 111 in 1990 and updated most recently updated in 2011. The Riverside County Transportation Commission (**RCTC**) adopted the 2011 CMP for the County of Riverside in December 2011. (4) No study area intersections are CMP intersections.

1.5 SENATE BILL 743 – VEHICLE MILES TRAVELED (VMT)

Senate Bill 743 (**SB 743**), approved in 2013, endeavors to change the way transportation impacts will be determined according to the California Environmental Quality Act (**CEQA**). The Office of Planning and Research (**OPR**) has recommended the use of vehicle miles traveled (**VMT**) as the replacement for automobile delay-based LOS. In December 2018, the Natural Resources Agency finalized updates to CEQA Guidelines to incorporate SB 743 (i.e., VMT). The VMT thresholds and methodology outlined in the City's TA guidelines will be utilized to conduct the VMT analysis for the Project. The City's TA Guidelines provides details on appropriate screening thresholds that can be used to identify when a proposed land use project is anticipated to result in a less than significant impact without conducting a more detailed project level analysis. Based on our review of applicable VMT screening thresholds, the proposed Project meets the screening thresholds and would therefore be assumed to result in a less than significant VMT impact; no additional VMT analysis is required. The VMT screening thresholds are provided in Appendix 1.1.

1.6 DEFICIENCIES

This section provides a summary of deficiencies by analysis scenario. Section 2 *Methodologies* provides information on the methodologies used in the analysis and Section 5 *E+P Traffic Conditions*, Section 6 *Opening Year Cumulative (2025) Traffic Conditions*, and Section 7 *Horizon Year (2040) Traffic Conditions* includes the detailed analysis. A summary of LOS results for all analysis scenarios is presented on Table 1-2.

TABLE 1-2: SUMMARY OF DEFICIENT INTERSECTIONS BY ANALYSIS SCENARIO

= A - D = E = F

1.6.1 EXISTING (2021) CONDITIONS

The following study area intersection is anticipated to operate at a deficient LOS during one or both peak hours for Existing traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

1.6.2 E+P CONDITIONS

The following study area intersection is anticipated continue to operate at a deficient LOS during one or both peak hours for E+P traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

1.6.3 OPENING YEAR CUMULATIVE (2025) CONDITIONS

The following study area intersection is anticipated to operate at a deficient LOS during one or both peak hours for Opening Year Cumulative (2025) Without Project traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

There are no additional study area intersections anticipated to operate at an unacceptable LOS with the addition of Project traffic under Opening Year Cumulative (2025) With Project traffic conditions.

1.6.4 HORIZON YEAR (2040) CONDITIONS

The following study area intersection is anticipated to operate at a deficient LOS during one or both peak hours under Horizon Year (2040) Without Project traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM and PM peak hours

There are no additional study area intersections anticipated to operate at an unacceptable LOS with the addition of Project traffic under Horizon Year (2040) With Project traffic conditions.

1.7 RECOMMENDATIONS

1.7.1 SITE ADJACENT AND SITE ACCESS RECOMMENDATIONS

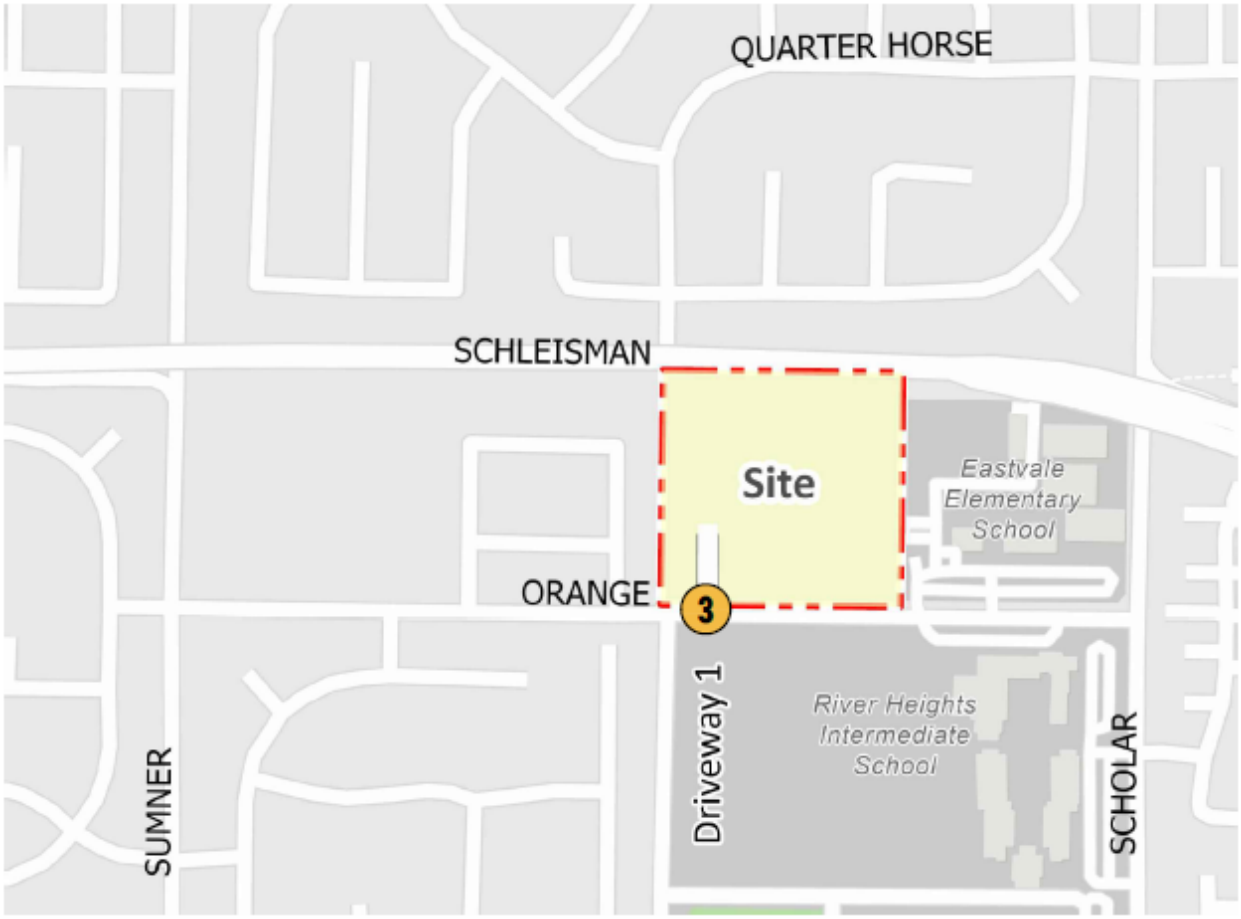
The following recommendations are based on the improvements needed to accommodate site access. The site adjacent recommendations are shown on Exhibit 1-4.

Recommendation 1 – Driveway 1 & Orange Street (#4) – The following improvements are necessary to accommodate site access:

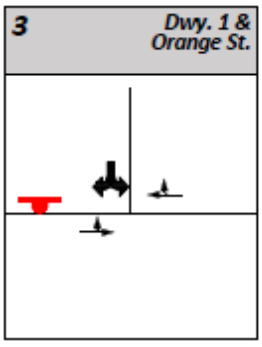
- Project to install a stop control for the southbound exiting Project traffic with a shared left-right turn lane.
- Project to restripe the existing eastbound through lane to provide an eastbound shared left-through lane.

Recommendation 2 – **Orange Street** – Orange Street is an east-west oriented roadway located along the southern boundary of the Project. Project to construct Orange Street from the western Project boundary to the eastern Project boundary at its ultimate half-section width as a 2-lane Collector (ultimate 74-foot right-of-way) in compliance with the circulation recommendations found in the City of Eastvale's General Plan.

Wherever necessary, roadways adjacent to the Project, site access points and site-adjacent intersections will be constructed to be consistent with the identified roadway classifications and respective cross-sections in the City of Eastvale General Plan Circulation Element.



On-site traffic signing and striping should be implemented in compliance with the provisions of the California Department of Transportation (Caltrans) California Manual on Uniform Traffic Control Devices (CA MUTCD) and in conjunction with detailed construction plans for the Project site.



Sight distance at each project access point should be reviewed with respect to standard Caltrans and City of Eastvale sight distance standards at the time of preparation of final grading, landscape, and street improvement plans.

1.7.2 OFF-SITE RECOMMENDATIONS

The recommended improvements needed to address the cumulative deficiencies identified under Existing (2021), E+P, Opening Year Cumulative (2025), and Horizon Year (2040) traffic conditions are shown in Table 1-3. For those improvements listed in Table 1-3 and not constructed as part of the Project, the Project Applicant's responsibility for the Project's contributions towards deficient intersections is fulfilled through payment of fees or fair share that would be assigned to construction of the identified recommended improvements.

EXHIBIT 1-4: SITE ACCESS RECOMMENDATIONS

= Stop Sign Improvement
= Existing Lane
= Lane Improvement

TABLE 1-3: SUMMARY OF IMPROVEMENTS AND ROUGH ORDER OF MAGNITUDE COSTS

#	Intersection	Jurisdiction	E+P	2025 With Project	Horizon Year (2040) With Project	Improvements in County DIF?[1]	Project Responsibility[2]	Total Cost[3,4]	Fair Share %[5]	Fair Share Cost[6]
1	Sumner Av. & Schleisman Rd.	Eastvale	Restripe the EB and WB lanes to accommodate 1 left turn lane and 1 shared through-right lane	Same	Same	No	Fair Share	$40,300	0.63%	$255
					Add 2nd NB through lane	No	Fair Share	$290,160		$1,838
					Add 2nd EB through lane	No	Fair Share	$290,160		$1,838
					Add 2nd WB through lane	No	Fair Share	$290,160		$1,838
					Add a WB left turn lane	No	Fair Share	$80,600		$511
							Total	$991,380		$6,280
							Total Costs for Horizon Year Improvements	**$991,380**		**$6,280**
							Total Project Fair Share Contribution to the City of Eastvale[7]			**$6,280**

[1] Improvements included in City of Eastvale DIF program for local and regional components.

[2] Identifies the Project's responsibility to construct an improvement or contribute fair share or fee payment towards the implementation of the improvement shown.

[3] Costs have been estimated using the data provided in Appendix "G" of the CMP for preliminary construction costs.

[4] Appendix "G" costs escalated by a factor of 1.612 except Traffic Signals.

[5] Program improvements constructed by project may be eligible for fee credit, at discretion of City. See Table 8-1 for Fair Share Calculations.

[6] Rough order of magnitude cost estimate.

[7] Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Eastvale.

1.8 QUEUING ANALYSIS

A queuing analysis was conducted along the site adjacent roadways of Orange Street, Schleisman Road, and at the Project driveways for Horizon Year (2040) traffic conditions to determine the turn pocket lengths and lane geometric necessary to accommodate long-term 95th percentile queues and recommend storage lengths for the turning movements shown on Exhibit 1-4. The analysis was conducted for the weekday AM and weekday PM peak hours using the SimTraffic modeling software. The Horizon Year (2040) queuing results are provided in Table 1-4 and Appendix 7.5 of this TA.

SimTraffic is designed to model networks of signalized and unsignalized intersections, with the primary purpose of checking and fine-tuning signal operations. SimTraffic uses the input parameters from Synchro (Version 11) to generate random simulations. The 95th percentile queue is not necessarily ever observed; it is simply based on statistical calculations (or Average Queue plus 1.65 standard deviations). The random simulations generated by SimTraffic have been utilized to determine the 95th percentile queue lengths observed for each turn lane. A SimTraffic simulation has been recorded 5 times, during the weekday AM and weekday PM peak hours, and has been seeded for 30-minute periods with 60-minute recording intervals.

As shown in Table 1-4, the available storage area would be able to accommodate Horizon Year (2040) With Project 95th percentile queues.

TABLE 1-4: QUEUING ANALYSIS FOR HORIZON YEAR (2040) CONDITIONS

#	Intersection	Movement	Available Stacking Distance (Feet)	95th Percentile Queue (Feet) AM Peak Hour	95th Percentile Queue (Feet) PM Peak Hour	Acceptable? [1] AM	Acceptable? [1] PM
4	Driveway 1 & Orange St.	EBL/T	1,500	0	10	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown in this table, where applicable.

2 METHODOLOGIES

This section of the report presents the methodologies used to perform the traffic analyses summarized in this report. The methodologies described are generally consistent with City of Eastvale traffic study guidelines.

2.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (**LOS**). LOS is a qualitative description of traffic flow based on several factors such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

2.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The Highway Capacity Manual (**HCM**) methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. (5) The HCM uses different procedures depending on the type of intersection control.

2.2.1 SIGNALIZED INTERSECTIONS

The City of Eastvale requires signalized intersection operations analysis based on the methodology described in the HCM. (5) Intersection LOS operations are based on an intersection's average control delay. Control delays include initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 2-1. A saturation flow rate of 1900 has been utilized for all study area intersections located within the County of Riverside. The traffic modeling and signal timing optimization software package Synchro (Version 11) has been utilized to analyze signalized intersections within the City of Eastvale.

The peak hour traffic volumes have been adjusted using a peak hour factor (**PHF**) to reflect peak 15-minute volumes. Common practice for LOS analysis is to use a peak 15-minute rate of flow. However, flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g., PHF = [Hourly Volume] / [4 x Peak 15-minute Flow Rate]). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. Existing PHFs have been used for all analysis scenarios. New intersections utilize a PHF of 0.92. Per the HCM, PHF values over 0.95 often are indicative of high traffic volumes with capacity constraints on peak hour flows while lower PHF values are indicative of greater variability of flow during the peak hour. (5)

TABLE 2-1: SIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0[1]
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.	80.01 and up	F

Source: HCM, 6th Edition

[1] If V/C is greater than 1.0 then LOS is F per HCM.

2.2.2 UNSIGNALIZED INTERSECTIONS

The City of Eastvale requires the operations of unsignalized intersections be evaluated using the methodology described in the HCM. (5) The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 2-2). At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. The worst delay and associated LOS for a controlled movement is utilized for the overall intersection delay and LOS for two-way stop-controlled intersections. For all-way stop controlled intersections, LOS is computed for the intersection as a whole (average delay).

TABLE 2-2: UNSIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0[1]
Little or no delays.	0 to 10.00	A
Short traffic delays.	10.01 to 15.00	B
Average traffic delays.	15.01 to 25.00	C
Long traffic delays.	25.01 to 35.00	D
Very long traffic delays.	35.01 to 50.00	E
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F

Source: HCM, 6th Edition

[1] If V/C is greater than 1.0 then LOS is F per HCM.

2.3 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by Caltrans and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TA update uses the signal warrant criteria presented in the latest edition of the Caltrans' California Manual on Uniform Traffic Control Devices (**CA MUTCD**), for all applicable study area intersections. (6) As shown in Table 2-3, traffic signal warrant analyses were performed for the following unsignalized study area intersection based on the average daily traffic (Figure 4C-103 (CA) of the CA MUTCD): (6)

TABLE 2-3: TRAFFIC SIGNAL WARRANT ANALYSIS LOCATIONS

#	Intersection	Jurisdiction
3	Driveway 1 & Orange St.	Eastvale

The traffic signal warrant analyses are presented in Section 5 *E+P Traffic Conditions*, Section 6 *Opening Year Cumulative (2025) Traffic Conditions*, and Section 7 *Horizon Year (2040) Traffic Conditions* of this report. It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with LOS. An intersection may satisfy a signal warrant condition and operate at or above acceptable LOS or operate below acceptable LOS and not meet a signal warrant.

2.4 MINIMUM ACCEPTABLE LEVELS OF SERVICE (LOS)

The City of Eastvale General Plan Policy C-10 sets a standard of LOS C with LOS D as acceptable in commercial and employment areas and at intersections of any combination of major highways, urban arterials, secondary highways, or freeway ramps. Based on this criterion, where feasible, LOS D is the minimum acceptable LOS at each of the study intersections within the City of Eastvale.

2.5 DEFICIENCY CRITERIA

This section outlines the methodology used in this analysis related to identifying circulation system deficiencies.

For the study area intersections that lie within the City of Eastvale, Project related deficiencies will be identified by comparing the "Without Project" condition to the "With Project" condition based on the following criteria:

- If the LOS deteriorates from acceptable LOS (LOS D or better) to unacceptable LOS (LOS E or F); or
- If the intersection is already operating at an unacceptable LOS (LOS E or F) in Without Project conditions and the addition of Project traffic increases the delay by more than 2.5 seconds.

Based on discussions with City staff, when the pre-Project condition is already below LOS D (i.e., unacceptable LOS), the Project will be responsible for improving its deficiencies to a level of service equal to or better than it was under pre-project traffic conditions for intersections that receive 50 or more project-related peak hour trips. This is a standard protocol in many urban jurisdictions to meet the circulation policies outlined in the respective General Plans. Thus, for intersections currently operating at unacceptable LOS during either the AM and/or PM peak hour under Without Project traffic conditions, improvements have been identified to bring the project's effect to a deficient intersection LOS that is equal to or better than pre-Project conditions.

Cumulative traffic deficiencies are created as a result of a combination of the proposed Project together with other future developments contributing to the overall traffic deficiencies requiring additional improvements to maintain acceptable level of service operations with or without the Project. A project's contribution to a cumulative deficiency can be improved if the project is required to implement or fund its fair share of improvements designed to alleviate its contribution to the deficiency. A deficiency has been deemed cumulatively considerable if the project contributes 50 or more peak hour trips.

2.6 PROJECT FAIR SHARE CALCULATION METHODOLOGY

Improvements found to be included in the TUMF and/or DIF will be identified as such. For improvements that do not appear to be in either of the pre-existing fee programs, a fair share contribution based on the Project's proportional share may be imposed in order to address the Project's share of deficiencies in lieu of construction. It should be noted that fair share calculations are for informational purposes only and the City Traffic Engineer will determine the appropriate improvements to be implemented by a project (to be identified in the conditions of approval). The Project's fair share contribution is determined based on the following equation, which is the ratio of Project traffic to net new traffic (where net new traffic is the future traffic less existing traffic):

Project Fair Share % = Project Traffic / (2040 With Project Total Traffic – Existing Traffic)

3 AREA CONDITIONS

This section provides a summary of the existing circulation network, the City of Eastvale General Plan Circulation Network, and a review of existing peak hour intersection operations and traffic signal warrant analyses.

3.1 EXISTING CIRCULATION NETWORK

Pursuant to the agreement with City of Eastvale staff (Appendix 1.1), the study area includes a total of 8 existing and future intersections as shown previously on Exhibit 1-2. Exhibit 3-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls.

3.2 CITY OF EASTVALE GENERAL PLAN CIRCULATION ELEMENT

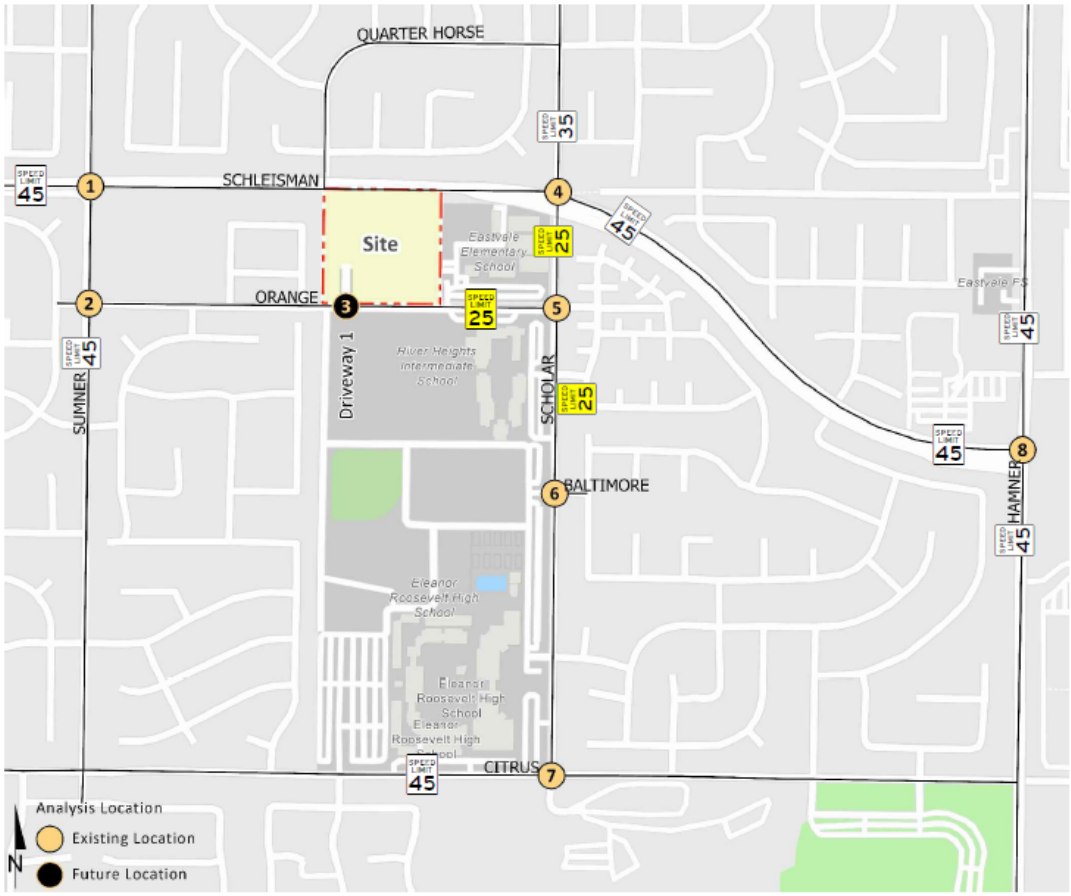
As noted previously, the Project site is located within the City of Eastvale. The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified on the City of Eastvale General Plan Circulation Element, are described subsequently. Exhibit 3-2 shows the City of Eastvale General Plan Circulation Element, and Exhibit 3-3 illustrates the City of Eastvale General Plan roadway cross-sections.

The study area roadways that are classified as 6-lane Urban Arterials are identified as having three lanes of travel in each direction. The following study area roadways within the City of Eastvale are classified as 6-lane Urban Arterials:

- Schleisman Road
- Hamner Avenue

The study area roadway that is classified as a 2-lane Major Collector is identified as having one lane of travel in each direction. The following study area roadway is classified as a 2-lane Major Collector:

- Sumner Avenue



The study area roadways that are classified as 2-lane Secondary Collectors are identified as having one lane of travel in each direction. The following study area roadways are classified as Secondary Collectors:

- Scholar Way
- Citrus Street

The study area roadway that is classified as a 2-lane Local Road is identified as having one lane of travel in each direction. The following study area roadways are classified as Local Roads:

- Orange Street

3.3 BICYCLE & PEDESTRIAN FACILITIES

Exhibit 3-4 illustrates the City of Eastvale current and future trails and bikeway systems which proposes off-street Class I multi-use trails along Schleisman Road. On-street Class II bike lanes are also proposed along Orange Street near the vicinity of the site. Existing pedestrian facilities within the study area are shown on Exhibit 3-5.

3.4 TRANSIT SERVICE

The Riverside Transit Authority (**RTA**) serves the City of Eastvale. Transit service is reviewed and updated by RTA periodically to address ridership, budget, and community demand needs. Based on a review of the existing transit routes within the vicinity of the proposed Project, RTA Route 3 currently operates on 68th Street, Sumner Avenue, and Citrus Street. Existing transit routes in the vicinity of the study area are illustrated on Exhibit 3-6. Changes in land use can affect these periodic adjustments which may lead to either enhanced or reduced service where appropriate.

3.5 EXISTING (2021) TRAFFIC COUNTS

The intersection LOS analysis is based on the traffic volumes observed during the peak hour conditions using traffic count data collected in October 2016, February 2018, January 2019, and January 2021. The following peak hours were selected for analysis:

- Weekday AM Peak Hour (peak hour between 7:00 AM and 9:00 AM)
- Weekday PM Peak Hour (peak hour between 4:00 PM and 6:00 PM)

Due to the currently ongoing COVID-19 pandemic, schools and businesses within the study area were closed or operating at less than full capacity at the time this study was prepared. As such, historic traffic counts were utilized in conjunction with a 1.6% compounded growth rate per year (compounded annually) to reflect 2021 conditions. The comparison of historical counts and adjustment factor calculation are included in Appendix 3.1. The historical weekday AM and weekday PM peak hour count data is representative of typical weekday peak hour traffic conditions in the study area. There were no observations made in the field that would indicate atypical traffic conditions on the count dates, such as construction activity or detour routes.

Historic traffic counts were not available for the intersections of Scholar Way & Orange Street, Scholar Way & Baltimore Street, and Scholar Way & Citrus Street. As such, new traffic counts were conducted in August 2021. August 2021 traffic counts were also conducted at the intersection of Hamner Avenue & Schleisman Road in order to determine an adjustment factor between the adjusted historic count data (to 2021) and the August 2021 traffic count for this location. This adjustment factor was then applied to August 2021 counts to determine the adjusted 2021 baseline to be used for the operations analysis. The raw manual peak hour turning movement traffic count data sheets are included in Appendix 3.1. Existing weekday ADT volumes are shown on Exhibit 3-7. Where actual 24-hour tube count data was not available, Existing ADT volumes were based upon factored intersection peak hour counts collected by Urban Crossroads, Inc. using the following formula for each intersection leg:

Weekday PM Peak Hour (Approach Volume + Exit Volume) x 14.88 = Leg Volume

##(##) AM(PM) Peak Hour Intersection Volumes
Average Daily Trips

A comparison of the PM peak hour and daily traffic volumes of various roadway segments within the study area indicated that the peak-to-daily relationship is approximately 7.56 percent. As such, the above equation utilizing a factor of 14.88 estimates the ADT volumes on the study area roadway segments assuming a peak-to-daily relationship of approximately 7.56 percent (i.e., 1/0.0756 = 14.88) and was assumed to sufficiently estimate average daily traffic (ADT) volumes for planning-level analyses. Existing weekday AM and weekday PM peak hour intersection volumes are also shown on Exhibit 3-7.

3.6 EXISTING (2021) TRAFFIC SPEED SURVEY

Count and speed data collection devices were placed along Orange Street, adjacent to the Project site. Existing traffic speed data by direction was collected, for 48 hours beginning on August 31, 2021, and ending on September 1, 2021.

The speed survey for Orange Street indicates that the vehicle pace speed is within the 31-40 MPH range with an 85th percentile speed of 39 MPH. The speed survey results on Orange Street indicate that vehicles are travelling above the 25 MPH speed limit. Approximately 60% of vehicles in the 48-hour survey exceeded the 25 MPH posted speed limit. The raw data is included in Appendix 3.2 of this TA.

3.7 EXISTING (2021) INTERSECTION OPERATIONS ANALYSIS

Existing peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2.2 *Intersection Capacity Analysis* of this report. The intersection operations analysis results are summarized in Table 3-1, which indicates that the following study area intersection operating at an unacceptable LOS under Existing (2021) traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

The intersection operations analysis worksheets are included in Appendix 3.3 of this TA.

TABLE 3-1: INTERSECTION ANALYSIS FOR EXISTING (2021) CONDITIONS

#	Intersection	Traffic Control[1]	Delay[2] (secs.) AM	Delay[2] (secs.) PM	Level of Service AM	Level of Service PM
1	Sumner Av. & Schleisman Rd.	TS	**111.2**	**58.6**	**F**	**E**
2	Sumner Av. & Orange St.	TS	8.6	8.5	A	A

5	Scholar Wy. & Orange St.	TS	3.6	6.4	A	A
6	Scholar Wy. & Baltimore St.	TS	21.0	10.8	C	B
7	Scholar Wy. & Citrus St.	TS	40.1	18.8	D	B
8	Hamner Av. & Schleisman Rd.	TS	14.6	11.9	B	B

* **BOLD** = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

1 CSS = Cross-street Stop; TS = Traffic Signal

2 Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

3.8 TRAFFIC SIGNAL WARRANTS ANALYSIS

All of the study area intersections are currently signalized. As such, no traffic signal warrants have bene evaluated for Existing traffic conditions.

This page intentionally left blank

4 PROJECTED FUTURE TRAFFIC

This section presents the traffic volumes estimated to be generated by the Project's trip assignment onto the study area roadway network. The Project is proposed to consist of up to 41 single family detached residential units.

Regional access to the Project site is available from the I-15 Freeway at Limonite Avenue interchange. The Project is bounded by Schleisman Road to the north and Orange Street to the south in the City of Eastvale. Vehicular traffic access will be provided via the following driveway:

- Driveway 1 via Orange Street – Full access

4.1 PROJECT TRIP GENERATION

Trip generation represents the amount of traffic which is both attracted to and produced by a development. Determining traffic generation for a specific project is therefore based upon forecasting the amount of traffic that is expected to be both attracted to and produced by the specific land uses being proposed for a given development.

Trip generation represents the amount of traffic that is attracted and produced by a development and is based upon the specific land uses planned for a given project. The Single Family Detached Residential (ITE Land Use Code 210) trip generation rates used for this analysis are based upon information collected by the Institute of Transportation Engineers (**ITE**) as provided in their Trip Generation Manual (11th Edition, 2017). (2) Trip generation rates used to estimate Project traffic are shown in Table 4-1.

The resulting trip generation for the proposed Project is also shown in Table 4-1. As shown in Table 4-1, the proposed Project is anticipated to generate a total of 388 vehicle trip-ends per day with 28 AM peak hour trips and 38 PM peak hour trips.

TABLE 4-1: PROJECT TRIP GENERATION SUMMARY

	ITE		AM Peak Hour			PM Peak Hour			
Land Use	Code	Units[2]	In	Out	Total	In	Out	Total	Daily
Trip Generation Rates[1]									
Single Family Detached Residential	210	DU	0.18	0.52	0.70	0.59	0.35	0.94	9.43

			AM Peak Hour			PM Peak Hour			
Land Use	Quantity	Units[2]	In	Out	Total	In	Out	Total	Daily
Trip Generation Summary									
Single Family Detached Residential	41	DU	7	21	28	24	14	38	388

[1] Trip Generation Source: Institute of Transportation Engineers (ITE), Trip Generation Manual, 11th Edition (2021).

[2] DU = Dwelling Units

4.2 PROJECT TRIP DISTRIBUTION

The Project trip distribution and assignment process represents the directional orientation of traffic to and from the Project site. The trip distribution pattern of passenger cars is heavily influenced by the geographical location of the site, the location of surrounding uses, and the proximity to the regional freeway system. Exhibit 4-1 illustrates the Project trip distribution patterns.

4.3 MODAL SPLIT

The potential for Project trips to be reduced by the use of public transit, walking or bicycling have not been included as part of the Project's estimated trip generation. Essentially, the Project's traffic projections are "conservative" in that these alternative travel modes would reduce the forecasted traffic volumes.

4.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project. Based on the identified Project traffic generation and trip distribution patterns, Project only ADT and peak hour intersection turning movement volumes are shown on Exhibit 4-2.

##(##) AM(PM) Peak Hour Intersection Volumes
Average Daily Trips

4.5 BACKGROUND TRAFFIC

4.5.1 OPENING YEAR CUMULATIVE CONDITIONS

Future year traffic forecasts have been based upon background (ambient) growth at 1.6% per year for 2025 traffic conditions. The ambient growth factor is intended to approximate regional traffic growth. The total ambient growth factor is 6.81 for 2025 traffic conditions (growth of 1.6 percent per year compounded over 4 years). This ambient growth rate is applied to existing traffic volumes to account for area-wide growth not reflected by cumulative development projects. Ambient growth traffic volumes have been added to daily and peak hour traffic volumes on surrounding roadways, in addition to traffic generated by the development of future projects that have been approved but not yet built and/or for which development applications have been filed and are under consideration by governing agencies.

Opening Year Cumulative (2025) traffic volumes are provided in Section 6 of this report. The traffic generated by the proposed Project was then manually added to the base volume to determine Opening Year Cumulative "With Project" forecasts for 2025.

4.5.2 HORIZON YEAR CONDITIONS

Horizon Year conditions represent the General Plan Buildout of the City of Eastvale and is based on the Riverside County Transportation Analysis Model (**RivTAM**) (see Section 4.7 *Horizon Year Volume Development* for additional discussion). The adopted Southern California Association of Governments (**SCAG**) 2020 Regional Transportation Plan/Sustainable Communities Strategy (**RTP/SCS**) (adopted September 2020) growth forecasts for the City of Eastvale identifies projected growth in population of 63,900 in 2016 to 72,700 in 2045, or a 13.77% increase over the 29-year period. (7) The change in population equates to roughly a 0.45% growth rate, compounded annually. Similarly, growth over the same 29-year period in households is projected to increase by 13.50%, or a 0.44% annual growth rate. Finally, growth in employment over the same 29-year period is projected to increase by 191.89%, or a 3.76% annual growth rate.

Based on a comparison of Existing (2021) traffic volumes to the Horizon Year forecasts, the average growth rate is estimated at approximately 2.46%, compounded annually between Existing (2021) and 2040 traffic conditions. The annual growth rate at each individual intersection is not lower than 0.62% compounded annually to as high as 6.55% compounded annually over the same time period.

Therefore, the annual growth rate utilized for the purposes of this analysis would appear to conservatively approximate the anticipated regional growth in traffic volumes in the City of Eastvale for Opening Year Cumulative and Horizon Year traffic conditions, especially when considered along with the addition of project-related traffic. As such, the growth in traffic volumes assumed in this traffic analysis would tend to overstate as opposed to understating the potential deficiencies to traffic and circulation.

The model data from RivTAM represents peak hour data and therefore did not require adjustments. Typically, the model growth is prorated and is subsequently added to the existing (base validation) traffic volumes to represent Horizon Year traffic conditions. In an effort to conduct a conservative analysis, reductions to traffic forecasts from either Existing or Opening Year Cumulative traffic conditions were not assumed as part of this analysis. As such, in conjunction with the addition of cumulative projects that are not consistent with the General Plan, additional growth has also been applied on a movement-by-movement basis, where applicable, to estimate reasonable Horizon Year forecasts. Horizon Year turning volumes were compared to Opening Year Cumulative (2025) volumes in order to ensure a minimum growth as a part of the refinement process. The minimum growth includes any additional growth between Opening Year Cumulative (2025) and Horizon Year traffic conditions that is not accounted for by the traffic generated by cumulative development projects and ambient growth rates assumed between Existing (2021) and Opening Year Cumulative (2025) conditions. Future estimated peak hour traffic data was used for new intersections and intersections with an anticipated change in travel patterns to further refine the Horizon Year peak hour forecasts.

The future Horizon Year Without Project peak hour turning movements were then reviewed by Urban Crossroads, Inc. for reasonableness, and in some cases, were adjusted to achieve flow conservation, reasonable growth, and reasonable diversion between parallel routes. Flow conservation checks ensure that traffic flow between two closely spaced intersections, such as two adjacent driveway locations, is verified in order to make certain that vehicles leaving one intersection are entering the adjacent intersection and that there is no unexplained loss of vehicles. The result of this traffic forecasting procedure is a series of traffic volumes which are suitable for traffic operations analysis.

RivTAM does not include a truck component or has data that is unusually low. As such, in an effort to conduct a conservative analysis, the presence of trucks has been accounted for based on the manual volume adjustments made to demonstrate growth above Opening Year Cumulative (2025) traffic forecasts. Post-processing worksheets for Horizon Year Without Project traffic conditions are provided in Appendix 4.1.

This page intentionally left blank

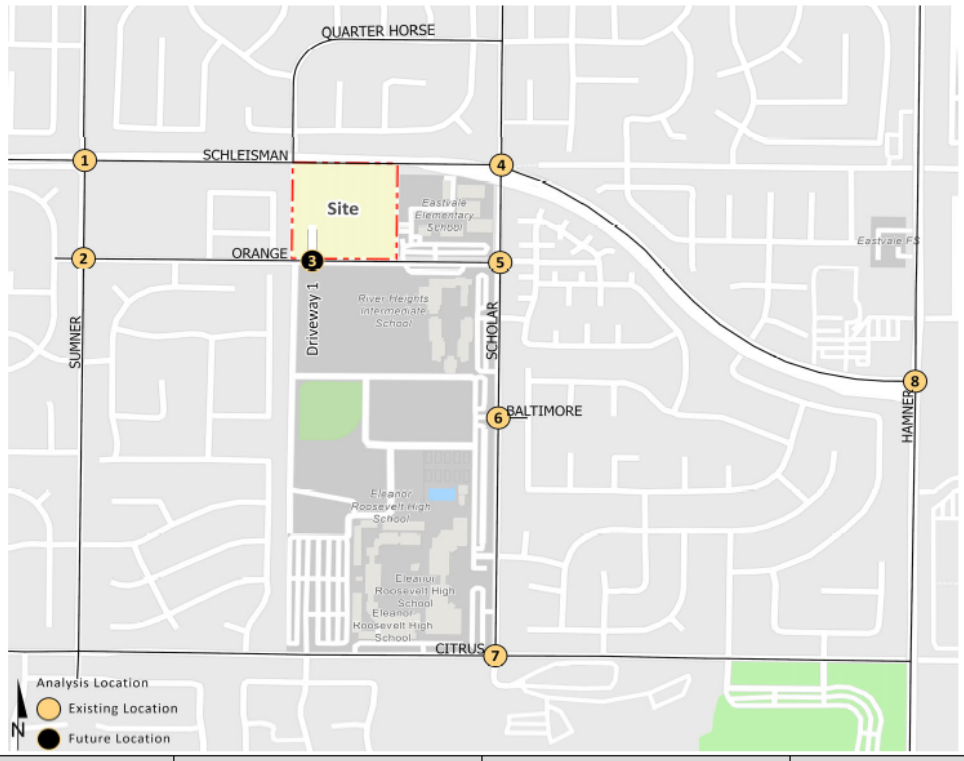
5 E+P TRAFFIC CONDITIONS

This section discusses the traffic forecasts for Existing plus Project (**E+P**) conditions and the resulting intersection operations and traffic signal warrant analyses.

5.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for E+P conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for E+P conditions only (e.g., intersection and roadway improvements at the Project's frontage and driveways).



5.2 E+P TRAFFIC VOLUME FORECASTS

This scenario includes Existing traffic volumes plus Project traffic. The ADT volumes and weekday AM and PM peak hour intersection turning movement volumes which can be expected for E+P traffic conditions are shown on Exhibit 5-1.

5.3 INTERSECTION OPERATIONS ANALYSIS

E+P peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TA. The intersection analysis results are summarized in Table 5-1, which indicates no additional intersections are anticipated to operate at an unacceptable LOS with addition of Project traffic, consistent with Existing (2021) traffic conditions. The intersection operations analysis worksheets for E+P traffic conditions are included in Appendix 5.1 of this TA.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

1 Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

2 CSS = Cross-street Stop; TS = Traffic Signal; CSS = Improvement

5.4 TRAFFIC SIGNAL WARRANTS ANALYSIS

No study area intersections are anticipated to meet average daily volume-based traffic signal warrants for E+P traffic conditions (see Appendix 5.2) of this report.

5.5 DEFICIENCIES AND IMPROVEMENTS

Improvements have been identified for each of the study area intersections that are operating at an unacceptable LOS during the peak hours. The effectiveness of the recommended improvement strategies to address E+P traffic deficiencies are presented on Table 5-2. Worksheets for E+P Conditions, with improvements, HCM calculation worksheets are provided in Appendix 5.3.

TABLE 5-2: SUMMARY OF INTERSECTION ANALYSIS FOR E+P CONDITIONS WITH IMPROVEMENTS

#	Intersection	Traffic Control[3]	Intersection Approach Lanes[1] Northbound L	T	R	Southbound L	T	R	Eastbound L	T	R	Westbound L	T	R	Delay[2] (secs.) AM	PM	Level of Service AM	PM

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes: L = Left; T = Through; R = Right; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

[3] TS = Traffic Signal

[4] Improvements require additional right-of-way. The improvements are assumed to be constructed by a future project adjacent to the intersection.

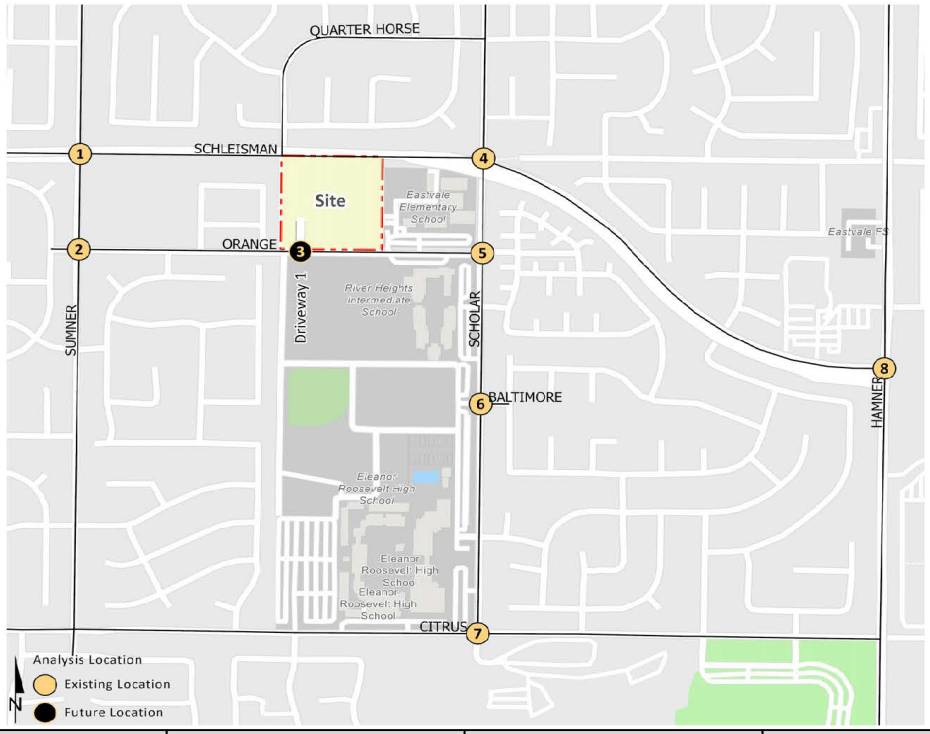
6 OPENING YEAR CUMULATIVE (2025) TRAFFIC CONDITIONS

This section discusses the methods used to develop Opening Year Cumulative (2025) Without and With Project traffic forecasts, and the resulting intersection operations and traffic signal warrant, analyses.

6.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Opening Year Cumulative (2025) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements at the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by cumulative developments to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the cumulative development's frontages).



6.2 OPENING YEAR CUMULATIVE (2025) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes Existing traffic volumes plus an ambient growth of 6.8% plus traffic from pending and approved but not yet constructed known development projects in the area. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2025) Without Project traffic conditions are shown on Exhibit 6-1.

6.3 OPENING YEAR CUMULATIVE (2025) WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes Opening Year Cumulative (2025) Without Project traffic in conjunction with the addition of Project traffic. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2025) With Project traffic conditions are shown on Exhibit 6-2.

##(##) AM(PM) Peak Hour Intersection Volumes

Average Daily Trips

6.4 INTERSECTION OPERATIONS ANALYSIS

6.4.1 OPENING YEAR CUMULATIVE (2025) WITHOUT PROJECT TRAFFIC CONDITIONS

LOS calculations were conducted for the study intersections to evaluate their operations under Opening Year Cumulative (2025) Without Project conditions with roadway and intersection geometrics consistent with Section 6.1 *Roadway Improvements*. As shown on Table 6-1, the following study area intersection is anticipated to operate at an unacceptable LOS under Opening Year Cumulative (2025) Without Project traffic conditions, consistent with Existing (2021) traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

The intersection operations analysis worksheets for Opening Year Cumulative (2025) Without Project traffic conditions are included in Appendix 6.1 of this TA.

6.4.2 OPENING YEAR CUMULATIVE (2025) WITH PROJECT TRAFFIC CONDITIONS

As shown in Table 6-1, no additional study area intersections are anticipated to operate at a deficient LOS during the peak hours with the addition of Project traffic. The intersection operations analysis worksheets for Opening Year Cumulative (2025) With Project traffic conditions are included in Appendix 6.2 of this TA.

TABLE 6-1: INTERSECTION ANALYSIS FOR OPENING YEAR CUMULATIVE (2025) CONDITIONS

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

1 Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

2 CSS = Cross-street Stop; TS = Traffic Signal; **CSS** = Improvement

6.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

The following study area intersection is not anticipated to meet average daily traffic volume-based traffic signal warrants for Opening Year Cumulative (2025) With Project traffic conditions (see Appendix 6.3).

6.6 DEFICIENCIES AND IMPROVEMENTS

Improvements have been identified for each of the study area intersections anticipated operating at an unacceptable LOS during the peak hours. The effectiveness of the recommended improvement strategies to address its traffic deficiencies are presented on Table 6-2. HCM calculation worksheets for Opening Year Cumulative (2025) With Project With Improvements are provided in Appendix 6.4 of this TA.

TABLE 6-2: INTERSECTION ANALYSIS FOR OPENING YEAR CUMULATIVE (2025) CONDITIONS WITH IMPROVEMENTS

	-With Improvements[4]	TS	1	1	0	1	1	0	**1**	1	**0**	**1**	1	**0**	54.0	31.8	D	C

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes: L = Left; T = Through; R = Right; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

[3] TS = Traffic Signal; **TS** = Improvement

[4] Improvements require additional right-of-way. The improvements are assumed to be constructed by a future project adjacent to the intersection.

This page intentionally left blank

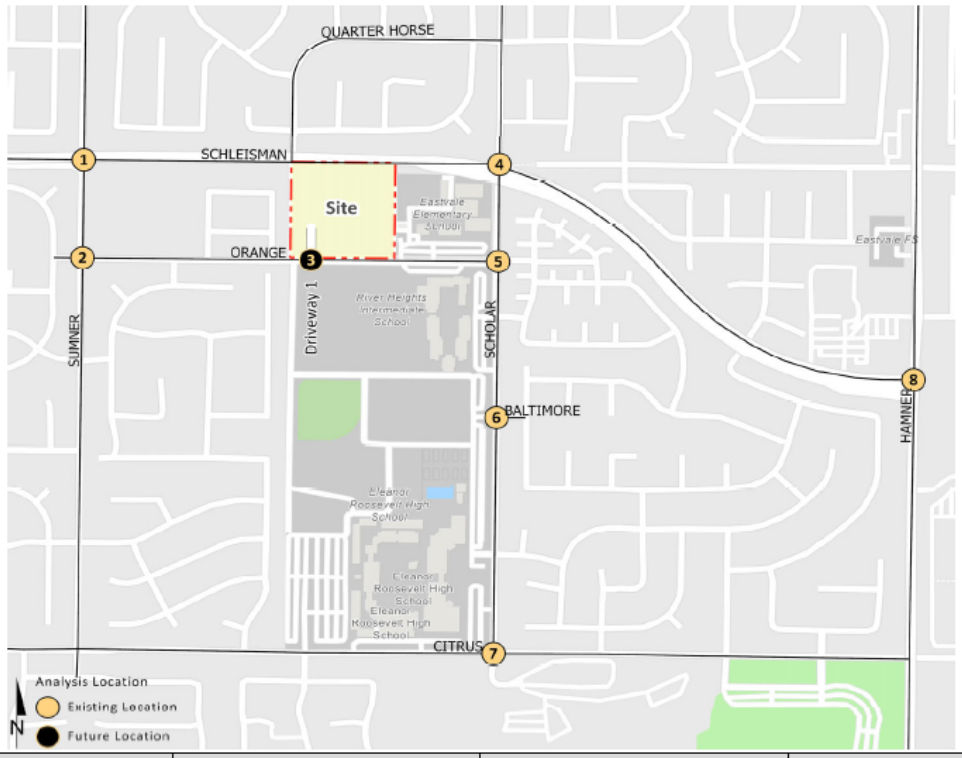
7 HORIZON YEAR (2040) TRAFFIC CONDITIONS

This section discusses the methods used to develop Horizon Year (2040) Without and With Project traffic forecasts, and the resulting intersection operations and traffic signal warrant analyses.

7.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Horizon Year (2040) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Horizon Year conditions only (e.g., intersection and roadway improvements along the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by cumulative developments to provide site access are also assumed to be in place for Horizon Year conditions only (e.g., intersection and roadway improvements along the cumulative development's frontages).



7.2 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the RivTAM (see Section 4.7 *Horizon Year Volume Development* of this TA for a detailed discussion on the post-processing methodology) and represents the General Plan buildout of the City of Eastvale. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year Without Project traffic conditions are shown on Exhibit 7-1.

7.3 HORIZON YEAR (2040) WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the RivTAM, plus the traffic generated by the proposed Project (see Section 4.7 *Horizon Year Volume Development* of this TA for a detailed discussion on the post-processing methodology). Horizon Year With Project traffic forecasts reflects buildout of the Project. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year With Project traffic conditions are shown on Exhibit 7-2.

##(##) AM(PM) Peak Hour Intersection Volumes

Average Daily Trips

7.4 INTERSECTION OPERATIONS ANALYSIS

7.4.1 HORIZON YEAR (2040) WITHOUT PROJECT CONDITIONS

LOS calculations were conducted for the study area intersections to evaluate their operations under Horizon Year Without Project traffic conditions with roadway and intersection geometrics consistent with Section 7.1 *Roadway Improvements*. As shown in Table 7-1, the following study area intersection is anticipated to operate at an unacceptable LOS under Horizon Year Without Project traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM and PM peak hours

The intersection operations analysis worksheets for Horizon Year Without Project traffic conditions are included in Appendix 7.1 of this TA.

7.4.2 HORIZON YEAR (2040) WITH PROJECT TRAFFIC CONDITIONS

As shown in Table 7-1, no additional study area intersections are anticipated to operate at a deficient LOS during the peak hours with the addition of Project traffic, consistent with Horizon Year Without Project traffic conditions. The intersection operations analysis worksheets for Horizon Year With Project traffic conditions are included in Appendix 7.2 of this TA.

TABLE 7-1: INTERSECTION ANALYSIS FOR HORIZON YEAR (2040) CONDITIONS

			2040 Without Project				2040 With Project			
			Delay[1] (secs.)		Level of Service		Delay[1] (secs.)		Level of Service	
#	Intersection	Traffic Control[2]	AM	PM	AM	PM	AM	PM	AM	PM
1	Sumner Av. & Schleisman Rd.	TS	**>200.0**	**>200.0**	**F**	**F**	**>200.0**	**>200.0**	**F**	**F**
2	Sumner Av. & Orange St.	TS	10.1	8.6	B	A	10.4	9.1	B	A
3	Driveway 1 & Orange St.	--/**CSS**	Future Intersection				9.1	9.1	A	A
4	Scholar Wy. & Schleisman Rd.	TS	32.3	43.1	C	D	34.4	43.6	C	D
5	Scholar Wy. & Orange St.	TS	8.1	6.7	A	A	8.1	6.8	A	A
6	Scholar Wy. & Baltimore St.	TS	28.4	11.5	C	B	28.6	11.5	C	B
7	Scholar Wy. & Citrus St.	TS	53.8	21.5	D	C	53.9	21.6	D	C
8	Hamner Av. & Schleisman Rd.	TS	48.7	45.1	D	D	48.9	45.3	D	D

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

1 Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

2 CSS = Cross-street Stop; TS = Traffic Signal; **CSS** = Improvement

3 The change in delay is calculated between pre-project and With Project scenarios for City of Eastvale intersections already operating at an unacceptable LOS in the pre-project traffic condition.

7.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

No study area intersections are anticipated to meet average daily traffic volume-based traffic signal warrants for Horizon Year (2040) With Project traffic conditions (see Appendix 7.3).

7.6 DEFICIENCIES AND IMPROVEMENTS

Improvements have been identified for each of the study area intersections that would be operating at an unacceptable LOS during the peak hours. The effectiveness of the recommended improvement strategies to address its traffic deficiencies are presented on Table 7-4. HCM calculation worksheets for Horizon Year With Project With Improvements are provided in Appendix 7.4 of this TA.

TABLE 7-3: INTERSECTION ANALYSIS FOR HORIZON YEAR (2040) CONDITIONS WITH IMPROVEMENTS

			Intersection Approach Lanes[1]												Delay[2] (secs.)		Level of Service	
		Traffic	Northbound			Southbound			Eastbound			Westbound						
#	Intersection	Control[3]	L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM
1	Sumner Av. & Schleisman Rd.																	
	-Without Improvements	TS	1	1	0	1	1	0	0	1	1	0	1	1	**>200.0**	**>200.0**	**F**	**F**
	-With Improvements[4]	TS	1	**2**	0	1	1	0	**1**	**2**	**0**	**1**	**2**	**1**	51.9	51.2	D	D

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes: L = Left; T = Through; R = Right; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

[3] TS = Traffic Signal; **TS** = Improvement

[4] Improvements require additional right-of-way. The improvements are assumed to be constructed by a future project adjacent to the intersection.

This page intentionally left blank

8 LOCAL AND REGIONAL FUNDING MECHANISMS

Transportation improvements within the City of Eastvale are funded through a combination of construction of improvements, development impact fee programs or fair share contributions, such as the City of Eastvale Development Impact Fee (**DIF**) program. Identification and timing of needed improvements is generally determined through local jurisdictions based upon a variety of factors.

8.1 RIVERSIDE COUNTY TRANSPORTATION UNIFORM MITIGATION FEE (TUMF)

The TUMF program is administered by the WRCOG based upon a regional Nexus Study most recently updated in 2016 to address major changes in right of way acquisition and improvement cost factors. (3) TUMF identifies a network of backbone and local roadways that are needed to accommodate growth through 2035. This regional program was put into place to ensure that development pays its fair share, and that funding is in place for construction of facilities needed to maintain the requisite level of service and critical to mobility in the region.

TUMF fees are imposed on new residential, industrial, and commercial development through application of the TUMF fee ordinance and fees are collected at the building or occupancy permit stage. The fee is $10,104 per dwelling unit for single family detached residential dwelling units (applicable to the proposed Project, effective January 1, 2022). In addition, an annual inflation adjustment is considered each year in January. In this way, TUMF fees are adjusted upwards on a regular basis to ensure that the development impact fees collected keep pace with construction and labor costs, etc.

The Project Applicant will be subject to the TUMF fee program and will pay the requisite TUMF fees at the rates then in effect pursuant to the TUMF Ordinance. WRCOG has a successful track record funding and overseeing the construction of improvements funded through the TUMF program. In total, the TUMF program is anticipated to generate nearly $5 billion in transportation projects for Western Riverside County.

8.2 CITY OF EASTVALE DEVELOPMENT IMPACT FEE (DIF) PROGRAM

The City of Eastvale has prepared a Nexus Study to establish fees which has been adopted by the City as of July 1, 2012. It is our understanding that the DIF program includes widening of the Hellman Avenue bridge over Cucamonga Creek and the signalization of up to twenty-three intersections. The fee for single family detached residential is $9,146 per dwelling unit as of December 2019. In addition, an annual inflation adjustment is considered each year. Fee credits and reimbursements will be available as part of the Fee Program and will only be given to projects that are identified as a Fee Program facility. The Project's Conditions of Approval will establish and clarify eligibility.

The timing to use the DIF fees is established through periodic capital improvement programs which are overseen by the City's Public Works Department. Periodic traffic counts, review of traffic accidents, and a review of traffic trends throughout the City are also periodically performed by City staff and consultants. The City uses this data to determine the timing of implementing the improvements listed in its facilities list. The City also uses this data to ensure that the improvements listed on the facilities list are constructed before the LOS falls below the LOS performance standards adopted by the City. In this way, the improvements are constructed before the LOS falls below the City's LOS performance

thresholds. The Project Applicant will be subject to the City's DIF fee program and will pay the requisite City DIF fees at the rates then in effect pursuant to the City's ordinance.

8.3 MIRA LOMA ROAD AND BRIDGE BENEFIT DISTRICT

Similar to other regions within Riverside County, the City of Eastvale is anticipated to experience substantial growth. Extensive improvements are necessitated by new development within the region. In particular, Riverside County recognized the impact of this growth on the vicinity of the study area when it formed the Mira Loma RBBD. The proposed Project lies within Zone D of the Mira Loma RBBD. Zone D is generally bounded by Bellegrave Avenue to the north, Hellman Avenue to the west, Hamner Avenue to the east, and the Eastvale city boundary to the south. As discussed above, the facilities improvements that will be ultimately constructed as a result of the collection of these fees and assessments are significant. The fee for residential use is $2,681 per single family residential dwelling unit within Zone D. They include:

Mira Loma Road and Bridge Benefits District (Zone D):

- Limonite Avenue interchange at the I-15 Freeway and between Hamner Avenue and Wineville Avenue
- Bellegrave Avenue overcrossing improvement at the I-15 Freeway
- Archibald Avenue roadway from River Road to the San Bernardino and Riverside County jurisdictional line
- Limonite Avenue roadway from Hamner Avenue to Archibald Avenue
- Schleisman Road roadway from Hamner Avenue to the San Bernardino and Riverside County jurisdictional line
- Archibald Avenue landscaped median from River Road to the San Bernardino and Riverside County jurisdictional line
- Hamner Avenue landscaped median between Bellegrave Avenue and the Santa Ana River
- Limonite Avenue landscaped median between Hamner Avenue and Archibald Avenue
- Schleisman Road landscaped median from Hamner Avenue to the San Bernardino and Riverside County jurisdictional line

8.4 FAIR SHARE CONTRIBUTION

Project improvement may include a combination of fee payments to established programs, construction of specific improvements, payment of a fair share contribution toward future improvements or a combination of these approaches. Improvements constructed by development may be eligible for a fee credit or reimbursement through the program where appropriate (to be determined at the City's discretion).

When off-site improvements are identified with a minor share of responsibility assigned to proposed development, the approving jurisdiction may elect to collect a fair share contribution or require the development to construct improvements. Detailed fair share calculations, for each peak hour, has been provided on Table 8-1 for the applicable deficient study area intersections.

These fees are collected with the proceeds solely used as part of a funding mechanism aimed at ensuring that regional highways and arterial expansions keep pace with the projected population increases.

TABLE 8-1: PROJECT FAIR SHARE CALCULATIONS

#	Intersection		Existing	Total Project	2040 With Project	Total New Traffic	Project % of New Traffic
1	Sumner Av. & Schleisman Rd.						
		AM:	2,230	10	3,936	1,706	0.59%
		PM:	1,836	16	4,362	2,526	**0.63%**

BOLD = Denotes highest fair share percentage.

[1] Fair share based on total traffic only.

RESOLUTION NO. 23-XX

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF EASTVALE, CALIFORNIA, APPROVING TENTATIVE TRACT MAP NO. 38167 TO SUBDIVIDE A 10-ACRE PARCEL OF LAND (8.28 NET ACRES) INTO FORTY-ONE (41) PARCELS AND THREE (3) LETTERED LOTS AND THE MASTER BUILDING ARCHITECTURE AND SITE PLANNING OF THE NEW MAGNOLIA RANCH RESIDENTIAL COMMUNITY ON REAL PROPERTY LOCATED NORTH OF ORANGE STREET, SOUTH OF SCHLEISMAN ROAD, EAST OF QUARTER HORSE DRIVE AND WEST OF SCHOLAR WAY, ASSESSOR'S PARCEL NUMBERS 152-040-003.

WHEREAS, the applicant, Woodside 05S, LP filed an application for Tentative Tract Map No. 38167 as part of Project No. PLN23-20043, to subdivide 10-acres (8.28 net) of land into forty-one (41) single-family lots and three (3) lettered lots for purposes of water quality, common open space, and pedestrian corridors, along with the master building and site planning of the new 41 unit residential community located north of Orange Street, south of Schleisman Road, east of Quarter Horse Drive, and west of Scholar Way, Assessor's Parcel Number 152-040-003; and

WHEREAS, the proposed application (Project No. PLN23-20043) is considered a "project" as defined by the California Environmental Quality Act (CEQA), Public Resources Code Section 21000 et seq.; and

WHEREAS, the City, as the Lead Agency, determined that the proposed project required the preparation of an Initial Study and Mitigated Negative Declaration (IS/MND) (SCH #2023090664) for compliance with the provisions of CEQA; and

WHEREAS, on September 28, 2023, in accordance with the CEQA Guidelines Section 15072(b), the City posted a Notice of Intent (NOI), and also published the NOI in the *Press Enterprise*, a local newspaper of general circulation, regarding the 20-day public review period; and

WHEREAS, the City made the proposed Mitigated Negative Declaration available for public review beginning on September 28, 2023, and concluding October 17, 2023, a period of not less than 20-days as prescribed by law; and

WHEREAS, in accordance with state law, on September 28, 2023, the City of Eastvale Planning Department published a legal notice in compliance with state law concerning Project No. PLN23-20043 in the *Press Enterprise*, a local newspaper of general circulation, regarding the Planning Commission meeting on October 18, 2023. In addition, September 25, 2023, a public hearing notice was mailed to each property owner and commercial tenant within a 600-foot radius of the project site, indicating the date and time of the public hearing at the Planning Commission meeting for Project No. PLN23-20043; and

WHEREAS, the City of Eastvale Planning Commission conducted a duly noticed public hearing on October 18, 2023, at which public testimony was received concerning Project No. PLN23-20043, and at which time the Commission considered proposed Project No. PLN23-20043.

NOW, THEREFORE, THE PLANNING COMMISSION OF THE CITY OF EASTVALE DOES HEREBY RESOLVE, DETERMINE, AND ORDER AS FOLLOWS:

SECTION 1. FINDINGS FOR THE CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

The Planning Commission of the City of Eastvale, in light of the whole record before it, including, but not limited to, the City's local CEQA Guidelines and thresholds of significance, the IS/MND (SCH #2023090664) and other documents incorporated therein by reference, the Mitigation Monitoring and Reporting Program (MMRP), any written comments received and responses provided, and other substantial evidence, within the meaning of Public Resources Code Sections 21080(e) and 21082.2, within the record and/or provided at the public hearing, hereby finds, determines, and certifies as follows:

A. Review Period: That the IS/MND has been provided for public review within the duration required under CEQA Guidelines.

B. Compliance with Law: That the IS/MND was prepared, processed, and noticed in accordance with CEQA (Public Resources Code Section 21000 et seq.), the CEQA Guidelines (14 California Code of Regulations Section 15000 et seq.), and the local CEQA guidelines and thresholds of significance adopted by the City of Eastvale. That the IS/MND was presented to the Planning Commission, and the Planning Commission has reviewed and considered the information contained in the IS/MND, and public testimony received thereon during the hearing, prior to any action on the project.

C. Independent Judgment: That the IS/MND reflects and represents the City of Eastvale's independent judgment and analysis and adequately addresses the impacts of, and proposes appropriate mitigation measures upon, the City's actions in approving or taking action on proposed Project No. PLN23-20043.

D. Mitigation Monitoring and Reporting Program: The Mitigation Monitoring and Reporting Program (MMRP) is designed to ensure compliance during project implementation in that changes to the project and/or mitigation measures have been incorporated into the project and are fully enforceable through permit conditions, agreements, or other measures as required by Public Resources Code Section 21081.6.

E. Less Than Significant Impact: The mitigation measures imposed on the project avoid or mitigate any potential significant effects on the environment identified in the IS/MND to a point below the threshold of significance. Furthermore, after

taking into consideration the revisions to the project and the mitigation measures imposed, the Planning Commission finds that there is no substantial evidence, in light of the whole record, from which it could be fairly argued that the project may have a significant effect on the environment. Therefore, the Planning Commission concludes that the project will not have a significant effect on the environment with adoption of the proposed mitigation measures as outlined in the MMRP.

SECTION 2. FINDINGS FOR TENTATIVE TRACT MAP NO. 38167

Pursuant to Eastvale Subdivision Ordinance No. 460, the staff report dated October 18, 2023, and all evidence and testimony heard at the public hearing of this item, the Planning Commission hereby finds and determines as follows:

Finding 1: Tentative Tract Map No. 38167 is consistent with the City's General Plan and any applicable specific plan as specified in Government Code Section 65451.

Evidence: The General Plan Land Use designation is Medium Density Residential. Proposed Tentative Tract Map No. 38167 is a land division to subdivide a 10-acre (8.28-acres net) site into forty-one (41) parcels and three (3) lettered lots to facilitate the future residential community referred to as Magnolia Ranch. The proposed density of 4.95 dwelling units per acre is consistent with the Medium Density Residential land use designation of 2.1-5 dwelling units to an acre. Further, Tentative Tract Map No. 38167 is processed under the provisions of Senate Bill 330 excusing the project from the requirement of rezoning the property if it is consistent with the General Plan; therefore, the project is not subject to any specific plan.

Finding 2: The design or improvement of the proposed subdivision is consistent with the City's General Plan and any applicable specific plan.

Evidence: Tentative Tract Map No. 35601 is designed to meet all City standards applicable to residential development to the extent feasible under the provisions of SB 330, including street widths, drainage, utilities, lot size and configuration, grading, required dedications and providing satisfactory pedestrian and vehicular circulation, emergency vehicle access and on- and off-site public improvements.

Finding 3: The site is physically suitable for the type and proposed density of development.

Evidence: The site is physically suitable for the type of development proposed in that the infrastructure and utilities either already serve the site or can be readily expanded to serve the site, and there are no intractable topographical peculiarities associated with the physical character of the property that may prevent the development of forth-one (41) lots with single family dwellings and three (3) lettered lots for community use. Further the site is physically suitable for the

proposed density of development of 4.95 dwelling units per acre in that the applicant has submitted a conceptual development plan which illustrates that single-family dwelling units can be constructed on this 10-acre (8.28-acre) site without adversely affecting the health, safety, or welfare of anyone who will live within the development or anyone living within the surrounding community.

Finding 4: The design of the subdivision or proposed improvements is not likely to cause significant environmental damage or substantially and avoidably injure fish or wildlife or their habitat.

Evidence: The City, as the Lead Agency, determined that the proposed project required the preparation of an Initial Study and Mitigated Negative Declaration (IS/MND) to evaluate the effect of the project on the environment. The mitigation measures identified in the IS/MND and conditioned on the project avoid or mitigate any potential significant effects on the environment to a point below the threshold of significance. As conditioned, the project will not have a significant effect on the environment or substantially and avoidably injure fish or wildlife or their habitat.

Finding 5: The design of the subdivision or type of improvements is not likely to cause serious public health problems.

Evidence: The design of the subdivision is in conformance with the City's General Plan, Zoning Code, and Subdivision Ordinance. Accordingly, the subdivision and improvements will comply with all applicable local, state, and federal laws to ensure the public's general health, safety, and welfare.

Finding 6: The design of the subdivision or the type of improvements will not conflict with easements, acquired by the public at large, for access through or use of property within the proposed subdivision.

Evidence: The project site includes a thirty-foot-wide public access easement along the eastern boundary of the site. The proposed easement will not conflict with the proposed subdivision and will encourage pedestrian and vehicular circulation around the project site.

SECTION 3. FINDINGS FOR MAJOR DEVELOPMENT REVIEW

The criteria and required findings for a Major Development Review are outlined in Section 120.02.010 "Development Review." The Planning Commission may approve a Major Development Review, with or without conditions, only after first making specific findings. The required findings and an analysis of the merits of the Major Development Review application are listed below:

Finding 1: The proposed project is consistent with the objectives of the general plan, and

complies with applicable zoning regulations, specific plan provisions, special planning area provisions, design guidelines, and improvement standards adopted by the city.

Evidence: The General Plan land use designation of the proposed site is Medium Density Residential. The Medium Density Residential land use designation allows for the development of single-family residential development with a maximum density of five (5) dwelling units to the acre. The proposed project would be consistent with the surrounding area and is consistent with the General Plan designation and Zoning to the extent permittable under the provisions of Senate Bill 330.

Finding 2: The proposed architecture, site design, and landscape are suitable for the purposes of the building and the site and will enhance the character of the neighborhood and community.

Evidence: The proposed project has been designed to conform to the logical pattern of development as envisioned by the Eastvale General Plan and has been designed to satisfy the General Plan design policies. The project has been designed with high-quality urban design, architecture, and landscaping, that includes common open space and connectivity between existing street networks for pedestrian and bicyclist, as well as landscaping along the proposed streets and paseos. The project has been designed to provide connections to the future trail along the south side of Schleisman Road, which will promote pedestrian activities between the project site and nearby uses. Finally, the project has been designed to meet the requirements and development standards of the Eastvale Zoning Code to the extent permitted under the provisions of Senate Bill SB 330.

Finding 3: The architecture, including the character, scale and quality of the design, relationship with the site and other buildings, building materials, colors, screening of exterior appurtenances, exterior lighting and signing and similar elements, establishes a clear design concept and is compatible with the character of buildings on adjoining and nearby properties.

Evidence: The architectural theme of the proposed single-family residential units are consistent with the surrounding neighborhoods in terms of character, scale, and quality. These standards focus on high quality design and articulation to provide visual interest and variety (both vertically and horizontally). The building includes stone veneer, board and batten, colored and scored stucco, shutters, and decorative garage doors as examples of the variation of materials designed to complement the exterior plaster and building finishes. Thus, the proposed design is consistent with the Eastvale Zoning Code and the General Plan.

Finding 4: The proposed project will not create conflicts with vehicular, bicycle, or pedestrian transportation modes of circulation.

Evidence: The proposed project is conditioned to ensure adequate circulation to and from the site. All streets have also been designed to handle the type and quantity of vehicular traffic associated with the project proposal. As conditioned, the project will include sidewalks and pedestrian and bicycle connections that will not create conflicts with motorized vehicles.

Finding 5: If the project is located within the Chino Airport influence area, the proposed project is consistent with the most recently adopted version of the airport land use compatibility plan.

Evidence: The project is not located within the Chino Airport Influence Area.

SECTION 4. MULTIPLE SPECIES HABITAT CONSERVATION PLAN

Finding: The project is found to be consistent with the Multiple Species Habitat Conservation Plan (MSHCP).

Evidence: The project is located outside of any MSHCP criteria area, and mitigation is provided through payment of the MSHCP Mitigation Fee.

SECTION 4. RECORD OF PROCEEDING

The documents and other materials that constitute the record of the proceedings upon which the Planning Commission's decision is based, which include but are not limited to the staff reports as well as all materials that support the staff reports for the proposed project, are located in the Planning Division of the City of Eastvale at 12363 Limonite Avenue, Suite 910, Eastvale, CA 91752. The custodian of these documents is the City Clerk of the City of Eastvale.

SECTION 5. DETERMINATION

Based upon the findings outlined in Sections 1 through 4 above, the Planning Commission of the City of Eastvale hereby approves PLN23-20043 Tentative Tract Map 38167 and Major Development Review, subject to the attached conditions of approval and directs the Community Development Director to file a Notice of Determination with the County of Riverside Clerk's Office within five (5) days of the approval date.

PASSED, APPROVED AND ADOPTED this 18th day of October 2023.

Deputy City Clerk

(STATE OF CALIFORNIA)
(COUNTY OF RIVERSIDE) §
(CITY OF EASTVALE)

I, Whitney Mayo, Deputy City Clerk of the City of Eastvale, California, do hereby certify that the foregoing Planning Commission Resolution No. 23-XX, was duly adopted by the Planning Commission of the City of Eastvale, California, at a regular meeting held on the 18th day of October 2023, by the following vote:

AYES:

NOES:

ABSENT:

ABSTAIN:

_____
Whitney Mayo,
Deputy City Clerk

CONDITIONS OF APPROVAL
Planning Application Number and Description: Project No. 23-20043 - Tentative Tract Map No. 38167 allows the subdivision of a 10-acre (8.28 net) site into 41 residential lots and three lettered lots for open space and water basins purposes. The project site is located at 13175 Orange Street, south of Schleisman Road, east of Quarter Horse Drive, west of Scholar Way, on the north side of Orange Street.
Assessor's Parcel Numbers: 152-040-003
Planning Commission Approval Date:

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
General Conditions				
1.	The applicant shall review and sign below verifying the "Acceptance of the Conditions of Approval" and return the signed page to the Eastvale Planning Department. Project approval is not final unital a signed copy of these conditions is filed with the City. Applicant Signature Date	Must be completed to finalize approval	Planning Division	
2.	In compliance with Section 15075 of the California Environmental Quality Act (CEQA) Guidelines, a Notice of Determination (NOD) shall be filed with the Riverside County Clerk within five (5) days of project approval. The NOD shall include the required California Department of Fish and Wildlife (CDFW) (Code Section 711.4.d.3) fee and the Riverside County Clerk administrative fee.	Five (5) days from project approval	Planning Division	
3.	The applicant shall indemnify, protect, defend, and hold harmless the City, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof, from any and all claims, demands,	Ongoing	Planning Division	

DRAFT

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	law suits, writs of mandamus, and other actions and proceedings (whether legal, equitable, declaratory, administrative or adjudicatory in nature), and alternative dispute resolutions procedures (including but not limited to arbitrations, mediations, and other such procedures) (collectively "Actions"), brought against the City, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof, that challenge, attack, or seek to modify, set aside, void, or annul any action of, or any permit or approval issued by, the City and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof (including actions approved by the voters of the City), for or concerning the project, whether such Actions are brought under CEQA, the Planning and Zoning Law, the Subdivisions Map Act, Code of Civil Procedure Section 1085 or 1094.5, or any other state, federal, or local statute, law, ordinance, rule, regulation, or any decision of a court of competent jurisdiction. It is expressly agreed that the City shall have the right to approve, which approval will not be unreasonably withheld, the legal counsel providing the City's defense and that applicant shall reimburse City for any costs and expenses directly and necessarily incurred by the City in the course of the defense. City shall promptly notify the applicant of any Action brought and City shall cooperate with applicant in the defense of the Action.			
4.	Any approval shall not be final until and unless the applicant's deposit account with Planning has a balance of at least **$5,000** at the time that the applicant signs these conditions of approval (per **Condition No. 1**) to cover staff time for follow-up, monitoring, and other post-approval work by staff. The City reserves the right to request additional deposits to cover post-	Ongoing	Planning and Building Divisions

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	approval staff work and to halt work if the deposit account is exhausted. Make check payable to the **City of Eastvale** and include **Project No. PLN23-20043** on the check.			
5.	Any approval shall not be final until and unless the applicant's deposit account with Public Works Division has a balance of at least $10,000 to cover staff time to follow-up, monitoring, and other post-approval work by staff. The City reserves the right to request additional deposits to cover post-approval staff work and to half work if the deposit account is exhausted.	Ongoing	Public Works Department	
6.	Tentative Tract Map 38167 is granted for a period of two years, until October 18, 2025, at which time said Map shall expire unless prior to the expiration date, either the final map has recorded or a written request for time extension, accompanied by the appropriate fee, is received by the Planning Division.	Ongoing	Public Works Department	
7.	Development shall occur substantially as shown on the plans approved by the Planning Commission and on file with the Community Development Department. The applicant shall obtain City approval for any modifications or revisions to the approval of this project. Deviations not identified on the plans may not be approved by the City, potentially resulting in the need for the project to be redesigned. Amended entitlement approvals may be necessary as a result.	Ongoing	Planning Division	
8.	Applicable mitigation measures included in the IS/MND shall be required for development of the proposed project (PLN23-20043) and are incorporated herein by reference.	Ongoing	Planning Division	

DRAFT

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
9.	All applicable Major Development Review conditions of approval (PLN23-20043) shall be incorporated herein by reference.	Ongoing	Planning Division	
10.	The project shall conform to the requirements of Senate Bill (SB) 330 Housing Crisis Act of 2019.	Ongoing	Planning Division	
11.	Applicants are responsible for all costs associated with off-site right-of-way acquisition, including any costs associated with the eminent domain process, if necessary.	Ongoing	Public Works Department	
12.	Should this project lie within any assessment/benefit district, the project proponent shall, prior to acceptance of improvements, make application for and pay for their reapportionment of the assessments or pay the unit fees in the benefit district unless said fees are otherwise deferred.	Ongoing	Public Works Department	
13.	The developer shall fully disclose in writing to the purchaser at time of entering escrow those requirements and obligations remaining outstanding or otherwise incomplete, including (but not limited to) streets, utilities, drainage, grading, walls, landscape planting and irrigation, and structure, or seismic activity. Such written disclosure shall be limited to subjects covered by these conditions of approval.	Ongoing	Planning Division	
14.	Final lot configurations shall be reviewed and approved by the Community Development Director and City Engineer prior to recordation of any portion of Tentative Tract Map 38167.	Ongoing	Planning & Public Works Divisions	
15.	Approval of this request shall not excuse compliance with all other applicable City ordinances and development standards	Ongoing	Planning, Public Works, and

	in effect at this time.		Building Divisions	
16.	This project is subject to compliance with Jurupa Community Services District's rules, regulations, conditions, requirements, and payment of appropriate fees.	Ongoing	Jurupa Community Services District	
17.	If this project proposes channels, storm drains 36 inches or larger in diameter, or other facilities that could be considered regional in nature and/or a logical extension of a District's facility, the District would consider accepting ownership of such facilities on written request by the City. The Project applicant shall enter into a cooperative agreement establishing the terms and conditions of inspection, operation, and maintenance with the District and any other maintenance partners. Facilities must be constructed to District standards, and District plan check and inspection will be required for District acceptance. Plan check, inspection, and administrative fees will be required. The regulatory permits' terms and conditions shall be approved by the District prior to improvement plan approval, map recordation, or finalization of the regulatory permits. There shall be no unreasonable constraint upon the District's ability to operate and maintain the flood control facility(ies) to protect public health and safety.	Ongoing	Riverside County Flood Control and Water Conservation District	
18.	An encroachment permit shall be obtained for any construction related activities occurring within District right of way or facilities, namely Eastvale Master Drainage Plan Lateral D-7. If a proposed storm drain connection exceeds the hydraulic performance of the existing drainage facilities, mitigation will be required. For further information, contact	Ongoing	Riverside County Flood Control and Water Conservation District	

DRAFT

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	the District's Encroachment Permit Section at 951.955.1266.			
19.	The project proponent shall bear the responsibility for complying with all applicable mitigation measures defined in the California Environmental Quality Act (CEQA) document (i.e., Negative Declaration, Mitigation Negative Declaration, Environmental Impact Report) and/or Mitigation Monitoring and Reporting Program, if a CEQA document was prepared for the project. The project proponent shall also bear the responsibility for complying with all other federal, state, and local environmental rules and regulations that may apply.	Ongoing	Riverside County Flood Control and Water Conservation District	
20.	If a natural watercourse or mapped floodplain is impacted by this project, the City should require the applicant to obtain a Section 1602 Agreement from the California Department of Fish and Wildlife and Clean Water Act Section 404 Permit from the U.S. Army Corps of Engineers, or written correspondence from these agencies indicating the project is exempt from these requirements. A Clean Water Act Section 401 Water Quality Certification may be required from the local California Regional Water Quality Control Board prior to issuance of the Corps 404 permit.	Ongoing	Riverside County Flood Control and Water Conservation District	
21.	If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the county coroner has made the necessary findings as to origin. Further, pursuant to California Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made.	Ongoing	Planning Division	

DRAFT

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	Following discovery and during assessment of the remains, work will be diverted at least 50 feet from the burial. The discovery shall be kept confidential, and secure to prevent disturbance. If left overnight, remains will be covered with a muslin cloth and steel plate over the excavation to protect the remains. If this method of protection is not feasible, a guard will be posted. If the Riverside County coroner determines the remains to be of Native American origin, the NAHC must be contacted by the coroner within 24 hours of the coroner's determination. The NAHC must then immediately identify the most likely descendants(s) for purposes of receiving notification of discovery. The most likely descendant(s) shall then make recommendations within 48 hours from the time that site access is granted and engage in consultation concerning the treatment of the remains as provided in Public Resources Code Section 507.98.			
22.	If cultural resources are encountered during ground-disturbing activities, work in the immediate area shall cease and an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for Archaeology shall be contacted immediately to evaluate the find(s). If the discovery proves to be significant under the California Environment Quality Act, additional work such as data recovery excavation may be warranted and shall be reported to the City.	Ongoing	Planning Division

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	MM CUL-1			
23.	The following measure shall be incorporated into project plans as implementation of SCAQMD Rule 402: • A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.	Ongoing	Planning Division	
24.	The following measures shall be incorporated into project plans as implementation of SCAQMD Rule 403: • All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 miles per hour (mph) per SCAQMD guidelines in order to limit fugitive dust emissions. • The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project site are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.	Ongoing	Planning Division	

DRAFT

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	• The contractor shall ensure that traffic speeds on unpaved roads and in project site areas are reduced to 15 mph or less.			
25.	The following measure shall be incorporated into project plans as implementation of SCAQMD Rule 1113: • In order to limit the volatile organic compound (VOC) content of architectural coatings used in the SCAB, architectural coatings shall be no more than a low VOC default level of 50 grams per liter (g/L) unless otherwise specified in the SCAQMD Table of Standards.	Ongoing	Planning Division	
26.	All applicable measures shall be incorporated into project plans as implementation of SCAQMD Rule 1403 if asbestos is found during the demolition of existing structures.	Ongoing	Planning Division	
27.	The project shall comply with the California Building Code and the City of Eastvale's grading requirements in Eastvale Municipal Code Section 130.08.040, *Street Grades*, and subject to the approval of the City Engineer.	Ongoing	Planning Division	
28.	The project shall comply with all recommendations contained in the project-specific Geotechnical Evaluation.	Ongoing	Planning Division	
29.	The following are applicable to the project and would assist in the reduction of GHG emissions: • Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32) - requires CARB to	Ongoing	Planning Division	

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	adopt rules and regulations that would achieve GHG emissions equivalent to Statewide levels in 1990 by 2020 • Regional GHG Emissions Reduction Targets/Sustainable Communities Strategies (Senate Bill [SB] 375) • California Code of Regulations, Title 24 (California Building Standards Code) – establishes energy efficiency requirements for new construction • California Code of Regulations, Title 20, Division 2, Chapter 4 (Appliance Efficiency Regulations) – establishes energy efficiency requirements for appliances • Senate Bill 100 (SB 1078) – requires that 100 percent of retail sales of electricity be generated from renewable or zero-carbon sources, by December 2045			
30.	The project will be subject to the general sound level standards of Eastvale Municipal Code Section 8.52.040, *General Sound Level Standards*.	Ongoing	Planning, Public Works, and Building Divisions	

DRAFT

Prior to Grading Permit				
31.	This project may require a National Pollutant Discharge Elimination System (NPDES) permit from the State Water Resources Control Board. Clearance for grading, recordation, or other final approval should not be given until the City has determined that the project has been granted a permit or is shown to be exempt.	Prior to Grading Permit Issuance	Riverside County Flood Control and Water Conservation District	
32.	If this project involves a Federal Emergency Management Agency (FEMA) mapped floodplain, then the City should require the applicant to provide all studies, calculations, plans, and other information required to meet FEMA requirements, and should further require that the applicant obtain a Conditional Letter of Map Revision (CLOMR) prior to grading, recordation, or other final approval of the project and a Letter of Map Revision (LOMR) prior to occupancy.	Prior to Grading Permit Issuance	Riverside County Flood Control and Water Conservation District	
33.	The developer shall prepare an address blocking exhibit with the proposed addressing and street names for review and approval by the Planning Division. This plan, including updates to the plan, shall include addressing for buildings (primary address and units) and utilities such as but not limited to electrical/water/single/dual irrigation meter pedestal(s) or temporary power poles.	Prior to Grading Permit Issuance	Planning and Building Divisions	
34.	Street names shall be approved by the Community Development Director. Suggested street names and alternatives shall be submitted in writing to the Community Development Director for approval. Phonic similarity with existing street names should be avoided.	Prior to Grading Permit Issuance	Planning and Building Divisions	

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
35.	Prior to issuance of grading permits, the project applicant shall prepare construction documents for approval by the City Engineer which shall include plans to construct a minimum 6.5□foot-high wall on the north side of Lots 9 through 15 and Lots 27-28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings. *MM NOI-1*	Prior to Grading Permit Issuance	Planning and Public Works Divisions	
36.	The project shall conduct focused burrowing owl pre-construction surveys as follows: 1. No more than 30 days prior to the first ground-disturbing activities, the project applicant shall retain a qualified Biologist to conduct a pre-construction survey of the project site. The survey shall establish the presence or absence of western burrowing owl and/or habitat features and evaluate use by owls in accordance with the California Department of Fish and Wildlife (CDFW) and Western Riverside County Regional Conservation Authority (RCA) survey guidelines. 2. On the parcel where the activity is proposed, the Biologist shall survey the proposed disturbance footprint and a 500-foot radius from the perimeter of the proposed footprint to identify burrows and burrowing owl. The survey shall take place near sunrise or sunset in accordance with the CDFW and RCA guidelines. All burrows or burrowing owl shall be identified and mapped. During the breeding season (February 1– August 31), surveys shall document whether burrowing	Prior to Grading Permit Issuance	Planning Division	

Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
owl are nesting on or directly adjacent to disturbance areas. During the non-breeding season (September 1– January 31), surveys shall document whether burrowing owl are using habitat on or directly adjacent to any disturbance area. Survey results shall be valid only for the season during which the survey is conducted. 3. If burrowing owl are not discovered, further mitigation is not required. If burrowing owl are observed during the pre-construction surveys, the applicant shall perform the following measures to limit the impact on the burrowing owls: A. Avoidance shall include the establishment of a 160-foot non-disturbance buffer zone. Construction may occur during the breeding season if a qualified Biologist monitors the nest and determines that the birds have not begun egg-laying and incubation, or that the juveniles from the occupied burrows have fledged. During the non-breeding season (September 1-January 31), the project applicant shall avoid the owls and the burrows they are using, if possible. Avoidance shall include the establishment of a 160-foot non-disturbance buffer zone. B. If it is not possible to avoid occupied burrows, passive relocation shall be implemented. Burrowing owl shall be excluded from burrows in the immediate impact zone and within a 160-foot buffer zone by installing one-way doors in burrow			

DRAFT

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	entrances. These doors shall be in place for 48 hours prior to excavation. The project area shall be monitored daily for 1 week to confirm that the owl has abandoned the burrow. Whenever possible, burrows should be excavated using hand tools and refilled to prevent re-occupation. Plastic tubing or a similar structure shall be inserted in the tunnels during excavation to maintain an escape route for any burrowing owl inside the burrow. *MM BIO-1*			
37.	The project applicant shall employ protective measures for active bird nests as follows (including pre-construction survey and implementation of avoidance buffer, if found): 1. Removal of trees shall be limited to only those necessary to construct the proposed project as reflected in the relevant project approval documents. It is recommended that a Biologist make sure the bird houses are not occupied and then block access to the bird houses for the duration of construction to avoid attracting nesting birds. 2. If construction occurs during the nesting season (February 1 to August 31), pre- construction surveys shall be conducted within 14 days prior to tree removal to determine whether or not active nests are present. 3. If an active nest is located during pre-construction surveys, a qualified Biologist shall determine an appropriately-sized avoidance buffer based on the species and anticipated disturbance level. A qualified	Prior to Grading Permit Issuance	Planning Division	

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	Biologist shall delineate the avoidance buffer using Environmentally Sensitive Area fencing, pin flags, and or yellow caution tape. The buffer zone shall be maintained around the active nest site(s) until the young have fledged and are foraging independently. No construction activities or construction foot traffic is allowed to occur within the avoidance buffer(s). 4. The qualified Biologist shall monitor the active nest during construction activities to prevent any potential impacts that may result from the construction of the proposed project, until the young have fledged. *MM BIO-2*			
38.	Prior to the issuance of a grading permit, the project applicant shall prepare and submit a Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis report to City of Eastvale to document the project's consistency with the goals, objectives, and requirements of the MSHCP. *MM BIO-3*	Prior to Grading Permit Issuance	Planning Division	
39.	Eastvale Municipal Code Section 4.62.100, *Payment of Fees*, states that the Western Riverside County MSHCP fee shall be paid at the time a certificate of occupancy is issued for a residential unit or development project or upon final inspection, whichever occurs first. Furthermore, no final inspection shall be made, and no certificate of occupancy shall be issued, prior to full payment of the Western Riverside County Multiple Species Habitat Conservation Plan fee. However, this section shall not be construed to prevent payment of the fee prior to the issuance of an	Prior to Grading Permit Issuance	Public Works Department	

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	occupancy permit or final inspection.			
40.	Prior to the issuance of a Grading Permit, the Developer shall pay all necessary fees as determined by the City Engineer including, but not limited to Multiple Species Habitat Conservation Plan ("MSHCP") fees and grading permit fees.	Prior to Grading Permit Issuance	Public Works Department	
41.	Grading in excess of 199 cubic yards will required performance security to be posted with the City	Prior to Grading Permit Issuance	Public Works Department	
42.	A permit for the hauling of material to and from the project site shall be submitted to the City for approval.	Prior to Grading Permit Issuance	Public Works Department	
43.	Submit a California registered Civil Engineer prepared earthwork cut and fill certification letter to the Engineering Division for review. If the required earthwork in cubic yards is 50 CY or less, a Precise Grading/Paving Plan will not be required; however, the applicant is required to pull an NPDES/Public Works permit prior to issuance of a Building Permit for record purposes.	Prior to Grading Permit Issuance	Public Works Department	
44.	Development of the site is subject to the requirements of the National Pollution Discharge Elimination System ("NPDES") Permit for the City of Eastvale, under the Santa Ana Regional Water Quality Control Board, Board Order No. R8-2010-0036. Pursuant to the NPDES Permit, the developer shall ensure development of the site incorporates post-construction Best Management Practices (“BMPs”) in accordance with the Model Water Quality Management Plan (“WQMP”) approved for use for the Santa Ana River Watershed. The developer is advised that applicable Site Design BMPs will be required to be incorporated into the final site design, pursuant to a site specific WQMP submitted	Prior to Grading Permit Issuance	Public Works Department	

DRAFT

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	to the City Engineer for review and approval. The site specific WQMP shall be submitted to the City Engineer for review and approval with the Precise Grading/Paving Plan.			
45.	Prior to commencing with any grading, the required erosion and dust control measures shall be in place. In addition, the following shall be included if not already identified: a. 6 foot high tan colored perimeter screened fencing b. Contractor information signage including contact information along the street frontage. c. Post dust control signage with the following verbiage: "Project Name, WDID No., IF YOU SEE DUST COMING FROM THIS PROJECT CALL: NAME (XXX) XXX-XXX, If you do not receive a response, please call the AQMD at 1-800-CUT-SMOG/1-800-228-7664"	Prior to Grading Permit Issuance	Public Works Department	
46.	A WQMP and Stormwater BMP Transfer, Access and Maintenance Agreement shall be required, obligating the Homeowners Association (HOA)/property owner(s) to appropriate operation and maintenance obligations of on-site BMPs constructed pursuant to the approved WQMP. The WQMP and Stormwater BMP Transfer, Access and Maintenance Agreement shall be approved prior to issuance of a Building Permit and shall be recorded by the Developer at the San Bernardino County Recorder's Office with a recorded copy provided to the Public Works Division prior to issuance of a Certificate of Occupancy.	Prior to Grading Permit Issuance	Public Works Department	
47.	A Notice of Intent ("NOI") to comply with the California General Construction Stormwater Permit is required via the California Regional Water Quality Control Board online	Prior to Grading Permit Issuance	Public Works Department	

DRAFT

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	Stormwater Multiple Application and Report Tracking System ("SMARTS"). A copy of the executed letter issuing a Waste Discharge Identification ("WDID") number shall be provided to the City Engineer. The Construction General Permit requires the Developer's contractor to prepare and maintain a Storm Water Pollution Prevention Plan ("SWPPP"). The SWPPP requires all appropriate measures be implemented to prevent erosion and water pollution during construction.			
48.	A California registered Geotechnical Engineer prepared Geotechnical/Soils Report shall be required for and incorporated as an integral part of the grading/paving plan for the proposed development. A copy of the Geotechnical/Soils Report shall be submitted to the Engineering Division with the first submittal of the Precise Grading/Paving Plan.	Prior to Grading Permit Issuance	Public Works Department	
49.	All stormwater runoff passing through the site shall be accepted and conveyed across the property in a manner acceptable to the City Engineer. All on-site City Engineer approved retention or other facilities are required to contain the increase stormwater runoff generated from the proposed development. Provide a hydrology study to determine the volume of increased stormwater runoff due to development of the site, and to determine required stormwater runoff mitigation measures for the proposed development. The City Engineer must approve the final retention basin sizing and other stormwater runoff mitigation measures determined upon review and approval of the hydrology and may require redesign or changes to site configuration or layout consistent with the findings of the final hydrology study. The existing "pre-developed" condition compared to the proposed	Prior to Grading Permit Issuance	Public Works Department	

DRAFT

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	"developed" condition shall be used to calculate the volume of increased stormwater runoff to retain on-site under the 100-year frequency storm.			
50.	Direct release of on-site nuisance water or stormwater runoff shall not be permitted to the adjacent public streets. Provisions for the interception of nuisance water from entering adjacent public streets from the project site shall be provided through the use of a minor storm drain system that collects and conveys nuisance water to landscape or parkway areas, and in only a stormwater runoff condition, pass runoff directly to the streets through parkway or under sidewalk drains.	Prior to Grading Permit Issuance	Public Works Department	
51.	The proposed project would be required to obtain coverage under the Santa Ana regional water quality control board's Statewide General Construction Permit (CGP), which requires the preparation, approval, and implementation of a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP would include Best Management Practices (BMPs) to be implemented during and after project construction to minimize erosion and sedimentation of downstream watercourses.	Prior to Grading Permit Issuance	Public Works Department	
52.	The project is subject to the Riverside County Storm Water Permit, also issued by the Santa Ana RWQCB (Order No. R8-2010-003, NPDES No. CAS 618033, as amended by R8-2013-0024, NPDES No. CAS618033) for discharges into the Municipal Separate Storm Sewer Systems (MS4S) draining the county.	Prior to Grading Permit Issuance	Public Works Department

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
53.	The project applicant will be required to prepare a final WQMP for the project, with BMPs incorporated in the plan.	Prior to Grading Permit Issuance	Public Works Department	
54.	Prior to the issuance of the grading permit, the project applicant shall submit a construction-related noise mitigation plan to the City for review and approval. The plan shall depict the locations of where construction equipment will operate on the project site and how the noise from the construction equipment will be mitigated during construction of the project, through use of such methods as: 1. Temporary noise attenuation fences; 2. Preferential location of equipment 3. Length of equipment use and idling time; and, 4. Use of current noise suppression technology and equipment	Prior to Grading Permit Issuance	Planning Division	
55.	Prior to the initiation of construction, the project applicant shall prepare a Traffic Management Plan (TMP) for approval by the City of Eastvale Traffic Engineer. The TMP shall comply with State standards set forth in the California Manual of Uniform Traffic Control Devices and include measures such as construction signage, limitations on timing for lane closures to avoid peak hours, temporary striping plans, and the need for a construction flag-person to direct traffic during heavy equipment use. The TMP shall specify that one lane of	Prior to Grading Permit Issuance	Public Works Department	

DRAFT

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	travel in each direction must always be maintained for Orange Street and Schleisman Road throughout project construction. The TMP shall be incorporated into project specifications for verification prior to final plan approval.			
56.	Prior to ground disturbing activities, the City of Eastvale Traffic Engineer shall verify that the project plans identify a stop control for southbound exiting project traffic with a shared left-right turn lane. The City of Eastvale Traffic Engineer shall also verify that the project plans indicate the existing eastbound through lane is restriped to provide an eastbound shared left-through lane. *MM TRA-1*	Prior to Grading Permit Issuance	Public Works Department	
57.	Prior to ground disturbing activities, the City of Eastvale Traffic Engineer shall verify that the project plans identify Orange Street from the western project boundary to the eastern project boundary at its ultimate half-section width as a 2-lane Collector (ultimate 74-foot right-of-way) in compliance with the circulation recommendations found in the City of Eastvale's General Plan. *MM TRA-2*	Prior to Grading Permit Issuance	Public Works Department	
Prior to Map Recordation				
58.	All provisions of Title 130 of the Eastvale Municipal Code shall be met as they relate to the division of land.	Prior to Map Recordation	Public Works Department	
59.	An irrevocable offer of dedication for public trail and landscape purposes shall be dedicated to the City of Eastvale	Prior to Map	Public Works Department

	and shown on the final map to the satisfaction of the City Engineer. A 30' easement for trail and landscape purpose shall be dedicated to the City of Eastvale along the entirety of the eastern project boundary.	Recordation		
60.	Those portions of the subject property proposed to be held under common ownership shall be labeled as such and identified by a separate lot number/letter on the final map.	Prior to Map Recordation	Public Works Department	
61.	Public street right-of-way and street improvements shall be dedicated and constructed in conformance with the street cross sections shown on the approved Tentative Tract Map as approved by the Planning Commission.	Prior to Map Recordation	Public Works Department	
62.	The Developer shall enter into a Subdivision Improvement Agreement with the City and shall guarantee by posting security(ies) to include all public improvements that the developer is conditioned to construct as part of this approval.	Prior to Map Recordation	Public Works Department	
63.	Dedicate City Engineer approved additional right-of-way along the entire frontage as may be required to provide a property line at ultimate right-of-way in accordance with the City General Plan, any applicable Specific Plan and/or as requested by the City Engineer. Dedicate 76' of right-of-way along Schleisman Road to the City for public right-of-way purposes.	Prior to Map Recordation	Public Works Department	
64.	A Final Map prepared by a California licensed Land Surveyor or registered Civil Engineer authorized to practice land surveying (pre-1982, RCE #33965 and lower) and all supporting documents to the Public Works Division for review and approval. A Title Report prepared for subdivision	Prior to Map Recordation	Public Works Department	

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	guarantee for the subject property, the traverse closures for the existing parcel and all lots created therefrom, and copies of record documents shall be submitted with the Final Map to the Engineering Division as part of the review of the Final Map. The Final Map shall be approved by the City Council prior to recordation of the Final Map.			
65.	Monument bond shall be posted with the City. The Developer shall provide a cost estimate to set monuments prepared by a California licensed Land Surveyor or registered Civil Engineer to the Public Works Division for review and approval by the City Engineer.	Prior to Map Recordation	Public Works Department	
66.	The Developer shall enter into an agreement with the City for bonding and improvements of all public streets, public infrastructure, private streets, and private infrastructure.	Prior to Map Recordation	Public Works Department	
67.	Various blanket and specific transportation and/or utility easements that are no longer in use are to be quitclaimed/abandoned on the Final Map.	Prior to Map Recordation	Public Works Department	
Prior to Encroachment Permit Issuance				
68.	The minimum pavement section for all on-site pavements shall be 3 inches asphalt concrete pavement over 6 inches crushed aggregate base with a minimum subgrade of 24 inches at 95% relative compaction, or equal. The pavement section shall be determined using appropriate Traffic Index ("TI") accepted by the City Engineer. A California registered Geotechnical Engineer shall design the pavement section using "R" values from the project site and submitted to the City	Prior to Encroachment Permit Issuance	Public Works Department	

	Conditions of Approval	Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	Engineer for approval.			
69.	Traffic Control Plan prepared by a California registered Civil Engineer or Traffic Engineer shall be submitted to the City Engineer for review and approval. Construction traffic shall be coordinated with Eastvale Elementary School and River Heights Intermediate to minimize disruptions during drop-off and pick-up hours.	Prior to Encroachment Permit Issuance	Public Works Department	
Prior to Building Permit Issuance				
70.	Major Development Review approval by the Planning Commission shall be accomplished for development of Tentative Tract Map 38167.	Prior to Building Permit Issuance	Planning Division	
71.	This project shall be subject to applicable school fees, the payment of which shall be documented to the satisfaction of the Building Official.	Prior to Building Permit Issuance	Building Division	
72.	All ground-mounted utility and mechanical equipment shall be screened and sound buffered to the satisfaction of the Community Development Director.	Prior to Building Permit Issuance	Planning Division	
73.	The applicant shall include plans to construct a minimum 6.5□ foot-high wall on the north side of Lots 9 through 15 and Lot 27 and 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings. *MM NOI-1*	Prior to Building Permit Issuance	Planning Division	
74.	Mailboxes shall be designed, installed, and located by the developer to the satisfaction of the Community Development	Prior to Building	Planning	

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	Director.	Permit Issuance	Division	
75.	The final site plan and model mix shall be reviewed and approved to the satisfaction of the Community Development Director.	Prior to Building Permit Issuance	Planning Division	
76.	An even mix of exterior façade treatments, colors and roof tile colors shall be used on the homes approved to the satisfaction of the Community Development Director.	Prior to Building Permit Issuance	Planning Division	
77.	Enhanced elevations shall be provided for side, rear, and corner view elevations visible from the public right-of-way and community open space. Front elevations of all product types are to be enhanced by nature.	Prior to Building Permit Issuance	Planning Division	
78.	Construction and architectural detailing shall be in substantial conformance with the approved plans, including but not necessarily limited to elevation drawings and material/colors sample board submitted as a part of this application and as approved by the Planning Commission, except that any modification shall be subject to the discretion of the Community Development Director upon finding that any changes are comparable in substance and quality to the original approval.	Prior to Building Permit Issuance	Planning Division	
79.	Any future modification to the building colors and materials approved by the Planning Commission shall be subject to review and approval by the Community Development Director. At the Community Development Director's discretion, proposed color and material modification may be referred to the Planning Commission for Major Development Plan review.	Prior to Building Permit Issuance	Planning Division	
80.	Any future monumentation into the development shall be subject to review and approval by the Community Development Director and City Traffic Engineer.	Prior to Building Permit Issuance	Planning Division	

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
81.	The master conceptual wall and fence plan approved by the Planning Commission as part of **PLN23-20043** shall serve as the master plan of development for community walls and fences within TTM 38167. The final design and location of project walls and fences shall be subject to review and approval of the Community Development Director.	Prior to Building Permit Issuance	Planning Division	
82.	Landscape construction plans shall be submitted to the Planning Division for review and approval. The plans shall be consistent with the Conceptual Landscape Plan approved by the Planning Commission on **October 18, 2023**. The plan shall be certified by a licensed landscape architect as required, taking into account approved preliminary landscape plan (if any), adopted plant palette guides, applicable scenic and master/specific plan requirements, and water conservation measures. This submittal shall be made to the Planning Division with the appropriate Application and Fee.	Prior to Building Permit Issuance	Planning Division	
83.	Submit photometric plan of street lighting. All lights shall be Edison LS-3 tariff and utilize General Electric Evolve LED luminaires per City Specifications. The Developer shall be responsible for applying with Southern California Edison ("SCE") for all appropriate service points and electrical meters early in the process to avoid delays. The Developer must pay for the electrical service of new meter pedestals installed until such time the improvements have been accepted and the underlying property is annexed into Community Facilities District ("CFD") or Landscaping Maintenance District ("LMD").	Prior to Building Permit Issuance	Public Works Department	
84.	The public street improvements outlined in these Conditions	Prior to Building	Public Works	

DRAFT

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	of Approval are intended to convey to the developer an accurate scope of required improvements; however, the City Engineer reserves the right to require reasonable additional improvements as may be determined in the course of the review and approval of street improvement plans required herein.	Permit Issuance	Department	
85.	The Developer shall submit landscape plans for the easterly 30' trail prepared by a California registered Landscape Architect.	Prior to Building Permit Issuance	Planning and Public Works Department	
86.	The Precise Grading/Paving Plan shall be City Engineer approved prior to issuance of a building permit.	Prior to Building Permit Issuance	Public Works Department	
87.	Provide pad elevation certifications for all building pads in conformance with the approved Precise Grading Plan to the Public Works Division prior to construction of any building foundation.	Prior to Building Permit Issuance	Public Works Department	
88.	The Developer shall connect to the JCSD sewer system and apply for a sewer connection account with JCSD. The project applicant, developer, or successor in interest shall provide written verification that the JCSD can and will provide sanitary sewer service to the project.	Prior to Building Permit Issuance	Public Works Department	
89.	The Developer shall submit sewer improvement plans prepared by a California registered Civil Engineer to the JCSD/Public Works Division. The plans shall be approved by the JCSD/City Engineer prior to issuance of any building permits.	Prior to Building Permit Issuance	Public Works Department	

DRAFT

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
90.	The Developer is advised that domestic water service is provided by JCSD. The developer shall be responsible for coordinating with JCSD and complying with all requirements for establishing domestic water service to the property.	Prior to Building Permit Issuance	Public Works Department	
91.	The Developer shall submit street improvement plans prepared by a California registered Civil Engineer to the Public Works Division for review and approval. Unless otherwise approved, the street improvement plans shall be approved concurrently with any street light, landscape and irrigation, and traffic signal plans.	Prior to Building Permit Issuance	Public Works Department	
92.	The Developer shall submit traffic striping and signage plans prepared by a California registered Civil Engineer, for review and approval by the City Engineer. All required traffic striping and signage improvements shall be completed concurrently with required street improvements, to the satisfaction of the City Engineer, and prior to issuance of a Building Permit.	Prior to Building Permit Issuance	Public Works Department	
Prior to Certificate Occupancy				
93.	Applicant shall build recycled water pipeline fronting their site and the landscaping area in Lot A shall be served by recycled water pipeline.	Prior to Certificate of Occupancy	JCSD	
94.	All parkway landscaping shall be guaranteed for a period of one (1) year from the date of the City Engineer acceptance. Any landscaping that fails during the one (1) year landscape maintenance period shall be replaced with similar plant material to the satisfaction of the City Engineer, and shall be subject to a subsequent one (1) year landscape maintenance	Prior to Certificate of Occupancy	Public Works Department	

DRAFT

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	period.			
95.	The development shall be annexed into all applicable City of Eastvale owned and administered Community Facilities Districts (CFDs) and/or Landscaping Maintenance Districts (LMDs) for ongoing maintenance of traffic signals, traffic signal synchronization, License Plate Reader cameras, street lights, full capture systems for all storm drains, multipurpose trails, and landscape maintenance of raised landscaped median and public parkways, to the satisfaction of the City Engineer or otherwise form a district where one is not currently in place.	Prior to Certificate of Occupancy	Public Works Department	
96.	With the exception of transmission lines, all existing overhead utility lines shall be undergrounded within the project frontage(s). Utility undergrounding shall extend to the nearest off-site power pole. Unless City Engineer approved, no new power poles shall be installed. A letter from the owners of the affected utilities shall be submitted to the City Engineer prior to approval of the Precise Grading/Paving Plan, informing the City that they have been notified of the City's utility undergrounding requirement and their intent to commence design of utility undergrounding plans. When available, the utility undergrounding plan shall be submitted to the City Engineer identifying all above ground facilities in the area of the project to be undergrounded.	Prior to Certificate of Occupancy	Public Works Department	

DRAFT

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
97.	Upon City Engineer approval of any improvement plan, the improvement plan shall be provided to the City in digital format, consisting of a DWG (AutoCAD drawing file), DXF (AutoCAD ASCII drawing exchange file), and PDF (Adobe Acrobat) formats. Variation of the type and format of the digital data to be submitted to the City may be authorized, upon prior City Engineer approval.	Prior to Certificate of Occupancy	Public Works Department	
98.	Mira Loma Road and Bridge Benefit Assessment District Fee ("MLRBA"), Transportation Uniform Mitigation Fee ("TUMF"), Area Drainage Plan ("ADP") fee, and any other regional pass-through fees in effect at that time shall be paid prior to issuance of Certificate of Occupancy.	Prior to Certificate of Occupancy	Public Works Department	
99.	The Developer shall submit to the City Engineer for review and approval the Covenants, Conditions, and Restrictions ("CC&Rs") and/or a Property Owners Association document to maintain and operate common areas and/or facilities including, but not limited to, parking areas, private utilities, and water quality basins.	Prior to Certificate of Occupancy	Public Works Department	
100.	Prior to issuance of a Certificate of Occupancy or final City approvals, demonstrate that all structural BMP's have been constructed and installed in conformance with approved plans and specifications, and as identified in the approved WQMP.	Prior to Certificate of Occupancy	Public Work Department	
101.	The applicant shall develop and construct a 30' wide trail along the eastern boundary of the property and dedicate an easement to the City. The trail shall be perpetually maintained by the HOA, CFD, or other entity acceptable to the City Engineer.	Prior to Certificate of Occupancy	Public Works Department	

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
102.	The Developer shall provide certification from JCSD Water Services demonstrating that all water and/or wastewater service accounts have been documented, prior to the issuance of a Certifiate of Occupancy.	Prior to Certificate of Occupancy	Public Works Department	
103.	All damaged, destroyed, or modified pavement legends, traffic control devices, signing, striping, and street lights, associated with the proposed development shall be replaced.	Prior to Certificate of Occupancy	Public Works Department	
104.	Remove existing, and construct new pavement with a minimum pavement section of 5 inches asphalt concrete pavement over 6 inches crushed aggregate base with a minimum subgrade of 24 inches at 95% relative compaction, or equal, along the entire half-width street frontage in accordance with City of Eastvale Standard Drawings. The pavement section shall be determined using appropriate Traffic Index ("TI") accepted by the City Engineer. A California registered Geotechnical Engineer shall design the pavement section using "R" values from the project site and submitted to the City Engineer for approval. Alternatively, depending on the existing street condition and as approved by the City Engineer, a street overlay, slurry seal, or other repair can be performed to preserve recent pavement improvements.	Prior to Certificate of Occupancy	Public Works Department	
105.	Construct an Americans with Disabilities Act ("ADA") compliant sidewalk behind curb along the entire frontage and interior streets in accordance with the General Plan, any Specific Plan, the City of Eastvale Standard Drawings, subject to the approval of the City Engineer.	Prior to Certificate of Occupancy	Public Works Department	
106.	Construct a curb ramp meeting current California State	Prior to	Public Works	

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	Accessibility standards along both sides of the Street "A" The developer shall ensure that an appropriate path of travel, meeting ADA guidelines, is provided across the driveway, and shall adjust the location of the access ramps, if necessary, to meet ADA guidelines, subject to the approval of the City Engineer. If necessary, additional pedestrian and sidewalk easements shall be provided on-site to construct a path of travel meeting ADA guidelines.	Certificate of Occupancy	Department	
107.	Grind and overlay entire ROW width of Orange Street within the project frontages.	Prior to Certificate of Occupancy	Public Works Department	
108.	The Developer is required to implement any recommendations/mitigations and pay any fair share costs identified in the approved Traffic Impact Analysis (TIA) and as required by the City Engineer: a. Driveway 1 & Orange Street - Install a stop control for the southbound existing Project traffic with a shared left-right turn lane. b. Driveway 1 & Orange Street - Restripe the existing eastbound through lane to provide an eastbound shared left-through lane. c. Orange Street - Construct Orange Street from the western Project boundary to the eastern Project boundary at its ultimate width as a 2-lane Collector (ultimate 74-foot right-of-way) in compliance with the circulation recommendations found in the City of Eastvale's General Plan.	Prior to Certificate of Occupancy	Public Works Department	

DRAFT

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	d. Pay a Project Fair Share Contribution to the City of Eastvale in the amount of $6,280 for future improvements at the intersection of Sumner Ave & Schleisman Road.			
109.	The Developer shall be responsible for coordinating with Riverside Transit Authority ("RTA") regarding the location of existing, proposed, and future bus stops along the property frontage of all public streets. The Developer shall design street, bus pad, and sidewalk improvements in accordance with the latest RTA bus stop guidelines and in compliance with current accessibility standards pursuant to the Americans with Disabilities Act ("ADA") requirements. The Developer shall design all bus stops to accommodate the RTA Shelters. The Developer shall submit to Public Works verification from RTA acknowledging concurrence with the existing, proposed, and future bus stop improvements in conformance with the Premium Shelter design guidelines.	Prior to Certificate of Occupancy	Public Works Department	
Ongoing				
110.	Provide street sweeping services for onsite and offsite within project frontages weekly.	Ongoing	Public Works Department	
111.	Remove all graffiti within 24 hours pre-construction, during construction, and after a Certificate of Occupancy is issued.	Ongoing	Public Works Department	
112.	A City of Eastvale Encroachment Permit is required for any improvements within the public right-of-way.	Ongoing	Public Works Department	
113.	All street cuts for utilities shall be repaired in accordance with City Standard or as recommended; and any interim trench repairs shall consist of compacted backfill to the bottom of the	Ongoing	Public Works Department	

DRAFT

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	pavement structural section followed by placement of standard base course material in accord by the City Engineer and with the Standard Specifications for Public Work Construction ("Greenbook"). The base course material shall be placed the full height of the structural section to be flush with the existing pavement surface and provide a smooth pavement surface until permanent cap paving occurs using an acceptable surface course material.			
114.	In accordance with City's Moratorium policy to preserve newly paved streets, any and all street and/or trench cuts in newly paved streets will be prohibited or be subject to moratorium street repair standards as reference in Section 12.08.260 of the Eastvale Municipal Code.	Ongoing	Public Works Department	
115.	Any and all utility trenches or other excavations within existing asphalt concrete pavement of off-site streets resulting from the proposed development shall be backfilled and repaired in accordance with City of Eastvale Standard Drawings. The Developer shall be responsible for removing, grinding, paving and/or overlaying existing asphalt concrete pavement of off-site streets including pavement repairs in addition to pavement repairs made by utility companies for utilities installed for the benefit of the proposed development (i.e. Jurupa Community Services District, Southern California Edison, Southern California Gas Company, Time Warner, Verizon, etc.). Multiple excavations, trenches, and other street cuts within existing asphalt concrete pavement of off-site streets resulting from the proposed development may require complete grinding and asphalt concrete overlay of the affected off-site streets, at the discretion of the City Engineer. The	Ongoing	Public Works Department	

Conditions of Approval		Timing/ Implementation	Enforcement/ Monitoring	Verification (Date and Signature)
	pavement condition of the existing off-site streets shall be returned to a condition equal to or better than what existed prior to construction of the proposed development.			
116.	Construction signing, lighting and barricading shall be provided during all phases of construction in accordance with City Standards and the direction of the City Engineer. As a minimum, all construction signing, lighting and barricading shall be in accordance with Part 6 "Temporary Traffic Control" of the latest California Manual on Uniform Traffic Control Devices, or subsequent editions in force at the time of construction.	Ongoing	Public Works Department	
117.	An encroachment permit shall be obtained for any construction related activities occurring within District right of way or facilities, namely Eastvale Master Drainage Plan Lateral D-7. If a proposed storm drain connection exceeds the hydraulic performance of the existing drainage facilities, mitigation will be required. For further information, contact the District's Encroachment Permit Section at 951.955.1266.	Ongoing	Riverside County Flood Control and Water Conservation District	
118.	The project applicant will be required to comply with the recommendations of the Riverside County Waste Management Department and all federal, State, and local statutes and regulations related to solid waste, including the Solid Waste Reuse and Recycling Access Act of 1991.	Ongoing	Waste Management	

DRAFT

CONDITIONS OF APPROVAL				
Planning Application Number and Description: Project No. PLN23-20043 – Major Development Review for the construction of 41 single family detached residential units on Tentative Tract Map 38167. The project also includes the development of a common open space area, and two (2) paseos.				
Assessor's Parcel Number: 152-040-003				
Planning Commission Approval Date:				
	Conditions of Approval	**Timing/ Implementation**	**Enforcement/ Monitoring**	**Verification (Date and Signature)**
General Conditions/Requirements				
1.	The applicant shall review and sign below verifying the "Acceptance of the Conditions of Approval" and return the signed page to the Eastvale Planning Department. Project approval is not final until a signed copy of these conditions is filed with the City. Applicant Signature Date	Must be completed to finalize approval	Planning Division	
2.	The applicant shall indemnify, protect, defend, and hold harmless the City, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof, from any and all claims, demands, law suits, writs of mandamus, and other actions and proceedings (whether legal, equitable, declaratory, administrative, or adjudicatory in nature), and alternative dispute resolutions procedures (including but not limited to arbitrations, mediations, and other such procedures) (collectively "Actions"), brought against the City, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof, that challenge, attack, or seek to modify, set aside, void, or annul any action of, or any permit or approval issued by, the City and/or any of its officials, officers,	Ongoing	Planning Division	

	employees, agents, departments, agencies, and instrumentalities thereof (including actions approved by the voters of the City), for or concerning the project, whether such Actions are brought under the California Environmental Quality Act, the Planning and Zoning Law, the Subdivisions Map Act, Code of Civil Procedure Section 1085 or 1094.5, or any other state, federal, or local statute, law, ordinance, rule, regulation, or any decision of a court of competent jurisdiction. It is expressly agreed that the City shall have the right to approve, which approval will not be unreasonably withheld, the legal counsel providing the City's defense, and that applicant shall reimburse City for any costs and expenses directly and necessarily incurred by the City in the course of the defense. City shall promptly notify the applicant of any Action brought and City shall cooperate with applicant in the defense of the Action.			
3.	Any approval shall not be final until and unless the applicant's deposit account with Planning has a balance of at least **$5,000** at the time that the applicant signs these conditions of approval (per **Condition No. 1**) to cover staff time for follow-up, monitoring, and other post-approval work by staff. The City reserves the right to request additional deposits to cover post-approval staff work and to halt work if the deposit account is exhausted. Make check payable to the **City of Eastvale** and include **Project No. PLN23-20043** on the check.	Ongoing	Planning Division	
4.	Applicant understands and agrees that failure to comply with all conditions of approval may result in the City Council/Planning Commission taking action resulting in modification of conditions of approval and/or suspension or revocation of the Major Development Review permit.	Ongoing	Planning Division	
5.	Approval of Major Development Review (PLN23-20043) shall lapse and become void as of October 18, 2025, unless building permits have been issued and construction is commenced and diligently pursued towards completion on the structures that are the subject of Major	Ongoing	Planning Division	

	Development Review (PLN23-20043), or a time extension is requested in writing prior to that date.			
6.	Approval of Major Development Review (PLN23-20043) is contingent upon approval of Tentative Tract Map 38167. Failure to approve Tentative Tract Map 38167 shall render any approval of Major Development Review (PLN23-20043) null and void.	Ongoing	Planning Division	
7.	All applicable Tentative Tract Map 38167 conditions of approval (PLN23-20043) shall be incorporated herein by reference.	Ongoing	Building, Planning, and Public Works Divisions	
8.	Applicable mitigation measures included in the IS/MND shall be required for the development of the proposed project (PLN23-20043) and are incorporated herein by reference.	Ongoing	Planning Division	
9.	Major Development Review (PLN23-20043) is for the site planning and architecture of 41 single-family residential dwellings within Tract 38167 along with three lettered lots for water quality, common open space and a pedestrian paseo.	Ongoing	Planning Division	
10	The project shall conform to the requirements of Senate Bill (SB) 330 Housing Crisis Act of 2019.	Ongoing	Planning Division/City Attorney's Office	
Notes on Grading and Construction Plans to be Implemented During Construction				
11.	The cover sheet of the building construction drawings shall include a blue line print of the City's conditions of approval and shall be attached to each set of plans submitted for City approval	On Going	Planning Division	
12.	The Title Sheet of the plans shall include: Occupancy Group Occupant Load	On Going	Building Division	

	Description of use Type of Construction Height of Building Floor area of buildings(s) and/or occupancy group(s)			
13.	Dimensioned building setbacks and property lines, street centerlines, and between buildings or other structures shall be designed on the plot plan.	On Going	Building, Planning, and Public Works Divisions	
14.	All property lines and easements must be shown on the plot plan. A statement that such lines and easements are shown is required.	On Going	Building, Planning, and Public Works Divisions	
15.	The project design will conform with energy conservation measures articulated in Title 24 of the California Code of Regulations and address measures to reduce energy consumption such as flow restrictions for toilets, low consumptions light fixtures, and insulation, and shall use to the extent feasible drought tolerant landscaping.	On Going	Building Divisions	
16.	A design professional will be required at the time of construction drawings, to prepare plans for proposed improvements per the Building and Professions Code.	On Going	Building Divisions	
17.	A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.	To be Implemented by the Applicant During Construction	Building and Public Works Divisions	

DRAFT

18.	All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 miles per hour (mph) per SCAQMD guidelines in order to limit fugitive dust emissions.	To be Implemented by the Applicant During Construction	Building and Public Works Divisions	
19.	The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project site are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.	To be Implemented by the Applicant During Construction	Building and Public Works Divisions	
20.	The contractor shall ensure that traffic speeds on unpaved roads and in project site areas are reduced to 15 mph or less.	To be Implemented by the Applicant During Construction	Building and Public Works Divisions	
21.	In order to limit the volatile organic compound (VOC) content of architectural coatings used in the SCAB, architectural coatings shall be no more than a low VOC default level of 50 grams per liter (g/L) unless otherwise specified in the SCAQMD Table of Standards.	To be Implemented by the Applicant During Construction	Building and Public Works Divisions	
22.	If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the county coroner has made the necessary findings as to origin. Further, pursuant to California Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made. Following discovery and during assessment of the remains, work will be diverted at least 50 feet from the burial. The discovery shall	To be Implemented by the Applicant During Construction	Planning Division	

DRAFT

	be kept confidential, and secure to prevent disturbance. If left overnight, remains will be covered with a muslin cloth and steel plate over the excavation to protect the remains. If this method of protection is not feasible, a guard will be posted. If the Riverside County coroner determines the remains to be of Native American origin, the NAHC must be contacted by the coroner within 24 hours of the coroner's determination. The NAHC must then immediately identify the most likely descendants(s) for purposes of receiving notification of discovery. The most likely descendant(s) shall then make recommendations within 48 hours from the time that site access is granted and engage in consultation concerning the treatment of the remains as provided in Public Resources Code Section 507.98.			
23.	If cultural resources are encountered during ground-disturbing activities, work in the immediate area shall cease and an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for Archaeology shall be contacted immediately to evaluate the find(s). If the discovery proves to be significant under the California Environment Quality Act, additional work such as data recovery excavation may be warranted and shall be reported to the City. *MM CUL-1*	To be Implemented by the Applicant During Construction	Planning Division	
24.	The project shall comply with the requirements of the Alquist-Priolo Earthquake Fault Zoning Act, as well as with the 2022 California Building Code (CBC), which includes specific design measures intended to maximize structural stability in the event of an earthquake. Construction of the project shall also be required to comply with current seismic design parameters and all other	To be Implemented by the Applicant During Construction	Building Division	

DRAFT

	recommendations as contained in the Geotechnical Evaluation to ensure structural integrity in the event of an earthquake.			
25.	The project shall comply with the California Building Code and the City of Eastvale's grading requirements in Eastvale Municipal Code Section 130.08.040, *Street Grades*, and subject to the approval of the City Engineer.	To be Implemented by the Applicant During Construction	Building Division	
26.	The project shall comply with all recommendations contained in the project-specific Geotechnical Evaluation.	To be Implemented by the Applicant During Construction	Building and Public Works Division	
27.	The project will be subject to the general sound level standards of Eastvale Municipal Code Section 8.52.040, *General Sound Level Standards.*	To be Implemented by the Applicant During Construction	Planning and Community Enhancement and Safety Divisions	
28.	As an infill development site, construction will be occurring within a noise-sensitive environment. In accordance with Municipal Code requirements, any construction or maintenance activity on real property which may disturb the peace and comfort of inhabitants of the neighborhood or comfortable enjoyment of life and property is prohibited between the hours of 6:00 p.m. and 6:00 a.m. during the months of June through September and 6:00 p.m. and 7:00 a.m. during the months of October through May, unless said work is of an emergency nature or a prior permit has been obtained from the Community Development Director.	To be Implemented by the Applicant During Construction	Planning and Community Enhancement and safety Divisions	
29.	Grading in excess of 199 cubic yards will require performance security to be posted with the City.	To be Implemented by the Applicant	Public Works Department	

DRAFT

		During Construction		
Prior to Issuance of Grading Permit				
30.	Prior to issuance of grading permits, the project applicant shall prepare construction documents for approval by the City Engineer which shall include plans to construct a minimum 6.5□foot-high wall on the north side of Lots 9 through 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings. *MM NOI-1*	Prior to Issuance of Grading Permit	Planning and Public Works Divisions	
31.	The project shall conduct focused burrowing owl pre-construction surveys as follows: 1. No more than 30 days prior to the first ground-disturbing activities, the project applicant shall retain a qualified Biologist to conduct a pre-construction survey of the project site. The survey shall establish the presence or absence of western burrowing owl and/or habitat features and evaluate use by owls in accordance with the California Department of Fish and Wildlife (CDFW) and Western Riverside County Regional Conservation Authority (RCA) survey guidelines. 2. On the parcel where the activity is proposed, the Biologist shall survey the proposed disturbance footprint and a 500-foot radius from the perimeter of the proposed footprint to identify burrows and burrowing owl. The survey shall take place near sunrise or sunset in accordance with the CDFW and RCA guidelines. All burrows or burrowing owl shall be identified and mapped. During the breeding season (February 1–August 31), surveys shall document whether burrowing owl are nesting on or directly adjacent to disturbance areas. During the	Prior to Issuance of Grading Permit	Planning Division	

	non-breeding season (September 1–January 31), surveys shall document whether burrowing owl are using habitat on or directly adjacent to any disturbance area. Survey results shall be valid only for the season during which the survey is conducted. 3. If burrowing owl are not discovered, further mitigation is not required. If burrowing owl are observed during the pre-construction surveys, the applicant shall perform the following measures to limit the impact on the burrowing owls: A. Avoidance shall include the establishment of a 160-foot non-disturbance buffer zone. Construction may occur during the breeding season if a qualified Biologist monitors the nest and determines that the birds have not begun egg-laying and incubation, or that the juveniles from the occupied burrows have fledged. During the non-breeding season (September 1-January 31), the project applicant shall avoid the owls and the burrows they are using, if possible. Avoidance shall include the establishment of a 160-foot non-disturbance buffer zone. B. If it is not possible to avoid occupied burrows, passive relocation shall be implemented. Burrowing owl shall be excluded from burrows in the immediate impact zone and within a 160-foot buffer zone by installing one-way doors in burrow entrances. These doors shall be in place for 48 hours prior to excavation. The project area shall be monitored daily for 1 week to confirm that the owl has abandoned the burrow. Whenever possible, burrows should be excavated using hand tools and refilled to prevent re-occupation. Plastic tubing or a similar structure shall be inserted in the tunnels during excavation to			

DRAFT

	maintain an escape route for any burrowing owl inside the burrow. *MM BIO-1*			
32.	The project applicant shall employ protective measures for active bird nests as follows (including pre-construction survey and implementation of avoidance buffer, if found): 1. Removal of trees shall be limited to only those necessary to construct the proposed project as reflected in the relevant project approval documents. It is recommended that a Biologist make sure the bird houses are not occupied and then block access to the bird houses for the duration of construction to avoid attracting nesting birds. 2. If construction occurs during the nesting season (February 1 to August 31), pre- construction surveys shall be conducted within 14 days prior to tree removal to determine whether or not active nests are present. 3. If an active nest is located during pre-construction surveys, a qualified Biologist shall determine an appropriately-sized avoidance buffer based on the species and anticipated disturbance level. A qualified Biologist shall delineate the avoidance buffer using Environmentally Sensitive Area fencing, pin flags, and or yellow caution tape. The buffer zone shall be maintained around the active nest site(s) until the young have fledged and are foraging independently. No construction activities or construction foot traffic is allowed to occur within the avoidance buffer(s). 4. The qualified Biologist shall monitor the active nest during construction activities to prevent any potential impacts that may result from the construction of the proposed project, until the young have fledged.	Prior to Issuance of Grading Permit	Planning Division	

	MM BIO-2			
33.	Prior to the issuance of a grading permit, the project applicant shall prepare and submit a Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis report to City of Eastvale to document the project's consistency with the goals, objectives, and requirements of the MSHCP. *MM BIO-3*	Prior to Issuance of Grading Permit	Planning Division	
34.	The developer shall pay the appropriate drainage impact mitigation fee to the Riverside County Flood Control and Water Conservation District.	Prior to the Issuance of Grading Permit	Public Works Department	
35.	The developer shall obtain coverage under the appropriate NPDES General Construction Permit for storm water discharges associated with construction activities. Order No. 99-08-DWQ, NPDES No. CAS000002.	Prior to the Issuance of Grading Permit	Public Works Department	
36.	The developer's contractor is required to submit for a haul route permit for the hauling of material to and from the project site. Said permit will include limitations of haul hours, number of loads per day, and the posting of traffic control personnel at all approved entrances/exits onto public roads. This permit shall be in place prior to the issuance of the grading permit and the mobilization of equipment on the project site.	Prior to the Issuance of Grading Permit	Public Works Department	
37.	Street names shall be approved by the Community Development Director prior to issuance of grading permit. Suggested street names and alternatives shall be submitted in writing to the Community Development Director for approval. Phonic similarity with existing street names should be avoided.	Prior to Issuance of Grading Permit	Planning Division	
38.	The applicant shall be responsible for creating a proposed addressing list and exhibit for review and approval by the Community Development Director, prior to issuance of grading permit. Addresses shall be suggested for any building(s) and/or any	Prior to Issuance of Grading Permit	Planning Division	

	electrical/water single/dual irrigation meter pedestal(s) or temporary power poles.			
Prior to Issuance of Building Permit				
39.	The developer shall pay all necessary impact and mitigation fees required. These fees include, but are not limited to, fees associated with Transportation Uniform Mitigation Fee (TUMF), Road Bridges Benefit District (RBBD) Fees, Quimby (parkland in-lieu) Fee, and City Development Impact Fees.	Prior to issuance of Building Permits	Building Division	
40.	The project applicant is required to pay school impact fees. California Government Code Section 65996 indicates that payment of school impact fees is considered full mitigation for project impacts to a school district.	Prior to issuance of Building Permits	Building Divisions	
41.	The project applicant will be required to comply with the recommendations of the Riverside County Waste Management Department and all federal, State, and local statutes and regulations related to solid waste, including the Solid Waste Reuse and Recycling Access Act of 1991.	Prior to issuance of Building Permits	Waste Management	
42.	The project applicant, developer, or successor in interest shall provide written verification that the Jurupa Community Services District can and will provide potable water service to the project.	Prior to issuance of Building Permits	Building Divisions	
43.	Water service is available from an existing 12-inch diameter waterline in Schleisman Road and an existing 8-inch diameter waterline in Orange Street. The applicant must provide the Jurupa Community Services District (District) with fire flow requirements from the Riverside County Fire Department to determine the adequacy of the existing water system. Two separate water service points of connection are required for the proposed residential development showing a total of 41 residential parcels. It is noted that the proposed technical site plan has only one connection to the existing waterline in Orange Street. A second connection is required.	Prior to issuance of Building Permits	Jurupa Community Services District	

DRAFT

	Any proposed waterline outside the public right-of-way must be located in an easement in favor of the District and comply with the District's standards and requirements for such an easement.			
44.	This project will be required to construct an 8-inch recycled waterline along the full frontage of Orange Street. All Common areas and frontages must be irrigated using recycled water sourced from this 8-inch recycled waterline. In the event that the District's facilities are not available when irrigation is needed, the developer will construct a connection to the potable water system with a District approved back flow device that the District will remove when the District's recycled water system is connected to the proposed 8-inch recycled waterline.	Prior to issuance of Building Permits	Jurupa Community Services District	
45.	A Final Site Plan of Development shall be approved prior to issuance of any building permits. The Final Site Plan of Development shall include but is not limited to the following: a. Master home plans and elevations. b. Dimensioned site plan showing, but not limited to, the following: o Setbacks o Attractive, walkways and/or design features at paseos o Location of mailboxes c. Final grading plan d. Landscape and irrigation plans for private, common, and public areas e. Wall and fence plans f. Photometric Lighting Plan to ensure proper outdoor light, pursuant to City of Eastvale Municipal Code Section 120.05.050, Outdoor Lighting	Prior to Issuance of Building Permit	Planning Department	

DRAFT

46.	Construction and architectural detailing shall be in substantial conformance with the approved plans, including but not necessarily limited to elevation drawings and material/colors sample board, submitted as part of this application and as approved by the Planning Commission.	Prior to Issuance of Building Permits	Planning Division	
47.	Any future modification to the building colors or architectural style approved by the Planning Commission shall be subject to review and approval by the Community Development Director. At the Community Development Director's discretion, proposed color or architectural style modifications may be referred to the Planning Commission for Major Development Review approval.	Prior to Issuance of Building Permits	Planning Division	
48.	Final plotting of homes on lots within Major Development Review (PLN23-20043) shall be subject to review and approval by the Planning Division.	Prior to Issuance of Building Permits	Planning Division	
49.	An even mix of exterior façade treatments, colors, and roof tile colors shall be used on the homes approved per this Major Development Review to the satisfaction of the Community Development Director. Applicant shall provide a tabulation of proposed architectural styles and colors schemes to be implemented on lots for review and approval by the Planning Division prior to issuance of building permits.	Prior to Issuance of Building Permits	Planning Division	
50.	Mailboxes shall be designed, installed and located by the developer to the satisfaction of the Community Development Director.	Prior to Issuance of Building Permits	Planning Division	
51.	Outdoor furniture and amenities provide on Lot A of Tentative Tract Map 38167 shall be safe, comfortable, of sturdy construction, hygienic and designed for outdoor use.	Prior to Issuance of Building Permits	Planning Division	
52.	Any future entry monumentation into the development of Tentative Tract Map 38167 shall be subject to review and approval by the	Prior to Issuance of Building Permits	Planning Division	

DRAFT

	Community Development Director and the City Traffic Engineer prior to issuance of a building permit.			
53.	The Master Conceptual Wall and Fence Plan approved by the Planning Commission as part of Major Development Review (PLN23-20043) shall serve as the master plan of development for community walls and fences within Major Development Review (PLN23-20043). The final design and location of project walls shall be subject to review and approval by the Community Development Director prior to issuance of building permits.	Prior to Issuance of Building Permits	Planning Division	
54.	The applicant shall include plans to construct a minimum 6.5□foot-high wall on the north side of Lots 9 through 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings. *MM NOI-1*	To be Incorporated Into Building Plans	Planning and Building Divisions	
55.	All mechanical equipment, including but not limited to HVAC units, shall be screened from public view and sound buffered from adjacent properties to the satisfaction of the Community Development Director and Building Official	Prior to Issuance of Building Permits	Planning and Building Divisions	
56.	Two sets of construction landscape plans as well as a digital copy shall be submitted to the Planning Division for review and approval. The plan shall be certified by a licensed landscape architect as required, taking into account approved preliminary landscape plan (if any), adopted plant alette guides, applicable scenic and specific plan requirements, and water conservation measures. **This submittal shall be made to the Planning Division with the appropriate Application and fee.**	Prior to Issuance of Building Permits	Planning Division	
57.	The above-described plans shall be in substantial conformance with the conceptual landscape plans as approved by the City Landscape	Prior to Issuance of Building Permits	Planning Division	

	Architect, City Administrative staff, Planning Commission and/or City Council. Notes, details, and specifications shall be included.			
58.	The Applicant shall submit a set of development plans, including a lighting plan, to the Eastvale Police Department for review and approval for appropriate safety measures including, but not limited to, the following: PROPERTY GATES AND KNOX BOX ENTRY a. The installation of the Knox Rapid Entry System if property gates are installed. This system permits law enforcement, fire, and first responders to obtain independent access to the property in the event of an emergency. The necessary order forms for the Knox Company may be obtained by contacting the Jurupa Valley Sheriff's Station Crime Prevention Programs Coordinator at (951) 955-9225. ADDRESS NUMBERING: b. Prominently displayed address numbering in size and contrasting in color from the building façade or on a fixed sign near the street/main entrances. The numbers need to be visible from the street and interior property sides for any approaching emergency vehicles. No obstructions should limit their visibility (i.e., landscaping). SECURITY AND LIGHTING PLAN c. Adequate crime prevention measures to assist with identifying any suspect(s) of any potential future vandalism or theft attempts. Due to the high possibility of theft/vandalism attempts during construction, additional security measures should be added during that time frame of proposed construction. All exterior access points should be properly illuminated to make clearly visible any person on or about the premises during the hours of darkness.	Prior to Issuance of Building Permit	Building and Police Departments	

DRAFT

	Residential units shall be equipped with solid core doors and quality dead bolt locking devices at entry points.			
59.	Plans should reflect that all street lights and other outdoor lighting are hooded or shielded to prevent either the spillage of lumens or reflection into the sky or above the horizontal plane.	Prior to Issuance of Building Permit	Planning Division	
Prior to Issuance of Certificate of Occupancy				
60.	A copy of the covenants, conditions, and restrictions (CC&R's) shall be submitted to the Community Development Director for review and approval, prior to execution.	Prior to Issuance of Certificate of Occupancy	Planning Division	
61.	Applicant shall include notification within the CC& R's as well as within the project sales office informing potential homeowners that landscaping within City or H.O.A.-maintained areas is not to be modified in any way by the homeowner, without express authorization by the entity (either the City or H.O.A) responsible for maintain said landscape.	Prior to Issuance of Certificate of Occupancy	Planning Division	
62.	Applicant shall build recycled water pipeline fronting their site and the landscaping area in Lot A shall be served by recycled water pipeline.	Prior to Issuance of Certificate of Occupancy	JCSD	
63.	All required landscape planting and irrigation shall have been installed consistent with the approved construction plans and shall be in a condition acceptable to the Community Development Director. The plants shall be healthy and free of weeds, disease, or pests. The irrigation system shall be properly constructed and in good working order. The applicant shall contact the Planning Division to schedule the final inspection(s).	Prior to Issuance of Certificate of Occupancy	Planning Department	
64.	The applicant shall develop and construct a 30' wide trail along the eastern boundary of the property and dedicate an easement to the City. The trail shall be perpetually maintained by the HOA, CFD, or other entity acceptable to the City Engineer.	Prior to Issuance of Certificate of Occupancy	Planning Department	

DRAFT

Ongoing/ General Conditions				
65.	The applicant shall comply with all provisions and procedures of the Eastvale Building Department related to the plan check review process. (Please contact the Building Department at 951-703-4450.)	Ongoing	Building Division	
66.	All construction shall comply with the most recently adopted City and State building codes: 2022 California Building Code 2022 California Residential Code 2022 California Electrical Code 2022 California Mechanical Code 2022 California Plumbing Code 2022 California Fire Code 2022 California Green Code	Ongoing	Building Division	
67.	Special Inspections- As indicated by California Building Code Section 1704, the owner shall employ one or more special inspectors who shall provide special inspections when required by CBC Section 1704. Please contact the Building Division at the time of plan submittal to obtain an application for special inspections.			
68.	No obstruction shall be placed on any existing easement. An approval document from easement holders shall be required for any easement encroachment.	Ongoing	Public Works Department	
69.	Written permission shall be obtained from the affected property owners allowing the proposed grading and/or facilities to be installed outside of the project boundaries.	Ongoing	Public Works Department	

DRAFT

70.	Project runoff shall be directed to a safe point of discharge. Any additional easement that may be necessary to accomplish such shall be obtained prior to issuance of grading permit. The applicant shall submit a Final Water Quality Management Plan (WQMP) in conformance with the requirements of the Riverside County Flood Control District. All storm water quality treatment devices shall be located outside of the ultimate public right-of-way. The applicant shall design the storm water quality treatment devices to accommodate all project runoff, ensuring post-construction flow rate, volumes, velocity, and duration do not exceed pre-construction levels, in accordance with City of Eastvale's Hydrology Manual, Storm water Quality Best Management Practice Design Handbook, Improvement Standards, and to the satisfaction of the City Engineer. These best management practices shall be consistent with the Final WQMP and installed to the satisfaction of the City Engineer.	Ongoing	Public Works Department	
71.	All connection to flood control facilities shall be reviewed and permitted by the Riverside County Flood Control and Water Conservation District, and shall be submitted through the City of Eastvale, unless otherwise directed by the City Engineer.	Ongoing	Public Works Department	
72.	The developer shall prepare and submit to the City for review and approval all required development plans including but not limited to Grading (Rough and/or Precise), Street Improvement, Street Light, Storm Drain, Traffic Signal, and Striping and Signing. All applicable processing and review fees and/or deposits shall be submitted with the first plan submittal.	Ongoing	Public Works Department	
73.	No grading shall be performed without prior issuance of a grading permit by the City.	Ongoing	Public Works Departments	
74.	All grading shall conform to the California Building Code and to all other relevant laws, rules, and regulations governing grading in the City of Eastvale. Prior to commencing any grading which includes	Ongoing	Public Works Department	

DRAFT

	50 or more cubic yards, the developer shall obtain a grading permit from the Public Works/Engineering Department.			
75.	All necessary measures to control dust shall be implemented by the applicant during grading to the satisfaction of the City Engineer.	Ongoing	Public Works Department	
76.	Graded slopes shall be limited to a maximum steepness ratio of 2:1 (horizontal to vertical) unless otherwise approved by the City Engineer.	Ongoing	Public Works Department	
77.	Grading in excess of 199 cubic yards will require performance security to be posted with the City.	Ongoing	Public Works Department	
78.	Erosion control-landscape plans, required for manufactured slopes greater than 3 feet in vertical height, are to be signed by a registered landscape architect and bonded accordingly. Planting shall occur within 30 days of meeting final grades to minimize erosion and to ensure slope coverage prior to the rainy season. The developer shall plant and irrigate all manufactured slopes steeper than a 4:1 (horizontal to vertical) ratio and 3 feet or greater in vertical height with grass or ground cover; slopes 15 feet or greater in vertical height shall be planted with additional shrubs or trees or as approved by the City Engineer.	Ongoing	Public Works Department	
79.	If soil is encountered during site development that is suspected of being contaminated by hazardous materials, work will be halted and site conditions will be evaluated by a qualified environmental professional. The results of the evaluation will be submitted to the County of Riverside Department of Environmental Health, and the appropriate response/remedial measures will be implemented, as directed by County of Riverside Department of Environmental Health, or other applicable oversight agency, until all specified	Ongoing	Public Works Department	

DRAFT

	requirements of the oversight agencies are satisfied and a "no-further-action" status is attained. Fill material imported from other areas shall be tested to assess that it is suitable to be used as fill, including testing for unsafe levels of hazardous materials, prior to placement on-site.			
80.	Outdoor furniture and amenities must at all times be properly secured and confined within Lot A of Tentative Tract Map 38167 and shall not impact the safety of other users or obstruct pedestrian or vehicular circulation.	Ongoing	Community Enhancement and Safety Division	
81.	Lot A of Tentative Tract Map 38167 shall be maintained in sound and aesthetically acceptable conditions, to the satisfaction of the Community Development Director. Landscaping shall remain in a healthy and thriving condition at all times and all amenities provided shall be free of graffiti, safe to use, and in good working order at all times. Further, the area shall be kept tidy and free of all debris.	Ongoing	Community Enhancement and Safety Division	

Fire Department Conditions of Approval

The Fire Department requires the listed fire protection measures be provided in accordance with the City of Eastvale and Riverside County Fire Department Fire Protection Standards. This is a preliminary review; final conditions will be addressed when complete buildings plans are reviewed.

1. Fire Hydrants and Fire Flow: Prior to the issuance of building permits, plans for the water system shall be submitted to the fire department for review and approval. The water system shall be capable of delivering the required fire flow. Fire hydrant location and spacing shall comply with the fire code An approved water supply shall be installed and accepted by the Office of the Fire Marshal prior to the arrival of combustible materials on site. Reference 2019 California Fire Code (CFC) 507.5.1, 3312, Appendices B and C.

2. Fire Department Access: The access roads shall be capable of sustaining 60,000 lbs. over two axels. Approved vehicle access, either permanent or temporary shall be provided during construction. CFC 503.1.1, 3310.1 and 503.2.1

3. Traffic calming devices shall be prohibited unless the design is reviewed and approved by the Office of the Fire Marshal. Ref. CFC 503.4.1

4. Phased Construction Access: If construction is phased, each phase shall provide approved access to any construction. Ref. CFC 503.1

5. Driveway Gates: Manual gates shall be equipped with approved Knox equipment. Electric gates shall be provided with Knox key switches. Electric gates shall also be connected to a remote signal receiver compatible for use with the premption devices on the Riverside County fire apparatus. Ref. CFC 506.1

6. Residential Fire Sprinklers: Residential fire sprinklers are required in all one and wo-family dwellings per the California Residential Code (CRC). Plans must be submitted to the Office of the Fire Marshal for review and approval prior to installation. Ref. CRC 313.2

7. Addressing: All residential dwellings shall display street numbers in a prominent location on the street side of the premises. Ref. CFC 505.1

8. Projects in the Fire Hazard Severity Zone: Prior to the approval of any tentative map, preliminary fuel modification plans shall be reviewed and approved by the Office of the Fire Marshal. Final fuel modification plans shall be reviewed and approved prior to the issuance of a grading permit. CFC 4906

Nothing in our review shall be construed as encompassing structural integrity. Review of this plan does not authorize or approve any omission or deviation from all applicable regulations. Final approval is subject to field inspection. All questions regarding the meaning of the code requirements should be directed to the Fire Department at (951) 737-8097.

1.0 INTRODUCTION

1.1 Purpose of Analysis and Study Objectives

This Noise Impact Analysis has been prepared to determine the noise impacts associated with the proposed Magnolia Ranch Residential project (proposed project). The following is provided in this report:

- A description of the study area and the proposed project;
- Information regarding the fundamentals of noise;
- Information regarding the fundamentals of vibration;
- A description of the local noise guidelines and standards;
- An evaluation of the current noise environment;
- An analysis of the potential short-term construction-related noise impacts from the proposed project; and
- An analysis of long-term operations-related noise impacts from the proposed project.

1.2 Site Location and Study Area

The project site is located in the City of Eastvale (City). The approximately 10.0 gross acre project site is relatively flat and currently includes a ranch house with barn and associated fencing and facilities for livestock/horses. The project site is bounded by Schleisman Road to the north, Eastvale Elementary School to the east, Orange Street and River Heights Intermediate School to the south and single-family homes to the west. The project study area is shown in Figure 1.

Sensitive Receptors in Project Vicinity

The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

1.3 Proposed Project Description

The proposed project would consist of a residential development on 8.28 net acres that would include 41 detached single-family homes with approximately 22,000 square feet of common open space. New sidewalks will be provided along the north side of Orange Street, a walkway will run in a north-south direction adjacent to the east property line, and a walkway will run in an east-west direction through the common open space area. The proposed project would also include development of an internal road system and road improvements to the portion of Orange Street that is adjacent to the project site. It should be noted that the project applicant is proposing to pay TUMF fees in lieu of road improvements to the portion of Schleisman Road that is adjacent to the project site, however in order to provide a conservative analysis, it has been assumed that this area will be graded as part of the proposed project. The proposed site plan is shown in Figure 2.

1.4 Executive Summary

Standard Noise Regulatory Conditions

The proposed project will be required to comply with the following regulatory conditions from the City and State of California (State).

City of Eastvale Noise Regulations

The following lists the noise and vibration regulations from the City of Eastvale Development Code that are applicable, but not limited to the proposed project.

- Section 120.05.130(b) - Noise control standards
- Section 120.05.130(b) – Vibration standards

State of California Noise Regulations

The following lists the State of California noise regulations that are applicable, but not limited to the proposed project.

- California Vehicle Code Section 27200-27207 – On Road Vehicle Noise Limits
- California Vehicle Code Section 38365-38350 – Off-Road Vehicle Noise Limits

Summary of Analysis Results

The following is a summary of the proposed project's impacts with regard to the State CEQA Guidelines noise checklist questions.

Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less than significant impact.

Generation of excessive groundborne vibration or groundborne noise levels?

Less than significant impact.

For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Less than significant impact.

1.5 Project Design Features Incorporated into the Proposed Project

This analysis was based on implementation of the following project design features that are either already depicted on the proposed project site plan and architectural plans or are required from City and State Regulations.

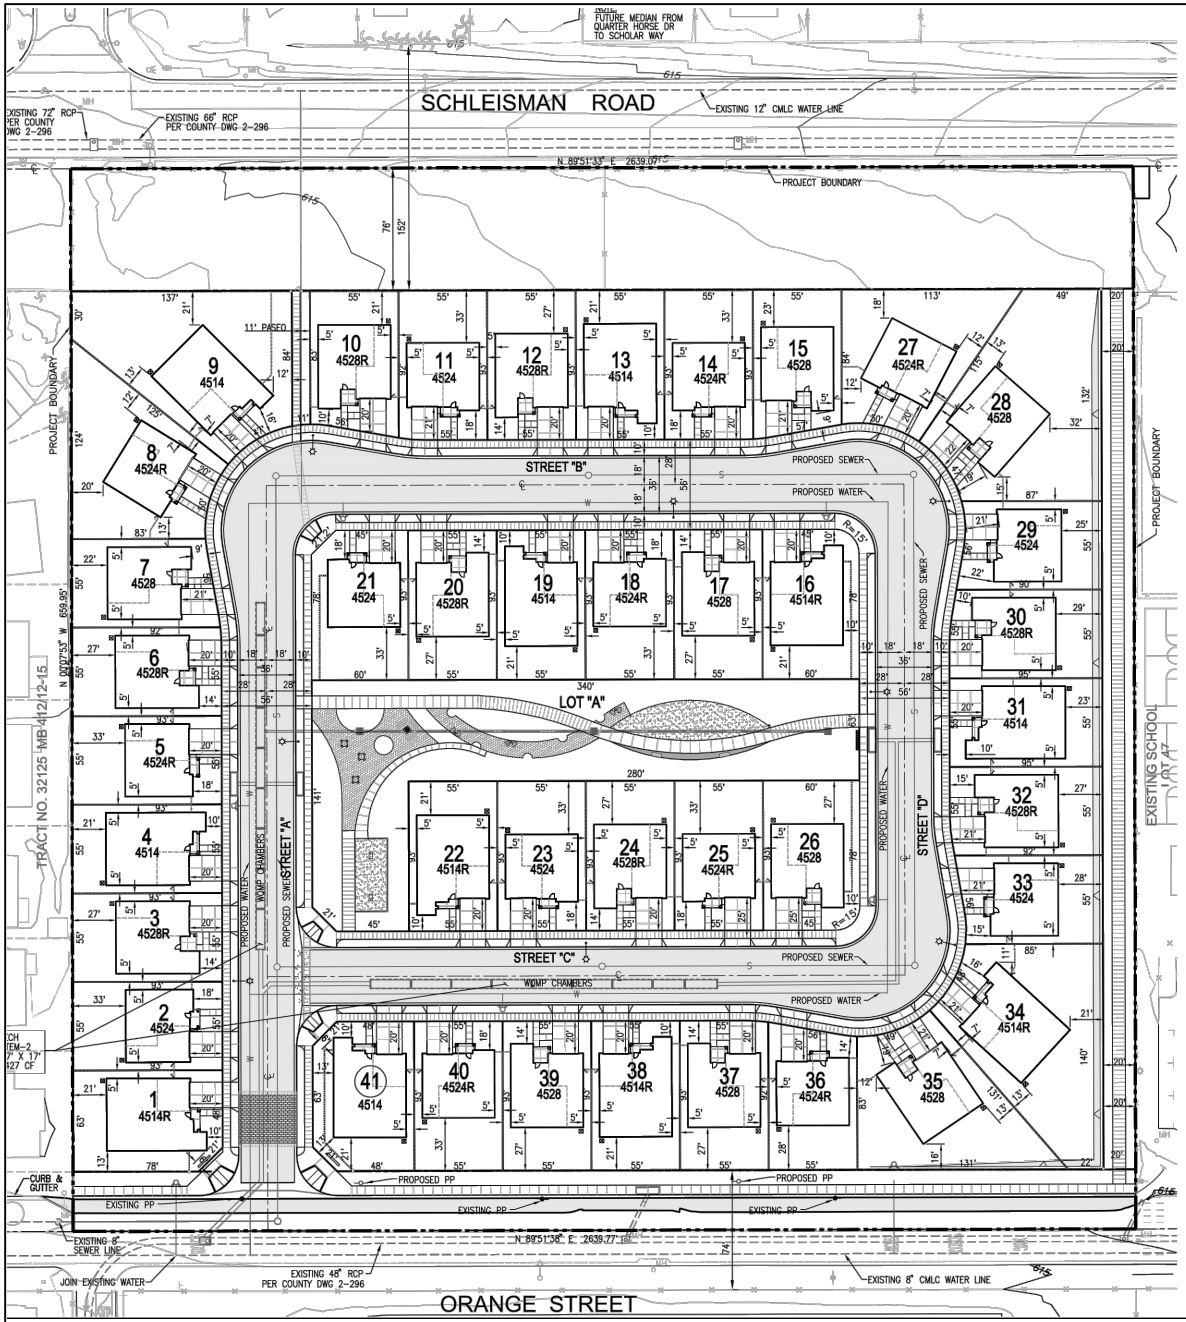
Project Design Feature 1:
Prior to the issuance of the grading permit, the project applicant shall submit a construction-related noise mitigation plan to the City for review and approval. The plan shall depict the

locations of where construction equipment will operate on the project site and how the noise from the construction equipment will be mitigated during construction of the project, through use of such methods as:

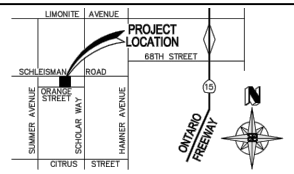
1. Temporary noise attenuation fences;
2. Preferential location of equipment
3. Length of equipment use and idling time; and,
4. Use of current noise suppression technology and equipment.

1.6 Mitigation Measures for the Proposed Project

This analysis found that through adherence to the noise and vibration regulations detailed in Section 1.4, through implementation of Project Design Feature 1 detailed in Section 1.5 above, and through implementation of the following mitigation all noise and vibration impacts would be reduced to less than significant levels.



Mitigation Measure 1:



The project applicant shall construct a minimum 6.5-foot high wall on the north side of Lots 9 through 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings.

Proposed Site Plan

2.0 NOISE FUNDAMENTALS

Noise is defined as unwanted sound. Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Sound is produced by the vibration of sound pressure waves in the air. Sound pressure levels are used to measure the intensity of sound and are described in terms of decibels. The decibel (dB) is a logarithmic unit which expresses the ratio of the sound pressure level being measured to a standard reference level. A-weighted decibels (dBA) approximate the subjective response of the human ear to a broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear.

2.1 Noise Descriptors

Noise Equivalent sound levels are not measured directly, but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (Leq) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. The worst-hour traffic Leq is the noise metric used by California Department of Transportation (Caltrans) for analyzing traffic noise impacts.

The Day-Night Average Level (Ldn or DNL) is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of ten decibels to sound levels at night between 10 p.m. and 7 a.m. While the Community Noise Equivalent Level (CNEL) is similar to the Ldn, except that it has another addition of 4.77 decibels to sound levels during the evening hours between 7 p.m. and 10 p.m. These additions are made to the sound levels at these time periods because during the evening and nighttime hours, when compared to daytime hours, there is a decrease in the ambient noise levels, which creates an increased sensitivity to sounds. For this reason, the sound appears louder in the evening and nighttime hours and is weighted accordingly. The City of Eastvale relies on the CNEL noise standard to assess transportation-related impacts on noise sensitive land uses.

2.2 Tone Noise

A pure tone noise is a noise produced at a single frequency and laboratory tests have shown that humans are more perceptible to changes in noise levels of a pure tone. For a noise source to contain a “pure tone,” there must be a significantly higher A-weighted sound energy in a given frequency band than in the neighboring bands, thereby causing the noise source to “stand out” against other noise sources. A pure tone occurs if the sound pressure level in the one-third octave band with the tone exceeds the average of the sound pressure levels of the two contiguous one-third octave bands by:

- 5 dB for center frequencies of 500 hertz (Hz) and above
- 8 dB for center frequencies between 160 and 400 Hz
- 15 dB for center frequencies of 125 Hz or less

2.3 Noise Propagation

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in level of noise as the distance from the source increases. The manner in which the noise level reduces with distance depends on whether the source is a point or line source as well as ground absorption, atmospheric effects and refraction, and shielding by natural and manmade features.

Sound from point sources, such as air conditioning condensers, radiate uniformly outward as it travels away from the source in a spherical pattern. The noise drop-off rate associated with this geometric spreading is 6 dBA per each doubling of the distance (dBA/DD) between source and receiver. Transportation noise sources such as roadways are typically analyzed as line sources, since at any given moment the receiver may be impacted by noise from multiple vehicles at various locations along the roadway. Because of the geometry of a line source, the noise drop-off rate associated with the geometric spreading of a line source is 3 dBA/DD.

2.4 Ground Absorption

The sound drop-off rate is highly dependent on the conditions of the land between the noise source and receiver. To account for this ground-effect attenuation (absorption), two types of site conditions are commonly used in traffic noise models, soft-site and hard-site conditions. Soft-site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation. For point sources, a drop-off rate of 7.5 dBA/DD is typically observed over soft ground with landscaping, as compared with a 6.0 dBA/DD drop-off rate over hard ground such as asphalt, concrete, stone and very hard packed earth. For line sources a 4.5 dBA/DD is typically observed for soft-site conditions compared to the 3.0 dBA/DD drop-off rate for hard-site conditions. Caltrans research has shown that the use of soft-site conditions is more appropriate for the application of the Federal Highway Administration (FHWA) traffic noise prediction model used in this analysis.

3.0 GROUND-BORNE VIBRATION FUNDAMENTALS

Ground-borne vibrations consist of rapidly fluctuating motions within the ground that have an average motion of zero. The effects of ground-borne vibrations typically only cause a nuisance to people, but at extreme vibration levels damage to buildings may occur. Although ground-borne vibration can be felt outdoors, it is typically only an annoyance to people indoors where the associated effects of the shaking of a building can be notable. Ground-borne noise is an effect of ground-borne vibration and only exists indoors, since it is produced from noise radiated from the motion of the walls and floors of a room and may also consist of the rattling of windows or dishes on shelves.

3.1 Vibration Descriptors

There are several different methods that are used to quantify vibration amplitude such as the maximum instantaneous peak in the vibrations velocity, which is known as the peak particle velocity (PPV) or the root mean square (rms) amplitude of the vibration velocity. Due to the typically small amplitudes of vibrations, vibration velocity is often expressed in decibels and is denoted as (L_v) and is based on the rms velocity amplitude. A commonly used abbreviation is "VdB", which in this text, is when L_v is based on the reference quantity of 1 micro inch per second.

3.2 Vibration Perception

Typically, developed areas are continuously affected by vibration velocities of 50 VdB or lower. These continuous vibrations are not noticeable to humans whose threshold of perception is around 65 VdB. Off-site sources that may produce perceptible vibrations are usually caused by construction equipment, steel-wheeled trains, and traffic on rough roads, while smooth roads rarely produce perceptible ground-borne noise or vibration.

3.3 Vibration Propagation

The propagation of ground-borne vibration is not as simple to model as airborne noise. This is due to the fact that noise in the air travels through a relatively uniform medium, while ground-borne vibrations travel through the earth which may contain significant geological differences. There are three main types of vibration propagation; surface, compression, and shear waves. Surface waves, or Rayleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wave front, similar to ripples produced by throwing a rock into a pool of water. P-waves, or compression waves, are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. S-waves, or shear waves, are also body waves that carry energy along an expanding spherical wave front. However, unlike P-waves, the particle motion is transverse or "side-to-side and perpendicular to the direction of propagation."

As vibration waves propagate from a source, the vibration energy decreases in a logarithmic nature and the vibration levels typically decrease by 6 VdB per doubling of the distance from the vibration source. As stated above, this drop-off rate can vary greatly depending on the soil but has been shown to be effective enough for screening purposes, in order to identify potential vibration impacts that may need to be studied through actual field tests.

4.0 REGULATORY SETTING

The project site is located in the City of Eastvale. Noise regulations are addressed through the efforts of various federal, state, and local government agencies. The agencies responsible for regulating noise are discussed below.

4.1 Federal Regulations

The adverse impact of noise was officially recognized by the federal government in the Noise Control Act of 1972, which serves three purposes:

- Promulgating noise emission standards for interstate commerce
- Assisting state and local abatement efforts
- Promoting noise education and research

The Federal Office of Noise Abatement and Control (ONAC) was initially tasked with implementing the Noise Control Act. However, the ONAC has since been eliminated, leaving the development of federal noise policies and programs to other federal agencies and interagency committees. For example, the Occupational Safety and Health Administration (OSHA) agency prohibits exposure of workers to excessive sound levels. The Department of Transportation (DOT) assumed a significant role in noise control through its various operating agencies. The Federal Aviation Administration (FAA) regulates noise of aircraft and airports. Surface transportation system noise is regulated by a host of agencies, including the Federal Transit Administration (FTA), which regulates transit noise, while freeways that are part of the interstate highway system are regulated by the Federal Highway Administration (FHWA). Finally, the federal government actively advocates that local jurisdictions use their land use regulatory authority to arrange new development in such a way that "noise sensitive" uses are either prohibited from being sited adjacent to a highway or, alternately that the developments are planned and constructed in such a manner that potential noise impacts are minimized.

Although the proposed project is not under the jurisdiction of the FTA, the *Transit Noise and Vibration Impact Assessment Manual* (FTA Manual), prepared by the FTA, September 2018, is the only guidance document from a government agency that has defined what constitutes a significant noise impact from implementing a project. The FTA standards are based on extensive studies by the FTA and other governmental agencies on the human effects and reaction to noise and a summary of the FTA findings are provided below in Table A.

Table A – FTA Project Effects on Cumulative Noise Exposure

Existing Noise Exposure (dBA Leq or Ldn)	Allowable Noise Impact Exposure dBA Leq or Ldn		
	Project Only	Combined	Noise Exposure Increase
45	51	52	+7
50	53	55	+5
55	55	58	+3
60	57	62	+2
65	60	66	+1
70	64	71	+1
75	65	75	0

Source: Federal Transit Administration, 2018.

The FTA also provides guidance on construction noise and recommends developing construction noise criteria on a project-specific basis that utilizes local noise ordinances if possible. However, local noise ordinances usually relates to nuisance and hours of allowed activity and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the noise impacts of a construction project. Project construction noise criteria should take into account the existing noise environment, the absolute noise levels during construction activities, the duration of the construction, and the adjacent land uses. The FTA standards are based on extensive studies by the FTA and other governmental agencies on the human effects and reaction to noise and a summary of the FTA findings for a detailed construction noise assessment are provided below in Table B.

Table B – FTA Construction Noise Criteria

Land Use	Day (dBA $Leq_{(8\text{-hour})}$)	Night (dBA $Leq_{(8\text{-hour})}$)	30-day Average (dBA Ldn)
Residential	80	70	75
Commercial	85	85	80[(1)]
Industrial	90	90	85[(1)]

Notes:
[(1)] Use a 24-hour $Leq_{(24\ hour)}$ instead of $Ldn_{(30\ day)}$.
Source: Federal Transit Administration, 2018.

Since the federal government has preempted the setting of standards for noise levels that can be emitted by the transportation sources, the City is restricted to regulating the noise generated by the transportation system through nuisance abatement ordinances and land use planning.

4.2 State Regulations

Noise Standards

California Department of Health Services Office of Noise Control

Established in 1973, the California Department of Health Services Office of Noise Control (ONC) was instrumental in developing regularity tools to control and abate noise for use by local agencies. One significant model is the "Land Use Compatibility for Community Noise Environments Matrix," which allows the local jurisdiction to clearly delineate compatibility of sensitive uses with various incremental levels of noise.

California Noise Insulation Standards

Title 24, Chapter 1, Article 4 of the California Administrative Code (California Noise Insulation Standards) requires noise insulation in new hotels, motels, apartment houses, and dwellings (other than single-family detached housing) that provides an annual average noise level of no more than 45 dBA CNEL. When such structures are located within a 60-dBA CNEL (or greater) noise contour, an acoustical analysis is required to ensure that interior levels do not exceed the 45-dBA CNEL annual threshold. In addition, Title 21, Chapter 6, Article 1 of the California Administrative Code requires that all habitable rooms, hospitals, convalescent homes, and places of worship shall have an interior CNEL of 45 dB or less due to aircraft noise.

Government Code Section 65302

Government Code Section 65302 mandates that the legislative body of each county and city in California adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines published by the State Department of Health Services. The guidelines rank noise land use compatibility in terms of normally acceptable, conditionally acceptable, normally unacceptable, and clearly unacceptable.

California Vehicle Code Section 27200-27207 – On-Road Vehicle Noise

California Vehicle Code Section 27200-27207 provides noise limits for vehicles operated in California. For vehicles over 10,000 pounds noise is limited to 88 dB for vehicles manufactured before 1973, 86 dB for vehicles manufactured before 1975, 83 dB for vehicles manufactured before 1988, and 80 dB for vehicles manufactured after 1987. All measurements are based at 50 feet from the vehicle.

California Vehicle Section 38365-38380 – Off-Road Vehicle Noise

California Vehicle Code Section 38365-38380 provides noise limits for off-highway motor vehicles operated in California. 92 dBA for vehicles manufactured before 1973, 88 dBA for vehicles manufactured before 1975, 86 dBA for vehicles manufactured before 1986, and 82 dBA for vehicles manufactured after December 31, 1985. All measurements are based at 50 feet from the vehicle.

Vibration Standards

Title 14 of the California Administrative Code Section 15000 requires that all state and local agencies implement the California Environmental Quality Act (CEQA) Guidelines, which requires the analysis of exposure of persons to excessive groundborne vibration. However, no statute has been adopted by the state that quantifies the level at which excessive groundborne vibration occurs.

The *Transportation- and Construction Vibration Guidance Manual*, prepared by Caltrans, April 2020, provides practical guidance to Caltrans engineers, planners, and consultants who must address vibration issues associated with the construction, operation, and maintenance of Caltrans projects. However, this manual is also used as a reference point by many lead agencies and CEQA practitioners throughout California, as it provides numeric thresholds for vibration impacts. Thresholds are established for continuous (construction-related) and transient (transportation-related) sources of vibration, which found that the human response becomes distinctly perceptible at 0.25 inch per second PPV for transient sources and 0.04 inch per second PPV for continuous sources.

4.3 Local Regulations – City of Eastvale

The *City of Eastvale General Plan* (General Plan), approved June 13, 2012, and the Eastvale, CA Code of Ordinances (Municipal Code), January 7, 2022, establishes the following applicable policies related to noise and vibration.

General Plan

The following applicable goals and policies to the proposed project are from the Noise Element of the General Plan.

Goal N-1: Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors, and noise-sensitive uses of Eastvale.

Goal N-3: Ensure that noise sensitive uses do not encroach into area needed by noise generating uses.

Goal N-4: Locate noise sources away from existing noise sensitive land uses unless appropriate noise control measures are provided.

Policy N-3: Consider the following uses to be sensitive to noise and vibration, and discourage these uses in areas where existing or projected future noise levels would be in excess of 65 CNEL and/or vibration would be more than 0.0787 Peak Particle Velocity (inches/second)

- Schools;
- Hospitals;
- Rest Homes;
- Long Term Care Facilities;
- Mental Care Facilities;
- Residential Uses;
- Libraries;
- Passive Recreation Uses; and
- Places of Worship

Policy N-4: Require noise sensitive land uses proposed in areas where existing or projected future noise levels would be in excess of 65 CNEL to have an acoustical specialist prepare a study of the noise problems and recommend structural and site design features that will adequately mitigate the noise problem.

Policy N-5: Require that exterior noise forecasts use the appropriate Level of Service for the adjacent roadways, or a 20-year projection of traffic volumes (whichever is greater) for future noise forecasts.

Policy N-6: Mitigate exterior noise levels to the levels shown in Table N-3 (Table C) to the extent feasible.

Table C – City of Eastvale Noise Compatibility by Land Use Designation[1]

Land Use Designations	Completely Compatible	Tentatively Compatible	Normally Incompatible	Completely Incompatible
All Residential (Single- and Multi-Family)	Less than 60 dBA	60 – 70 dBA	70 – 75 dBA	Greater than 75 dBA
All Non-Residential (Commercial, Industrial & Institutional)	Less than 70 dBA	70 – 75 dBA	Greater than 75 dBA	--[(2)]
Public Parks (Lands on which public parks are located or planned)	Less than 65 dBA	65 – 70 dBA	70 – 75 dBA	Greater than 75 dBA

Notes:
[1] All noise levels shown in this Table are designated CNEL.
[2] To be determined as part of the project review process.
Source: City of Eastvale, 2012.

Policy N-7: Table N-4 (Table D) provides the City's standards for maximum exterior non-transportation noise levels to which land designated for residential land uses may be exposed for any 30-minute period on any day. Where existing ambient noise levels

exceed these standards, the ambient noise level shall be the highest allowable noise level as measured in dBA Leq (30 minutes).

Note to Reader: Public schools are not regulated by the City; therefore, no noise standards for public schools are provided in this Chapter.

Table D – City of Eastvale Exterior Noise Level Standards for Non-Transportation Noise[1]

Land Use Type	Time Period	Maximum Noise Level (dBA)
Single-Family Homes and Duplexes	10 p.m. to 7 a.m.	50
	7 a.m. to 10 p.m.	60
Multiple Residential 3 or More Units per Building (Triplex +)	10 p.m. to 7 a.m.	55
	7 a.m. to 10 p.m.	60

Notes:
[1] Measured as dBA Leq (30 minutes).

Policy N-9: The City may impose exterior noise standards which are less restrictive than those specified in Table N-4, provided that:

1) The noise impact on the residential or other noise-sensitive use is addressed in an environmental analysis and at least one outdoor area meets the standards; and
2) A finding is made by the approving body specifying why the exception would not be detrimental to the public health, safety and general welfare; and
3) The exception would not adversely affect the character of the surrounding development.
4) The exception would not be injurious to adjacent uses, property and improvements; and,
5) Alternatives have been considered but none are technologically feasible for the proposal and,
6) Interior noise levels resulting from and external source will be no more than 45 dBA CNEL from 7 a.m. to 10 p.m.; and,
7) Residents of noise sensitive uses are informed of the proposal during the review stage and prior to approval.

Policy N-10: Table N-5 (Table E): Maximum Acceptable Interior Noise Levels Created by Exterior Noise Sources provides the City's standards for acceptable indoor noise levels for various types of land uses. These standards should receive special attention when projects are considered in "Tentatively Compatible" or "Normally Incompatible" areas.

- Noise created inside a use listed below shall not count toward the acceptable noise levels to be maintained in accordance with this policy.

Table E – Maximum Acceptable Interior Noise Levels Created by Exterior Noise Sources

Land Use Type	Acceptable Noise Level (dBA CNEL)
Residential Living and Sleeping Areas	45 dBA
Residential Living and Sleeping Areas where the dwelling unit is subject to noise from railroad tracks, aircraft overflights, or similar sources which produce clearly identifiable, discrete noise events (such as the passing of a trains as opposed to relatively steady or constant noise sources such as roadways)	40 dBA
Private & Semi Private Classrooms[(1)]	55 dBA
All Places of Work Other than School Classrooms	Conform with applicable state and federal workplace safety standards

Notes:
[1] Standards for public schools are set and enforced by the State of California and are not regulated by the City of Eastvale.
Source: City of Eastvale, 2012.

Policy N-11: Developers of new residential or other noise-sensitive uses which are placed in environments subject to existing or projected noise that exceeds the "completely compatible" guidelines in Table N-3 (see Table C) shall be responsible for ensuring that acceptable exterior and interior noise levels will be achieved.

Policy N-22: Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.

Policy N-23: Condition subdivision and other land development approval adjacent to developed/occupied noise-sensitive land uses to require the developer to submit a construction-related noise mitigation plan to the City for review and approval prior to issuance of a grading permit. The plan must depict the location of construction equipment and specify how the noise from this equipment will be mitigated during construction of this project, through the use of such methods as:

a) Temporary noise attenuation fences;

b) Preferential location of equipment

c) Length of equipment use and idling time; and,

d) Use of current noise suppression technology and equipment.

Policy N-24: Require that all construction equipment be kept properly tuned and use noise reduction features (e.g. mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

City of Eastvale Municipal Code

The City of Eastvale Municipal Code establishes the following applicable standards for new residential development related to noise and vibration.

Section 8.52.020 - Exemptions

Sound emanating from the following sources is exempt from the provisions of this chapter:

(9) Private construction projects located within one-quarter of a mile from an inhabited dwelling, provided that construction does not occur between the hours of:

a. 6:00 p.m. and 6:00 a.m. during the months of June through September; and

b. 6:00 p.m. and 7:00 a.m. during the months of October through May;

(10) Property maintenance, including, but not limited to, the operation of lawnmowers, leaf blowers, etc., provided such maintenance occurs between the hours of 7:00 a.m. and 8:00 p.m.;

(12) Heating and air conditioning equipment.

Section 8.52.040 – General sound level standards

No person shall create any sound, or allow the creation of any sound, on any property that causes the exterior sound level on any other occupied property to exceed the sound level standards set forth in the following table:

Table F – City of Eastvale Municipal Code Sound Level Standards

General Plan Foundation Component			Maximum Decibel Level	
Land Use Designation General Plan	Land Use Designation Name	Density (per acre)	7:00 a.m. – 10:00 p.m.	10:00 p.m. – 7:00 a.m.
MDR	Medium-Density Residential	2-5	55	45
MHDR	Medium High-Density Residential	5-8	55	45
HDR	High-Density Residential	8-14	55	45
PF	Public Facility		65	45
REC	Recreation		45	45

Source: City of Eastvale, 2015.

Section 120.05.130 – Noise, odor and vibration performance standards

a) *Applicability.* The standards of this section apply to all new and existing land uses within the city, unless otherwise exempted.

b) *Noise standards.* All uses shall comply with the noise standards set forth in the city's general plan and within the city's noise ordinance (see chapter 8.52).

d) *Vibration standards.* Uses shall be operated in compliance with the following provisions:

(1) Uses, activities and processes shall not generate vibrations that cause discomfort or annoyance to reasonable persons of normal sensitivity or which endanger the comfort, repose, health or peace of residents whose property abuts the property lines of the subject parcel.

(3) Vibrations from temporary construction/demolition and vehicles that leave the subject parcel (e.g., trucks, trains and aircraft) are exempt from the provisions of this section.

5.0 EXISTING NOISE CONDITIONS

To determine the existing noise levels, noise measurements have been taken in the vicinity of the project site. The field survey noted that noise within the proposed project area is generally characterized by vehicle traffic on Schleisman Road that is adjacent to the north side of the project site and from Orange Street that is adjacent to the south side of the project site. There is also noise created from Eastvale Elementary School, adjacent to the east side of the project site. The following describes the measurement procedures, measurement locations, noise measurement results, and the modeling of the existing noise environment.

5.1 Noise Measurement Equipment

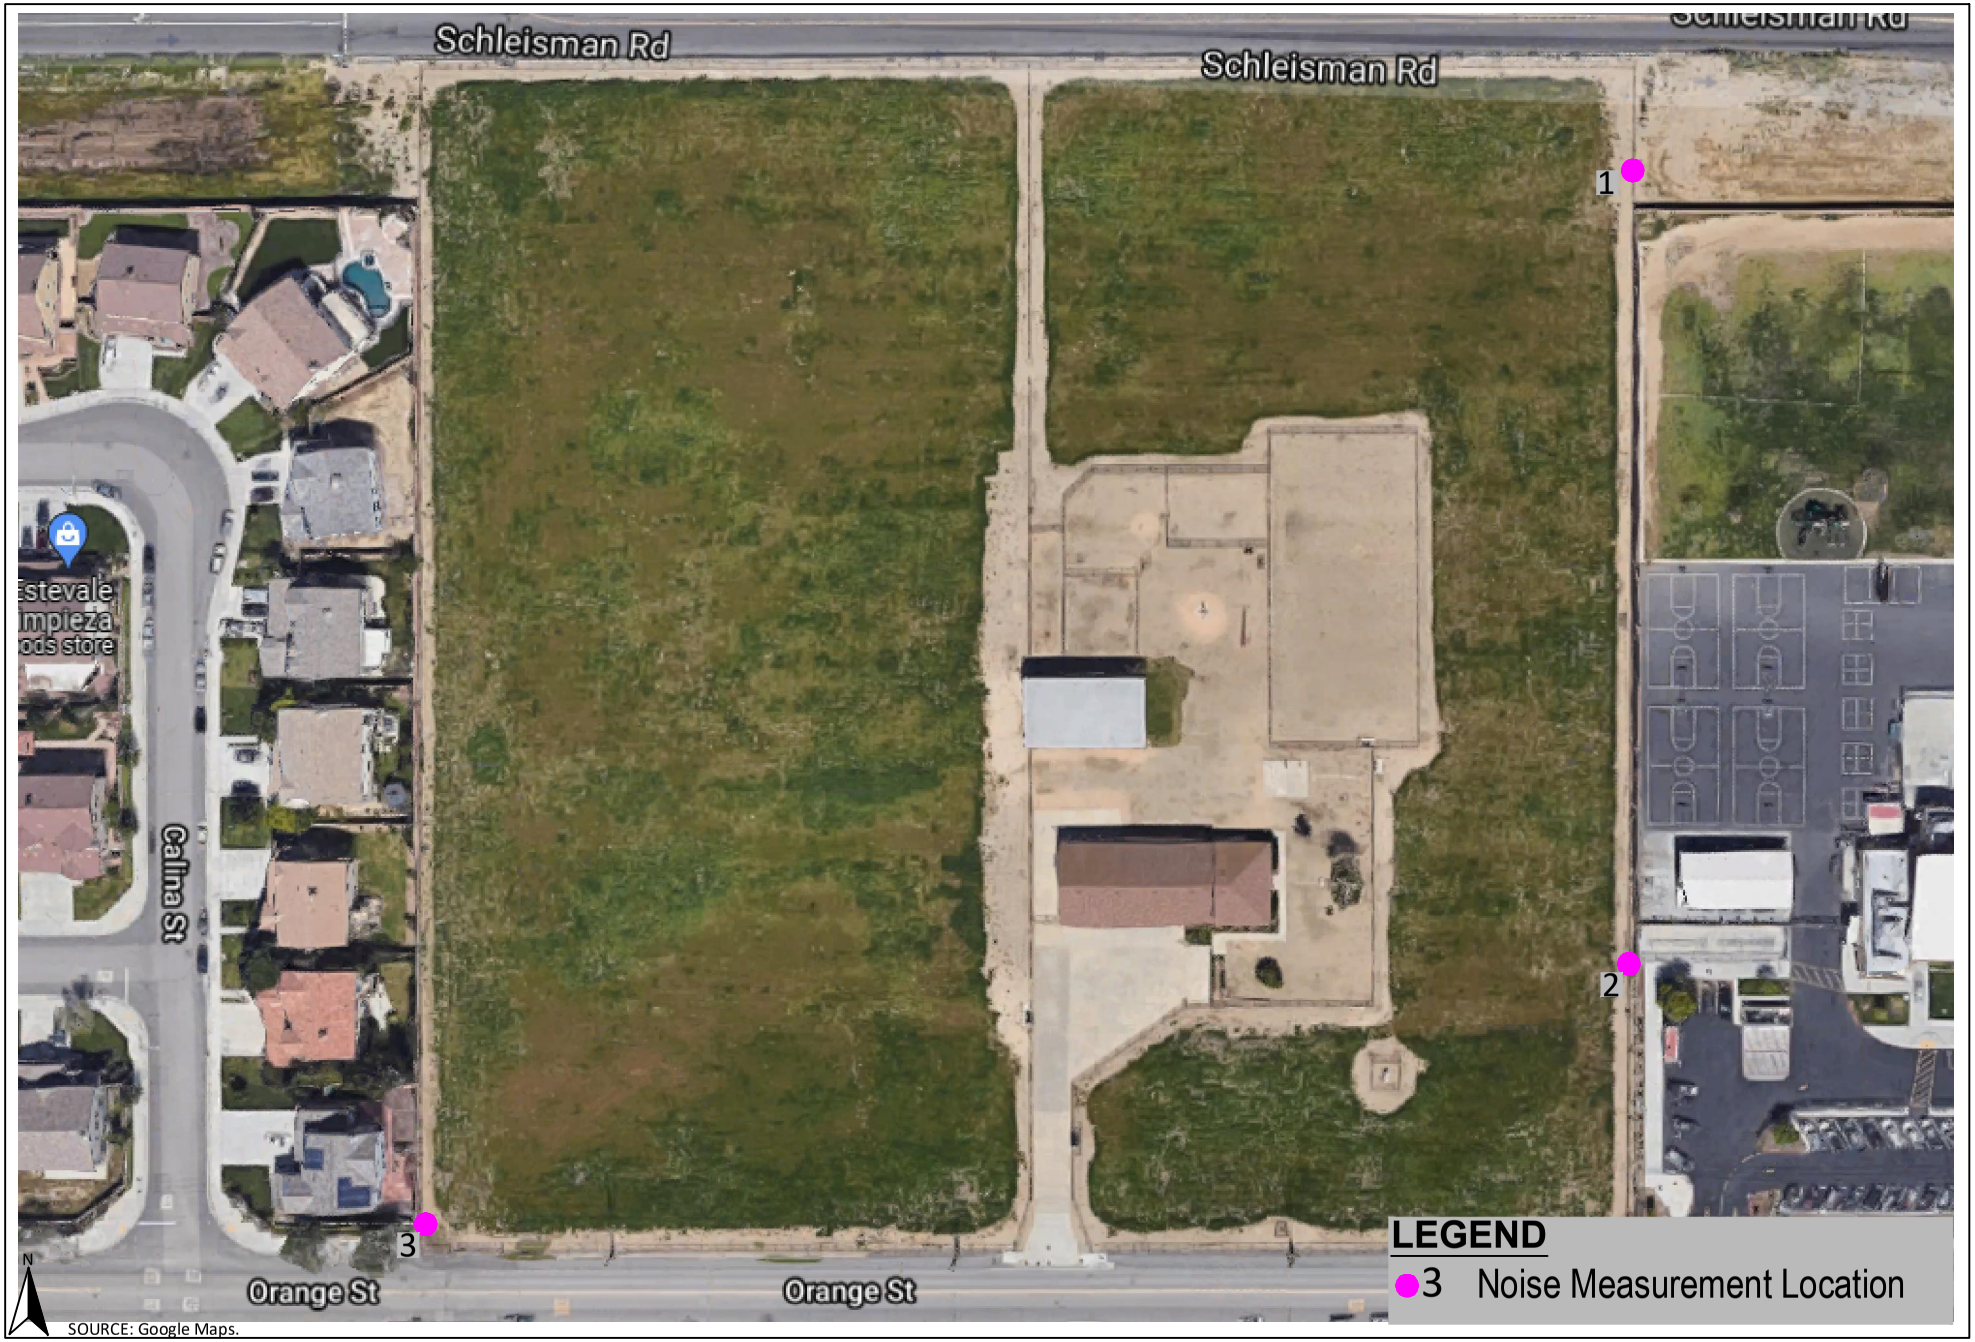
The noise measurements were taken using three Larson Davis Model LXT1 Class 1 sound level meters programmed in "slow" mode to record the sound pressure level at 1-second intervals for 24 hours in "A" weighted form. In addition, the L_{eq} averaged over the entire measuring time and L_{max} were recorded with the three sound level meters. The sound level meters and microphones were mounted on fences, were placed between four and six feet above the ground and were equipped with windscreens during all measurements. The noise meters were calibrated before and after the monitoring using a Larson Davis Cal200 calibrator. All noise level measurement equipment meets American National Standards Institute (ANSI) specifications for sound level meters (ANSI S1.4-2014 standard).

Noise Measurement Locations

The noise monitoring locations were selected in order to obtain noise levels on the project site and at the nearest residential uses located on the west side of the project site and at the school located on the east side of the project site. Descriptions of the noise monitoring sites are provided below in Table G and are shown in Figure 3. Appendix A includes a photo index of the study area and noise level measurement locations.

Noise Measurement Timing and Climate

The noise measurements were recorded between 4:09 p.m. on Thursday, December 9, 2021 and 4:21 p.m. on Friday, December 10, 2021. When the noise measurements were started the sky was cloudy, the temperature was 56 degrees Fahrenheit, the humidity was 71 percent, barometric pressure was 29.20 inches of mercury, and the wind was blowing around three miles per hour. Overnight, the temperature dropped to 43 degrees Fahrenheit and the humidity peaked at 95 percent. At the conclusion of the noise measurements, the sky was partly cloudy, the temperature was 61 degrees Fahrenheit, the humidity was 47 percent, barometric pressure was 29.44 inches of mercury, and there was no wind.



5.2 Noise Measurement Results

The results of the noise level measurements are presented in Table G. The measured sound pressure levels in dBA have been used to calculate the minimum and maximum L_{eq} averaged over 1-hour intervals. Table G also shows the L_{eq}, L_{max}, and CNEL, based on the entire measurement time. The CNEL was calculated through use of the hourly Leq that was entered into Equation 2-23 from *Technical Noise Supplement to the Traffic Noise Analysis Protocol* (TeNS), prepared by Caltrans, September 2013. The noise monitoring data printouts are included in Appendix B. Figure 4 shows a graph of the 24-hour noise measurements.

Table G – Existing (Ambient) Noise Level Measurements

Site No.	Site Description	Average (dBA L_{eq})		1-hr Average (dBA L_{eq}/Time)		24-hr dBA CNEL
		Daytime[1]	Nighttime[2]	Minimum	Maximum	
1	Located on a fence near the northeast corner of the project site, approximately 90 feet south of Schleisman Road centerline.	57.4	53.6	47.8 1:43 a.m.	60.4 6:59 a.m.	61.1
2	Located on a fence on the east side of the project site and adjacent to the bike parking area at Eastvale Elementary School and approximately 180 feet north of Orange Street centerline.	56.2	49.1	43.2 11:43 p.m.	63.4 11:39 a.m.	57.7
3	Located on a fence near the southwest corner of the project site and shared property line with the home at 7092 Calina Street, approximately 35 feet north of Orange Street centerline.	59.5	51.7	44.5 1:44 a.m.	64.2 7:33 a.m.	60.9

6.0 MODELING PARAMETERS AND ASSUMPTIONS

6.1 Construction Noise

The noise impacts from construction of the proposed project have been analyzed through use of the FHWA's Roadway Construction Noise Model (RCNM). The FHWA compiled noise measurement data regarding the noise generating characteristics of several different types of construction equipment used during the Central Artery/Tunnel project in Boston. Table H below provides a list of the construction equipment anticipated to be used for each phase of construction that was obtained from the *Air Quality, Energy, and Greenhouse Gas Impact Analysis Magnolia Ranch Residential Project* (Air Quality Analysis), prepared by Vista Environmental, July 26, 2022.

Table H – Construction Equipment Noise Emissions and Usage Factors

Equipment Description	Number of Equipment	Acoustical Use Factor[1] (percent)	Spec 721.560 Lmax at 50 feet[2] (dBA, slow[3])	Actual Measured Lmax at 50 feet[4] (dBA, slow[3])
Demolition				
Concrete/Industrial Saws	1	20	90	90
Excavators	3	40	85	81
Rubber Tired Dozers	2	40	85	82
Site Preparation				
Rubber Tired Dozers	3	40	85	82
Crawler Tractors	4	40	84	N/A
Grading				
Excavators	2	40	85	81
Grader	1	40	85	83
Rubber Tired Dozer	1	40	85	82
Scrapers	2	40	85	84
Crawler Tractors	2	40	84	N/A
Building Construction				
Crane	1	16	85	81
Forklift (Gradall)	3	40	85	83
Generator	1	50	82	81
Tractor	1	40	84	N/A
Front End Loader	1	40	80	79

Paving Equipment	2	50	85	77
Roller	2	20	85	80
Architectural Coating				
Air Compressor	1	40	80	78

Notes:
[1] Acoustical use factor is the percentage of time each piece of equipment is operational during a typical workday.
[2] Spec 721.560 is the equipment noise level utilized by the RCNM program.
[3] The "slow" response averages sound levels over 1-second increments. A "fast" response averages sound levels over 0.125-second increments.

[4] Actual Measured is the average noise level measured of each piece of equipment during the Central Artery/Tunnel project in Boston, Massachusetts primarily during the 1990s.
Source: Federal Highway Administration, 2006 and CalEEMod default equipment mix.

Table H shows the associated measured noise emissions for each piece of equipment from the RCNM model and measured percentage of typical equipment use per day. Construction noise impacts to the nearby sensitive receptors have been calculated according to the equipment noise levels and usage factors listed Table H and through use of the RCNM. For each phase of construction, all construction equipment was analyzed based on being placed in the middle of the project site, which is based on the analysis methodology detailed in FTA Manual for a General Assessment. However, in order to provide a conservative analysis, all equipment was analyzed, instead of just the two nosiest pieces of equipment as detailed in the FTA Manual. The RCNM model printouts are provided in Appendix C.

6.2 Operations-Related Noise

FHWA Model Methodology

The proposed project would result in increases in traffic noise to the nearby roadways as well as introduce new sensitive receptors to the project site. The project impacts to the offsite roadways were analyzed through use of the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108 (FHWA Model). The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). Adjustments are then made to the reference energy mean emission level to account for: the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT) and the percentage of ADT which flows during the day, evening and night, the travel speed, the vehicle mix on the roadway, which is a percentage of the volume of automobiles, medium trucks and heavy trucks, the roadway grade, the angle of view of the observer exposed to the roadway and site conditions ("hard" or "soft" relates to the absorption of the ground, pavement or landscaping). The following section provides a discussion of the software and modeling input parameters used in this analysis and a discussion of the resultant existing noise model.

FHWA Model Traffic Noise Prediction Model Inputs

The roadway parameters used for this study are presented in Table I. The roadway classifications are based on the City's General Plan Circulation Element. The roadway speeds are based on the posted speed limits. The distance to the nearest sensitive receptor was determined by measuring the distance from the roadway centerline to the nearest residence. Since the study area is located in a suburban environment and landscaping or natural vegetation exists along the sides of the nearby roads, soft site conditions were modeled.

Table I – FHWA Model Roadway Parameters

Roadway	Segment	General Plan Classification	Vehicle Speed (MPH)	Distance to Nearest Receptor[1] (feet)
Sumner Avenue	North of Schleisman Road	Major	45	85
Sumner Avenue	South of Schleisman Road	Major	45	45
Sumner Avenue	South of Orange Street	Major	45	60
Scholar Way	North of Schleisman Road	Secondary	35	70
Scholar Way	South of Schleisman Road	Secondary	35	60

Roadway	Segment	General Plan Classification	Vehicle Speed (MPH)	Distance to Nearest Receptor[1] (feet)
Scholar Way	South of Orange Street	Secondary	35	60
Scholar Way	South of Baltimore Street	Secondary	35	75
Hamner Avenue	North of Schleisman Road	Urban Arterial	45	90
Hamner Avenue	South of Schleisman Road	Urban Arterial	45	100
Schleisman Road	West of Sumner Avenue	Major	45	70
Schleisman Road	East of Sumner Avenue	Urban Arterial	45	80
Schleisman Road	West of Scholar Way	Urban Arterial	45	80
Schleisman Road	East of Scholar Way	Urban Arterial	45	80
Orange Street	East of Sumner Avenue	Collector	30	40
Orange Street	West of Scholar Way	Collector	30	100

Notes:
[1] Distance measured from nearest offsite residential structure to centerline of roadway.
Source: City of Eastvale, 2012; Vista Environmental.

The average daily traffic (ADT) volumes were obtained from the *Project Scoping Agreement for Land Use Project – PLN22-20024* (Traffic Scoping Agreement), prepared by Urban Crossroads, June 27, 2022. The ADT volumes used in this analysis are shown in Table J.

Table J – Average Daily Traffic Volumes

		Average Daily Traffic Volumes					
Roadway	Segment	Existing	Existing + Project	2024 No Project	2024 + Project	2040 No Project	2040 + Project
Sumner Avenue	North of Schleisman Road	10,950	11,050	11,800	11,900	12,500	12,550
Sumner Avenue	South of Schleisman Road	9,600	9,750	10,600	10,750	11,750	11,900
Sumner Avenue	South of Orange Street	8,400	8,400	9,000	9,000	9,300	9,350
Scholar Way	North of Schleisman Road	7,450	7,550	8,050	8,150	8,150	8,300
Scholar Way	South of Schleisman Road	6,950	7,100	7,550	7,750	7,600	7,800
Scholar Way	South of Orange Street	7,200	7,200	7,800	7,850	8,200	8,250
Scholar Way	South of Baltimore Street	7,850	7,850	8,500	8,550	8,850	8,900
Hamner Avenue	North of Schleisman Road	24,600	24,650	28,800	28,800	29,800	29,850
Hamner Avenue	South of Schleisman Road	24,650	24,700	28,600	28,650	29,650	29,700
Schleisman Road	West of Sumner Avenue	18,400	18,500	20,100	20,150	30,900	31,000
Schleisman Road	East of Sumner Avenue	9,600	9,600	10,900	10,900	28,300	28,300
Schleisman Road	West of Scholar Way	9,400	9,400	10,750	10,750	33,000	33,000

Source: City of Eastvale, 2012; Urban Crossroads, 2022.

The vehicle mixes used in the FHWA-RD-77-108 Model are shown in Table K and is based on the typical vehicle mixes observed in Riverside County. The vehicle mixes provides the hourly distribution percentages of automobiles, medium trucks, and heavy trucks for input into the FHWA model.

Table K – Roadway Vehicle Mixes

Vehicle Type	Traffic Flow Distributions			
	Day (7 a.m. to 7 p.m.)	Evening (7 p.m. to 10 p.m.)	Night (10 p.m. to 7 a.m.)	Overall
Secondary, Collector or Smaller				
Automobiles	73.60%	13.60%	10.22%	97.42%
Medium Trucks	0.90%	0.04%	0.9%	1.84%
Heavy Trucks	0.35%	0.04%	0.35%	0.74%
Major, Arterial Highways, and Expressways				
Automobiles	69.50%	12.90%	9.60%	92.00%
Medium Trucks	1.44%	0.06%	1.50%	3.00%
Heavy Trucks	2.40%	0.10%	2.50%	5.00%

Source: County of Riverside, 2015.

FHWA Model Source Assumptions

To assess the roadway noise generation in a uniform manner, all vehicles are analyzed at the single lane equivalent acoustic center of the roadway being analyzed. In order to determine the height above the road grade where the noise is being emitted from, each type of vehicle has been analyzed independently with autos at road grade, medium trucks at 2.3 feet above road grade, and heavy trucks at 8 feet above road grade. These elevations were determined through a noise-weighted average of the elevation of the exhaust pipe, tires and mechanical parts in the engine, which are the primary noise emitters from a vehicle.

6.3 Vibration

Construction activity can result in varying degrees of ground vibration, depending on the equipment used on the site. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings in the vicinity of the construction site respond to these vibrations with varying results ranging from no perceptible effects at the low levels to damage at the highest levels. Table L gives approximate vibration levels for particular construction activities. The data in Table L provides a reasonable estimate for a wide range of soil conditions.

Table L – Vibration Source Levels for Construction Equipment

Equipment		Peak Particle Velocity (inches/second)	Approximate Vibration Level (L_v)at 25 feet
Pile driver (impact)	Upper range	1.518	112
	typical	0.644	104
Pile driver (sonic)	Upper range	0.734	105
	typical	0.170	93
Clam shovel drop (slurry wall)		0.202	94
Vibratory Roller		0.210	94
Hoe Ram		0.089	87
Large bulldozer		0.089	87
Caisson drill		0.089	87
Loaded trucks		0.076	86
Jackhammer		0.035	79
Small bulldozer		0.003	58

Source: Federal Transit Administration, 2018.

The construction-related vibration impacts have been calculated through the vibration levels shown above in Table L and through typical vibration propagation rates. The equipment assumptions were based on the equipment lists provided above in Table H.

7.0 IMPACT ANALYSIS

7.1 CEQA Thresholds of Significance

Consistent with the California Environmental Quality Act (CEQA) and the State CEQA Guidelines, a significant impact related to noise would occur if a proposed project is determined to result in:

- Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Generation of excessive groundborne vibration or groundborne noise levels; or
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

7.2 Generation of Noise Levels in Excess of Standards

The proposed project would not generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. The following section calculates the potential noise emissions associated with the temporary construction activities and long-term operations of the proposed project and compares the noise levels to the City standards.

Construction-Related Noise

The construction activities for the proposed project are anticipated to include demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses, site preparation and grading of the 10.0 gross acre project site, building construction of the 41 single-family homes, paving of the onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site, and application of architectural coatings.

Noise impacts from construction activities associated with the proposed project would be a function of the noise generated by construction equipment, equipment location, sensitivity of nearby land uses, and the timing and duration of the construction activities. The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Section 8.52.020(9) of the City's Municipal Code exempts construction noise that occurs between 6:00 a.m. and 6:00 p.m. June thru September and between 7:00 a.m. and 6:00 p.m. October thru May. However, General Plan Policy N-23, requires that infill development projects to prepare a Construction Noise Mitigation Plan prior to obtaining a grading permit. The Plan will require the use temporary noise barriers, designated equipment staging areas, limits on idling and requirement of all equipment using mufflers. Project Design Feature 1 has been included in this analysis to ensure implementation of General Plan Policy N-23.

The City construction noise standards do not provide any limits to the noise levels that may be created from construction activities and even with adherence to the City standards, the resultant construction

noise levels may result in a significant substantial temporary noise increase to the nearby sensitive receptors. In order to determine if the proposed construction activities would create a significant substantial temporary noise increase, the FTA construction noise criteria thresholds detailed above in Section 4.1 have been utilized, which shows that a significant construction noise impact would occur if construction noise exceeds 80 dBA during the daytime at any of the nearby homes and school.

Construction noise impacts to the nearby sensitive receptors have been calculated through use of the RCNM and the parameters and assumptions detailed in Section 6.1 of this report including Table H that shows the anticipated construction equipment per phase. In order to account for the existing 6 to 7 foot high concrete masonry unit (cmu) wall on the west side of the project site, 5 dB of estimated shielding was added to the RCNM model for the homes to the west. The results are shown below in Table M and the RCNM printouts are provided in Appendix C.

Table M – Construction Noise Levels at the Nearest Sensitive Receptors

Construction Phase	Construction Noise Level (dBA Leq) at:	
	Nearest Homes to the West[1]	Nearest School to the East[2]
Demolition	65	70
Site Preparation	66	71
Grading	67	72
Building Construction	65	70
Paving	60	65
Painting	52	57
FTA Construction Noise Threshold[4]	**80**	**80**
Exceed Thresholds?	No	No

[1] The nearest homes to the west are located as near as 340 feet from the center of the project site. 5 dB of estimated shielding was included to account for the 6 to 7 foot high cmu wall on the west side of the project site.
[2] The nearest school structure to the east is located as near as 340 feet from the center of the project site.
[4] The FTA Construction noise thresholds are detailed above in Table B.
Source: RCNM, Federal Highway Administration, 2006

Table M shows that the greatest noise impacts would occur during the grading phase, with a noise level as high as 72 dBA Leq at the school to the east and 67 dBA Leq at the nearest homes to the west. Table M also shows that none of the construction phases would exceed the FTA noise standard of 80 dB at the nearby homes or school. Therefore, through adherence to the allowable construction times detailed in Section 8.52.020(9) of the Municipal Code and through implementation of Project Design Feature 1, that requires the preparation of a construction-related noise mitigation plan, prior to the issuance of the grading plan for the proposed project, the proposed project would not create a substantial temporary increase in ambient noise levels from construction of the proposed project. Impacts would be less than significant.

Operational-Related Noise

The proposed project would consist of a residential development with 41 single-family homes. Potential noise impacts associated with the operations of the proposed project would be from project-generated vehicular traffic on the nearby roadways. In addition, the proposed development would be adjacent to Schleisman Road and adjacent to Eastvale Elementary School, which may create exterior and interior noise levels in excess of City standards at the proposed homes. The noise impacts to the nearby existing homes and proposed homes have been analyzed separately below.

Roadway Vehicular Noise Impact to Nearby Homes

Vehicle noise is a combination of the noise produced by the engine, exhaust and tires. The level of traffic noise depends on three primary factors (1) the volume of traffic, (2) the speed of traffic, and (3) the number of trucks in the flow of traffic. The proposed project does not propose any uses that would require a substantial number of truck trips and the proposed project would not alter the speed limit on any existing roadway so the proposed project's potential offsite noise impacts have been focused on the noise impacts associated with the change of volume of traffic that would occur with development of the proposed project.

Neither the General Plan nor the Municipal Code defines what constitutes a "substantial permanent increase to ambient noise levels". As such, this impact analysis has utilized guidance from the Federal Transit Administration for a moderate impact that has been detailed above in Table A that shows that the project contribution to the noise environment can range between 0 and 7 dB, which is dependent on the existing roadway noise levels.

The potential offsite traffic noise impacts created by the on-going operations of the proposed project have been analyzed through utilization of the FHWA model and parameters described above in Section 6.2 and the FHWA model traffic noise calculation spreadsheets are provided in Appendix D. The proposed project's potential offsite traffic noise impacts have been analyzed for the existing year, opening year 2024, and future year 2040 scenarios that are discussed separately below.

Existing Year Conditions

The proposed project's potential offsite traffic noise impacts have been calculated through a comparison of the Existing scenario to the Existing With Project scenario. The results of this comparison are shown in Table N.

Table N – Existing Year Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]			
Roadway	Segment	Existing	Existing Plus Project	Project Contribution	Increase Threshold[2]
Sumner Avenue	North of Schleisman Road	63.0	63.1	0.1	+2 dBA
Sumner Avenue	South of Schleisman Road	67.4	67.5	0.1	+1 dBA
Sumner Avenue	South of Orange Street	64.4	64.4	0.0	+2 dBA
Scholar Way	North of Schleisman Road	59.3	59.4	0.1	+3 dBA
Scholar Way	South of Schleisman Road	60.1	60.2	0.1	+2 dBA
Scholar Way	South of Orange Street	60.3	60.3	0.0	+2 dBA
Scholar Way	South of Baltimore Street	59.1	59.1	0.0	+3 dBA
Hamner Avenue	North of Schleisman Road	66.6	66.6	0.0	+1 dBA
Hamner Avenue	South of Schleisman Road	65.8	65.8	0.0	+1 dBA
Schleisman Road	West of Sumner Avenue	66.7	66.7	0.0	+1 dBA
Schleisman Road	East of Sumner Avenue	63.5	63.5	0.0	+2 dBA
Schleisman Road	West of Scholar Way	63.4	63.4	0.0	+2 dBA
Schleisman Road	East of Scholar Way	63.0	63.0	0.0	+2 dBA
Orange Street	East of Sumner Avenue	52.7	53.3	0.6	+5 dBA
Orange Street	West of Scholar Way	50.1	50.4	0.3	+5 dBA

Notes:

[1] Distance to nearest residential use shown in Table I, does not take into account existing noise barriers.
[2] Increase Threshold obtained from the FTA's allowable noise impact exposures detailed above in Table A.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table N shows that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds detailed above. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels for the existing conditions. Impacts would be less than significant.

Opening Year 2024 Conditions

The proposed project's potential offsite traffic noise impacts have been calculated through a comparison of the opening year 2024 scenario to the opening year 2024 with project scenario. The results of this comparison are shown in Table O.

Table O – Opening Year 2024 Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]			
Roadway	Segment	Year 2024	Year 2024 Plus Project	Project Contribution	Increase Threshold[2]
Sumner Avenue	North of Schleisman Road	63.3	63.4	0.1	+2 dBA
Sumner Avenue	South of Schleisman Road	67.8	67.9	0.1	+1 dBA
Sumner Avenue	South of Orange Street	64.7	64.7	0.0	+1 dBA
Scholar Way	North of Schleisman Road	59.7	59.7	0.0	+2 dBA
Scholar Way	South of Schleisman Road	60.5	60.6	0.1	+2 dBA
Scholar Way	South of Orange Street	60.6	60.6	0.0	+2 dBA
Scholar Way	South of Baltimore Street	59.4	59.5	0.1	+3 dBA
Hamner Avenue	North of Schleisman Road	67.3	67.3	0.0	+1 dBA
Hamner Avenue	South of Schleisman Road	66.4	66.4	0.0	+1 dBA
Schleisman Road	West of Sumner Avenue	67.1	67.1	0.0	+1 dBA
Schleisman Road	East of Sumner Avenue	64.0	64.0	0.0	+2 dBA
Schleisman Road	West of Scholar Way	64.0	64.0	0.0	+2 dBA
Schleisman Road	East of Scholar Way	63.6	63.6	0.0	+2 dBA
Orange Street	East of Sumner Avenue	53.6	54.1	0.5	+5 dBA
Orange Street	West of Scholar Way	50.6	51.0	0.4	+5 dBA

Notes:
[1] Distance to nearest residential use shown in Table I, does not take into account existing noise barriers.
[2] Increase Threshold obtained from the FTA's allowable noise impact exposures detailed above in Table A.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table O shows that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds detailed above. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels for the opening year 2024 conditions. Impacts would be less than significant.

Future Year 2040 Conditions

The proposed project's potential offsite traffic noise impacts have been calculated through a comparison of the future year 2040 scenario to the future year 2040 with project scenario. The results of this comparison are shown in Table P.

Table P – Future Year 2040 Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]			
Roadway	Segment	Year 2040	Year 2040 Plus Project	Project Contribution	Increase Threshold[2]
Sumner Avenue	North of Schleisman Road	63.6	63.6	0.0	+2 dBA
Sumner Avenue	South of Schleisman Road	68.3	68.3	0.0	+1 dBA
Sumner Avenue	South of Orange Street	64.9	64.9	0.0	+1 dBA
Scholar Way	North of Schleisman Road	59.8	59.8	0.0	+2 dBA
Scholar Way	South of Schleisman Road	60.5	60.7	0.2	+2 dBA
Scholar Way	South of Orange Street	60.9	60.9	0.0	+2 dBA
Scholar Way	South of Baltimore Street	59.6	59.7	0.1	+2 dBA
Hamner Avenue	North of Schleisman Road	67.4	67.4	0.0	+1 dBA
Hamner Avenue	South of Schleisman Road	66.6	66.6	0.0	+1 dBA
Schleisman Road	West of Sumner Avenue	68.9	68.9	0.0	+1 dBA
Schleisman Road	East of Sumner Avenue	68.2	68.2	0.0	+1 dBA
Schleisman Road	West of Scholar Way	68.8	68.8	0.0	+1 dBA
Schleisman Road	East of Scholar Way	67.8	67.9	0.1	+1 dBA
Orange Street	East of Sumner Avenue	54.5	55.0	0.5	+5 dBA
Orange Street	West of Scholar Way	50.9	51.2	0.3	+5 dBA

Notes:
[1] Distance to nearest residential use shown in Table I, does not take into account existing noise barriers.
[2] Increase Threshold obtained from the FTA's allowable noise impact exposures detailed above in Table A.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table P shows that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds detailed above. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels for the future year 2040 conditions. Impacts would be less than significant.

Noise Impacts to the Proposed Homes

The proposed project would consist of a residential development with 41 single-family homes. The proposed development would be adjacent to Schleisman Road to the north and adjacent to Eastvale Elementary School to the east, which may create exterior and interior noise levels in excess of City standards at the proposed homes. The roadway noise impacts and non-transportation noise impacts have been analyzed separately below.

Non-Transportation Noise Impacts to Proposed Homes

The noise impacts from Eastvale Elementary School are controlled by General Plan Policy N-7 that provides the City's standards for maximum exterior non-transportation noise levels. For the proposed single-family homes, General Plan Policy N-7 provides a noise standard of 60 dBA between7 a.m. to 10 p.m. and 50 dBA between 10 p.m. to 7 a.m. at the exterior of the proposed single-family homes.

Noise Measurement 2 (see Table G above) is most representative of the noise created from the school, since it was located on the shared property line with the School, is in close proximity to the outdoor lunch area and playgrounds, and there are no roads in the immediate vicinity of Noise Measurement 2. Noise Measurement 2 recorded noise levels of 56.2 dBA Leq between 7 a.m. to 10 p.m. and 49.1 dBA Leq between 10 p.m. to 7 a.m.. As such, the noise created from the outdoor areas of the School are below the City's non-transportation exterior noise standards for single-family homes provided in General Plan Policy N-7. Therefore, the non-transportation noise impacts created from Eastvale Elementary School to the proposed homes would be within the City noise standards. Impacts would be less than significant.

Roadway Noise Impacts to Proposed Homes

The north side of the proposed development would be adjacent to Schleisman Road. General Plan Policy N-6 requires exterior noise levels for new residential uses to be mitigated to the levels shown above in Table C that shows the "Completely Compatible" noise standard of less than 60 dBA, "Tentatively Compatible" 60 to 70 dBA, "Normally Incompatible" 70 to 75 dBA, and "Completely Incompatible" greater than 75 dBA. General Plan Policy N-11 requires developers of new residential uses where the noise exceeds the "Completely Compatible" noise standard to ensure acceptable exterior and interior noise levels. General Plan Policy N-10 details that the maximum acceptable interior noise level from roadway noise sources is 45 dBA CNEL.

It is anticipated that the primary source of noise impacts to the project site will be traffic noise from Schleisman Road that is adjacent to the north side of the project site. The proposed homes will also experience some background traffic noise impacts from the proposed project's internal roadways and from Orange Street that is adjacent to the south side of the project site. As the traffic on these local streets would consist of low traffic volumes at slower speeds, the traffic noise from these roads would not make a significant contribution to the noise environment. As such, the noise levels from these roads were not analyzed. The FHWA traffic noise prediction model parameters used in this analysis are discussed above in detail in Section 6.2 and the FHWA model printouts are provided in Appendix G. The exterior and interior noise impacts to the proposed homes have been analyzed separately below.

Exterior Noise Impacts to Proposed Homes

The anticipated exterior noise levels have been calculated for the backyards of representative homes that are adjacent to Schleisman Road. For each backyard, the receptor was placed 10 feet behind the wall and 5 feet above the ground, which is based on the roadway noise analysis methodology provided in Appendix I-1 of the County of Riverside General Plan, December 8, 2015, since the City of Eastvale does not provide any roadway noise analysis standards to utilize. The calculated noise levels for backyards that are adjacent to Schleisman Road are shown below in Table R.

Table Q – Proposed Homes Exterior Noise Levels from Schleisman Road

Building Number	Exterior Noise Level Without Sound Walls (dBA CNEL)	Exceed City's 60 dBA CNEL Threshold?	Exterior Noise Level With 6.5 Foot High Sound Wall (dBA CNEL)	Exceed City's 60 dBA CNEL Threshold?
9	68.1	Yes	59.1	No
11	68.1	Yes	59.3	No
13	68.1	Yes	59.6	No
15	68.2	Yes	60.0	No
17	68.1	Yes	59.9	No

Notes:

City's residential 60 dBA CNEL residential exterior noise standard from General Plan Policy N-6.
Source: FHWA RD-77-108 Model.

Table R shows that without a sound wall, that the noise levels at all of the backyards adjacent to Schleisman Road would exceed the City's residential exterior noise standard of 60 dBA CNEL. This would be considered a significant impact.

Mitigation Measure 2 is provided that would require construction of a minimum 6.5 foot high cmu wall on the north side of all backyards that are adjacent to Schleisman Road. As shown in Table R, above, with implementation of Mitigation Measure 2, the proposed homes exterior noise levels would be within the City's 60 dBA CNEL residential exterior noise standard and would result in a less than significant impact.

Interior Noise Impacts to Proposed Homes

To assess the interior noise levels, the same proposed homes analyzed for the exterior private backyard analysis were also analyzed for their interior noise levels. The exterior noise level at the façade of the first and second floors were calculated through use of the same methodology detailed above for the outdoor noise calculations and the results are shown below in Table R. Table R also shows the interior noise levels calculated based on 25 dB of attenuation, which is the minimum exterior to interior noise reduction rate for new homes that are constructed to meet the required California Code of Regulations Title 24, Part 6 building energy-efficiency standards that require the installation of dual-paned windows as well as enhanced insulation requirements. The anticipated noise levels have been calculated at the facades of representative proposed homes to Schleisman Road and the results are shown below in Table R.

Table R – Proposed Homes Interior Noise Levels from Schleisman Road

Building Number	Floor	Road Noise Levels (dBA CNEL)		Exceed 45 dBA Interior Threshold?
		Exterior at Facade	Interior[1]	
9	First	58.9	33.9	No
	Second	66.9	40.4	No
11	First	58.2	33.2	No
	Second	65.4	40.4	No
13	First	58.8	33.8	No
	Second	65.7	40.7	No
15	First	60.0	35.0	No
	Second	66.9	41.9	No
17	First	58.3	33.3	No
	Second	64.3	39.3	No

Notes:
[1] Based on standard dual pane windows and doors with a 26 STC rating, which are required per Title 24 energy saving requirements.
Source: FHWA RD-77-108 Model.

Table R shows that the interior noise level of all homes adjacent to Schleisman Road would be within the City's 45 dBA CNEL interior noise standard. Impacts would be less than significant.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Mitigation Measure 1:

The project applicant shall construct a minimum 6.5-foot high wall on the north side of Lots 9 through 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings.

Level of Significance After Mitigation

Less than significant impact.

7.3 Generation of Excessive Groundborne Vibration

The proposed project would not expose persons to or generation of excessive groundborne vibration or groundborne noise levels. The following section analyzes the potential vibration impacts associated with the construction and operations of the proposed project.

Construction-Related Vibration Impacts

The construction activities for the proposed project are anticipated to include demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses, site preparation and grading of the 10.0 gross acre project site, building construction of the 41 single-family homes, paving of the onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site, and application of architectural coatings.

Vibration impacts from construction activities associated with the proposed project would typically be created from the operation of heavy off-road equipment. The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Section 120.05.130(e) of the Municipal Code provides a vibration standard for new development of any vibration that causes discomfort or annoyance to reasonable persons of normal sensitivity. However Section 120.05.130(e) of the Municipal Code exempts construction activities from this standard. Since neither the Municipal nor the General Plan provide a quantifiable vibration threshold for temporary construction activities, guidance from the *Transportation and Construction-Induced Vibration Guidance Manual*, prepared by Caltrans, April 2020, has been utilized, which defines the threshold of perception from transient sources such as off-road construction equipment at 0.25 inch per second peak particle velocity (PPV).

The primary source of vibration during construction would be from the operation of a bulldozer. From Table L above a large bulldozer would create a vibration level of 0.089 inch per second PPV at 25 feet. The vibration level at the nearest offsite homes (25 feet to west) and school structure (25 feet to east) would be below the 0.25 inch per second PPV threshold detailed above. Impacts would be less than significant.

Operations-Related Vibration Impacts

The proposed project would consist of the development of a residential community. The on-going operation of the proposed project would not include the operation of any known vibration sources other than typical onsite vehicle operations for a residential development. Therefore, a less than significant vibration impact is anticipated from operation of the proposed project.

Level of Significance

Less than significant impact.

7.4 Aircraft Noise

The proposed project may expose people residing in the project area to excessive noise levels from aircraft. The nearest airport is Chino Airport that is located as near as three miles west of the project site. The project site is located outside of the 60 dBA CNEL noise contours of this airport. Therefore, the proposed homes would not be exposed to excessive aircraft noise. Impacts would be less than significant.

Level of Significance

Less than significant impact.

FHWA Model Onsite Traffic Noise Calculation Printouts

FHWA-RD-77-108 HIGHWAY TRAFFIC NOISE PREDICTION MODEL

Road Name: Schleisman Road
Building: Building 9
Project Name: Magnolia Ranch
Job Number: 21003

NOISE MODEL INPUTS

Highway Data

Average Daily Traffic:	33,000 vehicles
Peak Hour Volume:	3,300 vehicles
Vehicle Speed:	45 mph
Near/Far Lane Distance:	78 feet

Vehicle Mix

	Day	Evening	Night	Daily
Autos:	69.5%	12.9%	9.6%	92.0%
Medium Trucks:	1.4%	0.1%	1.5%	3.0%
Heavy Trucks:	2.4%	0.1%	2.5%	5.0%

Site Data

Barrier Height:	**6.5 feet**
Barrier Type(Wall/Berm):	Wall
Site Conditions(Hard/Soft):	Soft
Centerline (C.L.) Dist. to Barrier:	76 feet
C.L. Dist. To Observer (Backyard):	86 feet
Barrier Dist. To Observer (Backyard):	10 feet
C.L. Dist. To Observer (Structure):	97 feet
Barrier Dist. To Observer (Structure):	21 feet
Road Grade:	0.00 %
Left View:	-90 degrees
Right View:	90 degrees

Elevations

Barrier Base Elevation:	615.4 feet
Road Elevation:	611.5 feet
Noise Source Elevation above Road	
Autos:	0 feet
Med Trucks:	2.3 feet
Hvy Trucks:	8 feet
Pad Elevation:	615.4 feet
Observer Heights Above Pad Elevation	
Exterior:	5 feet
First Floor:	5.5 feet
Second Floor:	14 feet

FHWA NOISE MODEL CALCULATIONS

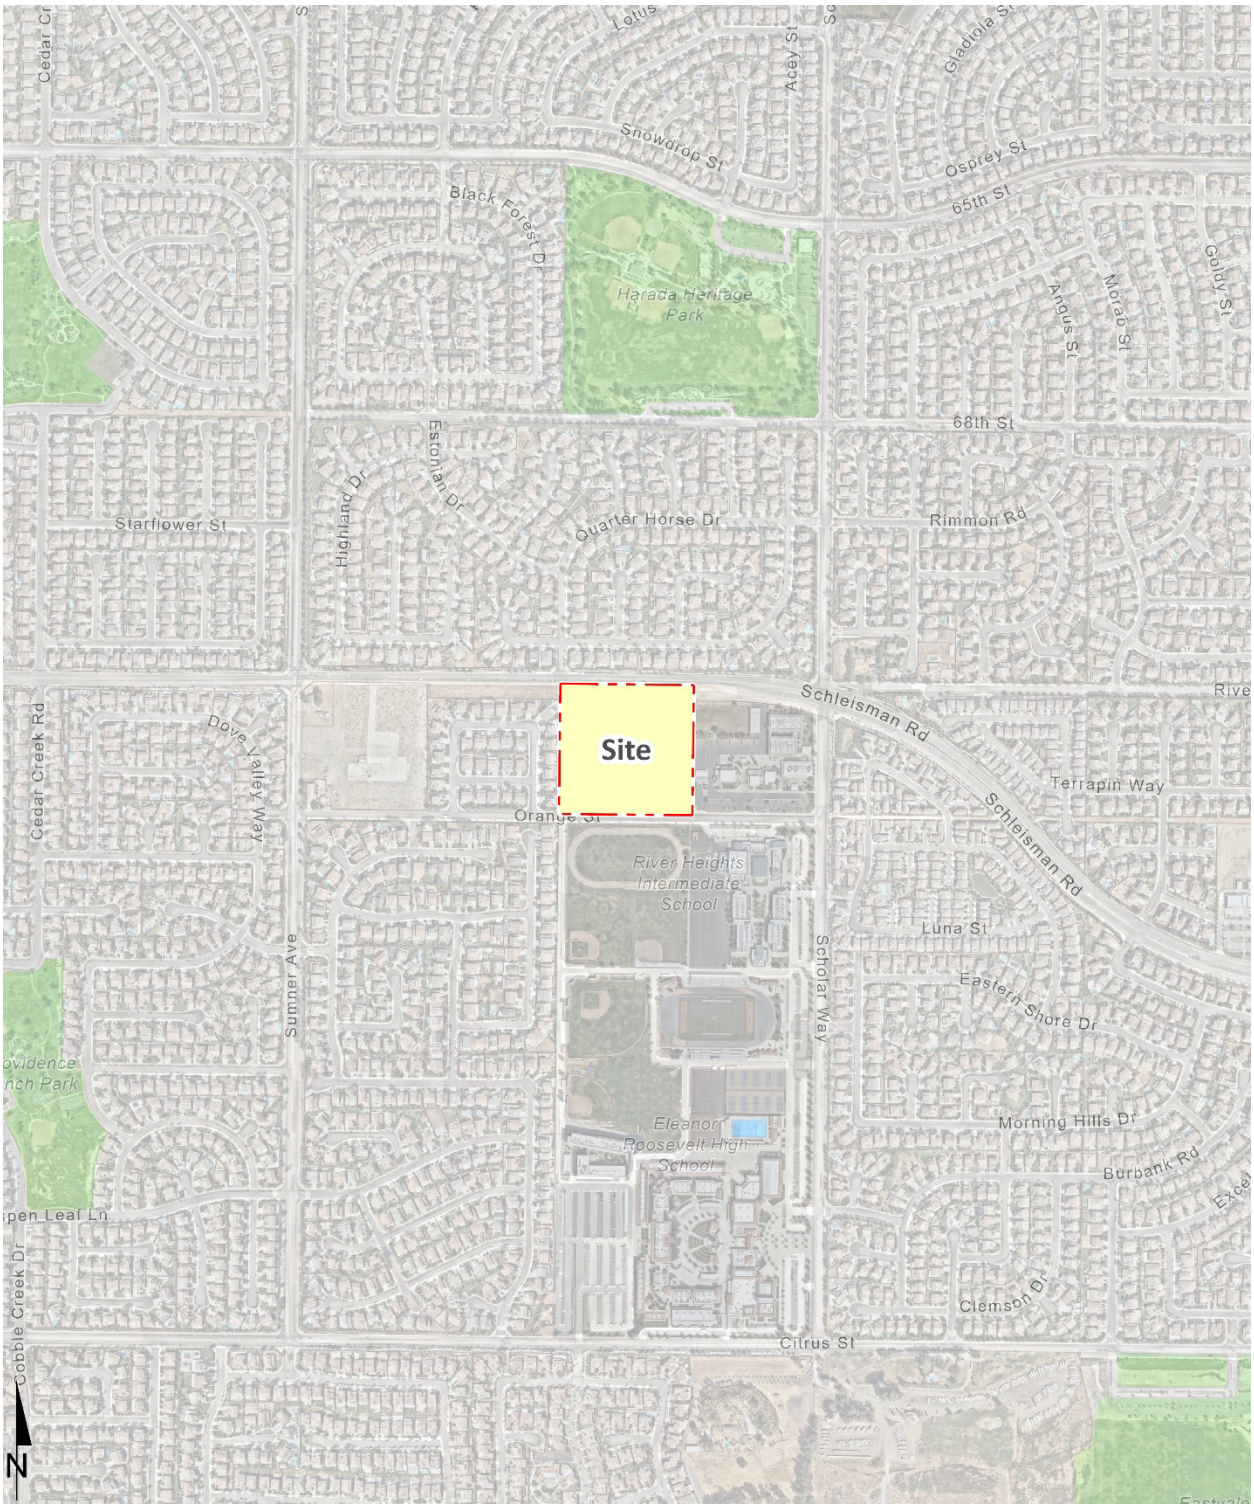
1 INTRODUCTION

This report presents the results of the traffic analysis (**TA**) for the proposed Magnolia Ranch development (**Project**), which is bounded by Schleisman Road to the north and Orange Street to the south in the City of Eastvale. The Project's location relative to the surrounding area is shown on Exhibit 1-1.

The purpose of this TA is to evaluate the potential circulation system deficiencies that may result from the development of the proposed Project, and to recommend improvements to achieve acceptable circulation system operational conditions. As directed by City of Eastvale staff, this traffic study has been prepared in accordance with the County of Riverside Transportation Analysis Guidelines for Level of Service Vehicle Miles Traveled, and consultation with City staff during the scoping process. (1) The approved Project Traffic Study Scoping agreement is provided in Appendix 1.1 of this TA.



1.1 SUMMARY OF FINDINGS

The Project is to construct the following improvements as design features in conjunction with development of the site:

- Project to install stop sign for egress traffic from the proposed Project at Driveway 1 on Orange Street, which is proposed for full access.
- The Project will construct Orange Street from the western Project boundary to the eastern Project boundary at its ultimate half-section width as a 2-lane Collector (ultimate 74-foot right-of-way) in compliance with the circulation recommendations found in the City of Eastvale's General Plan.

Additional details and intersection lane geometrics are provided in Section 1.7 *Recommendations* of this report. The addition of Project traffic is not anticipated to result in any operational deficiencies at the study area intersections under any of the future traffic conditions.

EXHIBIT 1-1: LOCATION MAP

1.2 PROJECT OVERVIEW

Exhibit 1-2 illustrates the preliminary site plan. As indicated on Exhibit 1-2, the Project is proposed to consist of up to 41 single family detached residential units. Regional access to the Project site is available via the I-15 Freeway at Limonite Avenue interchange. Vehicular traffic access will be provided via the following driveway:

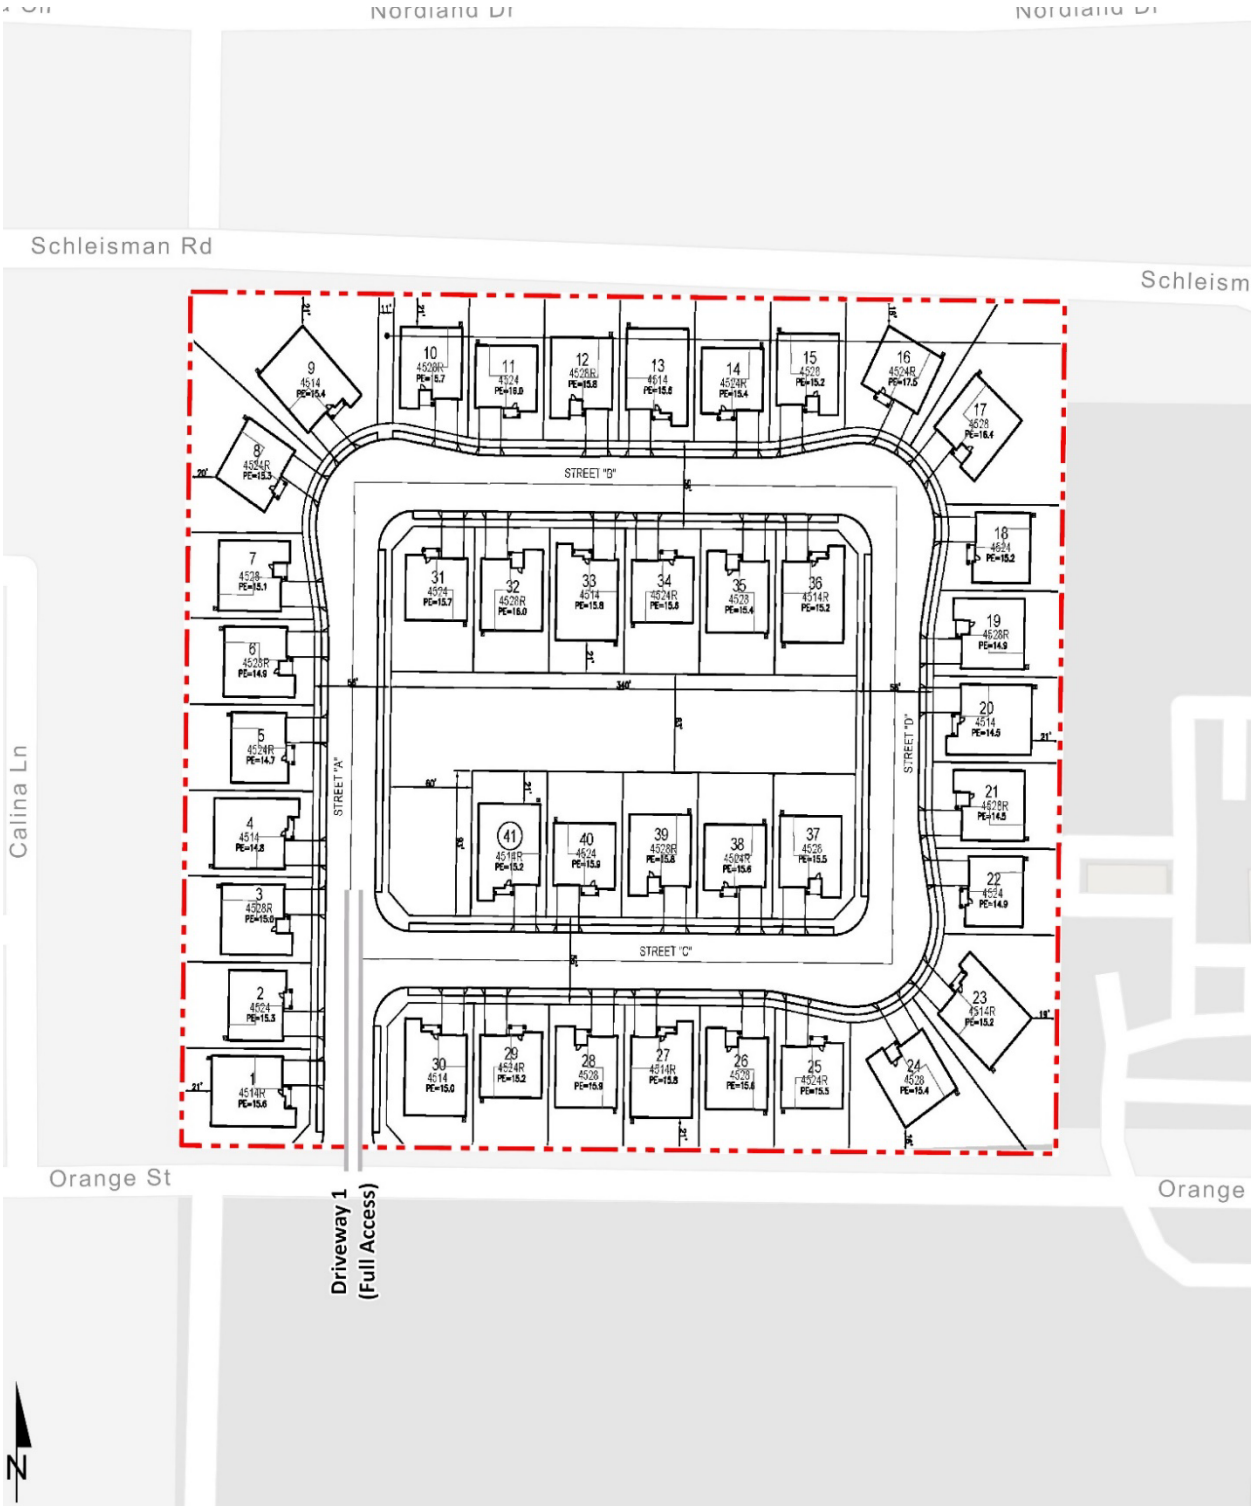
- Driveway 1 via Orange Street – Full access

Trips generated by the Project's proposed land uses have been estimated based on trip generation rates collected by the Institute of Transportation Engineers (**ITE**) Trip Generation Manual, 11th Edition, 2017. (2) The proposed Project is anticipated to generate a total of 388 vehicle trip-ends per day with 28 AM peak hour trips and 38 PM peak hour trips. The assumptions and methods used to estimate the Project's trip generation characteristics are discussed in greater detail in Section 4.1 *Project Trip Generation* of this report.

1.3 ANALYSIS SCENARIOS

For the purposes of this traffic study, potential deficiencies to traffic and circulation have been assessed for each of the following conditions:

- Existing (2021) Conditions
- Existing plus Project (**E+P**) Conditions
- Opening Year Cumulative (2025) Without Project Conditions
- Opening Year Cumulative (2025) With Project Conditions
- Horizon Year (2040) Without Project Conditions
- Horizon Year (2040) With Project Conditions



1.3.1 EXISTING (2021) CONDITIONS

Information for Existing (2021) conditions is disclosed to represent the baseline traffic conditions as they existed at the time this report was prepared. Due to the currently ongoing COVID-19 pandemic, the traffic counts utilized for the purposes of this analysis relied on both historic data and adjusted 2021 count data. Details on adjustments to the existing traffic counts are discussed in Section 3.5 *Existing (2021) Traffic Counts* of this TA.

1.3.2 EXISTING PLUS PROJECT CONDITIONS

The E+P analysis determines circulation system deficiencies that would occur on the existing roadway system in the scenario of the Project being placed upon Existing conditions. The E+P analysis is intended to identify the project-specific traffic deficiencies associated solely with the development of the proposed Project based on a comparison of the E+P traffic conditions to Existing (2021) conditions.

EXHIBIT 1-2: PRELIMINARY SITE PLAN

1.3.3 OPENING YEAR CUMULATIVE CONDITIONS

The Opening Year Cumulative traffic conditions analysis determines the potential near-term cumulative circulation system deficiencies. To account for background traffic growth, traffic associated with other known cumulative development projects in conjunction with an ambient growth factor from Existing conditions of 6.81 (for 2025 conditions – 1.6 percent per year compounded over 4 years) are included for Opening Year Cumulative traffic conditions. This list was compiled from information provided by the City of Eastvale.

1.3.4 HORIZON YEAR (2040) CONDITIONS

Traffic projections for Horizon Year Without Project conditions were derived from the Riverside Transportation Analysis Model (**RivTAM**) for study area intersections located in Riverside County. The Horizon Year conditions analysis will be utilized to determine if improvements funded through regional transportation mitigation fee programs, such as the Western Riverside Council of Governments Transportation Uniform Mitigation Fee (**TUMF**), City of Eastvale Development Impact Fee (**DIF**) programs, or other approved funding mechanism (e.g., Mira Loma Road and Bridge Benefit District (**RBBD**), etc.) can accommodate the long-range cumulative traffic at the target Level of Service (**LOS**) identified in the City of Eastvale (lead agency) General Plan. (3) Other improvements needed beyond the "funded" improvements (such as localized improvements to non-TUMF, non-DIF, or non-RBBD facilities) are identified as such.

1.4 STUDY AREA

To ensure that this TA satisfies the City of Eastvale's traffic study requirements, Urban Crossroads, Inc. prepared a project traffic study scoping package for review by City staff prior to the preparation of this report. The Agreement provides an outline of the Project study area, trip generation, trip distribution, and analysis methodology (see Appendix 1.1).

1.4.1 INTERSECTIONS

The following 8 study area intersections shown on Exhibit 1-3 and listed in Table 1-1 were selected for this TA based on consultation with City of Eastvale staff. The "50 peak hour trip" criterion utilized by the City of Eastvale is consistent with the methodology employed by the County of Riverside, and generally represents a minimum number of trips at which a typical intersection would have the potential to be substantively deficient by a given development proposal. Although each intersection may have unique operating characteristics, this traffic engineering rule of thumb is a widely utilized tool for estimating a potential area of analysis (i.e., study area).

EXHIBIT 1-3: STUDY AREA

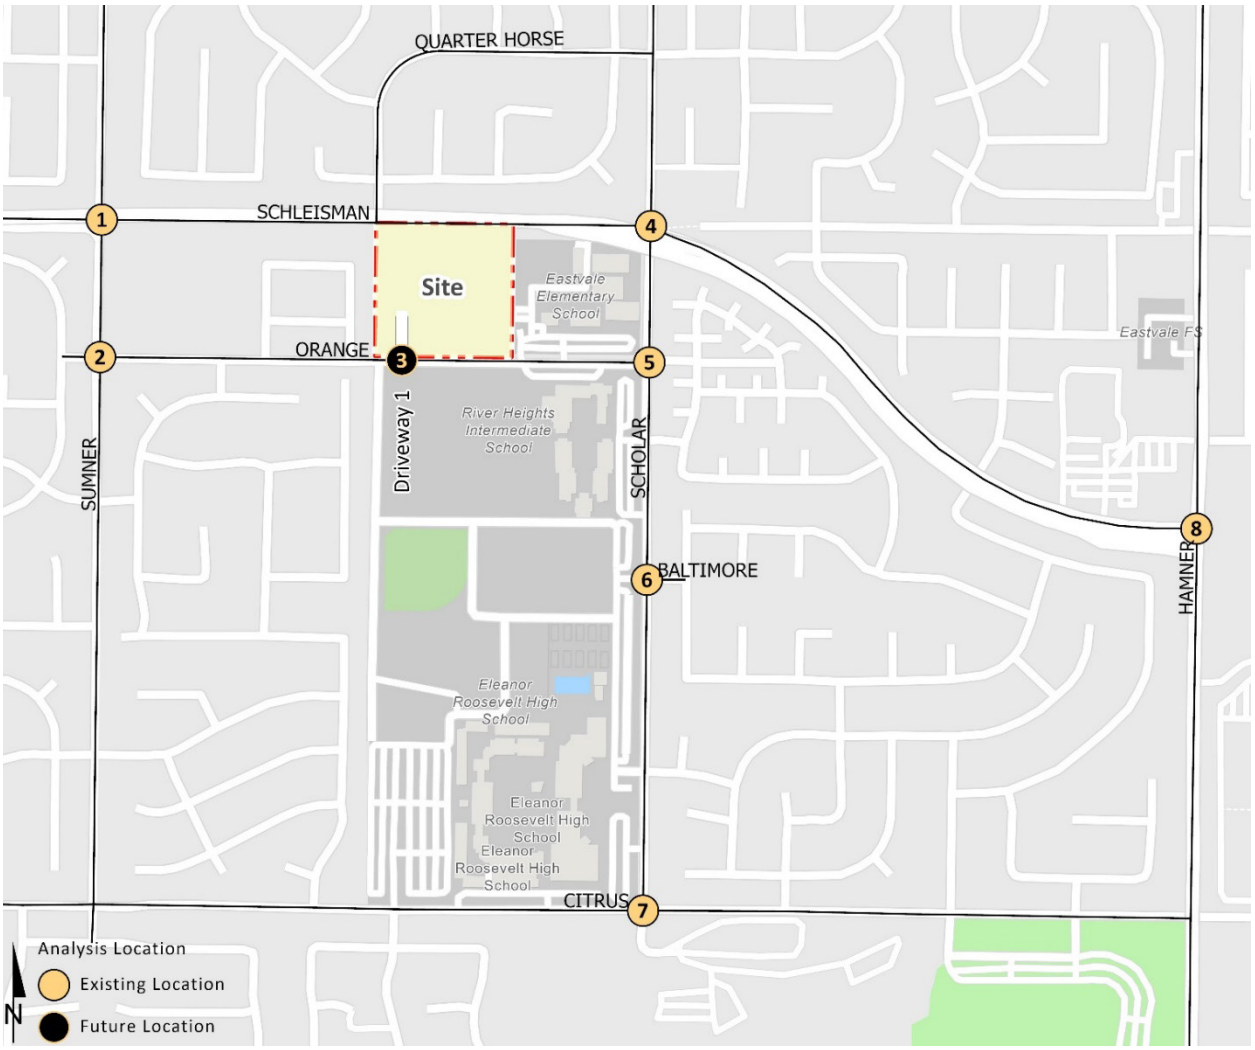


TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS

#	Intersection	Jurisdiction	CMP?
1	Sumner Av. & Schleisman Rd.	Eastvale	No
2	Sumner Av. & Orange St.	Eastvale	No
3	Driveway 1 & Orange St.	Eastvale	No
4	Scholar Wy. & Schleisman Rd.	Eastvale	No
5	Scholar Wy. & Orange St.	Eastvale	No
6	Scholar Wy. & Baltimore St.	Eastvale	No
7	Scholar Wy. & Citrus St.	Eastvale	No
8	Hamner Av. & Schleisman Rd.	Eastvale	No

The intent of a Congestion Management Program (**CMP**) is to more directly link land use, transportation, and air quality, thereby prompting reasonable growth management programs that will effectively utilize new transportation funds, alleviate traffic congestion and related deficiencies, and improve air quality. The County of Riverside CMP became effective with the passage of Proposition 111 in 1990 and updated most recently updated in 2011. The Riverside County Transportation Commission (**RCTC**) adopted the 2011 CMP for the County of Riverside in December 2011. (4) No study area intersections are CMP intersections.

1.5 SENATE BILL 743 – VEHICLE MILES TRAVELED (VMT)

Senate Bill 743 (**SB 743**), approved in 2013, endeavors to change the way transportation impacts will be determined according to the California Environmental Quality Act (**CEQA**). The Office of Planning and Research (**OPR**) has recommended the use of vehicle miles traveled (**VMT**) as the replacement for automobile delay-based LOS. In December 2018, the Natural Resources Agency finalized updates to CEQA Guidelines to incorporate SB 743 (i.e., VMT). The VMT thresholds and methodology outlined in the City's TA guidelines will be utilized to conduct the VMT analysis for the Project. The City's TA Guidelines provides details on appropriate screening thresholds that can be used to identify when a proposed land use project is anticipated to result in a less than significant impact without conducting a more detailed project level analysis. Based on our review of applicable VMT screening thresholds, the proposed Project meets the screening thresholds and would therefore be assumed to result in a less than significant VMT impact; no additional VMT analysis is required. The VMT screening thresholds are provided in Appendix 1.1.

1.6 DEFICIENCIES

This section provides a summary of deficiencies by analysis scenario. Section 2 *Methodologies* provides information on the methodologies used in the analysis and Section 5 *E+P Traffic Conditions*, Section 6 *Opening Year Cumulative (2025) Traffic Conditions*, and Section 7 *Horizon Year (2040) Traffic Conditions* includes the detailed analysis. A summary of LOS results for all analysis scenarios is presented on Table 1-2.

= A - D = E = F

1.6.1 EXISTING (2021) CONDITIONS

The following study area intersection is anticipated to operate at a deficient LOS during one or both peak hours for Existing traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

1.6.2 E+P CONDITIONS

The following study area intersection is anticipated continue to operate at a deficient LOS during one or both peak hours for E+P traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

1.6.3 OPENING YEAR CUMULATIVE (2025) CONDITIONS

The following study area intersection is anticipated to operate at a deficient LOS during one or both peak hours for Opening Year Cumulative (2025) Without Project traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

There are no additional study area intersections anticipated to operate at an unacceptable LOS with the addition of Project traffic under Opening Year Cumulative (2025) With Project traffic conditions.

1.6.4 HORIZON YEAR (2040) CONDITIONS

The following study area intersection is anticipated to operate at a deficient LOS during one or both peak hours under Horizon Year (2040) Without Project traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM and PM peak hours

There are no additional study area intersections anticipated to operate at an unacceptable LOS with the addition of Project traffic under Horizon Year (2040) With Project traffic conditions.

1.7 RECOMMENDATIONS

1.7.1 SITE ADJACENT AND SITE ACCESS RECOMMENDATIONS

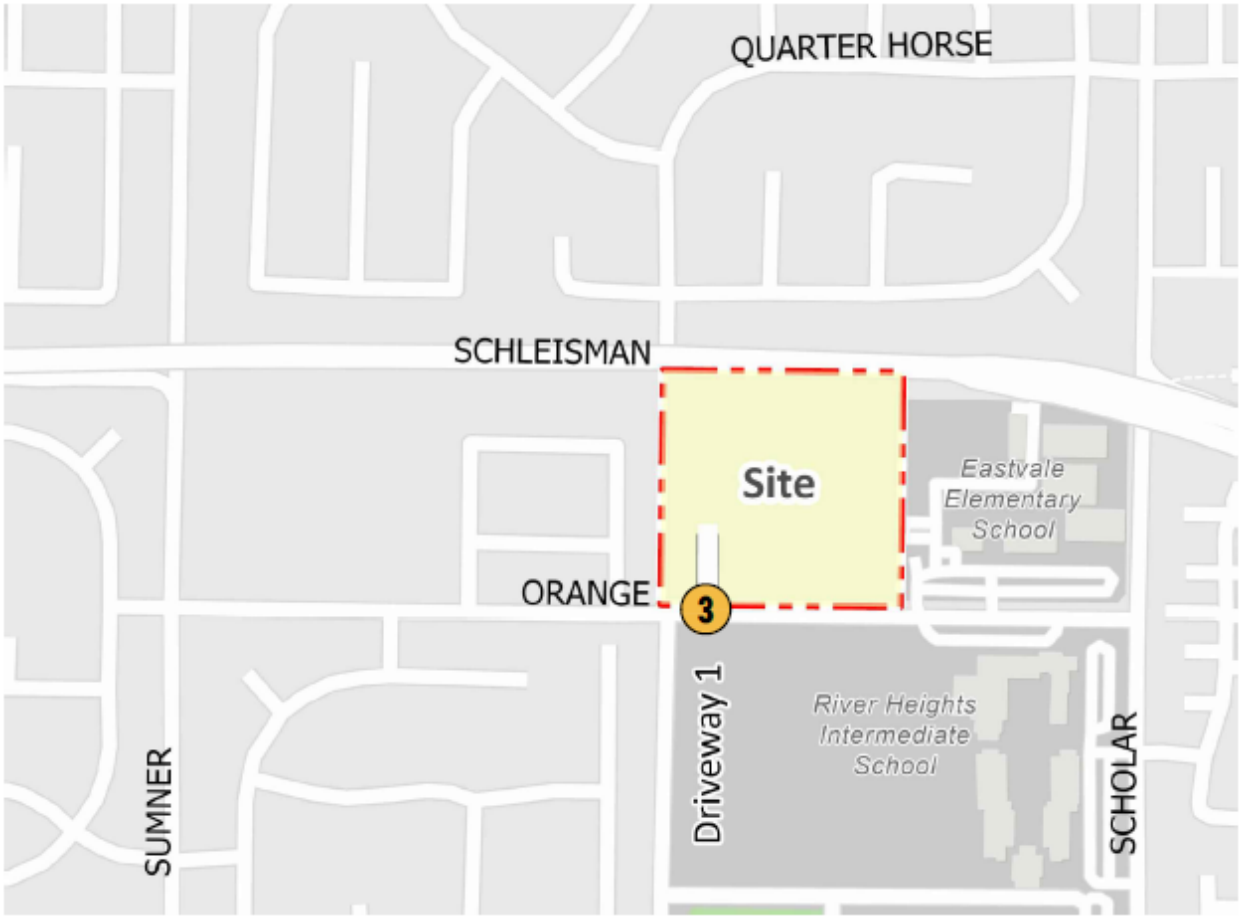
The following recommendations are based on the improvements needed to accommodate site access. The site adjacent recommendations are shown on Exhibit 1-4.

Recommendation 1 – Driveway 1 & Orange Street (#4) – The following improvements are necessary to accommodate site access:

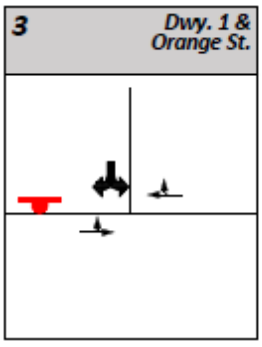
- Project to install a stop control for the southbound exiting Project traffic with a shared left-right turn lane.
- Project to restripe the existing eastbound through lane to provide an eastbound shared left-through lane.

Recommendation 2 – **Orange Street** – Orange Street is an east-west oriented roadway located along the southern boundary of the Project. Project to construct Orange Street from the western Project boundary to the eastern Project boundary at its ultimate half-section width as a 2-lane Collector (ultimate 74-foot right-of-way) in compliance with the circulation recommendations found in the City of Eastvale's General Plan.

Wherever necessary, roadways adjacent to the Project, site access points and site-adjacent intersections will be constructed to be consistent with the identified roadway classifications and respective cross-sections in the City of Eastvale General Plan Circulation Element.



On-site traffic signing and striping should be implemented in compliance with the provisions of the California Department of Transportation (Caltrans) California Manual on Uniform Traffic Control Devices (CA MUTCD) and in conjunction with detailed construction plans for the Project site.



Sight distance at each project access point should be reviewed with respect to standard Caltrans and City of Eastvale sight distance standards at the time of preparation of final grading, landscape, and street improvement plans.

1.7.2 OFF-SITE RECOMMENDATIONS

The recommended improvements needed to address the cumulative deficiencies identified under Existing (2021), E+P, Opening Year Cumulative (2025), and Horizon Year (2040) traffic conditions are shown in Table 1-3. For those improvements listed in Table 1-3 and not constructed as part of the Project, the Project Applicant's responsibility for the Project's contributions towards deficient intersections is fulfilled through payment of fees or fair share that would be assigned to construction of the identified recommended improvements.

EXHIBIT 1-4: SITE ACCESS RECOMMENDATIONS

= Stop Sign Improvement
= Existing Lane
= Lane Improvement

TABLE 1-3: SUMMARY OF IMPROVEMENTS AND ROUGH ORDER OF MAGNITUDE COSTS

#	Intersection	Jurisdiction	E+P	2025 With Project	Horizon Year (2040) With Project	Improvements in County DIF?[1]	Project Responsibility[2]	Total Cost[3,4]	Fair Share %[5]	Fair Share Cost[6]
1	Sumner Av. & Schleisman Rd.	Eastvale	Restripe the EB and WB lanes to accommodate 1 left turn lane and 1 shared through-right lane	Same	Same	No	Fair Share	$40,300	0.63%	$255
					Add 2nd NB through lane	No	Fair Share	$290,160		$1,838
					Add 2nd EB through lane	No	Fair Share	$290,160		$1,838
					Add 2nd WB through lane	No	Fair Share	$290,160		$1,838
					Add a WB left turn lane	No	Fair Share	$80,600		$511
							Total	$991,380		$6,280
							Total Costs for Horizon Year Improvements	**$991,380**		**$6,280**
							Total Project Fair Share Contribution to the City of Eastvale[7]			**$6,280**

[1] Improvements included in City of Eastvale DIF program for local and regional components.

[2] Identifies the Project's responsibility to construct an improvement or contribute fair share or fee payment towards the implementation of the improvement shown.

[3] Costs have been estimated using the data provided in Appendix "G" of the CMP for preliminary construction costs.

[4] Appendix "G" costs escalated by a factor of 1.612 except Traffic Signals.

[5] Program improvements constructed by project may be eligible for fee credit, at discretion of City. See Table 8-1 for Fair Share Calculations.

[6] Rough order of magnitude cost estimate.

[7] Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Eastvale.

1.8 QUEUING ANALYSIS

A queuing analysis was conducted along the site adjacent roadways of Orange Street, Schleisman Road, and at the Project driveways for Horizon Year (2040) traffic conditions to determine the turn pocket lengths and lane geometric necessary to accommodate long-term 95th percentile queues and recommend storage lengths for the turning movements shown on Exhibit 1-4. The analysis was conducted for the weekday AM and weekday PM peak hours using the SimTraffic modeling software. The Horizon Year (2040) queuing results are provided in Table 1-4 and Appendix 7.5 of this TA.

SimTraffic is designed to model networks of signalized and unsignalized intersections, with the primary purpose of checking and fine-tuning signal operations. SimTraffic uses the input parameters from Synchro (Version 11) to generate random simulations. The 95th percentile queue is not necessarily ever observed; it is simply based on statistical calculations (or Average Queue plus 1.65 standard deviations). The random simulations generated by SimTraffic have been utilized to determine the 95th percentile queue lengths observed for each turn lane. A SimTraffic simulation has been recorded 5 times, during the weekday AM and weekday PM peak hours, and has been seeded for 30-minute periods with 60-minute recording intervals.

As shown in Table 1-4, the available storage area would be able to accommodate Horizon Year (2040) With Project 95th percentile queues.

TABLE 1-4: QUEUING ANALYSIS FOR HORIZON YEAR (2040) CONDITIONS

#	Intersection	Movement	Available Stacking Distance (Feet)	95th Percentile Queue (Feet) AM Peak Hour	95th Percentile Queue (Feet) PM Peak Hour	Acceptable? [1] AM	Acceptable? [1] PM
4	Driveway 1 & Orange St.	EBL/T	1,500	0	10	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown in this table, where applicable.

2 METHODOLOGIES

This section of the report presents the methodologies used to perform the traffic analyses summarized in this report. The methodologies described are generally consistent with City of Eastvale traffic study guidelines.

2.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (**LOS**). LOS is a qualitative description of traffic flow based on several factors such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

2.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The Highway Capacity Manual (**HCM**) methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. (5) The HCM uses different procedures depending on the type of intersection control.

2.2.1 SIGNALIZED INTERSECTIONS

The City of Eastvale requires signalized intersection operations analysis based on the methodology described in the HCM. (5) Intersection LOS operations are based on an intersection's average control delay. Control delays include initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 2-1. A saturation flow rate of 1900 has been utilized for all study area intersections located within the County of Riverside. The traffic modeling and signal timing optimization software package Synchro (Version 11) has been utilized to analyze signalized intersections within the City of Eastvale.

The peak hour traffic volumes have been adjusted using a peak hour factor (**PHF**) to reflect peak 15-minute volumes. Common practice for LOS analysis is to use a peak 15-minute rate of flow. However, flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g., PHF = [Hourly Volume] / [4 x Peak 15-minute Flow Rate]). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. Existing PHFs have been used for all analysis scenarios. New intersections utilize a PHF of 0.92. Per the HCM, PHF values over 0.95 often are indicative of high traffic volumes with capacity constraints on peak hour flows while lower PHF values are indicative of greater variability of flow during the peak hour. (5)

TABLE 2-1: SIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0[1]
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.	80.01 and up	F

Source: HCM, 6th Edition

[1] If V/C is greater than 1.0 then LOS is F per HCM.

2.2.2 UNSIGNALIZED INTERSECTIONS

The City of Eastvale requires the operations of unsignalized intersections be evaluated using the methodology described in the HCM. (5) The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 2-2). At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. The worst delay and associated LOS for a controlled movement is utilized for the overall intersection delay and LOS for two-way stop-controlled intersections. For all-way stop controlled intersections, LOS is computed for the intersection as a whole (average delay).

TABLE 2-2: UNSIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0[1]
Little or no delays.	0 to 10.00	A
Short traffic delays.	10.01 to 15.00	B
Average traffic delays.	15.01 to 25.00	C
Long traffic delays.	25.01 to 35.00	D
Very long traffic delays.	35.01 to 50.00	E
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F

Source: HCM, 6th Edition

[1] If V/C is greater than 1.0 then LOS is F per HCM.

2.3 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by Caltrans and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TA update uses the signal warrant criteria presented in the latest edition of the Caltrans' California Manual on Uniform Traffic Control Devices (**CA MUTCD**), for all applicable study area intersections. (6) As shown in Table 2-3, traffic signal warrant analyses were performed for the following unsignalized study area intersection based on the average daily traffic (Figure 4C-103 (CA) of the CA MUTCD): (6)

TABLE 2-3: TRAFFIC SIGNAL WARRANT ANALYSIS LOCATIONS

#	Intersection	Jurisdiction
3	Driveway 1 & Orange St.	Eastvale

The traffic signal warrant analyses are presented in Section 5 *E+P Traffic Conditions*, Section 6 *Opening Year Cumulative (2025) Traffic Conditions*, and Section 7 *Horizon Year (2040) Traffic Conditions* of this report. It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with LOS. An intersection may satisfy a signal warrant condition and operate at or above acceptable LOS or operate below acceptable LOS and not meet a signal warrant.

2.4 MINIMUM ACCEPTABLE LEVELS OF SERVICE (LOS)

The City of Eastvale General Plan Policy C-10 sets a standard of LOS C with LOS D as acceptable in commercial and employment areas and at intersections of any combination of major highways, urban arterials, secondary highways, or freeway ramps. Based on this criterion, where feasible, LOS D is the minimum acceptable LOS at each of the study intersections within the City of Eastvale.

2.5 DEFICIENCY CRITERIA

This section outlines the methodology used in this analysis related to identifying circulation system deficiencies.

For the study area intersections that lie within the City of Eastvale, Project related deficiencies will be identified by comparing the "Without Project" condition to the "With Project" condition based on the following criteria:

- If the LOS deteriorates from acceptable LOS (LOS D or better) to unacceptable LOS (LOS E or F); or
- If the intersection is already operating at an unacceptable LOS (LOS E or F) in Without Project conditions and the addition of Project traffic increases the delay by more than 2.5 seconds.

Based on discussions with City staff, when the pre-Project condition is already below LOS D (i.e., unacceptable LOS), the Project will be responsible for improving its deficiencies to a level of service equal to or better than it was under pre-project traffic conditions for intersections that receive 50 or more project-related peak hour trips. This is a standard protocol in many urban jurisdictions to meet the circulation policies outlined in the respective General Plans. Thus, for intersections currently operating at unacceptable LOS during either the AM and/or PM peak hour under Without Project traffic conditions, improvements have been identified to bring the project's effect to a deficient intersection LOS that is equal to or better than pre-Project conditions.

Cumulative traffic deficiencies are created as a result of a combination of the proposed Project together with other future developments contributing to the overall traffic deficiencies requiring additional improvements to maintain acceptable level of service operations with or without the Project. A project's contribution to a cumulative deficiency can be improved if the project is required to implement or fund its fair share of improvements designed to alleviate its contribution to the deficiency. A deficiency has been deemed cumulatively considerable if the project contributes 50 or more peak hour trips.

2.6 PROJECT FAIR SHARE CALCULATION METHODOLOGY

Improvements found to be included in the TUMF and/or DIF will be identified as such. For improvements that do not appear to be in either of the pre-existing fee programs, a fair share contribution based on the Project's proportional share may be imposed in order to address the Project's share of deficiencies in lieu of construction. It should be noted that fair share calculations are for informational purposes only and the City Traffic Engineer will determine the appropriate improvements to be implemented by a project (to be identified in the conditions of approval). The Project's fair share contribution is determined based on the following equation, which is the ratio of Project traffic to net new traffic (where net new traffic is the future traffic less existing traffic):

Project Fair Share % = Project Traffic / (2040 With Project Total Traffic – Existing Traffic)

3 AREA CONDITIONS

This section provides a summary of the existing circulation network, the City of Eastvale General Plan Circulation Network, and a review of existing peak hour intersection operations and traffic signal warrant analyses.

3.1 EXISTING CIRCULATION NETWORK

Pursuant to the agreement with City of Eastvale staff (Appendix 1.1), the study area includes a total of 8 existing and future intersections as shown previously on Exhibit 1-2. Exhibit 3-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls.

3.2 CITY OF EASTVALE GENERAL PLAN CIRCULATION ELEMENT

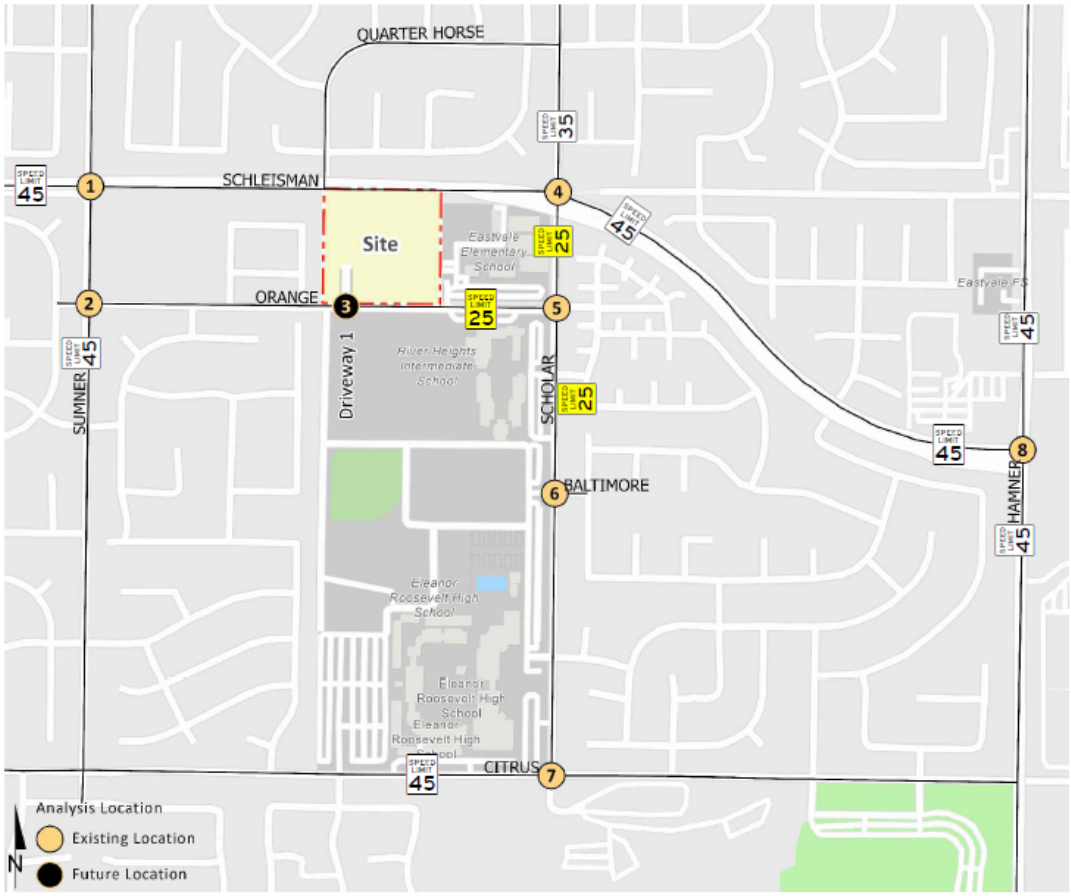
As noted previously, the Project site is located within the City of Eastvale. The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified on the City of Eastvale General Plan Circulation Element, are described subsequently. Exhibit 3-2 shows the City of Eastvale General Plan Circulation Element, and Exhibit 3-3 illustrates the City of Eastvale General Plan roadway cross-sections.

The study area roadways that are classified as 6-lane Urban Arterials are identified as having three lanes of travel in each direction. The following study area roadways within the City of Eastvale are classified as 6-lane Urban Arterials:

- Schleisman Road
- Hamner Avenue

The study area roadway that is classified as a 2-lane Major Collector is identified as having one lane of travel in each direction. The following study area roadway is classified as a 2-lane Major Collector:

- Sumner Avenue



The study area roadways that are classified as 2-lane Secondary Collectors are identified as having one lane of travel in each direction. The following study area roadways are classified as Secondary Collectors:

- Scholar Way
- Citrus Street

The study area roadway that is classified as a 2-lane Local Road is identified as having one lane of travel in each direction. The following study area roadways are classified as Local Roads:

- Orange Street

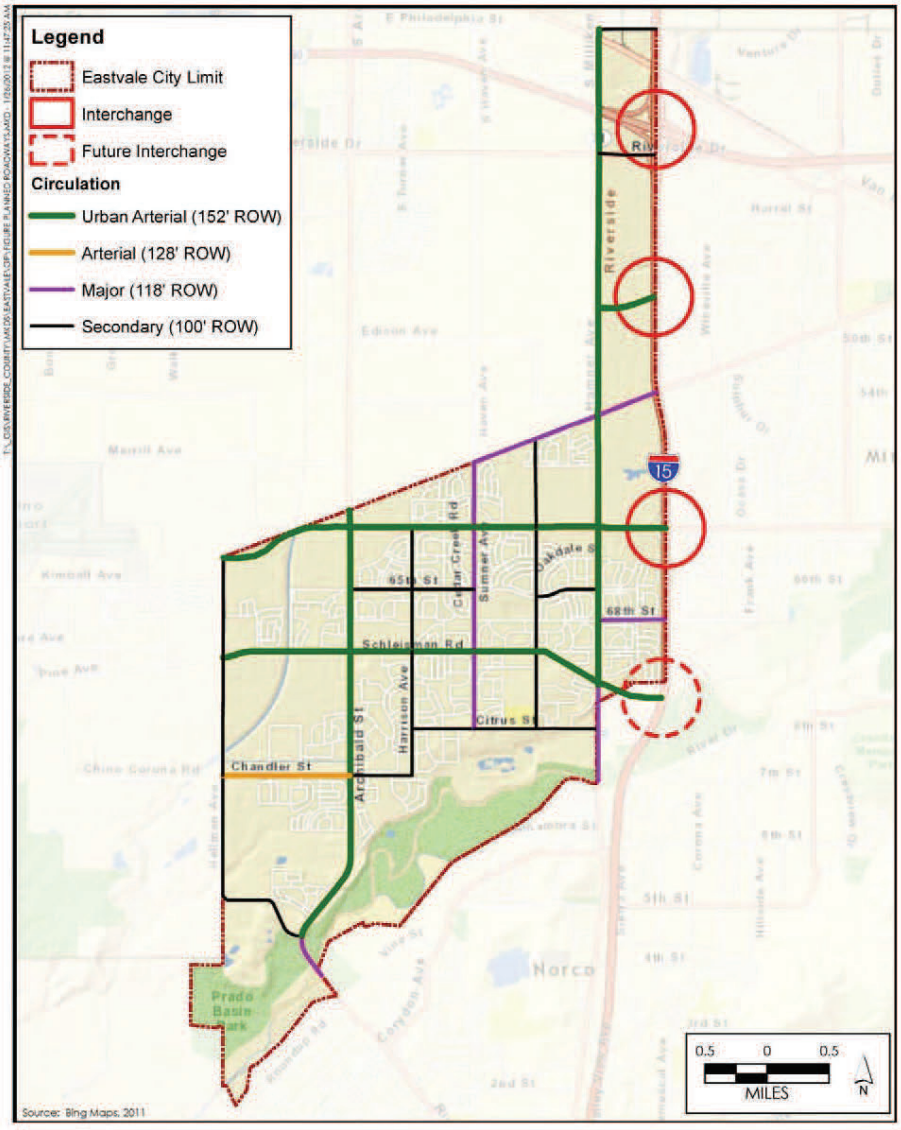
CHAPTER 4:
CIRCULATION AND INFRASTRUCTURE

CITY OF EASTVALE

FIGURE C-1: CIRCULATION PLAN



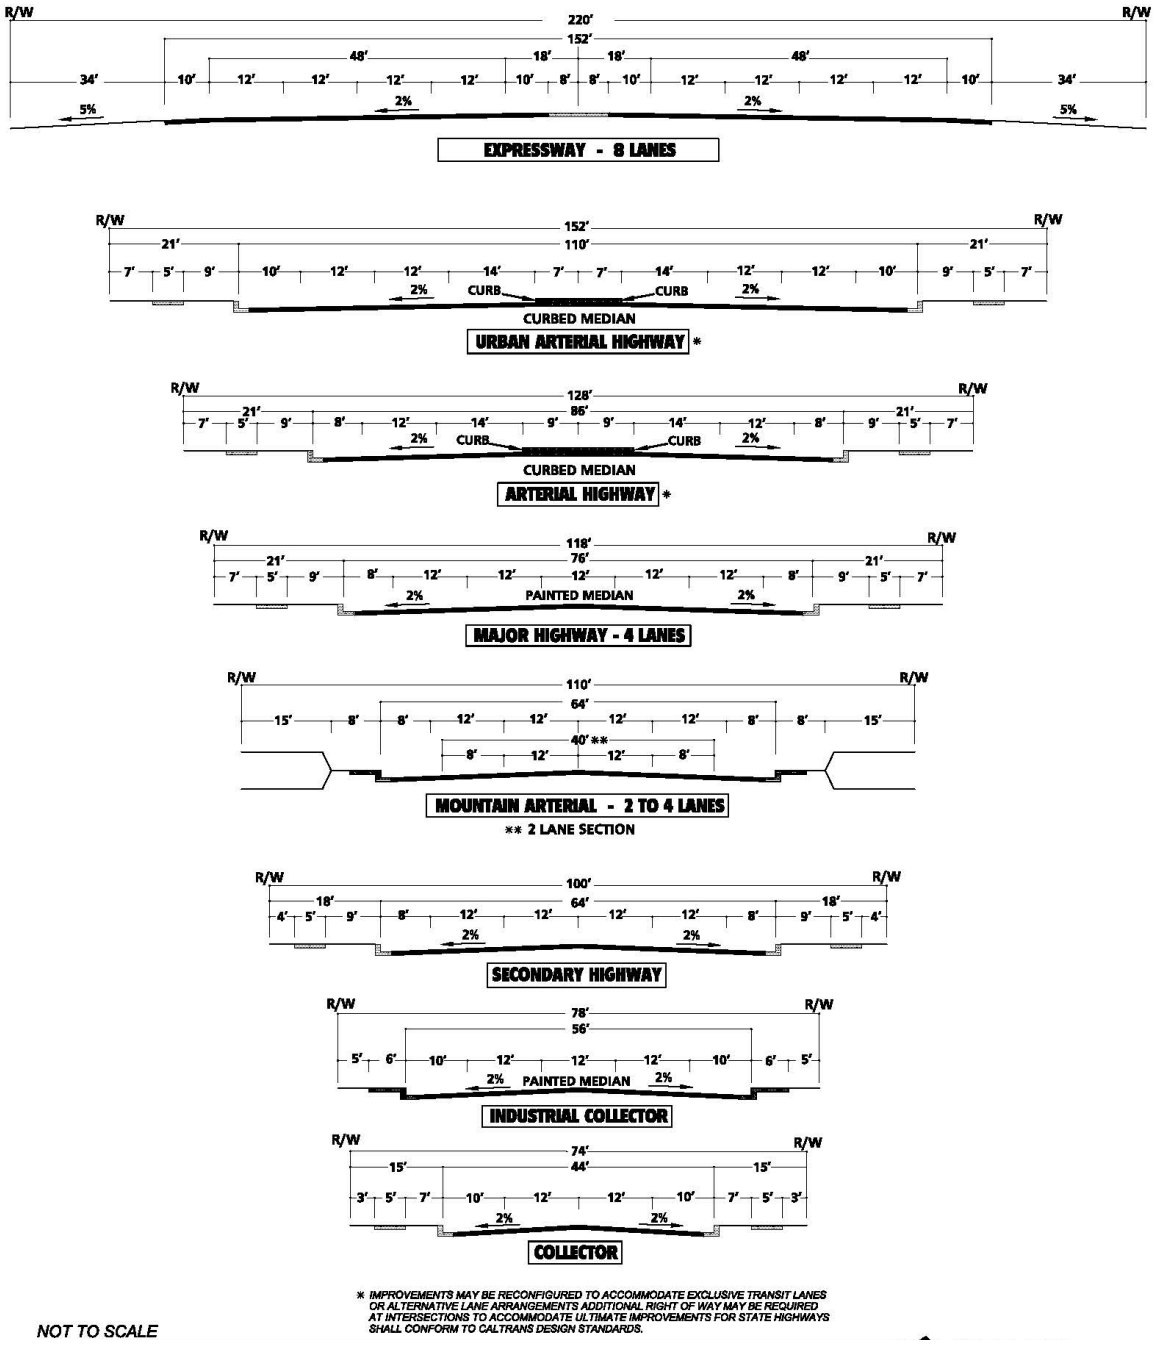


EXHIBIT 3-3: CITY OF EASTVALE GENERAL PLAN ROADWAY CROSS-SECTIONS

3.3 BICYCLE & PEDESTRIAN FACILITIES

Exhibit 3-4 illustrates the City of Eastvale current and future trails and bikeway systems which proposes off-street Class I multi-use trails along Schleisman Road. On-street Class II bike lanes are also proposed along Orange Street near the vicinity of the site. Existing pedestrian facilities within the study area are shown on Exhibit 3-5.

3.4 TRANSIT SERVICE

The Riverside Transit Authority (**RTA**) serves the City of Eastvale. Transit service is reviewed and updated by RTA periodically to address ridership, budget, and community demand needs. Based on a review of the existing transit routes within the vicinity of the proposed Project, RTA Route 3 currently operates on 68th Street, Sumner Avenue, and Citrus Street. Existing transit routes in the vicinity of the study area are illustrated on Exhibit 3-6. Changes in land use can affect these periodic adjustments which may lead to either enhanced or reduced service where appropriate.

3.5 EXISTING (2021) TRAFFIC COUNTS

The intersection LOS analysis is based on the traffic volumes observed during the peak hour conditions using traffic count data collected in October 2016, February 2018, January 2019, and January 2021. The following peak hours were selected for analysis:

- Weekday AM Peak Hour (peak hour between 7:00 AM and 9:00 AM)
- Weekday PM Peak Hour (peak hour between 4:00 PM and 6:00 PM)

Due to the currently ongoing COVID-19 pandemic, schools and businesses within the study area were closed or operating at less than full capacity at the time this study was prepared. As such, historic traffic counts were utilized in conjunction with a 1.6% compounded growth rate per year (compounded annually) to reflect 2021 conditions. The comparison of historical counts and adjustment factor calculation are included in Appendix 3.1. The historical weekday AM and weekday PM peak hour count data is representative of typical weekday peak hour traffic conditions in the study area. There were no observations made in the field that would indicate atypical traffic conditions on the count dates, such as construction activity or detour routes.

Historic traffic counts were not available for the intersections of Scholar Way & Orange Street, Scholar Way & Baltimore Street, and Scholar Way & Citrus Street. As such, new traffic counts were conducted in August 2021. August 2021 traffic counts were also conducted at the intersection of Hamner Avenue & Schleisman Road in order to determine an adjustment factor between the adjusted historic count data (to 2021) and the August 2021 traffic count for this location. This adjustment factor was then applied to August 2021 counts to determine the adjusted 2021 baseline to be used for the operations analysis. The raw manual peak hour turning movement traffic count data sheets are included in Appendix 3.1. Existing weekday ADT volumes are shown on Exhibit 3-7. Where actual 24-hour tube count data was not available, Existing ADT volumes were based upon factored intersection peak hour counts collected by Urban Crossroads, Inc. using the following formula for each intersection leg:

Weekday PM Peak Hour (Approach Volume + Exit Volume) x 14.88 = Leg Volume

##(##) AM(PM) Peak Hour Intersection Volumes
Average Daily Trips

A comparison of the PM peak hour and daily traffic volumes of various roadway segments within the study area indicated that the peak-to-daily relationship is approximately 7.56 percent. As such, the above equation utilizing a factor of 14.88 estimates the ADT volumes on the study area roadway segments assuming a peak-to-daily relationship of approximately 7.56 percent (i.e., 1/0.0756 = 14.88) and was assumed to sufficiently estimate average daily traffic (ADT) volumes for planning-level analyses. Existing weekday AM and weekday PM peak hour intersection volumes are also shown on Exhibit 3-7.

3.6 EXISTING (2021) TRAFFIC SPEED SURVEY

Count and speed data collection devices were placed along Orange Street, adjacent to the Project site. Existing traffic speed data by direction was collected, for 48 hours beginning on August 31, 2021, and ending on September 1, 2021.

The speed survey for Orange Street indicates that the vehicle pace speed is within the 31-40 MPH range with an 85th percentile speed of 39 MPH. The speed survey results on Orange Street indicate that vehicles are travelling above the 25 MPH speed limit. Approximately 60% of vehicles in the 48-hour survey exceeded the 25 MPH posted speed limit. The raw data is included in Appendix 3.2 of this TA.

3.7 EXISTING (2021) INTERSECTION OPERATIONS ANALYSIS

Existing peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2.2 *Intersection Capacity Analysis* of this report. The intersection operations analysis results are summarized in Table 3-1, which indicates that the following study area intersection operating at an unacceptable LOS under Existing (2021) traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

The intersection operations analysis worksheets are included in Appendix 3.3 of this TA.

TABLE 3-1: INTERSECTION ANALYSIS FOR EXISTING (2021) CONDITIONS

#	Intersection	Traffic Control[1]	Delay[2] (secs.) AM	Delay[2] (secs.) PM	Level of Service AM	Level of Service PM
1	Sumner Av. & Schleisman Rd.	TS	**111.2**	**58.6**	**F**	**E**
2	Sumner Av. & Orange St.	TS	8.6	8.5	A	A
3	Driveway 1 & Orange St.		Future Intersection			
4	Scholar Wy. & Schleisman Rd.	TS	23.1	17.6	C	B
5	Scholar Wy. & Orange St.	TS	3.6	6.4	A	A
6	Scholar Wy. & Baltimore St.	TS	21.0	10.8	C	B
7	Scholar Wy. & Citrus St.	TS	40.1	18.8	D	B
8	Hamner Av. & Schleisman Rd.	TS	14.6	11.9	B	B

* **BOLD** = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

1 CSS = Cross-street Stop; TS = Traffic Signal

2 Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

3.8 TRAFFIC SIGNAL WARRANTS ANALYSIS

All of the study area intersections are currently signalized. As such, no traffic signal warrants have bene evaluated for Existing traffic conditions.

This page intentionally left blank

4 PROJECTED FUTURE TRAFFIC

This section presents the traffic volumes estimated to be generated by the Project's trip assignment onto the study area roadway network. The Project is proposed to consist of up to 41 single family detached residential units.

Regional access to the Project site is available from the I-15 Freeway at Limonite Avenue interchange. The Project is bounded by Schleisman Road to the north and Orange Street to the south in the City of Eastvale. Vehicular traffic access will be provided via the following driveway:

- Driveway 1 via Orange Street – Full access

4.1 PROJECT TRIP GENERATION

Trip generation represents the amount of traffic which is both attracted to and produced by a development. Determining traffic generation for a specific project is therefore based upon forecasting the amount of traffic that is expected to be both attracted to and produced by the specific land uses being proposed for a given development.

Trip generation represents the amount of traffic that is attracted and produced by a development and is based upon the specific land uses planned for a given project. The Single Family Detached Residential (ITE Land Use Code 210) trip generation rates used for this analysis are based upon information collected by the Institute of Transportation Engineers (**ITE**) as provided in their Trip Generation Manual (11th Edition, 2017). (2) Trip generation rates used to estimate Project traffic are shown in Table 4-1.

The resulting trip generation for the proposed Project is also shown in Table 4-1. As shown in Table 4-1, the proposed Project is anticipated to generate a total of 388 vehicle trip-ends per day with 28 AM peak hour trips and 38 PM peak hour trips.

TABLE 4-1: PROJECT TRIP GENERATION SUMMARY

	ITE		AM Peak Hour			PM Peak Hour

[2] DU = Dwelling Units

4.2 PROJECT TRIP DISTRIBUTION

The Project trip distribution and assignment process represents the directional orientation of traffic to and from the Project site. The trip distribution pattern of passenger cars is heavily influenced by the geographical location of the site, the location of surrounding uses, and the proximity to the regional freeway system. Exhibit 4-1 illustrates the Project trip distribution patterns.

4.3 MODAL SPLIT

The potential for Project trips to be reduced by the use of public transit, walking or bicycling have not been included as part of the Project's estimated trip generation. Essentially, the Project's traffic projections are "conservative" in that these alternative travel modes would reduce the forecasted traffic volumes.

4.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project. Based on the identified Project traffic generation and trip distribution patterns, Project only ADT and peak hour intersection turning movement volumes are shown on Exhibit 4-2.

4.5 BACKGROUND TRAFFIC

4.5.1 OPENING YEAR CUMULATIVE CONDITIONS

Future year traffic forecasts have been based upon background (ambient) growth at 1.6% per year for 2025 traffic conditions. The ambient growth factor is intended to approximate regional traffic growth. The total ambient growth factor is 6.81 for 2025 traffic conditions (growth of 1.6 percent per year compounded over 4 years). This ambient growth rate is applied to existing traffic volumes to account for area-wide growth not reflected by cumulative development projects. Ambient growth traffic volumes have been added to daily and peak hour traffic volumes on surrounding roadways, in addition to traffic generated by the development of future projects that have been approved but not yet built and/or for which development applications have been filed and are under consideration by governing agencies.

Opening Year Cumulative (2025) traffic volumes are provided in Section 6 of this report. The traffic generated by the proposed Project was then manually added to the base volume to determine Opening Year Cumulative "With Project" forecasts for 2025.

4.5.2 HORIZON YEAR CONDITIONS

Horizon Year conditions represent the General Plan Buildout of the City of Eastvale and is based on the Riverside County Transportation Analysis Model (**RivTAM**) (see Section 4.7 *Horizon Year Volume Development* for additional discussion). The adopted Southern California Association of Governments (**SCAG**) 2020 Regional Transportation Plan/Sustainable Communities Strategy (**RTP/SCS**) (adopted September 2020) growth forecasts for the City of Eastvale identifies projected growth in population of 63,900 in 2016 to 72,700 in 2045, or a 13.77% increase over the 29-year period. (7) The change in population equates to roughly a 0.45% growth rate, compounded annually. Similarly, growth over the same 29-year period in households is projected to increase by 13.50%, or a 0.44% annual growth rate. Finally, growth in employment over the same 29-year period is projected to increase by 191.89%, or a 3.76% annual growth rate.

Based on a comparison of Existing (2021) traffic volumes to the Horizon Year forecasts, the average growth rate is estimated at approximately 2.46%, compounded annually between Existing (2021) and 2040 traffic conditions. The annual growth rate at each individual intersection is not lower than 0.62% compounded annually to as high as 6.55% compounded annually over the same time period.

Therefore, the annual growth rate utilized for the purposes of this analysis would appear to conservatively approximate the anticipated regional growth in traffic volumes in the City of Eastvale for Opening Year Cumulative and Horizon Year traffic conditions, especially when considered along with the addition of project-related traffic. As such, the growth in traffic volumes assumed in this traffic analysis would tend to overstate as opposed to understating the potential deficiencies to traffic and circulation.

The model data from RivTAM represents peak hour data and therefore did not require adjustments. Typically, the model growth is prorated and is subsequently added to the existing (base validation) traffic volumes to represent Horizon Year traffic conditions. In an effort to conduct a conservative analysis, reductions to traffic forecasts from either Existing or Opening Year Cumulative traffic conditions were not assumed as part of this analysis. As such, in conjunction with the addition of cumulative projects that are not consistent with the General Plan, additional growth has also been applied on a movement-by-movement basis, where applicable, to estimate reasonable Horizon Year forecasts. Horizon Year turning volumes were compared to Opening Year Cumulative (2025) volumes in order to ensure a minimum growth as a part of the refinement process. The minimum growth includes any additional growth between Opening Year Cumulative (2025) and Horizon Year traffic conditions that is not accounted for by the traffic generated by cumulative development projects and ambient growth rates assumed between Existing (2021) and Opening Year Cumulative (2025) conditions. Future estimated peak hour traffic data was used for new intersections and intersections with an anticipated change in travel patterns to further refine the Horizon Year peak hour forecasts.

The future Horizon Year Without Project peak hour turning movements were then reviewed by Urban Crossroads, Inc. for reasonableness, and in some cases, were adjusted to achieve flow conservation, reasonable growth, and reasonable diversion between parallel routes. Flow conservation checks ensure that traffic flow between two closely spaced intersections, such as two adjacent driveway locations, is verified in order to make certain that vehicles leaving one intersection are entering the adjacent intersection and that there is no unexplained loss of vehicles. The result of this traffic forecasting procedure is a series of traffic volumes which are suitable for traffic operations analysis.

RivTAM does not include a truck component or has data that is unusually low. As such, in an effort to conduct a conservative analysis, the presence of trucks has been accounted for based on the manual volume adjustments made to demonstrate growth above Opening Year Cumulative (2025) traffic forecasts. Post-processing worksheets for Horizon Year Without Project traffic conditions are provided in Appendix 4.1.

This page intentionally left blank

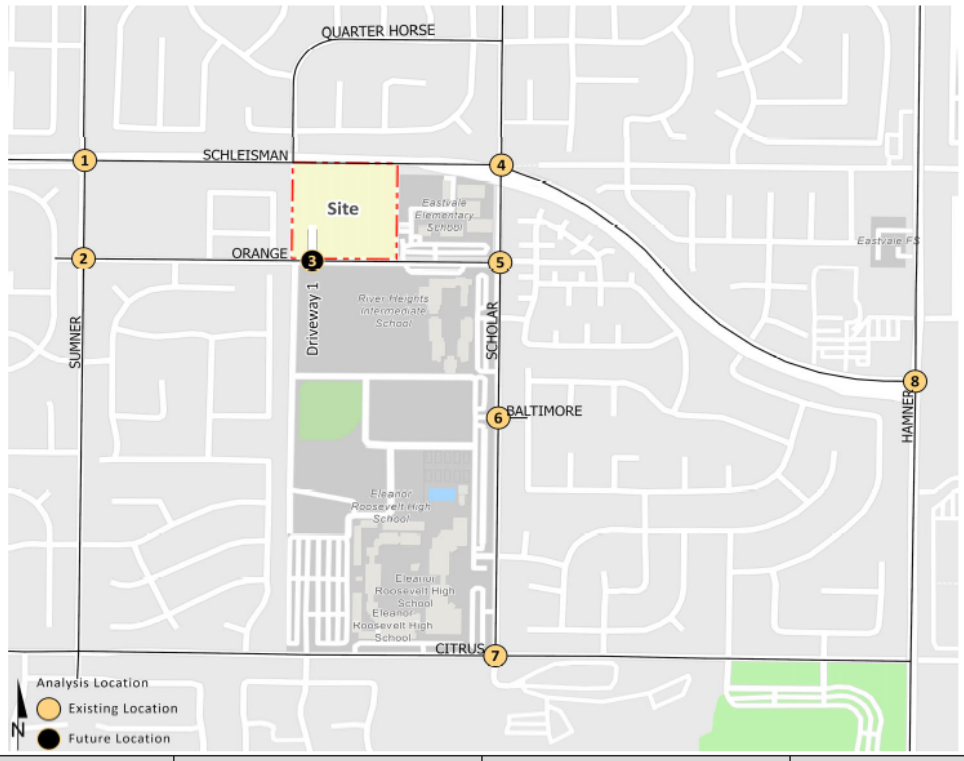
5 E+P TRAFFIC CONDITIONS

This section discusses the traffic forecasts for Existing plus Project (**E+P**) conditions and the resulting intersection operations and traffic signal warrant analyses.

5.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for E+P conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for E+P conditions only (e.g., intersection and roadway improvements at the Project's frontage and driveways).



5.2 E+P TRAFFIC VOLUME FORECASTS

This scenario includes Existing traffic volumes plus Project traffic. The ADT volumes and weekday AM and PM peak hour intersection turning movement volumes which can be expected for E+P traffic conditions are shown on Exhibit 5-1.

5.3 INTERSECTION OPERATIONS ANALYSIS

E+P peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TA. The intersection analysis results are summarized in Table 5-1, which indicates no additional intersections are anticipated to operate at an unacceptable LOS with addition of Project traffic, consistent with Existing (2021) traffic conditions. The intersection operations analysis worksheets for E+P traffic conditions are included in Appendix 5.1 of this TA.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

1 Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

2 CSS = Cross-street Stop; TS = Traffic Signal; CSS = Improvement

5.4 TRAFFIC SIGNAL WARRANTS ANALYSIS

No study area intersections are anticipated to meet average daily volume-based traffic signal warrants for E+P traffic conditions (see Appendix 5.2) of this report.

5.5 DEFICIENCIES AND IMPROVEMENTS

Improvements have been identified for each of the study area intersections that are operating at an unacceptable LOS during the peak hours. The effectiveness of the recommended improvement strategies to address E+P traffic deficiencies are presented on Table 5-2. Worksheets for E+P Conditions, with improvements, HCM calculation worksheets are provided in Appendix 5.3.

TABLE 5-2: SUMMARY OF INTERSECTION ANALYSIS FOR E+P CONDITIONS WITH IMPROVEMENTS

#	Intersection	Traffic Control[3]	Intersection Approach Lanes[1] Northbound L	T	R	Southbound L	T	R	Eastbound L	T	R	Westbound L	T	R	Delay[2] (secs.) AM	PM	Level of Service AM	PM

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes: L = Left; T = Through; R = Right; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

[3] TS = Traffic Signal

[4] Improvements require additional right-of-way. The improvements are assumed to be constructed by a future project adjacent to the intersection.

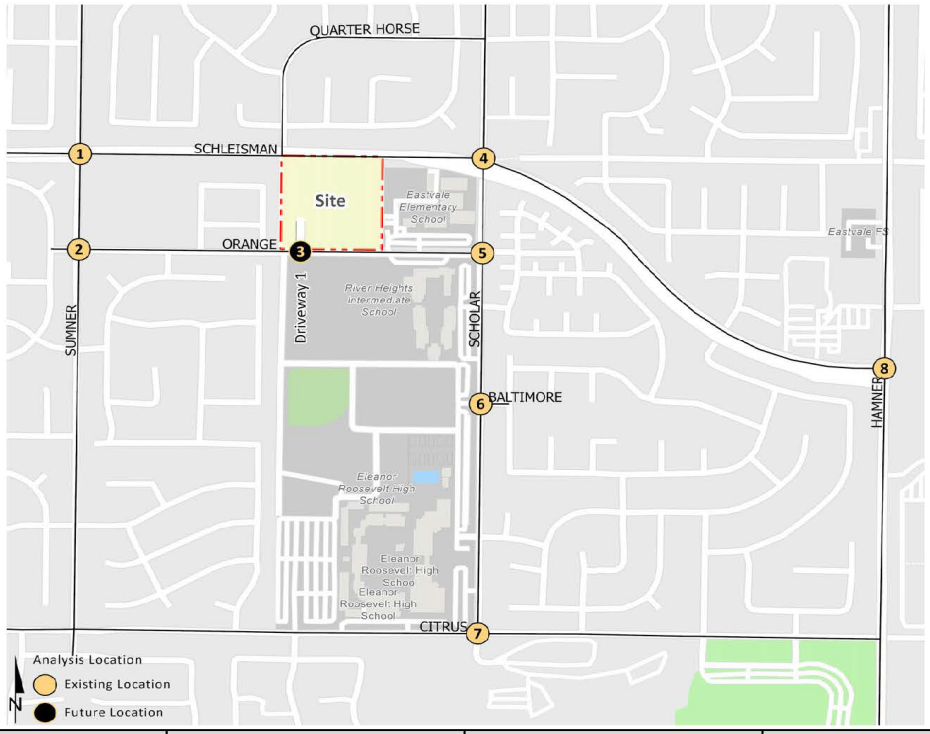
6 OPENING YEAR CUMULATIVE (2025) TRAFFIC CONDITIONS

This section discusses the methods used to develop Opening Year Cumulative (2025) Without and With Project traffic forecasts, and the resulting intersection operations and traffic signal warrant, analyses.

6.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Opening Year Cumulative (2025) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements at the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by cumulative developments to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the cumulative development's frontages).



6.2 OPENING YEAR CUMULATIVE (2025) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes Existing traffic volumes plus an ambient growth of 6.8% plus traffic from pending and approved but not yet constructed known development projects in the area. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2025) Without Project traffic conditions are shown on Exhibit 6-1.

6.3 OPENING YEAR CUMULATIVE (2025) WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes Opening Year Cumulative (2025) Without Project traffic in conjunction with the addition of Project traffic. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2025) With Project traffic conditions are shown on Exhibit 6-2.

Average Daily Trips

6.4 INTERSECTION OPERATIONS ANALYSIS

6.4.1 OPENING YEAR CUMULATIVE (2025) WITHOUT PROJECT TRAFFIC CONDITIONS

LOS calculations were conducted for the study intersections to evaluate their operations under Opening Year Cumulative (2025) Without Project conditions with roadway and intersection geometrics consistent with Section 6.1 *Roadway Improvements*. As shown on Table 6-1, the following study area intersection is anticipated to operate at an unacceptable LOS under Opening Year Cumulative (2025) Without Project traffic conditions, consistent with Existing (2021) traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM peak hour; LOS E PM peak hour

The intersection operations analysis worksheets for Opening Year Cumulative (2025) Without Project traffic conditions are included in Appendix 6.1 of this TA.

6.4.2 OPENING YEAR CUMULATIVE (2025) WITH PROJECT TRAFFIC CONDITIONS

As shown in Table 6-1, no additional study area intersections are anticipated to operate at a deficient LOS during the peak hours with the addition of Project traffic. The intersection operations analysis worksheets for Opening Year Cumulative (2025) With Project traffic conditions are included in Appendix 6.2 of this TA.

TABLE 6-1: INTERSECTION ANALYSIS FOR OPENING YEAR CUMULATIVE (2025) CONDITIONS

			2025 Without Project				2025 With Project

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

1 Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

2 CSS = Cross-street Stop; TS = Traffic Signal; **CSS** = Improvement

6.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

The following study area intersection is not anticipated to meet average daily traffic volume-based traffic signal warrants for Opening Year Cumulative (2025) With Project traffic conditions (see Appendix 6.3).

6.6 DEFICIENCIES AND IMPROVEMENTS

Improvements have been identified for each of the study area intersections anticipated operating at an unacceptable LOS during the peak hours. The effectiveness of the recommended improvement strategies to address its traffic deficiencies are presented on Table 6-2. HCM calculation worksheets for Opening Year Cumulative (2025) With Project With Improvements are provided in Appendix 6.4 of this TA.

TABLE 6-2: INTERSECTION ANALYSIS FOR OPENING YEAR CUMULATIVE (2025) CONDITIONS WITH IMPROVEMENTS

			Intersection Approach Lanes[1]												Delay[2] (secs.)		Level of Service	
		Traffic	Northbound			Southbound			Eastbound			Westbound						
#	Intersection	Control[3]	L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM
1	Sumner Av. & Schleisman Rd.																	
	-Without Improvements	TS	1	1	0	1	1	0	0	1	1	0	1	1	**161.5**	**78.3**	**F**	**E**

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes: L = Left; T = Through; R = Right; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

[3] TS = Traffic Signal; **TS** = Improvement

[4] Improvements require additional right-of-way. The improvements are assumed to be constructed by a future project adjacent to the intersection.

This page intentionally left blank

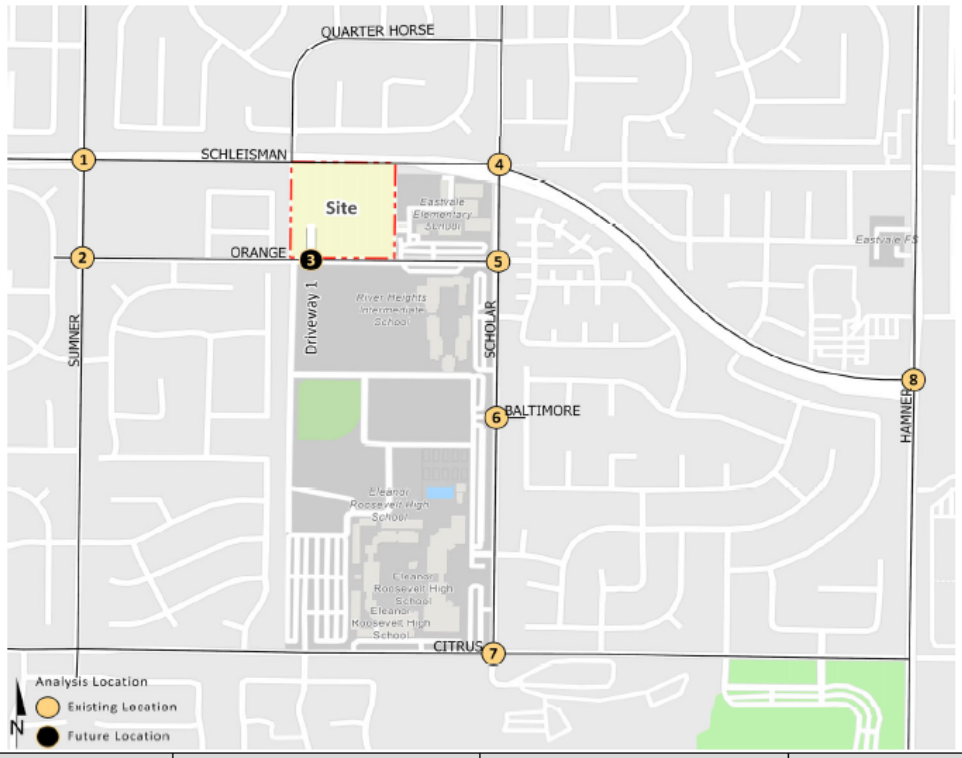
7 HORIZON YEAR (2040) TRAFFIC CONDITIONS

This section discusses the methods used to develop Horizon Year (2040) Without and With Project traffic forecasts, and the resulting intersection operations and traffic signal warrant analyses.

7.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Horizon Year (2040) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Horizon Year conditions only (e.g., intersection and roadway improvements along the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by cumulative developments to provide site access are also assumed to be in place for Horizon Year conditions only (e.g., intersection and roadway improvements along the cumulative development's frontages).



7.2 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the RivTAM (see Section 4.7 *Horizon Year Volume Development* of this TA for a detailed discussion on the post-processing methodology) and represents the General Plan buildout of the City of Eastvale. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year Without Project traffic conditions are shown on Exhibit 7-1.

7.3 HORIZON YEAR (2040) WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the RivTAM, plus the traffic generated by the proposed Project (see Section 4.7 *Horizon Year Volume Development* of this TA for a detailed discussion on the post-processing methodology). Horizon Year With Project traffic forecasts reflects buildout of the Project. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year With Project traffic conditions are shown on Exhibit 7-2.

##(##) AM(PM) Peak Hour Intersection Volumes

Average Daily Trips

7.4 INTERSECTION OPERATIONS ANALYSIS

7.4.1 HORIZON YEAR (2040) WITHOUT PROJECT CONDITIONS

LOS calculations were conducted for the study area intersections to evaluate their operations under Horizon Year Without Project traffic conditions with roadway and intersection geometrics consistent with Section 7.1 *Roadway Improvements*. As shown in Table 7-1, the following study area intersection is anticipated to operate at an unacceptable LOS under Horizon Year Without Project traffic conditions:

- Sumner Av. & Schleisman Rd. (#1) – LOS F AM and PM peak hours

The intersection operations analysis worksheets for Horizon Year Without Project traffic conditions are included in Appendix 7.1 of this TA.

7.4.2 HORIZON YEAR (2040) WITH PROJECT TRAFFIC CONDITIONS

As shown in Table 7-1, no additional study area intersections are anticipated to operate at a deficient LOS during the peak hours with the addition of Project traffic, consistent with Horizon Year Without Project traffic conditions. The intersection operations analysis worksheets for Horizon Year With Project traffic conditions are included in Appendix 7.2 of this TA.

TABLE 7-1: INTERSECTION ANALYSIS FOR HORIZON YEAR (2040) CONDITIONS

			2040 Without Project				2040 With Project			
			Delay[1] (secs.)		Level of Service		Delay[1] (secs.)		Level of Service

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

1 Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

2 CSS = Cross-street Stop; TS = Traffic Signal; **CSS** = Improvement

3 The change in delay is calculated between pre-project and With Project scenarios for City of Eastvale intersections already operating at an unacceptable LOS in the pre-project traffic condition.

7.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

No study area intersections are anticipated to meet average daily traffic volume-based traffic signal warrants for Horizon Year (2040) With Project traffic conditions (see Appendix 7.3).

7.6 DEFICIENCIES AND IMPROVEMENTS

Improvements have been identified for each of the study area intersections that would be operating at an unacceptable LOS during the peak hours. The effectiveness of the recommended improvement strategies to address its traffic deficiencies are presented on Table 7-4. HCM calculation worksheets for Horizon Year With Project With Improvements are provided in Appendix 7.4 of this TA.

TABLE 7-3: INTERSECTION ANALYSIS FOR HORIZON YEAR (2040) CONDITIONS WITH IMPROVEMENTS

			Intersection Approach Lanes[1]												Delay[2] (secs.)		Level of Service	
		Traffic	Northbound			Southbound			Eastbound			Westbound						
#	Intersection	Control[3]	L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes: L = Left; T = Through; R = Right; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) is considered the delay and LOS for the intersection.

[3] TS = Traffic Signal; **TS** = Improvement

[4] Improvements require additional right-of-way. The improvements are assumed to be constructed by a future project adjacent to the intersection.

This page intentionally left blank

8 LOCAL AND REGIONAL FUNDING MECHANISMS

Transportation improvements within the City of Eastvale are funded through a combination of construction of improvements, development impact fee programs or fair share contributions, such as the City of Eastvale Development Impact Fee (**DIF**) program. Identification and timing of needed improvements is generally determined through local jurisdictions based upon a variety of factors.

8.1 RIVERSIDE COUNTY TRANSPORTATION UNIFORM MITIGATION FEE (TUMF)

The TUMF program is administered by the WRCOG based upon a regional Nexus Study most recently updated in 2016 to address major changes in right of way acquisition and improvement cost factors. (3) TUMF identifies a network of backbone and local roadways that are needed to accommodate growth through 2035. This regional program was put into place to ensure that development pays its fair share, and that funding is in place for construction of facilities needed to maintain the requisite level of service and critical to mobility in the region.

TUMF fees are imposed on new residential, industrial, and commercial development through application of the TUMF fee ordinance and fees are collected at the building or occupancy permit stage. The fee is $10,104 per dwelling unit for single family detached residential dwelling units (applicable to the proposed Project, effective January 1, 2022). In addition, an annual inflation adjustment is considered each year in January. In this way, TUMF fees are adjusted upwards on a regular basis to ensure that the development impact fees collected keep pace with construction and labor costs, etc.

The Project Applicant will be subject to the TUMF fee program and will pay the requisite TUMF fees at the rates then in effect pursuant to the TUMF Ordinance. WRCOG has a successful track record funding and overseeing the construction of improvements funded through the TUMF program. In total, the TUMF program is anticipated to generate nearly $5 billion in transportation projects for Western Riverside County.

8.2 CITY OF EASTVALE DEVELOPMENT IMPACT FEE (DIF) PROGRAM

The City of Eastvale has prepared a Nexus Study to establish fees which has been adopted by the City as of July 1, 2012. It is our understanding that the DIF program includes widening of the Hellman Avenue bridge over Cucamonga Creek and the signalization of up to twenty-three intersections. The fee for single family detached residential is $9,146 per dwelling unit as of December 2019. In addition, an annual inflation adjustment is considered each year. Fee credits and reimbursements will be available as part of the Fee Program and will only be given to projects that are identified as a Fee Program facility. The Project's Conditions of Approval will establish and clarify eligibility.

The timing to use the DIF fees is established through periodic capital improvement programs which are overseen by the City's Public Works Department. Periodic traffic counts, review of traffic accidents, and a review of traffic trends throughout the City are also periodically performed by City staff and consultants. The City uses this data to determine the timing of implementing the improvements listed in its facilities list. The City also uses this data to ensure that the improvements listed on the facilities list are constructed before the LOS falls below the LOS performance standards adopted by the City. In this way, the improvements are constructed before the LOS falls below the City's LOS performance

thresholds. The Project Applicant will be subject to the City's DIF fee program and will pay the requisite City DIF fees at the rates then in effect pursuant to the City's ordinance.

8.3 MIRA LOMA ROAD AND BRIDGE BENEFIT DISTRICT

Similar to other regions within Riverside County, the City of Eastvale is anticipated to experience substantial growth. Extensive improvements are necessitated by new development within the region. In particular, Riverside County recognized the impact of this growth on the vicinity of the study area when it formed the Mira Loma RBBD. The proposed Project lies within Zone D of the Mira Loma RBBD. Zone D is generally bounded by Bellegrave Avenue to the north, Hellman Avenue to the west, Hamner Avenue to the east, and the Eastvale city boundary to the south. As discussed above, the facilities improvements that will be ultimately constructed as a result of the collection of these fees and assessments are significant. The fee for residential use is $2,681 per single family residential dwelling unit within Zone D. They include:

Mira Loma Road and Bridge Benefits District (Zone D):

- Limonite Avenue interchange at the I-15 Freeway and between Hamner Avenue and Wineville Avenue
- Bellegrave Avenue overcrossing improvement at the I-15 Freeway
- Archibald Avenue roadway from River Road to the San Bernardino and Riverside County jurisdictional line
- Limonite Avenue roadway from Hamner Avenue to Archibald Avenue
- Schleisman Road roadway from Hamner Avenue to the San Bernardino and Riverside County jurisdictional line
- Archibald Avenue landscaped median from River Road to the San Bernardino and Riverside County jurisdictional line
- Hamner Avenue landscaped median between Bellegrave Avenue and the Santa Ana River
- Limonite Avenue landscaped median between Hamner Avenue and Archibald Avenue
- Schleisman Road landscaped median from Hamner Avenue to the San Bernardino and Riverside County jurisdictional line

8.4 FAIR SHARE CONTRIBUTION

Project improvement may include a combination of fee payments to established programs, construction of specific improvements, payment of a fair share contribution toward future improvements or a combination of these approaches. Improvements constructed by development may be eligible for a fee credit or reimbursement through the program where appropriate (to be determined at the City's discretion).

When off-site improvements are identified with a minor share of responsibility assigned to proposed development, the approving jurisdiction may elect to collect a fair share contribution or require the development to construct improvements. Detailed fair share calculations, for each peak hour, has been provided on Table 8-1 for the applicable deficient study area intersections.

These fees are collected with the proceeds solely used as part of a funding mechanism aimed at ensuring that regional highways and arterial expansions keep pace with the projected population increases.

TABLE 8-1: PROJECT FAIR SHARE CALCULATIONS

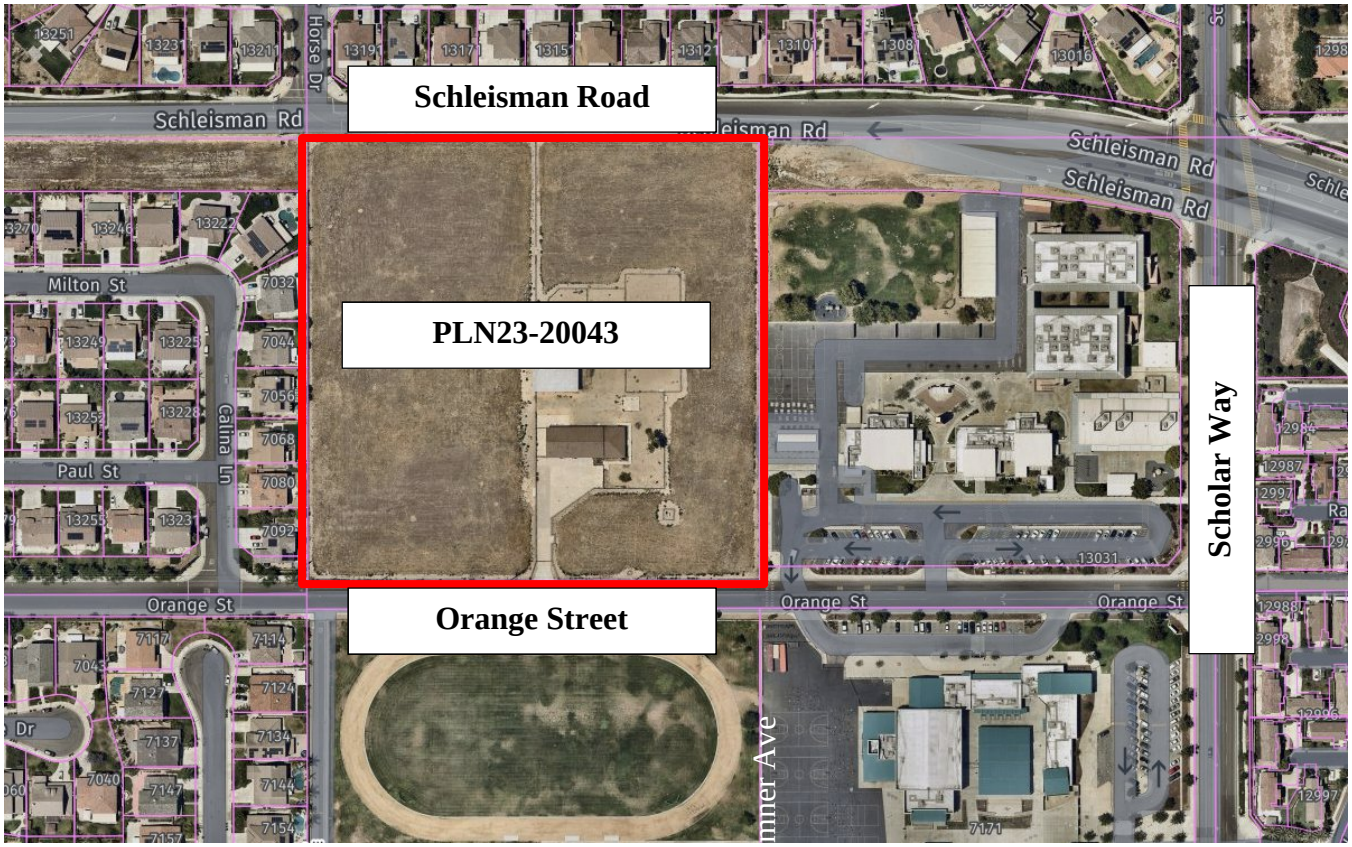
CITY OF EASTVALE NOTICE OF INTENT TO ADOPT A MITIGATED NEGATIVE DECLARATION AND PLANNING COMMISSION NOTICE OF PUBLIC HEARING FOR PROJECT NO. PLN23-20043 – MAGNOLIA RANCH

NOTICE IS HEREBY GIVEN that the City of Eastvale Planning Commission will hold a public hearing on **Wednesday, October 18, 2023**, at 6:00 p.m. at Eastvale City Hall Council Chambers located at 12363 Limonite Avenue, Suite 900, Eastvale, CA 91752, to consider Project **No. PLN23-20043** for the subdivision, site planning, and master building architecture of forty-one (41) single-family residential lots and three (3) lettered lots.

PROJECT DESCRIPTION: The proposed project includes the following entitlements:

1. **Tentative Tract Map 38167** to subdivide a single 10-acre lot (8.28 net acres) into 41 single-family residential and three (3) lettered lots, and

2. **Major Development Review** for the master building architecture and site planning of 41 single-family residential lots and three lettered lots.



PROJECT LOCATION: The project site is located on 10 acres of partially developed land, north of Orange Street, south of Schleisman Road, east of Quarter Horse Drive and west of Scholar Way (Assessor's Parcel Number 152-040-003). The project site is not located on a hazardous materials site listed under Government Code Section 65962.5.

ENVIRONMENTAL: An Initial Study/Mitigated Negative Declaration (IS/MND) was prepared for the project. Based upon the information contained in the IS/MND and pursuant to the requirements of CEQA, it has been determined that this project as proposed, revised, or mitigated will not have a significant impact on the environment. In accordance with CEQA Guidelines Sections 15702 and 15073, the IS/MND is available for a 20-day public review period, beginning on **Thursday, September 28, 2023,** through **Tuesday, October 17, 2023.** The IS/MND is available at: https://www.eastvaleca.gov/government/community-development/planning/environmental-documents

Any person may submit written comments prior to the public hearing or may appear in person before the Planning Commission to be heard. Written comments may be mailed to the City of Eastvale Planning Division located at 12363 Limonite Avenue, Suite 910, Eastvale, CA 91752 or via email to Jamie K. Cerda, AICP at jcerda@eastvaleca.gov. **For the comments to be presented to the Planning Commission at the meeting, all comments made in writing or via e-mail prior to the public hearing must be received by the City of Eastvale Planning Department no later than Wednesday, October 18, 2023, at 5:00 p.m.** Oral and written comments may be submitted directly to the Planning Commission at the public hearing. If you challenge the project in court, you may be limited to raising only those issues you raised at the public hearing as described in this notice or in written correspondence delivered to the Eastvale Planning Commission prior to or at the public hearing.

If you have any questions on the project, contact Jamie K. Cerda, AICP at (951) 703-4432 or jcerda@eastvaleca.gov.

Project Vicinity Map

WOODSIDE HOMES IS PLANNING A NEW COMMUNITY IN YOUR NEIGHBORHOOD LOCATED AT 13175 ORANGE STREET

Hello Neighbor,

My name is Kory Liston and I am a project manager for Woodside Homes. We are excited to share with you details about a new residential community being proposed in your neighborhood. We realize that the recent pandemic has made many people reluctant to participate in a large meeting so we have set aside time for smaller meetings. We invite you to reserve a time so we can meet you, inform you about this existing proposed community, and answer any of your questions. Please do not hesitate to reach out to me at the number or email below to schedule an appointment. We look forward to speaking with you!

Sincerely,

Two ways to reach me:

1. Phone: (951) 710-1913
2. E-mail: kory.liston@woodsidehomes.com

Community Overview

- Consistent with the General Plan
- Reduced from 127 attached and detached single-family homes to 41 single-family homes
- Two story floor plans
- 2,833 to 3,153 square feet
- 4-5 bedrooms
- Attached 2-car garages with full driveway (4 parking spaces per home)
- On-street parking (58 additional spaces within the community)

Frequently Asked Questions

How many homes are proposed and will they be for-sale or for-rent?
There will be 41 single-family homes. All homes will be for-sale at market rate.

How much will these homes cost?
There is no way to known for certain what the housing market will look like by the time these are built and ready for sale; however, based on current conditions, we anticipate these homes to be prices in the $900,000s.

Will this community have a Home Owners Association (HOA)?
Yes, an HOA will be fully responsible for managing and maintaining the community, including landscaping, common area amenities and parking enforcement.

Will this community be gated?
No, this development will not be gated.
